Overcurrent Shutdown with the UC3853

by James Noon

Boost converters are susceptible to large inrush currents at startup and with step changes in VLINE. This is due to the fact that the output capacitor is connected directly to the input through the boost diode. Therefore, controlling the boost MOSFET cannot limit the input current. However, the MOSFET can be protected from the large inrush or overcurrent by forcing the switch off when an overcurrent occurs. This is accomplished with the UC3853 by sensing when an overcurrent has occurred and forcing the FB pin high. Since the UC3853 incorporates a transconductance amplifier for the voltage loop, the FB pin has high input impedance and can easily be pulled up by external circuitry. The UC3853 uses this pin to both regulate the voltage loop and sense when an overvoltage occurs. If the FB pin is forced above 3.15V nominal, the gate drive will be terminated. By tying the overcurrent shutdown circuit into this pin, overcurrent protection can be achieved.

A circuit for providing overcurrent shutdown is shown below (the reference designators correspond with the demo board schematic). The circuit works by having R15 and R14 set the threshold level where the circuit is activated. For example, if R15 = R14, at approximately 1.4V across RSENSE Q2 will turn on. Once Q2 turns on, Q3 will be biased on. R17 and R16 set the bias for Q3 (we’re assuming negligible drop across Q2 and R14 as a first approximation). Once Q3 turns on the FB pin will be driven high. R18 is sized so that at minimum Vcc the voltage divider formed by R18 and the RVD1 gives greater than 3.15V at the FB pin.

The current limit is set by adjusting the voltage divider formed by R14 and R15 such that for the voltage across RSENSE that corresponds to the shutdown current, there is 0.7V across R15.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI’s standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE (“CRITICAL APPLICATIONS”). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER’S RISK.

In order to minimize risks associated with the customer’s applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI’s publication of information regarding any third party’s products or services does not constitute TI’s approval, warranty or endorsement thereof.
