1 Features

- Supports LED power up to 60 W (1): 18x 3-W HBLEDs
- Requires No External Current Sensing Resistor
- ±3% LED Current Accuracy
- Up to 96% Efficiency
- High Contrast Ratio (Minimum Dimming Current Pulse Width <10 µS)
- Integrated Low-Side N-Channel MOSFET
- Adjustable Constant LED Current From 350 mA to 1000 mA
- Support Analog Dimming and Thermal Fold-Back
- Wide Input Voltage Range:
  - 4.5 V to 42 V (LM3414)
  - 4.5 V to 65 V (LM3414HV)
- Constant Switching Frequency Adjustable from 250 kHz to 1000 kHz
- Thermal Shutdown Protection
- Power Enhanced SOIC-8 or 3 mm × 3 mm WSON-8 Package

2 Applications

- High Power LED Drivers
- Architectural Lighting, Office Troffers
- Automotive Lighting
- MR-16 LED Lamps

3 Description

The LM3414 and LM3414HV are 1-A 60-W (1) common anode-capable constant current buck LED drivers. They are suitable for driving single string of 3-W HBLED with up to 96% efficiency. They accept input voltages from 4.5 VDC to 65 VDC and deliver up to 1-A average LED current with ±3% accuracy. The integrated low-side N-channel power MOSFET and current sensing element realize simple and low component count circuitry, as no bootstrapping capacitor and external current-sensing resistor are required. An external small-signal resistor to ground provides very fine LED current adjustment, analog dimming, and thermal fold-back functions.

Constant switching frequency operation eases EMI. No external loop compensation network is needed. The proprietary Pulse-Level-Modulation (PLM) control method benefits in high conversion efficiency and true average LED current regulation. Fast response time realizes fine LED current pulse fulfilling the 240 Hz 256-step dimming resolution requirement for general lighting.

The LM3414 and LM3414HV are available in SOIC-8 and 3 mm × 3 mm WSON-8 packages.

Figure 13. LED Current With PWM Dimming (9-µs dimming pulse), LM3414HV
7 Detailed Description

7.1 Overview
The LM3414/HV is a high power floating buck LED driver with wide input voltage ranges. The device requires no external current sensing elements and loop compensation networks. The integrated power N-MOSFET enables high-output power with up to 1000-mA output current. The combination of Pulse Width Modulation (PWM), control architecture, and the proprietary Pulse Level Modulation (PLM) ensures accurate current regulation, good EMI performance, and provides high flexibility on inductor selection. High-speed dimming control input allows precision and high resolution brightness control for applications require fine brightness adjustment.

7.2 Functional Block Diagram
7.3 Feature Description

7.3.1 Pulse-Level-Modulation (PLM) Operation Principles

The main control circuitry of the LM3414/HV is generally a Pulse-Width-Modulated (PWM) controller with the incorporation of the Pulse-Level-Modulation (PLM) technology. PLM is a technology that facilitates true output average current control without the need to sense the output current directly. In the LM3414/LM3414HV, the PLM circuit senses the current of the internal switch through integrated current sensing circuitry to realize average output current control. The use of PLM reduces the current sensing power losses as it needs current information only when the switch is turned ON. For proper operation of this control scheme, the converter must operate in CCM (continuous conduction mode), so the switching frequency and inductor value must be chosen to prevent the inductor current reaching 0 A during the switch OFF time each cycle.

In general, for the LED drivers with current sensing resistor at the output, the power dissipation on the current sensing resistor is $I_{\text{LED}}^2 \times R_{\text{ISNS}}$, where $I_{\text{LED}}$ is the average output current and $R_{\text{ISNS}}$ is the resistance of the current sensing resistor. In the LM3414/LM3414HV, power dissipates on the internal $R_{\text{ISNS}}$ only during ON period of the internal power switch. The power loss on $R_{\text{ISNS}}$(internal) becomes $I_{\text{LED}}^2 \times R_{\text{ISNS}} \times D$, where D is the switching duty cycle. For example, when the switching duty cycle, $D$ of a converter is 0.5, the power loss on $R_{\text{ISNS}}$ with PLM is half of those with conventional output current sensing resulting in increased efficiency.

The Pulse-Level-Modulation is a patented method to ensure accurate average output current regulation without the need of direct output current sensing. Figure 14 shows the current waveforms of a typical buck converter under steady state, where, $I_{\text{L1}}$ is the inductor current and $I_{\text{LX}}$ is the main switch current flowing into the LX pin. For a buck converter operating in steady state, the mid-point of the RAMP section of the main switch current is equal to the average level of the inductor current—hence the average output current. In short, by regulating the mid-point of the RAMP section of the main switch current with respect to a precise reference level, PLM achieves output current regulation by sensing the main switch current solely.

![Figure 14. Waveforms of a Floating Buck LED Driver With PLM](image)

7.3.2 Minimum Switch ON-time

As the LM3414 features a 400 ns minimum ON time, it is essential to make sure the ON time of the internal switch is not shorter than 400 ns when setting the LED driving current. If the switching ON time is shorter than 400 ns, the accuracy of the LED current may not maintain and exceed the rated current of the LEDs. The ratio of the LED forward voltage to input voltage is restricted by the following restriction, as shown in Equation 1.

$$\frac{V_{\text{LED}}}{V_{\text{IN}}} \geq 400 \text{ nS} \times f_{\text{SW}}$$

(1)
Feature Description (continued)

7.3.3 Peak Switch Current Limit

The LM3414/HV features an integrated switch current limiting mechanism that protects the LEDs from being overdriven. The switch current limiter triggers when the switch current exceeds three times the current level set by $R_{\text{IADJ}}$. Once the current limiter is triggered, the internal power switch turns OFF for 3.6 µs to allow the inductor to discharge and cycles repetitively until the overcurrent condition is removed. The current limiting feature is exceptionally important to avoid permanent damage of the LM3414/HV application circuit due to short circuit of LED string.

7.3.4 PWM Dimming Control

The DIM pin of the LM3414/HV is an input with internal pullup that accepts logic signals for average LED current control. Applying a logic high (greater than 1.2 V) signal to the DIM pin or leaving the DIM pin open will enable the device. Applying a logic low signal (less than 0.9 V) to the DIM pin will disable the switching activity of the device but maintain VCC regulator active. The LM3414/HV allows the inductor current to slew up to the preset regulated level at full speed instead of charging the inductor with multiple restrained switching duty cycles. This enables the LM3414/HV to achieve high-speed dimming and very fine dimming control as shown in Figure 15 and Figure 16.

Figure 15. LED Current Slew Up With Multiple Switching Cycle
To ensure normal operation of the LM3414/HV, TI recommends setting the dimming frequency not higher than 1/10 of the switching frequency. The minimum dimming duty cycle is limited by the 400 ns minimum ON time. In applications that require high dimming contrast ratio, low dimming frequency should be used.

7.3.5 Analog Dimming Control

The IADJ pin can be used as an analog dimming signal input. As the average output current of the LM3414 depends on the current being drawn from the IADJ pin, thus the LED current can be increased or decreased by applying external bias current to the IADJ pin. The simplified circuit diagram for facilitating analog dimming is as shown in Figure 17. The minimum LED current for analog dimming is 100 mA and the converter must remain in continuous conduction mode (CCM). The switching frequency and inductor value must be sized accordingly.
When external bias current $I_{\text{EXT}}$ is applied to the IADJ pin, the reduction of LED current follows Equation 2 through Equation 3.

\[
I_{\text{LED}} = \left[ \frac{1.255}{R_{\text{ADJ}}} - I_{\text{EXT}} \right] \times 2490 \times 10^3 \text{ mA}
\]

Provided that

\[
I_{\text{EXT}} < \frac{1.255}{R_{\text{ADJ}}}
\]

$I_{\text{LED}}$ decreases linearly as $I_{\text{EXT}}$ increases.

This feature is exceptionally useful for the applications with analog dimming control signals such as those from analog temperature sensors and ambient light sensors.

Figure 18 shows an example circuit for analog dimming control using simple external biasing circuitry with a variable resistor.
Feature Description (continued)

In Figure 18, the variable resistor VR1 controls the base voltage of Q1 and eventually adjusts the bias voltage of current to the IADJ pin (I_{EXT}). As the resistance of VR1 increases and the voltage across VR1 exceeds 1.255 V + 0.7 V, the LED current starts to decrease as I_{EXT} increases.

Where

\[
I_{EXT} = \frac{VCC - 1.955 \left( \frac{R1}{VR1} + 1 \right)}{R2 \left( \frac{R1}{VR1} + 1 \right)} \text{ mA}
\]

The analog dimming begins only when I_{EXT} > 0.

Figure 19. Application Circuit of LM3414/HV With Temperature Fold-Back Circuitry and PWM Dimming
Feature Description (continued)

7.3.6 Internal VCC Regulator

The LM3414/HV features a 5.4-V internal voltage regulator that connects between the VIN and VCC pins for powering internal circuitry and provide biases to external components. The VCC pin must be bypassed to the GND pin with a 1-µF ceramic capacitor, C\textsubscript{VCC} that connected to the pins as close as possible. When the input voltage falls to less than 6 V, the VCC voltage will drop to less than 5.4 V and decrease proportionally as Vin decreases. The device will shutdown as the VCC voltage falls to less than 3.9 V. When the internal regulator is used to provide bias to external circuitry, it is essential to ensure the current sinks from VCC pin does not exceed 2 mA to maintain correct voltage regulation.

7.4 Device Functional Modes

There are no additional functional modes for this device.
8 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Setting the Switching Frequency

Both the LM3414 and LM3414HV are PWM LED drivers that contain a clock generator to generate constant switching frequency for the device. The switching frequency is determined by the resistance of an external resistor $R_{FS}$ in the range of 250 kHz to 1 MHz. Lower resistance of $R_{FS}$ results in higher switching frequency. The switching frequency of the LM3414/HV is governed using Equation 5.

$$f_{SW} = \frac{20 \times 10^6}{R_{FS}} \text{kHz}$$

![Figure 20. Switching Frequency vs $R_{FS}$](image)

Table 1. Examples for $f_{SW}$ Settings

<td>80</td>
</tr>
<tr>
<td>500</td>
<td>40</td>
</tr>
<tr>
<td>1000</td>
<td>20</td>
</tr>
</tbody>
</table>

To ensure accurate current regulation, the LM3414/HV should be operated in continuous conduction mode (CCM) and the ON time should not be shorter than 400 ns under all operation condition.

8.1.2 Setting LED Current

The LM3414/HV requires no external current sensing resistor for LED current regulation. The average output current of the LM3414/HV is adjustable by varying the resistance of the resistor, $R_{IADJ}$ that connects across the IADJ and GND pins. The IADJ pin is internally biased to 1.255 V. The LED current is then governed by Equation 6.

$$I_{LED} = \frac{3125 \times 10^3}{R_{IADJ}} \text{mA}$$

where

- $350 \text{ mA} < I_{LED} < 1 \text{A}$

(6)
The LED current can be set to any level in the range from 350 mA to 1A. To provide accurate LED current, $R_{IADJ}$ should be a resistor with no more than 0.5% tolerance. If the IADJ pin is accidentally shorted to GND ($R_{IADJ} = 0$), the output current is limited to avoid damaging the circuit. When the overcurrent protection is activated, current regulation cannot be maintained until the overcurrent condition is cleared.

### 8.1.3 Inductor Selection

To ensure proper output current regulation, the LM3414/HV must operate in Continuous Conduction Mode (CCM). With the incorporation of PLM, the peak-to-peak inductor current ripple can be set as high as ±60% of the defined average output current. The minimum inductance of the inductor is decided by the defined average LED current and allowable inductor current ripple. The minimum inductance can be found by the equations shown in Equation 7 through Equation 8.

Because:

$$\Delta I_L = \frac{V_{IN} - V_{LED}}{L} \times D \times T$$  \hspace{1cm} (7)

Thus:

$$L_{MIN} = \frac{V_{IN} - V_{LED}}{1.2 \times I_{LED} x \frac{V_{LED}}{V_{IN}} \times \frac{1}{f_{SW}}}$$ \hspace{1cm} (8)

The LM3414/HV can maintain LED current regulation without output filter capacitor. This is because the inductor of the floating buck structure provides continuous current to the LED throughout the entire switching cycle. When LEDs are driven without filter capacitor, the LED peak current must not exceed the rated current of the LED. The peak LED current is governed by Equation 9.

$$\Delta I_L = \left[ \frac{(V_{IN} - V_{LED})V_{LED}}{2L \times V_{IN} \times f_{SW}} \right] + I_{LED(AVG)}$$ \hspace{1cm} (9)
8.2 Typical Applications

8.2.1 LM3414/HV Design Example

![Schematic of LM3414/HV Design Example](image)

Figure 22. LM3414/HV Design Example Schematic

8.2.1.1 Design Requirements
- Input Voltage: $V_{IN}$
- LED String Voltage: $V_{LED}$
- LED Current: $I_{LED}$
- Switching Frequency: $f_{SW}$
- Maximum LED Current Ripple: $\Delta i_{L-PP}$
- Maximum Input Voltage Ripple: $\Delta V_{IN}$

8.2.1.2 Detailed Design Procedure

8.2.1.2.1 Calculate Operating Parameters
To calculate component values the operating duty cycle ($D$) must be calculated using Equation 10.

$$D = \frac{V_{LED}}{V_{IN}}$$

(10)

8.2.1.2.2 Calculate $R_{IADJ}$
To get the desired LED current calculate the value for $R_{IADJ}$ using Equation 11.

$$R_{IADJ} = \frac{3125}{I_{LED}}$$

(11)

8.2.1.2.3 Calculate $R_{FS}$
Calculate the value of $R_{FS}$ for the desired switching frequency using Equation 12.

$$R_{FS} = \frac{20 \times 10^9}{f_{SW}}$$

(12)
Typical Applications (continued)

8.2.1.2.4 Calculate L\textsubscript{MIN}

Calculate the minimum inductor value required for the desired LED current ripple using Equation 13.

\[
L_{MIN} = \frac{(V_{IN} - V_{LED}) \times V_{LED}}{f_{SW} \times V_{IN} \times \Delta i_{L-PP}}
\]  

(13)

8.2.1.2.5 Calculate C\textsubscript{IN-MIN}

Calculate the minimum input capacitor value for the desired input voltage ripple using Equation 14.

\[
C_{IN-MIN} = \frac{D \times (1 - D) \times I_{LED}}{f_{SW} \times \Delta V_{IN}}
\]  

(14)

8.2.2 LM3414/HV Design Example (I\textsubscript{OUT} = 1 A)

Figure 23. LM3414/HV Design Example (I\textsubscript{OUT} = 1 A) Schematic

8.2.2.1 Design Requirements

- Input Voltage: \( V_{IN} = 48 \text{ V} \pm 10\% \)
- LED String Voltage: \( V_{LED} = 35 \text{ V} \)
- LED Current: \( I_{LED} = 1 \text{ A} \)
- Switching Frequency: \( f_{SW} = 500 \text{ kHz} \)
- Maximum LED Current Ripple: \( \Delta i_{L-PP} \leq 500 \text{ mA} \)
- Maximum Input Voltage Ripple: \( \Delta V_{IN} \leq 200 \text{ mV} \)

8.2.2.2 Detailed Design Procedure

8.2.2.2.1 Calculate Operating Parameters

To calculate component values the operating duty cycle (D) for this application can be calculated using Equation 15.

\[
D = \frac{V_{LED}}{V_{IN}} = \frac{35\text{ V}}{48\text{ V}} = 0.73
\]  

(15)

8.2.2.2.2 Calculate R\textsubscript{IADJ}

For 1A LED current calculate the value for R\textsubscript{IADJ} using Equation 16.
Typical Applications (continued)

\[ R_{\text{IADJ}} = \frac{3125}{I_{\text{LED}}} = \frac{3125}{1\,\text{A}} = 3.125\,\text{k}\Omega \]  
(16)

Choose a standard value of \( R_{\text{IADJ}} = 3.24\,\text{k}\Omega \).

8.2.2.2.3 Calculate \( R_{\text{FS}} \)

Calculate the value of \( R_{\text{FS}} \) for 500-kHz switching frequency using Equation 17.

\[ R_{\text{FS}} = \frac{20 \times 10^9}{f_{\text{SW}}} = \frac{20 \times 10^9}{500\,\text{kHz}} = 40\,\text{k}\Omega \]  
(17)

Choose a standard value of \( R_{\text{FS}} = 40.2\,\text{k}\Omega \).

8.2.2.2.4 Calculate \( L_{\text{MIN}} \)

Calculate the minimum inductor value required for 500 mA or less peak-to-peak LED current ripple using Equation 18.

\[ L_{\text{MIN}} = \frac{(V_{\text{IN}} - V_{\text{LED}}) \times V_{\text{LED}}}{f_{\text{SW}} \times V_{\text{IN}} \times \Delta I_{\text{L-PP}}} = \frac{(48\,\text{V} - 35\,\text{V}) \times 35\,\text{V}}{500\,\text{kHz} \times 35\,\text{V} \times 500\,\text{mA}} = 37.9\,\mu\text{H} \]  
(18)

Choose a higher standard value of \( L = 47\,\mu\text{H} \).

8.2.2.2.5 Calculate \( C_{\text{IN-MIN}} \)

Calculate the minimum input capacitor value for 200 mV or less input voltage ripple using Equation 19.

\[ C_{\text{IN-MIN}} = \frac{D \times (1 - D) \times I_{\text{LED}}}{f_{\text{SW}} \times \Delta V_{\text{IN}}} = \frac{0.73 \times (1 - 0.73) \times 1\,\text{A}}{500\,\text{kHz} \times 200\,\text{mV}} = 1.97\,\mu\text{F} \]  
(19)

Choose a higher standard value of \( C_{\text{IN}} = 2.2\,\mu\text{F} \).

8.2.2.3 Application Curve

Figure 24. PWM Dimming Top = DIM. Bottom = LED Current.
9 Power Supply Recommendations

Use any DC output power supply with a maximum voltage high enough for the application. The power supply should have a minimum current limit of at least 1 A.

10 Layout

10.1 Layout Guidelines

Discontinuous currents are the most likely to generate EMI; therefore, take care when routing these paths. The main path for discontinuous current in the LM3414/HV buck converter contains the input capacitor (C_{IN}), the recirculating diode (D1), and the switch node (LX). This loop should be kept as small as possible and the connections between all three components should be short and thick to minimize parasitic inductance. In particular, the switch node (where L1, D1 and LX connect) should be just large enough to connect the components without excessive heating from the current it carries.

The IADJ, FS, and DIM pins are all high-impedance control inputs which couple external noise easily, therefore the loops containing these high impedance nodes should be minimized. The frequency setting resistor (R_{FS}) and current setting resistor (R_{IADJ}) should be placed close to the FS and IADJ pins as possible.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBsolete: TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a “~” will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
