# 2 Preprogrammed Software Advisories

Advisories that affect factory-programmed software.

✓ The check mark indicates that the issue is present in the specified revision.

The device does not have any errata for this category.

# 3 Debug Only Advisories

Advisories that affect only debug operation.

✓ The check mark indicates that the issue is present in the specified revision.

The device does not have any errata for this category.

# 4 Fixed by Compiler Advisories

Advisories that are resolved by compiler workaround. Refer to each advisory for the IDE and compiler versions with a workaround.

✓ The check mark indicates that the issue is present in the specified revision.

### 5 Nomenclature, Package Symbolization, and Revision Identification

The revision of the device can be identified by the revision letter on the Package Markings or by the HW\_ID located inside the TLV structure of the device.

#### 5.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

**XMS** – Experimental device that is not necessarily representative of the final device's electrical specifications

MSP - Fully qualified production device

Support tool naming prefixes:

X: Development-support product that has not yet completed Texas Instruments internal qualification testing.

null: Fully-qualified development-support product.

XMS devices and X development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. Tl's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format.

### 5.2 Package Markings

# ZQW113 BGA (ZQW), 113 Pin

NOTE: Package marking with "TM" applies only to devices released after 2011.

# **5.3 Memory-Mapped Hardware Revision (TLV Structure)**

This device does not support reading the hardware revision from memory.

Further guidance on how to locate the TLV structure and read out the HW\_ID can be found in the device User's Guide.

# **6 Advisory Descriptions**

CPU8 CPU Module

Category Compiler-Fixed

**Function** Using odd values in the SP register

**Description** If the stack pointer (SP) is written with an odd value then the first time that the SP is used,

the LSB of the SP is forced to zero.

**Workaround** Do not use odd values with the SP.

Refer to the table below for compiler-specific fix implementation information.

IDE/Compiler	Version Number	Notes
IAR Embedded Workbench	Not affected	
TI MSP430 Compiler Tools (Code Composer Studio)	Not affected	
MSP430 GNU Compiler (MSP430-GCC)	MSP430-GCC 4.9 build 389 or later	User is required to add the compiler flag option belowmsilicon-errata=cpu8 -msilicon-errata-warn=cpu8 generates a warning in addition
MSP430 GNU Compiler (MSP430-GCC)	MSP430-GCC 5.x build 14 or later	User is required to add the compiler flag option belowmsilicon-errata=cpu8 -msilicon-errata-warn=cpu8 generates a warning in addition

CPU16 CPU Module

Category Compiler-Fixed

**Function** Indexed addressing with instructions calla, mova and bra.

**Description** With indexed addressing mode and instructions calla, mova, and bra, it is not possible to

reach memory above 64k if the register content is < 64k.

Example: Assume R5 = FFFEh. The instruction calla 0004h(R5) will result in a 20-bit call

of address 0002h instead of 10002h.

Workaround - Use different addressing mode to reach memory above 64k.

- First use adda [index],[Rx] to calculate address in upper memory and then do a calla

[Rx]

Refer to the table below for compiler-specific fix implementation information.

CPU19 CPU Module

Category Compiler-Fixed

**Function** CPUOFF modification may result in unintentional register read

Description

If an instruction that modifies the CPUOFF bit in the Status Register is followed by an instruction with an indirect addressed operand (e.g. MOV @R8, R9, RET, POP, POPM), an unintentional register read operation can occur during the wakeup of the CPU. If the unintentional read occurs to a read sensitive register (e.g. UCB0RXBUF, TAIV), which changes its value or the value of other registers (IFG's), the bug leads to lost interrupts or

wrong register read values.

**Workaround** Insert a NOP instruction after each CPUOFF instruction.

OR

Refer to the table below for compiler-specific fix implementation information. Note that compilers implementing the fix may lead to double stack usage when RET/RETA follows the compiler-inserted NOP.

IDE/Compiler	Version Number	Notes
IAR Embedded Workbench	IAR EW430 v6.20.1 until v6.40	User is required to add the compiler or assembler flag option below hw_workaround=nop_after_lpm

DMA3 DMA Module

**Category** Functional

**Function** Read-modify-write instructions may corrupt DMA address registers

**Description** 

When a 16-bit wide read-modify-write instruction (such as add.w and sub.w) is directly used on a DMA address register (DMAxSA or DMAxDA), the register contents will get corrupted.

Workaround

1. Do not use 16-bit wide read-modify-write instructions on DMA address registers. Instead, in case address calculations are necessary, do the calculations first, and then assign the result to the DMA address registers. OR

2. Use 20-bit wide read-modify-write instructions (such as addx.a, subx.a) on the DMA address registers if needed.

# DMA4 DMA Module

Category

**Functional** 

**Function** 

Corrupted write access to 20-bit DMA registers

Description

When a 20-bit wide write to a DMA address register (DMAxSA or DMAxDA) is interrupted by a DMA transfer, the register contents may be unpredictable.

Workaround

1. Design the application to guarantee that no DMA access interrupts 20-bit wide accesses to the DMA address registers.

OR

2. When accessing the DMA address registers, enable the Read Modify Write disable bit (DMARMWDIS = 1) or temporarily disable all active DMA channels (DMAEN = 0).

OR

3. Use word access for accessing the DMA address registers. Note that this limits the values that can be written to the address registers to 16-bit values (lower 64K of Flash).

# FLL3 FLL Module

Category

**Functional** 

**Function** 

FLLDx = 11 for /8 may generate an unstable MCLK frequency

Description

When setting the FLL to higher frequencies using FLLDx = 11 (/8) the output frequency of the FLL may have a larger frequency variation (e.g. averaged over 2sec) as well as a lower average output frequency than expected when compared to the other FLLDx bit settings.

Workaround

None

FLL6

Functional

Category Function

LFXT1DIG bit is read incorrectly

Description

The LFXT1DIG bit always reads as '0' even when the bit is programmed to '1'. This affects only the readout of the bit and not the clock bypass implementation which functions as

expected.

Workaround

None

www.ti.com Advisory Descriptions

LCDA5 LCDA Module

Category Functional

**Function** Wrong cycle time for first cycle of COMx/Sx signals

**Description** The time of the first cycle of COMx/Sx signals after enabling the LCD\_A module is only

half of the selected value. All following cycles are correct

**Workaround** Not required, because it does not influence the LCD function.

LCDA7 LCDA Module

**Category** Functional

**Function** Higher current consumption when using shared LCD ports as fast toggling outputs

**Description** If a shared LCD pin (segment or com line) is used as digital fast toggling output (f>10kHz)

and the VLCD is >0V (BG enabled) the device current consumption increases with higher

toggling frequencies.

Workaround 1. Do not use shared LCD pins as fast toggling outputs if an LCD is used.

2. Reduce the toggle frequency of the shared pin to <10kHz.

RTC1 RTC Module

Category Functional

Function Incorrect RTCDAY count in BCD mode

**Description** When using the RTC in BCD mode, RTCDAY will count from 0x29 to 0x31 instead of

counting to 0x30 in the month of December (RTCMON=0x12). Furthermore, due to a malfunction in the leap year detection logic, RTCMON/RTCDAY may incorrectly count from 0x02/0x28 to 0x03/0x01 instead of 0x02/0x29, or it may incorrectly count from

0x02/0x28 to 0x02/0x29 instead of 0x03/0x01.

**Workaround** Do not operate the RTC module in BCD mode. Use the RTC in hexadecimal format mode

(RTCBCD = 0) instead. Convert RTC registers to BCD on demand using software.

NOTE: The CPU instruction DADD.B/.W can be used to efficiently implement a hex to BCD conversion. An Assembly language example of such an optimized 8-bit conversion is

shown below:

mov.b #8,R14 // Loop counter, process 8 bits clr.b R12 // Result will get assembled in R12

loop rlc.b R13 // Get MSB from input variable in R13

dadd.b R12,R12 dec.b R14 jnz loop

TA12 TA Module

**Category** Functional

Function Interrupt is lost (slow ACLK)

**Description** Timer\_A counter is running with slow clock (external TACLK or ACLK)compared to MCLK.

The compare mode is selected for the capture/compare channel and the CCRx register

is incremented by one with the occurring compare interrupt (if TAR = CCRx). Due to the fast MCLK the CCRx register increment (CCRx = CCRx+1) happens before the Timer\_A counter has incremented again. Therefore the next compare interrupt should happen at once with the next Timer\_A counter increment (if TAR = CCRx + 1). This interrupt gets lost

Workaround

Switch capture/compare mode to capture mode before the CCRx register increment. Switch back to compare mode afterwards.

TA16 TA Module

**Category** Functional

**Function** First increment of TAR erroneous when IDx > 00

**Description** The first increment of TAR after any timer clear event (POR/TACLR) happens immediately

following the first positive edge of the selected clock source (INCLK, SMCLK, ACLK or TACLK). This is independent of the clock input divider settings (ID0, ID1). All following

TAR increments are performed correctly with the selected IDx settings.

Workaround None

TA18 TA Module

**Category** Functional

**Function** MOV to TACTL may clear TAR

**Description** When TACTL is modified with a MOV instruction, the contents of TAR may be cleared,

even when TACLR is not set.

**Workaround** Use BIS or BIC instructions to modify TACTL.

Note

A DMA transfer must not occur while these BIS and BIC instructions execute. This can be prevented by disabling the DMA prior to these instructions, or by using the DMAONFETCH bit to align DMA transfers to instruction fetch boundaries.

TA21 TA Module

Category Functional

**Function** TAIFG Flag is erroneously set after Timer A restarts in Up Mode

**Description** In Up Mode, the TAIFG flag should only be set when the timer counts from TACCR0 to

zero. However, if the Timer A is stopped at TAR = TACCR0, then cleared (TAR=0) by setting the TACLR bit, and finally restarted in Up Mode, the next rising edge of the TACLK

will erroneously set the TAIFG flag.

Workaround None.

TAB22 TAB Module

**Category** Functional

Function Timer A/Timer B register modification after Watchdog Timer PUC

**Description**Unwanted modification of the Timer A/Timer B registers TACTL/TBCTL and TAIV/TBIV

can occur when a PUC is generated by the Watchdog Timer(WDT) in Watchdog mode and any Timer\_A/Timer\_B counter register TACCRx/TBCCRx is incremented/

decremented (Timer\_A/Timer\_B does not need to be running).

Workaround Initialize TACTL/TBCTL register after the reset occurs using a MOV instruction (BIS/BIC

may not fully initialize the register). TAIV/TBIV is automatically cleared following this

initialization.

Example code:

MOV.W #VAL, &TACTL

or

MOV.W #VAL, &TBCTL

Where, VAL=0, if Timer is not used in application otherwise, user defined per desired

function.

TB2 TB Module

**Category** Functional

Function Interrupt is lost (slow ACLK)

**Description** Timer B counter is running with slow clock (external TBCLK or ACLK) compared to

MCLK. The compare mode is selected for the capture/compare channel and the CCRx register is incremented by 1 with the occurring compare interrupt (if TBR = CCRx). Due to the fast MCLK, the CCRx register increment (CCRx = CCRx + 1) happens before the Timer\_B counter has incremented again. Therefore, the next compare interrupt should happen at once with the next Timer\_B counter increment (if TBR = CCRx + 1). This

interrupt is lost.

**Workaround** Switch capture/compare mode to capture mode before the CCRx register increment.

Switch back to compare mode afterward.

TB16 TB Module

Category Functional

**Function** First increment of TBR erroneous when IDx > 00

**Description** The first increment of TBR after any timer clear event (POR/TBCLR) happens

immediately following the first positive edge of the selected clock source (INCLK, SMCLK, ACLK, or TBCLK). This is independent of the clock input divider settings (ID0, ID1). All following TBR increments are performed correctly with the selected IDx settings.

Workaround None

TB18 TB Module

**Category** Functional

**Function** MOV to TBCTL may clear TBR

**Description** When TBCTL is modified with a MOV instruction, the contents of TBR may be cleared,

even when TBCLR is not set.

**Workaround** Use BIS or BIC instructions to modify TBCTL.

#### Note

A DMA transfer must not occur while these BIS and BIC instructions execute. This can be prevented by disabling the DMA prior to these instructions or by using the DMAONFETCH bit to align DMA transfers to instruction fetch boundaries.

TB24 TB Module

**Category** Functional

**Function** TBIFG Flag is erroneously set after Timer B restarts in Up Mode

**Description** In Up Mode, the TBIFG flag should only be set when the timer resets from TBCCR0 to zero. However, if the Timer B is stopped at TBR = TBCCR0, then cleared (TBR=0) by

setting the TBCLR bit, and finally restarted in Up Mode, the next rising edge of the TBCLK

will erroneously set the TBIFG flag.

Workaround None.

USCI16 USCI Module

**Category** Functional

Function UART/IrDA Mode Lost Characters

**Description** When configured for UART/IrDA mode, the USCI baud rate generator may halt operation

under the following conditions:

1 - IrDA mode: repeated invalid start bits on the receive line or

2 - UART/IrDA modes: positive pulse on the receive line during break character reception inside the stop bit time slot (the second stop bit time slot in case of UCSPB=1) with a pulse width that passes the deglitch filter but is shorter than half a bit time.

After halting, additional characters will be ignored. Transmit functionality is not affected.

#### Workaround

Check the UCBUSY flag status periodically in software. If the flag is set and no character has been received in the expected time, reset the USCI module in software. To reset the USCI module, toggle UCSWRST and re-enable the USCI interrupts.

# USCI19 USCI Module

**Category** Functional

**Function** LPM4 may affect USCI operation

**Description** When SMCLK is used as the USCI clock source, and SMCLK gets deactivated due to

a LPM4 entry, ongoing SPI master, I2C master, and UART transmit transaction will be

interrupted. Also, while in LPM4, UART receive operation is non-functional.

Workaround Do not enter LPM4 while SPI master, I2C master, or UART transmit operations are active.

Wait for the operation to be completed prior entering LPM4, or enter a different low-power mode instead. Also, do not use LPM4 in case of UART receive operation. Instead, use a

different low-power mode.

# USCI20 USCI Module

#### Category Functional

### Function I2C Mode Multi-master transmitter issue

# **Description** When configured for I2C master-transmitter mode, and used in a multi-master

environment, the USCI module can cause unpredictable bus behavior if all of the following four conditions are true:

1 - Two masters are generating SCL

And

2 - The slave is stretching the SCL low phase of an ACK period while outputting NACK on  $\ensuremath{\mathsf{SDA}}$ 

And

3 - The slave drives ACK on SDA after the USCI has already released SCL, and then the SCL bus line gets released

And

4 - The transmit buffer has not been loaded before the other master continues communication by driving SCL low

The USCI will remain in the SCL high phase until the transmit buffer is written. After the transmit buffer has been written, the USCI will interfere with the current bus activity and may cause unpredictable bus behavior.

### Workaround

1 - Ensure that slave doesn't stretch the SCL low phase of an ACK period

Or

2 - Ensure that the transmit buffer is loaded in time

Or

3 - Do not use the multi-master transmitter mode

**USCI** Module USCI21

**Functional** Category

**Function** UART IrDA receive filter

**Description** The IrDA receive filter can be used to filter pulses with length UCAIRRXFL configured

> in UCAxIRRCTL register. If UCIRRXFE is set the IrDA receive decoder may filter out pulses longer than the configured filter length depending on frequency of BRCLK. This is

resulting in framing errors or corrupted data on the receiver side.

Workaround Depending on the used baud rate and the configured filter length a maximum frequency

for BRCLK needs to be set to avoid this issue:

For baud rates equal and higher than 115.000 the maximum allowed BRCLK frequency is equal to the max specified system frequency.

Max BRCLK =  $\frac{\text{Filter Length} + 64}{2} \times \frac{\text{Baud Rate} \times 16}{3 \times 10^6}$

**USCI** Module USCI22

www.ti.com Advisory Descriptions

**Category** Functional

**Function** I2C Master Receiver with 10-bit slave addressing

**Description**Unexpected behavior of the USCI\_B can occur when configured in I2C master receive

mode with 10-bit slave addressing under the following conditions:

1) The USCI sends first byte of slave address, the slave sends an ACK and when second address byte is sent, the slave sends a NACK.

2) Master sends a repeat start condition (If UCTXSTT=1).

3) The first address byte following the repeated start is acknowledged.

However, the second address byte is not sent, instead the Master incorrectly starts to

receive data and sets UCBxRXIFG=1.

**Workaround** Do not use repeated start condition instead set the stop condition UCTXSTP=1 in the

NACK ISR prior to the following start condition (USTXSTT=1).

USCI23 USCI Module

**Category** Functional

**Function** UART transmit mode with automatic baud rate detection

**Description** Erroneous behavior of the USCI\_A can occur when configured in UART transmit mode

with automatic baud rate detection. During transmission if a "Transmit break" is initiated (UCTXBRK=1), the USCI\_A will not deliver a stop bit of logic high, instead, it will send a

logic low during the subsequent synch period.

Workaround 1) Follow User's Guide instructions for transmitting a break/synch field following

UCSWRST=1.

Or,

2) Set UCTXBRK=1 before an active transmission, i.e. check for bit UCBUSY=0 and then

set UCTXBRK=1.

USCI24 USCI Module

**Category** Functional

Function Incorrect baud rate information during UART automatic baud rate detection mode

**Description** Erroneous behavior of the USCI A can occur when configured in UART mode with

automatic baud rate detection. After automatic baud rate measurement is complete, the UART updates UCAxBR0 and UCAxBR1. Under Oversampling mode (UCOS16=1), for baud rates that should result in UCAxBRx=0x0002, the UART incorrectly reports it as

UCAxBRx=0x5555.

**Workaround** When break/synch is detected following the automatic baud rate detection, the flag

UCBRK flag is set to 1. Check if UCAxBRx=0x5555 and correct it to 0x0002.

USCI25 USCI Module

**Category** Functional

**Function** TXIFG is not reset when NACK is received in I2C mode

**Description** When the USCI\_B module is configured as an I2C master transmitter the TXIFG is not

reset after a NACK is received if the master is configured to send a restart (UCTXSTT=1

& UCTXSTP=0).

Workaround Reset TXIFG in software within the NACKIFG interrupt service routine

USCI26 USCI Module

**Category** Functional

**Function** Tbuf parameter violation in I2C multi-master mode

**Description** In multi-master I2C systems the timing parameter Tbuf (bus free time between a stop

condition and the following start) is not guaranteed to match the I2C specification of 4.7us in standard mode and 1.3us in fast mode. If the UCTXSTT bit is set during a running I2C transaction, the USCI module waits and issues the start condition on bus release causing

the violation to occur.

Note: It is recommended to check if UCBBUSY bit is cleared before setting UCTXSTT=1.

Workaround None

USCI27 USCI Module

**Category** Functional

**Function** Timing of USCI I2C interrupts may cause device reset due to automatic clear of an IFG.

**Description** When certain USCI I2C interrupt flags (IFG) are set and an automatic flag-clearing event on the I2C bus occurs, the program counter may become corrupted. This will only happen

when the IFG is cleared within a critical time window (~6 CPU clock cycles) after a USCI interrupt request occurs and before the interrupt servicing is initiated. The affected

interrupts are UCBxTXIFG, UCSTPIFG, UCSTTIFG and UCNACKIFG.

The automatic flag-clearing scenarios are described in the following situations:

(1) A pending UCBxTXIFG interrupt request is cleared on the falling SCL clock edge

following a NACK.

(2) A pending UCSTPIFG, UCSTTIFG, or UCNACKIFG interrupt request is cleared by a

following Start condition.

**Workaround** (1) Polling the affected flags instead of enabling the interrupts.

or

(2) Ensuring the above mentioned flag-clearing events occur after a time delay of 6 CPU

clock cycles has elapsed since the interrupt request occurred and was accepted.

USCI30 USCI Module

Category Functional

**Function** I2C mode master receiver / slave receiver

**Description**When the USCI I2C module is configured as a receiver (master or slave), it performs a double-buffered receive operation. In a transaction of two bytes, once the first byte is moved from the receive shift register to the receive buffer the byte is acknowledged and

the state machine allows the reception of the next byte.

If the receive buffer has not been cleared of its contents by reading the UCBxRXBUF register while the 7th bit of the following data byte is being received, an error condition may occur on the I2C bus. Depending on the USCI configuration the following may occur:

1) If the USCI is configured as an I2C master receiver, an unintentional repeated start condition can be triggered or the master switches into an idle state (I2C communication aborted). The reception of the current data byte is not successful in this case.

2) If the USCI is configured as I2C slave receiver, the slave can switch to an idle state stalling I2C communication. The reception of the current data byte is not successful in this case. The USCI I2C state machine will notify the master of the aborted reception with a NACK.

Note that the error condition described above occurs only within a limited window of the 7th bit of the current byte being received. If the receive buffer is read outside of this window (before or after), then the error condition will not occur.

#### Workaround

a) The error condition can be avoided altogether by servicing the UCBxRXIFG in a timely manner. This can be done by (a) servicing the interrupt and ensuring UCBxRXBUF is read promptly or (b) Using the DMA to automatically read bytes from receive buffer upon UCBxRXIFG being set.

OR

b) In case the receive buffer cannot be read out in time, test the I2C clock line before the UCBxRXBUF is read out to ensure that the critical window has elapsed. This is done by checking if the clock line low status indicator bit UCSCLLOW is set for atleast three USCI bit clock cycles i.e. 3 X t(BitClock).

Note that the last byte of the transaction must be read directly from UCBxRXBUF. For all other bytes follow the workaround:

Code flow for workaround

- (1) Enter RX ISR for reading receiving bytes
- (2) Check if UCSCLLOW.UCBxSTAT == 1
- (3) If no, repeat step 2 until set
- (4) If yes, repeat step 2 for a time period > 3 x t (BitClock) where t (BitClock) = 1/ f (BitClock)
- (5) If window of 3 x t(BitClock) cycles has elapsed, it is safe to read UCBxRXBUF

# USCI34 USCI Module

Category

**Functional** 

**Function** 

I2C multi-master transmit may lose first few bytes.

**Description** 

In an I2C multi-master system (UCMM =1), under the following conditions:

(1)the master is configured as a transmitter (UCTR =1)

AND

(2)the start bit is set (UCTXSTT =1);

if the I2C bus is unavailable, then the USCI module enters an idle state where it waits and checks for bus release. While in the idle state it is possible that the USCI master updates its TXIFG based on clock line activity due to other master/slave communication on the bus. The data byte(s) loaded in TXBUF while in idle state are lost and transmit pointers initialized by the user in the transmit ISR are updated incorrectly.

#### Workaround

Verify that the START condition has been sent (UCTXSTT =0) before loading TXBUF with data.

```
Example:
#pragma vector = USCIAB0TX VECTOR
  interrupt void USCIAB0TX ISR(void)
// Workaround for USCI34
if(UCB0CTL1&UCTXSTT)
// TXData = pointer to the transmit buffer start
// PTxData = pointer to transmit in the ISR
PTxData = TXData; // restore the transmit buffer pointer if the Start bit is set
if(IFG2&UCB0TXIFG)
if (PTxData < = PTxDataEnd) // Check TX byte counter
UCB0TXBUF = *PTxData++; // Load TX buffer
else
UCB0CTL1 |= UCTXSTP; // I2C stop condition
IFG2 &= ~UCB0TXIFG; // Clear USCI_B0 TX int flag
  bic SR register on exit(CPUOFF); // Exit LPM0
}
```

### USCI35

#### **USCI Module**

Category

**Functional** 

**Function** 

Violation of setup and hold times for (repeated) start in I2C master mode

**Description** 

In I2C master mode, the setup and hold times for a (repeated) START,  $t_{SU,STA}$  and  $t_{HD,STA}$  respectively, can be violated if SCL clock frequency is greater than 50kHz in standard mode (100kbps). As a result, a slave can receive incorrect data or the I2C bus can be stalled due to clock stretching by the slave.

Workaround

If using repeated start, ensure SCL clock frequencies is < 50kHz in I2C standard mode (100 kbps).

USCI40

### **USCI** Module

Category

**Functional** 

**Function** 

SPI Slave Transmit with clock phase select = 1

Description

In SPI slave mode with clock phase select set to 1 (UCAxCTLW0.UCCKPH=1), after the first TX byte, all following bytes are shifted by one bit with shift direction dependent on UCMSB. This is due to the internal shift register getting pre-loaded asynchronously when writing to the USCIA TXBUF register. TX data in the internal buffer is shifted by one bit after the RX data is received.

www.ti.com Advisory Descriptions

**Workaround** Reinitialize TXBUF before using SPI and after each transmission.

If transmit data needs to be repeated with the next transmission, then write back

previously read value:

UCAxTXBUF = UCAxTXBUF;

WDG2 WDG Module

**Category** Functional

Function Incorrectly accessing a flash control register

**Description** If a key violation is caused by incorrectly accessing a flash control register, the watchdog

interrupt flag is set in addition to the expected PUC.

Workaround None

XOSC5 XOSC Module

**Category** Functional

**Function** LF crystal failures may not be properly detected by the oscillator fault circuitry

**Description** The oscillator fault error detection of the LFXT1 oscillator in low frequency mode (XTS =

0) may not work reliably causing a failing crystal to go undetected by the CPU, i.e. OFIFG

will not be set.

Workaround None

XOSC8 XOSC Module

Category Functional

**Function** ACLK failure when crystal ESR is below 40 kOhm.

**Description** When ACLK is sourced by a low frequency crystal with an ESR below 40 kOhm, the duty

cycle of ACLK may fall below the specification; the OFIFG may become set or in some

instances, ACLK may stop completely.

Workaround Please refer to "XOSC8 Guidance" found at SLAA423 for information regarding working

with this erratum.

XOSC9 XOSC Module

Category Functional

**Function** XT1 Oscillator may not function as expected in HF mode

**Description** XT1 oscillator does not work correctly in high frequency mode at supply voltages below

2.0V with crystal frequency > 4MHz.

Workaround None. When XT1 oscillator is used in HF mode with crystal frequency > 4MHz ensure a

supply voltage > 2.2V.
