The INA115 is a precision instrumentation amplifier (IA). Its gain-sense and amplifier output connections are available so that gains can be accurately set using external resistors. By adding switches or a multiplexer, you can make a precision programmable-gain IA (PGIA). Using the circuit topology shown in this bulletin, the switches are in series with op amp inputs so their resistance does not add error.

Burr-Brown offers fixed and programmable-gain IAs with amplifiers similar to the INA115. If you need a fixed gain of 100V/V, use the INA131. If you need a digitally programmable IA with decade gains of 1, 10, 100, and 1000V/V, or binary gains of 1, 2, 4, and 8V/V, use the PGA204 or PGA205.

If you need an IA with more gain steps, you can cascade two or more PGIs. For example, if you cascade two PGA205s you will get gains of 1, 2, 4, 8, 16, 32, and 64V/V.

For other gains or gain-steps, you may want to make your own PGA using an INA115. The circuits and equations below make it easy to design a programmable-gain IA with any gains and any number of gain steps.

**TABLE I. Fixed and Programmable-Gain IAs.**

**FIGURE 1. Programmable-Gain Instrumentation Amplifier with n Gain Steps and Lowest Gain > 1V/V.**
If you want a PGIA with n gains and the first gain is not unity (1V/V), use the following relationships and the circuit shown in Figure 1.

**RESISTOR VALUES FOR PGIA WITH n GAINS AND LOWEST GAIN > 1V/V**

R₀ = Your choice (e.g. 25kΩ)

R₀ = 25kΩ when using the internal feedback resistors in the INA115 (see Figure 2)

R₁ = \( \frac{R₀ (G₁ - G₂)}{G₁} \)

R₂ = \( \frac{G₁ G₂ (G₁ - G₃)}{G₃} \)

\[ \vdots \]

Rₙ = \( \frac{Gₙ Rₙ (Gₙ - Gₙ₊₁)}{Gₙ₊₁} \)

Rₛ = \( \frac{2Gₙ Rₙ}{Gₙ (G₁ - 1)} \)

Where:

Gᵢ = Intermediate gain (V/V)

Gₙ = Highest gain (V/V)

R₀, R₁, ... Rₛ = Resistor value per circuit diagram (Ω)

If you want to use the 25kΩ feedback resistors in the INA115 for the R₀s, you can use the circuit shown in Figure 2. Keep in mind that the gain accuracy and gain drift will be limited by the internal feedback resistors. The 25kΩ feedback resistors have a tolerance of ±0.5% with a temperature coefficient of resistance drift (TCR) of up to 100ppm/°C. In the INA131, PGA204 and PGA205, resistor matching and TCR tracking of the resistors on the die give typical gain error and drift of 0.01% and 5ppm/°C.

**TABLE II. Examples of Resistor Values for Selected Gains—Figure 1 and 2 Circuits.**

FIGURE 2. Programmable-Gain Instrumentation Amplifier with n Gain Steps and Lowest Gain > 1V/V. This circuit uses the 25kΩ feedback resistor in the INA115 for R₀ of Figure 1.
If you want a PGIA with \(n\) gains and the first gain is unity (1V/V), use the following relationships and the circuit shown in Figure 3.

**RESISTOR VALUES FOR PGIA WITH \(n\) GAINS AND LOWEST GAIN = 1V/V**

\(R_0 = 0\)

\(R_1 = \text{Your choice (e.g. } 25k\Omega)\)

\(R_1 = 25k\Omega\) when using the internal feedback resistors in the INA115 (see Figure 4)

\[
R_2 = \frac{R_1 (G_1 - G_2)}{G_2 (1 - G_2)}
\]

\[
R_3 = \frac{G_2 R_1 (G_3 - G_4)}{G_3 G_m (1 - G_2)}
\]

\[
R_n = \frac{G_m R_1 (G_m - G_{m+1})}{G_m G_{m+1} (1 - G_2)}
\]

\[
R_n = \frac{2 G_n R_1}{G_n (G_2 - 1)}
\]

Where:

- \(G_m = \text{Intermediate gain (V/V)}\)
- \(G_n = \text{Highest gain (V/V)}\)
- \(R_0, R_1, \ldots, R_n = \text{Resistor value per circuit diagram (Ω)}\)

If you want to use the 25kΩ feedback resistors in the INA115 for the \(R_1\)’s, you can use the circuit shown in Figure 4. Keep in mind the gain accuracy and gain drift limitations discussed previously.

An actual example of a four-gain digitally programmable IA is shown in Figure 5. It uses a four-channel differential multiplexer (MUX) for gain switching.
