TPD6E001 Low-Capacitance 6-Channel ESD-Protection for High-Speed Data Interfaces

1 Features
- IEC 61000-4-2 Level 4 ESD Protection
  - ±8-kV IEC 61000-4-2 Contact Discharge
  - ±15-kV IEC 61000-4-2 Air-Gap Discharge
- I/O Capacitance: 1.5-pF (Typical)
- Low Leakage Current: 1-nA (Maximum)
- Low Supply Current: 1-nA (Typical)
- 0.9-V to 5.5-V Supply-Voltage Range
- Space-Saving RSE and RSF Package Options
- Alternate 2-, 3-, 4-Channel Options Available: TPD2E2U06, TPD3E001, and TPD4E1U06

2 Applications
- End Equipments
  - Portable Data Terminal
  - Industrial Monitor
  - IP Camera
  - Blood Glucose Meters
- Interfaces
  - SDIO
  - Precision Analog Interface
  - SVGA Connections
  - USB 2.0

3 Description
The TPD6E001 is a six-channel Transient Voltage Suppressor (TVS) based Electrostatic Discharge (ESD) protection diode array. The TPD6E001 is rated to dissipate ESD strikes at the maximum level specified in the IEC 61000-4-2 international standard (Level 4). This device has a 1.5-pF IO capacitance per channel, making it ideal for use in high-speed data IO interfaces. The ultra low leakage current (<1 nA max) is suitable for precision analog measurements in applications like glucose meters and heart rate monitors.

The TPD6E001 is available in space saving RSE (UQFN) and RSF (WQFN) packages and is specified for −40°C to 85°C operation. Also see TPD2E2U06, TPD3E001, and TPD4E1U06 which are 2, 3, and 4 channel ESD protection options, respectively, for ESD protection diode arrays with a different number of channels. The TPD2E2U06 provides a higher level of IEC ESD protection, when compared to the TPDxE001 family, and removes the need for an input capacitor. The TPD4E1U06 removes the need for an input capacitor, provides higher IEC ESD protection, and provides lower capacitance, when compared to the TPDxE001 family.

Figure 2. IO Leakage Current vs Temperature ($V_{CC} = 5.5 \text{ V}$)
7 Detailed Description

7.1 Overview
The TPD6E001 is a six-channel Transient Voltage Suppressor (TVS) based Electrostatic Discharge (ESD) protection diode array. The TPD6E001 is rated to dissipate ESD strikes at the maximum level specified in the IEC 61000-4-2 international standard (Level 4). This device has a 1.5-pF IO capacitance per channel, making it ideal for use in high-speed data IO interfaces. The ultra low leakage current (< 1 nA maximum) is suitable for precision analog measurements in applications like glucose meters and heart rate monitors.

7.2 Functional Block Diagram

7.3 Feature Description
TPD6E001 is a uni-directional ESD protection device with low capacitance. The device is constructed with a central ESD clamp that features two hiding diodes per line to reduce the capacitive loading. This central ESD clamp is also connected to $V_{CC}$ to provide protection for the $V_{CC}$ line. Each IO line is rated to dissipate ESD strikes at the maximum level specified in the IEC 61000-4-2 level 4 international standard. The TPD6E001's low loading capacitance makes it ideal for protection high-speed signal terminals.

7.4 Device Functional Modes
TPD6E001 is a passive-integrated circuit that activates whenever voltages above $V_{BR}$ or below the lower diodes $V_{forward}$ (~0.6V) are present upon the circuit being protected. During ESD events, voltages as high as ±15 kV can be directed to ground and $V_{CC}$ via the internal diode network. Once the voltages on the protected lines fall below the trigger voltage of the TPD6E001 (usually within 10's of nano-seconds) the device reverts back to a high-impedance state.
8 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

TPD6E001 is a diode array type Transient Voltage Suppressor (TVS) which is typically used to provide a path to ground for dissipating ESD events on hi-speed signal lines between a human interface connector and a system. As the current from ESD passes through the TVS, only a small voltage drop is present across the diode. This is the voltage presented to the protected IC. The low $R_{\text{DYN}}$ of the triggered TVS holds this voltage, $V_{\text{CLAMP}}$, to a tolerable level to the protected IC.

8.2 Typical Application

Figure 3. Typical Application Schematic

8.2.1 Design Requirements

For this design example, a single TPD6E001 is used to protect all the pins of three USB2.0 connectors. Given the USB application, the following parameters are known.

Table 1. Design Parameters

<table>

</tr>
<tr>
<td>Operating Frequency</td>
<td>240 MHz</td>
</tr>
</tbody>
</table>
8.2.2 Detailed Design Procedure

When placed near the USB connectors, the TPD6E001 ESD solution offers little or no signal distortion during normal operation due to low IO capacitance and ultra-low leakage current specifications. The TPD6E001 ensures that the core circuitry is protected and the system is functioning properly in the event of an ESD strike. For proper operation, the following layout/design guidelines should be followed:

1. Place the TPD6E001 solution close to the connectors. This allows the TPD6E001 to take away the energy associated with ESD strike before it reaches the internal circuitry of the system board.
2. Place a 0.1-μF capacitor very close to the V\textsubscript{CC} pin. This limits any momentary voltage surge at the IO pin during the ESD strike event.
3. Ensure that there is enough metallization for the V\textsubscript{CC} and GND loop. During normal operation, the TPD6E001 consumes 1 nA (max) leakage current. But during the ESD event, V\textsubscript{CC} and GND may see 15 A to 30 A of current, depending on the ESD level. Sufficient current path enables safe discharge of all the energy associated with the ESD strike.
4. Leave the unused IO pins floating. In this example of protecting three USB ports, none of the IO pins will be left unused.
5. The V\textsubscript{CC} pin can be connected in two different ways:
   (a) If the V\textsubscript{CC} pin is connected to the system power supply, the TPD6E001 works as a transient suppressor for any signal swing above V\textsubscript{CC} + V\textsubscript{F}. A 0.1-μF capacitor on the device V\textsubscript{CC} pin is recommended for ESD bypass.
   (b) If the V\textsubscript{CC} pin is not connected to the system power supply, the TPD6E001 can tolerate higher signal swing in the range up to 10 V. Please note that a 0.1-μF capacitor is still recommended at the V\textsubscript{CC} pin for ESD bypass.

8.2.3 Application Curve

Figure 4 is a capture of the voltage clamping waveform of TPD6E001 on IO1 during a +8kV Contact IEC61000-4-2 ESD strike.

![Figure 4. TPD6E001 +8kV Contact IEC61000-4-2 Voltage Clamping Waveform](image-url)
9 Power Supply Recommendations

TPD6E001 is a passive TVS diode, so there is no requirement to power this device. However, for best IEC 61000-4-2 ESD performance and lowest capacitance performance, it is recommended that the \( V_{CC} \) pin is biased with a 5V supply and that a 0.1\( \mu \)F capacitor is placed near the \( V_{CC} \) pin. Take care to make sure that the maximum voltage specification for the \( V_{CC} \) pin is not violated.

10 Layout

10.1 Layout Guidelines

- The optimum placement is as close to the connector as possible.
  - EMI during an ESD event can couple from the trace being struck to other nearby unprotected traces, resulting in early system failures.
  - The PCB designer needs to minimize the possibility of EMI coupling by keeping any unprotected traces away from the protected traces which are between the TVS and the connector.
- Route the protected traces as straight as possible.
- Eliminate any sharp corners on the protected traces between the TVS and the connector by using rounded corners with the largest radii possible.
  - Electric fields tend to build up on corners, increasing EMI coupling.

10.2 Layout Example

Figure 5 is an example of how to layout three differential data pairs with the TPD6E001. One example could be protecting three USB2.0 ports from IEC ESD, as discussed in the Application and Implementation section.

</table>

(1) The marketing status values are defined as follows:
- **ACTIVE**: Product device recommended for new designs.
- **LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
- **PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.
- **OBSOLETE**: TI has discontinued the production of the device.

(2) **RoHS**: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
- **RoHS Exempt**: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
- **Green**: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) **Lead/Ball Finish**: Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
## TAPE AND REEL INFORMATION

### TAPE DIMENSIONS

- **A0**: Dimension designed to accommodate the component width
- **B0**: Dimension designed to accommodate the component length
- **K0**: Dimension designed to accommodate the component thickness
- **W**: Overall width of the carrier tape
- **P1**: Pitch between successive cavity centers

### REEL DIMENSIONS

- **Reel Diameter**: Diameter of the reel
- **Reel Width (W1)**: Width of the reel

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

- **Pocket Quadrants**: Quadrants for component orientation
- **Sprocket Holes**: Holes for tape transport

B. This drawing is subject to change without notice.
C. QFN (Quad Flatpack No-Lead) package configuration.

⚠️ The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.

⚠️ Pin 1 identifiers are located on both top and bottom of the package and within the zone indicated. The Pin 1 identifiers are either a molded, marked, or metal feature.
F. Complies to JEDEC MO-220 variation WQGB.
THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

RSF (R--PWQFN--N12) PLASTIC QUAD FLATPACK NO-LEAD

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.
