ADC08831 / ADC08832 8-Bit Serial I/O CMOS A/D Converters with Multiplexer and Sample/Hold Function

Check for Samples: ADC08831, ADC08832

FEATURES
- 3-Wire Serial Digital Data Link Requires Few I/O Pins
- Analog Input Track/Hold Function
- 2-Channel Input Multiplexer Option with Address Logic
- Analog Input Voltage Range from GND to V_{CC}
- No Zero or Full Scale Adjustment Required
- TTL/CMOS Input/Output Compatible
- Superior Pin Compatible Replacement for ADC0831/2

APPLICATIONS
- Digitizing Sensors and Waveforms
- Process Control Monitoring
- Remote Sensing in Noisy Environments
- Instrumentation
- Embedded Systems

KEY SPECIFICATIONS
- Resolution: 8 Bits
- Conversion Time (f_{C} = 2 MHz): 4μs (Max)
- Power Dissipation: 8.5mW (Typ)
- Low Power Mode: 3.0mW (Typ)
- Single Supply: 5V_{DC}
- Total Unadjusted Error: ±1LSB
- No Missing Codes over Temperature

Typical Application

DESCRIPTION
The ADC08831/ADC08832 are 8-bit successive approximation Analog to Digital converters with 3-wire serial interfaces and a configurable input multiplexer for 2 channels. The serial I/O will interface to COPS family of micro-controllers, PLD's, microprocessors, DSP's, or shift registers. The serial I/O is configured to comply with the MICROWIRE serial data exchange standard.

To minimize total power consumption, the ADC08831/ADC08832 automatically go into low power mode whenever they are not performing conversions.

A track/hold function allows the analog voltage at the positive input to vary during the actual A/D conversion.

The analog inputs can be configured to operate in various combinations of single-ended, differential, or pseudo-differential modes. The voltage reference input can be adjusted to allow encoding of small analog voltage spans to the full 8-bits of resolution.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.
These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### Absolute Maximum Ratings

<table>
<thead>

</tbody>
</table>

(1) All voltages are measured with respect to GND = 0 V\text{DC}, unless otherwise specified.
(2) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur.
(3) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
(4) When the input voltage V\text{IN} at any pin exceeds the power supplies (V\text{IN} < (GND) or V\text{IN} > V\text{CC},) the current at that pin should be limited to 5 mA. The 20 mA maximum package input current rating limits the number of pins that can safely exceed the power supplies with an input current of 5 mA to four pins.
(5) Human body model, 100 pF capacitor discharged through a 1.5 kΩ resistor. The machine mode is a 200pF capacitor discharged directly into each pin.
(6) The maximum power dissipation must be derated at elevated temperatures and is dictated by T\text{JMAX}, \theta\text{JA} and the ambient temperature, T\text{A}. The maximum allowable power dissipation at any temperature is P\text{D} = (T\text{JMAX} − T\text{A})/\theta\text{JA} or the number given in the Absolute Maximum Ratings, whichever is lower.

(1) Operating Ratings indicate conditions for which the device is functional. These ratings do not specify specific performance limits. For specifications and test conditions, see the Electrical Characteristics. The specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.
(2) All voltages are measured with respect to GND = 0 V\text{DC}, unless otherwise specified.
Electrical Characteristics
The following specifications apply for \( V_{CC} = V_{REF} = +5V_{DC} \), and \( f_{CLK} = 2 \text{ MHz} \) unless otherwise specified. **Boldface limits** apply for \( T_{A} = T_{J} = T_{MIN} \text{ to } T_{MAX} \); all other limits \( T_{A} = T_{J} = 25^\circ C \).

## DC CHARACTERISTICS

| \(V_{IN(1)}\) | Logical “1” Input Voltage | 2.0 | V (min) |
| \(V_{IN(0)}\) | Logical “0” Input Voltage | 0.8 | V (max) |
| \(I_{IN(1)}\) | Logical “1” Input Current | \(V_{IN} = 5.0V\) | 0.05 | +1 | μA (max) |
| \(I_{IN(0)}\) | Logical “0” Input Current | \(V_{IN} = 0V\) | 0.05 | −1 | μA (max) |
| \(V_{OUT(1)}\) | Logical “1” Output Voltage | \(V_{CC} = 4.75V\) | | | |
|        | \(I_{OUT} = −360 \mu A\) | | 2.4 | V (min) |
|        | \(I_{OUT} = −10 \mu A\) | | 4.5 | V (min) |
| \(V_{OUT(0)}\) | Logical “0” Output Voltage | \(V_{CC} = 4.75V\) | | | |
|        | \(I_{OUT} = 1.6 mA\) | | 0.4 | V (max) |

(1) Typicals are at \( T_{J} = 25^\circ C \) and represent the most likely parametric norm.
(2) Specified to TI's AOQL (Average Outgoing Quality Level).
(3) Total Unadjusted Error (TUE) includes offset, full-scale, linearity, multiplexer errors.
(4) It is not tested for the ADC08832.
(5) For \( V_{IN(1)} = V_{IN(0)} \), the digital code will be 0000 0000. Two on-chip diodes are tied to each analog input (see ADC08832 Functional Block Diagram) which will forward-conduct for analog input voltages one diode drop below ground or one diode drop greater than \( V_{CC} \) supply. During testing at low \( V_{CC} \) levels (e.g., 4.5V), high level analog inputs (e.g., 5V) can cause an input diode to conduct, especially at elevated temperatures, which will cause errors for analog inputs near full-scale. The spec allows 50 mV forward bias of either diode; this means that as long as the analog \( V_{IN} \) does not exceed the supply voltage by more than 50 mV, the output code will be correct. Exceeding this range on an unselected channel will corrupt the reading of a selected channel. Achievement of an absolute 0 \( V_{CC} \) to 5 \( V_{CC} \) input voltage range will therefore require a minimum supply voltage of 4.950 \( V_{CC} \) over temperature variations, initial tolerance and loading.
(6) Channel leakage current is measured after a single-ended channel is selected and the clock is turned off. For off channel leakage current the following two cases are considered: one, with the selected channel tied high (5 \( V_{CC} \)) and the remaining off channel tied low (0 \( V_{CC} \)), total current flow through the off channel is measured; two, with the selected channel tied low and the off channels tied high, total current flow through the off channel is again measured. The two cases considered for determining channel leakage current are the same except total current flow through the selected channel is measured. The following specifications apply for \( V_{CC} = V_{REF} = +5V_{DC} \), and \( f_{CLK} = 2 \text{ MHz} \) unless otherwise specified. **Boldface limits** apply for \( T_{A} = T_{J} = T_{MIN} \text{ to } T_{MAX} \); all other limits \( T_{A} = T_{J} = 25^\circ C \).
(7) Channel leakage current is measured after a single-ended channel is selected and the clock is turned off. For off channel leakage current the following two cases are considered: one, with the selected channel tied high (5 \( V_{CC} \)) and the remaining off channel tied low (0 \( V_{CC} \)), total current flow through the off channel is measured; two, with the selected channel tied low and the off channels tied high, total current flow through the off channel is again measured. The two cases considered for determining channel leakage current are the same except total current flow through the selected channel is measured.
Electrical Characteristics (continued)
The following specifications apply for \( V_{CC} = V_{REF} = +5 \text{VDC} \), and \( f_{CLK} = 2 \text{MHz} \) unless otherwise specified. **Boldface limits apply for \( T_A = T_J = T_{MIN} \) to \( T_{MAX} \); all other limits \( T_A = T_J = 25^\circ \text{C} \).

</tbody>
</table>

(1) Typicals are at \( T_J = 25^\circ \text{C} \) and represent the most likely parametric norm.
(2) Specified to TI’s AOQL (Average Outgoing Quality Level).
(3) A 40% to 60% duty cycle range insures proper operation at all clock frequencies. In the case that an available clock has a duty cycle outside of these limits the minimum time the clock is high or low must be at least 250 ns. The maximum time the clock can be high or low is 60 μs.
(4) Since data, MSB first, is the output of the comparator used in the successive approximation loop, an additional delay is built in to allow for comparator response time.
(5) Analog inputs are typically 300 ohms input resistance to a 13pF sample and hold capacitor.
Dynamic Characteristics
The following specifications apply for $V_{CC} = 5\text{V}$, $f_{CLK} = 2\text{MHz}$, $T_A = 25\degree \text{C}$, $R_{SOURCE} = 50\Omega$, $f_{IN} = 45\text{kHz}$, $V_{IN} = 5\text{V}_{p}$, $V_{REF} = 5\text{V}$, non-coherent 2048 samples with windowing.

</table>

(1) Typical are at $T_J = 25\degree \text{C}$ and represent the most likely parametric norm.
(2) Specified to TI’s AOQL (Average Outgoing Quality Level).
(3) The maximum sampling rate is slightly less than $f_{CLK}/11$ if CS is reset in less than one clock period.
(4) The signal-to-noise ratio is the ratio of the signal amplitude to the background noise level. Harmonics of the input signal are not included in its calculation.
(5) The contributions from the first 6 harmonics are used in the calculation of the THD.
(6) Effective Number Of Bits (ENOB) is calculated from the measured signal-to-noise plus distortion ratio (SINAD) using the equation $ENOB = (SINAD-1.76)/6.02$.

FUNCTIONAL DESCRIPTION

MULTIPLEXER ADDRESSING

The design of these converters utilizes a comparator structure with built-in sample-and-hold which provides for a differential analog input to be converted by a successive approximation routine.

The actual voltage converted is always the difference between an assigned “+” input terminal and a “−” input terminal. The polarity of each input terminal of the pair indicates which line the converter expects to be the most positive. If the assigned “+” input voltage is less than the “−” input voltage the converter responds with an all zeros output code.

A unique input multiplexing scheme has been utilized to provide multiple analog channels with software-configurable single-ended, or differential operation. The analog signal conditioning required in transducer-based data acquisition systems is significantly simplified with this type of input flexibility. One converter package can now handle ground referenced inputs, differential inputs, as well as signals with some arbitrary reference voltage.

A particular input configuration is assigned during the MUX addressing sequence, prior to the start of a conversion. The MUX address selects which of the analog inputs are to be enabled and whether this input is single-ended or differential. In addition to selecting differential mode the polarity may also be selected. Channel 0 may be selected as the positive input and channel 1 as the negative input or vice versa. This programmability is illustrated by the MUX addressing codes for the ADC08832.

The MUX address is shifted into the converter via the DI line. Because the ADC08831 contains only one differential input channel with a fixed polarity assignment, it does not require addressing.

</tr>
</tbody>
</table>

Since the input configuration is under software control, it can be modified as required before each conversion. A channel can be treated as a single-ended, ground referenced input for one conversion; then it can be reconfigured as part of a differential channel for another conversion.

The analog input voltages for each channel can range from 50mV below ground to 50mV above $V_{CC}$ (typically 5V) without degrading conversion accuracy.

THE DIGITAL INTERFACE

A most important characteristic of these converters is their serial data link with the controlling processor. Using a serial communication format offers two very significant system improvements. It allows many functions to be included in a small package and it can eliminate the transmission of low level analog signals by locating the converter right at the analog sensor; transmitting highly noise immune digital data back to the host processor.
To understand the operation of these converters it is best to refer to Timing Diagrams and ADC08832 Functional Block Diagram and to follow a complete conversion sequence. For clarity, a separate timing diagram is shown for each device.

1. A conversion is initiated by pulling the CS (chip select) line low. This line must be held low for the entire conversion. The converter is now waiting for a start bit and its MUX assignment word, if applicable.

2. On each rising edge of the clock the status of the data in (DI) line is clocked into the MUX address shift register. The start bit is the first logic “1” that appears on this line (all leading zeros are ignored). Following the start bit the converter expects the next 2 bits to be the MUX assignment word.

3. When the start bit has been shifted into the start location of the MUX register, and the input channel has been assigned, a conversion is about to begin. An interval of ½ clock period (where nothing happens) is automatically inserted to allow the selected MUX channel to settle to a final analog input value. The DI line is disabled at this time. It no longer accepts data.

4. The data out (DO) line now comes out of TRI-STATE and provides a leading zero for this one clock period of MUX settling time.

5. During the conversion the output of the SAR comparator indicates whether the analog input is greater than (high) or less than (low) a series of successive voltages generated internally from a ratioed capacitor array (first 5 bits) and a resistor ladder (last 3 bits). After each comparison the comparator's output is shipped to the DO line on the falling edge of CLK. This data is the result of the conversion being shifted out (with the MSB first) and can be read by the processor immediately.

6. After 8 clock periods the conversion is completed.

7. The stored data in the successive approximation register is loaded into an internal shift register. The data, LSB first, is automatically shifted out the DO line after the MSB first data stream. The DO line then goes low and stays low until CS is returned high. The ADC08831 is an exception in that its data is only output in MSB first format.

8. The DI and DO lines can be tied together and controlled through a bidirectional processor I/O bit with one wire. This is possible because the DI input is only “looked-at” during the MUX addressing interval while the DO line is still in a high impedance state.

Reducing Power Consumption

The ADC08831 operate up to a 2MHz clock frequency, or about 181 ksp. At 5V supply, it consumes about 1.7 mA or 8.5 mW when CS is logic low. The ADC08831 has a low power mode to minimize total power consumption.

When the chip select is asserted with a logic high, some analog circuitry and digital logic are pulled to a static, low power condition. Also, DOUT, the output driver is taken into TRI-STATE mode.

To optimize static power consumption, special attention is needed to the digital input logic signals: CLK, CS, DI. Each digital input has a large CMOS buffer between VCC and GND. A traditional TTL level high (2.4V) will be sufficient for each input to read a logical “1”. However, there could be a large VIH to VCC voltage difference at each input. Such a voltage difference would cause static power dissipation, even when chip select pin is high and the part is in low power mode.

Therefore, to minimize static power dissipation, it is recommended that all digital input logic levels should equal the converter's supply. Various CMOS logic is particularly well suited for this application.

The reference pin on the ADC08831 is not affected by the power-down mode. To reduce static reference current during non-conversion time, there are a couple options. First, a low voltage external reference (ie, 2.5V could be used). A shunt reference, such as the LM385-2.5, could be powered by a logic gate that is the inverse of the signal on CS. When CS is high, the reference is off. As a second option, an external, low on-resistance switch could be used.

The ADC08832 is similar to the ADC08831, except its reference is derived from VCC. The ADC08832 does enter a low-power mode when CS is logic high, as the analog and digital logic enter static current modes. However power dissipation from the reference ladder occurs, regardless of the signal on CS.
REFERENCE CONSIDERATIONS

The voltage applied to the reference input on these converters, $V_{REF}$, defines the voltage span of the analog input (the difference between $V_{IN(MAX)}$ and $V_{IN(MIN)}$) over which the 256 possible output codes apply. The devices can be used either in ratiometric applications or in systems requiring absolute accuracy. The reference pin must be connected to a voltage source capable of driving the reference input resistance which can be as low as 2.8kΩ. This pin is the top of a resistor divider string and capacitor array used for the successive approximation conversion.

In a ratiometric system the analog input voltage is proportional to the voltage used for the A/D reference. This voltage is typically the system power supply, so the $V_{REF}$ pin can be tied to $V_{CC}$ (done internally on the ADC08832). This technique relaxes the stability requirements of the system reference as the analog input and A/D reference move together maintaining the same output code for a given input condition.

For absolute accuracy, where the analog input varies between very specific voltage limits, the reference pin can be biased with a time and temperature stable voltage source. The LM385, LM336 and LM4040 reference diodes are good low current devices to use with these converters.

The maximum value of the reference is limited to the $V_{CC}$ supply voltage. The minimum value, however, can be quite small (see Typical Performance Characteristics) to allow direct conversions of transducer outputs providing less than a 5V output span. Particular care must be taken with regard to noise pickup, circuit layout and system error voltage sources when operating with a reduced span due to the increased sensitivity of the converter (1 LSB equals $V_{REF}/256$).

![Figure 22. Reference Examples](image)

THE ANALOG INPUTS

The most important feature of these converters is that they can be located right at the analog signal source and through just a few wires can communicate with a controlling processor with a highly noise immune serial bit stream. This in itself greatly minimizes circuitry to maintain analog signal accuracy which otherwise is most susceptible to noise pickup. However, a few words are in order with regard to the analog inputs should the input be noisy to begin with or possibly riding on a large common-mode voltage.
The differential input of these converters actually reduces the effects of common-mode input noise, a signal common to both selected “+” and “−” inputs for a conversion (60 Hz is most typical). The time interval between sampling the “+” input and then the “−” input is ½ of a clock period. The change in the common-mode voltage during this short time interval can cause conversion errors. For a sinusoidal common-mode signal this error is:

\[ V_{\text{error}}(\text{max}) = V_{\text{PEAK}} \left( \frac{2\pi f_{\text{CM}}}{f_{\text{CLK}}} \right) \]

where
- \( f_{\text{CM}} \) is the frequency of the common-mode signal
- \( V_{\text{PEAK}} \) is its peak voltage value
- \( f_{\text{CLK}} \) is the A/D clock frequency

For a 60Hz common-mode signal to generate a ¼ LSB error (≈5mV) with the converter running at 250kHz, its peak value would have to be 6.63V which would be larger than allowed as it exceeds the maximum analog input limits.

Source resistance limitation is important with regard to the DC leakage currents of the input multiplexer. Bypass capacitors should not be used if the source resistance is greater than 1kΩ. The worst-case leakage current of ±1μA over temperature will create a 1mV input error with a 1kΩ source resistance. An op amp RC active low pass filter can provide both impedance buffering and noise filtering should a high impedance signal source be required.

Sample and Hold
The ADC08831/2 provide a built-in sample-and-hold to acquire the input signal. The sample and hold can sample input signals in either single-ended or pseudo differential mode.

Input Op Amps
When driving the analog inputs with an op amp it is important that the op amp settle within the allowed time. To achieve the full sampling rate, the analog input should be driven with a low impedance source (100Ω) or a high-speed op amp such as the LM6142. Higher impedance sources or slower op amps can easily be accommodated by allowing more time for the analog input to settle.

Source Resistance
The analog inputs of the ADC08831/2 look like a 13pF capacitor (\( C_{\text{IN}} \)) in series with 300Ω resistor (Ron). \( C_{\text{IN}} \) gets switched between the selected “+” and “−” inputs during each conversion cycle. Large external source resistors will slow the settling of the inputs. It is important that the overall RC time constants be short enough to allow the analog input to completely settle.

Board Layout Consideration, Grounding and Bypassing:
The ADC08831/2 are easy to use with some board layout consideration. They should be used with an analog ground plane and single-point grounding techniques. The GND pin should be tied directly to the ground plane. The supply pin should be bypassed to the ground plane with a surface mount or ceramic capacitor with leads as short as possible. All analog inputs should be referenced directly to the single-point ground. Digital inputs and outputs should be shielded from and routed away from the reference and analog circuitry.

OPTIONAL ADJUSTMENTS
Zero Error
The offset of the A/D does not require adjustment. If the minimum analog input voltage value, \( V_{\text{IN(MIN)}} \), is not ground a zero offset can be done. The converter can be made to output 0000 0000 digital code for this minimum input voltage by biasing any \( V_{\text{IN}} \) (−) input at this \( V_{\text{IN(MIN)}} \) value. This utilizes the differential mode operation of the A/D.
The zero error of the A/D converter relates to the location of the first riser of the transfer function and can be measured by grounding the $V_{\text{IN}} (-)$ input and applying a small magnitude positive voltage to the $V_{\text{IN}} (+)$ input. Zero error is the difference between the actual DC input voltage which is necessary to just cause an output digital code transition from 0000 0000 to 0000 0001 and the ideal $\frac{1}{2}$ LSB value ($\frac{1}{2}$ LSB = 9.8mV for $V_{\text{REF}} = 5.000V_{\text{DC}}$).

**Full Scale**

The full-scale adjustment can be made by applying a differential input voltage which is $1\frac{1}{2}$ LSB down from the desired analog full-scale voltage range and then adjusting the magnitude of the $V_{\text{REF}}$ input (or $V_{\text{CC}}$ for the ADC08832) for a digital output code which is just changing from 1111 1110 to 1111 1111.

**Adjusting for an Arbitrary Analog Input Voltage Range**

If the analog zero voltage of the A/D is shifted away from ground (for example, to accommodate an analog input signal which does not go to ground), this new zero reference should be properly adjusted first. A $V_{\text{IN}} (+)$ voltage which equals this desired zero reference plus $\frac{1}{2}$ LSB (where the LSB is calculated for the desired analog span, using $1$ LSB = analog span/256) is applied to selected “+” input and the zero reference voltage at the corresponding “−” input should then be adjusted to just obtain the 00HEX to 01HEX code transition.

The full-scale adjustment should be made [with the proper $V_{\text{IN}} (-)$ voltage applied] by forcing a voltage to the $V_{\text{IN}} (+)$ input which is given by:

$$V_{\text{IN}} (+) \text{ fs adj} = V_{\text{MAX}} - 1.5 \left( \frac{V_{\text{MAX}} - V_{\text{MIN}}}{256} \right)$$

where

- $V_{\text{MAX}}$ = the high end of the analog input range
- $V_{\text{MIN}}$ = the low end (the offset zero) of the analog range
- (Both are ground referenced.)

The $V_{\text{REF}}$ (or $V_{\text{CC}}$) voltage is then adjusted to provide a code change from FEHEX to FFHEX. This completes the adjustment procedure.

**DYNAMIC PERFORMANCE**

Dynamic performance specifications are often useful in applications requiring waveform sampling and digitization. Typically, a memory buffer is used to capture a stream of consecutive digital outputs for post processing. Capturing a number of samples that is a power of 2 (ie, 1024, 2048, 4096) allows the Fast Fourier Transform (FFT) to be used to digitally analyze the frequency components of the signal. Depending on the application, further digital filtering, windowing, or processing can be applied.

**Sampling Rate**

The Sampling Rate, sometimes referred to as the Throughput Rate, is the time between repetitive samples by an Analog-to-Digital Converter. The sampling rate includes the conversion time, as well as other factors such a MUX setup time, acquisition time, and interfacing time delays. Typically, the sampling rate is specified in the number of samples taken per second, at the maximum Analog-to-Digital Converter clock frequency.

Signals with frequencies exceeding the Nyquist frequency (1/2 the sampling rate), will be aliased into frequencies below the Nyquist frequency. To prevent signal degradation, sample at twice (or more) than the input signal and/or use of a low pass (anti-aliasing) filter on the front-end. Sampling at a much higher rate than the input signal will reduce the requirements of the anti-aliasing filter.

Some applications require under-sampling the input signal. In this case, one expects the fundamental to be aliased into the frequency range below the Nyquist frequency. In order to be assured the frequency response accurately represents a harmonic of the fundamental, a band-pass filter should be used over the input range of interest.
Signal-to-Noise Ratio

Signal-to-Noise Ratio (SNR) is the ratio of RMS magnitude of the fundamental to the RMS sum of all the non-fundamental signal, excluding the harmonics, up to 1/2 of the sampling frequency (Nyquist).

Total Harmonic Distortion

Total Harmonic distortion is the ratio of the RMS sum of the amplitude of the harmonics to the fundamental input frequency.

\[
THD = 20 \log \left( \frac{V_2^2 + V_3^2 + V_4^2 + V_5^2 + V_6^2}{V_1} \right)^{1/2}
\]

where

- \( V_1 \) is the RMS amplitude of the fundamental
- \( V_2, V_3, V_4, V_5, V_6 \) are the RMS amplitudes of the individual harmonics.

In theory, all harmonics are included in THD calculations, but in practice only about the first 6 make significant contributions and require measurement.

For under-sampling applications, the input signal should be band pass filtered (BPF) to prevent out of band signals, or their harmonics, to appear in the spectral response.

The DC Linearity transfer function of an Analog-to-Digital Converter tends to influence the dominant harmonics. A parabolic Linearity curve would tend to create 2\(^\text{nd}\) (and even) order harmonics, while an S-curve would tend to create 3\(^\text{rd}\) (or odd) order harmonics. The magnitude of an DC linearity error correlates to the magnitude of the harmonics.

Signal-to-Noise and Distortion

Signal-to-Noise And Distortion ratio (SINAD) is the ratio of RMS magnitude of the fundamental to the RMS sum of all the non-fundamental signals, including the noise and harmonics, up to 1/2 of the sampling frequency (Nyquist), excluding DC.

SINAD is also dependent on the number of quantization levels in the A/D Converter used in the waveform sampling process. The more quantization levels, the smaller the quantization noise and theoretical noise performance. The theoretical SINAD for a N-Bit Analog-to-Digital Converter is given by:

\[
SINAD = (6.02 N + 1.76) \text{ dB}
\]

Thus, for an 8-bit converter, the ideal SINAD = 49.92 dB

Effective Number of Bits

Effective Number Of Bits (ENOB) is another specification to quantify dynamic performance. The equation for ENOB is given by:

\[
ENOB = \frac{[(SINAD - 1.76)]}{6.02}
\]

The Effective Number Of Bits portrays the cumulative effect of several errors, including quantization, non-linearities, noise, and distortion.

Spurious Free Dynamic Range

Spurious Free Dynamic Range (SFDR) is the ratio of the signal amplitude to the amplitude of the highest harmonic or spurious noise component. If the amplitude is at full scale, the specification is simply the reciprocal of the peak harmonic or spurious noise.
Applications

Figure 23. Low-Cost Remote Temperature Sensor

\[ V_{IN} = 0.15 \text{V} \]

\[ 15\% \text{ of } V_{CC} \leq V_{XDR} \leq 85\% \text{ of } V_{CC} \]

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check [http://www.ti.com/productcontent](http://www.ti.com/productcontent) for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms “Lead-Free” or “Pb-Free” mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC–7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC–7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and implied warranties of the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, “Designers”) understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers’ applications and compliance of their applications (and of all TI products used in or for Designers’ applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI’s provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, “TI Resources”) are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer’s company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI’s provision of TI Resources does not expand or otherwise alter TI’s applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY COPYRIGHT, TRADEMARK, PATENT, TRADE SECRET, OR ANY OTHER INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED “AS IS” AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers’ own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer’s non-compliance with the terms and provisions of this Notice.
