**LM3881 Simple Power Sequencer With Adjustable Timing**

### 1 Features
- Easiest Method to Sequence Rails
- Power-Up and Power-Down Control
- Tiny Footprint
- Low Quiescent Current of 80 µA
- Input Voltage Range of 2.7 V to 5.5 V
- Output Invert Feature
- Timing Controlled by Small Value External Capacitor

### 2 Applications
- Security Cameras
- Servers
- Networking Elements
- FPGA Sequencing
- Microprocessor and Microcontroller Sequencing
- Multiple Supply Sequencing

### 3 Description
The LM3881 Simple Power Sequencer offers the easiest method to control power up and power down of multiple power supplies (switching or linear regulators). By staggering the start-up sequence, it is possible to avoid latch conditions or large inrush currents that can affect the reliability of the system.

Available in VSSOP-8 package, the Simple Sequencer contains a precision enable pin and three open-drain output flags. When the LM3881 is enabled, the three output flags will sequentially release, after individual time delays, thus permitting the connected power supplies to start up. The output flags will follow a reverse sequence during power down to avoid latch conditions. Time delays are defined using an external capacitor and the output flag states can be inverted by the user.

Figure 7. FLAG Voltage vs Current
7 Detailed Description

7.1 Overview

The LM3881 Simple Power Sequencer provides a simple solution for sequencing multiple rails in a controlled manner. An established clock signal facilitates control of the power up and power down of three open-drain FET output flags. These flags permit connection to shutdown or enable pins of linear regulators and/or switching regulators to control the operation of the power supplies. This allows design of a complete power system without the concern of large inrush currents or latch-up conditions that can occur during an uncontrolled startup. An invert (INV) pin reverses the logic of the output flags. This pin should be tied to a logic output high or low and not allowed to remain open circuit. The following discussion assumes the INV pin is held low such that the flag output is active high.

7.2 Functional Block Diagram

![Functional Block Diagram of LM3881](image)

7.3 Feature Description

7.3.1 Adjustable Timing

A small external timing capacitor is connected to the TADJ pin that establishes the clock waveform. This capacitor is linearly charged/discharged by a fixed current source/sink, denoted $I_{TADJ\_SRC}$ / $I_{TADJ\_SNK}$, of magnitude 12 µA between predefined voltage threshold levels, denoted $V_{LTH}$ and $V_{HTH}$, to generate the timing waveform as shown in Figure 8.
Feature Description (continued)

Thus, the clock cycle duration is directly proportional to the timing capacitor value. Considering the TADJ voltage threshold levels and the charge/discharge current magnitude, it can be shown that the timing capacitor-clock period relationship is typically 120 µs/nF. For example, a 10-nF capacitor sets up a clock period of 1.2 ms.

The timing sequence of the LM3881 is controlled by the enable (EN) pin. Upon power up, all the flags are held low until the precision enable pin exceeds its threshold. After the EN pin is asserted, the power-up sequence will commence and the open-drain flags will be sequentially released.

An internal counter will delay the first flag (FLAG1) from rising until a fixed time period, denoted by $T_{D1}$ in Figure 9, elapses. This corresponds to at least nine, maximum 10, clock cycles depending on where EN is asserted relative to the clock signal. Upon release of the first flag, another timer will begin to delay the release of the second flag (FLAG2). This time delay, denoted $T_{D2}$, corresponds to exactly eight clock periods. Similarly, FLAG3 is released after time delay $T_{D3}$, again eight clock cycles, has expired. Accordingly, a TADJ capacitor of 10 nF generates typical time delays $T_{D2}$ and $T_{D3}$ of 9.6 ms and $T_{D1}$ of from 10.8 ms to 12.0 ms.

The power-down sequence is the same as power up, but in reverse order. When the EN pin is deasserted, a timer will begin that delays the third flag (FLAG3) from pulling low. The second and first flag will then follow in a sequential manner after their appropriate time delays. These time delays, denoted $T_{D4}$, $T_{D5}$, $T_{D6}$, are equal to $T_{D1}$, $T_{D2}$, $T_{D3}$, respectively.

For robustness, the pulldown FET associated with each flag is designed such that it can sustain a short circuit to VCC.

![Figure 8. TADJ Pin Timing Waveform](image)

![Figure 9. Power-Up Sequence, INV Low](image)
Feature Description (continued)

Figure 10. Power-Up Sequence, INV High

Figure 11. Power-Down Sequence, INV Low
Feature Description (continued)

7.3.2 Enable Circuit

The enable circuit is designed with an internal comparator, referenced to a bandgap voltage (1.22 V), to provide a precision threshold. This allows the timing to be set externally using a capacitor as shown in Figure 13. Alternatively, sequencing can be based on a certain event such as a line voltage reaching 90% of its nominal value by employing a resistor divider from VCC to Enable.

Using the internal pullup current source to charge the external capacitor $C_{EN}$, the time delay while the enable voltage reaches the required threshold, assuming EN is charging from 0V, can be calculated by the equation as follows.

$$T_{\text{enable delay}} = \frac{1.22V \times C_{EN}}{7 \mu A}$$  \hspace{1cm} (1)
Feature Description (continued)

A resistor divider can also be used to enable the LM3881 based on exceeding a certain VCC supply voltage threshold. Take care when sizing the resistor divider to include the effects of the internal EN pullup current source. The supply voltage for which EN is asserted is given by

\[
V_{CC_{\text{ENABLE}}} = 1.22V \left(1 + \frac{R_{\text{EN1}}}{R_{\text{EN2}}}\right) - 7 \mu A \left(R_{\text{EN1}} || R_{\text{EN2}}\right)
\]

(2)

One of the features of the EN pin is that it provides glitch free operation. The timer will start counting at a rising threshold, but will always reset if the EN pin is deasserted before the first output flag is released. This is illustrated in Figure 16, assuming INV is low.
Feature Description (continued)

If the EN pin remains high for the entire power up sequence, then the part will operate as shown in the standard timing diagrams. However, if the EN signal is deasserted before the power-up sequence completes, the part will enter a controlled shutdown. This allows the system to initiate a controlled power sequence, preventing any latch conditions to occur. Figure 17 describes the flag sequence if the EN pin is deasserted after FLAG1 releases, but before the entire power-up sequence is completed. INV is assumed low.

Figure 17. Incomplete Sequence Timing, INV Low

7.4 Device Functional Modes

7.4.1 Power Up with EN Pin

The timing sequence of the Simple Power Sequencer is controlled entirely by the enable (EN) pin. Upon power up, all the flags are held low until this precision enable is pulled high. After the EN pin is asserted, the power-up sequence will commence.
Device Functional Modes (continued)

7.4.2 Power Down with EN Pin

When EN pin is deasserted, the power down sequence will commence. A timer will begin that delays the third flag (FLAG3) from pulling low. The second and first flag will then follow in a sequential manner after their appropriate delays.

7.4.3 Noninverted Output Mode

When the INV pin is tied to a logic output low, the logic mode of the output flags is active high. This mode is useful to sequence power supplies which have an active high enable input.

7.4.4 Inverted Output Mode

When the INV pin is tied to a logic output high, the logic mode of the output flags is active low. This mode is useful to sequence power supplies which have an active low enable input.
8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Open-Drain Flags Pullup
The Simple Power Sequencer contains three open-drain output flags which need to be pulled up for proper operation. 100-kΩ resistors can be used as pullup resistors.

8.1.2 Enable the Device
See Enable Circuit.

8.1.3 Timing Adjust
See Adjustable Timing.

8.2 Typical Application

8.2.1 Simple Sequencing of Three Power Supplies
The Simple Power Sequencer is used to implement a power-up (1 - 2 - 3) and power-down (3 - 2 - 1) sequence of three power supplies.

Figure 18. Typical Application Circuit
Typical Application (continued)

8.2.1.1 Design Requirements
For this design example, use the parameters listed in Table 1 as the input parameters.

<table>

</tbody>
</table>

8.2.1.2 Detailed Design Procedure

A timing capacitor of $C_{ADJ} = 10 \text{ nF}$ generates typical time delays $T_{D2}$ and $T_{D3}$ of 9.6 ms and $T_{D1}$ of between 10.8 ms and 12.0 ms. The INV pin is tied to GND so that the output flags are active high. See Adjustable Timing for calculating the value for $C_{ADJ}$.

8.2.1.3 Application Curves

![Figure 19. Power-Up Sequence, $C_{ADJ} = 10 \text{ nF}$](#)

![Figure 20. Power-Down Sequence, $C_{ADJ} = 10 \text{ nF}$](#)
8.2.2 Sequencing Using Independent Flag Supply

For applications requiring a flag output voltage that is different from the VCC, a separate Flag Supply may be used to pullup the open-drain outputs of the Simple Power Sequencer. This is useful when interfacing the flag outputs with inputs that require a different voltage than VCC. The designer must ensure the Flag Supply voltage is within the range specified in the *Recommended Operating Conditions*.

![Sequencing Using Independent Flag Supply](image)

**Figure 23. Sequencing Using Independent Flag Supply**
9 Power Supply Recommendations

The VCC pin should be located as close as possible to the input supply (2.7V - 5.5V). An input capacitor is not required but is recommended when noise might be present on the VCC pin. A 0.1 μF ceramic capacitor may be used to bypass this noise.

10 Layout

10.1 Layout Guidelines

- Pullup resistors should be connected between the flag output pins and a positive input supply, usually VCC. An independent flag supply may also be used. These resistors should be placed as close as possible to the Simple Power Sequencer and the flag supply. Minimal trace length is recommended to make the connections. A typical value for the pullup resistors is 100kΩ.
- For very tight sequencing requirements, minimal and equal trace lengths should be used to connect the flag outputs to the desired inputs. This will reduce any propagation delay and timing errors between the flag outputs along the line.

10.2 Layout Example

Figure 24 and Figure 25 are layout examples for the LM3881. These examples are taken from the LM3881EVAL. An optional component, assigned reference designator R4, is placed on the bottom side of the PCB to facilitate connection of INV to GND.
Layout Example (continued)

11 Device and Documentation Support

11.1 Device Support

11.1.1 Third-Party Products Disclaimer

TI’S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

11.2 Trademarks

All trademarks are the property of their respective owners.

11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.4 Glossary

SLYZ022 — Ti Glossary.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. </tbody>
</table>

(1) The marketing status values are defined as follows:
- **ACTIVE**: Product device recommended for new designs.
- **LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
- **PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.
- **OBSOLETE**: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check [http://www.ti.com/productcontent](http://www.ti.com/productcontent) for the latest availability information and additional product content details.

- **TBD**: The Pb-Free/Green conversion plan has not been defined.
- **Pb-Free (RoHS)**: TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
- **Pb-Free (RoHS Exempt)**: This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
- **Green (RoHS & no Sb/Br)**: TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. DGK (S-PDSO-G8) PLASTIC SMALL-OUTLINE PACKAGE

NOTES:  
A. All linear dimensions are in millimeters.  
B. This drawing is subject to change without notice.  
Caution: Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.  
Caution: Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.  
E. Falls within JEDEC MO-187 variation AA, except interlead flash.
**NOTES:**

A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
