1 Features
- Predriver for Single-Phase Full-Wave Drive
  - PNP-NMOS is used as an external power TR, enabling high-efficiency low-consumption drive by means of the low-saturation output and single-phase full-wave drive. (PMOS-NMOS also applicable)
- External PWM Input Enables Variable-Speed Control
  - Separately-excited upper direct PWM (f = 25 kHz) control method, enabling highly silent speed control
- Current Limiter Circuit
  - Chopper-type current limit at start
- Reactive Current-Cut Circuit
  - Reactive current before phase change is cut to enable silent and low-consumption drive
- Minimum Speed Setting Pin
  - Minimum speed can be set with external resistor. The start assistance circuit enables start at extremely low speed.
- Constant-Voltage Output Pin for Hall Bias
- Lock Protection and Automatic Reset Functions
- Rotation Speed Detection (FG) and Lock Detection (RD) Outputs

2 Applications
- Server Fans
- Appliance Fans

3 Description
The TMP816 is a single-phase bipolar variable-speed fan-motor predriver that works with an external PWM signal. A highly efficient, quiet, and low-power consumption motor driver circuit with a large variable speed can be implemented by adding a small number of external components.

The TMP816 device is optimal for driving large-scale fan motors (with large air volume and large current) such as those used in servers and consumer products.

6.6 Typical Characteristics

![Figure 1. 6VREGOUT Load Regulation](image-url)
7 Detailed Description

7.1 Overview

The TMP816 device is a single phase bipolar predriver which uses the hall sensor & speed control inputs for driving the single phase motor connected through H Bridge. The predriver outputs are designed for driving top side P-type devices and bottom side N-channel FETs in the bridge. Multiple protections like overcurrent, soft-start, speed control, lock detect, speed feedback and minimum speed are incorporated in the device.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Speed Control

The speed control functionality is obtained by VTH pin of the device. For pulsed inputs user can supply a 20-kHz to 100-kHz frequency input (20 kHz to 50 kHz recommended on the pin with a current limiting resistor in between. If not used, this pin needs to be connected to ground for full speed.)
Feature Description (continued)

7.3.2 Soft-Start
Soft-Start Time can be adjusted using the S-S pin. Connect this capacitor between 6VREG and S-S Pin. Connected to GND if not used.

7.3.3 Lock Detection
When the rotor is locked by external means or load conditions, The Lock detection feature helps to protect the circuit by not allowing the current to rise beyond control. A hiccup mechanism is also provided. The Lock detection is enabled by a connection to the lock detection capacitor. The constant current charge and discharge circuits cause drive stop when the pin voltage rises to 3.8V and enabling it back when voltage reached to 1.8V.
If lock detection feature is not desired in the application, this pin needs to be connected to ground.

7.3.4 Current Limit
Current limit resistor is connected in a return path of H Bridge connection. This input is connected to the SENSE pin where the Current is limited when the voltage across this resistor crosses the voltage at VLIM Pin.
If not used, this pin needs to be connected to ground.

7.3.5 Speed Output
The speed of the motor while running can be observed at the FG pin which is an open collector output and needs to be pulled high for using it.

7.3.6 Drive Frequency Selection
The P-channel switches in the device are switched with higher frequency whose duty cycle is decided by the speed control input. The frequency of the operation can be decided by the capacitor connected at the CPWM pin.
Feature Description (continued)

A. Minimum speed setting (stop) mode
   PWM-IN input is filtered to generate the VTH voltage. At low speed, the fan rotates with the minimum speed set with
   RMI during low speed. If the minimum speed is not set (RMI = 6VREG), the fan stops.

B. Low ↔ high-speed mode
   PWM control is made through comparison of oscillation and VTH voltages with CPWM changing between 1.6 V ↔ 4.6
   V.
   Upper and lower TRs are turned ON when the VTH voltage is higher. The upper output TR is turned OFF when the
   VTH voltage is lower, and the coil current is regenerated in the lower TR. Therefore, as the VTH voltage lowers, the
   output ON duty increases, increasing the coil current and raising the motor speed. The rotation speed is fed back by
   the FG output.

C. Full speed mode
   The full-speed mode becomes effective with the VTH voltage of 1.65 V or less. (VTH must be equal to GND when the
   speed control is not used.)

D. PWM-IN input disconnection mode
   When the PWM-IN input pin is disconnected, VTH becomes 1.65 V or less and the output enables full drive at 100%.
   The fan runs at full speed (see Figure 5).

8 Applications and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information
The TMP816 device needs few external components for the features described in Feature Description. The device needs a 1-µF or more capacitor connected at VCC. The device generates 6-V regulated output, which can be used for pullups in the circuit as well as the Hall sensor.

8.2 Typical Application

Figure 5. 12-V Sample Application Circuit
Typical Application (continued)

8.2.1 Design Requirements
For this design example, use the following parameters:
• Input Voltage: 6 to 16 V
• VCC capacitor: 1 µF or more
• H Bridge Top side: P-channel FETs or PNP transistors
• Bottom side: N-channel FETs

8.2.2 Detailed Design Procedure
Pins:
• CPWM Capacitor: 100 pF for 25-kHz switching or appropriate.
• VTH Pin connected to Ground for full-speed or supplied with pulsed input.
• RMI Pin Pulled high to 6VREG output or external connection if required.
• ROFF pulled to 6VREG.
• 6VREG connected to Hall Sensor. Hall sensor differential inputs connected to IN+ and IN-.
• SENSE pin or GND.
• CT connected to Lock Detection capacitor (0.47 µF or calculated values) or to GND.
• Drive outputs connected to the Gates of the H bridge switches.
• Pullup on FG.

Power Supply:
• Make sure the power supply has set with sufficient current limit at the decided at the motor voltage.

Build the circuit with previously recommended connections at the pins.

Test the motor circuit with hardware connected to it.

8.2.3 Application Curves

![Figure 6. Start-up at 12 V](image1)

![Figure 7. Motor Outputs and Phase Current at 100% Duty Cycle](image2)
Typical Application (continued)

Figure 8. Lock Detection Waveform
9 Power Supply Recommendations

For testing purposes, a current limited source can be connected with voltage between 6-to 16-V on the printed-circuit-board. Use a 1-μF capacitor (minimum) to meet load transient requirements.

10 Layout

10.1 Layout Guidelines

Connect a minimum of 1-μF or greater capacitor close to power supply pins. Connect other capacitors and resistors according to the calculations (for example, pullup resistors should be connected at various pins, the capacitors should be connected at lock detect, and so forth.)

10.2 Layout Example

Figure 9. Recommended Layout
11 Device and Documentation Support

11.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer’s risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
