TPS3808-EP Low Quiescent Current, Programmable Delay Supervisory Circuit

1 Features
• Controlled Baseline
  – One Assembly Site
  – One Test Site
  – One Fabrication Site
• Extended Temperature Performance of 
  –55°C to 125°C
• Enhanced Diminishing Manufacturing Sources
  (DMS) Support
• Enhanced Product-Change Notification
• Qualification Pedigree (1)
• Power-On Reset Generator With Adjustable Delay
  Time: 1.25 ms to 10 s
• Very Low Quiescent Current: 2.4 μA Typical
• High Threshold Accuracy: 0.5% Typical
• Fixed Threshold Voltages for Standard Voltage
  Rails From 0.9 V to 5 V and Adjustable Voltage
  Down to 0.4 V Are Available
• Manual Reset (MR) Input
• Open-Drain RESET Output
• Temperature Range: –55°C to 125°C
• Small SOT-23 Package

2 Applications
• DSP or Microcontroller Applications
• Notebook/Desktop Computers
• PDAs and Hand-Held Products
• Portable and Battery Powered Products
• FPGA and ASIC Applications

3 Description
The TPS3808xxx family of microprocessor supervisory circuits monitors system voltages from 0.4 V to 5.0 V, asserting an open-drain RESET signal when the SENSE voltage drops below a preset threshold or when the manual reset (MR) pin drops to a logic low. The RESET output remains low for the user-adjustable delay time after the SENSE voltage and manual reset (MR) return above the respective thresholds.

The TPS3808 uses a precision reference to achieve 0.5% threshold accuracy for \( V_{IT} \leq 3.3 \) V. The reset delay time can be set to 20 ms by disconnecting the \( C_T \) pin, 300 ms by connecting the \( C_T \) pin to \( V_{DD} \) using a resistor, or can be user-adjusted between 1.25 ms and 10 s by connecting the \( C_T \) pin to an external capacitor. The TPS3808 has a very low typical quiescent current of 2.4 μA, so it is well-suited to battery-powered applications. It is available in a small SOT-23 package, and is fully specified over a temperature range of –55°C to +125°C (\( T_J \)).

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) As a result of the low dissipated power in this device, it is assumed that \( T_J = T_A \).

Typical Characteristics (continued)

At $T_J = +25^\circ$C, $V_{DD} = 3.3\,\text{V}$, $R_{\text{RESET}} = 100\,\text{k}\Omega$, and $C_{\text{RESET}} = 50\,\text{pF}$, unless otherwise noted.

![Graph showing Low-Level RESET Voltage vs RESET Current](image)

Figure 8. Low-Level RESET Voltage vs RESET Current
7 Detailed Description

7.1 Overview
The TPS3808 microprocessor supervisory product family is designed to assert a \textit{RESET} signal when either the SENSE pin voltage drops below $V_{IT}$ or the manual reset (MR) is driven low. The \textit{RESET} output remains asserted for a user-adjustable time after both the manual reset (MR) and SENSE voltages return above the respective thresholds.

7.2 Functional Block Diagrams

7.3 Feature Description
A broad range of voltage threshold and reset delay time adjustments are available for the TPS3808 device, allowing these devices to be used in a wide array of applications. Reset threshold voltages can be factory-set from 0.82 V to 3.3 V or from 4.4 V to 5.0 V, while the TPS3808G01 can be set to any voltage above 0.405 V using an external resistor divider. Two preset delay times are also user-selectable: connecting the $C_T$ pin to $V_{DD}$ results in a 300 ms reset delay, while leaving the $C_T$ pin open yields a 20-ms reset delay. In addition, connecting a capacitor between $C_T$ and GND allows the designer to select any reset delay period from 1.25 ms to 10 s.

7.4 Device Functional Modes
The TPS3808 has two functional modes:
- \textbf{MR high:} in this mode, \textit{RESET} is high or low depending on the value of the SENSE pin relative to $V_{IT}$.
- \textbf{MR low:} in this mode, \textit{RESET} is held low regardless of the value of the SENSE pin.
8 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information
The following sections describe in detail how to properly use this device depending on the requirements of the final application.

8.1.1 SENSE Input
The SENSE input provides a terminal at which any system voltage can be monitored. If the voltage on this pin drops below \( V_{IT} \), then RESET is asserted. The comparator has a built-in hysteresis to ensure smooth RESET assertions and de-assertions. It is good analog design practice to put a 1-nF to 10-nF bypass capacitor on the SENSE input to reduce sensitivity to transients and layout parasitics.

The TPS3808 device is relatively immune to short negative transients on the SENSE pin. Sensitivity to transients is dependent on threshold overdrive, as shown in the Maximum Transient Duration at Sense vs Sense Threshold Overdrive Voltage graph (Figure 5) in Typical Characteristics.

The TPS3808G01 can be used to monitor any voltage rail down to 0.405 V using the circuit shown in Figure 9.

![Figure 9. Using the TPS3808G01 to Monitor a User-Defined Threshold Voltage](image)

8.1.2 Selecting the RESET Delay Time
The TPS3808 has three options for setting the RESET delay time as shown in Figure 10. Figure 10a shows the configuration for a fixed 300-ms typical delay time by tying \( C_T \) to \( V_{DD} \); a resistor from 40 kΩ to 200 kΩ must be used. Supply current is not affected by the choice of resistor. Figure 10b shows a fixed 20-ms delay time by leaving the \( C_T \) pin open. Figure 10c shows a ground referenced capacitor connected to \( C_T \) for a user-defined program time between 1.25 ms and 10 s.
Application Information (continued)

The capacitor $C_T$ should be $\geq 100$ pF nominal value in order for the TPS3808xxx to recognize that the capacitor is present. The capacitor value for a given delay time can be calculated using Equation 1.

$$C_T \text{(nF)} = \left[ t_0 \text{(s)} - 0.5 \times 10^{-3} \text{(s)} \right] \times 175$$

(1)

The reset delay time is determined by the time it takes an on-chip precision 220-nA current source to charge the external capacitor to 1.23 V. When a RESET is asserted the capacitor is discharged. When the RESET conditions are cleared, the internal current source is enabled and begins to charge the external capacitor. When the voltage on this capacitor reaches 1.23 V, RESET is deasserted. Note that a low-leakage type capacitor such as a ceramic should be used, and that stray capacitance around this pin may cause errors in the reset delay time.

8.1.3 Manual RESET (MR) Input

The manual reset (MR) input allows a processor or other logic circuits to initiate a reset. A logic low (0.3 V $V_{DD}$) on MR causes RESET to assert. After MR returns to a logic high and SENSE is above its reset threshold, RESET is de-asserted after the user defined reset delay expires. Note that MR is internally tied to $V_{DD}$ using a 90-k$\Omega$ resistor so this pin can be left unconnected if MR will not be used.

See Figure 11 for how MR can be used to monitor multiple system voltages. Note that if the logic signal driving MR does not go fully to $V_{DD}$, there will be some additional current draw into $V_{DD}$ as a result of the internal pullup resistor on MR. To minimize current draw, a logic-level FET can be used as illustrated in Figure 12.

Figure 10. Configuration Used to Set the RESET Delay Time

Figure 11. Using MR to Monitor Multiple System Voltages
8.1.4 RESET Output

RESET remains high (unasserted) as long as SENSE is above its threshold ($V_{IT}$) and the manual reset (MR) is logic high. If either SENSE falls below $V_{IT}$ or MR is driven low, RESET is asserted, driving the RESET pin to a low impedance.

Once MR is again logic high and SENSE is above $V_{IT} + V_{HYS}$ (the threshold hysteresis), a delay circuit is enabled which holds RESET low for a specified reset delay period. Once the reset delay has expired, the RESET pin goes to a high impedance state. The pullup resistor from the open-drain RESET to the supply line can be used to allow the reset signal for the microprocessor to have a voltage higher than $V_{DD}$ (up to 6.5 V). The pullup resistor should be no smaller than 10 kΩ as a result of the finite impedance of the RESET line.
8.2 Typical Application

A typical application of the TPS3808G33 used with a 3.3 V processor is shown in Figure 13. The open-drain RESET output is typically connected to the RESET input of a microprocessor. A pullup resistor must be used to hold this line high when RESET is not asserted. The RESET output is undefined for voltage below 0.8 V, but this is normally not a problem since most microprocessors do not function below this voltage.

![Diagram of TPS3808G33 with 3.3 V Processor](image)

Figure 13. Typical Application of the TPS3808 with a 3.3 V Processor

8.2.1 Design Requirements

The TPS3808 is intended to drive the RESET input of a microprocessor. The RESET pin is pulled high with a 1 MΩ resistor and the reset delay time is controlled by C_T depending on the reset requirement times of the microprocessor. In this case, C_T is left open for a typical reset delay time of 20 ms.

8.2.2 Detailed Design Procedure

The main constraint for this application is the reset delay time. In this case, since C_T is open, it is set to 20 ms. A 0.1 µF decoupling capacitor is connected to the V_DD pin and a 1 MΩ resistor is used to pull-up the RESET pin high. The MR pin can be connected to an external signal if desired.
Typical Application (continued)

8.2.3 Application Curve

Figure 14. Maximum Transient Duration at Sense vs Sense Threshold Overdrive Voltage
9 Power Supply Recommendations

These devices are designed to operate from an input supply with a voltage range between 1.7 and 6.5 V. Use a low-impedance power supply to eliminate inaccuracies caused by the current during the voltage reference refresh.

10 Layout

10.1 Layout Guidelines

Make sure the connection to the V_{DD} pin is low impedance. Place a 0.1-µF ceramic capacitor near the V_{DD} pin.

10.2 Layout Example

The layout example in Figure 15 shows how the TPS3808 is laid out on a PCB for a 20 ms delay.

![Layout Example for a 20 ms Delay](image-url)
11 Device and Documentation Support

11.1 Trademarks
All trademarks are the property of their respective owners.

11.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.3 Glossary

SLYZ022 — Ti Glossary.
This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. (1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check [http://www.ti.com/productcontent](http://www.ti.com/productcontent) for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
## TAPE AND REEL INFORMATION

### TAPE DIMENSIONS

- **A0**: Dimension designed to accommodate the component width
- **B0**: Dimension designed to accommodate the component length
- **K0**: Dimension designed to accommodate the component thickness
- **W**: Overall width of the carrier tape
- **P1**: Pitch between successive cavity centers

### REEL DIMENSIONS

- **Reel Diameter**: 179.0 mm
- **Reel Width (W1)**: 8.4 mm

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

- **User Direction of Feed**

*All dimensions are nominal*
NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
4. Leads 1,2,3 may be wider than leads 4,5,6 for package orientation.
5. Refernce JEDEC MO-178.
NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

9. Board assembly site may have different recommendations for stencil design.
