1 Features

- 60-nA operating quiescent current
- 100% duty-cycle mode with 120-nA $I_Q$
- Input voltage range $V_{IN}$ from 1.8 V to 6.5 V
- Output current up to 750 mA
- RF friendly DCS-Control™
- 80% efficiency at 1 µA $I_{OUT}$ (3.6 $V_{IN}$ to 1.8 $V_{OUT}$)
- 16 selectable output voltages via VSET pin
- Auto transition PFM/PWM or forced-PWM mode
- Selectable forced PWM and STOP modes
- Output discharge function
- 25-nA shutdown current
- SON-8, WCSP-6 and thermally enhanced HVSSOP-8 packages

2 Applications

- Smart meters, smart thermostats
- Asset tracking devices
- Wearable electronics
- Medical sensor patches and patient monitors
- Industrial IoT (smart sensors) / NB-IoT
- Test and measurement
- ATEX / Intrinsic safety

3 Description

The TPS62840 is a high efficiency step-down converter with ultra-low operating quiescent current of typically 60 nA. The device contains special circuitry to achieve just 120 nA $I_Q$ in 100% mode to further extend battery life near the end of discharge.

The device uses DCS-Control to cleanly power radios and operates with a typical switching frequency of 1.8 MHz. In Power-Save Mode the device extends the light load efficiency down to a load current range of 1-µA and below.

16 predefined output voltages can be selected by connecting a resistor to pin VSET, making the device flexible for various applications with a minimum amount of external components.

The device’s STOP pin immediately eliminates any switching noise in order to take a noise-free measurement in test & measurement systems.

The TPS6284x provides an output current of up to 750 mA. With an input voltage of 1.8 V to 6.5 V, the device supports multiple power sources such as 2S to 4S Alkaline, 1S to 2S Li-MnO$_2$ or 1S Li-Ion/Li-SOCl$_2$.

4 Revision History
NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (August 2019) to Revision C

• Added SON-8, WCSP-6, and thermally enhanced HVSSOP-8 to Features ................................................................. 1
• Added ATEX / Intrinsic safety to Applications .................................................................................................................... 1
• Updated Typical Application image to show TPS62842DGR device ........................................................................... 1
• Added orderable part number TPS62841DGR to Device Comparison Table ................................................................. 3
• Added orderable part number TPS62842DGR to Device Comparison Table ................................................................. 3
• Updated Thermal Information values to support TPS62842DGR ................................................................. 6
• Added low-side MOSFET switch current limit to Electrical Characteristics ............................................................ 8
• Added TPS62841DGR to Output Voltage Selection ......................................................................................................... 13
• Updated Efficiency Power Save graphs in Application Curves ........................................................................................ 20
• Updated Load Transient waveform in Application Curves ........................................................................................ 23
• Added PCB layout for DGR package ................................................. 28

Changes from Revision A (July 2019) to Revision B

• Changed Advance Information marketing status to Production Data ................................................................. 1

</tbody>
</table>

<sup>(1)</sup> Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

<sup>(2)</sup> All voltage values are with respect to network ground terminal GND.

<sup>(3)</sup> While switching.
7.2 ESD Ratings

<table>
<thead>
<tr>
<th>V(ESD)</th>
<th>Electrostatic discharge</th>
<th>VALUE</th>
<th>UNIT</th>
</tr>

<tr>
<td>CDM</td>
<td>Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(^{(2)})</td>
<td>±500</td>
<td>V</td>
</tr>
</tbody>
</table>

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. The human body model is a 100-pF capacitor discharged through a 1.5-kΩ resistor into each pin.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8 Detailed Description

8.1 Overview

The TPS6284x is a synchronous step-down converter with ultra-low quiescent current consumption. Using TI's DCS-Control™ topology the device extends the high efficiency operation area down to micro amperes of load current during Power-Save Mode Operation. Depending on the output voltage, the device consumes quiescent current from both the input and output to reduce the overall input current consumption to 60 nA typical.

DCS-Control™ (Direct Control with Seamless Transition into Power-Save Mode) is an advanced regulation topology, which combines the advantages of hysteretic and voltage mode controls. Characteristics of DCS-Control™ are excellent AC load regulation and transient response, low output ripple voltage and a seamless transition between PFM and PWM modes. It includes a AC loop which senses the output voltage (VOS pin) and directly feeds this information into a fast comparator stage.

The device operates with a nominal switching frequency of 1.8MHz. An additional voltage feedback loop is used to achieve accurate DC load regulation. The internally compensated regulation network achieves fast and stable operation with small external components and low ESR capacitors.

In Power-Save Mode, the switching frequency varies linearly with the load current. Since DCS-Control™ supports both operating modes, the transition from PWM to PFM is seamless with minimum output voltage ripple. The TPS6284x offers both, excellent DC voltage and superior load transient regulation, combined with low output voltage ripple thereby minimizing interferences with Radio Frequency circuits.

8.2 Functional Block Diagram
8.3 Feature Description

8.3.1 Smart Enable and Shutdown

To avoid a floating input an internal 450kΩ resistor pulls the EN pin to GND. This prevents an uncontrolled start-up of the device in case the EN pin can not be driven low safely. The device is in shutdown mode when the EN input is logic low.

The device turns on with a logic high EN signal. An internal control circuit disconnects the EN pin pull-down resistor once the device has finished soft-start and the output voltage is in regulation. With the EN pin set low, the device enters shutdown mode and the pull-down resistor is activated again.

8.3.2 Soft-start

In order to protect the battery and system from excessive inrush current, the device features a soft-start of the output voltage.

Once the device has been enabled, it initializes and powers up its internal circuits. This occurs during the regulator startup delay time ($t_{\text{STARTUP_DELAY}}$). Once this delay expires, the device enters soft-start, starts switching and ramps up the output voltage.

The device operates with a reduced switch current limit ($I_{\text{LIMF_SS}}$) throughout the entire soft-start phase ($t_{\text{SS}}$). The switch current limit is increased to its nominal value ($I_{\text{LIMF}}$) once the output voltage has reached its nominal value or the reduced current limit soft-start time ($t_{\text{SS_ILIMF}}$) has expired, whichever occurs first. The soft-start phase ($t_{\text{SS}}$) can last up to approx. 700µs. Figure 12 shows the startup procedure.

8.3.3 Mode Selection: Power-Save Mode (PFM/PWM) or Forced PWM Operation (FPWM)

Connecting the MODE input to GND enables the automatic PWM and power-save mode operation. The converter operates in PWM mode at moderate to heavy loads and in the PFM mode during light loads, which maintains high efficiency over a wide load current range.

Pulling the MODE pin high forces the converter to operate in PWM mode even at light load currents. That allows lower ripple compared to PFM mode switching. In this mode, the efficiency is lower compared to the power-save mode during light loads. For additional flexibility, it is possible to switch from power-save mode to forced PWM mode during operation. This allows efficient power management by adjusting the operation of the converter to the specific system requirements. The MODE pin must be terminated.

This pin is not available in the YBG package, where the device automatically transitions between power-save and PWM modes.

8.3.4 Output Voltage Selection (VSET)

The output voltage is set with a single external resistor connected between the VSET pin and GND. Once the device has been enabled and the control logic as well as the reference system are powered-up, an R2D (resistor to digital) conversion is started to detect the value of the external $R_{\text{SET}}$ resistor. A pre-defined fixed output voltage is set based on the $R_{\text{SET}}$ value. The output voltage is set once during the device’s startup delay phase.
Feature Description (continued)

Once the output voltage is set, the R2D converter is turned off to avoid current flowing through $R_{SET}$. Care must be taken that no parasitic current and/or capacitance greater than 100pF is present between the VSET and GND pins. This could cause false $R_{SET}$ readings and a faulty output voltage to be set. The R2D converter is designed to operate with resistor values out of E96 series. Table 1 shows the allowed $R_{SET}$ values.

The TPS62849’s output voltage is internally set to 3.4V. Connect VSET directly to GND for this device.

### 8.3.5 Undervoltage Lockout UVLO

To avoid mis-operation of the device at low input voltages, an undervoltage lockout (UVLO) comparator monitors the supply voltage. The UVLO comparator shuts down the device at an input below the threshold $V_{TH_UVLO-}$ with falling $V_{IN}$. The device starts at an input voltage higher than the threshold $V_{TH_UVLO+}$ with rising $V_{IN}$.

When the device resumes operation from an under voltage lockout condition, it behaves like being enabled. This means the internal control logic is powered up, the external $R_{SET}$ resistor is read out and a soft-start sequence is initiated.
8.3.6 Switch Current Limit / Short Circuit Protection

The TPS6284x integrates a current limit on the high-side as well as on the low-side MOSFETs to protect the device against overload or short circuit conditions. The current in the switches is monitored cycle-by-cycle. If the high-side MOSFET current limit \( I_{LIMF} \) trips, the high-side MOSFET is turned off and the low-side MOSFET is turned on to ramp the inductor current down. Once the inductor current decreases below the low-side current limit \( I_{LIMF} \), the low-side MOSFET turns off and the high-side MOSFET turns on again.

During soft-start, the current limit is reduced to \( I_{LIMF,SS} \). After soft-start has finished, the current limit value increases to the normal value \( I_{LIMF} \).

Due to internal propagation delay, the actual inductor current can exceed the static current limit during that time. The dynamic current limit can be calculated as follows:

\[
I_{peak,typ} = I_{LIMF} + \frac{V_L}{L} \cdot t_{LIM,DELAY}
\]

where
- \( I_{LIMF} \) is the static current limit, specified in Electrical Characteristics,
- \( L \) is the inductance,
- \( V_L \) is the voltage across the inductor \( (V_{IN} - V_{OUT}) \) and
- \( t_{LIM,DELAY} \) is the internal propagation delay.

In forced PWM mode, a negative current limit \( I_{LIMN} \) is enabled in order to prevent excessive current flowing backwards to the input. When the inductor current reaches \( I_{LIMN} \), the low-side MOSFET turns off and the high-side MOSFET turns on and kept on until TON time expires.

8.3.7 Output Voltage Discharge

The purpose of the output discharge function is to ensure a defined ramp-down of the output voltage when the device is disabled.

The internal discharge resistor is connected to the VOS pin. The discharge function is enabled as soon as the device is disabled or if UVLO is entered. It is not active during Thermal Shutdown. The discharge circuit remains active as long as the input voltage is above 0.7 V.

8.3.8 Thermal Shutdown

The junction temperature \( T_J \) of the device is monitored by an internal temperature sensor. The device enters thermal shutdown when the junction temperature exceeds the thermal shutdown threshold \( T_{SD} \) of 160°C (typ.). Both the high-side and low-side MOSFETs are turned off. The device resumes its operation when the junction temperature falls below typically 155°C again and begins with a soft-start cycle without reading \( R_{SET} \) again. In Power-Save Mode, the thermal shutdown feature is disabled.

8.3.9 STOP Mode

The TPS6284x includes the STOP input pin, allowing the user to temporarily stop the regulator’s switching. The STOP pin function does not depend on the setting of the MODE pin. The STOP pin is only present on the DLC package.

When a logic high level is applied to the STOP pin, the regulator is forced to stop switching after the current switching cycle. The application is powered by the charge available in the output capacitor. No switching noise is generated which could be beneficial in noise-sensitive sampled applications.

An MCU controlling this pin needs to take care to turn the device back on before the output voltage reaches a system critical level. Should this not happen, the output voltage will be clamped to about 0.5V below the set output voltage. In STOP mode, the device consumes typically 70µA operating quiescent current from the input supply.

When a logic low level is applied to the STOP pin, the regulator immediately resumes switching operation without a startup delay or soft start. To avoid a floating input, an internal 450kΩ resistor pulls the STOP pin to GND. A control circuit disconnects the pull-down resistor at the STOP pin once a high level has been detected (similarly to the EN pin).
8.4 Device Functional Modes

8.4.1 Power-Save Mode Operation

The DCS-Control™ topology supports Power-Save Mode operation. At light loads the device operates in PFM (Pulse Frequency Modulation) mode that generates a single switching pulse to ramp up the inductor current and recharge the output capacitor, followed by a sleep period where most of the internal circuits are shutdown to achieve lowest operating quiescent current. During this time, the load current is supported by the output capacitor. The duration of the sleep period depends on the load current and the inductor peak current. During the sleep periods, the current consumption is reduced to typically 60nA. This low quiescent current consumption is achieved by an ultra-low power reference, an integrated high-impedance feedback divider network and an optimized Power-Save Mode operation. To achieve a stable switching frequency in steady state operation, the on-time is calculated as in Equation 2.

\[ T_{\text{ON}} = \frac{V_{\text{OUT}}}{V_{\text{IN}}} \cdot 556\text{ns} \]

Equation 2

In PFM Mode, the switching frequency varies linearly with the load current and is calculated in Equation 3. At medium and high load conditions, the device enters automatically PWM (Pulse Width Modulation) mode and operates in continuous conduction mode with a nominal switching frequency \( f_{\text{sw}} \). The switching frequency in PWM mode is controlled and depends on \( V_{\text{IN}} \) and \( V_{\text{OUT}} \). The boundary between PWM and PFM mode is when the inductor current becomes discontinuous.

\[ f_{\text{PFM}} = \frac{2 \cdot I_{\text{OUT}}}{T_{\text{ON}}^2 \cdot \frac{V_{\text{IN}}}{V_{\text{OUT}}} \left( \frac{V_{\text{IN}}}{L} - \frac{V_{\text{OUT}}}{L} \right)} \]

Equation 3

If the load current decreases, the converter seamlessly enters PFM mode to maintain high efficiency down to ultra-light loads. Since DCS-Control™ supports both operation modes within one single building block, the transition from PWM to PFM modes is seamless with minimum output voltage ripple.

8.4.2 Forced PWM Mode Operation

With a high level on the MODE input, the device enters forced PWM Mode and operates with a high switching frequency over the entire load range, even at very light loads. This reduces or eliminates interference with RF and noise-sensitive circuits, but reduces efficiency at light loads. The MODE pin can be changed during operation and must be terminated.

8.4.3 100% Mode Operation

In PWM mode, the duty-cycle of a buck converter is given as \( D = \frac{V_{\text{OUT}}}{V_{\text{IN}}} \). The duty-cycle increases as the input voltage comes closer to the output voltage. Once the input voltage decreases near 100% duty cycle, the output voltage set point is increased by +30mV. As the input voltage decreases further, the device enters 100% duty-cycle mode and keeps the high-side MOSFET on continuously. The output \( (V_{\text{OUT}}) \) is connected to the input \( (V_{\text{IN}}) \) via the inductor and the internal high-side MOSFET. The minimum input voltage to maintain a given output voltage depends on the load current and is calculated as:

\[ V_{\text{IN, min}} = V_{\text{OUT}} + I_{\text{OUT}} \times (R_{\text{DS(on)}})_{\text{max}} + R_{L} \]

where

- \( I_{\text{OUT}} \) = output current
- \( (R_{\text{DS(on)}})_{\text{max}} \) = Maximum P-channel switch \( R_{\text{DS(on)}} \)
- \( R_{L} \) = DC resistance of the inductor

The TPS6284x contains special circuitry to keep an ultra-low \( I_{Q} \) of 120nA during 100% mode operation.
9 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information
The following section discusses the design of the external components to complete the power supply design for several input and output voltage options by using typical applications as a reference.

9.2 Typical Application

(1) Inductor tolerance and current de-rating is anticipated. The effective inductance can vary by 20% and -20%.
(2) Capacitance tolerance and bias voltage de-rating is anticipated. The effective capacitance varies by +20% and –50%.
(3) Typical application configuration. Other check marks indicate alternative filter combinations.

9.2.2.1 Inductor Selection

The inductor value affects the peak-to-peak ripple current, the PWM-to-PFM transition point, the output voltage ripple and the efficiency. The selected inductor has to be rated for its DC resistance and saturation current. The inductor ripple current ($\Delta I_L$) decreases with higher inductance and increases with higher $V_{IN}$ or $V_{OUT}$ and can be estimated according to Equation 4.

Equation 5 calculates the maximum inductor current under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current, as calculated with Equation 5. This is recommended because during a heavy load transient the inductor current rises above the calculated value. A more conservative way is to select the inductor saturation current according to the high-side MOSFET switch current limit, $I_{LIMF}$.

\[
\begin{align*}
\Delta I_L &= V_{out} \times \frac{1 - \frac{V_{out}}{V_{IN}}}{L \times f} \\
I_{max} &= I_{out max} + \frac{\Delta I_L}{2}
\end{align*}
\]

where
- $f$ = Switching Frequency
- $L$ = Inductance
- $\Delta I_L$ = Peak to Peak inductor ripple current
- $I_{max} =$ Maximum Inductor current

The table below shows a list of possible inductors.
9.2.2.2 Output Capacitor Selection
The DCS-Control™ scheme of the TPS62840 allows the use of tiny ceramic capacitors. Ceramic capacitors with low-ESR values have the lowest output voltage ripple and are recommended. The output capacitor requires either an X7R or X5R dielectric.

At light load currents, the converter operates in Power-Save Mode and the output voltage ripple is dependent on the output capacitor value. Larger output capacitors reduce the output voltage ripple. The leakage current of the output capacitor adds to the overall quiescent current.

9.2.2.3 Input Capacitor Selection
Because the buck converter has a pulsating input current, a low-ESR input capacitor is required for best input voltage filtering to minimize input voltage spikes. For most applications a 4.7-µF input capacitor is sufficient.

When operating from a high impedance source, a larger input buffer capacitor is recommended to avoid voltage drops during start-up and load transients.

The input capacitor can be increased without any limit for better input voltage filtering. The leakage current of the input capacitor adds to the overall quiescent current. Table 6 shows a selection of input and output capacitors.

#### Vᵢᵣ Sources
- 2 x Li-MnO₂ (6 V)
- 4 x 1.6 V Alkaline (6.4 V)
- 1 x Li-SOCL₂ (3.6 V)
- 1 x LiMnO₂ (3 V)
- 1 x Li-Ion (4.2 V)
- USB (5 V)

#### Main Rail

TPS6284x
60nA Iᵣ Buck Converter

#### LDOs

#### Load Switches

#### Ultra-Low Power Loads
- MCU
- SOC
- Few µA

#### High Power Loads
- WiFi
- WMBus
- LPWAN/NB-IoT
- Motors
- OHRM TX
- Several 100mA

#### Medium Power Loads
- Audio Amplifier
- Audio Codec
- Bluetooth Radio
- GPS
- Few 10mA

Figure 58. The Broad Range of Input Voltage Sources and Various Power Loads that TPS6284x Can Support
10 Power Supply Recommendations
The power supply must provide a current rating according to the supply voltage, output voltage and output current of the TPS62840.

11 Layout

11.1 Layout Guidelines
The TPS62840 pinout has been optimized to enable a single layer PCB routing of the device and its critical passive components such as $C_{IN}$, $C_{OUT}$ and $L$.

- As for all switching power supplies, the layout is an important step in the design. Care must be taken in board layout to get the specified performance.
- It is critical to provide a low inductance, low impedance ground path. Therefore, use wide and short traces for the main current paths.
- The input capacitor should be placed as close as possible to the device's VIN and GND pins. This is the most critical component placement.
- The VOS line is a sensitive, high impedance line and should be connected to the output capacitor and routed away from noisy components and traces (e.g. SW line) or other noise sources.

12 Device and Documentation Support

12.1 Device Support

12.1.1 Third-Party Products Disclaimer
TI's publication of information regarding third-party products or services does not constitute an endorsement regarding the suitability of such products or services or a warranty, representation or endorsement of such products or services, either alone or in combination with any TI product or service.

12.2 Support Resources
TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

12.3 Trademarks
DCS-Control, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution
These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.5 Glossary
SLYZ022 — TI Glossary.
This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information
The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

</table>

(1) The marketing status values are defined as follows:
- **ACTIVE**: Product device recommended for new designs.
- **LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
- **PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.
- **OBSOLETE**: TI has discontinued the production of the device.

(2) **RoHS**: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
- **RoHS Exempt**: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
- **Green**: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.**: The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI’s knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. See Texas Instruments Literature No. SNVA009 (www.ti.com/lit/snva009).
4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.
