## Errata

# MSP430F2001 Microcontroller

#### **ABSTRACT**

This document describes the known exceptions to the functional specifications (advisories).

## **Table of Contents**

# 2 Preprogrammed Software Advisories

Advisories that affect factory-programmed software.

✓ The check mark indicates that the issue is present in the specified revision.

The device does not have any errata for this category.

# 3 Debug Only Advisories

Advisories that affect only debug operation.

✓ The check mark indicates that the issue is present in the specified revision.

| Errata Number | Rev G | Rev F | Rev E | Rev D | Rev C | Rev B | Rev A |

## 5 Nomenclature, Package Symbolization, and Revision Identification

The revision of the device can be identified by the revision letter on the Package Markings or by the HW\_ID located inside the TLV structure of the device.

#### **5.1 Device Nomenclature**

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

XMS – Experimental device that is not necessarily representative of the final device's electrical specifications

MSP - Fully qualified production device

Support tool naming prefixes:

X: Development-support product that has not yet completed Texas Instruments internal qualification testing.

null: Fully-qualified development-support product.

XMS devices and X development-support tools are shipped against the following disclaimer:

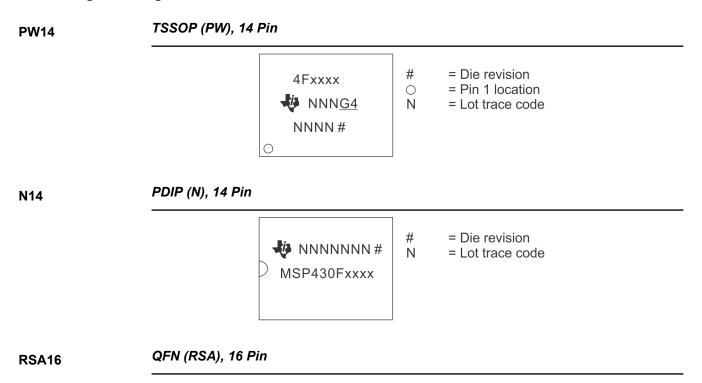

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. Tl's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format.

#### 5.2 Package Markings

M430F
xxxx
TI NNN
NNNN#

# = Die revision
O = Pin 1 location
N = Lot trace code

## **5.3 Memory-Mapped Hardware Revision (TLV Structure)**

This device does not support reading the hardware revision from memory.

Further guidance on how to locate the TLV structure and read out the HW\_ID can be found in the device User's Guide.

# **6 Advisory Descriptions**

BCL9 BCL Module

**Category** Functional

**Function** ACLK divider modifications require delay before entering LPM3

**Description** After modifying the DIVAx bits, immediately entering LPM3 can cause the modification to

be ignored and the divider settings not to take effect. Reading back the DIVAx bits will indicate the intended setting even when the divider has not been correctly applied.

Workaround When the DIVAx bits are modified, a delay of one complete ACLK (VLO or LFXT1CLK)

period must elapse before entering LPM3. The delay is only necessary the first time LPM3 is entered after the DIVAx bits are modified. After the one-period delay, LPM3 may be

entered and exited normally without additional delays.

BCL10 BCL Module

**Category** Functional

**Function** MCLK = ACLK and P2SEL control bits

**Description** When using ACLK as the CPU MCLK clock source, the oscillator failsafe feature does

not automatically switch MCLK to the DCO if the P2SEL6 or P2SEL7 bit is cleared. This applies when ACLK = LFXT1 (external low frequency clock source). The CPU will halt

operation since no MCLK signal is present.

Workaround None

BCL11 BCL Module

**Category** Functional

Function Watchdog failsafe when using ACLK

**Description** When using ACLK as the WDT+ clock source, the WDT+ oscillator failsafe feature does

not automatically switch to the DCO if the P2SEL6 or P2SEL7 bit is cleared. This applies when ACLK = LFXT1 (external low frequency clock source). The WDT+ will halt operation

since no clock signal is present.

Workaround None

BCL12 BCL Module

Category Functional

Function Switching RSELx or modifying DCOCTL can cause DCO dead time or a complete DCO

stop

**Description** After switching RSELx bits (located in register BCSCTL1) from a value of >13 to a value

of <12 OR from a value of <12 to a value of >13, the resulting clock delivered by the DCO can stop before the new clock frequency is applied. This dead time is approximately 20

us. In some instances, the DCO may completely stop, requiring a power cycle.

Furthermore, if all of the RSELx bits in the BSCTL1 register are set, modifying the DCOCTL register to change the DCOx or the MODx bits could also result in DCO dead

time or DCO hang up.

www.ti.com Advisory Descriptions

#### Workaround

- When switching RSEL from >13 to <12, use an intermediate frequency step. The intermediate RSEL value should be 13.

| Current RSEL | Target RSEL | Recommended Transition Sequence                                 |
|--------------|-------------|---|
| 15           | 14          | Switch directly to target RSEL                                  |
| 14 or 15     | 13          | Switch directly to target RSEL                                  |
| 14 or 15     | 0 to 12     | Switch to 13 first, and then to target RSEL (two step sequence) |
| 0 to 13      | 0 to 12     | Switch directly to target RSEL                                  |

#### AND

- When switching RSEL from <12 to >13 it's recommended to set RSEL to its default value first (RSEL = 7) before switching to the desired target frequency.

#### AND

- In case RSEL is at 15 (highest setting) it's recommended to set RSEL to its default value first (RSEL = 7) before accessing DCOCTL to modify the DCOx and MODx bits. After the DCOCTL register modification the RSEL bits can be manipulated in an additional step.

In the majority of cases switching directly to intermediate RSEL steps as described above will prevent the occurrence of BCL12. However, a more reliable method can be implemented by changing the RSEL bits step by step in order to guarantee safe function without any dead time of the DCO.

Note that the 3-step clock startup sequence consisting of clearing DCOCTL, loading the BCSCTL1 target value, and finally loading the DCOCTL target value as suggested in the in the "TLV Structure" chapter of the MSP430x2xx Family User's Guide is not affected by BCL12 if (and only if) it is executed after a device reset (PUC) prior to any other modifications being made to BCSCTL1 since in this case RSEL still is at its default value of 7. However any further changes to the DCOx and MODx bits will require the consideration of the workaround outlined above.

| R | CI. | 12 | BCL Module |  |
|---|-----|----|------------|--|
|   |     |    |            |  |

Category Functional

**Function** DCO powerup halt

**Description**When subject to very slow Vcc rise times, the device may enter into a state where the

DCO does not oscillate. No JTAG access or program execution is possible and the device

will remain in a reset state until the supply voltage is disconnected.

**Workaround** Apply a Vcc poweron ramp >= 10V/second under all power-on/power-cycle scenarios.

BCL14 BCL Module

**Category** Functional

**Function** Oscillator fault forced in bypass mode when P2SEL.7 bit is not set

**Description**When the LFXT1 oscillator is used in bypass mode and P2SEL.7 is not set, the oscillator

fault flag (OFIFG) will be forced to set and cannot be cleared. Due to the failsafe logic, LFXT1 cannot be used as MCLK in this case. The bug only affects the behavior of the

oscillator fault, the clocking itself works properly.

#### Workaround

Set both P2SEL.6 and P2SEL.7 if the application requires correct function of the oscillator fault flag (e.g. MCLK failsafe logic).

#### Note

Setting P2SEL.7 bit disables the GPIO functionality and enables the input schmitt trigger of the pin. P2.7 should be tied to a fixed voltage level (VCC or GND) to prevent cross current.

CPU4 CPU Module

Category Compiler-Fixed

Function PUSH #4, PUSH #8

**Description** The single operand instruction PUSH cannot use the internal constants (CG) 4 and 8. The

other internal constants (0, 1, 2, -1) can be used. The number of clock cycles is different:

PUSH #CG uses address mode 00, requiring 3 cycles, 1 word instruction PUSH #4/#8 uses address mode 11, requiring 5 cycles, 2 word instruction

**Workaround** Refer to the table below for compiler-specific fix implementation information.

| IDE/Compiler                                       | Version Number                    | Notes   |
|--|-----------------------------------|---|
| IAR Embedded Workbench                             | IAR EW430 v2.x until v6.20        | User is required to add the compiler flag option below hw_workaround=CPU4 |
| IAR Embedded Workbench                             | IAR EW430 v6.20 or later          | Workaround is automatically enabled                                       |
| TI MSP430 Compiler Tools (Code<br>Composer Studio) | v1.1 or later                     |   |
| MSP430 GNU Compiler (MSP430-GCC)                   | MSP430-GCC 4.9 build 167 or later |   |

EEM20 EEM Module

Category Debug

**Function** Debugger might clear interrupt flags

**Description** During debugging read-sensitive interrupt flags might be cleared as soon as the debugger

stops. This is valid in both single-stepping and free run modes.

Workaround None.

FLASH16 FLASH Module

**Category** Functional

**Function** Modifying INFOA addresses when LOCKA = 1 will modify main flash memory

**Description**When attempting to write to an address location or perform a segment erase of INFOA

while the LOCKA bit is set, flash memory beginning at main memory location 0xFC40 and

www.ti.com Advisory Descriptions

extending for 64 bytes to address 0xFC7F will be modified erroneously. These 64 bytes are addressed and modified in place of the INFOA addresses when writes or erases are

performed within the INFOA address space and LOCKA = 1.

Workaround Prior to modifying (writing or erasing) any address within the INFOA Flash memory

segment, properly clear the LOCKA control bit as described in the MSP430x2xx User's Guide (SLAU144) to unlock the segment. Once the modification is complete, setting the

LOCKA bit is recommended.

FLASH22 FLASH Module

**Category** Functional

Function Flash controller may prevent correct LPM entry

**Description** When ACLK (or SMCLK) is used as the flash controller clock source, and this clock

source gets deactivated due to a low-power mode entry while a flash erase or write operating is pending, the flash controller will keep ACLK (or SMCLK) active even after the flash operation has been completed. This will result in an incorrect LPM entry and increased current consumption. Note that this issue can only occur when the Flash operation and the low-power mode entry are initiated from code located in RAM.

**Workaround** Do not enter low-power modes while flash erase or write operations are active. Wait for

the operation to be completed before entering a low-power mode.

PORT10 PORT Module

**Category** Functional

**Function** Pull-up/down resistor selection when module pin function is selected

**Description** When the pull-up/down resistor for a certain port pin is enabled (PxREN.y=1) and the

module port pin function is selected (PxSEL.y=1), the pull-up/down resistor configuration of this pin is controlled by the respective module output signal (Module X OUT) instead of

the port output register (PxOUT.y).

**Workaround** None. Do not set PxSEL.y and PxREN.y at the same time.

SBW1 SBW Module

**Category** Functional

**Function** Increased current consumption

**Description** An error in the Spy-Bi-Wire Interface will increase the ICC under normal operating

conditions.

Workaround None

SYS15 SYS Module

**Category** Functional

**Function** LPM3 and LPM4 currents exceed specified limits

**Description** LPM3 and LPM4 currents may exceed specified limits if the SMCLK source is switched

from DCO to VLO or LFXT1 just before the instruction to enter LPM3 or LPM4 mode.

Workaround After clock switching, a delay of at least four new clock cycles (VLO or LFXT1) must be

implemented to complete the clock synchronization before going into LPM3 or LPM4.

TA12 TA Module

**Category** Functional

Function Interrupt is lost (slow ACLK)

**Description** Timer A counter is running with slow clock (external TACLK or ACLK) compared to MCLK.

The compare mode is selected for the capture/compare channel and the CCRx register is incremented by one with the occurring compare interrupt (if TAR = CCRx). Due to the fast MCLK the CCRx register increment (CCRx = CCRx+1) happens before the Timer\_A counter has incremented again. Therefore the next compare interrupt should happen at once with the next Timer\_A counter increment (if TAR = CCRx + 1). This interrupt gets

lost.

**Workaround** Switch capture/compare mode to capture mode before the CCRx register increment.

Switch back to compare mode afterwards.

TA16 TA Module

**Category** Functional

**Function** First increment of TAR erroneous when IDx > 00

**Description** The first increment of TAR after any timer clear event (POR/TACLR) happens immediately

following the first positive edge of the selected clock source (INCLK, SMCLK, ACLK or TACLK). This is independent of the clock input divider settings (ID0, ID1). All following

TAR increments are performed correctly with the selected IDx settings.

Workaround None

TA17 TA Module

Category Functional

Function Capture Input CCIOB missing ACLK connection

**Description** The Timer\_A Capture Input CCI0B is not internally connected to the ACLK signal.

Workaround The ACLK signal can be output on P1.0 and externally input on a Timer A capture input

pin.

TA21 TA Module

**Category** Functional

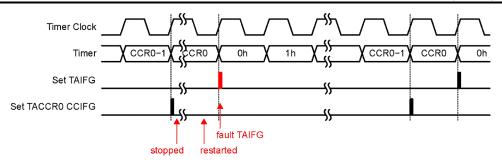

**Function** TAIFG Flag is erroneously set after Timer A restarts in Up Mode

**Description** In Up Mode, the TAIFG flag should only be set when the timer counts from TACCR0 to

zero. However, if the Timer A is stopped at TAR = TACCR0, then cleared (TAR=0) by setting the TACLR bit, and finally restarted in Up Mode, the next rising edge of the TACLK

will erroneously set the TAIFG flag.

Workaround None.

TAB22 TAB Module

**Category** Functional

Function Timer A/Timer B register modification after Watchdog Timer PUC

**Description** Unwanted modification of the Timer\_A/Timer\_B registers TACTL/TBCTL and TAIV/TBIV

can occur when a PUC is generated by the Watchdog Timer(WDT) in Watchdog mode and any Timer\_A/Timer\_B counter register TACCRx/TBCCRx is incremented/

decremented (Timer\_A/Timer\_B does not need to be running).

Workaround Initialize TACTL/TBCTL register after the reset occurs using a MOV instruction (BIS/BIC

may not fully initialize the register). TAIV/TBIV is automatically cleared following this

initialization.

Example code:

MOV.W #VAL, &TACTL

or

MOV.W #VAL, &TBCTL

Where, VAL=0, if Timer is not used in application otherwise, user defined per desired

function.

XOSC5 XOSC Module

Category Functional

**Function** LF crystal failures may not be properly detected by the oscillator fault circuitry

**Description** The oscillator fault error detection of the LFXT1 oscillator in low frequency mode (XTS =

0) may not work reliably causing a failing crystal to go undetected by the CPU, i.e. OFIFG

will not be set.

Workaround None

XOSC8 XOSC Module

**Category** Functional

**Function** ACLK failure when crystal ESR is below 40 kOhm.

**Description** When ACLK is sourced by a low frequency crystal with an ESR below 40 kOhm, the duty

cycle of ACLK may fall below the specification; the OFIFG may become set or in some

instances, ACLK may stop completely.

## Workaround

Please refer to "XOSC8 Guidance" found at SLAA423 for information regarding working with this erratum.
