5 Pin Configuration and Functions

Pin Functions

| PIN | | I/O | DESCRIPTION |
|------|------|---------------|--|
| NAME | SC70 | | |
| GND | 1, 2 | Analog | Ground for the power-supply voltage rail |
| IN- | 5 | Analog input | Connect to load side of shunt resistor |
| IN+ | 4 | Analog input | Connect to supply side of shunt resistor |
| OUT | 6 | Analog output | Output voltage |
| V+ | 3 | Analog | Power supply, 2.7 V to 6 V |

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT |
|---|--|-----------|------------|------|
| Supply voltage | | | 7 | V |
| Analog inputs, V_{IN+} , V_{IN-} ⁽²⁾ | Differential (V_{IN+}) – (V_{IN-}) | –26 | 26 | V |
| | Common-mode ⁽³⁾ | GND – 0.3 | 26 | |
| Output ⁽³⁾ | | GND – 0.3 | (V+) + 0.3 | V |
| Input current Into all pins ⁽³⁾ | | | 5 | mA |
| Temperature | Operating, T_A | –40 | 125 | °C |
| | Junction, T_J | | 150 | |
| | Storage, T_{stg} | –65 | 150 | |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) V_{IN+} and V_{IN-} are the voltages at the IN+ and IN– pins, respectively.
- (3) Input voltage at any pin can exceed the voltage shown if the current at that pin is limited to 5 mA.

6.2 ESD Ratings

| | | VALUE | UNIT |
|-------------------------------------|--|-------|------|
| $V_{(ESD)}$ Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ±2000 | V |
| | Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾ | ±1000 | |
| | Machine model (MM) | ±200 | |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|----------|--|-----|-----|-----|------|
| V_{CM} | Common-mode input voltage | | 12 | | V |
| V_S | Operating supply voltage (applied to V+) | | 3.3 | | V |
| T_A | Operating free-air temperature | –40 | | 105 | °C |

6.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | bq500100 | UNIT |
|-------------------------------|--|------------|------|
| | | DCK (SC70) | |
| | | 6 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 227.3 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 79.5 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 72.1 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 3.6 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 70.4 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | N/A | °C/W |

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

at $T_A = 25^\circ\text{C}$, $V_+ = 5\text{ V}$, $V_{\text{IN}+} = 12\text{ V}$, and $V_{\text{SENSE}} = V_{\text{IN}+} - V_{\text{IN}-}$ (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT | | |
|-------------------------------------|---|---|-----|----------------------------|---------------------------|------------------------------|-----|
| INPUT | | | | | | | |

7 Detailed Description

7.1 Overview

The bq500100 is specially-designed to facilitate foreign object detection (FOD) in wireless charging applications by monitoring the coil supply current. The current-sensing amplifier is able to accurately measure voltages developed across a current-sensing resistor on common-mode voltages that far exceed the supply voltage powering the device. Current can be measured on input voltage rails as high as 20 V when the device is powered off a lower supply voltage.

Low drift characteristics enables high-precision measurements with maximum input offset voltages as low as 200 μV with a maximum temperature contribution of 0.5 $\mu\text{V}/^\circ\text{C}$ over the full temperature range of -40°C to $+105^\circ\text{C}$.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 High Input Common-Mode Range

The bq500100 can support input common-mode voltages up to 20 V. Because of the internal topology, the common-mode range is not restricted by the supply voltage as long as the input supply stays within the operational range of 2.7 V to 6 V. The ability to operate with supply voltages lower than the input voltage common-mode signal makes the device well-suited for monitoring the current in wireless charging applications where the common-mode voltage varies to obtain a desired amount of power transfer.

When the dc common-mode voltage varies, the effect on the output voltage is very small as a result of the high common-mode rejection. The dc common-mode rejection for the bq500100 is expressed in decibels and is typically as high as 120 dB. In wireless charging applications, the current-sensed rail commonly varies in voltage to adjust for the amount of power transferred by the coil.

7.3.2 High Current-Sense Accuracy Over a Wide Dynamic Range

The offset voltage, gain error, and shunt resistor are the three primary contributors that determine the current measurement accuracy over a specified current range. The offset voltage dominates the error when operating at low current values and the gain error dominates when operating at high current values. The low offset voltage allows use of smaller shunt resistor values. Both the low offset and gain error allow the bq500100 to accurately measure current over a wide dynamic range and still maintain a high level of accuracy.

7.4 Device Functional Modes

7.4.1 Normal Operation

The bq500100 is in normal operation when the following conditions are met:

- $V+$ is between 2.7 V and 6.0 V
- The common-mode input voltage is less than 20 V
- The differential input signal times gain is less than the supply voltage minus the output voltage swing to $V+$
- The differential input signal times gain is greater than the swing to GND
- Current flows into the shunt resistor from $IN+$ to $IN-$ connection points (unidirectional)

When in the normal operating region, the device operates as expected and produces an output voltage that is the gained-up representation of the difference voltage from $IN+$ to $IN-$.

7.4.1.1 Device Power-Up

The topology of the bq500100 allows voltages to be present on the inputs before power is applied; therefore, there is no sequencing requirement in regards to the input voltages and the power supply rail for $V+$. There is a small delay of approximately 50 μ s from when power is applied to when the output voltage of the bq500100 settles to the correct voltage level.

7.4.1.2 Input Differential Overload

If the differential input voltage ($V_{IN+} - V_{IN-}$) multiplied by gain exceeds the voltage swing specification, the device drives the output as close as possible to the positive supply and does not provide accurate measurement of the differential input voltage. If this behavior occurs during normal circuit operation, then reduce the value of the shunt resistor to avoid this mode of operation. If a differential overload occurs in a fault event, then the output of the bq500100 returns to the expected value approximately 250 μ s after the fault condition is removed.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The bq500100 is tailored to monitor current in wireless charging applications. This section focuses on the current-sense requirements for wireless charging. A typical application schematic and design procedure are provided in this section as reference.

8.2 Typical Application

NOTE: $R_{F1} = R_{F2} = R_F$

Figure 6. Typical Application for Wireless Charging

8.2.1 Design Requirements

The design requirements for a typical wireless charging application is shown in Table 1. These requirements use the schematic shown in Figure 6.

Table 1. Design Parameters

| PARAMETER | DESIGN REQUIREMENT |
|---|--|
| Supply voltage range for V+ | 3.3 V ± 3% provided by a dc-dc converter |
| Common-mode voltage range | 9 V to 19 V provided by a dc-dc converter |
| Power loss in the shunt resistor | 20 mW or less at 1 A |
| Current-monitoring accuracy (gain error + offset error) | Better than 2.3% at 1 A, $V_{CM} = 12$ V, $T_A = 25^\circ\text{C}$ |
| I_SENSE peak-to-peak ripple | Less than 15 mV |

8.2.2 Detailed Design Procedure

The first step in designing a solution is to make sure that the supply voltage and common-mode voltage are within the specified operational range of the device. For the supply and common-mode voltage requirements specified in Table 1, the bq500100 reliably operates and is an ideal fit for this application.

The next step is to select the desired value for the shunt resistor. In this application example, the maximum power dissipation in the shunt resistor is specified to be 20 mW or less with a 1-A current-sense signal. The maximum power dissipation requirement limits the maximum value of the shunt resistor to $20 \text{ mW} / (1 \text{ A})^2$, or 20 mΩ. To meet this application requirement and still maximize the current-sense accuracy, the maximum allowable resistance of 20 mΩ is selected.

Additional input filtering (see [Figure 6](#)) is required to mitigate the affects of differential noise and switching ripple because the device is sensing the voltage rail of the dc-dc supply. When adding series resistance to the input, keeping the resistance as small as possible is recommended because any added resistance adds to the gain error of the device. For the bq500100, the amount of additional gain error resulting from the filter resistance R_S can be calculated using [Equation 1](#):

$$\text{Gain Error (\%)} = 100 - \left(100 \times \frac{20,000}{(17 \times R_F) + 20,000} \right) \quad (1)$$

Applying [Equation 1](#) for the case where R_F is equal to 1 Ω results in an additional gain error of 0.085%. Applying this result to the total gain error is calculated to be approximately 2.085%.

The total offset voltage can be calculated by adding the effects of drift, change in supply voltage, and change in the common-mode input voltage to the specified offset voltage. In this example, no additional errors need to be added to the common-mode voltage and temperature because the conditions specified in [Table 1](#) match the V_{OS} conditions specified in the [Electrical Characteristics](#) table. The only additional error that needs to be added to the offset voltage is the effect of changes to the supply voltage. This document specifies a supply voltage of 5 V; however, this application calls for a supply voltage of 3.3 V. The change in offset voltage resulting from the difference in supply voltage can be calculated by using the PSR specification in this document; see the [Electrical Characteristics](#) table. The PSRR of the device is typically $\pm 0.1 \mu\text{V/V}$; therefore, the change in offset voltage can be calculated by taking the difference in supply voltage and multiplying by this value. In this case, the supply voltage difference is 1.7 V (5 V – 3.3 V), so the change in offset voltage is 0.17 μV. Therefore the total offset voltage error is 150.17 μV. Because the offset voltage error is a fixed value, the percentage influence on the accuracy is a function of the load current and can be calculated by applying [Equation 2](#).

$$\text{Total Offset Error (\%)} = \frac{\text{Total Offset Error (V)}}{I_{\text{SHUNT}}(\text{A}) \times R_{\text{SHUNT}}(\Omega)} \times 100\% \quad (2)$$

Applying [Equation 2](#) with an offset value of 150.15 μV, an R_{SHUNT} value of 20 mΩ, and a shunt current of 1 A results in a percentage error of 0.751%.

Now that the total gain error and offset error of the device are known, the accuracy of the current-shunt monitor can be calculated with [Equation 3](#):

$$\text{Total Error (\%)} = \sqrt{\text{Total Gain Error (\%)}^2 + \text{Total Offset Error (\%)}^2} \quad (3)$$

Applying [Equation 3](#) with a total gain error of 2.085% and a total offset error of 0.751% results in a total accuracy of 2.22% at 1 A, which is within the design target of 2.3%. Using a resistor tolerance of 0.5% to minimize errors introduced by R_{SHUNT} is recommended.

Additional output filtering consisting of R_O and C_O (see [Figure 6](#)) is required to further reduce the ripple at the bq500100 current-sense output. For best performance, keeping the ripple on the current monitor output below 15 mV is recommended. The values provided in [Figure 6](#) are sufficient for most use cases.

8.2.3 Application Curve

An example output response of the wireless charging application is shown in [Figure 7](#).

The coil driver current is shown in green and has both ac and dc components. The I_SENSE signal is shown in red and is filtered to generate a signal representative of the dc current for foreign object detection.

Figure 7. Current-Sense Output in a Wireless Charging Application

9 Power Supply Recommendations

The input circuitry of the bq500100 can accurately measure beyond its power-supply voltage, V+. For example, the V+ power supply can be 5 V, whereas the load power-supply voltage can be as high as 20 V. However, the output voltage range of the OUT pin is limited by the voltages on the power-supply pin. Also, the bq500100 can withstand the full input signal range up to the 20-V range in the input pins, regardless of whether the device has power applied or not.

10 Layout

10.1 Layout Guidelines

- Make connections to the shunt resistor with a Kelvin or 4-wire connection. This connection technique ensures that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very low ohmic value of the current resistor, any additional high-current carrying impedance can cause significant measurement errors.
- Place the power-supply bypass capacitor as closely as possible to the supply and ground pins. The recommended value of this bypass capacitor is 0.1 μF . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.
- Place the input filter capacitor, C_F , as close as possible to the input pins of the device. Place the input filter resistors as close as possible to each other to minimize the enclosed loop area between the device and the shunt resistor.
- The output of the current-sense circuit must be located as close as possible to the wireless power transmitter manager device. If the distance to the wireless power transmitter is greater than 1 cm, the output filter capacitor (C_O) shown in [Figure 8](#) must be placed next to the I_SENSE pin of the wireless power transmitter manger. Placing the capacitor at the I_SENSE pin of the wireless power transmitter manger provides the best filtering of the current-sense signal.

11.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead finish/ Ball material (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|--------------------|------|----------------|-----------------|--------------------------------------|----------------------|--------------|-------------------------|-------------------------|
| BQ500100DCKR | ACTIVE | SC70 | DCK | 6 | 3000 | RoHS & Green | NIPDAU | Level-2-260C-1 YEAR | | 12Y | Samples |
| BQ500100DCKT | ACTIVE | SC70 | DCK | 6 | 250 | RoHS & Green | NIPDAU | Level-2-260C-1 YEAR | | 12Y | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
