ABSTRACT

Conventional regulators have a high drop-out voltage that is a function of the total output current. However, with just a regulator chip, an external transistor and a few passive components, this design forms a high output current regulator with a limited input voltage and high efficiency. The circuit presented has a drop-out of 0.7 V at 5A load current and 1.3 V at a current level of as high as 10A.

1 High-CURRENT Regulator Using LM2931CT ........................................................................ 2
1 Introduction

The circuit output voltage equals that of PNP regulator U1 and may be expressed as 
\[ V_{OUT} = V_{REF} \frac{R1 + R2}{R1} \] 
where \( V_{REF} \) equals U1's reference voltage of 1.2 V. To compensate for bias-current errors and to keep the extra quiescent current that is induced by this resistor network to a few \( \mu A \), resistor R1 is set at 28 k\( \Omega \). Thus, for a 5 V regulated output voltage, R2 is set at 88.7 k\( \Omega \). In addition, the output voltage can be adjusted between 3 V and 24 V by varying R2.

The circuit can handle a great deal of current because of external PNP transistor Q1. At high current levels, the circuit's drop-out voltage is a function of the saturation voltage of the PNP device. As a result, Q1 must have low saturation levels for \( V_{CE} \) and \( V_{BE} \) along with a high beta. In addition, the maximum output current is equal to the maximum output sink of regulator U1 multiplied by the maximum beta of Q1. A germanium transistor, such as a 2N4277 for the external pass element, satisfies the above requirements. For the components shown, the circuit gives excellent regulation at \( V_{IN} = 5.7V \) up to 5A in load current, giving a drop-out of only 0.7 V.

U1 is biased to a minimum of 30 mA by a resistor R3, which also functions as a bleeding resistor for Q1. The on-off pin of U1 permits extra remote on-off control and current-limiting functions for the circuit. Pulling this pin to ground enables the circuit, whereas keeping it open disables the circuit and leaves the regulator in the standby mode. The ratio R5:R6 limits the maximum output current. When the load current exceeds this maximum, the output voltage begins to fall and the voltage across R6 decreases. This low voltage cuts off transistor Q2, thereby disabling the circuit output. As a result, transistor Q1 and the load are protected from overdrive and damage.

2 Efficiency

Using Texas Instruments regulator LM2931CT, external transistors Q1 and Q2, and a few passive components, this circuit forms a high-current regulator having a low drop-out. For the components shown in the figure, the regulator has a drop-out of 0.7 V at 5A load current and 1.3 V at a level as high as 10A. The on-off pin of regulator U1 provides remote control, while transistor Q2 limits the maximum output current.
IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
