TPS737xx 1-A Low-Dropout Regulator With Reverse Current Protection

1 Features

- Stable With 1-μF or Larger Ceramic Output Capacitor
- Input Voltage Range: 2.2 V to 5.5 V
- Ultralow Dropout Voltage: 130 mV Typical at 1 A
- Excellent Load Transient Response—Even With Only 1-μF Output Capacitor
- NMOS Topology Delivers Low Reverse Leakage Current
- 1% Initial Accuracy
- 3% Overall Accuracy Over Line, Load, and Temperature
- Less Than 20 nA Typical I<sub>d</sub> in Shutdown Mode
- Thermal Shutdown and Current Limit for Fault Protection
- Available in Multiple Output Voltage Versions
  - Adjustable Output: 1.20 V to 5.5 V
  - Custom Outputs Available Using Factory Package-Level Programming

2 Applications

- Point-of-Load Regulation for DSPs, FPGAs, ASICs, and Microprocessors
- Post-Regulation for Switching Supplies
- Portable and Battery-Powered Equipment

3 Description

The TPS737xx family of linear low-dropout (LDO) voltage regulators uses an NMOS pass element in a voltage-follower configuration. This topology is relatively insensitive to output capacitor value and ESR, allowing a wide variety of load configurations. Load transient response is excellent, even with a small 1-μF ceramic output capacitor. The NMOS topology also allows very low dropout.

The TPS737xx family uses an advanced BiCMOS process to yield high precision while delivering very low dropout voltages and low ground pin current. Current consumption, when not enabled, is less than 20 nA and ideal for portable applications. These devices are protected by thermal shutdown and foldback current limit.

For applications that require higher output voltage accuracy, consider TI's TPS7A37xx family of 1% overall accuracy, 1-A low-dropout voltage regulators.

# Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision Q (May 2015) to Revision R Page

- Changed WSON to VSON and VSON to WSON in header row of Pin Functions table ......................................................... 4
- Changed unit from $V$ to $\%$ in $V_{OUT}$ parameter of Electrical Characteristics table ......................................................... 7

Changes from Revision P (July 2013) to Revision Q Page

- Added ESD Ratings table, Feature Description section, Device Functional Modes, Application and Implementation section, Power Supply Recommendations section, Layout section, Device and Documentation Support section, and Mechanical, Packaging, and Orderable Information section ........................................................................................................ 1
- Changed “free-air temperature” to “junction temperature” in Absolute Maximum Ratings condition statement ......................... 5
- Changed “free-air temperature” to “junction temperature” in Recommended Operating Conditions condition statement .......................................................... 5
- Changed Internal Reference parameter ($V_{FB}$) typical values from 1.2 V to 1.204 V ................................................................. 7

Changes from Revision O (June 2012) to Revision P Page

- Added last paragraph to Description section .......................................................................................................................... 1

Changes from Revision N (June 2011) to Revision O Page

- Changed Thermal Information table data and footnote 2b............................................................................................................. 6
- Changed $V_{FB}$ Internal reference parameter in Electrical Characteristics table ............................................................................. 7
- Changed title of Figure 6 ................................................................................................................................................................. 8
Changes from Revision M (October, 2010) to Revision N

- Added footnote (3) to Thermal Information table........................................................................................................ 7
- Added footnote to Figure 38................................................................................................................................................. 21

Changes from Revision L (August, 2010) to Revision M

- Corrected typo in Figure 38.................................................................................................................................................. 21

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC package thermal metrics application report.

(2) Thermal data for the DRB, DCQ, and DRV packages are derived by thermal simulations based on JEDEC-standard methodology as specified in the JESD51 series. The following assumptions are used in the simulations:
   i. DRB: The exposed pad is connected to the PCB ground layer through a $2 \times 2$ thermal via array.
   ii. DCQ: The exposed pad is connected to the PCB ground layer through a $3 \times 2$ thermal via array.
   iii. DRV: The exposed pad is connected to the PCB ground layer through a $2 \times 2$ thermal via array. Due to size limitation of thermal pad, 0.8-mm pitch array is used which is off the JEDEC standard.
   (b) The top copper layer has a detailed copper trace pattern. The bottom copper layer is assumed to have a 20% thermal conductivity of copper, representing a 20% copper coverage.
   (c) These data were generated with only a single device at the center of a JEDEC high-K (2s2p) board with 3-inch × 3-inch copper area. To understand the effects of the copper area on thermal performance, see the Power Dissipation and Estimating Junction Temperature sections of this data sheet.

(3) Power dissipation may limit operating range.

(4) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.

(5) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the top of the package. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

(6) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.

(7) The junction-to-top characterization parameter, $\psi_{\text{JT}}$, estimates the junction temperature of a device in a real system and is extracted from the simulation data to obtain $\theta_{\text{JA}}$ using a procedure described in JESD51-2a (sections 6 and 7).

(8) The junction-to-board characterization parameter, $\psi_{\text{JB}}$, estimates the junction temperature of a device in a real system and is extracted from the simulation data to obtain $\theta_{\text{JB}}$ using a procedure described in JESD51-2a (sections 6 and 7).

(9) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
6.5 Electrical Characteristics

7 Detailed Description

7.1 Overview
The TPS737xx belongs to a family of new generation LDO regulators that use an NMOS pass transistor to achieve ultralow dropout performance, reverse current blockage, and freedom from output capacitor constraints. These features combined with an enable input make the TPS737xx ideal for portable applications. This regulator family offers a wide selection of fixed-output voltage versions and an adjustable-output version. All versions have thermal and overcurrent protection, including foldback current-limit.

7.2 Functional Block Diagrams

![Functional Block Diagram](image)

Figure 29. Fixed-Voltage Version
7.3 Feature Description

7.3.1 Output Noise

A precision bandgap reference is used to generate the internal reference voltage, $V_{\text{ref}}$. This reference is the dominant noise source within the TPS737xx and it generates approximately $32 \mu V_{\text{RMS}}$ (10 Hz to 100 kHz) at the reference output (NR). The regulator control loop gains up the reference noise with the same gain as the reference voltage, so that the noise voltage of the regulator is approximately given by:

$$V_N = 32\mu V_{\text{RMS}} \times \frac{(R_1 + R_2)}{R_2} = 32\mu V_{\text{RMS}} \times \frac{V_{\text{OUT}}}{V_{\text{REF}}}$$

Because the value of $V_R$ is 1.2 V, this relationship reduces to:

$$V_N(\mu V_{\text{RMS}}) = 27 \left(\frac{\mu V_{\text{RMS}}}{V}\right) \times V_{\text{OUT}}(V)$$

for the case of no $C_{\text{NR}}$.

An internal 27-kΩ resistor in series with the noise reduction pin (NR) forms a low-pass filter for the voltage reference when an external noise reduction capacitor, $C_{\text{NR}}$, is connected from NR to ground. For $C_{\text{NR}} = 10 \text{ nF}$, the total noise in the 10-Hz to 100-kHz bandwidth is reduced by a factor of approximately 3.2, giving the approximate relationship:

$$V_N(\mu V_{\text{RMS}}) = 8.5 \left(\frac{\mu V_{\text{res}}}{V}\right) \times V_{\text{OUT}}(V)$$

for $C_{\text{NR}} = 10 \text{ nF}$.

This noise reduction effect is shown as RMS Noise Voltage vs $C_{\text{NR}}$ in the Typical Characteristics section.

---

NOTE: $V_{\text{OUT}} = (R_1 + R_2)R_2 \times 1.204$; $R_1 || R_2 = 19 \text{ kΩ}$ for best accuracy.
Feature Description (continued)

The TPS73701 adjustable version does not have the NR pin available. However, connecting a feedback capacitor, \( C_{FB} \), from the output to the feedback pin (FB) reduces output noise and improve load transient performance. This capacitor should be limited to 0.1 \( \mu \)F.

The TPS737xx uses an internal charge pump to develop an internal supply voltage sufficient to drive the gate of the NMOS pass element above \( V_{OUT} \). The charge pump generates approximately 250 \( \mu \)V of switching noise at approximately 4 MHz; however, charge-pump noise contribution is negligible at the output of the regulator for most values of \( I_{OUT} \) and \( C_{OUT} \).

7.3.2 Internal Current Limit

The TPS737xx internal current limit helps protect the regulator during fault conditions. Foldback current-limit helps to protect the regulator from damage during output short-circuit conditions by reducing current-limit when \( V_{OUT} \) drops below 0.5 V. See Figure 10 in the Typical Characteristics section.

Note from Figure 10 that approximately \(-0.2\) V of \( V_{OUT} \) results in a current-limit of 0 mA. Therefore, if OUT is forced below \(-0.2\) V before EN goes high, the device may not start up. In applications that work with both a positive and negative voltage supply, the TPS737xx should be enabled first.

7.3.3 Enable Pin and Shutdown

The enable pin (EN) is active high and is compatible with standard TTL-CMOS levels. \( V_{EN} \) below 0.5 V (maximum) turns the regulator off and drops the GND pin current to approximately 10 nA. When EN is used to shutdown the regulator, all charge is removed from the pass transistor gate, and the output ramps back up to a regulated \( V_{OUT} \) (see Figure 21).

When shutdown capability is not required, EN can be connected to \( V_{IN} \). However, the pass gate may not be discharged using this configuration, and the pass transistor may be left on (enhanced) for a significant time after \( V_{IN} \) has been removed. This scenario can result in reverse current flow (if the IN pin is low impedance) and faster ramp times upon power up. In addition, for \( V_{IN} \) ramp times slower than a few milliseconds, the output may overshoot upon power up.

Note that current limit foldback can prevent device start-up under some conditions. See the Internal Current Limit section for more information.

7.3.4 Reverse Current

The NMOS pass element of the TPS737xx provides inherent protection against current flow from the output of the regulator to the input when the gate of the pass device is pulled low. To ensure that all charge is removed from the gate of the pass element, the EN pin must be driven low before the input voltage is removed. If the EN pin is not driven low, the pass element may be left on because of stored charge on the gate.

After the EN pin is driven low, no bias voltage is needed on any pin for reverse current blocking. Reverse current is specified as the current flowing out of the IN pin because of voltage applied on the OUT pin. There is additional current flowing into the OUT pin as a result of the 80-k\( \Omega \) internal resistor divider to ground (see Figure 29 and Figure 30).

For the TPS73701, reverse current may flow when \( V_{FB} \) is more than 1.0 V above \( V_{IN} \).

7.4 Device Functional Modes

Driving the EN pin over 1.7 V turns on the regulator. Driving the EN pin below 0.5 V causes the regulator to enter shutdown mode. In shutdown, the current consumption of the device is reduced to 20 nA, typically.
8 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPS737xx family of LDO regulators use an NMOS pass transistor to achieve ultra-low-dropout performance, reverse current blockage, and freedom from output capacitor constraints. These features, combined with low noise and an enable input, make the TPS737xx ideal for portable applications. This regulator family offers a wide selection of fixed-output voltage versions and an adjustable-output version. All versions have thermal and overcurrent protection, including foldback current-limit.

8.2 Typical Application

Figure 31 shows the basic circuit connections for the fixed-voltage models. Figure 32 gives the connections for the adjustable output version (TPS73701).

Figure 31. Typical Application Circuit for Fixed-Voltage Versions

Figure 32. Typical Application Circuit for Adjustable-Voltage Version

8.2.1 Design Requirements

R1 and R2 can be calculated for any output voltage using the formula shown in Figure 32. Sample resistor values for common output voltages are shown in Figure 30.

For best accuracy, make the parallel combination of R1 and R2 approximately equal to 19 kΩ. This 19 kΩ, in addition to the internal 8-kΩ resistor, presents the same impedance to the error amp as the 27-kΩ bandgap reference output. This impedance helps compensate for leakages into the error amp terminals.

8.2.2 Detailed Design Procedure

Provide an input supply with adequate headroom to account for dropout and output current to compensate for the GND terminal current and to power the load. Further, select adequate input and output capacitors as discussed in Input and Output Capacitor Requirements.
Typical Application (continued)

8.2.2.1 Input and Output Capacitor Requirements

Although an input capacitor is not required for stability if input impedance is very low, it is good analog design practice to connect a 0.1-μF to 1-μF low equivalent series resistance (ESR) capacitor across the input supply near the regulator. This capacitor counteracts reactive input sources and improves transient response, noise rejection, and ripple rejection. A higher-value capacitor may be necessary if large, fast rise-time load transients are anticipated or the device is located several inches from the power source.

The TPS737xx requires a 1-μF output capacitor for stability. It is designed to be stable for all available types and values of capacitors. In applications where multiple low-ESR capacitors are in parallel, ringing may occur when the product of \( C_{\text{OUT}} \) and total ESR drops below 50 nF. Total ESR includes all parasitic resistances, including capacitor ESR and board, socket, and solder joint resistance. In most applications, the sum of capacitor ESR and trace resistance meets this requirement.

8.2.2.2 Dropout Voltage

The TPS737xx uses an NMOS pass transistor to achieve extremely low dropout. When \((V_{\text{IN}} - V_{\text{OUT}})\) is less than the dropout voltage \(V_{\text{DO}}\), the NMOS pass device is in its linear region of operation and the input-to-output resistance is the \(R_{\text{DS(on)}}\) of the NMOS pass element.

For large step changes in load current, the TPS737xx requires a larger voltage drop from \(V_{\text{IN}}\) to \(V_{\text{OUT}}\) to avoid degraded transient response. The boundary of this transient dropout region is approximately twice the DC dropout. Values of \((V_{\text{IN}} - V_{\text{OUT}})\) above this line ensure normal transient response.

Operating in the transient dropout region can cause an increase in recovery time. The time required to recover from a load transient is a function of the magnitude of the change in load current rate, the rate of change in load current, and the available headroom \((V_{\text{IN}} - V_{\text{OUT}})\) voltage drop). Under worst-case conditions [full-scale instantaneous load change with \((V_{\text{IN}} - V_{\text{OUT}})\) close to DC dropout levels], the TPS737xx can take a couple of hundred microseconds to return to the specified regulation accuracy.

8.2.2.3 Transient Response

The low open-loop output impedance provided by the NMOS pass element in a voltage follower configuration allows operation without a 1-μF output capacitor. As with any regulator, the addition of additional capacitance from the OUT pin to ground reduces undershoot magnitude but increases its duration. In the adjustable version, the addition of a capacitor, \(C_{\text{FB}}\), from the OUT pin to the FB pin will also improve the transient response.

The TPS737xx does not have active pulldown when the output is over-voltage. This architecture allows applications that connect higher voltage sources, such as alternate power supplies, to the output. This architecture also results in an output overshoot of several percent if the load current quickly drops to zero when a capacitor is connected to the output. The duration of overshoot can be reduced by adding a load resistor. The overshoot decays at a rate determined by output capacitor \(C_{\text{OUT}}\) and the internal/external load resistance. The rate of decay is given by:

\[
\frac{dV}{dT} = \frac{V_{\text{OUT}}}{C_{\text{OUT}} \times 80k\Omega \ || \ R_{\text{LOAD}}} \quad (4)
\]

\[
\frac{dV}{dT} = \frac{V_{\text{OUT}}}{C_{\text{OUT}} \times 80k\Omega \ || \ (R_1 + R_2) \ || \ R_{\text{LOAD}}} \quad (5)
\]
Typical Application (continued)

8.2.3 Application Curves

8.3 What To Do and What Not To Do

Place at least one 1-μF ceramic capacitor as close as possible to the OUT terminal of the regulator.

Do not place the output capacitor more than 10-mm away from the regulator.

Connect a 1-μF low equivalent series resistance (ESR) capacitor across the IN terminal and GND input of the regulator for improved transient performance.

Do not exceed the absolute maximum ratings.

9 Power Supply Recommendations

The device is designed to operate from an input voltage supply range between 2.2 V and 5.5 V. The input voltage range provides adequate headroom in order for the device to have a regulated output. This input supply must be well regulated. If the input supply is noisy, additional input capacitors with low ESR help improve the output noise performance.
10 Layout

10.1 Layout Guidelines
To improve AC performance such as PSRR, output noise, and transient response, TI recommends designing the printed-circuit-board (PCB) with separate ground planes for \( V_{IN} \) and \( V_{OUT} \), with each ground plane connected only at the GND pin of the device. In addition, the ground connection for the bypass capacitor should connect directly to the GND pin of the device.

10.1.1 Power Dissipation
Knowing the device power dissipation and proper sizing of the thermal plane that is connected to the tab or pad is critical to avoiding thermal shutdown and ensuring reliable operation.

Power dissipation of the device depends on input voltage and load conditions and can be calculated using Equation 6:

\[
P_D = (V_{IN} - V_{OUT}) \times I_{OUT}
\]

Power dissipation can be minimized and greater efficiency can be achieved by using the lowest possible input voltage necessary to achieve the required output voltage regulation.

On both SON (DRB) and SON (DRV) packages, the primary conduction path for heat is through the exposed pad to the printed circuit board (PCB). The pad can be connected to ground or be left floating; however, it should be attached to an appropriate amount of copper PCB area to ensure the device does not overheat. On the SOT-223 (DCQ) package, the primary conduction path for heat is through the tab to the PCB. That tab should be connected to ground. The maximum junction-to-ambient thermal resistance depends on the maximum ambient temperature, maximum device junction temperature, and power dissipation of the device and can be calculated using Equation 7:

\[
R_{THJA} = \frac{+125°C - T_A}{P_D}
\]

Knowing the maximum \( R_{THJA} \), the minimum amount of PCB copper area needed for appropriate heatsinking can be estimated using Figure 36.

Note: \( \theta_{JA} \) value at board size of 9 in\(^2\) (that is, 3 in × 3 in) is a JEDEC standard.

Figure 36. \( \theta_{JA} \) vs Board Size

Figure 36 shows the variation of \( \theta_{JA} \) as a function of ground plane copper area in the board. It is intended only as a guideline to demonstrate the effects of heat spreading in the ground plane and should not be used to estimate actual thermal performance in real application environments.

**NOTE**
When the device is mounted on an application PCB, TI strongly recommends using \( \Psi_{JT} \) and \( \Psi_{JB} \), as explained in the section.
Layout Guidelines (continued)

10.1.2 Thermal Protection

Thermal protection disables the output when the junction temperature rises to approximately 160°C, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits the dissipation of the regulator, protecting it from damage due to overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, junction temperature should be limited to 125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection should trigger at least 35°C above the maximum expected ambient condition of your application. This produces a worst-case junction temperature of 125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS737xx has been designed to protect against overload conditions. It was not intended to replace proper heatsinking. Continuously running the TPS737xx into thermal shutdown degrades device reliability.

10.1.3 Estimating Junction Temperature

Using the thermal metrics \( \Psi_{JT} \) and \( \Psi_{JB} \), as shown in the Thermal Information table, the junction temperature can be estimated with corresponding formulas (given in Equation 8). For backward compatibility, an older \( \theta_{JC,Top} \) parameter is listed as well.

\[
\begin{align*}
\Psi_{JT} : & \quad T_J = T_T + \Psi_{JT} \cdot P_D \\
\Psi_{JB} : & \quad T_J = T_B + \Psi_{JB} \cdot P_D 
\end{align*}
\]

(8)

Where \( P_D \) is the power dissipation shown by Equation 6, \( T_T \) is the temperature at the center-top of the IC package, and \( T_B \) is the PCB temperature measured 1-mm away from the IC package on the PCB surface (as Figure 38 shows).

**NOTE**

Both \( T_T \) and \( T_B \) can be measured on actual application boards using a thermo-gun (an infrared thermometer).

For more information about measuring \( T_T \) and \( T_B \), see the application note, *Using New Thermal Metrics* (SBVA025), available for download at [www.ti.com](http://www.ti.com).

By looking at Figure 37, the new thermal metrics (\( \Psi_{JT} \) and \( \Psi_{JB} \)) have very little dependency on board size. That is, using \( \Psi_{JT} \) or \( \Psi_{JB} \) with Equation 8 is a good way to estimate \( T_J \) by simply measuring \( T_T \) or \( T_B \), regardless of the application board size.

![Plot](image.png)  
*Figure 37. \( \Psi_{JT} \) and \( \Psi_{JB} \) vs Board Size*
Layout Guidelines (continued)

For a more detailed discussion of why TI does not recommend using $\theta_{JC(top)}$ to determine thermal characteristics, refer to application report, *Using New Thermal Metrics* (SBVA025), available for download at www.ti.com. For further information, refer to application report, *IC Package Thermal Metrics* (SPRA953), also available on the TI website.

(1) Power dissipation may limit operating range. Check *Thermal Information* table.

11 Device and Documentation Support

11.1 Device Support

11.1.1 Development Support

11.1.1.1 Evaluation Modules
An evaluation module (EVM) is available to assist in the initial circuit performance evaluation using the TPS737xx. The TPS73701DRVEVM-529 evaluation module (and related user's guide) can be requested at the Texas Instruments website through the product folders or purchased directly from the TI eStore.

11.1.1.2 Spice Models
Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. A SPICE model for the TPS737 is available through the product folders under Tools & Software.

11.1.2 Device Nomenclature

<table>

</tr>
</tbody>
</table>

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the device product folder at www.ti.com.
(2) For fixed 1.20-V operation, tie FB to OUT.

11.2 Documentation Support

11.2.1 Related Documentation
- Texas Instruments, Using New Thermal Metrics application report
- Texas Instruments, TPS73701DRVEVM-529 User's Guide user guide
- Texas Instruments, TMS320DM644x Power Reference Design application report
- Texas Instruments, TPS73x01DRBEVM-518 User's Guide user guide

11.3 Receiving Notification of Documentation Updates
To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on Alert me to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.4 Support Resources
TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided “AS IS” by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

11.5 Trademarks
E2E is a trademark of Texas Instruments. All other trademarks are the property of their respective owners.
11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.7 Glossary

SLYZ022 — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF TPS737:**

- Automotive: TPS737-Q1

**NOTE:** Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

</table>
Images above are just a representation of the package family, actual package may vary. Refer to the product data sheet for package details.
NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).

5. Vias are optional depending on application, refer to device data sheet. If some or all are implemented, recommended via locations are shown.
6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
DCQ (R-PDSO-G6)  PLASTIC SMALL-OUTLINE

NOTES:
A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. Controlling dimension in inches.
D. Body length and width dimensions are determined at the outermost extremes of the plastic body exclusive of mold flash, tie bar burrs, gate burrs, and interlead flash, but including any mismatch between the top and the bottom of the plastic body.
E. Lead width dimension does not include dambar protrusion.
F. Lead width and thickness dimensions apply to solder plated leads.
G. Interlead flash allow 0.008 inch max.
H. Gate burr/protrusion max. 0.006 inch.
I. Datums A and B are to be determined at Datum H.

4202109/D 06/09

Texas Instruments
www.ti.com
NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-SM-782 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
F. Please refer to the product data sheet for specific via and thermal dissipation requirements.
Images above are just a representation of the package family, actual package may vary. Refer to the product data sheet for package details.
