1 Features
- 2.7-V to 5.5-V Input Range
- Fixed 5-V Output
- 200-mA Output Current
- Inductorless Solution: Only Requires 3 Small Ceramic Capacitors
- Shutdown Disconnects Load from \( V_{IN} \)
- Current Limit and Thermal Protection
- 2-MHz Switching Frequency
- PFM Operation During Light Load Currents (PFM pin tied high)

2 Applications
- USB OTG
- HDMI Power
- Portable Electronics

3 Description
The LM2775 is a regulated switched-capacitor doubler that produces a low-noise output voltage. The LM2775 can supply up to 200 mA of output current over a 3.1-V to 5.5-V input range, as well as up to 125 mA of output current when the input voltage is as low as 2.7 V. At low output currents, the LM2775 can reduce its quiescent current by operating in a pulse frequency modulation (PFM) mode. PFM mode can be enabled or disabled by driving the PFM pin to high or low. Additionally, when the LM2775 is in shutdown, the user can chose to have the output voltage pulled to GND or left in a high impedance state by setting the OUTDIS pin high or low.

The LM2775 has been placed in TI's 8-pin WSON, a package with excellent thermal properties that keeps the part from overheating under almost all rated operating conditions.

7 Detailed Description

7.1 Overview

The LM2775 is a regulated switched capacitor doubler that, by combining the principles of switched-capacitor voltage boost and linear regulation, generates a regulated output from an extended Li-Ion input voltage range. A two-phase non-overlapping clock generated internally controls the operation of the doubler. During the charge phase (\(\phi_1\)), the flying capacitor (C1) is connected between the input and ground through internal pass transistor switches and is charged to the input voltage. In the pump phase that follows (\(\phi_2\)), the flying capacitor is connected between the input and output through similar switches. Stacked atop the input, the charge of the flying capacitor boosts the output voltage and supplies the load current.

A traditional switched capacitor doubler operating in this manner uses switches with very low on-resistance to generate an output voltage that is 2× the input voltage. Regulation is achieved by modulating the current of the two switches connected to the VIN pin (one switch in each phase).

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Pre-Regulation

The very low input current ripple of the LM2775, resulting from internal pre-regulation, adds minimal noise to the input line. The core of the LM2775 is very similar to that of a basic switched capacitor doubler: it is composed of four switches and a flying capacitor (external). Regulation is achieved by controlling the current through the two switches connected to the VIN pin (one switch in each phase). The regulation is done before the voltage doubling, giving rise to the term "pre-regulation". It is pre-regulation that eliminates most of the input current ripple that is a typical and undesirable characteristic of a many switched capacitor converters.

7.3.2 Input Current Limit

The LM2775 contains current limit circuitry that protects the device in the event of excessive input current and/or output shorts to ground. The input current is limited to 600 mA (typical) when the output is shorted directly to ground. When the LM2775 is current limiting, power dissipation in the device is likely to be quite high. In this event, thermal cycling should be expected.
Feature Description (continued)

7.3.3 PFM Mode
To minimize quiescent current during light load operation, the LM2775 provides a PFM operation option (selectable via the PFM pin. ‘1’ = PFM allowed, '0' = Fixed frequency). By allowing the charge pump to only switch when the $V_{OUT}$ voltage decays to a typical 5.05 V, the quiescent current drawn from the power source is minimized. The frequency of pulsed operation is not limited and can drop into the sub-1-kHz range when unloaded. As the load increases, the frequency of pulsing increases.

When PFM mode is disabled, the device operates in a constant frequency mode. In this mode, the quiescent current remains at normal levels even when the load current is decreased. The main advantages of fixed frequency operation include a lower output voltage ripple level due to the constant switching and a predictable switching frequency that stays at 2 MHz which can be important in noise sensitive applications.

7.3.4 Output Discharge
The LM2775 provides two different output discharge modes upon entering a shutdown state (EN pin = '0') after running in the on state (EN = '1'). The first mode is high impedance mode (OUTDIS = '0'). In this mode, the output remains high even when the EN pin is driven low. This enables use in applications where the LM2775 output might be tied to a system rail that has another power source connected (USBOTG). When OUTDIS = 0, the output of the LM2775 draws a minimal current from the output supply (1.6 µA typical).

In Discharge Mode (OUTDIS pin = '1'), the LM2775 actively pulls down on the output of the device until the output voltage reaches GND. In this mode, the current drawn from the output is approximately 450 µA.

7.3.5 Thermal Shutdown
The LM2775 implements a thermal shutdown mechanism to protect the device from damage due to overheating. When the junction temperature rises to 150°C (typical), the part switches into shutdown mode. The LM2775 releases thermal shutdown when the junction temperature of the part is reduced to 130°C (typical).

Thermal shutdown is most often triggered by self-heating, which occurs when there is excessive power dissipation in the device and/or insufficient thermal dissipation. LM2775 power dissipation increases with increased output current and input voltage. When self-heating brings on thermal shutdown, thermal cycling is the typical result. Thermal cycling is the repeating process where the part self-heats, enters thermal shutdown (where internal power dissipation is practically zero), cools, turns on, and then heats up again to the thermal shutdown threshold. Thermal cycling is recognized by a pulsing output voltage and can be stopped be reducing the internal power dissipation (reduce input voltage and/or output current) or the ambient temperature. If thermal cycling occurs under desired operating conditions, thermal dissipation performance must be improved to accommodate the power dissipation of the LM2775. The WSON package is designed to have excellent thermal properties that, when soldered to a PCB designed to aid thermal dissipation, allows the LM2775 to operate under very demanding power dissipation conditions.

7.3.6 Undervoltage Lockout
The LM2775 has an internal comparator that monitors the voltage at VIN and forces the LM2775 into shutdown if the input voltage drops to 2.4 V. If the input voltage rises above 2.6 V, the LM2775 resumes normal operation.
7.4 Device Functional Modes

7.4.1 Shutdown
The LM2775 enters Shutdown Mode if one of the two conditions are met.
• If $V_{\text{IN}}$ is removed or allowed to sag to ground, the device enters shutdown.
• If the EN pin is driven low when $V_{\text{IN}}$ is within the normal operating range.

In Shutdown, the LM2775 typically draws less than 1 µA from the supply. Depending on the state of the OUTDIS pin, the output is pulled low when entering shutdown (OUTDIS = '1'), or it remains near the final output voltage with the output in a low leakage state (OUTDIS = '0').

7.4.2 Boost Mode
The LM2775 is in Boost Mode if $V_{\text{IN}}$ is within the normal operating range, and the EN pin is driven high. Depending on the state of the PFM pin, the LM2775 either regulates the output via a PFM burst mode (PFM = '1') or via a constant switching mode (PFM = '0').
8 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information
The LM2775 can create a 5-V system rail capable of delivering up to 200 mA of output current to the load. The 2-MHz switched capacitor boost allows for the use of small value discrete external components.

8.2 Typical Application

8.2.1 Design Requirements

</tbody>
</table>

8.2.2 Detailed Design Procedure

8.2.2.1 Output Current Capability
The LM2775 provides 200 mA of output current when the input voltage is within 3.1 V to 5.5 V.

NOTE
Understanding relevant application issues is recommended and a thorough analysis of the application circuit should be performed when using the part outside operating ratings and/or specifications to ensure satisfactory circuit performance in the application. Special care should be paid to power dissipation and thermal effects. These parameters can have a dramatic impact on high-current applications, especially when the input voltage is high. (see the Power Dissipation section).

The schematic of Figure 20 is a simplified model of the LM2775 that is useful for evaluating output current capability. The model shows a linear pre-regulation block (Reg), a voltage doubler (2×), and an output resistance (\( R_{\text{OUT}} \)). Output resistance models the output voltage droop that is inherent to switched capacitor converters. The output resistance of the LM2775 is 3.5 \( \Omega \) (typical) and is approximately equal to twice the resistance of the four LM2775 switches. When the output voltage is in regulation, the regulator in the model controls the voltage \( V' \) to keep the output voltage equal to 5 V ± 4%. With increased output current, the voltage drop across \( R_{\text{OUT}} \)
increases. To prevent droop in output voltage, the voltage drop across the regulator is reduced, \( V' \) increases, and \( V_{\text{OUT}} \) remains at 5 V. When the output current increases to the point that there is zero voltage drop across the regulator, \( V' \) equals the input voltage, and the output voltage is near the edge of regulation. Additional output current causes the output voltage to fall out of regulation, and the LM2775 operation is similar to a basic open-loop doubler. As in a voltage doubler, increase in output current results in output voltage drop proportional to the output resistance of the doubler. The out-of-regulation LM2775 output voltage can be approximated by:

\[
V_{\text{OUT}} = 2 \times V_{\text{IN}} - I_{\text{OUT}} \times R_{\text{OUT}}
\]

Again, Equation 1 only applies at low input voltage and high output current where the LM2775 is not regulating. See Output Current vs. Output Voltage curves in the Typical Characteristics section for more details.

A more complete calculation of output resistance takes into account the effects of switching frequency, flying capacitance, and capacitor equivalent series resistance (ESR) (see Equation 2).

\[
R_{\text{OUT}} = 2 \cdot R_{\text{SW}} + \frac{1}{F_{\text{SW}} \times C_{1}} + 4 \cdot \text{ESR}_{C1} + \text{ESR}_{COUT}
\]

Switch resistance component (3 \( \Omega \) typical) dominates the output resistance equation of the LM2775. With a 2-MHz typical switching frequency, the \( 1/(F \times C) \) component of the output resistance contributes only 0.5 \( \Omega \) to the total output resistance. Increasing the flying capacitance only provides minimal improvement to the total output current capability of the LM2775. In some applications it may be desirable to reduce the value of the flying capacitor below 1 \( \mu \text{F} \) to reduce solution size and/or cost, but this should be done with care so that output resistance does not increase to the point that undesired output voltage droop results. If ceramic capacitors are used, ESR will be a negligible factor in the total output resistance, as the ESR of quality ceramic capacitors is typically much less than 100 m\( \Omega \).

### 8.2.2.2 Efficiency

Charge-pump efficiency is derived in Equation 3 and Equation 4 (supply current and other losses are neglected for simplicity):

\[
I_{\text{IN}} = G \times I_{\text{OUT}} \quad E = \frac{V_{\text{OUT}} \times I_{\text{OUT}}}{V_{\text{IN}} \times I_{\text{IN}}} = V_{\text{OUT}} \div (G \times V_{\text{IN}})
\]

If one includes the quiescent current drawn by the LM2775 to operate, the following can be derived:

\[
E = \frac{P_{\text{OUT}}}{P_{\text{IN}}} = \frac{V_{\text{OUT}} \times I_{\text{OUT}}}{V_{\text{IN}} \times (2 \cdot I_{\text{OUT}} + I_{Q})}
\]

In Equation 3, \( G \) represents the charge pump gain. Efficiency is at its highest as \( G \times V_{\text{IN}} \) approaches \( V_{\text{OUT}} \). For the LM2775 device, \( G = 2 \).

### 8.2.2.3 Power Dissipation

LM2775 power dissipation \( (P_{\text{D}}) \) is calculated simply by subtracting output power from input power:

\[
P_{\text{D}} = P_{\text{IN}} - P_{\text{OUT}} = [V_{\text{IN}} \times (2 \times I_{\text{OUT}} + I_{Q})] - [V_{\text{OUT}} \times I_{\text{OUT}}]
\]

Power dissipation increases with increased input voltage and output current, up to 1.35 W at the ends of the operating ratings \( (V_{\text{IN}} = 5.5 \text{ V}, I_{\text{OUT}} = 200 \text{ mA}) \). Internal power dissipation self-heats the device. Dissipating this amount power/heat so the LM2775 does not overheat is a demanding thermal requirement for a small surface-mount package. When soldered to a PCB with layout conducive to power dissipation, the excellent thermal properties of the WSON package enable this power to be dissipated from the LM2775 with little or no derating, even when the circuit is placed in elevated ambient temperatures.
8.2.2.4 Recommended Capacitor Types

The LM2775 requires 3 external capacitors for proper operation. Surface-mount multi-layer ceramic capacitors are recommended. These capacitors are small, inexpensive, and have very low ESR (≤ 15 mΩ typical). Tantalum capacitors, OS-CON capacitors, and aluminum electrolytic capacitors generally are not recommended for use with the LM2775 due to their high ESR compared to ceramic capacitors.

For most applications, ceramic capacitors with an X7R or X5R temperature characteristic are preferred for use with the LM2775. These capacitors have tight capacitance tolerance (as good as ±10%) and hold their value over temperature (X7R: ±15% over –55°C to 125°C; X5R: ±15% over –55°C to 85°C).

Capacitors with a Y5V or Z5U temperature characteristic are generally not recommended for use with the LM2775. These types of capacitors typically have wide capacitance tolerance (80% to 20%) and vary significantly over temperature (Y5V: 22%, –82% over –30°C to 85°C range; Z5U: 22%, –56% over 10°C to 85°C range). Under some conditions, a 1-µF-rated Y5V or Z5U capacitor could have a capacitance as low as 0.1 µF. Such detrimental deviation is likely to cause Y5V and Z5U capacitors to fail to meet the minimum capacitance requirements of the LM2775.

Net capacitance of a ceramic capacitor decreases with increased DC bias. This degradation can result in lower capacitance than expected on the input and/or output, resulting in higher ripple voltages and currents. Using capacitors at DC-bias voltages significantly below the capacitor voltage rating usually minimizes DC-bias effects. Consult capacitor manufacturers for information on capacitor DC-bias characteristics.

Capacitance characteristics can vary quite dramatically with different application conditions, capacitor types, and capacitor manufacturers. It is strongly recommended that the LM2775 circuit be thoroughly evaluated early in the design-in process with the mass-production capacitors of choice. This helps ensure that any such variability in capacitance does not negatively impact circuit performance.

The voltage rating of the output capacitor should be 10 V or more. All other capacitors should have a voltage rating at or above the maximum input voltage of the application.

8.2.2.5 Output Capacitor and Output Voltage Ripple

The output capacitor in the LM2775 circuit (C_OUT) directly impacts the magnitude of output voltage ripple. Other prominent factors also affecting output voltage ripple include input voltage, output current, and flying capacitance. One important generalization can be made: increasing (decreasing) the output capacitance results in a proportional decrease (increase) in output voltage ripple. A simple approximation of output ripple is determined by calculating the amount of voltage droop that occurs when the output of the LM2775 is not being driven. This occurs during the charge phase (φ1). During this time, the load is driven solely by the charge on the output capacitor. The magnitude of the ripple thus follows the basic discharge equation for a capacitor (I = C × dV/dt), where discharge time is one-half the switching period, or 0.5/F_SW (see Equation 6).

$$\text{Ripple}_{\text{Peak-Peak}} = \frac{I_{\text{OUT}}}{C_{\text{OUT}}} \times \frac{0.5}{F_{\text{SW}}}$$  \hspace{1cm} (6)
A more thorough and accurate examination of factors that affect ripple requires including effects of phase non-overlap times and output capacitor ESR. In order for the LM2775 to operate properly, the two phases of operation must never coincide. (If this were to happen all switches would be closed simultaneously, shorting input, output, and ground). Thus, non-overlap time is built into the clocks that control the phases. Since the output is not being driven during the non-overlap time, this time should be accounted for in calculating ripple. Actual output capacitor discharge time is approximately 60% of a switching period, or $0.6/F_{SW}$ (see Equation 7).

\[
\text{Ripple}_{\text{Peak-Peak}} = \left( \frac{I_{\text{OUT}}}{C_{\text{OUT}}} \times \frac{0.6}{F_{\text{SW}}} \right) + \left( 2 \times I_{\text{OUT}} \times \text{ESR}_{\text{COUT}} \right)
\]

(7)

**NOTE**

In typical high-current applications, a 10-µF, 10-V low-ESR ceramic output capacitor is recommended. Different output capacitance values can be used to reduce ripple, shrink the solution size, and/or cut the cost of the solution. But changing the output capacitor may also require changing the flying capacitor and/or input capacitor to maintain good overall circuit performance. If a small output capacitor is used and PFM mode is enabled, the output ripple can become large during the transition between PFM mode and constant switching. To prevent toggling, a 2-µF capacitance is recommended. For example, a 10-µF, 10-V output capacitor in a 0402 case size will typically only have 2-µF capacitance when biased to 5 V.

High ESR in the output capacitor increases output voltage ripple. If a ceramic capacitor is used at the output, this is usually not a concern because the ESR of a ceramic capacitor is typically very low and has only a minimal impact on ripple magnitudes. If a different capacitor type with higher ESR is used (tantalum, for example), the ESR could result in high ripple. To eliminate this effect, the net output ESR can be significantly reduced by placing a low-ESR ceramic capacitor in parallel with the primary output capacitor. The low ESR of the ceramic capacitor is in parallel with the higher ESR, resulting in a low net ESR based on the principles of parallel resistance reduction.

**8.2.2.6 Input Capacitor and Input Voltage Ripple**

The input capacitor ($C_{\text{IN}}$) is a reservoir of charge that aids a quick transfer of charge from the supply to the flying capacitor during the charge phase of operation. The input capacitor helps to keep the input voltage from drooping at the start of the charge phase when the flying capacitor is connected to the input. It also filters noise on the input pin, keeping this noise out of sensitive internal analog circuitry that is biased off the input line.

Much like the relationship between the output capacitance and output voltage ripple, input capacitance has a dominant and first-order effect on input ripple magnitude. Increasing (decreasing) the input capacitance results in a proportional decrease (increase) in input voltage ripple. Input voltage, output current, and flying capacitance also affect input ripple levels to some degree.

In typical high-current applications, a 10-µF low-ESR ceramic capacitor is recommended on the input. Different input capacitance values can be used to reduce ripple, shrink the solution size, and/or cut the cost of the solution. But changing the input capacitor may also require changing the flying capacitor and/or output capacitor to maintain good overall circuit performance.

**8.2.2.7 Flying Capacitor**

The flying capacitor ($C_{\text{f}}$) transfers charge from the input to the output. Flying capacitance can impact both output current capability and ripple magnitudes. If flying capacitance is too small, the LM2775 may not be able to regulate the output voltage when load currents are high. On the other hand, if the flying capacitance is too large, the flying capacitor might overwhelm the input and output capacitors, resulting in increased input and output ripple.

In typical high-current applications, 1-µF low-ESR ceramic capacitors are recommended for the flying capacitor. Polarized capacitors (tantalum, aluminum electrolytic, etc.) must not be used for the flying capacitor, as they could become reverse-biased during LM2775 operation.

</tbody>
</table>

8.2.4.2 Detailed Design Procedure

The 5-V output mode is normally used for the USB OTG / Mobile HDMI application. Therefore, the LM2775 can be enabled/disabled by applying a logic signal on only the EN pin while grounding the OUTDIS pin. Depending on the USB/HDMI mode of the application, the LM2775 can be enabled to drive the power bus line (Host), or disabled to put its output in high impedance allowing an external supply to drive the bus line (Slave). In addition to the high impedance-backdrive protection, the output current limit protection is 250 mA (typical), well within the USB OTG and HDMI requirements.
9 Power Supply Recommendations

The LM2775 is designed to operate from an input voltage supply range between 2.7 V and 5.5 V. This input supply must be well regulated and capable to supply the required input current. If the input supply is located far from the LM2775 additional bulk capacitance may be required in addition to the ceramic bypass capacitors.
10 Layout

10.1 Layout Guidelines
Proper board layout helps to ensure optimal performance of the LM2775 circuit. The following guidelines are recommended:

- Place capacitors as close to the LM2775 as possible, and preferably on the same side of the board as the device.
- Use short, wide traces to connect the external capacitors to the LM2775 to minimize trace resistance and inductance.
- Use a low resistance connection between ground and the GND pin of the LM2775. Using wide traces and/or multiple vias to connect GND to a ground plane on the board is most advantageous.

11.1 Trademarks
All trademarks are the property of their respective owners.

11.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.3 Glossary

SLYZ022 — Ti Glossary.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:
- **ACTIVE**: Product device recommended for new designs.
- **LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
- **PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.
- **OBSOLETE**: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check [http://www.ti.com/productcontent](http://www.ti.com/productcontent) for the latest availability information and additional product content details.
- **TBD**: The Pb-Free/Green conversion plan has not been defined.
- **Pb-Free (RoHS)**: TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
- **Pb-Free (RoHS Exempt)**: This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
- **Green (RoHS & no Sb/Br)**: TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material).

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
### TAPE AND REEL INFORMATION

#### Reel Dimensions

- **Reel Diameter (D)**: Dimensions designed to accommodate the component width
- **B0**: Dimension designed to accommodate the component length
- **K0**: Dimension designed to accommodate the component thickness
- **W**: Overall width of the carrier tape
- **P1**: Pitch between successive cavity centers

Images above are just a representation of the package family, actual package may vary. Refer to the product data sheet for package details.
NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).

5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and implied warranties of the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, “Designers”) understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers’ applications and compliance of their applications (and of all TI products used in or for Designers’ applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI’s provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, “TI Resources”) are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer’s company) agrees to use any particular TI Resource solely for the purpose and subject to the terms of this Notice.

TI’s provision of TI Resources does not expand or otherwise alter TI’s applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY TECHNOLOGY, PATENT RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED “AS IS” AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers’ own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer’s non-compliance with the terms and provisions of this Notice.
