1 Features

- Integrated 100-V, N-Channel Buck Switch
- Internal \( V_{CC} \) Regulator
- No Loop Compensation Required
- Ultra-Fast Transient Response
- On-Time Varies Inversely With Line Voltage
- Operating Frequency Remains Constant With Varying Line Voltage and Load Current
- Adjustable Output Voltage
- Highly Efficient Operation
- Precision Internal Reference
- Low Bias Current
- Intelligent Current Limit Protection
- Thermal Shutdown
- 8-Pin VSSOP and 8-Pin WSON-8 (4 mm × 4 mm) Packages

2 Applications

- Non-Isolated Telecommunication Buck Regulators
- Secondary High Voltage Post Regulators
- 42-V Automotive Systems

3 Description

The LM5008 step-down switching regulator features all of the functions needed to implement a low-cost, efficient, buck bias regulator. This high voltage regulator contains an 100-V N-channel buck switch. The device is easy to implement and is provided in the 8-pin VSSOP and the thermally enhanced 8-pin WSON packages. The regulator is based on a hysteretic control scheme using an on-time inversely proportional to \( V_{IN} \). This feature allows the operating frequency to remain relatively constant. The hysteretic control requires no loop compensation. An intelligent current limit is implemented with forced off-time, which is inversely proportional to \( V_{OUT} \). This scheme ensures short-circuit protection while providing minimum foldback. Other protection features include: thermal shutdown, \( V_{CC} \) undervoltage lockout, gate drive undervoltage lockout, and maximum duty cycle limiter.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision G (March 2013) to Revision H Page

• Added ESD Ratings table, Feature Description section, Device Functional Modes, Application and Implementation section, Power Supply Recommendations section, Layout section, Device and Documentation Support section, and Mechanical, Packaging, and Orderable Information section .......................................................... 1

• Deleted Lead temperature, soldering (260°C maximum) ............................................................................................................... 4

• Changed $R_{\text{JA}}$ values From: 200°C/W To: 139.7°C/W (VSSOP) and From: 40°C/W To: 42°C/W (WSON) .............................................. 4

Changes from Revision F (March 2013) to Revision G Page

• Changed layout of National Data Sheet to TI format ........................................................................................................ 1
## 5 Pin Configuration and Functions

### Pin Functions

<table>
<thead>
<tr>
<th>NO.</th>
<th>NAME</th>
<th>TYPE</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>SW</td>
<td>P</td>
<td>Switching node: power switching node. Connect to the output inductor, re-circulating diode, and bootstrap capacitor.</td>
</tr>
<tr>
<td>2</td>
<td>BST</td>
<td>I</td>
<td>Boost pin (bootstrap capacitor input): an external capacitor is required between the BST and the SW pins. A 0.01-µF ceramic capacitor is recommended. An internal diode charges the capacitor from ( V_{CC} ).</td>
</tr>
</tbody>
</table>
| 3   | R_{CL} | I  | Current limit OFF time set pin: a resistor between this pin and RTN sets the off-time when current limit is detected. The off-time is preset to 35 µs if FB = 0 V.  
\[
Toff = 10^{-5} / (0.285 + \left( FB / 6.35 \times 10^{-6} \times R_{CL} \right))
\] |
| 4   | RTN  | G    | Ground pin: ground for the entire circuit. |
| 5   | FB   | I    | Feedback input from regulated output: this pin is connected to the inverting input of the internal regulation comparator. The regulation threshold is 2.5 V. |
| 6   | R_{ON/SD} | I  | On-time set pin: a resistor between this pin and \( V_{IN} \) sets the switch on-time as a function of \( V_{IN} \). The minimum recommended on-time is 400 ns at the maximum input voltage. This pin can be used for remote shutdown.  
\[
Ton = 1.25 \times 10^{-10} R_{ON/SD} / V_{IN}
\] |
| 7   | \( V_{CC} \) | P   | Output from the internal high voltage series pass regulator. Regulated at 7 V. If an auxiliary voltage is available to raise the voltage on this pin, above the regulation set point (7 V), the internal series pass regulator will shutdown, reducing the IC power dissipation. Do not exceed 14 V. This voltage provides gate drive power for the internal buck switch. An internal diode is provided between this pin and the BST pin. A local 0.1-µF decoupling capacitor is recommended. Series pass regulator is current limited to 10 mA. |
| 8   | \( V_{IN} \) | P   | Input voltage: recommended operating range is 9.5 V to 95 V. |
|     | EP   | G    | Exposed pad: the exposed pad has no electrical contact. Connect to system ground plane for reduced thermal resistance (WSON package only). |

(1) All electrical characteristics having room temperature limits are tested during production with $T_A = T_J = 25^\circ C$. All hot and cold limits are specified by correlating the electrical characteristics to process and temperature variations and applying statistical process control.

(2) The $V_{CC}$ output is intended as a self bias for the internal gate drive power and control circuits. Device thermal limitations limit external loading.

7 Detailed Description

7.1 Overview

The LM5008 regulator is an easy-to-use buck DC-DC converter that operates from 9.5-V to 95-V supply voltage. The device is intended for step-down conversions from 12-V, 24-V, and 48-V unregulated, semi-regulated and fully-regulated supply rails. With integrated buck power MOSFET, the LM5008 delivers up to 350-mA DC load current with exceptional efficiency and low input quiescent current in a very small solution size.

Designed for simple implementation, a nearly fixed-frequency, constant on-time (COT) operation with discontinuous conduction mode (DCM) at light loads is ideal for low-noise, high current, fast transient load requirements. Control loop compensation is not required reducing design time and external component count.

The LM5008 incorporates other features for comprehensive system requirements, including VCC undervoltage lockout (UVLO), gate drive undervoltage lockout, maximum duty cycle limiter, intelligent current limit off timer, a precharge switch, and thermal shutdown with automatic recovery. These features enable a flexible and easy-to-use platform for a wide range of applications. The pin arrangement is designed for simple and optimized PCB layout, requiring only a few external components.

7.2 Functional Block Diagram
7.3 Feature Description

7.3.1 Hysteretic Control Circuit Overview

The LM5008 is a buck DC-DC regulator that uses a control scheme in which the on-time varies inversely with line voltage ($V_{IN}$). Control is based on a comparator and the on-time one-shot, with the output voltage feedback (FB) compared to an internal reference (2.5 V). If the FB level is below the reference the buck switch is turned on for a fixed time determined by the line voltage and a programming resistor ($R_{ON}$). Following the ON period, the switch remains off for at least the minimum off-timer period of 300 ns. If FB is still below the reference at that time, the switch turns on again for another on-time period. This will continue until regulation is achieved.

The LM5008 operates in discontinuous conduction mode at light load currents, and continuous conduction mode at heavy load current. In discontinuous conduction mode, current through the output inductor starts at zero and ramps up to a peak during the on-time, then ramps back to zero before the end of the off-time. The next on-time period starts when the voltage at FB falls below the internal reference; until then, the inductor current remains zero. In this mode the operating frequency is lower than in continuous conduction mode, and varies with load current. Therefore at light loads the conversion efficiency is maintained, because the switching losses reduce with the reduction in load and frequency. The discontinuous operating frequency can be calculated with Equation 1.

$$F = \frac{V_{OUT}^2 \times L \times 1.28 \times 10^{20}}{R_L \times (R_{ON})^2}$$

where

- $R_L$ = the load resistance

In continuous conduction mode, current flows continuously through the inductor and never ramps down to zero. In this mode the operating frequency is greater than the discontinuous mode frequency and remains relatively constant with load and line variations. The approximate continuous mode operating frequency can be calculated with Equation 2.

$$F = \frac{V_{OUT}}{1.25 \times 10^{-10} \times R_{ON}}$$

The output voltage ($V_{OUT}$) can be programmed by two external resistors as shown in Functional Block Diagram. The regulation point can be calculated with Equation 3.

$$V_{OUT} = 2.5 \times (R1 + R2) / R2$$

All hysteretic regulators regulate the output voltage based on ripple voltage at the feedback input, requiring a minimum amount of ESR for the output capacitor C2. A minimum of 25 mV to 50 mV of ripple voltage at the feedback pin (FB) is required for the LM5008. In cases where the capacitor ESR is too small, additional series resistance may be required (R3 in Functional Block Diagram).

For applications where lower output voltage ripple is required the output can be taken directly from a low-ESR output capacitor, as shown in Figure 7. However, R3 slightly degrades the load regulation.

![Functional Block Diagram](image-url)
Feature Description (continued)

7.3.2 High Voltage Start-Up Regulator

The LM5008 contains an internal high voltage start-up regulator. The input pin ($V_{IN}$) can be connected directly to the line voltages up to 95 Volts, with transient capability to 100 V. The regulator is internally current limited to 9.5 mA at $V_{CC}$. Upon power up, the regulator sources current into the external capacitor at $V_{CC}$ (C3). When the voltage on the $V_{CC}$ pin reaches the undervoltage lockout threshold of 6.3 V, the buck switch is enabled.

In applications involving a high value for $V_{IN}$, where power dissipation in the $V_{CC}$ regulator is a concern, an auxiliary voltage can be diode connected to the $V_{CC}$ pin. Setting the auxiliary voltage to 8 V to 14 V shuts off the internal regulator, reducing internal power dissipation. See Figure 8. The current required into the $V_{CC}$ pin is shown in Figure 1.

![Figure 8. Self-Biased Configuration](image)

7.3.3 Regulation Comparator

The feedback voltage at FB is compared to an internal 2.5-V reference. In normal operation (the output voltage is regulated), an on-time period is initiated when the voltage at FB falls below 2.5 V. The buck switch stays on for the on-time, causing the FB voltage to rise above 2.5 V. After the on-time period, the buck switch stays off until the FB voltage again falls below 2.5 V. During start-up, the FB voltage is below 2.5 V at the end of each on-time, resulting in the minimum off-time of 300 ns. Bias current at the FB pin is nominally 100 nA.

7.3.4 Overvoltage Comparator

The feedback voltage at FB is compared to an internal 2.875-V reference. If the voltage at FB rises above 2.875 V, the on-time pulse is immediately terminated. This condition can occur if the input voltage, or the output load, change suddenly. The buck switch will not turn on again until the voltage at FB falls below 2.5 V.

7.3.5 On-Time Generator and Shutdown

The on-time for the LM5008 is determined by the $R_{ON}$ resistor, and is inversely proportional to the input voltage ($V_{IN}$), resulting in a nearly constant frequency as $V_{IN}$ is varied over its range. Equation 4 shows the on-time equation for the LM5008.

$$T_{ON} = 1.25 \times 10^{-10} \times R_{ON} / V_{IN}$$  (4)

See Figure 2. $R_{ON}$ should be selected for a minimum on-time (at maximum $V_{IN}$) greater than 400 ns for proper current limit operation. This requirement limits the maximum frequency for each application, depending on $V_{IN}$ and $V_{OUT}$. See Figure 3.
Feature Description (continued)

The LM5008 can be remotely disabled by taking the R\textsubscript{ON}/SD pin to ground. See Figure 9. The voltage at the R\textsubscript{ON}/SD pin is between 1.5 and 3 volts, depending on V\textsubscript{IN} and the value of the R\textsubscript{ON} resistor.

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{shutdown_implementation.png}
\caption{Shutdown Implementation}
\end{figure}

7.3.6 Current Limit

The LM5008 contains an intelligent current limit off-timer. If the current in the buck switch exceeds 0.5 A the present cycle is immediately terminated, and a non-resetable off-timer is initiated. The length of off-time is controlled by an external resistor (R\textsubscript{CL}) and the FB voltage (see Figure 4). When FB = 0 V, a maximum off-time is required, and the time is preset to 35 µs. This condition occurs when the output is shorted, and during the initial part of start-up. This amount of time ensures safe short-circuit operation up to the maximum input voltage of 95 V. In cases of overload where the FB voltage is above zero volts (not a short circuit), the current limit off-time will be less than 35 µs. Reducing the off-time during less severe overloads reduces the amount of foldback, recovery time, and the start-up time. The off-time is calculated from Equation 5.

\[
T_{\text{OFF}} = \frac{10^{-5}}{0.285 + \frac{V_{\text{FB}}}{(6.35 \times 10^{-6} \times R_{\text{CL}})}}
\]

The current limit sensing circuit is blanked for the first 50-70 ns of each on-time so it is not falsely tripped by the current surge which occurs at turnon. The current surge is required by the re-circulating diode (D1) for its turnoff recovery.

7.3.7 N-Channel Buck Switch and Driver

The LM5008 integrates an N-Channel Buck switch and associated floating high voltage gate driver. The gate driver circuit works in conjunction with an external bootstrap capacitor and an internal high voltage diode. A 0.01-µF ceramic capacitor (C4) connected between the BST pin and SW pin provides the voltage to the driver during the on-time.

During each off-time, the SW pin is at approximately 0 V, and the bootstrap capacitor charges from V\textsubscript{CC} through the internal diode. The minimum off-timer, set to 300 ns, ensures a minimum time each cycle to recharge the bootstrap capacitor.

An external re-circulating diode (D1) carries the inductor current after the internal Buck switch turns off. This diode must be of the ultra-fast or Schottky type to minimize turnon losses and current overshoot.

7.3.8 Thermal Protection

The LM5008 must be operated so the junction temperature does not exceed 125°C during normal operation. An internal thermal shutdown circuit is provided to protect the LM5008 in the event of a higher than normal junction temperature. When activated, typically at 165°C, the controller is forced into a low power reset state, disabling the buck switch and the V\textsubscript{CC} regulator. This feature prevents catastrophic failures from accidental device overheating. When the junction temperature reduces below 140°C (typical hysteresis = 25°C), the V\textsubscript{CC} regulator is enabled, and normal operation is resumed.
7.4 Device Functional Modes

7.4.1 Shutdown Mode
The \text{R}^{\text{ON}} / \text{SD} pin provides ON and OFF control for the LM5008. When \( V_{\text{SD}} \) is below approximately 0.7 V, the device is in shutdown mode. Both the internal LDO and the switching regulator are off. The quiescent current in shutdown mode drops to 76 \( \mu \text{A} \) (typical) at \( V_{\text{IN}} = 48 \text{ V} \). The LM5008 also employs VCC bias rail undervoltage protection. If the \( V_{\text{CC}} \) bias supply voltage is below its UV threshold, the regulator remains off.

7.4.2 Active Mode
LM5008 is in active mode when the internal bias rail, VCC, is above its UV threshold. Depending on the load current, the device operates in either DCM or CCM mode.

Whenever the load current is reduced to a level less than half the peak-to-peak inductor ripple current, the device enters discontinuous conduction mode (DCM). Calculate the critical conduction boundary using Equation 6.

\[
I_{\text{BOUNDARY}} = \frac{\Delta I}{2} = \frac{V_{\text{OUT}} \cdot (1 - D)}{2 \cdot L_{F} \cdot F_{SW}}
\]

(6)

When the inductor current reaches zero, the SW node becomes high impedance. Resonant ringing occurs at SW as a result of the LC tank circuit formed by the buck inductor and the parasitic capacitance at the SW node. At light loads, several pulses may be skipped in between switching cycles, effectively reducing the switching frequency and further improving light-load efficiency.
8 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information
The final circuit is shown in Figure 10. The circuit was tested, and the resulting performance is shown in Figure 12 through Figure 6.

8.1.1 Minimum Load Current
A minimum load current of 1 mA is required to maintain proper operation. If the load current falls below that level, the bootstrap capacitor may discharge during the long off-time, and the circuit will either shutdown or cycle on and off at a low frequency. If the load current is expected to drop below 1 mA in the application, the feedback resistors should be chosen low enough in value so they provide the minimum required current at nominal $V_{OUT}$.

8.2 Typical Application

Figure 10. LM5008 Example Circuit

8.2.1 Design Requirements
A guide for determining the component values will be illustrated with a design example. Table 1 lists the bill of materials for this application. The following steps will configure the LM5008 for:
- Input voltage range ($V_{IN}$): 12 V to 95 V
- Output voltage ($V_{OUT1}$): 10 V
- Load current (for continuous conduction mode): 100 mA to 300 mA
- Maximum ripple at $V_{OUT2}$: 100 mVp-p at maximum input voltage
Typical Application (continued)

8.2.2 Detailed Design Procedure

R1 and R2: From Functional Block Diagram, \( V_{\text{OUT1}} = V_{\text{FB}} \times (R1 + R2) / R2 \), and because \( V_{\text{FB}} = 2.5 \text{ V} \), the ratio of \( R1 \) to \( R2 \) calculates as 3:1. Standard values of 3.01 kΩ \((R1) \) and 1.00 kΩ \((R2) \) are chosen. Other values could be used as long as the 3:1 ratio is maintained. The selected values, however, provide a small amount of output loading (2.5 mA) in the event the main load is disconnected. This allows the circuit to maintain regulation until the main load is reconnected.

\( F_s \) and \( R_{\text{ON}} \): The recommended operating frequency range for the LM5008 is 50 kHz to 600 kHz. Unless the application requires a specific frequency, the choice of frequency is generally a compromise because it affects the size of \( L1 \) and \( C2 \), and the switching losses. The maximum allowed frequency, based on a minimum on-time of 400 ns, is calculated from Equation 7:

\[
F_{\text{MAX}} = \frac{V_{\text{OUT}}}{(V_{\text{INMAX}} \times 400 \text{ ns})} \quad (7)
\]

For this exercise, \( F_{\text{MAX}} = 263 \text{ kHz} \). From Equation 2, \( R_{\text{ON}} \) calculates to 304 kΩ. A standard value 357-kΩ resistor is used to allow for tolerances in Equation 2, resulting in a frequency of 224 kHz.

\( L1 \): The main parameter affected by the inductor is the output current ripple amplitude. The choice of inductor value therefore depends on both the minimum and maximum load currents, keeping in mind that the maximum ripple current occurs at maximum \( V_{\text{IN}} \).

a. Minimum load current: To maintain continuous conduction at minimum \( I_0 \) (100 mA), the ripple amplitude \( (I_{\text{OR}}) \) must be less than 200 mAp-p so the lower peak of the waveform does not reach zero. \( L1 \) is calculated using Equation 8.

\[
L1 = \frac{V_{\text{OUT1}} \times (V_{\text{IN}} - V_{\text{OUT1}})}{I_{\text{OR}} \times F_s \times V_{\text{IN}}} \quad (8)
\]

At \( V_{\text{IN}} = 95 \text{ V} \), \( L1 \) (minimum) calculates to 200 µH. The next larger standard value (220 µH) is chosen and with this value \( I_{\text{OR}} \) calculates to 181 mAp-p at \( V_{\text{IN}} = 95 \text{ V} \) and 34 mAp-p at \( V_{\text{IN}} = 12 \text{ V} \).

b. Maximum load current: At a load current of 300 mA, the peak of the ripple waveform must not reach the minimum value of the LM5008's current limit threshold (410 mA). Therefore the ripple amplitude must be less than 220 mAp-p, which is already satisfied in Equation 8. With \( L1 = 220 \mu\text{H} \), at maximum \( V_{\text{IN}} \) and \( I_0 \), the peak of the ripple will be 391 mA. While \( L1 \) must carry this peak current without saturating or exceeding its temperature rating, it also must be capable of carrying the maximum value of the LM5008's current limit threshold (610 mA) without saturating, because the current limit is reached during start-up.

The DC resistance of the inductor should be as low as possible. For example, if the inductor’s DCR is 1 Ω, the power dissipated at maximum load current is 0.09 W. While small, it is not insignificant compared to the load power of 3 W.
C3: The capacitor on the \( V_{CC} \) output provides not only noise filtering and stability, but its primary purpose is to prevent false triggering of the \( V_{CC} \) UVLO at the buck switch ON/OFF transitions. For this reason, C3 should be no smaller than 0.1 \( \mu \)F.

C2, and R3: When selecting the output filter capacitor C2, the items to consider are ripple voltage due to its ESR, ripple voltage due to its capacitance, and the nature of the load.

a. **ESR and R3:** A low ESR for C2 is generally desirable so as to minimize power losses and heating within the capacitor. However, a hysteretic regulator requires a minimum amount of ripple voltage at the feedback input for proper loop operation. For the LM5008 the minimum ripple required at pin 5 is 25 mVp-p, requiring a minimum ripple at \( V_{OUT1} \) of 100 mV. Because the minimum ripple current (at minimum \( V_{IN} \)) is 34 mA, the minimum ESR required at \( V_{OUT1} \) is 100 mV / 34 mA = 2.94 \( \Omega \). Because quality capacitors for SMPS applications have an ESR considerably less than this, R3 is inserted as shown in Functional Block Diagram. R3’s value, along with C2’s ESR, must result in at least 25 mVp-p ripple at pin 5. Generally, R3 will be 0.5 to 3 \( \Omega \).

b. **Nature of the Load:** The load can be connected to \( V_{OUT1} \) or \( V_{OUT2} \). \( V_{OUT1} \) provides good regulation, but with a ripple voltage which ranges from 100 mV (at \( V_{IN} = 12 \) V) to 500 mV (at \( V_{IN} = 95 \) V). Alternatively, \( V_{OUT2} \) provides low ripple, but lower regulation due to R3.

For a maximum allowed ripple voltage of 100 mVp-p at \( V_{OUT2} \) (at \( V_{IN} = 95 \) V), assume an ESR of 0.4 \( \Omega \) for C2. At maximum \( V_{IN} \), the ripple current is 181 mA, creating a ripple voltage of 72 mVp-p. This leaves 28 mVp-p of ripple due to the capacitance. The average current into C2 due to the ripple current is calculated using the waveform in Figure 11.

\[
C = I \times \frac{\Delta t}{\Delta V} \quad (9)
\]

**R_{CL}:** When a current limit condition is detected, the minimum off-time set by this resistor must be greater than the maximum normal off-time which occurs at maximum \( V_{IN} \). Using Equation 4, the minimum on-time is 0.47 \( \mu \)s, yielding a maximum off-time of 3.99 \( \mu \)s. This is increased by 117 ns (to 4.11 \( \mu \)s) due to a ±25% tolerance of the on-time. This value is then increased to allow for:

- The response time of the current limit detection loop (400 ns).
- The off-time determined by Equation 5 has a ±25% tolerance.

\[
t_{OFFCL(MIN)} = (4.11 \mu s + 0.40 \mu s) \times 1.25 = 5.64 \mu s \quad (10)
\]

Using Equation 5, \( R_{CL} \) calculates to 264 k\( \Omega \) (at \( V_{FB} = 2.5 \) V). The closest standard value is 267 k\( \Omega \).
D1: The important parameters are reverse recovery time and forward voltage. The reverse recovery time determines how long the reverse current surge lasts each time the buck switch is turned on. The forward voltage drop is significant in the event the output is short-circuited as it is only this diode’s voltage which forces the inductor current to reduce during the forced off-time. For this reason, a higher voltage is better, although that affects efficiency. A good choice is an ultra-fast power diode, such as the MURA110T3 from ON Semiconductor. Its reverse recovery time is 30 ns, and its forward voltage drop is approximately 0.72 V at 300 mA at 25°C. Other types of diodes may have a lower forward voltage drop, but may have longer recovery times, or greater reverse leakage. D1’s reverse voltage rating must be at least as great as the maximum $V_{IN}$, and its current rating be greater than the maximum current limit threshold (610 mA).

C1: This capacitor’s purpose is to supply most of the switch current during the on-time, and limit the voltage ripple at $V_{IN}$ on the assumption that the voltage source feeding $V_{IN}$ has an output impedance greater than zero. At maximum load current when the buck switch turns on, the current into pin 8 will suddenly increase to the lower peak of the output current waveform, ramp up to the peak value, then drop to zero at turnoff. The average input current during this on-time is the load current (300 mA). For a worst case calculation, C1 must supply this average load current during the maximum on-time. To keep the input voltage ripple to less than 2 V (for this exercise), C1 is calculated with Equation 11.

$$C_1 = \frac{I \times t_{ON}}{\Delta V} = \frac{0.3A \times 3.72\mu s}{2.0V} = 0.56 \mu F$$

Equation 11

Quality ceramic capacitors in this value have a low ESR which adds only a few millivolts to the ripple. It is the capacitance which is dominant in this case. To allow for the capacitor’s tolerance, temperature effects, and voltage effects, a 1.0-µF, 100-V, X7R capacitor will be used.

C4: The recommended value is 0.01 µF for C4, as this is appropriate in the majority of applications. A high-quality ceramic capacitor, with low ESR is recommended as C4 supplies the surge current to charge the buck switch gate at turnon. A low ESR also ensures a quick recharge during each off-time. At minimum $V_{IN}$, when the on-time is at maximum, it is possible during start-up that C4 will not fully recharge during each 300-ns off-time. The circuit will not be able to complete the start-up, and achieve output regulation. This can occur when the frequency is intended to be low (for example, $R_{ON} = 500 K$). In this case C4 should be increased so it can maintain sufficient voltage across the buck switch driver during each on-time.

C5: This capacitor helps avoid supply voltage transients and ringing due to long lead inductance at $V_{IN}$. A low-ESR, 0.1-µF ceramic chip capacitor is recommended, placed close to the LM5008.

8.2.3 Application Curves

![Figure 12. Efficiency vs $V_{IN}$](image)

![Figure 13. Efficiency vs Load Current vs $V_{IN}$](image)
9 Power Supply Recommendations

The LM5008 converter is designed to operate from a wide input voltage range from 9.5 V to 95 V. The characteristics of the input supply must be compatible with the Absolute Maximum Ratings and Recommended Operating Conditions. In addition, the input supply must be capable of delivering the required input current to the fully-loaded regulator. Estimate the average input current with Equation 12.

\[ I_{\text{IN}} = \frac{V_{\text{OUT}} \cdot I_{\text{OUT}}}{V_{\text{IN}} \cdot \eta} \]

where

- \( \eta \) is the efficiency

If the converter is connected to an input supply through long wires or PCB traces with large impedance, achieving stable performance requires special care. The parasitic inductance and resistance of the input cables may have an adverse affect on converter operation. The parasitic inductance in combination with the low-ESR ceramic input capacitors form an underdamped resonant circuit. This circuit can cause overvoltage transients at \( V_{\text{IN}} \) each time the input supply is cycled ON and OFF. The parasitic resistance causes the input voltage to dip during a load transient. If the regulator is operating close to the minimum input voltage, this dip can cause false UVLO fault triggering and a system reset. The best way to solve such issues is to reduce the distance from the input supply to the regulator and use an aluminum or tantalum input capacitor in parallel with the ceramics. The moderate ESR of the electrolytic capacitors helps to damp the input resonant circuit and reduce any voltage overshoots. A capacitance in the range of 10 µF to 47 µF is usually sufficient to provide input damping and helps to hold the input voltage steady during large load transients.

An EMI input filter is often used in front of the regulator that, unless carefully designed, can lead to instability as well as some of the effects mentioned above. The user's guide Simple Success with Conducted EMI for DC-DC Converters (SNVA489) provides helpful suggestions when designing an input filter for any switching regulator.

10 Layout

10.1 Layout Guidelines

The LM5008 regulation and overvoltage comparators are very fast, and as such will respond to short duration noise pulses. Layout considerations are therefore critical for optimum performance. The components at pins 1, 2, 3, 5, and 6 should be as physically close as possible to the IC, thereby minimizing noise pickup in the printed-circuit tracks. The current loop formed by D1, L1, and C2 should be as small as possible. The ground connection from C2 to C1 must be as short and direct as possible.

If the internal dissipation of the LM5008 produces excessive junction temperatures during normal operation, good use of the printed-circuit board's (PCB) ground plane can help considerably to dissipate heat. The exposed pad on the bottom of the 8-pin WSON package can be soldered to a ground plane on the PCB, and that plane should extend out from beneath the IC to help dissipate the heat. Additionally, the use of wide PCB traces, where possible, can also help conduct heat away from the IC. Judicious positioning of the PCB within the end product, along with use of any available air flow (forced or natural convection) can help reduce the junction temperatures.

</table>

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OB SoL TE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms “Lead-Free” or “Pb-Free” mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

*All dimensions are nominal.*

**Notes:**
- A0: Dimension designed to accommodate the component width.
- B0: Dimension designed to accommodate the component length.
- K0: Dimension designed to accommodate the component thickness.
- W: Overall width of the carrier tape.
- P1: Pitch between successive cavity centers.

DGK (S-PDSO-G8)  PLASTIC SMALL-OUTLINE PACKAGE

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
E. Falls within JEDEC MO-187 variation AA, except interlead flash.
NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, “Designers”) understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers’ applications and compliance of their applications (and of all TI products used in or for Designers’ applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designers has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI’s provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, “TI Resources”) are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer’s company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI’s provision of TI Resources does not expand or otherwise alter TI’s applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource, NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY TECHNOLOGY, PATENT RIGHT OR ANY OTHER INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED “AS IS” AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designers may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers’ own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer’s non-compliance with the terms and provisions of this Notice.
