50-mA, 24-V, 3.2-µA SUPPLY CURRENT, LOW-DROPOUT LINEAR REGULATOR

FEATURES

- Controlled Baseline
  - One Assembly Site
  - One Test Site
  - One Fabrication Site
- Extended Temperature Performance of –55°C to 125°C
- Enhanced Diminishing Manufacturing Sources (DMS) Support
- Enhanced Product-Change Notification
- Qualification Pedigree(1)
- 24-V Maximum Input Voltage
- Low 3.2-µA Quiescent Current at 50 mA
- Stable With Any Capacitor (≥ 0.47 µF)
- 50-mA Low-Dropout Regulator
- Adjustable Output Voltage (1.2 V to 15 V)
- Designed to Support MSP430 Families:
  - 1.9-V Version Ensured to be Higher Than Minimum \( V_{\text{IN}} \) of 1.8 V
  - 2.3-V Version Ensured to Meet 2.2-V Minimum \( V_{\text{IN}} \) for Flash on MSP430F2xx
  - 3.45-V Version Ensured to be Lower Than Maximum \( V_{\text{IN}} \) of 3.6 V
  - Wide Variety of Fixed Output Voltage Options to Match \( V_{\text{IN}} \) to the Minimum Required for Desired MSP430 Speeds

(1) Component qualification in accordance with JEDEC and industry standards to ensure reliable operation over an extended temperature range. This includes, but is not limited to, Highly Accelerated Stress Test (HAST) or biased 85/85, temperature cycle, autoclave or unbiased HAST, electromigration, bond intermetallic life, and mold compound life. Such qualification testing should not be viewed as justifying use of this component beyond specified performance and environmental limits.

- Minimum/Maximum Specified Current Limit
- 5-Pin SC70/SOT-323 (DCK) Package
- For 80-mA Rated Current and Higher Power Package, See TPS715Axx

APPLICATIONS

- Ultra-Low Power Microcontrollers
- Cellular/Cordless Handsets
- Portable/Battery-Powered Equipment

DESCRIPTION

The TPS71501 low-dropout (LDO) voltage regulators offer the benefits of high input voltage, low dropout voltage, low-power operation, and miniaturized packaging. The device, which operates over an input range of 2.5 V to 24 V, is stable with any capacitor (≥0.47 µF). The low dropout voltage and low quiescent current allow operation at extremely low power levels. Therefore, the devices are ideal for powering battery-management ICs. Specifically, because the devices are enabled as soon as the applied voltage reaches the minimum input voltage, the output is quickly available to power continuously operating battery-charging ICs.

The usual PNP pass transistor has been replaced by a PMOS pass element. Because the PMOS pass element behaves as a low-value resistor, the low dropout voltage, typically 415 mV at 50 mA of load current, is directly proportional to the load current. The low quiescent current (3.2 µA typically) is stable over the entire range of output load current (0 mA to 50 mA).

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereon appears at the end of this data sheet.

All trademarks are the property of their respective owners.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Copyright © 2008, Texas Instruments Incorporated

On products compliant to MIL-PRF-38535, all parameters are tested unless otherwise noted. On all other products, production processing does not necessarily include testing of all parameters.
This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

Figure 11. POWER UP / POWER DOWN

Figure 12. LINE TRANSIENT RESPONSE

Figure 13. LOAD TRANSIENT RESPONSE
APPLICATION INFORMATION

The TPS71501 LDO regulator has been optimized for ultra-low power applications such as the MSP430 microcontroller. Its ultra-low supply current maximizes efficiency at light loads, and its high input voltage range makes it suitable for supplies such as unconditioned solar panels.

External Capacitor Requirements

Although not required, a 0.047-μF or larger input bypass capacitor, connected between IN and GND and located close to the device, is recommended to improve transient response and noise rejection of the power supply as a whole. A higher-value input capacitor may be necessary if large, fast-rise-time load transients are anticipated and the device is located several inches from the power source.

The TPS71501 requires an output capacitor connected between OUT and GND to stabilize the internal control loop. Any capacitor (including ceramic and tantalum) ≥ 0.47 μF properly stabilizes this loop. X7R type capacitors are recommended but X5R and others may be used.

Power Dissipation and Junction Temperature

To ensure reliable operation, worst-case junction temperature should not exceed +125°C. This restriction limits the power dissipation the regulator can handle in any given application. To ensure the junction temperature is within acceptable limits, calculate the maximum allowable dissipation, \( P_{D(\text{max})} \), and the actual dissipation, \( P_D \), which must be less than or equal to \( P_{D(\text{max})} \).

The maximum-power-dissipation limit is determined using the following equation:

\[
P_{D(\text{max})} = \frac{T_{J,\text{max}} - T_A}{R_{\theta JA}}
\]

(1)

where:

- \( T_{J,\text{max}} \) is the maximum allowable junction temperature.
- \( R_{\theta JA} \) is the thermal resistance junction-to-ambient for the package (see the Dissipation Ratings table).
- \( T_A \) is the ambient temperature.

The regulator dissipation is calculated using:

\[
P_D = (V_{\text{IN}} - V_{\text{OUT}}) \times I_{\text{OUT}}
\]

(2)

For a higher power package version of the TPS715xx, see the TPS715Axx.

Regulator Protection

The TPS71501 PMOS-pass transistor has a built-in back diode that conducts reverse current when the input voltage drops below the output voltage (e.g., during power-down). Current is conducted from the output to the input and is not internally limited. If extended reverse voltage operation is anticipated, external limiting might be appropriate.

The TPS71501 features internal current limiting. During normal operation, the TPS71501 limits output current to approximately 500 mA. When current limiting engages, the output voltage scales back linearly until the overcurrent condition ends. Take care not to exceed the power dissipation ratings of the package.
Programming the TPS71501 Adjustable LDO Regulator

The output voltage of the TPS71501 adjustable regulator is programmed using an external resistor divider as shown in Figure 14. The output voltage operating range is 1.2 V to 15 V, and is calculated using:

\[ V_{OUT} = V_{REF} \times \left(1 + \frac{R1}{R2}\right) \]  

where:

- \( V_{REF} = 1.205 \) V typ (the internal reference voltage)

Resistors \( R1 \) and \( R2 \) should be chosen for approximately 1.5-\( \mu \)A divider current. Lower value resistors can be used for improved noise performance, but the solution consumes more power. Higher resistor values should be avoided as leakage current into/out of FB across \( R1/R2 \) creates an offset voltage that artificially increases/decreases the feedback voltage and thus erroneously decreases/increases \( V_{OUT} \). The recommended design procedure is to choose \( R2 = 1 \) M\( \Omega \) to set the divider current at 1.5 \( \mu \)A, and then calculate \( R1 \) using Equation 4:

\[ R1 = \left(\frac{V_{OUT}}{V_{REF}} - 1\right) \times R2 \]  

![Figure 14. TPS71501 Adjustable LDO Regulator Programming](image)

Power the MSP430 Microcontroller

Several versions of the TPS715xx are ideal for powering the MSP430 microcontroller. Table 2 shows potential applications of some voltage versions.

<table>
<thead>
<tr>
<th>DEVICE</th>
<th>( V_{OUT} ) (TYP)</th>
<th>( V_{OUT, \text{MIN}} )</th>
<th>APPLICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPS71519</td>
<td>1.9 V</td>
<td>&gt; 1.800 V</td>
<td>required by many MSP430s. Allows lowest power consumption operation.</td>
</tr>
<tr>
<td>TPS71523</td>
<td>2.3 V</td>
<td>&gt; 2.200 V</td>
<td>required by some MSP430s FLASH operation.</td>
</tr>
<tr>
<td>TPS71530</td>
<td>3.0 V</td>
<td>&gt; 2.700 V</td>
<td>required by some MSP430s FLASH operation.</td>
</tr>
<tr>
<td>TPS715345</td>
<td>3.45 V</td>
<td>&lt; 3.600 V</td>
<td>required by some MSP430s. Allows highest speed operation.</td>
</tr>
</tbody>
</table>

The TPS715xx family offers many output voltage versions to allow designers to minimize the supply voltage for the processing speed required of the MSP430. This minimizes the supply current consumed by the MSP430.

(1) The marketing status values are defined as follows:
- **ACTIVE**: Product device recommended for new designs.
- **LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
- **PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.
- **OBSOLETE**: TI has discontinued the production of the device.

(2) **RoHS**: TI defines “RoHS” to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substances do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as “Pb-Free”.

- **RoHS Exempt**: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

- **Green**: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.**: The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) **Lead/Ball Finish**: Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer**: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
