Application Brief
Reworking LLP Chip Scale Package

Leadless Leadframe Package (LLP)

LLP is a “Leadless Leadframe Package” - there are no leads extending beyond the package body. If the contact pads are exposed and flush with the bottom of the package, providing a more compact footprint. Exposed die attach pad when soldered to the board provides a direct path for heat to transfer from the package to the PCB providing excellent thermal performance.

Standard surface mount equipment can be used to assemble LLP onto the PCB. There are design guidelines and recommendations that have been established by National Semiconductor (see AN-1187 at www.national.com/an/AN-1187.pdf) to achieve high surface mount assembly yield.

The rework process for LLP is similar to BGA and laminate CSP type packages where contacts are underneath the package. Commercially available equipment is used for LLP rework.

Typical rework process involves:
• Localized heating & device removal
• Site cleaning after device removal
• Application of solder paste
• Component placement
• Localized reflow
• Inspection

Site Preparation

Once the component is removed, the site must be cleaned and prepared for attachment of a new component. Typical cleaning procedures such as using low temperature, blade style conductive tool and de-soldering braid works well for cleaning. Care must be taken during the cleaning process to avoid damage to the PCB and the adjacent components.

Solder Paste Application

Application of a uniform solder paste for rework is very important in successful rework process. One method to achieve a uniform solder paste application is to apply the solder paste on the component pads rather than the PCB. The component is placed and clamped in a fixture and solder paste is applied to the pads through the openings in the stencil as shown in Figure 2.
Component Alignment & Placement

Placement of the LLP package on the pads requires precision tools available on most CSP rework stations. Best results are achieved with non-contact alignment, using a split field vision system to view the PCB pads and the component images simultaneously, as shown in Figure 3.

Localized Reflow

After placing the component on the board, underside preheating and localized heating of the component is utilized to reflow solder and create solder joints. The localized reflow profile for reflow and removal of the component can be programmed to the same profile that was used in the original assembly.

Inspection After Rework

After rework, X-rays can be used to check the quality of the solder joints and detect any solder defects. Figure 4 shows X-ray images of solder joints. One example is of good solder joints, and one example shows solder bridging.
Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI’s standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal and regulatory requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are not authorized for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any damages arising out of the use of TI products in such safety-critical applications.
