1 Features

- Digital bipolar-latch Hall sensor
- Superior temperature stability
  - \( B_{OP} \pm 10\% \) over temperature
- Multiple sensitivity options (\( B_{OP} / B_{RP} \))
  - \( \pm 1.3 \text{ mT} \) (FA, see Device Nomenclature)
  - \( \pm 2.7 \text{ mT} \) (AD, see Device Nomenclature)
  - \( \pm 6 \text{ mT} \) (AG, see Device Nomenclature)
  - \( \pm 12 \text{ mT} \) (BC, see Device Nomenclature)
- Supports a wide voltage range
  - 2.5 V to 38 V
  - No external regulator required
- Wide operating temperature range
  - \( T_A = -40 \) to \(+125\)^°C (Q, see Device Nomenclature)
  - \( T_A = -40 \) to \(+150\)^°C (E, see Device Nomenclature)
- Open-drain output (30-mA sink)
- Fast 35-µs power-on time
- Small package and footprint
  - Surface mount 3-pin SOT-23 (DBZ)
    - 2.92 mm × 1.30 mm
  - Through-hole 3-pin TO-92 (LPG, LPE)
    - 4.00 mm × 3.15 mm
- Protection features
  - Reverse supply protection (up to \(-22 \text{ V}\))
  - Supports up to 40-V load dump
  - Output short-circuit protection
  - Output current limitation

2 Applications

- Power tools
- Flow meters
- Valve and solenoid status
- Brushless dc motors
- Proximity sensing
- Tachometers

3 Description

The DRV5013 device is a chopper-stabilized Hall effect sensor that offers a magnetic sensing solution with superior sensitivity stability over temperature and integrated protection features.

The magnetic field is indicated via a digital bipolar latch output. The IC has an open-drain output stage with 30-mA current sink capability. A wide operating voltage range from 2.5 V to 38 V with reverse polarity protection up to \(-22 \text{ V}\) makes the device suitable for a wide range of industrial applications.

Internal protection functions are provided for reverse supply conditions, load dump, and output short circuit or overcurrent.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision J (June 2019) to Revision K

- Changed \( T_J \) to show existing range is for Q version device in the Absolute Maximum Ratings table ........................................... 5
- Added E version for \( T_J \) to the Absolute Maximum Ratings table ................................................................................. 5
- Changed \( T_A \) to show existing range is for Q version device in the Recommended Operating Conditions table ........................................ 5
- Added E version for \( T_A \) to the Recommended Operating Conditions table ........................................................................... 5
- Changed \( I_{CC} \) test condition for \( T_A \) from 125 to \( T_{A,\text{MAX}} \) to highlight the differences between the E and Q version devices .... 6
- Changed \( \tau_{\text{DS(on)}} \) test condition for \( T_A \) from 125 to \( T_{A,\text{MAX}} \) to highlight the difference between the E and Q version devices.. 6
- Changed all test conditions for \( T_A \) max from 125 to \( T_{A,\text{MAX}} \) to highlight difference between the E and Q devices ........... 7
- Added new condition statement to Typical Characteristics section ........................................................................................................... 8
- Added data up to 150°C to Figure 1, Figure 2, Figure 4, Figure 6, Figure 8, and Figure 10 .............................................................. 8

Changes from Revision I (August 2018) to Revision J

- Added TO-92 (LPE) package to data sheet ................................................................................................................................. 1

Changes from Revision H (September 2016) to Revision I

- Changed Power Supply Recommendations section ................................................................. 19

Changes from Revision G (August 2016) to Revision H

- Changed the power-on time for the FA version in the Electrical Characteristics table ................................................................. 6

Changes from Revision F (May 2016) to Revision G

- Changed the maximum \( B_{\text{QIP}} \) and the minimum \( B_{\text{RIP}} \) for the FA version in the Magnetic Characteristics table ................. 7
- Added the Layout section ......................................................................................................................................................... 19

---

Changes from Revision E (February 2016) to Revision F
- Revised preliminary limits for the FA version ................................................................. 7

Changes from Revision D (December 2015) to Revision E
- Added the FA device option .......................................................................................... 1
- Added the typical bandwidth value to Magnetic Characteristics table ......................... 7

Changes from Revision C (September 2014) to Revision D
- Corrected body size of SOT-23 package and SIP package name to TO-92 ......................... 1
- Added $B_{\text{MAX}}$ to Absolute Maximum Ratings ........................................................ 5
- Removed table note from junction temperature ............................................................ 5
- Updated package tape and reel options for M and blank ............................................. 20
- Added Community Resources ...................................................................................... 21

Changes from Revision B (July 2014) to Revision C
- Updated high sensitivity options ................................................................................... 1
- Changed the max operating junction temperature to 150°C ...................................... 5
- Updated the output rise and fall time typical values and removed max values in Switching Characteristics ................................. 6
- Updated the values in Magnetic Characteristics ........................................................... 7
- Updated all Typical Characteristics graphs ................................................................. 8
- Updated Equation 4 .................................................................................................... 17
- Updated Figure 24 ..................................................................................................... 20

Changes from Revision A (March 2014) to Revision B
- Changed $I_{\text{OC}}$ MIN and MAX values from 20 and 40 to 15 and 45, respectively, in the Electrical Characteristics ......................... 6
- Updated the hysteresis values for each device option in the Magnetic Characteristics table ......................................................... 7
- Changed the MIN value for the ±2.3 mt $B_{\text{op}}$ parameter from –4 to –5 in the Magnetic Characteristics table ............................ 7

Changes from Original (March 2014) to Revision A
- Changed all references to Hall IC to Hall Effect Sensor ............................................. 1
- Changed RPM Meter to Tachometers in the Applications list ..................................... 1
- Changed the power-on value from 50 to 35 μs in the Features list ............................... 1
- Changed the type of the OUT terminal from OD to Output in the Pin Functions table .......................................................... 4
- Deleted Output pin current and changed $V_{CC_{\text{MAX}}}$ to $V_{CC}$ after the voltage ramp rate for the supply voltage ........................ 5
- Changed $R_{O}$ to R1 in the test conditions for $t_{f}$ and $t_{r}$ in the Switching Characteristics table ................................................................. 6
- Added the bandwidth parameter to Magnetic Characteristics table ......................... 7
- Changed the MIN value for the ±2.3 mt $B_{\text{op}}$ parameter from +2.3 to –2.3 in the Magnetic Characteristics table ............................ 7
- Deleted condition statement from the Typical Characteristics and changed all $T_{j}$ to $T_{A}$ in the graph conditions .................... 8
- Deleted Number from the Power-On Time case names; added conditions to captions of case timing diagrams ...................... 12
- Added the R1 tradeoff and lower current text after the equation in the Output Stage section ............................................................. 14
- Added the C2 not required for most applications text after the second equation in the Output Stage section ............................. 14
- Changed $I_{O}$ to $I_{\text{SINK}}$ in condition statement of FET overload fault condition in Reverse Supply Protection section .................. 15

7 Detailed Description

7.1 Overview

The DRV5013 device is a chopper-stabilized Hall sensor with a digital latched output for magnetic sensing applications. The DRV5013 device can be powered with a supply voltage between 2.5 and 38 V, and continuously survives continuous –22-V reverse-battery conditions. The DRV5013 device does not operate when –22 to 2.4 V is applied to the \( V_{CC} \) pin (with respect to the GND pin). In addition, the device can withstand voltages up to 40 V for transient durations.

The field polarity is defined as follows: a south pole near the marked side of the package is a positive magnetic field. A north pole near the marked side of the package is a negative magnetic field.

The field polarity is defined as follows: a south pole near the marked side of the package is a positive magnetic field. A north pole near the marked side of the package is a negative magnetic field.

The output state is dependent on the magnetic field perpendicular to the package. A south pole near the marked side of the package causes the output to pull low (operate point, \( B_{OP} \)), and a north pole near the marked side of the package causes the output to release (release point, \( B_{RP} \)). Hysteresis is included in between the operate point and the release point therefore magnetic-field noise does not accidentally trip the output.

An external pullup resistor is required on the OUT pin. The OUT pin can be pulled up to \( V_{CC} \), or to a different voltage supply. This allows for easier interfacing with controller circuits.

7.2 Functional Block Diagram
7.3 Feature Description

7.3.1 Field Direction Definition

A positive magnetic field is defined as a south pole near the marked side of the package as shown in Figure 11.

![Figure 11. Field Direction Definition](image)

7.3.2 Device Output

If the device is powered on with a magnetic field strength between \( B_{\text{RP}} \) and \( B_{\text{OP}} \), then the device output is indeterminate and can either be Hi-Z or Low. If the field strength is greater than \( B_{\text{OP}} \), then the output is pulled low. If the field strength is less than \( B_{\text{RP}} \), then the output is released.

![Figure 12. DRV5013—\( B_{\text{OP}} > 0 \)](image)
Feature Description (continued)

7.3.3 Power-On Time

After applying \( V_{CC} \) to the DRV5013 device, \( t_{on} \) must elapse before the OUT pin is valid. During the power-up sequence, the output is Hi-Z. A pulse as shown in Figure 13 and Figure 14 occurs at the end of \( t_{on} \). This pulse can allow the host processor to determine when the DRV5013 output is valid after startup. In Case 1 (Figure 13) and Case 2 (Figure 14), the output is defined assuming a constant magnetic field \( B > B_{OP} \) and \( B < B_{RP} \).

**Figure 13. Case 1: Power On When \( B > B_{OP} \)**

**Figure 14. Case 2: Power On When \( B < B_{RP} \)**
Feature Description (continued)

If the device is powered on with the magnetic field strength \( B_{RP} < B < B_{OP} \), then the device output is indeterminate and can either be Hi-Z or pulled low. During the power-up sequence, the output is held Hi-Z until \( t_{on} \) has elapsed. At the end of \( t_{on} \), a pulse is given on the OUT pin to indicate that \( t_{on} \) has elapsed. After \( t_{on} \), if the magnetic field changes such that \( B_{OP} < B \), the output is released. Case 3 (Figure 15) and Case 4 (Figure 16) show examples of this behavior.

![Figure 15. Case 3: Power On When \( B_{RP} < B < B_{OP} \), Followed by \( B > B_{OP} \)](image)

![Figure 16. Case 4: Power On When \( B_{RP} < B < B_{OP} \), Followed by \( B < B_{RP} \)](image)
Feature Description (continued)

7.3.4 Output Stage

Figure 17 shows the DRV5013 open-drain NMOS output structure, rated to sink up to 30 mA of current. For proper operation, calculate the value of pullup resistor R1 using Equation 1.

\[
\frac{V_{\text{ref max}}}{30 \text{ mA}} \leq R1 \leq \frac{V_{\text{ref min}}}{100 \text{ µA}}
\]

(1)

The size of R1 is a tradeoff between the OUT rise time and the current when OUT is pulled low. A lower current is generally better, however faster transitions and bandwidth require a smaller resistor for faster switching.

In addition, make sure that the value of R1 > 500 Ω so that the output driver can pull the OUT pin close to GND.

\[
V_{\text{ref}} \text{ is not restricted to } V_{\text{CC}}. \text{ The allowable voltage range of this pin is specified in the Absolute Maximum Ratings.}
\]

NOTE

Figure 17. NMOS Open-Drain Output

Select a value for C2 based on the system bandwidth specifications as shown in Equation 2.

\[
2 \times f_{\text{BW}} (\text{Hz}) < \frac{1}{2\pi \times R1 \times C2}
\]

(2)

Most applications do not require this C2 filtering capacitor.
Feature Description (continued)

7.3.5 Protection Circuits
The DRV5013 device is fully protected against overcurrent and reverse-supply conditions. Table 1 lists a summary of the protection circuits.

Table 1. Protection Circuit Summary

<table>
<thead>
<tr>
<th>FAULT</th>

<td>Operating</td>
<td>Device will operate for a transient duration</td>
<td>( V_{\text{CC}} \leq 38 , \text{V} )</td>
</tr>
<tr>
<td>Reverse supply</td>
<td>( -22 , \text{V} &lt; V_{\text{CC}} &lt; 0 , \text{V} )</td>
<td>Disabled</td>
<td>Device will survive this condition</td>
<td>( V_{\text{CC}} \geq 2.5 , \text{V} )</td>
</tr>
</tbody>
</table>

7.3.5.1 Overcurrent Protection (OCP)
An analog current-limit circuit limits the current through the FET. The driver current is clamped to \( I_{\text{OCP}} \). During this clamping, the \( r_{\text{DS(on)}} \) of the output FET is increased from the nominal value.

7.3.5.2 Load Dump Protection
The DRV5013 device operates at DC \( V_{\text{CC}} \) conditions up to 38 V nominally, and can additionally withstand \( V_{\text{CC}} = 40 \, \text{V} \). No current-limiting series resistor is required for this protection.

7.3.5.3 Reverse Supply Protection
The DRV5013 device is protected in the event that the \( V_{\text{CC}} \) pin and the GND pin are reversed (up to \( -22 \, \text{V} \)).

**NOTE**
In a reverse supply condition, the OUT pin reverse-current must not exceed the ratings specified in the Absolute Maximum Ratings.

7.4 Device Functional Modes
The DRV5013 device is active only when \( V_{\text{CC}} \) is between 2.5 and 38 V.

When a reverse supply condition exists, the device is inactive.
8 Application and Implementation

**NOTE**
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information
The DRV5013 device is used in magnetic-field sensing applications.

8.2 Typical Applications

8.2.1 Standard Circuit

![Typical Application Circuit Diagram]

**Figure 18. Typical Application Circuit**

8.2.1.1 Design Requirements
For this design example, use the parameters listed in Table 2 as the input parameters.

<table>
<thead>
<tr>
<th>DESIGN PARAMETER</th>
<th>REFERENCE</th>
<th>EXAMPLE VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supply voltage</td>
<td>( V_{CC} )</td>
<td>3.2 to 3.4 V</td>
</tr>
<tr>
<td>System bandwidth</td>
<td>( f_{BW} )</td>
<td>10 kHz</td>
</tr>
</tbody>
</table>

8.2.1.2 Detailed Design Procedure

<table>
<thead>
<tr>
<th>COMPONENT</th>
<th>PIN 1</th>
<th>PIN 2</th>
<th>RECOMMENDED</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1</td>
<td>( V_{CC} )</td>

<td><strong>Optional</strong>: Place a ceramic capacitor to GND</td>
</tr>
<tr>
<td>R1</td>
<td>OUT</td>
<td>( \text{REF}^{(1)} )</td>
<td>Requires a resistor pullup</td>
</tr>
</tbody>
</table>

(1) REF is not a pin on the DRV5013 device, but a REF supply-voltage pullup is required for the OUT pin; the OUT pin may be pulled up to \( V_{CC} \).
8.2.1.2.1 Configuration Example

In a 3.3-V system, \(3.2 \leq V_{\text{ref}} \leq 3.4\) V. Use Equation 3 to calculate the allowable range for \(R1\).

\[
\frac{V_{\text{ref max}}}{30 \text{ mA}} \leq R1 \leq \frac{V_{\text{ref min}}}{100 \mu\text{A}}
\]  

For this design example, use Equation 4 to calculate the allowable range of \(R1\).

\[
\frac{3.4}{30 \text{ mA}} \leq R1 \leq \frac{3.2}{100 \mu\text{A}}
\]  

Therefore:

\[113 \Omega \leq R1 \leq 32 \text{ k}\Omega\]

After finding the allowable range of \(R1\) (Equation 5), select a value between 500 \(\Omega\) and 32 \(\text{k}\Omega\) for \(R1\).

Assuming a system bandwidth of 10 kHz, use Equation 6 to calculate the value of \(C2\).

\[
2 \times f_{\text{BW}} (\text{Hz}) < \frac{1}{2\pi \times R1 \times C2}
\]  

For this design example, use Equation 7 to calculate the value of \(C2\).

\[
2 \times 10 \text{ kHz} < \frac{1}{2\pi \times R1 \times C2}
\]

An \(R1\) value of 10 k\(\Omega\) and a \(C2\) value less than 820 pF satisfy the requirement for a 10-kHz system bandwidth. A selection of \(R1 = 10\) k\(\Omega\) and \(C2 = 680\) pF would cause a low-pass filter with a corner frequency of 23.4 kHz.

8.2.1.3 Application Curves

![Figure 19. 10-kHz Switching Magnetic Field](image)

![Figure 20. 10-kHz Switching Magnetic Field](image)

![Figure 21. Low-Pass Filtering](image)
8.2.2 Alternative Two-Wire Application

For systems that require minimal wire count, the device output can be connected to $V_{CC}$ through a resistor, and the total supplied current can be sensed near the controller.

![Circuit Diagram](image)

**Figure 22. 2-Wire Application**

Current can be sensed using a shunt resistor or other circuitry.

### 8.2.2.1 Design Requirements

Table 4 lists the related design parameters.

</tr>
</tbody>
</table>

### 8.2.2.2 Detailed Design Procedure

When the open-drain output of the device is high-impedance, current through the path equals the $I_{CC}$ of the device (approximately 3 mA).

When the output pulls low, a parallel current path is added, equal to $V_{CC} / (R1 + r_{DS(on)})$. Using 12 V and 1 kΩ, the parallel current is approximately 12 mA, making the total current approximately 15 mA.

The local bypass capacitor C1 should be at least 0.1 µF, and a larger value if there is high inductance in the power line interconnect.
9 Power Supply Recommendations

The DRV5013 device is designed to operate from an input voltage supply (VM) range between 2.5 V and 38 V. A 0.01-μF (minimum) ceramic capacitor rated for $V_{CC}$ must be placed as close to the DRV5013 device as possible. Larger values of the bypass capacitor may be needed to attenuate any significant high-frequency ripple and noise components generated by the power source. TI recommends limiting the supply voltage variation to less than 50 mVpp.

10 Layout

10.1 Layout Guidelines

The bypass capacitor should be placed near the DRV5013 device for efficient power delivery with minimal inductance. The external pullup resistor should be placed near the microcontroller input to provide the most stable voltage at the input; alternatively, an integrated pullup resistor within the GPIO of the microcontroller can be used.

Generally, using PCB copper planes underneath the DRV5013 device has no effect on magnetic flux, and does not interfere with device performance. This is because copper is not a ferromagnetic material. However, if nearby system components contain iron or nickel, they may redirect magnetic flux in unpredictable ways.

10.2 Layout Example

![Figure 23. DRV5013 Layout Example](image-url)
11 Device and Documentation Support

11.1 Device Support

11.1.1 Device Nomenclature

Figure 24 shows a legend for reading the complete device name for and DRV5013 device.

- **Prefix**
  - DRV5013: Digital latch Hall sensor

- **BOP/BRP**
  - FA: 1.3/-1.3 mT
  - AD: 2.7/-2.7 mT
  - AG: 6/-6 mT
  - BC: 12/-12 mT

- **AEC-Q100**
  - Q1: Automotive qualification
  - Blank: Non-auto

- **Tape and Reel**
  - R: 3000 pcs/reel
  - T: 250 pcs/reel
  - M: 3000 pcs/box (ammo)
  - Blank: 1000 pcs/bag (bulk)

- **Package**
  - DBZ: 3-pin SOT-23
  - LPG: 3-pin TO-92
  - LPE: 3-pin TO-92

- **Temperature Range**
  - Q: ±-40 to 125°C
  - E: ±-40 to 150°C

**Figure 25. SOT-23 (DBZ) Package**

- Indicates the Hall effect sensor (not to scale). The Hall element is located in the center of the package with a tolerance of ±100 µm. The height of the Hall element from the bottom of the package is 0.7 mm ±50 µm in the DBZ package, and 0.987 mm ±50 µm in the LPG and LPE packages.
11.2 Receiving Notification of Documentation Updates
To receive notification of documentation updates — go to the product folder for your device on ti.com. In the upper right-hand corner, click the Alert me button to register and receive a weekly digest of product information that has changed (if any). For change details, check the revision history of any revised document.

11.3 Community Resources
The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 Trademarks
E2E is a trademark of Texas Instruments. All other trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution
⚠️ These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.6 Glossary
**SLYZ022 — Ti Glossary.**
This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information
The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. </table>

(1) The marketing status values are defined as follows:
- **ACTIVE**: Product device recommended for new designs.
- **LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substances do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

</table>
Images above are just a representation of the package family, actual package may vary. Refer to the product data sheet for package details.
NOTES:
1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC registration TO-236, except minimum foot length.
NOTES: (continued)

4. Publication IPC-7351 may have alternate designs.
5. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

7. Board assembly site may have different recommendations for stencil design.
NOTES:
1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
