

LMH6657 and LMH6658 270-MHz Single Supply, Single and Dual Amplifiers

1 Features

$V_S = 5\text{ V}$, $T_A = 25^\circ\text{C}$, $R_L = 100\ \Omega$ (Typical Values Unless Specified)

- -3dB BW ($A_V = +1$) 270 MHz
- Supply Voltage Range 3 V to 12 V
- Slew Rate, ($V_S = \pm 5\text{ V}$) 700 V/ μs
- Supply Current 6.2 mA/amp
- Output Current +80/-90 mA
- Input Common-Mode Volt. 0.5 V Beyond V^- , 1.7 V from V^+
- Output Voltage Swing ($R_L = 2\text{ k}\Omega$) 0.8 V from Rails
- Input Voltage Noise 11 nV/ $\sqrt{\text{Hz}}$
- Input Current Noise 2.1 pA/ $\sqrt{\text{Hz}}$
- DG Error 0.03%
- DP Error 0.10°
- THD (5MHz) -55 dBc
- Settling Time (0.1%) 37ns
- Fully Characterized for 5 V, and $\pm 5\text{ V}$
- Output Overdrive Recovery 18 ns
- Output Short Circuit Protected⁽¹⁾
- No Output Phase Reversal With CMVR Exceeded

2 Applications

- CD/DVD ROM
- ADC Buffer Amps
- Portable Video
- Current Sense Buffers
- Portable Communications

(1) Short Circuit Test is a momentary test. See Note 3 under [Absolute Maximum Ratings](#).

3 Description

The LMH6657 and LMH6658 devices are low-cost operational amplifiers that operate from a single supply with input voltage range extending below the V^- . Based on easy to use voltage feedback topology and boasting fast slew rate (700 V/ μs) and high speed (140 MHz GBWP), the LMH6657 (Single) and LMH6658 (dual) can be used in high speed large signal applications. These applications include instrumentation, communication devices, set-top boxes, and so forth.

With a -3dB BW of 100 MHz ($A_V = +2$) and DG & DP of 0.03% & 0.10° respectively, the LMH6657 and LMH6658 are well suited for video applications. The output stage can typically supply 80 mA into the load with a swing of about 1 V from either rail.

For Industrial applications, the LMH6657 and LMH6658 are excellent cost-saving choices. Input referred voltage noise is low and the input voltage can extend below V^- to ease amplification of low level signals that could be at or near the system ground. With low distortion and fast settling, LMH6657 and LMH6658 can provide buffering for A/D and D/A applications.

The LMH6657 and LMH6658 versatility and ease of use is extended even further by offering these high slew rate, high-speed operational amplifiers in miniature packages such as SOT-23-5, SC70, SOIC-8, and VSSOP-8.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMH6657	SC70 (5)	2.00 mm x 1.25 mm
	SOT-23 (5)	2.90 mm x 1.60 mm
LMH6658	SOIC (8)	4.90 mm x 3.91 mm
	VSSOP (8)	3.00 mm x 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

-IN B	—	6	I	Inverting input channel B
+IN B	—	5	I	Noninverting input channel B
V ⁺	5	8	I	Positive supply

6 Specifications

6.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{IN} Differential			±2.5	V
Output Short Circuit Duration			See ⁽²⁾⁽³⁾	
Input Current			±10	mA
Supply Voltage (V ⁺ - V ⁻)			12.6	V
Voltage at Input/Output pins		V ⁻ - 0.8	V ⁺ + 0.8	V
Soldering Information	Infrared or Convection (20 sec.)		260	°C
	Wave Soldering (10 sec.)		260	
Storage temperature, T _{stg}		-65	100	°C
Junction Temperature ⁽⁴⁾			150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C.
- (3) Output short circuit duration is infinite for V_S < 6 V at room temperature and below. For V_S > 6 V, allowable short circuit duration is 1.5ms.
- (4) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PCB.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾⁽²⁾	±2000	V
	Machine Model ⁽³⁾	±200	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions. Pins listed as ±2000 V may actually have higher performance.
- (2) Human body model, 1.5 kΩ in series with 100 pF.
- (3) Machine Model, 0 Ω in series with 200 pF.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Supply Voltage (V ⁺ - V ⁻)		3	12	V
Operating Temperature ⁽¹⁾		-40	85	°C

- (1) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PCB.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾	LMH6657		LMH6658		UNIT
	DBV (SOT-23)	DCK (SC70)	D (SOIC)	DGK (VSSOP)	
	5 PINS		8 PINS		
R _{θJA} Junction-to-ambient thermal resistance ⁽²⁾	265	478	190	235	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PCB.

6.5 Electrical Characteristics, 5 V

Unless otherwise specified, all limits ensured for at $T_J = 25^\circ\text{C}$, $V^+ = 5\text{ V}$, $V^- = 0\text{ V}$, $V_{\text{CM}} = V_O = V^+/2$, and $R_L = 100\Omega$ (or as specified) tied to $V^+/2$.

PARAMETER		TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT
GB	Gain Bandwidth Product	$V_{\text{OUT}} < 200\text{ mV}_{\text{PP}}$		140		MHz
SSBW	-3-dB BW	$A_V = +1$, $V_{\text{OUT}} = 200\text{ mV}_{\text{PP}}$	220	270		MHz
		$A_V = +2$ or -1 , $V_{\text{OUT}} = 200\text{ mV}_{\text{PP}}$		100		
GFP	Frequency Response Peaking	$A_V = +2$, $V_{\text{OUT}} = 200\text{ mV}_{\text{PP}}$, DC to 100 MHz		1.5		dB
GFR	Frequency Response Rolloff	$A_V = +2$, $V_{\text{OUT}} = 200\text{ mV}_{\text{PP}}$, DC to 100 MHz		0.5		dB

DP	Differential Phase	NTSC, $V_{\text{CM}} = 2\text{ V}$, $R_L = 150\Omega$ to $V^+/2$ Pos. Video Only		0.1		deg
TIME DOMAIN RESPONSE						
t_r	Rise and Fall Time	$A_V = +2$, $V_{\text{OUT}} = 500\text{ mV}_{\text{PP}}$		3.3		ns
		$A_V = -1$, $V_{\text{OUT}} = 500\text{ mV}_{\text{PP}}$		3.4		
OS	Overshoot, Undershoot	$A_V = +2$, $V_{\text{OUT}} = 500\text{ mV}_{\text{PP}}$		18%		
t_s	Settling Time	$V_O = 2\text{ V}_{\text{PP}}$, $\pm 0.1\%$, $R_L = 500\Omega$ to $V^+/2$, $A_V = -1$		37		ns
SR	Slew Rate ⁽³⁾	$A_V = -1$, $V_O = 3\text{V}_{\text{PP}}$ ⁽⁴⁾		470		V/ μs
		$A_V = +2$, $V_O = 3\text{V}_{\text{PP}}$ ⁽⁴⁾		420		
DISTORTION AND NOISE RESPONSE						
HD2	2 nd Harmonic Distortion	$f = 5\text{MHz}$, $V_O = 2\text{V}_{\text{PP}}$, $A_V = -1$		-70		dBc
HD3	3 rd Harmonic Distortion	$f = 5\text{MHz}$, $V_O = 2\text{V}_{\text{PP}}$, $A_V = -1$		-57		dBc
THD	Total Harmonic Distortion	$f = 5\text{MHz}$, $V_O = 2\text{V}_{\text{PP}}$, $A_V = -1$		-55.5		dBc
V_n	Input-Referred Voltage Noise	$f = 100\text{KHz}$		11		nV/ $\sqrt{\text{Hz}}$
		$f = 1\text{KHz}$		19		
I_n	Input-Referred Current Noise	$f = 100\text{KHz}$		2.1		pA/ $\sqrt{\text{Hz}}$
		$f = 1\text{KHz}$		7.5		
XTLKA	Cross-Talk Rejection (LMH6658)	$f = 5\text{MHz}$, R_L (SND) = 100 Ω RCV: $R_F = R_G = 1\text{k}$		69		dB
STATIC, DC PERFORMANCE						
A_{VOL}	Large Signal Voltage Gain	$V_O = 1.25\text{V}$ to 3.75V , $R_L = 2\text{k}$ to $V^+/2$	85	95		dB
		$V_O = 1.5\text{V}$ to 3.5V , $R_L = 150\Omega$ to $V^+/2$	75	85		
		$V_O = 2\text{V}$ to 3V , $R_L = 50\Omega$ to $V^+/2$	70	80		
CMVR	Input Common-Mode Voltage Range	CMRR $\geq 50\text{dB}$	-0.2	-0.5		V
		At the temperature extremes	-0.1			
			3	3.3		
		At the temperature extremes	2.8			
V_{OS}	Input Offset Voltage			± 1.1	± 5	mV
		At the temperature extremes			± 7	
TC V_{OS}	Input Offset Voltage Average Drift	See ⁽⁵⁾		± 2		$\mu\text{V}/\text{C}$

(1) All limits are ensured by testing or statistical analysis.

(2) Typical values represent the most likely parametric norm.

(3) Slew rate is the "worst case" of the rising and falling slew rates.

(4) Output Swing not limited by Slew Rate limit.

(5) Drift determined by dividing the change in parameter at temperature extremes by the total temperature change.

Electrical Characteristics, 5 V (continued)

Unless otherwise specified, all limits ensured for at $T_J = 25^\circ\text{C}$, $V^+ = 5\text{ V}$, $V^- = 0\text{ V}$, $V_{\text{CM}} = V_O = V^+/2$, and $R_L = 100\ \Omega$ (or as specified) tied to $V^+/2$.

7 Detailed Description

7.1 Overview

7.1.1 Large Signal Behavior

The LMH6657 and LMH6658 are large-bandwidth, fast slew rate, voltage feedback operational amplifiers ideal for high-speed, large signal applications. The low input referred voltage noise in conjunction with an input voltage range, which extends below V_- , eases the adoption of this part in applications having a tiny signal at or near system ground, as well as other high-speed, low-distortion, and low-noise systems. Also, the large Gain Bandwidth Product allows high gain operation that does not compromise speed.

7.2 Feature Description

The LMH6657 and LMH6658 input stage is designed to provide excess overdrive when needed. This occurs when fast input signal excursions cannot be followed by the output stage. In these situations, the device encounters larger input signals than would be encountered under normal closed loop conditions. The LMH6657 and LMH6658 input stage is designed to take advantage of this "input overdrive" condition. The larger the amount of this overdrive, the greater is the speed with which the output voltage can change. Here is a plot of how the output slew rate limitation varies with respect to the amount of overdrive imposed on the input:

Figure 48. Plot Showing the Relationship Between Slew Rate and Input Overdrive

To relate the explanation above to a practical example, consider the following application example. Consider the case of a closed loop amplifier with a gain of -1 amplifying a sinusoidal waveform. From the plot of Output vs. Input (Figure 8), with a 30-MHz signal and $7V_{PP}$ input signal, it can be seen that the output will be limited to a swing of $6.9 V_{PP}$. From the frequency Response plot it can be seen that the inverting gain of -1 has a -32° output phase shift at this frequency.

It can be shown that this setup will result in about $1.9 V_{PP}$ differential input voltage corresponding to $650 V/\mu s$ of slew rate from Figure 48, above ($SR = V_O(pp) \times \pi \times f = 650V/\mu s$)

Note that the amount of overdrive appearing on the input for a given sinusoidal test waveform is affected by the following:

- Output swing
- Gain setting
- Input/output phase relationship for the given test frequency
- Amplifier configuration (inverting or noninverting)

Due to the higher frequency phase shift between input and output, there is no closed form solution to input overdrive for a given input. Therefore, Figure 48 is not very useful by itself in determining the output swing.

The following plots aid in predicting the output transition time based on the amount of swing required for a given gain setting.

Feature Description (continued)

Beyond a gain of 5 or so, the LMH6657/6658 output transition would be limited by bandwidth. For example, with a gain of 5, the -3dB BW would be around 30MHz corresponding to a rise time of about 12ns (10% - 90%). Assuming a near linear transition, the 20%-80% transition time would be around 9ns which matches the measured results as shown in [Figure 49](#).

When the output is heavily loaded, output swing may be limited by current capability of the device. Refer to [Output Current Capability](#) section for more details.

7.3 Device Functional Modes

7.3.1 Output Phase Reversal

This is a problem with some operational amplifiers. This effect is caused by phase reversal in the input stage due to saturation of one or more of the transistors when the inputs exceed the normal expected range of voltages. Some applications, such as servo control loops among others, are sensitive to this kind of behavior and would need special safeguards to ensure proper functioning. The LMH6657 and LMH6658 is immune to output phase reversal with input overload. With inputs exceeded, the LMH6657 and LMH6658 output will stay at the clamped voltage from the supply rail. Exceeding the input supply voltages beyond the [Absolute Maximum Ratings](#) of the device could however damage or otherwise adversely effect the reliability or life of the device.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Output Characteristics

8.1.1.1 Output Current Capability

The LMH6657/6658 output swing for a given load can be determined by referring to the Output Voltage vs. Output Current plots in [Typical Characteristics](#). Characteristic Tables show the output current when the output is 1V from either rail. The plots and table values can be used to predict closed loop continuous value of current for a given load. If left unchecked, the output current capability of the LMH6657 and LMH6658 could easily result in junction temperature exceeding the maximum allowed value specified under [Absolute Maximum Ratings](#). Proper heat sinking or other precautions are required if conditions as such exist.

Under transient conditions, such as when the input voltage makes a large transition and the output has not had time to reach its final value, the device can deliver output currents in excess of the typical plots mentioned above. Plots shown in [Figure 51](#) and [Figure 52](#) depict how the output current capability improves under higher input overdrive voltages:

The LMH6657 and LMH6658 output stage is designed to swing within approximately one diode drop of each supply voltage by utilizing specially designed high speed output clamps. This allows adequate output voltage swing even with 5-V supplies and yet avoids some of the issues associated with rail-to-rail output operational amplifiers. Some of these issues are:

- Supply current increases when output reaches saturation at or near the supply rails
- Prolonged recovery when output approaches the rails

The LMH6657 and LMH6658 output is exceedingly well-behaved when it comes to recovering from an overload condition. As can be seen from [Figure 53](#), the LMH6657 and LMH6658 will typically recover from an output overload condition in about 18 ns, regardless of the duration of the overload.

Application Information (continued)

Figure 53. Output Overload Recovery

8.1.1.2 Driving Capacitive Loads

The LMH6657 and LMH6658 can drive moderate values of capacitance by utilizing a series isolation resistor between the output and the capacitive load. [Typical Characteristics](#) shows the settling time behavior for various capacitive loads and 20 Ω of isolation resistance. Capacitive load tolerance will improve with higher closed loop gain values. Applications such as ADC buffers, among others, present complex and varying capacitive loads to the operational amplifier; best value for this isolation resistance is often found by experimentation and actual trial and error for each application.

8.1.1.3 Distortion

Applications with demanding distortion performance requirements are best served with the device operating in the inverting mode. The reason for this is that in the inverting configuration, the input common-mode voltage does not vary with the signal and there is no subsequent ill effects due to this shift in operating point and the possibility of additional non-linearity. Moreover, under low closed loop gain settings (most suited to low distortion), the noninverting configuration is at a further disadvantage of having to contend with the input common mode voltage range. There is also a strong relationship between output loading and distortion performance (that is, 1 k Ω vs. 100 Ω distortion improves by about 20 dB at 100 KHz) especially at the lower frequency end where the distortion tends to be lower. At higher frequency, this dependence diminishes greatly such that this difference is only about 4 dB at 10 MHz. But, in general, lighter output load leads to reduced HD3 term and thus improves THD.

9 Power Supply Recommendations

The LMH665x can operate off a single-supply or with dual supplies. The input CM capability of the parts (CMVR) extends all the way down to the V- rail to simplify single-supply applications. Supplies should be decoupled with low-inductance, often ceramic, capacitors to ground less than 0.5 inches from the device pins. TI recommends the use of ground plane, and as in most high-speed devices, it is advisable to remove ground plane close to device sensitive pins such as the inputs.

10 Layout

10.1 Layout Guidelines

Generally, a good high frequency layout will keep power supply and ground traces away from the inverting input and output pins. Parasitic capacitances on these nodes to ground will cause frequency response peaking and possible circuit oscillations. See Application Note OA-15, *Frequent Faux Pas in Applying Wideband Current Feedback Amplifiers* (SNOA367) for more information. TI suggests the following evaluation boards as a guide for high frequency layout and as an aid in device testing and characterization:

Layout Guidelines (continued)

Table 1. Evaluation Board Guide

DEVICE	PACKAGE	EVALUATION BOARD PIN
LMH6657MF	SOT-23-5	LMH730216
LMH6657MG	SC-70	LMH730165
LMH6658MA	8-Pin SOIC	LMH730036
LMH6658MM	8-Pin VSSOP	LMH730123

Another important parameter in working with high speed/high performance amplifiers, is the component values selection. Choosing external resistors that are large in value will effect the closed loop behavior of the stage because of the interaction of these resistors with parasitic capacitances. These capacitors could be inherent to the device or a by-product of the board layout and component placement. Either way, keeping the resistor values lower, will diminish this interaction to a large extent. On the other hand, choosing very low value resistors will load down nodes and will contribute to higher overall power dissipation.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
