ABSTRACT

This application report describes an IQ dump patch for the CC13xx SimpleLink™ Sub-1 GHz ultra-low power wireless microcontroller (MCU).

Project collateral and source code mentioned in this document can be downloaded from the following link: http://www.ti.com/lit/zip/swra571. The smartrf_settings.c file is for the CC1310, but similar files can be made for the other CC13x0 and CC13x2 devices, following the steps explained in Section 2.1.1 and Section 2.1.2.

1 Introduction

CC13xx SimpleLink™ Sub-1 GHz ultralow power wireless microcontroller (MCU) is centered around an ARM® Cortex®-M3 (CC13x0) or ARM Cortex-M4F (CC13x2) series processor that handles the application and an autonomous RF Core that handles all the low-level radio control and processing needed to transfer digital bits over the air. Normally the customers use the CM3/CM4F to implement their application/high level protocols on top of the physical layer, but it is also possible to use it to implement other novel or legacy physical layer modulation schemes. In order to do so, the CM3/CM4F requires access to the raw IQ samples in RX mode. With the default genfsk/prop PHY, IQ samples are not available outside RF Core and a dedicated patch is needed to automatically copy IQ samples to a partial read RX entry. This application note describes how to get access to these IQ samples using the IQ dump patch.
2 IQ Dump Patch

The IQ Dump patch (rf_patch_mce_iqdump.h) can run in two different modes; IQFifoBlind and IQFifoSync. IQFifoBlind mode starts copying IQ samples immediately while IQFifoSync mode starts copying IQ samples after a sync word has been detected. The mode of operation is selected by the MCE_RFE override (see Table 2). For both modes, IQ samples are copied through the RF Core’s internal FIFO to one or more partial read RX entries in the system RAM. The application simply waits for an RX_ENTRY_DONE interrupt saying that a partial read entry is full.

The IQ sample rate is fixed to 4 times oversampling and the IQ sample size is 12 bits. This means that each IQ pair will occupy 3 bytes in RAM in the format shown in Table 1. The format is signed meaning that MSB is the sign bit (two’s complement format).

<table>
<thead>
<tr>
<th>Byte</th>
<th>Bit Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>I_7 I_6 I_5 I_4 I_3 I_2 I_1 I_0</td>
</tr>
<tr>
<td>1</td>
<td>Q_3 Q_2 Q_1 Q_0 I_11 I_10 I_9 I_8</td>
</tr>
<tr>
<td>2</td>
<td>Q_11 Q_10 Q_9 Q_8 Q_7 Q_6 Q_5 Q_4</td>
</tr>
</tbody>
</table>

The patch has a built-in test pattern where the IQ samples are replaced with two counter values. The I-sample is replaced with an increasing counter value and the Q-sample is replaced with a decreasing counter value. The test pattern is enabled by the following register override:

HW_REG_OVERRIDE(0x52B4, 0x070D) // CC13x0
HW_REG_OVERRIDE(0x5328, 0x070D) // CC13x2

2.1 Recommended Operating Limits

When using the IQ Dump patch in RX the data rate is limited upwards to 12.5 kbps for CC13x0 and 25 kbps for CC13x2. In TX, the patch can be used within the same operating limits as the genfsk/prop PHY. The 50-kbps settings from SmartRF™ Studio [1] should be used as a starting point. The associated zip file contains a smartrf_settings.c file (for CC1310) that has the complete override list and API settings to be used with the patch.

2.1.1 Register Overrides

The MCE_RFE override (1) needs to be modified when running the IQ Dump patch. Table 2 shows how this should be done. In addition, there is one other override necessary to add when running the patch.

<table>
<thead>
<tr>
<th>Override</th>
<th>Description/Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCE_RFE_OVERRIDE(1,0,2,1,0,0)</td>
<td>Setting the mode of operation to IQFifoBlind</td>
</tr>
<tr>
<td>MCE_RFE_OVERRIDE(1,0,3,1,0,0)</td>
<td>Setting the mode of operation to IQFifoSync</td>
</tr>
<tr>
<td>(uint32_t)0x001082C3</td>
<td>Set to avoid internal FIFO overflow</td>
</tr>
<tr>
<td>HW_REG_OVERRIDE(0x52B4, 0x070D) // CC13x0</td>
<td>Enable built-in test pattern. Should only be included when testing the patch. For more details, see Section 3 (optional).</td>
</tr>
<tr>
<td>HW_REG_OVERRIDE(0x5328, 0x070D) // CC13x2</td>
<td></td>
</tr>
</tbody>
</table>

(1) Only one MCE_RFE can be present in the override list.
In addition you need to include the patch and update the TIRTOS RF Mode Object:

CC13x0:
#include DeviceFamily_constructPath(rf_patches/rf_patch_cpe_genfsk.h)
#include DeviceFamily_constructPath(rf_patches/rf_patch_mce_iqdump.h)
#include DeviceFamily_constructPath(rf_patches/rf_patch_rfe_genfsk.h)
#include "smartrf_settings.h"

// TI-RTOS RF Mode Object
RF_Mode RF_prop =
{
    .rfMode = RF_MODE_PROPRIETARY_SUB_1,
    .cpePatchFxn = &rf_patch_cpe_genfsk,
    .mcePatchFxn = &rf_patch_mce_iqdump,
    .rfePatchFxn = &rf_patch_rfe_genfsk,
};

CC13x2:
#include DeviceFamily_constructPath(rf_patches/rf_patch_cpe_prop.h)
#include DeviceFamily_constructPath(rf_patches/rf_patch_mce_iqdump.h)
#include "smartrf_settings.h"

// TI-RTOS RF Mode Object
RF_Mode RF_prop =
{
    .rfMode = RF_MODE_AUTO,
    .cpePatchFxn = &rf_patch_cpe_prop,
    .mcePatchFxn = &rf_patch_mce_iqdump,
    .rfePatchFxn = 0,
};

2.1.2 API Configuration

When using the patch some changes have to be done to the API exported from SmartRF Studio. formatConf.bMsbFirst in CMD_PROP_RADIO_DIV_SETUP must be set to 0 to allow for LSB to be transmitted first and maxPktLen in CMD_PROP_RX must be set to 0 for unlimited packet length. The RX bandwidth should be set to 39/38.9 kHz (CC13x0/CC13x2), and a good starting point for the deviation is to set it to half the data rate (see Table 3).

<table>
<thead>
<tr>
<th>API Field</th>
<th>Value</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>RF_cmdPropRadioDivSetup.formatConf.bMsbFirst</td>
<td>0</td>
<td>Least significant bit transmitted first</td>
</tr>
<tr>
<td>RF_cmdPropRx.maxPktLen</td>
<td>0</td>
<td>Unlimited length</td>
</tr>
<tr>
<td>RF_cmdPropRadioDivSetup.modulation.deviation</td>
<td>0x19</td>
<td>6.25 kHz</td>
</tr>
<tr>
<td>RF_cmdPropRadioDivSetup.rxBw</td>
<td>0x20</td>
<td>39 kHz (CC13x0)</td>
</tr>
<tr>
<td></td>
<td>0x4D</td>
<td>38.9 kHz (CC13x2)</td>
</tr>
<tr>
<td>RF_cmdPropRadioDivSetup.symbolRate.rateWord</td>
<td>0x2000</td>
<td>12.5 kbps</td>
</tr>
</tbody>
</table>
3 Building a Software Example

To test the RF performance of the patch, see the rfPacketRX example available when downloading [2] or [3].

The smartrf_settings.c file must be replaced with the one from the zip file that can be downloaded from the following link: http://www.ti.com/lit/zip/swra571. The following modifications must be done to rfPacketRX.c to be able to test the patch:

1. Define how many IQ sample pairs you want.

```
#define NUMBER_OF_SAMPLE_PAIRS 300
```

Setting NUMBER_OF_SAMPLE_PAIRS to 300 means that each data entry used must have room for 300 x 3 bytes.

2. Configure two partial read buffers for the received data. Make sure that the buffers are 4 byte aligned.

```
#define PARTIAL_RX_ENTRY_HEADER_SIZE 12

#if defined(__TI_COMPILER_VERSION__)
#pragma DATA_ALIGN (rxDataEntryBuf1, 4);
static uint8_t rxDataEntryBuf1[PARTIAL_RX_ENTRY_HEADER_SIZE + (NUMBER_OF_SAMPLE_PAIRS * 3)];
#pragma DATA_ALIGN (rxDataEntryBuf2, 4);
static uint8_t rxDataEntryBuf2[PARTIAL_RX_ENTRY_HEADER_SIZE + (NUMBER_OF_SAMPLE_PAIRS * 3)];
#endif

rfc_dataEntryPartial_t* partialReadEntry1 = (rfc_dataEntryPartial_t*)&rxDataEntryBuf1;
rfc_dataEntryPartial_t* partialReadEntry2 = (rfc_dataEntryPartial_t*)&rxDataEntryBuf2;
rfc_dataEntryPartial_t* currentReadEntry = (rfc_dataEntryPartial_t*)&rxDataEntryBuf1;
```

```c
void *mainThread(void *arg0)
{
    RF_Params rfParams;
    RF_Params_init(&rfParams);

    partialReadEntry1->length = (NUMBER_OF_SAMPLE_PAIRS * 3) + 4;
    partialReadEntry1->config.type = DATA_ENTRY_TYPE_PARTIAL;
    partialReadEntry1->status = DATA_ENTRY_PENDING;

    partialReadEntry2->length = (NUMBER_OF_SAMPLE_PAIRS * 3) + 4;
    partialReadEntry2->config.type = DATA_ENTRY_TYPE_PARTIAL;
    partialReadEntry2->status = DATA_ENTRY_PENDING;

    partialReadEntry1->pNextEntry = (uint8_t*)partialReadEntry2;
    partialReadEntry2->pNextEntry = (uint8_t*)partialReadEntry1;

    dataQueue.pCurrEntry = (uint8_t*)partialReadEntry1;
    dataQueue.pLastEntry = NULL;
}
```
3. Remove `RFQueue_defineQueue` and the modifications of `RF_cmdPropRX`, except for the `RF_cmdPropRx.pQueue`.

```c
// if( RFQueue_defineQueue(&dataQueue,
//    rxDataEntryBuffer, // failed to allocate space for all data entries */
//    sizeof(rxDataEntryBuffer),
//    NUM_DATA_ENTRIES,
//    MAX_LENGTH + NUM_APPENDED_BYTES))
//}
```

4. Implement handling of the IQ samples in the callback. In the callback the samples should simply be read from the data entries to make the data entries available for new samples. The processing of the IQ samples should be done outside the callback. It is not the scope of this application report to show how this can be done. The code below simply shows how to get access to the samples and how to handle the queue.

```c
void callback(RF_Handle h, RF_CmdHandle ch, RF_EventMask e)
{
    if (e & RF_EventRxEntryDone)
    {
        // Toggle pin to indicate RX
        PIN_setOutputValue(pinHandle,
                            Board_PIN_LED2,!PIN_getOutputValue(Board_PIN_LED2));

        // Get a pointer to the first IQ sample byte
        packetDataPointer = &currentReadEntry->rxData;

        // Implement code for handling the IQ data
        // ...
        // ...
        // ...
        //
        currentReadEntry->status = DATA_ENTRY_PENDING;
        currentReadEntry = (rfc_dataEntryPartial_t*)currentReadEntry->pNextEntry;
    }
}
```
4 Testing the Patch Using the Built-In Test Pattern

To test that the data entries are set up correctly and that the patch is working you can enable the built-in test pattern (see Table 2) and declare two arrays (iSamples and qSamples) that can hold the “received” I and Q samples.

```c
#define NUMBER_OF_BUFFERS 5
static uint16_t iSamples[NUMBER_OF_SAMPLE_PAIRS*NUMBER_OF_BUFFERS];
static uint16_t qSamples[NUMBER_OF_SAMPLE_PAIRS*NUMBER_OF_BUFFERS];
```

For test purposes, set `NUMBER_OF_SAMPLE_PAIRS` to a low number (2) to easi...
Figure 1 shows the five buffers with eight IQ sample pairs in each stored in an iSamples and qSamples array, each holding 40 samples (NUMBER_OF_BUFFERS \cdot NUMBER_OF_SAMPLE_PAIRS).

Figure 1. Built-In Test Pattern Stored as I and Q Samples
