

## STEREO AUDIO CODEC WITH USB INTERFACE, SINGLE-ENDED ANALOG INPUT/OUTPUT, AND S/PDIF

### FEATURES

- **PCM2900B:** Without S/PDIF
- **PCM2902B:** With S/PDIF
- **On-Chip USB Interface:**
  - With Full-Speed Transceivers
  - Fully Compliant with USB 2.0 Specification
  - Certified by USB-IF
  - Partially Programmable Descriptors <sup>(1)</sup>
  - USB Adaptive Mode for Playback
  - USB Asynchronous Mode for Record
  - Bus Powered
- **16-Bit Delta-Sigma ADC and DAC**
- **Sampling Rate:**
  - DAC: 32, 44.1, 48 kHz
  - ADC: 8, 11.025, 16, 22.05, 32, 44.1, 48 kHz
- **On-Chip Clock Generator with Single 12-MHz Clock Source**
- **Single Power Supply:**
  - 5 V Typical ( $V_{BUS}$ )
- **Stereo ADC:**
  - Analog Performance at  $V_{BUS} = 5\text{ V}$ :
    - THD+N = 0.01%
    - SNR = 89 dB
    - Dynamic Range = 89 dB
  - Decimation Digital Filter:
    - Passband Ripple =  $\pm 0.05\text{ dB}$
    - Stop-Band Attenuation = 65 dB
  - Single-Ended Voltage Input
  - Antialiasing Filter Included
  - Digital HPF Included

- **Stereo DAC:**
  - Analog Performance at  $V_{BUS} = 5\text{ V}$ :
    - THD+N = 0.005%
    - SNR = 96 dB
    - Dynamic Range = 93 dB
  - Oversampling Digital Filter:
    - Passband Ripple =  $\pm 0.1\text{ dB}$
    - Stop-Band Attenuation = -43 dB
  - Single-Ended Voltage Output
  - Analog LPF Included
- **Multifunctions:**
  - Human Interface Device (HID) Function:
    - Volume and Mute Controls
  - Suspend Flag Function
- **28-Pin SSOP Package**

### APPLICATIONS

- **USB Audio Speaker**
- **USB Headset**
- **USB Monitor**
- **USB Audio Interface Box**

### DESCRIPTION

The PCM2900B/2902B is Texas Instruments' single-chip, USB, stereo audio codec with a USB-compliant full-speed protocol controller and S/PDIF (PCM2902B only). The USB protocol controller requires no software code, but the USB descriptors can be modified in some areas (for example, vendor ID and/or product ID). The PCM2900B/2902B employs SpAct™ architecture, TI's unique system that recovers the audio clock from USB packet data. On-chip analog PLLs with SpAct architecture enable playback and record with low clock jitter as well as independent playback and record sampling rates.

(1) The descriptor can be modified by changing a mask.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

SpAct is a trademark of Texas Instruments.

System Two, Audio Precision are trademarks of Audio Precision, Inc.

All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) TEST0 and TEST1 apply to the PCM2900B; DIN and DOUT apply to the PCM2902B.

## DETAILED DESCRIPTION

### USB INTERFACE

Control data and audio data are transferred to the PCM2900B/2902B via D+ (pin 1) and D– (pin 2). All data to/from the PCM2900B/2902B are transferred at full speed. The device descriptor contains the information described in [Table 3](#). The device descriptor can be modified on request; contact a Texas Instruments representative for details.

## DEVICE CONFIGURATION

Figure 31 illustrates the USB audio function topology. The PCM2900B/2902B has four interfaces. Each interface consists of alternative settings.

M0024-03

Figure 31. USB Audio Function Topology

## Interface #0

Interface #0 is defined as the control interface. Alternative setting #0 is the only possible setting for interface #0. Alternative setting #0 describes the standard audio control interface. The audio control interface consists of a single terminal. The PCM2900B/2902B has the following five terminals:

- Input terminal (IT #1) for isochronous-out stream
- Output terminal (OT #2) for audio analog output
- Feature unit (FU #3) for DAC digital attenuator
- Input terminal (IT #4) for audio analog input
- Output terminal (OT #5) for isochronous-in stream

Input terminal #1 is defined as a *USB stream* (terminal type 0x0101). Input terminal #1 can accept two-channel audio streams consisting of left and right channels. Output terminal #2 is defined as a *speaker* (terminal type 0x0301). Input terminal #4 is defined as a *microphone* (terminal type 0x0201). Output terminal #5 is defined as a *USB stream* (terminal type 0x0101). Output terminal #5 can generate two-channel audio streams composed of left and right channel data. Feature unit #3 supports the following sound control features:

- Volume control
- Mute control

The built-in digital volume controller can be manipulated by an audio class specific request from 0 dB to –64 dB in 1-dB steps. Changes are made by incrementing or decrementing by one step (1 dB) for every  $1/f_s$  time interval until the volume level has reached the requested value. Each channel can be set for different values. The master volume control is not supported. A request to the master volume is stalled and ignored. The built-in digital mute controller can be manipulated by an audio class specific request. A master mute control request is acceptable. A request to an individual channel is stalled and ignored.

## Interface #1

Interface #1 is the audio streaming data-out interface. Interface #1 has five alternative settings listed in [Table 6](#). Alternative setting #0 is the zero bandwidth setting. All other alternative settings are operational settings.

**Table 6. Interface #1 Alternative Settings**

ALTERNATIVE SETTING	DATA FORMAT			TRANSFER MODE	SAMPLING RATE (kHz)
00	Zero Bandwidth				
01	16-bit	Stereo	Twos complement (PCM)	Adaptive	32, 44.1, 48
02	16-bit	Mono	Twos complement (PCM)	Adaptive	32, 44.1, 48

## Interface #3

Interface #3 is the interrupt data-in interface. Alternative setting #0 is the only possible setting for interface #3. Interface #3 consists of the HID consumer control device and reports the status of these three key parameters:

- Mute (0xE209)
- Volume up (0xE909)
- Volume down (0xEA09)

## End-Points

The PCM2900B/2902B has the following four end-points:

- Control end-point (EP #0)
- Isochronous-out audio data stream end-point (EP #2)
- Isochronous-in audio data stream end-point (EP #4)
- HID end-point (EP #5)

The control end-point is a default end-point. The control end-point is used to control all functions of the PCM2900B/2902B by a standard USB request and an USB audio class specific request from the host. The isochronous-out audio data stream end-point is an audio sink end-point, which receives the PCM audio data. The isochronous-out audio data stream end-point accepts the adaptive transfer mode. The isochronous-in audio data stream end-point is an audio source end-point, which transmits the PCM audio data. The isochronous-in audio data stream end-point uses asynchronous transfer mode. The HID end-point is an interrupt-in end-point. HID end-point reports HID0, HID1, and HID2 pin status every 32 ms.

The human interface device (HID) pins are defined as consumer control devices. The HID function is designed as an independent end-point from both isochronous-in and -out end-points. Therefore, the result obtained from the HID operation depends on the host software. Typically, the HID function is used as the primary audio-out device.

## **Clock and Reset**

The PCM2900B/2902B requires a 12-MHz ( $\pm 500$  ppm) clock for the USB and audio functions, which can be generated by a built-in crystal oscillator with a 12-MHz crystal resonator. The 12-MHz crystal resonator must be connected to XTI (pin 21) and XTO (pin 20) with one high (1-M $\Omega$ ) resistor and two small capacitors, the capacitance of which depends on the load capacitance of the crystal resonator. The external clock can be supplied from XTI (pin 21). If the external clock is supplied, XTO (pin 20) must be left open. Because there is no clock-disabling signal, it is not recommended to use the external clock supply.  $\overline{\text{SSPND}}$  (pin 28) is unable to use clock disabling.

The PCM2900B/2902B has an internal power-on reset circuit, which triggers automatically when  $V_{\text{BUS}}$  (pin 3) exceeds 2.5 V typical (2.7 V to 2.2 V). Approximately 700  $\mu\text{s}$  is required until internal reset release.

## **Digital Audio Interface (PCM2902B)**

The PCM2902B employs both S/PDIF input and output. Isochronous-out data from the host are encoded to the S/PDIF output and the DAC analog output. Input data are selected as either S/PDIF or ADC analog input. When the device detects an S/PDIF input and successfully locks the received data, the isochronous-in transfer data source is automatically selected from S/PDIF itself; otherwise, the data source is selected to ADC analog input.

This feature is a customer option. It is the responsibility of the user to implement this feature.

## **Supported Input/Output Data (PCM2902B)**

The following data formats are accepted by the S/PDIF input and output. All other data formats are unable to use S/PDIF.

- 48-kHz 16-bit stereo
- 44.1-kHz 16-bit stereo
- 32-kHz 16-bit stereo

Any mismatch of the sampling rate between the input S/PDIF signal and the host command is not acceptable. Any mismatch of the data format between the input S/PDIF signal and the host command may cause unexpected results, with the following exceptions:

- Recording in monaural format from stereo data input at the same data rate
- Recording in 8-bit format from 16-bit data input at the same data rate

A combination of these two conditions is not acceptable.

For playback, all possible data rate sources are converted to 16-bit stereo format at the same source data rate.

## **Channel Status Information (PCM2902B)**

The channel status information is fixed as consumer application, PCM mode, copyright, and digital/digital converter. All other bits are fixed as 0's except for the sample frequency, which is set automatically according to the data received through the USB.

## **Copyright Management (PCM2902B)**

Isochronous-in data are affected by the serial copy management system (SCMS). When receiving digital audio data that are indicated as original data in the control bit, input digital audio data transfer to the host. If the data are indicated as first generation or higher, the transferred data are routed to the analog input.

Digital audio data output is always encoded as original with SCMS control.

## INTERFACE SEQUENCE

### Power On, Attach, and Playback Sequence

The PCM2900B/2902B is ready for setup when the reset sequence has finished and the USB bus is attached. After connection has been established by setup, the PCM2900B/2902B is ready to accept USB audio data. While waiting, the audio data (idle state) and analog output are set to bipolar zero (BPZ).

When receiving the audio data, the PCM2900B/2902B stores the first audio packet, which contains 1-ms audio data, into the internal storage buffer. The PCM2900B/2902B starts playing the audio data when detecting the next start of frame (SOF) packet, as illustrated in Figure 32.

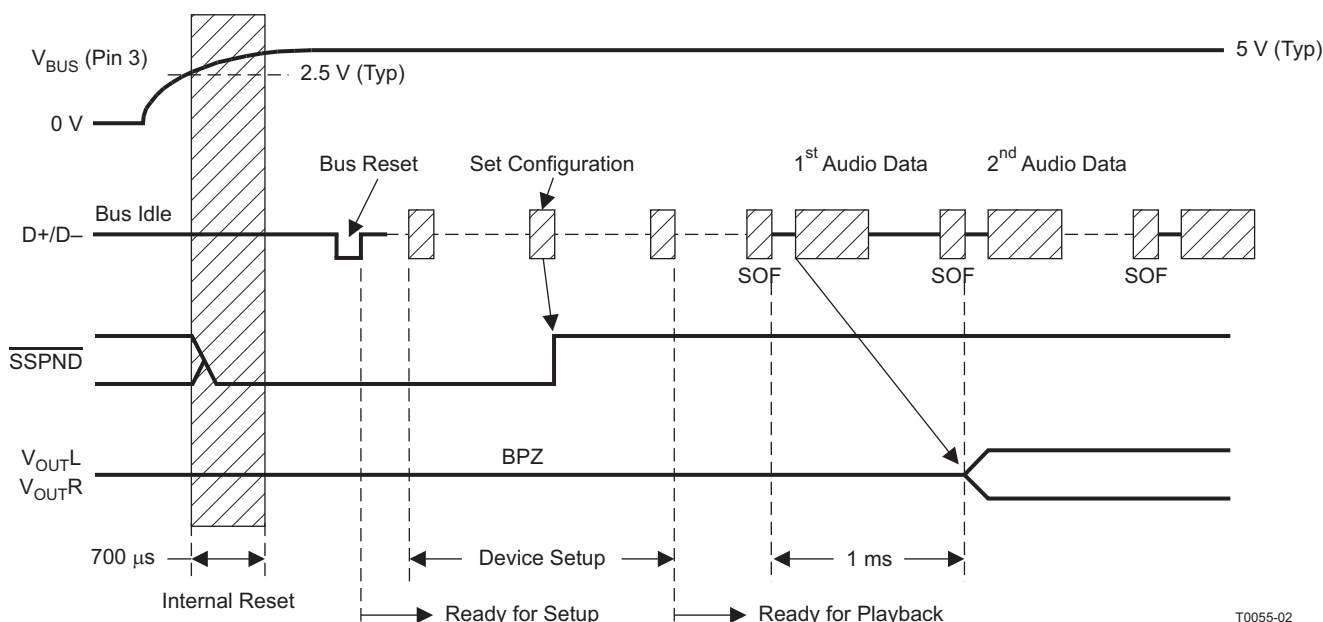

Figure 32. Initial Sequence

### Play, Stop, and Detach Sequence

When the host finishes or aborts playback, the PCM2900B/2902B stops playing after the last audio data have played, as shown in Figure 33.

Figure 33. Play, Stop, and Detach Sequence

## Record Sequence

The PCM2900B/2902B starts the audio capture into the internal memory after receiving the SET\_INTERFACE command, as shown in Figure 34.

Figure 34. Record Sequence

## Suspend and Resume Sequence

The PCM2900B/2902B enters the suspend state after it sees a constant idle state on the USB bus (approximately 5 ms), as shown in Figure 35. While the PCM2900B/2902B enters the suspend state,  $\overline{\text{SSPND}}$  flag (pin 28) is asserted. The PCM2900B/2902B wakes up immediately upon detecting a non-idle state on the USB bus.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
