About This Manual

The TMS320C2000™ digital signal processor (DSP) platform is part of the TMS320™ DSP family.

Notational Conventions

This document uses the following conventions.

- Hexadecimal numbers are shown with the suffix h or with a leading 0x. For example, the following number is 40 hexadecimal (decimal 64): 40h or 0x40.
- Registers in this document are shown in figures and described in tables.
  - Each register figure shows a rectangle divided into fields that represent the fields of the register. Each field is labeled with its bit name, its beginning and ending bit numbers above, and its read/write properties below. A legend explains the notation used for the properties.
  - Reserved bits in a register figure designate a bit that is used for future device expansion.

Related Documentation

The following books describe the TMS320x28x and related support tools that are available on the TI website:

Data Manual and Errata—

SPRS439— TMS320F28335, TMS320F28334, TMS320F28332, TMS320F28235, TMS320F28234, TMS320F28232 Digital Signal Controllers (DSCs) Data Manual contains the pinout, signal descriptions, as well as electrical and timing specifications for the F2833x/2823x devices.

SPRZ272— TMS320F28335, F28334, F28332, TMS320F28235, F28234, F28232 Digital Signal Controllers (DSCs) Silicon Errata describes the advisories and usage notes for different versions of silicon.

CPU User’s Guides—

SPRU430— TMS320C28x DSP CPU and Instruction Set Reference Guide describes the central processing unit (CPU) and the assembly language instructions of the TMS320C28x fixed-point digital signal processors (DSPs). It also describes emulation features available on these DSPs.

SPRUEO2— TMS320C28x Floating Point Unit and Instruction Set Reference Guide describes the floating-point unit and includes the instructions for the FPU.

Peripheral Guides—

SPRU566— TMS320x28xx, 28xxx Peripheral Reference Guide describes the peripheral reference guides of the 28x digital signal processors (DSPs).

SPRUFB0— TMS320x2833x, 2823x System Control and Interrupts Reference Guide describes the various interrupts and system control features of the 2833x digital signal controllers (DSCs).

SPRU812— TMS320x2833x, 2823x Analog-to-Digital Converter (ADC) Reference Guide describes how to configure and use the on-chip ADC module, which is a 12-bit pipelined ADC.
SPRUG04— **TMS320x2833x, 2823x Enhanced Pulse Width Modulator (ePWM) Module Reference Guide** describes the main areas of the enhanced pulse width modulator that include digital motor control, switch mode power supply control, UPS (uninterruptible power supplies), and other forms of power conversion.

SPRUG02— **TMS320x2833x, 2823x High-Resolution Pulse Width Modulator (HRPWM) Reference Guide** describes the operation of the high-resolution extension to the pulse width modulator (HRPWM).

SPRUG05— **TMS320x2833x, 2823x Enhanced Quadrature Encoder Pulse (eQEP) Reference Guide** describes the eQEP module, which is used for interfacing with a linear or rotary incremental encoder to get position, direction, and speed information from a rotating machine in high performance motion and position control systems. It includes the module description and registers.

SPRUEU1— **TMS320x2833x, 2823x Enhanced Controller Area Network (eCAN) Reference Guide** describes the eCAN that uses established protocol to communicate serially with other controllers in electrically noisy environments.

SPRUEU3— **TMS320x2833x, 2823x Serial Peripheral Interface (SPI) Reference Guide** describes the SPI - a high-speed synchronous serial input/output (I/O) port - that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmed bit-transfer rate.

SPRUG03— **TMS320x2833x, 2823x Inter-Integrated Circuit (I2C) Reference Guide** describes the features and operation of the inter-integrated circuit (I2C) module.

Tools Guides—

SPRUG03— **TMS320C28x Assembly Language Tools User's Guide** describes the assembly language tools (assembler and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C28x device.

SPRUFZ5— **TMS320F2833x, 2823x Serial Communication Interface (SCI) Reference Guide** describes the SCI, which is a two-wire asynchronous serial port, commonly known as a UART. The SCI modules support digital communications between the CPU and other asynchronous peripherals that use the standard non-return-to-zero (NRZ) format.

SPRUG03— **TMS320x2833x, 2823x Serial Peripheral Interface (SPI) Reference Guide** describes the SPI - a high-speed synchronous serial input/output (I/O) port - that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmed bit-transfer rate.

SPRUG03— **TMS320x2833x, 2823x Inter-Integrated Circuit (I2C) Reference Guide** describes the features and operation of the inter-integrated circuit (I2C) module.

SPRUG03— **TMS320x2833x, 2823x Inter-Integrated Circuit (I2C) Reference Guide** describes the features and operation of the inter-integrated circuit (I2C) module.
Introduction

The TMS320C2000™ DSP family consists of fixed-point and floating-point digital signal controllers (DSCs). TMS320C2000™ Digital Signal Controllers combine control peripheral integration and ease of use of a microcontroller (MCU) with the processing power and C efficiency of TI’s leading DSP technology. This chapter provides an overview of the architectural structure and components of the C28x plus floating-point unit CPU.

1.1 Introduction to the Central Processing Unit (CPU)

The C28x plus floating-point (C28x+FPU) processor extends the capabilities of the C28x fixed-point CPU by adding registers and instructions to support IEEE single-precision floating point operations. This device draws from the best features of digital signal processing; reduced instruction set computing (RISC); and microcontroller architectures, firmware, and tool sets. The DSC features include a modified Harvard architecture and circular addressing. The RISC features are single-cycle instruction execution, register-to-register operations, and modified Harvard architecture (usable in Von Neumann mode). The microcontroller features include ease of use through an intuitive instruction set, byte packing and unpacking, and bit manipulation. The modified Harvard architecture of the CPU enables instruction and data fetches to be performed in parallel. The CPU can read instructions and data while it writes data simultaneously to maintain the single-cycle instruction operation across the pipeline. The CPU does this over six separate address/data buses.

Throughout this document the following notations are used:

- C28x refers to the C28x fixed-point CPU.
- C28x plus Floating-Point and C28x+FPU both refer to the C28x CPU with enhancements to support IEEE single-precision floating-point operations.

1.2 Compatibility with the C28x Fixed-Point CPU

No changes have been made to the C28x base set of instructions, pipeline, or memory bus architecture. Therefore, programs written for the C28x CPU are completely compatible with the C28x+FPU and all of the features of the C28x documented in *TMS320C28x DSP CPU and Instruction Set Reference Guide* (literature number SPRU430) apply to the C28x+FPU.

Figure 1-1 shows basic functions of the FPU.
1.2.1 Floating-Point Code Development

When developing C28x floating-point code use Code Composer Studio 3.3, or later, with at least service release 8. The C28x compiler V5.0, or later, is also required to generate C28x native floating-point opcodes. This compiler is available via Code Composer Studio update advisor as a separate download. V5.0 can generate both fixed-point as well as floating-point code. To build floating-point code use the compiler switches: -v28 and -float_support = fpu32. In Code Composer Studio 3.3 the float_support option is in the build options under compiler-> advanced: floating point support. Without the float_support flag, or with float_support = none, the compiler will generate fixed-point code.

When building for C28x floating-point make sure all associated libraries have also been built for floating-point. The standard run-time support (RTS) libraries built for floating-point included with the compiler have fpu32 in their name. For example rts2800_fpu32.lib and rts2800_fpu_eh.lib have been built for the floating-point unit. The "eh" version has exception handling for C++ code. Using the fixed-point RTS libraries in a floating-point project will result in the linker issuing an error for incompatible object files.

To improve performance of native floating-point projects, consider using the **C28x FPU Fast RTS Library** (**SPRC664**). This library contains hand-coded optimized math routines such as division, square root, atan2, sin and cos. This library can be linked into your project before the standard runtime support library to give your application a performance boost. As an example, the standard RTS library uses a polynomial expansion to calculate the sin function. The Fast RTS library, however, uses a math look-up table in the boot ROM of the device. Using this look-up table method results in approximately a 20 cycle savings over the standard RTS calculation.

1.3 Components of the C28x plus Floating-Point CPU

The C28x+FPU contains:

- A central processing unit for generating data and program-memory addresses; decoding and executing instructions; performing arithmetic, logical, and shift operations; and controlling data transfers among CPU registers, data memory, and program memory
- A floating-point unit for IEEE single-precision floating point operations.
- Emulation logic for monitoring and controlling various parts and functions of the device and for testing device operation. This logic is identical to that on the C28x fixed-point CPU.
- Signals for interfacing with memory and peripherals, clocking and controlling the CPU and the emulation logic, showing the status of the CPU and the emulation logic, and using interrupts. This logic is identical to the C28x fixed-point CPU.

Some features of the C28x+FPU central processing unit are:

- Fixed-Point instructions are pipeline protected. This pipeline for fixed-point instructions is identical to that on the C28x fixed-point CPU. The CPU implements an 8-phase pipeline that prevents a write to and a read from the same location from occurring out of order. See Figure 3-1
- Some floating-point instructions require pipeline alignment. This alignment is done through software to allow the user to improve performance by taking advantage of required delay slots.
- Independent register space. These registers function as system-control registers, math registers, and data pointers. The system-control registers are accessed by special instructions.
- Arithmetic logic unit (ALU). The 32-bit ALU performs 2s-complement arithmetic and Boolean logic operations.
- Floating point unit (FPU). The 32-bit FPU performs IEEE single-precision floating-point operations.
- Address register arithmetic unit (ARAU). The ARAU generates data memory addresses and increments or decrements pointers in parallel with ALU operations.
- Barrel shifter. This shifter performs all left and right shifts of fixed-point data. It can shift data to the left by up to 16 bits and to the right by up to 16 bits.
- Fixed-Point Multiplier. The multiplier performs 32-bit × 32-bit 2s-complement multiplication with a 64-bit result. The multiplication can be performed with two signed numbers, two unsigned numbers, or one signed number and one unsigned number.
1.3.1 Emulation Logic

The emulation logic is identical to that on the C28x fixed-point CPU. This logic includes the following features. For more details about these features, refer to the TMS320C28x DSP CPU and Instruction Set Reference Guide (literature number SPRU430):

- Debug-and-test direct memory access (DT-DMA). A debug host can gain direct access to the content of registers and memory by taking control of the memory interface during unused cycles of the instruction pipeline.
- A counter for performance benchmarking.
- Multiple debug events. Any of the following debug events can cause a break in program execution:
  - A breakpoint initiated by the ESTOP0 or ESTOP1 instruction.
  - An access to a specified program-space or data-space location.
- When a debug event causes the C28x to enter the debug-halt state, the event is called a break event.
- Real-time mode of operation.

1.3.2 Memory Map

Like the C28x, the C28x+FPU uses 32-bit data addresses and 22-bit program addresses. This allows for a total address reach of 4G words (1 word = 16 bits) in data space and 4M words in program space. Memory blocks on all C28x+FPU designs are uniformly mapped to both program and data space. For specific details about each of the map segments, see the data sheet for your device.

1.3.3 On-Chip Program and Data

All C28x+FPU based devices contain at least two blocks of single access on-chip memory referred to as M0 and M1. Each of these blocks is 1K words in size. M0 is mapped at addresses 0x0000 – 0x03FF and M1 is mapped at addresses 0x0400 – 0x07FF. Like all other memory blocks on the C28x+FPU devices, M0 and M1 are mapped to both program and data space. Therefore, you can use M0 and M1 to execute code or for data variables. At reset, the stack pointer is set to the top of block M1. Depending on the device, it may also have additional random-access memory (RAM), read-only memory (ROM), external interface zones, or flash memory.

1.3.4 CPU Interrupt Vectors

The C28x+FPU interrupt vectors are identical to those on the C28x CPU. Sixty-four addresses in program space are set aside for a table of 32 CPU interrupt vectors. The CPU vectors can be mapped to the top or bottom of program space by way of the VMAP bit. For more information about the CPU vectors, see TMS320C28x DSP CPU and Instruction Set Reference Guide (literature number SPRU430). For devices with a peripheral interrupt expansion (PIE) block, the interrupt vectors will reside in the PIE vector table and this memory can be used as program memory.

1.4 Memory Interface

The C28x+FPU memory interface is identical to that on the C28x. The C28x+FPU memory map is accessible outside the CPU by the memory interface, which connects the CPU logic to memories, peripherals, or other interfaces. The memory interface includes separate buses for program space and data space. This means an instruction can be fetched from program memory while data memory is being accessed. The interface also includes signals that indicate the type of read or write being requested by the CPU. These signals can select a specified memory block or peripheral for a given bus transaction. In addition to 16-bit and 32-bit accesses, the C28x+FPU supports special byte-access instructions that can access the least significant byte (LSByte) or most significant byte (MSByte) of an addressed word. Strobe signals indicate when such an access is occurring on a data bus.
1.4.1 Address and Data Buses

Like the C28x, the memory interface has three address buses:

- **PAB: Program address bus**
  The PAB carries addresses for reads and writes from program space. PAB is a 22-bit bus.

- **DRAB: Data-read address bus**
  The 32-bit DRAB carries addresses for reads from data space.

- **DWAB: Data-write address bus**
  The 32-bit DWAB carries addresses for writes to data space.

The memory interface also has three data buses:

- **PRDB: Program-read data bus**
  The PRDB carries instructions during reads from program space. PRDB is a 32-bit bus.

- **DRDB: Data-read data bus**
  The DRDB carries data during reads from data space. DRDB is a 32-bit bus.

- **DWDB: Data-/Program-write data bus**
  The 32-bit DWDB carries data during writes to data space or program space.

A program-space read and a program-space write cannot happen simultaneously because both use the PAB. Similarly, a program-space write and a data-space write cannot happen simultaneously because both use the DWDB. Transactions that use different buses can happen simultaneously. For example, the CPU can read from program space (using PAB and PRDB), read from data space (using DRAB and DRDB), and write to data space (using DWAB and DWDB) at the same time. This behavior is identical to the C28x CPU.

1.4.2 Alignment of 32-Bit Accesses to Even Addresses

The C28x+FPU CPU expects memory wrappers or peripheral-interface logic to align any 32-bit read or write to an even address. If the address-generation logic generates an odd address, the CPU will begin reading or writing at the previous even address. This alignment does not affect the address values generated by the address-generation logic.

Most instruction fetches from program space are performed as 32-bit read operations and are aligned accordingly. However, alignment of instruction fetches is effectively invisible to a programmer. When instructions are stored to program space, they do not have to be aligned to even addresses. Instruction boundaries are decoded within the CPU.

You need to be concerned with alignment when using instructions that perform 32-bit reads from or writes to data space.
The C28x+FPU architecture is the same as the C28x CPU with an extended register and instruction set to support IEEE single-precision floating point operations. This section describes the extensions to the C28x architecture.

2.1 CPU Registers

Devices with the C28x+FPU include the standard C28x register set plus an additional set of floating-point unit registers. The additional floating-point unit registers are the following:

- Eight floating-point result registers, RnH (where n = 0 - 7)
- Floating-point Status Register (STF)
- Repeat Block Register (RB)

All of the floating-point registers except the repeat block register are shadowed. This shadowing can be used in high priority interrupts for fast context save and restore of the floating-point registers.

Figure 2-1 shows a diagram of both register sets and Table 2-1 shows a register summary. For information on the standard C28x register set, see the TMS320C28x DSP CPU and Instruction Set Reference Guide (literature number SPRU430).

(1) Reset value shown is for devices without the VMAP signal and MOM1MAP signal pinned out. On these devices both of these signals are tied high internal to the device.
2.1.1 Floating-Point Status Register (STF)

The floating-point status register (STF) reflects the results of floating-point operations. There are three basic rules for floating point operation flags:

1. Zero and negative flags are set based on moves to registers.
2. Zero and negative flags are set based on the result of compare, minimum, maximum, negative and absolute value operations.
3. Overflow and underflow flags are set by math instructions such as multiply, add, subtract and 1/x. These flags may also be connected to the peripheral interrupt expansion (PIE) block on your device. This can be useful for debugging underflow and overflow conditions within an application.

As on the C28x, program flow is controlled by C28x instructions that read status flags in the status register 0 (ST0). If a decision needs to be made based on a floating-point operation, the information in the STF register needs to be loaded into ST0 flags (Z,N,OV,TC,C) so that the appropriate branch conditional instruction can be executed. The MOVST0 FLAG instruction is used to load the current value of specified STF flags into the respective bits of ST0. When this instruction executes, it will also clear the latched overflow and underflow flags if those flags are specified.

Example 2-1. Moving STF Flags to the ST0 Register

Example:

```
Example
MOV32  R0H,*XAR4++
MOV32  R1H,*XAR3++
CMPF32 R1H, R0H
MOVST0 ZF, NF ; Move ZF and NF to ST0
BF     Loop, GT ; Loop if (R1H > R0H)
```

---

The following instructions will set this flag to 1 if an underflow occurs:
MPYF32, ADDF32, SUBF32, MACF32, EINVF32, EISQRTF32 |
|      |       | 1     | An underflow condition has not been latched. If the MOVST0 instruction is used to copy this bit to ST0, then LUF will be cleared. |
| 0    | LVF   | 0     | Latched Overflow Floating-Point Flag
The following instructions will set this flag to 1 if an overflow occurs:
MPYF32, ADDF32, SUBF32, MACF32, EINVF32, EISQRTF32 |
|      |       | 1     | An overflow condition has been latched. |

(1) A negative zero floating-point value is treated as a positive zero value when configuring the ZF and NF flags.
(2) A DeNorm floating-point value is treated as a positive zero value when configuring the ZF and NF flags.
2.1.2 Repeat Block Register (RB)

The repeat block instruction (RPTB) is a new instruction for C28x+FPU. This instruction allows you to repeat a block of code as shown in Example 2-2.

Example 2-2. The Repeat Block (RPTB) Instruction uses the RB Register

```
; find the largest element and put its address in XAR6
MOV32 R0H, *XAR0++;
.align 2 ; Aligns the next instruction to an even address
NOP ; Makes RPTB odd aligned - required for a block size of 8
RPTB VECTOR_MAX_END, AR7 ; RA is set to 1
MOVL ACC,XAR0
MOV32 R1H,*XAR0++ ; RSIZE reflects the size of the RPTB block
MAXF32 R0H,R1H ; in this case the block size is 8
MOVST0 NF,ZF
MOVL XAR6,ACC,LT
VECTOR_MAX_END: ; RE indicates the end address. RA is cleared
```

The C28x+FPU hardware automatically populates the RB register based on the execution of a RPTB instruction. This register is not normally read by the application and does not accept debugger writes.

<td></td>
<td>1-0xFFFF</td>
<td>This 16-bit value determines how many times the block will repeat. The counter is initialized when the RPTB instruction is executed and is decremented when the PC reaches the end of the block. When the counter reaches zero, the repeat active bit is cleared and the block will be executed one more time. Therefore the total number of times the block is executed is RC+1.</td>
</tr>
</tbody>
</table>
Pipeline

The pipeline flow for C28x instructions is identical to that of the C28x CPU described in TMS320C28x DSP CPU and Instruction Set Reference Guide (SPRU430). Some floating-point instructions, however, use additional execution phases and thus require a delay to allow the operation to complete. This pipeline alignment is achieved by inserting NOPs or non-conflicting instructions when required. Software control of delay slots allows you to improve performance of an application by taking advantage of the delay slots and filling them with non-conflicting instructions. This section describes the key characteristics of the pipeline with regards to floating-point instructions. The rules for avoiding pipeline conflicts are small in number and simple to follow and the C28x+FPU assembler will help you by issuing errors for conflicts.

</tbody>
</table>
3.1 Pipeline Overview

The C28x FPU pipeline is identical to the C28x pipeline for all standard C28x instructions. In the decode2 stage (D2), it is determined if an instruction is a C28x instruction or a floating-point unit instruction. The pipeline flow is shown in Figure 3-1. Notice that stalls due to normal C28x pipeline stalls (D2) and memory waitstates (R2 and W) will also stall any C28x FPU instruction. Most C28x FPU instructions are single cycle and will complete in the FPU E1 or W stage which aligns to the C28x pipeline. Some instructions will take an additional execute cycle (E2). For these instructions you must wait a cycle for the result from the instruction to be available. The rest of this section will describe when delay cycles are required. Keep in mind that the assembly tools for the C28x+FPU will issue an error if a delay slot has not been handled correctly.

3.2 General Guidelines for Floating-Point Pipeline Alignment

While the C28x+FPU assembler will issue errors for pipeline conflicts, you may still find it useful to understand when software delays are required. This section describes three guidelines you can follow when writing C28x+FPU assembly code.

Floating-point instructions that require delay slots have a 'p' after their cycle count. For example '2p' stands for 2 pipelined cycles. This means that an instruction can be started every cycle, but the result of the instruction will only be valid one instruction later.

There are three general guidelines to determine if an instruction needs a delay slot:
1. Floating-point math operations (multiply, addition, subtraction, 1/x and MAC) require 1 delay slot.
2. Conversion instructions between integer and floating-point formats require 1 delay slot.
3. Everything else does not require a delay slot. This includes minimum, maximum, compare, load, store, negative and absolute value instructions.

There are two exceptions to these rules. First, moves between the CPU and FPU registers require special pipeline alignment that is described later in this section. These operations are typically infrequent. Second, the MACF32 R7H, R3H, mem32, *XAR7 instruction has special requirements that make it easier to use. Refer to the MACF32 instruction description for details.

An example of the 32-bit ADDF32 instruction is shown in Example 3-1. ADDF32 is a 2p instruction and therefore requires one delay slot. The destination register for the operation, R0H, will be updated one cycle after the instruction for a total of 2 cycles. Therefore, a NOP or instruction that does not use R0H must follow this instruction.

Any memory stall or pipeline stall will also stall the floating-point unit. This keeps the floating-point unit aligned with the C28x pipeline and there is no need to change the code based on the waitstates of a memory block.
Example 3-1. 2p Instruction Pipeline Alignment

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDF32 R0H, #1.5, R1H</td>
<td>2 pipeline cycles (2p)</td>
</tr>
<tr>
<td>NOP</td>
<td>1 cycle delay or non-conflicting instruction</td>
</tr>
<tr>
<td>NOP</td>
<td>&lt;-- ADDF32 completes, R0H updated</td>
</tr>
<tr>
<td>NOP</td>
<td>Any instruction</td>
</tr>
</tbody>
</table>

3.3 Moves from FPU Registers to C28x Registers

When transferring from the floating-point unit registers to the C28x CPU registers, additional pipeline alignment is required as shown in Example 3-2 and Example 3-3.

Example 3-2. Floating-Point to C28x Register Software Pipeline Alignment

```
; MINF32: 32-bit floating-point minimum: single-cycle operation
; An alignment cycle is required before copying R0H to ACC
MINF32 R0H, R1H ; Single-cycle instruction
    ; <-- R0H is valid
NOP ; Alignment cycle
MOV32 @ACC, R0H ; Copy R0H to ACC
```

For 1-cycle FPU instructions, one delay slot is required between a write to the floating-point register and the transfer instruction as shown in Example 3-2. For 2p FPU instructions, two delay slots are required between a write to the floating-point register and the transfer instruction as shown in Example 3-3.

Example 3-3. Floating-Point to C28x Register Software Pipeline Alignment

```
; ADDF32: 32-bit floating-point addition: 2p operation
; An alignment cycle is required before copying R0H to ACC
ADDF32 R0H, R1H, #2 ; R0H = R1H + 2, 2 pipeline cycle instruction
NOP ; 1 delay cycle or non-conflicting instruction
    ; <-- R0H is valid
NOP ; Alignment cycle
NOP ; Any instruction
MOV32 @ACC, R0H ; Copy R0H to ACC
```

3.4 Moves from C28x Registers to FPU Registers

Transfers from the standard C28x CPU registers to the floating-point registers require four alignment cycles. In this case the four alignment cycles can be filled with NOPs or any non-conflicting instruction except for FRACF32, UI16TOF32, I16TOF32, F32TOUI32, and F32TOI32. These instructions cannot replace any of the four alignment NOPs.

Example 3-4. C28x Register to Floating-Point Register Software Pipeline Alignment

```
; Four alignment cycles are required after copying a standard 28x CPU register to a floating-point register.
; MOV32 R0H,@ACC ; Copy ACC to R0H
NOP
NOP
NOP
NOP ; Wait 4 cycles
ADDF32 R2H,R1H,R0H ; R0H is valid
```
3.5 Parallel Instructions

Parallel instructions are single opcodes that perform two operations in parallel. This can be a math operation in parallel with a move operation, or two math operations in parallel. Math operations with a parallel move are referred to as 2p/1 instructions. The math portion of the operation takes 2 pipelined cycles while the move portion of the operation is single cycle. This means that NOPs or other non conflicting instructions must be inserted to align the math portion of the operation. An example of an add with parallel move instruction is shown in Example 3-5.

**Example 3-5. 2p/1 Parallel Instruction Software Pipeline Alignment**

```
; ADDF32   | MOV32 instruction: 32-bit floating-point add with parallel move
; ADDF32 is a 2p operation
; MOV32 is a 1 cycle operation

; ADDF32 R0H, R1H, #2   ; R0H = R1H + 2, 2 pipeline cycle operation
; MOV32 R1H, @Val       ; R1H gets the contents of Val, single cycle operation
; NOP                   ; 1 cycle delay or non-conflicting instruction
; NOP                   ; Any instruction
```

Parallel math instructions are referred to as 2p/2p instructions. Both math operations take 2 cycles to complete. This means that NOPs or other non conflicting instructions must be inserted to align the both math operations. An example of a multiply with parallel add instruction is shown in Example 3-5.

**Example 3-6. 2p/2p Parallel Instruction Software Pipeline Alignment**

```
; MPYF32   | ADDF32 instruction: 32-bit floating-point multiply with parallel add
; MPYF32 is a 2p operation
; ADDF32 is a 2p cycle operation

; MPYF32 R0H, R1H, R3H   ; R0H = R1H * R3H, 2 pipeline cycle operation
; ADDF32 R1H, R2H, R4H   ; R1H = R2H + R4H, 2 pipeline cycle operation
; NOP                   ; 1 cycle delay or non-conflicting instruction
; NOP                   ; Any instruction
```

3.6 Invalid Delay Instructions

Most instructions can be used in delay slots as long as source and destination register conflicts are avoided. The C28x+FPU assembler will issue an error anytime you use an conflicting instruction within a delay slot. The following guidelines can be used to avoid these conflicts.

**Note:** Destination register conflicts in delay slots:

Any operation used for pipeline alignment delay must not use the same destination register as the instruction requiring the delay. See Example 3-7.

In Example 3-7 the MPYF32 instruction uses R2H as its destination register. The next instruction should not use R2H as its destination. Since the MOV32 instruction uses the R2H register a pipeline conflict will be issued by the assembler. This conflict can be resolved by using a register other than R2H for the MOV32 instruction as shown in Example 3-8.
Example 3-7. Destination Register Conflict

```
; Invalid delay instruction. Both instructions use the same destination register
MPYF32 R2H, R1H, ROH ; 2p instruction
MOV32 R2H, mem32 ; Invalid delay instruction
```

Example 3-8. Destination Register Conflict Resolved

```
; Valid delay instruction
MPYF32 R2H, R1H, ROH ; 2p instruction
MOV32 R1H, mem32 ; Valid delay
; -- MPYF32 completes, R2H valid
```

Note: Instructions in delay slots cannot use the instruction's destination register as a source register.

Any operation used for pipeline alignment delay must not use the destination register of the instruction requiring the delay as a source register as shown in Example 3-9. For parallel instructions, the current value of a register can be used in the parallel operation before it is overwritten as shown in Example 3-11.

In Example 3-9 the MPYF32 instruction again uses R2H as its destination register. The next instruction should not use R2H as its source since the MPYF32 will take an additional cycle to complete. Since the ADDF32 instruction uses the R2H register a pipeline conflict will be issued by the assembler. This conflict can be resolved by using a register other than R2H or by inserting a non-conflicting instruction between the MPYF32 and ADDF32 instructions. Since the SUBF32 does not use R2H this instruction can be moved before the ADDF32 as shown in Example 3-10.

Example 3-9. Destination/Source Register Conflict

```
; Invalid delay instruction. ADDF32 should not use R2H as a source operand
MPYF32 R2H, R1H, ROH ; 2p instruction
ADDF32 R3H, R3H, R2H ; Invalid delay instruction
SUBF32 R4H, R1H, ROH
```

Example 3-10. Destination/Source Register Conflict Resolved

```
; Valid delay instruction.
MPYF32 R2H, R1H, ROH ; 2p instruction
SUBF32 R4H, R1H, ROH ; Valid delay for MPYF32
ADDF32 R3H, R3H, R2H ; -- MPYF32 completes, R2H valid
NOP
; -- SUBF32 completes, R4H valid
```

It should be noted that a source register for the 2nd operation within a parallel instruction can be the same as the destination register of the first operation. This is because the two operations are started at the same time. The 2nd operation is not in the delay slot of the first operation. Consider Example 3-11 where the MPYF32 uses R2H as its destination register. The MOV32 is the 2nd operation in the instruction and can freely use R2H as a source register. The contents of R2H before the multiply will be used by MOV32.
Example 3-11. Parallel Instruction Destination/Source Exception

```plaintext
; Valid parallel operation.
MPYF32 R2H, R1H, R0H  ; 2p/1 instruction
|| MOV32 mem32, R2H  ; <-- Uses R2H before the MPYF32
     NOP  ; <-- Delay for MPYF32
     ; <-- R2H updated

Likewise, the source register for the 2nd operation within a parallel instruction can be the same as one of the source registers of the first operation. The MPYF32 operation in Example 3-12 uses the R1H register as one of its sources. This register is also updated by the MOV32 register. The multiplication operation will use the value in R1H before the MOV32 updates it.

Example 3-12. Parallel Instruction Destination/Source Exception

```plaintext
; Valid parallel instruction
MPYF32 R2H, R1H, R0H  ; 2p/1 instruction
|| MOV32 R1H, mem32  ; Valid
     NOP  ; <-- MOV32 completes, R1H valid
     ; <-- MPYF32, R2H valid

Note: Operations within parallel instructions cannot use the same destination register.
When two parallel operations have the same destination register, the result is invalid.
For example, see Example 3-13.

If both operations within a parallel instruction try to update the same destination register as shown in Example 3-13 the assembler will issue an error.

Example 3-13. Invalid Destination Within a Parallel Instruction

```plaintext
; Invalid parallel instruction. Both operations use the same destination register
MPYF32 R2H, R1H, R0H  ; 2p/1 instruction
|| MOV32 R2H, mem32  ; Invalid

Some instructions access or modify the STF flags. Because the instruction requiring a delay slot will also be accessing the STF flags, these instructions should not be used in delay slots. These instructions are SAVE, SETFLG, RESTORE and MOVST0.

Note: Do not use SAVE, SETFLG, RESTORE, or the MOVST0 instruction in a delay slot.
3.7 Optimizing the Pipeline

The following example shows how delay slots can be used to improve the performance of an algorithm. The example performs two \( Y = MX+B \) operations. In Example 3-14, no optimization has been done. The \( Y = MX+B \) calculations are sequential and each takes 7 cycles to complete. Notice there are NOPs in the delay slots that could be filled with non-conflicting instructions. The only requirement is these instructions must not cause a register conflict or access the STF register flags.

**Example 3-14. Floating-Point Code Without Pipeline Optimization**

```plaintext
; Using NOPs for alignment cycles, calculate the following:
; Y1 = M1*X1 + B1
; Y2 = M2*X2 + B2

; Calculate Y1
MOV32 R0H, @M1 ; Load R0H with M1 - single cycle
MOV32 R1H, @X1 ; Load R1H with X1 - single cycle
MPYF32 R1H, R1H, R0H ; R1H = M1 * X1 - 2p operation
|| MOV32 R0H, @B1 ; Load R0H with B1 - single cycle
NOP ; Wait for MPYF32 to complete
ADDF32 R1H, R1H, R0H ; R1H = R1H + R0H - 2p operation
NOP ; Wait for ADDF32 to complete
MOV32 @Y1, R1H ; Save R1H in Y1 - single cycle

; Calculate Y2
MOV32 R0H, @M2 ; Load R0H with M2 - single cycle
MOV32 R1H, @X2 ; Load R1H with X2 - single cycle
MPYF32 R1H, R1H, R0H ; R1H = M2 * X2 - 2p operation
|| MOV32 R0H, @B2 ; Load R0H with B2 - single cycle
NOP ; Wait for MPYF32 to complete
ADDF32 R1H, R1H, R0H ; R1H = R1H + R0H - 2p operation
NOP ; Wait for ADDF32 to complete
MOV32 @Y2, R1H ; Save R1H in Y2

; 14 cycles
; 48 bytes
```

The code shown in Example 3-15 was generated by the C28x+FPU compiler with optimization enabled. Notice that the NOPs in the first example have now been filled with other instructions. The code for the two \( Y = MX+B \) calculations are now interleaved and both calculations complete in only 9 cycles.
Example 3-15. Floating-Point Code With Pipeline Optimization

; Using non-conflicting instructions for alignment cycles,
; calculate the following:
; Y1 = M1*X1 + B1
; Y2 = M2*X2 + B2
;
; MOV32 R2H, @X1 ; Load R2H with X1 - single cycle
; MOV32 R1H, @M1 ; Load R1H with M1 - single cycle
; MPYF32 R3H, R2H, R1H ; R3H = M1 * X1 - 2p operation
; MOV32 R0H, @M2 ; Load R0H with M2 - single cycle
; MOV32 R1H, @X2 ; Load R1H with X2 - single cycle
; <---- MPYF32 completes, R3H is valid
; MPYF32 R0H, R1H, R0H ; R0H = M2 * X2 - 2p operation
; MOV32 R4H, @B1 ; Load R4H with B1 - single cycle
; <---- MOV32 completes, R4H is valid
; ADDF32 R1H, R4H, R3H ; R1H = B1 + M1*X1 - 2p operation
; MOV32 R2H, @B2 ; Load R2H with B2 - single cycle
; <---- MPYF32 completes, R0H is valid
; ADDF32 R0H, R2H, R0H ; R0H = B2 + M2*X2 - 2p operation
; MOV32 @Y1, R1H ; Store Y1
; <---- ADDF32 completes, R1H is valid
; MOV32 @Y2, R0H ; Store Y2
;
; 9 cycles
; 36 bytes
This chapter describes the assembly language instructions of the TMS320C28x plus floating-point processor. Also described are parallel operations, conditional operations, resource constraints, and addressing modes. The instructions listed here are an extension to the standard C28x instruction set. For information on standard C28x instructions, see the TMS320C28x DSP CPU and Instruction Set Reference Guide (literature number SPRU430).

4.1 Instruction Descriptions

This section gives detailed information on the instruction set. Each instruction may present the following information:

- Operands
- Opcode
- Description
- Exceptions
- Pipeline
- Examples
- See also

The example INSTRUCTION is shown to familiarize you with the way each instruction is described. The example describes the kind of information you will find in each part of the individual instruction description and where to obtain more information. On the C28x+FPU instructions, follow the same format as the C28x. The source operand(s) are always on the right and the destination operand(s) are on the left.

The explanations for the syntax of the operands used in the instruction descriptions for the TMS320C28x plus floating-point processor are given in Table 4-1. For information on the operands of standard C28x instructions, see the TMS320C28x DSP CPU and Instruction Set Reference Guide (SPRU430).

</tr>
</tbody>
</table>

Each instruction has a table that gives a list of the operands and a short description. Instructions always have their destination operand(s) first followed by the source operand(s).

Opcode

This section shows the opcode for the instruction.

Description

Detailed description of the instruction execution is described. Any constraints on the operands imposed by the processor or the assembler are discussed.

Restrictions

Any constraints on the operands or use of the instruction imposed by the processor are discussed.

Pipeline

This section describes the instruction in terms of pipeline cycles as described in Chapter 3.

Example

Examples of instruction execution. If applicable, register and memory values are given before and after instruction execution. All examples assume the device is running with the OBJMODE set to 1. Normally the boot ROM or the c-code initialization will set this bit.

See Also

Lists related instructions.
# 4.2 Instructions

The instructions are listed alphabetically, preceded by a summary.

**ABSF32 RaH, RbH**

32-bit Floating-Point Absolute Value

**Operands**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>RaH</td>
<td>floating-point destination register (R0H to R7H)</td>
</tr>
<tr>
<td>RbH</td>
<td>floating-point source register (R0H to R7H)</td>
</tr>
</tbody>
</table>

**Opcode**

LSW: 1110 0110 1001 0101

MSW: 0000 0000 00bb baaa

**Description**

The absolute value of RbH is loaded into RaH. Only the sign bit of the operand is modified by the ABSF32 instruction.

if (RbH < 0) {RaH = -RbH}
else {RaH = RbH}

**Flags**

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

NF = 0;
ZF = 0;
if (RaH[30:23] == 0) ZF = 1;

**Pipeline**

This is a single-cycle instruction.

**Example**

MOVIZ32 R1H, #-2.0 ; R1H = -2.0 (0xC0000000)
ABSF32 R1H, R1H ; R1H = 2.0 (0x40000000), ZF = NF = 0

MOVIZ32 ROH, #5.0 ; ROH = 5.0 (0x40A00000)
ABSF32 ROH, ROH ; ROH = 5.0 (0x40A00000), ZF = NF = 0

MOVIZ32 ROH, #0.0 ; ROH = 0.0
ABSF32 R1H, ROH ; R1H = 0.0 ZF = 1, NF = 0

<th>1110 1000 10II IIII</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSW:</td>
<td>IIII IIII 11bb baaa</td>
</tr>
</tbody>
</table>

**Description**

Add RbH to the floating-point value represented by the immediate operand. Store the result of the addition in RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

RaH = RbH + #16FHi: 0

This instruction can also be written as ADDF32 RaH, RbH, #16FHi.

**Flags**

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- **LUF** = 1 if ADDF32 generates an underflow condition.
- **LVF** = 1 if ADDF32 generates an overflow condition.

**Pipeline**

This is a 2 pipeline-cycle instruction (2p). That is:

```
ADDF32 RaH, #16FHi, RbH ; 2 pipeline cycles (2p)
NOP ; 1 cycle delay or non-conflicting instruction
    ; <-- ADDF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

**Example**

```
; Add to R1H the value 2.0 in 32-bit floating-point format
ADDF32 R0H, #2.0, R1H ; R0H = 2.0 + R1H
NOP ; Delay for ADDF32 to complete
    ; <-- ADDF32 completes, R0H updated
NOP

; Add to R3H the value -2.5 in 32-bit floating-point format
ADDF32 R2H, #-2.5, R3H ; R2H = -2.5 + R3H
NOP ; Delay for ADDF32 to complete
    ; <-- ADDF32 completes, R2H updated
NOP

; Add to R5H the value 0x3FC00000 (1.5)
ADDF32 R5H, #0x3FC0, R5H ; R5H = 1.5 + R5H
NOP ; Delay for ADDF32 to complete
    ; <-- ADDF32 completes, R5H updated
NOP
```

### ADDF32 RaH, RbH, #16FHi 32-bit Floating-Point Addition

#### Operands

<table>
<thead>
<tr>
<th>RaH</th>
<th>floating-point destination register (R0H to R7H)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RbH</td>
<td>floating-point source register (R0H to R7H)</td>
</tr>
<tr>
<td>#16FHi</td>
<td>A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.</td>
</tr>
</tbody>
</table>

#### Opcode

LSW: 1110 1000 10II IIII  
MSW: IIII IIII IIbb baaa

#### Description

Add RbH to the floating-point value represented by the immediate operand. Store the result of the addition in RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

RaH = RbH + #16FHi:0

This instruction can also be written as ADDF32 RaH, #16FHi, RbH.

#### Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if ADDF32 generates an underflow condition.
- LVF = 1 if ADDF32 generates an overflow condition.

#### Pipeline

This is a 2 pipeline-cycle instruction (2p). That is:

ADDF32 RaH, #16FHi, RbH ; 2 pipeline cycles (2p)  
NOP ; 1 cycle delay or non-conflicting instruction  
NOP  

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

#### Example

; Add to R1H the value 2.0 in 32-bit floating-point format  
ADDF32 R0H, R1H, #2.0 ; R0H = R1H + 2.0  
NOP ; Delay for ADDF32 to complete  
NOP  

; Add to R3H the value -2.5 in 32-bit floating-point format  
ADDF32 R2H, R3H, #-2.5 ; R2H = R3H + (-2.5)  
NOP ; Delay for ADDF32 to complete  
NOP  

; Add to R5H the value 0x3FC00000 (1.5)  
ADDF32 R5H, R5H, #0x3FC0 ; R5H = R5H + 1.5  
NOP ; Delay for ADDF32 to complete  
NOP

**32-bit Floating-Point Addition**

### Operands
- **RaH**: Floating-point destination register (R0H to R7H)
- **RbH**: Floating-point source register (R0H to R7H)
- **RcH**: Floating-point source register (R0H to R7H)

### Opcode
- **LSW**: 1110 0111 0001 0000
- **MSW**: 0000 000c ccbb baaa

### Description
Add the contents of RcH to the contents of RbH and load the result into RaH.

\[ RaH = RbH + RcH \]

### Flags
This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:
- **LUF** = 1 if ADD32 generates an underflow condition.
- **LVF** = 1 if ADD32 generates an overflow condition.

### Pipeline
This is a 2 pipeline-cycle instruction (2p). That is:

```
ADD32 RaH, RbH, RcH ; 2 pipeline cycles (2p)
NOP ; 1 cycle delay or non-conflicting instruction
    ; <-- ADD32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

### Example
Calculate \( Y = M1 \times X1 + B1 \). This example assumes that M1, X1, B1 and Y are all on the same data page.

```
MOVW DP, #M1     ; Load the data page
MOV32 R0H, @M1  ; Load R0H with M1
MOV32 R1H, @X1  ; Load R1H with X1
|| MOV32 R0H, @B1 ; and in parallel load R0H with B1
    ; <-- MOV32 complete
    ; <-- MPYF32 complete
ADD32 R1H, R1H, R0H ; Add M1\times X1 to B1 and store in R1H
NOP ; <-- ADDF32 complete
MOV32 @Y1, R1H ; Store the result
```

Calculate \( Y = A + B \).

```
MOV    XAR4, #A
MOV32 R0H, *XAR4 ; Load R0H with A
MOV    XAR4, #B
MOV32 R1H, *XAR4 ; Load R1H with B
ADD32 R0H, R1H, R0H ; Add A + B R0H=R0H+R1H
MOV    XAR4, #Y ; <-- ADDF32 complete
MOV32 *XAR4, R0H ; Store the result
```

<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if ADDF32 generates an underflow condition.
- LVF = 1 if ADDF32 generates an overflow condition.

Pipeline

ADDHF32 is a 2 pipeline-cycle instruction (2p) and MOV32 takes a single cycle. That is:

- ADDF32 RdH, ReH, RfH ; 2 pipeline cycles (2p)
  - MOV32 mem32, RaH ; 1 cycle
  - NOP ; 1 cycle delay or non-conflicting instruction
  - NOP

Any instruction in the delay slot must not use RdH as a destination register or use RdH as a source operand.

32-bit Floating-Point Addition with Parallel Move

Operands

| RdH | floating-point destination register for the ADDF32 (R0H to R7H). RdH cannot be the same register as RaH. |
| ReH | floating-point source register for the ADDF32 (R0H to R7H) |
| RfH | floating-point source register for the ADDF32 (R0H to R7H) |
| RaH | floating-point destination register for the MOV32 (R0H to R7H). RaH cannot be the same register as RdH. |
| mem32 | pointer to a 32-bit memory location. This is the source for the MOV32. |

Opcode

| LSW: 1110 0011 0001 fffe |
| MSW: eedd daaa mem32 |

Description

Perform an ADDF32 and a MOV32 operation in parallel. Add RfH to the contents of ReH and store the result in RdH. In parallel move the contents of the 32-bit location pointed to by mem32 to RaH. mem32 addresses memory using any of the direct or indirect addressing modes supported by the C28x CPU.

RdH = ReH + RfH,
RaH = [mem32]

Restrictions

The destination register for the ADDF32 and the MOV32 must be unique. That is, RaH and RdH cannot be the same register.

Any instruction in the delay slot must not use RdH as a destination register or use RdH as a source operand.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if ADDF32 generates an underflow condition.
- LVF = 1 if ADDF32 generates an overflow condition.

The MOV32 Instruction will set the NF, ZF, NI and ZI flags as follows:

NF = RaH(31);
ZF = 0;
if(RaH(30:23) == 0) { ZF = 1; NF = 0; }
NI = RaH(31);
ZI = 0;
if(RaH(31:0) == 0) ZI = 1;

Pipeline

The ADDF32 takes 2 pipeline cycles (2p) and the MOV32 takes a single cycle. That is:

<table>
<thead>
<tr>
<th>ADDF32 RdH, ReH, RfH</th>
<th>2 pipeline cycles (2p)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOV32 RaH, mem32</td>
<td>1 cycle</td>
</tr>
<tr>
<td></td>
<td>&lt;-- MOV32 completes, RaH updated</td>
</tr>
<tr>
<td>NOP</td>
<td>1 cycle delay or non-conflicting instruction</td>
</tr>
<tr>
<td></td>
<td>&lt;-- ADDF32 completes, RdH updated</td>
</tr>
<tr>
<td>NOP</td>
<td></td>
</tr>
</tbody>
</table>
Example

Calculate $Y = A + B - C$:

```
MOVL XAR4, #A
MOV32 R0H, *XAR4 ; Load R0H with A
MOVL XAR4, #B
MOV32 R1H, *XAR4 ; Load R1H with B
MOVL XAR4, #C
ADDF32 R0H,R1H,R0H ; Add A + B and in parallel
| | MOV32 R2H, *XAR4 ; Load R2H with C
  | | <--- MOV32 complete
 MOVL XAR4, #Y ; ADDF32 complete
 SUBF32 R0H,R0H,R2H ; Subtract C from (A + B)
 NOP ; <--- SUBF32 completes
 MOV32 *XAR4,R0H ; Store the result
```

</tbody>
</table>

**Opcode**

| LSW: 1110 0110 1001 0100 |
| MSW: 0000 0000 00bb baaa |

**Description**

Set ZF and NF flags on the result of RaH - RbH. The CMPF32 instruction is performed as a logical compare operation. This is possible because of the IEEE format offsetting the exponent. Basically the bigger the binary number, the bigger the floating-point value.

Special cases for inputs:

- Negative zero will be treated as positive zero.
- A denormalized value will be treated as positive zero.
- Not-a-Number (NaN) will be treated as infinity.

**Flags**

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- If(RaH == RbH) {ZF=1, NF=0}
- If(RaH > RbH) {ZF=0, NF=0}
- If(RaH < RbH) {ZF=0, NF=1}

**Pipeline**

This is a single-cycle instruction.

**Example**

; Behavior of ZF and NF flags for different comparisons

```
MOVI32 R1H, #-2.0 ; R1H = -2.0 (0xC0000000)
MOVI32 R0H, #5.0  ; R0H = 5.0  (0x40A00000)
CMPF32 R1H, R0H   ; ZF = 0, NF = 1
CMPF32 R0H, R1H   ; ZF = 0, NF = 0
CMPF32 R0H, R0H   ; ZF = 1, NF = 0
```

; Using the result of a compare for loop control

```
Loop:
  MOV32 R0H,*XAR4++ ; Load R0H
  MOV32 R1H,*XAR3++ ; Load R1H
  CMPF32 R1H, R0H   ; Set/clear ZF and NF
  MOVST0 ZF, NF     ; Copy ZF and NF to ST0 Z and N bits
  BF Loop, GT       ; Loop if R1H > R0H
```

## 32-bit Floating-Point Compare for Equal, Less Than or Greater Than

### Operands

<table>
<thead>
<tr>
<th>RaH</th>
<th>floating-point source register (R0H to R7H)</th>
</tr>
</thead>
<tbody>
<tr>
<td>#16FHi</td>
<td>A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.</td>
</tr>
</tbody>
</table>

### Opcode

<table>
<thead>
<tr>
<th>LSW</th>
<th>MSW</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110 1000</td>
<td>0001 0000</td>
</tr>
</tbody>
</table>

### Description

Compare the value in RaH with the floating-point value represented by the immediate operand. Set the ZF and NF flags on (RaH - #16FHi:0).

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0x0BFC0.

The CMPF32 instruction is performed as a logical compare operation. This is possible because of the IEEE floating-point format offsets the exponent. Basically the bigger the binary number, the bigger the floating-point value.

### Special cases for inputs:

- Negative zero will be treated as positive zero.
- Denormalized value will be treated as positive zero.
- Not-a-Number (NaN) will be treated as infinity.

### Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>Modified</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- If(RaH == #16FHi:0) {ZF=1, NF=0}
- If(RaH > #16FHi:0) {ZF=0, NF=0}
- If(RaH < #16FHi:0) {ZF=0, NF=1}

### Pipeline

This is a single-cycle instruction.

### Example

; Behavior of ZF and NF flags for different comparisons

```assembly
MOVIS32 R1H, #2.0 ; R1H = 2.0 (0xC0000000)
MOVIS32 R0H, #5.0 ; R0H = 5.0 (0x40000000)
CMPF32 R1H, #2.2 ; ZF = 0, NF = 0
CMPF32 R0H, #6.5 ; ZF = 0, NF = 1
CMPF32 R0H, #5.0 ; ZF = 1, NF = 0
```

; Using the result of a compare for loop control

```assembly
Loop:
  MOV32 R1H,*XAR3++ ; Load R1H
  CMPF32 R1H, #2.0 ; Set/clear ZF and NF
  MOVST0 ZF, NF ; Copy ZF and NF to ST0 Z and N bits
  BF Loop, GT ; Loop if R1H > #2.0
```

32-bit Floating-Point Compare for Equal, Less Than or Greater Than

Operands

<table>
<thead>
<tr>
<th>RaH</th>
<th>floating-point source register (R0H to R7H)</th>
</tr>
</thead>
<tbody>
<tr>
<td>#0.0</td>
<td>zero</td>
</tr>
</tbody>
</table>

Opcode

LSW: 1110 0101 1010 0aaa

Description

Set the ZF and NF flags on (RaH - #0.0). The CMPF32 instruction is performed as a logical compare operation. This is possible because of the IEEE floating-point format offsets the exponent. Basically the bigger the binary number, the bigger the floating-point value.

Special cases for inputs:
- Negative zero will be treated as positive zero.
- Denormalized value will be treated as positive zero.
- Not-a-Number (NaN) will be treated as infinity.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

If(RaH == #0.0) {ZF=1, NF=0}
If(RaH > #0.0) {ZF=0, NF=0}
If(RaH < #0.0) {ZF=0, NF=1}

Pipeline

This is a single-cycle instruction.

Example

; Behavior of ZF and NF flags for different comparisons

    MOV16F32 R0H, #5.0 ; R0H = 5.0 (0x40A00000)
    MOV16F32 R1H, #-2.0 ; R1H = -2.0 (0x0C000000)

**32-bit Floating-Point Reciprocal Approximation**

**Operands**

<table>
<thead>
<tr>
<th>RaH</th>
<th>floating-point destination register (R0H to R7H)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RbH</td>
<td>floating-point source register (R0H to R7H)</td>
</tr>
</tbody>
</table>

**Opcode**

LSW: 1110 0110 1001 0011
MSW: 0000 0000 00bb baaa

**Description**

This operation generates an estimate of 1/X in 32-bit floating-point format accurate to approximately 8 bits. This value can be used in a Newton-Raphson algorithm to get a more accurate answer. That is:

\[
Y_e = \text{Estimate}(1/X);
Y_e = Y_e \times (2.0 - Y_e \times X)
\]

After 2 iterations of the Newton-Raphson algorithm, you will get an exact answer accurate to the 32-bit floating-point format. On each iteration the mantissa bit accuracy approximately doubles. The EINVF32 operation will not generate a negative zero, DeNorm or NaN value.

\[
RaH = \text{Estimate of } 1/RbH
\]

**Flags**

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if EINVF32 generates an underflow condition.
- LVF = 1 if EINVF32 generates an overflow condition.

**Pipeline**

This is a 2 pipeline cycle (2p) instruction. That is:

```
EINVF32 RaH, RbH ; 2p
NOP               ; 1 cycle delay or non-conflicting instruction
                  ; <-- EINVF32 completes, RaH updated

NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.
Example

Calculate $Y = A/B$. A fast division routine similar to that shown below can be found in the C28x FPU Fast RTS Library (SPRC664).

```
MOVL XAR4, #A
MOV32 R0H, *XAR4 ; Load R0H with A
MOVL XAR4, #B
MOV32 R1H, *XAR4 ; Load R1H with B
LCR DIV ; Calculate R0H = R0H / R1H
MOV32 *XAR4, R0H ;
...

DIV:
EINVF32 R2H, R1H ; R2H = Ye = Estimate(1/B)
CMPF32 R0H, #0.0 ; Check if A == 0
MPYF32 R3H, R2H, R1H ; R3H = Ye*B
NOP
SUBF32 R3H, #2.0, R3H ; R3H = 2.0 - Ye*B
NOP
MPYF32 R2H, R2H, R3H ; R2H = Ye*(2.0 - Ye*B)
NOP
MPYF32 R3H, R2H, R1H ; R3H = Ye*B
CMPF32 R1H, #0.0 ; Check if B == 0.0
SUBF32 R3H, #2.0, R3H ; R3H = 2.0 - Ye*B
NEGF32 R0H, R0H, EQ ; Fixes sign for A/0.0
MPYF32 R2H, R2H, R3H ; R2H = Ye*Ye*(2.0 - Ye*B)
NOP
MPYF32 R0H, R0H, R2H ; R0H = Y = A*Ye = A/B
LRETR
```

<th>MSW</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110 0110</td>
<td>0000 0000 00bb baaa</td>
</tr>
</tbody>
</table>

Description

This operation generates an estimate of 1/sqrt(X) in 32-bit floating-point format accurate to approximately 8 bits. This value can be used in a Newton-Raphson algorithm to get a more accurate answer. That is:

Ye = Estimate(1/sqrt(X));
Ye = Ye*(1.5 - Ye*Ye*X/2.0)
Ye = Ye*(1.5 - Ye*Ye*X/2.0)

After 2 iterations of the Newton-Raphson algorithm, you will get an exact answer accurate to the 32-bit floating-point format. On each iteration the mantissa bit accuracy approximately doubles. The EISQRTF32 operation will not generate a negative zero, DeNorm or NaN value.

RaH = Estimate of 1/sqrt (RbH)

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if EISQRTF32 generates an underflow condition.
- LVF = 1 if EISQRTF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>EINVF32 RaH, RbH</td>
<td>2 pipeline cycles (2p)</td>
</tr>
<tr>
<td>NOP</td>
<td>1 cycle delay or non-conflicting instruction</td>
</tr>
<tr>
<td>NOP</td>
<td>&lt;= EISQRTF32 completes, RaH updated</td>
</tr>
</tbody>
</table>

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.
Example  
Calculate the square root of X. A square-root routine similar to that shown below can be found in the C28x FPU Fast RTS Library (SPRC664).

; Y = sqrt(X) 
; Ye = Estimate(1/sqrt(X))
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Y = Y*Ye

_sqrt:

R0H = X on entry
R1H = Ye = Estimate(1/sqrt(X))

F32TOI16R RaH, RbH  Convert 32-bit Floating-Point Value to 16-bit Integer and Round

Operands

RaH floating-point destination register (R0H to R7H)
RbH floating-point source register (R0H to R7H)

Opcode

LSW: 1110 0110 1000 1100
MSW: 1000 0000 00bb baaa

Description

Convert the 32-bit floating point value in RbH to a 16-bit integer and round to the nearest even value. The result is stored in RaH.

RaH(15:0) = F32ToI16round(RbH)
RaH(31:16) = sign extension of RaH(15)

Flags

This instruction does not affect any flags:

<table>
<thead>
<tr>
<th>Flag</th>
<th>Modified</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>

*Fractional Portion of a 32-bit Floating-Point Value*

**Operands**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>RaH</td>
<td>floating-point destination register (R0H to R7H)</td>
</tr>
<tr>
<td>RbH</td>
<td>floating-point source register (R0H to R7H)</td>
</tr>
</tbody>
</table>

**Opcode**

LSW: 1110 0110 1111 0001  
MSW: 0000 0000 00bb baaa

**Description**

Returns in RaH the fractional portion of the 32-bit floating-point value in RbH.

**Flags**

This instruction does not affect any flags:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Pipeline**

This is a 2 pipeline cycle (2p) instruction. That is:

```
FRACF32 RaH, RbH   ; 2 pipeline cycles (2p)
NOP                ; 1 cycle delay or non-conflicting instruction
                  ; <-- FRACF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

**Example**

```
MOVIF32 R2H, #19.625 ; R2H = 19.625 (0x419D0000)
FRACF32 R3H, R2H     ; R3H = FRACF32 (R2H)
NOP                   ; 1 Cycle delay for FRACF32 to complete
                    ; <-- FRACF32 complete, R3H = 0.625 (0x3F200000)
```

**See also**
I16TOF32 RaH, RbH  *Convert 16-bit Integer to 32-bit Floating-Point Value*

**Operands**

- **RaH**: floating-point destination register (R0H to R7H)
- **RbH**: floating-point source register (R0H to R7H)

**Opcode**

- **LSW**: 1110 0110 1000 1101
- **MSW**: 0000 0000 00bb baaa

**Description**

Convert the 16-bit signed integer in RbH to a 32-bit floating point value and store the result in RaH.

RaH = I16TOF32 RbH

**Flags**

This instruction does not affect any flags:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

**Pipeline**

This is a 2 pipeline cycle (2p) instruction. That is:

1. I16TOF32 RaH, RbH  ; 2 pipeline cycles (2p)
2. NOP  ; 1 cycle delay or non-conflicting instruction
3. NOP

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

**Example**

```
MOVIZ R0H, #0x0000 ; R0H[31:16] = 0.0 (0x0000)
MOVXI R0H, #0x0004 ; R0H[15:0] = 4.0 (0x0004)
I16TOF32 R1H, R0H ; R1H = I16TOF32 (R0H)
MOVIZ R2H, #0x0000 ; R2H[31:16] = 0.0 (0x0000)
I16TOF32 R3H, R2H  ;  R3H = I16TOF32 (R2H)
```

```
MOVIX R2H, #0xFFFC ; R2H[15:0] = -4.0 (0xFFFF)
I16TOF32 R3H, R2H ; I16TOF32 complete, R3H = -4.0 (0xFFFC)
```

UI32TOF32 RaH, mem32
MACF32 R3H, R2H, RdH, ReH, RfH  32-bit Floating-Point Multiply with Parallel Add

Operands
This instruction is an alias for the parallel multiply and add instruction. The operands are translated by the assembler such that the instruction becomes:

<table>
<thead>
<tr>
<th>Opcode</th>
<th>Description</th>
<th>Restrictions</th>
<th>Flags</th>
</tr>
</thead>
</table>

R3H  floating-point destination and source register for the ADDF32
R2H  floating-point source register for the ADDF32 operation (R0H to R7H)
RdH  floating-point destination register for MPYF32 operation (R0H to R7H)
R3H cannot be RdH
ReH  floating-point source register for MPYF32 operation (R0H to R7H)
RfH  floating-point source register for MPYF32 operation (R0H to R7H)

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>

<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:
- LUF = 1 if MPYF32 or ADDF32 generates an underflow condition.
- LVF = 1 if MPYF32 or ADDF32 generates an overflow condition.

Pipeline
Both MPYF32 and ADDF32 take 2 pipeline cycles (2p) That is:

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPYF32 RaH, RbH, RcH</td>
<td>2 pipeline cycles (2p)</td>
</tr>

</tbody>
</table>

Opcode

<table>
<thead>
<tr>
<th>LSW</th>
<th>MSW</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110 0011 0011 fffe</td>
<td>eedd daaa mem32</td>
</tr>
</tbody>
</table>

Description

Multiply and accumulate the contents of floating-point registers and move from register to memory. The destination register for the MOV32 cannot be the same as the destination registers for the MACF32.

R3H = R3H + R2H,  
RdH = ReH * RfH,  
RaH = [mem32]

Restrictions

The destination registers for the MACF32 and the MOV32 must be unique. That is, RaH cannot be R3H and RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MACF32 (add or multiply) generates an underflow condition.
- LVF = 1 if MACF32 (add or multiply) generates an overflow condition.

MOV32 sets the NF, ZF, NI and ZI flags as follows:

NF = RaH(31);  
ZF = 0;  
if(RaH(30:23) == 0) { ZF = 1; NF = 0; }  
NI = RaH(31);  
ZI = 0;  
if(RaH(31:0) == 0) ZI = 1;

Pipeline

The MACF32 takes 2 pipeline cycles (2p) and the MOV32 takes a single cycle. That is:

| MACF32 R3H, R2H, RdH, ReH, RfH | 2 pipeline cycles (2p) |
| MOV32 RaH, mem32 | 1 cycle |
| NOP | 1 cycle delay for MACF32 |
| NOP | 1 cycle delay for MACF32 |

Any instruction in the delay slot for this version of MACF32 must not use R3H or RdH as a destination register or R3H or RdH as a source operand.
Example

; Perform 5 multiply and accumulate operations:

; 1ST multiply: \( A = X_0 \times Y_0 \)
; 2nd multiply: \( B = X_1 \times Y_1 \)
; 3rd multiply: \( C = X_2 \times Y_2 \)
; 4TH multiply: \( D = X_3 \times Y_3 \)
; 5th multiply: \( E = X_3 \times Y_3 \)

Result = \( A + B + C + D + E \)

</tr>
</tbody>
</table>

Description

Perform an multiply and accumulate operation. When used as a stand-alone operation, the MACF32 will perform a single multiply as shown below:

Cycle 1: R3H = R3H + R2H, R2H = [mem32] * [XAR7++]

This instruction is the only floating-point instruction that can be repeated using the single repeat instruction (RPT ||). When repeated, the destination of the accumulate will alternate between R3H and R7H on each cycle and R2H and R6H are used as temporary storage for each multiply.

Cycle 1: R3H = R3H + R2H, R2H = [mem32] * [XAR7++]
Cycle 2: R7H = R7H + R6H, R6H = [mem32] * [XAR7++]
Cycle 3: R3H = R3H + R2H, R2H = [mem32] * [XAR7++]
Cycle 4: R7H = R7H + R6H, R6H = [mem32] * [XAR7++]
etc...

Restrictions

R2H and R6H will be used as temporary storage by this instruction.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MACF32 generates an underflow condition.
- LVF = 1 if MACF32 generates an overflow condition.

Pipeline

When repeated the MACF32 takes 3 + N cycles where N is the number of times the instruction is repeated. When repeated, this instruction has the following pipeline restrictions:

```plaintext
<instruction1> ; No restriction
<instruction2> ; Cannot be a 2p instruction that writes
RPT #(N-1) ; to R2H, R3H, R6H or R7H
| | MACF32 R7H, R3H, *XAR6++, *XAR7++ ; Execute N times, where N is even
<instruction3> ; No restrictions.
; Can read R2H, R3H, R6H and R7H
```
MACF32 can also be used standalone. In this case, the instruction takes 2 cycles and the following pipeline restrictions apply:

- No restriction
- Cannot be a 2p instruction that writes to R2H, R3H, R6H or R7H
- R3H = R3H + R2H, R2H = [mem32] * [XAR7++]
- R2H and R3H are valid (note: no delay required)

Example

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZERO R2H</td>
<td>Zero the accumulation registers</td>
</tr>
<tr>
<td>ZERO R3H</td>
<td>Zero temporary multiply storage registers</td>
</tr>
<tr>
<td>ZERO R6H</td>
<td></td>
</tr>
<tr>
<td>ZERO R7H</td>
<td></td>
</tr>
<tr>
<td>RPT #3</td>
<td>Repeat MACF32 N+1 (4) times</td>
</tr>
<tr>
<td>MACF32 R7H, R3H, *XAR6++, *XAR7++</td>
<td></td>
</tr>
<tr>
<td>ADDF32 R7H, R7H, R3H</td>
<td>Final accumulate</td>
</tr>
<tr>
<td>NOP</td>
<td></td>
</tr>
<tr>
<td>NOP</td>
<td></td>
</tr>
</tbody>
</table>

Cascading of RPT || MACF32 is allowed as long as the first and subsequent counts are even. Cascading is useful for creating interruptible windows so that interrupts are not delayed too long by the RPT instruction. For example:

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZERO R2H</td>
<td>Zero the accumulation registers</td>
</tr>
<tr>
<td>ZERO R3H</td>
<td></td>
</tr>
<tr>
<td>ZERO R6H</td>
<td></td>
</tr>
<tr>
<td>ZERO R7H</td>
<td></td>
</tr>
<tr>
<td>RPT #3</td>
<td>Execute MACF32 N+1 (4) times</td>
</tr>
<tr>
<td>MACF32 R7H, R3H, *XAR6++, *XAR7++</td>
<td></td>
</tr>
<tr>

MACF32 R3H, R2H, RdH, ReH, RfH || MOV32 RaH, mem32
MACF32 R7H, R6H, RdH, ReH, RfH || MOV32 RaH, mem32
MPYF32 RaH, RbH, RcH || ADDF32 RdH, ReH, RfH
MACF32 R7H, R6H, RdH, ReH, RfH  32-bit Floating-Point Multiply with Parallel Add

Operands
This instruction is an alias for the parallel multiply and add instruction. The operands are translated by the assembler such that the instruction becomes:

\[
\begin{align*}
\text{MPYF32} & \quad \text{RdH, RaH, RbH} \\
| | \quad \text{ADDF32} & \quad \text{R7H, R7H, R6H}
\end{align*}
\]

R7H  
floating-point destination and source register for the ADDF32
R6H  
floating-point source register for the ADDF32 operation (R0H to R7H)
RdH  
floating-point destination register for MPYF32 operation (R0H to R7H)
ReH  
floating-point destination register for MPYF32 operation (R0H to R7H)
RfH  
floating-point source register for MPYF32 operation (R0H to R7H)

Restrictions
The destination register for the MPYF32 and the ADDF32 must be unique. That is, RdH cannot be R7H.

Flags
This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 or ADDF32 generates an underflow condition.
- LVF = 1 if MPYF32 or ADDF32 generates an overflow condition.

Pipeline
Both MPYF32 and ADDF32 take 2 pipeline cycles (2p) That is:

\[
\begin{align*}
\text{MPYF32} & \quad \text{RaH, RbH, RcH} \quad ; \text{2 pipeline cycles (2p)} \\
| | \quad \text{ADDF32} & \quad \text{RdH, ReH, RfH} \quad ; \text{2 pipeline cycles (2p)} \\
\text{NOP} & \quad \text{NOP} \quad ; \text{1 cycle delay or non-conflicting instruction} \\
\text{NOP} & \quad \text{NOP} \quad ; \text{-- MPYF32, ADDF32 complete, RaH, RdH updated}
\end{align*}
\]

Any instruction in the delay slot must not use RaH or RdH as a destination register or as a source operand.
Example

; Perform 5 multiply and accumulate operations:
;
; 1st multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2
; 4th multiply: D = X3 * Y3
; 5th multiply: E = X3 * Y3
;
; Result = A + B + C + D + E

</tr>
</tbody>
</table>

Opcode

LSW: 1110 0011 1100 ffef
MSW: eedd daaa mem32

Description

Multiply/accumulate the contents of floating-point registers and move from register to memory. The destination register for the MOV32 cannot be the same as the destination registers for the MACF32.

R7H = R7H + R6H
RdH = ReH * RfH,
RaH = [mem32]

Restrictions

The destination registers for the MACF32 and the MOV32 must be unique. That is, RaH cannot be R7H and RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MACF32 (add or multiply) generates an underflow condition.
- LVF = 1 if MACF32 (add or multiply) generates an overflow condition.

The MOV32 Instruction will set the NF, ZF, NI and ZI flags as follows:

NF = RaH(31);
ZF = 0;
if(RaH(30:23) == 0) {ZF = 1; NF = 0;}
NI = RaH(31);
ZI = 0;
if(RaH(31:0) == 0) ZI = 1;

Pipeline

The MACF32 takes 2 pipeline cycles (2p) and the MOV32 takes a single cycle. That is:

MACF32 R7H, R6H, RdH, ReH, RfH ; 2 pipeline cycles (2p)
|| MOV32 RaH, mem32 ; 1 cycle
| NOP ; <-- MOV32 completes, RaH updated
| NOP ; 1 cycle delay
| NOP ; <-- MACF32 completes, R7H, RdH updated
Example

; Perform 5 multiply and accumulate operations:
;
; 1st multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2
; 4th multiply: D = X3 * Y3
; 5th multiply: E = X3 * Y3
;
; Result = A + B + C + D + E

MOV32 R0H, *XAR4++ ; R0H = X0
MOV32 R1H, *XAR5++ ; R1H = Y0

MPYF32 R6H, R0H, R1H ; In parallel R0H = X1
MV32 R0H, *XAR4++
MV32 R1H, *XAR5++ ; R1H = Y1

MPYF32 R7H, R0H, R1H ; In parallel R0H = X2
MV32 R0H, *XAR4++
MV32 R1H, *XAR5++ ; R1H = Y2

MACF32 R7H, R6H, R0H, R1H ; In parallel R0H = X3
MV32 R0H, *XAR4++
MOV32 R1H, *XAR5++ ; R1H = Y3

MACF32 R7H, R6H, R0H, R1H ; In parallel R0H = X4
MV32 R0H, *XAR4
MOV32 R1H, *XAR5 ; R1H = Y4

MPYF32 R6H, R0H, R1H ; in parallel R7H = (A + B) + C
ADD32 R7H, R7H, R6H ; R7H = (A + B + C) + D
NOP ; Wait for MPYF32 || ADDF32 to complete

ADD32 R7H, R7H, R6H ; R7H = (A + B + C + D) + E
NOP ; Wait for ADDF32 to complete
MOV32 @Result, R7H ; Store the result

MAXF32 RaH, RbH  

**32-bit Floating-Point Maximum**

**Operands**

<table>
<thead>
<tr>
<th>RaH</th>
<th>floating-point source/destination register (R0H to R7H)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RbH</td>
<td>floating-point source register (R0H to R7H)</td>
</tr>
</tbody>
</table>

**Opcode**

LSW: 1110 0110 1001 0110
MSW: 0000 0000 00bb baaa

**Description**

if(RaH < RbH) RaH = RbH

Special cases for the output from the MAXF32 operation:
- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

**Flags**

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

- if(RaH == RbH) {ZF=1, NF=0}
- if(RaH > RbH) {ZF=0, NF=0}
- if(RaH < RbH) {ZF=0, NF=1}

**Pipeline**

This is a single-cycle instruction.

**Example**

MOV1ZF32 R0H, #5.0 ; R0H = 5.0 (0x40A00000)
MOV1ZF32 R1H, #-2.0 ; R1H = -2.0 (0xC0000000)
MOV1ZF32 R2H, #-1.5 ; R2H = -1.5 (0xBF000000)
MAXF32 R2H, R1H ; R2H = -1.5, ZF = NF = 0
MAXF32 R1H, R2H ; R1H = -1.5, ZF = 0, NF = 1
MAXF32 R2H, R0H ; R2H = 5.0, ZF = 0, NF = 1
MAXF32 R0H, R2H ; R2H = 5.0, ZF = 1, NF = 0

MAXF32 RaH, #16FHi
MINF32 RaH, RbH
MINF32 RaH, #16FHi
MAXF32 RaH, #16FHi  32-bit Floating-Point Maximum

Operands

RaH  floating-point source/destination register (R0H to R7H)
#16FHi  A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

Opcode

LSW: 1110 1000 0010 0III
MSW: IIII IIII IIII Iaaa

Description

Compare RaH with the floating-point value represented by the immediate operand. If the immediate value is larger, then load it into RaH.

if(RaH < #16FHi:0) RaH = #16FHi:0

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

Special cases for the output from the MAXF32 operation:
• NaN output will be converted to infinity
• A denormalized output will be converted to positive zero.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

if(RaH == #16FHi:0) {ZF=1, NF=0}
if(RaH > #16FHi:0) {ZF=0, NF=0}
if(RaH < #16FHi:0) {ZF=0, NF=1}

Pipeline

This is a single-cycle instruction.

Example

MOV12F32 R0H, #5.0  ; R0H = 5.0 (0x40A00000)
MOV12F32 R1H, #4.0  ; R1H = 4.0 (0x40800000)
MOV12F32 R2H, #-1.5 ; R2H = -1.5 (0x8FC00000)
MAXF32 R0H, #5.5 ; R0H = 5.5, ZF = 0, NF = 1
MAXF32 R1H, #2.5 ; R1H = 4.0, ZF = 0, NF = 0
MAXF32 R2H, #1.0 ; R2H = -1.0, ZF = 0, NF = 1
MAXF32 R2H, #-1.0 ; R2H = -1.5, ZF = 1, NF = 0

MINF32 RaH, #16FHi
MAXF32 RaH, RbH
\|--MOV32 RcH, RdH

32-bit Floating-Point Maximum with Parallel Move

Operands

<table>
<thead>
<tr>
<th>RaH</th>
<th>floating-point source/destination register for the MAXF32 operation (R0H to R7H)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RbH</td>
<td>floating-point source register for the MAXF32 operation (R0H to R7H)</td>
</tr>
<tr>
<td>RcH</td>
<td>floating-point destination register for the MOV32 operation (R0H to R7H)</td>
</tr>
<tr>
<td>RdH</td>
<td>floating-point source register for the MOV32 operation (R0H to R7H)</td>
</tr>
</tbody>
</table>

Opcode

LSW: 1110 0110 1001 1100
MSW: 0000 dddc cccb baaa

Description

If RaH is less than RbH, then load RaH with RbH. Thus RaH will always have the maximum value. If RaH is less than RbH, then, in parallel, also load RcH with the contents of RdH.

```c
if(RaH < RbH) { RaH = RbH; RcH = RdH; }
```

The MAXF32 instruction is performed as a logical compare operation. This is possible because of the IEEE floating-point format offsets the exponent. Basically the bigger the binary number, the bigger the floating-point value.

Special cases for the output from the MAXF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

Restrictions

The destination register for the MAXF32 and the MOV32 must be unique. That is, RaH cannot be the same register as RcH.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```c
if(RaH == RbH) { ZF=1, NF=0; }
if(RaH > RbH) { ZF=0, NF=0; }
if(RaH < RbH) { ZF=0, NF=1; }
```

Pipeline

This is a single-cycle instruction.

Example

```c
MOVIZF32  R0H, #5.0 ; R0H = 5.0 (0x40A00000)
MOVIZF32  R1H, #4.0 ; R1H = 4.0 (0x40800000)
MOVIZF32  R2H, #1.5 ; R2H = -1.5 (0xBFCD0000)
MOVIZF32  R3H, #2.0 ; R3H = -2.0 (0xC0000000)
MAXF32    R0H, R1H ; R0H = 5.0, R3H = -1.5, ZF = 0, NF = 0
|| MOV32    R3H, R2H
|| MAXF32    R1H, R0H ; R1H = 5.0, R3H = -1.5, ZF = 0, NF = 1
|| MOV32    R3H, R2H
|| MAXF32    R0H, R1H ; R0H = 5.0, R2H = -1.5, ZF = 1, NF = 0
|| MOV32    R2H, R1H
```

| LSW:   | 1110 1000 0011 0III          |
| MSW:   | IIII IIII IIII Iaaa          |

Description

Compare RaH with the floating-point value represented by the immediate operand. If the immediate value is smaller, then load it into RaH.

\[
\text{if}(RaH > \#16FHi:0) \quad RaH = \#16FHi:0
\]

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

Special cases for the output from the MINF32 operation:
- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

if(RaH == #16FHi:0) \{ZF=1, NF=0\}  
if(RaH > #16FHi:0) \{ZF=0, NF=0\}  
if(RaH < #16FHi:0) \{ZF=0, NF=1\}

Pipeline

This is a single-cycle instruction.

Example

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
<th>Immediate Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOV1ZF32</td>
<td>R0H, #5.0</td>
<td>R0H = 5.0 (0x40A00000)</td>
</tr>
<tr>
<td>MOV1ZF32</td>
<td>R1H, #4.0</td>
<td>R1H = 4.0 (0x40800000)</td>
</tr>
<tr>
<td>MOV1ZF32</td>
<td>R2H, #1.5</td>
<td>R2H = -1.5 (0x8F800000)</td>
</tr>
<tr>
<td>MINF32</td>
<td>R0H, #5.5</td>
<td>R0H = 5.0, ZF = 0, NF = 1</td>
</tr>
<tr>
<td>MINF32</td>
<td>R1H, #2.5</td>
<td>R1H = 2.5, ZF = 0, NF = 0</td>
</tr>
<tr>
<td>MINF32</td>
<td>R2H, #1.0</td>
<td>R2H = -1.5, ZF = 0, NF = 1</td>
</tr>
<tr>
<td>MINF32</td>
<td>R2H, #1.5</td>
<td>R2H = -1.5, ZF = 1, NF = 0</td>
</tr>
</tbody>
</table>

32-bit Floating-Point Minimum with Parallel Move

Operands

<table>
<thead>
<tr>
<th>RaH</th>
<th>floating-point source/destination register for the MIN32 operation (R0H to R7H)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RaH cannot be the same register as RbH</td>
</tr>
<tr>
<td>RbH</td>
<td>floating-point source register for the MIN32 operation (R0H to R7H)</td>
</tr>
<tr>
<td>RcH</td>
<td>floating-point destination register for the MOV32 operation (R0H to R7H)</td>
</tr>
<tr>
<td></td>
<td>RcH cannot be the same register as RaH</td>
</tr>
<tr>
<td>RdH</td>
<td>floating-point source register for the MOV32 operation (R0H to R7H)</td>
</tr>
</tbody>
</table>

Opcode

<table>
<thead>
<tr>
<th>LSW: 1110 0110 1001 1101</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSW: 0000 dddc ccbb baaa</td>
</tr>
</tbody>
</table>

Description

if(RaH > RbH) { RaH = RbH; RcH = RdH; }

Special cases for the output from the MINF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

Restrictions

The destination register for the MINF32 and the MOV32 must be unique. That is, RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

if(RaH == RbH) {ZF=1, NF=0}
if(RaH > RbH) {ZF=0, NF=0}
if(RaH < RbH) {ZF=0, NF=1}

Pipeline

This is a single-cycle instruction.

Example

| MOVIZF32 | R0H, #5.0 | ; R0H = 5.0 (0x40A00000) |
| MOVIZF32 | R1H, #4.0 | ; R1H = 4.0 (0x40800000) |
| MOVIZF32 | R2H, #1.5 | ; R2H = -1.5 (0xBF000000) |
| MOVIZF32 | R3H, #2.0 | ; R3H = -2.0 (0xC0000000) |
| MINF32    | R0H, R1H  | ; R0H = 4.0, R3H = -1.5, ZF = 0, NF = 0 |
|           | MINF32    | R1H, R0H | ; R1H = 4.0, R3H = -1.5, ZF = 1, NF = 0 |
| MOV32     | R3H, R2H  | ; R2H = 4.0, R1H = -1.5, ZF = 0, NF = 1 |
|           | MINF32    | R2H, R1H | ; R1H = 4.0, R3H = -1.5, ZF = 1, NF = 1 |
| MOV32     | R1H, R3H  | ; R1H = 4.0, R3H = -1.5, ZF = 0, NF = 0 |

MOV32 *(0:16bitAddr), loc32  Move the Contents of loc32 to Memory

Operands

<table>
<thead>
<tr>
<th>Operand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:16bitAddr</td>
<td>16-bit immediate address, zero extended</td>
</tr>
<tr>
<td>loc32</td>
<td>32 bit source location</td>
</tr>
</tbody>
</table>

Opcode

LSW: 1011 1101  loc32
MSW: IIII IIII IIII IIII

Description

Move the 32-bit value in loc32 to the memory location addressed by 0:16bitAddr. The EALLOW bit in the ST1 register is ignored by this operation.

\[0:16bitAddr] = \{loc32\]

Flags

This instruction does not modify any STF register flags.

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline

This is a two-cycle instruction.

Example

MOVIZ  R5H, #0x1234 ; R5H[31:16] = 0x1234
MOVXI  R5H, #0xABCD ; R5H[15:0] = 0xABCD
NOP    ; 1 Alignment Cycle
MOV32  ACC, R5H ; ACC = 0x1234ABCD
MOV32  *(0xA000), @ACC ; [0x00A000] = ACC
NOP    ; 1 Cycle delay for MOV32 to complete
; <-- MOV32 *(0:16bitAddr), loc32 complete,
; [0x00A000] = 0xABCD, [0x00A001] = 0x1234

See also

MOV32 mem32, RaH
MOV32 mem32, STF

MOV32 ACC, RaH

Move 32-bit Floating-Point Register Contents to ACC

Operands

<table>
<thead>
<tr>
<th>Operand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACC</td>
<td>28x accumulator</td>
</tr>
<tr>
<td>RaH</td>
<td>floating-point source register (R0H to R7H)</td>
</tr>
</tbody>
</table>

Opcode

<table>
<thead>
<tr>
<th>LSW</th>
<th>MSW</th>
</tr>
</thead>
<tbody>
<tr>
<td>1011 1111</td>
<td>loc32</td>
</tr>
<tr>
<td>IIII IIII IIII IIII</td>
<td></td>
</tr>
</tbody>
</table>

Description

If the condition is true, then move the 32-bit value referenced by mem32 to the floating-point register indicated by RaH.

ACC = RaH

Flags

No STF flags are affected.

Pipeline

While this is a single-cycle instruction, additional pipeline alignment is required when copying a floating-point register to a C28x register. If the move follows a single cycle floating point instruction, a single alignment cycle must be added. For example:

```
MINF32 R0H,R1H<br/>NOP<br/>MOV32 @ACC,R0H<br/>NOP<br/>
```

If the move follows a 2 pipeline-cycle floating point instruction, then two alignment cycles must be used. For example:

```
ADDF32 R2H, R1H, R0H<br/>NOP<br/>NOP<br/>MOV32 ACC, R2H<br/>NOP<br/>
```

Example

```
MOV12F32 R0H, #2.5<br/>F32TOUI32 R0H, R0H<br/>NOP<br/>NOP<br/>MOV32 P, R0H<br/>
```

Operands

<table>
<thead>
<tr>
<th>Operand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>loc32</td>
<td>destination location</td>
</tr>
<tr>
<td>0:16bitAddr</td>
<td>16-bit address of the 32-bit source value</td>
</tr>
</tbody>
</table>

Opcode

<table>
<thead>
<tr>
<th>LSW:</th>
<th>MSW:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1011</td>
<td>loc32</td>
</tr>
<tr>
<td>1111</td>
<td></td>
</tr>
<tr>
<td></td>
<td>IIII</td>
</tr>
<tr>
<td></td>
<td>IIII</td>
</tr>
</tbody>
</table>

Description

Copy the 32-bit value referenced by 0:16bitAddr to the location indicated by loc32.

\[
[\text{loc32}] = [0:16\text{bitAddr}]
\]

Flags

No STF flags are affected. If loc32 is the ACC register, then the Z and N flag in status register zero (ST0) of the 28x CPU are affected.

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline

This is a 2 cycle instruction.

Example

```assembly
MOVW DP, #0x0300 ; DP = 0x0300
MOV @0, #0xFFFF ; [0x00C000] = 0xFFFF
MOV @1, #0x1111 ; [0x00C001] = 0x1111;
MOV32 @ACC, *(0xC000) ; AL = [0x00C000], AH = [0x00C001]
NOP ; 1 Cycle delay for MOV32 to complete

; --- MOV32 complete, AL = 0xFFFF, AH = 0x1111
```

<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline

While this is a single-cycle instruction, additional pipeline alignment is required when copying a floating-point register to a C28x register. If the move follows a single cycle floating point instruction, a single alignment cycle must be added. For example:

- MINF32 R0H,R1H  ; Single-cycle instruction
- NOP  ; 1 alignment cycle
- MOV32 @ACC,R0H  ; Copy R0H to ACC
- NOP  ; Any instruction

If the move follows a 2 pipeline-cycle floating point instruction, then two alignment cycles must be used. For example:

- ADDF32 R2H, R1H, R0H  ; 2 pipeline instruction (2p)
- NOP  ; 1 cycle delay for ADDF32 to complete
- NOP  ; 1 alignment cycle
- MOV32 ACC, R2H  ; copy R2H into ACC, takes 1 cycle
- NOP  ; Any instruction

Example

- MOVIZF32 R0H, #2.5  ; R0H = 2.5 = 0x40200000
- F32TOUT32 R0H, R0H  ; Delay for conversion instruction
- NOP  ; Conversion complete, R0H valid
- NOP  ; Alignment cycle
- MOV32 P, R0H  ; P = 2 = 0x00000002

See also

- MOV32 ACC, RaH
- MOV32 XARn, RaH
- MOV32 XT, RaH
MOV32 RaH, ACC  

**Move the Contents of ACC to a 32-bit Floating-Point Register**

**Operands**

| RaH      | floating-point destination register (R0H to R7H) |
| ACC      | accumulator                                       |

**Opcode**

| LSW: 1011 1101 | loc32 |
| MSW: IIII IIII | IIII IIII |

**Description**

Move the 32-bit value in ACC to the floating-point register RaH.  
RaH = ACC

**Flags**

This instruction does not modify any STF register flags.

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Pipeline**

While this is a single-cycle instruction, additional pipeline alignment is required. Four alignment cycles are required after any copy from a standard 28x CPU register to a floating-point register. The four alignment cycles can be filled with any non-conflicting instructions except for the following: FRACF32, UI16TOF32, I16TOF32, F32TOUI32, and F32TOI32.

MOV32 R0H, @ACC ; Copy ACC to ROH  
NOP ; Wait 4 cycles  
NOP ; Do not use FRACF32, UI16TOF32  
NOP ; I16TOF32, F32TOUI32 or F32TOI32  
NOP ;  

Example

MOV AH, #0x0000  
MOV AL, #0x0200 ; ACC = 512  
MOV32 R0H, ACC  
NOP  
NOP  
UI32TOF32 R0H, ROH ; ROH = 512.0 (0x44000000)

</tbody>
</table>

if(CNDF == UNCF)
{
    NF = RaH[31];  
    ZF = 0;  
    if(RaH[30:23] == 0) { ZF = 1; NF = 0; }  
    NI = RaH[31];  
    ZI = 0;  
    if(RaH[31:0] == 0) ZI = 1;  
}  
else No flags modified;

Pipeline

This is a single-cycle instruction.
Example

```
MOVW DP, #0x0300 ; DP = 0x0300
MOV @0, #0x5555 ; [0x00C000] = 0x5555
MOV @1, #0x5555 ; [0x00C001] = 0x5555
MOVIZF32 R3H, #7.0 ; R3H = 7.0 (0x40E00000)
MOVIZF32 R4H, #7.0 ; R4H = 7.0 (0x40E00000)
MAXF32 R3H, R4H ; ZF = 1, NF = 0
MOV32 R1H, @0, EQ ; R1H = 0x55555555
```

See also

```
MOV32 RaH, RbH{, CNDF}
MOVD32 RaH, mem32
```
MOV32 RaH, P

Move the Contents of P to a 32-bit Floating-Point Register

Operands

<table>
<thead>
<tr>
<th>RaH</th>
<th>floating-point register (R0H to R7H)</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>product register</td>
</tr>
</tbody>
</table>

Opcode

<table>
<thead>
<tr>
<th>LSW: 1011 1101 loc32</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSW: IIII IIII IIII IIII</td>
</tr>
</tbody>
</table>

Description

Move the 32-bit value in the product register, P, to the floating-point register RaH.

RaH = P

Flags

This instruction does not modify any STF register flags.

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline

While this is a single-cycle instruction, additional pipeline alignment is required. Four alignment cycles are required after any copy from a standard 28x CPU register to a floating-point register. The four alignment cycles can be filled with any non-conflicting instructions except for the following: FRACF32, UI16TOF32, I16TOF32, F32TOUI32, and F32TOI32.

Example

```assembly
MOV32 R0H,@P        ; Copy P to R0H
NOP                  ; Wait 4 alignment cycles
NOP                  ; Do not use FRACF32, UI16TOF32
NOP                  ; I16TOF32, F32TOUI32 or F32TOI32
NOP                  ; <-- R0H is valid
                     ; Instruction can use R0H as a source
MOV PH, #0x0000      ; P = 512
MOV PL, #0x0200      ; P = 512
MOV32 R0H, P
NOP
NOP
NOP
NOP
UI32TOF32 R0H, R0H   ; R0H = 512.0 (0x44000000)
```

MOV32 RaH, RbH {, CNDF}  Conditional 32-bit Move

Operands

RaH       floating-point destination register (R0H to R7H)
RbH       floating-point source register (R0H to R7H)
CNDF      optional condition.

Opcode

LSW: 1110 0110 1100 0000
MSW: 0000 0000 00bb baaa

Description

If the condition is true, then move the 32-bit value referenced by mem32 to the floating-point register indicated by RaH.

if (CNDF == TRUE) RaH = RbH

CNDF is one of the following conditions:

<table>
<thead>
<tr>
<th>Encode (1)</th>
<th>CNDF</th>
<th>Description</th>
<th>STF Flags Tested</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>NEQ</td>
<td>Not equal to zero</td>
<td>ZF == 0</td>
</tr>
<tr>
<td>0001</td>
<td>EQ</td>
<td>Equal to zero</td>
<td>ZF == 1</td>
</tr>
<tr>
<td>0010</td>
<td>GT</td>
<td>Greater than zero</td>
<td>ZF == 0 AND NF == 0</td>
</tr>
<tr>
<td>0011</td>
<td>GEQ</td>
<td>Greater than or equal to zero</td>

</tr>
<tr>
<td>1111</td>
<td>UNCF</td>
<td>Unconditional with flag modification</td>
<td>None</td>
</tr>
</tbody>
</table>

(1) Values not shown are reserved.
(2) This is the default operation if no CNDF field is specified. This condition will allow the ZF, NF, ZI, and NI flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

if(CNDF == UNCF)
{
    NF = RaH[31]; ZF = 0;
    if(RaH[30:23] == 0) {ZF = 1; NF = 0;}
    NI = RaH[31]; ZI = 0;
    if(RaH[31:0] == 0) ZI = 1;
} else No flags modified;

Pipeline

This is a single-cycle instruction.

Example

MOVIZF32 R3H, #8.0 ; R3H = 8.0 (0x41000000)
MOVIZF32 R4H, #7.0 ; R4H = 7.0 (0x40E00000)
MAXF32 R3H, R4H ; ZF = 0, NF = 0
MOV32 R1H, R3H, GT ; R1H = 8.0 (0x41000000)

MOV32 STF, mem32  Move 32-bit Value from Memory to the STF Register

Operands

<table>
<thead>
<tr>
<th>Operand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STF</td>
<td>floating-point unit status register</td>
</tr>
<tr>
<td>mem32</td>
<td>pointer to the 32-bit source memory location</td>
</tr>
</tbody>
</table>

Opcode

<table>
<thead>
<tr>
<th>LSW</th>
<th>MSW</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110 0010 1000 0000</td>
<td>0000 0000 mem32</td>
</tr>
</tbody>
</table>

Description

Move from memory to the floating-point unit’s status register STF.

STF = [mem32]

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Restoring status register will overwrite all flags.

Pipeline

This is a single-cycle instruction.

Example 1

```
MOVN DP, #0x0300 ; DP = 0x0300
MOV @2, #0x020C ; [0x000C002] = 0x020C
MOV @3, #0x0000 ; [0x000C003] = 0x0000
MOV32 STF, @2 ; STF = 0x0000020C
```

Example 2

```
MOV32 *SP++, STF ; Store STF in stack
MOVF32 R2H, #3.0 ; R2H = 3.0 (0x40400000)
MOVF32 R3H, #5.0 ; R3H = 5.0 (0x40A00000)
CMPF32 R2H, R3H ; ZF = 0, NF = 1, STF = 0x00000004
MOV32 R3H, R2H, LT ; R3H = 3.0 (0x40400000)
MOV32 STF, *--SP ; Restore STF from stack
```

MOV32 mem32, STF
MOVST0 FLAG
**MOV32 XARn, RaH**  
*Move 32-bit Floating-Point Register Contents to XARn*

**Operands**

<table>
<thead>
<tr>
<th>XARn</th>
<th>28x auxiliary register (XAR0 - XAR7)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RaH</td>
<td>floating-point source register (R0H to R7H)</td>
</tr>
</tbody>
</table>

**Opcode**

LSW: 1011 1111  loc32  
MSW: IIII IIII IIII IIII

**Description**

Move the 32-bit value from the floating-point register RaH to the auxiliary register XARn.

XARn = RaH

**Flags**

No flags affected in floating-point unit.

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Pipeline**

While this is a single-cycle instruction, additional pipeline alignment is required when copying a floating-point register to a C28x register. If the move follows a single cycle floating point instruction, a single alignment cycle must be added. For example:

```
MINF32 R0H,R1H ; Single-cycle instruction
NOP ; 1 alignment cycle
MOV32 @ACC,R0H ; Copy R0H to ACC
NOP ; Any instruction
```

If the move follows a 2 pipeline-cycle floating point instruction, then two alignment cycles must be used. For example:

```
ADDF32 R2H, R1H, R0H ; 2 pipeline instruction (2p)
NOP ; 1 cycle delay for ADDF32 to complete
NOP ; 1 alignment cycle
MOV32 ACC, R2H ; copy R2H into ACC, takes 1 cycle
NOP ; Any instruction
```

**Example**

```
MOVIZF32 R0H, #2.5 ; R0H = 2.5 = 0x40200000
F32OUT32 R0H, R0H
NOP ; Delay for conversion instruction
NOP ; <--- Conversion complete, R0H valid
NOP ; Alignment cycle
MOV32 XAR0, R0H ; XAR0 = 2 = 0x00000002
```

MOV32 XT, RaH

Move 32-bit Floating-Point Register Contents to XT

Operands

<table>
<thead>
<tr>
<th>XT</th>
<th>temporary register</th>
</tr>
</thead>
<tbody>
<tr>
<td>RaH</td>
<td>floating-point source register (R0H to R7H)</td>
</tr>
</tbody>
</table>

Opcode

LSW: 1011 1111  loc32
MSW: IIII IIII IIII IIII

Description

Move the 32-bit value in RaH to the temporary register XT.

XT = RaH

Flags

No flags affected in floating-point unit.

Pipeline

While this is a single-cycle instruction, additional pipeline alignment is required when copying a floating-point register to a C28x register. If the move follows a single cycle floating point instruction, a single alignment cycle must be added. For example:

```
MINF32 R0H,R1H ; Single-cycle instruction
NOP ; 1 alignment cycle
MOV32 @XT,R0H ; Copy R0H to ACC
NOP ; Any instruction
```

If the move follows a 2 pipeline-cycle floating point instruction, then two alignment cycles must be used. For example:

```
ADDF32 R2H, R1H, R0H ; 2 pipeline instruction (2p)
NOP ; 1 cycle delay for ADDF32 to complete
NOP ; <-- ADDF32 completes, R2H is valid
NOP ; 1 alignment cycle
MOV32 XT, R2H ; copy R2H into ACC, takes 1 cycle
NOP ; <-- MOV32 completes, ACC is valid
NOP ; Any instruction
```

Example

```
MOVIZF32 R0H, $2.5 ; R0H = 2.5 = 0x40200000
F32TOUT32 R0H, R0H
NOP ; Delay for conversion instruction
NOP ; <-- Conversion complete, R0H valid
NOP ; Alignment cycle
MOV32 XT, R0H ; XT = 2 = 0x00000002
```

</thead>
<tbody>
<tr>
<td>mem32</td>
<td>pointer to the 32-bit source memory location</td>
</tr>
</tbody>
</table>

Opcode

LSW: 1110 0010 0010 0011
MSW: 0000 0aaa mem32

Description

Move the 32-bit value referenced by mem32 to the floating-point register indicated by RaH.

RaH = [mem32]
[mem32+2] = [mem32]

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

NF = RaH[31];
ZF = 0;
if(RaH[30:23] == 0){ ZF = 1; NF = 0; }
NI = RaH[31];
ZI = 0;
if(RaH[31:0] == 0) ZI = 1;

Pipeline

This is a single-cycle instruction.

Example

MOVW DP, #0x02C0 ; DP = 0x02C0
MOV @2, #0x0000 ; [0x00B002] = 0x0000
MOV @3, #0x4110 ; [0x00B003] = 0x4110
MOVD32 R7H, @2 ; R7H = 0x41100000,
                ; [0x00B004] = 0x0000, [0x00B005] = 0x4110

See also

MOV32 RaH, mem32 {,CNDF}
MOVF32 RaH, #32F  Load the 32-bits of a 32-bit Floating-Point Register

Operands
This instruction is an alias for MOVIZ and MOVXI instructions. The second operand is translated by the assembler such that the instruction becomes:

```
MOVIZ RaH, #16FHiHex
MOVXI RaH, #16FLoHex
```

RaH    floating-point destination register (R0H to R7H)
#32F   immediate float value represented in floating-point representation

Opcode

```
LSW: 1110 1000 0000 0III (opcode of MOVIZ RaH, #16FHiHex)
MSW: IIII IIII IIII Iaaa
```

```
LSW: 1110 1000 0000 1III (opcode of MOVXI RaH, #16FLoHex)
MSW: IIII IIII IIII Iaaa
```

Description
Note: This instruction accepts the immediate operand only in floating-point representation. To specify the immediate value as a hex value (IEEE 32-bit floating-point format) use the MOVIZ32 RaH, #32FHex instruction.

Load the 32-bits of RaH with the immediate float value represented by #32F.

#32F is a float value represented in floating-point representation. The assembler will only accept a float value represented in floating-point representation. That is, 3.0 can only be represented as #3.0. #0x40400000 will result in an error.

RaH = #32F

Flags
This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline
Depending on #32FH, this instruction takes one or two cycles. If all of the lower 16-bits of the IEEE 32-bit floating-point format of #32F are zeros, then the assembler will convert MOVF32 into only MOVIZ instruction. If the lower 16-bits of the IEEE 32-bit floating-point format of #32F are not zeros, then the assembler will convert MOVF32 into MOVIZ and MOVXI instructions.

Example

```
MOVF32 R1H, #3.0  ; R1H = 3.0 (0x40400000)
 ; Assembler converts this instruction as
 ; MOVIZ R1H, #0x4040
MOVF32 R2H, #0.0  ; R2H = 0.0 (0x00000000)
 ; Assembler converts this instruction as
 ; MOVIZ R2H, #0x0
MOVF32 R3H, #12.265 ; R3H = 12.625 (0x41443D71)
 ; Assembler converts this instruction as
 ; MOVIZ R3H, #0x4144
            ; MOVXI R3H, #0x3D71
```

MOVI32 RaH, #32FHex
MOVIZF32 RaH, #16FHi
MOVI32 RaH, #32FHex  Load the 32-bits of a 32-bit Floating-Point Register with the immediate

Operands
This instruction is an alias for MOVIZ and MOVXI instructions. The second operand is translated by the assembler such that the instruction becomes:

MOVIZ RaH, #16FHiHex
MOVXI RaH, #16FLoHex

RaH  floating-point register (R0H to R7H)
#32FHex  A 32-bit immediate value that represents an IEEE 32-bit floating-point value.

Opcode
LSW: 1110 1000 0000 0III (opcode of MOVIZ RaH, #16FHiHex)
MSW: IIII IIII IIII Iaaa

LSW: 1110 1000 0000 1III (opcode of MOVXI RaH, #16FLoHex)
MSW: IIII IIII IIII Iaaa

Description
Note: This instruction only accepts a hex value as the immediate operand. To specify the immediate value with a floating-point representation use the MOVF32 RaH, #32F instruction.

Load the 32-bits of RaH with the immediate 32-bit hex value represented by #32Fhex.

#32Fhex is a 32-bit immediate hex value that represents the IEEE 32-bit floating-point value of a floating-point number. The assembler will only accept a hex immediate value. That is, 3.0 can only be represented as #0x40400000. #3.0 will result in an error.

RaH = #32FHex

Flags
This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline
Depending on #32FHex, this instruction takes one or two cycles. If all of the lower 16-bits of #32FHex are zeros, then assembler will convert MOVI32 to the MOVIZ instruction. If the lower 16-bits of #32FHex are not zeros, then assembler will convert MOVI32 to a MOVIZ and a MOVXI instruction.

Example

```c
MOVI32  R1H, #0x40400000  ; R1H = 0x40400000
        ; Assembler converts this instruction as
        ; MOVIZ R1H, #0x4040
MOVI32  R2H, #0x00000000  ; R2H = 0x00000000
        ; Assembler converts this instruction as
        ; MOVIZ R2H, #0x0
MOVI32  R3H, #0x40004001  ; R3H = 0x40004001
        ; Assembler converts this instruction as
        ; MOVIZ R3H, #0x4000
        ; MOVXI R3H, #0x0001
MOVI32  R4H, #0x00004040  ; R4H = 0x00004040
        ; Assembler converts this instruction as
        ; MOVIZ R4H, #0x0000
        ; MOVXI R4H, #0x0040
```

<tr>
<td>11101000</td>
<td>00000000</td>
</tr>
</tbody>
</table>

Description

Note: This instruction only accepts a hex value as the immediate operand. To specify the immediate value with a floating-point representation use the MOVIZF32 pseudo instruction.

Load the upper 16-bits of RaH with the immediate value #16FHiHex and clear the low 16-bits of RaH.

#16FHiHex is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. The assembler will only accept a hex immediate value. That is, -1.5 can only be represented as #0xBFC0. #-1.5 will result in an error.

By itself, MOVIZ is useful for loading a floating-point register with a constant in which the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). If a constant requires all 32-bits of a floating-point register to be initialized, then use MOVIZ along with the MOVXI instruction.

RaH[31:16] = #16FHiHex
RaH[15:0] = 0

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline

This is a single-cycle instruction.

Example

; Load R0H with -1.5 (0xBFC00000)
   MOVIZ R0H, #0xBFC0
   ; R0H = 0xBFC00000

; Load R0H with pi = 3.141593 (0x40490FDB)
   MOVIZ R0H, #0x4049
   ; R0H = 0x40490000
   MOVXI R0H, #0x0FDB
   ; R0H = 0x40490FDB

</tr>
</tbody>
</table>

Description

Load the upper 16-bits of RaH with the value represented by #16FHi and clear the low 16-bits of RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). #16FHi can be specified in hex or float. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

MOVIZF32 is an alias for the MOVIZ RaH, #16FHiHex instruction. In the case of MOVIZF32 the assembler will accept either a hex or float as the immediate value and encodes it into a MOVIZ instruction. For example, MOVIZF32 RaH, #-1.5 will be encoded as MOVIZ RaH, 0xBFC0.

RaH[31:16] = #16FHi
RaH[15:0] = 0

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline

This is a single-cycle instruction.

Example

MOVIZF32 R0H, #3.0 ; R0H = 3.0 = 0x40400000
MOVIZF32 R1H, #1.0 ; R1H = 1.0 = 0x3F800000
MOVIZF32 R2H, #2.5 ; R2H = 2.5 = 0x40200000
MOVIZF32 R3H, #5.5 ; R3H = -5.5 = 0xC0B00000
MOVIZF32 R4H, #0xC0B0 ; R4H = -5.5 = 0xC0B00000

; Load R5H with pi = 3.141593 (0x40490000)
MOVIZF32 R5H, #3.141593 ; R5H = 3.140625 (0x40490000)

; Load R0H with a more accurate pi = 3.141593 (0x40490FDB)
MOVIZF32 R0H, #0x40490FDB ; R0H = 0x40490000
MOVXI R0H, #0x0FDB ; R0H = 0x40490FDB

MOVST0 FLAG

Load Selected STF Flags into ST0

Operands

<table>
<thead>
<tr>
<th>Flag</th>
<th>Selected flag</th>
</tr>
</thead>
</table>

Opcode

LSW: 1010 1101  FFFF FFFF

Description

Load selected flags from the STF register into the ST0 register of the 28x CPU where FLAG is one or more of TF, CI, ZI, ZF, NI, NF, LUF or LVF. The specified flag maps to the ST0 register as follows:

- Set OV = 1 if LVF or LUF is set. Otherwise clear OV.
- Set N = 1 if NF or NI is set. Otherwise clear N.
- Set Z = 1 if ZF or ZI is set. Otherwise clear Z.
- Set C = 1 if TF is set. Otherwise clear C.
- Set TC = 1 if TF is set. Otherwise clear TF.

If any STF flag is not specified, then the corresponding ST0 register bit is not modified.

Restrictions

Do not use the MOVST0 instruction in the delay slots for pipelined operations. Doing so can yield invalid results. To avoid this, the proper number of NOPs or non-pipelined instructions must be inserted before the MOVST0 operation.

Example

Program flow is controlled by 28x instructions that read status flags in the status register 0 (ST0). If a decision needs to be made based on a floating-point operation, the information in the STF register needs to be loaded into ST0 flags (Z,N,OV,TC,C) so that the appropriate branch conditional instruction can be executed. The MOVST0 FLAG instruction is used to load the current value of specified STF flags into the respective bits of ST0. When this instruction executes, it will also clear the latched overflow and underflow flags if those flags are specified.

Loop:

```
MOV32 R0H,*XAR4++
MOV32 R1H,*XAR3++
CMPPF32 R1H, R0H
MOVST0 ZF, NF
BF Loop, GT ; Loop if (R1H > R0H)
```

**MOVXI RaH, #16FLoHex  Move Immediate to the Low 16-bits of a Floating-Point Register**

Operands

<table>
<thead>
<tr>
<th>Ra</th>
<th>floating-point register (R0H to R7H)</th>
</tr>
</thead>
<tbody>
<tr>
<td>#16FLoHex</td>
<td>A 16-bit immediate hex value that represents the lower 16-bits of an IEEE 32-bit floating-point value. The upper 16-bits will not be modified.</td>
</tr>
</tbody>
</table>

Opcode

<table>
<thead>
<tr>
<th>LSW: 1110 1000 0000 1111</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSW: IIII IIII IIII Iaaa</td>
</tr>
</tbody>
</table>

Description

Load the low 16-bits of RaH with the immediate value #16FLoHex. #16FLoHex represents the lower 16-bits of an IEEE 32-bit floating-point value. The upper 16-bits of RaH will not be modified. MOVXI can be combined with the MOVIZ or MOVIZF32 instruction to initialize all 32-bits of a RaH register.

RaH[15:0] = #16FLoHex  
RaH[31:16] = Unchanged

Flags

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>

Operands

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>RaH</td>
<td>floating-point destination register (R0H to R7H)</td>
</tr>
<tr>
<td>RbH</td>
<td>floating-point source register (R0H to R7H)</td>
</tr>
<tr>
<td>RcH</td>
<td>floating-point source register (R0H to R7H)</td>
</tr>
</tbody>
</table>

Opcode

| LSW: | 1110 0111 0000 0000 |
| MSW: | 0000 000c ccbb baaa |

Description

Multiply the contents of two floating-point registers.
RaH = RbH * RcH

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
MPYF32  RaH, RbH, RcH ; 2 pipeline cycles (2p)
NOP     ; 1 cycle delay or non-conflicting instruction
        ;     -- MPYF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example

Calculate Y = A * B:

```
MOVL   XAR4, #A
MOV32  R0H, *XAR4 ; Load R0H with A
MOV32  R1H, *XAR4 ; Load R1H with B
MPYF32 R0H, R1H, R0H ; Multiply A * B
MOVL   XAR4, #Y
        ;  --MPYF32 complete
MOVL   XAR4, R0H ; <---MPYF32 complete
MOV32  *XAR4, R0H ; Save the result
```

MPYF32 RaH, #16FHi, RbH  32-bit Floating-Point Multiply

Operands

| RaH  | floating-point destination register (R0H to R7H) |
| #16FHi | A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. |
| RcH  | floating-point source register (R0H to R7H) |

Opcode

LSW: 1110 1000 01II IIII
MSW: IIII IIII IIbb baaa

Description

Multiply RbH with the floating-point value represented by the immediate operand. Store the result of the addition in RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

RaH = RbH * #16FHi:0

This instruction can also be written as MPYF32 RaH, RbH, #16FHi.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

MPYF32 RaH, #16FHi, RbH ; 2 pipeline cycles (2p)
NOP ; 1 cycle delay or non-conflicting instruction
    ; <-- MPYF32 complete, R4H = 6.0 (0x40C00000)
NOP

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example 1

MOVIZF32 R3H, #2.0 ; R3H = 2.0 (0x40000000)
MPYF32 R4H, #3.0, R3H ; R4H = 3.0 * R3H
MOVL XAR1, #0xB006 ; <-- Non conflicting instruction
    ; <-- MPYF32 complete, R4H = 6.0 (0x40C00000)
MOV32 *XAR1, R4H ; Save the result in memory location 0xB006

Example 2

; Same as above example but #16FHi is represented in Hex
MOVIZF32 R3H, #2.0 ; R3H = 2.0 (0x40000000)
MPYF32 R4H, #0x4040, R3H ; R4H = 0x4040 * R3H
    ; 3.0 is represented as 0x40400000 in 
    ; IEEE 754 32-bit format
    ; <-- Non conflicting instruction
MOVL XAR1, #0xB006
    ; <-- MPYF32 complete, R4H = 6.0 (0x40C00000)
MOV32 *XAR1, R4H ; Save the result in memory location 0xB006

</table>

Opcode

LSW: 1110 1000 0111 IIII
MSW: IIII IIII IIbb baaa

Description

Multiply RbH with the floating-point value represented by the immediate operand. Store the result of the addition in RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

RaH = RbH * #16FHi:0

This instruction can also be written as MPYF32 RaH, #16FHi, RbH.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

MPYF32 RaH, RbH, #16FHi ; 2 pipeline cycles (2p)
NOP ; 1 cycle delay or non-conflicting instruction
; <- MPYF32 completes, RaH updated

NOP

Any instruction in the delay slot must not use RaH as a destination register or use RaH as a source operand.

Example 1

MOVIZF32 R3H, #2.0 ; R3H = 2.0 (0x40000000)
MPYF32 R4H, R3H, #3.0 ; R4H = R3H * 3.0
MOVL XAR1, #0xB008 ; <- Non conflicting instruction
; <- MPYF32 complete, R4H = 6.0 (0x40C00000)
MOV32 *XAR1, R4H ; Save the result in memory location 0xB008

Example 2

; Same as above example but #16FHi is represented in Hex
MOVIZF32 R3H, #2.0 ; R3H = 2.0 (0x40000000)
MPYF32 R4H, R3H, #0x4040 ; R4H = R3H * 0x4040
; 3.0 is represented as 0x40400000 in
; IEEE 754 32-bit format
MOVL XAR1, #0xB008 ; <- Non conflicting instruction
; <- MPYF32 complete, R4H = 6.0 (0x40C00000)
MOV32 *XAR1, R4H ; Save the result in memory location 0xB008

</tr>
</tbody>
</table>

Opcode

LSW: 1110 0111 0100 00ff
MSW: feee dddd ccbb baaa

Description

Multiply the contents of two floating-point registers with parallel addition of two registers.

RaH = RbH * RcH
RdH = ReH + RfH

This instruction can also be written as:

MACF32 RaH, RbH, RcH, RdH, ReH, RfH

Restrictions

The destination register for the MPYF32 and the ADDF32 must be unique. That is, RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 or ADDF32 generates an underflow condition.
- LVF = 1 if MPYF32 or ADDF32 generates an overflow condition.

Pipeline

Both MPYF32 and ADDF32 take 2 pipeline cycles (2p) That is:

MPYF32 RaH, RbH, RcH ; 2 pipeline cycles (2p)
|| ADDF32 RdH, ReH, RfH ; 2 pipeline cycles (2p)
NOP ; 1 cycle delay or non-conflicting instruction

Any instruction in the delay slot must not use RaH or RdH as a destination register or as a source operand.
Example

; Perform 5 multiply and accumulate operations:
; 1st multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2
; 4th multiply: D = X3 * Y3
; 5th multiply: E = X3 * Y3
; Result = A + B + C + D + E

MOV32 R0H, *XAR4++ ; R0H = X0

| ReH   | floating-point source register for the MPYF32 (R0H to R7H) |
| RfH   | floating-point source register for the MPYF32 (R0H to R7H) |
| RaH   | floating-point destination register for the MOV32 (R0H to R7H) |
| mem32 | pointer to a 32-bit memory location. This will be the source of the MOV32. |

Opcode

LSW: 1110 0011 0000 fffe
MSW: eedd daaa mem32

Description

Multiply the contents of two floating-point registers and load another.

RdH = ReH * RfH
RaH = [mem32]

Restrictions

The destination register for the MPYF32 and the MOV32 must be unique. That is, RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>Modified</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

The MOV32 Instruction will set the NF, ZF, NI and ZI flags as follows:

NF = RaH(31);
ZF = 0;
if(RaH(30:23) == 0) { ZF = 1; NF = 0; };
NI = RaH(31);
ZI = 0;
if(RaH(31:0) == 0) ZI = 1;

Pipeline

MPYF32 takes 2 pipeline-cycles (2p) and MOV32 takes a single cycle. That is:

| MPYF32 | RdH, ReH, RfH | 2 pipeline cycles (2p) |
|        |               |                       |
| MOV32  | RaH, mem32    | 1 cycle               |
|        |               | <-- MOV32 completes, RaH updated |
| NOP    |               | 1 cycle delay or non-conflicting instruction |
|        |               | <-- MPYF32 completes, RdH updated |
| NOP    |               |                       |

Any instruction in the delay slot must not use RdH as a destination register or as a source operand.
Example

Calculate \( Y = M1 \times X1 + B1 \). This example assumes that \( M1, X1, B1 \) and \( Y1 \) are all on the same data page.

\[
\begin{align*}
\text{MOVW} & \text{ DP, #M1} & \text{; Load the data page} \\
\text{MOV32} & \text{ ROH, @M1} & \text{; Load ROH with M1} \\
\text{MOV32} & \text{ RIH, @X1} & \text{; Load RIH with X1} \\
\text{MPYF32} & \text{ RIH, RIH, ROH} & \text{; Multiply } M1 \times X1 \\
\| & \text{ MOV32 ROH, @B1} & \text{; and in parallel load ROH with B1} \\
\text{NOP} & \text{ Wait 1 cycle for MPYF32 to complete} \quad \langle \text{-- MPYF32 complete} \rangle \\
\text{ADDF32} & \text{ RIH, RIH, ROH} & \text{; Add } M1 \times X1 \text{ to B1 and store in RIH} \\
\text{NOP} & \text{ Wait 1 cycle for ADDF32 to complete} \quad \langle \text{-- ADDF32 complete} \rangle \\
\text{MOV32} & \text{ @Y1, RIH} & \text{; Store the result}
\end{align*}
\]

Calculate \( Y = (A \times B) \times C \):

\[
\begin{align*}
\text{MOVL} & \text{ XAR4, #A} \\
\text{MOV32} & \text{ ROH, *XAR4} & \text{; Load ROH with A} \\
\text{MOVL} & \text{ XAR4, #B} \\
\text{MOV32} & \text{ RIH, *XAR4} & \text{; Load RIH with B} \\
\text{MOVL} & \text{ XAR4, #C} \\
\text{MPYF32} & \text{ RIH, RIH, ROH} & \text{; Calculate RIH = A \times B} \\
\| & \text{ MOV32 ROH, *XAR4} & \text{; and in parallel load R2H with C} \quad \langle \text{-- MOV32 complete} \rangle \\
\text{MOVL} & \text{ XAR4, #Y} & \text{; \langle -- MPYF32 complete} \rangle \\
\text{MPYF32} & \text{ R2H, RIH, ROH} & \text{; Calculate Y = (A \times B) \times C} \\
\text{NOP} & \text{ Wait 1 cycle for MPYF32 to complete} \quad \langle \text{-- MPYF32 complete} \rangle \\
\text{MOV32} & \text{ *XAR4, R2H}
\end{align*}
\]

</tr>
</tbody>
</table>

Opcode

| LSW: 1110 0000 0000 fffe | MSW: eedd daaa mem32 |

Description

Multiply the contents of two floating-point registers and move from memory to register.

RdH = ReH * RfH,
[mem32] = RaH

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

Pipeline

MPYF32 takes 2 pipeline-cycles (2p) and MOV32 takes a single cycle. That is:

|| MPYF32 RdH, ReH, RfH ; 2 pipeline cycles (2p) |
| MOV32 mem32, RaH ; 1 cycle<br>|| <-- MOV32 completes, mem32 updated |
| NOP ; 1 cycle delay or non-conflicting instruction<br>|| <-- MPYF32 completes, RdH updated |
| NOP |

Any instruction in the delay slot must not use RdH as a destination register or as a source operand.

Example

<table>
<thead>
<tr>
<th>MOVL</th>
<th>XAR1, #0xC003 ; XAR1 = 0xC003</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOVIZF32</td>
<td>R3H, #2.0 ; R3H = 2.0 (0x40000000)</td>
</tr>
<tr>
<td>MOVIZF32</td>
<td>R3H, R3H, #5.0 ; R3H = R3H * 5.0</td>
</tr>
<tr>
<td>MOVIZF32</td>
<td>R1H, #5.0 ; R1H = 5.0 (0x40A00000) ; R3H = R1H * R3H</td>
</tr>
<tr>
<td>MPYF32</td>
<td>R3H, R1H, R3H ; and in parallel store previous R3 value&lt;br&gt;</td>
</tr>
<tr>
<td>MOV32</td>
<td>*XAR1, R3H</td>
</tr>
<tr>
<td>NOP ; 1 cycle delay for MPYF32 to complete&lt;br&gt;</td>
<td></td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>RfH</td>
<td>floating-point source register for SUBF32 (R0H to R7H)</td>
</tr>
</tbody>
</table>

Restrictions

The destination register for the MPYF32 and the SUBF32 must be unique. That is, RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 or SUBF32 generates an underflow condition.
- LVF = 1 if MPYF32 or SUBF32 generates an overflow condition.

Pipeline

MPYF32 and SUBF32 both take 2 pipeline-cycles (2p). That is:

<table>
<thead>
<tr>
<th>Instruction</th>
<th>RaH, RbH, RcH</th>
<th>RdH, ReH, RfH</th>
<th>NOP</th>
<th>R7H, R4H, R5H</th>
<th>NOP</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPYF32</td>
<td>2 pipeline cycles (2p)</td>
<td></td>
<td></td>
<td></td>
<td></td>

</tbody>
</table>

(1) Values not shown are reserved.
(2) This is the default operation if no CNDF field is specified. This condition will allow the ZF, NF, ZI, and NI flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline

This is a single-cycle instruction.

Example

MOVIZF32 R0H, #5.0 ; R0H = 5.0 (0x40A00000)
MOVIZF32 R1H, #4.0 ; R1H = 4.0 (0x40800000)
MOVIZF32 R2H, #1.5 ; R2H = 1.5 (0xBFC00000)
MPYF32 R4H, R1H, R2H ; R4H = -6.0
MPYF32 R5H, R0H, R1H ; R5H = 20.0
; <= R4H valid
CMPF32 R4H, #0.0 ; NF = 1
; <= R5H valid
NEGF32 R4H, R4H, LT ; if NF = 1, R4H = 6.0
CMPF32 R5H, #0.0 ; NF = 0
NEGF32 R5H, R5H, GEQ ; if NF = 0, R4H = -20.0

POP RB

Pop the RB Register from the Stack

Operands

| RB | repeat block register |

Opcode

LSW: 1111 1111 1111 0001

Description

Restore the RB register from stack. If a high-priority interrupt contains a RPTB instruction, then the RB register must be stored on the stack before the RPTB block and restored after the RTPB block. In a low-priority interrupt RB must always be saved and restored. This save and restore must occur when interrupts are disabled.

Flags

This instruction does not affect any flags floating-point Unit:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline

This is a single-cycle instruction.

Example

A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the interrupt. If the interrupt service routine does not include a RPTB block, then you do not have to save the RB register.

```
; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
_INTERRUPT:
    RAS = RA, RA = 0
...
    PUSH RB ; Save RB register only if a RPTB block is used in the
    ISR
    ...
    ...
    RPTB #BlockEnd, AL ; Execute the block AL+1 times
    ...
...
BlockEnd ; End of block to be repeated
...
...
POP RB ; Restore RB register
...
IRET ; RA = RAS, RAS = 0
```

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The RB register must always be saved and restored in a low-priority interrupt. The RB register must stored before interrupts are enabled. Likewise before restoring the RB register interrupts must first be disabled.

```
; Repeat Block within a Low-Priority Interrupt (Interruptible)
_INTERRUPT:
    RAS = RA, RA = 0
...
    PUSH RB ; Always save RB register
...
    CLAC INTM ; Enable interrupts only after saving RB
...
    ...
    ...
    SETC INTM ; Disable interrupts before restoring RB
...
    POP RB ; Always restore RB register
...
    IRET ; RA = RAS, RAS = 0
```

PUSH RB  

*Push the RB Register onto the Stack*

**Operands**

- RB  
  repeat block register

**Opcode**

- LSW: 1111 1111 1111 0000

**Description**

Save the RB register on the stack. If a high-priority interrupt contains a RPTB instruction, then the RB register must be stored on the stack before the RPTB block and restored after the RTPB block. In a low-priority interrupt RB must always be saved and restored. This save and restore must occur when interrupts are disabled.

**Flags**

This instruction does not affect any flags floating-point Unit:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Pipeline**

This is a single-cycle instruction for the first iteration, and zero cycles thereafter.

**Example**

A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the interrupt. If the interrupt service routine does not include a RPTB block, then you do not have to save the RB register.

```plaintext
; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
_interrupt:  ; RAS = RA, RA = 0
  ...
PUSH RB  ; Save RB register only if a RPTB block is used in the
ISR  ...
  RPTB #BlockEnd, AL ; Execute the block AL+1 times
  ...
  BlockEnd  ; End of block to be repeated
  ...
POP RB  ; Restore RB register
  ...
IRET  ; RA = RAS, RAS = 0
```

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The RB register must always be saved and restored in a low-priority interrupt. The RB register must stored before interrupts are enabled. Likewise before restoring the RB register interrupts must first be disabled.

```plaintext
; Repeat Block within a Low-Priority Interrupt (Interruptible)
_interrupt:  ; RAS = RA, RA = 0
  ...
PUSH RB  ; Always save RB register
  ...
CLRC INTM  ; Enable interrupts only after saving RB
  ...
  ; ISR may or may not include a RPTB block
  ...
SETC INTM  ; Disable interrupts before restoring RB
  ...
POP RB  ; Always restore RB register
  ...
IRET  ; RA = RAS, RAS = 0
```

- RPTB #RSIZE, loc16
RESTORE

Restore the Floating-Point Registers

Operands

| none | This instruction does not have any operands |

Opcode

LSW: 1110 0101 0110 0010

Description

Restore the floating-point register set (R0H - R7H and STF) from their shadow registers. The SAVE and RESTORE instructions should be used in high-priority interrupts. That is interrupts that cannot themselves be interrupted. In low-priority interrupt routines the floating-point registers should be pushed onto the stack.

Restrictions

The RESTORE instruction cannot be used in any delay slots for pipelined operations. Doing so will yield invalid results. To avoid this, the proper number of NOPs or non-pipelined instructions must be inserted before the RESTORE operation.

Flags

Restoring the status register will overwrite all flags:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Pipeline

This is a single-cycle instruction.
Example

The following example shows a complete context save and restore for a high-priority interrupt. Note that the CPU automatically stores the following registers: ACC, P, XT, ST0, ST1, IER, DP, AR0, AR1 and PC. If an interrupt is low priority (that is it can be interrupted), then push the floating point registers onto the stack instead of using the SAVE and RESTORE operations.

; Interrupt Save
_HighestPriorityISR: ; Uninterruptable
    ASP ; Align stack
    PUSH RB ; Save RB register if used in the ISR
    PUSH AR1H:AR0H ; Save other registers if used
    PUSH XAR2
    PUSH XAR3
    PUSH XAR4
    PUSH XAR5
    PUSH XAR6
    PUSH XAR7
    PUSH XT
    SPM 0 ; Set default C28 modes
    CLRC AMODE
    CLRC PAGE0,OVM
    SAVE RNDF32=1 ; Save all FPU registers
    ... ; set default FPU modes
    ...

; Interrupt Restore
    ...
    RESTORE ; Restore all FPU registers
    POP XT ; restore other registers
    POP XAR7
    POP XAR6
    POP XAR5
    POP XAR4
    POP XAR3
    POP XAR2
    POP AR1H:AR0H
    POP RB ; restore RB register
    NASP ; un-align stack
    IRET ; return from interrupt

SAVE FLAG, VALUE
RPTB label, loc16  

Repeat A Block of Code

**Operands**

<table>
<thead>
<tr>
<th>label</th>
<th>This label is used by the assembler to determine the end of the repeat block and to calculate RSIZE. This label should be placed immediately after the last instruction included in the repeat block.</th>
</tr>
</thead>
<tbody>
<tr>
<td>loc16</td>
<td>16-bit location for the repeat count value.</td>
</tr>
</tbody>
</table>

**Opcode**

LSW: 1011 0101 0bbb bbbb  
MSW: 0000 0000  loc16

**Description**

Initialize repeat block loop, repeat count from [loc16]

**Restrictions**

- The maximum block size is ≤127 16-bit words.
- An even aligned block must be ≥ 9 16-bit words.
- An odd aligned block must be ≥ 8 16-bit words.
- Interrupts must be disabled when saving or restoring the RB register.
- Repeat blocks cannot be nested.
- Any discontinuity type operation is not allowed inside a repeat block. This includes all call, branch or TRAP instructions. Interrupts are allowed.
- Conditional execution operations are allowed.

**Flags**

This instruction does not affect any flags in the floating-point unit:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Pipeline**

This instruction takes four cycles on the first iteration and zero cycles thereafter. No special pipeline alignment is required.

**Example**

The minimum size for the repeat block is 8 words if the block is even aligned and 9 words if the block is odd aligned. If you have a block of 8 words, as in the following example, you can make sure the block is odd aligned by proceeding it by a .align 2 directive and a NOP instruction. The .align 2 directive will make sure the NOP is even aligned. Since a NOP is a 16-bit instruction the RPTB will be odd aligned. For blocks of 9 or more words, this is not required.

```asm
; Repeat Block of 8 Words (Interruptible)
;
; find the largest element and put its address in XAR6
.align 2
NOP
RPTB VECTOR_MAX_END, AR7 ; Execute the block AR7+1 times
MOV R0H,*XAR0++ ; min size = 8, 9 words
MAXF32 R0H,R1H ; max size = 127 words
MOVST0 NF,ZF
MOV XAR6,ACC,LT
VECTOR_MAX_END: ; label indicates the end
    RA is cleared
```

When an interrupt is taken the repeat active (RA) bit in the RB register is automatically copied to the repeat active shadow (RAS) bit. When the interrupt exits, the RAS bit is automatically copied back to the RA bit. This allows the hardware to keep track if a repeat loop was active whenever an interrupt is taken and restore that state automatically.

A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the interrupt. If the interrupt service routine does not include a RPTB block, then you do not
have to save the RB register.

; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
;
; Interrupt: ; RAS = RA, RA = 0
... 
PUSH RB ; Save RB register only if a RPTB block is used in the ISR
...
...
RPTB #BlockEnd, AL ; Execute the block AL+1 times
...
...
BlockEnd ; End of block to be repeated
...
...
POP RB ; Restore RB register
...
IRET ; RA = RAS, RAS = 0

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The RB register must always be saved and restored in a low-priority interrupt. The RB register must stored before interrupts are enabled. Likewise before restoring the RB register interrupts must first be disabled.

; Repeat Block within a Low-Priority Interrupt (Interruptible)
;
; Interrupt: ; RAS = RA, RA = 0
...
PUSH RB ; Always save RB register
...
CLRC INTM ; Enable interrupts only after saving RB
...
...
... ; ISR may or may not include a RPTB block
...
...
SETC INTM ; Disable interrupts before restoring RB
...
POP RB ; Always restore RB register
...
IRET ; RA = RAS, RAS = 0

POP RB
PUSH RB
RPTB label, RC
RPTB label, #RC

**Repeat a Block of Code**

**Operands**

| label | This label is used by the assembler to determine the end of the repeat block and to calculate RSIZE. This label should be placed immediately after the last instruction included in the repeat block. |
| #RC  | 16-bit immediate value for the repeat count. |

**Opcode**

LSW: 1011 0101 lbbb bbbb
MSW: cccc cccc cccc cccc

**Description**

Repeat a block of code. The repeat count is specified as an immediate value.

**Restrictions**

- The maximum block size is ≤127 16-bit words.
- An even aligned block must be ≥9 16-bit words.
- An odd aligned block must be ≥8 16-bit words.
- Interrupts must be disabled when saving or restoring the RB register.
- Repeat blocks cannot be nested.
- Any discontinuity type operation is not allowed inside a repeat block. This includes all call, branch or TRAP instructions. Interrupts are allowed.
- Conditional execution operations are allowed.

**Flags**

This instruction does not affect any flags int the floating-point unit:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Pipeline**

This instruction takes one cycle on the first iteration and zero cycles thereafter. No special pipeline alignment is required.

**Example**

The minimum size for the repeat block is 8 words if the block is even aligned and 9 words if the block is odd aligned. If you have a block of 8 words, as in the following example, you can make sure the block is odd aligned by proceeding it by a .align 2 directive and a NOP instruction. The .align 2 directive will make sure the NOP is even aligned. Since a NOP is a 16-bit instruction the RPTB will be odd aligned. For blocks of 9 or more words, this is not required.

```assembly
; Repeat Block (Interruptible)
;
; find the largest element and put its address in XAR6
.align 2

NOP
RPTB VECTOR_MAX_END, #(4-1) ; Execute the block 4 times
MOVL ACC,XAR0
MOV32 R1H,*XAR0++ ; 8 or 9 words ≤ block size ≤ 127 words
MAXF32 R0H,R1H
MOVST0 NF,ZF
MOVL XAR6,ACC,XAR
VECTOR_MAX_END: ; RE indicates the end address
; RA is cleared
```

When an interrupt is taken the repeat active (RA) bit in the RB register is automatically copied to the repeat active shadow (RAS) bit. When the interrupt exits, the RAS bit is automatically copied back to the RA bit. This allows the hardware to keep track if a repeat loop was active whenever an interrupt is taken and restore that state automatically.

A high priority interrupt is defined as an interrupt that cannot itself be interrupted. In a high priority interrupt, the RB register must be saved if a RPTB block is used within the interrupt. If the interrupt service routine does not include a RPTB block, then you do not
have to save the RB register.

; Repeat Block within a High-Priority Interrupt (Non-Interruptible)
;
; Interrupt: ; RAS = RA, RA = 0
... PUSH RB ; Save RB register only if a RPTB block is used in the
ISR ...
... ...
... RPTB #BlockEnd, #5 ; Execute the block 5+1 times ...
... ...
... BlockEnd ; End of block to be repeated ...
... ...
POP RB ; Restore RB register ...
... IRET ; RA = RAS, RAS = 0

A low-priority interrupt is defined as an interrupt that allows itself to be interrupted. The
RB register must always be saved and restored in a low-priority interrupt. The RB
register must stored before interrupts are enabled. Likewise before restoring the RB
register interrupts must first be disabled.

; Repeat Block within a Low-Priority Interrupt (Interruptible)
;
; Interrupt: ; RAS = RA, RA = 0
... PUSH RB ; Always save RB register ...
... CLRC INTM ; Enable interrupts only after saving RB ...
... ...
... ; ISR may or may not include a RPTB block ...
... ...
... SETC INTM ; Disable interrupts before restoring RB ...
... POP RB ; Always restore RB register ...
... IRET ; RA = RAS, RAS = 0

SAVE FLAG, VALUE  Save Register Set to Shadow Registers and Execute SETFLG

Operands

<table>
<thead>
<tr>
<th>Operand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FLAG</td>
<td>11 bit mask indicating which floating-point status flags to change.</td>
</tr>
<tr>
<td>VALUE</td>
<td>11 bit mask indicating the flag value; 0 or 1.</td>
</tr>
</tbody>
</table>

Opcode

<table>
<thead>
<tr>
<th>LSW</th>
<th>MSW</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110 0110</td>
<td>FFFF FVVV</td>
</tr>
<tr>
<td>01FF FFFF</td>
<td>VVVV VVVV</td>
</tr>
</tbody>
</table>

Description

This operation copies the current working floating-point register set (R0H to R7H and STF) to the shadow register set and combines the SETFLG FLAG, VALUE operation in a single cycle. The status register is copied to the shadow register before the flag values are changed. The STF[SHDWM] flag is set to 1 when the SAVE command has been executed. The SAVE and RESTORE instructions should be used in high-priority interrupts. That is interrupts that cannot themselves be interrupted. In low-priority interrupt routines the floating-point registers should be pushed onto the stack.

Restrictions

Do not use the SAVE instruction in the delay slots for pipelined operations. Doing so can yield invalid results. To avoid this, the proper number of NOPs or non-pipelined instructions must be inserted before the SAVE operation.

```
; The following is INVALID
MPYF32  R2H, R1H, R0H ; 2 pipeline-cycle instruction (2p)
SAVE RNDF32=1          ; INVALID, do not use SAVE in a delay slot
```

```
; The following is VALID
MPYF32  R2H, R1H, R0H ; 2 pipeline-cycle instruction (2p)
NOP     ; 1 delay cycle, R2H updated after this instruction
SAVE RNDF32=1          ; VALID
```

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Any flag can be modified by this instruction.

Pipeline

This is a single-cycle instruction.

Example

To make it easier and more legible, the assembler will accept a FLAG=VALUE syntax for the SETFLG operation as shown below:

```
SAVE RNDF32=0, TF=1, ZF=0 ; FLAG = 01001000100, VALUE = X0XX0XXX1XX
MOVST0 TF, ZF, LUF       ; Copy the indicated flags to ST0
; Note: X means this flag will not be modified.
; The assembler will set these X values to 0.
```

The following example shows a complete context save and restore for a high priority interrupt. Note that the CPU automatically stores the following registers: ACC, P, XT, ST0, ST1, IER, DP, AR0, AR1 and PC.
_HighestPriorityISR:
ASP ; Align stack
PUSH RB ; Save RB register if used in the ISR
PUSH AR1H:AR0H ; Save other registers if used
PUSH XAR2
PUSH XAR3
PUSH XAR4
PUSH XAR5
PUSH XAR6
PUSH XAR7
PUSH XT
SPM 0 ; Set default C28 modes
CLRC AMODE
CLRC PAGE0,OVM
SAVE RNDF32=0 ; Save all FPU registers
... ; set default FPU modes
... ;
RESTORE ; Restore all FPU registers
POP XT ; restore other registers
POP XAR7
POP XAR6
POP XAR5
POP XAR4
POP XAR3
POP XAR2
POP AR1H:AR0H
POP RB ; restore RB register
NASP ; un-align stack
IRET ; return from interrupt

RESTORE
SETFLG FLAG, VALUE
**SETFLG FLAG, VALUE**  Set or clear selected floating-point status flags

**Operands**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FLAG</td>
<td>11 bit mask indicating which floating-point status flags to change.</td>
</tr>
<tr>
<td>VALUE</td>
<td>11 bit mask indicating the flag value; 0 or 1.</td>
</tr>
</tbody>
</table>

**Opcode**

LWS: 1110 0110 00FF FFFF  
MSW: FFFF FVVV VVVV VVVV

**Description**

The SETFLG instruction is used to set or clear selected floating-point status flags in the STF register. The FLAG field is an 11-bit value that indicates which flags will be changed. That is, if a FLAG bit is set to 1 it indicates that flag will be changed; all other flags will not be modified. The bit mapping of the FLAG field is shown below:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>reserved</td>
</tr>
<tr>
<td>9</td>
<td>RNDF32</td>
</tr>
<tr>
<td>8</td>
<td>reserved</td>
</tr>
<tr>
<td>7</td>
<td>reserved</td>
</tr>
<tr>
<td>6</td>
<td>TF</td>
</tr>
<tr>
<td>5</td>
<td>ZI</td>
</tr>
<tr>
<td>4</td>
<td>NI</td>
</tr>
<tr>
<td>3</td>
<td>ZF</td>
</tr>
<tr>
<td>2</td>
<td>NF</td>
</tr>
<tr>
<td>1</td>
<td>LUF</td>
</tr>
<tr>
<td>0</td>
<td>LVF</td>
</tr>
</tbody>
</table>

The VALUE field indicates the value the flag should be set to; 0 or 1.

**Restrictions**

Do not use the SETFLG instruction in the delay slots for pipelined operations. Doing so can yield invalid results. To avoid this, the proper number of NOPs or non-pipelined instructions must be inserted before the SETFLG operation.

```assembly
; The following is INVALID
MPYF32 R2H, R1H, R0H ; 2 pipeline-cycle instruction (2p)
SETFLG RNDF32=1 ; INVALID, do not use SETFLG in a delay slot
```

```assembly
; The following is VALID
MPYF32 R2H, R1H, R0H ; 2 pipeline-cycle instruction (2p)
NOP ; 1 delay cycle, R2H updated after this instruction
SETFLG RNDF32=1 ; VALID
```

**Flags**

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Any flag can be modified by this instruction.

**Pipeline**

This is a single-cycle instruction.

**Example**

To make it easier and legible, the assembler will accept a FLAG=VALUE syntax for the SETFLG operation as shown below:

```assembly
SETFLG RNDF32=0, TF=1, ZF=0 ; FLAG = 01001001000, VALUE = X0XX1XX0XXX
MOVST0 TF, ZF, LUF ; Copy the indicated flags to ST0
; X means this flag is not modified.
; The assembler will set X values to 0
```

**See also**

SAVE FLAG, VALUE
SUBF32 RaH, RbH, RcH  

**32-bit Floating-Point Subtraction**

**Operands**

- **RaH**: floating-point destination register (R0H to R1)
- **RbH**: floating-point source register (R0H to R1)
- **RcH**: floating-point source register (R0H to R1)

**Opcode**

- **LSW**: 1110 0111 0010 0000
- **MSW**: 0000 000c ccbb baaa

**Description**

Subtract the contents of two floating-point registers

\[ RaH = RbH - RcH \]

**Flags**

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- **LUF** = 1 if MPYF32 generates an underflow condition.
- **LVF** = 1 if MPYF32 generates an overflow condition.

**Pipeline**

This is a 2 pipeline cycle (2p) instruction. That is:

```
SUBF32 RaH, RbH, RcH ; 2 pipeline cycles (2p)
NOP ; 1 cycle delay or non-conflicting instruction
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or as a source operand.

**Example**

Calculate \( Y - A + B - C \):

```
MOVL XAR4, #A
MOV32 R0H, *XAR4 ; Load R0H with A
MOVL XAR4, #B
MOV32 R1H, *XAR4 ; Load R1H with B
MOVL XAR4, #C
ADDF32 R0H, R1H, R0H ; Add A + B and in parallel
| | | |
MOV32 R2H, *XAR4 ; Load R2H with C
| | | |
MOVL XAR4, #_xt ; <--- MOV32 complete
MOVL XAR4, #_xt ; <--- ADDF32 complete
SUBF32 R0H, R0H, R2H ; Subtract C from (A + B)
NOP ; <--- SUBF32 completes
MOVL XAR4, R0H ; Store the result
```

SUBF32 RaH, #16FHi, RbH  32-bit Floating Point Subtraction

Operands

<table>
<thead>
<tr>
<th>Operand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RaH</td>
<td>Floating-point destination register (R0H to R1)</td>
</tr>
<tr>
<td>#16FHi</td>
<td>A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.</td>
</tr>
<tr>
<td>RbH</td>
<td>Floating-point source register (R0H to R1)</td>
</tr>
</tbody>
</table>

Opcode

<table>
<thead>
<tr>
<th>LSW</th>
<th>MSW</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110 1000</td>
<td>1111 1111</td>
</tr>
</tbody>
</table>

Description

Subtract RbH from the floating-point value represented by the immediate operand. Store the result of the addition in RaH.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value.

RaH = #16FHi:0 - RbH

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if MPYF32 generates an underflow condition.
- LVF = 1 if MPYF32 generates an overflow condition.

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
SUBF32 RaH, #16FHi, RbH ; 2 pipeline cycles (2p)
NOP ; 1 cycle delay or non-conflicting instruction
       ; <-- SUBF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or as a source operand.

Example

Calculate \( Y = 2.0 - (A + B): \)

```
MOVL XAR4, #A
MOV32 R0H, *XAR4 ; Load R0H with A
MOVL XAR4, #B
MOV32 R1H, *XAR4 ; Load R1H with B
ADDF32 ROH,R1H,ROH ; Add A + B and in parallel
NOP ; <-- ADDF32 complete
SUBF32 ROH,#2.0,R2H ; Subtract (A + B) from 2.0
NOP ; <-- SUBF32 completes
MOV32 *XAR4,ROH ; Store the result
```

See also

SUBF32 RdH, ReH, RfH
||MOV32 RaH, mem32           32-bit Floating-Point Subtraction with Parallel Move

Operands

| RdH       | floating-point destination register (R0H to R7H) for the SUBF32 operation
| ReH       | floating-point source register (R0H to R7H) for the SUBF32 operation
| RfH       | floating-point source register (R0H to R7H) for the SUBF32 operation
| RaH       | floating-point destination register (R0H to R7H) for the MOV32 operation
| mem32     | pointer to 32-bit source memory location for the MOV32 operation

Opcode

LSW: 1110 0011  0010 fffe
MSW: eedd daaa  mem32

Description

Subtract the contents of two floating-point registers and move from memory to a floating-point register.

RdH = ReH - RfH,
RaH = [mem32]

Restrictions

The destination register for the SUBF32 and the MOV32 must be unique. That is, RaH cannot be the same register as RdH.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if SUBF32 generates an underflow condition.
- LVF = 1 if SUBF32 generates an overflow condition.

The MOV32 Instruction will set the NF, ZF, NI and ZI flags as follows:

NF = RaH(31);
ZF = 0;
if(RaH(30:23) == 0) { ZF = 1; NF = 0; }
NI = RaH(31);
ZI = 0;
if(RaH(31:0) == 0) ZI = 1;

Pipeline

SUBF32 is a 2 pipeline-cycle instruction (2p) and MOV32 takes a single cycle. That is:

SUBF32 RdH, ReH, RfH ; 2 pipeline cycles (2p)
|| MOV32 RaH, mem32 ; 1 cycle
| | | <- MOV32 completes, RaH updated
| | | NOP ; 1 cycle delay or non-conflicting instruction
| | | <- SUBF32 completes, RdH updated
| | | NOP

Any instruction in the delay slot must not use RdH as a destination register or as a source operand.
Example

MOVL XAR1, #0xC000 ; XAR1 = 0xC000
SUBF32 R0H, R1H, R2H ; (A) R0H = R1H - R2H
| | MOV32 R3H, *XAR1 ;
| | | <-- R3H valid
| | | <-- (A) completes, R0H valid, R4H valid
| | ADDF32 R5H, R4H, R3H ; (B) R5H = R4H + R3H
| | | | MOV32 *+XAR1[4], R0H ;
| | | | | <-- R0H stored
| | MOVL XAR2, #0xE000 ;
| | | <-- (B) completes, R5H valid
| | MOV32 *XAR2, R5H ;
| | | <-- R5H stored

</tr>
</tbody>
</table>

**Opcode**

| LSW: 1110 0000 0010 fffe |
| MSW: eedd daaa mem32 |

**Description**

Subtract the contents of two floating-point registers and move from a floating-point register to memory.

RdH = ReH - RfH,

[mem32] = RaH

**Flags**

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The STF register flags are modified as follows:

- LUF = 1 if SUBF32 generates an underflow condition.
- LVF = 1 if SUBF32 generates an overflow condition.

**Pipeline**

SUBF32 is a 2 pipeline-cycle instruction (2p) and MOV32 takes a single cycle. That is:

<table>
<thead>
<tr>
<th>SUBF32 RdH, ReH, RfH</th>
<th>2 pipeline cycles (2p)</th>

</table>

(1) Values not shown are reserved.

(2) This is the default operation if no CNDF field is specified. This condition will allow the ZF, NF, ZI, and NI flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

**Flags**

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

No flags affected

**Pipeline**

This is a single-cycle instruction.

**Example**

; find the largest element and put it in R1H

```
MOVL XAR1, #0xB000 ;
MOVIS2 R1H, *XAR1 ; Initialize R1H
.align 2

NOP
RPTB LOOP_END, #{10-1}; Execute the block 10 times
MOVIS2 R2H, *XAR1++ ; Update R2H with next element
CMPS32 R2H, R1H ; Compare R2H with R1H
SWAPF R1H, R2H, GT ; Swap R1H and R2H if R2 > R1
NOP ; For minimum repeat block size
NOP
LOOP_END:
```

TESTTF CNDF

Test STF Register Flag Condition

Operands

<table>
<thead>
<tr>
<th>CNDF</th>
<th>condition to test</th>
</tr>
</thead>
</table>

Opcode

LSW: 1110 0101 1000 CNDF

Description

Test the floating-point condition and if true, set the TF flag. If the condition is false, clear the TF flag. This is useful for temporarily storing a condition for later use.

if (CNDF == true) TF = 1; else TF = 0;

CNDF is one of the following conditions:

<table>
<thead>
<tr>
<th>Encode (1)</th>
<th>CNDF</th>
<th>Description</th>
<th>STF Flags Tested</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>NEQ</td>
<td>Not equal to zero</td>

<tr>
<td>1110</td>
<td>UNC</td>
<td>Unconditional</td>
<td>None</td>
</tr>
<tr>
<td>1111</td>
<td>UNCF (2)</td>
<td>Unconditional with flag modification</td>
<td>None</td>
</tr>
</tbody>
</table>

(1) Values not shown are reserved.
(2) This is the default operation if no CNDF field is specified. This condition will allow the ZF, NF, ZI, and NI flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

Flags

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

TF = 0; if (CNDF == true) TF = 1;

Note: If (CNDF == UNC or UNCF), the TF flag will be set to 1.

Pipeline

This is a single-cycle instruction.

Example

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMPF32 R0H, #0.0</td>
<td>Compare R0H against 0</td>
</tr>
<tr>
<td>TESTTF LT</td>
<td>Set TF if R0H less than 0 (NF == 0)</td>
</tr>
<tr>
<td>ABS R0H, R0H</td>
<td>Get the absolute value of R0H</td>
</tr>
</tbody>
</table>
; Perform calculations based on ABS R0H
| MOVST0 TF | Copy TF to TC in ST0 |
| SBF End, NTC | Branch to end if TF was not set |
| NEGF32 R0H, R0H | |

End

UI16TOF32 RaH, mem16  Convert unsigned 16-bit integer to 32-bit floating-point value

Operands

<table>
<thead>
<tr>
<th>RaH</th>
<th>floating-point destination register (R0H to R7H)</th>
</tr>
</thead>
<tbody>
<tr>
<td>mem16</td>
<td>pointer to 16-bit source memory location</td>
</tr>
</tbody>
</table>

Opcode

LSW: 1110 0010 1100 0100
MSW: 0000 0aaa mem16

Description

When converting F32 to I16/UI16 data format, the F32TOI16/UI16 operation truncates to zero while the F32TOI16R/UI16R operation will round to nearest (even) value.

RaH = UI16ToF32(mem16)

Flags

This instruction does not affect any flags:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```
UI16TOF32 RaH, mem16  ; 2 pipeline cycles (2p)
NOP                   ; 1 cycle delay or non-conflicting instruction
                   ;  <-- UI16TOF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or as a source operand.

Example

```
;  float32 y,m,b;
;  AdcRegs.RESULT0 is an unsigned int
;  Calculate: y = (float)AdcRegs.ADCRESULT0 * m + b;
;
MOVN        DP   @0x01c4
UI16TOF32  R0H, @8 ; R0H = (float)AdcRegs.RESULT0
MOV32      R1H, *-SP[6] ; R1H = M
            ;  <-- Conversion complete, R0H valid
MPYF32     R0H, R1H, R0H ; R0H = (float)X * M
MOV32      R1H, *-SP[8] ; R1H = B
            ;  <-- MPYF32 complete, R0H valid
ADDF32     R0H, R0H, R1H ; R0H = Y = (float)X * M + B
NOP        ;  <-- ADDF32 complete, R0H valid
MOV32      *-[SP], R0H ; Store Y
```

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Pipeline

This is a 2 pipeline cycle (2p) instruction. That is:

```plaintext
UI16TOF32 RaH, RbH ; 2 pipeline cycles (2p)
NOP                ; 1 cycle delay or non-conflicting instruction
; <-- UI16TOF32 completes, RaH updated
NOP
```

Any instruction in the delay slot must not use RaH as a destination register or as a source operand.

Example

```plaintext
MOVXI R5H, #0x800F ; R5H[15:0] = 32783 (0x800F)
UI16TOF32 R6H, R5H ; R6H = UI16TOF32 (R5H[15:0])
NOP                ; 1 cycle delay for UI16TOF32 to complete
; R6H = 32783.0 (0x47000F00)
```

ZERO RaH  

**Zero the Floating-Point Register RaH**

**Operands**

| RaH | floating-point register (R0H to R7H) |

**Opcode**

LSW: 1110 0101 1001 0aaa

**Description**

Zero the indicated floating-point register:

RaH = 0

**Flags**

This instruction modifies the following flags in the STF register:

<table>
<thead>
<tr>
<th>Flag</th>
<th>TF</th>
<th>ZI</th>
<th>NI</th>
<th>ZF</th>
<th>NF</th>
<th>LUF</th>
<th>LVF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

No flags affected.

**Pipeline**

This is a single-cycle instruction.

**Example**

```c
;for(i = 0; i < n; i++)
{
  real += (x[2*i] * y[2*i]) - (x[2*i+1] * y[2*i+1]);
  imag += (x[2*i] * y[2*i+1]) + (x[2*i+1] * y[2*i]);
}

;Assume AR7 = n-1
ZERO R4H ; R4H = real = 0
ZERO R5H ; R5H = imag = 0

LOOP
  MOV AL, AR7
  MOV ACC, AL << 2
  MOV R0H, **XAR4[AR0] ; R0H = x[2*i]
  MOV R1H, **XAR5[AR0] ; R1H = y[2*i]
  ADD AR0, #2
  MPYF32 R6H, R0H, R1H ; R6H = x[2*i] * y[2*i]
  MOV32 R2H, **XAR4[AR0] ; R2H = x[2*i+1]
  MPYF32 R1H, R1H, R2H ; R1H = y[2*i] * x[2*i+1]
  MOV32 R3H, **XAR5[AR0] ; R3H = y[2*i+1]

<td>SUBF32 RaH, #16FHi, RbH</td>
<td>Modified the syntax for the immediate operand. Modified the description.</td>
</tr>
</tbody>
</table>
### Table A-1. Technical Changes Made in This Revision (continued)

<table>
<thead>
<tr>
<th>Location</th>
<th>Additions, Deletions, Modifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUBF32 RdH, ReH, RfH</td>
<td></td>
</tr>
<tr>
<td>UI16TOF32 RaH, RbH</td>
<td>Modified the UI16TOF32 RaH, RbH instruction</td>
</tr>
<tr>
<td>UI32TOF32 RaH, RbH</td>
<td>Modified the UI32TOF32 RaH, RbH instruction</td>
</tr>
<tr>
<td>Globally</td>
<td>The syntax sections of the #16F, #16I and #immF32 immediate addressing modes modes were changed to #16FHi, #16FHiHex, and #16FLoHex to be more descriptive and consistent. The descriptions for instructions using these modes were updated for clarity.</td>
</tr>
<tr>
<td>Example 2-2</td>
<td>Changed first instruction in example</td>
</tr>
<tr>
<td>Table 4-1</td>
<td>Updated the operand nomenclature table</td>
</tr>
<tr>
<td>Section 2.1.2</td>
<td>Modified the register figure introduction and register figure</td>
</tr>
<tr>
<td>EINVF32 RaH, RbH</td>
<td>Modified the example</td>
</tr>
<tr>
<td>EISQRTF32 RaH, RbH</td>
<td>Modified the example</td>
</tr>
<tr>
<td>Chapter 4</td>
<td>Added instructions to the See Also area of various instructions</td>
</tr>

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI’s standard warranty. Testing and other quality control techniques are used to test the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death. Users represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications. TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Users acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
