AN-173 IC Zener Eases Reference Design

ABSTRACT
A new IC zener with low dynamic impedance and wide operating current range significantly simplifies reference or regulator circuit design. The low dynamic impedance provides better regulation against operating current changes, easing the requirements of the biasing supply. Further, the temperature coefficient is independent of operating current, so that the LM129 can be used at any convenient current level. Other characteristics such as temperature coefficient, noise and long term stability are equal to or better than good quality discrete zeners.

1 Description

The LM129 uses a new subsurface breakdown IC zener combined with a buffer circuit to lower dynamic impedance. The new subsurface zener has low noise and excellent long term stability since the breakdown is in the bulk of the silicon. Circuitry around the zener supplies internal biasing currents and buffers external current changes from the zener. The overall breakdown is about 6.9 V with devices selected for temperature coefficients.

The zener is relatively straightforward. A buried zener D1 breaks down biasing the base of transistor Q1. Transistor Q1 drives two buffers Q2 and Q3. External current changes through the circuit are fully absorbed by the buffer transistors rather than by D1. Current through D1 is held constant at 250 μA by a 2k resistor across the emitter base of Q1 while the emitter-base voltage of Q1 nominally temperature compensates the reference voltage.

The other components, Q4, Q5 and Q6, set the operating current of Q1. Frequency compensation is accomplished with two junction capacitors.

All that is needed for biasing in most applications is a resistor as shown in Figure 2. Biasing current can be anywhere from 0.6 mA to 15 mA with little change in performance. Optimally, however, the biasing current should be as low as possible for the best regulation. The dynamic impedance of the LM129 is about 1 Ω and is independent of current. Therefore, the regulation of the LM129 against voltage changes is 1/Rs.

Lower currents or higher Rs give better regulation. For example, with a 15 V supply and 1 mA operating current, the reference change for a 10% change in the 15 V supply is 180 μV. If the LM129 is run at 5 mA, the change is 900 μV or 5 times worse. By comparison, a standard IN821 zener will change about 17 mV. All discrete zeners have about the same regulation since their dynamic impedance is inversely proportional to operating current.

If the zener does not have to be grounded, a bridge compensating circuit can be used to get virtually perfect regulation, as shown in Figure 3. A small compensating voltage is generated across R1, which matches the dynamic impedance of the LM129. Since the dynamic impedance of the LM129 is linear with current, this circuit will work even with large changes in the unregulated input voltage.
Other output voltages are easily obtained with the simple op-amp circuit shown in Figure 4. A simple non-inverting amplifier is used to boost and buffer the zener to 10 V. The reference is run directly from the input power rather than the output of the op-amp. When the zener is powered from the op-amp, special starting circuitry is sometimes necessary to insure the output comes up in the right polarity. For outputs lower than the breakdown of the LM129 a divider can be connected across the zener to drive the op-amp.

An AC square wave or bipolarity output reference can easily be made with an op-amp and FET switch as shown in Figure 5. When Q1 is “ON”, the LM108 functions as a normal inverting op-amp with a gain of $-1$ and an output of $-6.9$ V. With Q1 “OFF” the op-amp acts as a giving 6.9 V at the output. Some non-symmetry will occur from loading change on the LM129 in the different states and mismatch of R1 and R2. Trimming either R1 or R2 can make the output exactly symmetrical around ground.
By combining the LM129 with an LM117 three-terminal regulator a high stability power regulator can be made. This is shown in Figure 6. Resistor R1 biases the LM129 at about 1 mA from the 1.25 V reference in the LM117. The voltage of the LM129 is added to the 1.25 V of the LM117 to make a total reference voltage of 8.1 V. The output voltage is then set at 10 V by R2 and R3. Since the internal reference of the LM117 contributes only about 20% of the total reference voltage, regulation and drift are essentially those of the external zener. The regulator has 0.2% load and line regulation and if a low drift zener such as the LM129A is used overall temperature coefficient is less than 0.002%/°C.

The new zener can be used as the reference for conventional IC voltage regulators for enhanced performance. Noise is lower, time stability is better, and temperature coefficient can be better depending on the device selected. Further, the output voltage is independent of power changes in the regulator.

Figure 7 shows an LM723 using an external LM129 reference. The internal 7 V reference is not used and a single resistor biases the LM129 as the reference. The 5k resistor chosen provides sufficient operating current for the zener over the 10 V to 40 V input voltage range of the LM723. Since the dynamic impedance of the LM129 is so low, the reference regulation against line changes is only 0.02%/V. This is small compared to the regulation of 0.1%/V for the LM723; however, the resistor can be replaced by a 1 mA to 5 mA FET used as a constant current source for improved regulation. When the FET is used reference regulation is easily 0.001%/V. Output voltage is set in the standard manner except that for low output voltages sufficient current must be run through the zener to power the voltage divider supplying the reference to the LM723.

An overload protected power shunt regulator is shown in Figure 8. The output voltage is about 7.8 V – the 7 V breakdown of the LM129 plus the 0.8 V emitter-base voltage of the LM395. The LM395 is an IC, 1.5 A power transistor with complete overload protection on the chip. Included on the chip are current limiting and thermal limiting, making the device virtually blowout-proof. Further, the base current is only 5 μA, making it easy to drive as a shunt regulator. As the input voltage rises, more drive is applied to the base of the LM395, turning it on harder and dropping more voltage across the series resistance. Should the input voltage rise too high, the LM395 will current limit or thermal limit, protecting itself.

The new IC zener can replace existing zeners in just about any application with improved performance and simpler external circuitry. As with any zener reference, devices are selected for temperature coefficient and operating temperature range. Since the devices are made by a standard integrated circuit process, cost is low and good reproducibility is obtained in volume production.

Finally, since the device is actually an IC, it is packaged in a rugged TO-46 metal can package or a 3-lead plastic transistor package.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
