浮点数字信号处理器

查询样片: SMV320C6727B-SP

1 浮点数字信号处理器

1.1 特性

- **32** 和 **64** 位 **250MHz** 浮点数字信号处理器 **(DSP)**
- **LET = 117MeVcm^2/mg** 条件下，无单个事件闩锁
- 抗辐射：**100kRad** 总电离辐射剂量 **(TID) (Si)**
- 升级为 **C67x+ CPU**，原先为 **C67x™ DSP** 系列：
  - **2X CPU** 寄存器 **[64** 通用**]**
  - 与 **C67x CPU** 兼容
- 增强型存储器系统
  - **256K** 字节统一程序和数据 **RAM**
  - **384K** 字节统一程序和数据 **ROM**
  - 来自 **CPU** 的单周期数据访问
  - 大容量程序高速缓存（**32K** 字节）支持 **RAM**，**ROM** 和外部存储器
- 外部存储器接口 **(EMIF)** 支持
  - **133MHz SDRAM**（**16** 或 **32** 位）
  - 异步 **NOR** 闪存，**SRAM**（**8**，**16** 或 **32** 位）
  - **NAND** 闪存（**8** 或 **16** 位）
- 增强型输入输出 **(I/O)** 系统
  - 高性能纵横开关
  - 专用多通道串行端口 **(McASP)** 直接存储器存取 **(DMA)** 总线
  - 确定的 **I/O** 性能
- **dMAX**（双数据移动加速器）
  支持：
  - **16** 条独立的通道
  - 同时处理 **2** 个传输请求
  - **1**，**2** 和 **3** 维存储器到存储器的数据传输以及存储器到外设的数据传输
  - 循环寻址，在这里，循环缓冲器 **(FIFO)** 的大小未被限制为 **2^n**
  - 与一个循环缓冲器的基于表格的多阶延迟读取和写入传输
- **3** 个多通道串口
  - 发送和接收时钟高达 **50MHz**
  - **6** 个时钟区域和 **16** 个串行数据引脚
- 通用主机端口接口 **(UHPI)**
  - 针对高带宽的 **32** 位宽数据总线
  - 复用和非复用地址和数据
- **2** 个具有 **3**，**4** 和 **5** 引脚选项的 **10MHz** 串行外设接口 **(SPI)** 端口
- **2** 个集成电路间 **(I2C)** 端口
- 实时中断计数器和看门狗
- 振荡器和软件控制的锁相环 **(PLL)**
- 可用温度范围
  - **M-Temp**（**-55°C** 至 **125°C T$_{case}$**）
  - **W-Temp**（**-55°C** 至 **115°C T$_{case}$**）
- **256** 引脚，**0.5mm**，陶瓷四方扁平 **(CQFP)** 封装 **[HFH** 后缀**]**
- 可提供工程评估 **(/EM)** 样品 (1)

(1) 这些部件只用于工程评估。 它们的加工工艺为非兼容流程（例如，无预烧过程等），并且只在 25°C 的温度额定值下进行测试。 这些部件不适合于品质检定、生产、辐射测试或飞行使用。 不担保完全军用额定温度
-55°C 至 125°C 范围内或使用寿命内的部件性能。

1.2 说明

SMV320C6727B 是德州仪器 (TI) C67x 系列高性能 32 和 64 位浮点数字信号处理器的下一代产品。

增强型 C67x+ CPU。 C67x+ CPU 是 C671x DSP 上使用的 C67x CPU 的增强型版本。 它与 C67x CPU 兼容，但是大幅提升了每个时钟周期内的速度、代码密度和浮点性能。 此 CPU 本来就支持 32 位定点，32 位单精度浮点和 64 位双精度浮点算术运算。

高效的存储器系统。 此存储器控制器将大型片载 256K 字节 RAM 和 384K 字节 ROM 映射为统一程序和数据存储器。 由于与某些其它器件一样，在程序与数据存储器尺寸之间没有固定的分界，所以开发过程被简化。

此存储器控制器支持 C67x+ CPU 对 RAM 和 ROM 的单周期数据存取。 支持以下 4 个源中 3 个源对内部 RAM 和 ROM 高达 3 次并行存取：

- 来自 C67x+ CPU 的 2 个 64 位数据存取
- 一个来自内核与程序高速缓存的 256 位程序取指令
- 一个来自外设系统（dMAX 或 UHPI）的 32 位数据存取

对于大多数应用，大型（32K 字节）程序高速缓存转化为高命中率。 这防止了大多数与片载存储器的程序和数据存取冲突。 它还能够从一个诸如 SDRAM 的芯片外存储器上实现有效程序执行。

高性能纵横开关。 一个高性能纵横开关被用作不同总线主控 (CPU，dMAX，UHPI) 与不同目标（外设和存储器）之间的中央集线器。 此纵横开关被部分连接；不支持某些连接（例如，UHPI 到外设的连接）。

只要针对一个特定目标的多个总线主控之间没有冲突，可通过纵横开关实现并行多重传输。 当确实发生冲突时，仲裁是一个简单且确定的固定优先级机制。

由于 dMAX 负责大多数时间关键 I/O 传输，它被授予最高优先级，其次是 UHPI，最后是 CPU。

dMAX 双向数据传输加速器。 dMAX 是一个被设计用来执行数据传输加速的模块。 数据传输加速器 (dMAX) 控制器处理内部数据存储器控制器与 C6727B DSP 上器件外设之间的用户设定的数据传输。 dMAX 允许数据在任何可寻址存储器空间之间移动，其中包括内部存储器、外设和外部存储器。

dMAX 控制器包括一些特性，诸如执行三维数据传输以实现高级数据分类的能力，将存储器的一部分管理为支持基于阶延迟数据读取和写入的循环缓冲器或 FIFO 的能力。 dMAX 能够同时处理 2 个传输请求（如果它们去往且来自不同的源和目的）。

用于实现灵活性和扩展的外部存储器接口 (EMIF)。 C6727B 上的外部存储器接口支持一个单组 SDRAM 和单组异步存储器。 EMIF 数据宽度为 16 位宽。

SDRAM 支持含有具有 1，2 或 4 组的 x16 和 x32 SDRAM 器件。

C6727B 将 SDRAM 支持扩展至 256M 位和 512M 位器件。

异步存储器支持通常被用来从一个并行非复用 NOR 闪存器件引导，此器件可以为 8，16 或 32 位宽。 通过使用针对上部地址线路的通用 I/O 引脚，可实现从较大闪存器件（大于专用 EMIF 地址线路本来支持的器件）的引导。

此异步存储器接口也可被配置成支持 8 或 16 位宽 NAND 闪存。 它包括一个可在高达 512 字节数据块上运行的硬件纠错码 (ECC) 计算（用于单一位错误）。

针对高速并行 I/O 的通用主机端口接口 (UHPI)。通用主机端口接口 (UHPI) 是一个并行接口，通过这个接口，一个外部主机 CPU 能够访问 DSP 上的存储器。 C6727B UHPI 所支持的 3 个模式为：

- 复用地址和数据 - 半字（16 位宽）模式（与 C6713 相似）
- 复用地址和数据 - 全字（32 位宽）模式
- 非复用模式 - 16 位地址和 32 位数据总线

UHPI 也可被限制成访问 C6727B 地址空间内任一位置存储器的单页（64K 字节）；这个页可被改变，但是只能由 C6727B CPU 更改。 这个特性使得 UHPI 能够被用于高速数据传输，即使在对安全性有严格要求的系统中也是如此。

UHPI 只在 C6727B 上提供。

多通道串行端口（McASP0，McASP1 和 McASP2）。 多通道串行端口 (McASP) 与编解码器 (CODEC)，数模转换器 (DAC)，模数转换器 (ADC) 和其它器件无缝对接。

每个 McASP 包括一个发送和接收部分，此部分可单独或同步运行；此外，每个部分有其自身的灵活时钟发生器和扩展误差校验逻辑。

当数据通过 McASP 时，它可被重新排列，这样，在无需任何 CPU 开销进行转换的情况下，应用代码所使用的定点表示法可以不受外部器件使用的表示法的影响。

McASP 是一个可配置模块，并且支持 2 个至 16 个串行数据引脚。 它还具有支持一个数字接口发送器 (DIT) 模式的选项，此模式具有一个完全 384 位通道状态和用户数据存储器。

集成电路间串行端口 (I2C0，I2C1)。 C6727B 包含 2 个集成电路间 (I2C) 串行端口。 一个典型应用是，将一个 I2C 串行端口配置为一个受外部用户接口微控制器控制的端口。 然后，另外一个 I2C 串行端口可被 C6727B DSP 用来控制外部外设器件，诸如一个 CODEC 或网络控制器，这些外设是此 DSP 器件的功能外设。

这 2 个 I2C 串行端口与 SPI0 串行端口引脚复用。

串行外设接口端口 (SPI0，SPI1)。 与 I2C 串行端口的情况一样，C6727B DSP 也包含 2 个串行外设接口 (SPI) 串行端口。 这使得一个 SPI 端口可被配置为一个受控端口来控制 DSP，而另外一个 SPI 串行端口被 DSP 用来控制外设。

此 SPI 端口支持一个基本 3 引脚模式，以及可选的 4 和 5 引脚模式。 可选引脚包括一个受控芯片选择引脚和一个使能引脚，此使能引脚在硬件中执行自动握手以实现最大 SPI 数据吞吐量。

SPI0 端口与 2 个 I2C 串行端口（I2C0 和 I2C1）引脚复用。 SPI1 串行端口与 McASP0 和 McASP 1 的串行数据引脚中的 5 个引脚复用。

实时中断定时器 (RTI)。 实时中断定时器模块包括：

- 2 个 32 位计数器和预分频器对
- 2 个输入捕捉（被接至 McASP 直接存储器访问 [DMA] 事件以实现采样率测量）
- 具有自动升级功能的 4 个比较
- 针对增强型系统稳健耐用性的数字看门狗（可选）

时钟生成（PLL 和 OSC）。 C6727B DSP 包含一个片载振荡器，此振荡器支持的晶振范围为 12MHz 至 25MHz。 或者，此时钟可由 CLKIN 引脚从外部提供。

DSP 包含一个灵活的、软件设定的锁相环 (PLL) 时钟发生器。 通过分割 PLL 输出，可生成 3 个不同的时钟域（SYSCLK1，SYSCLK2 和 SYSCLK3）。 SYSCLK1 是 CPU，存储器控制和存储器使用的时钟。 SYSCLK2 是外设子系统和 dMAX 使用的时钟。 SYSCLK3 只由 EMIF 使用。

1.2.1 器件兼容性

SMV320C6727B 浮点数字信号处理器基于全新的 C67x+ CPU。 这个内核与 TMS320C671x DSP 上使用的 C67x CPU 内核代码兼容，但是它进行了包括额外浮点指令在内的重大改进。 请参阅Section 2.2

1.3 功能方框图

图 1-1显示了 C6727B 器件的功能方框图。

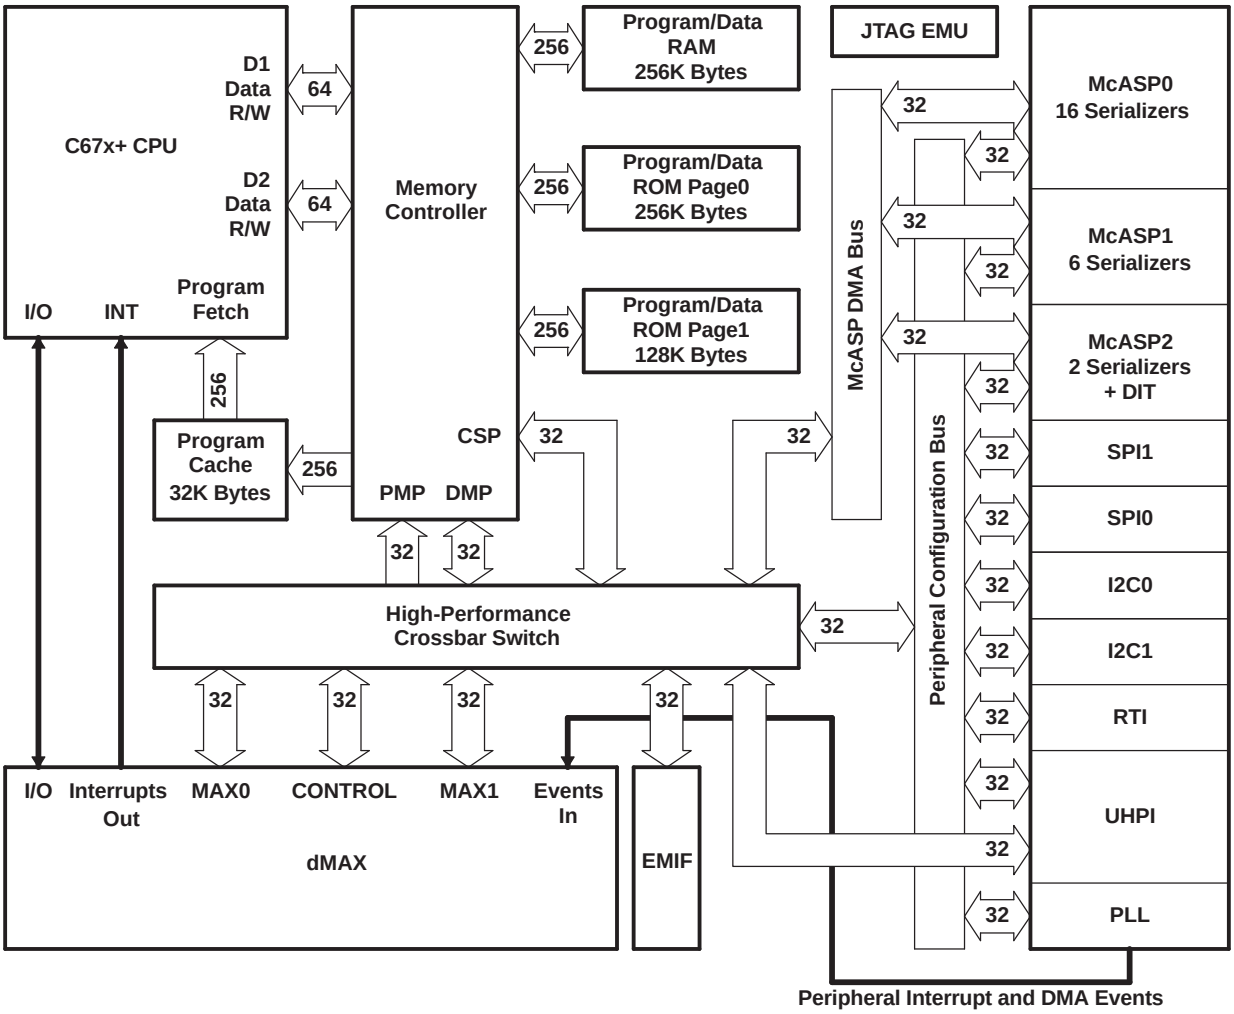

图 **1-1. C6727B DSP** 方框图

2 Device Overview

2.1 Device Characteristics

Table 2-1 provides an overview of the C6727B DSPs. The table shows significant features of each device, including the capacity of on-chip memory, the peripherals, the execution time, and the package type with pin count.

Table 2-1. Characteristics of the C6727B Processors

HARDWARE FEATURES		
Peripherals Not all peripheral pins are available at the same time. (For more details, see the Device Configurations section.)	dMAX	1
	EMIF	1 (32-bit)
	UHPI	1
	McASP	3
	SPI	2
	I2C	2
	RTI	1
On-Chip Memory	Size (KB)	32KB Program Cache 256KB RAM 384KB ROM
CPU ID + CPU Rev ID	Control Status Register (CSR.[31:16])	0x0300
Frequency	MHz	250
Cycle Time	ns	4 ns
EMIF Frequency	MHz	133
Voltage	Core (V)	1.4 V (C6727B-350) 1.2 V (C6727B-300) (C6727B-275) (C6727B**A**-250)
	I/O (V)	3.3 V
Clock Generator Options	Prescaler	/1, /2, /3, ..., /32
	Multiplier	x4, x5, x6, ..., x25
	Postscaler	/1, /2, /3, ..., /32
Package (see Section 6)	36 x 36 mm	256-Pin CQFP (HFH)
Process Technology	µm	0.13 µm
Product Status	Product Preview (PP), Advance Information (AI), or Production Data (PD)	PD(1)

(1) PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

2.2 Enhanced C67x+ CPU

The SMV320C6727B floating-point digital signal processors are based on the new C67x+ CPU. This core is code-compatible with the C67x CPU core used on the TMS320C671x DSPs, but with significant enhancements including an increase in core operating frequency of 250 MHz while operating at 1.2 V.

The CPU fetches 256-bit-wide advanced very-long instruction word (VLIW) fetch packets that are composed of variable-length execute packets. The execute packets can supply from one to eight 32-bit instructions to the eight functional units during every clock cycle. The variable-length execute packets are a key memory-saving feature, distinguishing the C67x CPU from other VLIW architectures. Additionally, execute packets can now span fetch packets, providing a code size improvement over the C67x CPU core.

The CPU features two data paths, shown in Figure 2-1, each composed of four functional units (.D, .M, .S, and .L) and a register file. The .D unit in each data path is a data-addressing unit that is responsible for all data transfers between the register files and the memory. The .M functional units are dedicated for multiplies, and the .S and .L functional units perform a general set of arithmetic, logical, and branch functions. All instructions operate on registers as opposed to data in memory, but results stored in the 32-bit registers can be subsequently moved to memory as bytes, half-words, or words.

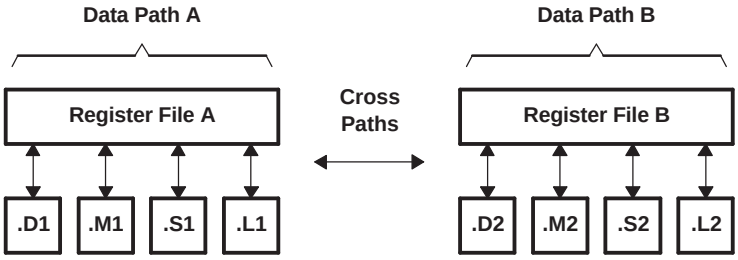

Figure 2-1. CPU Data Paths

The register file in each data path contains 32 32-bit registers for a total of 64 general-purpose registers. This doubles the number of registers found on the C67x CPU core, allowing the optimizing C compiler to pipeline more complex loops by decreasing register pressure significantly.

The four functional units in each data path of the CPU can freely share the 32 registers belonging to that data path. Each data path also features a single cross path connected to the register file on the opposing data path. This allows each data path to source one cross-path operand per cycle from the opposing register file. On the C67x+ CPU, this single cross-path operand can be used by two functional units per cycle, an improvement over the C67x CPU in which only one functional unit could use the cross-path operand. In addition, the cross-path register read(s) are not counted as part of the limit of four reads of the same register in a single cycle.

The C67x+ CPU executes all C67x instructions plus new floating-point instructions to improve performance specifically during processing. These new instructions are listed in Table 2-2.

Table 2-2. New Floating-Point Instructions for C67x+ CPU

INSTRUCTION	FLOATING-POINT OPERATION(1)	IMPROVES
MPYSPDP	SP x DP → DP	Faster than MPYDP. Improves high Q biquads (bass management) and FFT.
MPYSP2DP	SP x SP → DP	Faster than MPYDP. Improves Long FIRs (EQ).
ADDSP (new to CPU “S” Unit)	SP + SP → SP	Now up to four floating-point add and subtract operations in parallel. Improves FFT performance and symmetric FIR.
ADDDP (new to CPU “S” Unit)	DP + DP → DP	
SUBSP (new to CPU “S” Unit)	SP – SP → SP	
SUBDP (new to CPU “S” Unit)	DP – DP → DP	

(1) SP means IEEE Single-Precision (32-bit) operations and DP means IEEE Double-Precision (64-bit) operations.

Finally, two new registers, which are dedicated to communication with the dMAX unit, have been added to the C67x+ CPU. These registers are the dMAX Event Trigger Register (DETR) and the dMAX Event Status Register (DESR). They allow the CPU and dMAX to communicate without requiring any accesses to the memory system.

2.3 CPU Interrupt Assignments

Table 2-3 lists the interrupt channel assignments on the C6727B device. If more than one source is listed, the interrupt channel is shared and an interrupt on this channel could have come from any of the enabled peripherals on that channel.

The dMAX peripheral has two CPU interrupts dedicated to reporting FIFO status (INT7) and transfer completion (INT8). In addition, the dMAX can generate interrupts to the CPU on lines INT9–13 and INT15 in response to peripheral events. To enable this functionality, the associated Event Entry within the dMAX can be programmed so that a CPU interrupt is generated when the peripheral event is received.

Table 2-3. CPU Interrupt Assignments

CPU INTERRUPT	INTERRUPT SOURCE
INT0	RESET
INT1	NMI (From dMAX or EMIF Interrupt)
INT2	Reserved
INT3	Reserved
INT4	RTI Interrupt 0
INT5	RTI Interrupts 1, 2, 3, and RTI Overflow Interrupts 0 and 1.
INT6	UHPI CPU Interrupt (from External Host MCU)
INT7	FIFO status notification from dMAX
INT8	Transfer completion notification from dMAX
INT9	dMAX event (0x2 specified in the dMAX interrupt event entry)
INT10	dMAX event (0x3 specified in the dMAX interrupt event entry)
INT11	dMAX event (0x4 specified in the dMAX interrupt event entry)
INT12	dMAX event (0x5 specified in the dMAX interrupt event entry)
INT13	dMAX event (0x6 specified in the dMAX interrupt event entry)
INT14	I2C0, I2C1, SPI0, SPI1 Interrupts
INT15	dMAX event (0x7 specified in the dMAX interrupt event entry)

2.4 Internal Program/Data ROM and RAM

The organization of program/data ROM and RAM on C6727B is simple and efficient. ROM is organized as two 256-bit-wide pages with four 64-bit-wide banks. RAM is organized as a single 256-bit-wide page with eight 32-bit-wide banks.

The internal memory organization is illustrated in Figure 2-2 (ROM) and Figure 2-3 (RAM).

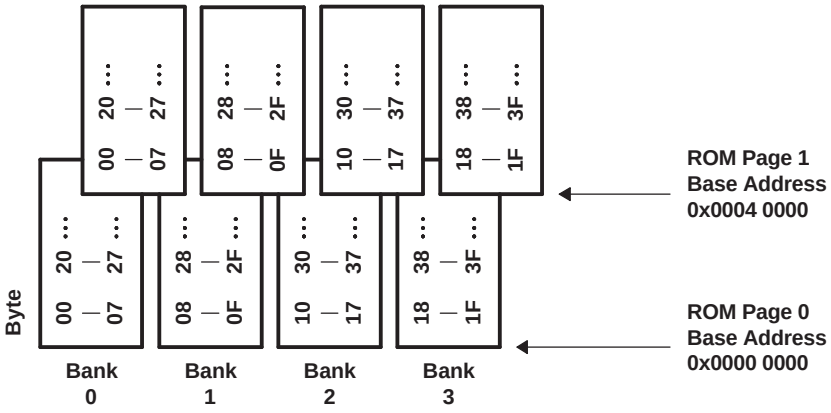

Figure 2-2. Program/Data ROM Organization

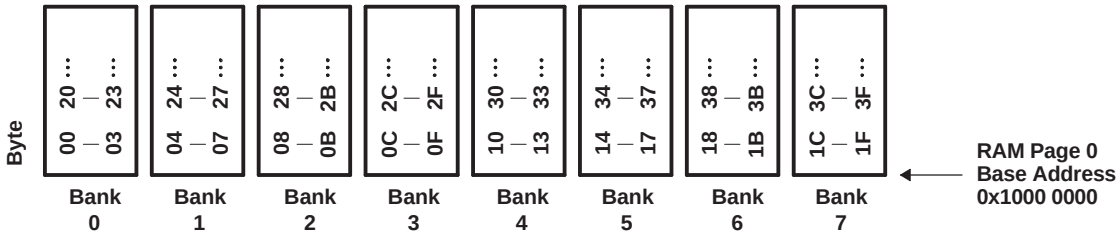

Figure 2-3. Program/Data RAM Organization

The C6727B memory controller supports up to three parallel accesses to the internal RAM and ROM from three of the following four sources as long as there are no bank conflicts:

- Two 64-bit data accesses from the C67x+ CPU
- One 256-bit-wide program fetch from the program cache
- One 32-bit data access from the peripheral system (either dMAX or UHPI)

A program cache miss is 256 bits wide and conflicts only with data accesses to the same page. Multiple data accesses to different pages, or to the same page but different banks will occur without conflict.

The organization of the C6727B internal memory system into multiple pages (3 total) and a large number of banks (16 total) means that it is straightforward to optimize DSP code to avoid data conflicts. Several factors, including the large program cache and the partitioning of the memory system into multiple pages, minimize the number of program versus data conflicts.

The result is an efficient memory system which allows easy tuning towards the maximum possible CPU performance.

The C6727B ROM consists of a software bootloader plus additional software.

2.5 Program Cache

The C6727B DSP executes code directly from a large on-chip 32K-byte program cache. The program cache has these key features:

- Wide 256-bit path to internal ROM/RAM
- Single-cycle access on cache hits
- 2-cycle miss penalty to internal ROM/RAM
- Caches external memory as well as ROM/RAM
- Direct-mapped
- Modes: Enable, Freeze, Bypass
- Software invalidate to support code overlay

The program cache line size is 256 bits wide and is matched with a 256-bit-wide path between cache and internal memory. This allows the program cache to fill an entire line (corresponding to eight C67x+ CPU instructions) with only a single miss penalty of 2 cycles.

The program cache control registers are listed in Table 2-4.

Table 2-4. Program Cache Control Registers

REGISTER NAME	BYTE ADDRESS	DESCRIPTION
L1PISAR	0x2000 0000	L1P Invalidate Start Address
L1PICR	0x2000 0004	L1P Invalidate Control Register

CAUTION

Any application which modifies the contents of program RAM (for example, a program overlay) must invalidate the addresses from program cache to maintain coherency by explicitly writing to the L1PISAR and L1PICR registers.

The Cache Mode (Enable, Freeze, Bypass) is configured through a CPU internal register (CSR, bits 7:5). These options are listed in Table 2-5. Typically, only the Cache Enable Mode is used. But advanced users may utilize Freeze and Bypass modes to tune performance.

Table 2-5. Cache Modes Set Through PCC Field of CSR CPU Register on C6727B

CPU CSR[7:5]	CACHE MODE
000b	Enable (Deprecated - Means direct mapped RAM on some C6000 devices)
010b	Enable - Cache is enabled, cache misses cause a line fill.
011b	Freeze - Cache is enabled, but contents are unchanged by misses.
100b	Bypass - Forces cache misses, cache contents frozen.
Other Values	Reserved - Not Supported

CAUTION

Although the reset value of CSR[7:5] (PCC field) is 000b, the value may be modified during the boot process by the ROM code. Refer to the appropriate ROM data sheet for more details. However, note that the cache may be **disabled** when control is actually passed to application code. Therefore, it may be necessary to write '010b' to the PCC field to explicitly enable the cache at the start of application code.

CAUTION

Changing the cache mode through CSR[7:5] does not invalidate any lines already in the cache. To invalidate the cache after modifications are made to program space, the control registers L1PISAR and L1PICR must be used.

2.6 High-Performance Crossbar Switch

The C6727B DSP includes a high-performance crossbar switch that acts as a central hub between bus masters and targets. Figure 2-4 illustrates the connectivity of the crossbar switch.

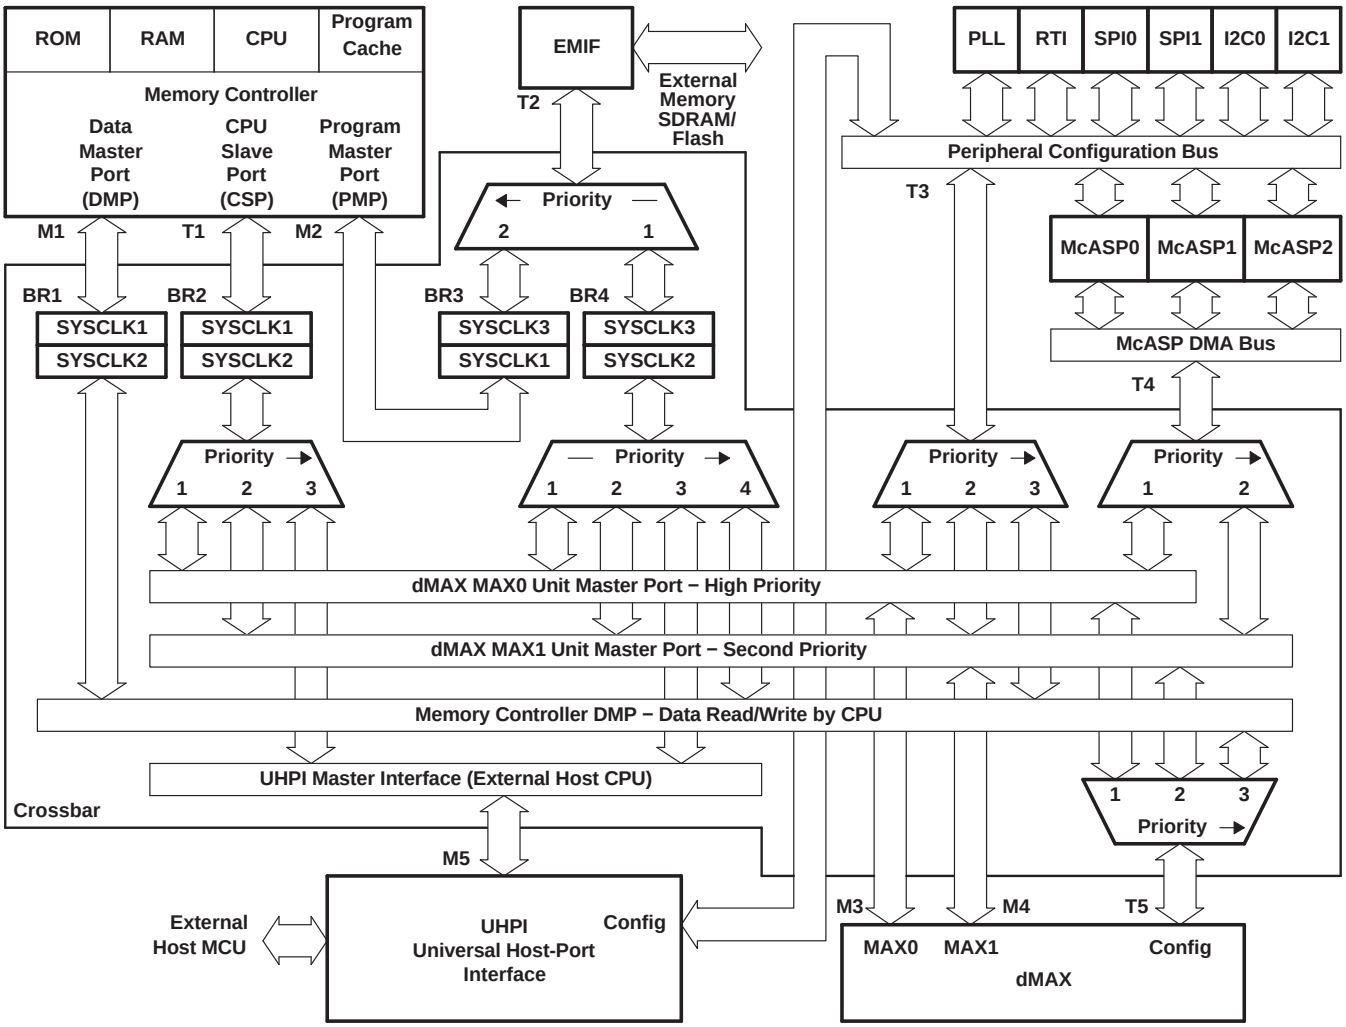

Figure 2-4. Block Diagram of Crossbar Switch

As shown in Figure 2-4, there are five bus masters:

M1	Memory controller DMP for CPU data accesses to peripherals and EMIF.
M2	Memory controller PMP for program cache fills from the EMIF.
M3	dMAX HiMAX master port for high-priority DMA accesses.
M4	dMAX LoMAX master port for lower-priority DMA accesses.
M5	UHPI master port for an external MCU to access on-chip and off-chip memories.

The five bus masters arbitrate for five different target groups:

T1	On-chip memories through the CPU Slave Port (CSP).
T2	Memories on the external memory interface (EMIF).
T3	Peripheral registers through the peripheral configuration bus.
T4	McASP serializers through the dedicated McASP DMA bus.
T5	dMAX registers.

The crossbar switch supports parallel accesses from different bus masters to different targets. When two or more bus masters contend for the same target beginning at the same cycle, then the highest-priority master is given ownership of the target while the other master(s) are stalled. However, once ownership of the target is given to a bus master, it is allowed to complete its access before ownership is arbitrated again. Following are two examples.

Example 1: Simultaneous accesses without conflict

- dMAX HiMAX accesses McASP Data Port for transfer of data.
- dMAX LoMAX accesses SPI port for control processing.
- UHPI accesses internal RAM through the CSP.
- CPU fills program cache from EMIF.

Example 2: Conflict over a shared resource

- dMAX HiMAX accesses RTI port for McASP sample rate measurement.
- dMAX LoMAX accesses SPI port for control processing.

In Example 2, both masters contend for the same target, the peripheral configuration bus. The HiMAX access will be given priority over the LoMAX access.

The master priority is illustrated in Figure 2-4 by the numbers 1 through 4 in the bus arbiter symbols. Note that the EMIF arbitration is distributed so that only one bridge crossing is necessary for PMP accesses. The effect is that PMP has 5th priority to the EMIF but lower latency.

A bus bridge is needed between masters and targets which run at different clock rates. The bus bridge contains a small FIFO to allow the bridge to accept an incoming (burst) access at one clock rate and pass it through the bridge to a target running at a different rate. Table 2-6 lists the FIFO properties of the four bridges (BR1, BR2, BR3, and BR4) in Figure 2-4.

Table 2-6. Bus Bridges

LABEL	BRIDGE DESCRIPTION	MASTER CLOCK	TARGET CLOCK
BR1	DMP Bridge to peripherals, dMAX, EMIF	SYSCLK1	SYSCLK2
BR2	dMAX, UHPI to ROM/RAM (CSP)	SYSCLK2	SYSCLK1
BR3	PMP to EMIF	SYSCLK1	SYSCLK3
BR4	CPU, UHPI, and dMAX to EMIF	SYSCLK2	SYSCLK3

Figure 2-5 shows the bit layout of the device-level bridge control register (CFGBRIDGE) and Table 2-7 contains a description of the bits.

31	16
Reserved	

15	1	0
Reserved		CSPRST
		R/W, 1

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 2-5. CFGBRIDGE Register Bit Layout (0x4000 0024)

Table 2-7. CFGBRIDGE Register Bit Field Description (0x4000 0024)

BIT NO.	NAME	RESET VALUE	READ WRITE	DESCRIPTION
31:1	Reserved	N/A	N/A	Reads are indeterminate. Only 0s should be written to these bits.
0	CSPRST	1	R/W	Resets the CSP Bridge (BR2 in Figure 2-4). 1 = Bridge Reset Asserted 0 = Bridge Reset Released

CAUTION

The CSPRST bit must be asserted after any change to the PLL that affects SYSCLK1 and SYSCLK2 and must be released before any accesses to the CSP bridge occur from either the dMAX or the UHPI.

2.7 Memory Map Summary

A high-level memory map of the C6727B DSP appears in Table 2-8. The base address of each region is listed. ***Any address past the end address must not be read or written.*** The table also lists whether the regions are word-addressable or byte- and word-addressable.

Table 2-8. C6727B Memory Map

DESCRIPTION	BASE ADDRESS	END ADDRESS	BYTE- OR WORD-ADDRESSABLE
Internal ROM Page 0 (256K Bytes)	0x0000 0000	0x0003 FFFF	Byte and Word
Internal ROM Page 1 (128K Bytes)	0x0004 0000	0x0005 FFFF	Byte and Word
Internal RAM Page 0 (256K Bytes)	0x1000 0000	0x1003 FFFF	Byte and Word
Memory and Cache Control Registers	0x2000 0000	0x2000 001F	Word Only
Emulation Control Registers (Do Not Access)	0x3000 0000	0x3FFF FFFF	Word Only

MAX1 (LoMAX) Transfer Entry Table	0x6200 80A0	0x6200 81FF	Byte and Word
External SDRAM space on EMIF	0x8000 0000	0x8FFF FFFF	Byte and Word
External Asynchronous / Flash space on EMIF	0x9000 0000	0x9FFF FFFF	Byte and Word
EMIF Control Registers	0xF000 0000	0xF000 00BF	Word Only(1)

(1) The upper byte of the EMIF's SDRAM Configuration Register (SDCR[31:24]) is byte-addressable to support placing the EMIF into the Self-Refresh State without triggering the SDRAM Initialization Sequence.

2.8 Boot Modes

The C6727B DSP supports only one hardware bootmode option, this is to boot from the internal ROM starting at address 0x0000 0000. Other bootmode options are implemented by a software bootloader stored in ROM. The software bootloader uses the CFGPIN0 and CFGPIN1 registers, which capture the state of various device pins at reset, to determine which mode to enter. Note that in practice, only a few pins are used by the software.

CAUTION

Only an externally applied $\overline{\text{RESET}}$ causes the CFGPIN0 and CFGPIN1 registers to recapture their associated pin values. Neither an emulator reset nor a RTI reset causes these registers to update.

The ROM bootmodes include:

- Parallel Flash on $\overline{\text{EM\_CS}}$[2]
- SPI0 or I2C1 master mode from serial EEPROM
- SPI0 or I2C1 slave mode from external MCU
- UHPI from an external MCU

Table 2-9 describes the required boot pin settings at device reset for each bootmode.

Table 2-9. Required Boot Pin Settings at Device Reset

BOOT MODE	$\overline{\text{UHPI\_HCS}}$	SPI0_SOMI	SPI0_SIMO	SPI0_CLK
UHPI	0	BYTEAD(1)	FULL(1)	NMUX(1)
Parallel Flash	1	0	1	0
SPI0 Master	1	0	0	1
SPI0 Slave	1	0	1	1
I2C1 Master	1	1	0	1
I2C1 Slave	1	1	1	1

(1) When $\overline{\text{UHPI\_HCS}}$ is 0, the state of the SPI0_SOMI, SPI0_SIMO, and SPI0_CLK pins is copied into the specified bits in the CFGHPI register described in Table 4-14.

Figure 2-6 shows the bit layout of the CFGPIN0 register and Table 2-10 contains a description of the bits.

2.9 Pin Assignments

2.9.1 Pin Maps

Figure 2-8 shows the pin assignments on the 256-pin HFH package.

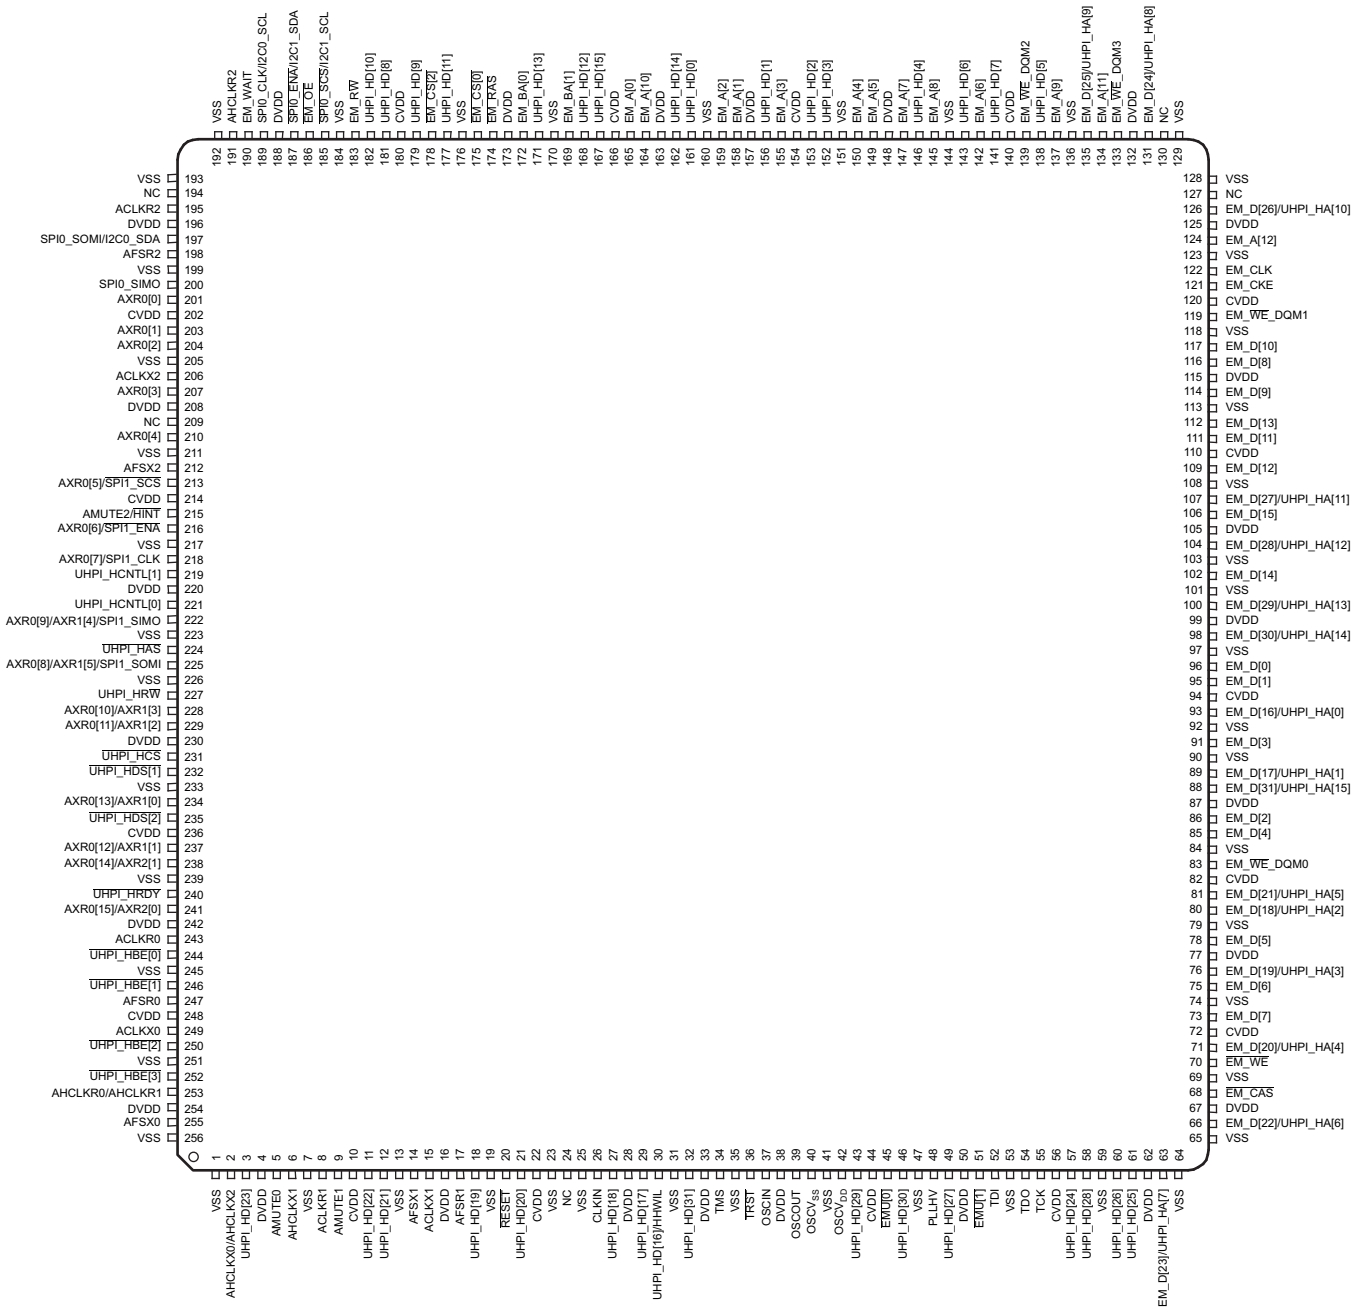

Figure 2-8. 256-Pin Ceramic Quad Flatpack (HFH Suffix)—Top View

2.9.2 Terminal Functions

Table 2-12, the Terminal Functions table, identifies the external signal names, the associated pin/ball numbers along with the mechanical package designator, the pin type (I, O, IO, OZ, or PWR), whether the pin/ball has any internal pullup/pulldown resistors, whether the pin/ball is configurable as an IO in GPIO mode, and a functional pin description.

Table 2-12. Terminal Functions

$\overline{\text{EM\_CAS}}$	68	O	-	N	SDRAM Column Address Strobe
$\overline{\text{EM\_RAS}}$	174	O	-	N	SDRAM Row Address Strobe
$\overline{\text{EM\_WE}}$	70	O	-	N	SDRAM/Asynchronous Write Enable
EM_CKE	121	O	-	N	SDRAM Clock Enable
EM_CLK	122	O	-	N	EMIF Output Clock
EM_$\overline{\text{WE}}$_DQM0	83	O	-	N	Write Enable or Byte Enable for EM_D[7:0]
EM_$\overline{\text{WE}}$_DQM1	119	O	-	N	Write Enable or Byte Enable for EM_D[15:8]
EM_$\overline{\text{WE}}$_DQM2	139	O	IPU	N	Write Enable or Byte Enable for EM_D[23:16]
EM_$\overline{\text{WE}}$_DQM3	133	O	IPU	N	Write Enable or Byte Enable for EM_D[31:24]
$\overline{\text{EM\_OE}}$	186	O	-	N	SDRAM/Asynchronous Output Enable
EM_R$\overline{\text{W}}$	183	O	-	N	Asynchronous Memory Read/not Write
EM_WAIT	190	I	IPU	N	Asynchronous Wait Input (Programmable Polarity) or Interrupt (NAND)

(1) TYPE column refers to pin direction in functional mode. If a pin has more than one function with different directions, the functions are separated with a slash (/).
(2) PULL column:
IPD = Internal Pulldown resistor
IPU = Internal Pullup resistor
(3) If the GPIO column is 'Y', then in GPIO mode, the pin is configurable as an IO unless otherwise marked.

2.10 Development

2.10.1 Development Support

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor

C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug) EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at http://www.ti.com uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

2.10.2 Device Support

2.10.2.1 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., **TMS**320C6727BZDH275). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX / TMDX) through fully qualified production devices/tools (TMS / TMDS).

Device development evolutionary flow:

TMX Experimental device that is not necessarily representative of the final device's electrical specifications

TMP Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification

TMS Fully-qualified production device

Support tool development evolutionary flow:

TMDX Development support product that has not yet completed Texas Instruments internal qualification testing

TMDS Fully qualified development support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, HFH) and the temperature range. Figure 2-9 provides a legend for reading the complete device name for any TMS320C6000™ DSP platform member.

For device part numbers and further ordering information for SMV320C6727B, see the Texas Instruments (TI) website at http://www.ti.com or contact your TI sales representative.

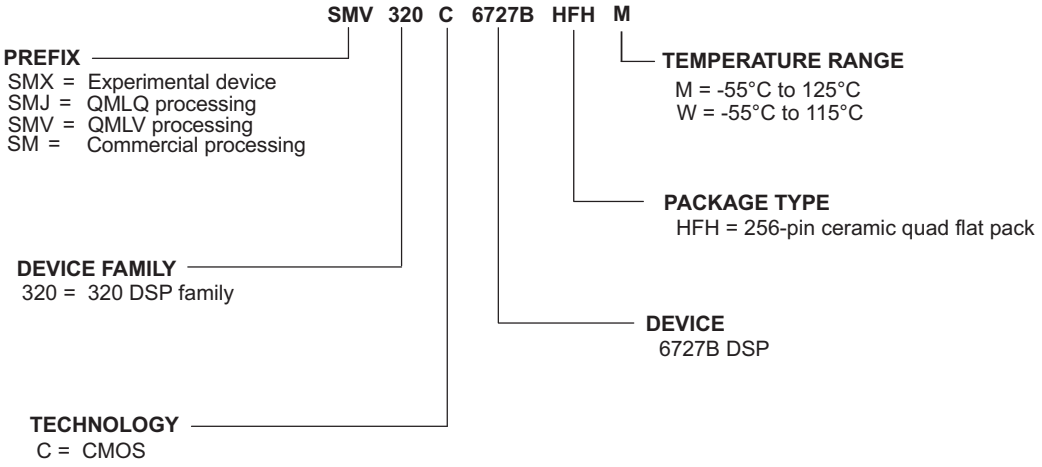

Figure 2-9. SMV320C6727B DSP Device Nomenclature

2.10.2.2 Documentation Support

Extensive documentation supports all TMS320™ DSP family generations of devices from product announcement through applications development. The types of documentation available include: data manuals, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6727B DSP devices:

SPRS277 ***C9230C100 SMV320C6727B Floating-Point Digital Signal Processor ROM Data Manual.*** Describes the features of the C9230C100 SMV320C6727B digital signal processor ROM.

SPRZ232 ***TMS320C6727, TMS320C6727B, TMS320C6726, TMS320C6726B, TMS320C6722, TMS320C6722B, TMS320C6720 Digital Signal Processors Silicon Errata.*** Describes the known exceptions to the functional specifications for the TMS320C6727, TMS320C6727B, TMS320C6726, TMS320C6726B, TMS320C6722, TMS320C6722B, and TMS320C6720 digital signal processors (DSPs).

SPRU723 ***SMV320C6727B DSP Peripherals Overview Reference Guide.*** This document provides an overview and briefly describes the peripherals available on the SMV320C6727B digital signal processors (DSPs) of the TMS320C6000 DSP platform.

SPRU877 ***SMV320C6727B DSP Inter-Integrated Circuit (I2C) Module Reference Guide.*** This document describes the inter-integrated circuit (I2C) module in the SMV320C6727B digital signal processors (DSPs) of the TMS320C6000 DSP platform.

SPRU795 ***SMV320C6727B DSP Dual Data Movement Accelerator (dMAX) Reference Guide.*** This document provides an overview and describes the common operation of the data movement accelerator (dMAX) controller in the SMV320C6727B digital signal processors (DSPs) of the TMS320C6000 DSP platform. This document also describes operations and registers unique to the dMAX controller.

SPRAA78 ***TMS320C6713 to SMV320C6727B Migration.*** This document describes the issues related to migrating from the TMS320C6713 to SMV320C6727B digital signal processor (DSP).

SPRU711 ***SMV320C6727B DSP External Memory Interface (EMIF) User's Guide.*** This document describes the operation of the external memory interface (EMIF) in the SMV320C6727B digital signal processors (DSPs) of the TMS320C6000 DSP platform.

SPRU718 ***SMV320C6727B DSP Serial Peripheral Interface (SPI) Reference Guide.*** This reference guide provides the specifications for a 16-bit configurable, synchronous serial peripheral interface. The SPI is a programmable-length shift register, used for high speed communication between external peripherals or other DSPs.

SPRU719 ***SMV320C6727B DSP Universal Host Port Interface (UHPI) Reference Guide.*** This document provides an overview and describes the common operation of the universal host port interface (UHPI).

SPRU878 ***SMV320C6727B DSP Multichannel Audio Serial Port (McASP) Reference Guide.*** This document describes the multichannel audio serial port (McASP) in the SMV320C6727B digital signal processors (DSPs) of the TMS320C6000 DSP platform.

SPRU879 ***SMV320C6727B DSP Software-Programmable Phase-Locked Loop (PLL) Controller Reference Guide.*** This document describes the operation of the software-programmable phase-locked loop (PLL) controller in the SMV320C6727B digital signal processors (DSPs) of the TMS320C6000 DSP platform.

SPRU733 ***TMS320C67x/C67x+ DSP CPU and Instruction Set Reference Guide.*** Describes the CPU architecture, pipeline, instruction set, and interrupts for the TMS320C67x and TMS320C67x+ digital signal processors (DSPs) of the TMS320C6000 DSP platform. The C67x/C67x+ DSP generation comprises floating-point devices in the C6000 DSP platform. The C67x+ DSP is an enhancement of the C67x DSP with added functionality and an expanded instruction set.

SPRAA69 ***Using the SMV320C6727B Bootloader Application Report.*** This document describes the design details about the SMV320C6727B bootloader. This document also addresses parallel flash and HPI boot to the extent relevant.

SPRU301 ***TMS320C6000 Code Composer Studio Tutorial.*** This tutorial introduces you to some of the key features of Code Composer Studio. Code Composer Studio extends the capabilities of the Code Composer Integrated Development Environment (IDE) to include full awareness of the DSP target by the host and real-time analysis tools. This tutorial assumes that you have Code Composer Studio, which includes the TMS320C6000 code generation tools along with the APIs and plug-ins for both DSP/BIOS and RTDX. This manual also assumes that you have installed a target board in your PC containing the DSP device.

SPRU198 ***TMS320C6000 Programmer's Guide.*** Reference for programming the TMS320C6000 digital signal processors (DSPs). Before you use this manual, you should install your code generation and debugging tools. Includes a brief description of the C6000 DSP architecture and code development flow, includes C code examples and discusses optimization methods for the C code, describes the structure of assembly code and includes examples and discusses optimizations for the assembly code, and describes programming considerations for the C64x DSP.

SPRU186 ***TMS320C6000 Assembly Language Tools v6.0 Beta User's Guide.*** Describes the assembly language tools (assembler, linker, and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C6000 platform of devices (including the C64x+ and C67x+ generations). **NOTE: The enhancements to tools release v5.3 to support the C6727B devices are documented in the tools v6.0 documentation.**

SPRU187 ***TMS320C6000 Optimizing Compiler v6.0 Beta User's Guide.*** Describes the TMS320C6000 C compiler and the assembly optimizer. This C compiler accepts ANSI standard C source code and produces assembly language source code for the TMS320C6000 platform of devices (including the C64x+ and C67x+ generations). The assembly optimizer helps you optimize your assembly code. **NOTE: The enhancements to tools release v5.3 to support the C6727B devices are documented in the tools v6.0 documentation.**

SPRA839 ***Using IBIS Models for Timing Analysis***. Describes how to properly use IBIS models to attain accurate timing analysis for a given system.

The tools support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE). For a complete listing of C6000™ DSP latest documentation, visit the Texas Instruments web site on the Worldwide Web at http://www.ti.com uniform resource locator (URL).

3 Device Configurations

3.1 Device Configuration Registers

The C6727B DSP includes several device-level configuration registers, which are listed in Table 3-1. These registers need to be programmed as part of the device initialization procedure. See Section 3.2.

Table 3-1. Device-Level Configuration Registers

REGISTER NAME	BYTE ADDRESS	DESCRIPTION	DEFINED
CFGPIN0	0x4000 0000	Captures values of eight pins on rising edge of $\overline{\text{RESET}}$ pin.	Table 2-10
CFGPIN1	0x4000 0004	Captures values of eight pins on rising edge of $\overline{\text{RESET}}$ pin.	Table 2-11
CFGHPI	0x4000 0008	Controls enable of UHPI and selection of its operating mode.	Table 4-14
CFGHPIAMSB	0x4000 000C	Controls upper byte of UHPI address into C6727B address space in Non-Multiplexed Mode or if explicitly enabled for security purposes.	Table 4-15
CFGHPIAUMB	0x4000 0010	Controls upper middle byte of UHPI address into C6727B address space in Non-Multiplexed Mode or if explicitly enabled for security purposes.	Table 4-16
CFGRTI	0x4000 0014	Selects the sources for the RTI Input Captures from among the six McASP DMA events.	Table 4-39
CFGMCASP0	0x4000 0018	Selects the peripheral pin to be used as AMUTEIN0.	Table 4-21
CFGMCASP1	0x4000 001C	Selects the peripheral pin to be used as AMUTEIN1.	Table 4-22
CFGMCASP2	0x4000 0020	Selects the peripheral pin to be used as AMUTEIN2.	Table 4-23
CFGBRIDGE	0x4000 0024	Controls reset of the bridge BR2 in Figure 2-4. This bridge must be reset explicitly after any change to the PLL controller affecting SYSCLK1 and SYSCLK2 and before the dMAX or UHPI accesses the CPU Slave Port (CSP).	Table 2-7

3.2 Peripheral Pin Multiplexing Options

This section describes the options for configuring peripherals which share pins on the C6727B DSP. Table 3-2 lists the options for configuring the SPI0, I2C0, and I2C1 peripheral pins.

Table 3-2. Options for Configuring SPI0, I2C0, and I2C1

		CONFIGURATION		
		OPTION 1	OPTION 2	OPTION 3
PERIPHERAL	SPI0	3-, 4,- or 5-pin mode	3-pin mode	disabled
	I2C0	disabled	disabled	enabled
	I2C1	disabled	enabled	enabled
PINS	SPI0_SOMI/I2C0_SDA	SPI0_SOMI	SPI0_SOMI	I2C0_SDA
	SPI0_SIMO	SPI0_SIMO	SPI0_SIMO	GPIO through SPI0_SIMO pin control
	SPI0_CLK/I2C0_SCL	SPI0_CLK	SPI0_CLK	I2C0_SCL
	$\overline{\text{SPI0\_SCS}}$/I2C1_SCL	$\overline{\text{SPI0\_SCS}}$	I2C1_SCL	I2C1_SCL
	$\overline{\text{SPI0\_ENA}}$/I2C1_SDA	$\overline{\text{SPI0\_ENA}}$	I2C1_SDA	I2C1_SDA

Table 3-3 lists the options for configuring the SPI1, McASP0, and McASP1 pins. Note that there are additional finer grain options when selecting which McASP controls the particular AXR serial data pins but these options are not listed here and can be made on a pin by pin basis.

Table 3-3. Options for Configuring SPI1, McASP0, and McASP1 Data Pins

		CONFIGURATION				
		OPTION 1	**OPTION 2**	**OPTION 3**	**OPTION 4**	**OPTION 5**
PERIPHERAL	SPI1	5-pin mode	4-pin mode	4-pin mode	3-pin mode	disabled
	McASP0 (max data pins)	11	12	12	13	16
	McASP1 (max data pins)	4	4	4	4	6
PINS	AXR0[5]/ SPI1_SCS	SPI1_SCS	SPI1_SCS	AXR0[5]	AXR0[5]	AXR0[5]
	AXR0[6]/ SPI1_ENA	SPI1_ENA	AXR0[6]	SPI1_ENA	AXR0[6]	AXR0[6]
	AXR0[7]/ SPI1_CLK	SPI1_CLK	SPI1_CLK	SPI1_CLK	SPI1_CLK	AXR0[7]
	AXR0[8]/AXR1[5]/ SPI1_SOMI	SPI1_SOMI	SPI1_SOMI	SPI1_SOMI	SPI1_SOMI	AXR0[8] ***or*** AXR1[5]
	AXR0[9]/AXR1[4]/ SPI1_SIMO	SPI1_SIMO	SPI1_SIMO	SPI1_SIMO	SPI1_SIMO	AXR0[9] ***or*** AXR1[4]

Table 3-4 lists the options for configuring the shared EMIF and UHPI pins.

Table 3-4. Options for Configuring EMIF and UHPI (C6727B Only)

		CONFIGURATION	
		OPTION 1	**OPTION 2**
PERIPHERAL	UHPI	Multiplexed Address/Data Mode, Fullword, or Half-Word	Non-Multiplexed Address/Data Mode Fullword
	EMIF	32-bit EMIF Data	16-bit EMIF Data
PINS	EM_D[31:16]/ UHPI_HA[15:0]	EM_D[31:16]	UHPI_HA[15:0]

3.3 Peripheral Pin Multiplexing Control

While Section 3.2 describes at a high level the most common pin multiplexing options, the control of pin multiplexing is largely determined on an individual pin-by-pin basis. Typically, each peripheral that shares a particular pin has internal control registers to determine the pin function and whether it is an input or an output.

The C6727B device determines whether a particular pin is an input or output based upon the following rules:

- The pin will be configured as an output if it is configured as an output in any of the peripherals sharing the pin.
- It is recommended that only one peripheral configure a given pin as an output. If more than one peripheral does configure a particular pin as an output, then the output value is controlled by the peripheral with highest priority for that pin. The priorities for each pin are given in Table 3-5.
- The value input on the pin is passed to all peripherals sharing the pin for input simultaneously.

Table 3-5. Priority of Control of Data Output on Multiplexed Pins

PIN	FIRST PRIORITY	SECOND PRIORITY	THIRD PRIORITY
SPI0_SOMI/I2C0_SDA	SPI0_SOMI	I2C0_SDA	
SPI0_CLK/I2C0_SCL	SPI0_CLK	I2C0_SCL	
$\overline{\text{SPI0\_SCS}}$/I2C1_SCL	$\overline{\text{SPI0\_SCS}}$	I2C1_SCL	
$\overline{\text{SPI0\_ENA}}$/I2C1_SDA	$\overline{\text{SPI0\_ENA}}$	I2C1_SDA	
AXR0[5]/$\overline{\text{SPI1\_SCS}}$	AXR0[5]	$\overline{\text{SPI1\_SCS}}$	
AXR0[6]/$\overline{\text{SPI1\_ENA}}$	AXR0[6]	$\overline{\text{SPI1\_ENA}}$	
AXR0[7]/SPI1_CLK	AXR0[7]	SPI1_CLK	
AXR0[8]/AXR1[5]/SPI1_SOMI	AXR0[8]	AXR1[5]	SPI1_SOMI
AXR0[9]/AXR1[4]/SPI1_SIMO	AXR0[9]	AXR1[4]	SPI1_SIMO
AXR0[10]/AXR1[3]	AXR0[10]	AXR1[3]	
AXR0[11]/AXR1[2]	AXR0[11]	AXR1[2]	
AXR0[12]/AXR1[1]	AXR0[12]	AXR1[1]	
AXR0[13]/AXR1[0]	AXR0[13]	AXR1[0]	
AXR0[14]/AXR2[1]	AXR0[14]	AXR2[1]	
AXR0[15]/AXR2[0]	AXR0[15]	AXR2[0]	
AHCLKR0/AHCLKR1	AHCLKR0	AHCLKR1	
AHCLKX0/AHCLKX2	AHCLKX0	AHCLKX2	
AMUTE2/HINT	AMUTE2	HINT	
HD[16]/HHWIL	HD[16]	HHWIL	
EM_D[31:16]/UHPI_HA[15:0](1)	EM_D[31:16] (Disabled if CFGHPI.NMUX=1)	UHPI_HA[15:0] (Input Only)	

(1) When using the UHPI in non-multiplexed mode, ensure EM_D[31:16] are configured as inputs so that these pins may be used as UHPI_HA[15:0]. To ensure this, you must set the CFGHPI.NMUX bit to a '1' ***before the EMIF SDRAM initialization completes***; otherwise, a drive conflict will occur. [The EMIF bus parking function drives the data bus in between accesses.]

4 Peripheral and Electrical Specifications

4.1 Electrical Specifications

This section provides the absolute maximum ratings and the recommended operating conditions for the SMV320C6727B DSP.

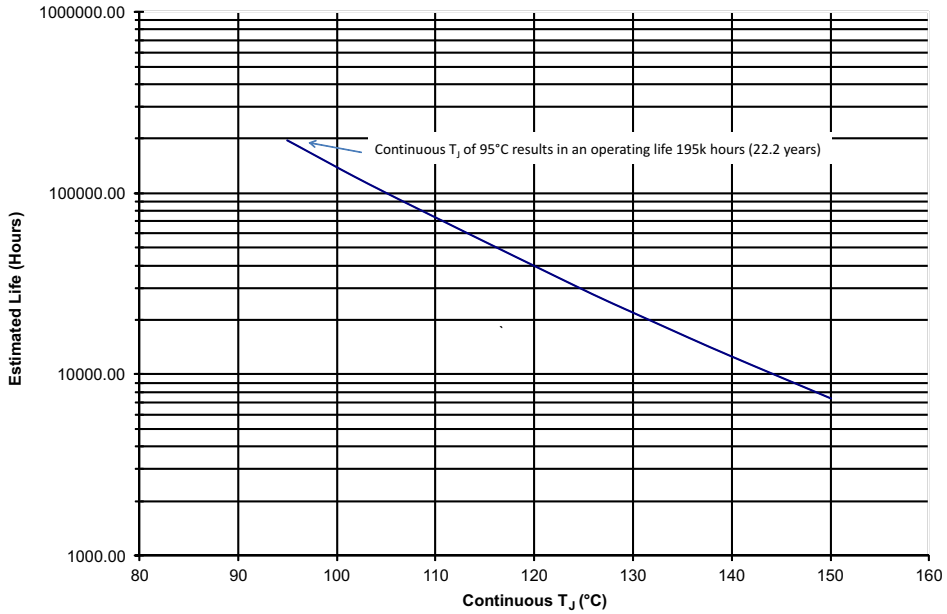
All electrical and switching characteristics in this data manual are valid over the recommended operating conditions unless otherwise specified.

4.2 Absolute Maximum Ratings(1) (2)

Over Operating Case Temperature Range (Unless Otherwise Noted)

			UNIT
Supply voltage range, CV_{DD}, $OSCV_{DD}$ (3)		–0.3 to 1.8	V
Supply voltage range, DV_{DD} , PLLHV		–0.3 to 4	V
Input Voltage Range	All pins except OSCIN	–0.3 to DV_{DD} + 0.5	V
	OSCIN pin	–0.3 to CV_{DD} + 0.5	
Output Voltage Range	All pins except OSCOUT	–0.3 to DV_{DD} + 0.5	V
	OSCOUT pin	–0.3 to CV_{DD} + 0.5	
Clamp Current		±20	mA
Operating case temperature range, T_C		–55 to 125	°C
Storage temperature range, T_{stg}		–65 to 150	°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with referenced to V_{SS} unless otherwise specified.
(3) If $OSCV_{DD}$ and $OSCV_{SS}$ pins are used as filter pins for reduced oscillator jitter, they should not be connected to CV_{DD} and V_{SS} externally.



(1) See datasheet for absolute maximum and minimum recommended operating conditions.
(2) Mil-Prf 38535, appendix B, section B.3.4 targets a 15 year operating life at 65°C ≤ T_J ≤ 95°C.

Figure 4-1. SM320C6727B-SP EM Operating Life Derating Chart

4.3 Recommended Operating Conditions(1)

			MIN	NOM	MAX	UNIT
CV_{DD}	Core Supply Voltage		1.14	1.2	1.32	V
DV_{DD}	I/O Supply Voltage		3.13	3.3	3.47	V
Freq1	Operating frequency				250	MHz
Freq2	Maximum frequency for 15 year operating life(2)				225	MHz
T_C	Operating Case Temperature Range	M-Temp	–55		125	°C
		W-Temp	–55		115	

(1) All voltage values are with referenced to V_{SS} unless otherwise specified.
(2) Maximum recommended frequency based on technology characterization and failure mechanism modeling for 15-year operating life reliability target at 65°C ≤ T_J ≤ 95°C, per MIL-PRF-38535, B.3.4.

4.4 Electrical Characteristics

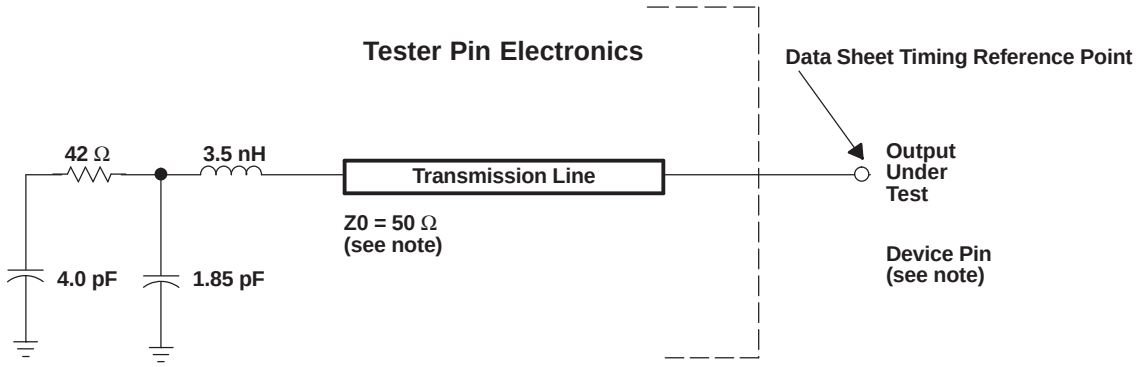
Over Operating Case Temperature Range (Unless Otherwise Noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
V_{OH}	High Level Output Voltage	I_O = –100 µA		DV_{DD} – 0.2			V
V_{OL}	Low Level Output Voltage	I_O = 100 µA				0.2	V
I_{OH}	High-Level Output Current	V_O = 0.78 x DV_{DD}				–8	mA
I_{OL}	Low-Level Output Current	V_O = 0.22 x DV_{DD}				8	mA
V_{IH}	High-Level Input Voltage			2		DV_{DD}	V
V_{IL}	Low-Level Input Voltage			0		0.8	V
V_{HYS}	Input Hysterisis				0.13 x DV_{DD}		V
I_I, I_{OZ}	Input Current and Off State Output Current	Pins without pullup or pulldown				±10	µA
		Pins with internal pullup	W temperature	–50		–170	
			M temperature	–40		–170	
		Pins with internal pulldown	W temperature	50		170	
			M temperature	40		170	
t_{tr}	Input Transition Time				25		ns
C_I	Input Capacitance(1)					10	pF
C_O	Output Capacitance(1)					10	pF
I_{DD2V}	CV_{DD} Supply(2)	CV_{DD} = 1.2 V, CPU clock = 250 MHz			800		mA
I_{DD3V}	DV_{DD} Supply(2)	DV_{DD} = 3.3 V, 32-bit EMIF speed = 100 MHz			76		mA

(1) Tested at initial qualification or major change only.
(2) Assumes the following conditions: 25°C case temperature; 60% CPU utilization; EMIF at 50% utilization (100 MHz), 50% writes, 50% bit switching; two 10-MHz SPI at 100% utilization, 50% bit switching.
The actual current draw is highly application-dependent.

4.5 Parameter Information

4.5.1 Parameter Information Device-Specific Information



A. The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not neccessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timings.
Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 4-2. Test Load Circuit for AC Timing Measurements

4.5.1.1 Signal Transition Levels

All input and output timing parameters are referenced to 1.5 V for both "0" and "1" logic levels.

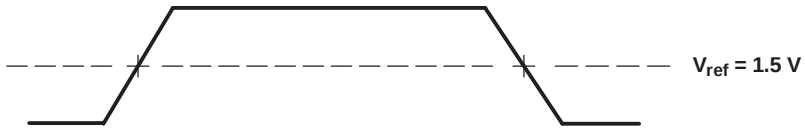


Figure 4-3. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to V_{IL} MAX and V_{IH} MIN for input clocks, V_{OL} MAX and V_{OH} MIN for output clocks.

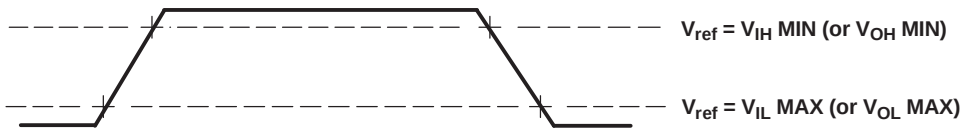

Figure 4-4. Rise and Fall Transition Time Voltage Reference Levels

4.5.1.2 Signal Transition Rates

All timings are tested with an input edge rate of 4 Volts per nanosecond (4 V/ns).

4.6 Timing Parameter Symbology

Timing parameter symbols used in the timing requirements and switching characteristics tables are created in accordance with JEDEC Standard 100. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

Lowercase subscripts and their meanings:	
a	access time
c	cycle time (period)
d	delay time
dis	disable time
en	enable time
f	fall time
h	hold time
r	rise time
su	setup time
t	transition time
v	valid time
w	pulse duration (width)
X	Unknown, changing, or don't care level

Letters and symbols and their meanings:	
H	High
L	Low
V	Valid
Z	High impedance

4.7 Power Supplies

For more information regarding TI's power management products and suggested devices to power TI DSPs, visit www.ti.com/dsppower.

4.7.1 Power-Supply Sequencing

This device does not require specific power-up sequencing between the DV_{DD} and CV_{DD} voltage rails; however, there are some considerations that the system designer should take into account:

1. Neither supply should be powered up for an extended period of time (>1 second) while the other supply is powered down.
2. The I/O buffers powered from the DV_{DD} rail also require the CV_{DD} rail to be powered up in order to be controlled; therefore, an I/O pin that is supposed to be 3-stated by default may actually drive momentarily until the CV_{DD} rail has powered up. Systems should be evaluated to determine if there is a possibility for contention that needs to be addressed. In most systems where both the DV_{DD} and CV_{DD} supplies ramp together, as long as CV_{DD} tracks DV_{DD} closely, any contention is also mitigated by the fact that the CV_{DD} rail would reach its specified operating range well before the DV_{DD} rail has fully ramped.

4.7.2 Power-Supply Decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. The core supply caps can be placed in the interior space of the package and the I/O supply caps can be placed around the exterior space of the package. For the HFH package, it is recommended that the core supply caps be placed on the underside of the PCB and the I/O supply caps be placed on the top side of the PCB.

Both core and I/O decoupling can be accomplished by alternating small (0.1 µF) low ESR ceramic bypass caps with medium (0.220 µF) low ESR ceramic bypass caps close to the DSP power pins and adding large tantalum or ceramic caps (ranging from 10 µF to 100 µF) further away. Assuming 0603 caps, it is recommended that at least 6 small, 6 medium, and 4 large caps be used for the core supply and 12 small, 12 medium, and 4 large caps be used for the I/O supply.

Any cap selection needs to be evaluated from an electromagnetic radiation (EMI) point-of-view; EMI varies from one system design to another so it is expected that engineers alter the decoupling capacitors to minimize radiation. Refer to the *High-Speed DSP Systems Design Reference Guide* (literature number SPRU889) for more detailed design information on decoupling techniques.

4.8 Reset

A hardware reset ($\overline{\text{RESET}}$) is required to place the DSP into a known good state out of power-up. The $\overline{\text{RESET}}$ signal can be asserted (pulled low) prior to ramping the core and I/O voltages or after the core and I/O voltages have reached their proper operating conditions. As a best practice, $\overline{\text{RESET}}$ should be held low during power-up. Prior to deasserting $\overline{\text{RESET}}$ (low-to-high transition), the core and I/O voltages should be at their proper operating conditions.

4.8.1 Reset Electrical Data/Timing

Table 4-1 assumes testing over recommended operating conditions.

Table 4-1. Reset Timing Requirements

NO.	PARAMETER		MIN	TYP	MAX	UNIT
1	$t_{w(RSTL)}$	Pulse width, $\overline{\text{RESET}}$ low	100			ns
2	$t_{su(BPV-RSTH)}$	Setup time, boot pins valid before $\overline{\text{RESET}}$ high	20			ns
3	$t_{h(RSTH-BPV)}$	Hold time, boot pins valid after $\overline{\text{RESET}}$ high	20			ns

4.9 Dual Data Movement Accelerator (dMAX)

4.9.1 dMAX Device-Specific Information

The dMAX is a module designed to perform Data Movement Acceleration. The dMAX controller handles user-programmed data transfers between the internal data memory controller and the device peripherals on the C6727B DSP. The dMAX allows movement of data to/from any addressable memory space, including internal memory, peripherals, and external memory. The dMAX controller in the C6727B DSP has a different architecture from the previous EDMA controller in the C621x/C671x devices.

The dMAX controller includes features, such as capability to perform three-dimensional data transfers for advanced data sorting, capability to manage a section of the memory as a circular buffer/FIFO with delay tap based reading and writing data. The dMAX controller is capable of concurrently processing two transfer requests (provided that they are to/from different source/destinations).

Figure 4-5 shows a block diagram of the dMAX controller.

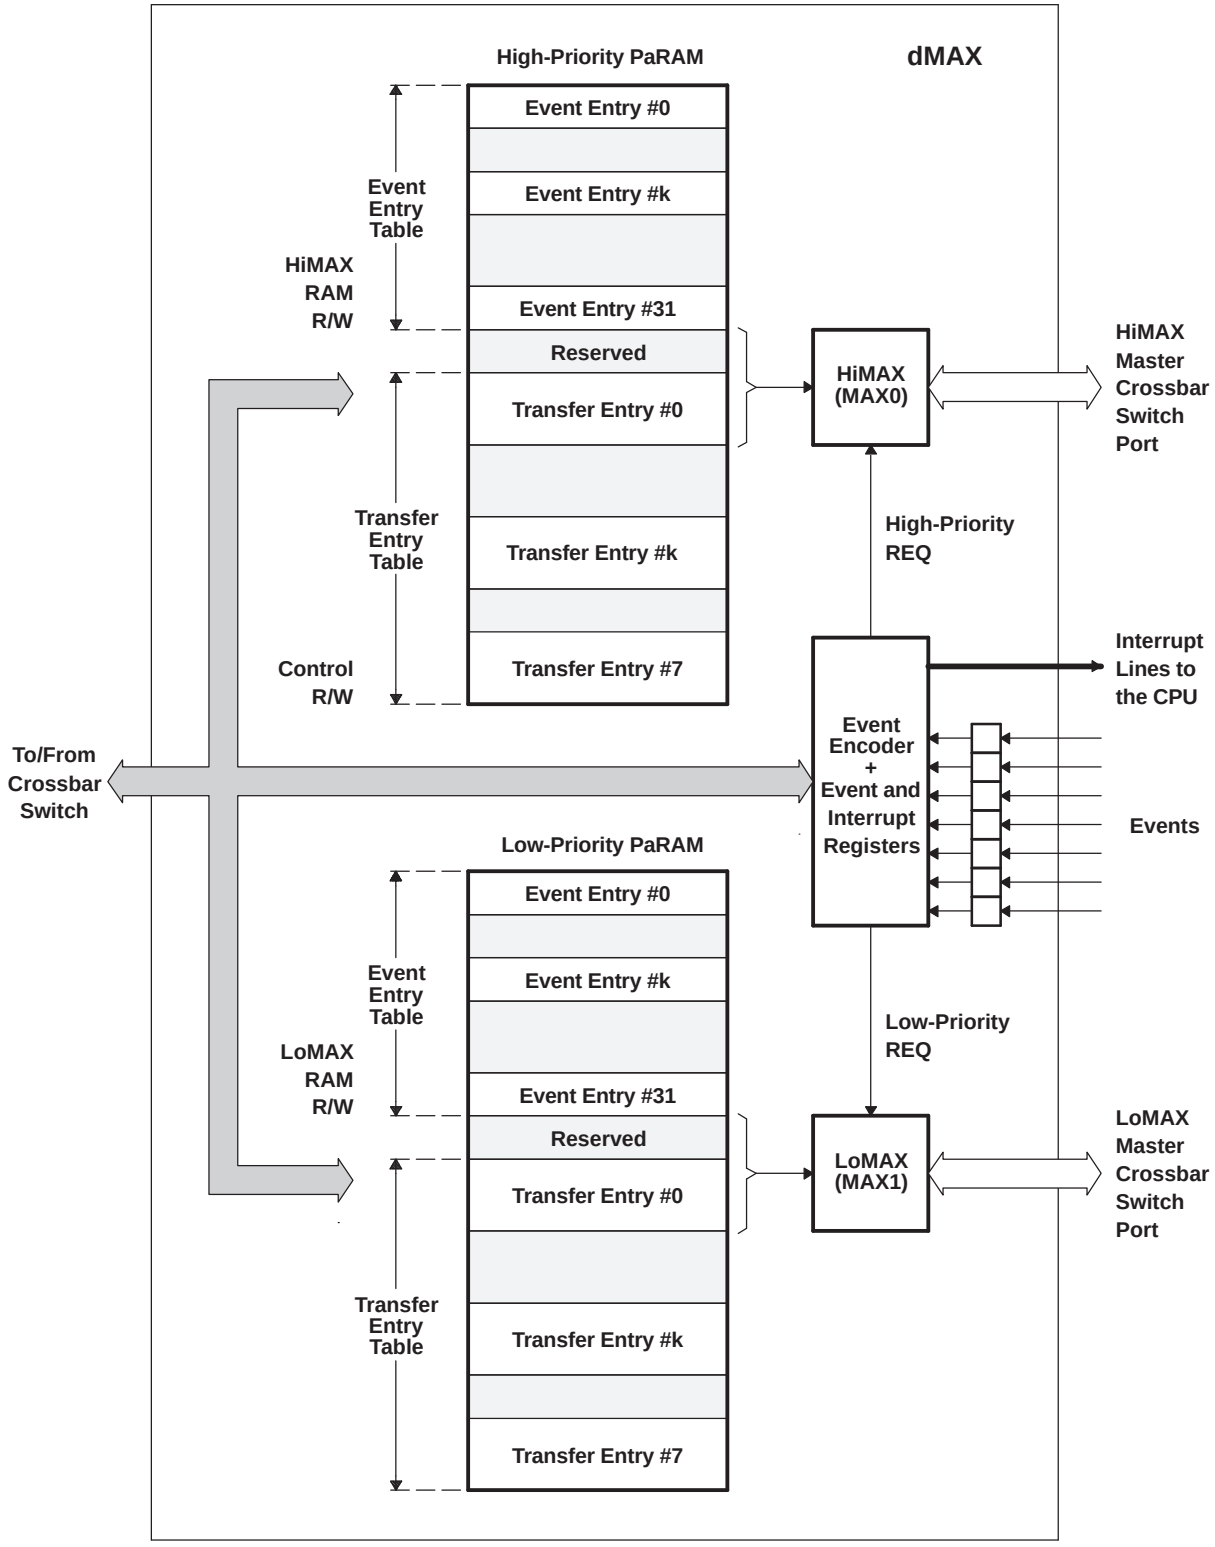

Figure 4-5. dMAX Controller Block Diagram

The dMAX controller comprises:

- Event and interrupt processing registers
- Event encoder
- High-priority event Parameter RAM (PaRAM)
- Low-priority event Parameter RAM (PaRAM)
- Address-generation hardware for High-Priority Events – MAX0 (HiMAX)
- Address-generation hardware for Low-Priority Events – MAX1 (LoMAX)

The SMV320C6727B Peripheral Bus Structure can be described logically as a Crossbar Switch with five master ports and five slave ports. When accessing the slave ports, the MAX0 (HiMAX) module is always given the highest priority followed by the MAX1 (LoMAX) module. In other words, in case several masters (including MAX0 and MAX1) attempt to access same slave port concurrently, the MAX0 will be given the highest priority followed by MAX1.

Event signals are connected to bits of the dMAX Event Register (DER), and the bits in the DER reflect the current state of the event signals. An event is defined as a transition of the event signal. The dMAX Event Flag Register (DEFR) can be programmed, individually for each event signal, to capture either low-to-high or high-to-low transitions of the bits in the DER (event polarity is individually programmable).

An event is a synchronization signal that can be used: 1) to either trigger dMAX to start a transfer, or 2) to generate an interrupt to the CPU. All the events are sorted into two groups: low-priority event group and high-priority event group.

The high-priority data movement accelerator MAX0 (HiMAX) module is dedicated to serving requests coming from the high-priority event group. The low-priority data movement accelerator MAX1 (LoMAX) module is dedicated to serving requests coming from the low-priority event group.

Each PaRAM contains two sections: the event entry table section and the transfer entry table section. An event entry describes an event type and associates the event to either one of transfer types or to an interrupt. In case an event entry associates the event to one of the transfer types, the event entry will contain a pointer to the specific transfer entry in the transfer entry table. The transfer table may contain up to eight transfer entries. A transfer entry specifies details required by the dMAX controller to perform the transfer. In case an event entry associates the event to an interrupt, the event entry specifies which interrupt should be generated to the CPU in case the event arrives.

Prior to enabling events and triggering a transfer, the event entry and transfer entry must be configured. The event entry must specify: type of transfer, transfer details (type of synchronization, reload, element size, etc.), and should include a pointer to the transfer entry. The transfer entry must specify: source, destination, counts, and indexes. If an event is sorted in the high-priority event group, the event entry and transfer entry must be specified in the high-priority Parameter RAM. If an event is sorted in the low-priority event group, the event entry and transfer entry must be specified in the low-priority parameter RAM.

The dMAX Event Flag Register (DEFR) captures up to 31 separate events; therefore, it is possible for events to occur simultaneously on the dMAX event inputs. In such cases, the event encoder resolves the order of processing. This mechanism sorts simultaneous events and sets the priority of the events. The dMAX controller can simultaneously process one event from each priority group. Therefore, the two highest-priority events (one from each group) can be processed at the same time.

An event-triggered dMAX transfer allows the submission of transfer requests to occur automatically based on system events, without any intervention by the CPU. The dMAX also includes support for CPU-initiated transfers for added control and robustness, and they can be used to start memory-to-memory transfers. To generate an event to the dMAX controller the CPU must create a transition on one of the bits from the dMAX Event Trigger (DETR) Register, which are mapped to the DER register.

Table 4-2 lists how the synchronization events are associated with event numbers in the dMAX controller.

Table 4-2. dMAX Peripheral Event Input Assignments

EVENT NUMBER	EVENT ACRONYM	EVENT DESCRIPTION
0	DETR[0]	The CPU triggers the event by creating appropriate transition (edge) on bit0 in DETR register.
1	DETR[16]	The CPU triggers the event by creating appropriate transition (edge) on bit16 in DETR register.
2	RTIREQ0	RTI DMA REQ[0]
3	RTIREQ1	RTI DMA REQ[1]
4	MCASP0TX	McASP0 TX DMA REQ
5	MCASP0RX	McASP0 RX DMA REQ
6	MCASP1TX	McASP1 TX DMA REQ
7	MCASP1RX	McASP1 RX DMA REQ
8	MCASP2TX	McASP2 TX DMA REQ
9	MCASP2RX	McASP2 RX DMA REQ
10	DETR[1]	The CPU triggers the event by creating appropriate transition (edge) on bit1 in DETR register.
11	DETR[17]	The CPU triggers the event by creating appropriate transition (edge) on bit17 in DETR register.
12	UHPIINT	UHPI CPU_INT
13	SPI0RX	SPI0 DMA_RX_REQ
14	SPI1RX	SPI1 DMA_RX_REQ
15	RTIREQ2	RTI DMA REQ[2]
16	RTIREQ3	RTI DMA REQ[3]
17	DETR[2]	The CPU triggers the event by creating appropriate transition (edge) on bit2 in DETR register.
18	DETR[18]	The CPU triggers the event by creating appropriate transition (edge) on bit18 in DETR register.
19	I2C0XEVT	I2C 0 Transmit Event
20	I2C0REVT	I2C 0 Receive Event
21	I2C1XEVT	I2C 1 Transmit Event
22	I2C1REVT	I2C 1 Receive Event
23	DETR[3]	The CPU triggers the event by creating appropriate transition (edge) on bit3 in DETR register.
24	DETR[19]	The CPU triggers the event by creating appropriate transition (edge) on bit19 in DETR register.
25	Reserved	
26	MCASP0ERR	AMUTEIN0 or McASP0 TX INT or McASP0 RX INT (error on McASP0)
27	MCASP1ERR	AMUTEIN1 or McASP1 TX INT or McASP1 RX INT (error on McASP1)
28	MCASP2ERR	AMUTEIN2 or McASP2 TX INT or McASP2 RX INT (error on McASP2)
29	OVLREQ[0/1]	Error on RTI
30	DETR[20]	The CPU triggers the event by creating appropriate transition (edge) on bit20 in DETR register.
31	DETR[21]	The CPU triggers the event by creating appropriate transition (edge) on bit21 in DETR register.

4.9.2 dMAX Peripheral Registers Description(s)

Table 4-3 is a list of the dMAX registers.

Table 4-3. dMAX Configuration Registers

BYTE ADDRESS	REGISTER NAME	DESCRIPTION
0x6000 0008	DEPR	Event Polarity Register
0x6000 000C	DEER	Event Enable Register
0x6000 0010	DEDR	Event Disable Register
0x6000 0014	DEHPR	Event High-priority Register
0x6000 0018	DELPR	Event Low-priority Register
0x6000 001C	DEFR	Event Flag Register
0x6000 0034	DER0	Event Register 0
0x6000 0054	DER1	Event Register 1
0x6000 0074	DER2	Event Register 2
0x6000 0094	DER3	Event Register 3
0x6000 0040	DFSR0	FIFO Status Register 0
0x6000 0060	DFSR1	FIFO Status Register 1
0x6000 0080	DTCR0	Transfer Complete Register 0
0x6000 00A0	DTCR1	Transfer Complete Register 1
N/A	DETR	Event Trigger Register (Located in C67x+ DSP Register File)
N/A	DESR	Event Status Register (Located in C67x+ DSP Register File)

4.10 External Interrupts

The C6727B DSP has no dedicated general-purpose interrupt pins, but the dMAX can be used in combination with a McASP AMUTEIN signal to provide external interrupt capability. There is a multiplexer for each McASP, controlled by the CFGMCASP0/1/2 registers, which allows the AMUTEIN input for that McASP to be sourced from one of seven I/O pins on the DSP. Once a pin is configured as an AMUTEIN source, a very short pulse (two SYSCLK2 cycles or more) on that pin will generate an event to the dMAX. This event can trigger the dMAX to generate a CPU interrupt by programming the assoicated Event Entry.

There are a few additional points to consider when using the AMUTEIN signal to enable external interrupts as described above. The I/O pin selected by the CFGMCASP0/1/2 registers must be configured as a general-purpose input pin within the associated peripheral. Also, the AMUTEIN signal should be disabled within the corresponding McASP so that AMUTE is not driven when AMUTEIN is active. This can be done by clearing the INEN bit of the AMUTE register inside the McASP. Finally, AMUTEIN events are logically ORed with the McASP transmit and receive error events within the dMAX; therefore, the ISR that processes the dMAX interrupt generated by these events must discern the source of the event.

The EMIF EM_WAIT pin has the ability to generate an NMI (INT1) based upon a rising edge on the EM_WAIT pin. Note that while this interrupt is connected to the CPU NMI (non-maskable interrupt), it is actually maskable through the EMIF control registers. In fact, the default state for this interrupt is disabled. Also, interrupt generation always occurs on a rising edge of EM_WAIT; the polarity selection for wait state generation has no effect on the interrupt polarity. The EM_WAIT pin should remain asserted for at least two SYSCLK3 cycles to ensure that the edge is detected.

4.11 External Memory Interface (EMIF)

4.11.1 EMIF Device-Specific Information

The C6727B DSP includes an external memory interface (EMIF) for optional SDRAM, NOR FLASH, NAND FLASH, or SRAM. The key features of this EMIF are:

- One chip select ($\overline{\text{EM\_CS[0]}}$) dedicated for x16 and x32 SDRAM (x8 not supported)
- One chip select ($\overline{\text{EM\_CS[2]}}$) dedicated for x8, x16, or x32 NOR FLASH; x8, x16, or x32 Asynchronous SRAM; or x8 or x16 NAND FLASH
- Data bus width is 32 bits on the C6727B.
- SDRAM burst length of 16 bytes
- External Wait Input on the C6727B through EM_WAIT (programmable active-high or active-low)
- External Wait pin functions as an interrupt for NAND Flash support
- NAND Flash logic calculates ECC on blocks of up to 512 bytes
- ECC logic suitable for single-bit errors

Figure 4-6 shows a typical example of EMIF-to-memory hookup on the C6727B DSP.

As the figures illustrate, the C6727B DSP includes a limited number of EMIF address lines. These are sufficient to connect to SDRAM seamlessly. Asynchronous memory such as FLASH typically will need to use additional GPIO pins to act as upper address lines during device boot up when the FLASH contents are copied into SDRAM. (Normally, code is executed from SDRAM since SDRAM has faster access times).

Any pins listed with a ‘Y' in the GPIO column of Table 2-12 may be used for this purpose, as long as it can be assured that they be pulled low at (and after) reset and held low until configured as outputs by the DSP.

Note that EM_BA[1:0] are used as low-order address lines for the asynchronous interface. For example, in Figure 4-6, the flash memory is not byte-addressable and its A[0] input selects a 16-bit value. The corresponding DSP address comes from EM_BA[1]. The remaining address lines from the DSP (EM_A[12:0]) drive a word address into the flash inputs A[13:1].

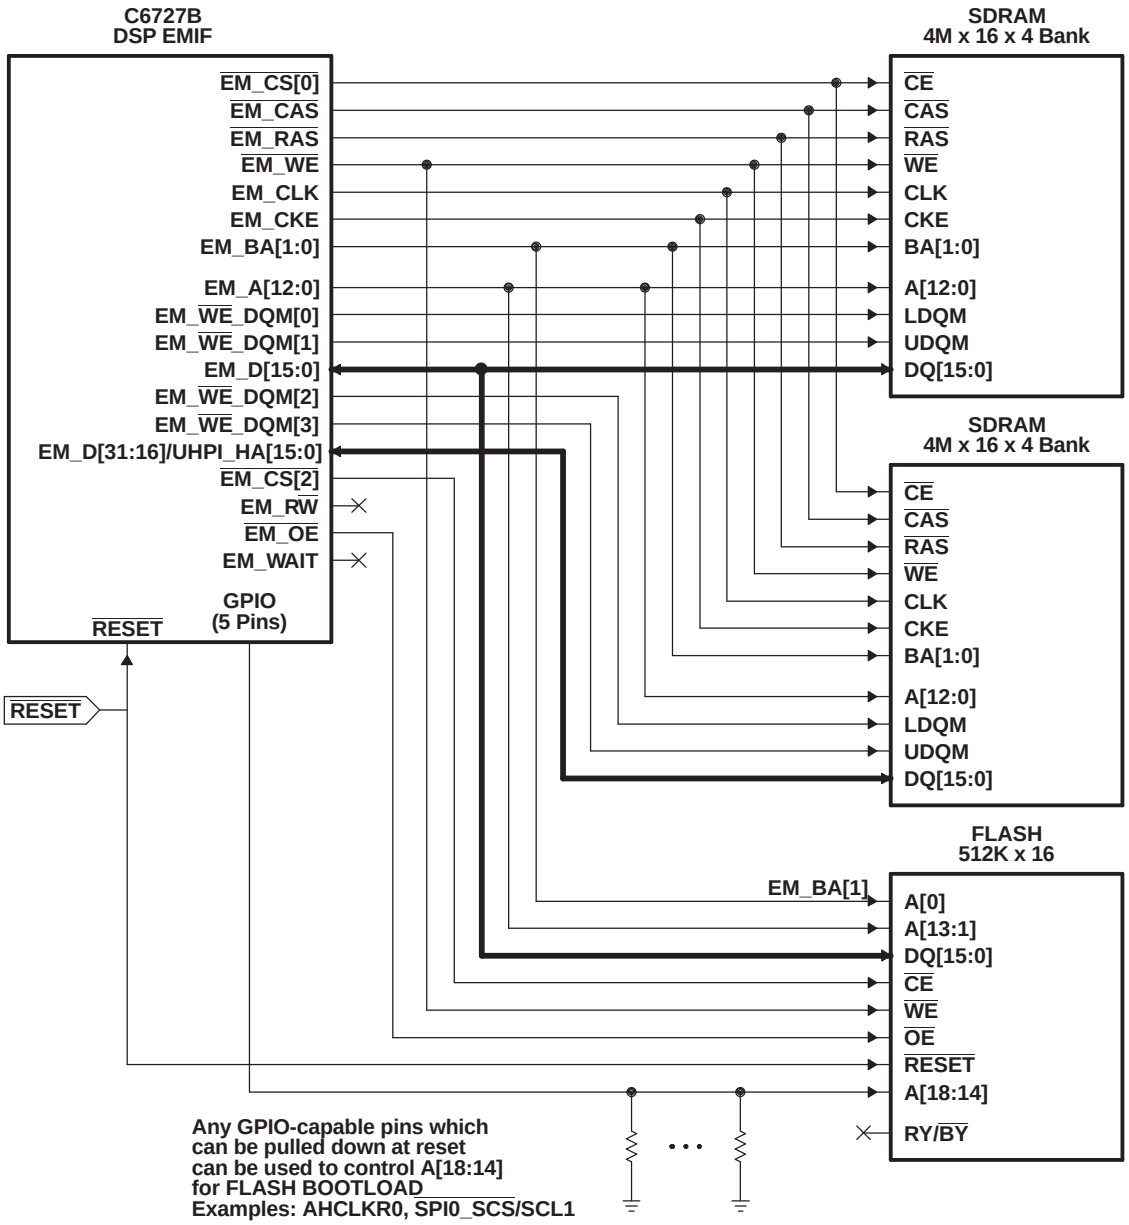

Figure 4-6. C6727B DSP 32-Bit EMIF Example

4.11.2 EMIF Peripheral Registers Description(s)

Table 4-4 is a list of the EMIF registers. For more information about these registers, see the *TMS320C6727B DSP External Memory Interface (EMIF) User's Guide* (literature number SPRU711).

Table 4-4. EMIF Registers

BYTE ADDRESS	REGISTER NAME	DESCRIPTION
0xF000 0004	AWCCR	Asynchronous Wait Cycle Configuration Register
0xF000 0008	SDCR	SDRAM Configuration Register
0xF000 000C	SDRCR	SDRAM Refresh Control Register
0xF000 0010	A1CR	Asynchronous 1 Configuration Register
0xF000 0020	SDTIMR	SDRAM Timing Register
0xF000 003C	SDSRETR	SDRAM Self Refresh Exit Timing Register
0xF000 0040	EIRR	EMIF Interrupt Raw Register
0xF000 0044	EIMR	EMIF Interrupt Mask Register
0xF000 0048	EIMSR	EMIF Interrupt Mask Set Register
0xF000 004C	EIMCR	EMIF Interrupt Mask Clear Register
0xF000 0060	NANDFCR	NAND Flash Control Register
0xF000 0064	NANDFSR	NAND Flash Status Register
0xF000 0070	NANDF1ECC	NAND Flash 1 ECC Register

4.11.3 EMIF Electrical Data/Timing

Table 4-5 through Table 4-10 assume testing over recommended operating conditions (see Figure 4-7 through Figure 4-13).

Table 4-5. 100-MHz EMIF SDRAM Interface Timing Requirements(1)

NO.	PARAMETER		MIN	TYP	MAX	UNIT
19	$t_{su(EM\_DV-EM\_CLKH)}$	Input setup time, read data valid on D[31:0] before EM_CLK rising	3			ns
20	$t_{h(EM\_CLKH-EM\_DIV)}$	Input hold time, read data valid on D[31:0] after EM_CLK rising	1.9			ns

15	$t_{d(EM\_CLKH\text{-}EM\_WEV)S}$	Delay time, EM_CLK rising to $\overline{EM\_WE}$ valid			7.7	ns
16	$t_{oh(EM\_CLKH\text{-}EM\_WEIV)S}$	Output hold time, EM_CLK rising to $\overline{EM\_WE}$ invalid	1.15			ns
17	$t_{dis(EM\_CLKH\text{-}EM\_DHZ)S}$	Delay time, EM_CLK rising to EM_D[31:0] 3-stated		7.7		ns
18	$t_{ena(EM\_CLKH\text{-}EM\_DLZ)S}$	Output hold time, EM_CLK rising to EM_D[31:0] driving		1.15		ns

(1) For more information about supported EMIF frequency, see Table 2-1.

Table 4-9. EMIF Asynchronous Interface Timing Requirements(1) (2)

NO.	PARAMETER		MIN	TYP	MAX	UNIT
28	$t_{su(EM\_DV\text{-}EM\_CLKH)A}$	Input setup time, read data valid on EM_D[31:0] before EM_CLK rising	11			ns
29	$t_{h(EM\_CLKH\text{-}EM\_DIV)A}$	Input hold time, read data valid on EM_D[31:0] after EM_CLK rising	2			ns
30	$t_{su(EM\_CLKH\text{-}EM\_WAITV)A}$	Setup time, EM_WAIT valid before EM_CLK rising edge	6			ns
31	$t_{h(EM\_CLKH\text{-}EM\_WAITIV)A}$	Hold time, EM_WAIT valid after EM_CLK rising edge	0			ns
33	$t_{w(EM\_WAIT)A}$	Pulse width of EM_WAIT assertion and deassertion	2E + 5			ns
34	$t_{d(EM\_WAITD\text{-}HOLD)A}$	Delay from EM_WAIT sampled deasserted on EM_CLK rising to beginning of HOLD phase			4E(3)	ns
35	$t_{su(EM\_WAITA\text{-}HOLD)A}$	Setup before end of STROBE phase (if no extended wait states are inserted) by which EM_WAIT must be sampled asserted on EM_CLK rising in order to add extended wait states.(4)	4E(3)			ns

(1) E = SYSCLK3 (EM_CLK) period.
(2) These parameters apply to memories selected by $\overline{EM\_CS[2]}$ in both normal and NAND modes.
(3) These parameters specify the number of EM_CLK cycles of latency between EM_WAIT being sampled at the device pin and the EMIF entering the HOLD phase. However, the asynchronous setup (parameter 30) and hold time (parameter 31) around each EM_CLK edge must also be met in order to ensure the EM_WAIT signal is correctly sampled.
(4) In Figure 4-13, it appears that there are more than 4 EM_CLK cycles encompassed by parameter 35. However, EM_CLK cycles that are part of the extended wait period should not be counted; the 4 EM_CLK requirement is to the start of where the HOLD phase would begin if there were no extended wait cycles.

Table 4-10. EMIF Asynchronous Interface Switching Characteristics(1)

NO.	PARAMETER			MIN	TYP	MAX	UNIT
1	$t_{c(EM\_CLK)}$	Cycle time, EMIF clock EM_CLK	100-MHz EMIF Frequency	10			ns
			133-MHz EMIF Frequency	7.5			
2	$t_{w(EM\_CLK)}$	Pulse width, high or low, EMIF clock EM_CLK		3			ns
17	$t_{dis(EM\_CLKH\text{-}EM\_DHZ)S}$	Delay time, EM_CLK rising to EM_D[31:0] 3-stated			7.7		ns
18	$t_{ena(EM\_CLKH\text{-}EM\_DLZ)S}$	Output hold time, EM_CLK rising to EM_D[31:0] driving			1.15		ns
21	$t_{d(EM\_CLKH\text{-}EM\_CS2V)A}$	Delay time, from EM_CLK rising edge to $\overline{EM\_CS[2]}$ valid		0		8	ns
22	$t_{d(EM\_CLKH\text{-}EM\_WE\_DQMV)A}$	Delay time, EM_CLK rising to EM_$\overline{WE}$_DQM[3:0] valid		-2		8	ns
23	$t_{d(EM\_CLKH\text{-}EM\_AV)A}$	Delay time, EM_CLK rising to EM_A[12:0] and EM_BA[1:0] valid		-0.3		8	ns
24	$t_{d(EM\_CLKH\text{-}EM\_DV)A}$	Delay time, EM_CLK rising to EM_D[31:0] valid		-0.8		8	ns
25	$t_{d(EM\_CLKH\text{-}EM\_OEV)A}$	Delay time, EM_CLK rising to $\overline{EM\_OE}$ valid		0		8	ns
26	$t_{d(EM\_CLKH\text{-}EM\_RW)A}$	Delay time, EM_CLK rising to EM_$\overline{RW}$ valid		0		8	ns
27	$t_{dis(EM\_CLKH\text{-}EM\_DDIS)A}$	Delay time, EM_CLK rising to EM_D[31:0] 3-stated			4		ns
32	$t_{d(EM\_CLKH\text{-}EM\_WE)A}$	Delay time, EM_CLK rising to $\overline{EM\_WE}$ valid		0		8	ns

(1) These parameters apply to memories selected by $\overline{EM\_CS[2]}$ in both normal and NAND modes.

4.12 Universal Host-Port Interface (UHPI) [C6727B Only]

4.12.1 UHPI Device-Specific Information

The C6727B DSP includes a flexible universal host-port interface (UHPI) with more options than the host-port interface on the C671x DSP.

The UHPI on the C6727B DSP supports three major operating modes listed in Table 4-11.

Table 4-11. UHPI Major Modes on C6727B

UHPI MAJOR MODE	EXAMPLE FIGURE
Multiplexed Host Address/Data Half-Word (16-Bit) Mode	Figure 4-15
Multiplexed Host Address/Data Fullword (32-Bit) Mode	Figure 4-16
Non-Multiplexed Host Address/Data Fullword (32-Bit) Mode	Figure 4-17

In all modes, the UHPI uses three select inputs ($\overline{\text{UHPI\_HCS}}$, $\overline{\text{UHPI\_HDS[2:1]}}$) which are combined internally to produce the internal strobe signal $\overline{\text{HSTROBE}}$. The $\overline{\text{HSTROBE}}$ strobe signal is used in the UHPI to capture incoming address and control signals on its falling edge and write data on its rising edge. The $\overline{\text{UHPI\_HCS}}$ signal also gates the deassertion of the $\overline{\text{UHPI\_HRDY}}$ signal externally.

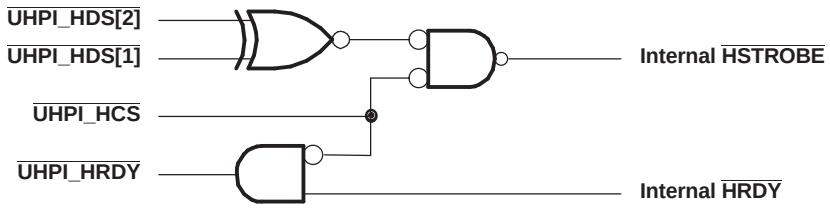

Figure 4-14. UHPI Strobe and Ready Interaction

The two HPI control pins UHPI_HCNTL[1:0] determine the type of access that the host will perform. Note that only two of the four access types are supported in Non-Multiplexed Host Address/Data Fullword Mode.

Table 4-12. HPI Access Types Selected by UHPI_HCNTL[1:0]

UHPI_HCNTL[1:0]	DESCRIPTION	MULTIPLEXED HALF-WORD	MULTIPLEXED FULLWORD	NON-MULTIPLEXED FULLWORD
00	HPI Control Register (HPIC) Access	Y	Y	Y
01	HPI Data Access (HPID) with autoincrementing address	Y	Y	N
10	HPI Address Register (HPIA) Access	Y	Y	N
11	HPI Data Access (HPID) without autoincrementing address	Y	Y	Y

CAUTION

When performing a set of HPID with autoincrementing address accesses (UHPI_HCNTL[1:0] = '01'), the set must begin and end at a word-aligned address. In addition, all four of the $\overline{\text{UHPI\_HBE[3:0]}}$ must be enabled on every access in the set.

CAUTION

The encoding of UHPI_CNTL[1:0] on the C6727B DSP is different from HCNTL[1:0] on the C671x DSP. Modes 01 and 10 are swapped.

Figure 4-15 illustrates the Multiplexed Host Address/Data Half-Word Mode hookup between the C6727B DSP and an external host microcontroller. In this mode, each 32-bit HPI access is broken up into two halves. The UHPI_HD[16]/HHWIL pin functions as UHPI_HHWIL which must be '0' during the first half of access and '1' during the second half.

CAUTION

Unless configured as general-purpose I/O in the UHPI module, UHPI_HD[31:17] and UHPI_HD[16]/HHWIL will be driven as outputs along with UHPI_HD[15:0] when the HPI is read, even though only the lower half-word is used to transfer data. This can be especially problematic for the UHPI_HD[16]/HHWIL pin which should be used as an input in this mode. Therefore, be sure to configure the upper half of the UHPI_HD bus as general-purpose I/O pins. Furthermore, be sure to program the UHPI_HD[16] function as a general-purpose *input* to avoid a drive conflict with the external host MCU.

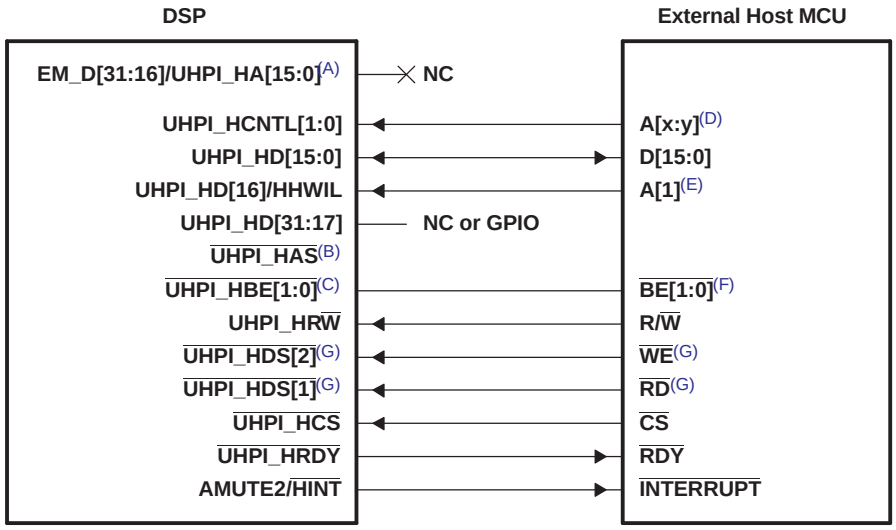
In this mode, as well as the Multiplexed Host Address/Data Fullword mode, the UHPI can be made more secure by restricting the upper 16 bits of the DSP addresses it can access to what is set in CFGHPIAMSB and CFGHPIAUMB registers. (See Table 4-15 and Table 4-16).

The host is responsible for configuring the internal HPIA register whether or not it is being overridden by the device configuration registers CFGHPIAMSB and CFGHPIAUMB.

After the HPIA register has been set, either a single or a group of autoincrementing accesses to HPID may be performed.

The $\overline{\text{UHPI\_HRDY}}$ adds wait states to extend the host MCU access until the C6727B DSP has completed the desired operation.

The $\overline{\text{HINT}}$ signal is available for the DSP to interrupt the host MCU. The UHPI also includes an interrupt to the DSP core from the host as part of the HPIC register.



A. May be used as EM_D[31:16]

B. Optional for hosts supporting multiplexed address and data. Pull up if not used. Low when address is on the bus.

C. DSP byte enables $\overline{\text{UHPI\_HBE[3:2]}}$ are not required in this mode.

D. Two host address lines ***or*** host GPIO if address lines are not available.

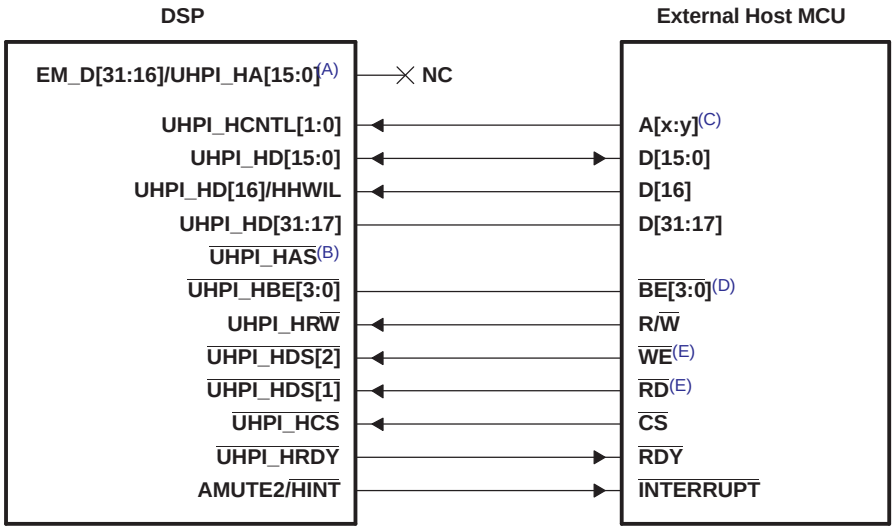
E. A[1], assuming this address increments from 0 to 1 between two successive 16-bit accesses.

F. Byte Enables (active during reads and writes). Some processors support a byte-enable mode on their write-enable pins.

G. Only required if needed for strobe timing. Not required if $\overline{\text{CS}}$ meets strobe timing requirements. Tie $\overline{\text{UHPI\_HDS[2]}}$ and $\overline{\text{UHPI\_HDS[1]}}$ opposite. For more information, see Figure 4-14.

Figure 4-15. UHPI Multiplexed Host Address/Data Half-Word Mode

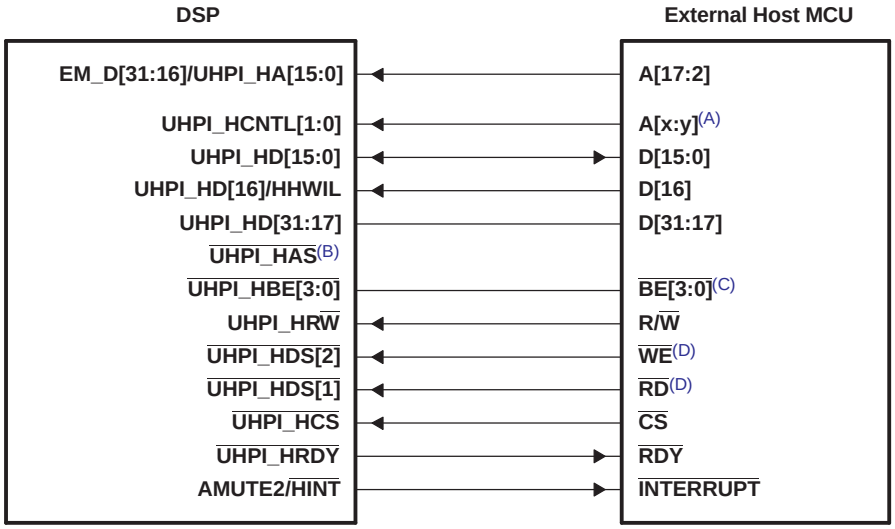
Figure 4-16 illustrates the Multiplexed Host Address/Data Fullword Mode hookup between the C6727B DSP and an external host microcontroller. In this mode, all 32 bits of UHPI_HD[31:0] are used and the host can access HPIA, HPID, and HPIC in a single bus cycle.



A. May be used as EM_D[31:16]
B. Optional for hosts supporting multiplexed address and data. Pull up if not used. Low when address is on the bus.
C. Two host address lines ***or*** host GPIO if address lines are not available.
D. Byte Enables (active during reads and writes). Some processors support a byte-enable mode on their write enable pins.
E. Only required if needed for strobe timing. Not required if $\overline{CS}$ meets strobe timing requirements.

Figure 4-16. UHPI Multiplexed Host Address/Data Fullword Mode

Figure 4-17 illustrates the Non-Multiplexed Host Address/Data Fullword mode of the UHPI. In this mode, the UHPI behaves almost like an asynchronous SRAM except it asserts the UHPI_HRDY signal. This mode allows the host to randomly access a 64K-byte page in the C6727B address space. The upper 32 bits of the C6727B address are set by the DSP (only) through the CFGHPIAMSB and CFGHPIAUMB registers (see Table 4-15 and Table 4-16).



A. Two host address lines ***or*** host GPIO if address lines are not available.
B. Not used in this mode.
C. Byte Enables (active during reads and writes). Some processors support a byte-enable mode on their write enable pins.
D. Only required if needed for strobe timing. Not required if CS meets strobe timing requirements.

Figure 4-17. UHPI Non-Multiplexed Host Address/Data Fullword Mode

CAUTION

The EMIF data bus and UHPI HA inputs share the EM_D[31:16]/UHPI_HA[15:0] pins. When using Non-Multiplexed mode, make sure the EMIF does not drive EM_D[31:16]; otherwise, a drive conflict with the external host MCU may result. Normally, the EMIF will begin to drive the EM_D[31:16] lines immediately after it completes the SDRAM initialization sequence, which occurs automatically after RESET is released. To avoid a drive conflict then, the boot software must set CFGHPI.NMUX to '1' before the EMIF drives EM_D[31:16]. Setting CFGHPI.NMUX to '1' forces these pins to be input pins.

4.12.2 UHPI Peripheral Registers Description(s)

Table 4-13 is a list of the UHPI registers.

Table 4-13. UHPI Configuration Registers

BYTE ADDRESS	REGISTER NAME	DESCRIPTION
Device-Level Configuration Registers Controlling UHPI		
0x4000 0008	CFGHPI	UHPI Configuration Register
0x4000 000C	CFGHPIAMSB	Most Significant Byte of UHPI Address
0x4000 0010	CFGHPIAUMB	Upper Middle Byte of UHPI Address
UHPI Internal Registers		
0x4300 0000	PID	Peripheral ID Register
0x4300 0004	PWREMU	Power and Emulation Management Register
0x4300 0008	GPIOINT	General Purpose I/O Interrupt Control Register
0x4300 000C	GPIOEN	General Purpose I/O Enable Register
0x4300 0010	GPIODIR1	General Purpose I/O Direction Register 1
0x4300 0014	GPIODAT1	General Purpose I/O Data Register 1
0x4300 0018	GPIODIR2	General Purpose I/O Direction Register 2
0x4300 001C	GPIODAT2	General Purpose I/O Data Register 2
0x4300 0020	GPIODIR3	General Purpose I/O Direction Register 3
0x4300 0024	GPIODAT3	General Purpose I/O Data Register 3
0x4300 0028	Reserved	Reserved
0x4300 002C	Reserved	Reserved
0x4300 0030	HPIC	Control Register
0x4300 0034	HPIAW	Write Address Register
0x4300 0038	HPIAR	Read Address Register
0x4300 003C	Reserved	Reserved
0x4300 0040	Reserved	Reserved

The UHPI has several device-level configuration registers which affect its behavior. Figure 4-18, Figure 4-19, and Figure 4-20 show the bit layout of these registers. Table 4-14, Table 4-15, and Table 4-16 contain a description of the bits in these registers.

31	8
Reserved	

7	5	4	3	2	1	0
Reserved		BYTEAD	FULL	NMUX	PAGEM	ENA
		R/W, 0	R/W, 0	R/W, 0	R/W, 0	R/W, 0

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 4-18. CFGHPI Register Bit Layout (0x4000 0008)

Table 4-14. CFGHPI Register Bit Field Description (0x4000 0008)

BIT NO.	NAME	RESET VALUE	READ WRITE	DESCRIPTION
31:5	Reserved	N/A	N/A	Reads are indeterminate. Only 0s should be written to these bits.
4	BYTEAD	0	R/W	UHPI Host Address Type 0 = Host Address is a word address 1 = Host Address is a byte address
3	FULL	0	R/W	UHPI Multiplexing Mode (when NMUX = 0) 0 = Half-Word (16-bit data) Multiplexed Address and Data Mode 1 = Fullword (32-bit data) Multiplexed Address and Data Mode
2	NMUX	0	R/W	UHPI Non-Multiplexed Mode Enable 0 = Multiplexed Address and Data Mode 1 = Non-Multiplexed Address and Data Mode (utilizes optional UHPI_HA[15:0] pins). Host data bus is 32 bits in Non-Multiplexed mode. Setting this bit prevents the EMIF from driving data out or 'parking' the shared EM_D[31:16]/UHPI_HA[15:0] pins.
1	PAGEM	0	R/W	UHPI Page Mode Enable (Only for Multiplexed Address and Data Mode). 0 = Full 32-bit DSP address specified through host port. 1 = Only lower 16 bits of DSP address are specified through host port. Upper 16 bits are restricted to the page selected by CFGHPIAMSB and CFGHPIAUMB registers.
0	ENA	0	R/W	UHPI Enable 0 = UHPI is disabled 1 = UHPI is enabled. Set this bit to '1' only after configuring the other bits in this register.

31:8	Reserved	N/A	N/A	Reads are indeterminate. Only 0s should be written to these bits.
7:0	HPIAUMB	0	R/W	UHPI upper middle byte of DSP address to access in Non-Multiplexed mode and in Multiplexed Address and Data mode when PAGEM = 1. Sets bits [23:16] of the DSP internal address as accessed through UHPI.

4.12.3 UHPI Electrical Data/Timing

4.12.3.1 Universal Host-Port Interface (UHPI) Read and Write Timing

Table 4-17 and Table 4-18 assume testing over recommended operating conditions (see Figure 4-21 through Figure 4-24).

Table 4-17. UHPI Read and Write Timing Requirements(1) (2)

NO.	PARAMETER		MIN	TYP	MAX	UNIT
9	$t_{su(HASL-DSL)}$	Setup time, $\overline{\text{UHPI\_HAS}}$ low before DS falling edge	6.5			ns
10	$t_{h(DSL-HASL)}$	Hold time, $\overline{\text{UHPI\_HAS}}$ low after DS falling edge	2			ns
11	$t_{su(HAD-HASL)}$	Setup time, HAD valid before $\overline{\text{UHPI\_HAS}}$ falling edge	6.5			ns
12	$t_{h(HASL-HAD)}$	Hold time, HAD valid after $\overline{\text{UHPI\_HAS}}$ falling edge	5			ns
13	$t_{w(DSL)}$	Pulse duration, DS low	15			ns
14	$t_{w(DSH)}$	Pulse duration, DS high	2P			ns
15	$t_{su(HAD-DSL)}$	Setup time, HAD valid before DS falling edge	5			ns
16	$t_{h(DSL-HAD)}$	Hold time, HAD valid after DS falling edge	5			ns
17	$t_{su(HD-DSH)}$	Setup time, HD valid before DS rising edge	7			ns
18	$t_{h(DSH-HD)}$	Hold time, HD valid after DS rising edge	0			ns
37	$t_{su(HCSL-DSL)}$	Setup time, $\overline{\text{UHPI\_HCS}}$ low before DS falling edge	0.75			ns
38	$t_{h(HRDYL-DSH)}$	Hold time, DS high after $\overline{\text{UHPI\_HRDY}}$ falling edge	1			ns

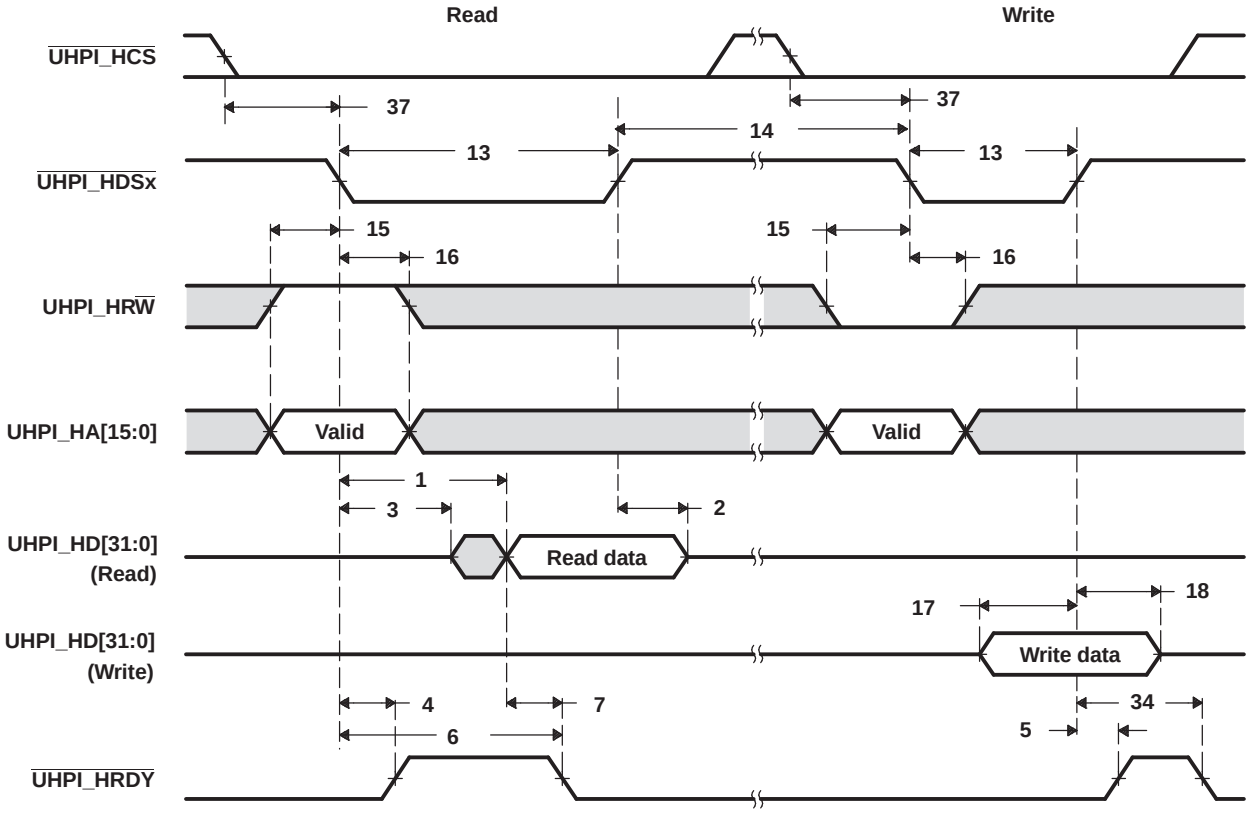
(1) P = SYSCLK2 period

(2) DS refers to $\overline{\text{HSTROBE}}$. HD refers to UHPI_HD[31:0]. HDS refers to $\overline{\text{UHPI\_HDS[1]}}$ or $\overline{\text{UHPI\_HDS[2]}}$. HAD refers to UHPI_HCNTL[0], UHPI_HCNTL[1], UHPI_HHWIL, and UHPI_HRW.

Table 4-18. UHPI Read and Write Switching Characteristics(1) (2)

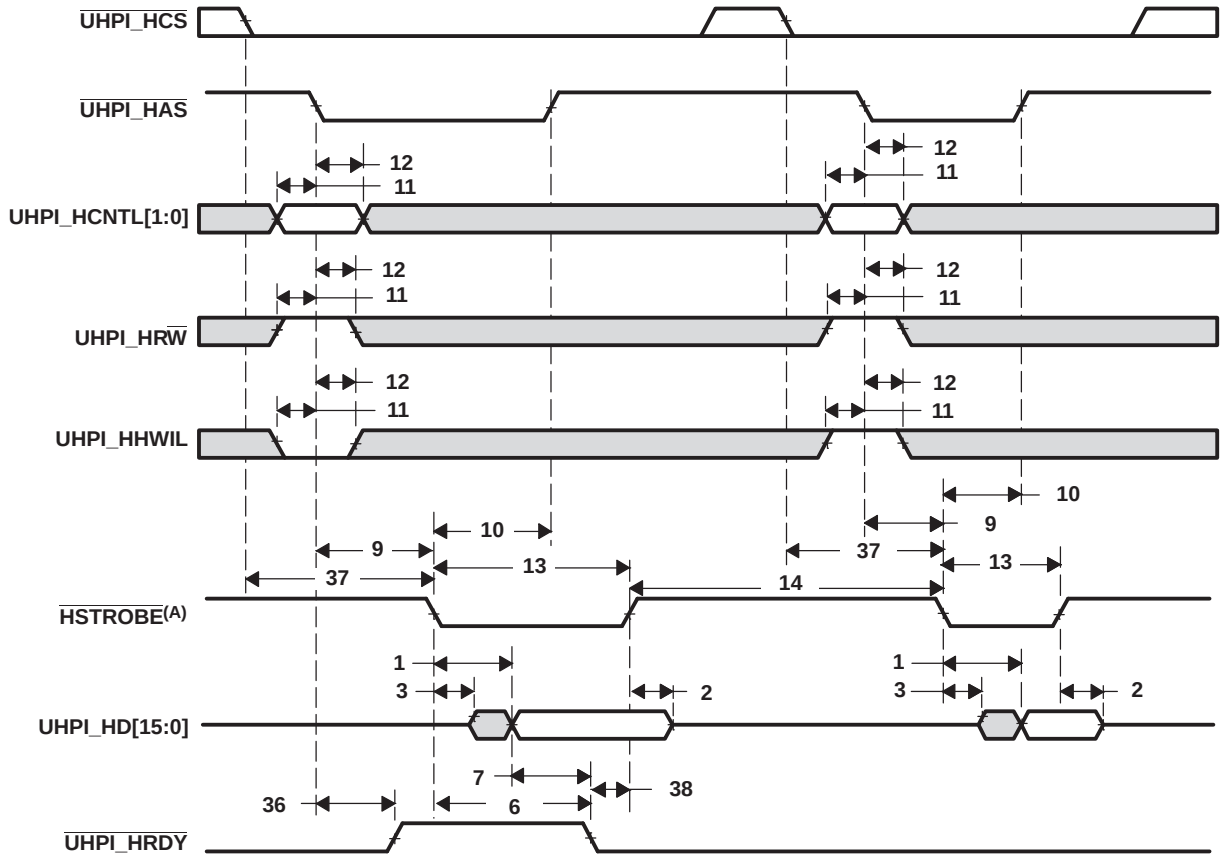
NO.	PARAMETER			MIN	TYP	MAX	UNIT
1	$t_{d(DSL-HDV)}$	Delay time, DS low to HD valid	Case 1. HPIC or HPIA read	-1		15	ns
			Case 2. HPID read with no auto-increment			9 * 2H + 20(3)	
			Case 3. HPID read with auto-increment and read FIFO initially empty			9 * 2H + 20(3)	
			Case 4. HPID read with auto-increment and data previously prefetched into the read FIFO	-1.5		15	
2	$t_{dis(DSH-HDV)}$	Disable time, HD high-impedance from DS high			2.5		ns
3	$t_{en(DSL-HDD)}$	Enable time, HD driven from DS low			9		ns
4	$t_{d(DSL-HRDYH)}$	Delay time, DS low to $\overline{\text{UHPI\_HRDY}}$ high				14	ns
5	$t_{d(DSH-HRDYH)}$	Delay time, DS high to $\overline{\text{UHPI\_HRDY}}$ high				14	ns
6	$t_{d(DSL-HRDYL)}$	Delay time, DS low to $\overline{\text{UHPI\_HRDY}}$ low	Case 1. HPID read with no auto-increment			10 * 2H + 20(3)	ns
			Case 2. HPID read with auto-increment and read FIFO initialy empty			10 * 2H + 20(3)	
7	$t_{d(HDV-HRDYL)}$	Delay time, HD valid to $\overline{\text{UHPI\_HRDY}}$ low		0			ns
34	$t_{d(DSH-HRDYL)}$	Delay time, DS high to $\overline{\text{UHPI\_HRDY}}$ low	Case 1. HPIA write			5 * 2H + 20(3)	ns
			Case 2. HPID read with auto-increment and read FIFO initially empty			5 * 2H + 20(3)	
35	$t_{d(DSL-HRDYL)}$	Delay time, DS low to $\overline{\text{UHPI\_HRDY}}$ low for HPIA write and FIFO not empty				40 * 2H + 20(3)	ns
36	$t_{d(HASL-HRDYH)}$	Delay time, $\overline{\text{UHPI\_HAS}}$ low to $\overline{\text{UHPI\_HRDY}}$ high				12	ns

(1) H = 0.5 * SYSCLK2 period
(2) DS refers to $\overline{\text{HSTROBE}}$. HAD refers to UHPI_HCNTL[0], UHPI_HCNTL[1], UHPI_HHWIL, and UHPI_$\overline{\text{HRW}}$.
(3) Max delay is a best case, assuming no delays due to resource conflicts between UHPI and dMAX or CPU. $\overline{\text{UHPI\_HRDY}}$ should always be used to indicate when an access is complete instead of relying on these parameters.



A. Depending on the type of write or read operation (HPID or HPIC), transitions on UHPI_HRDY may or may not occur.

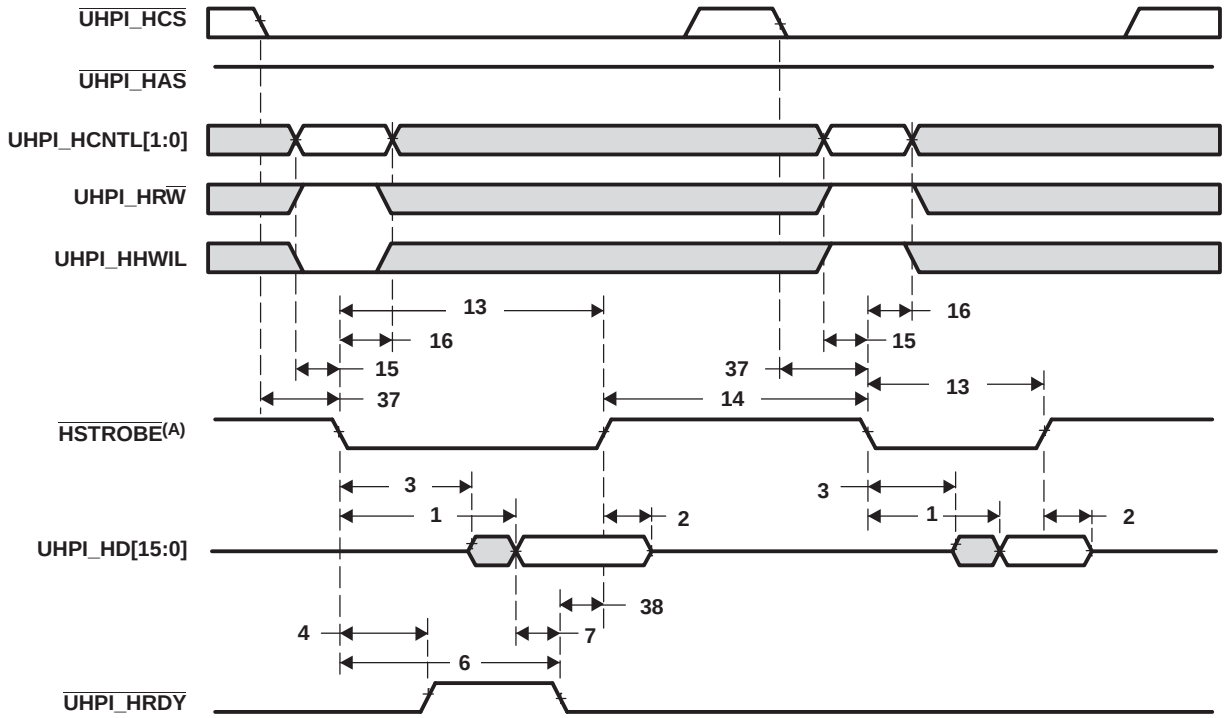
Figure 4-21. Non-Multiplexed Read/Write Timings



A. See Figure 4-14.

B. Depending on the type of write or read operation (HPID without auto-incrementing, HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on UHPI_HRDY may or may not occur.

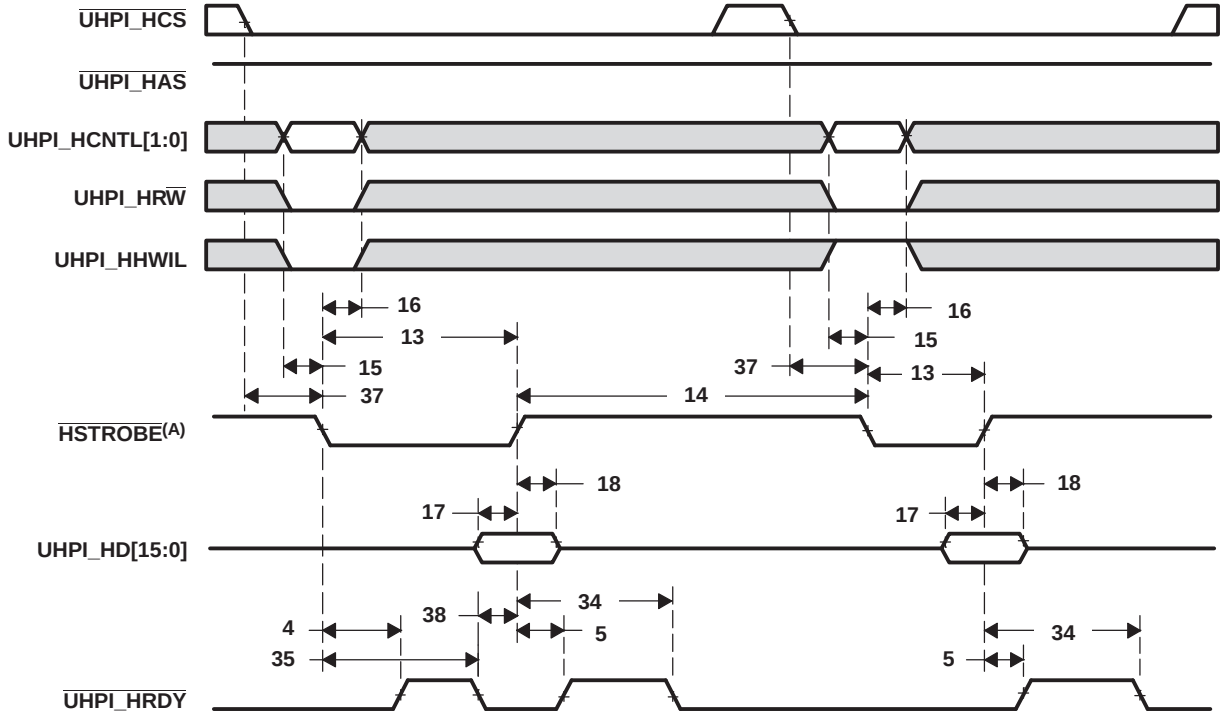
Figure 4-22. Multiplexed Read Timings Using UHPI_HAS



A. See Figure 4-14.

B. Depending on the type of write or read operation (HPID without auto-incrementing, HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on UHPI_HRDY may or may not occur.

Figure 4-23. Multiplexed Read Timings With UHPI_HAS Held High



A. See Figure 4-14.

B. Depending on the type of write or read operation (HPID without auto-incrementing, HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on UHPI_HRDY may or may not occur.

Figure 4-24. Multiplexed Write Timings With UHPI_HAS Held High

4.13 Multichannel Serial Ports (McASP0, McASP1, and McASP2)

The McASP serial port is specifically designed for multichannel applications. Its key features are:

- Flexible clock and frame sync generation logic and on-chip dividers
- Up to sixteen transmit or receive data pins and serializers
- Large number of serial data format options, including:
  - TDM Frames with 2 to 32 time slots per frame (periodic) or 1 slot per frame (burst).
  - Time slots of 8,12,16, 20, 24, 28, and 32 bits.
  - First bit delay 0, 1, or 2 clocks.
  - MSB or LSB first bit order.
  - Left- or right-aligned data words within time slots
- DIT Mode (optional) with 384-bit Channel Status and 384-bit User Data registers.
- Extensive error-checking and mute generation logic
- All unused pins GPIO-capable

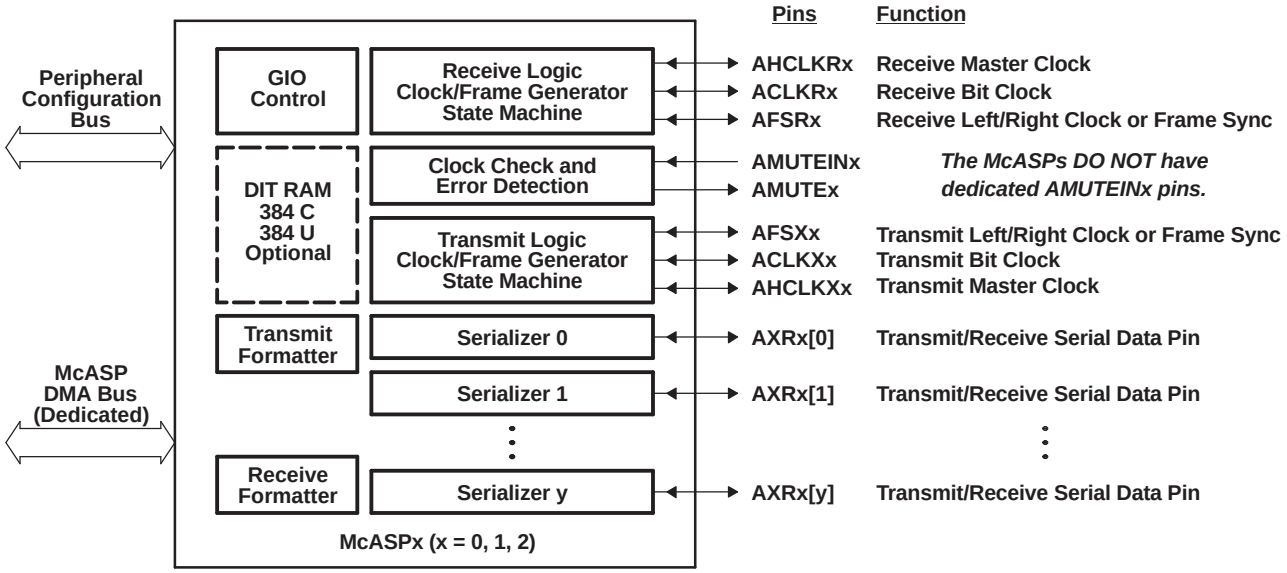


Figure 4-25. McASP Block Diagram

The three McASPs on C6727B have different configurations (see Table 4-19).

Table 4-19. McASP Configurations on C6727B DSP

McASP	DIT	CLOCK PINS	DATA PINS	COMMENTS
McASP0	No	AHCLKX0/AHCLKX2, ACLKX0, AFSX0 AHCLKR0/AHCLKR1, ACLKR0, AFSR0	Up to 16	AHCLKX0/AHCLKX2 share pin. AHCLKR0/AHCLKR1 share pin.
McASP1	No	AHCLKX1, ACLKX1, AFSX1, ACLKR1, AFSR1	Up to 6	AHCLKR0/AHCLKR1 share pin
McASP2	Yes	ACLKX2, AFSX2, AHCLKR2, ACLKR2, AFSR2 (Only available on the C6727B.)	Up to 2	Full functionality on C6727B. On C6726B, functions only as DIT since only AHCLKX0/AHCLKX2 is available.

NOTE: The McASPs ***do not*** have dedicated AMUTEINx pins. Instead they can select one of the pins listed in Table 4-21, Table 4-22, and Table 4-23 to use as a mute input.

4.13.1 McASP Peripheral Registers Description(s)

Table 4-20 is a list of the McASP registers. For more information about these registers, see the *TMS320C6727B DSP Multichannel Audio Serial Port (McASP) Reference Guide* (literature number SPRU878).

Table 4-20. McASP Registers Accessed Through Peripheral Configuration Bus

McASP0 BYTE ADDRESS	McASP1 BYTE ADDRESS	McASP2 BYTE ADDRESS	REGISTER NAME	DESCRIPTION
Device-Level Configuration Registers Controlling McASP				
0x4000 0018	0x4000 001C	0x4000 0020	CFGMCASPx	Selects the peripheral pin to be used as AMUTEINx

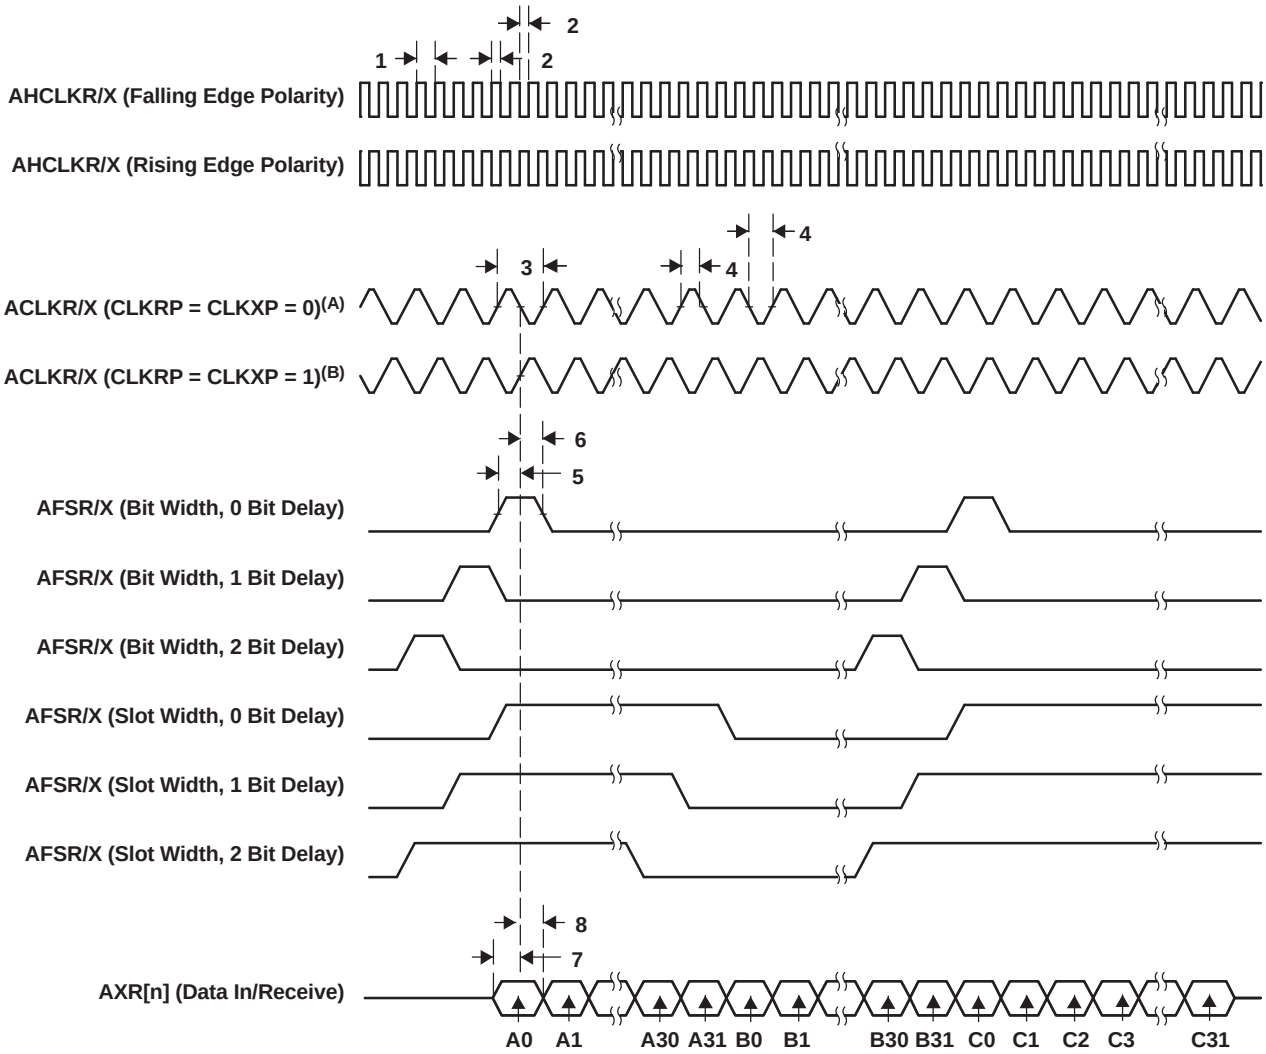
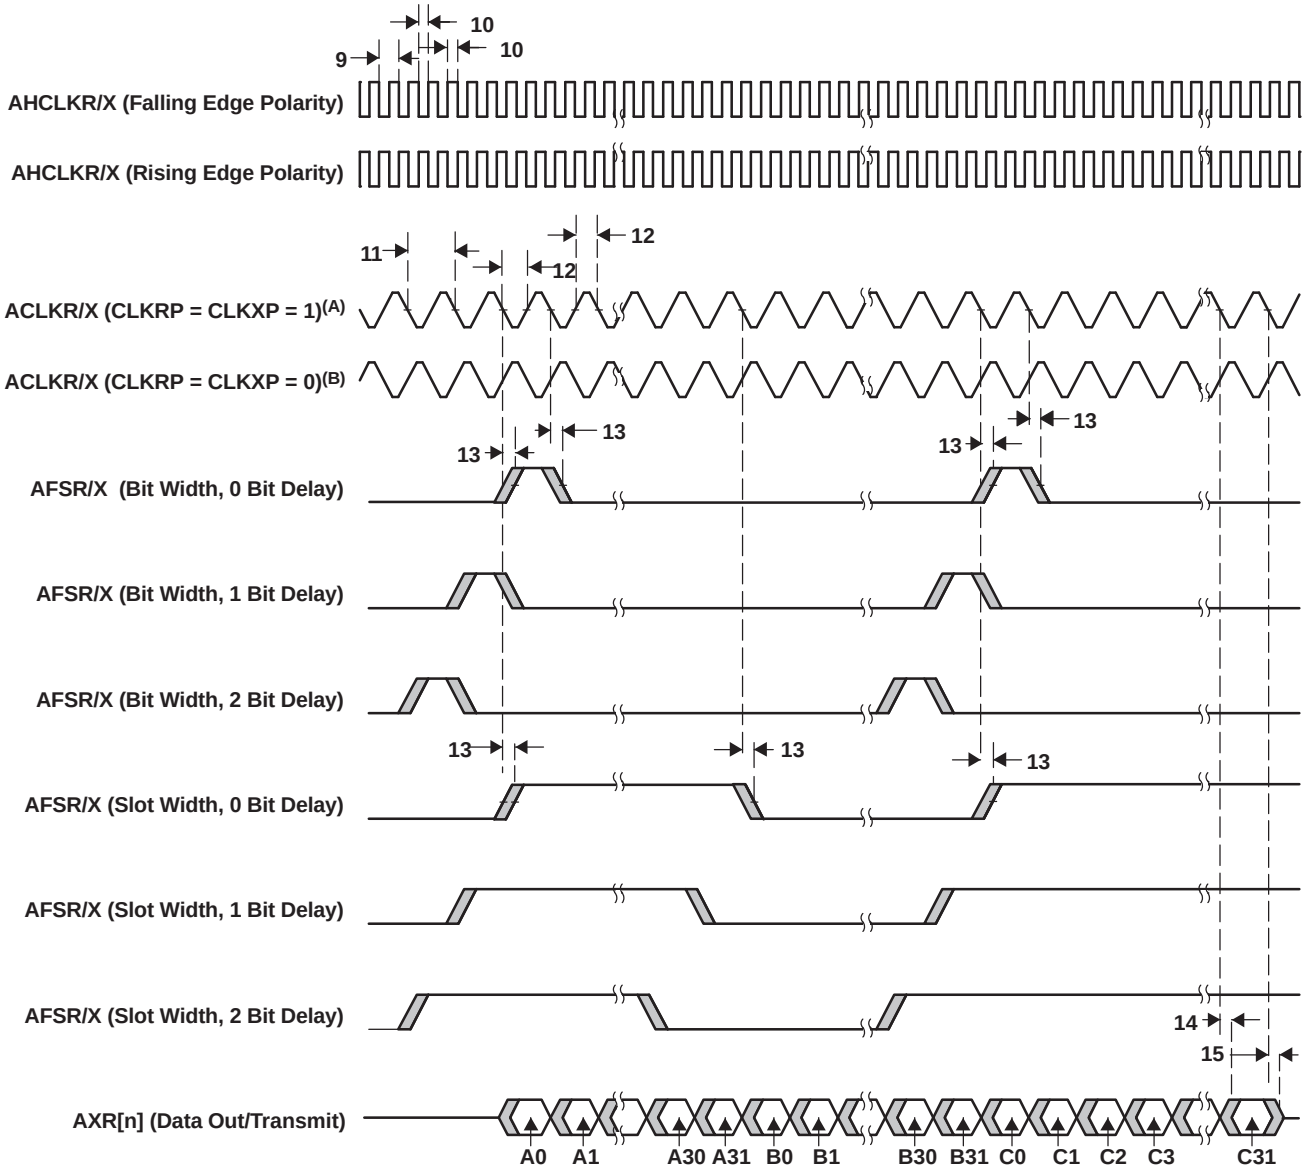
(2) AHR - Cycle time, AHCLKR.
(3) AHX - Cycle time, AHCLKX.
(4) P = SYSCLK2 period
(5) AR - ACLKR period.
(6) AX - ACLKX period.



A. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

B. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).

Figure 4-29. McASP Input Timings



A. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).

B. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

Figure 4-30. McASP Output Timings

4.14 Serial Peripheral Interface Ports (SPI0, SPI1)

4.14.1 SPI Device-Specific Information

Figure 4-31 is a block diagram of the SPI module, which is a simple shift register and buffer plus control logic. Data is written to the shift register before transmission occurs and is read from the buffer at the end of transmission. The SPI can operate either as a master, in which case, it initiates a transfer and drives the SPIx_CLK pin, or as a slave. Four clock phase and polarity options are supported as well as many data formatting options.

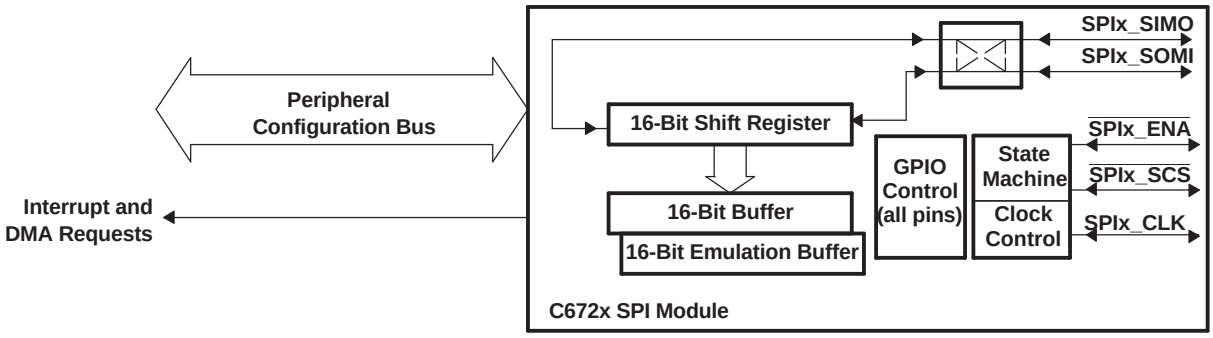


Figure 4-31. Block Diagram of SPI Module

The SPI supports 3-, 4-, and 5-pin operation with three basic pins (SPIx_CLK, SPIx_SIMO, and SPIx_SOMI) and two optional pins ($\overline{\text{SPIx\_SCS}}$, $\overline{\text{SPIx\_ENA}}$).

The optional $\overline{\text{SPIx\_SCS}}$ (Slave Chip Select) pin is most useful to enable in slave mode when there are other slave devices on the same SPI port. The C6727B will only shift data and drive the SPIx_SOMI pin when $\overline{\text{SPIx\_SCS}}$ is held low.

In slave mode, $\overline{\text{SPIx\_ENA}}$ is an optional output and can be driven in either a push-pull or open-drain manner. The $\overline{\text{SPIx\_ENA}}$ output provides the status of the internal transmit buffer (SPIDAT0/1 registers). In four-pin mode with the enable option, $\overline{\text{SPIx\_ENA}}$ is asserted only when the transmit buffer is full, indicating that the slave is ready to begin another transfer. In five-pin mode, the $\overline{\text{SPIx\_ENA}}$ is additionally qualified by $\overline{\text{SPIx\_SCS}}$ being asserted. This allows a single handshake line to be shared by multiple slaves on the same SPI bus.

In master mode, the $\overline{\text{SPIx\_ENA}}$ pin is an optional input and the master can be configured to delay the start of the next transfer until the slave asserts $\overline{\text{SPIx\_ENA}}$. The addition of this handshake signal simplifies SPI communications and, on average, increases SPI bus throughput since the master does not need to delay each transfer long enough to allow for the worst-case latency of the slave device. Instead, each transfer can begin as soon as both the master and slave have actually serviced the previous SPI transfer.

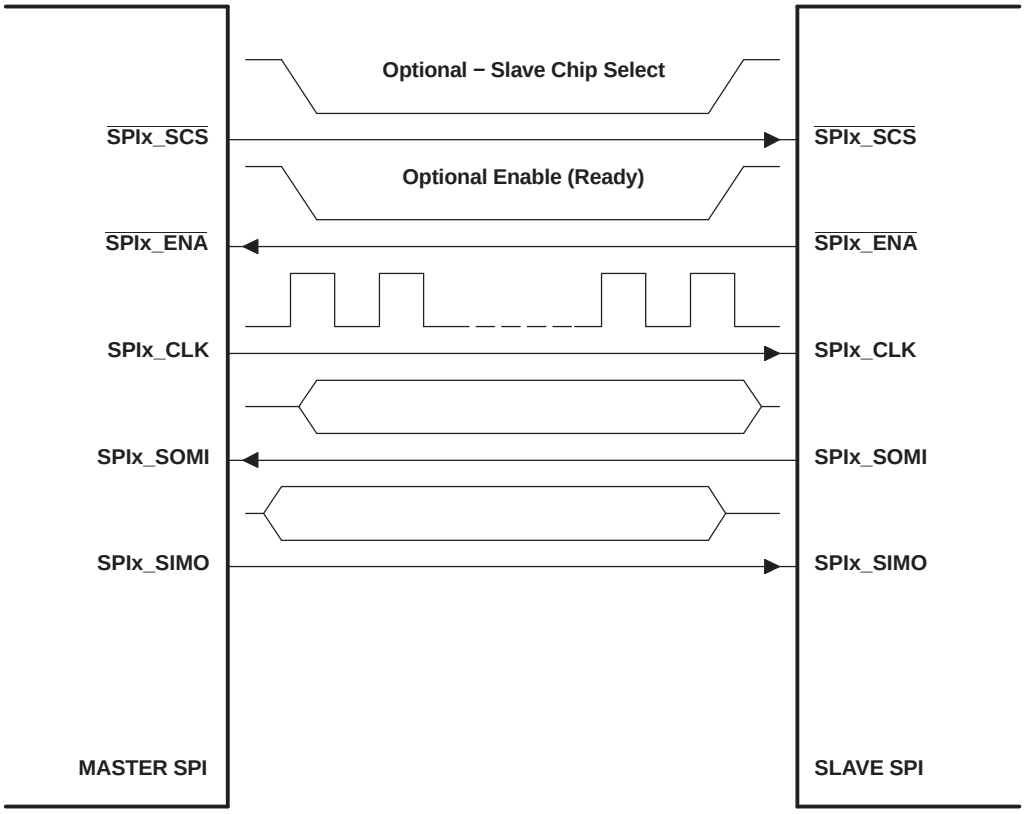

Figure 4-32. Illustration of SPI Master-to-SPI Slave Connection

4.14.2 SPI Peripheral Registers Description(s)

Table 4-26 is a list of the SPI registers.

Table 4-26. SPIx Configuration Registers

SPI0 BYTE ADDRESS	SPI1 BYTE ADDRESS	REGISTER NAME	DESCRIPTION
0x4700 0000	0x4800 0000	SPIGCR0	Global Control Register 0
0x4700 0004	0x4800 0004	SPIGCR1	Global Control Register 1

0x4700 0064	0x4800 0064	TGINTVECT1	Interrupt Vector for SPI INT1

4.14.3 SPI Electrical Data/Timing

4.14.3.1 Serial Peripheral Interface (SPI) Timing

Table 4-27 through Table 4-34 assume testing over recommended operating conditions (see Figure 4-33 through Figure 4-36).

Table 4-27. General Timing Requirements for SPIx Master Modes(1)

NO.	PARAMETER			MIN	TYP	MAX	UNIT
1	$t_{c(SPC)M}$	Cycle Time, SPIx_CLK, All Master Modes		greater of 8P or 100 ns		256P	ns
2	$t_{w(SPCH)M}$	Pulse Width High, SPIx_CLK, All Master Modes		greater of 4P or 45 ns			ns
3	$t_{w(SPCL)M}$	Pulse Width Low, SPIx_CLK, All Master Modes		greater of 4P or 45 ns			ns
4	$t_{d(SIMO\_SPC)M}$	Delay, initial data bit valid on SPIx_SIMO to initial edge on SPIx_CLK(2)	Polarity = 0, Phase = 0, to SPIx_CLK rising	2P			ns
			Polarity = 0, Phase = 1, to SPIx_CLK rising	$0.5t_{c(SPC)M}$ + 2P			
			Polarity = 1, Phase = 0, to SPIx_CLK falling	2P			
			Polarity = 1, Phase = 1, to SPIx_CLK falling	$0.5t_{c(SPC)M}$ + 2P			
5	$t_{d(SPC\_SIMO)M}$	Delay, subsequent bits valid on SPIx_SIMO after transmit edge of SPIx_CLK	Polarity = 0, Phase = 0, from SPIx_CLK rising			15	ns
			Polarity = 0, Phase = 1, from SPIx_CLK falling			15	
			Polarity = 1, Phase = 0, from SPIx_CLK falling			15	
			Polarity = 1, Phase = 1, from SPIx_CLK rising			15	
6	$t_{oh(SPC\_SIMO)M}$	Output hold time, SPIx_SIMO valid after receive edge of SPIxCLK, except for final bit(3)	Polarity = 0, Phase = 0, from SPIx_CLK falling	$0.5t_{c(SPC)M}$ – 10			ns
			Polarity = 0, Phase = 1, from SPIx_CLK rising	$0.5t_{c(SPC)M}$ – 10			
			Polarity = 1, Phase = 0, from SPIx_CLK rising	$0.5t_{c(SPC)M}$ – 10			
			Polarity = 1, Phase = 1, from SPIx_CLK falling	$0.5t_{c(SPC)M}$ – 10			
7	$t_{su(SOMI\_SPC)M}$	Input Setup Time, SPIx_SOMI valid before receive edge of SPIx_CLK	Polarity = 0, Phase = 0, to SPIx_CLK falling	0.5P + 15			ns
			Polarity = 0, Phase = 1, to SPIx_CLK rising	0.5P + 15			
			Polarity = 1, Phase = 0, to SPIx_CLK rising	0.5P + 15			
			Polarity = 1, Phase = 1, to SPIx_CLK falling	0.5P + 15			
8	$t_{ih(SPC\_SOMI)M}$	Input Hold Time, SPIx_SOMI valid after receive edge of SPIx_CLK	Polarity = 0, Phase = 0, from SPIx_CLK falling	0.5P + 5			ns
			Polarity = 0, Phase = 1, from SPIx_CLK rising	0.5P + 5			
			Polarity = 1, Phase = 0, from SPIx_CLK rising	0.5P + 5			
			Polarity = 1, Phase = 1, from SPIx_CLK falling	0.5P + 5			

(1) P = SYSCLK2 period
(2) First bit may be MSB or LSB depending upon SPI configuration. MO(0) refers to first bit and MO(n) refers to last bit output on SPIx_SIMO. MI(0) refers to the first bit input and MI(n) refers to the last bit input on SPIx_SOMI.
(3) The final data bit will be held on the SPIx_SIMO pin until the SPIDAT0 or SPIDAT1 register is written with new data.

Table 4-28. General Timing Requirements for SPIx Slave Modes(1)

NO.	PARAMETER			MIN	TYP	MAX	UNIT
9	$t_{c(SPC)S}$	Cycle Time, SPIx_CLK, All Slave Modes		greater of 8P or 100 ns		256P	ns
10	$t_{w(SPCH)S}$	Pulse Width High, SPIx_CLK, All Slave Modes		greater of 4P or 45 ns			ns
11	$t_{w(SPCL)S}$	Pulse Width Low, SPIx_CLK, All Slave Modes		greater of 4P or 45 ns			ns
12	$t_{su(SOMI\_SPC)S}$	Setup time, transmit data written to SPI and output onto SPIx_SOMI pin before initial clock edge from master.(2) (3)	Polarity = 0, Phase = 0, to SPIx_CLK rising	2P			ns
			Polarity = 0, Phase = 1, to SPIx_CLK rising	2P			
			Polarity = 1, Phase = 0, to SPIx_CLK falling	2P			
			Polarity = 1, Phase = 1, to SPIx_CLK falling	2P			
13	$t_{d(SPC\_SOMI)S}$	Delay, subsequent bits valid on SPIx_SOMI after transmit edge of SPIx_CLK	Polarity = 0, Phase = 0, from SPIx_CLK rising			2P + 15	ns
			Polarity = 0, Phase = 1, from SPIx_CLK falling			2P + 15	
			Polarity = 1, Phase = 0, from SPIx_CLK falling			2P + 15	
			Polarity = 1, Phase = 1, from SPIx_CLK rising			2P + 15	
14	$t_{oh(SPC\_SOMI)S}$	Output hold time, SPIx_SOMI valid after receive edge of SPIxCLK, except for final bit(4)	Polarity = 0, Phase = 0, from SPIx_CLK falling	$0.5t_{c(SPC)S} - 10$			ns
			Polarity = 0, Phase = 1, from SPIx_CLK rising	$0.5t_{c(SPC)S} - 10$			
			Polarity = 1, Phase = 0, from SPIx_CLK rising	$0.5t_{c(SPC)S} - 10$			
			Polarity = 1, Phase = 1, from SPIx_CLK falling	$0.5t_{c(SPC)S} - 10$			
15	$t_{su(SIMO\_SPC)S}$	Input Setup Time, SPIx_SIMO valid before receive edge of SPIx_CLK	Polarity = 0, Phase = 0, to SPIx_CLK falling	0.5P + 15			ns
			Polarity = 0, Phase = 1, to SPIx_CLK rising	0.5P + 15			
			Polarity = 1, Phase = 0, to SPIx_CLK rising	0.5P + 15			
			Polarity = 1, Phase = 1, to SPIx_CLK falling	0.5P + 15			
16	$t_{ih(SPC\_SIMO)S}$	Input Hold Time, SPIx_SIMO valid after receive edge of SPIx_CLK	Polarity = 0, Phase = 0, from SPIx_CLK falling	0.5P + 5			ns
			Polarity = 0, Phase = 1, from SPIx_CLK rising	0.5P + 5			
			Polarity = 1, Phase = 0, from SPIx_CLK rising	0.5P + 5			
			Polarity = 1, Phase = 1, from SPIx_CLK falling	0.5P + 5			

(1) P = SYSCLK2 period
(2) First bit may be MSB or LSB depending upon SPI configuration. SO(0) refers to first bit and SO(n) refers to last bit output on SPIx_SOMI. SI(0) refers to the first bit input and SI(n) refers to the last bit input on SPIx_SIMO.
(3) Measured from the termination of the write of new data to the SPI module, as evidenced by new output data appearing on the SPIx_SOMI pin. In analyzing throughput requirements, additional internal bus cycles must be accounted for to allow data to be written to the SPI module by either the DSP CPU or the dMAX.
(4) The final data bit will be held on the SPIx_SOMI pin until the SPIDAT0 or SPIDAT1 register is written with new data.

Table 4-29. Additional[1] SPI Master Timings, 4-Pin Enable Option[2][3]

NO.	PARAMETER			MIN	TYP	MAX	UNIT
17	$t_{d(ENA\_SPC)M}$	Delay from slave assertion of SPIx_ENA active to first SPIx_CLK from master.[4]	Polarity = 0, Phase = 0, to SPIx_CLK rising			3P + 15	ns
			Polarity = 0, Phase = 1, to SPIx_CLK rising			$0.5t_{c(SPC)M}$ + 3P + 15	
			Polarity = 1, Phase = 0, to SPIx_CLK falling			3P + 15	
			Polarity = 1, Phase = 1, to SPIx_CLK falling			$0.5t_{c(SPC)M}$ + 3P + 15	
18	$t_{d(SPC\_ENA)M}$	Max delay for slave to deassert SPIx_ENA after final SPIx_CLK edge to ensure master does not begin the next transfer.[5]	Polarity = 0, Phase = 0, from SPIx_CLK falling			$0.5t_{c(SPC)M}$	ns
			Polarity = 0, Phase = 1, from SPIx_CLK falling			0	
			Polarity = 1, Phase = 0, from SPIx_CLK rising			$0.5t_{c(SPC)M}$	
			Polarity = 1, Phase = 1, from SPIx_CLK rising			0	

(1) These parameters are in addition to the general timings for SPI master modes (Table 4-27).
(2) P = SYSCLK2 period
(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four master clocking modes.
(4) In the case where the master SPI is ready with new data before SPIx_ENA assertion.
(5) In the case where the master SPI is ready with new data before SPIx_ENA deassertion.

Table 4-30. Additional[1] SPI Master Timings, 4-Pin Chip Select Option[2][3]

NO.	PARAMETER			MIN	TYP	MAX	UNIT
19	$t_{d(SCS\_SPC)M}$	Delay from SPIx_SCS active to first SPIx_CLK[4] [5]	Polarity = 0, Phase = 0, to SPIx_CLK rising	2P – 10			ns
			Polarity = 0, Phase = 1, to SPIx_CLK rising	$0.5t_{c(SPC)M}$ + 2P – 10			
			Polarity = 1, Phase = 0, to SPIx_CLK falling	2P – 10			
			Polarity = 1, Phase = 1, to SPIx_CLK falling	$0.5t_{c(SPC)M}$ + 2P – 10			
20	$t_{d(SPC\_SCS)M}$	Delay from final SPIx_CLK edge to master deasserting SPIx_SCS [6] [7]	Polarity = 0, Phase = 0, from SPIx_CLK falling	$0.5t_{c(SPC)M}$			ns
			Polarity = 0, Phase = 1, from SPIx_CLK falling	0			
			Polarity = 1, Phase = 0, from SPIx_CLK rising	$0.5t_{c(SPC)M}$			
			Polarity = 1, Phase = 1, from SPIx_CLK rising	0			

(1) These parameters are in addition to the general timings for SPI master modes (Table 4-27).
(2) P = SYSCLK2 period
(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four master clocking modes.
(4) In the case where the master SPI is ready with new data before SPIx_SCS assertion.
(5) This delay can be increased under software control by the register bit field SPIDELAY.C2TDELAY[4:0].
(6) Except for modes when SPIDAT1.CSHOLD is enabled and there is additional data to transmit. In this case, SPIx_SCS will remain asserted.
(7) This delay can be increased under software control by the register bit field SPIDELAY.T2CDELAY[4:0].

(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four slave clocking modes.

Table 4-34. Additional[1] SPI Slave Timings, 5-Pin Option[2][3]

NO.	PARAMETER		MIN	TYP	MAX	UNIT
25	$t_{d(SCSL\_SPC)S}$	Required delay from $\overline{SPIx\_SCS}$ asserted at slave to first SPIx_CLK edge at slave.	P			ns
26	$t_{d(SPC\_SCSH)S}$	Required delay from final SPIx_CLK edge before $\overline{SPIx\_SCS}$ is deasserted. Polarity = 0, Phase = 0, from SPIx_CLK falling	$0.5t_{c(SPC)M}$ + P + 10			ns
		Polarity = 0, Phase = 1, from SPIx_CLK falling	P + 10			
		Polarity = 1, Phase = 0, from SPIx_CLK rising	$0.5t_{c(SPC)M}$ + P + 10			
		Polarity = 1, Phase = 1, from SPIx_CLK rising	P + 10			
27	$t_{ena(SCSL\_SOMI)S}$	Delay from master asserting $\overline{SPIx\_SCS}$ to slave driving SPIx_SOMI valid			P + 15	ns
28	$t_{dis(SCSH\_SOMI)S}$	Delay from master deasserting $\overline{SPIx\_SCS}$ to slave 3-stating SPIx_SOMI			P + 15	ns
29	$t_{ena(SCSL\_ENA)S}$	Delay from master deasserting $\overline{SPIx\_SCS}$ to slave driving $\overline{SPIx\_ENA}$ valid			15	ns
30	$t_{dis(SPC\_ENA)S}$	Delay from final clock receive edge on SPIx_CLK to slave 3-stating or driving high $\overline{SPIx\_ENA}$.[4] Polarity = 0, Phase = 0, from SPIx_CLK falling			2P + 15	ns
		Polarity = 0, Phase = 1, from SPIx_CLK rising			2P + 15	
		Polarity = 1, Phase = 0, from SPIx_CLK rising			2P + 15	
		Polarity = 1, Phase = 1, from SPIx_CLK falling			2P + 15	

(1) These parameters are in addition to the general timings for SPI slave modes (Table 4-28).
(2) P = SYSCLK2 period
(3) Figure shows only Polarity = 0, Phase = 0 as an example. Table gives parameters for all four slave clocking modes.
(4) $\overline{SPIx\_ENA}$ is driven low after the transmission completes if the SPIINT0.ENABLE_HIGHZ bit is programmed to 0. Otherwise it is 3-stated. If 3-stated, an external pullup resistor should be used to provide a valid level to the master. This option is useful when tying several SPI slave devices to a single master.

4.15 Inter-Integrated Circuit Serial Ports (I2C0, I2C1)

4.15.1 I2C Device-Specific Information

Having two I2C modules on the C6727B simplifies system architecture, since one module may be used by the DSP to control local peripherals ICs (DACs, ADCs, etc.) while the other may be used to communicate with other controllers in a system or to implement a user interface. Figure 4-37 is block diagram of the C6727B I2C Module.

Each I2C port supports:

- Compatible with Philips® I2C Specification Revision 2.1 (January 2000)
- Fast Mode up to 400 Kbps (no fail-safe I/O buffers)
- Noise Filter to Remove Noise 50 ns or less
- Seven- and Ten-Bit Device Addressing Modes
- Master (Transmit/Receive) and Slave (Transmit/Receive) Functionality
- Events: DMA, Interrupt, or Polling
- General-Purpose I/O Capability if not used as I2C

CAUTION

The C6727B I2C pins use a standard ±8 mA LVCMOS buffer, not the slow I/O buffer defined in the I2C specification. Series resistors may be necessary to reduce noise at the system level.

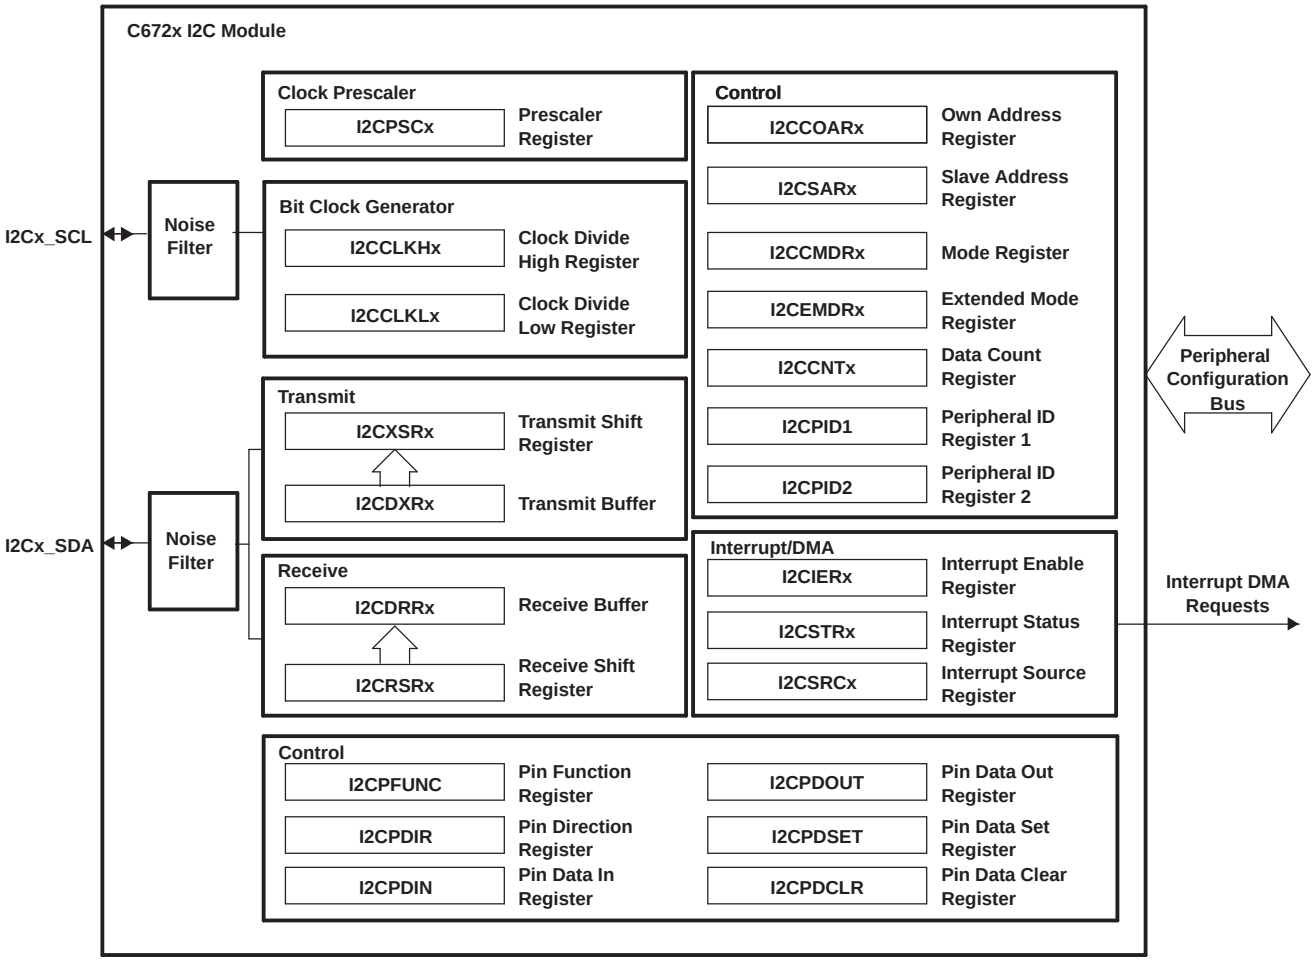

Figure 4-37. I2C Module Block Diagram

4.15.2 I2C Peripheral Registers Description(s)

Table 4-35 is a list of the I2C registers.

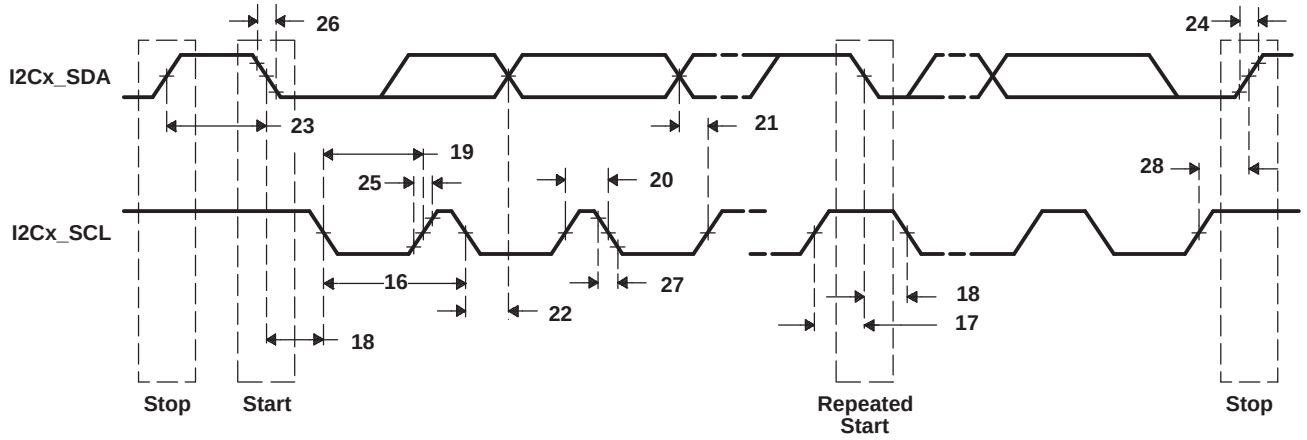

Figure 4-39. I2C Transmit Timings

4.16 Real-Time Interrupt (RTI) Timer With Digital Watchdog

4.16.1 RTI/Digital Watchdog Device-Specific Information

C6727B includes an RTI timer module which is used to generate periodic interrupts. This module also includes an optional digital watchdog feature. Figure 4-40 contains a block diagram of the RTI module.

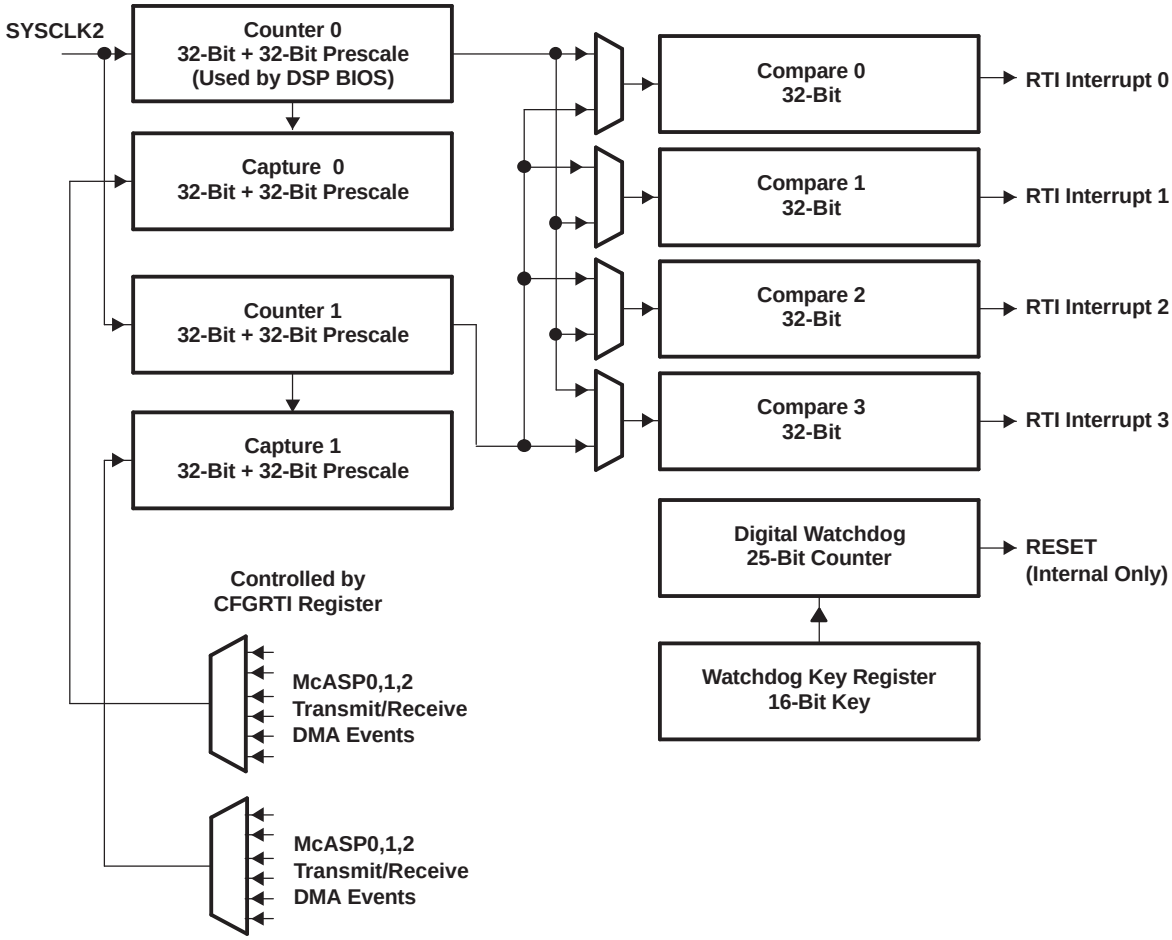

Figure 4-40. RTI Timer Block Diagram

The RTI timer module consists of two independent counters which are both clocked from SYSCLK2 (but may be started individually and may have different prescaler settings).

The counters provide the timebase against which four output comparators operate. These comparators may be programmed to generate periodic interrupts. The comparators include an adder which automatically updates the compare value after each periodic interrupt. This means that the DSP only needs to initialize the comparator once with the interrupt period.

The two input captures can be triggered from any of the McASP0, McASP1, or McASP2 DMA events. The device configuration register which selects the McASP events to measure is defined in Table 4-39.

Measuring the time difference between these events provides an accurate measure of the sample rates at which the McASPs are transmitting and receiving. This measurement can be useful as a hardware assist for a software asynchronous sample rate converter algorithm.

The digital watchdog is disabled by default. Once enabled, a sequence of two 16-bit key values (0xE51A followed by 0xA35C in two separate writes) must be continually written to the key register before the watchdog counter counts down to zero; otherwise, the DSP will be reset. This feature can be used to provide an added measure of robustness against a software failure. If the application fails and ceases to write to the watchdog key; the watchdog will respond by resetting the DSP and thereby restarting the application.

Note that Counter 0 and Compare 0 are used by DSP BIOS to generate the tick counter it requires; however, Capture 0 is still available for use by the application as well as the remaining RTI resources.

4.16.2 RTI/Digital Watchdog Registers Description(s)

Table 4-38 is a list of the RTI registers.

Table 4-38. RTI Registers

BYTE ADDRESS	REGISTER NAME	DESCRIPTION
Device-Level Configuration Registers Controlling RTI		
0x4000 0014	CFGRTI	Selects the sources for the RTI input captures from among the six McASP DMA event.
RTI Internal Registers		
0x4200 0000	RTIGCTRL	Global Control Register. Starts / stops the counters.
0x4200 0004	Reserved	Reserved bit.
0x4200 0008	RTICAPCTRL	Capture Control. Controls the capture source for the counters.
0x4200 000C	RTICOMPCTRL	Compare Control. Controls the source for the compare registers.
0x4200 0010	RTIFRC0	Free-Running Counter 0. Current value of free-running counter 0.
0x4200 0014	RTIUC0	Up-Counter 0. Current value of prescale counter 0.
0x4200 0018	RTICPUC0	Compare Up-Counter 0. Compare value compared with prescale counter 0.
0x4200 0020	RTICAFRC0	Capture Free-Running Counter 0. Current value of free-running counter 0 on external event.
0x4200 0024	RTICAUC0	Capture Up-Counter 0. Current value of prescale counter 0 on external event.
0x4200 0030	RTIFRC1	Free-Running Counter 1. Current value of free-running counter 1.
0x4200 0034	RTIUC1	Up-Counter 1. Current value of prescale counter 1.
0x4200 0038	RTICPUC1	Compare Up-Counter 1. Compare value compared with prescale counter 1.
0x4200 0040	RTICAFRC1	Capture Free-Running Counter 1. Current value of free-running counter 1 on external event.
0x4200 0044	RTICAUC1	Capture Up-Counter 1. Current value of prescale counter 1 on external event.
0x4200 0050	RTICOMP0	Compare 0. Compare value to be compared with the counters.
0x4200 0054	RTIUDCP0	Update Compare 0. Value to be added to the compare register 0 value on compare match.
0x4200 0058	RTICOMP1	Compare 1. Compare value to be compared with the counters.
0x4200 005C	RTIUDCP1	Update Compare 1. Value to be added to the compare register 1 value on compare match.
0x4200 0060	RTICOMP2	Compare 2. Compare value to be compared with the counters.
0x4200 0064	RTIUDCP2	Update Compare 2. Value to be added to the compare register 2 value on compare match.
0x4200 0068	RTICOMP3	Compare 3. Compare value to be compared with the counters.
0x4200 006C	RTIUDCP3	Update Compare 3. Value to be added to the compare register 3 value on compare match.
0x4200 0070	Reserved	Reserved bit.
0x4200 0074	Reserved	Reserved bit.
0x4200 0080	RTISETINT	Set Interrupt Enable. Sets interrupt enable bits int RTIINTCTRL without having to do a read-modify-write operation.
0x4200 0084	RTICLEARINT	Clear Interrupt Enable. Clears interrupt enable bits int RTIINTCTRL without having to do a read-modify-write operation.
0x4200 0088	RTIINTFLAG	Interrupt Flags. Interrupt pending bits.

Table 4-38. RTI Registers (continued)

BYTE ADDRESS	REGISTER NAME	DESCRIPTION
0x4200 0090	RTIDWDCTRL	Digital Watchdog Control. Enables the Digital Watchdog.
0x4200 0094	RTIDWDPRLD	Digital Watchdog Preload. Sets the experation time of the Digital Watchdog.
0x4200 0098	RTIWDSTATUS	Watchdog Status. Reflects the status of Analog and Digital Watchdog.
0x4200 009C	RTIWDKEY	Watchdog Key. Correct written key values discharge the external capacitor.
0x4200 00A0	RTIDWDCNTR	Digital Watchdog Down-Counter

Figure 4-41 shows the bit layout of the CFGRTI register and Table 4-39 contains a description of the bits.

31 – 8	7	6 – 4	3	2 – 0
Reserved	Reserved	CAPSEL1	Reserved	CAPSEL0
		R/W, 0		R/W, 0

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 4-41. CFGRTI Register Bit Layout (0x4000 0014)

Table 4-39. CFGRTI Register Bit Field Description (0x4000 0014)

BIT NO.	NAME	RESET VALUE	READ WRITE	DESCRIPTION
31:7,3	Reserved	N/A	N/A	Reads are indeterminate. Only 0s should be written to these bits.
6:4	CAPSEL1	0	R/W	CAPSEL0 selects the input to the RTI Input Capture 0 function. CAPSEL1 selects the input to the RTI Input Capture 1 function. The encoding is the same for both fields: 000 = Select McASP0 Transmit DMA Event 001 = Select McASP0 Receive DMA Event 010 = Select McASP1 Transmit DMA Event 011 = Select McASP1 Receive DMA Event 100 = Select McASP2 Transmit DMA Event 101 = Select McASP2 Receive DMA Event Other values are reserved and their effect is not determined.
2:0	CAPSEL0	0	R/W	

4.17 External Clock Input From Oscillator or CLKIN Pin

The C6727B device includes two choices to provide an external clock input, which is fed to the on-chip PLL to generate high-frequency system clocks. These options are illustrated in Figure 4-42.

- Figure 4-42 (a) illustrates the option that uses an on-chip oscillator with external crystal circuit.
- Figure 4-42 (b) illustrates the option that uses an external 3.3-V LVCMOS-compatible clock input with the CLKIN pin.

Note that the two clock inputs are logically combined internally before the PLL so the clock input that is not used must be tied to ground.

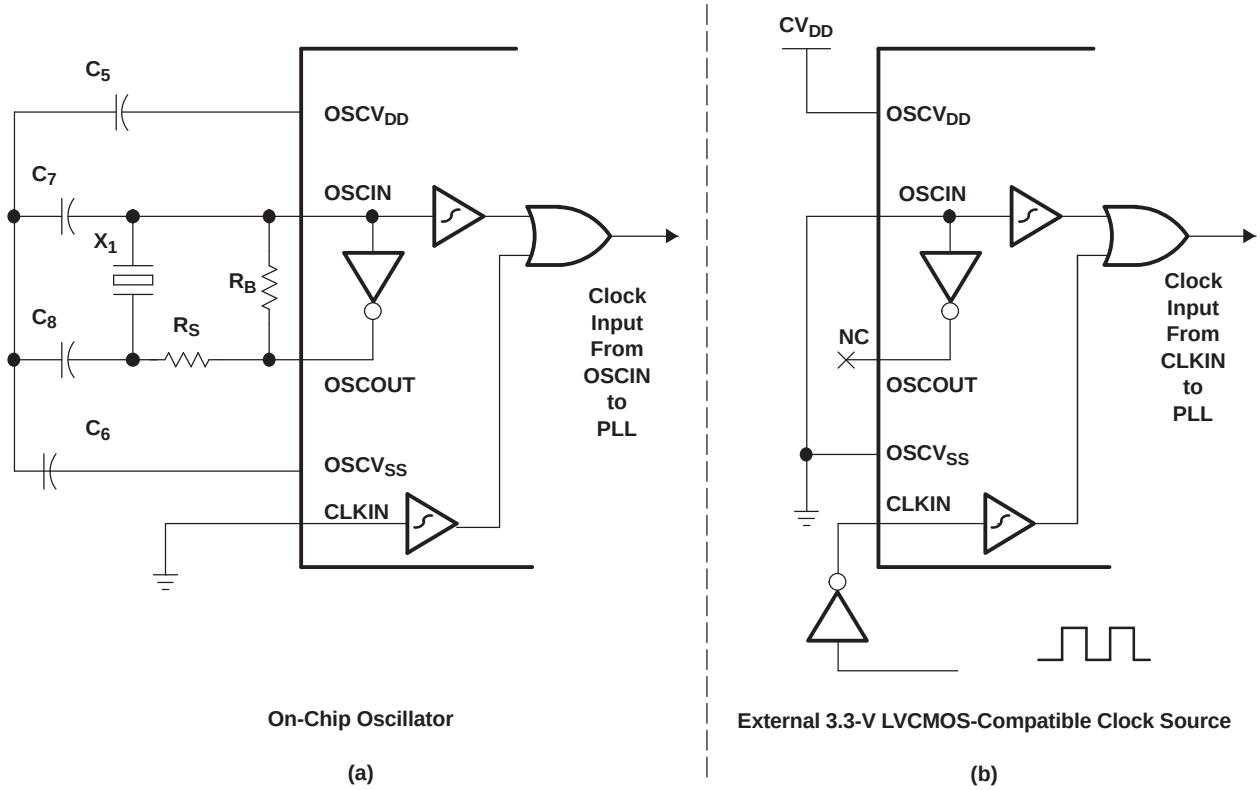

Figure 4-42. C6727B Clock Input Options

If the on-chip oscillator is chosen, then the recommended component values for Figure 4-42 (a) are listed in Table 4-40.

Table 4-40. Recommended On-Chip Oscillator Components

FREQUENCY	XTAL TYPE	X_1	C_5 (1)	C_6 (1)	C_7	C_8	R_B	R_S
22.579	AT-49	KDS 1AF225796A	470 pF	470 pF	8 pF	8 pF	1 MΩ	0 Ω
22.579	SMD-49	KDS 1AS225796AG	470 pF	470 pF	8 pF	8 pF	1 MΩ	0 Ω
24.576	AT-49	KDS 1AF245766AAA	470 pF	470 pF	8 pF	8 pF	1 MΩ	0 Ω
24.576	SMD-49	KDS 1AS245766AHA	470 pF	470 pF	8 pF	8 pF	1 MΩ	0 Ω

(1) Capacitors C_5 and C_6 are used to reduce oscillator jitter, but are optional. If C_5 and C_6 are not used, then the node connecting capacitors C_7 and C_8 should be tied to $OSCV_{SS}$ and $OSCV_{DD}$ should be tied to CV_{DD}.

4.17.1 Clock Electrical Data/Timing

Table 4-41 assumes testing over recommended operating conditions.

Table 4-41. CLKIN Timing Requirements

NO.	PARAMETER		MIN	TYP	MAX	UNIT
1	f_{osc}	Oscillator frequency range (OSCIN/OSCOUT)	12		25	MHz
2	$t_{c(CLKIN)}$	Cycle time, external clock driven on CLKIN	20			ns
3	$t_{w(CLKINH)}$	Pulse width, CLKIN high	$0.4t_{c(CLKIN)}$			ns
4	$t_{w(CLKINL)}$	Pulse width, CLKIN low	$0.4t_{c(CLKIN)}$			ns
5	$t_{t(CLKIN)}$	Transition time, CLKIN			5	ns
6	f_{PLL}	Frequency range of PLL input	12		50	MHz

4.18 Phase-Locked Loop (PLL)

4.18.1 PLL Device-Specific Information

The C6727B DSP generates the high-frequency internal clocks it requires through an on-chip PLL.

The input to the PLL is either from the on-chip oscillator (OSCIN pin) or from an external clock on the CLKIN pin. The PLL outputs four clocks that have programmable divider options. Figure 4-43 illustrates the PLL Topology.

The PLL is disabled by default after a device reset. It must be configured by software according to the allowable operating conditions listed in Table 4-42 before enabling the DSP to run from the PLL by setting PLLEN = 1.

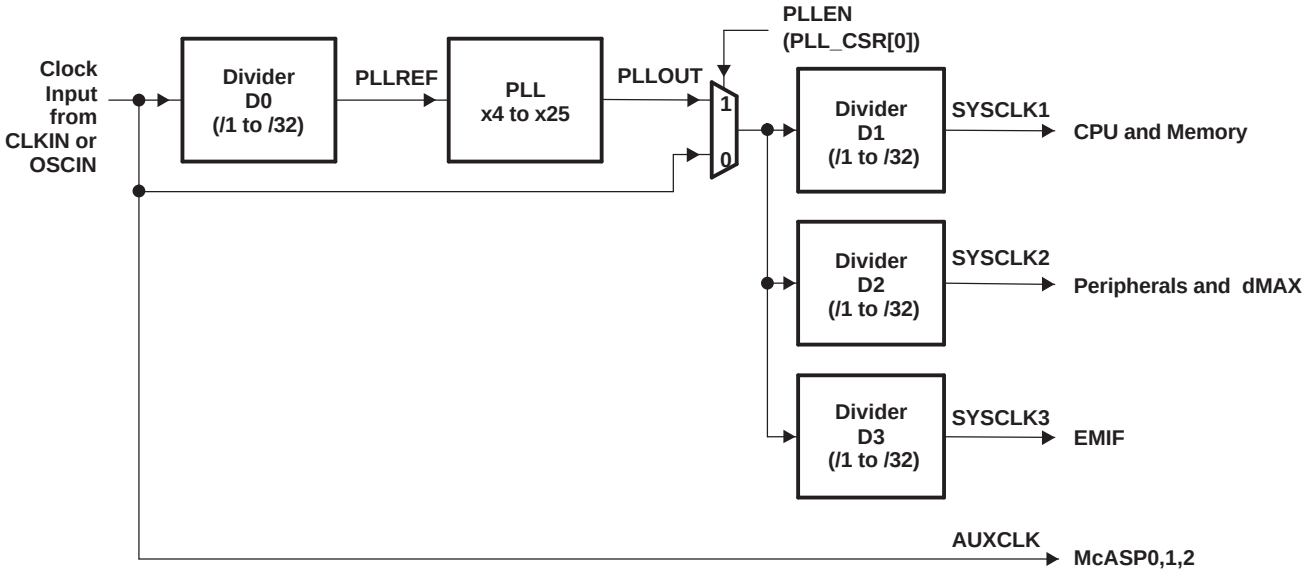

Figure 4-43. PLL Topology

Table 4-42. Allowed PLL Operating Conditions

NO.	PARAMETER	DEFAULT VALUE	ALLOWED SETTING OR RANGE		
			MIN	TYP	MAX
1	PLLRST = 1 assertion time during initialization	N/A	125 ns		
2	Lock time before setting PLLEN = 1. After changing D0, PLLM, or input clock.	N/A	187.5 µs		
3	PLL input frequency (PLLREF after D0(1))		12 MHz		50 MHz
4	PLL multiplier values (PLLM)	x13	x4		x25
5	PLL output frequency (PLLOUT before dividers D1, D2, D3)(2)	N/A	140 MHz		600 MHz
6	SYSCLK1 frequency (set by PLLM and dividers D0, D1)	PLLOUT/1			Device Frequency Specification
7	SYSCLK2 frequency (set by PLLM and dividers D0, D2)	PLLOUT/2	/2, /3, or /4 of SYSCLK1		
8	SYSCLK3 frequency (set by PLLM and dividers D0, D3)	PLLOUT/3			EMIF Frequency Specification

(1) Some values for the D0 divider produce results outside of this range and should not be selected.
(2) In general, selecting the PLL output clock rate closest to the maximum frequency will decrease clock jitter.

CAUTION

SYSCLK1, SYSCLK2, SYSCLK3 must be configured as aligned by setting ALNCTL[2:0] to '1'; and the PLLCMD.GOSET bit must be written every time the dividers D1, D2, and D3 are changed in order to make sure the change takes effect and preserves alignment.

CAUTION

When changing the PLL parameters which affect the SYSCLK1, SYSCLK2, SYSCLK3 dividers, the bridge BR2 in Figure 2-4 must be reset by the CFGBRIDGE register. See Table 2-7.

The PLL is an analog circuit and is sensitive to power supply noise. Therefore it has a dedicated 3.3-V power pin (PLLHV) that should be connected to DV_{DD} at the board level through an external filter, as illustrated in Figure 4-44.

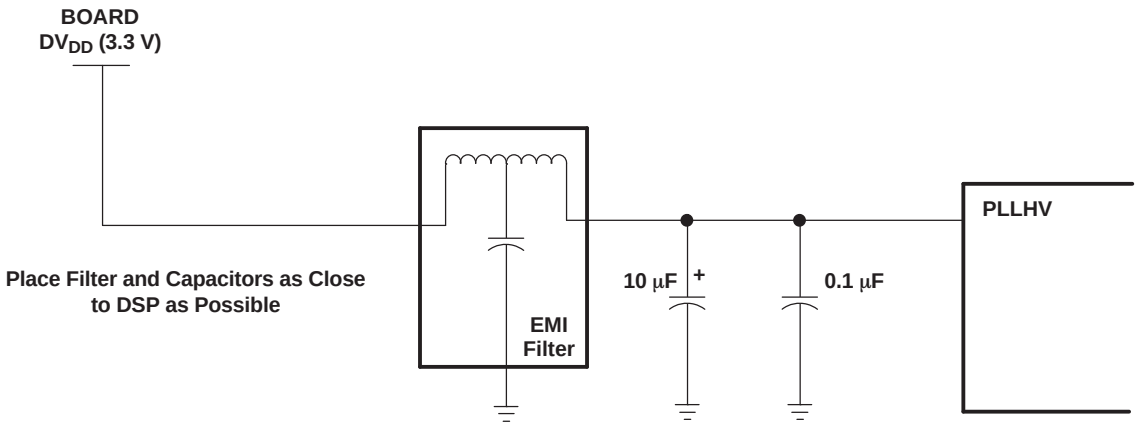

Figure 4-44. PLL Power Supply Filter

4.18.2 PLL Registers Description(s)

Table 4-43 is a list of the PLL registers. For more information about these registers, see the *SMV320C6727B DSP Software-Programmable Phase-Locked Loop (PLL) Controller Reference Guide* (literature number SPRU879).

Table 4-43. PLL Controller Registers

BYTE ADDRESS	REGISTER NAME	DESCRIPTION
0x4100 0000	PLLPID	PLL controller peripheral identification register
0x4100 0100	PLLCSR	PLL control/status register
0x4100 0110	PLLM	PLL multiplier control register
0x4100 0114	PLLDIV0	PLL controller divider register 0
0x4100 0118	PLLDIV1	PLL controller divider register 1
0x4100 011C	PLLDIV2	PLL controller divider register 2
0x4100 0120	PLLDIV3	PLL controller divider register 3
0x4100 0138	PLLCMD	PLL controller command register
0x4100 013C	PLLSTAT	PLL controller status register
0x4100 0140	ALNCTL	PLL controller clock align control register
0x4100 0148	CKEN	Clock enable control register
0x4100 014C	CKSTAT	Clock status register
0x4100 0150	SYSTAT	SYSCLK status register

5 Application Example

Figure 5-1 illustrates a high-level block diagram of the device and other devices to which it may typically connect. See 节 1.2 for an overview of each major block.

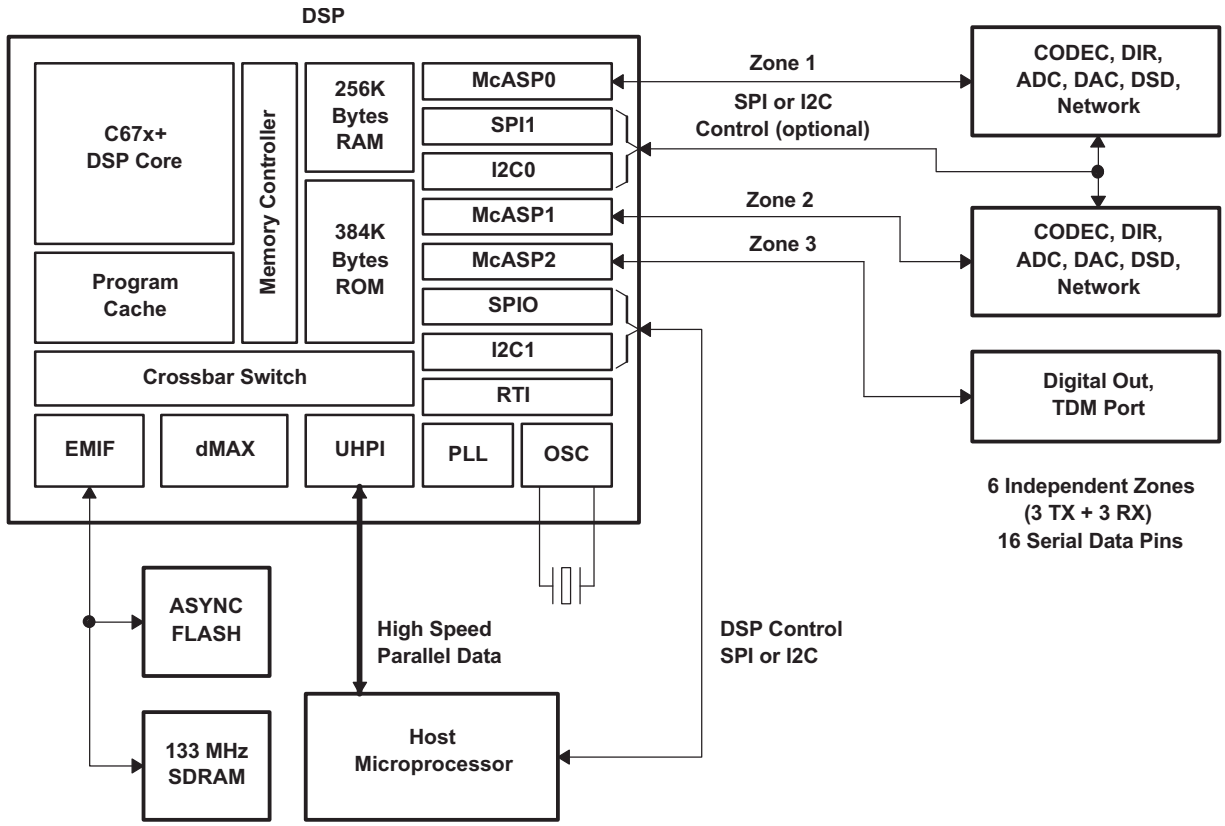

Figure 5-1. SMV320C6727B DSP System Diagram

6 Mechanical Data

6.1 Package Thermal Resistance Characteristics

Table 6-1 provides the thermal characteristics for the HFH package.

Table 6-1. Thermal Characteristics

		°C/W	AIR FLOW (m/s)
Two-Signal, Two-Plane, 101.5 x 114.5 x 1.6 mm , 2-oz Cu. EIA/JESD51-9 PCB			
$R\theta_{JC}$	Thermal Resistance Junction to Top of Case	2.2	0

NOTE

Device utilizes a polyimide die coat. Contact factory for details.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SMV320C6727BHFH/EM	ACTIVE	CFP	HFH	256	1	Non-RoHS & Non-Green	AU	N / A for Pkg Type	0 to 0	EVAL ONLY SMV320C6727BHFH /EM	Samples
SMV320C6727BHFHM	LIFEBUY	CFP	HFH	256	1	Non-RoHS & Non-Green	AU	N / A for Pkg Type	-55 to 125	SMV320C6727BHFHM	
SMV320C6727BHFHW	LIFEBUY	CFP	HFH	256	3	Non-RoHS & Non-Green	AU	N / A for Pkg Type	-55 to 115	SMV320C6727BHF HW	

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
