

SINGLE 12-BIT, 65-MSPS IF SAMPLING ANALOG-TO-DIGITAL CONVERTER

FEATURES

- 12-Bit Resolution
- 65-MSPS Maximum Sample Rate
- 2-V_{pp} Differential Input Range
- 3.3-V Single Supply Operation
- 1.8-V to 3.3-V Output Supply
- 400-mW Total Power Dissipation
- Two's Complement Output Format
- On-Chip S/H and Duty Cycle Adjust Circuit
- Internal or External Reference

- 48-Pin TQFP Package With PowerPad (7 mm x 7 mm body size)
- 64.5-dBFS SNR and 72-dBc SFDR at 65 MSPS and 190-MHz Input
- Power-Down Mode
- Single-Ended or Differential Clock
- 1-GHz -3-dB Input Bandwidth

APPLICATIONS

- High IF Sampling Receivers
- Medical Imaging
- Portable Instrumentation

DESCRIPTION

The ADS5413 is a low power, 12-bit, 65-MSPS, CMOS pipeline analog-to-digital converter (ADC) that operates from a single 3.3-V supply, while offering the choice of digital output levels from 1.8 V to 3.3 V. The low noise, high linearity, and low clock jitter makes the ADC well suited for high-input frequency sampling applications. On-chip duty cycle adjust circuit allows the use of a non-50% duty cycle. This can be bypassed for applications requiring low jitter or asynchronous sampling. The device can also be clocked with single ended or differential clock, without change in performance. The internal reference can be bypassed to use an external reference to suit the accuracy and low drift requirements of the application.

The device is specified over full temperature range (-40°C to +85°C).

FUNCTIONAL BLOCK DIAGRAM

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

APPLICATION INFORMATION

CONVERTER OPERATION

The ADS5413 is a 12-bit pipeline ADC. Its low power (400 mW) at 65 MSPS and high sampling rate is achieved using a state-of-the-art switched capacitor pipeline architecture built on an advanced low-voltage CMOS process. The ADS5413 analog core operates from a 3.3 V supply consuming most of the power. For additional interfacing flexibility, the digital output supply (OVDD) can be set from 1.6 V to 3.6 V. The ADC core consists of 10 pipeline stages and one flash ADC. Each of the stages produces 1.5 bits per stage. Both the rising and the falling clock edges are utilized to propagate the sample through the pipeline every half clock, for a total of six clock cycles.

ANALOG INPUTS

The analog input for the ADS5413 consists of a differential track-and-hold amplifier implemented using a switched capacitor technique, shown in Figure 27. This differential input topology, along with closely matched capacitors, produces a high level of ac-performance up to high sampling and input frequencies.

The ADS5413 requires each of the analog inputs (VINP and VINM) to be externally biased around the common mode level of the internal circuitry (CML, pin 6).

For a full-scale differential input, each of the differential lines of the input signal (pins 3 and 4) swings symmetrically between $CML+(V_{\text{ref}+}+V_{\text{ref}b})/2$ and $CML-(V_{\text{ref}+}+V_{\text{ref}b})/2$. The maximum swing is determined by the difference between the two reference voltages, the top reference (REFT), and the bottom reference (REFB). The total differential full-scale input swing is $2(V_{\text{ref}+} - V_{\text{ref}b})$. See the reference circuit section for possible adjustments of the input full scale.

Although the inputs can be driven in single-ended configuration, the ADS5413 obtains optimum performance when the analog inputs are driven differentially. The circuit in Figure 30 shows one possible configuration. The single-ended signal is fed to the primary

of an RF transformer. Since the input signal must be biased around the common-mode voltage of the internal circuitry, the common-mode (CML) reference from the ADS5413 is connected to the center-tap of the secondary. To ensure a steady low noise CML reference, the best performance is obtained when the CML output is connected to ground with a 0.1- μF and 0.01- μF low inductance capacitor.

Figure 30. Driving the ADS5413 Analog Input With Impedance Matched Transmission Line

If it is necessary to buffer or apply a gain to the incoming analog signal, it is possible to combine a single-ended amplifier with an RF transformer as shown in Figure 31. Texas Instruments offers a wide selection of operational amplifiers, as the THS3001/2, the OPA847, or the OPA695 that can be selected depending on the application. R_{IN} and C_{IN} can be placed to isolate the source from the switching inputs of the ADC and to implement a low-pass RC filter to limit the input noise in the ADC. Although not needed, it is recommended to lay out the circuit with placement for those three components, which allows fine tune of the prototype if necessary. Nevertheless, any mismatch between the differential lines of the input produces a degradation in performance at high input frequencies, mainly characterized by an increase in the even harmonics. In this case, special care should be taken keeping as much electrical symmetry as possible between both inputs. This includes shorting R_{IN} and leaving C_{IN} unpopulated.

Figure 31. Converting a Single-Ended Input Signal Into a Differential Signal Using an RF Transformer

Another possibility is the use of differential input/output amplifiers that can simplify the driver circuit for applications requiring input dc coupling. Flexible in their configurations (see Figure 32), such amplifiers can be used for single ended to differential conversion, for signal amplification, and for filtering prior to the ADC.

Figure 32. Using the THS4503 With the ADS5413

REFERENCE CIRCUIT

The ADS5413 has its own internal reference generation saving external circuitry in the design. For optimum performance, it is best to connect both VREFB and VREFT to ground with a 1- μ F and a 0.1- μ F decoupling capacitor in parallel and a 0.1- μ F capacitor between both pins (see Figure 33). The band-gap voltage output is not a voltage source to be used external to the ADS5413. However, it should be decoupled to ground with a 1- μ F and a 0.01- μ F capacitor in parallel.

For even more design flexibility, the internal reference can be disabled using the pin 48. By default, this pin is internally connected with a 70-k Ω pulldown resistor to ground, which enables the internal reference circuit. Tying this pin to AVDD powers down the internal reference generator, allowing the user to provide external voltages for VREFT (pin 9) and VREFB (pin 8). In addition to the power consumption reduction (typically 56 mW) which is now transferred to the external circuitry, it also allows for a precise setting of the input range. To further remove any variation with external factors, such as temperature or supply voltage, the user has direct access to the internal resistor divider, without any intermediate buffering. The equivalent circuit for the reference input pins is shown in Figure 26. The core of the ADC is designed for a 1 V difference between the reference pins. Nevertheless, the user can use these pins to set a different input range. Figure 11 shows the variation on SNR and SFDR for a sampling rate of 65 MHz and a single-tone input of 80 MHz at -1 dBFS for different VREFT-VREFB voltage settings.

Figure 33. Internal Reference Usage

CLOCK INPUTS

The ADS5413 clock input can be driven with either a differential clock signal or a single ended clock input with little or no difference in performance between the single-ended and differential-input configurations (see Figure 17). The common mode of the clock inputs is set internally to AVDD/2 using 5-k Ω resistors (see Figure 28).

When driven with a single-ended clock input, it is best to connect the CLKC input to ground with a 0.01- μ F capacitor (see Figure 34), while CLK is ac-coupled with 0.01 μ F to the clock source.

Figure 34. AC-Coupled Single-Ended Clock Input

The ADS5413 clock input can also be driven differentially. In this case, it is best to connect both clock inputs to the differential input clock signal with 0.01- μ F capacitors (see Figure 35). The differential input swing can vary between 1 V and 6 V with little or no performance degradation (see Figure 17).

Figure 35. AC-Coupled Differential Clock Input

Although the use of the ac-coupled configuration is recommended to set up the common mode for the clock, the ADS5413 can be operated with different common modes for those cases where the ac configuration can not be used. Figure 18 shows the performance of the ADS5413 versus different clock common modes.

ADS5413

SLWS153 – DECEMBER 2003

The ADS5413 can be driven either with a sine wave or a square wave. The internal ADC core uses both edges of the clock for the conversion process. This means that ideally, a 50% duty cycle should be provided. Nevertheless, the ADC includes an on-board duty cycle adjuster (DCA) that adjusts the incoming clock duty cycle which may not be 50%, to a 50% duty cycle for the internal use. By default, this circuit is enabled internally (with a pull-up resistor of 70 k Ω), which relaxes the design specifications of the external clock. Figure 16 shows the performance of the ADC for a 65-MHz clock and 14-MHz input signal versus clock duty cycle, for the two cases, with the DCA enabled and disabled. Nevertheless, there are some situations where the user may prefer to disable the DCA. For asynchronous clocking, i.e., when the sampling period is purposely not constant, this circuit should be disabled. Another situation is the case of high input frequency sampling. For high input frequencies, a low jitter clock should be provided. On that sense, we recommend to band-pass filter the source which, consequently, provides a sinusoidal clock with 50% duty cycle. The use of the DCA on that case would not be beneficial and adds noise to the internal clock, increasing the jitter and degrading the performance. Figure 19 shows the performance versus input frequency for the different clocking schemes. Finally, adding the DCA introduces delay between the input clock and the output data and what is more important, slightly bigger variation of this delay versus external conditions, such as temperature. To disable the DCA, user should connect it to ground.

POWER DOWN

When power down (pin 16) is tied to AVDD, the device reduces its power consumption to a typical value of 23 mW. Connecting this pin to GND or leaving it not connected (an internal 70-k Ω pulldown resistor is provided) enables the device operation.

DIGITAL OUTPUTS

The ADS5413 output format is 2s complement. The voltage level of the outputs can be adjusted by setting the OVDD voltage between 1.6 V and 3.6 V, allowing for direct interface to several digital families. For better performance, customers should select the smaller output swing required in the application. To improve the performance, mainly on the higher output voltage swing configurations, the addition of a series resistor at the outputs, limiting peak currents, is recommended. The maximum value of this resistor is limited by the maximum data rate of the application. Values between 0 Ω and 200 Ω are usual. Also, limiting the length of the external traces is a good practice.

All the data sheet plots have been obtained in the worst case situation, where OVDD is 3.3 V. The external series resistors were 150 Ω and the load was a 74AVC16244 buffer, as the one used in the evaluation board. In this configuration, the rising edge of the ADC output is 5 ns, which allows for a window to capture the data of 10.4 ns (without including other factors).

DEFINITION OF SPECIFICATIONS

Analog Bandwidth

The analog bandwidth is the analog input frequency at which the spectral power of the fundamental frequency (as determined by the FFT analysis) is reduced by 3 dB in respect to the value measured at low input frequencies.

Aperture Delay

The delay between the 50% point of the rising edge of the CLK command and the instant at which the analog input is sampled.

Aperture Uncertainty (Jitter)

The sample-to-sample variation in aperture delay.

Differential Nonlinearity

The average deviation of any single LSB transition at the digital output from an ideal 1 LSB step at the analog input.

Integral Nonlinearity

The deviation of the transfer function from a reference line measured in fractions of 1 LSB using a *best straight line* determined by a least square curve fit.

Clock Pulse Width/Duty Cycle

Pulse width high is the minimum amount of time that the CLK pulse should be left in logic 1 state to achieve rated performance; pulse width low is the minimum time CLK pulse should be left in low state. At a given clock rate, these specifications define acceptable clock duty cycles.

Maximum Conversion Rate

The clock rate at which parametric testing is performed.

Power Supply Rejection Ratio

The ratio of a change in input offset voltage to a change in power supply voltage.

Signal-to-Noise and Distortion (SINAD)

The ratio of the rms signal amplitude (set 1 dB below full scale) to rms value of the sum of all other spectral components, including harmonics but excluding dc.

Signal-to-Noise Ratio (Without Harmonics)

The ratio of the rms signal amplitude (set at 1 dB below full scale) to the rms value of the the sum of all other spectral components, excluding the first five harmonics and dc.

Spurious-Free Dynamic Range

The ratio of the rms signal amplitude to the rms value of the peak spurious spectral component. The peak spurious component may or may not be a harmonic and it is reported in dBc.

Two-Tone Intermodulation Distortion Rejection

The ratio of the rms value of either input tone to the rms value of the worst third order intermodulation product reported in dBc.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADS5413IPHP	ACTIVE	HTQFP	PHP	48	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	AZ5413	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

THERMAL PAD MECHANICAL DATA

PHP (S-PQFP-G48)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4206329-2/0 05/14

NOTE: A. All linear dimensions are in millimeters

 Tie strap features may not be present.

PowerPAD™ PLASTIC QUAD FLATPACK

4207626-2/H 04/12

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting options for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
