ABSTRACT
The TSC2007 Microsoft® Windows® CE (WinCE) 6.0 touch driver was developed with an I²C™ control interface; the code has been tested on a Samsung® SC32442 application processor. This application report discusses the TSC2007 driver, including the hardware connection between the TSC2007 and the platform, the WinCE 6.0 driver code structure, and the installations. Project collateral discussed in this application report can be downloaded from the following URL: http://www.ti.com/lit/zip/SBAA168.

1 Introduction
The TSC2007 WinCE 6.0 driver was developed to help users of the TSC2007 touch screen controller device from Texas Instruments to quickly set up, run, and use the device and to shorten software driver development time. The TSC2007 touch driver was coded on the standard WinCE touch device driver platform-dependent device (PDD) layer, and the PDD layer was further split to have an additional processor-dependent layer (PDL) to make the TSC2007 driver easy to port into different host processors. See TI application report SLAA187 for additional details on both PDD and PDL. The driver was developed and tested using a TSC2007EVM board and the Samsung SMDK platform with an SC32442 application processor.

2 Connections
The TSC2007 device must be wired and connected to a host processor to which the device driver code is ported and executed. In developing the TSC2007 drivers for this application, the TI TSC2007EVM board and the Samsung platform with the SC32442A application processor were used.

The host processor controls the TSC2007 through an interface that consists of three digital signals:
- The two-wire I²C bus: SCL and SDA;
- The touch pen-down interrupt, PENIRQ.

See Figure 1 for the connections between the TSC2007 device and the SMDK2442 applications processor.

On the TSC2007EVM board, a connection to J2 was made in order to wire the three digital signals SCL, SDA, and PENIRQ. For details on J2 and other aspects of the TSC2007EVM, see the TSC2007EVM User Guide.

On the Samsung SMDK2442 platform, the original touch module connected on the SMDK2442 main board was removed and replaced with the connections as shown in Figure 1. See Reference 4 and other relevant Samsung documentation for additional information about the Samsung SMDK2442 platform.
In addition to the three digital signal pins, the TSC2007 touch panel input signals, X+, X−, Y+ and Y−, are connected to the corresponding pins on the Samsung SMDK2442 touch panel, as Figure 1 indicates.

3 Device Driver

Figure 2 details the TSC2007 touch device driver code file structure.

Figure 2. TSC2007 WinCE 6.0 Driver Files with \textsuperscript{I^C} Control Interface
3.1 I²C Interface

The I²C bus is the control and data bus through which the host processor sends address and control commands to the TSC2007 and reads the touch screen or other data back from the device. The I²C communication code was developed as a library and put into the directory, TSCLIB.

On the hardware side, the two TSC2007 I²C bus pins (SCL and SDA) are connected to pins GPE14 and GPE15 of the Samsung SC32442 processor, respectively.

On the software side, the Samsung SC32442, I²C, and clock management control registers are set up to communicate to the TSC2007 through the I²C interface. The setup is implemented at the routine, HWInitI2C(), which is inside the file HostI2CComm.C.

```c
BOOL HWInitI2C(BOOL InPowerHandle)
{
    UINT8 reg = 0x00;
    RETAILMSG(TOUCH, (TEXT("Setup Host GPIO & I2C for an I2C Interface..\r\n")));
    // init I2C control register (disabled I2C unit)
    // enable I2C unit clock (the clock should be enabled first)
    g_pClockRegs->CLKCON |= S3C_CLKEN_I2C;
    // set up GPE
    g_pGPIORegs->GPEDN |= GPE_DN; //0xc000, Pull-up disable
    //Making GPE15=>IICSDA, GPE14=>IICSCL
    g_pGPIORegs->GPECON |= (GPE14_IIC_SCL | GPE15_IIC_SDA);
    //Enable ACK, Prescalar IICCLK=PCLK/16, Enable interrupt, Transmit clock //value Tx clock=IICCLK/16
    //e.g. If PCLK 50.7MHz, IICCLK = 3.17 MHz, TX Clock = 0.198MHz
    reg = ICR_ACK | ICR_INTR;
    reg &= ~(ICR_TXCLK);
    reg |= ICR_TXCLKVAL;
    g_pI2CRegs->IICCON = reg;
    g_pI2CRegs->IICADD = 0x10; //2442 slave address [??:1]
    g_pI2CRegs->IICSTAT |= ISR_ENOP; //IIC bus data output enable(Rx/Tx)
    //Filter enable and
    g_pI2CRegs->IILCR = ILCR_FEN | ILCR_SDADLY; //15 clocks SDA output delay
    DumpRegsI2C();
    return(TRUE);
}
```
Two other important I2C interface routines are the `HWI2CWrite()` and `HWI2CRead()`. These routines allow the S3C2442 to control the TSC2007, performing touch data acquisition and reading the data back from the TSC2007. The complete I2C write and read transmissions are defined as shown in the TSC2007 product data sheet (Reference 1).

```c
// Function: HWI2CWrite Routine
// Purpose: This routine allows the SMDK2442 to write to TSC2007 control register(s) using I2C bus.
// Note: The first byte in bytesBuf is the starting address for writing; and the 2nd and on are bytes/contents writing to TSC2007.
BOOL HWI2CWrite(UINT8 *bytesBuf, int bytesCount, BOOL InPowerHandle)
{
    int i;
    RETAILMSG(TOUCH, (TEXT("HWI2CWrite. ... \r\n"))); if (!InPowerHandle)
    {
        UINT8 reg, time = 100;
        iicMod = WR_DATA;
        iicPtr = 0;
        for(i = 0; i < bytesCount; i++) //Putting 1st byte i.e register addr iicDat[i] = *bytesBuf++;
            //2nd byte onwards actual data
            iicDCount = bytesCount;
        g_pI2CRegs->IICDS = I2C_WRITE; //I2C_WRITE;
        //Putting TSC2007 slave address (7bit address + 0 'write bit')
        reg = g_pI2CRegs->IICSTAT; //Master transmit mode, START signal generation, Enable output
        reg = (ISR_MTX | ISR_START | ISR_ENOP); //Master tx mode, START signal generation,
        g_pI2CRegs->IICSTAT = reg;
        while(iicDCount != -1)
            Run_Iic_Poll();
        iicMod = POLL_ACK;
        while(time--)
            {
                g_pI2CRegs->IICDS = I2C_WRITE; //I2C_WRITE;
                //Putting TSC2007 slave address (7bit address + 0 'write bit')
                reg = g_pI2CRegs->IICSTAT; //Master transmit mode, START signal generation,
                g_pI2CRegs->IICSTAT = reg;
                while((iicStat & 0x1) == 0)
                    Run_Iic_Poll();
                if(!(iicStat & 0x1))
                    break; //When ACK is received
            }
        g_pI2CRegs->IICSTAT = ~{ISR_STOP}; //Stop MasTx condition
        reg = g_pI2CRegs->IICCON; //Resumes IIC operation.
        reg = ICR_ACK | ICR_INTR | ICR_TXCLKVAL;
        reg &= ~(ICR_PENITR); //Resumes IIC operation.
        g_pI2CRegs->IICCON = reg;
        Delay(3); //Wait until stop condition is in effect.
    }
```
///Write is completed.
   return(TRUE);
}
else
{
   RETAILMSG(TOUCH, (TEXT("HW Tx Error...\n")));
   return(FALSE);
}

/// Function: HWI2CRead Routine
/// Purpose: This routine allows the SMDK2442 to read from TSC2007
/// control register(s) using I2C bus.
/// Note: The first byte in bytesBuf is the starting address for
/// reading; and the 2nd and on are values reading from TSC2007
///
/// UINT8 HWI2CRead(UINT8 *bytesBuf, INT bytesCount, BOOL InPowerHandle)
{
   RETAILMSG(TOUCH, (TEXT("HWI2CRead.... \r\n")));
   if (!InPowerHandle)
   {
      UINT8 reg;
      iicMod = SETRD_ADDR;
      iicPtr = 0;
      iicDat[0] = *bytesBuf++ ; //Putting 1st byte i.e. register address
      iicDCount = 1;

      //Putting slave address of TSC2007 for write mode [7:0]
      g_pI2CRegs->IICDS = I2C_WRITE;
      Delay(1);

      reg = g_pI2CRegs->IICSTAT;
      reg = (ISR_MTX | ISR_START | ISR_ENOP); g_pI2CRegs->IICSTAT = reg;

      while(iicDCount!=-1)
      Run_Iic_Poll();

      iicMod = RD_DATA;
      iicPtr = 0;
      iicDCount = bytesCount;

      //Putting slave address of TSC2007 for read mode [7:1]
      g_pI2CRegs->IICDS = I2C_READ;
      Delay(1);

      reg = g_pI2CRegs->IICSTAT;
      reg = (ISR_MRX | ISR_START | ISR_ENOP);
      g_pI2CRegs->IICSTAT = reg; //Mater Rx, Start signal
      g_pI2CRegs->IICCON = reg; //Resumes IIC operation.

      while(iicDCount!=-1)
      Run_Iic_Poll();

      reg = g_pI2CRegs->IICC0N;
      reg &= ~(ICR_PENITR);
      g_pI2CRegs->IICC0N = reg; //Mater Rx, Start signal
      reg = g_pI2CRegs->IICC0N;
      reg &= ~(ICR_PENITR);
      g_pI2CRegs->IICC0N = reg;

      *bytesBuf++ = (UINT8) iicDat[1];
      return(1);
   }
   else
   {
      RETAILMSG(TOUCH, (TEXT("HW Rx Error....\r\n")));
      return(0);
   }
}
3.2 Touch Device Driver

In the Samsung SMDK2442 system, the interrupt PENIRQ pin has been connected to the external interrupt EINT22, where the PENIRQ is fed to the S3C2442 GPG14 (J2.2) pin. The touch device driver is in the directory TOUCH, developed on the PDD layer of the standard touch device driver structure.

In the TSC2007 touch driver, PENIRQ is enabled to detect any touch on the screen; PENIRQ then triggers the DdsiTouchPanelGetPoint() routine on the PDD layer whenever PENIRQ becomes active.

```c
void DdsiTouchPanelGetPoint(TOUCH_PANEL_SAMPLE_FLAGS *pTipStateFlags, INT *pUncalX, INT *pUncalY) {
    static INT PrevX = 0;
    static INT PrevY = 0;
    static bool fPenDown = TRUE;
    UINT8 pWords[] = {0,0,0,0,0};

    // EINTPEND Reg holds the raw interrupt status for the TOUCH interrupt.
    // making use of the EINTPEND reg here to know status of the TOUCH.
    g_pIORegs->EINTPEND = (1<<22);
    if(g_pIORegs->EINTPEND & (1<<22)) // TOUCH occurred
        fPenDown = TRUE; // NO TOUCH
    else
        fPenDown = FALSE;

    if (g_pINTregs->INTMSK & (1<<IRQ_TIMER3)) //gIntrTouchChanged Case.
        if(!GetCoordinate(&PrevX, &PrevY))
            *pTipStateFlags = TouchSampleIgnore;
        else{
            TransCoordinate(&PrevX, &PrevY);
            *pTipStateFlags = TouchSampleValidFlag | TouchSampleDownFlag;
            *pTipStateFlags &= ~TouchSampleIgnore;
            *pUncalX = PrevX;
            *pUncalY = PrevY;
            TouchTimerStart();
        }
    InterruptDone(gIntrTouchChanged);

    // The next expected interrupt will come from TIMER.
    RETAILMSG(TOUCH, (TEXT("$S$S$S$ TIMER: X=%d\tY=%d\n"),*pUncalX,*pUncalY));
    else
        if(fPenDown) // The TIMER irq ...
            *pTipStateFlags = TouchSampleValidFlag;
        else{
            TransCoordinate(&PrevX, &PrevY);
            *pTipStateFlags = TouchSampleValidFlag | TouchSampleDownFlag;
            *pUncalX = PrevX;
            *pUncalY = PrevY;
            TouchTimerStop();
        }
    InterruptDone(gIntrTouch); InterruptDone(gIntrTouchChanged);

    // The next expected interrupt will come from pen-down event.
    RETAILMSG(TOUCH, (TEXT("***** UP: X=%d\tY=%d\n"),*pUncalX,*pUncalY));
}
```
4 Installation

This section presents the installation steps required to run the TSC2007 WinCE 6.0 drivers on the Samsung SMDK2442 platform. The SC32442 application processor BSP can be obtained from Samsung and should be installed. After the application processor BSP installation, it will be located on your PC in a standard location within the WinCE directory; for example, at C:\WinCE600\PLATFORM\ as SMDK2442.

To install the TSC2007 WinCE 6.0 driver into the SMDK2442 workspace, execute the following steps.

4.1 Step 1: Copy

Copy the following files and directories:

1. Copy all files inside \TSC2007WinCE6Driver\INC\ into this directory: C:\WinCE600\PLATFORM\SMDK2442\SRC\INC\n
2. Copy \TSC2007WinCE6Driver\Intr\intr.c file to this location: C:\WinCE600\PLATFORM\SMDK2442\SRC\Common\Intr\n
3. Copy the directories TSCLIB and TOUCH into: C:\WINCE600\PLATFORM\SMDK2442\SRC\DRIVERS\n
4.2 Step 2: Open

This step, in the Microsoft Visual Studio® 2005 Platform Builder IDE for CE 6.0, opens a new or existing SMDK2442 workspace. This procedure is ignored here.
### 4.3 Step 3: Modify

This step modifies the building device drivers to include the TI TSC2007 drivers.

1. Open the `dirs` file in the directory: `C:\WINCE600\PLATFORM\SMDK2442\SRC\DRIVERS\`

2. Add in the `TSCLIB` just before the `TOUCH`.

   For example, the `dirs` file could be:
   
   ```plaintext
   DIRS=\
   ceddk\ 
   keybd\ 
   PowerButton\ 
   pccard\ 
   serial\ 
   nledrvr\ 
   BattDRVr\ 
   cs8900\ 
   Display\ 
   Backlight\ 
   TSCLIB\ 
   Touch
   ```

### 4.4 Step 4: Update

This step updates the hardware-specific files so that the operating system will use the TSC2007 device drivers.

1. Open the existing `platform.reg` file from the parameter files section under the SMDK2442 in the PLATFORM window of the workspace.

2. Edit the `platform.reg` file such as to delete the old `Touch.dll` file, and to add in the TSC2007 Touch Screen Controller:

   ```plaintext
   ;**********************************************TI-TSC200x***********
   ; @CESYSGEN IF CE_MODULES_POINTERS
   IF BSP_NOTOUCH !
   [HKEY_LOCAL_MACHINE\HARDWARE\DEVICEMAP\TOUCH]
   "DriverName"="touch.dll"
   "MaxCalError"=dword:10
   ; portrait
   "CalibrationData"="491,632 115,124 110,1136 848,1136 852,132 "
   ENDIF BSP_NOTOUCH ! 
   ; @CESYSGEN ENDFILE CE_MODULES_POINTERS
   ;*********************************************************
   ```

3. Save and close the updated `platform.reg` file.

4. Similarly, edit the `platform.bib` file, located in the same path as the `platform.reg` file, by replacing the existing entry of the touch related `.dll` files into the NK.bin image with the following entry in the `platform.bib` file:

   ```plaintext
   ;**********************************************************TI-TSC200x**********************
   ; @CESYSGEN IF CE_MODULES_POINTERS
   touch.dll $(\FLATRELEASEDIR)\touch.dll NK SHK
   ENDIF BSP_NOTOUCH !
   ; @CESYSGEN ENDFILE CE_MODULES_POINTERS
   ;**************************************************************
   ```

5. Save and close the updated `platform.bib` file.
