ABSTRACT
The TAS5825M Class-D audio power amplifier is the latest TI digital input amplifier that uses advanced PWM switching techniques for reducing electromagnetic interference (EMI) without degrading audio performance. This application note describes the system design and printed circuit board (PCB) guidelines used to maximize the technology employed in this device. These techniques include the EMI suppression without the need for expensive inductor filters and the reduction of external component count.

1 General Overview

The emphasis on green technologies and sleek-looking electronics (such as the flat panel TV) has lead manufacturers to produce space-efficient and attractive products without sacrificing performance. The TAS5825M Class-D audio power amplifier provides Class AB audio performance using only the PCB as heat sink due to its high efficiency. In addition, the TAS5825M device has advanced PWM modulation and switching schemes that help reduce EMI while eliminating the need for the traditional Class-D output filter. PWM filtering requires only smaller and less expensive RF filter components. No external heat sink and less RF filtering result directly in PCB size reduction.

Discussions in the following sections explain the PCB layout practice and external components selection in order to achieve optimal audio performance and pass electromagnetic compatibility (EMC) specification EN55022.

• Section 2 describes the advanced emission suppression techniques used to combat EMI.
• Section 3 discusses the PCB design guidelines for audio quality and EMC.
• Section 4 shows the EMC results.

2 Advanced Emission Suppression

2.1 Spread Spectrum Modulation

EMI is electromagnetic radiation emitted by electrical systems with fast changing signals that are common to the outputs of a Class-D audio power amplifier. EMI encompasses two aspects: emission and susceptibility. Emission refers to the generation of unwanted electromagnetic energy by the equipment. Susceptibility, by contrast, refers to the degree in which the equipment is affected by the electromagnetic disturbances. EMC is achieved by addressing both emission and susceptibility issues. The TAS5825M device has advanced emission suppression technology which enables the device to run without an LC filter with speaker wires up to one meter long and still meet the EMI regulatory standards such as EN55022, CISPR 22, or FCC Part 15 Class B.

The TAS5825M device features an advanced spread spectrum modulation mode with low EMI emission to lower the overall system cost. This reduced system cost is achieved by replacing large expensive LC output filters with small, low-cost ferrite beads filters. The spread spectrum modulation scheme exhibits less EMI by flattening the wideband spectral components from the speaker cables and still retains the high-efficiency feature of a traditional Class-D amplifier.

Figure 1 shows the topology of a conventional (nonspread-spectrum) BD modulation Class-D amplifier. The BD switching technique uses an internally generated triangular waveform with a fixed frequency and a complementary signal pair at the input stage. The output PWM changes the duty cycle to generate a moving average of the signal that correspond to the input analog signal. The advantages of PWM switching topology is high efficiency, which provides low power consumption and small thermal design.

Figure 1. Class-D Audio Amplifier
The TAS5825M device features two modulation modes: fixed-frequency modulation mode (FFM) and spread spectrum modulation (SSM) mode. In the conventional FFM mode (Figure 1) the frequency of the triangular waveform is fixed as shown in Figure 2. In SSM mode, the frequency of the triangular waveform frequency varies cycle-to-cycle with a center frequency at switching frequency configured. SSM mode improves EMI emissions radiated by the speaker wires by spreading the energy over a larger bandwidth and reducing the wideband spectral content. On the other hand, FFM produces larger amounts of spectral energy at multiples of the PWM switching frequency. The cycle-to-cycle variation of the switching frequency does not affect the efficiency of the audio amplifier. Figure 3 shows the effects of the frequency variation on the triangular waveform.

Compared to traditional FFM Class-D amplifier, the spread spectrum scheme has reduced the peak energy of the switching frequency and lessens harmonics. Figure 6 shows a comparison of FFM and SSM modulation.
2.2 Dephase and Multi-Device Phase Synchronization

In addition to the spread spectrum technology, the TAS5825M device employs dephase circuits to further reduce electromagnetic emission without degrading audio performance.

The dephase circuit improves EMI and noise performance by interleaving the switching timing between the two audio channels. This improved EMI and noise performance reduces conducted emission on the PVDD line because the output ripple current of the two audio channels will be out of phase, and the ripple peak current from the PVDD line will thus be reduced to half value.

Also, TAS5825M supports 45° phase shifts between multiple channels to reduce EMI in multi-device systems. See more details in the TAS5825M datasheet.

3 Printed Circuit Board Design for EMC

3.1 Printed Circuit Board Layout

It is necessary to follow recommended PCB guidelines for EMC success. Proper PCB floor planning, component selection, component placement, and routing are all essential to counter EMI. Emissions are exacerbated by improper layout, components, and output trace length causing antenna effect. Practical PCB design guidelines for achieving EMC include:

• Place the high-frequency decoupling capacitors as close to the power pin and ground pin of the device as possible to reduce the parasitic inductance of the trace. To ensure low AC impedance over a wide frequency range for noise reduction, use good quality, low-ESR, 1-nF ceramic capacitors. For mid-frequency noise due to PWM transients, use another good quality 0.1 µF ceramic capacitor placed as close as possible to the PVDD leads.
• Use a continuous ground plane and avoid voltage offset on the ground planes whenever possible.
• Low impedance routing back to source (return signal).
• Power planes should be away from the edges of the PCB.
• Proper filtering of the PCB connectors.
• Place EMC snubbers and ferrite bead filters as close as possible to the IC. Minimize unfiltered loops and trace length as well as stray inductance.
• Keep amplifier output traces to the speaker as short as possible. PCB traces and the speaker wire are the largest sources of emission.
3.2 Ferrite Bead Filter

Low-cost ferrite bead filters are used to suppress EMI. They are placed close to the amplifier output to minimize loop antennas. At low frequencies, ferrite beads act as 0 Ω resistors with no DC drop. However, the impedance of ferrite bead increases significantly at frequencies above 1 MHz to suppress radiation. Ferrite beads also play a significant role on the THD+N of the system. Examples of ferrite beads which have been tested and worked well with the TAS5825M device include the NFZ2MSM series from Murata.

The trade-off of ferrite beads is their impedance and rated current. If the rated current can meet the system requirements, larger impedance means larger EMI margins for the EMI, especially for the 5 MHz to 50 MHz frequency range. 300 ohm @ 100 MHz is a typical value, which can pass EMI in most applications.

The trade-off of capacitors is their capacitance and idle current. Larger capacitance leads to larger idle current. Using 2.2 nF instead of 1 nF capacitors is helpful in the 5 MHz to 100 MHz range.

3.3 Power Supply and Speaker Wires

When performing the conducted emission test, it is essential to keep the AC power cable away from the speaker cables. This prevents stray signals from coupling to power source and other potential unintended radiators or conductors.

When ferrite bead filters are used, an AC to DC adapter with an EMI filter is required to pass conducted EMI. Most applications (for example TVs, Voice Controlled Speakers, Wireless Speakers and Sound Bars) that need a 110 V / 220 V AC power supply usually have already included an EMI filter in the AC to DC adapter. Some applications use DC power supplies. They need a simple EMI filter on the PVDD supply. Refer to this application note: AN-2162 Simple Success With Conducted EMI From DC to DC Converters (SNVA489C).

3.4 TAS5825M Device Configurations

If ferrite bead filters are chosen as the output filters, we recommend to choose BD modulation, set the switching frequency to 384kHz and also have Spread Spectrum enabled. Refer to the TAS5825M datasheet for the recommended Spread Spectrum configurations.

4 TAS5825M EMI Test Results

The following sections show the EMI test results from a certified third-party vendor. The radiated and conducted EMI plots below are taken using a TAS58x5M EMI Test Board, which is a 2-layer board and has been designed specifically for EMI testing. In addition, a 12 V TV power supply is used to power the board in the conducted emission testing.

4.3 Conclusions

The TAS5825M device has the proven advanced RF emission suppression technology that helps to design an EMI-compliant audio system without compromising cost and performance. By adhering to the guidelines discussed in this report, EMI requirements are met and costly PCB rework is avoided.

Please note that we usually recommend inductor filters so that customers can make good use of TAS5825M features and capabilities.

For further questions and discussions on this topic, go to the TI E2E Forums (http://e2e.ti.com/).
IMPORTANT NOTICE FOR TI DESIGN INFORMATION AND RESOURCES

Texas Instruments Incorporated (‘TI’) technical, application or other design advice, services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, “TI Resources”) are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using any particular TI Resource in any way, you (individually or, if you are acting on behalf of a company, your company) agree to use it solely for this purpose and subject to the terms of this Notice.

TI’s provision of TI Resources does not expand or otherwise alter TI’s applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources.

You understand and agree that you remain responsible for using your independent analysis, evaluation and judgment in designing your applications and that you have full and exclusive responsibility to assure the safety of your applications and compliance of your applications (and of all TI products used in or for your applications) with all applicable regulations, laws and other applicable requirements. You represent that, with respect to your applications, you have all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. You agree that prior to using or distributing any applications that include TI products, you will thoroughly test such applications and the functionality of such TI products as used in such applications. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

You are authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.
