LM74202-Q1 過電圧 / 過電流保護機能搭載 40V、2.2A 統合型理想ダイオード

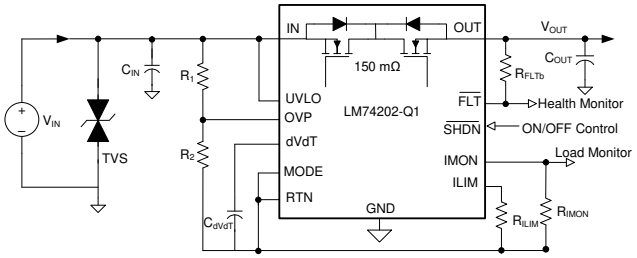
1 特長

- 車載アプリケーション用に AEC-Q100 認定済み
  - 温度グレード 1:-40°C ≤ T_A ≤ +125°C
  - AEC-Q100-012 短絡信頼性グレード A
  - HBM ESD 分類レベル 2
  - CDM ESD 分類レベル C6
- 動作電圧：4.2V～40V、絶対最大定格 42V
- –40V までの入力逆極性保護機能内蔵
- バック・ツー・バック MOSFET を内蔵し、合計 RON 150mΩ
- 過渡耐性：最大 55V
- 電流制限を 0.1A～ 2.23A に調整可能 (1A において ±5% 精度)
- ISO7637 および ISO16750-2 試験時の負荷保護
- バッテリへの短絡と GND への短絡から保護
- 逆電流ブロックにより出力のバッテリ短絡から保護
- IMON 電流インジケータ出力 (±8.5% 精度)
- 低い静止電流：動作時 285µA、シャットダウン時 16µA
- 可変 UVLO、OVP カットオフ、突入電流制御
- 電流を制限するフォルトへの応答オプションを選択可能 (自動再試行、ラッチオフ、サーキット・ブレーカー・モード)
- 使いやすい 16 ピンの HTSSOP パッケージで供給

2 アプリケーション

- フロント・カメラ、リア・カメラ
- 運転支援 ECU
- テレマティクス制御ユニット
- 携帯電話/スマートフォン・モジュールのアセット・トラッキング

概略回路図



3 概要

LM74202-Q1 は、各種保護機能を備えた小型で機能豊富な 40V の統合型理想ダイオードです。入力電源電圧範囲が広いため、12V の車載用バッテリで動作するアプリケーションを制御できます。このデバイスは最大 ±40V の正負の電源電圧に耐え、負荷を保護できます。負荷、入力電源、デバイスの保護機能は、過電流、突入電流制御、過電圧、低電圧スレッショルドを含めて多くの機能をプログラム可能です。内蔵の堅牢な保護制御ブロックと 40V の定格により、ISO 規格パルス試験を考慮したシステム設計が簡単になります。

シャットダウン・ピンを使うと内蔵 FET のイネーブル/ディセーブルを外部的に制御でき、デバイスを低電流のシャットダウン・モードに移行させることもできます。システム状態の監視と下流負荷の制御のため、フォルト出力と高精度の電流監視出力を備えています。MODE ピンにより、電流を制限する 3 種類のフォルト応答 (サーキット・ブレーカー、ラッチオフ、自動再試行モード) のどれにでも柔軟にデバイスを構成できます。$V_{(IN)}$ および $V_{(OUT)}$ を監視し、V(IN) < (V(OUT)-10mV) のときに逆電流保護を行います。この機能は、出力がバッテリに短絡した障害時に過電圧からシステム・バスを保護し、電力障害およびブラウンアウト状況での電圧ホールドアップ要件を満たすためにも役立ちます。

このデバイスは 5mm × 4.4mm の 16 ピン HTSSOP で供給され、–40℃～+125℃の温度範囲で完全に動作が規定されています。

Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1, 2	IN	P	Input supply voltage. See *IN, OUT, RTN and GND Pins* section.
3	UVLO	I	Input for setting the programmable Undervoltage Lockout threshold. An undervoltage event turns off the internal FET and asserts $\overline{\text{FLT}}$ to indicate power failure. If the Undervoltage Lockout function is not needed, the UVLO terminal must be connected to the IN terminal. See *Undervoltage Lockout (UVLO)* section.
4, 13	NC	—	No internal connection. These pins can be connected to RTN for enhanced thermal performance.
5	OVP	I	Input for setting the programmable Overvoltage Protection threshold. An overvoltage event turns off the internal FET and asserts $\overline{\text{FLT}}$ to indicate the overvoltage fault. See *Overvoltage Protection (OVP)* section.
6	MODE	I	Mode selection pin for overload fault response. See the *Device Functional Modes* section.
7	$\overline{\text{SHDN}}$	I	Shutdown pin. Pulling $\overline{\text{SHDN}}$ low enters the device into low-power shutdown mode. Cycling $\overline{\text{SHDN}}$ pin voltage resets the device that has latched off due to a fault condition. See *Low Current Shutdown Control ($\overline{\text{SHDN}}$)* section.
8	RTN	—	Reference for device internal control circuits. If reverse input polarity protection is not required, this pin can be connected to GND. See *IN, OUT, RTN and GND Pins* section.
9	GND	—	Connect GND to system ground. See *IN, OUT, RTN and GND Pins* section.
10	IMON	O	Analog current monitor output. This pin sources a scaled down ratio of current through the internal FET. A resistor from this pin to RTN converts current to proportional voltage. If pin is unused, leave pin floating. See *Current Monitoring* section.
11	ILIM	I/O	A resistor from this pin to RTN sets the overload and short-circuit current limit. See the *Overload and Short Circuit Protection* section.
12	dVdT	I/O	A capacitor from this pin to RTN sets output voltage slew rate. See the *Hot Plug-In and In-Rush Current Control* section.
14	$\overline{\text{FLT}}$	O	Fault event indicator. Indicator is an open drain output. If indicator is unused, leave indicator floating. See *FAULT Response* section.
15,16	OUT	P	Power output of the device. See *IN, OUT, RTN and GND Pins* section.
PowerPAD		—	PowerPAD integrated circuit package must be connected to RTN plane on PCB using multiple vias for enhanced thermal performance. PowerPAD is not internally connected to RTN. Do not use the PowerPAD as the only electrical connection to RTN.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range, all voltages referred to GND (unless otherwise noted)(1)

		MIN	MAX	UNIT
IN, IN-OUT		-42	42	V
IN, IN-OUT (350ms transient), T_A = 25°C		-55	55	
[IN, OUT, $\overline{FLT}$, UVLO, $\overline{SHDN}$] to RTN		-0.3	42	
[OVP, dVdT, ILIM, IMON, MODE] to RTN		-0.3	5	
RTN		-42	0.3	
$I_{\overline{FLT}}$, I_{dVdT}, $I_{\overline{SHDN}}$	Sink current	10		mA
I_{dVdT}, I_{ILIM}, I_{IMON}	Source Current	Internally limited	Internally limited	
T_J	Operating junction temperature	-40	150	°C
	Transient junction temperature	-65	$T_{(TSD)}$	°C
T_{stg}	Storage Temperature	-65	150	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002(1)		±2000	V
		Charged device model (CDM), per AEC Q100-011	All pins	±1000	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
IN	Input voltage range	-40		40	V
UVLO, OUT, $\overline{FLT}$		0		40	
OVP, dVdT, ILIM, IMON, $\overline{SHDN}$		0		4	
ILIM	Resistance	5.36		120	kΩ
IMON		1			
IN, OUT	External capacitance	0.1	1		µF
dVdT		10			nF
T_J	Operating junction temperature range	-40	25	125	°C

6.4 Thermal Information

THERMAL METRIC(1)		LM74202-Q1 PWP (HTSSOP) 16 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	38.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	22.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	18.2	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.5	°C/W
Y_{JB}	Junction-to-board characterization parameter	18	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	1.5	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

6.5 Electrical Characteristics

–40°C ≤ T_A = T_J ≤ +125°C, $V_{(IN)}$ = 12 V, $V_{(\overline{SHDN})}$ = 2 V, $R_{(ILIM)}$ = 120 kΩ, IMON = $\overline{FLT}$ = OPEN, $C_{(IN)}$ = 0.1 µF, $C_{(OUT)}$ = 1 µF, $C_{(dVdT)}$ = OPEN.

8 Detailed Description

8.1 Overview

LM74202-Q1 is an ideal diode with integrated back-to-back FETs and enhanced built-in protection circuitry. It provides robust protection for all systems and applications powered from 4.2 V to 40 V. The device integrates reverse battery input, reverse current, overvoltage, undervoltage, overcurrent and short circuit protection. The precision overcurrent limit (±5% at 1A) helps to minimize over design of the input power supply, while the fast response short circuit protection immediately isolates the load from input when a short circuit is detected. The device allows the user to program the overcurrent limit threshold between 0.1 A and 2.23 A with an external resistor. The device monitors the bus voltage for brown-out and overvoltage protection, asserting the FLTb pin to notify downstream systems.

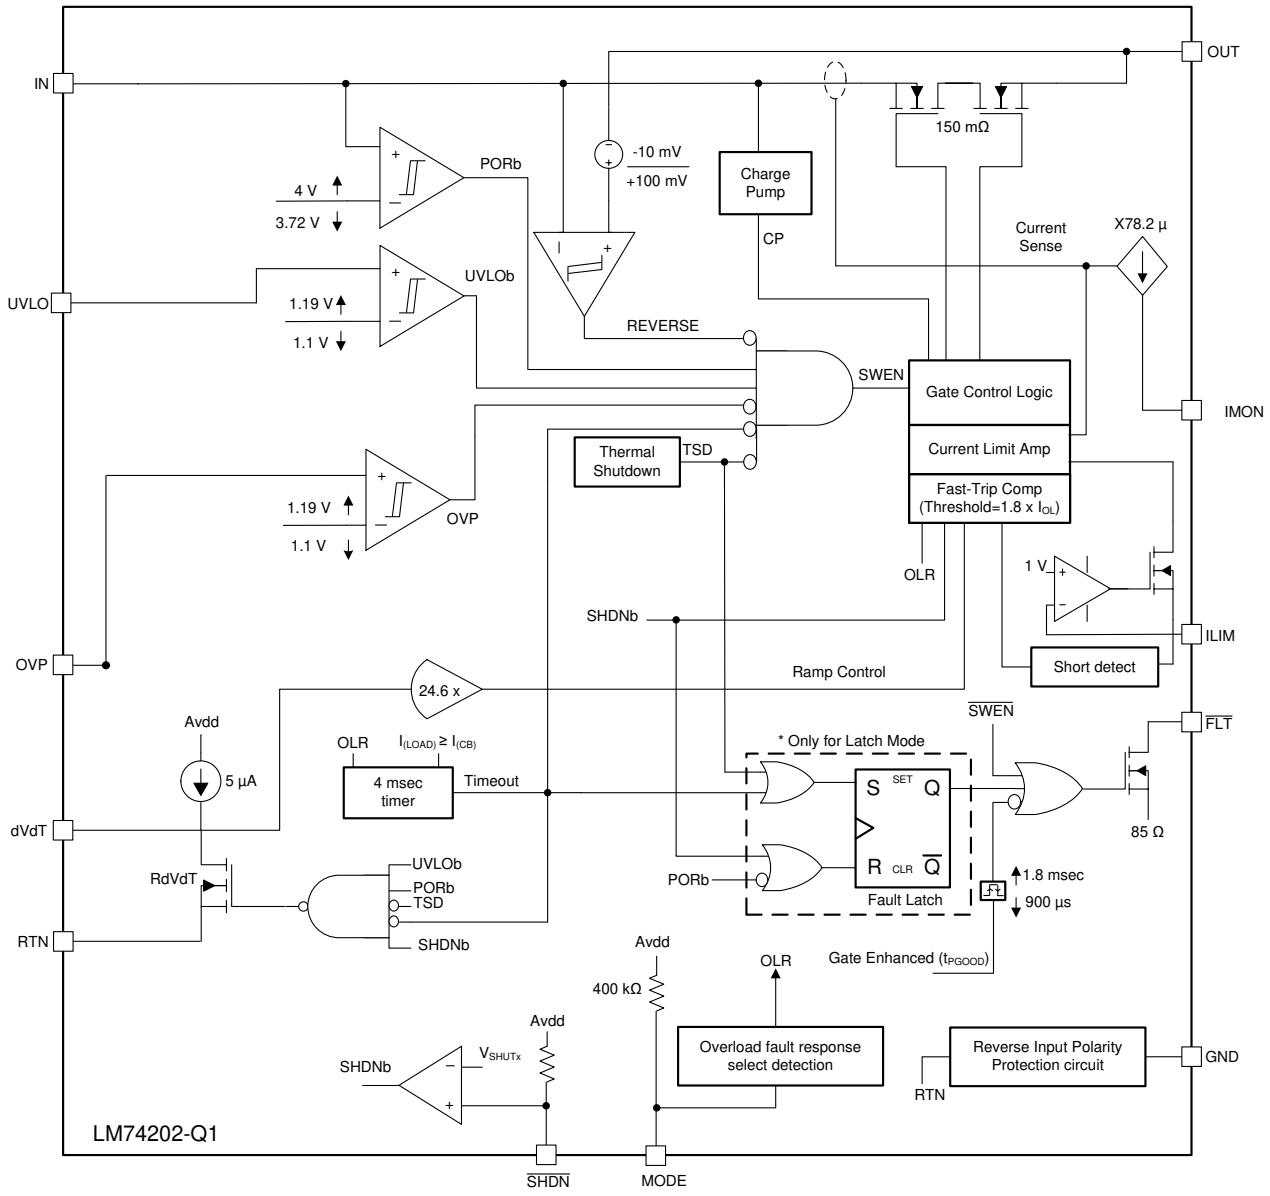
The device is designed to protect systems such as ADAS camera supplies against sudden output short to battery events. The device monitors V(IN) and V(OUT) to provide true reverse blocking from output when output short to battery fault condition or input power fail condition is detected. The internal robust protection control blocks of the LM74202-Q1 device along with its ±40 V rating helps to simplify the system designs for the various ISO and LV124 compliance ensuring complete protection of the load and the device.

The device monitors $V_{(IN)}$ and $V_{(OUT)}$ to provide true reverse current blocking when a reverse condition or input power failure condition is detected. The LM74202-Q1 device is also designed to control redundant power supply systems.

Additional features of the LM74202-Q1 device include:

- Reverse input battery protection
- Reverse current blocking
- Current monitor output for health monitoring of the system
- Electronic circuit breaker operation with overload timeout using MODE pin
- A choice of latch off or automatic restart mode response during current limit fault using MODE pin
- Over temperature protection to safely shutdown in the event of an overcurrent event
- De-glitched fault reporting for brown-out and overvoltage faults
- Look ahead overload current fault indication (see the *Look Ahead Overload Current Fault Indicator* section)

8.2 Functional Block Diagram



8.3 Feature Description

8.3.1 Undervoltage Lockout (UVLO)

This section describes the undervoltage comparator input. When the voltage at UVLO pin falls below $V_{(UVLOF)}$ during input power fail or input undervoltage fault, the internal FET quickly turns off and $\overline{FLT}$ is asserted. The UVLO comparator has a hysteresis of 90 mV. To set the input UVLO threshold, connect a resistor divider network from IN supply to UVLO terminal to RTN as shown in 図 20.

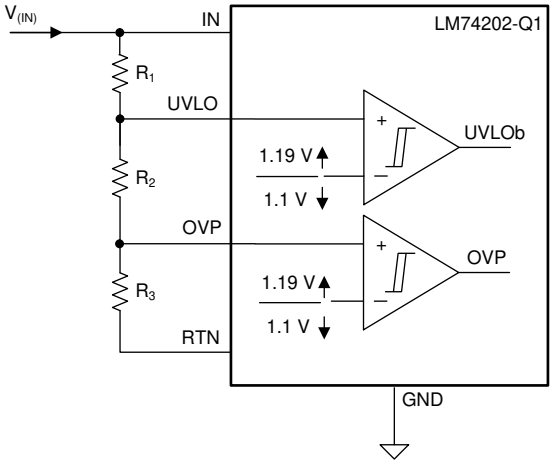


図 20. UVLO and OVP Thresholds Set by R_1, R_2 and R_3

If the undervoltage lockout (UVLO) function is not needed, the UVLO terminal must be connected to the IN terminal. UVLO terminal must not be left floating.

The device also implements an internal power ON reset (POR) function on the IN terminal. The device disables the internal circuitry when the IN terminal voltage falls below internal POR threshold $V_{(PORF)}$. The internal POR threshold has a hysteresis of 275 mV.

8.3.2 Overvoltage Protection (OVP)

The device incorporates circuitry to protect the system during overvoltage conditions. This device features an overvoltage cut off functionality. A voltage more than $V_{(OVPR)}$ on OVP pin turns off the internal FET and protects the downstream load. To program the OVP threshold, connect a resistor divider from IN supply to OVP terminal to RTN as shown in 図 21. OVP Overvoltage Cut-off response is shown in 図 22. OVP pin must not be left floating. If OVP pin could be floating due to dry soldering, an additional zener diode at the output will be required for protection from over voltage.

Feature Description (continued)

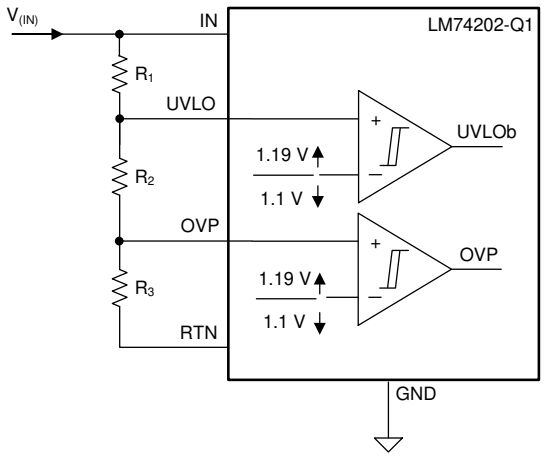

図 21. OVP Threshold Setting

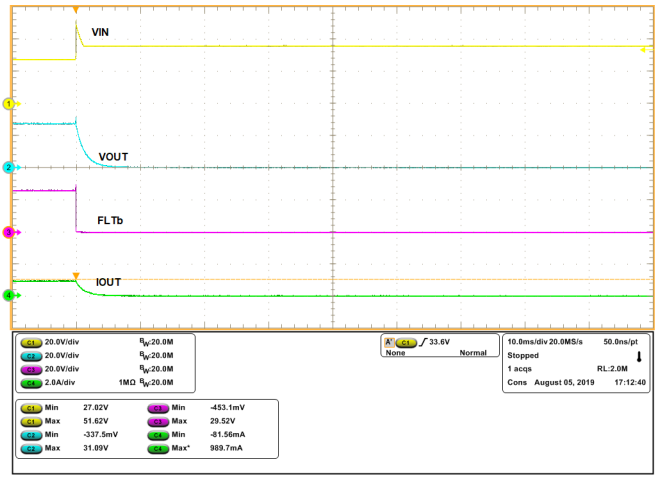

図 22. OVP Overvoltage Cut-Off

Programmable overvoltage clamp can also be achieved using LM74202-Q1 by connecting the resistor ladder from Vout to OVP to RTN as shown in 図 23 . This results in clamping of output voltage close to OVP set-point by resistors R1 and R2. as shown in 図 24. This scheme will also help in achieving minimal system Iq during off state. For this OVP configurataion, use R1 > 90 kΩ.

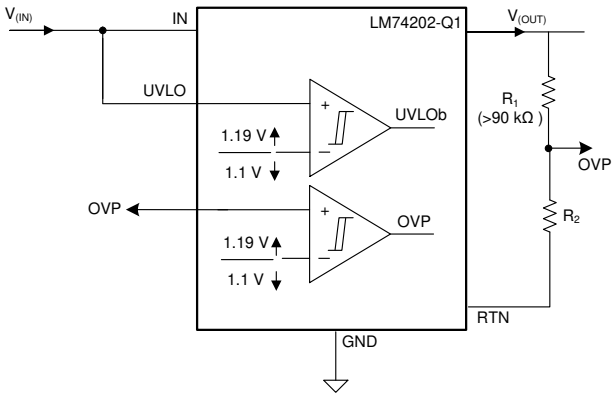

図 23. Programmable OV Clamp

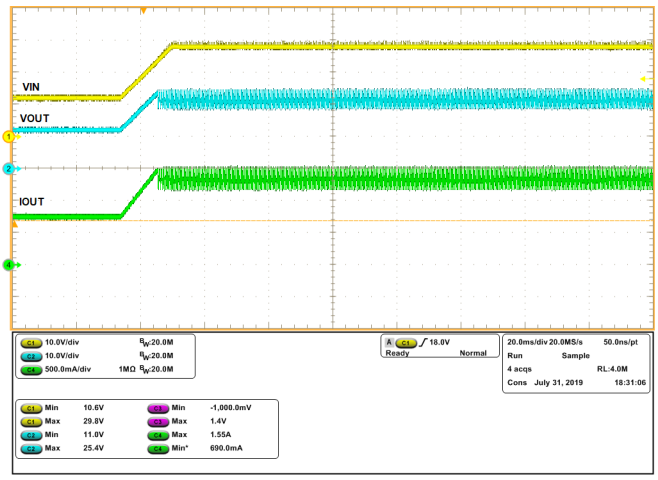

図 24. Programmable Overvoltage Clamp Response

If the OVP pin is connected to GND, the device will clamp the output voltage to 37.5 V (typical).

8.3.3 Reverse Battery Protection

To protect the electronic systems from reverse battery voltage due to miswiring, often a power component like a schottky diode is added in series with the supply line as shown in 図 25. These additional discretes result in a lossy and bulky protection solution. The LM74202-Q1 devices feature fully integrated reverse input supply protection and does not need an additional diode. These devices can withstand a reverse voltage of –40 V without damage. 図 26 illustrates the reverse input polarity protection functionality.

Feature Description (continued)

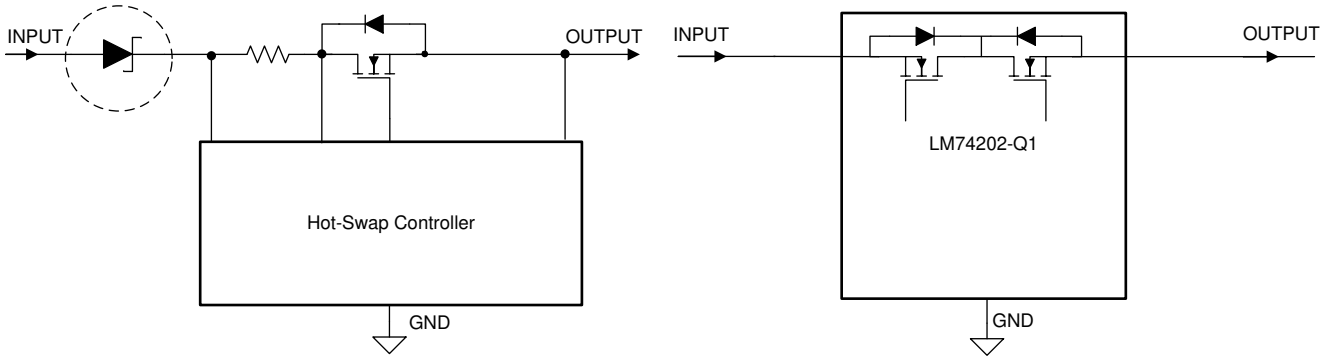

図 25. Reverse Battery Protection Circuits - Discrete vs LM74202-Q1

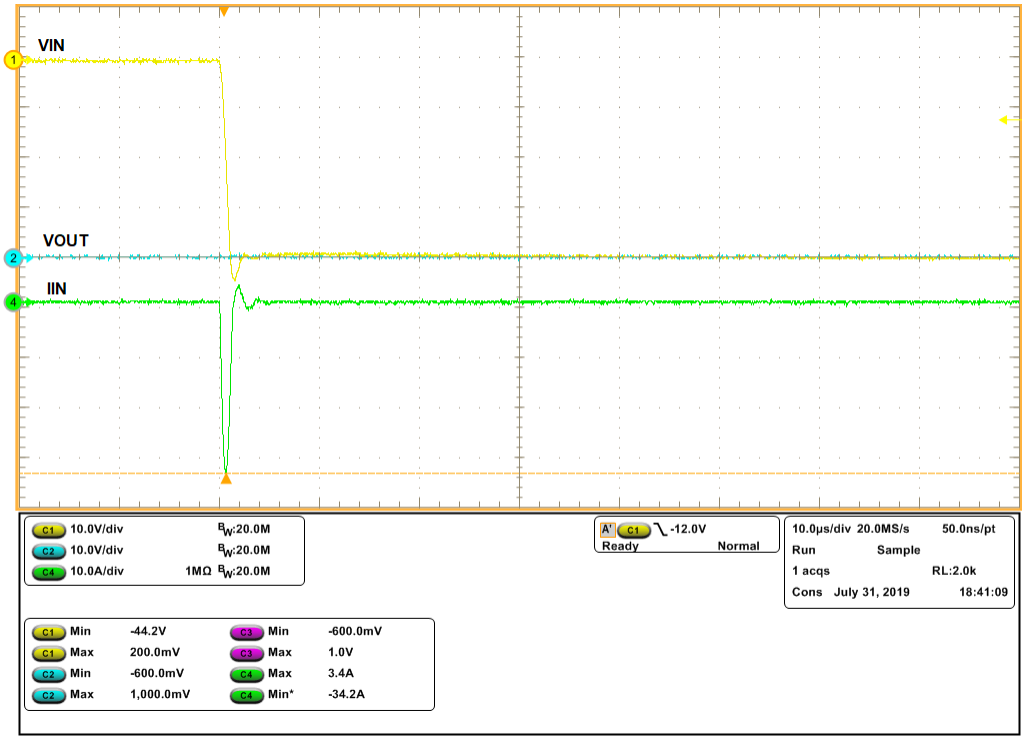

図 26. Reverse Input Supply Protection at –40 V

8.3.4 Hot Plug-In and In-Rush Current Control

The device is designed to control the in-rush current upon insertion of a card into a live backplane or other "hot" power source. This limits the voltage sag on the supply voltage and prevents unintended resets of the system power. The controlled start-up also helps to eliminate conductive and radiative interferences. An external capacitor connected from the dVdT pin to RTN defines the slew rate of the output voltage at power-on as shown in 図 27 and 図 28.

Feature Description (continued)

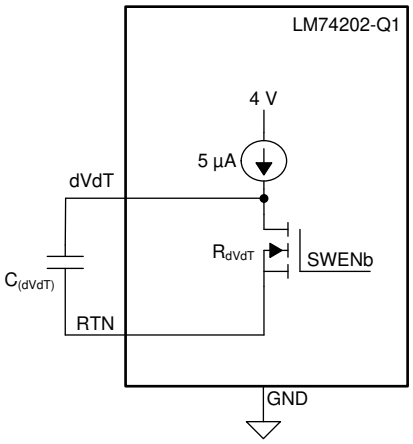

図 27. Output Ramp Up Time t_{dVdT} is Set by $C_{(dVdT)}$

The dVdT pin can be left floating to obtain a predetermined slew rate (t_{dVdT}) on the output. When the terminal is left floating, the devices set an internal output voltage ramp rate of 23.9 V / 1.6 ms. A capacitor can be connected from dVdT pin to RTN to program the output voltage slew rate slower than 23.9 V / 1.6 ms. Use 式 1 and 式 2 to calculate the external $C_{(dVdT)}$ capacitance.

式 1 governs slew rate at start-up.

$$I_{(dVdT)} = \left(\frac{C_{(dVdT)}}{Gain_{(dVdT)}} \right) \times \left(\frac{dV_{(OUT)}}{dt} \right)$$

where

- $I_{(dVdT)}$ = 4.7 µA (typical)
- $\frac{dV_{(OUT)}}{dt}$
- $Gain_{(dVdT)}$ = dVdT to V_{OUT} gain = 24.6 (1)

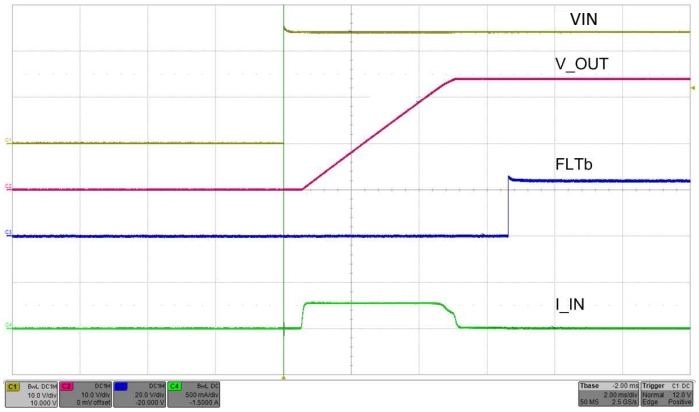
The total ramp time (t_{dVdT}) of $V_{(OUT)}$ for 0 to $V_{(IN)}$ can be calculated using 式 2.

$$t_{dVdT} = 8.7 \times 10^3 \times V_{(IN)} \times C_{(dVdT)} \quad (2)$$

The inrush current can be calculated by 式 3

$$I_{INRUSH} = C_{OUT}/[8.7 \times 10^3 \times C_{dVdT}] \quad (3)$$

Feature Description (continued)



C_{dVdT} = 22 nF C_{OUT} = 47 µF R_{ILIM} = 5.36 kΩ

図 28. Hot Plug-In and In-Rush Current Control at 24-V Input

8.3.5 Overload and Short Circuit Protection

The device monitors the load current by sensing the voltage across the internal sense resistor. The FET current is monitored during start-up and normal operation.

8.3.5.1 Overload Protection

The device offers following choices for the overload protection fault response:

- Active current limiting (Auto-retry and Latch-off modes)
- Electronic Circuit Breaker with overload timeout (Auto-retry mode)

See the configurations in 表 1 to select a specific overload fault response.

表 1. Overload Fault Response Configuration

MODE Pin Configuration	Overload Protection Type
Open	Electronic circuit breaker with auto-retry
Shorted to RTN	Active current limiting with auto-retry
A 402-kΩ resistor across MODE pin to RTN pin	Active current limiting with latch-off

8.3.5.1.1 Active Current Limiting

When the active current limiting mode is selected, during overload events, the device continuously regulates the load current to the overcurrent limit $I_{(OL)}$ programmed by the $R_{(ILIM)}$ resistor as shown in 式 4.

$$I_{OL} = \frac{12}{R_{(ILIM)}} \quad (4)$$

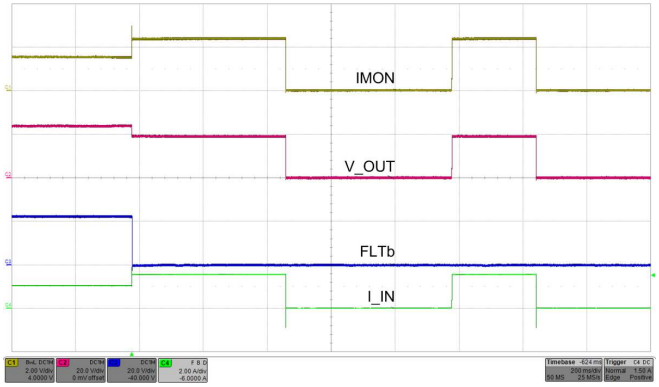
where

- $I_{(OL)}$ is the overload current limit in Ampere
- $R_{(ILIM)}$ is the current limit resistor in kΩ

During an overload condition, the internal current-limit amplifier regulates the output current to $I_{(LIM)}$. The $\overline{FLT}$ signal assert after a delay of t_{PGOODF}. The output voltage droops during the current regulation, resulting in increased power dissipation in the device. If the device junction temperature reaches the thermal shutdown threshold ($T_{(TSD)}$), the internal FET is turn off. The device configured in latch-off mode stays latched off until it is reset by either of the following conditions:

- Cycling $V_{(IN)}$ below $V_{(PORF)}$
- Toggling $\overline{SHDN}$

When the device is configured in auto-retry mode, it commences an auto-retry cycle $t_{CBretry(dly)}$ ms after $T_J < [T_{(TSD)} – 10°C]$. The $\overline{FLT}$ signal remains asserted until the fault condition is removed and the device resumes normal operation. 図 29 and 図 30 illustrates the behavior of the system during current limiting with auto-retry functionality.

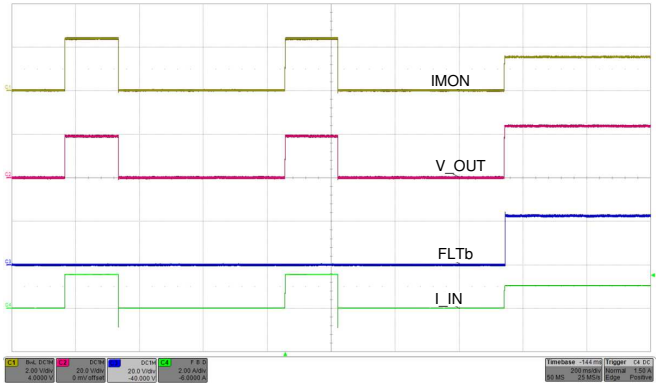


Load transition from 22 Ω to 12 Ω

R_{ILIM} = 8 kΩ

MODE pin connected to RTN

図 29. Auto-Retry MODE Fault Behavior



R_{ILIM} = 5.36 kΩ

図 30. Response During Coming Out of Overload Fault

8.3.5.1.2 Electronic Circuit Breaker with Overload Timeout, MODE = OPEN

In this mode, during overload events, the device allows the overload current to flow through the device until $I_{(LOAD)} < I_{(FASTRIP)}$. The circuit breaker threshold $I_{(CB)}$ can be programmed using the $R_{(ILIM)}$ resistor, as shown in 式 5.

$$I_{(CB)} = \frac{12}{R_{(ILIM)}} + 0.03A \quad (5)$$

where

- $I_{(CB)}$ is circuit breaker current threshold in A
- $R_{(ILIM)}$ is the current limit resistor in kΩ

The device commences an auto-retry cycle after a delay of $t_{CBretry(dly)}$. The $\overline{FLT}$ signal remains asserted until the fault condition is removed and the device resumes normal operation. 図 31 and 図 32 illustrate behavior of the system during electronic circuit breaker with auto-retry functionality.

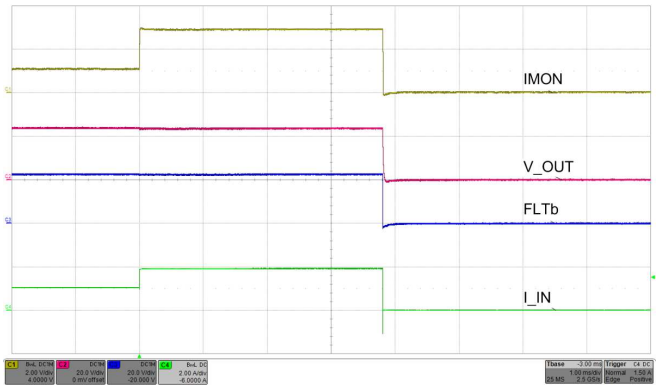
R_{ILIM} = 8 kΩ

Load Transition from 22 Ω to 12 Ω

図 31. Circuit Breaker Functionality

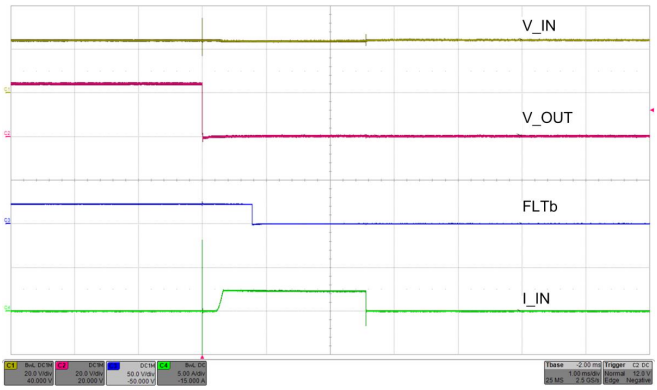


Load Transition from 22 Ω to 12 Ω , R_{ILIM} = 8 kΩ

図 32. Zoomed at the Instance of Load Step

8.3.5.2 Short Circuit Protection

During a transient output short circuit event, the current through the device increases very rapidly. As the current-limit amplifier cannot respond quickly to this event due to its limited bandwidth, the device incorporates a fast-trip comparator, with a threshold $I_{(FASTRIP)}$. The fast-trip comparator turns off the internal FET after a duration of $t_{FASTTRIP(dly)}$, when the current through the FET exceeds $I_{(FASTRIP)}$ ($I_{(OUT)}$ > $I_{(FASTRIP)}$), and terminates the rapid short-circuit peak current. The fast-trip threshold is internally set to 87% higher than the programmed overload current limit ($I_{(FASTRIP)}$ = 1.87 × $I_{(OL)}$ + 0.015). The fast-trip circuit holds the internal FET off for only a few microseconds, after which the device turns back on slowly, allowing the current-limit loop to regulate the output current to $I_{(OL)}$. Then the device behaves similar to overload condition. 図 33 and 図 34 illustrate the behavior of the system when the current exceeds the fast-trip threshold.



VIN = 24 V, R_{ILIM} = 5.36 kΩ

図 33. Output Hot Short Functionality at 24-V Input

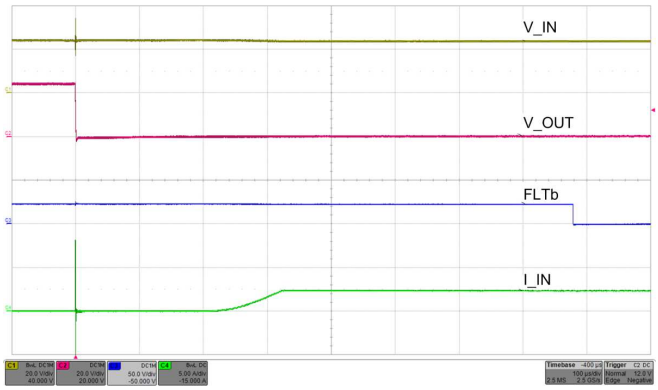


図 34. Zoomed at the Instance of Output Short

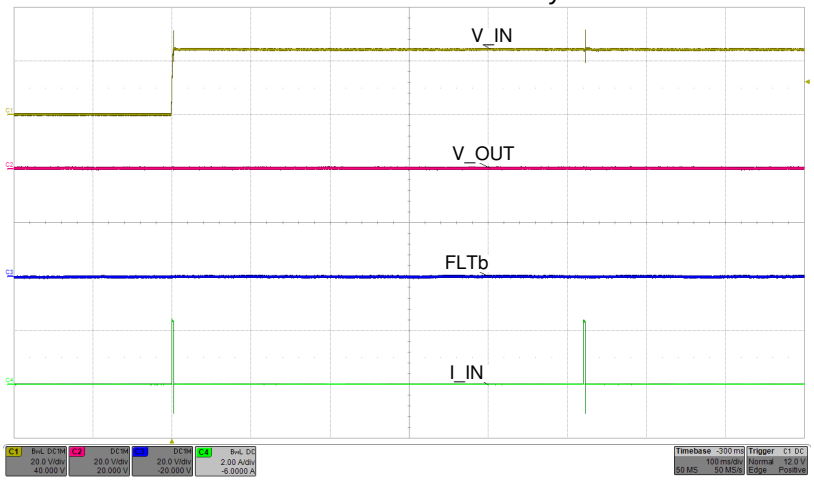
8.3.5.2.1 Start-Up With Short-Circuit On Output

When the device is started with a short-circuit on the output end, it limits the load current to the current limit $I_{(OL)}$, and behaves similarly to the overload condition. 図 35 illustrates the behavior of the device in this condition. This feature helps in quick isolation of the fault and hence ensures stability of the DC bus.



MODE pin connected to RTN

VIN = 24 V R_{ILIM} = 5.36 kΩ

図 35. Start-Up With Short on Output

8.3.5.3 FAULT Response

The $\overline{FLT}$ open-drain output asserts (active low) under following conditions:

- Fault events such as undervoltage, overvoltage, overload, reverse current and thermal shutdown conditions
- When the device enters low current shutdown mode when $\overline{SHDN}$ is pulled low
- During start-up when the internal FET GATE is not fully enhanced (for example: V_{OUT} has not reached V_{IN}).

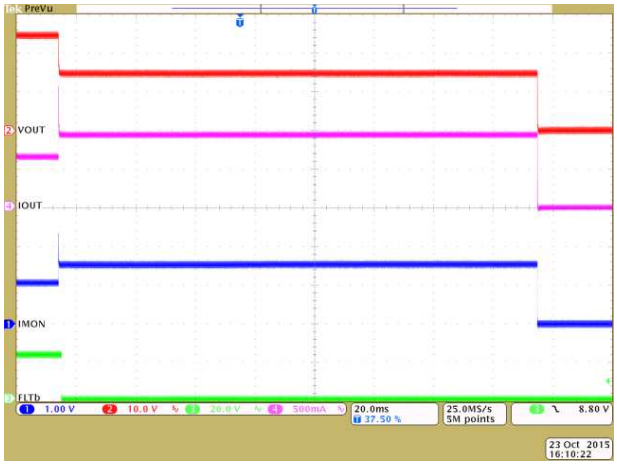
The $\overline{FLT}$ output does not assert in the event of reverse voltage on Input.

The device is designed to eliminate false reporting by using an internal "de-glitch" circuit for fault conditions without the need for an external circuitry.

The $\overline{FLT}$ signal can also be used as Power Good indicator to the downstream loads like DC-DC converters. An internal Power Good (PGOOD) signal is OR'd with the fault logic. During start-up, when the device is operating in dVdT mode, PGOOD and $\overline{FLT}$ remains low and is de-asserted after the dVdT mode is completed and the internal FET is fully enhanced and V_{OUT} has reached V_{IN}. The PGOOD signal has deglitch time incorporated to ensure that internal FET is fully enhanced before heavy load is applied by the downstream converters. Rising deglitch delay is determined by $t_{PGOOD(degl)}$ = Maximum {(900 + 20 × $C_{(dVdT)}$), t_{PGOODR}}, where $C_{(dVdT)}$ is in nF and $t_{PGOOD(degl)}$ is in µs. $\overline{FLT}$ can be left open or connected to RTN when not used. $V_{(IN)}$ falling below $V_{(PORF)}$ resets $\overline{FLT}$.

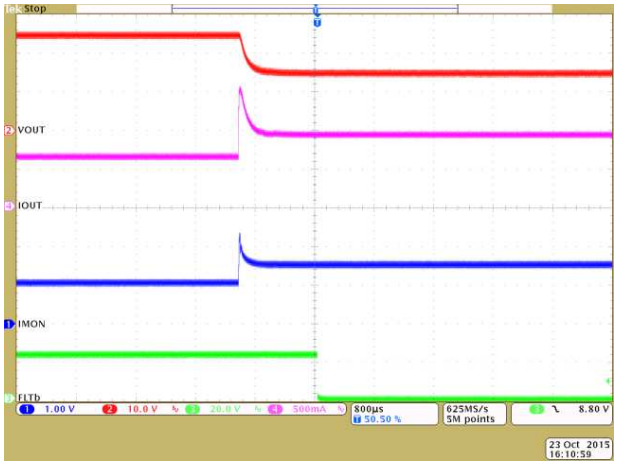
8.3.5.3.1 *Look Ahead* Overload Current Fault Indicator

With the device configured in current limit operation and when the overload condition exists for more than t_{PGOODF}, the $\overline{FLT}$ asserts to warn of impending turnoff of the internal FETs due to the subsequent thermal shutdown event. 図 36 and 図 37 depict this behavior. The $\overline{FLT}$ signal remains asserted until the fault condition is removed and the device resumes normal operation.



R_{ILIM} = 12 kΩ MODE pin connected to RTN Load transient event from 37 Ω to 15 Ω

図 36. Look Ahead Overload Current Fault Indication



R_{ILIM} = 12 kΩ MODE pin connected to RTN Load transient event from 37 Ω to 15 Ω

図 37. Output Turnoff Due to Thermal Shutdown With $\overline{FLT}$ Asserted in Advance

8.3.5.4 Current Monitoring

The current source at IMON terminal is internally configured to be proportional to the current flowing from IN to OUT. This current can be converted into a voltage using a resistor $R_{(IMON)}$ from IMON terminal to RTN terminal. The IMON voltage can be used as a means of monitoring current flow through the system. The maximum voltage range ($V_{(IMONmax)}$) for monitoring the current is limited to minimum of ([$V_{(IN)}$ – 1.5 V, 4 V]) to ensure linear output. This puts a limitation on maximum value of $R_{(IMON)}$ resistor and is determined by 式 6.

$$R_{(IMONmax)} = \frac{\text{Min}\left[(V_{(IN)} - 1.5),\ 4\ V\right]}{1.8 \times I_{(LIM)} \times GAIN_{(IMON)}} \quad (6)$$

The output voltage at IMON terminal is calculated using 式 7 and 式 8.

For I_{OUT} > 50 mA,

$$V(IMON) = \left[I(OUT) \times GAIN(IMON)\right] \times R(IMON)$$

Where,

- $GAIN_{(IMON)}$ is the gain factor $I_{(IMON)}$:$I_{(OUT)}$
- $I_{(OUT)}$ is the load current
- $I_{(MON\_OS)}$ = 2 µA (Typical)

(7)

For I_{OUT} < 50 mA (typical), IMON output current is close to $I_{(MON\_OS)}$ and 式 8 provides the voltage output with R_{IMON}.

$$V(IMON) = (I(IMON\_OS)) \times R(IMON)$$

(8)

This pin must not have a bypass capacitor to avoid delay in the current monitoring information.

In case of reverse input polarity fault, an external 100-kΩ resistor is recommended between IMON pin and ADC input to limit the current through the ESD protection structures of the ADC.

8.3.5.5 IN, OUT, RTN and GND Pins

The device has two pins for input (IN) and output (OUT). All IN pins must be connected together and to the power source. A ceramic bypass capacitor close to the device from IN to GND is recommended to alleviate bus transients. The recommended input operating voltage range is 4.2 V to 40 V. Similarly all OUT pins must be connected together and to the load. $V_{(OUT)}$, in the ON condition, is calculated using 式 9.

$$V(OUT) = V(IN) - \left(RON \times I(OUT)\right)$$

Where,

- R_{ON} is the total ON resistance of the internal FETs.

(9)

The GND pin must be connected to the system ground. RTN is the device ground reference for all the internal control blocks. Connect the device support components: $R_{(ILIM)}$, $C_{(dVdT)}$, $R_{(IMON)}$, $R_{(MODE)}$ and resistors for UVLO and OVP with respect to the RTN pin. Internally, the device has reverse input polarity protection block between RTN and the GND terminal. Connecting RTN pin to GND pin disables the reverse input polarity protection feature. if negative input voltage is applied on IN pins with RTN pin connected to GND, the device can get damaged.

8.3.5.6 Thermal Shutdown

The device has a built-in overtemperature shutdown circuitry designed to protect the internal FETs, if the junction temperature exceeds $T_{(TSD)}$. After the thermal shutdown event, depending upon the mode of fault response, the device either latches off or commences an auto-retry cycle 540 ms after T_J < [$T_{(TSD)}$ – 10°C]. During the thermal shutdown, the fault pin $\overline{FLT}$ pulls low to indicate a fault condition.

8.3.5.7 Low Current Shutdown Control ($\overline{SHDN}$)

The internal FETs and hence the load current can be switched off by pulling the $\overline{SHDN}$ pin below $V_{(SHUTF)}$ threshold with a micro-controller GPIO pin as shown in 図 38. The device quiescent current reduces to 16 µA (typical) in shutdown state. To assert $\overline{SHDN}$ low, the pull down must sink at least 10 µA at 400 mV. To enable the device, $\overline{SHDN}$ must be pulled up to $V_{(SHUTR)}$ threshold. Once the device is enabled, the internal FETs turns on with dVdT mode.

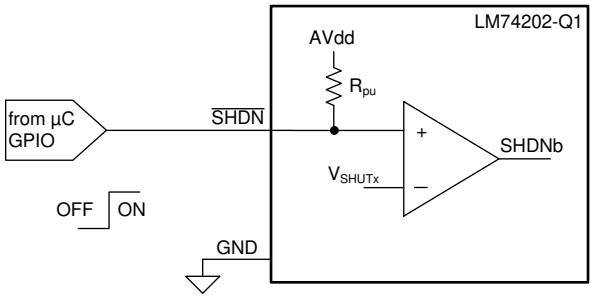


図 38. Shutdown Control

8.4 Device Functional Modes

The device responds differently to overload and short circuit conditions. The operational differences are explained in 表 2.

表 2. Device Operational Differences Under Different MODE Configurations

Mode Pin Configuration	Mode Connected To RTN (Current Limit With Auto-Retry)	A 402-KΩ Resistor Connected Between Mode And RTN Pins (Current Limit With Latchoff)	Mode Pin = Open
Start-up	Inrush current controlled by dVdT		
	Inrush limited to $I_{(OL)}$ level as set by $R_{(ILIM)}$	Inrush limited to $I_{(OL)}$ level as set by $R_{(ILIM)}$	Inrush limited to $I_{(OL)}$ level as set by $R_{(ILIM)}$
			Fault timer runs when current is limited to $I_{(OL)}$
			Fault timer expires after $t_{CB(dly)}$ causing the FETs to turnoff
	If $T_J > T_{(TSD)}$, device turns off	If $T_J > T_{(TSD)}$, device turns off	Device turns off if $T_J > T_{(TSD)}$ before timer expires
Overcurrent response	Current is limited to $I_{(OL)}$ level as set by $R_{(ILIM)}$	Current is limited to $I_{(OL)}$ level as set by $R_{(ILIM)}$	Current is allowed through the device if $I_{(LOAD)} < I_{(FASTTRIP)}$
	Power dissipation increases as $V_{(IN)} – V_{(OUT)}$ increases	Power dissipation increases as $V_{(IN)} – V_{(OUT)}$ increases	Fault timer runs when the current increases above $I_{(OL)}$
			Fault timer expires after $t_{CB(dly)}$ causing the FETs to turnoff
	Device turns off when $T_J > T_{(TSD)}$	Device turns off when $T_J > T_{(TSD)}$	Device turns off if $T_J > T_{(TSD)}$ before timer expires
	Device attempts restart 540 ms after $T_J < [T_{(TSD)} – 10°C]$	Device remains off	Device attempts restart 540 ms after $T_J < [T_{(TSD)} – 10°C]$.
Short-circuit response	Fast turnoff when $I_{(LOAD)} > I_{(FASTRIP)}$		
	Quick restart and current limited to $I_{(OL)}$, follows standard start-up		

9 Application and Implementation

注

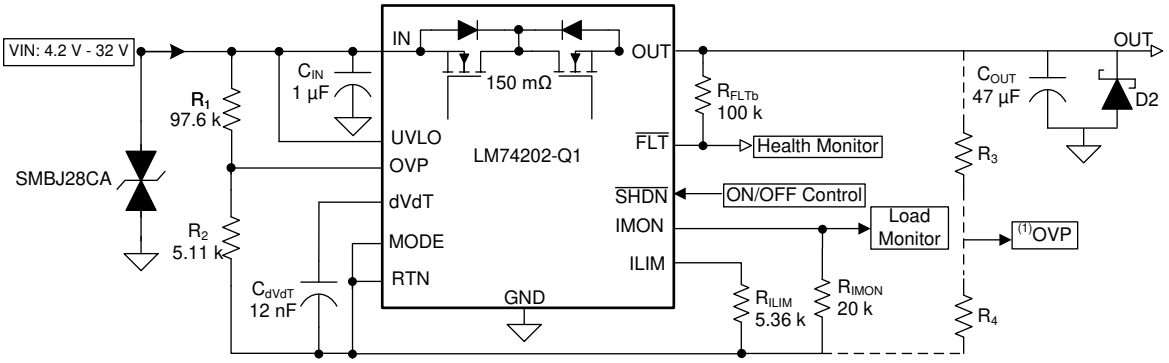
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The device is an automotive ideal diode, typically used for load protection in automotive applications. It can operate from 12-V battery with programmable current limit, overvoltage, undervoltage and reverse polarity protections. The device provides robust protection against reverse current and transients (such as ISO 7637-2 Pulse 1 and ISO 16750-2 Pulse 5b) due to cables and switches in different automotive systems such as an ECU. The device also provides robust protection for output short to battery, output short to GND, reverse battery and input overvoltage.

The *Detailed Design Procedure* section can be used to select component values for the device.

9.2 Typical Application



(1) OVP connection for Programmable over voltage clamp. See *Overvoltage Protection (OVP)*.

図 39. 12-V, 2-A Ideal Diode Load Protection Circuit for Automotive ECU

9.2.1 Design Requirements

表 3 shows the Design Requirements for LM74202-Q1. In addition to below requirements, the circuit is designed to provide protection for transients as per ISO 7637-2 Pulse 1 and ISO 16750-2 Pulse 5b.

表 3. Design Requirements

DESIGN PARAMETER		EXAMPLE VALUE
$V_{(IN)}$	Typical input voltage	4.2 to 32 V
$V_{(UV)}$	Undervoltage lockout set point	4 V
$V_{(OV)}$	Overvoltage cutoff set point	24 V
$I_{(LIM)}$	Current limit	2.23 A
$C_{(OUT)}$	Load capacitance	47 µF
$I_{(LOAD)}$	Load current	2 A

9.2.2 Detailed Design Procedure

9.2.2.1 Step by Step Design Procedure

To begin the design process, the designer must know the following parameters:

- Operating voltage range

- Maximum output capacitance
- Start-up time
- Maximum current limit
- Transient voltage levels

9.2.2.2 Setting Undervoltage Lockout and Overvoltage Set Point for Operating Voltage Range

To provide operation in cold crank conditions for automotive batteries, the UVLO is set to POR value (4 V) by connecting UVLO to IN pin and OVP threshold is set from resistors connected from IN pins to provide protection from transient during ISO 16750 Pulse 5b. During the ISO 16750 5b transient, output voltage is cut-off at 24 V and provides protection to load from high input voltage during the transient. The overvoltage threshold is calculated by 式 10.

$V_{OVPR} = R_2/(R_1 + R_2) \times V_{OV}$

where

- Overvoltage threshold rising, V_{OVPR} = 1.19 V
- V_{OV} is overvoltage protection voltage (= 24 V) (10)

However, the leakage current due to external active components connected at resistor string can add error to these calculations. So, the resistor string current, $I(R_{23})$ must be chosen to be 20x greater than the leakage current of OVP pin.

9.2.2.3 Programming the Current-Limit Threshold—$R_{(ILIM)}$ Selection

The $R_{(ILIM)}$ resistor at the ILIM pin sets the over load current limit, this can be set using 式 4.

$R_{(ILIM)}$ = 5.36 kΩ was selected to set I_{LIM} to 2.23 A.

9.2.2.4 Programming Current Monitoring Resistor—R_{IMON}

The voltage at IMON pin $V_{(IMON)}$ represents the voltage proportional to the load current. This can be connected to an ADC of the downstream system for health monitoring of the system. The $R_{(IMON)}$ must be configured based on the maximum input voltage range of the ADC used. $R_{(IMON)}$ is set using 式 11.

$$R(IMON) = \frac{V(IMON\,max)}{I(LIM) \times 75 \times 10^{-6}} \quad (11)$$

For current monitoring up-to a current of 2.2 A, and considering the operating input voltage range of ADC from 0 V to 4 V, $V_{(IMONmax)}$ is 4 V and $R_{(IMON)}$ is selected as 20 kΩ.

9.2.2.5 Limiting the Inrush Current

To limit the inrush current and power dissipation during start-up, an appropriate value of C_{dVdT} must be selected. The inrush current during start-up is estimated by 式 12. A 12nF capacitance is selected for C_{dVdT} to keep inrush current less than 0.5 A.

$I_{INRUSH} = C_{OUT} / [8.7 \times 10^3 \times C_{dVdt}]$ (12)

9.2.2.5.1 Selection of Input TVS for Transient Protection

To protect the device and the load from input transients exceeding the absolute maximum ratings of the device, a TVS diode is required at input of the device. To meet the requirements of protection for ISO 16750 pulse 5b and ISO 7637 pulse 1 as per 表 4, SMBJ28CA is selected for protection from transients.

表 4. Input TVS Selection for Transients

Parameter	ISO 16750 Pulse 5b	ISO 7637 Pulse 1 and Reverse Battery	
Maximum Transient Voltage of Pulse (V_T)	35 V	-150V	A bidirectional TVS is required to protect from positive and negative transients
Pulse Current through TVS (I_{Pulse})	$(V_T - V_C)/(R_i)$	$(V_T - V_C)/(R_i)$	R_i = Source impedance. For ISO 16750 Pulse 5b; R_i = 0.5 Ω For ISO 7637 Pulse 1;R_i = 10 Ω

表 4. Input TVS Selection for Transients (continued)

Parameter	ISO 16750 Pulse 5b	ISO 7637 Pulse 1 and Reverse Battery	
Clamping voltage of TVS (V_C) at Pulse current I_{Pulse}	< 55 V	> –(55 - $V_{OUT-Max}$) V	To keep input voltage below absolute maximum rating of the device. See 式 13 for V_C
Breakdown voltage of TVS (V_{BR})	> 32V	> 14V	To operate with maximum operating input voltage and to protect from maximum reverse battery voltage

$$V_C = V_{BR} + I_{Pulse} \times [V_{Clamp-max} - V_{BR}]/[I_{PP} - I_T] \quad (13)$$

where

- V_C is the clamping voltage of TVS at I_{Pulse} current through it.
- V_{BR} is break down voltage of TVS with I_T test current through it.
- $V_{Clamp-max}$ is maximum clamping voltage of TVS at peak pulse current I_{PP}
- V_{BR}, I_T, $V_{Clamp-max}$ and I_{PP} are the specifications of the TVS diode.

図 44. Protection from Reverse Battery [V_{IN} = -12 V, V_{OUT} = 0 V, ILIM = 2.23 A]

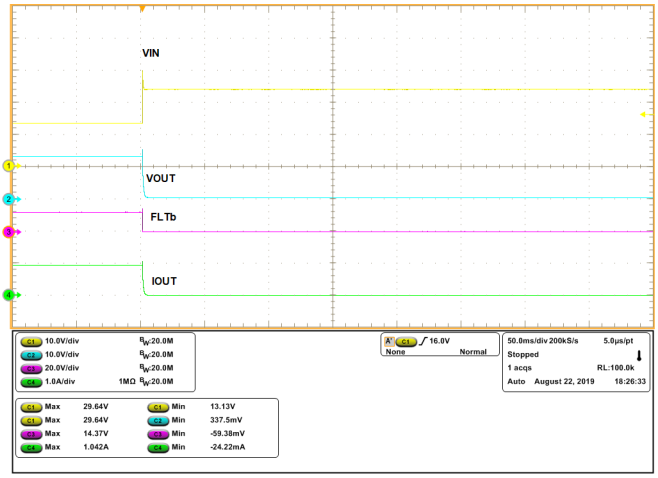

図 45. Protection from overvoltage at Input [V_{IN} = 36 V, R_{LOAD} = 14 Ω, ILIM = 2.23 A]

10 Power Supply Recommendations

The device is designed for the supply voltage range of 4.2 V ≤ V_{IN} ≤ 40 V. Power supply must be rated higher than the current limit set to avoid voltage droops during overcurrent and short circuit conditions.

10.1 Transient Protection

In case of short circuit and over load current limit, when the device interrupts current flow, input inductance generates a positive voltage spike on the input and output inductance generates a negative voltage spike on the output. The peak amplitude of voltage spikes (transients) is dependent on value of inductance in series to the input or output of the device. Such transients can exceed the *Absolute Maximum Ratings* of the device if steps are not taken to address the issue.

Typical methods for addressing transients include:

- Minimizing lead length and inductance into and out of the device
- Using large PCB GND plane
- Schottky diode across the output to absorb negative spikes
- A ceramic capacitor at input ($C_{(IN)}$) with value more than 1µF to absorb the energy and dampen the transients.

The approximate value of input capacitance can be estimated with 式 14.

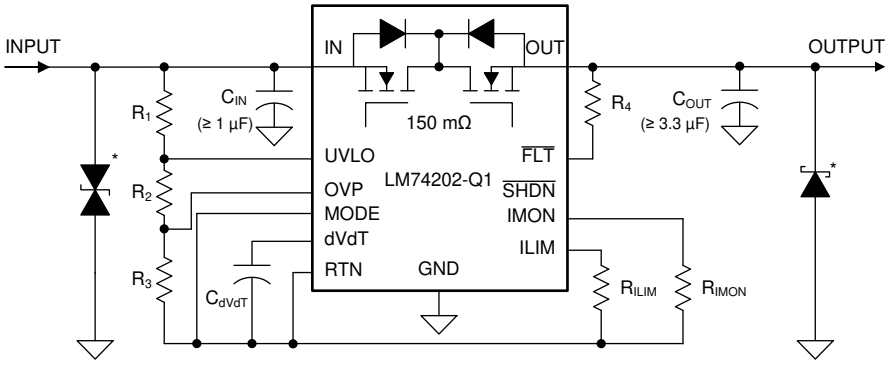
$$V_{spike(Absolute)} = V_{(IN)} + I_{(Load)} \times \sqrt{\frac{L_{(IN)}}{C_{(IN)}}} \quad (14)$$

where

- $V_{(IN)}$ is the nominal supply voltage
- $I_{(LOAD)}$ is the load current
- $L_{(IN)}$ equals the effective inductance seen looking into the source
- $C_{(IN)}$ is the capacitance present at the input

Automotive applications could require additional Transient Voltage Suppressor (TVS) to prevent transients from exceeding the *Absolute Maximum Ratings* of the device. These transients include ISO 7637 Pulse 1, Output short to battery, Output short to GND and reverse battery at input.

The circuit implementation with optional protection components (TVS Diode at Input and schottky diode at output) is shown in 図 46. For protection from automotive transients similar to ISO 7637 Pulse 1, Output short to battery , output short to GND and reverse battery, use C_{IN} ≥ 1 µF and C_{OUT} ≥ 3.3 µF. For selection of TVS diode and other components, see *Application Information*.



* Optional components needed for suppression of transients

図 46. Circuit Implementation for Automotive Transient Protection

11 Layout

11.1 Layout Guidelines

- For all the applications, a 0.1 µF or higher value ceramic decoupling capacitor is recommended between IN terminal and GND. Use C_{IN} ≥ 1 µF for automotive transient protection. See *Transient Protection*.
- The optimum placement of decoupling capacitor is closest to the IN and GND terminals of the device. Care must be taken to minimize the loop area formed by the bypass-capacitor connection, the IN terminal, and the GND terminal of the device. See 図 47 for PCB layout example with HTSSOP package.
- High current carrying power path connections must be as short as possible and must be sized to carry atleast twice the full-load current.
- RTN, which is the reference ground for the device must be a copper plane or island.
- Locate all the device support components $R_{(ILIM)}$, $C_{(dVdT)}$, $R_{(IMON)}$, and MODE, UVLO, OVP resistors close to their connection pin. Connect the other end of the component to the RTN with shortest trace length.
- The trace routing for the R_{ILIM} and $R_{(IMON)}$ components to the device must be as short as possible to reduce parasitic effects on the current limit and current monitoring accuracy. These traces must not have any coupling to switching signals on the board.
- Protection devices such as TVS, snubbers, capacitors, or diodes must be placed physically close to the device they are intended to protect, and routed with short traces to reduce inductance. For example, a protection Schottky diode is recommended to address negative transients due to switching of inductive loads, and it must be physically close to the OUT and GND pins.
- Thermal Considerations: When properly mounted, the PowerPAD package provides significantly greater cooling ability. To operate at rated power, the PowerPAD must be soldered directly to the board RTN plane directly under the device. Other planes, such as the bottom side of the circuit board can be used to increase heat sinking in higher current applications. Designs that do not need reverse input polarity protection can have RTN, GND and PowerPAD connected together. PowerPAD in these designs can be connected to the PCB ground plane.

重要なお知らせと免責事項

TI は、技術データと信頼性データ（データシートを含みます）、設計リソース（リファレンス・デザインを含みます）、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションが適用される各種規格や、その他のあらゆる安全性、セキュリティ、またはその他の要件を満たしていることを確実にする責任を、お客様のみが単独で負うものとします。上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、TI の販売条件（www.tij.co.jp/ja-jp/legal/termsofsale.html）、または ti.com やかかる TI 製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。TI がこれらのリソースを提供することは、適用されるTI の保証または他の保証の放棄の拡大や変更を意味するものではありません。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LM74202QPWPRQ1	ACTIVE	HTSSOP	PWP	16	2000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	M74202Q	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

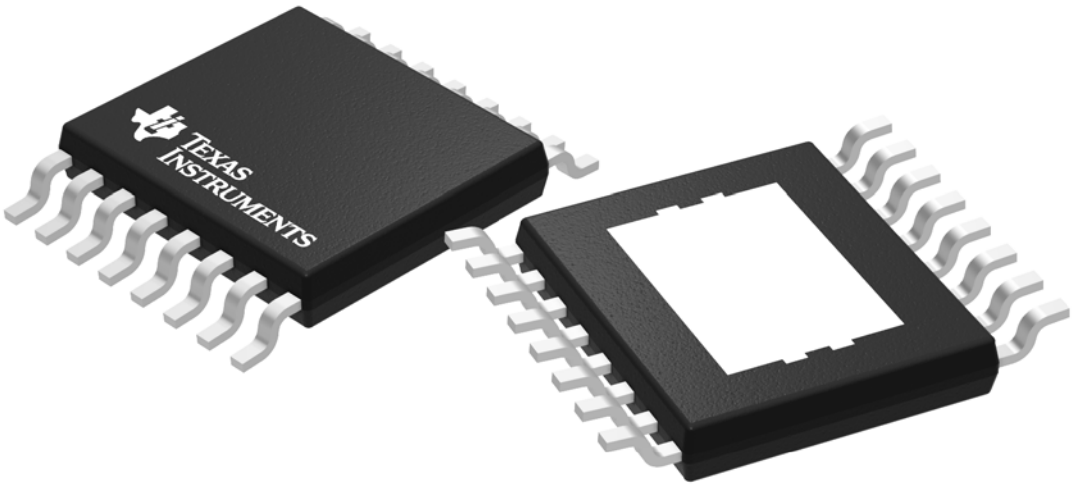
(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

PWP 16 PowerPAD™ TSSOP - 1.2 mm max height

PLASTIC SMALL OUTLINE



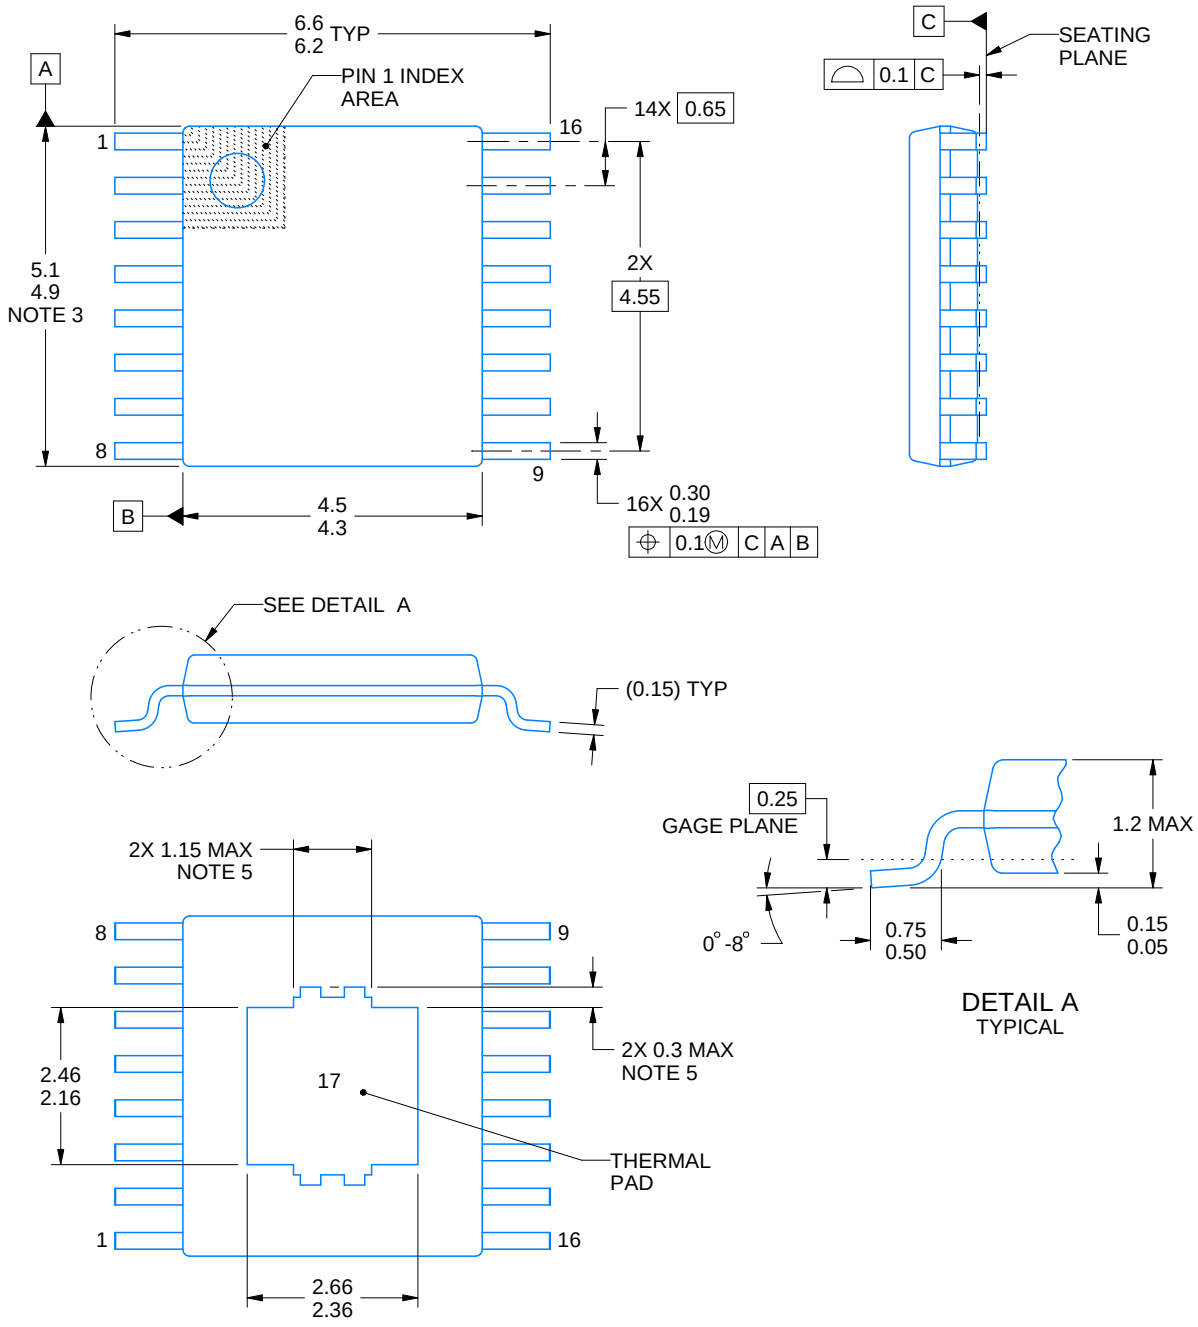
Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

PACKAGE OUTLINE

PWP0016H

PowerPAD™ TSSOP - 1.2 mm max height

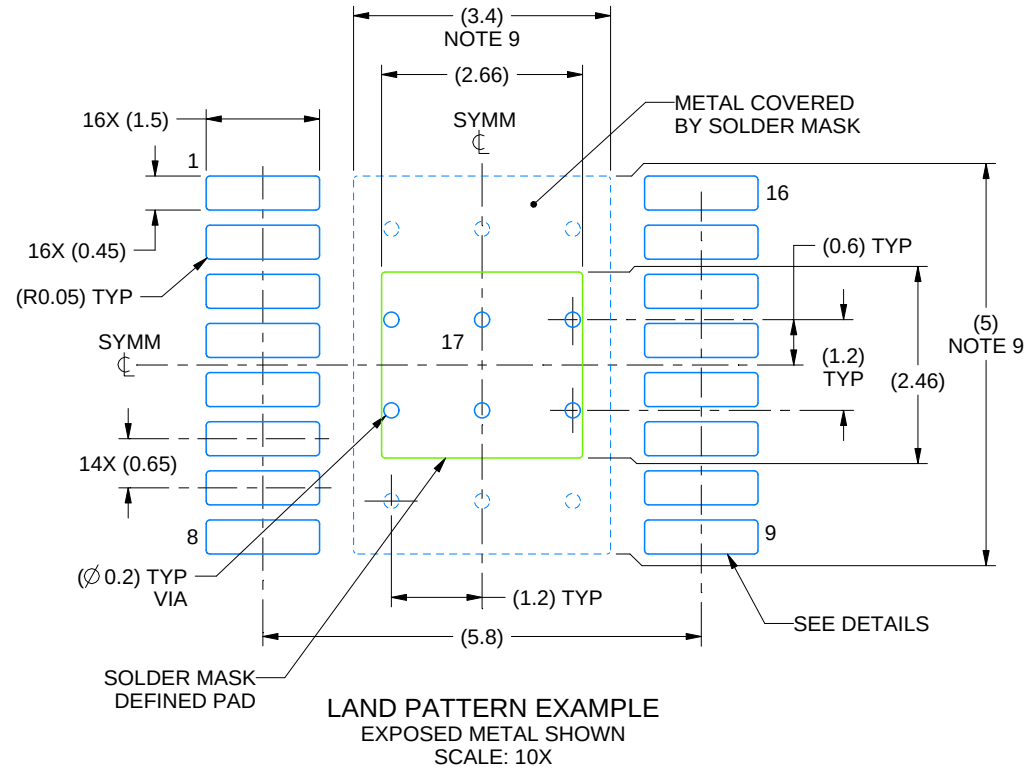
SMALL OUTLINE PACKAGE



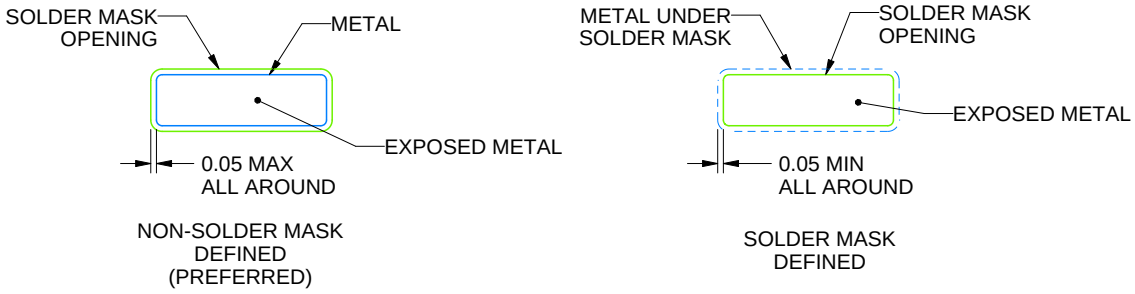
PowerPAD is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC registration MO-153.
5. Features may differ or may not be present.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 10X

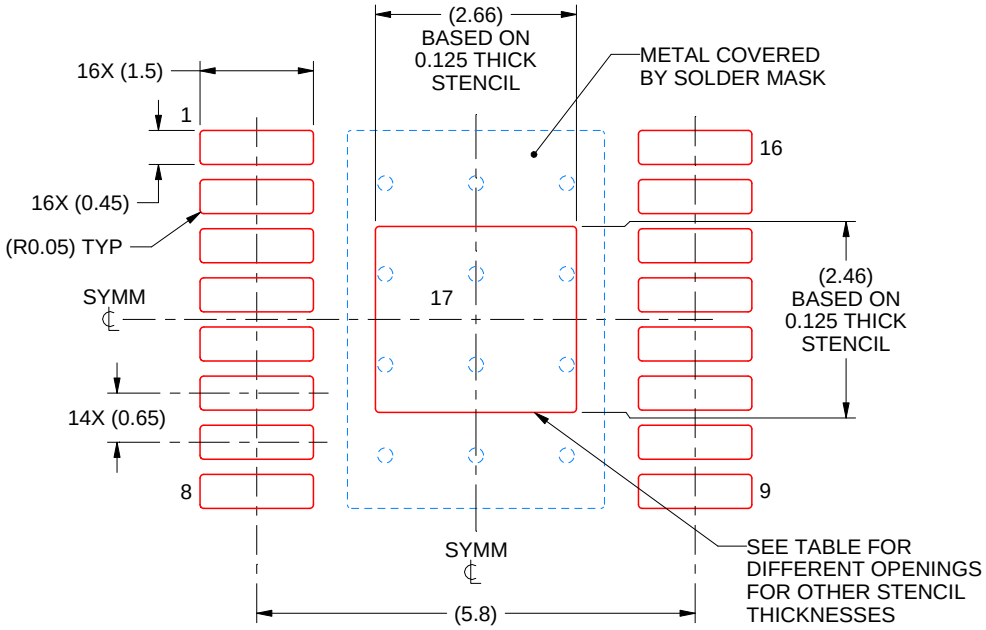


SOLDER MASK DETAILS

4223630/A 04/2017

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
9. Size of metal pad may vary due to creepage requirement.
10. Vias are optional depending on application, refer to device data sheet. It is recommended that vias under paste be filled, plugged or tented.



SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE: 10X

STENCIL THICKNESS	SOLDER STENCIL OPENING
0.1	2.97 X 2.75
0.125	2.66 X 2.46 (SHOWN)
0.15	2.43 X 2.25
0.175	2.25 X 2.08

4223630/A 04/2017

NOTES: (continued)

11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
12. Board assembly site may have different recommendations for stencil design.
