

15-W, WIDE-INPUT ADJUSTABLE POSITIVE-TO-NEGATIVE VOLTAGE REGULATOR MODULE

FEATURES

- Up to 3-A Output Current
- Wide-Input Voltage (9 V to 29 V)
- Wide-Output Voltage Adjust (–15 V to –3 V)
- High Efficiency (Up to 88%)
- Undervoltage Lockout
- Output Current Limit
- Overtemperature Shutdown
- Operating Temperature: –40°C to 85°C
- Surface-Mount Package Available

APPLICATIONS

- General-Purpose, Industrial Controls, HVAC Systems
- Test and Measurement, Medical Instrumentation
- AC/DC Adaptors, Vehicles, Marine, and Avionics

DESCRIPTION

The PTN78060A is a series of high-efficiency, buck-boost, integrated switching regulators (ISR), that represent the third generation in the evolution of the (PT)78NR100 series of products. In new designs, the PTN78060A series should also be considered in place of the PT6640 series of single in-line pin (SIP) products. In all cases, the PTN78060A has either similar or improved electrical performance characteristics. The caseless, double-sided package has excellent thermal characteristics, and is compatible with TI's roadmap for RoHS and lead-free compliance.

Operating from a wide-input voltage range of 9 V to 29 V, the PTN78060A provides high-efficiency, positive-to-negative voltage conversion for loads of up to 3 A. The output voltage can be set to any value over a wide adjustment range using a single external resistor. The adjust range is –15 V to –3 V.

The PTN78060A is suited to a wide variety of general-purpose industrial applications that operate off 12-V, 24-V, or tightly regulated 28-V dc power.

- (1) See the *Application Information* section for capacitor recommendations
- (2) R_{SET} is required to adjust the output voltage lower than –3 V. See the *Application Information* section for values.
- (3) For reduced V_O ripple and noise, a ceramic capacitor is suggested.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

For the most current package and ordering information, see the Package Option Addendum at the end of this datasheet, or see the TI website at www.ti.com.

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

over operating free-air temperature range unless otherwise noted
all voltages with respect to GND

			UNIT
T_A	Operating free-air temperature	Over V_I range	–40°C to 85°C
	Wave solder temperature	Surface temperature of module body or pins (5 seconds)	Horizontal TH (suffix AH) 260°C
	Solder reflow temperature	Surface temperature of module body or pins	Horizontal SMD (suffix AS) 235°C
			Horizontal SMD (suffix AZ) 260°C
T_{stg}	Storage temperature		–40°C to 125°C
P_O	Output power	$ V_O \geq 5\text{ V}$	15 W

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

		MIN	MAX	UNIT
V_I	Input voltage	9	$32 - V_O $	V
T_A	Operating free-air temperature	–40	85	°C

PACKAGE SPECIFICATIONS

PTN78060x (Suffix AH, AS, and AZ)			
Weight			3.9 grams
Flammability	Meets UL 94 V-O		
Mechanical shock	Per Mil-STD-883D, Method 2002.3, 1 ms, ½ sine, mounted		500 G ⁽¹⁾
Mechanical vibration	Mil-STD-883D, Method 2007.2, 20-2000 Hz	Horizontal T/H (suffix AH)	20 G ⁽¹⁾
		Horizontal SMD (suffix AS & AZ)	20 G ⁽¹⁾

(1) Qualification limit.

ELECTRICAL CHARACTERISTICS

operating at 25°C free-air temperature, $V_I = 20\text{ V}$, $V_O = -5\text{ V}$, $I_O = I_O(\text{max})$, $C_1 = 100\text{ }\mu\text{F}$, $C_2 = 3 \times 4.7\text{ }\mu\text{F}$, $C_3 = 100\text{ }\mu\text{F}$, and $C_4 = 4.7\text{ }\mu\text{F}$ (unless otherwise noted)

- (1) The maximum output current is 3 A or a maximum output power of 15 W, whichever is less.
- (2) The maximum input voltage is limited and defined to be $(32 - |V_O|)$.
- (3) The set-point voltage tolerance is affected by the tolerance and stability of R_{SET} . The stated limit is unconditionally met if R_{SET} has a tolerance of 1% with 100 ppm/ $^\circ\text{C}$ or better temperature stability.
- (4) A 100- μF electrolytic capacitor and three 4.7- μF ceramic capacitors are required across the input (V_I and GND) for proper operation. Locate the ceramic capacitors close to the module.
- (5) 100 μF of output capacitance is required for proper operation. See the application information for further guidance.
- (6) This is the typical ESR for all the electrolytic (nonceramic) capacitance. Use 17 m Ω as the minimum when using max-ESR values to calculate.

PIN ASSIGNMENT

TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
V_O	1, 7	O	The negative output voltage power connection. It is also the reference for the V_O <i>Adjust</i> control input. For proper operation, pins 1 and 7 must be connected.
V_I	2	I	The positive input voltage power node to the module, which is referenced to common GND.
N/C	3		This pin is active and must be isolated from any electrical connection.
V_O Adjust	4	I	A 1% resistor must be connected between pin 4 and pin 7 to set the output voltage of the module. The adjust range is -15 V to -3 V. If left open-circuit, the output voltage defaults to -3 V. The temperature stability of the resistor should be 100 ppm/ $^{\circ}$ C (or better). The standard resistor value for a number of common output voltages is provided in the application information.
N/C	5		This pin is active and must be isolated from any electrical connection.
GND	6	I/O	The common ground connection for both V_I and V_O power connections.

APPLICATION INFORMATION

Adjusting the Output Voltage of the PTN78060A Wide-Output Adjust Power Modules

General

A resistor must be connected directly between the V_O *Adjust* control (pin 4) and the output *voltage* (pin 7) to set the output voltage lower than -3 V. The adjustment range is from -15 V to -3 V. If pin 4 is left open, the output voltage defaults to the highest value, -3 V.

Table 1 gives the standard resistor value for a number of common voltages, and with the actual output voltage that the value produces. For other output voltages, the resistor value can either be calculated using the following formula, or simply selected from the range of values given in Table 2. Figure 18 shows the placement of the required resistor.

$$R_{SET} = 54.9 \text{ k}\Omega \times \frac{1.25 \text{ V}}{|V_O| - 3 \text{ V}} - 5.62 \text{ k}\Omega \quad (1)$$

Input Voltage Considerations

The PTN78060A is a buck-boost switching regulator. In order that the output remains in regulation, the input voltage must not exceed the output by a maximum differential voltage.

Another consideration is the pulse width modulation (PWM) range of the regulator's internal control circuit. For stable operation, its operating duty cycle should not be lower than some minimum percentage. This defines the maximum advisable ratio between the regulator's input and output voltage magnitudes.

For satisfactory performance, the maximum operating input voltage range must be equal to $(32 - |V_O|)$ volts.

As an example, Table 1 gives the operating input voltage range for the common output bus voltages. In addition, the Electrical Characteristics define the available output voltage adjust range for various input voltages.

Table 1. Standard Values of R_{set} for Common Output Voltages

V_O (Required)	R_{SET} (Standard Value)	V_O (Actual)	Operating V_I Range
-15 V	100Ω	-14.997 V	9 V to 17 V
-12 V	$2 \text{ k}\Omega$	-12.006 V	9 V to 20 V
-5 V	$28.7 \text{ k}\Omega$	-5.000 V	9 V to 27 V
-3.3 V	$221 \text{ k}\Omega$	-3.303 V	9 V to 28.7 V

- (1) A 0.05-W rated resistor may be used. The tolerance should be 1%, with a temperature stability of 100 ppm/°C (or better). Place the resistor as close to the regulator as possible. Connect the resistor directly between pins 4 and 7 using dedicated PCB traces.
- (2) Never connect capacitors from V_O *Adjust* to either GND or V_O . Any capacitance added to the V_O *Adjust* pin affects the stability of the regulator.

Figure 18. V_O Adjust Resistor Placement

Table 2. Output Voltage Set-Point Resistor Values

V_O Required	R_{SET}	V_O Required	R_{SET}	V_O Required	R_{SET}
-15.0 V	99 Ω	-11.9 V	2.09 kΩ	-8.8 V	6.21 kΩ

-12.4 V	1.68 kΩ	-9.3 V	5.27 kΩ	-3.6 V	109 kΩ
-12.3 V	1.76 kΩ	-9.2 V	5.45 kΩ	-3.4 V	166 kΩ
-12.2 V	1.84 kΩ	-9.1 V	5.63 kΩ	-3.2 V	338 kΩ
-12.1 V	1.92 kΩ	-9.0 V	5.82 kΩ	-3.0 V	OPEN
-12.0 V	2.01 kΩ	-8.9 V	6.01 kΩ		

CAPACITOR RECOMMENDATIONS FOR THE PTN78060 WIDE-OUTPUT ADJUST POWER MODULES

Input Capacitor

The minimum requirement for the input bus is 100 μF of nonceramic capacitance and 14.1 μF ($3 \times 4.7 \mu\text{F}$) of ceramic capacitance, in either an X5R or X7R temperature characteristic. Ceramic capacitors should be located within 0.5 inch (1.27 cm) of the regulator's input pins. Electrolytic capacitors can be used at the input, but only in addition to the required ceramic capacitance. The minimum ripple current rating for any nonceramic capacitance must be 350 mA rms. The ripple current rating of electrolytic capacitors is a major consideration when they are used at the input. This ripple current requirement can be reduced by placing more ceramic capacitors at the input, in addition to the minimum required 14.1 μF .

Tantalum capacitors are not recommended for use at the input bus, as none were found to meet the minimum voltage rating of $2 \times$ (maximum dc voltage + ac ripple). The $2 \times$ rating is standard practice for regular tantalum capacitors to ensure reliability. Polymer-tantalum capacitors are more reliable, and are available with a maximum rating of typically 20 V. These can be used with input voltages up to 16 V.

Output Capacitor

The minimum capacitance required to ensure stability is a 100- μF capacitor. Either ceramic or electrolytic-type capacitors can be used. The minimum ripple current rating for the nonceramic capacitance must be at least 200 mA rms. The stability of the module and voltage tolerances is compromised if the capacitor is not placed near the output bus pins. A high-quality, computer-grade electrolytic capacitor should be adequate. A ceramic capacitor can be also be located within 0.5 inch (1.27 cm) of the output pin.

For applications with load transients (sudden changes in load current), the regulator response improves with additional capacitance. Additional electrolytic capacitors should be located close to the load circuit. These capacitors provide decoupling over the frequency range, 2 kHz to 150 kHz. Aluminum electrolytic capacitors are suitable for ambient temperatures above 0°C. For operation below 0°C, tantalum or Os-Con-type capacitors are recommended. When using one or more nonceramic capacitors, the calculated equivalent ESR should be no lower than 10 m Ω (17 m Ω using the manufacturer's maximum ESR for a single capacitor). A list of recommended capacitors and vendors are identified in [Table 3](#).

Ceramic Capacitors

Above 150 kHz, the performance of aluminum electrolytic capacitors becomes less effective. To further reduce the reflected input ripple current, or improve the output transient response, multilayer ceramic capacitors must be added. Ceramic capacitors have low ESR, and their resonant frequency is higher than the bandwidth of the regulator. When placed at the output, their combined ESR is not critical as long as the total value of ceramic capacitance does not exceed 200 μF .

Tantalum Capacitors

Tantalum-type capacitors may be used at the output and are recommended for applications where the ambient operating temperature can be less than 0°C. The AVX TPS, Sprague 593D/594/595, and Kemet T495/T510/T520 capacitors series are suggested over many other tantalum types due to their rated surge, power dissipation, and ripple current capability. As a caution, many general-purpose tantalum capacitors have considerably higher ESR, reduced power dissipation, and lower ripple current capability. These capacitors are also less reliable as they have lower power dissipation and surge current ratings. Tantalum capacitors that do not have a stated ESR or surge current rating are not recommended for power applications. When specifying Os-Con and polymer-tantalum capacitors for the output, the minimum ESR limit is encountered well before the maximum capacitance value is reached.

Capacitor Table

The capacitor table, [Table 3](#), identifies the characteristics of capacitors from vendors with acceptable ESR and ripple current (rms) ratings. The recommended number of capacitors required at both the input and output buses is identified for each capacitor type. This is not an extensive capacitor list. Capacitors from other vendors are available with comparable specifications. Those listed are for guidance. The rms rating and ESR (at 100 kHz) are critical parameters necessary to ensure both optimum regulator performance and long capacitor life.

Designing for Load Transients

The transient response of the dc/dc converter has been characterized using a load transient with a di/dt of 1 A/μs. The typical voltage deviation for this load transient is given in the data sheet specification table using the required value of output capacitance. As the di/dt of a transient is increased, the response of a converter's regulation circuit ultimately depends on its output capacitor decoupling network. This is an inherent limitation of any dc/dc converter once the speed of the transient exceeds its bandwidth capability. If the target application specifies a higher di/dt or lower voltage deviation, the requirement can only be met with additional output capacitor decoupling. In these cases, special attention must be paid to the type, value, and ESR of the capacitors selected.

If the transient performance requirements exceed those specified in the data sheet, the selection of output capacitors becomes more important. Review the minimum ESR in the characteristic data sheet for details on the capacitance maximum.

Table 3. Recommended Input/Output Capacitors

CAPACITOR VENDOR/ COMPONENT SERIES	CAPACITOR CHARACTERISTICS					QUANTITY		VENDOR NUMBER

- (1) The voltage rating of the input capacitor must be selected for the desired operating input voltage range of the regulator. To operate the regulator at a higher input voltage, select a capacitor with the next higher voltage rating.
- (2) The maximum voltage rating of the capacitor must be selected for the desired set-point voltage (V_O). To operate at a higher output voltage, select a capacitor with a higher voltage rating.
- (3) Not recommended (N/R). The voltage rating does not meet the minimum operating limits in most applications.
- (4) The maximum rating of the ceramic capacitor limits the regulator's operating input voltage to 20 V. Select an alternative ceramic component to operate at a higher input voltage.

Power-Up Characteristics

When configured per the standard application, the PTN78060A power module produces a regulated output voltage following the application of a valid input source voltage. During power up, internal soft-start circuitry slows the rate that the output voltage rises, thereby limiting the amount of in-rush current that can be drawn from the input source. The soft-start circuitry introduces a short time delay (typically 5 ms – 10 ms) into the power-up characteristic. This is from the point that a valid input source is recognized. Figure 19 shows the power-up waveforms when operating from a 12-V input and with the output voltage adjusted to –5-V. The waveforms were measured with a 2.8-A resistive load.

Figure 19. Power-Up Waveforms

Undervoltage Lockout

The undervoltage lockout (UVLO) circuit prevents the module from attempting to power up until the input voltage is above the UVLO threshold. This is to prevent the module from drawing excessive current from the input source at power up. Below the UVLO threshold, the module is held off.

Current Limit Protection

The module is protected against load faults with a continuous current limit characteristic. Under a load-fault condition, the output current increases to the current limit threshold. Attempting to draw current that exceeds the current limit threshold causes the module to progressively reduce its output voltage. Current is continuously supplied to the fault until the fault is removed. Once it is removed, the output voltage promptly recovers. When limiting output current, the regulator experiences higher power dissipation, which increases its temperature. If the temperature increase is excessive, the module's overtemperature protection begins to periodically turn the output voltage off.

Overtemperature Protection

A thermal shutdown mechanism protects the module's internal circuitry against excessively high temperatures. A rise in temperature may be the result of a drop in airflow, a high ambient temperature, or a sustained current limit condition. If the internal temperature rises excessively, the module turns itself off, reducing the output voltage to zero. The module exercises a soft-start power up when the sensed temperature has decreased by about 10°C below the trip point.

NOTE: Overtemperature protection is a last-resort mechanism to prevent damage to the module. It should not be relied on as permanent protection against thermal stress. Always operate the module within its temperature derated limits, for the worst-case operating conditions of output current, ambient temperature, and airflow. Operating the module above these limits, albeit below the thermal shutdown temperature, reduces the long-term reliability of the module.

Optional Input/Output Filters

Power modules include internal input and output ceramic capacitors in all of their designs. However, some applications require much lower levels of either input reflected or output ripple/noise. This application describes various filters and design techniques found to be successful in reducing both input and output ripple/noise.

Input/Output Capacitors

The easiest way to reduce output ripple and noise is to add one or more 1- μF ceramic capacitors, such as C5 shown in Figure 20. Ceramic capacitors should be placed close to the output power terminals. A single 4.7- μF capacitor reduces the output ripple/noise by 10% to 30% for modules with a rated output current of less than 3 A. (Note: C4 is required to improve the regulators transient response, and does not reduce output ripple and noise.)

Switching regulators draw current from the input line in pulses at their operating frequency. The amount of reflected (input) ripple/noise generated is directly proportional to the equivalent source impedance of the power source including the impedance of any input lines. The addition of C1, $\geq 4.7\text{-}\mu\text{F}$ ($2 \times 2.2 \mu\text{F}$) ceramic capacitor, near the input power pins, reduces reflected conducted ripple/noise by up to 20%.

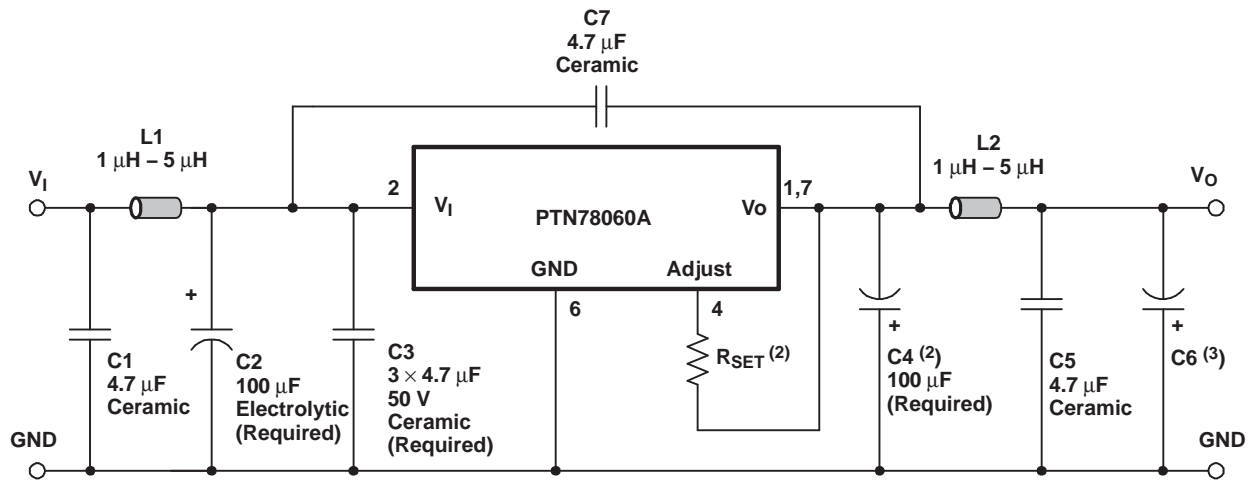

- (1) See the specifications for required value and type.
- (2) See the *Application Information* section for suggested value and type.

Figure 20. Adding High-Frequency Bypass Capacitors to the Input and Output

π Filters

If a further reduction in ripple/noise level is required for an application, higher order filters must be used. A π (pi) filter, employing a ferrite bead (Fair-Rite Pt. No. 2673000701 or equivalent) in series with the input or output terminals of the regulator reduces the ripple/noise by at least 20 db (see Figure 21 and Figure 22). In order for the inductor to be effective ceramic capacitors are also required. (See the Capacitor Recommendations for additional information on vendors and component suggestions.)

These inductors plus ceramic capacitors form an excellent filter because of the rejection at the switching frequency (650 kHz - 1 MHz). The placement of this filter is critical. It must be located as close as possible to the input or output pins to be effective. The ferrite bead is small (12,5 mm \times 3 mm), easy to use, low cost, and has low dc resistance. Fair-Rite also manufactures a surface-mount bead (part number 2773021447). It is rated to 5 A, and can be used on the output bus. As an alternative, suitably rated 1- μH to 5- μH wound inductors can be used in place of the ferrite inductor bead.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
