

## ABSTRACT

This report discusses the results of the total-ionizing dose (TID) testing for the Texas Instruments TPS7H2140-SEP. The TPS7H2140-SEP device is a fully protected quad-channel eFuse with four integrated 160-mΩ NMOS power FETs. Full diagnostics and high-accuracy current sense enables intelligent control of the loads. An external adjustable current limit improves the reliability of whole system by limiting the inrush or overload current.

The study was done to determine TID effects under high dose rate (HDR) and low dose rate (LDR) up to 30 krad(Si). The results show that all samples passed within the specified limits up to 30 krad(Si) for HDR and LDR.

## 2 Total Dose Test Setup

### 2.1 Test Overview

The TPS7H2140-SEP was tested according to MIL-STD-883, Test Method 1019.9. For this testing, Conditions A and D were used. For this test, the product was irradiated up to the target radiation level, and then put through full electrical parametric testing on the production Automated Test Equipment (ATE). All devices remained functional passing all parametric test limits.

### 2.2 Test Description and Facilities

The TPS7H2140-SEP HDR exposure was performed on biased and unbiased devices in a Co-60 gamma cell at Texas Instruments CLAB in Dallas, Texas. The dose rate for exposure must be between 50 and 300krad(Si) / sec per MIL standard (MIL-STD-883). For the purpose of these tests, the actual dose rate for the devices was 202.039 rad(Si) / sec. After exposure, the devices were packed in dry ice (per MIL-STD-883 Method 1019.9 section 3.10) and tested at room-temperature for post-radiation electrical evaluation using Texas Instruments ATE. ATE test limits are set per data sheet electrical limits based on qualification and characterization data.

The TPS7H2140-SEP LDR exposure was performed on biased and unbiased devices in a Co60 gamma cell under a 10-mrad(Si) / s exposure rate. The dose rate of the irradiator used in the exposure ranges from < 10 mrad(Si) / s to a maximum of approximately 65 rad(Si) / s, determined by the distance from the source. The exposure boards are housed in a lead-aluminum box (as specified in MIL-STD-883 TM 1019.9) to harden the gamma spectrum and minimize dose enhancement effects. The irradiator calibration is maintained by Logmire Laboratories using Thermoluminescence Dosimeters (TLDs) traceable to the National Institute of Standards and Technology (NIST) and the dosimetry was verified using TLDs prior to the radiation exposures. After exposure, the devices were returned to TI Dallas and tested at room temperature for postradiation electrical evaluation using Texas Instruments production ATE. ATE test limits are set per data sheet electrical limits based on qualification and characterization data.

### 2.3 Test Setup Details

The devices under HDR and LDR exposure were tested in two conditions, biased and unbiased, as described in the following sections.

#### 2.3.1 Unbiased

For the unbiased HDR and LDR conditions, the exposure was performed with all pins grounded.

#### 2.3.2 Biased

Figure 2-1 shows the bias conditions used for HDR and LDR exposure.

## 3 TID Characterization Test Results

### 3.1 TID Characterization Summary Results

The results show that all devices were fully functional and within specification limits up to 30 krad(Si) for HDR and LDR TID.

Overall, the TPS7H2140-SEP showed a strong degree of hardness to HDR and LDR TID irradiation up to 30 krad(Si) for both biased and unbiased exposure conditions. The measurements taken post-irradiation for each sample set showed a marginal shift for most parameters at each dose level for both biased and unbiased. The parameters that did show a greater degree of change between pre- and post-irradiation were still within the data sheet electrical specifications (see [Section 3.2](#) for the data sheet electrical parameters table).

See [Appendix A](#) for HDR report up to 30 krad(Si).

See [Appendix B](#) for LDR report up to 30 krad(Si).
