

LP38513-ADJ 3A Fast-Transient Response Adjustable Low-Dropout Linear Voltage Regulator

Check for Samples: [LP38513-ADJ](#)

FEATURES

- 2.25V to 5.5V Input Voltage Range
- Adjustable Output Voltage Range of 0.5V to 4.5V
- 3.0A Output Load Current
- $\pm 2.0\%$ Accuracy over Line, Load, and Full-Temperature Range from -40°C to $+125^{\circ}\text{C}$
- Stable with tiny 10 μF ceramic capacitors
- Enable pin
- Typically less than 1 μA of Ground pin current when Enable pin is low
- 25dB of PSRR at 100 kHz
- Over-Temperature and Over-Current Protection
- TO-263 THIN 5-Pin Surface Mount Package

APPLICATIONS

- Digital Core ASICs, FPGAs, and DSPs
- Servers
- Routers and Switches
- Base Stations
- Storage Area Networks
- DDR2 Memory

DESCRIPTION

The LP38513-ADJ Fast-Transient Response Low-Dropout Voltage Regulator offers the highest-performance in meeting AC and DC accuracy requirements for powering Digital Cores. The LP38513-ADJ uses a proprietary control loop that enables extremely fast response to change in line conditions and load demands. Output Voltage DC accuracy at 2.5% over line, load and full temperature range from -40°C to $+125^{\circ}\text{C}$. The LP38513-ADJ is designed for inputs from the 2.5V, 3.3V, and 5.0V rail, is stable with 10 μF ceramic capacitors, and has an adjustable output voltage. The LP38513-ADJ provides excellent transient performance to meet the demand of high performance digital core ASICs, DSPs, and FPGAs found in highly-intensive applications such as servers, routers/switches, and base stations.

Typical Application Circuit

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

Pin Descriptions for TO-263 THIN Package

Pin #	Pin Name	Function
1	EN	Enable. Pull high to enable the output, low to disable the output. This pin has no internal bias and must be tied to the input voltage, or actively driven.
2	IN	Input Supply Pin
3	GND	Ground
4	OUT	Regulated Output Voltage Pin
5	ADJ	The feedback to the internal Error Amplifier to set the output voltage
DAP	DAP	The TO-263 THIN DAP connection is used as a thermal connection to remove heat from the device to an external heat-sink in the form of the copper area on the printed circuit board. The DAP is physically connected to backside of the die, but is not internally connected to device ground. The DAP should be soldered to the Ground Plane copper..

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

Storage Temperature Range	-65°C to +150°C
Soldering Temperature ⁽²⁾	
Thin TO-263	260°C, 10s
ESD Rating ⁽³⁾	±2 kV
Power Dissipation ⁽⁴⁾	Internally Limited
Input Pin Voltage (Survival)	-0.3V to +6.0V
Enable Pin Voltage (Survival)	-0.3V to +6.0V
Output Pin Voltage (Survival)	-0.3V to +6.0V
ADJ Pin Voltage (Survival)	-0.3V to +6.0V
I _{OUT} (Survival)	Internally Limited

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but does not specific performance limits. For specifications and conditions, see the Electrical Characteristics.
- (2) Refer to JEDEC J-STD-020C for surface mount device (SMD) package reflow profiles and conditions. Unless otherwise stated, the temperatures and times are for Sn-Pb (STD) only.
- (3) The human body model (HBM) is a 100 pF capacitor discharged through a 1.5 kΩ resistor into each pin. Test method is per JESD22-A114.
- (4) Device operation must be evaluated, and derated as needed, based on ambient temperature (T_A), power dissipation (P_D), maximum allowable operating junction temperature (T_{J(MAX)}), and package thermal resistance (θ_{JA}). The typical θ_{JA} rating given is worst case based on minimum land area on two-layer PCB (EIA/JESD51-3). See [POWER DISSIPATION/HEAT-SINKING](#) for details.

OPERATING RATINGS ⁽¹⁾

Input Supply Voltage, V _{IN}	2.25V to 5.5V
Output Voltage, V _{OUT}	V _{ADJ} to 5V
Enable Input Voltage, V _{EN}	0.0V to 5.5V
Output Current (DC)	1 mA to 3A
Junction Temperature ⁽²⁾	-40°C to +125°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but does not specific performance limits. For specifications and conditions, see the Electrical Characteristics.
- (2) Device operation must be evaluated, and derated as needed, based on ambient temperature (T_A), power dissipation (P_D), maximum allowable operating junction temperature (T_{J(MAX)}), and package thermal resistance (θ_{JA}). The typical θ_{JA} rating given is worst case based on minimum land area on two-layer PCB (EIA/JESD51-3). See [POWER DISSIPATION/HEAT-SINKING](#) for details.

ELECTRICAL CHARACTERISTICS

Unless otherwise specified: $V_{IN} = 2.50V$, $V_{OUT} = V_{ADJ}$, $I_{OUT} = 10\text{ mA}$, $C_{IN} = 10\text{ }\mu\text{F}$, $C_{OUT} = 10\text{ }\mu\text{F}$, $V_{EN} = 2.0V$. Limits in standard type are for $T_J = 25^\circ\text{C}$ only; limits in **boldface type** apply over the junction temperature (T_J) range of -40°C to $+125^\circ\text{C}$. Minimum and Maximum limits are specified through test, design, or statistical correlation. Typical values represent the most likely parametric norm at $T_J = 25^\circ\text{C}$, and are provided for reference purposes only.

Symbol	Parameter	Conditions	Min	Typ	Max	Units
V_{ADJ}	V_{ADJ} Accuracy ⁽¹⁾	$2.25V \leq V_{IN} \leq 5.5V$ $10\text{ mA} \leq I_{OUT} \leq 3A$	495.0 490.0	500.	505.0 510.0	mV

		$V_{EN} = 0V$	-	-1	-	
$t_{d(OFF)}$	Turn-off delay	Time from $V_{EN} < V_{EN(TH)}$ to $V_{OUT} = \text{OFF}$, $I_{LOAD} = 3A$	-	5	-	μs
$t_{d(ON)}$	Turn-on delay	Time from $V_{EN} > V_{EN(TH)}$ to $V_{OUT} = \text{ON}$, $I_{LOAD} = 3A$	-	5	-	
AC Parameters						
PSRR	Ripple Rejection	$V_{IN} = 2.5V$ $f = 120\text{Hz}$	-	73	-	dB
		$V_{IN} = 2.5V$ $f = 1\text{ kHz}$	-	70	-	
$\rho_n(f)$	Output Noise Density	$f = 120\text{Hz}$	-	0.4	-	$\mu\text{V}/\sqrt{\text{Hz}}$
e_n	Output Noise Voltage	$\text{BW} = 10\text{Hz} - 100\text{kHz}$	-	25	-	μV_{RMS}
Thermal Characteristics						
T_{SD}	Thermal Shutdown	T_J rising	-	165	-	$^\circ\text{C}$
ΔT_{SD}	Thermal Shutdown Hysteresis	T_J falling from T_{SD}	-	10	-	
θ_{J-A}	Thermal Resistance Junction to Ambient ⁽⁵⁾	TO-263 THIN	-	67	-	$^\circ\text{C}/\text{W}$
θ_{J-C}	Thermal Resistance Junction to Case	TO-263 THIN	-	2	-	$^\circ\text{C}/\text{W}$

- (1) The line and load regulation specification contains only the typical number. However, the limits for line and load regulation are included in the output voltage tolerance specification.
- (2) Line regulation is defined as the change in V_{ADJ} from the nominal value due to change in the voltage at the input.
- (3) Load regulation is defined as the change in V_{ADJ} from the nominal value due to change in the load current at the output.
- (4) Dropout voltage (V_{DO}) is typically defined as the input to output voltage differential ($V_{IN} - V_{OUT}$) where the input voltage is low enough to cause the output voltage to drop 2%. For the LP38513-ADJ, the minimum operating voltage of 2.25V is the limiting factor when the programmed output voltage is less than typically 1.80V.
- (5) Device operation must be evaluated, and derated as needed, based on ambient temperature (T_A), power dissipation (P_D), maximum allowable operating junction temperature ($T_{J(MAX)}$), and package thermal resistance (θ_{JA}). The typical θ_{JA} rating given is worst case based on minimum land area on two-layer PCB (EIA/JESD51-3). See [POWER DISSIPATION/HEAT-SINKING](#) for details.

TYPICAL PERFORMANCE CHARACTERISTICS

Unless otherwise specified: $T_J = 25^\circ\text{C}$, $V_{IN} = 2.50\text{V}$, $V_{OUT} = V_{ADJ}$, $V_{EN} = 2.0\text{V}$, $C_{IN} = 10\ \mu\text{F}$, $C_{OUT} = 10\ \mu\text{F}$, $I_{OUT} = 10\ \text{mA}$.

BLOCK DIAGRAM

APPLICATION INFORMATION

EXTERNAL CAPACITORS

Like any low-dropout regulator, external capacitors are required to assure stability. These capacitors must be correctly selected for proper performance.

Input Capacitor

A ceramic input capacitor of at least 10 μF is required. For general usage across all load currents and operating conditions, a 10 μF ceramic input capacitor will provide satisfactory performance.

Output Capacitor

A ceramic capacitor with a minimum value of 10 μF is required at the output pin for loop stability. It must be located less than 1 cm from the device and connected directly to the output and ground pin using traces which have no other currents flowing through them. As long as the minimum of 10 μF ceramic is met, there is no limitation on any additional capacitance.

X7R and X5R dielectric ceramic capacitors are strongly recommended, as they typically maintain a capacitance range within $\pm 20\%$ of nominal over full operating ratings of temperature and voltage. Of course, they are typically larger and more costly than Z5U/Y5U types for a given voltage and capacitance.

Z5U and Y5V dielectric ceramics are not recommended as the capacitance will drop severely with applied voltage. A typical Z5U or Y5V capacitor can lose 60% of its rated capacitance with half of the rated voltage applied to it. The Z5U and Y5V also exhibit a severe temperature effect, losing more than 50% of nominal capacitance at high and low limits of the temperature range.

Application Information

REVERSE VOLTAGE

A reverse voltage condition will exist when the voltage at the output pin is higher than the voltage at the input pin. Typically this will happen when V_{IN} is abruptly taken low and C_{OUT} continues to hold a sufficient charge such that the input to output voltage becomes reversed. A less common condition is when an alternate voltage source is connected to the output.

There are two possible paths for current to flow from the output pin back to the input during a reverse voltage condition.

While V_{IN} is high enough to keep the control circuitry alive, and the Enable pin is above the $V_{\text{EN(ON)}}$ threshold, the control circuitry will attempt to regulate the output voltage. Since the input voltage is less than the programmed output voltage, the control circuit will drive the gate of the pass element to the full on condition when the output voltage begins to fall. In this condition, reverse current will flow from the output pin to the input pin, limited only by the $R_{\text{DS(ON)}}$ of the pass element and the output to input voltage differential. Discharging an output capacitor up to 1000 μF in this manner will not damage the device as the current will rapidly decay. However, continuous reverse current should be avoided. When the Enable is low this condition will be prevented.

The internal PFET pass element in the LP38513-ADJ has an inherent parasitic diode. During normal operation, the input voltage is higher than the output voltage and the parasitic diode is reverse biased. However, if the output voltage to input voltage differential is more than 500 mV (typical) the parasitic diode becomes forward biased and current flows from the output pin to the input pin through the diode. The current in the parasitic diode should be limited to less than 1A continuous and 5A peak.

If used in a dual-supply system where the regulator output load is returned to a negative supply, the output pin must be diode clamped to ground. A Schottky diode is recommended for this protective clamp.

SHORT-CIRCUIT PROTECTION

The LP38513-ADJ is short circuit protected, and in the event of a peak over-current condition the short-circuit control loop will rapidly drive the output PMOS pass element off. Once the power pass element shuts down, the control loop will rapidly cycle the output on and off until the average power dissipation causes the thermal shutdown circuit to respond to servo the on/off cycling to a lower frequency. Please refer to the [POWER DISSIPATION/HEAT-SINKING](#) section for power dissipation calculations.

SETTING THE OUTPUT VOLTAGE

The output voltage is set using the external resistive divider R1 and R2. The output voltage is given by the formula:

$$V_{OUT} = V_{ADJ} \times (1 + (R1/R2)) \quad (1)$$

The resistors used for R1 and R2 should be high quality, tight tolerance, and with matching temperature coefficients. It is important to remember that, although the value of V_{ADJ} is specified, the final value of V_{OUT} is not. The use of low quality resistors for R1 and R2 can easily produce a V_{OUT} value that is unacceptable.

It is recommended that the values selected for R1 and R2 are such that the parallel value is less than 1.00 k Ω . This is to reduce the possibility of any internal parasitic capacitances on the ADJ pin from creating an undesirable phase shift that may interfere with device stability.

$$((R1 \times R2) / (R1 + R2)) \leq 1.00 \text{ k}\Omega \quad (2)$$

FEED FORWARD CAPACITOR, C_{FF}

When using a ceramic capacitor for C_{OUT} , the typical ESR value will be too small to provide any meaningful positive phase compensation, F_Z , to offset the internal negative phase shifts in the gain loop.

$$F_Z = 1 / (2 \times \pi \times C_{OUT} \times \text{ESR}) \quad (3)$$

A capacitor placed across the gain resistor R1 will provide additional phase margin to improve load transient response of the device. This capacitor, C_{FF} , in parallel with R1, will form a zero in the loop response given by the formula:

$$F_Z = 1 / (2 \times \pi \times C_{FF} \times R1) \quad (4)$$

For optimum load transient response select C_{FF} so the zero frequency, F_Z , falls between 20 kHz and 40 kHz.

$$C_{FF} = 1 / (2 \times \pi \times R1 \times F_Z) \quad (5)$$

The phase lead provided by C_{FF} diminishes as the DC gain approaches unity, or V_{OUT} approaches V_{ADJ} . This is because C_{FF} also forms a pole with a frequency of:

$$F_P = 1 / (2 \times \pi \times C_{FF} \times (R1 \parallel R2)) \quad (6)$$

It's important to note that at higher output voltages, where R1 is much larger than R2, the pole and zero are far apart in frequency. At lower output voltages the frequency of the pole and the zero mover closer together. The phase lead provided from C_{FF} diminishes quickly as the output voltage is reduced, and has no effect when $V_{OUT} = V_{ADJ}$. For this reason, relying on this compensation technique alone is adequate only for higher output voltages.

Table 1 lists some suggested, best fit, standard $\pm 1\%$ resistor values for R1 and R2, and a standard $\pm 10\%$ capacitor values for C_{FF} , for a range of V_{OUT} values. Other values of R1, R2, and C_{FF} are available that will give similar results.

Table 1.

V _{OUT}	R1	R2	C _{FF}	F _Z
0.80V	1.07 kΩ	1.78 kΩ	4700 pF	31.6 kHz
1.00V	1.00 kΩ	1.00 kΩ	4700 pF	33.8 kHz
1.20V	1.40 kΩ	1.00 kΩ	3300 pF	34.4 kHz
1.50V	2.00 kΩ	1.00 kΩ	2700 pF	29.5 kHz
1.80V	2.94 kΩ	1.13 kΩ	1500 pF	36.1 kHz
2.00V	1.02 kΩ	340Ω	4700 pF	33.2 kHz
2.50V	1.02 kΩ	255Ω	4700 pF	33.2 kHz
3.00V	1.00 kΩ	200Ω	4700 pF	33.8 kHz
3.30V	2.00 kΩ	357Ω	2700 pF	29.5 kHz

Please refer to Application Note AN-1378 *Method For Calculating Output Voltage Tolerances in Adjustable Regulators* [SNVA112](#) for additional information on how resistor tolerances affect the calculated V_{OUT} value.

ENABLE OPERATION

The Enable ON threshold is typically 1.2V, and the OFF threshold is typically 1.0V. To ensure reliable operation the Enable pin voltage must rise above the maximum V_{EN(ON)} threshold and must fall below the minimum V_{EN(OFF)} threshold. The Enable threshold has typically 200mV of hysteresis to improve noise immunity.

The Enable pin (EN) has no internal pull-up or pull-down to establish a default condition and, as a result, this pin must be terminated either actively or passively.

If the Enable pin is driven from a single ended device (such as the collector of a discrete transistor) a pull-up resistor to V_{IN}, or a pull-down resistor to ground, will be required for proper operation. A 1 kΩ to 100 kΩ resistor can be used as the pull-up or pull-down resistor to establish default condition for the EN pin. The resistor value selected should be appropriate to swamp out any leakage in the external single ended device, as well as any stray capacitance.

If the Enable pin is driven from a source that actively pulls high and low (such as a CMOS rail to rail comparator output), the pull-up, or pull-down, resistor is not required.

If the application does not require the Enable function, the pin should be connected directly to the adjacent V_{IN} pin.

POWER DISSIPATION/HEAT-SINKING

A heat-sink may be required depending on the maximum power dissipation (P_{D(MAX)}), maximum ambient temperature (T_{A(MAX)}) of the application, and the thermal resistance (θ_{JA}) of the package. Under all possible conditions, the junction temperature (T_J) must be within the range specified in the Operating Ratings. The total power dissipation of the device is given by:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} + (V_{IN}) \times I_{GND} \quad (7)$$

where I_{GND} is the operating ground current of the device (specified under Electrical Characteristics).

The maximum allowable junction temperature rise (ΔT_J) depends on the maximum expected ambient temperature (T_{A(MAX)}) of the application, and the maximum allowable junction temperature (T_{J(MAX)}):

$$\Delta T_J = T_{J(MAX)} - T_{A(MAX)} \quad (8)$$

The maximum allowable value for junction to ambient Thermal Resistance, θ_{JA}, can be calculated using the formula:

$$\theta_{JA} = \Delta T_J / P_{D(MAX)} \quad (9)$$

LP38513-ADJ is available in the TO-263 THIN surface mount package. For a comparison of the TO-263 THIN package to the standard TO-263 package see Application Note *AN-1797 TO-263 THIN Package* [SNVA328](#). The thermal resistance depends on amount of copper area, or heat sink, and on air flow. See Application Note *AN-1520 A Guide to Board Layout for Best Thermal Resistance for Exposed Packages* [SNVA183](#) for guidelines.

Heat-Sinking the TO-263 THIN Package

The DAP of the TO-263 THIN package is soldered to the copper plane for heat sinking. The TO-263 THIN package has a θ_{JA} rating of 67°C/W, and a θ_{JC} rating of 2°C/W. The θ_{JA} rating of 67°C/W includes the device DAP soldered to an area of 0.055 square inches (0.22 in x 0.25 in) of 1 ounce copper on a two sided PCB, with no airflow. See JEDEC standard EIA/JESD51-3 for more information.

[Figure 19](#) shows a curve for the θ_{JA} of TO-263 THIN package for different thermal via counts under the exposed DAP, using a four layer PCB for heat sinking. The thermal vias connect the copper area directly under the exposed DAP to the first internal copper plane only. See JEDEC standards EIA/JESD51-5 and EIA/JESD51-7 for more information.

Figure 19. θ_{JA} vs Thermal Via Count for the TO-263 THIN Package on 4-Layer PCB

[Figure 20](#) shows the thermal performance when the Thin TO-263 is mounted to a two layer PCB where the copper area is predominately directly under the exposed DAP. As shown in the figure, increasing the copper area beyond 1 square inch produces very little improvement.

Figure 20. θ_{JA} vs Copper Area for the TO-263 THIN Package

REVISION HISTORY

Changes from Revision B (April 2013) to Revision C	Page
• Changed layout of National Data Sheet to TI format	12

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LP38513TJ-ADJ/NOPB	ACTIVE	TO-263	NDQ	5	1000	RoHS & Green	SN	Level-1-260C-UNLIM	-40 to 125	LP38513 TJ-ADJ	

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
