4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (May 2013) to Revision C	Page
<ul style="list-style-type: none"> Added <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i>, <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section 	1

Changes from Revision A (August, 2011) to Revision B	Page
<ul style="list-style-type: none"> Changed all 1.8V to 2.0V throughout data sheet 	1
<ul style="list-style-type: none"> Deleted 1.8-V Typical Characteristics section 	9
<ul style="list-style-type: none"> Changed X-axis for Figure 35 	13
<ul style="list-style-type: none"> Changed X-axis for Figure 36 	13

Changes from Original (August, 2008) to Revision A	Page
<ul style="list-style-type: none"> Changed specifications and test conditions for input low voltage parameter 	6
<ul style="list-style-type: none"> Changed specifications and test conditions for input high voltage parameter 	6

5 Device Comparison

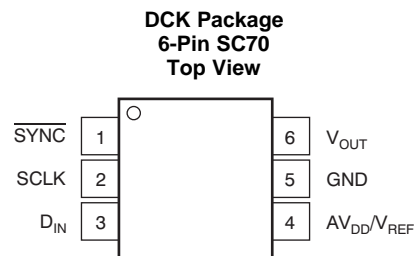

Table 1. Related Devices

RELATED DEVICES	16-BIT	14-BIT	12-BIT	10-BIT	8-BIT
Pin and Function Compatible	DAC8411	DAC8311	DAC7311	DAC6311	DAC5311

Table 2. Package Information

PRODUCT	MAXIMUM RELATIVE ACCURACY (LSB)	MAXIMUM DIFFERENTIAL NONLINEARITY (LSB)
DAC8411	±8	±2
DAC8311	±4	±1

6 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
AV_{DD}/V_{REF}	4	I	Power Supply Input, +2 V to +5.5 V.
D_{IN}	3	I	Serial Data Input. Data is clocked into the 24-bit (DAC8411) or 16-bit (DAC8311) input shift register on the falling edge of the serial clock input.
GND	5	—	Ground reference point for all circuitry on the part.
SCLK	2	I	Serial Clock Input. Data can be transferred at rates up to 50 MHz.
\overline{SYNC}	1	I	Level-triggered control input (active low). This is the frame synchronization signal for the input data. When \overline{SYNC} goes low, it enables the input shift register and data are transferred in on the falling edges of the following clocks. The DAC is updated following the 24th (DAC8411) or 16th (DAC8311) clock cycle, unless \overline{SYNC} is taken high before this edge, in which case the rising edge of \overline{SYNC} acts as an interrupt and the write sequence is ignored by the DAC8x11. Refer to the DAC8311 and DAC8411 \overline{SYNC} Interrupt sections for more details.
V_{OUT}	6	O	Analog output voltage from DAC. The output amplifier has rail-to-rail operation.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage	AV _{DD} to GND	-0.3	6	V
	Digital input voltage to GND	-0.3	AV _{DD} +0.3	V
	V _{OUT} to GND	-0.3	AV _{DD} +0.3	V
Temperature	Junction, T _J max		150	°C
	Storage, T _{stg}	-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T _A	Operating temperature	-40		+125	°C
AV _{DD}	Supply voltage	2.0		+5.5	V

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DAC8x11	UNIT
		DCK (SC70)	
		6 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	216.4	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	52.1	°C/W
R _{θJB}	Junction-to-board thermal resistance	65.9	°C/W
ψ _{JT}	Junction-to-top characterization parameter	1.3	°C/W
ψ _{JB}	Junction-to-board characterization parameter	65.2	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

7.5 Electrical Characteristics

at $AV_{DD} = 2\text{ V}$ to 5.5 V , $R_L = 2\text{ k}\Omega$ to GND, and $C_L = 200\text{ pF}$ to GND, and $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$ unless otherwise noted.

PARAMETER	TEST CONDITIONS	DAC8411, DAC8311			UNIT	
		MIN	TYP	MAX		
STATIC PERFORMANCE⁽¹⁾						
DAC8411	Resolution			16	Bits	
	Relative accuracy	Measured by the line passing through codes 485 and 64714	3.6 V to 5 V	± 4	± 8	LSB
			2 V to 3.6 V	± 4	± 12	
Differential nonlinearity			± 0.5	± 2	LSB	
DAC8311	Resolution			14	Bits	
	Relative accuracy	Measured by the line passing through codes 120 and 16200		± 1	± 4	LSB
	Differential nonlinearity			± 0.125	± 1	LSB
Offset error	Measured by the line passing through two codes ⁽²⁾		± 0.05	± 4	mV	
Offset error drift			3		$\mu\text{V}/^\circ\text{C}$	
Zero code error	All zeros loaded to the DAC register		0.2		mV	
Full-scale error	All ones loaded to DAC register		0.04	0.2	% of FSR	
Gain error			0.05	± 0.15	% of FSR	
Gain temperature coefficient	$AV_{DD} = 5\text{ V}$		± 0.5		ppm of FSR/ $^\circ\text{C}$	
	$AV_{DD} = 2\text{ V}$		± 1.5			
OUTPUT CHARACTERISTICS						
Output voltage range			0	AV_{DD}	V	
Output voltage settling time ⁽³⁾	$R_L = 2\text{ k}\Omega$, $C_L = 200\text{ pF}$, $AV_{DD} = 5\text{ V}$, 1/4 scale to 3/4 scale		6	10	μs	
	$R_L = 2\text{ M}\Omega$, $C_L = 470\text{ pF}$		12		μs	
Slew rate			0.7		V/ μs	
Capacitive load stability	$R_L = \infty$		470		pF	
	$R_L = 2\text{ k}\Omega$		1000		pF	
Code change glitch impulse	1LSB change around major carry		0.5		nV-s	
Digital feedthrough			0.5		nV-s	
Power-on glitch impulse	$R_L = 2\text{ k}\Omega$, $C_L = 200\text{ pF}$, $AV_{DD} = 5\text{ V}$		17		mV	
DC output impedance			0.5		Ω	
Short-circuit current	$AV_{DD} = 5\text{ V}$		50		mA	
	$AV_{DD} = 3\text{ V}$		20		mA	
Power-up time	Coming out of power-down mode		50		μs	
AC PERFORMANCE						
SNR	$T_A = 25^\circ\text{C}$, BW = 20 kHz, 16-bit level, $AV_{DD} = 5\text{ V}$, $f_{OUT} = 1\text{ kHz}$, 1st 19 harmonics removed for SNR calculation		88		dB	
THD			-66		dB	
SFDR			66		dB	
SINAD			66		dB	
DAC output noise density ⁽⁴⁾	$T_A = 25^\circ\text{C}$, at zero-scale input, $f_{OUT} = 1\text{ kHz}$, $AV_{DD} = 5\text{ V}$		17		$\text{nV}/\sqrt{\text{Hz}}$	
	$T_A = 25^\circ\text{C}$, at mid-code input, $f_{OUT} = 1\text{ kHz}$, $AV_{DD} = 5\text{ V}$		110		$\text{nV}/\sqrt{\text{Hz}}$	
DAC output noise ⁽⁵⁾	$T_A = 25^\circ\text{C}$, at mid-code input, 0.1 Hz to 10 Hz, $AV_{DD} = 5\text{ V}$		3		μV_{pp}	

(1) Linearity calculated using a reduced code range of 485 to 64714 for 16-bit, and 120 to 16200 for 14-bit, output unloaded.

(2) Straight line passing through codes 485 and 64714 for 16-bit, and 120 and 16200 for 14-bit, output unloaded.

(3) Specified by design and characterization, not production tested.

(4) For more details, see [Figure 33](#).

(5) For more details, see [Figure 34](#).

Electrical Characteristics (continued)

 at $AV_{DD} = 2\text{ V to }5.5\text{ V}$, $R_L = 2\text{ k}\Omega$ to GND, and $C_L = 200\text{ pF}$ to GND, and $T_A = -40^\circ\text{C to }+125^\circ\text{C}$ unless otherwise noted.

PARAMETER		TEST CONDITIONS		DAC8411, DAC8311			UNIT	
				MIN	TYP	MAX		
LOGIC INPUTS⁽³⁾								
Input current						± 1	μA	
V_{INL} , input low voltage		$AV_{DD} = 2.7\text{ V to }5.5\text{ V}$				$0.3 \times AV_{DD}$	V	
		$AV_{DD} = 2\text{ V to }2.7\text{ V}$				$0.1 \times AV_{DD}$	V	
V_{INH} , input high voltage		$AV_{DD} = 2.7\text{ V to }5.5\text{ V}$				$0.7 \times AV_{DD}$	V	
		$AV_{DD} = 2\text{ V to }2.7\text{ V}$				$0.9 \times AV_{DD}$	V	
Pin capacitance					1.5	3	pF	
POWER REQUIREMENTS								
AV_{DD}				2		5.5	V	
I_{DD}	Normal mode	$V_{INH} = AV_{DD}$ and $V_{INL} = \text{GND}$, at mid-scale code ⁽⁶⁾		$AV_{DD} = 3.6\text{ V to }5.5\text{ V}$		110	160	μA
				$AV_{DD} = 2.7\text{ V to }3.6\text{ V}$		95	150	
				$AV_{DD} = 2\text{ V to }2.7\text{ V}$		80	140	
	All power-down mode	$V_{INH} = AV_{DD}$ and $V_{INL} = \text{GND}$, at mid-scale code ⁽⁶⁾		$AV_{DD} = 3.6\text{ V to }5.5\text{ V}$		0.5	3.5	μA
				$AV_{DD} = 2.7\text{ V to }3.6\text{ V}$		0.4	3.0	
				$AV_{DD} = 2\text{ V to }2.7\text{ V}$		0.1	2.0	
Power dissipation	Normal mode	$V_{INH} = AV_{DD}$ and $V_{INL} = \text{GND}$, at mid-scale code ⁽⁶⁾		$AV_{DD} = 3.6\text{ V to }5.5\text{ V}$		0.55	0.88	mW
				$AV_{DD} = 2.7\text{ V to }3.6\text{ V}$		0.25	0.54	
				$AV_{DD} = 2\text{ V to }2.7\text{ V}$		0.14	0.38	
	All power-down mode	$V_{INH} = AV_{DD}$ and $V_{INL} = \text{GND}$, at mid-scale code ⁽⁶⁾		$AV_{DD} = 3.6\text{ V to }5.5\text{ V}$		2.50	19.2	μW
				$AV_{DD} = 2.7\text{ V to }3.6\text{ V}$		1.08	10.8	
				$AV_{DD} = 2\text{ V to }2.7\text{ V}$		0.72	8.1	

 (6) For more details, see [Figure 14](#) and [Figure 55](#).

7.6 Timing Requirements: 14-Bit

All specifications at -40°C to 125°C , and $\text{AV}_{\text{DD}} = 2\text{ V}$ to 5.5 V , unless otherwise noted. ⁽¹⁾ ⁽²⁾

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$f_{(\text{SCLK})}$	Serial clock frequency	$\text{AV}_{\text{DD}} = 2.0\text{ V}$ to 3.6 V			20	MHz
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V			50	
t_1	SCLK cycle time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	50			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	20			
t_2	SCLK high time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	25			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	10			
t_3	SCLK low time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	25			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	10			
t_4	$\overline{\text{SYNC}}$ to SCLK rising edge setup time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	0			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	0			
t_5	Data setup time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	5			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	5			
t_6	Data hold time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	4.5			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	4.5			
t_7	SCLK falling edge to $\overline{\text{SYNC}}$ rising edge	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	0			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	0			
t_8	Minimum $\overline{\text{SYNC}}$ high time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	50			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	20			
t_9	16th SCLK falling edge to $\overline{\text{SYNC}}$ falling edge	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	100			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	100			
t_{10}	$\overline{\text{SYNC}}$ rising edge to 16th SCLK falling edge (for successful $\overline{\text{SYNC}}$ interrupt)	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	15			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	15			

(1) All input signals are specified with $t_R = t_F = 3\text{ ns}$ (10% to 90% of AV_{DD}) and timed from a voltage level of $(V_{\text{IL}} + V_{\text{IH}})/2$.

(2) See [Figure 1](#) timing diagram.

7.7 Timing Requirements: 16-Bit

All specifications at -40°C to 125°C , and $\text{AV}_{\text{DD}} = 2\text{ V}$ to 5.5 V , unless otherwise noted. ⁽¹⁾ ⁽²⁾

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$f(\text{SCLK})$	Serial clock frequency	$\text{AV}_{\text{DD}} = 2.0\text{ V}$ to 3.6 V			20	MHz
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V			50	
t_1	SCLK cycle time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	50			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	20			
t_2	SCLK high time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	25			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	10			
t_3	SCLK low time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	25			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	10			
t_4	$\overline{\text{SYNC}}$ to SCLK rising edge setup time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	0			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	0			
t_5	Data setup time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	5			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	5			
t_6	Data hold time	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	4.5			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	4.5			
t_7	SCLK falling edge to $\overline{\text{SYNC}}$ rising edge	$\text{AV}_{\text{DD}} = 2\text{ V}$ to 3.6 V	0			ns
		$\text{AV}_{\text{DD}} = 3.6\text{ V}$ to 5.5 V	0			

(1) All input signals are specified with $t_R = t_F = 3\text{ ns}$ (10% to 90% of AV_{DD}) and timed from a voltage level of $(V_{\text{IL}} + V_{\text{IH}})/2$.

(2) See [Figure 2](#) timing diagram.

Timing Requirements: 16-Bit (continued)

All specifications at –40°C to 125°C, and $AV_{DD} = 2\text{ V to }5.5\text{ V}$, unless otherwise noted.^{(1) (2)}

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_8	Minimum $\overline{\text{SYNC}}$ high time	$AV_{DD} = 2\text{ V to }3.6\text{ V}$	50		ns
		$AV_{DD} = 3.6\text{ V to }5.5\text{ V}$	20		
t_9	24th SCLK falling edge to $\overline{\text{SYNC}}$ falling edge	$AV_{DD} = 2\text{ V to }3.6\text{ V}$	100		ns
		$AV_{DD} = 3.6\text{ V to }5.5\text{ V}$	100		
t_{10}	$\overline{\text{SYNC}}$ rising edge to 24th SCLK falling edge (for successful SYNC interrupt)	$AV_{DD} = 2\text{ V to }3.6\text{ V}$	15		ns
		$AV_{DD} = 3.6\text{ V to }5.5\text{ V}$	15

8 Detailed Description

8.1 Overview

The DAC8x11 family of devices are low-power, single-channel, voltage output DACs. These devices are monotonic by design, provide excellent linearity, and minimize undesired code-to-code transient voltages while offering an easy upgrade path within a pin-compatible family. All devices use a versatile, 3-wire serial interface that operates at clock rates of up to 50 MHz and is compatible with standard SPI, QSPI, Microwire, and digital signal processor (DSP) interfaces.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 DAC Section

The DAC8311 and DAC8411 are fabricated using Texas Instruments' proprietary HPA07 process technology. The architecture consists of a string DAC followed by an output buffer amplifier. Because there is no reference input pin, the power supply (AV_{DD}) acts as the reference. Figure 74 shows a block diagram of the DAC architecture.

Figure 74. DAC8x11 Architecture

The input coding to the DAC8311 and DAC8411 is straight binary, so the ideal output voltage is given by:

$$V_{OUT} = AV_{DD} \times \frac{D}{2^n}$$

where

- n = resolution in bits; either 14 (DAC8311) or 16 (DAC8411).
- D = decimal equivalent of the binary code that is loaded to the DAC register; it ranges from 0 to 16,383 for the 14-bit DAC8311, or 0 to 65,535 for the 16-bit DAC8411.

Feature Description (continued)

8.3.2 Resistor String

The resistor string section is shown in [Figure 75](#). It is simply a string of resistors, each of value R. The code loaded into the DAC register determines at which node on the string the voltage is tapped off to be fed into the output amplifier by closing one of the switches connecting the string to the amplifier. The resistor string architecture is inherently monotonic.

Figure 75. Resistor String

8.3.3 Output Amplifier

The output buffer amplifier is capable of generating rail-to-rail voltages on its output which gives an output range of 0V to AV_{DD} . The output amplifier is capable of driving a load of 2 k Ω in parallel with 1000 pF to GND. The source and sink capabilities of the output amplifier can be seen in the Typical Characteristics section for each device. The slew rate is 0.7 V/ μ s with a half-scale settling time of typically 6 μ s with the output unloaded.

8.3.4 Power-On Reset to Zero-Scale

The DAC8x11 contains a power-on reset circuit that controls the output voltage during power up. On power up, the DAC register is filled with zeros and the output voltage is 0 V. The DAC register remains that way until a valid write sequence is made to the DAC. This design is useful in applications where it is important to know the state of the output of the DAC while it is in the process of powering up.

The occurring power-on glitch impulse is only a few mV (typically, 17 mV; see [Figure 31](#), [Figure 72](#), or [Figure 31](#)).

8.4 Device Functional Modes

8.4.1 Power-Down Modes

The DAC8x11 contains four separate modes of operation. These modes are programmable by setting two bits (PD1 and PD0) in the control register. [Table 3](#) shows how the state of the bits corresponds to the mode of operation of the device.

Table 3. Modes of Operation for the DAC8x11

PD1	PD0	OPERATING MODE
NORMAL MODE		
0	0	Normal Operation
POWER-DOWN MODES		
0	1	Output 1 kΩ to GND
1	0	Output 100 kΩ to GND
1	1	High-Z

When both bits are set to 0, the device works normally with a standard power consumption of typically 80 μA at 2 V. However, for the three power-down modes, the typical supply current falls to 0.5 μA at 5 V, 0.4 μA at 3 V, and 0.1 μA at 2.0 V. Not only does the supply current fall, but the output stage is also internally switched from the output of the amplifier to a resistor network of known values. The advantage of this architecture is that the output impedance of the part is known while the part is in power-down mode. There are three different options. The output is connected internally to GND either through a 1-kΩ resistor or a 100-kΩ resistor, or is left open-circuited (High-Z). See [Figure 76](#) for the output stage.

Figure 76. Output Stage During Power-Down

All linear circuitry is shut down when the power-down mode is activated. However, the contents of the DAC register are unaffected when in power-down. The time to exit power-down is typically 50 μs for $AV_{DD} = 5\text{ V}$ and $AV_{DD} = 3\text{ V}$. See the [Typical Characteristics: \$AV_{DD} = 5\text{ V}\$](#) for each device for more information.

8.5 Programming

8.5.1 DAC8311 Serial Interface

The DAC8311 has a 3-wire serial interface ($\overline{\text{SYNC}}$, SCLK, and DIN) compatible with SPI, QSPI, and Microwire interface standards, as well as most DSPs. See [Figure 1](#) for an example of a typical write sequence.

8.5.1.1 DAC8311 Input Shift Register

The input shift register is 16 bits wide, as shown in [Figure 77](#). The first two bits (PD0 and PD1) are reserved control bits that set the desired mode of operation (normal mode or any one of three power-down modes) as indicated in [Table 3](#).

The write sequence begins by bringing the $\overline{\text{SYNC}}$ line low. Data from the DIN line are clocked into the 16-bit shift register on each falling edge of SCLK. The serial clock frequency can be as high as 50 MHz, making the DAC8311 compatible with high-speed DSPs. On the 16th falling edge of the serial clock, the last data bit is clocked in and the programmed function is executed.

At this point, the $\overline{\text{SYNC}}$ line may be kept low or brought high. In either case, it must be brought high for a minimum of 20 ns before the next write sequence so that a falling edge of $\overline{\text{SYNC}}$ can initiate the next write sequence.

8.5.1.2 DAC8311 $\overline{\text{SYNC}}$ Interrupt

In a normal write sequence, the $\overline{\text{SYNC}}$ line is kept low for at least 16 falling edges of SCLK and the DAC is updated on the 16th falling edge. However, bringing $\overline{\text{SYNC}}$ high before the 16th falling edge acts as an interrupt to the write sequence. The shift register is reset and the write sequence is seen as invalid. Neither an update of the DAC register contents or a change in the operating mode occurs, as shown in [Figure 78](#).

Figure 77. DAC8311 Data Input Register

Figure 78. DAC8311 $\overline{\text{SYNC}}$ Interrupt Facility

8.5.2 DAC8411 Serial Interface

The DAC8411 has a 3-wire serial interface ($\overline{\text{SYNC}}$, SCLK, and DIN) compatible with SPI, QSPI, and Microwire interface standards, as well as most DSPs. See the [Figure 1](#) for an example of a typical write sequence.

8.5.2.1 DAC8411 Input Shift Register

The input shift register is 24 bits wide, as shown in [Figure 79](#). The first two bits are reserved control bits (PD0 and PD1) that set the desired mode of operation (normal mode or any one of three power-down modes) as indicated in [Table 3](#). The last six bits are *don't care*.

The write sequence begins by bringing the $\overline{\text{SYNC}}$ line low. Data from the DIN line are clocked into the 24-bit shift register on each falling edge of SCLK. The serial clock frequency can be as high as 50 MHz, making the DAC8411 compatible with high-speed DSPs. On the 18th falling edge of the serial clock, the last data bit is clocked in and the programmed function is executed. The last six bits are *don't care*.

At this point, the $\overline{\text{SYNC}}$ line may be kept low or brought high. In either case, it must be brought high for a minimum of 20 ns before the next write sequence so that a falling edge of $\overline{\text{SYNC}}$ can initiate the next write sequence. As previously mentioned, it must be brought high again before the next write sequence.

The $\overline{\text{SYNC}}$ line may be brought high after the 18th bit is clocked in because the last six bits are *don't care*.

8.5.2.2 DAC8411 $\overline{\text{SYNC}}$ Interrupt

In a normal write sequence, the $\overline{\text{SYNC}}$ line is kept low for 24 falling edges of SCLK and the DAC is updated on the 18th falling edge, ignoring the last six *don't care* bits. However, bringing $\overline{\text{SYNC}}$ high before the 18th falling edge acts as an interrupt to the write sequence. The shift register is reset and the write sequence is seen as invalid. Neither an update of the DAC register contents or a change in the operating mode occurs, as shown in Figure 80.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Microprocessor Interfacing

9.1.1.1 DAC8x11 to 8051 Interface

Figure 81 shows a serial interface between the DAC8x11 and a typical 8051-type microcontroller. The setup for the interface is as follows: TXD of the 8051 drives SCLK of the DAC8x11, while RXD drives the serial data line of the part. The SYNC signal is derived from a bit programmable pin on the port. In this case, port line P3.3 is used. When data are to be transmitted to the DAC8x11, P3.3 is taken low. The 8051 transmits data only in 8-bit bytes; thus, only eight falling clock edges occur in the transmit cycle. To load data to the DAC, P3.3 remains low after the first eight bits are transmitted, and a second write cycle is initiated to transmit the second byte of data. P3.3 is taken high following the completion of this cycle. The 8051 outputs the serial data in a format which has the LSB first. The DAC8x11 requires its data with the MSB as the first bit received. Therefore, the 8051 transmit routine must take this requirement into account, and *mirror* the data as needed.

NOTE: (1) Additional pins omitted for clarity.

Figure 81. DAC8x11 to 80C51/80L51 Interfaces

9.1.1.2 DAC8x11 to Microwire Interface

Figure 82 shows an interface between the DAC8x11 and any Microwire-compatible device. Serial data are shifted out on the falling edge of the serial clock and are clocked into the DAC8x11 on the rising edge of the SK signal.

NOTE: (1) Additional pins omitted for clarity.

Figure 82. DAC8x11 to Microwire Interface

Application Information (continued)

9.1.1.3 DAC8x11 to 68HC11 Interface

Figure 83 shows a serial interface between the DAC8x11 and the 68HC11 microcontroller. SCK of the 68HC11 drives the SCLK of the DAC8x11, while the MOSI output drives the serial data line of the DAC. The SYNC signal is derived from a port line (PC7), similar to what was done for the 8051.

NOTE: (1) Additional pins omitted for clarity.

Figure 83. DAC8X11 to 68HC11 Interface

The 68HC11 should be configured so that its CPOL bit is a '0' and its CPHA bit is a '1'. This configuration causes data appearing on the MOSI output to be valid on the falling edge of SCK. When data are being transmitted to the DAC, the SYNC line is taken low (PC7). Serial data from the 68HC11 are transmitted in 8-bit bytes with only eight falling clock edges occurring in the transmit cycle. Data are transmitted MSB first. In order to load data to the DAC8x11, PC7 is held low after the first eight bits are transferred, and a second serial write operation is performed to the DAC; PC7 is taken high at the end of this procedure.

9.2 Typical Applications

9.2.1 Loop Powered Transmitter

The described loop powered transmitter can accurately source currents from 4 mA to 20 mA.

Figure 84. Loop Powered Transmitter Schematic

9.2.1.1 Design Requirements

The transmitter has only two external input terminals; a supply connection and a ground (or return) connection. The transmitter communicates back to the host, typically a PLC analog input module, by precisely controlling the magnitude of the return current. In order to conform to the 4-mA to 20-mA communication standards, the complete transmitter must consume less than 4 mA of current.

Typical Applications (continued)

The complete design of this circuit is outlined in [TIPD158, Low Cost Loop-Powered 4-20mA Transmitter EMC/EMI Tested Reference Design](#). The design is expected to be low-cost and deliver immunity to the IEC61000-4 suite of tests with minimum impact on the accuracy of the system. Reference design [TIPD158](#) includes the design goals, simulated results, and measured performance.

9.2.1.2 Detailed Design Procedure

Amplifier U1 uses negative feedback to make sure that the potentials at the inverting (V_-) and noninverting (V_+) input terminals are equal. In this configuration, V_- is directly tied to the local GND; therefore, the potential at the noninverting input terminal is driven to local ground. Thus, the voltage difference across R_2 is the DAC output voltage (V_{OUT}), and the voltage difference across R_5 is the regulator voltage (V_{REG}). These voltage differences cause currents to flow through R_2 and R_5 , as illustrated in [Figure 85](#).

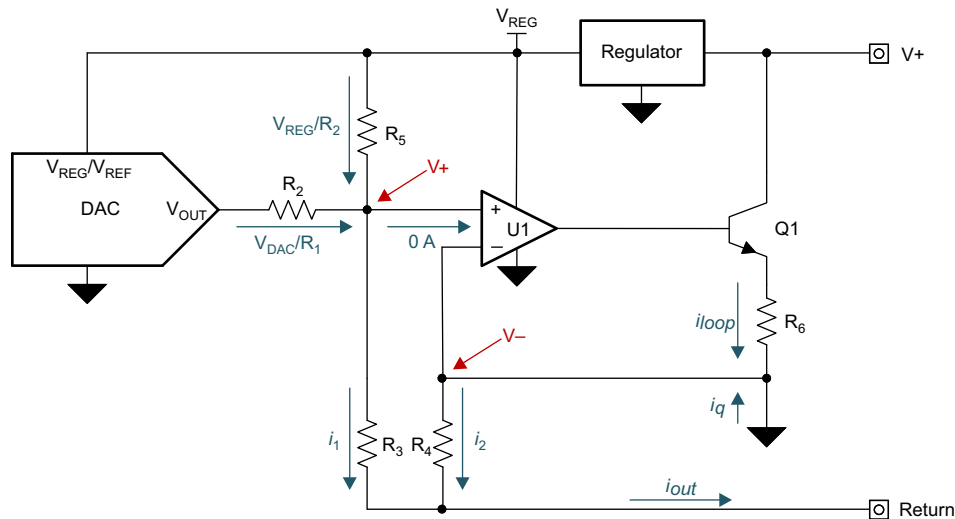

Figure 85. Voltage to Current Conversion

The currents from R_2 and R_5 sum into i_1 (defined in [Equation 1](#)), and i_1 flows through R_3 .

$$i_1 = \frac{V_{DAC}}{R_2} + \frac{V_{REG}}{R_5} \quad (1)$$

Amplifier U2 drives the base of Q1, the NPN bipolar junction transistor (BJT), to allow current to flow through R_4 so that the voltage drops across R_3 and R_4 remain equal. This design keeps the inverting and noninverting terminals at the same potential. A small part of the current through R_4 is sourced by the quiescent current of all of the components used in the transmitter design (regulator, amplifier, and DAC). The voltage drops across R_3 and R_4 are equal; therefore, different-sized resistors cause different current flow through each resistor. Use these different-sized resistors to apply gain to the current flow through R_4 by controlling the ratio of resistor R_3 to R_4 , as shown in [Equation 2](#):

$$\begin{aligned} V_+ &= i_1 \cdot R_3 \\ V_- &= i_2 \cdot R_4 \Rightarrow i_2 = \frac{i_1 \cdot R_3}{R_4} \\ V_+ &= V_- \end{aligned} \quad (2)$$

The current gain in the circuit helps allow a majority of the output current to come directly from the loop through Q1 instead of from the voltage-to-current converter. This current gain, in addition to the low-power components, keeps the current consumption of the voltage-to-current converter low. Currents i_1 and i_2 sum to form output current i_{out} , as shown in [Equation 3](#):

$$i_{out} = i_1 + i_2 = \frac{V_{DAC}}{R_2} + \frac{V_{REG}}{R_5} + \frac{R_3}{R_4} \cdot \left(\frac{V_{DAC}}{R_2} + \frac{V_{REG}}{R_5} \right) = \left(\frac{V_{DAC}}{R_2} + \frac{V_{REG}}{R_5} \right) \cdot \left(1 + \frac{R_3}{R_4} \right) \quad (3)$$

Typical Applications (continued)

The complete transfer function, arranged as a function of input code, is shown in Equation 4. The remaining sections divide this circuit into blocks for simplified discussion.

$$i_{out}(\text{Code}) = \left(\frac{V_{REG} \cdot \text{Code}}{2^{\text{Resolution}} \cdot R_2} + \frac{V_{REG}}{R_5} \right) \cdot \left(1 + \frac{R_3}{R_4} \right) \tag{4}$$

Resistor R_6 is included to reduce the gain of transistor Q1, and therefore, reduce the closed-loop gain of the voltage-to-current converter for a stable design. Size resistors R_2 , R_3 , R_4 , and R_5 based on the full-scale range of the DAC, regulator voltage, and the desired current output range of the design.

9.2.1.3 Application Curves

Figure 86 shows the measured transfer function of the circuit. Figure 87 shows the total unadjusted error (TUE) of the circuit, staying below 0.15 %FSR.

9.2.2 Using the REF5050 as a Power Supply for the DAC8x11

As a result of the extremely low supply current required by the DAC8x11, an alternative option is to use a REF5050 5 V precision voltage reference to supply the required voltage to the part, as shown in Figure 88. This option is especially useful if the power supply is too noisy or if the system supply voltages are at some value other than 5 V. The REF5050 outputs a steady supply voltage for the DAC8x11. If the REF5050 is used, the current needed to supply DAC8x11 is typically 110 μ A at 5V, with no load on the output of the DAC. When the DAC output is loaded, the REF5050 also needs to supply the current to the load. The total current required (with a 5-k Ω load on the DAC output) is:

$$110 \mu\text{A} + (5 \text{ V} / 5 \text{ k}\Omega) = 1.11 \text{ mA}$$

The load regulation of the REF5050 is typically 0.002%/mA, resulting in an error of 90 μ V for the 1.1 -mA current drawn from it. This value corresponds to a 1.1 LSB error at 16bit (DAC8411).

Figure 88. REF5050 as Power Supply to DAC8x11

Typical Applications (continued)

For other power-supply voltages, alternative references such as the [REF3030](#) (3 V), [REF3033](#) (3.3 V), or [REF3220](#) (2.048 V) are recommended. For a full list of available voltage references from TI, see TI web site at www.ti.com.

9.2.3 Bipolar Operation Using the DAC8x11

The DAC8x11 has been designed for single-supply operation but a bipolar output range is also possible using the circuit in [Figure 89](#). The circuit shown gives an output voltage range of $\pm 5V$. Rail-to-rail operation at the amplifier output is achievable using an [OPA211](#), [OPA340](#), or [OPA703](#) as the output amplifier. For a full list of available operational amplifiers from TI, see TI web site at www.ti.com

The output voltage for any input code can be calculated as follows:

$$V_O = \left[AV_{DD} \times \left(\frac{D}{2^n} \right) \times \left(\frac{R_1 + R_2}{R_1} \right) - AV_{DD} \times \left(\frac{R_2}{R_1} \right) \right]$$

where

- n = resolution in bits; either 14 (DAC8311) or 16 (DAC8411).
- D = the input code in decimal; either 0 to 16,383 (DAC8311) or 0 to 65,535 (DAC8411).

With $AV_{DD} = 5\text{ V}$, $R_1 = R_2 = 10\text{ k}\Omega$:

$$V_O = \left(\frac{10 \times D}{2^n} \right) - 5V \quad (6)$$

The resulting output voltage range is $\pm 5V$. Code 000h corresponds to a -5-V output and FFFFh (16-bit level) corresponding to a 5-V output.

Figure 89. Bipolar Operation With the DAC8x11

10 Power Supply Recommendations

The DAC8x11 is designed to operate with a unipolar analog power supply ranging from 2 V to 5.5 V on the AV_{DD} pin. The AV_{DD} pin supplies power to the digital and analog circuits (including the resistor string) inside the DAC. The current consumption of this pin is specified in the [Electrical Characteristics](#) table. Use a 1- μF to 10- μF capacitor in parallel with a 0.1- μF bypass capacitor on this pin to remove high-frequency noise.

11 Layout

11.1 Layout Guidelines

A precision analog component requires careful layout, adequate bypassing, and clean, well-regulated power supplies.

The DAC8x11 offers single-supply operation; it will often be used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it will be to achieve good performance from the converter.

Because of the single ground pin of the DAC8x11, all return currents, including digital and analog return currents, must flow through the GND pin. Ideally, GND would be connected directly to an analog ground plane. This plane would be separate from the ground connection for the digital components until they were connected at the power entry point of the system.

The power applied to AV_{DD} should be well-regulated and low-noise. Switching power supplies and dc/dc converters often have high-frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high-frequency spikes as the internal logic switches state. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output. This condition is particularly true for the DAC8x11, as the power supply is also the reference voltage for the DAC.

As with the GND connection, AV_{DD} should be connected to a 5 V power supply plane or trace that is separate from the connection for digital logic until they are connected at the power entry point. In addition, TI strongly recommends the 1 μ F to 1 μ F and 0.1 μ F bypass capacitors. In some situations, additional bypassing may be required, such as a 100 μ F electrolytic capacitor or even a *Pi* filter made up of inductors and capacitors—all designed to essentially low-pass filter the 5 V supply, removing the high-frequency noise.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:18X

SOLDER MASK DETAILS

4214835/B 04/2024

NOTES: (continued)

5. Publication IPC-7351 may have alternate designs.
6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
BASED ON 0.125 THICK STENCIL
SCALE:18X

4214835/B 04/2024

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
