LM2636

6A Termination Supply Tracks 1/2 Core Voltage

Literature Number: SNVA564
6A TERMINATION SUPPLY TRACKS 1/2 CORE VOLTAGE

DESCRIPTION OF THE APPLICATION

Modern microprocessors require core voltages that are typically in the range of 2 - 3V. They also require "termination" voltages that should be 1/2 of the core voltage for best performance. The design problem is that the core voltage varies for different CPU's, and some designs even incorporate variable core voltage supplies which allow the system to adjust the core voltage on the fly to increase or decrease CPU operating speed as required in order to optimize power consumption.

Because of the variable nature of the core voltage, a termination voltage power supply design which can maintain an output of 1/2 Vcore over a wide range of core voltages allows greater design flexibility, since the core voltage can be varied without upsetting the termination voltage set point.

This document describes a 6A power supply design which will generate a termination voltage which regulates to 1/2 Vcore, intended for use in applications where the core voltage is between about 1.8V and 3.6V.

CIRCUIT DESCRIPTION (See schematic)

A LM2636 synchronous-rectifier controller switching at 300 kHz is used to build an efficient power converter which operates from a 5V input (details for designing with the LM2636 can be found on the data sheet).

Because the LM2636 is designed to operate at a fixed output voltage (as set by the control bits on pins 14 through 18), a different control scheme is used here so that the regulated output can track at 1/2 Vcore.
The core voltage is divided by 1/2 through resistors R15 and R17, and this voltage is used as the reference by error amplifier U2-B. U2-B compares the "1/2 Vcore" reference to the Termination output voltage obtained through R16, and adjusts its output as required to lock the Termination voltage at 1/2 Vcore. In this way, the Termination output voltage is set by the core voltage signal.

U2-A is a unity-gain inverter to correct the phase of the feedback signal which is applied to the input of the LM2636's internal error amplifier. The gain of the internal amplifier is also set to unity by R6.

R11 is included to force a soft-start on turn on and eliminate overshoot. U2-D is used to amplify the 1.23V internal reference up to about 2.5V which sets the operating point for the error amplifier U2-B. This 2.5V is also applied to the sense input of the LM2636, which normally would sense the regulated output voltage. Since the Termination output voltage must be variable (to track the core voltage), a fixed 2.5V is applied to the sense pin and the control pins at pins 16 and 18 are grounded which programs the internal DAC to an output of 2.5V.

In this way, the internal error detection circuitry of the LM2636 is prevented from shutting down the part due to an over or undervoltage condition, which would otherwise occur since the output is continuously adjustable.

Loop compensation is set by R16, R19, C7, and C10.
6A TERMINATION SUPPLY TRACKS 1/2 CORE VOLTAGE

NOTE 1. USE LOW ESR ALUMINUM ELECTROLYTIC CAPACITOR SUITABLE FOR 300K HZ SWITCHING APPLICATIONS.

NOTE 2. UNLESS OTHERWISE SHOWN, RESISTOR TOLERANCES ARE 5%.

NOTE 3. "CER" DESIGNATES A CERAMIC CAPACITOR, TEMP RANGE X7R OR X5R.
IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.
