In addition, the DSP_MMU0 traffic can be aborted in case of a lockup via the DSP_SYS_MMU_CONFIG [8] MMU0_ABORT bit. In other words, this bit can be used to clear a hang condition that may occur if the DSP_MMU0 encounters a page fault that cannot be serviced.

For more information on device DSP_MMU0 functionality and register settings, refer to the Section 15.3, *MMU Functional Description* and Section 15.5, *MMU Register Manual*, in the chapter, *Memory Management Units*, respectively.

4.3.6.3 Routing EDMA Traffic thorugh DSP MMU1

The DSP_EDMA traffics initiated on the DSP EDMA master port can be optionally routed through the DSP_MMU1 on the EDMA address path. This is controlled in two levels :

- **global** by the DSP_SYSTEM register DSP_SYS_MMU_CONFIG [4] MMU1_EN bit. This bit acts as a

mux-select : setting it to 0b1 enables requests to use the DSP_MMU1; clearing this bit to 0b0 disables MMU table lookup and causes accesses to use the non-translated address (MMU bypass). By default the DSP_MMU1 is disabled in DSP_SYSTEM and EDMA traffic bypasses the DSP_MMU1.

- **local** by MMU enable control in a dedicated DSP_MMU1 memory mapped register. It is used to enable the MMU functionality after the page tables are programmed for MMU operation. For details, refer to the Section 15.5, *MMU Register Manual*, in the Chapter 15,*Memory Management Units*.

NOTE: For the DSP_MMU1 to operate, SW should enable it both at the DSP_SYSTEM global level and DSP_MMU1 local register level.

When enabling the DSP_MMU1, software must take care that no transactions are in flight through that MMU. This is typically handled by disabling any EDMA transactions prior to enabling the MMU. Note that the local enable bit inside the DSP_MMU1 must be configured as normal (refer to the Chapter 15,*Memory Management Units*.)

For more information on the MFENCE operation, refer to the section, *C66x CPU Instruction Set* of the *TMS320C66x DSP CPU and Instruction Set*).

In addition, the DSP_MMU1 traffic can be aborted in case of a lockup via the DSP_SYS_MMU_CONFIG [12] MMU1_ABORT bit. In other words, this bit can be used to clear a hang condition that may occur if the DSP_MMU1 encounters a page fault that cannot be serviced.

For more information on device DSP_MMU1 functionality and settings, refer to the Section 15.3, *MMU Functional Description* and the Section 15.5, *MMU Register Manual*, in the chapter, *Memory Management Units*, respectively.

4.3.7 DSP Integrated EDMA Subsystem

This section represents an overview of the DSP integrated EDMA functionalities, as well as the subsystem level and device related register controls. For more details on the EDMA functionalities and programming registers, refer to the Chapter 11, *Enhanced DMA*.

4.3.7.1 DSP EDMA Overview

The enhanced-DMA subsystem which is part of the DSP1 (DSP1_EDMA) and the DSP2 (DSP2_EDMA) subsystems is the primary DMA engine for transfers between system memory (DDR and/or L3_MAIN SRAM) and DSP internal memories (L1s and L2).

The Channel Controller - DSP_EDMA_CC serves as the “user interface” of the DSP_EDMA. The two Transfer Controllers - DSP_EDMA_TC0 and DSP_EDMA_TC1 serve as the data transfer engines of the DSP_EDMA. The C66x CPU tipically programs the Channel Controller, which in turn submits Transfer Requests (TR) to the appropriate Transfer Controller. Interrupts are posted in the DSP_EDMA_CC upon transfer completion (if requested), and signaled to the C66x. The EDMA TC completion interrupt is not supported/connected.

The DSP_EDMA is primarily used to perform block transfers between DSP C66x CorePac memories (mostly L2 memory) and system memory (mostly DDR or L3 SRAM).

The DSP_EDMA is configured with 2 Queues (in the CC). Two DSP_EDMA traffic controllers (TC) offer high performance and preemptability of transfers. For typical use cases, it is expected that low latency/small payload transfers) use Queue0/TC0 and high bandwidth/large payload transfers (e.g., DDR on L3_MAIN or DSP local L2 SRAM) will use Queue1/TC1.

DSP_EDMA_CC configuration in the device features :

- 64x EDMA channels
- 8x QDMA channels
- 64x interrupt channels
- 128x PaRAM entries
- 2x Event Queues
- 2x Traffic controllers

- memory protection support
- channel mapping capability
- 8x memory protected and Shadow Regions

DSP_EDMA_TC0/TC1 configuration in the device features :

- 2048 Byte FIFO support
- multitag support
- 16-bit data bus
- 4-level destination register depth
- 7-bit address for internal FIFOs
- 16 IDs for Read commands
- 16 IDs for Write commands

NOTE: The device DSP integrated EDMA controller instances (DSP_EDMA_CC, DSP_EDMA_TC0 and DSP_EDMA_TC1) are functionally identical with the device EDMA controller instances (EDMA_TPCC, EDMA_TPTC0 and EDMA_TPTC1). The only difference is that the DSP_EDMA instances are located at different physical addresses.

For more details on the DSP_EDMA_CC, DSP_EDMA_TC0 and DSP_EDMA_TC1 controllers functionalities, refer to Section 11.4, *EDMA Controller Functional Description*, in Chapter 11, *Enhanced DMA*.

The DSP_EDMA instances, their corresponding registers summary and descriptions are covered in the Section 11.7, *EDMA Register Manual* of the Chapter 11, *Enhanced DMA*.

4.3.7.2 DSP System and Device Level Settings of DSP EDMA

DSP_EDMA traffic TC0 and TC1 controllers "Active" or "Idle" status: can be monitored in DSP_SYSTEM located :

- DSP_SYS_STAT[1] TC0_STAT bit
- DSP_SYS_STAT[2] TC1_STAT bit

The **default** burst size for both the DSP_EDMA_TC0 and DSP_EDMA_TC1 can be defined in DSP_SYSTEM register. This is achieved via programming :

- DSP_SYS_BUS_CONFIG [1:0] TC0_DBS
- DSP_SYS_BUS_CONFIG [5:4] TC1_DBS

There are also other DSP_EDMA controls associated with DSP_NoC interconnect pressure settings. For more details, refer to the Section 4.3.8.

The 3 error events associated with the DSP_EDMA_CC, DSP_EDMA_TC0 and DSP_EDMA_TC1 are exported outside the DSP C66x CorePac in the subsystem, and are able to trigger the ERRINT_IRQ aggregated interrupt output. See also corresponding **"tpcc_errint_level", "tptc_errint0_level" and "tptc_errint1_level"** events, respectively in the Table 4-5.

NOTE: The DSP_EDMA_CC, DSP_EDMA_TC0 and DSP_EDMA_TC1 events are NOT exported outside DSP subsystem. However they are merged (OR-ed) along with other error event sources within the DSP subsystem to produce a single ERRINT_IRQ interrupt exported outside the DSP subsystem.

For more details on ERRINT_IRQ generation and asscoiated event registers at DSP_SYSTEM level, refer to the Section 4.3.4.2.2.

The DSP_SYSTEM logic is assigned to route the external DMA requests to the EDMA hardware request inputs. Additionally, EDMA events can conditionally wake-up the DSP system from a low power mode, via software enabling DSP_SYSTEM MWakeup handshake with the device PRCM. This mechanism is described in the Section 4.3.5.

The programmable muxing of various external DMA request sources to the DSP EDMA. DMA_DSP1_DREQ_x and DMA_DSP2_DREQ_x input lines (where x=0 to 19) is covered in the Section 13.4.6.5, *DMA_CROSSBAR Module Functional Description*, of the Chapter 13, *Control Module*.

DSP1/DSP2 subsystem external DMA request sources : For the default DSP1 / DSP2 external DMA request sources, routed via the device DMA_CROSSBAR to the DSP1_EDMA / DSP2_EDMA channel controller inputs (DMA_DSP1_DREQ_i / DMA_DSP2_DREQ_i), respectively, refer to the Section 4.3.5.

4.3.8 DSP L2 interconnect Network

A 128-bit level 2 (L2) Interconnect from Arteris - FlexNoC® is instantiated in the DSP subsystem, outside the DSP C66x CorePac. It is signified as "DSP_NoC" throughout this chapter.

NOTE: The C66x master MDMA data does NOT flow through the DSP_NoC.

The system and local initiators on DSP_NoC are as follows :

- local C66x CPU 32-bit CFG master port which traffic is split via DSP_NoC fabric into several configuration target traffics inside and outside the DSP subsystem.
- SDMA initiator port on DSP_NoC which conveys accesses towards DSP Memories and memory-mapped registers initiated outside the DSP subsystem via the L3_MAIN interconnect.
- EDMA traffic controllers - TC0 read / write initiator ports
- EDMA traffic controllers - TC1 read / write initiator ports

NOTE: The DSP_ICFG space is not visible to SDMA initiators (DSP_EDMA or DSP hosts on L3_MAIN) with CFG traffic.

The targets on the DSP_NoC are as follows :

- DSP C66x CorePac SDMA port
- Internal CFG targets on the DSP_NoC :
  - DSP_MMU0 Cfg
  - DSP_MMU1 Cfg
  - DSP_SYSTEM Cfg
  - DSP_EDMA_CC Cfg
  - DSP_EDMA_TC0 Cfg
  - DSP_EDMA_TC1 Cfg
- 32-bit CFG port on L3_MAIN (it acts as master on the L3_MAIN)
- EDMA Target port which conveys EDMA bidi transfers outside the DSP (through or bypassing DSP_MMU1).

The Table 4-8 summarizes the interconnections which can be established between DSP initiators and targets over the L2 DSP_NoC in the device. In this table HW implemented interconnections are marked with an asterics.

Table 4-8. DSP_NoC Defined Connectivities

		DSP_NoC Initiators			
		DSP C66x CorePac CFG init	EDMA_TC0 init	EDMA_TC1 init	SDMA init (mapped to SDMA port on L3_MAIN)
DSP_NoC Targets	DSP C66x CorePac SDMA (slave) port	n.a.	*	*	*
	DSP_MMU0 Cfg	*	n.a.	n.a.	*
	DSP_MMU1 Cfg	*	n.a.	n.a.	*
	DSP_SYSTEM Cfg	*	n.a.	n.a.	*
	DSP_EDMA_CC Cfg	*	n.a.	n.a.	*
	DSP_EDMA_TC0 Cfg	*	n.a.	n.a.	*
	DSP_EDMA_TC1 Cfg	*	n.a.	n.a.	*
	DSP_NoC Cfg	*	n.a.	n.a.	*
	Cfg port (Cfg Init on L3_MAIN)	*	n.a.	n.a.	n.a.
	Master DMA port (DSP DMA init on L3_MAIN)	n.a.	*	*	n.a.

A DSP_NoC error event (combination of several local to the interconnect events) is exported outside the DSP C66x CorePac in the subsystem, and can be enabled to trigger the ERRINT_IRQ aggregated interrupt output. See also corresponding **"noc_errint_level"** event in the Table 4-5.

NOTE: The DSP_NoC event is NOT exported outside DSP subsystem. However it is merged (OR-ed) along with other error event sources within the DSP subsystem to produce a single ERRINT_IRQ interrupt exported outside the DSP subsystem.

For more details on ERRINT_IRQ generation and asscoiated event registers at DSP_SYSTEM level, refer to the Section 4.3.4.2.2.

4.3.8.1 DSP Public Firewall Settings

The DSP1 and DSP2 L2 Interconnect (DSP1_NoC and DSP2_NoC, respectively) implements two firewalls – dsp firewall0 (DSP_FW0) is used to protect DSP_MMU0's configuration space (which includes the TLB) and dsp firewall1 is used to protect DSP_MMU1's configuration space (which includes the TLB). Access permission is based on the privilege level, domain, ConnID, and access types of a request.

The default value of 0xFFFF_FFFF in the MRM region 0 permission registers:

- L3_DSPSS_INIT_OCP_MMU0_CTRL_TARG_OCP_FW_503000_MRM_PERMISSION_REGION_LOW_0
- L3_DSPSS_INIT_OCP_MMU0_CTRL_TARG_OCP_FW_503000_MRM_PERMISSION_REGION_HIGH_0
- L3_DSPSS_INIT_OCP_MMU1_CTRL_TARG_OCP_FW_504000_MRM_PERMISSION_REGION_LOW_0
- L3_DSPSS_INIT_OCP_MMU1_CTRL_TARG_OCP_FW_504000_MRM_PERMISSION_REGION_HIGH_0

permits any requestor to access the DSP_MMU0 and DSP_MMU1 configuration space.

For more information on the access region definitions, public privilege access, public user access and initiator permission settings, which are identical between DSP_NoC firewalls and L3_MAIN interconnect firewalls, refer to the Section 9.2.3.7.3, *L3_MAIN Firewall Functionality*, in the, Section 9.2, *L3_MAIN Interconnect*.

There are also several other DSP_NoC registers - L3_DSPSS_INIT_OCP_MMU0_CTRL_TARG_OCP_FW_503000_LOGICAL_ADDR_ERRLOG_0, L3_DSPSS_INIT_OCP_MMU0_CTRL_TARG_OCP_FW_503000_REGUPDATE_CONTROL used for error handling, firewall reset and other purposes. These are functionally identical with the corresponding L3_MAIN interconnect registers, described in the Section 9.2.3.8, *L3_MAIN Interconnect Error Handling*, in the Section 9.2, *L3_MAIN Interconnect*.

The various firewall access control registers are part of the C66x CPU local accessible - DSP_FW_L2_NOC_CFG address space, and L3_MAIN initiators accessible DSP1/2_FW_L2_NOC_CFG configuration space. The corresponding MMU0 and MMU1 configuration space firewall registers (DSP_FW0 starting at offset **0x0000_0000** , and DSP_FW1 starting at offset **0x0000_1000**) are summarized and described in the Section 4.4.4.

4.3.8.2 DSP NoC Flag Mux and Error Log Registers

The DSP_NoC registers (starting at offset >= 0x0000_4000) are used for error logging and flag muxing purposes. The status information stored in there can be used for example to resolve issues related to DSP_NoC access conflicts, for debug purposes, etc.

For more information, refer to the Section 9.2.3.5, *Flag Muxing*, in the Section 9.2, *L3_MAIN Interconnect*.

4.3.8.3 DSP NoC Arbitration

A pressure based arbitration is implemented for the DSP_NoC interconnect.

A DSP_NoC local MFlag mechanism is used but it is SW controlled in the DSP_SYSTEM configuration space.

This is done via the register DSP_SYS_BUS_CONFIG bitfields :

- TC0_L2PRES - for DSP_EDMA_TC0 pressure control
- TC1_L2PRES - for DSP_EDMA_TC1 pressure control
- CFG_L2PRES - for the DSP C66x CorePac 32-bit CFG pressure control
- SDMA_L2PRES - for pressure control of the DSP system and L3_MAIN accesses targetting the DSP C66x CorePac SDMA slave port

The pressure for each port is signaled on a MFlag[1:0] bus and conveys a value of 0 (lowest), 1 (medium), or 3 (highest). A value of 0x2 is reserved/undefined.

NOTE: The default pressure level for all ports is 0x0 and is recommended for most systems. This results in round-robin arbitration across active requests.

4.3.9 DSP Boot Configuration

DSP1 subsystem boot vector input which defines the 22-bit DSP1 Boot Address is mapped to the device core control module register CTRL_CORE_CONTROL_DSP1_RST_VECT[21:0] DSP1_RST_VECT bitfield. DSP2 subsystem boot vector input which defines the 22-bit DSP2 Boot Address is mapped to the device core control module register CTRL_CORE_CONTROL_DSP2_RST_VECT[21:0] DSP2_RST_VECT bitfield.In general, the device host loads code to a given address location in the device system memory, sets the DSP1_RST_VECT / DSP2_RST_VECT bitfield to the address value, and then release the DSP1 / DSP2 from reset. At that point, the DSP1 / DSP2 will begin fetching code from that location.

NOTE: If the values of the control core module CTRL_CORE_CONTROL_DSP1_RST_VECT[21:0] / CTRL_CORE_CONTROL_DSP2_RST_VECT [21:0] register change, the values will be taken into account by DSP upon the next reset.

NOTE: Upon device boot time (a power-on reset applied), the device "sysboot15" input latched in the Control Module bootstrap register defines the value of DSP functional clock divider (2 or 3). For more details, refer to the Section 4.3.3.1

4.3.10 DSP Internal and External Memory Views

4.3.10.1 C66x CPU View of the Address Space

The **C66x CPU View** represents the view from the DSP, which result from program fetches, or load / store instructions. Accesses to DSP memories (L1P, L1D, L2) and to DSP Internal configuration space (DSP_ICFG) are intercepted within the DSP C66x CorePac (whether using local or global addresses).

The DSP C66x CorePac CFG (C66x CPU 32-bit master port) interface is strictly for non-cacheable loads and stores, and is intended to be used for I/O space or memory mapped registers (MMR) space. DSP C66x CorePac CFG accesses are routed / arbitrated by the DSP_NoC L2 inteconnect. DSP C66x CorePac CFG accesses are mapped between 0x01C0_0000 and 0x0FFF_FFFF.

NOTE: The DSP C66x CorePac CFG initiator interface is strictly for non-cacheable loads and stores within MMR and I/O spaces.

DSP configuration accesses to **external to DSP subsystem** peripherals can be issued on either the DSP subsystem CFG Master port which is mapped to the device L3_MAIN or DSP 32-bit CFG "system" interface is connected to the chip level L3_MAIN interconnect and used to access L3_MAIN addressses that are mapped between 0x01C0_0000 and 0x0FFF_FFFF.

DSP **accesses (to non-DSP memories like SDRAM on L3_MAIN) for addresses above 0x1000_0000 are handled via the DSP (XMC) MDMA 128-bit master interface and are routed to the DSP subsystem MDMA Initiator port either through DSP_ MMU0 or bypassing MMU.**

NOTE: In some cases, L3_MAIN peripherals may be mapped to both the MDMA bus and the CFG bus. In that case, there may be a latency advantage of using the CFG address for those peripherals

Table 4-9 shows the DSP C66x CPU memory view of the various DSP C66x CorePac internal and external resources.

Table 4-9. C66x CPU View Map

C66x CPU View (DSP C66x CorePac Internal only, MDMA or CFG init ports)[1]		Size	DSP Memory Region	Function
Start Address	End Address			
0x0080_0000	0x0084_7FFF	288 KiB	DSP_L2	DSP L2 SRAM (local)
0x00E0_0000	0x00E0_7FFF	32 KiB	DSP_L1P	DSP L1P SRAM (local)
0x00F0_0000	0x00F0_7FFF	32KiB	DSP_L1D	DSP L1D SRAM (local)
0x0180_0000	0x01BF_FFFF	4096 KiB	DSP_ICFG	DSP Internal CFG [2]
0x01D0_0000	0x01D0_0FFF	4 KiB	DSP_SYSTEM	DSP_SYSTEM Memory Mapped Registers block
0x01D0_1000	0x01D0_1FFF	4 KiB	DSP_MMU0CFG	DSP MMU0 configuration / registers
0x01D0_2000	0x01D0_2FFF	4 KiB	DSP_MMU1CFG	DSP MMU1 configuration / registers
0x01D0_5000	0x01D0_5FFF	4 KiB	DSP_EDMA_TC0	DSP_EDMA Transfer Controller 0
0x01D0_6000	0x01D0_6FFF	4 KiB	DSP_EDMA_TC1	DSP_EDMA Transfer Controller 1
0x01D0_7000	0x01D0_7FFF	4 KiB	DSP_NoC	DSP L2 interconnect registers
0x01D1_0000	0x01D1_7FFF	32 KiB	DSP_EDMA_CC	DSP_EDMA Channel Controller
0x0200_0000	0x020F_FFFF	1 MiB	EVE	DSP configuration traffic to the EVE (mapped on the DSP CFG interface)
0x0210_0000	0x023F_FFFF	3 MiB	Reserved	Reserved
0x0330_0000	0x033F_FFFF	1 MiB	EDMA_TPCC	DSP configuration traffic to the EDMA_TPCC (mapped on the DSP CFG interface)
0x0340_0000	0x034F_FFFF	1 MiB	EDMA_TC0	DSP configuration traffic to the EDMA_TC0 (mapped on the DSP CFG interface)
0x0350_0000	0x035F_FFFF	1 MiB	EDMA_TC1	DSP configuration traffic to the EDMA_TC1 (mapped on the DSP CFG interface)
0x0800_0000	0x0800_FFFF	64 KiB	DSP_XMC_CTRL MMRs	DSP internal MMRs for XMC controller (non-cache)
0x0802_0000	0x080F_FFFF	896 KiB	MDMA non-cache	MDMA initiator (non-cache) to L3_MAIN (DSP_MMU0)
0x0810_0000	0x0BBF_FFFF	59 MiB		
0x1000_0000	0x10FF_FFFF	16 MiB	DSP1 L1P, L1D and L2 memories	An image of DSP1 C66x CorePac internal space - only L1P, L1D and L2 memories (global) [3]
0x1000_0000	0x10FF_FFFF	16 MiB	DSP2 MDMA (cached)	DSP2 MDMA initiator (cached) to L3_MAIN (through DSP2_MMU0)

(1) Only the C66x CPU view of device implemented functional memory regions are shown. The remaining regions are reserved.

(2) The internal configuration space registers are visible ONLY to the C66x CPU (DSP_C0) within the DSP C66x CorePac, i.e. they are NOT visible to initiators outside the DSP C66x CorePac.

(3) The DSP1 CPU sees an image of its own memories in the 0x1000_0000 - 0x10FF_FFFF address range (the same mapped also at lower addresses 0x0080_0000 - 0x00F0_7FFF). On the other side, DSP2 CPU addresses, generated in the same range (with DSP2_MMU0 involved), are mapped to the DSP2 MDMA port (cached transfers to/from L3_MAIN connected system memories).

Table 4-9. C66x CPU View Map (continued)

C66x CPU View (DSP C66x CorePac Internal only, MDMA or CFG init ports)[1]		Size	DSP Memory Region	Function
Start Address	End Address			
0x1100_0000	0x11FF_FFFF	16 MiB	DSP2 L1P, L1D and L2 memories	An image of DSP2 C66x CorePac internal space - only L1P, L1D and L2 memories (global) [4]
			DSP1 MDMA (cached)	MDMA initiator (cached) to L3_MAIN (through DSP1_MMU0)
0x1200_0000	0x1FFF_FFFF	224 MiB	MDMA (cached)	DSP1 and DSP2 MDMA initiator (cached) to L3_MAIN (through DSP1_MMU0 / DSP2_MMU0, respectively)
0x2000_0000	0xFFFF_FFFF	3584 MiB	MDMA (cached)	DSP1 and DSP2 MDMA initiator (cached) to L3_MAIN (through DSP1_MMU0 / DSP2_MMU0, respectively)

(4) The DSP2 CPU sees an image of its own memories in the 0x1100_0000 - 0x11FF_FFFF address range (the same mapped also at lower addresses 0x0080_0000 - 0x00F0_7FFF). On the other side, DSP1 CPU addresses, generated in the same range (with DSP1_MMU0 involved), are mapped to the DSP1 MDMA port (cached transfers to / from L3_MAIN connected system memories).

Refer to the Section 2.2, *L3_MAIN Memory Space Mapping*, in the chapter, *Memory Mapping*, for the addresses of the L3_MAIN space memory-mapped registers. Refer to the Section 2.6, *DSP Subsystem Memory Space Mapping* in the same chapter for a description of the DSP1 and DSP2 internal memory, additional memory, and peripherals that the DSP1 and DSP2 have access to.

4.3.10.2 DSP_EDMA View of the Address Space

EDMA is able to initiate internal accesses directly to the DSP memories via the DSP C66x CorePac SDMA bus. The access is conducted to the DSP C66x CorePac internal memories over the L2 DSP_NoC interconnect.

Table 4-10 shows the DSP integrated EDMA controller memory view of the various DSP C66x CorePac internal and external resources.

Table 4-10. DSP EDMA Controller View Map

DSP_EDMA Controller View (EDMA master internal / external port)		Size	DSP Memory Region	Function
Start Address	End Address			
0x0080_0000	0x0084_7FFF	288 KiB	DSP_L2	DSP L2 SRAM (local)
0x00E0_0000	0x00E0_7FFF	32 KiB	DSP_L1P	DSP L1P SRAM (local)
0x00F0_0000	0x00F0_7FFF	32KiB	DSP_L1D	DSP L1D SRAM (local)
0x0802_0000	0x0BBF_FFFF	59 MiB	EDMA to L3_MAIN	EDMA initiator (DSP_MMU1)
0x1000_0000	0x10FF_FFFF	16 MiB	DSP L1/L2	An image of DSP C66x CorePac internal space - only L1P, L1D and L2 memories (global) [1]
0x2000_0000	0xFFFF_FFFF	3584 MiB	DMA OCP	L3_MAIN interconnect memory via MMU1 / DMA OCP Initiator

(1) The internal configuration space registers DSP_ICFG are visible ONLY to the C66x CPU (DSP_C0) within the DSP C66x CorePac , i.e. they are NOT visible to the DSP_EDMA.

Access from EDMA to external resources on L3_MAIN are routed via DSP subsystem **EDMA initiator port**. **Note that these accesses are transferred through the DSP_MMU1 memory management unit.**

NOTE: The DSP_EDMA can NOT access the DSP_ICFG (DSP C66x CorePac internal) addresses.

With the DSP_MMU1 disabled, the subset of the memory map used for DSP_EDMA internal accesses will NOT be visible. Thus only addresse which equal 0x2000_0000 and above will be considered as valid 32-bit addresses (i.e. L3_MAIN space accesses only).

Refer to the Section 2.2, *L3_MAIN Memory Space Mapping*, in the chapter, *Memory Mapping*, for the addresses of the L3_MAIN space memory-mapped registers. Refer to the Section 2.6, *DSP Subsystem Memory Space Mapping* in the same chapter for a description of the DSP1 and DSP2 internal memory, additional memory, and peripherals that the DSP1 and DSP2 have access to.

4.3.10.3 L3_MAIN View of the DSP Address Space

System initiated accesses (i.e. external-to-DSP accesses over device L3_MAIN) to DSP are issued over the DSP SDMA target port.

NOTE: The MSB-bits of the address are truncated to only provide an 8 MiB view of the memory map within the DSP subsystem. Notice that the relative offsets of the DSP CFG space is different for the OCP SDMA target port relative to the DSP internal initiators.

The SDMA target bus is able to access internal subsystem address space (such as DSP_EDMA, DSP_MMU0, DPS_MMU1, etc.), or the DSP local memory address space. The SDMA target bus **is NOT able to access the DSP ICFG space (such as DSP_INTC, DSP_BWM, etc)** or the other initiator ports on the DSP subsystem boundary (i.e., accesses cannot go through DSPSS to get to the DSP_EDMA initiator port, L3_MAIN CFG initiator port).

The DSP slave DMA port memory map - Table 4-11 shows an 8 MiB window (23-bit address) both from the SDMA Target bus (0x0000_0000 through 0x007F_FFFF), as well as the EDMA (0x0080_0000 through 0x00FF_FFFF). The DSP C66x CorePac internally views itself as a 16 MiB window where 0x0000_0000 through 0x007F_FFFF is reserved, L2 SRAM starts at 0x0080_0000, L1P SRAM starts at 0x00E0_0000, and L1D SRAM starts at 0x00F0_0000).

Table 4-11. SDMA Target Port Memory Map

System L3_MAIN View[1]		Size	DSP Memory Region	Function
Start Address	End Address			
0x0000_0000	0x0004_7FFF	288 KiB	DSP_L2	DSP L2 SRAM (local)
0x0050_0000	0x0050_0FFF	4 KiB	DSP_SYSTEM	DSP SYSTEM MMR Block
0x0050_1000	0x0050_1FFF	4 KiB	DSP_MMU0CFG	DSP MMU0 configuration / regs
0x0050_2000	0x0050_2FFF	4 KiB	DSP_MMU1CFG	DSP MMU1 configuration / regs
0x0050_5000	0x0050_5FFF	4 KiB	DSP_EDMA_TC0	DSP EDMA Transfer Controller 0

0x0060_0000	0x0060_7FFF	32 KiB	DSP_L1P	DSP L1P SRAM (local)
0x0070_0000	0x0070_7FFF	32 KiB	DSP_L1D	DSP L1D SRAM (local)

(1) Only system (L3_MAIN) view over functionally used regions are shown. The remaining regions are reserved.

Refer to the Section 2.2, *L3_MAIN Memory Space Mapping*, in the chapter, *Memory Mapping*, for the addresses of the L3_MAIN space memory-mapped registers. Refer to the Section 2.6, *DSP Subsystem Memory Space Mapping* in the same chapter for a description of the DSP1 and DSP2 internal memory, additional memory, and peripherals that the DSP1 and DSP2 have access to.

4.4 DSP Subsystem Register Manual

This section describes the DSP Subsystem instances registers.

4.4.1 DSP Subsystem Instance Summary

Table 4-12. DSP Subsystem Instance Summary

Module Name	Module Base Address	Size
DSP_ICFG	0x0180 0000[(1)]	4 KiB
DSP_SYSTEM	0x01D0 0000[(1)]	256 Bytes
DSP_FW_L2_NOC_CFG	0x01D0 3000[(1)]	8576 Bytes
DSP1_SYSTEM	0x40D0 0000	256 Bytes
DSP1_FW_L2_NOC_CFG	0x40D0 3000	8576 Bytes
DSP2_SYSTEM	0x4150 0000	256 Bytes
DSP2_FW_L2_NOC_CFG	0x4150 3000	8576 Bytes

(1) **The registers of DSP subsystem instances prefixed only with DSP in the name, and NOT DSP1 or DSP2, are NOT visible on the device L3_MAIN. They are visible only within the DSP_ICFG internal configuration space hence accessible only by the DSP C66x CPU.**

NOTE: For more details on the DSP_MMU0 and DSP_MMU1 registers, as well as their :

- DSP_MMU0CFG and DSP_MMU1CFG physical addresses accesible only by DSP_C0 CPU core in the DSP subsystem
- DSP1_MMU0CFG and DSP1_MMU1CFG physical addresses visible on L3_MAIN
- DSP2_MMU0CFG and DSP2_MMU1CFG physical addresses visible on L3_MAIN

refer to Section 15.5, *MMU Register Manual*, in Chapter 15, *Memory Management Units*.

NOTE: For more details on the DSP_EDMA_CC, DSP_EDMA_TC0 and DSP_EDMA_TC1 registers, as well as their :

- DSP1_EDMA_CC, DSP1_EDMA_TC0 and DSP1_EDMA_TC1 physical addresses visible on L3_MAIN
- DSP2_EDMA_CC, DSP2_EDMA_TC0 and DSP2_EDMA_TC1 physical addresses visible on L3_MAIN

refer to Section 11.7, *EDMA Register Manual*, in Chapter 11, *Enhanced DMA*.

CAUTION

The L1P, L1D and L2 memory controller registers mapped in the L3_MAIN are limited to 32-bit data access; 16- and 8-bit access are not allowed and can corrupt register content.

4.4.2 DSP_ICFG Registers

4.4.2.1 DSP_ICFG Register Summary

NOTE: The DSP_ICFG addresses are visible only within the DSP core internal configuration space.

Table 4-13. DSP_ICFG Registers Mapping Summary

4.4.2.2 DSP_ICFG Register Description

For bitfield descriptions of all registers which reside within the DSP_ICFG configuration address space, refer to the *TMS320C66x DSP CorePac User Guide*, (SPRUGW0C).

4.4.3 DSP_SYSTEM Registers

4.4.3.1 DSP_SYSTEM Register Summary

NOTE: While the DSP1_SYSTEM and DSP2_SYSTEM addresses are part of the device L3_MAIN memory space, **the DSP_SYSTEM addresses are visible only within the DSP_ICFG internal configuration space (visible only to C66x CPU and debug logic).**

8	RESERVED	Reserved. User must write 0.	RW	0x0
7:6	RESERVED	Reserved. Read returns 0.	R	0x0

Bits	Field Name	Description	Type	Reset
5:4	STANDBYMODE	0x0: FORCE_STANDBY This mode is a backup mode intended to be used only if the smart-idle mode is bugged. When in this mode, the SAF asserts with minimal hardware condition the "STANDBY" status. It is the responsibility of the software to ensure that the SAF is in a correct quiet state before programming this mode. Additionally when in this mode, the SAF is not allowed to generate wakeup request. 0x1: NO_STANDBY This mode is a backup mode intended to be used only if the smart-idle mode is bugged. When in this mode, the SAF in C66xOSS asserts the "STANDBY" status. 0x2: SMART_STANDBY default. C66xOSS generates the standby status based upon all hardware internal status, namely after having performed all hardware operations necessary to be in a correct quiet state. Additionally when in this mode, the SAF is not allowed to generate wakeup request. 0x3: SMART_STANDBY_WKUP Same as Smart-Standby. (C66xOSS generates the standby status based upon all hardware internal status, namely after having performed all hardware operations necessary to be in a correct quiet state). . Additionally when in this mode, the SAF is allowed to generate wakeup request	RW	0x2
3:2	IDLEMODE	0x0: FORCE_IDLE This mode is a backup mode intended to be used only if the smart-idle mode is bugged. When in this mode, the IAF acknowledges a request to go idle from the power manager with minimal hardware condition. It is the responsibility of the software to ensure that the IAF are in a correct quiet state before requesting a force-idle transition. Additionally when in this mode, the IAF is not allowed to generate any wakeup request. 0x1: NO_IDLE When in this mode, the IAF disregards any request to go idle from the power manager. 0x2: SMART_IDLE default. When in this mode, the IAF acknowledges a request to go idle from the power manager after having performed all hardware operations necessary to be in a correct quiet state. Additionally when in this mode, the IAF is not allowed to generate any wakeup request 0x3: SMARTIDLEWKUP When in this mode, the IAF acknowledges a request to go idle from the power manager after having performed all hardware operations necessary for the IAF to be in a correct quiet state. Additionally when in this mode, the IAF is allowed to generate wakeup request.	RW	0x2

Table 4-30. DSP_SYS_IRQWAKEEN0

Address Offset	0x0000 0020		
Physical Address	0x01D0 0020 0x40D0 0020 0x4150 0020	**Instance**	DSP_SYSTEM DSP1_SYSTEM DSP2_SYSTEM
Description	The register provides a global interrupt wakeup enable bit vector that defines which input interrupts are used to cause a wake from powerdown state (via the slave idle protocol). IRQWAKEEN0 is for interrupt inputs 63 thru 32, and IRQWAKEEN1 is for interrupt inputs 95 thru 64. Internal interrupts cannot cause a wake condition since in this state there is no guaranteed clock and all sub-modules should be in idle state. Software can write 1 to set and 0 to clear the corresponding bit (i.e., enable the corresponding interrupt for wakeup). Reads of this register return the actual state of the enable register.

Table 4-69. Register Call Summary for Register DSP_SYS_HW_DBGOUT_VAL

DSP Subsystem Register Manual

- DSP_SYSTEM Register Summary: [0][1]

4.4.4 DSP_FW_L2_NOC_CFG Registers

This section covers the DSPSS level defined public firewall (DSP_MMU0, DSP_MMU1) and L2 interconnect (DSP_NoC) functional registers.

4.4.4.1 DSP_FW_L2_NOC_CFG Register Summary

NOTE: While the DSP1_FW_L2_NOC_CFG and DSP2_FW_L2_NOC_CFG addresses are part of the device L3_MAIN memory space, **the DSP_FW_L2_NOC_CFG addresses are visible only within the DSP_ICFG internal configuration space (visible only to C66x CPU and debug logic).**

Table 4-70. DSP_FW_L2_NOC_CFG and DSP1_FW_L2_NOC_CFG Registers Mapping Summary

Dual Cortex-M4 IPU Subsystem

This chapter describes the dual Cortex-M4 image processor unit (IPU) subsystem.

Topic **Page**

5.1 Dual Cortex-M4 IPU Subsystem Overview

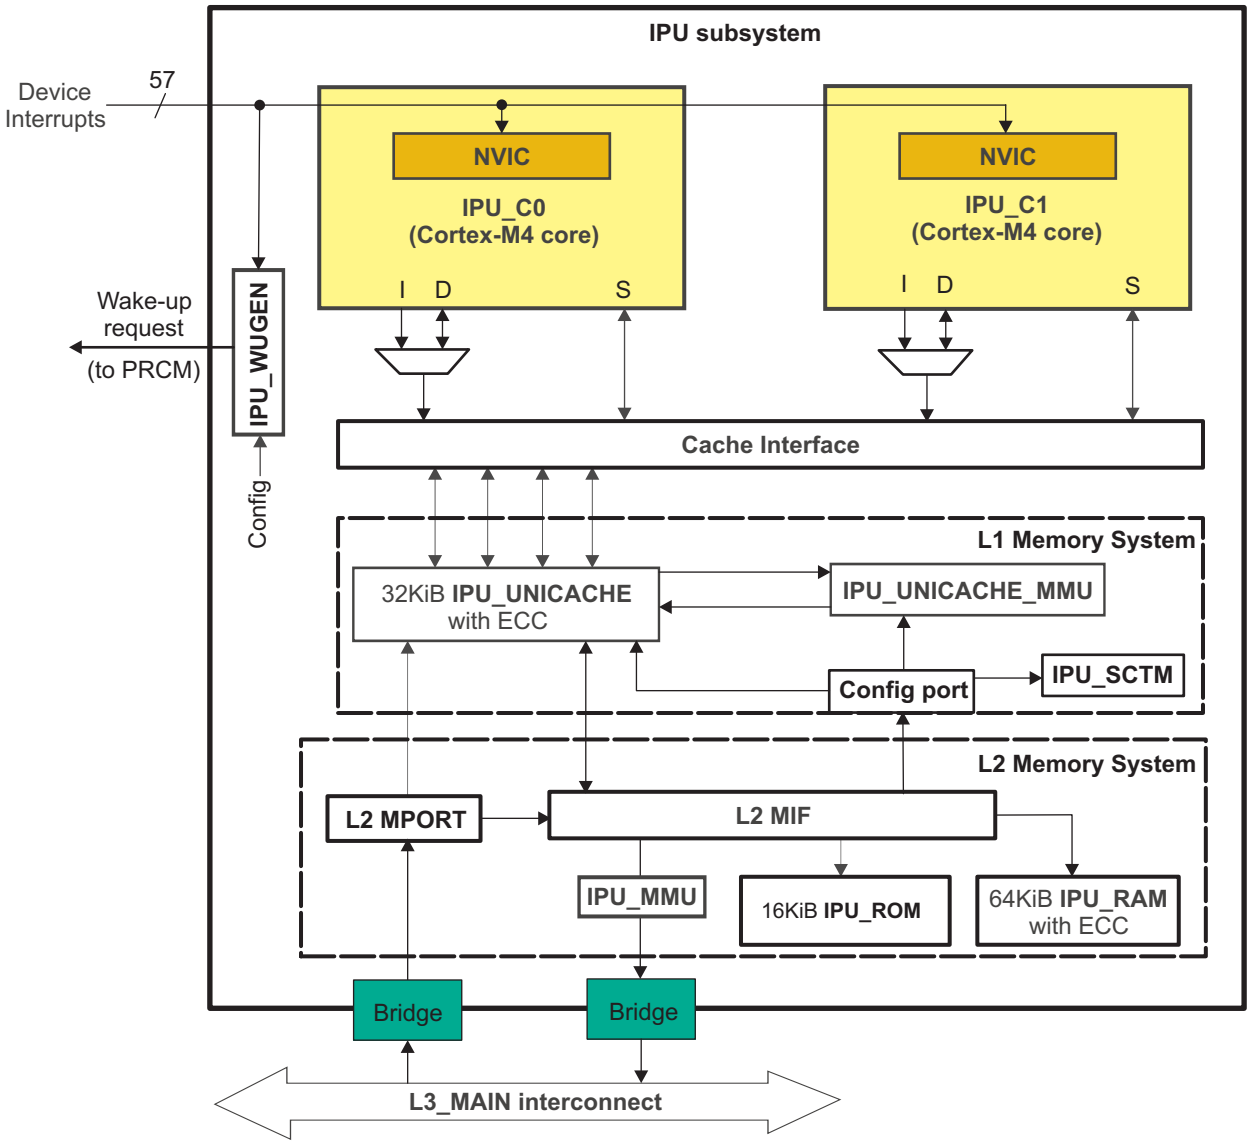
5.1.1 Introduction

The Imaging Processor Unit (IPU) subsystem contains two Arm® Cortex™-M4 cores (IPU_C0 and IPU_C1) that share a common level 1 (L1) cache (called unicache). The two Cortex-M4 cores are completely homogeneous to one another. Any task possible using one Cortex-M4 core is also possible using the other Cortex-M4 core. Both Cortex-M4 cores could be used for tasks such as running RTOS, controlling ISP, SIMCOP, DSS, and other functions. It is software responsibility to distribute the various tasks between the Cortex-M4 cores for optimal performance. The integrated interrupt handling of the IPU subsystem allows it to function as an efficient control unit.

IPU is the boot master of this device with its own boot ROM.

Figure 5-1 is a high-level block diagram of the IPU subsystem.

Figure 5-1. IPU Subsystem Overview



5.1.2 Key Features

The key features of the IPU subsystem are:

- Two Arm Cortex-M4 microprocessors (IPU_C0 and IPU_C1):
  - Armv7-M and Thumb®-2 instruction set architecture (ISA)
  - Armv6 SIMD and digital signal processor (DSP) extensions
  - Single-cycle MAC
  - Integrated nested vector interrupt controller (NVIC) (also called IPU_Cx_INTC, where x = 0, 1)
  - Integrated bus matrix
    - Bus arbiter
    - Bit-banding – atomic bit manipulation
    - Write buffer
    - Memory interface (I and D) plus system interface (S) and private peripheral bus (PPB)
  - Registers:
    - Thirteen general-purpose 32-bit registers
    - Link register (LR)
    - Program counter (PC)
    - Program status register, xPSR
    - Two banked SP registers
  - Integrated power management
  - Extensive debug capabilities
- Unicache interface:
  - AHBLite to unicache interface
  - Instruction and data interface
  - Supports interleaved Cortex-M4 requests
- L1 cache (IPU_UNICACHE):
  - 32KiB divided into 16 banks
  - 4-way
  - Runs at twice the Cortex-M4 CPU frequency
  - Cache configuration lock/freeze/preload
  - Internal MMU:
    - 16-entry region-based address translation
    - Read/write control and access type control
    - Execute Never (XN) MMU protection policy
    - Little-endian format
  - OCP port for configuration and cache maintenance
- Subsystem counter timer module (SCTM) connected to unicache
- L2 master interface (MIF):
  - Splitter for access to memory or OCP ports
  - Interleaved bank request for fast memory access
- L2 internal memories:
  - 16KiB ROM (IPU_ROM); used for device boot/initialization
  - 64KiB banked RAM – IPU_RAM
- L2 MMU (IPU_MMU): 32 entries with Table Walking Logic (TWL)
- Wake-up generator (IPU_WUGEN): Generates wake-up request from external interrupts
- Two OCP ports at IPU boundary (connected to the L3_MAIN interconnect):

  - Master port – allows the IPU to access system resources (memories and peripherals)
  - Slave port – allows other requestors to access a part of the IPU internal memory space
- Power management:
  - Local power-management control: Configurable through the IPU_WUGEN registers.
  - Two sleep modes supported by Cortex-M4, controlled by its integrated interrupt controller (NVIC).
  - Cortex-M4 system is clock-gated in both sleep modes.
  - NVIC interrupt interface stays awake.
  - Supports L1 cache and L2 memories retention
- Error-Correcting Code (ECC) supported for both L1 unicache and L2 RAM
- Debug/emulation features supported

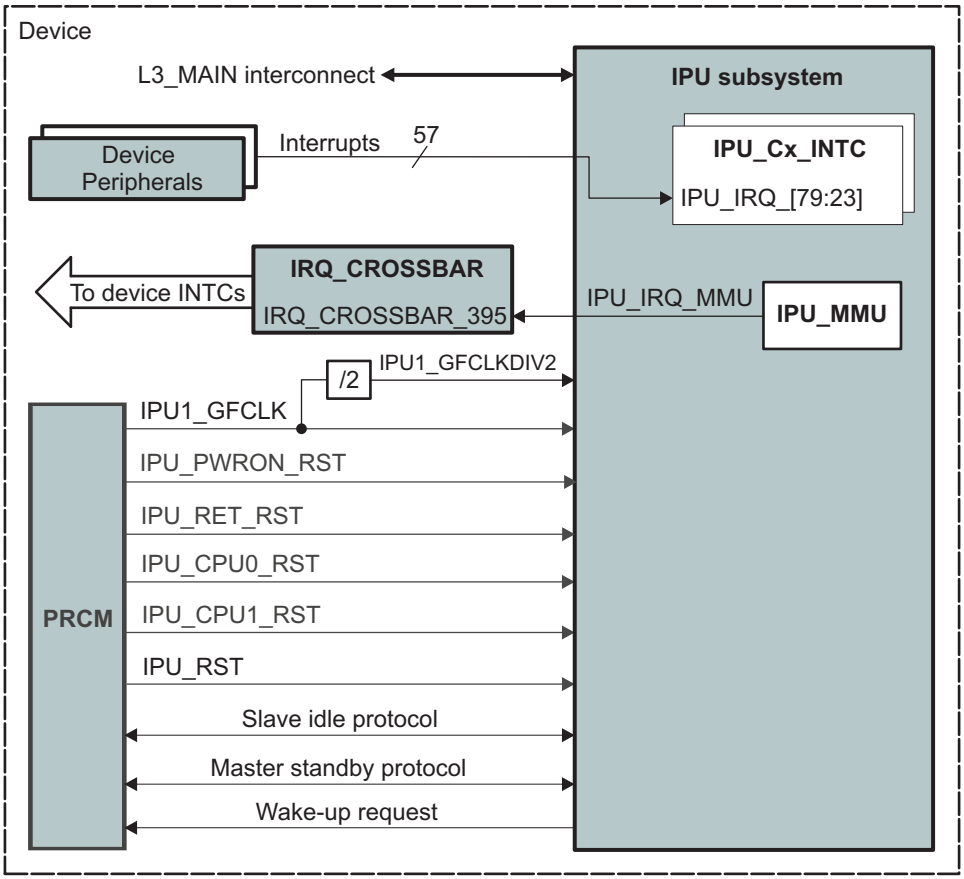
Section 5.3 provides more details about the IPU features.

5.2 Dual Cortex-M4 IPU Subsystem Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests.

Figure 5-2 shows the IPU integration in the device.

Figure 5-2. IPU Subsystem Integration



NOTE: In Figure 5-2, only interrupts external to IPU (that is, outside IPU boundary) are shown. The complete IPU interrupt mapping is presented in Chapter 12, *Interrupt Controllers*.

NOTE: For more information about the master standby and slave idle protocols, and the wake-up request, see Section 3.1.1.1.2, *Module-Level Clock Management*, in Chapter 3, *Power, Reset, and Clock Management*.

Table 5-1 through Table 5-3 summarize the integration of the module in the device.

Table 5-1. IPU Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
IPU	PD_IPU, PD_COREAON	L3_MAIN

Table 5-2. IPU Hardware Requests

Interrupt Requests				
Module Instance	**Interrupt Name (Source)**	**IRQ_CROSSBAR Input (Destination)**	**Default Mapping**	**Description**
IPU	IPU_IRQ_MMU	IRQ_CROSSBAR_395	N/A	IPU_MMU fault interrupt. This IRQ is not mapped to any device interrupt controller by default, other than the IPU interrupt controller itself (IPU_IRQ_16 interrupt line). However, this IRQ can be mapped to other device interrupt controllers by properly configuring the corresponding IRQ_CROSSBAR related registers in the CTRL_MODULE.

Table 5-3. IPU Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
IPU	IPU1_GFCLK	IPU1_GFCLK	PRCM	IPU interface and functional clock(s). See Section 5.2.1 for details.
	IPU1_GFCLKDIV2	IPU1_GFCLK		
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
IPU	IPU_PWRON_RST	IPU_PWRON_RST	PRCM	Power-on reset. Resets the entire IPU subsystem (except SWJ-DP)
	IPU_RET_RST	IPU_RET_RST	PRCM	Retention reset to few retention logic inside the IPU_UNICACHE
	IPU_CPU0_RST	IPU_CPU0_RST	PRCM	IPU_C0 reset. Resets the entire processor (except all the debug logic in the processor and SWJ-DP)
	IPU_CPU1_RST	IPU_CPU1_RST	PRCM	IPU_C1 reset. Resets the entire processor (except all the debug logic in the processor and SWJ-DP)
	IPU_RST	IPU_RST	PRCM	Reset signal to the IPU_UNICACHE and the IPU_MMU

For more information about clocks, resets, and power domains, see Chapter 3, *Power, Reset, and Clock Management*.

5.2.1 IPU Subsystem Clock Distribution

The IPU subsystem has two clock inputs:

- **IPU1_GFCLK**: Main source clock for IPU; feeds most of IPU internal modules:
  - IPU Unicache & MMU, L2 MIF & MPORT (all running on (1x) IPU_GFCLK)
  - Cortex-M4 cores, IPU_RAM, IPU_ROM (all running on (1/2x) IPU_GFCLK via internal divider)
- **IPU1_GFCLKDIV2**: This is IPU1_GFCLK externally divided by two; feeds IPU L2 MMU

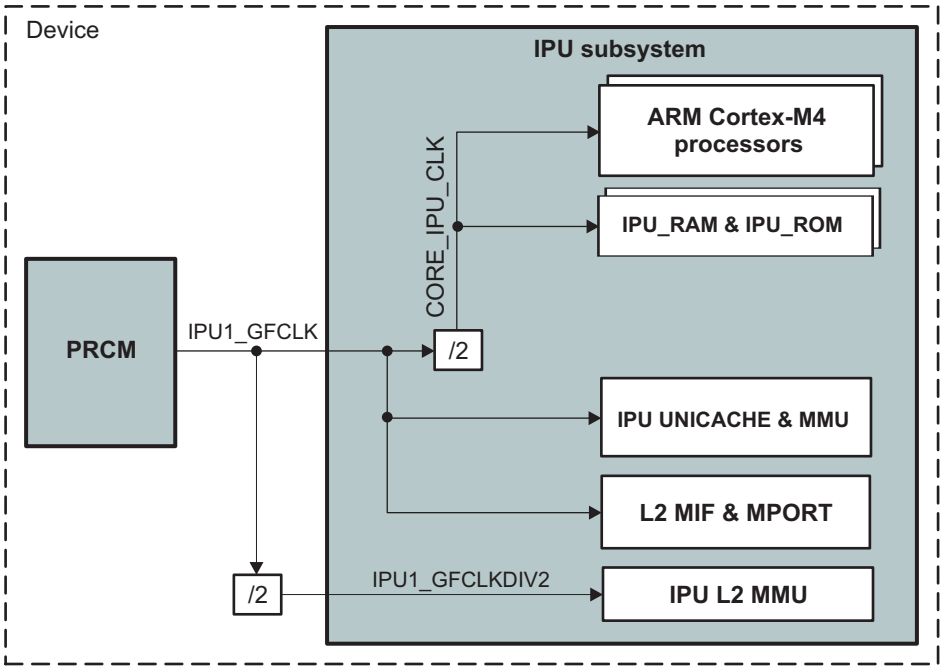
The IPU1_GFCLK itself can be derived from either:

- CORE_IPU_ISS_BOOST_CLK – main clock for IPU from DPLL_CORE, or
- DPLL_ABE_X2_CLK – alternative clock from DPLL_DDR

For more information, see Chapter 3, *Power, Reset, and Clock Management*.

Figure 5-3 shows the clocking scheme of the IPU subsystem.

Figure 5-3. IPU Subsystem Clocking Scheme



5.2.2 IPU Subsystem Reset Distribution

Three reset signals controlled by the PRCM module let the two Cortex-M4 processors and the rest of the IPU subsystem be reset independently. These three reset signals are: IPU_CPU0_RST, IPU_CPU1_RST, and IPU_RST. They can be controlled (assert/clear) by programming the following PRCM register bits:

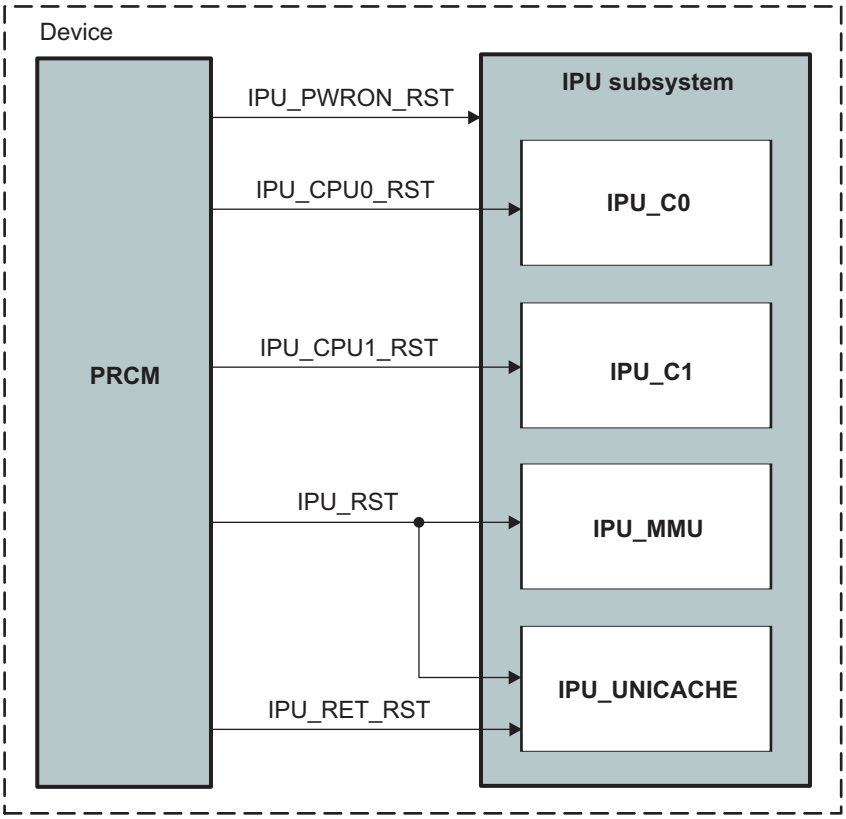
- RM_IPU_RSTCTRL[0] RST_CPU0 – reset control for IPU_C0.
- RM_IPU_RSTCTRL[1] RST_CPU1 – reset control for IPU_C1.
- RM_IPU_RSTCTRL[2] RST_IPU – reset control for IPU_UNICACHE and IPU_MMU.

At bootup, both IPU_CPU0_RST and IPU_CPU1_RST will be released (without any programming of the RST_CPU0 and RST_CPU1 bits) and thus, both Cortex-M4 cores will start executing their code. Subsequently, the RST_CPU0 and RST_CPU1 bits can be written to control the two CPU resets independently.

For details about IPU power-on reset sequence, see Chapter 3, *Power, Reset, and Clock Management*.

Figure 5-4 shows the reset scheme of the IPU subsystem.

Figure 5-4. IPU Subsystem Reset Scheme



5.3 Dual Cortex-M4 IPU Subsystem Functional Description

5.3.1 IPU Block Diagram

The IPU subsystem integrates the following blocks:

- Two fully identical Arm Cortex-M4 cores:
  - Revision r0p1
  - Integrated interrupt controller (NVIC)
- Memory system:
  - L1 memory system
    - Cache interface
    - 32KiB L1 unicache – IPU_UNICACHE
    - L1 MMU, serving the role of an attribute MMU (AMMU) for the unicache (and thus, labelled also as IPU_UNICACHE_MMU)
    - Profiling counters for the unicache – SCTM
  - L2 memory system
    - L2 MMU – IPU_MMU
    - 16KiB L2 ROM (IPU_ROM)
    - 64KiB L2 banked RAM – IPU_RAM
    - L2 master port – MPORT
    - L2 master interface – MIF
- Wake-up generator – IPU_WUGEN
- Two OCP ports at IPU boundary (connected to the L3_MAIN interconnect):
  - Master port – allows the IPU to access system resources (memories and peripherals)
  - Slave port – allows other requestors to access a part of the IPU internal memory space. For more information about which IPU modules are accessible via L3_MAIN, refer to Chapter 2, *Memory Mapping*.

The IPU subsystem is illustrated in Figure 5-1.

5.3.2 Cortex-M4 Core

5.3.2.1 Cortex-M4 Microprocessor

Refer to Arm *Cortex-M4 Technical Reference Manual* for a detailed description of the Cortex-M4 microprocessor. The Cortex-M4 version used in this device is the r0p1 revision.

5.3.2.2 Nested Vectored Interrupt Controller (NVIC)

Each Cortex-M4 core includes an Arm Nested Vectored Interrupt Controller (NVIC) which facilitates low-latency exception and interrupt handling. All exceptions are handled and prioritized within the NVIC. In order to facilitate parallel processing, the interrupt mapping is the same for the two cores. Each Cortex-M4 core receives the same interrupts, except for a few IPU internal interrupts. The interrupts are dynamically prioritized with 16 levels of priority defined for each core. In addition, Cortex-M4 also has a Non-Maskable Interrupt (NMI) input. When it is asserted, the NMI interrupt service routine is executed unconditionally.

The IPU interrupt mapping and an overview of the NVIC are presented in Chapter 12, *Interrupt Controllers*. For detailed description of NVIC functionality, refer to Arm *Cortex-M4 Technical Reference Manual*.

NOTE: The NVIC module is also referenced as IPU_Cx_INTC (x = 0, 1) throughout this device TRM.

5.3.2.3 Cortex-M4 Configuration in this Device

Different configurations are possible for the Cortex-M4 core. Table 5-4 lists the configuration for the Cortex-M4 in this device (same configuration for both cores).

Table 5-4. Cortex-M4 Configuration

Parameter	Implementation
Number of interrupts	96 external interrupts (in addition to the 16 Cortex-M4 internal interrupts)
Number of bits of interrupt priority	4 bits (defining 16 levels of priority)
Floating Point Unit (FPU)	Not included
Memory Protection Unit (MPU)	Not included
Trace Port Interface Unit (TPIU)	Not included
Istrumentation Trace Macrocell (ITM)	Not included
Embedded Trace Macrocell (ETM)	Not included
SW-DP or SWJ-DP	SW JTAG-DP interface (supported outside core level)
Data Watchpoint and Trace (DWT)	Included; 4 data watchpoints and event monitors
Flash-Patch and Breakpoint (FPB)	Included; 8 hardware breakpoints with program patching
Architectural clock-gating	Enabled

In adition, the following Cortex-M4 features are not supported in this device:

- The Cortex-M4 calibration register (SYST_CALIB) which is used to reload the SYSTICK timer to generate a fixed interval is not supported in the Cortex-M4 core within the IPU subsystem. The TENMS field is not available due to the different frequencies during voltage scaling. The SYSTICK timer stops counting when the processor is halted during debugging.
- The Cortex-M4 self-reset feature controllable through the SYSRESETREQ bit in the Cortex-M4 AIRCR register is not supported at the processor level. Writing to this bit will have no effect in the IPU subsystem. This feature is supported at the PRCM level. The global PRCM module can reset the complete IPU subsystem writing to the corresponding register.

For more information about the Cortex-M4 SYST_CALIB and AIRCR registers, refer to the Arm *Cortex-M4 Devices Generic User Guide*.

5.3.3 IPU Memory System

The IPU subsystem includes a 32KiB unified L1 cache (called IPU_UNICACHE) and a memory system built around the cache. The IPU memory system can be seen as a two-level hierarchical system:

- L1 memory system
- L2 memory system

The L1 memory system is the direct connection to the Cortex-M4 cores. It has the following features:

- Always runs on (1x) IPU_GFCLK frequency for both logic and memories
- Integrates a unified cache (IPU_UNICACHE) with a dedicated OCP port (for configuration and cache maintanance purposes). See Section 5.3.3.2 for more information about IPU_UNICACHE.
- Integrates L1 MMU which serves the role of an attribute MMU for the IPU_UNICACHE
  - L1 cache lookups provide L1 and L2 cache attributes
  - CPU lookup provides write policy attributes only
  - L1 lookup for address translation, and prefetch (if used)
  - L2 lookup for address translation, and prefetch (if used)
  - Integrated maintenance between L1 and L2
  - See Section 5.3.3.3 for more information about IPU_UNICACHE_MMU.
- Integrates a Subsystem Counter Timer Module (SCTM), with the ability to perform dynamic export of benchmarking data. See Section 5.3.3.4 for more information about the SCTM.

The L2 memory system has the following features:

- Always runs on (1x) IPU_GFCLK frequency for logic and (1/2x) for memories
- Master port (MPORT) for slave or DMA accesses
  - Built in coherency query to L1 cache to ensure transfers to L2 RAM are coherent
  - MPORT accesses must always have: logical = physical addresses
- Memory Interface (MIF) for internal memories
  - Decodes memory space
  - Decodes configuration space
- 16KiB ROM
- 64KiB banked RAM
- L2 MMU with lookup to L1
  - Address translation, and prefetch attributes

5.3.3.1 Cache Interface

The cache interface converts the data from the AHBLite protocol (supported by Cortex-M4) to the unicache. The AHBLite protocol is part of the AMBA® specification. The AHBLite protocol has been defined to support single master with several slaves. Four slave ports are required on the unicache to support the four buses from the Cortex-M4 cores (two per core).The I and D connections from each Cortex-M4 are multiplexed but the Cortex-M4 core internally prevents any conflict on this connection.

Because the Memory Protection Unit is not present within the Cortex-M4 in this device, default cache policies which are provided through the sideband signals are not used to access the cache. The cacheability is provided throught the AMMU present in the cache. AHBLite exclusive accesses are not supported at the unicache interface and an error is generated back to the interface when such access happens.

The ICode and DCode interface on each Cortex-M4 are a 32-bit AHBLite bus interface. Instruction fetches and vector fetches from code memory space (0x00000000 – 0x1FFFFFFF) are performed over the ICode bus. Data and debug accesses to code memory space (0x00000000 – 0x1FFFFFFF) are performed over the DCode bus. Control logic in the Dcode interface converts unaligned data and debug accesses into two or three (depending on the size and alignment of the unaligned access) aligned accesses.

The cache interface converts the AHBLite protocol to cache requests, converting burst access to sequential access to the cache. Although the Cortex-M4 processor supports unaligned transfers, there is no unaligned transfer on this bus, because the bus interface on the processor core converts the unaligned transfers into aligned transfers (adding extra cycles if required).

Since a bus multiplexer is used between I and D bus, the transfers cannot take place at the same time on these buses and the Cortex-M4 handles the arbitration between the two buses. The data bus (D bus) accesses are given higher priority.

5.3.3.2 L1 Unified Cache (IPU_UNICACHE)

The unicache provides a multi-access cache which is scalable for number of slaves and size. Integrated coherency management is provided by sideband signals of slave interfaces, as well as a dedicated maintenance interface. The cache architecture is two pipeline stages, where the first stage is a tag memory access, and the second stage is a banked data array. Each slave has a dedicated tag to enable high-frequency access with no dynamic arbitration between slaves, and the banked data array reduces the probability of conflicts between slaves.

5.3.3.2.1 IPU_UNICACHE Configuration in the Device

Table 5-5 describes the IPU_UNICACHE configuration in the device.

Table 5-5. IPU_UNICACHE Configuration

Parameter	Value
Way	4
Size	32 KiB
Bank elements	32 bits
Bank number	16
Slave interface data size	32 bits
Master interface data size	64 bits
Line size	256 bits
MMU lookup	Included
Number of slaves	4
Number of masters	1
Number of fill/prefetch buffers	Four prefetch buffers
Slave types	Cache interface

5.3.3.2.2 IPU_UNICACHE Maintenance

The IPU_UNICACHE allows basic maintenance operations, which are performed through its OCP configuration port:

1. Preload (CACHE_MAINT[0] PRELOAD)
2. Lock/Unlock (CACHE_MAINT[1] LOCK; CACHE_MAINT[2] UNLOCK)
3. Clean (CACHE_MAINT[3] CLEAN)
4. Invalidate (CACHE_MAINT[4] INVALIDATE)

Maintenance of the cache is performed between the start and end addresses (configurable via the CACHE_MTSTART[31:0] START_ADDR and CACHE_MTEND[31:0] END_ADDR bit fields, respectively). This allows for direct control of memory regions. All maintenance operations occur in the background and can generate an interrupt (if enabled via the CACHE_MAINT[5] INTERRUPT bit) when they complete. Such operations are protected by software semaphore, because only one operation at a time can be performed. The maintenance operations can also be performed using MMU small entries.

5.3.3.3 L1 MMU (IPU_UNICACHE_MMU)

The IPU_UNICACHE_MMU serves the role of an attribute MMU (AMMU) for the unicache. It provides the multi-access cache with region-based address translation, read/write control, access type control, and multi-level cache maintenance. The IPU_UNICACHE_MMU regions are register entry based to enable low-latency lookup and it is not a table-walking MMU.

The IPU_UNICACHE_MMU is connected directly to the unicache. There is a dedicated interface for a CPU to query cache policies for writes in supporting a pipeline write buffer that follows the write policies of the IPU_UNICACHE_MMU.

5.3.3.3.1 IPU_UNICACHE_MMU Configuration in the Device

Table 5-6 describes the IPU_UNICACHE_MMU configuration in the device.

Table 5-6. IPU_UNICACHE_MMU Configuration

Parameter	Values
Number of large pages	Four entries
Size of large pages	512 MiB or 32 MiB (configurable)
Number of medium pages	Two entries
Size of medium pages	256 KiB or 128 KiB (configurable)
Number of small pages	10 entries
Size of small pages	16 KiB or 4 KiB (configurable)
Number of patch pages	Not included
Size of line pages	256-bit
Number of comparison interfaces	4
Number of comparator sets	1
Write pipeline data comparison	Disabled
Number of IPU_UNICACHE maintenance interfaces	3
Size of entry address	32-bit

5.3.3.3.2 Page Attributes

As can be seen in Table 5-6, IPU_UNICACHE_MMU supports different page sizes: large, medium, and small. The number of large pages, number of medium pages, etc., is defined at design time. The size of the pages is configurable in the following IPU_UNICACHE_MMU registers:

- CACHE_MMU_LARGE_POLICY_i[1] SIZE
- CACHE_MMU_MED_POLICY_j[1] SIZE
- CACHE_MMU_SMALL_POLICY_k[1] SIZE

The different MMU page sizes can be used to create smaller policies within a larger region.

The logical source address is configured in:

- CACHE_MMU_LARGE_ADDR_i[31:25] ADDRESS
- CACHE_MMU_MED_ADDR_j[31:17] ADDRESS
- CACHE_MMU_SMALL_ADDR_k[31:12] ADDRESS

The logical source translated address is configured in:

- CACHE_MMU_LARGE_XLTE_i[31:25] ADDRESS
- CACHE_MMU_MED_XLTE_j[31:17] ADDRESS
- CACHE_MMU_SMALL_XLTE_k[31:12] ADDRESS

When the SIZE bit is set to 0, all the bits in the ADDRESS bit field of the corresponding logical source address and logical source translated address can be used.

When the SIZE bit is set to 1, the ADDRESS bit field of the corresponding logical source address and logical source translated address must be programmed only with addresses that can address the size of a second possible page.

5.3.3.3.3 Policy Support

The following policies are supported by the IPU_UNICACHE_MMU:

- L1 global execute only policy
- L1 global read only policy
- L1 global volatile policy
- Unique L1 and L2 cacheable / non-cacheable policies
- Unique L1 and L2 posted / non-posted policies
- Unique L1 and L2 allocate / non-allocate policies
- Unique L1 and L2 write through / write back policies
- L2 exclusion policy
- L1 or L2 address translation policy
- L1 or L2 prefetch policy

The various policies can be configured in the following registers:

- CACHE_MMU_LARGE_POLICY_i – for large pages
- CACHE_MMU_MED_POLICY_j – for medium pages
- CACHE_MMU_SMALL_POLICY_k – for small pages

5.3.3.4 Subsystem Counter Timer Module (SCTM)

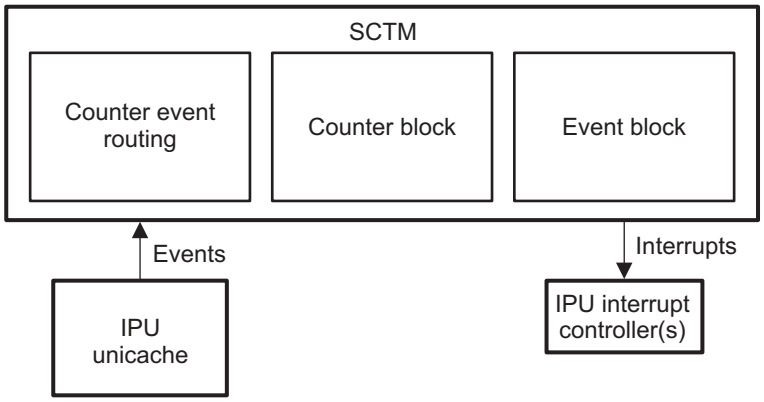
The Subsystem Counter Timer Module (SCTM) is a generic profile counter and timer module that provides the following functions:

- Counter functions:
  - Input events counting
  - Two counter modes:
    - Event counting
    - Duration counting
  - Counter chaining
- Timer functions:
  - Periodic intervals generation
  - Two timer modes:
    - Run-once mode
    - Restart mode
  - Events and/or interrupt generation

The SCTM has eight counters (two of which have timer functions). There are input events going into the SCTM and interrupt events going to the IPU INTC. For more information about the counter configuration and the SCTM input events, see Section 26.7.1, *IPU Subsystem Performance Monitoring*, in Chapter 26, *On-Chip Debug Support*. For more information about the mapping of the SCTM interrupt event signals to IPU interrupt controller inputs, see Section 12.3.3, *Interrupt Requests to IPU_Cx_INTC*, in Chapter 12, *Interrupt Controllers*.

Figure 5-5 shows the SCTM block diagram.

Figure 5-5. SCTM Block Diagram



5.3.3.4.1 Counter Functions

5.3.3.4.1.1 Input Events

Signals from within the subsystem are routed to the SCTM and used to control the counters and timers in the module. The routing of the input events from the module boundary to an individual counter is accomplished through an input event multiplexer and is controlled by the CACHE_SCTM_CTCR_WT_i[20:16] INPSEL and CACHE_SCTM_CTCR_WOT_j[20:16] INPSEL bit fields.

NOTE: For more information about input events to the module boundary, see Section 26.7.1.2, *Cache Events*, in Chapter 26, *On-Chip Debug Support*.

5.3.3.4.1.2 Counters

There are individual 32-bit counters in the SCTM. The counters count when the input event signals are asserted.

5.3.3.4.1.2.1 Counting Modes

The counters in the SCTM support two mutually exclusive counting modes:

- Event mode: The counter increments each time a rising edge is detected on the designated input event signal.
- Duration mode: The counter continually increments when the event input is asserted.

5.3.3.4.1.2.2 Counter Overflow

When the counter reaches the terminal value (0xFFFFFFF) it wraps and continues to increment. This is considered a timer overflow condition. The CACHE_SCTM_CTCR_WT_i[6] OVRFLW and CACHE_SCTM_CTCR_WOT_j[6] OVRFLW bits indicate that overflow has occurred. The overflow bit can be cleared by reading it. When chained, only the high-order counter overflows.

5.3.3.4.1.2.3 Counters and Processor State

The counters can be configured to alter their behavior based on the state of the CPU. The CACHE_SCTM_CTCR_WT_i[4] FREE and CACHE_SCTM_CTCR_WOT_j[4] FREE bits determine whether the counter will continue to operate when the processor enters debug halt state. When the FREE bit is set to 0, the counter stops incrementing while the debug halt input from the CPU is asserted. Normal operation resumes when the processor exits the debug halt state and the debug halt input is deasserted. When the FREE bit is set to 1, the state of the debug halt input is not used to control counter operation.

The CACHE_SCTM_CTCR_WT_i[5] IDLE and CACHE_SCTM_CTCR_WOT_j[5] IDLE bits determine whether the counter will continue to operate when the processor enters idle state (the processor is no longer executing instructions and is waiting for a wake-up event). When the IDLE bit is set to 0, the counter stops incrementing while the idle input from the CPU is asserted. Normal operation resumes when the processor exits the idle state and the idle input is deasserted. When the IDLE bit is set to 1, the state of the idle input is not used to control counter operation.

5.3.3.4.1.2.4 Chaining Counters

The individual 32-bit counters in the SCTM can be chained with an adjacent counter to form a 64-bit counter. Counters chained to a counter across an even-odd index boundary with the even counter contain the least-significant 32 bits of the 64-bit pairing. For example, counters 1 and 0 can be paired and counter 1 will contain bits 63:32 and counter 0 will contain bits 31:0. The high-order counter increments by 1 each time the low-order counter wraps.

Counters are chained by setting the CACHE_SCTM_CTCR_WT_i[2] CHAIN or CACHE_SCTM_CTCR_WOT_j[2] CHAIN bit for both counters. When chained, the counter control for both counters is taken from the CACHE_SCTM_CTCR_WT_i or CACHE_SCTM_CTCR_WOT_j register of the low-order counter. Other than the CHAIN bit, all other bits in the high-order CACHE_SCTM_CTCR_WT_i or CACHE_SCTM_CTCR_WOT_j register are ignored.

Chained counters can function only in counter mode. Timer mode is not supported.

The CACHE_SCTM_CTCR_WT_i[7] CHNSDW and CACHE_SCTM_CTCR_WOT_j[7] CHNSDW bits are used to indicate that a counter can provide atomics accessed when chained. These bits are valid only for counters with even indexes (the lower half of a 64-bit counter pair). When these bits are set, the counter can shadow the value of the lower half of the chained counter value at the same time the upper half of the counter is read. The shadowed value (not the current value) is returned when the value of the low-order counter is read. Therefore, when a chained counter has atomic read capability, an atomic counter value can be obtained simply by reading the high-order counter first, followed by the low-order counter. This order must always be observed to prevent reading stale counter values from the low-order counter. When counters are functioning independently, the shadow feature is deactivated and a read of the counter always returns the current value.

5.3.3.4.1.2.5 Enabling and Disabling Counters

After the counter is correctly configured, it can be started by setting the CACHE_SCTM_CTCR_WT_i[0] ENBL or CACHE_SCTM_CTCR_WOT_j[0] ENBL bit. At this point, the counter begins incrementing under the control of the configured event input. The counter can be disabled (counting stops) at any time by clearing the ENBL bit. Counters can be enabled and disabled dynamically during application flow.

Counters can also be enabled and disabled as groups through the CACHE_SCTM_CTGNBL register. This register provides control of the individual counter-enable in groups. This allows an application to enable or disable groups of counters in lockstep by setting corresponding bits to 1 (bit number corresponds to counter number).

5.3.3.4.1.2.6 Resetting Counters

The counters can be reset to their initial value (0x00000000) by writing 1 to the CACHE_SCTM_CTCR_WT_i[1] RESET or CACHE_SCTM_CTCR_WOT_j[1] RESET bit. If the counter is chained, the high-order and low-order counters are reset when the RESET bit is written for the low-order counter.

Counters can also be reset as groups through the CACHE_SCTM_CTGRST registers. These registers provide control of the individual counter reset in groups. This allows an application to reset groups of counters in lockstep.

5.3.3.4.2 Timer Functions

Counters 0 and 1 in the SCTM can function as timers. When operating as timers, interrupts and/or debug input events are generated when the value of the counter reaches a designated interval.

5.3.3.4.2.1 Periodic Intervals

The interval for a timer is contained in the CACHE_SCTM_TINTVLR_i register. There is a CACHE_SCTM_TINTVLR_i register for every timer-capable counter in the SCTM. Timers are initialized to 0. When the corresponding CACHE_SCTM_CTCNTR_k increments and matches the values designated in CACHE_SCTM_TINTVLR_i, the timer is considered to be triggered and events configured in CACHE_SCTM_CTCR_WT_i are generated.

Timers can function in one of two mutually exclusive modes:

- Run-once mode: The timer stops after the first interval match and is not re-enabled until the timer is reset to the initial value (0) by setting the CACHE_SCTM_CTCR_WT_i[1] RESET bit to 1.
- Restart mode: The timer automatically resets to the initial value (0) each time the designated interval is reached.

The CACHE_SCTM_CTCR_WT_i[10] RESTART bit is used to configure the timer mode.

5.3.3.4.2.2 Event Generation

Timers can generate interrupts and debug events. Interrupts are routed from the module boundary to the interrupt controller(s) in the subsystem. Debug events are routed as triggers to debug logic within the subsystem.

The generation of the interrupts is controlled by the CACHE_SCTM_CTCR_WT_i[8] INT bit. The generation of debug events is controlled by the CACHE_SCTM_CTCR_WT_i[9] DBG bit. The INT and DBG bits can be set simultaneously and both signals are generated on interval match.

If neither INT nor DBG is set, the timer function is disabled and the counter functions as a regular counter.

5.3.3.5 L2 MMU (IPU_MMU)

An additional MMU provides address translation for the accesses done from the IPU subsystem to the L3_MAIN interconnect. The main characteristics of this MMU are:

- 32 entries
- Compatible with Armv6 architecture MMU translation tables (protection bits not used)
- Page-based or access-based endianness conversion
- Two-level descriptor hierarchy
- One intermediate page table
- Four page sizes (16 MiB, 1 MiB, 64 KiB, 4 KiB)
- Page table alignment on 128-byte boundary for Arm11 compatibility

The configuration of the IPU_MMU can be done from one of the Cortex-M4 cores or from the L3_MAIN interconnect slave port. The accesses done to configure the IPU_MMU cannot be part of a burst access.

For more information about the IPU_MMU, see Chapter 15, *Memory Management Units*.

5.3.3.5.1 IPU_MMU Behavior on Page-Fault

Table 5-7. IPU_MMU Behavior on Page-Fault

Table-Walker Enabled	Table-Walker Disabled
Application	
Use Table-Walker to find translation. Update TLB cache if successful, set TRANSLATIONFAULT bit and interrupt if not. The following bits are used for the purpose: MMU_IRQENABLE[1] TRANSLATIONFAULT and MMU_IRQSTATUS[1] TRANSLATIONFAULT.	Set TLBMISS bit and interrupt and stall. The following registers are used for the purpose: MMU_IRQENABLE[0] TLBMISS and MMU_IRQSTATUS[0] TLBMISS.
Debug	

Table 5-7. IPU_MMU Behavior on Page-Fault (continued)

Table-Walker Enabled	Table-Walker Disabled
Application	
Use Table-Walker to find translation. Update TLB cache if successful (only if the MMU_CNTL[3] EMUTLBUPDATE bit is set), generate in-band bus error if not.	Set EMUMISS bit and interrupt and stall. The following bits are used for the purpose: MMU_IRQENABLE[2] EMUMISS and MMU_IRQSTATUS[2] EMUMISS.

The MMU fault interrupt line is connected to both Cortex-M4 cores (at IPU_IRQ_16 interrupt line) and is also propagated outside of the IPU subsystem and connected to an IRQ_CROSSBAR input (IRQ_CROSSBAR_395). The user can route this interrupt to other device processors by properly programming the corresponding Control Module registers.

The default behavior of the IPU_MMU previously described can be overridden by setting the MMU_GP_REG[0] BUS_ERR_BACK_EN bit to 1. Once this bit is set, all MMU faults (including TLB miss) return a bus error to the IPU subsystem (interrupt event XLATE_MMU_FAULT). This allows the end user to quickly establish the cause of the MMU fault by having appropriate code in the ISR.

5.3.3.6 L2 MPORT

The MPORT provides three functions:

- Configuration of the L2 MMU – only allowed during functional reset or IDLE
- Data transfer to L2 banked RAM
- Coherency control between L1 cache and L2 memory system:
  - a. Query on L1 cache to determine if line exists
  - b. Query interface cleans/invalidates line
  - c. Once query is complete, MPORT can complete transfer to L2 RAM

5.3.3.7 ECC Implementation

In IPU subsystem, ECC support is implemented for L1 cache and L2 RAM. This enables Single Error Correction (SEC) and Double Error Detection (DED) in the memories. Since read-modify-write support is not implemented for partial accesses, individual ECC code is generated for each granular memory block. This is how each row is organized into data and ECC blocks:

- **L1 Data**: Access granularity to L1 data cache memory is 8 bits. Hence, a 32-bit row is divided into 4 blocks and 5-bit ECC code is generated for each block (see Figure 5-6)
- **L1 Tag**: As shown in Figure 5-7, ECC code is generated individually for flag and tag bits. Lock and LRA flags can be accesses exclusively and hence ECC support for this bit is not possible.
- **L2 RAM**: For L2 RAM, 64-bit data can be accessed with a granularity of 8 bits and hence, 8 ECC blocks each of width 5-bits are implemented (see Figure 5-8).

Figure 5-6. L1 Data ECC

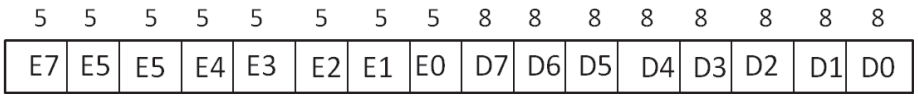


Figure 5-7. L1 Tag ECC

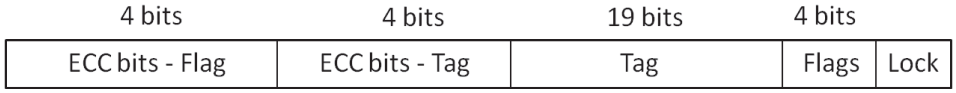

Figure 5-8. L2 RAM ECC

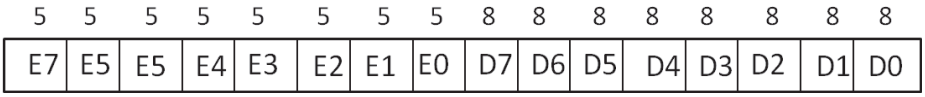


For all the ECC supported memories, error is detected/corrected for individual blocks and status is updated in the ECC registers in L1 unicache. As the errors can occur back-to-back, the registers are updated with the latest information. On SEC or DED event, interrupt is generated and propagated to both the Cortex-M4 cores. Also, in case of DED event in L1 data and L2 RAM, the error response is propagated along with the data so that it does not corrupt the system. If granular accesses are made to these memories, DED and error will still be reported for error occurring at other locations in the memory row. This is because entire row is read from the memory even for granular accesses. Moreover, DED event in L1 tag memory results in a tag miss and data is fetched from an external memory. The tag will still result in the hit if DED occurs in a way other than the one where hit condition occurred. However, DED interrupt will still be propagated to the register. In case of DED event in data or tag memory, it is recommended that the cache is invalidated by M4 in the interrupt service routine. For silicon validation, ECC blockimplementation also supports the individual masking of ecc or data block. On enabling the code/ data mask register, the data or ECC block can be corrupted and SEC / DED event can be validated accordingly.

5.3.4 IPU Power Management

5.3.4.1 Wake-Up Generator (IPU_WUGEN)

The IPU_WUGEN provides efficient power management by generating a wake-up request to the PRCM module when the IPU subsystem is in standby or full-idle mode and at least one enabled external interrupt becomes active. Upon assertion of the IPU wake-up request, the PRCM module will recover IPU functional clock (IPU_GFCLK) and thus, IPU will make a transition to active mode. In general, the IPU_WUGEN allows:

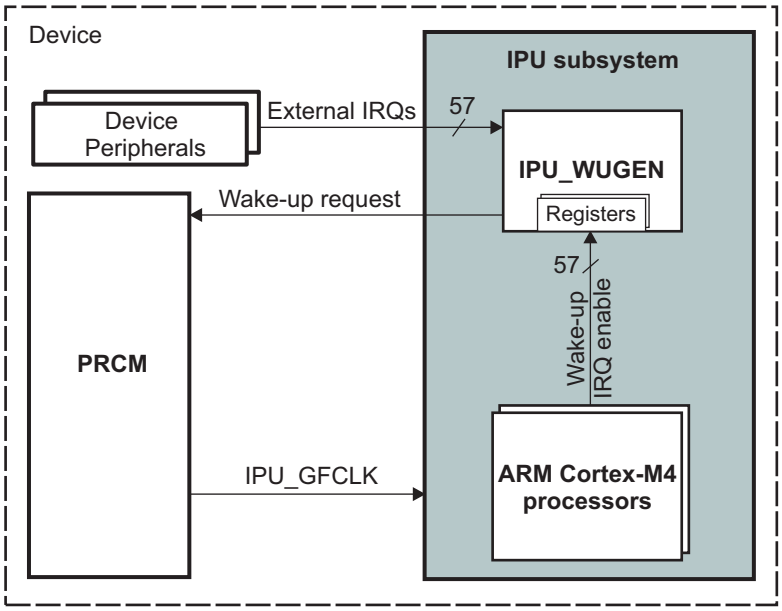
- Gating of the IPU subsystem clock dynamically, thus reducing power consumption
- Simplifying of dependencies in the PRCM module

Two retention registers are used to control which interrupts will cause a wake-up request generation:

- WUGEN_MEVT0 – wake-up interrupt enable for interrupts mapped to the IPU_IRQ_[47:23] interrupt lines.
- WUGEN_MEVT1 – wake-up interrupt enable for interrupts mapped to the IPU_IRQ_[79:48] interrupt lines.

Figure 5-9 is an overview of the IPU_WUGEN.

Figure 5-9. IPU_WUGEN Overview



5.3.4.2 Cortex-M4 Local Power Management

The Cortex-M4 processor provides two sleep modes to reduce power consumption:

- Sleep mode
- Deep-sleep mode

During sleep mode, the system clock can be stopped but the free running clock input should still be running to allow the processor to be woken by an interrupt or an event. The support of the sleep mode is done within the IPU subsytem. Deep-sleep mode also stops the processor clock but this can also be supported by the PRCM module. A combined signal is generated from the two Cortex-M4 processors in deep-sleep mode to initiate another power state and let the PRCM module handle the next power states. At this time, software must ensure that all IPU_UNICACHE background operations (for example, maintenance) are complete before PRCM asserts an idle request.

The sleep modes are invoked by wait for interrupt (WFI) or wait for event (WFE) instructions. For more information about entering/exiting sleep modes, see the Arm *Cortex-M4 Devices Generic user Guide*.

5.3.4.3 STANDBY and IDLE Protocols

The IPU subsystem supports the STANDBY and IDLE power-managment protocols. The following registers (part of the IPU_WUGEN register space) can be used to configure the different STANDBY and IDLE modes:

- STANDBY_CORE_SYSCONFIG[1:0] STANDBYMODE bit field. The default is smart wake-up STANDBY mode.
- IDLE_CORE_SYSCONFIG[1:0] IDLEMODE bit field. The default is smart wake-up IDLE mode.

NOTE: It is not recommended to change the default values of the STANDBY and IDLE modes in software.

5.3.4.4 Power Domains

The IPU subsystem is divided into two power domains (PD_IPU and PD_COREAON), which are controlled by the PRCM module.

The PD_IPU power domain is the main power domain and includes all the IPU subsystem components (two Arm Cortex-M4 processors, IPU_UNICACHE, IPU_ROM and IPU_RAM memories, and emulation\debug modules) except the IPU_WUGEN.

The PD_COREAON power domain is an always-on power domain. The PD_COREAON power domain contains the IPU_WUGEN, which generates a wake-up request from external interrupts. By this separate PD_COREAON power domain, the wake-up request can be generated even when the PD_IPU power domain is in OFF or RET state.

For information about the PD_IPU and PD_COREAON power domains, see Chapter 3, *Power, Reset, and Clock Management*.

5.3.4.5 Voltage Domain

The IPU subsystem is located within the CORE voltage domain (VD_CORE). All IPU logic (Cortex-M4 cores, IPU_UNICACHE/MMU, IPU_WUGEN, etc...) is fed by VD_CORE. All IPU memory arrays are fed by on-chip memory (SRAM) LDO dedicated to the CORE domain – SLDO_CORE.

For information about VD_CORE and SLDO_CORE, see Chapter 3, *Power, Reset, and Clock Management*.

5.3.4.6 Power States and Modes

Table 5-8 lists the different power modes and the expected states for each power domain.

Table 5-8. IPU Subsystem Power Modes

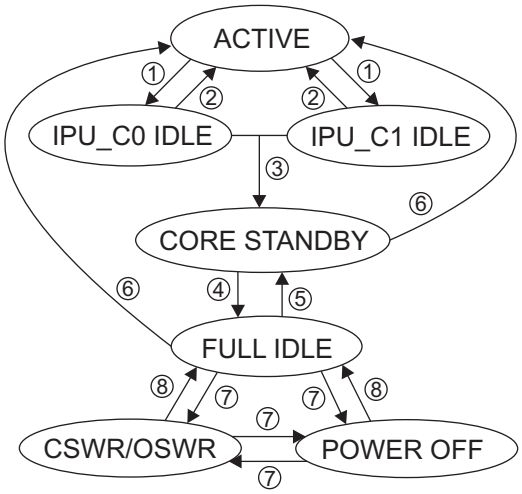
		Activity			Power Status	
	Functional Domain	Core		IPU subsystem	PD_IPU Power Domain	PD_COREAON Power Domain
	Modules included	IPU_C0	IPU_C1	IPU_WUGEN		
Power modes	Active	Active	Active	Active	ON	ON
	IPU_C0 idle	Idle	Active	Active	ON	ON
	IPU_C1 idle	Active	Idle	Active	ON	ON
	Core standby	Idle	Idle	Active	ON	ON
	Full idle	Idle	Idle	Idle	ON	ON
	CSWR	Idle	Idle	Idle	ON/LOWV	ON/LOWV
	OSWR	Idle	Idle	Idle	RET	ON
	Power off	Idle	Idle	Idle	OFF	OFF

The different power modes and their features are:

- Active mode: All functional domains are operative.
- IPU_C0 and IPU_C1 idle mode:
  - Only the CPU core is idled (when running WFE/WFI instructions).
  - Only one Cortex-M4 core can be in this mode. Interrupts or events can wake-up the core.
  - Can go into sleep or deep-sleep mode. Potentially, both cores can be in sleep mode.
  - When both cores are in deep-sleep mode, a standby request is sent to the PRCM module.
  - Software must ensure that all IPU_UNICACHE background operations (for example, maintenance) are complete before the PRCM module asserts an idle request.
- Core standby mode
  - In this mode, both cores in the CORE functional domain are in idle mode (an interrupt cannot wake up either of the cores).
  - The PRCM module must have acknowledged its acceptance by an MWait signal.
  - After this handshake, all power management is under the control of the PRCM module.
- Full-idle mode:
  - In this mode, the IPU subsystem functional domain is also idled.
  - This mode is only reached by PRCM's initiative. When PRCM finds all conditions (by hardware and/or software configuration) are met to idle, it sends idle requests to the local PRCM, and it affects each functional domain.
  - After coming to this mode, power states can be moved deeper.
- CSWR mode:
  - In this mode, the logic supply voltage is lowered to reduce static power consumption by leakage current. Logic power switch in the PD_IPU power domain is still closed (ON); thus, all logic states are retained.
  - IPU_WUGEN is still active and can generate wake-up request to PRCM.
  - L1 and/or L2 memories can go independently in retention depending upon the settings done at PRCM level.
- OSWR mode:
  - In this mode, logic power switch is open (OFF); thus, most logic states are lost except the retention logics. Voltage level is typically lowered, but not necessarily.
  - Cache/L2 memory contents are retained
  - WUGEN is still active and can generate wakeup request to PRCM.
- Power off mode:
  - The voltage source is shut down. The logic states, including the retention logic, are lost.
  - The IPU_WUGEN is not operating and only the PRCM module can trigger the IPU subsystem wakeup.
  - Reset must be applied to the IPU subsystem to restart the two Cortex-M4 processors and the memory subsystem.

Figure 5-10 shows the power mode transitions in the IPU subsystem.

Figure 5-10. IPU Power Mode Transitions



Legend for Figure 5-10:

- 1 = WFE/WFI instruction
- 2 = Events/interrupts
- 3 = "Deep-sleep" generated
- 4 = L1/L2/IPU_WUGEN functional domain idled
- 5 = Wakeup (OCP)
- 6 = Wakeup (IRQ)
- 7 = PRCM
- 8 = PRCM or wakeup

5.3.5 IPU Interprocessor Communication (IPC)

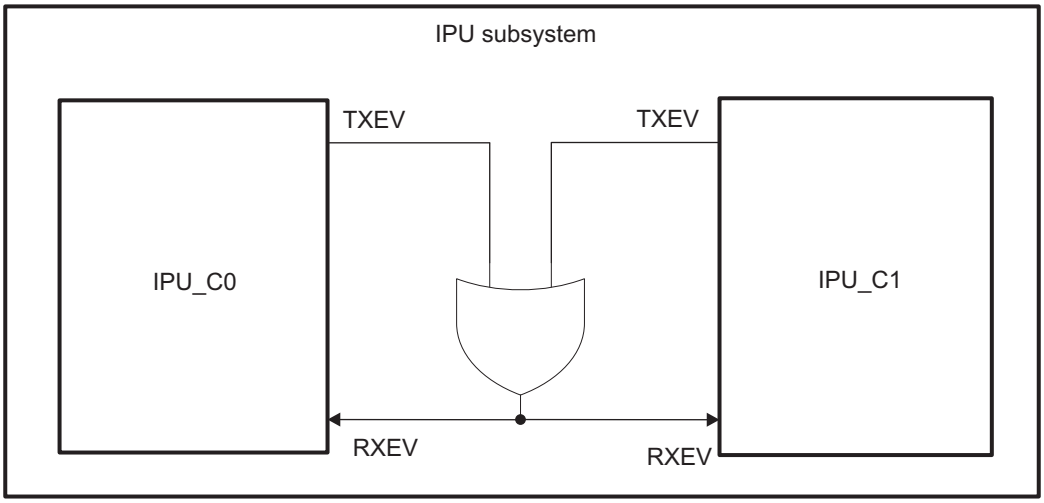
5.3.5.1 Use of WFE and SEV

The IPU subsystem provides a multiprocessor communication interface for synchronizing tasks. The Arm processors have one output signal, TXEV (transmit event), for sending events and one input signal, RXEV (receive event), for receiving events. Figure 5-11 shows how TXEV and RXEV are connected in the IPU subsystem.

When a WFE instruction is executed, the processor enters into sleep mode waiting for an event and continues instruction execution when an external event is received. With an SEV (send event) instruction, one processor can wake up the other processor, which is in sleep mode.

The WFE and SEV instructions can help reduce the number of iterations around a lock acquire loop (a spinlock), and thereby reduce power consumption. The basic mechanism involves an observer that is in a spinlock executing a WFE instruction, which suspends execution on that observer until an asynchronous exception or an explicit event (sent by an observer using the SEV instruction) is seen by that observer. The observer that holds the lock uses the SEV instruction to send an event after a lock is released.

Figure 5-11. Event Communication Connection in IPU Subsystem



5.3.5.2 Use of Interrupt for IPC

Each Cortex-M4 core can interrupt the other Cortex-M4 core by setting up an interrupt register (CORTEXM4_CTRL_REG). This register is used to trigger the corresponding 'per core' HWSEM_M4_IRQ interrupt (interrupt number 19). Because the priority level for that interrupt can be defined, it is possible to choose the task level at which the interrupt will run. For example, if IPU_C0 was active and IPU_C1 was idle (WFI state), when IPU_C0 completes its task it sets the bit for IPU_C1 in the control register (CORTEXM4_CTRL_REG[16] INT_CORTEX_2) and goes into sleep mode. IPU_C1 wakes up seeing this interrupt, and starts running its task. After the completion of its task, IPU_C1 sets the interrupt for IPU_C0 (CORTEXM4_CTRL_REG[0] INT_CORTEX_1), and then goes into WFI state. This kind of handshake ensures that if IPU_C0 and IPU_C1 are accessing the same resources (memory, registers etc.), only one of the CPUs at a time is active.

5.3.5.3 Use of the Bit-Band Feature for Semaphore Operations

The two Cortex-M4 cores share the same memory system, and it is possible to use the bit-band feature to carry semaphore operations. Because the bit-band alias writes are locked read-modify-write transfers, provided that all tasks changed only the lock bit representing themselves, the lock bits of other tasks are not lost, even if two tasks try to write to the same memory location at the same time.

Each Cortex-M4 core supports two bit-band regions.

Bit-band 1 applies to the virtual address space 0x2000 0000–0x200F FFFF (1 MiB). This virtual address space can be mapped to any physical address and bit-banding will apply to that region. It is recommended that the user map the L2 IPU_RAM (64 KiB) to this virtual space and use it only for bit-banding operations. If required, the user can define other available small and medium pages over and above the L2 IPU_RAM virtual space and further extend the use of the bit-band feature.

Bit-band 2 applies to the virtual address space 0x4000 0000–0x400F FFFF (1 MiB). The first 16 KiB of this space (0x4000 0000–0x4000 3FFF) are already reserved for small (one page) pages and cannot be remapped by software. The bit-band alias that corresponds to this 16-KiB region (0x4200 0000–0x4207 FFFF) must also be treated as reserved and no access should be made. The rest of bit-band 2 can be used by appropriately defining the available small and medium pages. In this device, because it is likely that during normal AMMU programming all of L3_MAIN is mapped to this region, it is highly recommended that the user use only bit-band 1 for all purposes and bit-band 2 only if it is necessary.

5.3.5.4 Cortex-M4 Private Memory Space

Each Cortex-M4 processor has its own memory space (address range 0xE000_1000 – 0xE00F_FFFF), inaccessible by the other processor (and also by the L3_MAIN interconnect). Because the registers in this memory space are not shared, they do not require the bit-band feature (semaphore) to read from and write to them.

5.3.6 IPU Memory Mapping

The Cortex-M4 processor has a predefined memory map that specifies which bus interface is to be used when a memory location is accessed. The Cortex-M4 also features a bit-band support from which a special region is defined. For more details about the Cortex-M4 memory model, refer to Arm *Cortex-M4 Technical Reference Manual*.

IPU memory map is presented in Chapter 2, *Memory Mapping*.

5.3.7 IPU Boot Configuration

IPU is the boot master of this device. The device initialization is described in Chapter 25, *Initialization*.

The IPU boot location is controlled via two Control Module registers:

- CTRL_CORE_CORTEX_M4_MMUADDRTRANSLTR[19:0] CORTEX_M4_MMUADDRTRANSLTR: Used to set the physical translated address for IPU AMMU
- CTRL_CORE_CORTEX_M4_MMUADDRLOGICTR[19:0] CORTEX_M4_MMUADDRLOGICTR: Used to set the logical source address for IPU AMMU

By default, two AMMU pages are enabled:

- Small page-0: Translates the 16KB address range from CORTEX_M4_MMUADDRLOGICTR to (CORTEX_M4_MMUADDRLOGICTR + 0x3FFF). If CORTEX_M4_MMUADDRLOGICTR is set to 0x00000, page-0 will control the boot location. If the boot location needs to be mapped to the L2 RAM (0x5502_0000), then CORTEX_M4_MMUADDRTRANSLTR needs to be set to 0x55020. This page is set as non-cacheable at reset.
- Small page-1: Loaded with the physical address of the IPU AMMU configuration registers (0x5508_0000 - 0x5508_0FFF), which is mapped to the virtual address range from 0x4000_0000 to 0x4000_0FFF. This page is also set as non-cacheable at reset.

NOTE: Small page-1 is by default 4KB. Software has to modify it to 16KB to cover L2MMU/WUGEN masks.

For IPU to boot from any location in L3:

1. Provide boot address through CORTEX_M4_MMUADDRTRANSLTR to AMMU page-0 (CORTEX_M4_MMUADDRLOGICTR set to 0x00000). Keep L2 MMU disabled (or enable L2 MMU but keep the same translation for 0x0; otherwise there will be L2-MMU page-walks / page-faults).
2. Set CORTEX_M4_MMUADDRTRANSLTR to 0x00000 (or any value). Host CPU re-programs AMMU page to map 0x0 virtual address to a physical L2 RAM / L3 location. Only after the programming is complete, Cortex-M4 reset is released. L2 MMU as described above.
3. Set CORTEX_M4_MMUADDRTRANSLTR to 0x00000 (no translation). Host CPU programs L2 MMU to do the address translation for 0x0.

For IPU to boot from L2 RAM:

1. This must be done through AMMU page-0. Use either (1) or (2) as described above.

5.3.8 IPU Debug and Emulation Features

The IPU subsystem (and the Cortex-M4 core, in particular) provides some debug and emulation capabilities. They are described in Chapter 26, *On-Chip Debug Support*.

5.4 Dual Cortex-M4 IPU Subsystem Register Manual

5.4.1 IPU Subsystem Instance Summary

Table 5-9 summarizes the IPU subsystem instances.

Table 5-9. IPU Subsystem Instance Summary

Module Name	Base Address (IPU Private Access)	Base Address (L3_MAIN Interconnect)	Size
IPU_UNICACHE_CFG	0x5508 0000	N/A	256 B

Table 5-52. CACHE_SCTM_CTCR_WT_i

Address Offset	0x0000 0100 + (0x4 * i)		
Physical Address	0x5508 0500 + (0x4 * i)	**Instance**	IPU_UNICACHE_SCTM_IPU
Description	These registers contain the control and status settings for a single counter in the module. There will be a CTCR for every counter in the module (WT: with timer)		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								INPSEL								RESERVED					RESTART	DBG	INT	CHNSDW	OVRFLW	IDLE	FREE	DURMODE	CHAIN	RESET	ENBL

Bits	Field Name	Description	Type	Reset
31:21	RESERVED	Reserved.	R	0x000
20:16	INPSEL	Counter Timer input selection 0: Constantly asserted input that results in a free-running counter/timer 1-31: Index of event input signal selected	RW	0x00
15:11	RESERVED	Reserved.	R	0x00
10	RESTART	Restart the timer after an interval match 0: The timer stops after the first interval match. It must be manually reset by software before it starts counting again (run-once timer mode). 1: The timer immediately resets to 0 and begins incrementing again based on the current input configuration (restart timer mode).	RW	0
9	DBG	Signal debug logic on interval match 0: No debug event is generated. 1: Upon interval match, generates a debug event on the corresponding debug output event signal	RW	0
8	INT	Generate interrupt on interval match 0: No interrupt is generated. 1: Upon interval match, generates an interrupt on the corresponding interrupt output event signal	RW	0
7	CHNSDW	Counter has a shadow register for chain reads. 0: The read of the corresponding counter register returns the current value. 1: Read of the high-order counter register, simultaneously loads the current value of the 32 LSBs into a shadow register. The read of the counter register that corresponds to this counter returns the value of the shadow register. This is applicable only when the counter is chained.	R	0
6	OVRFLW	Counter has wrapped since it was last read 0: The counter has not wrapped since the last read. 1: The counter has wrapped since the last read.	R	0
5	IDLE	Counter ignores processor IDLE state 0: The counter does not increment during IDLE state. 1: The counter continues to function during IDLE state; applicable if IDLEMODE = 1.	RW	0
4	FREE	Counter ignores processor debug halt state 0: The counter does not increment (decrement) during the debug halt state.	RW	0

Bits	Field Name	Description	Type	Reset
		1: The counter continues to function during debug halt state.		
3	DURMODE	Counter is in duration or occurrence mode 0: The counter operates in event mode. The counter increments by 1 each time a rising edge is seen on the designated input event signal. 1: The counter operates in duration mode. The counter increments every time a clock cycle is seen and the corresponding input event signal is asserted.	RW	0
2	CHAIN	Counter is chained to an adjacent counter 0: The counter is not chained. 1: Reserved	RW	0
1	RESET	Counter reset control 0: No effect 1: The corresponding counter is reset to the initial value and the OVERFLW bit is cleared. It continues to function if it is still enabled.	RW	0
0	ENBL	Counter enable control 0: The counter does not increment. 1: The counter increments as configured.	RW	0

Embedded Vision Engine

This chapter describes the embedded vision engine (EVE) for the device.

Topic **Page**

6.1 Embedded Vision Engine (EVE) Subsystem

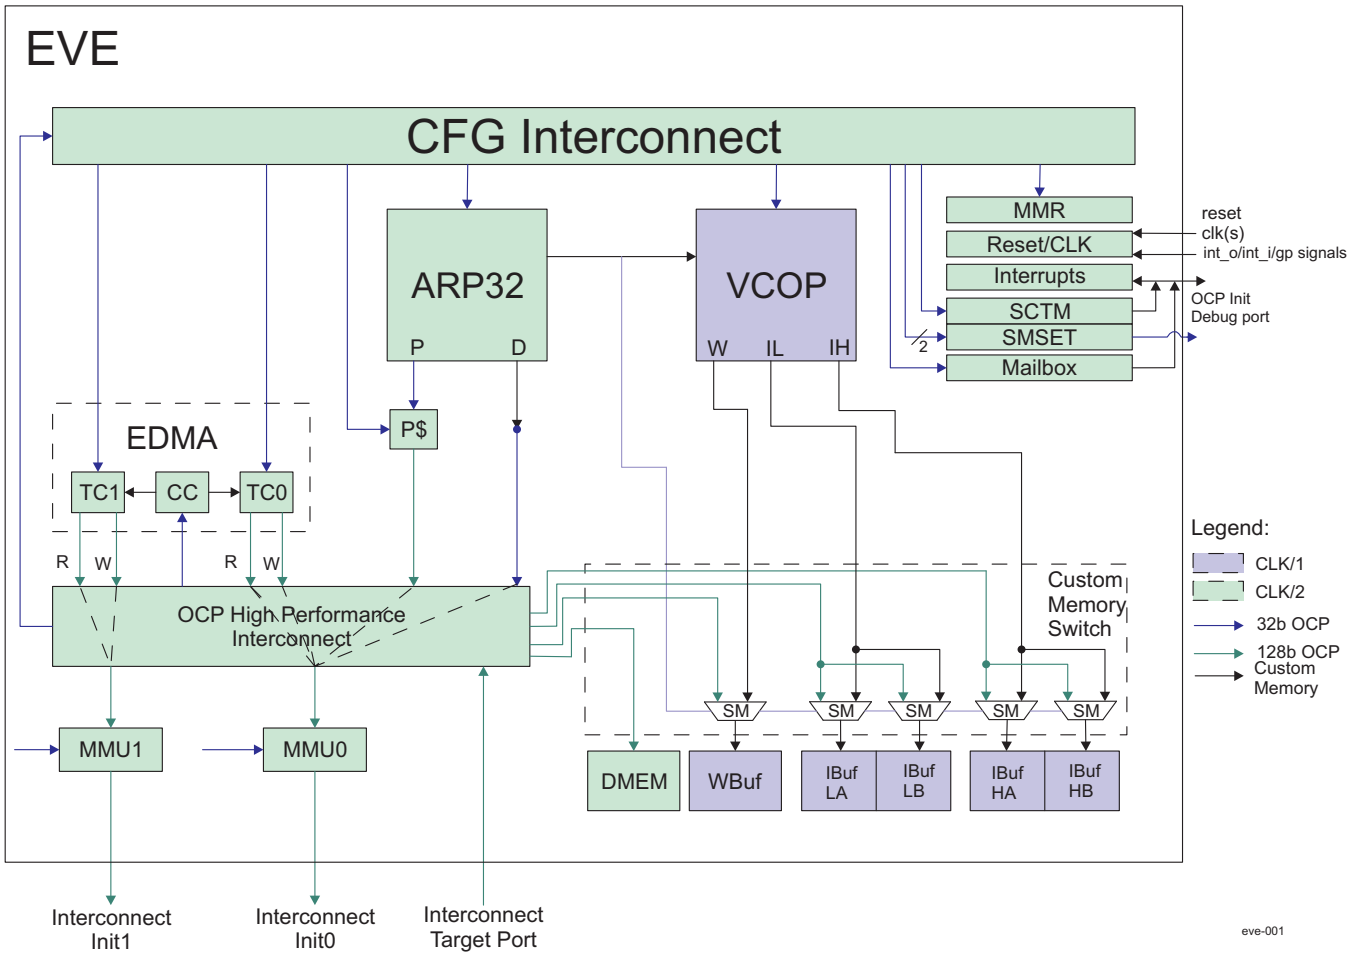
6.1.1 EVE Overview

The embedded vision engine (EVE) module is a programmable imaging and vision processing engine, intended for use in devices that serve customer electronics imaging and vision applications. Its programmability meets late-in-development or post-silicon processing requirements, and lets third parties or customers add differentiating features in imaging and vision products.

The device includes one instantiation of the EVE engine. A single EVE module consists of an ARP32 scalar core, a vector coprocessor (VCOP) vector core, and an Enhanced DMA (EDMA3) controller.

Figure 6-1 is a high-level block diagram of the EVE module.

Figure 6-1. EVE Overview



The ARP32 scalar core is the subsystem controller. It coordinates internal EVE interaction, as well as interaction with other components in the system on chip (SoC), like host processor and the DSP. The VCOP is a SIMD engine with built-in loop control and address generation.

The EDMA block is the local DMA. It is used for transferring data between system memories (typically SDRAM and/or L3 SRAM) and internal EVE memories.

Module interconnect is conceptually broken into two parts: A high-performance interconnect and a configuration interconnect. The high-performance interconnect serves as primary high bandwidth (partial) crossbar connection between the EDMA, ARP32, DMA, OCP initiator/target buses and EVE memories. The configuration interconnect provides connectivity to the various memory-mapped registers (MMR) within the EVE module.

The custom memory switch provides a statically muxed low-latency and high-bandwidth connection between the VCOP and the internal EVE memories. The custom memory switch also provides any accesses from the high-performance interconnect and EVE memories.

The interrupt controller (INTC) handles incoming interrupts, merging them with internal interrupt sources to drive the interrupt inputs of the ARP32 .

The MMR block includes control and status bits for general EVE functions that do not reside in other blocks, including reset and clock controller registers and memory static mux ownership.

The SCTM block includes debug logic that supports the counting and timing of various EVE level events, namely VCOP stall counts, VCOP access counts, ARP32 cache miss counts, and so on. The SMSET block provides software message tracing, as well as event tracking.

The reset-clock controller handles subsystem reset and power-management functions.

The EVE engine includes the following main features:

- Two 128-bit interconnect initiator ports used for:
  - Paging between system-level memory (L3 SRAM/DDR) and EVE memory (primarily IBUF, WBUF)
  - ARP32 program fetches to system memory (through program cache)
  - ARP32 load or store requests to system memory
  - ARP32 program cache-related read requests, including prefetch/preload requests
- 128-bit interconnect target port used for system-level host or DMA access to EVE memory or MMR space
- Scalar core (ARP32) with the following features:
  - 32KB program cache (direct mapped and prefetch)
  - 32KB data memory (DMEM)
- Vector core (VCOP):
  - 32KB working buffer (WBUF)
  - 16KB image buffer low copy A (IBUFLA)
  - 16KB image buffer low copy B (IBUFLB)
  - 16KB image buffer high copy A (IBUFHA)
  - 16KB image buffer high copy B (IBUFHB)
- EDMA channel controller (EDMACC): 128 PaRAM entries, 2 Queues
- EDMA transfer controllers: two instances, 2k FIFO each
- Memory Management Units (MMUs):
  - 32-entry TLB per MMU
  - Page walking with hardware
  - EDMA accesses and ARP32 program or data accesses to system memory space
  - Can limit EVE accesses to desired subset of system addresses
- Configuration interconnect for MMR and debug accesses
- High-performance interconnect for high throughput and high concurrency data transfers between connected endpoints
- Multiple interrupts for interrupt mapping, DMA event mapping, and interprocessor handshaking
- Support for slave idle and master standby protocols for clock gating
- No support for retention and memory array off modes
- Error detection on all memories:
  - Single bit error detect on DMEM, WBUF, IBUFLA, IBUFLB, IBUFHA, and IBUFHB
  - Double bit error detect on program cache
- Invalid instruction detection in the two processor units (ARP32 and VCOP)
- Debug support
  - Subsystem Counter Timer Module (SCTM) for counting and measuring of VCOP, EVE program

cache, and EDMA performance-related state
  - Software Messaging System Event Trace (SMSET) for trace of software messages and hardware events
  - ARP32 debug support: State visibility, breakpoint, run control, cross-triggering
  - VCOP debug support: State visibility and run control
- Interprocessor communication: Internal Mailbox for DSP/EVE communication

6.1.1.1 EVE Memories

Table 6-1 lists the memories inside the EVE subsystem. See Section 6.1.3.3, *Internal Memory Overview*, for an overview of each memory and its organization, see Section 6.1.3.15, *Memory Map*, for the subsystem memory mapping.

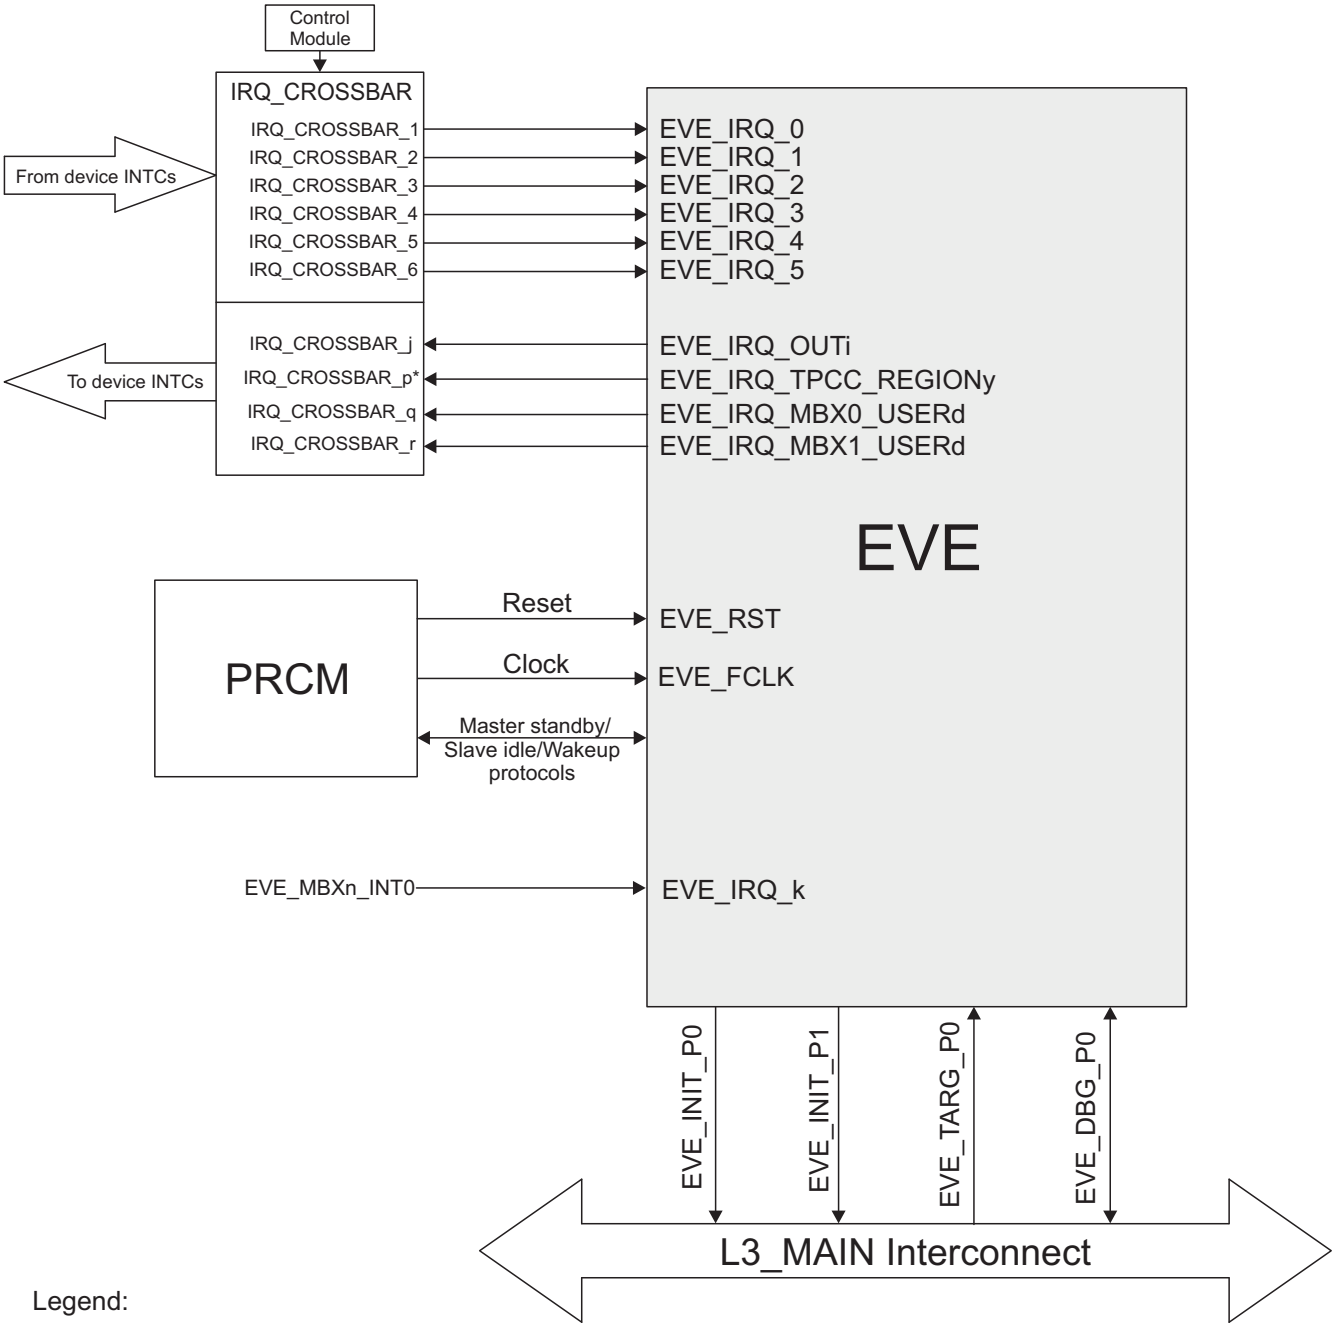
Table 6-1. EVE Subsystem Memory Blocks

Memory	Organization	Size	Function
PMEM	1024 × 256	32KB	ARP32 program cache
DMEM	2048 × 128	32KB	ARP32 data memory
WBUF	8 × 1024 × 32	32KB	VCOP working buffer
IBUFLA	8 × 512 × 32	16KB	Image buffer low copy A
IBUFLB	8 × 512 × 32	16KB	Image buffer low copy B
IBUFHA	8 × 512 × 32	16KB	Image buffer high copy A
IBUFHB	8 × 512 × 32	16KB	Image buffer high copy B

6.1.2 EVE Integration

Figure 6-2 shows the EVE integration inside the device. EVE includes a number of mailboxes, interrupts, DMA events, and general-purpose I/Os (GPIOs) to facilitate handshaking between the EVE modules and also between other initiators or targets such as DSP, IPU, VIP and the PRCM module.

Figure 6-2. EVE Integration



Legend:

j = 168 to 171
p = 281 to 283 (p = 398, for y = 4)*
q = 284 to 286
r = 287 to 289
n = 2, 3, 4

i = 0, 1, 2, 3
y = 1 to 4
d = 1 to 3

k = 28, 29, 30

eve-002

NOTE: Figure 6-2 is an overview of the EVE integration. For detailed explanation of the interrupt, mailbox, and general-purpose signals coming out or going in EVE subsystem, see Figure 6-3.

Table 6-2 through Table 6-4 summarize the integration of the EVE subsystem in the device.

Table 6-2. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
EVE	PD_EVE	L3_MAIN

Table 6-3. Clocks and Resets

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
Clocks				
EVE	EVE_FCLK	EVE_GFCLK	PRCM	EVE functional clock, gated. For more information about clock gating and management, refer to Chapter 3, *Power, Reset, and Clock Management (PRCM).*
Resets				
EVE	EVE_RST	EVE_RST	PRCM	For information about PRCM reset sources and distribution, see Section 3.1.1.1, *Reset Management Functional Description*, in Chapter 3, *Power, Reset, and Clock Management (PRCM).*
		EVE_CPU_RST		
		EVE_PWRON_RST		

Table 6-4. Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**

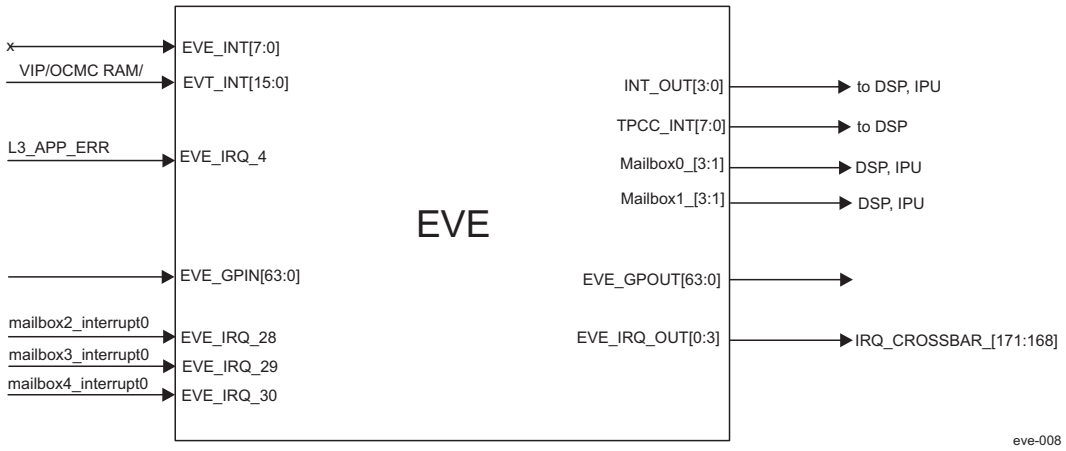
No DMA Requests				

NOTE: The **Default Mapping** column in Table 6-4 shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device INTC through the IRQ_CROSSBAR module.
For more information about the IRQ_CROSSBAR module, see Section 13.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 13, *Control Module*.

6.1.2.1 EVE Recommended Connections

Figure 6-3 show the interrupts, general purpose signals, and DMA requests for EVE instance.

Figure 6-3. EVE Signals



EVE INT[7:0] Usage:

EVE_INT[7:0] are not connected to any chip-level or inter-EVE interrupt. These interrupts can be tied to any chip-level mailboxes or any other interrupts that are intended as wake-up interrupts.

TPCC Interrupts Usage:

TPCC interrupts are used as region-based interrupts. The transfers for different processors are divided into separate regions and on completion of a transfer the associated TPCC_INT interrupts the corresponding processor. Region 0 interrupt is reserved for the internal ARP32 processor. Region 1 is reserved and not used. Region 2 is routed to DSP1, region 3 to DSP2, and region 4 to IPU.

6.1.3 EVE Functional Description

6.1.3.1 EVE Connection ID (ConnID) Mapping

The ConnID value is used for error reporting in the memory switch error register (EVE_MSW_ERR[24:16] CONNID). Table 1-5 lists the EVE internal initiators and their assigned 9-bit ConnID values.

Table 6-5. EVE Internal ConnID Mapping

Initiator	CONNID Value
System initiators (through OCP target bus)	0 to FFh
ARP32	100h
VCOP	101h
EDMA TC0	102h
EDMA TC1	103h

6.1.3.2 EVE Processors Overview

6.1.3.2.1 Scalar Core (ARP32)

The scalar core (ARP32) executes conventional RISC instructions. The scalar core is based on the ARP32 processor, which contains the following five functional units:

- The L-unit performs the logical, shift, rotation, extraction, reverse, clear, set, and equal operations.
- The S-unit performs the move operations.
- The D-unit performs arithmetic operations that include compare less than and greater than instructions, address calculation for load and store instructions, PC calculations for branch instructions and stack pointer increment/decrement for PUSH/POP and CALL/RETURN instructions.
- The M-unit performs multiplication.
- The DIV-unit is used for bit serial divide logic.

The ARP32 includes 32-bit program fetch and 32-bit data access bus. For additional information about ARP32 core see Section 6.2, *ARP32 CPU and Instruction Set*.

6.1.3.2.2 VCOP

The VCOP is an SIMD engine with built-in loop control and address generation. The VCOP is programmed in array of 2D block processing level. The vector core has the following resources:

- 4 nested for loops, with loop variables i1, i2, i3, and i4
- 8 address generators, each capable of 4-dimensional addressing; address pattern is *base + i1*const1 + i2*const2 + i3*const3 + i4*const4*
- 16-entry vector register file, each entry is 8-way SIMD × 40-bit signed (sign-extended or zero-padded from 8/16/32-bit signed/unused memory data, or zero-padded from operation upon register data)
- Two general-purpose functional units, each N-way SIMD, N = 2, 4, 8, 16, 32
- Table lookup unit supporting up to N parallel histogram operations
- 8 load units
- 8 store units
- Flat versus Aliased view of EVE memory

In addition, the VCOP supports the following functions:

- Generic compute
- Table lookup
- Histogram and weighted histogram

For additional information about VCOP, see Section 6.3, *VCOP CPU and Instruction Set*.

6.1.3.2.3 Scalar-Vector Interaction

The ARP32 scalar and vector cores share one program memory, but can execute in parallel on separate threads. The scalar core has sole control of the program memory, so all vector instructions are accessed by the scalar core. When a vector instruction is recognized as such it is relayed through the scalar-vector interface to the vector core for execution.

6.1.3.3 Internal Memory Overview

This section provides a functional overview for each of the memory endpoints listed in Table 6-6.

Table 6-6. Internal Memory Blocks

Memory	Organization	Size	Function
PMEM	1024 × 256	32KB	ARP32 program cache
DMEM	2048 × 128	32KB	ARP32 data memory
WBUF	8 × 1024 × 32	32KB	VCOP working buffer
IBUFLA	8 × 512 × 32	16KB	Image buffer low copy A
IBUFLB	8 × 512 × 32	16KB	Image buffer low copy B
IBUFHA	8 × 512 × 32	16KB	Image buffer high copy A
IBUFHB	8 × 512 × 32	16KB	Image buffer high copy B

NOTE: EVE internal memories, PMEM, DMEM, WBUFs and IBUFs, are visible in the SoC. Device host processors like IPU and DSP access the EVE memories through its OCP ports. For EVE memory mapping, see Table 6-25. For information about the address space of EVE subsystem modules and memories from device point of view see, Chapter 2, *Memory Mapping*.

6.1.3.3.1 Program Cache/Memory

For detailed explanation of the program cache operation, see Section 6.1.3.4, *Program Cache Architecture*.

6.1.3.3.2 ARP32 Data Memory (DMEM)

The ARP32 data memory is logically organized as four banks of 32-bit memories. It is the primary location for storing run-time variables and stack for the software execution environment for the ARP32 core. This memory is byte addressable, and is accessed with byte granularity by all valid initiators. DMEM is accessed at peak rate of up to 4B/cycle by the ARP32 core, or up to 16B/cycle by the system components (EVE EDMA, DMA target bus). The vector core cannot access this memory.

The arbitration between the ARP32 and DMA/System accesses to DMEM is done on round-robin scheme. That is a continuous stream of requests from two (or more) initiator ports results in each requestor gaining access on alternating burst boundaries, therefore DMA/System accesses to DMEM should be minimized in order to avoid impacting the ARP32 performance. Only a single access (ARP32 or DMA/System access) occurs in a single cycle.

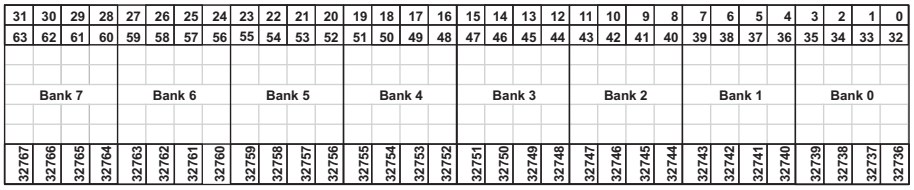
6.1.3.3.3 WBUF

VCOP WBUF is the primary location for VCOP look-up tables (LUTs) and other relatively long-lived data buffers. This memory is byte addressable. On a time-slot basis (as controlled by the ARP32 core) WBUF ownership is assigned to either the system (ARP32, EDMA, DMA target bus) or the VCOP.

WBUF is accessible by VCOP, ARP32, and system components (EDMA, DMA target bus) depending on the programmed ownership. The primary master of working buffer is the VCOP.

As shown in Figure 6-4, VCOP can access each of the eight banks of memory independently, giving a total of 256-bits per cycle. ARP32 core can access up to 32-bits per cycle in a given bank and EDMA (and other system components) can access up to 128-bits per cycle of contiguous banks of memory within a 128-bit aligned window (this is a case when there are no independent bank accesses, and single access does not cross 128-bit boundary).

Figure 6-4. WBUF Bank Organization



EDMA versus system accesses (through OCP target bus) are arbitrated dynamically, on OCP bus boundaries, with round-robin policy within the OCP high performance Interconnect. EDMA/System versus ARP32 accesses are arbitrated at dataphase boundaries.

The master that owns the WBUF is pseudostatically defined in the EVE_MSW_CTL[16] WBUF bit. When EVE_MSW_CTL[16] WBUF = 0x0 the static mux (SM) provides a connection from the OCP high-performance interconnect (EDMA, ARP32 or external-to-EVE initiated access) to the WBUF memory, and VCOP accesses are not allowed. Otherwise, (EVE_MSW_CTL[16] WBUF = 0x1) SM provides a connection from VCOP to the WBUF memory and system accesses are not allowed.

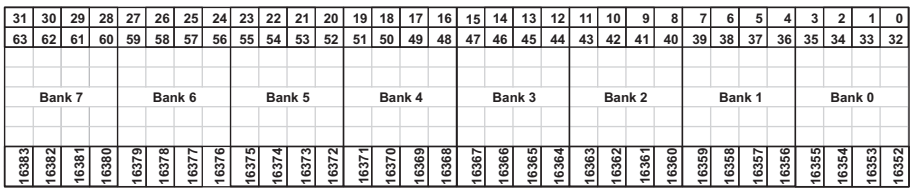
In case VCOP or system initiators access the WBUF address location while WBUF is not owned, an error is captured in the EVE memory switch error register (EVE_MSW_ERR) and EVE memory switch error the address register (EVE_MSW_ERRADDR) and the corresponding flag in EVE_MSW_ERR_IRQSTATUS_RAW register is set. Debug accesses do not set the error registers or interrupt, but result in OCP ERR response.

6.1.3.3.4 Image Buffers–IBUFLA, IBUFLB, IBUFHA, and IBUFHB

EVE image buffers are the primary location for the time-slot based data buffers. These buffers are built to facilitate ping-pong ownership and accesses by the EDMA and the VCOP. On a time-slot bases (as controlled by the ARP32 core), each of the respective image buffers can be assigned ownership to either the System (ARP32, EDMA, OCP target bus) or the VCOP.

IBUFLx and IBUFHx (x = A, B) are typically used as output buffers, and as such VCOP can concurrently access up to eight banks of memory in the VCOP-owned IBUFLA and IBUFLB banks and up to eight banks of memory in one of the VCOP owned IBUFHA and IBUFHB (see Figure 6-5). ARP32 accesses 32-bits per cycle in one of the system-owned IBUF banks.

Figure 6-5. IBUF Bank Organization



EDMA (and other EVE system components) access up to 128 bits per cycle of contiguous banks of memory (in case there are no independent bank accesses) within a 128-bit window (a single access does not cross 128-bit boundary) for each system-owned corresponding IBUF bank. For example, if all banks are system owned, EDMA TC0 (or any other EVE system resource) accesses IBUFL at 128-bits per cycle in parallel with EDMA TC1 accessing IBUFH at 128-bits per cycle, giving a total throughput of 256-bits per cycle.

EDMA versus system versus ARP32 accesses are arbitrated dynamically on OCP burst boundaries. The arbitration is done with round-robin policy inside the EVE high-performance interconnect.

The ownership of each IBUF is pseudostatically controlled by the EVE_MSW_CTL [12]IBUFHB, EVE_MSW_CTL [8]IBUFLB, EVE_MSW_CTL [4]IBUFHA, EVE_MSW_CTL [0]IBUFLA bits. Ownership is also internally changed by ARP32 custom instruction or through writes to the memory-mapped address.

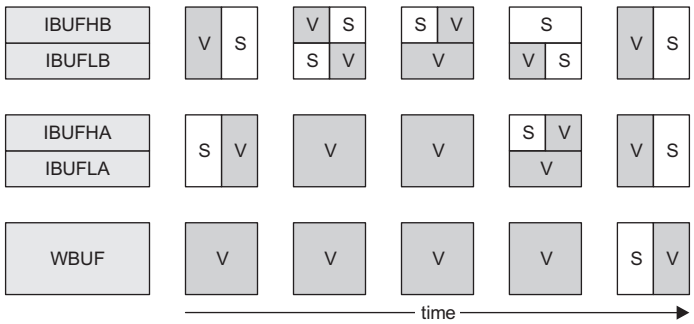
By setting EVE_MSW_CTL [12/8/4/0]IBUF = 0x1 the ownership of the IBUF memory is granted to VCOP, otherwise (EVE_MSW_CTL:IBUF = 0x0) the memory is owned by the EVE system resources. If IBUF is system owned, then the SM provides a connection from the EVE high-performance interconnect (for EDMA, ARP32, or external-to-EVE initiated access) to the corresponding IBUF memory, and VCOP accesses are not allowed. If IBUF is VCOP owned, the static mux provides a connection from VCOP to the IBUF memory, and system accesses are not allowed.

Ownership of each of the four IBUF regions (IBUFLA, IBUFLB, IBUFHA, and IBUFHB) is independently programmable with no restrictions. Aliased versus nonaliased mode is controlled by setting the EVE_MEMMAP register. In nonaliased mode it is possible for the VCOP core to own all four IBUFs, or for the system resources to own all four IBUFs or any combination. In aliased mode VCOP owns only one of the IBUFHx regions and one of the IBUFLx regions (x = A, B) because both A and B copies of the IBUFs are mapped to the same address.

In case VCOP or system initiators access the WBUF address location while IBUF is not owned, an error is captured in EVE memory switch error register (EVE_MSW_ERR) and EVE memory switch error address register (EVE_MSW_ERRADDR) and the corresponding flag in the EVE_MSW_ERR_IRQSTATUS_RAW register is set. Debug accesses do not cause the error registers or interrupt to be set, but result in OCP ERR response.

Figure 6-6 shows the typical ownership patterns that offer different amounts of memory/bandwidth to VCOP (V) versus system (S) accesses.

Figure 6-6. VCOP VersusSystem Memory Ownership Examples



6.1.3.3.5 Memory Switch Error Registers

The memory switch error registers capture the first occurrence of an error caused by a functional access. Software must service the error and clear the MMR to capture subsequent errors. The registers capture the identity of the specific requester through the OCP ConnID (see Table 6-5) field and the specific address that is requested.

The MSBs of the address is always 0x400, which matches the internal (local) address view. For system accesses, this does not necessarily match the system view base address. For IBUFL and IBUFH, the physical address offset is captured even in aliased mode (for example, IBUFLB address at 0x4007 0000 is used in both aliased and nonaliased mode).

Unlike the parity/error detect registers, that provide unique error registers per memory type, the memory switch error registers capture errors regardless of which specific memory is accessed.

Debug accesses do not cause the error or interrupt registers to be set, but result in OCP error response.

The memory switch error registers are:

- EVE_MSW_ERR– indicates whether the error is system-, EDMA-, VCOP-, or ARP32-initiated buffer ownership error and captures the corresponding ConnID

- EVE_MSW_ERRADDR– Captures the physical address of memory switch error

Associated error interrupts are mapped on:

- EVE_MSW_ERR_IRQSTATUS_RAW - indicates error interrupt
- EVE_MSW_ERR_IRQSTATUS - indicates error interrupt if event is enabled
- EVE_MSW_ERR_IRQENABLE_SET - enables the corresponding error interrupt
- EVE_MSW_ERR_IRQENABLE_CLR - disables the corresponding error interrupt

6.1.3.3.6 Memory Error Detection

EVE supports parity-based error detection for all internal data memories (including DMEM, WBUF, IBUFLA, IBUFLB, IBUFHA, and IBUFHB) on the minimum access size granularity of 8 bits (that is, there is 1 bit of parity per byte of memory). EVE subsystem also implements double bit error detection for program cache SRAM through a distance 3, 10-bit Hamming code. The 10-bit Hamming code is also applied to the tag and address for a particular cache line.

When parity is enabled, write accesses to any memory cause the parity/encoding bit(s) to be calculated for the specific write data (along with tag and address value for program cache) and written to the corresponding encoding location. For all read accesses from any data memory, the parity bit is read and compared against previously calculated parity for the current pattern in the memory. For program cache, only ARP32 program fetches perform stored versus expected encoding comparison (accesses through program cache OCP debug target port do not result in code calculation). If a mismatch occurs the error details are recorded in parity error MMR (different for each memory - IBUF, WBUF, DMEM) and the associated interrupt is asserted. At the same time, an OCP error response is generated.

The registers that capture program cache-related parity errors, ARP32 DMEM-related parity errors, WBUF-related parity errors, and IBUF-related parity errors are:

- EVE_PMEM_ED_CTL– Enables and disables error PMEM detection logic. Also lets the user invert error detection logic.
- EVE_PMEM_ED_STAT–Status register for the detected PMEM error
- EVE_PMEM_EDADDR– Physical address of parity error
- EVE_DMEM_ED_CTL– Enables/Disables DMEM error detection logic. Also lets the user invert error detection logic.
- EVE_DMEM_ED_STAT– Status register for the detected DMEM error
- EVE_DMEM_EDADDR– Physical address of parity error
- EVE_DMEM_EDADDR_BO– Address byte offset for parity error
- EVE_WBUF_ED_CTL– Enables/Disables WBUF error detection logic. Also lets the user invert error detection logic.
- EVE_WBUF_ED_STAT– Status register for the detected WBUF error
- EVE_WBUF_EDADDR– Physical address of parity error
- EVE_WBUF_EDADDR_BO– Address byte offset for parity error
- EVE_IBUF_ED_CTL– Enables/Disables IBUF error detection logic. Also lets the user invert error detection logic.
- EVE_IBUF_ED_STAT– Status register for the detected IBUF error
- EVE_IBUF_EDADDR– Physical address of parity error
- EVE_IBUF_EDADDR_BO– Address byte offset for parity error

Data returned to the requestor is not modified even in the case of error. The requestor consumes the data potentially causing execution or propagation of bad code and/or data. For a description of the recovery mechanism, see Section 6.1.3.3.6.4, *Parity Error Recovery*.

Each MMR captures the first occurrence of an error. Software then services the error and clears the MMR to capture subsequent errors (generation of OCP error responses continue if additional errors are detected). The parity error MMRs include bit fields to describe which initiator generated the memory access and the specific byte address. Debug accesses do not cause the error or interrupt registers to be set, but result in OCP error response.

Error interrupts are routed to both ARP32 and as EVE outputs to the device level host. ARP32 services interrupts caused by VCOP, EDMA, or OCP target accesses. However, for errors caused by ARP32 accesses, the ARP32 core is unable to service interrupt, and either the DSP or device local CPU detects and services those errors. This detect and service action is described in Section 6.1.3.9.1, *EVE Interrupt Sources – Memory Switch and Parity Error Interrrupts*.

6.1.3.3.6.1 Captured Address – EDADDR and EDADDR_BO

The EDADDR registers (EVE_PMEM_EDADDR, EVE_DMEM_EDADDR, EVE_WBUF_EDADDR, and EVE_IBUF_EDADDR) capture the memory width aligned address for the faulting address. A byte offset bit array for the corresponding memory (EVE_PMEM_EDADDR_BO, EVE_DMEM_EDADDR_BO, EVE_WBUF_EDADDR_BO, and EVE_IBUF_EDADDR_BO) is used to indicate which specific bytes relative to the aligned address is at fault. For most requestors this gives an accurate view of the specific byte for which parity error was detected.

For VCOP, because independent word addresses are generated to the eight banks of IBUF and WBUF, the BANK0 address is latched in the EDADDR register even if that bank is not at fault. In the case of linear addressing, BANK0 + byte_offset mask gives an accurate view. In the case of table-base loads (each bank uses a different address) the reported BANK0 address and the byte offset are used to post-mortem determine which specific address have the error.

The MSBs of the address are always 0x400, which matches the internal (local) address view. For system accesses this does not necessarily match the system view base address. For IBUFs the physical address offset is captured in both aliased and nonaliased mode (for example, IBUFLB address at 0x4007 is used in both aliased and nonaliased modes).

NOTE: EDADDR_BO does not exist for PMEM memory. PMEM only supports Hamming code-based error detection. PMEM does not support parity per 8-bit detection (unlike the data memories).

6.1.3.3.6.2 Modes of Operation

The EVE error detection includes two basic modes of operation by setting the EN bit in the EVE_<MEMORY>_ED_CTRL (EVE_PMEM_ED_CTL, EVE_DMEM_ED_CTL, EVE_WBUF_ED_CTL and EVE_IBUF_ED_CTL) register, as listed in Table 6-7.

Table 6-7. Error Detection Modes

Mode	Description
EN	Error detection logic is enabled. Writes update parity. Reads check parity.
DIS	Error detection logic is disabled and can be clock gated. Writes do not modify parity. Reads do not check parity.

NOTE: No parity valid bit exists in addition to a parity state bit. After an existing reset, the ED logic is in disabled state. In this mode the parity RAMs are clock gated to minimize power consumption (though state must be retained). When transitioning to enable state, the underlying SRAM + Parity is in a state that may result in parity mismatch.

For ARP32 program cache, the program cache automatically goes through an Invalidate All sequence; during this time the ARP32 program cache fetch path is stalled. After all lines are invalidated, any subsequent ARP32 request is serviced as cache miss. The newly fetched cacheline is written to PMEM along with valid hamming code bits, and subsequent cache hits check the parity for each instruction fetch. For debug and configuration accesses, the parity and encoding bits are not checked. Debug software uses the tag state to produce an appropriate visual for debug purposes.

For data memory (DMEM, WBUF, and IBUF), it is possible (though not recommended for functional and nontest software) for ARP32, VCOP, or DMA to read a memory location for which the parity bit is not set. After enabling EVE_<DMEM, WBUF, or IBUF>_ED_CTL for the corresponding memory, software must initialize all of the memory, which results in setting a valid parity bit. After this, any parity mismatch results in error signaling, as summarized in the previous sections.

6.1.3.3.6.3 Parity Error Testability

For the software to test their parity error interrupt service routine (ISRs), parity errors can be forced to occur. The EVE subsystem does this by providing an INVERT mode of operation per memory endpoint (by setting the INV bit in the EVE_<PMEM, DMEM, WBUF, or IBUF>_ED_CTL register). When INVERT mode is set (EVE_<MEMORY>_ED_CTL[1] INV = 0x1), and parity is enabled, all read accesses to the corresponding memory return the inverse value of the stored parity bit before the parity check comparison. As a result a parity error is latched and reported through an interrupt, as described in Section 6.1.3.3.5, *Memory Switch Error Registers.* For program memory, the INV bit causes the encoding calculation to return the inverted value for pass or fail.

For testing the ARP32 parity error ISR, these registers can be set asynchronously by the host processor or system EDMA controller. This setting mimics the random nature of radiation-induced soft error.

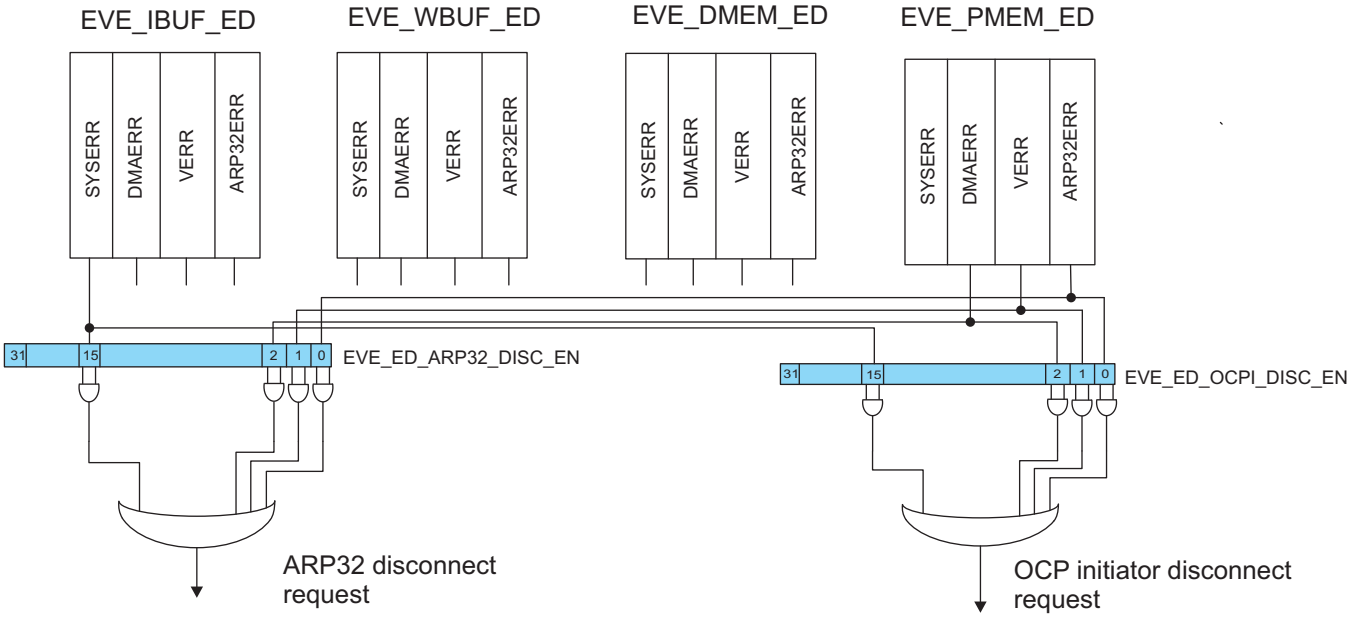
Parity or Hamming errors can be injected to a specific address after the initialization sequence. Parity or error detection is placed in disable mode (EVE_<MEMORY>_ED_CTL[0] EN = 0x0), and software can write an incorrect value to the desired address. Writes during disable mode do not modify the parity bit or encoding bits, thus the stored parity or encoding bits are considered incorrect. The memory then can be enabled. Any subsequent read access to that memory location results in a parity error mismatch.

6.1.3.3.6.4 Parity Error Recovery

When a parity error occurs, the faulty data is consumed by the requester. VCOP may fetch and process bad data from IBUF or WBUF. ARP32 may try to execute a faulty instruction from the program cache, or read a faulty pointer from DMEM. To avoid these problems, the subsystem parity error interrupt scheme notifies ARP32 or the host of any parity errors (see Section 6.1.3.9.1*, EVE Interrupt Sources – Memory Switch and Parity Error Interrupts*).

To minimize corruption of the system, and to let the system host query the error detection registers, a user selectable parity error disconnect scheme is provided. This mechanism lets the user disconnect the ARP32 from the neighboring EVE system, and/or disconnect the OCP initiator port from the device interconnect. Each of these disconnects can be manually initiated by setting the EVE_DISC_CONFIG register, or EVE_DISC_CONFIG can be initiated when a specific parity error is detected based on requestor and memory. The disconnect sequence is enabled in the EVE_ED_OCPI_DISC_EN and EVE_ED_ARP32_DISC_EN registers. Figure 6-7 shows an overview of the disconnection request.

Figure 6-7. Parity Error ARP32/OCP Disconnect



6.1.3.3.7 VCOP System Error Halt Conditions

VCOP has several internal error conditions that force the core to halt execution and freeze its internal state so that ARP32 or debugger can inspect the state of the VCOP. The vector core also provides an error interrupt that causes VCOP to halt based on detection of EVE-level errors. These are mapped to the VCOP memory switch error source status (EVE_MSW_ERR[1] VERR) and VCOP parity error source status (EVE_WBUF_ED_STAT[1] VERR or EVE_IBUF_ED_STAT[1] VERR). By default the halt signals are enabled. Halt signal generation can be modified by writing to the EVE_VCOP_HALT_CONFIG[1] MSW_EN and EVE_VCOP_HALT_CONFIG[0] ED_EN bits.

In addition, the EVE_VCOP_HALT_CONFIG[2] FORCE_ABORT bit is used to directly force the vector core to halt based on any unforseen error condition. The error is detected by ARP32 through a watchdog timer at which point ARP32 sets the FORCE_ABORT signal to halt or abort the current loop occurring in the VCOP core.

6.1.3.4 Program Cache Architecture

The main features of ARP32 program cache are:

- 32-KB direct mapped cache
- 32-B line size
- Hit throughput: 32-bits per cycle, 100% throughput
- Read-only (from ARP32 perspective), all accesses are cacheable
- Read and write by debug OCP port
- Software directed preload
- Demand based prefetch
- Software directed invalidate
  - Global
  - Range based
- Debug support:
  - Single register one-line invalidate (for breakpoint support)
  - Tags memory mapped
  - SRAM memory mapped

  - Cache miss signaling to SCTM
- Hamming code based error detection: 10-bits per 256-bit location + tag + address

Program cache is a direct-mapped cache, therefore software controls the linking of the functions in external memory to minimize conflict misses. The program cache supports error detection encoding and can correct two errors per 256 bits of program code.

6.1.3.4.1 Basic Operation

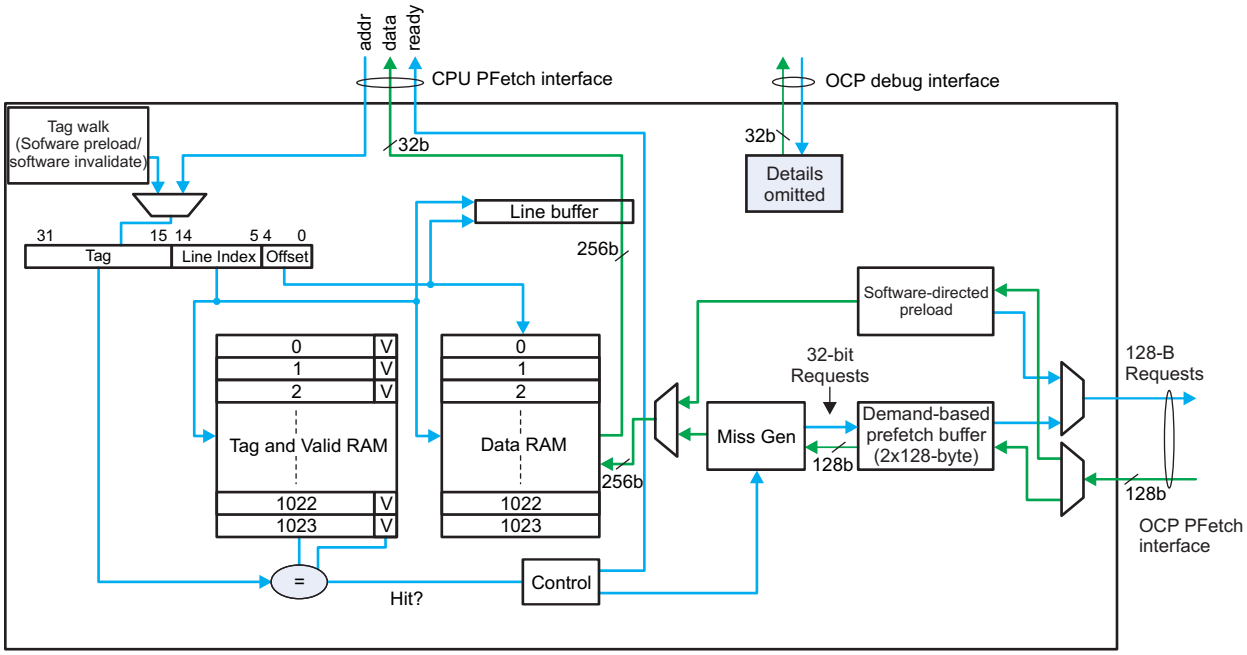
The program cache is always enabled and treats all ARP32 accesses as cacheable.

For cache hits the interface between ARP32 and program cache can handle back-to-back requests with 0 cycle latency to provide full throughput and program execution for the ARP32. For cache misses, the cache controller stalls ARP32, and internally submits a 32-bit OCP request (through the demand-based prefetch (DBP) block). After the 32-bit cacheline returns, the program cache returns the appropriate data to the ARP32 and starts the CPU.

For CPU-generated miss requests (not software-direct preload), the DBP block snoops the internal request and either services the request directly or schedules a miss+prefetch operation to the system.

Figure 6-8 shows the program cache block diagram.

Figure 6-8. EVE Program Cache Architecture



6.1.3.4.2 Line Buffer

The program cache includes a software and performance transparent 256-bit line buffer. The line buffer minimizes accesses to the underlying cache/SRAM in the case of back-to-back hits to the same line; doing so minimizes power consumption. The line buffer is allocated on any program cache access to a new line. As long as subsequent program fetches are to the same line, the data returns to ARP32 directly from the line buffer.

6.1.3.4.3 Software Direct Preload

Software Direct Preload SDP allows preloading of a range of system memory into the program cache. Software sets the preload base address register (EVE_PC_PBAR), along with a preload byte counter (EVE_PC_PBC) register (maximum = 0x8000). Hardware will issue a cache line fill request to the system for the associated line for the programmed address range. When the data is returned for each line, it is written into the cache (32-bits per write, to minimize program stalls) and the tag is marked as valid for the new address. This process is repeated for every cache line in the requested range. When the operation completes, the EVE_PC_PBC register is set to 0.

NOTE: Software must verify that the previous operation is completed before issuing another SDP operation.

Functional ARP32 requests are given a lower priority relative to software preload requests. The normal operation of the software preload results in many idle cycles while preload requests are in flight through the system. During that time ARP32 CPU accesses that result in cache hits proceed unhindered. If a CPU cache miss occurs while SDP operation is active, the two operations proceed in parallel.

The start address can be any arbitrary byte address, whereas the preload operation occurs on cache lines (32-bit aligned).Thus, the range preloaded is effectively rounded down to the nearest cache-line address relative to the start address, and rounded up to include the entire cache line relative to the end address.

Preload requests operate in parallel with the DBP block and do not use the buffering provided by the DBP block. Instead, the returned data for software direct preload is written directly to the program cache as highest priority, thus minimizing the required buffering and minimizing the impact on the system.

6.1.3.4.4 User Coherence Operation

The memory spaces cached in ARP32 program cache are not always coherent with the external memory. For example, if the copy of the code in external memory is modified, it is possible that the copy of the code that is cached in L1P is out of date with respect to the corresponding location contents in system memory. This may happen, for example, if software is implemented using code overlays. The application controlling such paging should take the appropriate steps to invalidate a cache that is rendered incoherent.

In addition, the ARP32 breakpoint methodology involves emulation and debug software inserting a breakpoint instruction in the program image in system memory (by replacing a valid instruction). Thus, there is a mechanism to update the cache to reflect the newly inserted breakpoint instruction. This is accomplished with the same software or hardware mechanism.

To allow for such software-directed invalidate, the cache controller supports three methods to invalidate the content of the cache:

- Global invalidate
- Range-based invalidate
- Single-address invalidate

6.1.3.4.4.1 Global Invalidate

The program cache clear register must be set (EVE_PC_INV[0] I = 0x1) to invalidate all the lines in the program cache. This is done by resetting all valid bits. Because EVE implements the valid bits with memory, the operation takes approximately a number of cycles equal to the number of tags. During invalidate-all operation, any CPU fetches are stalled until the invalidate-all operation completes, resulting in subsequent misses in the program cache.

6.1.3.4.4.2 Range-Based Invalidate

The program cache controller supports a programmable invalidate mechanism, with which the starting address and the number of words to invalidate can be specified to start an invalidation sequence. The programming model for the invalidation mechanism consist of two memory mapped registers: the start address register (EVE_PC_IBAR[31:0] ADDR) that holds the start address and the byte count register (EVE_PC_IBC[15:0] BC) that holds the number of bytes to be invalidated.

The invalidate operation begins immediately with the writing into EVE_PC_IBC[15:0] BC (maximum = 0x8000). The application first sets the EVE_PC_IBAR[31:0] ADDR bit field and then the byte count register to ensure correct operation. The operation involves cycling through addresses starting from the value of EVE_PC_IBAR[31:0] ADDR in increments of the cache line size, doing tag lookups to check if the line exists in the cache. If the line exists in cache, the corresponding valid bit is reset. The. EVE_PC_IBC[15:0] BC bit field is reset to 0 when the invalidate completes. As the byte count register is readable, a check for 0 provides a synchronization event for the application to execute from the region being invalidated or before issuing another range-based invalidate.

NOTE: EVE_PC_IBAR[31:0] ADDR can be any arbitrary byte address; whereas the invalidate operation occurs on cache-lines (that is, 32-bit aligned). Thus the range invalidated is effectively rounded down to the nearest cache-line address relative to the start address, and rounded up to include the entire cache line relative to the end address.

As in the global invalidate case, any CPU program fetches issued during the invalidate-range operation are stalled until the invalidation completes.

6.1.3.4.4.3 Single-Address Invalidate – For Breakpoint Operation

Because ARP32 supports breakpoint insertion, a single register version of the range-based invalidate is provided through the invalidate single address register (EVE_PC_ISAR). This is distinct from the previously defined range based invalidate, though the underlying hardware mechanism is the same. It is legal for the range-based invalidate and single-address invalidate to occur at the same time. Both commands must complete, though the order of completion is not explicitly defined.

Emulation software replaces the appropriate instruction in system memory with the breakpoint instruction. To ensure that future ARP32 execution of that line of code is fetched from system memory (as opposed to directly serviced from the cache), emulation software writes the address to EVE_PC_ISAR[31:0] ADDR.

The invalidate operation begins immediately on writing into the EVE_PC_ISAR register. The hardware operation involves checking the tag for the specified address. If the line exists in the cache, the corresponding valid bit is reset. Upon completion, the EVE_PC_ISAR[31:0] ADDR bit field is set to 0, thus informing the emulation software driver that the command is complete.

Operation is undefined if the application of emulation software tries to write to this register before the previous command completes.

6.1.3.4.5 Demand-Based Prefetch

The DBP block is used to improve performance for straight line cache misses, by snooping the program cache miss/software preload requests and issuing larger/pipelined burst requests to the system. The DBP block includes a 256-byte buffer that is logically composed of two 128-byte buffers.

When EVE is reset, the buffers are reset to an idle/empty state and DBP defaults to enabled (EVE_BUS_CONFIG[4] DBP_ENABLE = 0x1). When a new cache-line request is detected, the DBP initiates 128-byte burst to the system for the current 128-byte aligned range, and another 128-byte burst for the next 128-byte aligned range. DBP requests never cross the 128-byte boundary. Depending on the alignment of the new cache request, for initial requests with LSB = 0, 128-byte request is issued; for LSB = 0x20, a 96-byte burst is issued; for LSB = 0x40 a 64-byte burst is issued; and for LSB = 0x60, a 32-byte burst is issued. This last case does not allocate space in the prefetch buffer.

Any subsequent cache miss requests that match addresses for the previously prefetched data are returned directly from the prefetch buffer. When a cache request is received for address with LSB = 0x60 (last 32 bytes of a 128-byte aligned buffer), then that 128-byte buffer segment is marked invalid and the next sequential 128 bytes of data is prefetched. The prefetch buffer is always 256 bytes ahead of the program cache miss requests, and operates in ping-pong fashion with each of the 128-bytes buffer segments.

Example:

1. Buffer 0 holds addresses from 0x0 through 0x7F and buffer 1 holds addresses 0x80 through 0xFF. If the next miss request is to any location in buffer 1 (for example 0xA0), then buffer 0 is invalidated and prefetches range 0x100 through 0x17F.

2. Buffer 0 holds addresses from 0x0 through 0x7F and buffer 1 holds addresses 0x80 through 0xFF. If the next miss request is to the final quadrant of buffer 1 (0xE0), then return data from 0xE0 is returned. Both buffer 1 and buffer 0 are invalidated and addresses 0x100 and 0x180 are prefetched.

When a discontinuous cache-line request is received (that is, the request is not allocated [or in flight] in the prefetch buffer), then the entire prefetch buffer is invalidated, and the sequence begins from the start.

The prefetch buffer is invalidated when any user coherence operation is initiated.

DBP is disabled by clearing the EVE_BUS_CONFIG[4] DBP_ENABLE bit. When disabled, all cache miss requests bypass the DBP buffers and are issued to the system as 32-byte demand cache misses.

6.1.3.4.6 Debug Support

6.1.3.4.6.1 Read/Write Accessibility through OCP Debug Target Port

The OCP debug target port into the program cache provides full read and write of the cache SRAM contents, both for the data as well as tag contents, including parity/ecc and valid bits.

Writability is provided for memory self-test and parity error injection. ARP32 is in halted (for example in IDLE or debug halt) or reset state while write accesses are issued to program cache SRAM or tags. This is not intended as a code-preload feature. As such, if writes are performed to the tag value, 0 must be written to the valid bit before ARP32 can resume operation.

Relative to the EVE level base address, the data RAM resides at address 0x0 through 0x7FFF. The tag + ECC + valid bits reside at word-aligned addresses in the range of 0x8000 through 0x8FFF (base relative).

Table 6-. EVE Tag Visibility

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TAG																Reserved					HC										V	

Bit	Name	Description
31:15	TAG	Tag. When valid bit = 1, this bit represents the 17 MSBs of the cached address. Reads return tag; writes have no effect. Read access when LB = 0.
14:11	Reserved	Reserved. Read return 0s.
10:1	HC	Hamming code. Written by hardware based on computed Hamming code value calculated based on tag, address, and program cache data contents for this line. Read and compared by hardware to recalculated value when cache-line hit occurs. Reads return Hamming code; writes have no effect. Read accesses when LB = 0.
0	V	Valid bit. Set to 1 by hardware when tag + data line is valid/allocated. Cleared to 0 by hardware when tag + data line is invalid. Reads return valid bit; writes have no effect. Read access when LB = 0.

6.1.3.4.6.2 Breakpoint Support

Breakpoints are supported through the single-address invalidate operation summarized in Section 6.1.3.4.4.3, *Single-Address Invalidate – For Breakpoint Operation*. The emulation software replaces a functional instruction in system memory with the breakpoint opcode, and then invalidates that address in program cache through the range-based invalidate operation.

6.1.3.4.6.3 Cache Profiling

The program cache provides several output signals to the EVE SCTM block for the purpose of profiling and debugging cache performance issues.

Table 6-9 lists the cache profiling signals. The Type column of the table is either pulse or duration. The pulse signals are driven active one cycle for each occurrence. A sequence of consecutive active cycles represent multiple occurrences. It is possible that the duration signal stays active for multiple cycles on a given occurrence. These are stall signals that determine the total number of cycles in the stalled state. The SCTM Mode column describes the counter mode that is programmable in the SCTM module for a given counter. The SCTM Mode column is either event or duration. Event signals result in incrementing

the counter once per low-to-high transition on a given input. As such, the event mode is not overly useful for cache profiling. The duration mode measures the number of cycles during which a given signal is active. This is the mode used for most Cache profiling. In the case of counting pulses, this reports the total number of occurrences of a given state/signal (that is, cache hits). In the case of counting duration, this reports the total time in a given state.

Table 6-9. Cache Profiling Signal List

Name	Type	SCTM Mode	Description
cache_miss_count	Pulse	Duration	Per cache miss request occurrence
cache_hit_count	Pulse	Duration	Per cache hit request occurrence
line_buffer_hit_count	Pulse	Duration	Line buffer hit occurrence
cache_miss_stall	Duration	Duration (or event)	Driven high for the duration of a cache miss. Used by SCTM to measure the time the ARP32 is stalled due to a cache miss.
prefetch_compulsory_count	Pulse	Duration	Pulse on each or every compulsory DBP request to the system (that is, for the first 128-bit request after a buffer flush, or from IDLE state).
prefetch_lookahead_count	Pulse	Duration	Pulse on each or every lookahead DBP request to the system (that is, for the second 128-bit request after a flush).
prefetch_hit_count	Pulse	Duration	Pulse on each or every cache request that hits an already requested prefetch cache line, whether resident in the prefetch buffer or already requested but still in flight, and thus does not generate an additional prefetch request.
prefetch_line_count	Pulse	Duration	Pulse on every 32-bit cacheline that is requested/allocated into the prefetch buffer (including those that bypass the buffer due to starting at address 0x60). The difference between prefetch_line_count and prefetch_hit_count is equivalent to a prefetch_flush_line_count.
prefetch_discard_stall	Duration	Duration (or event)	Represents the amount of time that previously issued prefetch requests data is in flight (and is discarded) while a new compulsatory prefetch request begins.

6.1.3.4.7 Error Detection

For a description of the error detection mechanism, see Section 6.1.3.3.6, *Memory Error Detection*.

6.1.3.5 EDMA

NOTE: The device EVE integrated EDMA controller instance (EDMA3_0_CC0) which is functionally identical with the device EDMA controller instances (EDMA_TPCC, EDMA_TPTC0 and EDMA_TPTC1). The only difference is that the EDMA3_0_CC0 instance is located at different physical addresses.

EDMA is a DMA engine for transfers between the system memory (DDR and L3 SRAM) and EVE internal memories. For more detailed description of EDMA controller, see Chapter 11, *Enhanced DMA*, in .

Figure 6-9 is a high-level overview figure of the EDMA controller embedded in the EVE subsystem. The figure shows two major components:

- The Channel Controller (EDMACC or CC), which serves as the user interface of EDMA
- The Transfer Controllers (EDMATC or TC), which serve as the data transfer engine of EDMA

The ARP32 submits requests to the channel controller, which in turn submits transfer requests (TRs) to the appropriate transfer controller. Interrupts are posted in the EDMA CC upon transfer completion (if requested) and signaled to ARP32 core.

The EDMA is configured with two queues (in the CC) and two TC instances. The two TC instances offer maximum performance and concurrency for the case where simultaneous transfers occur between two different system-level endpoints, and two different EVE internal memories. For typical use cases, it is expected that transfers involving EMIF or DDR and L3 SRAM are mapped to two different TCs (TC0 for EMIF-related requests and TC1 for L3 SRAM related requests). For example, EMIF or DDR to IBUFL in parallel with IBUFH to L3 SRAM can be processed with maximum performance.

Table 6-10 shows the specific EDMA configuration for the available resources on EVE.

Figure 6-9. EDMA Block Diagram

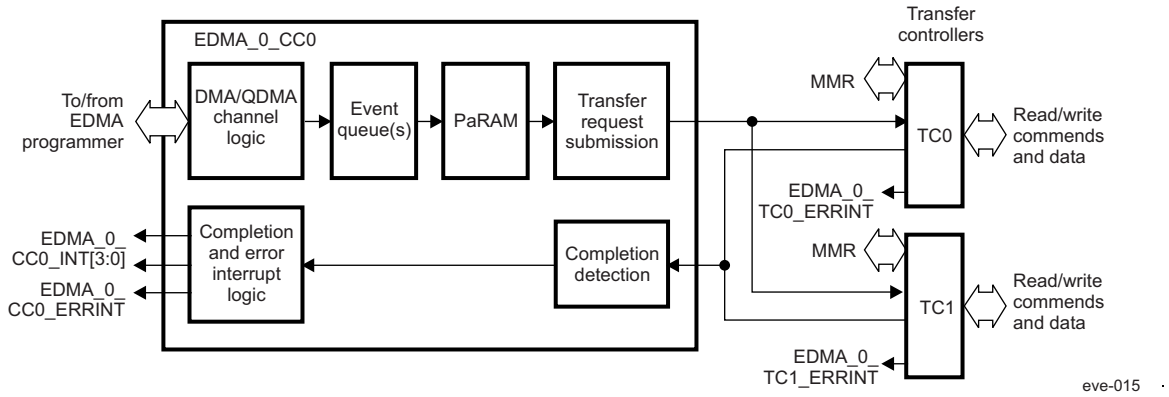


Table 6-10. EDMA Configuration

Name	Description	Configuration
NUM_DMACH	Number of EDMA channels	16
NUM_QDMACH	Number of QDMA channels	8
NUM_INTCH	Number of interrupt channels	16
NUM_PARAMENTRY	Number of PaRAM entries	128
NUM_EVQUE	Number of event queues	2
NUM_TC	Number of TPTC interfaces	2
MPEXIST	Memory protection exitsts	No
NUM_REGIONS	Number of MP and shadow regions	8
CHMAPEXIST	Channel mapping exists	Yes

6.1.3.5.1 DMA Channel Events

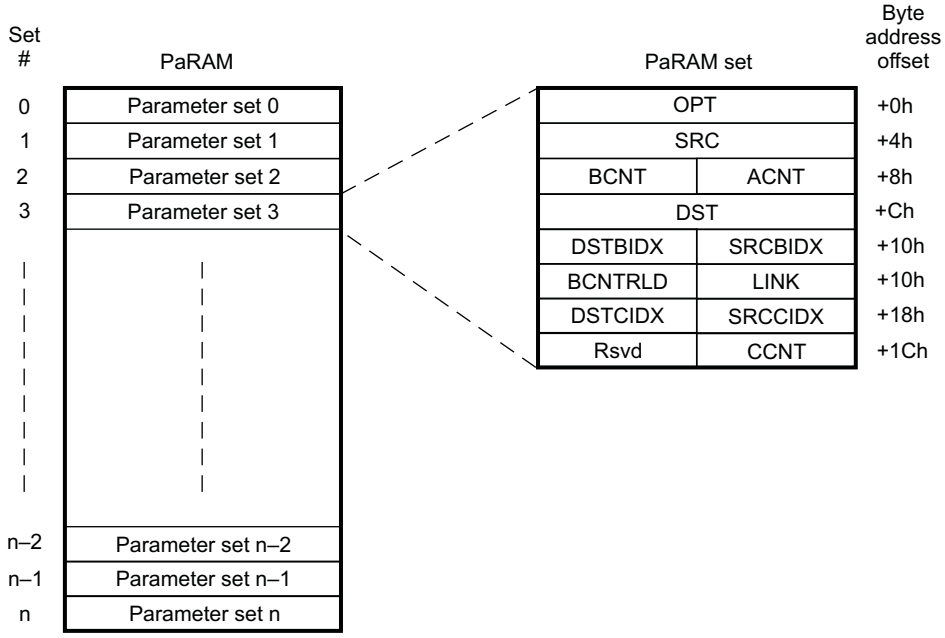
The EDMA input events/signals are driven by the evt_int[15:0] input signals. Those input interrupts are also connected to INTC1 of the EVE. A subset of these event inputs is mapped to ECM start events. Software must enable individual input interrupts as either events or ARP32 interrupts.

The EDMA channels can also be used under software control. In this case the DMA channels are triggered by writes to the event set register, or through internal chaining feature.

6.1.3.5.2 DMA Parameter Set

Figure 6-10 shows the layout of parameter RAM sets as a sequence of 128 entries which are adjacent in memory, and a detailed look into the contents of each parameter RAM.

Figure 6-10. Structure of Parameter RAM Sets and Contents



Note: *n* is the number of PaRAM sets supported in the EDMACC for a specific device.

Table 6-11. Fields in Parameter RAM

Acronym	Parameter
OPT	Channel Options
SRC	Channel Source Address
ACNT	Count for 1st Dimension
BCNT	Count for 2nd Dimension
DST	Channel Destination Address
SRCBIDX	Source BCNT Index
DSTBIDX	Destination BCNT Index
LINK	Link Address
BCNTRLD	BCNT Reload
SRCCIDX	Source CCNT Index
DSTCCIDX	Destination CCNT Index
CCNT	Count for 3rd Dimension
RSVD	Reserved

For a detailed explanation of the configuration of DMA PARAM set, see the *EVE Programmers Guide*, available through a TI representative.

6.1.3.5.3 Channel Controller

This section reviews various hardware resources of the channel controller that are programmed from the ARP32 controller of the EVE subsystem.

Parameter set: A parameter set is the program memory of the channel controller that describes the attributes of a transfer. Each parameter set describes one data transfer from a source address to a destination address. A parameter set is a group of eight contiguous 32-bit words and has an address that is aligned on a 256-bit boundary. There are 64 of these parameter sets, allowing the description of 64 transfers ahead of time. Individual parameter sets are used to describe isolated transfers, or they are linked together to describe a group of related transfers.

There are two types of DMA channels in the channel controller (CC) interface:

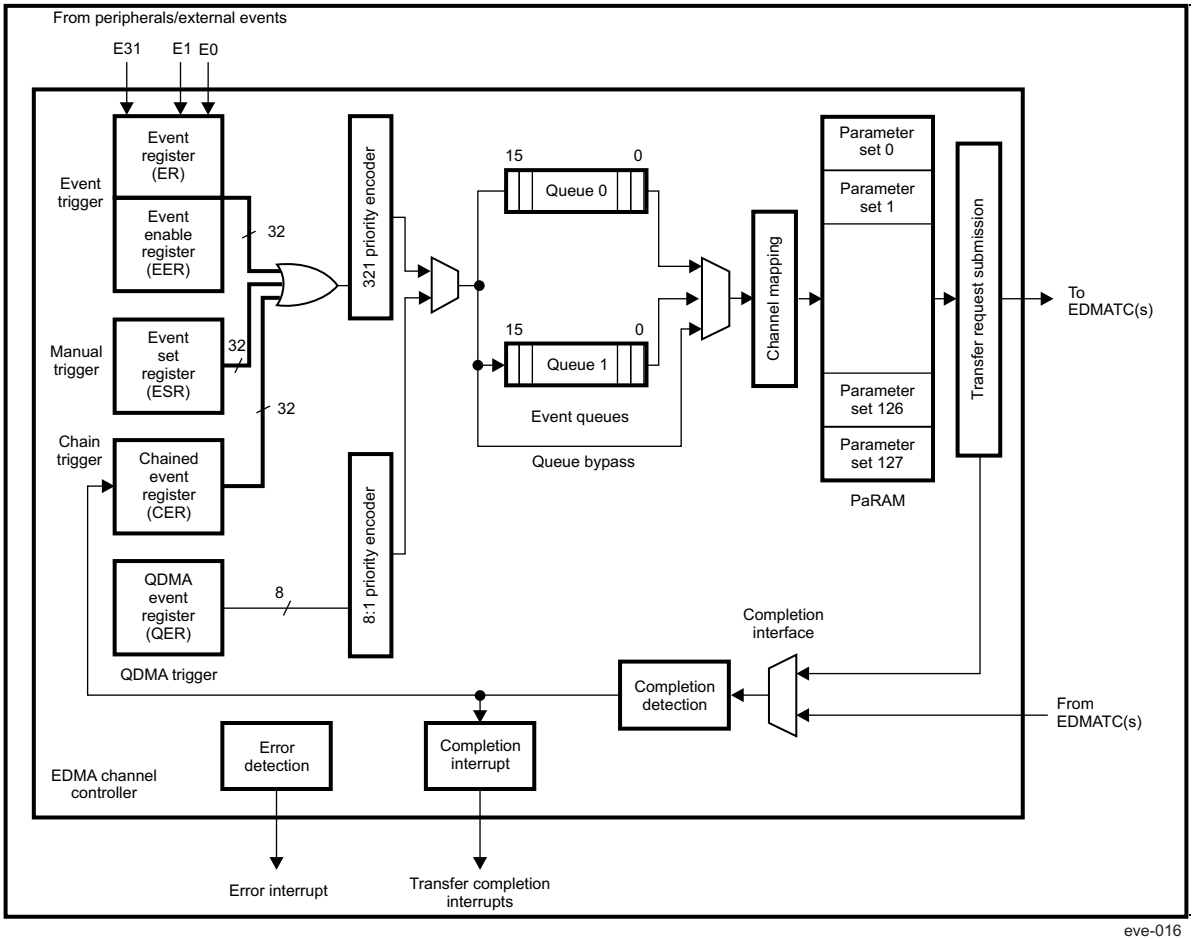
- EDMA channel: a data transfer channel that takes a parameter set as an input and requires that an event is triggered by a write to the corresponding event of the event set register (ESR), or by detecting assertion of a hardware event (Event Triggered), or by chain triggering. Software can designate a specific event as the trigger event by programming the mapping between the parameter set and the event in the DCHMAP register, and by mapping a DMA channel to a specific hardware event queue in the DMAQNUM register. EVE has 16 EDMA channels that must be assigned to 1 of 16 events of the ESR register, and mapped to 1 of 2 TC queues using DMAQNUM registers.
- QDMA channel: a data transfer channel that is similar to an EDMA channel, but is automatically triggered by the write to a specific word of parameter set (typically the eighth word). Eight QDMA channels are mapped to one of the two TC queues using the QDMAQNUM register.

An EDMA channel is used to describe a regular sequence of data transfers, in which the amount of data sent or received, and source and destination data address increments between successive transfers does not vary dynamically, but by regular amounts. A QDMA channel is used when it is needed to program in new values for the source and destination addresses. The amount of data to transfered varies from one transfer to another, and for other dynamic situations.

EVENT queue: data transfer events are different physical DMA channels (ESR writes for EDMA channels and parameter set trigger word writes for QDMA channels) and are detected simultaneously. The events are queued based on a fixed priority arbitration scheme; the EDMA channels are higher-priority events than the QDMA channels. Among the two groups of channels, the lowest-numbered channel is the highest priority.

Figure 6-11 shows the block diagram of the channel controller.

Figure 6-11. Channel Controller Block Diagram



6.1.3.5.4 EVE-Level Bus Width and Throughput

Table 6-12 shows the EVE-level effective bus width and the resulting peak bandwidth. In general, the effective bus width is the minimum of the bus width values between a given initiator and given target. For example, the DMEM port is effectively 4 bytes wide when accessed by ARP32 and is effectively 16 bytes wide when accessed by DMA. Similarly, VCOP memories are 4 bytes, 32 bytes and 16 bytes wide when accessed by ARP32, VCOP, and TCn, respectively.

Table 6-12. EVE-Level Effective Bus Width

		INITIATORS									
		ARP32		VCOP			TC0		TC1		OCP Target Port
		Program	Data	WBUF	IBUFL	IBUFH	Read	Write	Read	Write	
TARGETS	Program cache hit	4									
	Program cache OCP Target		4				4	4	4	4	4
	DMEM		4				16	16	16	16	16
	WBUF		4	32			16	16	16	16	16
	IBUFL		4		32		16	16	16	16	16
	IBUFH		4			32	16	16	16	16	16
	CC MMRs		4				4	4	4	4	4
	TC MMRs		4				4	4	4	4	4
	CFGMMRs		4				4	4	4	4	4
	OCP Init0	16	4				16	16			
	OCP Init1								16	16	

6.1.3.5.4.1 Concurrent Transfer Requirements

The two OCP ports are independent from one another to allow full bandwidth and nonblock requests, when EVE TC0 accesses one system-level memory at the same time as EVE TC1 accesses a different system-level memory and both internally access two different IBUF memories. The overall throughput is limited to only 128 bits per cycle in the case when the two TCs are accessing:

- The same system-level memory (EMIF, L3 SRAM)
- The same internal memory buffer

6.1.3.6 General-Purpose Inputs/Outputs

The general-purpose input signal state can be read directly through EVE_GPIN0 (for inputs 31:0) and EVE_GPIN1 (for inputs 63:32). These registers/GPIN signals are also mapped to the ARP32 INTC2 and INTC3 registers respectively.

The GPIs are used to convey state information (readable in the GPIN registers), or they are enabled as interrupts through the corresponding ARP32_INTn_IRQENABLE_SET register. A rising edge on the GP input is latched as a new interrupt in the corresponding ARP32_INTn_IRQSTATUS register.

The EVE subsystem also provides 64 GPOs. These outputs are manipulated by EVE_GPOUTm, EVE_GPOUTm_SET, EVE_GPOUTm_CLR, and EVE_GPOUTm_PULSE. The EVE_GPOUT0 register group controls eve_gpout[31:0] signals and the EVE_GPOUT1 register group controls eve_gpout[63:32] signals. The current state of the output is detected by reading any of the EVE_GPOUTm, EVE_GPOUTm_SET, EVE_GPOUTm_CLR, or EVE_GPOUTm_PULSE registers. The 64 GPOs are used to drive interrupts or state information to other EVEs in a multi-EVE system.

The GPOUTn register can be explicitly set with the corresponding write data word. Byte or halfword writes are permitted in this case (though support may depend on the specific initiator). A read-modify-write sequence can be required if different tasks own different bits within the GPOUT bank. In this case, access for the read-modify-write sequence must be assured. The EVE_GPOUTm_SET register unconditionally drives the corresponding output event to 1. GPIOm_CLR unconditionally drives the corresponding output event to 0. The EVE_GPOUTm_PULSE register unconditionally drives the output to one for four cycles, then deasserts the signal to 0. If the signal is 1, then the EVE_GPOUTm_PULSE simply deasserts the output signal. Software must ensure the output is low before using the EVE_GPOUTm_PULSE feature.

There are several GPOUT signals connected to arbitration/pressure bits (MFlag bits) in the device.

For EVE port 1 and EVE port 2 (EVE TC0 and EVE TC1) MFlag is driven by eve_gpout[63] and eve_gpout[62] respectively; eve_gpout[63] is connected to EMIF and eve_gpout[62] is connected to EMIF.

EVE signals are described in through .

EVE MFlag signals are not used inside L3_MAIN. Within the device main interconnect bandwidth regulators are used to control pressure/arbitration of EVE traffic.

6.1.3.7 CME Signaling

The credit management engine (CME) protocol is a credit-based data transfer scheme. A central agent asserts a START signal to a DMA engine or host processor. This signal indicates that a fixed-size data buffer is available to be read or written. Then the DMA engine or host processor is responsible for asserting a DONE signal back to the CME when the data buffer is read or written. The Central Agent uses this information to update its credit accounting (there is a consumer end and producer end for any buffer that is managed by CME). The EVE subsystem generically supports START and DONE signaling, and software must service the request accordingly.

CME START signal:

In a multi-EVE system the CME START signals are broadcast to the eve_evt_int[n:0] input signals of each EVE. These signals are mapped on both EDMA events or ARP32 interrupts. Software enables the appropriate event or input in the appropriate EVE, based on the overall system goals.

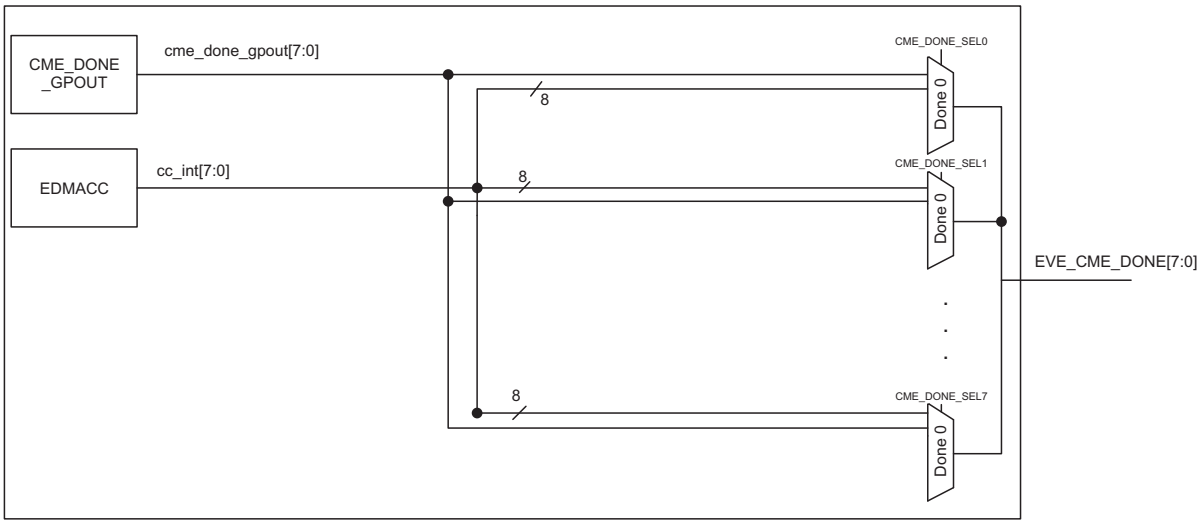
For a given EVE, a START signal must either be used to trigger an EDMA transfer directly for a known or agreed quantity of data, or it must trigger an ARP32 interrupt, which then manually sets up an EDMA transfer as necessary.

CME DONE signal:

EVE provides eight CME DONE signals that can be triggered from multiple internal conditions or sources. For any EVE in the system, the DONE output signals are driven either based on any one of the eight EDMA region interrupt outputs, or based on the EVE_CME_DONE_GPOUT register.

The EDMA region interrupt outputs are statically allocated in the device or host. As such, it is desirable to connect higher-numbered "done" bits to the CME to avoid resource allocation issues. The basic logic is essentially a mux select for each respective bit (see Figure 6-12). The selection is done through the EVE_CME_DONE_SEL[31:0] register.

Figure 6-12. CME Done Logic



CME registers in the EVE subsystem are:

- EVE_CME_DONE_GPOUT
- EVE_CME_DONE_GPOUT_SET
- EVE_CME_DONE_GPOUT_CLR
- EVE_CME_DONE_GPOUT_PULSE
- EVE_CME_DONE_SEL
- EVE_CME_DONE_EN

The DONE GPOUT registers are used to directly drive the state of the internal CME DONE output signals. The EVE_CME_DONE_SEL register sets whether the EVE output signals are driven from the EDMA region interrupts, the DONE GPOUT internal value, or a pass through from the eve_passthru signals.

NOTE: The device does not support hardware CME.

6.1.3.8 Memory Management Unit

There are two MMUs. Each of the two EDMA TCs is mapped to a different MMU. One of the MMUs is also shared with ARP32 program and data accesses. The ARP32 program cache and data accesses share an MMU to provide a convenient mechanism whereby ARP32 debug accesses have a single and consistent view of the system, which is equivalent to ARP32 software view. For the EDMA paths, the two MMUs provide maximum concurrency for each TC and its respective accesses to system memory. See Table 6-13 for MMU Configurations

Table 6-13. MMU Configuration

Name	Description	Configuration
MMU_Entries_Number	The number of entries in the TLB cache	32 entries
MMU_Command_Bypass	Bypass command register	2 cycle latency
MMU_Response_Bypass	Bypass response register(depends on clock speed versus technology)	2 cycle latency
MMU_LRU_Enable	LRU algorithm for TLB endry replacement	Disabled
MMU_RRB_Enable	Determines if Generic RRB module is instantiated (Zero only for DSPSS)	Present
LOG_DATA_WIDTH	data width configuration	128-bit data bus

For more information about MMU configuration see Chapter 15, *Memory Management Unit*

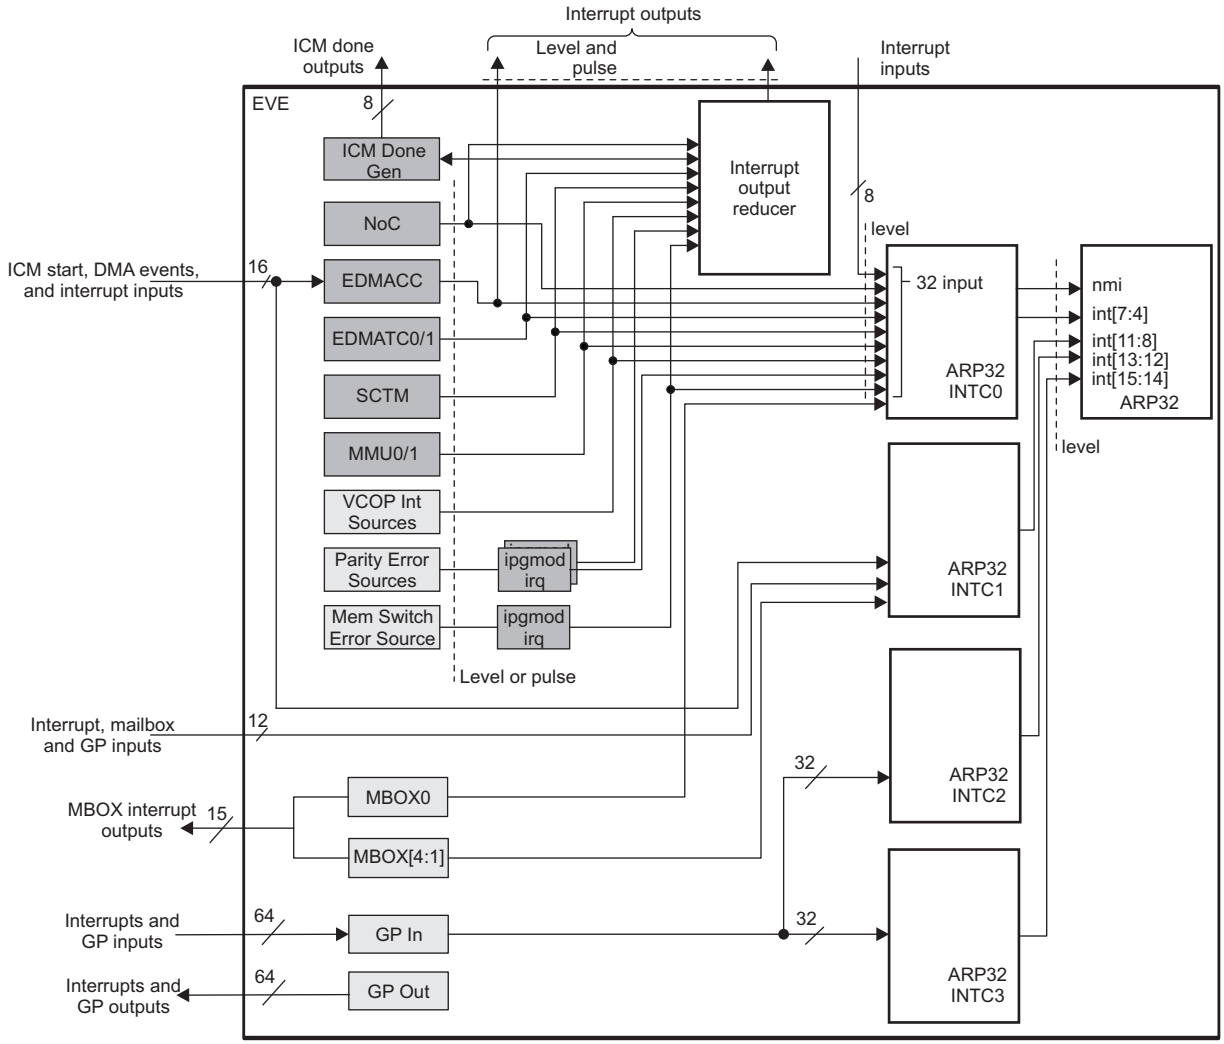
6.1.3.9 Interrupt Control

Each standard block (Interconnect, EDMA, SCTM) provides active high interrupts directly to the ARP32 INTC. In some cases, the submodule IP generated interrupts are mapped as outputs on the EVE boundary.

EVE interrupts (parity error interrupts and memory switch error interrupts) are summarized in Section 6.1.3.9.1, *EVE Interrupt Sources – Memory Switch and Parity Error Interrupts*. EVE accepts active-high input interrupts from the system and maps them to system-level mailbox interrupts.

Figure 6-13 is an overview of EVE interrupt topology.

Figure 6-13. EVE Interrupt Block Diagram



6.1.3.9.1 EVE Interrupt Sources – Memory Switch and Parity Error Interrupts

Figure 6-14 illustrates the mapping of EVE memory switch errors to a single interrupt output (EVE_MSW_ERR_INT). Figure 6-15 shows the mapping of EVE parity and error detect error interrupt outputs (EVE_ED_LCL_IRQ and EVE_ED_OUT_IRQ).

The errors are captured in the appropriate functional error bit field along with the additional error details (such as ConnID and specific address). Error status interrupts are readable in the EVE_MSW_ERR_IRQSTATUS_RAW registers. Software enables (or disables) interrupt generation for that source by writing to the appropriate bit in the interrupt enable set or clear register. When any enabled EVE_MSW_ERR_IRQSTATUS_RAW bit is set, then an interrupt is generated to the ARP32 INTC on the corresponding IRQ output (enabling of IRQSTATUS_RAW event is done through EVE_MSW_ERR_IRQENABLE_SET[3:0]ENABLE and EVE_MSW_ERR_IRQENABLE_CLR[3:0] ENABLE registers).

When the interrupt is served, software clears the interrupt status register fields and the source error register (through the EVE_MSW_ERR register or the EVE_<MEM>_ED register). New interrupt is latched into the EVE_MSW_ERR_IRQSTATUS register only after the register is cleared and new error occurs on the corresponding source error bit or signal. The appropriate bit in the EVE_MSW_ERR_IRQSTATUS_RAW register must be set on a low-to-high transition of the corresponding source error bit or signal. The EVE_MSW_ERR_IRQSTATUS register is routed to EVE-level interrupt output (active-high level and pulse signals are output) and as an active-high level interrupt to the ARP32 INTC.

Two interrupts are provided for EVE parity or error detect interrupt. The first is the local version (EVE_ED_LCL_IRQ) provided as an active-high level interrupt to the ARP32 INTC. The second is an output version (EVE_ED_OUT_IRQ) provided as an output on the EVE boundary as both active-high level and pulse version. This lets software selectively control which parity error sources are serviced by the ARP32, and which parity error sources are serviced by the external host. Typically, ARP32 services parity error interrupts generated by VCOP, EDMA, or system accesses and the system host services parity error interrupts generated by ARP32 accesses. The following registers control the detection and servicing of those interrupts (EVE_ED_LCL_IRQ and EVE_ED_OUT_IRQ):

- EVE_ED_LCL_IRQSTATUS_RAW
- EVE_ED_LCL_IRQSTATUS
- EVE_ED_LCL_IRQENABLE_SET
- EVE_ED_LCL_IRQENABLE_CLR
- EVE_ED_OUT_IRQSTATUS_RAW
- EVE_ED_OUT_IRQSTATUS
- EVE_ED_OUT_IRQENABLE_SET
- EVE_ED_OUT_IRQENABLE_CLR

The mechanism for detecting LCL and OUT interrupts is the same as the sequence described for the memory switch error interrupts. Any interrupt condition is captured in the IRQSTATUS_RAW registers (EVE_ED_LCL_IRQSTATUS_RAW[31:0] EVENT and EVE_ED_OUT_IRQSTATUS_RAW[32:0]EVENT), but only after enabling the appropriate IRQSTATUS_RAW bits (through EVE_ED_LCL_IRQENABLE_SET[3:0] ENABLE and EVE_ED_LCL_IRQENABLE_SET[3:0] ENABLE bit fields) the event is outputted for further processing (to the EVE parity or error detect error interrupts).

See Table 6-14,Figure 6-15, and Figure 6-15 for more information.

Figure 6-14. EVE Memory Switch Error Interrupt

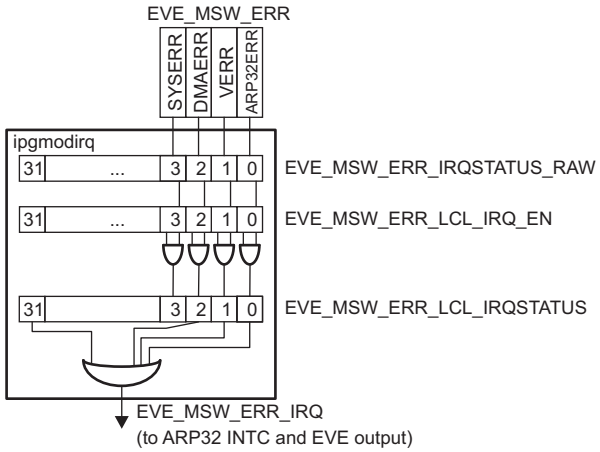


Table 6-14. EVE_MSW_ERR Register Interrupt Mapping

Bit Position	Source	Error
0	ARP32ERR	ARP32 initiated buffer ownership error
1	VERR	VCOP initiated buffer ownership error
2	DMAERR	EDMA initiated buffer ownership error
3	SYSERR	System-initiated ownership error

9	EVE_WBUF_ED_STAT[1] VERR	VCOP-initiated parity error
10	EVE_WBUF_ED_STAT[2] DMAERR	EDMA-initiated parity error
11	EVE_WBUF_ED_STAT[3] SYSERR	System-initiated parity error
12	EVE_IBUF_ED_STAT[0] ARP32ERR	ARP32-initiated parity error
13	EVE_IBUF_ED_STAT[1] VERR	VCOP-initiated parity error
14	EVE_IBUF_ED_STAT[2] DMAERR	EDMA-initiated parity error
15	EVE_IBUF_ED_STAT[3] SYSERR	System-initiated parity error

6.1.3.9.2 ARP32 INTC

The EVE subsystem instantiates four INTC subblocks. Each ARP32 INTC supports up to 32 active-high level interrupt inputs, and outputs up to five active-high level interrupt outputs. NTC0 maps to NMI and INT[7:4]; INTC1 maps to INT[11:8]; INTC2 maps to INT[13:12]; and INTC3 maps to INT[15:14].

The ARP32_INTn_IRQSTATUS_RAW or ARP32_NMI_IRQSTATUS_RAW register is set when the input signal transitions from a low-to-high state. Software clears the ARP32_INTn_IRQSTATUS_RAW or ARP32_NMI_IRQSTATUS_RAW register by writing 1 into the appropriate bit position. To latch a new level interrupt, software must first clear the source so that a new low-to-high transition is generated on the INTC input. This is compatible with both level and source interrupt sources.

Upon clearing any bit in a given ARP32_[INTn(j)|NMI]_IRQSTATUS_RAW register, if any enabled interrupts are still set, that is ARP32_[INTn(j)|NMI] output signal pulse is low for two clock cycles and is about to transition back to high state. This results in resetting the ARP32 IFR and thus triggers a new ISR, protecting against race conditions. Any new interrupts must occur after the initial read of the ARP32_INTn_IRQSTATUS or ARP32_NMI_IRQSTATUS state.

Upon entering an ISR, software must first read from the EVE_INTk_OUT_IRQSTATUS register, which may show multiple enabled interrupts pending. Software clears the state of those enabled interrupts that are set (by writing 1 to EVE_INTk_OUT_IRQENABLE_CLR and IRQSTATUS bit) and that are dispatched for servicing. Software determines which interrupt source to service first through whatever scheme is convenient. Upon servicing the selected interrupt, software clears the original source interrupt status.

Figure 6-16 shows the INTC for ARP32.

Figure 6-16. EVE INTC for ARP32

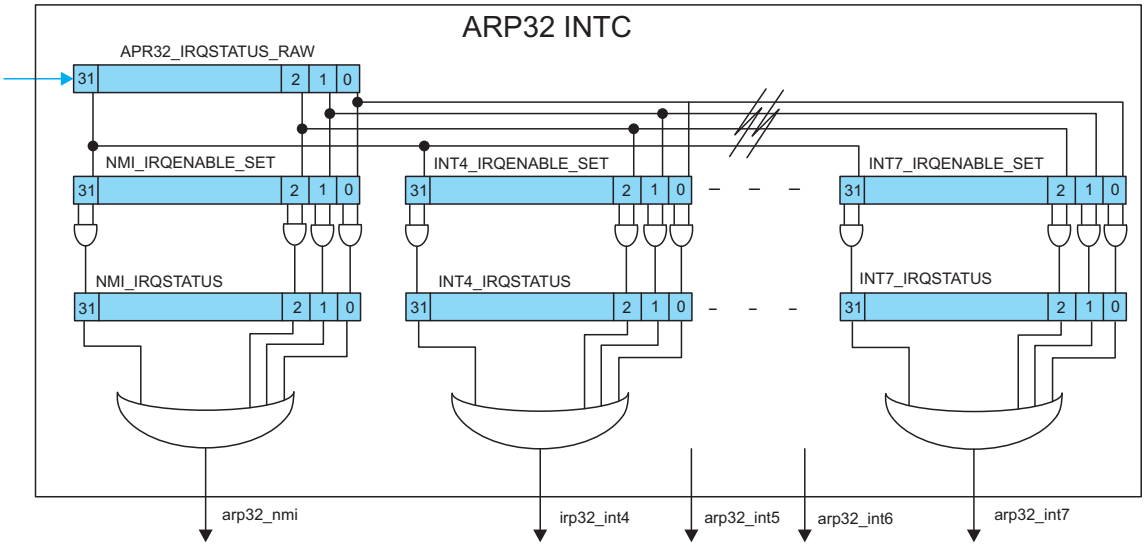

Table 6-16, Table 6-17, Table 6-18, and Table 6-19 summarize the ARP32 interrupt mapping.

Table 6-16. EVE ARP32 Interrupt Event Mapping Group0/INTC0

Interrupt	Name	Description	Source
0	eve_int00 (1)	Mapping to Mailbox 0	EVE input
1	eve_int01 (1)	Mapping to Mailbox 1	EVE input
2	eve_int02 (1)	Mapping to Mailbox 2	EVE input
3	eve_int03 (1)	Reserved	EVE input
4	eve_int04 (1)	Reserved	EVE input
5	eve_int05 (1)	Reserved	EVE input
6	eve_int06 (1)	Reserved	EVE input
7	eve_int07 (1)	Reserved	EVE input
8	tpcc_intg	EDMA CC global interrupt	EDMA CC
9	tpcc_int0	EDMA CC region 0 interrupt	EDMA CC
10	tpcc_int1	EDMA CC region 1 interrupt	EDMA CC
11	tpcc_int2	EDMA CC region 2 interrupt	EDMA CC
12	tpcc_int3	EDMA CC region 3 interrupt	EDMA CC
13	tpcc_int4	EDMA CC region 4 interrupt	EDMA CC
14	tpcc_int5	EDMA CC region 5 interrupt	EDMA CC
15	tpcc_int6	EDMA CC region 6 interrupt	EDMA CC
16	tpcc_int7	EDMA CC region 7 interrupt	EDMA CC
17	SCTM_TIMEVNTINT0	SCTM timer interrupt 0	SCTM
18	SCTM_TIMEVNTINT1	SCTM timer interrupt 1	SCTM
19	vcop_done (2)	VCOP done	VCOP
20	vcop_err_intn	VCOP error	VCOP
21	mmu0_int	MMU0 interrupt	MMU0

(1) eve_int[7:0] are available only to the ARP32 interrupt controller. They are unavailable and reserved to the output interrupt reducer.

(2) Vcop_done will deassert when new instructions are issued. Using the interrupt service routine, the interrupt is cleared in ARP32 INTC. Clearing of the actual source is with the functional mechanism of sending new instructions.

Table 6-16. EVE ARP32 Interrupt Event Mapping Group0/INTC0 (continued)

Interrupt	Name	Description	Source
22	mmu1_int	MMU1 interrupt	MMU1
23	tpcc_errint	EDMA CC error interrupt	EDMA CC
24	tptc_errint0	EDMA TC0 error interrupt	EDMA TC0
25	tptc_errint1	EDMA TC1 error interrupt	EDMA TC1
26	noc_errint	Interconnect error interrupt	Interconnect
27	EVE_MSW_ERR_INT	Buffer error interrupt	EVE top
28	EVE_ED_LCL_ERR_INT or EVE_ED_OUT_ERR_INT (3)	Parity error interrupt	EVE top
29	mailbox0_interrupt0	Mailbox 0 interrupt 0	Mailbox 0
30	mailbox1_interrupt0	Mailbox 1 interrupt 0	Mailbox 1
31	Reserved	Reserved	Reserved

(3) EVE_ED_LCL_ERR_INT (EVE_ED_LCL_IRQSTATUS_RAW, EVE_ED_LCL_IRQSTATUS) is used by the ARP32 INTC and EVE_ED_OUT_ERR_INT (EVE_ED_OUT_IRQSTATUS_RAW, EVE_ED_OUT_IRQSTATUS) is used for the output interrupts reducer.

Table 6-17. EVE ARP32 Interrupt Event Mapping Group1/INTC1

Interrupt	Name	INTC1 Mapping	Description	Source
0	eve_evt_int[0]	eve_intc1[00]	Require mapping to ICM_cstart0 signal or VIP interrupt	EVE input

6.1.3.9.3 Output Interrupt Reduction

EVE provides four output interrupts based on the same approach shown previously for the ARP32 INTC. The EDMA region interrupts, as well as the four output interrupts, are provided at the EVE boundary as shown in Figure 6-13.

For more information about the IRQ_CROSSBAR module, see Section 13.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 13, *Control Module*.

Table 6-16 shows the interrupt mapping for the output interrupt reducer.

6.1.3.9.4 End of Interrupt Mapping

End of interrupt (EOI) is a feature used for software handshake with pulsed interrupts.

EOI MMR functionality is provided for EVE-generated interrupts that are mapped as outputs to the system. This feature is necessary when the external system uses the pulsed version of a given interrupt. Because all interrupts inside EVE are level interrupts, the EOI feature is not required for those interrupts.

NOTE: The EVE subsystem does not condition interrupts for internal submodules (EDMA, interconnect, MMU, or SCTM). Those interrupts are mapped directly as outputs to the system and no EOI functionality is provided for them.

Table 6-20 lists the EOI mapping for the required interrupts.

Table 6-20. EVE EOI Mapping

EVE MMR Value	EVE Interrupt Overview
1	eve_int0_out
2	eve_int1_out
3	eve_int2_out
4	eve_int3_out

6.1.3.10 Interprocessor Communication

This kind of communication is managed through mailboxes. The mailbox function supports 2-way communication between a maximum of four users. This function relies on internal submodules, each supporting 1-way communication between one user referred to as the sender and another user referred to as the receiver. Software allocates the mailbox submodule to the communication between two users. EVE includes internal mailbox to support synchronization and messages passing between EVE-, ARP32-, and system-level hosts.

6.1.3.10.1 Mailbox Configuration

The mailbox submodule includes support for four users and, therefore, provides four interrupt outputs. MAILBOX_Interrupt0 is mapped to the EVE INTC and MAILBOX_Interrupt[3:1] are mapped to three external host processors.

Six submailboxes are provided, allowing bidirectional communication between the ARP32 and the three external hosts:

- MAILBOX_MESSAGE0: HOST0 to EVE
- MAILBOX_MESSAGE1: HOST1 to EVE
- MAILBOX_MESSAGE2: HOST2 to EVE
- MAILBOX_MESSAGE3: EVE to HOST0
- MAILBOX_MESSAGE4: EVE to HOST1
- MAILBOX_MESSAGE5: EVE to HOST2

The listed allocation in this section is just an example. For more information about the Mailbox module see Chapter 14, *Mailbox*.

6.1.3.10.1.1 Mailbox 0 – EVE to DSP1 and DSP2

Mailbox 0 is dedicated to bidirectional communication between local EVE and two DSPs (DSP1 & DSP2). In this mailbox, 6 out of 16, submailboxes are used, 3 for senders and 3 for receivers. Additional mailboxes are available, if needed, to separate message traffic based on type or content between each sender and receiver pair (see Table 6-21).

Table 6-21. EVE to DSP1 and DSP2 Mapping

		Receiver		
		EVE	DSP1	DSP2
Sender	EVE	-	En_M0	En_M0
	DSP1	En_M0	-	-
	DSP2	En_M0	-	-

6.1.3.10.1.2 Mailbox 1 – EVE to Other Hosts

Mailbox 1 is dedicated to bidirectional communication with other system-level hosts . The actual usage and mapping varies on the different devices.

In a multicore system, additional mailbox modules are included to support generic and lower-frequency, higher-latency communication. This mailbox is used by host that needs tightly coupled interaction with the local EVE.

This mailbox has a similar usage as mailbox 0. Six sub-mailboxes are used, three for senders and three for receivers (see Table 6-22).

Table 6-22. EVE to Other Hosts Mapping

		Receiver			
		EVE	Host X	Host Y	Host Z
Sender	EVE	-	En_M1	En_M1	En_M1
	Host X	En_M1	-	-	-
	Host Y	En_M1	-	-	-
	Host Z	En_M1	-	-	-

6.1.3.11 Powerdown

The EVE subsystem supports two methods of power-minimization and clock gating:

- Active mode power minimization
- Extended duration sleep

6.1.3.11.1 Extended Duration Sleep

Extended duration sleep is an explicitly requested powerdown mode handshaking with the device-level PRCM. As a result, the EVE input clocks are gated. The EVE subsystem is able to latch new interrupts and wake-up requests while in this clock gated state. Internal state is retained, including ARP32 registers, ARP32 data SRAM and program cache contents, VCOP state, EDMA registers, PaRAM, EVE level registers, and so forth.

Since the EVE subsystem has only one logical clock domain (even though divided clocks are used) the PRCM only gates clocks to the EVE subsystem after all of the appropriate handshakes (that is IDLE, STANDBY, and OCP Disconnect) are concluded and the EVE subsystem is in a completely IDLE, STANDBY, and DISCONNECTED state.

6.1.3.11.1.1 Sequence Overview

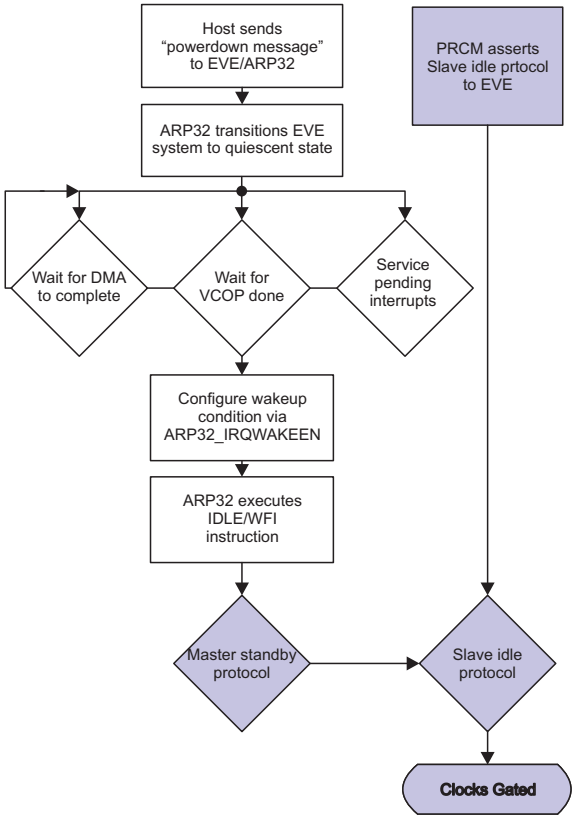
To enter extended duration sleep mode, the system host first signals the EVE subsystem (through systemlevel mailbox and interrupt) that it is entering this mode. In parallel, the PRCM asserts an SIdleReq request to the EVE subsystem. ARP32 performs any software bookkeeping necessary to transition the EVE subsystem to a quiescent state. This can include:

- Waiting for outstanding DMA transfers to complete
- Waiting for VCOP to finish the current task
- Servicing pending interrupts

If the EVE_SYSCONFIG[5:4] STANDBYMODE bit field is set accordingly, then the EVE hardware transitions to IDLE state and signals the desire to enter powerdown state to the device through the STANDBY and Idle protocols. After handshakes are completed internal EVE clocks are gated.

Figure 6-17 depicts the extended duration sleep software/hardware sequence.

Figure 6-17. Extended Duration Sleep Software/Hardware Sequence



6.1.3.11.1.2 Idle Protocol Overview

EVE IDLE protocol is associated with the EVE OCP target port. The configuration of the IDLE state is done by setting the EVE_SYSCONFIG[3:2] IDLEMODE bit field.

When the EVE subsystem is configured in Smart-Idle or in Smart-Idle-Wakeup, the following sequence must be performed upon an IDLE request from the PRCM:

- Acknowledge the receipt of the request by going into sleeptrans state.
- Wait for MSTANDBY state.
- Disconnect all OCP target ports using the OCP disconnect protocol.
- Gate EVE internal clocks.
- Acknowledge the IDLE request by going into IDLE state.

Externally generated OCP requests (through DMA OCP target bus) to EVE memory space are gated only after the MStandby state is entered. This is required because explicit messaging with the DMA may be necessary before ARP32 software can reach a state that allows entrance to MStandby.

6.1.3.11.1.3 Mstandby Protocol Overview

MSTANDBY protocol is initiated based on ARP32 executing idle instruction provided the other internal EVE masters are in idle state (assuming in Smart-Standby mode).

ARP32 software must wait until all internal operations are finished, before executing idle instruction.

The standby sequence follows:

1. ARP32 software waits for all activity to stop.
2. ARP32 issues IDLE instruction and all EVE submodules are in IDLE state.
3. Using the OCP disconnect protocol, deactivate all OCP initiator ports.

4. Assert the MStandby signal.

6.1.3.11.1.4 IDLE Wakeup

To facilitate auto-idle wakeup of the EVE subsystem, the wakeup capability of the idle protocol is used. A wake-up operation is executed when SYSCONFIG[3:2] IDLEMODE = 3h (SmartIdle-Wakeup).

In this mode, while in IDLE state, if an external input interrupt source that is enabled through the ARP32_IRQWAKEEN mask is active, then the SWakeup signal is asserted to the system. The device is expected to monitor the SWakeup request and enable clocks and exit the STANDBY and IDLE states. At this point, ARP32 can branch to the pending ISR.

The SWakeup signal is deasserted when all interrupt signals that are enabled in the IRQWAKEEN register are deasserted.

The logic controlling the assertion of SWakeup is completely asynchronous and does not rely on any input clock.

ARP32_IRQWAKEEN is not replicated per NMI, INTx. Any interrupt enabled in the ARP32_IRQWAKEEN mask must be enabled in one of the corresponding ARP32_INT_IRQENABLE registers.

6.1.3.12 Hardware-Assisted Software Self-Test – MISRs

To facilitate software self-test, MISRs are instantiated on address and data buses at key points in the system, such as ARP32 interfaces and the interconnect-WBUF interface. ARP32 is covered because it is the key control engine. WBUF coverage is provided as a convenient central destination that is used to indirectly provide coverage for a majority of EVE logic.

The MISRs monitor the address and data buses and calculate a signature based on the address or data pattern on a valid address or data phases. The signature registers reset to 0. A different speed value can be manually written through software to each signature register: MISR0_A, MISR0_D, MISR1_A, MISR1_D, and MISR2_Dk. Based on a known memory access data pattern, the MISR signature can be predicted or calculated and used as a reference for subsequent tests that occur at boot time or during runtime in a safety critical application.

The MISR calculation is a shift-register/XOR tree calculation using classical CRC algorithms.

The MISR calculation is initiated by setting the MISR_CTL[2:0] ENABLE bit field:

- bit 0: enable MISR 0 – ARP32 PMEM path
- bit 1: enable MISR 1 – ARP32 DMEM path
- bit 2: enable MISR2 – Interconnect WBUF path

The MISR_CLEAR[2:0] CLEAR register clears the MISR 0 and MISR 1 calculations for the corresponding path.

Table 6-23 describes the location and width of the various MISRs in the system and is shown as thick blue lines in the block diagram in Figure 6-1.

Table 6-23. MISR Mapping

		Address	Read Data	Write Data	Bus Width	MISR algorithm
MISR0_A	ARP32/PMEM	x			32	CRC-32
MISR0_D	ARP32/PMEM		x		32	CRC-32
MISR1_A	ARP32/DMEM	x			32	CRC-32
MISR1_D	ARP32/DMEM			x	32	CRC-32
MISR2_Dk (k = 0:3)	Interconnect/WBUF			x	128	CRC-32 (*4)

6.1.3.12.1 Mapping of MISRs to Different Width Buses

For WBUF data MISR, four instances of CRC-32 MISRs are instantiated in parallel to populate the width of the data bus. For ARP32 interfaces, a single instance of CRC-32 MISR is instantiated on each interface.

Each write data bus MISR (MISR1_D and MISR2_Dk) is activated based on the byte-enable pattern for the corresponding 32-bit word of memory. If any single byte-enable signal (of the 4 for the 4-bytes in the word) is active, then that MISR is updated. Byte-enables that are active use the corresponding data bus value. To avoid "don't care" signals from corrupting the MISR calculation, byte-enables that are inactive use a value of 0 on the input to the 32-bit MISR.

6.1.3.12.2 Detection of Valid Address and Data Cycles

For each MISR in the EVE subsystem, the update cycle occurs for functional accesses, once per read or write request or address phase for address based MISRs, and once per data phase for data-bus based MISRs. If a phase is extended due to "not ready" condition on the target, then the MISR is not updated on that cycle. MISR is updated only on the cycle where the REQUEST and READY signals are active.

6.1.3.12.3 Creating a Unique Signature – Software Self-Test Implications

To create tests that produce a unique signature, software must take care to ensure that the order of transactions (and resulting data/address phases) to a given MISR are consistent. Varying time between transactions does not affect the signature, because it is not updated on idle or not-ready cycles.

For cases that use a single initiator to access a given MISR, crossing asynchronous boundaries is acceptable. This is always true for ARP MISRs, but not necessarily for the WBUF MISRs.

For example if TC0 reads the OCP initiator bus and writes to WBUF MISR, the result is a consistent signature. And when TC0 reads EMIF address space (which is asynchronous) and writes to WBUF, while TC1 is also writing to WBUF results in different order of transactions.

For cases where all transactions/interactions are synchronous, using multiple initiators results in a consistent signature.

6.1.3.12.4 Multipass Tests Using WBUF MISR

The WBUF MISR is used to indirectly provide coverage for a majority of EVE logic. The EVE-level EDMA can be used to perform memcopy operation between a given source memory range and a WBUF memory address range and thus the WBUF MISR. The source buffer contains known values that are either the interim results of a VCOP self-test, or simply initialized to a known data pattern to provide interconnect level coverage. This is repeated for the necessary paths in the EVE subsystem to provide indirect coverage for those paths.

It is possible to reserve a portion of WBUF memory for the write data accesses during the self-test operation. The necessary reserved address space can be minimized by using EDMA constant mode transfers, which require a minimum of 32 bits of reserved space.

6.1.3.13 Error Recovery – ARP32 and OCP Disconnect

To prevent runaway code from corrupting the remainder of the system, and provide a clean reset/recovery mechanism, the EVE subsystem provides a mechanism to disconnect ARP32 from the remainder of the EVE subsystem, and to disconnect L3 initiator buses from the remainder of the device.

When ARP32 or OCP initiator buses are disconnected, the debugger can detect the EVE MMRs and memories through the interconnect target bus.

When the ARP32 and OCP buses are disconnected, a full reset and reboot cycle are issued in order to resume normal ARP32<->EVE operation. This is required in order to avoid any asynchronous timing paths due to asynchronous reset assertion to ARP32.

6.1.3.13.1 ARP32 Disconnect

ARP32 disconnect occurs when a specific parity error is detected and is enabled in the corresponding EVE_ED_ARP32_DISC_EN register. A disconnect request can also be issued by setting the EVE_DISC_CONFIG[0] ARP32_DISC bit to 1.

When the ARP32 core is in the process of disconnecting (waiting on in-flight request and response) the EVE_STAT[17:16] ARP32_DISC_STATUS bit field is set to 0x1, meaning "attempting to disconnect". When ARP32 is disconnected on both the program and data interfaces, then this bit field is set to 0x0 (disconnected).

NOTE: Software must wait for disconnected state before issuing a reset to the ARP32 core. This status ensures the neighboring system is not in a corrupted state

6.1.3.13.2 OCP Initiator Disconnect

The OCP initiator disconnect request occurs based on a specific parity error that is enabled in the corresponding EVE_ED_OCPI_DISC_EN register, or when the EVE_DISC_CONFIG[4] OCPI_DISC bit is set to 0x1.

When a disconnect request is issued both OCP initiator buses are disconnected. The disconnect logic forces the OCP initiator buses to stall at a clean boundary, such that EVE reset can be issued without violating the OCP protocol detected by the neighboring L3 interconnect. The disconnect logic also tries to fence any new requests, by allowing the current request handshake to complete, but gating any new OCP requests to the system. When the previously issued requests have received all responses, the interface is drained; at this point, the OCP disconnect protocol enters the M_OFF state.

When the OCP initiators are disconnecting, waiting on in-flight request/responses to complete, the EVE_STAT[21:20] OCPI_DISC_STATUS read value is 0x1 or "attempting to disconnect". Otherwise, when both initiators are disconnected, then the bit field contains the value 0, meaning that initiators are disconnected. In order to guarantee that the neighboring system is not left in a corrupted state, software must wait for disconnected state before issuing a reset to EVE

NOTE: Any requests into the OCP target bus must be stopped.

6.1.3.14 Lock and Unlock Feature

The EVE subsystem provides a Lock/Unlock mechanism that helps to prevent unintended access to the various control registers of the EVE control module, or EVE subcomponents. Ten lock and unlock registers are defined, where each register is used to lock and unlock access to a specific area of the memory map. Table 6-24 summarizes the logical groupings.

Table 6-24. Lock Register Mapping

Register Name	Mapping	Locked Registers
MMR_LOCK0	EVE memory configuration and standard EVE registers	EVE_REVISION, EVE_HWINFO, EVE_SYSCONFIG, EVE_STAT, EVE_DISC_CONFIG, EVE_BUS_CONFIG, EVE_VCOP_HALT_CONFIG, EVE_MMU_CONFIG
MMR_LOCK1	Memory switch registers and error registers	EVE_MEMMAP, EVE_MSW_CTL, EVE_MSW_ERR, EVE_MSW_ERRADDR
MMR_LOCK2	Program cache registers	EVE_PC_INV, EVE_PC_IBAR, EVE_PC_IBC, EVE_PC_ISAR, EVE_PC_ISAR_DONE, EVE_PC_PBAR, EVE_PC_PBC

Table 6-24. Lock Register Mapping (continued)

Register Name	Mapping	Locked Registers
MMR_LOCK3	Memory error detection registers	EVE_<Memory>_ED_CTL, EVE_<Memory>_ED_STAT, EVE_<Memory>_EDADDR, EVE_<Memory>_EDADDR_BO, EVE_ED_ARP32_DISC_EN, EVE_ED_OCPI_DISC_EN
MMR_LOCK4	Interrupt registers and GPout signals and CME signaling	EVE_MSW_ERR_X, EVE_ED_LCL_X, ARP32_NMI_X, ARP32_INTi_X (see (1), (2)), EVE_GPOUTm, EVE_GPOUTm_SET/CLR/PULSE, EVE_GPIN0, EVE_GPIN1, EVE_CME_DONE
MMR_LOCK5	MISR registers	See Section 6.1.5.
MMR_LOCK6	MMU, ARP32, VCOP	See appropriate chapter, MMU, ARP32 Reference Guide, VCOP Reference guide.
MMR_LOCK7	Debug	–
MMR_LOCK8	EDMA channel controller	–
MMR_LOCK9	EVE output interrupts	EVE_ED_OUT_IRQSTATUS_RAW, EVE_ED_OUT_IRQSTATUS, EVE_ED_OUT_IRQENABLE_SET, EVE_ED_OUT_IRQENABLE_CLR, EVE_INTk_OUT_IRQSTATUS_RAW, EVE_INTk_OUT_IRQSTATUS, EVE_INTk_OUT_IRQENABLE_SET, EVE_INTk_OUT_IRQENABLE_CLR (3)

(1) X = IRQSTATUS_RAW, IRQSTATUS, IRQENABLE_SET, or IRQENABLE_CLR
(2) i = 4 to 7 and 8 to 15
(3) k = 0 to 3

6.1.3.15 EVE Memory Map

For ARP32/EDMA view, the entire 32-bit address space is defined. Accesses to addresses less than 0x4000 0000 and greater than or equal to 0x4010 0000 are used to generate accesses to the external system. These accesses are managed through the MMU module. Accesses to addresses 0x4000 0000 to 0x400F FFFF that are generated directly by ARP32/EDMA are used to access the internal EVE address space. The MMU initiator is only able to access external-to-EVE address space, thus EVE logically remaps a virtual address (address generated by ARP32/EDMA below 0x4000 0000 and above 0x4010 0000) to any 32-bit physical address in the system, such that addresses mapped to 0x4000 0000 still occur. In other words, the EVE address space coexists with the same address space mapped for a different function at system memory through the MMU translation.

EDMA views a compressed/aliased version of the VCOP memories. This is dependent on the EVE_MEMMAP[4] LCL_EDMA_ALIAS bit.

VCOP address space is limited to the VCOP memories. The VCOP memory map depends on the setting of the EVE_MEMMAP[0] VCOP_ALIAS bit.

The system address space represents accesses to the external system through the OCP target bus. At the system level, this memory range is mapped to a fixed base address. Table 6-25 lists the address that represents the offset relative to that base address.

Table 6-25 shows the EVE subsystem memory map, with separate columns to show the ARP32/EDMA, VCOP, and SYS views.

Table 6-25. EVE Subsystem Memory Map

ARP32/EDMA View		VCOP View		SYS View		Size	Region	Function
Start Address	End Address	Start Address	End Address	Start Address	End Address

6.1.3.15.1 VCOP and Local EDMA: IBUF Memory Map Aliasing

To facilitate ping-pong buffer management, EVE allows the local EDMA and VCOP view of IBUFLA versus IBUFLB, and IBUFHA versus IBUFHB memories to be aliased into the same address ranges. ARP32 and System accesses (through OCP target port) always use the unique/256-KB address map for IBUF memory accesses.

Having a VCOP accesses and EVE_MEMMAP[0] VCOP_ALIAS = 0x1 limits VCOP data memory view to 128KB, with A and B sets aliased to the same address range, depending on the MMR ownership bits (EVE_MSW_CTL). When EVE_MEMMAP[0]VCOP_ALIAS = 0x0, VCOP uses the full 256 KB address. The EVE_MEMMAP[0]VCOP_ALIAS bit has no effect on how other initiators (ARP32, EDMA or SYS) see the VCOP memories. The VCOP view truth table is shown in Table 6-26.If IBUFLA/IBUFHA is set (while VCOP owned), then the memory switch points to the IBUFHA/IBUFLA memory and IBUFHB/IBUFLB is a "don't care". If VCOP accesses address that is shown in gray in Table 6-26, that is reported as an error.

Having local EDMA accesses, when EVE_MEMMAP[4] LCL_EDMA_ALIAS = 0x1, limits local EDMA data memory view to 128KB, with A and B sets aliased to the same address range, dependent on the MMR ownership bits (EVE_MSW_CTL). When EVE_MEMMAP[4] LCL_EDMA_ALIAS = 0x0, EDMA uses the full 256-KB address. The EVE_MEMMAP[4] LCL_EDMA_ALIAS bit has no effect on how other initiators detect the VCOP memories. Table 6-27 is the local EDMA truth table. If IBUFHA or IBUFLA is cleared (while EDMA/system owned), then the memory switch points to the IBUFHA or IBUFLA memory and IBUFHB/LB bit is a don't care bit. If ARP32, EDMA, or system accesses an address shown in gray, then that is reported as an error.

NOTE: The ALIAS and ownership register are modified when the system is initializated, or between major modes of operation when no memory transactions are ongoing. If the mode changes while accesses are in progress, then a given address may change from valid to reserved (or viceversa), or a given address can change from one memory to another.

NOTE: ARP32 and system accesses (including the system EDMA) always view the expanded 256-KB unique addresses for access to IBUF memories.

When a memory switch error is detected, the physical address is captured. IBUFLB address is 0x40007 0000 even if in aliased mode.

6.1.3.15.2 ARP32 Write Model – Avoiding Race Conditions

ARP32 uses posted writes exclusively. This implies that writes are "fire-and-forget" and that writes on a given path complete some variable number of cycles after being issued by ARP32. If ARP32 issues a write followed by either a read or write to the same endpoint, then those accesses complete in order. However, if ARP32 issues a write to a given endpoint target (for example MSW_CTL) and then issues a read or write to a different endpoint target (for example IBUF), then the IBUF access may occur before the MSW_CTL write. To assure that a write has landed, that ARP32 must issues a read to the same address range.

In case of memory switch ownership or aliasing modifications, software must ensure that the mode change is established. This is done by reading back the value of the ownership or alias registers.

Table 6-26. VCOP IBUF Aliasing Truth Table

EVE_MEMMAP: VCOP_ALIAS Bit	EVE_MSW_CTL Bit				VCOP Address			
	IBUFLA	IBUFHA	IBUFLB	IBUFHB	10000h	14000h	30000h	34000h

6.1.3.16 Debug Support

The SCTM and SMSET modules facilitate application and kernel-level performance tuning, as well as general debug. The EVE subsystem minimizes debug intrusion.

6.1.3.16.1 ARP32 Debug Support

The EVE subsystem provides the entire IcePick™ and cross-triggering interfaces at the EVE boundary for use at the system level. EVE ARP32 configuration supports two hardware watchpoints. There are no hardware breakpoints.

The ARP32 core supports the following debug features:

- A 32-bit OCP slave port as the debug interface
- Memory-mapped registers showing and controlling debug status of the core
- Ownership mechanism for managing use of all debug features by application code or debug software
- View of CPU resources (program memory, data memory, CPU architectural register, CPU control registers)
- Real-time debug access to CPU resources, if the CPU does not need to be halted to make a debug access
- Unlimited number of simultaneous software breakpoints using the BKPT instruction supported by the core
- Limited number of simultaneous hardware watchpoint (HWWP) units
- Run control:
  - Halting cpu at SWBP, HWBP, HWWP, incoming external Trigger
  - Single stepping in processor - instruction by instruction
  - Resuming CPU from halted state
- Cross triggering:
  - Halting the CPU on an incoming external trigger
  - Sending a trigger pulse out when the CPU halts as a result of SWBP, HWBP, HWWP trigger/match
  - Sending a trigger pulse out when HWBP, HWWP match is detected, even if the CPU is not configured to halt
- Debug control and status registers:
  - Shows the status of debug access, CPU core execution status
  - Shows miscellaneous status like RESET and IDLE state

6.1.3.16.2 SCTM

The SCTM provides general-purpose counters and timers. It also allows counting and measuring of specific internal EVE signals (for example, stall signals). The general-purpose counter/timer functionality is used by both BIOS software and application software. The signal-measuring functions are typically used for performance-related debug. See Section 6.1.6 for more details concerning SCTM.

6.1.3.16.2.1 SCTM Configuration

Table 6-28 shows the SCTM configuration for EVE. The SCTM module is configured for eight 32-bit counters, two of which can be configured as timers. Timers are counters that include a threshold MMR value and an interrupt. The interrupt is pulsed when the counter reaches the programmed threshold. It is possible for any two even and odd counter pairs to be chained (through MMR) to operate as a 64-bit counter. The SCTM configuration in EVE supports the atomic read feature on counter[3:0] pair and counter[5:6] pair.

Table 6-28. SCTM Configuration in EVE

Generic	SCTM Feature/Parameter Details	Value	Number on Device
CTM_NUMINPT	Number of event input signals supported	0 to 127	31
CTM_NUMCNTR	Number of counters in the module	1 to 32	8
CTM_NUMTIMR	Number of timers	0 to 8	2
CTM_TIMINTPOLARITY	Timer interrupt polarity	0 = Active low 1 = Active high	1
CTM_TIMINTWIDTH	Timer interrupt pulse width	1 or more	2
CTM_NUMSTM	Number of counters for STM export	0 to 32	0
CTM_CCMAVAIL	CCM frame export available	0 = No 1 = Yes	0
CTM_NUMDBGSGL	Number of debug event signals	0 to 8	0

Table 6-28. SCTM Configuration in EVE (continued)

Generic	SCTM Feature/Parameter Details	Value	Number on Device
CTM_ASYNCIDLEREQ	Whether IDLE request is asynchronous signal	0 = No 1 = Yes	0
CTM_CNTR_ CHAINSHADOW	Atomicity feature for even-indexed counters	One per counter. 0 = No chain shadow feature 1 = Chain shadow feature in counter chain mode	Counter numbers 2 and 4 have the chaining feature.

6.1.3.16.2.2 SCTM Resources Reserved for BIOS

Timer 0 (and associated interrupt) is exclusively reserved for BIOS software for driving the BIOS tick.

Timer 1 (and associated interrupt) is free to be used by application software.

BIOS also requires a 64-bit free-running counter with low-latency accessibility that is used during application logging. This is provided through the ARP32 free-running 64-bit counter.

6.1.3.16.2.3 SCTM Event Mapping

The SCTM events include low-level stall and duration signals sourced by various components of EVE, mainly program cache-related signals and VCOP-related signals. Table 6-29 summarized the event mapping. Event inputs start numbering at 1, because event0 is reserved and SCTM internally uses the functional clock as event0.

For more details on the functionality of each signal listed in the table, see *EVE Programmer's Guide*. Contact your TI representative for instructions how to access this document.

The SCTM module operates at half the clock rate (EVEx_GFCLK), CLK2 = 0.5 × CLK1. The event sources include CLK2 and CLK1 signals. The CLK2 relative signals are connected directly to SCTM. The CLK1 relative signals are conditioned by EVE-level logic to scale from CLK1 to CLK2. Because these signals are Duration type signals, EVE logic asserts a CLK2 pulse for every two CLK1 pulses detected. This results in, at most, 1 CLK1 cycle of inaccuracy in the CLK2 duration reported by the SCTM.

The SCTM allows measurement of active-high signals. The Type column represents the functional characteristics of the source signals, which can be Pulse, Duration or Edge. The SCTM Mode column describes the typical mode for the SCTM counter when used with a particular signal. The options are event or duration mode. The pulse signals are driven active one cycle for each occurrence, a sequence of consecutive active cycles represents multiple occurrences. For a type of signal where the duration implies the number of occurrences in particular state (for example, the number of cache hits) the furation mode of SCTM is used. The Duration type represents a signal that may stay active for multiple cycles on a given occurrence. These are stall signals, where software tried to determine the number of cycles in the stalled state. Duration mode indicates the time stalled. Event mode indicates the number of unique occurrences of stalls. Event is useful in this case since there is always a deassertion between occurrences. The Edge type goes active for undefined periods of time but must go inactive before the next occurrence. Event mode of the SCTM is used for these signals.

Table 6-29. SCTM Events

SCTM Event	Name	Source	Type	SCTM Mode	Clock
1	cache_miss_count	ARP32_Pcache	Pulse	Duration	CLK2
2	cache_hit_count	ARP32_Pcache	Pulse	Duration	CLK2
3	cache_miss_stall	ARP32_Pcache	Duration	Duration or Event	CLK2
4	prefetch_compulsory_count	ARP32_Pcache	Pulse	Duration	CLK2
5	Prefetch_lookahead_count	ARP32_Pcache	Pulse	Duration	CLK2

33	arp32_int9	INTC	Duration	Duration of event	CLK2
34	arp32_int10	INTC	Duration	Duration of event	CLK2
35	arp32_int11	INTC	Duration	Duration of event	CLK2
36	arp32_int12	INTC	Duration	Duration of event	CLK2
37	arp32_int13	INTC	Duration	Duration of event	CLK2
38	arp32_int14	INTC	Duration	Duration of event	CLK2
39	arp32_int15	INTC	Duration	Duration of event	CLK2

6.1.3.16.2.4 SCTM Halt and Idle Modes

The SCTM module has a method for enabling and disabling counters based on whether the CPU is in debug-halt (SUSPEND) state or idle state (IDLE). This state information is provided from the ARP32 CPU to the SCTM module through the SUSPEND and IDLE inputs.

6.1.3.16.3 SMSET

The SMSET allows tracing of key EVE subsystem events, as well as software messages from the ARP32 CPU. SMSET accepts software messages through its OCP target port, and accepts key system events through the system event input. These messages or events are queued locally in SMSET and written to the chip-level software trace module through the SMSET and EVE OCP debug initiator port. The system trace macrocell (STM) then traces these messages along with trace content with other chip-level agents. For details, see Chapter 26, *On-Chip Debug Support*, for details.

6.1.3.16.3.1 SMSET Configuration

Table 6-30 summarizes the SMSET configuration in EVEN. The SMSET module is configured to support both event and software message tracing, and supports cross-triggering. System events (that are not stallable and can overflow) include a 4-deep buffer; and software events (that can be stalled and never overflow) support a 2-deep buffer.

Table 6-30. SMSET Configuration in EVE

Generic	SCTM Feature/Parameter Details	Value	In EVE Subsystem	Number on Device
NB_EVENTS	Number of system events	1 to 255	52	9
SW_MESSAGE	Software messages support	0 to 1	1	1
TRIG_MIN_WIDTH	Minimum trigger input pulse (L4 cycles)	1 to 8	2	2
EVENTS_BUF_DEPTH	System events buffer depth	1 to 16	4	4
SW_BUF_DEPTH	Software message buffer depth	0 to 16	2	2

6.1.3.16.3.2 SMSET Event Mapping

The SMSET events include higher-level start and end task events. Table 6-31 summarize the event mapping. Refer to the *EVE Programmer's Guide* for details on the functionality of each signal listed. Contact your TI representative for instructions how to access the *EVE Programmer's Guide*.

The SMSET module operates at the CLK2 rate.

The SMSET traces events on either a high-to-low transition or low-to-high transition, but not both. Thus, the EDMAs tpcc_aet signal is not directly compatible with SMSET tracing. The tpcc_aet is an active-high signal that is used to measure the duration of a specific EDMA transfer. The tpcc_aet signal is programmed (in EDMA CC MMRs) to go high when a specific trigger is detected and to go low when a specific completion code is received. EVE logic implements custom tpcc_aet_start and tpcc_aet_end signals. The tpcc_aet_start signal pulses high (for one cycle) when tpcc_aet transitions to high, and the tpcc_aet_end signal pulses high (for one cycle) when tpcc_aet transitions to low.

The Type column in Table 6-31 lists the functional characteristics of the source signal (Pulse, Duration, or Edge).

The Pulse signals are expected to be driven active one cycle for each occurrence. A sequence of consecutive active cycles represent multiple occurrences. Duration mode of SCTM makes sense for this type of signal where the duration implies the number of occurrences in a particular state (for example, the number of cache hits).

The Duration type represents a signal that may stay active for multiple cycles on a given occurrence. These are typically stall signals where the user is trying to determine the number of cycles in the stalled state. Duration mode indicates the total time stalled. Event mode will indicate the number of unique occurrences of stalls. "Event" is useful in this case because there will always be a deassertion between occurrences.

An Edge signal goes active for undefined period of time but is goes inactive before the next occurrence. Event mode of the SCTM must be used for these signals.

Table 6-31. List of SMSET Events

SMSET Event	Name	Source	Type	SMSET Mode	Clock
0	tpcc_aet_start	EDMA	Pulse	Duration	CLK2
1	tpcc_aet_stop	EDMA	Pulse	Duration	CLK2
2	arp32_int4	INTC	Duration	Duration or event	CLK2
3	arp32_int5	INTC	Duration	Duration or event	CLK2
4	arp32_int6	INTC	Duration	Duration or event	CLK2
5	arp32_int7	INTC	Duration	Duration or event	CLK2

Table 6-31. List of SMSET Events (continued)

16	arp32_int15	INTC	Duration	Duration or event	CLK2

6.1.3.17 EVE L2_FNOC Interconnect

A level 2 (L2) Interconnect from Arteris - FlexNoC® is instantiated in the EVE subsystem.

6.1.3.17.1 EVE L2_FNOC Flag Mux and Error Log Registers

The EVE_L2_FNOC flagmux and error log registers are used for error logging and flag muxing purposes. The status information stored in them can be used to resolve issues related to EVE_NoC access coflicts, debugging, and so forth. The related registers are described in Section 6.1.5.3. For more information on flag muxing and error logging, see Section 9.2.3.5 and Section 9.2.3.8 in Section 9.2 *L3_MAIN Interconnect.*

6.1.4 EVE Programming Model

6.1.4.1 Boot

The EVE boot process follows:

1. EVE_RST and EVE_CPU_RST are asserted for a minimum of 16 cycles.
2. Host processor (through PRCM) deasserts eve_rst_n (eve_arp32vcop_rst_n remains asserted). This lets the system access EVE-level memories/MMRs through the OCP target bus while ARP32 remains in reset.
3. Host processor initializes EVE state:
   a. Enable parity generation for EVE memories: clear DMEM, WBUF, IBUF memories to initialize parity state (optional and can be handled at runtime by ARP32).
   b. Load ARP32 code and data into desired memories:
      i. Code is typically in EMIF/DDR memory, but can be any valid chip-level memory.
      ii. Data is typically in EVE DMEM, but can also be in EMIF/DDR or other chip level memory
   c. Initialize MMU TLB and related page tables: A translation must exist for address 0h because ARP32 boot vector is always at 0h (for MMU programming model see Chapter 15, *Memory Management Unit*).
   d. Load VCOP memories: Ownership defaults to non-VCOP so no extra steps are required (optional and can be handled at runtime by ARP32).
   e. Initialize EDMA, INTC (optional and can be handled at runtime by ARP32).
4. Host processor (through PRCM) deasserts eve_arp32vcop_rst_n
5. ARP32 initializes EVE state, for steps not handled by host processor:
   a. Configure EDMA.
   b. Configure interrupt controller: Enable all error-related interrupts.

c. Enable parity on all memories: Scrub memories to initialize parity state.
d. Initialize VCOP working buffers.

6. ARP32 manages ping-pong processing:
   a. Page in input buffers through EDMA.
   b. Assign memory ownership of I/O buffers to VCOP or EDMA/SYS.
   c. Page out output buffers through EDMA.
   d. Initialize VCOP program.
   e. Wait for VCOP completion, EDMA input paging completion, and EDMA output paging completion.

6.1.4.2 Task Change and Program Cache Prefetch

The ARP32 switches tasks in a number of ways. In this context, a task represents a unit of program flow that typically executes for many ping-pong time slices and represents a code section that is typically 16k to 32k long.

6.1.4.2.1 Simple or Unoptimized Branch to New Task

In the simplest case, the ARP32 branches to the new code section. The existence of program cache provides reasonable performance, especially if the new task program code is cache friendly and is executed a number of times before the next task switch occurs.

6.1.4.2.2 Prefetch, Wait, then Branch to New Task

To optimize the task switch efficiency, use the software-directed preload operation. In this case:

- Complete with the current task.
- Execute a Software directed preload command (as described in Section 6.1.3.4.3, Software Direct Preload).
- Wait for preload completion.
- Branch to the new address.

Given that the cache view and system view of the program address are still the same, there are no additional overhead and constraints.

6.1.4.2.3 Hidden Prefetch

If any two tasks are small enough to fit in program cache, software uses SDP to fetch the contents of the next tasks into program cache while operating on the current task. If that program cache is direct mapped, extra care must be taken to ensure that any two tasks do not reside in the same modulo-32k range of memory.

6.1.4.3 Interrupts

The following pseudocode describes a typical and simple workflow for ARP32 to service pending interrupts. This flow is not the only possible sequence and is not meant to represent a mandated software sequence:

1. ARP32 enables and maps interrupts:
   a. Enable ARP32 global interrupt enable (ARP32.CSR.GIE).
   b. Enable ARP32 nonmaskable interrupts (ARP32.IER.NMIE).
   c. Enable ARP32 interrupt inputs (ARP32.IER[*n*]).
   d. Map EVE-level interrupts to the appropriate ARP32 interrupt input (ARP32_INTn_IRQENABLE_SET).
2. When interrupt is asserted, ARP32 branches into interrupt vector code:
   a. ARP32 hardware clears the GIE bit, new interrupts are ignored
   b. ARP32 software reads ARP32_INTn_IRQSTATUS
   c. Clear to be serviced interrupts in ARP32_INTn_IRQSTATUS (by issuing write of 1)
   d. For each pending interrupt in ARP32_INTn_IRQSTATUS:
      i. ARP32 software reads IP interrupt status (<IP_INT>_IRQSTATUS)
      ii. For each pending interrupt in <IP_INT>_IRQSTATUS:
         1. May not be necessary for pulsed or timer type interrupts.
         2. Perform functional operations necessary to service interrupt.
         3. Clear IP source interrupt status (by setting correct bit in <IP_INT>_IRQSTATUS to 1).
         4. Ideally, only exit loop after <IP_INT>_IRQSTATUS is all 0s.
      iii. Only exit loop after <IP_INT>_IRQSTATUS is all 0s
   e. ARP32 software returns from interrupt through BIRP (branch interrupt return pointer) instruction: ARP32 hardware sets the GIE bit (by copy of SCSR to CSR, new interrupts are enabled) and clears IFR*n*.

For ARP32 register and state details (especially for CSR, GIE, and SCSR functionalities), see the *ARP32 CPU and Instruction Set Reference Guide*.

6.1.4.4 Safety Considerations

This section highlights the known hardware that must be enabled in a safety-conscious system, and specific software techniques that increases the level of safety of EVE.

6.1.4.4.1 Memory Error Detection

Memory error detection provides hardware to detect single-bit errors in data memories (DMEM, WBUF, and IBUF) and detect double-bit errors in program memories. This hardware can capable detect stuck-at faults, as well as radiation-induced soft errors.

- For data memories, to avoid false error signaling, memories must be initialized with known values before reading those memories. See Section 6.1.3.3.6, *Memory Error Detection*.
- All sources of error detection error interrupts must be enabled. See Section 6.1.3.3.6, *Memory Error Detection,* and Section 6.1.3.9.1, *EVE Interrupt Sources – Memory Switch and Parity Error Interrupts*.
- Software must be tested at development time to ensure robust response to random errors. See Section 6.1.3.3.6.3, *Parity Error Testability*.
- Software must be tested at runtime to ensure hardware is properly operating. See Section 6.1.3.3.6.3, *Parity Error Testability*.

6.1.4.4.2 MMU

The MMU is configured to minimize the view of system memory that ARP32 and EDMA are allowed to access. This prevents either coding bugs or faulty hardware from impacting other critical areas of the system, such as the system host code and data sections. For detailed explanation of the MMU and its programming, see Chapter 15, *Memory Management Unit (MMU)*.

6.1.4.4.3 Firewall

The system firewall is used to prevent access by unintended system initiators from accidentally modifying EVE memory; or accesses from intended system initiators to unintended EVE memory. For firewall configuration see Section 9.2, *Interconnect*.

6.1.4.4.4 Interconnect

The EVE detects accesses to reserved locations in the memory-map and informs the system.

6.1.4.4.5 Application Stability/Sequencing

The Mailbox module or the local EVE SMSET module can be leveraged to report either heartbeat or sequence messages to the system host. By sending deterministic messages, the host ARM verifies that EVE is still active and following a reasonable path of code execution.

6.1.4.4.6 Interrupt Servicing

ISRs are implemented to count the expected number of interrupts (for example, EDMA, mailbox, timer) and check for extra or missing interrupts where possible. For example, if the ARP32_INTn_IRQSTATUS[31:0] EVENT bit field is set, then at least one of the source registers is set as well. Or, if an EDMA interrupt is received, then at least one of the CIPR bits is set. For EDMA interrupts, software tracks DMAs submitted versus DMAs completed.

6.1.5 EVE Subsystem Register Manual

6.1.5.1 EVE Instance Summary

Table 6-32 lists EVE instances.

Table 6-32. EVE Instance Summary

Module Name	Base Address	Size
EVE	0x4200 0000	4KiB
EVE_DSP(1)	0x0200 0000	4KiB
EVE_L2_FNOC (2)	0x0208 A000	1024 Bytes

(1) Address space is NOT visible on L3_MAIN for the device. It is visible only within the DSP_ICFG internal configuration space, hence accessible only by the DSP C66x CPU.
(2) Address space is NOT visible on L3_MAIN for the device.

6.1.5.2 EVE Registers

6.1.5.2.1 EVE Register Summary

Table 6-33 summarizes the EVE registers.

RESERVED																								STANDBYMODE		IDLEMODE		FREEEMU		SOFTRESET	

Bits	Field Name	Description	Type	Reset
31:6	RESERVED	Reserved. Read returns 0s	RW	0x0000
5:4	STANDBYMODE	00: Force-Standby mode: This mode is a backup mode intended to be used only if the smart-idle mode is bugged. When in this mode / the SAF asserts with minimal hardware condition the status saying :I am in standby:. It is the responsibility of the software to ensure that the SAF is in a correct quiet state before programming this mode. Additionally when in this mode / the SAF is not allowed to generate wakeup reques . 01: No-Standby: This mode is a backup mode intended to be used only if the smart-idle mode is bugged. When in this mode / the SAF never asserts the status declaring that the system is in standby. 10: Smart-Standby: default. EVE generates the standby status based upon all hardware internal status / namely after having performed all hardware operations necessary to be in a correct quiet state. Additionally when in this mode / the SAF is not allowed to generate wakeup request. 11: Smart-Standby-Wkup: Same as Smart-Standby. (EVE generates the standby status based upon all hardware internal status / namely after having performed all hardware operations necessary to be in a correct quiet state). . Additionally when in this mode / the SAF is allowed to generate wakeup request	RW	0x0
3:2	IDLEMODE	00: Force-idle: This mode is a backup mode intended to be used only if the smart-idle mode is bugged. When in this mode the IAF acknowledges a request to go idle from the power manager with minimal hardware condition. It is the responsibility of the software to ensure that the IAF are in a correct quiet state before requesting a force-idle transition. Additionaly when in this mode the IAF is not allowed to generate any wakeup request. 01: No-idle: When in this mode the IAF disregards any request to go idle from the power manager. 10: Smart-idle: default mode. default. When in this mode / the IAF acknowledges a request to go idle from the power manager after having performed all hardware operations necessary to be in a correct quiet state. Additionally when in this mode / the IAF is not allowed to generate any wakeup reques 11: SmartIdleWkup : When in this mode / the IAF acknowledges a request to go idle from the power manager after having performed all hardware operations necessary for the IAF to be in a correct quiet state. Additionally when in this mode / the IAF is allowed to generate wakeup request	RW	0x0
1	FREEEMU	Resered. Note that SCTM has free control bit to define the timer operation during ARP32 debug halt mode	R	0x0

Table 6-68. EVE_PC_PBAR

Address Offset	0x0008 0060		
Physical Address	0x4208 0060 0x0208 0060	**Instance**	EVE EVE_DSP
Description	Program cache preload base address register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDR																															

Bits	Field Name	Description	Type	Reset
31:0	ADDR	Preload Base Address register. Defines system byte address base to be Preloaded into L1P. The entire range to be Preloaded is (loosely speaking) from the base address to the base address + byte count. The actual range is inclusive of cache line (32-B aligned) addresses containing the start address and end address	RW	0x0000 0000

6.1.6 Subsystem Counter Timer Module

6.1.6.1 Introduction

6.1.6.1.1 Overview

As the complexity of SoC architectures increases, system and subsystem optimization requires increased visibility into the frequency and duration of events within the system. One way to address these profiling requirements is to embed dedicated event or profile counters in all functional modules with profiling requirements. While this can address the fundamental requirements, there are several disadvantages to this approach:

- System architects must determine the detailed profiling requirements very early in the specification process.
- These dedicated profiling resources are generally quite similar across functional blocks so the redundant function introduces gate/area penalties in each functional module.
- Embedded profiling resources are harder to optimize out of subsequent system revisions when profiling requirements may be less prevalent.
- The embedded resources may have different configuration and control interfaces and this increases the difficulty of providing unified profiling data from all modules in a subsystem.

This section defines the functional specification for a generic counter timer module that can be instantiated within the processor subsystem and that also functions as a centralized profiling module for the entire subsystem. This module maps a large number of system and subsystem event signals to a smaller number of counter resources. Some of the counter resources in the module can be configured for timer functionality where system and/or debug events can be generated when designated intervals are matched.

In the EVE subsystem eight 32-bit counters are instantiated. Two of those eight counters can be configured as timers.

The generic centralized counter timer approach provides several advantages:

- Unified programmers view of all profiling resources within the subsystem
- Accessible by debug tools and application
- Parameterized synthesis for full configurability of the number of event inputs and counter resources
- A more flexible solution that lets designers tailor gate count to customer profiling requirements
- Standard configuration and control interfaces encourage reuse across subsystem modules within a complex SoC.
- In addition to profiling functions, resources in this module can be used to address normal application counter/timer functions, such as OS timers.

6.1.6.1.2 Top-Level Requirements

The SCTM has the following top-level functional requirements:

- Counter timer resources:
  - A maximum of 32 counters can be instantiated in a single SCTM.
  - A maximum of eight of the counters can be instantiated with timer (event generation) functionality in addition to the base counter function.
- System event signal inputs:
  - A maximum of 127 event signal inputs can be supported by the SCTM.
  - Any of the system event signal inputs can be routed to any of the counter timer resources in the SCTM.
- Counter functionality:
  - The module contains a collection of 32-bit counters that can be chained to an adjacent counter for 64-bit capability.
  - The counters can be configured to operate with any one of the event signal inputs.

  - The counters can be configured to operate in a free-running mode that counts the total number of clock cycles.
  - The counters can operate in duration mode that counts the total duration in cycles that the assigned input signal is asserted.
  - The counters can operate in event mode that counts the total number of times the assigned event signal is asserted.
  - The counters can be configured to continue to run or to temporarily stop when the CPU enters the debug halt state.
  - The counters can be configured to continue to run or to temporarily stop when the CPU enters the IDLE state.
- Timer functionality:
  - Timers have all the functionality of counters.
  - Timers have a 32-bit interval match register.
  - Timers can be configured to generate an interrupt event when the counter matches the interval register.
  - Timers can be configured to generate a debug event when the counter matches the interval register.
  - The timers can be configured to run to the interval register once or to reinitialize each time the interval counter is matched.
- System Trace Interface:
  - The counter state dump can be configured as periodic or may be generated under application control.

6.1.6.1.3 Configuration

Table 6-265 lists the configuration of the SCTM in EVE.

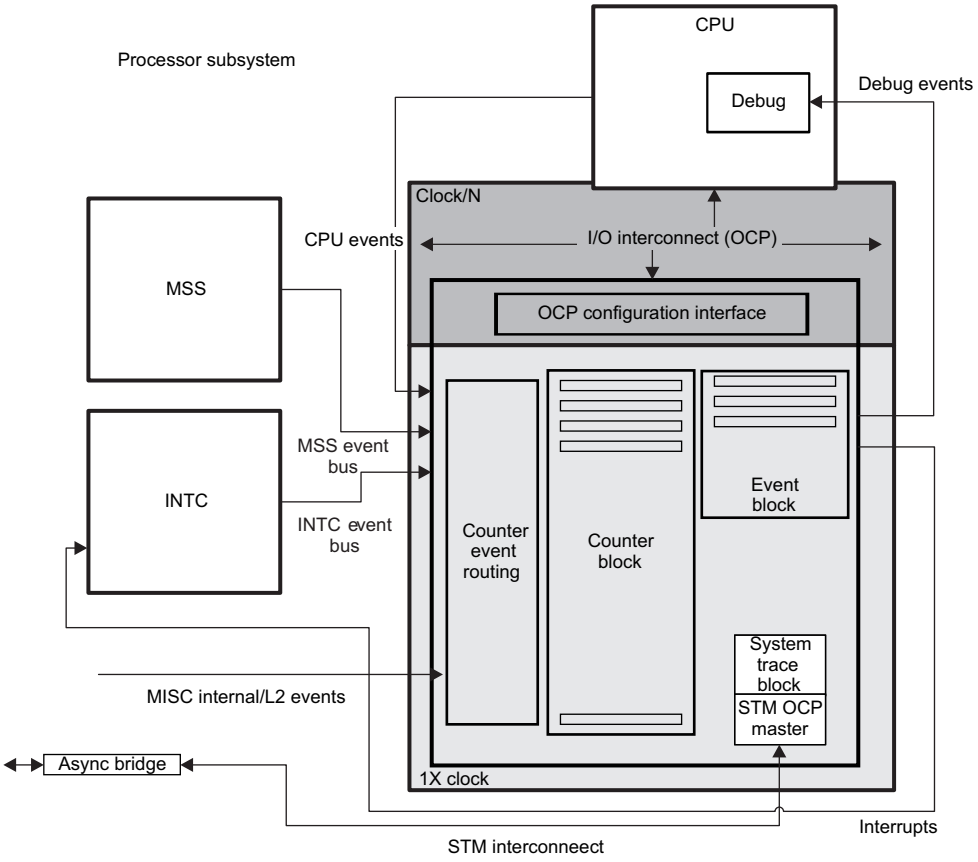
Table 6-265. SCTM Configuration

Generic	SCTM Feature/Parameter Details	Value	Number on Device
CTM_NUMINPT	Number of event input signals supported	0 to 127	31
CTM_NUMCNTR	Number of counters in the module	1 to 32	8
CTM_NUMTIMR	Number of timers	0 to 8	2
CTM_TIMINTPOLARITY	Timer interrupt polarity	0 = Active low 1 = Active high	1
CTM_TIMINTWIDTH	Timer interrupt pulse width	1 or more	2
CTM_NUMSTM	Number of counters for STM export	0-32	0
CTM_CCMAVAIL	CCM frame export available	0 = No 1 = Yes	0
CTM_NUMDBGSGL	Number of debug event signals	0-8	0
CTM_ASYNCIDLEREQ	Whether IDLE request is asynchronous signal	0 = No 1 = Yes	0
CTM_CNTR_CHAINSHADOW	Atomicity feature for even-indexed counters	One per counter. 0 = No chain shadow feature 1 = Chain shadow feature in counter chain mode	Counter numbers 2 and 4 have the chaining feature.

6.1.6.1.4 Block Diagram

Figure 6-18 represents a block diagram for the Counter Timer Module.

Figure 6-18. SCTM Block Diagram



6.1.6.2 Functional Description

The SCTM is a generic profile counter and timer module that can integrate these functions into a single module in a subsystem.

6.1.6.2.1 Configuration Interface

The SCTM has an OCP 2.1-compliant slave interface for configuring and controlling the module. For a detailed description of the register file and the individual registers, see Section 6.1.6.4, SCTM Register Manual. The configuration interface has the following basic functional requirements:

- Any unimplemented configuration memory space:
  - Generates a bus error on application read or write
  - Generates a bus error on debug right
  - Returns 0s and no bus error on debug read
- Any write to a read only register (application or debug) generates a bus error.

6.1.6.2.2 Counter Function

6.1.6.2.2.1 Input Events

Any signal of interest from within the subsystem can be routed to this module and used to control the counters and timers in the module. The routing of the input events from the module boundary to an individual counter is accomplished through an input event multiplexer and is controlled by the INPSEL bit field in the CTCR_WT_j or CTCR_WOT_j register.

The SCTM supports a maximum of 127 input events. The details of the input events for a particular device are detailed in a device-specific appendix to this specification. Application and debug software can determine the number of counters in the SCTM by reading the NUMINPT field in the SCTM_CTCNTL register.

6.1.6.2.2.2 Counters

The individual 32-bit counters in the SCTM count when the input event signals are asserted. The SCTM supports a maximum of 32 counters. The counter configuration for a particular device is detailed in a device-specific appendix to this specification. Application and debug software can determine the number of counters in the SCTM by reading the NUMCNTR field in the SCTM_CTCNTL register.

6.1.6.2.2.3 Counting Mode

Counters function in one of two mutually exclusive counting modes:

- Event mode – The counter increments each time a rising edge is detected on the designated input event signal.
- Duration mode – The counter continually increments when the event input is asserted.

The DURMOD bit in the SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j register controls operating mode of the counter.

6.1.6.2.2.4 Counter Overflow

When the counter reaches the terminal value (FFFF FFFFh) it wraps and continues to increment. This condition is considered a timer overflow condition and the OVRFLW bit in the SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j register indicates that overflow has occurred. The overflow bit can be cleared by reading the SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j register . When chained, only the high-order counter (bits 63:32) can overflow.

6.1.6.2.2.5 Counters and Processor State

The counters can be configured to alter their behavior based on the state of the CPU in the subsystem supported by the SCTM. The FREE bit in the SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j register determines if the counter continues to operate when the processor enters the debug-halt state. When this bit is 0 (the default), the counter stops incrementing while the debug-halt input from the CPU is asserted. Normal operation resumes when the processor exits the debug halt state and the debug-halt input is deasserted. When the FREE bit is 1, the state of the debug-halt input is not used to control counter operation.

The IDLE bit in the SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j register determines if the counter continues to operate when the processor enters the IDLE state (the processor is no longer executing instructions and is waiting for a wakeup event). When this bit is 0 (the default), the counter stops incrementing while the IDLE state input from the CPU is asserted. Normal operation resumes when the processor exits the idle state and the idle state INPUT is deasserted. When the IDLE bit is 1, the state of the idle input does not control counter operation.

Not all subsystems may contain a processor or the subsystem processor may not support debug halt and/or idle modes. In this case, the processor state inputs to the SCTM are tied to the inactive value.

When there are multiple CPUs in a subsystem, the processor state inputs can be sourced from a single processor, or they can be the logical OR of the processor state signals from all CPUs in the subsystem.

6.1.6.2.2.6 Chaining Counters

The individual 32-bit counters in the SCTM can be chained with an adjacent counter to form a 64-bit counter. Counters can be chained to a counter across an even-odd index boundary with the even counter containing the least-significant 32-bits of the 64-bit pairing. For example, when counters 1 and 0 are paired, counter 1 contains bits 63:32 and counter 0 contains bits 31:00. The higher-order counter increments by 1 each time the lower order counter wraps.

Counters are chained by setting the CHAIN bit in the SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j register for both of the counters. When chained, the counter control for both counters is taken from the lower-order SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j register. Other than CHAIN, all the other bits in the higher-order SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j register are ignored.

Chained counters can function in counter mode only. Timer mode is not supported.

6.1.6.2.2.6.1 Reading Chained Counters

Some applications may require atomic reads of the 64 bits of a chained counter pair. An SCTM instance can be configured at synthesis time to provide an atomic read capability for one or more 64-bit counter pairs. When this capability is present, the designated counter pair provides atomic access when the correct read sequence is performed.

So when a chained counter has atomic read capability, an atomic counter value can be obtained by first reading the high-order counter followed by the low-order counter. Always observe this ordering, to prevent reading stale counter values from the low-order counter.

The shadow feature for chained counters is active only when the low-order counter is chained to a high-order counter. When functioning independently, the shadow feature is deactivated and a read of the counter always returns the current value.

To prevent sync errors introduced by the debugger, only application accesses activate the shadow feature. Debug qualified accesses always return the current value of the low-order counter, regardless of configuration.

6.1.6.2.2.7 Enabling and Disabling Counters

After the counter is correctly configured, the counter can be started by setting the ENBL bit in the corresponding SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j register . At this point, the counter begins incrementing under the control of the configured event input. The counter can be disabled (counting stops) at any time by clearing ENBL. Counters can be enabled and disabled dynamically during application flow.

Counters can also be enabled and disabled as groups through the SCTM_CTGNBL0 registers. These registers provide control of the individual counter enables in groups of 32. This allows an application to enable or disable groups of counter in lockstep.

6.1.6.2.2.8 Resetting Counters

The counters can be reset to their initial value (0000 0000h) by setting the RESET bit in the SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j register to 1 . If the counter is chained, both the high-order and low-order counters are reset when the RESET bit is set in the CTCR*n* for the low-order counter.

Counters can also be reset as groups through the SCTM_CTGRSTL0 register. These registers provide control of the individual counter reset in groups of 32. This control letss an application reset groups of counters in lockstep.

6.1.6.2.3 Timer Function

A subset of the counters modules in the SCTM can function as timers. When operating as timers, interrupts and/or debug input events are generated when the counter value reaches a designated interval. The counters with timer capabilities always occupy the lowest indexed counters in the SCTM. A maximum of eight counters can function as timers in SCTM v1. The actual number for a particular implementation of the SCTM is configured at synthesis time. The number of timers in a particular device is detailed in a device-specific appendix to this specification. Application and debug software can determine the total number of counters with timer capabilities reading the NUMTIMR field in the SCTM_CTCNTL register.

6.1.6.2.3.1 Periodic Intervals

The interval for a timer is contained in the SCTM_TINTVLR_i register. There is a SCTM_TINTVLR_i register for every timer capable counter in the SCTM. Timers are initialized to 0. When the corresponding CTCNTRn increments and matches the values designated in SCTM_TINTVLR_i, the timer is considered to be triggered and events configured in SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j are generated.

Timers can function in one of two mutually exclusive modes:

- Run once mode – The timer stops after the first interval match and is not re-enabled until the timer is reset to the initial value (0) by setting the RESET bit in the SCTM_CTCR_WT_j and SCTM_CTCR_WOT_j register to 1.
- Restart mode – The timer automatically resets to the initial value (0) each time the designated interval is reached.

6.1.6.2.3.2 Event Generation

Timers are able to generate both interrupts and debug events. Interrupts are routed from the module boundary to INTC in the subsystem. Debug events are routed as triggers to debug logic within the subsystem. It is assumed that these debug trigger events are merged with other debug resources and used to control debug activity like CPU control or trace.

The generation of the interrupts is controlled by the INT bit in the SCTM_CTCR_WT_j or SCTM_CTCR_WOT_j register. The generation of debug events is controlled by the DBG in the CTCR*n*. Both INT and DBG can be set simultaneously and both signals are generated on interval match.

For debug events, the pulse width is one cycle and the active polarity is high (a high going pulse of one cycle). For interrupts, the polarity and duration of the pulse are synthesizable options that can be tailored to the requirements of the INTC in the subsystem.

If neither the INT nor the DBG bit is set, the timer function is disabled and the counter functions as a regular counter.

The SCTM events include low-level stall and duration signals sourced by various components of the EVE subsystem. The primary categories include program cache-related signals and VCOP-related signals. Table 6-266 summarized the event mapping. Event inputs start numbering at 1, because event0 is reserved and the SCTM internally uses the functional clock as event 0.

The SCTM module operates at the CLK2 rate (nominally 250 to 300 MHz). The event sources include CLK2 and CLK1 (CLK1 = 2 × CLK2) signals. The CLK2 relative signals are connected directly to the SCTM. The CLK1 relative signals are conditioned by EVE level logic to scale from CLK1 to CLK2. Because these are duration type signals, EVE logic asserts a CLK2 pulse for every two CLK1 pulses detected. This results in, at most, one CLK1 cycle of inaccuracy in the CLK2 duration reported by SCTM.

Table 6-266. List of SCTM Events

SCTM Event	Name	Source	Type	SCTM Mode	Clock

6.1.6.2.3.3 Watchdog Timer Function

A normally configured timer supports a software watchdog capability in which software can continually reset the timer by writing to the SCTM_CTCR_j[1] RESET bit or to the corresponding bit in the SCTM_CTGRST0 register before the interval expires (and the interrupt is generated).

The timers also support a hardware watchdog function where selected input events can start and reset the timers without software interaction.

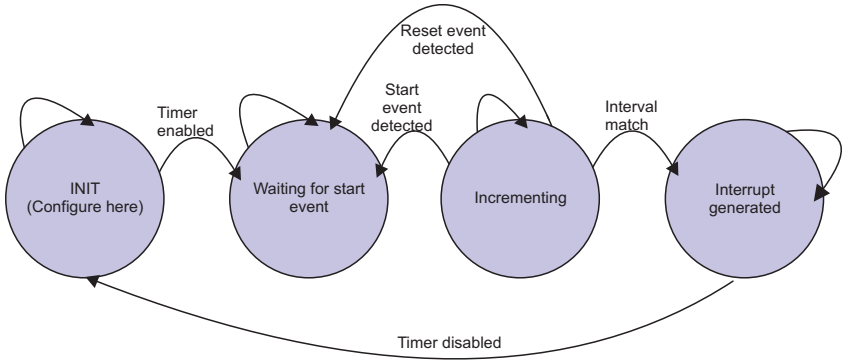
When hardware watchdog mode is enabled, the SCTM_CTCR_WT/WOT_j[23:16] INPSEL bit field selects the event that starts a WD timer. Once the input event is selected, the timer increments using the functional clock. If it reaches the interval match value before being reset, the interrupt is generated.

The WD timer is reset when an input event is detected. This resets the counter to 0. The counter does not restart until another input event is detected. The state-machine shown in Figure 6-19 illustrated the functional operation of the timer when configured for hardware watchdog mode.

Some important notes about WD timer mode operation:

- The INPSEL field selects the WD start event. This is always a rising edge event.
- The DURMODE bit is overridden. Once started, the timer continues to increment using the functional clock.

Figure 6-19. Watchdog Operation



6.1.6.2.4 System Trace Integration

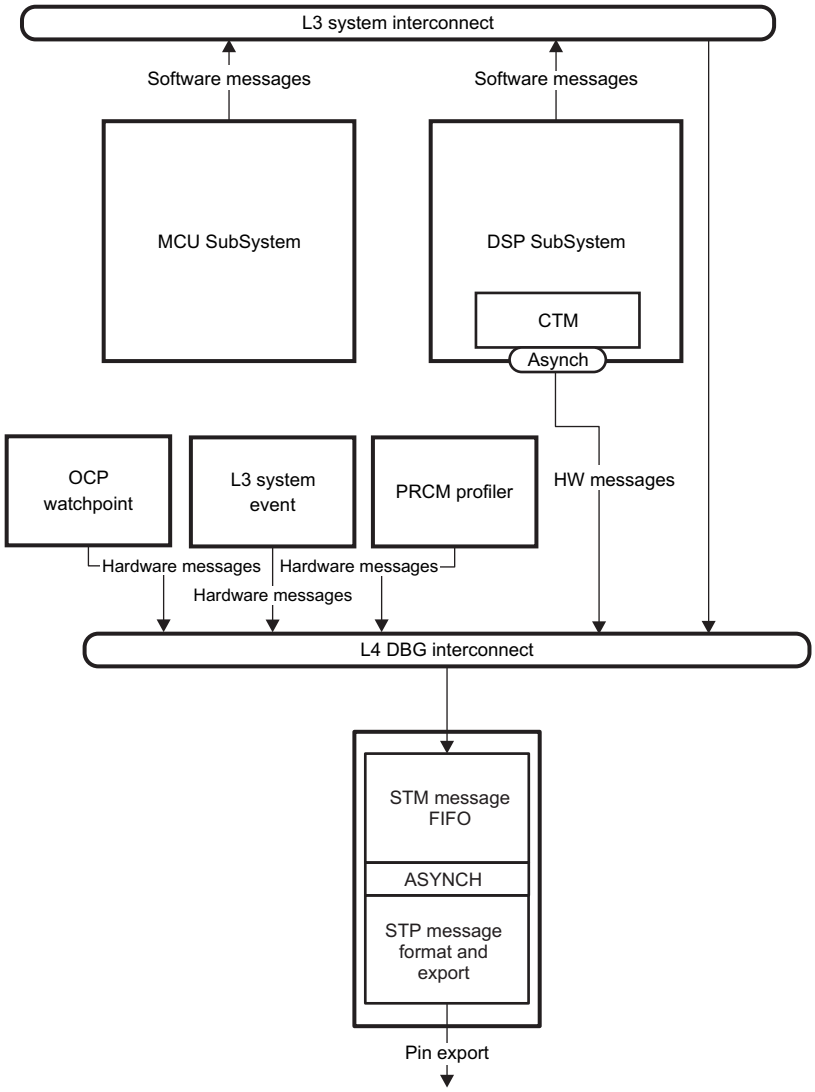
6.1.6.2.4.1 Overview

Many devices have system-level trace capabilities. This capability is generally implemented in a top-level module called the STM. The STM collects software and hardware messages (the trace data) from various other system modules and subsystems through a dedicated STM bus (OCP compliant). The STM then formats these high-level trace messages into streams of MIPI® system trace protocol (STP) compliant messages. The STP messages are then transmitted to a dedicated STP receiver over a narrow (generally four pins), high-speed export interface.

The SCTM has an optional mode that provides an STM OCP interface and a mode where the state of the counters can be transferred through the STM.

Figure 6-20 shows a typical STM system configuration with the SCTM as a hardware master. The hardware master messages from the SCTM STM bus enter the L4 debug interconnect through an asynchronous bridge. Other system-level hardware masters are also writing messages to the STM through this interconnect. Software messages from applications running on the MCU or DSP to reach the STM message buffer through a bridge from L3 interconnect to the L4 interconnect. The STM orders and formats the high-level hardware and software messages into STP protocol messages and exports them to an off-chip trace receiver.

Figure 6-20. Typical STM System Integration



6.1.6.2.4.2 STM Configuration

Because the STM function of the SCTM is an optional feature, the NUMSTM bit in the SCTM_CTCCNTL register is read to determine if any counters are available for STM export:

- If the value in NUMSTM is 0, there is no STM capability in the module.
- If the value is greater than 0 (N ≤ the total counters in the module), then the first N counters can also be designated for STM export.

The STM capability of the SCTM is enabled by setting the ENBL bit in the SCTM_CTSTMCNTL register to 1.

6.1.6.2.4.2.1 Periodic Counter State Export

The general operating mode of the SCTM STM function is to periodically export a message frame that provides a snapshot of the state of each counter designated for inclusion in the STM counter state message. The length of the snapshot interval is controlled by a programmable counter. The interval for this counter is determined by the value in the SCTM_CTSTMINTVL_i register. A periodic counter is reloaded with this value. The counter decrements using the functional clock of the SCTM. When the counter decrements to 0, a snapshot of all the designated counters is taken for STM export and the counter is reloaded using the value in CTSTMINTVL. If the value in CTSTMINTVL is 0, periodic message export is disabled.

Because an entire snapshot of data must be captured when an interval expires, the SCTM must have temporary storage for all the counter values that are designated for export.

6.1.6.2.4.2.2 Application Control of Counter State Export

Application software can also independently trigger the export of a CSM frame bsetting the CSMXPORT bit in the CTSTMCNTL register to 1.

- When the bit is set to 1, a snapshot is captured and a CSM frame is exported.
- Software-triggered export is available only when periodic export is not active; writing 1 when periodic export is active has no effect.
- The SW bit in the CSM header designates that this frame is generated by software.

6.1.6.2.4.2.3 Application Control of the Counter Configuration Export

The STM system also supports an optional counter configuration message (CCM). The capability for generating this message is a synthesizable option. If the module has been synthesized to support CCM, the SCTM_CTSTMCNTL[3] CCMAVAIL bit is asserted.

Export of the CCM message frame is only triggered by setting the CCMXPORT bit in the CTSTMCNTL register to 1.

- When 1 is written, a snapshot is captured and a CCM frame is exported.
- Software-triggered export is available only when periodic export is not active; writing 1 when periodic export is active has no effect.

6.1.6.3 Use Case Examples

This section contains high-level examples of the programming sequences for common SCTM user scenarios. The following examples assume that the counter timer module is already enabled by setting the ENBL bit in the SCTM_CTCNTL register to 1. The examples also assume that the CTCR*n*:ENBL bit is cleared before any configuration writes other than RESET.

6.1.6.3.1 Counter Enable

6.1.6.3.1.1 Enabling a Single Counter

Perform the following procedure to enable a single counter:

1. Reset the counter by setting the SCTM_CTCR_WOT_j[1] RESET bit to 1.
2. Select which signal drives the counter function by writing the correct index to the SCTM_CTCR_WOT_j[23:16]INPSEL bit field
3. Configure the sampling scheme to be used by the counter (edge/level) by writing to the SCTM_CTCR_WOT_j [3]DURMODE bit (if required).
4. Set the behavior for system state by writing to the SCTM_CTCR_WOT_j[5]IDLE and SCTM_CTCR_WOT_j[4] FREE bits (if required).
5. Start the counter function by setting the SCTM_CTCR_WOT_j[0] ENBL bit to 1.

6.1.6.3.1.2 Reading a Single Counter

Perform the following procedure to read a single counter:

1. Read the value of the counter through the CTCNTR_k register.
2. Read the corresponding SCTM_CTCR_WOT_j[6] OVRFLW bit to determine if the counter has wrapped since the last read of the registers.
3. (Optional) The counter can then be reset by setting the SCTM_CTCR_WOT_j[1] RESET bit to 1.

6.1.6.3.1.3 Enabling a Group of Counters Simultaneously

Perform the following procedure to enable a group of counters:

1. For each counter in the group:
   a. Enable access to the SCTM by setting the SCTM_CTCNTL[0] ENBL bit to 1.
   b. Select which signal drives the counter function by writing the correct index to the SCTM_CTCR_WOT_j [23:16] INPSEL bit field.
   c. Configure the sampling scheme to be used by the counter (edge/level) by writing to the SCTM_CTCR_WOT_j [3] DURMODE bit (if required).
   d. Set the behavior for system state by writing to the SCTM_CTCR_WOT_j [5] IDLE and [4]FREE bits (if required).
2. Start all counters in lockstep by writing to the CTGNBL0 register for all counters that are set to 1 in the group.

6.1.6.3.1.4 Reading a Group of Counters Simultaneously

Perform the following procedure to read a group of counters:

1. Read the SCTM_CTGNBL0 register and save.
2. Clear the corresponding enable bit of each counter in the group to 0.
3. Write back the SCTM_CTGNBL0 register content.
4. For each counter in the group:
   a. Read the value of the counter through the SCTM_CTCNTR_k register.
   b. Read the corresponding SCTM_CTCR_WOT_j[6] OVRFLW bit to determine if the counter has wrapped since the last read of the SCTM_CTCR_WOT_j register.
5. (Optional) Resume the group count by writing back the saved value of the SCTM_CTGNBL0 register.

6.1.6.3.1.5 Configuring a Chained Counter

Perform the following procedure to configure a chained counter:

1. Select the counter pair to be used for chaining (N and N + 1).
2. Set the SCTM_CTCR_WOT_j [2]CHAIN bit of counter N + 1 to 1.
3. For the SCTM_CTCR_WOT_j register for counter N in the counter pair:
   a. Select which signal drives the counter function by writing the correct index to the SCTM_CTCR_WOT_j[23:16]INPSEL bit field.
   b. Configure the sampling scheme to be used by the counter (edge/level) by writing to the SCTM_CTCR_WOT_j [3]DURMODE bit (if required).
   c. Set the behavior for system state by writing to the SCTM_CTCR_WOT_j [5]IDLE and SCTM_CTCR_WOT_j [4]FREE bits (if required).
   d. Start the counter function by setting the SCTM_CTCR_WOT_j[0] ENBL bit to 1.

6.1.6.3.2 Timer Enable

This example assumes interrupt generation capabilities. Perform the following procedure to enable the timer:

1. Disable interrupts globally using the CPU INTM mask or some other global interrupt masking in the

target subsystem.

2. Select which signal drives the counter function by writing the correct index to the SCTM_CTCR_WT_j[23:16] INPSEL bit field.
3. Configure the sampling scheme to be used by the counter (edge/level) by writing to the SCTM_CTCR_WT_j[3] DURMODE bit (if required).
4. Set the behavior for system state by writing to the SCTM_CTCR_WT_j [5]IDLE and [4] FREE bits (if required).
5. If the timer function is continuous, set the SCTM_CTCR_j[10] RESTART bit to 1.
6. Set the SCTM_CTCR_WT_j[8] INT bit to 1.
7. Set the interval match value in the corresponding SCTM_TINTVLR_i register.
8. Enable the corresponding interrupt in the subsystem INTC.
9. Enable interrupts globally.
10. Start the counter function by setting the SCTM_CTCR_WT_j[0] ENBL bit to 1.

6.1.6.3.3 Periodic STM Export Enable

Perform the following procedure to enable periodic STM export:

1. Configure, but do not enable, all the counters required for export per Section 6.1.6.3.1, Counter Enable.
2. Enable the STM configuration capability by setting the SCTM_CTSTMCNTL[0] ENBL bit to 1.
3. Disable periodic export by writing 0000 0000h to the SCTM_CTSTMINTVL register.
4. (Optional) Change the hardware master ID by writing the new value to the SCTM_CTSTMMSTID[6:0] MASTID bit.
5. Tag which counters are selected for export by setting the corresponding bits.
6. Set the total number of counters tagged for export through a write to the SCTM_CTSTMCNTL[11:6] NUMXPORT bit.
7. (Optional) To include overflow information in the CSM message, set the SCTM_CTSTMCNTL[1] SENDOVR bit to 1.
8. (Optional) To send a counter configuration message (CCM), set the SCTM_CTSTMCNTL[4] CCMXPORT bit to 1.
   a. This feature is only available if the SCTM_CTSTMCNTL[3]CCMAVAIL bit reads as 1.
   b. Test for completion of the CCM export through the SCTM_CTSTMCNTL[5] XPORTACT bit.
9. Enable periodic export by writing the interval value to the SCTM_CTSTMINTVL register.
10. Enable the counters per Section 6.1.6.3.1, *Counter Enable*.

6.1.6.3.4 Disabling the SCTM

Perform the following procedure to disable the SCTM:

1. When periodic STM export is enabled:
   a. Disable periodic export by writing 0000 0000h to the SCTM_CTSTMINTVL register.
   b. Test for completion of the CCM export through the SCTM_CTSTMCNTL[5] XPORTACT bit.
   c. Disable the STM function by writing 0 to the SCTM_CTSTMCNTL[0]ENBL bit.
2. Disable all counters by setting the SCTM_CTGNBL0 register to 0000 0000h.
3. Disable the SCTM by setting the SCTM_CTCNTL[0] ENBL bit to 0.

6.1.7 Software Message and System Event Trace

6.1.7.1 Introduction

6.1.7.1.1 Overview

The SMSET is a trace module used for monitoring key system events and transferring software messages. SMSET is performing arbitration between hardware messages and software messages written to the trace receiver through STM by the host processor. SMSET module provides various debug features such as: monitor system events, enable/disable event detection, Start/Stop event monitoring upon external trigger, time sampling, generating hardware message upon system event or every sampling window boundary and interleaving of hardware and software messages.

6.1.7.1.2 Configuration

Table 6-295 lists the configuration of the SMSET in the EVE subsystem.

Table 6-295. SMSET Configuration

Generic	SMSET Feature	Number on Device
NB_EVENTS	Number of system events	9
SW_MESSAGE	Software messages support	1
TRIG_MIN_WIDTH	Minimum trigger input pulse (L4 cycles)	2
EVENTS_BUF_DEPTH	System events buffer depth	4
SW_BUF_DEPTH	Software message buffer depth	2

6.1.7.1.3 Block Diagram

The block diagram shown in Figure 6-21 is a generic example to show the main concept of SMSET. Software messages are initiated by processors. Basically, a processor is writing a message to the trace receiver through STM. SMSET is performing arbitration between hardware messages and software messages.

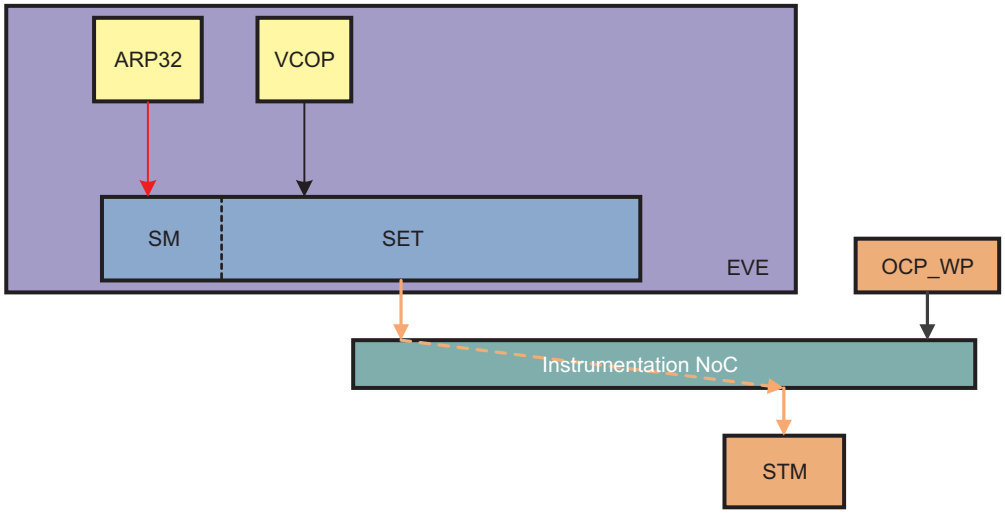
Software messages and system event messages can be interleaved. Software messages do not require a sequence of write accesses; therefore, the SMSET is can switch to the system event detection as soon as the event is detected.

In case of conflicting accesses between software message and detection of system events, the SMSET can switch to the system event detection as soon as the event is detected. Software messages are never lost. Therefore, an SMSET buffer allows absorbing instrumentation accesses peaks, which prevents stalling the processor originating the message.

In case of a platform implementing several SMSET instances, the priority is arbitrated by the instrumentation NoC at SoC level.

It is possible to program the sampling window size to exchange STM bandwidth for time-stamping accuracy. All the events detected within the sampling window are considered close enough and packed in the same message as concurrent events and therefore reported in the trace log with the same time stamp. In case a selected event has been captured but not yet written to the STM queue, the system event trace module shall not wait for the sampling window boundary to write the pending packet to the STM. This results in two separate messages reporting the first and second pulse of the selected event. System events are considered synchronous to the SMSET functional clock. The sampling window size granularity is one SMSET cycle. The size ranges from 1 to 256 cycles.

Figure 6-21. SMSET Block Diagram



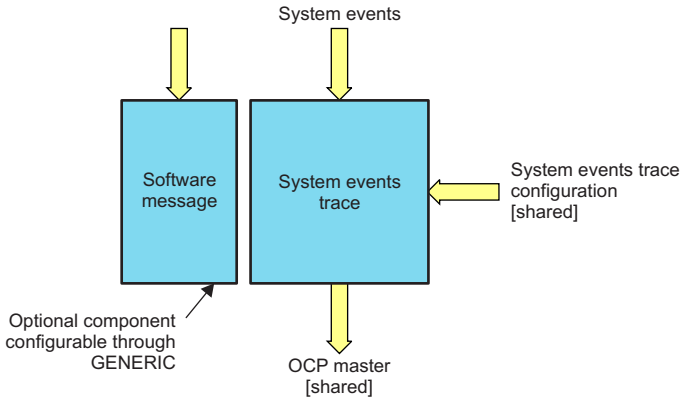
6.1.7.2 Functional Description

6.1.7.2.1 Connectivity

The SMSET component is interfaced to the following:

- Configuration OCP slave port to configure the SMSET parameters
- System events [x N] for monitoring
- Processors supporting software messages (through OCP interface)
- Instrumentation OCP master port to write hardware and software messages into the STM queue

Figure 6-22. SMSET Interfaces



6.1.7.2.2 SMSET Event Mapping

The SMSET events include higher-level start and end task events. Table 6-296 summarize the event mapping.

The SMSET module operates at the CLK2 rate.

SMSET traces events on either a high-to-low transition or low-to-high transition, but not both. Thus, the EDMA tpcc_aet signal is not directly compatible with SMSET tracing. The tpcc_aet is an active high signal that can be used to measure the duration of a specific edma transfer. The tpcc_aet signal can be programmed (in EDMA CC MMRs) to go high when a specific trigger is detected, and go low when a specific completion code is received. EVE logic will implement a custom tpcc_aet_start and tpcc_aet_end signals. The tpcc_aet_start signal will pulse high (for one cycle) when tpcc_aet transitions to high, and tpcc_aet_end signal will pulse high (for one cycle) when tpcc_aet_end signal when tpcc_aet transitions to low.

Table 6-296 details the various profiling signals.

The “pulse” signals are expected to be driven active one cycle for each occurrence. A sequence of consecutive active cycles represent multiple occurrences. "Duration" mode of the SMSET makes sense for this type of signal where the duration implies the number of occupancies in a particular state (for example the number of cache hits)

The “duration” type represents a signal that may stay active for multiple cycles on a given occurrence. These are typically stall signals where the user is attempting to determine the total number of cycles in the “stalled” state. “Duration” mode will indicate the total time stalled. “Event” mode will indicate the number of unique occurrences of stalls. “Event” is useful in this case since there will always be a deassertion between occurrences.

“Edge” type goes active for undefined period of time but is guaranteed to go inactive before the next occurrence. “Event” mode of the SCTM should be used for these signals.

Table 6-296. List of SMSET Events

SMSET Event	Name	Source	Type	SMSET Mode	Clock
0	tpcc_aet_start	EDMA	Pulse	Duration	CLK2
1	tpcc_aet_stop	EDMA	Pulse	Duration	CLK2
2	arp32_int4	INTC	Duration	Duration or event	CLK2
3	arp32_int5	INTC	Duration	Duration or event	CLK2
4	arp32_int6	INTC	Duration	Duration or event	CLK2
5	arp32_int7	INTC	Duration	Duration or event	CLK2
6	vcop_loop_start	VCOP	Edge	Event	CLK2
7	vcop_done	VCOP	Edge	Event	CLK2
8	arp32_nmi	INTC	Duration	Duration or event	CLK2
9	arp32_int8	INTC	Duration	Duration or event	CLK2
10	arp32_int9	INTC	Duration	Duration or event	CLK2
11	arp32_int10	INTC	Duration	Duration or event	CLK2
12	arp32_int11	INTC	Duration	Duration or event	CLK2
13	arp32_int12	INTC	Duration	Duration or event	CLK2
14	arp32_int13	INTC	Duration	Duration or event	CLK2
15	arp32_int14	INTC	Duration	Duration or event	CLK2
16	arp32_int15	INTC	Duration	Duration or event	CLK2

6.1.7.2.3 Software Messages

A GENERIC shall specify if software messages generated to STM through SMSET is supported. Software messages are initiated by processors. Basically a processor is writing a message to the trace receiver through STM. SMSET is just performing arbitration between hardware messages and software messages. Most of the subsystems cannot afford to have two OCP master ports for debug purpose. Interleaving is done in SMSET module.

6.1.7.2.4 SMSET Master Port

The SMSET master port is connected to an instrumentation OCP master port to export hardware and software messages through the STM module. The write accesses to STM are arbitrated at the instrumentation OCP interconnect level.

The SMSET master port supports burst transactions to reduce trace export surplus on the PTI interface; this surplus is due to instrumentation flows interleaving at instrumentation NoC level.

6.1.7.2.4.1 OCP Disconnect

The SMSET is supporting disconnect protocol on its master OCP interface, to make sure that software message transactions always complete. If software messages are initiated, while the instrumentation interconnect is disconnected, the access completes with a DVA response, and written data are lost.

6.1.7.2.5 SMSET Debug Features

The SMSET component provides the following system debug capabilities:

- Monitor events.
- Enable and disable event detection.
- Start event monitoring upon external trigger.
- Stop event monitoring upon external trigger.
- Time stamping.
- Generate hardware message upon system event.
- Generate hardware message every sampling window boundary.
- Interleave hardware messages and software messages.
- Program SMSET from debugger.
- Program SMSET from application.

6.1.7.2.6 Component Ownership

Some of the SMSET resources are owned either by the application or by the debugger. The ownership is required to configure or program SMSET. In other words, ownership determines if write access is granted to the SMSET control registers. The SMSET resource ownership is exclusive. Hence, simultaneous use of SMSET resources by both the debugger and the application is not permitted. However, the debugger can forcibly seize ownership of SMSET resources.

NOTE: A read access does not require ownership; therefore, either the debugger or the application can read any SMSET registers with or without ownership.

6.1.7.2.6.1 Ownership State

The ownership has three basic states:

- AVAILABLE: The unit has not been claimed.
- CLAIMED: The unit has been claimed.
- ENABLED: The unit is enabled by the owning party.

6.1.7.2.6.1.1 Available State

An SMSET is set to the AVAILABLE state when one of two conditions occurs:

- The state is available when power-on reset (POR) is asserted.
- The state is available if the SMSET is owned by the debugger and the emulator is disconnected.

NOTE: A warm reset has no effect on the operation of SMSET. An emulator disconnect has no effect when the application owns the unit.

6.1.7.2.6.1.2 Claimed State

An SMSET is in the CLAIMED state when either the debugger or the application has claimed it. The CLAIMED state provides exclusive access to the owner. The other party is not permitted write access to the unit until the owning party releases the claim. Once a unit is claimed, only the owner can write to the other resources controlled by the claim.

The debugger, however, is allowed to forcibly seize control of a unit, if it is already claimed by the application, by setting the DEBUGGEROVERRIDE bit to 1 in the SMSET configuration register (CFG).

6.1.7.2.6.1.3 Enabled State

An SMSET enters the ENABLED state when it is activated. The owner can continue writing to the other resources while SMSET is enabled.

6.1.7.2.6.2 Ownership Commands

Ownership of the SMSET resources is managed through the OWNERSHIP bit in the SMSET configuration register (CFG). Table 6-297 lists the ownership commands.

Table 6-297. Ownership Commands

OWNERSHIP Bits	Meaning	Description
00	Release ownership	Release ownership of system events trace. The Release command is accepted only from the owner.
01	Claim ownership	Claim access to system events trace. The claim command is successful only if the unit is available, or the requester is the debugger and the DEBUGGEROVERRIDE bit is high.
10	Enable unit	Activate system events trace for use. The enable command is accepted only from the owner.
11	No Operation	The NOP command does not affect ownership or claim state.

6.1.7.2.6.3 Claim Reset

When a resource is owned by the debugger, the resource is released if the debugger is disconnected. Debugger disconnection is accomplished by asserting PIDCON = 0.

If a resource is owned by the application and the processor enters the debug state, the resource continues to belong to the application. The SMSET is not sensitive to debug state.

If SMSET ownership is released while there are still data in the SMSET FIFO, the master port continues to export data to the STM until the FIFO is drained.

6.1.7.3 Use Case Examples

6.1.7.3.1 Procedure to Enable System Event Capture

Perform the following procedure to enable system event capture:

1. Claim the ownership by setting the OWNERSHIP bit in the SMSET configuration register (SMSET_CFG) to 01b.
2. Check the ownership and the current owner by reading the OWNERSHIP bit in the SMSET configuration register (SMSET_CFG).
3. Set the appropriate sampling window size value in the system event sampling window register (SMSET_SESW).
4. Enable the events needed to be detected by setting the appropriate bits in the programming of the

system event detection enable registers (SMSET_SEDEN_i) to 1.

5. Select the polarity of the event detection by writing the appropriate value to the EventPolarity bit in the SMSET configuration register (SMSET_CFG).
6. Select the message event generation by writing the appropriate value to the MessageEventGeneration bit in the SMSET configuration register (SMSET_CFG).
7. Enable system event capture by setting the SystemEventCapture bit in the SMSET configuration register (SMSET_CFG) to 1.

6.1.7.3.2 Procedure to Start and Stop System Event Capture from External Trigger Detection

Perform the following procedure to start and stop system event capture from external trigger detection:

1. Claim the ownership by setting the OWNERSHIP bit in the SMSET configuration register (SMSET_CFG) to 1.
2. Check the ownership and the current owner by reading the OWNERSHIP bit in the SMSET configuration register (SMSET_CFG).
3. Set the appropriate sampling window size value in the system event sampling window register (SMSET_SESW).
4. Enable the events to be detected by setting the appropriate bits in the programming of the system event detection enable registers (SMSET_SEDEN_i) to 1.
5. Select the polarity of the event detection by writing the appropriate value to the EventPolarity bit in the SMSET configuration register (SMSET_CFG).
6. Select the message event generation by writing the appropriate value to the MessageEventGeneration bit in the SMSET configuration register (SMSET_CFG).
7. Enable capturing system events from external trigger detection by setting the StopCapturingSystemEvents bit in the SMSET configuration register to 1.
8. Enable capturing system events from external trigger detection by setting the StartCapturingSystemEvents bit in the SMSET configuration register to 1.
9. Enable system event capture by writing a 1 to the SystemEventCapture bit in the SMSET configuration register.

6.1.7.3.3 Procedure to Disable System Event Capture

Perform the following procedure to disable system event capture:

1. Disable system event capture by setting the SystemEventCapture bit in the SMSET configuration register (SMSET_CFG) to 0.
2. Release the ownership by setting the OWNERSHIP bit in the SMSET configuration register (SMSET_CFG) to 0.
3. Check the ownership by reading the OWNERSHIP bit in the SMSET configuration register (SMSET_CFG). It must be available (OWNERSHIP = 0).

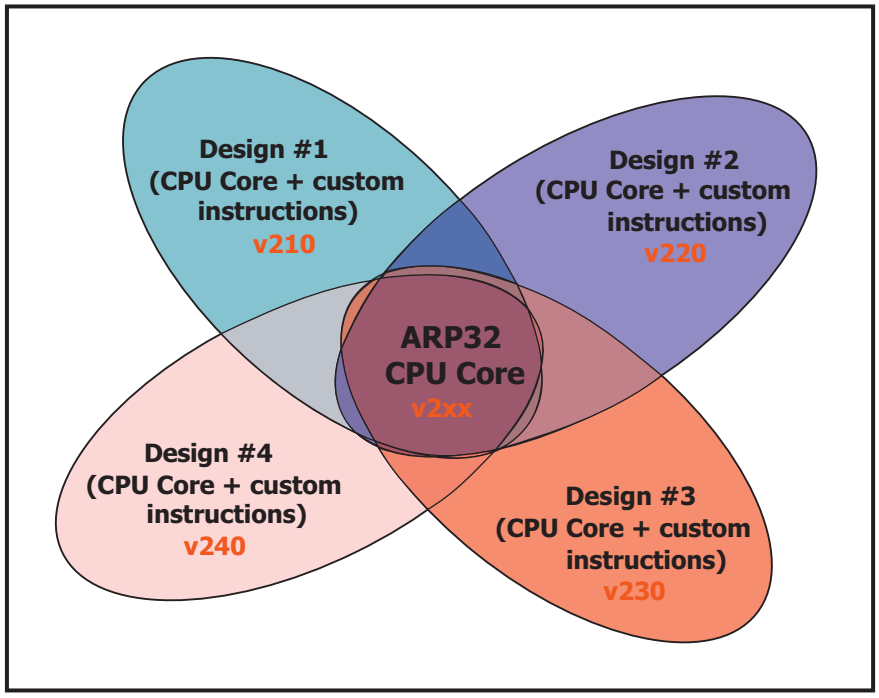
6.2 ARP32 CPU and Instruction Set

6.2.1 Overview

ARP32 refers to a family of customizable, embedded processors targeted for deeply embedded control applications that require high-performance at very-low system cost (die size) and dynamic power-consumption. Example of applications that can benefit using the ARP32 includes embedded video processing engine, computer vision, and video analytics processing engine.

Figure 6-23 illustrates the overlapping nature of the ARP32 CPU and feature set in different application contexts.

Figure 6-23. ARP32 Versions and ISA/Feature Space



6.2.2 Features

The main features of the ARP32 processor include:

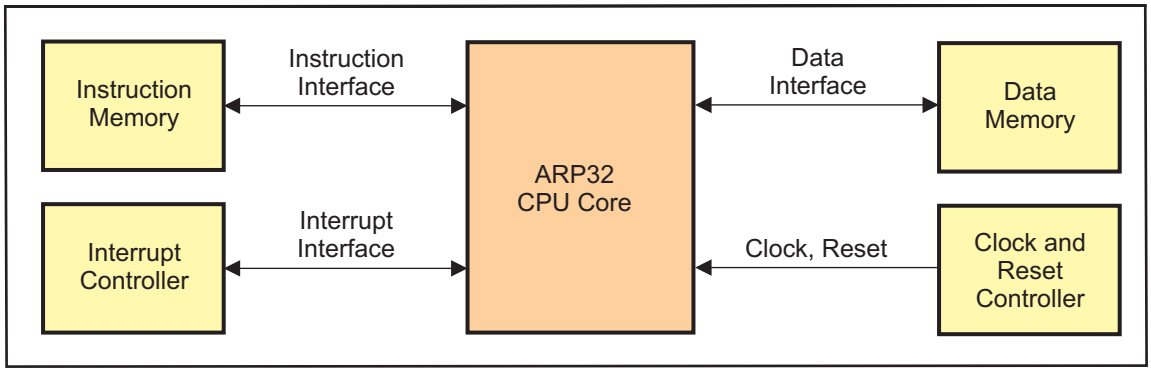
- Single issue RISC processor with Harvard memory architecture
- Highly efficient integer pipeline delivering high performance at low area and power cost
- Provides customization of instruction set to provide acceleration of a target application
- Supported by fully optimizing C/C++ compiler including intrinsic-driven usage of special custom instructions

It is recommended that ARP32 CPU users only use C/C++ language with the supported TI compiler and tools; assembly level programming is highly discouraged and may break future compatibility with the ARP32 processor family or its variants.

6.2.3 Block Diagram

Figure 6-24 shows the ARP32 core interfaces.

Figure 6-24. ARP32 CPU Block Diagram



6.2.4 Architecture

6.2.4.1 Interface Description

Table 6-312 provides the basic description of the interface signals of the core. The data and instruction memory interface implements a simple request-ready based handshake sufficient to directly interface TIs compiled SRAM memories.

There is no architectural clock-gating implemented within the ARP32 core. The clock control logic is implemented outside the ARP32 core assisted by signals driven by the CPU core via the **IDLE** instruction.

Table 6-312. Interface Signals

Signal	Direction	Width	Description
		Clock, Reset	
cpu_fclk	In	1	Functional clock input
cpu_porz_i	In	1	Power On reset (active low)
cpu_resetz_i	In	1	Functional reset (active low)
cpu_standby_o	Out	1	CPU standby status (active high

Table 6-312. Interface Signals (continued)

Signal	Direction	Width	Description
Data Interface			
cpu_dmem_enz_o	Out	1	Data memory request, active low
cpu_dmem_dbg_o	Out	1	Debug access qualifier for Data memory request
cpu_dmem_wrz_o	Out	1	Data memory write enable, active low (0: write, 1:read)
cpu_dmem_bez[3:0]	Out	4	Data memory byte enables, active low
cpu_dmem_addr_o[31:2]	Out	30	Data memory address (carries a word address)
cpu_dmem_wdata_o[31:0]	Out	32	Data memory write data
cpu_dmem_rdata_i[31:0]	In	32	Data memory read data
cpu_dmem_rdy_i	In	1	Data memory ready, active high
cpu_dmem_err_i	In	1	Data memory access error, active high, valid along with cpu_dmem_rdy_i
Instruction Interface			
cpu_imem_enz_o	Out	1	Instruction memory request, active low
cpu_imem_dbg_o	Out	1	Debug access qualifier for Instruction memory request
cpu_imem_addr_o[31:2]	Out	30	Instruction memory address (carries a word address)
cpu_imem_rdata_i[31:0]	In	32	Instruction memory read data
cpu_imem_rdy_i	In	1	Instruction memory ready, active high
cpu_imem_err_i	In	1	Instruction memory access error, active high, valid along with cpu_imem_rdy_i
Interrupt Interface			
cpu_nmi_i	In	1	Non-maskable interrupt, active high
cpu_int4_i	In	1	Maskable interrupt 4, active high
cpu_int5_i	In	1	Maskable interrupt 5, active high
cpu_int6_i	In	1	Maskable interrupt 6, active high
cpu_int7_i	In	1	Maskable interrupt 7, active high
cpu_int8_i	In	1	Maskable interrupt 8, active high
cpu_int9_i	In	1	Maskable interrupt 9, active high
cpu_int10_i	In	1	Maskable interrupt 10, active high
cpu_int11_i	In	1	Maskable interrupt 11, active high
cpu_int12_i	In	1	Maskable interrupt 12, active high
cpu_int13_i	In	1	Maskable interrupt 13, active high
cpu_int14_i	In	1	Maskable interrupt 14, active high
cpu_int15_i	In	1	Maskable interrupt 15, active high
cpu_iack_o	Out	1	Interrupt acknowledge, active high
cpu_inum_o	Out	4	Identifier of acknowledged interrupt

6.2.4.1.1 Data Memory Interface

- The address sent out to data memory is always a word address. Access sizes smaller than word size are supported via byte enables.
- The CPU core asserts the memory request signal (active low, cpu_dmem_enz_o) along with corresponding address (cpu_dmem_addr_o) and read/write qualifier (active low, cpu_dmem_wrz_o) until a ready (active high, cpu_dmem_rdy_i) is received from the memory sub-system.
- For a zero-wait state access, the ready is expected next cycle to the request. Ready must be de-asserted to extend the access cycle for a higher wait state memory subsystem.
- For read accesses, the CPU samples the read data bus (cpu_dmem_rdata_i[31:0]) when ready is asserted. For write accesses, ready indicates write completion whereas read data bus is a don't care.
- For writes accesses, appropriate byte enables (active low, cpu_dmem_bez[3:0]) are asserted in request phase. This is the only way for the memory sub-system to identify access size of a write access. Byte steering is done by the core, hence the memory sub-system can use the ANY lanes of write data bus for easy selections/multiplexing of write data - for byte writes, the write data is duplicated on all four byte lanes of write data bus whereas for halfword writes, the write data is duplicated on both the halfword lanes of write data bus.
- For read accesses, access size is always 32b - the memory sub-system always returns 32b at the requested word address. CPU core selects the appropriate bytes based on access size and access address.

6.2.4.1.2 Instruction Memory Interface

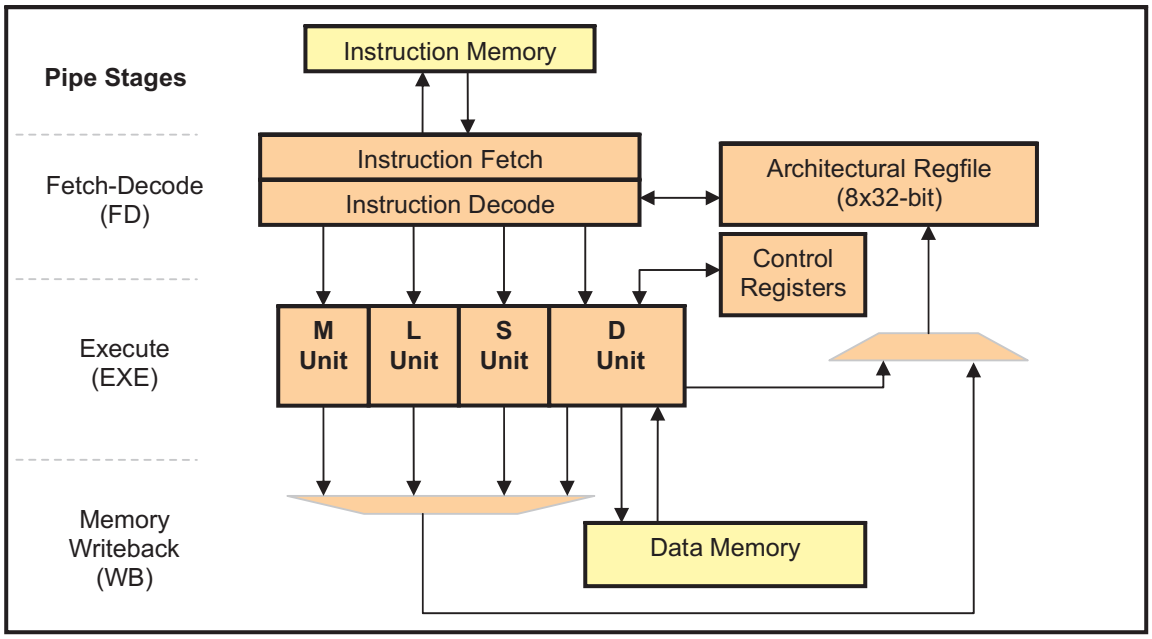
- The address sent out to the instruction memory is always a word address, access size is always a word (32 bits) and writes are not supported. Hence, byte enables and read/write qualifiers are not present for the instruction memory interface.
- The CPU core asserts the memory request signal (active low, cpu_imem_enz_o) along with the corresponding address (cpu_imem_addr_o) until a ready (active high, cpu_imem_rdy_i) is received from the memory subsystem.
- For a zero-wait state access, the ready is expected the next cycle to the request. Ready must be de-asserted to extend the access cycle for a higher wait state memory subsystem.
- The CPU samples the read data bus (cpu_imem_rdata_i[31:0]) when ready is asserted.

6.2.4.2 Pipeline

6.2.4.2.1 Overview

The ARP32 CPU implements a three-deep pipeline (see Figure 6-25): merged fetch-decode (FD), Execute (EXE), and Writeback (WB). The fetch-decode and writeback stages are overlapped.

Figure 6-25. ARP32 CPU Pipeline



6.2.4.2.2 Pipeline Operation

The first stage (FetchDecode/FD) of the pipe operates directly on the instruction memory read data input. This stage consists of the following:

- Instructions are decoded to determine
  - size of the instruction (32 bit/16 bit)
  - source operand, destination operand (in architectural and control register file)
  - if it is a blocking multi-execute cycle instruction
- Source operands are read from architectural register file

In the second stage (Execute/EXE) of the pipe:

- All arithmetic/data processing instructions are executed.
- For a single execute cycle instruction, the results are available at the end of this stage and are written back to architectural register file and control register file (if required).
- Instructions requiring data memory access (load, store, call, return etc) compute the access address in this cycle and place the memory access request on data memory bus (along with all other qualifiers). For write accesses, write data is also provided in this stage.

In the last stage (MemoryWriteback/WB) of the pipe:

- All instructions having data memory access request issued in EXE stage waits for the read data (for read accesses) or write completion notification (for write accesses) via the data memory 'ready' signal.
- If memory subsystem asserts the ready signal, the read data is updated to architectural register file

NOTE: The Writeback stage is really outside the processor core and is used for load/store instructions only. All other instructions complete at EXE stage updating the result. Hence, in some sense the pipe depth of the ARP32 processor is really 2 (Fetch-Decode, Execute).

Consider the following example code sequence in Example 6-1. Table 6-313 shows how the instructions flows through the pipe, highlighting the fact that only load/store instructions use the WB stage (others complete/retire at EXE).

Example 6-1. ARP32 CPU Pipeline Operation

```
MVK   0x100, R0         ; (I1) Move 0x100 into R0
MVKH  0x02000000, R0    ; (I2) Move 0x0200 into R0[31:16]
ADD   100, R0, R0       ; (I3) Add 100 to R0
LDW   *+R2(0), R3       ; (I4) Load a word to R3
ADD   4, R2, R2         ; (I5) Increment R2 to next word address
STW   R3, *+R4(0)       ; (I6) Store R3 to address pointed by R4
ADD   4, R4, R4         ; (I7) Increment R4 to next word address
```

Table 6-313. ARP32 CPU Pipeline Operation

Cycle	1	2	3	4	5	6	7	8	9
FD	MVK (I1)	MVKH (I2)	ADD (I3)	LDW (I4)	ADD (I5)	STW (I6)	ADD (I7)		
EXE		MVK (I1)	MVKH (I2)	ADD (I3)	LDW (I4)	ADD (I5)	STW (I6)	ADD (I7)	
WB						LDW (I4)		STW (I6)	

6.2.4.2.3 Pipeline Interlocks

The pipeline is fully interlocked – the CPU stalls in case of source operand registers have pending loads. Data bypassing for read-after-write dependency is implemented at the end of EXE and WB stages to increase instructions-per-cycle (IPC).

The load data has a single-cycle load use penalty since the load data is written back to register file at WB stage. In the following example, the ADD instruction stalls for a cycle to allow load to complete:

```
LDW   *+R0(0), R0       ; Load a word into R0
ADD   4, R0, R0         ; Increment R0 to the next word address
MVK   100, R1           ; Move a value 100 into R1
```

Since the CPU allows a nondependent instruction to continue executing, this stall is avoided, if the MVK (no dependency on the load data) instruction is placed in the load delay slot – the CPU executes all three instructions without a stall.

```
LDW   *+R0(0), R0       ; Load a word into R0
MVK   100, R1           ; Move a value 100 into R1
ADD   4, R0, R0         ; Increment R0 to the next word address
```

6.2.4.3 Data Format

The ARP32 CPU is an integer machine supporting three different data width/formats: byte, halfword, and word. A byte is 8 bits, a halfword is 16 bits, and a word is 32 bits – they directly map to native C data types: char, short, and int, respectively.

Each type is aligned with the corresponding size, that is, byte aligned to byte boundary, halfword aligned to 2-byte boundary, word aligned to 4-byte boundary. It is the compiler/toolchain and the programmers responsibility to maintain the access alignment all the time (for global and/or local variables).

The ARP32 core does not support unaligned access. If an unaligned access is attempted by software (via an appropriate instruction), the CPU ignores the lower 2 bits of the data memory (byte) address, thus forcing an alignment to the (truncated, floored) word address.

6.2.4.4 Endian Support

The ARP32 CPU supports only little-endian byte ordering in the memory subsystem (see Figure 6-26). A word loaded from the memory is loaded into a CPU register as follows:

- a byte or half word at address A is the least significant byte or half word within the word at that address
- a byte at address A is the least significant byte within the half word at that address

Figure 6-26. ARP32 CPU Little Endianness

	31 24	23 16	15 8	7 0
Word at address A	Byte [Addr + 3]	Byte [Addr + 2]	Byte [Addr + 1]	Byte [Addr + 0]
Halfword at address A			Byte [Addr + 1]	Byte [Addr + 0]

6.2.4.5 Architectural Register File

The ARP32 CPU contains an 8-entry, 32-bit architectural register file named R0-R7.

The architectural registers are read (for source operands) at the end of Fetch-decode (2 dedicated read ports available at fetch-decode for this) and written back at the end of execute stage (1 dedicated write port available at EXE for this). Additionally, for load instructions, the memory read data is written back to architectural register file at the end of writeback stage (1 dedicated write port available at WB for this) and for store instructions, the architectural register file is read (for write data) at the execute stage (via a dedicated read port available in EXE phase).

The register file contains logic to detect matching of write address in the execute stage and two read addresses in the decode stage for bypassing of result data to read data buses. The read data is flopped in the register file and routed to the execution unit in the execute stage.

6.2.4.6 CPU Control Registers

The control register file (CREG) contains registers that control or report status for the ARP32 CPU. Table 6-314 lists the control registers contained in the control register file.

Control registers are accessed via **MVC**, **MVCH** instructions – this is the only mechanism for moving the contents of registers between the architectural register file and the control register file. Control registers are addressable via 5 bits in the *creg* field of the **MVC/MVCH** instructions. All control registers are defined as 32 bits – **MVC** + **MVCH** pair should be used to move immediate values to any control registers.

The following instructions are available in the **MVC/MVCH** family:

- **MVC** *ucst16, creg*
- **MVC** *areg, creg*
- **MVC** *creg, areg*
- **MVCH** *ucst16, creg*

Table 6-314. Control Registers

Acronym	Register Name	Section
CSR	Control Status Register	Section 6.2.4.6.1

TSCH	Time-Stamp Counter (high 32 bits) Register	Section 6.2.4.6.22
TSCL	Time-Stamp Counter (low 32 bits) Register	Section 6.2.4.6.22

Direct modification of the CREG entries is limited to a few special case instructions. For example, some forms of the **ADD** and **SUB** instructions directly modify the stack pointer (SP) to improve code execution performance.

A read of a control register (by **MVC** *creg, areg*) can be immediately followed by any other instruction using the same *areg* without causing a stall – the read data is forwarded to the next instruction in the pipeline. The following example illustrates the behavior:

```
// Read from IRP and push it stack
MVC   IRP, R0          ; Read IRP and place it is R0
STRF  R0, R0           ; No stall, content of IRP is pushed to stack
```

A write to a control register is also bypassed to another instruction immediately following it and using the same *creg*. The following example illustrates the behavior:

```
// Update SP before a register push
MVC   5000, SP         ; Update SP to 5000
STRF  R0, R0           ; No stall, R0 is pushed @5000
```

However, a write to a control register (by **MVC** *areg, creg*) has one exposed effective delay slot for an immediately following read from the same control register (by **MVC** *creg, areg*). The following examples illustrate the behavior:

```
// Write to LCNT0 and read it back
MVC   2000, LCNT0      ; Update LCNT0 again
NOP                    ; without this NOP the next MVC will read UNPREDICTABLE value
MVC   LCNT0, R0        ; R0=2000
```

6.2.4.6.1 Control Status Register (CSR)

The control status register (CSR) contains control and status bits. The CSR is shown in Figure 6-27 and described in Table 6-315.

The condition code bits GT, LT, and EQ are not required to be one-hot. They may be set in any combinations using the **MVC** instruction or by combinations of **CMP** and instructions that update the EQ bit. However, execution of compare instructions enforces a one-hot condition for GT/LT/EQ.

Having more than one bit set does not affect conditional branch execution, as each branch compares only the respective condition bits, that is, the **BGE** instruction uses the CSR[4] and CSR[2] bits to determine if the branch is taken. The remaining condition bits have no effect on the **BGE** instruction.

Figure 6-27. Control Status Register (CSR)

Table 6-315. Control Status Register (CSR) Field Descriptions

Bit	Field	Value	Description
31-14	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
13	DBZ	0-1	Divide-By-Zero. Status indicating if a Divide-By-Zero condition occurred since last time it was cleared. Once set, software MUST clear this bit. It is set only if the DBZE bit is set.
12	DBZE	0-1	Divide-By-Zero exception enable. When set to 1, CPU takes an UNDEF interrupt when a divide-by-zero condition is detected by **DIV, DIVU, MOD,** or **MODU** instructions. By default this bit is disabled.
11-8	INUM		Interrupt Number. Indicates the interrupt ID of the last taken interrupt.
		0	Reset
		1h	NMI
		2h	SWI
		3h	UNDEF
		4h	INT4
		5h	INT5
		6h	INT6
		7h	INT7
		8h	INT8
		9h	INT9
		Ah	INT10
		Bh	INT11
		Ch	INT12
		Dh	INT13
		Eh	INT14
		Fh	INT15
7	V	0-1	Overflow bit. Arithmetic operations that results in overflow or borrow set this bit. See individual instruction descriptions for instructions that modify the V bit.
6	SAT	0-1	Saturation bit. Arithmetic operations whose results have been saturated set this bit. See individual instruction descriptions for instructions that modify the SAT bit.
5	C	0-1	Carry bit. Arithmetic operations that results in carry out or borrow set this bit. See individual instruction descriptions for instructions that modify the C bit.

Table 6-315. Control Status Register (CSR) Field Descriptions (continued)

Bit	Field	Value	Description
4	GT	0-1	Greater-than bit. This bit is set or cleared based on the result of a **CMP** instruction. (GT = 1 if Rx > Ry; else GT = 0). See individual instruction descriptions for instructions that modify the GT bit.
3	LT	0-1	Less-than bit. This bit is set or cleared based on the result of a **CMP** instruction. (LT = 1 if Rx < Ry; else LT = 0). See individual instruction descriptions for instructions that modify the LT bit.
2	EQ	0-1	Equal bit. This bit is set to 1 if the result of an instruction execution results in a zero result or the result of a **CMP** instruction returns equality (EQ = 1 if Rx == Ry; else EQ = 0). See individual instruction descriptions for instructions that modify the EQ bit.
1	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	GIE		Global interrupt enable.
		0	Disables all interrupts, except the reset interrupt and NMI (nonmaskable interrupt).
		1	Enables all interrupts.

6.2.4.6.2 Interrupt Enable Register (IER)

The interrupt enable register (IER) enables and disables individual interrupts. The IER is shown in Figure 6-28 and described in Table 6-316.

Figure 6-28. Interrupt Enable Register (IER)

31															16

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R-0		R/W-0	R-1

LEGEND: R = Readable by the **MVC** instruction; W = Writeable by the **MVC** instruction; -*n* = value after reset

Table 6-316. Interrupt Enable Register (IER) Field Descriptions

Bit	Field	Value	Description
31-16	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
15-4	IE*n*		Interrupt enable. An interrupt triggers interrupt processing only if the corresponding bit is set to 1.
		0	Interrupt is disabled.
		1	Interrupt is enabled.
3-2	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
1	NMIE		Nonmaskable interrupt enable. An interrupt triggers interrupt processing only if the bit is set to 1.
			The NMIE bit is cleared at reset. After reset, software must set the NMIE bit to enable the NMI and to allow INT15-INT4 to be enabled by the GIE bit in CSR and the corresponding IER bit. The NMIE bit cannot be cleared manually; a write of 0 has no effect. The NMIE bit is also cleared by the occurrence of an NMI.
		0	All nonreset interrupts are disabled.
		1	All nonreset interrupts are enabled.
0	Reserved	1	Reserved. The reserved bit location is always read as 1. A value written to this field has no effect.

6.2.4.6.3 Interrupt Flag Register (IFR)

The interrupt flag register (IFR) contains the status of the maskable interrupts (INT15-INT4) and the NMI interrupt. Each corresponding bit in the IFR is set to 1 when that interrupt occurs; otherwise, the bits are cleared to 0. The IFR is shown in Figure 6-29 and described in Table 6-317.

The update to IFR via a write to the interrupt set register (ISR)/interrupt clear register (ICR) has one effective delay slot; IFR cannot be set/cleared using one **MVC** instruction (a write to ISR/ICR) and read the corresponding changed value of IFR via a very next **MVC** instruction. Software should use a **NOP** after a write to ISR/ICR, if the changed value has to be read immediately.

```
MVC   0x10, ISR         ; Set IFR[4]
NOP                     ; a NOP to fill the delay slot
MVC   IFR, R0           ; R0 would contain 0x10
```

Figure 6-29. Interrupt Flag Register (IFR)

Table 6-317. Interrupt Flag Register (IFR) Field Descriptions

Bit	Field	Value	Description
31-16	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
15-4	IF*n*		Interrupt flag. Indicates the status of the corresponding maskable interrupt. An interrupt flag may be manually set by setting the corresponding bit (IS*n*) in the interrupt set register (ISR) or manually cleared by setting the corresponding bit (IC*n*) in the interrupt clear register (ICR).
		0	Interrupt has not occurred.
		1	Interrupt has occurred.
3-2	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
1	NMIF		Nonmaskable interrupt flag.
		0	Interrupt has not occurred.
		1	Interrupt has occurred.
0	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.

6.2.4.6.4 Interrupt Set Register (ISR)

The interrupt set register (ISR) allows to manually set the maskable interrupts (INT15-INT4) in the interrupt flag register (IFR). Writing a 1 to any of the bits in ISR causes the corresponding interrupt flag (IF*n*) to be set in IFR. Writing a 0 to any bit in ISR has no effect. It is not possible to set any bit in ISR to affect NMI or reset. The ISR is shown in Figure 6-30 and described in Table 6-318.

NOTE: Any write to ISR (by the **MVC** instruction) effectively has one delay slot because the results cannot be read (by the **MVC** instruction) in IFR until two cycles after the write to ISR.

Any write to the interrupt clear register (ICR) is ignored by a simultaneous write to the same bit in ISR.

Figure 6-30. Interrupt Set Register (ISR)

Table 6-318. Interrupt Set Register (ISR) Field Descriptions

Bit	Field	Value	Description
31-16	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
15-4	IS*n*		Interrupt set.
		0	Corresponding interrupt flag (IF*n*) in IFR is not set.
		1	Corresponding interrupt flag (IF*n*) in IFR is set.
3-0	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.

6.2.4.6.5 Interrupt Clear Register (ICR)

The interrupt clear register (ICR) allows to manually clear the maskable interrupts (INT15-INT4) in the interrupt flag register (IFR). Writing a 1 to any of the bits in ICR causes the corresponding interrupt flag (IF*n*) to be cleared in IFR. Writing a 0 to any bit in ICR has no effect. Incoming interrupts have priority and override any write to ICR. It is not possible to set any bit in ICR to affect NMI or reset. The ISR is shown in Figure 6-31 and described in Table 6-319.

NOTE: Any write to ICR (by the **MVC** instruction) effectively has one delay slot because the results cannot be read (by the **MVC** instruction) in IFR until two cycles after the write to ICR.

Any write to ICR is ignored by a simultaneous write to the same bit in the interrupt set register (ISR).

Figure 6-31. Interrupt Clear Register (ICR)

31													16

Table 6-319. Interrupt Clear Register (ICR) Field Descriptions

Bit	Field	Value	Description
31-16	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
15-4	IC*n*		Interrupt clear.
		0	Corresponding interrupt flag (IF*n*) in IFR is not cleared.
		1	Corresponding interrupt flag (IF*n*) in IFR is cleared.
3-0	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.

6.2.4.6.6 Nonmaskable Interrupt (NMI) Return Pointer Register (NRP)

The NMI return pointer register (NRP) contains the return pointer that directs the CPU to the proper location to continue program execution after NMI processing. A branch using the address in NRP (**BNRP**) in your interrupt service routine returns to the program flow when NMI servicing is complete. The NRP is shown in Figure 6-32 and described in Table 6-320.

Figure 6-32. NMI Return Pointer Register (NRP)

Rsvd	Return Address	
R-0	R/W-x	

LEGEND: R = Readable by the **MVC** instruction; W = Writeable by the **MVC** instruction; -x = value is indeterminate after reset

Table 6-320. NMI Return Pointer Register (NRP) Field Descriptions

Bit	Field	Value	Description
31	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
30-0	Return Address	0-7FFF FFFFh	Contains the return address. It is written by the CPU while taking an NMI. It is read by the CPU to execute the **BNRP** instruction.

6.2.4.6.7 Interrupt Return Pointer Register (IRP)

The interrupt return pointer register (IRP) contains the return pointer that directs the CPU to the proper location to continue program execution after processing a maskable interrupt (INT15-INT4, SWI, or UNDEF). A branch using the address in IRP (**BIRP**) in your interrupt service routine returns to the program flow when interrupt servicing is complete. The IRP is shown in Figure 6-33 and described in Table 6-321.

Bit	Field	Value	Description
31	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
30-0	Return Address	0-7FFF FFFFh	Contains the return address. It is written by the CPU while taking an interrupt. It is read by the CPU to execute the **BIRP** instruction.

6.2.4.6.8 Stack Pointer Register (SP)

The stack pointer register (SP) may be directly updated by software using the **MVC** instruction. The SP points to the top of the stack and always contains a byte address. The programmer is responsible for ensuring the correct alignment of the SP. See Section 6.2.4.14 for more details on stack pointer convention that must be followed. The SP is shown in Figure 6-34.

Figure 6-34. Stack Pointer Register (SP)

31	0

R/W-0	

LEGEND: R = Readable by the **MVC** instruction; W = Writeable by the **MVC** instruction; -*n* = value after reset

6.2.4.6.9 Global Data Pointer Register (GDP)

The GDP may be directly updated by software using the **MVC/MVCH** instruction. The GDP points to the start of the global data section (.bss section) and always contains a byte address. The programmer is responsible for ensuring that the convention described in Section 6.2.4.15 is maintained. The GDP is shown in Figure 6-35.

Figure 6-35. Global Data Pointer Register (GDP)

R/W-0	

LEGEND: R = Readable by the **MVC** instruction; W = Writeable by the **MVC** instruction; -*n* = value after reset

6.2.4.6.10 Link Register (LR)

The link register (LR) contains the return address (a halfword address) for a **RET** instruction. A **CALL** instruction saves the last return address into the stack and updates LR with the return address. A **RET** instruction uses the current value of LR as the target address and restores the last return address into LR from the stack. The LR is shown in Figure 6-36 and described in Table 6-322.

30-0	Return Address	0-7FFF FFFFh	Contains the return address (a halfword address) for a **RET** instruction.

6.2.4.6.11 Loop 0 Start Address Register (LSA0)

The loop 0 start address register (LSA0) contains the start address (byte address) of Loop 0. Note that Loop 0 is the inner loop. The LSA0 is shown in Figure 6-37 and described in Table 6-323.

See Section 6.2.4.17 for more details on hardware loop mechanism and usage of this register.

6.2.4.6.13 Loop 0 Iteration Count Register (LCNT0)

The loop 0 iteration count register (LCNT0) contains the iteration count of Loop 0. Note that Loop 0 is the inner loop. The LCNT0 is shown in Figure 6-39 and described in Table 6-325.

See Section 6.2.4.17 for more details on hardware loop mechanism and usage of this register.

Bit	Field	Value	Description
31-0	LCNT1	0-FFFF FFFFh	Iteration count of Loop 1.

6.2.4.6.17 Loop 0 Iteration Count Reload Value Register (LCNT0RLD)

The loop 0 iteration count reload value register (LCNT0RLD) contains the value that the loop 0 iteration count register (LCNT0) is reloaded during the outer loop rewind. LCNT0RLD is automatically updated by hardware when a write to LCNT0 is performed (via **MVC** instruction), thus LCNT0RLD does not need to be explicitly programmed during a loop setup. The LCNT0RLD is shown in Figure 6-43 and described in Table 6-329.

See Section 6.2.4.17 for more details on hardware loop mechanism and usage of this register.

Bit	Field	Value	Description
31-0	LCNT0RLD	0-FFFF FFFFh	Reload value of the loop 0 iteration count register (LCNT0).

6.2.4.6.18 Shadow Control Status Register (SCSR)

The shadow control status register (SCSR) contains a copy of the control status register (CSR) (of background code) in the interrupt context (except for an NMI). The SCSR is shown in Figure 6-44 and described in Table 6-330.

On acceptance of an interrupt (except for an NMI), the current state of the control status register (CSR) is copied to SCSR. On execution of a **BIRP** instruction, SCSR is copied back to CSR. SCSR facilitates fast interrupt response. A write to SCSR has no effect on machine operation.

Figure 6-44. Shadow Control Status Register (SCSR)

3	LT	0-1	Shadow copy of CSR:LT bit.
2	EQ	0-1	Shadow copy of CSR:EQ bit.
1	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	GIE	0-1	Shadow copy of CSR:GIE bit.

6.2.4.6.19 NMI Shadow Control Status Register (NMISCSR)

The NMI shadow control status register (NMISCSR) contains a copy of the control status register (CSR) (of background code) in the nonmaskable interrupt context. The NMISCSR is shown in Figure 6-45 and described in Table 6-331.

On acceptance of an NMI, the current state of the control status register (CSR) is copied to NMISCSR. On execution of a **BNRP** instruction, NMISCSR is copied back to CSR. NMISCSR facilitates correct servicing of an NMI even in a nested context. A write to NMISCSR has no effect on machine operation.

Figure 6-45. NMI Shadow Control Status Register (NMISCSR)

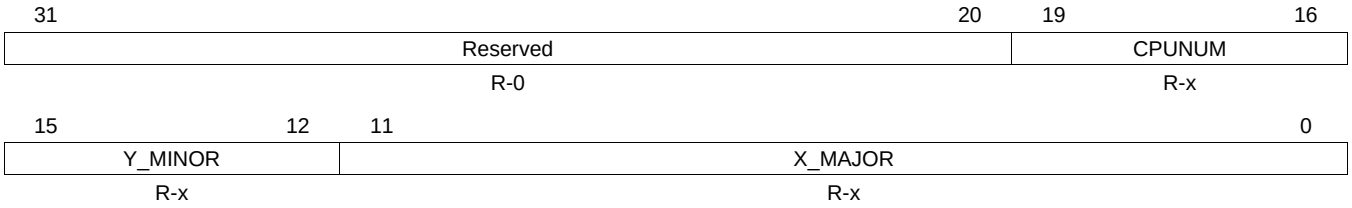
1	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	GIE	0-1	Shadow copy of CSR:GIE bit.

6.2.4.6.20 CPU Identification Register (CPUID)

The CPU identification register (CPUID) contains the major and minor version ID. The CPUID is shown in Figure 6-46 and described in Table 6-332.

Figure 6-46. CPU Identification Register (CPUID)



LEGEND: R = Readable by the **MVC** instruction; W = Writeable by the **MVC** instruction; -*n* = value after reset; -x = value is indeterminate after reset

Table 6-332. CPU Identification Register (CPUID) Field Descriptions

Bit	Field	Value	Description
31-20	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
19-16	CPUNUM	0-Fh	Reflects the value on the t_cpunum_i[3:0] input port. The input port is sampled on reset release and kept constant – it is not sampled continuously.
15-12	Y_MINOR	0-Fh	Minor revision.
11-0	X_MAJOR	0-FFFh	Major revision.

6.2.4.6.21 Decode Program Counter Register (DPC)

The decode program counter register (DPC) contains the halfword address of the next instruction to be executed (or instruction currently at DEC stage of the pipe). The DPC is shown in Figure 6-47 and described in Table 6-333.

The DPC is a read-only register provided for debug purposes only. A read of DPC while the CPU is halted at a debug event shows the PC of the next instruction to be executed (after the CPU is resumed from a halted state). The debugger can use DPC to determine the halt location. Reading DPC from the debugger while the CPU is running has limited or no use.

An **MVC** instruction with DPC as write address is ignored by the CPU, no errors are generated.

A read of DPC via the **MVC** instruction returns the address of the **MVC** instruction itself. For example, in the following assembly instruction sequence, the read of DPC via the **MVC** instruction returns 0x101 in R1:

```
0x100    ADDD 1, R0, R0
0x101    MVC  DPC, R1   ; R1 gets 0x101
```

Figure 6-47. Decode Program Counter Register (DPC)

Table 6-333. Decode Program Counter Register (DPC) Field Descriptions

Bit	Field	Value	Description
31	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
30-0	Decode Program Counter	0-7FFF FFFFh	Contains the address of the next instruction to be executed.

6.2.4.6.22 Time Stamp Counter Registers (TSCL and TSCH)

The CPU contains a free running 64-bit counter that advances each CPU clock under normal operation. The counter is accessed as two 32-bit read-only control registers, TSCL (Figure 6-48) and TSCH (Figure 6-49).

Figure 6-48. Time Stamp Counter Register - Low Half (TSCL)

31	0
CPU clock count (32 LSBs of 64-bit value)	
R-0	

LEGEND: R = Readable by the **MVC** instruction; -*n* = value after reset

Figure 6-49. Time Stamp Counter Register - High Half (TSCH)

31	0
CPU clock count (32 MSBs of 64-bit value)	
R-0	

LEGEND: R = Readable by the **MVC** instruction; -*n* = value after reset

6.2.4.6.22.1 Initialization

The counter is cleared to 0 after reset, and counting is disabled. Subsequently, any write to TSCL initializes the counter to 0 (the write data is ignored) and enables the counter. A write to TSCH is completely ignored, without any side effect of enabling the time stamp counter (like that with TSCL). The counter remains enabled until the next CPU functional reset. Once enabled, there is no way to disable the counter or reinitialize the counter to 0.

6.2.4.6.22.2 Enabling Counting

The counter is enabled by writing to TSCL. The value written is ignored. Counting begins in the cycle after the **MVC** instruction executes. If executed with the count disabled, the following code sequence shows the timing of the count starting (assuming no stalls occur in the three cycles shown).

```
MVC   0, TSCL          ; Start the counter
MVC   TSCL, R0         ; R0 = 0
MVC   TSCL, R1         ; R1 = 1
```

6.2.4.6.22.3 Disabling Counting

Once enabled, counting cannot be disabled under program control. Counting is disabled in the following cases:

- After exiting the reset state.
- When the CPU is fully powered down.

6.2.4.6.22.4 Reading the Counter

Reading the full 64-bit count takes two sequential **MVC** instructions. A read from TSCL causes the upper 32 bits of the current count (the value of the counter when the corresponding **MVC** instruction is at Fetch/DEC stage) to be copied into TSCH. In normal operation, only this snapshot of the upper half of the 64-bit count is available to the programmer. The value read will always be the value copied at the cycle of the last **MVC TSCL,** *reg* instruction. If it is read with no TSCL reads having taken place since reset, then the reset value of 0 is read.

When reading the full 64-bit value, it must be ensured that no interrupts are serviced between the two **MVC** instructions if an ISR is allowed to make use of the time stamp counter. There is no way for an ISR to restore the previous value of TSCH (snapshot) if it reads TSCL, since a new snapshot is performed.

The following example shows the correct and recommended way of obtaining the full 64-bit value of the time stamp counter:

```
// Disable interrupts
MVC   CSR, R7          ; Get CSR into R7
CLR   0, 0, R7, R7     ; Clear R7[0]
MVC   R7, CSR          ; Copy R7 back to CSR (clears GIE)

// Read Counter
MVC   TSCL, R0         ; read lower 32b into R0
MVC   TSCH, R1         ; read upper 32b into R1

// Enable interrupts
MVC   CSR, R7          ; Get CSR into R7
SET   0, 0, R7, R7     ; Set R7[0]
MVC   R7, CSR          ; Copy R7 back to CSR (sets GIE)
```

6.2.4.7 CPU Shadow Registers

The ARP32 CPU implements a shadow copy for the following registers:

- All architectural registers: R0-R7
- Loop control registers: LSA*n*, LEA*n*, LCNT*n*

The shadow registers are used to save-off the main registers during an interrupt processing. When an interrupt is taken, the main registers are copied onto the corresponding shadow register by the CPU along with saving the interrupt return address in IRP/NRP. The original registers are restored back upon a return from interrupt – as a result of a **BIRP** or **BNRP** instruction execution.

As a result of this, as long as interrupts are not allowed to be nested, interrupt handler routines in the ARP32 CPU do not need to save of any registers on the stack, this significantly reduces the interrupt processing latency.

Table 6-334 provides the list of the shadow registers in the ARP32 CPU.

Table 6-334. CPU Shadow Registers

Acronym	Register Name	Description
SR0	Shadow R0	Shadow copy of R0
SR1	Shadow R1	Shadow copy of R1
SR2	Shadow R2	Shadow copy of R2
SR3	Shadow R3	Shadow copy of R3
SR4	Shadow R4	Shadow copy of R4
SR5	Shadow R5	Shadow copy of R5
SR6	Shadow R6	Shadow copy of R6
SR7	Shadow R7	Shadow copy of R7
SLSA0	Shadow Loop 0 Start Address	Shadow copy of LSA0
SLEA0	Shadow Loop 0 End Address	Shadow copy of LEA0
SLCNT0	Shadow Loop 0 Iteration Count	Shadow copy of LCNT0
SLSA1	Shadow Loop 1 Start Address	Shadow copy of LSA1
SLEA1	Shadow Loop 1 End Address	Shadow copy of LEA1
SLCNT1	Shadow Loop 1 Iteration Count	Shadow copy of LCNT1
SLCNT0RLD	Shadow Loop 0 Iteration Count Reload	Shadow copy of LCNT0RLD

Shadow registers are access via the **MVS** instruction:

- **MVS** *sreg, areg* - Read shadow register into an architectural register
- **MVS** *areg, sreg* - Write shadow register from an architectural register

The **MVS** instruction is executed by the S unit. Any write to the shadow registers (via a **MVS** *areg, sreg* instruction) has two exposed delay slots - a subsequent read from the same *sreg* (via a **MVS** *areg, sreg* instruction) must be separated by at least two instructions. Otherwise, the old value of *sreg* is read.

The read result (of a **MVS** *sreg, areg* instruction) is bypassed appropriately to a subsequent instruction using the same *areg* – there is no delay slot or stall in this case.

The following examples illustrate the behavior:

```
// Update SR0 and then read back (assume SR0 = 0x100, R0 = 0x200)
MVS   R0, SR0         ; Move R0 to SR0
NOP                   ; NOP to fill delay slot #1
MVS   SR0, R7         ; Move SR0 to R7, R7 = 0x100 (old value)

// Update SR0 and then read back (assume SR0 = 0x100, R0 = 0x200)
MVS   R0, SR0         ; Move R0 to SR0
NOP                   ; NOP to fill delay slot #1
NOP                   ; NOP to fill delay slot #2
MVS   SR0, R7         ; Move SR0 to R7, R7 = 0x200 (new value)
```

6.2.4.8 Functional Units

The ARP32 CPU contains the following main functional units:

- **L-Unit:** Performs all logical operations (AND/OR/XOR/NOT/shift and minimum/maximum), some bit level operations like bit rotation, signed/unsigned bit extraction, bit reversal, bit clear, bit set operations, left most bit detection, and saturation operation.
- **S-Unit:** Performs the move operations.
- **D-Unit:** Performs arithmetic operations that include compare less/greater than instructions, address calculation for load/store instructions, PC calculations for branch instructions, and stack pointer increment/decrement for **PUSH/POP** and **CALL/RETURN** instructions.
- **M-Unit:** Performs multiplication, division, and modulo operations.

6.2.4.9 Instruction Fetch

The ARP32 ISA has instructions that are either 16 bit or 32 bit; the mix being chosen to achieve optimal code size without sacrificing the performance (of the amount of actual work done per instruction per cycle).

The ARP32 CPU allows 16/32-bit instructions to be mixed freely without any overhead or switching between instruction decoding mode. The program counter (PC) always points to a halfword address aligned with an instruction boundary. However, the program fetch is always aligned with a word boundary. The ARP32 CPU always requests a 32-bit word from a word-aligned address over its 32-bit wide program interface. Internally, the CPU maintains a 16 bit single entry fetch buffer (FetchBuffer[15:0]) to store an unused instruction word or part of an instruction word.

This allows a simpler program memory subsystem design and allows area, power efficient implementation of tightly coupled program memory subsystem without incurring any overhead on code density.

Since instructions in the ARP32 CPU are either 16 bit or 32 bit and they are freely mixable, any 32-bit word fetched from the program memory (FetchWord[31:0]) may have the following cases:

- **The FetchWord contains two 16-bit instructions:** the first instruction (FetchWord[15:0]) is sent to the instruction decoder and the second instruction (FetchWord[31:16]) is stored in the FetchBuffer. The stored instruction is then sent to the instruction decoder at the next decode cycle. No program request is sent for a cycle (as the fetch buffer already contains the next instruction to be executed) unless there is a branch.
- **The FetchWord contains one 32-bit instruction:** the entire FetchWord is sent to the instruction decoder and the FetchBuffer is invalidated.
- **The FetchWord contains one 16-bit instruction and the lower halfword of the next 32-bit instruction:** the valid 16-bit instruction (in FetchWord[15:0]) is sent to the instruction decoder and the lower halfword of the next 32-bit instruction is stored in the FetchBuffer. A second fetch must be performed to fetch the upper halfword of the 32-bit instruction before it is decoded. The request for this second fetch is sent in the current cycle. When the corresponding FetchWord is available (for example, at the next cycle), its lower halfword constitutes the full 32-bit instruction word and is sent to the instruction decoder. The unused upper halfword of the current FetchWord is stored back to the FetchBuffer again.

Thus, for a sequential program with an arbitrary mix of 16-bit and 32-bit instructions, the instruction is executed without a single cycle of stall (due to unavailability of a whole instruction word for decoding) in the pipeline. However, if the target address of a program discontinuity (due to branch, call, return interrupt) is not word aligned and there exists a 32-bit instruction at the target address, a single 32-bit aligned fetch is not sufficient to fetch a full 32-bit instruction word. In this case, there is a stall/bubble cycle in the CPU pipeline. The fetch engine of the CPU issues an additional instruction fetch request at the next cycle to fulfill the required 32-bit instruction fetch and the CPU pipeline continues normally.

6.2.4.10 Alignment of 32-bit Instructions

The fetch engine of the ARP32 CPU supports 16-bit and 32-bit instructions to be aligned at any halfword boundary. For a sequential execution, CPU fetches and executes from such instruction stream without incurring any stall cycles. However, if a program discontinuity target contains an unaligned 32-bit instruction, the CPU stalls for a cycle.

NOTE: The following requirements are for efficient code generation, not functionally correct code generation. The ARP32 CPU supports having a 32-bit instruction at an unaligned discontinuity target – with the associated stall overhead. There are cases where this cannot be avoided – for example, an interrupt return to an unaligned 32-bit instruction.

This requires that for the most efficient programming of the ARP32 CPU, all programs contain 32-bit instructions to be aligned on a 32-bit boundary in the program memory. For the ARP32 C/C++ compiler/toolchain, this means that a 32-bit alignment is maintained for the following cases:

- All assembly level basic blocks that start with a 32-bit instruction
- All functions that start with a 32-bit instruction
- All HLA loop rewind targets (content of LSA*n* registers) that contains a 32-bit instruction

If the previous conditions are met, the following most frequent cases where a program discontinuity happens, do not incur any additional stalls:

- Use of branch/call immediate instructions (**Bcc** *scst9*, **Bcc** *scst16*, or **CALL** *scst22*) for general program flow control
- Use of register call (**CALL** *src1*) for long calls to labels or function calls using function pointers
- Use of HLA for loop constructs and corresponding branch

6.2.4.11 Instruction Execution in Branch Delay Slot

The ARP32 CPU allows one delay slot for the following control flow instructions:

- branch (**Bcc** *scst9*, **Bcc** *scst16*, or **Bcc** *dst*)
- call (**CALL** *scst22* or **CALL** *src1*)
- return (**RET**)

There is no delay slot for SWI.

An instruction is placed in a branch delay slot as long as the restrictions mentioned in Section 6.2.5.3 are maintained.

6.2.4.12 Address Space

The ARP32 CPU uses the convention that both instruction and data memory is byte addressable. The ARP32 CPU is capable of supporting full 32-bit instruction and data memory address space.

The ARP32 core is a pure Harvard architecture, separate instruction and data bus access the program and data memory space. However, while integrating the core, it is possible to unify the program and data space to make it a unified (modified Harvard) memory architecture.

6.2.4.13 Program Counter Convention

In the ARP32 CPU, the PC (program counter register) always contains halfword addresses. Correspondingly, all PC related registers (IRP, NRP) also contain a halfword address. The PC conventions used in pseudo code and other program snippets presume this convention, PC = PC + 1 indicates advancement of the PC by 1 entry, with each entry containing 2 bytes.

However, since program fetch is always of word size and word aligned, a word address is sent over the instruction fetch address bus (cpu_imem_raddr_o[31:2]).

This convention is used in most of the cases in the ISA where a PC related operation is implied. However, there are some use cases where an absolute byte address is needed to reference a location in program memory. Based on these considerations, the following rules/conventions are applied to PC related instructions and operations; the ARP32 compiler/toolchain and assembly code must maintain the following rules/conventions:

- For immediate branch instructions (**Bcc** *scst9* or **Bcc** *scst16*), the branch offset is treated as halfword offsets. This offset is directly added to the PC to calculate effective branch address (see immediate branch instructions).
- For immediate call instructions (**CALL** *scst22*), the call address is treated as PC relative halfword offset. This offset is directly added to the PC to calculate effective call address (see immediate call instructions).
- For register branch or call instructions (**Bcc** *src1* or **CALL** *src1*), the register content is treated as the absolute byte address of the branch/call destination. This address is first converted to a halfword address and then loaded to the PC.
- For set loop address instruction (**SLA** *ucst16, creg*), the immediate offset is treated as a PC relative halfword offset. This offset is directly added to the PC to calculate effective branch address (see immediate branch instructions).
- While setting up address in loop address registers (LSA*n*, LEA*n*) using the **MVC/MVCH** instructions (immediate or register forms), the value set in the loop address register is the absolute halfword address (of loop start/end instruction).
- A call instruction (**CALL** *src1* or **CALL** *scst22*) saves off a return address to the stack that is a halfword address. A corresponding return instruction (**RET**) loads this address directly onto the PC to return to the correct location.
- An interrupt saves off a return address to the IRP/NRP register that is a halfword address. A corresponding return instruction (**BIRP** or **BNRP**) loads this address directly onto the PC to return to the correct location.
- Interrupt Service Table (IST) entries are treated as a halfword address to the interrupt handler routine.

The PC is an architectural register, that is, it contains machine state, but is not directly accessible through the instruction set. Instruction execution has an effect on the PC, but the current PC value can not be read or written explicitly.

6.2.4.14 Stack Pointer Convention

The ARP32 CPU has a 32-bit stack pointer register (SP) and its content is always assumed to be a byte address. Any address computation using the SP value considers content of the SP as a byte address while computing an effective address of a byte/halfword/word access.

The ARP32 CPU is a descending stack machine. The ARP32 CPU programming model requires that the programmer and/or the compiler/toolchain maintain the following conventions:

- Stack pointer (SP) is initialized to a high address, it reduces to a lower address as it proceeds through function calls during program execution.
- Stack pointer (SP) must be always aligned to a 4-byte word address. It is software responsibility to keep the SP always aligned to 4-byte word address when allocating/de-allocating stack – there is no hardware support to do this alignment automatically. Since the ARP32 CPU does not support unaligned access, a stack pointer value not aligned to 4-byte boundary may result in access to unaligned addresses and thus produce unexpected result.
- In all cases where the CPU itself modifies the SP (call, return, **LDRF/STRF**), it always increments/decrements it by 4 (word aligned).

- Stack pointer (SP) always points to the next free location where an entry is stacked. For pushing anything onto stack, the CPU writes to the location the SP is currently pointing to and then post-decrements the SP. Similarly, while popping anything from the stack, the CPU pre-decrements the SP and then reads from the location (pre-decremented) the SP points to. For example:
  - Every **CALL** saves the return address to the location the SP is currently pointing to and then post-decrements the SP.
  - Every **RET** pre-decrements the SP and then loads the return address from the location updated SP points to.
- To allocate stack in a function (in the function prolog), reduce the SP by an amount equal to local stack frame size.
- Local variables, input arguments to functions and spilled variables all are accessed via the SP relative positive offset load/store instructions.
- To de-allocate stack in a function (in the function epilog), increase the SP by an amount equal to local stack frame size.

The ARP32 core does not save any context on stack during interrupt processing. The same stack layout and convention is applied to the interrupt handler function/procedure – except for additional register save requirements.

6.2.4.15 Global Data Pointer Convention

Global data pointer register (GDP) contains a byte address of the start of global data section. It is computed by the linker and assigned to a linker symbol that the boot routine must be used to initialize GDP.

6.2.4.16 Conditional Execution

On the ARP32 CPU, conditional execution is available only by using conditional branches.

Most data processing instructions and all compare instructions update the condition flags in control status register: CSR[2]EQ, CSR[3]LT, CSR[4]GT. Some instructions update all flags and some instructions only update a subset. See the instruction descriptions for the flags they affect. Instructions update the status bit relevant to it; other status bits are left unchanged.

Conditional branch instructions are executed, based on the condition flags set in another instruction, either:

- immediately after the instruction that updated the flags
- after any number of intervening instructions that have not updated the flags

See conditional branch instruction for more details.

6.2.4.17 Hardware Loop Acceleration

6.2.4.17.1 Overview

The ARP32 CPU implements a hardware loop assist (HLA) function to reduce cycles in critical inner loops that are typically spent in loop control operations such as loop index increment, decrement, compare, branch operations. Using an HLA mechanism, a zero-overhead rewind to the top of the loop is achieved for up to two levels of nested loops. The structure and operation of the HLA is conformable for easy mapping of loop constructs (for, while, do, etc.) available in C/C++.

Up to two levels of nested loops are supported. Additional levels of nesting are possible through standard software techniques.

In a two level nested loop construct, the inner most level is termed as Loop 0, while the outer level is termed Loop 1. For a single-level nested loop, only Loop 0 is used. Control registers associated with Loop 0 and Loop 1 control the operation of each level.

6.2.4.17.2 Loop Registers

HLA operation is setup and controlled by six control registers listed in Table 6-335. Note that LSA*n* and LEA*n* registers contain/reflect the byte address.

Table 6-335. Hardware Loop Control Registers

Acronym	Register Name	Description
LSA0	Loop 0 Start Address Register	Contains the Start Address of Loop 0
LEA0	Loop 0 End Address Register	Contains the End Address of Loop 0
LCNT0	Loop 0 Iteration Count Register	Contains the Iteration Count of Loop 0
LSA1	Loop 1 Start Address Register	Contains the Start Address of Loop 1
LEA1	Loop 1 End Address Register	Contains the End Address of Loop 1
LCNT1	Loop 1 Iteration Count Register	Contains the Iteration Count of Loop 1
LCNT0RLD	Loop 0 Iteration Count Reload Value Register	Contains the LCNT0 reload value during outer loop rewind

6.2.4.17.3 Loop Setup Instructions

Loop control registers are accessed via the **MVC/MVCH** instructions like any other control registers.

To simplify and optimize loop setup in the most frequent compiler generated use cases, a separate instruction called set loop address (**SLA** *ucst16, creg*) is provided. The **SLA** instruction takes a PC-relative immediate positive halfword offset (*ucst16*) and writes the byte address of the location indicated by the PC + *ucst16* value to the LSA*n* and LEA*n* registers.

Loop setup occurs in the following order:

- For a single-level loop (only Loop 0):
  1. Setup LSA0
  2. Setup LEA0
  3. Setup LCNT0
- For a two-level loop (Loop 0 and Loop 1):
  1. Setup LSA1
  2. Setup LEA1
  3. Setup LCNT1
  4. Setup LSA0
  5. Setup LEA0
  6. Setup LCNT0

HLA is not assured to work if the above order is not maintained.

6.2.4.17.4 Loop Operation

The loop setup process for each level of nesting consists of the following (in the specified order):

1. Setup loop start address register (LSAn) with the byte address of the first instruction in the corresponding loop.
2. Setup loop end address register (LEAn) with the byte address of the last instruction in the corresponding loop.
3. Setup loop iteration count register (LCNTn) with the intended loop iteration count.

A loop becomes active as soon as a value greater than 1 is programmed in LCNTn. The LSAn and LEAn registers are written when the corresponding **MVC/SLA** instruction is executed but the values are not used by the processor (for detecting loop rewind condition) until the corresponding loop becomes active.

When a loop becomes active (LCNTn > 1), the PC of the instruction at DEC phase is checked with the LEAn register. If they match, the CPU takes a zero-cycle overhead branch to the top of the loop provided by the LSAn registers. The program fetch request to LSAn is placed when the last instruction of a loop is at DEC. Thus there is no delay slot for the loop rewind branch, neither any stall or null cycle.

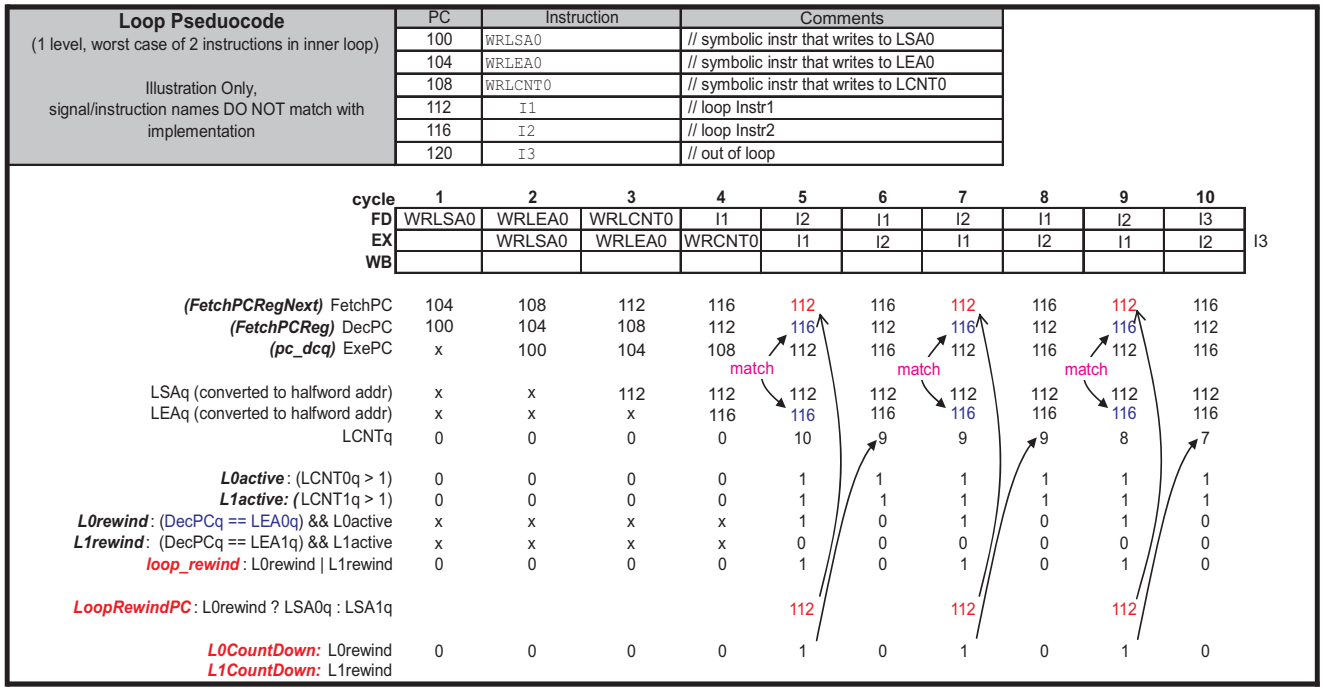
For LCNTn = x, the loop rewinds x - 1 times, effectively the loop body executes total x times (x - 1 rewinds and the last fall through pass). For LCNTn = 1, the loop body executes once (zero rewind). For LCNTn = 0, the loop is not considered active – the CPU just linearly executes – however, as a result, the loop body executes once (linear fall through). Note that LCNTn = 0 does not mean loop body would not be executed.

During operation, the LCNTn registers are directly updated (decremented) with the remaining iteration count. The loop counters are updated along with the corresponding rewind-branch. At any time LCNTn is read to determine how many iterations of the corresponding loop are still to be executed. When each level completes, the corresponding LCNTn registers become zero, the LSAn/LEAn registers are left unchanged. Note that for LCNTn = 1, the loop body executes once and the loop counter is decremented when the last instruction of the corresponding loop is executed.

The LCNT0RLD register is updated automatically by the CPU whenever a value is written to LCNT0 (for example, during loop setup). For a two-level nested loop, once the inner most level iteration completes and the CPU rewinds to the top of the outer loop, the LCNT0 is reloaded with the content of LCNT0RLD. Note that even if LCNT0RLD is a programmer visible control register, it acts as a shadow register of LCNT0 (updated on any write to LCNT0) and must not be explicitly written during a loop setup.

There are no restrictions in embedding an HLA construct or instruction sequence, consisting of one or two levels of nested loops, into a larger level of nested loop implemented by normal software techniques.

Figure 6-50. Loop Operation



6.2.4.17.5 Call and Branch within Loop Context

Branches (**Bcc** *scst9*, **Bcc** *scst16*, or **Bcc** *dst*) within the loop are allowed, provided the conditions explicitly mentioned in Section 6.2.5.3.2 are met.

Calls (**CALL** *scst22* or **CALL** *dst*) within the loop are generally not supported as the loop registers are not explicitly saved off when a CALL is executed within the loop context. However, software uses **CALL** instructions if the call tree does not contain any HLA usage within the caller code.

6.2.4.17.6 Dynamic Changes to Loop Iteration Count

A write to the LCNTn register within the loop body (of either of the loops) is used to dynamically change the iteration count, including pre-maturely terminating the corresponding level. Such a write to LCNTn instruction must be executed at least 2 instructions before the last (ending) instruction of the corresponding loop (x).

It is also possible to skip inner loop dynamically (per iteration of the outer loop) by simply branching across the inner loop within the outer loop context. It is not necessary to explicitly set the inner loop count to 0/1 (loop inactive values). Similarly, a branch out of the outer loop context is possible without setting the outer loop count to inactive values. This relies on the fact that even if the inner or outer loop count has not been set to an inactive value, a loop rewind des not happen unless the loop end PC (LEAn) is encountered.

These features (dynamically changing the loop iteration count, skipping inner/outer loop via branches) are used by the compiler to implement constructs such as last/continue/break and alike.

6.2.4.17.7 Interrupt Processing During HLA

Interrupts are not taken while the last instruction of a loop level is at DEC. Interrupts are taken after the loop rewind happens. The return address saved off during the interrupt processing points to the loop rewind address (LSAn). Consequently, a return from interrupt returns to the last rewind address (LSAn).

When taking an interrupt (irrespective if an HLA is active), the CPU saves off the six loop registers in the corresponding shadow registers. They are restored when interrupts are returned via the **BIRP/BNRP** instructions.

6.2.4.17.8 HLA Usage in Interrupt Context

Since loop context is fully saved by hardware while taking an interrupt, HLA is used within an ISR context freely without requiring any additional context save. For allowing nested interrupts, the shadow copies of HLA registers must be saved off to the stack explicitly along with other shadow registers. This helps achieve very-low interrupt latency in the ARP32 CPU under a single-level-nested-interrupt use model.

6.2.4.17.9 HLA Usage Restrictions

There are certain restrictions on HLA usage, see Section 6.2.5.3.2.

6.2.4.17.10 HLA Mapping Examples

6.2.4.17.10.1 Loops With Single Level of Nesting

Example 6-2. C memset-like Loop, Single Level, Minimum Instructions

Pseudo C code:

```
int   i, myarray[100];
for (i=0; i< 100; i++) {
    myarray[i] = 1;
}
```

Table 6-336. Example 1 of Generated Assembly Code (relevant instructions only)

Byte Address	Instruction	Comment
0x100	`MVKS 1, R0`	Write data
0x102	`SLA 6, LSA0`	First instr of loop0 is at #6 halfword offset `LSA0 = 0x102 + hex(6 x 2) = 0x10E`
0x106	`SLA 5, LEA0`	Last instr of loop0 is at #5 halfword offset `LEA0 = 0x106 + hex(5 x 2) = 0x110`
0x10A	`MVC 100, LCNT0`	iter count = 100
0x10E	`STW R0, *++R1(1)`	First instr of Loop 0
0x110	`NOP`	Last instr of Loop 0 (padding needed)

Table 6-337. Example 2 of Generated Assembly Code (relevant instructions only)

Byte Address	Instruction	Comment
0x100	`MVKS 1, R0`	Write data
0x102	`SLA 6, LSA0`	First instr of loop0 is at #6 halfword offset `LSA0 = 0x102 + hex(6 x 2) = 0x10E`
0x106	`SLA 5, LEA0`	Last instr of loop0 is at #5 halfword offset `LEA0 = 0x106 + hex(5 x 2) = 0x110`
0x10A	`MVC 100, LCNT0`	iter count = 100
0x10E	`STW R0, *+R1(0)`	First instr of Loop 0
0x110	`ADD 4, R1, R1`	Last instr of Loop 0 (padding needed)

Example 6-3. C memcpy-like Loop, Single Level, Minimum Instructions

Pseudo C code:

```
void MyMemcpyByWord (void *ptr1, void *ptr2, int size){
  int ii, dbwSize = size>>2;
  unsigned int *dst = ptr1;
  unsigned int *src = ptr2;
  for (ii=0 ; ii< dbwSize ; ii++)
  dst[ii] = src[ii];
}
```

Table 6-338. Example 1 of Generated Assembly Code (relevant instructions only)

Byte Address	Instruction	Comment
0x100	`SLA 5, LSA0`	First instr of loop0 is at #5 halfword offset `LSA0 = 0x100 + hex(5 x 2) = 0x10A`
0x104	`SLA 4, LEA0`	Last instr of loop0 is at #4 halfword offset `LEA0 = 0x104 + hex(4 x 2) = 0x10C`
0x108	`MVC R1, LCNT0`	iter count = “size” (passed via R1)
0x10A	`LDW *++R2(1), R3`	Load word from source (Loop 0, instr 1)
0x10C	`STW R3, *++R4(1)`	Store word to dest (Loop 0, instr 2)

Table 6-339. Example 2 of Generated Assembly Code (relevant instructions only)

Byte Address	Instruction	Comment
0x100	`SLA 5, LSA0`	First instr of loop0 is at #5 halfword offset `LSA0 = 0x100 + hex(5 x 2) = 0x10A`
0x104	`SLA 6, LEA0`	Last instr of loop0 is at #6 halfword offset `LEA0 = 0x104 + hex(6 x 2) = 0x110`
0x108	`MVC R1, LCNT0`	iter count = “size” (passed via R1)
0x10A	`LDW *+R2(0), R3`	Load word from source (Loop 0, instr 1)
0x10C	`ADD 4, R2, R2`	Increment src pointer
0x10E	`STW R3, *+R4(0)`	Store word to dest
0x110	`ADD 4, R4, R4`	Increment dest pointer (Loop 0, instr 4)

6.2.4.17.10.2 Loops With Two Levels of Nesting

Example 6-4. Two-level Nesting, Both Loops Ending at Same Instruction

Pseudo C code:

```
For (i=0; i<20; i++) {
   Instruction1      // size 16b
   Instruction2      // size 32b
   Instruction3      // size 32b
   Instruction4      // size 16b
   For (j=0; j<10; j++) {
      Instruction5   // size 16b
      Instruction6   // size 32b
      Instruction7   // size 16b
   }
}
```

Table 6-340. Example of Generated Assembly Code (relevant instructions only)

Byte Address	Instruction	Comment
0x100	`SLA 18, LSA1`	First instr of loop1 is at #18 halfword offset `LSA1 = 0x100 + hex(18 x 2) = 0x124`
0x104	`SLA 19, LEA1`	Last instr of loop0 is at #19 halfword offset `LEA0 = 0x104 + hex(19 x 2) = 0x12A`
0x108	`MVC 20, LCNT1`	iter count (=20) of loop1
0x10C	`SLA 6, LSA0`	First instr of loop0 is at #6 halfword offset `LSA1 = 0x10C + hex(6 x 2) = 0x118`
0x110	`SLA 9, LEA0`	First instr of loop0 is at #9 halfword offset `LEA0 = 0x110 + hex(9 x 2) = 0x122`
0x114	`MVC 10, LCNT0`	iter count (=10) of loop0
0x118	`Instruction1`	Loop1 start
0x11A	`Instruction2`	
0x11E	`Instruction3`	
0x122	`Instruction4`	
0x124	`Instruction5`	Loop0 start
0x126	`Instruction6`	
0x12A	`Instruction7`	Loop0 end, Loop1 end

Example 6-5. Two-level Nesting, Different Ending Instructions for Two Levels

Pseudo C code:

```
For (i=0; i<20; i++) {
   Instruction1      // size 16b
   Instruction2      // size 32b
   Instruction3      // size 32b
   Instruction4      // size 16b
   For (j=0; j<10; j++) {
      Instruction5   // size 16b
      Instruction6   // size 32b
      Instruction7   // size 16b
   }
   Instruction8      // size 32b
   Instruction9      // size 32b
   Instruction10     // size 16b
}
```

Table 6-341. Example of Generated Assembly Code (relevant instructions only)

Byte Address	Instruction	Comment
0x100	`SLA 18, LSA1`	First instr of loop1 is at #18 halfword offset `LSA1 = 0x100 + hex(18 x 2) = 0x124`
0x104	`SLA 19, LEA1`	Last instr of loop1 is at #19 halfword offset `LEA0 = 0x104 + hex(19 x 2) = 0x12A`
0x108	`MVC 20, LCNT1`	iter count (=20) of loop1
0x10C	`SLA 6, LSA0`	First instr of loop0 is at #6 halfword offset `LSA1 = 0x10C + hex(6 x 2) = 0x118`
0x110	`SLA 18, LEA0`	First instr of loop0 is at #18 halfword offset `LEA0 = 0x110 + hex(18 x 2) = 0x134`
0x114	`MVC 10, LCNT0`	iter count (=10) of loop0
0x118	`Instruction1`	Loop1 start
0x11A	`Instruction2`	
0x11E	`Instruction3`	
0x122	`Instruction4`	
0x124	`Instruction5`	Loop0 start
0x126	`Instruction6`	
0x12A	`Instruction7`	Loop0 end
0x12C	`Instruction8`	
0x130	`Instruction9`	
0x134	`Instruction10`	Loop1 end

6.2.4.18 Interrupts

6.2.4.18.1 Overview

The ARP32 CPU supports various types of interrupts that include: reset, a non-maskable interrupt (NMI), 12 maskable interrupts (INT15-INT4), an undefined instruction interrupt (UNDEF), and a software interrupt (SWI). The following registers control the CPU behavior on receipt of an interrupt:

- Control Status Register (CSR)
- Interrupt Enable Register (IER)
- Interrupt Flag Register (IFR)
- Interrupt Set Register (ISR)
- Interrupt Clear Register (ICR)
- Nonmaskable Interrupt Return Pointer Register (NRP)
- Interrupt Return Pointer Register (IRP)

The SWI and UNDEF interrupts are special cases that do not have an associated input pin. The SWI interrupt mechanism is activated by decoding of the **SWI** instruction. The UNDEF interrupt is activated by detection of an undefined instruction.

On acknowledge of an enabled interrupt, the ARP32 CPU loads the contents of the interrupt service table entry associated with the interrupt into the PC.

Each interrupt type is discussed in the following sections; Table 6-342 summarizes the ARP32 CPU interrupts.

Table 6-342. Interrupt Summary

Interrupt Name	Vector Address (byte)	Input Pin	Enable Control	Interrupt Return Pointer Register	Interrupt Return Instruction to be Used	Context Save and Restore Actions	
						By Hardware	By Software
Reset	00h	cpu_reset_i	Always Enabled	NA	NA	NA	NA
NMI	04h	cpu_nmi_i	IER:NMIE	NRP	BNRP	CSR to NMISCSR	R0-R7 to Stack, LSA*n* to Stack, LEA*n* to Stack, LCNT*n* to Stack
SWI	08h	None	Always Enabled	IRP	BIRP	CSR to SCSR, R0-R7 to SR0-SR7, LSA*n* to SLSA*n*, LEA*n* to SLEA*n*, LCNT*n* to SLCNT*n*	None
UNDEF	0Ch	None	Always Enabled	IRP	BIRP	CSR to SCSR, R0-R7 to SR0-SR7, LSA*n* to SLSA*n*, LEA*n* to SLEA*n*, LCNT*n* to SLCNT*n*	None
INT4	10h	cpu_int4_i	CSR:GIE; IER:NMIE; IER:IE4	IRP	BIRP	CSR to SCSR, R0-R7 to SR0-SR7, LSA*n* to SLSA*n*, LEA*n* to SLEA*n*, LCNT*n* to SLCNT*n*	None

INT15	3Ch	cpu_int15_i	CSR:GIE; IER:NMIE; IER:IE15	IRP	BIRP	CSR to SCSR, R0-R7 to SR0-SR7, LSA*n* to SLSA*n*, LEA*n* to SLEA*n*, LCNT*n* to SLCNT*n*	None

6.2.4.18.2 Interrupt Processing

Figure 6-51 provides an illustration of different actions and events of interest during an interrupt processing. In this case, both INT4 and INT5 were asserted simultaneously, INT4 was selected as the winner and was taken after few cycles when all enable conditions (CSR[0]GIE, IER[1]NMIE, IER[n]) were met.

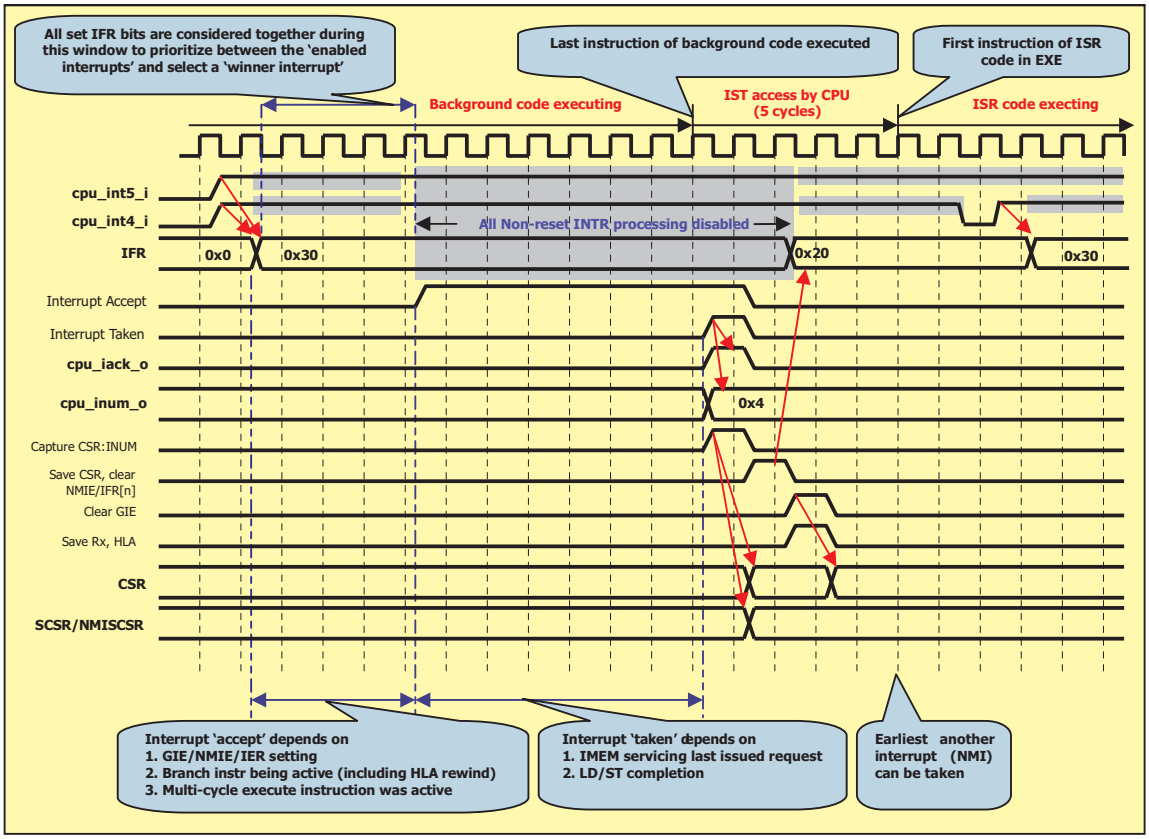
Note that the CPU entity signals/registers are shown in **bold** font; internal (and sometimes just conceptual) signals are shown in normal font.

The conceptual signal “Interrupt Accept” shows when a particular interrupt (in this case, INT4) is accepted to be taken next. This is generated by considering that all set bits of IFR, the interrupt priority, the enable conditions, and a safe cycle boundary within the CPU, where accepting an interrupt is safe.

The conceptual signal “Interrupt Taken” shows when a particular interrupt (in this case, INT4) is actually taken. The actions corresponding to an interrupt processing (IST access, context save, etc.) starts to take place within the CPU after this condition is achieved.

The delay between ‘Interrupt Accept’ and ‘Interrupt Taken’ is due to pending memory transaction on CPU instruction and data interfaces. The CPU waits for all outstanding instruction and data memory requests to be serviced before staring interrupt context save or IST access process.

Figure 6-51. Interrupt Processing



6.2.4.18.3 *Interrupt Acknowledgment*

The ARP32 CPU interrupts are sensitive to rising edge detected on the input interrupt pins (detected synchronously detected on the rising edge of the input clock). All interrupt pins are active high, with the exception of reset, which is active low and asynchronous.

The cpu_iack_o output signal is asserted high for a single cycle to indicate (to hardware external to the CPU core) that the CPU has begun processing an interrupt. The cpu_inum_o signal indicates the number of the interrupt that is being processed. The value driven on cpu_inum_o signal is also captured in the INUM field of the control status register (CSR).

Note that cpu_iack_o and cpu_inum_o are asserted for all interrupts (including reset). Table 6-343 summarizes the cpu_inum_o values.

Table 6-343. cpu_inum_o Values

cpu_inum_o[3:0]	Interrupt
0h	Reset
1h	NMI
2h	SWI
3h	UNDEF
4h	INT4
5h	INT5
6h	INT6

	INT10
	INT11
	INT12
	INT13
	INT14
	INT15
Lowest	UNDEF

6.2.4.18.5 Interrupt Service Table (IST)

Each entry of the interrupt service table (IST) contains a byte address that points to the beginning of the interrupt service routine for that interrupt. When the ARP32 CPU accepts an interrupt, the contents of the associated IST entry is read (IST[n]), converted to the corresponding halfword address, and then loaded into the PC creating an effective branch.

The starting address of the IST is always the address 00h in the instruction memory; the IST can not be relocated. The addresses (byte address) of each entry is shown in Table 6-345.

IST entries are byte address(s) of the interrupt handler (interrupt service routine) functions. Since 4 bytes are allocated for each IST entry, the interrupt handlers are placed anywhere in the 32-bit program memory space and the ARP32 CPU directly branches to that address. This reduces interrupt latency significantly since an instruction need not be fetched/decoded/executed from an IST location, nor an intermediate routine/call/branch needs to be processed for a branch to relatively large distance.

In fact, the IST is an “array of pointers (each entry 32 bits) to interrupt handler functions in C/C++” placed at the instruction memory address 0, which is remapped to a physical address by using the memory management unit (MMU0) that services program cache requests.

Table 6-345. Interrupt Service Table (IST)

Byte Address	IST Entry
00h	Reset
04h	NMI
08h	SWI
0Ch	UNDEF
10h	INT4
14h	INT5
18h	INT6
1Ch	INT7
20h	INT8
24h	INT9
28h	INT10

30h	INT12
34h	INT13
38h	INT14
3Ch	INT15

6.2.4.18.6 Interrupt Flags

The ARP32 CPU maintains the pending status of all non-reset external interrupts (NMI, INT15-INT4) in the corresponding bit in the interrupt flag register (IFR). A 1 indicates the corresponding interrupt is pending, reading a 0 indicates the corresponding interrupt is not pending (either is being processed or it has not occurred).

When a rising edge is detected on the input pins of external interrupts (NMI, INT15-INT4), the corresponding bits in IFR are set unconditionally in the next CPU clock cycle. When the CPU actually takes a particular interrupt, the corresponding IFR bit is cleared by the CPU. Thus at any point, reading IFR using the **MVC** instruction shows which input external interrupts is asserted or is not yet processed by the CPU (or in pending state).

The CPU checks the status of IFR bits to understand that an interrupt is asserted, and starts processing this interrupt. Processing of an interrupt involves checking for all associated enable conditions, prioritization between simultaneously asserted interrupts and actions to perform interrupt service table look up to finally achieve a branch to the interrupt service routine of the corresponding interrupt. The exact behavior and actions taken on each kind of interrupts are described in Section 6.2.4.18.7.

It is possible to set one or more interrupt flags of maskable interrupts in IFR - by writing to the corresponding bit in the interrupt set register (ISR) - creating the same effect of an external interrupt assertion. This makes it possible for the software to raise a maskable interrupt. The following examples illustrate this:

Example 6-6. Setting Interrupt Flag

```
MVC   0x10, ISR      ; Set IFR[4] to raise INT4
```

Example 6-7. Setting Interrupt Flag

```
MVC   IFR,  R0       ; Get current state
SET   5,5,  R0, R0   ; Set R0:bit[5]
MVC   R0,   ISR      ; Set IFR[5] without changing other bits
```

NOTE: Setting of IFR by an external interrupt assertion has a higher priority than writing or clearing the IFR bits via the **MVC** instruction.

6.2.4.18.7 Interrupt Behavior

All maskable (INT15-INT4) and non-maskable (NMI) interrupt processing is triggered by the corresponding interrupt flag bit in the interrupt flag register (IFR). For SWI and UNDEF, a direct instruction decode (or non-decode) triggers interrupt processing. Once an interrupt is triggered, the CPU checks the corresponding enabling conditions (if any), does a priority resolution among simultaneously asserted interrupts, and then starts processing the interrupt.

The details of conditions for processing each type of interrupts and the actions taken by the CPU during and returning from the interrupts are described in the following subsections.

6.2.4.18.7.1 Reset Interrupt

Reset is the highest priority interrupt and is used to initialize the CPU to a known state. The reset interrupt is unique in a number of ways:

- cpu_resetz_i is an active-low signal and is treated asynchronously. All other interrupts are active-high signals, or activated via the instruction decoder.
- cpu_resetz_i must be held low for 4 clock cycles before it goes high again to reinitialize the CPU properly.
- cpu_resetz_i is not affected by branches or pending loads or any enable bits or any other condition applicable for processing other interrupts. The current instruction execution is aborted and the CPU registers are returned to their default state.
- Reset uses interrupt semantics, that is, loading of the IST table entry; however, it is not required to issue a **BIRP** instruction to exit reset processing.

6.2.4.18.7.2 Non-maskable Interrupt (NMI)

NMI is the second-highest priority interrupt and is generally used to alert the CPU of a serious hardware problem. For an NMI to be detected (and processed) by the ARP32 CPU, the non-maskable interrupt enable (NMIE) bit in the interrupt enable register (IER) must be set to 1. The NMIE bit is cleared to 0 at reset to prevent an NMI being taken prematurely (before system initialization). The NMI bit is set (to enable NMI) by software only after the system has been properly initialized and is ready to accept NMIs. The NMIE bit is also cleared at the occurrence of an NMI to prevent another NMI from being processed; it may be set again in the interrupt set register (ISR), to allow nested NMIs, by software after the CPU state has been saved properly in the previous NMI ISR. While the NMIE bit is cleared, all maskable interrupts (INT15–INT4) are also disabled.

When the NMIF bit is set, (as a result of an NMI assertion via cpu_nmi_i input pin), assuming the previous conditions are met, the ARP32 CPU is said to accept the interrupt and performs the following actions to process the NMI:

- CPU stops fetching further instruction from instruction memory
- CPU execute pipe is allowed to drain
  - Any load/store instructions (including **LDRF, STRF, CALL, RET**) currently executing are allowed to complete
  - Any instruction in the branch/call/return delay slot is allowed to complete
- The CSR[11:8]INUM field is updated with the NMI interrupt ID.
- The CSR content is copied to the NMISCSR.
- The IER[1]NMIE bit is cleared.
- The CSR[0]GIE bit is cleared.
- The IFR[1]NMIF bit in the IFR is cleared.
- The PC value of the next instruction to execute (after completion of the interrupt service routine) is stored to the NRP register. This is the interrupt return address.
- The cpu_iack_o is asserted for a cycle along with the corresponding interrupt ID on cpu_inum_o.
- An instruction fetch request to NMI IST location is sent and eventually the NMI IST entry is loaded into the PC. As a result, the CPU begins executing the NMI interrupt service routine.

To exit an NMI service routine, the **BNRP** instruction must be used. Execution of the **BNRP** instruction causes:

- The NMISCSR content is copied to the CSR.
- The PC loaded with the contents of the NRP.
- IER[1]NMIE bit is set.

6.2.4.18.7.3 SWI Interrupt

The **SWI** instruction is used to trigger the software interrupt. Software interrupts are always enabled. The SWI interrupt does not have a corresponding entry in the IFR, ICR, ISR, or IER, and it is not affected by the state of the CSR:GIE or IER[1]NMIE bits. An SWI does not have any delay slot. Decoding of SWI causes the following actions to be taken by the ARP32 CPU:

- The CSR:INUM field is updated with the SWI interrupt ID.
- The CSR content is copied to the SCSR.
- All architectural registers (R0-R7) and HLA registers (LSAn, LEAn, and LCNTn) are saved to the corresponding shadow registers.
- The CSR[0]GIE bit is cleared.
- The address of the next instruction (interrupt return address) to be stored to the IRP register.
- The cpu_iack_o is asserted for a cycle along with the corresponding interrupt ID on cpu_inum_o.
- An instruction fetch request to SWI IST location is sent and eventually the SWI IST entry is loaded into the PC. As a result, the CPU begins executing the SWI ISR.

To exit a SWI service routine, the **BIRP** instruction must be used. Execution of the **BIRP** instruction causes:

- The SCSR content is copied to the CSR.
- All architectural registers (R0-R7) and HLA registers (LSAn, LEAn, and LCNTn) are restored from the corresponding shadow registers.
- The PC loaded with the contents of the IRP.

6.2.4.18.7.4 Maskable Interrupts

The ARP32 CPU supports 12 maskable interrupts (INT15-INT4). For a maskable interrupt to be detected (and processed) by the ARP32 CPU:

- The global (maskable) interrupt enable (GIE) bit in the control status register (CSR) must be set to 1. The GIE bit is cleared to 0 at reset to prevent a maskable interrupt being taken prematurely (before system initialization). The GIE bit is set (to enable maskable interrupts) only after the system has been properly initialized and is ready to accept interrupts. The GIE bit is also cleared at the occurrence of an interrupt (NMI, INT15-INT4, SWI, and UNDEF) to prevent another interrupt from being processed; it may be set again in the ISR (to enable nested maskable interrupts) by software after the CPU state has been saved off properly.
- The IER:NMIE bit must be set.
- The corresponding enable bit in the interrupt enable register (IER) must also be set. IER bits allow enabling/disabling single maskable interrupt at a time.

When any of the IFR flag bits (IFR[15-4]) of maskable interrupts are set, (as a result of an maskable interrupt assertion via cpu_int[15-4]_i input pins), assuming the previous conditions are met, the ARP32 CPU accepts the highest priority interrupt and performs the following actions to process the interrupt:

- CPU stops fetching further instruction from instruction memory
- CPU execute pipe is allowed to drain
  - Any load/store instructions (including **LDRF, STRF, CALL, RET**) currently executing are allowed to complete
  - Any instruction in the branch/call/return delay slot is allowed to complete
- The CSR[11:8]INUM field is updated with the corresponding maskable interrupt ID.
- The CSR content is copied to the SCSR.
- All architectural registers (R0-R7) and HLA registers (LSAn, LEAn, and LCNTn) are saved to the corresponding shadow registers.
- The CSR[0]GIE bit is cleared.
- The associated bit in the IFR is cleared.
- The PC value of the next instruction to execute (after completion of the interrupt service routine) is stored to the IRP register. This is the interrupt return address.
- The cpu_iack_o is asserted for a cycle along with the corresponding interrupt ID on cpu_inum_o.
- An instruction fetch request to the corresponding IST location is sent and eventually the IST entry is loaded into the PC. As a result, the CPU begins executing the corresponding interrupt service routine.

To exit a maskable service routine, the **BIRP** instruction must be used. Execution of the **BIRP** instruction causes:

- The SCSR content is copied to the CSR.
- All architectural registers (R0-R7) and HLA registers (LSAn, LEAn, and LCNTn) are restored from the corresponding shadow registers.
- The PC loaded with the contents of the IRP.

6.2.4.18.7.5 UNDEF Interrupt

An UNDEF interrupt is triggered by either of the following conditions:

- The CPU decodes an undefined/unsupported instruction, an unmapped primary opcode in instruction word 7:0. This normally happen as a result of instruction memory getting corrupted. Note that not all kinds of invalid opcodes are detected by the CPU; for example, invalid fields other than the primary opcode of a valid instruction.
- The CPU executes a **DIV/DIVU/MOD/MODU** instruction where the divisor operand (*src1*) is 0.

An UNDEF interrupt causes the UNDEF IST entry to be loaded into the PC. UNDEF interrupts are always enabled, it does not have a corresponding entry in the IFR, ICR, ISR, or IER, and is unaffected by the state of the CSR[0]GIE or IER[1]NMIE bits.

The ARP32 CPU treats an UNDEF as an irrecoverable exception. It is not possible to correctly return from an UNDEF interrupt. The only way to recover from an UNDEF interrupt is to reset the CPU.

For example, when UNDEF is caused by an invalid instruction decode, the size of (undecoded) instruction under consideration is not determined unambiguously (since the ARP32 CPU supports freely mixable 16-bit and 32-bit instructions) and hence a recoverable return address is not saved to the IRP while taking an UNDEF interrupt.

The purpose of the UNDEF interrupt is to provide just the basic detection and diagnostic mechanism when such an irrecoverable fault occurs in the system. It is software responsibility to design such an UNDEF handler such that within the UNDEF handler context (without requiring to return from the UNDEF interrupt service routine), it can do diagnostic check(s), if any, and inform the external world (for example, a host CPU) that an irrecoverable fault/exception has happened within the ARP32 CPU that cannot be handled.

It is possible an **IDLE** instruction to be used in the UNDEF interrupt service routine to hold the processor in the UNDEF service routine, for debug purposes, and avoid returning to an incorrect instruction boundary (because of incorrect return address saved to IRP/NRP) causing further UNDEF(s).

Also a manipulation of the IRP to return to some known address (after clearing all machine state correctly, for example, CSR, SCSR), for example the C entry point (__cinit_00) with the expectation that the CPU practically re-executes from reset with all ISA initialization done freshly by the boot code at the entry point. However, it is still just a workaround considering that the root cause of instruction memory corrupt remains uncorrected.

When an undefined instruction is decoded by the ARP32 CPU it performs the following action:

- The CSR[11:8]INUM field is updated with the UNDEF interrupt ID.
- The CSR content is copied to the SCSR.
- All architectural registers (R0-R7) and HLA registers (LSAn, LEAn, and LCNTn) are saved to the corresponding shadow registers.
- The CSR[0]GIE bit is cleared.
- The address of the next instruction (interrupt return address) to be stored to the IRP register.
- The cpu_iack_o is asserted for a cycle along with the corresponding interrupt ID on cpu_inum_o.
- An instruction fetch request to the UNDEF IST location is sent and eventually the UNDEF IST entry is loaded into the PC. As a result, the CPU begins executing the UNDEF interrupt service routine.

To exit an UNDEF service routine, the **BIRP** instruction is used. Execution of the **BIRP** instruction causes:

- The SCSR content is copied to the CSR.
- All architectural registers (R0-R7) and HLA registers (LSAn, LEAn, and LCNTn) are restored from the corresponding shadow registers.
- The PC loaded with the contents of the IRP.

However, it is not assured to result in successfully returning to a correct instruction boundary. More UNDEF may follow immediately.

6.2.4.18.8 Interrupt Context Save and Restore

The ARP32 CPU supports extensive automatic context save and restore during interrupt processing to reduce the effective interrupt latency significantly.

While processing all maskable interrupts (INT15-INT4) , SWI and UNDEF, the ARP32 CPU saves off all key registers into shadow registers and during an interrupt return, via the **BIRP** instruction, restores them back:

- The Control Status Register (CSR) is saved to Shadow Control Status Register (SCSR)
- All architectural registers (R0-R7) are saved to corresponding shadow registers (SR0-SR7)
- The HLA setup registers (LSA*n*, LEA*n*, LCNT*n*, LCNT0RLD) are saved to the corresponding shadow registers (SLSAn, SLEAn, SLCNTn, SLCNT0RLD)

Both saving and restoring happens in a single cycle in parallel to interrupt vector fetch or the return branch execution. Also, as long as interrupt nesting is not enabled, there is absolutely no need of any additional context save (or restore) by the software at the start (or end) of the interrupt service routine. Hence, these interrupts have extremely low effective latency and are considered fast.

While processing the non-maskable interrupt (NMI), however, the CPU does not do extensive context save and restore. Only the CSR register is saved off to NMISCSR and during an NMI return, via the **BNRP** instruction, CSR is restored back. So, at the beginning of an NMI ISR, the software ensures to save off the complete CPU state to stack and restore them back before issuing a **BNRP** instruction (to accomplish a return from NMI):

- All architectural registers (R0-R7)
- The HLA setup registers (LSAn, LEAn, LCNTn, LCNT0RLD)

Thus, the interrupt behavior of the ARP32 CPU makes all maskable interrupts (INT15-INT4), SWI, and UNDEF as fast, and non-maskable interrupt (NMI) as just correct. The maskable interrupts (INT15-INT4) are used as the functional interrupt(s) of the system and the NMI are used to handle/service System Error, Exception scenarios (for example, a bus fault on program or data access).

The following example illustrates the process of context save and restore within an NMI service routine. In this example, the `NMIHandler()` is the actual software NMI handler function and a single unified stack across background and interrupt handler code is intended.

```
__NonMaskableInterruptHandlerWrapper:

        ; Save off Arch regs first
          STRF   R7, R0

        ; Save off HLA regs
          MVC    LSA0,     R0
          MVC    LEA0,     R1
          MVC    LCNT0,    R2
          MVC    LSA1,     R3
          MVC    LEA1,     R4
          MVC    LCNT1,    R5
          MVC    LCNT0RLD, R6
          STRF   R6, R0

        ; Now call the actual handler function
          CALL   NMIHandler
          NOP

        ; Restore HLA regs
          LDRF   R0, R6
          MVC    R0, LSA0
          MVC    R1, LEA0
          MVC    R2, LCNT0
          MVC    R3, LSA1
          MVC    R4, LEA1
          MVC    R5, LCNT1
          MVC    R6, LCNT0RLD

        ; Restore Arch regs
          LDRF   R0, R7

        ; Return from NMI ISR
          BNRP
          NOP
```

Note that in the example, during context restore, a write to LCNT0 also gets written to LCNT0RLD. Hence, the LCNT0RLD register is restored after LCNT0 is restored.

6.2.4.18.9 Nested Interrupts

When an interrupt (INT15–INT4, SWI, and UNDEF) is taken, the CSR[0]GIE bit is cleared by the hardware and subsequently the GIE bit is restored on interrupt return via the **BIRP** instruction. Thus all maskable interrupts (INT15–INT4) are disabled within the interrupt service routine of maskable interrupts.

Also, when an NMI is taken, the IER[1]NMIE bit is cleared by the hardware and subsequently the IER[1]NMIE bit is restored on interrupt return via the **BNRP** instruction. Thus NMI and all maskable interrupts (INT15–INT4) are disabled within the NMI service routine.

So in general, nesting of interrupts (except the case of NMI within a maskable interrupt routine) is disabled. However, under software control, it is possible that the ARP32 CPU is configured to take fully nested interrupts.

The ARP32 CPU offers two programming models with respect to usage of interrupts in a nested or non-nested manner.

6.2.4.18.9.1 Non-nested Interrupt Model

In this programming model, the CSR[0]GIE (or IER[1]NMIE) bit is not enabled within interrupts service routine of maskable interrupts (INT15–INT4), SWI, or UNDEF interrupt (or NMI). Hence, maskable interrupts (INT15–INT4), SWI, and UNDEF are not nested. However, an NMI is taken as a nested interrupt within a maskable interrupt (INT15–INT4), SWI, or UNDEF.

While adopting this programming model, the following points must be noted:

- It is the software responsibility to not use an **SWI** instruction within an ISR context. Otherwise, SWI corrupts the shadow registers and results in an unpredictable behavior.
- An UNDEF interrupts may be taken. UNDEF interrupts are irrecoverable exception and cannot be recovered from (see Section 6.2.4.18.7.5)
- NMI service routine follows the procedure described in Section 6.2.4.18.8. An NMIE must not be enabled within an NMI service routine as nesting of NMI itself is not supported.

Note that this programming model offers fast response time to system events via the maskable interrupt lines (INT15–INT4) by fully exploiting the extensive automatic context save/restore feature of the ARP32 CPU (see Section 6.2.4.18.8).

6.2.4.18.9.2 Nested Interrupt Model

In this programming model, the CSR[0]GIE bit is enabled within the interrupts service routine of maskable interrupts (INT15–INT4), SWI, or UNDEF interrupt. Hence, it is possible that maskable interrupts are nested. An NMI can always be taken with all other non-NMI interrupts.

Before enabling the CSR[0]GIE bit (in ISR), the software must ensure proper context save of all CPU registers onto the stack:

- Architectural registers (R0-R7)
- Shadow registers (SR0-SR7)
- Key control registers: SCSR, IRP/NRP
- Optional control register: SP, IER

While adopting this programming model, the following points must be noted:

- The SP needs to be saved, if a separate stack for the interrupt service routine is required
- IER needs to be saved, if a different interrupt mask is expected within an ISR
- Once the GIE bit is enabled, even the current interrupt (the once being serviced) becomes enabled to be re-entered. If reentrant behavior is not intended, IER must be appropriately modified after saving it off to the stack.
- NMI service routine must follow the procedure described in Section 6.2.4.18.8. An NMIE must not be enabled within an NMI service routine as nesting of NMI itself is not supported. All maskable interrupts (INT15–INT4) and NMI remain disabled within an NMI service routine.

The following example illustrates the process of context save and restore within a maskable interrupt service routine. In this example, it is assumed that the `InterruptHandler()` is the actual software interrupt handler function and a single unified stack across background and interrupt handler code is intended.

```
__NonMaskableInterruptHandlerWrapper:

        ; Save off Arch regs first
          STRF   R7, R0

        ; Save off HLA shadow regs
          MVS    SLSA0,     R0
          MVS    SLEA0,     R1
          MVS    SLCNT0,    R2
          MVS    SLSA1,     R3
          MVS    SLEA1,     R4
          MVS    SLCNT1,    R5
          MVS    SLCNT0RLD, R6
          STRF   R6, R0

        ; Save off SCSR, IRP
          MVC    SCSR,     R0
          MVC    IRP,      R1
          STRF   R1, R0

        ; Now call the actual handler function
          CALL   InterruptHandler
          NOP

        ; Restore SCSR, IRP
          LDRF   R0, R1

          MVS    R0, SR7

        ; Return from NMI ISR
          BIRP
          NOP
```

6.2.4.18.10 Non-nested Interrupt Latency

This section describes the best and worst case interrupt latencies in the non-nested interrupt programming model (described in Section 6.2.4.18.9.1).

6.2.4.18.10.1 Best Case Interrupt Latency

In the best case (and the most frequent case), the ARP32 CPU takes an interrupt as soon as (very next cycle) it is signaled at its boundary via the cpu_int[15-4]_i or cpu_nmi_i input ports. In this case, the ARP32 CPU takes as little as 5 cycles (from the cycle when the IFR bit gets set) to start executing the first instruction of the ISR:

- **Cycle 0:** cpu_int[15-4]_i or cpu_nmi_i assertion
- **Cycle 1:** corresponding IFR bit is set, interrupt enable conditions checked, interrupt priorities resolved, a winner interrupt is selected to be taken
- **Cycle 2:** cpu_iack_o, cpu_inum_o are asserted, program read request is sent to the corresponding IST address associate with the interrupt being serviced
- **Cycle 3:** program read data (IST content) is received and is loaded to PC
- **Cycle 4:** program read request is sent to the first instruction of the ISR routine
- **Cycle 5:** first instruction of the ISR routine is decoded
- **Cycle 6:** first instruction of the ISR routine is executed

Note that the ARP32 CPU saves off all architectural registers and other required CPU registers while taking the interrupt (in cycle 1) and as a result the ISR routine does not need to have any instructions to save off the machine state. The ISR routine directly starts executing code related to actual actions to be taken to service the interrupt.

6.2.4.18.10.2 Worst Case Interrupt Latency

Under certain cases, the ARP32 CPU blocks taking an interrupt, thus introducing variable interrupt latency. The following are the worst cases:

- When a load/store multiple (**LDRF, STRF**) instruction is at the EXE stage of the CPU pipeline and an interrupt is asserted. The interrupt is not taken until the **LDRF/STRF** instruction is completed, which takes several (variable) cycles.

  In compiler-generated code, **LDRF/STRF** is normally used as a function context save/restore across function calls; a maximum of three save-on-entry (SOE) registers as per the ARP32 CPU EABI function calling convention. Thus, three load/stores would need to finish before the CPU takes an interrupt. Moreover, if the stack pointer points to a wait-stated memory, this register save/restore takes even longer. Also, the program fetch request to the IST is stalled if the corresponding memory region is not zero-wait state, thus, increasing interrupt latency further.
- When a blocking, multicycle execute (**DIV/DIVU/MOD/MODU**) instruction is at the EXE stage of the CPU pipeline and an interrupt is asserted. The interrupt is not taken until the instruction at EXE is completed, which takes 13 (fixed) cycles.

6.2.5 Instruction Set

This section provides a description of the instruction set. Unless otherwise explicitly mentioned, all instructions are a single execute cycle instruction. All instructions that are multicycle execute are mentioned explicitly.

6.2.5.1 Instruction Operation and Execution Notations

Table 6-346 explains the symbols used in the instruction Pseudo Code descriptions.

All immediate values are unsigned (zero-extended) or signed (sign-extended) to match the relevant associated operand size. For example, zero (or sign) extended to 32 bits for operations with architectural registers (32 bit in size), zero-extended to 32 bits for operation with SP (32 bits in size), and zero-extended to the width of the PC for operations with the PC.

Although the instruction set architecture (ISA) does not contain a writable program counter (PC) register, in the description of some instructions (especially in the pseudo code), a conceptual register, PC, has been used. This is to simplify the description and does not imply existence of such a physical register.

Table 6-346. Instruction Pseudo Code Notations

Symbol	Meaning
AND	bitwise AND
areg	architectural register (R0-R7)
baseR	base address register
creg	control register
dst	destination operand
GDP	global data pointer register
lmb0(x)	leftmost 0 bit search of x
lmb1(x)	leftmost 1 bit search of x
lsb*n*	n least-significant bits (for example, lsb32)
op*n*	field within opcode that specifies a unique instruction
OR	bitwise OR
PC	program counter
sat	saturate
SP	stack pointer register
src1	source operand 1
src2	source operand 2
sreg	shadow register
ucst*n*	n-bit unsigned immediate constant field (for example, ucst6)
XOR	bitwise exclusive-OR
+	addition
-	subtraction
×	multiplication
/	division
%	modulo
~	logical inverse
++	increment by 1
==	equal to
>	greater than
>=	greater than or equal to
<	less than
<=	less than or equal to
<<	shift left
>>	shift right
&&	logical AND

6.2.5.2 Instruction Syntax and Opcode Notations

Table 6-347 defines the syntaxes and opcode fields used in the instruction descriptions.

Table 6-347. Instruction Syntax and Opcode Notations

Symbol	Meaning
areg	architectural register (R0-R7)
baseR	base address register
cc	condition code (LT, GT, EQ, LE, GE, NE)
creg	control register
dst	destination
GDP	global data pointer register
opn	opfield; field within opcode that specifies a unique instruction
scstn	n-bit signed constant field
sreg	shadow register
SP	stack pointer register
src1	source 1
src2	source 2
ucstn	n-bit unsigned constant field
x	don't care

6.2.5.3 Instruction Scheduling Restrictions

The ARP32 CPU architecture places the following restrictions on instruction scheduling that must be maintained. Whereas the compiler maintains these restrictions while generating assembly code for C/C++ programs, it is the responsibility of the programmer to maintain the restrictions for codes written directly in assembly.

6.2.5.3.1 Restrictions Applicable to a Branch Delay Slot

The following restrictions are applicable for an instruction in the delay slot of a branch (**Bcc** *scst9*, **Bcc** *scst16*, or **Bcc** *dst*), call (**CALL** *scst22* or **CALL** *src1*), and return (**RET**) instruction:

- 32-bit instructions are not allowed
- Another branch/call/return is not allowed
- **IDLE** instruction is not allowed
- **SWI** instruction is not allowed
- **LDRF/STRF** instructions with more than one register operand

Also, a branch delay slot cannot be the target of any branch/call/return.

6.2.5.3.2 Restrictions on Loops Using Hardware Loop Assist (HLA)

Loops setup using the HLA mechanism (Section 6.2.4.17) are required to maintain the following restrictions:

- Minimum number of instructions in Loop 0 is 2
- Branches (**Bcc/CALL/RET** + the delay slot instruction) cannot be placed at the end of a loop. This makes the loop rewind and branch target unambiguous.
- Last two instruction of any level cannot be a multi-slot load/store multiple (**LDRF/STRF**)
- Software cannot branch (**Bcc/CALL/RET**) to the last instruction of any loop, that is, the last instruction of any loop cannot be a branch target.

6.2.5.3.3 Restrictions on Other Types of Control Flow Instructions

The following restrictions are applicable for other types of control flow instructions:

- **SWI** instruction must be followed by a **NOP**
- **BIRP/BNRP** instructions must be followed by a **NOP**

6.2.5.3.4 Restrictions for Write Data Bypass to Control Register Reads

The following restrictions are applicable for write data bypass to control register reads:

- An **MVC** instruction that writes to a control register (**MVC** *areg, creg*; **MVC** *ucst16, creg*; or **MVCH** *ucst16, creg*), must not be followed by an **MVC** instruction (**MVC** *creg, areg*) that reads the same control register.
- An **SLA** instruction that writes to a control register (**SLA** *ucst16*, LSA*n* or **SLA** *ucst16*, LEA*n*) must not be followed by an **MVC** instruction (**MVC** *creg, areg*) that reads the same control register.
- An **SLA** instruction that writes to a control register (**SLA** *ucst16*, LSA*n* or **SLA** *ucst16*, LEA*n*) must not be followed by an **MVCH** instruction (**MVCH** *creg, areg*) that reads the same control register.

6.2.5.3.5 Restrictions for Write Data Bypass to Shadow Register Reads

The following restriction is applicable for write data bypass to shadow register reads:

- Thereare at least two instructions separating an **MVS** instruction writing to a shadow register (**MVS** *areg, sreg*) and another **MVS** instruction reading the same shadow register (**MVS** *sreg, areg*).

6.2.5.3.6 Restrictions for Link Register Update

The following restriction is applicable for link register update:

- Link registers cannot be read or written in the delay slot of a call (**CALL** *scst22* or **CALL** *src1*) and return (**RET**) instruction.

6.2.5.4 Instruction Set Encoding

The ARP32 ISA comprises of a mix of 16-bit and 32-bit instructions. An instruction packet is defined as a 32-bit field for a 32-bit instruction and a 16-bit field for a 16-bit instruction. The instruction decoder is sent an instruction packet every cycle.

6.2.5.5 Instruction Descriptions

Table 6-348 lists the instructions for the ARP32 CPU.

Table 6-348. Instruction Summary

Instruction	Description	Size
ABS src2, dst	Absolute value of a register	16-bit
ADD ucst16, src2, dst	Add 16-bit unsigned constant to a register	32-bit
ADD ucst16, SP	Add 16-bit unsigned constant to stack pointer, result to stack pointer	32-bit
ADD ucst16, SP, dst	Add 16-bit unsigned constant to stack pointer, result to register	32-bit
ADD ucst3, src2, dst	Add 3-bit unsigned constant to a register	16-bit
ADD src1, src2, dst	Signed addition of two register values	16-bit
AND ucst16, src2, dst	Bitwise AND 16-bit unsigned constant with a register	32-bit
AND src1, src2, dst	Bitwise AND two registers	16-bit
B dst	Indirect unconditional branch using a register	16-bit
BEQ dst	Indirect conditional branch using a register	16-bit
BGE dst	Indirect conditional branch using a register	16-bit
BGT dst	Indirect conditional branch using a register	16-bit
BLE dst	Indirect conditional branch using a register	16-bit

Table 6-348. Instruction Summary (continued)

Instruction	Description	Size
BLT dst	Indirect conditional branch using a register	16-bit
BNE dst	Indirect conditional branch using a register	16-bit
B scst9	Direct unconditional branch using a 9-bit signed constant offset	16-bit
BEQ scst9	Direct conditional branch using a 9-bit signed constant offset	16-bit
BGE scst9	Direct conditional branch using a 9-bit signed constant offset	16-bit
BGT scst9	Direct conditional branch using a 9-bit signed constant offset	16-bit
BLE scst9	Direct conditional branch using a 9-bit signed constant offset	16-bit
BLT scst9	Direct conditional branch using a 9-bit signed constant offset	16-bit
BNE scst9	Direct conditional branch using a 9-bit signed constant offset	16-bit
B scst16	Direct unconditional branch using a 16-bit signed constant offset	32-bit
BEQ scst16	Direct conditional branch using a 16-bit signed constant offset	32-bit
BGE scst16	Direct conditional branch using a 16-bit signed constant offset	32-bit
BGT scst16	Direct conditional branch using a 16-bit signed constant offset	32-bit
BLE scst16	Direct conditional branch using a 16-bit signed constant offset	32-bit
BLT scst16	Direct conditional branch using a 16-bit signed constant offset	32-bit
BNE scst16	Direct conditional branch using a 16-bit signed constant offset	32-bit
BIRP	Unconditional branch to interrupt return pointer	16-bit
BKPT	Software breakpoint	16-bit
BNRP	Unconditional branch to NMI return pointer	16-bit
CALL src1	Unconditional call using a register	16-bit
CALL scst22	Unconditional call using a 22-bit signed constant offset	32-bit
CLR ucst5_1, ucst5_2, src2, dst	Clear bit field bounded by two immediate values	32-bit
CLR src1, src2, dst	Clear bit field bounded by two register values	32-bit
CMP scst16, src2	Compare for equality, less than, greater than, 16-bit signed constant to a register	32-bit
CMP scst3, src2	Compare for equality, less than, greater than, 3-bit signed constant to a register	16-bit
CMP src1, src2	Signed compare for equality, less than, greater than, two register values	16-bit
CMPU ucst16, src2	Compare for equality, less than, greater than, 16-bit unsigned constant to a register	32-bit
CMPU ucst3, src2	Compare for equality, less than, greater than, 3-bit unsigned constant to a register	16-bit
CMPU src1, src2	Unsigned compare for equality, less than, greater than, two register values	16-bit
DIV src1, src2, dst	Signed division of two register values	32-bit
DIVU src1, src2, dst	Unsigned division of two register values	32-bit
EXT ucst5_1, ucst5_2, src2, dst	Extract and sign-extend a bit field bounded by two immediate values	32-bit
EXT src1, src2, dst	Extract and sign-extend a bit field bounded by two register values	32-bit
EXTU ucst5_1, ucst5_2, src2, dst	Extract and zero-extend a bit field bounded by two immediate values	32-bit
EXTU src1, src2, dst	Extract and zero-extend a bit field bounded by two register values	32-bit
IDLE	Idle until interrupt or reset	16-bit
LDB *+baseR[ucst3], dst	Load signed byte from memory with a 3-bit unsigned constant offset	16-bit
LDB *+baseR[ucst16], dst	Load signed byte from memory with a 16-bit unsigned constant offset	32-bit
LDB *+baseR[src1], dst	Load signed byte from memory with a register offset	16-bit
LDB *baseR++[ucst3], dst	Load signed byte from memory, postincrement memory with a 3-bit unsigned constant offset	16-bit
LDB *baseR++[src1], dst	Load signed byte from memory, postincrement memory with a register offset	16-bit

Table 6-348. Instruction Summary (continued)

Instruction	Description	Size
LDB *+SP[ucst6], dst	Load signed byte from memory with a SP-relative 6-bit unsigned constant offset	16-bit
LDB *+SP[ucst19], dst	Load signed byte from memory with a SP-relative 19-bit unsigned constant offset	32-bit
LDB *+GDP[ucst19], dst	Load signed byte from memory with a GDP-relative 19-bit unsigned constant offset	32-bit
LDBU *+baseR[ucst3], dst	Load unsigned byte from memory with a 3-bit unsigned constant offset	16-bit
LDBU *+baseR[ucst16], dst	Load unsigned byte from memory with a 16-bit unsigned constant offset	32-bit
LDBU *+baseR[src1], dst	Load unsigned byte from memory with a register offset	16-bit
LDBU *baseR++[ucst3], dst	Load unsigned byte from memory, postincrement memory with a 3-bit unsigned constant offset	16-bit
LDBU *baseR++[src1], dst	Load unsigned byte from memory, postincrement memory with a register offset	16-bit
LDBU *+SP[ucst6], dst	Load unsigned byte from memory with a SP-relative 6-bit unsigned constant offset	16-bit
LDBU *+SP[ucst19], dst	Load unsigned byte from memory with a SP-relative 19-bit unsigned constant offset	32-bit
LDBU *+GDP[ucst19], dst	Load unsigned byte from memory with a GDP-relative 19-bit unsigned constant offset	32-bit
LDH *+baseR[ucst3], dst	Load signed halfword from memory with a 3-bit unsigned constant offset	16-bit
LDH *+baseR[ucst16], dst	Load signed halfword from memory with a 16-bit unsigned constant offset	32-bit
LDH *+baseR[src1], dst	Load signed halfword from memory with a register offset	16-bit
LDH *baseR++[ucst3], dst	Load signed halfword from memory, postincrement memory with a 3-bit unsigned constant offset	16-bit
LDH *baseR++[src1], dst	Load signed halfword from memory, postincrement memory with a register offset	16-bit
LDH *+SP[ucst6], dst	Load signed halfword from memory with a SP-relative 6-bit unsigned constant offset	16-bit
LDH *+SP[ucst19], dst	Load signed halfword from memory with a SP-relative 19-bit unsigned constant offset	32-bit
LDH *+GDP[ucst19], dst	Load signed halfword from memory with a GDP-relative 19-bit unsigned constant offset	32-bit
LDHU *+baseR[ucst3], dst	Load unsigned halfword from memory with a 3-bit unsigned constant offset	16-bit
LDHU *+baseR[ucst16], dst	Load unsigned halfword from memory with a 16-bit unsigned constant offset	32-bit
LDHU *+baseR[src1], dst	Load unsigned halfword from memory with a register offset	16-bit
LDHU *baseR++[ucst3], dst	Load unsigned halfword from memory, postincrement memory with a 3-bit unsigned constant offset	16-bit
LDHU *baseR++[src1], dst	Load unsigned halfword from memory, postincrement memory with a register offset	16-bit
LDHU *+SP[ucst6], dst	Load unsigned halfword from memory with a SP-relative 6-bit unsigned constant offset	16-bit
LDHU *+SP[ucst19], dst	Load unsigned halfword from memory with a SP-relative 19-bit unsigned constant offset	32-bit
LDHU *+GDP[ucst19], dst	Load unsigned halfword from memory with a GDP-relative 19-bit unsigned constant offset	32-bit
LDW *+baseR[ucst3], dst	Load word from memory with a 3-bit unsigned constant offset	16-bit
LDW *+baseR[ucst16], dst	Load word from memory with a 16-bit unsigned constant offset	32-bit
LDW *+baseR[src1], dst	Load word from memory with a register offset	16-bit
LDW *baseR++[ucst3], dst	Load word from memory, postincrement memory with a 3-bit unsigned constant offset	16-bit

Table 6-348. Instruction Summary (continued)

Instruction	Description	Size
LDW *baseR++[src1], dst	Load word from memory, postincrement memory with a register offset	16-bit
LDW *+SP[ucst6], dst	Load word from memory with a SP-relative 6-bit unsigned constant offset	16-bit
LDW *+SP[ucst19], dst	Load word from memory with a SP-relative 19-bit unsigned constant offset	32-bit
LDW *+GDP[ucst19], dst	Load word from memory with a GDP-relative 19-bit unsigned constant offset	32-bit
LDRF op1, op2	Load register file from stack pointer	16-bit
LMBD ucst3, src2, dst	Left most bit detection	32-bit
MAX src1, src2, dst	Maximum of two signed register values	32-bit
MAXU src1, src2, dst	Maximum of two unsigned register values	32-bit
MIN src1, src2, dst	Minimum of two signed register values	32-bit
MINU src1, src2, dst	Minimum of two unsigned register values	32-bit
MOD src1, src2, dst	Signed modulo (32 % 32 = 32)	32-bit
MODU src1, src2, dst	Unsigned modulo (32 % 32 = 32)	32-bit
MPY src1, src2, dst	Signed multiplication of two register values (32-bit × 32-bit = 32-bit)	32-bit
MPYU src1, src2, dst	Unsigned multiplication of two register values (32-bit × 32-bit = 32-bit)	32-bit
MV src1, dst	Move register to register	16-bit
MVC areg, creg	Move architectural register to control register	16-bit
MVC creg, areg	Move control register to architectural register	16-bit
MVC ucst16, creg	Move 16-bit unsigned constant to control register	32-bit
MVCH ucst16, creg	Move 16-bit unsigned constant to upper bits of control register	32-bit
MVK ucst16, dst	Move 16-bit unsigned constant to register	32-bit
MVKH ucst16, dst	Move 16-bit unsigned constant to upper bits of register	32-bit
MVKLS scst16, dst	Move 16-bit signed constant to register	32-bit
MVKS scst6, dst	Move 6-bit signed constant to register	16-bit
MVS areg, sreg	Move architectural register to shadow register	16-bit
MVS sreg, areg	Move shadow register to architectural register	16-bit
NEG src2, dst	Negation	16-bit
NOP	No operation	16-bit
NOT src2, dst	Bitwise NOT	16-bit
OR ucst16, src2, dst	Bitwise OR 16-bit unsigned constant with a register	32-bit
OR src1, src2, dst	Bitwise OR two registers	16-bit
RET	Return from subroutine	16-bit
REV src1, src2, dst	Reverse a bit field bounded by two register values	32-bit
ROT src1, src2, dst	Rotate right	32-bit
ROTC src1, src2, dst	Rotate right through carry bit	32-bit
SADD src1, src2, dst	Signed addition of two register values with saturation	16-bit
SATN ucst3, src2, dst	Saturation to signed/unsigned *n*-bit value with sign/zero extend	32-bit
SET ucst5_1, ucst5_2, src2, dst	Set bit field bounded by two immediate values	32-bit
SET src1, src2, dst	Set bit field bounded by two register values	32-bit
SHL ucst5, src2, dst	Logical shift left by 5-bit unsigned constant	32-bit
SHL src1, src2, dst	Logical shift left by register value	16-bit
SHRA ucst5, src2, dst	Arithmetic shift right by 5-bit unsigned constant	32-bit
SHRA src1, src2, dst	Arithmetic shift right by register value	16-bit
SHRU ucst5, src2, dst	Logical shift right by 5-bit unsigned constant	32-bit
SHRU src1, src2, dst	Logical shift right by register value	16-bit
SLA ucst16, creg	Set loop address	32-bit

Table 6-348. Instruction Summary (continued)

Instruction	Description	Size
SSUB src1, src2, dst	Subtraction of two register values with saturation	16-bit
STB dst, *+baseR[ucst3]	Store byte to memory with a 3-bit unsigned constant offset	16-bit
STB dst, *+baseR[ucst16]	Store byte to memory with a 16-bit unsigned constant offset	32-bit
STB dst, *+baseR[src1]	Store byte to memory with a register offset	16-bit
STB dst, *baseR++[ucst3]	Store byte to memory, postincrement memory with a 3-bit unsigned constant offset	16-bit
STB dst, *baseR++[src1]	Store byte to memory, postincrement memory with a register offset	16-bit
STB dst, *+SP[ucst6]	Store byte to memory with a SP-relative 6-bit unsigned constant offset	16-bit
STB dst, *+SP[ucst19]	Store byte to memory with a SP-relative 19-bit unsigned constant offset	32-bit
STB dst, *+GDP[ucst19]	Store byte to memory with a GDP-relative 19-bit unsigned constant offset	32-bit
STH dst, *+baseR[ucst3]	Store halfword to memory with a 3-bit unsigned constant offset	16-bit
STH dst, *+baseR[ucst16]	Store halfword to memory with a 16-bit unsigned constant offset	32-bit
STH dst, *+baseR[src1]	Store halfword to memory with a register offset	16-bit
STH dst, *baseR++[ucst3]	Store halfword to memory, postincrement memory with a 3-bit unsigned constant offset	16-bit
STH dst, *baseR++[src1]	Store halfword to memory, postincrement memory with a register offset	16-bit
STH dst, *+SP[ucst6]	Store halfword to memory with a SP-relative 6-bit unsigned constant offset	16-bit
STH dst, *+SP[ucst19]	Store halfword to memory with a SP-relative 19-bit unsigned constant offset	32-bit
STH dst, *+GDP[ucst19]	Store halfword to memory with a GDP-relative 19-bit unsigned constant offset	32-bit
STW dst, *+baseR[ucst3]	Store word to memory with a 3-bit unsigned constant offset	16-bit
STW dst, *+baseR[ucst16]	Store word to memory with a 16-bit unsigned constant offset	32-bit
STW dst, *+baseR[src1]	Store word to memory with a register offset	16-bit
STW dst, *baseR++[ucst3]	Store word to memory, postincrement memory with a 3-bit unsigned constant offset	16-bit
STW dst, *baseR++[src1]	Store word to memory, postincrement memory with a register offset	16-bit
STW dst, *+SP[ucst6]	Store word to memory with a SP-relative 6-bit unsigned constant offset	16-bit
STW dst, *+SP[ucst19]	Store word to memory with a SP-relative 19-bit unsigned constant offset	32-bit
STW dst, *+GDP[ucst19]	Store word to memory with a GDP-relative 19-bit unsigned constant offset	32-bit
STHI ucst16, *+baseR[ucst6]	Store 16-bit halfword to memory with a 6-bit unsigned constant offset	32-bit
STRF op1, op2	Store register file to stack pointer	16-bit
SUB ucst16, src2, dst	Subtract 16-bit unsigned constant from a register	32-bit
SUB ucst16, SP	Subtract 16-bit unsigned constant from stack pointer, result to stack pointer	32-bit
SUB ucst16, SP, dst	Subtract 16-bit unsigned constant from stack pointer, result to register	32-bit
SUB ucst3, src2, dst	Subtract 3-bit unsigned constant from a register	16-bit
SUB src1, src2, dst	Signed subtraction of two register values	16-bit
SWI	Software interrupt	16-bit
XOR ucst16, src2, dst	Bitwise XOR 16-bit unsigned constant with a register	32-bit
XOR src1, src2, dst	Bitwise XOR two registers	16-bit

ABS *Absolute Value*

Syntax

ABS *src2, dst*

Functional unit = L

Opcode

16 bit

15 13	12 10	9									0
dst	*src2*	0	0	0	1	0	0	0	0	0	0
3	3	*opcode*									

Description

The absolute value of *src2* is placed in *dst*. Note that *src2* is considered a signed 32-bit value.

Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = (src2 < 0)? -src2:src2
```

ADD *Add 16-Bit Unsigned Constant to Register*

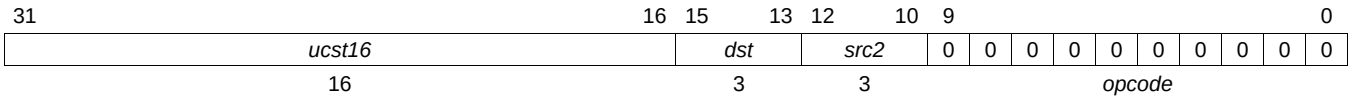
Syntax

ADD *ucst16, src2, dst*

Functional unit = D

Opcode

32 bit



Description

Addition of a 16-bit unsigned constant (*ucst16*) with *src2* and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

CSR[5]C = {carry out} from (dst + {zero extend}ucst16)

CSR[7]V = {overflow} from (dst + {zero extend}ucst16)

Note that the carry (CSR:C) and overflow (CSR:V) bits are relevant to unsigned and signed operations, respectively. Appropriate bits are checked depending on if the operands are represented (or, interpreted) as unsigned or signed numbers.

Pseudo Code

```
dst = src2 + {zero extend}ucst16
```

ADD *Add 16-Bit Unsigned Constant to Stack Pointer, Result to Stack Pointer*

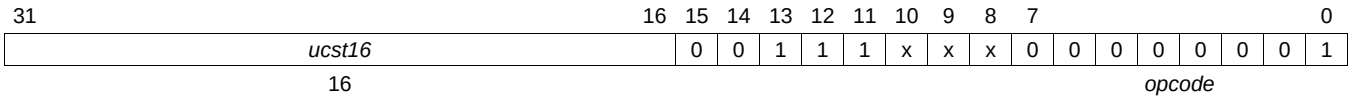
Syntax

ADD *ucst16,* **SP**

Functional unit = D

Opcode

32 bit



Description

Addition of a 16-bit unsigned constant (*ucst16*) with the stack pointer (SP) and store result to SP.

Condition Codes

None

Pseudo Code

```
SP = SP + ucst16
```

ADD *Add 16-Bit Unsigned Constant to Stack Pointer, Result to Register*

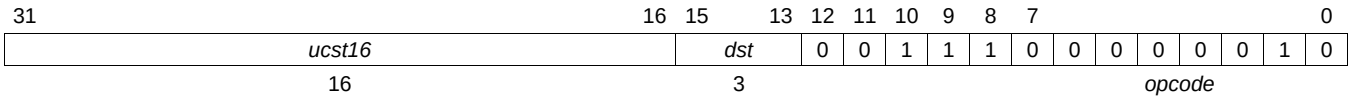
Syntax

ADD *ucst16,* **SP**, *dst*

Functional unit = D

Opcode

32 bit



31 … 16	15 … 13	12	11	10	9	8	7							0
ucst16	*dst*	0	0	1	1	1	0	0	0	0	0	0	1	0
16	3	*opcode*												

Description

Addition of a 16-bit unsigned constant (*ucst16*) with the stack pointer (SP) and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

CSR[5]C = {carry out} from (SP + ucst16)

CSR[7]V = {overflow} from (SP + ucst16)

Note that the carry (CSR:C) and overflow (CSR:V) bits are relevant to unsigned and signed operations, respectively. Appropriate bits are checked depending on if the operands are represented (or, interpreted) as unsigned or signed numbers.

Pseudo Code

```
dst = SP + ucst16
```

ADD *Add 3-Bit Unsigned Constant to Register*

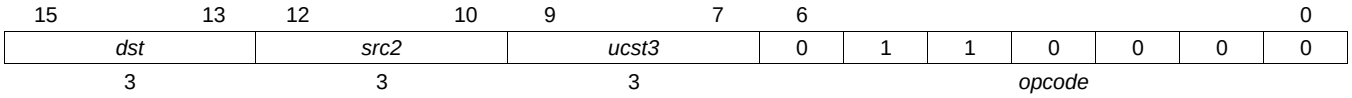
Syntax

ADD *ucst3, src2, dst*

Functional unit = D

Opcode

16 bit



Description

Addition of a 3-bit unsigned constant (*ucst3*) with *src2* and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

CSR[5]C = {carry out} from (src2 + {zero extend}ucst3)

CSR[7]V = {overflow} from (src2 + {zero extend}ucst3)

Note that the carry (CSR:C) and overflow (CSR:V) bits are relevant to unsigned and signed operations, respectively. Appropriate bits are checked depending on if the operands are represented (or, interpreted) as unsigned or signed numbers.

Pseudo Code

```
dst = src2 + {zero extend}ucst3
```

ADD *Signed Addition of Two Register Values*

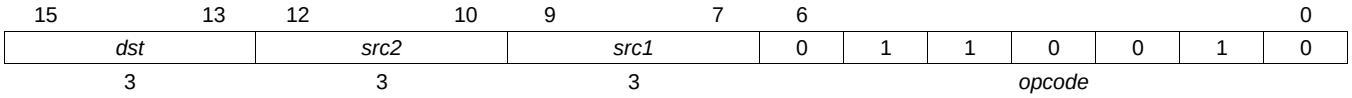
Syntax

ADD *src1, src2, dst*

Functional unit = D

Opcode

16 bit



15–13	12–10	9–7	6			5–0			
dst	*src2*	*src1*	0	1	1	0	0	1	0
3	3	3	*opcode*						

Description

Signed addition of *src1* with *src2* and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

CSR[5]C = {carry out} from (src2 + src1)

CSR[7]V = {overflow} from (src2 + src1)

Note that the carry (CSR[5]C) and overflow (CSR[7]V) bits are relevant to unsigned and signed operations, respectively. Appropriate bits are checked depending on if the operands are represented (or, interpreted) as unsigned or signed numbers.

The status of the CSR[5]C bit is used to synthesize multiword (wider) addition. To synthesize a multiword addition, subsequent instructions use the CSR[5]C bit as a carry in operand, performing a normal addition if CSR[5]C == 0 and adding one more than usual if CSR[5]C == 1.

For example, if register pairs R0/R1 and R2/R3 hold 64-bit values (where R0 and R2 hold the least-significant words), the following instructions leave the 64-bit sum in the register pair R4/R5:

```
ADD   R2, R0, R4       ; R4=R2+R0, sets CSR[C]
MVC   CSR, R6          ; leaves CSR[C] untouched
EXTU  5, 5, R6, R6     ; if (CSR[C]) R6=0x1 else R6=0x0
ADD   R3, R1, R5       ; R5=R3+R1
ADD   R5, R6, R5       ; R5=R5+1 if CSR[C] was set, else R5=R5
```

Note that the above example needs appropriate modification in order to generate correct carry/overflow applicable for the total 64-bit result.

Pseudo Code

```
dst = src2 + src1
```

AND — *Bitwise AND 16-Bit Unsigned Constant with Register*

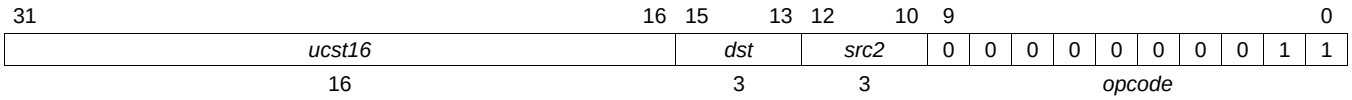
Syntax

AND *ucst16, src2, dst*

Functional unit = L

Opcode

32 bit



Description

Bitwise AND of a zero-extended 16-bit unsigned constant (*ucst16*) with *src2* and store result to *dst*.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = src2 AND {zero extend}ucst16
```

AND — *Bitwise AND Two Registers*

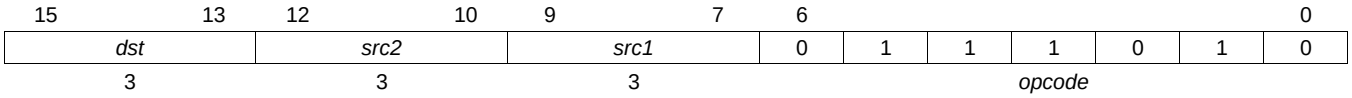
Syntax

AND *src1, src2, dst*

Functional unit = L

Opcode

16 bit



15–13	12–10	9–7	6			5–0
dst	*src2*	*src1*	0	1	1	1 0 1 0
3	3	3	*opcode*			

Description

Bitwise AND of *src1* with *src2* and store result to *dst*.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = src2 AND src1
```

B(cc) *Indirect Branch Using a Register*

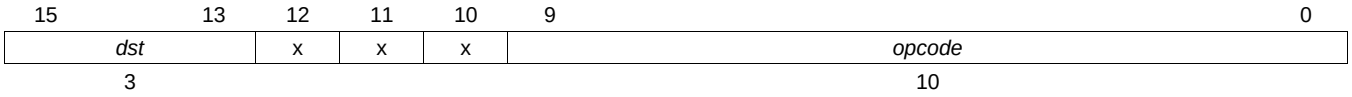
Syntax

B(cc) *dst*

Functional unit = D

Opcode

16 bit



Syntax	Opcode
B *dst*	00 0111 1110
BLT *dst*	01 0111 1110
BGT *dst*	10 1111 1110
BEQ *dst*	01 1111 1110
BLE *dst*	11 0111 1110
BGE *dst*	11 1111 1110
BNE *dst*	10 0111 1110

Description

Performs a branch to the address specified by the *dst* register. The contents of *dst* is treated as a byte address, it is converted to a halfword address before assigning to the PC. Note that the PC always contains a halfword address.

This instruction has one delay slot. See Section 6.2.5.3.1 for restrictions on scheduling an instruction in this delay slot.

For conditional branches, if the associated conditional (cc) bit is set in the control status register (CSR), the branch is taken; otherwise, the PC is incremented by 1. Valid values for ***cc*** are:

- <blank> = unconditional
- LT = CSR[3]LT bit is set to 1
- GT = CSR[4]GT bit is set to 1
- EQ = CSR[2]EQ bit is set to 1
- LE = CSR[3]LT and CSR:EQ bits are set to 1
- GE = CSR[4]GT and CSR:EQ bits are set to 1
- NE = CSR[2]EQ bit is cleared to 0

Condition Codes

None

Pseudo Code

```
if (cond)     PC = (*dst >> 1)
else          PC = PC + 1
```

B(cc) *Direct Branch Using a 9-Bit Signed Constant Offset*

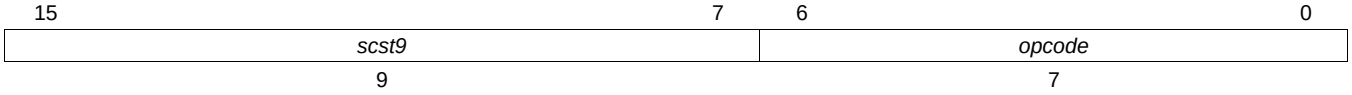
Syntax

B(cc) *scst9*

Functional unit = D

Opcode

16 bit



Syntax	Opcode
B *scst9*	100 1010
BLT *scst9*	100 1011
BGT *scst9*	100 1110
BEQ *scst9*	100 1100
BLE *scst9*	100 1111
BGE *scst9*	101 0000
BNE *scst9*	100 1101

Description

Performs a branch to the effective address formed by the signed addition of *scst9* with the current PC value. The offset is considered as a halfword offset. Note that the PC always contains a halfword address.

This instruction has one delay slot. See Section 6.2.5.3.1 for restrictions on scheduling an instruction in this delay slot.

For conditional branches, if the associated conditional (cc) bit is set in the control status register (CSR), the branch is taken; otherwise, the PC is incremented by 1. Valid values for ***cc*** are:

- <blank> = unconditional
- LT = CSR[3]LT bit is set to 1
- GT = CSR[4]GT bit is set to 1
- EQ = CSR[2]EQ bit is set to 1
- LE = CSR[3]LT and CSR:EQ bits are set to 1
- GE = CSR[4]GT and CSR:EQ bits are set to 1
- NE = CSR[2]EQ bit is cleared to 0

Condition Codes

None

Pseudo Code

```
if (cond)     PC = (PC + scst9)
else          PC = PC + 1
```

B(cc) *Direct Branch Using a 16-Bit Signed Constant Offset*

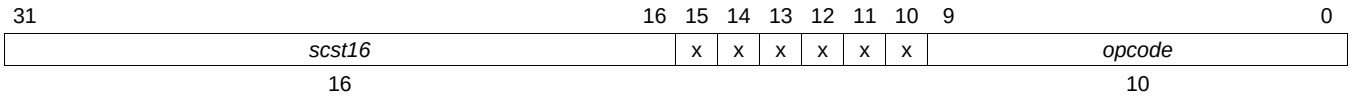
Syntax

B(cc) *scst16*

Functional unit = D

Opcode

32 bit



Syntax	Opcode
B *scst16*	00 1000 1001
BLT *scst16*	01 0000 1001
BGT *scst16*	10 1000 1001
BEQ *scst16*	01 1000 1001
BLE *scst16*	11 0000 1001
BGE *scst16*	11 1000 1001
BNE *scst16*	10 0000 1001

Description

Performs a branch to the effective address formed by the signed addition of *scst16* with the current PC value. The offset is considered as a halfword offset. Note that the PC always contains a halfword address.

This instruction has one delay slot. See Section 6.2.5.3.1 for restrictions on scheduling an instruction in this delay slot.

For conditional branches, if the associated conditional (cc) bit is set in the control status register (CSR), the branch is taken; otherwise, the PC is incremented by 1. Valid values for ***cc*** are:

- <blank> = unconditional
- LT = CSR[3]LT bit is set to 1
- GT = CSR[4]GT bit is set to 1
- EQ = CSR[2]EQ bit is set to 1
- LE = CSR[3]LT and CSR:EQ bits are set to 1
- GE = CSR[4]GT and CSR:EQ bits are set to 1
- NE = CSR[2]EQ bit is cleared to 0

Condition Codes

None

Pseudo Code

```
if (cond)     PC = (PC + scst16)
else          PC = PC + 1
```

BIRP *Branch Using an Interrupt Return Pointer*

Syntax

BIRP

Functional unit = D

Opcode

16 bit

15	14	13	12	11	10	9									0
x	x	x	x	x	x	1	0	0	1	1	1	1	1	1	1
										opcode					

Description

Performs an unconditional branch to the address in the interrupt return pointer register (IRP). The content of IRP is treated as a halfword address. The shadow control status register (SCSR) content is copied back to the control status register (CSR) as a result of this instruction.

This instruction has one delay slot. Only a NOP instruction is supported in a BIRP delay slot.

Condition Codes

For context restore: CSR = SCSR

Pseudo Code

```
PC = *IRP
CSR = SCSR, Rn = SRn, LSAn = SLSAn, LEAn = SLEAn, LCNTn = SLCNTn
```

BKPT *Software Breakpoint*

Syntax

BKPT

Functional unit = S

Opcode

16 bit

15	14	13	12	11	10	9									0
x	x	x	x	x	x	0	0	1	1	1	1	1	1	1	1
										opcode					

Description

The **BKPT** instruction is equivalent to a single instruction endless loop. The ARP32 CPU re-fetches this same instruction again until released through the debug interface.

Condition Codes

None

Pseudo Code

None

BNRP *Branch Using NMI Return Pointer*

Syntax

BNRP

Functional unit = D

Opcode

16 bit

15	14	13	12	11	10	9									0
x	x	x	x	x	x	0	1	0	1	1	1	1	1	1	1
										opcode					

Description

Performs an unconditional branch to the address in the nonmaskable interrupt return pointer register (NRP). The content of NRP is treated as a halfword address. The IER1 is set to 1 upon executing this instruction. The shadow control status register (SCSR) content is copied back to the control status register (CSR) as a result of this instruction.

This instruction has one delay slot. Only a NOP instruction is supported in a BNRP delay slot.

Condition Codes

For context restore: CSR = NMISCSR

Pseudo Code

```
PC = *NRP
CSR = NMISCSR
```

CALL *Call Using a Register*

Syntax

CALL *src1*

Functional unit = D

Opcode

16 bit

15 13	12	11	10	9									0
src1	x	x	x	0	0	0	1	1	1	1	1	1	0
3								*opcode*					

Description

Store the link register (LR) to the location pointed to by the stack pointer (SP), decrement the SP, store PC + 2 into LR, then perform an unconditional branch to the address contained in *src1*. The contents of *src1* is treated as a byte address.

This instruction has one delay slot. See Section 6.2.5.3.1 for restrictions on scheduling an instruction in this delay slot.

Condition Codes

None

Pseudo Code

```
*(SP) = LR; SP -=4; LR = PC + 2; PC = *src1 >> 1
```

CALL *Call Using a 22-Bit Signed Constant Offset*

Syntax

CALL *scst22*

Functional unit = D

Opcode

32 bit

Description

Store the link register (LR) to the location pointed to by the stack pointer (SP), decrement the SP, store PC + 3 into LR, then perform an unconditional branch to the address specified by the PC relative immediate signed halfword offset (*scst22*).

This instruction has one delay slot. See Section 6.2.5.3.1 for restrictions on scheduling an instruction in this delay slot.

Condition Codes

None

Pseudo Code

```
*(SP) = LR; SP -=4; LR = PC + 3; PC = PC + scst22
```

CLR *Clear Bit Field Bounded by Two Immediate Values*

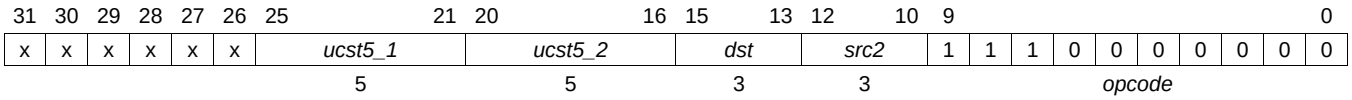
Syntax

CLR *ucst5_1, ucst5_2, src2, dst*

Functional unit = L

Opcode

32 bit



Description

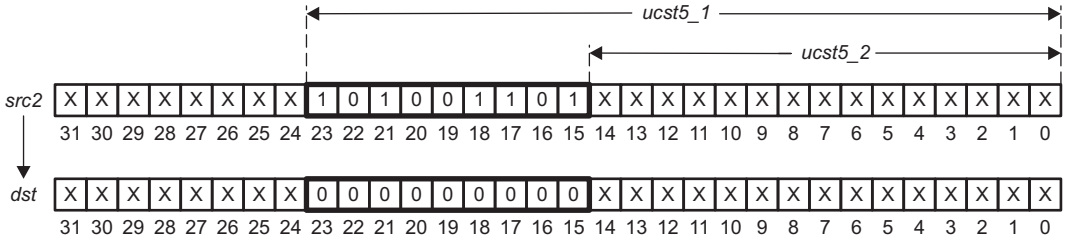
For *ucst5_1* ≥ *ucst5_2*, the field in *src2* as specified by *ucst5_2* to *ucst5_1* is cleared to all 0s and the resulting value of *src2* is written to *dst*. *src2* is left unchanged. *ucst5_2* is the LSB of the field and *ucst5_1* is the MSB of the field. In other words, *ucst5_2* and *ucst5_1* represent the beginning and ending bits, respectively, of the field to be cleared to all 0s. The LSB location of *src2* is bit 0 and the MSB location of *src2* is bit 31.

Valid values of *ucst5_1* and *ucst5_2* are:

- 0 ≤ *ucst5_1* ≤ 31; 0 ≤ *ucst5_2* ≤ 31
- *ucst5_1* ≥ *ucst5_2*

For *ucst5_1* < *ucst5_2*, the result is undefined.

In the following example, *ucst5_2* is 15 and *ucst5_1* is 23.



Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = src2
for( i = 0; i < 32; i++) {
 if ( i >= ucst5_2 && i <= ucst5_2) dst[i] = 0;
};
```

CLR *Clear Bit Field Bounded by Two Register Values*

Syntax

CLR *src1, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	13	12	10	9	7	6						0
x	x	x	x	x	x	x	x	x	x	x	1	0	0	0	1	*dst*		*src2*		*src1*		0	0	0	0	1	0	0
																3		3		3					*opcode*			

Description

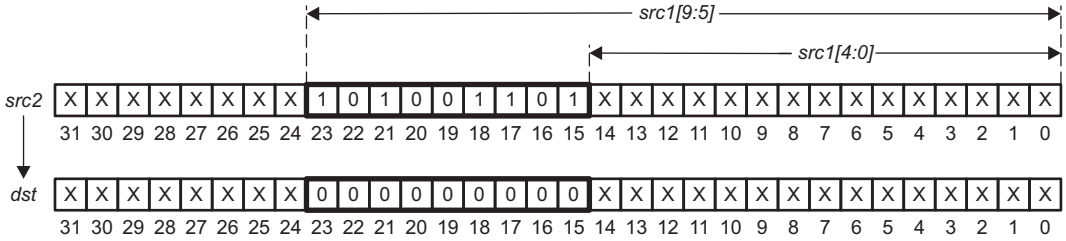
For *src1[9:5]* ≥ *src1[4:0*, the field in *src2* as specified by *src1[4:0]* to *src1[9:5]* is cleared to all 0s and the resulting value of *src2* is written to *dst*. *src2* is left unchanged. *src1[4:0]* is the LSB of the field and *src1[9:5]* is the MSB of the field. In other words, *src1[4:0]* and *src1[9:5]* represent the beginning and ending bits, respectively, of the field to be cleared to all 0s. The LSB location of *src2* is bit 0 and the MSB location of *src2* is bit 31.

Valid values of *src1[9:5* and *src1[4:0]* are:

- 0 ≤ *src1[9:5]* ≤ 31; 0 ≤ *src1[4:0]* ≤ 31
- *src1[9:5]* ≥ *src1[4:0]*

For *src1[9:5]* < *src1[4:0]*, the result is undefined.

In the following example, *src1[4:0]* is 15 and *src1[9:5]* is 23.



Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2
for( i = 0; i < 32; i++) {
 if ( i >= src1[4:0] && i <= src1[9:5]) dst[i] = 0;
};
```

CMP *Compare for Equality, Less Than, Greater Than, 16-Bit Signed Constant to Register*

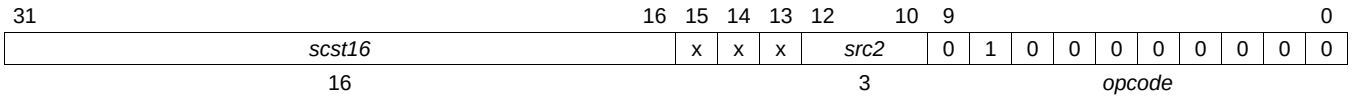
Syntax

CMP *scst16, src2*

Functional unit = D

Opcode

32 bit



Description

Compares *src2* to a sign-extended 16-bit constant (*scst16*). The condition bits CSR:EQ, CSR:LT, and CSR:GT are updated based on the comparison.

Condition Codes

CSR[2]EQ = (src2 == {sign extend}(scst16)

CSR[3]LT = (src2 < {sign extend}(scst16)

CSR[4]GT = (src2 > {sign extend}(scst16)

Pseudo Code

See Condition Codes

CMP *Compare for Equality, Less Than, Greater Than, 3-Bit Signed Constant to Register*

Syntax

CMP *scst3, src2*

Functional unit = D

Opcode

16 bit

15	14	13	12 10	9 7	6						0
x	x	x	*src2*	*scst3*	0	1	1	0	1	0	0
			3	3				*opcode*			

Description

Compares *src2* to a sign-extended 3-bit constant (*scst3*). The condition bits CSR:EQ, CSR:LT, and CSR:GT are updated based on the comparison.

Condition Codes

CSR[2]EQ = (src2 == {sign extend}(scst3)

CSR[3]LT = (src2 < {sign extend}(scst3)

CSR[4]GT = (src2 > {sign extend}(scst3)

Pseudo Code

See Condition Codes

CMP *Signed Compare for Equality, Less Than, Greater Than, Two Register Values*

Syntax

CMP *src1, src2*

Functional unit = D

Opcode

16 bit

15	14	13	12 10	9 7	6						0
x	x	x	*src2*	*src1*	0	1	1	0	1	1	0
			3	3				*opcode*			

Description

Compares *src2* to *src1*. The condition bits CSR:EQ, CSR:LT, and CSR:GT are updated based on the comparison.

Condition Codes

CSR[2]EQ = (src2 == src1)

CSR[3]LT = (src2 < src1)

CSR[4]GT = (src2 > src1)

Pseudo Code

See Condition Codes

CMPU *Compare for Equality, Less Than, Greater Than, 16-Bit Unsigned Constant to Register*

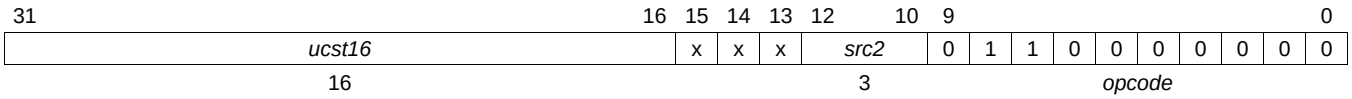
Syntax

CMPU *ucst16, src2*

Functional unit = D

Opcode

32 bit



31 16	15	14	13	12 10	9								0
ucst16	x	x	x	*src2*	0	1	1	0	0	0	0	0	0
16				3	*opcode*								

Description

Compares *src2* to a zero-extended 16-bit constant (*ucst16*). The condition bits CSR:EQ, CSR:LT, and CSR:GT are updated based on the comparison. This is an unsigned comparison.

Condition Codes

CSR[2]EQ = (src2 == {zero extend}(ucst16)

CSR[3]LT = (src2 < {zero extend}(ucst16)

CSR[4]GT = (src2 > {zero extend}(ucst16)

Pseudo Code

See Condition Codes

CMPU

Compare for Equality, Less Than, Greater Than, 3-Bit Unsigned Constant to Register

Syntax

CMPU *ucst3, src2*

Functional unit = D

Opcode

16 bit

15	14	13	12 10	9 7	6						0
x	x	x	*src2*	*ucst3*	0	1	1	0	1	0	1
			3	3				*opcode*			

Description

Compares *src2* to a zero-extended 3-bit constant (*ucst3*). The condition bits CSR:EQ, CSR:LT, and CSR:GT are updated based on the comparison. This is an unsigned comparison.

Condition Codes

CSR[2]EQ = (src2 == {zero extend}(ucst3)

CSR[3]LT = (src2 < {zero extend}(ucst3)

CSR[4]GT = (src2 > {zero extend}(ucst3)

Pseudo Code

See Condition Codes

CMPU *Unsigned Compare for Equality, Less Than, Greater Than, Two Register Values*

Syntax

CMPU *src1, src2*

Functional unit = D

Opcode

16 bit

15	14	13	12 10	9 7	6						0
x	x	x	*src2*	*src1*	0	1	1	0	1	1	1
			3	3				*opcode*			

Description

Compares *src2* to *src1*. The condition bits CSR:EQ, CSR:LT, and CSR:GT are updated based on the comparison. This is an unsigned comparison.

Condition Codes

CSR[2]EQ = (src2 == src1)

CSR[3]LT = (src2 < src1)

CSR[4]GT = (src2 > src1)

Pseudo Code

See Condition Codes

DIV *Signed Division of Two Register Values*

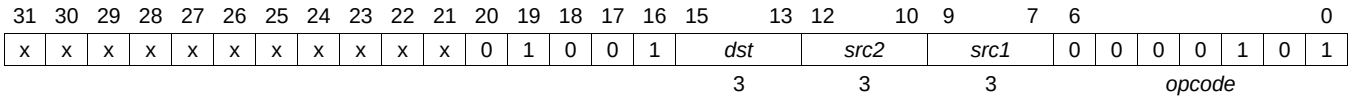
Syntax

DIV *src1, src2, dst*

Functional unit = M

Opcode

32 bit



31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	0	1	0	0	1	*dst*			*src2*			*src1*			0	0	0	0	1	0	1
																3			3			3			*opcode*						

Description

Signed division of *src1* and *src2* and store result to *dst*. Divide by 0 raises UNDEF interrupt, *dst* is written with 0, CSR:EQ gets set.

Using **DIV** (integer division) and **SHRA** (arithmetic right shift) does not produce the same result for negative numbers. The quotient of **DIV** is rounded towards zero, whereas the quotient of **SHRA** is rounded towards negative infinity. For example, using the **DIV** instruction: -9/4 = -2, whereas using the **SHRA** instruction: -9/4 = -3.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = src2 / src1
```

Cycles

14 execute cycles. This is a blocking multi-execute cycle instruction.

DIVU *Unsigned Division of Two Register Values*

Syntax

DIVU *src1, src2, dst*

Functional unit = M

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	0	1	1	0	1	*dst*			*src2*			*src1*			0	0	0	0	1	0	1
																3			3			3			*opcode*						

Description

Unsigned division of *src1* and *src2* and store result to *dst*. Divide by 0 raises UNDEF interrupt, *dst* is written with 0, CSR:EQ gets set.

Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2 / src1
```

Cycles

14 execute cycles. This is a blocking multi-execute cycle instruction.

EXT *Extract and Sign-Extend a Bit Field Bounded by Two Immediate Values*

Syntax

EXT *ucst5_1, ucst5_2, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25 21	20 16	15 13	12 10	9									0
x	x	x	x	x	x	*ucst5_1*	*ucst5_2*	*dst*	*src2*	1	0	0	0	0	0	0	0	0	0
						5	5	3	3	*opcode*									

Description

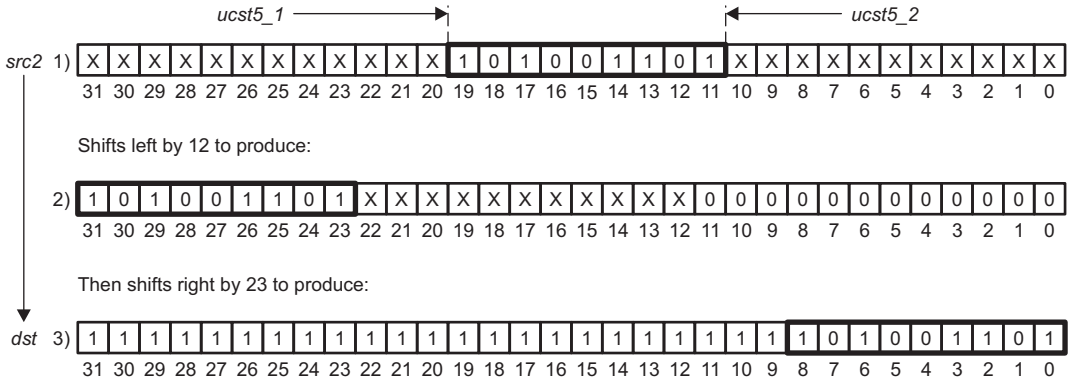
For *ucst5_1* ≥ *ucst5_2*, the field in *src2* as specified by *ucst5_2* to *ucst5_1* is extracted and sign-extended to 32 bits and is written to *dst*. *src2* is left unchanged. *ucst5_2* is the LSB of the field and *ucst5_1* is the MSB of the field to be extracted. In other words, *ucst5_2* and *ucst5_1* represent the beginning and ending bits, respectively, of the field to be extracted. The LSB location of *src2* is bit 0 and the MSB location of *src2* is bit 31.

Valid values of *ucst5_1* and *ucst5_2* are:

- 0 ≤ *ucst5_1* ≤ 31; 0 ≤ *ucst5_2* ≤ 31
- *ucst5_1* ≥ *ucst5_2*

For *ucst5_1* < *ucst5_2*, the result is undefined.

In the following example, *ucst5_2* is 11 and *ucst5_1* is 19.



Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
tmpdst = 0; j = 0;
for( i = 0; i < 32; i++) {
 if ( i >= ucst5_2 && i <= ucst5_1) tmpdst[j++] = src2[i];
};
dst = tmpdst[j] ? signext(tmpdst) : tmpdst ;
```

EXT *Extract and Sign-Extend a Bit Field Bounded by Two Register Values*

Syntax

EXT *src1, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

																3			3			3			*opcode*						

Description

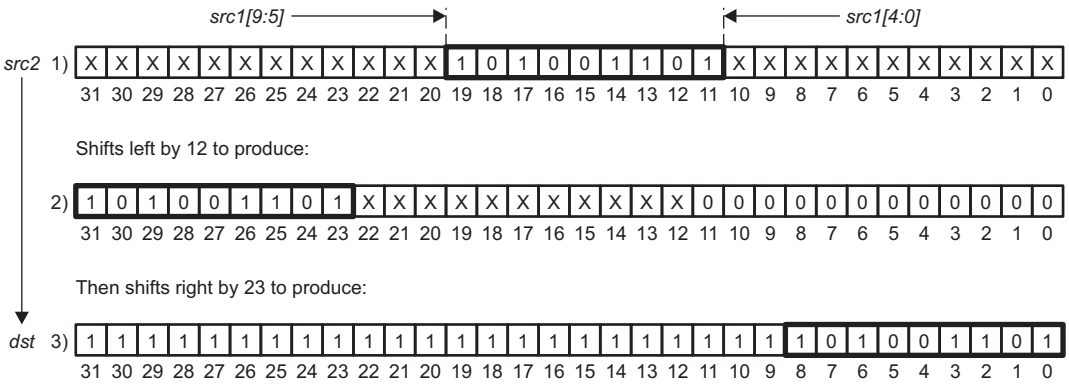
For *src1[9:5]* ≥ *src1[4:0]*, the field in *src2* as specified by *src1[4:0]* to *src1[9:5]* is extracted and sign-extended to 32 bits and is written to *dst*. *src2* is left unchanged. *src1[4:0]* is the LSB of the field and *src1[9:5]* is the MSB of the field to be extracted. In other words, *src1[4:0]* and *src1[9:5]* represent the beginning and ending bits, respectively, of the field to be extracted. The LSB location of *src2* is bit 0 and the MSB location of *src2* is bit 31.

Valid values of *src1[9:5]* and *src1[4:0]* are:

- 0 ≤ *src1[9:5]* ≤ 31; 0 ≤ *src1[4:0]* ≤ 31
- *src1[9:5]* ≥ *src1[4:0]*

For *src1[9:5]* < *src1[4:0]*, the result is undefined.

In the following example, *src1[4:0]* is 11 and *src1[9:5]* is 19.



Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
tmpdst = 0; j = 0;
for( i = 0; i < 32; i++) {
 if ( i >= src1[4:0] && i <= src1[9:5]) tmpdst[j++] = src2[i];
};
dst = tmpdst[j] ? signext(tmpdst) : tmpdst ;
```

IDLE *Idle Until Interrupt or Reset*

Syntax

IDLE

Functional unit = S

Opcode

16 bit

15	14	13	12	11	10	9									0
x	x	x	x	x	x	1	1	0	1	1	1	1	1	1	1
										opcode					

Description

The **IDLE** instruction causes the CPU to wait for all pending instruction and data memory transactions to complete and then go to an idle state. The idle state is the equivalent of an endless loop. Termination of this loop occurs on an interrupt or reset. However, the CPU does not actually continue fetch/executing any actual instructions. On acceptance of an interrupt, PC + 1 is stored into the interrupt return pointer register (IRP), subsequent instruction execution after return from the interrupt begins at the instruction following the **IDLE** instruction.

For more details on usage of IDLE instruction, see Section 6.2.6.3.

LDB(U) *Load Byte from Memory with a 3-Bit Unsigned Constant Offset*

Syntax

LDB **+baseR[ucst3], dst*

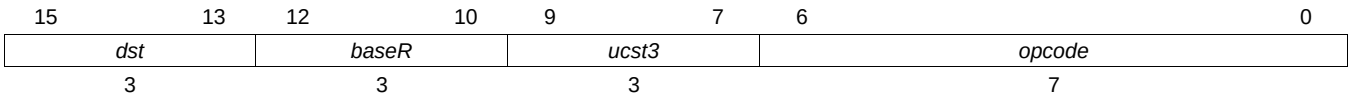
or

LDBU **+baseR[ucst3], dst*

Functional unit = D

Opcode

16 bit



Syntax	Opcode	Load Type
LDB **+baseR[ucst3], dst*	101 1010	Load byte (sign-extended)
LDBU **+baseR[ucst3], dst*	101 1000	Load byte unsigned (zero-extended)

Description

Loads a byte (signed or unsigned) from memory (effective address) to *dst*. The memory address is formed from a base address register (*baseR*) and an offset (number of bytes) that is a 3-bit unsigned constant (*ucst3*). If an offset is not given, the assembler assigns an offset of zero.There must be brackets, [ ], around the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst3* is scaled by a left-shift of 0 bits. After scaling, *ucst3* is added to *baseR*. The result of the calculation is the effective address to be accessed in memory and the content loaded into *dst*.

The content is loaded into the 8 LSBs of *dst*. For the **LDB** instruction, the upper 24 bits of *dst* are sign-extended; for the **LDBU** instruction, the upper 24 bits of *dst* are zero-extended.

Condition Codes

None

Pseudo Code

```
dst = *(baseR[ucst3])
```

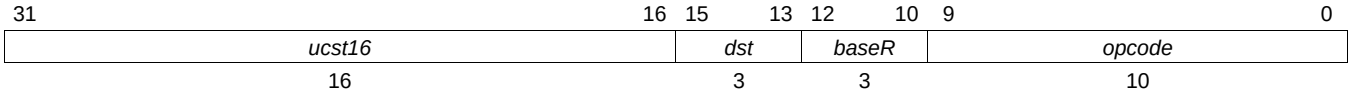
Functional unit = D

Opcode

32 bit



Syntax	Opcode	Load Type
LDB **+baseR[ucst16], dst*	01 0000 1000	Load byte (sign-extended)
LDBU **+baseR[ucst16], dst*	00 0000 1000	Load byte unsigned (zero-extended)

Description

Loads a byte (signed or unsigned) from memory (effective address) to *dst*. The memory address is formed from a base address register (*baseR*) and an offset (number of bytes) that is a 16-bit unsigned constant (*ucst16*). If an offset is not given, the assembler assigns an offset of zero. Brackets,[], must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst16* is scaled by a left-shift of 0 bits. After scaling, *ucst16* is added to *baseR*. The result of the calculation is the effective address to be accessed in memory and the content loaded into *dst*.

The content is loaded into the 8 LSBs of *dst*. For the **LDB** instruction, the upper 24 bits of *dst* are sign-extended; for the **LDBU** instruction, the upper 24 bits of *dst* are zero-extended.

Condition Codes

Description

Loads a halfword (signed or unsigned) from memory (effective address) to *dst*. The memory address is formed from the stack pointer (SP) and an offset (number of halfwords) that is a 19-bit unsigned constant (*ucst19*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ],must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst19* is scaled by a left-shift of 1 bit. After scaling, *ucst19* is added to SP. The result of the calculation is the effective address to be accessed in memory and the content loaded into *dst*.

The content is loaded into the 16 LSBs of *dst*. For the **LDH** instruction, the upper 16 bits of *dst* are sign-extended; for the **LDHU** instruction, the upper 16 bits of *dst* are zero-extended.

Halfword addresses must be aligned on halfword (LSB is 0) boundaries.

Condition Codes

None

Pseudo Code

```
dst = *(SP[ucst19])
```

LDH(U) *Load Halfword from Memory with a GDP-Relative 19-Bit Unsigned Constant Offset*

Syntax

LDH *+**GDP***[ucst19], dst*

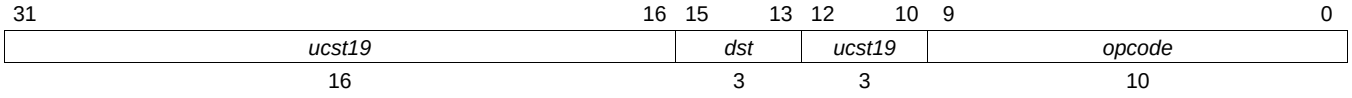
or

LDHU *+**GDP***[ucst19], dst*

Functional unit = D

Opcode

32 bit



Syntax	Opcode	Load Type
LDH *+**GDP***[ucst19], dst*	01 1000 0110	Load halfword (sign-extended)
LDHU *+**GDP***[ucst19], dst*	00 1000 0110	Load halfword unsigned (zero-extended)

Description

Loads a halfword (signed or unsigned) from memory (effective address) to *dst*. The memory address is formed from the global data pointer register (GDP) and an offset (number of halfwords) that is a 19-bit unsigned constant (*ucst19*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ],must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst19* is scaled by a left-shift of 1 bit. After scaling, *ucst19* is added to GDP. The result of the calculation is the effective address to be accessed in memory and the content loaded into *dst*.

The content is loaded into the 16 LSBs of *dst*. For the **LDH** instruction, the upper 16 bits of *dst* are sign-extended; for the **LDHU** instruction, the upper 16 bits of *dst* are zero-extended.

Halfword addresses must be aligned on halfword (LSB is 0) boundaries.

Condition Codes

None

Pseudo Code

```
dst = *(GDP[ucst19])
```

LDW *Load Word from Memory with a 3-Bit Unsigned Constant Offset*

Syntax

LDW **+baseR[ucst3], dst*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*baseR*	*ucst3*	1	0	1	1	1	0	0
3	3	3	*opcode*						

Description

Loads a word from memory (effective address) to *dst*. The memory address is formed from a base address register (*baseR*) and an offset (number of words) that is a 3-bit unsigned constant (*ucst3*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ],must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst3* is scaled by a left-shift of 2 bits. After scaling, *ucst3* is added to *baseR*. The result of the calculation is the effective address to be accessed in memory and the content loaded into *dst*.

The entire content is loaded into *dst*.

Word addresses must be aligned on word (two LSBs are 0) boundaries.

Condition Codes

None

Pseudo Code

```
dst = *(baseR[ucst3])
```

LDW *Load Word from Memory with a 16-Bit Unsigned Constant Offset*

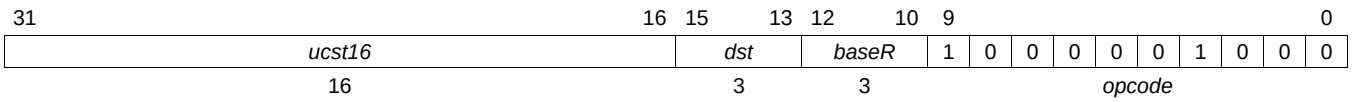
Syntax

LDW **+baseR[ucst16], dst*

Functional unit = D

Opcode

32 bit



Description

Loads a word from memory (effective address) to *dst*. The memory address is formed from a base address register (*baseR*) and an offset (number of words) that is a 16-bit unsigned constant (*ucst16*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ],must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst16* is scaled by a left-shift of 2 bits. After scaling, *ucst16* is added to *baseR*. The result of the calculation is the effective address to be accessed in memory and the content loaded into *dst*.

The entire content is loaded into *dst*.

Word addresses must be aligned on word (two LSBs are 0) boundaries.

Condition Codes

None

Pseudo Code

```
dst = *(baseR[ucst16])
```

LDW *Load Word from Memory with a Register Offset*

Syntax

LDW **+baseR[src1], dst*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*baseR*	*src1*	1	0	1	0	1	1	1
3	3	3	*opcode*						

Description

Loads a word from memory (effective address) to *dst*. The memory address is formed from a base address register (*baseR*) and an offset (number of words) that is a register (*src1*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ],must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *src1* is scaled by a left-shift of 2 bits. After scaling, *src1* is added to *baseR*. The result of the calculation is the effective address to be accessed in memory and the content loaded into *dst*.

The entire content is loaded into *dst*.

Word addresses must be aligned on word (two LSBs are 0) boundaries.

Condition Codes

None

Pseudo Code

```
dst = *(baseR[src1])
```

LDW *Load Word from Memory, Postincrement with a 3-Bit Unsigned Constant Offset*

Syntax

LDW **baseR++[ucst3], dst*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*baseR*	*ucst3*	1	1	0	0	1	1	0
3	3	3	*opcode*						

Description

Loads a word from memory (effective address) to *dst*. The value of *baseR* is the effective address to be accessed in memory and the content loaded into *dst*. After accessing, an offset (number of words) that is a 3-bit unsigned constant (*ucst3*) is added to *baseR* at the end of the EXE phase. Brackets, [ ],must surround the specified offset, if using the optional offset parameter.

The entire content is loaded into *dst*.

Word addresses must be aligned on word (two LSBs are 0) boundaries.

Condition Codes

None

Pseudo Code

```
dst = *(baseR++[ucst3])
```

LDW *Load Word from Memory, Postincrement with a Register Offset*

Syntax

LDW **baseR++[src1], dst*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*baseR*	*src1*	1	1	0	0	0	0	1
3	3	3	*opcode*						

Description

Loads a word from memory (effective address) to *dst*. The value of *baseR* is the effective address to be accessed in memory and the content loaded into *dst*. After accessing, an offset (number of words) that is a register (*src1*) is added to *baseR* at the end of the EXE phase. Brackets, [ ],must surround the specified offset, if using the optional offset parameter.

The entire content is loaded into *dst*.

Word addresses must be aligned on word (two LSBs are 0) boundaries.

Condition Codes

None

Pseudo Code

```
dst = *(baseR++[src1])
```

LDW *Load Word from Memory with a SP-Relative 6-Bit Unsigned Constant Offset*

Syntax

LDW *+**SP***[ucst6], dst*

Functional unit = D

Opcode

16 bit

15 13	12 7	6						0
dst	*ucst6*	1	1	0	1	0	1	1
3	6	*opcode*						

Description

Loads a word from memory (effective address) to *dst*. The memory address is formed from the stack pointer (SP) and an offset (number of words) that is a 6-bit unsigned constant (*ucst6*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ],must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst6* is scaled by a left-shift of 2 bits. After scaling, *ucst6* is added to SP. The result of the calculation is the effective address to be accessed in memory and the content loaded into *dst*.

The entire content is loaded into *dst*.

Word addresses must be aligned on word (two LSBs are 0) boundaries.

Condition Codes

None

Pseudo Code

```
dst = *(SP[ucst6])
```

LDW *Load Word from Memory with a SP-Relative 19-Bit Unsigned Constant Offset*

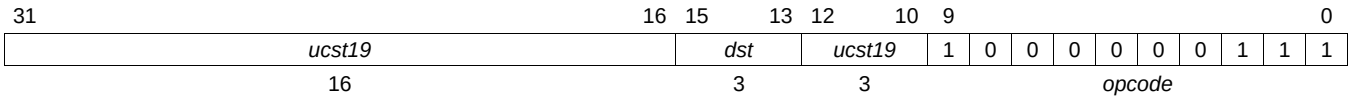
Syntax

LDW *+**SP***[ucst19], dst*

Functional unit = D

Opcode

32 bit



Description

Loads a word from memory (effective address) to *dst*. The memory address is formed from the stack pointer (SP) and an offset (number of words) that is a 19-bit unsigned constant (*ucst19*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ],must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst19* is scaled by a left-shift of 2 bits. After scaling, *ucst19* is added to SP. The result of the calculation is the effective address to be accessed in memory and the content loaded into *dst*.

The entire content is loaded into *dst*.

Word addresses must be aligned on word (two LSBs are 0) boundaries.

Condition Codes

None

Pseudo Code

```
dst = *(SP[ucst19])
```

LDW *Load Word from Memory with a GDP-Relative 19-Bit Unsigned Constant Offset*

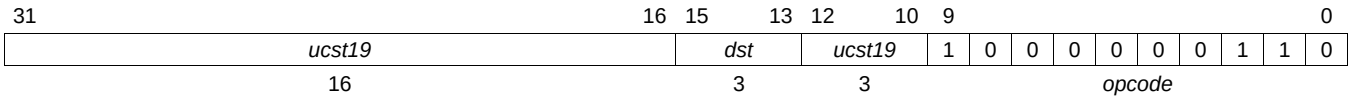
Syntax

LDW *+**GDP***[ucst19], dst*

Functional unit = D

Opcode

32 bit



Description

Loads a word from memory (effective address) to *dst*. The memory address is formed from the global data pointer register (GDP) and an offset (number of words) that is a 19-bit unsigned constant (*ucst19*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ],must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst19* is scaled by a left-shift of 2 bits. After scaling, *ucst19* is added to GDP. The result of the calculation is the effective address to be accessed in memory and the content loaded into *dst*.

The entire content is loaded into *dst*.

Word addresses must be aligned on word (two LSBs are 0) boundaries.

Condition Codes

None

Pseudo Code

```
dst = *(GDP[ucst19])
```

LDRF *Load Register File from Stack Pointer*

Syntax

LDRF *op1, op2*

Functional unit = D

Opcode

16 bit

15 13	12 10	9	8	7	6						0
op2	*op1*	x	x	x	1	0	1	0	0	0	1
3	3							*opcode*			

Description

The current base register file is loaded from the starting address specified by the preincremented value of the stack pointer (SP). *op1* specifies the ending register (last register loaded) and *op2* specifies the beginning register (first register loaded). All registers between *op1* and *op2* are loaded inclusive. The registers are loaded in order from highest register (*op2*) to lowest register (*op1*).

Valid values of *op1* and *op2* are: *op1* ≤ *op2*

For *op1* > *op2*, results in unspecified behavior.

This is a multicycle blocking instruction. The number of cycles is determined by the registers, for example, **LDRF** R0, R5 requires 6 cycles to complete.

Condition Codes

None

Pseudo Code

```
for ( i = op2; i <= op1 ; i--) {
SP += 4;
Ri = *SP;
}
```

LMBD *Left Most Bit Detection*

Syntax

LMBD *ucst3, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18 16	15 13	12 10	9								0
x	x	x	x	x	x	x	x	x	x	x	x	x	*ucst3*	*dst*	*src2*	1	1	0	0	0	0	0	0	1	1
													3	3	3					*opcode*					

Description

The LSB of *ucst3* determines whether to search for a leftmost 1 or 0 in *src2*. The number of bits to the left of the first 1 or 0 when searching for a 1 or 0, respectively, is placed in *dst*.

- *ucst3* = 0, searches for leftmost 0 (count leading ones)
- *ucst3* = 1, searches for leftmost 1 (count leading zeros)
- Other values of *ucst3* are reserved. The result is undefined if reserved values are used.

The following diagrams illustrate the operation of **LMBD** for several cases.

When searching for 0 in *src2*, **LMBD** returns 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

When searching for 1 in *src2*, **LMBD** returns 4:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	1	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

When searching for 0 in *src2*, **LMBD** returns 32:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = if (ucst3 == 0), lmb0(src2)
dst = if (ucst3 == 1), lmb1(src2)
```

MAX *Maximum of Two Signed Register Values*

Syntax

MAX *src1, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	13	12	10	9	7	6						0
x	x	x	x	x	x	x	x	x	x	x	1	1	0	0	0	*dst*		*src2*		*src1*		0	0	0	0	1	0	0
																3		3		3					*opcode*			

Description

Performs a maximum operation on the signed values in *src1* and *src2*. The larger value is loaded in *dst*.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = (src2 > src1) ? src2:src1
```

MAXU *Maximum of Two Unsigned Register Values*

Syntax

MAXU *src1, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	13	12	10	9	7	6						0
x	x	x	x	x	x	x	x	x	x	x	1	1	0	1	0	*dst*		*src2*		*src1*		0	0	0	0	1	0	0
																3		3		3					*opcode*			

Description

Performs a maximum operation on the unsigned values in *src1* and *src2*. The larger value is loaded in *dst*.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = (src2 > src1) ? src2:src1
```

MIN *Minimum of Two Signed Register Values*

Syntax

MIN *src1, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	1	0	1	1	1	*dst*			*src2*			*src1*			0	0	0	0	1	0	0
																3			3			3			*opcode*						

Description

Performs a minimum operation on the signed values in *src1* and *src2*. The smaller value is loaded in *dst*.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = (src2 < src1) ? src2:src1
```

MINU *Minimum of Two Unsigned Register Values*

Syntax

MINU *src1, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	1	1	0	0	1	*dst*			*src2*			*src1*			0	0	0	0	1	0	0
																3			3			3			*opcode*						

Description

Performs a minimum operation on the unsigned values in *src1* and *src2*. The smaller value is loaded in *dst*.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = (src2 < src1) ? src2:src1
```

MOD *Signed Modulo*

Syntax

MOD *src1, src2, dst*

Functional unit = M

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	0	1	0	1	0	*dst*			*src2*			*src1*			0	0	0	0	1	0	1
																3			3			3			*opcode*						

Description

Performs a signed modulo on the values in *src1* and *src2* and the resulting value is written to *dst*. Sign of the result is the same as *src2* (the dividend). *src1* = 0 (that is, a modulo 0 case), raises the UNDEF interrupt, *dst* is written with 0, and CSR:EQ is set.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = src2 % src1
```

Cycles

14 execute cycles. This is a blocking multi-execute cycle instruction.

MODU *Unsigned Modulo*

Syntax

MODU *src1, src2, dst*

Functional unit = M

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15 13	12 10	9 7	6					0
x	x	x	x	x	x	x	x	x	x	x	0	1	1	1	0	*dst*	*src2*	*src1*	0	0	0	0	1	0	1
																3	3	3				*opcode*			

Description

Performs an unsigned modulo on the values in *src1* and *src2* and the resulting value is written to *dst*. *src1* = 0 (that is, a modulo 0 case), raises the UNDEF interrupt, *dst* is written with 0, and CSR:EQ is set.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = src2 % src1
```

Cycles

14 execute cycles. This is a blocking multi-execute cycle instruction.

MPY *Signed Multiplication of Two Register Values*

Syntax

MPY *src1, src2, dst*

Functional unit = M

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	0	1	0	0	0	*dst*			*src2*			*src1*			0	0	0	0	1	0	1
																3			3			3			*opcode*						

Description

Performs a multiply on the signed values in *src1* and *src2*. Only the 32 least-significant bits of the result are retained and written to *dst*.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = lsb32(src2 × src1)
```

MPYU *Unsigned Multiplication of Two Register Values*

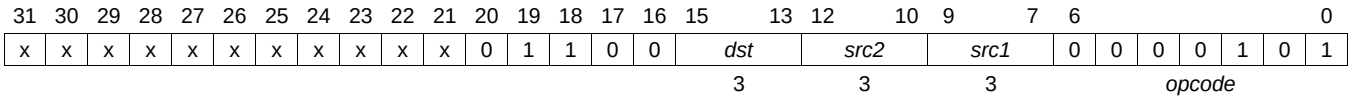
Syntax

MPYU *src1, src2, dst*

Functional unit = M

Opcode

32 bit



31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	0	1	1	0	0	*dst*			*src2*			*src1*			0	0	0	0	1	0	1
																3			3			3			*opcode*						

Description

Performs a multiply on the unsigned values in *src1* and *src2*. Only the 32 least-significant bits of the result are retained and written to *dst*.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = lsb32(src2 × src1)
```

MV *Move Register to Register*

Syntax

MV *src1, dst*

Functional unit = S

Opcode

16 bit

15 13	12	11	10	9 7	6						0
dst	x	x	x	*src1*	1	0	0	1	0	0	1
3				3				*opcode*			

Description

The contents of *src1* are copied to *dst*.

Condition Codes

None

Pseudo Code

```
dst = src1
```

MVC *Move Architectural Register to Control Register*

Syntax

MVC *areg, creg*

Functional unit = S

Opcode

16 bit

15	11	10	9	7	6						0
creg		0	*areg*		1	0	0	1	0	0	0
5			3					*opcode*			

Description

The content of the architectural register (*areg*) is moved to the control register (*creg*).

Condition Codes

None

Pseudo Code

```
creg = areg
```

MVC *Move Control Register to Architectural Register*

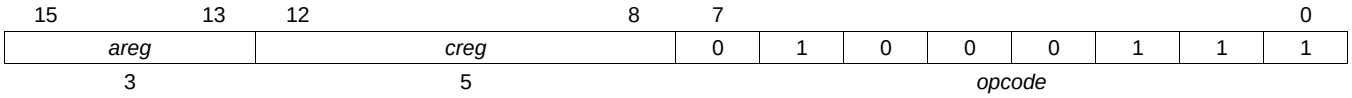
Syntax

MVC *creg, areg*

Functional unit = S

Opcode

16 bit



Description

The content of the control register (*creg*) is moved to the architectural register (*areg*).

Condition Codes

None

Pseudo Code

```
areg = creg
```

MVC *Move 16-Bit Unsigned Constant to Control Register*

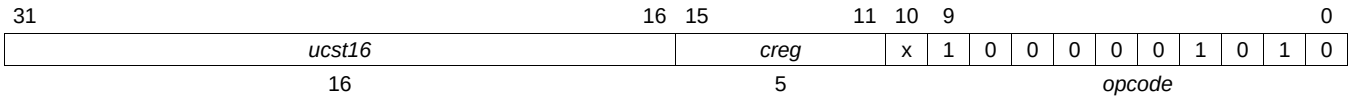
Syntax

MVC *ucst16, creg*

Functional unit = S

Opcode

32 bit



Description

A 16-bit unsigned constant (*ucst16*) is moved to the control register (*creg*).

Condition Codes

None

Pseudo Code

```
creg = {zero extend}ucst16
```

MVCH *Move 16-Bit Unsigned Constant to Upper Bits of Control Register*

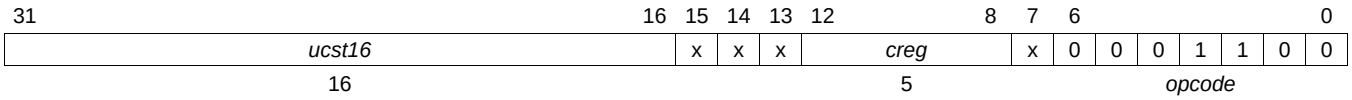
Syntax

MVCH *ucst16, creg*

Functional unit = S

Opcode

32 bit



Description

A 16-bit unsigned constant (*ucst16*) is moved to the upper halfword (bits 31-16) of the control register (*creg*). The lower halfword (bits 15-0) of *creg* is left unchanged.

Condition Codes

None

Pseudo Code

```
creg[31:16] = ucst16
```

MVK *Move 16-Bit Unsigned Constant to Register*

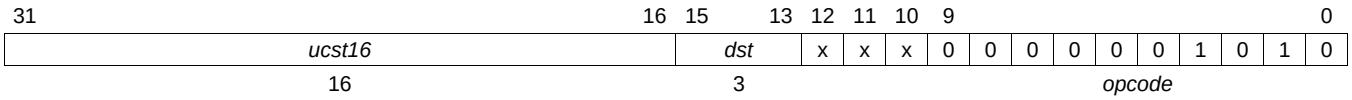
Syntax

MVK *ucst16, dst*

Functional unit = S

Opcode

32 bit



31	16	15	13	12	11	10	9									0
ucst16		*dst*		x	x	x	0	0	0	0	0	0	1	0	1	0
16		3									*opcode*					

Description

A 16-bit unsigned constant (*ucst16*) is moved to *dst*.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = {zero extend}ucst16
```

MVKH *Move 16-Bit Unsigned Constant to Upper Bits of Register*

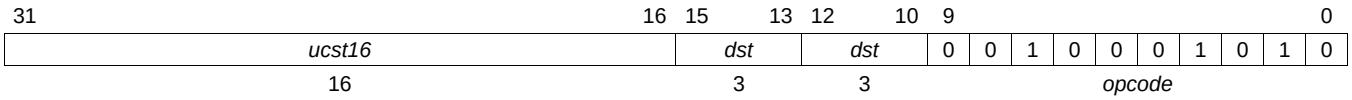
Syntax

MVKH *ucst16, dst*

Functional unit = S

Opcode

32 bit



Description

A 16-bit unsigned constant (*ucst16*) is moved to the upper halfword (bits 31-16) of *dst*. The lower halfword (bits 15-0) of *dst* is left unchanged.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst[31:16] = ucst16
```

MVKLS *Move 16-Bit Signed Constant to Register*

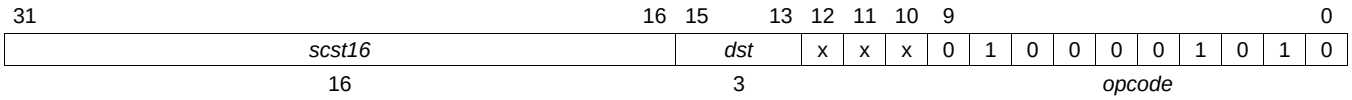
Syntax

MVKLS *scst16, dst*

Functional unit = S

Opcode

32 bit



Description

A 16-bit constant (*scst16*) is sign extended and is moved to *dst*.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = {sign extend}scst16
```

MVKS *Move 6-Bit Signed Constant to Register*

Syntax

MVKS *scst6, dst*

Functional unit = S

Opcode

16 bit

15 13	12 7	6						0
dst	*scst6*	1	0	0	0	1	1	0
3	6	*opcode*						

Description

A 6-bit signed constant (*scst6*) is sign extended and is moved to *dst*.

Condition Codes

CSR:EQ = (dst == 0)

Pseudo Code

```
dst = {sign extend}scst6
```

MVS *Move Architectural Register to Shadow Register*

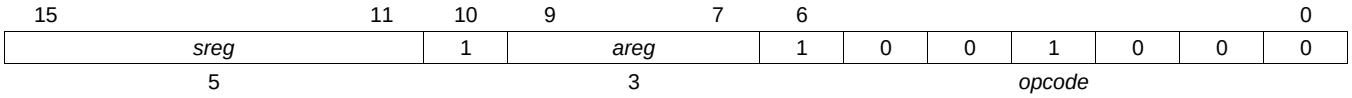
Syntax

MVS *areg, sreg*

Functional unit = S

Opcode

16 bit



Description

The content of the architectural register (*areg*) is moved to the shadow register (*sreg*). This instruction has two exposed delay slots, the data written cannot be read back until the third cycle from the cycle when this instruction enters the EXE phase.

Condition Codes

None

Pseudo Code

```
sreg = areg
```

MVS *Move Shadow Register to Architectural Register*

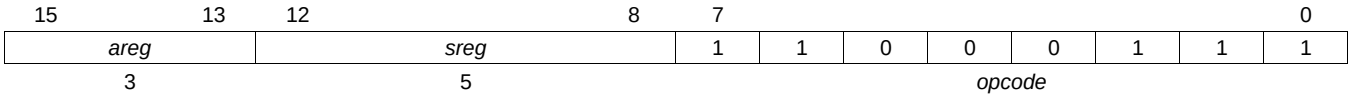
Syntax

MVS *sreg, areg*

Functional unit = S

Opcode

16 bit



Description

The content of the shadow register (*sreg*) is moved to the architectural register (*areg*).

Condition Codes

None

Pseudo Code

```
areg = sreg
```

NEG *Negation*

Syntax

NEG *src2, dst*

Functional unit = L

Opcode

16 bit

15 13	12 10	9									0
dst	*src2*	0	1	0	1	0	0	0	0	0	0
3	3	*opcode*									

Description

src2 is subtracted from zero and the result is stored in *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = 0 - src2
```

NOP *No Operation*

Syntax

NOP

Functional unit = None

Opcode

16 bit

15	14	13	12	11	10	9									0
x	x	x	x	x	x	1	1	1	1	1	1	1	1	1	1
										opcode					

Description

No operation.

Condition Codes

None

Pseudo Code

None

NOT — *Bitwise NOT*

Syntax

NOT *src2, dst*

Functional unit = L

Opcode

16 bit

15 13	12 10	9									0
dst	*src2*	0	0	1	1	0	0	0	0	0	0
3	3	*opcode*									

Description

Performs a bitwise inversion of *src2* and stores the result in *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = ~src2
```

OR — *Bitwise OR 16-Bit Unsigned Constant with Register*

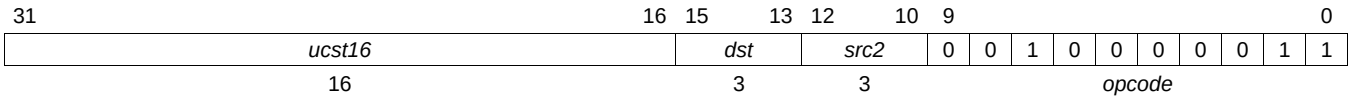
Syntax

OR *ucst16, src2, dst*

Functional unit = L

Opcode

32 bit



Description

Bitwise OR of a zero-extended 16-bit unsigned constant (*ucst16*) with *src2* and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2 OR {zero extend}ucst16
```

OR — *Bitwise OR Two Registers*

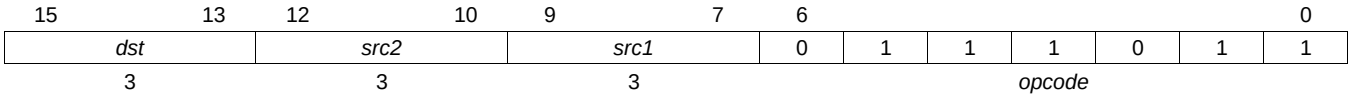
Syntax

OR *src1, src2, dst*

Functional unit = L

Opcode

16 bit



15–13	12–10	9–7	6						0
dst	*src2*	*src1*	0	1	1	1	0	1	1
3	3	3	*opcode*						

Description

Bitwise OR of *src1* with *src2* and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2 OR src1
```

RET *Return from Subroutine*

Syntax

RET

Functional unit = D

Opcode

16 bit

15	14	13	12	11	10	9									0
x	x	x	x	x	x	0	1	1	1	1	1	1	1	1	1
										opcode					

Description

Load the link register (LR) into the program counter (PC), increment the stack pointer (SP), then load the contents of the memory location pointed to by SP into LR. The content of LR and the content of the memory location pointed to by SP in this case is treated as an absolute halfword address.

This instruction has one delay slot. See Section 6.2.5.3.1 for restrictions on scheduling an instruction in this delay slot.

Condition Codes

None

Pseudo Code

```
PC = LR; SP += 4; LR = *(SP)
```

REV *Reverse a Bit Field Bounded by Two Register Values*

Syntax

REV *src1, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20				16	15		13	12		10	9		7	6					0
x	x	x	x	x	x	x	x	x	x	x	1	0	1	0	0	*dst*			*src2*			*src1*			0	0	0	0	1	0	0
																3			3			3						*opcode*			

Description

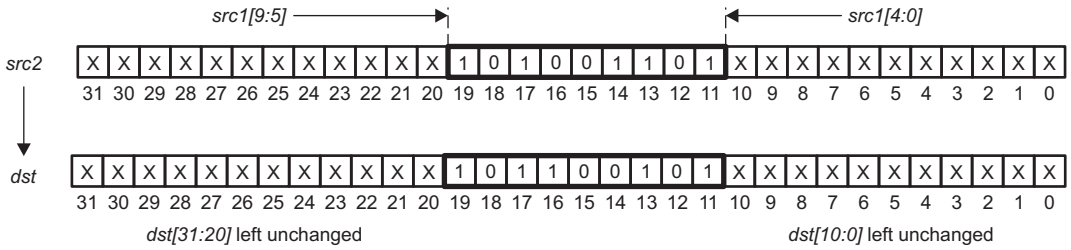
For *src1[9:5]* ≥ *src1[4:0]*, the field in *src2* as specified by *src1[4:0]* to *src1[9:5]* is bit reversed. The reversed bits are merged with the remaining (unchanged) bits in *dst* and are stored in *dst*. *src2* is left unchanged. *src1[4:0]* is the LSB of the field and *src1[9:5]* is the MSB of the field to be bit reversed. In other words, *src1[4:0]* and *src1[9:5]* represent the beginning and ending bits, respectively, of the field to be bit reversed. The LSB location of *src2* is bit 0 and the MSB location of *src2* is bit 31.

Valid values of *src1[9:5]* and *src1[4:0]* are:

- 0 ≤ *src1[9:5]* ≤ 31; 0 ≤ *src1[4:0]* ≤ 31
- *src1[9:5]* ≥ *src1[4:0]*

For *src1[9:5]* < *src1[4:0]*, the result is undefined.

In the following example, *src1[4:0]* is 11 and *src1[9:5]* is 19.



Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2
pntr = src1[9:5];
for( i = 0; i < 32; i++) {
  if ( i >= src1[4:0] && i <= src1[9:5]){
  dst[i] = dst[pntr]
  --pntr;
} else
  dst[i] = dst[i];
}
```

ROT *Rotate Right*

Syntax

ROT *src1, src2, dst*

Functional unit = L

Opcode

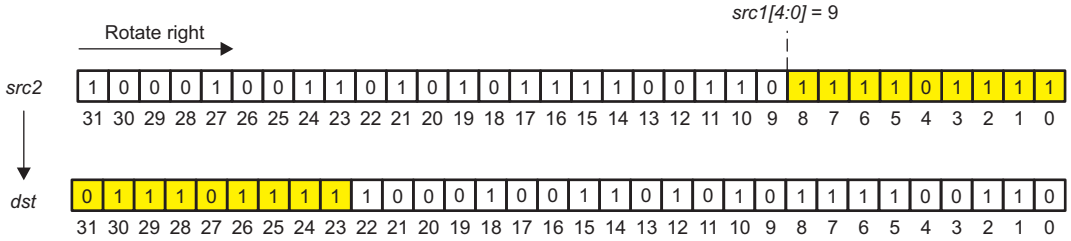
32 bit

31	30	29	28	27	26	25	24	23	22	21	20				16	15		13	12		10	9		7	6						0
x	x	x	x	x	x	x	x	x	x	x	1	0	1	0	1	*dst*			*src2*			*src1*			0	0	0	0	1	0	0
																3			3			3						*opcode*			

Description

src1[4:0] contains the number of bit positions that *src2* is to be rotated right. The new MSB value is defined by the previous LSB value of *src2*. The result is stored in *dst*. A *src1[4:0]* = 0, results in the **MV** *src1, dst* instruction.

In the following example, *src1[4:0]* is 9.



Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2
for( i = 1; i < src1; i++) {
  dst = { dst[0], dst[32-2: 1] };
}
```

ROTC *Rotate Right Through Carry Bit*

Syntax

ROTC *src1, src2, dst*

Functional unit = L

Opcode

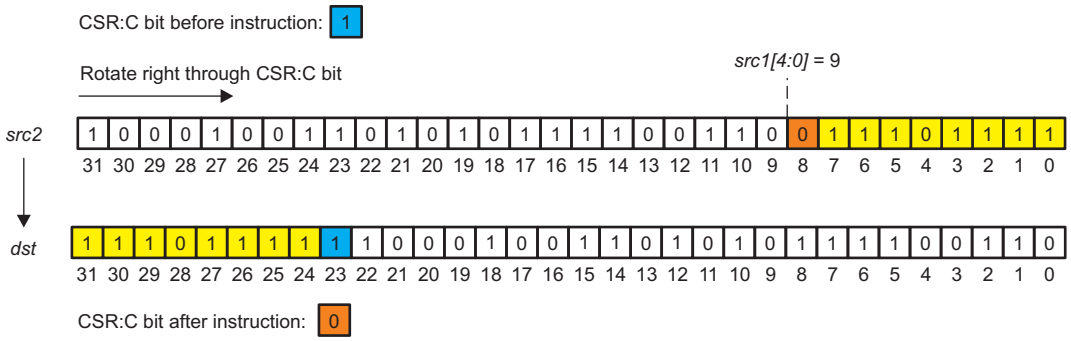
32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	1	0	1	1	0	*dst*			*src2*			*src1*			0	0	0	0	1	0	0
																3			3			3			*opcode*						

Description

src1[4:0] contains the number of bit positions that *src2* is to be rotated right through the Carry bit (CSR[5]C). The new MSB value is defined by the current SAT bit in the control status register (CSR). The rotated LSB of *src2* is moved to CSR[5]C. The result is stored in *dst*. A *src1[4:0]* = 0, results in the **MV** *src1, dst* instruction.

In the following example, *src1[4:0]* is 9.



Condition Codes

CSR[2]EQ = (dst == 0)

CSR[5]C: see the Pseudo Code

Pseudo Code

```
tmp = src2
for( i = 1; i < src1; i++) {
  tmp = { CSR[C], tmp[32-2: 1] };
  CSR[C] = tmp[0] ;
}
dst = tmp;
```

SADD *Signed Addition of Two Register Values with Saturation*

Syntax

SADD *src1, src2, dst*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*src2*	*src1*	0	1	1	1	0	0	0
3	3	3	*opcode*						

Description

Signed addition of *src1* with *src2* with result saturation and stored to *dst*. If a saturate occurs, the SAT bit in the control status register (CSR) is set after *dst* is written.

Condition Codes

CSR[2]EQ = (dst == 0)

CSR[5]SAT = satP OR satN

Pseudo Code

```
tmp = src2 + src1
satP = tmp > 2^31 -     1
satN = tmp <     -2^31
dst = satP ? (2^31 - 1)     : (satN ? -2^31 : tmp)
```

SATN *Saturation to Signed/Unsigned N-Bit Value with Sign/Zero Extend*

Syntax

SATN *ucst3, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18 16	15 13	12 10	9								0
x	x	x	x	x	x	x	x	x	x	x	x	x	*ucst3[2:0]*	*dst*	*src2*	1	1	1	0	0	0	0	1	1
													3	3	3					*opcode*				

Description

Saturation to signed/unsigned N-bit value and sign/zero extend to 32 bits. *src2* is saturated based on *ucst3*:

- *ucst3[2]* = 1 indicates signed saturation
- *ucst3[2]* = 0 indicates unsigned saturation
- *ucst3[1:0]* = 0 indicates saturation to 8 bit value
- *ucst3[1:0]* = 1 indicates saturation to 16 bit value
- *ucst3[1:0]* = other values (2 or 3) are reserved

src2 is considered a signed value that needs to be saturated to a signed or unsigned range. The result is undefined, if reserved values in *ucst3* are used.

Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

dst = (src2 <= $-2^{(N-1)}$) ? $-2^{(N-1)}$: ((src2 >= $2^{(N-1)}$ - 1) ? $2^{(N-1)}$ - 1 : src2);

SET — *Set Bit Field Bounded by Two Immediate Values*

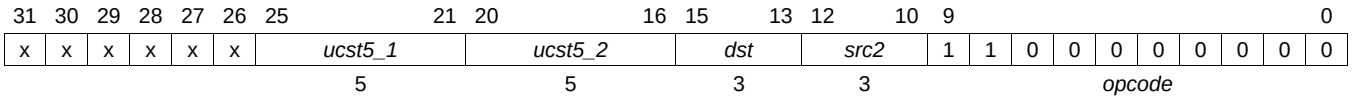
Syntax

SET *ucst5_1, ucst5_2, src2, dst*

Functional unit = L

Opcode

32 bit



Description

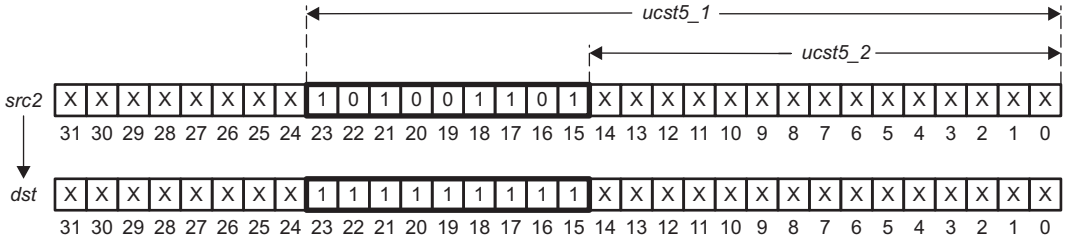
For *ucst5_1* ≥ *ucst5_2*, the field in *src2* as specified by *ucst5_2* to *ucst5_1* is set to all 1s and the resulting value of *src2* is written to *dst*. *src2* is left unchanged. *ucst5_2* is the LSB of the field and *ucst5_1* is the MSB of the field. In other words, *ucst5_2* and *ucst5_1* represent the beginning and ending bits, respectively, of the field to be set to all 1s. The LSB location of *src2* is bit 0 and the MSB location of *src2* is bit 31.

Valid values of *ucst5_1* and *ucst5_2* are:

- 0 ≤ *ucst5_1* ≤ 31; 0 ≤ *ucst5_2* ≤ 31
- *ucst5_1* ≥ *ucst5_2*

For *ucst5_1* < *ucst5_2*, the result is undefined.

In the following example, *ucst5_2* is 15 and *ucst5_1* is 23.



Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2
for( i = 0; i < 32; i++) {
  if ( i >= ucst5_2 && i <= ucst5_2) dst[i] = 1;
};
```

SET *Set Bit Field Bounded by Two Register Values*

Syntax

SET *src1, src2, dst*

Functional unit = L

Opcode

32 bit

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	13	12	10	9	7	6						0
x	x	x	x	x	x	x	x	x	x	x	1	0	0	0	0	*dst*		*src2*		*src1*		0	0	0	0	1	0	0
																3		3		3					*opcode*			

Description

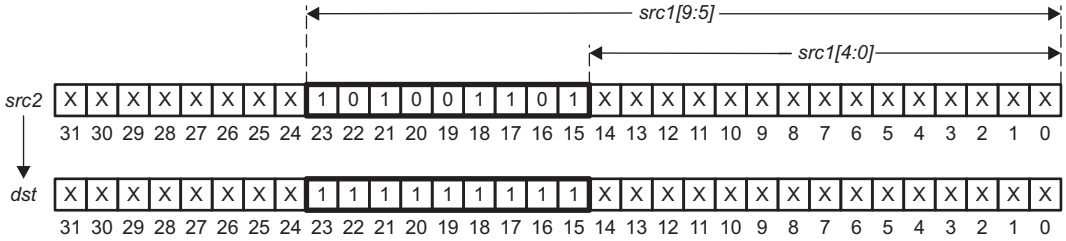
For *src1[9:5]* ≥ *src1[4:0*, the field in *src2* as specified by *src1[4:0]* to *src1[9:5]* is set to all 1s and the resulting value of *src2* is written to *dst*. *src2* is left unchanged. *src1[4:0]* is the LSB of the field and *src1[9:5]* is the MSB of the field. In other words, *src1[4:0]* and *src1[9:5]* represent the beginning and ending bits, respectively, of the field to be set to all 1s. The LSB location of *src2* is bit 0 and the MSB location of *src2* is bit 31.

Valid values of *src1[9:5* and *src1[4:0]* are:

- 0 ≤ *src1[9:5]* ≤ 31; 0 ≤ *src1[4:0]* ≤ 31
- *src1[9:5]* ≥ *src1[4:0]*

For *src1[9:5]* < *src1[4:0]*, the result is undefined.

In the following example, *src1[4:0]* is 15 and *src1[9:5]* is 23.



Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2
for( i = 0; i < 32; i++) {
  if ( i >= src1[4:0] && i <= src1[9:5]) dst[i] = 1;
};
```

SHL *Logical Shift Left by 5-Bit Unsigned Constant*

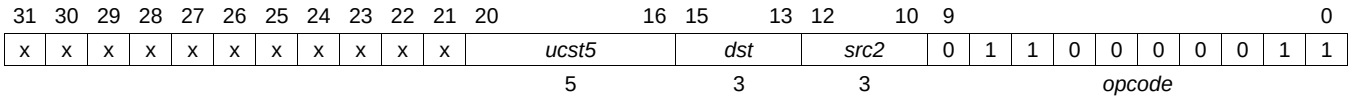
Syntax

SHL *ucst5, src2, dst*

Functional unit = L

Opcode

32 bit



31	30	29	28	27	26	25	24	23	22	21	20 – 16	15 – 13	12 – 10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	*ucst5*	*dst*	*src2*	0	1	1	0	0	0	0	0	1	1
											5	3	3	*opcode*									

Description

src2 is left shifted by a 5-bit unsigned constant (*ucst5*) and the result is stored to *dst*. The shift in value is 0.

Condition Codes

CSR[2] EQ = (dst == 0)

Pseudo Code

```
dst = src2 << ucst5
```

SHL *Logical Shift Left by Register Value*

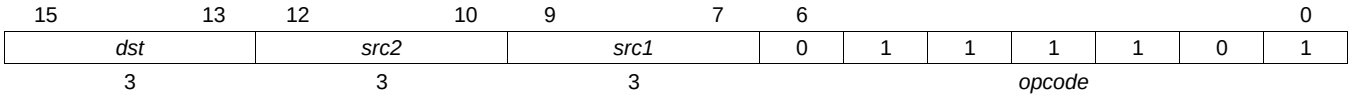
Syntax

SHL *src1, src2, dst*

Functional unit = L

Opcode

16 bit



15–13	12–10	9–7	6						0
dst	*src2*	*src1*	0	1	1	1	1	0	1
3	3	3	*opcode*						

Description

src2 is left shifted by an unsigned value (*src1*) and the result is stored to *dst*. The shift in value is 0. If the *src1* value is greater than 31, *dst* is cleared to 0.

Condition Codes

CSR[2] EQ = (dst == 0)

Pseudo Code

```
dst = (src1 > 31) ? 0: (src2 << src1)
```

SHRA *Arithmetic Shift Right by 5-Bit Unsigned Constant*

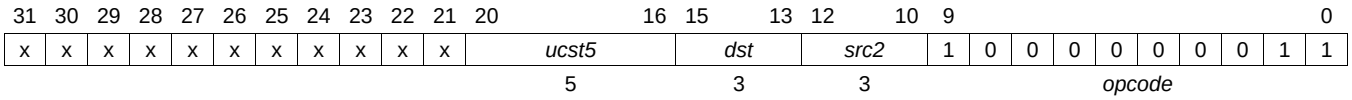
Syntax

SHRA *ucst5, src2, dst*

Functional unit = L

Opcode

32 bit



31	30	29	28	27	26	25	24	23	22	21	20 – 16	15 – 13	12 – 10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	*ucst5*	*dst*	*src2*	1	0	0	0	0	0	0	0	1	1
											5	3	3	*opcode*									

Description

src2 is right shifted by a 5-bit unsigned constant (*ucst5*) and the result is stored to *dst*. The shift in value is the sign bit (bit 31) of *src2*.

Using **DIV** (integer division) and **SHRA** (arithmetic right shift) does not produce the same result for negative numbers. The quotient of **DIV** is rounded towards zero, whereas the quotient of **SHRA** is rounded towards negative infinity. For example, using the **DIV** instruction: -9/4 = -2, whereas using the **SHRA** instruction: -9/4 = -3.

Condition Codes

CSR[2] EQ = (dst == 0)

Pseudo Code

```
dst = {sign extend}{src2 >> ucst5}
```

SHRA *Arithmetic Shift Right by Register Value*

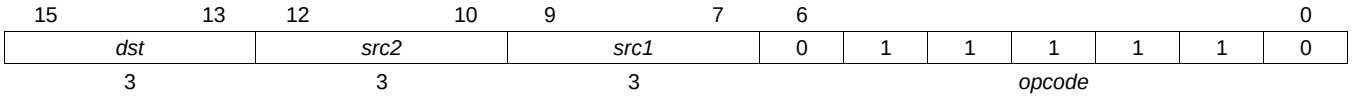
Syntax

SHRA *src1, src2, dst*

Functional unit = L

Opcode

16 bit



15–13	12–10	9–7	6						0
dst	*src2*	*src1*	0	1	1	1	1	1	0
3	3	3	*opcode*						

Description

src2 is right shifted by an unsigned value (*src1*) and the result is stored to *dst*. The shift in value is the sign bit (bit 31) of *src2* . If the *src1* value is greater than 31, *dst* is -1.

Using **DIV** (integer division) and **SHRA** (arithmetic right shift) does not produce the same result for negative numbers. The quotient of **DIV** is rounded towards zero, whereas the quotient of **SHRA** is rounded towards negative infinity. For example, using the **DIV** instruction: -9/4 = -2, whereas using the **SHRA** instruction: -9/4 = -3.

Condition Codes

CSR[2] EQ = (dst == 0)

Pseudo Code

```
dst = (src1 > 31) ? FFFF FFFFh: {sign extend}{src2 >> src1}
```

SHRU *Logical Shift Right by 5-Bit Unsigned Constant*

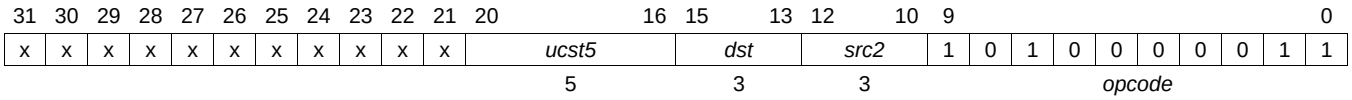
Syntax

SHRU *ucst5, src2, dst*

Functional unit = L

Opcode

32 bit



31	30	29	28	27	26	25	24	23	22	21	20 – 16	15 – 13	12 – 10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	*ucst5*	*dst*	*src2*	1	0	1	0	0	0	0	0	1	1
											5	3	3	*opcode*									

Description

src2 is right shifted by a 5-bit unsigned constant (*ucst5*) and the zero-extended result is stored to *dst*.

Condition Codes

CSR[2] EQ = (dst == 0)

Pseudo Code

```
dst = {zero extend}{src2 >> ucst5}
```

SHRU *Logical Shift Right by Register Value*

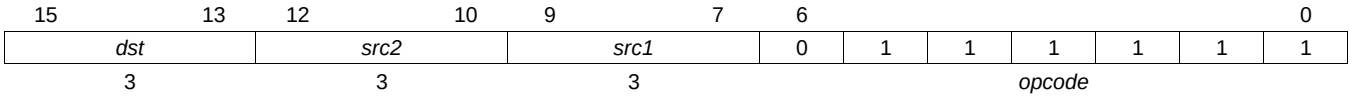
Syntax

SHRU *src1, src2, dst*

Functional unit = L

Opcode

16 bit



Description

src2 is right shifted by an unsigned value (*src1*) and the result is stored to *dst*. The shift in value is 0. If the *src1* value is greater than 31, *dst* is cleared to 0.

Condition Codes

CSR[2] EQ = (dst == 0)

Pseudo Code

```
dst = (src1 > 31) ? 0: {zero extend}{src2 >> src1}
```

SLA *Set Loop Address*

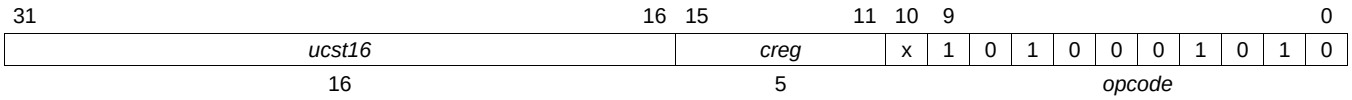
Syntax

SLA *ucst16, creg*

Functional unit = S

Opcode

32 bit



Description

Sets up loop bound address using a program counter (PC)-relative immediate positive offset. A zero-extended 16-bit unsigned immediate value (*ucst16*) is added to the PC of the instruction and is written to *creg*. Note that the offset is treated as a halfword offset. The only allowed *creg* registers for this instruction are: LSA0, LEA0, LSA1, and LEA1.

Condition Codes

None

Pseudo Code

```
creg = PC + {zero extend}ucst16
```

SSUB *Subtraction of Two Register Values with Saturation*

Syntax

SSUB *src1, src2, dst*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*src2*	*src1*	0	1	1	1	0	0	1
3	3	3	*opcode*						

Description

src1 is subtracted from *src2* with result saturation and stored to *dst*. If a saturate occurs, the SAT bit in the control status register (CSR) is set after *dst* is written.

Condition Codes

CSR[2] EQ = (dst == 0)

CSR[6] SAT = satP OR satN

Pseudo Code

```
tmp = src2 - src1
satP = tmp > 2^31 -     1
satN = tmp <     -2^31
dst = satP ? (2^31 - 1)     : (satN ? -2^31 : tmp)
```

STB *Store Byte to Memory with a 3-Bit Unsigned Constant Offset*

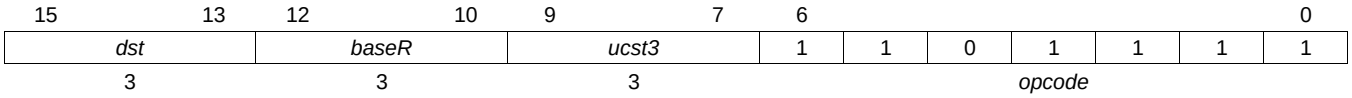
Syntax

STB *dst, *+baseR[ucst3]*

Functional unit = D

Opcode

16 bit



15–13	12–10	9–7	6						0
dst	*baseR*	*ucst3*	1	1	0	1	1	1	1
3	3	3	*opcode*						

Description

The 8 LSBs (byte) of *dst* are stored to memory (effective address). The memory address is formed from a base address register (*baseR*) and an offset (number of bytes) that is a 3-bit unsigned constant (*ucst3*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ], must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst3* is scaled by a left-shift of 0 bits. After scaling, *ucst3* is added to *baseR*. The result of the calculation is the effective address in memory that contains the content from *dst*.

Condition Codes

None

Pseudo Code

```
*(baseR[ucst3]) = *dst
```

STB *Store Byte to Memory with a 16-Bit Unsigned Constant Offset*

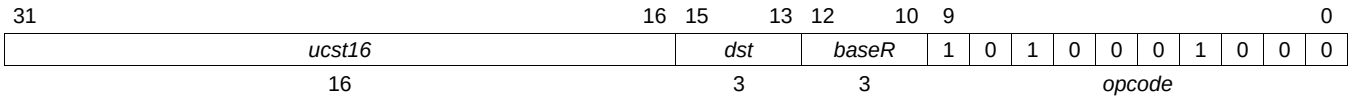
Syntax

STB *dst, *+baseR[ucst16]*

Functional unit = D

Opcode

32 bit



Description

The 8 LSBs (byte) of *dst* are stored to memory (effective address). The memory address is formed from a base address register (*baseR*) and an offset (number of bytes) that is a 16-bit unsigned constant (*ucst16*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ], must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst16* is scaled by a left-shift of 0 bits. After scaling, *ucst16* is added to *baseR*. The result of the calculation is the effective address in memory that contains the content from *dst*.

Condition Codes

None

Pseudo Code

```
*(baseR[ucst16]) = *dst
```

STB *Store Byte to Memory with a Register Offset*

Syntax

STB *dst, *+baseR[src1]*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*baseR*	*src1*	1	1	0	1	1	0	0
3	3	3	*opcode*						

Description

The 8 LSBs (byte) of *dst* are stored to memory (effective address). The memory address is formed from a base address register (*baseR*) and an offset (number of bytes) that is a register (*src1*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ], must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *src1* is scaled by a left-shift of 0 bits. After scaling, *src1* is added to *baseR*. The result of the calculation is the effective address in memory that contains the content from *dst*.

Condition Codes

None

Pseudo Code

```
*(baseR[src1]) = *dst
```

STB *Store Byte to Memory, Postincrement with a 3-Bit Unsigned Constant Offset*

Syntax

STB *dst, *baseR++[ucst3]*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*baseR*	*ucst3*	1	1	1	0	1	0	1
3	3	3	*opcode*						

Description

The 8 LSBs (byte) of *dst* are stored to memory (effective address). The memory address is the value of the base address register (*baseR*). After accessing, an offset (number of bytes) that is a 3-bit unsigned constant (*ucst3*) is added to *baseR* at the end of the EXE phase. Brackets, [ ], must surround the specified offset, if using the optional offset parameter.

Condition Codes

None

Pseudo Code

```
*(baseR++[ucst3]) = *dst

STB *Store Byte to Memory with a GDP-Relative 19-Bit Unsigned Constant Offset*

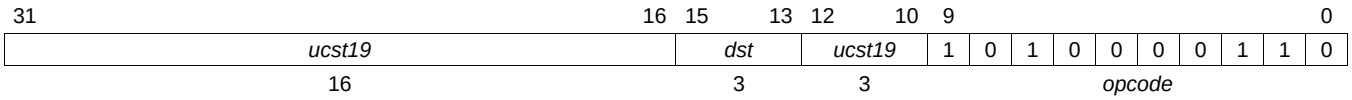
Syntax

STB *dst, **+**GDP***[ucst19]***

Functional unit = D

Opcode

32 bit



Description

The 8 LSBs (byte) of *dst* are stored to memory (effective address). The memory address is formed from the global data pointer register (GDP) and an offset (number of bytes) that is a 19-bit unsigned constant (*ucst19*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ], must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst19* is scaled by a left-shift of 0 bits. After scaling, *ucst19* is added to GDP. The result of the calculation is the effective address in memory that contains the content from *dst*.

Condition Codes

None

Pseudo Code

```
*(GDP[ucst19]) = *dst
```

STH *Store Halfword to Memory with a 3-Bit Unsigned Constant Offset*

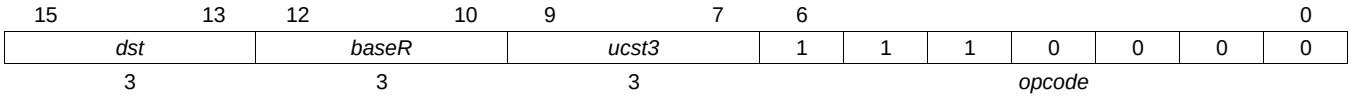
Syntax

STH *dst, *+baseR[ucst3]*

Functional unit = D

Opcode

16 bit



15–13	12–10	9–7	6	5	4	3	2	1	0
dst	*baseR*	*ucst3*	1	1	1	0	0	0	0
3	3	3	*opcode*						

Description

The 16 LSBs (halfword) of *dst* are stored to memory (effective address). The memory address is formed from a base address register (*baseR*) and an offset (number of halfwords) that is a 3-bit unsigned constant (*ucst3*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ], must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst3* is scaled by a left-shift of 1 bit. After scaling, *ucst3* is added to *baseR*. The result of the calculation is the effective address in memory that contains the content from *dst*.

Halfword addresses must be aligned on halfword (LSB is 0) boundaries.

Condition Codes

None

Pseudo Code

```
*(baseR[ucst3]) = *dst
```

STH *Store Halfword to Memory with a 16-Bit Unsigned Constant Offset*

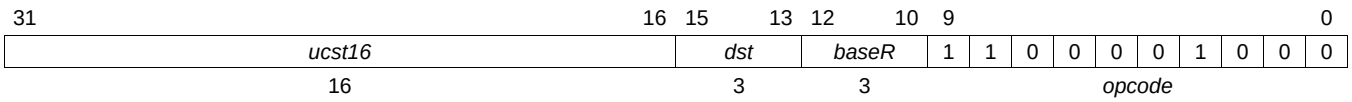
Syntax

STH *dst, *+baseR[ucst16]*

Functional unit = D

Opcode

32 bit



Description

The 16 LSBs (halfword) of *dst* are stored to memory (effective address). The memory address is formed from a base address register (*baseR*) and an offset (number of halfwords) that is a 16-bit unsigned constant (*ucst16*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ], must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *ucst16* is scaled by a left-shift of 1 bit. After scaling, *ucst16* is added to *baseR*. The result of the calculation is the effective address in memory that contains the content from *dst*.

Halfword addresses must be aligned on halfword (LSB is 0) boundaries.

Condition Codes

None

Pseudo Code

```
*(baseR[ucst16]) = *dst
```

STH *Store Halfword to Memory with a Register Offset*

Syntax

STH *dst, *+baseR[src1]*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*baseR*	*src1*	1	1	0	1	1	0	1
3	3	3	*opcode*						

Description

The 16 LSBs (halfword) of *dst* are stored to memory (effective address). The memory address is formed from a base address register (*baseR*) and an offset (number of halfwords) that is a register (*src1*). If an offset is not given, the assembler assigns an offset of zero. Brackets, [ ], must surround the specified offset, if using the optional offset parameter.

The square brackets, [ ], indicate that the *src1* is scaled by a left-shift of 1 bit. After scaling, *src1* is added to *baseR*. The result of the calculation is the effective address in memory that contains the content from *dst*.

Halfword addresses must be aligned on halfword (LSB is 0) boundaries.

Condition Codes

None

Pseudo Code

```
*(baseR[src1]) = *dst
```

STH *Store Halfword to Memory, Postincrement with a 3-Bit Unsigned Constant Offset*

Syntax

STH *dst, *baseR++[ucst3]*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*baseR*	*ucst3*	1	1	1	0	1	1	0
3	3	3	*opcode*						

Description

The 16 LSBs (halfword) of *dst* are stored to memory (effective address). The memory address is the value of the base address register (*baseR*). After accessing, an offset (number of halfwords) that is a 3-bit unsigned constant (*ucst3*) is added to *baseR* at the end of the EXE phase. You must type the brackets, [ ], around the specified offset, if you use the optional offset parameter.

Halfword addresses must be aligned on halfword (LSB is 0) boundaries.

Condition Codes

None

Pseudo Code

```
*(baseR++[ucst3]) = *dst
```

STH *Store Halfword to Memory, Postincrement with a Register Offset*

Syntax

STH *dst, *baseR++[src1]*

Functional unit = D

Opcode

Pseudo Code

```
*(GDP[ucst19]) = *dst
```

STHI *Store 16-Bit Halfword to Memory with a 6-Bit Unsigned Constant Offset*

Syntax

STHI *ucst16, *+baseR[ucst6]*

Functional unit = S

Opcode

32 bit

31 16	15 13	12 10	9 7	6						0
ucst19	*ucst6*	*baseR*	*ucst6*	0	0	0	1	0	1	1
16	3	3	3						*opcode*	

Description

The 16-bit unsigned constant (*ucst16*) is stored to memory (effective address). The memory address is formed from a base address register (*baseR*) and an offset (number of halfwords) that is a 6-bit unsigned constant (*ucst6*). If an offset is not given, the assembler assigns an offset of zero. You must type the brackets, [ ], around the specified offset, if you use the optional offset parameter.

The square brackets, [ ], indicate that the *ucst6* is scaled by a left-shift of 1 bit. After scaling, *ucst6* is added to *baseR*. The result of the calculation is the effective address in memory that contains *ucst16*.

Halfword addresses must be aligned on halfword (LSB is 0) boundaries.

Condition Codes

None

Pseudo Code

```
*(baseR[ucst6]) = ucst16
```

STRF *Store Register File to Stack Pointer*

Syntax

STRF *op1, op2*

Functional unit = D

Opcode

16 bit

15 13	12 10	9	8	7	6						0
op2	*op1*	x	x	x	1	0	1	0	0	1	0
3	3							*opcode*			

Description

The current base register file is stored to the starting address specified by the postdecremented value of the stack pointer (SP). *op1* specifies the ending register (last register stored) and *op2* specifies the beginning register (first register stored). All registers between *op1* and *op2* are stored inclusive. The registers are stored in order from lowest register (*op2*) to highest register (*op1*).

Valid values of *op1* and *op2* are: *op1* ≥ *op2*

For *op1* < *op2*, results in unspecified behavior.

Condition Codes

None

Pseudo Code

```
for ( i = op2; i <= op1 ; i++) {
  *(SP) = Ri;
  SP -= 4;
}
```

SUB *Subtract 16-Bit Unsigned Constant from Register*

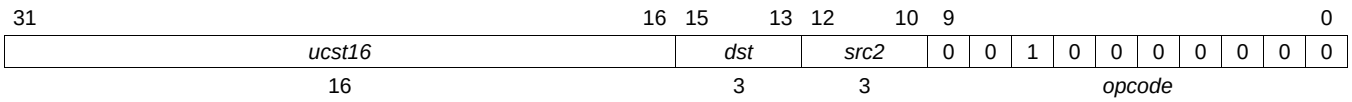
Syntax

SUB *ucst16, src2, dst*

Functional unit = D

Opcode

32 bit



Description

Subtract a 16-bit unsigned constant (*ucst16*) from *src2* and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

CSR[5]C = {not borrow} from (src2 - ucst16)

CSR[7]V = {overflow} from (src2 - ucst16)

Note that the carry (CSR[5]C) and overflow (CSR[7]V) bits are relevant to unsigned and signed operations, respectively. Appropriate bits are checked depending on if the operands are represented (or, interpreted) as unsigned or signed numbers.

Pseudo Code

```
dst = src2 - ucst16
```

SUB *Subtract 16-Bit Unsigned Constant from Stack Pointer, Result to Stack Pointer*

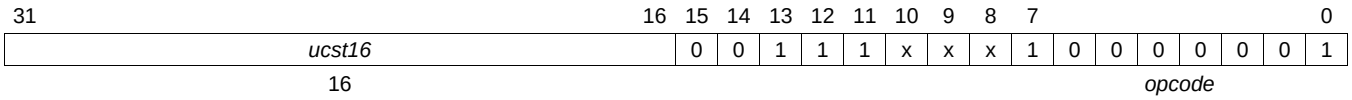
Syntax

SUB *ucst16,* **SP**

Functional unit = D

Opcode

32 bit



Description

Subtract a 16-bit unsigned constant (*ucst16*) from the stack pointer (SP) and store result to SP.

Condition Codes

None

Pseudo Code

```
SP = SP - ucst16
```

SUB *Subtract 16-Bit Unsigned Constant from Stack Pointer, Result to Register*

Syntax

SUB *ucst16,* **SP**, *dst*

Functional unit = D

Opcode

32 bit

31 16	15 13	12	11	10	9	8	7							0
ucst16	*dst*	0	0	1	1	1	1	0	0	0	0	0	1	0
16	3									*opcode*				

Description

Subtract a 16-bit unsigned constant (*ucst16*) from the stack pointer (SP) and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

CSR[5]C = {not borrow} from (SP - ucst16)

CSR[7]V = {overflow} from (SP - ucst16)

Note that the carry (CSR:C) and overflow (CSR:V) bits are relevant to unsigned and signed operations, respectively. Appropriate bits are checked depending on if the operands are represented (or, interpreted) as unsigned or signed numbers.

Pseudo Code

```
dst = SP - ucst16
```

SUB *Subtract 3-Bit Unsigned Constant from Register*

Syntax

SUB *ucst3, src2, dst*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*src2*	*ucst3*	0	1	1	0	0	0	1
3	3	3	*opcode*						

Description

Subtract a 3-bit unsigned constant (*ucst3*) from *src2* and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

CSR[5]C = {not borrow} from (src2 - ucst3)

CSR[7]V = {overflow} from (src2 - ucst3)

Note that the carry (CSR:C) and overflow (CSR:V) bits are relevant to unsigned and signed operations, respectively. Appropriate bits are checked depending on if the operands are represented (or, interpreted) as unsigned or signed numbers.

Pseudo Code

```
dst = src2 - ucst3
```

SUB *Signed Subtraction of Two Register Values*

Syntax

SUB *src1, src2, dst*

Functional unit = D

Opcode

16 bit

15 13	12 10	9 7	6						0
dst	*src2*	*src1*	0	1	1	0	0	1	1
3	3	3	*opcode*						

Description

Subtract *src1* from *src2* and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

CSR[5]C = {not borrow} from (src2 - src1)

CSR[7]V = {overflow} from (src2 - src1)

Note that the carry (CSR[5]C) and overflow (CSR[7]V) bits are relevant to unsigned and signed operations, respectively. Appropriate bits are checked depending on if the operands are represented (or, interpreted) as unsigned or signed numbers.

The status of the CSR[5]C bit can be used to synthesize multiword (wider) subtraction. With the **SUB** instruction, the CSR[5]C bit is set if no borrow occurs and the CSR[5]C bit is cleared if a borrow occurs. In other words, for **SUB** instructions, the CSR[5]C bit represents a not borrow. To synthesize multiword subtractions, subsequent instructions can use the CSR[5]C bit as a NOT(borrow) operand, performing a normal subtraction if CSR[5]C == 1 and subtracting one more than usual if CSR[5]C == 0.

For example, if register pairs R0/R1 and R2/R3 hold 64-bit values (where R0 and R2 hold the least-significant words), the following instructions leave the 64-bit difference in the register pair R4/R5:

```
     SUB   R2, R0, R4       ; R4=R0-R2, sets CSR[C]
     MVC   CSR, R6          ; leaves CSR[C] untouched
     EXTU  5, 5, R6, R6     ; if (CSR[C]) R6=0x1 else R6=0x0
     BNEQ  L1
     SUB   R3, R1, R5       ; R5=R1-R3
     SUB   1, R5, R5        ; R5=R5-1 if CSR[C] was NOT set
L1:  NOP                    ; else R5=R5
```

Note that the above example needs appropriate modification in order to generate correct carry/overflow applicable for the total 64-bit result.

Pseudo Code

```
dst = src2 - src1
```

SWI *Software Interrupt*

Syntax

SWI

Functional unit = S

Opcode

16 bit

15	14	13	12	11	10	9									0
x	x	x	x	x	x	0	0	0	1	1	1	1	1	1	1
										opcode					

Description

Subtract *src1* from *src2* and store result to *dst*.

Condition Codes

SCSR = CSR; CSR[0] = 0

Pseudo Code

```
PC = *(IMEM[IST[SWI]]); IRP = PC + 1;
```

XOR — *Bitwise Exclusive-OR Unsigned 16-Bit Constant with Register*

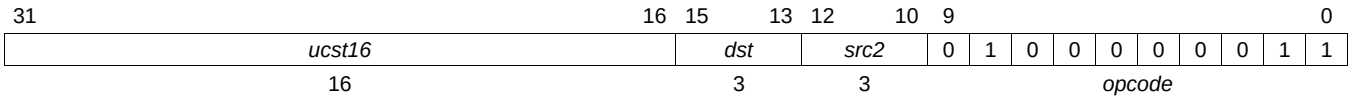
Syntax

XOR *ucst16, src2, dst*

Functional unit = L

Opcode

32 bit



Description

Bitwise exclusive-OR (XOR) of a zero-extended 16-bit unsigned constant (*ucst16*) with *src2* and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2 XOR {zero extend}ucst16
```

XOR *Bitwise Exclusive-OR Two Registers*

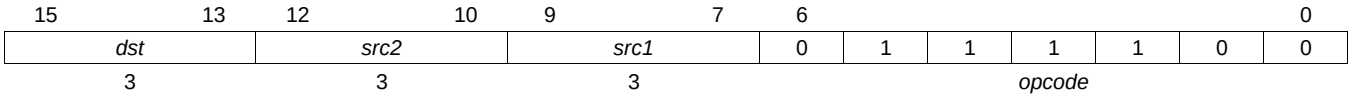
Syntax

XOR *src1, src2, dst*

Functional unit = L

Opcode

16 bit



15–13	12–10	9–7	6						0
dst	*src2*	*src1*	0	1	1	1	1	0	0
3	3	3	*opcode*						

Description

Bitwise exclusive-OR (XOR) of *src1* with *src2* and store result to *dst*.

Condition Codes

CSR[2]EQ = (dst == 0)

Pseudo Code

```
dst = src2 XOR src1
```

6.2.6 Clock, Reset, and Dynamic Power Management

6.2.6.1 Introduction

The ARP32 CPU has a single clock domain (cpu_fclk) and two reset domains:

- An asynchronous Power-On-Reset (cpu_porz_i)
- An asynchronous CPU Functional Reset (cpu_resetz_i)

Both of the reset signals are used asynchronously inside the design. Both the leading and trailing edges of these reset signals are synchronized with the CPU input clock by the external clock/reset management logic.

To reduce dynamic power consumption, the ARP32 CPU gates all of its internal clocks based on debugger connection status and CPU idle/standby status:

- If the ARP32 CPU is in the IDLE state and the CPU standby indication is asserted, all internal clocks of the ARP32 CPU remain gated.
- If debug connection is established, indicated via the input port cpu_dbgenable_i, the ARP32 CPU unconditionally enables all its internal clocks.

6.2.6.2 CPU Reset Modes

Table 6-349 summarizes the two reset signals of the ARP32 CPU and their effects. Table 6-350 summarizes the different application of the two resets.

Figure 6-52 illustrates the ARP32 CPU power-on-reset sequence.

If warm reset is applied without Power on reset, to avoid meta-stability issues within the CPU core, the functional clock to the CPU core must be stopped by external clock generation logic prior to Warm reset assertion and the functional clock must be restored prior to Warm reset de-assertion.

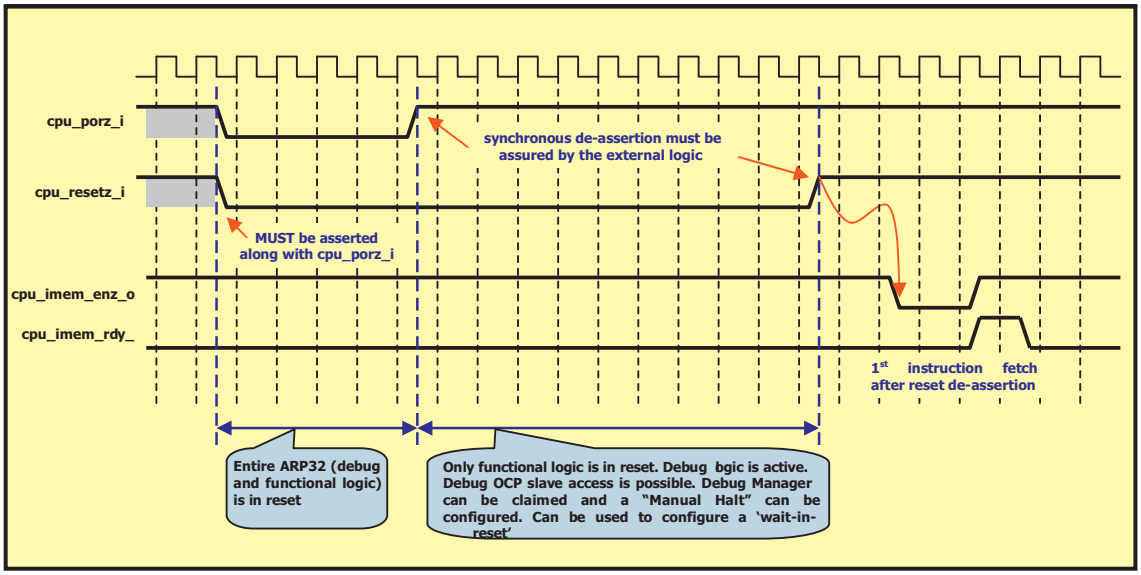
Table 6-349. CPU Reset Types

			Does CPU Reset?	
Reset Type	**Signal Name**	**Reset Type**	**Debug Logic**	**Functional Logic**
Power On Reset	cpu_porz_i	Async	Yes	No
Warm Reset	cpu_resetz_i	Async	No	Yes

Table 6-350. CPU Reset Modes

				Does CPU Reset?		Need Synchronization?	
cpu_ porz_i	**cpu_resetz_i**	**Reset Mode**	**Application**	**Debug Logic**	**Functional Logic**	**Assertion**	**De-assertion**
0	0	Power On Reset	Reset at power up, full system reset	Yes	No	NA	Yes
0	1	Not supported	NA	NA	NA	NA	NA
1	0	Warm Reset	Reset of CPU core only, for example, watchdog reset	No	Yes	Yes	Yes
1	1	Normal	No reset, normal running mode	No	No	NA	NA

Figure 6-52. Power-On-Reset



6.2.6.3 Dynamic Power Management

The ARP32 CPU supports instruction driven transition to a low-power state that is used to trigger a CPU system-wide low-power state. This is accomplished by the **IDLE** instruction. Upon execution of the **IDLE** instruction, the ARP32 CPU waits for any pending instruction or data memory transaction to complete and then goes to an endless wait state.

When in idle state, the CPU output signal cpu_standby_o is asserted high. During this window, the CPU gates clocks to all of its registers (except the interrupt flag register (IFR)) to achieve maximum saving of dynamic power. It is assured that the ARP32 CPU does not issue any new transactions on either instruction or data memory interfaces during this window. So, peripherals external to the CPU that don't need to be active while the CPU is in IDLE are also clock gated during this window.

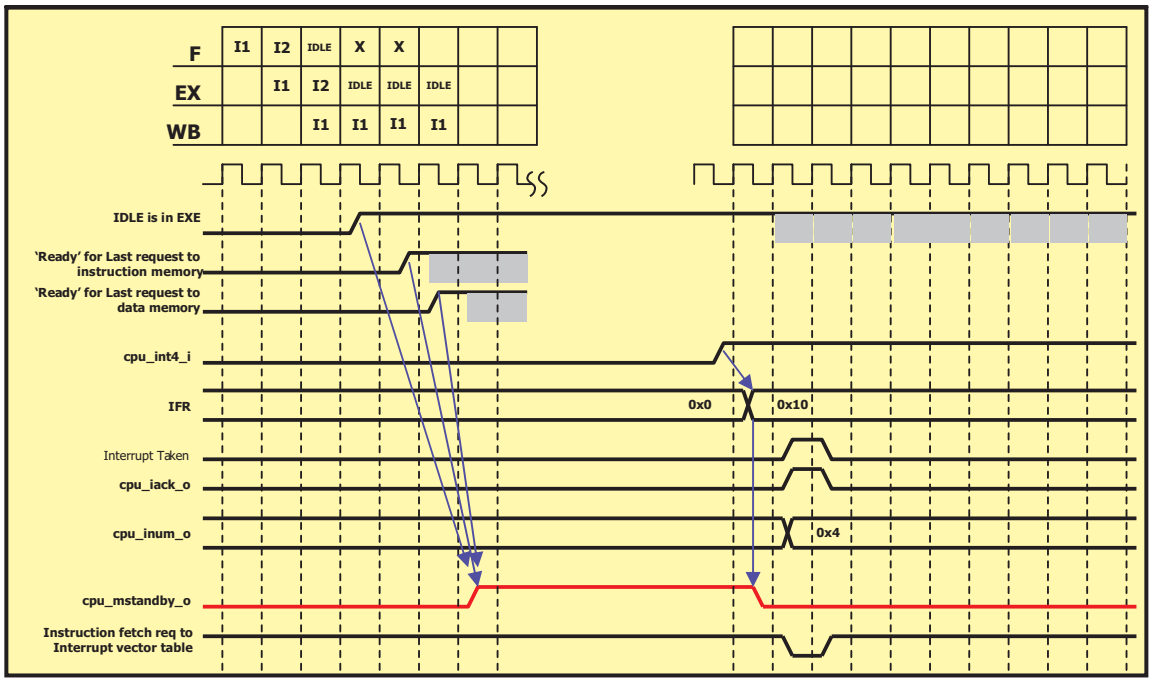
The CPU comes out of this wait state only via an enabled external interrupt (NMI, INT4-INT7) or reset. The cpu_standby_o signal is de-asserted as soon as one of the following events occurs:

- any of the interrupt flag register (IFR) bits are set
- a debug connection is established (cpu_dbgenable_i is asserted high)

Interrupt enable conditions (like GIE, IER, etc.) are not considered when de-asserting cpu_standby_o. Thus, a disabled interrupt being asserted at the CPU boundary causes the cpu_standby_o signal to be de-asserted but the CPU still remains in idle state until an enabled interrupt (or reset) occurs.

Figure 6-53 provides an illustrative waveform showing the CPU going into IDLE mode followed by a wakeup via INT4.

Figure 6-53. CPU Standby and Wakeup Procedure



6.2.7 Notes on Programming Model

6.2.7.1 Booting

The entry for reset in the ARP32 interrupt service table (IST) is setup such that the program flow after reset calls an initialization or boot code as soon as possible and performs at least the following functions:

- Initialize the stack pointer (SP) register.
- Initialize the global data pointer (GDP) register.
- Call 'main' function.

The following tasks are additionally performed if interrupt processing is needed from the very beginning; else, they are done as soon as the system is ready for (or expecting) interrupt processing:

- Initialize the interrupt enable register (IER) to enable the required maskable interrupts, as required.
- Initialize the interrupt enable register (IER) to enable the nonmaskable interrupt, if required.
- Initialize the control status register (CSR) to enable all the maskable interrupts globally.

6.2.7.2 Enabling and Disabling Interrupts

The ARP32 CPU provides a mechanism for easy and flexible interrupt control.

6.2.7.2.1 Globally Enabling or Disabling Maskable Interrupts

The global interrupt enable (GIE) bit in the control status register (CSR) allows programmers to enable or disable all maskable interrupts by controlling the value of a single bit. On the ARP32 CPU, programs must directly manipulate the GIE bit in CSR to disable and enable interrupts:

- CSR[0]GIE = 1 enables the maskable interrupts so that they are processed
- CSR[0]GIE = 0 disables the maskable interrupts so that they are not processed

For example, the following code sequence globally enables all maskable interrupts:

```
MVC   CSR, R0        ; Get CSR into R0
SET   0, 0, R0, R0   ; Set R0[0]
MVC   R0, CSR        ; Copy R0 back to CSR (sets GIE)
```

Similarly, the following code sequence globally disables all maskable interrupts:

```
MVC   CSR, R0        ; Get CSR into R0
CLR   0, 0, R0, R0   ; Clear R0[0]
MVC   R0, CSR        ; Copy R0 back to CSR (clears GIE)
```

As interrupt detection occurs in parallel with CPU execution, the CPU takes an interrupt in the cycle immediately following an **MVC** instruction that clears the GIE bit. However, CPU context save/restore behavior ensures that interrupts do not occur after subsequent instruction. Consider the following code example where the CPU takes an interrupt between instructions 1 and 2, between instructions 2 and 3, or between instructions 3 and 4. The CPU does not service an interrupt between instructions 4 and 5.

```
; assume GIE=1
MVC   CSR, R0        ;(1) Get CSR
AND   -2, R0, R0     ;(2) Get ready to clear GIE
MVC   R0, CSR        ;(3) Clear GIE
ADD   R0, R2, R3     ;(4)
ADD   R4, R4, R5     ;(5)
```

If the CPU services an interrupt between instructions 1 and 2 or between instructions 2 and 3, the SCSR[0]GIE bit holds the value 1 when arriving at the interrupt service routine. If the CPU services an interrupt between instructions 3 and 4, the SCSR[0]GIE bit holds the value 0. Thus, when the interrupt service routine resumes the interrupted code, it resumes with the GIE bit cleared (as a result of context restore of SCSR to CSR) as the interrupted code intended.

6.2.7.2.2 Enabling or Disabling Individual Interrupts

Software can enable and disable individual interrupts by setting and clearing the bits in the interrupt enable register (IER) that correspond to the individual interrupts. An interrupt can trigger interrupt processing only if the corresponding bit in the IER is set.

For example, the following code sequence enables INT4:

```
MVC   IER, R0        ; Get IER into R0
SET   4, 4, R0, R0   ; Set R0[4]
MVC   R0, IER        ; Copy R0 back to IER (sets IER[4])
```

Similarly, the following code sequence disables INT5:

```
MVC   IER, R0        ; Get IER into R0
CLR   5, 5, R0, R0   ; Clear R0[5]
MVC   R0, IER        ; Copy R0 back to IER (clears IER[5])
```

6.2.7.3 Stack Usage in Interrupt Service Routine

The ARP32 CPU has only one stack pointer and thus a unified stack is used for background and interrupt code. As a result, the programmer is responsible for maintaining a clean boundary of operations that modifies the stack pointer (for example, stack allocation and de-allocation for a function, context save onto stack via push/pop operations using the **LDRF/STRF** instructions).

Instructions/operations in the CPU that modify the stack pointer are designed so that an interrupt cannot disrupt the operations halfway through to completion. For example, a stack allocation and de-allocation for function can happen via the **ADD** *ucst16,* **SP** instruction that atomically modifies the stack. The return address save while taking a CALL or retrieving the return address while executing a RET is also atomic, and cannot be interrupted. The **LDRF/STRF** instructions used for single or multiple pop and push are also uninterruptable. The ARP32 C/++ compiler uses these instructions to maintain the C/C++ stack and thus the sanity of the stack is always maintained.

Under certain scenarios, to save additional user context onto the stack, it is done via the **LDRF/STRF** instruction. **LDRF/STRF** modifies the stack pointer and hence results in the stack layout of a function to be not valid anymore. Hence, such additional context save/restore to the stack must happen at function boundaries only.

These considerations are important for assembly level programmers doing additional context save/restore (beyond what the ARP32 compiler does) and also to new custom instruction design for the ARP32 CPU if they depend on stack pointer relative operations.

6.2.7.4 General Restrictions

The ARP32 CPU has the following restrictions on the programming model:

- **Long Long (as 64 bit) is not supported natively in the architecture.** 'long long' is supported via emulation in the Run Time Support (RTS) library. Since this is non-standard and sub-optimal, use of long may severely degrade performance. Hence, it is highly recommended not to use the C 'long long' datatype.
- **64-bit arithmetic.** Add/sub of more than 32-bit values (operand or results) requires **ADDC/SUBC/BC** (addition with carry, subtraction with borrow, branch on carry) instructions that are not supported in the ARP32 CPU. Again, it is possible to emulate this in RTS but it is a sub-optimal implementation and it is not recommended.
- **Multi-threading via mutex is not supported in the architecture.** In the ARP32 CPU, it does not implement an "EXCLUSIVE access instruction" to implement a 'proper' mutex in RTS. A polling based multi-threading is still possible.

6.3 VCOP CPU and Instruction Set

NOTE: Throughout this section, various sample assembly code pieces are used to illustrate VCOP architecture and functionality. Programmers are expected to write code in VCOP Kernel-C, instead of in assembly.

6.3.1 Module Overview

The Embedded Vision Engine (EVE) module is a programmable imaging and vision processing engine, intended to be used in devices that serves consumer electronics imaging and vision applications. Its programmability allows late-in-development or post-silicon processing requirements to be met, and allows third party or customers to add differentiating features in imaging and vision products.

The EVE Module consists of an ARP32 scalar core, a VCOP vector core, and a DMA controller.

6.3.2 Features

- Interfaces
  - CLK/2 MHz custom interface with the scalar core
- Functionality
  - CLK MHz functional clock
  - Based on VICP coprocessor
  - Dual-issue, N-way SIMD per instruction
  - Scalable in N ways of SIMD, N = {2 | 4 | 8 | 16 | 32}
  - For the first version of VCOP N = 8
  - 16 entries x N ways x 40-bit register file
  - Binary morphology acceleration
  - N-way table lookup and histogram acceleration (capable of N lookups per cycle or N histograms per 4 cycle)
  - Up to 20-bit vector data memory address space
- Debug interface with visibility of loop variables and load/store pointers (VCOP_LD_PTR_i/VCOP_ST_PTR_j).

6.3.3 Block Diagram

The EVE subsystem contains an ARP32 scalar core, VCOP vector core, EDMA, memory blocks, memory switch, local interconnect, reset/clock, interrupt controller, SCTM and SMSET instrumentation blocks. Figure 6-54 provides a block diagram.

Figure 6-54. EVE Block Diagram

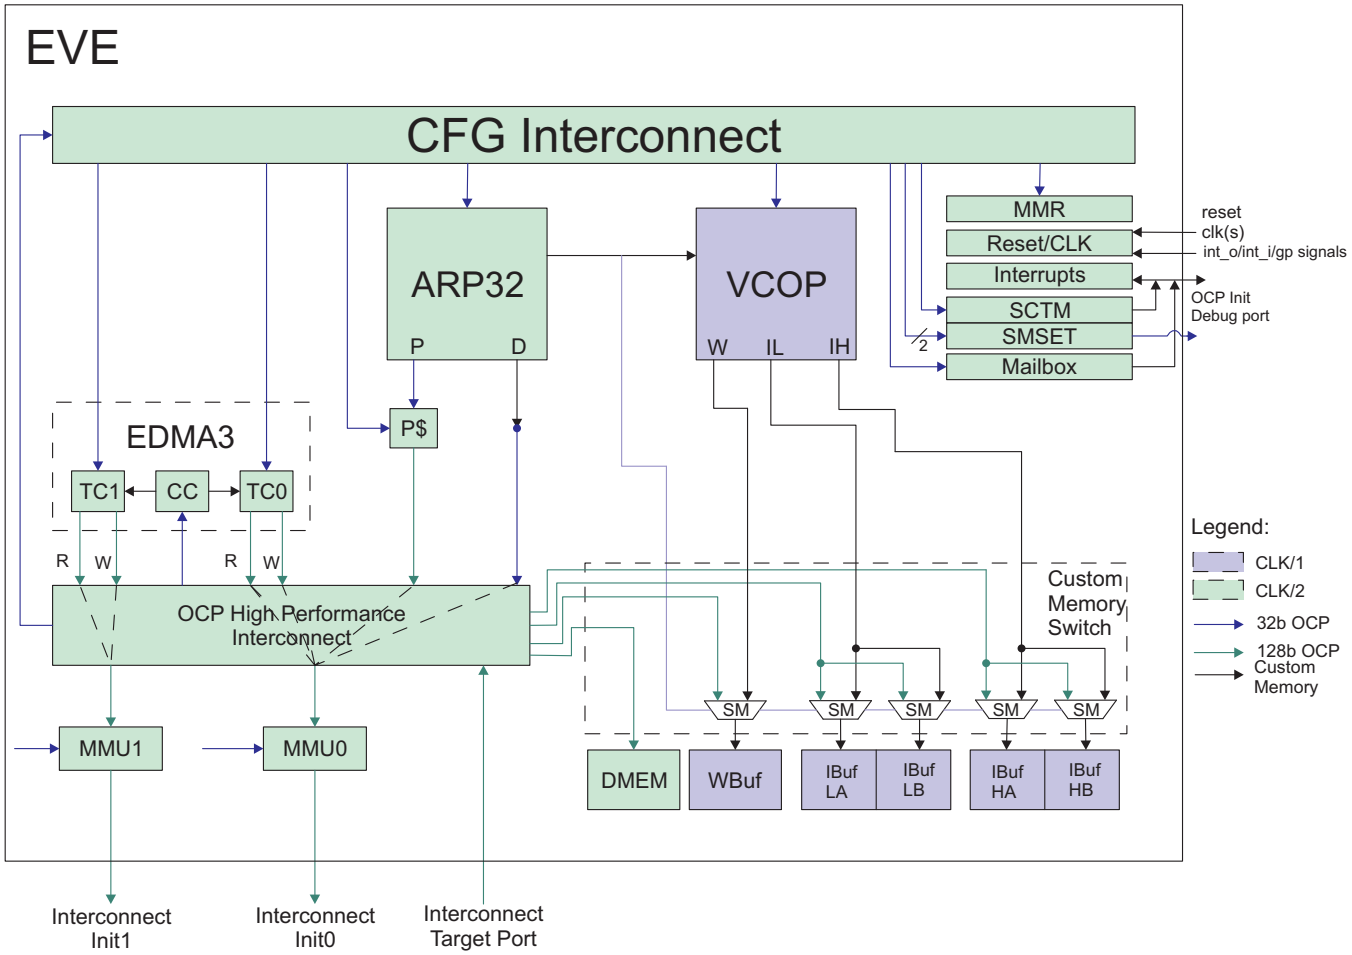


Figure 6-55 depicts the functional block diagram of EVE's Vector Coprocessor (VCOP).

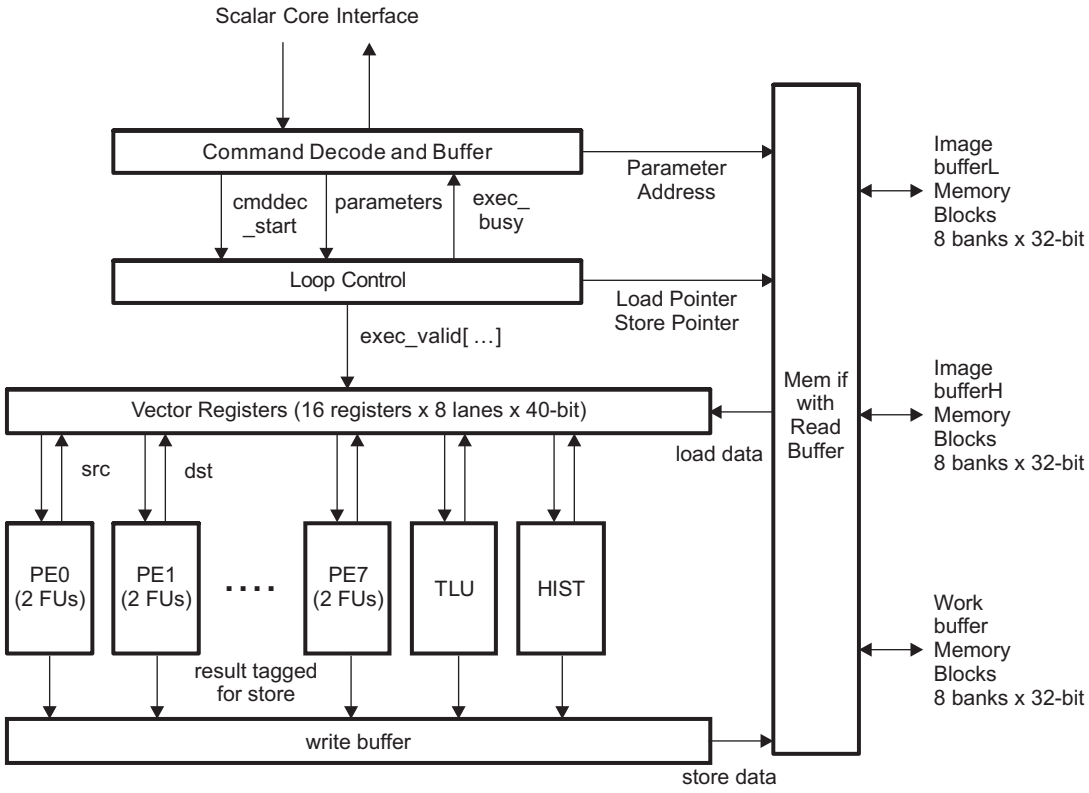
Figure 6-55. VCOP Block Diagram



6.3.4 System Interfaces

6.3.4.1 Interrupts

The vec_err_intn interrupt is driven by the vector core and indicates that the vector core has encountered an error condition, see Section 6.3.7.2.1 VCOP Register Manual for details.

6.3.4.2 Configuration Bus Slave Port

VCOP has a configuration bus slave interface that follows the OCP 32-bit slave protocol. The interface enables module configuration, status, processor state readout during debug.

The interface operates in the same clock domain as clk_eve_sca, the scalar core and scalar/vector interface clock.

The memory map of the configuration bus is specified in Section 6.3.7.2.1.

6.3.4.3 Performance Counter Interface

On the EVE level there is an SCTM module and an SMSET module to collect performance statistics.

SCTM is for counting signal active time and rise and fall transitions. SMSET is for conveying events to include into the system trace. Table 6-351 lists the signals that are exported to SCTM or SMSET as indicated. All SCTM signals are level signals operating at full vector core speed (clk_eve_vec), and all SMSET signals are rising-edge triggered signals.

Table 6-351. Performance Counter Signal List

Signal	Destination	Description
vcop_busy	SCTM	Indicate VCOP busy, for measuring VCOP loading
vcop_idle_and_done	SCTM	Indicate VCOP idle and done, basically not(vcop_busy) and vec_done, for measuring slack in real-time schedule
vcop_wait_for_arp32	SCTM	Indicate VCOP idle and waiting for ARP32 to feed instruction, basically vec_rdy and not(vec_instr) and not(vcop_busy). This indicates VCOP under utilization that might be improved by reducing ARP32 interrupt services
vcop_arp32_awaits	SCTM	Indicate ARP32 has vector instruction ready and is waiting for VCOP to accept it, basically not(vec_rdy) and vec_valid. This indicates ARP32 idle time that might be utilized, however, not to the extent that vcop_wait_for_ARP32 time becomes significant.
vcop_overhead	SCTM	Indicate VCOP busy but not executing the loop, meaning exposed command decode (from decode-execute pipeline) and parameter access time. The former might be reduced by having more back-to-back loops, and the latter is unavoidable.
vcop_ld_stall_by_st	SCTM	Indicate LD stage is stalled by ST stage (forced write when write buffer is full). This means there is insufficient gaps in LD for ST to occur in the background, but this does not mean LD+ST is slowing down computation.
vcop_op_stall_by_ldst	SCTM	Indicate gaps in operation stage between iterations due to LD+ST, indicating extent of load/store bound (as opposed to compute-bound). This may be reduced by merging loops to reduce load/store.
vcop_op_stall_by_ dependency	SCTM	Idle cycle inserted in operation stage due to dependency. This may be minimized by scheduling.
vcop_rd_ibufl	SCTM	Indicate VCOP reading from IBUFL
vcop_rd_ibufh	SCTM	Indicate VCOP reading from IBUFH
vcop_rd_wbuf	SCTM	Indicate VCOP reading from WBUF
vcop_wr_ibufl	SCTM	Indicate VCOP writing to IBUFL
vcop_wr_ibufh	SCTM	Indicate VCOP writing to IBUFH
vcop_wr_wbuf	SCTM	Indicate VCOP writing to WBUF
vcop_loop_start	SMSET	Indicate VCOP getting a VLOOP instruction
vcop_done	SMSET	Indicate VCOP executing a VWDONE instruction, copy of vec_done

6.3.4.4 Data Memory Map

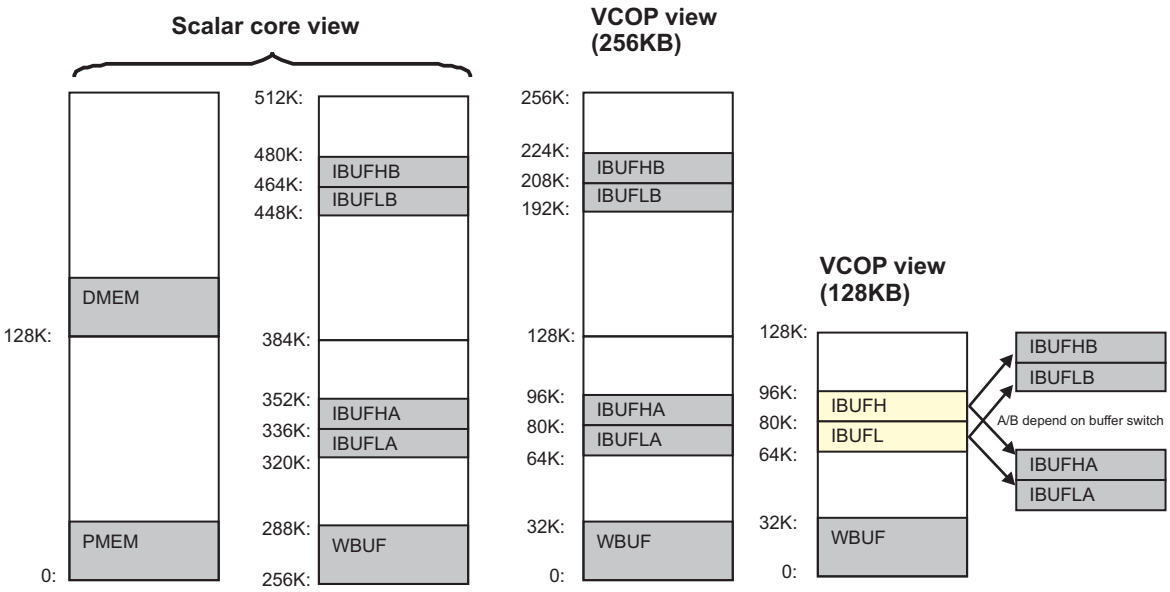
The first instance of EVE has a data memory configuration and a memory-map as listed in Table 6-352.

Memory maps for scalar and vector core are shown in Figure 6-56. An optional MMR field, VEC_MEM_128KB, wraps the VCOP memory map around 128KB, aliasing the A and B sets to the same address range.

Table 6-352. EVE Vector Data Memory Map

Byte Address	Name	Description
0x00000 ~ 0x07FFF	WBUF	Vector working buffer, 32Kbytes
0x08000 ~ 0x0FFFF	reserved	Reserved for future expansion
0x10000 ~ 0x13FFF	IBUFLA	Image buffer low copy A, 16 Kbytes
0x14000 ~ 0x17FFF	IBUFHA	Image buffer high copy A, 16 Kbytes
0x30000 ~ 0x33FFF	IBUFLB	Image buffer low copy B, 16 Kbytes
0x34000 ~ 0x37FFF	IBUFHB	Image buffer high copy B, 16 Kbytes

Figure 6-56. EVE Memory Map



6.3.5 Functional Description

6.3.5.1 Scalar-Vector Architecture

The EVE subsystem consists of a scalar core as the subsystem controller, a vector core as the high-throughput coprocessor, shared memories, DMA, clock/reset and interrupt controllers. See the *EVE Subsystem Reference Guide* for details.

6.3.5.1.1 Scalar Core

The scalar core executes conventional RISC instructions. The scalar core is based on the ARP32 processor.

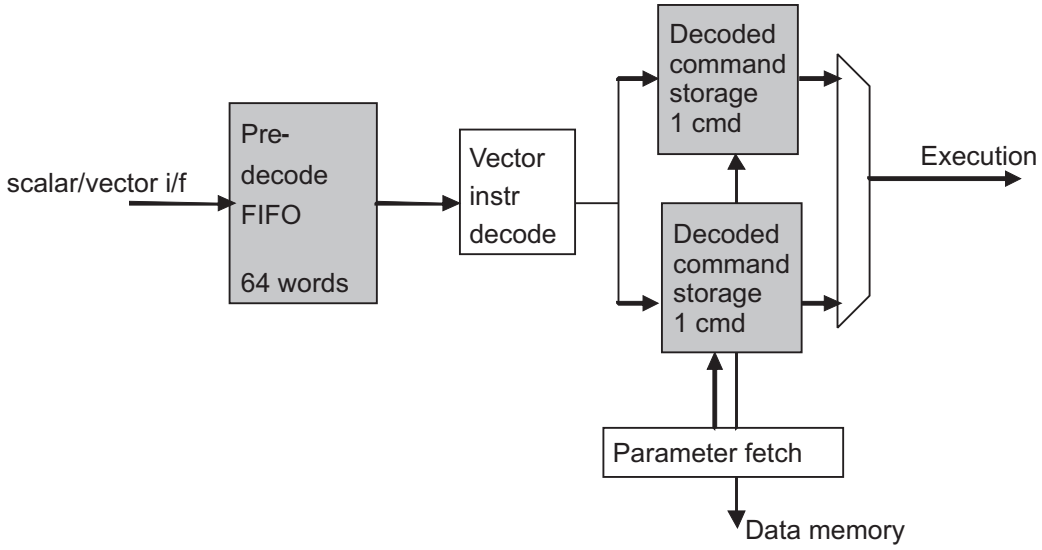
See the *ARP32 CPU and Instruction Set Reference Guide* for more details.

6.3.5.1.2 Scalar-Vector Interaction

The EVE scalar and vector cores share one program memory, but can execute in parallel on separate threads. The scalar core has sole control of the program memory, so all vector instructions are accessed by the scalar core, recognized being a vector instruction, and relayed via the scalar/vector interface to the vector core for execution. The vector core executes a sequence of instructions (called a vector command) repeatedly, so typically can be busy executing and does not need further vector instructions for thousands of clock cycles at a time.

The vector core has temporary instruction storage. There is a pre-decode buffer of 64 words, plus a decoded buffer for two maximal-sized commands (see Figure 6-57). The vector core attempts to decode and fill the two commands first, and if vector instructions keep coming, fill the pre-decode buffer. Together the buffering holds 4 or more typical vector commands, and keep the vector core busy for a while, allowing the scalar core to switch context to serve interrupts when interrupts occur.

Figure 6-57. VCOP Instruction Buffering



6.3.5.2 Vector Core Overview

The vector core is a SIMD machine with built-in loop control and address generation. It is programmed in array or 2D block processing level. The vector core has the following resources:

- 4 nested for loops, with loop variables i1, i2, i3, and i4, plus an optional outer loop i0
- 8 address generators, each capable of 4-dimensional addressing, that is, the address pattern is: base + i1 × const1 + i2 × const2 + i3 × const3 + i4 × const4
- 16-entry vector register file, each entry is N-way SIMD × 40-bit signed (sign-extended or zero-padded from 8/16/32-bit signed/unsigned memory data, or from operation upon register data)
- Two general-purpose functional units, each N-way SIMD. Functional spec supports N = {2 | 4 | 8 | 16 | 32}, first instance N = 8.
- Table lookup unit supporting up to N parallel lookups.
- Histogram unit supporting up to N parallel histogram operations.
- 8 load units
- 8 store units

The vector core supports the following functions:

- Generic compute
- Table lookup
- Histogram and weighted histogram

6.3.5.2.1 Nested for Loop Model

EVE vector operation is controlled by a four-level nested for loop. Inside the loop, the behavior can be represented in sequential stages: load, arithmetic operation, store, and pointer update.

In each stage, a number of load, operation, stores, or pointer updates are carried out, with respect to the 16 × N × 40-bit vector register file. There is no dependency among loads, stores, or pointer updates; multiple loads unto the same register file is not allowed. Dependency among operations assumes 2 operations are carried out in parallel, with no delay slot for most operations, and 1 cycle of delay slot for some specific operations.

The vector register file, loop variables, address generators are replicated as needed in the hardware to support pipelining among the various stages.

Example 6-8 shows a skeleton of the nested loop model. There are four loop variables, i1, i2, i3, and i4. A snapshots of the loop variables are contained in the follwoing registers:

- VCOP_I0_I1[15:0] I0 - I0 loop variable
- VCOP_I0_I1[31:16] I1 - I1 loop variable
- VCOP_I2_I3[15:0] I2 - I2 loop variable
- VCOP_I2_I3[31:16] I3 - I3 loop variable
- VCOP_I4[15:0]I4 - I4 loop variable

Example 6-8. Nested Loop Model Skeleton

```
EVE_compute(...)
{
   for (i1=0; i1<=lpend1; i1++) {
      for (i2=0; i2<=lpend2; i2++) {
         for (i3=0; i3<=lpend3; i3++) {
            for (i4=0; i4<=lpend4; i4++) {

               for (k=0; k<num_inits; k++)
                  initialize_vreg_from_parameters(...);

               for (k=0; k<num_loads; k++)
                  load_vreg_from_local_memory(...);

               for (k=0; k<num_ops; k++)
                  op(...);         // 2 functional units, executing 2 ops per cycle

               for (k=0; k<num_stores; k++)
                  store_vreg_to_local_memory(...);

               for (k=0; k<num_agens; k++)
                  update_agen(...);
            }
         }
      }
   }
}
```

Each stage is described in more details in the following sections.

Note that loads and stores are predicated on the loop variables matching specific conditions and are thus not always carried out at every i4 iteration.

Each i4 iteration takes a number of cycles equal to the maximal number of cycles spent in loads, arithmetic operatoins, and stores. Cycle count in the arthmetic operations is constant for each loop, but cycle count in load and store can change depending on pointer update, loop level, and read/write memory contention.

For example, with lpend1 = 3, lpend2 = 1, lpend3 = 2, and lpend4 = 4, the nested for loop executes in exactly 4 × 2 × 3 × 5 = 120 i4 iterations. For the first few iterations the loop variables progress as:

i1	i2	i3	i4
0	0	0	0
0	0	0	1
0	0	0	2
0	0	0	3
0	0	0	4
0	0	1	0
0	0	1	1
0	0	1	2
...			

6.3.5.2.2 Instruction Organization

Vector instructions cannot appear in the program stream in arbitrary order. Instructions are classified as:

- Control
  - Repeat end count
  - Parameter pointer
  - Write buffer switch
- Synchronization
  - Wait for ready
  - Wait for done
- Computation
  - VLOOP
  - Register initialization
  - Address generator
  - Load
  - Operations
  - Store

The sequencing rule is that computation instructions that form a loop are in one contiguous block, starting with VCOP_VLOOP_PTR[31:0]VLOOP_PTR. This block of computation instructions is called a vector command. Control, synchronization, and scalar instructions can appear in any order, except that they cannot appear inside a vector command.

6.3.5.3 Vector Control

The VCTRL instruction is used to convery control information to the vector core. The instruction syntax is:

VCTRL *scalar_register*, *control_register*

The control registers so far defined are 0: RPT_END and 1: PARAM_PTR (VCOP_PARAM.

6.3.5.3.1 Repeat End Count

A VCTRL instruction variation programs the repeat end count. The syntax is:

VCTRL *scalar_register*, **RPT_END**

Subsequent VLOOP is executed RPT_END + 1 times. Reset default is 0, or repeating just once, and is the normal mode of operation. At end of loop execution, RPT_END is automatically reset to 0, so if the subsequent is non-repeating, which is most of the cases, there is no need to issue another VCTRL RPT_END to reset it.

RPT_END is a 12-bit value; the largest value supported is 0:4095, allowing for up to 4096 iterations of the repeat loop.

Note that the VLOOP instruction that follows can be of any type (computer, table lookup, histogram).

The repeat mechanism can be viewed as enclosing VLOOP by an outer loop, i0. The difference between this i0 loop and the i1, i2, i3, i4 loops inside VLOOP is that parameter pointer is advanced at the end of VLOOP. The repeat feature allows the same program code to be executed with a different set of parameters each time.

The repeat feature is useful for performing the same processing steps on a list of data regions that are not spaced regularly and/or not having the same dimension. Instead of having a scalar loop around the repeated VLOOP, using the repeat feature reduces scalar/vector interaction and resulting overhead.

Software must allocate memory appropriately to allow results of these data blocks to be stored (sequentially or otherwise is under programmer's control).

6.3.5.3.2 Parameter Pointer

In addition to the vector instructions in PMEM, the vector core must read a parameter file in WBUF or IBUFL/IBUFH (depending on the pointer value) before it begins intended computation. The parameters include loop counts, address pointers to arrays, constants used in the computation, round/truncate shift count, saturation bounds, etc. The parameter pointer is located in VCOP_PARAM_PTR[31:0] PARAM_PTR.

Separation of configuration coded in the program memory versus configuration conveyed in data memory is essential, as this allows library functions to be constructed with reasonable code size and can serve a variety of need in applications. Loop counts and address pointers being conveyed via parameters is needed, so that, for example, one filter function works for various data/coefficient/output arrays and block and coefficient kernel sizes. Round/truncation shifts being convey via parameters means that, for example, the same filtering kernel program can work for filters with different radix point bit positions for filter coefficients.

Parameter registers are 16-bit per entry in the parameter file, up to 64 entries. The first 2 entries of the parameter file, P0 and P1, are hard-coded to constant values 0 and 1 respectively, as these are commonly used and it reduces code size by referring to these constants without taking up data memory space.

Parameters are referred to in the vector instructions either as single register, 16-bit parameter, or as a register pair, together make up 32-bit. Where a pair is used, the first parameter must be an even index, and contains the lower 16-bit of the 32-bit.

From an application development point of view, algorithm kernels are sometimes coded in one vector command per kernel, sometimes in several commands. Thus it is beneficial for the vector core to advance the parameter pointer automatically to reduce overhead. This requires a mechanism to specify or modify the parameter pointer when needed. This is addressed by the parameter pointer update feature through VCTRL.

A VCTRL instruction variation updates the parameter pointer for the subsequent VLOOP. The syntax is:

VCTRL *scalar_register*, **PARAM_PTR**

Unless updated again by VCTRL, the parameter pointer is advanced automatically at the end of VLOOP execution by the #PL field of VLOOP. Thus, parameter blocks for multiple consecutive VLOOPs can be placed consecutively in data memory, and no VCTRL VCOP_PARAM_PTR is needed except for the first VLOOP.

For efficiency of parameter access by VLOOP, the pointer value conveyed via VCTRL must be 32-bit aligned. The parameter length specified in VLOOP is also 32-bit aligned. Thus, at the beginning of any VLOOP, the pointer is 32-bit aligned.

Note that inside a VLOOP while parameters are pulled off to configure the loop, the parameter pointer is only 16-bit aligned.

For example, if 11 parameter registers are used in a vector command, P0..10, the encoded parameter length is ceiling((11 – 2)/2) = 5. The subsequent next vector command accesses parameter registers 5 32-bit words from the current vector command, leaving one 16-bit halfword in memory unused.

6.3.5.3.3 Switch Buffers

To minimize task-switching overhead, an instruction is added to write to buffer switch MMR. The instruction syntax is:

VSWITCHBUF *ucst20*

Where ucst20 is a 20-bit immediate value to be written to a dedicated MMR for buffer switches.

This instruction is carried out by the scalar core, and vector core just ignores it.

Change made to the buffer switch is visible in MMR as well, as both VSWITCHBUF and generic scalar core store to the buffer switch MMR are both valid ways to program the buffer switches, only that VSWITCHBUF achieves lower latency. Both mechanisms are kept consistent in the simulator/ debugger toolset.

6.3.5.4 Vector-Scalar Synchronization

6.3.5.4.1 Wait for Vector Core Done

The VWDONE instruction is used as a synchronization barrier between scalar and vector core, and affects the scalar/vector interface signal vec_done. Upon reset, vec_done is true. Upon execution of VWDONE in the scalar core, the scalar stalls and waits for vec_done. The vector core, upon exeucting this instruction, implying all previous submitted vector instructions are all done, asserts vec_done. Once asserted, vec_done stays true until receiving a subsequent VLOOP that turns the vector busy and vec_done false again.

The VWDONE instruction is typically used before the scalar core switches shared memory to itself or DMA. Before it changes the switch it makes sure that the vector core is idle and thus not accessing the memory.

VWDONE must appear between vector commands in the program, not inside a vector command.

6.3.5.4.2 Wait for Vector Core Ready

The VWRDY instruction is used to stall the scalar core until vector core is ready to accept additonal vector instructions. Vector core ignores this instruciton.

Normally the scalar core can simply issues vector instruction, and when the vector core is not ready, VCOP_STATUS[2]VEC_RDY = 0 the scalar core is automatically stalled. Having VWRDY allows inserting timer read before and after VWRDY to measure the time duration of vector core not being ready, for performance tuning purposes.

6.3.5.5 Vector Computation

6.3.5.5.1 Vector Loop

The VLOOP instruction marks the beginning of a vector command specifying a loop. Assembly format:

VLOOP *cmd_type* **,** *CL#* **:** *cmd_len***,** *PL#***:***param_len*

The *cmd_type* field specifies whether it is the main compute (COMP), table lookup (TLU), or histogram (HIST).

Command length (*cmd_len*) and parameter length (*param_len*) in 32-bit words are encoded to facilitate quick parsing of the vector commands. The ending loop counts, lpend1/2/3/4, are encoded at fixed entries in the parameter file, P2 = lpend1, P3 = lpend2, P4 = lpend3, P5 = lpend4. This allows easy adaptation of EVE function to different array dimensions.

The first two entries of the parameter file have implicit values and are thus not conveyed in the data memory. P0 = 0 and P1 = 1. **The param_len does not include these two entries.**

The binary code of VLOOP includes a *version* field, which allows a compiler/assembler to indicate which version of EVE hardware the vector command is compiled for. The first version has *version* = 0, the next version, *version* = 1, and so on. This allows future version of EVE to offer backward compatibility; that is, execute previous-version binary as is. For example, if a future version of EVE has 16-way SIMD, it can execute 8-way SIMD binary by disabling half of the datapath.

Each vector command can have:

- Up to 8 address generators
- Up to 16 vector register initialization
- Up to 8 loads
- Up to 40 operations
- Up to 8 stores

Maximal command length is 81 instructions (VLOOP + 16 VINITs + 8 VAGENs + 8 VLDs + 40 operations + 8 VSTs).

6.3.5.5.1.1 Retention of State Between VLOOPs

From one VLOOP to the next VLOOP, the following state information is retained:

- Parameter pointer, advanced by parameter length in the first VLOOP
- Vector register contents, whatever left over from the last iteration of the first VLOOP

The following state information is not retained, thus must be configured within each VLOOP:

- Parameter register file (must be reloaded from data memory)
- Agen configuration, such as association of the four counts to parameter registers
- Agen address counter (reset at the beginning of each VLOOP execution)

6.3.5.5.2 Vector Register Initialization

It is useful to initialize vector register with constants provided in the parameter file. As parameter file is scalar (not NWAY SIMD), each value is broadcast to all NWAY of the destination vector register. Assembly syntax:

VINIT *type_init_loop preg***,** *vreg*

The data *type* can be signed/unsigned halfword or word. In case of word, two parameter register entries (16-bit each) are used, first one being copied to the lower halfword, and the second one to the upper halfword.

For the word type initialization, *preg* specified is the lower halfword and must be even. For example, *VINITWU_ONCE P10, V2* initializes V2 using (P11 << 16) + P10.

The *init_loop* field can be {ONCE, I234_ZERO, I34_ZERO, I4_ZERO, ALWS }.

The VINIT instruction is equivalent to initializing a specific vector register in the nested i1/i2/i3/i4 loop shown in Section 6.3.5.3.2:

- ONCE is for initialization before the loop.
- I234_ZERO is for initialization inside the i1 loop, before entering the i2 loop.
- I34_ZERO is for initialization inside the i2 loop, before entering the i3 loop.
- I4_ZERO is for initialization inside the i3 loop, before entering the i4 loop.
- ALWS is for initialization inside the i4 loop, running every iteration.

The VINIT feature is used to initialize vector registers to certain initial values. For example, FIR filtering is implemented by iterating over filter taps with MADD instructions, and VINIT is used to initialize the accumulator to zero at the proper iteration, i4 for 1-D filter, and i3 for 2-D filter. Constants are brought into the computation loop with VINIT as well. For example, to scale an entire input array by a constant factor.

Note that VINIT broadcasts one value to all SIMD lanes. Initializing a vector register to multiple values is accomplished with a vector load (VLD) with zero address increment.

Sometimes it is useful to refer to loop variables in the computation. For example, to collect the maximal five values in an array and recording their indices, software can first do this in SIMD fashion to get to 5 sets of values and indices, then merge among SIMD lanes. Indices are readily copied from the loop variable i4, instead of spending cycles to compute with ALU operations.

VINIT provides this capability by extending the parameter count to cover loop variables:

- P64 = i0, the repeat outer loop enabled via VCTRL <scalar_reg>, RPT_END
- P65 = i1
- P66 = i2
- P67 = i3
- P68 = i4

When using these parameter counts, only the unsigned halfword type is supported.

6.3.5.5.3 Address Generator (agen)

In image, video, vision computation, there are often many operations performed on arrays of the same dimension; which can use the same addressing pattern (with different base addresses) in the memory read/write. The address generator resource is included to take advantage of this. One agen can be shared among multiple loads and/or multiple stores.

The VAGEN instruction has this assembly format:

VAGEN *agen*, [*pinc4*, *pinc3*, *pinc2*, *pinc1*]

Agen field is a label (A0..7) to identify one of 8 agen resources.

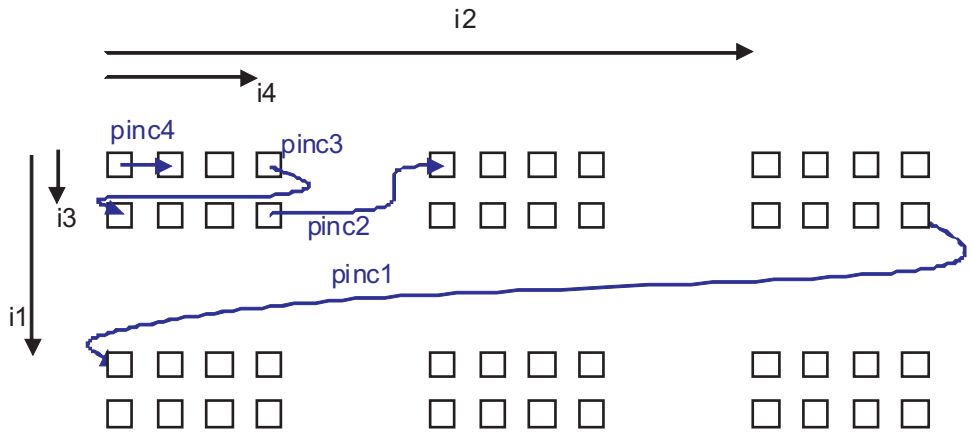
VAGEN is defined in strict linear order A0, A1, A2, till the last agen used in the command. The agens defined can be used (in loads and stores) in any order. It is allowed to share agen between load(s) and store(s).

The address increments represent:

- pinc4: inside the i4 loop, default
- pinc3: inside the i3 loop, when i4 matches the ending loop count
- pinc2: inside the i2 loop, when where i3 and i4 both match the ending loop counts
- pinc1: inside the i1 loop, when i2, i3, and i4 all match the ending loop counts

Figure 6-58 shows an example of 2 × 3 × 2 × 4 data object, addressed by the loop variables i1, i2, i3 and i4, with i1 being the outer-most loop. The address increments to access the object are shown in Figure 6-58.

Figure 6-58. Addressing a Four-Dimensional Data Object



In the VAGEN instruction, pointers to the parameter file are encoded, not the address increments themselves. Most data objects do not require 4-dimension addressing. For example, coefficient data for 2D FIR filter is normally stored consecutively, and advance by 1 data point most of the times, and wraps back at the end of i3 loop.Then pinc4 = pinc3 is specified to one parameter register (initialized to 2 for 16-bit coefficients), and pinc2 = pinc1 to another parameter register for the wrap-back. Thus, this scheme reduces command plus parameter data.

All address increments are in bytes. This allows misaligned halfword (16-bit) and word (32-bit) accesses that are some times needed in the processing.

Each address increment is encoded with one 16-bit parameter register, treated as signed value. The above example shows address increment moving forward, but in many cases, for example coefficients for filtering, negative increments are used.

Note that the address increments together specify addressing pattern of a single pointer, and the data distribution controls how consecutive memory data from that pointer, up to 32N-bit, are distributed among the SIMD dimension of the vector register entry.

In case multiple VAGEN instructions are issued for the same agen resource (for example, A0), the last one takes effect, and the preceding ones with the same agen resource is ignored.

6.3.5.5.4 Vector Load

The VLD instruction specifies the data distribution, data type, base address, agen, and the vector register to load the data to. Format of the VLD instruction in assembly is:

VLD *type_distribution base* [*agen*], *vreg*

The *base* field points to a pair of parameter registers (even/odd pair only), for example base = P8 to refer to the P8:P9 pair. The vector data memory space is 20-bit, with the lower 16-bit encoded in the even parameter register (P8 in this case), the upper 4-bit in the odd parameter register (P9 in this case).

The destination vector register specified in VLD must be an even register. VLD_DINTRLV loads into an even/odd pair of registers. VLD with any other distribution option loads into one register.There are up to eight VLD instructions in a loop to potentially load up all 16 registers. No register can be the destination of more than one VLD instruction in the same loop.

As EVE is an N-way SIMD machine, loading of N consecutive data points from local memory is supported, with each data point being a byte, short, or long (32-bit) word, either signed or unsigned.

In addition to loading N data points, EVE supports a few other distribution options. EVE supports the following:

- NPT: N data points, one to each way of SIMD
- 1PT: broadcasting one data point to all
- CIRC2: circuiting between two data points, useful for Bayer image processing
- DS2: downsample by 2; every other data point (**not available for word-size input**)
- US2: upsample by 2; repeat each input data point twice
- DINTRLV: deinterleave inputs; load 2N data points into two registers, deinterleave data items so that even items go to the first register, odd items go to the second register. Supported only for byte or halfword per data point, **not word data type**. Two registers must be an even/odd pair, but only the first register (even) is encoded in assembly and in instruction binary.
- CUST_P8: custom distribution as provided by {P8..} in the parameter file
- CUST_P16: custom distribution as provided by {P16..} in the parameter file
- CUST_P24: custom distribution as provided by {P24..} in the parameter file
- EXP: load with expansion using predicate register V0
- NBITS: N bits, one bit to each way of SIMD, regardless of the data type (for example, when N = 16, a halfword is read). Signed/unsigned data type affects how this bit is to be sign-extended. Unsigned means 0 -> 0, 1 -> 1, and signed means 0 -> 0, 1 -> -1. This is useful for expanding load and other cases where boolean arrays are packed.

For CUST_Pi options, number of bits required to specify the address offset for each way of SIMD depends on N, the number of ways of SIMD. Arbitrary distribution of N data items (each a byte, halfword, or word) is supported. For N = {2 | 4 | 8 | 16}, 4 bits is used to encode each destination. For N = 32, 5 bits is used; and each 16-bit parameter register supplies three fields (leaving 1 bit unused).

- N = 2, 2 × 4 = 8 bits, one parameter register required
- N = 4, 4× 4 = 16 bits, one parameter register required
- N = 8, 8 × 4 = 32 bits, two parameter registers required
- N = 16, 16 × 4 = 64 bits, four parameter registers required
- N = 32, ceiling(32/3) = 11 parameter registers required

The DINTRLV option is supported so software can fully utilize the two function units for simple operation sequences, by processing 2N data points in parallel.

VLD instruction normally loads into one destination vector register. VLD_DINTRLV is the exception in that it loads into a pair of vector registers. Only even registers, V0, V2, ..., V14, can be referenced in the destination register field. In case of VLD_DINTRLV, the referenced register and the next register shall be the destination, for example V0 and V1.

The following data types are supported:

- B: signed byte
- BU: unsigned byte
- H: signed halfword (16-bit)
- HU: unsigned halfword
- W: signed word (32-bit)
- WU: unsigned word

Address offsets for each way of SIMD, as the function of distribution option and data type are shown in Table 6-353 and Figure 6-59, Figure 6-60, and Figure 6-61.

Table 6-353. VLD Data Distribution Options[1][2]

Distribution	vreg[r][0] gets	vreg[r][1] gets	vreg[r][2] gets	vreg[r][3] gets	vreg[r][4] gets	vreg[r][5] gets	vreg[r][6] gets	vreg[r][7] gets
NPT	data[0]	data[1]	data[2]	data[3]	data[4]	data[5]	data[6]	data[7]
1PT	data[0]	data[0]	data[0]	data[0]	data[0]	data[0]	data[0]	data[0]
CIRC2	data[0]	data[1]	data[0]	data[1]	data[0]	data[1]	data[0]	data[1]
DS2	data[0]	data[2]	data[4]	data[6]	data[8]	data[10]	data[12]	data[14]
US2	data[0]	data[0]	data[1]	data[1]	data[2]	data[2]	data[3]	data[3]
DINTRLV	vreg[r][0] = data[0], vreg[r+1][0] = data[1]	vreg[r][1] = data[2], vreg[r+1][1] = data[3]	vreg[r][2] = data[4], vreg[r+1][2] = data[5]	vreg[r][3] = data[6], vreg[r+1][3] = data[7]	vreg[r][4] = data[8], vreg[r+1][4] = data[9]	vreg[r][5] = data[10], vreg[r+1][5] = data[11]	vreg[r][6] = data[12], vreg[r+1][6] = data[13]	vreg[r][7] = data[14], vreg[r+1][7] = data[15]
CUST_Pi[3]	data[pf[0]]	data[pf[1]]	data[pf[2]]	data[pf[3]]	data[pf[4]]	data[pf[5]]	data[pf[6]]	data[pf[7]]

(1) Table “data” is type-cast to the appropriate signed/unsigned byte/halfword/word so that correct offsets are applied.

(2) This is a table of what data element gets loaded into each SIMD lane of a vector register, in the order lane 0 to lane 7. This does not reflect a debugger memory window hex display.

(3) pf[0], pf[1], ... pf[7] refer to bit fields in the indicated parameter registers. For example, for the 8-way SIMD EVE, it takes two parameter registers for the distribution information, so for CUST_P8 use: distrib_info = (P9 << 16) | P8, and assign (distrib_info >> (4 × i)) & 0xF to pf[i].

Loads are automatically predicated. Loads are always performed at the very first iteration, and then subsequently upon any change in the associated agen address pointer.

See Section 6.3.5.5.10 for address alignment requirement for various data type and distribution options.

LD_EXP is load with expansion, and is for reading a compacted (collated) array and expanding the elements to the original locations. It is the opposite of ST_COLLAT (collating store). Per-item address increment is implied by the load data type (1/2/4 bytes depending on byte/halfword/word type). The agen field is don't care. Per iteration, load pointer (VCOP_LD_PTR_i/VCOP_ST_PTR_j) is increment by number of non-zeroes in predicate register V2 times the data size. Agen is not used, and so the agen field is not required in the assembly code:

VLD *type*_**EXP** *base*, *vreg*

For example with this instruction, where V2 = {0, 0, 1, 0, 1, 1, 0, 0}, load_ptr = 0x100:

```
LDBU_EXP Pbase[A0], V1
```

There shall be, after this instruction:

```
V1 = {0, 0, mem[0x100], 0, mem[0x101], mem[0x102], 0, 0}, and load_ptr = 0x103
```

Load with expansion is restricted to be used in table lookup VLOOP. This is because the dependency (where the expanding load depends on predicated register data from another load) is more similar to table lookup, and thus it's feasible to achieve N data points per clock cycle inside table lookup pipeline. As in normal table lookup, no operation instructions are allowed in table lookup VLOOP.

Figure 6-59. Load Word Distribution Options

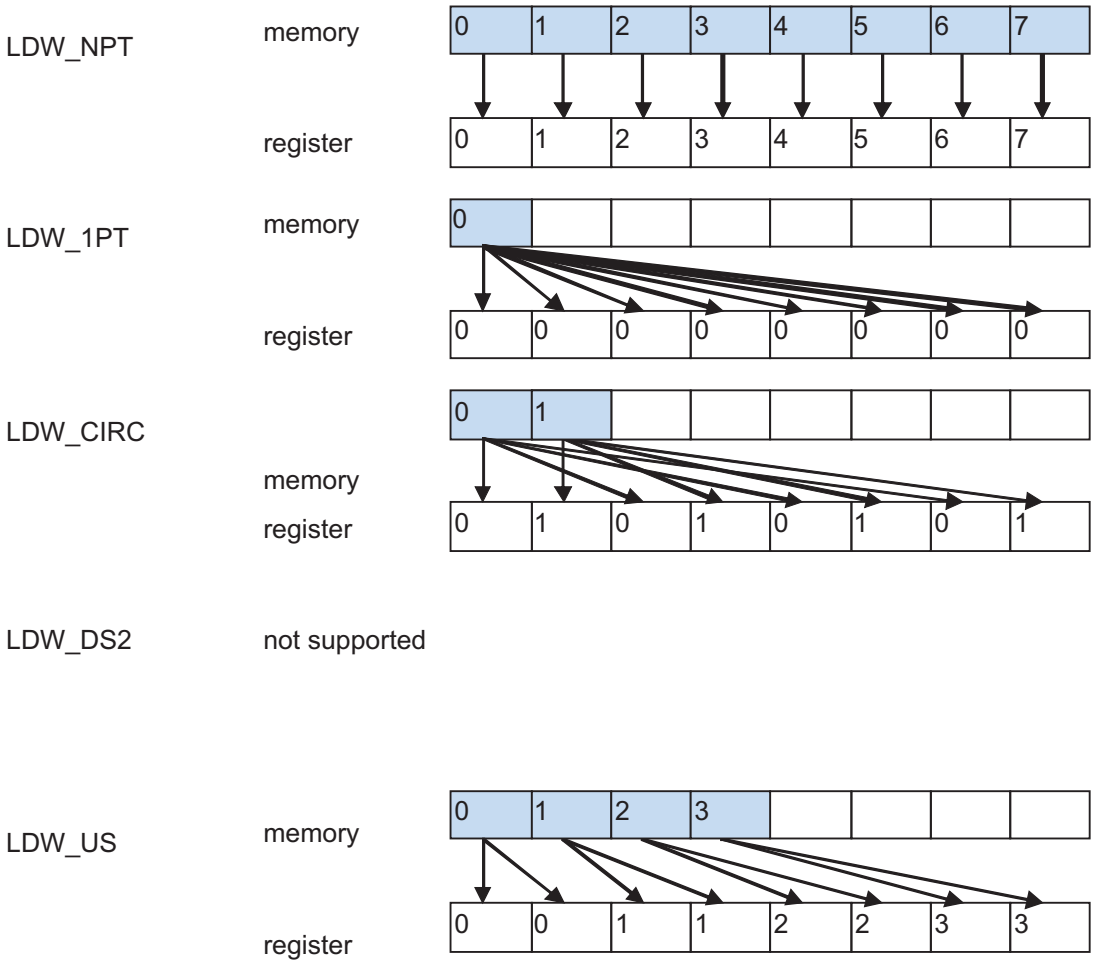


Figure 6-60. Load halfword Distribution Options

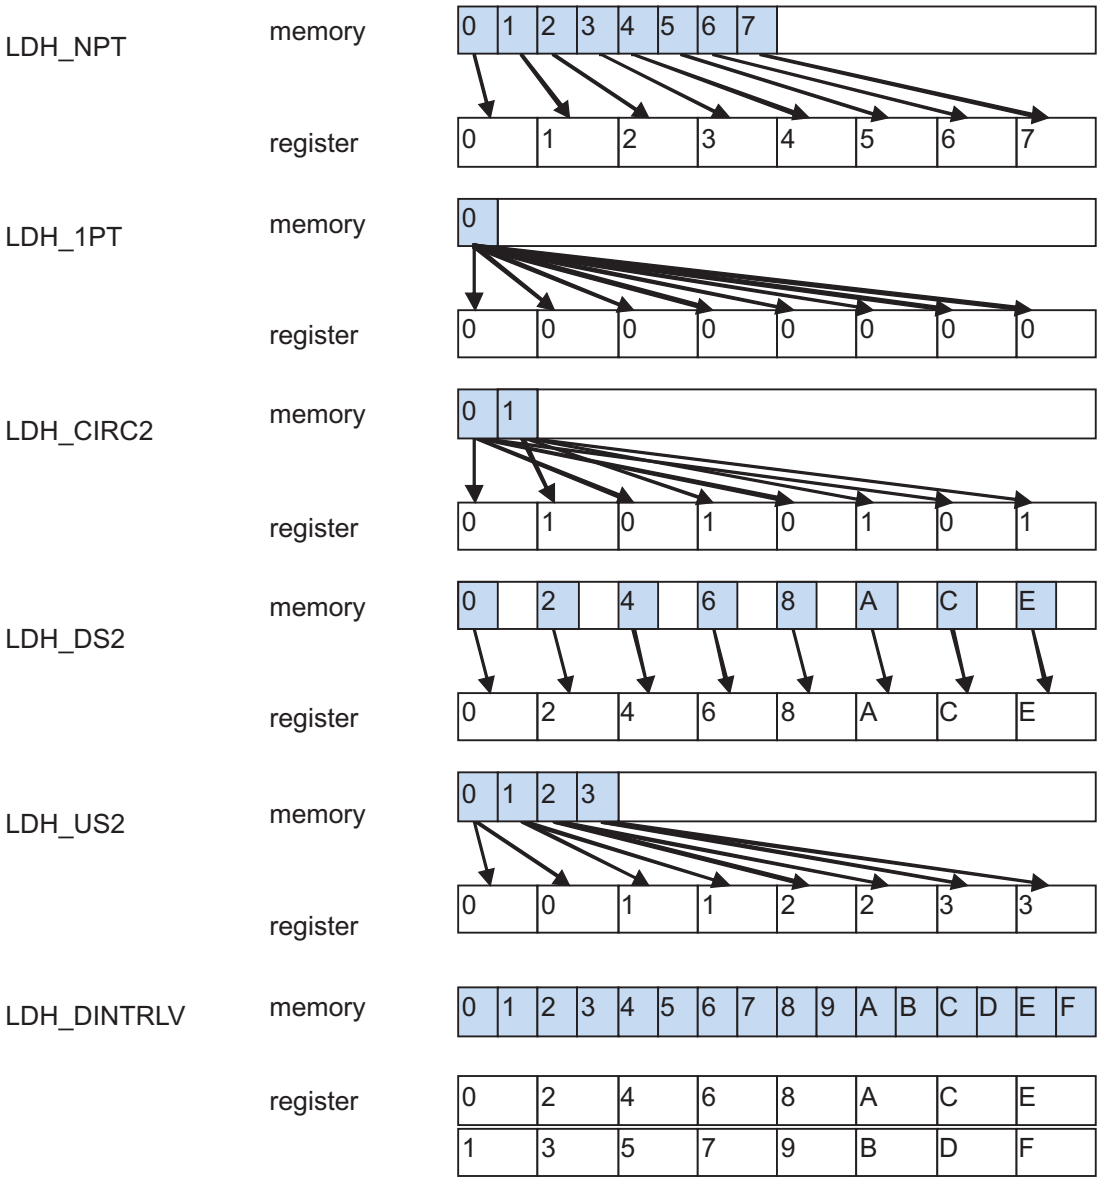

Figure 6-61. Load Byte Distribution Options

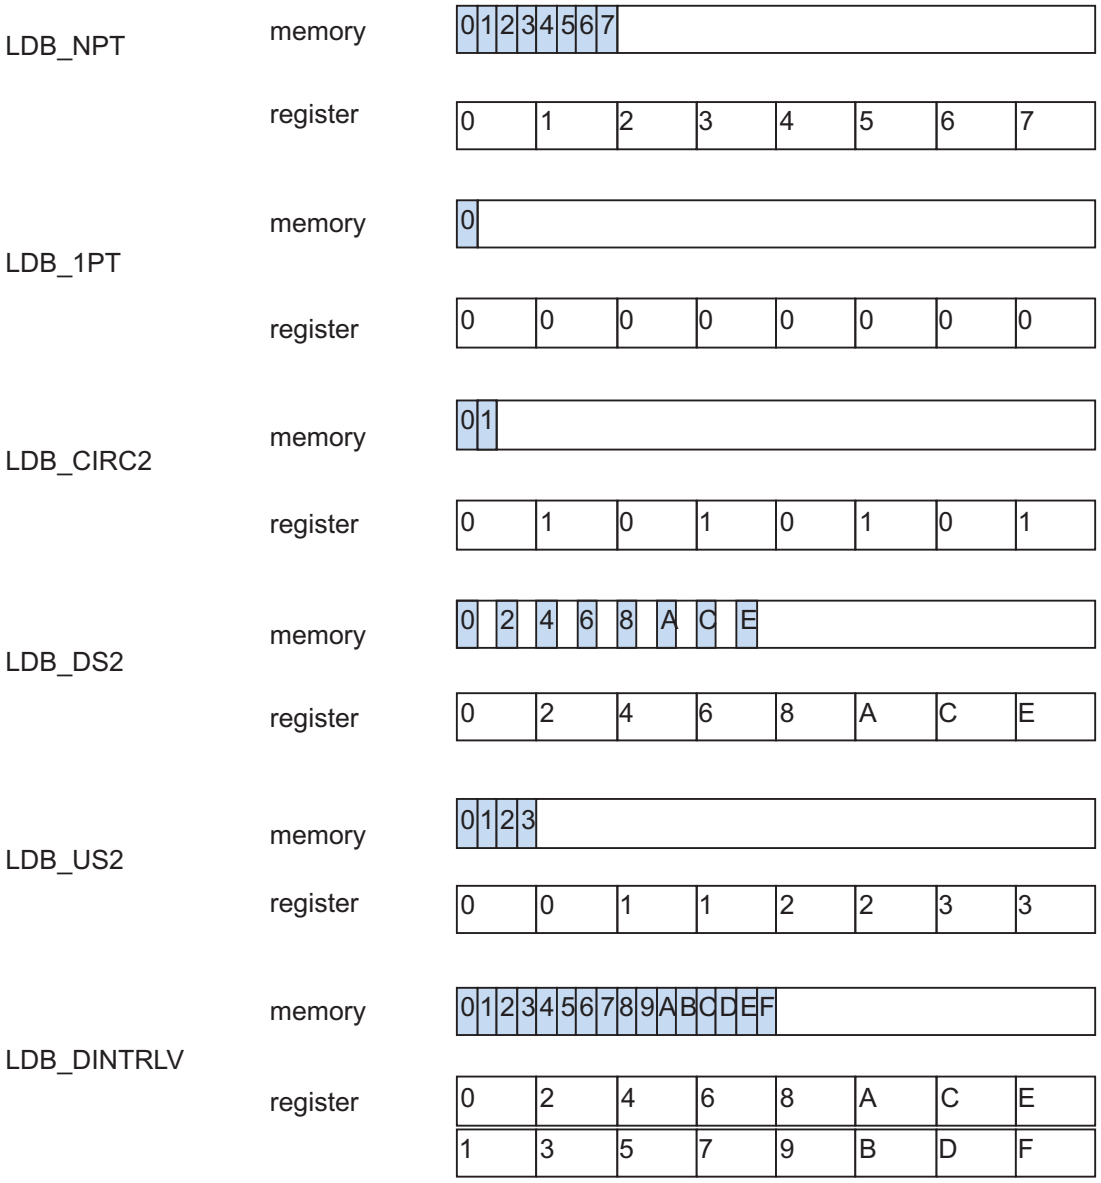

6.3.5.5.5 Vector Arithmetic/Logic Operations

Various arithmetic and logic operations are available in the compute command, which is indicated by starting the command with:

VLOOP COMP, *cmd_len*, *param_len*

Vector arithmetic/logic instructions have the following assembly formats, depending on whether it is 1-input-1-output, 2-input-1-output, 2-input-2-output, or 3-input-1-output, whether accumulator clearing is enabled, and whether rounding is enabled.

V<op_1i1o> src1, dst

V<op_2i1o> src1, src2, dst

V<op_2i1o> src1, src2, dst, RND: rnd_param

V<op_2i2o> src1/dst1, src2/dst2

V<op_2i2o> src1, src2/dst1, dst2

V<op_3i1o> src1, src2, src3, dst

V<op_3i1o> src1, src2, src3, dst, RND: rnd_param

All operations are 40-bit, except:

- Input to multiply (MPY, MADD, MSUB) is 17-bit data.
- BINLOG, BITC, BITDI, BITI, BITR are 32-bit instructions.
- BITPK, BITUNPK, SORT2, MIN, MAX are 33-bit instructions (to allow processing of up to 32-bit signed data)
- BITTR, bit transpose, bit width is limited to ways of SIMD, thus 8-bit data for 8-way SIMD.

The operations in Table 6-354 are supported. See Section 6.3.5.9 for details on each operation.

Table 6-354. VCOP Arithmetic/Logic Operations

Operation	#In- Out	#Bits	#Del	Syntax[1]	Note
VNOP		40		VNOP	
VADD	2-1	40		VADD src1, src2, dst	src1 + src2
VSUB	2-1	40		VSUB src1, src2, dst	src1 – src2
VABSDIF	2-1	40		VABSDIF src1, src2, dst	|src1 – src2|
VMPY	2-1	17/33	1	VMPY src1, src2, dst, RND:rnd_param	src1 * src2
VAND	2-1	40		VAND src1, src2, dst	src1 & src2
VOR	2-1	40		VOR src1, src2, dst	src1 | src2
VXOR	2-1	40		VXOR src1, src2, dst	src2 ^ src2
VMIN	2-1	33		VMIN src1, src2, dst	min(src1, src2)
VMAX	2-1	33		VMAX src1, src2, dst	max(src1, src2)
VANDN	2-1	40		VANDN src1, src2, dst	src1 & (~src2)
VSHF	2-1	40/6		VSHF src1, src2, dst	src1 << src2, or src1 >> (-src2)
VRND	2-1	40/5	1	VRND src1, src2, dst	(src1 + (1 << (src2-1)) >> src2
VCMPEQ	2-1	40		VCMPEQ src1, src2, dst	(src1 == src2) ? 1 : 0
VCMPGT	2-1	40		VCMPGT src1, src2, dst	(src1 > src2) ? 1 : 0
VCMPGE	2-1	40		VCMPGE src1, src2, dst	(src1 >= src2) ? 1 : 0
VBINLOG	1-1	32	1	VBINLOG src1, dst	approximate binary log
VBITC	1-1	32	1	VBITC src1, dst	count one bits
VNOT	1-1	40		VNOT src1, dst	~src1

(1) The parameters src1, src2, src3, dst, dst2 refer to the vector register entry for source or destination.

Table 6-354. VCOP Arithmetic/Logic Operations (continued)

Operation	#In- Out	#Bits	#Del	Syntax[1]	Note
VMADD	3-1	17/40	1 / 2	VMADD src1, src2, src3, dst, RND: rnd_param	src3 + src1 * src2
VMSUB	3-1	17/40	1 / 2	VMSUB src1, src2, src3, dst, RND: rnd_param	src3 – src1 * src2
VADD3	3-1	40	1	VADD3 src1, src2, src3, dst	src1 + src2 + src3
VSAD	3-1	40	1	VSAD src1, src2, src3, dst	src3 + abs(src1 – src2)
VSEL	3-1	40		VSEL src1, src2, src3, dst	src1 ? src2 : src3
VAND3	3-1	40	1	VAND3 src1, src2, src3, dst	src1 & src2 & src3
VOR3	3-1	40	1	VOR3 src1, src2, src3, dst	src1 | src2 | src3
VSHFOR	3-1	40/6	1	VSHFOR src1, src2, src3, dst	src3 | (src1 << src2) or src3 | (src1 >> -src2)
VSORT2	2-2	33		VSORT2 src1/dst1, src2/dst2	dst1 = min(src1, src2) dst2 = max(src1, src2)
VBITPK	2-1	33	1	VBITPK src1, src2, dst	compare, bit-pack, broadcast
VBITUNPK	2-1	40	1	VBITUNPK src1, src2, dst	bit unpack
VEXITNZ		40		VEXITNZ level, src1	exit loop at end of iteration when (src1 != 0)
VCMOV		40		VCMOV cond, src1, dst	conditional move
VBITR	1-1	32	1	VBITR src1, dst	bit reverse
VBITI	2-1	32	1	VBITI src1, src2, dst	bit interleave
VBITDI	1-2	32		VBITI src1, dst1, dst2	bit deinterleave
VABS	1-1	40		VABS src1, dst	abs(src1)
VADDH	2-1	40		VADDH src1, src2, dst	src1+ signext(src2[39:32])
VLMBD	3-1	40	1	VLMBD src1, src2, dst	left-most-bit-detect
VBITTR	1-1	NSIMD	1	VBITTR src1, dst	bit transpose
VSIGN	2-1	40		VSIGN src1, src2, dst	apply sign of src1 on src2
VADDSUB	2-2	40		VADDSUB src1/dst1, src2/dst2	dst1 = src1 + src2 dst2 = src1 – src2
VINTRLV	2-2	40		VINTRLV src1/dst1, src2/dst2	interleave
VDINTRLV	2-2	40		VDINTRLV src1/dst1, src2/dst2	deinterleave
VMINSETF	2-2	33		VMINSETF src1, src2/dst1, dst2	minimum and set flag
VMAXSETF	2-2	33		VMAXSETFsrc1, src2/dst1, dst2	maximum and set flag
VINTRLV2	2-2	40		VINTRLV2 src1/dst1, src2/dst2	interleave with 2-element frequency
VDINTRLV2	2-2	40		VDINTRLV2 src1/dst1, src2/dst2	deinterleave with 2-element frequency
VINTRLV4	2-2	40		VINTRLV2 src1/dst1, src2/dst2	interleave with 4-element frequency
VSHF16	1-2	33		VSHF16 src1, dst1, dst2	shift up 16 bits into 2 registers
VADIF3	3-1	40	1	VADIF3 src1, src2, src3, dst	add difference, dst = src1 – src2 + src3
VSWAP	3-2	40		VSWAP cond, src1/dst1, src2/dst2	conditional swap

Operations with two destinations must use two different destination registers, otherwise the outcome is undefined.

The accumulating register (being a source as well as the destination of an operation) must be src1 for 2-input-1-output operations, and must be src3 for 3-input-1-output operations.

The rounding parameter is needed for VMPY, VMADD and VMSUB instructions, and specifies an index to the parameter file, see Section 6.3.5.9.

EVE hardware executes up to 2 operations in parallel per clock cycle. Assembly program (by programmer or by compiler) contains the parallel bar notation to indicate if an instruction is to be executed by itself, or is to be executed in parallel with another instruction.

VMADD, VMSUB instruction have two delay slots for the multiplication input, and one delay slot for the addition/subtraction input.

VMPY, VRND, VBINLOG, VBITC, VADD3, VSAD, VAND3, VOR3, VSHFOR, VBITPK, VBITUNPK, VBITR, VBITI, VLMBD, VBITTR, VADIF3 instructions have one delay slot.

All other operations do not have delay slots.

The hardware detects and treats write/read dependency between any two sequential instructions, but not inside parallel executed instruction pairs. When necessary for correctness, hardware inserts idle cycles automatically. Still to achieve good performance, software must try to schedule the operations to avoid automatic idle cycles.

There is a forwarding path *within each* functional unit and *between* the two functional units to forward from destination to source 3 (accumulator input) of 3-input-1-output operations.

Register forwarding, dependency checking and automatic idle cycle insertion work across iterations as well, from end of one iteration to the beginning of the next iteration. For example, the FIR filtering kernel executes in one cycle per iteration with the destination-to-source3 dependency across iterations.

Table 6-355 shows delay slots and automatically inserted idle cycles.

Table 6-355. Example of Operation Delay Slots

Time	VMPY	VMADD	VSUB	VMSUB	VAND	VOR	VADD
0	V0*V1						
1	V0*V1 => V7	V2*V3	V2-V6 => V6				
2		V2*V3 =>p		V4*V5	V3 & V6 => V6		
3		V7 + p => V7		V4*V5 => p		wait for V7	
4				V7 - p => V7		wait for V7	
5						V1|V8 => V9	V6 + V7 => V6

Zero-delay slot operation executes in one cycle. VMPY, an one-delay slot opeartion takes two cycles to execute. VMADD and VMSUB, two-delay slot operations take 3 cycles for execution, but need its additional input only on the third cycle. The dependency between the two instructions (VMADD-VMSUB) on the additional operand does not introduce idle cycles, but VMSUB-VADD dependency adds 2 idle cycles to execution per iteration.

6.3.5.5.6 Vector Store

The VST instruction specifies the data distribution, data type, base address (index to parameter file), agen, the vector register to get the store from, loop level when stores are to occur, and rounding/saturation configuration. Format of VST is:

[*pred***] VST***type_ distribution_wr_loop vreg***, base[***agen***], RND_SAT:** *rnd_sat_param*

Storing of up to N data points from vector register to local memory is supported, with each data point being a byte, short, or long (32-bit) word, either signed or unsigned. Signed/unsigned information is used in performing saturation.

There are up to eight VST instructions in one loop, and each VST can be from the full vector register file, V0..V15. It is allowed to overlap the source registers, i.e., having more than one VST instructions storing out the same vector register. Also, in the extreme case of having all eight VST being interleaving stores, all 16 vector registers can be written out.

There is a further constraint on source registers for vector store. Only V0, V1, V2, and V3 can be stored without being the destination of any operation.

VCOP supports the following store patterns:

- NPT: For 8-way SIMD, 8 data points
- 1PT: write only the first SIMD unit
- DS2: downsample by 2; every-other SIMD units are written
- INTRLV: interleave outputs; store 2N data points from two registers interleaved. Two registers must be an {i, i+1} pair (i = 0..14), but only the first register (i) is encoded in assembly and in instruction binary. Byte and halfword types are supported, but not word type. It is NOT allowed to predicate interleaving stores. (If one must predicate interleaving store, use VINTRLV operation to interleave two sets of N data points, then use two predicated VST<type>_NPT.)
- OFFST_NP1: write out all N data points, in (N + 1) words = (4N + 4) bytes address increments (for transposition). Note that although address offset is word-aligned, storing to partial word, in case of byte and halfword types, are supported. In case of byte or halfword type, the 2 LSBs of address determines the byte or halfword within each word that VCOP writes data into.
- COLLAT: collating store, use predicate register to indicate store/not-store, up to N data items stored per cycle, agen is don't care, and hardware increments store address by the size implied by the data type. The agen field is not required in the assembly code:

[*pred***] VST***type_* **COLLAT***_wr_loop vreg***, base, RND_SAT:** *rnd_sat_param*

- SDDA: sequential data-driven addressing, taking M cycles to store M data points (predication can lead to less than N stores), store Vreg[i] to address base + agen + V0[i] Note that agen can be used to vary the pointer, in addition to V0. Only unsigned address offset in V0 is supported.
- PDDA: parallel data-driven addressing. Use this mode when address offsets in V0 is such that all lanes enabled for store go to separate memory banks. Hardware executes the store of up to N data points in one cycle. In case there is bank conflict, outcome is indefinite, and an error interrupt is generated.
- SKIP: store N data points into every other elements in memory. Allowed for byte and halfword types, not for word type.

The following data types are supported:

- B: signed byte
- BU: unsigned byte
- H: signed halfword (16-bit)
- HU: unsigned halfword
- W: signed word (32-bit)
- WU: unsigned word

Table 6-356. EVE ST Data Distribution Options for NWAY = 8[1][2]

Distribution	vreg[r][0] goes to	vreg[r][1] goes to	vreg[r][2] goes to	vreg[r][3] goes to	vreg[r][4] goes to	vreg[r][5] goes to	vreg[r][6] goes to	vreg[r][7] goes to

(1) Table “dptr” is type-cast to the appropriate signed/unsigned byte/halfword/word so that correct offsets are applied. dptr = base + agen.
(2) Custom distribution is not supported for stores.

Stores are predicated to perform at the indicated loop level, with wr_loop selectable from:

- ALWS: write out on every i4 iteration
- LAST_I4: write out on the last i4 iteration, when i4 = lpend4
- LAST_I34: write out on the last i3 iteration, when i3 = lpend3 and i4 = lpend4
- LAST_I234: write out on the last i2 iteration, when i2 = lpend2, i3 = lpend3, and i4 = lpend4

Rounding and saturation arithmetic is available in the store pipeline to provide rounding and saturation without taking additional cycles.

Rounding and saturation parameters are provided in the parameter file to allow easy adaptation of EVE functions to different rounding and saturation configurations. The rnd_sat_param field in the instruction points to a parameter (instruction encoding limits this field to 5 bits, thus restricting it to P0..P31) that contains the following fields shown in Figure 6-62.

Figure 6-62. VST Rounding and Saturation Parameters

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
sat_mode: 0 = NO_SAT 1 = SYMM 2 = ASYMM 3 = 4PARAM 4 = SYMM32 5 = ASYMM32			sat_bound_param: index to param that specifies saturation bound						rnd_mode: 0 = no rounding 1 = round 2 = truncate		rnd_shift: number of bits to round/shift down				

The following saturation modes are supported:

- NO_SAT: no saturation performed
- SYMM: signed symmetrical saturation [-bound, bound] (for unsigned store, [0, bound])
- ASYMM: signed asymmetrical saturation [-bound-1, bound] (for unsigned store, [0, bound]), useful for fixed bit width. For example, when bound = 1023, saturate to [-1024, 1023]
- 4PARAM: use 4 parameter registers to specify sat_high_cmp, sat_high_set, sat_low_cmp, sat_low_set.
- SYMM32: same as SYMM, except using a pair of parameters to specify a 32-bit bound
- ASYMM32: same as ASYMM, except using a pair of parameters to specify a 32-bit bound

Signed/unsigned designation is on the VST type, and signed/unsigned designation affects whether the bound parameter(s) are interpreted as signed or unsigned. The comparison is carried out between signed 40-bit register and such interpreted bounds.

When no rounding and saturation feature is needed, specifying RND_SAT: P0 is working, since constant 0 in these fields represents doing nothing.

Conditional store is specified by the pred field. Omission means no predication. Pred = V1, V2, V3 indicates that register V1, V2, V3 is used to predicate the store of each way of SIMD; store is executed when the register is not zero.

With the COLLAT distribution option, all SIMD ways are examined for conditional store. Truth in the predication register leads to the data item being stored and incrementing of the data pointer by size of the store type (1/2/4 bytes). False in the predication register leads to doing nothing. Thus, stored data items are compacted without leaving any gaps for the blocked data items.

With other distribution options, conditional store behaves differently. Agen is incremented as in unconditional stores. Truth in the predication register leads to the data item being stored, and false in the predication register leads to the data item being skipped. Thus, it is possible for the stored data items to contain gaps among them from the blocked data items.

The store stage hardware has separate resource for each VCOP data memory region (IBUFL, IBUFH, WBUF). Sequential data-driven store is executed in X cycles, X being the number of data items enabled in predication (or when predication is not used, N). The other store modes are executed in a single cycle per store (note that collating store executes in one cycle as well). All memory regions are carried out in parallel, but there is also potential memory contention with the load stage. There is write buffering in the store stage to reduce load/store contention to some degree. See Section 6.3.5.6 for load/store buffering details.

6.3.5.5.7 Table Lookup Operation

Table lookup operation is indicated by starting the vector command with

VLOOP TLU, *CL#***:***cmd_len***,** *PL#***:** *param_len*

The table lookup operation uses a subset of the available resources and instructions:

- VAGEN (address generator): fixed A0 for data, A1 for table pointer, A2 for output.
- VLD (load): one for loading data into V2.
- VTLD (table load): for performing the lookup, using V2 as indices to load table entry into V0.
- VST (store): for storing outcome in V0.
- Full set of 4 levels for looping.

The table pointer is allowed to move via agen, to allow loop-variable-dependent manipulation of table base. For example, software might process three color components (RGB or YUV), each having a different table, in the same command, and use the outer loop variables to index among the color components and the corresponding tables.

Data is loaded with normal load into V2, for example:

```
VLDBU_1PT      data_base[A0], V2
```

The data load using VLD has access to a subset of load distribution options: {NPT, 1PT, DS2, US2}.

- 1PT works for single table configuration
- NPT works for all other cases of normal table lookup
- DS2 and US2 provides additional flexibility to downsample/upsample data

A special table load, VTLD, is used for the lookup:

VTLD*type_m* **TBL_** *n***PT** *tbl_base*[*tbl_agen*][**V2**]**, V0, RND_SAT:***rnd_sat*

Normally lookups only fetch one item per lookup. Multiple items are useful for bilinear and bicubic interpolations. The _*m*TBL field in VTLD specifies the number of parallel tables and the _*n*PT field in VTLD specifies the number of data items per lookup table.

There are constraints on num_par_tbl, num_data_per_lu, and the table data size:

- num_par_tbl × num_data_per_lu <= N (ways of SIMD)
- num_data_per_lu = {1 | 2 | 4} regardless of N (ways of SIMD)

Constraints for 8-way SIMD architecture are shown in Table 6-357.

Table 6-357. Lookup Constraints for 8-Way SIMD

Table type	Num items per lookup, num_data_per_lu	Number of parallel tables, num_par_tbl			
		1	2	4	8
Byte	1	√	√	√	√
	2	√	√	√	
	4	√	√		
	8	√			
Half word	1	√	√	√	√
	2	√	√	√	
	4	√	√		
	8	√			
Word	1	√	√	√	√
	2	√	√	√	
	4	√	√		
	8	√			

Results are stored back to memory with a normal data store as in compute loop with simplification:

VST*type_distribution*_**ALWS V0,** *base*[*agen*]**, RND_SAT:** *rnd_sat_param*

This VST has access to a subset of store distribution optons: {NPT | SKIP}.

Number of data points that are stored per i4 iteration is num_data_per_lu × num_par_tbl from the table load, and this is an implicit predication.

For example, when there is table load VTLDHU_1TBL_2PT, the store VSTHU_NPT is not storing N points, but just 2 point.

In forming the indices for lookup, data are read in, rounded and saturated. Rounding and saturation parameters are specified in VTLD's RND_SAT: rnd_sat field. This field is 5-bit (like VST), so only P0..P31 is allowed. The same set of round/saturate parameters as the normal store, VST, are used. VTLD's RND_SAT is for round/saturate the data to form table lookup index. VST also contains a RND_SAT field, which is used to round/saturate looked up table entries before storing back to data memory.

Various other table lookup parameters are extracted from the instructions:

- Input data type is from VLD*type*, and is limited to unsigned types.
- Table entry type is from VTLD*type*, and can be signed or unsigned although the signed/ unsigned information is not used.
- Output type is from VST*type*, can be signed or unsigned, and can be different from the table entry type. Signed versus unsigned information is used for saturation.
- Input data distribution is from VLD V2, with SIMD units 0..num_par_tbl-1 used for the lookup.
- Output distribution option is either NPT, storing consecutively (which may not be N points), or SKIP, storing to every other memory location.

- Table entries are read into the vector register SIMD lanes by iterating on num_par_tbl in the outer loop, and num_data_per_lu in the inner loop. For example, with num_par_tbl = 2 and num_data_per_lu = 4, with VSTBU_NPT we have:

```
V0[0] = tbl_base[data0],      V0[1] = tbl_base[data0 + 1],
V0[2] = tbl_base[data0+2],    V0[3] = tbl_base[data0 + 3],
V0[4] = tbl_base[data1],      V0[5] = tbl_base[data1 + 1],
V0[6] = tbl_base[data1+2],    V0[7] = tbl_base[data1 + 3]
```

Table organization in memory depends on table type and num_par_tbl. The N physical banks of 32-bit memory is partitioned into num_par_tbl logical banks, and each parallel table is organized inside its own bank.

For example, when NWAY = 8, you can have 1, 2, 4, or 8 parallel tables. Data organization for these and byte, halfword, and word type entries is shown in Figure 6-63.

A few examples of the table lookup operation follow. The NPT distribution for load and store works for normal lookup scenarios.

```
; single table, byte data, short table/output

   VLOOP            TLU, #cmd_len, #param_len
   VAGEN            A0, ...
   VAGEN            A1, ...
   VAGEN            A2, ...
   VLDBU_1PT        data_base[A0], V2                          ; load data to V0
   VTLDHU_1TBL_1PT  table_base[A1][V2], V0, RND_SAT: rnd_sat   ; look up
   VSTH_NPT_ALWS    V0, outp_base[A2], RND_SAT: rnd_sat_st     ; store outcome
; 4 parallel tables, 2 items per table, short data, byte table/output

   VLOOP            TLU, #cmd_len, #param_len
   VAGEN            A0, ...
   VAGEN            A1, ...
   VAGEN            A2, ...
   VLDHU_NPT        data_base[A0], V2                          ; load data to V0
   VTLDBU_4TBL_2PT  table_base[A1][V2], V0, RND_SAT: rnd_sat   ; look up
   VSTB_NPT_ALWS    V0, outp_base[A2], RND_SAT: rnd_sat_st     ; store outcome
```

Load with expansion can only be used in a table lookup loop. An example follows.

```
; load with expansion, short input data, unsigned byte flags, short expanded output

   VLOOP            TLU, #cmd_len, #param_len
   VAGEN            A0, ...
   VAGEN            A2, ...
   VLDBU_NPT        flag_base[A0], V2                          ; load flags to V2
   VLDH_EXP         input_base, V0                             ; load with expansion
   VSTH_NPT_ALWS    V0, outp_base[A2], RND_SAT: rnd_sat_st     ; store outcome
```

For example, in a particular iteration, suppose there are flags V2 = {0, 0, 1, 0, 1, 1, 0, 0}, and the expanding load pointer = 0x100 before the expanding load. After the expanding load:

```
V0 = {0, 0, mem[0x100], 0, mem[0x102], mem[0x104], 0, 0}
```

The pointer is advanced to 0x106, incremented by 3 (number of nonzero flags) times the size of data type (2 bytes for halfword).

Optionally, predicated store can be used while writing the expanded outcome array, leaving flag==0 data points unaltered.

```
   VLOOP            TLU, #cmd_len, #param_len
   VAGEN            A0, ...
   VAGEN            A2, ...
   VLDBU_NPT        flag_base[A0], V2                        ; load flags to V2
   VLDH_EXP         input_base, V0                           ; load with expansion
[V2] VSTH_NPT_ALWS  V0, outp_base[A2], RND_SAT: rnd_sat_st   ; store where V2 != 0
```

Performance of load with expansion is NWAY expanded data points per cycle when there is no memory contention, by pipelining the flag load, data load, and output store.

Figure 6-63. Lookup Table Organization for Various Entry Size and Parallel Tables (NWAY = 8)

Byte-size single table

6.3.5.5.8 Histogram Operation

Histogram functionality includes normal histogram, in which the addressed bin entry is incremented by 1, and weighted histogram, in which the addressed bin entry is incremented by an element in the weight array input.

Histogram operation is indicated by starting the vector command with:

VLOOP HIST,*CL#***:***cmd_len* **,** *PL#***:** *param_len*

The histogram operation uses a subset of the available resources and instructions:

- VAGEN (address generator): fixed A0 for data, optional A1 for histogram input/output pointer, A2 for weights
- VINIT (register initialization) for normal histogram, providing a fixed increment value (normally 1)
- VLD (load): one load for data, and in the case of weighted histogram, one additional load for weights
- VHLD (histogram load): load histogram bins
- VADD (add) to increment histogram bins
- VHST (histogram store): store histogram bins back to memory
- Full set of 4 levels for looping

For normal histogram, the increment value is initialized via a VINIT instruction on V4:

```
VINITHU_ONCE   P1, V4
```

Data is loaded with normal load into V2, for example,

```
VLDBU_NPT      data_base[A0], V2
```

Distribution options of VLD are {1PT, NPT, DS2, US2}. 1PT works for single histogram configuration, NPT works for 2, 4, or 8 parallel histograms.

Optional weights (for weighted histogram) are loaded with another normal load into V4, for example,

```
VLDBU_NPT      weight_base[A1], V4
```

A special histogram load, VHLD, is used to read in the bins:

VHLD*type_m***HIST** *hist_base*[*hist_agen*][**V2**]**, V0, RND_SAT:** *rnd_sat*

The bins are then incremented with normal VADD.

```
VADD  V0, V4, V0
```

Results are stored back to the histogram memory with a special histogram store, VHST:

VHST*type_m***HIST V0,** *hist_base*[*hist_agen*][**V2**]

Base and agen are supposed to be consistent between VHLD and VHST; otherwise, the outcome is undetermined.

Both signed and unsigned types are supported in data load, weight load, histogram load/store, to support unsigned histogram as well as weighted histogram with positive and negative weights.

Parameters for histogram are extracted from the instructions:

- Input data type is from VLD V2
- Input data distribution is from VLD V2, with SIMD units 0..num_par_hist-1 used for indexing histogram. NPT, 1PT, DS2, US2 distribution options are supported.
- Optional weight type is from VLD V4.
- Weight distribution behaves like data distribution, i.e., SIMD units 0..num_par_hist-1 used for incrementing parallel histogram bins
- Histogram data type is from VHLD and VHST, and the two instructions must be consistent in the data type, otherwise the outcome is indeterminate.

- rnd_sat in VHLD specifies round/truncate mode and how many bits to round off data before indexing the histogram, and also saturation mode and bound. This field is 5-bit (like VST and VTLD), so only P0..P31 is allowed.

The histogram command basically takes the data array, and processes num_par_hist data points at a time by assuming that many sets of parallel histogram bin storage. Each data value is rounded, saturated to generate a bin index. The address bin storage elements (which can be byte, halfword, or word) is then incremented by 1 or the weight, saturated to min/max values of that type, signed/unsigned byte/halfword/word:

- For unsigned byte, bin data is saturated to [0, 255].
- For signed byte, bin data is saturated to [-128, 127].
- For unsigned halfword, bin data is saturated to [0, 65535].
- For signed halfword, bin data is saturated to [-32768, 32767].
- For unsigned word, bin data is saturated to [0, 0xFFFF FFFF].
- For signed word, bin data is saturated to [-0x8000 0000, 0x7FFF FFFF].

There are restrictions on the weight data type (as indicated on the VLD into V4):

- Its signed/unsigned designation must agree with the histogram bin (as indicated in VHLD, VHST).
- Its size is limited to byte and halfword, and must be no bigger size then the histogram bin. Thus, for byte sized bins, only byte-sized weights are possible. For halfword or word sized bins, byte or halfword sized weights are possible.

C representation of histogram processing for a single histogram is as follows.

```
for (i=0; i<num_data; i++)
{
    data = data_base[i];
    bin = saturate(round(data));
    hist[bin]++;
}
```

Weighted histogram has the following C representation:

```
for (i=0; i<num_data; i++)
{
    data = data_base[i];
    bin = saturate(round(data));
    hist[bin] += weight[i];
}
```

Histogram organization in memory depends on histogram type and num_par_hist. The N physical banks of 32-bit memory is partitioned into num_par_hist logical banks, and each parallel histogram is organized inside its own bank, as with parallel lookup tables (see Figure 6-63).

The histogram command does not pre-initialize the histogram bin storage. The histogram command also does not sum up the parallel sets of storage into a single set; this is performed as a post-processing step.

Histogram operation takes 2M/P cycles plus some per-command overhead to process M data items with P parallel histograms (P = 1, 2, 4, or 8). As P parallel histograms takes P times the storage of a single histogram, it is a tradeoff of memory size and performance.

An example of histogram operation is:

```
; single histogram, byte data, short histogram, round down 2 bits, 33 bins
; rounding mode, shift, saturation bound coded in P7 using scalar instructions

   VLOOP           HIST, CL#: cmd_len, PL#: param_len
   VINITHU_ONCE    P1, V4                          ; initialize V4 = 1
   VLDBU_NPT       data_base[A0], V2               ; load data to V2
   VHLDHU_1HIST    hist_base[A1][V2], V0, RND_SAT: P7 ; load hist entry into V0
   VADD            V0, V4, V0                      ; increment entry
   VHSTH_1HIST     V0, hist_base[A1][V2]           ; store histogram entry
```

An example of weighted histogram operation is:

```
; single weighted histogram, byte data, byte weight, short histogram,
; round down 2 bits, 33 bins
; rounding mode, shift, saturation bound coded in P7 using scalar instructions

   VLOOP            HIST, CL#: cmd_len, PL#: param_len
   VLDBU_NPT        data_base[A0], V2                ; load data to V2
   VLDBU_NPT        weight_base[A2], V4              ; load weights to V4
   VHLDHU_1HIST     hist_base[A1][V2], V0, RND_SAT: P7 ; load hist entry into V0
   VADD             V0, V4, V0                       ; increment entry by weights
   VHSTH_1HIST      V0, hist_base[A1][V2]            ; store histogram entry
```

Table lookup and histogram loops are limited to use designated vector register and address generator resources as shown in Table 6-358.

Table 6-358. Table Lookup and Histogram Hardware Resources

Loop type	Input/outputstream	Address generator	Vector register
table lookup	data	A0	V2
	table	A1	V0
	output	A2	V0
load with expansion	flag	A0	V2
	data	n/a	V0
	output	A2	V0
histogram	data	A0	V2
	histogram	A1	V0
	weight	A2	V4

6.3.5.5.9 Circular Buffer Addressing Support

In certain applications, it is desirable to maintain circular buffers for input data and intermediate results. Thus, circular buffer addressing is supported in VCOP.

- Support circular buffer in VLD and VST instructions in compute loops, table lookup loops, and histogram loops. No circular buffer in VTLD (table load) and VHLD/VHST (histogram bin load/store).
- Support is in pointer increment arithmetic, so no load or store in any iteration should straddle the circular buffer boundary.
- Support only 2's power buffer size from 1Kbytes, aligned to the size. For example, 1KB circular buffer can only start/end at 1KB alignment of the memory map.
- Support is in all memory regions.

Circular buffer addressing option is encoded in the circ_buf field taking up bits 23..20 of base address:

- 0: no circular buffer addressing
- 1: circular buffer size 1K bytes
- 2: circular buffer size 2K bytes
- 3: circular buffer size 4K bytes
- 4: circular buffer size 8K bytes
- 5: circular buffer size 16K bytes
- 6: circular buffer size 32K bytes
- 7~15: reserved

The base address does not need to be aligned to the circular buffer size, in the abive example's case, 0x400. To avoid any single load/store straddle the circular buffer boundary, the base address and the pointer increments must all be aligned to the access size of each iteration.

For example, when loading N data points of halfword data, where N = 8. Access size = 16, so the base address and any pointer increment must be aligned to multiples of 16.

Hardware adjusts the memory address for circular buffering by this process:

```
circ_buf = (base >> 20) & 0xF;            // extract circ_buf
mask = (0x200 << circ_buf) - 1;           // mask = size of buffer - 1
cbuf = (base & 0xFFFFF) & ~mask;          // find base addr of buffer
addr = cbuf + (base + agen) & mask;       // add offset from base of buffer
```

For example, base = 0x10420, agen = 0xFF0.

1. Extract circ_buf field by cir_buf = (base >> 20) & 0xF = 1, indicating 1KB circular buffer size.
2. Set mask = (0x200 << 1) – 1 = 0x3FF, forming the bit mask that defines the circular addressing bits versus linear, non-circular bits.
3. Get rid of the circ_buf field by ANDing base with 0xFFFFF, then zero out the circular addressing bits by ANDing with the complement of mask, to get cbuf = 0x400, so the circular buffer is 0x400 ~ 0x7FF.
4. Next, add the address generator value to the base address, and AND with mask to find offset from the cbuf base. (base + agen) & mask = (0x10420 + 0xFF0) & 0x3FF = 0x11410 & 0x3FF = 0x10.
5. Finally, add the offset 0x10 to the circular buffer base 0x400 to get the final address, 0x410.

The agen is allowed to go over the circular buffer many times over to wrap back inside, and that agen can even go backward to wrap from the beginning to the end of the buffer.

6.3.5.5.10 Load/Store Address Alignment Constraints

Load/store pointer alignment constraints are summarized in Table 6-359, for data load/store as well as table and histogram load/store, for various data types.

Table 6-359. Load and Store Address Alignment Constraints

Type of load/store and distribution	Byte type	halfword type	Word type
VLD_NPT	any	any	word-aligned
VLD_1PT	any	any	any
VLD_CIRC2	any	any	any
VLD_DS2	any	halfword-aligned	not supported
VLD_US2	any	any	any
VLD_DINTRLV	any	word-aligned	not supported
VLD_CUST_Pi	any	any	word-aligned
VLD_EXP	any	halfword-aligned	word-aligned
VST_NPT	any	halfword-aligned	word-aligned
VST_1PT	any	halfword-aligned	word-aligned
VST_DS2	any	halfword-aligned	word-aligned
VST_INTRLV	any	word-aligned	not supported
VST_OFFST_NP1	any	halfword-aligned	word-aligned
VST_COLLAT	any	halfword-aligned	word-aligned
VST_DDA	any	halfword-aligned	word-aligned
VST_SKIP	any	halfword-aligned	not supported
VTLD_1TBL_1PT	any	halfword-aligned	word-aligned
VTLD_mTBL_nPT (other than 1TBL_1PT)	32-byte-aligned	32-byte-aligned	32-byte-aligned
VHLD_mHIST	32-byte-aligned	32-byte-aligned	32-byte-aligned
VHST_mHIST	32-byte-aligned	32-byte-aligned	32-byte-aligned

The rationale is:

- For data load, in general any alignment is supported. Exception: When software loads 32 bytes, the pointer needs to be word-aligned.
- For data store, in general any alignment is supported for byte, halfword alignment for halfword, and word-alignment for word. Exception: When 32 or 64 bytes is stored, the value needs to be word-aligned. In case of LDH_DS2, the pointer must be 16-bit aligned.
- For table load with one table, 1-point lookup, the table base pointer can be of any alignment for byte, halfword alignment for halfword, and word-alignment for word.
- For table load with other configurations, only a 32-byte aligned table base is supported.
- Table store is really data store with 1, 2, 4, or 8 data points. The same alignment is supported as a data store, i.e., any alignment for byte, halfword alignment for halfword, and word-alignment for word.
- For histogram load/store, the histogram base pointer must be 32-byte aligned.

6.3.5.6 Load/Store Buffer and Scheduling

There is load data buffer associated with each VLD instruction in the loop to reduce memory reads and resulting contention and slow-down.

- Size of the buffer is 32 bytes, and is filled with 8 32-bit words on word alignment.
- When the requested data is not contained in the buffer (completely or partially), VCOP reads another 8 32-bit words from the first requested word.
- There is no sharing of data among separate load data buffers.

There is one common store data buffer, basically a shadow copy of all vector registers, for all the VST instructions in the loop to skew memory write timing to reduce memory contentions and resulting slow-down.

- The store data buffer is 16 × 8 × 40-bit in size.
- Vector registers are copied to the store data buffer at the end of i4 iteration, when there is any store to be performed for that iteration. In case stores are not all completed then, load and execution stages are stalled, until all stores are completed.
- Write data from multiple iterations of the same store instruction are not combined. For example, STB_NPT_ALWS causes a memory store of 8 bytes in each iteration.
- Write data from multiple stores of the loop, same iteration, are not combined.

Memory loads and stores are arbitrated for each memory port. There are three memory ports:

- WBUF: Dedicated to WBUF
- IBUFL: For IBULA and IBUFLB
- IBUFH: For IBUFHA and IBUFHB

Load store priorities are: force store > load > store. Force store is issued when the load and operation stages are stalled to free up the store stage so the hardware can advance to the next iteration. Other than force store, load has priority over normal store.

Example 6-9. 3-Tap Horizontal Filtering, Byte Type

```
      VLDB_DINTRLV  Pdata[a0], V0                ; data, starts from 0x10000 (IBUFLA)
      VLDB_1PT      Pcoef[a1], V2                ; coef, starts from 0x0 (WBUF)
      VMADD         V0, V2, V4, V4
||    VMADD         V1, V2, V5, V5
      VSTB_INTRLV   V4, Pout[a2], RND_SAT: rnd_sat_param ; output, start from 0x10400 (IBUFLA)
```

Table 6-360. Load and Store Buffering Example, Byte-Type Horizontal Filter

Cycle	LD stage	OP stage	ST stage
0	iter 0 LD0 need 0x10000..0x1000F, **read IBUFLA** LD0_buf = {0x10000..0x1001F} LD2 need 0x0, **read WBUF** LD2_buf = {0x0..0x1F}		
1	iter 1 LD0 need 0x10001..0x10010, from LD0_buf LD2 need 0x1, from LD2_buf	iter 0 MADD || MADD	
2	iter 2 LD0 need 0x10002..0x10011, from LD0_buf LD2 need 0x2, from LD2_buf	iter 1 MADD || MADD	iter 0
3	iter 3 LD0 need 0x10010..0x1001F, from LD0_buf LD2 need 0x0, from LD2_buf	iter 2 MADD || MADD	iter 1
4	iter 4 LD0 need 0x10011..0x10020, **read IBUFLA** LD0_buf = {0x10010..0x1002F} LD2 need 0x1, from LD2_buf	iter 3 MADD || MADD	iter 2 ST0 store 0x10400..0x1040F queue the store

Table 6-360. Load and Store Buffering Example, Byte-Type Horizontal Filter (continued)

Cycle	LD stage	OP stage	ST stage
5	iter 5 LD0 need 0x10012..0x10021, from LD0_buf LD2 need 0x2, from LD2_buf	iter 4 MADD || MADD	iter 3 store IBUFLA
6	iter 6 LD0 need 0x10020..0x1002F, from LD0_buf LD2 need 0x0, from LD2_buf	iter 5 MADD || MADD	iter 4
7	iter 7 LD0 need 0x10021..0x10030, **read IBUFLA** LD0_buf = {0x10020..0x1003F} LD2 need 0x1, from LD2_buf	iter 6 MADD || MADD	iter 5 ST0 store 0x10410..0x1041F queue the store

Here LDB_DINTRLV is used to read 16 data points, to operate on 16 outputs in parallel. The hardware issues memory reads for iteration 0, 4, 7, etc, is able to supply data for subsequent hold data read in for subsequent LD; on average there is 1 read every 3 cycles. For coefficient, since only 3 bytes is used, just one read in iteration 0 is sufficient to supply data for the whole loop. Output is produced in iteration 2, 5, etc, and the store buffer delays the write until there is no read traction, avoiding read/write contention and slowdown.

Due to memory read/write timing, delayed slot in operation, and round/saturate feature in the store stage, the skew between load, operation, and store stages is more than what is shown in Table 6-360, but for calculating steady-state performance, simplified analysis like this is sufficient.

Example 6-10. Horizontal Filtering, Short Type

```
      VLDH_NPT      Pdata0[a0], V0              ; data, start from 0x10000 (IBUFLA)
      VLDH_NPT      Pdata1[a0], V2              ; data next row, start from 0x10080 (IBUFLA)
      VLDH_1PT      Pcoef[a1], V4               ; coef, start from 0x0 (WBUF)
      VMADD         V0, V4, V6, V6
||    VMADD         V2, V4, V7, V7
      VSTH_NPT      V6, Pout0[a2], RND_SAT: rnd_sat_param ; start from 0x10400 (IBUFLA)
      VSTH_NPT      V7, Pout1[a2], RND_SAT: rnd_sat_param ; start from 0x10480 (IBUFLA)
```

Software cannot issue VLDH_DINTRLV on odd halfwords, so use two LDH_NPT.

Table 6-361. Load and Store Buffering Example, Short-Type Horizontal Filter

Cycle	LD stage	OP stage	ST stage
0	iter 0 LD0 need 0x10000..0x1000F, **read IBUFLA** LD0_buf = {0x10000..0x1001F} LD1 need 0x10080 .. 0x1008F, **stalled** LD2 need 0..1, **read WBUF** LD2_buf = {0x0..0x1F}		
1	iter 0 LD1 **read IBUFLA** LD1_buf = {0x10080..0x1009F}		
2	iter 1 LD0 need 0x10002..0x10011, from LD0_buf LD1 need 0x10082..0x10091, from LD1_buf LD2 need 2..3, from LD2_buf	iter 0 MADD || MADD	
3	iter 2 LD0 need 0x10004..0x10013, from LD0_buf LD1 need 0x10084..0x10093, from LD1_buf LD2 need 4..5, from LD2_buf	iter 1 MADD || MADD	iter 0
4	iter 3 LD0 need 0x10010..0x1001F, from LD0_buf LD1 need 0x10090 .. 0x1009F, from LD1_buf LD2 need 0..1, from LD2_buf	iter 2 MADD || MADD	iter 1

Table 6-361. Load and Store Buffering Example, Short-Type Horizontal Filter (continued)

Cycle	LD stage	OP stage	ST stage
5	iter 4 LD0 need 0x10012..0x10021, **read IBUFLA** LD0_buf = {0x10010..0x1002F} LD1 need 0x10092 .. 0x100A1, **stall** LD2 need 2..3, from LD2_buf	iter 3 MADD || MADD	iter 2 ST0 store 0x10400..0x1040F ST0 queued ST1 store 0x10480..0x1048F ST1 queued
6	iter 4 LD1 **read IBUFLA** LD1_buf = {0x10090..0x100AF}	stalled	stalled
7	iter 5 LD0 need 0x10014..0x10023, from LD0_buf LD1 need 0x10094..0x100A3, from LD1_buf LD2 need 4..5, from LD2_buf	iter 4 MADD || MADD	iter 3 ST0 **write IBUFLA**
8	iter 6 LD0 need 0x10020..0x1002F, from LD0_buf LD1 need 0x100A0..0x100AF, from LD1_buf LD2 need 0..1, from LD2_buf	iter 5 MADD || MADD	iter 4 ST1 **write IBUFLA**
9	iter 7 LD0 need 0x10022..0x10031, **read IBUFLA** LD0_buf = {0x20..x3F} LD1 need 0x100A2..0x100B1, **stall** LD2 need 2..3, from LD2_buf	iter 6	iter 5 ST0 store 0x10410..0x1041F ST0 queuedST1 store 0x10490..0x1049F ST1 queued
10	iter 7 LD1 **read IBUFLA** LD1_buf = {0x100A0..0x100BF}	stalled	stalled

In this loop, with 2 VLDH_NPT to sustain 16 multiply-accumulates per iteration, the load stage stalled due to memory contention in IBUFL from the 2 loads. The read buffer supplies data for 2 subsequent iterations in steady state, leaving 2 memory-read free cycles every 3 iterations. With output writing back to IBUFL, the store buffer effectively delays the memory writes to use these free memory slots. Each i4 loop of 3 iterations thus takes 4 cycles to complete.

6.3.5.7 VCOP Per-Loop Overhead

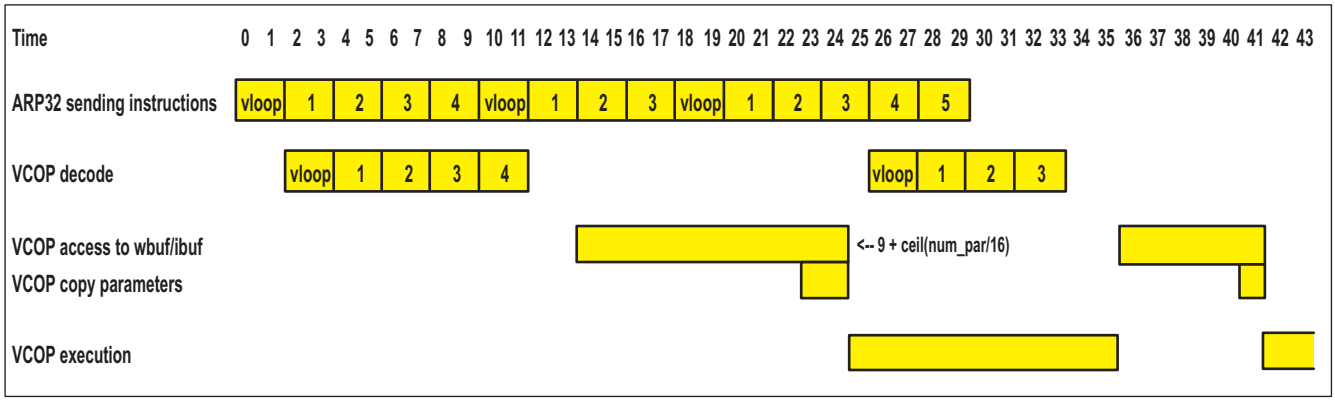
For each vector command specifying a loop, several overhead components are present. In general, developers are encouraged to run place into each loop as much processing as possible and run as many iterations as possible to reduce the percentage of time spent on overhead.

Overhead components are:

- Command decode time: it takes 2 cycles per instruction to decode, since scalar core is providing instructions at this rate. Command decode time can be hidden if ARP32 feeds these instructions while VCOP is executing a previous command.
- Parameter fetch time: it takes 9 + ceiling(num_param/16) cycles to fetch parameter from data memory (WBUF, IBUFL, or IBUFH).
- Execution pipeline ramp up/down time: it takes time to ramp up and down the long pipeline of VCOP. Minimal time for any loop is execution is about 17 cycles, due to the pipeline ramp up/down time.

Figure 6-64 shows a decode-parameter-fetch-execution time line.

Figure 6-64. Example of Operation Delay Slots



- t = 0, ARP32 sends VLOOP, followed by VCOP instructions in the loop, instructions go into FIFO.
- t = 2, VCOP pulls instruction out of FIFO, recognizes VLOOP.
- t = 10 (depend on command length), VCOP pulls last instruction of loop from FIFO.
- t = 10, ARP32 sends next command, starting from VLOOP.
- t = 14, VCOP starts access to parameter memory, 16 parameters/cycle.
- t = 18, ARP32 keeps sending vector commands, until program stream switches to scalar code, or VCOP pre-decode instruction FIFO becomes full (capacity is 64 words).
- t = 23 (14 + 9), VCOP starts to copy parameters into decoded command buffer.
- t = 25 (after parameter copy), VCOP starts executing the loop.
- t = 26 (sync to 250-MHz clock), VCOP pulls instruction out of FIFO, recognizes VLOOP.
- t = 32 (depend on command length), VCOP pulls last instruction of loop from FIFO.
- t = 36 (after prev loop finishes executing), VCOP starts to access parameter memory.

This is for showing the dependency among activities; execution time here is not realistic; it takes minimally 17 cycles to execute any loop, due to the pipeline depth.

6.3.5.8 VCOP Error Handling

Upon detection of erroneous instruction code, parameter, load/store address, or loop in execution exceeding programmed max iteration count, VCOP signals the error by generating an interrupt and registering the error source in the MMR VCOP_ERROR. Refer to register manual for details.

Upon detection of error, VCOP:

1. Terminates current loop, leaving vloop_ptr, param_ptr, loop variables i0, i1, i2, i3, i4 in MMR.
2. Parses and clears vector instructions until encountering VWDONE.
3. Issues interrupt, assert vec_done = 1, deassert vec_rdy = 0 to block subsequent vector instructions.
4. Upon VCOP_ERROR status being cleared (by writing 1s to clear bits 10:0), VCOP becomes idle (assert VCOP_STATUS[2]VEC_RDY = 1) and ready to resume processing.
5. Alternatively, VCOP can be reset to resume processing.

Depending on the EVE-level memory switch setting, VCOP's access of the data memory space may be deemed invalid by the memory switch. When this happens, the memory switch signals VCOP to enter error handling state, as described above. VCOP does not send an error interrupt, as the memory switch is doing that (for invalid access from VCOP or from other masters).

6.3.5.9 Vector Operation Details

6.3.5.9.1 VABS

Assembly syntax:	**VABS** *src1*, *dst*
Operation:	Absolute value
Classification:	1-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = abs(src1);

6.3.5.9.2 VABSDIF

Assembly syntax:	**VABSDIF** *src1*, *src2*, *dst*
Operation:	absolute-difference
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = abs(src1 – src2);

6.3.5.9.3 VADD

Assembly syntax:	**VADD** *src1*, *src2*, *dst*
Operation:	addition
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 + src2;

6.3.5.9.4 VADDH

Assembly syntax:	**VADDH** *src1*, *src2*, *dst*
Operation:	Add high
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 + (src2 >> 32);

6.3.5.9.5 VADDSUB

Assembly syntax:	VADDSUB src1/dst1, src2/dst2
Operation:	Add-subtract
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst1 = src1 + src2; dst2 = src1 – src2;

6.3.5.9.6 VADD3

Assembly syntax:	**VADD3** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Add 3 items,
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	dst = src1 + src2 + src3;

6.3.5.9.7 VADIF3

Assembly syntax:	**VADIF3** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Add difference
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	dst = src1 – src2 + src3;

6.3.5.9.8 VAND

Assembly syntax:	**VAND** *src1*, *src2*, *dst*
Operation:	Bitwise and
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 & src2;

6.3.5.9.9 VANDN

Assembly syntax:	**VANDN** *src1*, *src2*, *dst*
Operation:	Bitwise and-not
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 & ~src2;

6.3.5.9.10 VAND3

Assembly syntax:	**VAND3** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Bitwise-and 3 items
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	dst3 = src1 & src2 & src3;

Using VAND3 accelerates a morphological erosion operation.

6.3.5.9.11 VBINLOG

Assembly syntax:	**VBINLOG** *src1*, *dst*
Operation:	Binary log
Classification:	1-input 1-output
Bit width:	32-bit
Delay slot:	one
C statement:	As follows

VBINLOG computes an approximate binary log, by detecting the left-most 1 bit in the input, encoding the bit position in bits 31..28, and left-justifying the following input bits in bits 27..0. The detected position of bit 31 is encoded as 15 (bit position minus 16), bit 30 as 14, and so on, and bit 17 as 1. If the left-most 1 bit is not found in bits 31..17, 0 is coded.

The VBINLOG operation is a non-standard floating point representation. Say a 32-bit integer x = 2^exp * (1 + frac/(2^28)), where exp and frac are integers. If (exp >= 16), binlog(x) = (exp – 16) * (2^28) + frac, concatenating the 4-bit adjusted exponent, exp – 16, with the 28-bit fraction. Otherwise, the representation is subnormal, leaving 0 in the exponent and bits 16..0 of input left-justified in the fraction part of output, bits 27..0.

For example, the number 0x0700_0000 has leading 1 in bit 26, so the bit position is coded as 26 – 16 = 10 = 0xA. The subsequent bits, two 1s immediately following the leading 1, left-justified in 28 bits or 7 hex digits, is 0xC00_0000. Thus the VBINLOG outcome of the number is 0xAC00_0000.

For a subnormal example, the number 0x8000 < 2^16 (is half of that), so its VBINLOG outcome is 0x0400_0000.

Figure 6-65. Binlog Function

input																		binlog output

0	0	0	0	0	0	0	0	0	0	0	1	b19	b18	b17	b16	b15	...	0	1	0	0	b19	b18	...	0
0	0	0	0	0	0	0	0	0	0	0	0	1	b18	b17	b16	b15	...	0	0	1	1	b18	b17	...	0
0	0	0	0	0	0	0	0	0	0	0	0	0	1	b17	b16	b15	...	0	0	1	0	b17	b16	...	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	b16	b15	...	0	0	0	1	b16	b15	...	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	b16	b15	...	0	0	0	0	b16	b15	...	0

Input of VBINLOG is 32-bit, and so is the outcome, not 40-bit. VLMBD supports full 40-bit input range leading bit detection. VBINLOG is useful in compressing dynamic range and preserving precision. VBINLOG followed by table lookup can be used to produce the reciprocal of a number.

6.3.5.9.12 VBITC

Assembly syntax:	**VBIT** *src1*, *dst*
Operation:	Bit count
Classification:	1-input 1-output
Bit width:	32-bit
Delay slot:	one
C statement:	As follows

Count number of “1” bits in src1[31:0].

6.3.5.9.13 VBITDI

Assembly syntax:	**VBITDI** *src1*, *dst1*, *dst2*
Operation:	Bit deinterleave
Classification:	1-input 2-output
Bit width:	32-bit
Delay slot:	0
C statement:	As follows

Bit deinterleave is basically the inverse of bit interleave (VBITI).

For example,

```
src1 = 0x523(0000_0000_0000_0000_0000_1001_0010_0011)
```

Results in:

```
dst1 = 0x25 (0000_0000_0010_0101),
dst2 = 0x11(0000_0000_0001_0001)
```

6.3.5.9.14 VBITI

Assembly syntax:	**VBITI** *src1*, *src2*, *dst*
Operation:	Bit interleave
Classification:	2-input 1-output
Bit width:	32-bit
Delay slot:	one
C statement:	As follows

Bit interleave 16 LSBs of src1 and src2 (each), and write to dst.

For example,

```
src1 = 0x25 (0000_0000_0010_0101)
src2 = 0x11(0000_0000_0001_0001)
```

Results in:

```
dst = 0x523(0000_0000_0000_0000_0000_1001_0010_0011)
```

6.3.5.9.15 VBITPK

Assembly syntax:	**VBITPK** *src1*, *src2*, *dst*
Operation:	Bit-pack
Classification:	2-input 1-output
Bit width:	33-bit
Delay slot:	one
C statement:	As follows

Pack boolean (src1[i] >= src2[i]) into bits in dst[0], and broadcast dst[0] to all SIMD lanes so that dst[j] = dst[0], 1 <= j <= NSIMD.

VBITPK is useful in accessing bit-packed data (binary images).

6.3.5.9.16 VBITR

Assembly syntax:	**VBITR** *src1*, *dst*
Operation:	Bit reverse
Classification:	1-input 1-output
Bit width:	32-bit
Delay slot:	one
C statement:	As follows

Reverse bits in src1[31:0] and write to dst.

6.3.5.9.17 VBITTR

Assembly syntax:	**VBITTR** *src1*, *dst*
Operation:	Bit transpose
Classification:	1-input 1-output
Bit width:	NSIMD-bit
Delay slot:	one

VBITTR, bit transpose, also called corner turn, takes N × N bits in the source, from N LSBs of each of the N registers, and transpose them. Here is an example:

Input:			**Output:**		
		Bit position			**Bit position**
Lane	**Value**	**0 1 2 3**	**Lane**	**Value**	**0 1 2 3**
0	1	1 0 0 0	0	5	1 0 1 0
1	2	0 1 0 0	1	6	0 1 1 0
2	3	1 1 0 0	2	8	0 0 0 1
3	4	0 0 1 0	3	0	0 0 0 0

6.3.5.9.18 VBITUNPK

Assembly syntax:	**VBITUNPK** *src1*, *src2*, *dst*
Operation:	Bit-unpack
Classification:	2-input 1-output
Bit width:	33-bit
Delay slot:	one
C statement:	As follows

Unpack bits in src1[0]. Set dst[i] = src2[i] if the unpacked bit to lane i is 1, otherwise dst[i] = 0.

6.3.5.9.19 VCMOV

Assembly syntax:	**VCMOV** *cond*, *src1*[, *src2*|*dst*]
Operation:	Conditional move
Classification:	special
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

cond = {I1234_ZERO, I234_ZERO, I34_ZERO, LAST_I4_ZERO, LAST_I34, LAST_I234, LAST_I1234}.

Move src1 to dst in the iterations designated by cond. This is parallel move within each SIMD lane; dst[i] = src1[i] when condition is true. Otherwise, dst[i] = src2[i]. By always writing to the dst register, dst register does not need to be {V0, V1, V2, V3} (see Section 6.3.5.5.6 for details on the store-without-being destination register constraint).

6.3.5.9.20 VCMPEQ

Assembly syntax:	**VCMPEQ***src1*, *src2*, *dst*
Operation:	Compare equal
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = (src1 == src2) ? 1 : 0;

6.3.5.9.21 VCMPGE

Assembly syntax:	**VCMPGE** *src1*, *src2*, *dst*
Operation:	Compare greater-than-or-equal
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = (src1 >= src2) ? 1 : 0;

6.3.5.9.22 VCMPGT

Assembly syntax:	**VCMPGT** *src1*, *src2*, *dst*
Operation:	Compare greater-than
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = (src1 > src2) ? 1 : 0;

6.3.5.9.23 VDINTRLV

Assembly syntax:	**VDINTRLV** {*src1*|*dst1*}, {*src2*|*dst2*}
Operation:	Deinterleave
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VDINTRLV is basically the inverse of VINTRLV.

For 8-way SIMD, this is used:

```
dst1[0] = src1[0];
dst2[0] = src1[1];
dst1[1] = src1[2];
dst2[1] = src1[3];
dst1[2] = src1[4];
dst2[2] = src1[5];
dst1[3] = src1[6];
dst2[3] = src1[7];
dst1[4] = src2[0];
dst2[4] = src2[1];
dst1[5] = src2[2];
dst2[5] = src2[3];
dst1[6] = src2[4];
dst2[6] = src2[5];
dst1[7] = src2[6];
dst2[7] = src2[7];
```

6.3.5.9.24 VDINTRLV2

Assembly syntax:	**VDINTRLV2** {*src1*|*dst1*}**,** {*src2*|*dst2*}
Operation:	Deinterleave with 2-element frequency
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VDINTRLV2 is basically the inverse of VINTRLV2.

For 8-way SIMD, this is used:

```
dst1[0] = src1[0];
dst1[1] = src1[1];
dst2[0] = src1[2];
dst2[1] = src1[3];
dst1[2] = src1[4];
dst1[3] = src1[5];
dst2[2] = src1[6];
dst2[3] = src1[7];
dst1[4] = src2[0];
dst1[5] = src2[1];
dst2[4] = src2[2];
dst2[5] = src2[3];
dst1[6] = src2[4];
dst1[7] = src2[5];
dst2[6] = src2[6];
dst2[7] = src2[7];
```

6.3.5.9.25 VEXITNZ

Assembly syntax:	**VEXITNZ** *level***,** *src1*
Operation:	Exit upon non-zero
Classification:	special
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VEXITNZ is for early termination of VLOOP or in the repeat-loop level. The designated src1 register's 0th way is examined every time the instruction executes, and if it is not zero, the hardware terminates either at VLOOP level or at VRPT level, as indicated by the level parameter.

Parameter src1 is examined at the time the instruction executes, and an exit/no-exit decision is made. However, any exit/no-exit action is not taken immediately. For VEXITNZ VLOOP, subsequent instructions in the same iteration, remaining operations and all the stores, are executed, then the loop terminates. For VEXITNZ VRPT; all subsequent instructions in the same loop are executed, including the rest of the iteration, and all remaining iterations until i1, i2, i3, i4 all run to respective end counts, then the repeated loop terminates.

There can only be one VEXITNZ in each vector command; no mixing of VEXITNZ VLOOP and VEXITNZ VRPT. When the vector command is not repeated (RPT_END = 0), VEXITNZ VRPT behaves like VEXITNZ VLOOP.

6.3.5.9.26 VINTRLV

Assembly syntax:	**VINTRLV** {*src1*|*dst1*}**,** {*src2*|*dst2*}
Operation:	Interleave
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VINTRLV is basically interleaving among SIMD lanes.

For 8-way SIMD, this is used:

```
dst1[0] = src1[0];
dst1[1] = src2[0];
dst1[2] = src1[1];
dst1[3] = src2[1];
dst1[4] = src1[2];
dst1[5] = src2[2];
dst1[6] = src1[3];
dst1[7] = src2[3];
dst2[0] = src1[4];
dst2[1] = src2[4];
dst2[2] = src1[5];
dst2[3] = src2[5];
dst2[4] = src1[6];
dst2[5] = src2[6];
dst2[6] = src1[7];
dst2[7] = src2[7];
```

6.3.5.9.27 VINTRLV2

Assembly syntax:	**VINTRLV2** {*src1*|*dst1*}**,** {*src2*|*dst2*}
Operation:	Interleave with 2-element frequency
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VINTRLV is basically interleaving among SIMD lanes.

For 8-way SIMD, this is used:

```
dst1[0] = src1[0];
dst1[1] = src1[1];
dst1[2] = src2[0];
dst1[3] = src2[1];
dst1[4] = src1[2];
dst1[5] = src1[3];
dst1[6] = src2[2];
dst1[7] = src2[3];
dst2[0] = src1[4];
dst2[1] = src1[5];
dst2[2] = src2[4];
dst2[3] = src2[5];
dst2[4] = src1[6];
dst2[5] = src1[7];
dst2[6] = src2[6];
dst2[7] = src2[7];
```

6.3.5.9.28 VINTRLV4

Assembly syntax:	**VINTRLV4** {*src1*|*dst1*}**,** {*src2*|*dst2*}
Operation:	Interleave with 4-element frequency
Classification:	2-input 2-output
Bit width:	40-bit
Delay slot:	no
C statement:	As follows

VINTRLV is basically interleaving among SIMD lanes.

For 8-way SIMD, this is used:

```
dst1[0] = src1[0];
dst1[1] = src1[1];
dst1[2] = src1[2];
dst1[3] = src1[3];
dst1[4] = src2[0];
dst1[5] = src2[1];
dst1[6] = src2[2];
dst1[7] = src2[3];
dst2[0] = src1[4];
dst2[1] = src1[5];
dst2[2] = src1[6];
dst2[3] = src1[7];
dst2[4] = src2[4];
dst2[5] = src2[5];
dst2[6] = src2[6];
dst2[7] = src2[7];
```

6.3.5.9.29 VLMBD

Assembly syntax:	**VLMBD** *src1***,** *src2***,** *dst*
Operation:	Left-most bit detect
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	As follows

Depending on src2 being zero or not, VLMBD searches for 0 or 1 in src1, starting from bit 39. Bit position where the first 0 or 1 occurs is returned, and -1 is returned if it's not found.

6.3.5.9.30 VMADD

Assembly syntax:	**VMADD** *src1*, *src2*, *src3*, *dst*, **RND:** *rnd_param* (dst same as src3)
Operation:	Multiply-add
Classification:	3-input 1-output
Bit width:	17-bit src1/src2, 40-bit src3/dst
Delay slot:	2 delay from src1/src2, 1 delay from src3
C statement:	dst = src3 + round_or_shift(src1 * src2, rnd_param)

The RND field specifies a parameter, in which additional fields are read to support built-in round/shift feature in the operation:

Figure 6-66. VMPY, VMADD and VMSUB Rounding Parameters

Parameter Indexed by rnd_param

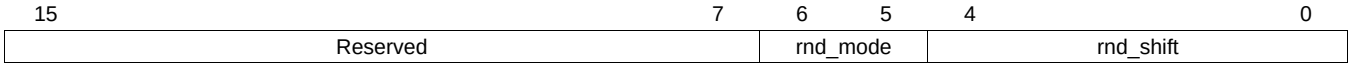

Table 6-362. Parameter Indexed by rnd_param Field Descriptions

Bits	Name	Description	
15-7	Reserved		
6-5	rnd_mode	Sets rounding mode:	
		0	No rounding
		1	Round
		2	Truncate
		3	Left-shift
4-0	rnd_shift	Number of bits to round/shift, limited to:	
		{8|15|16}	Round/truncate
		1	Left-shift

When rnd_mode = round or truncate, src1 * src2 is rounded down before the addition or subtraction. When rnd_mode = left-shift, src1 * src2 is shifted up before the addition or subtraction. Note the restriction on the number of bits to shift.

6.3.5.9.31 VMAX

Assembly syntax:	**VMAX** *src1*, *src2*, *dst*
Operation:	Maximum
Classification:	2-input 1-output
Bit width:	33-bit
Delay slot:	no
C statement:	dst = (src1 > src2) ? src1 : src2;

6.3.5.9.32 VMAXSETF

Assembly syntax:	**VMAXSETF** *src1*, {*src2*|*dst1*}, *dst2*
Operation:	Maximum and set flag
Classification:	2-input 2-output
Bit width:	33-bit
Delay slot:	no
C statement	dst1 = max(src1, src2); dst2 = (src1>src2) ? 1:0

6.3.5.9.33 VMIN

Assembly syntax:	**VMIN** *src1*, *src2*, *dst*
Operation:	Minimum
Classification:	2-input 1-output
Bit width:	33-bit
Delay slot:	no
C statement:	dst = (src1 < src2) ? src1 : src2;

6.3.5.9.34 VMINSETF

Assembly syntax:	**VMINSETF** *src1*, {*src2*|*dst1*}, *dst2*
Operation:	Minimum and set flag
Classification:	2-input 2-output
Bit width:	33-bit
Delay slot:	
C statement:	dst1 = min(src1, src2); dst2 = (src1 < src2) ? 1 : 0;

6.3.5.9.35 VMPY

Assembly syntax:	**VMPY** *src1*, *src2*, *dst*, **RND:** *rnd_param*
Operation:	multiply
Classification:	2-input 1-output
Bit width:	17-bit input, 40-bit output
Delay slot:	one
C statement:	dst = round_or_shift(src1 * src2, rnd_param);

See VMADD for the RND field.

6.3.5.9.36 VMSUB

Assembly syntax:	**VMSUB** *src1*, *src2*, *src3*, *dst*, **RND:** *rnd_param* (dst same as src3)
Operation:	Multiply-subtract
Classification:	3-input 1-output
Bit width:	17-bit src1/src2, 40-bit src3/dst
Delay slot:	2 delay from src1/src2, 1 delay from src3
C statement:	dst = src3 - round_or_shift(src1 * src2, rnd_param);

See VMADD for the RND field.

6.3.5.9.37 VNOP

Assembly syntax:	**VNOP**
Operation:	no operation
Classification:	n/a
Bit width:	n/a
Delay slot:	no
C statement:	n/a

NOP is used to pad the two operations per clock cycle operation pipeline, so the next operation is mapped to functional unit 1. This is used to align data dependency to within functional unit 0 or 1, to avoid idle cycles being inserted by hardware.

6.3.5.9.38 VNOT

Assembly syntax:	**VNOT** *src1*, *dst*
Operation:	Bitwise complement
Classification:	1-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = ~src1;

6.3.5.9.39 VOR

Assembly syntax:	**VOR** *src1*, *src2*, *dst*
Operation:	Bitwise or
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 | src2;

6.3.5.9.40 VOR3

Assembly syntax:	**VOR3** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Bitwise-or 3 items
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	dst3 = src1 | src2 | src3;

Using VOR3 accelerates the morphological dilation operation.

6.3.5.9.41 VRND

Assembly syntax:	**VRND** *src1*, *src2*, *dst*
Operation:	Round src1 by number of bits expressed in src2
Classification:	2-input 1-output
Bit width:	40-bit src1/dst, 5-bit src2, allowing rounding by 0 ~ 31 bits
Delay slot:	one
C statement:	rnd_add = (src2 > 0) ? (1 << (src2 – 1)) : 0; dst = (src1 + rnd_add) >> src2;

A half-unit is added before the right-shift. For example, if src2 = 8, dst = (src1 + 128) >> 8.

Only src2[4:0] are read, so for example src2 = 40 causes a rounding by 8 bits, since src2[4:0] = 0x08.

6.3.5.9.42 VSAD

Assembly syntax:	**VSAD** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Sum of absolute difference, dst = |src1 – src2| + src3
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	one
C statement:	dst = src3 + abs(src1 – src2);

6.3.5.9.43 VSEL

Assembly syntax:	**VSEL** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Select
Classification:	3-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 ? src2 : src3;

6.3.5.9.44 VSHF

Assembly syntax:	**VSHF** *src1*, *src2*, *dst*
Operation:	Arithmetic shift, shift left when src2 > 0, shift right by –src2 when src2 < 0
Classification:	2-input 1-output
Bit width:	40-bit src1/dst, 6-bit src2, allowing shifting by -32 ~ 31 bits
Delay slot:	no
C statement:	dst = (src2 >= 0) ? (src1 << src2) : (src1 >> –src2);

VSHF is an arithmetic shift, not logic shift, compared to conventional instruction sets that have both options. This is because VCOP performs sign extension in the load stage, and all signed/unsigned 8/16/32-bit operations are carried out with the 40-bit register file.

Only src2[5:0] are read, so for example src2 = 32 causes a right-shift by 32 bits, since src2[5:0] = 0x20.

6.3.5.9.45 VSHFOR

Assembly syntax:	**VSHFOR** *src1*, *src2*, *src3*, *dst* (dst same as src3)
Operation:	Shift-or
Classification:	3-input 1-output
Bit width:	40-bit src1/src3, 6-bit src2
Delay slot:	one
C statement:	dst3 = (src2 >= 0) ? (src3 | (src1 << src2)) : (src3 | (src1 >> –src2));

See VSHF for the supported range of src2.

6.3.5.9.46 VSHF16

Assembly syntax:	**VSHF16** *src1*, *dst2*, *dst2*
Operation:	Shift-up 16 bits
Classification:	1-input 2-output
Bit width:	33-bit src1
Delay slot:	no
C statement:	dst1 = (src1 & 0xffff) << 16;dst2 = src1 >> 16;

Shift up src1 by 16 bits, producing two destinations to hold the outcome, dst1 having the lower unsigned 32-bit, and dst2 having the signed upper portion, sign extended from src1[32] to full 40 bits in dst2.

VSHF16 is useful for 32 × 32 multiplication.

6.3.5.9.47 VSIGN

Assembly syntax:	**VSIGN** *src1*, *src2*, *dst*
Operation:	Sign
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = (src1 == 0) ? 0 :((src1 > 0) ? src2 : –src2);

6.3.5.9.48 VSORT2

Assembly syntax:	**VSORT2** *src1*, *src2*, *dst*
Operation:	Sort two items
Classification:	2-input 2-output
Bit width:	33-bit
Delay slot:	no
C statement:	dst1 = min(src1, src2); dst2 = max(src1, src2);

6.3.5.9.49 VSUB

Assembly syntax:	**VSUB** *src1*, *src2*, *dst*
Operation:	Subtraction
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 – src2;

6.3.5.9.50 VSWAP

Assembly syntax:	**VSWAP** *cond*, {*src1*|*dst1*}, {*src2*|*dst2*}
Operation:	Conditional swap
Classification:	3-input 2-output
Bit width:	1-bit cond, 40-bit src1 & src2
Delay slot:	no
C statement:	if (cond & 1) swap(src1, src2)

Only the LSB of the vector register indicated by cond is checked. A swap/no-swap decision is made in each SIMD lane using the LSB of cond register in the lane.

6.3.5.9.51 VXOR

Assembly syntax:	**VXOR** *src1*, *src2*, *dst*
Operation:	Bitwise exclusive-or
Classification:	2-input 1-output
Bit width:	40-bit
Delay slot:	no
C statement:	dst = src1 ^ src2;

6.3.6 Debug Support

VCOP supports single stepping, one innermost (i4) iteration per step. Due to the deeply pipelined architecture, instruction-by-instruction single stepping support is not feasible.

Normally VCOP executes load in one stage of the pipeline, and operations and stores in the next stage of the pipeline. In single step mode, only one iteration is executed at a time, so there is no pipelining among iterations. The hardware executes all the loads, then operations and stores, then halts until instructed to continue on the next iteration. The signle step operation is controlled via the VCOP_CTRL register. The operation is enabled by setting VCOP_CTRL[0]STEP_EN to 1. Setting VCOP_CTRL[1]STEP_GO to 1 the engine starts executing i4 iteration.

As outlined in the previous section, step_en, step_go, step_rdy register fields are provided for single stepping control. In addition, VCOP internal state is exported as read-only view as memory-map registers as well.

Interaction of debug driver, scalar core, and VCOP is as follows:

1. Debug driver enables debug mode by setting VCOP_CTRL[0]STEP_EN = 1 and wait for VCOP_STATUS[0]STEP_RDY = 1.
2. Scalar core sends the vector command to be single-stepped the normal fashion.
3. Vector core executes the vector command and stalls at the end of the first i4 iteration and assert sVCOP_STATUS[0]STEP_RDY.
4. When VCOP_STATUS[0]STEP_RDY =1, debug driver accesses buffer switch and switch WBUF, IBUFL/H memories to system bus.
5. Debug driver read out the memory contents to refresh on the debugger user interface.
6. Debug driver read out VCOP internal state to refresh on the debugger user interface.
7. Debug driver accesses buffer switch and switch memories to VCOP.
8. Debug driver triggers VCOP to take the next step by writing ‘1’ to step_go, and wait for VCOP_STATUS[0]STEP_RDY = 1.
9. Repeat 3 through 8, until completion of the vector command or user input to stop single-stepping.
10. The debug driver disables the debug mode by setting VCOP_CTRL[0]STEP_EN = 0.
11. VCOP and scalar core continue to operate.

Video Input Port

This chapter describes the Video Input Port (VIP) module for the device.

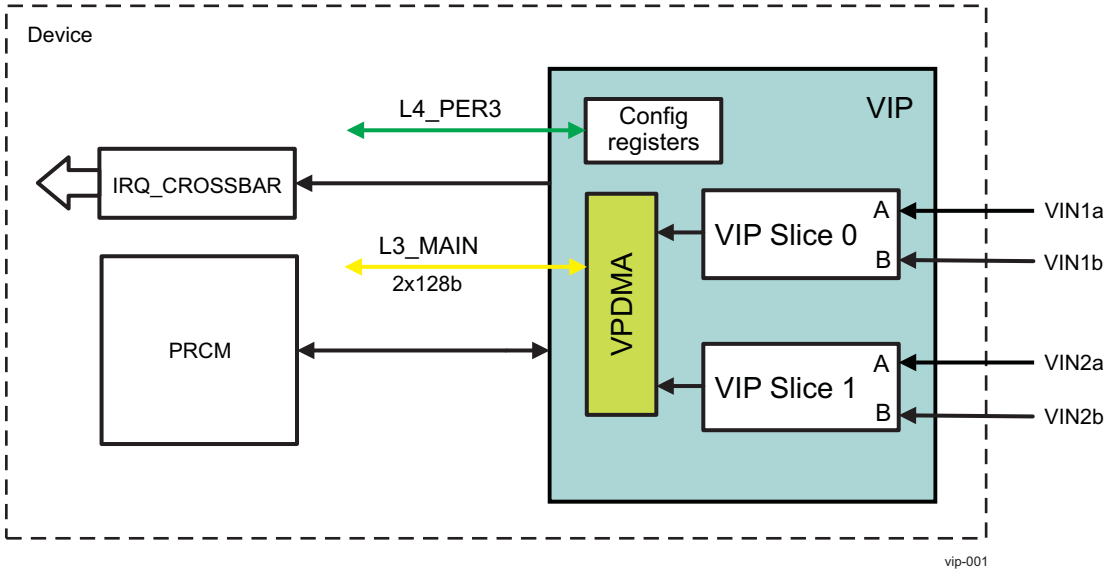
Topic **Page**

7.1 VIP Overview

The VIP module provides video capture functions for the device. VIP incorporates a multi-channel raw video parser, various video processing blocks, and a flexible Video Port Direct Memory Access (VPDMA) engine to store incoming video in various formats. The device integrates a single instantiation of the VIP module giving the ability of capturing up to four video streams.

Figure 7-1 shows a block diagram with the VIP module within the device.

Figure 7-1. VIP Overview



A VIP module includes the following main features:

- Two independently configurable external video input capture slices (Slice 0 and Slice 1) each providing up to two video input ports, Port A and Port B:
  - Port A can be configured as a 16/8-bit port.
  - Port B is a fixed 8-bit port.
  - At device level, the same device pads may be shared between Port A and Port B of each slice. For more information, see the multiplexing characteristics in device Data Manual.
- Each video Port A can be operated as a port with clock independent input channels (with interleaved or separated Y/C data input). Embedded sync and external sync modes are supported for all input configurations.
- Support for a single external asynchronous pixel clock, up to 165MHz per port.
- Pixel Clock Input Domain Port A supports up to one 16-bit input data bus, including BT.1120 style embedded sync for 16-bit data.
- Embedded Sync data interface mode supports single or multiplexed sources
- Discrete Sync data interface mode supports only single source input
- 16-bit data input plus discrete syncs can be configured to include:
  - 8-bit YUV422 (Y and U/V time interleaved)
  - 16-bit YUV422 (CbY and CrY time interleaved)
  - 16-bit RGB565
  - 16-bit RAW Capture
- Discrete sync modes include:
  - VSYNC + HSYNC (FID determined by FID signal pin or HSYNC/VSYNC skew)
  - VSYNC + ACTVID + FID
  - VBLANK + ACTVID (ACTVID toggles in VBLANK) + FID

  - VBLANK + ACTVID (no ACTVID toggles in VBLANK) + FID
- Multichannel parser (embedded syncs only):
  - Embedded syncs only
  - Pixel (2x or 4x) or Line multiplexed modes supported
  - Performs demultiplexing and basic error checking
  - Supports maximum of 9 channels in Line Mux (8 normal + 1 split line)
- Ancillary data capture support:
  - For 16-bit input, ancillary data may be extracted from any single channel
  - For 8-bit time interleaved input, ancillary data can be chosen from the Luma channel, the Chroma channel, or both channels
  - Horizontal blanking interval data capture only supported when using discrete syncs (VSYNC + HSYNC or VSYNC + HBLANK)
  - Ancillary data extraction supported on multichannel capture as well as single source streams
- Format conversion and scaling:
  - Programmable color space conversion
  - YUV422 to YUV444 conversion
  - YUV444 to YUV422 conversion
  - YUV422 to YUV420 conversion
  - YUV422 Source: YUV422 to YUV422, YUV422 to YUV420, YUV422 to YUV444, YUV422 to RGB888
  - Supports RAW to RAW (no processing)
  - Scaling and format conversions do not work for multiplexed input
- Supports up to 2047 pixels wide input - when scaling is engaged
- Supports up to 3840 pixels wide input - when only chroma up/down sampling is engaged, without scaling
- Supports up to 4095 pixels wide input - without scaling and chroma up/down sampling
- The maximum supported input resolution is further limited by pixel clock and feature-dependent constraints

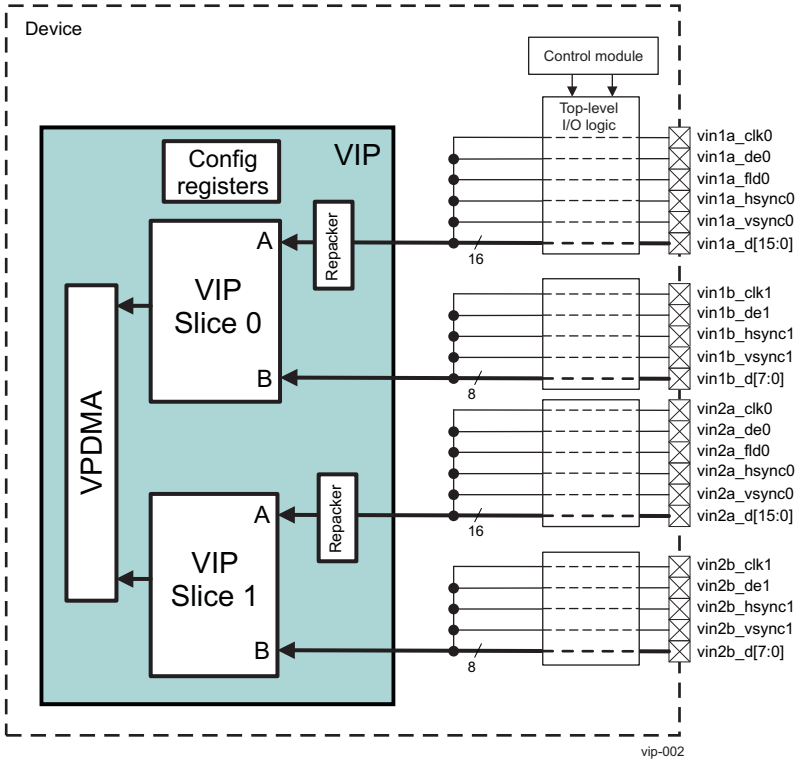
A VPDMA module includes the following main features:

- VPDMA output buffer size restriction feature, which ensures that writes do not exceed allocated memory buffer size
- Support for Tiled (2D) and raster addressing without bandwidth penalty
- Dual clients per channel allows for capture of scaled and nonscaled versions of the data stream (non-multiplexed mode only)
- Start on new frame capability
- Interrupt every X number of frames
- Interrupt every X lines (synced to frame start)
- Dynamic MFLAG generation

7.2 VIP Environment

This section describes the VIP module from an environment point of view (external connections). It describes the VIP connectivity options and lists all possible interfaces. Figure 7-2 is a block diagram of the VIP environment.

Figure 7-2. VIP Environment



NOTE: The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to different pads of the device and is programmable in the device Control Module registers and/or dedicated module registers. For more information, see Section 13.4.6.1, *Pad Configuration Registers* in Chapter 13, *Control Module*.

Table 7-1. VIP Interface Signals

Sub-module Name	Signal Name	Type[1]	Description
Slice 0	vin1a_d[15:0]	I	Pixel data.
Port A	vin1a_clk0	I	Pixel clock.
	vin1a_vsync0	I	Vertical synchronization.
	vin1a_hsync0	I	Horizontal synchronization.
	vin1a_de0	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin1a_fld0	I	The FID signal indicates the field identifier for the video input field: • 0 means even. • 1 means odd.
Slice 0	vin1b_d[7:0]	I	Pixel data.
Port B	vin1b_clk1	I	Pixel clock.
	vin1b_vsync1	I	Vertical synchronization.
	vin1b_hsync1	I	Horizontal synchronization.

(1) I = Input, O = Output, I/O = Input/Output

Table 7-1. VIP Interface Signals (continued)

Sub-module Name	Signal Name	Type[1]	Description
	vin1b_de1	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
Slice 1	vin2a_d[15:0]	I	Pixel data.
Port A	vin2a_clk0	I	Pixel clock.
	vin2a_vsync0	I	Vertical synchronization.
	vin2a_hsync0	I	Horizontal synchronization.
	vin2a_de0	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.
	vin2a_fld0	I	The FID signal indicates the field identifier for the video input field: • 0 means even. • 1 means odd.
Slice 1	vin2b_d[7:0]	I	Pixel data.
Port B	vin2b_clk1	I	Pixel clock.
	vin2b_vsync1	I	Vertical synchronization.
	vin2b_hsync1	I	Horizontal synchronization.
	vin2b_de1	I	The DE signal acts as an Input-enable signal to indicate when data must be latched using the input clock. DE is also referred to as ACTVID throughout the VIP chapter. Both of these terms, ACTVID and DE, are the same and used interchangeably.

NOTE: At device level, the same device pads may be shared between Port A and Port B of each slice. For more information, see the multiplexing characteristics in device Data Manual.

Table 7-2 summarizes the mapping of YUV color components to VIP input data signals, with corresponding settings of VIP_MAIN[1:0] DATA_INTERFACE_MODE register bit-field.

Table 7-2. VIP Input Data Signals to YUV Color Components Mapping

VIP Port A Data Signals	VIP Port B Data Signals	16-bit YUV422 Input Mode [1]	8-bit YUV422 Input Mode [2]
X = 1 to 2	X = 1 to 2	DATA_INTERFACE_MODE = 01b	DATA_INTERFACE_MODE = 10b
vinXa_d15	-	Y7 (MS bit)	-
vinXa_d14	-	Y6	-
vinXa_d13	-	Y5	-
vinXa_d12	-	Y4	-
vinXa_d11	-	Y3	-
vinXa_d10	-	Y2	-
vinXa_d9	-	Y1	-
vinXa_d8	-	Y0	-
vinXa_d7	vinXb_d7	Cb7/Cr7/...	Cb7/Y7/Cr7/... (MS bit)

(1) Chroma is time division multiplexed (interleaved). For more details, see Section 7.4.5.6.2, *16b Interface Mode*.
(2) Luma and Chroma are time division multiplexed (interleaved). For more details, see Section 7.4.5.6.1, *8b Interface Mode*.

Table 7-2. VIP Input Data Signals to YUV Color Components Mapping (continued)

VIP Port A Data Signals	VIP Port B Data Signals	16-bit YUV422 Input Mode (1)	8-bit YUV422 Input Mode (2)
vinXa_d6	vinXb_d6	Cb6/Cr6/...	Cb6/Y6/Cr6/...
vinXa_d5	vinXb_d5	Cb5/Cr5/...	Cb5/Y5/Cr5/...
vinXa_d4	vinXb_d4	Cb4/Cr4/...	Cb4/Y4/Cr4/...
vinXa_d3	vinXb_d3	Cb3/Cr3/...	Cb3/Y3/Cr3/...
vinXa_d2	vinXb_d2	Cb2/Cr2/...	Cb2/Y2/Cr2/...
vinXa_d1	vinXb_d1	Cb1/Cr1/...	Cb1/Y1/Cr1/...
vinXa_d0	vinXb_d0	Cb0/Cr0/... (LS bit)	Cb0/Y0/Cr0/... (LS bit)

NOTE: 16-bit RGB data can also be captured on the vinXa_d[15:0] input data bus of Port A. The 16-bit RGB data captured by the VIP_PARSER will be passed to VPDMA, as if it is a 16-bit YUV data. The VIP_MAIN[1:0] DATA_INTERFACE_MODE register bit-field must be configured for a 16-bit input mode. The VPDMA will then directly store this data in memory as a 16-bit data, provided that any 16-bit data type in the VPDMA outbound descriptor is set.

7.3 VIP Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests. Figure 7-3summarizes the integration of the module in the device.

Figure 7-3. VIP Integration

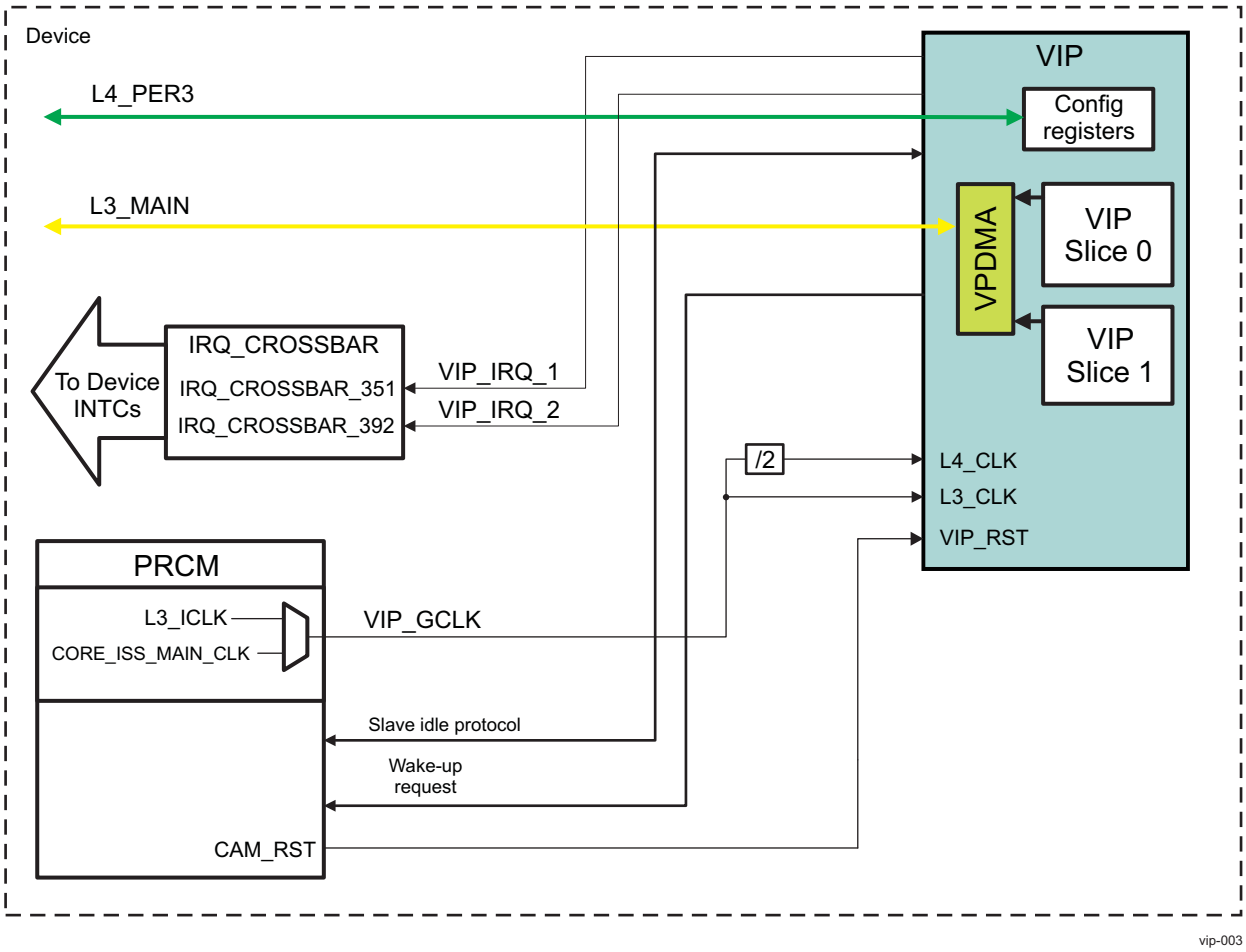


Table 7-3 and Table 7-4 list the integration attributes and clock and resets, respectively.

Table 7-3. VIP Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
VIP	PD_CAM	L4_PER3 for configuration L3_MAIN for data (through VPDMA module)

Table 7-4. VIP Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
VIP	L3_CLK PROC_CLK	VIP_GCLK	PRCM	L3_CLK is the clock used to drive and receive data over the bus to L3_MAIN. The VIP subsystem uses this clock to fetch external data and transfer this data to internal processing PROC_CLK is the clock used to drive data processing within the VIP subsystem.
	L4_CLK	VIP_GCLK/2	PRCM	L4_CLK is the interface clock for Memory Mapped Registers (MMR) configuration bus
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
VIP	VIP_RST	CAM_RST	PRCM	VIP1 Reset

Table 7-5. VIP Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
VIP	VIP_IRQ1	IRQ_CROSSBAR_351	N/A	VIP interrupt requests. These IRQ source signals are not mapped by default to any device INTC.
	VIP_IRQ2	IRQ_CROSSBAR_392	N/A	

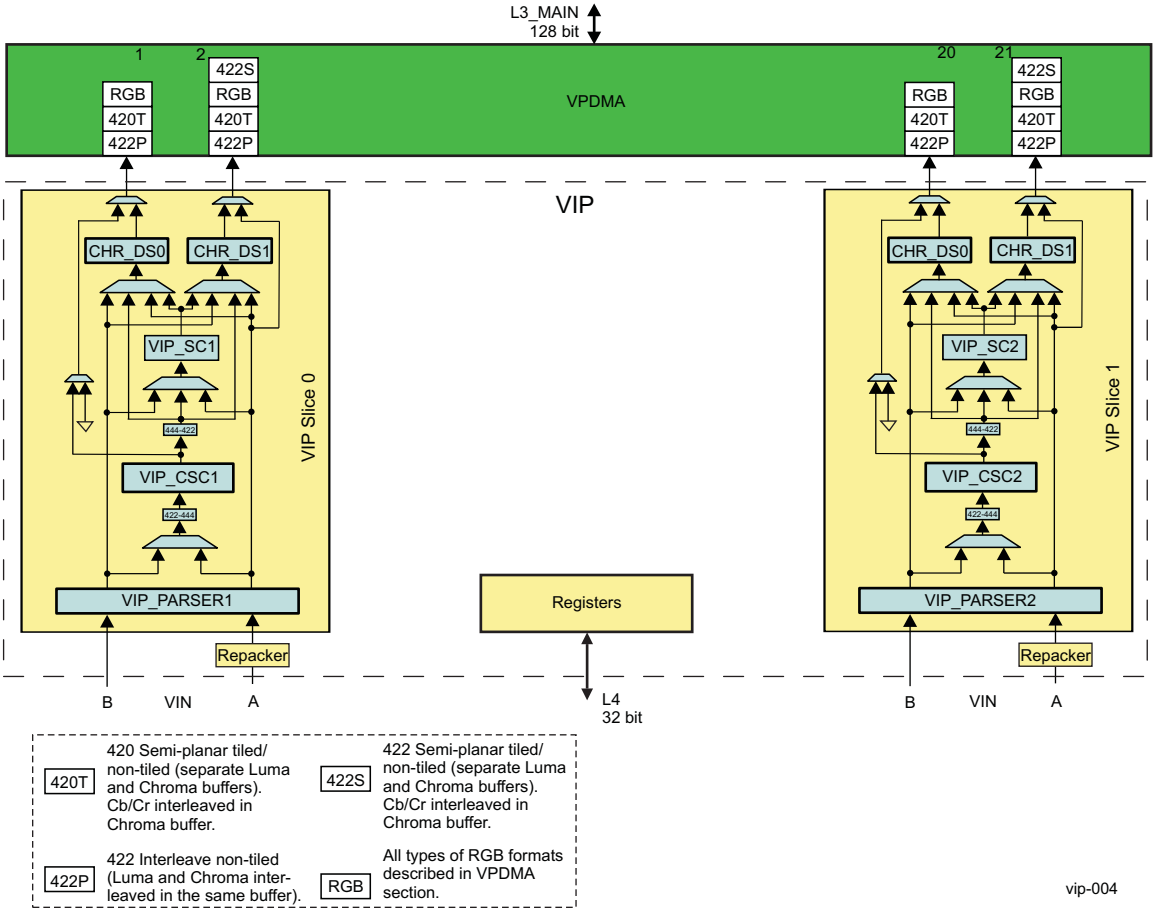
NOTE: The "**Default Mapping**" column in Table 7-5 *VIP Hardware Requests* shows the default mapping of module IRQ source signals. These module IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ_CROSSBAR module, respectively.
For more information about the IRQ_CROSSBAR module, see Section 13.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 13, *Control Module*.
For more information about the device interrupt controllers, see Chapter 12, *Interrupt Controllers*.

7.4 VIP Functional Description

7.4.1 VIP Block Diagram

Figure 7-4 shows the internal structure of a single VIP module in the device.

Figure 7-4. VIP Block Diagram



7.4.2 VIP Software Reset

Software reset in the VIP module can be done by setting the VIP_CLKC_RST[16] VIP1_DP_RST for Slice 0, VIP_CLKC_RST[17] VIP2_DP_RST for Slice 1, VIP_CLKC_RST[0] VPDMA_RST for VIP VPDMA to 0x1. By setting VIP_CLKC_RST[31] MAIN_RST reset is performed for all modules within the instance. Software must ensure that the software reset completes before performing operations within the VIP module.

7.4.3 VIP Power and Clocks Management

The VIP modules support the MStandby/Wait and IdleReq/SidleAck protocols as defined in Chapter 3, *Power, Reset, and Clock Management.*

Power Management within the VIP module can be accomplished in several ways:

- L4 MConnect/SConnect can disable the internal L4 clock network
- L3 MConnect/Sconnect can disable the internal L3 clock network

These items are accomplished using the standard slave idle (for L4) and master standby (for L3) protocols. When these modules are instructed to disable clocks for the internal L3 or L4 (MMR) clock domains, the internal clock networks will be shut down. This shut down applies to the clock signals - L3_CLK and L4_CLK.

7.4.3.1 VIP Clocks

The VIP internal clock domains can only be shut down by writing the appropriate register bit within the Clock Enable register - VIP_CLKC_CLKEN[16] VIP1_DP_EN for slice0, VIP_CLKC_CLKEN[17] VIP2_DP_EN for slice1 and VIP_CLKC_CLKEN[0] VPDMA_EN for the VPDMA engine

7.4.3.2 VIP Idle Mode

The VIP supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected byprogramming the appropriate value in the VIP_SYSCONFIG[3:2] IDLEMODE bit field.

Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state.

- Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements.
- No-idle mode: local target never enters idle state.
- Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA related requests) wakeup events

7.4.3.3 VIP StandBy Mode

The VIP supports no-standby mode and force-standby mode. The mode is set in the VIP_SYSCONFIG[5:4] STANDBYMODE bit field.

Configuration of the local initiator state management mode:

- Force-standby mode: local initiator is unconditionally placed in standby state.
- No-standby mode: local initiator is unconditionally placed out of standby state.

7.4.4 VIP Slice

7.4.4.1 VIP Slice Processing Path Overview

Figure 7-5 shows in details the internal processing path and output signals to VPDMA for a single VIP Slice. External video source drives the input side of the VIP Slice. Port A[x:y] can be in YUV422 format (A[15:0] in the diagram). Port B[x:y] can be in YUV422 format (B[15:0] in the diagram). Multiplexer selections and controls shown in Figure 7-5 are described in register VIP_CLKC_VIP0DPS for Slice 0, and register VIP_CLKC_VIP1DPS for Slice 1. The outputs of each VIP Slice drive the VPDMA module, which sends the resulting data to DDR memory.

NOTE: VIP_MAIN[1:0] DATA_INTERFACE_MODE bit-field must be properly configured for the expected data format on Port A.

By default, DATA_INTERFACE_MODE bit-field is set for 24-bit input data interface on Port A. It is SW responsibility to select 16-bit or 8-bit data interface, depending on the use case.

Port B input data interface is always 8-bit.

Figure 7-5. VIP Slice Processing Path Block Diagram

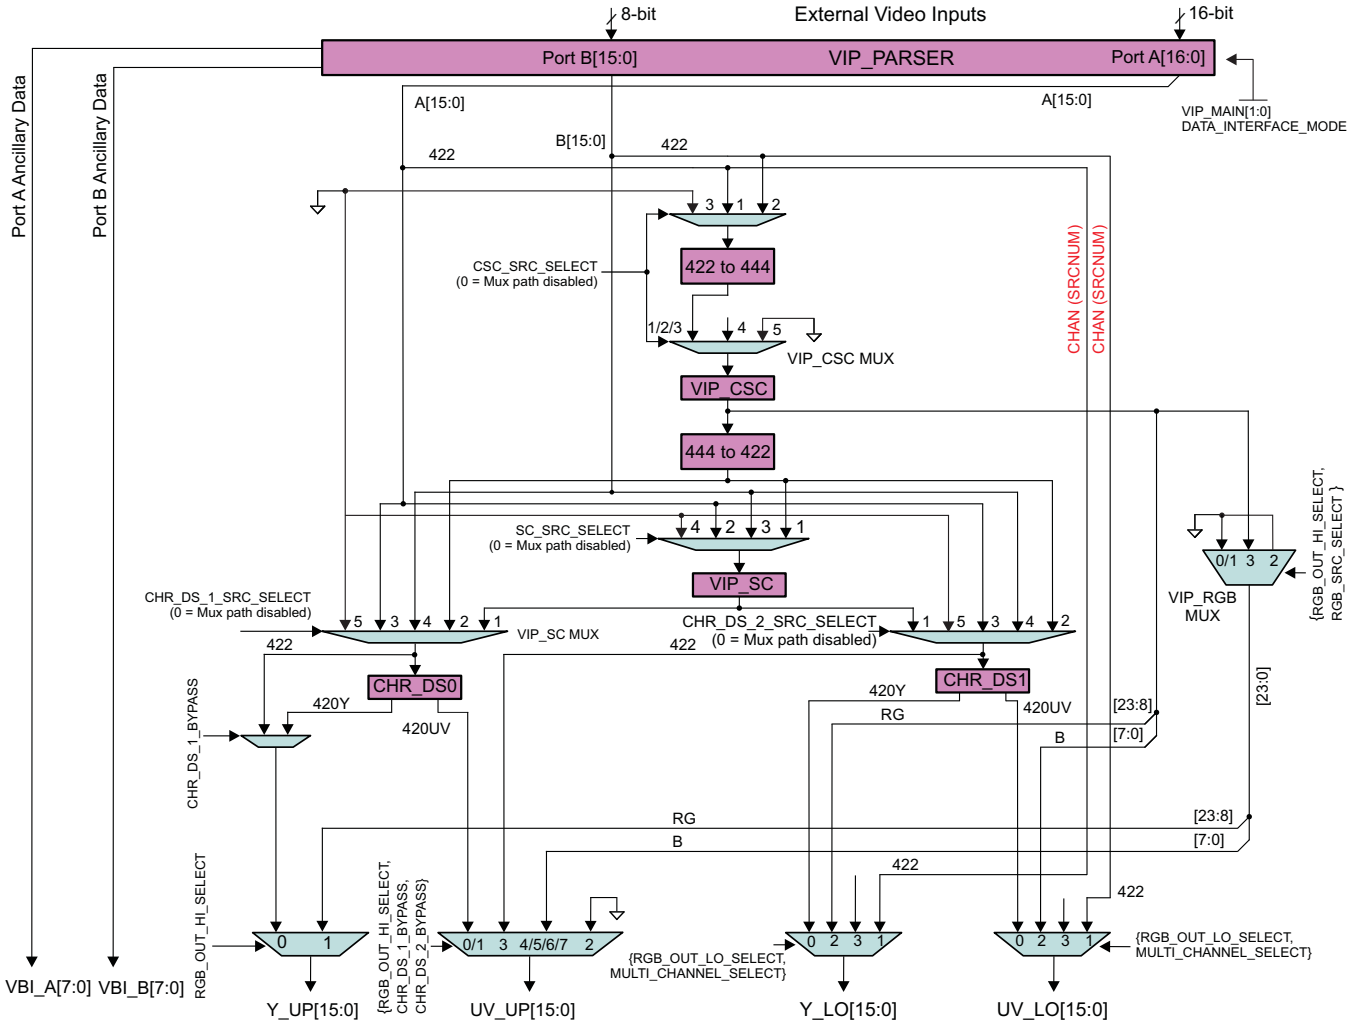


Table 7-6 provides summary of the registers controlling the multiplexers within VIP slice processing path.

7.4.4.2 VIP Slice Processing Path Multiplexers

7.4.4.2.1 VIP_CSC Multiplexers

The following registers are controling the VIP Color Space Converter (CSC) multiplexers: VIP_CLKC_VIP0DPS[2:0] VIP1_CSC_SRC_SELECT for Slice 0 and VIP_CLKC_VIP1DPS[2:0] VIP2_CSC_SRC_SELECT for Slice 1.

The VIP_CSC block (for each slice within the VIP subsystem) receives data from one the following sources:

- VIP_PARSER Port A Output (422)
- VIP_PARSER Port B Output (422)

The default state for this multiplexer is disabled, so there is no VIP_CSC input.

7.4.4.2.2 VIP_SC Multiplexer

The multiplexer for Slice 0 and Slice 1 is controleld by VIP_CLKC_VIP0DPS[5:3] VIP1_SC_SRC_SELECT and VIP_CLKC_VIP1DPS[5:3] VIP2_SC_SRC_SELECT, respectively.

The scaler module (VIP_SC) within the VIP subsystem (for a single slice) receives data from one of the following sources:

- VIP_CSC
- VIP_PARSER Port A Output
- VIP_PARSER Port B Output

The default state for this multiplexer is disabled, so there is no VIP_SC input.

7.4.4.2.3 Output to VPDMA Multiplexers

This section is under development and is included as a placeholder for future updates.

7.4.4.3 VIP Slice Processing Path Examples

The following sections provide VIP Slice data path examples for different types of input data, and describe the corresponding multiplexer configurations. Refer to Table 7-6, *VIP Slice Processing Path Control*, for mapping of the multiplexer controls to registers.

In the block diagrams of the following sections:

- Output A refers to the result of processing Input A data.
- Output B refers to the result of processing Input B data.

7.4.4.3.1 Input: B=YUV422; Output: B=RGB

7.4.5 VIP Parser

The VIP Parser (VIP_PARSER) module is used to capture the external video data into the VIP module.

7.4.5.1 Features

Each VIP module contains two VIP_PARSER modules (one VIP_PARSER per slice).

For a single VIP_PARSER, the video capture functions include:

- Two Pixel Clock Input Domains are supported (Port A and Port B):
  - Each Pixel Clock Input Domain has separate clock and framing signals.
  - Each Pixel Clock Input Domain can support embedded (BT.656/1120 style in 16-bit, or BT.656 in 8-bit) or discrete (BT.601 style) sync.
  - Pixel Clock Input Domain Port B supports one 8-bit input data bus. Port A supports one 16-bit input data bus. At device level, the same device pads may be shared between Port A and Port B. For more information, see the multiplexing characteristics in device Data Manual.
- Embedded Sync data interface mode supports single or multiplexed sources;
- Discrete Sync data interface mode supports only single source input;
- The two Pixel Clock Input Domains can be individually configured in any combination of Embedded or Discrete Sync;
- Vertical Ancillary Data capture is supported for each input source;
- A maximum of 8 + 1 (8 normal line sources + 1 split-line source) multiplexed sources are supported for a single Pixel Clock Input Domain using TI Line Mux Mode;
- Multiplexed data can only appear in embedded sync mode;
- Where possible, blanking pixels that may contain embedded vertical ancillary data will be stored in a dedicated buffer per each video source;
- Optional selection of channel (Luma or Chroma, or both) from which Vertical Ancillary data is extracted for YUV422 source;
- Ancillary Data can appear in the Horizontal Blanking as well as the Vertical Blanking. Typically, only Vertical Blanking Ancillary Data is captured. However, Horizontal Blanking Ancillary Data can be captured as well using HSYNC style discrete sync capture mode;
- Video up to WUXGA (1920 × 1200) can be supported using Port A in 16-bit mode.

7.4.5.2 Repacker

The Repacker module rearranges the input bit ordering of the 16-bit data bus on Port A of each VIP slice. This module allows external input data to be presented to the datapath such that various data packing formats can be achieved in memory. As shown in Figure 7-12, a Repacker exists for each 16-bit input port.

The Repacker module is a simple multiplexer that serves to move input bits to different locations on the its output bus to VIP Parser. Figure 7-12 shows the supported bytelane swapping modes corresponding to different VIP_XTRA_PORT_A[30:28] REPACK_SEL settings.

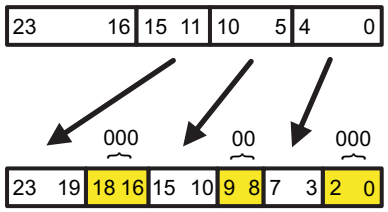
Figure 7-12. Bytelane Swapping Modes

REPACK_SEL = 0, Straight Through Mode

REPACK_SEL = 3, Center/Right Swap Mode

16-bit RAW data entering the VIP subsystem is packed as a contiguous input bus from bits 15 to 0. This 16-bit RAW input must be remapped to the RGB565 format, so that it can be saved to DDR memory properly, because the VPDMA does not support the RAW16 input format natively. Instead, the RAW 16 format is first remapped as RGB565 data and then given to the VPDMA. Figure 7-13 describes the VIP_XTRA_PORT_A[30:28] REPACK_SEL = 6 option to remap a contiguous [15:0] RAW input data bus to a RGB565 compliant output bus. This RAW16 data will use RGB565 data types in the VPDMA Data Descriptors.

Figure 7-13. RAW16 to RGB565 Mapping



REPACK_SEL = 6, RAW16 Mapping Mode

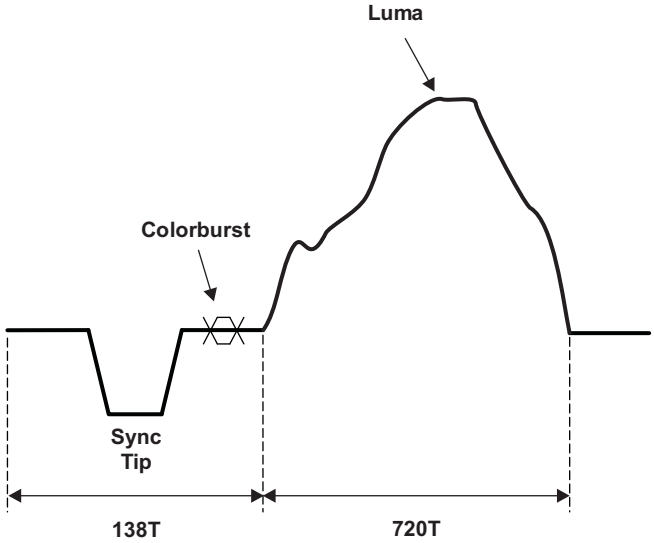
NOTE: There is no repacker for the 8-bit input port (Port B of each VIP slice).

The RAW16 mapping mode does not work for embedded sync streams.

7.4.5.3 Analog Video

A digital interface stream is based on analog video. The waveform for a line of NTSC analog video is shown in Figure 7-14.

Figure 7-14. NTSC Analog Video Waveform for One Horizontal Line



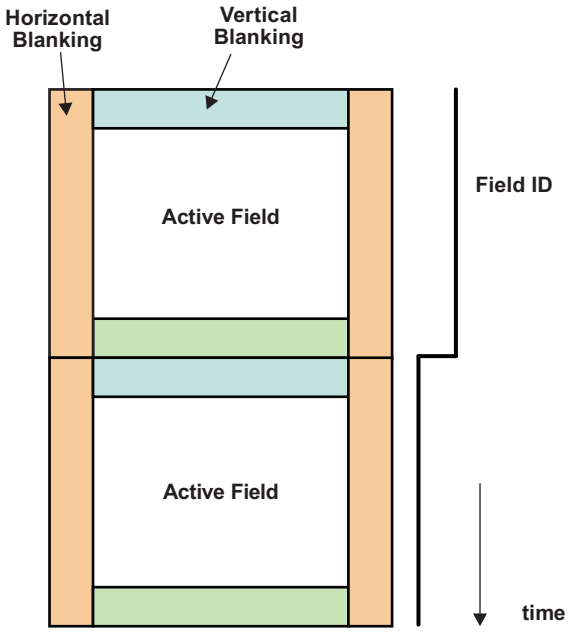
T is a time constant. For NTSC, T=1/13.5 MHz = 74ns.

7.4.5.4 Digitized Video

Digitized video is based on scan lines in found in analog video. BT.601 uses various sync signals to specify when a new field and a new line starts. BT.656 and BT.1120 uses sync words embedded in the data stream to specify start of field and start of line.

An image can be digitized into regions shown in Figure 7-15.

Figure 7-15. Digitized Video



With the capability to encode sync words inside the data stream, there is more flexibility for adding non-video related data, called Ancillary Data. Also, code words embedded in the digital stream can be used as a type of identifier for multiplexing several sources of video into one data stream.

Figure 7-16 shows End-of-Active-Video (EAV) and Start-of-Active-Video (SAV) code words added to a video transmission. The period between the EAV and SAV is equivalent to Horizontal Blanking. The period between the SAV to the next EAV is active video or vertical blanking.

In the BT.656 or BT.1120 embedded code word scheme, three bits of the EAV/SAV code word are important: F (field), H (horizontal blanking), and V (vertical blanking).

Figure 7-16. Code Word Embedded Video Format

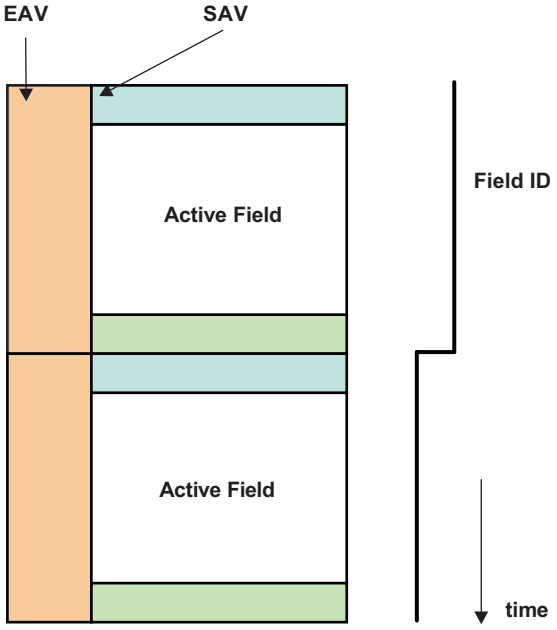


Figure 7-17 shows the values of F, V, and H flags at different locations in the picture. The Field flag represents the state of the Field ID for the picture. For progressive frames, F is always '0.' The V flag specifies vertical blanking areas. The H flag specifies horizontal blanking portions of the picture.

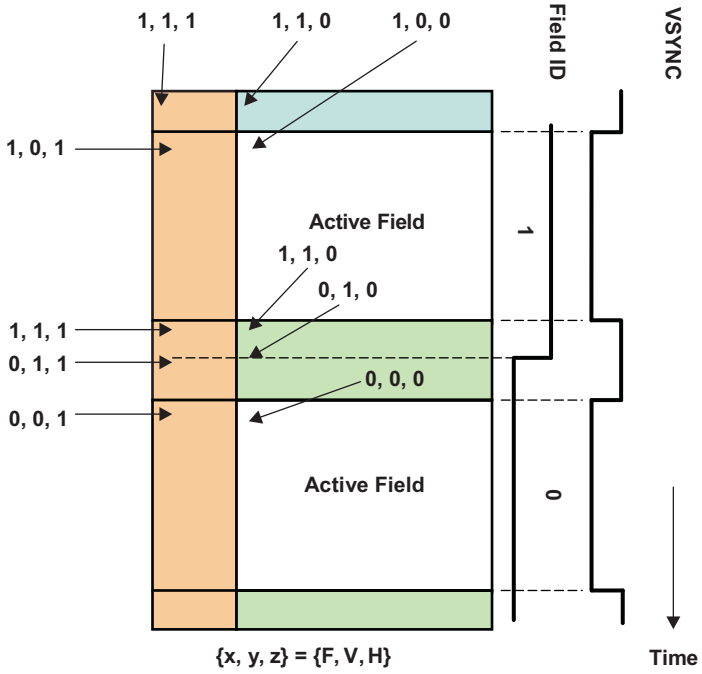
Figure 7-17. Digitized Video with F, V, and H Flags in EAV/SAV



7.4.5.5 Frame Buffers

The VIP/VPDMA support Frame Buffers in DDR memory for Active Video and Ancillary Data.

4:2:2 data is always saved in packed pixel buffers.

4:2:0 data is saved in Planar Luma buffers and Planar CbCr pair buffers.

A Luma Frame Buffer is a Planar storage area. Each line is the width in pixels (1Byte/pixel) of the output picture size format. The frame buffer contains the number of active video lines in the output picture size format.

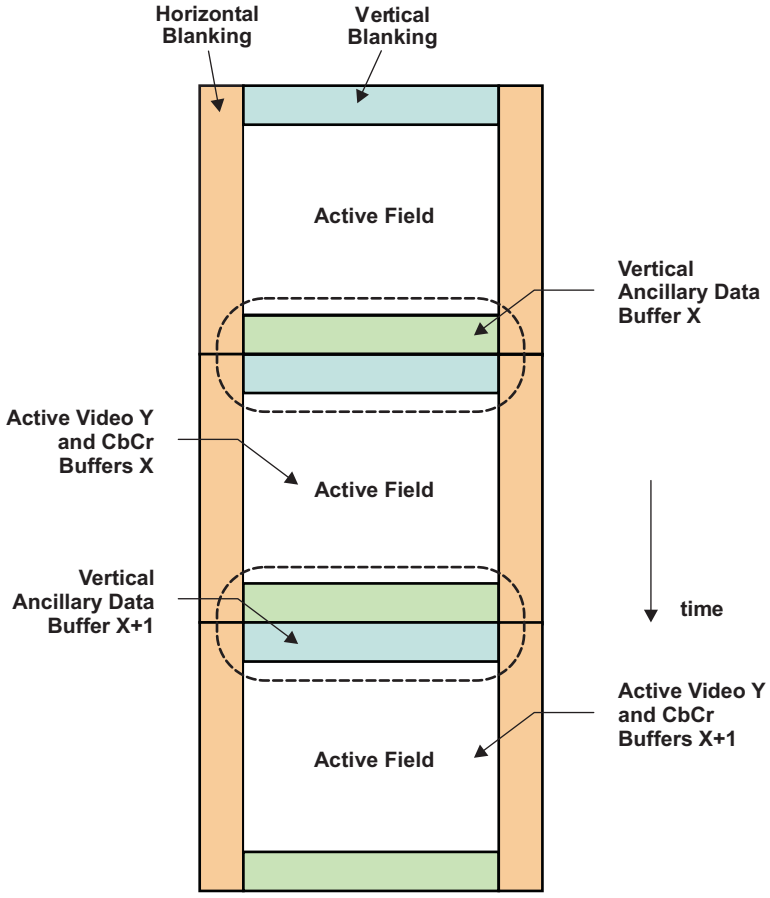
A Chroma Pair Frame Buffer is Planar storage of CbCr pixel pairs, with each pixel being a byte. For 4:2:0 storage, N lines in the output picture active video results in N/2 lines of CbCr pairs being stored.

The Ancillary Data buffer is different than the Active Video Frame Buffers. The Ancillary Data buffer only stores Vertical Blanking Ancillary Data. The number of lines in the Ancillary Data buffer is the same as the number of Vertical Blanking lines. Typically, only one channel is extracted from the Vertical Blanking data, so the width of the Ancillary Data buffer is the same as the width of the Luma Buffer.

In 8-bit input mode, it is possible for both Luma and Chroma sites to be extracted for Vertical Ancillary data. Each color component is strobed on separate input clock cycles. In this case, the line width of the Ancillary data is twice the Luma line width of the picture. Both Luma and Chroma sites cannot be extracted for 16-bit input mode because both Luma and Chroma are sent on the same input clock cycle and the Ancillary port to the VPDMA VPI is only 8 bits wide.

Figure 7-18 shows how the planar data regions are stored in DDR memory. The vertical blanking data is stored in a set of Planar Buffers. Note that the bottom of the Vertical Ancillary Data from the previous field or frame is stored in the same buffer as the top of the Vertical Ancillary Data from the current field or frame.

Figure 7-18. Planar Buffer Storage Description



The Luma representing Active Video is stored in a set of Planar Buffers. The CbCr Chroma Pairs are stored in a set of Planar Buffers.

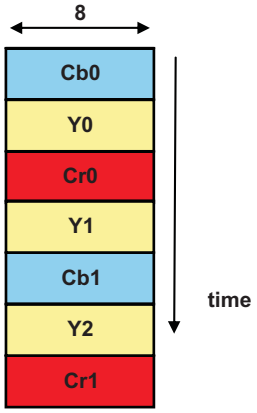
7.4.5.6 Input Data Interface

This section describes how the data (luma and chroma data for YUV422 format capture) is muxed for the various interface modes.

7.4.5.6.1 8b Interface Mode

In 8-bit data interface mode, the input pixels are multiplexed according to Figure 7-19. The Chroma Format is 4:2:2. Sites with Cb/Cr pixels are known as Chroma sites. Those sites with Y pixels are known as Luma sites. The 8-bit data interface mode is selected by setting VIP_MAIN[1:0] DATA_INTERFACE_MODE bit-field to 0x2.

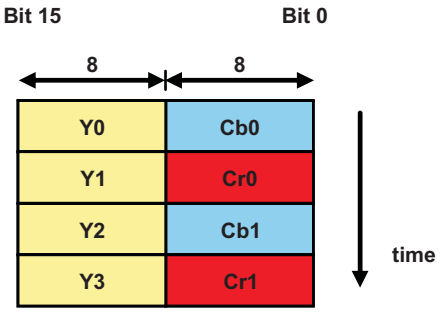
Figure 7-19. 8-bit Interface Discrete Sync Pixel Multiplexing



7.4.5.6.2 16b Interface Mode

In 16-bit interface mode, Luma is on 8 MSB bits of the data bus and Cb/Cr chroma pixels alternate on the other 8 bits of the data bus as shown in Figure 7-20. The 16-bit data interface mode is selected by setting VIP_MAIN[1:0] DATA_INTERFACE_MODE bit-field to 0x1.

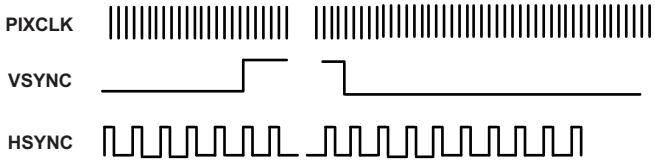
Figure 7-20. 16-bit Interface Discrete Sync Pixel Multiplexing



7.4.5.6.3 Signal Relationships

A digital representation of video can be realized by using HSYNC and VSYNC signals to identify frame start and line start. Suppose HSYNC and VSYNC are active high, Figure 7-21 shows the general relationship of these signals.

Figure 7-21. Discrete Sync Signals



Every PIXCLK cycle carries either an active pixel or a blanking pixel. VSYNC pulses between two fields (or frames, in the case of progressive video). HSYNC pulses to signify the beginning of every line. An ACTVID signal can be used as a data valid to specify active video.

Discrete Sync cannot be used with any multi-camera multiplexed stream inputs. In the device, if Port A is configured for 24-bit discrete sync, then Port B must be disabled since there are no more data input pins left over for Port B.

If Port A is not 24 bits, then the 8-bit Port B can be configured and enabled for either discrete or embedded sync.

7.4.5.6.4 General 5 Pin Interfaces

Discrete Sync signal handling varies among different sending devices. The information that must be conveyed includes the pixel data value, field ID, horizontal blanking, and vertical blanking. Many devices can be configured to adjust the timing of the signals relative to each other.

In this section, DATA will be depicted as 8 bits. However, discrete sync does optionally support 16-bit data input. Type 1 is named after a generic five pin interface between the sending and receiving devices.

In Figure 7-22, P0 represents the first pixel in the horizontal blanking interval following the last vertical blanking line of the previous field or frame. HSYNC specifies the horizontal blanking region and VSYNC specifies that the P0 pixel is in the vertical sync area. HSYNC can be a strobe that is active one or more cycles and can deassert before the actual end of horizontal blanking or HSYNC may be active for the full duration of horizontal blanking.

Likewise, VSYNC can be a strobe that is active one or more cycles and can deassert before the actual end of vertical blanking or VSYNC may be active for the full duration of vertical blanking.

FID can change at this pixel or it may change later. For interlaced source, though, the FID will be inverted for this pixel at the same time point in the next field. So, it does not really matter when FID is captured. Many sending devices allow the location of FID changes to be programmable.

In this diagram and all others in this document, the active polarities of the interface signals can be either high or low. For the sake of uniformity in this document, all polarities are drawn active high. Also, different vendors have different datasheet names for the interface signals.

Figure 7-22. Type 1, First Horizontal Blanking Pixel

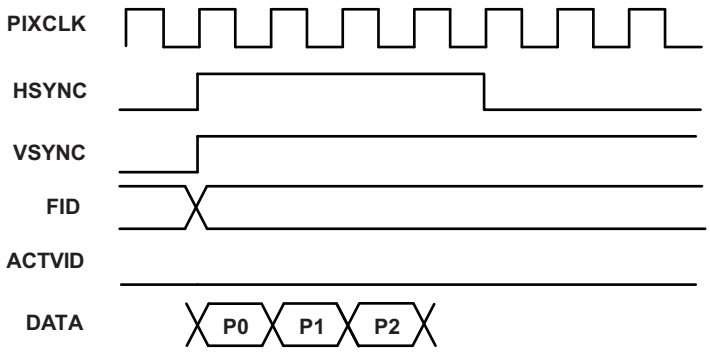


Figure 7-23 shows the P0 pixel being the first Chroma Channel data value in the Vertical Ancillary Data region. HSYNC is definitely de-asserted by now since P0 is no longer in horizontal blanking. ACTVID may or may not be active for Vertical Ancillary Data. Some devices consider these pixels to be Active (as in non-horizontal blanking). Other devices consider only video to be ACTIVE Video.

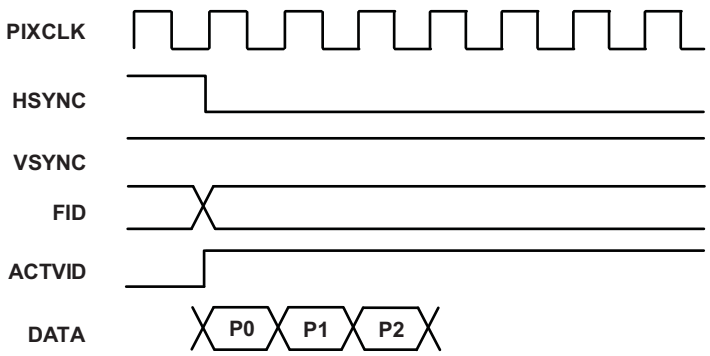
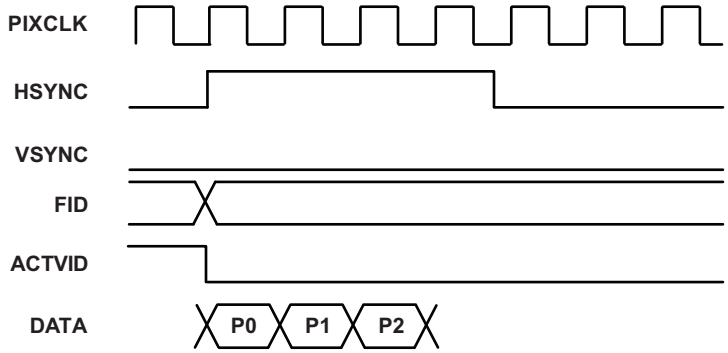
Figure 7-23. Type 1, First Vertical Ancillary Data Pixel



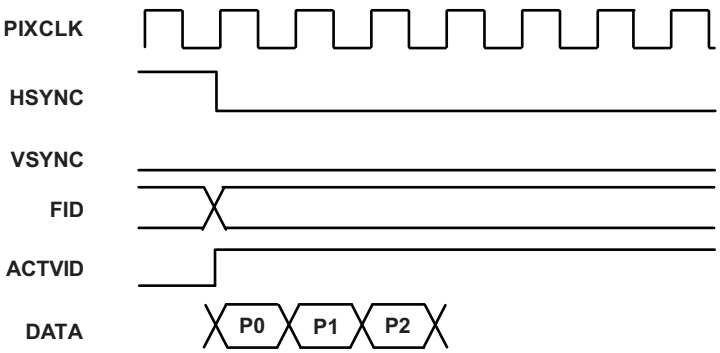
Following the vertical blanking region, the video portion of the field or frame starts. Figure 7-24 shows the horizontal blanking area in this video portion of the field or frame. P0 is the first pixel in the horizontal blanking. HSYNC is active for one or more pixel clocks. VSYNC is inactive in this video area. FID can change here. ACTVID is low since P0 is horizontal blanking.

Figure 7-24. Type 1, Horizontal Blanking in Video Region



In Figure 7-25, P0 represents the first Chroma pixel in the Active video line. HSYNC is inactive, since P0 is in the active video region. Likewise, VSYNC is inactive. FID may or may not change here. ACTVID is high to signal capturing of video pixels.

Figure 7-25. Type 1, First Video Pixel



7.4.5.6.5 Signal Subsets—4 Pin VSYNC, ACTVID, and FID

A sending device may use only a subset of the signals described in Section 7.4.5.6.3. The sending device just needs to convey important signals required to capture the field or frame. It can be shown that various selections of four pins can be used to satisfy all Type 1 conditions.

Three pins, VSYNC, ACTVID, and FID, plus a pixel clock can be used to support discrete sync. VSYNC would bump the capture buffer. An inactive to active level of ACTVID specifies a line of data to capture. FID determines the field ID polarity. The scenario in which the sending device wants the receiving end to capture Vertical Ancillary Data using 4-pin signaling is shown in Figure 7-26.

Figure 7-26. 4-Pin Reduced ACTVID Signaling with Vertical Ancillary Data

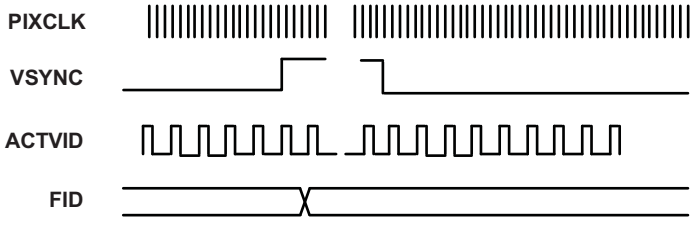


Figure 7-27 describes the case using the 4-pin interface in which the sending device does not send Vertical Ancillary Data.

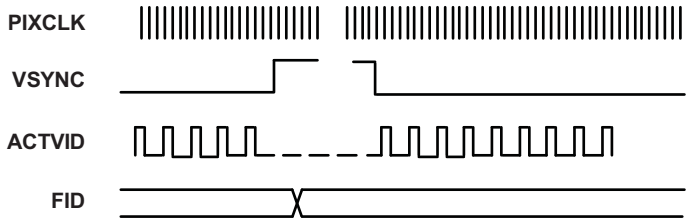
Figure 7-27. 4-Pin Reduced ACTVID Signaling with No Vertical Ancillary Data

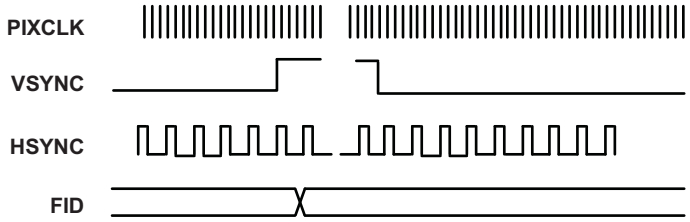


7.4.5.6.6 Signal Subsets—4 Pin VSYNC, HSYNC, and FID

In this style of Discrete Sync, as shown in Figure 7-28, four pins are used including the Pixel Clock. HSYNC signals the beginning of the line. All data in the line is captured, including Horizontal Blanking Data. In fact, this signaling mode is the only one which allows Horizontal Blanking Data to be captured.

Of course, by capturing the horizontal blanking pixels in the frame buffers, there is no way to be certain exactly where the blanking ends and the active video starts. One would have to rely solely on video format specs to find the active video inside the frame buffer.

Figure 7-28. 4-Pin Reduced HSYNC Signaling with Vertical Ancillary Data



7.4.5.6.7 Vertical Sync

Vertical Sync is used to indicate lines that are in the vertical blanking interval. The VSYNC also separates fields or frames. To be spec compliant, VSYNC should be active for a few lines at the bottom of the picture. The exact number of vertical blanking lines at the bottom depends on the specification for the picture format (480i, 480p, 720p, 1080i, 1080p).

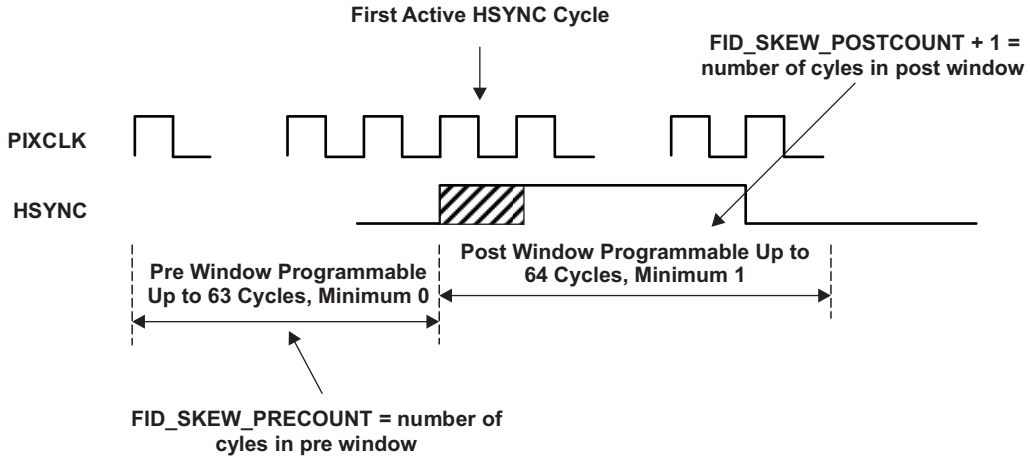
Likewise, the number of vertical blanking lines at the top of the picture depends on the video format specification corresponding to the incoming picture.

In the VIP_PARSER, lines associated with an Active VSYNC are stored in the vertical ancillary data buffers using the ANC VPI port to the VPDMA. Lines without an Active VSYNC are stored in the active video Luma and Chroma-pair buffers using the Y and UV VPI ports, respectively, to the VPDMA.

When using HSYNC signaling instead of ACTVID, the VSYNC signal may be derived from an analog source such as an NTSC/PAL decoder. In this case, VSYNC may not transition on the exact cycle as HSYNC. Thus, the VIP_PARSER supports a window region around HSYNC in which VSYNC transitions will be detected. A VSYNC transition occurring within the window is identified the same way as if VSYNC transitioned on the same cycle as HSYNC going active.

The window is defined by a pre-window, which is determined by the VIP_PORT_A[21:16] FID_SKEW_PRECOUNT and VIP_PORT_B[21:16] FID_SKEW_PRECOUNT registers. There is also a post-window that is defined by VIP_PORT_A[29:24] FID_SKEW_POSTCOUNT and VIP_PORT_B[29:24] FID_SKEW_POSTCOUNT for port B. Note that although the configuration registers are named FID_SKEW, they are also used for defining the VSYNC transition window. The window region definition is shown in Figure 7-29.

Figure 7-29. VSYNC Pre and Post Window



The results of VSYNC behavior in the transition window are shown in Figure 7-30. A low to high transition in the window is equivalent to VSYNC going low to high on the active HSYNC cycle.

Likewise, a high to low transition in the window is equivalent to VSYNC going high to low on the active HSYNC cycle.

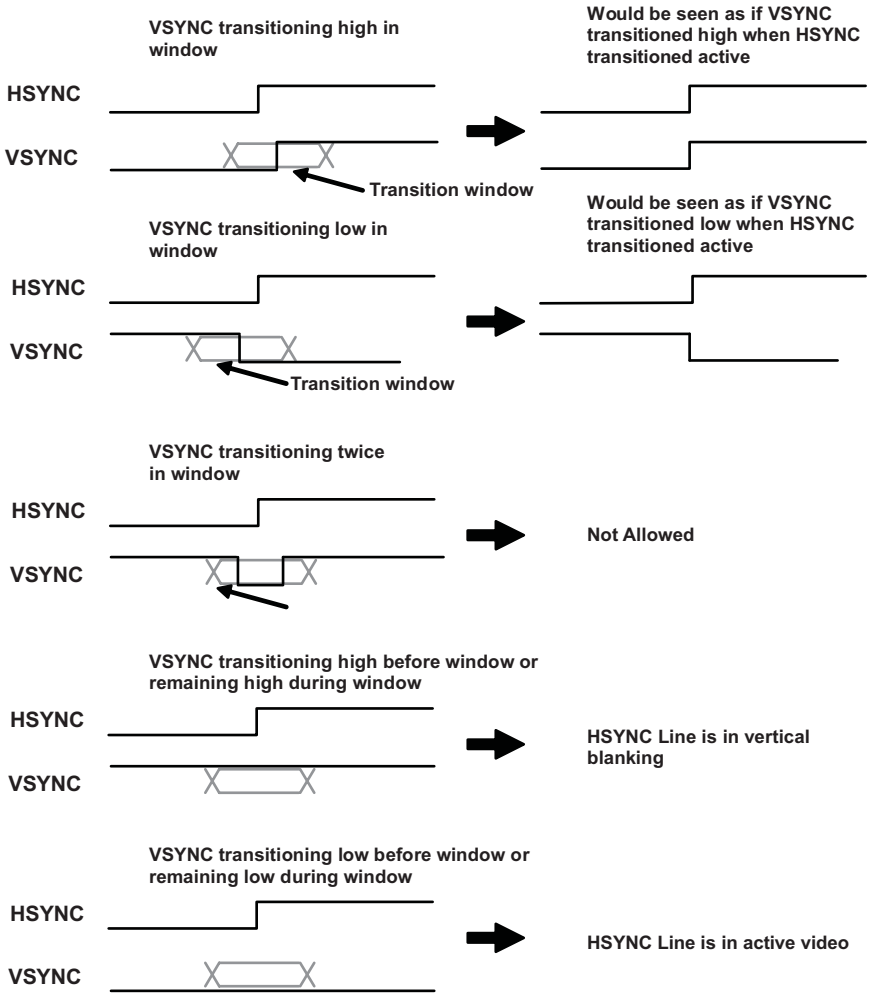
Two transitions of VSYNC within the VSYNC window is not allow and is undefined behavior.

If VSYNC is high throughout the transition window, then the HSYNC line is in vertical blanking.

If VSYNC is low throughout the transition window, then the HSYNC line is in active video.

Note that VSYNC skew generally only applies to input signals that have been sampled from an analog source, as in a NTSC/PAL decoder. If the VSYNC is a VBLANK-type signal or if the sending device is another all-digital IC, then the VSYNC signal does not have a skew since VSYNC will be aligned to HSYNC. In this case, setting FID_SKEW_PRECOUNT = ‘0’ and FID_SKEW_POSTCOUNT = ‘0’ (within PORT_A and PORT_B registers) defines a minimum size window which will capture the value of VSYNC on the same cycle that HSYNC goes active.

Figure 7-30. VSYNC Equivalence When Using Transition Window



7.4.5.6.8 Field ID Determination Using Dedicated Signal

For Progressive Source, FIELD ID is always '0.'

For Interlaced Source, FIELD ID needs to be extracted consistently.

In some cases, vertical sync is active on the first pixel of a line in the vertical blanking period and it stays active until the last line in the vertical blanking period.

However, the pixel where the FIELD ID signal transitions can be quite variable and depends on the external chip driving the VIP_PARSER. Many parts that generate digitized raw video have a programmable feature to specify when FIELD ID changes. FIELD ID is valid at the same point for every field. That is, if FIELD ID is read at one particular place in a field, the polarity of the signal will be reversed at the same location in the next field. So, FIELD ID can be corrected with a programmable polarity configuration bit FID_POLARITY (within VIP_PORT_A and VIP_PORT_B registers) that is XOR'ed with the captured value.

For discrete sync mode, FIELD ID will be registered on the first active pixel capture cycle of each line in both styles of HSYNC and ACTVID usage as specified in Figure 7-31 and Figure 7-32.

Figure 7-31. FID Registering When Using HSYNC

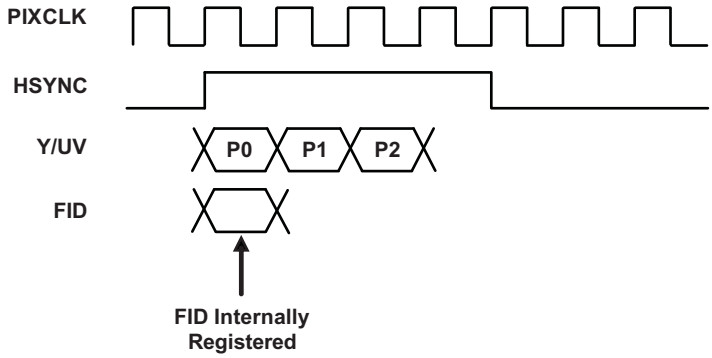


Figure 7-32. FID Registering When Using ACTVID

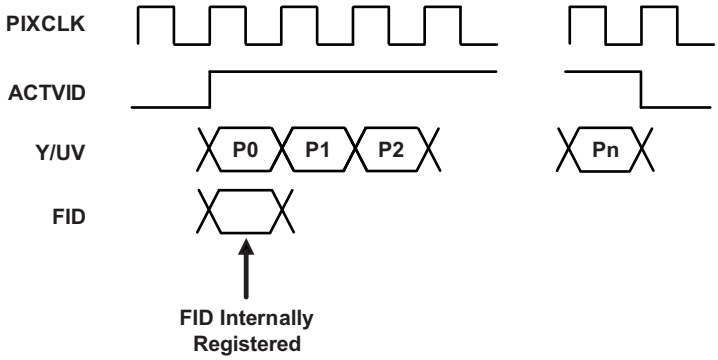
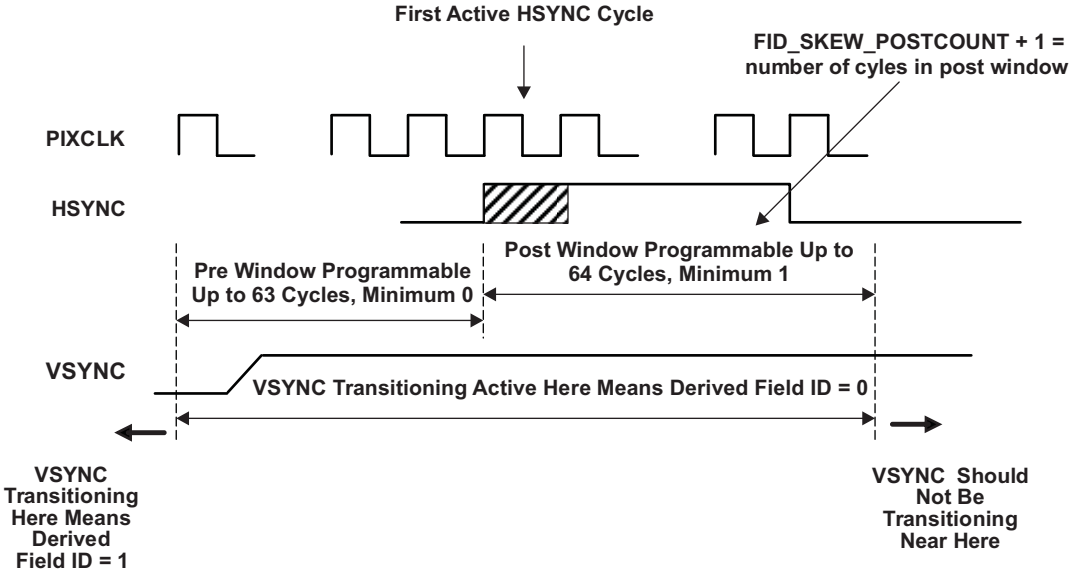


7.4.5.6.9 Field ID Determination Using VSYNC Skew

In order to save a device pin, there is a case where a skew may be inserted into VSYNC (with respect to HSYNC) when HSYNC is used as a start of line indicator as described in Figure 7-28. In this case, no FIELD ID signal is sent by the source chip. A description of Field ID determination by VSYNC skew is shown in Figure 7-33.

The active polarity of VSYNC falling within n pixel clock cycles of the first active cycle of HSYNC indicates the field id. If VSYNC is active before this time window, then the FIELD_ID = ‘1’ for the next picture. If VSYNC becomes active within this window, then FIELD_ID = ‘0’ for the next picture.

Figure 7-33. Field ID Determination By VSYNC Skew



When using FID determination by VSYNC skew, the value for VSYNC is also determined by transitions in the window as shown in Figure 7-30.

The VIP_PARSER supports a configuration FID_POLARITY bit within VIP_PORT_A and VIP_PORT_B registers. For FID determination by VSYNC Skew, the fid determination functions are described in Table 7-7.

Table 7-7. Polarity Table for FID Determination By VSYNC Skew

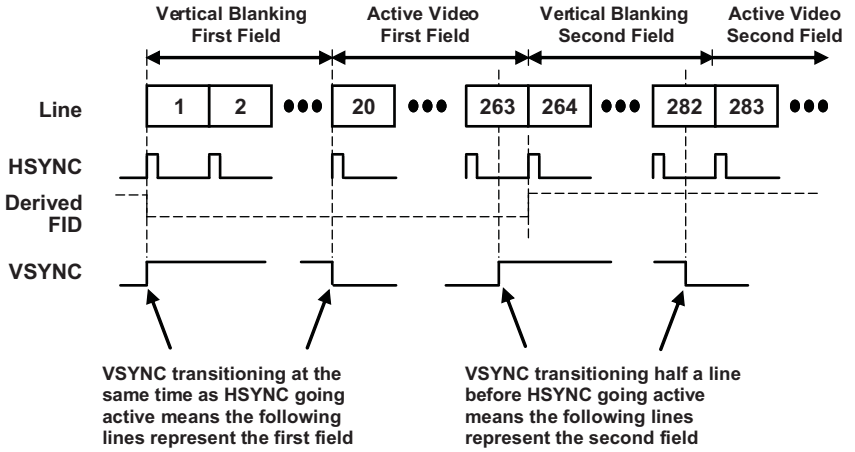
FID_POLARITY	Transition in Pre/Post Range	FID Determination
0	No	1
0	Yes	0
1	No	0
1	Yes	1

7.4.5.6.10 Rationale for FID Determination By VSYNC Skew

FID determination by VSYNC skew is a method for field ID determination derived from the analog NTSC and PAL interlaced specifications. Under this method, the sending device will not be providing a FID signal. NTSC has 525 total lines split between two fields. PAL has 625 total lines split between two fields. Each of these interlaced standards support an odd number of lines.

Let's consider just the 525 active line NTSC signal. For the sake of consistency, let's call Line 1 the first line of the 2-field pair and Line 525 the last line of the 2-field pair.

Figure 7-34. Example of 525-line FID Determination By VSYNC Skew



A waveform is shown in Figure 7-34. VSYNC is defined to go active at the same time as HSYNC for the first line of the first field in a two-field picture pair. For this first field, VSYNC will go inactive after Line 20.

For the second field, VSYNC will go active in the middle of Line 263 to signal that Line 264 is the start of a vertical blanking interval. When HSYNC for Line 264 arrives, coinciding with the vertical blanking interval for the beginning of the second field, VSYNC has already been active for half of Line 263. For the second field, VSYNC will go inactive midway through Line 282 to indicate that Line 283 is active video. When HSYNC for Line 283 appears, VSYNC has already been inactive for half a line.

By seeing whether VSYNC transitions at the beginning of a line or whether it transitions at the midway point of a line, one can determine whether the upcoming group of lines represents the first field or the second field. The derived FID is shown in dashed lines.

The analog NTSC specification defines the field ID changing part way into the vertical blanking. That is, the first few lines of vertical blanking belong to the previous field and the next several lines of vertical blanking belong to the upcoming field. The VIP_PARSER saves one channel of the entire vertical blanking interval between two active video fields into a single buffer. The hardware does not discriminate between whether the vertical blanking lines belong to the bottom of the previous field or those belonging to the start of the next field. This usage model is consistent with vertical ancillary data capture for embedded sync mode of operation.

Obviously, FID Determination by VSYNC skew cannot be used when framing does not use the VSYNC signal but rather relies on the ACTVID signal instead.

7.4.5.6.11 ACTVID Framing

Instead of an HSYNC signal, the VIP_PARSER can use ACTVID framing as described in Figure 7-27. Under ACTVID Framing, VSYNC is used to separate vertical blanking lines from active video lines.

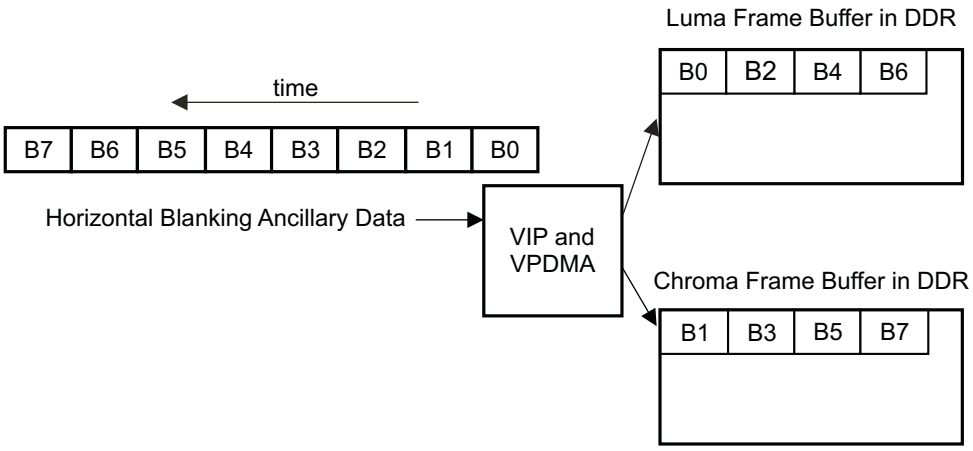
FID determination by VSYNC Skew is not allowed for ACTVID framing because there is no HSYNC input signal in this mode. Also, the VSYNC transition window is not employed. VSYNC is captured at the first pixel of each ACTVID grouping of pixels. Lines are separated by ACTVID transitioning inactive.

7.4.5.6.12 Ancillary Data Storage in Descrete Sync Mode

Ancillary data appearing in horizontal blanking is called Horizontal Blanking Ancillary Data. Ancillary Data in vertical blanking is called Vertical Blanking Ancillary Data.

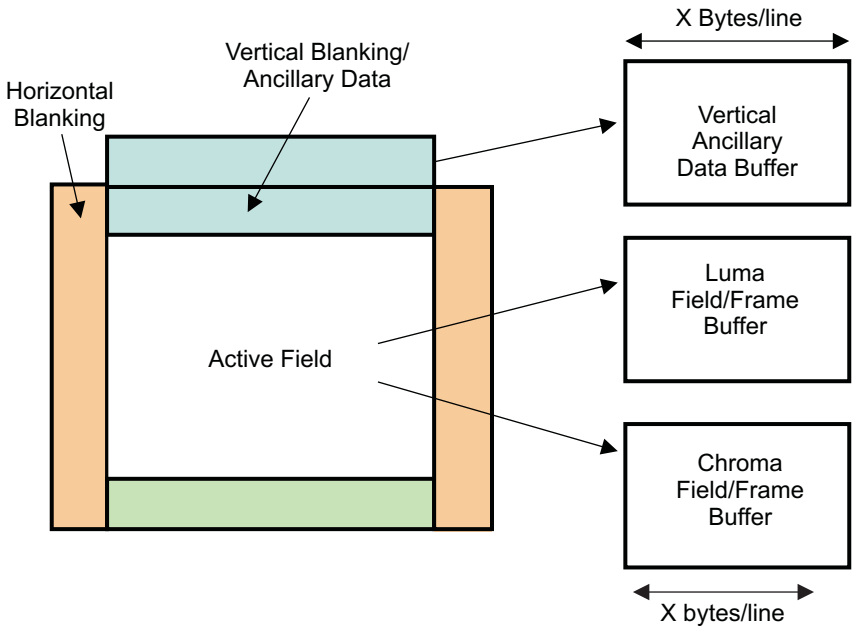
Horizontal Blanking Ancillary Data is not commonly used. For the ACTVID data valid mode described in Figure 7-26, there is no way to capture Horizontal Blanking Ancillary Data. Using the HSYNC mode in Figure 7-28, all blanking pixels are captured. However, the horizontal ancillary data is byte-by-byte distributed between the Luma and Chroma frame buffers. Chroma sited bytes are saved in the Chroma frame buffer and Luma sited bytes are saved in the Luma frtame buffer. Some CPU effort would be needed in order to extract ancillary data from the desired Luma or Chroma channel frame buffers. Also, the video on each line starts after the horizontal blanking period. This situation is shown in Figure 7-35.

Figure 7-35. Horizontal Ancillary Data Packing When HSYNC Used as Sync Signal



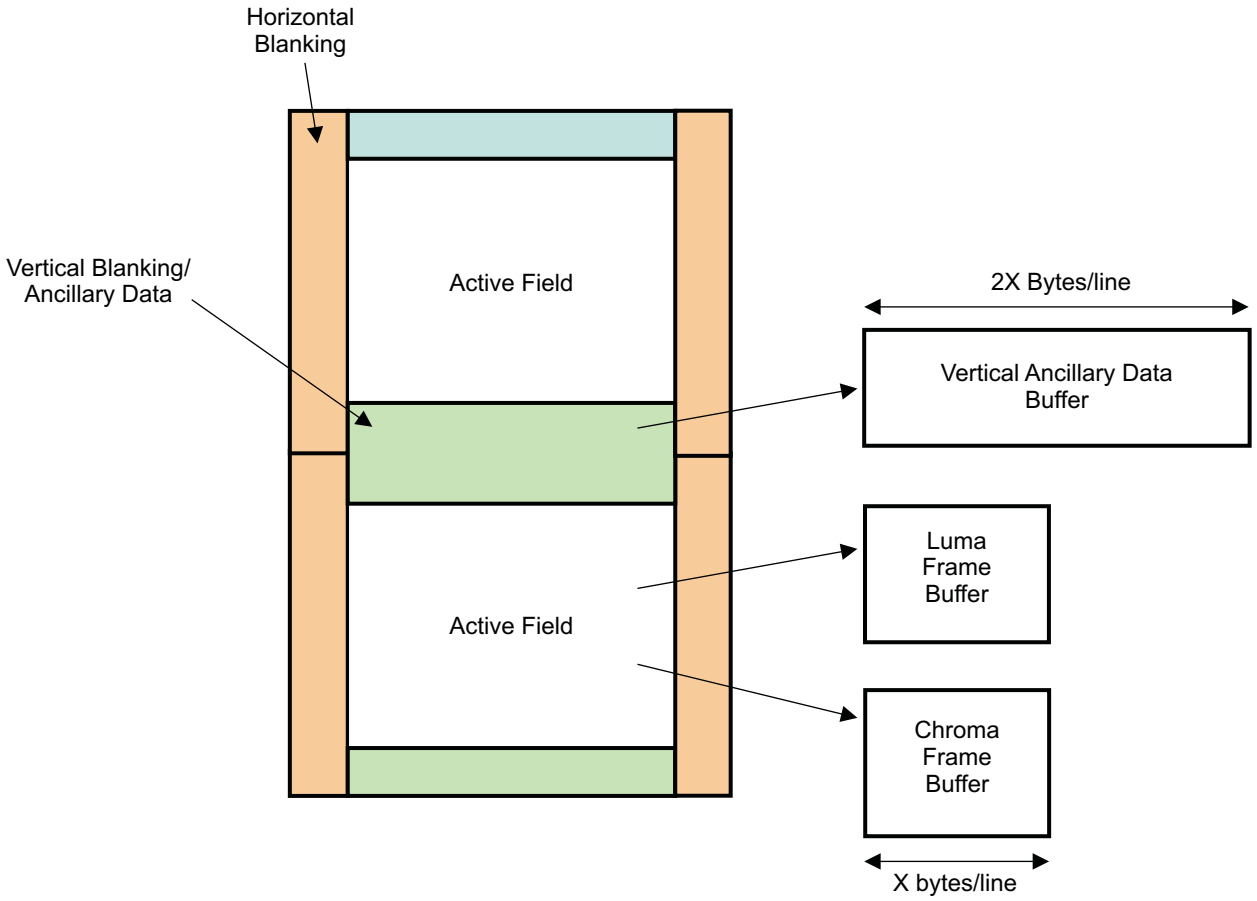
With Interlaced source material, Vertical Blanking Ancillary data will be stored in a separate Vertical Ancillary Data Buffer as shown in Figure 7-36. The Channel from which vertical ancillary data is extracted is a configuration option. For an input image of x active pixels per line, each line of Vertical Blanking Ancillary Data will have x bytes. Unlike the horizontal case, the CPU parsing this Ancillary Data will see a contiguous section of Vertical Ancillary Data that is not intermixed with Video data.

Figure 7-36. Interlaced Field Vertical Blanking Ancillary Data Storage



For Progressive source video, the FIELD ID does not change. So, the Vertical Ancillary Data Buffer will contain all the information beginning from the vertical blanking of the previous frame. This situation is shown in Figure 7-37.

Figure 7-37. Progressive Frame Vertical Blanking Ancillary Data Storage

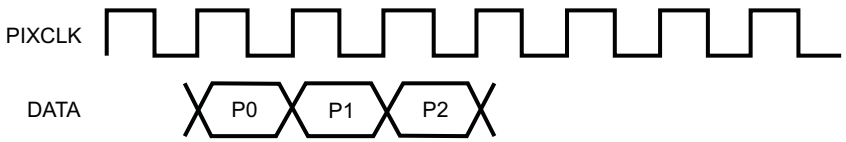


7.4.5.7 BT.656 Style Embedded Sync

7.4.5.7.1 Data Input

Like Discrete Sync Input, Embedded Sync mode takes data from the input bus. Input data can be 8, 16 bits wide. A sample is retrieved each and every Pixel Clock cycle. There is no valid signal gating data entry. Figure 7-38 shows a valid data sample each Pixel Clock period.

Figure 7-38. Embedded Sync Data Entry



7.4.5.7.2 Sync Words

In embedded sync mode, code words are inserted into the stream at pixel clock rates. For external devices that send out 10 bits (single pixel interface) or 20 bits (parallel Y-Cb/Cr interface) of data, only the 8 (single pixel interface) or 16 (parallel 8bY-8bCb/Cr interface) most significant bits of each pixel are used.

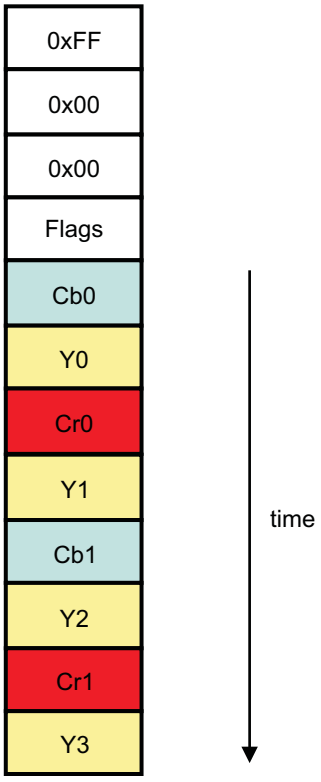
The key code words are Start of Active Video (SAV) and End of Active Video (EAV). Three flags are found in these code words: F (field), V (vertical sync), and H (horizontal sync). These flags signify the position in the frame corresponding to the data immediately following the codeword. The flags determine whether the code is EAV or SAV and where they lie in the picture. The first byte of the code word is 0xFF. The second and third bytes are 0x00. The bit ordering of the fourth byte is detailed in Table 7-8.

Table 7-8. Fourth Byte of EAV/SAV Code Word

7 (fixed)	6 (F)	5 (V)	4 (H)	3 (P3=V^H)	2 (P2=F^H)	1 (P1=F^V)	0 (P0=F^V^H)	Description
1	0	0	0	0	0	0	0	SAV, Field 0, Active Video
1	0	0	1	1	1	0	1	EAV. Field 0, Horizontal Blanking
1	0	1	0	1	0	1	1	SAV, Field 0, Vertical Blanking
1	0	1	1	0	1	1	0	EAV, Field 0, Horizontal Blanking in Vertical Blanking Region
1	1	0	0	0	1	1	1	SAV, Field 1, Active Video
1	1	0	1	1	0	1	0	EAV, Field 1, Horizontal Blanking
1	1	1	0	1	1	0	0	SAV, Field 1, Vertical Blanking
1	1	1	1	0	0	0	1	EAV, Field 1, Horizontal Blanking in Vertical Blanking Region

An example of the input ordering of the embedded code word, followed by active video, is shown in Figure 7-39. The input data mode is 8 bits for the example.

Figure 7-39. Code Word Format Example Followed by Video Data



7.4.5.7.3 Error Correction

The FVH flags are sent with four protection bits to support double error detection, single error correction. A non-correctable detected error is simply ignored. An option exists for the protection bits to correct a single bit error in the FVH flags. The correction table is shown in Table 7-9. n/c means that the error condition is detected, but it is non-correctable.

Table 7-9. Error Correction Matrix

	F, V, and H Flags							
P3, P2, P1, P0	**000**	**001**	**010**	**011**	**100**	**101**	**110**	**111**
0000	000	000	000	n/c	000	n/c	n/c	111
0001	000	n/c	n/c	111	n/c	111	111	111
0010	000	n/c	n/c	011	n/c	101	n/c	n/c
0011	n/c	n/c	010	n/c	100	n/c	n/c	111
0100	000	n/c	n/c	011	n/c	n/c	110	n/c
0101	n/c	001	n/c	n/c	100	n/c	n/c	111
0110	n/c	011	011	011	100	n/c	n/c	011
0111	100	n/c	n/c	011	100	100	100	n/c
1000	000	n/c	n/c	n/c	n/c	101	110	n/c
1001	n/c	001	010	n/c	n/c	n/c	n/c	111
1010	n/c	101	010	n/c	101	101	n/c	101
1011	010	n/c	010	010	n/c	101	010	n/c
1100	n/c	001	110	n/c	110	n/c	110	110
1101	001	001	n/c	001	n/c	001	110	n/c
1110	n/c	n/c	n/c	011	n/c	101	110	n/c
1111	n/c	001	010	n/c	100	n/c	n/c	n/c

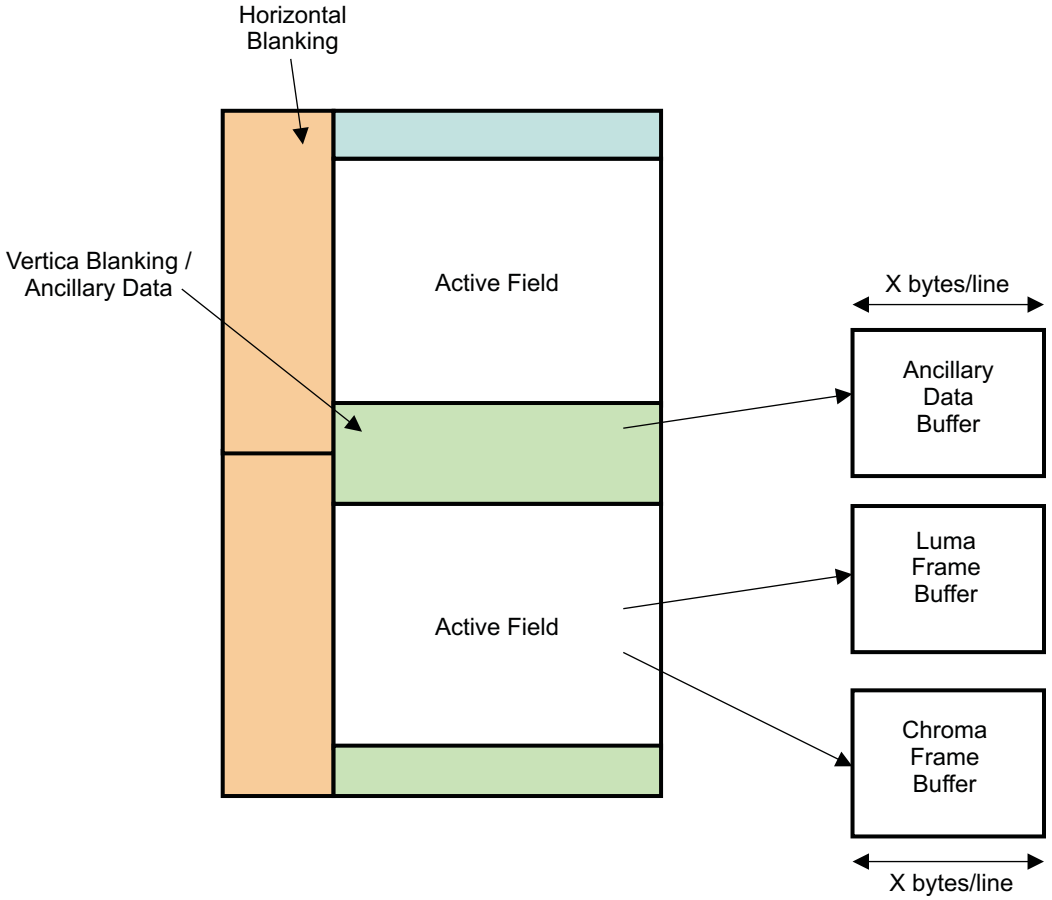
7.4.5.7.4 Embedded Sync Ancillary Data

With Embedded Sync streams, only Vertical Ancillary Data can be extracted. The Vertical Ancillary Data buffer is the same width as the corresponding Luma and Chroma buffers. The channel from which Vertical Ancillary Data is extracted is a configuration option.

Horizontal Ancillary data cannot be extracted using embedded sync mode.

The Vertical Ancillary Data is captured starting from the end of the previous active video. See Figure 7-40 for a more detailed description of embedded sync packing.

Figure 7-40. Embedded Sync Packing



7.4.5.8 Source Multiplexing

7.4.5.8.1 Multiplexing Scenarios

Some applications require multiple camera sources to be used at the same time. For this type of device, one solution would be to support N-number of 8-bit or 16-bit data interfaces for each of N cameras. However, this solution does not efficiently minimize pin count. One set of 8-bit or 16-bit interfaces has the bandwidth to support more than one video source, depending on the resolution of the video. Table 7-10 is explanatory only and shows the number of sources that can be multiplexed in one VIP for 8-bit and 16-bit interface modes. Note that it does not reflect the capabilities of the VIP_PARSER. In addition, the interface pixel clock rates are shown. The VPDMA limits 16 camera sources to be saved to DDR memory per Pixel Clock Input Domain.

Table 7-10. Multiplexing Configurations and Pixel Clock Rates

	Maximum Channels in Single 16-bit Data Interface Mode	Maximum Channels in Dual 8-bit Data Interface Mode - Interleaved Channels per Single 8-bit Port. One 16-bit VIP can be configured to support two such 8-bit ports.	Interface Clock Rate (MHz)
HD Interlaced	2	1	148.5
D1 Interlaced	8	4	108.1
CIF Interlaced	n/a	n/a	n/a
HD Progressive	1	n/a	148.5

Table 7-10. Multiplexing Configurations and Pixel Clock Rates (continued)

D1 Progressive	4	2	108.1
CIF Progressive (1)	32	16	162.2

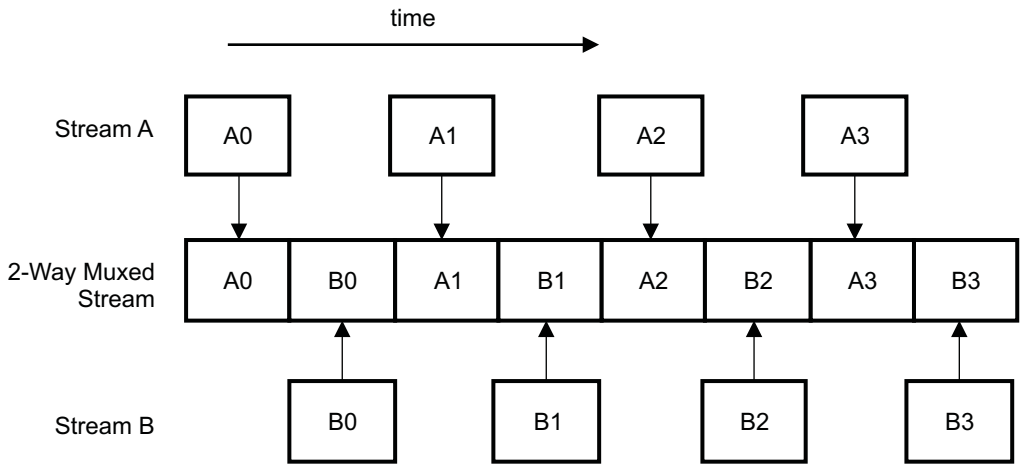
(1) Blanking pixels are not used in the CIF clock rate calculations. Addition of blanking pixels would require a slightly higher clock rate.

NOTE: These Channel Density values reflect one VIP subsystem.

7.4.5.8.2 2-Way Multiplexing

For 2-Way Multiplexing, two embedded sync streams are interleaved a pixel at a time as shown in Figure 7-41.

Figure 7-41. 2-Way Multiplexing



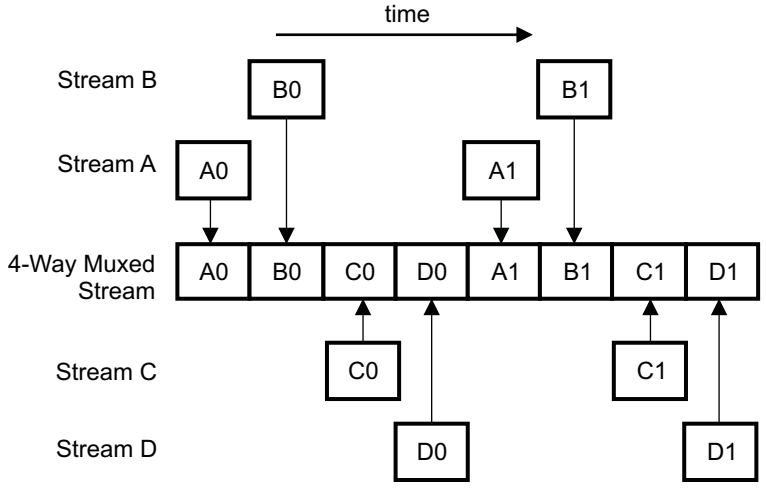
The sync codeword, FF-00-00-XY, is replicated in both source streams. In 2-Way Multiplexing, the sizes of both camera sources must be the same. Likewise, the Vertical Ancillary Data size for both sources must be identical. However, the two streams are not necessarily sending the same pixel site in adjacent clock cycles.

7.4.5.8.3 4-Way Multiplexing

For 4-Way Multiplexing, four embedded sync streams are multiplexed into one as seen in Figure 7-42.

Again, the sync codeword is in all four sources. Like 2-Way Multiplexing, the sizes of the four camera sources are the same and the sizes of the Vertical Ancillary Data regions are the same. The four streams are not necessarily sending the same pixel site in adjacent clock cycles.

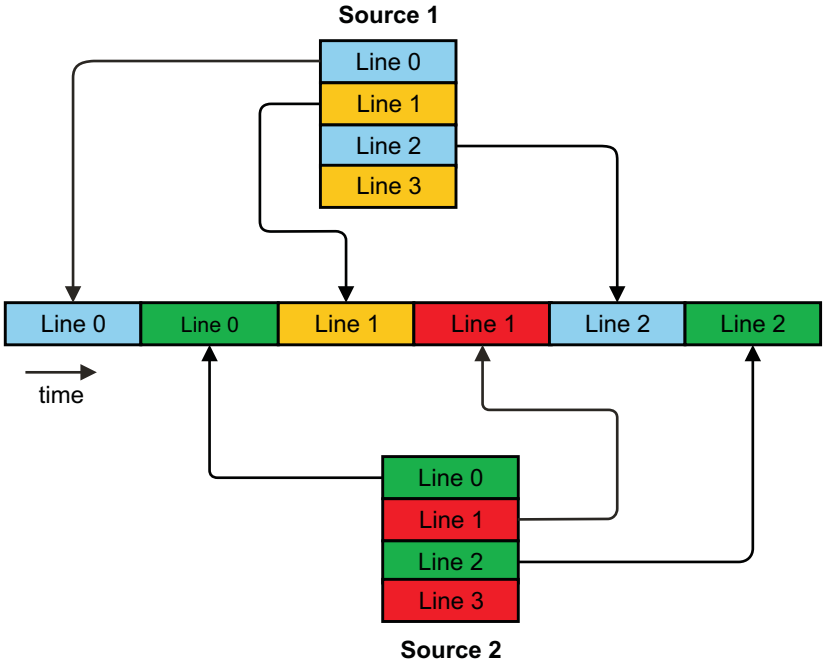
Figure 7-42. Example of 4-Way Multiplexing



7.4.5.8.4 Line Multiplexing

In Line Multiplexing, n-different sources are sent into the VIP a complete line at a time using a modified version of embedded sync. An example of Line Multiplexing for two sources is shown in Figure 7-43.

Figure 7-43. Example of Line Multiplexing



The width and height of each source in Line Multiplexed data can be different. For instance, one source can be PAL while another one can be NTSC. A line is comprised of YUV422 pixels in repeating patterns of CbYCrY.

7.4.5.8.5 Super Frame Concept in Line Multiplexing

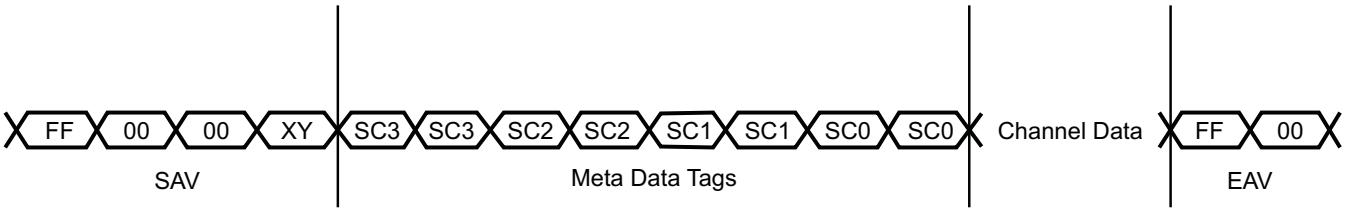
Different camera sources are interleaved on a line-by-line basis. The beginning of each line carries a Metadata tag that provides key information about that line. This Metadata tag is preceded by a SAV codeword in which F=0, V=0, and H=0.

At the end of the line, an EAV code is inserted with an appropriate number of padding pixels following it. This EAV code has F=0, V=0, and H=1. The startcodes used for the Metadata wrapped lines and the dummy lines form the Super Frame. The VIP_PARSER module has logic to parse out the super frame, analyze the Metadata tags, and frame buffer the line contents appropriately.

7.4.5.8.6 8-bit Data Interface in Line Multiplexing

Figure 7-44 is an example of an 8-bit line multiplexing interface. Channel Data is the CbYCrY sequence representing a line. Preceding Channel Data is the four byte Meta Data tags. Note that the Meta Data bytes are replicated in both the Luma and the Chroma sites. The entire structure is bounded by a traditional SAV/EAV code in which the V flag is 0.

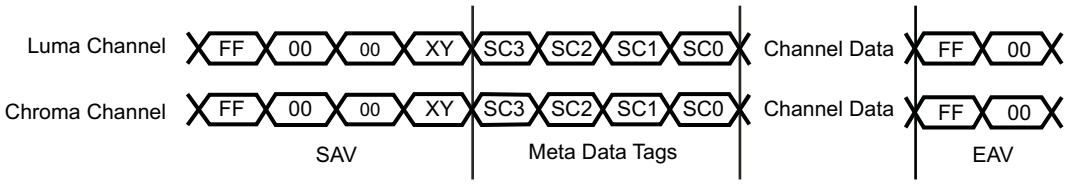
Figure 7-44. 8-bit Line Mux Interface



7.4.5.8.7 16-bit Data Interface in Line Multiplexing

Figure 7-45 describes the 16-bit line multiplexing interface. Channel Data is the active line. All the Y pixels are in the Luma Channel. The CbCr pixels are in the Chroma Channel. Each cycle, a 16-bit value representing one Luma sample and one Chroma sample enters the VIP_PARSER. The Meta Data tags are replicated in both channels. Likewise, the SAV/EAV startcodes are found in both channels. The V flags for the SAV/EAV startcodes are always 0.

Figure 7-45. 16-bit Line Mux Interface



7.4.5.8.8 Split Lines in Line Multiplex Mode

Suppose an external device is sending two dissimilar sources in Line Multiplex mode. One narrower source has X pixels per line. The wider source has 2X pixels per line.

The Meta Data has provisions for the external device to split a line. The Beginning of Line (BOL) and End of Line (EOL) flags tag a split line as described in Table 7-11.

Table 7-11. Split Line Table

BOL	EOL	Function
0	0	Undefined
0	1	Line Segment is the second half of a line
1	0	Line Segment is the first half of a line
1	1	Line has not been segmented into two.

7.4.5.8.9 Meta Data

Table 7-12 shows the bitfields in the Meta Data start codes.

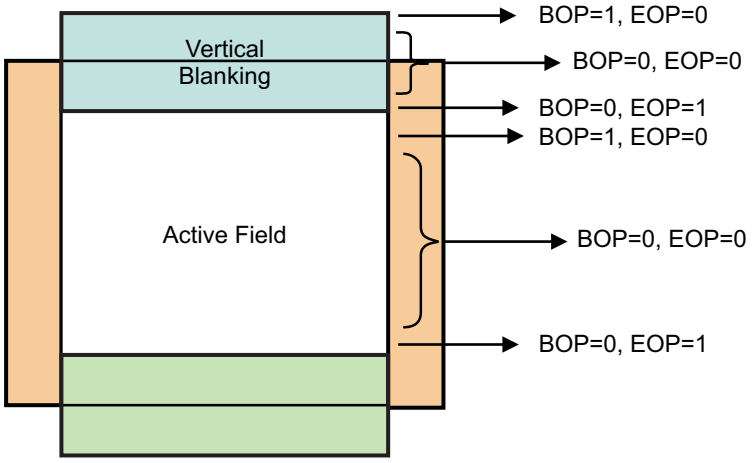
Table 7-12. Meta Data Layout

Byte	7	6	5	4	3	2	1	0
SC3	1	BOP	EOP	RSVD	CH_ID[3:0]			
SC3	1	BOP	EOP	RSVD	CH_ID[3:0]			
SC2	0	BOL	EOL	VDET	LINE_ID[10:7]			
SC1	~LINE_ID[6]	LINE_ID[6:0]						
SC0	PAD	F	V	H	P3	P2	P1	P0

BOP tags the line as a startline in a period. A period is defined as the contiguous lines in a vertical blanking period or the contiguous lines in a field or frame. For the vertical blanking period case, the vertical blanking at the bottom of the previous field or frame combined with the vertical blanking at the top of the current field or frame is combined to create one period.

EOP tags the line as an endline in a period. Figure 7-46 shows the definition of the two types of Periods as outlined by BOP and EOP.

Figure 7-46. BOP/EOP Definition of a Period



For the Split Line at the top of a Period, the BOP bit is set for both halves of the split line. Likewise, for the Split Line at the bottom of a Period, the EOP bit is set for both halves of the split line.

CH_ID is the channel ID, which tags the camera source that generated the incoming line. A maximum of 16 camera sources are support per Pixel Input Clock Domain.

LINE_ID is the line number, starting from 0 and incrementing by one for each subsequent line from the same source.

PAD is a flag which tags the line as an artificially inserted padding line. When PAD is ‘0’, the line should be discarded.

F, V, H, P3, P2, P1, and P0 are the bits representing the normal XY code. F is the Field ID associated with line, V signals when the line is in the vertical blanking, H specifies that the line is in the Horizontal Blanking, and P3:P0 are the protection bits.

Since only active video and vertical ancillary data lines are encapsulated in the Meta Data, the H bit in the SC0 byte should never be ‘1’.

7.4.5.8.10 TI Line Mux Mode, Split Lines, and Channel ID Remapping

The VIP_PARSER supports a maximum of 8 different Channel IDs per Port. The Channel IDs must be in the range {0:7} (3 bits). In the source multiplex, only one source can be a split line source and have the same Channel ID as one of the non-split line sources.

This scenario involves an external NTSC decoder which supports 8 D1 cameras. The external NTSC decoder will downscale the 8 sources to SIF format. However, one camera source will be sent in the multiplex as both the downscaled version and the original D1 sized version. They will both have the same Channel ID. However, the D1 version will be sent as a split-line. The source multiplex will thus have 9 maximum streams.

The VIP_PARSER (for TI Line Mux Mode only), will left shift the Channel ID by one. Bit 0 is used as an indicator whether the Source is a split-line source or a normal non-split line source. Only one of the nine inputs can be a split line source.

Table 7-13. TI Line Mux Mode Channel ID Remapping

	Channel ID Sent to VPDMA	
Source Input Channel ID	**Non-split Line**	**Split Line**
0x0	0x0	0x1
0x1	0x2	0x3
0x2	0x4	0x5
0x3	0x6	0x7
0x4	0x8	0x9
0x5	0xA	0xB
0x6	0xC	0xD
0x7	0xE	0xF

All subsequent references to the Camera Source, such as in a VPDMA return descriptor, will reference the remapped Channel ID.

The VIP_OUTPUT_PORT_A_SRC0_SIZE through VIP_OUTPUT_PORT_A_SRC15_SIZE registers for Port A, and VIP_OUTPUT_PORT_B_SRC0_SIZE through VIP_OUTPUT_PORT_B_SRC15_SIZE registers for Port B and the VIP_OUTPUT_PORT_A_SRC_FID and VIP_OUTPUT_PORT_B_SRC_FID status registers reflect the remapped Channel ID when the port is in TI Line Mux mode.

7.4.5.9 Channel ID Extraction for 2x/4x Multiplexed Source

7.4.5.9.1 Channel ID Extraction Overview

For 2-way and 4-way multiplexed source, the Channel ID is either embedded in the four protection bits inside the EAV/SAV code words or in the horizontal blanking pixel data. A configuration setting determines where the VIP_PARSER would search for the Channel ID.

7.4.5.9.2 Channel ID Embedded in Protection Bits for 2- and 4-Way Multiplexing

The four-bit channel ID is an identifier corresponding with the source number (camera) of the incoming video. As shown in Table 7-14, the Channel ID is placed in the code fourth byte of the EAV/SAV code words normally used for protection bits. With 4 bits, the maximum number of sources that can be defined in this range is 16. However, only Channel IDs in the range {0:7} are supported. Obviously, error correction cannot be performed on the FVH flags since the protection bits are no longer there.

Table 7-14. Channel ID Embedded in EAV/SAV

7 (fixed)	6 (F)	5 (V)	4 (H)	3 (ch_id[3])	2 (ch_id[2])	1 (ch_id[1])	0 (ch_id[0])	Description
1	0	0	0	Ch_id = {0:15}				SAV, Field 0, Active Video
1	0	0	1	Ch_id = {0:15}				EAV, Field 0, Horizontal Blanking
1	0	1	0	Ch_id = {0:15}				SAV, Field 0, Vertical Blanking

Table 7-14. Channel ID Embedded in EAV/SAV (continued)

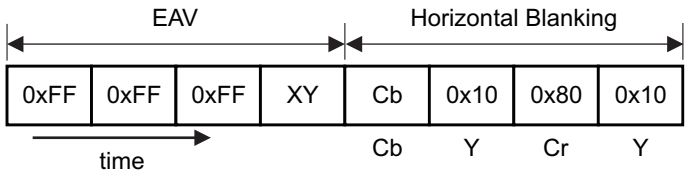
7 (fixed)	6 (F)	5 (V)	4 (H)	3 (ch_id[3])	2 (ch_id[2])	1 (ch_id[1])	0 (ch_id[0])	Description
1	0	1	1	Ch_id = {0:15}				EAV, Field 0, Horizontal Blanking in Vertical Blanking Region
1	1	0	0	Ch_id = {0:15}				SAV, Field 1, Active Video
1	1	0	1	Ch_id = {0:15}				EAV, Field 1, Horizontal Blanking
1	1	1	0	Ch_id = {0:15}				SAV, Field 1, Vertical Blanking
1	1	1	1	Ch_id = {0:15}				EAV, Field 1, Horizontal Blanking in Vertical Blanking Region

7.4.5.9.3 Channel ID Embedded in Horizontal Blanking Pixel Data for 2- and 4-Way Multiplexing

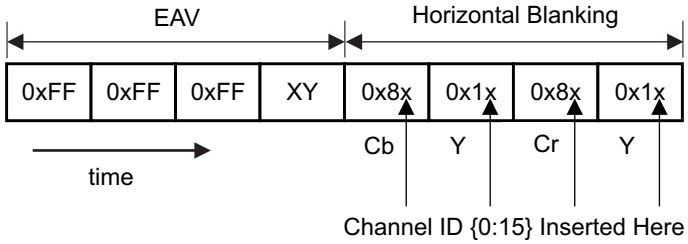
In Horizontal Blanking and Vertical Blanking, non-ancillary data pixels should be Y=0x10 and Cb=Cr=0x80. When the Channel ID is embedded in the Horizontal Blanking for 2 and 4-way multiplexing, the lower nibbles of all Luma and Chroma pixels are replaced by the 4 bit Channel ID. This scenario is shown in Figure 7-47. The maximum number of values defined by this 4-bit range is 2^4 = 16. However, only Channel IDs in the range {0:7} are supported.

Figure 7-47. Channel ID Inserted Into Horizontal Blanking

Regular Horizontal Blanking Following EAV



Channel ID Inserted Into Horizontal Blanking Following EAV



7.4.5.10 Embedded Sync Mux Modes and Data Bus Widths

Legal combinations of Embedded Sync Mux Modes and Data Bus Widths are described in Table 7-15.

Table 7-15. Valid Embedded Sync Mux Mode and Data Bus Width Combinations

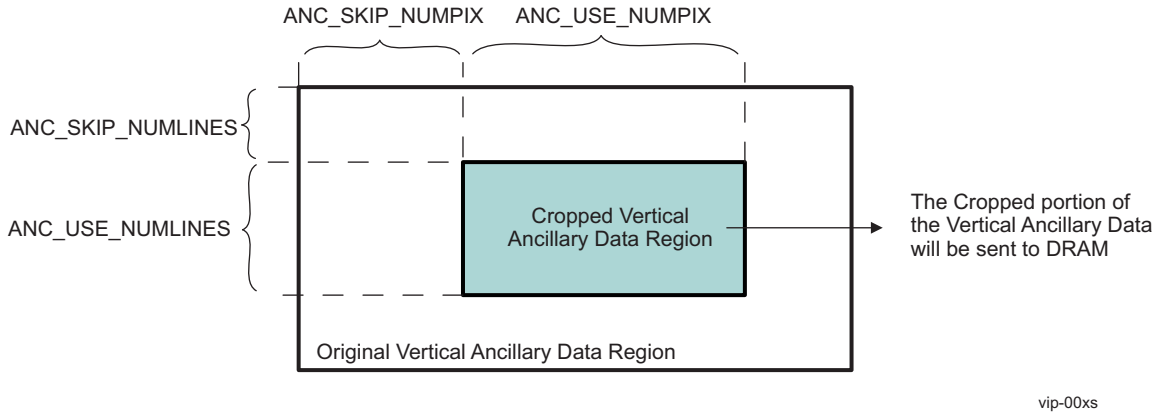
	1x Mux	2x Mux	4x Mux	Line Mux
8 Bit	v	v	v	v
16 Bit	v	n/a	n/a	v

7.4.5.11 Ancillary and Active Video Cropping

One Source Number for each Port can be cropped. Cropping is available for both Ancillary Data and Active Video.

For the Vertical Ancillary Data from Port A, cropping is enabled by setting the VIP_ANC_CROP_HORZ_PORT_A[15] ANC_BYPASS_N bit. The Source Number from Port A that gets cropped is defined by the VIP_ANC_CROP_HORZ_PORT_A[31:28] ANC_TARGET_SRCNUM register. VIP_ANC_CROP_HORZ_PORT_A[11:0] ANC_SKIP_NUMPIX, VIP_ANC_CROP_HORZ_PORT_A[27:16] ANC_USE_NUMPIX, VIP_ANC_CROP_VERT_PORT_A[11:0] ANC_SKIP_NUMLINES, and VIP_ANC_CROP_VERT_PORT_A[27:16] ANC_USE_NUMLINES define the region of the selected Source Number that is cropped and sent to DRAM. The Vertical Ancillary Data Cropping region is described in Figure 7-48.

Figure 7-48. Vertical Ancillary Data Cropping

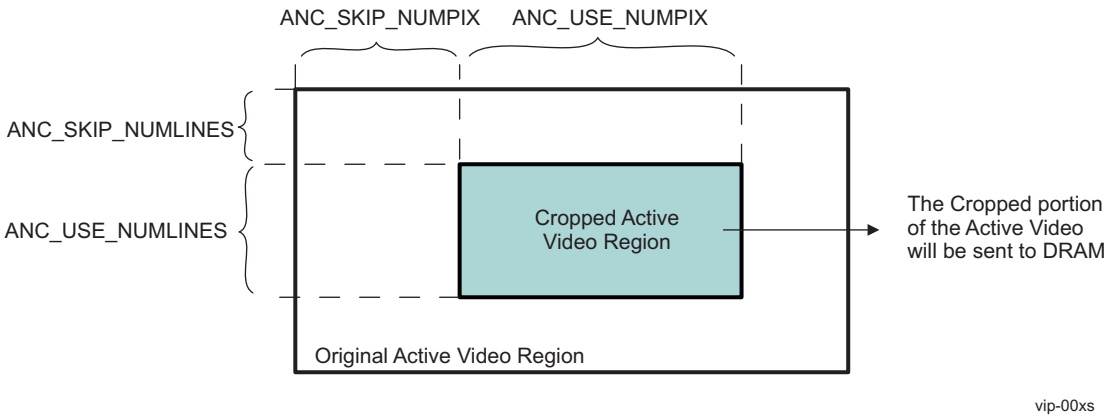


Note that for 8-bit input mode only, a setting exists that allow Vertical Ancillary data from both the Luma and Chroma channels to be captured. Both channels of Vertical Ancillary Data are captured when VIP_XTRA_PORT_A[14:13] ANC_CHAN_SEL_8B is set to “1x”. Thus, the number of data elements per line in this case is twice the equivalent number of Luma pixels per line. In other words, for this particular dual channel capture example, if there are 720 Luma pixels per line, then the total number of Vertical Ancillary Data Pixels in the source picture can be 2x720=1440 pixels.

For Active Video from Por tA, cropping is enabled by setting the VIP_CROP_HORZ_PORT_A[15] ACT_BYPASS_N bit. The Source Number from Port A that gets cropped is defined by the VIP_CROP_HORZ_PORT_A[31:28] ACT_TARGET_SRCNUM register.

VIP_CROP_HORZ_PORT_A[11:0] ACT_SKIP_NUMPIX, VIP_CROP_HORZ_PORT_A[27:16] ACT_USE_NUMPIX, VIP_CROP_VERT_PORT_A[11:0] ACT_SKIP_NUMLINES, and VIP_CROP_VERT_PORT_A[27:16] ACT_USE_NUMLINES define the region of the selected Source Number that is cropped and sent to DRAM. The Vertical Ancillary Data Cropping region is described in Figure 7-49

Figure 7-49. Active Video Cropping

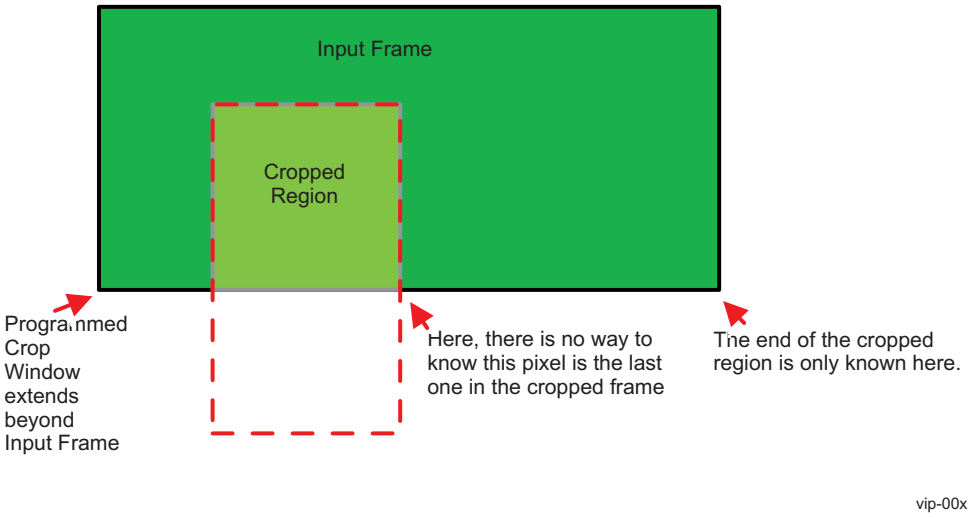


Cropping for Port B works in a similar way to Port A. Since picture data is in 4:2:2 format, ANC_SKIP_NUMPIX(ACT_SKIP_NUMPIX) and ANC_USE_NUMPIX (ACT_USE_NUMPIX) must be evenly divisible by 2. If the output of VIP_PARSER is sent to a 4:2:2 to 4:2:0 converter, then ANC_USE_NUMLINES(ACT_USE_NUMLINES) must also be evenly divisible by 2.

Error cases in cropping occur when the crop window programmed is larger than the incoming video frame. Crop window errors normally result in the return of the crop region where the crop window overlays the incoming video frame. However, there is one problematic error cropping case, as illustrated in Figure 7-50.

The programmed crop window extends below the input picture and the last pixel of the input picture is not a part of the selected crop region. In this case, at the last pixel of the last line in the green crop output, there is no way to determine that this pixel is the last pixel of the cropped output.

Figure 7-50. Problematic Error Cropping Case



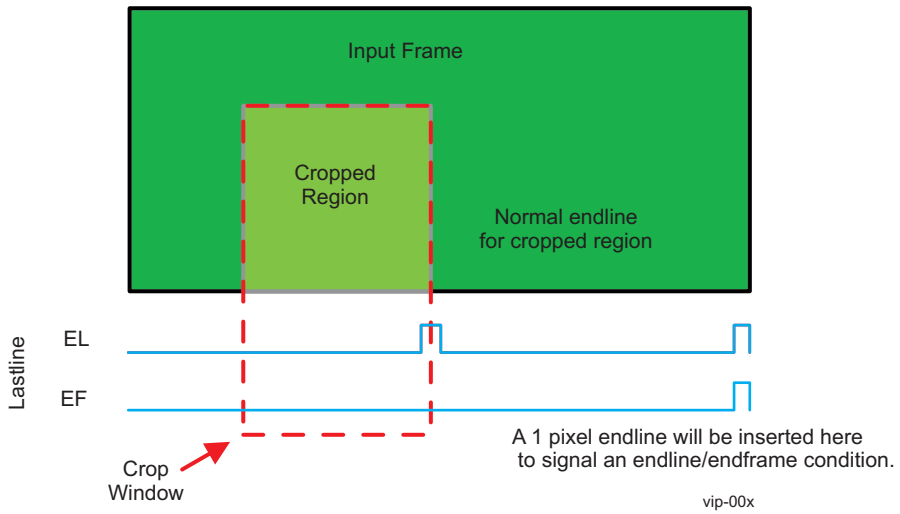
In this case, the crop tool sends outs a single pixel with an endline and endframe when it reaches the last pixel of the input picture. If the green cropped region has n lines, the actual output from the crop tool will have n+1 lines and the width of the last line will be 1 pixel.

Figure 7-51 shows the endline (EL) and endframe (EF) signals corresponding to the last line of the cropped region. At the last line and last pixel of the cropped region, the crop tool will only output an endline. It cannot output an endframe at this point because the crop tool might get another line from the streaming input.

Later, on the same input line, the last pixel of the input frame appears. Here, the crop tool knows that the cropped region has ended. In this case, a single endline/endframe pixel is sent out to signal that the frame has ended.

NOTE: There is no interrupt to notify that application level that a crop error has occurred.

Figure 7-51. Endline/Endframe Behavior for Error Cropping Case



7.4.5.12 Interrupts

The VIP_PARSER module has 19 interrupts out of which one can be mapped to VIP top level.

When an interrupt occurs and is determined to be from the VIP_PARSER module, the VIP_PARSER level of masks, clears, and status registers must be checked and updated first.

Table 7-16 describes each of the interrupts events supported by the VIP_PARSER, together with associated Interrupt Mask (VIP_FIQ_MASK), Interrupt Clear (VIP_FIQ_CLEAR), and Interrupt Status (VIP_FIQ_STATUS) registers.

Table 7-16. VIP_PARSER Interrupt Events

Event Flag	Event Mask	Map to	Description
VIP_FIQ_STATUS[21] PORT_A_YUV_PROTOCOL_VIOLATION	VIP_FIQ_MASK[21] PORT_A_YUV_PROTOCOL_VIOLATION_MASK	PrtBDisableComplete	When a port is running and VIP_PORT_B[8] ENABLE bit is turned off, logic exists to ensure that a complete frame is sent out of the Ancillary and Active Video VPI ports. That is, a frame is not stopped in the middle. This interrupt is activated when all active frames have been sent out Port B following a disable.
VIP_FIQ_STATUS[20] PORT_A_ANC_PROTOCOL_VIOLATION	VIP_FIQ_MASK[20] PORT_A_ANC_PROTOCOL_VIOLATION_MASK	PrtADisableComplete	When a port is running and VIP_PORT_A[8] ENABLE bit is turned off, logic exists to ensure that a complete frame is sent out of the Ancillary and Active Video VPI ports. That is, a frame is not stopped in the middle. This interrupt is activated when all active frames have been sent out Port A following a disable.
VIP_FIQ_STATUS[19] PORT_B_YUV_PROTOCOL_VIOLATION	VIP_FIQ_MASK[19] PORT_B_YUV_PROTOCOL_VIOLATION_MASK	PrtBANCProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Ancillary VPI of Port B.
VIP_FIQ_STATUS[18] PORT_B_ANC_PROTOCOL_VIOLATION	VIP_FIQ_MASK[18] PORT_B_ANC_PROTOCOL_VIOLATION_MASK	PrtBYUVProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Active Video VPI of Port B.
VIP_FIQ_STATUS[17] PORT_A_CFG_DISABLE_COMPLETE	VIP_FIQ_MASK[17] PORT_A_CFG_DISABLE_COMPLETE_MASK	PrtAANCProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Ancillary VPI of Port A.
VIP_FIQ_STATUS[16] PORT_B_CFG_DISABLE_COMPLETE_CLR	VIP_FIQ_MASK[16] PORT_B_CFG_DISABLE_COMPLETE_MASK	PrtAYUVProtocolVio	This interrupt is enabled when the protocol checker on the output of the VIP_PARSER encounters a violation on the Active Video VPI of Port A.
VIP_FIQ_STATUS[15] PORT_B_SRC0_SIZE_STATUS	VIP_FIQ_MASK[15] PORT_B_SRC0_SIZE	PrtBSrc0Size	The output size for Srcnum=0 on Port B differs from the XTRA_PORT_B[11:0] SRC0_NUMLINES and [27:16] SRC0_NUMPIX register settings
VIP_FIQ_STATUS[14] PORT_A_SRC0_SIZE_STATUS	VIP_FIQ_MASK[14] PORT_A_SRC0_SIZE	PrtASrc0Size	The output size for Srcnum=0 on Port A differs from the XTRA_PORT_B[11:0] SRC0_NUMLINES and [27:16] SRC0_NUMPIX register settings
VIP_FIQ_STATUS[13] PORT_B_DISCONN_STATUS	VIP_FIQ_MASK[13] PORT_B_DISCONN	PrtBDisconn	Port B Link Disconnect for Srcnum 0
VIP_FIQ_STATUS[12] PORT_B_CONN_STATUS	VIP_FIQ_MASK[12] PORT_B_CONN	PrtBConn	Port B Link Connect for Srcnum 0
VIP_FIQ_STATUS[11] PORT_A_DISCONN_STATUS	VIP_FIQ_MASK[11] PORT_A_DISCONN	PrtADisConn	Port A Link Disconnect for Srcnum 0
VIP_FIQ_STATUS[10] PORT_A_CONN_STATUS	VIP_FIQ_MASK[10] PORT_A_CONN	PrtAConn	Port A Link Connect for Srcnum 0
VIP_FIQ_STATUS[9] OUTPUT_FIFO_PRTB_ANC_STATUS	VIP_FIQ_MASK[9] OUTPUT_FIFO_PRTB_ANC_OF	OpPrtBAnc	Overflow at Ancillary Data VPDMA interface for the Port B
VIP_FIQ_STATUS[7] OUTPUT_FIFO_PRTB_LUMA_STATUS	VIP_FIQ_MASK[7] OUTPUT_FIFO_PRTB_YUV_OF	OpPrtBYUV	Overflow at Luma VPDMA interface for Port B

Table 7-16. VIP_PARSER Interrupt Events (continued)

Event Flag	Event Mask	Map to	Description
VIP_FIQ_STATUS[6] OUTPUT_FIFO_PRTA_ANC_STATUS	VIP_FIQ_MASK[6] OUTPUT_FIFO_PRTA_ANC_OF	OpPrtAAnc	Overflow at Ancillary Data VPDMA interface for the Port A
VIP_FIQ_STATUS[4] OUTPUT_FIFO_PRTA_LUMA_STATUS	VIP_FIQ_MASK[4] OUTPUT_FIFO_PRTA_YUV_OF	OpPrtAYUV	Overflow at Luma VPDMA interface for Port A
VIP_FIQ_STATUS[3] ASYNC_FIFO_PRTB_STATUS	VIP_FIQ_MASK[3] ASYNC_FIFO_PRTB_OF	InPrtB	Overflow at Input Async FIFO for Port B
VIP_FIQ_STATUS[2] ASYNC_FIFO_PRTA_STATUS	VIP_FIQ_MASK[2] ASYNC_FIFO_PRTA_OF	InPrtA	Overflow at Input Async FIFO for Port A
VIP_FIQ_STATUS[1] PRTB_VDET_STATUS	VIP_FIQ_MASK[1] PRTB_VDET_MASK	PrtBVdet	Video Detect Interrupt for Port B
VIP_FIQ_STATUS[0] PRTA_VDET_STATUS	VIP_FIQ_MASK[0] PRTA_VDET_MASK	PrtAVdet	Video Detect Interrupt for Port A

A ‘1’ in the Status register associated with an Interrupt source shows that the interrupt source is pending. The Status register is read-only. To clear a bit in the Status register, the associated bit in the Clear register must be written with a ‘1.’

A ’1’ in the bit position of the Mask register associated with an Interrupt source ensures that the hardware interrupt will never be passed on to the VIP top level. A ‘0’ in the bit position of the Mask register associated with an Interrupt source will cause the interrupt controller to see a VIP_PARSER interrupt in the event the hardware in the parser triggers it.

A ‘1’ in the bit position of the Clear register associated with an Interrupt source clears the hardware interrupt status register until the next time the hardware triggers it. After a Clear, the CPU should set the bit back to a ‘0.’ Otherwise, the hardware would not be able to set any subsequent interrupts of the same type.

7.4.5.13 VDET Interrupt

For Line Multiplexing Embedded Sync mode only, the Meta Data Header includes a Video Detect (VDET) flag. The device sets this VDET flag whenever NTSC or PAL sync is found. Some other external devices using Line Multiplexing mode may not use VDET. However, when VDET changes, a VDET interrupt is issued (see Table 7-16, *Interrupts*, for more details on the interrupt). Each Pixel Clock Input Domain (Port A and Port B) has a separate VDET interrupt.

The VDET status register is comprised of 32 bits, each bit representing the value of the VDET flag found in the meta data of the Channel ID. Bit 0 is the VDET value from Channel ID 0, Bit 1is is VDET value from Channel ID 1, and so on. There is a separate status register for each Pixel Input Clock Domain (VIP_PORT_A_VDET_VEC and VIP_PORT_B_VDET_VEC registers).

In Line Mux mode, the meta-data field defining the srcnum is 5-bits wide. Only the last three bits of this field and the upper two bits are reserved. This bit should always be set to 1 in TI Line Mux mode.

7.4.5.14 Source Video Size

For each Pixel Input Clock Domain, status registers are available to log the last active video height and width found from 16 camera sources. There is no interrupt activated on the change in the source size in any of the input sources. These readonly registers only inform the application of the width and the height of the last active field or frame associated with each channel ID.

In 2x/4x pixel multiplexing, the four bit nibble carrying the Srcnum defines a maximum of 16 sources.

7.4.5.15 Clipping

In ITU-656/BT.1120 embedded sync streams, the values 0x00 and 0xFF are reserved for sync detection. These values are illegal in the rest of the stream. Only when the ITU-1364 standard came out to for digitally inserted vertical blanking data structures did the 0x00 and 0xFF codes get re-used in the packet synchronization structure.

The VIP_PARSER supports one configuration bit that, when enabled, changes all 0x00 to 0x01 and 0xFF to 0xFE in the vertical ancillary data. Another configuration bit, when enabled, changes all 0x00 to 0x01 and 0xFF to 0xFE in the active video portion of the input picture.

Generally, clipping is only desired for discrete sync input data captured from a NTSC/PAL decoder type of device which does not follow pixel range rules. For Discrete Sync input, the possibility to clip inputs to legal values exists. Clipping is desired if the picture sent to DRAM will be streamed out of the IC again usin an ITU-656/BT.1120 style output port. If the picture is processed inside the SOC before it is streamed out, then the processing procedure or the output streaming hardware needs to ensure that illegal values are not in the stream.

For Embedded Sync input, illegal values should not exist except for the ITU-1364 data sync sequence 00-FF-FF. Otherwise, the VIP Parser cannot determine good EAV/SAV. In the hardware, clipping is allowed for Embedded Sync streams even though it is not particularly a useful feature.

Note that if the clipping is enabled for ancillary data, the post processing software will never be able to find a data packet sync header, since the 00-FF-FF sequence will be changed to 01-FE-FE.

For 24-bit YUV, clipping is done on each 8 bit channel. If data[23:16]==0xFF, the clipped value will be 0xFE. If data[23:16]==0x00, the clipped value will be 0x01. Likewise, clipping is done for data bit ranges 15:8 and 7:0

From a software point of view, clipping should never be enabled for 24-bit RGB. RGB should use the full 8-bit quantization range for each color component. The hardware, however, will clip RGB in active video, if VIP_MAIN[5] CLIP_ACTIVE='1'. The clipping will be done on each 8-bit channel as described for 24-bit YUV.

7.4.5.16 Current and Last FID Value

The FID values for the current field or frame are reported in the Status Registers. When a new field or frame enters, the current FID values are saved into the previous FID status registers and the new FID value is loaded into the current FID register.

Following a reset, the previous and current FID status registers are set to '1.' The first two fields or frames are ignored. On the third input field or frame after a reset, the previous FID is loaded with the current FID ('1'), and the current FID is loaded with the actual FID. By the fourth field or frame after a reset, both the previous and current FID values should represent the values found in the input stream.

The FID values are reported for each camera source in both Pixel Input Clock Domains.

7.4.5.17 Disable Handling

A feature was defined for the case of single stream (either discrete sync or embedded sync) input handling where VIP_PORT_A[8] ENABLE for Port A and VIP_PORT_B[8] ENABLE for Port B is taken inactive. The single stream case was deemed more important than the multi-stream one since the output of the VIP_PARSER may be used to drive the Scaler module. The Scaler needs to work on a frame boundary (startframe to endframe) or it may lock up without a reset. The goal of the disable handling for the single stream case is to complete a field or frame of output data to the downstream module. Then, upon enabling of the port again, the system should start up properly without a need to reset the individual modules within the VIP instance.

In this scenario, suppose the VIP_PARSER has been processing a single input stream. Then, ENABLE is brought inactive. The VIP_PARSER will continue to output data downstream until it sends out an endframe pixel and the downstream module accepts the endframe pixel.

7.4.5.18 Picture Size Interrupt

Each VIP port can be set up to trigger an interrupt if the picture size varies from a pre-programmed expected picture size. This interrupt is supported only for the Active Video portion of the input video and not for the Vertical Ancillary portion. Also this interrupt is only support for source number 0 in multi channel capture.

The interrupts are named PrtASrc0Size and PrtBSrc0Size. They are described in Table 7-16, *VIP_PARSER Interrupt Events*

For Port A, the expected active video picture size values are programmed in VIP_XTRA_PORT_A[11:0] SRC0_NUMLINES and VIP_XTRA_PORT_A[27:16] SRC0_NUMPIX. For PortB, the expected active video picture size values are programmed in VIP_XTRA_PORT_B[11:0] SRC0_NUMLINES and VIP_XTRA_PORT_B[27:16] SRC0_NUMPIX.

NOTE: Picture Size Interrupt reflects the Active Video going into the DRAM. If cropping is enabled for Srcnum=0, the Picture Size is the post-cropped size.

7.4.5.19 Discrete Sync Signals

External ICs generally produce discrete sync interface signals seen in Figure 7-52.

VBLNKrepresents the vertical blanking interval. Generally, vertical blanking is at the top of a NTSC/PAL field. In certain standards, the last few lines of a field or frame are in vertical blanking in addition to the beginning few lines in the following field or frame.

VSYNC is the vertical sync indicator. VSYNC is active during a portion of the vertical blanking. For NTSC and PAL, since these standards define an odd number of lines for a field pair, VSYNC can be use in conjunction with HSYNC to determine FID polarity. Generally, VSYNC is defined to transition inactive to active sometime during vertical blanking. This signal then transitions to an inactive state before the end of vertical blanking. Certain standards define the line numbers where VSYNC transitions.

HBLNK is the horizontal blanking interval for each line. The horizontal blanking is the same number of pixels whether the line is in the active video region or in the vertical blanking region of the scan.

ACTVID is the region of a line that is active video. It is the inverse of the HBLNK signal. The number of pixels in the ACTVID region is the same for a line in vertical blanking as a line in active video. ACTVID(1) is a situation where the signal toggles in vertical blanking as well as active video. ACTVID(2) shows the signal toggling only in non-vertical blanking regions. Once ACTVID transitions active, it stays active for every PIXCLK until the end of the line.

HSYNC transitions from inactive to active for the first pixel of each line, which is a horizontal blanking pixel. HSYNC will transition to the inactive state before the end of the line. HSYNC is similar to HBLNK in that they both transition active on the same PIXCLK cycle. However, HBLNK transitions inactive at the end of the horizontal blanking period. HSYNC can transition inactive either before or after the horizontal blanking period.

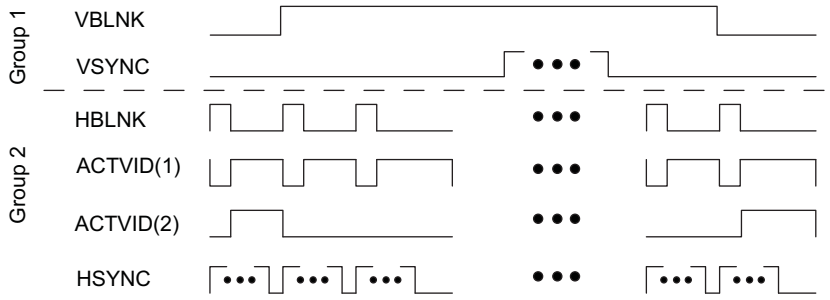
Group 1 signals define the vertical separation between fields or frames. Group 2 signals define the separation between lines. One of the Group 1 signals can be tied to the VSYNC input. The ACTVID(1) and ACTVID(2) signals from Group 2 are tied to the ACTVID input. One of the other two Group 2 signals, HBLNK or HSYNC, can be tied to the HSYNC input.

VIP_PORT_A[15] USE_ACTVID_HSYNC_N for Port A and VIP_PORT_B[15] USE_ACTVID_HSYNC_N for Port B defines whether the line separation method uses the signal from the ACTVID or the HSYNC input of the VIP_PARSER module.

VIP_PORT_A[22] DISCRETE_BASIC_MODE for Port A VIP_PORT_B[22] DISCRETE_BASIC_MODE for Port B determines whether discrete sync works as described in Section 7.4.5.6 *Input Data Interface* or whether a “basic mode” input handler is invoked.

By choosing one signal from Group 1 and one signal from Group 2, there should be a way to capture the external data.

Figure 7-52. Generic External Sync Signals



NOTE: 1. VIP_PARSER module defines three discrete sync control signals: ACTVID, HSYNC, and VSYNC.

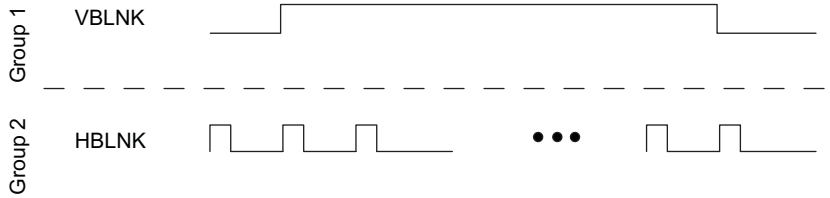
2. In order to capture external data PIXCLK must never stop, for either horizontal or vertical blanking.

7.4.5.19.1 VBLNK and HBLNK

Figure 7-53 shows VBLNK from Group 1 and HBLNK from Group 2 being used. In this case, set USE_ACTVID_HSYNC_N=’0’ and DISCRETE_BASIC_MODE=’0’. Vertical Ancillary lines will be sent to the Vertical Ancillary output at Active Video will be sent out the Active Video output.

If DISCRETE_BASIC_MODE=’1’ is chosen, all lines including vertical blanking ones will be sent to the Active Video buffer. Since a line is delineated by HBLNK and HBLNK toggles in vertical blanking as well as active video, every incoming pixel will be save to the Active Video buffer.

Figure 7-53. vblnk and hblnk

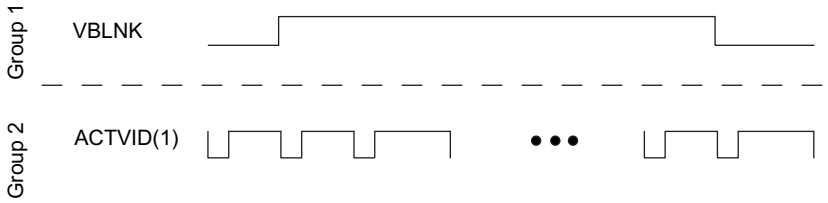


7.4.5.19.2 BLNK and ACTVID (1)

Figure 7-54 shows VBLNK from Group 1 and ACTVID(1) from Group 2 being used. ACTVID is toggling during Vertical Blanking. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='0'. Vertical Ancillary lines will be sent to the Vertical Ancillary output and Active Video will be sent out the Active Video output.

If DISCRETE_BASIC_MODE='1' is chosen, all lines will be sent to the Active Video output.

Figure 7-54. VBLNK and ACTID (1)

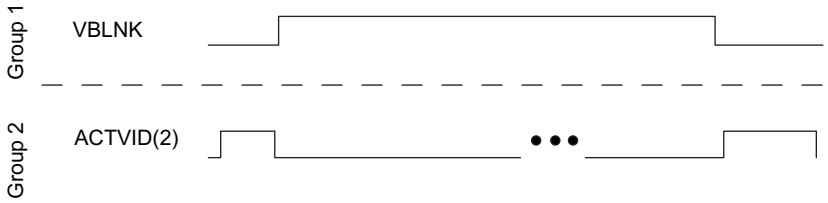


7.4.5.19.3 VBLNK and ACTVID(2)

Figure 7-55 shows VBLNK from Group 1 and ACTVID(2) from Group 2 being used. ACTVID is not toggling during Vertical Blanking. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='1'. Since there are no line sync/clocking signals in the Vertical Blanking period, only Active Video lines will be sent to the Active Video output.

If DISCRETE_BASIC_MODE='0' is set, then the hardware will lock up as there is no way for it to determine a frame boundary.

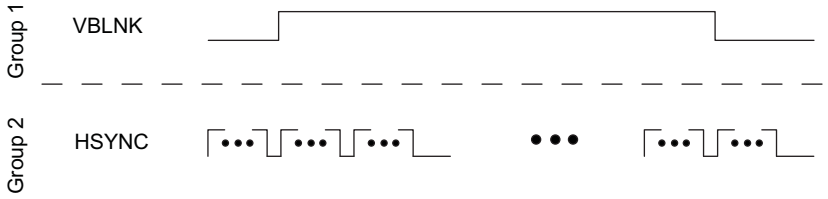
Figure 7-55. VBLNK and ACTVID(2)



7.4.5.19.4 VBLNK and HSYNC

Figure 7-56 shows VBLNK from Group 1 and HSYNC from Group 2 being used. In this scenario, set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODEN='0'. Vertical Ancillary lines will be sent to the Vertical Ancillary output at Active Video will be sent out the Active Video output.

Figure 7-56. VBLNK and HSYNC



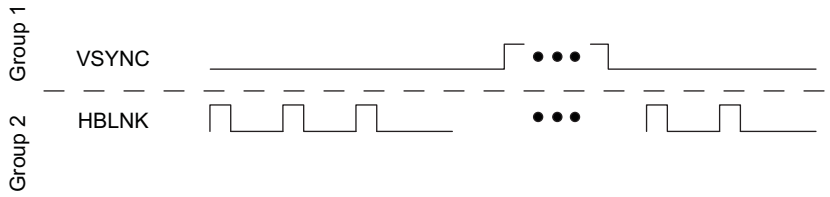
7.4.5.19.5 VSYNC and HBLNK

Figure 7-57 shows VSYNC from Group 1 and HBLINK from Group 2 being used. Set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='1'.

Also, no automatic parsing of vertical ancillary data will be performed so the Ancillary VPI port to the VPDMA should be disabled. All lines, including both vertical ancillary and active video, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Every data element strobed on the Pixel clock's active edge will be stored in the Active Video Buffer.

In Figure 7-57, it is likely the HBLINK will toggle when VSYNC is active. In this case, setting USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='0' mean that those lines appearing under the active VSYNC will be sent to the Ancillary Data Buffer. All other captured lines will be sent to the Active Video Buffer.

Figure 7-57. VSYNC and HBLNK

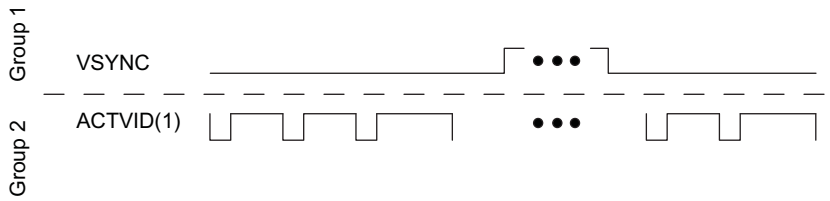


7.4.5.19.6 VSYNC and ACTIVID(1)

Figure 7-58 shows VSYNC from Group 1 and ACTIVID(1) from Group 2 being used. ACTIVID is toggling during the VBLNK interval. ACTIVID does not necessarily toggle during VSYNC. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='1'.

Also, no automatic parsing of vertical ancillary data will be performed so there is no activity on the Ancillary VPI port to the VPDMA. All lines, including both vertical ancillary and active video, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Lines are denoted by an inactive to active transition of ACTIVID. Only those pixels gated by an active ACTIVID will be saved.

Figure 7-58. VSYNC and ACTIVID(1)

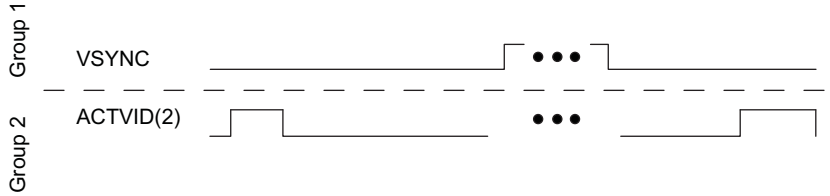


7.4.5.19.7 VSYNC and ACTIVID(2)

Figure 7-59 shows VSYNC from Group 1 and ACTIVID(2) from Group 2 being used. ACTIVID is not toggling during the entire VBLNK interval. Set USE_ACTVID_HSYNC_N='1' and DISCRETE_BASIC_MODE='1'.

Also, no automatic parsing of vertical ancillary data will be performed so the the Ancillary VPI port to the VPDMA should be turned off. All active video lines, since there are no vertical ancillary data lines, will appear in the Video DRAM buffer. Lines starting after an inactive to active transition on VSYNC will delineate a start of frame. Lines are denoted by an inactive to active transition of ACTIVID. Once a line starts, ACTIVID stays active for every pixel clock until the end of the line. Only those pixels gated by an active ACTIVID will be saved.

Figure 7-59. VSYNC and ACTIVID(2)

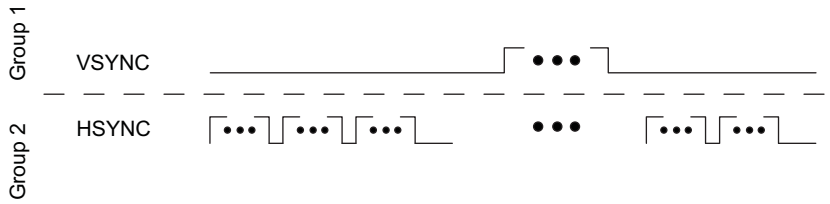


7.4.5.19.8 VSYNC and HSYNC

Figure 7-60 shows VSYNC from Group 1 and HSYNC from Group 2 being used. Set USE_ACTVID_HSYNC_N='0' and DISCRETE_BASIC_MODE='1'.

In the event that the machine is set to DISCRETE_BASIC_MODE='0', lockup will not occur as long as there is an HSYNC active transition during the time that VSYNC is active. This scenario is likely. However, if there is not at least one such transition on HSYNC, then the machine experiences a lock up. It cannot distinguish the end of one frame from the start of the next frame.

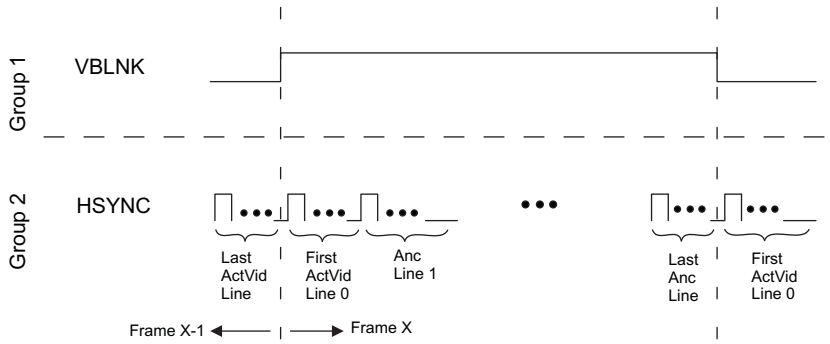
Figure 7-60. VSYNC and HSYNC



7.4.5.19.9 Line and Pixel Capture Examples

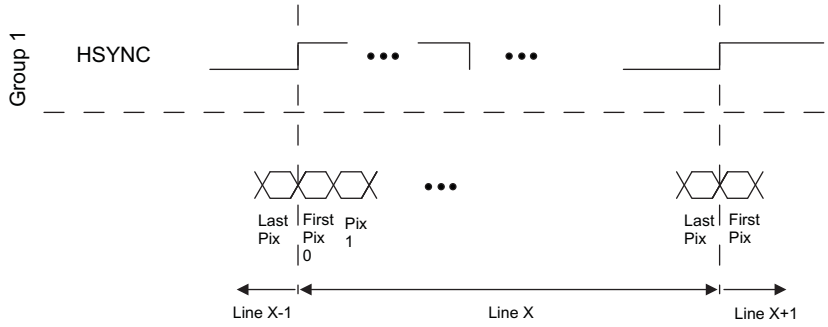
When DISCRETE_BASIC_MODE='0', VBLNK is generally used. All the lines where the start of line is under an active VBLNK are sent to the Ancillary Data buffer. All the lines where the start of line is not under an active VBLNK are sent to the Active Video framebuffer. This situation is shown in Figure 7-61.

Figure 7-61. Ancillary and Active Video Line Determination



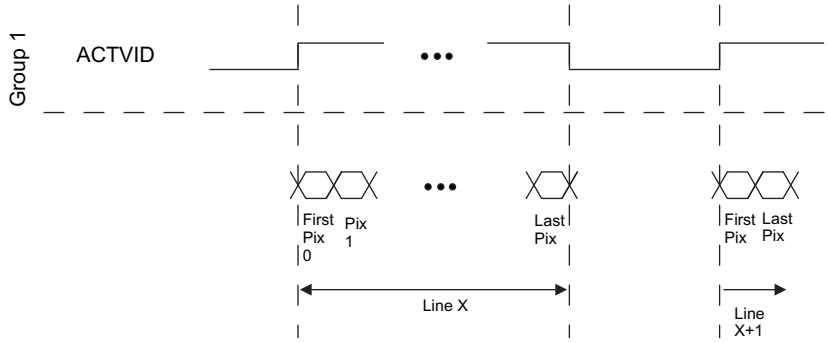
The start of line is the pixel represented by the inactive to active transition on HSYNC when USE_ACTVID_HSYNC_N = '1'. Figure 7-62 illustrates the delineation of a line when using USE_ACTVID_HSYNC_N = '1.'

Figure 7-62. HSYNC Pixel Capture



The start of line is the pixel represented by the inactive to active transition on ACTVID when USE_ACTVID_HSYNC_N = '0.' Note that ACTVID stays active for the entire duration of active video portion of the line. This scenario is shown in Figure 7-63

Figure 7-63. ACTVID Pixel Capture



In 8-bit mode, the 4:2:2 YUV input color component order is Cb, Y followed by Cr and Y. For 16-bit input mode, all the components are sent in the same cycle.

7.4.5.20 VIP Overflow Detection and Recovery

It is possible that an overflow can occur in the VIP_PARSER. Overflow detection is determined by reading the VIP_FIQ_STATUS register and checking for bits 8, 7, 5, 4, 3 and 2. If video is being captured, and any of these bits are set, it indicates that not all of the incoming video data was sent to DDR meory. VIP overflow can be caused by one of the following:

1. External pixel clock is faster than processing clock

2. DDR bandwidth is temporarily over-consumed

3. VIP scaler is being used inline with external video input, and is upscaling.

- VIP scaler in this use case can only be used for downscaling

4. VIP scaler is being used inline with external video input, but has not been configured with scaler coefficients

- VIP scaler will not accept video input if it is not first configured with scaler coefficients. This will cause overflow

5. VIP scaler is being used inline, but has not been enabled

6. External cables are connected or disconnected while the system is running, resulting in corrupted video streams going into the VIP

7. Bad external video cable, which causes corrupted video streams going into the VIP

Items 6 and 7 above are typically seen as noise events, where it is likely that multiple horizontal syncs per line and/or multiple vertical syncs per frame will be observed. These result in high peak throughput requirements, leading to DDR bandwidth being temporarily over-consumed, and thus VIP overflow.

The high level recovery method for VIP overflow on Port A is outlined in the steps below. Port B is similar.

1. Set VIP_XTRA6_PORT_A[31:16] YUV_SRCNUM_STOP_IMMEDIATELY = 0xFFFF_FFFF
2. Set VIP_XTRA6_PORT_A[15:0] ANC_SRCNUM_STOP_IMMEDIATELY = 0xFFFF_FFFF
3. Set VIP_PORT_A[8] ENABLE = 0
4. Set VIP_PORT_A[7] CLR_ASYNC_FIFO_RD and VIP_PORT_A[6] CLR_ASYNC_FIFO_WR to 1
5. Set VIP_PORT_A[23] SW_RESET to 1
6. Reset other VIP modules
   - For each module used downstream of VIP_PARSER, write 1 to the bit location of the VIP_CLKC_RST register which is connected to VIP_PARSER
7. Abort VPDMA channels
   - Write to list attribute to stop list 0
   - Write to list address register location of abort list
   - Write to list attribute register list 0 and size of abort list
8. Set VIP_PORT_A[23] SW_RESET to 0
9. Un-reset other VIP modules
   - For each module used downstream of VIP_PARSER, write 0 to the bit location of the VIP_CLKC_RST register which is connected to VIP_PARSER
10. (Delay)
11. SC coeff downloaded (if VIP_SCALER is being used)
12. (Delay)
13. Set VIP_XTRA6_PORT_A[31:16] YUV_SRCNUM_STOP_IMMEDIATELY = 0x0000_0000
14. Set VIP_XTRA6_PORT_A[15:0] ANC_SRCNUM_STOP_IMMEDIATELY = 0x0000_0000
15. Set VIP_PORT_A[8] ENABLE = 1
16. Set VIP_PORT_A[7] CLR_ASYNC_FIFO_RD and VIP_PORT_A[6] CLR_ASYNC_FIFO_WR to 0

7.4.6 VIP Color Space Converter (CSC)

The Color Space Converter (CSC) module is used to convert video data from one color space to another with nine programmable integer multipliers.

7.4.6.1 CSC Features

- All parameters are programmable
- Each parameter is configurable in signed 13-bits
- Support for Bypass Mode

7.4.6.2 CSC Functional Description

The conversion between the different color spaces requires addition and multiplication operations on color and intensity components. The mathematical expression of the conversion can be written as:

```
Y   = A0*R + B0*G + C0*B + D0
Cb  = A1*R + B1*G + C1*B + D1
Cr  = A2*R + B2*G + C2*B + D2
```

Color space coeficients are set through the following registers:

- For luma component:
  - VIP_CSC00[12:0] A0
  - VIP_CSC00[28:16] B0

  - VIP_CSC01[28:16] C0
  - VIP_CSC04[27:16] D0
- For Cb component:
  - VIP_CSC01[28:16] A1
  - VIP_CSC02[12:0] B1
  - VIP_CSC02[27:16] C1
  - VIP_CSC05[11:0] D1
- For Cr component :
  - VIP_CSC03[12:0] A2
  - VIP_CSC03[27:16] B2
  - VIP_CSC04[12:0] C2
  - VIP_CSC05[27:16] D2

Using YUV to RGB conversion as an example: YUV represents one color space and RGB represents another color space. The conversion can be written in the matrix format shown in Figure 7-64.

Figure 7-64. Matrix Format

$$\begin{bmatrix} Y \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} A0 & B0 & C0 \\ A1 & B1 & C1 \\ A2 & B2 & C2 \end{bmatrix} \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} D0 \\ D1 \\ D2 \end{bmatrix}$$

Since HDTV and SDTV have different conversion requirements, both conversions of RGB-to-YCbCr and YCbCr-to-RGB are described. The details of derivations of these matrixes will be given in the following subsections.

7.4.6.2.1 HDTV Application

7.4.6.2.1.1 HDTV Application with Video Data Range

The two equations presented in this section are for the HDTV application. The chromaticity parameters are defined by ITU-R709 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 7-65. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.2126 & 0.7152 & 0.0722 \\ -0.1172 & -0.3942 & 0.5114 \\ 0.5114 & -0.4646 & -0.0468 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 7-66. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1.5396 \\ 1 & -0.1831 & -0.4577 \\ 1 & 1.8142 & 0 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -197 \\ 82 \\ -232 \end{bmatrix} D$$

7.4.6.2.1.2 HDTV Application with Graphics Data Range

The two equations presented in this section are for the HDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R709 standard.

The input data ranges for these equations are as follows.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

Figure 7-67. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.1826 & 0.6142 & 0.0620 \\ -0.1006 & -0.3385 & 0.4392 \\ 0.4392 & -0.3990 & -0.0402 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 7-68. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1.1644 & -0.0003 & 1.7927 \\ 1.1644 & -0.2132 & -0.5329 \\ 1.1642 & 2.1125 & -0.0001 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -248 \\ 77 \\ -289 \end{bmatrix} D$$

7.4.6.2.1.3 Quantized Coefficients for Color Space Converter in HDTV

This section quantizes all the coefficients of color space conversion based on a 10-bit system for HDTV application. These coefficients can be input to the registers of programmable color space converter. Refer to register section for the corresponding register setting.

Table 7-17. Quantized Coefficients of HDTV Application with Video Data Range

7.4.6.2.2 SDTV Application

7.4.6.2.2.1 SDTV Application with Video Data Range

The two equations presented in this section are for the SDTV application. The chromaticity parameters are defined by ITU-R601 standard.

The input video data for these equations should be within the range that is defined for video application.

In an 8-bit system:

- Rd, Gd, Bd, and Yd will be in the range [16-235]
- Cb and Cr will be the range [16-240]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, and Yd will be in the range [64-940]
- Cb and Cr will be in the range [64-960]
- D = 4

Conversion from RGB to YCbCr:

Figure 7-69. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.172 & -0.339 & 0.511 \\ 0.511 & -0.428 & -0.083 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 7-70. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1 & -0.0003 & 1.3717 \\ 1 & -0.3365 & -0.6984 \\ 1 & 1.7336 & -0.0016 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -176 \\ 132 \\ -222 \end{bmatrix} D$$

7.4.6.2.2.2 SDTV Application with Graphics Data Range

The two equations presented in this section are for the SDTV application with graphics range data input. The main application is for computer graphics display. The chromaticity parameters are defined by ITU-R601 standard.

The input data ranges for these equations are as following.

In an 8-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be the range [0-255]
- D = 1

In a 10-bit system:

- Rd, Gd, Bd, Yd, Cb and Cr will be in the range [0-1023]
- D = 4

Conversion from RGB to YCbCr:

Figure 7-71. Conversion from RGB to YCbCr

$$\begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.257 & 0.504 & 0.098 \\ -0.148 & -0.291 & 0.439 \\ 0.439 & -0.368 & -0.071 \end{bmatrix} \begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix} D$$

Conversion from YCbCr to RGB:

Figure 7-72. Conversion from YCbCr to RGB

$$\begin{bmatrix} Rd \\ Gd \\ Bd \end{bmatrix} = \begin{bmatrix} 1.1641 & -0.0018 & 1.5958 \\ 1.1641 & -0.3914 & -0.8135 \\ 1.1641 & 2.0178 & -0.0012 \end{bmatrix} \begin{bmatrix} Yd \\ Cb \\ Cr \end{bmatrix} + \begin{bmatrix} -223 \\ 136 \\ -277 \end{bmatrix} D$$

7.4.6.2.2.3 Quantized Coefficients for Color Space Converter in SDTV

7.4.6.3 CSC Bypass Mode

CSC module can be bypassed by setting VIP_CSC05[28] BYPASS bit-field to 1.

7.4.7 VIP Scaler (SC)

This section describes the highly optimized video resizers, SC (scalers), in the VIP modules.

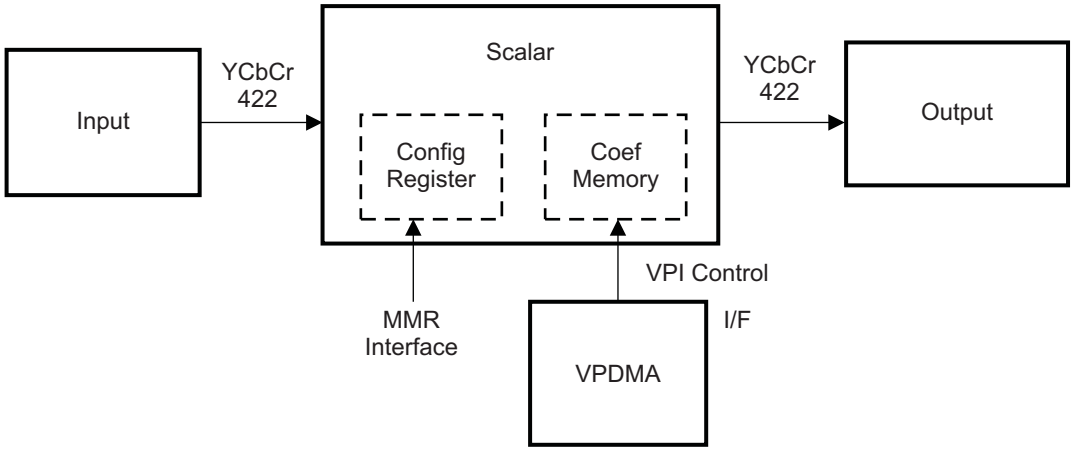
7.4.7.1 SC Features

- Independent vertical and horizontal up and down scaling
- Running average vertical down scaling for memory optimization
- Decimation and polyphase filtering for horizontal scaling
- Non-linear scaling for stretched/compressed left and right sides
- Input image trimmer for pan/scan support
- Pre-scaling peaking filter for enhanced sharpness
- Scale field as frame
- Interlacing of scaled output
- Full 1080p input and output support
- YCbCr422 input and output
- Maximum horizontal scaling ratio only limited by output line buffer (2047 pixels)
- Scaling filter Coefficient memory download via VPI (Video Port Interface) Control interface

7.4.7.2 SC Functional Description

Scaler takes in a 10-bit YCbCr 422 video frame from an upstream module, performs vertical/horizontal scaling and outputs a YCbCr422 scaled image to a next downstream module. All configurations are done via the MMR interface except for the scaler coefficient memory configuration that is done via the common VPI control interface bus by VPDMA. Figure 7-73 shows the high-level block diagram of the scaler module.

Figure 7-73. High Level Block Diagram

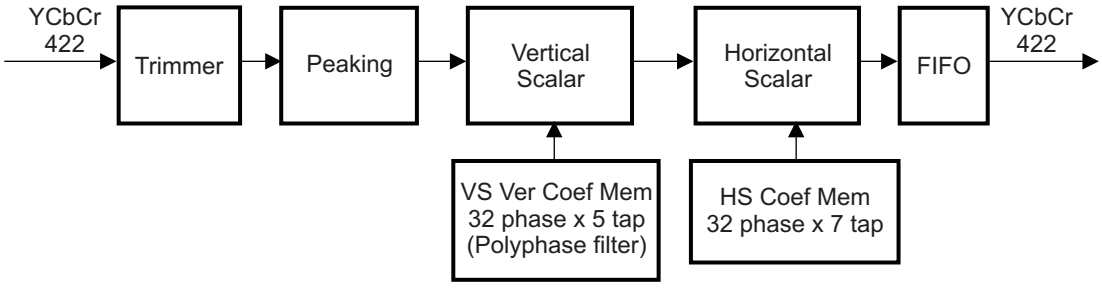


The SC is used in the video path and in all other video write-back data paths in the VIP module.

Scaling is performed in following three steps:

1. Trimming and Pre-peaking filtering
2. Vertical Scaling (Polyphase/Running Average Filter)
3. Horizontal polyphase scaling

Figure 7-74. SC Block Diagram



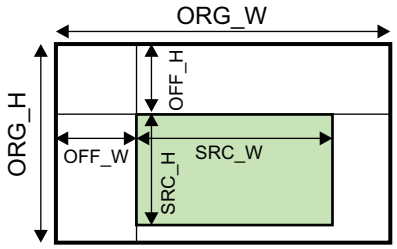
7.4.7.2.1 Trimmer

The trimmer can be programmed to re-define a new source image within the input video frame sent from an upstream module before it is sent to the scaling sub-modules. This feature enables small area zoom out, source pan/scan, or removal of unwanted area in the video (such as black box / curtains / noisy line-21 video) without modifying the VPDMA parameters.

Horizontal and vertical offset is set through VIP_CFG_SC25[26:16] CFG_OFF_W and VIP_CFG_SC25[10:0] CFG_OFF_H registers.

Width and height are set through VIP_CFG_SC24[26:16] CFG_ORG_W and VIP_CFG_SC24[10:0] CFG_ORG_H registers.

Figure 7-75. Input Image Trimming



NOTE: Width and height of the source image are global parameters and are set with VIP_CFG_SC5[22:12] CFG_SRC_W and VIP_CFG_SC5[10:0] CFG_SRC_H registers.

It is required that the input image frame (CFG_SRC_W x CFG_SRC_H) to be at least 32 × 32 (after trimming, if the trimming is enabled) to properly fill the input filter stage pipelines.

7.4.7.2.2 Peaking

The peaking block increases the amplitude of high frequency luminance information in horizontal direction to increase the sharpness of a video image before it is scaled. As shown in Figure 7-76, the high-frequency luminance is increased using an 11-tap High-Pass filter with adjustable gain. The non-linear coring function removes low-level noise and the modified luminance is then added to the original luminance signal. The implementation details are shown in Figure 7-76.

Figure 7-76. Filter Implementation and Parameter Description

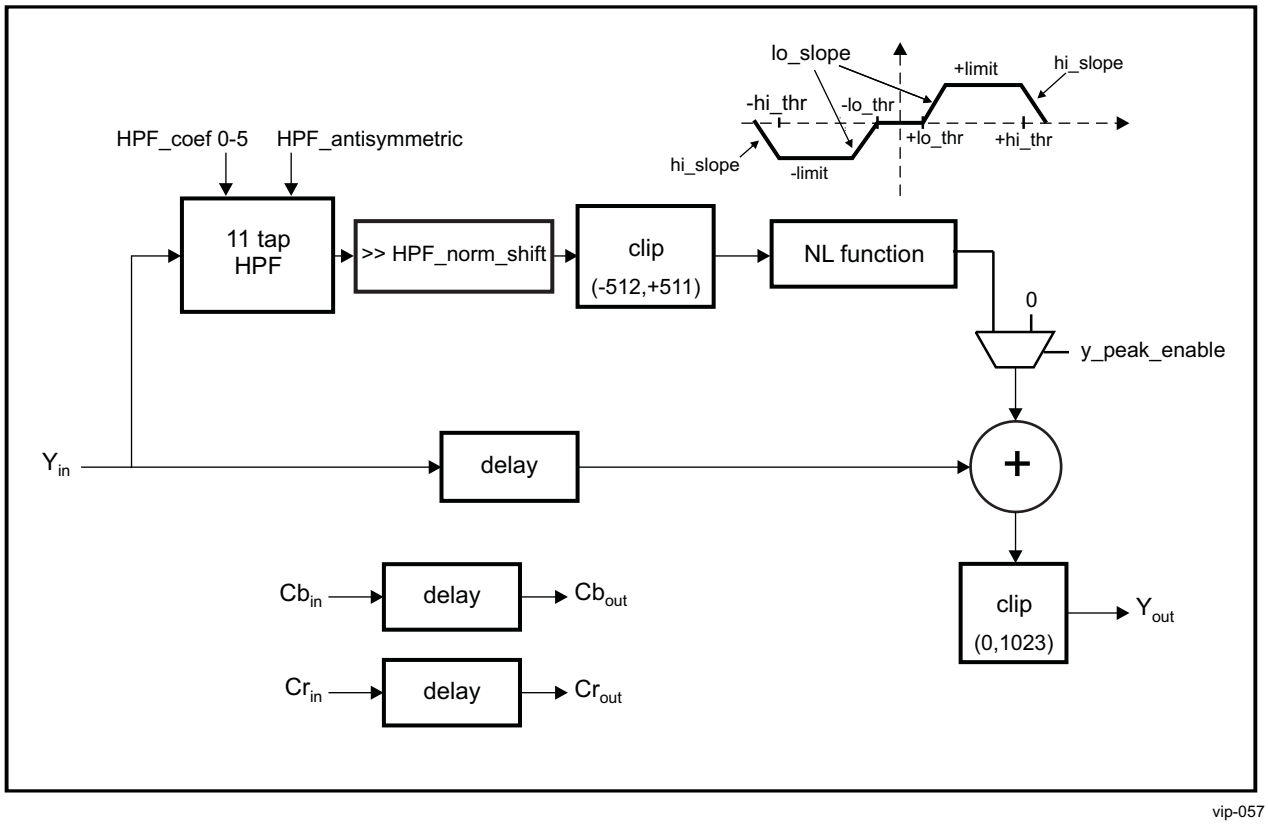


Table 7-21. Parameter Description

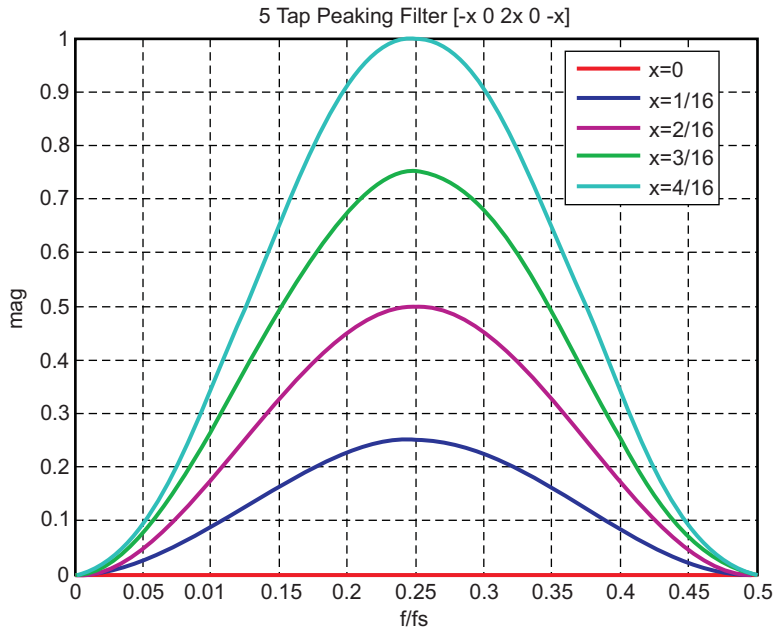
Parameter	Description	Bits	Default
VIP_CFG_SC19[7:0] CFG_HPF_COEF0 to VIP_CFG_SC20[15:8] CFG_HPF_COEF5	FIR coefficients	8	[0 0 0-4 0 8]
VIP_CFG_SC20[18:16] CFG_HPF_NORM_SHIFT	Right shift	3	4
VIP_CFG_SC21[8:0] CFG_NL_LO_THR	Coring threshold	9	16
VIP_CFG_SC22[8:0] CFG_NL_HI_THR	High threshold	9	400
VIP_CFG_SC21[23:16] CFG_NL_LO_SLOPE	Lo slope= - CFG_NL_LO_SLOPE/16	8	16
VIP_CFG_SC22[18:16] CFG_NL_HI_SLOPE_SHIFT	Hi slope = $2^{(CFG\_NL\_HI\_SLOPE\_SHIFT-3)}$	3	4
VIP_CFG_SC20[28:20] CFG_NL_LIMIT	Clipping limit	9	200
VIP_CFG_SC0[14] CFG_Y_PK_EN	Control	1	0

Parameters for the Peaking filters are defined in VIP_CFG_SC19 through VIP_CFG_SC22 registers. The frequency responses of the peaking-filter with different sets of coefficients are shown in Figure 7-77. If the source of the input video is NTSC or PAL format, the peaking filter can be configured to reject the color subcarrier frequency.

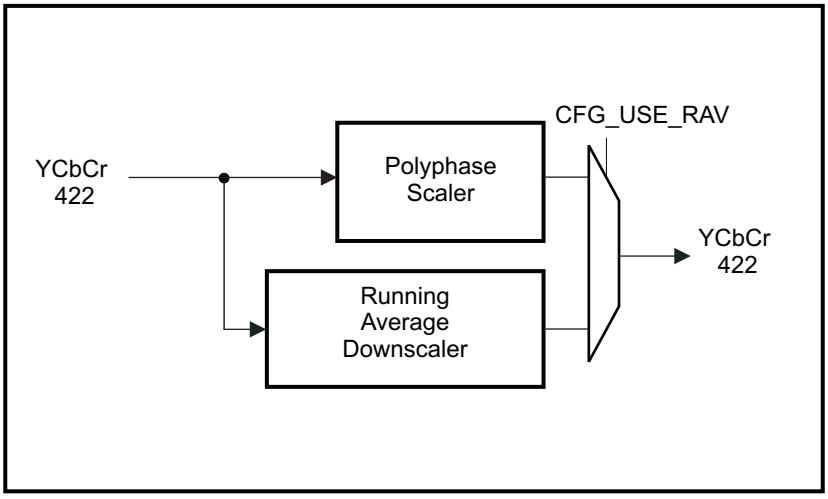
Figure 7-77. Peaking Filter at fs/4



7.4.7.2.3 Vertical Scaler

The vertical scaler has a polyphase (32-phase × 5-tap) filter and a running average filter as shown in Figure 7-78. While the polyphase filter can be used for any up-scaling and preferably downscaling to 3/16 scale factor, the running average filter is used only for downscaling to a ½ or less size. Selection between these two scalers is based on the user setting of VIP_CFG_SC0[4] CFG_USE_RAV parameter (CFG_USE_RAV= '0' for poliphase filter, and CFG_USE_RAV= '1' for running average filter), according to the user preference of the tradeoff between sharpness preserving and introduced artifacts.

Figure 7-78. Vertical Scaler Block Diagram



7.4.7.2.3.1 Running Average Filter

When a poly-phase filter is used, usually it has to have many taps in order to achieve acceptable quality for very small downscaling ratio, which requires the use of many line buffers. In VIP, there is a weighted Running Average filter for downscaling when the scaling factor is small (for example, when the scaling ratio is less than 0.5). This highly optimized design requires only one line buffer for luma and one for chroma, which still achieving acceptable quality. The output of the running average filter is based on weighted average of pixels in the current and previous rows in vertical direction. Initializations of accumulators affect the weights.

7.4.7.2.3.2 Vertical Scaler Configuration Parameters

Table 7-22. Vertical Scaler Configuration Parameters

Parameter	Typical Value	Controls	Description
VIP_CFG_SC0[10] CFG_INTERLACE_I		Frame or Field	0 = progressive, 1 = interlace
VIP_CFG_SC0[0] CFG_INTERLACE_O			0 = progressive 1 = interlace
VIP_CFG_SC0[3] CFG_INVT_FID			Invert field ID input
VIP_CFG_SC0[4] CFG_USE_RAV		Scaler Mode	0 = use polyphase scaler 1 = use running average scaler
VIP_CFG_SC1[26:0] CFG_ROW_ACC_INC		Bilinear & Polyphase Scalers	For progressive in/progressive out: round(2^{16}*(srcH-1)/(tarH - 1)) For progressive_in/interlace_out: round(2^{16}*2*(srcH-1)/(2*tarH - 1)) For interlace_in/progressive_out: round(2^{16}*(2*srcH-1)/(2*(tarH - 1))) For interlace_in/interlace_out: round(2^{16}*(2*srcH - 1)/(2*tarH - 1)) For interlace in/out, srcH/tarH are number of field lines as specified in VIP_CFG_SC4/VIP_CFG_SC5 descriptions.
VIP_CFG_SC2[27:0] CFG_ROW_ACC_OFFSET	0		Initial row accumulator value for progressive frame and top field
VIP_CFG_SC3[27:0] CFG_ROW_ACC_OFFSET_B	0		Initial row accumulator value for bottom field
VIP_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR	4	Bilinear Scaler	Range for chroma soft switch based on pixel differences (max limit = 8)

Table 7-22. Vertical Scaler Configuration Parameters (continued)

Parameter	Typical Value	Controls	Description
VIP_CFG_SC13[21:12] CFG_CHROMA_INTP_THR	64		Threshold used in chroma soft switch based on pixel differences
VIP_CFG_SC13[9:0] CFG_SC_FACTOR_RAV		Running Average Scaler	Scale factor = round(1024 × tarH/srcH)
VIP_CFG_SC6[9:0] CFG_ROW_ACC_INIT_RAV			Initial row accumulator value for progressive frame and top field
VIP_CFG_SC6[19:10] CFG_ROW_ACC_INIT_RAV_B			Initial row accumulator value for bottom field

NOTE: Bi-linear scaler is not present in this device

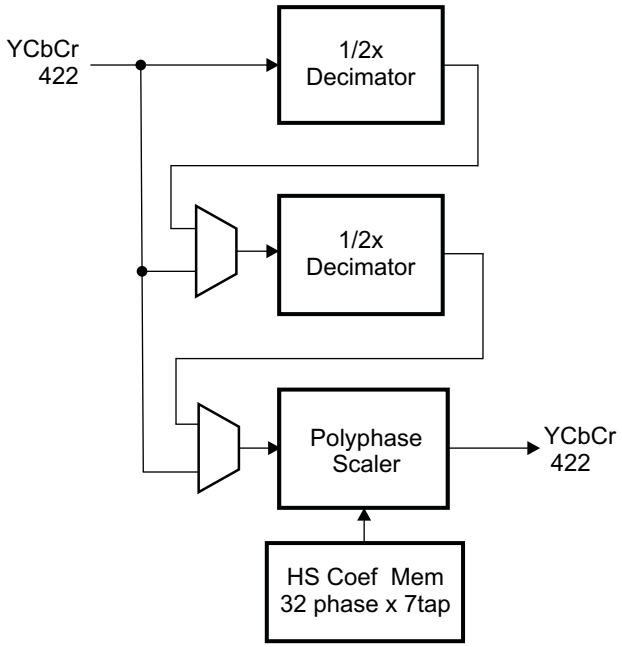
7.4.7.2.4 Horizontal Scaler

The Horizontal scaler is implemented using a 32-phase × 7-tap polyphase filter preceded by two sets of 1/2x decimators. The general configuration of the Horizontal scaler is performed as follows:

- For up scaling, the input video is interpolated using the polyphase scaler.
- For downscaling, it is recommended that input video is decimated by 2 until the modified scale factor falls between 1/2 and 1. Then, a polyphase filter is configured with coefficients selected based on the mod_scale_factor calculated as shown below from one of nine different sets of coefficients: (8,9,10,11,12,13,14,15,16)/16.

```
if  (scale_factor>=1/2)  {
   mux=0;  mod_scale_factor=scale factor;
} else if  (scale_factor>=1/4) {
   mux=1; mod_scale_factor=2*scale_factor;
} else {
   mux=2; mod_scale_factor=4*scale_factor;
}
```

Figure 7-79. Horizontal Scaler Block Diagram



In auto mode (CFG_AUTO_HS == 1), scaler will operate as per above recommendation. In addition to this, for (CFG_AUTO_HS==1), polyphase filtering will be bypassed when (scale_factor == 1) or (scale_factor == ½) or (scale_factor == ¼). If CFG_AUTO_HS==0) is used, user must provide proper values for dcm_2x, dcm_4x, proper values for all inputs to polyphase filter in the registers as well as appropriate coefficient sets. There is no constraint on polyphase filtering in terms of scaling ratio. However, there are constraints on input and output image width for scaler. Frame dimensions are limited from 64x64 to 2047x2047.

7.4.7.2.4.1 Half Decimation Filter

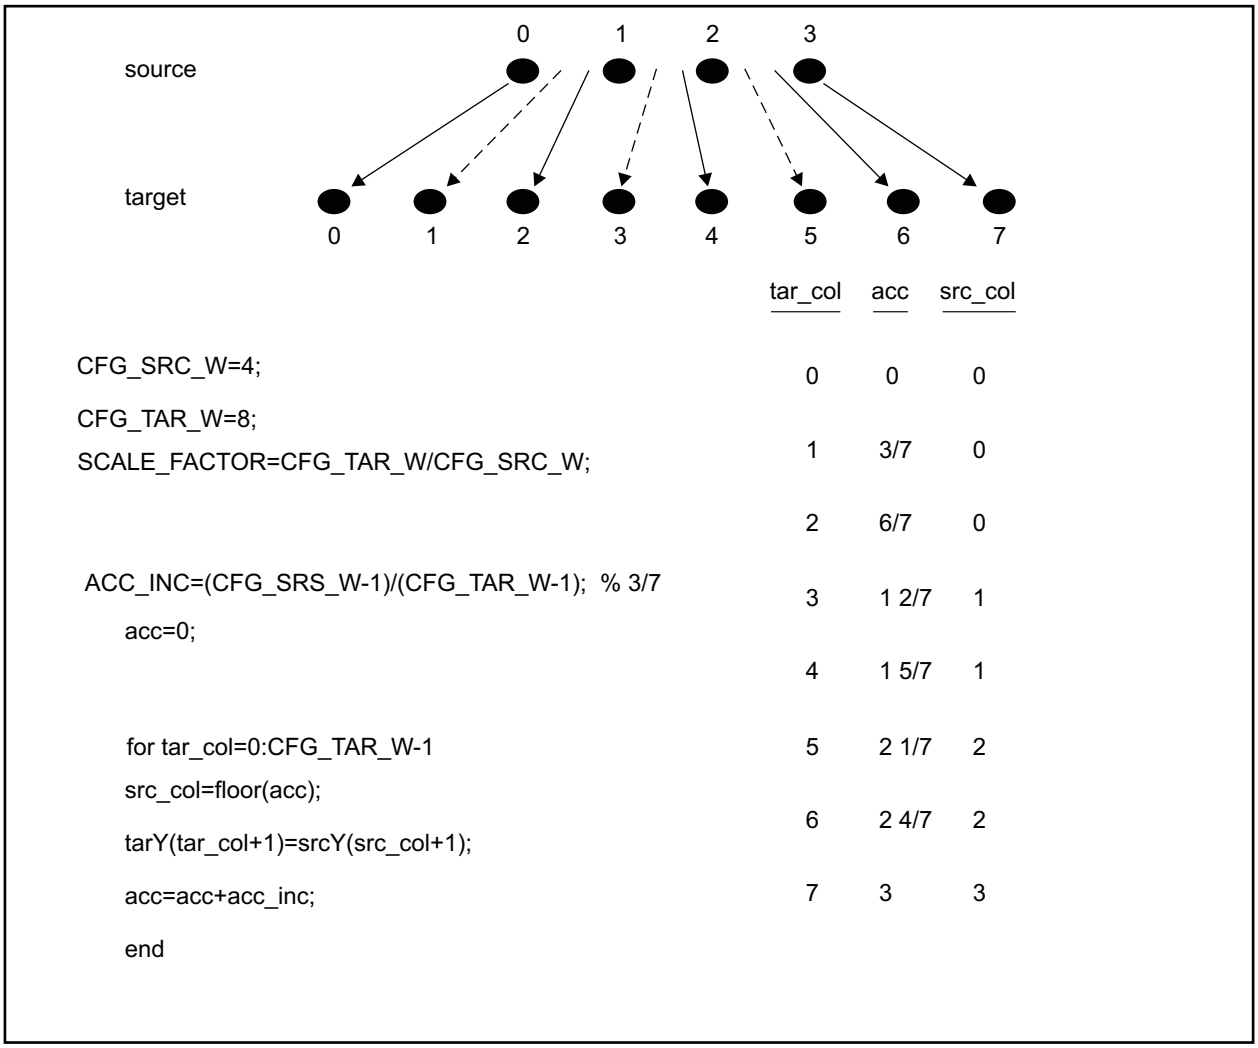
The half-decimation filter is an 11-tap filter with following coefficients: (14, 0, -29, 0, 79, 128, 79, 0, -29, 0, 14). For processing left and right edge pixels, the first and last data are repeated to pre-fill and extend the filter data pipeline respectively. These coefficients are hard-coded into scaler design and user cannot modify these.

7.4.7.2.4.2 Polyphase Filter

The horizontal scaling is done by stepping across the target row and interpolating target pixels based on source pixels. Accumulator points to the source pixel that corresponds to the target pixel.

Figure 7-80 shows an up-scaling example.

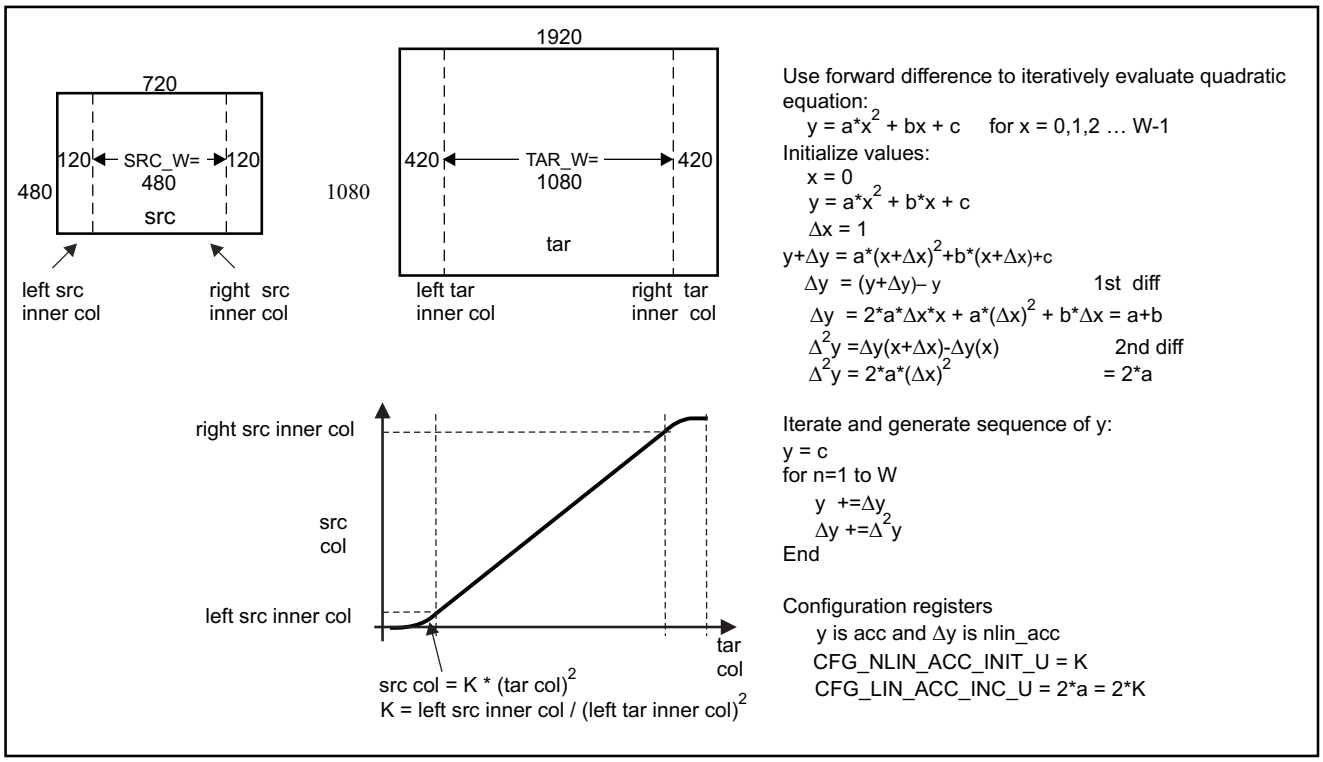
Figure 7-80. Polyphase Filtering Example



7.4.7.2.4.3 Nonlinear Horizontal Scaling

The horizontal scaler supports non-linear scaling to maintain the same aspect ratio for inner picture while stretching picture edges to fill the required resolution when capturing a 4 × 3 picture and fetching it as a 16 × 9 to memory. Non-linear scaling parameters are set with VIP_CFG_SC4[30:28] CFG_NLIN_ACC_INIT_U and VIP_CFG_SC4[26:24] CFG_LIN_ACC_INC_U registers. When setting up a non-linear scaling application, the inner picture is defined as the center square portion of the image with width and height equal to the height of the source image. Remaining side regions are then scaled non-linearly. Figure 7-81 shows a non-linear scaling case.

Figure 7-81. Non-linear Scaling Example



7.4.7.2.4.4 Horizontal Scaler Configuration Registers

Table 7-23. Register Group 1

Parameter	Controls	Description

7.4.7.2.6 Coefficient Memory

7.4.7.2.6.1 Overview

The scaler requires initialization of eight coefficient SRAMS prior to processing a video frame. These coefficients are stored in the external DDR memories and downloaded by the VPDMA. The VPDMA writes the coefficient data through the VPI Control Interface bus.

The eight coefficient SRAMs are:

- HS horizontal polyphase scaler, Luma and Chroma (7tap)
- VS vertical polyphase scaler, Luma and Chroma (5tap or 3tap)

7.4.7.2.6.2 Physical Coefficient SRAM Layout

Each of the six legacy coefficient SRAMs is 32 phases × 91 bits. A single coefficient value is 13 bits. Therefore, one word of the SRAM contains 7 coefficient values as shown in Figure 7-82, and 224 coefficient values are stored in each SRAM.

Figure 7-82. SRAM Layout for 7tap Coefficient

Phase 0	C6	C5	C4	C3	C2	C1	C0
Phase 31	C223	C222	C221	C220	C219	C218	C217

The two vertical polyphase SRAMs are 32 phases × 65 bits. A single coefficient is 13 bits. Therefore, one word of SRAM contains 5 coefficient values as shown in Figure 7-83.

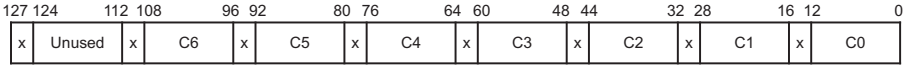
Figure 7-83. SRAM Layout for 5tap Coefficient

Phase 0	C4	C3	C2	C1	C0
Phase 31	C221	C220	C219	C218	C217

7.4.7.2.6.3 Scaler Coefficients Packing on 128-bit VPI Control I/F

A coefficient value is 13 bits wide and takes a single half word. Thus, one VPI Control write carries one phase's worth of coefficients. The last half-word in a quad-word is not used for 7tap coefficients.

Figure 7-84. VPI Control I/F Coef Data Format (7tap)



The Vertical Polyphase scaler coefficients have only five or three values per phase, so the last three (or five) entries are unused. The Vertical Polyphase coefficient packing is shown in Figure 7-85 and Figure 7-86.

Figure 7-85. VPI Control I/F Coef Data Format (5tap)

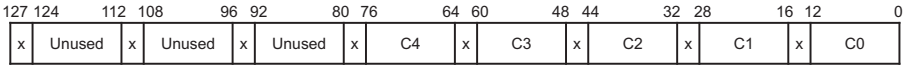


Figure 7-86. VPI Control I/F Coef Data Format (3tap)

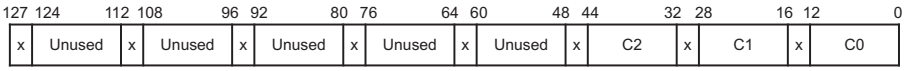
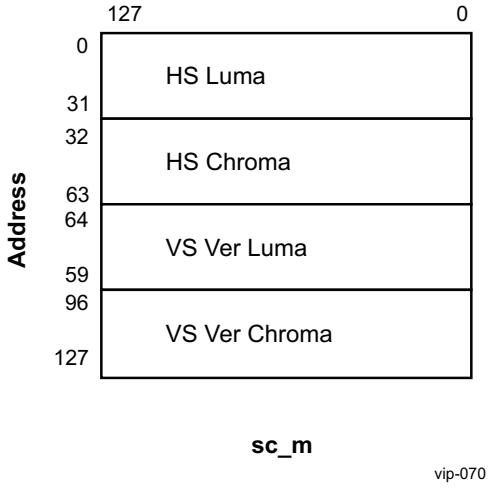


7.4.7.2.6.4 VPI Control I/F Memory Map for Scaler Coefficients

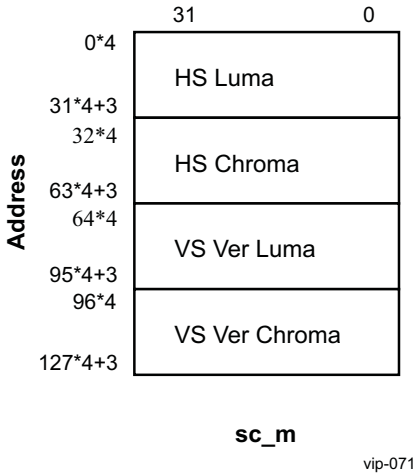
The memory map of the VPI Control I/F for the Scaler coefficients is shown in Figure 7-87. All coefficients can be filled up by a single VPI Control write command. The update address feature of VPI Control I/F enables individual access to a certain location of memories.

Figure 7-87. VPI Control I/F Memory Map (Write)



The module supports the VPI Control Read to read back the contents in the coefficient memories for debug purpose. Figure 7-88 shows the memory map of the VPI Control Read. As the VPI Control Read has only 32 bit data bus, it requires the word addressing while the write does the quad-word addressing.

Figure 7-88. VPI Control I/F Memory Map (Read)



7.4.7.2.6.5 VPI Control Interface

VPDMA is used to configure the coefficient memories of scaler through VPI control interface. Since the coefficient memories are not shadowed (unlike the memory mapped registers), VPI control write access needs to be done only during the gap between video frame processing times. If a write request is made while the Scaler is active, the access will be held off by the hardware until the last data of the currently processed frame is sent out. Care must be given to the order of the DMA descriptors so that blocking of VPI control bus does not occur.

7.4.7.2.6.6 Coefficient Table Selection Guide

The scaler filter coefficient tables are pre-generated using a MATLAB® program for various scaling factor ranges. Table 7-28 provides a general selection guide table for coefficient data files.

The mentioned .dat files are available in Section 7.4.7.4.

Table 7-28. Coefficient Data Files

Scaler	Scale Factor	Coeff table
HS Polyphase Filter	All upscaling	Section 7.4.7.4.1.1, *ppfcoef_scael_eq_1_32_phases_flip.dat*
	½ or ¼ down scaling	Section 7.4.7.4.1.1, ppfcoef_scale_eq_1_32_phases_flip.dat
	> 15/16	Section 7.4.7.4.1.9, *ppfcoef_scale_eq_15div16_32_phases_flip.dat*
	> 14/16	Section 7.4.7.4.1.8, *ppfcoef_scale_eq_14div16_32_phases_flip.dat*
	> 13/16	Section 7.4.7.4.1.7, *ppfcoef_scale_eq_13div16_32_phases_flip.dat*
	> 12/16	Section 7.4.7.4.1.6, *ppfcoef_scale_eq_12div16_32_phases_flip.dat*

7.4.7.3.3 Typical Configuration Values

The following is the list of all scaler register fields that are set to constant values, representing typical settings:

VIP_CFG_SC0[3] CFG_INVT_FID = 0 (Field ID will be used without inversion)

VIP_CFG_SC0[5] CFG_ENABLE_EV = 1 (Field ID will be used without inversion)

VIP_CFG_SC0[6] CFG_AUTO_HS = 1 (The hardware will automatically decide, if current operation is up or down scaling. In down-scaling, it will also decide, if 2X or 4X decimation filter is needed)

VIP_CFG_SC0[7] CFG_DCM_2X = 0 (The 2X decimation filter is disabled)

VIP_CFG_SC0[8] CFG_DCM_4X = 0 (The 4X decimation filter is disabled)

VIP_CFG_SC0[11] CFG_ENABLE_SIN2_VER_INTP = 1 (Modified bilinear interpolation is used)

VIP_CFG_SC0[14] CFG_Y_PK_EN = 0 (Luma peaking is disabled)

VIP_CFG_SC0[15] CFG_TRIM= 1 (Trimming is enabled)

VIP_CFG_SC12[24:0] CFG_COL_ACC_OFFSET = 0 (No horizontal offset is involved)

VIP_CFG_SC13[21:12] CFG_CHROMA_INTP_THR = 64 (If the difference is less than this threshold, the interpolation of chroma should be done along edge direction. Otherwise, the interpolation of chroma should be done vertically)

VIP_CFG_SC13[27:24] CFG_DELTA_CHROMA_THR = 4 (max limit=8)

VIP_CFG_SC18[24:16] CFG_CONF_DEFAULT = 0x100 (Defines confidence factor when edge detection is disabled (VIP_CFG_SC0[5] CFG_ENABLE_EV bit = 0))
VIP_CFG_SC19 = 0xFC000000
VIP_CFG_SC20 = 0x0C840800
VIP_CFG_SC21 = 0x00100010
VIP_CFG_SC22 = 0x00040190

7.4.8 VIP Video Port Direct Memory Access (VPDMA)

7.4.8.1 VPDMA Introduction

The VPDMA primary function is to move data between external memory and internal processing modules that source or sink data. VPDMA is capable buffering this data and then delivering the data as demanded to the modules as programmed. The modules that source or sink data are referred to as clients. A channel is setup inside the VPDMA to connect a specific memory buffer to a specific client. The VPDMA centralizes the DMA control functions and buffering required to allow all the clients to minimize the effect of long latency times. The VPDMA also supports a descriptor based mode where lists of descriptors can be setup to configure all the channels as they become available.

Additionally, in a third-party configuration, the VPDMA is capable of performing DMA transfers as requested by the pulsing of an event strobe. The VPDMA is capable of generation of an address which may reach any location in the range for which it is configured. It is capable of moving this data either to or from a Shared Buffer and ultimately to or from a Client Buffer. For the two type of Client Buffers that are used to drive data into a subsystem (Streaming Buffer and Random Access Buffer) data is either pushed into the buffer or pulled out of the buffer dependent upon the direction of the data transfer. For third-party DMA operations the data is transferred into a Client buffer, and then transferred out of the Client Buffer to the transfer destination. These transfers are triggered by an Event pulse to each of the Client Buffers which are Routing Buffer types.

7.4.8.2 VPDMA Basic Definitions

7.4.8.2.1 Client

The modules that source or sink data are referred to as clients. The clients of the VPDMA are the physical between the processing modules (VIP) and external memory. A channel is the mechanism inside the VPDMA that connects a specific memory buffer or transfer to a specific client.

The start event can also be selected by a channel attribute or to be controlled by an internal frame signal controlled by the List Manager.

7.4.8.2.2 Channel

The VPDMA requires a channel to be setup for each group of transfers. All the channels are described through a Data Transfer Descriptor that has a common format. The client that the channel is mapped to interprets the information in the descriptor to perform the requested data transfer.

Each of the channels has a type of data that it can support based upon the client that it services. The VPDMA supports three types of channels:

- **YUV Channel** - Clients taking data YUV data
- **RGB Channel** - Clients taking RGB data
- **Miscellaneous Channel** - The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client.

7.4.8.2.3 List

A list is a group of descriptors that makes up a set of DMA transfers that need to be completed. The VPDMA supports one kind of list only:

- The **Regular List** is a single list that the VPDMA will execute each descriptor once and initiate an interrupt when the list has completed. A regular list can contain any kind of descriptor without limitation and be of any size.

The VPDMA Controller works on lists of descriptors. In this mode the processor writes the lists of descriptors in the order it wants them executed. It then writes the location of the list to the VIP_LIST_ADDR register, followed by writing the size (bit LIST_SIZE) and type (bit LIST_TYPE) of the list, and list number (bit LIST_NUM) to the VIP_LIST_ATTR register. The List Manager module then schedules a DMA transfer to pull in the portion of the list that it can store in internal VPDMA memory. The List Manager will sequentially process the active list of descriptors until either the descriptor requires the use of a client that is currently active, or if it is waiting for the next portion of the list to be transferred from a DMA request. If there is no active list to process the list manager will go into an IDLE mode waiting for any client that is blocking a list or a list DMA transfer to complete.

All the DMA transfers are controlled by List Manager module inside VPDMA. List Manager needs to be loaded with FIRMWARE, before any DMA transfer from memory, after the VPDMA reset. The first MMR write to VIP_LIST_ADDR register after VPDMA reset should be the address of the memory buffer(128-bit aligned, that is, last four bits of the buffer address should be zero) where the firmware is stored. List Manager then schedules a DMA transaction to fetch the firmware and sets the VIP_LIST_ATTR[19] RDY bit after the firmware loading is complete.

7.4.8.2.4 Data Formats Supported

Following list summarizes the data formats supported in the VPDMA. For more inforamtion see Section 7.4.8.9, *VPDMA Data Formats*.

- RGB Data Types:
  - RGB16-565
  - ARGB-1555
  - ARGB-4444
  - RGBA-5551
  - RGBA-4444
  - ARGB24-6666
  - RGB24-888
  - ARGB32-8888
  - RGBA24-6666
  - RGBA32-8888
  - BGR16-565
  - ABGR-1555

  - ABGR-4444
  - BGRA-5551
  - BGRA-4444
  - ABGR24-6666
  - BGR24-888
  - ABGR32-8888
  - BGRA24-6666
  - BGRA32-8888
- YUV Data Types:
  - Y 4:4:4
  - Y 4:2:2
  - Y 4:2:0
  - C 4:4:4
  - C 4:2:2
  - C 4:2:0
  - CY 4:2:2
  - YCbC 4:4:4
  - YC 4:2:2

NOTE: VPDMA supports swapping formats (RGB/BGR and Cb/Cr)

7.4.8.3 VPDMA Client Buffering and Functionality

Table 7-29 lists for each client:

- The channels used, amount of buffering allocated for it, and the shared buffer used for its memory
- The line sizes it handles for tiled and non-tiled memory spaces, as well as any additional features it supports

Table 7-29. VPDMA Client Buffering and Functionality

Client	Channel(s)	Tiled Memory Max Line Size	Non-Tiled Memory Max Line Size	Additional Features
vip1_lo_y	vip1_mult_porta_src0 vip1_mult_porta_src1 vip1_mult_porta_src2 vip1_mult_porta_src3 vip1_mult_porta_src4 vip1_mult_porta_src5 vip1_mult_porta_src6 vip1_mult_porta_src7 vip1_mult_porta_src8 vip1_mult_porta_src9 vip1_mult_porta_src10 vip1_mult_porta_src11 vip1_mult_porta_src12 vip1_mult_porta_src13 vip1_mult_porta_src14 vip1_mult_porta_src15 vip1_portb_luma vip1_portb_rgb	1920 (color seperate) 960 (interleaved)	4096	TILED

7.4.8.4 VPDMA Channels Assignment

Table 7-30 lists all of the channels in VPDMA and its base attributes. The Data Type column states what type of data YUV, RGB or OTHER the channel handles and in parentheses are the legal data type values that can be entered into a data transfer decriptor. The Client field states the name of the Client and in parentheses it states the reference number in Figure 7-4, *VIP Block Diagram*.

Table 7-30. VPDMA Channels Assignment

Channel	Description	Channel Number	Data Type	Client
vip1_mult_porta_src0	Video Input 1 Port A Channel 0	38	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src1	Video Input 1 Port A Channel 1	39	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src2	Video Input 1 Port A Channel 2	40	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src3	Video Input 1 Port A Channel 3	41	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src4	Video Input 1 Port A Channel 4	42	YUV (0x7)	vip1_lo_y (2)

Table 7-30. VPDMA Channels Assignment (continued)

Channel	Description	Channel Number	Data Type	Client
vip1_mult_porta_src5	Video Input 1 Port A Channel 5	43	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src6	Video Input 1 Port A Channel 6	44	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src7	Video Input 1 Port A Channel 7	45	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src8	Video Input 1 Port A Channel 8	46	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src9	Video Input 1 Port A Channel 9	47	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src10	Video Input 1 Port A Channel 10	48	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src11	Video Input 1 Port A Channel 11	49	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src12	Video Input 1 Port A Channel 12	50	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src13	Video Input 1 Port A Channel 13	51	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src14	Video Input 1 Port A Channel 14	52	YUV (0x7)	vip1_lo_y (2)
vip1_mult_porta_src15	Video Input 1 Port A Channel 15	53	YUV (0x7)	vip1_lo_y (2)

7.4.8.5 VPDMA MFLAG Mechanism

The device L3_MAIN interconnect accepts MFLAG signals from certain initiators that can influence the internal L3_MAIN arbitration mechanisms. As a result, a higher priority is given to the data traffic initiated by these initiators. The VIP VPDMA can directly drive such MFLAG signals dynamically. The MFLAG generation for VIP VPDMA is enabled by default, and there is no register control over it.

The VPDMA arbitrates between multiple DMA sources within the VIP based on FIFO levels of DMA channels connected to VPDMA. Priority escalation mechanism implemented within VIP subsystem is based on overflow threshold and FIFO margin.

The following is a summary of priority and MFLAG levels provided by the VIP:

- High priority (MFLAG = 3) when FIFO margin is below 25%
- Medium priority (MFLAG = 1) when FIFO margin is between 25% and 50%
- Low priority (MFLAG = 0) when FIFO margin is above 50%

Additionally, the VIP subsystem also generates MReqPriority based upon a programmed descriptor configuration. The MReqPriority configuration influences the arbitration mechanism in the Memory Subsystem only and has no influence on the arbitration that takes place within L3_MAIN interconnect. For more information see Section 7.4.8.7.1.4, *Data Packet Descriptor Word 3*.

7.4.8.6 VPDMA Interrupts

The VPDMA has 4 interrupt group(s). Each group has an interrupt for all the client interrupts, an interrupt for every 32 channels, a interrupt for each list complete, an interrupt for each list notify and an interrupt for for all of the descriptor interrupts. Each of these groups can be individually masked so that only the interrupts specified will trigger the higher level interrupt.

Each interrupt source can be individually masked independently for each seperate interrupt group. A status register bit exists for each interrupt source for for each interrupt group, that is set whenever the interrupt event occurs even when if the interrupt is masked. The status register bit will remain set until cleared by software by writing a one to the status bit.

Table 7-31 shows all interrupt events from VPDMA that go to VIP top level. The interrupt events are mapped to two interrupt lines, INT0 and INT1, that go to VIP top level.

Table 7-31. VPDMA Interrupt Events

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_channel_group0	VIP_INT0_CHANNEL0_INT_STAT VIP_INT1_CHANNEL0_INT_STAT	VIP_INT0_CHANNEL0_INT_MASK VIP_INT1_CHANNEL0_INT_MASK	An unmasked channel interrupt for interrupt group 0 in channel register 0 or 1 has fired.
vpdma_int_channel_group1	VIP_INT0_CHANNEL1_INT_STAT VIP_INT1_CHANNEL1_INT_STAT	VIP_INT0_CHANNEL1_INT_MASK VIP_INT1_CHANNEL1_INT_MASK	An unmasked channel interrupt for interrupt group 1 in channel register 0 or 1 has fired.
vpdma_int_channel_group2	VIP_INT0_CHANNEL2_INT_STAT VIP_INT1_CHANNEL2_INT_STAT	VIP_INT0_CHANNEL2_INT_MASK VIP_INT1_CHANNEL2_INT_MASK	An unmasked channel interrupt for interrupt group 2 in channel register 0 or 1 has fired.
vpdma_int_channel_group3	VIP_INT0_CHANNEL3_INT_STAT VIP_INT1_CHANNEL3_INT_STAT	VIP_INT0_CHANNEL3_INT_MASK VIP_INT1_CHANNEL3_INT_MASK	An unmasked channel interrupt for interrupt group 3 in channel register 0 or 1 has fired.
vpdma_int_channel_group4	VIP_INT0_CHANNEL4_INT_STAT VIP_INT1_CHANNEL4_INT_STAT	VIP_INT0_CHANNEL4_INT_MASK VIP_INT1_CHANNEL4_INT_MASK	An unmasked channel interrupt for interrupt group 4 in channel register 0 or 1 has fired.
vpdma_int_channel_group5	VIP_INT0_CHANNEL5_INT_STAT VIP_INT1_CHANNEL5_INT_STAT	VIP_INT0_CHANNEL5_INT_MASK VIP_INT1_CHANNEL5_INT_MASK	An unmasked channel interrupt for interrupt group 5 in channel register 0 or 1 has fired.
vpdma_int_list0_complete			List 0 has completed
vpdma_int_list0_notify			The data transfer in list 0 with the Notify Field set in the descriptor has completed
vpdma_int_list1_complete			List 1 has completed

Table 7-31. VPDMA Interrupt Events (continued)

Interrupt	Event Flag Registers	Event Mask Registers	Description
vpdma_int_list1_notify			The data transfer in list 1 with the Notify Field set in the descriptor has completed
vpdma_int_list2_complete			List 2 has completed
vpdma_int_list2_notify			The data transfer in list 2 with the Notify Field set in the descriptor has completed
vpdma_int_list3_complete			List 3 has completed
vpdma_int_list3_notify			The data transfer in list 3 with the Notify Field set in the descriptor has completed
vpdma_int_list4_complete	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	VIP_INT0_LIST0_INT_MASK VIP_INT1_LIST0_INT_MASK	List 4 has completed

vpdma_int_list5_complete			List 5 has completed
vpdma_int_list5_notify			The data transfer in list 5 with the Notify Field set in the descriptor has completed
vpdma_int_list6_complete			List 6 has completed
vpdma_int_list6_notify			The data transfer in list 6 with the Notify Field set in the descriptor has completed
vpdma_int_list7_complete			List 7 has completed
vpdma_int_list7_notify			The data transfer in list 7 with the Notify Field set in the descriptor has completed
vpdma_int_client	VIP_INT0_CLIENT0_INT_STAT VIP_INT0_CLIENT1_INT_STAT VIP_INT1_CLIENT0_INT_STAT VIP_INT1_CLIENT1_INT_STAT	VIP_INT0_CLIENT0_INT_MASK VIP_INT0_CLIENT1_INT_MASK VIP_INT1_CLIENT0_INT_MASK VIP_INT1_CLIENT1_INT_MASK	Client Interrupt
vpdma_int_descriptor	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	VIP_INT0_LIST0_INT_STAT VIP_INT1_LIST0_INT_STAT	Descriptor Interrupt

In Table 7-31 above, the “channel_group”, “client” and “descriptor” interrupts are actually a set of additional interrupts. When software receives an interrupt from a “channel_group,” “client,” or “descriptor” it must read the appropriate register within the VPDMA (refer to Table 7-32 to determine what the actual interrupt was).

Table 7-32. VIP Interrupt Sources

Interrupt	Interrupt Group	Description
channel_vip1_mult_anca_src0	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src1	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src10	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src11	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src12	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src13	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src14	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src15	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src2	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src3	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src4	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src5	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_anca_src6	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src7	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src8	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_anca_src9	channel_group2	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point.
channel_vip1_mult_ancb_src0	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src1	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src10	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src11	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src12	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src13	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src14	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src15	channel_group3	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_ancb_src2	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src3	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src4	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src5	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src6	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src7	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src8	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_ancb_src9	channel_group2	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point.
channel_vip1_mult_porta_src0	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src1	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src10	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src11	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_porta_src12	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src13	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src14	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src15	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src2	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src3	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src4	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src5	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src6	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src7	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src8	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip1_mult_porta_src9	channel_group1	The last write DMA transaction has completed for channel vip1_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_portb_src0	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src1	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src10	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src11	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src12	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src13	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src14	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src15	channel_group2	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src2	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src3	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src4	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src5	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip1_mult_portb_src6	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src7	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src8	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_mult_portb_src9	channel_group1	The last write DMA transaction has completed for channel vip1_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point.
channel_vip1_porta_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_luma	channel_group3	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_porta_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point.
channel_vip1_portb_chroma	channel_group3	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_portb_luma	channel_group3	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip1_portb_rgb	channel_group3	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point.
channel_vip2_mult_anca_src0	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src1	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_anca_src10	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src11	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src12	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src13	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src14	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src15	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src2	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src3	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src4	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src5	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src6	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src7	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_anca_src8	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_anca_src9	channel_group4	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point.
channel_vip2_mult_ancb_src0	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src1	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src10	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src11	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src12	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src13	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src14	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src15	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src2	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src3	channel_group4	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_ancb_src4	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src5	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src6	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src7	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src8	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_ancb_src9	channel_group5	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point.
channel_vip2_mult_porta_src0	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src1	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src10	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src11	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src12	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src13	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_porta_src14	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src15	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src2	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src3	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src4	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src5	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src6	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src7	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src8	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_porta_src9	channel_group3	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
channel_vip2_mult_portb_src0	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src1	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_portb_src10	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src11	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src12	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src13	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src14	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src15	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src2	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src3	channel_group3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src4	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src5	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src6	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src7	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
channel_vip2_mult_portb_src8	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_mult_portb_src9	channel_group4	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point.
channel_vip2_porta_chroma	channel_group5	The last write DMA transaction has completed for channel vip2_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_porta_luma	channel_group5	The last write DMA transaction has completed for channel vip2_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_porta_rgb	channel_group5	The last write DMA transaction has completed for channel vip2_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_up_y then the client will be fully empty at this point.
channel_vip2_portb_chroma	channel_group5	The last write DMA transaction has completed for channel vip2_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_portb_luma	channel_group5	The last write DMA transaction has completed for channel vip2_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point.
channel_vip2_portb_rgb	channel_group5	The last write DMA transaction has completed for channel vip2_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point.
client_vip1_anc_a	client	The client interface vip1_anc_a has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_anc_b	client	The client interface vip1_anc_b has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_lo_uv	client	The client interface vip1_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_lo_y	client	The client interface vip1_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
client_vip1_up_uv	client	The client interface vip1_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip1_up_y	client	The client interface vip1_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_anc_a	client	The client interface vip2_anc_a has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_anc_b	client	The client interface vip2_anc_b has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_lo_uv	client	The client interface vip2_lo_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_lo_y	client	The client interface vip2_lo_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_up_uv	client	The client interface vip2_up_uv has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vip2_up_y	client	The client interface vip2_up_y has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having received the End of Frame signal from the transmitting module.
client_vpi_ctl	client	The client interface vpi_ctl has reached its current configured interrupt event as specified by the last received control descriptor for this client. If no control descriptor has been configured this will default to having sent the End of Frame signal to the receiving module.
control_descriptor_int0	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0.
control_descriptor_int1	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1.
control_descriptor_int10	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10.
control_descriptor_int11	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11.
control_descriptor_int12	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12.
control_descriptor_int13	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13.
control_descriptor_int14	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14.
control_descriptor_int15	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15.

Table 7-32. VIP Interrupt Sources (continued)

Interrupt	Interrupt Group	Description
control_descriptor_int2	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2.
control_descriptor_int3	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3.
control_descriptor_int4	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4.
control_descriptor_int5	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5.
control_descriptor_int6	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6.
control_descriptor_int7	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7.
control_descriptor_int8	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8.
control_descriptor_int9	descriptor	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9.
list0_complete	list0_complete	List 0 has completed
list0_notify	list0_notify	The data transfer in list 0 with the Notify Field set in the descriptor has completed
list1_complete	list1_complete	List 1 has completed
list1_notify	list1_notify	The data transfer in list 1 with the Notify Field set in the descriptor has completed
list2_complete	list2_complete	List 2 has completed
list2_notify	list2_notify	The data transfer in list 2 with the Notify Field set in the descriptor has completed
list3_complete	list3_complete	List 3 has completed
list3_notify	list3_notify	The data transfer in list 3 with the Notify Field set in the descriptor has completed
list4_complete	list4_complete	List 4 has completed
list4_notify	list4_notify	The data transfer in list 4 with the Notify Field set in the descriptor has completed
list5_complete	list5_complete	List 5 has completed
list5_notify	list5_notify	The data transfer in list 5 with the Notify Field set in the descriptor has completed
list6_complete	list6_complete	List 6 has completed
list6_notify	list6_notify	The data transfer in list 6 with the Notify Field set in the descriptor has completed
list7_complete	list7_complete	List 7 has completed
list7_notify	list7_notify	The data transfer in list 7 with the Notify Field set in the descriptor has completed

7.4.8.7 VPDMA Descriptors

The VPDMA needs to be programmed through descriptors (a pre-defined structure of eight or four 32-bit words depending on type of descriptors) other than VPDMA Memory Mapped Registers (MMR). Descriptors are of three types:

i. **Data Transfer Descriptors** - A memory structure used to describe a desired memory transaction to or from a client.

ii. **Control Descriptors** - A memory structure used to perform a control operation inside the DMA controller

iii. **Configuration Descriptors** - A memory structure used to described a setup that should be applied to an processing modules like MMR write, scalar coefficient write etc.

7.4.8.7.1 Data Transfer Descriptors

In order to set up data transfers from the VPDMA, a data transfer descriptor is added into a list. The fields used for an Inbound and Outbound descriptor vary slightly. An outbound transfer can have two different outbound transfers. The two transfers are the main data transfer and a write of an Inbound Descriptor. The created inbound descriptor is formatted so it can be read back in directly to the next channel specified in the original descriptor.

Figure 7-89. Inbound Data Transfer Descriptor Format

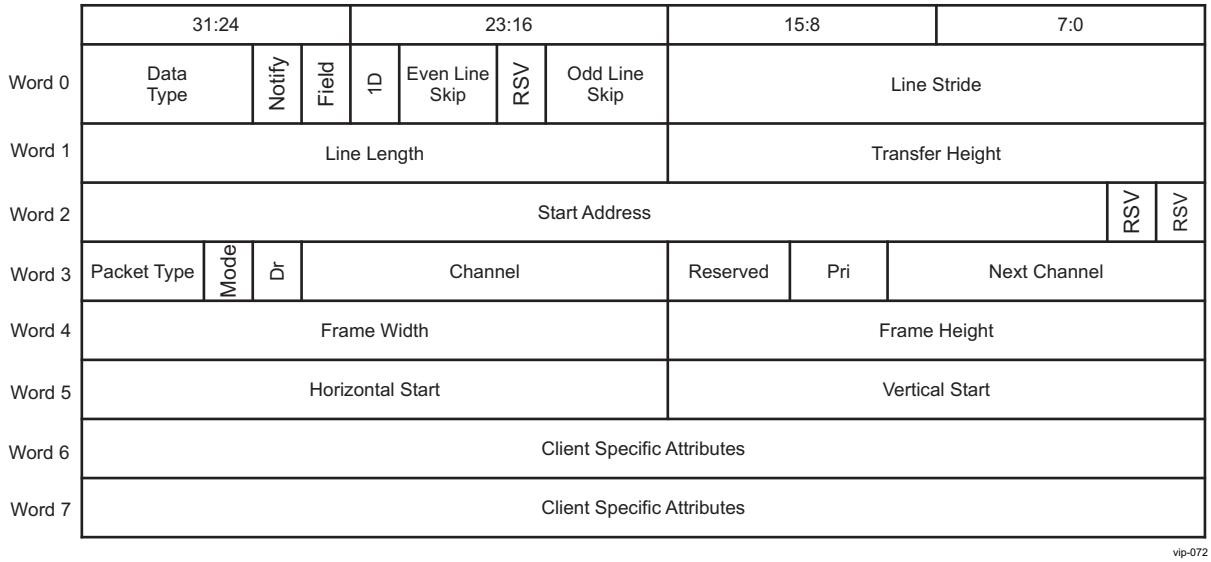

Figure 7-90. Outbound Data Transfer Descriptor Format

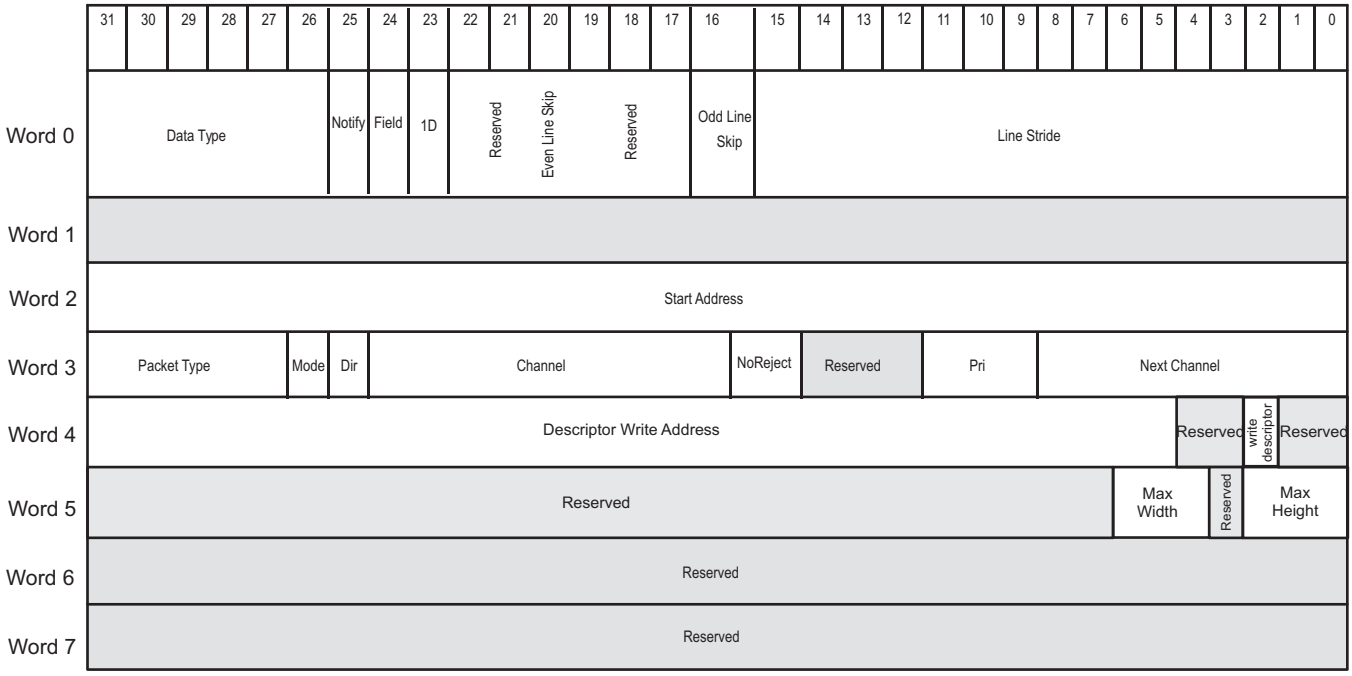


The general data transfer Descriptor formats can be seen in the above figures. The descriptor consists of 8 × 32bit words. A Data Transfer Descriptor will be removed from the list when the resource specified by the Channel field is free. If the Channel is not free when the list reaches a data transfer descriptor then the list will stall until the current transfer on the channel has completed.

7.4.8.7.1.1 Data Packet Descriptor Word 0 (Data)

Table 7-33. Data Packet Descriptor Word 0 Field Descriptions

Bit	Field	Value	Description
31:26	Data Type		**Miscellaneous Channel**
			Sets the pixel size in bits plus 1
			RGB Channel
		0	RGB16-565
		1h	ARGB-1555
		2h	ARGB-4444
		3h	RGBA-5551
		4h	RGBA-4444
		5h	ARGB24-6666
		6h	RGB24-888
		7h	ARGB32-8888
		8h	RGBA24-6666
		9h	RGBA32-8888
		10h	BGR16-565
		11h	ABGR-1555
		12h	ABGR-4444
		13h	BGRA-5551
		14h	BGRA-4444
		15h	ABGR24-6666
		16h	BGR24-888
		17h	ABGR32-8888
		18h	BGRA24-6666
		19h	BGRA32-8888
			YUV Channel
		0	Y 4:4:4
		1	Y 4:2:2
		2	Y 4:2:0
		4	C 4:4:4
		5	C 4:2:2
		6	C 4:2:0
		7	CY 4:2:2
		8	YCbC 4:4:4
		14h	Cb 4:4:4
		15h	Cb 4:2:2
		16h	Cb 4:2:0
		17h	CbY 4:2:2
		27h	YC 4:2:2
		37h	YCb 4:2:2
25	Notify	0-1	Send List Notification Interrupt upon last transfer of this channel
24	Field	0-1	Field Value
23	1D	0	The transfer is one dimensional. The transfer and frame sizes are combined to make a single 32 bit transfer size. For writes this value is passed to the generated descriptor. This feature is not supported by all clients. Only clients that support the feature will recognize this bit. **Note:** 1D mode is not supported by VIP modules

Table 7-33. Data Packet Descriptor Word 0 Field Descriptions (continued)

Bit	Field	Value	Description
22:20	Even Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
19	Reserved		Reserved for future use
18:16	Odd Line Skip		Field Value
		0	+1 line
		1h	+2 lines
		2h-7h	Reserved
15:0	Line Stride	0-FFFFh	Address stride between lines in bytes

7.4.8.7.1.1.1 Data Type

Bits 31-26 indicate the type of data that is to be transferred. This value is used to compute the number of bytes per pixel so that transactions may be made for the appropriate amount of data. The types of data are dependent on the type of channel. The VPDMA descriptor data types RGB or YUV are defined associated with the VPDMA channel assignment. This helps the engine to distinguish between the overlapping values of the descriptor data types for RGB and YUV data.

- For the Miscellaneous channel, the Data Type selects the size in bits of the data. The range is from 0 to 63 to represent the sizes from 1 to 64 bits.
- For a YUV channel, the Data Type determines, if the data channel is interleaved or color space separate. If color spaced separate, it is still assumed that the two chroma pixels are interleaved.

CAUTION

VPDMA defines the component ordering for its RGB data types in the opposite direction of what commonly used image identifiers expect. To avoid color component swapping in the display and/or in the video/image data written out to the memory, the proper Data Type settings for both RGB and YUV data types must be made. The following paragraphs provide more details on how to set Data Type correctly, in order to match the data stored or expected in the memory.

Setting RGB Data Types

The commonly used RGB format identifiers require the color components to be stored in a little-endian style, where the left most component is the LSB component.

- For an ARGB data type, the A component is the LSB location, as shown in Table 7-34 and Table 7-35;
- For a BGRA data type, the B component would be in the LSB location;

Table 7-34. Common ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
A	R	G	B

Table 7-35. Common ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
B	G	R	A

VPDMA specifies its component ordering in the big-endian style, which requires the data to be stored in the reversed order. Example with ARGB data type is shown in Table 7-36 and Table 7-37. The VPDMA ordering for ARGB data type matches the common BGRA data format.

Table 7-36. VPDMA ARGB in Memory (Byte Order)

Addr (LSB)	Addr + 1	Addr + 2	Addr + 3 (MSB)
B	G	R	A

Table 7-37. VPDMA ARGB in 32-bit Memory/CPU Register

Bit 31	Bit 23	Bit 15	Bit 7
A	R	G	B

In order color components to be mapped correctly and to avoid swapping, the reversal must be taken into consideration when configuring the Data Type in the VPDMA transfer descriptor.

Table 7-38 shows the proper settings required for RGB data types for both storage schemes.

Table 7-38. VPDMA Descriptor RGB Data Type Mapping

Source/Destination Image		VPDMA Data Type Mapping Value	
RGB Component order	Common Image Format Names	**Column A** Source data stored in the VPDMA defined order	**Column B** Source data stored in the opposite of VPDMA defined order
RGB	RGB16-565	0x0	0x10
	ARGB-1555	0x1	0x13
	ARGB-4444	0x2	0x14
	RGBA-5551	0x3	0x11
	RGBA-4444	0x4	0x12
	ARGB24-6666	0x5	0x18
	RGB24-888	0x6	0x16
	ARGB32-8888	0x7	0x19
	RGBA24-6666	0x8	0x15
	RGBA32-8888	0x9	0x17
BGR	BGR16-565	0x10	0x0
	ABGR-1555	0x11	0x3
	ABGR-4444	0x12	0x4
	BGRA-5551	0x13	0x1
	BGRA-4444	0x14	0x2
	ABGR24-6666	0x15	0x8
	BGR24-888	0x16	0x6
	ABGR32-8888	0x17	0x7
	BGRA24-6666	0x18	0x5
	BGRA32-8888	0x19	0x9

In Table 7-38, if the application uses the same data type definition as the VPDMA (that is, RGB24 refers to the B in the LSB), the data types in Column A should be used. But, if the application expects the common data type component order for RGB data type names, the VPDMA data types in Column B should be used.

For example:

- To display an ARGB32-8888 source image data with A in the LSB, the data type in the descriptor should be set to 0x19. But, to display an ARGB32-888 source image data with B in the LSB, the data type in the descriptor should be set to 0x7.
- To capture and write out a RGB24-888 image in the memory with R in the LSB, the data type in the

descriptor should be set to 0x16 (this case assumes the VIP VIN d[23:0] data input is mapped to RGB bus with B component in the LSB).

Setting YUV Data Types

There is no component order reversal for YUV data types. The VPDMA uses generic data type names to specify the memory storage format and the application simply needs to follow the VPDMA defined ordering.

Table 7-39 shows how common YUV data types map to the VPDMA YUV data types in order to clarify the YUV data type configuration.

Table 7-39. VPDMA Descriptor YUV Data Type Mapping

Source YUV Image Types			VPDMA Data Type Mapping (Value)		
Chroma Sub-sample	Common YUV Image Format Type Names	Memory Packed Order [MSB - LSB]	Luma/Chroma Interleaved Channel	Luma-only Channel	Chroma-only Channel
444	YUV	V U Y	YC 4:4:4 (0x8)		
	UVY	Y V U	Cb 4:4:4 (0x14)		
422	NV16 (YUV422SP_UV)	V U		Y 4:2:2 (0x1)	C 4:2:2 (0x5)
	NV16 (YUV422SP_VU)	U V		Y 4:2:2 (0x1)	Cb 4:2:2 (0x15)
	YUV2/YUYV/V422 (YUV422I_YUYV)	V Y U Y	YC 4:2:2 (0x7)		
	YUV422I_YVYU	U Y V Y	CbY 4:2:2 (0x17)		
	Y422/UYVY (YUV422I_UYVY)	Y V Y U	YC 4:2:2 (0x27)		
	YUV422I_VYUY	Y U Y V	YCb 4:2:2 (0x37)		
420	NV12 (YUV420SP_UV)	V U		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see (1))	C 4:2:0 (0x6) YC 4:2:2 (0x7) (see (1))
	NV21 (YUV420SP_VU)	U V		Y 4:2:0 (0x2) YC 4:2:2 (0x7) (see (1))	Cb 4:2:0 (0x16) YC 4:2:2 (0x7) (see (1))

(1) If 422 source data is used, unused component data fetched (either Luma or Chroma) will be discarded.

For further details on the data formats, refer to Section 7.4.8.9, *VPDMA Data Formats*.

7.4.8.7.1.1.2 Notify

The Notify bit is used in conjunction with the Notify interrupts and when the channel has completed the DMA transfer the Notify Interrupt for the list that contains the descriptor will fire. The last Notify bit set for a specific list will be used so only a single Notify should be set in a list.

7.4.8.7.1.1.3 Field

The Field bit is the field value of the data that will be passed down to the clients. If the data is interlaced, then this value should be cleared to 0.

7.4.8.7.1.1.4 Even Line Skip

The Even Line skip is used with Line Stride to generate the next line address on an even line. All frames start on line 0. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

7.4.8.7.1.1.5 Odd Line Skip

The Odd Line skip is used with Line Stride to generate the next line address on an odd line. All frames start on line 0, so this will apply starting with the second line. This value allows for the DMA controller to skip lines for interlaced data in a progressive frame buffer.

7.4.8.7.1.1.6 Line Stride

Bits 15:0 are the stride between lines in bytes at the external address. This value is added or subtracted based upon an adjustment using the current skip value. Operation of the external address pointer shall load the Source Address upon start of the transfer, then at the end of each line increment or decrement by the value computed using the Line Stride and Skip value for the line. The line stride must be aligned to an L3 data bus width. The lower bits of the stride will always be treated as zero to force the alignment.

7.4.8.7.1.2 Data Packet Descriptor Word 1

Table 7-40. Data Packet Descriptor Word 1 Field Description

Bits	Name	Description
31:16	Line Length	Line Length in Pixels
15:0	Transfer Height	Number of rows in transfer.

7.4.8.7.1.2.1 Line Length

Bits 31-16 are the line length in pixels of the current channel. This is ignored for the outbound transfer as the client will provide the line length with the end of line signal on the client interface. The maximum supported line length is currently 4096.

7.4.8.7.1.2.2 Transfer Height

Bits 15-0 are the number of lines to be transferred in the current channel. This is ignored for outbound transfers as the client will provide the line length with the end of frame signal on the client interface. The maximum supported transfer size is currently 2048.

7.4.8.7.1.3 Data Packet Descriptor Word 2

Table 7-41. Data Packet Descriptor Word 2 Field Descriptions

Bit	Field	Value	Description
31:0	Start Address		32-bit data source address [31:0]
			If Mode is TILED, then TILER specific ADDRESS Map is used:
			Bits 31-29:
		0	0-degree view
		1h	180-degree view + mirroring
		2h	0-degree view + mirroring
		3h	180-degree view
		4h	270-degree view + mirroring
		5h	270-degree view
		6h	90-degree view
		7h	90-degree view + mirroring
			Bits 28-27:
		0	8-bit container
		1h	16-bit container
		2h	32-bit container
		3h	Page Mode
			If Mode is NORMAL, then bits 31-26 are the upper bits of the address.

7.4.8.7.1.3.1 Start Address

This is the byte aligned address for the first data transfer. The address on the OCP bus will always be word aligned.

7.4.8.7.1.4 Data Packet Descriptor Word 3

Table 7-42. Data Packet Descriptor Word 3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xa
26	Mode	0= Normal, 1=TILED
25	Direction	Inbound = 0, Outbound = 1
24:16	Channel	Channel for which this descriptor describes
15	Reserved	Reserved for future use
11:9	Priority	Only Bit 9 and Bit 11 are used to set the priority. Bit 10 is ignored. Highest = 0, Lowest = 3 By default, hardware assigns priority = 3. This priority level is used in the arbitration between the masters (for DDR access). See Section 7.4.8.7.1.4.5, *Priority*, for more details.
8:0	Next Channel	Next Channel to execute on a line or the channel to use in the generated write descriptor.

7.4.8.7.1.4.1 Packet Type

Bits 31:27 are a unique code which indicates that this Descriptor is a VPDMA descriptor.

7.4.8.7.1.4.2 Mode

Bit 26 is used to indicate if the transfer is to regular memory space or to Tiled memory space. The VPDMA will use this to determine if it does standard raster based addressing or if it assumes that the data is stored in TILER format. If data is stored in TILER format then the buffer is turned into 2 or 4 line buffers depending on the container type. For shared clients that use the memory, such as the ancillary data and the VIP port, only one can be active, if the mode field is set. Only clients that support Tiling will properly pack the data for tiling on the output interface. This must only be set for channels going to clients that support the TILING feature in the client configuration.

7.4.8.7.1.4.3 Direction

Bit 25 is used to indicate the direction of transfer. This bit indicates that the data flow is from an external source to an internal buffer (inbound) or data transfers form an internal buffer to an external location (outbound).

7.4.8.7.1.4.4 Channel

Bits 24:16 are the Channels which is supported by the descriptor. This is the identification of the specific Channel which is controlled by the contents of the descriptor. The channel assignments can be found in the channel table.

7.4.8.7.1.4.5 Priority

Bits 11:9 are set to indicate priority of the transfer, these are directly mapped to the OCP reqinfo bits.

7.4.8.7.1.4.6 Next Channel

Bits 8:0 give the next channel to use to create a composite frame. The next channel must be to a free channel. The last channel of a row should point back to the initial channel which must be a channel tied directly to a client. The Descriptor for the Next Channel must be of the same type as the current descriptor.

7.4.8.7.1.5 Data Packet Descriptor Word 4

7.4.8.7.1.5.1 Inbound data

Table 7-43. Data Packet Descriptor Word 4 Inbound Data Field Descriptions

Bits	Name	Description
31:16	Frame Width	Width of the client frame.
15:0	Frame Height	Height of the client frame

7.4.8.7.1.5.1.1 Frame Width

Bits 31:16 indicate the width in pixels of the frame. This is the width of the entire frame and not just the width of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum width is 4096.

7.4.8.7.1.5.1.2 Frame Height

Bits 15:0 indicate the height in pixels of the entire frame. This is the height of the entire frame and not just the height of the data represented by the current channel unless this channel fills the entire frame. This allows for the VPDMA to present a larger frame of data to the client while only fetching the required data. The currently supported maximum height is 2048.

7.4.8.7.1.5.2 Outbound data

Table 7-44. Data Packet Descriptor Word 4 Outbound Data Field Descriptions

Bits	Name	Description
31:5	Descriptor Write Address	The 32 byte aligned location to write an inbound descriptor
2	Write Descriptor	If set to 1, a descriptor will be generated when the client completes a frame.
1	Drop Data	If set to 1, the data will not be written out. Also, if this is set, the write descriptor bit must be set. This allows for descriptors to only be written out so that software can determine the size of the required buffer before data is written out.
0	Use Descriptor Register	If set to 1, the CURRENT_DESCRIPTOR register will be used for the write address location. If set to 0, the Descriptor Write Address field in this word will be used for the Descriptor Write Address.

7.4.8.7.1.5.2.1 Descriptor Write Address

Bits 31:5 set the 32 byte address to write the generated descriptor. This address is only used if the Write Descriptor bit is set to 1 and the Use Descriptor Register bit is set to 0. If this case is met when the channel is complete a descriptor that meets the inbound descriptor format will be written to the location specified by this field. This allows for software to have a specific channel write its descriptor to a specific address no matter what order the channel completes compared to other outbound channels.

7.4.8.7.1.5.2.2 Write Descriptor

Bit 2 determines if a descriptor should be written out when the client is completed. If this bit is set the descriptor will be written. The format of the descriptor will be of an Inbound Data Transfer descriptor with the LINE LENGTH and TRANSFER HEIGHT fields determined by the counters in the clients. This means that the direction bit will be the opposite of the inbound descriptor. The FRAME WIDTH and FRAME HEIGHT values will match the LINE LENGTH and TRANSFER HEIGHT fields. The CHANNEL and NEXT CHANNEL fields will match the NEXT CHANNEL field of the original descriptor. The FIELD bit will match the source field captured by the client. The NOTIFY bit will always be 0. All other fields will match the original outbound descriptor. If the Outbound descriptor MODE is set to TILED data then the descriptor address used will be in TILED data space and software must ensure that the address is in page mode for the address of the descriptor.

7.4.8.7.1.5.2.3 Drop Data

Bit 1 determines if the data should be written out or not. In some cases software might only want to write the descriptor out to determine the size of the buffer that will be required to store incoming data. By setting this bit,no data will be written out. If this bit is set then the Write Descriptor bit MUST be set. Bit 0 determines where the descriptor should be written.

7.4.8.7.1.6 Data Packet Descriptor Word 5

7.4.8.7.1.6.1 Outbound data

Width and Height are set in the following register bit-fields:

- For Max_Size1: VIP_MAX_SIZE1[31:16] MAX_WIDTH and VIP_MAX_SIZE1[15:0] MAX_HEIGHT registers
- For Max_Size2: VIP_MAX_SIZE2[31:16] MAX_WIDTH and VIP_MAX_SIZE2[15:0] MAX_HEIGHT registers
- For Max_Size3: VIP_MAX_SIZE3[31:16] MAX_WIDTH and VIP_MAX_SIZE3[15:0] MAX_HEIGHT registers

Table 7-45. Data Packet Descriptor Word 5 Outbound Data Field Descriptions

Bits	Name	Description
6:4	Max Width	The maximum allowable pixels per line. 0: Unlimited Line Size
		1: Use Max_Size1 Max Width field
		2: Use Max_Size2 Max Width field
		3: Use Max_Size3 Max Width field
		4: 352 pixels
		5: 768 pixels
		6: 1280 pixels
		7: 1920 pixels
		Others: Reserved
2:0	Max Height	The maximum allowable lines per frame. 0: Unlimited Frame Size
		1: Use Max_Size1 Max Height field
		2: Use Max_Size2 Max Height field
		3: Use Max_Size3 Max Height field
		4: 288 lines
		5: 576 lines
		6: 720 lines
		7: 1080 lines
		Others: Reserved

7.4.8.7.1.6.1.1 Max Width

Bits 6:4 are encoded to set the maximum transferred line size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed pixels the data will continue to be received from the client but will not be sent to external memory until an end of line is received from the client sending data. The outbound descriptor if created will still have the transmitted size of the last line of the frame which will match the max width. If the frame does not exceed the max width then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0. If Max Width is 0 and the line size is larger then 4096 pixels then the address counters will overflow and the data at the start of the line will be overwritten.

7.4.8.7.1.6.1.2 Max Height

Bits 2:0 are encoded to set the maximum transferred frame size. If the field is not set to unlimited if the client sending data into the VPDMA exceeds the maximum allowed lines the data will continue to be received from the client but will not be sent to external memory until an end of frame is received from the client sending data. The outbound descriptor if created will still have the transmitted number of lines received which would match the max height. If the frame does not exceed the max height then the actual transmitted size will be placed in the descriptor. Tiled clients such as the noise filter should always set this to 0.

7.4.8.7.2 Configuration Descriptor

The Configuration Descriptor is used in a List to setup a client configuration. The configuration descriptor consists of a header and a payload portion. The payload can either be part of the list that the descriptor is contained in or it can be at a separate location. The VPDMA will pass the payload of the configuration descriptor down to the client over the VPI Control port interface or through the MMR configuration port depending on the destination field. A Configuration Descriptor to any single destination except Destination 0 must be on a single list. Configuration Descriptors to different destinations may be on different lists..

The Configuration Descriptor Header is 4 × 32 bit words. A configuration descriptor is not consumed until the destination specified has received the entire configuration payload. Therefore the list is expected to stall while the configuration takes place. This ensures that all descriptors after a configuration descriptor in the list will occur after the desired configuration.

7.4.8.7.2.1 Configuration Descriptor Header Word0

Table 7-46. Configuration Descriptor Header Word0 Field Descriptions

Bits	Name	Description
31:0	Address Offset of the Destination	This is the address offset location in the destination that the block of data in the payload should be written. This field is only used if the descriptor Class is a block type. Otherwise this field is reserved.

7.4.8.7.2.2 Configuration Descriptor Header Word1

Table 7-47. Configuration Descriptor Header Word1 Field Descriptions

Bits	Name	Description
15:0	Number of Data Words	Length of First Data Packet for Class 1(block).

7.4.8.7.2.2.1 Number of Data Words

Bits 15:0 indicate the length of the first data block if the class is 1 as specified in Configuration Descriptor Header Word3. If the class is not 1 then this field should be set to 0.

7.4.8.7.2.3 Configuration Descriptor Header Word2

Table 7-48. Configuration Descriptor Header Word2 Field Descriptions

Bits	Name	Description
31:0	Payload Location	Pointer to the data payload

7.4.8.7.2.3.1 Payload Location

Bits 31:0 contain the pointer to the data payload if the command packet is an indirect type. This value along with the Payload Length will be combined to issue a DMA transaction that must complete before the List Manager can finish processing this descriptor. The list will be made inactive pending this DMA completion. This address should be on a 16 byte boundary so the lower 4 bits should always be 0.

7.4.8.7.2.4 Configuration Descriptor Header Word3

Table 7-49. Configuration Descriptor Header Word3 Field Descriptions

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xb
26	Direct	Direct Command = 1 Indirect Command = 0
25:24	Class	0 = Address, Data Set 1 = Block 2,3 Reserved for Future Use
23:16	Destination	Destination of the configuration payload
15:0	Payload Length	Length of Payload in Words.

7.4.8.7.2.4.1 Packet Type

Bits 31:27, this field indicates the type of descriptor and should be set 0xB for configuration descriptor.

7.4.8.7.2.4.2 Direct

Bit 26, this field indicates that the descriptor is a direct command or indirect command. A direct command means that the payload is contiguous with the descriptor and will be pulled in by the list manager descriptor control as it processes the list. A direct payload must end on or before a 256 byte boundary in the list. An indirect command is when the Address is located in Word2 is a pointer to the data payload. A DMA transaction will be scheduled to bring the payload into the List Manager to allow for the payload to be sent to the destination.

7.4.8.7.2.4.3 Class

Bits 25:24, this field indicates the type of payload is associated with command descriptor, and thus how to handle the payload.

A 0 indicates that the payload consists of blocks of data with each block having an address and length. The first word after a sub-block contains the next address and length in bytes. This allows for writing to multiple configuration regions in a client. The Configuration Descriptor word1 is the first address and length pair. All addresses used must be larger then the previous address for all destinations except for the MMR destination. If a sub block length is not evenly divisible into 16 then zeroes should be padded in the payload so that the Next Client Address and Length field start on a 16 byte boundary.

7.4.8.7.2.4.3.1 Address Data Block Format

Table 7-50. Address Data Block Format Field Descriptions

Bits	Name	Description
31-0		Next Client Address
31-0		Configuration for Next Client Address
31-0		Configuration for Next Client Address + 4
31-0		Configuration for Next Client Address + 8
31-0		Configuration for Next Client Address + 12
31-0		Configuration for Next Client Address + 16
31-0		Next Client Address 2
15-0		Sub Block Length

A 1 indicates the payload is simply block data. The data is contiguous and starts at the offset of the destination as specified in word1.

7.4.8.7.2.4.4 Destination

The Destination field is used to determine where the configuration payload should be sent. The values for the destination field can be seen in the table below.

Table 7-51. Destination Field Description

Destination Value	Actual Destination	Description
0	mmr_client	Write to MMR registers to setup other modules
7	VIP Slice 0	VIP Slice 0 Scaler Coefficient Tables
8	VIP Slice 1	VIP Slice 1 Scaler Coefficient Tables

7.4.8.7.2.4.5 Descriptor Length

Bits 15:0, this field indicates the size of the payload in words for the command. This is 128 bit words. The maximum number of words is 1023 words in a single payload

7.4.8.7.3 Control Descriptor

7.4.8.7.3.1 Generic Control Descriptor Format

A control descriptor is the mechanism that is used in a list to give commands to the List Manager. These descriptors are not considered consumed until the List Manager has done the instruction required by the descriptor. All control descriptors have a common Header located at Word 3 but the remaining words are based on the specific control descriptor.

7.4.8.7.3.2 Control Descriptor Header Description

Table 7-52. Control Descriptor Header Description

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = 0xc
26:25	Reserved	Reserved
24:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	The type of control descriptor that should be run by the List Manager

7.4.8.7.3.2.1 Packet Type

This field indicates a VPDMA control descriptor.

7.4.8.7.3.2.2 Source

The source is combined with the control field to determine what the control descriptor should use as the source for its synchronization event.

7.4.8.7.3.2.3 Control

The Control field defines the specific function of the descriptor. Table 7-53 lists the different control descriptors.

7.4.8.7.3.3 Control Descriptor Types

Table 7-53. Control Descriptor Types Summary

Control Descriptor	Control Field Value	Description
Sync on Client	0	Wait for the client attached to the channel specified to reach a certain event before proceeding.
Sync on List	1h	Wait for another list(s) to reach its Sync on List Descriptor
Sync on External Event	2h	Wait for a Register write to the LIST_STAT_SYNC bit specified or for an external event.
Sync on Channel	4h	Wait for the channel specified to complete
Change Client Interrupt	5h	Change the interrupt event for a client interrupt but do not wait for the event to occur.
Send Interrupt	6h	Generate an interrupt event on one of the Control Descriptor Interrupts
Reload List	7h	Reload the list from the location and size specified.
Abort Channel	8h	Abort the transfer in the channel specified.

7.4.8.7.3.3.1 Sync on Client

A Sync on Client Control descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. For a client that supports multiple channels then only an event on the portion of the client that supports that client will cause the interrupt to be generation. After configuring the interrupt generation event the list will then stall until that event has occurred.

Table 7-54. Sync on Client Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger

Table 7-55. Sync on Client Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 0

7.4.8.7.3.3.2 Sync on List

The Sync on List Control descriptor is a mechanism to ensure that multiple lists have all reached a common point. The Sync on List descriptor uses the Source field as a mask for each list that should be synchronized which must include the list where the control descriptor resides. Once all lists specified in the source field have reached their Sync on List descriptor all lists will resume with the lowest list number resuming first. All Sync on List Control descriptors in each of the lists must have the same source field so that all lists will synchronize upon reaching that point.

If it is desired to synchronize list 0 and list 1 then the source field would be 0x3. If it is desired to synchronize list 1, list 3, and list 4 then the source field would be 0x1a. Word 0, Word 1 and Word 2 are reserved.

Table 7-56. Sync on List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 1h

7.4.8.7.3.3.3 Sync on External Event

A Sync on External Event descriptor ensures an external event has occurred before proceeding. The external event can be a write to a bit of the LIST_STAT_SYNC register or other external events that are determined at VPDMA elaboration to have occurred. This descriptor can be used to allow for external software to control progression of the list. The descriptor can also be used to select external signals that are brought into the VPDMA. The current implementation just synchronize on the LIST_STAT_SYNC bit for the list number that called the descriptor.

Table 7-57. Sync on External Event Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 2h

7.4.8.7.3.3.4 Sync on Channel

A Sync on Channel descriptor stalls the list until the channel specified is free. If the channel is already free then the descriptor will not cause the list to stall. Word 0, Word 1 and Word 2 are reserved.

Table 7-58. Sync on Channel Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 4h

7.4.8.7.3.3.5 Sync on LM Timer

A Sync on LM Timer descriptor sets a value from the current timer position to wait. The LM timer is a free running counter at the LM processing clock. The Timer Value in the descriptor is added to the value of the timer at the time the descriptor is received and the list will stall for this many cycles before it becomes active again.

7.4.8.7.3.3.6 Change Client Interrupt

A Change Channel Interrupt Source descriptor uses the source field to select a channel to modify the attached clients interrupt generation event. The list will not stall on this descriptor. The format of the fields is identical to the Sync on Client Descriptor. Word 0 is reserved.

Table 7-59. Change Client Interrupt Field Descriptions (Word - 1)

Bits	Name	Description
31:16	PIXEL_COUNT	Specify the pixel position on a line specified by LINE_COUNT where a pixel based event would occur.
15:0	LINE_COUNT	Specify the line where a line based event would trigger.

Table 7-60. Change Client Interrupt Field Descriptions (Word - 2)

Bits	Name	Description
31:4	Reserved	Reserved
3:0	Event	Specify the event which should trigger the client interrupt.

Table 7-61. Change Client Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved

Table 7-61. Change Client Interrupt Field Descriptions (Word - 3) (continued)

Bits	Name	Description
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 5h

7.4.8.7.3.3.7 Send Interrupt

A Send Interrupt descriptor will cause the VPDMA to generate an interrupt on the list manager controlled interrupts as specified by the Source Field. The list will not stall on this descriptor. For example, if source is 0 then control_descriptor_int0 will fire. If source is 12, then control_descriptor_int12 will fire. For more information ot VPDMA interrupt events, see Section 7.4.8.6, *VPDMA Interrupts*.

Table 7-62. Send Interrupt Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:24	Reserved	Reserved
23:16	Source	Specifies the source used for the control event.
15:4	Reserved	Reserved for future use
3:0	Control	Control type = 6h

7.4.8.7.3.3.8 Reload List

A Reload List descriptor causes ending descriptors after this descriptor in the original list to be dropped and a new list at the location and of the size specified in the descriptor. This descriptor can be used to allow for linked lists in the VPDMA as the list will continue from this point and fetch the list specified and it does not have to be continuous with the current list.

Table 7-63. Reload List Field Descriptions (Word - 0)

Bits	Name	Description
31:0	LIST_ADDRESS	31 most-significant Bits of the memory address where the descriptors to be loaded are stored. Address must be 16 byte aligned.

Table 7-64. Reload List Field Descriptions (Word - 1)

Bits	Name	Description
31:16	Reserved	Reserved
15:0	LIST_SIZE	Size of the list to load

Table 7-65. Reload List Field Descriptions (Word - 3)

Bits	Name	Description
31:27	Packet Type	Host Packet Descriptor Type = Ch
26:4	Reserved	Reserved
3:0	Control	Control type = 7h

7.4.8.7.3.3.9 Abort Channel

An Abort Channel descriptor is used to clear a channel. This clears the channel from issuing any more requests. Any outstanding requests for that channel will complete as originally scheduled. All data inside the client will be flushed. For Tiled Clients such as the noise filter it is required to issue two consecutive abort channel descriptors to ensure the channel is aborted for both the current tile and next tile. Word 0, Word 1 and Word 2 are reserved.

Table 7-66. Abort Channel Field Descriptions (Word - 3)

Bit	Name	Description
31:27	Packet Type	Host Packet Descriptor type = 0xC
26:24	Reserved	Reserved
23:16	Source	VPDMA Channel Number whose transfers are to be aborted
15:4	Reserved	Reserved
3:0	Control	Control type = 9h

7.4.8.8 VPDMA Configuration

The following section describes the different ways of configuring VPDMA for data transfers.

7.4.8.8.1 Regular List

A regular list executes each descriptor in order until the end of the list is reached. When the end of the list is reached an interrupt is sent and the list can be reused by software. A regular list can contain any descriptor types. Software creates the list at some location in external memory. After completing writing the list software then writes the location of the list to the VIP_LIST_ADDR[31:0] VIP_LIST_ADDR register and then writes the VIP_LIST_ATTR register. If the NUMBER in the VIP_LIST_ATTR[26:24] LIST_NUM is not an active list then the List will be loaded and begin to execute the next time the List Manager gets to IDLE after processing previous loaded lists. If the NUMBER in the VIP_LIST_ATTR[26:24] LIST_NUM is busy then the VIP_LIST_ADDR and VIP_LIST_ATTR registers will be locked until the active list specified by NUMBER completes.

The different ports inside VPDMA requires different list setup, as explained in the following sections.

7.4.8.8.2 Video Input Ports

The Video Input Ports can be used in multiple ways. Depending on how the input ports are configured will determine how the lists to manage them need to be setup. The ways in which the ports can work are multiplexed data stream, single YUV color separate stream, dual YUV interleaved or single RGB stream. Each port also has an ancillary data port that can run either multiplexed or single data stream and shares the buffering with the main data stream. For all cases the descriptor must be loaded into the client before the vertical sync is received on the VIP port or the entire frame will be dropped. As with all write clients the VIP channels can be shadowed so the next frame/field descriptor can be loaded while the previous frame is running without stalling the list.

7.4.8.8.2.1 Multiplexed Data Streams

In the case of a multiplexed data stream input the channels that should be used are VIP(X)_MULT_PORT(Y)_SRC(Z). Where X is the specific VIP slice of the instance that wants to be used and port Y is the port A or port B that is receiving the data. Finally Z is the channel number. For Split line mux mode the LSB of the channel will determine, if the line is a split line or a complete line. This is required so that the data streams do not get mixed when a channel ends without completing a line. In this mode the data will always be sent out as 422 Interleaved data to the destination specified in the descriptor.

7.4.8.8.2.2 Single YUV Color Separate

If the port is configured to be used as sending out color separated YUV data then the channels that must be used are VIPX_PORTY_LUMA and VIPX_PORTY_CHROMA for the luma and chroma components respectively. The data type can be either 420 or 422 color separate in this case.

7.4.8.8.2.3 Dual YUV Interleaved

If the port is configured to be used to send out 422 interleaved data from a non-multiplexed source then the channels that must be used are VIPX_PORTY_LUMA or VIPX_PORTY_CHROMA depending on if the data stream is connected to the luma or chroma port. The data type must be 422 interleaved in this case.

7.4.8.9 VPDMA Data Formats

Each of the channels has a type of data that it can support based upon the client that it services. Also for each channel, the data type will assume that data is packed in memory a certain way and will be prevented to the client in the same manner to the client no matter what the format of the data in memory.

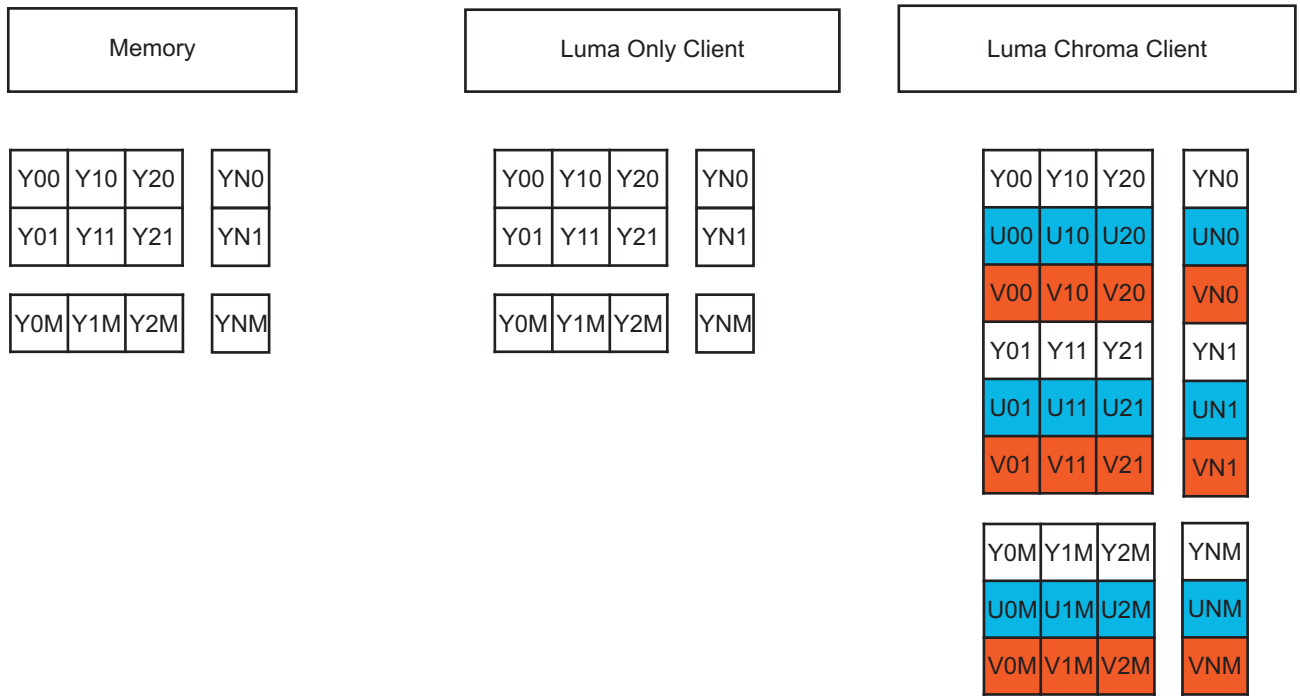
7.4.8.9.1 YUV Data Formats

The YUV formatted channels expect video data that is in YUV color space. The YUV data can be type is for YUV data and it can support both interleaved data where Luma and Chroma are in the same data buffer or it can support co-planar data where the Luma and Chroma are in separate data buffers. The YUV channel also can be given a position to give a different start position for the client instead of the default upper left hand corner of the frame. The storage format for YUV data depends on the data type field. The data type must be set to a data type that the channel can support. All the clients that data are provided too will either accept Luma Only, Chroma Only or Luma and Chroma in a parallel data bus.

7.4.8.9.1.1 Y 4:4:4 (Data Type 0)

The Y 4:4:4 data type is used for a co-planar 4:4:4 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and height set to the desired frame size expected by the receiving client.

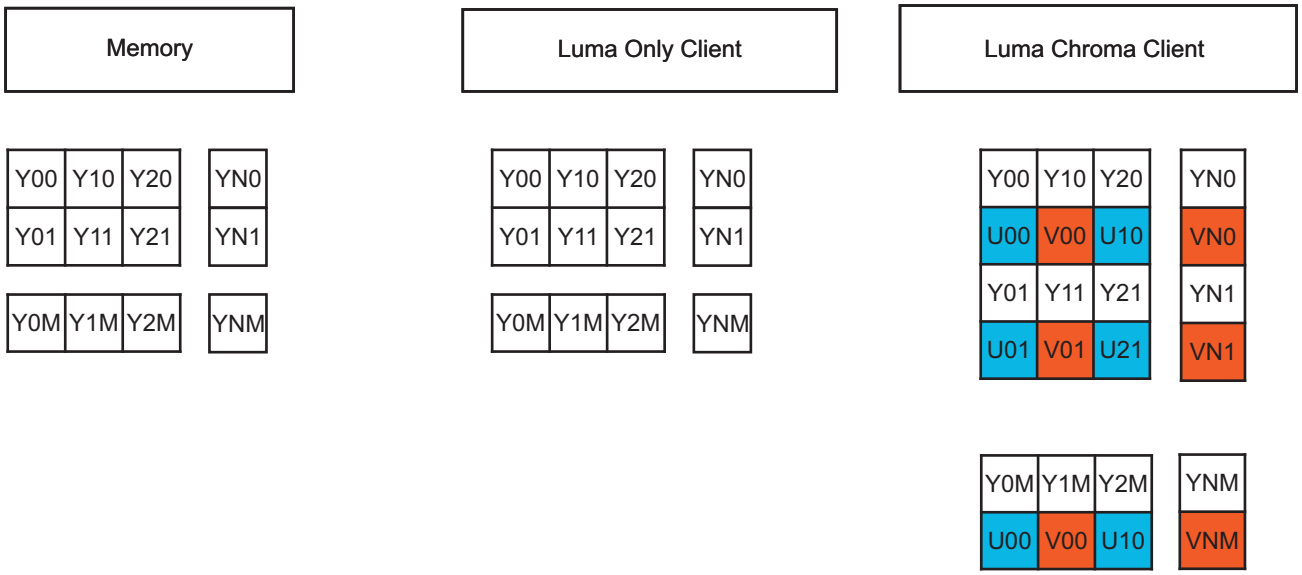
Figure 7-91. Y 4:4:4 (Data Type 0)



7.4.8.9.1.2 Y 4:2:2 (Data Type 1)

The Y 4:2:2 data type is used for a co-planar 4:2:2 data. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the desired frame sent by the VPDMA to the receive client.

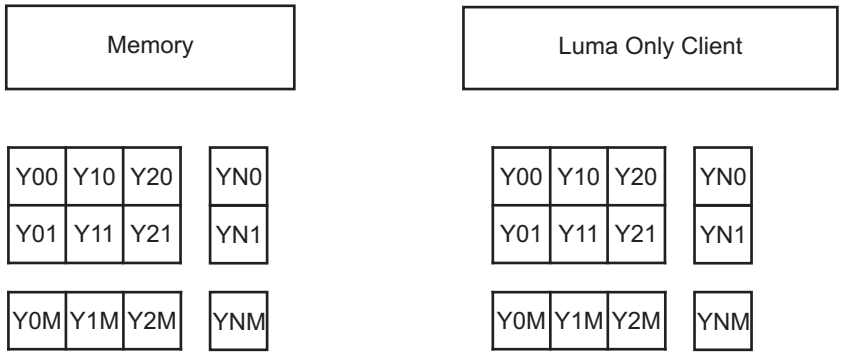
Figure 7-92. Y 4:2:2 (Data Type 1)



7.4.8.9.1.3 Y 4:2:0 (Data Type 2)

The Y 4:2:0 data type is used for a co-planar 4:2:0 data type. In this mode the data is assumed to be a single byte with each pixel is packed in a line. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 8 bit container. This data block should have the width and the height of the expected frame for the client.

Figure 7-93. Y 4:2:0 (Data Type 2)



7.4.8.9.1.4 C 4:4:4 (Data Type 4)

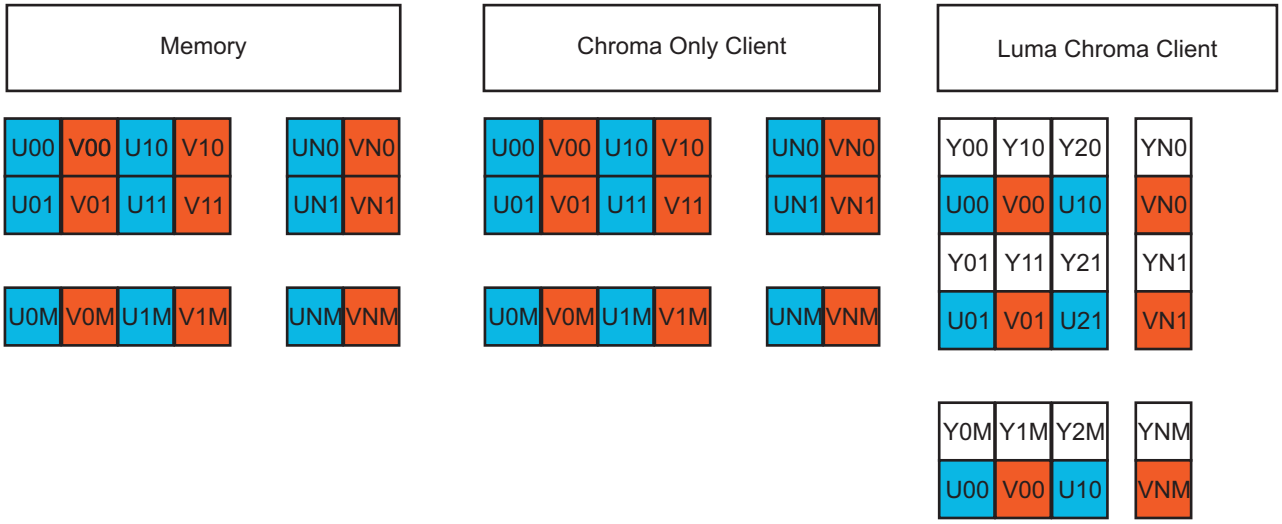
The C 4:4:4 data type is used for a co-planar 4:4:4 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and height of the expected client frame.

Figure 7-94. C 4:4:4 (Data Type 4)

7.4.8.9.1.5 C 4:2:2 (Data Type 5)

The C 4:2:2 data type is used for co-planar 4:2:2 data.It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 16 bit container. This data block should have the width and the height of the expected client frame.

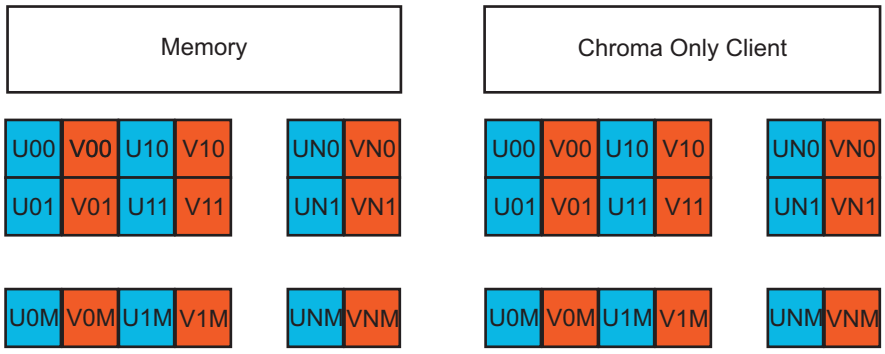
Figure 7-95. C 4:2:2 (Data Type 5)



7.4.8.9.1.6 C 4:2:0 (Data Type 6)

The C 4:2:0 data type is used for a co-planar 4:2:0 data. It is expected to be packed Cb in the lower byte and Cr in the upper byte in 16 bit words for each pixel. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in a 16 bit container. This data block should have the width and half the height of the expected clients frame.

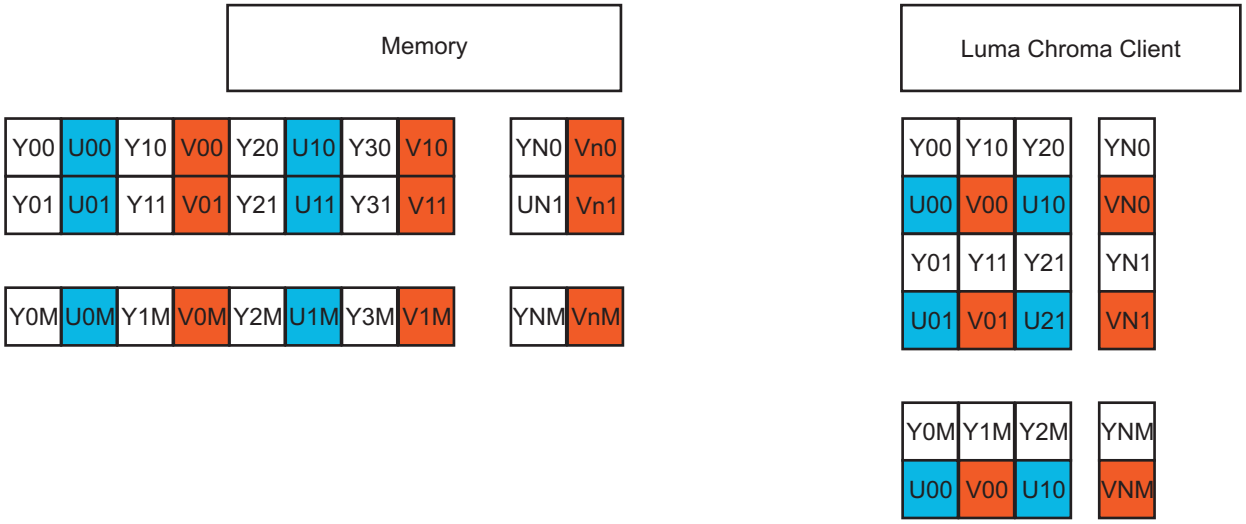
Figure 7-96. C 4:2:0 (Data Type 6)



7.4.8.9.1.7 YC 4:2:2 (Data Type 7)

The YC 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Y1 finally Cr in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

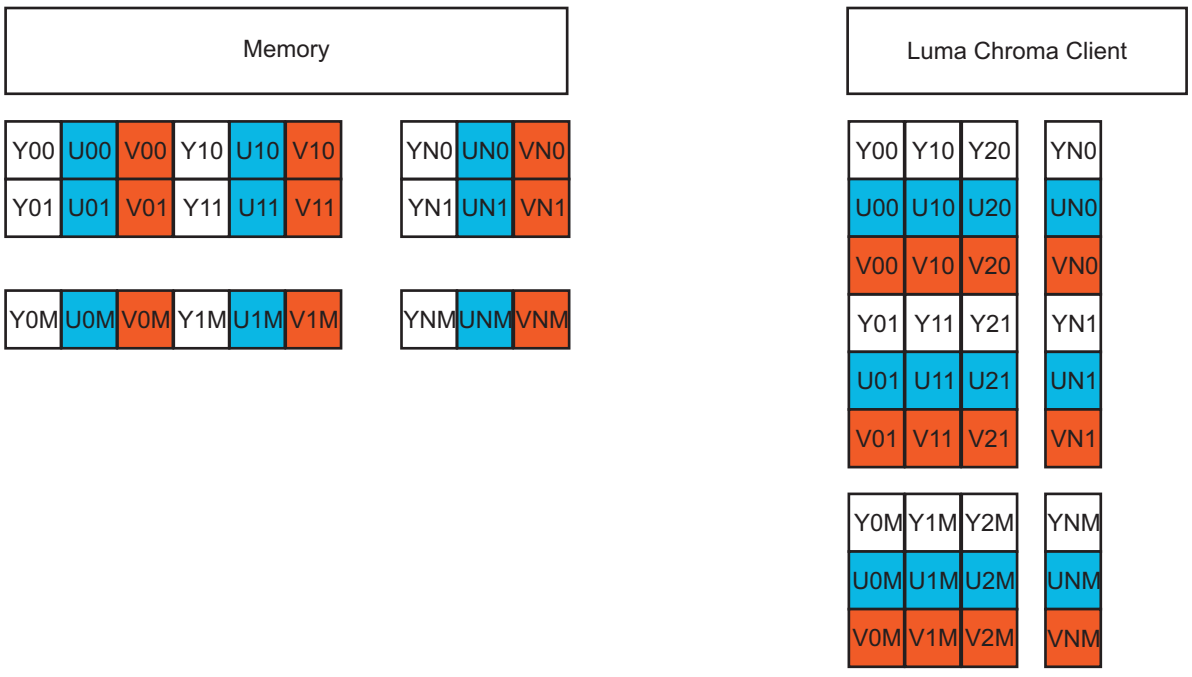
Figure 7-97. YC 4:2:2 (Data Type 7)



7.4.8.9.1.8 YC 4:4:4 (Data Type 8)

The YC 4:4:4 data type is used for interleaved 4:4:4 data. It is expected to be packed with Y0 in the lowest byte followed by Cb followed by Cr. The transfer counts each YCbCr triplet in a 24 bit word as a pixel. A 2D transfer of the data is NOT supported in the VPDMA. The data block width and height should be set to the number of pixels and lines that are expected by the client.

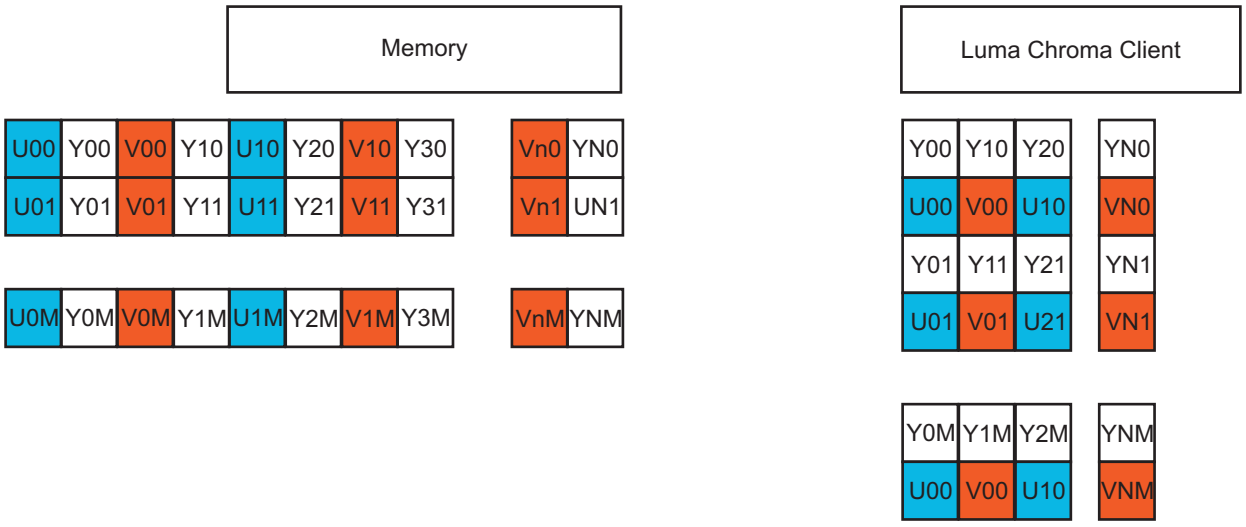
Figure 7-98. YC 4:4:4 (Data Type 8)



7.4.8.9.1.9 CY 4:2:2 (Data Type 23)

The CY 4:2:2 data type is used for interleaved 4:2:2 data. It is expected to be packed with Cb in the lowest byte followed by Y0 followed by Cr finally Y1 in the upper most byte. The transfer counts each YC pair in a 16 bit word as a pixel but the number of pixels should be even. If a 2D transfer of the data is used the VPDMA will assume this data type is stored in an 32 bit container. The data block width and height should be set the same as the expected client.

Figure 7-99. CY 4:2:2 (Data Type 23h)



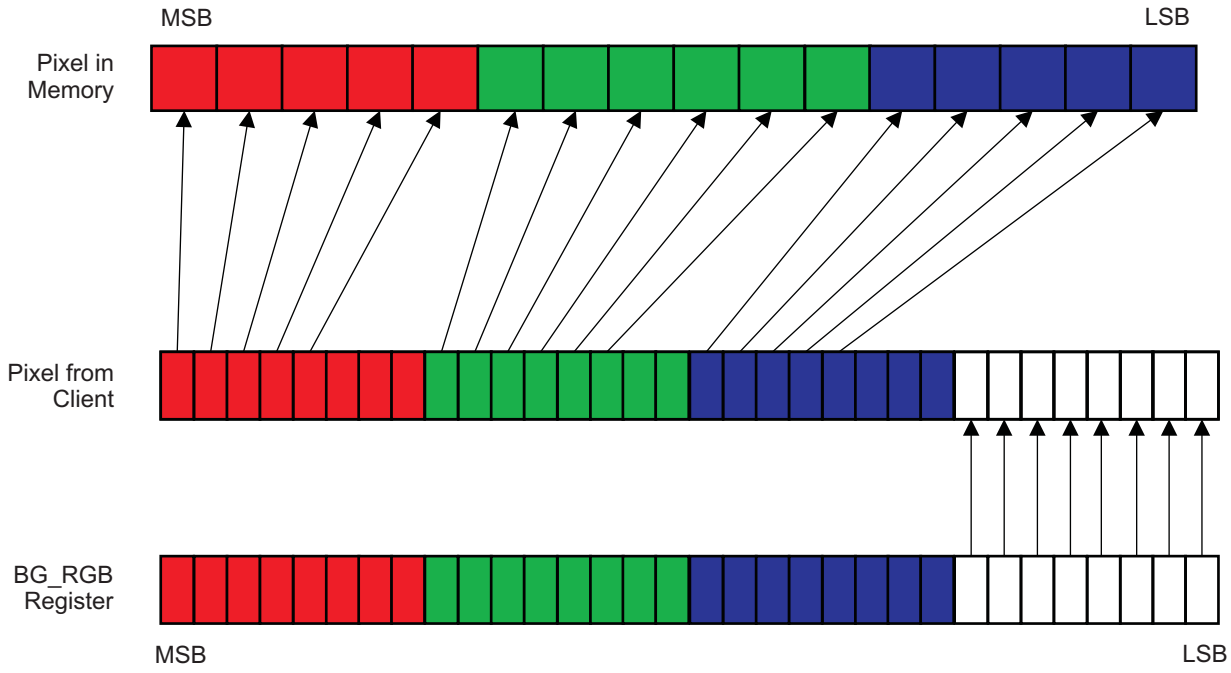
7.4.8.9.2 RGB Data Formats

The RGB channel type is used to provide data for a client that expects to transmit RGB data. In all modes the client is always RGBA 8888 data. The lower bits, if not provided by the data stream, are a replication of the lower bit of the data. For outbound data the input is assumed to be RGB 888 and the Alpha value is taken from the Background Color register to make a full ARGB 8888. The lower bits are dropped from this data, if a data type specifies less then the full 8 bits per color. The client has individual data buses for each component so they have no order dependency in the data bus.

7.4.8.9.2.1 RGB16-565 (Data Type 0)

In RGB16-565 mode, each pixel is a single RGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the middle 6 bits for green data and the upper 5 bits for red data.

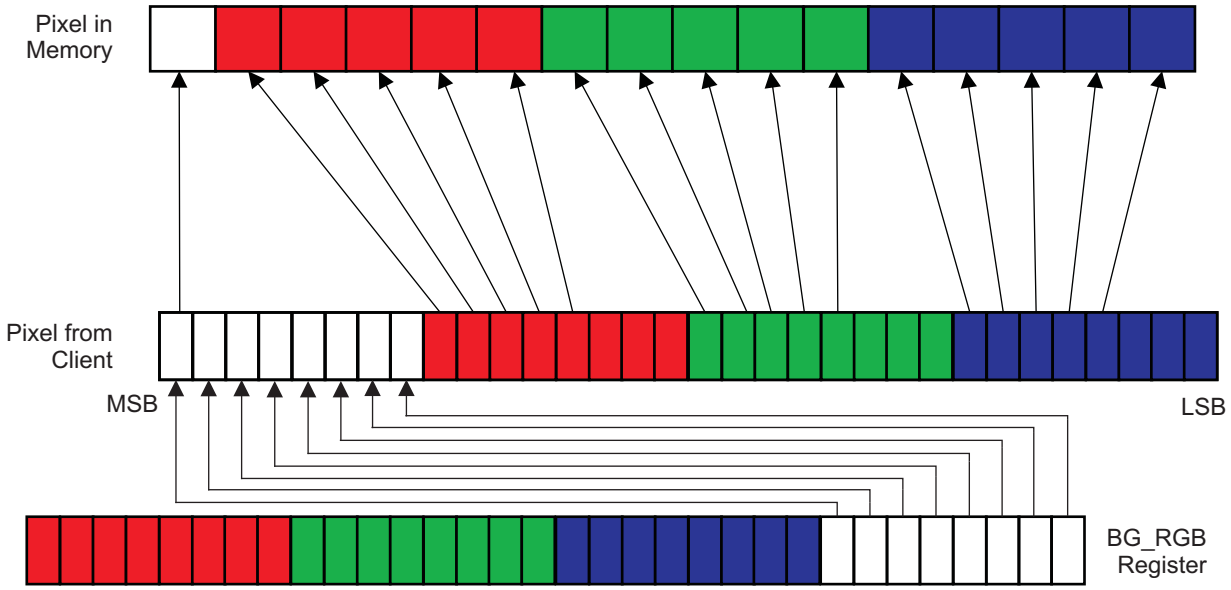
Figure 7-100. RGB16-565 (Data Type 0)



7.4.8.9.2.2 ARGB-1555 (Data Type 1)

In ARGB-1555 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lower 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data and the upper most bit for the blend value to use 0 or 0xFF.

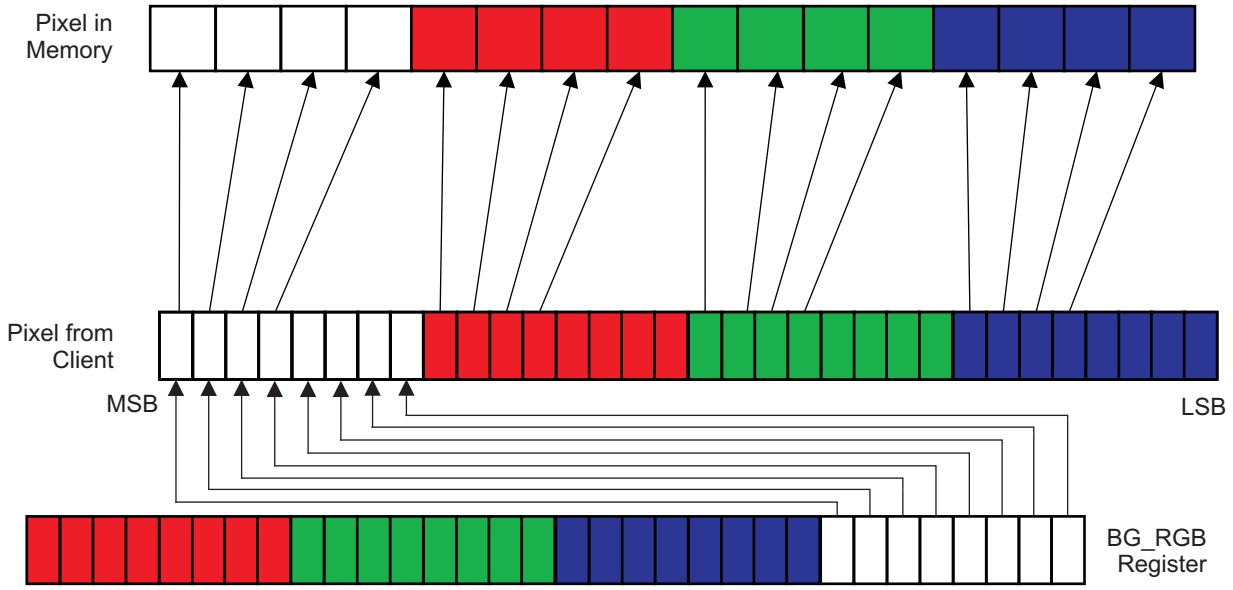
Figure 7-101. ARGB-1555 (Data Type 1)



7.4.8.9.2.3 ARGB-4444 (Data Type 2)

In ARGB16-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for blue data, the next 4 bits for green data the next 4 bits for red data and the upper most 4 bits for the blend value.

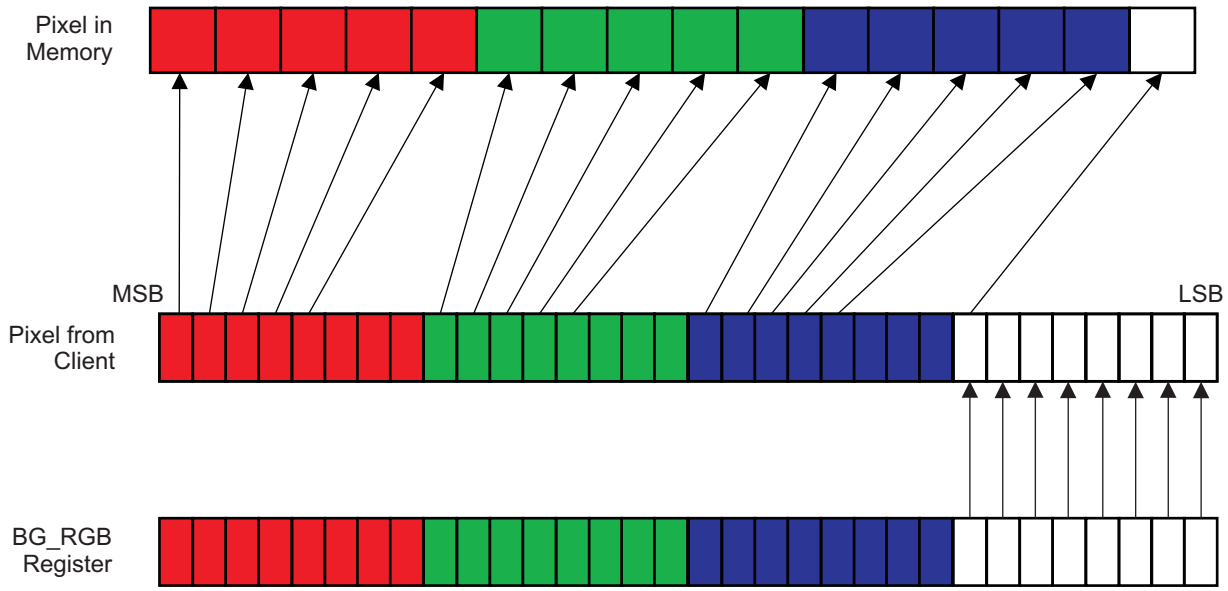
Figure 7-102. ARGB-4444 (Data Type 2)



7.4.8.9.2.4 RGBA-5551 (Data Type 3)

In RGBA-5551 mode, each pixel is a single ARGB pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest most bit for the blend value to use 0 or 0xff the next 5 bits for blue data, the next 5 bits for green data the next 5 bits for red data.

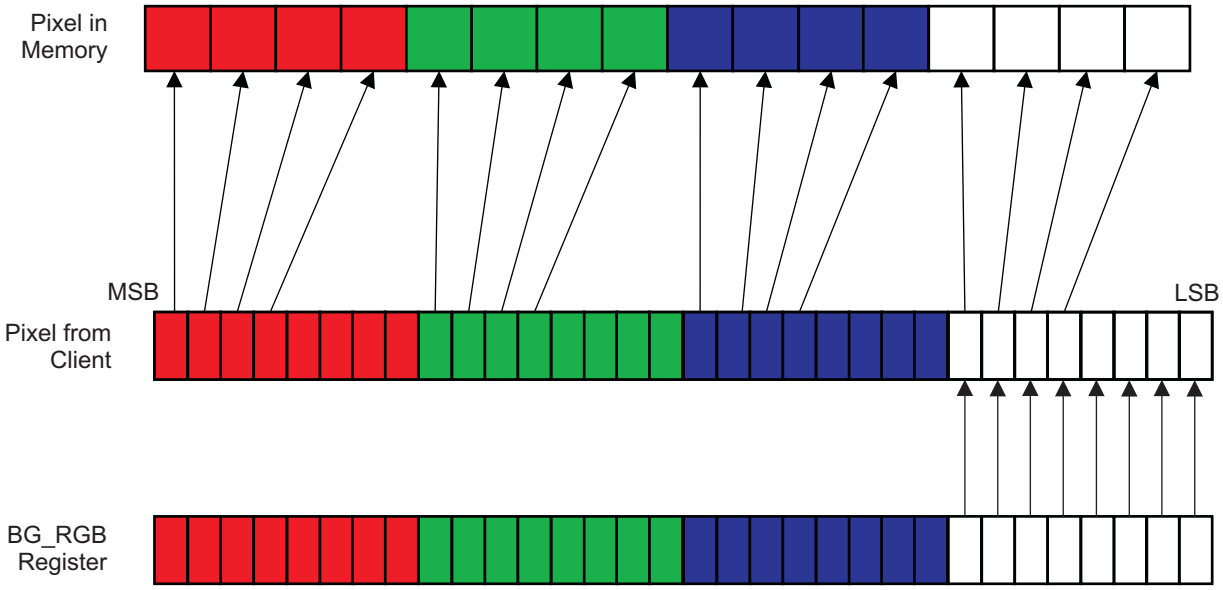
Figure 7-103. RGBA-5551 (Data Type 3)



7.4.8.9.2.5 RGBA-4444 (Data Type 4)

In RGBA-4444 mode, each pixel is a single RGBA pixel with 16 bits of data for each pixel. The 16 bits of data uses the lowest 4 bits for the blend value, the next 4 bits for blue data, the next 4 bits for green data and the upper most 4 bits for red data.

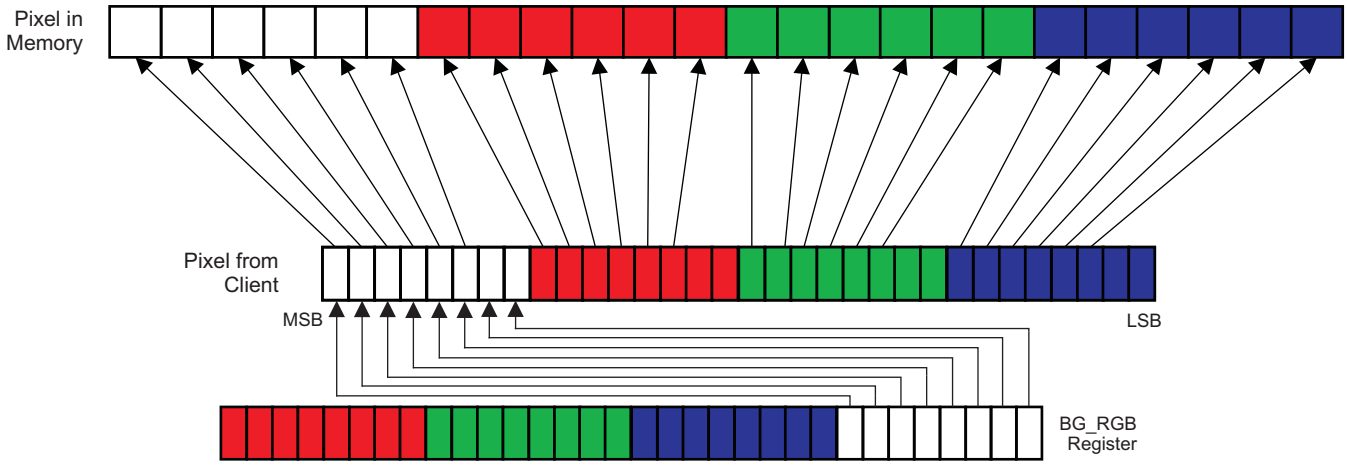
Figure 7-104. RGBA-4444 (Data Type 4)



7.4.8.9.2.6 ARGB24-6666 (Data Type 5)

In ARGB24-6666 mode, each pixel is a single ARGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper most 6 bits for red data.

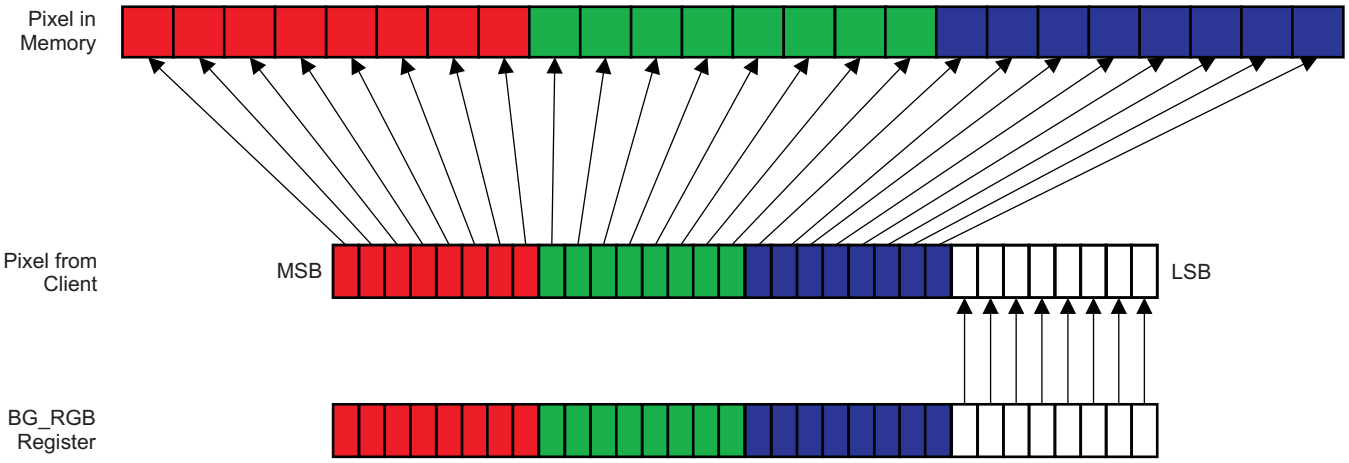
Figure 7-105. ARGB24-6666 (Data Type 5)



7.4.8.9.2.7 RGB24-888 (Data Type 6)

In RGB24-888 mode, each pixel is a single RGB pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data it uses the BG_RGB Blend value for the Blend value.

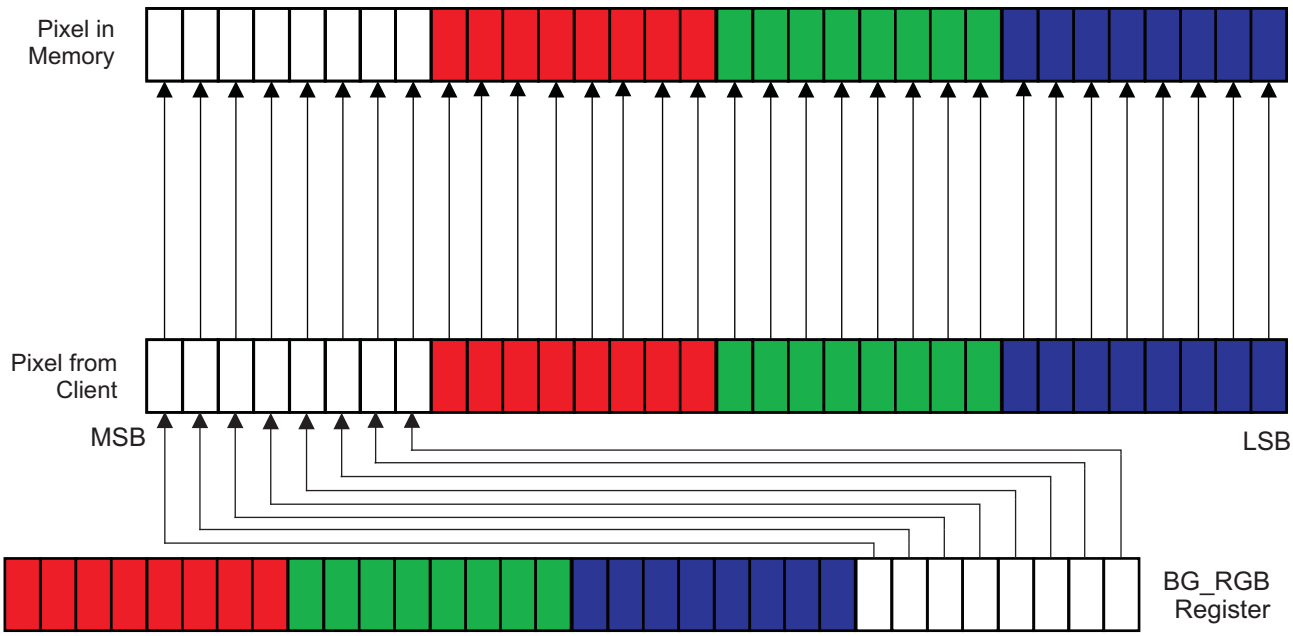
Figure 7-106. RGB24-888 (Data Type 6)



7.4.8.9.2.8 ARGB32-8888 (Data Type 7)

In ARGB32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bitsof data uses the lowest 8 bits for blue data, the next 8 bits for green data and the next 8 bits for red data it uses the upper most bits for the blend value.

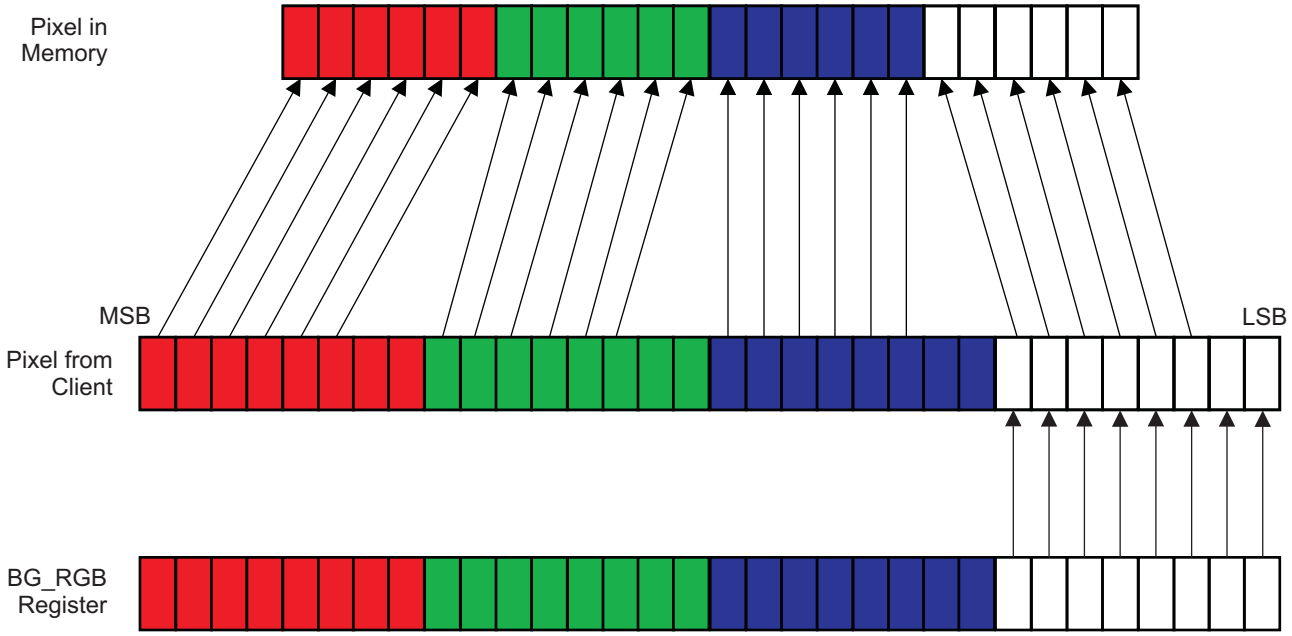
Figure 7-107. ARGB32-8888 (Data Type 7)



7.4.8.9.2.9 RGBA24-6666 (Data Type 8)

In RGBA24-6666 mode, each pixel is a single RGBA pixel with 24 bits of data for each pixel. The 24 bits of data uses the lowest 6 bits for the blend value, the next 6 bits for blue data, the next 6 bits for green data and the upper 6 bits for red data.

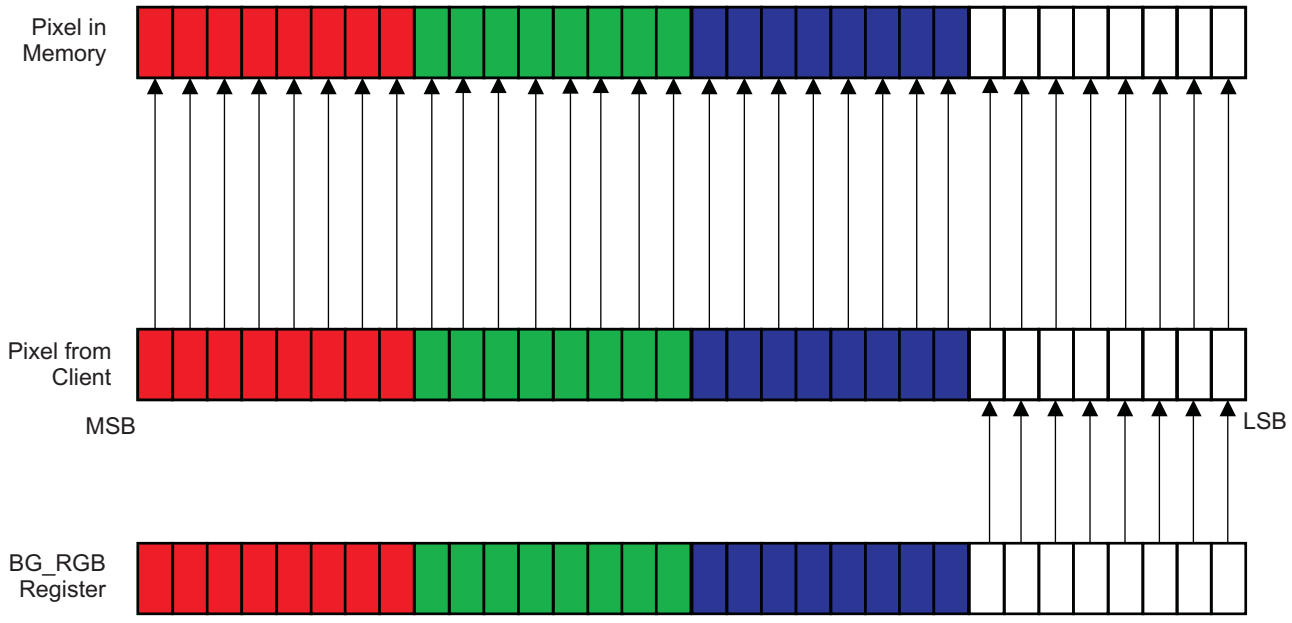
Figure 7-108. RGBA24-6666 (Data Type 8)



7.4.8.9.2.10 RGBA32-8888 (Data Type 9)

In RGBA32-8888 mode, each pixel is a single ARGB pixel with 32 bits of data for each pixel. The 32 bits of data uses the lowest 8 bits for the blend value the next 8 bits for blue data, the next 8 bits for green data and the upper most 8 bits for red data.

Figure 7-109. RGBA32-8888 (Data Type 9)



7.4.8.9.3 Miscellaneous Data Type

The Miscellaneous channel type is for any data type that is not a normal video type. The Miscellaneous channel type makes no assumptions on data type and just passes the data to the client and supports a single buffer for the client. The size of the miscellaneous data type is always determined by the Data Type field of the descriptor which specifies the number of bits in the descriptor.

A memory structure used to describe a desired memory transaction to or from a client. The descriptor at a minimum gives an address location for the memory portion of the transfer, the channel to use for this transaction and the size of the transaction. The data descriptor can also contain attributes to be passed down to the client or be linked to another data descriptor to form a larger frame from many smaller frames.

Bits	Field Name	Description	Type	Reset
15	VIP1_MULTI_CHANNEL_SELECT	Video Input Port 1 Multi Channel Select 0 : VIP_PARSER A and B channels operate in single channel mode 1 : VIP_PARSER A and B channels directly drive VPDMA (multi-channel case) Multi-Channel means that the A and B sources are from multiple channels and used in a multiplexed stream mode. The VIP Parser extracts the channel ID from each source and outputs this information to VPDMA, and thus to memory. When operating in a multiplexed stream mode, this bit must be set to 1 to enable the channel information to be passed to memory. If this is not set, the channel number (or source number) will be 0 for all streams. If vip1_rgb_out_select = 1, then VIP_PARSER A port is connected to VPDMA	RW	0x0

ANALYZER_FVH_ERR_CORRECTION_ENABLE	ANALYZER_2X4X_SRCNUM_POS	FID_SKEW_POSTCOUNT						SW_RESET	DISCRETE_BASIC_MODE	FID_SKEW_PRECOUNT						USE_ACTVID_HSYNC_N	FID_DETECT_MODE	ACTVID_POLARITY	VSYNC_POLARITY	HSYNC_POLARITY	PIXCLK_EDGE_POLARITY	FID_POLARITY	ENABLE	CLR_ASYNC_FIFO_RD	CLR_ASYNC_FIFO_WR	CTRL_CHAN_SEL	SYNC_TYPE				

Bits	Field Name	Description	Type	Reset
31	ANALYZER_FVH_ERR_CORRECTION_ENABLE	Embedded Sync Only 0 = Ignore the protection bits in the XV (fvh) codeword header. This setting is typically desired. 1 = Use the protection bits in an attempt to do error correction for the fvh control bits.	RW	0x0
30	ANALYZER_2X4X_SRCNUM_POS	Embedded Sync Only 0 = For 2x/4x mux mode, srcnum is in the least significant nibble of the XV/fvh codeword (srcnum replaces the protection bits) 1 = For 2x/4x mux mode, srcnum is in the least significant nibble of a horizontal blanking pixel value	RW	0x0
29:24	FID_SKEW_POSTCOUNT	Discrete Sync Only post count value when using vsync skew in FID determination	RW	0x0
23	SW_RESET	0 = Normal 1 = Reset Port A logic. Must be set to ?0? again by the software for the module to function.	RW	0x0
22	DISCRETE_BASIC_MODE	This register is valid for Discrete Sync mode only. 0 = Normal Discrete Mode. Hsync Style Capture operates as follows: - Captures line starting from HSYNC inactive to active condition. - VSYNC determined by sync window. - FID can be determined by VSYNC skew or captured from pin at first pixel in first line. ACTVID style capture works as follows: - Captures line during contiguous ACTVID envelope. - VSYNC is captured at the first pixel in each line. - FID is captured on first pixel of ACTVID window. 1 = Basic Discrete Mode. When using hsync with Hsync Style Capture operates as follows: - The last line of active video ends on the pixel clock cycle where VSYNC transitions from inactive to active. - FID pin value is captured on this cycle and is used for the next field. - FID detection by VSYNC skew is not allowed. ACTVID style capture works as follows: - VSYNC is expected to transition from inactive to active between ACTVID window. - This VSYNC transition allows the next line in an ACTVID envelope to be sent to a new VPDMA buffer. - FID value is determined by the FID pin value on the cycle where VSYNC transitions from inactive to active. In basic discrete mode, there is no Vertical Ancillary Data. Therefore, VPDMA descriptors should not use Ancillary Data channels.	RW	0x0
21:16	FID_SKEW_PRECOUNT	Discrete Sync Only pre count value when using vsync skew in FID determination	RW	0x0
15	USE_ACTVID_HSYNC_N	Discrete Sync Only 0 = Use HSYNC style line capture 1 = Use ACTVID style line capture	RW	0x0
14	FID_DETECT_MODE	Discrete Sync Only 0 = Take FID from pin 1 = FID is determined by VSYNC skew	RW	0x0

Bits	Field Name	Description	Type	Reset
13	ACTVID_POLARITY	Discrete Sync Only 0 = ACTVID is active low 1 = ACTVID is active high	RW	0x0
12	VSYNC_POLARITY	Discrete Sync Only 0 = VSYNC is active low 1 = VSYNC is active high	RW	0x0
11	HSYNC_POLARITY	Discrete Sync Only 0 = HSYNC is active low 1 = HSYNC is active high	RW	0x0
10	PIXCLK_EDGE_POLARITY	0 = Rising Edge is active PIXCLK edge 1 = Falling Edge is active PIXCLK edge	RW	0x0
9	FID_POLARITY	0 = Keep FID as found 1 = Invert Determined Value of FID	RW	0x0
8	ENABLE	0 = Disable Port 1 = Enable Port	RW	0x0
7	CLR_ASYNC_FIFO_RD	0 = Normal 1 = Clear Async FIFO Read Logic	RW	0x0
6	CLR_ASYNC_FIFO_WR	0 = Normal 1 = Clear Async FIFO Write Logic	RW	0x0
5:4	CTRL_CHAN_SEL	Embedded Sync Only In 8b mode.. there is only one channel on data[7:0]. In 16b mode.. there are two channels. The Luma Channel is on data[15:8]. The Chroma Channel is on data[7:0]. In 24b mode.. there are three channels. The R channel is on data[23:16].. the G channel is on [15:8]. and the B channel is on data[7:0]. 00 = Use data[7:0] to extract control codes. 01 = Use data[15:8] to extract control codes. 10 = Use data[23:16] to extract control codes. 11 = Undefined In 16b and 24b modes.. this register is also used to select the channel from which Ancillary Data is extracted. The Ancillary Data channel must be the same as the control code channel. For 8b mode.. the anc_chan_sel_8b register is used to select the Luma or Chroma channel from which Ancillary Data is taken.	RW	0x0
3:0	SYNC_TYPE	0000 = embedded sync single 4:2:2 YUV stream 0001 = embedded sync 2x multiplexed 4:2:2 YUV stream 0010 = embedded sync 4x multiplexed 4:2:2 YUV stream 0011 = embedded sync line multiplexed 4:2:2 YUV stream 0100 = discrete sync single 4:2:2 YUV stream 0101 = embedded sync single RGB stream or single 444 YUV stream 0110 = reserved 0111 = reserved 1000 = reserved 1001 = reserved 1010 = discrete sync single 24b RGB stream	RW	0x0

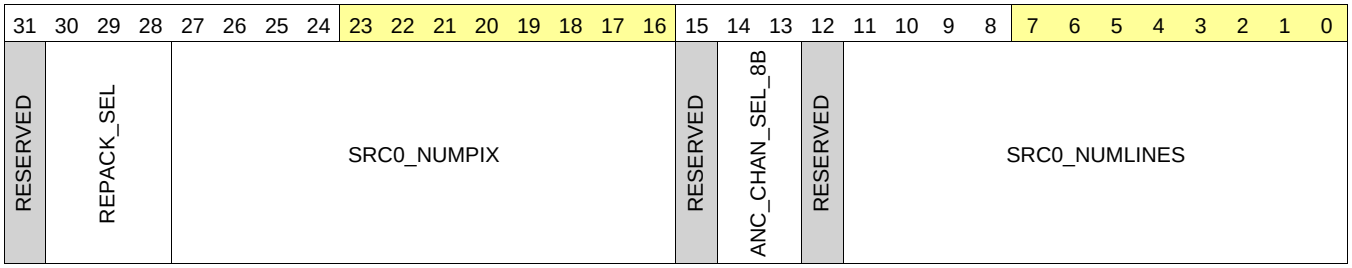
Table 7-122. VIP_XTRA_PORT_A

Address Offset	0x0000 0008		
Physical Address	0x4897 5508 0x4897 5A08	**Instance**	VIP_Slice0_parser VIP_Slice1_parser
Description	ore Configuration for Input Port A		
Type	RW		



Bits	Field Name	Description	Type	Reset
31	RESERVED		R	0x0
30:28	REPACK_SEL	000 = Straight Through 001 = Cross Swap 010 = Left Center Swap 011 = Center Right Swap 100 = Right Rotate 101 = Left Rotate 110 = RAW16 to RGB565 Mapping 111 = RAW12 Swap	RW	0x0
27:16	SRC0_NUMPIX	Number of expected pixels on Source Number 0. The Port_a_src0_size interrupt will trigger if a line is encountered that differs from this pixelcount.	RW	0x0
15	RESERVED		R	0x0
14:13	ANC_CHAN_SEL_8B	In 8b mode, Vertically Ancillary Data typically resides in the Luma sites. This bit allows vertical ancillary data to be extracted from the chroma sites instead . 00 = Extract 8b Mode Vertical Ancillary Data from Luma Sites 01 = Extract 8b Mode Vertical Ancillary Data from Chroma Sites 10, 11 = Extract every single sample of vertical ancillary data. The output line is twice as wide as the other modes. For 16b and 24b inputs, ctrl_chan_sel is used to select which channel is used as a source for vertical ancillary data.	RW	0x0
12	RESERVED		R	0x0
11:0	SRC0_NUMLINES	Number of expected lines on Source Number 0. The Port_a_src0_size interrupt will trigger if a field/frame is encountered that differs from this linecount.	RW	0x0

Address Offset	0x0000 000C		
Physical Address	0x4897 550C 0x4897 5A0C	**Instance**	VIP_Slice0_parser VIP_Slice1_parser
Description	Configuration for Input Port B		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ANALYZER_FVH_ERR_CORRECTION_ENABLE	ANALYZER_2X4X_SRCNUM_POS	FID_SKEW_POSTCOUNT						SW_RESET	DISCRETE_BASIC_MODE	FID_SKEW_PRECOUNT						USE_ACTVID_HSYNC_N	FID_DETECT_MODE	ACTVID_POLARITY	VSYNC_POLARITY	HSYNC_POLARITY	PIXCLK_EDGE_POLARITY	FID_POLARITY	ENABLE	CLR_ASYNC_FIFO_RD	CLR_ASYNC_FIFO_WR	CTRL_CHAN_SEL	SYNC_TYPE				

Bits	Field Name	Description	Type	Reset
31	ANALYZER_FVH_ERR_CORRECTION_ENABLE	Embedded Sync Only 0 = Ignore the protection bits in the XV (fvh) codeword header. This setting is typically desired. 1 = Use the protection bits in an attempt to do error correction for the fvh control bits.	RW	0x0
30	ANALYZER_2X4X_SRCNUM_POS	Embedded Sync Only 0 = For 2x/4x mux mode, srcnum is in the least significant nibble of the XV/fvh codeword (srcnum replaces the protection bits) 1 = For 2x/4x mux mode, srcnum is in the least significant nibble of a horizontal blanking pixel value	RW	0x0
29:24	FID_SKEW_POSTCOUNT	Discrete Sync Only post count value when using vsync skew in FID determination	RW	0x0
23	SW_RESET	0 = Normal 1 = Reset Port B logic. Must be set to ?0? again by the software for the module to function.	RW	0x0
22	DISCRETE_BASIC_MODE	This register is valid for Discrete Sync mode only. 0 = Normal Discrete Mode. Hsync Style Capture operates as follows: - Captures line starting from HSYNC inactive to active condition. - VSYNC determined by sync window. - FID can be determined by VSYNC skew or captured from pin at first pixel in first line. ACTVID style capture works as follows: - Captures line during contiguous ACTVID envelope. - VSYNC is captured at the first pixel in each line. - FID is captured on first pixel of ACTVID window. 1 = Basic Discrete Mode. When using hsync with Hsync Style Capture operates as follows: - The last line of active video ends on the pixel clock cycle where VSYNC transitions from inactive to active. - FID pin value is captured on this cycle and is used for the next field. - FID detection by VSYNC skew is not allowed. ACTVID style capture works as follows: - VSYNC is expected to transition from inactive to active between ACTVID window. - This VSYNC transition allows the next line in an ACTVID envelope to be sent to a new VPDMA buffer. - FID value is determined by the FID pin value on the cycle where VSYNC transitions from inactive to active. In basic discrete mode, there is no Vertical Ancillary Data. Therefore, VPDMA descriptors should not use Ancillary Data channels.	RW	0x0
21:16	FID_SKEW_PRECOUNT	Discrete Sync Only pre count value when using vsync skew in FID determination	RW	0x0
15	USE_ACTVID_HSYNC_N	Discrete Sync Only 0 = Use HSYNC style line capture 1 = Use ACTVID style line capture	RW	0x0
14	FID_DETECT_MODE	Discrete Sync Only 0 = Take FID from pin 1 = FID is determined by VSYNC skew	RW	0x0

Bits	Field Name	Description	Type	Reset
13	ACTVID_POLARITY	Discrete Sync Only 0 = ACTVID is active low 1 = ACTVID is active high	RW	0x0
12	VSYNC_POLARITY	Discrete Sync Only 0 = VSYNC is active low 1 = VSYNC is active high	RW	0x0
11	HSYNC_POLARITY	Discrete Sync Only 0 = HSYNC is active low 1 = HSYNC is active high	RW	0x0
10	PIXCLK_EDGE_POLARITY	0 = Rising Edge is active PIXCLK edge 1 = Falling Edge is active PIXCLK edge	RW	0x0
9	FID_POLARITY	0 = Keep FID as found 1 = Invert Determined Value of FID	RW	0x0
8	ENABLE	0 = Disable 1 = Enable	RW	0x0
7	CLR_ASYNC_FIFO_RD	0 = Normal 1 = Clear Async FIFO Read Logic	RW	0x0
6	CLR_ASYNC_FIFO_WR	0 = Normal 1 = Clear Async FIFO Write Logic	RW	0x0
5:4	CTRL_CHAN_SEL	PORT B supports on 8b mode. Always write 0 to this field. The anc_chan_sel_8b register is used to select the Luma or Chroma channel from which Ancillary Data is taken.	RW	0x0
3:0	SYNC_TYPE	0000 = embedded sync single YUV stream 0001 = embedded sync 2x multiplexed YUV stream 0010 = embedded sync 4x multiplexed YUV stream 0011 = embedded sync line multiplexed YUV stream 0100 = discrete sync single YUV stream 0101 = embedded sync single RGB stream 0110 = reserved 0111 = reserved 1000 = reserved 1001 = reserved 1010 = discrete sync single 24b RGB stream	RW	0x0

YUV_SRCNUM_STOP_IMMEDIATELY																ANC_SRCNUM_STOP_IMMEDIATELY															

Bits	Field Name	Description	Type	Reset
31:16	YUV_SRCNUM_STOP_IMMEDIATELY	For the Active Video Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following cfg_enable transitioning inactive for that port. Each bit in this vector represents a srcnum (remapped srcnum for TI line mux mode) going to the VPDMA. For example, bit 0 is srcnum 0, bit 1 is srcnum 1, etc. A ?0? in a bit position means that the hardware will wait for that srcnum, if it is in the middle of a frame, to continue until the end of the frame before stopping. A ?1? in a bit position means that it is ok for a srcnum to stop in the middle of a frame. For example, suppose a source is removed and the input will never complete sending a frame. If the bit position representing that srcnum is set to ?0?, the port will never disable.	RW	0x0
15:0	ANC_SRCNUM_STOP_IMMEDIATELY	For the Ancillary Data Port to the VPDMA, logic exists to ensure that a complete frame is sent out to the VPDMA following cfg_enable transitioning inactive for that port. Bits	Field Name	Description	Type	Reset
31:29	RESERVED		RW	0x0
28:16	B0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. (Same format conversion as A0)	RW	0x0
15:13	RESERVED		RW	0x0
12:0	A0	Coefficients of color space converter. This coefficient is a real number in the range of 4. The MSB is sign bit. Rules for converting a real number coefficient to a 12-bit hex number for this register: - If the real number is positive, then simply multiply it by 1024, and convert the integer part to hex format. For example, 0.673 X 1024 = 689.152, then 0x2B1 should fill in to this register - If the real number is negative, then multiply it by 1024, and convert it to 2's compliment format in 12-bit. For example, if a coefficient is -1.893, by *1024 to this number, it becomes -1938. The 2'S compliment format of -1938 is 0x186E (in 13-bit width). Then 0x186E should be the number assigned to this register.	RW	0x0

Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED															CFG_FID_SELFGEN	CFG_TRIM	CFG_Y_PK_EN	RESERVED			CFG_INTERLACE_I	CFG_HP_BYPASS	CFG_DCM_4X	CFG_DCM_2X	CFG_AUTO_HS	CFG_ENABLE_EV	CFG_USE_RAV	CFG_INVT_FID	CFG_SC_BYPASS	CFG_LINEAR	CFG_INTERLACE_O

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0
16	CFG_FID_SELFGEN	FID self generate enable. When input is progressive and this bit is set, the SC generates self-toggling (top/bottom) output FID when performing interlacing.	RW	0x0
15	CFG_TRIM	Trimming enable. When 1, the input image whose size is specified by orgW and orgH registers is trimmed to the size with srcW and srcH from the offset specified by offW and offH. 0: disable trimming 1: enable trimming	RW	0x0
14	CFG_Y_PK_EN	This parameter is used by peaking block. 0: disable luma peaking 1: enable luma peaking	RW	0x0
13:11	RESERVED		R	0x0
10	CFG_INTERLACE_I	This parameter is used by both horizontal and vertical scaling 0: the input video format is progressive 1: the input video format is interlace	RW	0x0
9	CFG_HP_BYPASS	This parameter is used by horizontal scaling. If cfg_auto_hs is 0, horizontal polyphase filter is always enabled. In this case, this register is DON?T CARE. If cfg_auto_hs is 1, 0 : The polyphase scaler is always used regardless of the scaling ratio. 1 : The polyphase scaler is bypassed only when (tar_w == src_w) or (tar_w == src_w/2) or (tar_w == src_w/4)	RW	0x0
8	CFG_DCM_4X	This parameter is used by horizontal scaling. 0: the 4X decimation filter is disabled 1: the 4X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (horizontal scale ratio 0.25). (3) This register is DON?T CARE when cfg_auto_hs = 1.	RW	0x0
7	CFG_DCM_2X	This parameter is used by horizontal scaling. 0: the 2X decimation filter is disabled 1: the 2X decimation filter is enabled Note: (1) Either 2X or 4X can be enabled, but they cannot be enabled simultaneously. (2) This register is only set to 1 when it makes sense to do so. Typically, it is used when (0.25 horizontal scale ratio 0.5). (3) This register is DON?T CARE when cfg_auto_hs = 1.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	CFG_AUTO_HS	This parameter is used by horizontal scaling. 0: the cfg_dcm_2x and cfg_dcm_4x bits will enable appropriate decimation filters 1: HW will decide whether up-scaling or down-scaling is required based on horizontal scaling ratio (SR). SR 0.5 : horizontal polyphase filter is enabled, all decimation filters are disabled SR = 0.5 : dcm_2x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.5 SR 0.25 : dcm_2x and horizontal polyphase filter both are enabled SR = 0.25 : dcm_4x is enabled, horizontal polyphase filter is enabled or disabled based on cfg_hp_bypass 0.25 SR 0.125 : dcm_4x and horizontal polyphase filter are both enabled SR = 0.125 : Functionally supported, but not recommended in auto mode for image quality concerns	RW	0x0
5	CFG_ENABLE_EV	This parameter is used by the edge-detection block. 0: The output of edge-detection block will be force to ?0? 1: The calculation results of edge-detection block will be output normally	RW	0x0
4	CFG_USE_RAV	This parameter is used by vertical scaling. 0: Poly-phase filter will be used for the vertical scaling 1: Running average filter will be used for the vertical scaling (down scaling only)	RW	0x0
3	CFG_INVT_FID	This parameter is used by vertical scaling. 0: Progressive input 1: Interlaced input Must be set to 1 when CFG_INTERFACE_I = 1.	RW	0x0
2	CFG_SC_BYPASS	This parameter is a general purpose. 0: Scaling module will engaged 1: Scaling module will be bypassed	RW	0x0
1	CFG_LINEAR	This parameter is used by horizontal scaling. 0: Anamorphic scaling 1: Linear scaling	RW	0x0
0	CFG_INTERLACE_O	This parameter is used by vertical scaling. 0: The output format of SC is progressive 1: The output format of SC is interlace	RW	0x0

7.5.6 VIP VPDMA Registers

NOTE: The functionality of the following sets of registers is not supported by VIP VPDMA in this family of devices:

- All VIP_INT2_* registers
- All VIP_INT3_* registers

The following channels are not used by VIP VPDMA in this family of devices. All register bit-fields corresponding to these channels should be kept at their reset value.

- HQ_*
- GRPX_*
- SCALER_OUT
- SCALER_LUMA
- SCALER_CHROMA
- NF_*
- TRANSCODE1_*
- TRANSCODE2_*
- AUX_IN
- PIP_FRAME
- POST_COMP_WR
- VBI_SD_VENC

The following clients are not used by VIP VPDMA in this family of devices. All register bit-fields corresponding to these clients should be kept at their reset value.

- DEI_HQ_*
- TRANS1_LUMA
- TRANS1_CHROMA
- TRANS2_LUMA
- TRANS2_CHROMA
- HDMI_WRBK
- VBI_SDVENC
- NF_420_UV_OUT
- NF_420_Y_OUT
- NF_420_UV_IN
- NF_420_Y_IN
- NF_422_IN
- GRPX1_ST
- GRPX2_ST
- GRPX3_ST
- GRPX1_DATA
- GRPX2_DATA
- GRPX3_DATA
- PIP_WRBK
- SC_IN_*
- SC_OUT
- COMP_WRBK

Table 7-293. VIP_LIST_ATTR

Address Offset	0x0000 0008		
Physical Address	0x4897 D008	**Instance**	VIP_VPDMA
Description	The attributes of a new list. This register should always be written after VIP_LIST_ADDR.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED					LIST_NUM			RESERVED			STOP	RDY	LIST_TYPE			LIST_SIZE																

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:24	LIST_NUM	The list number that should be assigned to the list located at VIP_LIST_ADDR. If the list is still active this will block all future list writes until the list is available.	RW	0x0
23:21	RESERVED		R	0x0
20	STOP	This bit is written with the LIST_NUMBER field to stop a self-modifying list. When this bit is written a one the list specified by the LIST_NUMBER is sent a stop signal and will finish the current frame of transfers and then free the list resources.	RW	0x0
19	RDY	This bit is low when a new list cannot be written to the VIP_LIST_ADDR register. The reasons this bit would be low are at initial startup if the LIST_MANAGER State Machine image has not completed loading. It also would be low if the last write to the VIP_LIST_ATTR attempted to start a list that is currently active. When this bit is low any writes to the list address register will cause access to not be accepted until this bit has set by the previous list having completed.	R	0x0
18:16	LIST_TYPE	The type of list that has been generated.\\n0: Normal List\\n1: Self-Modifying List\\n2: List Doorbell\\nOthers Reserved for future use	RW	0x0
15:0	LIST_SIZE	Number of 128 bit word in the new list of descriptors. Writes to this register will activate the list in the list stack of the list manager and begin transfer of the list into VPDMA. This size can not be 0.	RW	0x0

Table 7-307. VIP_MAX_SIZE3

Address Offset	0x0000 003C		
Physical Address	0x4897 D03C	**Instance**	VIP_VPDMA
Description	Configures maximum width and maximum height global parameters that are shared by all clients to allow for configurable max width and max height when setting is 3 in write descriptor.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MAX_WIDTH																MAX_HEIGHT															

Bits	Field Name	Description	Type	Reset
31:16	MAX_WIDTH	The maximum width to use for setting of max_width 3 in a write descriptor. The value is the number of pixels + 1 so if 1024 pixels are required then set the value to 1023.	RW	0x0
15:0	MAX_HEIGHT	The maximum height to use for setting of max_height 3 in a write descriptor. The value is the number of lines + 1 so if 1024 lines are required then set the value to 1023.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_GRPX3	The last read DMA transaction has occurred for channel grpx3 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpx3_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_GRPX2	The last read DMA transaction has occurred for channel grpx2 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpx2_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_GRPX1	The last read DMA transaction has occurred for channel grpx1 and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client grpx1_data will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
28	INT_STAT_SCALER_OUT	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value	RW	0x0
27:20	RESERVED	Reserved	R	0x00
19	INT_STAT_SCALER_CHROMA	The last write DMA transaction has completed for channel scaler_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_SCALER_LUMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_HQ_SCALER	The last write DMA transaction has completed for channel hq_scaler. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	RESERVED	Reserved	R	0x0
15	INT_STAT_HQ_MV_OUT	The last write DMA transaction has completed for channel hq_mv_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_hq_mv_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14:13	RESERVED	Reserved	R	0x0
12	INT_STAT_HQ_MV	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11:6	RESERVED	Reserved	R	0x00
5	INT_STAT_HQ_VID3_CHROMA	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_HQ_VID3_LUMA	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. 13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

26	INT_MASK_VIP1_MULT_ANCB_SRC4	The interrupt for Video Input 1 Port B Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP1_MULT_ANCB_SRC3	The interrupt for Video Input 1 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP1_MULT_ANCB_SRC2	The interrupt for Video Input 1 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP1_MULT_ANCB_SRC1	The interrupt for Video Input 1 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP1_MULT_ANCB_SRC0	The interrupt for Video Input 1 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP1_MULT_ANCA_SRC15	The interrupt for Video Input 1 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP1_MULT_ANCA_SRC14	The interrupt for Video Input 1 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP1_MULT_ANCA_SRC13	The interrupt for Video Input 1 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP1_MULT_ANCA_SRC12	The interrupt for Video Input 1 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP1_MULT_ANCA_SRC11	The interrupt for Video Input 1 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP1_MULT_ANCA_SRC10	The interrupt for Video Input 1 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP1_MULT_ANCA_SRC9	The interrupt for Video Input 1 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP1_MULT_ANCA_SRC8	The interrupt for Video Input 1 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP1_MULT_ANCA_SRC7	The interrupt for Video Input 1 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP1_MULT_ANCA_SRC6	The interrupt for Video Input 1 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_MULT_ANCA_SRC5	The interrupt for Video Input 1 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_MULT_ANCA_SRC4	The interrupt for Video Input 1 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_MULT_ANCA_SRC3	The interrupt for Video Input 1 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_MULT_ANCA_SRC2	The interrupt for Video Input 1 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_MULT_ANCA_SRC1	The interrupt for Video Input 1 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_MULT_ANCA_SRC0	The interrupt for Video Input 1 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_PORTB_SRC15	The interrupt for Video Input 1 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_MASK_VIP1_MULT_PORTB_SRC14	The interrupt for Video Input 1 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_PORTB_SRC13	The interrupt for Video Input 1 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_PORTB_SRC12	The interrupt for Video Input 1 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_PORTB_SRC11	The interrupt for Video Input 1 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_PORTB_SRC10	The interrupt for Video Input 1 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
30	INT_STAT_VIP2_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_PORTB_SRC3	The interrupt for Video Input 2 Port B Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_PORTB_SRC2	The interrupt for Video Input 2 Port B Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_PORTB_SRC1	The interrupt for Video Input 2 Port B Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_PORTB_SRC0	The interrupt for Video Input 2 Port B Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_PORTA_SRC15	The interrupt for Video Input 2 Port A Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_PORTA_SRC14	The interrupt for Video Input 2 Port A Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_PORTA_SRC13	The interrupt for Video Input 2 Port A Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_PORTA_SRC12	The interrupt for Video Input 2 Port A Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_PORTA_SRC11	The interrupt for Video Input 2 Port A Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_PORTA_SRC10	The interrupt for Video Input 2 Port A Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_PORTA_SRC9	The interrupt for Video Input 2 Port A Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_PORTA_SRC8	The interrupt for Video Input 2 Port A Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_PORTA_SRC7	The interrupt for Video Input 2 Port A Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_PORTA_SRC6	The interrupt for Video Input 2 Port A Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_PORTA_SRC5	The interrupt for Video Input 2 Port A Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_PORTA_SRC4	The interrupt for Video Input 2 Port A Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
24	INT_STAT_VIP2_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
15	INT_STAT_VIP2_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_ANCB_SRC3	The interrupt for Video Input 2 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_ANCB_SRC2	The interrupt for Video Input 2 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_ANCB_SRC1	The interrupt for Video Input 2 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_ANCB_SRC0	The interrupt for Video Input 2 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_ANCA_SRC15	The interrupt for Video Input 2 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_ANCA_SRC14	The interrupt for Video Input 2 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_ANCA_SRC13	The interrupt for Video Input 2 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_ANCA_SRC12	The interrupt for Video Input 2 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_ANCA_SRC11	The interrupt for Video Input 2 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_ANCA_SRC10	The interrupt for Video Input 2 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_ANCA_SRC9	The interrupt for Video Input 2 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP2_MULT_ANCA_SRC8	The interrupt for Video Input 2 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_ANCA_SRC7	The interrupt for Video Input 2 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_ANCA_SRC6	The interrupt for Video Input 2 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_ANCA_SRC5	The interrupt for Video Input 2 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_ANCA_SRC4	The interrupt for Video Input 2 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_ANCA_SRC3	The interrupt for Video Input 2 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_ANCA_SRC2	The interrupt for Video Input 2 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_ANCA_SRC1	The interrupt for Video Input 2 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_ANCA_SRC0	The interrupt for Video Input 2 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP2_MULT_PORTB_SRC15	The interrupt for Video Input 2 Port B Channel 15 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP2_MULT_PORTB_SRC14	The interrupt for Video Input 2 Port B Channel 14 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP2_MULT_PORTB_SRC13	The interrupt for Video Input 2 Port B Channel 13 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP2_MULT_PORTB_SRC12	The interrupt for Video Input 2 Port B Channel 12 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP2_MULT_PORTB_SRC11	The interrupt for Video Input 2 Port B Channel 11 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP2_MULT_PORTB_SRC10	The interrupt for Video Input 2 Port B Channel 10 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP2_MULT_PORTB_SRC9	The interrupt for Video Input 2 Port B Channel 9 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP2_MULT_PORTB_SRC8	The interrupt for Video Input 2 Port B Channel 8 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP2_MULT_PORTB_SRC7	The interrupt for Video Input 2 Port B Channel 7 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
2	INT_MASK_VIP2_MULT_PORTB_SRC6	The interrupt for Video Input 2 Port B Channel 6 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP2_MULT_PORTB_SRC5	The interrupt for Video Input 2 Port B Channel 5 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP2_MULT_PORTB_SRC4	The interrupt for Video Input 2 Port B Channel 4 should generate an interrupt on interrupt vpdma_int0. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sdvenc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel nf_write_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel vip2_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel vip2_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel vip2_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel vip2_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel vip2_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel vip2_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_CONTROL_DESCRIPTOR_INT15	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 15. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_CONTROL_DESCRIPTOR_INT14	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 14. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_CONTROL_DESCRIPTOR_INT13	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 13. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_CONTROL_DESCRIPTOR_INT12	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 12. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_CONTROL_DESCRIPTOR_INT11	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_CONTROL_DESCRIPTOR_INT10	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_CONTROL_DESCRIPTOR_INT9	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_CONTROL_DESCRIPTOR_INT8	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_CONTROL_DESCRIPTOR_INT7	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_CONTROL_DESCRIPTOR_INT6	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_CONTROL_DESCRIPTOR_INT5	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_CONTROL_DESCRIPTOR_INT4	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_CONTROL_DESCRIPTOR_INT3	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_CONTROL_DESCRIPTOR_INT2	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_CONTROL_DESCRIPTOR_INT1	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_CONTROL_DESCRIPTOR_INT0	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_LIST7_NOTIFY	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_LIST7_COMPLETE	List 7 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_LIST6_NOTIFY	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_LIST6_COMPLETE	List 6 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_LIST5_NOTIFY	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_LIST5_COMPLETE	List 5 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_LIST4_NOTIFY	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_LIST4_COMPLETE	List 4 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_LIST3_NOTIFY	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_LIST3_COMPLETE	List 3 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_LIST2_NOTIFY	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_LIST2_COMPLETE	List 2 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_LIST1_NOTIFY	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_LIST1_COMPLETE	List 1 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_LIST0_NOTIFY	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_LIST0_COMPLETE	List 0 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_GRPX3	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_GRPX2	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_GRPX1	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
28	INT_STAT_SCALER_OUT	The last write DMA transaction has completed for channel scaler_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27:20	RESERVED	Reserved	R	0x00
19	INT_STAT_SCALER_CHROMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_SCALER_LUMA	The last write DMA transaction has completed for channel scaler_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_HQ_SCALER	The last write DMA transaction has completed for channel hq_scaler. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_sc_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	RESERVED	Reserved	R	0x0
15	INT_STAT_HQ_MV_OUT	The last write DMA transaction has completed for channel hq_mv_out. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client dei_hq_mv_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14:13	RESERVED	Reserved	R	0x0
12	INT_STAT_HQ_MV	The last read DMA transaction has occurred for channel hq_mv and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client dei_hq_mv_in will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11:6	RESERVED	Reserved	R	0x00
5	INT_STAT_HQ_VID3_CHROMA	The last write DMA transaction has completed for channel hq_vid3_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_HQ_VID3_LUMA	The last write DMA transaction has completed for channel hq_vid3_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_HQ_VID2_CHROMA	The last write DMA transaction has completed for channel hq_vid2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_HQ_VID2_LUMA	The last write DMA transaction has completed for channel hq_vid2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_HQ_VID1_CHROMA	The last write DMA transaction has completed for channel hq_vid1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_HQ_VID1_LUMA	The last write DMA transaction has completed for channel hq_vid1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP1_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip1_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP1_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip1_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP1_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip1_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP1_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip1_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP1_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip1_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP1_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip1_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP1_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip1_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP1_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip1_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP1_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip1_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_VIP1_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip1_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP1_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip1_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP1_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip1_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP1_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip1_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP1_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip1_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP1_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip1_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP1_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip1_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP1_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip1_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP1_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip1_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
13	INT_STAT_VIP1_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip1_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP1_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip1_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip1_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip1_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip1_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip1_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip1_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip1_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip1_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_STAT_VIP1_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip1_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP1_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip1_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip1_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip1_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip1_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP1_MULT_ANCB_SRC9	The interrupt for Video Input 1 Port B Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP1_MULT_ANCB_SRC8	The interrupt for Video Input 1 Port B Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP1_MULT_ANCB_SRC7	The interrupt for Video Input 1 Port B Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP1_MULT_ANCB_SRC6	The interrupt for Video Input 1 Port B Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP1_MULT_ANCB_SRC5	The interrupt for Video Input 1 Port B Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP1_MULT_ANCB_SRC4	The interrupt for Video Input 1 Port B Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP1_MULT_ANCB_SRC3	The interrupt for Video Input 1 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP1_MULT_ANCB_SRC2	The interrupt for Video Input 1 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP1_MULT_ANCB_SRC1	The interrupt for Video Input 1 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP1_MULT_ANCB_SRC0	The interrupt for Video Input 1 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP1_MULT_ANCA_SRC15	The interrupt for Video Input 1 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP1_MULT_ANCA_SRC14	The interrupt for Video Input 1 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP1_MULT_ANCA_SRC13	The interrupt for Video Input 1 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP1_MULT_ANCA_SRC12	The interrupt for Video Input 1 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP1_MULT_ANCA_SRC11	The interrupt for Video Input 1 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP1_MULT_ANCA_SRC10	The interrupt for Video Input 1 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP1_MULT_ANCA_SRC9	The interrupt for Video Input 1 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP1_MULT_ANCA_SRC8	The interrupt for Video Input 1 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP1_MULT_ANCA_SRC7	The interrupt for Video Input 1 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP1_MULT_ANCA_SRC6	The interrupt for Video Input 1 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP1_MULT_ANCA_SRC5	The interrupt for Video Input 1 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_MULT_ANCA_SRC4	The interrupt for Video Input 1 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_MULT_ANCA_SRC3	The interrupt for Video Input 1 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_MULT_ANCA_SRC2	The interrupt for Video Input 1 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_MULT_ANCA_SRC1	The interrupt for Video Input 1 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_MULT_ANCA_SRC0	The interrupt for Video Input 1 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_PORTB_SRC15	The interrupt for Video Input 1 Port B Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
4	INT_MASK_VIP1_MULT_PORTB_SRC14	The interrupt for Video Input 1 Port B Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_PORTB_SRC13	The interrupt for Video Input 1 Port B Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_PORTB_SRC12	The interrupt for Video Input 1 Port B Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_PORTB_SRC11	The interrupt for Video Input 1 Port B Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_PORTB_SRC10	The interrupt for Video Input 1 Port B Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_PORTB_SRC3	The last write DMA transaction has completed for channel vip2_mult_portb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
30	INT_STAT_VIP2_MULT_PORTB_SRC2	The last write DMA transaction has completed for channel vip2_mult_portb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_PORTB_SRC1	The last write DMA transaction has completed for channel vip2_mult_portb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_PORTB_SRC0	The last write DMA transaction has completed for channel vip2_mult_portb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_PORTA_SRC15	The last write DMA transaction has completed for channel vip2_mult_porta_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_PORTA_SRC14	The last write DMA transaction has completed for channel vip2_mult_porta_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_PORTA_SRC13	The last write DMA transaction has completed for channel vip2_mult_porta_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VIP2_MULT_PORTA_SRC12	The last write DMA transaction has completed for channel vip2_mult_porta_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_PORTA_SRC11	The last write DMA transaction has completed for channel vip2_mult_porta_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_PORTA_SRC10	The last write DMA transaction has completed for channel vip2_mult_porta_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
21	INT_STAT_VIP2_MULT_PORTA_SRC9	The last write DMA transaction has completed for channel vip2_mult_porta_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_PORTA_SRC8	The last write DMA transaction has completed for channel vip2_mult_porta_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_PORTA_SRC7	The last write DMA transaction has completed for channel vip2_mult_porta_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_PORTA_SRC6	The last write DMA transaction has completed for channel vip2_mult_porta_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_PORTA_SRC5	The last write DMA transaction has completed for channel vip2_mult_porta_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_PORTA_SRC4	The last write DMA transaction has completed for channel vip2_mult_porta_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_MULT_PORTA_SRC3	The last write DMA transaction has completed for channel vip2_mult_porta_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_PORTA_SRC2	The last write DMA transaction has completed for channel vip2_mult_porta_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_PORTA_SRC1	The last write DMA transaction has completed for channel vip2_mult_porta_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
12	INT_STAT_VIP2_MULT_PORTA_SRC0	The last write DMA transaction has completed for channel vip2_mult_porta_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP1_PORTB_RGB	The last write DMA transaction has completed for channel vip1_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP1_PORTA_RGB	The last write DMA transaction has completed for channel vip1_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP1_PORTB_CHROMA	The last write DMA transaction has completed for channel vip1_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP1_PORTB_LUMA	The last write DMA transaction has completed for channel vip1_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP1_PORTA_CHROMA	The last write DMA transaction has completed for channel vip1_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP1_PORTA_LUMA	The last write DMA transaction has completed for channel vip1_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP1_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip1_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP1_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip1_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
3	INT_STAT_VIP1_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip1_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP1_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip1_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP1_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip1_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP1_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip1_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip1_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_PORTB_SRC3	The interrupt for Video Input 2 Port B Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_PORTB_SRC2	The interrupt for Video Input 2 Port B Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_PORTB_SRC1	The interrupt for Video Input 2 Port B Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_PORTB_SRC0	The interrupt for Video Input 2 Port B Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_PORTA_SRC15	The interrupt for Video Input 2 Port A Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_PORTA_SRC14	The interrupt for Video Input 2 Port A Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_PORTA_SRC13	The interrupt for Video Input 2 Port A Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_PORTA_SRC12	The interrupt for Video Input 2 Port A Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_PORTA_SRC11	The interrupt for Video Input 2 Port A Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_PORTA_SRC10	The interrupt for Video Input 2 Port A Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_PORTA_SRC9	The interrupt for Video Input 2 Port A Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
20	INT_MASK_VIP2_MULT_PORTA_SRC8	The interrupt for Video Input 2 Port A Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_PORTA_SRC7	The interrupt for Video Input 2 Port A Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_PORTA_SRC6	The interrupt for Video Input 2 Port A Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_PORTA_SRC5	The interrupt for Video Input 2 Port A Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_PORTA_SRC4	The interrupt for Video Input 2 Port A Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_PORTA_SRC3	The interrupt for Video Input 2 Port A Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_PORTA_SRC2	The interrupt for Video Input 2 Port A Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_PORTA_SRC1	The interrupt for Video Input 2 Port A Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_PORTA_SRC0	The interrupt for Video Input 2 Port A Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
11	INT_MASK_VIP1_PORTB_RGB	The interrupt for Video Input 1 Port B RGB Data should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP1_PORTA_RGB	The interrupt for Video Input 1 Port A RGB Data should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP1_PORTB_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP1_PORTB_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP1_PORTA_CHROMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP1_PORTA_LUMA	The interrupt for should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP1_MULT_ANCB_SRC15	The interrupt for Video Input 1 Port B Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP1_MULT_ANCB_SRC14	The interrupt for Video Input 1 Port B Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP1_MULT_ANCB_SRC13	The interrupt for Video Input 1 Port B Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
2	INT_MASK_VIP1_MULT_ANCB_SRC12	The interrupt for Video Input 1 Port B Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP1_MULT_ANCB_SRC11	The interrupt for Video Input 1 Port B Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP1_MULT_ANCB_SRC10	The interrupt for Video Input 1 Port B Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_VIP2_MULT_ANCB_SRC3	The last write DMA transaction has completed for channel vip2_mult_ancb_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_VIP2_MULT_ANCB_SRC2	The last write DMA transaction has completed for channel vip2_mult_ancb_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
29	INT_STAT_VIP2_MULT_ANCB_SRC1	The last write DMA transaction has completed for channel vip2_mult_ancb_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_VIP2_MULT_ANCB_SRC0	The last write DMA transaction has completed for channel vip2_mult_ancb_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_VIP2_MULT_ANCA_SRC15	The last write DMA transaction has completed for channel vip2_mult_anca_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_VIP2_MULT_ANCA_SRC14	The last write DMA transaction has completed for channel vip2_mult_anca_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_VIP2_MULT_ANCA_SRC13	The last write DMA transaction has completed for channel vip2_mult_anca_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
24	INT_STAT_VIP2_MULT_ANCA_SRC12	The last write DMA transaction has completed for channel vip2_mult_anca_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_VIP2_MULT_ANCA_SRC11	The last write DMA transaction has completed for channel vip2_mult_anca_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
22	INT_STAT_VIP2_MULT_ANCA_SRC10	The last write DMA transaction has completed for channel vip2_mult_anca_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_VIP2_MULT_ANCA_SRC9	The last write DMA transaction has completed for channel vip2_mult_anca_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_VIP2_MULT_ANCA_SRC8	The last write DMA transaction has completed for channel vip2_mult_anca_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_VIP2_MULT_ANCA_SRC7	The last write DMA transaction has completed for channel vip2_mult_anca_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_VIP2_MULT_ANCA_SRC6	The last write DMA transaction has completed for channel vip2_mult_anca_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_MULT_ANCA_SRC5	The last write DMA transaction has completed for channel vip2_mult_anca_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_MULT_ANCA_SRC4	The last write DMA transaction has completed for channel vip2_mult_anca_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
15	INT_STAT_VIP2_MULT_ANCA_SRC3	The last write DMA transaction has completed for channel vip2_mult_anca_src3. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_MULT_ANCA_SRC2	The last write DMA transaction has completed for channel vip2_mult_anca_src2. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_MULT_ANCA_SRC1	The last write DMA transaction has completed for channel vip2_mult_anca_src1. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_MULT_ANCA_SRC0	The last write DMA transaction has completed for channel vip2_mult_anca_src0. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_a then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_PORTB_SRC15	The last write DMA transaction has completed for channel vip2_mult_portb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_PORTB_SRC14	The last write DMA transaction has completed for channel vip2_mult_portb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
9	INT_STAT_VIP2_MULT_PORTB_SRC13	The last write DMA transaction has completed for channel vip2_mult_portb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_PORTB_SRC12	The last write DMA transaction has completed for channel vip2_mult_portb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_PORTB_SRC11	The last write DMA transaction has completed for channel vip2_mult_portb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
6	INT_STAT_VIP2_MULT_PORTB_SRC10	The last write DMA transaction has completed for channel vip2_mult_portb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_PORTB_SRC9	The last write DMA transaction has completed for channel vip2_mult_portb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_PORTB_SRC8	The last write DMA transaction has completed for channel vip2_mult_portb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_PORTB_SRC7	The last write DMA transaction has completed for channel vip2_mult_portb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_PORTB_SRC6	The last write DMA transaction has completed for channel vip2_mult_portb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_PORTB_SRC5	The last write DMA transaction has completed for channel vip2_mult_portb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_VIP2_MULT_PORTB_SRC4	The last write DMA transaction has completed for channel vip2_mult_portb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_uv then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_MASK_VIP2_MULT_ANCB_SRC3	The interrupt for Video Input 2 Port B Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
30	INT_MASK_VIP2_MULT_ANCB_SRC2	The interrupt for Video Input 2 Port B Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
29	INT_MASK_VIP2_MULT_ANCB_SRC1	The interrupt for Video Input 2 Port B Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
28	INT_MASK_VIP2_MULT_ANCB_SRC0	The interrupt for Video Input 2 Port B Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
27	INT_MASK_VIP2_MULT_ANCA_SRC15	The interrupt for Video Input 2 Port A Ancillary Data Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
26	INT_MASK_VIP2_MULT_ANCA_SRC14	The interrupt for Video Input 2 Port A Ancillary Data Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
25	INT_MASK_VIP2_MULT_ANCA_SRC13	The interrupt for Video Input 2 Port A Ancillary Data Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
24	INT_MASK_VIP2_MULT_ANCA_SRC12	The interrupt for Video Input 2 Port A Ancillary Data Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
23	INT_MASK_VIP2_MULT_ANCA_SRC11	The interrupt for Video Input 2 Port A Ancillary Data Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
22	INT_MASK_VIP2_MULT_ANCA_SRC10	The interrupt for Video Input 2 Port A Ancillary Data Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
21	INT_MASK_VIP2_MULT_ANCA_SRC9	The interrupt for Video Input 2 Port A Ancillary Data Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
20	INT_MASK_VIP2_MULT_ANCA_SRC8	The interrupt for Video Input 2 Port A Ancillary Data Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
19	INT_MASK_VIP2_MULT_ANCA_SRC7	The interrupt for Video Input 2 Port A Ancillary Data Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
18	INT_MASK_VIP2_MULT_ANCA_SRC6	The interrupt for Video Input 2 Port A Ancillary Data Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
17	INT_MASK_VIP2_MULT_ANCA_SRC5	The interrupt for Video Input 2 Port A Ancillary Data Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
16	INT_MASK_VIP2_MULT_ANCA_SRC4	The interrupt for Video Input 2 Port A Ancillary Data Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
15	INT_MASK_VIP2_MULT_ANCA_SRC3	The interrupt for Video Input 2 Port A Ancillary Data Channel 3 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
14	INT_MASK_VIP2_MULT_ANCA_SRC2	The interrupt for Video Input 2 Port A Ancillary Data Channel 2 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
13	INT_MASK_VIP2_MULT_ANCA_SRC1	The interrupt for Video Input 2 Port A Ancillary Data Channel 1 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
12	INT_MASK_VIP2_MULT_ANCA_SRC0	The interrupt for Video Input 2 Port A Ancillary Data Channel 0 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
11	INT_MASK_VIP2_MULT_PORTB_SRC15	The interrupt for Video Input 2 Port B Channel 15 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
10	INT_MASK_VIP2_MULT_PORTB_SRC14	The interrupt for Video Input 2 Port B Channel 14 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
9	INT_MASK_VIP2_MULT_PORTB_SRC13	The interrupt for Video Input 2 Port B Channel 13 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
8	INT_MASK_VIP2_MULT_PORTB_SRC12	The interrupt for Video Input 2 Port B Channel 12 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
7	INT_MASK_VIP2_MULT_PORTB_SRC11	The interrupt for Video Input 2 Port B Channel 11 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
6	INT_MASK_VIP2_MULT_PORTB_SRC10	The interrupt for Video Input 2 Port B Channel 10 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
5	INT_MASK_VIP2_MULT_PORTB_SRC9	The interrupt for Video Input 2 Port B Channel 9 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
4	INT_MASK_VIP2_MULT_PORTB_SRC8	The interrupt for Video Input 2 Port B Channel 8 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
3	INT_MASK_VIP2_MULT_PORTB_SRC7	The interrupt for Video Input 2 Port B Channel 7 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
2	INT_MASK_VIP2_MULT_PORTB_SRC6	The interrupt for Video Input 2 Port B Channel 6 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
1	INT_MASK_VIP2_MULT_PORTB_SRC5	The interrupt for Video Input 2 Port B Channel 5 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0
0	INT_MASK_VIP2_MULT_PORTB_SRC4	The interrupt for Video Input 2 Port B Channel 4 should generate an interrupt on interrupt vpdma_int1. Write a 1 for the interrupt event to trigger the interrupt signal.	RW	0x0

Bits	Field Name	Description	Type	Reset
31	INT_STAT_TRANSCODE2_CHROMA	The last write DMA transaction has completed for channel transcode2_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
30	INT_STAT_TRANSCODE2_LUMA	The last write DMA transaction has completed for channel transcode2_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
29	INT_STAT_TRANSCODE1_CHROMA	The last write DMA transaction has completed for channel transcode1_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
28	INT_STAT_TRANSCODE1_LUMA	The last write DMA transaction has completed for channel transcode1_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
27	INT_STAT_AUX_IN	The last read DMA transaction has occurred for channel aux_in and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client comp_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_PIP_FRAME	The last read DMA transaction has occurred for channel pip_frame and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client pip_wrbk will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_POST_COMP_WR	The last write DMA transaction has completed for channel post_comp_wr. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client hdmi_wrbk_out then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_VBI_SD_VENC	The last read DMA transaction has occurred for channel vbi_sd_venc and the channel is free to be updated for the next transfer. This will fire before the destination has received the data as it will have just been stored in the internal buffer. The client vbi_sdvenc will now accept a new descriptor from the List Manager. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	RESERVED	Reserved	R	0x0
22	INT_STAT_NF_LAST_CHROMA	The last write DMA transaction has completed for channel nf_last_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_NF_LAST_LUMA	The last write DMA transaction has completed for channel nf_last_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_NF_WRITE_CHROMA	The last write DMA transaction has completed for channel nf_write_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
19	INT_STAT_NF_WRITE_LUMA	The last write DMA transaction has completed for channel nf_write_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_OTHER	This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_VIP2_PORTB_RGB	The last write DMA transaction has completed for channel vip2_portb_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_lo_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_VIP2_PORTA_RGB	The last write DMA transaction has completed for channel vip2_porta_rgb. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_up_y then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_VIP2_PORTB_CHROMA	The last write DMA transaction has completed for channel vip2_portb_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_VIP2_PORTB_LUMA	The last write DMA transaction has completed for channel vip2_portb_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_VIP2_PORTA_CHROMA	The last write DMA transaction has completed for channel vip2_porta_chroma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_VIP2_PORTA_LUMA	The last write DMA transaction has completed for channel vip2_porta_luma. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_VIP2_MULT_ANCB_SRC15	The last write DMA transaction has completed for channel vip2_mult_ancb_src15. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_VIP2_MULT_ANCB_SRC14	The last write DMA transaction has completed for channel vip2_mult_ancb_src14. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_VIP2_MULT_ANCB_SRC13	The last write DMA transaction has completed for channel vip2_mult_ancb_src13. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_VIP2_MULT_ANCB_SRC12	The last write DMA transaction has completed for channel vip2_mult_ancb_src12. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_VIP2_MULT_ANCB_SRC11	The last write DMA transaction has completed for channel vip2_mult_ancb_src11. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_VIP2_MULT_ANCB_SRC10	The last write DMA transaction has completed for channel vip2_mult_ancb_src10. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_VIP2_MULT_ANCB_SRC9	The last write DMA transaction has completed for channel vip2_mult_ancb_src9. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_VIP2_MULT_ANCB_SRC8	The last write DMA transaction has completed for channel vip2_mult_ancb_src8. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_VIP2_MULT_ANCB_SRC7	The last write DMA transaction has completed for channel vip2_mult_ancb_src7. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_VIP2_MULT_ANCB_SRC6	The last write DMA transaction has completed for channel vip2_mult_ancb_src6. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_VIP2_MULT_ANCB_SRC5	The last write DMA transaction has completed for channel vip2_mult_ancb_src5. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
0	INT_STAT_VIP2_MULT_ANCB_SRC4	The last write DMA transaction has completed for channel vip2_mult_ancb_src4. All data from the channel has been sent and received by the external memory. If a new channel has not been setup for the client vip2_anc_b then the client will be fully empty at this point. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

27	INT_STAT_CONTROL_DESCRIPTOR_INT11	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 11. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
26	INT_STAT_CONTROL_DESCRIPTOR_INT10	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 10. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
25	INT_STAT_CONTROL_DESCRIPTOR_INT9	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 9. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
24	INT_STAT_CONTROL_DESCRIPTOR_INT8	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 8. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
23	INT_STAT_CONTROL_DESCRIPTOR_INT7	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 7. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
22	INT_STAT_CONTROL_DESCRIPTOR_INT6	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 6. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
21	INT_STAT_CONTROL_DESCRIPTOR_INT5	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 5. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
20	INT_STAT_CONTROL_DESCRIPTOR_INT4	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 4. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
19	INT_STAT_CONTROL_DESCRIPTOR_INT3	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 3. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
18	INT_STAT_CONTROL_DESCRIPTOR_INT2	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 2. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
17	INT_STAT_CONTROL_DESCRIPTOR_INT1	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 1. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
16	INT_STAT_CONTROL_DESCRIPTOR_INT0	A Send Interrupt Control Descriptor has been received by the list manager with a source value of 0. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
15	INT_STAT_LIST7_NOTIFY	A channel set by List 7 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
14	INT_STAT_LIST7_COMPLETE	List 7 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
13	INT_STAT_LIST6_NOTIFY	A channel set by List 6 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
12	INT_STAT_LIST6_COMPLETE	List 6 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
11	INT_STAT_LIST5_NOTIFY	A channel set by List 5 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
10	INT_STAT_LIST5_COMPLETE	List 5 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Bits	Field Name	Description	Type	Reset
9	INT_STAT_LIST4_NOTIFY	A channel set by List 4 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
8	INT_STAT_LIST4_COMPLETE	List 4 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
7	INT_STAT_LIST3_NOTIFY	A channel set by List 3 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
6	INT_STAT_LIST3_COMPLETE	List 3 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
5	INT_STAT_LIST2_NOTIFY	A channel set by List 2 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
4	INT_STAT_LIST2_COMPLETE	List 2 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
3	INT_STAT_LIST1_NOTIFY	A channel set by List 1 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
2	INT_STAT_LIST1_COMPLETE	List 1 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
1	INT_STAT_LIST0_NOTIFY	A channel set by List 0 has completed and the Notify bit had been set in the descriptor for that channel. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0
0	INT_STAT_LIST0_COMPLETE	List 0 has completed and a new list can be loaded. This event will cause a one to be set in this register until cleared by software. Write a 1 to this field to clear the value.	RW	0x0

Display Subsystem

This chapter describes the display subsystem for the device.

Topic **Page**

8.1 Display Subsystem Overview

The Display Subsystem (DSS) provides the logic to interface display peripherals. DSS integrates a DMA engine as part of DISPC module, which allows direct access to the memory frame buffer. Various pixel processing capabilities are supported, such as: color space conversion, filtering, scaling, blending, color keying, etc.

The supported display interfaces are:

- One parallel CMOS output, which can be used for MIPI® DPI 2.0, or BT-656 or BT-1120.
- One TV output, which is connected to the internal Video Encoder module (VENC). The VENC drives a single video digital-to-analog converter (SD_DAC) supporting composite video mode.

The modules integrated in the display subsystem are:

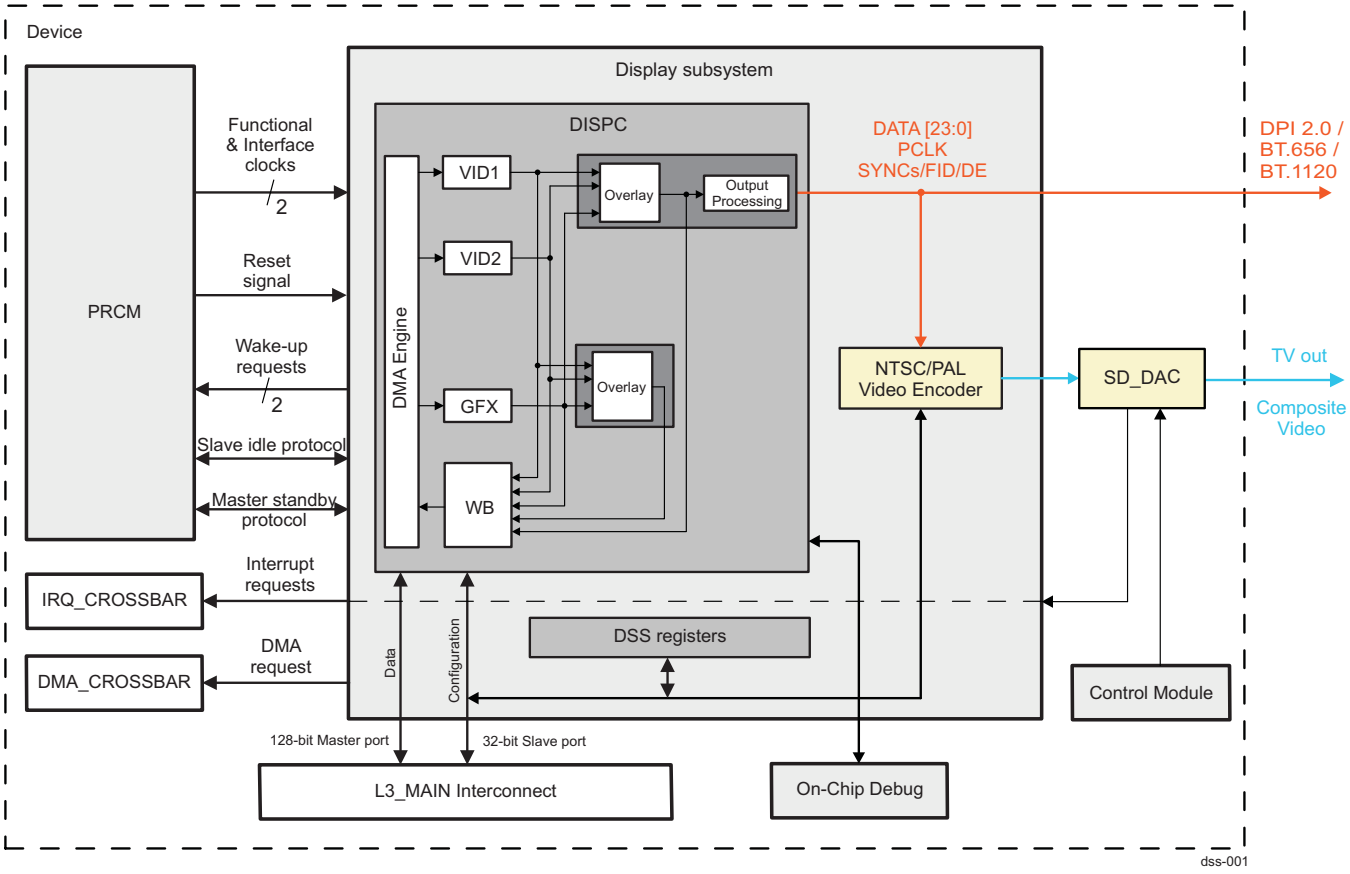
- Display controller (DISPC), with the following main features
  - One direct memory access (DMA) engine
  - One graphics pipeline (GFX), two video pipelines (VID1 and VID2), and one write-back pipeline (WB)
  - Two overlay managers
  - Active Matrix color support for 12/16/18/24-bit (truncated or dithered encoded pixel values)
  - One Video Port (VP) with programmable timing generator to support:
    - DPI: up to 165 MHz pixel clock video formats defined in CEA-861-E and VESA DMT standards
    - VENC: NTSC/PAL standards with 60Hz/50Hz refresh rates
  - Supported maximum FrameBuffer width of 4096 for all pixel formats
  - Configurable output mode: progressive or interlaced
  - Selection between RGB and YUV422 output pixel formats (YUV4:2:2 only available when BT-656 or BT-1120 output mode is enabled)
  - Refer to Section 8.2, *Display Controller*, for more details
- Video Encoder (VENC) with 10-bit standard definition video DAC (SD_DAC). Refer to Section 8.3, *Video Encoder*, for more details.

DSS provides two interfaces to L3_MAIN interconnect

- One 128-bit master port (with MFLAG support). The DMA engine in DISPC uses this single master to read/write data from/to device system memory.
- One 32-bit slave port. Used for registers configuration. It is further connected internally to DISPC and VENC modules.

Figure 8-1 is a high-level diagram of the display subsystem.

Figure 8-1. Display Subsystem Overview



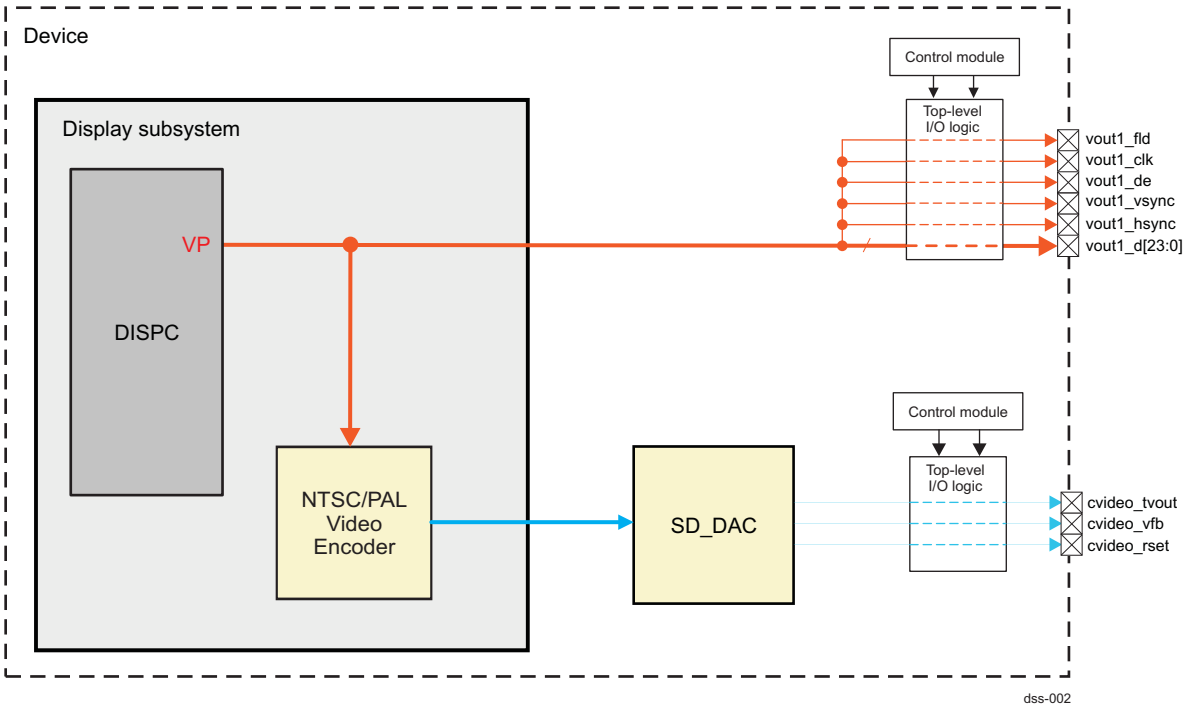
8.1.1 Display Subsystem Environment

This section describes the various outputs handled by the display subsystem:

- Parallel interface (MIPI DPI 2.0, or BT-656 or BT-1120) support
- TV (composite video) output support

Figure 8-2 is a diagram of the display subsystem environment.

Figure 8-2. Display Subsystem Environment



NOTE: The path from a module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see Section 13.4.6.3 *Pad Configuration Registers* in Chapter 13, *Control Module*.

CAUTION

The parallel and TV out interfaces cannot be used simultaneously.

- When the DSS_DPI_CTRL[0] DPI_ENABLE is set to 0x1, the parallel DPI output is enabled.
- When the DSS_DPI_CTRL[0] DPI_ENABLE is set to 0x0, the parallel DPI output is disabled. The TV composite output through VENC and SD_DAC modules can be used.

8.1.1.1 Display Subsystem Parallel Interface

In a parallel interface configuration, the DISPC outputs the VP data and interface signals on device I/O pads: DATA[23:0] (data bus), HSYNC (horizontal synchronization signal), VSYNC (vertical synchronization signal), DE (data enable), FID (field identification, odd/even) and PCLK (pixel clock). The required data and control signals can be provided directly to an external MIPI DPI-compatible LCD panels.

For more details on the output pixel data formats for the parallel interface, see Section 8.2.2 *DISPC Environment*, in *Display Controller*.

8.1.1.2 Display Subsystem TV Output

In a TV output configuration, the DISPC, VENC and video SD_DAC modules are used in the data path. The DISPC receives synchronization signals from the VENC and synchronously sends pixel data to the VENC with these signals. The digital output of the DISPC is always a 24-bit RGB value based on a pixel request from the VENC. The VENC converts RGB video signals to conform to the NTSC/PAL standards for analog video.

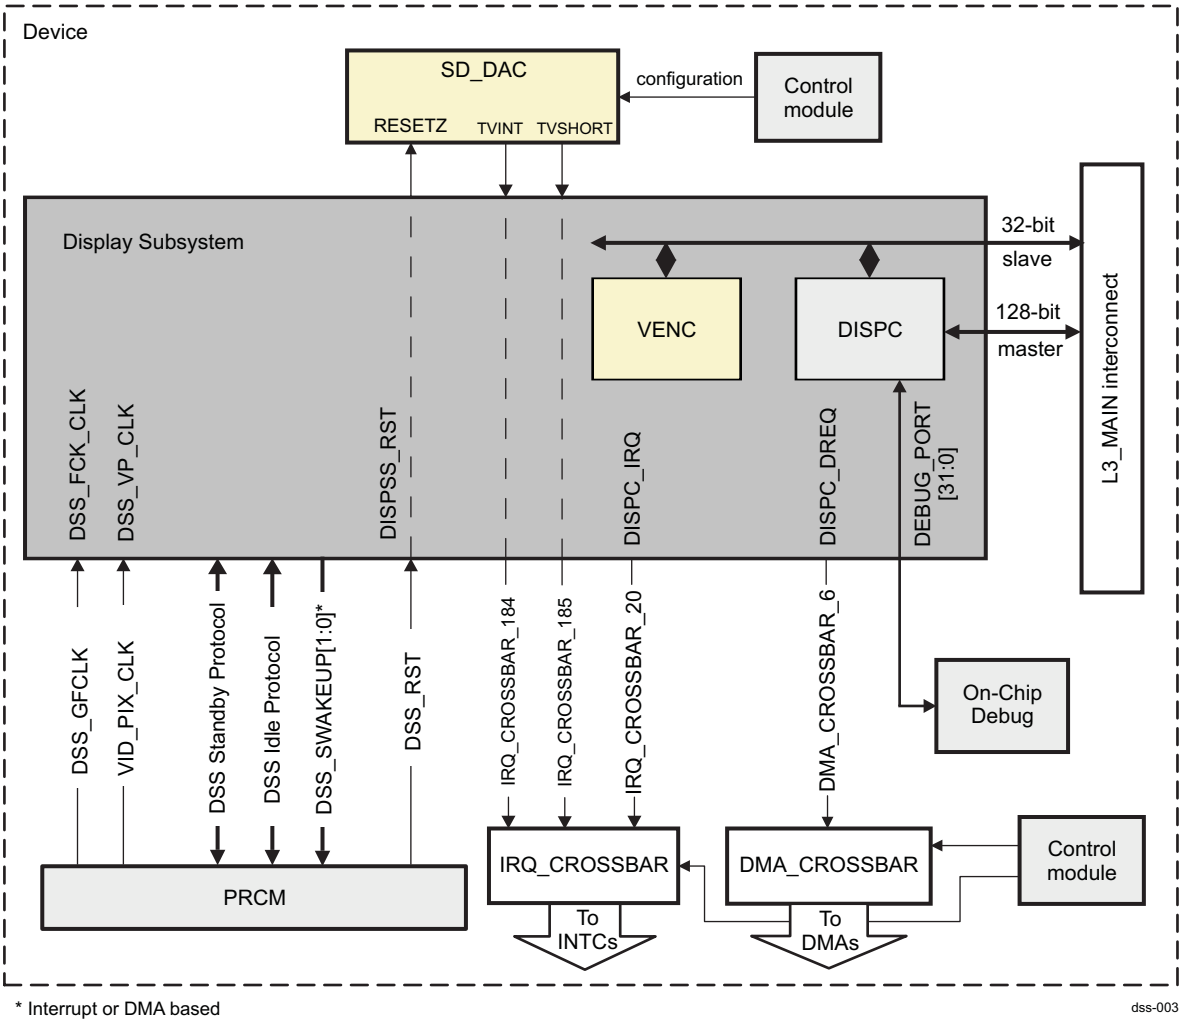
For more details, see Section 8.3, *Video Encoder*.

8.1.2 Display Subsystem Integration

This section describes the integration of the display subsystem module in the device, including information about clocks, resets, and hardware requests.

Figure 8-3 shows the integration of the display subsystem in the device.

Figure 8-3. Display Subsystem Integration



8.1.2.1 Display Subsystem Interrupt and DMA Requests

Table 8-1 shows the interrupt and DMA requests generated by the DISPC and SD_DAC module.

Table 8-1. Display Subsystem Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20	DSP1_IRQ_51 DSP2_IRQ_51 IPU1_IRQ_23	DISPC interrupt request
SD_DAC	SD_DAC_IRQ_TVINT	IRQ_CROSSBAR_184	-	Interrupt for TV load detection from SD_DAC
	SD_DAC_IRQ_TVSHORT	IRQ_CROSSBAR_185	-	Interrupt for TV short detection from SD_DAC

Table 8-1. Display Subsystem Hardware Requests (continued)

DMA Requests				
Module Instance	**Source Signal Name**	**Destination DMA_CROSSBAR Input**	**Default Mapping**	**Description**
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5	The line trigger signal used for synchronization of a logical channel in the device-level EDMA for memory-to-memory transfer, generated by the DISPC module. There is no data received by the DISPC based on the DMA request.

NOTE: The "**Default Mapping**" column in Table 8-1 *Display Subsystem Hardware Requests* shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.
For more information about the IRQ_CROSSBAR module, see Section 13.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 13, *Control Module*.
For more information about the DMA_CROSSBAR module, see Section 13.4.6.5, *DMA_CROSSBAR Module Functional Description*, in Chapter 13, *Control Module*.
For more information about the device interrupt controllers, see Chapter 12, *Interrupt Controllers*.
For more information about the device EDMA module, see Chapter 11, *Enhanced DMA*.

8.1.2.2 Display Subsystem Clocks

The power, reset, and clock management (PRCM) module provides the clock signals, and status for their activity, to the display subsystem.

Figure 8-4 shows the details of the display subsystem clock tree.

Figure 8-4. Display Subsystem Clock Tree

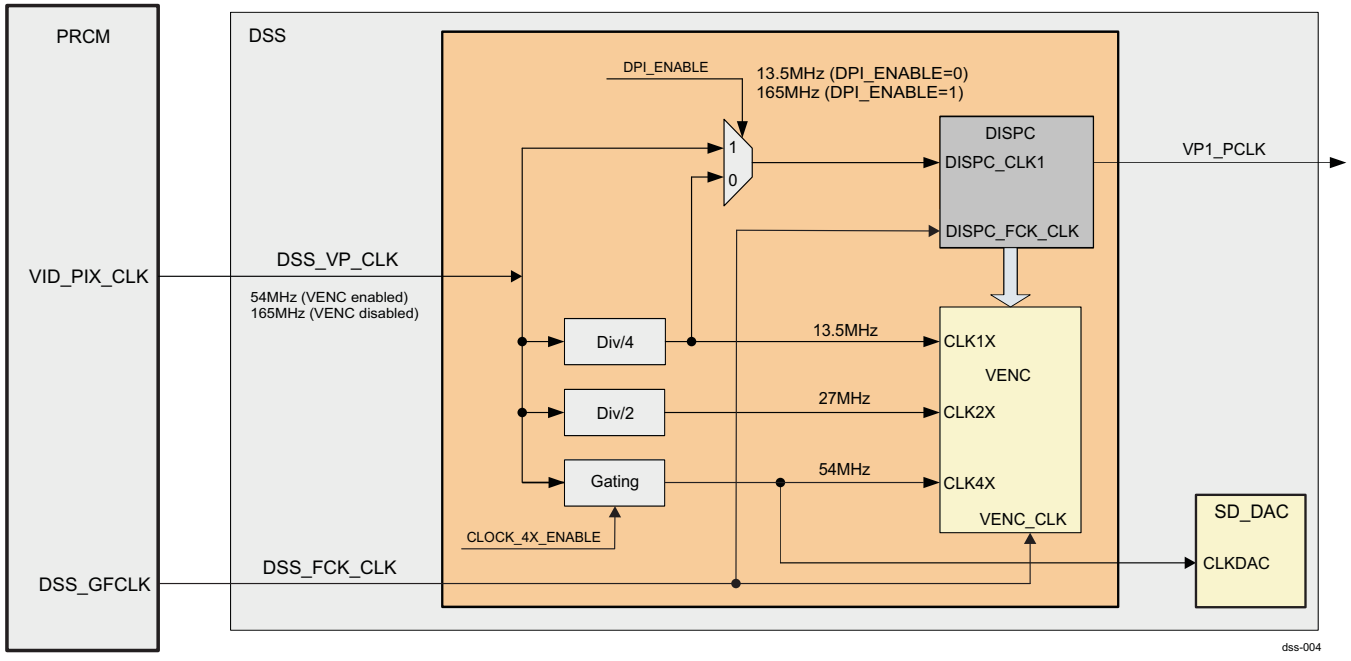


Table 8-2 lists the main DSS clocks and their sources.

Table 8-2. Display Subsystem Clocks

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
DSS	DSS_VP_CLK	VID_PIX_CLK	PRCM module	Functional clock used for the VP pixel clock, Sync buffer and Timing generator modules within DISPC, and VENC/SD_DAC modules
	DSS_FCK_CLK	DSS_GFCLK	PRCM module	DISPC functional and interface clock; VENC interface clock

The DPI_ENABLE signal in Figure 8-4 is driven by DSS_DPI_CTRL[0] DPI_ENABLE register bit.

The gating of VENC clock CLK4X is controlled via DSS_VENC_CTRL[0] VENC_CLOCK_4X_ENABLE bit.

8.1.2.3 Display Subsystem Reset

The PRCM module provides one HW reset signal (DSS_RST) to the display subsystem, which is propagated to the DISPC, VENC and SD_DAC modules.

The DSS submodules can also be reset by a corresponding SW reset on submodule level.

The DSS_SYSSTATUS[0] DSS_RESETDONE register bit indicates the completion of the DISPC reset, following a HW or SW reset.

In order VENC reset status to be indicated in the DSS_SYSSTATUS[6] VENC_RESETDONE bit, the VENC functional clock (VENC_CLK) must be running.

8.1.2.4 Display Subsystem Power Management

The display subsystem and submodules are in the PD_DSS power domain.

The DSS supports no-idle mode, force-idle mode, and smart-idle modes. The mode can be selected by programming the appropriate value in the DSS_SYSCONFIG[1:0] SIDLEMODE register bitfield.

8.1.2.4.1 Display Subsystem Standby Mode

As part of the system-wide power-management scheme, the display subsystem supports the MStandby/MWait and SIdleReq/SIdleAck protocols:

- MStandby/MWait
  - DISPC
- SIdleReq/SIdleAck
  - DISPC

The PRCM module asserts the MWait and receives MStandby directly from DISPC. When the display subsystem initiates a standby procedure, it also initiates a master standby/wait protocols with the PRCM module that lets the PRCM cut the display subsystem clocks. For information about the conditions that allow the subsystem to exit standby mode, see Section 8.2.4.3.2 *DISPC StandBy Mode*, in *Section 8.2 Display Controller*.

The PRCM also asserts the SIdleReq. Then, it is split at the display subsystem level and send to the appropriate modules. Consequently, all SIdleAck are merged into one and sent back to PRCM.

8.1.2.4.2 Display Subsystem Wake-Up Mode

The DISPC module supports the wake-up protocol. DSS_SWAKEUP[1:0] signals are associated with DISPC_DREQ and DISPC_IRQ. For the events that generate an Swakeup and the description and configuration of the registers,see Section 8.2.4.3.3 *DISPC StandBy Mode*, in *Section 8.2 Display Controller*..

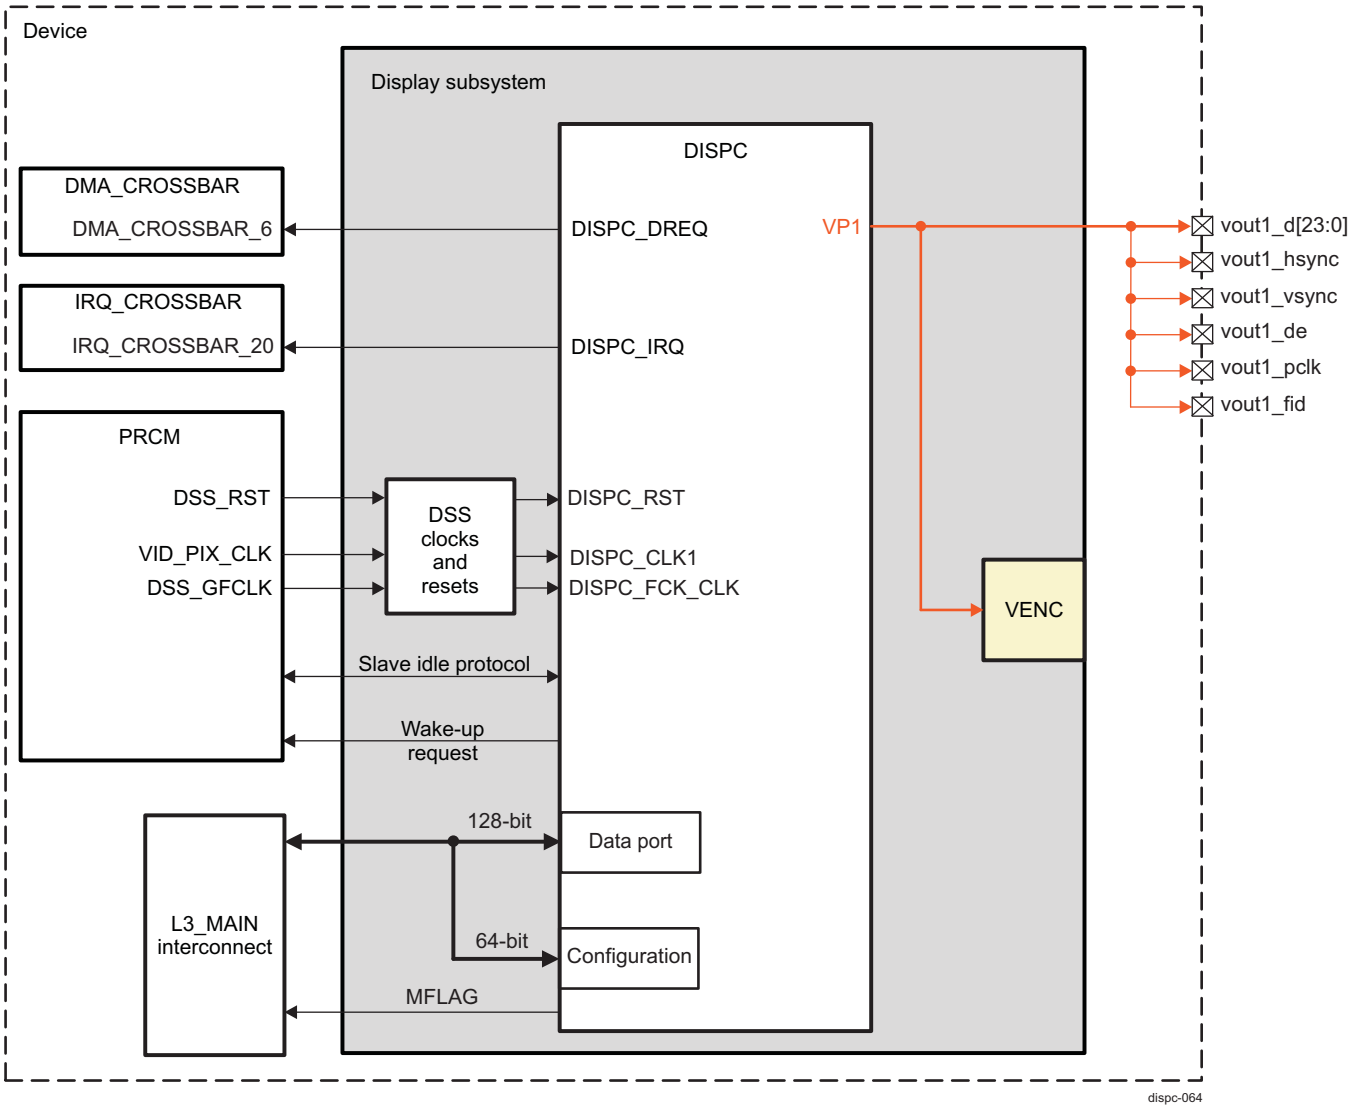
8.2.1 DISPC Overview

Figure 8-5 shows a block diagram of the display controller (DISPC) within the display subsystem.

Figure 8-5. DISPC Overview



The DISPC includes the following main features:

- Pipelines for processing:
  - One Graphics (GFX) pipeline:
    - Pixel formats: ARGB16-4444, ABGR16-4444, RGBA16-4444, RGB16-565, BGR16-565, ARGB16-1555, ABGR16-1555, ARGB32-8888, ABGR32-8888, BGRA32-8888, RGBA32-8888, RGB24-888, ARGB32-2101010, ABGR32-2101010, ARGB48-12121212, RGBA48-12121212, ARGB64-16161616, RGBA64-16161616, BITMAP1, BITMAP2, BITMAP4, BITMAP8. (A component can be ignored by not selecting Alpha pixel)
    - Premultiplied ARGB and RGBA formats
    - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888, and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the most significant bits [MSBs])

- Support for color look-up table (CLUT): 256 × 24-bit entries palette in RGB
- Support for anti-aliasing on RGB pixel formats using 3-tap filter
- Up to 4K-by-4K frame buffer size

– Two Video pipelines (VID1 and VID2):
  - Pixel formats: ARGB16-4444, ABGR16-4444, RGBA16-4444, RGB16-565, BGR16-565, ARGB16-1555, ABGR16-1555, ARGB32-8888, ABGR32-8888, BGRA32-8888, RGBA32-8888, RGB24-888, ARGB32-2101010, ABGR32-2101010, ARGB48-12121212, RGBA48-12121212, ARGB64-16161616, RGBA64-16161616, RGB565-A8, BITMAP1, BITMAP2, BITMAP4, BITMAP8, YUV422-UYVY, YUV422-YUV2, YUV420-NV12, YUV420-NV21 and in addition RGBx, xRGB, xBGR, and BGRx pixel formats defined considering that A component of RGBA, ARGB, ABGR, BGRA pixel formats is ignored by HW (e.g. ARGB->xRGB)
  - Premultiplied ARGB and RGBA formats
  - Support for color look-up table (CLUT): 256 × 24-bit entries palette in RGB
  - Programmable poly-phase filter:
    - Independent horizontal and vertical resampling. Upsampling up to x16, and downsampling down to 1/4
    - Maximum input width of 1280 pixels (2560 in 3-tap mode)
    - No limitation on the input height
    - Supported input formats are all above listed formats, except BITMAP formats. The alpha blending factor is rescaled like the R, G and B color components. 16 phases with symmetrical coefficients are implemented.
  - Programmable color space conversion from YUV4:2:2 (YUV4:4:4, YUV4:2:0 after Chroma upsampling through the scaler) into ARGB48-12121212.
  - Programmable VC-1 range mapping
  - Up to 4K-by-4K frame buffer size

– One Write-back (WB) pipeline: Allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing to perform memory-to-memory transfer with data processing or capturing a displayed frame
  - Pixel formats: ARGB16-4444, ABGR16-4444, RGBA16-4444, RGB16-565, BGR16-565, ARGB16-1555, ABGR16-1555, ARGB32-8888, ABGR32-8888, BGRA32-8888, RGBA32-8888, RGB24-888, ARGB32-2101010, ABGR32-2101010, ARGB48-12121212, RGBA48-12121212, ARGB64-16161616, RGBA64-16161616, RGB565-A8, YUV422-UYVY, YUV422-YUV2, YUV420-NV12, YUV420-NV21 and in addition RGBx, xRGB, xBGR, and BGRx pixel formats defined considering that A component of RGBA, ARGB, ABGR, BGRA pixel formats is ignored by HW (e.g. ARGB->xRGB)
  - Programmable color space conversion RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, YUV4:2:0-NV12, or YUV4:2:0-NV21
  - Programmable poly-phase filter:
    - Independent horizontal and vertical resampling. Upsampling up to x16, and downsampling down to 1/4. When the output format of WB pipeline includes a format change from RGB or YUV4:2:2 to YUV4:2:0, the maximum downscaling provided by the WB scaler is 1/2.
    - Maximum input width of 1280 pixels using 32-bit pixels and 5-tap, and 2560 pixels using 32-bit pixels and 3-tap
    - No limitation on the input height
    - The supported formats are RGB888/RGBA-8888/ARGB32-8888, ARGB48-12121212, RGB565-A8, YUV422-UYVY, YUV422-YUV2, YUV420-NV12 and YUV420-NV21
    - Alpha blending factor is rescaled like the R, G, and B color components
    - 16 phases with symmetrical coefficients are implemented
  - Selection of the source of the data:
    - One of the overlay manager outputs
    - One of the pipeline outputs

- One Video Port (VP1) output:
  - Up to 24-bit per pixel on the output interface, with selection between 12, 16, 18 or 24-bit
  - Independent programmable timing generator to support up to 165 MHz pixel clock video formats defined in CEA-861-E and VESA-DMT standards
  - Independent programmable multiple cycles output format on 8/9/12/16-bit interface (TDM)
  - Configurable output mode: progressive or interlaced mode
  - Selection between RGB and YUV422 output pixel format (YUV4:2:2 only available when BT output is enabled)
- Two Overlay Managers (OVR1 and OVR2):
  - Input Pixel format: ARGB48-12121212
  - Output Pixel format: ARGB48-12121212 (A component is only used for Write-back)
  - Overlay of the graphics and video pipelines
  - Transparency color keys (source and destination)
  - Global and pixel alpha blending
  - Programmable Z-order (full flexibility)
- Common:
  - Programmable 8-bit gamma curve support on VP1 output
  - Programmable color phase rotation (CPR)
  - Alpha blending support:
    - Embedded pixel factor (ARGB and RGBA)
    - Global pixel
    - Combination of global pixel and pixel factor
- DMA (internal to the DISPC):
  - No support for rotation, flip-flop, mirroring and memory fragmentation
  - Integrated shared buffers between DMA engine and pipelines
  - Programmable buffer thresholds
  - Bandwidth limiter on write request (insertion on idle cycles between requests)
- Advanced:
  - Mode outputting data on display only from the DMA buffer (self-refresh using the DMA FIFO)
  - Arbitration between normal and low priority pipelines (GFX, VID1, VID2 and WB pipelines)
- Power modes:
  - Low-power saving modes
  - Support on-the-fly dynamic voltage and frequency scaling (DVFS)
  - Merge capability of the DMA buffers to support greater OFF period on the L3_MAIN interconnect
    - All buffers associated to a single pipeline
    - Reallocation of the buffers of the nonactive pipelines to the active pipelines

NOTE: The display resolution is programmable and can be any width in the range [1:4096] pixels. The following limitations, related to the type of display or the processing done, apply:

- Active Matrix screen + dithering forces a width multiple of 2 pixels
- Active Matrix + TDM may force a width multiple of 2 pixels

The display buffers in the system memory consist of contiguous pixels.

8.2.2 DISPC Environment

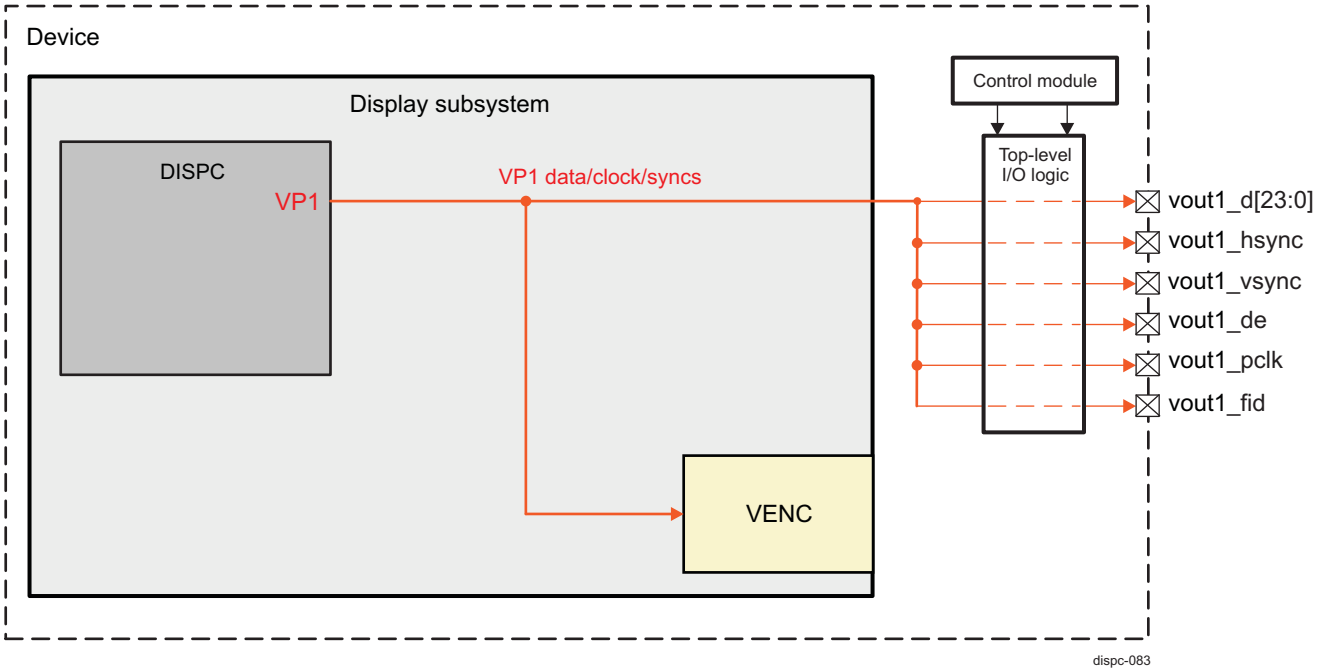
The DISPC VP1 provides the required data and control signals to interface:

- Directly to device CMOS pads for MIPI DPI 2.0, or BT.656 or BT.1120 interface support
- Video Encoder (VENC) module with dedicated standard definition video DAC (SD_DAC) for composite TV out support

Figure 8-6 shows the supported interfaces.

NOTE: The parallel and TV out interfaces cannot be used simultaneously. The selection can be done at DSS top level. For more information, see Section 8.1.1, *Display Subsystem Environment*.

Figure 8-6. DISPC VP1 Output Interfaces



NOTE: The path from a module pin to device pad (or pads) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the control module registers and dedicated IP registers. For more information, see Section 13.4.6.1, Pad Configuration Registers, in Chapter 13 *Control Module*.

Table 8-17 describes the VP1 interface signals.

Table 8-17. DISPC VP1 Interface Signals

Signal Name	Type[1]	Description
vout1_d[23:0]	O	Pixel data
vout1_pclk	O	Pixel clock
vout1_vsync	O	Vertical synchronization. The frame synchronization pulse (vsync) toggles after all the lines in a frame are transmitted and a programmable number of line clock cycles has elapsed at the beginning and the end of each frame.

(1) I = Input, O = Output, I/O = Input/Output

Table 8-17. DISPC VP1 Interface Signals (continued)

Signal Name	Type[1]	Description
vout1_hsync	O	Horizontal synchronization. The line synchronization pulse (hsync) toggles after all pixels in a line are transmitted and a programmable number of pixel clock wait-states has elapsed at the beginning and the end of each line.
vout1_de	O	Pixel data output-enable signal to indicate when data must be latched using the pixel clock.
vout1_fid	O	The FID signal indicates the output field identifier: • 0 means even • 1 means odd The FID signal is 0 when the progressive mode is selected for the VP output.

8.2.2.1 DISPC VP1 Output and Data Formats

This section describes the pixel data bus and shows timing diagrams of transactions and synchronizations.

In the Active matrix display type, one pixel per pixel clock is displayed. The diagrams represent the configuration of assertion of the data on the rising edge of the pixel clock. It is possible to program the interface timing to output the data on the falling edge of the pixel clock.

Active matrix displays bypass the STN dithering logic block and the output FIFO. Each line represents one pixel.Figure 8-7 through Figure 8-10 show 12-, 16-, 18-, and 24-active matrix displays, respectively. The width of the data bus can be configured through DISPC_VP1_CONTROL[10:8] DATALINES register bitfield.

8.2.2.2 DISPC VP1 Active Marix Display Timing Diagrams

Figure 8-11 through Figure 8-14 show timing diagrams of synchronization signals and pixel clocks for active matrix panels. The DISPC directly drives these signals, which are related to the programmable fields listed in Table 8-19.

Table 8-19. DISPC VP1 Programmable Fields for Active Matrix Display

Name	Register	Description
PPL	DISPC_VP1_SIZE_SCREEN[11:0] PPL value + 1	Pixels per line
LPP	DISPC_VP1_SIZE_SCREEN[27:16] LPP value + 1	Lines per panel
HBP	DISPC_VP1_TIMING_H[31:20] HBP value + 1	Horizontal back porch
HFP	DISPC_VP1_TIMING_H[19:8] HFP value + 1	Horizontal front porch
HSW	DISPC_VP1_TIMING_H[7:0] HSW value + 1	Horizontal synchronization pulse width
VBP	DISPC_VP1_TIMING_V[31:20] VBP value	Vertical back porch
VFP	DISPC_VP1_TIMING_V[19:8] VFP value	Vertical front porch
VSW	DISPC_VP1_TIMING_V[7:0] VSW value + 1	Vertical synchronization pulse width
ONOFF(1)	DISPC_VP1_POL_FREQ[17] ONOFF	DISPC_HSYNC and DISPC_VSYNC pixel clock control
RF(2)	DISPC_VP1_POL_FREQ[16] RF	DISPC_HSYNC and DISPC_VSYNC pixel clock edge control
IEO	DISPC_VP1_POL_FREQ[15] IEO	Invert output enable
IPC(3)	DISPC_VP1_POL_FREQ[14] IPC	Invert DISPC_PCLK
IHS	DISPC_VP1_POL_FREQ[13] IHS	Invert DISPC_HSYNC
IVS	DISPC_VP1_POL_FREQ[12] IVS	Invert DISPC_VSYNC

(1) DISPC_VP1_POL_FREQ[17] ONOFF and Control Module register CTRL_CORE_SMA_SW_1[]DSS_CH0_ON_OFF must match.
(2) DISPC_VP1_POL_FREQ[16] RF and Control Module register CTRL_CORE_SMA_SW_1[]DSS_CH0_RF must match.
(3) DISPC_VP1_POL_FREQ[14] IPC and Control Module register CTRL_CORE_SMA_SW_1[]DSS_CH0_IPC must match.

- Active matrix timing configuration 1:
  - DISPC_VP1_POL_FREQ[17] ONOFF = 0 and CTRL_CORE_SMA_SW_1[]DSS_CH0_ON_OFF = 0
  - DISPC_VP1_POL_FREQ[16] RF = 0 and CTRL_CORE_SMA_SW_1[]DSS_CH0_RF = 0
    The HSYNC and VSYNC signals are driven on the opposite edge of PCLK from the pixel data.
  - DISPC_VP1_POL_FREQ[15] IEO = 0
    The DE signal is active high.
  - DISPC_VP1_POL_FREQ[14] IPC = 0 and CTRL_CORE_SMA_SW_1[]DSS_CH0_IPC = 0
    The pixel data are driven on the rising edge of PCLK.
  - DISPC_VP1_POL_FREQ[13] IHS = 0
    The HSYNC signal is active high.
  - DISPC_VP1_POL_FREQ[12] IVS = 0
    The VSYNC signal is active high.

Figure 8-11. DISPC Active Matrix Timing Diagram of Configuration 1 (Start of Frame)

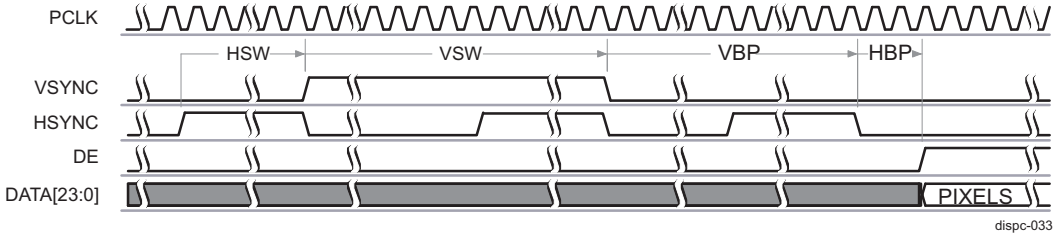

Figure 8-12. DISPC Active Matrix Timing Diagram of Configuration 1 (Between Lines)

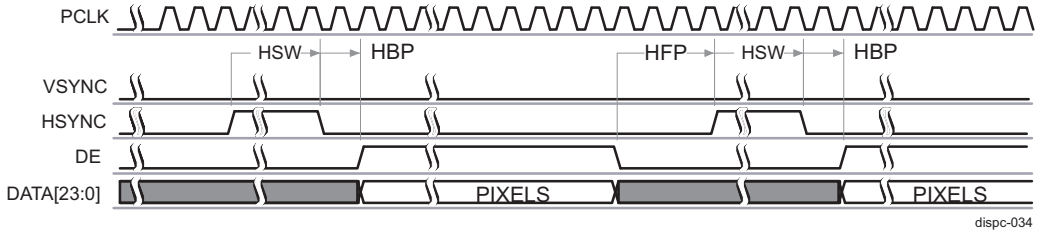

Figure 8-13. DISPC Active Matrix Timing Diagram of Configuration 1 (Between Frames)

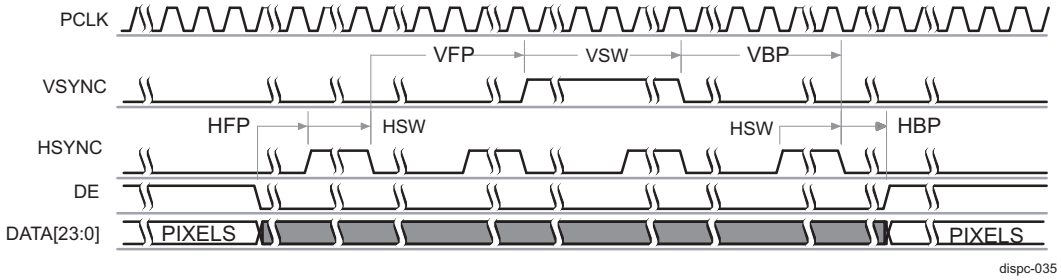

Figure 8-14. DISPC Active Matrix Timing Diagram of Configuration 1 (End of Frame)

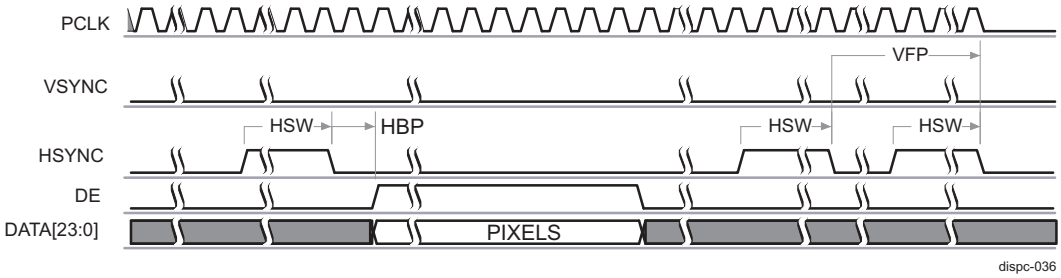

- Active matrix timing configuration 2:
  - DISPC_VP1_POL_FREQ[17] ONOFF = 1 and CTRL_CORE_SMA_SW_1[]DSS_CH0_ON_OFF = 1
  - DISPC_VP1_POL_FREQ[16] RF = 1 and CTRL_CORE_SMA_SW_1[]DSS_CH0_RF = 1
    The HSYNC and VSYNC signals are driven on the rising edge of PCLK.
  - DISPC_VP1_POL_FREQ[15] IEO = 1
    The DE signal is active low.
  - DISPC_VP1_POL_FREQ[14] IPC = 1 and CTRL_CORE_SMA_SW_1[]DSS_CH0_IPC = 1
    The pixel data is driven on the falling edge of PCLK.
  - DISPC_VP1_POL_FREQ[13] IHS = 1
    The HSYNC signal is active low.
  - DISPC_VP1_POL_FREQ[12] IVS = 1
    The VSYNC signal is active low.

8.2.3 DISPC Integration

This section describes the DISPC integration in the device (see Figure 8-23). For complete details about clocks and resets, see Section 8.1, *Display Subsystem Overview*.

Figure 8-23. DISPC Integration

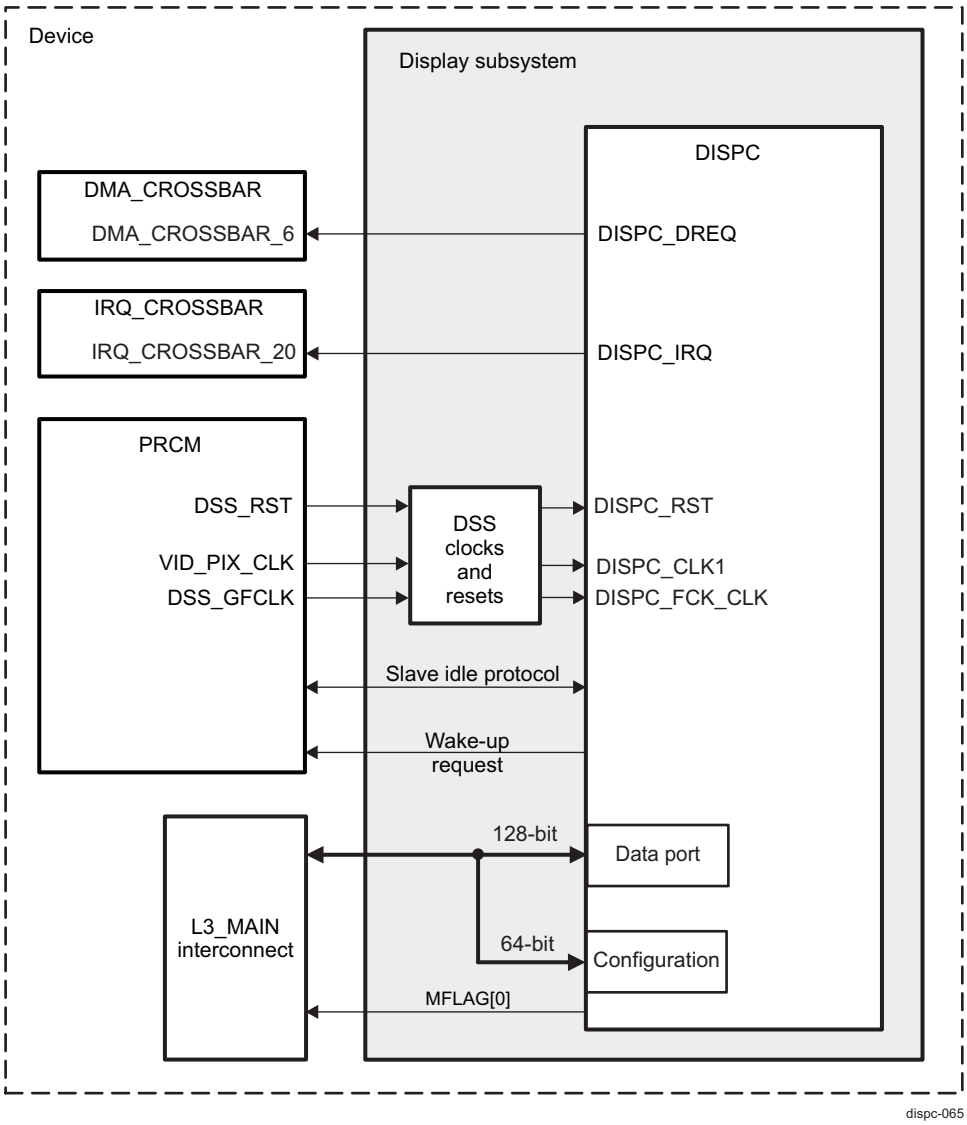

Table 8-20 and Table 8-21 list the integration attributes and clock and resets, respectively.

Table 8-20. DISPC Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
DISPC	PD_DSS	128-bit master port to L3_MAIN for data transfer to/from system memory 32-bit slave port to L3_MAIN for configuration

Table 8-21. DISPC Clocks and Resets

Clocks				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
DISPC	DISPC_FCK_CLK	DSS_GFCLK	PRCM	Functional clock for the internal DISPC logic. Also DISPC interface clock. For additional details, see Section 8.1.2, *Display Subsystem Integration*.
	DISPC_CLK1	VID_PIX_CLK	PRCM	Clock used to generate the pixel clock (VP1_PCLK) for the video port (VP1) interface. For additional details, see Section 8.1.2, *Display Subsystem Integration*.
Resets				
Module Instance	**Destination Signal Name**	**Source Signal Name**	**Source**	**Description**
DISPC	DISPC_RST	DSS_RST	PRCM	Hardware reset is coming from the PRCM module. For additional details, see Section 8.1.2, *Display Subsystem Integration*. **NOTE:** The DSS_RST signal is provided to the entire display subsystem. When inside the display subsystem boundaries, it is named DISPSS_RST, which on its end is provided to the DISPC and is named DISPC_RST.

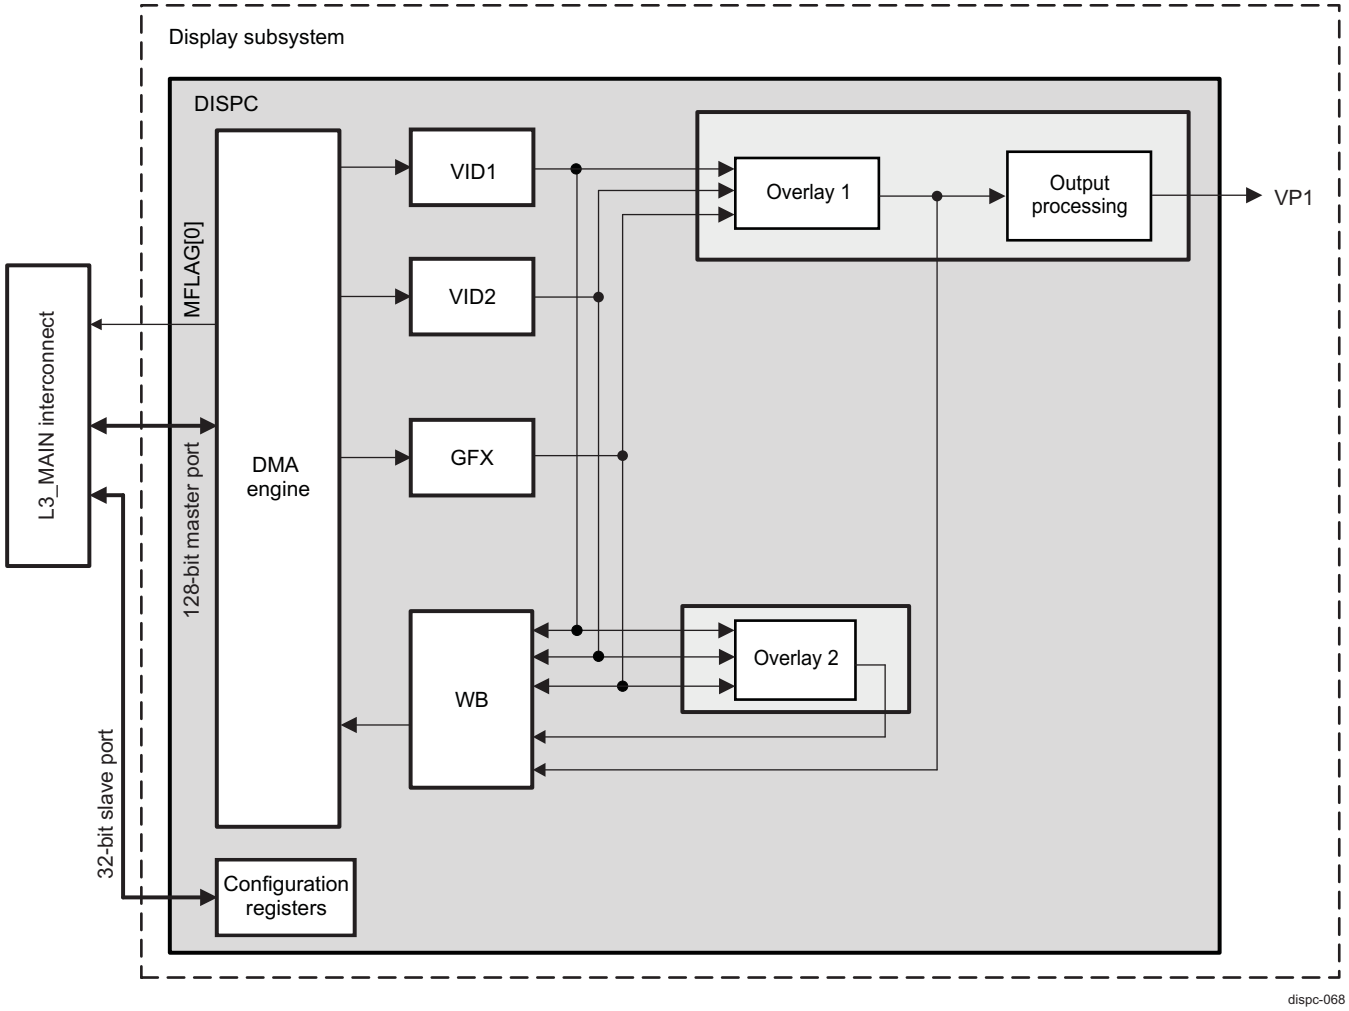
Table 8-22. DISPC Hardware Requests

Interrupt Requests				
Module Instance	**Source Signal Name**	**Destination IRQ_CROSSBAR Input**	**Default Mapping**	**Description**
DISPC	DISPC_IRQ	IRQ_CROSSBAR_20	DSP1_IRQ_51 DSP2_IRQ_51 IPU1_IRQ_23	DISPC interrupt request
DMA Requests				
Module Instance	**Source Signal Name**	**Destination DMA_CROSSBAR Input**	**Default Mapping**	**Description**
DISPC	DISPC_DREQ	DMA_CROSSBAR_6	DMA_EDMA_DREQ_5	Associated with the line trigger signal used for synchronization of a logical channel in the device-level EDMA for memory-to-memory transfer, generated by the DISPC module. There is no data received by the DISPC based on the DMA request. Indicates when the programmable line number matches the current primary VP1 panel refresh line number. See Section 8.2.4.5, *DISPC DMA Requests*, for more details.

NOTE: The "**Default Mapping**" column in Table 8-22 *DISPC Hardware Requests* shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ_CROSSBAR and DMA_CROSSBAR modules, respectively.
For more information about the IRQ_CROSSBAR module, see Section 13.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 13, *Control Module*.
For more information about the DMA_CROSSBAR module, see Section 13.4.6.5, *DMA_CROSSBAR Module Functional Description*, in Chapter 13, *Control Module*.
For more information about the device interrupt controllers, see Chapter 12, *Interrupt Controllers*.
For more information about the device EDMA module, see Chapter 11, *Enhanced DMA*.

8.2.4 DISPC Functional Description

Figure 8-24. DISPC Architecture Overview



The DISPC can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into system memory.

Several processes can be configured to manage the graphics pipeline (antialiasing) and video pipelines (VC-1, color space conversion, scaling, and so forth).

The data coming out of a pipeline is sent to the overlay managers (and from there to VP1 or WB), or to the WB pipeline directly. An overlay manager manages inputs of multiple pipelines. Transparency settings and user timing configurations for VP1 output are available, based on VESA-DMT and CEA-861 standards.

The DISPC allows the capturing of one of the pipeline outputs, or one of the overlay manager outputs, to redirect it into the WB pipeline. It allows the use of the hardware processing available inside the DISPC, such as color space conversion, rescaling, and compositing, and so forth, to perform memory-to-memory transfer with data processing. It can be used as a HW front end compositing unit in order to pre-compose the output frame and write in memory before being fetched again by DISPC for display on VP1.

NOTE: DISPC does not support any tiled frame buffer, nor any compressed frame buffer, and is not able to generate any compressed output to memory through the write-back pipeline. The DISPC has no capability to support by itself rotation of the frame buffer.

DISPC can be used for composition using memory to memory transfer. In that case the frame buffer on the input and output can be split into smaller blocks of pixels, processed separately by DISPC. Scaling/filtering of the split blocks requires fetching extra pixels around the processed pixel-block. This can be achieved by properly programming the initial accumulator (accu) value of the polyphase filter inside VID/WB pipelines. The number of taps used by the polyphase filter implies the number of extra pixels to fetch (5-tap requires 2 pixels on left/right/bottom/top to be fetched).

8.2.4.1 DISPC Clock Configuration

The VP1_PCLK clock for the VP1 output is provided directly from the DISPC_CLK1 input clock. There is no internal divisor on this clock.

The pixel clock transitions continuously as long as the VP1 is enabled and DISPC_VP1_CONFIG[0] PIXELGATED register bit is 0x0.

The DISPC functional clock FCK_CLK is the internal logic clock, and also acts as the interface clock.

The FCK_CLK has to be greater or equal to the VP1_PCLK, in order for DISPC internal logic to function properly.

The FCK_CLK must be faster or equal to the highest clock required by the user application, in order to support the processing for the VP1 output.

The minimum ratio between the pixel clock frequency and the core functional clock does not depend on the vertical scaling ratio. It is possible to rescale vertically between 16x and 0.25x with a clock ratio between functional clock and pixel clock of 1x. For the horizontal scaling, the minimum clock ratio does not depend on the video window width but on the display width. Considering for example 1080p video frame downscaled by 0.25 on a 1080p screen, the minimum clock ratio is 1x.

The pixel clock and the core functional clocks are asynchronous. There is re-synchronization logic between internal logic and the VP1 output interface.

8.2.4.2 DISPC Software Reset

To perform a software reset on the DISPC, set the DISPC_SYSCONFIG[1] SOFTRESET bit to 0x1. The DISPC_SYSSTATUS[0] DISPC_FUNC_RESETDONE bit indicates that the software reset is complete when its value is 0x1. When the software reset completes, the DISPC_SYSCONFIG[1] SOFTRESET bit is automatically reset. Software must ensure that the software reset completes before performing DISPC operations.

The completion of the software reset for the VP logic is indicated in the DISPC_SYSSTATUS[1] DISPC_VP1_RESETDONE bit.

8.2.4.3 DISPC Power Management

The DISPC supports the MStandby/Wait, IdleReq/SidleAck, Disconnect and Wake-up protocols as defined in Chapter 3, *Power, Reset, and Clock Management*.

8.2.4.3.1 DISPC Idle Mode

The DISPC supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the DISPC_SYSCONFIG[4:3] SIDLEMODE bit field.

Condition of assertion of the SIdleAck signal:

- In no-idle mode: SIdleAck is never asserted.
- In force-idle mode: SIdleAck is asserted unconditionally with a 1-configuration port interface clock cycle delay with respect to an IdleReq assertion.

NOTE: The proper use of force-idle mode assumes that no interrupt needs to be generated.

- In smart-idle mode: SIdleAck is asserted when at least the following conditions are satisfied:
  - No interrupt is pending.
  - The DISPC no longer uses the interface clock for the slave port.

Once SIdleAck is asserted, the DISPC interface clock used by the slave port can be shut down at any time. Any transactions on the configuration port are ignored.

The conditions of deassertion of the SIdleAck signal are:

- In force-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.
- In smart-idle mode: SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to an IdleReq deassertion.

Once SIdleAck is released, the DISPC is fully operational and a DMA request can be processed normally.

8.2.4.3.2 DISPC StandBy Mode

The DISPC supports no-standby mode, force-standby mode, and a single smart-standby mode. The mode is set in the DISPC_SYSCONFIG[13:12] MIDLEMODE bit field. The functional clock is always active, if the module is enabled. The L3_MAIN clock can be shut down at any time independently of the status of MStandby.

The conditions of assertion of the MStandby signal are:

- In no-standby mode: MStandby is never asserted.
- In force-standby mode: MStandby is asserted when the module is disabled.
- In smart-standby: In the case of one of the following conditions:
  - The GFX pipeline is disabled or enabled and the data fetch is complete for the GFX window, or the GFX pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
  - A VID pipeline (VID1 or VID2) is disabled or enabled and the data fetch is complete for the VID window, or the VID pipeline is enabled but the data fetch did not complete and data in the DMA buffer is greater than the high threshold value.
  - The WB pipeline is disabled or enabled and the data store to memory is complete for the WB picture, or the WB pipeline is enabled but the data storage did not complete and data in the DMA buffer is lower than the low threshold value.

The MStandby signal asserts whenever all the above events have occurred or the DISPC is disabled. While MStandby is asserted, the DISPC does not generate any transaction on the L3_MAIN master port.

The conditions of deassertion of the MStandby signal are:

- In force-standby mode: MStandby is deasserted only when the DISPC is enabled.
- In smart-standby mode: In the case of one of the following conditions:
  - The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
  - A VID pipeline (VID1 or VID2) is enabled but the data fetch did not complete for the VID window, and the data in the DMA buffer is less than the low threshold value.

– The WB pipeline is enabled but the data store did not complete for the WB picture, and the data in the DMA buffer more than the high threshold value.

The above events are conditions for MStandby signal de-assertion. MStandby signal is de-asserted whenever any one the above event happens.

Detection of the deassertion conditions assumes that the interface clocks are active.

8.2.4.3.3 DISPC Wakeup

The DISPC supports wake-up signaling. The mode can be selected by programming the appropriate value in the DISPC_SYSCONFIG[2] ENAWAKEUP bit. Because the SWakeUp signal is asynchronous, it does not require the interface clock.

The conditions of assertion of the SWakeUp signal are:

- The GFX pipeline is enabled but the data fetch did not complete for the GFX window, and the data in the DMA buffer is less than the low threshold value.
- At least one of the the video pipelines (VID1 or VID2) is enabled but the data fetch did not complete for the VID window, and the data in the DMA buffer is less than the low threshold value.
- The WB pipeline is enabled and the data in the DMA buffer is more than the high threshold value.
- The last pixel displayed into the VP1 panel if it is not the last frame

The SWakeUp signal is asserted whenever any one of the abpveevents occurs and IdleAck is asserted, and Idlemode is set to smart-idle.

The condition of deassertion of the SWakeUp signal is:

- Immediately after deassertion of IdleReq

8.2.4.4 DISPC Interrupt Requests

The interrupt line, DISPC_IRQ, indicates when one or more events are detected by the hardware. Each event is independently maskable by setting the DISPC_IRQENABLE_SET register.

To check when a particular interrupt event occurs and to reset a particular event, the DISPC_IRQSTATUS register must be accessed. This register regroups the status of internal events in the module that generate an interrupt (read 0: no interrupt occurred; read 1: interrupt occurred; write 1: status bit reset).

There are two level of interrupts. The first level, controlled by the DISPC_IRQENABLE_SET, DISPC_IRQENABLE_CLR and DISPC_IRQSTATUS registers, is used to indicate common events and also source for the second level of interrupt. The second level of interrupts consists of status and enable interrupt registers for each pipeline and the video port.

Table 8-23. DISPC Interrupts - First Level

Interrupt Name	Description
VP1_IRQ	At least one event of the Video Port 1 interrupt events occurred
GFX_IRQ	At least one event of the GFX pipeline interrupt events occurred
VID1_IRQ	At least one event of the VID1 pipeline interrupt events occurred
VID2_IRQ	At least one event of the VID2 pipeline interrupt events occurred
WB_IRQ	At least one event of the WB pipeline interrupt events occurred
WAKEUP_IRQ	WakeUp: Occurs when the SWakeUp signal is asserted.

The second level of interrupts for GXF pipeline is controlled through the DISPC_GFX1_IRQENABLE and DISPC_GFX1_IRQSTATUS registers.

Table 8-24. DISPC Interrupts - Second Level - GFX Pipeline

Interrupt Name	Description
GFXENDWINDOW_IRQ	End of the graphics window: The DMA engine has fetched all the data from memory for the graphics for the current frame.

Table 8-24. DISPC Interrupts - Second Level - GFX Pipeline (continued)

Interrupt Name	Description
GFXBUFFERUNDERFLOW_IRQ	GFX DMA buffer underflow: The input graphics DMA buffer goes underflow.
GFXREGIONBASEDPIPESTART_IRQ	Graphics window started on overlay. Used for Region-based feature.
GFXREGIONBASEDPIPEEND_IRQ	Graphics window ended on overlay. Used for Region-based feature.

The second level of interrupts for VID pipelines is controlled through the DISPC_VID_IRQENABLE and DISPC_VID_IRQSTATUS registers.

Table 8-25. DISPC Interrupts - Second Level - VID Pipelines

Interrupt Name	Description
VIDENDWINDOW_IRQ	End of the VID window: The DMA engine has fetched all the data from memory for the VID for the current frame.
VIDBUFFERUNDERFLOW_IRQ	VID DMA buffer underflow: The input VID DMA buffer goes underflow. Does not necessary means that the buffer is empty (out of order refill), but simply that the required pixel is not in yet.
VIDREGIONBASEDPIPESTART_IRQ	Video window started on overlay. Used for Region-based feature.
VIDREGIONBASEDPIPEEND_IRQ	Video window ended on overlay. Used for Region-based feature.

The second level of interrupts for WB pipeline is controlled through the DISPC_WB_IRQENABLE and DISPC_WB_IRQSTATUS registers.

Table 8-26. DISPC Interrupts - Second Level - WB Pipeline

Interrupt Name	Description
WBUNCOMPLETEERROR_IRQ	The WB pipe is reset before all data of the frame currently written back are output to the system memory.
WBBUFFEROVERFLOW_IRQ	Write-back DMA buffer Overflow. The output Write-back DMA buffer goes overflow. It can not occur when write-back channel is used in memory to memory transfer mode, but only in capture mode. In capture mode the timings are defined by the timer associated with the output. In memory to memory mode, there is timing constraint.
WBREGIONBASEDEVENT_IRQ	For Write-back region-based feature, event indicating end of current window.
WBSYNC_IRQ	Indicates that Write-back has synced to new configuration (configuration copied from shadow registers to work).
WBFRAMEDONE_IRQ	FrameDone interrupt for WriteBack. Indicates that the WB frame has been completely flushed out of WB-DMA.

The second level of interrupts for VP1 ouput is controlled through the DISPC_VP1_IRQENABLE and DISPC_VP1_IRQSTATUS registers.

Table 8-27. DISPC Interrupts - Second Level - VP1 Output

Interrupt Name	Description
FRAMEDONE_IRQ	Frame Done for VP1 output. After disabling the VP output of the DISPC, the interrupt is set when the active frame related to the VP has completed.
VSYNC_IRQ	VSYNC for VP1 output: VSYNC interrupt for the VP1 has occurred at the end of the frame.
VSYNC_ODD_IRQ	VSYNC for odd field. VSYNC_ODD interrupt has occurred at the end of the frame(EVSYNC received and the field polarity is odd).
PROGRAMMEDLINENUMBER_IRQ	Programmed line number: The VP1 has reached the user programmed line number.
SYNCLOST_IRQ	Synchronization lost on VP1 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (VP1 output).

8.2.4.5 DISPC DMA Requests

The DISPC DMA request signal, DISPC_DREQ, is not a classical one, but rather a synchronization signal between the DISPC and device DMA controller. The device DMA controller is informed that a programmable number of lines are output to the VP1 and that a system memory can be updated. This request is related to the interrupt event PROGRAMMEDLINENUMBER_IRQ described in Table 8-27. This allows the device DMA controller channel to be synchronized with the internal DMA controller of the DISPC.

In other words, it allows synchronizing a memory-to-memory frame buffer update based on the scan line of the frame buffer in system memory (SDRAM or SRAM) by the DISPC. The DISPC_DREQ request is generated at a programmable line number defined in the DISPC_VP1_LINE_NUMBER[11:0] LINENUMBER bit field. This process allows an application to use a single frame buffer and to update it after a certain number of lines are read by the DISPC.

8.2.4.6 DISPC DMA Engine

The DISPC DMA engine:

- Requests and supplies data from system memory to the GFX, VID1 and VID2 pipelines through the interconnect, based on the configuration of the DISPC and GFX/VID pipelines settings.
- Stores composed frames from GFX/VID pipelines or overlay managers to system memory through the WB pipeline and interconnect, based on the configuration of the DISPC and WB pipeline settings.
- Is fully programmable to support configuration with only 1D burst.

Each pipeline has a dedicated buffer and a channel with independent settings. Table 8-28 lists the default size and allocation of the DMA buffer. Each DMA buffer is divided into two spaces, top and bottom. Depending on the application, a DMA buffer space can be associated to a pipeline or merged with other spaces. The total number of spaces for each pipeline is from 0 (pipeline inactive) to the number of pipelines × 2 (in that case, all the DMA buffers are associated to a single pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum number of available spaces. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum number of spaces required to support the throughput and system latency. The space assignations are done in the DISPC_GLOBAL_BUFFER register.

Table 8-28. DISPC DMA Buffer Size

Pipelines	DMA Buffer Size
GFX	4 lines × 640 × 128 bits
VID1	4 lines × 640 × 128 bits
VID2	4 lines × 640 × 128 bits
WB	4 lines × 640 × 128 bits

8.2.4.6.1 DISPC DMA Addressing and Bursts

For each line to be fetched/stored, the DMA engine:

- Calculates the pixel address
- Aligns the address
- Defines the burst structure:
  - Type of burst (1D only)
  - Length of the burst

The DMA engine generates scan addresses to read and write data to and from system memory. The base address defines the start address of the first pixel, and then the address is incremented based on the number of pixels per line, offset between two consecutive lines and number of lines. The ROW_INC registers of GFX/VID pipelines allow to access a frame using 1D bursts, but as a two-dimensional block by adding a fixed address offset at the end of a line. The ROW_INC can also be used to skip lines from the input frame. The byte address of each pixel in the frame buffer in the system memory is determined by:

Pixel address = Base address + x × bpp + (y × ((width × bpp) + increment))

where:

- Base address corresponds to the base address (for YUV–NV12 or YUV4:2:0-NV21 format) defined by:
  - DISPC_GFX1_BA_j[31:0] BA bit fields
  - DISPC_VID_BA_j[31:0] BA bit fields
  - DISPC_VID_BA_UV_j[31:0] BA bit fields
- bpp corresponds to the number of bits per pixel defined by the DISPC_GFX1_ATTRIBUTES[6:1] FORMAT bit field or the DISPC_VID_ATTRIBUTES[6:1] FORMAT bit field.
- width corresponds to the number of pixels per line defined by the DISPC_GFX1_SIZE[11:0] SIZEX + 1 bit field or DISPC_VID_SIZE[11:0] SIZEX + 1 bit field.
- increment corresponds to the number of bytes to skip between two contiguous lines defined by the DISPC_GFX1_ROW_INC[31:0] ROWINC – 1 bit field or the DISPC_VID_ROW_INC[31:0] ROWINC – 1 bit field.
- x corresponds to the pixel position on the x-axis.
- y corresponds to the pixel position on the y-axis.

NOTE: For YUV420-NV12 or YUV420-NV21 format, the pixel values are defined in two buffers (Y and UV). The base address of the Y buffers is defined in the DISPC_VID_BA_j[31:0] BA bit field. The base address of the UV buffers is defined in the DISPC_VID_BA_UV_j[31:0] BA bit field.

In case of interlaced mode, DISPC_VID_BA_0 and DISPC_VID_BA_UV_0 registers define the base address of the even field, and DISPC_VID_BA_1 and DISPC_VID_BA_UV_1 registers define the base address of the odd field.

Table 8-29 summarizes the register settings for a simple access of a picture in the system memory.

Table 8-29. DISPC Register Settings for Accessing Image in Internal Memory

Registers	Value
DISPC_GFX1_BA_j/DISPC_VID_BA_j/DISPC_WB_BA_j	PBA, the physical base address of image in the memory
DISPC_VID_BA_UV_j/DISPC_WB_BA_UV_j	PBA, the physical base address of UV buffers image in the memory
DISPC_GFX1_PIXEL_INC/DISPC_VID_PIXEL_INC	1 or other in pixel incremental value
DISPC_GFX1_ROW_INC/DISPC_VID_ROW_INC	1 or other in row incremental value

An interconnect request (128 bits) corresponds to one or several pixels, depending on the bits per pixel. Therefore, the DMA engine determines the appropriate burst sequence to optimize the fetching/storing of each new line. The DMA engine must prevent a single burst from crossing two lines. The DMA engine supports only 1D burst. 1D burst is used, if the fetch/storage is linear in memory. The size of the burst can be one of the following values: 1x128bit, 2x128-bit, 4x128-bit or 8x128-bit. The default burst size at reset time is 8 × 128 bits. Because the burst size must be aligned to the burst boundary, in case of misalignment, the DMA engine may issue one or more smaller burst requests.

8.2.4.6.2 DISPC DMA Buffers

8.2.4.6.2.1 DISPC READ DMA Buffers (GFX and VID Pipelines)

When the vertical front porch (VFP) period starts after the last horizontal front porch (HFP) of the last line, the DMA buffers are flushed according to the selected output associated with the pipeline. The DMA engine restarts fetching data from the memory through the L3_MAIN interconnect. Enabling or disabling the DISPC flushes the DMA buffers (except the WB DMA buffers).

Programmable high and low thresholds, independent for each DMA buffer, are used by the DMA engine to start and stop requesting data to the L3_MAIN interconnect.

- When low threshold (set in the DISPC_GFX1_BUF_THRESHOLD[15:0] BUFLOWTHRESHOLD or DISPC_VID_BUF_THRESHOLD[15:0] BUFLOWTHRESHOLD bit field) is reached, the DMA engine starts a request on the L3_MAIN interconnect to fill the DMA buffer.
- When high threshold (set in the DISPC_GFX1_BUF_THRESHOLD[31:16] BUFHIGHTHRESHOLD or DISPC_VID_BUF_THRESHOLD[31:16] BUFHIGHTHRESHOLD bit field) is reached, the DMA engine stops requesting encoded pixels.

NOTE: The following limitations on DISPC_VID_BUF_THRESHOLD[15:0] BUFLOWTHRESHOLD must be considered:

- If VID scaler is disabled, BUFLOWTHRESHOLD can be programmed as low as interconnect latency and pixel output rate allow it
- If VID scaler is enabled, BUFLOWTHRESHOLD must be programmed to guarantee that at least four full lines can be stored

To avoid underflow at the beginning of a frame and have sufficient encoded pixel data to start some processing, a preloading of the DMA buffer is configurable between a fixed value of bytes or the high threshold value. The preload ensures a minimum number of pixels present in the buffer. When the preload value is reached, the associated channel must start pulling pixels out of the DMA buffer. To enable the preload based on the value entered in the DISPC_GFX1_PRELOAD[11:0] PRELOAD or DISPC_VID_PRELOAD[11:0] PRELOAD bit field, the DISPC_GFX1_ATTRIBUTES[11] BUFPRELOAD bit or the DISPC_VID_ATTRIBUTES[19] BUFPRELOAD bit must be set to 0x0.

NOTE: When self-refresh mode is selected, meaning the data in the DMA buffers are used for multiple frames, and at the end of each frame, the DMA buffers are not flushed.

8.2.4.6.2.2 DISPC WRITE DMA Buffer (WB Pipeline)

Two modes are supported by the WB channel, selectable through the DISPC_WB_ATTRIBUTES[19] WRITEBACKMODE bit:

- Capture mode, WRITEBACKMODE bit set to 0: The OVR1 output, connected to external interface, is captured and at the same time the data are sent on the VP1 output. The WB timings are controlled by the VP1 timings. The output of a VID/GFX pipeline is not sent to the write back, when the WB pipeline is connected to an overlay used in capture mode.
- Memory-to-memory mode, WRITEBACKMODE bit set to 1: One of the overlay outputs or one of the pipeline outputs is captured to perform a memory-to-memory transfer, with some processing by the DISPC (rescaling, overlaying, color space conversion, etc.).

In capture mode: The DMA engine starts storing data to memory through the L3_MAIN-based interconnect as soon as enough data is available for the programmed burst size. When enabling/disabling the DISPC, the DMA buffer is flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

NOTE: In WB capture mode, if a new frame starts before the WB DMA buffers contents are fully written onto external memory, then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). The DISPC_WB_IRQSTATUS[1] WBUNCOMPLETEERROR_IRQ interrupt bit indicates this situation and triggers every frame. The WBUNCOMPLETEERROR interrupt can be enabled through the DISPC_WB_IRQSTATUS[1] WBUNCOMPLETEERROR_EN register bit.

In memory-to-memory mode: The WB pipeline is not synchronized to any internal or external timing generator. The WB pipeline stores the output of one of the overlay outputs or one of the pipelines. When enabling or disabling the DISPC, the DMA buffers are flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

Programmable high and low thresholds are used by the DMA engine to start and stop sending data to the L3_MAIN interconnect.

- When high threshold (set in the DISPC_WB_BUF_THRESHOLD[31:16] BUFHIGHTHRESHOLD bit

field) is reached, the DMA engine starts sending data on the L3_MAIN interconnect to empty buffer.

- When low threshold (set in the DISPC_WB_BUF_THRESHOLD[15:0] BUFLOWTHRESHOLD bit field) is reached, the DMA engine stops sending encoded pixels.

At the end of the frame, to completely drain the DMA buffer, some smaller bursts (even single requests) must be issued. To limit the number of interconnect requests from the DISPC, a number of IDLE cycles between requests can be inserted. IDLE cycles can be inserted only when WB is used in memory-to-memory mode. It is ignored when WB is in capture mode.

The number of IDLE cycles between requests can be activated and determined by:

- Setting the DISPC_WB_ATTRIBUTES[27] IDLESIZE bit to 0x0 (default value) and entering the number of idles between requests in the DISPC_WB_ATTRIBUTES[31:28] IDLENUMBER bit field. Idle numbers vary from 0 to 15.
- Setting the DISPC_WB_ATTRIBUTES[27] IDLESIZE bit to 0x1, which considers the size of the burst to determine the number of IDLE cycles. In this case, the number of IDLE cycles equals IDLENUMBER × 8 (0 to 120).

8.2.4.6.3 DISPC DMA MFLAG Mechanism and Arbitration

The MFLAG mechanism allows a dynamic increase of the priority of DISPC real-time traffic, when required, based on the fullness of the DISPC DMA read and write buffers.

The mechanism is implemented for all DMA buffers (GFX, VID1, VID2, and WB).

Programmable buffer thresholds (hysteresis) for each pipeline are used to indicate when the local MFLAG signal for each pipeline is generated. All local MFLAG signals are OR-ed to generate a single DSS MFLAG out band signal, which is provided to the L3 interconnect for granting OCP requests. The out band DSS MFLAG signal is asynchronous to any ongoing OCP transaction.

The threshold for each pipeline corresponds to the fullness of the associated DMA buffer, and is defined by two threshold parameters:

- HT_MFLAG: High threshold.
  - For read access from the GFX, VID1 and VID2 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted).
  - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
  - This threshold can be programmed in the following bit fields:
    - For the GFX pipeline in the DISPC_GFX1_MFLAG_THRESHOLD[31:16] HT_MFLAG bit field
    - For the VID pipelines in the DISPC_VID_MFLAG_THRESHOLD[31:16] HT_MFLAG bit fields
    - For the WB pipeline in the DISPC_WB_MFLAG_THRESHOLD[31:16] HT_MFLAG bit field
- LT_MFLAG: Low threshold.
  - For read access from the GFX, VID1 and VID2 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
  - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted).
  - This threshold can be programmed in the following bit fields:
    - For the GFX pipeline in the DISPC_GFX1_MFLAG_THRESHOLD[15:0] LT_MFLAG bit field
    - For the VID pipelines in the DISPC_VID_MFLAG_THRESHOLD[15:0] LT_MFLAG bit fields
    - For the WB pipeline in the DISPC_WB_MFLAG_THRESHOLD [15:0] LT_MFLAG bit field

By default, the MFLAG mechanism is disabled (DISPC_GLOBAL_MFLAG_ATTRIBUTE[1:0] MFLAG_CTRL bit field = 0x0), and the DSS MFLAG out band signal is low (de-asserted). The arbitration scheme for the DISPC pipelines is the same as described in Section 8.2.4.6.5, *DISPC Arbitration*. That is, round-robin either between high-priority pipelines, or between normal-priority pipelines (if all pipelines are of normal priority).

When the DISPC_GLOBAL_MFLAG_ATTRIBUTE[1:0] MFLAG_CTRL bit field is set to 0x2, the MFLAG mechanism is enabled, and the DSS MFLAG out band signal is dynamically set to 0 or 1, depending on DMA buffers fullness and programmed threshold levels, as explained previously in this section. In this case, the arbitration scheme for DISPC pipelines is round-robin between those high-priority pipelines, which have asserted local MFLAG signals. If there are no high-priority pipelines with asserted local MFLAG signals, then the arbitration scheme is the same as described in Section 8.2.4.6.5, *DISPC Arbitration*.

The DISPC_GLOBAL_MFLAG_ATTRIBUTE[2] MFLAG_START bit defines additional rules for the MFLAG mechanism:

- If the MFLAG_START bit is set to 0x0 (default value), then in the beginning of the frame when the DMA buffer is empty, the local MFLAG signal of each pipeline is kept at 0 until PRELOAD is reached (for more information on preloading, see Section 8.2.4.6.2.1, *DISPC READ DMA Buffers (GFX and VID Pipelines)*. Then, based on the setting of the DISPC_GLOBAL_MFLAG_ATTRIBUTE[1:0] MFLAG_CTRL bit field, the MFLAG signal is generated and internal logic is arbitrating between pipeline requests.
- If the MFLAG_START bit is set to 0x1, then even in the beginning of the frame when the DMA buffer is empty, the DISPC_GLOBAL_MFLAG_ATTRIBUTE[1:0] MFLAG_CTRL bit field defines the generation of the MFLAG signal for each pipeline.

8.2.4.6.4 DISPC DMA Predecimation

The predecimation process consists of downscaling an image by fetching only the necessary pixels in the memory. Vertical and horizontal predecimation are possible:

- Vertical predecimation: The picture stored in memory can be predecimated vertically by skipping lines. Burst mode is used to fetch the data when skipping lines. Only the lines that will be used by the DISPC are fetched from memory; the other lines are skipped. The DMA engine sends requests only for the useful lines using 1D burst. The base address indicates the first valid pixel to fetch from memory. The number of lines to skip is set in the DISPC_GFX1_ROW_INC[31:0] ROWINC or DISPC_VID_ROW_INC[31:0] ROWINC bit field.
- Horizontal predecimation: When fetching data from memory, it is possible to skip 1 of 2 pixel data containers, up to 1 of 2047 pixel data containers, by setting the DISPC_GFX1_PIXEL_INC[7:0] PIXELINC or DISPC_VID_PIXEL_INC[7:0] PIXELINC bit field to the number of pixel data containers to skip (n), multiplied by the size of a pixel data container (in bytes), + 1. See the following note for more details.

NOTE: The restriction to horizontal predecimation is that there is at least one useful pixel per 128-bit request. In that case, the DMA engine uses burst mode instead of singles to optimize the requests in terms of latency and SDRAM efficiency.

No decimation is supported when the input format is 1, 2, 4, or 8-bit BITMAP.

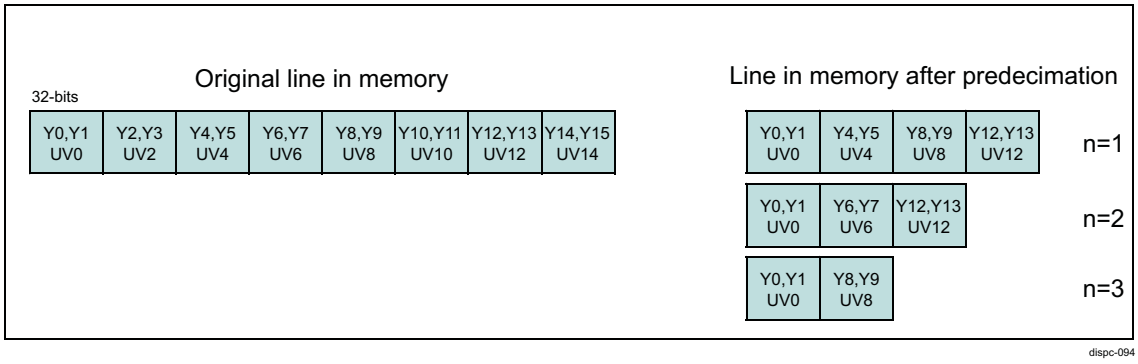
For RGB and YUV4:2:0 data formats, each pixel data container in memory holds 1 pixel. Thus, when configuring the PIXELINC bit field, the value of n equals the number of pixels to skip:

- For RGB format, one pixel data container = 32 bits = 1 pixel
- For YUV format:
  - One Y pixel data container = 8 bits = 1 pixel
  - One UV pixel data container = 16 bits = 1 pixel

For YUV4:2:2 format, each 32-bit pixel data container holds the Luma components for 2 pixels, and the Chrominance component of 1 pixel (see Figure 8-25). Therefore, for the valid values of the PIXELINC bit field in the case of the following YUV4:2:2 format, caution must be taken because n equals the number of pixel data containers to skip, not the number of pixels:

- For n = 1, PIXELINC = 5
- For n = 2, PIXELINC = 9
- For n = 3, PIXELINC = 13
- For n = 4, PIXELINC = 17, etc.

Figure 8-25. DISPC YUV4:2:2 Predecimation



8.2.4.6.5 DISPC DMA Arbitration

The requests (reads or writes) sent to the L3_MAIN interconnect are pipelined and arbitrated in a round-robin scheme. The default arbitration scheme must be modified by setting the priority attribute of each pipeline as defined in the following bits:

- DISPC_GFX1_ATTRIBUTES[14] ARBITRATION
- DISPC_VID_ATTRIBUTES[14] ARBITRATION
- DISPC_WB_ATTRIBUTES[14] ARBITRATION

By default, all pipelines have the same priority (normal), which means all pipeline requests are treated in a round-robin order manner. If one or more pipelines require a higher number of requests going to the L3_MAIN interconnect, its priority can be moved up to high priority. In this case, the high-priority pipeline is granted access before any pipeline in normal priority. If more than one active pipeline is in high priority, the behavior is the same as all active pipelines in normal priority. Normal active pipelines are not treated until all high active pipelines are finished. The ARBITRATION bit cannot be modified during the entire frame.

This functionality balances the bandwidth of the pipeline depending on its constraint. It can be used to give higher priority to the pipelines with real-time constraints versus non-real-time pipelines. For example, pipelines associated with the WB (used in memory-to-memory mode) must have lower priority than the pipelines associated with VP1 output.

8.2.4.6.6 DISPC DMA Power Modes

8.2.4.6.6.1 DISPC DMA Low-Power Mode

Each DMA buffer is divided into two spaces. Each space can be associated with the pipeline or merged with other DMA buffers. The total number of DMA buffers for each pipeline is from 0 (pipeline inactive) to the number of pipelines × 2 (in that case all the DMA buffers are associated with a single pipeline). The sum of the number of DMA buffers allocated for each pipeline must not be greater than the maximum available. The correct number of DMA buffers must be allocated to ensure no underflow. The number of DMA buffers allocated to each pipeline must be greater than or equal to the minimum required to support the throughput and the system latency.

NOTE: When the number of buffers is changed, the thresholds must be reprogrammed to reflect the new configuration of the DMA buffer.

8.2.4.6.6.2 DISPC DMA Ultralow-Power Mode

In low-power mode, the L3_MAIN interconnect is used to fill up the DMA buffers to store all the data required to display a full frame. The L3_MAIN interconnect is not used to fetch new pixels for the following frames. The data in the DMA buffer are reused to display on the screen.

The setting of the mode is independent for each pipeline. One pipeline may have all the frame pixels in its DMA buffer and the other pipelines may have to refill their respective DMA buffers along the display scan because the frame buffer is too big to be stored in the DMA buffer.

The DMA buffers can be merged to optimize the L3_MAIN interconnect off time. Merging the DMA buffers into a single buffer can be used at the same time to improve ultralow-power mode (see Section 8.2.4.6.6.1, *Low-Power Mode*).

During the time in which the frames are fetched in the internal DMA buffer, MStandby must be asserted if the DISPC_SYSCONFIG[13:12] MIDLEMODE bit field is set to 0x2 (smart-standby mode).

Two ultralow-power modes can be entered manually or automatically:

- Self-refresh mode: Starting self-refresh mode is done manually by setting the DISPC_GFX1_ATTRIBUTES[15] SELFREFRESH or DISPC_VID_ATTRIBUTES[15] SELFREFRESH bit to 0x1 after capturing a frame in the DMA buffers. Self-refresh mode is stopped by setting the SELFREFRESH bit to 0x0.
- Automatic self-refresh mode: By setting the DISPC_GFX1_ATTRIBUTES[17] SELFREFRESHAUTO or DISPC_VID_ATTRIBUTES[17] SELFREFRESHAUTO bit to 0x1, the transition from off to on self-refresh mode is done by hardware after capturing the first frame. The hardware reflects the status of the self-refresh mode by setting the SELFREFRESH bit to 0x1, which means that the data are read inside the DMA buffer without accessing the interconnect and system memory during the frame. Setting the SELFREFRESH bit to 0x0 updates the DMA buffer.

NOTE: The WB pipeline does not support ultralow-power mode.

8.2.4.7 DISPC Memory Formats

The graphic, video and write-back pipelines support various types of memory formats. Table 8-30 lists all supported formats for each pipeline.

For the BITMAP formats in GFX pipeline the nibble mode can be enabled by setting the DISPC_GFX1_ATTRIBUTES[7] NIBBLEMODE bit to 0x1. For VID pipelines the nibble mode can be selected in DISPC_VID_ATTRIBUTES[10] NIBBLEMODE register bit.

Table 8-30. DISPC Memory Formats Supported

Formats	GFX	VID1	VID2	WB
BITMAP 1-bpp	x	x	x	
BITMAP 2-bpp	x	x	x	
BITMAP 4-bpp	x	x	x	
BITMAP 8-bpp	x	x	x	
xRGB12-4444	x	x	x	x
RGBx12-4444	x	x	x	x
ARGB16-4444	x	x	x	x
RGBA16-4444	x	x	x	x
RGB16-565	x	x	x	x
xRGB16-1555	x	x	x	x
ARGB16-1555	x	x	x	x
xRGB24-8888	x	x	x	x
RGBx24-8888	x	x	x	x
RGB24-888	x	x	x	x
ARGB32-8888	x	x	x	x
RGBA32-8888	x	x	x	x
BGRA32-8888	x	x	x	x
UYVY 4:2:2		x	x	x
YUV2 4:2:2		x	x	x
YUV4:2:0 – NV12		x	x	x
YUV4:2:0 – NV21		x	x	x

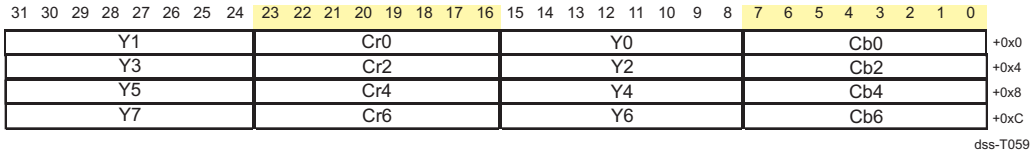
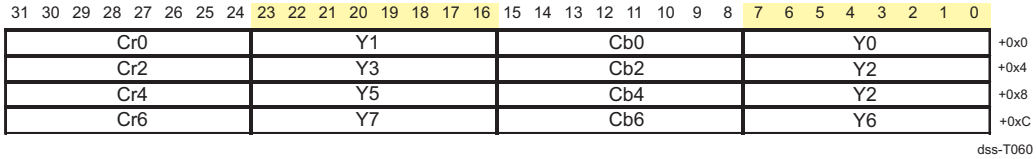
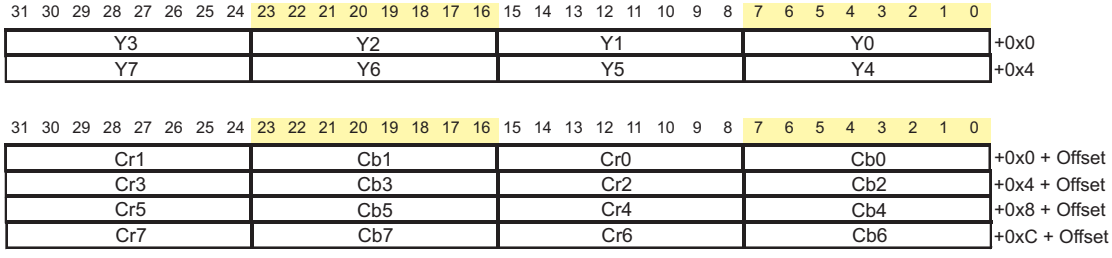
- UYVY4:2:2 data memory organization



- YUV2 4:2:2 data memory organization



- YUV4:2:0-NV12 data memory organization (same for YUV4:2:0-NV21, with only UV in reverse order)



8.2.4.8 DISPC Graphics Pipeline

The input port of the graphics pipeline (GFX) is connected to the graphics DMA buffer controller. The output port of the GFX pipeline is connected to the overlay managers or WB pipeline. The pixel output is directed to the OVR1, OVR2 or WB path by setting the DISPC_GFX1_ATTRIBUTES[8] CHANNELOUT bit. Table 8-41 lists the bit field settings to orient a pipeline to OVR1, OVR2 or WB output. The default value directs the GFX pipeline to OVR1. The GFX pipeline can be enabled by setting the DISPC_GFX1_ATTRIBUTES[0] ENABLE bit to 0x1.

NOTE: It is not possible to change the direction of the GFX pipeline on the fly. If the graphics pipeline must be connected to an overlay manager different from the one to which it is currently connected, then the following steps must be performed:

1. Disable the GFX pipeline by setting the DISPC_GFX1_ATTRIBUTES[0] ENABLE bit to 0x0.
2. Direct the GFX pipeline to the new overlay manager by modifying the DISPC_GFX1_ATTRIBUTES[8] CHANNELOUT bit.
3. Disable the DISPC output which corresponds with the overlay manager to which the GFX pipeline will be connected next. This is done by setting the in the following bits to 0x0 for the listed outputs:
   - The DISPC_VP1_CONTROL1[0] VPENABLE bit for VP1 output
4. Enable the GFX pipeline by setting the DISPC_GFX1_ATTRIBUTES[0] ENABLE bit to 0x1.
5. Enable the DISPC output that corresponds with the overlay manager to which the GFX pipeline will be connected. This is done by setting the following bits to 0x1 for the listed outputs:
   - The DISPC_VP1_CONTROL1[0] VPENABLE bit for VP1 output

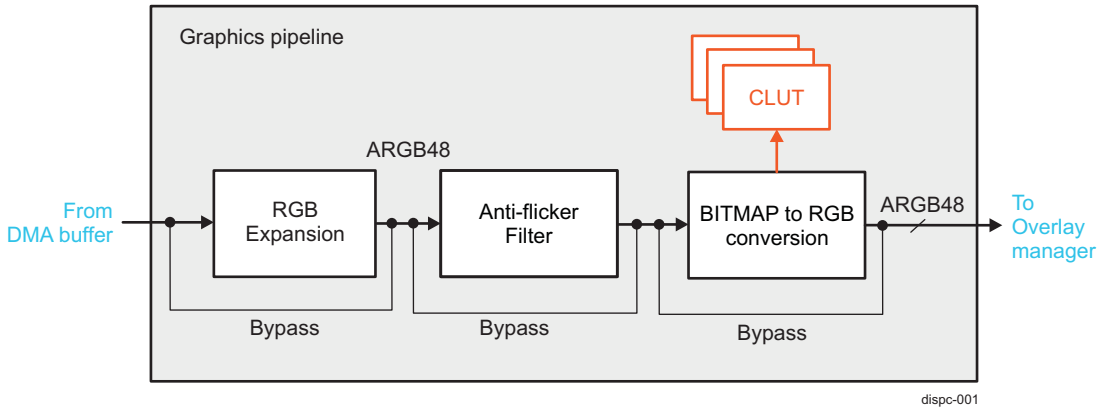
The pipeline contains replication logic, an anti-aliasing filter, and one 256-entry Color Look-up Table (CLUT). The anti-aliasing filter processes the graphics data in RGB format to remove some of the vertical aliasing. The replication logic is used to convert the RGB, ARGB, RGBA pixel formats into ARGB48 format. The 256-entry CLUT is used to convert BITMAP (1, 2, 4, or 8-bit indexed formats) into RGB format.

NOTE: The GFX pipeline does not include a scaler.

Table 8-30 lists the input formats supported by the graphics pipeline.

Figure 8-26 shows the graphics pipeline.

Figure 8-26. DISPC Graphics Pipeline



8.2.4.8.1 DISPC GFX Replication Logic

The replication logic (RGB expansion) increases the color depth of the graphics-encoded pixels (from true color RGB 12 and 16, to 48 bpp).

- The replication logic is always enabled, and the MSBs are copied to the missing LSBs. Table 8-31 describes the remapping of the RGB pixels into ARGB 48-bit values.

Table 8-31. DISPC GFX Replication: RGB Pixel Formats Remapping Into ARGB48-12.12.12.12

	A[11:0]	R[11:0]	G[11:0]	B[11:0]
