4:1 High-Speed Multiplexer
Check for Samples: OPA4872

FEATURES
- 500MHz SMALL-SIGNAL BANDWIDTH
- 500MHz, 2Vpp BANDWIDTH
- 0.1dB GAIN FLATNESS to 120MHz
- 10ns CHANNEL SWITCHING TIME
- LOW SWITCHING GLITCH: 40mVpp
- 2300V/μs SLEW RATE
- 0.035%/0.005° DIFFERENTIAL GAIN, PHASE
- QUIESCENT CURRENT = 10.6mA
- 1.1mA QUIESCENT CURRENT IN SHUTDOWN MODE
- 88dB OFF ISOLATION IN DISABLE OR SHUTDOWN (10MHz)

APPLICATIONS
- VIDEO ROUTER
- LCD AND PLASMA DISPLAY
- HIGH SPEED PGA
- DROP-IN UPGRADE TO AD8174

DESCRIPTION
The OPA4872 offers a very wideband 4:1 multiplexer in an SO-14 package. Using only 10.6mA, the OPA4872 provides a user-settable output amplifier gain with greater than 500MHz large-signal bandwidth (2Vpp). The switching glitch is improved over earlier solutions using a new (patented) input stage switching approach. This technique uses current steering as the input switch while maintaining an overall closed-loop design. The OPA4872 exhibits an off isolation of 88dB in either Disable or Shutdown mode. With greater than 500MHz small-signal bandwidth at a gain of 2, the OPA4872 gives a typical 0.1dB gain flatness to greater than 120MHz.

System power may be optimized using the chip enable feature for the OPA4872. Taking the chip enable (EN) line high powers down the OPA4872 to less than 3.4mA total supply current. Further power reduction to 1.1mA quiescent current can be achieved by bringing the shutdown (SD) line high. Muxing multiple OPA4872s outputs together, then using the chip enable to select which channels are active, increases the number of possible inputs.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.
This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

APPLICATION INFORMATION

WIDEBAND MULTIPLEXER OPERATION

The OPA4872 gives a new level of performance in wideband multiplexers. Figure 27 shows the dc-coupled, gain of +2V/V, dual power-supply circuit used as the basis of the ±5V Electrical Characteristics and Typical Characteristic curves. For test purposes, the input impedance is set to 75Ω with a resistor to ground and the output impedance is set to 75Ω with a series output resistor. Voltage swings reported in the specifications are taken directly at the input and output pins while load powers (in dBm) are defined at a matched 75Ω load. For the circuit of Figure 27, the total effective load will be 150Ω || 1046Ω = 131Ω. Logic pins A0 and A1 control which of the four inputs is selected while EN and SD allow for power reduction. One optional component is included in Figure 27. In addition to the usual power-supply decoupling capacitors to ground, a 0.01μF capacitor is included between the two power-supply pins. In practical printed circuit board (PCB) layouts, this optional added capacitor typically improves the 2nd-harmonic distortion performance by 3dB to 6dB for bipolar supply operation.

Even though the internal architecture of the OPA4872 includes current steering, it is advantageous to look at it as four switches looking into the noninverting input of a current feedback amplifier. Depending on the logic applied to channel control pins A0 and A1, one switch is on at all times. Figure 27 represents the OPA4872 in this configuration. The truth table for channel selection is shown in Table 2.

Table 2. TRUTH TABLE

<table>

<tr>
<td>X</td>
<td>X</td>
<td>X</td>
<td>1</td>
<td>High-Z, I_Q = 1.1mA</td>
</tr>
</tbody>
</table>

The OPA4872 is in disable mode, with a quiescent current of 3.4mA typical, when the EN pin is set to 0V. After being placed in disable mode, the OPA4872 is fully enabled in 6ns. For further power savings, the SD pin can be used. Setting the SD pin to 5V places the device in shutdown mode with a standing quiescent current of 1.1mA. Note that in this shutdown mode, the OPA4872 requires 15ns to be fully powered again. The truth table for disable and shutdown modes can be found in Table 2.

Figure 27. DC-Coupled, G = +2V/V Bipolar Specification and Test Circuit (Channel 0 Selected)
2-BIT HIGH-SPEED PGA

The OPA4872 can be used as a 2-bit, high-speed programmable gain amplifier (PGA) when used in conjunction with another amplifier. Figure 28 shows one OPA695 used in series with each OPA4876 input and configured with gains of +1V/V, +2V/V, +4V/V, and +8V/V, respectively.

When channel 0 is selected, the overall gain to the matched load of the OPA4872 is 0dB. When channel 1 is selected, this circuit delivers 6dB of gain to the matched load. When channel 2 is selected, this circuit delivers 12dB of gain to the matched load. When channel 3 is selected, this circuit delivers 18dB of gain to the matched load.

Figure 28. 2-Bit, High-Speed PGA, Greater Than 300MHz Channel Bandwidth
2-BIT, HIGH-SPEED ATTENUATOR

In contrast to the PGA, a two-bit high-speed attenuator can be implemented by using an R-2R ladder together with the OPA4872. Figure 29 shows such an implementation.

Channel 0 sees the full input signal amplitude, where as channel 1 sees 1/2 \( V_{IN} \), channel 2 see 1/4 \( V_{IN} \) and channel 3 sees 1/8 \( V_{IN} \).

![Figure 29. 2-Bit, High-Speed Attenuator, 500MHz Channel Bandwidth](image)

4-INPUT RGB ROUTER

Three OPA4872s can be used together to form a four-input RGB router. The router for the red component is shown in Figure 30. Identical stages would be used for the green and blue channels.

![Figure 30. 4-Input RGB Router (Red Channel Shown)](image)

8-TO-1 VIDEO MULTIPLEXER

Two OPA4872s can be used together to form an 8-input video multiplexer. The multiplexer is shown in Figure 31.

![Figure 31. 8-to-1 Video Multiplexer](image)

When connecting OPA4872 outputs together, maintain a gain of +1V/V at the load. The OPA4872 configuration shown is a gain of +6dB; thus, the matching resistance must be selected to achieve −6dB.

The set of equations to solve are shown in Equation 1 and Equation 2. Here, the impedance of interest is 75Ω.

\[
\begin{align*}
R_D &= Z_0 \parallel (R_O + R_F + R_G) \\
1 + \frac{R_F}{R_G} &= 2 \\
R_F + R_G &= 1046\Omega \\
R_F &= R_G
\end{align*}
\]

(1)

(2)
Solving for \( R_o \), with \( n \) devices connected together, results in Equation 3:

\[
R_o = \frac{75 \times (n - 1) + 804}{2} \times \left( \sqrt{1 + \frac{241200}{[75 \times (n - 1) + 804]^2}} - 1 \right)
\]

Results for \( n \) varying from 2 to 6 are given in Table 3.

### Table 3. Series Resistance versus Number of Parallel Outputs

<table>
<thead>
<tr>
<th>NUMBER OF OPA4872s</th>
<th>( R_o ) (Ω)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>69</td>

</tr>
<tr>
<td>5</td>
<td>55.59</td>
</tr>
<tr>
<td>6</td>
<td>52.15</td>
</tr>
</tbody>
</table>

The two major limitations of this circuit are the device requirements for each OPA4872 and the acceptable return loss resulting from the mismatch between the load and the matching resistor.

### DESIGN-IN TOOLS

### DEMONSTRATION FIXTURE

A printed circuit board (PCB) is available to assist in the initial evaluation of circuit performance using the OPA4872. The fixture is offered free of charge as an unpopulated PCB, delivered with a user's guide. The summary information for this fixture is shown in Table 4.

The demonstration fixture can be requested at the Texas Instruments web site at (www.ti.com) through the OPA4872 product folder.

### MACROMODELS AND APPLICATIONS SUPPORT

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. This practice is particularly true for video and RF amplifier circuits, where parasitic capacitance and inductance can have a major effect on circuit performance. A SPICE model for the OPA4872 is available through the Texas Instruments web site at www.ti.com. This model does a good job of predicting small-signal ac and transient performance under a wide variety of operating conditions. It does not do as well in predicting the harmonic distortion or dG/dP characteristics.

### OPERATING SUGGESTIONS

### SETTING RESISTOR VALUES TO OPTIMIZE BANDWIDTH

The output stage of the OPA4872 is a current-feedback op amp, meaning it can hold an almost constant bandwidth over signal gain settings with the proper adjustment of the external resistor values. This performance is shown in the Typical Characteristic curves; the small-signal bandwidth decreases only slightly with increasing gain. These curves also show that the feedback resistor has been changed for each gain setting. The resistor values on the feedback path can be treated as frequency response compensation elements while the ratio sets the signal gain of the feedback resistor divided by the gain resistor. Figure 32 shows the small-signal frequency response analysis circuit for a current feedback amplifier.

![Figure 32. Recommended Feedback Resistor versus Noise Gain](image)
R_I, the buffer output impedance, is a critical portion of the bandwidth control equation. R_I for the OPA4872 is typically about 30Ω. A current-feedback op amp senses an error current in the inverting node (as opposed to a differential input error voltage for a voltage-feedback op amp) and passes this on to the output through an internal frequency dependent transimpedance gain. The Typical Characteristics show this open-loop transimpedance response. This open-loop response is analogous to the open-loop voltage gain curve for a voltage-feedback op amp. Developing the transfer function for the circuit of Figure 32 gives Equation 4:

\[
\frac{V_O}{V_I} = \frac{\alpha \left(1 + \frac{R_F}{R_G}\right)}{R_F + R_I \left(1 + \frac{\frac{R_F}{R_G}}{Z(S)}\right) + \frac{\alpha NG}{1+Z(S)}}
\]

where:

\[
NG = \left(1 + \frac{R_F}{R_G}\right)
\]

(4)

This formula is written in a loop-gain analysis format, where the errors arising from a noninfinite open-loop gain are shown in the denominator. If Z(S) were infinite over all frequencies, the denominator of Equation 4 would reduce to 1 and the ideal desired signal gain shown in the numerator would be achieved. The fraction in the denominator of Equation 4 determines the frequency response. Equation 5 shows this as the loop-gain equation:

\[
\frac{Z(S)}{R_F + R_I NG} = \text{Loop Gain}
\]

(5)

If 20 × \log(R_F + NG × R_I) were drawn on top of the open-loop transimpedance plot, the difference between the two calculations would be the loop gain at a given frequency. Eventually, Z(S) rolls off to equal the denominator of Equation 5, at which point the loop gain reduces to 1 (and the curves intersect). This point of equality is where the amplifier closed-loop frequency response given by Equation 4 starts to roll off, and is exactly analogous to the frequency at which the noise gain equals the open-loop voltage gain for a voltage-feedback op amp. The difference here is that the total impedance in the denominator of Equation 5 may be controlled somewhat separately from the desired signal gain (or NG).

The OPA4872 is internally compensated to give a maximally flat frequency response for R_F = 523Ω at NG = 2 on ±5V supplies. Evaluating the denominator of Equation 5 (which is the feedback transimpedance) gives an optimal target of 663Ω. As the signal gain changes, the contribution of the NG × R_I term in the feedback transimpedance will change, but the total can be held constant by adjusting R_F. Equation 6 gives an approximate equation for optimum R_F over signal gain:

\[
R_F = 663Ω - NG × R_I
\]

(6)

As the desired signal gain increases, this equation will eventually predict a negative R_F. A somewhat subjective limit to this adjustment can also be set by holding R_O to a minimum value of 20Ω. Lower values load both the buffer stage at the input and the output stage, if R_F gets too low, actually decreasing the bandwidth. Figure 33 shows the recommended R_F versus NG for ±5V operation. The values for R_F versus gain shown here are approximately equal to the values used to generate the Typical Characteristics. They differ in that the optimized values used in the Typical Characteristics are also correcting for board parasitics not considered in the simplified analysis leading to Equation 5. The values shown in Figure 33 give a good starting point for design where bandwidth optimization is desired.

Figure 33. Feedback Resistor vs Noise Gain

The total impedance going into the inverting input may be used to adjust the closed-loop signal bandwidth. Inserting a series resistor between the inverting input and the summing junction increases the feedback impedance (denominator of Equation 4), decreasing the bandwidth.
VOSO_envelope = VOS × G ± Ib × Rf ± (RS × Ib) × G
                  ± |5 - (VS+) | × 10^-PSRR+
                  ± |−5 - (VS−) | × 10^-PSRR−
(7)

Where:
RS: Input resistance seen by R0, R1, G0, G1, B0, or B1.
Ib: Noninverting input bias current
Ib: Inverting input bias current
G: Gain
VS+: Positive supply voltage
VS−: Negative supply voltage
PSRR+: Positive supply PSRR
PSRR−: Negative supply PSRR
VOS: Input Offset Voltage

Evaluating the front-page schematic, using a worst-case, +25°C offset voltage, bias current and
PSRR specifications and operating at ±6V, gives a worst-case output equal to Equation 8:
±10mV + 75Ω × ±14μA × 2
+523Ω × ±18μA ± |5 - 6| × 10^-51
± |−5 - (−6) | × 10^-51
= ±29.2mV
(8)

DISTORTION PERFORMANCE

The OPA4872 provides good distortion performance into a 150Ω load on ±5V supplies. Relative to
alternative solutions, it provides exceptional performance into lighter loads. Generally, until the
fundamental signal reaches very high frequency or power levels, the 2nd harmonic dominates the
distortion with a negligible 3rd harmonic component. Focusing then on the 2nd harmonic, increasing the
load impedance directly improves distortion. Also, providing an additional supply decoupling capacitor
(0.01μF) between the supply pins (for bipolar operation) improves the 2nd-order distortion slightly
(3dB to 6dB).

In most op amps, increasing the output voltage swing increases harmonic distortion directly. The Typical
Characteristics show the 2nd harmonic increasing at a little less than the expected 2X rate while the 3rd
harmonic increases at a little less than the expected 3X rate. Where the test power doubles, the 2nd
harmonic increases only by less than the expected 6dB, whereas the 3rd harmonic increases by less
than the expected 12dB.
The total output spot noise voltage can be computed as the square root of the sum of all squared output noise voltage contributors. Equation 9 shows the general form for the output noise voltage using the terms shown in Figure 35.

$$E_O = \sqrt{E_{NI}^2 + (I_{IN}R_S)^2 + 4kT R_S} NG + (I_{IB} R_F)^2 + 4kT R_F NG$$

Dividing this expression by the noise gain ($NG = (1 + R_F/R_O)$) gives the equivalent input-referred spot noise voltage at the noninverting input, as shown in Equation 10.

$$E_O = \sqrt{E_{NI}^2 + (I_{IN}R_S)^2 + 4kT R_S} + \left(\frac{I_{IB} R_F}{NG} + 4kT R_F NG\right)$$

Evaluating these two equations for the OPA4872 circuit and component values (see Figure 27) gives a total output spot noise voltage of 14.2nV/√Hz and a total equivalent input spot noise voltage of 7.1nV/√Hz. This total input-referred spot noise voltage is higher than the 4.5nV/√Hz specification for the OPA4872 voltage noise alone. This voltage reflects the noise added to the output by the inverting current noise times the feedback resistor. If the feedback resistor is reduced in high-gain configurations, the total input-referred voltage noise given by Equation 10 approaches only the 4.5nV/√Hz of the op amp itself. For example, going to a gain of +10 using $R_F = 178\Omega$ gives a total input-referred noise of 4.7nV/√Hz.

Figure 34. Op Amp Noise Analysis Model
THERMAL ANALYSIS

Heatsinking or forced airflow may be required under extreme operating conditions. Maximum desired junction temperature sets the maximum allowed internal power dissipation as discussed in this document. In no case should the maximum junction temperature be allowed to exceed +150°C.

Operating junction temperature (T_J) is given by T_A + P_D × θ_JA. The total internal power dissipation (P_D) is the sum of quiescent power (P_{DQ}) and additional power dissipated in the output stage (P_{DL}) to deliver load power. Quiescent power is simply the specified no-load supply current times the total supply voltage across the part. P_{DL} depends on the required output signal and load; for a grounded resistive load, P_{DL} is at a maximum when the output is fixed at a voltage equal to 1/2 of either supply voltage (for equal bipolar supplies). Under this condition P_{DL} = V_S^2/(4 × R_L), where R_L includes feedback network loading.

Note that it is the power in the output stage and not in the load that determines internal power dissipation.

![Figure 35. OPA4872 Noise Analysis Model](image_url)
As a worst-case example, compute the maximum $T_J$ using an OPA4872ID in the circuit of Figure 27 operating at the maximum specified ambient temperature of $+85^\circ\text{C}$ with its output driving a grounded 100Ω load to $+2.5\text{V}$:

$$P_D = 10\text{V} \times 11.7\text{mA} + \left(5/\left(4 \times (150\text{Ω} || 1046\text{Ω})\right)\right) = 165\text{mW}$$

Maximum $T_J = +85^\circ\text{C} + (165\text{mW} \times 80^\circ\text{C/W}) = 98^\circ\text{C}$

This worst-case condition does not exceed the maximum junction temperature. Normally, this extreme case is not encountered.

**BOARD LAYOUT GUIDELINES**

Achieving optimum performance with a high-frequency amplifier such as the OPA4872 requires careful attention to board layout parasitics and external component types. Recommendations to optimize performance include:

**a)** Minimize parasitic capacitance to any ac ground for all of the signal I/O pins. Parasitic capacitance on the output pin can cause instability; on the noninverting input, it can react with the source impedance to cause unintentional bandlimiting. To reduce unwanted capacitance, a window around the signal I/O pins should be opened in all of the ground and power planes around those pins. Otherwise, ground and power planes should be unbroken elsewhere on the board.

**b)** Minimize the distance (< 0.25") from the power-supply pins to high frequency 0.1μF decoupling capacitors. At the device pins, the ground and power plane layout should not be in close proximity to the signal I/O pins. Avoid narrow power and ground traces to minimize inductance between the pins and the decoupling capacitors. The power-supply connections (on pins 9, 11, 13, and 15) should always be decoupled with these capacitors. An optional supply decoupling capacitor across the two power supplies (for bipolar operation) improves 2nd harmonic distortion performance. Larger (2.2μF to 6.8μF) decoupling capacitors, effective at lower frequency, should also be used on the main supply pins. These capacitors may be placed somewhat farther from the device and may be shared among several devices in the same area of the PCB.

**c)** Careful selection and placement of external components will preserve the high-frequency performance of the OPA4872. Resistors should be a very low reactance type. Surface-mount resistors work best and allow a tighter overall layout. Metal-film and carbon composition, axially-leded resistors can also provide good high-frequency performance. Again, keep their leads and PCB trace length as short as possible. Never use wirewound type resistors in a high-frequency application. Other network components, such as noninverting input termination resistors, should also be placed close to the package.

**d)** Connections to other wideband devices on the board may be made with short direct traces or through onboard transmission lines. For short connections, consider the trace and the input to the next device as a lumped capacitive load. Relatively wide traces (50mils to 100mils) should be used, preferably with ground and power planes opened up around them.

Estimate the total capacitive load and set $R_S$ from the plot of Figure 5. Low parasitic capacitive loads (greater than 5pF) may not need an $R_S$ because the OPA4872 is nominally compensated to operate with a 2pF parasitic load. If a long trace is required, and the 6dB signal loss intrinsic to a doubly-terminated transmission line is acceptable, implement a matched impedance transmission line using microstrip or stripline techniques (consult an ECL design handbook for microstrip and stripline layout techniques). A 50Ω environment is normally not necessary on the board, and in fact, a higher impedance environment improves distortion as shown in the Distortion versus Load plot; see Figure 7. With a characteristic board trace impedance defined based on board material and trace dimensions, a matching series resistor into the trace from the output of the OPA4872 is used as well as a terminating shunt resistor at the input of the destination device. Remember also that the terminating impedance will be the parallel combination of the shunt resistor and the input impedance of the destination device; this total effective impedance should be set to match the trace impedance. The high output voltage and current capability of the OPA4872 allows multiple destination devices to be handled as separate transmission lines, each with its own series and shunt terminations. If the 6dB attenuation of a doubly-terminated transmission line is unacceptable, a long trace can be series-terminated at the source end only. Treat the trace as a capacitive load in this case and set the series resistor value as shown in Figure 5. This configuration does not preserve signal integrity as well as a doubly-terminated line. If the input impedance of the destination device is low, there will be some signal attenuation because of the voltage divider formed by the series output into the terminating impedance.
e) **Socketing a high-speed part like the OPA4872 is not recommended.** The additional lead length and pin-to-pin capacitance introduced by the socket can create an extremely troublesome parasitic network that can make it almost impossible to achieve a smooth, stable frequency response. Best results are obtained by soldering the OPA4872 onto the board.

**INPUT AND ESD PROTECTION**

The OPA4872 is built using a very high-speed complementary bipolar process. The internal junction breakdown voltages are relatively low for these very small geometry devices. These breakdowns are reflected in the [Absolute Maximum Ratings](#) table. All device pins have limited ESD protection using internal diodes to the power supplies as shown in Figure 36.

![Figure 36. Internal ESD Protection](#)

These diodes provide moderate protection to input overdrive voltages above the supplies as well. The protection diodes can typically support 30mA continuous current. Where higher currents are possible (for example, in systems with ±15V supply parts driving into the OPA4872), current-limiting series resistors should be added into the two inputs. Keep these resistor values as low as possible because high values degrade both noise performance and frequency response.
# REVISION HISTORY

(1) The marketing status values are defined as follows:
- **ACTIVE**: Product device recommended for new designs.
- **LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
- **PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.
- **OBSOLETE**: TI has discontinued the production of the device.

(2) **RoHS**: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
- **RoHS Exempt**: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
- **Green**: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES:  
A. All linear dimensions are in millimeters.  
B. This drawing is subject to change without notice.  
C. Publication IPC-7351 is recommended for alternate designs.  
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.  
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI’s published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and/or implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, “Designers”) understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers’ applications and compliance of their applications (and of all TI products used in or for Designers’ applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI’s provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, “TI Resources”) are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer’s company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI’s provision of TI Resources does not expand or otherwise alter TI’s applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, improvements, enhancements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY TECHNOLOGY, INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED ‘AS IS’ AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers’ own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer’s non-compliance with the terms and provisions of this Notice.
