- Configuration 2 (YUVCHROMARESAMPLING = 1): VC-1 range mapping unit followed by a scaler unit and then a CSC unit. The configuration is used to support RGB, ARGB, and RGBA formats and YUV4:2:2, YUV420-NV12, and YUV420-NV21 formats, taking advantage of the scaler to resample the chrominance using five taps horizontally and three or five taps vertically. Each block can be independently bypassed.

The DISPC\_VIDn\_ATTRIBUTES2[8] YUVCHROMARESAMPLING bit controls the order of the scaler unit in the video pipeline:

- When the YUVCHROMARESAMPLING bit is set to 0x0, the video pipeline is in configuration 1, and the scaler comes after the CSC unit. In case of YUV input data in 4:2:2 format, the chrominance resampling (4:2:2 to 4:4:4 format) is done by averaging the chrominance adjacent samples for only 0 degrees (zero rotation), because other rotation (90/180/270 degrees) is not supported in this mode. For more information about the supported chrominance resampling methods, see [Section 11.2.4.10.3.1, Chrominance Resampling](#).
- When the YUVCHROMARESAMPLING bit is set to 0x1, the video pipeline is in configuration 2, and the scaler comes before the CSC unit.
  - In case of YUV4:2:2 input data with 90-/270-degree rotation, the data is preprocessed by

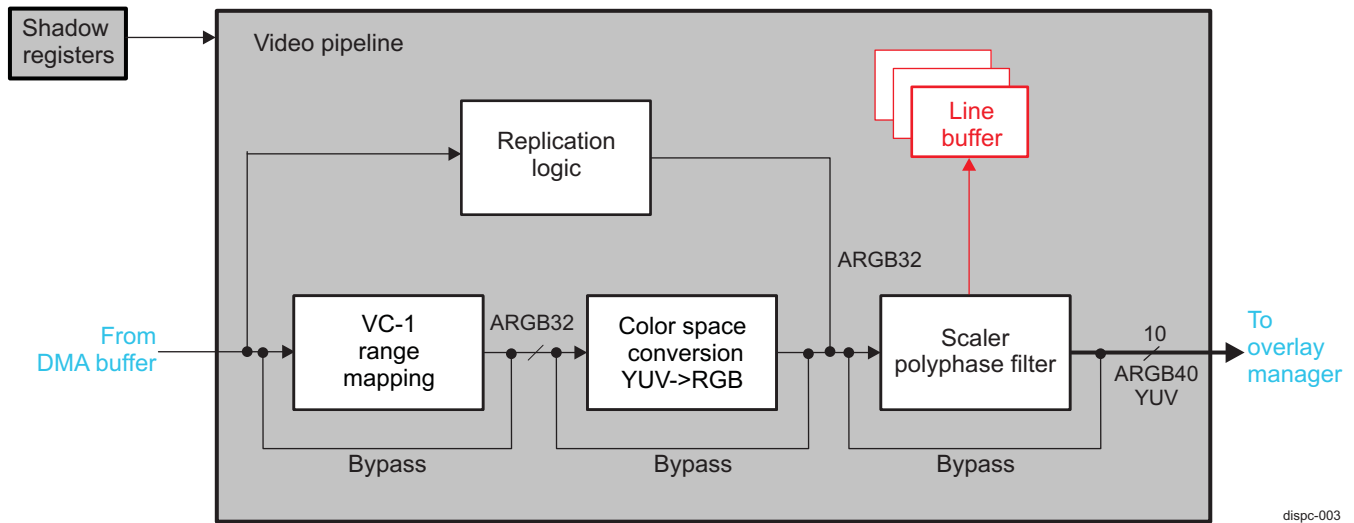

duplicating the missing chrominance samples.

- In case of YUV4:2:2 input data with 0-/180-degree rotation, the Chroma upsampling is performed in the scaler unit.

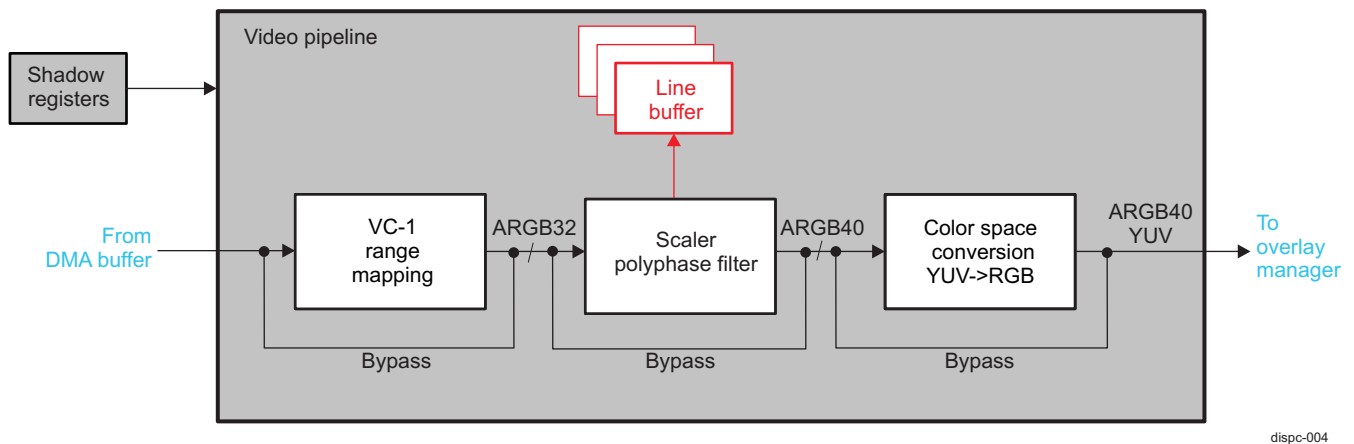

Table 11-95 lists the input formats supported by the video pipelines.

The video pipeline is enabled by setting the DISPC\_VIDp\_ATTRIBUTES[0] ENABLE bit to 0x1.

**Figure 11-48. DISPC Configuration 1: Video Pipeline**

**Figure 11-49. DISPC Configuration 2: Video Pipeline**

#### 11.2.4.10.1 DISPC Replication Logic

The replication logic increases the color depth of the video-encoded pixels (from true color RGB 12, and 16 to 32 bpp) available only in configuration 1.

The expansion from 8- to 10-bit color component is done by the following units:

- The CSC unit, when the scaler is after the CSC module and when the vertical scaler is disabled
- The vertical scaler, when the scaler is after the CSC unit and enabled
- The replication bit module, when the CSC unit and scaler are disabled
- When the replication logic is enabled by setting the DISPC\_VIDp\_ATTRIBUTES[10] REPLICATIONENABLE bit to 0x1, the MSBs are copied to the missing LSBs. Table 11-98 describes the remapping of the RGB pixels into ARGB 32-bit values.

**Table 11-98. DISPC Replication Enabled: RGB Pixel Formats Remapping Into ARGB32-8888**

Formats	A[7:0]	R[7:0]	G[7:0]	B[7:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB
xRGB12-4444	11111111	R[3:0]R[3:0]	G[3:0]G[3:0]	B[3:0]B[3:0]
RGBx12-4444	11111111	R[3:0]R[3:0]	G[3:0]G[3:0]	B[3:0]B[3:0]
RGB16-565	11111111	R[4:0]R[4:2]	G[5:0]G[5:4]	B[4:0]B[4:2]
xRGB16-1555	11111111	R[4:0]R[4:2]	G[4:0]G[4:2]	B[4:0]B[4:2]
ARGB16-1555	AAAAAAAA	R[4:0]R[4:2]	G[4:0]G[4:2]	B[4:0]B[4:2]
ARGB16-4444	A[3:0]A[3:0]	R[3:0]R[3:0]	G[3:0]G[3:0]	B[3:0]B[3:0]
RGBA16-4444	A[3:0]A[3:0]	R[3:0]R[3:0]	G[3:0]G[3:0]	B[3:0]B[3:0]

- When the replication logic is disabled by setting the DISPC\_VIDp\_ATTRIBUTES[10] REPLICATIONENABLE bit to 0x0, the encoded pixel values are shifted to the MSB boundary of the 24-bit format. The missing bit values are filled with 0s. [Table 11-99](#) describes the remapping of the RGB pixels into ARGB 32-bit values.

**Table 11-99. DISPC Replication Disabled: RGB Pixel Formats Remapping Into ARGB32-8888**

#### 11.2.4.10.2 DISPC VC-1 Range Mapping Unit

The VC-1 range mapping unit is used when the video frame picture is decoded using a VC-1 codec by the video accelerator. It remaps the Y, Cb, and Cr components. The unit is used primarily for YUV4:2:0-NV12 and YUV4:2:0-NV21 pixel formats but also can be applied to YUV4:2:2 pixel formats (YUV2 and UYVY).

The VC-1 range mapping unit is enabled by setting the DISPC\_VIDp\_ATTRIBUTES2[0] VC1ENABLE bit to 0x1. The DISPC\_VIDp\_ATTRIBUTES2[3:1] VC1\_RANGE\_Y and DISPC\_VIDp\_ATTRIBUTES2[6:4] VC1\_RANGE\_CBCR bit fields are two 3-bit values programmed by the user and are independent for each video pipeline. The module is governed by the equations:

$$Y_{out} = \text{CLIP}((((Y_{int} - 128) \times (\text{VC1\_RANGE\_Y} + 9) + 4) / 8) + 128)$$

$$C_b = \text{CLIP}((((C_b - 128) \times (\text{VC1\_RANGE\_CBCR} + 9) + 4) / 8) + 128)$$

$$C_r = \text{CLIP}((((C_r - 128) \times (\text{VC1\_RANGE\_CBCR} + 9) + 4) / 8) + 128)$$

**NOTE:** The input and output pixel values are unsigned (Y, Cr, and Cb).

The function CLIP () clips to 0 or 255 when minimum or maximum, respectively, are reached; otherwise, the resulting output remains identical.

#### 11.2.4.10.3 DISPC CSC Unit YUV to RGB

The CSC unit converts the video-encoded pixel values from YUV4:4:4 format into RGB24 or RGB30 format. The output format depends on the video pipeline configuration selected:

- Configuration 1: RGB24 output format, with 8-bit value per component: red, green, and blue

- Configuration 2: RGB30 output format, with 10-bit value per component: red, green, and blue

In case of YUV4:2:0 or YUV4:2:2 formats, a chrominance resampling to YUV4:4:4 is required before converting the YUV into RGB values (see [Section 11.2.4.10.3.1, Chrominance Resampling](#)). YUV4:2:2 or YUV4:2:0 to YUV4:4:4 chrominance resampling is a preprocessing to the color space conversion.

[Figure 11-50](#) through [Figure 11-53](#) show the 3 × 3 11-bit coefficients used to convert from YUV4:4:4 into RGB24. The coefficients are set according to the standard used to encode the pixel data in YUV color space. [Table 11-100](#) summarizes the coefficients with their respective bit fields.

**Table 11-100. DISPC Color Space Conversion YUV to RGB Bit Field Setting**

Coefficients	Bit Field Registers
R <sub>Y</sub>	DISPC_VIDp_CONV_COEF0[10:0] RY
R <sub>Cr</sub>	DISPC_VIDp_CONV_COEF0[26:16] RCR
R <sub>Cb</sub>	DISPC_VIDp_CONV_COEF1[10:0] RCB
G <sub>Y</sub>	DISPC_VIDp_CONV_COEF1[26:16] GY
G <sub>Cr</sub>	DISPC_VIDp_CONV_COEF2[10:0] GCR
G <sub>Cb</sub>	DISPC_VIDp_CONV_COEF2[26:16] GCB
B <sub>Y</sub>	DISPC_VIDp_CONV_COEF3[10:0] BY
B <sub>Cr</sub>	DISPC_VIDp_CONV_COEF3[26:16] BCR
B <sub>Cb</sub>	DISPC_VIDp_CONV_COEF4[10:0] BCB

- For configuration 1 with an RGB24 output:

If the active range for the luminance samples (Y) is [235:16] and [240:16] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [255:0].

**NOTE:** The scaling and CSC clipping is set by the same bit, DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE.

**Figure 11-50. DISPC YCbCr to RGB Registers (FULLRANGE = 0), 8-Bit Outputs**

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 16 \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-005

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [255:0], the range selection is done by setting the DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [255:0].

**Figure 11-51. DISPC YCbCr to RGB Registers (FULLRANGE = 1), 8-Bit Outputs**

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-006

- For configuration 2 with an RGB30 output:

If the active range for the luminance samples (Y) is [940:64] and [960:64] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [1023:0].

**NOTE:** The scaling and CSC clipping is set by the same bit, DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE.

**Figure 11-52. DISPC YCbCr to RGB Registers (FULLRANGE = 0), 10-Bit Outputs**

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 64 \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-074

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [1023:0], the range selection is done by setting the DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [1023:0].

**Figure 11-53. DISPC YCbCr to RGB Registers (FULLRANGE = 1), 10-Bit Outputs**

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-075

**11.2.4.10.3.1 DISPC Chrominance Resampling**

Two methods are supported to resample chrominance:

- Averaging of the chrominance is done by software, followed by hardware conversion when the video pipeline is in configuration 1.
- Filtering of the chrominance using the scaler unit (chrominance resampling and rescaling can be combined to support native rescaling of YUV format) when the video pipeline is in configuration 2.

To convert the YUV4:2:2 encoded pixel values into YUV4:4:4 format, the averaging of the chrominance technique can be used as shown in Figure 11-54. The missing chrominance samples (Cb and Cr) are interpolated using the average values of the two closest values on the same line ( , ) or are repeated from the second pixel in the same 32-bit container (see Figure 11-55). For the last pixel, the chrominance samples are duplicated using the values from the previous pixel; otherwise, the chrominance samples are averaged using the two adjacent values. Figure 11-56 shows the flow of the pixel.

**Figure 11-54. DISPC Averaging of the Chrominance Formula**

$$Cb_n(YCbCr\ 444) = \frac{Cb_{n-1}(YCbCr\ 422) + Cb_{n+1}(YCbCr\ 422)}{2} \text{ (n odd)}$$

$$Cr_n(YCbCr\ 444) = \frac{Cr_{n-1}(YCbCr\ 422) + Cr_{n+1}(YCbCr\ 422)}{2} \text{ (n odd)}$$

dispc-010

**Figure 11-55. DISPC Averaging of the Chrominance Representation**

**Figure 11-56. DISPC YUV4:2:2 to RGB30 Using Averaging of the Chrominance**

disp-007

The scaler unit can be used to resample the chrominance of YUV4:2:0 and YUV4:2:2, as shown in [Figure 11-57](#) and [Figure 11-58](#), respectively. The settings of the scaler unit to perform chrominance resampling are described in [Section 11.2.4.10.4, DISPC Scaler Unit](#).

**Figure 11-57. DISPC YUV4:2:0 to RGB30 Using Scaler Unit for Resampling Chrominance**

disp-008

**Figure 11-58. DISPC YUV4:2:2 to RGB30 Using Scaler Unit for Resampling Chrominance**

disp-009

**NOTE:** If rotation must be supported, YUV4:2:2 and YUV4:2:0 (0-/180-degree rotation) chrominance resampling is done as shown in [Figure 11-58](#) and [Figure 11-57](#), respectively. For YUV4:2:2 (90-/270-degree rotation) data are preprocessed to present YUV4:4:4 on the scaler input (duplication of the missing chroma), as shown in [Figure 11-56](#).

#### 11.2.4.10.4 DISPC Scaler Unit

All video formats are supported, including formats with alpha blending. Alpha blending is scaled with the same parameters as RGB color components. For the YUV formats, Y and Cb/Cr are processed independently. The filter is based on a finite impulse response (FIR) filter. The filtering can be used for different processing:

- Upsampling of the picture
- Downsampling of the picture
- Antiflicker reduction
- Spatial de-interlacing using bob algorithm
- Chrominance resampling in case of YUV data formats

**NOTE:** The user must ensure that the resizing frame displays in the LCD/screen boundaries.

[Figure 11-59](#) shows an example of video upsampling.

Figure 11-59. DISPC Video Upsampling

The upsampling and downsampling filter is a polyphase filter with five taps and eight phases for the horizontal filter, and a programmable number of taps (three or five) and eight phases for vertical filter. The input buffer has five input memory lines. The following limitations must be considered:

- The upsampling ratio is up to x8.
- The downsampling ratio using 3-tap configuration is down to x0.5 for RGB format.
- The downsampling ratio using 5-tap configuration is down to x0.25 for RGB format.
- If the input format is changed from YUV4:2:2 to YUV4:2:0 (WB pipeline), the downsampling ratio is further reduced:
  - Using 5-tap configuration, the ratio is down to x0.5 for RGB format.
  - Using 3-tap configuration, no downscaling is available.

For vertical upsampling and downsampling in a 3-tap configuration, the equations are:

For RGB formats	For YUV formats
$A_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * A_{in}(n+i)) \gg 5$	$Y_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi_y) * Y_{in}(n+i)) \gg 5$
$R_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * R_{in}(n+i)) \gg 5$	$Cr_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\Phi_c) * Cb_{in}(n+i)) \gg 5$
$G_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * G_{in}(n+i)) \gg 5$	$Cb_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\Phi_c) * Cr_{in}(n+i)) \gg 5$
$B_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * B_{in}(n+i)) \gg 5$	

dispc-013

(1)

For vertical upsampling and downsampling in a 5-tap configuration, the equations are:

For RGB formats	For YUV formats
$A_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * A_{in}(n+i)) \gg 5$	$Y_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi_y) * Y_{in}(n+i)) \gg 5$
$R_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * R_{in}(n+i)) \gg 5$	$Cb_{out}(n) = (\sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cb_{in}(n+i)) \gg 5$
$G_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * G_{in}(n+i)) \gg 5$	$Cr_{out}(n) = (\sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cr_{in}(n+i)) \gg 5$
$B_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * B_{in}(n+i)) \gg 5$	

dispc-012

(2)

For horizontal upsampling and downsampling in a 5-tap configuration, the equations are:

<p style="text-align: center;">For RGB formats</p> $A_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hi}(\Phi) * A_{in}(n+i) \right) \gg 7$ $R_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hi}(\Phi) * R_{in}(n+i) \right) \gg 7$ $G_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hi}(\Phi) * G_{in}(n+i) \right) \gg 7$ $B_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hi}(\Phi) * B_{in}(n+i) \right) \gg 7$	<p style="text-align: center;">For YUV formats</p> $Y_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hi}(\Phi) * Y_{in}(n+i) \right) \gg 7$ $Cb_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hcl}(\Phi_c) * Cb_{in}(n+i) \right) \gg 7$ $Cr_{out}(n) = \left( \sum_{i=-2}^{i=2} C_{hcl}(\Phi_c) * Cr_{in}(n+i) \right) \gg 7$
--	---

(3)

dispc-014

**NOTE:** The pixel (n + 1) is the previous pixel with respect to pixel (n). The line (n + 1) is the previous line with respect to line (n).

The coefficients Ci() depend on the phase between input and output pixels.

**NOTE:** The coefficients are different for Y and Cr, Cb filtering because the calculations are independent due to the chrominance resampling for YUV4:2:2 and YUV4:2:0.

First, the vertical filter is applied to the encoded input pixel data, and then the horizontal filter is applied on the resulting pixel values to generate the output pixel values. The vertical input of the filter consists of five lines of 2048 x 32 bits for both 3-tap and 5-tap configurations (see [Table 11-101](#)).

**Table 11-101. DISPC Line Buffer Width for Scaler Unit**

Vertical Taps	Maximum Input Width (Pixels)
3, 5	2048 x 32 bits

At the beginning of frame scaling processing, the first line is duplicated to fill the first two lines in 3-tap configuration and the first three lines in 5-tap configuration.

At the end of frame scaling processing, the last line is duplicated if the scaling logic requires loading more lines and the last line has been reached.

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The video scalers have an 8-bit input and a 10-bit output. The vertical scaling changes the 8-bit input into a 10-bit clipped output and the horizontal scaling takes the 10-bit input.

[Figure 11-60](#) and [Figure 11-61](#) show the scaler macro-architecture for the component A, R, G, B, and Y. [Figure 11-62](#) and [Figure 11-63](#) show the scaler macro-architecture for component Cr and Cb.

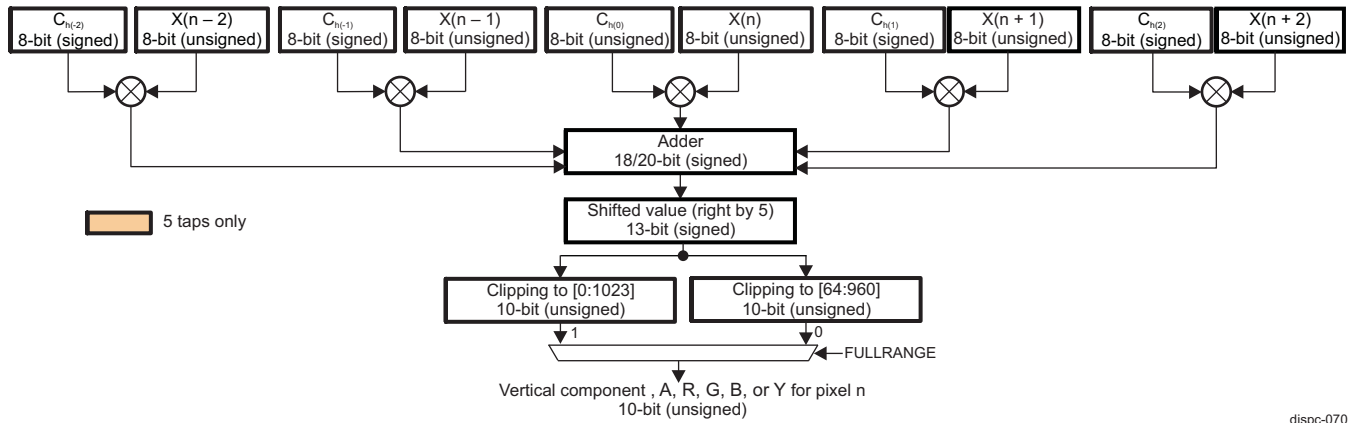

The scaling output can be clipped to an output range of [1023:0] or [960:64] by configuring the DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE bit.

**NOTE:** The scaling and CSC clipping is set by the same bit, DISPC\_VIDp\_ATTRIBUTES[11] FULLRANGE.

	Chc(2)		FIRHC0	DISPC_VIDp_FIR_COE F_H2_i

The VID scaler unit vertical or/and horizontal sampling is defined by setting/resetting the DISPC\_VIDp\_ATTRIBUTES[6:5] RESIZEENABLE bit field.

A set of configurations must be valid before enabling the video upsampling and downsampling block.

The following fields define the configuration of the video upsampling downsampling block for VIDp:

- Vertical upsampling and downsampling increments the value of the DISPC\_VIDp\_FIR[28:16] FIRVINC bit field. The unsigned integer value range is [4096:1]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left( \frac{SIZEY}{MEMSIZEY} \right) \quad \text{dispc-066} \quad (4)$$

**NOTE:**

- If the value of the DISPC\_VIDp\_FIR[28:16] FIRVINC bit field is greater than 4096, it is clipped to 4096.
  - If the DISPC\_VIDp\_SIZE[27:16] SIZEY bit field equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
  - The values of the DISPC\_VIDp\_PICTURE\_SIZE[27:16] MEMSIZEY and DISPC\_VIDp\_SIZE[27:16] SIZEY bit fields must be programmed with the value desired minus 1.
- Horizontal upsampling and downsampling increments the value of the DISPC\_VIDp\_FIR[12:0] FIRHINC bit field. The unsigned integer value range is [4096:1]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left( \frac{SIZEX}{MEMSIZEX} \right) \quad \text{dispc-067} \quad (5)$$

**NOTE:**

- If the value of the DISPC\_VIDp\_FIR[12:0] FIRHINC bit field is greater than 4096, it is clipped to 4096.
  - If the DISPC\_VIDp\_SIZE[10:0] SIZEX bit field equals 1, SIZEX is replaced by 2 in the previous equation.
  - The values of the DISPC\_VIDp\_PICTURE\_SIZE[10:0] MEMSIZEX and DISPC\_VIDp\_SIZE[10:0] SIZEX bit fields must be programmed with the value desired minus 1.
- 
- Vertical up/downsampling accumulator value DISPC\_VIDp\_ACCU\_j[26:16] VERTICALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the vertical filtering starts. The register DISPC\_VIDp\_ACCU\_0 is used for progressive output and for interlace output; the DISPC\_VIDp\_ACCU\_0 and DISPC\_VIDp\_ACCU\_1 registers are used. Similarly, DISPC\_VIDp\_ACCU2\_0 and DISPC\_VIDp\_ACCU2\_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
  - Vertical upsampling and downsampling line buffer configuration DISPC\_VIDp\_ATTRIBUTES[21] VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
  - Horizontal upsampling and downsampling accumulator value DISPC\_VIDp\_ACCU\_j[10:0] HORIZONTALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the horizontal filtering starts. The register DISPC\_VIDp\_ACCU\_0 is used for progressive output and for interlace output; the DISPC\_VIDp\_ACCU\_0 and DISPC\_VIDp\_ACCU\_1 registers are used. Similarly, DISPC\_VIDp\_ACCU2\_0 and DISPC\_VIDp\_ACCU2\_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.

Table 11-104 lists the DISPC vertical and horizontal accumulator values and phases.

**Table 11-104. DISPC Vertical and Horizontal Accumulator Phase**

Accumulator Value	Phases f
0	0
128 or −896	1
256 or −768	2
384 or −640	3
512 or −512	4
640 or −384	5
768 or −256	6
896 or −128	7

- Vertical upsampling and downsampling coefficients:
  - The 3-tap vertical upsampling and downsampling coefficients are defined in the DISPC\_VIDp\_FIR\_COEF\_HV\_i registers. There are 8 registers for the 8 phases with 3 coefficients for each, or a total of 24 programmable coefficients for the vertical upsampling and downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
  - The 5-tap vertical upsampling and downsampling coefficients: Two extra-tap vertical upsampling and downsampling coefficients are defined in the DISPC\_VIDp\_FIR\_COEF\_V\_i registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical upsampling downsampling block are used in addition to the 3-tap registers previously defined.

Four YUV vertical upsampling and downsampling coefficients are set in DISPC\_VIDp\_FIR\_COEF\_HV2\_i and DISPC\_VIDp\_FIR\_COEF\_V2\_i registers. Table 11-102 and Table 11-103 summarize all coefficients and their respective registers.
- Horizontal upsampling and downsampling coefficients:

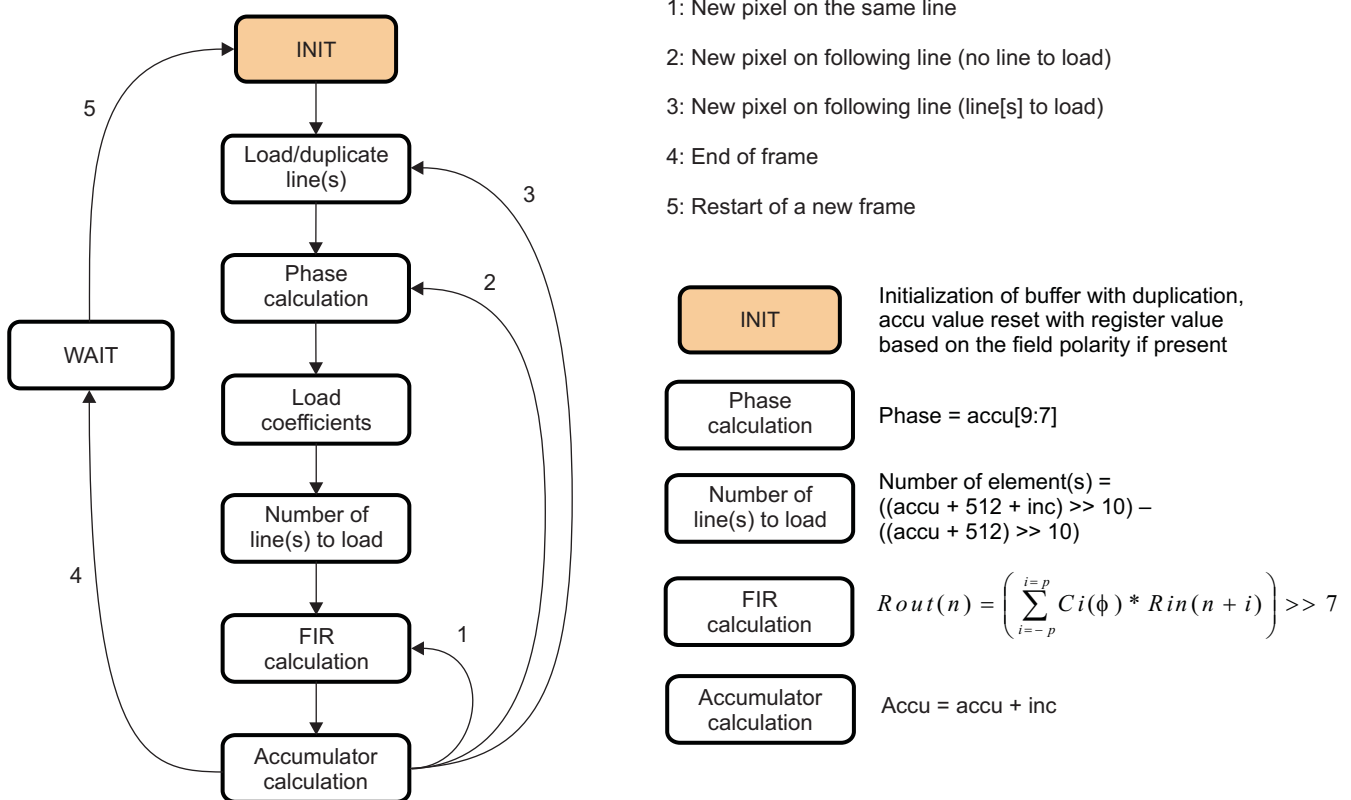

- The DISPC\_VIDp\_FIR\_COEF\_H\_i and DISPC\_VIDp\_FIR\_COEF\_HV\_i registers define the 5-tap horizontal up/downsampling coefficients. Each DISPC\_VIDp\_FIR\_COEF\_H\_i register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each DISPC\_VIDp\_FIR\_COEF\_HV\_i register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal upsampling and downsampling block are used.

Four YUV horizontal upsampling and downsampling coefficients are set in the DISPC\_VIDp\_FIR\_COEF\_HV2\_i and DISPC\_VIDp\_FIR\_COEF\_H2\_i registers. Table 11-102 and Table 11-103 summarize all coefficients and their respective registers.

#### 11.2.4.10.4.1 DISPC Scaling Algorithms

Figure 11-64 and Figure 11-65 show details of the vertical and horizontal upsampling and downsampling finite state-machines (FSMs), respectively.

Figure 11-64. DISPC Vertical Upsampling and Downsampling Algorithm

dispc-086

Figure 11-65 shows the horizontal up/downsampling FSM.

Figure 11-65. DISPC Horizontal Up/Downsampling Algorithm

- 2: New pixel (pixel(s) to load)
- 3: End of line
- 4: Restart of a line

INIT	Initialization of buffer with duplication, accu value reset with register value based on the field polarity if present
Phase calculation	Phase = accu[9:7]
Number of line(s) to load	Number of element(s) = ((accu + 512 + inc) >> 10) - ((accu + 512) >> 10)
FIR calculation	$R_{out}(n) = \left( \sum_{i=-p}^{i=p} C_i(\phi) * R_{in}(n+i) \right) >> 7$
Accumulator calculation	Accu = accu + inc

dispc-087

11.2.4.10.4.2 DISPC Scaling limitations

Table 11-105 lists the minimum ratio between the pixel clock frequency (DSS\_DISPC\_LCDn\_PCLK) and the functional clock (F\_CLK) in the input pixel format when using the scaler unit. DSS\_DISPC\_LCDn\_PCLK and F\_CLK are asynchronous. For each LCD output, a dedicated LCD clock is programmable with the LCD and PCD divisor values in DISPC\_DIVISORo[23:16][7:0].

**NOTE:** The F\_CLK is derived from DSS\_FCLK through the LCD divisor.

**NOTE:** The downscaling ratio is not an integer, it is the ratio F\_CLK / DSS\_DISPC\_LCDn\_PCLK, meaning if the ratio is 2.7, then the downscaling ratio is 2.7 and not 2.

Table 11-105. DISPC Pixel Clock Frequency Limitations (Any Pixel Format) – Active Matrix Display

F_CLK/DSS_DISPC_LCDn_PCLK Minimum Ratio	Horizontal Resampling				
	Off	Up	1:1–1:2	1:2–1:3	1:3–1:4
	2 or 1 <sup>(1)</sup>	2 or 1 <sup>(1)</sup>	2	3	4

<sup>(1)</sup> The minimum ratio can be 1 if the data are output on the rising edge of the PCLK (DISPC\_POL\_FREQo.IPC = 0 and CTRL\_CORE\_SMA\_SW\_1[DSS\_CHx\_IPC]); otherwise, the minimum ratio must be 2.

### 11.2.4.11 DISPC Write-Back Pipeline

The write-back pipeline is used to store in the system memory the capture of the overlay output or the output of one of the pipelines. The WB pipeline consists of a CSC unit, a scaler unit, and an RGB truncation logic. Because the overlay works on ARGB32-8888 format and the video accelerator works on YUV format, the color space conversion from RGB to YUV is used to directly output to memory the format that can be encoded with no extra processing.

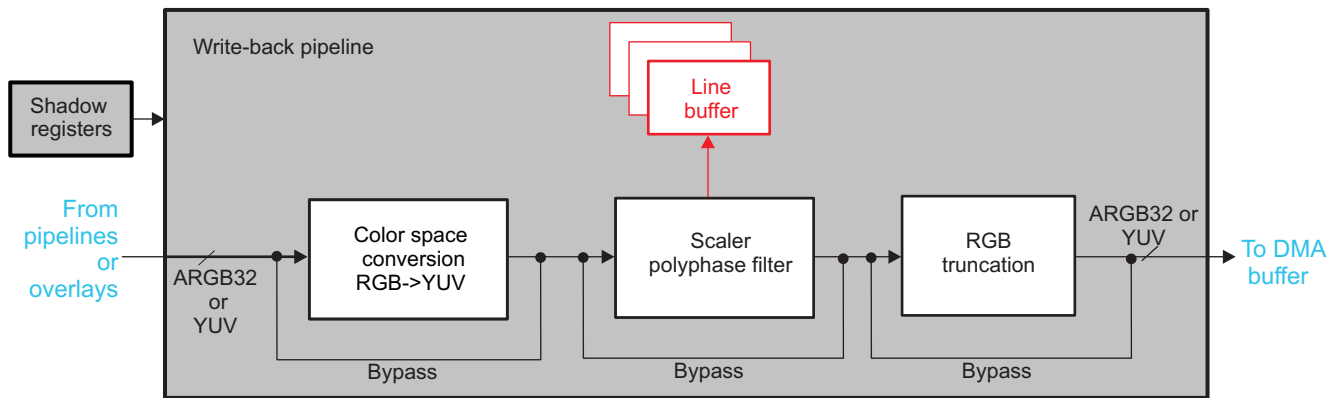

The write-back pipeline is connected to all the pipeline outputs (GFX, VD1, VID2, and VID3 pipelines) and to the output of the three overlay managers (LCD1, LCD2, LCD3, and TV). The input is selected by setting the `DISPC_WB_ATTRIBUTES[18:16] CHANNELIN` bit field, and the capture frame rate is set in the `DISPC_WB_ATTRIBUTES[26:24] CAPTUREMODE` bit field.

Because the output format of the TV overlay manager is ARGB40, the graphics pipeline output is ARGB40, the video pipeline outputs are YUV4:2:2, YUV4:2:0, or ARGB40, and the write-back input is ARGB32, the write-back input does not consider the 2 LSBs of each ARGB component.

The write-back pipeline is enabled by setting the `DISPC_WB_ATTRIBUTES[0] ENABLE` bit to 0x1.

Figure 11-66 shows the graphics pipeline.

Figure 11-66. DISPC Write-Back Pipeline

dispc-016

#### 11.2.4.11.1 DISPC Write-Back CSC Unit RGB to YUV

The RGB-to-YUV CSC unit converts the encoded pixel values from RGB24 into YUV4:4:4 format. For YUV4:2:0 or YUV4:2:2 formats, a chrominance sub-sampling is required after converting the RGB into YUV values. Because of the subsampling, the following limitations must be considered:

- When converting RGB into YUV4:2:0 NV12 format:
  - Maximum horizontal downscale = x0.5
  - Maximum vertical downscale = x0.5
- When converting RGB into YUV4:2:2 format:
  - Maximum horizontal downscale = x0.5
  - Maximum vertical downscale = x0.25

Figure 11-67 and Figure 11-68 show the 3 × 3 11-bit coefficients used to convert from RGB24 into YUV4:4:4. The user sets the coefficients according to the standard used to encode the pixel data in YUV color space. Table 11-106 lists the coefficients with their respective bit fields.

Table 11-106. DISPC CSC RGB to YUV Bit Field Setting

Coefficients	Bit Fields
Y <sub>R</sub>	DISPC_WB_CONV_COEF0[10:0] YR
Y <sub>G</sub>	DISPC_WB_CONV_COEF0[26:16] YG
Y <sub>B</sub>	DISPC_WB_CONV_COEF1[10:0] YB

**Table 11-106. DISPC CSC RGB to YUV Bit Field Setting (continued)**

Coefficients	Bit Fields
Cr <sub>R</sub>	DISPC_WB_CONV_COEF1[26:16] CRR
Cr <sub>G</sub>	DISPC_WB_CONV_COEF2[10:0] CRG
Cr <sub>B</sub>	DISPC_WB_CONV_COEF2[26:16] CRB
Cb <sub>R</sub>	DISPC_WB_CONV_COEF3[10:0] CBR
Cb <sub>G</sub>	DISPC_WB_CONV_COEF3[26:16] CBG
Cb <sub>B</sub>	DISPC_WB_CONV_COEF4[10:0] CBB

If the active range for the luminance samples (Y) is [16:235] and [16:240] for the chrominance samples (Cb and Cr), the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the [DISPC\\_WB\\_ATTRIBUTES\[11\] FULLRANGE](#) bit to 0x0.

**Figure 11-67. DISPC RGB to YCbCr (FULLRANGE = 0)**

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \end{bmatrix}$$

dispc-017

If the active range for the luminance samples (Y) and or the chrominance samples (Cb and Cr) is [0:255], the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the [DISPC\\_WB\\_ATTRIBUTES\[11\] FULLRANGE](#) bit to 0x1.

**Figure 11-68. DISPC RGB to YCbCr (FULLRANGE = 1)**

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \end{bmatrix}$$

dispc-018

#### 11.2.4.11.2 DISPC Write-Back Scaler Unit

The functional aspect of the write-back pipeline scaler unit is identical to the video pipeline scaler unit (see [Section 11.2.4.10.4, DISPC Scaler Unit](#)), except in the output width when scaling ARGB components. The resulting output format is ARGB32 instead of ARGB40. In addition, the scaling limitations described in [Section 11.2.4.10.4.2](#) are relevant only to the video pipelines scaler units. In write-back memory-to-memory mode there are no limitations on the F\_CLK/DSS\_DISPC\_LCDn\_PCLK ratio for horizontal resampling.

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The write-back scaler component has an 8-bit input and an 8-bit output.

[Figure 11-69](#) and [Figure 11-70](#) show the scaler macro-architecture for the component A, R, G, B, and Y. [Figure 11-71](#) and [Figure 11-72](#) show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [0:255] or [16:240] by configuring the [DISPC\\_WB\\_ATTRIBUTES\[11\] FULLRANGE](#) bit.

Figure 11-69. DISPC Macro-Architecture of the Vertical Scaling for A, R, G, B, and Y Components

Figure 11-70. DISPC Macro-Architecture of the Horizontal Scaling for A, R, G, B, and Y Components

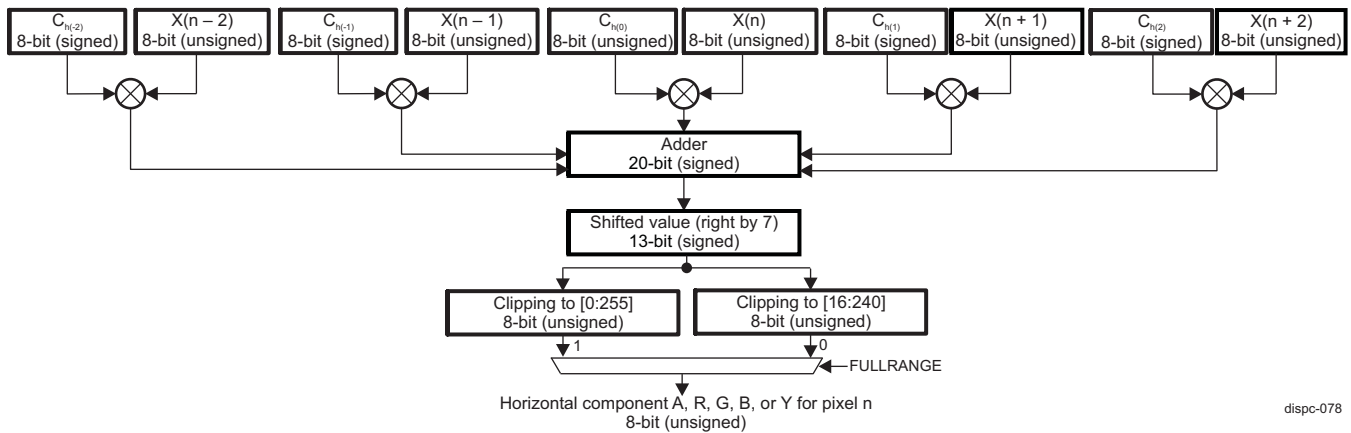

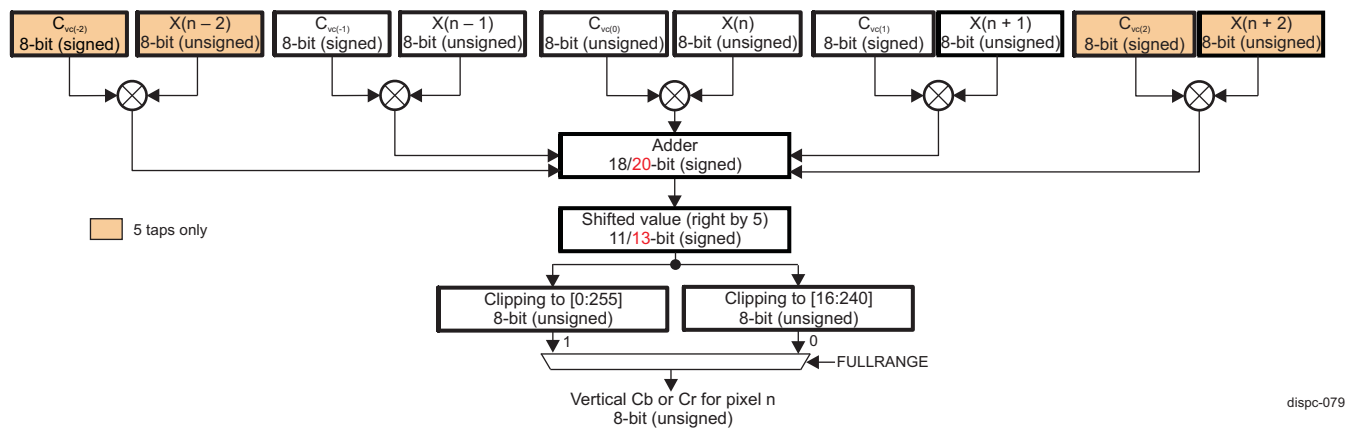

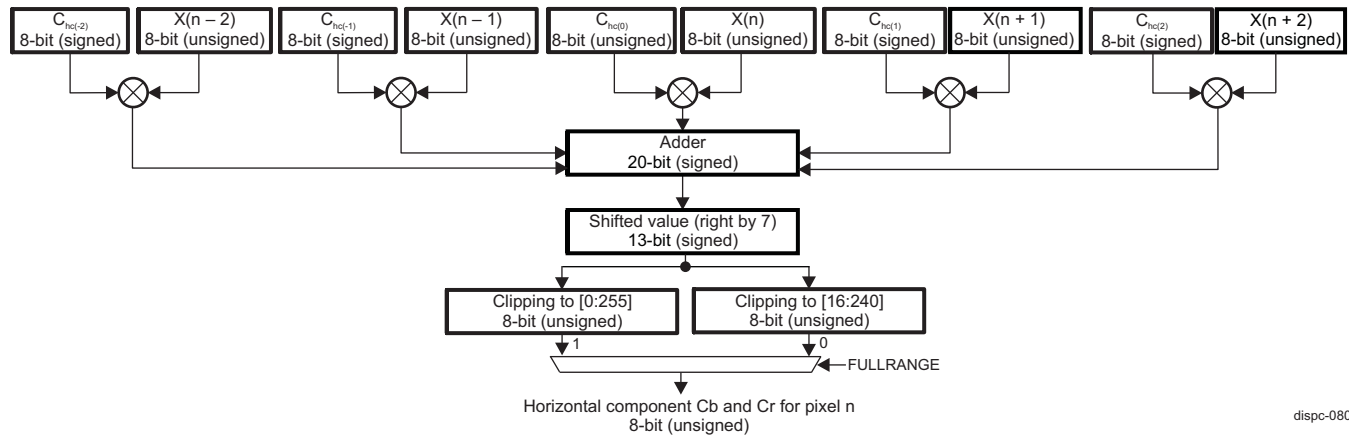

Figure 11-71. DISPC Macro-Architecture of the Vertical Scaling for Cr and Cb Components

**Figure 11-72. DISPC Macro-Architecture of the Horizontal Scaling for Cr and Cb Components**

dispc-080

Table 11-107 and Table 11-108 list all the bit fields in the function to set each coefficient.

**Table 11-107. DISPC Register Bit Field Associated With Coefficient for ARGB and Y Configuration in WB Scaler**

Taps	Coefficient	3 Taps	5 Taps	Registers
		Bit Field	Bit Field	
Vertical	$C_v(-2)$		FIRVC22	DISPC_WB_FIR_COEF_V_i
	$C_v(-1)$	FIRVC2	FIRVC2	DISPC_WB_FIR_COEF_HV_i
	$C_v(0)$	FIRVC1	FIRVC1	DISPC_WB_FIR_COEF_HV_i
	$C_v(1)$	FIRVC0	FIRVC0	DISPC_WB_FIR_COEF_HV_i

	$C_h(2)$		FIRHC0	DISPC_WB_FIR_COEF_H_i

**Table 11-108. DISPC Register Bit Field Associated With Coefficient for Cb and Cr Configuration in WB Scaler**

Taps	Coefficient	3 Taps	5 Taps	Registers
		Bit Field	Bit Field	
Vertical	Cvc(-2)		FIRVC22	DISPC_WB_FIR_COEF_V2_i
	Cvc(-1)	FIRVC2	FIRVC2	DISPC_WB_FIR_COEF_HV2_i
	Cvc(0)	FIRVC1	FIRVC1	DISPC_WB_FIR_COEF_HV2_i
	Cvc(1)	FIRVC0	FIRVC0	DISPC_WB_FIR_COEF_HV2_i
	Cvc(2)		FIRVC00	DISPC_WB_FIR_COEF_V2_i
Horizontal	Chc(-2)		FIRHC4	DISPC_WB_FIR_COEF_HV2_i
	Chc(-1)		FIRHC3	DISPC_WB_FIR_COEF_H2_i
	Chc(0)	N/A	FIRHC2	DISPC_WB_FIR_COEF_H2_i
	Chc(1)		FIRHC1	DISPC_WB_FIR_COEF_H2_i
	Chc(2)		FIRHC0	DISPC_WB_FIR_COEF_H2_i

The WB scaler unit vertical or/and horizontal sampling is defined by setting/resetting the [DISPC\\_WB\\_ATTRIBUTES\[6:5\] RESIZEENABLE](#) bit field.

A set of configuration must be valid before enabling the video up/downsampling block.

The following fields define the configuration of the video up/downsampling block for WB:

- Vertical up/downsampling increments the value of the [DISPC\\_WB\\_FIR\[28:16\] FIRVINC](#) bit field. The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left( \frac{SIZEY}{MEMSIZEY} \right)$$

dispc-066

(6)

**NOTE:**

- If the value of the [DISPC\\_WB\\_FIR\[28:16\] FIRVINC](#) bit field is greater than 4096, it is clipped to 4096.
  - If the [DISPC\\_WB\\_SIZE\[27:16\] SIZEY](#) bit field equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
  - The values of the [DISPC\\_WB\\_PICTURE\\_SIZE\[27:16\] MEMSIZEY](#) and [DISPC\\_WB\\_SIZE\[27:16\] SIZEY](#) bit fields must be programmed with the value desired minus 1.
- Horizontal up/downsampling increments the value of the [DISPC\\_WB\\_FIR\[12:0\] FIRHINC](#) bit field: The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left( \frac{SIZEX}{MEMSIZEX} \right)$$

dispc-067

(7)

**NOTE:**

- If the value of the [DISPC\\_WB\\_FIR\[12:0\]](#) FIRHINC bit field is greater than 4096, it is clipped to 4096.
  - If the [DISPC\\_WB\\_SIZE\[10:0\]](#) SIZEX bit field equals 1, the [DISPC\\_WB\\_SIZE\[10:0\]](#) SIZEX bit field is replaced by 2 in the previous equation.
  - The value of the [DISPC\\_WB\\_PICTURE\\_SIZE\[10:0\]](#) MEMSIZEX and [DISPC\\_WB\\_SIZE\[10:0\]](#) SIZEX bit fields must be programmed with the value desired minus 1.
- 
- Vertical up/downsampling accumulator value [DISPC\\_WB\\_ACCU\\_j\[26:16\]](#) VERTICALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the vertical filtering starts. The register [DISPC\\_WB\\_ACCU\\_0](#) is used for progressive output and for interlace output the [DISPC\\_WB\\_ACCU\\_0](#) and [DISPC\\_WB\\_ACCU\\_1](#) registers are used. Similarly, [DISPC\\_WB\\_ACCU2\\_0](#) and [DISPC\\_WB\\_ACCU2\\_1](#) are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
  - Vertical up/downsampling line buffer configuration [DISPC\\_WB\\_ATTRIBUTES\[21\]](#) VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
  - Horizontal up/downsampling accumulator value [DISPC\\_WB\\_ACCU\\_j\[10:0\]](#) HORIZONTALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the horizontal filtering starts. The register [DISPC\\_WB\\_ACCU\\_0](#) is used for progressive output and for interlace output the [DISPC\\_WB\\_ACCU\\_0](#) and [DISPC\\_WB\\_ACCU\\_1](#) registers are used. Similarly, [DISPC\\_WB\\_ACCU2\\_0](#) and [DISPC\\_WB\\_ACCU2\\_1](#) are used in progressive or interlace output to set the accumulator value of Cb and Cr components when scaling YUV format.

[Table 11-109](#) lists the DISPC vertical and horizontal accumulator values and phases.

**Table 11-109. DISPC Vertical/Horizontal Accumulator Phase**

Accumulator Value	Phases f
0	0
128 or −896	1
256 or −768	2
384 or −640	3
512 or −512	4
640 or −384	5
768 or −256	6
896 or −128	7

- Vertical up/downsampling coefficients:
  - The 3-tap vertical up/downsampling coefficients are defined in the [DISPC\\_WB\\_FIR\\_COEF\\_HV\\_i](#) registers. There are 8 registers for the 8 phases with 3 coefficients for each, or a total of 24 programmable coefficients for the vertical up/downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
  - The 5-tap vertical up/downsampling coefficients: Two extra-tap vertical up/downsampling coefficients are defined in the [DISPC\\_WB\\_FIR\\_COEF\\_V\\_i](#) registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical up/downsampling block are used in addition to the 3-tap registers previously defined.

Four YUV vertical up/downsampling coefficients are set in the [DISPC\\_WB\\_FIR\\_COEF\\_HV2\\_i](#) and [DISPC\\_WB\\_FIR\\_COEF\\_V2\\_i](#) registers. [Table 11-107](#) and [Table 11-108](#) summarize all coefficients and their respective registers.
- Horizontal up/downsampling coefficients:
  - The [DISPC\\_WB\\_FIR\\_COEF\\_H\\_i](#) and [DISPC\\_WB\\_FIR\\_COEF\\_HV\\_i](#) registers define the 5-tap horizontal up/downsampling coefficients. Each [DISPC\\_WB\\_FIR\\_COEF\\_H\\_i](#) register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each

[DISPC\\_WB\\_FIR\\_COEF\\_HV\\_i](#) register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal up/downsampling block are used.

Four YUV horizontal up/downsampling coefficients are set in the [DISPC\\_WB\\_FIR\\_COEF\\_HV2\\_i](#) and [DISPC\\_WB\\_FIR\\_COEF\\_H2\\_i](#) registers. [Table 11-107](#) and [Table 11-108](#) summarize all coefficients and their respective registers.

### 11.2.4.11.3 DISPC Write-Back RGB Truncation Logic

Truncation logic is used to convert a pixel from ARGB 32-bit format into a lower color depth: 12- or 16-bit format based. Setting the [DISPC\\_WB\\_ATTRIBUTES\[10\]](#) TRUNCATIONENABLE bit to 0x1 enables the truncation to the pixel format defined by the [DISPC\\_WB\\_ATTRIBUTES\[4:1\]](#) FORMAT bit field. The truncation is done by removing the necessary LSB of each component to match the output format. [Table 11-110](#) describes the truncation done on each component of the pixel.

**Table 11-110. DISPC Truncation Logic**

Output Formats	A[7:0]	R[7:0]	G[7:0]	B[7:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB
xRGB12-4444	Ignored	R[7:4]	G[7:4]	B[7:4]
RGBx12-4444	Ignored	R[7:4]	G[7:4]	B[7:4]
RGB16-565	Ignored	R[7:3]	G[7:2]	B[7:3]
xRGB16-1555	Ignored	R[7:3]	G[7:3]	B[7:3]
ARGB16-4444	A[7:4]	R[7:4]	G[7:4]	B[7:4]
RGBA16-4444	A[7:4]	R[7:4]	G[7:4]	B[7:4]
ARGB16-1555	A[7]	R[7:3]	G[7:3]	B[7:3]

**NOTE:** If there is no alpha field in the pixel format description, 0s or 1s must fill the container. 0s must be used for transparent and 1s for opaque. For example, in xRGB12 pixel format, the upper 4 bits are set to 0s because the RGB value is only 12 bits inside a 16-bit container.

### 11.2.4.12 DISPC Hardware Cursor

The video layer or graphics layer can be used to display the hardware cursor. The encoded pixel data for the cursor image are in one of the following formats if the source transparency color key is used:

- xRGB12-4444
- ARGB16-4444
- RGBx12-4444
- RGBA16-4444
- ARGB16-1555
- RGB16-565
- RGB24-888
- xRGB24-88888
- RGBA32-8888
- BGRA32-8888
- ARGB32-8888

Otherwise, any pixel format can be used for the cursor image, considering the limitation in terms of pixels supported by the pipeline used to display the cursor image. To display a nonrectangle cursor, the transparency color key or alpha blending (pixel alpha blending) can be used (see [Section 11.2.4.13.1.3, DISPC Transparency Color Keys](#)). Global alpha blending can be used in addition to the transparency source color key to create a fading effect when the cursor (with a nonrectangle shape) appears and disappears on the screen. The image of the cursor can be stored entirely inside the DMA buffer to use the self-refresh mode (see [Section 11.2.4.6.8.2, DISPC DMA Ultralow-Power Mode](#)). In that case, the image is loaded once and then displayed without accessing the system memory for loading the image for each frame. This saves bandwidth on interconnect and memory.

### 11.2.4.13 DISPC LCD Outputs

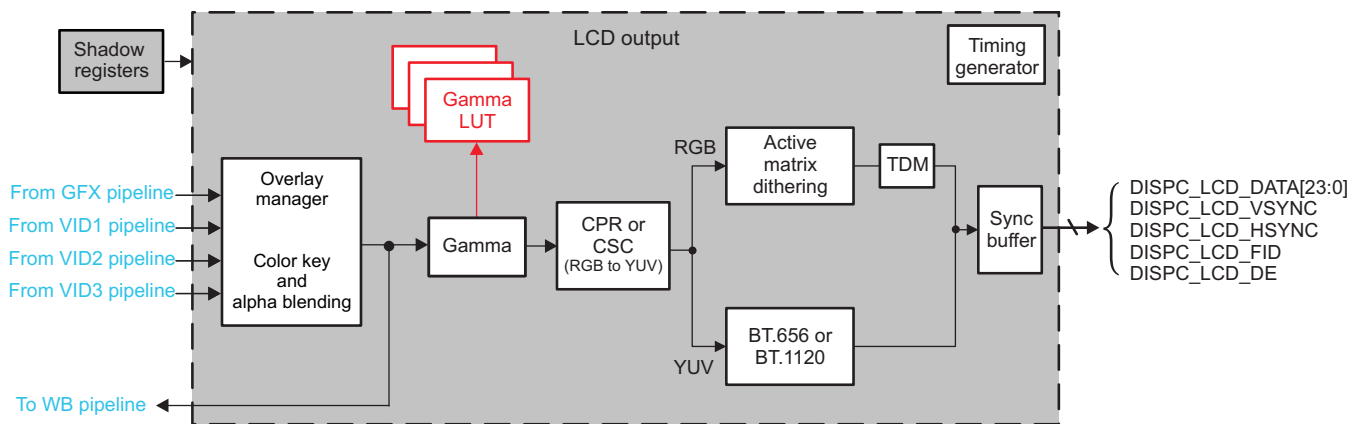

The LCD1, LCD2, LCD3 output paths consist of several processing blocks (see [Figure 11-73](#)):

- Overlay manager
- Gamma correction unit
- Color phase rotation (CPR) block, also used for RGB-to-YUV color space conversion (CSC)
- Active matrix dithering with TDM
- BT.656
- BT.1120
- Synchronization buffer
- Timing generator

The display subsystem supports active matrix technologie (monochrome and color modes):

- Active matrix displays: the configuration of colors depends on the color depth:
  - 24 bpp supports 16,777,216 colors.
  - 18 bpp supports 262,144 colors.
  - 16 bpp supports 65,536 colors.
  - 12 bpp supports 4096 colors.

**Figure 11-73. DISPC LCD Output Architecture**

dispc-028

**NOTE:** In BT.656 mode only bits 9 through 0 are used from DISPC\_LCD\_DATA[23:0] data bus.

#### 11.2.4.13.1 DISPC Overlay Manager

The overlay mechanism consists of displaying more than one layer (GFX, VID1, VID2, and VID3 layers) using:

- A priority rule based on a Z-order: Application can set the ordering layer of the frames.
- Transparency color keys: Destination and source transparency color keys can be set.

- Alpha blending values: Using the A component of a pixel or a blending set by the user for a layer, a level of transparency can be determined.

Each pipeline (GFX, VID1, VID2, and VID3) is assigned to a single overlay and, as a consequence, to a single display controller output, LCD1, LCD2, LCD3, TV, or WB pipeline. An overlay manager can be connected to all four pipelines outputs simultaneously. The pipeline output is directed using the [DISPC\\_GFX\\_ATTRIBUTES\[8\]](#) CHANNELOUT bit and the [DISPC\\_VIDp\\_ATTRIBUTES\[31:30\]](#) CHANNELOUT2 bit field. [Table 11-111](#) summarizes the bit field settings to direct a pipeline to an LCD/TV or WB output. The default value directs all pipelines to LCD1.

**Table 11-111. DISPC Pipeline Connection to LCD, TV, or WB Output**

Overlay Manager/Output	DISPC_GFX_ATTRIBUTES/DISPC_VIDp_ATTRIBUTES	
	CHANNELOUT Bit	CHANNELOUT2 Bit Field
LCD1	0x0	0x0
LCD2	0x0	0x1
LCD3	0x0	0x2
WB	0x0	0x3
TV	0x1	0x0 (See the following note)

---

**NOTE:** When CHANNELOUT = 0x1, the settings CHANNELOUT2 = 0x0, 0x1, 0x2, and 0x3 are reserved.

---

The output of each LCD overlay manager is connected to CPR block through the gamma table unit in the case of gamma correction.

---

**NOTE:** When the pixel format is ARGB or RGBA, the color key match logic uses only the RGB value defined by ARGB or RGBA. The alpha blending factor is ignored.

---

#### 11.2.4.13.1.1 DISPC Priority Rule

The overlay manager is configured using the Z-order parameter. The Z-order value defined for each pipeline indicates the visibility order to the window on the screen. If the Z-order value of window A is lower than the Z-order to layer B, layer A is displayed below layer B. The transparency color keys and the alpha blending factors are then used to blend the layers together (see [Section 11.2.4.13.1.2, DISPC ALPHA Blender](#), and [Section 11.2.4.13.1.3, DISPC Transparency Color Keys](#)). The Z-order is enabled by setting the [DISPC\\_GFX\\_ATTRIBUTES\[25\]](#) ZORDERENABLE bit or the [DISPC\\_VIDp\\_ATTRIBUTES\[25\]](#) ZORDERENABLE bit to 0x1 and by defining the Z-order in the [DISPC\\_GFX\\_ATTRIBUTES\[27:26\]](#) and [DISPC\\_VIDp\\_ATTRIBUTES\[27:26\]](#) ZORDER bit fields. [Table 11-112](#) summarizes the register settings to enable and set the Z-order of a pipeline. [Table 11-112](#) shows the default Z-order values when LCDALPHABLENDERENABLE and ZORDERENABLE are disabled.

**Table 11-112. DISPC Z-Order Register Settings and Default Configuration**

Pipeline	LCDALPHA BLENDERENABLE <sup>(1)</sup>	ZORDERENABLE	ZORDER	Resulting Z-Order Number
GFX	0	0	Don't care	0
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	3
VID1	0	0	Don't care	1
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	0

<sup>(1)</sup> Applies only to LCD1

**Table 11-112. DISPC Z-Order Register Settings and Default Configuration (continued)**

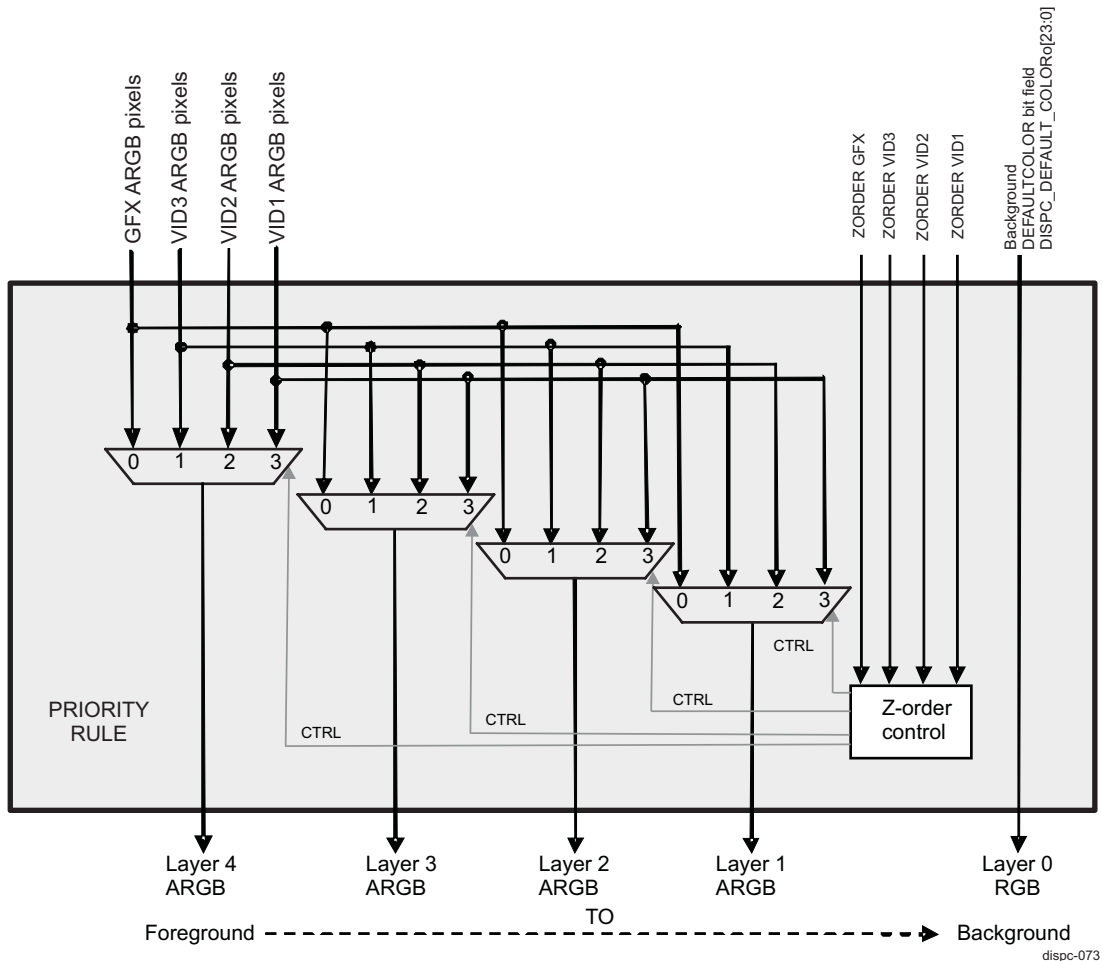

Pipeline	LCDALPHA BLENDERENABLE <sup>(1)</sup>	ZORDERENABLE	ZORDER	Resulting Z-Order Number
VID2	0	0	Don't care	2
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	1
VID3	0	0	Don't care	3
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	2

Figure 11-74 shows the architecture of the priority rule.

**NOTE:**

- If ZORDERENABLE = 1, each Z-order must be different for each active pipeline. It is not possible to use the same value for more than one pipeline.
- Two modes are maintained for backward compatibility with legacy devices:
  - LCDALPHABLENDERENABLE = 0 and ZORDERENABLE = 0 equivalent to the normal mode overlay settings
  - LCDALPHABLENDERENABLE = 1 equivalent to the alpha mode overlay settings

**Figure 11-74. DISPC Priority Rule Architecture**

The height and width of each enabled layer (pipeline) must be defined in the SIZEY and SIZEX bit fields [DISPC\\_GFX\\_SIZE\[27:16\]\[10:0\]](#) / [DISPC\\_VIDp\\_SIZE\[27:16\]\[10:0\]](#), and its x and y positions defined in the POSX and POSY bit fields [DISPC\\_GFX\\_POSITION\[26:16\]\[10:0\]](#) / [DISPC\\_VIDp\\_POSITION\[26:16\]\[10:0\]](#). If there are no graphics or video-encoded pixels at a specific position, the programmable, solid background color appears. The solid background color is set in the [DISPC\\_DEFAULT\\_COLORo\[23:0\]](#) DEFAULTCOLOR bit field. [Figure 11-75](#) is an example of priority rule.

The Z-order reordering block must always map the pipelines to the blender logic in the same order—from background to foreground.

**Figure 11-75. DISPC Example of Priority Rule: From Lower to Higher VID1, VID2, VID3, GFX**

dispc-019

The DISPC is capable of outputting simultaneously two graphic/video windows in frame packing mode. Framepacking mode is enabled from [DISPC\\_GFX\\_ATTRIBUTES\[10\]](#) FRAMEPACKINGMODE / [DISPC\\_VIDp\\_ATTRIBUTES\[8\]](#) FRAMEPACKINGMODE. The position of the second graphic/video windows is defined in [DISPC\\_GFX\\_POSITION2](#) / [DISPC\\_VIDp\\_POSITION2](#) registers. The size is again defined in SIZEY and SIZEX bit fields of [DISPC\\_GFX\\_SIZE\[27:16\]\[10:0\]](#) / [DISPC\\_VIDp\\_SIZE\[27:16\]\[10:0\]](#) registers.

### 11.2.4.13.1.2 DISPC Alpha Blender

[Figure 11-76](#) shows the alpha blending processing in detail.

Figure 11-76. DISPC Alpha Blending Architecture With Premultiplied Alpha Support

dispc-020

**CAUTION**

The Z order of the Source Transparency Layer must have the value 3 (0x3: Z-order 3: layer above all the other layers).

**NOTE:** 1-alpha operator corresponds to the basic 1s-complement operation.

The alpha blending value is defined by:

- The component value A when using an ARGB or RGBA pixel format.

- For ARGB-1555, the alpha blending is defined using a 1-bit value. It is converted into an 8-bit value by duplicating the 1-bit value (see [Table 11-113](#)).
- For ARGB-4444, the alpha blending is defined using a 4-bit value. It is converted into an 8-bit value by duplicating the 4-bit value (see [Table 11-113](#)).
- If the pixel format contains no alpha blending value, the pixel alpha value is considered to be 0xFF and if alpha is equal to 0xFF, there is no multiplication.
- For YUV formats, there is no alpha blending factor associated with each pixel value. Only the global alpha blending factor associated with the window displaying the YUV format is used.
- The global alpha blending value set in the individual bit fields of the [DISPC\\_GLOBAL\\_ALPHA](#) register for LCD:
  - VID3GLOBALALPHA
  - VID2GLOBALALPHA
  - VID1GLOBALALPHA
  - GFXGLOBALALPHA
- A total alpha blending value can be used when a combination of the pixel alpha blending value A and a global alpha blending is present. The resulting alpha value is determined as: Alpha = (Pixel Alpha × Global Alpha) / 256.

[Table 11-113](#) lists the percentage of alpha blending in the function of the alpha blending value on 8 bits.

**Table 11-113. DISPC Alpha Blending – ARGB**

Alpha Blending 1-Bit Value	Alpha Blending 4-Bit Value	Alpha Blending 8-Bit Value (Converted Value or Resulting Alpha)	Percent Blending
0x0	0x0	0x00	100 (transparent)
N/A	0x1	0x11	93.33
N/A	0x2	0x22	86.6
N/A	...	...	...
N/A	0xE	0xEE	6.6
0x1	0xF	0xFF	0 (opaque)

### Premultiplied Alpha

The image ARGB may have its RGB component already premultiplied with the alpha (ARGB) where:

- $R = A * R$
- $G = A * G$
- $B = A * B$

In that case, the processing is as follows:

- Color component of premultiplied layers are multiplied with the Global Alpha, if Global Alpha is not equal to 0.
- Color component of the composed underlying layers are multiplied with  $(1-A) \times$  Global Alpha.

The additional premultiplied alpha option is associated with the pipelines GFX, VID1, VID2, and VID3. The option is accessible through the [28] PREMULIPLYALPHA bit for the respective pipeline register:

- [DISPC\\_GFX\\_ATTRIBUTES](#)
- [DISPC\\_VID1\\_ATTRIBUTES](#)
- [DISPC\\_VID2\\_ATTRIBUTES](#)
- [DISPC\\_VID3\\_ATTRIBUTES](#)

The following settings are available:

- PREMULIPLYALPHA bit = 0: Source is not premultiplied with alpha. Full blending is done in the DISPC.
- PREMULIPLYALPHA bit = 1: Source is premultiplied with alpha. Partial blending is done.

---

**NOTE:** The *prealpha* controls in [Figure 11-76](#), correspond to the PREMULIPLYALPHA of the pipelines mapped on the respective layers.

---

The logic marked in red in [Figure 11-76](#) corresponds to the alpha value, computed when the write-back channel copies back to memory the premultiplied color component:  $A(\text{destination}) = A(\text{source}) + (1-A(\text{source})) \times A(\text{destination})$

When the `DISPC_WB_ATTRIBUTES[7]` ALPHAENABLE bit is cleared, or when the overlay channel is not selected for WB, the computation of the A(destination) is disabled. The default value for `DISPC_WB_ATTRIBUTES[7]` ALPHAENABLE bit is 0x0. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available:

- The ALPHAENABLE bit is set to 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay.
- The ALPHAENABLE bit is set to 0x0: The alpha value is not written back.

---

**NOTE:** The `DISPC_WB_ATTRIBUTES[7]` ALPHAENABLE bit is effective only when one of the output channels is written back, otherwise it is ignored.

---

### 11.2.4.13.1.3 DISPC Transparency Color Keys

The two transparency color keys are the source transparency color key and the destination transparency color key. The transparency color key can be used only with RGB formats (ARGB, RGB, RGBA, xRGB, and RGBx). In this case the A information is ignored for the comparison between the pixel value and the color key value. It is possible to use YUV formats with some care because the comparison is between the input pixel value of the overlay manager from pipeline (GFX or one of the VID pipelines depending on the Z-order) and the color key value. The YUV data is converted to RGB format. If the original format is YUV, the user must consider the color space conversion processing to define the RGB color key value used for the comparison.

The transparency color key is enabled by setting the following bits to 0x1:

- `DISPC_CONFIG1[10]` TCKLCDENABLE (for LCD1)
- `DISPC_CONFIG2[10]` TCKLCDENABLE (for LCD2)
- `DISPC_CONFIG3[10]` TCKLCDENABLE (for LCD3)
- `DISPC_CONFIG1[12]` TCKTVENABLE (for TV)

The transparency color key is determined in the following bit fields.

- `DISPC_TRANS_COLOR0[23:0]` TRANSCOLORKEY (for LCD1)
- `DISPC_TRANS_COLOR2[23:0]` TRANSCOLORKEY (for LCD2)
- `DISPC_TRANS_COLOR3[23:0]` TRANSCOLORKEY (for LCD3)
- `DISPC_TRANS_COLOR1[23:0]` TRANSCOLORKEY (for TV)

---

**NOTE:** The video source transparency color key and graphics destination transparency color key cannot be active at the same time.

---

- Video source transparency color key

The value of the video source transparency color key defines the encoded pixel data considered as a transparent pixel. The encoded pixel values with the source color key value are not visible, and the encoded pixel values of the under layers or solid background color are visible (the pixel alpha blending value of layer 4 is forced to 0x00, fully transparent).

The scaler can be enabled as a preprocessor in the VID pipeline, but it is necessary to consider the pixel scaling preprocessing in order to define the color key value to be used after the rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The source transparency color key mode is selected by setting the following bits to 0x1:

- `DISPC_CONFIG1[11]` TCKLCDSELECTION (for LCD1)

- DISPC\_CONFIG2[11] TCKLCDSELECTION (for LCD2)
- DISPC\_CONFIG3[11] TCKLCDSELECTION (for LCD3)
- DISPC\_CONFIG1[13] TCKTVENABLE (for TV)

Figure 11-77 shows an example of source color key. The pixels with the transparency color key are not displayed; instead, pixels of the resulting layer underneath are shown.

Figure 11-77. DISPC Source Transparency Color Key Example

dispc-021

- Graphics destination transparency color key value

The graphics destination transparency color key value defines the encoded pixels in layer 1, which are not displayed. Other layer 1 pixels (nonequal to destination transparency color key) are displayed over layer 2. The encoded pixel values with the destination color key value are pixels not visible on the screen because pixels at the same position in layer 2 are visible; otherwise, encoded pixels are visible above layer 2. The destination transparency color key applies only if layer 1 overlaps layer 2 (see the Z-order section for details on layer position depending on the Z-order parameter in [Section 11.2.4.13.1.1, Priority Rule](#)); otherwise, the destination transparency color key is ignored.

The scaler can be enabled as a preprocessor in the VID pipeline. It is necessary, however, to consider the pixel scaling preprocessing in order to define the color key value to be used after rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The destination transparency color key mode is selected by setting the following bits to 0x0:

- DISPC\_CONFIG1[11] TCKLCDSELECTION (for LCD1)
- DISPC\_CONFIG2[11] TCKLCDSELECTION (for LCD2)
- DISPC\_CONFIG3[11] TCKLCDSELECTION (for LCD3)
- DISPC\_CONFIG1[13] TCKTVSELECTION (for TV)

Figure 11-78 shows an example of the destination color key. The pixels, equal to the transparency color key, are not displayed and are replaced by layer 2 pixels. All other layer 1 pixels, different from the transparency color key, are displayed over layer 2.

**Figure 11-78. DISPC Destination Transparency Color Key Example**

dispc-022

#### 11.2.4.13.1.4 DISPC Overlay Optimization

The overlay optimization consists in fetching only the required pixels (that is, pixels that contribute to the final picture to be displayed [LCD1, LCD2, LCD3, or TV]). The decision to fetch the pixel from memory is based on the information available in the registers and on the following rules:

- The layer is enabled.
- The global alpha blending factor for the layer is different than 0x00.
- The current layer is behind a nonopaque layer (global alpha blending factor is different than 0xFF for the layer in the preceding).

The result of the overlay optimization is a reduction of the bandwidth by fetching only the mandatory pixels. The overlay mechanism is independent for each overlay: LCD1, LCD2, LCD3, and TV. Because each layer (GFX, VID1, VID2, and VID3) can be associated to only one overlay at a time, it is possible to optimize the fetch of the pixels for each layer based on the overlay information. The overlay optimization must be run on the DMA engine time window and not on the display time window. The pixels are fetched by the DMA engine before the display processing.

The overlay optimization is enabled by setting the following bits to 0x1:

- [DISPC\\_CONTROL1](#)[12] OVERLAYOPTIMIZATION (for LCD1)
- [DISPC\\_CONTROL2](#)[12] OVERLAYOPTIMIZATION (for LCD2)
- [DISPC\\_CONTROL3](#)[12] OVERLAYOPTIMIZATION (for LCD3)
- [DISPC\\_CONTROL2](#)[13] TVOVERLAYOPTIMIZATION (for TV)

---

**NOTE:**

- The pixel alpha blending factor in case of ARGB and RGBA formats cannot be used to take advantage of the pixel fully transparent (alpha blending factor equals 0x00).
  - By default, the overlay optimization is disabled (OVERLAYOPTIMIZATION bits = 0x0 for all DISPC outputs), and all the data for all the enabled pipelines are fetched from memory regardless of the overlay or alpha blending configuration.
- 

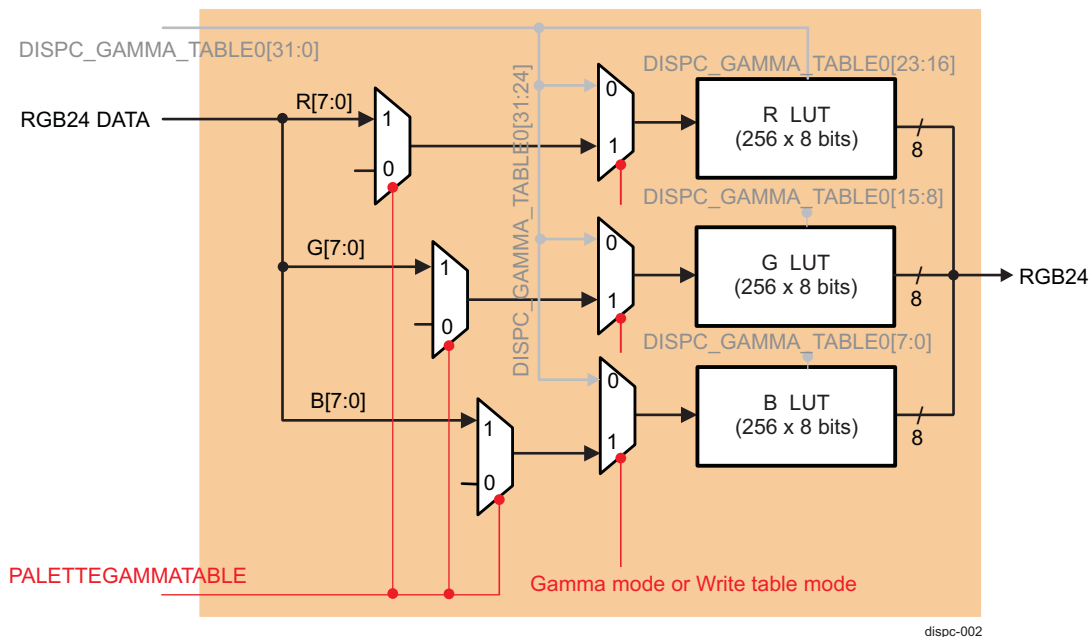

#### 11.2.4.13.2 DISPC Gamma Correction Unit

Each LCD output supports a look up table to perform gamma correction on the display output.

[Figure 11-79](#) shows the internal architecture of the gamma table for LCD1 output.

The gamma table is split into three memories of 256 × 8-bit entries and indexed by the R/G/B component data.

**Figure 11-79. DISPC LCD1 Gamma Correction Architecture**

When performing gamma correction, the selected encoded pixel values based on the color keys by the overlay manager from the video or graphics paths are sent to the gamma curve table. Each component of encoded pixel value is used as a pointer to index 1 out of 256 × 24-bit gamma curve entries in the table. Each 8-bit component is replaced with the 8-bit table value corresponding to R, G, or B component. The table is loaded by software. It is possible to load only part of the table. For each access to the table, the 24-bit value is associated with index in the table by concatenating the 24-bit value (LSB of 32-bit access) and the 8-bit index value (MSB of the 32-bit access).

The sequence to load the gamma table is:

1. SW writes (only writes are supported) 32-bit gamma correction values using single access, or burst access in streaming mode, into `DISPC_GAMMA_TABLE0` register (for LCD1 output). The LSB 24 bits [23:0] are used for the value, and the MSB 8 bits [31:24] are used for the index into the table.
2. Loop to Step 1, if there is a new access to the gamma table register. The SW can access other registers between two accesses to the gamma table register.

SW needs to ensure that there is no visible effect when modifying the table, since it is not under HW control.

For LCD1 output the usage of the gamma table is activated by setting `DISPC_CONFIG1[3]` `PALETTEGAMMATABLE` register bit to 0x1.

For LCD2 and LCD3 outputs, the associated gamma tables are enabled by setting `DISPC_CONFIG1[9]` `GAMATABLEENABLE` register bit to 0x1.

- For LCD2 output the gamma values are loaded into `DISPC_GAMMA_TABLE1` register
- For LCD3 output the gamma values are loaded into `DISPC_GAMMA_TABLE3` register

Figure 11-80 describes the format of one of the gamma curve values in the memory.

**Figure 11-80. DISPC Data Memory Organization for Gamma Mode in LCD Output**

### 11.2.4.13.3 DISPC Color Phase Rotation Unit

The CPR unit can be used to correct the LCD output colorimetry in case of nonpure white backlight.

The CPR is enabled by setting the DISPC\_CONFIG0[15] CPR bit to 0x1. The coefficients are programmed in the following registers:

- Red 10-bit signed coefficients in DISPC\_CPRo\_COEF\_R
- Green 10-bit signed coefficients in DISPC\_CPRo\_COEF\_G
- Blue 10-bit signed coefficients in DISPC\_CPRo\_COEF\_B

The CPR can be selected for active matrix panel. The logic is integrated after the LCD overlay manager and the gamma correction, and before the spatial/temporal dithering. The CPR can be selected to correct the nonpure white backlight of the LCD module by using a programmable matrix to convert the 24-bit RGB pixel value into a new 24-bit RGB pixel value. The matrix is programmed through a set of nine 10-bit signed coefficients. The output of the calculation is clipped to [0:255]. The CPR is processed by the equation shown in [Figure 11-81](#). [Table 11-114](#) lists all coefficients with their respective bit field registers for settings.

**Figure 11-81. DISPC CPR Matrix**

$$\begin{bmatrix} R_{out} \\ G_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} R_r & R_g & R_b \\ G_r & G_g & G_b \\ B_r & B_g & B_b \end{bmatrix} * \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix}$$

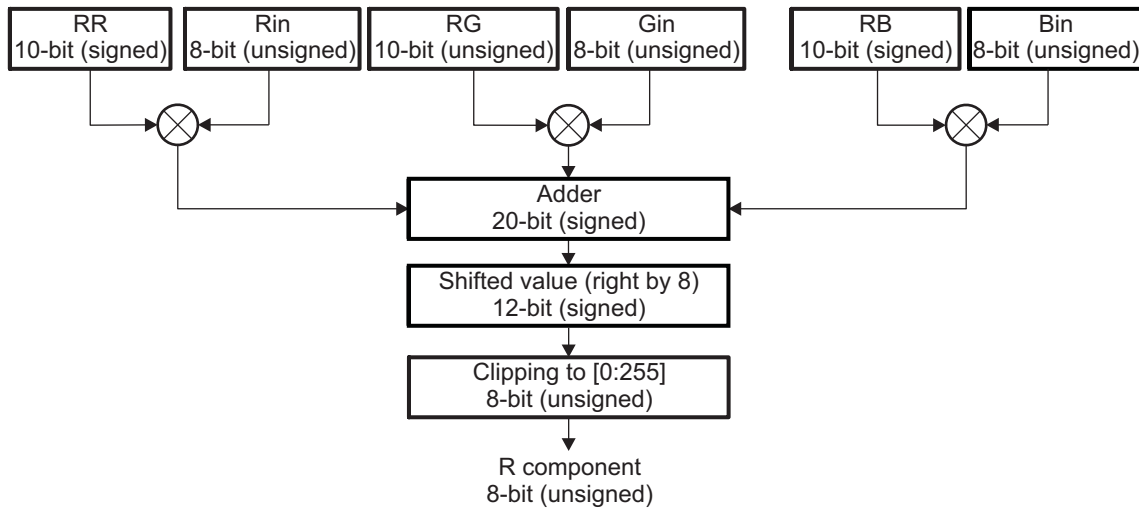

dispc-023

**Table 11-114. DISPC CPR or RGB to YUV Coefficients With Associated Bit Fields**

Registers	Bit Field	Color Phase Rotation	RGB to YUV
DISPC_CPRo_COEF_R	RR	Rr	Yr
	RG	Rg	Yg
	RB	Rb	Yb
DISPC_CPRo_COEF_G	GR	Gr	Cbr
	GG	Gg	Cbg
	GB	Gb	Cbb
DISPC_CPRo_COEF_B	BR	Br	Crr
	BG	Bg	Crg
	BB	Bb	Crb

Figure 11-82 shows the CPR macro-architecture.

Figure 11-82. DISPC CPR Macro-Architecture

dispc-024

**NOTE:** CPR is kept as 8 bit output. For the optional 10 bit BT.656-4 format, zero is simply added as 2 LSBs.

#### 11.2.4.13.4 DISPC Color Space Conversion

The Color Phase Rotation block can be used to perform color space conversion. Table 11-114 lists the associated coefficients with their respective register bit-fields. The Color Space Conversion logic uses the CPR registers for the coefficients. The Color Space Conversion processing is enabled by setting the DISPC\_CONFIG0[24] COLORCONVENABLE register bit to 0x1.

The color space conversion on the LCD output can be selected in order to convert from 24-bit RGB to YUV444. The matrix is programmed through a set of nine 10-bit signed coefficients. The result is clipped to [16:235] for the luminance and [16:240] for the chrominance, when full-range equals zero (DISPC\_CONFIG0[25] FULLRANGE = 0).

Figure 11-83. DISPC RGB to YUV Registers (FullRange=0)

$$\begin{bmatrix} Y \\ Cr \\ Cb \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} YR & YG & YB \\ CrR & CrG & CrB \\ CbR & CbG & CbB \end{bmatrix} * \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-098

If the programmed active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:255], the values Y, Cb, and Cr are clipped to the range [0:255]. The following equation gives the 11-bit coefficients of the RGB to YUV color space conversion, for full-range (DISPC\_CONFIG0[25] FULLRANGE = 1)

**Figure 11-84. DISPC RGB to YUV Registers (FullRange=1)**

$$\begin{bmatrix} Y \\ Cr \\ Cb \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} YR & YG & YB \\ CrR & CrG & CrB \\ CbR & CbG & CbB \end{bmatrix} * \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-098

In order to provide YUV422 data to the BT-656 or BT-1120 blocks, the YUV444 format is converted to YUV422 by sub-sampling the chrominance values. The hardware does this by averaging two-by-two the chrominance samples. The conversion from YUV444 to YUV422 is performed when the color space conversion is enabled. Thus, the output of the CPR unit is always YUV422 after color space conversion.

**11.2.4.13.5 DISPC BT.656 and BT.1120 Modes**

The LCD outputs (LCD1, LCD2 and LCD3) can be configured in BT.656 or BT.1120 mode. The following standards are not supported in BT.656 mode:

- BT.470 (Support for conventional Analog TV Systems)
- BT.803 (The avoidance of interference generated by digital television studio equipment)
- BT.1364 (Format of ancillary data signals carried in digital component studio interfaces)

Unsupported formats when BT.1120 mode is used:

- BT.1364 (Support for Ancillary Data during blanking period)

BT.656/BT.1120 modes use embedded EAV/SAV syncs.

**CAUTION**

DISPC supports maximum 256 bytes of horizontal blanking when the LCD outputs are configured in BT modes (bitfield HSW of [DISPC\\_TIMING\\_H1/2/3](#) registers is 8 bits wide). This is not compliant with BT.656 and BT.1120 standards, both of which require higher blanking periods. If more than 256 bytes of horizontal blanking are required by the application, then the RGB mode must be used for the LCD outputs.

Figure 11-85 shows signal mapping on DISPC\_LCD\_DATA[23:0] data bus. Bits 9 to 0 are used in BT.656 mode (10-bit).

**Figure 11-85. DISPC Signal Mapping in BT.656 Mode**

23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Unused														BT.656									

**NOTE:** For compatibility with existing 8-bit interfaces, the two LSB are ignored, and only bits [9:2] are used.

Figure 11-86 shows signal mapping on DISPC\_LCD\_DATA[23:0] data bus for BT.1120 mode. Bits [19:10] (CbCr) and [9:0] (Y) are used in 20-bit mode. Bits [19:12] (CbCr) and [9:2] (Y) are used in 16-bit mode (YCbCr 4:2:2).

**Figure 11-86. DISPC Signal Mapping in BT.1120 Mode**

**NOTE:** The LCD outputs support both interlace and progressive content in BT.656/BT.1120 modes. In progressive mode the maximum resolution will be limited, as it requires two clock cycles to send out one pixel.

**11.2.4.13.5.1 Blanking**

During the transmission of the video signal, the portion of the stream in-between active video data segments is known as the horizontal blanking interval.

Strictly speaking this entire region is the blanking interval, but this interval also includes the EAV and SAV codes. The remaining bytes of information in a digital blanking interval are filled with values corresponding to the blanking levels of the Cb, Y and Cr signals respectively, and in accordance with the standard multiplex sequence for the stream (CbYCrY..). The blanking levels are as follows:

- Cb = 80h
- Y = 10h
- Cr = 80h.

The sequence in the BLANKING region of the data stream is therefore: 80h, 10h, 80h, 10h.....80h, 10h  
For more details on setting the blanking timing values for BT.1120 and/or BT.656 mode, see [Section 11.2.4.13.8, DISPC Timing Generator and Panel Settings](#).

**11.2.4.13.5.2 EAV and SAV**

The End of Active Video(EAV) and Start of Active Video (SAV) parts of the stream are timing codes. Their function can be summarized as follows:

- EAV – marks the end of the active video data within the current line and therefore also the start of the subsequent line.
- SAV – heralds the start of the active video data within the current line.

These codes are embedded within the BT.656 video data stream, thereby eliminating the need for additional timing signals (HSYNC, VSYNC) to be included as part of the interface.

Both EAV and SAV codes are comprised of a sequence of four bytes ( FFh – 00h – 00h - XY). The first three bytes in the sequence constitute a fixed preamble. The fourth byte, contains information about the field being transmitted (Field 1 or Field 2 in an interlaced video signal), the state of field blanking (Vertical) and the state of line blanking (Horizontal). The bit assignment for this byte of the code is shown in [Figure 11-87](#), with the function of each bit described in [Table 11-115](#).

**Figure 11-87. Bit-assignment for the fourth byte of EAV/SAV codes**

MSB							LSB
1	F	V	H	P3	P2	P1	P0

**Table 11-115. Bit function**

Bit	Symbol	Function
7	1	Always set to '1'.
6	F	Field bit. 0 – Field 1 1 – Field 2
5	V	Vertical Blanking Status bit. This bit goes High during a vertical field blanking interval, otherwise it remains Low.
4	H	Horizontal Blanking Status bit. 0 – byte is part of SAV code (i.e. stream is entering an active video data region for the current line) 1 – byte is part of EAV code (i.e. stream has entered a horizontal blanking interval - start of a new line)
3	P3	Protection bit 3
2	P2	Protection bit 2
1	P1	Protection bit 1
0	P0	Protection bit 0

The protection bits allow for detection and correction of 1-bit errors and the detection of 2-bit errors. The status of P3, P2, P1 and P0 depend on the states of bits F, V and H. This dependency is shown in [Table 11-116](#).

**Table 11-116. Status of protection bits as F, V and H vary**

F	V	H	P3	P2	P1	P0
0	0	0	0	0	0	0
0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1
1	0	1	1	0	1	0
1	1	0	1	1	0	0
1	1	1	0	0	0	1

Enabling BT.656 or BT.1120 format is done by setting:

- [DISPC\\_CONFIG1\[20\]](#) BT656ENABLE or [DISPC\\_CONFIG1\[21\]](#)BT1120ENABLE registers for LCD1 output
- [DISPC\\_CONFIG2\[20\]](#) BT656ENABLE or [DISPC\\_CONFIG2\[21\]](#)BT1120ENABLE registers for LCD2 output
- [DISPC\\_CONFIG3\[20\]](#) BT656ENABLE or [DISPC\\_CONFIG3\[21\]](#)BT1120ENABLE registers for LCD3 output

---

**NOTE:** It is not possible to enable BT.656 and BT.1120 mode simultaneously on the same LCD output

---

#### 11.2.4.13.6 DISPC Active Matrix

Depending on the color depth, the active matrix output:

- 24 bpp supports 16,777,216 colors.
- 18 bpp supports 262,144 colors.
- 16 bpp supports 65,536 colors.
- 12 bpp supports 4096 colors.

When in active matrix path configuration, after setting the [DISPC\\_CONTROLo\[3\]](#) STNTFT bit to 0x1, two submodules must be configured:

- Spatial/temporal dithering
- Multiple cycle output format (TDM)

### 11.2.4.13.6.1 DISPC Spatial/Temporal Dithering

When the active matrix path is used, the spatial/temporal dithering logic can be selected to enhance the quality of the active matrix outputs. The encoded pixel values are used by spatial/temporal dithering logic to display the data in a lower color depth on the LCD panel. The dithering logic is integrated after the CPR and before the TDM. The spatial/temporal dithering algorithm is based on the (x,y) pixel position and frame rate control. The dithering logic can process the pixels over one frame, two frames, or four frames. The number of frames is selected by setting the DISPC\_CONTROLo[31:30]

SPATIALTEMPORALDITHERINGFRAMES bit field. In the case of a single frame, only spatial processing is applied, and in multiple frames, spatial and temporal processing are applied to the pixels. The spatial/temporal dithering logic is enabled by setting the DISPC\_CONTROLo[7] STDITHERENABLE bit to 0x1.

**NOTE:** When the spatial/temporal dithering logic is disabled (see also [Table 11-117](#)):

- If the interface data bus is smaller than the pixel format size, then the MSBs of the pixel color components are output on the interface data bus.
- If the interface data bus is larger than the pixel format size, then by programming the pixel components replication active/inactive, the MSB is replicated to the LSB of the interface data bus (when replication is enabled), or the LSB is filled with 0s (when replication is disabled). The pixel components replication is performed in the associated pipeline, as described in [Section 11.2.4.9.1](#) and [Section 11.2.4.10.1](#), *DISPC Replication Logic*.

### 11.2.4.13.6.2 DISPC Multiple Cycle Output Format (TDM)

When the TDM is enabled (DISPC\_CONTROLo[20] TDMENABLE = 1), after the active matrix display processing, the pixels are formatted on one or multiple cycles (a maximum of three cycles). The number of bits for each cycle is set in the DISPC\_DATAo\_CYCLE1 register for the first cycle, the DISPC\_DATAo\_CYCLE2 register for the second cycle, and the DISPC\_DATAo\_CYCLE3 register for the third cycle. The interface data bus width can be 8, 9, 12, or 16 bits. The configuration of the data bus is done in the DISPC\_CONTROLo[22:21] TDMPARALLELMODE bit field.

When the TDM is disabled (DISPC\_CONTROLo[20] TDMENABLE = 0), the DISPC outputs the pixels using the conventional formats: active matrix display monochrome/color. In this case, the configuration of the data bus width is done through the DISPC\_CONTROLo[9:8] TFTDATALINES bit field.

Figure 11-88 through Figure 11-91 show various examples of TDM settings in the function of pixel data formats and the interface data bus width.

### 11.2.4.13.7 DISPC Synchronized Buffer Update

A synchronization mismatch between the frame buffer and the display refreshes, named tearing effect, can lead to images that appear to be stretched on the screen. To avoid it, a synchronization mechanism is used between the DISPC and the process that updates the buffer. An interrupt is generated when the display reaches a predefined line number. The PROGRAMMEDLINENUMBER\_IRQ interrupt (DISPC\_IRQSTATUS and DISPC\_IRQENABLE) is a level signal and stays active during the programmed line of the display.

### 11.2.4.13.8 DISPC Timing Generator and Panel Settings

When Active Matrix Display is used the following registers must be set:

The size of and panel is defined by:

- Number of lines, DISPC\_SIZE\_LCD0[27:16] LPP bit field, with a value from 1 to 4096
- Number of pixels per line, DISPC\_SIZE\_LCD0[11:0]PPL bit field, with a value from 1 to 4096

Standard HSYNC/VSYNC timing generation are programmable for each LCD outputs independently:

- Horizontal front porch is set in the DISPC\_TIMING\_Ho[19:8] HFP bit field.
- Horizontal back porch is set in the DISPC\_TIMING\_Ho[31:20] HBP bit field.
- Horizontal synchronization pulse width is set in the DISPC\_TIMING\_Ho[7:0] HSW bit field.
- Vertical front porch is set in the DISPC\_TIMING\_Vo[19:8] VFP bit field.
- Vertical back porch is set in the DISPC\_TIMING\_Vo[31:20] VBP bit field.
- Vertical synchronization pulse width is set in the DISPC\_TIMING\_Vo[7:0] VSW bit field.

When the output is in BT.1120 or BT.656 mode, the following timing constant are mapped onto the DISPC\_TIMING\_Ho and DISPC\_TIMING\_Vo registers:

- Progressive mode:
  - Horizontal blanking is set in the DISPC\_TIMING\_Ho[7:0] HSW bit field
  - Vertical frame blanking No 1 is set in the DISPC\_TIMING\_Vo[19:8] VFPbit field.
  - Vertical frame blanking No 2 is set in the DISPC\_TIMING\_Vo[31:20] VBPbit field.
  - Number of lines is set in the [DISPC\\_SIZE\\_LCD1\[27:16\]](#) LPP bit field
  - Number of pixels per line is set in the [DISPC\\_SIZE\\_LCD1\[11:0\]](#) PPL bit field.
- Interlaced mode:
  - Horizontal blanking is set in the DISPC\_TIMING\_Ho[7:0] HSW bit field.
  - Vertical field blanking No 1 for Even Field is set in the DISPC\_TIMING\_Ho[19:8] HFP bit field.
  - Vertical field blanking No 2 for Even Field is set in the DISPC\_TIMING\_Ho[31:20] HBP bit field.
  - Vertical field blanking No 1 for Odd Field is set in the DISPC\_TIMING\_Vo[19:8] VFP bit field.
  - Vertical field blanking No 2 for Odd Field is set in the DISPC\_TIMING\_Vo[31:20] VBP bit field.
  - Number of lines per field (even) is set in the [DISPC\\_SIZE\\_LCD1\[27:16\]](#) LPP bit field.
  - Delta number of odd field compared to even field (in a single line) is set in the [DISPC\\_SIZE\\_LCD1\[15:14\]](#) DELTA bit field.
  - Number of pixels per line is set in the [DISPC\\_SIZE\\_LCD1\[11:0\]](#) PPL bit field.

Horizontal/vertical synchronization and ACBIAS signals polarity are programmable by setting the DISPC\_POL\_FREQo[12] IVS, DISPC\_POL\_FREQo[13] IHS, and DISPC\_POL\_FREQo[15] IEO bits. These signals can be gated by setting the DISPC\_CONFIGo[7] VSYNCGATED and DISPC\_CONFIGo[6] HSYNCGATED bits.

The latch of data can be driven on the rising or falling edge of the pixel clock by setting the IPC bit of DISPC\_POL\_FREQo[14] IPC and CTRL\_CORE\_SMA\_SW\_1[] DSS\_CHx\_IPC (the values must mach) registers. The drive of the SYNC and VSYNC signals in the function of the pixel clock is done by setting the DISPC\_POL\_FREQo[16] RF and CTRL\_CORE\_SMA\_SW\_1[] DSS\_CHx\_RF bit.

[Table 11-118](#) describes the programming rules for LCD timing.

**Table 11-118. DISPC Programming Rules**

	No Downsampling	Downsampling H or V	Downsampling H + V
$(HBP + HSW + HFP) \times PCD$	>8	>10	>20

Figure 11-92 shows the timing values description in the case of an active matrix display.

**Figure 11-92. DISPC Timing Values (Active Matrix Display)**

dispc-031

The 8-bit pixel clock divider (the `DISPC_DIVISORo[7:0]` PCD bit field) selects the pixel clock frequency. This bit field generates a range of pixel clock frequencies from LC/2 to LC/256, where LC is the logic clock from the divided functional clock of the DISPC by the `DISPC_DIVISOR[23:16]` LCD bit field.

The pixel clock is defined by the following equation:

$$\text{Pixel Clock} = (\text{FunctionalClock}/\text{LCD}[7:0])/\text{PCD}[7:0]$$

The pixel clock can be gated by setting the `DISPC_CONFIGo[5]` `PIXELCLOCKGATED` bit to 0x1.

The LCD output can be configured in progressive output or interlace output. The selection is done by writing into the `DISPC_CONFIGo[22]` `OUTPUTMODEENABLE` bit. The reset value is 0x0, which means progressive mode. When progressive mode is selected, the FID signal associated to the LCD output is driven low (INACTIVE state). The selection can be changed only if the corresponding LCD output is disabled. The configuration is independent for each LCD output.

When in interlaced mode, the `DISPC_CONFIGo[23]` `FIDFIRST` bit indicates which field is output first:

- 0x0: Even field first (FID = 0)
- 0x1: Odd field first (FID = 1)

#### 11.2.4.14 DISPC TV Output

The TV output paths consist of several processing blocks (see Figure 11-93):

- Overlay manager
- Gamma correction unit
- Synchronization buffer

Figure 11-93. DISPC TV Output Architecture

dispc-029

The TV output is connected to the HDMI. In analog output or HDMI, the DISPC TV output receives an external clock, DISPC\_TV\_CLK, and based on the VSYNC generated by the HDMI, hold time, vertical offset, and horizontal offset, outputs the pixels synchronously. The size of the field/frame to output defines the number of pixels to output on each line and the number of lines for each field/frame.

#### 11.2.4.14.1 DISPC Overlay Manager

The overlay mechanism is identical in LCD1, LCD2, and LCD3 (see Section 11.2.4.13.1, *Overlay Manager*).

#### 11.2.4.14.2 DISPC Gamma Correction Unit

The gamma correction unit works as described in Section 11.2.4.13.2, *Gamma Correction Unit*. The only difference is in the input pixel format RGB30. Each component of encoded pixel value is used as a pointer to index 1 out of 1024 × 30-bit gamma curve entries in the table. Each 10-bit component is replaced with the 10-bit table value corresponding to R, G, or B component. The table is loaded by software, through the DISPC\_GAMMA\_TABLE2 register, and enabled via DISPC\_CONFIG1[9] GAMATABLEENABLE register bit. It is possible to load only part of the table. For each write access to the table, the 30-bit gamma value is associated with bit [31] INDEX to indicate that a new table is defined. Setting bit [31] INDEX to 0x1 for the first time, resets the internal index counter. All the following accesses are considered to be for incremented index addressing in the table (bit [31] INDEX is set to 0 for each subsequent access). Figure 11-94 shows the format of one of the gamma curve values in the memory.

Figure 11-94. DISPC Data Memory Organization for Gamma Mode in TV Output

dispc-084

#### 11.2.4.14.3 DISPC Synchronized Buffer Update

The synchronized buffer update is identical in LCD1, LCD2, and LCD3 (see Section 11.2.4.13.7, *Synchronized Buffer Update*).

#### 11.2.4.14.4 DISPC Timing and TV Format Settings

Figure 11-95 shows the TV formats supported.

Figure 11-95. DISPC Example Timing TV Formats

dispc-061

The size of a TV output format is defined by:

- Number of lines, [DISPC\\_SIZE\\_TV\[27:16\]](#) LPP bit field, with a value from 1 to 4096
- Number of pixels per line, [DISPC\\_SIZE\\_TV\[11:0\]](#) PPL bit field, with a value from 1 to 4096
- Delta size between odd/even field, [DISPC\\_SIZE\\_TV\[15:14\]](#) DELTA\_LPP bit field. This bit field controls only the output channel and not the size of the data field fetched from the frame buffer in memory.

The hold time of the pixels on the data bus is determined in clock cycles by the [DISPC\\_CONTROL1\[19:17\]](#) HT bit field. The default value at reset time is 0x0 (one cycle).

- When connected to the HDMI encoder, [Table 11-119](#) indicates the [DISPC\\_SIZE\\_TV](#) (PPL and LPP) value for each HD standard.

Table 11-119. DISPC PPL and LLP Value for HD Standard

Standards		Active Pixels/Line	Active Lines	Digital Clock	DISPC_SIZE_TV
HDTV	720p	1280	720	74.25/74.125 MHz (60/59.99..frames/s)	0x02CF 04FF
	1080i	1920	540	74.25/74.125 MHz (60/59.99..frames/s)	0x021B 07FF
	1080p	1920	1080	148.5/148.25 MHz (60/59.99..frames/s)	0x0437 07FF
	720p 3D (frame packing)	1280	1470	148.5/148.35/148.5 MHz (60/59.94/50 frames/s)	0x05BD 04FF
	1080p 3D (frame packing)	1920	2205	148.5/148.35 MHz (24/23.98 frames/s)	0x089C 07FF
	1080p 3D (side-by-side half)	1920	1080	148.5 MHz (60 frames/s)	0x0437 07FF

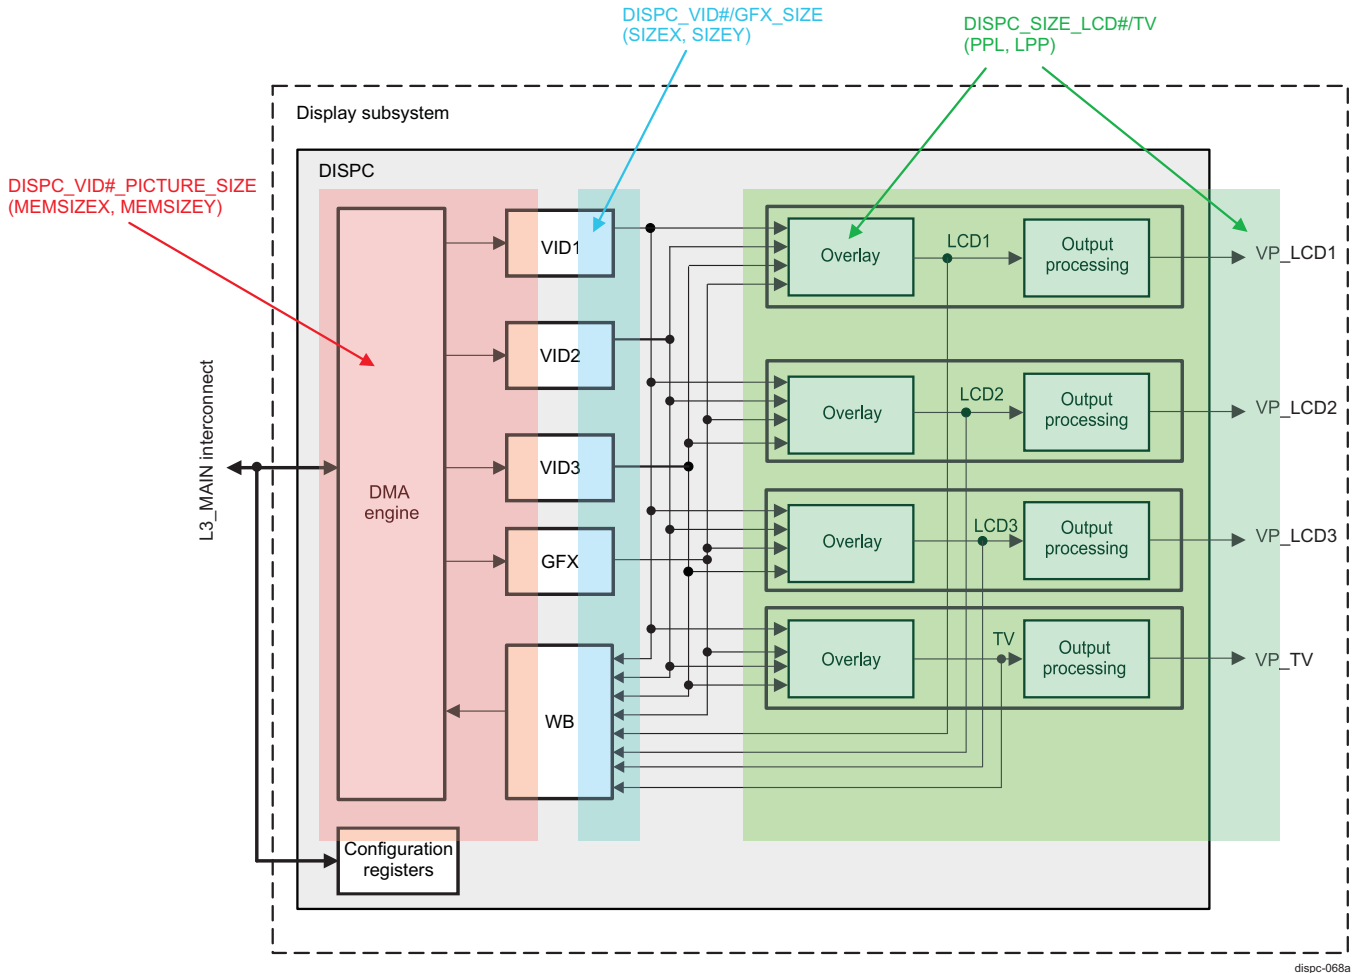

- 
- NOTE:** When configuring the DISPC for outputting any supported 3D frame-packing format, the following generic details must be considered:
- As defined by the *HDMI v1.4a Specification*, Section 8.2.3.2, 3D frame-packing is a video format structure composed of two stereoscopic pictures: left and right.
  - The stereoscopic pictures can be processed through the three video pipelines (VID1, VID2, or VID3). For more information about the configuration of video pipelines, see [Section 11.2.4.10, Video Pipelines](#).
  - The 3D frame is generated by setting the TV overlay manager to combine the outputs of the selected video pipelines that hold the pictures. One video pipeline (VID1 or VID3) must carry the top field of the 3D frame (left stereoscopic picture), and the other video (VID2) pipeline must always carry the bottom field of the frame (right stereoscopic picture). The top and bottom fields are separated by an active space area. For more information, see the *HDMI v1.4a Specification*, Section 8.2.3.2.
  - The pipeline carrying each field (top and bottom) of the 3D frame must have its height and width parameters defined in the [27:16] SIZEY and [10:0] SIZEX bit fields of the DISPC\_VIDp\_SIZE register, and its Y and X positions defined in the [26:16] POSY and [10:0] POSX bit fields of the DISPC\_VIDp\_POSITION register. The active space area of the 3D frame can be encoded by setting the solid background color for the TV output (the DISPC\_DEFAULT\_COLOR1[23:0] DEFAULTCOLOR bit field). For more information about the overlay mechanism, see [Section 11.2.4.14.1, DISPC Overlay Manager](#).
- 

#### 11.2.4.15 DISPC Frame Width Considerations

DISPC provides three sets of configuration registers to control the maximum frame size in different stages of its internal pipelines (see [Figure 11-96, DISPC Frame Width Control](#)):

- DISPC\_VID#\_PICTURE\_SIZE registers: MEMSIZEX and MEMSIZEY bit-fields define the number of pixels and lines to fetch from memory (via DISPC DMA engine).
- DISPC\_GFX/VID#\_SIZE registers: SIZEX and SIZEY bit-fields define the size of the output frame from each processing pipeline to LCD/TV overlay manager for blending.
- DISPC\_SIZE\_TV/LCD# registers: LPP and PPL bit-fields define the final display panel output resolution.

Figure 11-96. DISPC Frame Width Control

dispc-068a

The MEMSIZE\_X and SIZE\_X bit-fields are 11-bit, meaning the maximum horizontal frame size allowed is 2048 pixels. This parameter determines the maximum source frame (including the input to the scalers) that can be displayed.

The MEMSIZE\_Y and SIZE\_Y bit-fields are 12-bit, meaning the maximum vertical size allowed is 4096 lines.

The LPP and PPL bit-fields are also 12-bit, which means that starting at the LCD/TV overlay manager and including the output to the display panel, the frame size can be up to 4096x4096 as long as the pixel clock constraints are met.

Implication: The output to display panel can be as large as 4096 x 4096 (4K x 4K), although the actual size of the output frame would be smaller due to the maximum pixel clock limitation. However, the maximum source frame that can be read from memory by a single GFX/VID pipeline can be 2048 x 4096 (2K x 4K) only. Therefore, to display a source frame with width > 2048 pixels, two layers must be used and corresponding pipeline outputs must be merged in the overlay manager before being sent out to the display panel.

Refer to device Data Manual for details on the maximum supported pixel clock (VOUT<sub>x</sub>\_CLK) or HDMI supported frame rates.

#### 11.2.4.16 DISPC Extended 3D Support

The DISPC supports several formats to support 3D displays. The following three sections provide further details.

### 11.2.4.16.1 DISPC Extended 3D Support - Line Alternative Format

Line alternative format is defined by the HDMI Specification 1.4a. In general the functionality is:

- Lines from the left and the right frames are interleaved alternatively on the screen to produce a 3D image.
- Required also to support interleaving column-wise to support all possible screen orientations.

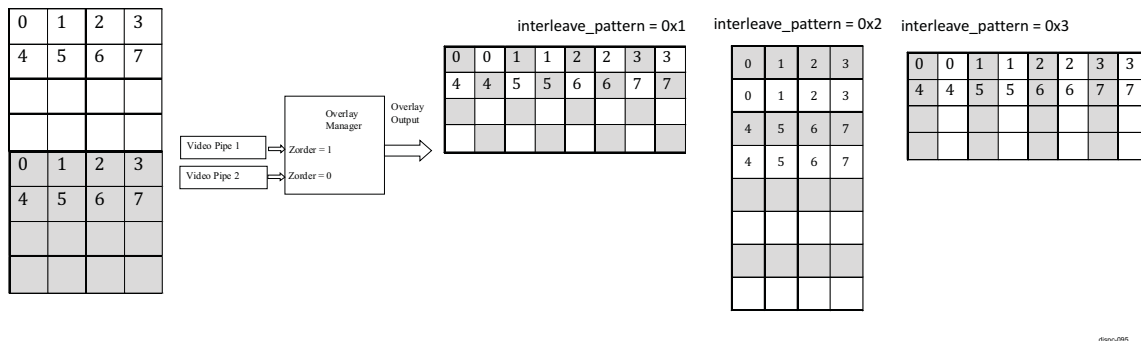

The functionality is done in the overlay manager:

- The layers are grouped into two categories based on the z-order: Odd z-order may blend together and will interleave with even z-order pipes, which may blend together.
- Two types of interleaves are possible, line-based interleaving and pixel-based interleaving to support landscape and portrait screen orientations.

The configuration is done from the [DISPC\\_CONFIG1\[29:28\]](#) TVINTERLEAVE for the TV output, [DISPC\\_CONFIG1\[27:26\]](#) PLCDINTERLEAVE for the primary LCD, [DISPC\\_CONFIG2\[27:26\]](#) SLCDINTERLEAVE for the secondary LCD, and [DISPC\\_CONFIG3\[27:26\]](#) TLCDINTERLEAVE for the third LCD. The following values apply for these bitfields:

- 0x0: If zero then no interleaving happens in the overlay manager.
- 0x1: Checkerboard pattern:
  - All even pixels on even lines have a contribution from even z-order pipes.
  - All odd pixels on even lines have a contribution from odd z-order pipes.
  - All even pixels on odd lines have a contribution from odd z-order pipes.
  - All odd pixels on odd lines have a contribution from even z-order pipes.
- 0x2: All even lines (all pixels) have a contribution from even z-order pipes. All odd lines (all pixels) have a contribution from the odd z-order pipes.
- 0x3: All even pixels (for all lines) have a contribution from even z-order pipes. All odd pixels (for all lines) have a contribution from the odd z-order pipes.

**Figure 11-97. DISPC Illustration of 3D Interleaving**

Moreover, from [Figure 11-97](#) above, if `interleave_pattern` is programmed as 0x2, in this case the entire screen composited by the overlay manager (PPL x LPP) gets sub-divided into odd and even lines. It is possible for a 3D window created using the two pipes to have a non-zero position (that is, POSX and POSY not equal to zero).

In such cases depending on the oddness or evenness of the POSY setting, the first line in the window may come from Video Pipe 1 or Video Pipe 2.

For instance, if the POSX = 3, POSY = 3 (set in [DISPC\\_GFX\\_POSITION](#), [DISPC\\_VID1\\_POSITION](#), [DISPC\\_VID2\\_POSITION](#), [DISPC\\_VID3\\_POSITION](#) registers), then the final composited screen with PPL = 8, LPP = 12 may look like below:

**Figure 11-98. DISPC Illustration of a Non-zero Position of 3D Window**

---

**NOTE:** In this case the first line comes from the odd z-order pipeline, that is Video Pipe 1.

---

The following limitations apply to the 3D Line alternative format:

- Software must ensure that the left/right frames are of same size.
- Software must ensure that in case of line interleaving the SIZEY is not greater than LPP/2.
- Software must ensure that in case of pixel interleaving the SIZEX is not greater than PPL/2.
- Software must program POSX and POSY for both left and right frame to be the same.
- Color-keying is not available for 3D formats.
- Since each overlay manager can support 4k x 4k frames, max resolution of each left/right frame will be restricted to 2k x 2k.

#### 11.2.4.16.2 DISPC Extended 3D Support - Frame Packing Format Format

In this mode the pipe fetches two windows (of SIZEX x SIZEY) during a complete panel frame (PPL x LPP). The mode is enabled from [DISPC\\_GFX\\_ATTRIBUTES\[10\] FRAMEPACKINGMODE](#) and [DISPC\\_VID1\\_ATTRIBUTES\[8\]](#), [DISPC\\_VID2\\_ATTRIBUTES\[8\]](#), [DISPC\\_VID3\\_ATTRIBUTES\[8\]](#) [FRAMEPACKINGMODE](#)

The position for the first window is set in [DISPC\\_GFX\\_POSITION](#), [DISPC\\_VID1\\_POSITION](#), [DISPC\\_VID2\\_POSITION](#), [DISPC\\_VID3\\_POSITION](#), while the position for the second window is set in [DISPC\\_GFX\\_POSITION2](#), [DISPC\\_VID1\\_POSITION2](#), [DISPC\\_VID2\\_POSITION2](#), [DISPC\\_VID3\\_POSITION2](#)

When it is detected that a pipe has finished sending the programmed number of lines to the overlay or Write-back pipe, a reset is generated for the pipe as well as the DMA channel associated with the pipe. At the same instant, the base address configuration for the DMA channel is changed from the BA0 to the BA1.

Due to the reset the pipe and DMA starts fetching the data from BA1. At the end of the processing of BA1 data, the DMA channel and the pipe become idle and clock gated.

The overlay manager composes the final frame to be sent to the panel and uses the (POSX, POSY) coordinates for the first window and (POSX2, POSY2) for the second window.

The following limitations apply to the 3D Frame Packing format:

- Only frame packing for progressive mode is supported. Frame packing of interlaced formats is not supported.
- End-of-window interrupts will be generated twice per outgoing-frame.
- Flip Immediate will not work as expected.
- It is software responsibility to calculate and program the (POSX2, POSY2) as per the active space

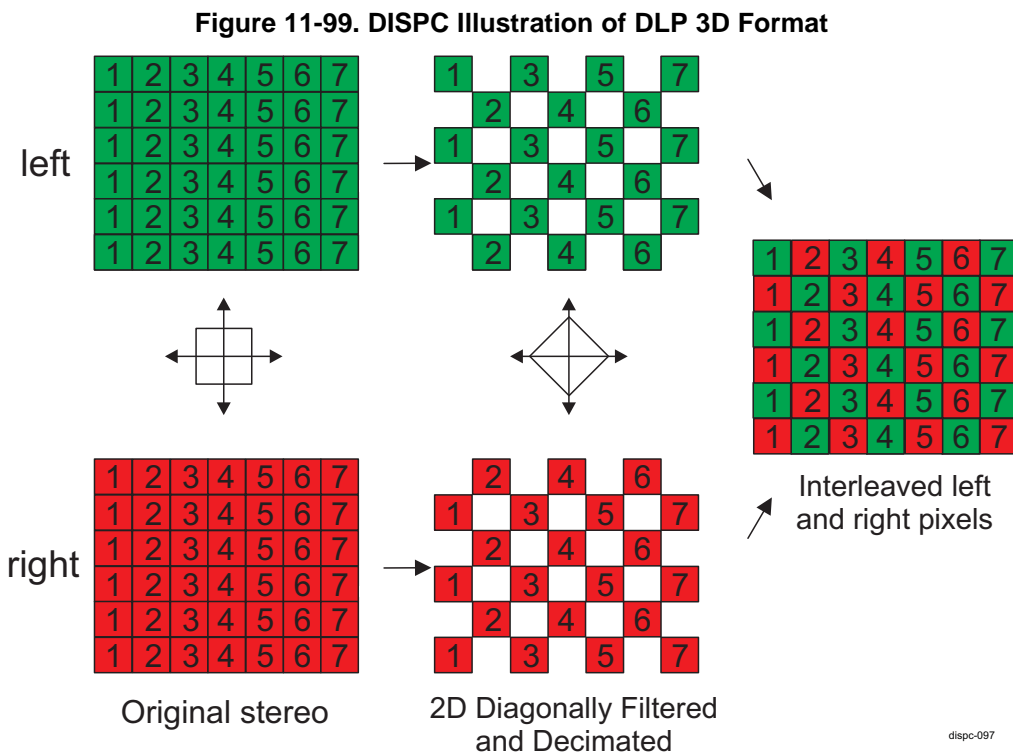

required by the panel.

### 11.2.4.16.3 DISPC Extended 3D Support - DLP 3D Format

The DLP 3D format sub-samples the left and right frames across the diagonal before interleaving the frames in a checker-board fashion.

The sub-sampling required on the left and the right frame is complementary. This sampling pattern is also defined in the HDMI 3D Specification 1.4a as two Quincunx matrices. The format is configured from `DISPC_GFX_ATTRIBUTES[20:18] SUBSAMPLINGPATTERN`, `DISPC_VID1_ATTRIBUTES2[11:9]`, `DISPC_VID2_ATTRIBUTES2[11:9]`, `DISPC_VID3_ATTRIBUTES2[11:9] SUBSAMPLINGPATTERN` with the following possible configuration values:

- 0x0: All pixels from the pipes are used. No sub-sampling.
- 0x1: Quincunx Matrix Odd-position sub-sampling is used.
- 0x2: Quincunx Matrix Even-position sub-sampling is used.
- 0x3 to 0x7: Reserved

The following limitations apply to the DLP 3D Format :

- Even z-order pipes can have only sub-sampling = 0x1.
- Odd z-order pipes can only have sub-sampling = 0x2.

### 11.2.4.17 DISPC Shadow Registers

Some DISPC registers are termed *shadow registers*. A shadow register change has no direct effect on the configuration of the DISPC. The registers are shadow registers let software change the values of the registers at any time. When all the registers for a given configuration are into the registers, software must set 1 bit only to validate the configuration. When hardware reaches the end of the current frame and sees that the bit field has been set by software, the new configuration is now the configuration used by the hardware.

**NOTE:** As a general rule, all shadow registers are updated with the value of their shadows when:

- The interface is enabled.
- The GO bit field of the pipeline, with which the register is associated, is set and the output sync is active.

The bits enabling the hardware to use the new configuration are:

- **DISPC\_CONTROL1**[5] GOLCD bit for all the registers associated to the LCD1 output, and for all registers of WB and DMA, if the LCD1 channel is captured. The update of the registers of the WB and DMA is further delayed by the **DISPC\_WB\_ATTRIBUTES2**[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the **DISPC\_WB\_ATTRIBUTES**[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- **DISPC\_CONTROL1**[6] GOTV bit for all the registers associated to the TV output, and for all registers of WB and DMA, if the TV channel is captured. The update of the registers of the WB and DMA is further delayed by the **DISPC\_WB\_ATTRIBUTES2**[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the **DISPC\_WB\_ATTRIBUTES**[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the external EVSYNC.
- **DISPC\_CONTROL2**[5] GOLCD bit for all the registers associated to the LCD2 output, and for all registers of WB and DMA, if the LCD2 channel is captured. The update of the registers of the WB and DMA is further delayed by the **DISPC\_WB\_ATTRIBUTES2**[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the **DISPC\_WB\_ATTRIBUTES**[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- **DISPC\_CONTROL3**[5] GOLCD bit for all the registers associated to the LCD3 output, and for all registers of WB and DMA, if the LCD3 channel is captured. The update of the registers of the WB and DMA is further delayed by the **DISPC\_WB\_ATTRIBUTES2**[7:0] WBDELAYCOUNTER bit field or done when the next frame is captured (the **DISPC\_WB\_ATTRIBUTES**[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- **DISPC\_WB\_ATTRIBUTES**[0] ENABLE bit for all the registers associated to the WB, if the transfer memory-to-memory is not associated with a channel out.
- The **DISPC\_CONTROL2**[6] GOWB bit and the [5] GOLCD and [6] GOTV bits in the **DISPC\_CONTROL1/DISPC\_CONTROL2** registers, combined with the synchronization event of the channel output selected for write back. This applies to all registers associated with the selected channel out and further delayed by the setting in the **DISPC\_WB\_ATTRIBUTES2**[7:0] WBDELAYCOUNT bit field, for all registers of the write back and DMA. The GOWB bit is required to be set only in WB capture mode; it is not required when WB memory-to-memory mode is used.

**NOTE:** Before setting the GOLCD, GOTV, or GOWB bits, the user must ensure that the bits are cleared. The hardware resets the bits when the update completes.

Table 11-120 lists the shadow registers. Registers that do not have a mark in any column are not shadowed.

**Table 11-120. DISPC Shadow Registers**

## 11.2.5 DISPC Programming Guide

### 11.2.5.1 DISPC Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the module.

#### 11.2.5.1.1 DISPC Global Initialization

##### 11.2.5.1.1.1 DISPC Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the DISPC module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DISPC. For more information, see [Section 11.1.2, DISPC Integration](#), and [Section 11.1.1, DISPC Environment](#).

**Table 11-121. DISPC Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. See <a href="#">Section 3.1.1.1.2, Module-Level Clock Management</a> , in <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Control module	Module-specific pad muxing and configuration must be set in the control module. See <a href="#">Section 18.4.6.1.1, Pad Configuration Registers</a> , in <a href="#">Chapter 18, Control Module</a> .
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see <a href="#">Chapter 17, Interrupt Controllers</a> .
Interconnect	For more information about interconnect configuration, see <a href="#">Section 14.2, L3 Interconnect</a> .
DMA_CROSSBAR	DMA_CROSSBAR configuration must be done to allow module DREQs to be mapped to certain device DMA line. For more information see <a href="#">Section 18.4.6.5, DMA_CROSSBAR Module Functional Description</a> , in <a href="#">Chapter 18, Control Module</a> .
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see <a href="#">Section 18.4.6.4, IRQ_CROSSBAR Module Functional Description</a> , in <a href="#">Chapter 18, Control Module</a> .

#### 11.2.5.1.2 DISPC Operational Modes Configuration

[Table 11-122](#) lists the steps to configure the operational modes in the DISPC.

**Table 11-122. DISPC Configuration**

Step	Register/Bit Field/Programming Model
For a GFX pipeline configuration	
Configure the GFX DMA channel.	See <a href="#">Table 11-123</a> .
Configure the GFX pipeline.	See <a href="#">Table 11-126</a> .
Configure the LCD or TV output.	For LCD output, see <a href="#">Table 11-143</a> . For TV output, see <a href="#">Table 11-152</a> .
For a Video pipeline configuration	
Configure the video DMA channel.	See <a href="#">Table 11-124</a> .
Configure the video pipeline.	See <a href="#">Table 11-130</a> .
Configure the LCD or TV output.	For LCD output, see <a href="#">Table 11-143</a> . For TV output, see <a href="#">Table 11-152</a> .
For a WB pipeline configuration	
Configure the WB DMA channel.	See <a href="#">Table 11-125</a> .
Configure the WB pipeline.	For video pipelines, see <a href="#">Table 11-138</a> .

### 11.2.5.1.2.1 DISPC DMA Configuration

#### 11.2.5.1.2.1.1 DISPC Main Sequence – DISPC DMA Channel Configuration

This procedure describes the parameters of the GFX, video, and WB DMA channel parameters (see [Table 11-123](#) through [Table 11-125](#), respectively).

**Table 11-123. DISPC Configure the GFX DMA Channel**

Step	Register/Bit Field/Programming Model	Value
Set the base address for RGB pixel format according to memory access type, rotation, mirroring (see <a href="#">Section 11.2.4.6, DISPC DMA Engine</a> ).	DISPC_GFX_BA_j[31:0] BA	0x—
Set the rotation flag.	DISPC_GFX_ATTRIBUTES[13:12] ROTATION	0x—
Set the number of bytes to increment at the end of the row.	DISPC_GFX_ROW_INC[31:0] ROWINC	0x—
Set the number of bytes to increment between two pixels.	DISPC_GFX_PIXEL_INC[7:0] PIXELINC	0x—
Determine the FIFO preload mode.	DISPC_GFX_ATTRIBUTES[11] BUFPRELOAD	0x—
Set the preload value.	DISPC_GFX_PRELOAD[11:0] PRELOAD	0x—
Determine the burst type.	DISPC_GFX_ATTRIBUTES[29] BURSTTYPE	0x—
Set the burst size.	DISPC_GFX_ATTRIBUTES[7:6] BURSTSIZE	0x—
Set the high level of DMA FIFO threshold.	DISPC_GFX_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x—
Set the low level of DMA FIFO threshold.	DISPC_GFX_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x—
Enable self-refresh.	DISPC_GFX_ATTRIBUTES[24] SELFREFRESH	0x—
Select priority over the other pipeline.	DISPC_GFX_ATTRIBUTES[23] ARBITRATION	0x—

**Table 11-124. DISPC Configure the Video DMA Channel**

Step	Register/Bit Field/Programming Model	Value
Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (see <a href="#">Section 11.2.4.6, DISPC DMA Engine</a> ).	DISPC_VIDp_BA_j[31:0] BA	0x—
Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (see <a href="#">Section 11.2.4.6, DISPC DMA Engine</a> ) <sup>(1)</sup> .	DISPC_VIDp_BA_UV_j[31:0] BA	0x—
Set the rotation flag.	DISPC_VIDp_ATTRIBUTES[13:12] ROTATION	0x—
Set the number of bytes to increment at the end of the row.	DISPC_VIDp_ROW_INC[31:0] ROWINC	0x—
Set the number of bytes to increment between two pixels.	DISPC_VIDp_PIXEL_INC[7:0] PIXELINC	0x—
Set the X original image size.	DISPC_VIDp_PICTURE_SIZE[10:0] MEMSIZE_X	0x—
Set the Y original image size.	DISPC_VIDp_PICTURE_SIZE[27:16] MEMSIZE_Y	0x—
Determine the FIFO preload mode.	DISPC_VIDp_ATTRIBUTES[19] BUFPRELOAD	0x—
Set the preload value.	DISPC_VIDp_PRELOAD[11:0] PRELOAD	0x—
Determine the burst type.	DISPC_VIDp_ATTRIBUTES[29] BURSTTYPE	0x—
Set the burst size.	DISPC_VIDp_ATTRIBUTES[15:14] BURSTSIZE	0x—
Set the high level of DMA FIFO threshold.	DISPC_VIDp_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x—
Set the low level of DMA FIFO threshold.	DISPC_VIDp_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x—
Enable self-refresh.	DISPC_VIDp_ATTRIBUTES[24] SELFREFRESH	0x—

<sup>(1)</sup> Applicable only for YUV pixel format

**Table 11-124. DISPC Configure the Video DMA Channel (continued)**

Step	Register/Bit Field/Programming Model	Value
Select priority over the other pipeline.	DISPC_VIDp_ATTRIBUTES[23] ARBITRATION	0x–

**Table 11-125. DISPC Configure the WB DMA Channel**

Step	Register/Bit Field/Programming Model	Value
Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (see <a href="#">Section 11.2.4.6</a> , <i>DISPC DMA Engine</i> ).	DISPC_WB_BA_j[31:0] BA	0x–
Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (see <a href="#">Section 11.2.4.6</a> , <i>DISPC DMA Engine</i> ) <sup>(1)</sup> .	DISPC_WB_BA_UV_j[31:0] BA	0x–
Set the stride of CbCr component <sup>(2)</sup> .	DISPC_WB_ATTRIBUTES[22] DOUBLESTRIDE	0x–
Set the rotation flag.	DISPC_WB_ATTRIBUTES[13:12] ROTATION	0x–
Set the number of bytes to increment at the end of the row.	DISPC_WB_ROW_INC[31:0] ROWINC <sup>(3)</sup>	0x–
Set the number of bytes to increment between two pixels.	DISPC_WB_PIXEL_INC[7:0] PIXELINC	0x–
Set the X final image size in system memory.	DISPC_WB_PICTURE_SIZE[10:0] ORGSIZEX	0x–
Set the Y final image size in system memory.	DISPC_WB_PICTURE_SIZE[27:16] ORGSIZEY	0x–
Set the burst size.	DISPC_WB_ATTRIBUTES[15:14] BURSTSIZE	0x–
Set the high level of DMA FIFO threshold.	DISPC_WB_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x–
Set the low level of DMA FIFO threshold.	DISPC_WB_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x–
Select priority over the other pipeline.	DISPC_WB_ATTRIBUTES[23] ARBITRATION	0x–

<sup>(1)</sup> Applicable only for YUV pixel format

<sup>(2)</sup> Applicable only for YUV pixel format.

<sup>(3)</sup> The [DISPC\\_WB\\_ROW\\_INC](#) register can be used only in 2D mode (using the Tiler). In order to use the [DISPC\\_WB\\_ROW\\_INC](#) register, the [DISPC\\_WB\\_ATTRIBUTES\[8\]](#) BURSTTYPE bit must be set to 1.

### 11.2.5.1.2.2 DISPC GFX Pipeline Configuration

#### 11.2.5.1.2.2.1 DISPC Main Sequence – Configure the GFX Pipeline

This procedure details the steps for a GFX pipeline configuration (see [Table 11-126](#)).

**Table 11-126. DISPC Configure the GFX Pipeline**

Step	Register/Bit Field/Programming Model	Value
Configure the GFX window.	See <a href="#">Table 11-127</a> .	
Configure the GFX pipeline processing.	See <a href="#">Table 11-128</a> .	
Configure the GFX pipeline layer output.	See <a href="#">Table 11-129</a> .	
Validate the GFX configuration according to outputs associated to the pipeline.	<a href="#">DISPC_CONTROL1</a> [5] GOLCD	
	<a href="#">DISPC_CONTROL2</a> [5] GOLCD	
	<a href="#">DISPC_CONTROL2</a> [6] GOWB	
	<a href="#">DISPC_CONTROL1</a> [6] GOTV	
Enable the GFX pipeline.	<a href="#">DISPC_GFX_ATTRIBUTES</a> [0] ENABLE	0x1

#### 11.2.5.1.2.2.2 DISPC Subsequence – Configure the GFX Window

This subsequence describes the parameters of the image to be displayed on the LCD panel (see [Table 11-127](#)).

**Table 11-127. DISPC Configure the GFX Window**

Step	Register/Bit Field/Programming Model	Value
Select the format of image.	<a href="#">DISPC_GFX_ATTRIBUTES</a> [4:1] FORMAT	0x–
Set the X size of image to be displayed onto LCD panel.	<a href="#">DISPC_GFX_SIZE</a> [10:0] SIZEX	0x–
Set the Y size of image to be displayed onto LCD panel.	<a href="#">DISPC_GFX_SIZE</a> [27:16] SIZEY	0x–
Set the X position of image in respect to LCD panel.	<a href="#">DISPC_GFX_POSITION</a> [10:0] POSX	0x–
Set the Y position of image in respect to LCD panel.	<a href="#">DISPC_GFX_POSITION</a> [26:16] POSY	0x–

#### 11.2.5.1.2.2.3 DISPC Subsequence – Configure the GFX Pipeline Processing

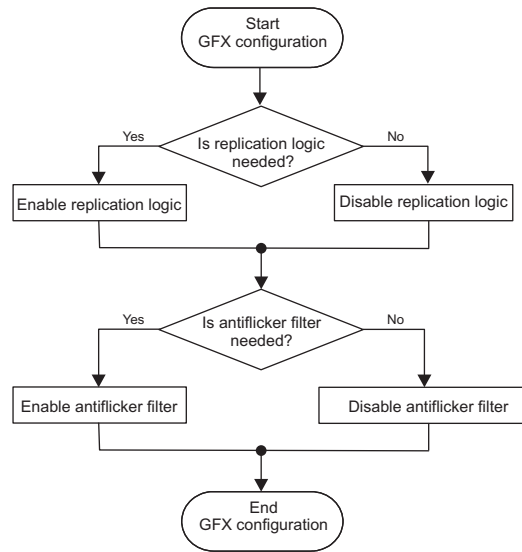

This subsequence describes the steps to configure the GFX pipeline processing in the DISPC (see [Table 11-128](#)).

**Table 11-128. DISPC Configure the GFX Pipeline Processing**

Step	Register/Bit Field/Programming Model	Value
Enable replication logic.	<a href="#">DISPC_GFX_ATTRIBUTES</a> [5] REPLICATIONENABLE	0x1
Enable antiflicker filter.	<a href="#">DISPC_GFX_ATTRIBUTES</a> [24] ANTIFLICKER	0x1

Figure 11-100 shows the configuration of the DISPC graphics pipeline processing.

**Figure 11-100. DISPC GFX Pipeline Processing Configuration**

dispc-091

**11.2.5.1.2.2.4 DISPC Subsequence – Configure the GFX Pipeline Layer Output**

This subsequence describes the video layer settings available at the pipeline level necessary when using the overlay manager (see Table 11-129).

**Table 11-129. DISPC Configure the GFX Pipeline Layer Output**

Step	Register/Bit Field/Programming Model	Value
Set the LCD/TV output.	DISPC_GFX_ATTRIBUTES[8] CHANNELOUT	0x–
If DISPC_GFX_ATTRIBUTES[8] = 0, set the LCD output.	DISPC_GFX_ATTRIBUTES[31:30] CHANNELOUT2	0x–
Set the Z-order priority of the layer for overlay manager.	DISPC_GFX_ATTRIBUTES[27:26] ZORDER	0x–
Enable the video pipeline Z-order.	DISPC_GFX_ATTRIBUTES[25] ZORDERENABLE	0x–
Set the Global Alpha value for the alpha blender unit.	DISPC_GLOBAL_ALPHA[7:0] GFXGLOBALALPHA	0x–

**11.2.5.1.2.3 DISPC Video Pipeline Configuration**

**11.2.5.1.2.3.1 DISPC Main Sequence – Configure the Video Pipeline**

This sequence describes the steps to configure the video pipeline (see Table 11-130).

**Table 11-130. DISPC Configure the Video Pipeline**

Step	Register/Bit Field/Programming Model	Value
Configure the video window.	See Table 11-131.	
Configure the video pipeline processing.	See Table 11-132.	
Configure the video pipeline layer output.	See Table 11-137.	
Validate the video configuration according to outputs associated to the pipeline.	DISPC_CONTROL1[5] GOLCD	
	DISPC_CONTROL2[5] GOLCD	
	DISPC_CONTROL2[6] GOWB	
	DISPC_CONTROL1[6] GOTV	

**Table 11-130. DISPC Configure the Video Pipeline (continued)**

Step	Register/Bit Field/Programming Model	Value
Enable video pipeline.	DISPC_VIDp_ATTRIBUTES[0] ENABLE	0x1

#### 11.2.5.1.2.3.2 DISPC Subsequence – Configure the Video Window

This subsequence describes the parameters of the image to be displayed on the LCD panel (see [Table 11-131](#)).

**Table 11-131. DISPC Configure the Video Window**

Step	Register/Bit Field/Programming Model	Value
Select the format of image.	DISPC_VIDp_ATTRIBUTES[4:1] FORMAT	0x–
Set the X size of image to be displayed onto LCD panel.	DISPC_VIDp_SIZE[10:0] SIZEX	0x–
Set the Y size of image to be displayed onto LCD panel.	DISPC_VIDp_SIZE[27:16] SIZEY	0x–
Set the X position of image in respect to LCD panel.	DISPC_VIDp_POSITION[10:0] POSX	0x–
Set the Y position of image in respect to LCD panel.	DISPC_VIDp_POSITION[26:16] POSY	0x–

#### 11.2.5.1.2.3.3 DISPC Subsequence – Configure the Video Pipeline Processing

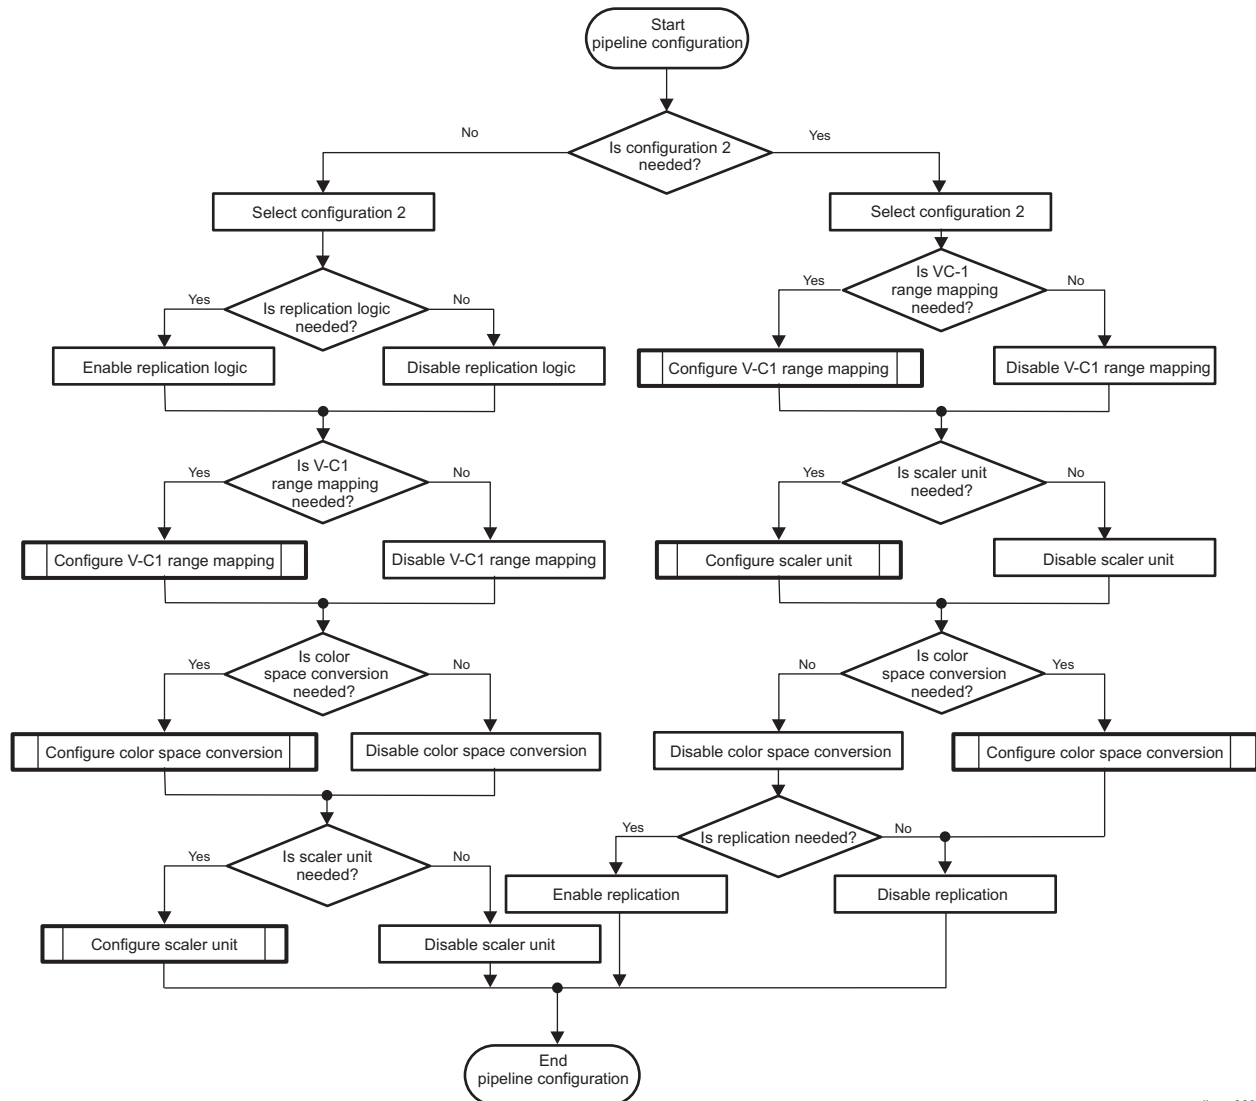

This subsequence describes the steps to configure video pipeline processing (see [Table 11-132](#) and [Figure 11-101](#)).

**Table 11-132. DISPC Configure the Video Pipeline Processing**

Step	Register/Bit Field/Programming Model	Value
Select the video pipeline configuration 1 or 2.	DISPC_VIDp_ATTRIBUTES2[8] YUVCHROMARESAMPLING	0x–
Enable/disable replication logic <sup>(1)</sup> .	DISPC_VIDp_ATTRIBUTES[10] REPLICATIONENABLE	0x1
Configure the VC-1 range mapping <sup>(1)</sup> .	See <a href="#">Section 11.2.5.1.2.3.4</a> .	
Configure the video color space conversion <sup>(1)</sup> .	See <a href="#">Section 11.2.5.1.2.3.5</a> .	
Configure the video scaler unit <sup>(1)</sup> .	See <a href="#">Section 11.2.5.1.2.3.6</a> .	

- <sup>(1)</sup> This module configuration can be optional depending on:
- The video mode configuration selected. See [Figure 11-101](#).
  - The video format and application needs

Figure 11-101. DISPC Video Pipeline Processing Configuration

dispc-089

11.2.5.1.2.3.4 DISPC Subsequence – Configure the VC-1 Range Mapping

This subsequence describes the steps to configure the VC-1 range mapping (see Table 11-133).

Table 11-133. DISPC Configure the VC-1 Range Mapping

Step	Register/Bit Field/Programming Model	Value
Set the Y component VC-1 range mapping.	DISPC_VIDp_ATTRIBUTES2[3:1] VC1_RANGE_Y	0x–
Set the Cb and Cr component VC-1 range mapping.	DISPC_VIDp_ATTRIBUTES2[6:4] VC1_RANGE_CBCR	0x–
Enable VC-1 range mapping.	DISPC_VIDp_ATTRIBUTES2[0] VC1ENABLE	0x1

11.2.5.1.2.3.5 DISPC Subsequence – Configure the Video Color Space Conversion

This subsequence describes the steps to configure the video color space conversion (see Table 11-134).

**Table 11-134. DISPC Configure the Video Color Space Conversion**

Step	Register/Bit Field/Programming Model	Value
Select the range of the color space conversion.	DISPC_VIDp_ATTRIBUTES[11] FULLRANGE	0x–
Set the RCr and RY coefficients.	DISPC_VIDp_CONV_COEF0[26:16][10:0] RCR, RY	0x–
Set the GY and RCB coefficients.	DISPC_VIDp_CONV_COEF1[26:16][10:0] GY, RCB	0x–
Set the GCb and GCr coefficients.	DISPC_VIDp_CONV_COEF2[26:16][10:0] GCB, GCr	0x–
Set the BCr and BY coefficients.	DISPC_VIDp_CONV_COEF3[26:16][10:0] BCR, BY	0x–
Set the BCb coefficient.	DISPC_VIDp_CONV_COEF4[10:0] BCB	0x–
Enable color space conversion.	DISPC_VIDp_ATTRIBUTES[9] COLORCONVENABLE	0x1

### 11.2.5.1.2.3.6 DISPC Subsequence – Configure the Video Scaler Unit

This subsequence configures the video scaler unit. [Table 11-135](#) is applicable for RGB pixel format. [Table 11-135](#) and [Table 11-136](#) are applicable for YUV pixel format.

**Table 11-135. DISPC Configure the Video Scaler Unit for RGB Pixel Formats or Y Component**

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio.	DISPC_VIDp_FIR[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients.	DISPC_VIDp_FIR_COEF_H_i[31:24][23:16][15:8] [7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_VIDp_FIR_COEF_HV_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value.	DISPC_VIDp_ACCU_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Select number of vertical taps.	DISPC_VIDp_ATTRIBUTES[21] VERTICALTAPS	0x–
Set the vertical resizing ratio.	DISPC_VIDp_FIR[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for RGB pixel format or Y component.	DISPC_VIDp_FIR_COEF_HV_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for RGB pixel format or Y component.	DISPC_VIDp_ACCU_j[26:16] VERTICALACCU	0x–
Enable horizontal and vertical scaler unit.	DISPC_VIDp_ATTRIBUTES[6:5] RESIZEENABLE	0x–

**Table 11-136. DISPC Configure the Video Scaler Unit for Cb and Cr Components**

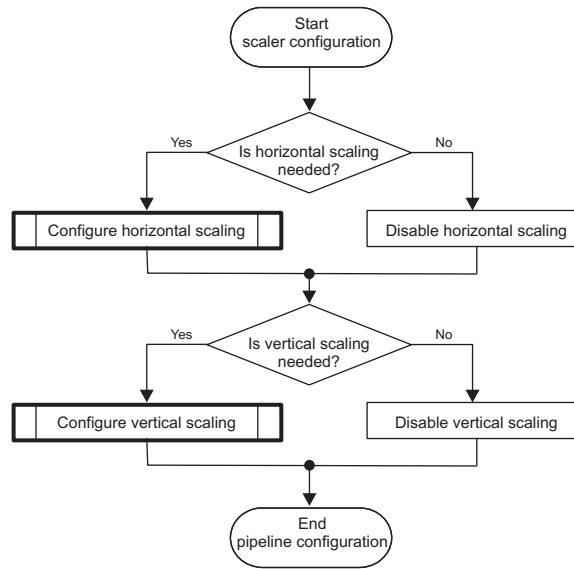

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio for Cb and Cr components.	DISPC_VIDp_FIR2[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients for Cb and Cr components.	DISPC_VIDp_FIR_COEF_H2_i[31:24][23:16][15:8] [7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_VIDp_FIR_COEF_HV2_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value for Cb and Cr components.	DISPC_VIDp_ACCU2_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Set the vertical resizing ratio for Cb and Cr components.	DISPC_VIDp_FIR2[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for Cb and Cr components.	DISPC_VIDp_FIR_COEF_HV2_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V2_i[15:8][7:0] FIRVC22, FIRVC00	0x–

**Table 11-136. DISPC Configure the Video Scaler Unit for Cb and Cr Components (continued)**

Step	Register/Bit Field/Programming Model	Value
Set the vertical accumulators value for Cb and Cr components.	DISPC_VIDp_ACCU2_[26:16] VERTICALACCU	0x-

Figure 11-102 shows the programming flow of the DISPC scaler unit.

**Figure 11-102. DISPC Scaler Unit Programming Flow**

dispc-090

**11.2.5.1.2.3.7 DISPC Subsequence – Configure the Video Pipeline Layer Output**

This subsequence describes the video layer settings available at the pipeline level necessary when using the overlay manager (see Table 11-137).

**Table 11-137. DISPC Configure the Video Pipeline Layer Output**

Step	Register/Bit Field/Programming Model	Value
Set the LCD/TV output.	DISPC_VIDp_ATTRIBUTES[16] CHANNELOUT	0x-
If DISPC_VIDp_ATTRIBUTES[16] = 0, set the LCD output.	DISPC_VIDp_ATTRIBUTES[31:30] CHANNELOUT2	0x-
Set the Z-order priority of the layer for overlay manager.	DISPC_VIDp_ATTRIBUTES[27:26] ZORDER	0x-
Enable the video pipeline Z-order.	DISPC_VIDp_ATTRIBUTES[25] ZORDERENABLE	0x-
Set the Global Alpha value for the alpha blender unit.	DISPC_GLOBAL_ALPHA[31:24][23:16][15:8] VID3GLOBALALPHA, VID2GLOBALALPHA, VID1GLOBALALPHA	0x-

**11.2.5.1.2.4 DISPC WB Pipeline Configuration**

**11.2.5.1.2.4.1 DISPC Main Sequence – Configure the WB Pipeline**

This procedure describes the steps to configure the WB pipeline (see Table 11-138).

**Table 11-138. DISPC Configure the WB Pipeline**

Step	Register/Bit Field/Programming Model	Value
Configure the capture window.	See <a href="#">Table 11-139</a> .	
Configure the WB scaler unit.	See <a href="#">Table 11-140</a> .	
Enable truncation logic to match pixel size defined in the format of image <a href="#">DISPC_WB_ATTRIBUTES</a> [4:1] FORMAT.	<a href="#">DISPC_WB_ATTRIBUTES</a> [10] TRUNCATIONENABLE	0x–
If <a href="#">DISPC_WB_ATTRIBUTES</a> [10] !=, configure the WB color space conversion unit.	See <a href="#">Table 11-142</a> .	
Validate the configuration according to the registers modification.	<a href="#">DISPC_CONTROL2</a> [6] GOWB	
Enable WB pipeline.	<a href="#">DISPC_WB_ATTRIBUTES</a> [0] ENABLE	0x1

#### 11.2.5.1.2.4.2 DISPC Subsequence – Configure the Capture Window

This subsequence describes the parameters of the image to be captured in the system memory (see [Table 11-139](#)).

**Table 11-139. DISPC Configure the Capture Window**

Step	Register/Bit Field/Programming Model	Value
Set the input source.	<a href="#">DISPC_WB_ATTRIBUTES</a> [18:16] CHANNELIN	0x–
Select the format of image.	<a href="#">DISPC_WB_ATTRIBUTES</a> [4:1] FORMAT	0x–
Set the X size of image to be captured.	<a href="#">DISPC_WB_SIZE</a> [10:0] SIZEX	0x–
Set the Y size of image to be captured.	<a href="#">DISPC_WB_SIZE</a> [10:0] SIZEY	0x–

#### 11.2.5.1.2.4.3 DISPC Subsequence – Configure the WB Scaler Unit

This subsequence configures the scaler unit. [Table 11-140](#) is applicable for RGB pixel format. [Table 11-140](#) and [Table 11-141](#) are applicable for YUV pixel format.

**Table 11-140. DISPC Configure the WB Scaler Unit for RGB Pixel Formats or Y Component**

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio.	<a href="#">DISPC_WB_FIR</a> [12:0] FIRHINC	0x–
Set the horizontal FIR coefficients.	<a href="#">DISPC_WB_FIR_COEF_H_j</a> [31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	<a href="#">DISPC_WB_FIR_COEF_HV_j</a> [7:0] FIRHC4	0x–
Set the horizontal accumulators value.	<a href="#">DISPC_WB_ACCU_j</a> [10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Select number of vertical taps.	<a href="#">DISPC_WB_ATTRIBUTES</a> [21] VERTICALTAPS	0x–
Set the vertical resizing ratio.	<a href="#">DISPC_WB_FIR</a> [28:16] FIRVINC	0x–
Set the vertical FIR coefficients for RGB pixel format or Y component.	<a href="#">DISPC_WB_FIR_COEF_HV_j</a> [31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: <a href="#">DISPC_WB_FIR_COEF_V_j</a> [15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for RGB pixel format or Y component.	<a href="#">DISPC_WB_ACCU_j</a> [26:16] VERTICALACCU	0x–
Enable horizontal and vertical scaler unit.	<a href="#">DISPC_WB_ATTRIBUTES</a> [6:5] RESIZEENABLE	0x–

**Table 11-141. DISPC Configure the WB Scaler Unit for Cb and Cr Components**

Step	Register/Bit Field/Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio for Cb and Cr components.	DISPC_WB_FIR2[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients for Cb and Cr components.	DISPC_WB_FIR_COEF_H2_j[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_WB_FIR_COEF_HV2_j[7:0] FIRHC4	0x–
Set the horizontal accumulators value for Cb and Cr components.	DISPC_WB_ACCU2_j[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Set the vertical resizing ratio for Cb and Cr components.	DISPC_WB_FIR2[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for Cb and Cr components.	DISPC_WB_FIR_COEF_HV2_j[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_WB_FIR_COEF_V2_j[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for Cb and Cr components.	DISPC_WB_ACCU2_j[26:16] VERTICALACCU	0x–

#### 11.2.5.1.2.4.4 DISPC Subsequence – Configure the WB Color Space Conversion Unit

This subsequence describes the steps to configure the WB color space conversion unit (see [Table 11-142](#)).

**Table 11-142. DISPC Configure the WB Color Space Conversion Unit**

Step	Register/Bit Field/Programming Model	Value
Select the range of the color space conversion.	DISPC_WB_ATTRIBUTES[11] FULLRANGE	0x–
Set the RCr and RY coefficients.	DISPC_WB_CONV_COEF0[26:16][10:0] YG, YR	0x–
Set the GY and RCb coefficients	DISPC_WB_CONV_COEF1[26:16][10:0] CRR, YB	0x–
Set the GCb and GCr coefficients.	DISPC_WB_CONV_COEF2[26:16][10:0] CRB, CRG	0x–
Set the BCr and BY coefficients.	DISPC_WB_CONV_COEF3[26:16][10:0] CBG, CBR	0x–
Set the BCb coefficient.	DISPC_WB_CONV_COEF4[10:0] CBB	0x–
Enable color space conversion.	DISPC_WB_ATTRIBUTES[9] COLORCONVENABLE	0x1

#### 11.2.5.1.2.5 DISPC LCD Output Configuration

##### 11.2.5.1.2.5.1 DISPC Main Sequence – Configure the LCD Output

This procedure details the LCD output configuration (see [Table 11-143](#)).

**Table 11-143. DISPC Configure the LCD Output**

Step	Register/Bit Field/Programming Model
Configure the LCD overlay manager.	See <a href="#">Table 11-144</a> .
Configure the gamma table for gamma correction.	See <a href="#">Section 11.2.5.1.2.5.3</a> .
Configure the CPR.	See <a href="#">Table 11-148</a> .
Configure the LCD panel timings and parameters.	See <a href="#">Table 11-149</a> .
Configure BT.656 or BT.1120 mode.	See <a href="#">Table 11-150</a>
Validate the LCD output configuration according.	DISPC_CONTROL1[5] GOLCD
	DISPC_CONTROL2[5] GOLCD
Enable LCD output.	DISPC_CONTROL1[0] LCDENABLE

**Table 11-143. DISPC Configure the LCD Output (continued)**

Step	Register/Bit Field/Programming Model
	<a href="#">DISPC_CONTROL2</a> [0] LCDENABLE

### 11.2.5.1.2.5.2 DISPC Subsequence – Configure the Overlay Manager

This subsequence describes the overlay manager settings and transparency color key configuration (see [Table 11-144](#)).

**Table 11-144. DISPC Configure the LCD Overlay Manager**

Step	Register/Bit Field/Programming Model	Value
Set the LCD panel background color.	<a href="#">DISPC_DEFAULT_COLOR</a> [23:0] DEFAULTCOLOR	0x–
Enable/disable overlay optimization.	<a href="#">DISPC_CONTROL</a> [12] OVERLAYOPTIMIZATION	0x–
Enable the alpha blender.	<a href="#">DISPC_CONFIG1</a> [18] LCDALPHABLENDERENABLE	0x1
Configure the transparency color key		
Set source or destination transparency color key mode.	<a href="#">DISPC_CONFIG</a> [11] TCKLCDSELECTION	0x–
Set the transparency color value.	<a href="#">DISPC_TRANS_COLOR</a> [23:0] TRANSCOLORKEY	0x–
Enable transparency color key mode.	<a href="#">DISPC_CONFIG</a> [10] TCKLCDENABLE	0x–

### 11.2.5.1.2.5.3 DISPC Subsequence – Configure the Gamma Table for Gamma Correction

This subsequence describes the settings for configuring the gamma correction for LCD1, LCD2, and LCD3 (see [Table 11-145](#) through [Table 11-147](#), respectively).

**NOTE:** Software must ensure there is no visible effect when modifying the table because it is not under hardware control. The synchronization done using the DMA engine inside the DISPC to load the table when it is not used to display the picture on the screen is not present for this mode.

**Table 11-145. DISPC Configure the Gamma Table for LCD1**

Step	Register/Bit Field/Programming Model	Value
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index.	<a href="#">DISPC_GAMMA_TABLE0</a> [31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–
Enable the gamma table.	<a href="#">DISPC_CONFIG1</a> [3] PALETTEGAMMABLE	0x1
Select the load mode of the gamma look-up table.	<a href="#">DISPC_CONFIG1</a> [2:1] LOADMODE	0x–

**Table 11-146. DISPC Configure the Gamma Table for LCD2**

Step	Register/Bit Field/Programming Model	Value
Enable Gamma table for LCD2 and TV.	<a href="#">DISPC_CONFIG1</a> [9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index.	<a href="#">DISPC_GAMMA_TABLE2</a> [31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

**Table 11-147. DISPC Configure the Gamma Table for LCD3**

Step	Register/Bit Field/Programming Model	Value
Enable Gamma table for LCD3 and TV.	DISPC_CONFIG3[9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index.	DISPC_GAMMA_TABLE3[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

#### 11.2.5.1.2.5.4 DISPC Subsequence – Configure the Color Phase Rotation

Table 11-148 describes the settings for the CPR unit (see Table 11-148).

**Table 11-148. DISPC Configure the Color Phase Rotation**

Step	Register/Bit Field/Programming Model	Value
<b>For Color Phase Rotation Processing</b>		
Set the Red coefficients.	DISPC_CPRo_COEF_R [31:22][20:11][9:0] RR, RG, RB	0x–
Set the Green coefficients	DISPC_CPRo_COEF_G [31:22][20:11][9:0] GR, GG, GB	0x–
Set the Blue coefficients.	DISPC_CPRo_COEF_B [31:22][20:11][9:0] BR, BG, BB	0x–
Disable the CPR unit in RGB to YUV conversion.	DISPC_CONFIGo[24] COLORCONVENABLE	0x0
Enable the CPR unit.	DISPC_CONFIGo[15] CPR	0x1
<b>For Color Space Conversion Processing</b>		
Set the Y coefficients.	DISPC_CPRo_COEF_R [31:22][20:11][9:0] RR, RG, RB	0x–
Set the Cb coefficients.	DISPC_CPRo_COEF_G [31:22][20:11][9:0] GR, GG, GB	0x–
Set the Cr coefficients.	DISPC_CPRo_COEF_B [31:22][20:11][9:0] BR, BG, BB	0x–
Set the CSC range.	DISPC_CONFIGo[25] FULLRANGE	0x–
Enable the CPR unit in RGB to YUV conversion.	DISPC_CONFIGo[24] COLORCONVENABLE	0x1
Disable the CPR unit.	DISPC_CONFIGo[15] CPR	0x0

#### 11.2.5.1.2.5.5 DISPC Subsequence – Configure the LCD Panel Timings and Parameters

This subsequence describes the setting for horizontal and vertical synchronization and signal polarity (see Table 11-149).

**Table 11-149. DISPC Configure the LCD Panel Timings and Parameters**

Step	Register/Bit Field/Programming Model	Value
<b>Configure spatial/temporal dithering</b>		
Select spatial/temporal number of frames.	DISPC_CONTROLo[31:30] SPATIALTEMPORALDITHERINGFRAMES	0x–
Enable spatial/temporal dithering.	DISPC_CONTROLo[7] STDITHERENABLE	0x–
<b>Configure AC-bias</b>		
Configure the VSYNC, HSYNC and AC bias polarity.	DISPC_POL_FREQo	0x–
Configure the gating of AC bias polarity.	DISPC_CONFIGo[8] ACBIASGATED	0x–
Configure the AC bias polarity.	DISPC_POL_FREQo[15] IEO	0x–
Set the AC bias frequency.	DISPC_POL_FREQo[7:0] ACB	0x–
Set the number of AC bias transitions per interrupt.	DISPC_POL_FREQo[11:8] ACBI	0x–
<b>Configure the pixel clock</b>		
Set the DISPC logic clock divisor.	DISPC_DIVISORo[23:16] LCD	0x–
Set the pixel clock divisor.	DISPC_DIVISORo[7:0] PCD	0x–
Configure the gating of pixel clock.	DISPC_CONFIGo[5] PIXELCLOCKGATED	0x–
<b>Configure the data</b>		

**Table 11-149. DISPC Configure the LCD Panel Timings and Parameters (continued)**

Step	Register/Bit Field/Programming Model	Value
Set the pixel clock edge to drive data output.	DISPC_POL_FREQo[14] IPC and CTRL_CORE_SMA_SW_1[DSS_CHx_IPC <sup>(1)</sup>	0x-
Configure the gating of data output.	DISPC_CONFIGo[4] PIXELDATAGATED	0x-
Set the data output mode.	DISPC_CONFIGo[22] OUTPUTMODEENABLE	0x-
Configure the panel parameters		
Set the vertical TV size.	DISPC_SIZE_LCDo[27:16] LPP	0x-
Set the horizontal TV size.	DISPC_SIZE_LCDo[11:0] PPL	0x-
Set the panel type.	DISPC_CONTROLo[3] STNTFT	0x-
Configure the refresh rate and horizontal and vertical parameters		
Set the vertical synchronization timing.	DISPC_TIMING_Vo[31:20][19:8][7:0], VBP, VFP, VSW	0x-
Configure the VSYNC polarity.	DISPC_POL_FREQo[12] IVS	0x-
Configure the gating of VSYNC.	DISPC_CONFIGo[7] VSYNCGATED	0x-
Set the horizontal synchronization timing.	DISPC_TIMING_Ho[31:20][19:8][7:0], HBP, HFP, HSW	0x-
Configure the HSYNC polarity.	DISPC_POL_FREQo[13] IHS	0x-
Configure the gating of HSYNC.	DISPC_CONFIGo[6] HSYNCGATED	0x-
Set the opposition of HSYNC and VSYNC driving.	DISPC_POL_FREQo[17] ONOFF and CTRL_CORE_SMA_SW_1[DSS_CHx_ON_OFF <sup>(1)</sup>	0x-
If DISPC_POL_FREQo[17] = 1, set the pixel clock edge to drive HSYNC and VSYNC.	DISPC_POL_FREQo[16] RF and CTRL_CORE_SMA_SW_1[DSS_CHx_RF <sup>(1)</sup>	0x-
Set the alignment of HSYNC and VSYNC.	DISPC_POL_FREQo[18] ALIGN	0x-

<sup>(1)</sup> The values of the DISPC and Control Module registers must mach

#### 11.2.5.1.2.5.6 DISPC Subsequence – Configure BT.656 or BT.1120 Mode

### CAUTION

DISPC supports maximum 256 bytes of horizontal blanking when the LCD outputs are configured in BT modes (bitfield HSW of [DISPC\\_TIMING\\_H1/2/3](#) registers is 8 bits wide). This is not compliant with BT.656 and BT.1120 standards, both of which require higher blanking periods. If more than 256 bytes of horizontal blanking are required by the application, then the RGB mode must be used for the LCD outputs.

[Table 11-150](#) lists the steps to configure BT.656 or BT.1120.

**Table 11-150. DISPC Configure BT.656 or BT.1120 Mode**

Step	Register/Bit Field/Programming Model	Value
Enable BT.656 mode <sup>(1)</sup>	DISPC_CONFIGo[20] BT656ENABLE	0x1
Enable BT.1120 mode <sup>(1)</sup>	DISPC_CONFIGo[21] BT1120ENABLE	0x1
Configure the blanking values	See <a href="#">Table 11-151</a>	-
Configure the color phase rotation block	See <a href="#">Table 11-148</a>	-
Disable STALL mode	DISPC_CONTROLo[11] STALLMODE	0x0
Disable TDM	DISPC_CONTROLo[20] TDMENABLE	0x0

<sup>(1)</sup> It is not possible to enable BT.656 and BT.1120 modes simultaneously on one LCD output.

[Table 11-151](#) lists the blankng values for BT.656 and BT.1120.

**Table 11-151. DISPC Configure BT.656 or BT.1120 Blanking Values**

Step	Register/Bit Field/Programming Model	Value
<b>For Progressive Mode</b>		
Select progressive mode	DISPC_CONFIG0[22] OUTPUTMODEENABLE	0x0
Set Horizontal blanking	DISPC_TIMING_Ho[7:0] HSW	0x-
Set Vertical frame blanking No 1	DISPC_TIMING_Vo[19:8] VFP	0x-
Set Vertical frame blanking No 2	DISPC_TIMING_Vo[31:20] VBP	0x-
Set Number of lines	DISPC_SIZE_LCD1[27:16] LPP	0x-
Set Number of pixels per line	DISPC_SIZE_LCD1[11:0] PPL	0x-
<b>For Interlaced Mode</b>		
Select interlaced mode	DISPC_CONFIG0[22] OUTPUTMODEENABLE	0x1
Set Horizontal blanking	DISPC_TIMING_Ho[7:0] HSW	0x-
Set Vertical field blanking No 1 for Even Field	DISPC_TIMING_Ho[19:8] HFP	0x-
Set Vertical field blanking No 2 for Even Field	DISPC_TIMING_Ho[31:20] HBP	0x-
Set Vertical field blanking No 1 for Odd Field	DISPC_TIMING_Vo[19:8] VFP	0x-
Set Vertical field blanking No 2 for Odd Field	DISPC_TIMING_Vo[31:20] VBP	0x-
Set Number of lines per field (even)	DISPC_SIZE_LCD1[27:16] LPP	0x-
Set Delta number of odd field compared to even field (in a single line)	DISPC_SIZE_LCD1[15:14] DELTA	0x-
Set Number of pixels per line	DISPC_SIZE_LCD1[11:0] PPL	0x-

### 11.2.5.1.2.6 DISPC TV Output Configuration

#### 11.2.5.1.2.6.1 DISPC Main Sequence – Configure the TV Output

This procedure describes the TV output configuration (see [Table 11-152](#)).

**Table 11-152. DISPC Configure the TV Output**

Step	Register/Bit Field/Programming Model
Configure the TV overlay manager.	See <a href="#">Table 11-153</a> .
Configure the gamma table for gamma correction.	See <a href="#">Table 11-154</a> .
Configure the TV panel timings and parameters.	See <a href="#">Table 11-155</a> .
Validate the TV output configuration accordingly.	DISPC_CONTROL1[6] GOTV
Enable the TV output.	DISPC_CONTROL1[1] TVENABLE

#### 11.2.5.1.2.6.1.1 DISPC Subsequence – Configure the TV Overlay Manager

This subsequence describes the overlay manager settings and transparency color key configuration (see [Table 11-153](#)).

**Table 11-153. DISPC Configure the TV Overlay Manager**

Step	Register/Bit Field/Programming Model	Value
Set the TV panel background color.	DISPC_DEFAULT_COLOR1[23:0] DEFAULTCOLOR	0x-
Enable/disable overlay optimization.	DISPC_CONTROL2[13] TVOVERLAYOPTIMIZATION	0x-
Enable the alpha blender.	DISPC_CONFIG1[19] TVALPHABLENDERENABLE	0x1
<b>Configure the transparency color key</b>		
Set source or destination transparency color key mode.	DISPC_CONFIG1[13] TCKTVSELECTION	0x-
Set the transparency color value.	DISPC_TRANS_COLOR1[23:0] TRANSCOLORKEY	0x-
Enable transparency color key mode.	DISPC_CONFIG1[10] TCKTVENABLE	0x-

### 11.2.5.1.2.6.1.2 DISPC Subsequence – Configure the Gamma Table for Gamma Correction

This subsequence describes the steps to configure the gamma table for gamma correction (see [Table 11-154](#)).

**NOTE:** Software must ensure there is no visible effect when modifying the table because it is not under hardware control. The synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.

**Table 11-154. DISPC Configure the Gamma Table for TV Output**

Step	Register/Bit Field/Programming Model	Value
Enable Gamma table for LCD2 and TV.	DISPC_CONFIG1[9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values. For more information, see <a href="#">Section 11.2.4.14.2, Gamma Correction Unit</a> .	DISPC_GAMMA_TABLE2[31][29:20][19:10][9:0] INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

### 11.2.5.1.2.6.1.3 DISPC Subsequence – Configure the TV Panel Timings and Parameters

This subsequence describes the settings for horizontal and vertical synchronization and signal polarity (see [Table 11-155](#)).

**Table 11-155. DISPC Configure the TV Panel Timings and Parameters**

Step	Register/Bit Field/Programming Model	Value
Set the hold time for TV data outputs.	DISPC_CONFIG1[19:17]	0x–
Set the vertical TV size.	DISPC_SIZE_TV[27:16] LPP	See <a href="#">Table 11-119</a>
Set the horizontal TV size.	DISPC_SIZE_TV[11:0] PPL	for HD standards.

## 11.2.6 DISPC Register Manual

### 11.2.6.1 DISPC Instance Summary

**Table 11-156. DISPC Instance Summary**

Module Name	L3_MAIN Base Address	Size
DISPC	0x5800 1000	4 KiB

### 11.2.6.2 DISPC Logical Register Mapping

**Table 11-157. DISPC\_VIDp\_BA\_j Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_VID1_BA_j</a>	Base address of video pipeline 1
<a href="#">DISPC_VID2_BA_j</a>	Base address of video pipeline 2
<a href="#">DISPC_VID3_BA_j</a>	Base address of video pipeline 3

**Table 11-158. DISPC\_VIDp\_BA\_UV\_j Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_VID1_BA_UV_j</a>	Base address of UV components for video pipeline 1
<a href="#">DISPC_VID2_BA_UV_j</a>	Base address of UV components for video pipeline 2

<a href="#">DISPC_VID3_CONV_COEF2</a>	Configuration of the Color Space Conversion coefficient for the video pipeline 3

**Table 11-178. DISPC\_VIDp\_CONV\_COEF3 Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_VID1_CONV_COEF3</a>	Configuration of the Color Space Conversion coefficients for the video pipeline 1
<a href="#">DISPC_VID2_CONV_COEF3</a>	Configuration of the Color Space Conversion coefficient for the video pipeline 2
<a href="#">DISPC_VID3_CONV_COEF3</a>	Configuration of the Color Space Conversion coefficient for the video pipeline 3

**Table 11-179. DISPC\_VIDp\_CONV\_COEF4 Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_VID1_CONV_COEF4</a>	Configuration of the Color Space Conversion coefficients for the video pipeline 1
<a href="#">DISPC_VID2_CONV_COEF4</a>	Configuration of the Color Space Conversion coefficient for the video pipeline 2
<a href="#">DISPC_VID3_CONV_COEF4</a>	Configuration of the Color Space Conversion coefficient for the video pipeline 3

**Table 11-180. DISPC\_CONTROLo Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_CONTROL1</a>	Configuration control of the LCD1 and TV.
<a href="#">DISPC_CONTROL2</a>	Configuration control of the LCD2.
<a href="#">DISPC_CONTROL3</a>	Configuration control of the LCD3.

**Table 11-181. DISPC\_CONFIGo Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_CONFIG1</a>	Configuration of the LCD1 and TV.
<a href="#">DISPC_CONFIG2</a>	Configuration of the LCD2.
<a href="#">DISPC_CONFIG3</a>	Configuration of the LCD3.

**Table 11-182. DISPC\_DEFAULT\_COLORo Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_DEFAULT_COLOR0</a>	Configuration of the background color for LCD1.
<a href="#">DISPC_DEFAULT_COLOR1</a>	Configuration of the background color for TV.
<a href="#">DISPC_DEFAULT_COLOR2</a>	Configuration of the background color for LCD2.
<a href="#">DISPC_DEFAULT_COLOR3</a>	Configuration of the background color for LCD3.

**Table 11-183. DISPC\_TRANS\_COLORo Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_TRANS_COLOR0</a>	Configuration of the transparency color key for LCD1.
<a href="#">DISPC_TRANS_COLOR1</a>	Configuration of the transparency color key for TV.
<a href="#">DISPC_TRANS_COLOR2</a>	Configuration of the transparency color key for LCD2.

**Table 11-183. DISPC\_TRANS\_COLORo Logical Register Mapping (continued)**

Hardware Register	Description
<a href="#">DISPC_DEFAULT_COLOR3</a>	Configuration of the background color for LCD3.

**Table 11-184. DISPC\_GAMMA\_TABLEo Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_GAMMA_TABLE0</a>	Configuration of the gamma table for LCD1.
<a href="#">DISPC_GAMMA_TABLE1</a>	Configuration of the gamma table for LCD2.
<a href="#">DISPC_GAMMA_TABLE2</a>	Configuration of the gamma table for TV output.
<a href="#">DISPC_GAMMA_TABLE3</a>	Configuration of the gamma table for LCD3.

**Table 11-185. DISPC\_TIMING\_Ho Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_TIMING_H1</a>	Configuration of the horizontal timing for LCD1.
<a href="#">DISPC_TIMING_H2</a>	Configuration of the horizontal timing for LCD2.
<a href="#">DISPC_TIMING_H3</a>	Configuration of the horizontal timing for LCD3.

**Table 11-186. DISPC\_TIMING\_Vo Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_TIMING_V1</a>	Configuration of the vertical timing for LCD1.
<a href="#">DISPC_TIMING_V2</a>	Configuration of the vertical timing for LCD2.
<a href="#">DISPC_TIMING_V3</a>	Configuration of the vertical timing for LCD3.

**Table 11-187. DISPC\_POL\_FREQo Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_POL_FREQ1</a>	Configuration of the output signals for LCD1.
<a href="#">DISPC_POL_FREQ2</a>	Configuration of the output signals for LCD2.
<a href="#">DISPC_POL_FREQ3</a>	Configuration of the output signals for LCD3.

**Table 11-188. DISPC\_DIVISORo Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_DIVISOR1</a>	Configuration of the divisors for LCD1.
<a href="#">DISPC_DIVISOR2</a>	Configuration of the divisors for LCD2.
<a href="#">DISPC_DIVISOR3</a>	Configuration of the divisors for LCD3.

**Table 11-189. DISPC\_SIZE\_LCDo Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_SIZE_LCD1</a>	Configuration of the divisors for LCD1.
<a href="#">DISPC_SIZE_LCD2</a>	Configuration of the divisors for LCD2.
<a href="#">DISPC_SIZE_LCD3</a>	Configuration of the divisors for LCD3.

**Table 11-190. DISPC\_SIZE Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_SIZE_LCD1</a>	Configuration of the LCD size on LCD1.
<a href="#">DISPC_SIZE_LCD2</a>	Configuration of the LCD size on LCD2.
<a href="#">DISPC_SIZE_LCD3</a>	Configuration of the LCD size on LCD3.

**Table 11-191. DISPC\_DATAo\_CYCLE1 Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_DATA1_CYCLE1</a>	Configuration of the output data format for first cycle on LCD1.
<a href="#">DISPC_DATA2_CYCLE1</a>	Configuration of the output data format for first cycle on LCD2.
<a href="#">DISPC_DATA3_CYCLE1</a>	Configuration of the output data format for first cycle on LCD3.

**Table 11-192. DISPC\_DATAo\_CYCLE2 Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_DATA1_CYCLE2</a>	Configuration of the output data format for second cycle on LCD1.
<a href="#">DISPC_DATA2_CYCLE2</a>	Configuration of the output data format for second cycle on LCD2.
<a href="#">DISPC_DATA3_CYCLE2</a>	Configuration of the output data format for second cycle on LCD3.

**Table 11-193. DISPC\_DATAo\_CYCLE3 Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_DATA1_CYCLE3</a>	Configuration of the output data format for third cycle on LCD1.
<a href="#">DISPC_DATA2_CYCLE3</a>	Configuration of the output data format for third cycle on LCD2.
<a href="#">DISPC_DATA3_CYCLE3</a>	Configuration of the output data format for third cycle on LCD3.

**Table 11-194. DISPC\_CPRo\_COEF\_R Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_CPR1_COEF_R</a>	Configuration of the CPR matrix coefficients for the red component on LCD1.
<a href="#">DISPC_CPR2_COEF_R</a>	Configuration of the CPR matrix coefficients for the red component on LCD2.
<a href="#">DISPC_CPR3_COEF_R</a>	Configuration of the CPR matrix coefficients for the red component on LCD3.

**Table 11-195. DISPC\_CPRo\_COEF\_G Logical Register Mapping**

Hardware Register	Description
<a href="#">DISPC_CPR1_COEF_G</a>	Configuration of the CPR matrix coefficients for the green component on LCD1.
<a href="#">DISPC_CPR2_COEF_G</a>	Configuration of the CPR matrix coefficients for the green component on LCD2.
<a href="#">DISPC_CPR3_COEF_G</a>	Configuration of the CPR matrix coefficients for the green component on LCD3.

**Table 11-196. DISPC\_CPRo\_COEF\_B Logical Register Mapping**

Hardware Register	Description
DISPC_CPR1_COEF_B	Configuration of the CPR matrix coefficients for the blue component on LCD1.
DISPC_CPR2_COEF_B	Configuration of the CPR matrix coefficients for the blue component on LCD2.
DISPC_CPR3_COEF_B	Configuration of the CPR matrix coefficients for the blue component on LCD3.

### 11.2.6.3 DISPC Registers

#### 11.2.6.3.1 DISPC Register Summary

**Table 11-197. DISPC Registers Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	L3_MAIN Physical Address
DISPC_REVISION	R	32	0x0000 0000	0x5800 1000
DISPC_SYSCONFIG	RW	32	0x0000 0010	0x5800 1010

**Table 11-200. DISPC\_SYSCONFIG**

<b>Address Offset</b>	0x0000 0010		
<b>Physical Address</b>	0x5800 1010	<b>Instance</b>	DISPC
<b>Description</b>	This register allows to control various parameters of the OCP interface.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																MIDLEMODE	RESERVED	CLOCKACTIVITY	RESERVED	WARMRESET	SIDLEMODE	ENWAKEUP	SOFTRESET	AUTOIDLE							

Bits	Field Name	Description	Type	Reset
31:14	RESERVED	Write 0s for future compatibility. Reads returns 0.	R	0x00000
13:12	MIDLEMODE	Master interface power management, standby/wait control  0x0: Force-standby. MStandby is only asserted when the module is disabled. MStandby is only asserted when the module is disabled. 0x1: No-Standby: MStandby is never asserted. 0x2: Smart-Standby. MStandby is asserted based on the internal activity of the module. 0x3: Reserved	RW	0x0
11:10	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x0

Bits	Field Name	Description	Type	Reset
9:8	CLOCKACTIVITY	<p>Clocks activity during wake up mode period</p> <p>0x0: OCP and functional clocks can be switched off.</p> <p>0x1: Functional clocks can be switched off and OCP clocks are maintained during wake up period.</p> <p>0x2: OCP clocks can be switched off and Functional clocks are maintained during wake up period.</p> <p>0x3: OCP and functional clocks are maintained during wake-up period.</p>	RW	0x0
7:6	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x0
5	WARMRESET	<p>Warm reset. Set this bit to 1 triggers a module warm reset. The bit is automatically reset by the hardware. During reads, it always returns 0. The warm reset keep the configuration registers unchanged.</p> <p>0x0: Normal mode</p> <p>0x1: The warm reset is set.</p>	RW	0
4:3	SIDLEMODE	<p>Slave interface power management, Idle req/ack control</p> <p>0x0: Force-idle. An idle request is acknowledged unconditionally.</p> <p>0x1: No-idle. An idle request is never acknowledged.</p> <p>0x2: Smart-idle. Acknowledgment to an idle request is given based on the internal activity of the module.</p> <p>0x3: Reserved</p>	RW	0x0
2	ENWAKEUP	<p>WakeUp feature control</p> <p>0x0: Wakeup is disabled.</p> <p>0x1: Wakeup is enabled.</p>	RW	0
1	SOFTRESET	<p>Software reset. Set this bit to 1 to trigger a module reset. The bit is automatically reset by the hardware. During reads, it always returns 0.</p> <p>0x0: Normal mode</p> <p>0x1: The module is reset.</p>	RW	0
0	AUTOIDLE	<p>Internal interface clock gating strategy</p> <p>0x0: Interface clock is free-running.</p> <p>0x1: Automatic interface L3_MAIN gating strategy is applied, based on the OCP interface activity. Automatic functional clock gating is also applied to the functional clock based on the module activity (for instance DISPC_&lt;pipe&gt;_ATTRIBUTES.ENABLE).</p>	RW	1

Bits	Field Name	Description	Type	Reset
31	FLIPIIMMEDIATEDONE_IRQ	<p>Flip Immediate Done. The DMA engine has acknowledged the immediate BA change, and software can write the new BA0.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
30	FRAMEDONE3_IRQ	<p>Frame done for the third LCD. The third LCD output has been disabled by user. All the data have been sent.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
29	ACBIASCOUNT STATUS3_IRQ	<p>AC bias count status for the third LCD</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
28	VSYNC3_IRQ	<p>Vertical synchronization for the third LCD</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
27	SYNCLOST3_IRQ	<p>Synchronization lost on the third LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the third LCD output.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
26	WBUNCOMPLETE ERROR_IRQ	<p>Write-back DMA buffer is flushed before it is completely drained.</p> <p>In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that case and will trigger every frame</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged</p> <p>0x1: READS: Event is true (Pending) WRITES: Status bit is reset</p>	RW W1toClr	0
25	WBBUFFER OVERFLOW_IRQ	<p>Write-back DMA buffer overflow. The DMA buffer is full.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
24	FRAME DONETV_IRQ	<p>Frame done for the TV. The TV output has been disabled by user. All the data have been sent.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
23	FRAME DONEWB_IRQ	<p>Frame done for the write-back channel. The write-back channel has output the frame. All the data of the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. It is available only when the write-back pipeline transfers back to memory the output of one of the pipelines. In case of overlay capture, the interrupt is not generated and the user shall use the FrameDone for the corresponding captured output.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
22	FRAME DONE2_IRQ	<p>Frame done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
21	ACBIASCOUNT STATUS2_IRQ	<p>AC bias count status for the secondary LCD</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
20	VID3BUFFER UNDERFLOW_IRQ	<p>Video 3 DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses)</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
19	VID3END WINDOW_IRQ	<p>The end of the video 3 window has been reached. It is detected by the overlay manager when the full video 3 has been displayed.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
18	VSYNC2_IRQ	<p>Vertical synchronization for the secondary LCD</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
17	SYNC LOST2_IRQ	<p>Synchronization lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output.</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0
16	WAKEUP_IRQ	<p>Wakeup</p> <p>0x0: READS: Event is false. WRITES: Status bit unchanged.</p> <p>0x1: READS: Event is true (pending). WRITES: Status bit is reset.</p>	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
15	SYNCLOST TV_IRQ	Synchronization lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
14	SYNC LOST1_IRQ	Synchronization lost on the primary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the primary LCD output.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
13	VID2END WINDOW_IRQ	The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
12	VID2BUFFER UNDERFLOW_IRQ	Video 2 DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses)  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
11	VID1END WINDOW_IRQ	The end of the video 1 Window has been reached. It is detected by the overlay manager when the full video 1 has been displayed.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
10	VID1BUFFER UNDERFLOW_IRQ	Video 1 DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses)  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
9	OCPERROR_IRQ	OCP error. L3_MAIN Interconnect has sent SResp=ERR.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
8	PALETTEGAMMA LOADING_IRQ	Palette Gamma loading status. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully.  <b>NOTE: CLUT and BITMAP formats are not supported in this family of devices.</b>  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
7	GFXEND WINDOW_IRQ	The end of the graphics window has been reached. It is detected by the overlay manager when the full graphics has been displayed.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
6	GFXBUFFER UNDERFLOW_IRQ	Graphics DMA buffer underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses)  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
5	PROGRAMMED LINENUMBER_IRQ	Programmed line number. It indicates that the scan of the primary LCD has reached the programmed user line number.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
4	ACBIASCOUNT STATUS1_IRQ	AC bias count status for the primary LCD  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
3	EVSYNC_ ODD_IRQ	VSYNC for odd field from the TV encoder (HDMI)  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
2	EVSYNC_ EVEN_IRQ	VSYNC for even field from the TV encoder (HDMI)  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
1	VSYNC1_IRQ	Vertical synchronization for the primary LCD.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
0	FRAME DONE1_IRQ	Frame done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent.  0x0: READS: Event is false. WRITES: Status bit unchanged.  0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
31	FLIPIIMMEDIATEDONE_EN	Flip Immediate Done. The DMA engine has acknowledged the immediate BA change, and software can write the new BA0.  0x0: FrameDone for the primary LCD output is masked 0x1: FrameDone for the primary LCD output generates an interrupt when it occurs	RW	0
30	FRAMEDONE3_EN	Frame done for the third LCD. The third LCD output has been disabled by user. All the data have been sent.  0x0: Frame Done for the secondary LCD is masked. 0x1: Frame Done for the secondary LCD generates an interrupt when it occurs.	RW	0
29	ACBIASCOUNTSTATUS3_EN	AC Bias count status for the third LCD  0x0: ACBiasCountStatus for the secondary LCD output is masked 0x1: ACBiasCountStatus for the secondary LCD output generates an interrupt when it occurs	RW	0
28	VSYNC3_EN	Vertical synchronization for the third LCD  0x0: VSYNC for the secondary LCD output is masked. 0x1: VSYNC for the secondary LCD output generates an interrupt when it occurs.	RW	0
27	SYNCLOST3_EN	Synchronization lost on the third LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the third LCD output.  0x0: Synchronization Lost on the secondary LCD output is masked. 0x1: Synchronization Lost on the secondary LCD output generates an interrupt when it occurs.	RW	0
26	WBUNCOMPLETEERROR_EN	The write back buffer has been flushed before been fully drained. Enable.  0x0: Interrupt is masked. 0x1: Interrupt is enabled.	RW	0

Bits	Field Name	Description	Type	Reset
25	WBBUFFER OVERFLOW_EN	Write-back DMA buffer overflow. The DMA buffer is full. 0x0: WBBufferOverflow is masked. 0x1: WBBufferOverflow generates an interrupt when it occurs.	RW	0
24	FRAME DONETV_EN	Frame done for the TV. The TV output has been disabled by user. All the data have been sent. 0x0: Frame Done for the TV output is masked. 0x1: Frame Done for the TV output generates an interrupt when it occurs.	RW	0
23	FRAME DONEWB_EN	Frame done for the write-back channel. The write-back channel has output the frame. All the data have been sent for the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. 0x0: Frame done for the write-back is masked. 0x1: Frame done for the write-back generates an interrupt when it occurs.	RW	0
22	FRAME DONE2_EN	Frame done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent. 0x0: Frame done for the secondary LCD is masked. 0x1: Frame done for the secondary LCD generates an interrupt when it occurs.	RW	0
21	ACBIASCOUNT STATUS2_EN	AC Bias count status for the secondary LCD 0x0: ACBiasCountStatus for the secondary LCD output is masked. 0x1: ACBiasCountStatus for the secondary LCD output generates an interrupt when it occurs.	RW	0
20	VID3BUFFER UNDERFLOW_EN	Video 3 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid3BufferUnderflow is masked. 0x1: Vid3BufferUnderflow generates an interrupt when it occurs.	RW	0
19	VID3END WINDOW_EN	The end of the video 3 window has been reached. It is detected by the overlay manager when the full video 3 has been displayed. 0x0: Vid3EndWindow is masked. 0x1: Vid3EndWindow generates an interrupt when it occurs.	RW	0
18	VSYNC2_EN	Vertical synchronization for the secondary LCD 0x0: VSYNC for the secondary LCD output is masked. 0x1: VSYNC for the secondary LCD output generates an interrupt when it occurs.	RW	0
17	SYNC LOST2_EN	Synchronization lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output. 0x0: Synchronization Lost on the secondary LCD output is masked. 0x1: Synchronization Lost on the secondary LCD output generates an interrupt when it occurs.	RW	0
16	WAKEUP_EN	Wake up mask 0x0: WakeUp is masked. 0x1: WakeUp generates an interrupt when it occurs.	RW	0

Bits	Field Name	Description	Type	Reset
15	SYNC LOSTTV_EN	Synchronization lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output.  0x0: Synchronization Lost on the TV output is masked. 0x1: Synchronization Lost on the TV output generates an interrupt when it occurs.	RW	0
14	SYNC LOST1_EN	Synchronization lost for the primary LCD  0x0: SyncLost for the primary LCD output is masked. 0x1: SyncLost for the primary LCD output generates an interrupt when it occurs.	RW	0
13	VID2END WINDOW_EN	The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed.  0x0: Vid2EndWindow is masked. 0x1: Vid2EndWindow generates an interrupt when it occurs.	RW	0
12	VID2BUFFER UNDERFLOW_EN	Video 2 DMA buffer underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses)  0x0: Vid2BufferUnderflow is masked. 0x1: Vid2BufferUnderflow generates an interrupt when it occurs.	RW	0
11	ENDVID1 WINDOW_EN	The end of the video 1 window has been reached. It is detected by the overlay manager when the full video 1 has been displayed.  0x0: EndVid1Window is masked. 0x1: EndVid1Window generates an interrupt when it occurs.	RW	0
10	VID1BUFFER UNDERFLOW_EN	Video 1 DMA buffer underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses)  0x0: Vid1bufferunderflow is masked. 0x1: Vid1bufferunderflow generates an interrupt when it occurs.	RW	0
9	OCPERROR_EN	OCP Error. L3_MAIN Interconnect has sent SResp=ERR.  0x0: OCPErrror is masked. 0x1: OCPErrror generates an interrupt when it occurs.	RW	0
8	PALETTE GAMMA_EN	Palette gamma loading mask. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully.  <b>NOTE: CLUT and BITMAP formats are not supported in this family of devices.</b>  0x0: PaletteGamma is masked. 0x1: PaletteGamma generates an interrupt when it occurs.	RW	0
7	GFXEND WINDOW_EN	The end of the graphics Window has been reached. It is detected by the overlay manager when the full graphics has been displayed.  0x0: GfxEndWindow is masked. 0x1: GfxEndWindow generates an interrupt when it occurs.	RW	0

Bits	Field Name	Description	Type	Reset
6	GFXBUFFER UNDERFLOW_EN	Graphics DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses)  0x0: GfxBufferUnderflow is masked.  0x1: GfxBufferUnderflow generates an interrupt when it occurs.	RW	0
5	PROGRAMMED LINENUMBER_EN	Programmed Line Number. It indicates that the scan of the primary LCD has reached the programmed user line number.  0x0: ProgrammedLineNumber is masked.  0x1: ProgrammedLineNumber generates an interrupt when it occurs.	RW	0
4	ACBIASCOUNT STATUS1_EN	AC Bias count status for the primary LCD  0x0: ACBiascountstatus for the primary LCD output is masked.  0x1: ACBiascountstatus for the primary LCD output generates an interrupt when it occurs.	RW	0
3	EVSYNC_ODD_EN	VSYNC for odd field from the TV encoder (HDMI)  0x0: EVSYNC_ODD for the TV output is masked.  0x1: EVSYNC_ODD for the TV output generates an interrupt when it occurs.	RW	0
2	EVSYNC_EVEN_EN	VSYNC for even field from the TV encoder (HDMI)  0x0: EVSYNC_EVEN for the TV output is masked.  0x1: EVSYNC_EVEN for the TV output generates an interrupt when it occurs.	RW	0
1	VSYNC1_EN	Vertical synchronization for the primary LCD.  0x0: VSYNC for the primary LCD output is masked.  0x1: VSYNC for the primary LCD output generates an interrupt when it occurs.	RW	0
0	FRAMEDONE_EN	Frame done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent.  0x0: Frame Done for the primary LCD output is masked.  0x1: FrameDone for the primary LCD output generates an interrupt when it occurs.	RW	0

Bits	Field Name	Description	Type	Reset
31:30	SPATIALTEMPORAL DITHERINGFRAMES	Spatial/temporal dithering number of frames for the primary LCD output wr: VFP start period of primary LCD 0x0: Spatial only 0x1: Spatial and temporal over 2 frames 0x2: Spatial and temporal over 4 frames 0x3: Reserved	RW	0x0
29	LCDENABLEPOL	Write 0s for future compatibility. Reads return 0.	R	0
28	LCDENABLESIGNAL	Write 0s for future compatibility. Reads return 0.	R	0
27	PCKFREEENABLE	Write 0s for future compatibility. Reads return 0.	R	0
26:25	TDMUNUSEDBITS	State of unused bits (TDM mode only) for the primary LCD output. wr: VFP start period of primary LCD 0x0: Low level (0) 0x1: High level (1) 0x2: Unchanged from previous state 0x3: Reserved	RW	0x0
24:23	TDMCYCLEFORMAT	Cycle format (TDM mode only) for the primary LCD output WR: VFP start period of primary LCD 0x0: 1 cycle for 1 pixel 0x1: 2 cycles for 1 pixel 0x2: 3 cycles for 1 pixel 0x3: 3 cycles for 2 pixels	RW	0x0
22:21	TDMPARALLELMODE	Output interface width (TDM mode only) for the primary LCD output WR: VFP start period of primary LCD 0x0: 8-bit parallel output interface selected 0x1: 9-bit parallel output interface selected 0x2: 12-bit parallel output interface selected 0x3: 16-bit parallel output interface selected	RW	0x0

Bits	Field Name	Description	Type	Reset
20	TDMENABLE	Enable the multiple cycle format for the primary LCD output. WR: VFP start period of primary LCD 0x0: TDM disabled 0x1: TDM enabled	RW	0
19:17	HT	Hold time for TV output WR: EVSYNC Encoded value (from 1 to 8) to specify the number of external digital clock periods to hold the data (programmed value = value minus 1)	RW	0x0
16	GPOUT1	General purpose output signal WR: immediate 0x0: The GPout1 is reset. 0x1: The GPout1 is set.	RW	0
15	GPOUT0	General Purpose Output Signal WR:immediate 0x0: The GPout0 is reset. 0x1: The GPout0 is set.	RW	0
14	GPIN1	General purpose input signal WR: immediately Read 0x0: The GPin1 has been reset. Read 0x1: The GPin1 has been set.	R	0
13	GPIN0	General purpose input signal WR: immediately Read 0x0: The GPin0 has been reset. Read 0x1: The GPin0 has been set.	R	0
12	OVERLAYOPTIMIZATION	Overlay optimization for the primary LCD output WR: VFP start period of the primary LCD 0x0: All the data for all the enabled pipelines are fetched from memory regardless of the overlay/alpha blending configuration. 0x1: The data not used by the overlay manager because of overlap between layers with no alpha blending between them must not be fetched from memory in order to optimize the bandwidth.	RW	0
11	STALLMODE	STALL mode for the primary LCD output wr: VFP start period of primary LCD 0x0: Normal mode selected 0x1: STALL mode selected. The Display Controller sends the data without considering the VSYNC/HSYNC. The LCD output is disabled at the end of the transfer of the frame. To generate a new frame, the software must re-enable the LCD output.	RW	0
10	RESERVED	Reserved	R	0
9:8	TFTDATALINES	Number of lines of the primary LCD interface WR: VFP start period of primary LCD 0x0: 12-bit output aligned on the LSB of the pixel data interface 0x1: 16-bit output aligned on the LSB of the pixel data interface 0x2: 18-bit output aligned on the LSB of the pixel data interface 0x3: 24-bit output aligned on the LSB of the pixel data interface	RW	0x0
7	STDITHERENABLE	Spatial temporal dithering enable for the primary LCD output WR: VFP start period of primary LCD 0x0: Spatial/temporal dithering logic disabled 0x1: Spatial/temporal dithering logic enabled	RW	0

Bits	Field Name	Description	Type	Reset
6	GOTV	<p>GO command for the TV output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the TV output. WR: immediate</p> <p>0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) associated with the TV output using the user values. The hardware resets the bit when the update is completed.</p> <p>0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the TV output and the hardware can update the internal registers at the external VSYNC.</p>	RW	0
5	GOLCD	<p>GO command for the primary LCD output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the primary LCD output. WR: immediate</p> <p>0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) connected to the LCD output using the user values. The hardware resets the bit when the update is completed.</p> <p>0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the LCD output and the hardware can update the internal registers at the VFP start period</p>	RW	0
4	M8B	<p>Mono 8-bit mode of the primary LCD wr: VFP start period of primary LCD output</p> <p>0x0: Reserved</p> <p>0x1: Reserved</p>	RW	0
3	STNTFT	<p>LCD Display type of the primary LCD WR: VFP start period of primary LCD output</p> <p>0x0: STN display operation enabled. STN dither logic is enabled.</p> <p>0x1: Active or TFT display operation enabled. STN Dither logic and output FIFO bypassed.</p>	RW	0
2	MONOCOLOR	<p>Monochrome/color selection for the primary LCD WR: VFP start period of primary LCD output</p> <p>0x0: Color operation enabled (STN mode only)</p> <p>0x1: Monochrome operation enabled (STN mode only)</p>	RW	0
1	TVENABLE	<p>Enable the TV output wr: immediate effect only occurs at the end of the current frame.</p> <p>0x0: TV output disabled (at the end of the current field if interlace output when the bit is reset)</p> <p>0x1: TV output enabled</p>	RW	0
0	LCDENABLE	<p>Enable the primary LCD outputs wr: immediate Effect only occurs at the end of the current frame</p> <p>0x0: LCD output disabled (at the end of the frame when the bit is reset)</p> <p>0x1: LCD output enabled</p>	RW	0

**Table 11-210. DISPC\_CONFIG1**

<b>Address Offset</b>	0x0000 0044	<b>Instance</b>	DISPC
<b>Physical Address</b>	0x5800 1044		
<b>Description</b>	The control register configures the Display Controller module for the primary LCD output and TV output. Shadow register, updated on VFP start period of primary LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
31:30	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x0
29:28	TVINTERLEAVE	TV Interleave Pattern	RW	0x0
27:26	PLCDINTERLEAVE	pLCD Interleave Pattern	RW	0x0
25	FULLRANGE	Color Space Conversion full range setting. wr: VFP start of primary LCD 0x0: Limited range selected. 0x1: Full range selected.	RW	0
24	COLORCONV ENABLE	Enable the color space conversion. It shall be reset when CPR bit field is set to 0x1. wr: VFP start of primary LCD 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0
23	FIDFIRST	Selects the first field to output in case of interlace mode. In case of progressive mode, the value is not used. wr: VFP start of primary LCD 0x0: First field is even. 0x1: Odd field is first.	RW	0
22	OUTPUTMODE ENABLE	Selects between progressive and interlace mode for the primary LCD output. wr: VFP start of primary LCD 0x0: Progressive mode selected. 0x1: Interlace mode selected.	RW	0

Bits	Field Name	Description	Type	Reset
21	BT1120ENABLE	Selects BT.1120 format on the primary LCD output. It is not possible to enable BT.656 and BT.1120 at the same time on the same LCD output. wr: VFP start of primary LCD  0x0: BT.1120 is disabled 0x1: BT.1120 is enabled.	RW	0
20	BT656ENABLE	Selects BT.656 format on the primary LCD output. It is not possible to enable BT.656 and BT.1120 at the same time on the same LCD output. wr: VFP start of primary LCD  0x0: BT.656 is disabled. 0x1: BT.656 is enabled.	RW	0
19	TVALPHABLENDER ENABLE	Selects the alpha blender overlay manager for the TV output instead of the color key alpha blender (LCD output). The bit field is deprecated. It is present for software backward compatibility only. When it is enabled, the Z-order defined in each ATTRIBUTES registers for only the pipelines associated pipeline connected to the TV output are invalid and replaced by the following: graphics z-order = 3, video3 z-order = 2, video2 z-order = 1 and video1 z-order=0 If it disabled, the z-order and z-order enable bit fields defined in each ATTRIBUTES register are used. wr: EVSYNC start of primary LCD  0x0: Alpha blender is disabled. 0x1: The alpha blender is enabled.	RW	0
18	LCDALPHABLENDER ENABLE	Selects the alpha blender overlay manager for the primary LCD output instead of the color key alpha blender (LCD output). The bit field is deprecated. It is present for software backward compatibility only. When it is enabled, the Z-order defined in each ATTRIBUTES registers for only the pipelines associated with the primary LCD output are invalid and replaced by the following: graphics z-order = 3, video3 z-order = 2, video2 z-order = 1 and video1 z-order=0 If it disabled, the z-order and z-order enable bit fields defined in each ATTRIBUTES register are used. wr: VFP start of primary LCD  0x0: Alpha blender is disabled. The color key alpha blending is used. 0x1: The alpha blender is enabled.	RW	0
17	BUFFERFILLING	Controls if the DMA buffers are refilled only when the LOW threshold is reached or if all DMA buffers are refilled when at least one of them reaches the LOW threshold. wr: immediate  0x0: Each DMA buffer is refilled when it reaches LOW threshold.  0x1: All DMA buffers are refilled up to high threshold when at least one of them reaches the LOW threshold. (only active DMA buffers shall be considered and when reaching the end of the frame the DMA buffer goes to empty condition so no need to fill it again).	RW	0
16	RESERVED	Write 0s for future compatibility. Reads return 0.	RW	0
15	CPR	Color phase rotation control (primary LCD output). It shall be reset when ColorConvEnable bit field is set to 1 wr: VFP start period of primary LCD output  0x0: Color Phase Rotation Disabled 0x1: Color Phase Rotation Enabled	RW	0

Bits	Field Name	Description	Type	Reset
14	BUFFERMERGE	<p>Buffer merge control wr: EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory or VFP. When enabled, the <a href="#">DISPC_GLOBAL_BUFFER</a> register is ignored. This bit must be set to zero when the write back channel is used. When <a href="#">DISPC_CONTROL2.GOWB</a> is used <b>BUFFERMERGE MUST be zero</b>. When <a href="#">DISPC_CONTROL2.GOWB</a> is used <b>BUFFERMERGE MUST be zero</b>.</p> <p>WR: immediate</p> <p>0x0: DMA buffer merge disabled Each DMA buffer is dedicated to one pipeline.</p> <p>0x1: DMA buffer merge enabled All the DMA buffers are merged into a single one to be used by the single active pipeline.</p>	RW	0
13	TCKTV SELECTION	<p>Transparency color key selection (TV output) wr: EVSYNC</p> <p>0x0: Destination transparency color key selected</p> <p>0x1: Source transparency color key selected</p>	RW	0
12	TCKTVENABLE	<p>Transparency color key enabled (TV output) WR: EVSYNC</p> <p>0x0: Disable the transparency color key for the TV output</p> <p>0x1: Enable the transparency color key for the TV output</p>	RW	0
11	TCKLCD SELECTION	<p>Transparency color key selection (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: Destination transparency color key selected</p> <p>0x1: Source transparency color key selected</p>	RW	0
10	TCKLCDENABLE	<p>Transparency color key enabled (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: Disable the transparency color key for the LCD</p> <p>0x1: Enable the transparency color key for the LCD</p>	RW	0
9	GAMATABLE ENABLE	<p>For backward compatibility, an enable bit has been added on the 2 additional gamma tables (secondary display and TV). Gamma table of LCD1 is always enabled.</p> <p>0x0: Gamma table LCD2 and TV are bypassed</p> <p>0x1: Gamma table LCD2 and TV are enabled</p>	RW	0
8	ACBIASGATED	<p>ACBias Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: AcBias gated disabled</p> <p>0x1: AcBias gated enabled</p>	RW	0
7	VSYNCGATED	<p>VSYNC Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: VSYNC gated disabled</p> <p>0x1: VSYNC gated enabled</p>	RW	0
6	HSYNCGATED	<p>HSYNC Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: HSYNC gated disabled</p> <p>0x1: HSYNC gated enabled</p>	RW	0
5	PIXELCLOCK GATED	<p>Pixel Clock Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: Pixel clock gated disabled</p> <p>0x1: Pixel clock gated enabled</p>	RW	0

Bits	Field Name	Description	Type	Reset
4	PIXELDATAGATED	Pixel data gated enabled (primary LCD output) wr: VFP start period of primary LCD output  0x0: Pixel data gated disabled  0x1: Pixel data gated enabled	RW	0
3	PALETTEGAMMA TABLE	Palette/gamma table selection wr: VFP start period of primary LCD output or VFP start period of secondary LCD output or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the graphics pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory. In case of the table is used as gamma table, it is used for the primary LCD output only.  <b>NOTE: CLUT and BITMAP formats are not supported in this family of devices.</b>  0x0: LUT used as palette (only if graphics format is BITMAP1, 2, 4, and 8)  0x1: LUT used as gamma table (only if graphics format is NOT BITMAP1, 2, 4, and 8 or no graphics window present)	RW	0
2:1	LOADMODE	Loading mode for the palette/gamma table wr: VFP start period of primary LCD output or VFP start period of secondary LCD output or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory  0x0: Palette/Gamma Table and data are loaded every frame  0x1: Palette/Gamma Table to be loaded. The user sets the bit when the palette/gamma table has to be loaded. Hardware resets the bit to 0x2 when table has been loaded. ( <a href="#">DISPC_GFX_ATTRIBUTES.ENABLE</a> has to be set to 1).  0x2: Frame data only loaded every frame  0x3: Palette/Gamma Table and frame data loaded on first frame then switch to 0x2 (Hardware).	RW	0x0
0	PIXELGATED	Pixel gated enable (only for TFT) (primary LCD output) wr: VFP start period of primary LCD output  0x0: Pixel clock always toggles (only in TFT mode)  0x1: Pixel clock only toggles when there is valid data to display. (only in TFT mode)	RW	0

**Table 11-244. DISPC\_GFX\_ATTRIBUTES**

<b>Address Offset</b>	0x0000 00A0
<b>Physical Address</b>	0x5800 10A0
<b>Description</b>	The register configures the graphics attributes. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory
<b>Type</b>	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CHANNELOUT2	BURSTTYPE	PREMULTIPLYALPHA	ZORDER	ZORDERENABLE	ANTIFLICKER	RESERVED	RESERVED	SUBSAMPLINGPATTERN	SELFREFRESHAUTO	FORCE1DTILEDMODE	SELFREFRESH	ARBITRATION	ROTATION	BUFPRELOAD	FRAMEPACKINGMODE	NIBBLEMODE	CHANNELOUT	BURSTSIZE	REPLICATIONENABLE	FORMAT	ENABLE										

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should set to zero) wr: immediate  0x0: Primary LCD output selected. 0x1: Secondary LCD output selected. 0x2: Third LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. (It does not apply to the palette loading OCP requests using INCR burst only)  0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC GFX to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data.  0x0: Non premultiplied alpha data color component 0x1: Premultiplied alpha data color component	RW	0

Bits	Field Name	Description	Type	Reset
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.  0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values.  0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3  0x3: Z-order 3: layer above all the other layers  0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled.  0x0: Z-order disabled. The Z-order of the layer is 0.  0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	ANTIFLICKER	Antiflicker filtering using a 3-tap filter with hardcoded coefficients (1/4, 1/2, 1/4)  0x0: Antiflicker disabled.  0x1: Antiflicker enabled.	RW	0
23:21	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x0
20:18	SUBSAMPLINGPATTERN	Subsampling pattern setting.	RW	0x0
17	SELFREFRESHAUTO	Automatic self-refresh mode  0x0: The transition from Selfrefresh disabled to enabled is controlled by software  0x1: The transition from Selfrefresh disabled to enabled is controlled only by hardware	RW	0
16	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D.  0x0: 2D accesses for tiled regions  0x1: 1D accesses for tiled regions	RW	0x0
15	SELFREFRESH	Enables the self refresh of the graphics window from its own DMA buffer. This bit should be set only after having set the GO bit of the channel and read back a zero in its field.  0x0: The graphics pipeline accesses the interconnect to fetch data from the system memory.  0x1: The graphics pipeline does not need anymore to fetch data from memory. Only the graphics DMA buffer is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
14	ARBITRATION	Determines the priority of the graphics pipeline. When the graphics pipeline is one of the high priority pipelines. The arbitration wheel gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.  0x0: The graphics pipeline is one of the normal priority pipeline.  0x1: The graphics pipeline is one of the high priority pipeline.	RW	0

Bits	Field Name	Description	Type	Reset
13:12	ROTATION	Graphics rotation flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	BUFPRELOAD	Graphics preload value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
10	FRAMEPACKINGMODE	Frame packing mode control. 0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0x0
9	NIBBLEMODE	Graphics nibble mode (only for 1-, 2- and 4 bpp) <b>NOTE: BITMAP formats and associated Nibble Mode are not supported in this family of devices.</b> 0x0: Nibble mode is disabled 0x1: Nibble mode is enabled	RW	0
8	CHANNELOUT	Graphics Channel Out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
7:6	BURSTSIZE	Graphics DMA burst size 0x0: 2 × 128-bit bursts 0x1: 4 × 128-bit bursts 0x3: Reserved 0x2: 8 × 128-bit bursts	RW	0x2
5	REPLICATIONENABLE	Graphics replication enabled: RGB, ARGB, and RGBA formats are converted into ARGB32-8888 using replication of the MSBs or 0s 0x0: Disable graphics replication logic. The conversion to ARGB32-8888 is done by adding 0s for the LSBs 0x1: Enable graphics replication logic. The conversion to ARGB32-8888 is done by duplicating the MSBs for the LSBs	RW	1

Bits	Field Name	Description	Type	Reset
4:1	FORMAT	Graphics format. It defines the pixel format when fetching the graphics picture into memory.  0x6: RGB16-565 0xA: RGBx12-4444 0x7: ARGB16-1555 0xD: RGBA32-8888 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: RGBA12-4444 0x4: xRGB12-4444 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Graphics enable  0x0: Graphics disabled (graphics pipeline inactive and graphics window not present)  0x1: Graphics enabled (graphics pipeline active and graphics window present on the screen)	RW	0

<b>Address Offset</b>	0x0000 00BC + (0x4 * j)	<b>Index</b>	j = 0 to 1
<b>Physical Address</b>	<a href="#">0x5800 10BC + (0x4 * j)</a>	<b>Instance</b>	DISPC
<b>Description</b>	The register configures the base address of the video buffer for the video window 1 (DISPC_VID1_BA_0 and DISPC_VID1_BA_1 for ping-pong mechanism with external trigger, based on the field polarity otherwise only DISPC_VID1_BA_0 is used). Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or or VFP start period of the third LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BA																															

Bits	Field Name	Description	Type	Reset
31:0	BA	Video base address Base address of the video buffer (aligned on pixel size boundary except in case of RGB24 packed format, 4-pixel alignment is required; in case of YUV4:2:2, 2-pixel alignment is required, and YUV4:2:0, byte alignment is supported)). In case of YUV4:2:0 format, it indicates the base address of the Y buffer. When the TILER is addressed, the bits: [28:27] = 0x0 for 8-bit tiled [28:27] = 0x1 for 16-bit tiled [28:27] = 0x2 for 32-bit tiled [28:27] = 0x3 for page mode [31:29] = 0x0 for 0-degree view [31:29] = 0x1 for 180-degree view + mirroring [31:29] = 0x2 for 0-degree view + mirroring [31:29] = 0x3 for 180-degree view [31:29] = 0x4 for 270-degree view + mirroring [31:29] = 0x5 for 270-degree view [31:29] = 0x6 for 90-degree view [31:29] = 0x7 for 90-degree view + mirroring Otherwise the bits indicated the corresponding bit address to access the SDRAM.	RW	0x0000 0000

<b>Address Offset</b>	0x0000 00CC	<b>Instance</b>	DISPC
<b>Physical Address</b>	0x5800 10CC		
<b>Description</b>	The register configures the attributes of the video window 1. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CHANNELOUT2	BURSTTYPE	PREMULTIPHYPALPHA	ZORDER	ZORDERENABLE	SELFREFRESH	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	FORCE1DTILEDMODE	BUFPRELOAD	RESERVED	SELFREFRESHAUTO	CHANNELOUT	BURSTSIZE	ROTATION	FULLRANGE	REPLICATIONENABLE	COLORCONVENABLE	FRAMEPACKINGMODE	HRESIZECONF	RESIZEENABLE	FORMAT				ENABLE					

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should be set to zero) wr: immediate  0x0: Primary LCD output selected. 0x1: Secondary LCD output selected. 0x2: Third LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine.  0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPHYALPHA	The field configures the DISPC VID1 to process incoming data as pre-multiplied alpha data or non pre-multiplied alpha data. Default setting is non pre-multiplied alpha data.  0x0: Non pre-multiplied alpha data color component 0x1: Pre-multiplied alpha data color component	RW	0
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.  0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled.  0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only.  0x0: The video pipeline accesses the interconnect to fetch data from the system memory.  0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video1 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.  0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0.  0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0

Bits	Field Name	Description	Type	Reset
21	VERTICALTAPS	Video vertical resize tap number. The vertical polyphase filter can be configured in 3-tap or 5-tap configuration. According to the number of taps, the maximum input picture width is double while using 3-tap compared to 5-tap.  0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized.  0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D.  0x0: 2D accesses for tiled regions 0x1: 1D accesses for tiled regions	RW	0
19	BUFPRELOAD	Video Preload Value  0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
17	SELFREFRESHAUTO	Automatic self-refresh mode  0x0: The transition from SELFREFRESH disabled to enabled is controlled by SW. 0x1: The transition from SELFREFRESH disabled to enabled is controlled only by hardware.	RW	0
16	CHANNELOUT	Video channel out configuration: LCD, WB or TV. wr: immediate  0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA burst size  0x0: 2x128bit bursts 0x1: 4x128bit bursts 0x3: Reserved 0x2: 8x128bit bursts	RW	0x2
13:12	ROTATION	Video rotation flag  0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color space conversion full range setting.  0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication enable  0x0: Disable Video replication logic 0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV.  0x0: Disable Color Space Conversion YUV to RGB 0x1: Enable Color Space Conversion YUV to RGB	RW	0

Bits	Field Name	Description	Type	Reset
8	FRAMEPACKINGMODE	Frame packing mode control. 0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video Resize Enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0
4:1	FORMAT	Video Format. It defines the pixel format when fetching the video 1 picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Video Enable 0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

RESERVED								MEMSIZEY								RESERVED								MEMSIZEX							

Bits	Field Name	Description	Type	Reset
31:28	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x0
27:16	MEMSIZEY	Number of lines of the video picture. Encoded value (from 1 to 4096) to specify the number of lines of the video picture in memory (program to value minus 1). When predecimation is set, the value represents the size of the image after predecimation but the max size of the unpredecimated image size in memory is still bounded to $2^{11}$ .	RW	0x000
15:11	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
10:0	MEMSIZEX	Number of pixels of the video picture Encoded value (from 1 to 2048) to specify the number of pixels of the video picture in memory (program to value minus 1). The size is limited to the size of the line buffer of the vertical sampling block in case the video picture is processed by the vertical filtering unit. (program to value minus 1). When predecimation is set, the value represents the size of the image after predecimation but the max size of the unpredecimated image size in memory is still bounded to $2^{11}$ .	RW	0x000

**Table 11-276. DISPC\_VID1\_ACCU\_j**

<b>Address Offset</b>	0x0000 00E8 + (0x4 * j)	<b>Index</b>	j = 0 to 1
<b>Physical Address</b>	0x5800 10E8 + (0x4 * j)	<b>Instance</b>	DISPC
<b>Description</b>	The register configures the resize accumulator init values for horizontal and vertical up/downsampling of the video window 1 (DISPC_VID1_ACCU_0 and DISPC_VID1_ACCU_1 for ping-pong mechanism with external trigger, based on the field polarity) It is used for ARGB and Y setting. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

<b>Address Offset</b>	0x0000 015C	<b>Instance</b>	DISPC
<b>Physical Address</b>	0x5800 115C		
<b>Description</b>	The register configures the attributes of the video window 2. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CHANNELOUT2	BURSTTYPE	PREMULTIPLYALPHA	ZORDER	ZORDERENABLE	SELFREFRESH	ARBITRATION	DOUBLESTRIDE	VERTICALTAPS	FORCE1DTILEDMODE	BUFPRELOAD	RESERVED	SELFREFRESHAUTO	CHANNELOUT	BURSTSIZE	ROTATION	FULLRANGE	REPLICATIONENABLE	COLORCONVENABLE	FRAMEPACKINGMODE	HRESIZECONF	RESIZEENABLE	FORMAT				ENABLE					

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (must be set to zero) wr: immediate  0x0: Primary LCD output selected. 0x1: Secondary LCD output selected. 0x2: Third LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine.  0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC VID2 to process incoming data as pre-multiplied alpha data or non pre-multiplied alpha data. Default setting is non pre-multiplied alpha data.  0x0: Non pre-multiplied alpha data color component 0x1: Pre-multiplied alpha data color component	RW	0
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.  0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled.  0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only.  0x0: The video pipeline accesses the interconnect to fetch data from the system memory.  0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video2 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.  0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0.  0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0

Bits	Field Name	Description	Type	Reset
21	VERTICALTAPS	Video Vertical Resize Tap Number  0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized.  0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D.  0x0: 2D accesses for tiled regions 0x1: 1D accesses for tiled regions	RW	0
19	BUFPRELOAD	Video Preload Value  0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
17	SELFREFRESHAUTO	Automatic self-refresh mode  0x0: The transition from SELFREFRESH disabled to enabled is controlled by SW. 0x1: The transition from SELFREFRESH disabled to enabled is controlled only by hardware.	RW	0
16	CHANNELOUT	Video Channel Out configuration: LCD, WB or TV. wr: immediate  0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA burst size  0x0: 2 x 128-bit bursts 0x1: 4 x 128-bit bursts 0x3: Reserved 0x2: 8 x 128-bit bursts	RW	0x2
13:12	ROTATION	Video Rotation Flag  0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color space conversion full range setting.  0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication Enable  0x0: Disable Video replication logic 0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable color space conversion YUV to RGB 0x1: Enable color space conversion YUV to RGB	RW	0
8	FRAMEPACKINGMODE	Frame packing mode control.  0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0

Bits	Field Name	Description	Type	Reset
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video Resize Enable  0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0
4:1	FORMAT	Video Format. It defines the pixel format when fetching the video 2 picture into memory.  0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	VidEnable  0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

<b>Address Offset</b>	0x0000 016C	<b>Instance</b>	DISPC
<b>Physical Address</b>	0x5800 116C		
<b>Description</b>	The register configures the number of bytes to increment between two pixels for the buffer associated with the video window 2. For more information, see <a href="#">Section 11.2.4.6.5, Predecimation</a> . The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

<b>Physical Address</b>	<a href="#">0x5800 11CC</a>		
<b>Description</b>	The register configures the color space conversion matrix coefficients for the video pipeline 2. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

The S/W has to re-enable the LCD output in order to generate a new frame.	RW	0
10	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
9:8	TFTDATALINES	Number of lines of the secondary LCD interface wr: VFP start period of secondary LCD output 0x0: 12-bit output aligned on the LSB of the pixel data interface 0x1: 16-bit output aligned on the LSB of the pixel data interface 0x2: 18-bit output aligned on the LSB of the pixel data interface 0x3: 24-bit output aligned on the LSB of the pixel data interface	RW	0x0
7	STDITHER ENABLE	Spatial temporal dithering enable for the secondary LCD output wr: VFP start period of secondary LCD output 0x0: Spatial/Temporal dithering logic disabled 0x1: Spatial/Temporal dithering logic enabled	RW	0

Bits	Field Name	Description	Type	Reset
6	GOWB	GO command for the write-back output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the write-back output to the memory. wr:immediate  0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) connected to the write-back pipeline using the user values. The hardware resets the bit when the update is completed.  0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the write-back pipeline and the hardware can update the internal registers immediately	RW	0
5	GOLCD	GO command for the secondary LCD output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the secondary LCD output. wr:immediate  0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) connected to the LCD output using the user values. The hardware resets the bit when the update is completed.  0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the LCD output and the hardware can update the internal registers at the VFP start period	RW	0
4	M8B	Mono 8-bit mode of the secondary LCD wr: VFP start period of secondary LCD output  0x0: Reserved 0x1: Reserved	RW	0
3	STNTFT	LCD Display type of the secondary LCD wr: VFP start period of secondary LCD output  0x0: Reserved 0x1: Active or TFT display operation enabled. STN Dither logic and output FIFO bypassed.	RW	0
2	MONOCOLOR	Monochrome/Color selection for the secondary LCD wr: VFP start period of secondary LCD output  0x0: Reserved 0x1: Reserved	RW	0
1	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
0	LCDENABLE	Enable the secondary LCD output wr:immediate  0x0: LCD output disabled (at the end of the frame when the bit is reset) 0x1: LCD output enabled	RW	0

BA																															

Bits	Field Name	Description	Type	Reset
31:0	BA	Video base address Base address of the video buffer (aligned on pixel size boundary except in case of RGB24 packed format, 4-pixel alignment is required; in case of YUV4:2:2, 2-pixel alignment is required, and YUV4:2:0, byte alignment is supported)). In case of YUV4:2:0 format, it indicates the base address of the Y buffer. When the TILER is addressed, the bits: [28:27] = 0x0 for 8-bit tiled [28:27] = 0x1 for 16-bit tiled [28:27] = 0x2 for 32-bit tiled [28:27] = 0x3 for page mode [31:29] = 0x0 for 0-degree view [31:29] = 0x1 for 180-degree view + mirroring [31:29] = 0x2 for 0-degree view + mirroring [31:29] = 0x3 for 180-degree view [31:29] = 0x4 for 270-degree view + mirroring [31:29] = 0x5 for 270-degree view [31:29] = 0x6 for 90-degree view [31:29] = 0x7 for 90-degree view + mirroring Otherwise the bits indicated the corresponding bit address to access the SDRAM.	RW	0x0000 0000

28	PREMULTIPLYALPHA	The field configures the DISPC VID3 to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data.  0x0: Non premultiplied alpha data color component 0x1: Premultiplied alpha data color component	RW	0
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.  0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is used only when the Z-order is enabled.  0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	SELFREFRESH	Enables the self refresh of the video window from its own DMA buffer only.  0x0: The video pipeline accesses the interconnect to fetch data from the system memory.  0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video3 is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
23	ARBITRATION	Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.  0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0.  0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0

Bits	Field Name	Description	Type	Reset
21	VERTICALTAPS	Video vertical resize tap number  0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized.  0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	FORCE1DTILEDMODE	Force TILED regions access to 1D or 2D.  0x0: 2D accesses for tiled regions 0x1: 1D accesses for tiled regions	RW	0
19	BUFPRELOAD	Video Preload Value  0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
17	SELFREFRESHAUTO	Automatic self-refresh mode  0x0: The transition from SELFREFRESH disabled to enabled is controlled by SW. 0x1: The transition from SELFREFRESH disabled to enabled is controlled only by hardware.	RW	0
16	CHANNELOUT	Video channel out configuration: LCD, WB or TV. wr: immediate  0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA burst size  0x0: 2 × 128-bit bursts 0x1: 4 × 128-bit bursts 0x3: Reserved 0x2: 8 × 128-bit bursts	RW	0x2
13:12	ROTATION	Video rotation flag  0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting.  0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication enable  0x0: Disable Video replication logic 0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion YUV to RGB 0x1: Enable Color Space Conversion YUV to RGB	RW	0
8	FRAMEPACKINGMODE	Frame packing mode control.  0x0: Frame Packing mode is disabled 0x1: Frame Packing mode is enabled	RW	0

Bits	Field Name	Description	Type	Reset
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video resize enable  0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0
4:1	FORMAT	Video format. It defines the pixel format when fetching the video 3 picture into memory.  0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: RGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0x3: BGRA32-8888 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Video Enable  0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

<b>Address Offset</b>	0x0000 0398		
<b>Physical Address</b>	0x5800 1398	<b>Instance</b>	DISPC
<b>Description</b>	The register configures the number of bytes to increment between two pixels for the buffer associated with the video window 3. For more information, see <a href="#">Section 11.2.4.6.5, Predecimation</a> . The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). **Table 11-426. DISPC\_WB\_ACCU\_j**

<b>Address Offset</b>	0x0000 0500 + (0x4 * j)	<b>Index</b>	j = 0 to 1
<b>Physical Address</b>	0x5800 1500 + (0x4 * j)	<b>Instance</b>	DISPC
<b>Description</b>	The register configures the resize accumulator init values for horizontal and vertical up/downsampling of the write back pipeline (DISPC_WB_ACCU_0 and DISPC_WB_ACCU_1 for ping-pong mechanism with external trigger, based on the field polarity). It is used for ARGB and Y setting. Shadow register, updated when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline), when the WB pipeline is directly connected to one of the pipelines (graphics or video), combined with the synchronization event of the channel overlay output selected as an input to the WB pipeline (that is, VFP start period of primary LCD, or VFP start period of secondary LCD, or VFP start period of the third LCD, or EVSYNC), for all registers associated with the selected channel out and further delayed by the <a href="#">DISPC_WB_ATTRIBUTES2.WBDELAYCOUNT</a> bit-field, for all registers of the Write back and DMA. In WB capture mode, both <a href="#">DISPC_CONTROL2.GOWB</a> and <a href="#">DISPC_CONTROL#.GOLCD/TV</a> corresponding to the selected output channel shall be set. It is not required to set the GOWB bit when WB memory-to-memory mode is used.

Bits	Field Name	Description	Type	Reset
31:28	IDLENUMBER	<p>Determines the number of idles between requests on the L3_MAIN interconnect.</p> <p>It is only used when the write-back pipeline does data transfer from memory to memory.</p> <p>When the output of an overlay is stored in memory through the write-back pipeline in capture mode, the bit field IDLENUMBER is ignored since a timing generator is used to time the transfer.</p> <p>The number of IDLE cycles is IDLENUMBER (from 0 to 15) if IDLESIZE = 0.</p> <p>The number of IDLE cycles is IDLENUMBERx8 (from 0 to 120) if IDLESIZE = 1 and BURSTSIZE = 2.</p> <p>The number of IDLE cycles is IDLENUMBERx4 (from 0 to 60) if IDLESIZE = 1 and BURSTSIZE = 1.</p> <p>The number of IDLE cycles is IDLENUMBERx2 (from 0 to 30) if IDLESIZE = 1 and BURSTSIZE = 0.</p>	RW	0x0
27	IDLESIZE	<p>Determines if the IDLENUMBER corresponds to a number of bursts or singles.</p> <p>0x0: The number of idles between requests is defined by IDLENUMBER as number of cycles.</p> <p>0x1: The number of idles between requests is defined by IDLENUMBER multiplied by burst size as number of cycles.</p>	RW	0

Bits	Field Name	Description	Type	Reset
26:24	CAPTUREMODE	<p>Defines the frame rate capture.</p> <p>0x6: Only one out of six frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x1: Only one frame is captured.</p> <p>0x7: Only one out of seven frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x0: All frames are captures until the write-back channel is disabled or there is no more data generated by the overlay or the pipeline attached to the write-back channel.</p> <p>0x2: Only one out of two frames is captured. The first one is captured, and then the second one is skipped, and so on.</p> <p>0x4: Only one out of four frames is captured. The first one is captured, and then the second one is skipped, and so on.</p> <p>0x5: Only one out of five frames is captured. The first one is captured, and then the second one is skipped, and so on.</p> <p>0x3: Only one out of three frames is captured. The first one is captured, and then the second one is skipped, and so on.</p>	RW	0x0
23	ARBITRATION	<p>Determines the priority of the write-back pipeline. The write-back pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.</p> <p>0x0: The write-back pipeline is one of the normal priority pipeline.</p> <p>0x1: The write-back pipeline is one of the high priority pipeline.</p>	RW	0
22	DOUBLESTRIDE	<p>Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0.</p> <p>0x0: The CbCr stride value is equal to the Y stride.</p> <p>0x1: The CbCr stride value is double to the Y stride.</p>	RW	0
21	VERTICALTAPS	<p>Video Vertical Resize Tap Number</p> <p>0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used.</p> <p>0x1: 5 taps are used for the vertical filtering logic.</p>	RW	0
20	FORCE1DTILEDMODE	<p>Force TILED regions access to 1D or 2D.</p> <p>0x0: 2D accesses for tiled regions</p> <p>0x1: 1D accesses for tiled regions</p>	RW	0x0
19	WRITEBACKMODE	<p>When connected to the overlay output of a channel the write back can operate as a simple transfer from memory to memory (composition engine) or as a capture channel.</p> <p>0x0: Capture mode (default mode)</p> <p>0x1: Memory-to-memory mode</p>	RW	0x0

Bits	Field Name	Description	Type	Reset
18:16	CHANNELIN	Video Channel In configuration WR: immediate  0x6: Video3 pipeline output 0x1: Secondary LCD output 0x0: Primary LCD overlay output 0x2: TV overlay output 0x4: Video1 pipeline output 0x5: Video2 pipeline output 0x3: Graphics pipeline output 0x7: Third LCD output	RW	0x0
15:14	BURSTSIZE	Write-back DMA Burst Size  0x0: 2 × 128-bit bursts 0x1: 4 × 128-bit bursts 0x3: Reserved 0x2: 8 × 128-bit bursts	RW	0x2
13:12	RESERVED	Reserved	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting.  0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	TRUNCATIONENABLE	It applies only when the input format to the write-back pipeline from the overlay or directly from one of the pipelines is ARGB32. If the format is one of the YUV supported formats, the bit field is ignored.  0x0: Disable truncation logic 0x1: Enable truncation logic from ARGB32 to the pixel format defined in the field FORMAT.	RW	0
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV.  0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0
8	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine.  0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
7	ALPHAENABLE	Premultiplied alpha enable Read 0x1: Enabled Read 0x0: Disabled. This bit also disable the logic present in the associated channel out that compute the alpha component sent to the WB pipe. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available: 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay. 0x0: The alpha value is not written back.	RW	0

Bits	Field Name	Description	Type	Reset

<b>Address Offset</b>	0x0000 063C	<b>Instance</b>	DISPC
<b>Physical Address</b>	0x5800 163C		
<b>Description</b>	The register configures the resize factors for horizontal and vertical up/downsampling of the video window 1. It is used for Crb and Cr setting. It is used only when the pixel format at the input of the filter is one of the YUV formats. If the pixel format at the input of the filter is ARGB (all ARGB, RGB, RGBA are converted to ARGB32-8888 by the color space conversion before going to the filter is the color space conversion is done before the filter). When the register is not used by the hardware, any value can be used for the bit fields. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								FIRVINC								RESERVED								FIRHINC							

Bits	Field Name	Description	Type	Reset
31:29	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x0
28:16	FIRVINC	Vertical increment of the up/downsampling filter for Cb and Cr. Encoded value (from 1 to 4096). The value 0 is invalid. The values greater than 4096 are invalid.	RW	0x0400
15:13	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x0
12:0	FIRHINC	Horizontal increment of the up/downsampling filter for Cb and Cr. Encoded value (from 1 to 4096). The value 0 is invalid. The values greater than 4096 are invalid.	RW	0x0400

<b>Physical Address</b>	0x5800 1728 + (0x4 * j)	<b>Instance</b>	DISPC
<b>Description</b>	The register configures the resize accumulator init values for horizontal and vertical up/downsampling of the video window 3 (DISPC_VID3_ACCU2_0 and DISPC_VID3_ACCU2_1 for ping-pong mechanism with external trigger, based on the field polarity). It is used for Cb and Cr setting. It is used only when the pixel format at the input of the filter is one of the YUV formats. If the pixel format at the input of the filter is ARGB (all ARGB, RGB, RGBA are converted to ARGB32-8888 by the color space conversion before going to the filter is the color space conversion is done before the filter). When the register is not used by the hardware, any value can be used for the bit fields. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or VFP start period of the third LCD or EVSYNC or when <a href="#">DISPC_CONTROL2.GOWB</a> is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, third LCD, TV output or write-back to the memory

### 11.3 High-Definition Multimedia Interface

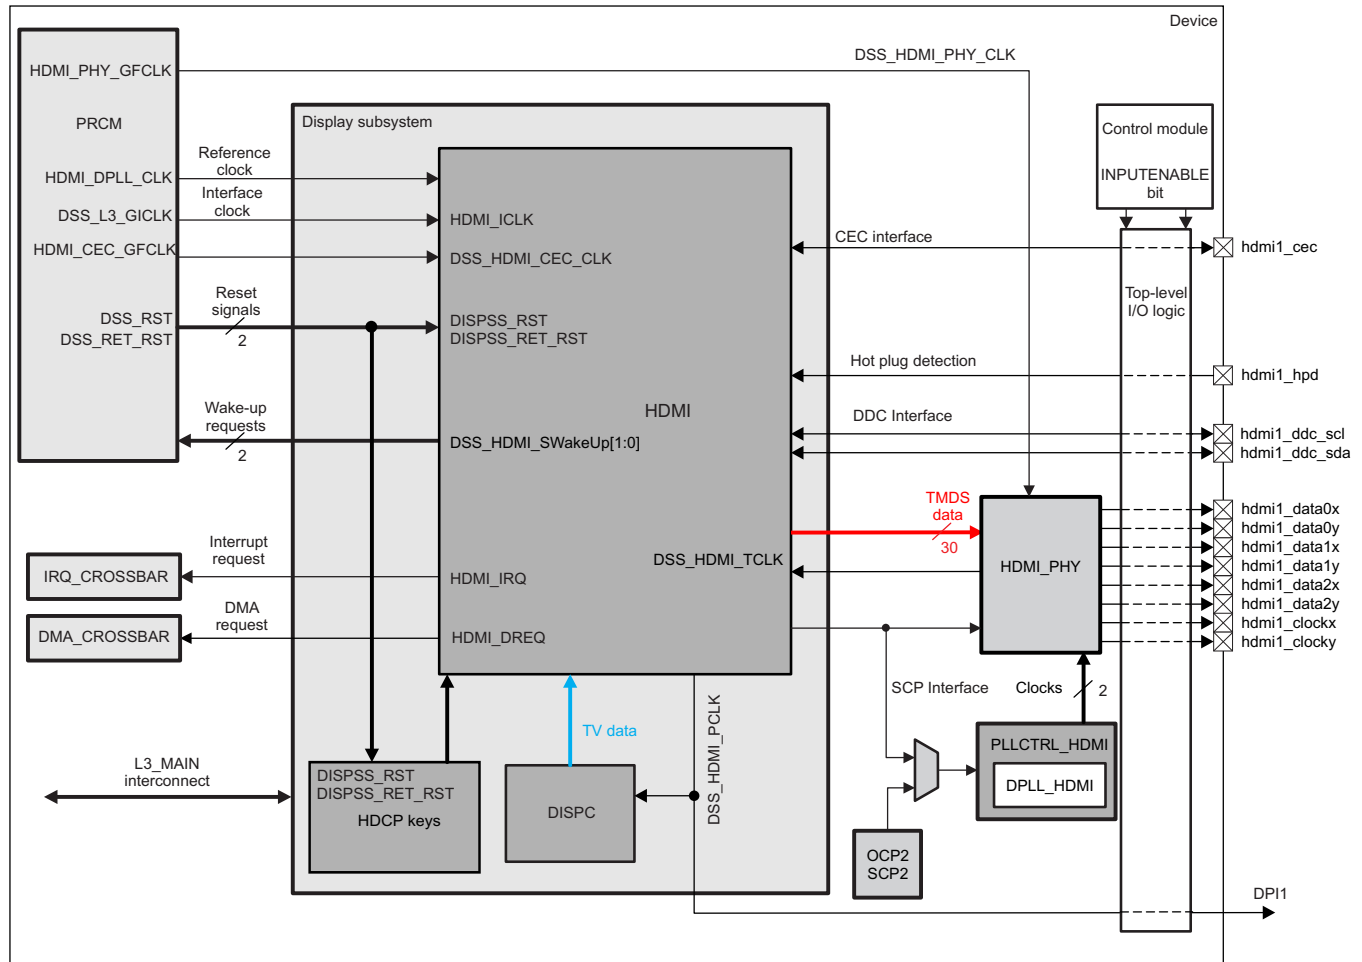

This section introduces the high-definition multimedia interface (HDMI) module and describes its main functions and connections in the device.

**NOTE:** All the HDMI features described in this chapter may not be supported in software. For example, 3D-frame packing is not supported. Refer to the software development kit (SDK) for which HDMI features are supported.

#### 11.3.1 HDMI Overview

Figure 11-103 shows an overview of the HDMI module.

Figure 11-103. HDMI Overview

hdmi-001

### 11.3.1.1 HDMI Main Features

The HDMI module provides the following main features:

- HDMI 1.4a, HDCP 1.4, and DVI 1.0 compliant
  - Includes support for the 3D stereoscopic frame-packing formats of the HDMI v1.4a standard (1080p24Hz, 720p50Hz, 720p60Hz + side-by-side half structure: 1080p60Hz)
- EIA/CEA-861-D video format support (See [Table 11-578](#) for more information.)
- VESA® display monitor timing (DMT) video format support(See [Table 11-579](#) for more information.)
- Support for deep-color mode:
  - 10-bit color component deep-color modes up to 1080p @ 60 Hz
  - 12-bit color component deep-color modes up to 720p/1080i @ 60 Hz
  - 16-bit/component color depth is not supported
- Support for x.v.Color (x.v.Color data from memory outputted by HDMI. No processing, pass-through mode only)
- Supports up to 148.5-MHz pixel clock with deep-color modes (10-bit or 12-bit)
- Supports up to 186 MHz pixel clock with no deep-color mode (8-bit)
- Video formats: 24-bit RGB input
  - ❑ 24/30/36-bit RGB/YCbCr 4:4:4 (deep color) output
  - ❑ 16/20/24-bit YCbCr 4:2:2 output

- Uncompressed multichannel (up to eight channels) audio (L-PCM) support.
- Master inter-integrated circuit (I<sup>2</sup>C™) interface for display data channel (DDC) connection
- Consumer electronic control (CEC) interface
- Integrated transition minimized differential signaling (TMDS®) and TMDS error reduction coding (TERC4) encoders for data island support
- Integrated TMDS physical layer (PHY) (three TMDS differential data lanes + TMDS differential clock lane)
  - Up to 1.86 Gbps per lane at (1080p @ 60 Hz at 10 bits/component)

### 11.3.1.2 HDMI Video Formats and Timings

#### 11.3.1.2.1 HDMI CEA-861-D Video Formats and Timings

Table 11-578 presents the video timings supported by the HDMI module, according to the CEA-861-D standard:

**Table 11-578. HDMI Video Timings (CEA-861-D)**

Refresh Rate	Resolution
24 Hz (Low field rate)	1920 x 1080p
50 Hz	1920 x 1080p
	1920 x 1080i
	2880 x 576p
	2880 x 288p
	1440 x 576p
	1440 x 288p
	1280x720p
59.94 Hz	720 x 576p
	1920 x 1080p
	1920 x 1080i
	1280 x 720p
	2880 x 480p
	2880 x 240p
	1440 x 480p
	1440 x 480i
	1440 x 240p
720 x 480p	
60 Hz	640 x 480p
	1920 x 1080p
	1920 x 1080i
	2880 x 480p
	2880 x 240p
	1280 x 720p
	1440 x 480p
	1440 x 480i
	1440 x 240p
	1280 x 720p
720 x 576p	
200 Hz	720 x 480p
	640 x 480p
239 Hz	720 x 576p
	720 x 480p

**Table 11-578. HDMI Video Timings (CEA-861-D) (continued)**

Refresh Rate	Resolution
240 Hz	720 x 480p

### 11.3.1.2.2 VESA DMT Video Formats and Timings

Table 11-579 lists the video timings supported by the HDMI module and based on the VESA DMT standard:

**Table 11-579. HDMI Video timings (VESA DMT)**

Refresh Rate	Resolution
60 Hz	640 x 480p
	800 x 600p
	848 x 480p
	1024 x 768p
	1280 x 768p
	1280 x 800p
	1280 x 960p
	1280 x 1024p
	1360 x 768p
	1366 x 768p
	1400 x 1050p
	1440 x 900p
	1680 x 1200p
60 Hz (reduced blanking)	1680 x 1050p
	1920 x 1080p
	1280 x 768p
	1280 x 800p
	1400 x 1050p
	1440 x 900p
1680 x 1050p	
1920 x 1200p	

**NOTE:** Custom resolutions may work, but are not supported by the device. Using non-standard values can lead to noncompliance with the HDMI interface standard.

## 3D Graphics Accelerator

---

---

This chapter is a basic overview and describes the integration of the 3D graphics processing unit (GPU) subsystem in the device.

---

**NOTE:** The GPU subsystem is an instantiation by Texas Instruments of the PowerVR® SGX544 core from Imagination Technologies Limited.

This document contains materials that are © Imagination Technologies Limited.

<b>12.4 GPU Register Manual .....</b>	<b>3177</b>

## 12.1 GPU Overview

The 3D graphics processing unit (GPU) accelerates 2-dimensional (2D) and 3-dimensional (3D) graphics and compute applications. It is based on the PowerVR® SGX544-MP2 core from Imagination Technologies Limited. The SGX544-MP2 core is a multicore (dual-core) evolution of the PowerVR SGX544 GPU.

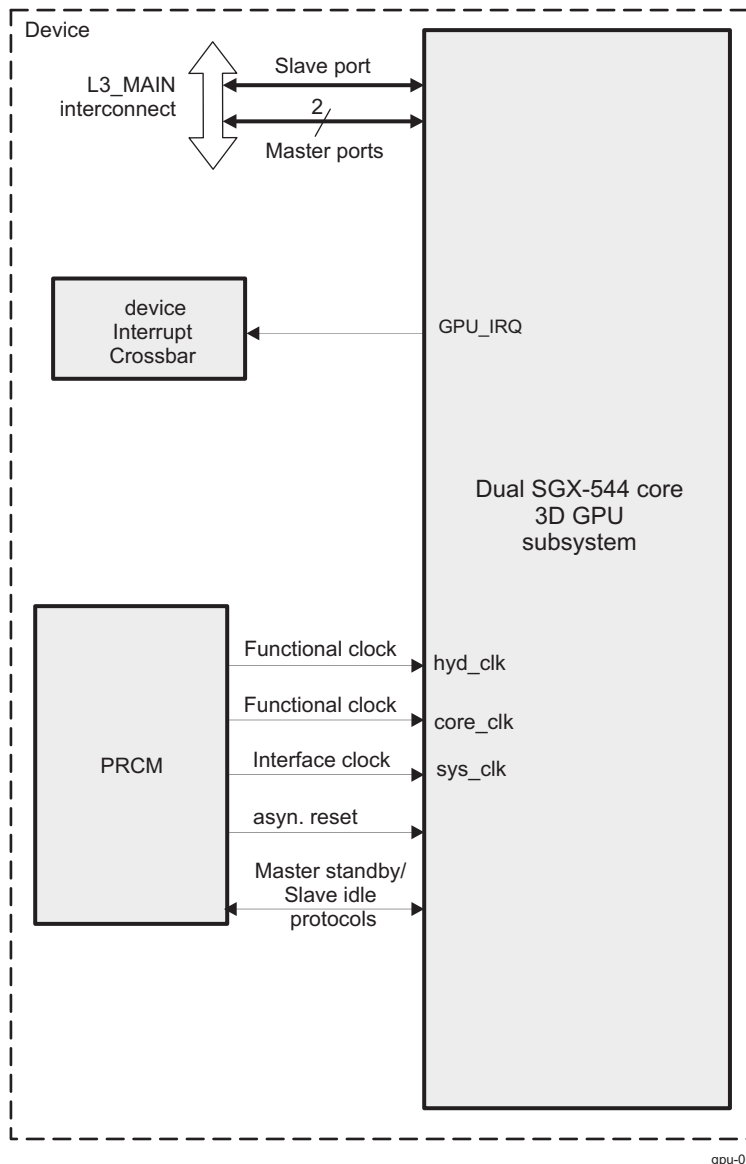

SGX is a new generation of programmable PowerVR graphics and video IP cores. The PowerVR SGX is a scalable architecture which efficiently processes a number of differing multimedia data types concurrently :

- Pixel Data
- Vertex Data
- General Purpose Processing

The dual core GPU splits geometry and pixel rendering among the cores to improve performance proportional to the number of cores.

Figure 12-1 shows the device GPU subsystem.

Figure 12-1. GPU Overview

gpu-001

### 12.1.1 GPU Features Overview

- API support for industry standards:
  - OpenCL™-EP 1.1
  - Direct3D® Feature Level 9.3
- Multicore GPU architecture:
  - 2 × SGX544 cores
  - Shared system level cache of 128 KiB (64 KiB per SGX-544 core)
- Tile-based deferred rendering architecture:
  - Reduces external bandwidth to SDRAM
- Universal Scalable Shader Engine (USSE™):
  - Multithreaded engine incorporating vertex and pixel shader functionality
  - Automatic load balancing of vertex and pixel processing tasks
- Present and texture load accelerator (PTLA):
  - Enables to move, rotate, twiddle, and scale texture surfaces
  - Supports RGB, ARGB, YUV4:2:2, and YUV4:2:0 surface formats
  - Supports bilinear upscale
  - Supports source color key
- Fully virtualized memory addressing for operating system (OS) in a unified memory architecture:
  - Memory management unit (MMU)
  - Up to 4-GiB virtual address space

The 3D-GPU subsystem generates a single (aggregate) interrupt connected to the device Interrupt Crossbar. This allows for this interrupt to be programmatically mapped to multiple device host interrupt controllers (see [Section 12.2](#)).

### 12.1.2 Graphics Feature Overview

- Texture support:
  - Cube map
  - Projected textures
  - Non-square textures
- Texture formats:
  - RGBA 8888, 565, 1555, and 1565
  - Monochromatic 8, 16, 16f, 32f, and 32int
  - Dual channel, 8:8, 16:16, and 16f:16f
  - Compressed textures:
    - PVRTC-i 2 bpp
    - PVRTC-i 4 bpp
    - PVRTC-ii 2 bpp
    - PVRTC-ii 4 bpp
    - ETC1
    - DXT 1-5 and BC 4-5
  - Programmable support for YUV formats:
    - Programmable matrix in hardware, coefficients on 12 bits
    - YUV4:2:2, YUV4:2:0, two planes (NV12 or NV21); YUV4:2:0, three planes
- Resolution support:
  - Frame buffer maximum = 4096 × 4096

- Texture maximum size = 4096 × 4096
- Texture filtering:
  - Bilinear, trilinear
  - Independent minimum and mag control
- Anti-aliasing:
  - 4× multisampling
  - Programmable sample positions

---

**NOTE:** TI provides the DXT1-5 and BC4-5 texture compression technology for use only with a Microsoft Windows operating system. A separate license is required for the use of this technology (also referred to as S3 texture compression technology) with any other operating system.

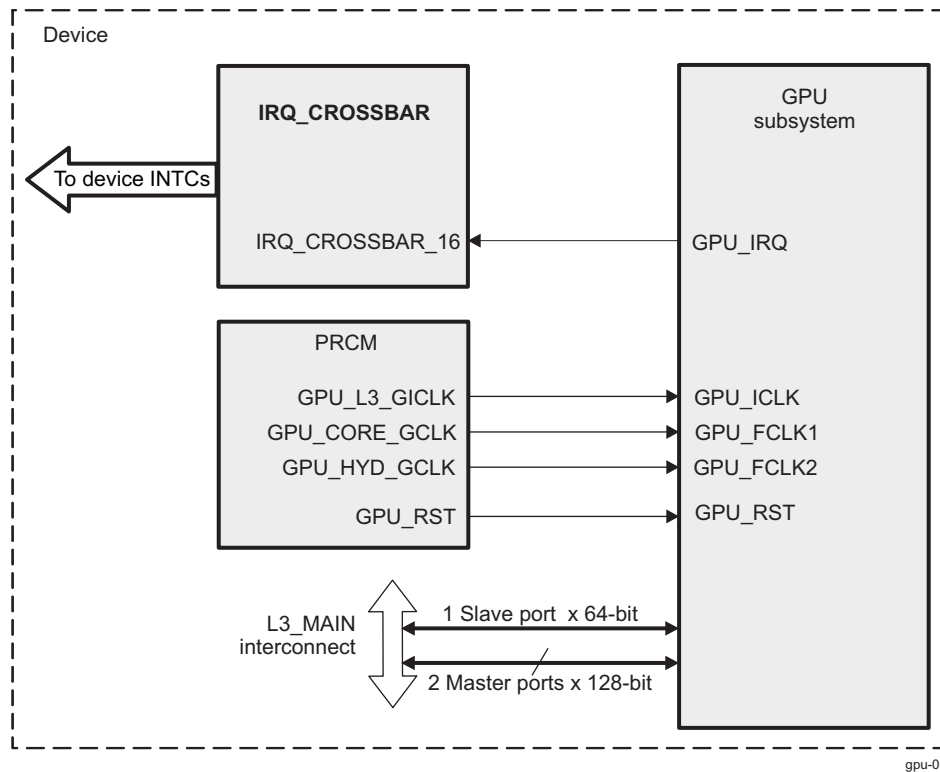

---

## 12.2 GPU Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests.

Figure 12-2 shows the GPU integration.

**Figure 12-2. GPU Integration**

The GPU subsystem is connected to the level 3 (L3\_MAIN) interconnect by two 128-bit master and a 64-bit slave interfaces.

Table 12-1 through Table 12-3 summarize the integration of the module in the device.

**Table 12-1. GPU Integration Attributes**

Module Instance	Attributes	
	Power Domain	Interconnect
GPU	PD_GPU	L3_MAIN

**Table 12-2. GPU Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPU	GPU_ICLK	GPU_L3_GICLK	PRCM	GPU interface clock
GPU	GPU_FCLK1	GPU_CORE_GCLK	PRCM	GPU functional clock of the internal graphic cores
GPU	GPU_FCLK2	GPU_HYD_GCLK	PRCM	GPU functional clock of the internal L2-cache controller and memories
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPU	GPU_RST	GPU_RST	PRCM	GPU non-retention reset signal

**Table 12-3. GPU Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	IRQ_CROSSBAR Input	Default Mapping	Description
GPU	GPU_IRQ	IRQ_CROSSBAR_16	MPU_IRQ_21 DSP1_IRQ_47 DSP2_IRQ_47	GPU interrupt request mapped to the device Interrupt Crossbar

**NOTE:** The “**Default Mapping**” column in [Table 12-3, GPU Hardware Requests](#) shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ\_CROSSBAR module. For more information about the IRQ\_CROSSBAR module, see [Section 18.4.6.4, IRQ\\_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#). For more information about the device interrupt controllers, see [Chapter 17, Interrupt Controllers](#).

**NOTE:** No DMA and no wake-up requests are generated by the GPU subsystem.

## 12.3 GPU Functional Description

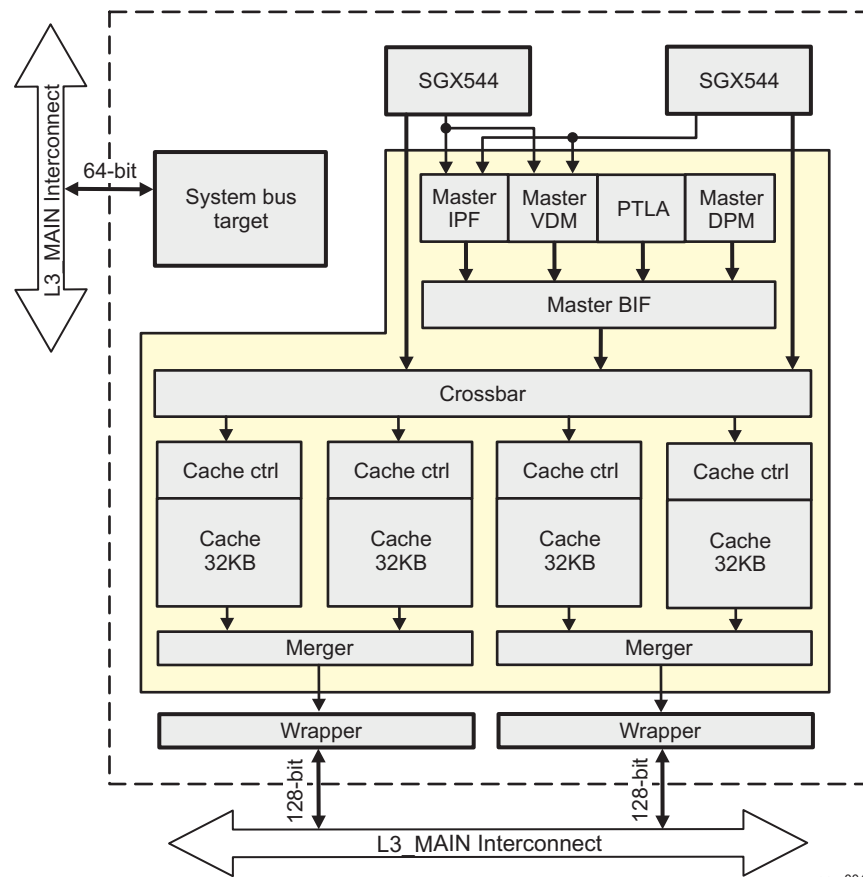

### 12.3.1 GPU Block Diagram

The GPU subsystem is based on the PowerVR SGX544-MP2 core. Multicore GPU can split geometry and pixel rendering among the cores to improve performance proportional to the number of cores. The graphics software engineer programming the device GPU does not have to deal with the multiple cores, this is done by the graphics drivers. The multiple cores are completely hidden behind the standard high-level graphics APIs that are supported by the graphics core. The GPU architecture comprises the following elements:

- SGX544 cores
- PTLA
- Cross bar
- System-level cache (SLC)

Figure 12-3 shows the GPU top-level block diagram.

**Figure 12-3. GPU Block Diagram**

gpu-004

The SGX544-MP2 has 2x SGX544 cores. Graphics rendering is automatically load-balanced between the 2x SGX544 cores. It is possible to disable one or two of the cores if required. The glue logic is used to enable the multicore architecture. The crossbar enables any SGX544 core to access the SLC. The SLC is a 128-KiB unified multibanked cache with four banks of 32 KiB. The cache line size is 64 bytes. The SGX544 core accesses are interleaved in the different banks.

### 12.3.2 GPU Clock Configuration

The GPU subsystem operates from three clocks: an interface clock (GPU\_ICLK) and two functional clocks (GPU\_FCLK1 and GPU\_FCLK2). The power, reset, and clock management (PRCM) module generates and distributes the clocks inside the device.

- The GPU\_ICLK manages the data transfer on the L3\_MAIN master and slave ports.

The GPU\_ICLK frequency is selected based on the L3\_MAIN interconnect clock frequency of the whole device. For more information about the interface clock, see [Section 3.6.4.12, CD\\_GPU Clock Domain](#), in the [Chapter 3, Power, Reset, and Clock Management](#).

When no longer required by the GPU subsystem, GPU\_ICLK can be disabled by software at the PRCM level. For more information, see [Section 3.7.10, PD\\_GPU Description](#), in the [Chapter 3, Power, Reset, and Clock Management](#).

---

**NOTE:** GPU\_ICLK is cut only if the GPU is ready to go into IDLE state.

- GPU\_FCLK1 and GPU\_FCLK2 are the functional clocks and are used inside the GPU subsystem to generate clock signals to multiple GPU clock domains. The GPU\_FCLK1 input supplies clock to the internal graphics cores and the GPU\_FCLK2 input supplies clock to the shared-cache memories and controllers.

Using the clock source selection and the digital phase-locked loop (DPLL) settings, GPU\_FCLK1 and GPU\_FCLK2 frequencies can be adjusted.

The GPU\_FCLK1 and GPU\_FCLK2 clocks are provided by the peripheral DPLL and the core DPLL, as described in [Section 3.6.4.12, CD\\_GPU Clock Domain](#) in the [Chapter 3, Power, Reset, and Clock Management](#). Selection is made at the PRCM level.

When no longer needed by the GPU subsystem, GPU\_FCLK1 and GPU\_FCLK2 can be cut by software at the PRCM level if the module is ready to enter IDLE state. For more information, see [Section 3.7.10, PD\\_GPU Description](#) in the [Chapter 3, Power, Reset, and Clock Management](#).

### 12.3.3 GPU Software Reset

The GPU subsystem has its own reset domain. Global reset of the GPU is performed by activating the GPU\_RST signal in the GPU\_RST domain.

---

**NOTE:** The APIs delivered with the GPU provide a software reset functionally equivalent to a hardware reset.

---

### 12.3.4 GPU Power Management

The GPU subsystem has its own power domain ( GPU power domain - PD\_GPU ).

The GPU handles automatic clock gating performed on the multiple internal module clock domains.

In addition, software-controlled clock gating is managed inside the GPU and handled by the related API delivered with the module.

For additional information about the GPU power domain, see [Section 3.7.10, PD\\_GPU Description](#) in the [Chapter 3, Power, Reset, and Clock Management](#).

### 12.3.5 GPU Thermal Management

There is a dedicated thermal sensor to monitor operating temperature of the GPU subsystem in the chip. The GPU temperature processing logic is located within the device CTRL\_MODULE\_CORE and is capable to generate a thermal alert interrupt which can be mapped to all (host) interrupt controllers within the device, via the device IRQ\_CROSSBAR. The thermal logic can also generate a thermal shut-down warm reset event to the device PRCM. For further details on the GPU thermal management operation features and register settings, refer to the [Section 18.4.6.2, Thermal Management Related Registers of the Chapter 18, Control Module](#).

### 12.3.6 GPU Interrupt Requests

The GPU subsystem can generate one interrupt signal - GPU\_IRQ mapped to the IRQ\_CROSSBAR\_16 input of the device interrupt crossbar.

For more details on programmable configuration of the GPU\_IRQ mapping to the different device host interrupt controllers, refer to the [Chapter 18, Control Module](#) and the [Chapter 17, Interrupt Controllers](#).

## 12.4 GPU Register Manual

### CAUTION

All GPU registers are limited to 32-bit data accesses; 8- and 16-bit accesses are not allowed because they can corrupt register content.

### 12.4.1 GPU Instance Summary

**Table 12-4. GPU Instance Summary**

Module Name	Base Address	Size
GPU_WRAPPER	0x5600 FE00	512 bytes

The GPU domain's base address is at 0x5600 0000. GPU address space is 32MiB wide.

### 12.4.2 GPU Registers

## 2D Graphics Accelerator

---

---

This chapter describes the advanced bit blitter 2-dimensional (2D) graphics accelerator (BB2D) for the device.

---

**NOTE:** The BB2D subsystem is an instantiation by Texas Instruments of the GC320™ core from Vivante Corp.

This document contains materials that are © Vivante Corp.

GC320 is a trademark or registered trademark of Vivante Corp.

### 13.1 BB2D Overview

The 2D graphics accelerator subsystem accelerates 2D graphics applications. The 2D graphics accelerator subsystem is based on the GC320 2D GPU core from Vivante Corporation. The hardware acceleration is brought to numerous 2D applications, including on-screen display and touch screen user interfaces, graphical user interfaces (GUIs) and menu displays, flash animation, and gaming.

Figure 13-1 shows the BB2D subsystem.

Figure 13-1. BB2D Overview

#### 13.1.1 BB2D Key Features Overview

- API support:
  - OpenWF™, DirectFB
  - GDI/DirectDraw™
  - Flash
- **BB2D architecture:**
  - BitBlit and StretchBlit
  - DirectFB hardware acceleration
  - ROP2, ROP3, ROP4 full alpha blending and transparency
  - Clipping rectangle support
  - Alpha blending includes Java® 2 Porter-Duff compositing rules
  - 90-, 180-, 270-degree rotation on every primitive
  - YUV-to-RGB color space conversion

- Programmable display format conversion with 14 source and 7 destination formats
- High-quality 9-tap, 32-phase filter for image and video scaling at 1080p
- Monochrome expansion for text rendering
- 32 K × 32 K coordinate system
- **Hardware acceleration for DirectFB:**
  - High-speed video scaler
  - ROP2/3/4
  - Rectangle filling and drawing
  - Line drawing
  - Simple blitting
  - Stretch blitting
  - Blending with alpha channel (per-pixel alpha)
  - Blending with alpha factor (alpha modulation)
  - Nine source and destination blending functions
  - Porter-Duff rules support
  - Premultiplied alpha support
  - Colorized blitting (color modulation)
  - Source color keying
  - Destination color keying

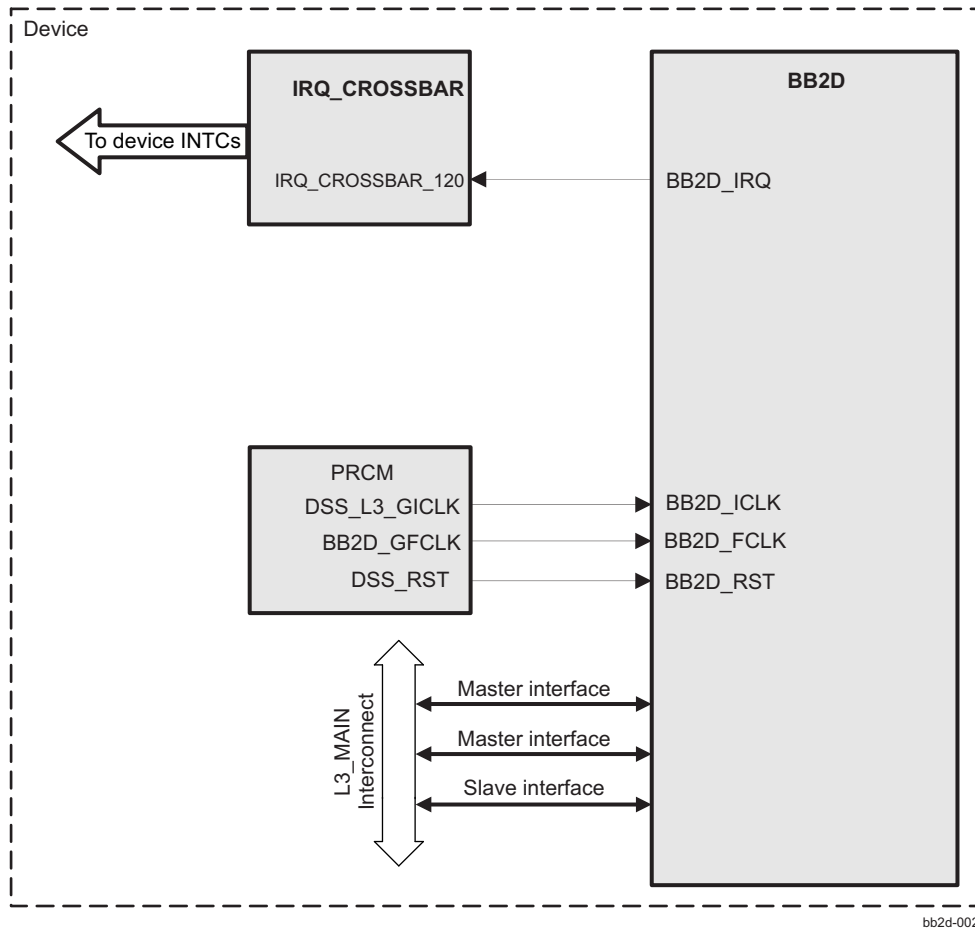

The device BB2D generates a single (aggregate) interrupt request connected to the device Interrupt Crossbar. This allows for this interrupt to be programmatically mapped to multiple device host interrupt controllers (see [Section 13.2](#)).

### 13.2 BB2D Integration

This section describes subsystem integration in the device, including information about clocks, resets, and hardware requests.

Figure 13-2 shows BB2D integration.

Figure 13-2. BB2D Integration

The BB2D subsystem is connected to the level 3 (L3\_MAIN) interconnect by two 128-bit master interfaces and one 32-bit slave interface.

Table 13-1 through Table 13-3 summarize the integration of the subsystem in the device.

Table 13-1. BB2D Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
BB2D	PD_DSS	L3_MAIN

Table 13-2. BB2D Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
BB2D	BB2D_ICLK	DSS_L3_GICLK	PRCM	BB2D interfaces clock
	BB2D_FCLK	BB2D_GFCLK	PRCM	BB2D functional clock.
Resets				

**Table 13-2. BB2D Clocks and Resets (continued)**

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
BB2D	BB2D_RST	DSS_RST	PRCM	BB2D non-retention reset signal

**Table 13-3. BB2D Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
BB2D	BB2D_IRQ	IRQ_CROSSBAR_120	MPU_IRQ_125 IPU1_IRQ_65 IPU2_IRQ_65	BB2D interrupt request to the device interrupt crossbar

---

**NOTE:** The “**Default Mapping**” column in [Table 13-3, BB2D Hardware Requests](#) shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ\_CROSSBAR module. For more information about the IRQ\_CROSSBAR module, see [Section 18.4.6.4, IRQ\\_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#). For more information about the device interrupt controllers, see [Chapter 17, Interrupt Controllers](#).

---

---

**NOTE:** No DMA and no wake-up requests are generated by the BB2D module.

---

### 13.3 BB2D Functional Description

#### 13.3.1 BB2D Block Diagram

The BB2D subsystem is based on the following main blocks:

- Host interface: Allows the BB2D core to communicate with external memory and the MPU through the L3\_MAIN interconnect. In this block, data crosses clock domain boundaries.
- Memory controller: Internal memory unit that is the block-to-host interface for memory requests
- Graphics pipeline front-end: Inserts high-level primitives and commands into the graphics pipeline.
- 2D drawing and scaling engine: Draws 2D graphics primitives and rasterizes 2D images.
- Pixel engine: manipulates and filters pixels in rendered images. BB2D has four pixel pipes.

Figure 13-3 shows the BB2D top-level block diagram.

#### 13.3.2 BB2D Clock Configuration

The BB2D subsystem operates from two clocks: an interface clock (BB2D\_ICLK) and functional clock (BB2D\_FCLK). The power, reset, and clock management (PRCM) module generates and distributes the clocks inside the device.

- The BB2D\_ICLK interface clock manages the data transfer on the L3\_MAIN master and slave ports. The BB2D\_ICLK frequency is selected based on the whole device L3\_MAIN interconnect clock frequency. For more information on the interface clock, see [Section 3.6.4.14, CD\\_DSS Clock Domain](#), in the chapter, *Power, Reset and Clock Management*.

When BB2D\_ICLK is no longer required by the BB2D subsystem, it can be disabled by software at the PRCM level.

**NOTE:** BB2D\_ICLK is cut only if the BB2D is ready to go into IDLE state.

- The BB2D\_FCLK functional clock is used inside the BB2D subsystem to generate clock signals to multiple BB2D clock domains. The BB2D automatically gates clocks to domains, that are not currently in use.

Using the clock source selection and the DPLL settings, the frequency of BB2D\_FCLK can be adjusted.

When BB2D\_FCLK is no longer needed by the BB2D subsystem, it can be cut by software at the PRCM level, if the module is ready to enter IDLE state.

### 13.3.3 BB2D Software Reset

The BB2D subsystem is part of the DSS reset domain. A global reset of the BB2D is performed by activating the BB2D\_RST signal in the DSS\_RST domain.

---

**NOTE:** The APIs delivered with the BB2D provide a software reset functionally equivalent to a hardware reset.

---

### 13.3.4 BB2D Power Management

The BB2D subsystem is part of the DSS power domain (PD\_DSS). For additional information about PD\_DSS, see [Section 3.7.12, PD\\_DSS Description](#) in the [Chapter 3, Power, Reset, and Clock Management](#).

---

**NOTE:** The BB2D handles automatic clock gating performed on the multiple internal clock domains.

---

When 2D operations are complete, software may set the [GCGPOUT0\[0\] GCHOLD](#) bit to 1 to enter a low-power state. Setting GCHOLD to 1 moves the BB2D operational state into IDLE. Once in IDLE state, the system standby hardware signal (mstandby) is asserted.

## 13.4 BB2D Register Manual

### CAUTION

All BB2D registers are limited to 32-bit data accesses; 8- and 16-bit accesses are not allowed because they can corrupt register content.

### 13.4.1 BB2D Instance Summary

**Table 13-4. BB2D Instance Summary**

Bits	Field Name	Description	Type	Reset
31	FE20_BIT_INDEX	Supports 20 bit index.	R	1
30	RS_YUV_TARGET	Supports resolveing into YUV target.	R	1
29	BYTE_WRITE_3D	3D PE has byte write capability.	R	1
28	FE20	FE 2.0 is present.	R	0
27	VGTS	VG tessalator is present.	R	0
26	PIPE_VG	VG pipe is present.	R	0
25	MEM32_BIT_SUPPORT	32 bit memory address support.	R	0
24	YUY2_RENDER_TARGET	YUY2 support in PE and YUY2 to RGB conversion in resolve.	R	0
23	HALF_TX_CACHE	TX cache is half.	R	0
22	HALF_PE_CACHE	PE cache is half.	R	0
21	YUY2_AVERAGING	YUY2 averaging support in resolve.	R	1
20	NO_SCALER	No 2D scaler.	R	0
19	BYTE_WRITE_2D	Supports byte write in 2D.	R	1
18	BUFFER_INTERLEAVING	Supports interleaving depth and color buffers.	R	1
17	NO422_TEXTURE	No 422 texture input format.	R	0
16	NO_EZ	No early-Z.	R	0
15	MIN_AREA	Configured to have minimum area.	R	1
14	MODULE_CG	Second level clock gating is available.	R	1
13	YUV420_TILER	YUV 4:2:0 tiler is available.	R	1
12	HIGH_DYNAMIC_RANGE	Shows if there is HDR support.	R	1
11	FAST_SCALER	Shows if there is HD scaler.	R	1
10	ETC1_TEXTURE_COMPRESSION	ETC1 texture compression.	R	1
9	PIPE_2D	Shows if there is 2D engine.	R	1
8	DC	Shows if there is a display controller.	R	0
7	MSAA	MSAA support.	R	1
6	YUV420_FILTER	YUV 4:2:0 support in filter blit.	R	1
5	ZCOMPRESSION	Depth and color compression.	R	0

Bits	Field Name	Description	Type	Reset
4	DEBUG_MODE	Debug registers.	R	0
3	DXT_TEXTURE_COMPRESSION	DXT texture compression.	R	1
2	PIPE_3D	3D pipe.	R	0
1	SPECIAL_ANTI_ALIASING	Full-screen anti-aliasing.	R	1
0	FAST_CLEAR	Fast clear.	R	0

Bits	Field Name	Description	Type	Reset
31	ENHANCE_VR	Enhance VR and add a mode to walk 16 pixels in 16-bit mode in vertical pass to improve cache hit rate when rotating 90/270.	R	1
30	CORRECT_STENCIL	Correct stencil behavior in depth only.	R	1
29	A8_TARGET_SUPPORT	2D engine supports A8 target.	R	0
28	NEW_TEXTURE	New texture unit is available.	R	0
27	HIERARCHICAL_Z	Hierarchical Z is supported.	R	1
26	BYPASS_IN_MSAA	Shader supports bypass mode when MSAA is enabled.	R	0
25	VAA	VAA is available or not.	R	0
24	BUG_FIXES0		R	1
23	SHADER_MSAA_SIDE BAND	Put the MSAA data into sideband fifo.	R	0
22	MC_20	New style MC with separate paths for color and depth.	R	0
21	DEFAULT_REG0	Unavailable registers will return 0.	R	1
20	EXTRA_SHADER_INSTRUCTIONS1	Sqrt, sin, cos instructions are available.	R	1
19	SHADER_GETS_W	W is sent to SH from RA.	R	1
18	VG_21	Minor updates to VG pipe (Event generation from VG, TS, PE). Tiled image support.	R	0
17	VG_FILTER	VG filter is available.	R	0
16	EXTRA_SHADER_INSTRUCTIONS0	Floor, ceil, and sign instructions are available.	R	1

Bits	Field Name	Description	Type	Reset
15	COMPRESSION_FIFO_FIXED	If this bit is not set, the FIFO counter should be set to 50. Else, the default should remain.	R	1
14	TS_EXTENDED_COMMANDS	New commands added to the tessellator.	R	0
13	VG_20	Major updates to VG pipe (TS buffer tiling. State masking.).	R	0
12	SUPER_TILED_32X32	32 x 32 super tile is available.	R	1
11	SEPARATE_TILE_STATUS_WHEN_INTERLEAVED	Use 2 separate tile status buffers in interleaved mode.	R	1
10	TILE_STATUS_2BITS	2 bits are used instead of 4 bits for tile status.	R	1
9	RENDER_8K	Supports 8K render target.	R	1
8	CORRECT_AUTO_DISABLE	Reserved.	R	0
7	PE20_2D	2D PE 2.0 is present.	R	1
6	FAST_CLEAR_FLUSH	Proper flush is done in fast clear cache.	R	1
5	SPECIAL_MSAA_LOD	Special LOD calculation when MSAA is on.	R	1
4	CORRECT_TEXTURE_CONVERTER	Driver hack is not needed.	R	1
3	TEXTURE8_K	Supports 8K x 8K textures.	R	1
2	ENDIANNESS_CONFIG	Configurable endianness support.	R	1
1	DUAL_RETURN_BUS	Dual Return Bus from HI to clients.	R	1
0	FLIP_Y	Y flipping capability is added to resolve.	R	1

**Table 13-90. GCDISPLAYPRIORITY**

<b>Address Offset</b>	0x0000 0434	<b>Instance</b>	BB2D
<b>Physical Address</b>	0x5900 0434		
<b>Description</b>	Controls the priority of the display controller requests. This works like a PWM. One register gives the period, and the other gives the ON time. When PWM is ON, display requests are accepted if both display and the other request is valid. If it is OFF, the other request will be accepted. If only one request is valid, it takes the bus regardless of the PWM bit.

<b>14.1 Interconnect Overview</b> .....	<b>3244</b>
<b>14.2 L3_MAIN Interconnect</b> .....	<b>3247</b>
<b>14.3 L4 Interconnects</b> .....	<b>3423</b>

## 14.1 Interconnect Overview

### 14.1.1 Terminology

The following terminology is critical to understanding the interconnect:

- Initiator: Module able to initiate read and write requests to the chip interconnect (typically: processors, DMA, etc.).
- Target: Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers).

---

**NOTE:** A module can have several separate ports; therefore, a module can be an initiator and a target.

---

- Agent: Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).
- Interconnect: The decoding, routing, and arbitration logic that enables the connection between multiple initiator modules and multiple target modules connected on it. Quality of service (QoS) is guaranteed.
- Register target (RT): Special TA used to access the interconnect internal configuration registers
- Data-flow signal: Any signal that is part of a clearly identified transfer or data flow (typically: command, address, byte enables, etc.). Signal behaviour is defined by the protocol semantics.
- Sideband signal: Any signal whose behaviour is not associated to a precise transaction or data flow.
- Out-of-band error: Any signal whose behaviour is associated to a device error-reporting scheme, as opposed to in-band errors.

---

**NOTE:** Interrupt requests and DMA requests are not routed by the interconnect in the device.

---

- Firewall: A programmable feature integrated in a target agent or L4 interconnect to prevent unauthorized access to or from a module. A firewall can be configured using three criteria:
  - Initiator requesting access
  - Address space access
  - Type of access
- ConnID: Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted in band with the request and is used for firewall and error-logging mechanism.
- Firewall comparison mechanism: A comparison made in the firewall between access in-band qualifiers and access permissions that are programmed in the firewall configuration registers. If the comparison is successful, access is allowed; otherwise, access is denied.
- MCcmd qualifier: Command bus that indicates the type of transfer requested. [Table 14-1](#) lists the commands encoded. For information specific to L3 Interconnect error logging, see *L3 Firewall Error-Logging Registers*

**Table 14-1. MCcmd Qualifier Description**

MCcmd[2:0]	Transaction Type
0 0 0	Idle
0 0 1	Write
0 1 0	Read
0 1 1	ReadEx
1 0 0	Read link
1 0 1	Write nonposted
1 1 0	Write conditional

**Table 14-1. MCmd Qualifier Description (continued)**

MCmd[2:0]	Transaction Type
1 1 1	Write broadcast

- MReqInfo qualifier: Four MReqInfo qualifiers describe the access during the use of the firewall comparison mechanism, as described in [Table 14-2](#).

**Table 14-2. MReqInfo Qualifier Description**

Qualifiers	Description
MReqType	0: Data access
	1: Opcode fetch
MReqSupervisor	0: User mode
	1: Supervisor mode
MReqDebug	0: Functional access
	1: Debug access

- Register that configures the combination of the MReqInfo, allowing access permission to the target module (TM) based on the MReqInfo in-band qualifier values.
- SError: Target that indicates an error condition to the initiator.
- SResp qualifier: Response from the target to the initiator concerning the transaction, as described in [Table 14-3](#).

**Table 14-3. SResp Qualifier Description**

SResp[1:0]	Description
0 0	No response
0 1	Data valid/accept
1 0	Not used
1 1	Error

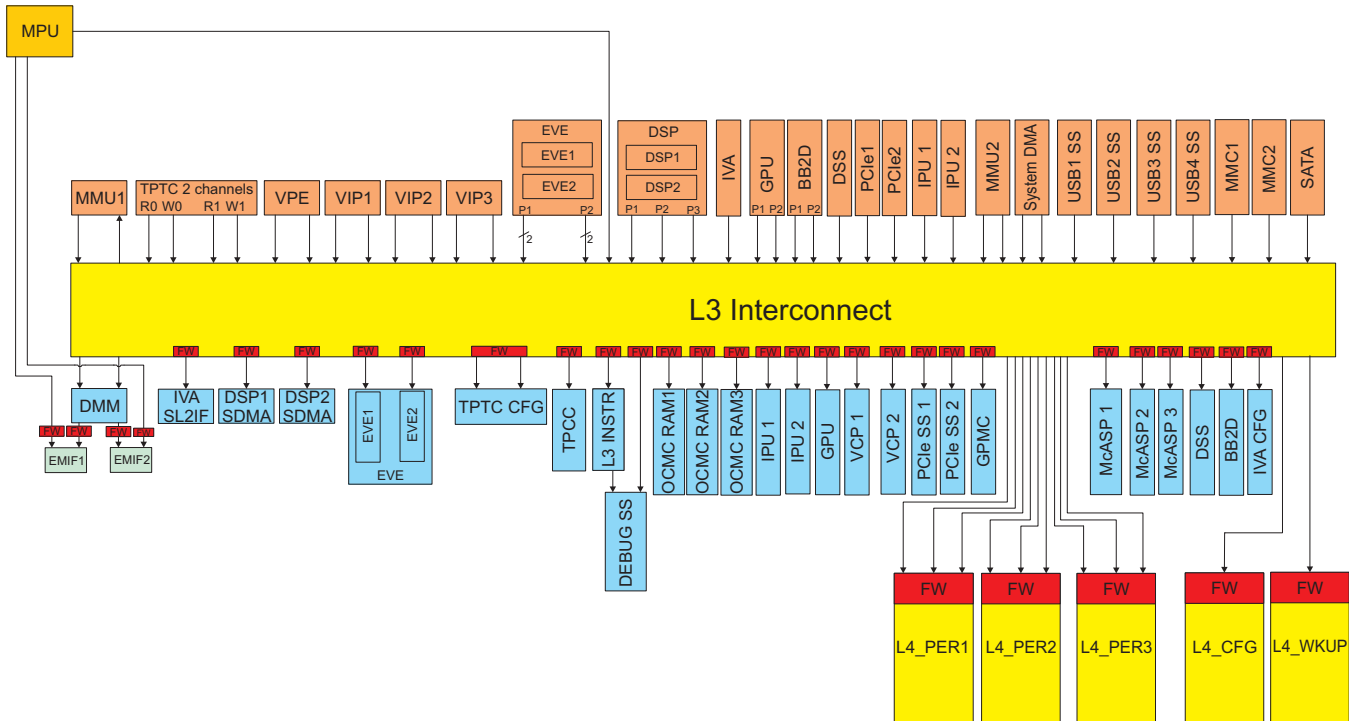

- MTagID: Interconnect qualifier generated by the L3\_MAIN masters which purpose is to identify whether reordering is allowed or not relative to other transactions. Strong ordering is ensured by using same MTagID values between transactions. Reordering is allowed by using different MTagID values between transactions.  
The MTagID values may or may not be changed by the interconnect, but the intended reordering restriction must match what came from the master. In other words, the interconnect allocates dynamically MTagID values in such a way that the intended reordering restrictions from each master are honored.

### 14.1.2 Architecture Overview

The device memory hierarchy includes four levels:

- L1 is internal to the CPUs. It concerns data exchange with the internal Level1 cache memory subsystem, and it is the closest memory to the microprocessor unit (MPU) core and the IVA core.
- L2 is included in the IPU subsystem and the MPU subsystem.
- The chip-level interconnect consists of one L3 interconnect and five L4 interconnects. It enables communication among the modules and subsystems in the device.

[Figure 14-1](#) shows an overview of the L3 and L4 interconnect architecture.

**Figure 14-1. Interconnect Overview**

- L3 handles many types of data transfers, especially exchanges with system-on-chip/external memories. L3 transfers data with a maximum width of 128 bits from the initiator to the target. The L3 interconnect is a little-endian platform
- The L4 is composed of the following:
  - L4\_CFG: Includes the majority of the firewall configuration interface for level 3 (L3) system modules and peripheral interconnect;
  - L4\_PER: Includes the main peripherals that require system direct memory access (sDMA) access. L4\_PER has three instances L4\_PER1, L4\_PER2 and L4\_PER3. Each of these three instances has three ports connecting it to L3\_MAIN interconnect:
    - L4\_PER1\_P1, L4\_PER1\_P2, L4\_PER1\_P3
    - L4\_PER2\_P1, L4\_PER2\_P2, L4\_PER2\_P3
    - L4\_PER3\_P1, L4\_PER3\_P2, L4\_PER3\_P3
 Through L3\_MAIN interconnect, different initiators can access each of these L4\_PERx\_Pi ports. For information regarding which initiator accesses which L4\_PERx\_Pi port, see [Figure 14-3](#).
  - L4\_WKUP: Includes peripherals attached to the WKUP power domain.

Modules are connected to the interconnect through an IA for the initiator module and a TA for target modules. Each module/subsystem connection is statically configured to tune the access, depending on the characteristics of the module.

To unauthorize a module or L4 interconnect access, some TAs include configurable firewalls (FWs). A firewall restricts or filters the accesses allowed to an initiator according to different access criteria. The firewalls can usually be configured by software.

The L3 and L4 interconnect default settings are fully functional; they enable all possible functional data paths and a minimal default protection setting.

## 14.2 L3\_MAIN Interconnect

This section describes the L3\_MAIN interconnect and its components. With the exception of register points, each component includes functions for the request and response networks.

### 14.2.1 L3\_MAIN Interconnect Overview

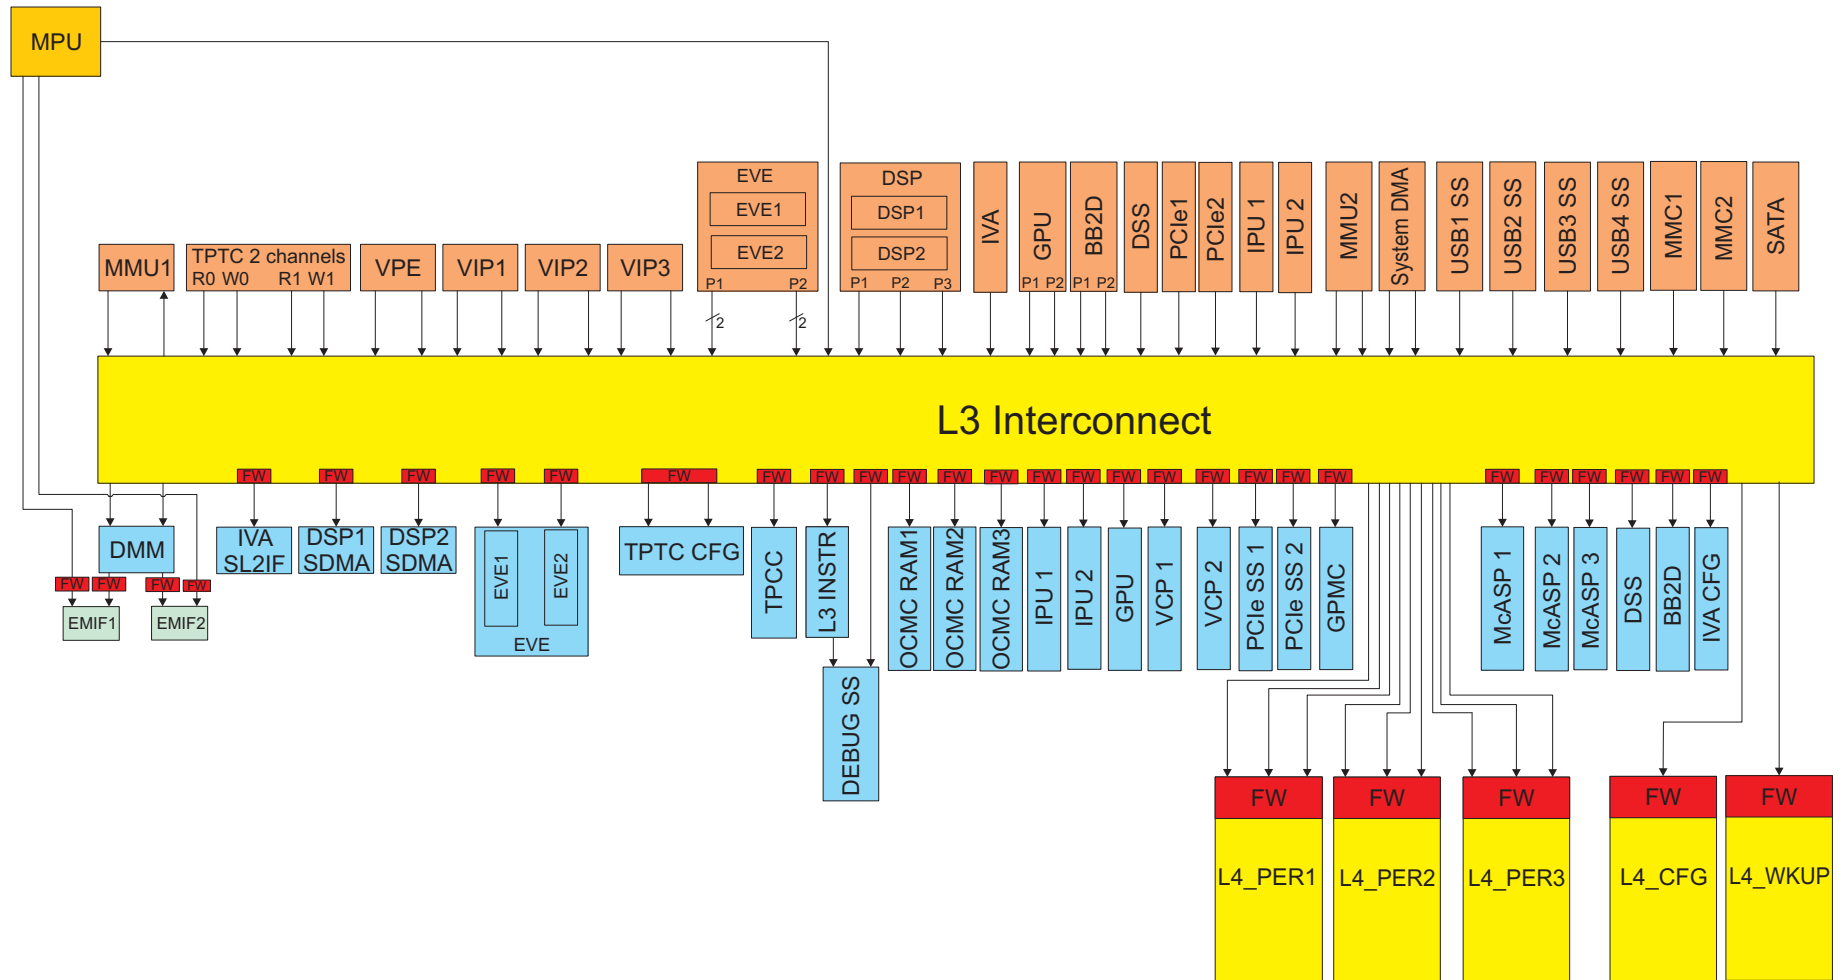

The L3\_MAIN interconnect links cores in a flexible topology that couples low power with high performance. Innovative physical structures and advanced protocols ensure bandwidth and latency to individual IP cores, providing dedicated connections between IP cores and logical connections over a shared interconnect.

The main features of the L3\_MAIN interconnects are:

- NIUs: Master NIUs for the IAs and slave NIUs for the TAs
- A partially depleted cross-bar exchange network
- A special internal slave NIU for accessing L3\_MAIN interconnect configuration registers
- QoS management for real-time hardware operators, while maintaining optimal memory latency for CPU access to memory resources
- True little-endian platform
- Transaction errors tracking and logging registers
- All signaling support for chip-level power-management infrastructure
- One interrupt line signaling transaction error
- One interrupt line for reporting statistical events on the L3\_MAIN interconnect

[Figure 14-2](#) shows an overview of the L3 interconnect and the peripherals attached to it.

Figure 14-2. L3\_MAIN Interconnect Overview

## 14.2.2 L3\_MAIN Interconnect Integration

Table 14-4 through Table 14-6 summarize the integration of the module in the device.

**Table 14-4. L3\_MAIN Integration Attributes**

Module Instance	Attributes
	Power Domain
L3_MAIN	PD_COREAON

**Table 14-5. L3\_MAIN Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L3_MAIN	L3_CLK1	L3MAIN1_L3_GICLK	PRCM	Functional and interface clock
	L3_CLK2	L3INSTR_L3_GICLK	PRCM	Functional and interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L3_MAIN	L3_CORE_RET_RST	CORE_PWRON_RET_RST	PRCM	Reset of L3_MAIN interconnect registers
	L3_CORE_RST	CORE_RST	PRCM	Reset of L3_MAIN interconnect

**Table 14-6. L3\_MAIN Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
L3_MAIN	L3_MAIN_IRQ_DBG_ERR	IRQ_CROSSBAR_4	MPU_IRQ_9	Interrupt indicating debug error occurrence.
			DSP1_IRQ_35	
			DSP2_IRQ_35	
L3_MAIN	L3_MAIN_IRQ_APP_ERR	IRQ_CROSSBAR_5	MPU_IRQ_10 <sup>(1)</sup>	Interrupt indicating application error occurrence.
			DSP1_IRQ_36	
			DSP2_IRQ_36	
			EVE1_IRQ_4	
			EVE2_IRQ_4	
			IPU1_IRQ_46	
			IPU2_IRQ_46	
L3_MAIN	L3_MAIN_IRQ_STAT_ALARM	IRQ_CROSSBAR_11	MPU_IRQ_16	Statistic collector alarm interrupt
			DSP1_IRQ_42	
			DSP2_IRQ_42	

<sup>(1)</sup> The L3\_MAIN\_IRQ\_APP\_ERR interrupt is directly mapped to the MPU\_IRQ\_10 line bypassing IRQ\_CROSSBAR\_5. In all other cases IRQ\_CROSSBAR\_5 is used to map L3\_MAIN\_IRQ\_APP\_ERR to the corresponding INTC.

**NOTE:** The “Default Mapping” column in Table 14-6 *L3\_MAIN Hardware Requests* shows the default mapping of module IRQ source signals. These IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ\_CROSSBAR module.

For more information about the IRQ\_CROSSBAR module, see Section 18.4.6.4, *IRQ\_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.

For more information about the device interrupt controllers, see Chapter 17, *Interrupt Controllers*.

## 14.2.3 L3\_MAIN Interconnect Functional Description

### 14.2.3.1 Module Use in L3\_MAIN Interconnect

The L3\_MAIN interconnect network components have ConnID values for each master NIU or slave NIU. The ID uniquely identifies the master NIU or the slave NIU for an interconnect transfer. The interconnect uses ConnIDs for a number of purposes, including the following:

- Slave NIUs for error logging
- Power disconnect slave NIU for error logging
- Eight FLAGMUXes to mask interrupts
- STATCOLL for configuring and monitoring: The STATCOLL components compute the traffic statistics within a user-defined window and periodically report to the user through the debug interface.
- Bandwidth regulator for configuration

### 14.2.3.2 Module Distribution

Master NIUs and slave NIUs provide the interface to connect the different modules to their associated interconnect.

[Table 14-7](#) and [Table 14-8](#) list all the modules and subsystems with their associated agents. The agents are listed for each L3\_MAIN interconnect domain.

#### 14.2.3.2.1 L3\_MAIN Interconnect Agents

Any initiator or target core is connected to the L3\_MAIN interconnect through an NIU. NIUs act as entry points to the L3\_MAIN interconnect, and also include various programming registers. [Table 14-7](#) lists the supported master NIU ports.

**Table 14-7. Master NIUs**

Master NIU	Description
MPU_INIT	MPU initiator port. One 64b OCP initiator port, and two 128b ports connected directly to the EMIF, bypassing L3
DSP1_INIT	DSP Initiator port. One 128b MDMA interconnect initiator port (used also for cache requests) One EDMA initiator port per instance
DSP2_INIT	DSP Initiator port. One 128b MDMA interconnect initiator port (used also for cache requests) One EDMA initiator port per instance
EVE1_INIT	Embedded Vision Engine 1 (EVE1) initiator port. Two 128b interconnect initiator ports (P1/P2)
EVE2_INIT	Embedded Vision Engine 1 (EVE2) initiator port. Two 128b interconnect initiator ports (P1/P2)
IVA_INIT	Image and video accelerator (IVA) initiator port. One 128b initiator port
GPU_P1_INIT	GPU 128b initiator port 1
GPU_P2_INIT	GPU 128b initiator port 2
BB2D_P1_INIT	2D Graphics accelerator 128b initiator port 1
BB2D_P2_INIT	BB2D 128b initiator port 2
DSS_INIT	Display SubSystem initiator port. One 128b initiator port
VIP1_INIT	VIP initiator ports. Two 128b initiator ports
VIP2_INIT	VIP initiator ports. Two 128b initiator ports
VIP3_INIT	VIP initiator ports. Two 128b initiator ports
VPE_P1_INIT	VPE 128b initiator port 1
VPE_P2_INIT	VPE 128b initiator port 2
PCIE1_INIT	PCIe 64b initiator port

**Table 14-7. Master NIUs (continued)**

Master NIU	Description
PCIE2_INIT	PCIe 64b initiator port
TPTC1_INIT	EDMA_TC1 initiator port. Two 128b initiator ports(one read port and one write port)
TPTC2_INI	EDMA_TC2 initiator port. Two 128b initiator ports(one read port and one write port)
MMU1_INIT	MMU initiator port.One 128b initiator port
MMU2_INIT	MMU initiator port. One 128b initiator port
IPU1_INIT	IPU initiator port. One 64b initiator port
IPU2_INIT	IPU initiator port. One 64b initiator port
DMA_SYSTEM_INIT	Two 64b initiator ports per instance (one read port and one write port)
GMAC_SW_INIT	GMAC_SW 32b initiator port
MMC1_INIT	MMC initiator port. One 32b initiator port
MMC2_INIT	MMC 32b initiator port
SATA_INIT	SATA 32b initiator port
MLBSS_INIT	MLB 32b initiator port
USB1_INIT	USB3.0 initiator port. One 64b OTG initiator port
USB2_INIT	USB2.0 initiator port. One 64b OTG initiator port
USB3_INIT	USB2.0 initiator port. One 64b OTG initiator port
USB4_INIT	USB2.0 initiator port. One 64b OTG initiator port
IEEE1500_INIT	IEEE1500 32b initiator port
DEBUGSS_INIT	Debug subsystem 32b initiator port

Table 14-8 lists the supported slave NIU ports.

**Table 14-8. Slave NIUs**

Slave NIU	Description
DSP_TARG	DSP 128b target port per instance
DMM_P1_TARG	Dynamic memory management128b target port 1
DMM_P2_TARG	Dynamic memory management 128b target port 2
IVA_CONFIG_TARG	Video accelerator subsystem 32b configuration target port
IVA_SL2IF_TARG	Video accelerator subsystem 128b SL target port
L4_CFG_TARG	L4 CFG 32b target port
L4_WKUP_TARG	L4 WKUP 32b target port
TPTC_P1_TARG	TPTC 32b target port 1
TPTC_P2_TARG	TPTC 32b target port 2
TPCC_TARG	Third party channel controller (TPCC) 32b target port
OCMC_RAM1_TARG	On-chip memory controller 128b target port 1
OCMC_RAM2_TARG	On-chip memory controller 128b target port 2
OCMC_RAM3_TARG	On-chip memory controller 128b target port 3
PCIe1/2_TARG	PCIe1/2 64b target port
GPU_TARG	3D graphics accelerator 64b target port
IPU_P1_TARG	DUAL Cortex M4 subsystem 64b target port 1
IPU_P2_TARG	DUAL Cortex M4 subsystem 64b target port2
VCP1_TARG	VCP 64b target port 1
VCP2_TARG	VCP 64b target port 2
GPMC_TARG	General-purpose memory controller target port

**Table 14-8. Slave NIUs (continued)**

Slave NIU	Description
L4_PER1/2/3_TARG	L4 interconnect peripherals 32b initiator port
MCASP1/2/3_TARG	McASP 32b target ports
DSS_TARG	Display subsystem 64b target port
BB2D_TARG	2D graphics accelerator (BB2D) 32b target port
QSPI_TARG	QSPI 32b target port
EVE1_TARG	Embedded vision engine (EVE) 128b target port
EVE2_TARG	EVE2 128b target port
MMU1_TARG	Memory management unit (MMU) 128b target port 1
MMU2_TARG	MMU 128b target port 2
L3_INSTR_TARG	L3 instrumentation 32b target port
DEBUGSS_TARG	Debug subsystem 32b target port

#### 14.2.3.2.2 L3\_MAIN Connectivity Matrix

The L3 interconnect is divided into two clock domains L3\_CLK1 and L3\_CLK2. CLK1 domain is further splitted into two sub groups:

- L3\_CLK1\_1: Low-power domain
- L3\_CLK1\_2: Peripherals and multimedia
- L3\_CLK2: Instrumentation (debug)

The two clock elements (CLK1 and CLK2) are implemented in a different clock domain.

#### 14.2.3.2.2.1 Clock Domain Mapping of the L3\_MAIN Interconnect Modules

Each clock domain (CLK1 and CLK2) has its own host, flag mux, slave NIUs, and bandwidth regulators. [Table 14-9](#) lists the relationships between these domains and these elements.

**Table 14-9. L3\_MAIN Clock Domains and Elements**

Clock Domain	Elements
	HOST_CLK1_1
	L4_WKUP
	VCP1
	VCP2
	QSPI
	L4_PER3_P1
	L4_PER3_P2

Figure 14-3 shows the functional paths between the L3\_MAIN master NIUs and the L3\_MAIN and L3 slave NIU agents. The functional paths in L3\_MAIN are indicated by the following:

- A cell contains the letter C when a functional path exists.
- A cell is empty when a functional path does not exist.

### 14.2.3.2.3 Master NIU Identification

A master NIU ID (ConnID) is assigned to every module in the device. The ID uniquely identifies the master NIU for an interconnect transfer (see [Table 14-10](#)). The interconnect uses ConnID values for a number of purposes, including:

- Master source identification for the protection mechanism
- Response route generation
- Firewall error logging
- L3\_MAIN interconnect error logging

**Table 14-10. ConnID Values**

8-bit ConnID (hex)	4-bit ConnID (hex)	Master NIU
0	0	MPU
10	1	CS_DAP
20	2	DSP1 MDMA

9E	9	VPE P2
A0	A	MMC1
A2	A	GPU P1
A4	A	MMC2
A6	A	GPU P2
A8	A	BB2D P1

**Table 14-10. ConnID Values (continued)**

8-bit ConnID (hex)	4-bit ConnID (hex)	Master NIU
AA	A	BB2D P2
AC	A	GMAC_SW
B0	B	USB1 (USB3.0_SS)
B4	B	USB2 (USB2_SS)
B8	B	USB3 (USB2_ULPI_SS1)
BC	B	USB4 (USB2_ULPI_SS2)
CC	C	SATA
D2	D	EVE1 P2
D6	D	EVE2 P2

The 8-bit ConnID values are used by error decoding to distinguish the different initiators, see [Section 14.2.3.8.5, Example for Decoding Standard/Custom Errors Logged in L3\\_MAIN](#). They are also used by the EMIF controller. The 4-bit ConnID values are used by the firewalls to allow or not an access to a slave NIU, see [Table 14-18](#).

### 14.2.3.3 Bandwidth Regulators

The bandwidth regulators prevent master NIUs from consuming too much bandwidth of a link, or a slave NIU that is shared between several data flows: packets are then transported at a slower rate. The value of a bandwidth can be programmed in the bandwidth regulator. When the bandwidth is below the programmed value, the pressure bit is set to 1, giving priority to this master. When the bandwidth is above the programmed value, the pressure bit is set to 0 and the concerned master has the same weight as others.

A counter is used to store the sum of data lengths (in bytes) of each packet passing through the bandwidth regulator, and a value equal to the expected bandwidth is subtracted from the counter at each clock cycle. The value of the counter is compared to a programmable threshold (called Watermark), and this comparison determines whether the packet is processed with high pressure for minimum latency or low pressure for best effort processing.

The bandwidth regulator monitors the traffic using open connections between the initiators and the targets. If there is insufficient bandwidth allocated to the connection, the bandwidth regulator can increase the pressure on connections. Generally, the connection is a dataflow between master and slave NIUs. In some cases, the bandwidth regulator is attached to the master and monitors single dataflow to a target (single connection).

**Figure 14-4. Bandwidth Regulator Pressure Settings**

NOTE: When Counter value falls below Watermark pressure bit is assigned to 1

When Counter Value (bytes) falls below Watermark, the pressure bit is assigned to 1

The bandwidth regulator effective resolution is set to 8.3125 MBps

The following is an example of bandwidth regulator settings:

Suppose the bandwidth regulator is set to run at 200 MHz and the application requires an expected bandwidth of 165.888 MBps ( $\pm 5$  MBps), computed through a moving window of 5  $\mu$ s (1000 cycles). To attribute high pressure on all packet requests, the watermark could be set to the maximum bandwidth needed in the 5- $\mu$ s window.

Considering the example, the settings of the bandwidth regulator are:

- `L3_BW_REGULATOR_WATERMARK[11:0] WATERMARK` = moving window  $\times$  expected bandwidth = 829.44 bytes = 0x33D
- `L3_BW_REGULATOR_BANDWIDTH[15:0] BANDWIDTH` =  $\text{ceil}(165.888/8.3125)$  =  $\text{ceil}(19.956)$  = 20d = 0x14

The bandwidth registers regulate the packet flow by applying flow control on the RX port, thus ensuring that the traffic does not exceed the allocated bandwidth. The next packet is sent only when an internal timer expires. The registers in this group are:

- `L3_BW_REGULATOR_WATERMARK`: Gives the amount of data allowed to exceed the average bandwidth during a short time period
- `L3_BW_REGULATOR_PRESS`: Describes the pressure applied to outgoing packets
- `L3_BW_REGULATOR_CLEARHISTORY`: Resets the traffic counter when set to 1. This register is used after an update in the `L3_BW_REGULATOR_BANDWIDTH` and `L3_BW_REGULATOR_WATERMARK` registers (see [Section 14.2.5.1.7, L3 BW Regulator Register Summary and Description](#)).

Bandwidth regulators are mainly used to give priority to the following masters: DSP1 MDMA, DSP2 MDMA, EVE1 and EVE2 (both ports per instance), IVA, MMU2, PCIe, DSP1 EDMA, DSP2 EDMA, GMAC SW, BB2D.

Priority to: DSP1\_CFG, DSP2\_CFG, DSS, GPU\_P1, GPU\_P2, IPU1, IPU2, MLB, MMC1, MMC2, MMU 2 initiator ports, MPU initiator port, PCIe1 and PCIe2 initiator ports, TPTC1 and TPTC2 (RD and WR initiator ports), USB3 initiator port, VIP1\_P1/P2, VIP2\_P1/P2, VIP3\_P1/P2 initiator ports is given by setting their internal MFlag signal.

#### 14.2.3.4 Bandwidth Limiters

The bandwidth limiter is added to control the bandwidth of the EDMA\_TC1\_RD, EDMA\_TC1\_WR, EDMA\_TC2\_RD, EDMA\_TC2\_WR, VPE, BB2D and GPU module. This prevents a large number of RD requests being processed together, thus avoiding a large number of RD responses.

The bandwidth limiter regulates the packet flow in the L3\_MAIN interconnect by applying flow control when a user-defined bandwidth limit is reached. The next packet is served only after an internal timer expires, thus ensuring that traffic does not exceed the allocated bandwidth. Bandwidth limiter can be used with a watermark mechanism that allows traffic to temporarily exceeds the peak bandwidth.

The registers in this group are:

- [L3\\_BW\\_LIMITER\\_WATERMARK\\_0](#): Gives the amount of data allowed to exceed the average bandwidth during a short time period. To set the actual watermark to n bytes, the register must be set to n + 1.
- [L3\\_BW\\_LIMITER\\_CLEARHISTORY](#): Resets the traffic counter when set to 1.
- [L3\\_BW\\_LIMITER\\_BANDWIDTH\\_FRACTIONAL](#) and [L3\\_BW\\_L\\_BANDWIDTH\\_INTEGER](#): These two registers are used to set the average payload bandwidth.

Example of setting the Bandwidth Limiters:

[L3\\_BW\\_LIMITER\\_BANDWIDTH\\_FRACTIONAL](#) must be set to BandwidthConf [4 down to 0] and [L3\\_BW\\_LIMITER\\_BANDWIDTH\\_INTEGER](#) contains the remaining BandwidthConf bits, shifted to the right. BandwidthConf = AverageBandwidth / EffectiveResolution, where EffectiveResolution parameter is set to 8.3125 MHz at design time.

AverageBandwidth is a parameter representing the value to which the payload bandwidth must be limited in average; this parameter depends on the use case and is the reason that makes the content of the registers variable. In addition the maximum packet length is 8 cells, that is 32 bytes.

Assuming that the use case requires that in average the payload bandwidth is limited to 200 MB/s, then registers must be set to the following values:

BandwidthConf = 200 MBps / 8.3125 MHz = 38 (0x26)

[L3\\_BW\\_LIMITER\\_BANDWIDTH\\_FRACTIONAL](#) = LSBs [4 down to 0] of BandwidthConf = 0x6.

[L3\\_BW\\_LIMITER\\_BANDWIDTH\\_INTEGER](#) = the remaining bits of BandwidthConf shifted to the right = 0x1.

By setting [L3\\_BW\\_LIMITER\\_WATERMARK](#) to 65 ([L3\\_BW\\_LIMITER\\_WATERMARK\\_0](#) = 0x41), the bandwidth limiter is able to send three packets consecutively during peaks, therefore exceeding the peak traffic with two packets (64 bytes)

#### 14.2.3.5 Flag Muxing

The flag mux generator collects information such as errors and interrupts from slave NIUs and the interconnect firewall. The result signals are then sent to the MPU interrupt controller (INTC) without interfering with the interconnect traffic. Using the [L3\\_FLAGMUX\\_MASK](#) registers can prevent the flag mux from seeing certain events.

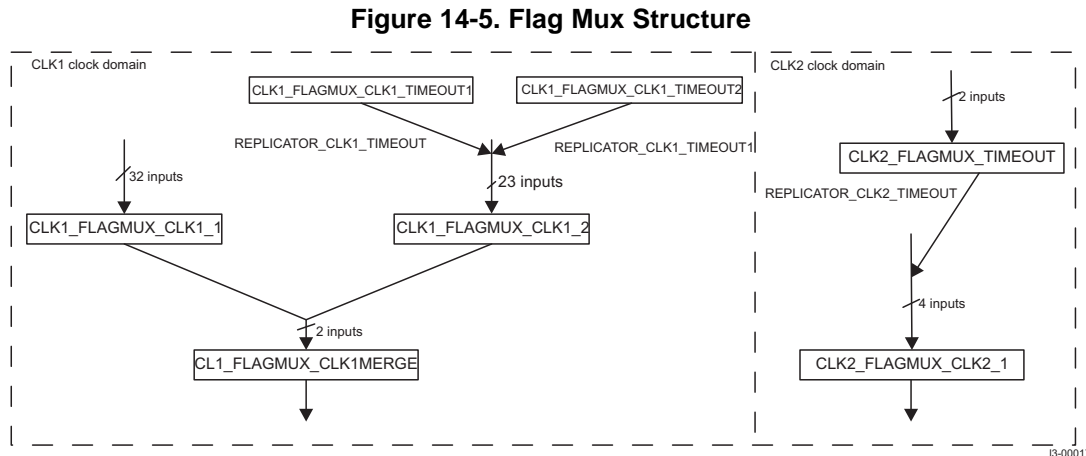

The unit has a standard COREREG register for identification of the attached core type. The [L3\\_FLAGMUX\\_STDHOSTHDR\\_VERSIONREG](#) register identifies the characteristics of the attached core. Use unit-specific registers (MASK bit 0 or bit 1 of the flag inputs, and [L3\\_FLAGMUX\\_REGERR](#) bit 0 or bit 1) to read the input errors. Each register is dedicated to reporting the bit corresponding to the register number; for example, [L3\\_FLAGMUX\\_REGERR0](#) reports on bit 0, and [L3\\_FLAGMUX\\_REGERR1](#) reports on bit 1. Any given [L3\\_FLAGMUX\\_REGERR](#) register reports the same bit for all flag source inputs (see [Table 14-170](#)).

There are three flag muxs ([CLK1\\_FLAGMUX\\_CLK1\\_1](#), [CLK1\\_FLAGMUX\\_CLK1\\_2](#) and [CLK2\\_FLAGMUX\\_CLK2\\_1](#)) collecting information from targets in each clock domain in L3\_MAIN interconnect ([CLK1\\_1](#), [CLK1\\_2](#) and [CLK2\\_1](#)). Both [CLK1\\_FLAGMUX\\_CLK1\\_1](#) and [CLK1\\_FLAGMUX\\_CLK1\\_2](#) flag muxes are located in the [CLK1\\_2](#) clock domain (with base address 0x4480 0000).

Also there is a separate mux (L3\_FMAGMUX\_CLK1MERGE) that merges the inputs from CLK1\_1 and CLK1\_2 flag muxes. Its functionality is similar to the functionality of the other L3\_FLAGMUXES:

- L3\_FLAGMUX\_CLK1MERGE\_COREREG and L3\_FLAGMUX\_STDHOSHTDR\_VERSIONREG registers are used to identify the attached core and its characteristics.
- L3\_FLAGMUX\_CLK1MERGE\_MASK0 is used to mask (enable) application error sources
- L3\_FLAGMUX\_CLK1MERGE\_REGERR0 is used to check which application error sources are active
- L3\_FLAGMUX\_CLK1MERGE\_MASK1 is used to mask debug error sources
- L3\_FLAGMUX\_CLK1MERGE\_REGERR1 is used to check which debug error sources are active

Following is a block diagram of the flag mux organization in L3\_MAIN interconnect:

#### 14.2.3.5.1 Flag Mux Time-out

If a target does not respond after a fixed number of clock cycles, an error time-out flag is generated, in case it is enabled. The value of the flag is always 3 if a time-out error is present.

To enable time-out for each target, set the corresponding bit in L3\_FLAGMUX\_TIMEOUT\_MASK0 register to 1. See Table 14-11.

**Table 14-11. L3 Time-out Flag Mapping**

	Flag Mux Input	Source	
CLK1_1 Time-out FlagMux (TIMEOUT1)	2	DSP1 SDMA	
	3	DSP2 SDMA	
	4	DSS	
	5	EVE1	
	6	EVE2

	15	DMM P1	
	16	DMM P2	
	17	IVA SL2IF	
	18	MMU2	
	19	L4_PER1 P1	
	20	L4_PER1 P2	
	21	L4_PER1 P3	
	22	L4_PER2 P2	
	23	L4_PER2 P1	
	24	L4_PER2 P3	
	25	L4_PER3 P2	
	26	L4_PER3 P1	
	27	L4_PER3 P3	
	28	L4_CFG	
	29	L4_WKUP	
	2		PCIE1
			PCIE2
		6	QSPI
	8	TPCC	
	9	TPTC1	
	10	TPTC2	
	12	OCMC_RAM3	
CLK1_2 Time-out FlagMux (TIMEOUT2)	13	McASP1	
	14	McASP2	
	15	McASP3	
	16	OCMC_RAM1	
	17	OCMC_RAM2	
	18	GPMC	
	19	VCP1	
	20	VCP2	
	CLK2_1 Time-out FlagMux	0	L3_INSTR
		1	DEBUGSS_CT_TBR

For example, to enable all targets in CLK1\_1, write 0x3FL3\_FLAGMUX\_TIMEOUT1\_MASK0; to enable all targets in CLK1\_2, write 0x1F FFFF L3\_FLAGMUX\_TIMEOUT2\_MASK0. To enable only OCMC\_RAM1 (target in CLK1\_2) write 0x1L3\_FLAGMUX\_TIMEOUT2\_MASK0. If an error time-out occurs, read the registers L3\_FLAGMUX\_TIMEOUT1\_REGERR0 and L3\_FLAGMUX\_TIMEOUT2\_REGERR0 to determine the source of error concerning Table 14-11. CLK2 time-outs are reported through CLK1\_FLAGMUX\_CLK2\_1 status registers (L3\_FLAGMUX\_REGERR0, L3\_FLAGMUX\_REGERR1) and masked through L3\_FLAGMUX\_MASK0 and L3\_FLAGMUX\_MASK1 registers.

Similarly, to enable a target in CLK2\_1, write the appropriate value (as described in Table 14-11) in L3\_FLAGMUX\_TIMEOUT\_MASK0.

If an error time-out occurs in CLK2\_1, read the L3\_FLAGMUX\_TIMEOUT\_REGERR0 register to determine the source of error concerning Table 14-11.

#### 14.2.3.6 Statistic Collectors Group

Statistic collectors are internal masters that share the same master address as the master NIUs. These components compute the traffic statistics within a defined window and periodically report through the DEBUG interface. The key features of the statistic collector are:

- Nonintrusive monitoring
- Programmable filters and counters
- Collects results at a programmable time interval

Event detectors are programmed through the L3\_STCOL\_REQEVT and L3\_STCOL\_RSPEVT configuration registers for request and response ports, respectively. The following events can be identified:

- Word transfer
- WAIT cycles
- Flow control
- Payload transfers
- Latency measurements

Performance monitoring is enabled through the L3\_STCOL\_EN register. The L3\_STCOL\_SOFTEN register enables software to monitor the performance. Event muxes are programmed through the L3\_STCOL\_EVTMUX\_SEL0 configuration register, which determines which port will be monitored by a filter configured by the filter registers (see Section 14.2.5.1.9).

Filters are programmed through the L3\_STCOL\_FILTER\_i\_GLOBALEN configuration register, along with additional selection criteria programmed through the mask/match registers (see Table 14-235). A filter can be configured to accept or reject:

- Read operations
- Write operations
- Errors
- Addresses

Filter operation is programmed through the L3\_STCOL\_OP registers (see Table 14-235).

There are ten statistic collectors used to monitor the traffic on DRAM (EMIF1, EMIF2, MA\_MPU\_P1 and MA\_MPU\_P2), MPU, MMU, TPTC, VIP, VPE, EVE Subsystem, DSP MDMA/EDMA, IVA, GPU, BB2D, DSS, IPU, OCMC RAM, USB, PCIe Subsystem, DSP CFG, MMC, SATA, VCP, GPMC, and McASP ports. For more detailed descriptions of statistic collectors, see Section 33.10.7.1, L3 Target Load Monitoring, and Section 33.10.7.2, L3 Master Latency Monitoring.

#### 14.2.3.7 L3\_MAIN Protection and Firewalls

Device protection relies on L3 firewalls and their configuration.

##### 14.2.3.7.1 L3\_MAIN Firewall Reset

The values of L3\_MAIN firewall registers on reset are tied in hardware or exported from the control module registers.

Values exported from the control module are intended to give defined rights to the firewalls at reset and thus ensure the content after going out of reset.

The L3\_MAIN firewall registers are located in the CORE AON power domain and thus no retention capability is needed. The control module registers are reset by a cold reset only, whereas the L3\_MAIN firewall registers are reset by clearing the [REGUPDATE\\_CONTROL\[1\] FW\\_LOAD\\_REQ](#) bit. When the [REGUPDATE\\_CONTROL\[1\] FW\\_LOAD\\_REQ](#) bit comes back automatically to 1, the exported values are loaded.

#### CAUTION

Before reprogramming the firewall registers and/or before using the FW\_LOAD\_REQ mechanism, the request must be asserted by configuring the [REGUPDATE\\_CONTROL\[0\] BUSY\\_REQ](#) bit.

To load the exported values at run time:

1. Set the [REGUPDATE\\_CONTROL\[0\] BUSY\\_REQ](#) bit to 0x1 to ensure that no transaction can reach the slave NIU (suspend).
2. Clear the [REGUPDATE\\_CONTROL\[1\] FW\\_LOAD\\_REQ](#) bit by writing 0x1 to it.
3. Wait until the [REGUPDATE\\_CONTROL\[1\] FW\\_LOAD\\_REQ](#) bit is reset to 0x1 by hardware.
4. Set the [REGUPDATE\\_CONTROL\[0\] BUSY\\_REQ](#) bit to 0x0 to allow transactions to reach the slave NIU (resume).

To reprogram the firewall registers at run time:

1. Write 0x1 to the [REGUPDATE\\_CONTROL](#) register.
2. Update the firewall registers.
3. Write 0x0 to the [REGUPDATE\\_CONTROL](#) register.

---

**NOTE:** While reprogramming the firewall registers at run time it must be taken into account that the [REGUPDATE\\_CONTROL\[1\] FW\\_LOAD\\_REQ](#) bit is written as '0' because a value of '1' reloads the firewall default values.

---

---

**NOTE:** At reset, exported values from the control module can modify hardware reset values.

---

#### 14.2.3.7.1.1 L3\_MAIN Firewall – Exported Reset Values

Table 14-12 and Table 14-13 list the exported reset values and mapping, respectively.

**Table 14-12. L3\_MAIN Firewall Exported Reset Values**

For more information, see [Chapter 18, Control Module](#).

#### 14.2.3.7.2 Power Management

As part of the system-wide power-management scheme, the L3\_MAIN interconnect goes into IDLE state after receiving a request from the power, reset, and clock management (PRCM) module after all commands are serviced. This function is handled by hardware.

To reduce power consumption, the L3\_MAIN interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

L3\_MAIN supports a partial retention scheme. Retention is performed on the following registers:

- Statistic collectors
- Bandwidth regulators
- Firewalls

This process prevents reconfiguration after a clock domain switches off.

### 14.2.3.7.3 L3\_MAIN Firewall Functionality

The access to the slave NIUs is granted only to master NIUs according to in-band attributes sent in each transaction crossing the L3\_MAIN interconnect, such as:

- MCMD: Specifies the type of access (read or write) required by the master NIU
- ConnID: Used to determine the permission of the master NIU
- MReqInfo: Transaction attribute adding information about the access type

[Table 14-15](#) lists the MReqInfo values.

**Table 14-15. MReqInfo Values**

Qualifier	Access Definition	Access Description
MReqType	00: Processor data access 01: Processor instruction access 10: DMA access 11: Other	Indicates whether the request is for processor instruction fetch, processor data access or DMA access
MReqDebug	0: Functional 1: Debug	When set, indicates that the request has been issued by a master NIU in DEBUG state
MReqSupervisor	0: User 1: Privilege	When set, indicates that the request is qualified with the supervisor attribute. It can be provided by a processor running in supervisor mode or by a module that inherited this attribute from the processor (DMA channel with a supervisor attribute).

The firewall comparison mechanism enables access to a protected slave NIU only when a correct combination of three MReqInfo in-band parameters is transmitted.

MReqInfo is a combination of a fixed 3-bit pattern that corresponds to a combination of the parameters MReqDebug, MReqType, and MReqSupervisor. See [Table 14-16](#).

Slave NIUs

### 14.2.3.7.3.1 Protection Regions

Each slave NIU address space is subdivided into protection regions (maximum of 10). The regions are configurable with a size of 4-KiB granularity. The firewalls can also be multiport while using the description of the same regions for dual access memories or to support interleaving mechanisms on several memories.

Table 14-17 lists the number of protected regions and ports for each slave NIU.

**Table 14-17. Slave NIU Firewall and Region Configuration**

Domain	Slave NIU	Firewall	Number of Regions	Number of Ports
CLK1	DSP1_SDMA	DSP1_SDMA_FW	1	1
	DSP2_SDMA	DSP2_SDMA_FW	1	1
	DSS	DSS_FW	8	1
	EVE1	EVE1_FW	1	1
	EVE2	EVE2_FW	1	1
	GPMC	GPMC_FW	8	1
	GPU	GPU_FW	1	1
	BB2D	BB2D_FW	1	1
	IPU1	IPU1_FW	4	1
	IPU2	IPU2_FW	4	1
	IVA_CFG	IVA_CFG_FW	1	1
	IVA_SL2IF	IVA_SL2IF_FW	4	1
	McASP1	MCASP1_FW	1	1
	McASP2	MCASP2_FW	1	1
	McASP3	MCASP3_FW	1	1
	OCMC_RAM1	OCMC1_RAM_FW	16	1
	OCMC_RAM2	OCMC2_RAM_FW	16	1
	OCMC_RAM3	OCMC3_RAM_FW	16	1
	EMIF1, EMIF2	EMIF_OCP_FW	8	2
	EMIF1, EMIF2	MA_MPU_NTTP_FW	8	2
	PCIESS1	PCIESS1_FW	8	1
	PCIESS2	PCIESS2_FW	8	1
	QSPI	QSPI_FW	1	1
	TPCC	TPCC_FW	1	1
	TPTC	TPTC_FW	2	2
	VCP1	VCP1_FW	1	1
	VCP2	VCP2_FW	1	1
CLK2	L3_INSTR	L3_INSTR_FW	2	1
	DEBUGSS_CT_TBR	DEBUGSS_CT_TBR_FW	1	1

Two types of regions are distinguished in a slave NIU firewall:

- Default region: Available in all slave NIUs. The default region covers the entire slave NIU address range. Other firewall-configured regions must reset or overlay the default region, because it always has the lowest priority.
- Normal region: The number of normal regions varies in a slave NIU; they have identical capabilities (see Table 14-17).

Each region has the following characteristics:

- Start address: Physical slave NIU start address
- End address: Physical slave NIU end address
- Specific access rights (see Section 14.2.3.7.3.3, *Protection Mechanism per Region Examples*)
- Priority level from 0 (lowest) to 10 (highest)

Depending on its priority level, a region can override the settings of another region; the access rights of the region with the highest priority apply. All regions have a fixed (not configurable) priority level that corresponds to their number: Region 1 has priority level 1, region 2 has priority level 2, and so on.

Figure 14-6 shows the priority level with associated regions. This priority level scheme allows multiplying the flexibility and capability of the firewall. Figure 14-6 shows a 7-region firewall setting that creates 16 regions (twice the number of regions created than originally available).

**Figure 14-6. L3 Interconnect Region Overlay and Priority Level Overview**

I3-003

The address range covered by the regions is defined in the [START\\_REGION<sub>i</sub>](#) and [END\\_REGION<sub>i</sub>](#) registers. The boundary checks are done on a minimum size of 4-KiB pages; thus, bits [11:0] of those 32-bit registers are not checked.

The address space size of the slave NIUs ([bits [31:12]]) depends on the size of the slave NIU to protect (that is, if a memory is only 48KiB, then the size is defined through bits [16:12] of the slave NIU start and end address registers of the firewall region ([START\\_REGION<sub>i</sub>\[16:12\]](#) and [END\\_REGION<sub>i</sub>\[16:12\]](#)).

On multiport firewalls (EMIF\_OCP\_FW), the checking of each REGION {0, n} can activate on one or several ports at the same time. However, if interleaving is not desired on some parts of the protected memory space, it is possible to apply or not apply region checking on selected ports using the region enable/disable on port instance capability of the [END\\_REGION<sub>i</sub>](#) register.

Most slave NIUs support only one input port (port 0) except:

- The MA\_MPU firewall (MA\_MPU\_NTTP\_FW) which has two ports:

- Port 0 for access from the MPU to EMIF1
- Port 1 for access from the MPU to EMIF2
- The EMIF firewall which has two ports:
  - Port 0 for access from the DMM to EMIF1
  - Port 1 for access from the DMM to EMIF2
- The EDMA\_TC firewall which has two ports:
  - Port 0 logs errors in the ERROR\_LOG\_0 register for the traffic to EDMA\_TPTC0 module generated by the MPU, DSP1/2, EVE1/2, IPU1/2, DMA\_SYSTEM, MLB, PCIESS1/2, MMU1/2 and DAP modules.
  - Port 1 logs errors in the ERROR\_LOG\_1 register for the traffic to EDMA\_TPTC1 module generated by the MPU, DSP1/2, EVE1/2, IPU1/2, DMA\_SYSTEM, MLB, PCIESS1/2, MMU1/2 and DAP modules.

A region can be applied or not to each port independently. To enable and disable the regions:

- For port 0: Set/clear the [END\\_REGION\\_i\[0\]](#) [END\\_REGION\\_i\\_ENABLE\\_CORE0](#) bit (for all L3\_MAIN firewalls).
- For port 1: Set/clear the [END\\_REGION\\_i\[1\]](#) [END\\_REGION\\_i\\_ENABLE\\_CORE1](#) bit (for MA\_MPU, EMIF and EDMA\_TC firewalls).

The EMIF firewall (EMIF\_OCP\_FW ) uses 16 GiB address space and protects both the SDRAM and the EMIF configuration registers. The EMIF firewall allows defining access restrictions per region. The region can apply to:

- Both EMIF1 and EMIF2 controllers (interleaving mode)
- Only the EMIF1 controller
- Only the EMIF2 controller

This per-region capability is defined by configuring the [END\\_REGION\\_i\[1:0\]](#) bit field for:

- Both EMIF1 and EMIF2 (interleaving mode): [END\\_REGION\\_i\[0\]](#) [END\\_REGION\\_i\\_ENABLE\\_CORE\\_0](#) = 0x1 and [END\\_REGION\\_i\[1\]](#)[END\\_REGION\\_i\\_ENABLE\\_CORE\\_1](#) = 0x1
- Only EMIF1: [END\\_REGION\\_i\[0\]](#) [END\\_REGION\\_i\\_ENABLE\\_CORE\\_0](#) = 0x1
- Only EMIF2: [END\\_REGION\\_i\[1\]](#) [END\\_REGION\\_i\\_ENABLE\\_CORE\\_1](#) = 0x1

The protection regions for EMIF firewall are configurable with a size of 4-KiB granularity (the same applies to the MA\_MPU\_NTTP\_FW). The address range covered by the regions is defined in the [START\\_REGION\\_i](#) and [END\\_REGION\\_i](#) registers. Since EMIF firewall sees 16 GiB address space but these two registers have only 32 bits, the [START\\_REGION\\_i/END\\_REGION\\_i\[31\]](#) bit is mapped to bit [33] of the EMIF address space, that is, bits [31:10] of [START\\_REGION\\_i/END\\_REGION\\_i](#) are mapped to EMIF Address [33:12]. [START\\_REGION\\_i/END\\_REGION\\_i](#) [9:0] are not checked for the minimum page size of 4 KiB.

The start address in the EMIF address space for accessing the EMIF configuration registers is 0x3\_0000\_0000. If protection of these registers is needed, that address must be right shifted by 2 bits and then the result (0xC000\_0000) must be written to the [START\\_REGION\\_i](#) register. The [REGUPDATE\\_CONTROL\[19:16\]](#) [FW\\_ADDR\\_SPACE\\_MSB](#) bit field indicates how many bits are shifted in the firewall address space. In case of EMIF\_OCP\_FW and MA\_MPU\_NTTP\_FW, 2 bits are shifted. If target address space is ≤ 4 GiB then [REGUPDATE\\_CONTROL\[19:16\]](#) [FW\\_ADDR\\_SPACE\\_MSB](#) is 0x0 and the [START\\_REGION\\_i/END\\_REGION\\_i](#) [31:12] bits match target physical address [31:12]. Bits [11:0] are ignored by the firewall. These bits are not involved in the address check. To match address spaces greater than 4 GiB but keep the minimum page size of 4 KiB some of the [START\\_REGION\\_i/END\\_REGION\\_i](#) [11:0] bits must also be configured. In the EMIF case bits [11:10] are also used.

For example, the EMIF1 configuration registers are accessible through system base address 0x4C00\_0000. But the EMIF\_OCP\_FW sees them at start address 0x3\_0000\_0000. As previously mentioned that address must be shifted before being programmed to the [START\\_REGION\\_i](#) register. In this case the programmed value should be 0xC000\_0000. This has to be taken into account.

### 14.2.3.7.3.2 L3\_MAIN Firewall Registers Overview

Table 14-18 and Table 14-19 list the L3\_MAIN firewall permission-setting registers.

**Table 14-18. L3\_MAIN Firewall Read/Write Permission-Setting Register**

Register Name	Bits	Field Name	4-bit ConnID Value (hex) (see Table 14-10)	Field Modifiability
<a href="#">MRM_PERMISSION_REGION_HIGH_j</a>	31	W	ConnID = F write permission	RW
	30	R	ConnID = F read permission	RW
	29	W	ConnID = E write permission	RW
	28	R	ConnID = E read permission	RW
	27	W	ConnID = D write permission	RW
	26	R	ConnID = D read permission	RW
	25	W	ConnID = C write permission	RW
	24	R	ConnID = C read permission	RW
	23	W	ConnID = B write permission	RW
	22	R	ConnID = B read permission	RW
	21	W	ConnID = A write permission	RW
	20	R	ConnID = A read permission	RW
	19	W	ConnID = 9 write permission	RW
	18	R	ConnID = 9 read permission	RW
	17	W	ConnID = 8 write permission	RW
	16	R	ConnID = 8 read permission	RW
	15	W	ConnID = 7 write permission	RW
	14	R	ConnID = 7 read permission	RW
	13	W	ConnID = 6 write permission	RW
	12	R	ConnID = 6 read permission	RW
	11	W	ConnID = 5 write permission	RW
	10	R	ConnID = 5 read permission	RW
	9	W	ConnID = 4 write permission	RW
	8	R	ConnID = 4 read permission	RW
	7	W	ConnID = 3 write permission	RW
	6	R	ConnID = 3 read permission	RW
	5	W	ConnID = 2 write permission	RW
	4	R	ConnID = 2 read permission	RW
	3	W	ConnID = 1 write permission	RW
	2	R	ConnID = 1 read permission	RW
	1	W	ConnID = 0 write permission	RW
	0	R	ConnID = 0 read permission	RW

**Table 14-19. L3\_MAIN Firewall Permission-Setting Register**

Register name	Type of Permission	Bits	Field Name	Description	Field Modifiability
MRM_PERMISSION_REGION_LOW_j	Reserved	31:16		Reserved	
	Debug	15	DEBUG	PUBLIC PRIVILEGE DOMAIN DEBUG ALLOWED	RW
		14	DEBUG	PUBLIC USER DOMAIN DEBUG ALLOWED	RW
	Reserved	13:12		Reserved	
	Access	11	READ	PUBLIC PRIVILEGE READ ACCESS ALLOWED	RW
		10	WRITE	PUBLIC PRIVILEGE WRITE ACCESS ALLOWED	RW
		9	EXE	PUBLIC PRIVILEGE EXE ACCESS ALLOWED	RW
		8	READ	PUBLIC USER READ ACCESS ALLOWED	RW
		7	WRITE	PUBLIC USER WRITE ACCESS ALLOWED	RW
		6	EXE	PUBLIC USER ECXE ACCESS ALLOWED	RW

**14.2.3.7.3.3 Protection Mechanism per Region Examples**

The access permission of each region is configurable and defined through the [MRM\\_PERMISSION\\_REGION\\_HIGH\\_j](#) and [MRM\\_PERMISSION\\_REGION\\_LOW\\_j](#) registers (see [Section 14.2.3.7.3.2, L3\\_MAIN Firewall Registers Overview](#)).

**Master NIU permissions:**

- To give read access to the master NIU with 4-bit ConnID = n(1), set the [MRM\\_PERMISSION\\_REGION\\_HIGH\\_j\[n x 2\]](#) R bit.
  - To give write access to the master NIU with 4-bit ConnID = n(1), set the [MRM\\_PERMISSION\\_REGION\\_HIGH\\_j\[n x 2 + 1\]](#) W bit.
- (1) - n should be first converted from hex to decimal value

**Debug permissions:**

- To give privilege debug access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[15\]](#) DEBUG bit.
- To give user debug access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[14\]](#) DEBUG bit.

**User, read, write, and executable permissions:**

- To give privileged read access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[11\]](#) READ bit.
- To give privileged write access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[10\]](#) WRITE bit.
- To give privileged executable access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[9\]](#) EXE bit.
- To give user read access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[8\]](#) READ bit.
- To give user write access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[7\]](#) WRITE bit.
- To give user executable access, set the [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[6\]](#) EXE bit.

Example: To provide debug write privilege access to the master NIU with 4-bit ConnID = 0x7, set the following bits:

- [MRM\\_PERMISSION\\_REGION\\_HIGH\\_j\[15\]](#) W
- [MRM\\_PERMISSION\\_REGION\\_LOW\\_j\[15\]](#) DEBUG

**14.2.3.7.3.4 L3\_MAIN Firewall Error Logging**

If a protection violation error is detected, the following signals are generated:

- An in-band error (SRESP = ERROR) is generated to the master NIU of the access.

- An out-band error is sent to the control module
- An interrupt is generated to the Cortex-A15 INTC.

The L3\_MAIN interconnect does not differentiate errors generated by firewalls from all other supported types of errors.

An in-band error is generated by modules each time an access is not allowed. When an in-band error is sent back into the transaction it is seen as an external prefetch or data abort by the initiator, depending on whether the transaction was an instruction fetch or a data access.

Information about in-band errors is logged into two registers:

- **ERROR\_LOG\_k**: Logs the information about the start/end address of the hit region and the qualifiers of the transaction
- **LOGICAL\_PHYSICAL\_ADDRESS\_ERRLOG\_k[31:12]**: Logs the address of the failed access

---

**NOTE:** When a multiport firewall is implemented, these registers are duplicated for each port.

---

Table 14-20 lists the L3\_MAIN firewall error-logging registers.

**Table 14-20. L3 Firewall Error-Logging Registers**

Register Name	Register Field Name	Field Modifiability	Parameter Comments
<b>ERROR_LOG_k</b> (When multiport firewall is implemented the error log register is duplicated for each port.)	RESERVED[31:24]	Read only	Reads return 0s.
	BLK_BURST_VIOLATION[23]	Read/write	Read 0x1: 2D burst not allowed or exceeds allowed size. Write to clear the ERROR_LOG and LOGICAL_PHYSICAL_ADDRESS_ERRLOG registers.
	RESERVED[22]	Read only	Read return 0s.
	REGION_START_ERRLOG[21:17]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG and LOGICAL_PHYSICAL_ADDRESS_ERRLOG registers.
	REGION_END_ERRLOG[16:12]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG and LOGICAL_PHYSICAL_ADDRESS_ERRLOG registers.
	REQINFO_ERRLOG[11:0]	Read/write	Mapping of the error according to the reqinfo vector: ConnID [3:0] MCMD [0] [3] MReqDebug [1] MReqSupervisor [0] MReqType

L3 firewall errors can be cleared by writing to the **ERROR\_LOG\_k** register in the firewall that recorded the error. Clearing the **ERROR\_LOG\_k** register deasserts the corresponding error if it exists.

The L3 firewall register **ERROR\_LOG\_k** must be cleared before clearing the **SEC\_ERR\_STATUS\_FUNC\_1/2** and **SEC\_ERR\_STATUS\_DEBUG\_1/2** registers in the control module.

When a protection violation occurs, an interrupt is sent to the **IRQ\_CROSSBAR**. An in-band error is sent back, and an error is logged in the **SEC\_ERR\_STATUS\_FUNC\_1/2** and **SEC\_ERR\_STATUS\_DEBUG\_1/2** registers, depending on the functional mode:

- In application mode:
  - **SEC\_ERR\_STATUS\_FUNC\_1[1]** – L3 RAM protection violation
  - **SEC\_ERR\_STATUS\_FUNC\_1[2]** – GPMC protection violation
  - **SEC\_ERR\_STATUS\_FUNC\_1[3]** – EMIF protection violation
  - **SEC\_ERR\_STATUS\_FUNC\_1[4]** – IVA protection violation
  - **SEC\_ERR\_STATUS\_FUNC\_1[5]** – IPU protection violation

- SEC\_ERR\_STATUS\_FUNC\_1[6] – IVA SL2 protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[8] – SYSTEM DMA protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[10] – DSPDMA slave NIU protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[13] – GPU protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[14] – DSS protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[16] – L4\_PER1 protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[17] – L4\_CFG protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[18] – DEBUG subsystem protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[22] – L4\_WKUP protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[23] – BB2D protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[26] – CT\_TBR protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[28] – EVE1 protection violation
- SEC\_ERR\_STATUS\_FUNC\_1[29] – EVE2 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[0] – DSP1 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[1] – DSP2 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[2] – OCMC\_RAM2 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[3] – OCMC\_RAM3 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[4] – L4\_PER2 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[5] – L4\_PER3 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[6] – IPU2 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[7] – PCISS1 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[8] – PCISS2 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[11] – MCASP1 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[12] – MCASP2 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[13] – MCASP3 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[16] – EDMA\_TPTC1 protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[17] – EDMA\_TPCC protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[22] – QSPI protection violation
- SEC\_ERR\_STATUS\_FUNC\_2[23] – EDMA\_TPTC2 protection violation
- 
- In debug mode:
  - SEC\_ERR\_STATUS\_DEBUG\_1[1] – L3 RAM protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[2] – GPMC protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[3] – EMIF protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[4] – IVA protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[5] – IPU protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[6] – IVA SL2 protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[8] – SYSTEM DMA protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[10] – DSPDMA slave NIU protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[13] – GPU protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[14] – DSS protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[16] – L4\_PER1 protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[17] – L4\_CFG protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[18] – DEBUG subsystem protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[22] – L4\_WKUP protection violation

- SEC\_ERR\_STATUS\_DEBUG\_1[23] – BB2D protection violation
- SEC\_ERR\_STATUS\_DEBUG\_1[26] – CT\_TBR protection violation
- SEC\_ERR\_STATUS\_DEBUG\_1[28] – EVE1 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_1[29] – EVE2 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[0] – DSP1 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[1] – DSP2 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[2] – OCMC\_RAM2 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[3] – OCMC\_RAM3 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[4] – L4\_PER2 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[5] – L4\_PER3 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[6] – IPU2 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[7] – PCISS1 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[8] – PCISS2 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[11] – McASP1 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[12] – McASP2 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[13] – McASP3 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[16] – EDMA\_TPTC1 protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[17] – EDMA\_TPCC protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[22] – QSPI protection violation
- SEC\_ERR\_STATUS\_DEBUG\_2[23] – EDMA\_TPTC2 protection violation
- For more information, see [Chapter 18, Control Module](#).

#### 14.2.3.7.3.5 L3\_MAIN Firewall Default Configuration

[Table 14-21](#) summarizes the configuration of the L3\_MAIN firewalls.

**Table 14-21. L3\_MAIN Firewalls Default Configurations**

Device/Region: 0						
Permission Type	Reset Value	Reset Value	Reset Type	Run Time	Firewall Register (where j = 0)	Control Module Register
ACCESS_PERMISSION	All	0xFFFF	Exported	Configurable	<a href="#">MRM_PERMISSION_REGION_LOW_j[11:0]</a>	CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF_LOC K_1[k] CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF_LOC K_2[j]
DEBUG_PERMISSION	All	0xF	Exported	Configurable	<a href="#">MRM_PERMISSION_REGION_LOW_j[15:12]</a>	CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF_LOC K_1[k] CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF_LOC K_2[j]
INITIATOR_PERMISSION	All	0xFFFF FFFFFF	Tied	Configurable	<a href="#">MRM_PERMISSION_REGION_HIGH_j[31:0]</a>	N/A

**NOTE:** For the values of k and j see [Table 14-22](#), [Table 14-13](#) and [Table 14-14](#).

**Table 14-22. Control Module Register – Factorization**

Variable Value	Module Name	Regions
<b>k</b>		
[0]	GPMC	8
[3]	OCMC RAM1	16

**Table 14-22. Control Module Register – Factorization (continued)**

Variable Value	Module Name	Regions
[4]	DSS	8
[6]	GPU	1

0	DSP1	1
1	DSP2	1
2	OCMC RAM2	16
3	OCMC RAM3	16
8	QSPI	1
9	EDMA TC	1
10	EDMA TPCC	1

### 14.2.3.8 L3\_MAIN Interconnect Error Handling

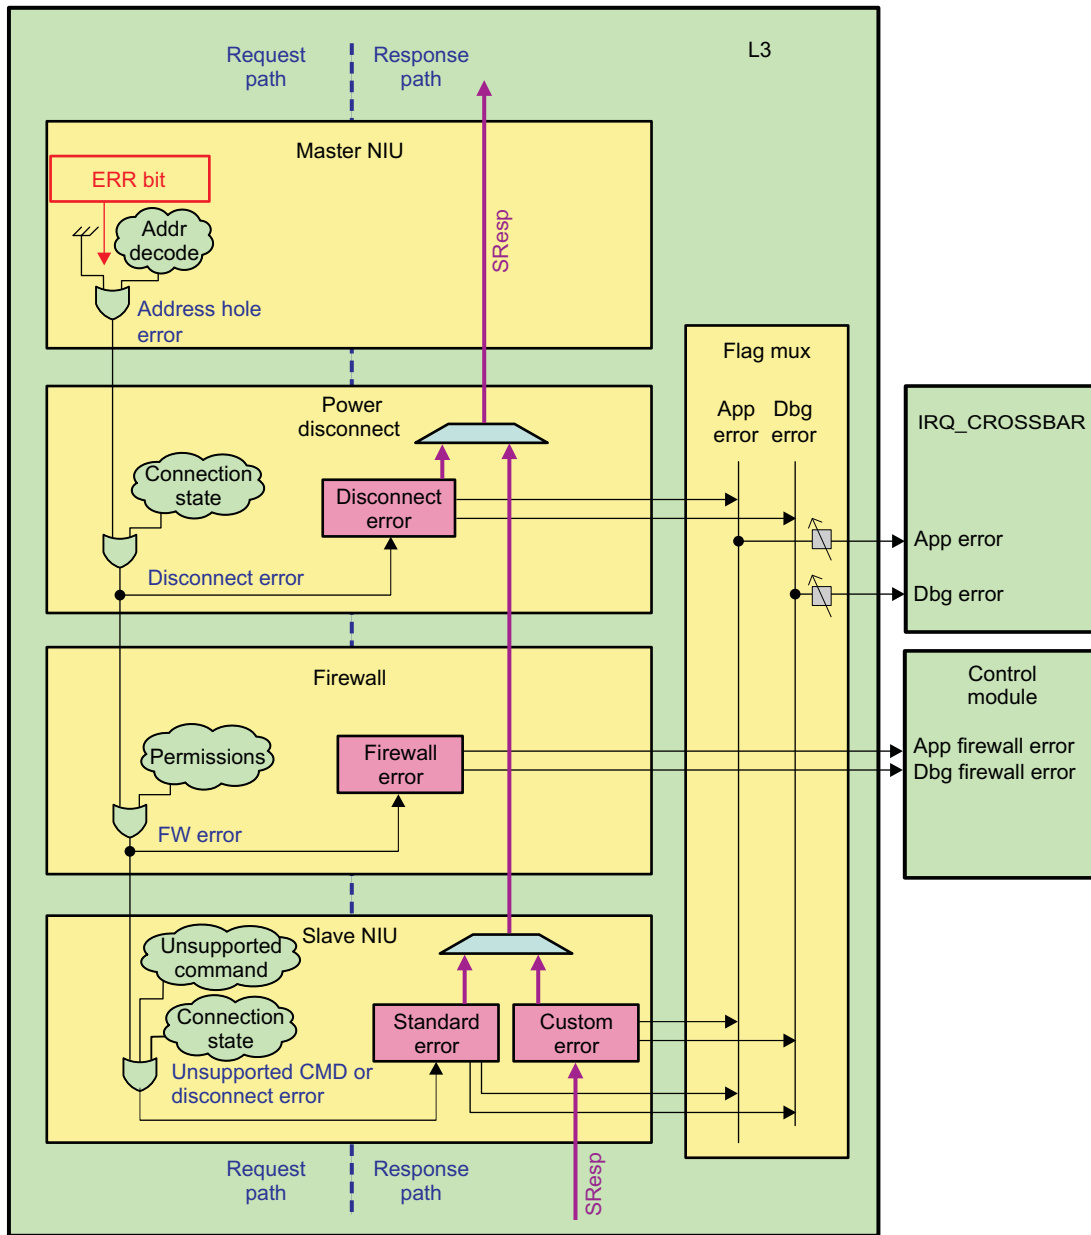

Error logging is enabled in the L3\_MAIN interconnect. The three major types of errors are:

- Slave NIU errors
- Firewall errors (see [Section 14.2.3.7.3.4, L3\\_MAIN Firewall Error Logging](#))
- Flag mux errors

#### 14.2.3.8.1 Global Error-Routing Scheme

[Figure 14-7](#) shows the L3\_MAIN global error-routing scheme.

Figure 14-7. L3\_MAIN Global Error-Routing Scheme

13-005

### 14.2.3.8.2 Slave NIU Error Logging

Error logging is implemented only at slave NIUs. Because the interconnect does not support master NIU error logging, an erroneous packet must be created and sent to one of the slave NIUs. The slave NIU that receives an erroneous packet is predictable but can change per master (see Table 14-23).

Table 14-23. L3\_MAIN Connectivity and Holes Error Routing

Master	Connectivity and Holes Errors Logged Into Slave NIUs
All initiators except DSP1_CFG and DSP2_CFG	GPMC_TARG
DSP1_CFG	EVE1_TARG
DSP2_CFG	

The slave NIU can be configured to report standard errors (errors generated within the interconnect):

- Firewall error: Protection violation; this error indicates that a request was rejected by a firewall and is reported to the control module. For more information, see [Section 14.2.3.7.3.4](#), *L3\_MAIN Firewall Error Logging*.
- Address hole: This error reports an unknown address for a request. The address map is local to each master NIU; therefore, an address hole error is reported each time a master NIU requests an access to a slave NIU to which it is not logically connected, even if this address exists in the global L3\_MAIN address map. This error is detected only once per burst.
- Unsupported commands: This error reports that the master NIU sent a command that cannot be processed, because the slave NIU cannot accept it and no conversion to another command is possible. This error is detected only once per burst.
- Report custom errors: Basically, when the slave answer is SResp = ERR
- Report severity level, for standard error and custom errors:
  - None: Error logging for this type of error is disabled.
  - Error: Error is logged for this type of error.
  - Fault: Error is logged and interrupt is generated for this type of error.
- Generate interrupt on 2 bits depending on the MReqDebug qualifier:
  - Application error - FAULT[0]
  - Debug error - FAULT[1]

By default, all slave NIUs are configured with standard and custom error levels set to FAULT. The errors are reported on the two flag muxes (see [Figure 14-7](#)), depending on the access type, application or debug. For more information, see [Section 14.2.3.8.3](#), *Flag Mux Error Logging*.

The slave NIU power-disconnect component also has error logging enabled, because in this case the slave NIU is in a clock domain that is switched off and therefore cannot catch the error. By nature, this component can generate only standard errors. By default, it is configured with the error level set to FAULT.

Wake up on demand: If an error packet reaches a slave NIU that is set with MDiscBehave = 1 (wake up on demand), then the active signal is asserted and L3 processes the error generation when the slave is awake. Although this is inefficient, it simplifies NIU implementation and should not be a problem because errors are supposed to occur only during software debug.

#### 14.2.3.8.3 Flag Mux Error Logging

All fault signals are sent to a flag mux component. There are four important FLAGMUX registers:

- [L3\\_FLAGMUX\\_MASK0](#): Masks application error sources
- [L3\\_FLAGMUX\\_MASK1](#): Masks debug error sources
- [L3\\_FLAGMUX\\_REGERR0](#): Checks which application error sources are active
- [L3\\_FLAGMUX\\_REGERR1](#): Checks which debug error sources are active

The two L3\_FLAGMUX\_MASK registers mask bit 0 or bit 1 of the flag inputs, and the L3\_FLAGMUX\_REGERR registers read input errors. Each register is dedicated to reporting the bit corresponding to the register number.

[Table 14-24](#) describes the mapping of the flags to the corresponding sources.

**Table 14-24. Interconnect Flag Mapping**

	Flag Mux Input	Source	
CLK1_1 Flag Mux	1	DMM_P1	
	2	DSP2 SDMA	
	3	EVE2	
	4	DMM_P2	
	6	DSP1 SDMA

	21	QSPI	
	23	CLK1_TARG_PWR_DISC_CLK2	

**Table 14-24. Interconnect Flag Mapping (continued)**

	Flag Mux Input	Source
CLK2_1 Flag Mux	0	L3_INSTR
	1	DEBUGSS_CT_TBR
	2	HOST_CLK2_1
	3	REPLICATOR_CLK2_TIMEOUT

**NOTE:** Missing inputs in [Table 14-24](#) are reserved. Writing in them has no effect.

#### 14.2.3.8.4 Severity Level of Standard and Custom Errors

The slave NIU registers are important for error logging.

- The [L3\\_TARG\\_STDERRLOG\\_SVRTSTDLVL](#) register shows the severity level for standard errors. According to the severity level, error logging is disabled, enabled with level ERROR, or enabled with level ERROR and flag FAULT.
- The [L3\\_TARG\\_STDERRLOG\\_SVRTCUSTOMLVL](#) register shows the severity level for custom errors.
- The [L3\\_TARG\\_STDERRLOG\\_MAIN](#) register (the main register for error-logging management) shows the validity of the logged information, standard or custom.
- The [L3\\_TARG\\_STDERRLOG\\_HDR](#) register stores packets in case of a standard error.
- The [L3\\_TARG\\_STDERRLOG\\_MSTADDR](#) register returns the MSTADDR field of the logged packet.
- The [L3\\_TARG\\_STDERRLOG\\_SLVADDR](#) register returns the SLVADDR field of the stored packet.
- The [L3\\_TARG\\_STDERRLOG\\_INFO](#) register saves the information field of the logged packet.

#### 14.2.3.8.5 Example for Decoding Standard/Custom Errors Logged in L3\_MAIN

Following is a procedure that must be followed for identifying Standard/Custom errors logged in L3\_MAIN:

- Read the \*\_STDERRLOG\_MAIN registers ([L3\\_HOST\\_STDERRLOG\\_MAIN](#) & [L3\\_TARG\\_STDERRLOG\\_MAIN](#)):
  - bit[0]STDERRLOG\_MAIN\_ERRLOGVLD = 0 -> NO ERROR
  - bit[0]STDERRLOG\_MAIN\_ERRLOGVLD = 1 -> ERROR
  - Error type is visible through:
    - bit[1]STDERRLOG\_MAIN\_ERRTYPE = 0 -> Standard Error (FW error, Address Hole, Unsupported command, OCP disconnect)
    - bit[1]STDERRLOG\_MAIN\_ERRTYPE = 1 -> Custom Error
- Standard Error:
  - Read [L3\\_TARG\\_STDERRLOG\\_HDR](#)[3:0] STDERRLOG\_HDR\_OPCODE
  - Read [L3\\_TARG\\_STDERRLOG\\_MSTADDR](#)[7:0] STDERRLOG\_MSTADDR -> 8-bit NTP master address used to distinguish the different initiators (see [Table 14-10](#)). That master address is also referred to as ConnID or MConnID.
  - Read [L3\\_TARG\\_STDERRLOG\\_SLVADDR](#)[4:0] STDERRLOG\_SLVADDR -> NTP Slave Address of the logged packet
  - Read [L3\\_TARG\\_STDERRLOG\\_INFO](#)[7:0]STDERRLOG\_INFO -> see , *Terminology* for details.

The procedure for Custom error is the same, but the \*\_STDERRLOG\_CUSTOMINFO\_\* registers should be read.

## 14.2.4 L3\_MAIN Interconnect Programming Guide

### 14.2.4.1 L3\_MAIN Interconnect Low-Level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L3\_MAIN interconnect module.

#### 14.2.4.1.1 Global Initialization

##### 14.2.4.1.1.1 Global Initialization of Surrounding Modules

This section identifies the requirements for initializing the surrounding modules when the L3\_MAIN interconnect module is to be used for the first time after a device reset. The initialization of surrounding modules is based on the integration and environment of the L3\_MAIN interconnect. For more information, see [Section 14.2.2, L3\\_MAIN Interconnect Integration](#).

**Table 14-25. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	For information about the configuration of the PRCM module, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Control module	For information about the configuration of the control module, see <a href="#">Chapter 18, Control Module</a> .
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see <a href="#">Chapter 17, Interrupt Controllers</a> .
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see <a href="#">Section 18.4.6.4, IRQ_CROSSBAR Module Functional Description</a> , in <a href="#">Chapter 18, Control Module</a> .

#### 14.2.4.2 Operational Modes Configuration

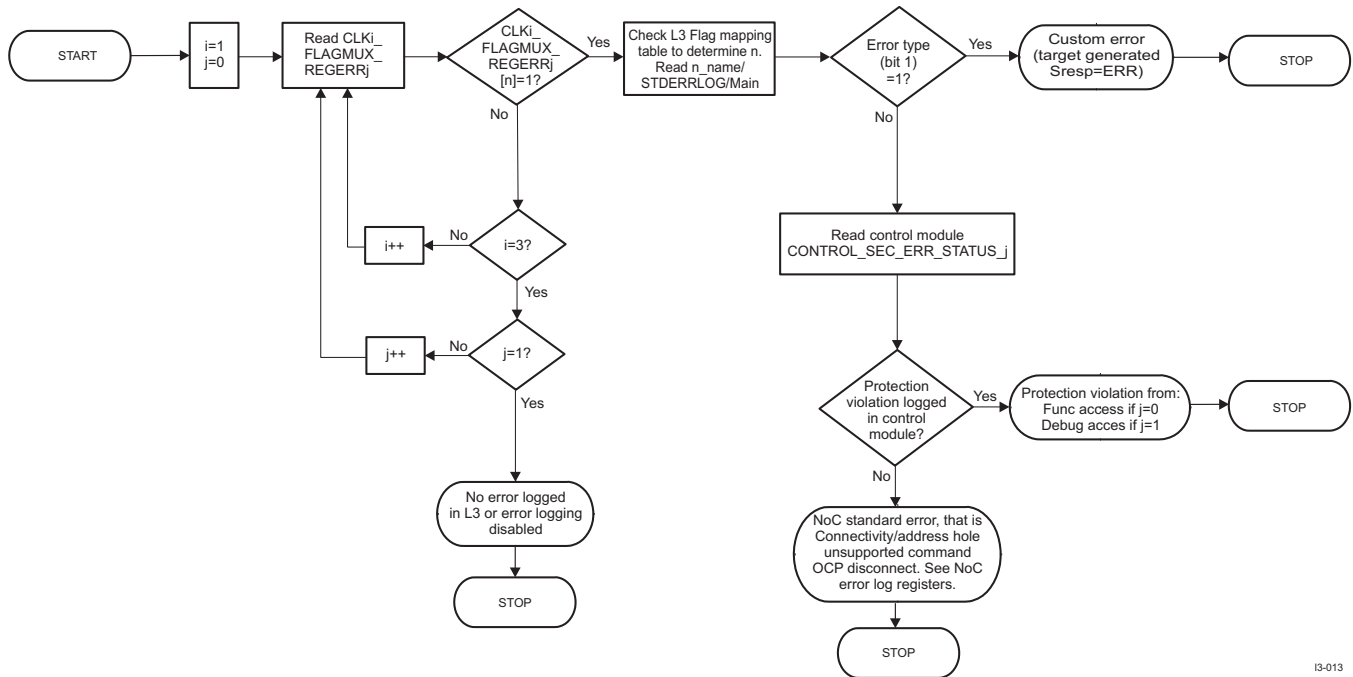

##### 14.2.4.2.1 L3\_MAIN Interconnect Error Analysis Mode

###### 14.2.4.2.1.1 Main Sequence: L3\_MAIN Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 14-8](#) shows the software sequence required in most cases.

**Figure 14-8. Typical Error Analysis Sequence**

13-013

**NOTE:** In case flag is set due to timeout flagmux, user can check the status in CONTROL\_SEC\_ERR\_STATUS for that Timeout Flagmux.

Table 14-26 lists the subprocess call summary for error analysis mode in the main sequence.

**Table 14-26. Subprocess Call Summary for Main Sequence – Error Analysis Mode**

Subprocess	Cross-Reference
L3 interconnect error analysis	See Section 14.2.4.2.1, L3_MAIN Interconnect Error Analysis Mode.
L3_MAIN interconnect protection violation error identification	See Section 14.2.4.2.1.1.2, Subsequence: L3_MAIN Interconnect Protection Violation Error Identification.
L3_MAIN interconnect unsupported command/address hole error identification	See Section 14.2.4.2.1.1.3, Subsequence: L3_MAIN Interconnect Standard Error Identification.
L3_MAIN interconnect reset FLAGMUX and module	See Section 14.2.4.2.1.1.4, Subsequence: L3_MAIN Interconnect FLAGMUX Configuration.

**14.2.4.2.1.1.1 Subsequence: L3\_MAIN Custom Error Identification**

The procedure listed in Table 14-27 describes custom error identification.

**Table 14-27. Custom Error Identification**

Step	Register/Bit Field/Programming Model	Value
IF: Is custom error detected?	L3_TARG_STDERRLOG_MAIN[1] STDERRLOG_MAIN_ERRTYPE	=0x1
Read information field of the response packet.	L3_TARG_STDERRLOG_CUSTOMINFO_INFO[7:0] STDERRLOG_CUSTOMINFO_INFO	xxx
Read the address of the initiator that caused error.	L3_TARG_STDERRLOG_CUSTOMINFO_MSTADDR[10:0] STDERRLOG_CUSTOMINFO_MSTADDR	xxx
Read the type of operation (read/write).	L3_TARG_STDERRLOG_CUSTOMINFO_OPCODE[1:0] STDERRLOG_CUSTOMINFO_OPCODE	xxx

**Table 14-27. Custom Error Identification (continued)**

Step	Register/Bit Field/Programming Model	Value
ENDIF		

**14.2.4.2.1.1.2 Subsequence: L3\_MAIN Interconnect Protection Violation Error Identification**

The procedure listed in [Table 14-28](#) describes protection violation error identification and where it is logged in the control module registers. Two types of errors are logged: application errors and debug errors.

**Table 14-28. L3\_MAIN Protection Violation Error Identification**

Step	Register/Bit Field/Programming Model	Value
Read the burst violation.	<a href="#">ERROR_LOG_k[23]</a> 2D_BURST_VIOLATION	xxx
Read the initiator ID.	<a href="#">ERROR_LOG_k[3:0]</a> ConnID	xxx
Read the command that caused the error.	<a href="#">ERROR_LOG_k[7]</a> MCMD	xxx
Read the address of the request that caused the error.	<a href="#">ERROR_LOG_k[31:12]</a> SLVOFS_LOGICAL	xxx
<b>IF:</b> Is it an application error?	<a href="#">L3_FLAGMUX_REGERR0</a> [31:0] REGERROR0	0x0
Read the status bits to see which module firewall has worked.	CONTROL.SEC_ERR_STATUS_FUNC_1[20:0]	xxx
Clear the status bits.	CONTROL.SEC_ERR_STATUS_FUNC_1[20:0]	xxx
Clear the status bit.	<a href="#">L3_TARG_STDERRLOG_MAIN</a> [31] STDERRLOG_MAIN_CLRLOG	0x0
<b>ELSE IF</b>	<a href="#">L3_FLAGMUX_REGERR1</a> [7:0] REGERROR1	= 0x1
Read the status bits to see the module.	CONTROL.SEC_ERR_STATUS_DEBUG_1[20:0]	xxx
Clear the status bits.	CONTROL.SEC_ERR_STATUS_DEBUG_1[20:0]	xxx
Clear the status bit.	<a href="#">L3_TARG_STDERRLOG_MAIN</a> [31] STDERRLOG_MAIN_CLRLOG	0x0
<b>ENDIF</b>		
Clear the burst violation.	<a href="#">ERROR_LOG_k[23]</a> 2D_BURST_VIOLATION	0x0
Clear the error status.	<a href="#">ERROR_LOG_k[21:17]</a> REGION_START_ERRLOG	0x00

**14.2.4.2.1.1.3 Subsequence: L3\_MAIN Interconnect Standard Error Identification**

The procedure listed in [Table 14-29](#) describes the identification of standard errors inside the L3\_MAIN interconnect. The standard errors are: unsupported command, address hole, and disconnect.

**Table 14-29. L3\_MAIN Standard Error Identification**

Step	Register/Bit Field/Programming Model	Value
<b>IF:</b> Is an error detected?	<a href="#">L3_TARG_STDERRLOG_MAIN</a> [18] STDERRLOG_MAIN_ERRCNT	= 0x1
Read the corresponding flag.	<a href="#">L3_FLAGMUX_REGERR0</a> [31:0] REGERROR0	xxx
Read the corresponding flag.	<a href="#">L3_FLAGMUX_REGERR1</a> [31:0] REGERROR1	xxx
Localize the slave NIU that generated the error.	See <a href="#">Table 14-24</a> .	
<b>ELSE</b>		
Clear the error log.	<a href="#">L3_TARG_STDERRLOG_MAIN</a> [31] STDERRLOG_MAIN_CLRLOG	0x0
Clear the severity error status.	<a href="#">L3_TARG_STDERRLOG_SVRTSTDLVL</a> [1:0] STDERRLOG_SVRTSTDLVL_0	0x2
<b>ENDIF</b>		

#### 14.2.4.2.1.1.4 Subsequence: L3\_MAIN Interconnect FLAGMUX Configuration

The procedures listed in [Table 14-30](#) and [Table 14-31](#) give information about the configuration of FLAGMUX masks.

**Table 14-30. FLAGMUX Configuration**

Step	Register/Bit Field/Programming Model	Value
Set the FLAGMUX masks to mask an event.	<a href="#">L3_FLAGMUX_MASK0</a> [31:0] MASK0 <a href="#">L3_FLAGMUX_MASK1</a> [31:0] MASK1	xxx
Read the REGERR bits to see if an error is recorded.	<a href="#">L3_FLAGMUX_REGERR0</a> [31:0] REGERR0 <a href="#">L3_FLAGMUX_REGERR1</a> [31:0] REGERR1	xxx
Clear the slave NIU error log and the FLAGMUX error.	<a href="#">L3_TARG_STDERRLOG_MAIN</a> [31] STDERRLOG_SVRTSTDLVL_0	0x1

**Table 14-31. FLAGMUX Time-out Configuration (for CLK1\_1 and CLK1\_2)**

Step	Register/Bit Field/Programming Model	Value
Enable time-out for target.	<a href="#">L3_FLAGMUX_TIMEOUTx_MASK0</a> [24:0] MASK0 <sup>(1)</sup>	xxx
Read the REGERR bits to see if an error is recorded.	<a href="#">L3_FLAGMUX_TIMEOUTx_REGERR0</a> [24:0] REGERR0 <sup>(1)</sup>	xxx

<sup>(1)</sup> x = 1 for CLK1\_FLAGMUX\_CLK1\_1  
x=2 for CLK1\_FLAGMUX\_CLK1\_2  
Bit fields are [24:0] for CLK1\_FLAGMUX\_CLK1\_1, [20:0] for CLK1\_FLAGMUX\_CLK1\_2

**Table 14-32. FLAGMUX Time-out Configuration (for CLK2\_1)**

Step	Register/Bit Field/Programming Model	Value
Enable time-out for target.	<a href="#">L3_FLAGMUX_TIMEOUT_MASK0</a> [1:0] MASK0	xxx
Read the REGERR bits to see if an error is recorded.	<a href="#">L3_FLAGMUX_TIMEOUT_REGERR0</a> [1:0] REGERR0	xxx

## 14.2.5 L3\_MAIN Interconnect Register Manual

### 14.2.5.1 L3\_MAIN Register Group Summary

The registers in the L3 interconnect are divided into eight groups:

- Firewall registers (see [Section 14.2.5.1.1](#))
- HOST registers (see [Section 14.2.5.1.2](#))
- TARG registers (see [Section 14.2.5.1.3](#))
- FLAGMUX registers (see [Section 14.2.5.1.4](#) thru [Section 14.2.5.1.6](#))
- BW registers (see [Section 14.2.5.1.7](#) and [Section 14.2.5.1.8.1](#))
- STATCOLL registers (see [Section 14.2.5.1.9](#))

#### 14.2.5.1.1 L3\_MAIN Firewall Registers Summary and Description

**Table 14-33. L3\_MAIN Firewall Instance Summary**

Module Name	Base Address	Size

<b>Type</b>	RW		

Bits	Field Name	Description	Type	Reset
31:10	END_REGION	Physical target end address of firewall region i. The size of this bit field depends on target addressable space, the maximum is [31:10]. See Table 14-54. Each of the LSbits is assumed to be 1. The programmed address is included in the region i boundary.	RW	0x00000
9:2	RESERVED	Reads return 0s.	R	0x0000
1	END_REGION_i_ENABLE_COR E1	Enable this region for port 1 <sup>(1)</sup> .	RW	0x0
0	END_REGION_i_ENABLE_COR E0	Enable this region for port 0.	RW	0x0

<sup>(1)</sup> Only for multiport firewalls

### 14.3 L4 Interconnects

This section details the device L4 interconnects.

#### 14.3.1 L4 Interconnect Overview

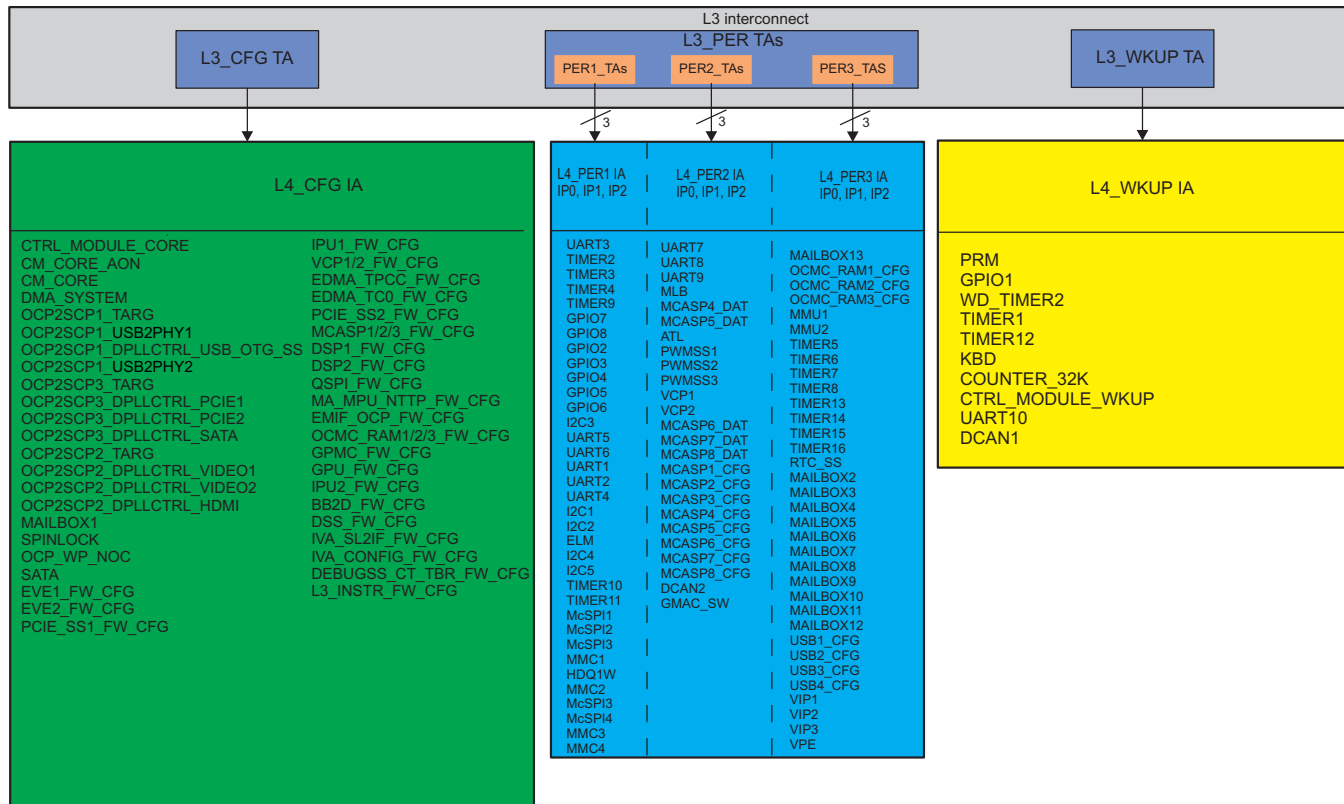

The device uses three separate L4 interconnect structures to connect peripheral modules. All L4s handle transfers with peripherals but are located in distinct power domains.

Figure 14-9 is an overview of the L4 interconnects and the peripherals attached to them.

The L4 interconnect is composed of the following interconnects:

- L4\_CFG: Includes the majority of the configuration interface for L3\_MAIN system modules and peripheral interconnect
- L4\_PER: Includes the main peripherals that require sDMA access. L4\_PER is further divided into three sub-interconnects: L4\_PER1, L4\_PER2 and L4\_PER3. As shown in Figure 14-9, each of these L4\_PERx sub-interconnects is connected to L3\_MAIN initiators via three ports:
  - L4\_PER1\_P1, L4\_PER1\_P2, L4\_PER1\_P3
  - L4\_PER2\_P1, L4\_PER2\_P2, L4\_PER2\_P3
  - L4\_PER3\_P1, L4\_PER3\_P2, L4\_PER3\_P3
 L3\_MAIN initiators access the L4\_PERx peripherals through these ports. All peripherals attached to L4\_PER1 are visible from all three L4\_PER1 ports; this is also correct for L4\_PER2 and L4\_PER3. For information on which initiator can access which L4\_PERx port, see Figure 14-3.
- L4\_WKUP: Includes peripherals attached to the WKUP power domain

Figure 14-9. L4 Interconnect Overview

icnt-013

The main features of the L4 interconnects are:

- Eleven ports from L3\_MAIN interconnect onto 5 parallel L4 interconnects
- From one to three 32-bit initiator ports for each L4 interconnect instance (11 in total)
- 8-, 16-, or 32-bit data, single, or burst transactions

- Little-endian platform
- Non-blocking architecture with fair arbitration between masters
- Target interfaces: Fully synchronous or divided synchronous clock frequencies
- L4\_CFG and L4\_PER1, L4\_PER2, L4\_PER3 frequency equals half of L3 frequency
- Protection logic that provides user-configurable access control to targets by each initiator

### 14.3.2 L4 Interconnect Integration

Table 14-377 and Table 14-378 summarize the integration of the module in the device.

**Table 14-377. Integration Attributes**

Module Instance	Attributes
	Power Domain
L4_PER1, L4_PER2, L4_PER3	PD_COREAON
L4_CFG	PD_COREAON
L4_WKUP	PD_WKUPAON

**Table 14-378. Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L4_PER1	L4_PER1_CLK	L4PER_L3_GICLK	PRCM module	Functional and interface clock

### 14.3.3 L4 Interconnect Functional Description

#### 14.3.3.1 Module Distribution

IAs and TAs provide the interface to connect the different modules to their associated interconnect.

[Table 14-379](#) through [Table 14-388](#) list all the modules and subsystems with their associated agents. The agents are listed for each L4 interconnect domain.

##### 14.3.3.1.1 L4\_PER1 Interconnect Agents

The L4\_PER1 interconnect handles transfers only to peripherals in the PER power domain. [Table 14-379](#) lists the L4\_PER1 TAs.

**Table 14-379. L4\_PER1 TAs**

Module Target Name	Description
UART3_TARG	Universal Asynchronous Receiver/Transmitter target port
TIMER2_TARG	General Purpose Timer 2 target port
TIMER3_TARG	TIMER3 target port
TIMER4_TARG	TIMER4 target port
TIMER9_TARG	TIMER9 target port
GPIO7_TARG	General-Purpose Interface 7 target port
GPIO8_TARG	GPIO8 target port
GPIO2_TARG	GPIO2 target port
GPIO3_TARG	GPIO3 target port
GPIO4_TARG	GPIO4 target port
GPIO5_TARG	GPIO5 target port
GPIO6_TARG	GPIO6 target port
I2C3_TARG	Inter-Integrated Circuit 3 target port
UART5_TARG	UART5 target port
UART6_TARG	UART6 target port
UART1_TARG	UART1 target port
UART2_TARG	UART2 target port
UART4_TARG	UART4 target port
I2C1_TARG	I2C1 target port
I2C2_TARG	I2C2 target port
ELM_TARG	Error Location Module target port
I2C4_TARG	I2C4 target port
I2C5_TARG	I2C5 target port
TIMER10_TARG	TIMER10 target port
TIMER11_TARG	TIMER11 target port
MCSP11_TARG	Multi-channel Serial Peripheral Interface 1 target port
MCSP12_TARG	McSPI2 target port
MMC1_TARG	MMC1 target port
HDQ1W_TARG	HDQ1W target port
MMC2_TARG	MMC2 target port
MMC3_TARG	MMC3 target port
MCSP13_TARG	McSPI3 target port
MCSP14_TARG	McSPI4 target port
MMC4_TARG	MMC4 target port

Four ports communicate between the L3\_MAIN interconnect and the L4\_PER1 interconnect to allow the L3\_MAIN initiators to access the L4\_PER1 targets. [Table 14-380](#) lists the L4\_PER1 initiator TAs.

For the list of initiators authorized to access the L4\_PER1, peripherals, see [Section 14.2.3.2.2, Connectivity Matrix](#).

**Table 14-380. L4\_PER1 IAs**

Module Initiator Name	Description
L3_MAIN_IP0_INIT	L3 sDMA RD interconnect port
L3_MAIN_IP1_INIT	L3 sDMA WR interconnect port
L3_MAIN_IP2_INIT	L3 MPU subsystem interconnect port

#### 14.3.3.1.2 L4\_PER2 Interconnect Agents

The L4\_PER2 interconnect handles transfers only to peripherals in the PER power domain. [Table 14-381](#) lists the L4\_PER2 TAs.

**Table 14-381. L4\_PER2 TAs**

Module Target Name	Description
UART7_TARG	UART7 target port
UART8_TARG	UART8 target port
UART9_TARG	UART9 target port
MLB_TARG	Media Local Bus target port
MCASP4_DAT_TARG	Multi-Channel Audio Serial Port - DAT target port
MCASP5_DAT_TARG	MCASP5_DAT target port
ATL_TARG	Audio Tracking Logic target port
PWMSS1_TARG	Pulse-Width Modulation Subsystem1 target port
PWMSS2_TARG	PWMSS2 target port
PWMSS3_TARG	PWMSS3 target port
VCP1_CFG_TARG	Viterby Coder/Decoder 1 target port
VCP2_CFG_TARG	Viterby Coder/Decoder 2 target port
MCASP6_DAT_TARG	MCASP6_DAT target port
MCASP7_DAT_TARG	MCASP7_DAT target port
MCASP8_DAT_TARG	MCASP8_DAT target port
MCASP1_CFG_TARG	MCASP1_CFG target port
MCASP2_CFG_TARG	MCASP2_CFG target port
MCASP3_CFG_TARG	MCASP3_CFG target port
MCASP4_CFG_TARG	MCASP4_CFG target port
MCASP5_CFG_TARG	MCASP5_CFG target port
MCASP6_CFG_TARG	MCASP6_CFG target port
MCASP7_CFG_TARG	MCASP7_CFG target port
MCASP8_CFG_TARG	MCASP8_CFG target port
DCAN2_TARG	DCAN2 target port
GMAC_SW_TARG	Ethernet Controller target port

Three ports communicate between the L3\_MAIN interconnect and the L4\_PER2 interconnect to allow the L3\_MAIN initiators to access the L4\_PER2 targets. [Table 14-382](#) lists the L4\_PER2 initiator TAs.

For the list of initiators authorized to access the L4\_PER2 peripherals, see [Section 14.2.3.2.2, Connectivity Matrix](#).

**Table 14-382. L4\_PER2 IAs**

Module Initiator Name	Description
L3_MAIN_IP0_INIT	L3 sDMA RD interconnect port
L3_MAIN_IP1_INIT	L3 sDMA WR interconnect port
L3_MAIN_IP2_INIT	L3 MPU subsystem interconnect port

#### 14.3.3.1.3 L4\_PER3 Interconnect Agents

The L4\_PER3 interconnect handles transfers only to peripherals in the PER power domain. [Table 14-383](#) lists the L4\_PER3 TAs.

**Table 14-383. L4\_PER3 TAs**

Module Target Name	Description
TIMER5_TARG	TIMER5 target port
TIMER6_TARG	TIMER6 target port
TIMER7_TARG	TIMER7 target port
TIMER8_TARG	TIMER8 target port
TIMER13_TARG	TIMER13 target port
TIMER14_TARG	TIMER14 target port
TIMER15_TARG	TIMER15 target port
TIMER16_TARG	TIMER16 target port
VIP1_TARG	Video Input Parser(VIP) 1 target port
VIP2_TARG	VIP2 target port
VIP3_TARG	VIP3 target port
VPE_TARG	VPE target port
RTC_SS_TARG	Real-Time Clock (RTC) target port
MBX2_TARG	Mailbox 2 target port
MBX3_TARG	Mailbox 3 target port
MBX4_TARG	Mailbox 4 target port
MBX5_TARG	Mailbox 5 target port
MBX6_TARG	Mailbox 6 target port
MBX7_TARG	Mailbox 7 target port
MBX8_TARG	Mailbox 8 target port
MBX12_TARG	Mailbox 12 target port
MBX9_TARG	Mailbox 9 target port
MBX10_TARG	Mailbox 10 target port
MBX11_TARG	Mailbox 11 target port
USB4_CFG_TARG	USB4 configuration port
SATA_TARG	SATA target port
USB2_CFG_TARG	USB2 configuration port
OCMC_RAM1_TARG	On-Chip Memory Controller RAM1 target port
USB1_CFG_TARG	USB1 configuration target port
USB3_CFG_TARG	USB3 configuration target port
OCMC_RAM2_TARG	OCMC_RAM2 target port
OCMC_RAM3_TARG	OCMC_RAM3 target port
MMU1_TARG	Memory Management Unit 1 target port
MMU2_TARG	MMU2 target port
MBX13_TARG	Mailbox 13 target port

Three ports communicate between the L3\_MAIN interconnect and the L4\_PER3 interconnect to allow the L3\_MAIN initiators to access the L4\_PER3 targets. [Table 14-384](#) lists the L4\_PER3 initiator TAs.

For the list of initiators authorized to access the L4\_PER3 peripherals, see [Section 14.2.3.2.2, Connectivity Matrix](#).

**Table 14-384. L4\_PER3 IAs**

Module Initiator Name	Description
L3_MAIN_IP0_INIT	L3 sDMA RD interconnect port
L3_MAIN_IP1_INIT	L3 sDMA WR interconnect port
L3_MAIN_IP2_INIT	L3 MPU subsystem interconnect port

#### 14.3.3.1.4 L4\_CFG Interconnect Agents

The L4\_CFG interconnect handles only transfers to peripherals in the CORE power domain. [Table 14-385](#) lists the TAs.

**Table 14-385. L4\_CFG TAs**

Module Target Name	Description
CTRL_MODULE_CORE_TARG	Control Module core target
CM_CORE_AON_TARG	CORE_AON module
CM_CORE_TARG	CM_CORE module
DMA_SYSTEM_TARG	System DMA
SCP1_TARG	SCP1 module
SCP2_TARG	SCP2 module
MAILBOX_TARG	Mailbox module
SPINLOCK_TARG	Spinlock module
OCP_WP_NOC_TARG	OCP watchpoint module
SATA_TARG	SATA controller module
EVE1_FW_CFG_TARG	Embedded Vision Engine firewall
EVE2_FW_CFG_TARG	EVE2 firewall
IPU1_FW_CFG_TARG	Image Processing Unit (IPU) 1 firewall
IPU2_FW_CFG_TARG	IPU 2 firewall
VCP1_FW_CFG_TARG	Viterby Coder/Decoder 1 firewall
VCP2_FW_CFG_TARG	VCP2 module firewall
TPCC_FW_CFG_TARG	EDMA Channel Controller firewall
TPTC_FW_CFG_TARG	EDMA Transfer Controller firewall
PCISS1_FW_CFG_TARG	PCIE1 firewall
MCASP1_FW_CFG_TARG	MCASP1 firewall
SCP3_TARG	SCP3 module
OCP2SCP1_USB2PHY1	OCP2SCP1_USB2PHY1 core target port
OCP2SCP1_DPLLCTRL_USB_OTG_SS_TARG	USB OTG Subsystem DPLLCTRL target port
OCP2SCP3_USB2PHY2	USB2PHY2 target port
OCP2SCP3_DPLLCTRL_PCIE1_TARG	PCIE1 DPLL CTRL target port
OCP2SCP3_DPLLCTRL_PCIE2_TARG	PCIE2 DPLL CTRL target port
OCP2SCP3_DPLLCTRL_SATA_TARG	SATA DPLL CTRL target port
OCP2SCP2_DPLLCTRL_VIDEO1_TARG	VIDEO1 DPLL CTRL target port
OCP2SCP2_DPLLCTRL_VIDEO2_TARG	VIDEO2 DPLL CTRL target port
OCP2SCP2_DPLLCTRL_HDMI_TARG	HDMI DPLL CTRL target port
DSP1_SDMA_FW_CFG_TARG	DSP1 firewall
DSP2_SDMA_FW_CFG_TARG	DSP2 firewall

**Table 14-385. L4\_CFG TAs (continued)**

Module Target Name	Description
MA_MPU_NTTP_FW_CFG_TARG	MA_MPU firewall
EMIF_OCP_FW_CFG_TARG	EMIF firewall
OCMC_RAM2_FW_CFG_TARG	OCMC_RAM2 firewall
GPMC_FW_CFG_TARG	GPMC firewall
OCMC_RAM1_FW_CFG_TARG	OCMC_RAM1 firewall
GPU_FW_CFG_TARG	GPU firewall
OCMC_RAM3_FW_CFG_TARG	OCMC_RAM3 firewall
DSS_FW_CFG_TARG	DSS firewall
IVA_SL2IF_FW_CFG_TARG	IVA SL2IF firewall
IVA_CONFIG_FW_CFG_TARG	IVA Config firewall
DEBUGSS_CT_TBR_FW_CFG_TARG	Debug subsystem firewall
L3_INSTR_FW_CFG_TARG	L3 Instrumentation firewall
MCASP2_FW_CFG_TARG	MCASP2 firewall
QSPI_FW_CFG_TARG	QSPI firewall
MCASP3_FW_CFG_TARG	MCASP3 firewall
PCISS2_FW_CFG_TARG	PCI E2 firewall

A unique port, L3\_MAIN\_INIT, communicates between the L3 interconnect and the L4\_CFG interconnect to allow the L3 initiators to access the L4\_CFG targets (see [Table 14-386](#)).

For the list of initiators authorized to access the L4\_CFG peripherals, see [Section 14.2.3.2.2, Connectivity Matrix](#).

**Table 14-386. L4\_CFG IAs**

Module Initiator Name	Description
L3_MAIN_IP0	L3 interconnect port

#### 14.3.3.1.5 L4\_WKUP Interconnect Agents

The L4-WKUP interconnect handles transfers only to peripherals in the WKUP power domain. [Table 14-387](#) lists the TAs. [Table 14-388](#) lists the L4 WKUP IAs.

**Table 14-387. L4\_WKUP TAs**

Module Target Name	Description
PRM_TARG	PRM module
GPIO1_TARG	GPIO1 module
WD_TIMER2_TARG	Watchdog Timer 2
TIMER1_TARG	Timer 1
TIMER12_TARG	Timer 12
KBD_TARG	Keyboard controller
COUNTER_32K_TARG	Counter 32k timer
CTRL_MODULE_WKUP_TARG	Control Module Wakeup module
UART10_TARG	UART10 module
DCAN1_TARG	CAN1 module

**Table 14-388. L4\_WKUP IAs**

Module Initiator Name	Description
L3_MAIN_IP0	L3 interconnect port

### 14.3.3.2 Power Management

As part of the system-wide power-management scheme, the L4 interconnects go into IDLE state after receiving a request from the PRCM module after all commands are serviced. This function is handled by hardware. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

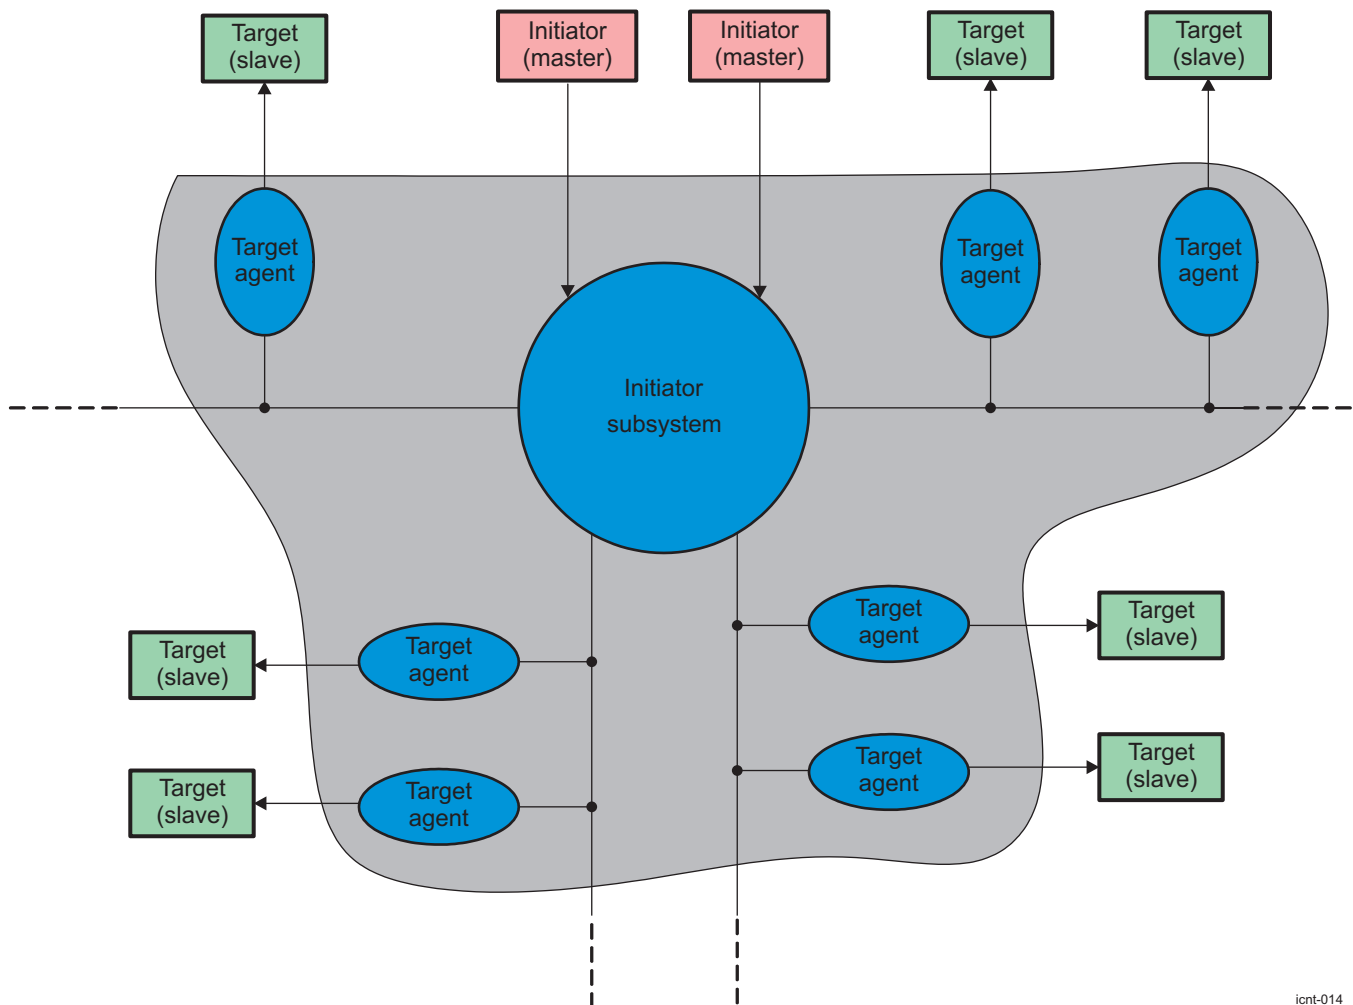

To reduce power consumption, each L4 interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

L4\_CFG, L4\_PER1, L4\_PER2, L4\_PER3, and L4\_WKUP are located in the always-on power domain and no retention is needed for these L4 interconnects.

### 14.3.3.3 L4 Firewalls

[Figure 14-10](#) is an internal view of the L4 interconnects in the overall interconnect. This architecture, with one initiator subsystem centralizing all initiator master requests and distributing them to all target modules (peripherals), enables the L4 interconnect firewall functions to be centralized at the L4 initiator subsystem level. The L4 firewall filters the accesses based on the configurable protection groups defined in the L4 address protection (AP) registers. Each module or TA is assigned to a protection group. The configuration is also defined in the L4 AP and is programmable on a module-per-module basis.

**Figure 14-10. L4 Initiator-Target Connectivity**

icnt-014

---

**NOTE:** As [Figure 14-10](#) shows, targets are attached to branches. Branches do not impact the function of the L4 interconnect but are present to simplify timing closure and reduce active power consumption.

---

Because of the large address spaces and the number of peripherals connected to an L4 interconnect, two parameters are used to set up access permission:

- Programmable groups for initiators:
  - Eight protection groups for the L4 interconnect
- Segments divided into regions
  - 85 regions for the L4\_PER1 interconnect
  - 63 regions for the L4\_PER2 interconnect
  - 97 regions for the L4\_PER3 interconnect
  - 129 regions for the L4\_CFG interconnect
  - 44 regions for the L4\_WKUP interconnect

Protection group members are TAs with the same protection settings. A region is programmed to allow access to a unique selectable protection group. For better protection, different regions are grouped into protection group regions and associated with a protection group member.

#### 14.3.3.3.1 Protection Group

A protection group is defined by its initiators (or members) and MReqInfo is allowed. Two registers define these two settings:

- The 64-bit CONNID\_BIT\_VECTOR field [L4\\_AP\\_PROT\\_GROUP\\_MEMBERS\\_k\\_L](#) and [L4\\_AP\\_PROT\\_GROUP\\_MEMBERS\\_k\\_H](#) registers define which initiator belongs to a group. A protection group is accessible by an initiator when the bit position corresponding to its ConnID is set to 1 in the CONNID\_BIT\_VECTOR field. [Table 14-389](#) lists all the ConnIDs available at the L4 levels.
- The ENABLE field [L4\\_AP\\_PROT\\_GROUP\\_ROLES\\_k\\_L](#) register lists all possible MReqInfo combinations associated with the L4\_AP\_PROT\_GROUP\_MEMBERS register. Setting a Req bit in this register determines the initiators type of access. For more information, see [Section 14.2.3.7.3, L3\\_MAIN Firewall Functionality](#). Two MReqInfos are used in L4 interconnects: MReqDebug and MReqSupervisor.

---

**NOTE:** Permissions are identical for read and write accesses in L4 interconnect.

k indicates the protection group number.

L indicates the region number.

---

**Table 14-389. L4 ConnID Definition**

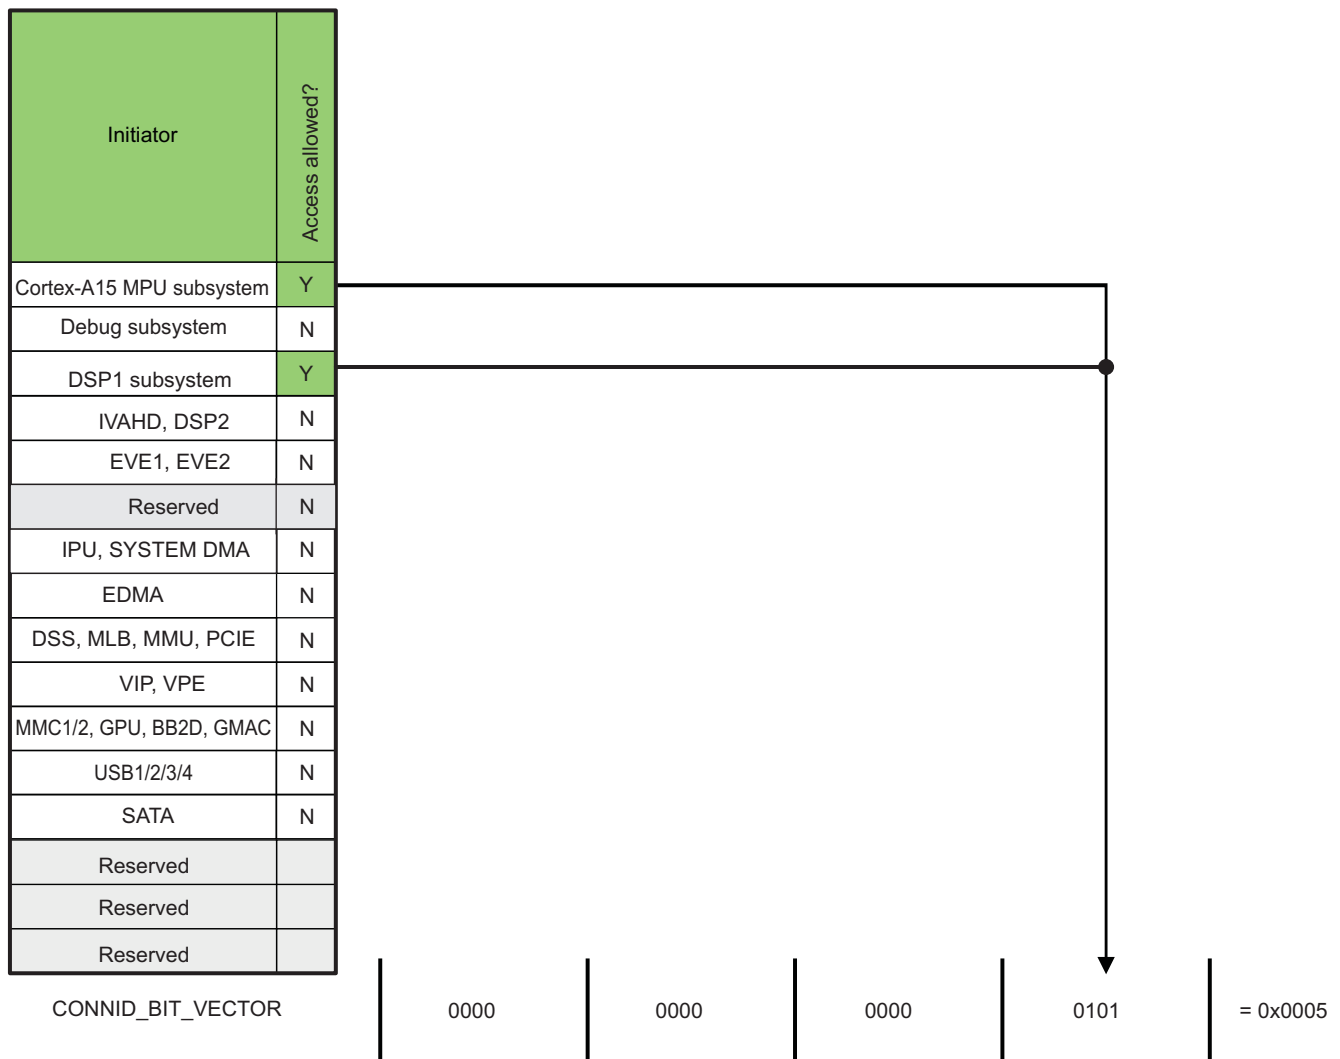

ConnID	Initiator
0	Cortex-A15 MPU subsystem
1	Debug subsystem
2	DSP1 subsystem (CFG, EDMA, MDMA), DSP2 (EDMA)
3	IVAHD, DSP2(CFG, MDMA)
4	EVE1, EVE2
5	Reserved
6	IPU1/2; SYSTEM_DMA
7	EDMA
8	DSS, MLB, MMU1, MMU2, PCIE1 and PCIE2
9	VIP1, VIP2, VIP3, VPE
A	MMC1, MMC2, GPU, BB2D, GMAC

**Table 14-389. L4 ConnID Definition (continued)**

ConnID	Initiator
B	USB1, USB2, USB3, USB4
C	SATA
D	Reserved
E	Reserved
F	Reserved

Figure 14-11 is an example of CONNID\_BIT\_VECTOR.

**Figure 14-11. Example of CONNID\_BIT\_VECTOR L4\_AP\_PROT\_GROUP\_MEMBERS\_k**

icnt-015

Setting bits 0 and 2 in the PROT\_GROUP\_MEMBERS\_L register defines a group initiator that can access targets in protection group 1, and includes the following:

- Cortex-A15 MPU subsystem
- DSP subsystem

Protection group 1 can be applied to multiple protection regions with no limitation. Each protection region that is configured with protection group 1 enables permission access only to the two initiators.

The L4\_AP\_REGION\_i\_H PROT\_GROUP\_ID field determines the region to which the protection group member is attached.

The values of some CONNID\_BIT\_VECTOR and ENABLE fields are exported by the system control module (SCM) at reset or are user writable (see [Figure 14-11](#) for more information).

[Table 14-390](#) and [Table 14-393](#) list the default configuration of the various groups for each L4 interconnect. For each group, some modules or regions are associated with it using default initiator members.

**Table 14-390. L4\_PER1 Firewall Default Configuration**

Group	Default Modules Associated With Group	Register	Modifiability	Default Value
Group 0 AP registers	L4_PER1_AP registers	L4_AP_PROT_GROUP_ROL ES_0_L	No	EXPORTED

**NOTE:** For EXPORTED default values see CONTROL\_SEC\_LOAD\_FW\_EXPORTED\_VALUE register in [Chapter 18, Control Module](#)

**14.3.3.2 Segments and Regions**

The protection mechanism for L4 interconnects is based on a hierarchical segmentation, as shown in [Figure 14-12](#). By default, some regions are attached to specific protection group members. This specificity lets users set up the permission access to certain types of modules requiring the same access protection without managing region allocation.

**Figure 14-12. L4 Segmentation**

icnt-016

All interconnect address spaces are covered by regions. [Table 14-395](#) through [Table 14-399](#) list the module mapping with their addresses, region numbers, and default protection group allocated to them.

**NOTE:** Module refers to the configuration registers of the module.

TA (Target Agent) refers to the interconnect configuration registers of the TA associated with the module.

#### 14.3.3.3 L4 Firewall Address and Protection Register Settings

Table 14-400 lists the settings of the AP registers relative to an L4 interconnect firewall. These values are computed based on the physical implementation of each L4 interconnect.

**Table 14-400. L4 Firewall Register Description Overview**

Register Type	Register Name	Bits	Field	Description
Segment	L4_AP_SEGMENT_i_L <sup>(1)</sup>	31:0	BASE	Segment base address
	L4_AP_SEGMENT_i_H <sup>(1)</sup>	5:0	SIZE	Segment size equals to 2 <sup>SIZE</sup>
Protection groups	L4_AP_PROT_GROUP_MEMBERS_k_L <sup>(2)</sup>	15:0	CONNID_BIT_VECTOR	For L4ConnID, see <a href="#">Table 14-389</a> .
	L4_AP_PROT_GROUP_ROLES_k_L <sup>(2)</sup>	31:0	ENABLE	See for REQ_INFO description. <sup>(3)</sup>
	L4_AP_PROT_GROUP_ROLES_k_H			
Region setting	L4_AP_REGION_l_L <sup>(4)</sup>	20:0	BASE	Defines the base address of region with respect to its segment base address
	L4_AP_REGION_l_H <sup>(4)</sup>	31:28	MADDRSPACE	Target interconnect MAddrSpace
		26:24	SEGMENT_ID	Segment ID number of the region
		22:20	PROT_GROUP_ID	Protection group member attached to the region
		18:17	BYTE_DATA_WIDTH_EXP	Determines the number of bytes in an access
		14:8	PHY_TARGET_ID	Physical target ID
		6:1	SIZE	Size of the region equals to 2 <sup>SIZE</sup>
		0	ENABLE	Enables the region protection

<sup>(1)</sup> i = 0 to 1 for PER1\_AP  
i = 0 for PER2\_AP  
i = 0 for PER3\_AP  
i = 0 to 2 for CFG\_AP  
i = 0 to 3 for WKUP\_AP

<sup>(2)</sup> k = 0 to 7 for PER1\_AP  
k = 0 to 7 for PER2\_AP  
k = 0 to 7 for PER3\_AP  
k = 0 to 7 for CFG\_AP  
k = 0 to 7 for WKUP\_AP

<sup>(3)</sup> For L4 interconnects, only MReqDebug and MReqSupervisor are available.

<sup>(4)</sup> l = 0 to 84 for PER1\_AP  
l = 0 to 56 for PER2\_AP  
l = 0 to 96 for PER3\_AP  
l = 0 to 128 for CFG\_AP  
l = 0 to 43 for WKUP\_AP

### 14.3.3.4 L4 Error Detection and Reporting

#### 14.3.3.4.1 IA and TA Error Detection and Logging

The L4 interconnect provides mechanisms for handling internally detected errors or errors reported by modules attached to the L4 target ports.

---

**NOTE:** L4\_IA denotes the IA for all L4 interconnects: L4\_PER1, L4\_PER2, L4\_PER3, L4\_CFG, and L4\_WKUP.

L4\_TA denotes the TA for all L4 interconnects: L4\_PER1, L4\_PER2, L4\_PER3, L4\_CFG, and L4\_WKUP.

---

The L4 interconnects handle four types of errors:

- No target core found or address hole, detected and logged at IA
- Unsupported command, detected and logged at IA
- Protection violation, detected and logged at IA (see [Section 14.3.3.3, L4 Firewalls](#))
- Target does not service a request before a time-out expires. The error is detected and logged at TA (see [Section 14.3.3.4.2, Time-Out](#)).

Table 14-401 lists the value of the [L4\\_IA\\_ERROR\\_LOG\\_L\[25:24\]](#) CODE bit field stored when an error occurs.

**Table 14-401. L4 CODE Bit Field Definition**

CODE (bits 1:0)	Error Type	REQ_INFO	Secondary	ConnID	CMD
0	No error				
1	Unsupported command	x	x	x	x
2	Address hole	x	x	x	x
3	Protection violation	x		x	x

- **No target core found/address hole:** This error indicates that a request was addressed to a hole in the L4 address map. When this error occurs, an in-band error response is returned to the L3 level. The error is also logged into the [L4\\_IA\\_AGENT\\_STATUS\\_L\[27\]](#) INBAND\_ERROR bit. Additionally, an address hole error code is logged to the [L4\\_IA\\_ERROR\\_LOG\\_L\[25:24\]](#) CODE bit field.
- **Unsupported command:** This error indicates that the command type of the request is not supported by the accessed target register. The error is logged into the [L4\\_IA\\_AGENT\\_STATUS\\_L\[27\]](#) INBAND\_ERROR bit. An unsupported command error code is written to the [L4\\_IA\\_ERROR\\_LOG\\_L\[25:24\]](#) CODE bit field for the initiator interface.
- **Protection violation:** This error indicates that a request is not issued from an allowed initiator member or is issued with the inappropriate ReqInfo qualifiers associated with the target region. This error is reported using an in-band error and is written to the [L4\\_IA\\_AGENT\\_STATUS\\_L\[27\]](#) INBAND\_ERROR bit. A protection violation error code is saved into the [L4\\_IA\\_ERROR\\_LOG\\_L\[25:24\]](#) CODE bit field for the same initiator interface. A protection violation is also logged in the [L4\\_IA\\_AGENT\\_STATUS\\_L\[31\]](#) PROT\_ERROR\_SECONDARY or [30] PROT\_ERROR\_PRIMARY bit when in debug or applicative mode, respectively.

The [L4\\_IA\\_ERROR\\_LOG\\_L\[30\]](#) SECONDARY bit indicates whether the error occurred in application or debug.

The [L4\\_IA\\_ERROR\\_LOG\\_H\[15:0\]](#) REQ\_INFO bit field returns the type of access (REQ\_INFO qualifier) that caused the error.

The [L4\\_IA\\_ERROR\\_LOG\\_L\[13:8\]](#) CONNID bit field returns the ID of the initiator that caused the error.

The [L4\\_IA\\_ERROR\\_LOG\\_ADDR\\_L\[31:0\]](#) ADDR register logs the address for error conditions.

#### 14.3.3.4.2 Time-Out

A time-out mechanism can be enabled at the interconnect level and on a per-target basis. If the mechanism is enabled for a TA and interconnect and commands are not accepted or responses are not returned within the expected delay, the L4 interconnect generates an error event.

---

**NOTE:** The time-out mechanism is not available on the L4\_WKUP interconnect, but L4\_WKUP time-outs are detected in CFG\_TA\_L4WKUP of the L4\_CFG interconnect.

---

The error is logged in the [L4\\_TA\\_AGENT\\_STATUS\\_L\[8\]](#) REQ\_TIMEOUT bit. The affected TA enters an error state that causes it to send an error response to any new request targeted at it. To recover from this state, system software must reset the TA. The time-out is counted starting from the moment a command is presented to the target, regardless of the target response to this command.

The L4 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected TAs. The time-base circuit offers four possible sets of four time-base signals. The time-base signals are selected by programming the [L4\\_LA\\_NETWORK\\_CONTROL\\_L\[10:8\]](#) TIMEOUT\_BASE bit field.

The selected time-base signals are available at any TA. Each TA can be programmed to refer to one of these four time-base signals, using the [L4\\_TA\\_AGENT\\_CONTROL\\_L\[10:8\]](#) REQ\_TIMEOUT bit field. These four signals are referred to as 1X time-base, 4X time-base, 16X time-base, and 64X time-base.

Table 14-402 lists all values in number of L4 clock cycles.

**Table 14-402. L4 Time-out Link and TA Programming**

		<b>L4_TA_AGENT_CONTROL_L [10:8] REQ_TIMEOUT</b>			
<b>L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE</b>	<b>0</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>
0	All L4 time-out features are disabled.				
1	Locally disabled	64	256	1024	4096
2		256	1024	4096	16,384
3		1024	4096	16,384	65,536
4		4096	16,384	65,536	262,144

The default reset value is 0x2 for REQ\_TIMEOUT and 0x4 for TIMEOUT\_BASE, implying 16,384 clock cycles.

A time-out condition is detected when the command acceptance or the response is not received after a delay of from one to three time-base periods.

**Example:**

- L4 frequency = 65-MHz, 15.3- $\mu$ s period
- TIMEOUT\_BASE = 4 in the [L4\\_LA\\_NETWORK\\_CONTROL\\_L](#) register
- REQ\_TIMEOUT = 2 in the [L4\\_TA\\_AGENT\\_CONTROL\\_L](#) for TA A
- REQ\_TIMEOUT = 4 in the [L4\\_TA\\_AGENT\\_CONTROL\\_L](#) for TA B

At agent A, the time-base unit is 16,384 cycles. A time-out is issued when a request to the attached module is not accepted, or no response is sent after a delay of 252  $\mu$ s to 756  $\mu$ s.

At agent B, the time-base unit is 262,144 cycles. A time-out is issued when a request to the attached module is not accepted or no response is sent after a delay of 4 ms to 12 ms.

When a time-out condition is detected, the TA logs the error in the [L4\\_TA\\_AGENT\\_STATUS\\_L\[8\]](#) REQ\_TIMEOUT bit, and it also reports the error to the IA, which forwards it to the L3 interconnects.

After the time-out is detected and logged, the behavior of the attached module is ignored. A new request targeting the module arriving at the timed-out TA receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

To recover from a time-out error, software is assumed to first reset the faulty module and then the TA using the [L4\\_TA\\_AGENT\\_CONTROL\\_L\[0\]](#) OCP\_RESET bit.

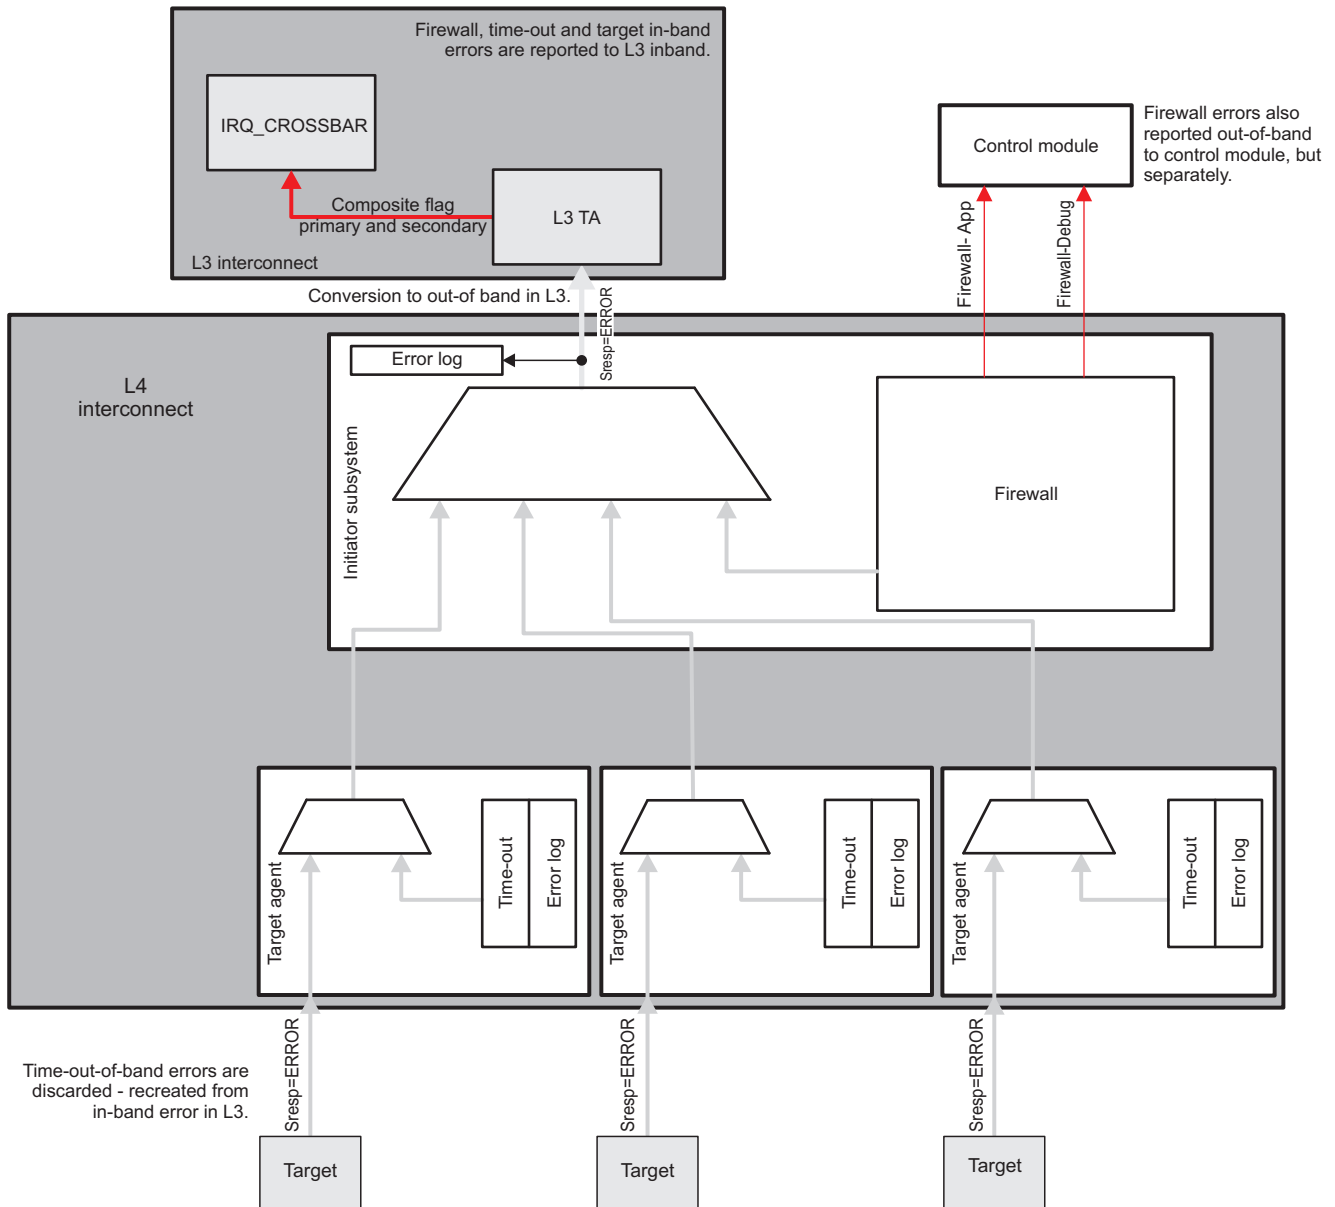

**14.3.3.4.3 Error Reporting**

[Figure 14-13](#) shows the error-reporting scheme used in the L4 interconnects. All L4 in-band errors are reported to their respective L3 TA, where errors are converted in an out-of band error signal (the L3 applicative and debug composite flags) going to the L3 INTCs.

Two levels of mask are present to report the error at INTC level:

- At the applicative and debug composite flag, to enable interrupt reporting, the following bits must be set:
  - L4\_CFG in L3\_FLAGMUX\_MASK0 and L3\_FLAGMUX\_STATUS1
  - L4\_PER in L3\_FLAGMUX\_MASK0 and L3\_FLAGMUX\_STATUS1
- At the L3 TA level, see [Section 14.2.1](#), *L3 Interconnect*.

Figure 14-13. L4 Error Reporting

icnt-017

#### 14.3.3.4.4 Error Recovery

Setting the **L4\_TA\_AGENT\_CONTROL\_L[0] OCP\_RESET** bit to 1 initiates the software reset period. Software reset must be asserted for at least 16 cycles of the target module interface clock, which can be a divided clock with respect to the L4 clock.

During the software reset period:

- Requests sent to the target module receive error responses. Therefore, if the faulty request is part of a DMA transfer, it is necessary to stop the DMA to prevent unwanted errors.
- Requests sent to the TA register block are processed as usual.
- The **L4\_TA\_AGENT\_STATUS\_L[8] REQ\_TIMEOUT** status bit is cleared.

Setting the **L4\_TA\_AGENT\_CONTROL\_L[0] OCP\_RESET** bit to 0 terminates the software reset period.

Reset the attached module to complete the recovery.

#### 14.3.3.4.5 Firewall Error Logging in the Control Module

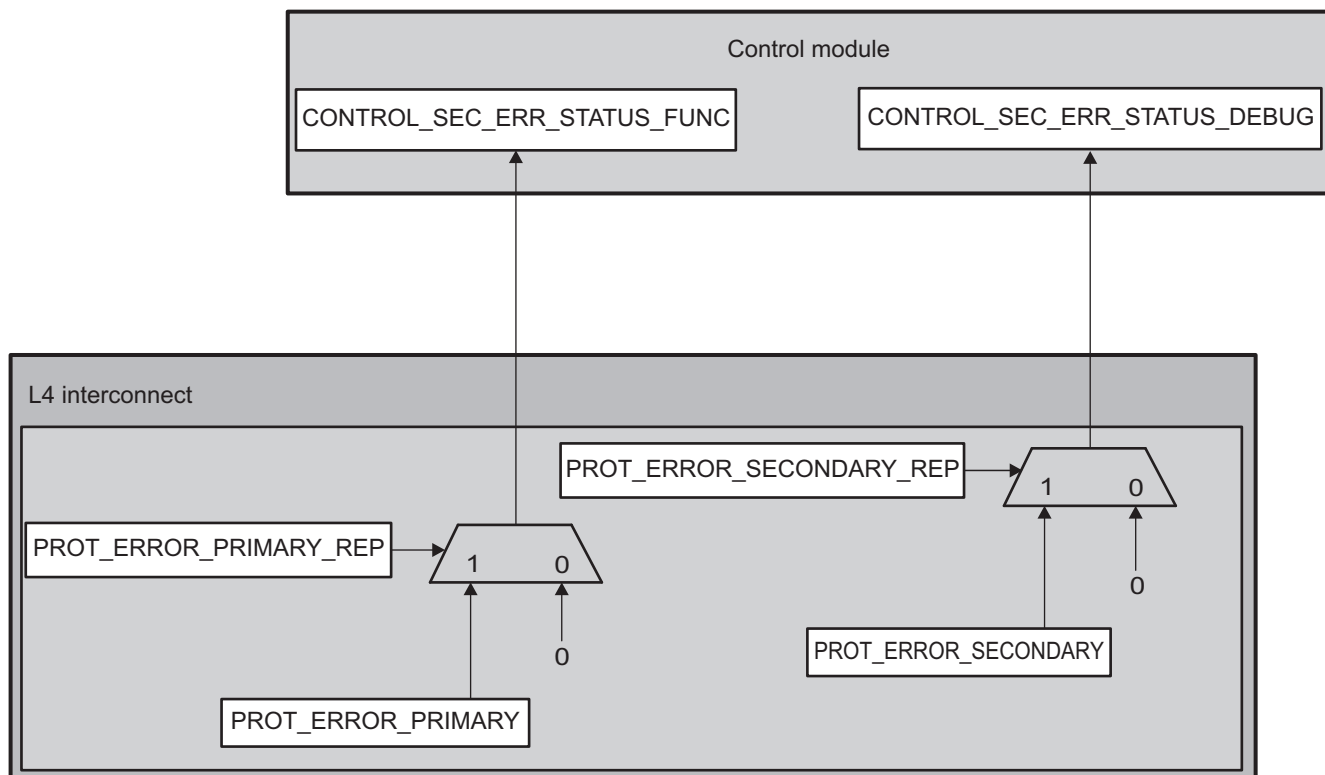

When a protection violation occurs, an interrupt is sent to the INTCs (if enabled). An in-band error is sent back to L3 IA and an out-of-band error can also be logged in the CONTROL.CONTROL\_SEC\_ERR\_STATUS register in the SCM. These out-of-band errors are enabled and disabled at the L4 IA level by setting the [L4\\_IA\\_AGENT\\_CONTROL\\_L\[31\]\[30\]](#) PROT\_ERROR\_SECONDARY\_REP or PROT\_ERROR\_PRIMARY\_REP bit to 1 for debug and application mode, respectively.

At the control module level, two logging registers are used, depending on the mode:

- In application mode or primary error reporting:
  - SEC\_ERR\_STATUS\_FUNC\_1[16] = L4\_PER1 protection violation
  - SEC\_ERR\_STATUS\_FUNC\_2[4] = L4\_PER2 protection violation
  - SEC\_ERR\_STATUS\_FUNC\_2[5] = L4\_PER3 protection violation
  - SEC\_ERR\_STATUS\_FUNC\_1[17] = L4\_CFG protection violation
  - SEC\_ERR\_STATUS\_FUNC\_1[22] = L4\_WKUP protection violation
- In debug mode or secondary error reporting:
  - SEC\_ERR\_STATUS\_DEBUG\_1[16] = L4\_PER1 protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_2[4] = L4\_PER2 protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_2[5] = L4\_PER3 protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[17] = L4\_CFG protection violation
  - SEC\_ERR\_STATUS\_DEBUG\_1[22] = L4\_WKUP protection violation

Figure 14-14 shows the global protection error reporting to the control module.

**Figure 14-14. Protection Violation Out-of-Band Error Reporting**

## 14.3.4 L4 Interconnect Programming Guide

### 14.3.4.1 L4 Interconnect Low-level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L4 interconnect module.

#### 14.3.4.1.1 Global Initialization

##### 14.3.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the L4 interconnect module is used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the L4 interconnect. For more information, see [Section 14.3.2, L4 Interconnect Integration](#).

[Table 14-403](#) lists the surrounding modules.

**Table 14-403. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	For more information about the configuration of the module, see <a href="#">Section 3.6</a> , in <i>Power, Reset, and Clock Management</i> .
Control module	For more information about the configuration of the module, see <a href="#">Chapter 18</a> , <i>Control Module</i> .
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see <a href="#">Chapter 17</a> , <i>Interrupt Controllers</i> .
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see <a href="#">Section 18.4.6.4</a> , <i>IRQ_CROSSBAR Module Functional Description</i> , in <a href="#">Chapter 18</a> , <i>Control Module</i> .
L3 interconnect	For more information about the interconnect configuration, see <a href="#">Section 14.2.1</a> , <i>L3 Interconnect</i> .

#### 14.3.4.1.2 Operational Modes Configuration

##### 14.3.4.1.2.1 L4 Interconnect Error Analysis Mode

###### 14.3.4.1.2.1.1 Main Sequence: L4 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 14-15](#) shows the software sequence required in most cases.

Figure 14-15. Typical Error Analysis Sequence

icnt-019

**NOTE:** L4 interconnects don't log any address or other specific information for a custom error returned from any target IP. They rather pass an error response up to the master supposed to analyze it.

In case of posted writes, the master access completes before it actually completed at the end slave level, this way no error response is sent back to the master, making it impossible to have a direct way of understanding the origin of L4 error during posted writes. However, even though no address is logged, an error flag is generated and needs to be processed.

14.3.4.1.2.1.2 Subsequence: L4 Interconnect Protection Violation Error Identification

This procedure describes the protection violation error identification (see Table 14-404).

Table 14-404. Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	x
Read initiator ID.	L4_IA_ERROR_LOG_L[13:8] CONNID	xxxxx
Read command that cause the error.	L4_IA_ERROR_LOG_L[2:0] CMD	xxx
Read address of request that caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	xxxxxxxxx
<b>IF:</b> Is it a primary error?	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	=0x1
Read status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_FUNC	xx
Write 1 to clear status bits.	CONTROL.SEC_ERR_STATUS_FUNC_1 [16][17][22] CONTROL.SEC_ERR_STATUS_FUNC_2 [4][5]	xxxx
Write 1 to clear IA status bit.	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	0x1
<b>ELSE</b>		
Read status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_DEB UG	xx

**Table 14-404. Protection Violation Error Identification (continued)**

Step	Register/Bit Field/Programming Model	Value
Write 1 to clear status bits.	CONTROL.SEC_ERR_STATUS_DEBUG_1 [16][17][22] CONTROL.SEC_ERR_STATUS_DEBUG_2 [4][5]	xxx
Write 1 to clear IA status bit	L4_IA_AGENT_STATUS_L[31] PROT_ERROR_SECONDARY	0x1
<b>ENDIF</b>		
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear in-band error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

#### 14.3.4.1.2.1.3 Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification

This procedure describes the identification of unsupported command/address hole error (see [Table 14-405](#)).

**Table 14-405. Unsupported Command/Address Hole Error Identification**

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	x
Read initiator ID.	L4_IA_ERROR_LOG_L[11:8] CONNID	xxxx
Read command that caused the error.	L4_IA_ERROR_LOG_L[2:0] CMD	xxx
Read address of request that caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	xxxxxxxx
Read secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	x
Write 1 to clear secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	0x1
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear inband error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

#### 14.3.4.1.2.1.4 Subsequence: L4 Interconnect Reset TA and Module

This procedure describes the reset TA and module (see [Table 14-406](#)).

**Table 14-406. Reset TA and Module**

Step	Register/Bit Field/Programming Model	Value
Reset TA.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x1
Wait until target module clock = 16 cycles.		
Write 0 to clear TA time-out status.	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	0x0
Write 0 to clear TA reset.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x0
Reset the attached module. <sup>(1)</sup>		

<sup>(1)</sup> For more information, see the respective module chapter.

#### 14.3.4.1.2.2 L4 Interconnect Time-Out Configuration Mode

##### 14.3.4.1.2.2.1 Main Sequence: L4 Interconnect Time-Out Configuration Mode

This procedure describes the time-out configuration sequence (see [Table 14-407](#)).

**Table 14-407. Time-Out Configuration**

Step	Register/Bit Field/Programming Model	Value
Disable time-out.	L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE	0x0

**Table 14-407. Time-Out Configuration (continued)**

Step	Register/Bit Field/Programming Model	Value
Clear TA time-out error status. <sup>(1)</sup>	L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT	0x1
Set time-out at TA level. <sup>(1)</sup>	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	xxx
Set time-out base.	L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE	xxx

<sup>(1)</sup> Required for each TA.

### 14.3.4.1.2.3 L4 Interconnect Firewall Configuration Mode

#### 14.3.4.1.2.3.1 Main Sequence: L4 Interconnect Firewall Configuration Mode

This procedure describes the firewall configuration sequence (see [Table 14-408](#)).

**Table 14-408. Firewall Configuration**

Step	Register/Bit Field/Programming Model	Value
Define the members of protection group k. <sup>(1)</sup>	L4_AP_PROT_GROUP_MEMBERS_k_L[15:0] CONNID_BIT_VECTOR	xxx
Define the access type of a protection group k. <sup>(1)</sup>	L4_AP_PROT_GROUP_ROLES_k_L[15:0] ENABLE	xx
Set region affiliation to protection group. <sup>(2)</sup>	L4_AP_REGION_I_L[22:20] PROT_GROUP_ID	xxx

<sup>(1)</sup> Required for each protection group.

<sup>(2)</sup> Required for each region.

### 14.3.5 L4 Interconnects Register Manual

Table 14-409 through Table 14-413 list all L4 register blocks for IA, TA, AP, and LA. Each module instance is shown with the module register mapping and bit and bit field definitions.

#### 14.3.5.1 L4 Interconnects Instance Summary

**Table 14-409. L4\_PER1 Instance Summary**

Module Name	L3_MAIN Base Address	Size

<b>Physical Address</b>	0x4800 0824 0x4840 0824 0x4880 0824 0x4A00 0824 0x4AE0 0824		
<b>Description</b>	Control interconnect global power control		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CLOCK_GATE_DISABLE	RESERVED		THREAD0_PRI	RESERVED								EXT_CLOCK	RESERVED										

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Read returns 0.	R	0x00
24	CLOCK_GATE_DISABLE	When set to 1 this field disables all clock gating.	RW	0
23:21	RESERVED	Read returns 0.	R	0x0
20	THREAD0_PRI	Sets thread priority. If the field is set to 0, the default, all initiator threads are treated the same. Setting the THREAD0_PRI field to 1 assigns a higher arbitration priority to thread 0 of the first initiator OCP interface. To avoid starvation, arbitration is imposed by the initiator subsystem. When multiple requests from different initiator threads are dispatched to targets simultaneously, the oldest request is dispatched first. If thread 0 is assigned a higher priority, a request on thread 0 always wins arbitration. Assigning thread 0 of the first initiator OCP the highest priority on a request or response can result in the starvation of other threads.	R	1
19:9	RESERVED	Read returns 0.	R	0x000
8	EXT_CLOCK	Global external clock control. When set to 1, the ext_clk_off_i signal on the initiator subsystem instructs the entire L4 to shut off.	R	1
7:0	RESERVED	Read returns 0.	R	0x00

## Memory Subsystem

---

---

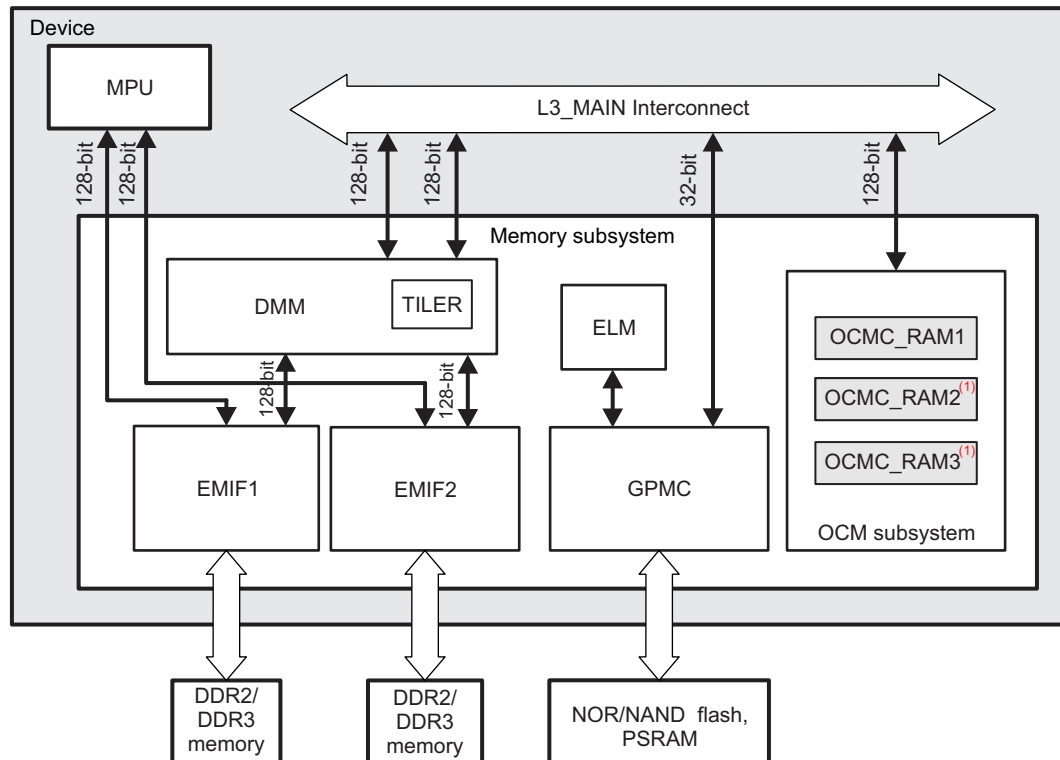

This chapter introduces the memory subsystem of the device.

Topic	Page
15.1 Memory Subsystem Overview .....	3512
15.2 Dynamic Memory Manager .....	3517
15.3 EMIF Controller.....	3609
15.4 General-Purpose Memory Controller .....	3756
15.5 Error Location Module.....	3902
15.6 On-Chip Memory (OCM) Subsystem .....	3932

## 15.1 Memory Subsystem Overview

Figure 15-1 shows a functional diagram of all memory subsystems in the device.

**Figure 15-1. Memory Subsystem Functional Diagram**

(1) OCMC\_RAM2 and OCMC\_RAM3 banks are not present on DRA74x devices, but are included in some of the DRA75x devices. For details, see the device data manual.

memss\_over-001

### 15.1.1 DMM Overview

The dynamic memory manager (DMM) module is typically located immediately in front of the SDRAM controllers (EMIFs), as shown in Figure 15-1, *Memory Subsystem Functional Diagram*.

In a broad sense, the DMM manages various aspects of memory accesses such as:

- Initiator-indexed priority generation
- Multizone SDRAM interleaving configuration
- Block object transfer optimization – tiling
- Centralized low-latency page translation – MMU-like feature

The dynamic qualifier for memory management highlights the software configurability, and hence the runtime nature, of the four aspects of memory management handled by the DMM.

From a functional perspective, the role of the DMM is to:

- Add initiator-based priority to any incoming requests
- Perform to/from tiling conversions of tiled requests
- Make on-the-fly basic transforms, such as quadrant rotations and mirroring
- Optionally, provide a low-latency page-based translation to handle memory fragmentation – MMU
- Distribute the traffic on all attached memory controllers according to the interleaving configuration

The main features of the DMM are:

- Programmable multizone DRAM mapping and interleaving configuration
- Programmable initiator-based request priority extension

- Multichannel memory transfer optimization
- Single SDRAM page request generation
- Low-latency interconnect port
- Page-grained address translation to manage memory fragmentation
- Automatic synchronized reloading of the address translation table

### 15.1.2 TILER Overview

The tiling and isometric lightweight engine for rotation (TILER) is a submodule of the DMM and is therefore described in [Section 15.2, Dynamic Memory Manager](#).

The TILER is intended to improve bidimensional (tiled) block transfer efficiency. It is, therefore, a module aimed at:

- Primarily, efficient handling of 2-dimension (2D) data mapped in tiles, such as video or graphics macroblocks
- Optionally, managing the memory fragmentation and zero-copy physical frame-buffer swapping through a page-grained translation
- Making isometric (distance preserving) transforms, such as 90-, 180-, or 270-degree rotations, with a horizontal or vertical reflection

The lightweight qualifier of this engine highlights its limited support of isometric transforms, as:

- Rotation performs only basic quadrant rotations by some multiple of 90 degrees.
- Reflection is limited to horizontal and vertical flip.
- Translation is restricted to a 4-KiB page granularity.

Written differently, the functionality of the TILER is to map a 2D virtually addressed interconnect request into one or more physically addressed interconnect requests by:

- Transforming the virtual address, data, and byte-enable to match the requested 0-, 90-, 180-, or 270-degree orientation in a tiled 2D addressing space
- Optionally, translating the oriented tiled address by a page-specific vector to manage memory fragmentation and physical object aliasing

The main features of the TILER are:

- Efficiency improvement of 2D block access on SDRAMs
- Optimized interlaced access on tiled frames
- 2D virtual-to-physical address translation of SDRAM bidimensional objects to handle rotation
- Page-grained address translation to manage memory fragmentation and physical buffer aliasing
- Unlimited number of 2D tiled objects supported in any (0, 90, 180, or 270 degrees) orientation
- Full bandwidth use by minimizing the size of raster-based initiator buffers
- Optimization of multichannel memory transfers
- Interconnect request granularity balance (in X and Y directions)

### 15.1.3 EMIF Overview

The two external memory interface (EMIF) modules are typically located near the DMM module, as shown in [Figure 15-1, Memory Subsystem Functional Diagram](#).

The EMIF module provides connectivity between DDR memory types and manages data bus read/write accesses between external memories and device subsystems which have master access to the L3\_MAIN interconnect and DMA capability.

Each EMIF module has the following capabilities:

- Supports JEDEC standard-compliant DDR2-SDRAM and DDR3-SDRAM memory types
- 2-GiB SDRAM address range over one chip-select. This range is configurable through the dynamic memory manager (DMM) module
- Supports SDRAM devices with one, two, four or eight internal banks

- Supports SDRAM devices with single die (one chip select supported)
- Data bus widths:
  - 128-bit L3\_MAIN (system) interconnect data bus width
  - 128-bit port for direct connection with MPU subsystem
  - 32-bit SDRAM data bus width
  - 16-bit SDRAM data bus width used in narrow mode
- Supported CAS latencies:
  - DDR3: 5, 6, 7, 8, 9, 10 and 11
  - DDR2: 2, 3, 4, 5, 6 and 7
- Supports 256-, 512-, 1024-, and 2048-word page sizes
- Supported burst length: 8
- Supports sequential burst type
- SDRAM auto initialization from reset or configuration change
- Supports self refresh and power-down modes for low power
- Partial array self-refresh mode for low power when DDR3 is used
- Output impedance (ZQ) calibration for DDR3
- Supports on-die termination (ODT) for DDR2 and DDR3
- Supports prioritized refresh
- Programmable SDRAM refresh rate and backlog counter
- Programmable SDRAM timing parameters
- Write and read leveling/calibration and data eye training for DDR3.
- ECC on the SDRAM data bus for EMIF1 only:
  - 7-bit ECC over 32-bit data
  - 6-bit ECC over 16-bit data when narrow mode is used
  - 1-bit error correction and 2-bit error detection
  - Programmable address ranges to define ECC protected region
  - ECC calculated and stored on all writes to ECC protected address region
  - ECC verified on all reads from ECC protected address region
  - Statistics for 1-bit ECC and 2-bit ECC errors
  - The total width of the ECC DDR data bus is 8 bits

The EMIF modules do not support:

- Burst chop for DDR3
- Interleave burst type
- Auto precharge because of better Bank Interleaving performance
- OCD calibration for DDR2
- CAS Read Latency of 2 and CAS Write Latency of 1 for DDR2
- DLL disabling from EMIF side
- SDRAM devices with more than one die, or topologies which require more than one chip select on a single EMIF channel

### **15.1.4 GPMC Overview**

The General Purpose Memory Controller (GPMC) is an external memory controller of the device. Its data access engine provides a flexible programming model for communication with all standard memories.

The GPMC supports the following various access types:

- Asynchronous read/write access
- Asynchronous read page access (4, 8, and 16 Word16)

- Synchronous read/write access
- Synchronous read/write burst access without wrap capability (4, 8 and 16 Word16)
- Synchronous read/write burst access with wrap capability (4, 8 and 16 Word16)
- Address-data-multiplexed (AD) access
- Address-address-data (AAD) multiplexed access
- Little- and big-endian access

The GPMC can communicate with a wide range of external devices:

- External asynchronous or synchronous 8-bit wide memory or device (non burst device)
- External asynchronous or synchronous 16-bit wide memory or device
- External 16-bit non-multiplexed NOR flash device
- External 16-bit address and data multiplexed NOR Flash device
- External 8-bit and 16-bit NAND flash device
- External 16-bit pseudo-SRAM (pSRAM) device

The main features of the GPMC are:

- 8- or 16-bit-wide data path to external memory device
- Supports up to eight CS regions of programmable size and programmable base addresses in a total address space of 1 GiB
- Supports transactions controlled by a firewall
- On-the-fly error code detection using the Bose-Chaudhuri-Hocquenghem (BCH) ( $t = 4, 8, \text{ or } 16$ ) or Hamming code to improve the reliability of NAND with a minimum effect on software (NAND flash with 512-byte page size or greater)
- Fully pipelined operation for optimal memory bandwidth use
- The clock to the external memory is provided from GPMC functional clock divided by 1, 2, 3, or 4
- Supports programmable autoclock gating when no access is detected
- Independent and programmable control signal timing parameters for setup and hold time on a per-chip basis. Parameters are set according to the memory device timing parameters, with a timing granularity of one GPMC functional clock cycle.
- Flexible internal access time control (WAIT state) and flexible handshake mode using external WAIT pin monitoring
- Support bus keeping
- Support bus turnaround
- Prefetch and write posting engine associated with a device DMA controller to achieve full performance from the NAND device with minimum effect on NOR/SRAM concurrent access

---

**NOTE:** Page mode is available only in nonmultiplexed mode.

---

### 15.1.5 *ELM Overview*

In the case of NAND modules with no internal correction capability, sometimes referred to as bare NAND, the correction process can be delegated to the error location module (ELM) used in conjunction with the GPMC.

The ELM supports the following features:

- 4, 8, and 16 bits per 512-byte block error location based on BCH algorithm
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation when error location process completes:
  - When the full page has been processed in page mode
  - For each syndrome polynomial (checksum-like information) in continuous mode

### 15.1.6 OCM Overview

The on-chip memory (OCM) subsystem consists of the following OCM controllers (OCMC):

- Up to three OCMC connected to an on-chip RAM. Presence of RAM banks is device part number dependent. Refer to device Data Manual for more information.

An OCM Controller supports the following features:

- L3\_MAIN data interface:
  - Used for maximum throughput performance
  - 128-bit data bus width
  - Burst supported
- L4 interface:
  - Used for access to configuration registers
  - 32-bit data bus width
  - Only single accesses supported
  - The L4 associated OCMC clock is two times lower than the L3 associated OCMC clock
- Error correction and detection:
  - Single error correction and dual error detection
  - 9-bit Hamming error correction code (ECC) calculated on 128-bit data word which is concatenated with memory address bits
  - Hamming distance of 4
  - Enable/Disable mode control through a dedicated register
  - Single bit error correction on a read transaction
  - Exclusion of repeated addresses from correctable error address trace history
  - ECC valid for all write transactions to an enabled region
  - Sub-128-bit writes supported via read modify write
- ECC Error Status Reporting:
  - Trace history buffer (FIFO) with depth of 4 for corrected error address
  - Trace history buffer with depth of 4 for non correctable error address and also including double error detection
  - Interrupt generation for correctable and uncorrectable detected errors
- ECC Diagnostics Configuration:
  - Counters for single error correction (SEC), double error detection (DED) and address error events (AEE)
  - Programmable threshold registers for exceptions associated with SEC, DED and AEE counters
  - Register control for enabling and disabling of diagnostics
  - Configuration registers and ECC status accessible through L4 interconnect
- Circular buffer for sliced based VIP frame transfers:
  - Up to 12 programmable circular buffers mapped with unique virtual frame addresses
  - On the fly (with no additional latency) address translation from virtual to OCMC circular buffer memory space
  - Virtual frame size up to 8 MiB and circular buffer size up to 1 MiB
  - Error handling and reporting of illegal CBUF addressing
  - Underflow and Overflow status reporting and error handling
  - Last access read/write address history
- Two Interrupt outputs configured independently to service either ECC or CBUF interrupt events

The OCM controllers do not have a memory protection logic and do not support endianism conversion.

## 15.2 Dynamic Memory Manager

### 15.2.1 DMM Overview

The function of the dynamic memory manager (DMM) is to:

- Add initiator-based priority to any incoming requests
- Perform to-and-from tiling and subtiling conversions of tiled requests
- Make on-the-fly basic transforms, such as quadrant rotations and mirroring
- Optionally provide a low-latency page-based translation to handle memory fragmentation – memory management unit (MMU)
- Distribute the traffic on all attached memory controllers according to the interleaving configuration

The DMM is introduced also in [Section 15.1.1, DMM Overview](#) of [Section 15.1, Memory Subsystem Overview](#).

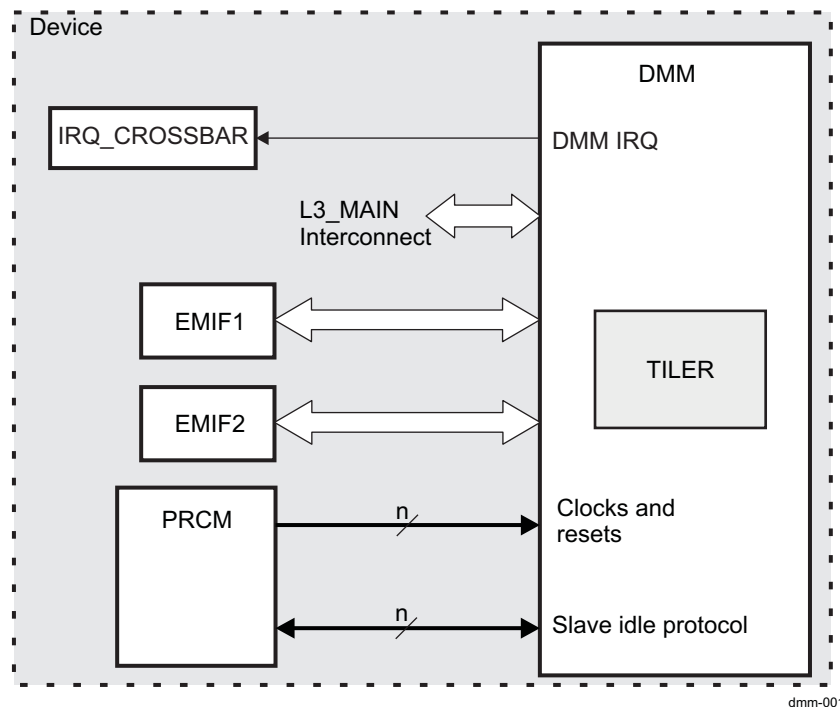

The functions of the TILER are:

- Primary handling efficiently 2-dimensional (2D) data mapped in tiles, such as video or graphics macroblocks
- Optionally managing the memory fragmentation and zero-copy physical frame buffers swapping through a page-grained translation
- Allowing optimized interlaced accesses on tiled frames
- Making (distance preserving) transforms, such as 90-, 180-, or 270-degree rotations, with a horizontal or vertical reflection
- Interleaving the memory accesses among the two memory controllers (also called EMIF).

The TILER is also introduced in [Section 15.1.2, TILER Overview](#) of [Section 15.1, Memory Subsystem Overview](#).

Figure 15-2 is an overview of the DMM and TILER in the device.

**Figure 15-2. DMM and Tiler Overview**

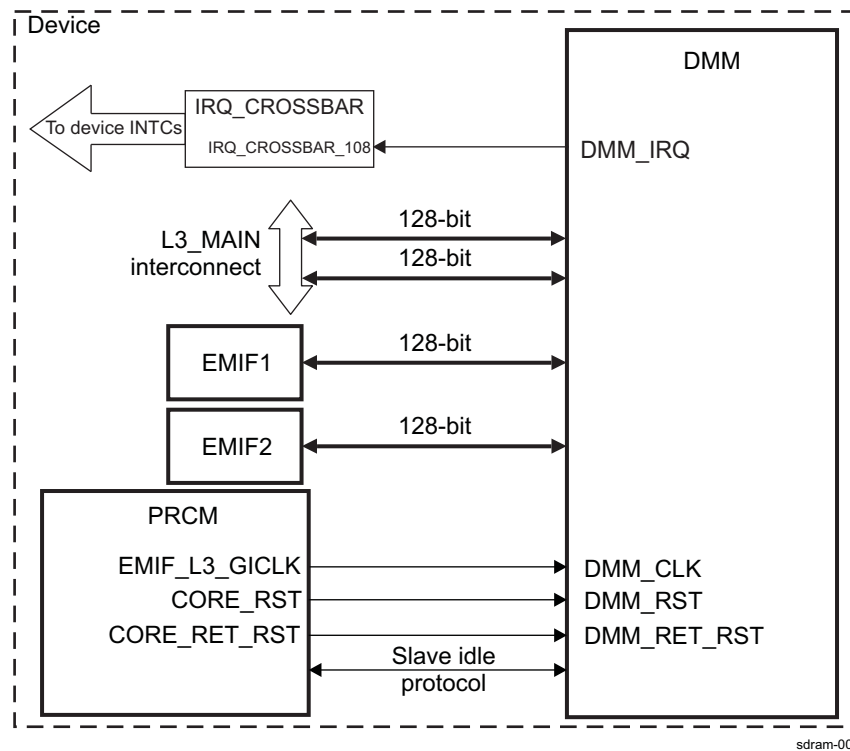

### 15.2.2 DMM Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

- Slave idle protocol (the DMM supports only smart-idle mode)
- No master standby protocol
- No wake-up request
- No system direct memory access (sDMA) requests
- One interrupt line for interrupt request (IRQ)
- One functional clock

Figure 15-3 shows the integration of DMM in the device.

Figure 15-3. DMM Integration

**NOTE:** For more information about the slave idle protocol, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 15-1 through Table 15-3 summarize the integration of DMM in the device.

Table 15-1. DMM Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
DMM	PD_COREAON	No	L3_MAIN

Table 15-2. DMM Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description

**Table 15-2. DMM Clocks and Resets (continued)**

Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DMM	DMM_CLK	EMIF_L3_GICLK	PRCM	DMM interface and functional clock. For information about power, reset, and clock management (PRCM) module clock gating and management, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
<b>Resets</b>				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DMM	DMM_RST	CORE_RST	PRCM	Functional reset. For information about PRCM reset sources and distribution, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
DMM	DMM_RET_RST	CORE_RET_RST	PRCM	Reset for the following registers: <a href="#">DMM_SYSCONFIG</a> <a href="#">DMM_LISA_LOCK</a> <a href="#">DMM_LISA_MAP_i</a> <a href="#">DMM_TILER_OR0</a> <a href="#">DMM_TILER_OR1</a> <a href="#">DMM_PAT_VIEW0</a> <a href="#">DMM_PAT_VIEW1</a> <a href="#">DMM_PAT_VIEW_MAP_i</a> <a href="#">DMM_PAT_VIEW_MAP_BASE</a> <a href="#">DMM_PAT_DESCR_i</a> <a href="#">DMM_PAT_AREA_i</a> <a href="#">DMM_PAT_CTRL_i</a> <a href="#">DMM_PAT_DATA_i</a> <a href="#">DMM_PEG_PRIO_k</a> <a href="#">DMM_PEG_PRIO_PAT</a> For information about PRCM reset sources and distribution, see <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .

	<a href="#">DMM_PAT_GEOMETRY</a> [13:8] ADDR_RANGE	0x10	2-GiB PAT output physical address range
	<a href="#">DMM_PAT_HWINFO</a> [6:0] VIEW_CNT	0x10	16 view entries
	<a href="#">DMM_PAT_HWINFO</a> [11:8] VIEW_MAP_CNT	0x4	Four view maps
	<a href="#">DMM_PAT_HWINFO</a> [20:16] LUT_CNT	0x1	One PAT LUT
PEG	<a href="#">DMM_PAT_HWINFO</a> [28:24] ENGINE_CNT	0x4	Four PAT refill engines
	<a href="#">DMM_PEG_HWINFO</a> [6:0] PRIO_CNT	0x40	64 priority entries

### 15.2.3 DMM Functional Description

#### 15.2.3.1 DMM Block Diagram

[Figure 15-4](#) shows the DMM macro architecture. The DMM consists of six blocks:

- Two TILERS, each with its own interconnect slave port for converting requests back and forth between the input virtual addressing mode and the output physical tiled addressing mode. The tiling conversions of requests, write data, and responses is performed entirely in the TILER blocks.
- Two reordering buffer and initiator nodes (ROBINS), each with its own interconnect master port to initiate requests to the SDRC and allow tiled data, tiled response, and split response reconstruction. The ROBIN block manages only the reordering buffer and performs data reordering due to the orientation.
- A physical address translator (PAT) for managing the memory fragmentation
- A priority extension generator (PEG) to generate priorities required by the SDRC; these priorities are not used in the DMM.
- A local interconnect and synchronization agent (LISA) to synchronize all DMM subsystems and provide access to their configuration registers

[Figure 15-4](#) is a block diagram of the DMM.

Figure 15-4. DMM Block Diagram

**CAUTION**

The interconnect must ensure that virtually addressed requests target only a TILER port.

### 15.2.3.2 DMM Clock Configuration

Table 15-5 describes the DMM clocks.

Table 15-5. DMM Clocks

Signal	I/O <sup>(1)</sup>	Description
DMM_CLK	I	Functional and interface clock

<sup>(1)</sup> I = Input; O = Output

The DMM is concerned with SDRC management and is in the MEMIF clock domain among the SDRCs. The DMM is a fully synchronous module, which uses the clock and clock-enable signals provided in the MEMIF clock domain to generate its interface and functional clocks.

To configure DMM\_CLK control and settings, see Table 15-2.

### 15.2.3.3 DMM Power Management

DMM power is supplied by the CORE power domain, and DMM power management complies with system power-management guidelines.

Table 15-6 describes the power-management features available for the DMM module.

**Table 15-6. DMM Local Power-Management Features**

Feature	Registers	Description
Slave idle modes	<a href="#">DMM_SYSCONFIG</a> [3:2] SIDLEMODE bit field	Only smart-idle wake-up mode is available.

Some of the DMM module registers are affected by the save-and-restore (SAR) mechanism. For more information about SAR, see [Chapter 3, Power, Reset, and Clock Management](#).

### 15.2.3.4 DMM Interrupt Requests

Errors in PAT area refill registers are reported through the [DMM\\_PAT\\_STATUS\\_i](#)[15:10] ERROR bit field (see [Table 15-7](#)).

**Table 15-7. DMM Hardware Status Features**

Feature	Type	Register	Description
PAT error flags	Read-only	<a href="#">DMM_PAT_STATUS_i</a> [15:10] ERROR (where i = 0 to 3)	Unexpected update of the PAT area refill registers

[Table 15-8](#) lists the event flags, and their masks, that can cause module interrupts.

**Table 15-8. Events**

Interrupt	Event Flag	Event Mask

### 15.2.3.5 DMM

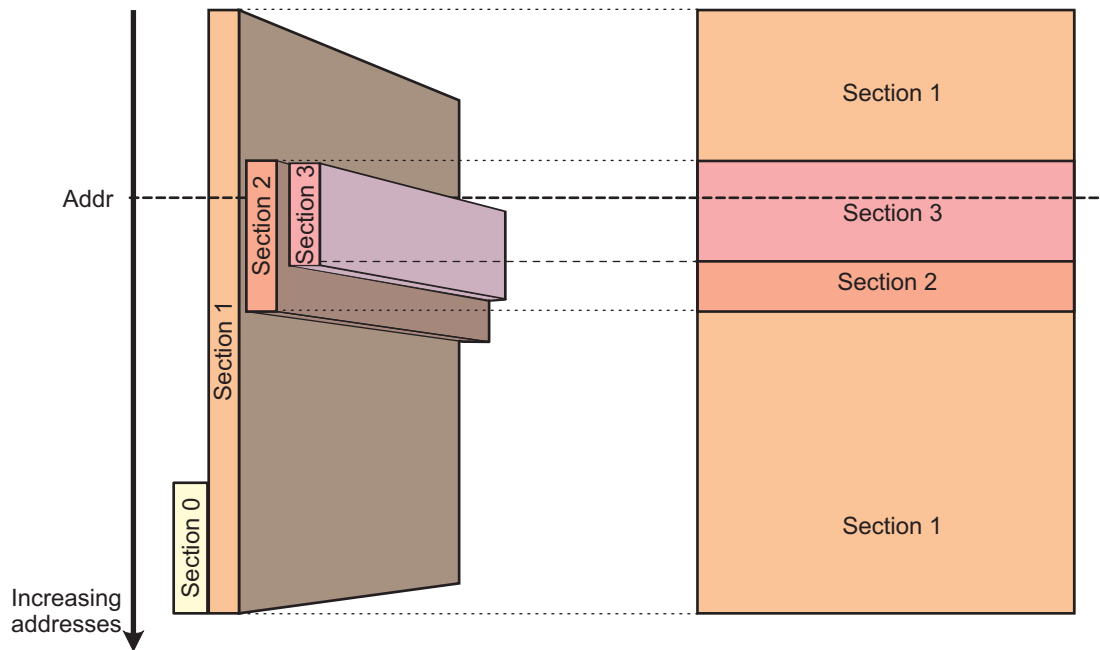

#### 15.2.3.5.1 DMM Concepts

The DMM introduces the concepts of dynamic mapping and DMM atomic units.

##### 15.2.3.5.1.1 Dynamic Mapping

The DMM manages its internal memory space as an ordered set of up to four sections. [Figure 15-5](#) shows the DMM sections and memory mapping.

**Figure 15-5. DMM Sections and Memory Mapping**

sdrum\_004

In the DMM, a section is:

- A segment of 16MiB to 2GiB, which is power-of-two in size and aligned to that size in the system map
- An area with a constant interleaving scheme: constant interleaving granularity on a constant set of

SDRC (EMIF) targets

- Given a priority equal to its index: the higher the index, the higher the priority

---

**NOTE:** Whenever a request hits more than one DMM section, it follows the interleaving scheme of the section having the highest index.

---

The interleaving configuration of the DMM, its section-based dynamic memory mapping, is shown on the right in [Figure 15-5](#). In this example, a request at the system address Addr follows the interleaving scheme of section 3, although it hits sections 1, 2, and 3. Similarly, the DMM configuration given in this example prevents any request from using the interleaving scheme of section 0, because section 0 is fully masked by section 1, which has a higher priority.

Each of the four sections is configured through a [DMM\\_LISA\\_MAP\\_i](#) register, where  $i = 0$  to 3.

---

**NOTE:** The DMM and EMIF registers (see [Section 15.3, EMIF Controller](#)) are declared in two extra static DMM sections of the highest priority so that they cannot be masked by any standard programmable DMM section.

---

**NOTE:** The DMM atomic size is:

- 1KiB in noninterleaved sections
  - Equal to the interleaving granularity (128, 256, or 512 bytes) in interleaved sections
- 

#### 15.2.3.5.1.2 Address Mapping

The address mapping inside the DMM is configurable through up to four sections. A DMM section description fits in a single register ([DMM\\_LISA\\_MAP\\_i](#)). Each section is defined based on:

- Its system address: The base address of the decoding range for the section
- Its size: The encoding is the number of bits used in the upper 8 bits of the incoming system address
- Its physical address: The base address of the memory range access in the external memory controller
- Its address space: The address space used on the external memory controller (for the DMM) when hitting this section. For details, see [Section 15.3.4.1.1, Local Interface](#) in [Section 15.3, EMIF Controller](#).
- The target memory controller. A section may hit a single or pair of controllers.
- Its interleaving definition

The address decoding is priority-based. In case of overlapping sections, only the highest-order one is hit. Register memory spaces have priority over regular memory sections. In case of four sections, the priority order is therefore:

1. Registers
2. DMM\_LISA\_MAP\_3
3. DMM\_LISA\_MAP\_2
4. DMM\_LISA\_MAP\_1
5. DMM\_LISA\_MAP\_0

All register-related addresses are reserved and fixed in the overall address mapping:

- DMM registers: 0x4E00\_0000 to 0x4FFF\_FFFF
- EMIF1 registers: 0x4C00\_0000 to 0x4CFF\_FFFF
- EMIF2 registers: 0x4D00\_0000 to 0x4DFF\_FFFF

There is no overlapping between register sections.

---

**NOTE:** Section decoding happens after PAT address translation in the case of TILER. In non-bypass mode, the system address considered for TILER accesses is the virtual address computed based on the PAT translation tables.

---

The [DMM\\_LISA\\_LOCK](#) register is used to lock the configuration once set. If written to 1, the LOCK bit prevents further writes to all [DMM\\_LISA\\_MAP\\_i](#) registers. The LOCK bit cannot be written back to 0. A reset is required to reprogram the sections.

### 15.2.3.5.1.3 Address Translation

The PAT engine of the DMM is composed of a 32-k entry physical address translation vector table and one or two refill engines. The refill engine is a specialized DMA for refilling the content of the PAT table.

The address translation mechanism is available only when the incoming request hits a page mode or tiled mode container; that is, when the incoming address targets the TILER or its aliased view in the system addressing space. Otherwise, the PAT logic is bypassed so that the resulting physical address corresponds to the input address.

The PAT engine supports multiple address translation schemes, called views, which can be bound to one or more initiators through a view mapping mechanism.

#### 15.2.3.5.1.3.1 PAT View Mappings

The PAT engine can have up to 16 groups of initiators that share a set of four PAT views. The connection from an initiator to a PAT view is made through the [DMM\\_PAT\\_VIEW](#) register. Given that each PAT view index is coded on 4 bits, the [DMM\\_PAT\\_VIEW](#) register is a 64-bit register split into two 32-bit registers ([DMM\\_PAT\\_VIEW0](#) for the first eight PAT view indexes and [DMM\\_PAT\\_VIEW1](#) for the last eight PAT view indexes).

The PAT view index that corresponds to the initiator having the value *i* as the 4 most-significant bits (MSBs) of its L3 ConnID uses the view referenced in entry *i* of the [DMM\\_PAT\\_VIEW](#). For example, the initiator 0xC7 uses the thirteenth view index of the [DMM\\_PAT\\_VIEW](#) register, the fifth view index in the [DMM\\_PAT\\_VIEW1](#) register.

The PAT view index of the initiator *i* is found in the *Vi* field. The *Wi* field is aimed at writing the corresponding *Vi*. When writing to the [DMM\\_PAT\\_VIEW](#) registers, the only *Vi* view indexes that are updated are those having their corresponding *Wi* bit, and byte enable, set. The *Wi* bits are always read as 0. For instance, to set the PAT view indexes V3 and V7 to 2 and 1, respectively, the [DMM\\_PAT\\_VIEW0](#) register must be written with 5000 6000h.

#### 15.2.3.5.1.3.2 PAT View Map Base Address

The PAT view map base address defines the base address of all PAT translated addresses.

Bit [31] of all PAT translated addresses is set to [BASE\\_ADDR](#). For example, if the [DMM\\_PAT\\_VIEW\\_MAP\\_BASE](#) register is set to 8000 0000h, all PAT translated addresses will have bit [31] set to 1 so that the translated addresses range from 8000 0000h to FFFF FFFFh. All reserved bits of this DMM PAT base address register are read to 0.

#### 15.2.3.5.1.3.3 PAT Views

A PAT view defines the kind of physical address translation to perform for each mode accesses (page, 8-bit, 16-bit and 32-bit). Each mode of each PAT view can be configured to use a container-grained translation or page-mode translation.

##### 15.2.3.5.1.3.3.1 PAT Direct Access Translation

The container-grained translation is named the direct access. In this mode, the translation vector is given directly by the [CONT\\_x](#) bit field that corresponds to the accessed mode.

- A page mode access uses the vector contained in the [DMM\\_PAT\\_VIEW\\_MAP\\_i\[26:24\]](#) [CONT\\_PAGE](#) bit field concatenated with 1 (bit 27 of translated address).
- A 32-bit mode access uses the vector contained in the [DMM\\_PAT\\_VIEW\\_MAP\\_i\[18:16\]](#) [CONT\\_32](#) bit field concatenated with 0 (bit 27 of translated address).
- A 16-bit mode access uses the vector contained in the [DMM\\_PAT\\_VIEW\\_MAP\\_i\[10:8\]](#) [CONT\\_16](#) bit field concatenated with 0 (bit 27 of translated address).
- An 8-bit mode access uses the vector contained in the [DMM\\_PAT\\_VIEW\\_MAP\\_i\[2:0\]](#) [CONT\\_8](#) bit field

concatenated with 0 (bit 27 of translated address).

Figure 15-6, PAT Direct Access Translation describes PAT direct access translation .

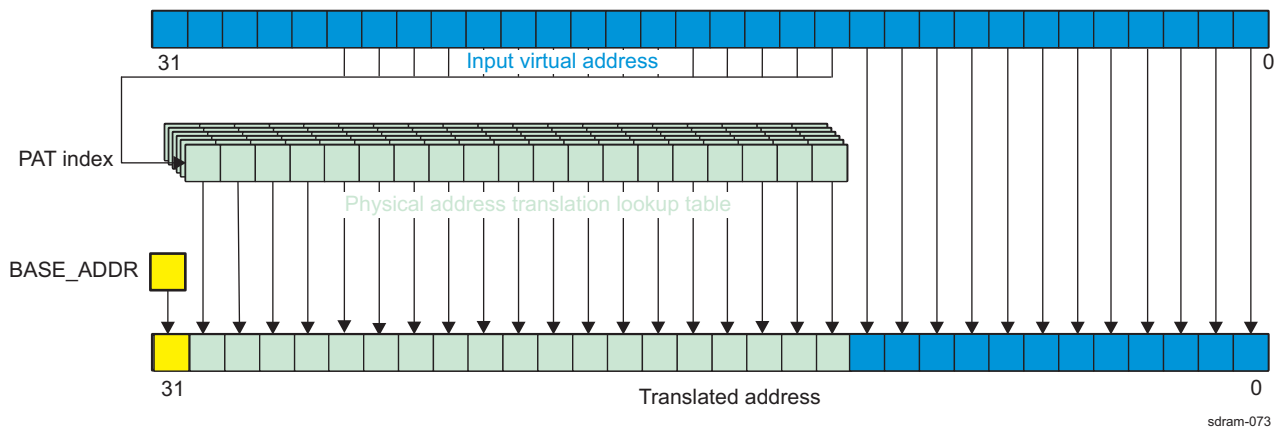

Figure 15-6. PAT Direct Access Translation

15.2.3.5.1.3.3.2 PAT Indirect Access Translation

The page-grained translation is named the indirect access. In this mode the translation vector is found in the internal 32-k entry physical address translation vector table at the index given by bits [26:12] of the input virtual address, and the DMM\_PAT\_VIEW\_MAP\_i CONT\_x bit field references the internal physical address translation table to use. Because the DMM uses only one such table, in this mode the CONT\_x bit field must be written as 0. See Figure 15-7.

Figure 15-7. PAT Indirect Access Translation

Each entry of the PAT lookup table (LUT) is a 19-bit vector that replaces bits [30:12] of the input virtual address. The PAT index aimed at selecting the vector in the table consists of bits [26:12] of the input virtual address.

The mode associated to the transaction is used to define if the upper or lower half of the LUT is effectively used:

- If the mode is 8-, 16- or 32-bit, the lower part of the LUT (indexes 0x0000 to 0x7FFF; that is, lines 0 to 127) is used.
- If the mode is page, the upper part of the LUT (indexes 0x8000 to 0xFFFF; that is, ines 128 to 256) is used.

This means the PAT index used is the concatenation of 0 and address bits 12 to 26 in 8-, 16- or 32-bit mode, and the concatenation of 1 and address bits 12 to 26 in page mode.

Using different LUT indexes depending on the mode enables the user to define a larger tiled space, with the constraint that half of the space can be used only in 8-, 16- or 32-bit mode and the other half only in page mode. If the user wishes to preserve software compatibility with the case CONT\_HGHT = 128, it is required to mirror the configuration for the lower half of the LUT on the upper half of the LUT. In that way, all views see the same address decoding through PAT.

### 15.2.3.5.1.3.3.3 PAT View Configuration

There are four different views in a DMM, each with its own `DMM_PAT_VIEW_MAP_i` register for defining the kind of address translation to perform.

The PAT view type of each mode is selected by the `ACCESS_x` bit field in the `DMM_PAT_VIEW_MAP_i` register, `i` being the index of the considered view. When this field is set to 1, the indirect access scheme is used; otherwise, the PAT performs the address translation in a direct way with the corresponding `CONT_x` vector.

When configuring a mode in a view to use the indirect access, the corresponding `CONT_x` bit field must be filled with 0.

### 15.2.3.5.1.3.3.4 PAT Address Translation LUT

The PAT LUT does not have the same geometry as the DMM container. The PAT LUT has 256 lines of 256 entries of 19 bits each. The geometry of the DMM container is 256 × 128 entries.

- The lower 128MiB are restricted for use with 8-, 16-, and 32-bit modes.
- The upper 128MiB are restricted for use with page mode.

See [Figure 15-8](#).

**Figure 15-8. Physical Address Translation Table**

### 15.2.3.5.1.3.3.5 Direct Access to the PAT Table Vectors

The PAT table is typically refilled with specialized DMA called refill engines. Some direct read and write access to the content of this table is granted when disabling the use of one or the other refill engine by writing 1 in the `MODEi` field of the `DMM_PAT_CONFIG` register that corresponds to the refill engine `i` to disable.

In this mode, often called the debug mode, the data read in or written to the `DMM_PAT_DATA_i` register corresponds to the vector in the PAT table, whose index is in the `X0` and `Y0` fields of the `DMM_PAT_AREA_i` register.

### 15.2.3.5.1.3.3.6 Automatic Refill Through the Refill Engines

See [Section 15.2.4.1](#), *PAT Use Cases*.

## 15.2.3.5.2 DMM Transaction Flows

### 15.2.3.5.2.1 Nontiled Transaction Flow

Each nontiled interconnect transaction that reaches the DMM on a TILER port is subject to the same processing.

The TILER blocks consider separated request, data, and response paths. An overview of each path follows and more detailed information is in [Section 15.2.3.5.3](#), *DMM Internal Macro-Architecture*.

On the request path, the flow consists of:

- Allocating a TILER response context for the timely generation of the appropriate responses
- Splitting 2D requests in a collection of 1D requests – TILER ports
- Splitting requests at DMM unit boundaries; the split granularity is provided by the LISA mapping

registers

- Allocating an available buffer in the appropriate ROBIN, for both read and write requests
- In case of a write request, allocating and updating a TILER write context to direct the incoming write data into the relevant reordering buffer
- Generating the initiator-indexed priority extension by use of the PEG block

On the write data path, the flow consists of forwarding incoming data to the relevant reordering buffer in accordance with the corresponding TILER write context.

On the response path, responses are returned when:

- At least one response has entered each related buffer, in case of read requests.
- All related responses have returned from the SDRC, in case of write requests.
- No other previous pending response with the same tag exists.

#### **15.2.3.5.2.2 Tiled Transaction Flow**

Similarly, each tiled interconnect transaction that reaches the DMM is subject to the same processing.

The TILER blocks consider separated request, data, and response paths. An overview of each path follows, and more detailed information is in [Section 15.2.3.5.3, DMM Internal Macro-Architecture](#).

On the request path, the processing phase consists of:

- Decoding the address to qualify whether the request targets the TILER or the memory directly
- Transforming TILER-specific requests to their natural representation; the address, width, and height are modified accordingly

On the request path, the generation phase consists of:

- Allocating a TILER response context for the timely generation of the appropriate responses
- Splitting malformed: The request stride differs from the container stride and from the double of this container stride – tiled 2D requests in a collection of 1D requests
- Splitting tiled requests at tile boundaries
- Performing the page-based address translation by use of the PAT block
- Allocating an available buffer in the appropriate ROBIN, for read and write requests
- In case of a write request, allocating and updating a TILER write context to direct the incoming write data into the relevant reordering buffer
- Generating the initiator-indexed priority extension by use of the PEG block

On the data path, any incoming data is transformed in accordance with the corresponding TILER write context and sent to the appropriate reordering buffer.

On the response path, responses are returned when:

- A minimal number of responses have entered the corresponding buffers, in case of read requests.
- All related responses have returned from the SDRCs, in case of write requests.
- No other previous pending response with the same tag exists.

#### **15.2.3.5.3 DMM Internal Macro-Architecture**

This section describes the DMM internal macro-architecture, specifically:

- Input request decoding
- PAT and synchronized translation table reloading
- Output request and response generation
- Memory mapping in the system addressing space, including interleaving
- Tag management
- Priority handling
- Contexts

- Maximum allowed burst size
- Reconstruction buffer dimensioning

### 15.2.3.5.3.1 LISA Description

The LISA is a full crossbar aimed at setting priorities, managing tags, and mapping memory.

The interconnect routes are:

- TILER requests on the ROBIN initiator nodes
- TILER write data on the ROBIN write buffers
- ROBIN read data to the relevant TILER initiators

The LISA block registers are [DMM\\_LISA\\_MAP\\_i](#) (where  $i = 0$  to 3) and [DMM\\_LISA\\_LOCK](#).

When two ROBINS are in use, the two ports are interleaved at a programmable boundary from 128 bytes or more (configurable with the [DMM\\_LISA\\_MAP\\_i\[19:18\]](#) SDR\_C\_INTL bit field).

### 15.2.3.5.3.2 PAT Description

The PAT block maps physical pages to each TILER container page. The internal address translation memories used in the PAT block are designed with RFFs. It consists of:

- A memory-based LUT which has the same geometry as the container pages
- A refill engine for modifying entries in a given area of the internal LUT

A PAT descriptor is a singly-linked list node (see [Figure 15-9](#)) that contains:

- A description of the LUT area to reload
- A description of how to reload the defined LUT area
- A pointer to the location where the corresponding LUT entries are stored

**Figure 15-9. PAT Descriptors**

sdram-065

PAT descriptors are chained and processed until a NULL pointer is encountered. The PAT bank allocation scheme allows the updating of four consecutive entries of a line in a single cycle regardless of the refilling orientation.

The PAT descriptor structure directly maps the following registers (where  $i = 0$  to 3):

- [DMM\\_PAT\\_DESCR\\_i](#)
- [DMM\\_PAT\\_AREA\\_i](#)
- [DMM\\_PAT\\_CTRL\\_i](#)
- [DMM\\_PAT\\_DATA\\_i](#)

The PAT refill engine can be started either of the following:

- Filling manually all the necessary registers:
  - [DMM\\_PAT\\_AREA\\_i](#) with the (x0, y0) (x1, y1) area definition
  - [DMM\\_PAT\\_DATA\\_i](#) with the physical address of the corresponding area entry table
  - [DMM\\_PAT\\_CTRL\\_i\[6:4\]](#) DIRECTION bit field with the relevant (S, Y, X) direction of the area refill
  - [DMM\\_PAT\\_CTRL\\_i\[0\]](#) START bit with 1
- Writing the physical address of a memory-mapped PAT descriptor in [DMM\\_PAT\\_DESCR\\_i](#) register, which updates:
  - [DMM\\_PAT\\_AREA\\_i](#) with the area value of the descriptor
  - [DMM\\_PAT\\_DATA\\_i](#) with the data value of the descriptor
  - [DMM\\_PAT\\_CTRL\\_i](#) with the control value of the descriptor
  - [DMM\\_PAT\\_DESCR\\_i](#) with the next value of the descriptor

The data part of the PAT refill starts only when the [DMM\\_PAT\\_CTRL\\_i\[0\]](#) START bit is asserted.

The [DMM\\_PAT\\_STATUS\\_i](#) register can be used to determine whether the process has completed without errors.

### 15.2.3.5.3.3 PEG Description

The PEG is a dynamic software-programmable, initiator-indexed table of priorities. Its unique role is to bind a priority to an initiator on the fly. The mapping of each initiator to the table (split into eight registers) is based on its 6-MSB group ConnID (see [Section 14.2.3.2.2, L3\\_MAIN Connectivity Matrix](#), in [Chapter 14, Interconnect](#)).

When an interconnect request enters the DMM, its priority is extracted from the PEG LUT.

The 64 priority entries are software-programmable with the [DMM\\_PEG\\_PRIO\\_k](#) register. A priority of 0 defines the highest priority and a priority of 7 defines the lowest priority. At reset, all priorities are set to 4.

These registers are each split into eight 4-bit fields, each field mapping an entry of the LUT with:

- The 3-bit priority coded on the 3 least-significant bits (LSBs): P field
- A  $\bar{W}$  field-specific active-low local write enable bit, always read as 0, on the MSB. The role of the  $\bar{W}$  bit is to allow the modification of a single entry without requiring a read-modify-write sequence. Because its  $\bar{W}$  bits are always read as 0, writing back the modified register updates all priority fields of the register.

[Table 15-9](#) lists the initiator ConnIDs that are mapped to PEG priority register fields (P/W).

**Table 15-9. ConnIDs vs PEG Priority Register Fields**

Registers	P0/W0	P1/W1	P2/W2	P3/W3	P4/W4	P5/W5	P6/W6	P7/W7
DMM_PEG_PRIO_0	0	1	2	3	4	5	6	7
DMM_PEG_PRIO_1	8	9	10(0xA)	11(0xB)	12(0xC)	13(0xD)	14(0xE)	15(0xF)
DMM_PEG_PRIO_2	16(0x10)	17(0x11)	18(0x12)	19(0x13)	20(0x14)	21(0x15)	22(0x16)	23(0x17)
DMM_PEG_PRIO_3	24(0x18)	25(0x19)	26(0x1A)	27(0x1B)	28(0x1C)	29(0x1D)	30(0x1E)	31(0x1F)
DMM_PEG_PRIO_4	32(0x20)	33(0x21)	34(0x22)	35(0x23)	36(0x24)	37(0x25)	38(0x26)	39(0x27)
DMM_PEG_PRIO_5	40(0x28)	41(0x29)	42(0x2A)	43(0x2B)	44(0x2C)	45(0x2D)	46(0x2E)	47(0x2F)
DMM_PEG_PRIO_6	48(0x30)	49(0x31)	50(0x32)	51(0x33)	52(0x34)	53(0x35)	54(0x36)	55(0x37)
DMM_PEG_PRIO_7	56(0x38)	57(0x39)	58(0x3A)	59(0x3B)	60(0x3C)	61(0x3D)	62(0x3E)	63(0x3F)

Although this priority information is generated before entering the LISA block, it is not used internally in the local interconnect arbitration but is forwarded to the EMIF as MReqInfo, where it indicates the command priority.

It is also possible to give a priority for the internal PAT engine through the [DMM\\_PEG\\_PRIO\\_PAT](#) register.

#### 15.2.3.5.3.4 LISA Interconnect Arbitration

When  $Mflag[i][63:0] \neq 0$  is signaled at TILER<sub>i</sub> or both TILERS, the transactions of TILER<sub>i</sub> or both TILERS form an additional new group called the high priority group. Within this group, reads and writes are sorted and arbitrated the same way as in the normal priority group. Arbitration between transactions out of the high priority group and out of the normal priority group is based on a weighted round-robin algorithm. Weight is software selectable using the [DMM\\_EMERGENCY\[20:16\] WEIGHT](#) bit field. Weight selection is considered static (that is, behavior is undefined when software changes the weight, and DMM is not empty of transaction).

The counter that is implemented to support the weighted round-robin is enabled as long as emergency signaling is present. The counter increments by one each time a command (from the normal or the high priority group) is pushed to ROBIN. The counter wraps on [DMM\\_EMERGENCY\[20:16\] WEIGHT](#) value. One command from the normal priority group is serviced in any of the following scenarios:

- The counter is enabled and wraps.
- The counter is enabled, has not reached its wrap value, and no command is queued in the high priority group (a case where one device module is signaling emergency but its requests have not yet reached the TILERS).
- The counter is disabled.

Setting the [DMM\\_EMERGENCY\[0\] ENABLE](#) bit to 1 enables the emergency arbitration scheme.

---

**NOTE:** It is recommended to set the [DMM\\_EMERGENCY\[0\] ENABLE](#) bit to 1, and the [DMM\\_EMERGENCY\[20:16\] WEIGHT](#) bit to 0x8. This provides better and faster recovery behavior, and benefits system performance.

---

#### 15.2.3.5.3.5 ROBIN Description

The ROBIN is a block that provides some working buffering for converting data and responses to-and-from between raster and tiled organizations, and a master port to connect to the EMIF.

The ROBIN block:

- Forwards requests
- Writes data and buffers responses
- Keeps write data ordering
- Performs intraword tiling and orientation transforms
- Handles tags

#### 15.2.3.5.3.6 TILER Description

The main function of the TILER is request conversion caused by tiling.

The TILER block:

- Decodes the address to qualify whether the request targets the TILER or the memory directly
- Converts TILER-specific requests to their natural representation; address, width, and height are modified accordingly
- Allocates an internal response context for the timely generation of appropriate responses
- Splits tiled requests at tile boundaries and not-tiled requests at DMM atomic section boundaries
- Requests the page-based address translation
- Requests buffer allocation in the appropriate ROBIN
- In case of a write request, allocates and updates an internal write context to direct the incoming write data into the relevant reordering buffer

The interdependent tiling and isometric transform concepts introduced in the TILER are described in the following section.

## 15.2.3.6 TILER

### 15.2.3.6.1 TILER Concepts

This section describes the concepts behind the TILER transforms, through a top-down approach starting from the main object container.

#### 15.2.3.6.1.1 TILER Rationale

This section is a synthesis of all TILER concepts, giving one rule per TILER structure level.

[Figure 15-10](#) shows the TILER address space structure for tiled modes.

**Figure 15-10. TILER Address Space Structure for Tiled Modes**

sdram-005\_public

**15.2.3.6.1.1.1 The TILER is a 4-GiB Virtual Address Space Composed of Eight Views**

There is one view for each of the eight possible ways of scanning a frame-buffer:

- From left to right and then from top to bottom

- From right to left and then from top to bottom
- From left to right and then from bottom to top
- From right to left and then from bottom to top
- From top to bottom and then from left to right
- From top to bottom and then from right to left
- From bottom to top and then from left to right
- From bottom to top and then from right to left

#### **15.2.3.6.1.1.2 A View is a 512-MiB Virtual Address Space Composed of Four Containers**

There is one container per element size to allow correct access patterns in any of the eight possible orientations. The container is the entity where all objects of a given element type are allocated.

The element is the entity of maximum size (8, 16, 32 bits, or page-sized), which is invariant in any orientation.

#### **15.2.3.6.1.1.3 A Container is a 128-MiB Virtual Address Space**

A container is composed of an array of 128 lines of 256 pages of 4kiB each.

The page defines the granularity of physical memory allocation through a PAT unit – MMU.

#### **15.2.3.6.1.1.4 A Page is a 4-kiB Virtual Address Space**

A page is composed of two lines. Each line consists of two tiles.

#### **15.2.3.6.1.1.5 A Tile is a 1-kiB Address Space**

The tile is designed to offer bidimensional data locality in a single SDRAM page. In this respect, it is sized to 1kiB; that is, to the size of the smallest SDRAM page.

#### **15.2.3.6.1.1.6 A Subtile is a 128-Bit Address Space**

A subtile is composed of:

- In 8-bit tiled mode: An array of four horizontal lines of four elements of 8 bits
- In 16-bit tiled mode: An array of two horizontal lines of four elements of 16 bits
- In 32-bit tiled mode: An array of two horizontal lines of two elements of 32 bits

The subtile structure is designed to increase the SDRAM access payload on macroblock requests; that is, to minimize the required line buffering of raster-based initiators to handle on-the-fly rotation, and to improve interlaced accesses to tiled frame-buffers.

#### **15.2.3.6.1.2 TILER Modes**

The TILER supports three major modes, bypass, page, and tiled. Each mode has a specific output request generation.

##### **15.2.3.6.1.2.1 Bypass Mode**

This mode is transparent from the TILER perspective. However, from the DMM perspective:

- 2D block bursts are broken down on a line basis in a set of incremental bursts.
- Incremental bursts, including those issued by a 2D block burst breakdown, are split at the DMM atomic unit of the section hit by the burst at:
  - The interleaving granularity of the section (128, 256, or 512 bytes) in interleaved sections
  - 1-kiB boundary in noninterleaved sections

### 15.2.3.6.1.2.2 Page Mode

This mode uses the DMM address translation mechanism for nontiled accesses. In this respect it is similar to bypass mode:

- 2D block bursts are broken down on a line basis in a set of incremental bursts.
- Incremental bursts, including those issued by a 2D block burst breakdown, are split at:
  - The interleaving granularity of the section (128, 256, or 512 bytes) in interleaved sections
  - 1-kiB boundary in noninterleaved sections

### 15.2.3.6.1.2.3 Tiled Mode

Tiled mode has two major breakdown algorithms:

- One for well-formed 2D block requests that conform to the orientation, mode, and stride listed in [Table 15-10](#)
- One for 1D incremental requests and ill-formed 2D block requests

**Table 15-10. Well-Formed Tiled Mode 2D Block Requests**

Orientation			Mode		Stride	Description
S	Y	X	M1	M0	(bytes)	
0	x	x	0	0	16,384	Plain access to an 8-bit progressive frame in 0 or 180 degrees
					32,768	Field access to an 8-bit interlaced frame 0 or 180 degrees
					32,768	Plain access to a 16-bit progressive frame in 0 or 180 degrees
			1	0	65,536	Field access to a 16-bit interlaced frame 0 or 180 degrees
					32,768	Plain access to a 32-bit progressive frame in 0 or 180 degrees
					65,536	Field access to a 32-bit interlaced frame 0 or 180 degrees
1	x	x	0	0	8192	Plain access to an 8-bit progressive frame in 90 or 270 degrees
					16,384	Field access to an 8-bit interlaced frame 90 or 270 degrees
					8192	Plain access to a 16-bit progressive frame in 90 or 270 degrees
			1	0	16,384	Field access to a 16-bit interlaced frame 90 or 270 degrees
					16,384	Plain access to a 32-bit progressive frame in 90 or 270 degrees
					32,768	Field access to a 32-bit interlaced frame 90 or 270 degrees

Similar to the bypass and page modes, ill-formed 2D block requests are broken down on a line basis in a set of incremental bursts. In tiled mode, however, these incremental virtual bursts do not translate to 1D physical burst requests.

### 15.2.3.6.1.3 Object Container Definition

The object container is the unique addressable entry point of the TILER. It is a 128-MiB virtual address space, where all objects of a same kind and orientation are allocated.

Four main types of containers are present in the TILER, each referred by a mode:

- 8-bit element mode, for efficiently accessing bidimensional arrays of 8-bit data
- 16-bit element mode, for efficiently accessing bidimensional arrays of 16-bit data
- 32-bit element mode, for efficiently accessing bidimensional arrays of 32-bit data
- Page mode, for efficient 1D accesses

Figure 15-11 shows the TILER object containers and views.

**Figure 15-11. TILER Object Containers and Views**

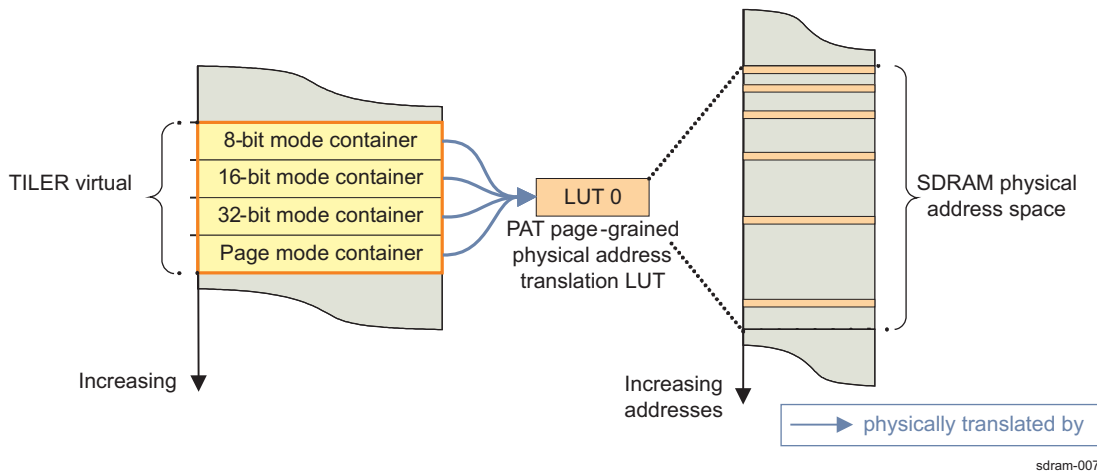

The 512-MiB virtual address space composed of four 128-MiB object containers of different modes is called a view. Because eight orientations are available per mode, the TILER actually manages 32 kinds of containers.

The physical memory footprint of a 512-MiB TILER view is directly subject to the nature of the PAT unit.

A unique PAT LUT is instantiated in the DMM. This table is shared by all TILER modes. Hence, each of the four modes cannot be given its own private page-grained PAT LUT. A maximum of 128MiB of objects among all TILER modes can be managed as shown in Figure 15-12.

**Figure 15-12. TILER Memory Footprint With PAT and Shared Physical Address Translation LUT**

Although each of the four modes has its own separate virtual 128-MiB object container, these containers are all mapped to the same piecewise 128-MiB physical address space, and are then not physically separated. Consequently, a memory-related system constraint is that no more than 128-MiB of objects can be available simultaneously in a TILER view.

**NOTE:** Software must ensure that any object allocated in a mode does not physically overlap with any other object, even in another mode.

#### 15.2.3.6.1.4 Page Definition

A TILER page defines the granularity of object allocation in virtual TILER containers.

Because the subpage structure is mode-specific, the page is the smallest granularity common to all modes, making it the granularity to consider in the TILER resource manager for object allocation.

### 15.2.3.6.1.4.1 Container Geometry With 4-kiB Pages

Because the size of the page is 4kiB, any 128-MiB object container is a set of 32,768 pages, organized in an array of 256 columns and 128 rows, as shown in Figure 15-13.

Figure 15-13. Object Container Geometry With 4-kiB Pages

This array of pages is mapped to the system address space, as shown in Figure 15-14.

Figure 15-14. TILER Page Mapping When Using 4-kiB Pages

In any 128-MiB object container, the 4-kiB page  $P_{x,y}$  at column  $x$  (where  $0 \leq x < 256$ ) and row  $y$  (where  $0 \leq y < 128$ ), is found at an offset of  $4096 \cdot (x + 256 \cdot y)$  bytes from the base address of the related object container.

Similarly, the page  $P_{x,y}$  at column  $x$  (where  $0 \leq x < 256$ ) and row  $y$  (where  $0 \leq y < 128$ ), is translated by the LUT entry  $E_{x+256 \cdot y}$  found at the index  $x + 256 \cdot y$ .

### 15.2.3.6.1.4.2 Container Geometry and Page Mapping Summary

The TILER has a page size of 4096 bytes. The page  $P_{x,y}$ :

- Has  $\max_x = 256$  and  $\max_y = 128$
- Is found at an offset of  $4096 \cdot (x + \max_x \cdot y)$  bytes from the base address of the related object container
- Is translated by the entry at the index  $(x + \max_x \cdot y)$  of the LUT

15.2.3.6.1.5 Orientation

This section describes the eight on-the-fly orientation-related isometric transforms, which correspond to all available changes of orthonormal basis in the bidimensional space of the TILER container.

Figure 15-15 shows isometric transforms in the TILER container

Figure 15-15. Isometric Transforms in the TILER Container

sdram-010

Mathematically speaking, all these transforms correspond to the composition of a 0-, 90-, 180-, or 270-degree rotation with an optional reflection. The nature of this orientation is based on the three following binary parameters:

- X to change the direction of the  $x$  axis of the TILER container
- Y to change the direction of the  $y$  axis of the TILER container
- S to swap the modified  $x$  and  $y$  axis

Hereafter in this document the term orientation refers to any composition of a "quadrant" rotation with an optional horizontal (flip-flop) or vertical mirroring.

15.2.3.6.1.6 Tile Definition

A tile is a subdivision of a page that is aimed at:

- Representing a 2D block to better balance accesses in both directions
- Ensuring that any tiled access that fits within a tile is made atomic in the SDRC and fits in a single SDRAM memory page
- Minimizing the number of SDRAM page openings per 2D block transfer

The tile is defined as a 1-kiB 2D block, and a 4-kiB page as an array of two lines of two tiles each.

When the considered page is in an interleaved DMM section, it is necessary that:

- The DMM memory interleaving size of tiled accesses is set to 1kiB (a tile size) so that any tiled request that fits within a tile, fits in a single SDRAM memory page.
- Any request that spans two or four tiles is distributed on a maximum number of SDRCs.

### 15.2.3.6.1.7 Subtiles

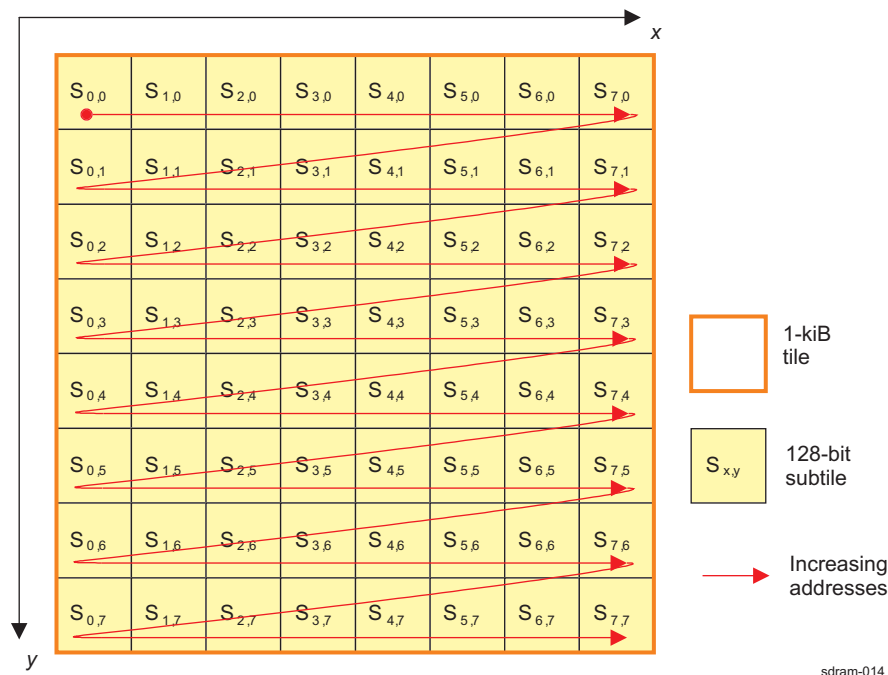

#### 15.2.3.6.1.7.1 Subtiling Definition

To summarize, a subtile is a subtle refinement of a tile whose purpose is to:

- Lower the size (length x height) of 128-bit bursts in case of relatively small 2D block requests, such as video macroblocks
- Better balance the granularity in the two directions
- Better balance the accesses in the two (x and y) directions
- Minimize the size of the line buffer of the raster-based initiators to handle isometric transforms efficiently

A subtile is defined as a 128-bit 2D block, and a tile as an array of eight lines of eight subtiles, as shown in Figure 15-16.

**Figure 15-16. Tile Geometry**

In any tile, the subtile  $S_{x,y}$  at column  $x$  ( $0 \leq x < 8$ ) and row  $y$  ( $0 \leq y < 8$ ) is found at an offset of  $16.(x + 8.y)$  bytes from the base address of the related tile. Besides, this array organization of subtiles is common to each tiled mode. For instance, the subtile  $S_{0,1}$  is always located at an offset of 128 bytes (that is,  $16.(0 + 8 \times 1)$ ) from the base address of the related tile.

Figure 15-17 shows the subtile mapping.

Figure 15-17. Subtile Mapping

sdrmm-015

### 15.2.3.6.1.8 TILER Virtual Addressing

The TILER can be virtually accessed in four different modes: 8-, 16-, 32-bit, and page modes. Each mode defines the element granularity to apply isometric transforms, as summarized in Table 15-11.

Table 15-11. Coding and Description of TILER Modes

Mode	Name	Granularity (Element Size)
0	8-bit tiled mode	8 bits
1	16-bit tiled mode	16 bits
2	32-bit tiled mode	32 bits
3	Page mode	4096 bytes

For instance, making a vertical mirror of a 16-byte horizontal line that contains the word 000102030405060708090A0B0C0D0E0Fh, leads to:

- 0F0E0D0C0B0A09080706050403020100h in 8-bit tiled mode
- 0E0F0C0D0A0B08090607040502030001h in 16-bit tiled mode
- 0C0D0E0F08090A0B0405060700010203h in 32-bit tiled mode
- 000102030405060708090A0B0C0D0E0Fh in page mode – unchanged because the element granularity is 4 KiB

Besides, because each of the eight orientations is available for any of the four modes, the TILER has 32 addressing possibilities (see Table 15-12).

Table 15-12. Coding and Description of TILER Orientations

S	Y	X	Description	Alternate description
0	0	0	0-degree view	Natural view
0	0	1	0-degree view with vertical mirror	180-degree view with horizontal mirror

**Table 15-12. Coding and Description of TILER Orientations (continued)**

S	Y	X	Description	Alternate description
0	1	0	0-degree view with horizontal mirror	180-degree view with vertical mirror
0	1	1	180-degree view	
1	0	0	90-degree view with vertical mirror	270-degree view with horizontal mirror
1	0	1	270-degree view	
1	1	0	90-degree view	
1	1	1	90-degree view with horizontal mirror	270-degree view with vertical mirror

### 15.2.3.6.1.8.1 Page Mode Virtual Addressing and Characteristics

When used in page mode, the 128-MiB TILER space is seen as an orientation-specific sequence of 32,768 pages of 4kiB each. The access sequence inside a page is left unchanged.

Therefore, in page mode, the TILER is accessed similarly to any 128-MiB memory, with a 27-bit byte-based address.

**NOTE:** From here forward, the address is noted as *a* (see [Figure 15-18](#)).

**Figure 15-18. Page Mode Virtual Addressing**

sdram-027

### 15.2.3.6.1.8.2 Tiled Mode Virtual Addressing and Characteristics

When used in tiled mode, the 128-MiB TILER space is seen as a giant frame-buffer, the container. The addressing and characteristics of this giant frame-buffer depend on:

- The tiled mode, which defines the considered atomic element size
- The orientation, which potentially swaps its x and y axis, and hence the container geometry

[Table 15-13](#) summarizes the container characteristics in tiled mode.

**Table 15-13. Tiled Mode Container Characteristics**

Orientation			Element Size (Bits)	Width (Elements)	Height (Elements)	Stride (Bytes)	
S	Y	X				Progressive	Interlaced
0	x	x	8	16,384	8192	16,384	32,768
			16	16,384	4096	32,768	65,536
			32	8192	4096	32,768	65,536
1	x	x	8	8192	16,384	8192	16,384
			16	4096	16,384	8192	16,384
			32	4096	8192	16,384	32,768

As a result, the coordinate  $(x_0, y_0)$  of a pixel in an oriented view is translated in a virtual address, as shown in Figure 15-19 and Figure 15-20.

**Figure 15-19. Tiled Mode Addressing in 0- or 180-Degree Orientation (S = 0)**

**Figure 15-20. Tiled Mode Addressing in 90- or 270-Degree Orientation (S = 1)**

**15.2.3.6.1.8.3 Element Ordering in the TILER Container**

This section describes how elements (8-, 16-, or 32-bit data or a 4-kilobyte page) are ordered in the container. In other words, this section describes how the path of incrementing virtual addresses is mapped in the container.

Regardless of the mode, and hence the element size, the sequence for ordering the elements in their related container is strictly similar and depends only on the related orientation. In other words:

- Mode is concerned with element granularity.
- Orientation is concerned with change of orthonormal basis for ordering the elements in the mode-specific container.

A corollary to the previous statements is that in a given mode the internal structure of an element is unchanged regardless of the orientation. In page mode for instance, the offset of a word inside a page is invariant by orientation; the content of a page is always accessed in the same manner.

In the following sections, the natural container orthonormal basis is referenced as:

$$(\vec{x}_N, \vec{y}_N)$$

sdram-030

and the oriented orthonormal basis is referenced as:

$$(\vec{x}_O, \vec{y}_O)$$

sdram-031

**15.2.3.6.1.8.3.1 Natural View or 0-Degree View (Orientation 0)**

This orientation defined by  $S = 0$ ,  $\bar{Y} = 0$ , and  $\bar{X} = 0$  means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{x}_N \\ \vec{y}_O = \vec{y}_N \end{cases}$$

sdram-032

In any TILER mode, the elements are ordered from left to right and then from top to bottom in their container, as shown in Figure 15-21 and Figure 15-22.

Figure 15-21. Tiled Mode Ordering of Elements in Natural View

Figure 15-22. Page Mode Ordering of Elements in Natural View

15.2.3.6.1.8.3.2 0-Degree View With Vertical Mirror or 180-Degree View With Horizontal Mirror (Orientation 1)

This orientation defined by  $S = 0$ ,  $\bar{Y} = 0$ , and  $\bar{X} = 1$  and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{x}_N \\ \vec{y}_O = \vec{y}_N \end{cases}$$

sdram-035

In any TILER mode, the elements are then ordered from right to left and then from top to bottom in their container, as shown in Figure 15-23 and Figure 15-24.

Figure 15-23. Tiled Mode Ordering of Elements in 0-Degree View With Vertical Mirror

Figure 15-24. Page Mode Ordering of Elements in 0-Degree View With Vertical Mirror

15.2.3.6.1.8.3.3 0-Degree View With Horizontal Mirror or 180-Degree View With Vertical Mirror (Orientation 2)

This orientation defined by  $S = 0$ ,  $\bar{Y} = 1$ , and  $\bar{X} = 0$  and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{x}_N \\ \vec{y}_O = -\vec{y}_N \end{cases}$$

sdram-038

In any TILER mode, the elements are ordered from left to right and then from bottom to top in their container, as shown in Figure 15-25 and Figure 15-26.

**Figure 15-25. Tiled Mode Ordering of Elements in 0-Degree View With Horizontal Mirror**

**Figure 15-26. Page Mode Ordering of Elements in 0-Degree View With Horizontal Mirror**

**15.2.3.6.1.8.3.4 180-Degree View (Orientation 3)**

This orientation defined by  $S = 0$ ,  $\bar{Y} = 1$ , and  $\bar{X} = 1$  and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{x}_N \\ \vec{y}_O = -\vec{y}_N \end{cases}$$

sdram-041

In any TILER mode, the elements are ordered from right to left and then from bottom to top in their container, as shown in [Figure 15-27](#) and [Figure 15-28](#).

Figure 15-27. Tiled Mode Ordering of Elements in 180-Degree View

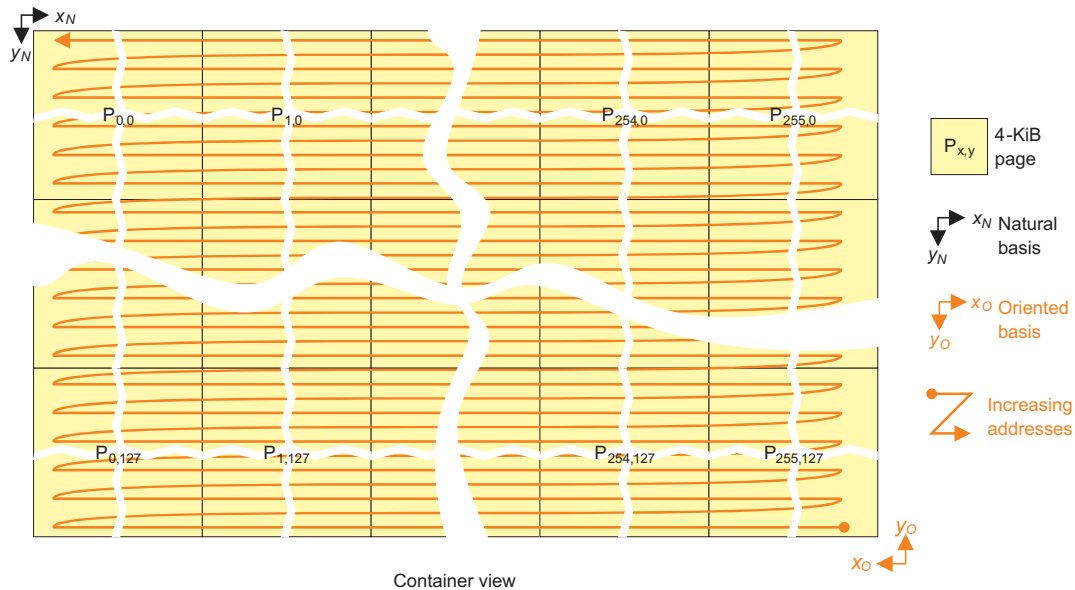

Figure 15-28. Page Mode Ordering of Elements in 180-Degree View

15.2.3.6.1.8.3.5 90-Degree View With Vertical Mirror or 270-Degree View With Horizontal Mirror (Orientation 4)

This orientation defined by  $S = 1$ ,  $\bar{Y} = 0$ , and  $\bar{X} = 0$  and means that the operated change of basis is:

$$\begin{cases} \bar{x}_O = \bar{y}_N \\ \bar{y}_O = \bar{x}_N \end{cases}$$

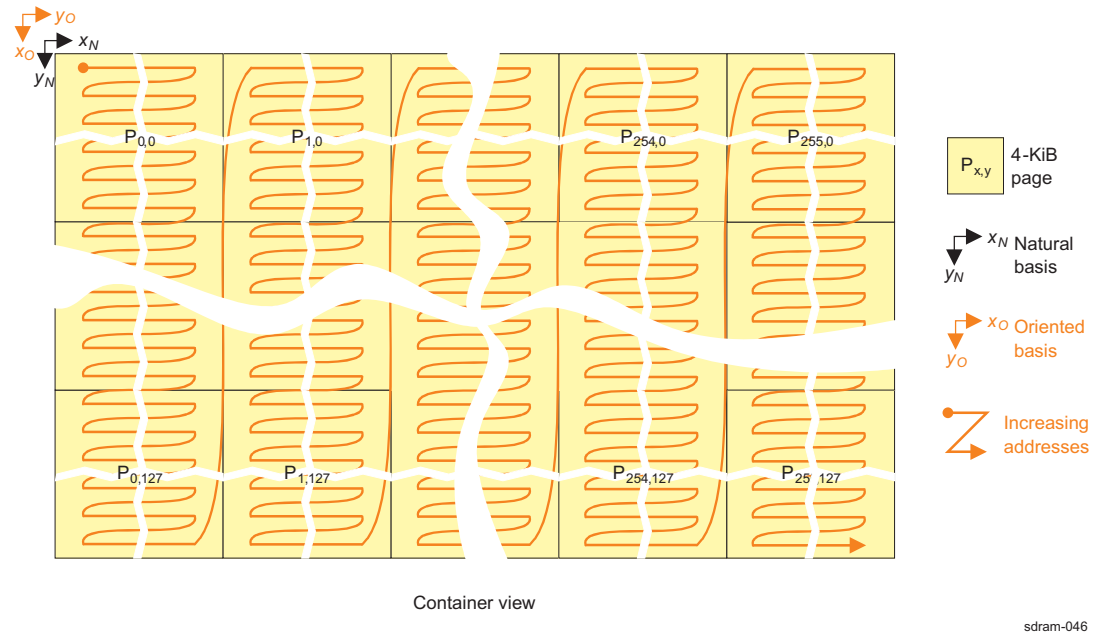

s dram-044

In any TILER mode, the elements are ordered from top to bottom and then from left to right in their container, as shown in Figure 15-29 and Figure 15-30.

**Figure 15-29. Tiled Mode Ordering of Elements in 90-Degree View With Vertical Mirror**

**Figure 15-30. Page Mode Ordering of Elements in 90-Degree View With Vertical Mirror**

**15.2.3.6.1.8.3.6 270-Degree View (Orientation 5)**

This orientation defined by  $S = 1$ ,  $\bar{Y} = 0$ , and  $\bar{X} = 1$  and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{y}_N \\ \vec{y}_O = -\vec{x}_N \end{cases}$$

sdram-047

In any TILER mode, the elements are ordered from top to bottom and then from right to left in their container, as shown in [Figure 15-31](#) and [Figure 15-32](#).

Figure 15-31. Tiled Mode Ordering of Elements in 270-Degree View

Figure 15-32. Page Mode Ordering of Elements in 270-Degree View

15.2.3.6.1.8.3.7 90-Degree View (Orientation 6)

This orientation defined by  $S = 1$ ,  $\bar{Y} = 1$ , and  $\bar{X} = 0$  and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{y}_N \\ \vec{y}_O = \vec{x}_N \end{cases}$$

sdram-050

In any TILER mode, the elements are ordered from bottom to top and then from left to right in their container, as shown in Figure 15-33 and Figure 15-34.

Figure 15-33. Tiled Mode Ordering of Elements in 90-Degree View

Figure 15-34. Page Mode Ordering of Elements in 90-Degree View

15.2.3.6.1.8.3.8 90-Degree View With Horizontal Mirror or 270-Degree View With Vertical Mirror (Orientation 7)

This orientation defined by  $S = 1$ ,  $\bar{Y} = 1$ , and  $\bar{X} = 1$  and means that the operated change of basis is:

$$\begin{cases} \bar{x}_O = -\bar{y}_N \\ \bar{y}_O = -\bar{x}_N \end{cases}$$

sdram-053

In any TILER mode, the elements are ordered from bottom to top and then from right to left in their container, as shown in Figure 15-35 and Figure 15-36.

Figure 15-35. Tiled Mode Ordering of Elements in 90-Degree View With Horizontal Mirror

Figure 15-36. Page Mode Ordering of Elements in 90-Degree View With Horizontal Mirror

### 15.2.3.6.2 TILER Macro-Architecture

The TILER requires a 4-GiB addressing space to map its 128-MiB physical container in four modes and eight orientations. Because its addressing space alone fills the 4-GiB global system address map, the TILER addressing space cannot enter as-is into the system address map. Besides, putting in place a register-based mechanism per initiator to specify the orientation of the following accesses and then reducing the TILER addressing space to a single 512-MiB view is not an option; this is because most of the bandwidth-hungry initiators require simultaneous accesses to the TILER container in different views.

As a result, 32 bits are not enough to address all these requests, because the TILER port must convey not only virtually addressed requests to the "oriented" TILER containers but also physically addressed requests to the attached SDRs. A thirty-third address bit is necessary to distinguish the two separated address maps, as shown in Figure 15-37.

**Figure 15-37. TILER Port Address Map**

Still, having separated systems and TILER-specific address maps is not sufficient. In a system many existing and external IP blocks still rely on a 32-bit address and would then be limited to one or the other 4-GiB addressing space. To overcome this limitation, one 512-MiB view is aliased in the system address map as (see [Table 15-14](#) and [Figure 15-38](#)).

**Table 15-14. TILER Aliased View in the L3 Interconnect Mapping**

Start Address (hex)	End Address (hex)	Size
0x6000_0000	0x7FFF_FFFF	512 MiB

From all incoming requests, TILER requests are filtered as having an address that fits one of the following:

- The address format in the TILER-specific address map given in [Table 15-15](#)
- The address format of the aliased view in the system address map given in [Table 15-16](#)

Other requests are forwarded directly to the SDR in TILER bypass mode.

**Table 15-15. Address Format in the TILER-Specific Address Map**

32	31	30	29	28	27	26 ... 4	3 ... 0
T	Orientation			Mode		Virtual address	
1	S	Y	X	M1	M0	A26 ... A4	0

**Table 15-16. Address Format of the TILER Aliased View in the System Address Map**

32	31	30	29	28	27	26 ... 4	3 ... 0
T	TILER aliasing			Mode		Virtual address	
0	0	1	1	M1	M0	A26 ... A4	0

In these address formats:

- The thirty-third bit, noted T, is aimed at distinguishing the standard 4-GiB system address map from the 4-GiB TILER-specific address map.
- The orientation bits, noted S,  $\bar{Y}$ , and  $\bar{X}$ , define the request orientation, as specified in Table 15-12.
- The mode bits, noted M1 and M0, define the request mode, as specified in Table 15-11.
- The remaining 27 bits, noted A0 to A26, define the mode and orientation specific virtual address, as defined in Figure 15-18, Figure 15-19, and Figure 15-20.

The orientation of the aliased TILER view is extracted from an initiator-indexed LUT, as shown in Figure 15-38.

Figure 15-38. TILER Aliased View Orientation

sdram-057

As shown in Figure 15-38, an internal initiator-indexed LUT stores the current orientation of the aliased view for each initiator.

When an interconnect request hits the TILER aliased view in the system address map, the request initiator orientation is extracted from the LUT and the request address is translated according to this orientation: the T bit is set and bits [31:29] are replaced with the orientation.

Regarding the dimensioning of this LUT, given that initiators simultaneously accessing multiple views use the TILER-specific address map, and many initiators do not need to access any view or can be restricted to accessing only the natural view, only a limited number of initiators are likely to dynamically modify the orientation of its aliased TILER view.

The orientation LUT is limited to 16 entries. These 16 orientation entries are mapped on the two 32-bit `DMM_TILER_OR0` and `DMM_TILER_OR1` registers.

The first eight entries of the LUT are mapped in the `DMM_TILER_OR0` register, and the last eight entries are mapped in the `DMM_TILER_OR1` register. Therefore, given an index x, the orientation related to this index is given in the ORx field.

Each of these registers is split into eight 4-bit fields, each field mapping an entry of the LUT with:

- An S,  $\bar{Y}$ ,  $\bar{X}$  orientation code on the 3 LSBs
- An  $\bar{W}$  field-specific active-low local write-enable bit, always read as 0, on the MSB.

The registers fields that correspond to initiators that do not need any dynamic configuration of their aliased view orientation must be specified as reserved fields, and only written with zeros.

The  $\bar{W}$  bit allows the modification of a single entry without requiring a read-modify-write sequence. This approach is then more accommodating:

- In a system where multiple initiators can modify their own fields in the registers
- With initiators unable to make the read-modify-write sequence, such as DMA

Still, the  $\overline{W}$  bit is active-low to keep the compatibility with the usual read-modify-write sequence. When reading an aliased view orientation register, because all its  $\overline{W}$  bits are read as 0, if these bits are untouched by the modification—as they should be—writing back the modified register updates all orientation fields of the register.

### 15.2.3.6.3 TILER Guidelines for Initiators

#### 15.2.3.6.3.1 Buffered Raster-Based Initiators

##### 15.2.3.6.3.1.1 Buffer Size

The necessary minimum buffer size depends on the SDRAM prefetch size and on initiator support in terms of the following:

- Element size
- Orientation
- Maximum number of elements per line in all supported element sizes and orientations

Let  $N$  be the maximum number of elements per line for a given mode (element size) and orientation,  $P$  be the SDRAM memory prefetch size in bytes, and  $max$  be the function returning the maximum of the two parameters. The minimum necessary line buffer size to handle all resolutions in a given mode and orientation is listed in [Table 15-17](#).

**Table 15-17. Minimum Buffer Size to Efficiently Handle Lines of up to N Elements**

	0- or 180- Degree Orientation (S = 0)	90- or 270-Degree Orientation (S = 1)
8-bit mode	$4 \times N$ bytes	$max(4, P/4) \times N$ bytes
16-bit mode	None	$max(8, P/2) \times N$ bytes
32-bit mode	None	$max(8, P/2) \times N$ bytes

This minimal buffer size can be reached only with an advanced FIFO management scheme. The standard ping-pong buffer requires twice this buffer size.

---

**NOTE:** Given their nature, field accesses to an interlaced frame-buffer require buffers twice as small as in the standard progressive case.

---

For instance, an initiator that must handle only a single progressive frame-buffer in any orientation of:

- Up to  $1920 \times 1080$  in YUV4:2:0
- Up to  $1600 \times 1200$  in 16-bit RGB565
- Up to  $800 \times 600$  in 32-bit ARGB

requires a line buffer of at least 15,360 bytes because:

- $4 \times 1920 + 4 \times 2960 = 15,360$  bytes required for a 3-plane YUV4:2:0 frame of  $1920 \times 1080$
- $4 \times 1920 + 8 \times 960 = 15,360$  bytes required for a 2-plane YUV4:2:0 frame of  $1920 \times 1080$
- $8 \times 1600 = 12,800$  bytes required for a 16-bit RGB565 frame of  $1600 \times 1200$
- $8 \times 800 = 6400$  bytes required for a 32-bit ARGB frame of  $800 \times 600$

and a line buffer of at least 30,720 bytes when using a simple ping-pong buffer scheme.

##### 15.2.3.6.3.1.2 Performance

[Table 15-18](#) lists the ratio of effective data-to-transferred data at the external memory interface for the buffered raster-based initiators in each mode and orientation when using a 32-bit DDR2 or DDR3 memory.

**Table 15-18. Memory Data Payload for Buffered Raster-Based Initiators on 32-Bit DDR2 or DDR3**

	0- or 180-Degree Orientation (S = 0)		90- or 270-Degree Orientation (S = 1)	
	Progressive	Interlaced	Progressive	Interlaced
8-bit mode	100%	50%	100%	50%
16-bit mode	100%	50%	100%	50%
32-bit mode	100%	50%	100%	50%
Page mode	100%	N/A	100%	100%

When using 32-bit DDR2 or DDR3 SDRAMs, whenever all previous guidelines are fulfilled, there is no penalty for these initiators to access a tiled object in any orientation, except for accesses to an interlaced frame in any orientation where the memory bandwidth is twice the requested bandwidth.

When using DDR2 or DDR3 SDRAMs, all accesses, except interlaced accesses, are equally efficient and offer the full possible memory bandwidth.

Similarly, page mode does not introduce any performance hit.

## 15.2.4 DMM Use Cases and Tips

### 15.2.4.1 PAT Use Cases

Five ways to use PAT are:

- Simple manual area refill: [Section 15.2.4.1.1](#)
- Single auto-configured area refill: [Section 15.2.4.1.2](#)
- Chained auto-configured area refill: [Section 15.2.4.1.3](#)
- Synchronized auto-configured area refill: [Section 15.2.4.1.4](#)
- Cyclic synchronized auto-configured area refill: [Section 15.2.4.1.5](#)

**NOTE:** PAT refill area must be fully contained within either the LUT lower half or the LUT upper half. It must not span over both areas. That is,  $y_0$  MS

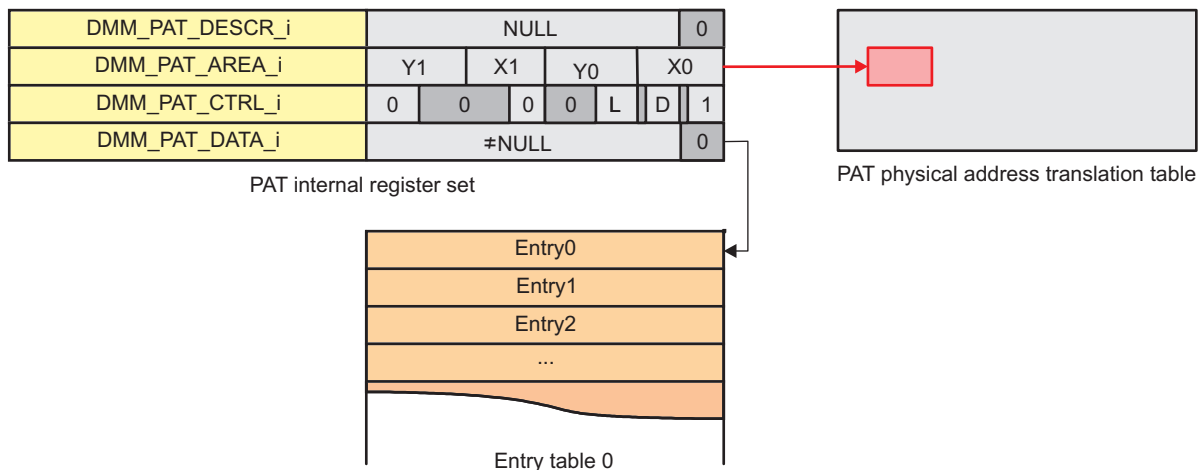

bit  $y_0[7]$  must be equal to  $y_1$  MSbit  $y_1[7]$  when defining the area descriptor.

#### 15.2.4.1.1 Simple Manual Area Refill

The following must be performed to create a 16-byte aligned memory-mapped entry table containing all entries of the defined area (see [Figure 15-39](#)):

1. Write the `DMM_PAT_AREA_i` register with the relevant  $(x_0, y_0)$   $(x_1, y_1)$  area definition.
2. Write the `DMM_PAT_DATA_i` register with the physical address of the created entry table.
3. Write the `DMM_PAT_CTRL_i` register with the requested refill direction and assert the `DMM_PAT_CTRL_i[0]` START bit with the requested refill direction D and with the LUT ID L if multiple LUTs are present in the system.
4. The refill is done when the `DMM_PAT_STATUS_i[3]` DONE bit is set.
5. A new refill can be initiated when the `DMM_PAT_STATUS_i[0]` READY bit is set.

**Figure 15-39. Simple Manual Area Refill Scheme**

sdr-am-067

#### 15.2.4.1.2 Single Auto-Configured Area Refill

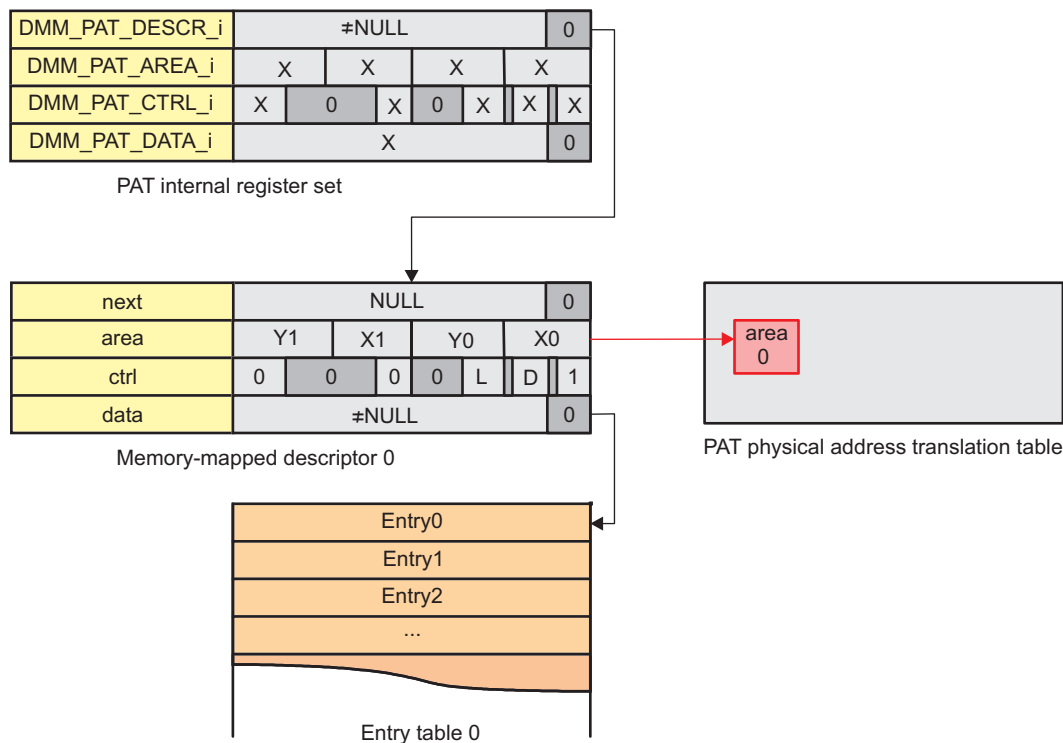

The following must be performed to create a 16-byte aligned memory-mapped entry table containing all entries of the defined area (see [Figure 15-40](#)):

1. Create a 16-byte aligned memory-mapped descriptor structure where:
  - The next field is set to NULL.
  - The area field is set with the relevant  $(x_0, y_0)$   $(x_1, y_1)$  area definition.
  - The ctrl field is set with the requested direction D, with the requested LUT ID L if multiple LUTs are

present in the system, and the START bit is asserted to start refilling as soon as this descriptor enters the PAT refill engine.

- The data field is set to the physical address of the created entry table.
2. Write the `DMM_PAT_DESCR_i` register with the physical address of the created descriptor.
  3. The refill is done when the `DMM_PAT_STATUS_i[3]` DONE bit is set.
  4. A new refill can be initiated when the `DMM_PAT_STATUS_i[0]` READY bit is set.

**Figure 15-40. Single Auto-Configured Area Refill Scheme**

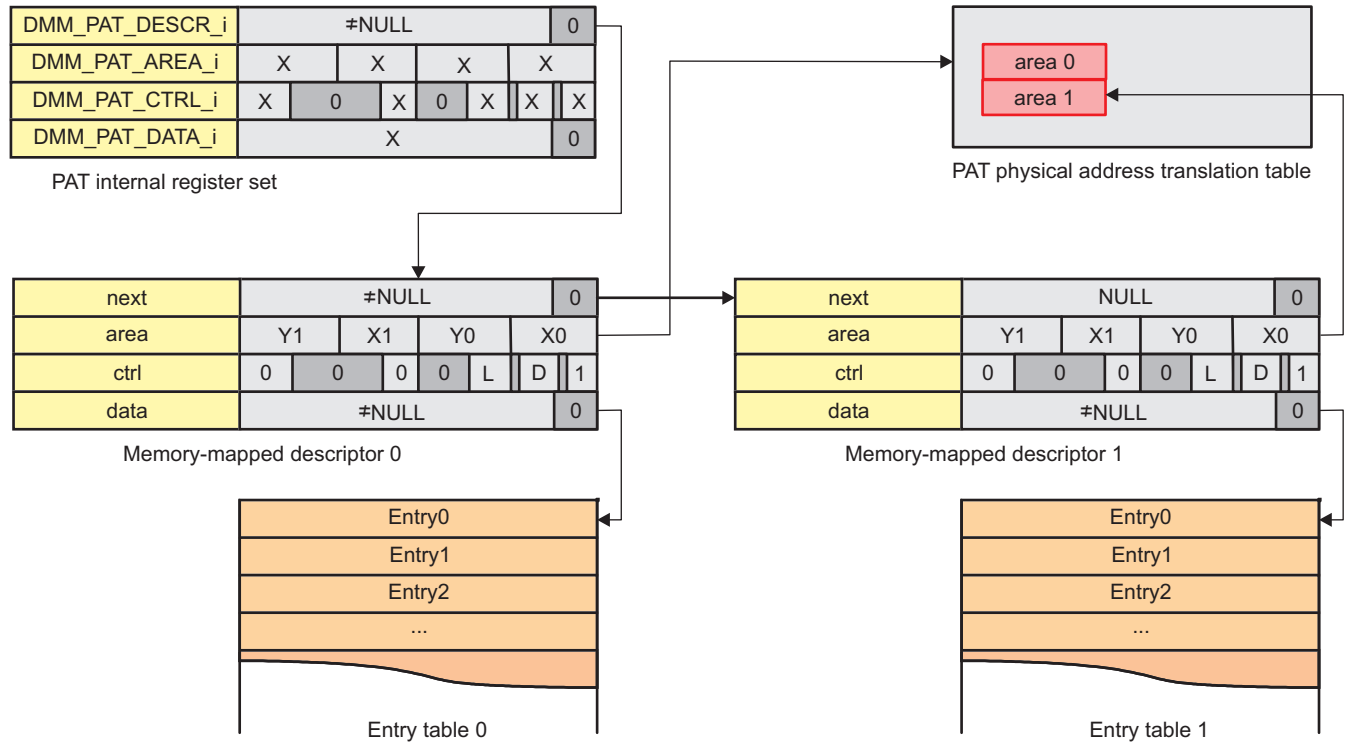

sdram-068

### 15.2.4.1.3 Chained Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see Figure 15-41):

1. Create one 16-byte aligned memory-mapped descriptor structure per area where:
  - The next field is set to the physical address of the next descriptor or NULL for the last one.
  - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
  - The ctrl field is set with the requested direction D, with the requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done.
  - The data field is set to the physical address of the corresponding entry table.
2. Write the `DMM_PAT_DESCR_i` register with the physical address of the first created descriptor.
3. Each area refill is done when the `DMM_PAT_STATUS_i[3]` DONE bit is set.
4. All area refills are done when the `DMM_PAT_STATUS_i[0]` READY bit is set.
5. A new refill can be initiated when the `DMM_PAT_STATUS_i[0]` READY bit is set.

**Figure 15-41. Chained Auto-Configured Area Refill Scheme**

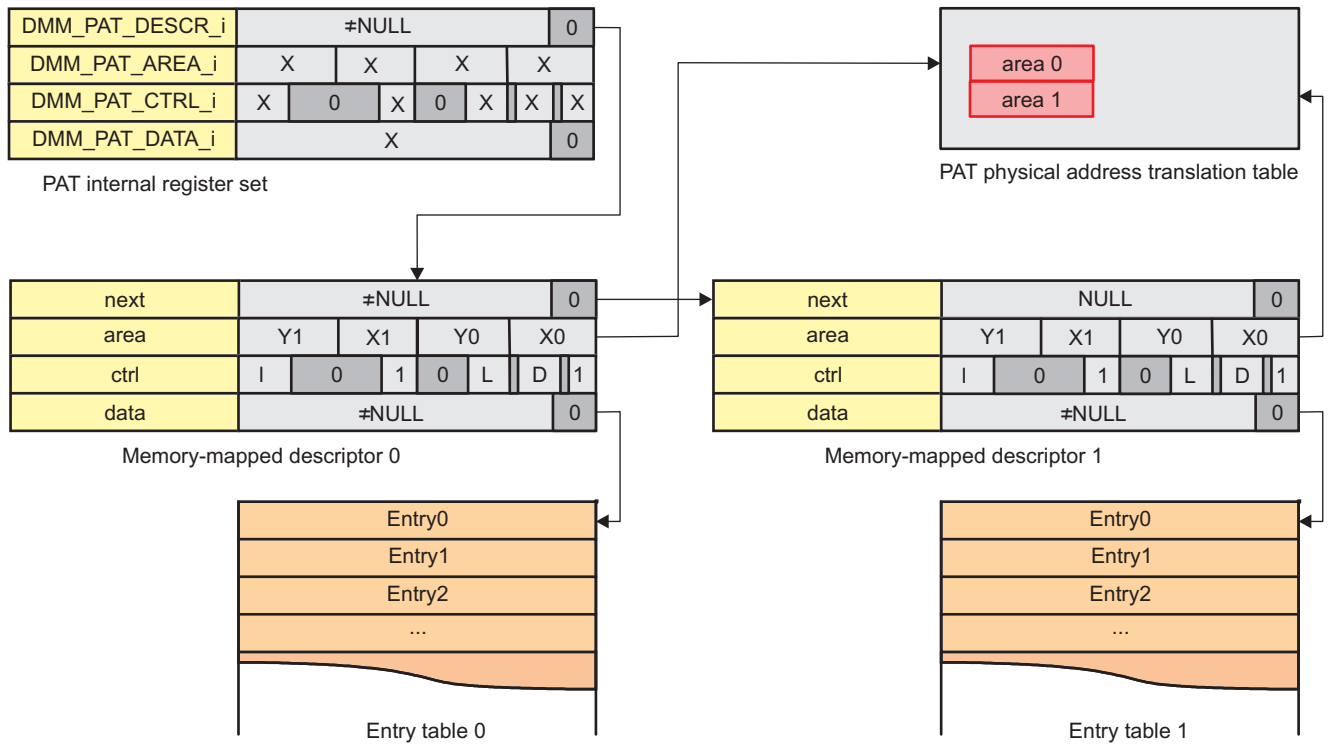

sdram-069

#### 15.2.4.1.4 Synchronized Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see Figure 15-42):

1. Create one 16-byte aligned memory-mapped descriptor structure per area where:
  - The next field is set to the physical address of the next descriptor or NULL for the last one.
  - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
  - The ctrl field is set with the synchronizing initiator identifier I, the SYNC bit is asserted, the requested direction D and the requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area.
  - The data field is set to the physical address of the corresponding entry table.
2. Write the `DMM_PAT_DESCR_i` register with the physical address of the first created descriptor.
3. Each area refill is done when the `DMM_PAT_STATUS_i[3]` DONE bit is set.
4. All area refills are done when the `DMM_PAT_STATUS_i[0]` READY bit is set.
5. A new refill can be initiated when the `DMM_PAT_STATUS_i[0]` READY bit is set.

Figure 15-42. Synchronized Auto-Configured Area Refill Scheme

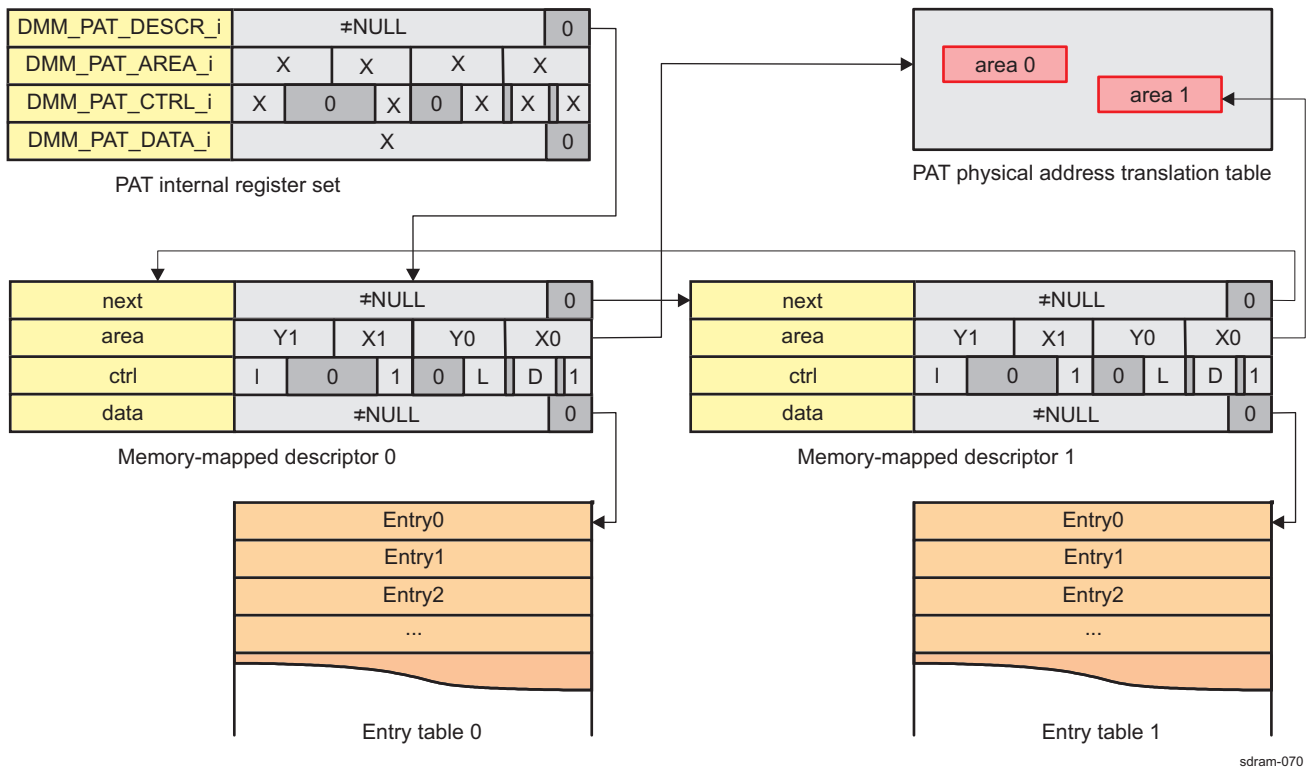

sdram-071

### 15.2.4.1.5 Cyclic Synchronized Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see Figure 15-43):

1. Create one 16-byte aligned memory-mapped descriptor structure per area where:
  - The next field is set to the physical address of the next descriptor in the circular list.
  - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
  - The ctrl field is set with the synchronizing initiator identifier I, the SYNC bit asserted, the requested direction D and requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area.
  - The data field is set to the physical address of the corresponding entry table.
2. Write the `DMM_PAT_DESCR_i` register with the physical address of the initial descriptor.
3. Each area refill is done when the `DMM_PAT_STATUS_i[3]` DONE bit is set.
4. A new refill can be initiated by writing any value to the `DMM_PAT_DESCR_i` register to abort the current one.

**Figure 15-43. Cyclic Synchronized Auto-Configured Area Refill Scheme**

**NOTE:** Never use circular lists of descriptors where all descriptors have the `DMM_PAT_CTRL_i[0]` START bit set and there is no synchronization. This leads to an endless continuous refill.

### 15.2.4.2 Addressing Management with LISA

#### 15.2.4.2.1 Case 1: Use of One Memory Controller

In this example, assume there is 1 GiB of external memory evenly spread onto two address spaces. The address range for address space 0 must start at offset 0x2000\_0000 (see Table 15-19).

**Table 15-19. Address Definition**

Address Range	Memory Controller	Memory Controller Address Space <sup>(1)</sup>	Memory Controller Address Range
0x8000_0000 to 0x9FFF_FFFF	EMIF1	0x0	0x0000_0000 to 0x1FFF_FFFF
0xA000_0000 to 0xBFFF_FFFF	EMIF1	0x0	0x2000_0000 to 0x3FFF_FFFF

<sup>(1)</sup> For memory controller address spaces, see Section 15.3.4.1.1, Local Interface in Section 15.3, EMIF Controller.

This configuration requires two nonoverlapping sections to be set. They can be defined in any order because there is no concern with priority in this case (see Table 15-20):

**Table 15-20. Configuration**

Bit Field	Section 0 (DMM_LISA_MAP_0)	Section 1 (DMM_LISA_MAP_1)
[31:24] SYS_ADDR	0x80	0xA0
[22:20] SYS_SIZE	0x5	0x5
[19:18] SDRG_INTL	0x0 (not applicable)	0x0 (not applicable)

**Table 15-20. Configuration (continued)**

Bit Field	Section 0 (DMM_LISA_MAP_0)	Section 1 (DMM_LISA_MAP_1)
[17:16] SDRG_ADDRSPC	0x0	0x0
[9:8] SDRG_MAP	0x1 (only EMIF1)	0x1 (only EMIF1)
[7:0] SDRG_ADDR	0x00	0x20

To check whether an address hits a section, use the 8 upper address bits of the address and mask them with the hit mask:  $2^8 - 2^{\text{SYS\_SIZE}}$ . If the result is equal to SYS\_ADDR, the section is hit.

To define the physical address to be issued to the memory controller, use the 8 upper address bits of the system address, mask them with the address mask:  $2^{\text{SYS\_SIZE}} - 1$ , and OR them with SDRG\_ADDR. This gives the resulting 8 upper physical address bits. All lower address bits are forwarded unchanged.

Request to address 0x99AE\_37F0:

- Upper address bits: 0x99
- Hit mask:  $2^8 - 2^5 = 0xE0$
- Masked upper address bits: 0x80, that is, hits section 0
- Address mask:  $2^5 - 1 = 0x1F$
- Masked upper address bits: 0x19
- OR with SDRG\_ADDR: 0x19
- Physical address: 0x19AE\_37F0

This request is forwarded to address 0x19AE\_37F0, address space 1 of the memory controller.

Request to address 0xB7FF\_0340:

- Upper address bits: 0xB7
- Hit mask:  $2^8 - 2^5 = 0xE0$
- Masked upper address bits: 0xA0, that is, hits section 1
- Address mask:  $2^5 - 1 = 0x1F$
- Masked upper address bits: 0x17
- OR with SDRG\_ADDR: 0x37
- Physical address: 0x37FF\_0340

This request is forwarded to address 0x37FF\_0340, address space 0 of the memory controller.

#### 15.2.4.2.2 Case 2: Use of Two Memory Controllers

In the case of 512 MiB interleaved at 128-byte boundaries and 256 MiB noninterleaved on the second memory controller, one address space per memory controller, we have the following results (see [Table 15-21](#)).

**Table 15-21. Address Definition**

Address Range	Memory Controller	Memory Controller Address Space <sup>(1)</sup>	Memory Controller Address Range
0x8000_0000 to 0x9FFF_FFFF	EMIF1 and EMIF2, interleaved at 128-byte boundaries	0x0 on both controllers	0x0000_0000 to 0x0FFF_FFFF on both controllers
0xA000_0000 to 0xAFFF_FFFF	EMIF2 only	0x0	0x1000_0000 to 0x1FFF_FFFF

<sup>(1)</sup> For memory controller address spaces, see [Section 15.3.4.1.1, Local Interface](#) in [Section 15.3, EMIF Controller](#).

Two sections are used to map such a configuration (see [Table 15-22](#)).

**Table 15-22. Configuration**

Bit Field	Section 0 (DMM_LISA_MAP_0)	Section 1 (DMM_LISA_MAP_1)
[31:24] SYS_ADDR	0x80	0xA0
[22:20] SYS_SIZE	0x5	0x4
[19:18] SDRC_INTL	0x1	0x0 (not applicable)
[17:16] SDRC_ADDRSPC	0x0	0x0
[9:8] SDRC_MAP	0x3	0x2
[7:0] SDRC_ADDR	0x00	0x10

Detecting a section hit is the same for the interleaved case as for the single controller case: To check whether an address hits a section, use the 8 upper address bits of the address and mask them with the hit mask:  $2^8 - 2^{\text{SYS\_SIZE}}$ . If the result is equal to SYS\_ADDR, the section is hit.

The physical address generation is modified for the interleaved case. In case of 256-byte interleaving, the first chunk of 256 bytes is mapped to the first controller, the second chunk to the second controller, and so on. This results in system address bit 8 to be decoded as the controller indicator, 0 for the first controller, and 1 for the second controller (system address bit 7 is used for interleaving at the 128-byte boundary, and bit 9 for 512 bytes). This bit is not included in the computed physical address, meaning the upper system address bits [31:9] are shifted to bits [30:8] when generating the physical address.

The rest of the address generation is handled the same as for the single controller case: to define the physical address to be issued to the memory controller, use the 8 upper address bits of the system address, mask them with the address mask:  $2^{\text{SYS\_SIZE}} - 1$ , and OR them with SDRC\_ADDR. This gives the resulting 8 upper physical address bits. All lower address bits are forwarded unchanged.

Request to address 0x99AE\_37F0:

- Upper address bits: 0x99
- Hit mask:  $2^8 - 2^5 = 0xE0$
- Masked upper address bits: 0x80, that is, hits section 0
- Address mask:  $2^5 - 1 = 0x1F$
- Masked upper address bits: 0x19
- Full masked address: 0x19AE\_37F0
- Bit 7 is 1, that is, targets the second memory controller
- Full masked shifted address (suppressing bit 7): 0x0CD7\_1BF0 (see [Section 15.2.4.2.2.1](#))
- OR upper physical address bits with SDRC\_ADDR: 0x0CD7\_1BF0
- Physical address: 0x0CD7\_1BF0

This request is forwarded to address 0x0CD7\_1BF0, address space 0, of the second memory controller.

**15.2.4.2.2.1 Address Upper Bits Shifting**

Table 15-23 describes shifting the address upper bits.

**Table 15-23. Address Upper Bits Shifting**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## 15.2.5 DMM Basic Programming Model

The programming model section:

- Describes how objects can be addressed in all TILER modes and orientations
- Explains how the physical containers and PAT LUT can be shared between different modes
- Does not give an exhaustive description of the TILER and DMM registers, because these are described in [Section 15.2.3.5, DMM](#), and [Section 15.2.3.6, TILER](#).

### 15.2.5.1 Global Initialization

This section identifies the requirements for initializing the surrounding modules when the DMM is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DMM (see [Table 15-24](#)).

**Table 15-24. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. See <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Image processing unit (IPU)	IPU interrupt controller (INTC) configuration must be done to enable the interrupts from the DMM. See <a href="#">Chapter 17, Interrupt Controllers</a> .
Main processing unit (MPU)	MPU INTC configuration must be done to enable interrupts from the DMM. See <a href="#">Chapter 17, Interrupt Controllers</a> .
L3_MAIN interconnect	Data interface

### 15.2.5.2 DMM Module Global Initialization

The procedure in [Table 15-25](#) initializes the DMM after a power-on reset (POR).

**Table 15-25. DMM Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Configure the DMM for smart-idle power management mode.	<a href="#">DMM_SYSCONFIG</a> [3:2] IDLE_MODE	0x2

### 15.2.5.3 DMM Operational Modes Configuration

#### 15.2.5.3.1 Different Operational Modes

The TILER can be virtually accessed in four different modes: 8-, 16-, 32-bit, and page modes. Each mode defines the element granularity to apply isometric transforms (see [Table 15-26](#)).

**Table 15-26. Coding and Description of TILER Modes**

Mode	Name	Granularity (Element Size)
0	8-bit tiled mode	8 bits
1	16-bit tiled mode	16 bits
2	32-bit tiled mode	32 bits
3	Page mode	4096 bytes

#### 15.2.5.3.2 Configuration Settings and LUT Refill

The procedure in [Table 15-27](#) provides the configuration settings and LUT refill.

**Table 15-27. Configuration Settings and LUT Refill**

Step	Register/Bit Field/Programming Model	Value
PAT configuration refill Engine 0	DMM_PAT_CONFIG[0] MODE0	xxx
PAT configuration refill Engine 1	DMM_PAT_CONFIG[1] MODE1	xxx
Set DMM PAT view register value for each initiator.	DMM_PAT_VIEW0 Vx DMM_PAT_VIEW1 Vx	xxx
Set DMM PAT write enable for the initiators.	DMM_PAT_VIEW0 Wx DMM_PAT_VIEW1 Wx	xxx
Choosing container type and access method	DMM_PAT_VIEW_MAP_i	xxx
Define the base address of all view mappings.	DMM_PAT_VIEW_MAP_BASE[31] BASE_ADDR	xxx
Set area definition for DMM physical address translator.	DMM_PAT_AREA_i	xxx
Set the physical address of the current table refill entry data or entry data when in manual mode.	DMM_PAT_DATA_i[31:4] ADDR	xxx
Define the direction of this PAT table refill (S Y X), different from 0x011.	DMM_PAT_CTRL_i[6:4] DIRECTION	xxx
Start a PAT table refill.	DMM_PAT_CTRL_i[0] START	0x1

### 15.2.5.3.3 Interleaving Settings

The procedure in [Table 15-28](#) provides the interleaving settings.

**Table 15-28. Interleaving Settings**

Step	Register/Bit Field/Programming Model	Value
Set DMM system section address MSB.	DMM_LISA_MAP_i[31:24] SYS_ADDR	xxx
Set DMM system section size.	DMM_LISA_MAP_i[22:20] SYS_SIZE	xxx
Set SDRC interleaving mode.	DMM_LISA_MAP_i[19:18] SDRC_INTL	xxx
Set SDRC address space.	DMM_LISA_MAP_i[17:16] SDRC_ADDRSPC	xxx
Set SDRC mapping.	DMM_LISA_MAP_i[9:8] SDRC_MAP	xxx
Set SDRC address MSB.	DMM_LISA_MAP_i[7:0] SDRC_ADDR	xxx
Enable/disable DMM memory mapping lock.	DMM_LISA_LOCK[0] LOCK	xxx

### 15.2.5.3.4 Aliased Tiled View Orientation Settings and LUT Refill

The procedure in [Table 15-29](#) provides the settings for aliased tiled view and LUT refill.

**Table 15-29. Aliased Tiled View Orientation Settings and LUT Refill**

Step	Register/Bit Field/Programming Model	Value
Set DMM TILER orientation for each initiator.	DMM_TILER_OR0 ORx DMM_TILER_OR1 ORx	xxx
Set DMM TILER write enable for the initiators.	DMM_TILER_OR0 Wx DMM_TILER_OR1 Wx	xxx
Define the base address of all view mappings.	DMM_PAT_VIEW_MAP_BASE[31] BASE_ADDR	xxx
DMM PAT initiator for synchronization	DMM_PAT_CTRL_i[31:28] INITIATOR	xxx
Set DMM PAT table reload synchronization.	DMM_PAT_CTRL_i[16] SYNC	xxx
Set DMM PAT LUT index (when more than one LUTs).	DMM_PAT_CTRL_i[9:8] LUT_ID	xxx
Define the direction of this PAT table refill (S Y X).	DMM_PAT_CTRL_i[6:4] DIRECTION	xxx
Start a PAT table refill.	DMM_PAT_CTRL_i[0] START	0x1

### 15.2.5.3.5 Priority Settings

The procedure in [Table 15-30](#) provides the sequence to set priorities.

**Table 15-30. Priority Settings**

Step	Register/Bit Field/Programming Model	Value
Set priority for each initiator.	<a href="#">DMM_PEG_PRIO_k Px</a>	xxx
Set write enable for P_PAT field.	<a href="#">DMM_PEG_PRIO_PAT[4] W_PAT</a>	xxx
Set priority for PAT engine.	<a href="#">DMM_PEG_PRIO_PAT[2:0] W_PAT</a>	xxx

### 15.2.5.3.6 Error Handling

The procedure in [Table 15-31](#) provides the sequence for error handling.

**Table 15-31. Error Handling**

Step	Register/Bit Field/Programming Model	Value
Enable interrupt for selected type of error.	<a href="#">DMM_PAT_IRQENABLE_SET[15:9]</a> <a href="#">DMM_PAT_IRQENABLE_SET[7:0]</a>	xxx
When interrupt occurs		
Disable type of error to handle.	<a href="#">DMM_PAT_IRQENABLE_CLR[15:9]</a> <a href="#">DMM_PAT_IRQENABLE_CLR[7:0]</a>	xxx
Check error status.	<a href="#">DMM_PAT_IRQSTATUS[15:9]</a> <a href="#">DMM_PAT_IRQSTATUS[7:0]</a>	xxx

### 15.2.5.3.7 PAT Programming Model

The PAT maps the tiled data anywhere in the 4-GiB physical address range, with a PAGE granularity. (The TILER page is the granularity of physical memory allocation in the TILER container. Each page is 4kiB).

A PAT view defines the kind of PAT to perform for each page, 8-, 16-, and 32-bit mode access. Each mode in each PAT view can be programmed in two different modes: direct translation and indirect translation.

#### 15.2.5.3.7.1 PAT in Direct Translation Mode

In this mode, the PAT performs a translation of the 128-MiB virtual container as a whole in the physical address space (that is, in the SDRAM). This mode is used only for debug or in case of a DMM without a PAT.

#### 15.2.5.3.7.2 PAT in Indirect Translation Mode

This is the most commonly used mode. In this mode, the PAT performs a translation of each 4-KiB page individually. In this way the 128-MiB virtual address space can be scattered in the whole 2 GiB of the physical address space. This is achieved by using a 32,678-word LUT that converts each page index (32,768 possible values) into 19 address bits that represent this page address in the physical memory. The main characteristic of this mode is there is no constraint on the use of the physical memory except that it uses a multiple of 4-KiB areas located at 4-KiB boundaries in the physical memory. In this mode, the translation vector is in the internal 32-k entry PAT vector table at the index given by bits [26:12] of the input virtual address, and `CONT_x = 0`.

Programming sequence:

1. Set the [DMM\\_PAT\\_VIEW0](#) register (or [DMM\\_PAT\\_VIEW1](#), depending on the L3 `CONN_ID` of the initiator that is to perform the tiled accesses) with the appropriate value. For example, if the L3 `CONN_ID` equals 0, then the [DMM\\_PAT\\_VIEW0](#) register must be programmed with the value `0x0000_0001` (PAT view 1 selected for initiator 0).
2. Set [DMM\\_PAT\\_VIEW\\_MAP\\_BASE\[31\] = 0x8000\\_0000](#) (must always be programmed at 1 to select

the upper 2 GiB of the physical address space that corresponds to the external memory).

- Set all 16-bit tiled accesses in indirect translation mode by setting at least the field ACCESS\_16 to 1 (DMM\_PAT\_VIEW\_MAP\_1 = 0x0000\_8000), program DMM\_PAT\_VIEW\_MAP\_1 at 0x8080\_8080.

### 15.2.5.4 Addressing an Object in Tiled Mode

This section describes how a frame-buffer with a top-left pixel at (x0,y0) in the natural view container and a bottom right pixel at (x1,y1) in the natural view container is addressed in any tiled mode and orientation.

#### 15.2.5.4.1 Frame-Buffer Addressing

**NOTE:** In this section, the (x,y) coordinates are given in pixel units.

Given an (S,  $\bar{Y}$ ,  $\bar{X}$ ) orientation, the (x,y) coordinates of the first pixel of the frame in the oriented view (where W = the width and H = the height in pixels of the container in the considered frame mode) is:

(x,y) = (x<sub>or</sub>, y<sub>or</sub>) when S, (y<sub>or</sub>, x<sub>or</sub>) otherwise  
with:

x<sub>or</sub> = x<sub>0</sub> when  $\bar{X}$ , W-1-x<sub>1</sub> otherwise  
y<sub>or</sub> = y<sub>0</sub> when  $\bar{Y}$ , H-1-y<sub>1</sub> otherwise

Given a (M<sub>1</sub>, M<sub>0</sub>) TILER mode where M<sub>1</sub> # 0 or M<sub>0</sub> # 0, the size in bytes of a pixel is 2<sup>2M<sub>1</sub>+M<sub>0</sub></sup>.

Therefore, given an (S,  $\bar{Y}$ ,  $\bar{X}$ ) orientation and a n(M<sub>1</sub>, M<sub>0</sub>) TILER mode where M<sub>1</sub> # 0 or M<sub>0</sub> # 0, the byte offset of the base address of the considered oriented frame in its container is:

base\_address((x<sub>0</sub>, y<sub>0</sub>), (x<sub>1</sub>, y<sub>1</sub>), (S,  $\bar{Y}$ ,  $\bar{X}$ ), (M<sub>1</sub>, M<sub>0</sub>)) = (y<sub>or</sub>W + x<sub>or</sub>) P<sub>5</sub> when S, (x<sub>or</sub>H + y<sub>or</sub>) P<sub>5</sub> otherwise  
with:

x<sub>or</sub> = x<sub>0</sub> when  $\bar{X}$ , W-1-x<sub>1</sub> otherwise  
y<sub>or</sub> = y<sub>0</sub> when  $\bar{Y}$ , H-1-y<sub>1</sub> otherwise  
P<sub>5</sub> = 2<sup>2M<sub>1</sub>+M<sub>0</sub></sup>

In its natural orientation, the TILER container consists of 8192 lines of 16,384 pixels of 8 bits, or 4096 lines of 16,384 pixels of 16 bits, or 4096 lines of 8192 pixels of 32 bits.

Figure 15-44. Example of 8-Bit Frame-Buffer Addressing in any Orientation

sdram-075

This frame-buffer address generation is independent from the page size. For instance, the 8-bit frame-buffer shown in [Figure 15-44](#) that ranges from the top-left pixel at (16, 32) to the bottom-right pixel at (223, 159) in the natural orientation view, corresponds to the 29-bit view address offsets and full 33-bit TILER addresses given in [Table 15-32](#).

**Table 15-32. 29-Bit View Address Offset and 33-Bit Full TILER Address for an 8-Bit Frame-Buffer**

S	Y	X	$x_{or}$	$y_{or}$	29-Bit Address Offset in View	Full 33-Bit TILER Address
0	0	0	16	32	00080010h	100080010h
0	0	1	16,160	32	00083F20h	120083F20h
0	1	0	16	8032	07D80010h	147D80010h
0	1	1	16,160	8032	07D83F20h	167D83F20h
1	0	0	16	32	00020020h	180020020h
1	0	1	16,160	32	07E40020h	1A7E40020h
1	1	0	16	8032	00021F60h	1C0021F60h
1	1	1	16,160	8032	07E41F60h	1E7E41F60h

In this example the TILER is addressed in 8-bit mode, which translates to addresses with all mode bits (bits 27 and 28) cleared in the 29-bit address offset in view and in the full 33-bit TILER address.

#### 15.2.5.4.2 TILER Page Mapping

Let:

- $c$  ( $c = 0, 1, \text{ or } 2$ ) be the TILER page configuration (0 for 4-kiB pages, 1 for 16-kiB pages, and 2 for 64-kiB pages)
- $(x_0, y_0)$  be the top-left pixel and  $(x_1, y_1)$  be the bottom-right pixel of a frame in its natural orientation
- $W$  be the width and  $H$  the height in pixels of the container in the considered frame mode

The top-left page coordinates  $(P_{x_0}, P_{y_0})$  and bottom-right page coordinates  $(P_{x_1}, P_{y_1})$  that correspond to the frame are given by:  $P_{x_0} = (64 \cdot x_0 \cdot 2^{2-c}) / W$ ,  $P_{y_0} = (32 \cdot y_0 \cdot 2^{2-c}) / H$ ,  $P_{x_1} = (64 \cdot x_1 \cdot 2^{2-c}) / W$  and  $P_{y_1} = (32 \cdot y_1 \cdot 2^{2-c}) / H$ .

In its natural orientation, the TILER container consists of 8192 lines of 16,384 pixels of 8 bits, or 4096 lines of 16,384 pixels of 16 bits, or 4096 lines of 8192 pixels of 32 bits.

---

**NOTE:** The page area type has the same structure as the [DMM\\_PAT\\_AREA\\_i](#) registers. For instance, the 8-bit frame-buffer described in [Figure 15-44](#) and ranging from the top-left pixel at (16, 32) to the bottom-right pixel at (223, 159) in the natural orientation view, is mapped from the top-left page at P0,0 to the bottom-right page P3,2.

---

#### 15.2.5.5 Addressing an Object in Page Mode

In page mode, the orientation modifies only the sequence of accessed pages, not their content. In this respect the orientation must be seen as a way to optimize the one-dimensional (1D) object allocation in a TILER container by allowing a 1D object spanning multiple pages to map a set of adjacent pages in any direction. For instance, a 1.25-MiB object, mapped on 320 pages of 4kiB can be allocated in a TILER container in any of the eight orientations (see [Section 15.2.3.6.1.8.3, Element Ordering in the TILER Container](#)).

The initial page can be chosen freely among all pages. In this respect, the address offset of a page in a TILER container is expressed as:

Let:

- $c$  ( $c = 0, 1 \text{ or } 2$ ) be the TILER page configuration (0 for 4-kiB pages, 1 for 16-kiB pages, and 2 for 64-kiB pages)
- $(S, Y, X)$  be the orientation of the considered 1D object in page mode
- $(P_x, P_y)$  be the coordinate of the initial page in the natural orientation view

The byte offset of the base address of the considered initial page in its oriented container is:

base\_address((P<sub>x</sub>, P<sub>y</sub>), (S,  $\bar{Y}$ ,  $\bar{X}$ )) = 4096.(64.y<sub>or</sub>.2<sup>2-c</sup> + x<sub>or</sub>).2<sup>2-c</sup> when S, 4096.(32.x<sub>or</sub>.2<sup>2-c</sup> + y<sub>or</sub>).2<sup>2-c</sup> otherwise with:

x<sub>or</sub> = P<sub>x</sub> when  $\bar{X}$ , 64.2<sup>2-c</sup>-1-P<sub>x</sub> otherwise

y<sub>or</sub> = P<sub>y</sub> when  $\bar{Y}$ , 32.2<sup>2-c</sup>-1-P<sub>y</sub> otherwise

For instance, a 1D object starting from the page P32,63 in the natural orientation view on a DMM using 4-kB pages, corresponds to the 29-bit view address offsets and full 33-bit TILER addresses given in

[Table 15-33](#).

**Table 15-33. 29-Bit View Address Offset and 33-Bit Full TILER Address for a 1D Object**

S	$\bar{Y}$	$\bar{X}$	x <sub>or</sub>	y <sub>or</sub>	29-Bit Address Offset in View	Full 33-Bit TILER Address
0	0	0	32	63	1BF20000h	11BF20000h
0	0	1	223	63	1BFDF000h	13BFDF000h
0	1	0	32	64	1C020000h	15C020000h
0	1	1	223	64	1C0DF000h	17C0DF000h
1	0	0	32	63	1903F000h	19903F000h
1	0	1	223	63	1EFBF000h	1BEFBF000h
1	1	0	32	64	19040000h	1D9040000h
1	1	1	223	64	1EFC0000h	1FEFC0000h

In this example the TILER is addressed in page mode, which translates to addresses with mode bits (bits 27 and 28) set in the 29-bit address offset in view and full 33-bit TILER address.

### 15.2.5.6 Sharing Containers Between Different Modes

When allocating objects in TILER containers, ensure that no two objects physically overlap.

In this respect, and to ease the object allocation and deallocation, it is strongly advised to share a TILER page only for different objects that do both of the following:

- Belong to the same mode
- Have the same lifetime (that is, are allocated and deallocated simultaneously)

Two objects of different modes can physically overlap if:

- One physical page is mapped twice in two different locations of the DMM LUT.
- The two objects share the DMM LUT and the intersection of their two page set is not empty.

These two issues can be easily avoided by allocating a physical page only once in the DMM LUT.

The second issue is a bit more difficult, especially if the allocation of objects in the various TILER containers must be dynamic. Managing the fragmentation within a flat memory model in a space-constrained system is not straightforward, and is the main reason for the existence of MMUs in most current processors, which adds yet another constraint to the problem (the y dimension, which makes it even more difficult).

Returning to the CPU-analogy, the memory fragmentation issue is mostly solved by using a virtual memory space larger than the actual physical memory space and a virtual-to-physical translation system. This allows contiguous virtual memory allocation when sufficient physical memory is available and the larger contiguous physical buffer is smaller than the requested memory allocation.

Similarly, the DMM answer to this object allocation in the TILER containers is two-fold:

- The DMM must have sufficient virtual address space in all modes to permit a static allocation of a pool of virtual buffers in all TILER modes for all TILER-aware initiators.
- Each TILER-aware initiator must dynamically manage its own pool of virtual buffers.

## 15.2.6 DMM Register Manual

This section provides information about the DMM registers. [Table 15-34](#) describes the DMM instance.

### 15.2.6.1 DMM Instance Summary

**Table 15-34. DMM Instance Summary**

Module Name	Base Address	Size
DMM	0x4E00 0000	32 MiB

### 15.2.6.2 DMM Registers

#### 15.2.6.2.1 DMM Register Summary

[Table 15-35](#) provides a summary of the DMM registers.

**Table 15-35. DMM Registers Mapping Summary**

Bits	Field Name	Description	Type	Reset
31	ERR_LUT_MISS3	Unexpected access to a yet-to-be-refilled area interrupt source mask for area 4.n+3  Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
30	ERR_UPD_DATA3	Unexpected data register update whilst refilling interrupt source mask for area 4.n+3  Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
29	ERR_UPD_CTRL3	Unexpected control register update whilst refilling interrupt source mask for area 4.n+3  Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
28	ERR_UPD_AREA3	Unexpected area register update whilst refilling interrupt source mask for area 4.n+3  Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
27	ERR_INV_DATA3	Invalid entry-table pointer interrupt source mask for area 4.n+3 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
26	ERR_INV_DSC3	Invalid descriptor pointer interrupt source mask for area 4.n+3 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
25	FILL_LST3	End of refill interrupt source mask for the last descriptor in area 4.n+3 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
24	FILL_DSC3	End of refill interrupt source mask for any descriptor in area 4.n+3 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
23	ERR_LUT_MISS2	Unexpected access to a yet-to-be-refilled area interrupt source mask for area 4.n+2 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
22	ERR_UPD_DATA2	Unexpected data register update whilst refilling interrupt source mask for area 4.n+2 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
21	ERR_UPD_CTRL2	Unexpected control register update whilst refilling interrupt source mask for area 4.n+2 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
20	ERR_UPD_AREA2	Unexpected area register update whilst refilling interrupt source mask for area 4.n+2 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
19	ERR_INV_DATA2	Invalid entry-table pointer interrupt source mask for area 4.n+2 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
18	ERR_INV_DSC2	Invalid descriptor pointer interrupt source mask for area 4.n+2 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
17	FILL_LST2	End of refill interrupt source mask for the last descriptor in area 4.n+2 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
16	FILL_DSC2	End of refill interrupt source mask for any descriptor in area 4.n+2 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
15	ERR_LUT_MISS1	Unexpected access to a yet-to-be-refilled area interrupt source mask for area 4.n+1 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
14	ERR_UPD_DATA1	Unexpected data register update whilst refilling interrupt source mask for area 4.n+1 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
13	ERR_UPD_CTRL1	Unexpected control register update whilst refilling interrupt source mask for area 4.n+1 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
12	ERR_UPD_AREA1	Unexpected area register update whilst refilling interrupt source mask for area 4.n+1 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
11	ERR_INV_DATA1	Invalid entry-table pointer interrupt source mask for area 4.n+1 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
10	ERR_INV_DSC1	Invalid descriptor pointer interrupt source mask for area 4.n+1 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
9	FILL_LST1	End of refill interrupt source mask for the last descriptor in area 4.n+1 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
8	FILL_DSC1	End of refill interrupt source mask for any descriptor in area 4.n+1 Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
7	ERR_LUT_MISS0	Unexpected access to a yet-to-be-refilled area interrupt source mask for area 4.n Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
6	ERR_UPD_DATA0	Unexpected data register update whilst refilling interrupt source mask for area 4.n Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
5	ERR_UPD_CTRL0	Unexpected control register update whilst refilling interrupt source mask for area 4.n Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
4	ERR_UPD_AREA0	Unexpected area register update whilst refilling interrupt source mask for area 4.n Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
3	ERR_INV_DATA0	Invalid entry-table pointer interrupt source mask for area 4.n Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
2	ERR_INV_DSC0	Invalid descriptor pointer interrupt source mask for area 4.n Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
1	FILL_LST0	End of refill interrupt source mask for the last descriptor in area 4.n Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0
0	FILL_DSC0	End of refill interrupt source mask for any descriptor in area 4.n Write 0x0: Keep current mask of this interrupt source. Write 0x1: Disable (mask) this interrupt source. Read 0x1: This interrupt source is enabled (unmasked). Read 0x0: This interrupt source is disabled (masked).	RW W1toClr	0

### 15.3 EMIF Controller

This section describes mainly the features and functions of the two external memory interface (EMIF) controllers and also their associated PHYs.

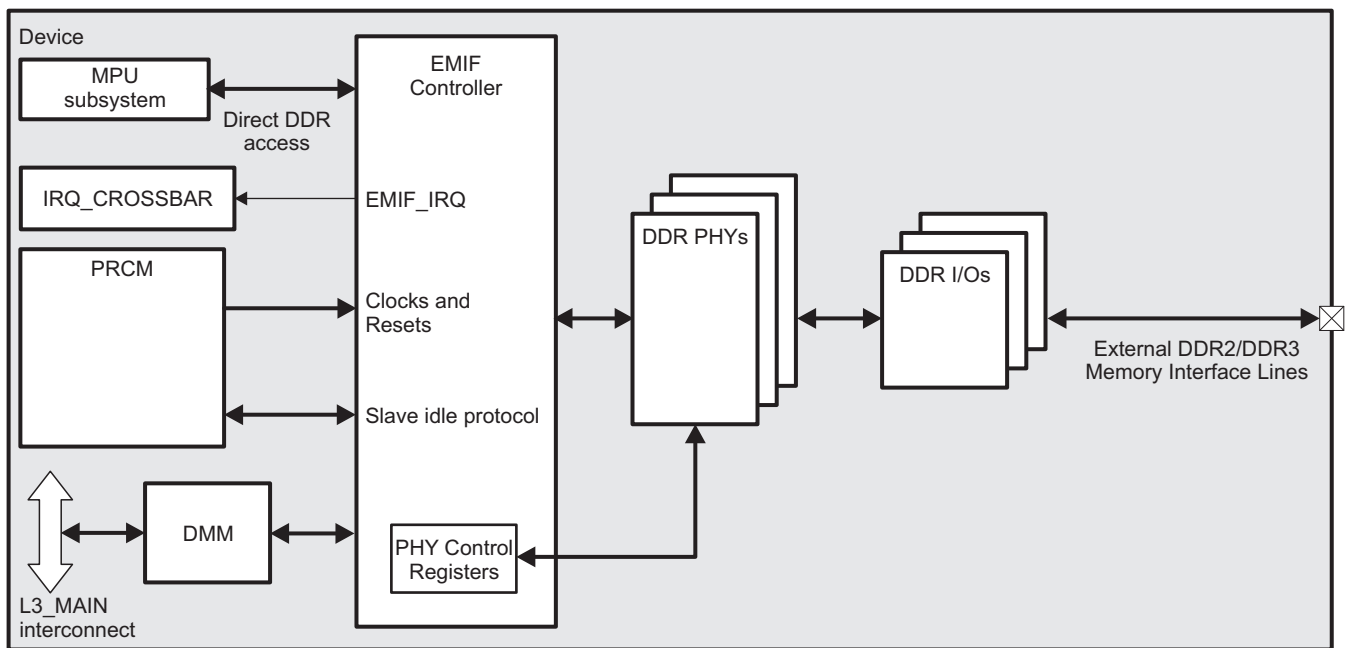

#### 15.3.1 EMIF Controller Overview

The EMIF controller provides connectivity between the device and DDR2 type or DDR3 type of memories and manages data bus read/write accesses between external memories and the device subsystems which have access to the L3\_MAIN interconnect and DMA capability too.

The EMIF features are introduced in [Section 15.1.3 EMIF Overview](#) of [Section 15.1 Memory Subsystem Overview](#).

The device includes two EMIF controllers. Each controller supports up to 2 GiB of SDRAM over one chip select. As a result the total physical available SDRAM space is 4 GiB. [Figure 15-45](#) shows an overview of these EMIF controllers and also the connections to the other surrounding modules. As can be seen on [Figure 15-45](#) the two EMIFs are not directly available on device pads. That is, they are not directly connected to the external SDRAMs. There are DDR PHYs and then DDR I/Os between each EMIF controller and external SDRAM. The EMIF controller, the DDR PHYs and the DDR I/Os work like a single unit to manage data exchanges to and from external memories. To achieve successful data transaction between an internal device initiator and external SDRAM all these three components must be used.

**Figure 15-45. EMIF Controller Overview**

emif-001

#### 15.3.2 EMIF Module Environment

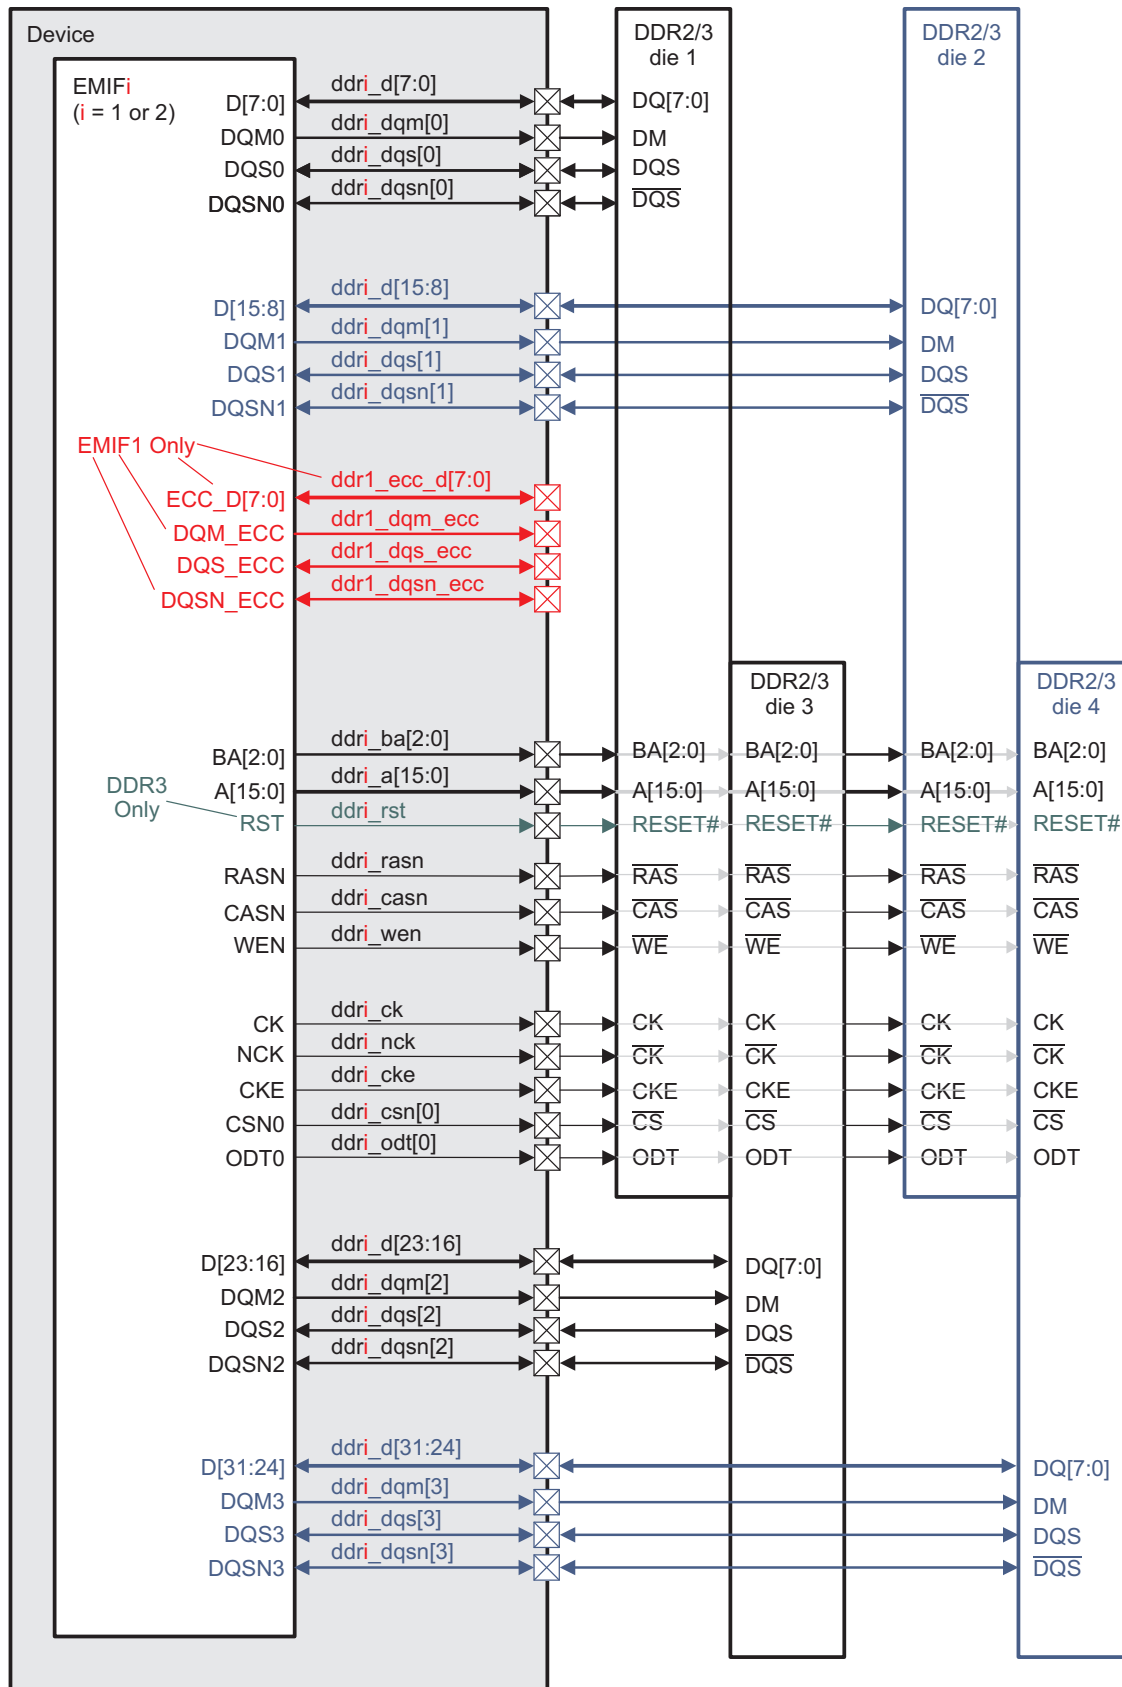

This section describes the external connections of the two EMIF modules.

[Figure 15-46](#) shows an example EMIF DDR2/DDR3 configuration without ECC memory connected.

[Figure 15-47](#) shows an example EMIF DDR2/DDR3 configuration with ECC memory connected.

For simplification the DDR PHYs and DDR I/Os are not shown. Only the I/O signals and their corresponding EMIF pins are shown.

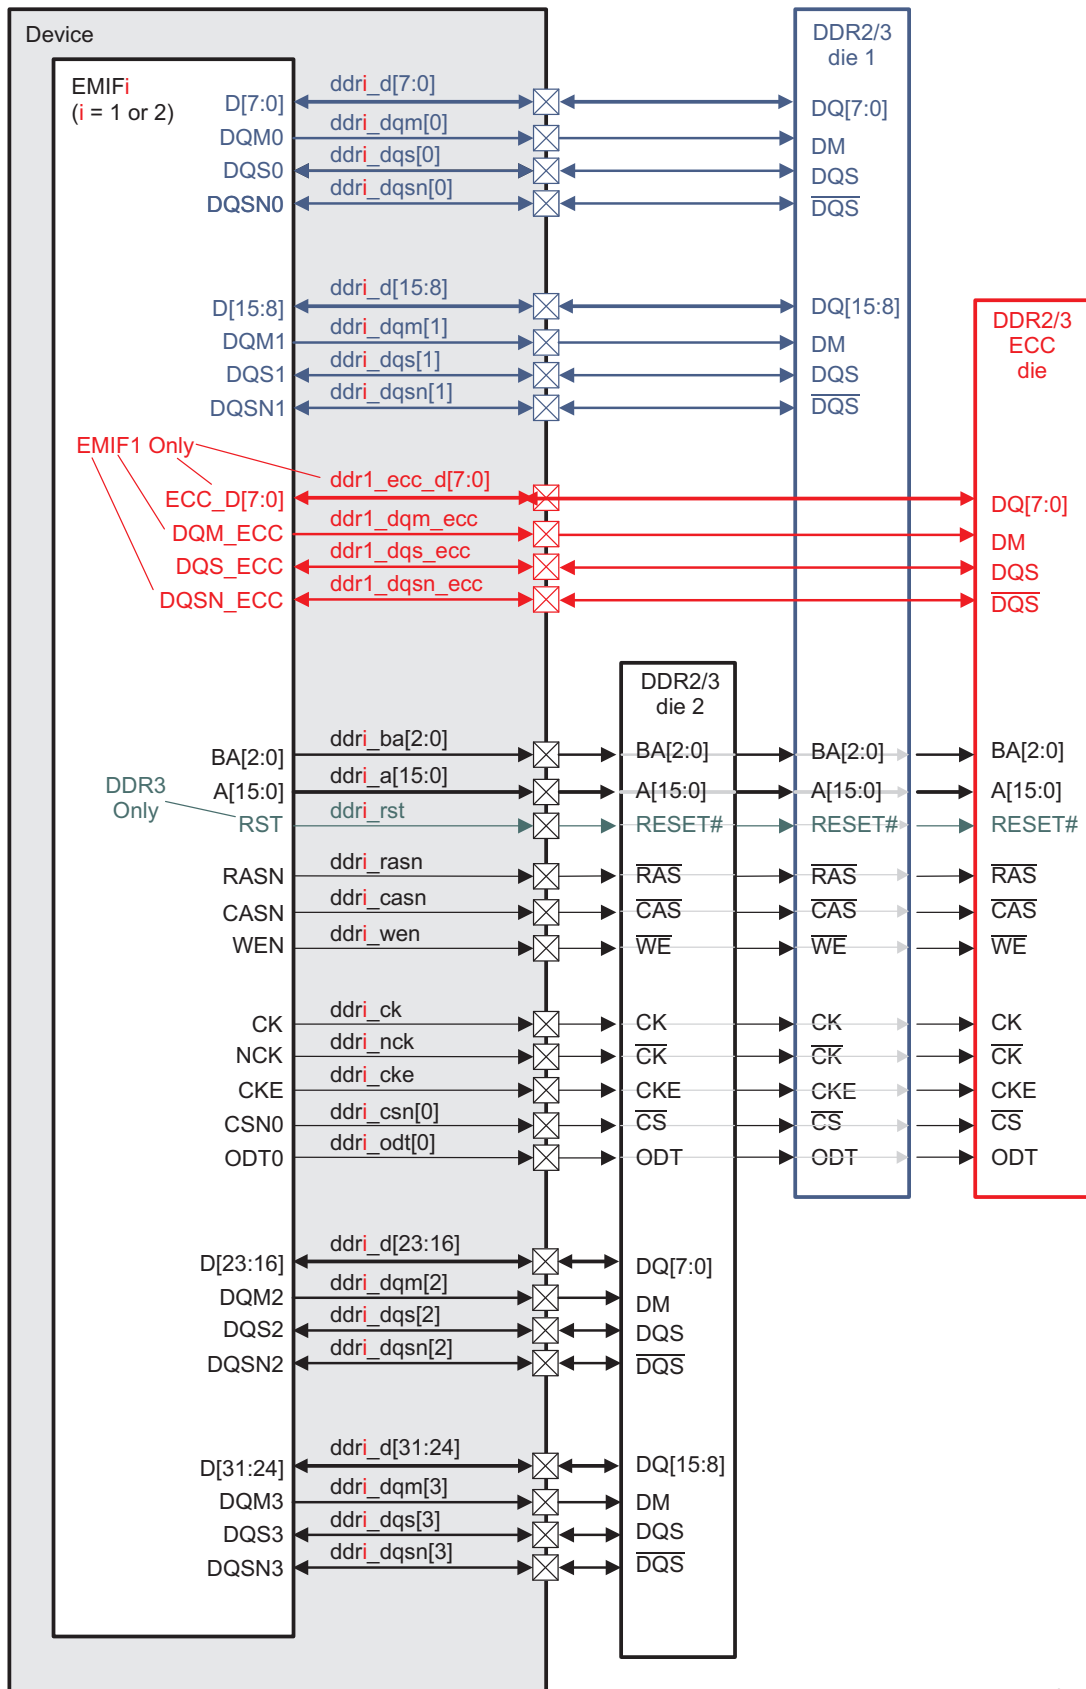

Figure 15-46. EMIF DDR2/DDR3 Configuration Without ECC

Figure 15-47. EMIF DDR2/DDR3 Configuration With ECC

emif-006

Table 15-96 describes the EMIF module associated I/O signals used for connection to DDR2 and DDR3 memory types.

**Table 15-96. EMIF Module I/O signals**

EMIF Pin Name	Device DDR2 and DDR3 I/O Signal Names	I/O <sup>(1)</sup>	Description
<b>EMIF1 Data PHYs</b>			
D[31:0]	ddr1_d[31:0]	I/O	Data bus
DQM[3:0]	ddr1_dqm[3:0]	O	Data mask
DQS[3:0]	ddr1_dqs[3:0]	I/O	Data strobe
DQSN[3:0]	ddr1_dqsn[3:0]	I/O	Data strobe invert
ECC_D	ddr1_ecc_d[7:0]	I/O	Data bus used for ECC (EMIF1 Only)
DQM_ECC	ddr1_dqm_ecc	O	Data mask used for ECC (EMIF1 Only)
DQS_ECC	ddr1_dqs_ecc	I/O	Data strobe used for ECC (EMIF1 Only)
DQSN_ECC	ddr1_dqsn_ecc	I/O	Data strobe invert used for ECC (EMIF1 Only)
<b>EMIF1 Command PHYs</b>			
A[15:0]	ddr1_a[15:0]	O	Row/column address bus
BA[2:0]	ddr1_ba[2:0]	O	Bank select
CK	ddr1_ck	O	Differential clock
NCK	ddr1_nck	O	Differential clock
CSN[0]	ddr1_csn[0]	O	Active low rank select signal (chip select)
CKE	ddr1_cke	O	Clock enable
CASN	ddr1_casn	O	Command
RASN	ddr1_rasn	O	Command
WEN	ddr1_wen	O	Command
RST	ddr1_rst	O	Active low asynchronous reset (DDR3 only)
ODT[0]	ddr1_odt[0]	O	On-die termination enable signal
<b>EMIF2 Data PHYs</b>			
D[31:0]	ddr2_d[31:0]	I/O	Data bus
DQM[3:0]	ddr2_dqm[3:0]	O	Data mask
DQS[3:0]	ddr2_dqs[3:0]	I/O	Data strobe
DQSN[3:0]	ddr2_dqsn[3:0]	I/O	Data strobe invert
<b>EMIF2 Command PHYs</b>			
A[15:0]	ddr2_a[15:0]	O	Row/column address bus
BA[2:0]	ddr2_ba[2:0]	O	Bank select
CK	ddr2_ck	O	Differential clock
NCK	ddr2_nck	O	Differential clock
CSN[0]	ddr2_csn[0]	O	Active low rank select signal (chip select)
CKE	ddr2_cke	O	Clock enable
CASN	ddr2_casn	O	Command
RASN	ddr2_rasn	O	Command
WEN	ddr2_wen	O	Command
RST	ddr2_rst	O	Active low asynchronous reset (DDR3 only)
ODT[0]	ddr2_odt[0]	O	On-die termination enable signal

<sup>(1)</sup> I = Input; O = Output

The CKE memory pad is dynamically driven by the EMIF module according to the memory interface activity. It can also be forced to tri-state by a dedicated Control Module register. For more information, see [Section 15.3.4.17 Forcing CKE to tri-state](#).

---

**NOTE:** The index numbers 1 and 2 which are part of the EMIF DDR2 and DDR3 associated signals listed in [Table 15-96 EMIF Associated I/O signals](#), column "**Device DDR2 and DDR3 I/O Signal Names**" should not be confused with DDR1 and DDR2 types of memories. They are used to indicate whether the corresponding signal is associated with EMIF1 or with EMIF2 controller. For example, ddr1\_csn[0] signal is the chip select associated with EMIF1 and ddr2\_csn[0] is the chip select associated with EMIF2.

---

The DDR memory connected to the DDR ECC bus does NOT need to be the same part number as the DDR memories connected to the DDR data bus. However, some constraints do apply. When selecting a memory for the DDR ECC bus, the following restrictions must be adhered to.

Compared to the DDR memories on the data bus, the DDR ECC memory must:

- Match the same DDR type (DDR3, DDR2, etc.) and speed grade
- Have an equal number of internal banks
- Have an equal number of columns
- Have a greater or equal number of rows

In addition,

- Unused pins should be properly tied off as described in the routing guidelines of the device data manual.
- EMIF register settings should be configured to satisfy the larger minimum timing requirements and the smaller maximum timing requirements between the two different DDR memories to ensure that all DDR memories connected to the EMIF channel are running within their specified range.

---

**NOTE:** For a full list of supported DDR device types, frequencies, and topologies, refer to the routing guidelines of the device data manual.

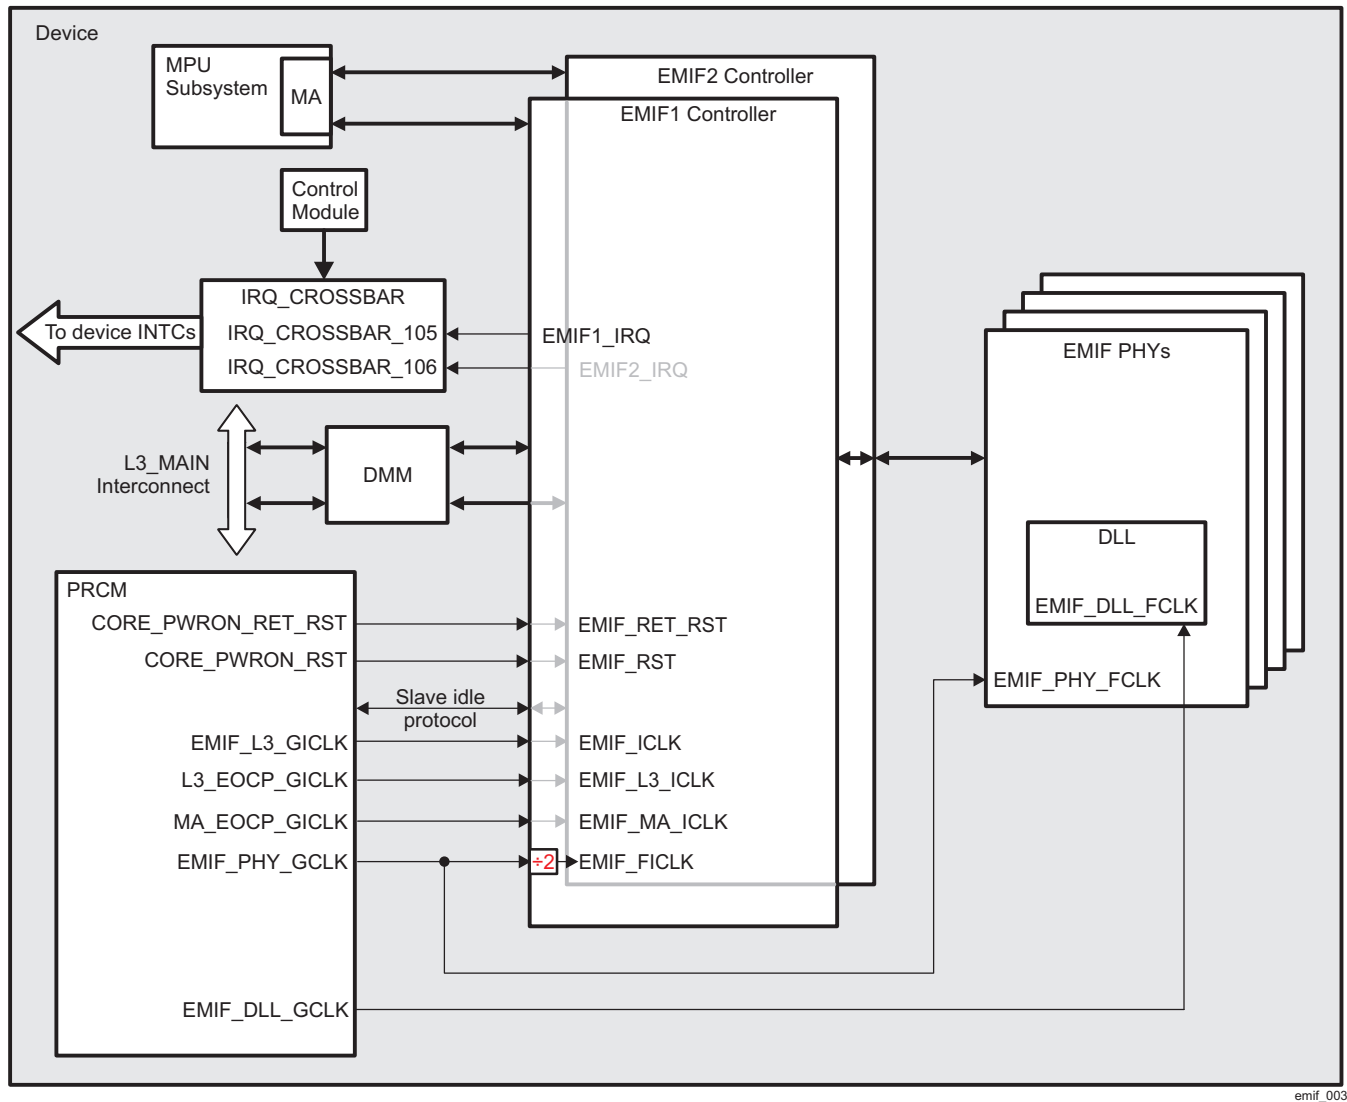

---

### 15.3.3 EMIF Module Integration

This section describes the integration of the EMIF modules in the device and includes information about clocks, resets, and hardware requests.

Figure 15-48 shows the integration of the two EMIF modules in the device.

Figure 15-48. EMIF Modules Integration

emif\_003

**NOTE:** For more information about the slave idle protocol, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 15-97 through Table 15-99 summarize the integration of the EMIF modules in the device.

**Table 15-97. EMIF Integration Attributes**

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
EMIF1	PD_COREAON	No	EMIF1 Controller is accessible via L3_MAIN interconnect but not directly, and only through the DMM.
EMIF2	PD_COREAON	No	EMIF2 Controller is accessible via L3_MAIN interconnect but not directly, and only through the DMM.

**Table 15-98. EMIF Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
EMIF1/ EMIF2	EMIF_ICLK	EMIF_L3_GICLK	PRCM	Interface clock for EMIF1/EMIF2 Controller used for driving the L3 interface logic and for SDRAM Read Data FIFO.
	EMIF_L3_ICLK	L3_EOCP_GICLK	PRCM	Interface clock for EMIF1/ EMIF2 Controller which frequency is equal to EMIF_L3_GICLK interface clock. Used for command/write data pre-FIFO to Command/Write Data FIFO paths when MPU is idle.
	EMIF_MA_ICLK	MA_EOCP_GICLK	PRCM	Additional interface clock for EMIF1/EMIF2 Controller which frequency is equal to MPU_GCLK/4. Used for command/write data pre-FIFO to Command/Write Data FIFO paths when the MPU is active.
	EMIF_PHY_FCLK	EMIF_PHY_GCLK	PRCM	Common functional clock for the EMIF1/EMIF2 associated PHYs. This clock is equal to the DDR2/DDR3 clock rate.
	EMIF_FICLK	EMIF_PHY_GCLK/2	PRCM	Functional and interface clock for EMIF1/EMIF2 Controller. This clock runs at half the DDR2/DDR3 clock rate.
	EMIF_DLL_FCLK	EMIF_DLL_GCLK	PRCM	Common functional clock for all DLLs associated with the EMIF1/EMIF2 PHYs.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
EMIF1/ EMIF2	EMIF_RET_RST	CORE_PWRON_RET_RST	PRCM	Power-on reset
	EMIF_RST	CORE_PWRON_RST	PRCM	Power-on reset

**NOTE:** The two clocks MA\_EOCP\_GICLK and L3\_EOCP\_GICLK are mutually exclusive. EMIF controllers are clocked by EMIF\_MA\_ICLK when MPU interface is active. When system interface is active, EMIF\_L3\_ICLK clock is used. This action is done automatically by the PRCM.

**Table 15-99. EMIF Hardware Requests**

Interrupt Requests				
Module Instance	IRQ Source Name	IRQ_CROSSBAR Input	Default IRQ Source Mapping	Description
EMIF1	EMIF1_IRQ	IRQ_CROSSBAR_105	MPU_IRQ_110	EMIF1 interrupt request
EMIF2	EMIF2_IRQ	IRQ_CROSSBAR_106	MPU_IRQ_111	EMIF2 interrupt request

**NOTE:** The “**Default IRQ Source Mapping**” column in [Table 15-99 EMIF Hardware Requests](#) shows the default mapping of the IRQ sources listed in column “**IRQ Source Name**” to a certain interrupt line of one of the device interrupt controllers. These IRQ sources can also be mapped to other interrupt lines of each device interrupt controller through the IRQ\_CROSSBAR module. For more information about the IRQ\_CROSSBAR module, see [Section 18.4.6.4, IRQ\\_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#). For more information about the device interrupt controllers, see [Chapter 17, Interrupt Controllers](#).

**NOTE:** For the description of the interrupt source, see [Section 15.3.4.5, Interrupt Requests](#).

### 15.3.4 EMIF Functional Description

#### 15.3.4.1 Block Diagram

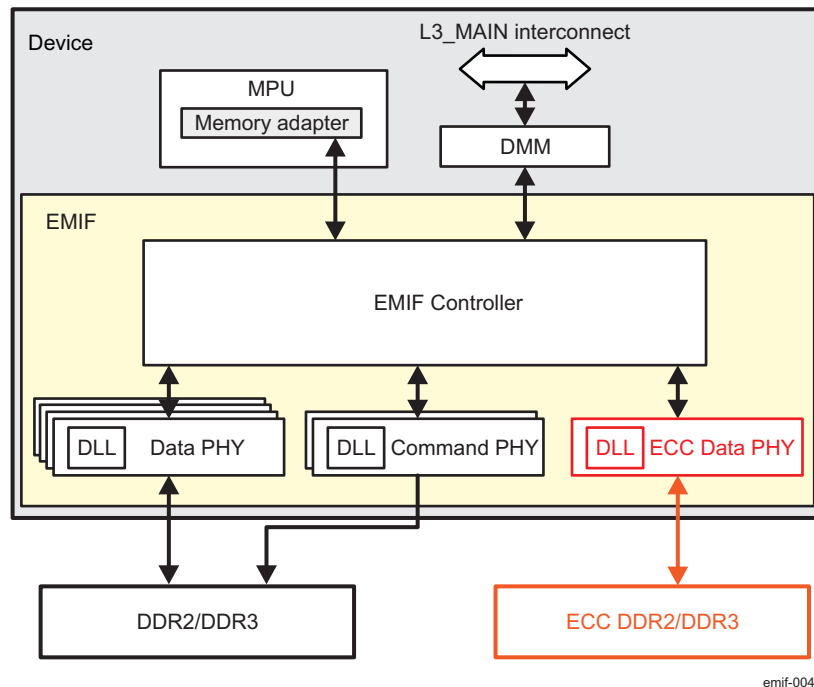

The EMIF module provides an interface to DDR2 and DDR3 SDRAM memories.

Figure 15-49 shows the interconnection between the EMIF module and the other modules.

Digital locked loops (DLLs) are used to delay the input DQS signals during reads so that these strobe signals can be used to latch incoming data on the DQ pins, as required by the DDR standard.

Physical layers (PHYS) convert single-data rate (SDR) signals to DDR signals.

Figure 15-49. EMIF Block Diagram

emif-004

##### 15.3.4.1.1 Local Interface

The EMIF supports two local (on-chip) interfaces:

- System interface (from L3\_MAIN interconnect)
- MPU interface (from MPU subsystem)

System interface is used to request all external memory device accesses, to access the EMIF registers, and to transfer all data to and from the EMIF controller. MPU interface is used to process memory accesses. Table 15-100 shows the MAddrSpace mapping.

Table 15-100. MAddrSpace Mapping

MAddrSpace <sup>(1)</sup>	Chip-Select	Description	Exclusions
0x0	CSN0	SDRAM(s)	
0x1	N/A	Reserved.	
0x2	N/A	Reserved. Any access to this area will generate an error on the L3 interface. This can be used by the software to track any unwanted access to the section defined in the DMM_LISA_MAP_i register.	Not visible through the MPU port
0x3	N/A	Internal registers	Not visible through the MPU port

<sup>(1)</sup> See DMM\_LISA\_MAP\_i [17:16] SDR\_ADDRSPC register bitfield in Section 15.2, Dynamic Memory Manager.

### 15.3.4.1.2 FIFO Description

The EMIF module contains the following FIFOs:

- Command FIFO
- Write data FIFO
- Return command FIFO
- Two read data FIFOs

Figure 15-50 shows the overall architecture of the EMIF FIFOs.

Figure 15-50. FIFO Block Diagram

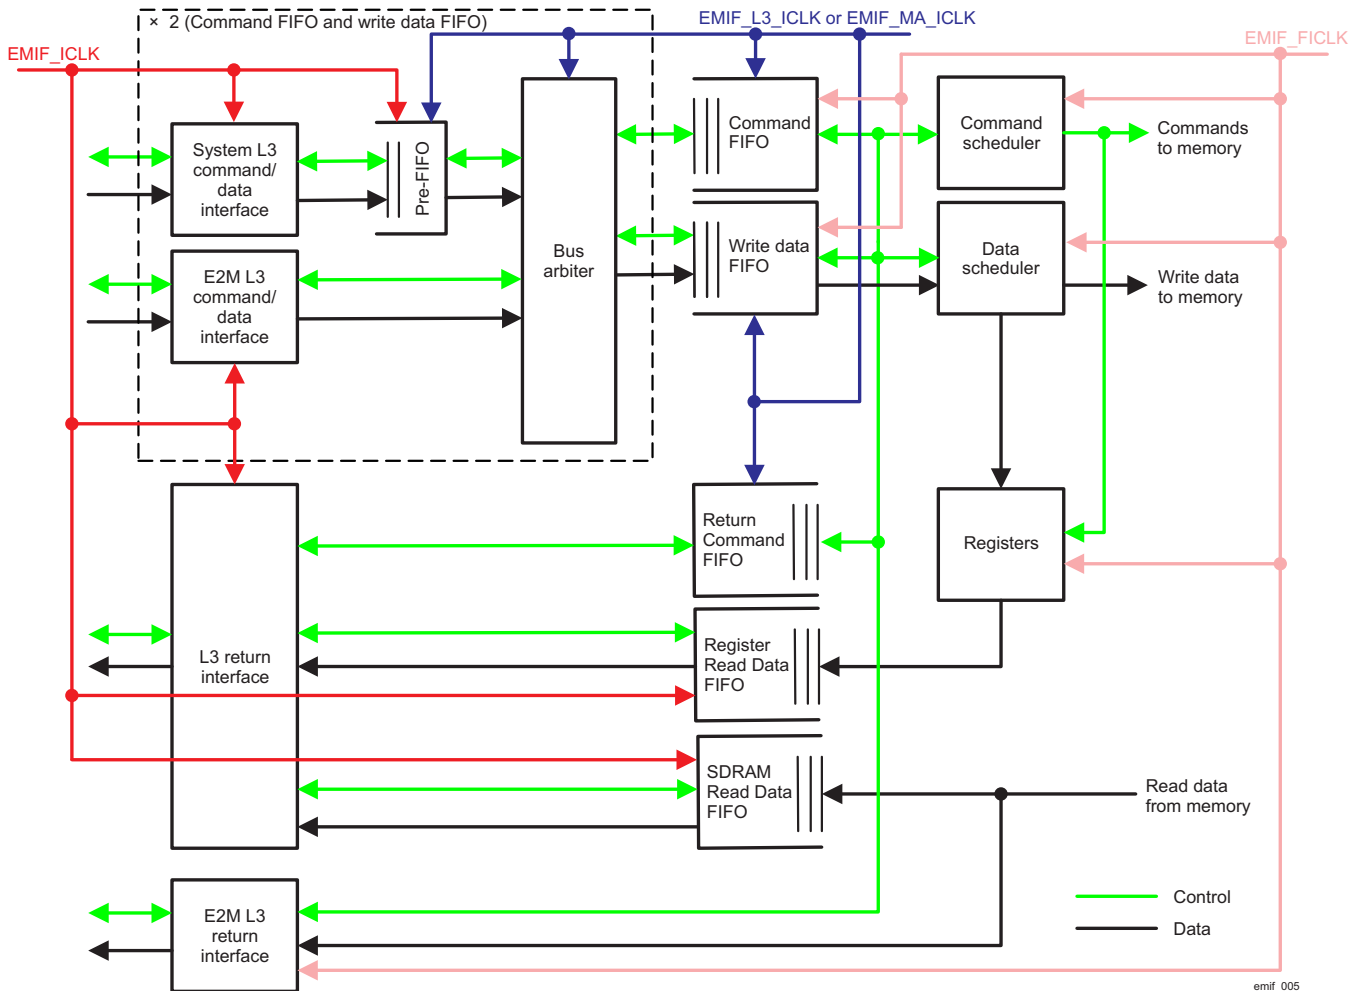

Table 15-101 lists the allocation of the entries.

Table 15-101. FIFO Allocation

Parameter	System Local Interface Entries	MPU Local Interface Entries
Pre Command FIFO	6	4
Command FIFO	Programmable <sup>(1)</sup>	Programmable <sup>(1)</sup>
Pre Write FIFO	6	8
Write Data FIFO (256-bit)	Up to (19 × 256 bits) + 6	Up to 19 + 8
Return Command FIFO	22	24
SDRAM Read Data FIFO	22	24

<sup>(1)</sup> The total number of entries in the command FIFO is 10.

**Table 15-101. FIFO Allocation (continued)**

Parameter	System Local Interface Entries	MPU Local Interface Entries
Register Read Data FIFO	2	0

The command FIFO is shared between the two local interfaces, whereas there are two different FIFOs for every other type, one dedicated to each local interface.

The command FIFO stores all the commands coming in on the local command interface. The allocation of entries in the command FIFO is programmable per local interface using the following bit fields:

- [EMIF\\_OCP\\_CONFIG\[27:24\]](#) SYS\_THRESH\_MAX
- [EMIF\\_OCP\\_CONFIG\[23:20\]](#) MPU\_THRESH\_MAX

#### 15.3.4.1.3 MPU Port Restrictions

The EMIF MPU port is defined only to process memory requests. All register accesses are processed through the system port of the EMIF. The EMIF MPU port does not support 2D or register requests required or provided by the system interface. The MPU port has a fixed ConnID equal to 0x0. The access burst length of the MPU port must not exceed 7.

To maintain coherency, the following rules must be followed:

- Any command arriving on MPU or system interface that matches an address in the command FIFO is executed after the command in the command FIFO
- The matching address is any address within a 2,000-address boundary
- On a 2D transfer, the starting address is the compared address. The computed addresses of the 2D transfer are not considered in address overlapping.
- Any command arriving within a 10-cycle window of another, from the different interfaces that do not match any address in the command FIFO, but may match command addresses arriving on a different interface, can be executed in any order.

#### 15.3.4.1.4 Arbitration of Commands in the Command FIFO

The EMIF looks at all the commands stored in the command FIFO to schedule commands to the external memory. All commands with the same MTagID on a particular local interface complete in order. The EMIF does not ensure ordering between commands with different MTagIDs or between commands from two local interfaces.

However, the EMIF does maintain data coherency. Therefore, the EMIF blocks a command, regardless of priority or the local interface, if that command is to the same block address (2048 bytes) as an older command that is not complete. Thus, the EMIF may have one pending read or write for each MTagID. For information about MTagID, see [Section 14.1.1, Terminology](#) in [Chapter 14, Interconnect](#). Among all pending reads, the EMIF selects all reads that have their corresponding SDRAM banks already open. Similarly, among all pending writes, the EMIF selects all writes that have their corresponding SDRAM banks already open. Accesses to memory mapped registers are treated as accesses that have open banks.

As a result of this reordering, the EMIF may now have several pending reads and writes that have their corresponding banks open. The EMIF then selects the highest priority read from pending reads, and the highest priority write from pending writes. If two or more commands have the highest priority, the EMIF selects the oldest command. As a result, the EMIF may now have the next read and a write command. If the return command FIFO and the read data FIFO have space and the external bus conflict is resolved, the EMIF performs the final read command before the final write command. If the return command FIFO has space but the read data FIFO is full, the EMIF performs the final write command before the final read command. Resolution of external bus conflict means all the SDRAM command-to-command counters are satisfied and the read-to-write or write-to-read turnaround time is met.

The EMIF does not support tag interleaving. In other words, for an local interface, the EMIF completes executing an local command before it switches to another command. The EMIF can, however, interleave execution between commands from two local interfaces.

The data coherency inside the EMIF is ensured only in a single level of local infrastructure. For example, if a write from a secondary local bus segment is blocked by a bridge element, the read from a tertiary bus can still beat the write to the EMIF. In such a case, to confirm that a write from master A has landed before a read from master B is performed, master A must wait for the write status from the EMIF before indicating to master B that the data is ready to be read. If master A does not use the local wait status, it must do the following:

1. Perform the required write.
2. Perform a dummy write to the [EMIF\\_REVISION](#) register.
3. Perform a dummy read to the [EMIF\\_REVISION](#) register.
4. Indicate to master B that the data is ready to be read after completion of read in Step 3. The completion of read in Step 3 ensures that the previous writes were done.

Apart from reads and writes, the EMIF must also open and close SDRAM banks and maintain the refresh counts for an SDRAM. The priority of SDRAM commands with respect to refresh levels are:

1. SDRAM refresh request when refresh-must level is reached (highest priority)
2. ZQ calibration
3. Leveling
4. local request for a read or write
5. local request for a write
6. SDRAM activate commands
7. SDRAM deactivate commands
8. SDRAM power-down request
9. SDRAM refresh request when refresh-may or release level is reached
10. SDRAM self-refresh request (lowest priority)

To avoid continuous blocking effect which can be caused by a continuous stream of high-priority commands which thus block the lower priority commands, the EMIF momentarily raises the priority of the oldest command over all other commands when the time for the oldest command configured through the [EMIF\\_COS\\_CONFIG\[7:0\]](#) PR\_OLD\_COUNT bit field expires.

It should be taken into account that while performing the scheduling algorithm described, the EMIF may also encounter a condition in which continuous stream of SDRAM commands to a row in an open bank can block commands to another row in the same bank.

In addition to this scheduling, the highest priority condition is a reset command. If this condition occurs, the EMIF abandons what it is currently doing and begins its start-up sequence. In this case, commands and data stored in the FIFOs are lost. The EMIF also starts its start-up sequence whenever the [EMIF\\_SDRAM\\_CONFIG](#) register is written and the [EMIF\\_SDRAM\\_REFRESH\\_CONTROL\[31\]](#) INITREF\_DIS bit is set to 0. In this case, commands and data stored in the FIFOs are not lost. The EMIF ensures that in-flight read or write transactions to the SDRAM are complete before starting the initialization sequence.

All the accesses to an SDRAM are pipelined to maximize use of the external bus. All of these are done while fulfilling the access timing requirements of an SDRAM.

### 15.3.4.2 Clock Management

#### 15.3.4.2.1 EMIF\_FICLK Overview

The EMIF can gate EMIF\_FICLK. There is an internal mechanism that can stop EMIF\_FICLK automatically. EMIF\_FICLK is stopped only after the SDRAM is put into self-refresh mode and the power-idle protocol on the local bus completes. The EMIF\_FICLK frequency can be changed only after putting the external SDRAM in self-refresh mode.

The EMIF waits for the DLL lock before performing any memory access.

EMIF\_FICLK frequency is equal to half of the EMIF\_PHY\_FCLK frequency.

### 15.3.4.2.2 EMIF Dependency on MPU Clock Rate

The EMIF Write Data FIFO and Command FIFO clocks are derived from the MPU clock (specifically,  $EMIF\_MA\_ICLK = MPU\_GCLK/4$ ) any time the MPU is active. As such, the DDR Peak Write bandwidth scales in proportion to the MPU clock frequency. At lower MPU clock frequencies (< 1 GHz), the Write Data FIFO limits writes to less than peak DDR bandwidth (assuming DDR3-1066 operating conditions.)

The SDRAM Read Data FIFO is always clocked by the EMIF\_ICLK, so there is no relationship for read bandwidth relative to the MPU operating frequency.

The Command FIFO bandwidth is also controlled by the EMIF\_MA\_ICLK. However, because the command bandwidth is much lower than the data bandwidth, there is no visible bandwidth scaling for the command interface (and as a result, the read interface can be fully used).

The total available bandwidth is not affected for most systems. The write bandwidth is limited on an internal path, not on the DDR pins. The DDR pin bandwidth is still available for reads. Because most systems have higher bandwidth requirements for read relative to write, the available DDR bandwidth is still usable.

### 15.3.4.3 Reset

The EMIF does not support a software reset.

The EMIF supports a global warm reset mode, during which the EMIF keeps the SDRAM content. Upon a request from the PRCM module indicating a need to enter global warm reset mode, the EMIF does the following:

1. During leveling operation, EMIF will immediately exit this mode and automatically perform a write to the MR1 register of DDR3 memory to disable the leveling at the memory side too.
2. EMIF completes the ongoing access, and then puts the SDRAM in self-refresh mode. If the [EMIF\\_SDRAM\\_REFRESH\\_CONTROL\[31\] INITREF\\_DIS](#) field is set to 1, the EMIF does not put SDRAM in self-refresh mode.
3. EMIF clears all its FIFO contents.
4. EMIF does not wait for all interrupts to be serviced.

To exit the global warm reset:

1. If the EMIF was in Self Refresh state, it will exit Self Refresh state.
2. If leveling was enabled at the time of a global warm reset, a PHY reset must occur to bring the PHY back into a known state, as it may have been left in a leveling state upon warm reset assertion. To guarantee that the SDRAM memory clocks are off when issuing PHY reset, software can use the [EMIF\\_POWER\\_MANAGEMENT\\_CONTROL](#) register to enter self refresh before asserting the PHY reset.

### 15.3.4.4 System Power Management

#### 15.3.4.4.1 Power-Down Mode

The EMIF supports SDRAM power-down mode for low power. The EMIF automatically puts the SDRAM into power-down mode after it is idle for [EMIF\\_POWER\\_MANAGEMENT\\_CONTROL\[15:12\] PD\\_TIM](#) number of DDR clock cycles and the [EMIF\\_POWER\\_MANAGEMENT\\_CONTROL\[10:8\] LP\\_MODE](#) bit field is set to 0x4. In power-down mode, the EMIF does not stop the clocks to the SDRAM. The EMIF maintains CKE pin low to maintain the power-down mode.

If refresh-must level is not reached before power-down entering, EMIF will not precharge all SDRAM banks before it issues the power-down command. As a result of this EMIF puts the SDRAM in active power-down mode. If refresh-must level is reached before power-down entering, EMIF will precharge all SDRAM banks and before it issues the power-down command, EMIF issues refreshes until refresh-release level is reached. As a result of this EMIF puts the SDRAM in precharge power-down mode.

When the SDRAM is in power-down mode, the EMIF services register accesses normally.

If the SDRAM is in power-down mode and one of the following occurs, the EMIF brings SDRAM out of power-down mode:

- [EMIF\\_POWER\\_MANAGEMENT\\_CONTROL\[10:8\]](#) LP\_MODE bit field is changed from 0x4 to some other value.
- An SDRAM access is requested.
- The refresh-must level is reached.

If refresh-must level brings the SDRAM out of power-down mode, EMIF puts it in power-down again when the refreshes are complete and keeps this state until the next SDRAM request.

To exit power-down, the EMIF:

1. Drives CKE high after  $t_{cke} + 1$  cycles have elapsed since the power-down command was issued. The value of  $t_{cke}$  is taken from [EMIF\\_SDRAM\\_TIMING\\_2\[2:0\]](#) T\_CKE bit field.
2. Waits for [EMIF\\_SDRAM\\_TIMING\\_2\[30:28\]](#) T\_XP + 1 cycles
3. Enters its idle state and can issue any commands

#### 15.3.4.4.2 Self-Refresh Mode

The EMIF supports SDRAM self-refresh mode for low power. The EMIF automatically puts the SDRAM into self-refresh mode after the EMIF is idle for [EMIF\\_POWER\\_MANAGEMENT\\_CONTROL\[7:4\]](#) SR\_TIMING number of DDR clock cycles and the [EMIF\\_POWER\\_MANAGEMENT\\_CONTROL\[10:8\]](#) LP\_MODE bit field is set to 0x2. The EMIF will complete all pending refreshes before it puts the SDRAM into self-refresh. Therefore, after the expiration of SR\_TIMING, the EMIF will start issuing refreshes to complete the refresh backlog, and then issue a self-refresh command to the SDRAM.

In self-refresh mode, the EMIF automatically stops the SDRAM clock. The EMIF drives CKE pin low to maintain self-refresh mode.

When the SDRAM is in self-refresh mode, the EMIF services register accesses normally.

If the SDRAM is in self-refresh mode and one of the following occurs, the EMIF brings SDRAM out of self-refresh mode:

- The [EMIF\\_POWER\\_MANAGEMENT\\_CONTROL\[10:8\]](#) LP\_MODE bit field is changed from 0x2 to some other value.
- SDRAM access is requested.
- [EMIF\\_SDRAM\\_TIMING\\_2\[2:0\]](#) T\_CKE + 1 cycles have elapsed since the last self-refresh command.

To exit self-refresh, for DDR2, the EMIF:

1. Enables the SDRAM clock
2. Drives CKE pin high
3. Waits [EMIF\\_SDRAM\\_TIMING\\_2\[24:16\]](#) T\_XSNR + 1 cycles
4. Starts a refresh cycle in the next cycle.
5. Enters its idle state and can issue any other command except write or read command. A write or a read command is issued only after [EMIF\\_SDRAM\\_TIMING\\_2\[15:6\]](#) T\_XSRD + 1 cycles clock cycles have elapsed since pin CKE is driven high.

To exit self-refresh, for DDR3, the EMIF does the following:

1. Enables the SDRAM clock
2. Drives CKE pin high
3. Waits [EMIF\\_SDRAM\\_TIMING\\_2\[24:16\]](#) T\_XSNR + 1 cycles
4. Starts a refresh cycle in the next cycle. EMIF also services all refreshes down to the refresh-release level.
5. Enters its idle state and can issue any other command except write or read command. A write or a read command is issued only after [EMIF\\_SDRAM\\_TIMING\\_2\[15:6\]](#) T\_XSRD + 1 cycles clock cycles have elapsed since pin CKE is driven high.

To use partial array self-refresh, the [EMIF\\_SDRAM\\_REFRESH\\_CONTROL\[26:24\]](#) PASR bits must be appropriately programmed. The EMIF performs bank interleaving when [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) IBANK\_POS = 0x0. Because the SDRAM is partially refreshed during partial array self-refresh, for software ease, it is recommended that the IBANK\_POS bit field to be set to 0x1, 0x2, or 0x3 depending on the scheme used. If IBANK\_POS is set to 0x0, software must move critical data into the banks that are going to be refreshed during partial array self-refresh.

#### 15.3.4.5 Interrupt Requests

Each EMIF controller is able to generate one interrupt request which is connected to the IRQ\_CROSSBAR module. Totally, there are two interrupt lines connected to two IRQ\_CROSSBAR inputs. EMIF1 produces EMIF1\_IRQ and EMIF2 produces EMIF2\_IRQ. These interrupt lines can be asserted by one of the interrupt events listed in [Table 15-102](#).

Each EMIF controller generates an interrupt on its interrupt line only if the interrupts are enabled by setting to 0x1 the corresponding bits in the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_ENABLE\\_SET](#) register. These interrupts can be disabled by setting to 0x1 the corresponding bits in the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_ENABLE\\_CLEAR](#) register. After the interrupt has been serviced the corresponding status flag must be cleared by software. This is done by setting to 0x1 the corresponding bit in the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_STATUS](#) register which also clears the corresponding bit in the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_RAW\\_STATUS](#) register. The status flags in the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_RAW\\_STATUS](#) register are set even if the corresponding interrupt is disabled unlike those in the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_STATUS](#) register, which are set only if the corresponding interrupt is enabled. An interrupt is also generated by the EMIF controller, if certain bit in the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_RAW\\_STATUS](#) register is set to 0x1 and the corresponding interrupt is enabled through the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_ENABLE\\_SET](#) register. This feature is useful when user software debugging is performed. In addition, even if interrupts are not enabled, certain status bit in [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_RAW\\_STATUS](#) register can be cleared by setting to 0x1 the corresponding bit in the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_STATUS](#) register.

The EMIF sets both the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_RAW\\_STATUS\[0\]](#) ERR\_SYS and [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_STATUS\[0\]](#) ERR\_SYS bits to 0x1, if access request for an unsupported command type, an unsupported addressing mode or an access request to an unsupported MAddrSpace is received. If such an error occurs, it is due to bad programming of the DMM. For more information about addressing, see [Section 15.2, Dynamic Memory Manager](#).

The EMIF sets both the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_RAW\\_STATUS\[3\]](#) WR\_ECC\_ERR\_SYS and [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_STATUS\[3\]](#) WR\_ECC\_ERR\_SYS bits to 0x1, if a write access with byte count that is not multiple of the ECC quanta or with a non ECC quanta aligned address is performed within the address range protected by the ECC.

The EMIF sets both the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_RAW\\_STATUS\[4\]](#) TWOBIT\_ECC\_ERR\_SYS and [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_STATUS\[4\]](#) TWOBIT\_ECC\_ERR\_SYS bits to 0x1, if 2-bit ECC error for a read access performed within the address range protected by the ECC occurs.

The EMIF sets both the [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_RAW\\_STATUS\[5\]](#) ONEBIT\_ECC\_ERR\_SYS and [EMIF\\_SYSTEM\\_OCP\\_INTERRUPT\\_STATUS\[5\]](#) ONEBIT\_ECC\_ERR\_SYS bits to 0x1, if the threshold for 1-bit ECC error is reached. For more information about the EMIF ECC feature, see [Section 15.3.4.14, Error Correction And Detection Feature](#).

[Table 15-102](#) lists the event flags and their corresponding event mask bits of the sources which can cause module interrupts.

**Table 15-102. Events**

Event Flag	Event Mask	Description
<a href="#">EMIF_SYSTEM_OCP_INTERRUPT_RAW_STATUS[5]</a> ONEBIT_ECC_ERR_SYS/ <a href="#">EMIF_SYSTEM_OCP_INTERRUPT_STATUS[5]</a> ONEBIT_ECC_ERR_SYS	<a href="#">EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_SET[5]</a> ONEBIT_ECC_ERR_SYS/ <a href="#">EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_CLEAR[5]</a> ONEBIT_ECC_ERR_SYS	Interrupt if one bit ECC error threshold is reached

**Table 15-102. Events (continued)**

Event Flag	Event Mask	Description
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[4] TWOBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[4] TWOBIT_ECC_ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[4] TWOBIT_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[4] TWOBIT_ECC_ERR_SYS	Interrupt for two bit error detection
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[3] WR_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[3] WR_ECC_ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[3] WR_ECC_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[3] WR_ECC_ERR_SYS	Interrupt for memory access made to a non-quanta aligned location or done with byte count not multiple of the ECC quanta
EMIF_SYSTEM_OCP_INTERRUPT_RAW_STA TUS[0] ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_STATUS[0] ERR_SYS	EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ SET[0] EN_ERR_SYS/ EMIF_SYSTEM_OCP_INTERRUPT_ENABLE_ CLEAR[0] EN_ERR_SYS	Interrupt for command or address error

#### 15.3.4.6 SDRAM Refresh Scheduling

The EMIF uses two counters to schedule the Refresh (REF) commands: a 13-bit decrementing refresh interval counter and a 4-bit refresh backlog counter. The interval counter is used to define the rate at which connected SDRAM devices are refreshed. It is loaded with the value of the [EMIF\\_SDRAM\\_REFRESH\\_CONTROL\[15:0\] REFRESH\\_RATE](#) bit field at reset (only the 13 LSBs are taken). The interval counter decrements by 1 each cycle until it reaches 0x0, at which point it reloads from the [EMIF\\_SDRAM\\_REFRESH\\_CONTROL\[15:0\] REFRESH\\_RATE](#) bit field and restarts decrementing. The counter also reloads and restarts decrementing whenever the [EMIF\\_SDRAM\\_REFRESH\\_CONTROL\[15:0\] REFRESH\\_RATE](#) bit field is updated.

The refresh backlog counter records the number of the outstanding REF commands which the EMIF controller currently has. The backlog counter increments by 1 each time the interval counter reloads (unless it has reached its maximum value of 8). The backlog counter decrements by 1 each time the EMIF issues a REF command (unless it is already 0). For the range of values that the backlog counter can take, there are three levels of urgency with which the EMIF must perform refresh cycle in which it issues REF commands:

1. Refresh-may level is reached when the backlog count is greater than 0x0, which indicates that there is a refresh backlog and if the EMIF is not busy and there are no open SDRAM banks, the EMIF must perform refresh cycle.
2. Refresh-release level is reached when the backlog count is greater than 0x4, which indicates that the refresh backlog is getting bigger and if the EMIF is not busy it must perform refresh cycle even if there is an open SDRAM bank.
3. Refresh-must level is reached when the backlog count is greater than 0x7, which indicates that the refresh backlog is becoming excessive and the EMIF must perform refresh cycle before any new memory access request being serviced. The EMIF starts servicing new memory accesses after the refresh-release level is cleared.

The two counters do not operate when SDRAM is in self-refresh mode. They start tracking the missed refreshes (the outstanding REF commands) only after initialization is complete.

The time between two REF commands is set through the [EMIF\\_SDRAM\\_TIMING\\_3\[12:4\] T\\_RFC](#) bit field.

#### 15.3.4.7 SDRAM Initialization

---

**NOTE:** To avoid error responses from the EMIF controller the SDRAM initialization must be performed per 16-Byte blocks if [EMIF\\_SDRAM\\_CONFIG\[15:14\] NARROW\\_MODE](#) = 0x0 or per 8-Byte blocks if [EMIF\\_SDRAM\\_CONFIG\[15:14\] NARROW\\_MODE](#) = 0x1.

---

### 15.3.4.7.1 DDR2 SDRAM Initialization

On coming out of reset, the EMIF controller begins the DDR2 initialization sequence after a write to any one of the following three registers, providing that the corresponding listed conditions are met.

1. [EMIF\\_SDRAM\\_CONFIG](#)
  - a. Condition 1: [EMIF\\_SDRAM\\_REFRESH\\_CONTROL](#)[31] INITREF\_DIS = 0 (that is, cleared before the write to [EMIF\\_SDRAM\\_CONFIG](#))
2. [EMIF\\_SDRAM\\_TIMING\\_1](#)
  - a. Condition 1: [EMIF\\_SDRAM\\_REFRESH\\_CONTROL](#)[31] INITREF\_DIS = 0 (that is, cleared before the write to [EMIF\\_SDRAM\\_TIMING\\_1](#)) AND
  - b. Condition 2: The write access modifies register bit field T\_WR (bits 20:17)
3. [EMIF\\_SDRAM\\_REFRESH\\_CONTROL](#)
  - a. Condition 1: [EMIF\\_SDRAM\\_REFRESH\\_CONTROL](#)[31] INITREF\_DIS = 0 AND
  - b. Condition 2: The write access modifies register bit field SRT (bit 29), ASR (bit 28), or PASR (bits 26:24).

For the first DDR2 initialization sequence, the EMIF controller performs the following actions:

1. Drives the CKE pin low.
2. After 16 SDRAM refresh rate intervals, issues a NOP command with CKE pin held high. The SDRAM refresh rate is as defined in the [EMIF\\_SDRAM\\_REFRESH\\_CONTROL](#)[15:0] REFRESH\_RATE bit field.
3. After 1 SDRAM refresh rate interval, issues Precharge all Banks command.
4. Issues EMRS command to the DDR2 EMR(2) register (bits BA[2:0] = 0x2) with bits A[15:0] = 0x0.
5. Issues EMRS command to the DDR2 EMR(3) register (bits BA[2:0] = 0x3) with bits A[15:0] = 0x0.
6. Issues EMRS command to the DDR2 EMR(1) register (bits BA[2:0] = 0x1) with bits A[15:0] set as in [Table 15-103](#).

**Table 15-103. Load Value For The EMR(1) Register During DDR2 SDRAM Initialization**

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Output buffer enabled
A[11]	0x0	RDQS disable
A[10]	<a href="#">EMIF_SDRAM_CONFIG</a> [23] DDR2_DDQS	Differential DQS enable value
A[9:7]	0x0	Exit OCD calibration mode
A[6], A[2]	<a href="#">EMIF_SDRAM_CONFIG</a> [26:24] DDR_TERM	DDR2 termination resistor value. For DDR2 the <a href="#">EMIF_SDRAM_CONFIG</a> [26] bit is not used.
A[5:3]	0x0	Additive latency = 0
A[1]	<a href="#">EMIF_SDRAM_CONFIG</a> [19:18] SDRAM_DRIVE	SDRAM drive strength. For DDR2 the <a href="#">EMIF_SDRAM_CONFIG</a> [19] bit is not used.
A[0]	<a href="#">EMIF_SDRAM_CONFIG</a> [20] DDR_DISABLE_DLL = 0x0	Enable DLL

7. Issues MRS command to the DDR2 MR register (BA[2:0] = 0x0) with A[15:0] set as in [Table 15-104](#).

**Table 15-104. Load Value For The MR Register During DDR2 SDRAM Initialization**

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Active power down exit time - fast exit
A[11:9]	<a href="#">EMIF_SDRAM_TIMING_1</a> [20:17] T_WR	Write recovery for autoprecharge
A[8]	0x1	DLL reset
A[7]	0x0	Normal mode

**Table 15-104. Load Value For The MR Register During DDR2 SDRAM Initialization (continued)**

Bits	Value	Description
A[6:4]	EMIF_SDRAM_CONFIG[13:10] CL	CAS latency value. For DDR2 the EMIF_SDRAM_CONFIG[13] bit is not used.
A[3]	0x0	Sequential burst type
A[2:0]	0x3	Burst length of 8

8. After 267 clock cycles, issues Precharge all Banks command.
9. After two Refresh commands, issues MRS command to the DDR2 MR register (BA[2:0] = 0x0) with A[15:0] set as in Table 15-105.

**Table 15-105. Another Load Value For The MR Register During DDR2 SDRAM Initialization**

Bits	Value	Description
A[15:9]	Equal to Step 7	
A[8]	0x0	No DLL reset
A[7:0]	Equal to Step 7	

10. Issues EMRS command to the DDR2 EMR(1) register (bits BA[2:0] = 0x1) with bits A[15:0] equal to Step 6.
11. The EMIF enters its IDLE state.

The EMIF updates the DDR Mode registers if the DDR2 initialization sequence is triggered again. However, the EMIF controller starts from Step 3.

The EMIF does not perform any transactions until the DDR2 initialization sequence is complete.

When the EMIF comes out of reset, the delay time in Step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately  $16 \times \text{REFRESH\_RATE} / \text{input frequency}$ .

---

**NOTE:** The values of the bit fields in the EMIF\_SDRAM\_CONFIG register are loaded by the control module at reset. These values can be modified by the configuration header (CH) feature of the ROM code or by the initial boot image running from an external booting memory or internal RAM. They must not be modified during run time, because they reflect the used hardware SDRAM memory configurations.

---

### 15.3.4.7.2 DDR3 SDRAM Initialization

On coming out of reset, the EMIF controller begins the DDR3 initialization sequence after a write to any one of the following three registers, providing that the corresponding listed conditions are met.

1. EMIF\_SDRAM\_CONFIG
  - a. Condition 1: EMIF\_SDRAM\_REFRESH\_CONTROL[31] INITREF\_DIS = 0 (that is, cleared before the write to EMIF\_SDRAM\_CONFIG)
2. EMIF\_SDRAM\_TIMING\_1
  - a. Condition 1: EMIF\_SDRAM\_REFRESH\_CONTROL[31] INITREF\_DIS = 0 (that is, cleared before the write to EMIF\_SDRAM\_TIMING\_1) AND
  - b. Condition 2: The write access modifies register bit field T\_WR (bits 20:17)
3. EMIF\_SDRAM\_REFRESH\_CONTROL
  - a. Condition 1: EMIF\_SDRAM\_REFRESH\_CONTROL[31] INITREF\_DIS = 0 AND
  - b. Condition 2: The write access modifies register bit field SRT (bit 29), ASR (bit 28), or PASR (bits 26:24).

For the first DDR3 initialization sequence, the EMIF controller performs the following actions:

1. After 7 SDRAM refresh rate intervals, de-asserts the RST pin.
2. After 16 SDRAM refresh rate intervals, issues a NOP command with CKE pin held high. The SDRAM

refresh rate is as defined in the [EMIF\\_SDRAM\\_REFRESH\\_CONTROL\[15:0\]](#) REFRESH\_RATE bit field.

- After 1 SDRAM refresh rate interval, issues MRS command to the DDR3 MR2 register (bits BA[2:0] = 0x2) with bits A[15:0] set as in [Table 15-106](#)

**Table 15-106. Load Value For The MR2 Register During DDR3 SDRAM Initialization**

Bits	Value	Description
A[15:11]	0x0	Reserved
A[10:9]	<a href="#">EMIF_SDRAM_CONFIG[22:21]</a> DYN_ODT	Dynamic ODT value
A[8]	0x0	Reserved
A[7]	<a href="#">EMIF_SDRAM_REFRESH_CONTR</a> OL[29] SRT	Self-refresh temperature range
A[6]	<a href="#">EMIF_SDRAM_REFRESH_CONTR</a> OL[28] ASR	Auto self-refresh enable
A[5]	0x0	Reserved
A[4:3]	<a href="#">EMIF_SDRAM_CONFIG[17:16]</a> CWL	CAS write latency
A[2:0]	<a href="#">EMIF_SDRAM_REFRESH_CONTR</a> OL[26:24] PASR	Partial array self-refresh

- After T<sub>RFC</sub> + 1 DDR clock cycles, issues MRS command to the DDR3 MR3 register (bits BA[2:0] = 0x3) with A[15:0] = 0x0
- After T<sub>RFC</sub> + 1 DDR clock cycles, issues MRS command to the DDR3 MR1 register (BA[2:0] = 0x1) with A[15:0] set as in [Table 15-107](#)

**Table 15-107. Load Value For The MR1 Register During DDR3 SDRAM Initialization**

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Output buffer enabled
A[11]	0x0	TDQS disable
A[10]	0x0	Reserved
A[9], A[6], A[2]	<a href="#">EMIF_SDRAM_CONFIG[26:24]</a> DDR_TERM	DDR3 termination resistor value
A[8]	0x0	Reserved
A[7]	0x0	Write leveling disabled
A[5], A[1]	<a href="#">EMIF_SDRAM_CONFIG[19:18]</a> SDRAM_DRIVE	SDRAM drive strength
A[4:3]	0x0	Additive latency = 0
A[0]	<a href="#">EMIF_SDRAM_CONFIG[20]</a> DDR_DISABLE_DLL = 0x0	Enable SDRAM DLL

- After T<sub>RFC</sub> + 1 DDR clock cycles, issues MRS command to the DDR3 MR0 register (BA[2:0] = 0x0) with A[15:0] set as in [Table 15-108](#)

**Table 15-108. Load Value For The MR0 Register During DDR3 SDRAM Initialization**

Bits	Value	Description
A[15:13]	0x0	Reserved
A[12]	0x0	Slow exit. The DDR3 SDRAM DLL is "OFF" after entering precharge power-down.
A[11:9]	<a href="#">EMIF_SDRAM_TIMING_1[20:17]</a> T_WR	Write recovery for autoprecharge
A[8]	0x1	DLL reset
A[7]	0x0	Normal mode

**Table 15-108. Load Value For The MR0 Register During DDR3 SDRAM Initialization (continued)**

Bits	Value	Description
A[6:4], A[2]	<a href="#">EMIF_SDRAM_CONFIG</a> [13:10] CL	Value for CAS latency
A[3]	0x0	Nibble sequential read burst type
A[1:0]	0x0	Burst length of 8

7. After  $T_{RFC} + 1$  DDR clock cycles, issues a ZQCL command to start long ZQ calibration
8. Waits for  $t_{DLLK}$  and  $t_{ZQinit}$  to complete
9. Issues REF command
10. The EMIF enters its IDLE state.

The EMIF updates the DDR Mode registers if the DDR3 initialization sequence is triggered again. However, the EMIF controller first issues a precharge command and then starts from Step 3.

The EMIF does not perform any transactions until the DDR3 initialization sequence is complete.

When the EMIF comes out of reset, the delay time in Step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately  $16 \times \text{REFRESH\_RATE} / \text{input frequency}$ .

#### 15.3.4.8 DDR3 Read-Write Leveling

The EMIF supports one type of write/read leveling for DDR3 - full leveling.

The full leveling consists of three parts:

1. Write leveling
2. Read data eye training
3. Read DQS gate training

##### Write leveling

The goal of write leveling is to locate the delay between the rising edge of the write DQS signal and the rising edge of the SDRAM memory clock (CK). When this delay is identified, the system is able to accurately align the write DQS signal with the DDR3 memory clock. During Write leveling, the ODT function must be on and proper ODT values must be selected at the external memory side by setting Rtt\_Nom (A9, A6, A2) bits in MR1 register of the external DDR3 memory. For more information about write leveling, see the *DDR3 SDRAM Standard*, section *Write leveling*.

##### Read data eye training

Through the read data eye training the delay between the rising edge of the read DQS signal and the rising and falling edges of the associated DQ data eye is determined. By identifying these delays, the midpoint between them can be calculated and thus the rising edge of the read DQS signal can be accurately centered within the DQ data eye.

##### Read DQS gate training

Read DQS Gate training is used for timing the internal read window during a read operation as opposed to the write leveling and read data eye training which are used for skew compensation of external signals. The goal of read DQS gate training is to locate the shortest delay that can be applied to each DQS gate such that it functions properly, then find the longest delay that can be applied to each DQS gate and keep its proper function again, and then align the midpoint of the DQS gate delay between these two.

#### 15.3.4.8.1 Full Leveling

The EMIF does not perform full leveling after initialization upon reset. Full leveling must be triggered by software after the EMIF's registers are properly configured.

Full leveling is triggered by setting the [EMIF\\_READ\\_WRITE\\_LEVELING\\_CONTROL](#)[31] RDWRLVLFULL\_START bit to 0x1. The leveling execution order is as follows:

1. Write leveling
2. Read DQS gate training

### 3. Read data eye training

After leveling procedure has finished the [EMIF\\_READ\\_WRITE\\_LEVELING\\_CONTROL\[31\]](#) RDWRLVLFULL\_START bit clears itself automatically.

---

**NOTE:** SDRAM Refreshes must be disabled before triggering full leveling.

---

---

**NOTE:** The [EMIF\\_EXT\\_PHY\\_CONTROL\\_2](#) through [EMIF\\_EXT\\_PHY\\_CONTROL\\_21](#) registers have to be configured only in case of software leveling.

---

#### 15.3.4.8.2 Software Leveling

In case of software leveling, the following registers must be configured:

- [EMIF\\_EXT\\_PHY\\_CONTROL\\_2](#) to [EMIF\\_EXT\\_PHY\\_CONTROL\\_6](#) containing the PHY\_REG\_FIFO\_WE\_SLAVE\_RATIO value
- [EMIF\\_EXT\\_PHY\\_CONTROL\\_26](#) to [EMIF\\_EXT\\_PHY\\_CONTROL\\_30](#) containing the REG\_PHY\_GATELVL\_INIT\_RATIO value
- [EMIF\\_EXT\\_PHY\\_CONTROL\\_25](#) containing the DQ offset value

The bit fields of the [EMIF\\_EXT\\_PHY\\_CONTROL\\_2](#) to [EMIF\\_EXT\\_PHY\\_CONTROL\\_6](#) registers must be loaded with same values. The bit fields of the [EMIF\\_EXT\\_PHY\\_CONTROL\\_26](#) to [EMIF\\_EXT\\_PHY\\_CONTROL\\_30](#) registers must also be loaded with same values.

The REG\_PHY\_DQ\_OFFSET fields in register [EMIF\\_EXT\\_PHY\\_CONTROL\\_25](#) must be loaded with 0x40. That value corresponds to quarter cycle shift between the DQS signals and the data to be written to the SDRAM.

To calculate the PHY\_REG\_FIFO\_WE\_SLAVE\_RATIO value one of the following two formulas can be used:

- $0x80 + 2 * [(Board\ Delay\ in\ ps) * 0x100] / (Clock\ Period\ in\ ps)$ . This formula is used when the [EMIF\\_DDR\\_PHY\\_CONTROL\\_1\[18\]](#) PHY\_INVERT\_CLKOUT bit is set to 0x1.
- $2 * [(Board\ Delay\ in\ ps) * 0x100] / (Clock\ Period\ in\ ps)$ . This formula is used when the [EMIF\\_DDR\\_PHY\\_CONTROL\\_1\[18\]](#) PHY\_INVERT\_CLKOUT bit is set to 0x0.

The Board Delay in the previously described formulas is measured directly from the board. It depends on the trace length. When the calculated value for PHY\_REG\_FIFO\_WE\_SLAVE\_RATIO is greater than 0x20, then a value of 0x27 must be used. That means, 0x27 must be loaded in registers [EMIF\\_EXT\\_PHY\\_CONTROL\\_2](#) to [EMIF\\_EXT\\_PHY\\_CONTROL\\_6](#).

To calculate the REG\_PHY\_GATELVL\_INIT\_RATIO value the following formula is used:

$$REG\_PHY\_GATELVL\_INIT\_RATIO = PHY\_REG\_FIFO\_WE\_SLAVE\_RATIO - 0x20$$

When the calculated value for REG\_PHY\_GATELVL\_INIT\_RATIO is less than 0x0, then a value of 0x0 must be used. When the calculated value is greater than or equal to 0x0, then that value is used for registers [EMIF\\_EXT\\_PHY\\_CONTROL\\_26](#) to [EMIF\\_EXT\\_PHY\\_CONTROL\\_30](#).

In addition, when read DQS gate training is not performed the PHY\_REG\_FIFO\_WE\_SLAVE\_RATIO value is used. When read DQS gate training is performed REG\_PHY\_GATELVL\_INIT\_RATIO is used and PHY\_REG\_FIFO\_WE\_SLAVE\_RATIO is don't care.

---

**NOTE:** Software leveling is not recommended to be used. Hardware leveling must be used instead.

---

#### 15.3.4.9 EMIF Access Cycles

By default, the EMIF keeps its SDRAM  $\overline{CS}$  signal high. To direct a command to only one of the SDRAMs, EMIF asserts its  $\overline{CS}$  signal to the SDRAM for the duration of the command.

The EMIF always performs burst accesses to the SDRAM. Multiple SDRAM bursts may need to service a single local burst request. Table 15-109 through Table 15-112 show a few examples how EMIF performs SDRAM accesses for a linear incrementing transaction type. T0, T1, etc. are clock cycles. R0 is read starting at column 0, R8 is read starting at column 8, and R16 is read starting at column 16. D0-1 is the data from column 0 and 1, D2-3 is the data from column 2 and 3, and so on.

**Table 15-109. 64-Byte Linear Read Starting at Address 0x0 (DDR2 and DDR3)**

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11
R0				R8							
				D0-1	D2-3	D4-5	D6-7	D8-9	D10-11	D12-13	D14-15

**Table 15-110. 64-Byte Linear Read Starting at Address 0x8 (DDR2)**

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12	T13	T14	T15
R2		R4		R8				R16							
				D2-3	Unused	D4-5	D6-7	D8-9	D10-11	D12-13	D14-15	D16-17	Unused	Unused	Unused

**Table 15-111. 64-Byte Linear Read Starting at Address 0x10 (DDR2 and DDR3)**

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12	T13
R4		R8						R16					
				D4-5	D6-7	D8-9	D10-11	D12-13	D14-15	D16-17	D18-19	Unused	Unused

**Table 15-112. 64-Byte Linear Read Starting at Address 0x18 (DDR2 and DDR3)**

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12	T13
R6		R8						R16					
				D6-7	Unused	D8-9	D10-11	D12-13	D14-15	D16-17	D18-19	D20-21	Unused

The EMIF uses the unused data phases in the preceding figures by issuing successive read commands if there are reads to open banks pending in the command FIFO.

The write data conversion from SDR to DDR is done outside the EMIF.

#### 15.3.4.10 Turnaround Time

Table 15-113 lists the turnaround time that EMIF introduces on the data bus for various back-to-back accesses. The EMIF takes advantage of the CAS latencies and packs the commands as close as possible on the control bus to introduce the following turnaround time on the data bus.

**Table 15-113. Turnaround Time**

Current Access	Next Access	Turnaround Time (Number of DDR Clock Cycles)
SDRAM write	SDRAM read	<a href="#">EMIF_SDRAM_TIMING_1</a> [2:0] T_WTR + 1 + CL
SDRAM read	SDRAM write	<a href="#">EMIF_SDRAM_TIMING_1</a> [31:29] T_RTW + 1

#### 15.3.4.11 PHY DLL Calibration

When running in normal locked mode, the PHY DLL gets a reference clock (EMIFi\_DLL\_FCLK) from the PRCM, which is used by the DLL master to lock to the right frequency and provide the control code for a full period phase shift to the slave. The slave uses this code as a control for its internal delay line to produce the required delay for the signal considered.

When working in locked mode, the delay lines only get an updated control value from the master DLLs when an explicit `dll_calib` command is issued by the EMIF controller. Failure to send such commands on a timely basis will result in inaccurate delay-line information if there is a significant voltage and temperature drift in the system. It is recommended to issue at least one command every 100  $\mu$ s. EMIF automatically sends `ctrl_update` commands for:

- Refresh Exit
- Self Refresh Exit
- `phy_ready` asserted during initialization

The PHY also internally generates a control value update upon completion of a leveling operation. Control is also added when leveling is not used and there are gradual voltage changes during frequency change. The `EMIF_DLL_CALIB_CTRL` register can be programmed to generate a `phy_dll_calib` for a periodic interval based on `EMIF_FICLK` cycles, so allow continued memory access as voltage is changing. A safe window of no activity will be guaranteed for this periodic generation of `phy_dll_calib`. In addition, a one shot generator for `phy_pll_calib` has also been added that will generate a single `phy_dll_calib` by setting the `EMIF_MISC_REG[0] DLL_CALIB_OS` bit to 1.

### 15.3.4.12 SDRAM Address Mapping

From the system point of view, the external SDRAM is seen as one block of SDRAM. If two external 64-MiB devices are used, a 128-MiB memory block is observed. If two external 32-MiB devices are used, a 64-MiB block is observed.

Table 15-114 shows the SDRAM address space.

**Table 15-114. SDRAM Addressing Space**

Module Name	Base Address	Size
EMIF1   EMIF2-CS0-SDRAM <sup>(1)</sup>	0x8000 0000	0 to 1GiB, programmable in DMM (see Section 15.2, <i>Dynamic Memory Manager</i> )

<sup>(1)</sup> The addressing space is interleaved on two SDRAM memory controllers (EMIF1, EMIF2), each activating its CS0 line. These CSs can address 64, 128, 256, 512, 1024, or 2048MiB. Interleaving occurs at 128-byte granularity. EMIF1-CS0 base address is always 0x8000 0000 at reset, and occupies a 1-GiB address space at reset (interleaving disabled at reset).

When addressing SDRAM, if the `EMIF_SDRAM_CONFIG[28:27] IBANK_POS` bit field is set to 0, the EMIF uses the following two bit fields to determine the mapping from the source address to the SDRAM row, column and bank:

- `EMIF_SDRAM_CONFIG[6:4] IBANK`
- `EMIF_SDRAM_CONFIG[2:0] PAGESIZE`

If the `EMIF_SDRAM_CONFIG[28:27] IBANK_POS` bit field is set to 1, 2, or 3, the EMIF uses the following three bit fields to determine the mapping from the source address to the SDRAM row, column and bank:

- `EMIF_SDRAM_CONFIG[6:4] IBANK`
- `EMIF_SDRAM_CONFIG[2:0] PAGESIZE`
- `EMIF_SDRAM_CONFIG[9:7] ROWSIZE`

In all cases the EMIF considers its SDRAM address space to be a single logical block, regardless of the number of physical devices.

#### 15.3.4.12.1 Address Mapping for `IBANK_POS = 0` and `EBANK_POS = 0`

For `EMIF_SDRAM_CONFIG[28:27] IBANK_POS = 0` and `EMIF_SDRAM_CONFIG_2[27] EBANK_POS = 0`, Table 15-115 lists which source address bits (MAddr) are mapped to the SDRAM row, column and bank bits for all combinations of `IBANK` and `PAGESIZE`.

**Table 15-115. Local Address to SDRAM Address Mapping for IBANK\_POS = 0 and EBANK\_POS = 0**

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
row address		bank address		column address	
ROWSIZE value	row width (bits)	IBANK value	bank[2:0] width (bits)	PAGESIZE value	col width (bits)
In this case the ROWSIZE bit field is not used	16	0	0	0	8
		1	1	1	9
		2	2	2	10
		3	3	3	11

**NOTE:** The ROWSIZE bit field is unused in case of IBANK\_POS = 0 and EBANK\_POS = 0.

For [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) IBANK\_POS = 0, the effect of the address-mapping scheme is that as the source address increments across the SDRAM pages, EMIF moves to page with the same number as in the previous bank. This movement across the banks continues until the same page is accessed in all banks and then EMIF moves to the next page in the first bank. The EMIF uses this movement across internal banks while remaining on the same page to maximize the number of the open SDRAM banks within the overall SDRAM space.

Thus, the EMIF can keep a maximum of 8 banks open at a time, and can interleave among all of them.

#### 15.3.4.12.2 Address Mapping for IBANK\_POS = 1 and EBANK\_POS = 0

[Table 15-116](#) list the local address to SDRAM address mapping when IBANK\_POS = 1 and EBANK\_POS = 0.

**Table 15-116. Local Address to SDRAM Address Mapping for IBANK\_POS = 1 and EBANK\_POS = 0**

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address[2]		row address		bank address[1:0]		column address	
IBANK value	bank[2] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[1:0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	8
1	0	1	10	1	1	1	9
2	0	2	11	2	2	2	10
3	1	3	12	3	2	3	11
		4	13				
		5	14				
		6	15				
		7	16				

For [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) IBANK\_POS = 1, the EMIF interleaves banks the same as for [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) IBANK\_POS = 0 but the interleaving of banks is limited to four banks.

Thus, the EMIF can keep a maximum of 8 banks open at a time but can interleave among only 4 of them.

#### 15.3.4.12.3 Address Mapping for IBANK\_POS = 2 and EBANK\_POS = 0

[Table 15-117](#) list the local address to SDRAM address mapping when IBANK\_POS = 2 and EBANK\_POS = 0.

**Table 15-117. Local Address to SDRAM Address Mapping for IBANK\_POS = 2 and EBANK\_POS = 0**

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address[2:1]		row address		bank address[0]		column address	
IBANK value	bank[2:1] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	8
1	0	1	10	1	1	1	9
2	1	2	11	2	1	2	10
3	2	3	12	3	1	3	11
		4	13				
		5	14				
		6	15				
		7	16				

For [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) IBANK\_POS = 2, the EMIF interleaves banks the same as for [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) IBANK\_POS = 0 but the interleaving of banks is limited to two banks. Thus, the EMIF can keep a maximum of 8 banks open at a time but can interleave among only 2 of them.

#### 15.3.4.12.4 Address Mapping for IBANK\_POS = 3 and EBANK\_POS = 0

[Table 15-118](#) list the local address to SDRAM address mapping when IBANK\_POS = 3 and EBANK\_POS = 0.

**Table 15-118. Local Address to SDRAM Address Mapping for IBANK\_POS = 3 and EBANK\_POS = 0**

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
bank address		row address		column address	
IBANK value	bank width (bits)	ROWSIZE value	row width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	8
1	1	1	10	1	9
2	2	2	11	2	10
3	3	3	12	3	11
		4	13		
		5	14		
		6	15		
		7	16		

If [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) IBANK\_POS = 3, the bank interleaving is not possible for EMIF.

#### 15.3.4.12.5 Address Mapping for IBANK\_POS = 0 and EBANK\_POS = 1

[Table 15-119](#) list the local address to SDRAM address mapping when IBANK\_POS = 0 and EBANK\_POS = 1.

**Table 15-119. Local Address to SDRAM Address Mapping for IBANK\_POS = 0 and EBANK\_POS = 1**

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
row address		bank address		column address	
ROWSIZE value	row width (bits)	IBANK value	bank width (bits)	PAGESIZE value	col width (bits)
0	9	0	0	0	8
1	10	1	1	1	9
2	11	2	2	2	10
3	12	3	3	3	11
4	13				

**Table 15-119. Local Address to SDRAM Address Mapping for IBANK\_POS = 0 and EBANK\_POS = 1 (continued)**

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
row address		bank address		column address	
ROWSIZE value	row width (bits)	IBANK value	bank width (bits)	PAGESIZE value	col width (bits)
5	14				
6	15				
7	16				

For [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) IBANK\_POS = 0, and [EMIF\\_SDRAM\\_CONFIG\\_2\[27\]](#) EBANK\_POS = 1, the EMIF can keep a maximum of 8 banks open at a time and can interleave among all of them.

#### 15.3.4.12.6 Address Mapping for IBANK\_POS = 1 and EBANK\_POS = 1

[Table 15-120](#) list the local address to SDRAM address mapping when IBANK\_POS = 1 and EBANK\_POS = 1.

**Table 15-120. Local Address to SDRAM Address Mapping for IBANK\_POS = 1 and EBANK\_POS = 1**

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address[2]		row address		bank address[1:0]		column address	
IBANK value	bank[2] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[1:0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	8
1	0	1	10	1	1	1	9
2	0	2	11	2	2	2	10
3	1	3	12	3	2	3	11
		4	13				
		5	14				
		6	15				
		7	16				

For [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) IBANK\_POS = 1, and [EMIF\\_SDRAM\\_CONFIG\\_2\[27\]](#) EBANK\_POS = 1, the EMIF can keep a maximum of 8 banks open at a time but can interleave among only 4 of them.

#### 15.3.4.12.7 Address Mapping for IBANK\_POS = 2 and EBANK\_POS = 1

[Table 15-121](#) list the local address to SDRAM address mapping when IBANK\_POS = 2 and EBANK\_POS = 1.

**Table 15-121. Local Address to SDRAM Address Mapping for IBANK\_POS = 2 and EBANK\_POS = 1**

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width							
bank address[2:1]		row address		bank address[0]		column address	
IBANK value	bank[2:1] width (bits)	ROWSIZE value	row width (bits)	IBANK value	bank[0] width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	0	0	8
1	0	1	10	1	1	1	9
2	1	2	11	2	1	2	10
3	2	3	12	3	1	3	11
		4	13				
		5	14				
		6	15				
		7	16				

For [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) IBANK\_POS = 2 and [EMIF\\_SDRAM\\_CONFIG\\_2\[27\]](#) EBANK\_POS = 1, the EMIF can keep a maximum of 8 banks open at a time but can interleave among only 2 of them.

#### 15.3.4.12.8 Address Mapping for IBANK\_POS = 3 and EBANK\_POS = 1

[Table 15-122](#) list the local address to SDRAM address mapping when IBANK\_POS = 3 and EBANK\_POS = 1.

**Table 15-122. Local Address to SDRAM Address Mapping for IBANK\_POS = 3 and EBANK\_POS = 1**

MAddr[31:N] N = 1 if 16-bit data bus width; N = 2 if 32-bit data bus width					
bank address		row address		column address	
IBANK value	bank width (bits)	ROWSIZE value	row width (bits)	PAGESIZE value	col width (bits)
0	0	0	9	0	8
1	1	1	10	1	9
2	2	2	11	2	10
3	3	3	12	3	11
		4	13		
		5	14		
		6	15		
		7	16		

For [EMIF\\_SDRAM\\_CONFIG\[28:27\]](#) IBANK\_POS = 3 and [EMIF\\_SDRAM\\_CONFIG\\_2\[27\]](#) EBANK\_POS = 1, the bank interleaving is not possible for EMIF.

#### 15.3.4.13 DDR3 Output Impedance Calibration

The EMIF controller supports automatic output impedance (ZQ) calibration for DDR3 memories. This feature is supported by DDR3 and not supported by DDR2 memories. The ZQ calibration can be enabled by setting to 0x1 the [EMIF\\_SDRAM\\_OUTPUT\\_IMPEDANCE\\_CALIBRATION\\_CONFIG\[30\]](#) ZQ\_CS0EN bit. The EMIF supports three types of ZQ calibration commands:

- ZQINIT: ZQ calibration command during initialization
- ZQCL: ZQ calibration long command
- ZQCS: ZQ calibration short command

The EMIF automatically issues ZQINIT command during DDR3 memory initialization. It also issues ZQCS command each time the [EMIF\\_SDRAM\\_OUTPUT\\_IMPEDANCE\\_CALIBRATION\\_CONFIG\[15:0\]](#) ZQ\_REFINTERVAL bit field expires. In other words, the ZQ\_REFINTERVAL defines the interval between two ZQCS commands. When ZQCS command is issued, the EMIF waits and blocks any other command for [EMIF\\_SDRAM\\_TIMING\\_3\[20:15\]](#) ZQ\_ZQCS + 1 number of DDR clock cycles.

If the [EMIF\\_SDRAM\\_OUTPUT\\_IMPEDANCE\\_CALIBRATION\\_CONFIG\[28\]](#) ZQ\_SFEXITEN bit field is set to 0x1, the EMIF issues ZQCL command every time it exits self-refresh, active power-down and precharge power-down modes. When ZQCL command is issued, the EMIF waits and blocks any other command for ([EMIF\\_SDRAM\\_OUTPUT\\_IMPEDANCE\\_CALIBRATION\\_CONFIG\[17:16\]](#) ZQ\_ZQCL\_MULT + 1) × ([EMIF\\_SDRAM\\_TIMING\\_3\[20:15\]](#) ZQ\_ZQCS + 1) number of DDR clock cycles.

The ZQINIT is a non periodic command issued only once during DDR3 initialization as opposed to the ZQCL and ZQCS calibration commands which are issued by the EMIF periodically at regular intervals.

### 15.3.4.14 Error Correction And Detection Feature

For data integrity, the EMIF1 supports ECC on the data written or read from the SDRAM and is enabled by programming the [EMIF\\_ECC\\_CTRL\\_REG](#) register. ECC accesses are allowed for the both SYS and the MPU ports. 7-bit ECC is calculated over 32-bit data when in 32-bit DDR mode. 6-bit ECC is calculated over 16-bit data when in 16-bit DDR mode. The ECC is calculated for all accesses that are within the address ranges protected by ECC. The address ranges are specified in the [EMIF\\_ECC\\_ADDRESS\\_RANGE\\_1](#) and [EMIF\\_ECC\\_ADDRESS\\_RANGE\\_2](#) registers. Both registers have identical bits and functionality. This provides flexibility allowing two non-overlapping memory regions to be ECC protected.

The system must ensure that any burst access with starting address in the ECC protected region must not cross over to the un-protected region and vice-versa. The ECC is stored inside the SDRAM during writes. If a write access with byte count that is not a multiple of ECC quanta or with a non quanta aligned address is performed within the address range protected by ECC, the EMIF will send out a write ECC error interrupt. The EMIF will also report an error on the SYS and MPU response interface. In this case, the EMIF will perform the write to the SDRAM. However, the ECC value written to the SDRAM will be corrupted. The EMIF will also log the MConnID, MCmd, MBurstSeq, and MAddrSpace for the first error transaction in the [EMIF\\_OCP\\_ERROR\\_LOG](#) register.

The ECC quanta is either 32 bit or 16 bit based on the [EMIF\\_SDRAM\\_CONFIG\[15:14\] NARROW\\_MODE](#) bit field. For 32 bit mode (128 bits per EMIF clock cycle), an ECC quanta is 32 bits. For 16 bit narrow mode (64 bits per EMIF clock cycle), the ECC quanta is 16 bits.

Once ECC is enabled, the entire protected region must be initialized with data. These writes must be quanta-sized and quanta-aligned.

The ECC is read and verified during reads. For 1-bit ECC error in the data, the EMIF will correct the data and send it on the SYS or MPU return interface. The EMIF will log the starting address of the SDRAM burst in an internal 4 deep address FIFO. The internal FIFO will store the first four 1-bit ECC errors. The 1-Bit ECC Error Address Log register will display the address on top of the internal FIFO. The software must write a 0x1 to the [EMIF\\_1B\\_ECC\\_ERR\\_ADDR\\_LOG](#) register to pop the FIFO and display the next address stored. For subsequent reads in the ECC regions, the FIFO will be loaded with the address for the next 1-bit ECC error if it is not full. It must be noted that no address comparison will be performed, that is, if a single address has ECC errors back-to-back, that address will be logged twice.

The number of 1-bit ECC errors can be counted using the [EMIF\\_1B\\_ECC\\_ERR\\_CNT](#) register. The EMIF also supports programming a threshold and a window in the [EMIF\\_1B\\_ECC\\_ERR\\_THRSH](#) register. The window is programmed in number of refresh periods. When the programmed window value is 0x0, that is, window is disabled, and the internal error count meets the programmed threshold, the EMIF will generate a 1-bit ECC error interrupt. When the programmed window value is non-zero, that is, window is enabled, the EMIF will generate a 1-bit ECC error interrupt only if the internal error count meets the programmed threshold in that window. The internal error count is reset every time the window expires. The software can use this to gauge the degree of 1-bit ECC errors occurring in the system.

For diagnosis, the EMIF supports a 1-Bit ECC data error distribution register ([EMIF\\_1B\\_ECC\\_ERR\\_DIST\\_1](#)) that represent whether an error has occurred in a given data channel location. This is advantageous to detect whether the errors are random or systemic. The distribution registers will be overlay of all 1-bit ECC errors until the software clears the register. Therefore, multiple bits could be set as a result of multiple 1-bit ECC errors occurring over multiple read accesses.

For 2-bit ECC errors in the data, the EMIF will generate a 2-bit ECC error interrupt. For any bit errors in the address, the EMIF will generate an address error interrupt. It must be noted that the EMIF will neither correct the data for these uncorrectable errors. Along with generating the interrupts, the EMIF will also report an error on the SYS or MPU return interface. In this case the EMIF will send the resultant data from the ECC correction logic. The read data received from the memory may have further been corrupted by the ECC correction logic since it will have attempted to correct the read data but failed due to uncorrectable error.

For all uncorrectable ECC errors listed above, the EMIF will log the starting address of the SDRAM burst in the [EMIF\\_2B\\_ECC\\_ERR\\_ADDR\\_LOG](#) register. This register will show the address of the first uncorrectable error. After the software clears the register, it will be loaded with the address for the next uncorrectable error.

In the event that the EMIF detects a single bit ECC error, although the error is corrected on the returned data, the data in the SDRAM is not corrected. It is the responsibility of the system software to correct the ECC error at that location. To the extent possible, the system software should correct multiple bit errors with the caveat that the returned data was not corrected but corrupted by the ECC correction logic.

#### 15.3.4.15 Class of Service

The class of service mechanism can be enabled by setting to 0x1 the [EMIF\\_READ\\_WRITE\\_EXECUTION\\_THRESHOLD](#)[31] MFLAG\_OVERRIDE bit. In this case EMIF services the order of commands given by the class of service rules described in the following paragraphs. If MFLAG\_OVERRIDE is set to 0x0 then class of service does not apply. When MFLAG\_OVERRIDE is 0x0 and the MFLAG is high then the EMIF alternates between one command coming from the MPU interface and one from the System interface and so forth. The MFLAG value is ignored if MFLAG\_OVERRIDE is 0x1.

The commands in the Command FIFO can be mapped to two classes of service namely 1 and 2. The mapping of commands to a particular class of service can be done based on the priority or the master ID. The mapping based on priority can be done by setting the appropriate values in the [EMIF\\_PRIORITY\\_TO\\_CLASS\\_OF\\_SERVICE\\_MAPPING](#) register. The mapping based on master ID can be done by setting the appropriate values of master ID and the masks in the [EMIF\\_CONNECTION\\_ID\\_TO\\_CLASS\\_OF\\_SERVICE\\_1\\_MAPPING](#) and [EMIF\\_CONNECTION\\_ID\\_TO\\_CLASS\\_OF\\_SERVICE\\_2\\_MAPPING](#) registers. There are 3 master ID and mask values that can be set for each class of service. In conjunction with the masks, each class of service can have a maximum of 144 master IDs mapped to it. For example, a master ID value of 0xFF along with a mask value of 0x3 will map all master IDs from 0xF8 to 0xFF to that particular class of service.

Each class of service has an associated latency counter ([EMIF\\_COS\\_CONFIG](#)[23:16] COS\_COUNT\_1 and [EMIF\\_COS\\_CONFIG](#)[15:8] COS\_COUNT\_2). When the latency counter for a command expires, that is, reaches the value programmed for the class of service that the command belongs to, that command is executed next. If there is more than one command that has expired latency counter, the command with the highest priority is executed first. One exception to this rule is, if the [EMIF\\_COS\\_CONFIG](#)[7:0] PR\_OLD\_COUNT value expires for the oldest command in the queue. That command is executed first irrespective of priority or class of service. This is done to prevent the continuous blocking effect.

The [EMIF\\_COS\\_CONFIG](#)[7:0] PR\_OLD\_COUNT value is used to identify when the oldest command in the command FIFO has timed out. At this point during the arbitration process, this oldest command is issued regardless of the priority of the other commands in the FIFO. This feature is disabled when writing 0x0 to the [EMIF\\_COS\\_CONFIG](#)[7:0] PR\_OLD\_COUNT bit field. After issuing the oldest command, the other remaining commands in the FIFO are reordered by age. The next oldest command in the FIFO is given highest priority again and issued after the [EMIF\\_COS\\_CONFIG](#)[7:0] PR\_OLD\_COUNT value expires. If a new value in the PR\_OLD\_COUNT bit field is written during counting, that is, before PR\_OLD\_COUNT expires, the counter keeps working but if this value is smaller the oldest command is issued sooner and if this value is larger the oldest command is issued later.

The master ID mapping allows the same master ID to be put in both class of service 1 and 2. Also, a transaction might belong to one class of service if viewed by master ID and might belong to another class of service if viewed by priority. In these cases, the command will belong to both class of service. The EMIF will try executing the command as soon as possible, when the smaller of the two counters ([EMIF\\_COS\\_CONFIG](#)[23:16] COS\_COUNT\_1 and [EMIF\\_COS\\_CONFIG](#)[15:8] COS\_COUNT\_2) expires.

#### 15.3.4.16 Performance Counters

The [EMIF\\_PERFORMANCE\\_COUNTER\\_1](#) and [EMIF\\_PERFORMANCE\\_COUNTER\\_2](#) registers are used to monitor or calculate the EMIF Controller bandwidth and efficiency. These counters are able to count events such as accesses made to EMIF, Activate (ACT) commands sent to SDRAM, read and write accesses made to EMIF, and other events. Each counter counts independently of the other. In addition to the ability of events counting, the counters can also filter the events from a particular master or address space. The events counting and filter enabling are configured using the [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG](#) register. The filter value used is configured through the [EMIF\\_PERFORMANCE\\_COUNTER\\_MASTER\\_REGION\\_SELECT](#) register. Each counter can be configured independently.

Table 15-123 lists all the events that can be counted and whether a filter can be applied to a particular event. A filter is applied to an event if the following bits are set to 0x1 for that event:

- For Performance Counter 1: [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[15\]](#) CNTR1\_MCONNID\_EN and [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[14\]](#) CNTR1\_REGION\_EN;
- For Performance Counter 2: [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[31\]](#) CNTR2\_MCONNID\_EN and [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[30\]](#) CNTR2\_REGION\_EN.

**Table 15-123. Performance Counter Filter Configuration**

CNTR <sub>n</sub> _CFG <sup>(1)</sup>	CNTR <sub>n</sub> _REGION_EN	CNTR <sub>n</sub> _MCONNID_EN	Description
0x0	0x0	0x0 or 0x1	Count the accesses made to EMIF
0x1	0x0	0x0 or 0x1	Count the Activate (ACT) commands sent to SDRAM
0x2	0x0 or 0x1	0x0 or 0x1	Count the read accesses made to EMIF
0x3	0x0 or 0x1	0x0 or 0x1	Count the write accesses made to EMIF
0x4	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Command FIFO is full
0x5	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Write Data FIFO is full
0x6	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Read Data FIFO is full
0x7	0x0	0x0	Count number of EMIF_FICLK clock cycles during which the local Return Command FIFO is full
0x8	0x0 or 0x1	0x0 or 0x1	Count number of priority elevations
0x9	0x0	0x0	Count number of EMIF_FICLK clock cycles that a command was pending
0xA	0x0	0x0	Count number of EMIF_FICLK cycles used by the EMIF controller for reads and writes.
0xB - 0xF	0x0	0x0	Reserved for future use.

<sup>(1)</sup> n = 1 or 2

---

**NOTE:** When the MReqDebug qualifier is set to 0x1 for a particular local command, the performance counters are not incremented for that particular command if the CNTR<sub>n</sub>\_CFG values are equal to 0x0, 0x1, 0x2, 0x3, or 0xA.

---

---

**NOTE:** The EMIF performance counters cannot distinguish between single access and burst access. In both cases they are incremented by 1. If the actual SDRAM bandwidth of an initiator has to be measured the EMIF performance counters may not be sufficient.

---

#### 15.3.4.16.1 Performance Counters General Examples

- **General Example for Counting All Write Accesses made to EMIF**

If the [EMIF\\_PERFORMANCE\\_COUNTER\\_1](#) register is used to count all write accesses made to EMIF from master with connection ID equal to 0x86 (this is the system MMU) the following steps should be performed:

- To enable the writes counting, the [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[3:0\]](#) CNTR1\_CFG bit field must be set to 0x3.
- The [EMIF\\_PERFORMANCE\\_COUNTER\\_MASTER\\_REGION\\_SELECT\[15:8\]](#) MCONNID1 bit field must be set to 0x86.
- To enable filtering, the [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[15\]](#) CNTR1\_MCONNID\_EN bit must be set to 0x1.

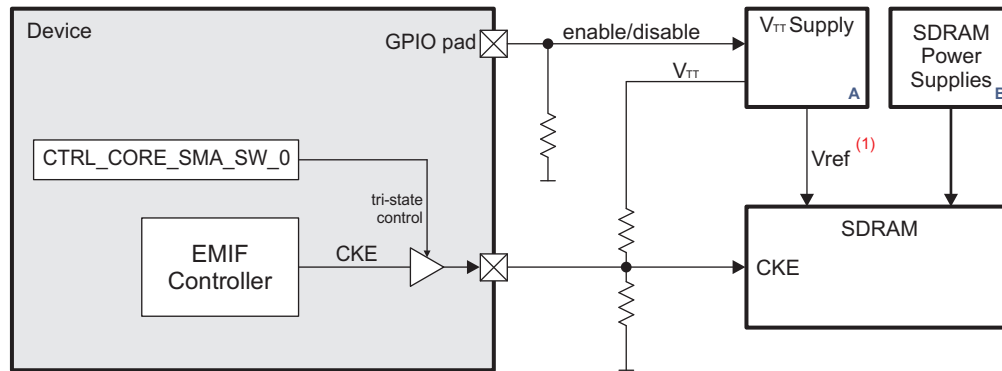

With this configuration [EMIF\\_PERFORMANCE\\_COUNTER\\_1](#) counts every write made to the EMIF from master 0x86 to any address space. This does not include accesses from other masters and commands other than writes.

- **General Example for Counting Total Accesses made to EMIF**  
If the [EMIF\\_PERFORMANCE\\_COUNTER\\_2](#) register is used to count total accesses made to EMIF regardless of the address space or master the following steps should be performed:
  - To enable counting of all accesses to the SDRAM, the [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[19:16\]](#) CNTR2\_CFG bit field must be set to 0x0.
  - To disable filtering, both the [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[31\]](#) CNTR2\_MCONNID\_EN and [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[30\]](#) CNTR2\_REGION\_EN bits must be set to 0x0.  
With this configuration [EMIF\\_PERFORMANCE\\_COUNTER\\_2](#) counts every access made to the EMIF. This includes all accesses from all masters and to any address space.
- **General Example for Counting All Read Accesses made to EMIF**  
If the [EMIF\\_PERFORMANCE\\_COUNTER\\_1](#) register is used to count all read accesses made to EMIF from master with connection ID equal to 0x86 (this is the system MMU) to address space 0x0 the following steps should be performed:
  - To enable the reads counting, the [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[3:0\]](#) CNTR1\_CFG bit field must be set to 0x2.
  - The [EMIF\\_PERFORMANCE\\_COUNTER\\_MASTER\\_REGION\\_SELECT\[15:8\]](#) MCONNID1 bit field must be set to 0x86
  - The [EMIF\\_PERFORMANCE\\_COUNTER\\_MASTER\\_REGION\\_SELECT\[1:0\]](#) REGION\_SEL1 bit field must be set to 0x0.
  - To enable filtering, both the [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[15\]](#) CNTR1\_MCONNID\_EN and the [EMIF\\_PERFORMANCE\\_COUNTER\\_CONFIG\[14\]](#) CNTR1\_REGION\_EN bits must be set to 0x1.  
With this configuration, [EMIF\\_PERFORMANCE\\_COUNTER\\_1](#) counts every read made to the EMIF from master 0x86 to address space 0x0. This does not include accesses from other masters or to other address spaces and does not include commands other than reads.

#### 15.3.4.17 Forcing CKE to tri-state

The CKE pad can be forced to tri-state when the corresponding bit in the CTRL\_CORE\_SMA\_SW\_0 register is set to 0x1. For the ddr1\_cke pad this is the CTRL\_CORE\_SMA\_SW\_0[0] EMIF1\_CKE\_GATING\_CTRL bit and for the ddr2\_cke pad the CTRL\_CORE\_SMA\_SW\_0[1] EMIF2\_CKE\_GATING\_CTRL bit. This functionality facilitates fast resume by allowing a strong external pull-down resistor to hold the CKE memory pad low thus keeping the SDRAM in self-refresh while the device is completely powered off. [Figure 15-51](#) and the following example sequence provide more details how this functionality can be used:

- When device is running configure EMIF for self refresh. As a result it drives CKE low.
- Disable  $V_{TT}$  supply (can be controlled through a device GPIO pad).
- Ramp down all power rails to the device. When power is already off, EMIF doesn't drive CKE low. The external pull-down does this instead. Note that only  $V_{TT}$  must be off. All SDRAM supplies (including  $V_{REF}$ ) must be on.
- After these three steps the device is completely powered off and the SDRAM is in self-refresh. The waking-up from this state is system specific.
- To resume from self-refresh the CKE pad must be forced to tri-state by writing 0x1 to one of the CKE\_GATING\_CTRL bits previously mentioned. Then EMIF must be configured for self-refresh so that its state becomes consistent with the actual SDRAM state.
- Write 0x0 to the corresponding CKE\_GATING\_CTRL bit to release CKE driver from tri-state. This allows EMIF to take control over CKE which is now driven low as EMIF has already been configured for self-refresh.
- Enable  $V_{TT}$  supply.
- Access the SDRAM to bring it out of self refresh and resume application.

**Figure 15-51. Example for Using the CKE Tri-state Functionality**

(1) -  $V_{ref}$  (derived either from A or B) must remain ON when  $V_{TT}$  is OFF.

emif-007

**NOTE:** In case the device is powered off but the SDRAM is in self-refresh (as previously described) it must be taken into account that the SDRAM RESET# signal has to be controlled externally to preserve the SDRAM contents. This is needed as `ddr1_rst/ddr2_rst` signal is not controlled by the `CTRL_CORE_SMA_SW_0` register and therefore cannot be used.

## 15.3.5 EMIF Programming Guide

### 15.3.5.1 EMIF Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the EMIF module.

The following programming sequences are doubled, when the two EMIF modules (EMIF1 and EMIF2) are used.

#### 15.3.5.1.1 Global Initialization

**Table 15-124. Global Initialization of Surrounding Modules**

Surrounding Modules	Comments
PRCM	The module interface and functional clocks must be enabled. See <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
DMM	The EMIF is a slave to the DMM. The DMM must be enabled and configured. See <a href="#">Section 15.2, Dynamic Memory Manager</a> .
Device INTCs	Device INTCs must be configured to enable the interrupt request generation. For more information see <a href="#">Chapter 17, Interrupt Controllers</a> .
IRQ_CROSSBAR	IRQ_CROSSBAR configuration must be done to allow module IRQs to be mapped to certain device INTC line. For more information see <a href="#">Section 18.4.6.4, IRQ_CROSSBAR Module Functional Description</a> , in <a href="#">Chapter 18, Control Module</a> .

#### 15.3.5.1.1.1 EMIF Configuration Sequence

[Table 15-125](#) shows all steps needed to configure and use the EMIF.

**Table 15-125. EMIF Configuration Sequence**

Step	Register/ Bit Field	Value
Configure DPLL_DDR to the required frequency:		
· <b>IF</b> DPLL_DDR is locked:	CM_IDLEST_DPLL_DDR[0] ST_DPLL_CLK	0x1
Unlock DPLL_DDR	CM_CLKMODE_DPLL_DDR[2:0] DPLL_EN	0x6
· <b>ENDIF</b>		
· Configure the DPLL multiplier and divider factors	CM_CLKSEL_DPLL_DDR[18:8] DPLL_MULT and CM_CLKSEL_DPLL_DDR[6:0] DPLL_DIV	0x-
· Configure the M2 post-divider factor	CM_DIV_M2_DPLL_DDR[4:0] DIVHS	0x-
· Configure the H11 post-divider factor	CM_DIV_H11_DPLL_DDR[5:0] DIVHS	0x-
· Lock the DPLL_DDR	CM_CLKMODE_DPLL_DDR[2:0] DPLL_EN	0x7
Disable DLL Override	CM_DLL_CTRL[0] DLL_OVERRIDE	0x0
Configure the output impedance, slew rate and weak pull resistors of the DDR IO cells. For more information, see <a href="#">Section 18.4.6.10 Software Controls for the DDR2/DDR3 I/O Cells</a> .	For EMIF1:	0x-
	· CTRL_CORE_CONTROL_DDRCACH1_0	
	· CTRL_CORE_CONTROL_DDRCH1_0	
	· CTRL_CORE_CONTROL_DDRCH1_1	
	· CTRL_CORE_CONTROL_DDRCH1_2	
	For EMIF2:	
	· CTRL_CORE_CONTROL_DDRCACH2_0	
	· CTRL_CORE_CONTROL_DDRCH2_0	
	· CTRL_CORE_CONTROL_DDRCH2_1	

**Table 15-125. EMIF Configuration Sequence (continued)**

Step	Register/ Bit Field	Value
If needed, configure the Vref-Generation Cells. For more information, see <a href="#">Section 18.4.6.11 Reference Voltage for the Device DDR2/DDR3 Receivers</a> .	For EMIF1: · CTRL_CORE_CONTROL_DDRIO_0	0x-
	For EMIF2: · CTRL_CORE_CONTROL_DDRIO_1	
Set the number of DQ samples required for read leveling	CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT[15:14] EMIF1_REG_PHY_NUM_OF_SAMPLES	0x3
	CTRL_WKUP_EMIF2_SDRAM_CONFIG_EXT[15:14] EMIF2_REG_PHY_NUM_OF_SAMPLES	0x3
Choose SDRAM read response on only one DQ bit during read leveling	CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT[12] EMIF1_REG_PHY_ALL_DQ_MPR_RD_RESP	0x0
	CTRL_WKUP_EMIF2_SDRAM_CONFIG_EXT[12] EMIF2_REG_PHY_ALL_DQ_MPR_RD_RESP	0x0
Configure ODT for the device DDR IOs	CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT [6:5] EMIF1_PHY_RD_LOCAL_ODT	0x1 for 60 Ohms
		0x2 for 80 Ohms
		0x3 for 120 Ohms
	CTRL_WKUP_EMIF2_SDRAM_CONFIG_EXT [6:5] EMIF2_PHY_RD_LOCAL_ODT	0x1 for 60 Ohms
		0x2 for 80 Ohms
		0x3 for 120 Ohms
<b>IF ECC is used OR IF special <sup>(1)</sup> use-cases:</b>		
Enable ECC	CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT[16] EMIF1_EN_ECC	0x1
<b>ENDIF</b>		
Based on the memory type other bits from CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT/ CTRL_WKUP_EMIF2_SDRAM_CONFIG_EXT can also be configured.		
Read the <a href="#">EMIF_IODFT_TLGC</a> register	<a href="#">EMIF_IODFT_TLGC</a>	RD_VAL_1
Read the <a href="#">EMIF_DDR_PHY_CONTROL_2</a> register	<a href="#">EMIF_DDR_PHY_CONTROL_2</a>	RD_VAL_2
<b>IF</b> External warm reset or global warm software reset has occurred:	PRM_RSTST[5]EXTERNAL_WARM_RST or PRM_RSTST[1] GLOBAL_WARM_SW_RST	0x1
		0x1
Reset the DDR PHY	<a href="#">EMIF_IODFT_TLGC</a> [10] RESET_PHY	0x1
<b>ENDIF</b>		
Program the necessary ratio values to the <a href="#">EMIF_EXT_PHY_CONTROL_1</a> register	<a href="#">EMIF_EXT_PHY_CONTROL_1</a> [19:10] PHY_REG_CTRL_SLAVE_RATIO1	0x80 if PHY_INVERT_CLK OUT = 0x0 or 0x100 if PHY_INVERT_CLK OUT = 0x1
	<a href="#">EMIF_EXT_PHY_CONTROL_1</a> [9:0] PHY_REG_CTRL_SLAVE_RATIO0	0x80 if PHY_INVERT_CLK OUT = 0x0 or 0x100 if PHY_INVERT_CLK OUT = 0x1

<sup>(1)</sup> In some special use-cases with features like suspend to RAM where EMIF may be reset but SDRAM content needs to be maintained correctly across such an event. In such cases, when EMIF is configured at first boot with hardware leveling enabled, the hardware leveling output from EMIF\_PHY\_STATUS\_x registers is copied to the EMIF\_EXT\_PHY\_CONTROL\_x registers. When EMIF comes back from a reset state and needs to be reconfigured without losing SDRAM content, the [EMIF\\_READ\\_WRITE\\_LEVELING\\_RAMP\\_CONTROL](#)[31] RDWRLVL\_EN bit must be 0 and hardware leveling must not be triggered. In this case, the [EMIF\\_EXT\\_PHY\\_CONTROL\\_2](#) through [EMIF\\_EXT\\_PHY\\_CONTROL\\_21](#) registers take effect. Here it is expected that SDRAM is moved to self-refresh mode before EMIF enters reset state and SDRAM content is maintained correctly by appropriate circuitry external to the SoC.

**Table 15-125. EMIF Configuration Sequence (continued)**

Step	Register/ Bit Field	Value
Program the shadow register of <a href="#">EMIF_EXT_PHY_CONTROL_1</a>	<a href="#">EMIF_EXT_PHY_CONTROL_1_SHADOW</a>	<a href="#">EMIF_EXT_PHY_CONTROL_1</a>
If software leveling will be used, program registers <a href="#">EMIF_EXT_PHY_CONTROL_2</a> through <a href="#">EMIF_EXT_PHY_CONTROL_21</a> and their corresponding shadow registers <b>NOTE: Software leveling is not recommended to be used. Hardware leveling must be used instead.</b>	<a href="#">EMIF_EXT_PHY_CONTROL_2/EMIF_EXT_PHY_CONTROL_2_SHADOW</a> through <a href="#">EMIF_EXT_PHY_CONTROL_21/EMIF_EXT_PHY_CONTROL_21_SHADOW</a>	0x-
Program the necessary delay values to the <a href="#">EMIF_EXT_PHY_CONTROL_22</a> register	<a href="#">EMIF_EXT_PHY_CONTROL_22</a> [24:16] <a href="#">PHY_REG_FIFO_WE_IN_DELAY</a> <sup>(2) (3)</sup>	Recommended value is 0x0
	<a href="#">EMIF_EXT_PHY_CONTROL_22</a> [8:0] <a href="#">PHY_REG_CTRL_SLAVE_DELAY</a> <sup>(2) (3)</sup>	Recommended value is 0x0
Program the shadow register of <a href="#">EMIF_EXT_PHY_CONTROL_22</a>	<a href="#">EMIF_EXT_PHY_CONTROL_22_SHADOW</a> <sup>(2) (3)</sup>	<a href="#">EMIF_EXT_PHY_CONTROL_22</a>
Program the necessary delay values to the <a href="#">EMIF_EXT_PHY_CONTROL_23</a> register	<a href="#">EMIF_EXT_PHY_CONTROL_23</a> [24:16] <a href="#">PHY_REG_WR_DQS_SLAVE_DELAY</a> <sup>(2) (3)</sup>	Recommended value is 0x0

Program the shadow register of <a href="#">EMIF_EXT_PHY_CONTROL_25</a>	<a href="#">EMIF_EXT_PHY_CONTROL_25_SHADOW</a>	<a href="#">EMIF_EXT_PHY_CONTROL_25</a>
If hardware leveling (read-write leveling) will be used, program with zeros registers <a href="#">EMIF_EXT_PHY_CONTROL_26</a> through <a href="#">EMIF_EXT_PHY_CONTROL_35</a> and their corresponding shadow registers	<a href="#">EMIF_EXT_PHY_CONTROL_26/EMIF_EXT_PHY_CONTROL_26_SHADOW</a> through <a href="#">EMIF_EXT_PHY_CONTROL_35/EMIF_EXT_PHY_CONTROL_35_SHADOW</a>	0x0
Program the <a href="#">EMIF_EXT_PHY_CONTROL_36</a> register	<a href="#">EMIF_EXT_PHY_CONTROL_36</a>	0x-
Program the shadow register of <a href="#">EMIF_EXT_PHY_CONTROL_36</a>	<a href="#">EMIF_EXT_PHY_CONTROL_36_SHADOW</a>	<a href="#">EMIF_EXT_PHY_CONTROL_36</a>

<sup>(2)</sup> These values are only used when [CM\\_DLL\\_CTRL\[0\] DLL\\_OVERRIDE](#) is set to 0x1. This is used only for debug purposes.

<sup>(3)</sup> The values of these fields do not depend on the board topology.

<sup>(4)</sup> These fields control the delay between the corresponding DQ byte lane and DQS/DQSN pair. Their values should correspond to delay of 1/4 clock cycle to center the DQ relative to the rising/falling edges of DQS/DQSN. Regardless of topology, it is recommended that all the DQ bits are skew matched to the corresponding DQS/DQSN pair.

**Table 15-125. EMIF Configuration Sequence (continued)**

Step	Register/ Bit Field	Value

**Table 15-125. EMIF Configuration Sequence (continued)**

Step	Register/ Bit Field	Value
Configure the SDRAM refresh rate with a value of 31.25µs to get 500µs delay between RESET de-assertion to CKE assertion after power-up	<a href="#">EMIF_SDRAM_REFRESH_CONTROL_SHADOW</a> [15:0] REFRESH_RATE_SHDW	0x-
Program the <a href="#">EMIF_SDRAM_REFRESH_CONTROL</a> register with value same as its shadow register	<a href="#">EMIF_SDRAM_REFRESH_CONTROL</a> [15:0] REFRESH_RATE	REFRESH_RATE_SHDW
<b>ELSEIF</b> Memory type == DDR2:		
Configure the SDRAM refresh rate with value used initially to get 200µs delay between POWER UP and PRECHARGE ALL command	<a href="#">EMIF_SDRAM_REFRESH_CONTROL_SHADOW</a> [15:0] REFRESH_RATE_SHDW	0x-
Program the <a href="#">EMIF_SDRAM_REFRESH_CONTROL</a> register with value same as its shadow register	<a href="#">EMIF_SDRAM_REFRESH_CONTROL</a> [15:0] REFRESH_RATE	REFRESH_RATE_SHDW
<b>ELSEIF</b> Memory type == LPDDR2:		
Configure the SDRAM refresh rate with value used initially to get 200µs delay between POWER UP and RESET command to LPDDR2	<a href="#">EMIF_SDRAM_REFRESH_CONTROL_SHADOW</a> [15:0] REFRESH_RATE_SHDW	0x-
Program the <a href="#">EMIF_SDRAM_REFRESH_CONTROL</a> register with value same as its shadow register	<a href="#">EMIF_SDRAM_REFRESH_CONTROL</a> [15:0] REFRESH_RATE	REFRESH_RATE_SHDW
<b>ENDIF</b>		
Assign the external bank address bits from lower or higher L3 address as shown in <a href="#">Section 15.3.4.12, SDRAM Address Mapping</a>	<a href="#">EMIF_SDRAM_CONFIG_2</a> [27] EBANK_POS	0x-
Select the SDRAM type	<a href="#">EMIF_SDRAM_CONFIG</a> [31:29] SDRAM_TYPE	0x-
Assign internal bank address bits from L3 address as shown in <a href="#">Section 15.3.4.12, SDRAM Address Mapping</a>	<a href="#">EMIF_SDRAM_CONFIG</a> [28:27] IBANK_POS	0x-
Choose SDRAM data bus width	<a href="#">EMIF_SDRAM_CONFIG</a> [15:14] NARROW_MODE	0x-
Define CAS latency when accessing connected SDRAM devices.	<a href="#">EMIF_SDRAM_CONFIG</a> [13:10] CL	0x-
Define the number of row address bits of connected SDRAM device.	<a href="#">EMIF_SDRAM_CONFIG</a> [9:7] ROWSIZE	0x-
Define the number of banks inside connected SDRAM device.	<a href="#">EMIF_SDRAM_CONFIG</a> [6:4] IBANK	0x-
Define the internal page size of connected SDRAM device.	<a href="#">EMIF_SDRAM_CONFIG</a> [2:0] PAGESIZE	0x-
Wait 1ms		
Configure the SDRAM refresh rate with value according to the actual memory refresh period requirements	<a href="#">EMIF_SDRAM_REFRESH_CONTROL_SHADOW</a> [15:0] REFRESH_RATE_SHDW	0x-
Program the <a href="#">EMIF_SDRAM_REFRESH_CONTROL</a> register with value same as its shadow register	<a href="#">EMIF_SDRAM_REFRESH_CONTROL</a> [15:0] REFRESH_RATE	REFRESH_RATE_SHDW
<b>IF</b> Memory type == DDR3 <b>AND</b> Hardware leveling is used <b>AND</b> SDRAM content doesn't need to be maintained:		
<b>IF</b> ECC is used:		

**Table 15-125. EMIF Configuration Sequence (continued)**

Step	Register/ Bit Field	Value
Perform dummy ECC setup just to allow hardware leveling of ECC memories	EMIF_ECC_ADDRESS_RANGE_1	0x0
	EMIF_ECC_ADDRESS_RANGE_2	0x0
	EMIF_ECC_CTRL_REG	0xC000 0000
<b>ENDIF</b>		
Clear the phy_reg_fifo_we_in_misaligned_sticky status flag	EMIF_EXT_PHY_CONTROL_36[8] REG_PHY_FIFO_WE_IN_MISALIGNED_CLR	0x1
Temporarily disable SDRAM refreshes	EMIF_SDRAM_REFRESH_CONTROL[31] INITREF_DIS	0x1
Trigger read-write leveling	EMIF_READ_WRITE_LEVELING_CONTROL[31] RDWRLVLFULL_START	0x1
Wait 300µs		
Wait till read-write leveling completes	EMIF_READ_WRITE_LEVELING_CONTROL[31] RDWRLVLFULL_START	0x0
Enable the temporarily disabled SDRAM refreshes	EMIF_SDRAM_REFRESH_CONTROL[31] INITREF_DIS	0x0
Check EMIF_STATUS for leveling timeouts	EMIF_STATUS[6] RDLVLGATETO	0x1
	EMIF_STATUS[5] RDLVLTO	0x1
	EMIF_STATUS[4] WRLVLTO	0x1
<b>IF special <sup>(1)</sup> use-cases:</b>		
Copy EMIF_PHY_STATUS_12 through EMIF_PHY_STATUS_16 to EMIF_EXT_PHY_CONTROL_2 through EMIF_EXT_PHY_CONTROL_6		
Copy EMIF_PHY_STATUS_7 through EMIF_PHY_STATUS_11 to EMIF_EXT_PHY_CONTROL_7 through EMIF_EXT_PHY_CONTROL_11		
Copy EMIF_PHY_STATUS_17 through EMIF_PHY_STATUS_26 to EMIF_EXT_PHY_CONTROL_12 through EMIF_EXT_PHY_CONTROL_21		
Mask read data eye training, DQS gate training and write leveling training to disable the use of registers EMIF_PHY_STATUS_7 through EMIF_PHY_STATUS_26 registers	EMIF_DDR_PHY_CONTROL_1[27:25]	0x7
Program the shadow register of EMIF_DDR_PHY_CONTROL_1	EMIF_DDR_PHY_CONTROL_1_SHADOW	EMIF_DDR_PHY_CONTROL_1
Disable read-write leveling	EMIF_READ_WRITE_LEVELING_RAMP_CONTROL[31] RDWRLVLFULL_START	0x0
<b>ENDIF</b>		
Clear the ECC control register	EMIF_ECC_CTRL_REG	0x0
<b>ENDIF</b>		
Configure the LISA_MAP registers based on the EMIF1/EMIF2 usage and EMIF interleaving modes. For more information see <a href="#">Section 15.2.4.2, Addressing Management with LISA.</a>	DMM_LISA_MAP_i (i = 0 to 3)	0x-
	MA_LISA_MAP_i (i = 0 to 3)	0x-

### 15.3.5.1.2 Operational Modes Configuration

#### 15.3.5.1.2.1 EMIF Output Impedance Calibration Mode

**Table 15-126. EMIF Output Impedance Calibration Mode**

Step	Register/ Bit Field / Programming Model	Value
Enable ZQ callibration for CS0.	<a href="#">EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG</a> [30] ZQ_CS0EN	0x1
Define the interval (number of refresh periods) between ZQCS commands.	<a href="#">EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG</a> [15:0] ZQ_REFINTERVAL	0x-
Define the number of ZQCS intervals that build the ZQCL duration.	<a href="#">EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG</a> [17:16] ZQ_ZQCL_MULT	0x-
Enable the issuing of ZQ-Long Command on Self-Refresh, Active Power-Down, and Precharge Power-Down exit.	<a href="#">EMIF_SDRAM_OUTPUT_IMPEDANCE_CALIBRATION_CONFIG</a> [28] ZQ_SFEXITEN	0x1

#### 15.3.5.1.2.2 EMIF SDRAM Self-Refresh

**Table 15-127. EMIF SDRAM Self-Refresh Entering**

Step	Register/ Bit Field / Programming Model	Value
Define the number of DDR clock cycles after which the EMIF puts the external SDRAM in Self Refresh mode, when EMIF is idle.	<a href="#">EMIF_POWER_MANAGEMENT_CONTROL</a> [7:4] SR_TIM	0x-
Enable the Self-Refresh mode	<a href="#">EMIF_POWER_MANAGEMENT_CONTROL</a> [10:8] LP_MODE	0x2
Write the shadow register of <a href="#">EMIF_POWER_MANAGEMENT_CONTROL</a>	<a href="#">EMIF_POWER_MANAGEMENT_CONTROL_SHADOW</a>	0x-

**Table 15-128. EMIF SDRAM Self-Refresh Exiting**

Step	Register/ Bit Field / Programming Model	Value
Change LP_MODE bitfield from 0x2 to any value.	<a href="#">EMIF_POWER_MANAGEMENT_CONTROL</a> [10:8] LP_MODE	0x-
Write the shadow register of <a href="#">EMIF_POWER_MANAGEMENT_CONTROL</a>	<a href="#">EMIF_POWER_MANAGEMENT_CONTROL_SHADOW</a>	0x-

#### 15.3.5.1.2.3 EMIF SDRAM Power-Down Mode

**Table 15-129. EMIF SDRAM Power-Down Mode Entering**

Step	Register/ Bit Field / Programming Model	Value
Define the number of DDR clock cycles after which the EMIF puts the external SDRAM in Power Down mode, when EMIF is idle.	<a href="#">EMIF_POWER_MANAGEMENT_CONTROL</a> [15:12] PD_TIM	0x-
Enable (enter) the Power-down mode	<a href="#">EMIF_POWER_MANAGEMENT_CONTROL</a> [10:8] LP_MODE	0x4
Write the shadow register of <a href="#">EMIF_POWER_MANAGEMENT_CONTROL</a>	<a href="#">EMIF_POWER_MANAGEMENT_CONTROL_SHADOW</a>	0x-

**Table 15-130. EMIF SDRAM Power-Down Mode Exiting**

Step	Register/ Bit Field / Programming Model	Value
Change LP_MODE bitfield from 0x4 to any value.	<a href="#">EMIF_POWER_MANAGEMENT_CONTROL</a> [10:8] LP_MODE	0x-

**Table 15-130. EMIF SDRAM Power-Down Mode Exiting (continued)**

Step	Register/ Bit Field / Programming Model	Value
Write the shadow register of <a href="#">EMIF_POWER_MANAGEMENT_CONTROL</a>	<a href="#">EMIF_POWER_MANAGEMENT_CONTROL_SHA</a> DOW	0x-

#### 15.3.5.1.2.4 EMIF ECC Configuration

Table 15-131 lists the ECC configuration settings.

**Table 15-131. EMIF ECC Configuration**

Step	Register/ Bit Field / Programming Model	Value
Before configuring the EMIF ECC registers, the ECC must be enabled from the Control Module	<a href="#">CTRL_WKUP_EMIF1_SDRAM_CONFIG_EXT</a> [16] <a href="#">EMIF1_EN_ECC</a>	0x1
Configure the address ranges which have to be ECC protected	<a href="#">EMIF_ECC_ADDRESS_RANGE_1</a> and <a href="#">EMIF_ECC_ADDRESS_RANGE_2</a> <sup>(1)</sup>	0x-
Enable the first ECC protected address range	<a href="#">EMIF_ECC_CTRL_REG</a> [0] <a href="#">REG_ECC_ADDR_RGN_1_EN</a>	0x1
Enable the second ECC protected address range	<a href="#">EMIF_ECC_CTRL_REG</a> [1] <a href="#">REG_ECC_ADDR_RGN_2_EN</a> <sup>(1)</sup>	0x1
Configure whether the EMIF accesses within the address ranges defined by <a href="#">EMIF_ECC_ADDRESS_RANGE_1</a> and <a href="#">EMIF_ECC_ADDRESS_RANGE_2</a> are ECC protected (=0x1) or the EMIF accesses outside these address ranges are ECC protected (=0x0).	<a href="#">EMIF_ECC_CTRL_REG</a> [30] <a href="#">REG_ECC_ADDR_RGN_PROT</a>	0x-
(Optional) Configure the thresholds to generate 1-bit error interrupt	<a href="#">EMIF_1B_ECC_ERR_THRSH</a>	0x-
Enable ECC	<a href="#">EMIF_ECC_CTRL_REG</a> [31] <a href="#">REG_ECC_EN</a>	0x1
Initialize the ECC protected memory regions with quanta-sized and quanta-aligned data		
Clear the status flags and other status history	<a href="#">EMIF_1B_ECC_ERR_CNT</a>	Read the register value and write it back to clear
	<a href="#">EMIF_1B_ECC_ERR_DIST_1</a>	0xFFFF FFFF
	<a href="#">EMIF_2B_ECC_ERR_ADDR_LOG</a>	0x1
	<a href="#">EMIF_SYSTEM_OCP_INTERRUPT_STATUS</a> [5:3]	0x7

<sup>(1)</sup> It is not mandatory to enable both address ranges. This is provided for flexibility, allowing two non-overlapping ECC protected regions to be created.

**NOTE:** If ECC is used the following must be taken into account to avoid unexpected behavior and possible errors:

- The memory interleaving must be disabled through setting the [DMM\\_LISA\\_MAP\\_i](#)[19:18] [SDRC\\_INTL](#) bit field to 0x0.
- The [xxx\\_RATIO8](#) and [xxx\\_RATIO9](#) bit fields are associated with the ECC data PHY and in case of software leveling must be loaded with values same as in the [xxx\\_RATIO0](#) through [xxx\\_RATIO7](#) bit fields from registers [EMIF\\_EXT\\_PHY\\_CONTROL\\_x](#).

**NOTE:** Software leveling is not recommended to be used. Hardware leveling must be used instead.

### 15.3.6 EMIF Register Manual

Table 15-132 lists the EMIF instance.

#### 15.3.6.1 EMIF Instance Summary

**Table 15-132. EMIF Instance Summary**

Module Name	Base Address	Size
EMIF1	0x4C00 0000	16 MiB
EMIF2	0x4D00 0000	16 MiB

#### 15.3.6.2 EMIF Registers

Many register values are programmed with full-speed DDR clock cycles, whereas EMIF always runs at half the speed of this clock. Because EMIF is only capable of decrementing these values at half speed (taking into account the minus 1 programming model) the following model applies for data issued on a lower bus:

- REG\_VALUE = 0 → 2 DDR clocks
- REG\_VALUE = 1 → 2 DDR clocks
- REG\_VALUE = 2 → 4 DDR clocks
- REG\_VALUE = 3 → 4 DDR clocks
- REG\_VALUE = 4 → 6 DDR clocks
- REG\_VALUE = 5 → 6 DDR clocks
- REG\_VALUE = 6 → 8 DDR clocks
- REG\_VALUE = 7 → 8 DDR clocks

Activate and deactivate commands use the upper bus. Register values associated with these operations follow the general rule:

- REG\_VALUE = 0 → 1 DDR clocks
- REG\_VALUE = 1 → 2 DDR clocks
- REG\_VALUE = 2 → 2 DDR clocks
- REG\_VALUE = 3 → 4 DDR clocks
- REG\_VALUE = 4 → 4 DDR clocks
- REG\_VALUE = 5 → 6 DDR clocks
- REG\_VALUE = 6 → 6 DDR clocks

---

**NOTE:** Shadow registers are loaded on any frequency change or SidleReq/SidleAck transition at the point where the EMIF has put SDRAM into self-refresh mode.

---

Table 15-133 summarizes the EMIF register mapping.

#### 15.3.6.2.1 EMIF Register Summary

**Table 15-133. EMIF Registers Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	EMIF1 Physical Address	EMIF2 Physical Address

<b>Address Offset</b>	0x0000 0004	<b>Instance</b>	EMIF1 EMIF2
<b>Physical Address</b>	0x4C00 0004 0x4D00 0004		
<b>Description</b>	SDRAM Status Register (STATUS)		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BE	DUAL_CLK_MODE	FAST_INIT	RESERVED														RDLVLGATETO	RDLVLTO	WRLVLTO	RESERVED	PHY_DLL_READY	RESERVED									

Bits	Field Name	Description	Type	Reset
31	BE	Big endian mode select for 8 and 16-bit devices, set to 1 for big endian or 0 for little endian operation. In current implementation, only 32-bit devices are supported - this bit is don't care.	R	0
30	DUAL_CLK_MODE	Dual Clock mode. Defines whether the EMIFi_L3_ICLK and EMIF_FICLK clock are asynchronous. EMIFi_L3_ICLK and EMIF_FICLK clock are asynchronous, if set to 1.	R	0
29	FAST_INIT	Fast Init. Defines whether the EMIF fast initialization mode has been enabled. Fast initialization is enabled if set to 1.	R	0
28:7	RESERVED	Reserved	R	0x00 0000
6	RDLVLGATETO	Read DQS Gate Training Timeout. Value of 1 indicates read DQS gate training has timed out because read DQS gate training done was not received from the PHY.	R	0
5	RDLVLTO	Read Data Eye Training Timeout. Value of 1 indicates read data eye training has timed out because read data eye training done was not received from the PHY.	R	0
4	WRLVLTO	Write Leveling Timeout. Value of 1 indicates write leveling has timed out because write leveling done was not received from the PHY.	R	0
3	RESERVED		R	0
2	PHY_DLL_READY	DDR PHY Ready. The DDR PHY is ready for normal operation, if set to 1.	R	0
1:0	RESERVED	Reserved	R	0x0

<b>Address Offset</b>	0x0000 0008	<b>Instance</b>	EMIF1 EMIF2
<b>Physical Address</b>	0x4C00 0008 0x4D00 0008		
<b>Description</b>	SDRAM Config Register. A write to this register will cause the EMIF to start the SDRAM initialization sequence. <b>CAUTION:</b> This register is loaded with values by control module at device reset.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SDRAM_TYPE			IBANK_POS			DDR_TERM			DDR2_DDQS	DYN_ODT	DDR_DISABLE_DLL	SDRAM_DRIVE		CWL	NARROW_MODE		CL				ROWSIZE			IBANK		RESERVED	PAGESIZE				

Bits	Field Name	Description	Type	Reset
31:29	SDRAM_TYPE	SDRAM Type selection. This field is loaded from e-fuse. Set to 2 for DDR2 Set to 3 for DDR3 All other values are reserved.	RW	0x0
28:27	IBANK_POS	Internal bank position. See <a href="#">Section 15.3.4.12</a> , <i>SDRAM Address Mapping</i> .	RW	0x0
26:24	DDR_TERM	DDR3 termination resistor value. Set to 0 to disable termination. For DDR3, set to 1 for RZQ/4, set to 2 for RZQ/2, set to 3 for RZQ/6, set to 4 for RZQ/12, and set to 5 for RZQ/8. All other values are reserved.	RW	0x0
23	DDR2_DDQS	DDR2 differential DDQS enable. NOT SUPPORTED. Set to 1 for compatibility.	RW	0
22:21	DYN_ODT	DDR3 Dynamic ODT. NOT SUPPORTED. Set to 0 to turn off dynamic ODT.	RW	0x0
20	DDR_DISABLE_DLL	Disable DLL select. Set to 1 to disable DLL inside SDRAM.	RW	0
19:18	SDRAM_DRIVE	SDRAM drive strength. For DDR3, set to 0 for RZQ/6 and set to 1 for RZQ/7. All other values are reserved.	RW	0x0
17:16	CWL	DDR3 CAS Write latency. Value of 0, 1, 2, and 3 (CAS write latency of 5, 6, 7, and 8) are supported. Use the lowest value supported for best performance. All other values are reserved.	RW	0x0
15:14	NARROW_MODE	SDRAM data bus width. Set to 0 for 32-bit data bus width. Set to 1 for 16-bit data bus width. All other values are reserved.	RW	0x0
13:10	CL	CAS Latency (referred to as read latency (RL) in some SDRAM specs). The value of this field defines the CAS latency to be used when accessing connected SDRAM devices. Values of 2, 3, 4 and 5 (CAS latency of 2, 3, 4 and 5) are supported for DDR2. Values of 2, 4, 6, 8, 10, 12 and 14 (CAS latency of 5, 6, 7, 8, 9, 10 and 11) are supported for DDR3. All other values are reserved.	RW	0x0

Bits	Field Name	Description	Type	Reset
9:7	ROWSIZE	Row Size. Defines the number of row address bits of connected SDRAM devices. Set to 0 for 9 row bits, Set to 1 for 10 row bits, Set to 2 for 11 row bits, Set to 3 for 12 row bits, Set to 4 for 13 row bits, Set to 5 for 14 row bits, Set to 6 for 15 row bits, Set to 7 for 16 row bits. This field is only used when <a href="#">EMIF_SDRAM_CONFIG</a> [28:27] IBANK_POS field is set to 1, 2, or 3 or EBANK_POS field in <a href="#">EMIF_SDRAM_CONFIG_2</a> register is set to 1.	RW	0x0
6:4	IBANK	Internal Bank setup. Defines number of banks inside connected SDRAM devices. Set to 0 for 1 bank, Set to 1 for 2 banks, Set to 2 for 4 banks, Set to 3 for 8 banks. All other values are reserved.	RW	0x0
3	RESERVED		R	0
2:0	PAGESIZE	Page Size. Defines the internal page size of connected SDRAM devices. Set to 0 for 256-word page (8 column bits), Set to 1 for 512-word page (9 column bits), Set to 2 for 1024-word page (10 column bits), Set to 3 for 2048-word page (11 column bits). All other values are reserved.	RW	0x0

**Table 15-142. EMIF\_SDRAM\_REFRESH\_CONTROL**

<b>Address Offset</b>	0x0000 0010		
<b>Physical Address</b>	0x4C00 0010 0x4D00 0010	<b>Instance</b>	EMIF1 EMIF2
<b>Description</b>	SDRAM Refresh Control Register		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
INITREF_DIS	RESERVED	SRT	ASR	RESERVED	PASR	RESERVED										REFRESH_RATE															

Bits	Field Name	Description	Type	Reset
31	INITREF_DIS	Initialization and Refresh disable. When set to 1, EMIF will disable SDRAM initialization and refreshes, but will carry out SDRAM write/read transactions.	RW	1
30	RESERVED		R	0

Bits	Field Name	Description	Type	Reset
29	SRT	DDR3 Self Refresh temperature range. Set to 0 for normal operating temperature range and set to 1 for extended operating temperature range when the ASR field is set to 0. This bit must be set to 0 if the ASR field is set to 1. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0
28	ASR	DDR3 Auto Self Refresh enable. Set to 1 for auto Self Refresh enable. Set to 0 for manual Self Refresh reference indicated by the SRT field. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0
27	RESERVED		R	0
26:24	PASR	Partial Array Self Refresh. These bits get loaded into the Extended Mode Register of DDR3 during initialization. For DDR3, set to 0 for full array, set to 1 or 5 for 1/2 array, set to 2 or 6 for 1/4 array, set to 3 or 7 for 1/8 array, and set to 4 for 3/4 array to be refreshed. All other values are reserved. A write to this field will cause the EMIF to start the SDRAM initialization sequence.	RW	0x0
23:16	RESERVED		R	0x00
15:0	REFRESH_RATE	Refresh Rate. Value in this field is used to define the rate at which connected SDRAM devices will be refreshed. SDRAM refresh rate = REFRESH_RATE / EMIF_PHY_FCLK. A 533-MHz DDR clock rate system that requires a 7.8 $\mu$ s refresh rate would need $7.8 \times 533 = 4157$ or 0x103D value to be written. To avoid lock-up situations, the programmer must not program $REFRESH\_RATE < (6 \times EMIF\_SDRAM\_TIMING\_3[12:4] T\_RFC)$ . <b>NOTE:</b> The SDRAM refresh rate can be changed on-the-fly by writing to this field.  When changing the SDRAM refresh rate all timing parameters that use the refresh rate value have to be recalculated. For example, tRASmax specified in the <a href="#">EMIF_SDRAM_TIMING_3[3:0] T_RAS_MAX</a> field must be recalculated.	RW	0x0000

<b>Description</b>	PHY control register 1		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								RESERVED				PHY_HALF_DELAYS PHY_CLK_STALL_LEVEL PHY_DIS_CALIB_RST PHY_INVERT_CLKOUT				PHY_DLL_LOCK_DIFF				PHY_FAST_DLL_LOCK		RESERVED				READ_LATENCY					

Bits	Field Name	Description	Type	Reset
31:28	RESERVED	Reserved	RW	0x0
27	RDLVL_MASK	Writing a 1 to this field will mask read data eye training during full leveling command, plus drives reg_phy_use_rd_data_eye_level control low to allow user to use programmed ratio values.	RW	0
26	RDLVLGATE_MASK	Writing a 1 to this field will mask dqs gate training during full leveling command, plus drives reg_phy_use_rd_dqs_level control low to allow user to use programmed ratio values.	RW	0
25	WRLVL_MASK	Writing a 1 to this field will mask write leveling training during full leveling command, plus drives reg_phy_use_wr_level control low to allow user to use programmed ratio values.	RW	0
24:22	RESERVED	Reserved	RW	0x0
21	PHY_HALF_DELAYS	Adjust slave delay line delays to support 2x mode 1: 2x mode (MDLL clock is half the rate of PHY) 0: 1x mode (MDLL clock rate is same as PHY)	RW	0
20	PHY_CLK_STALL_LEVEL	Enable variable idle value for delay lines. Enable during normal operations to avoid differential aging in the delay lines.	RW	0
19	PHY_DIS_CALIB_RST	Disable the dll_calib (internally generated) signal from resetting the Read Capture FIFO pointers and portions of data PHYs. Debug only. Note: dll_calib is generated by 1. EMIF_MISC_REG[0] DLL_CALIB_OS set to 1, or 2. by the PHY when it detects that the clock frequency variation has exceeded the bounds set by PHY_DLL_LOCK_DIFF or 3. periodically throughout the leveling process.	RW	0
18	PHY_INVERT_CLKOUT	Inverts the polarity of DRAM clock. 0: core clock is passed on to DRAM 1: inverted core clock is passed on to DRAM	RW	0
17:10	PHY_DLL_LOCK_DIFF	The maximum number of delay line taps variation while maintaining the master DLL lock. When the PHY is in locked state and the variation on the clock exceeds the variation indicated by this field, the lock signal is de-asserted and a dll_calib signal is generated. To prevent the dll_calib signal from being asserted in the middle of traffic when the clock jitter exceeds the variation, this register needs to be set to a value which will ensure that the lock will not be lost. Recommended value is 16.	RW	0x02
9	PHY_FAST_DLL_LOCK	Controls master DLL to lock fast or average logic must be part of locking process. Set to 1 before OPP transition commences, and set back to 0 after OPP transition completes. 1: MDLL lock is asserted based on single sample 0: MDLL lock is asserted based on average of 16 samples.	RW	0
8:5	RESERVED	Reserved	RW	0x00

Bits	Field Name	Description	Type	Reset
4:0	READ_LATENCY	This field defines the read latency for the read data from SDRAM in number of DDR clock cycles. This field is used by the EMIF as well as the PHY. $READ\_LATENCY = RL + reg\_phy\_rdc\_we\_to\_re - 1$ . EMIF uses above equation to calculate $reg\_phy\_rdc\_we\_to\_re$ and forward it to the PHY. For DDR3, the true RL is used, not the decoded value. See JEDEC spec.	RW	0x01E

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								REG_PHY_GATELVL_INIT_RATIO3								RESERVED								REG_PHY_GATELVL_INIT_RATIO2							

Bits	Field Name	Description	Type	Reset
31:27	RESERVED		R	0x0
26:16	REG_PHY_GATELVL_INIT_RATIO3	The user programmable initialization ratio value used by the gate training finite state machine (hardware leveling) for the FIFO write enable slave DLL in PHY data macro 1, chip select 1. This is the fraction of a clock cycle in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line. <b>NOTE: Chip select 1 is not supported on this device.</b>	RW	0x150
15:11	RESERVED		R	0x0
10:0	REG_PHY_GATELVL_INIT_RATIO2	The user programmable initialization ratio value used by the gate training finite state machine (hardware leveling) for the FIFO write enable slave DLL in PHY data macro 1, chip select 0. This is the fraction of a clock cycle in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line.	RW	0x150

## 15.4 General-Purpose Memory Controller

This section describes the features and functions of the device GPMC controller.

### 15.4.1 GPMC Overview

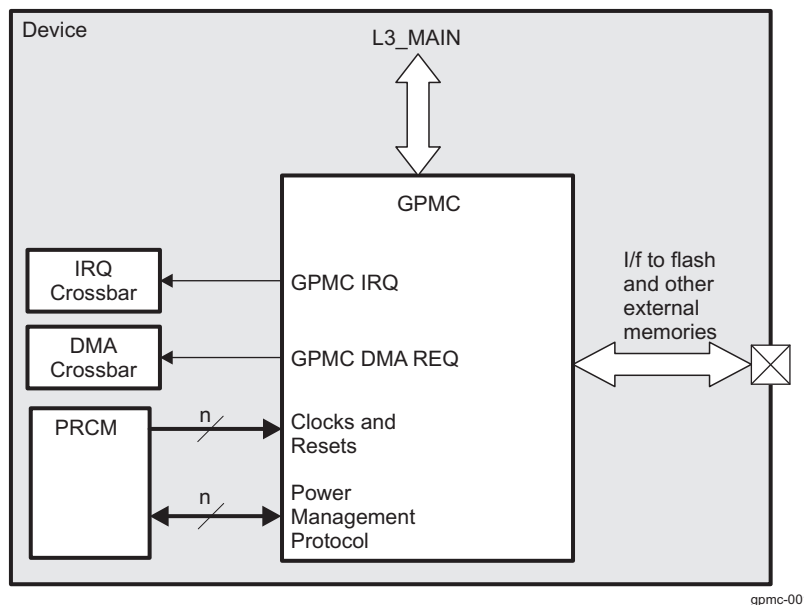

The general-purpose memory controller (GPMC) is a unified memory controller dedicated for interfacing with external memory devices like:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (available only in nonmultiplexed mode) burst NOR flash devices
- NAND flash
- Pseudo-SRAM devices

Figure 15-52 shows the GPMC module overview.

The GPMC features are introduced in [Section 15.1.4, GPMC Overview](#) of [Section 15.1, Memory Subsystem Overview](#).

**Figure 15-52. GPMC Overview**

### 15.4.2 GPMC Environment

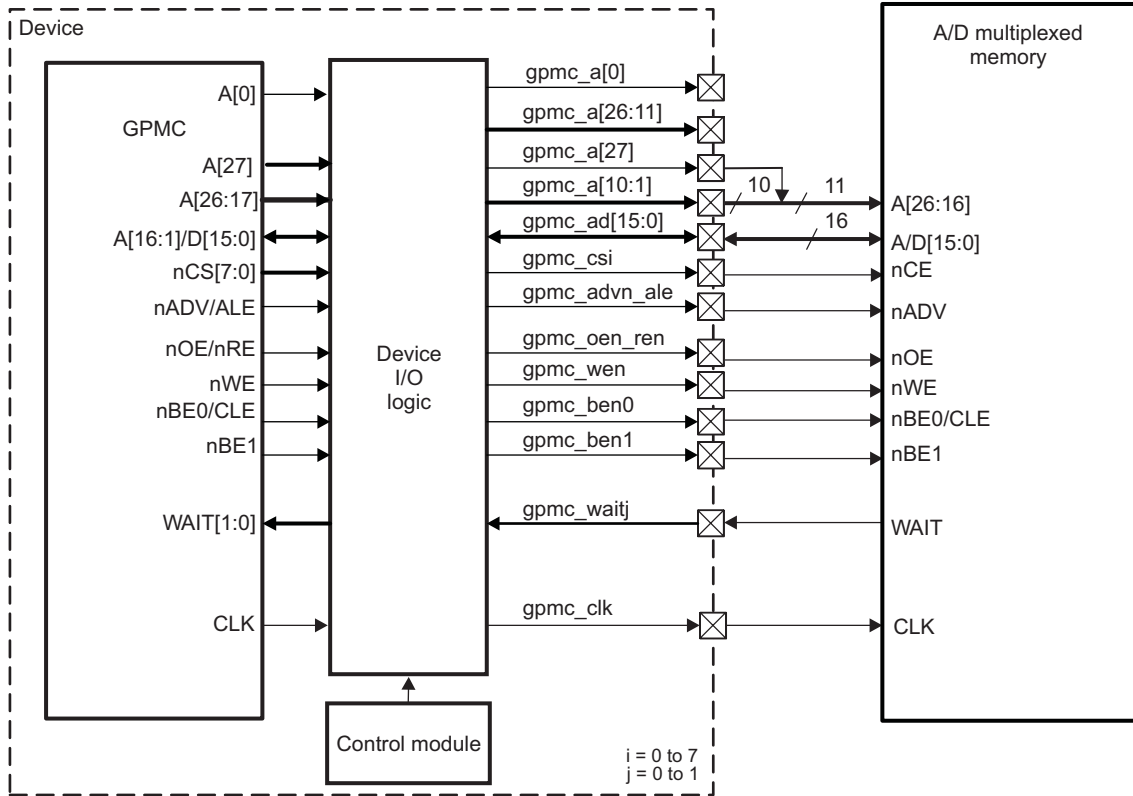

This section describes the GPMC application fields from an environment point of view (external connections). It describes GPMC connectivity options, and gives three possible interfaces.

#### 15.4.2.1 GPMC Modes

This section shows three GPMC external connections options:

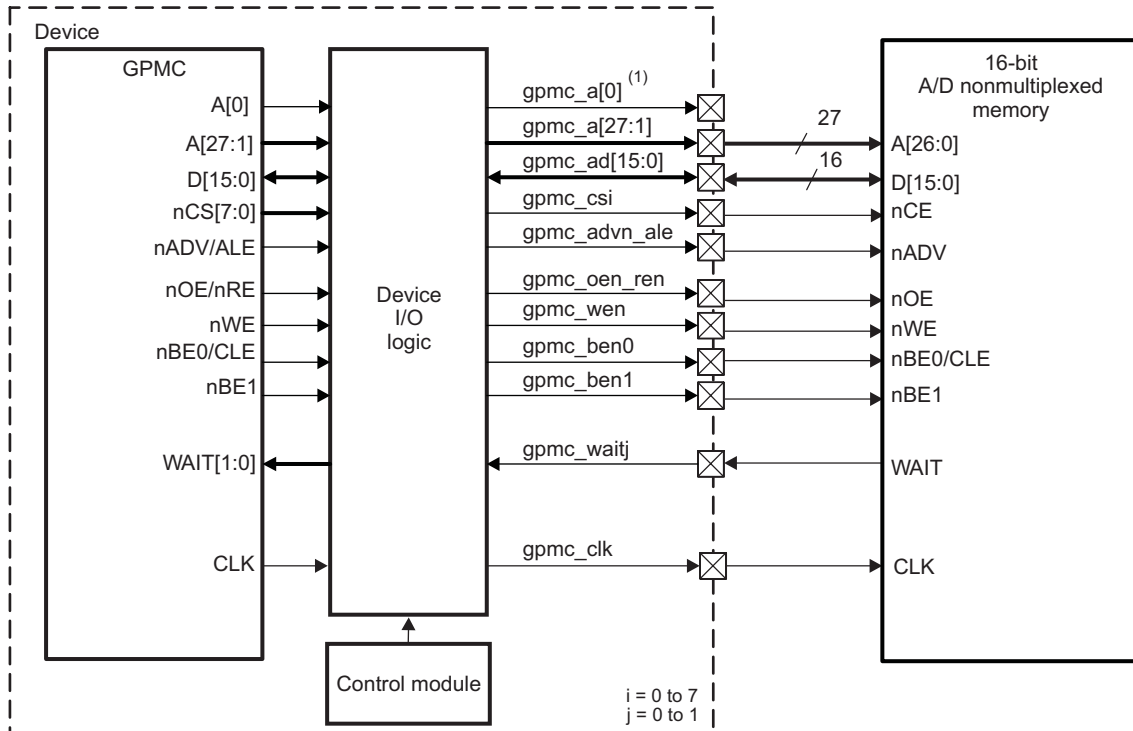

- [Figure 15-53](#) shows a connection between the GPMC and a 16-bit synchronous address/data-multiplexed (or AAD-multiplexed, but this protocol uses fewer address pins) external memory device.
- [Figure 15-54](#) shows a connection between the GPMC and a 16-bit synchronous nonmultiplexed external memory device.
- [Figure 15-55](#) shows a connection between the GPMC and an 8-bit synchronous non-multiplexed external memory device.
- [Figure 15-56](#) shows a connection between the GPMC and a 8-bit NAND device.

Figure 15-53. GPMC to 16-Bit Address/Data-Multiplexed Memory

gpmc-002

Figure 15-54. GPMC to 16-Bit Nonmultiplexed Memory

Note (1): the gpmc\_a[0] pin is not used with 16-bit memory devices

gpmc-045

Figure 15-55. GPMC to 8-Bit Nonmultiplexed Memory

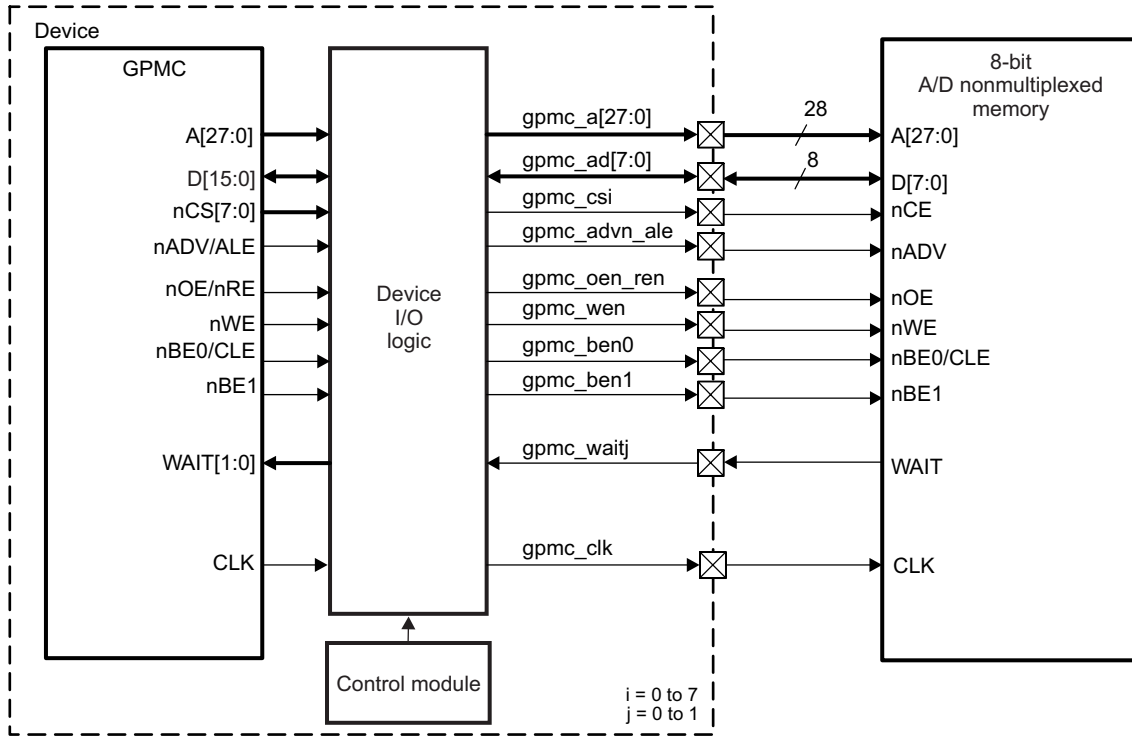

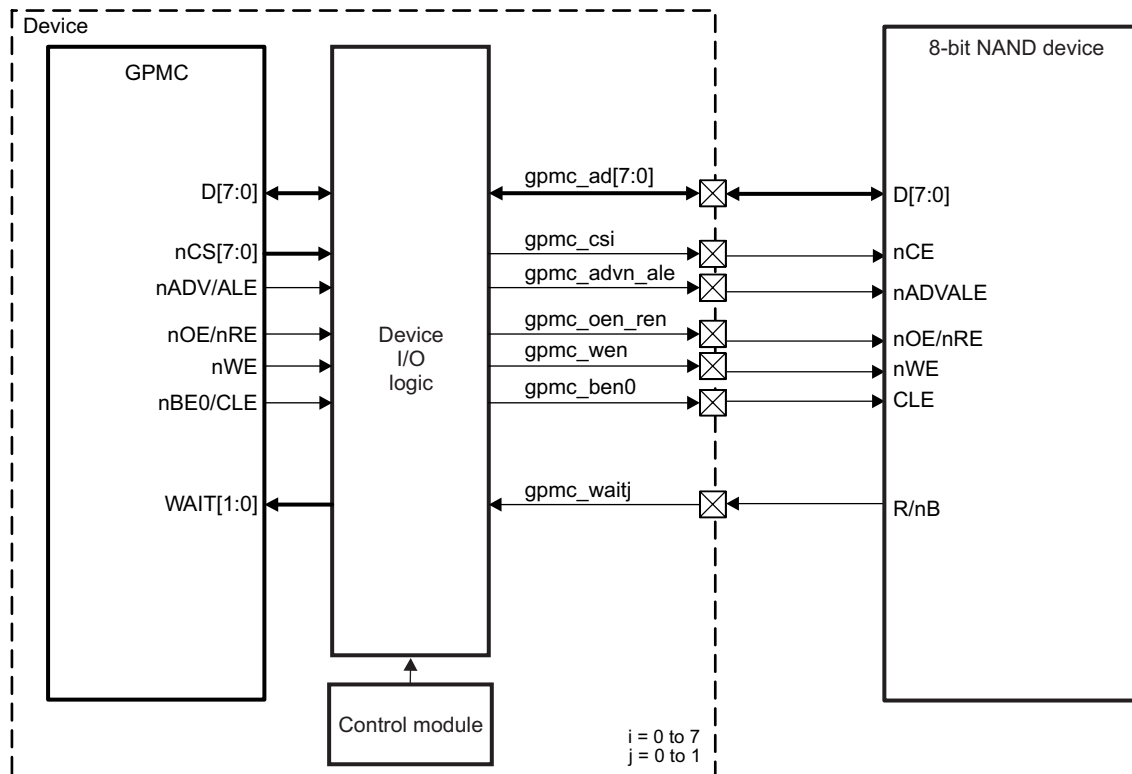

Figure 15-56. GPMC to 8-Bit NAND Device

### 15.4.2.2 GPMC Signals

Table 15-444 lists the GPMC subsystem input/output (I/O) pins.

**Table 15-444. GPMC I/O Description**

Pin Name	Device Signal	I/O <sup>(1)</sup>	Description
A[27:0]	gpmc_a[27:0]	O	28-bit output address bus
A[16:1]/D[15:0]	gpmc_ad[15:0]	I/O	Multiplexed address/data
nCS[7:0]	gpmc_cs[7:0]	O	Chip-selects (active low)
CLK	gpmc_clk	O	Clock generated for the external memory or device
nADV/ALE	gpmc_advn_ale	O	Address valid (active low). Also used as address latch enable (active high) for NAND protocol memories.
nOE/nRE	gpmc_oen_ren	O	Output enable (active low). Also used as read enable (active low) for NAND protocol memories.
nWE	gpmc_wen	O	Write enable (active low)
nBE0/CLE	gpmc_ben0	O	Lower-byte enable (active low). Also used as command latch enable for NAND protocol memories.
nBE1	gpmc_ben1	O	Upper-byte enable (active low).
WAIT[1:0]	gpmc_wait[1:0]	I	External wait signal for NOR and NAND protocol memories. The wait signals can be mapped on any of the chip-select.

<sup>(1)</sup> I = Input; O = Output

**NOTE:** For the gpmc\_clk signal to work properly, the INPUTENABLE bit of the appropriate CTRL\_CORE\_PAD\_x register should be set to 0x1 because of retiming purposes.

**NOTE:** On SR2.0 devices the internal PU/PD resistors on pads gpmc\_a[27:24, 22:19] can be permanently disabled. For more information, see [Section 18.4.6.1.1.1, Permanent PU/PD disabling \(SR 2.0 only\)](#) in [Chapter 18, Control Module](#).

Table 15-445 shows the use of address and data GPMC controller pins based on the type of external device.

gpmc_ad[0]	A1/D0	D0	D0	D0	D0

<sup>(1)</sup> Used to effectively address 8-bit (only) non-multiplexed memories

With all device types, the GPMC does not drive unnecessary address lines. They stay at their reset value of 0x00.

Address mapping supports address/data-multiplexed 16-bit-wide devices:

- The NOR flash memory controller still supports nonmultiplexed address and data memory devices.
- Multiplexing mode can be selected through the [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA bit field (where i = 0 to 7).
- Asynchronous page mode is not supported for multiplexed address and data devices.

### 15.4.3 GPMC Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

- No master standby protocol

- Supports slave idle protocol with device PRCM
- Supports Auto Idle
- No wake-up request
- One direct memory access request mapped via the device DMA crossbar (DMA\_CROSSBAR) to all device integrated DMA controllers
- One interrupt request mapped via the device interrupt crossbar (IRQ\_CROSSBAR) to all device integrated interrupt controllers (MPU\_INTC, etc.)
- One clock for functional and interface domains

Figure 15-57 shows GPMC integration.

Figure 15-57. GPMC Integration

gpmc-004

Table 15-446, Table 15-447 and Table 15-448 summarize the integration of the module in the device.

**Table 15-446. GPMC Integration Attributes**

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
GPMC	PD_COREAON	No	L3_MAIN

**NOTE:**

- For the description of the operation performance point (OPP) configuration, see [Section 3.1.1.1.2, Module Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For information about frequencies associated with each OPP, see the device data manual.

**Table 15-447. GPMC Clocks and Resets**

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPMC	GPMC_FCLK	L3MAIN1_L3_GICLK	PRCM	Functional clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
GPMC	GPMC_RST	CORE_RET_RST	PRCM	GPMC reset

**NOTE:** For the clock description, see [Section 15.4.4.2, GPMC Clock Configuration](#).

**Table 15-448. GPMC Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
GPMC	GPMC_IRQ	IRQ_CROSSBAR_15	MPU_IRQ_20 DSP1_IRQ_46 DSP2_IRQ_46	GPMC interrupt

DMA Requests				
Module Instance	Source Signal Name	Destination DMA_CROSSBAR Input	Default Mapping	Description
GPMC	GPMC_DREQ	DMA_CROSSBAR_4	DMA_EDMA_DREQ_3 DMA_SYSTEM_DREQ_3	DMA request from GPMC prefetch engine.

**NOTE:** The “**Default Mapping**” column in [Table 15-448 GPMC Hardware Requests](#) shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the IRQ\_CROSSBAR and DMA\_CROSSBAR modules, respectively. For more information about the IRQ\_CROSSBAR module, see [Section 18.4.6.4, IRQ\\_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#). For more information about the DMA\_CROSSBAR module, see [Section 18.4.6.5, DMA\\_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#). For more information about the device interrupt controllers, see [Chapter 17, Interrupt Controllers](#). For more information about the device DMA\_SYSTEM module, see [Section 16.1, System DMA](#). For more information about the device EDMA module, see [Section 16.2, Enhanced DMA](#).

**NOTE:** For the description of the interrupt source, see [Section 15.4.4.5, GPMC Interrupt Requests](#).

### 15.4.4 GPMC Functional Description

The GPMC basic programming model offers maximum flexibility to support various access protocols for each of the eight configurable chip-selects. Use optimal chip-select settings, based on the characteristics of the external device:

- Different protocols can be selected to support generic asynchronous or synchronous random-access devices (NOR flash, SRAM) or to support specific NAND devices.
- The address and data bus can be multiplexed on the same external bus.
- Read and write access can be independently defined as asynchronous or synchronous.
- System requests (byte, 16-bit word, burst) are performed through single or multiple accesses. External access profiles (single, multiple with optimized burst length, native- or emulated-wrap) are based on external device characteristics (supported protocol, bus width, data buffer size, native-wrap support).
- System burst read or write requests are synchronous-burst (multiple-read or multiple-write). When neither burst nor page mode is supported by external memory or ASIC devices, system burst read or write requests are translated to successive single synchronous or asynchronous accesses (single reads or single writes). 8-bit wide devices are supported only in single synchronous or single asynchronous read or write mode.
- To simulate a programmable internal-wait-state, an external wait pin can be monitored to dynamically control external access at the beginning (initial access time) of and during a burst access.

Each control signal is controlled independently for each chip-select. The internal functional clock of the GPMC (GPMC\_FCLK) is used as a time reference to specify the following:

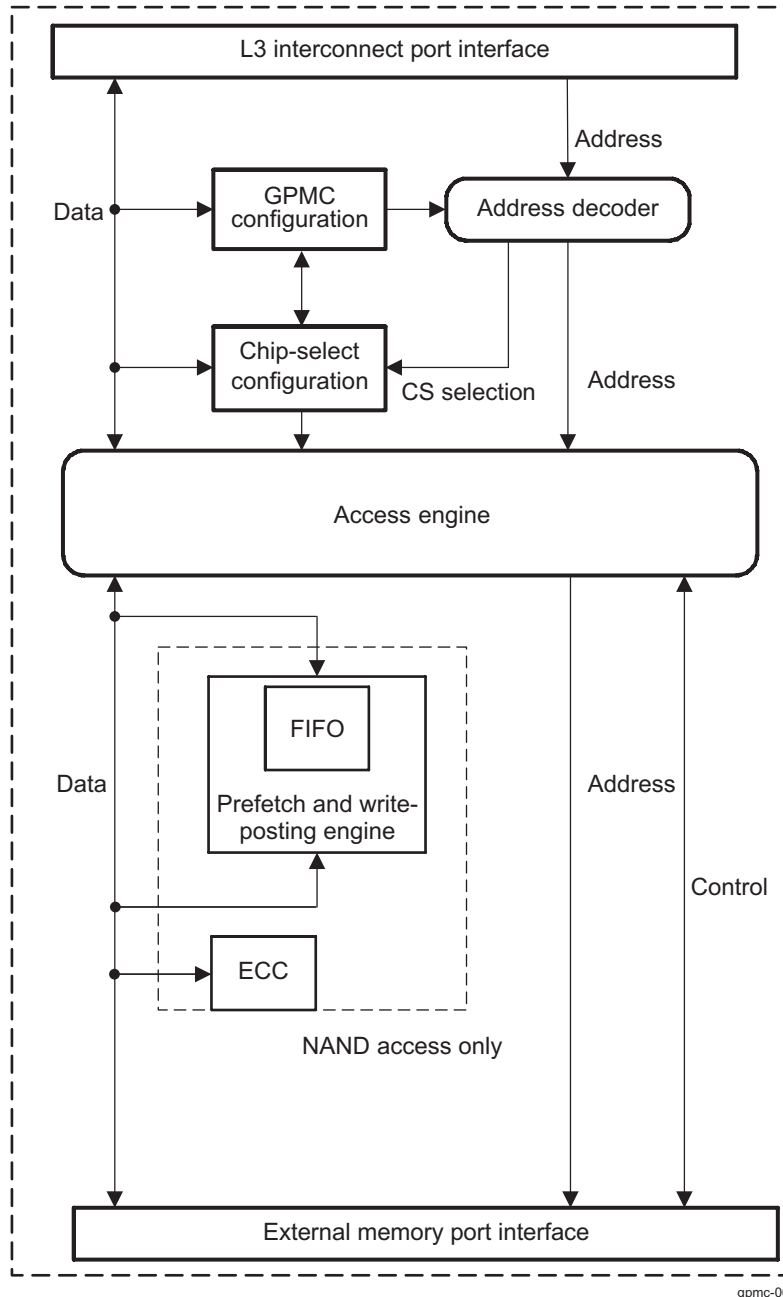

- Read- and write-access duration
- Most GPMC external interface control-signal assertion and deassertion times
- Data-capture time during read access
- External wait-pin monitoring time
- Duration of idle time between accesses, when required

#### 15.4.4.1 GPMC Block Diagram

[Figure 15-58](#) shows the GPMC functional block diagram. The GPMC consists of six blocks:

- L3 interconnect port interface
- Address decoder, GPMC configuration, and chip-select configuration register file
- Access engine
- Prefetch and write-posting engine
- Error correction code engine (ECC)
- External device/memory port interface

Figure 15-58. GPMC Block Diagram

gpmc-005

The GPMC can access various external devices. The flexible programming model allows a wide range of attached device types and access schemes.

Based on the programmed configuration bit fields stored in the GPMC registers, the GPMC can generate the timing of all control signals depending on the attached device and access type.

Given the chip-select decoding and its associated configuration registers, the GPMC selects the appropriate control signal timing for the device type.

#### 15.4.4.2 GPMC Clock Configuration

Table 15-449 describes the GPMC clocks.

**Table 15-449. GPMC Clocks**

Signal	I/O <sup>(1)</sup>	Description
GPMC_FCLK	I	Functional and interface clock
gpmc_clk	O	External clock provided to synchronous external memory devices

<sup>(1)</sup> I = Input; O = Output

The gpmc\_clk is generated by the GPMC from the internal GPMC\_FCLK clock. The source of the GPMC\_FCLK is described in [Table 15-447](#). The gpmc\_clk is configured using the [GPMC\\_CONFIG1\\_i\[1:0\]](#) GPMCFCLKDIVIDER bit field (where i = 0 to 7), as shown in [Table 15-450](#).

**Table 15-450. gpmc\_clk Configuration**

Source Clock	<a href="#">GPMC_CONFIG1_i[1:0]</a> GPMCFCLKDIVIDER	gpmc_clk Generated Clock Provided to External Memory Device
GPMC_FCLK	00	GPMC_FCLK
	01	GPMC_FCLK/2
	10	GPMC_FCLK/3
	11	GPMC_FCLK/4

### 15.4.4.3 GPMC Software Reset

The GPMC can be reset by software through the [GPMC\\_SYSCONFIG\[1\]](#) SOFTRESET bit. Setting the bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Hardware and software resets initialize all GPMC registers and the finite state-machine (FSM) immediately and unconditionally. The [GPMC\\_SYSSTATUS\[0\]](#) RESETDONE bit indicates that the software reset is complete when its value is 1. Software must ensure that the software reset completes before performing GPMC operations.

### 15.4.4.4 GPMC Power Management

GPMC power is supplied by the CORE power domain, and GPMC power management complies with system power-management guidelines.

[Table 15-451](#) describes the power-management features available for the GPMC module.

**NOTE:**

- For information about source clock gating and sleep/wake-up transitions, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of the EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.6, Clock Management Functional Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).

**Table 15-451. GPMC Local Power-Management Features**

Feature	Registers	Description
Clock autogating	<a href="#">GPMC_SYSCONFIG[0]</a> AUTOIDLE	This bit allows a local power optimization inside the module, by gating the GPMC_FCLK clock upon the internal activity.
Slave idle modes	<a href="#">GPMC_SYSCONFIG[4:3]</a> SIDLEMODE	Force-idle, no-idle and smart-idle wake-up modes are available.
Clock activity	N/A	Feature not available
Master standby modes	N/A	Feature not available
Global wake-up enable	N/A	Feature not available
Wake-up sources enable	N/A	Feature not available

### 15.4.4.5 GPMC Interrupt Requests

The GPMC generates one interrupt request (see [Figure 15-57](#)).

[Table 15-452](#) lists the event flags, and their mask, that can cause module interrupts.

**Table 15-452. GPMC Interrupt Events**

Event Flag	Event Mask	Sensitivity	Description
<a href="#">GPMC_IRQSTATUS</a> [9] WAIT1EDGE DETECTIONSTATUS	<a href="#">GPMC_IRQENABLE</a> [9] WAIT1EDGE DETECTIONENABLE	Edge	Wait1 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait1 signal. The rising or falling edge detection of Wait1 is selected through the <a href="#">GPMC_CONFIG</a> [9] WAIT1PINPOLARITY bit.
<a href="#">GPMC_IRQSTATUS</a> [8] WAIT0EDGE DETECTIONSTATUS	<a href="#">GPMC_IRQENABLE</a> [8] WAIT0EDGE DETECTIONENABLE	Edge	Wait0 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait0 signal. The rising or falling edge detection of Wait0 is selected through the <a href="#">GPMC_CONFIG</a> [8] WAIT0PINPOLARITY bit.
<a href="#">GPMC_IRQSTATUS</a> [1] TERMINAL COUNTSTATUS	<a href="#">GPMC_IRQENABLE</a> [1] TERMINAL COUNTENABLE	Level	Terminal count event: Triggered on prefetch process completion; that is, when the number of currently remaining data to be requested reaches 0
<a href="#">GPMC_IRQSTATUS</a> [0] FIFOEVENTSTATUS	<a href="#">GPMC_IRQENABLE</a> [0] FIFOEVENTENABLE	Level	FIFO event interrupt: Indicates available FIFO levels for write-posting mode and prefetch mode. <a href="#">GPMC_PREFETCH_CONFIG1</a> [2] DMAMODE must be set to 0.

### 15.4.4.6 L3 Interconnect Interface

The GPMC L3 interconnect interface is a pipelined interface including a 16 × 32-bit word write buffer.

Any system host can issue external access requests through the GPMC.

The device system can issue the following requests through this interface:

- One 8-, 16-, or 32-bit interconnect access (read/write)
- Two incrementing 32-bit interconnect accesses (read/write)
- Two wrapped 32-bit interconnect accesses (read/write)
- Four incrementing 32-bit interconnect accesses (read/write)
- Four wrapped 32-bit interconnect accesses (read/write)
- Eight incrementing 32-bit interconnect accesses (read/write)
- Eight wrapped 32-bit interconnect accesses (read/write)

Only linear burst transactions are supported; interleaved burst transactions are not supported. Only power-of-two-length precise bursts 2 × 32, 4 × 32, 8 × 32, and 16 × 32, with the burst base address aligned on the total burst size, are supported (this limitation applies to incrementing bursts only).

This interface also provides one interrupt and one DMA request line for specific event control.

It is recommended to program the [GPMC\\_CONFIG1\\_i](#)[24:23] ATTACHEDDEVICEPAGELENGTH bit field according to the page length of the effective attached device and to enable the [GPMC\\_CONFIG1\\_i](#)[31] WRAPBURST bit if the attached device supports wrapping burst.

It is possible, however, to emulate wrapping burst on a nonwrapping memory by providing relevant addresses within the page or by splitting transactions. Bursts larger than the memory page length are chopped into multiple burst transactions. Because of the alignment requirements, a page boundary is never crossed.

### 15.4.4.7 GPMC Address and Data Bus

The current application supports GPMC connection to NAND devices and to address/data-multiplexed memories or devices. Connection to address/data-nonmultiplexed memories or devices is supported with an address range up to 256 MB (that is, 28 address bits in 8-bit mode or 27 address bits in 16-bit mode).

Depending on the GPMC configuration of each chip-select, address and data bus lines that are not required for a particular access protocol are not updated (changed from current value) and are not sampled when input (input data bus).

- For address/data-multiplexed and AAD-multiplexed NOR devices, the address is multiplexed on the data bus.
- 8-bit-wide NOR devices do not use GPMC I/O: gpmc\_ad[15:8] for data (they are used for address if needed).
- 16-bit-wide NAND devices do not use GPMC I/O: gpmc\_a[27:0].
- 8-bit-wide NAND devices do not use GPMC I/O: gpmc\_a[27:0] and GPMC I/O: gpmc\_ad[15:8].

#### 15.4.4.7.1 GPMC I/O Configuration Setting

---

**NOTE:** In this section and the following sections, the *i* in GPMC\_CONFIGx\_i stands for the GPMC chip-select *i*, where *i* = 0 to 7.

---

To select a NAND device, program the following register fields:

- [GPMC\\_CONFIG1\\_i\[11:10\]](#) DEVICETYPE = 0b10
- [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA = 0b00

To select an address/data-multiplexed device, program the following register fields:

- [GPMC\\_CONFIG1\\_i\[11:10\]](#) DEVICETYPE = 0b00
- [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA = 0b10

To select an address/address/data-multiplexed device, program the following register fields:

- [GPMC\\_CONFIG1\\_i\[11:10\]](#) DEVICETYPE = 0b00
- [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA = 0b01

To select an address/data-nonmultiplexed device, program the following register fields:

- [GPMC\\_CONFIG1\\_i\[11:10\]](#) DEVICETYPE = 0b00
- [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA = 0b00

#### 15.4.4.7.2 GPMC CS0 Default Configuration at Device Reset

To ensure a correct, fast external boot (see [Section 32.3.6, Fast External Booting](#), in [Chapter 32, Initialization](#)) with a GPMC access on device reset, several pins are sampled:

- The "sysboot0" through "sysboot5" pins (device boundary) define the sequence of interfaces and devices to use for booting (i.e. SYSBOOT[5:0] vector). They are sampled by the control module at reset and used later by the device ROM code. For more information, see [Section 32.2.4, Sysboot Configuration](#), in [Chapter 32, Initialization](#).
- Additional pins are used to configure reset values in the [GPMC\\_CONFIG1\\_i](#) register (where *i* = 0) as explained in the following and in [Table 15-453](#):
  - The *bootdevicesize* input pin (at the GPMC boundary) defines the size of the attached device on chip-select 0 (CS0) and is used to configure the [GPMC\\_CONFIG1\\_i\[13:12\]](#) DEVICEMEMORYSIZE bit field (where *i* = 0). The BOOT\_DEVICE\_SIZE signal is propagated from the device Control Module. Its value 0b0 (8-bit memories) or 0b1 (16-bit memories) can be externally determined upon booting by **user hardware** via the device external input signal - "sysboot13".
  - The *cs0muxdevice* input pin (at the GPMC boundary) selects whether or not the device attached to CS0 is an address/data-multiplexed device. The input pin is used to configure the [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA bit field (where *i* = 0). The CS0\_MUX\_DEVICE[1:0] signal is propagated from the Control Module. Its value 0x0 (**non-muxed memory attached**) or 0x2 (**Addr-Data Mux memory attached**) can be externally determined upon booting by **user hardware** via combining the device external input signals - "sysboot12" and "sysboot11", i.e. SYSBOOT[12:11].
  - The *bootwaiten* input pin (at the GPMC boundary) enables the monitoring on CS0 of the wait pin at device reset release time for read accesses. The input pin is used to configure the

**GPMC\_CONFIG1\_i[22]** WAITREADMONITORING bit (where  $i = 0$ ). The **BOOT\_WAIT\_EN** signal is propagated from the Control Module. Its value 0x0 (**wait pin is not monitored for read accesses**) or 0x1 (**wait pin is monitored for read accesses**) can be externally determined upon booting by **user hardware** via the device external input signal - "sysboot10".

**NOTE:** If WAIT pin monitoring function is enabled upon booting (i.e. **BOOT\_WAIT\_EN="1"**), the default (power-on-reset) monitored input for CS0 is always the device **gpmc\_wait0** input.

**Table 15-453. Boot Control Interface Input Signals Description**

Signal Name	Width	Description
BOOT_DEVICE_SIZE	1	Size of the device attached on CS0 0b00: 8-bit 0b01: 16-bit 0b10: Reserved (not used) 0b11: Reserved (not used)
CS0_MUX_DEVICE	2	Multiplexing mode of the device on CS0 0b00: Nonmultiplexed device on CS0 0b01: AAD-multiplexed device on CS0 (address-address-data) 0b10: Address/data-multiplexed device on CS0 0b11: Reserved
BOOT_WAIT_EN	1	Wait monitoring on CS0 at device reset release time for read accesses 0: Wait pin is not monitored 1: Wait pin is monitored

#### CAUTION

Using the internal boot code, the entire CS0 configuration can be modified before the first CS0 access. For more information, see [Section 32.3.7, Memory Booting](#), and [Section 32.3.8, Image Format](#), in [Chapter 32, Initialization](#). This modification of internal boot code is necessary for two external devices:

- NAND device attached to CS0
- Nonmultiplexed memory device attached to CS0

At reset time, the device can boot from the internal ROM.

The reset values of the timing control parameters are defined to cope with direct boot on address and data-multiplexed NOR flash devices, nonmultiplexed NOR flash devices, or any asynchronous device with large timing margins, assuming a low GPMC\_FCLK frequency (for example, 19.2 MHz) at boot time.

For a multiplexed access, the address 16 low-order bits are presented onto **gpmc\_ad[15:0]**, while the high-order bits are presented onto **gpmc\_a[26:16]**. If the external chip interface to the memories uses a 16-bit data bus, the high-order address bits are sampled on the address bus.

The reset values of timing parameters used at boot time are:

- CSONTIME = 1
- CSRDOFFTIME = 16
- ADVONTIME = 4
- ADVRDOFFTIME = 5
- OEONTIME = 6
- OEOFFTIME = 16
- RDACCESSTIME = 15
- RDCYCLETIME = 17

For an AAD-multiplexed access, all address bits are passed onto the data bus using two nADV rising edges. The first rising edge latches the address most-significant bit (MSB) down to bit 17, while the second rising edge latches address bits 16 down to 1. This configuration is only used for 16-bit memories.

The reset values of these timing parameters used at boot time are:

- ADVAADMUXONTIME = 1
- ADVAADMUXRDOFFTIME = 2
- OEADMUXONTIME = 1
- OEADMUXOFFTIME = 3

#### 15.4.4.8 Address Decoder and Chip-Select Configuration

Addresses are decoded accordingly with the address request of the chip-select and the content of the chip-select base address register file, which includes a set of global GPMC configuration registers and eight sets of chip-select configuration registers.

The GPMC configuration register file is memory-mapped and can be read or written with byte, 16-bit word, or 32-bit word accesses. The register file must be configured as a noncacheable, nonbufferable region to prevent any desynchronization between host execution (write request) and the completion of register configuration (write completed with register updated). [Section 15.4.7](#), *GPMC Register Manual*, provides the GPMC register locations. For the map of GPMC memory locations, see [Chapter 2](#), *Memory Mapping*.

After the chip-select is configured, the access engine accesses the external device, drives the external interface control signals, and applies the interface protocol based on user-defined timing parameters and settings.

##### 15.4.4.8.1 Chip-Select Base Address and Region Size

Any external memory or ASIC device attached to the GPMC external interface can be accessed by any device system host within the GPMC 512-MiB address space. For more information, see [Chapter 2](#), *Memory Mapping*.

---

**NOTE:** Even though GPMC supports total address space of 1GB, only 512MB are physically available in this device.

---

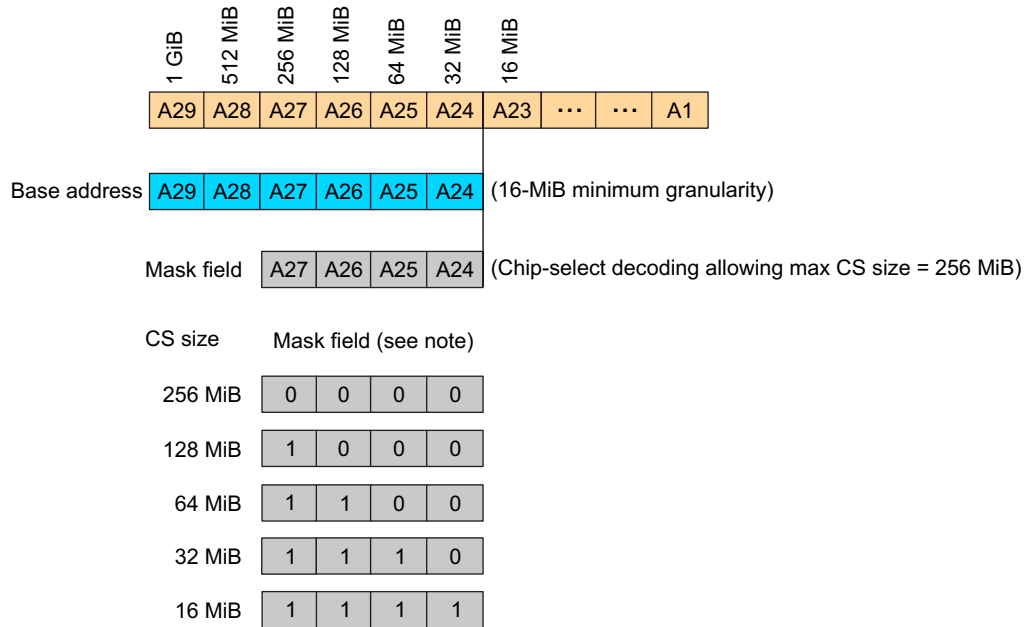

The GPMC 512-MiB address space can be divided into a maximum of eight chip-select regions with programmable base address and programmable chip-select size. The chip-select size is programmable from 16 MiB to 256 MiB (must be a power-of-two) and is defined by the mask field. Attached memory smaller than the programmed chip-select region size is accessed through the entire chip-select region (aliasing).

Each chip-select has a 6-bit base address encoding and 4-bit decoding mask, which must be programmed according to the following rules:

- The programmed chip-select region base address must be aligned on the chip-select region size address boundary and is limited to a power-of-two address value. During access decoding, the value of the register base address is used to compare the address with the address bit line mapping, as shown in [Figure 15-59](#) (with A0 as the device system byte-address line). The base address is programmed through the `GPMC_CONFIG7_i[5:0] BASEADDRESS` bit field.
- The register mask is used to exclude some address lines from the decoding. A register mask bit field set to 0 suppresses the associated address line from the address comparison (incoming address bit line is don't care). The value of the register mask must be limited to the subsequent value, based on the desired chip-select region size. Any other value has an undefined result. When multiple chip-select regions with overlapping addresses are enabled concurrently, access to these chip-select regions is cancelled and a GPMC access error is posted. The mask field is programmed through the `GPMC_CONFIG7_i[11:8] MASKADDRESS` bit field.

**Figure 15-59. Chip-Select Address Mapping and Decoding Mask**

gpmc-006

Following is an example mapping that divides the 512MB memory reach into two 256MB regions:

- 1<sup>st</sup> 256MB region – 0x0000 0000 to 0x0FFF FFFF – program base address for that chip select equal to 0x0
- 2<sup>nd</sup> 256MB region – 0x1000 0000 to 0x1FFF FFFF – program base address for that chip select equal to 0x10

Chip-select configuration (base and mask address or any protocol and timing settings) must be performed while the associated chip-select is disabled through the `GPMC_CONFIG7_i[6]` CSVALID bit (where i stands for the GPMC chip-select value, 0 to 7). In addition, a chip-select configuration can be disabled only if there is no ongoing access to that chip-select. This requires monitoring the activity of the prefetch or write-posting engine if the engine is active on the chip-select. Also, the write buffer state must be monitored to wait for any posted write completion to the chip-select.

Any access attempted to a nonvalid GPMC address region (CSVALID disabled or address decoding outside a valid chip-select region) is not propagated to the external interface and a GPMC access error is posted. In case of overlapping chip-selects, an error is generated and no access occurs on either chip-select.

CS0 is the only chip-select region enabled after a power up or GPMC reset.

**CAUTION**

Although the GPMC interface can drive up to eight chip-selects, the frequency specified for this interface is for a specific load. If this load is exceeded, the maximum frequency cannot be reached. One solution is to implement a board with buffers to allow the slowest device to maintain the total load on the lines.

**15.4.4.8.2 Access Protocol**

**15.4.4.8.2.1 Supported Devices**

The access protocol of each chip-select can be independently specified through the `GPMC_CONFIG1_i[11:10]` DEVICETYPE parameter (where i = 0 to 7) for:

- Random-access synchronous or asynchronous memory, such as NOR flash and SRAM

- NAND flash asynchronous devices

---

**NOTE:** For more information about the NAND flash GPMC basic programming model and NAND support, see [Section 15.4.4.12, NAND Device Basic Programming Model](#), and [Section 15.4.4.12.1, NAND Memory Device in Byte or Word16 Stream Mode](#).

---

#### 15.4.4.8.2.2 Access Size Adaptation and Device Width

Each chip-select can be independently configured through the [GPMC\\_CONFIG1\\_i\[13:12\]](#) DEVICESIZE bit field (where  $i = 0$  to  $7$ ) to interface with a 16- or 8-bit-wide device. System requests with data width greater than the external device data bus width are split into successive accesses according to the external device data-bus width and little-endian data organization.

#### 15.4.4.8.2.3 Address/Data-Multiplexing Interface

For random synchronous or asynchronous memory interfacing (DEVICETYPE = 0b00), an address- and data-multiplexing protocol can be selected through the [GPMC\\_CONFIG1\\_i\[9:8\]](#) MUXADDDATA bit field (where  $i = 0$  to  $7$ ). The nADV signal must be used as the external device address latch control signal. For the associated chip-select configuration, nADV assertion and deassertion time and nOE assertion time must be set to the appropriate value to meet the address latch setup/hold time requirements of the external device. See [Section 15.4.3, GPMC Integration](#).

---

**NOTE:** This address/data-multiplexing interface is not applicable to NAND device interfacing. NAND devices require a specific address, command, and data-multiplexing protocol. See [Section 15.4.4.12, NAND Device Basic Programming Model](#).

---

#### 15.4.4.8.3 External Signals

---

**NOTE:** The "DIR" (direction control) output signal is NOT pinned out on any of the device pads. It is an internal signal only representing a signal direction on the GPMC data bus.

---

#### 15.4.4.8.3.1 Wait Pin Monitoring Control

GPMC access time can be dynamically controlled using an external gpmc\_wait pin when the external device access time is not deterministic and cannot be defined and controlled using only the GPMC internal RDACCESSTIME, WRACCESSTIME, and PAGEBURSTACCESSTIME wait-state generator.

The GPMC features two input wait pins: gpmc\_wait1, and gpmc\_wait0. These pins allow control of external devices with different wait pin polarity. They also allow the overlap of wait pin assertion from different devices without affecting access to devices for which the wait pin is not asserted.

- The [GPMC\\_CONFIG1\\_i\[17:16\]](#) WAITPINSELECT bit field (where  $i = 0$  to  $7$ ) selects which input gpmc\_wait pin is used for the device attached to the corresponding chip-select.
- The polarity of the wait pin is defined through the WAITxPINPOLARITY bit of the [GPMC\\_CONFIG](#) register. A wait pin configured to be active low means that low level on the WAIT signal indicates that the data is not ready and that the data bus is invalid. When a wait pin is inactive, data is valid.

The GPMC access engine can be configured per chip-select to monitor or not the wait pin of the external memory device, based on the access type: read or write.

- The [GPMC\\_CONFIG1\\_i\[22\]](#) WAITREADMONITORING bit defines whether or not the wait pin must be monitored during read accesses.
- The [GPMC\\_CONFIG1\\_i\[21\]](#) WAITWRITEMONITORING bit defines whether or not the wait pin must be monitored during write accesses.

The GPMC access engine can be configured to monitor the wait pin of the external memory device asynchronously or synchronously with the GPMC\_CLK clock, depending on the access type: synchronous or asynchronous (the [GPMC\\_CONFIG1\\_i\[29\]](#) READTYPE and [GPMC\\_CONFIG1\\_i\[27\]](#) WRITETYPE bits).

#### 15.4.4.8.3.1.1 Wait Monitoring During Asynchronous Read Access

When wait pin monitoring is enabled for read accesses (WAITREADMONITORING), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the wait-deasserted state.

During asynchronous read accesses with wait pin monitoring enabled, the wait pin must be at a valid level (asserted or deasserted) for at least two GPMC clock cycles before RDACCESSTIME completes, to ensure correct dynamic access-time control through wait pin monitoring. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

In this context, RDACCESSTIME is used as a wait invalid timing window and is set to such a value that the wait pin is at a valid state two GPMC clock cycles before RDACCESSTIME completes.

Similarly, during a multiple-access cycle (for example, asynchronous read page mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-deasserted state. Wait monitoring pipelining is also applicable to multiple accesses (access within a page).

- Wait monitored as active freezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, wait monitored as asserted extends the current access time in the page. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- Wait monitored as inactive unfreezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, wait monitored as inactive completes the current access time and starts the next access phase in the page. The data bus is considered valid, and data are captured during this clock cycle. In case of a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their related control timing value and according to the CYCLETIME counter status.

When a delay larger than two GPMC clocks must be observed between wait-pin deactivation time and data valid time (including the required GPMC and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data-capture time and the effective unlock of the CYCLETIME counter. This extra delay can be programmed in the [GPMC\\_CONFIG1\\_i\[19:18\]](#) WAITMONITORINGTIME bit field (where i = 0 to 7).

---

**NOTE:**

- The WAITMONITORINGTIME parameter does not delay the wait pin active or inactive detection, nor does it modify the two GPMC clocks pipelined detection delay.
  - This extra delay is expressed as a number of GPMC\_CLK clock cycles, even though the access is defined as asynchronous, and no GPMC\_CLK clock is provided to the external device. Still, because GPMCFCLKDIVIDER is used as a divider for the GPMC clock, it must be programmed to define the correct WAITMONITORINGTIME delay.
- 

Figure 15-60 shows wait behavior during an asynchronous single read access.

**Figure 15-60. Wait Behavior During an Asynchronous Single Read Access (GPMCFCLKDivider = 1)**

gpmc-008

**NOTE:** The WAIT signal is active low. [GPMC\\_CONFIG1\\_i\[19:18\] WAITMONITORINGTIME = 0b00](#), or [0b01](#).

#### 15.4.4.8.3.1.2 Wait Monitoring During Asynchronous Write Access

When wait pin monitoring is enabled for write accesses ([GPMC\\_CONFIG1\\_i\[21\] WAITWRITEMONITORING](#) bit = 0x1), the wait invalid timing window is defined by the WRACCESSTIME field. WRACCESSTIME must be set so that the wait pin is at a valid state two GPMC clock cycles before WRACCESSTIME completes. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

- Wait monitored as active freezes the CYCLETIME counter. This informs the GPMC that the data bus is not captured by the external device. The control signals are kept in their current state. The data bus still drives the data.
- Wait monitored as inactive unfreezes the CYCLETIME counter. This informs that the data bus is correctly captured by the external device. All signals, including the data bus, are controlled according to their related control timing value and to the CYCLETIME counter status.

When a delay larger than two GPMC clock cycles must be observed between wait-pin deassertion time and the effective data write into the external device (including the required GPMC data setup time and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data write time into the external device and the effective unfreezing of the CYCLETIME counter. This extra delay can be programmed in the [GPMC\\_CONFIG1\\_i\[19:18\]](#) WAITMONITORINGTIME bit field (where  $i = 0$  to 7).

---

**NOTE:**

- The WAITMONITORINGTIME parameter does not delay the wait pin assertion or deassertion detection, nor does it modify the two GPMC clock cycles pipelined detection delay.
  - This extra delay is expressed as a number of GPMC\_CLK clock cycles, even though the access is defined as asynchronous, and even though no clock is provided to the external device. Still, because the [GPMC\\_CONFIG1\\_i\[1:0\]](#) GPMCFCLKDIVIDER bit field is used as a divider for the GPMC clock, it must be programmed to define the correct WAITMONITORINGTIME delay.
- 

#### 15.4.4.8.3.1.3 Wait Monitoring During Synchronous Read Access

During synchronous accesses with wait pin monitoring enabled, the wait pin is captured synchronously with GPMC\_CLK, using the rising edge of this clock.

The WAIT signal can be programmed to apply to the same clock cycle in which it is captured. Alternatively, it can be sampled one or two GPMC\_CLK cycles ahead of the clock cycle to which it applies. This pipelining is applicable to the entire burst access and to all data phases in the burst access. This wait pipelining depth is programmed in the [GPMC\\_CONFIG1\\_i\[19:18\]](#) WAITMONITORINGTIME bit field (where  $i = 0$  to 7), and is expressed as a number of GPMC\_CLK clock cycles.

In synchronous mode, when wait pin monitoring is enabled (the [GPMC\\_CONFIG1\\_i\[22\]](#) WAITREADMONITORING bit), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the wait-deasserted state detection.

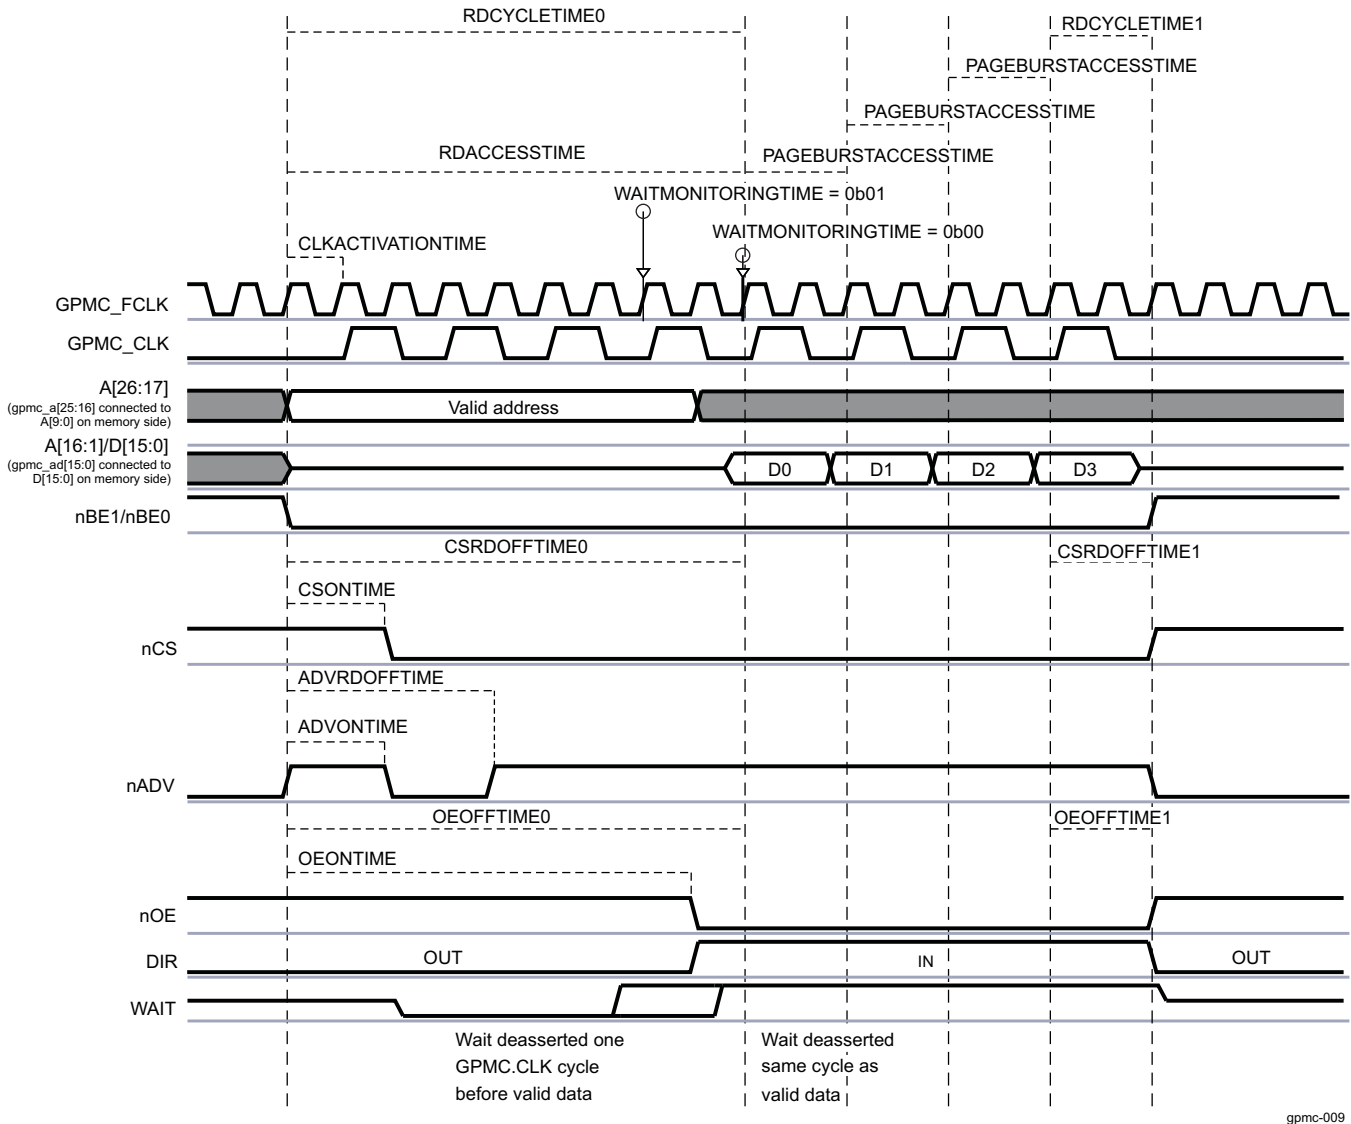

Depending on the programmed value of WAITMONITORINGTIME, the wait pin must be at a valid level, either asserted or deasserted:

- In the same clock cycle the data is valid if WAITMONITORINGTIME = 0 ( at RDACCESSTIME completion)
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC\_FCLK clock cycles before RDACCESSTIME completion if WAITMONITORINGTIME is not equal to 0

Similarly, during a multiple-access cycle (burst mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the WAIT-INACTIVE state. The wait pipelining-depth programming applies to the whole burst access.

- Wait monitored as active freezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in a lock state), wait monitored as active extends the current access time in the burst. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- Wait monitored as inactive unfreezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in lock state), wait monitored as inactive completes the current access time and starts the next access phase in the burst. The data bus is considered valid, and data are captured during this clock cycle. In a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their relative control timing value and the CYCLETIME counter status.

[Figure 15-61](#) shows wait behavior during a synchronous read burst access.

**Figure 15-61. Wait Behavior During a Synchronous Read Burst Access**

gpmc-009

**NOTE:** The WAIT signal is active low. WAITMONITORINGTIME = 00, 01.

#### 15.4.4.8.3.1.4 Wait Monitoring During Synchronous Write Access

During synchronous accesses with wait pin monitoring enabled (the WAITWRITEMONITORING bit), the wait pin is captured synchronously with GPMC\_CLK, using the rising edge of this clock.

If enabled, external wait pin monitoring can be used in combination with WRACCESSTIME to delay the GPMC\_CLK capture edge of the effective memory device.

Wait-monitoring pipelining depth is similar to synchronous read access:

- At WRACCESSTIME completion if WAITMONITORINGTIME = 0
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC\_FCLK cycles before WRACCESSTIME completion if WAITMONITORINGTIME is not equal to 0

Wait-monitoring pipelining definition applies to whole burst accesses:

- Wait monitored as active freezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, wait monitored as active indicates that the data

bus is not being captured by the external device. Control signals are kept in their current state. The data bus is kept in its current state.

- Wait monitored as inactive unfreezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, wait monitored as inactive indicates the effective data capture of the bus by the external device and starts the next access of the burst. In case of a single access or if this was the last access in a multiple access cycle, all signals, including the data bus, are controlled according to their related control timing value and the CYCLETIME counter status.

---

**NOTE:** Wait monitoring is supported for all configurations except [GPMC\\_CONFIG1\\_i\[19:18\]](#) WAITMONITORINGTIME = 0x0 (where i = 0 to 7) for write bursts with a clock divider of 1 or 2 (the [GPMC\\_CONFIG1\\_i\[1:0\]](#) GPMCFCLKDIVIDER bit field is equal to 0x0 or 0x1, respectively).

---

#### **15.4.4.8.3.1.5 Wait With NAND Device**

For information about the use of the wait pin for communication with a NAND flash external device, see [Section 15.4.4.12.2, NAND Device-Ready Pin](#).

#### **15.4.4.8.3.1.6 Idle Cycle Control Between Successive Accesses**

##### **15.4.4.8.3.1.6.1 Bus Turnaround (BUSTURNAROUND)**

To prevent data-bus contention, an access that follows a read access to a slow memory/device must be delayed (in other words, control the nCS/nOE deassertion to data bus in high-impedance delay).

The bus turnaround is a time-out counter starting after nCS or nOE deassertion time, whichever occurs first, and delays the next access start-cycle time. The counter is programmed through the [GPMC\\_CONFIG6\\_i\[3:0\]](#) BUSTURNAROUND bit field (where i = 0 to 7).

After a read access to a chip-select with a nonzero BUSTURNAROUND, the next access is delayed until the BUSTURNAROUND delay completes, if the next access is one of the following:

- A write access to any chip-select (the same or different chip-select from which the data was read)
- A read access to a different chip-select than the chip-select from which the data was read access
- A read or write access to a chip-select associated with an address/data-multiplexed device

---

**NOTE:** Bus keeping starts after bus turnaround completion so that DIR changes from IN to OUT after bus turnaround. The bus does not have enough time to go into high-impedance even though it can be driven with the same value before bus turnaround timing.

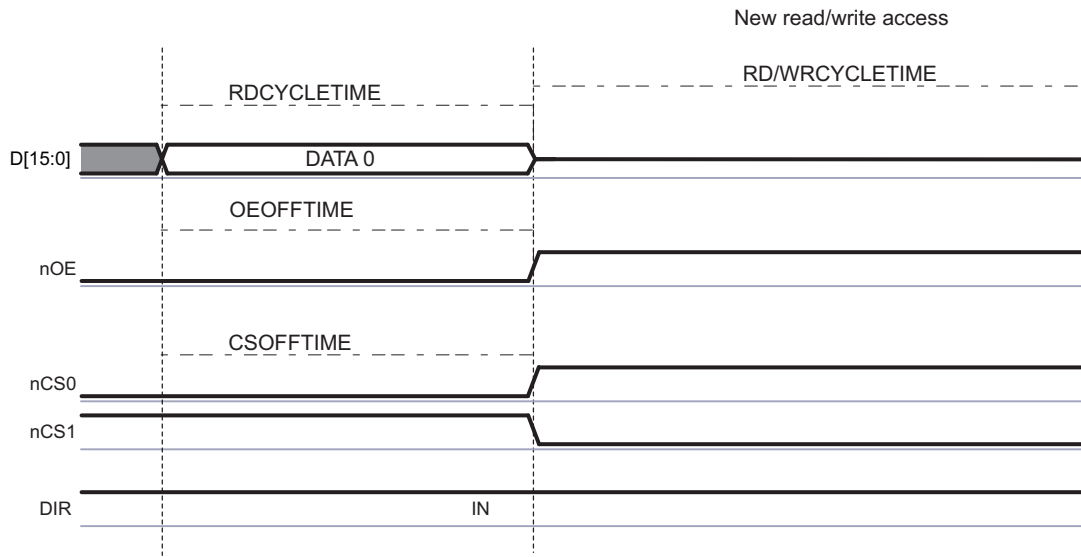

---

BUSTURNAROUND delay runs in parallel with [GPMC\\_CONFIG6\\_i\[3:0\]](#) CYCLE2CYCLEDELAY bit field delays. BUSTURNAROUND is a timing parameter for the ending chip-select access, while CYCLE2CYCLEDELAY is a timing parameter for the following chip-select access. The effective minimum delay between successive accesses is driven by these delay timing parameters and by the access type of the following access (see [Figure 15-62](#) through [Figure 15-64](#)).

Another way to prevent bus contention is to define an earlier nCS or nOE deassertion time for slow devices or to extend the value of RDCYCLETIME. Doing this prevents bus contention, but it also affects all accesses of this specific chip-select.

**Figure 15-62. Read-to-Read for an Address-Data Multiplexed Device, on Different Chip-Select, Without Bus Turnaround (nCS Attached to a Fast Device)**

gpmc-049

**Figure 15-63. Read- to-Read/Write for an Address-Data Multiplexed Device, on Different Chip-Select, With Bus Turnaround**

gpmc-050

**Figure 15-64. Read-to-Read/Write for a Address-Data or AAD-Multiplexed Device, on Same Chip-Select, With Bus Turnaround**

**15.4.4.8.3.1.6.2 Idle Cycles Between Accesses to Same Chip-Select (CYCLE2CYCLESAMECSSEN, CYCLE2CYCLEDELAY)**

Some devices require a minimum chip-select signal inactive time between accesses. The [GPMC\\_CONFIG6\\_i\[7\]](#) CYCLE2CYCLESAMECSSEN bit (where  $i = 0$  to 7) enables insertion of a minimum number of GPMC\_FCLK cycles, defined by the [GPMC\\_CONFIG6\\_i\[11:8\]](#) CYCLE2CYCLEDELAY bit field, between successive accesses of any type (read or write) to the same chip-select.

If CYCLE2CYCLESAMECSSEN is enabled, any subsequent access to the same chip-select is delayed until its CYCLE2CYCLEDELAY completes. The CYCLE2CYCLEDELAY counter starts when CSRDOFFTIME/CSWROFFTIME completes.

The same applies to successive accesses occurring during 32-bit word or burst accesses split into successive single accesses when the single-access mode is used ([GPMC\\_CONFIG1\\_i\[30\]](#) READMULTIPLE = 0 or [GPMC\\_CONFIG1\\_i\[28\]](#) WRITEMULTIPLE = 0).

All control signals (CS, ADV#/ALE, BE0#/CLE, WE#, and GPMC.CLK) are kept inactive (ADV#/ALE, BE0#/CLE, and GPMC.CLK at low level; and CS, OE#/RE, and WE at high level) during the idle GPMC.FCLK cycles. This prevents back-to-back accesses to the same chip-select without idle cycles between accesses.

**15.4.4.8.3.1.6.3 Idle Cycles Between Accesses to Different Chip-Select (CYCLE2CYCLEDIFFCSSEN, CYCLE2CYCLEDELAY)**

Because of the pipelined behavior of the system, successive accesses to different chip-selects can occur back-to-back with no idle cycles between accesses. Depending on the control signals (nCS, nADV/ALE, nBE0/CLE, nOE/RE, nWE) assertion and deassertion timing parameters and on the device timing parameters, the assertion times of some control signals may overlap between the successive accesses to a different chip-select. Similarly, some control signals (WE, OE/RE) may not respect required transition times.

To work around overlapping and to observe the required control-signal transitions, a minimum of CYCLE2CYCLEDELAY inactive cycles is inserted between the access being initiated to this chip-select and the previous access ending for a different chip-select. This applies to any type of access (read or write).

If the [GPMC\\_CONFIG6\\_i](#)[6] CYCLE2CYCLEDIFFCSEN bit is enabled, the chip-select access is delayed until CYCLE2CYCLEDELAY cycles have expired since the end of a previous access to a different chip-select. CYCLE2CYCLEDELAY count starts at CSRDOFFTIME/CSWROFFTIME completion. All control signals are kept inactive during the idle GPMC\_FCLK cycles.

**NOTE:** CYCLE2CYCLESAMECSEN and CYCLE2CYCLEDIFFCSEN must be set in the [GPMC\\_CONFIG6\\_i](#) registers to get idle cycles inserted between accesses on this chip-select and after accesses to a different chip-select, respectively.

The CYCLE2CYCLEDELAY delay runs in parallel with the BUSTURNAROUND delay. The BUSTURNAROUND is a timing parameter defined for the ending chip-select access, whereas CYCLE2CYCLEDELAY is a timing parameter defined for the starting chip-select access. The effective minimum delay between successive accesses is based on the larger delay timing parameter and on access type combination, because bus turnaround does not apply to all access types. For more information about bus turnaround, see [Section 15.4.4.8.3.1.6.1, Bus Turnaround \(BUSTURNAROUND\)](#).

[Table 15-454](#) describes the configuration required for idle cycle insertion.

**Table 15-454. Idle Cycle Insertion Configuration**

1st Access Type	BUSTURN AROUND Timing Parameter	Second Access Type	Chip-Select	Add/Data Multiplexed	CYCLE2 CYCLE SAMECSEN Parameter	CYCLE2 CYCLE DIFFCSEN Parameter	Idle Cycle Insertion Between the Two Accesses
R/W	= 0	R/W	Any	Any	0	x	No idle cycles are inserted if the two accesses are well pipelined.
R	> 0	R	Same	Nonmuxed	x	0	No idle cycles are inserted if the two accesses are well pipelined.
R	> 0	R	Different	Nonmuxed	0	0	BUSTURNAROUND cycles are inserted.
R	> 0	R/W	Any	Muxed	0	0	BUSTURNAROUND cycles are inserted.
R	> 0	W	Any	Any	0	0	BUSTURNAROUND cycles are inserted.
W	> 0	R/W	Any	Any	0	0	No idle cycles are inserted if the two accesses are well pipelined.
R/W	= 0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted.
R/W	= 0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted.
R/W	> 0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is max (BUSTURNAROUND, CYCLE2CYCLEDELAY).
R/W	> 0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is maximum (BUSTURNAROUND, CYCLE2CYCLEDELAY).

**15.4.4.8.3.1.7 Slow Device Support (TIMEPARAGRANULARITY Parameter)**

All access-timing parameters can be multiplied by 2 by setting the [GPMC\\_CONFIG1\\_i](#)[4] TIMEPARAGRANULARITY bit (where i stands for the GPMC chip-select value, 0 to 7). Increasing all access timing parameters allows support of slow devices.

#### 15.4.4.8.3.2 Reset

No reset signal is sent to the external memory device by the GPMC. For more information about external-device reset, see [Chapter 3, Power, Reset, and Clock Management](#).

The PRCM module provides an input pin, `global_rst_n`, to the GPMC:

- The `global_rst_n` pin is activated during device warm reset and cold reset.
- The `global_rst_n` pin initializes the internal state-machine and the internal configuration registers.

#### 15.4.4.8.3.3 Byte Enable (`nBE1/nBE0`)

Byte enable signals (`nBE1/nBE0`) are:

- Valid (asserted or nonasserted according to the incoming system request) from access start to access completion for asynchronous and synchronous single accesses
- Asserted low from access start to access completion for asynchronous and synchronous multiple read accesses
- Valid (asserted or nonasserted, according to the incoming system request) synchronously to each written data for synchronous multiple write accesses

#### 15.4.4.8.4 Error Handling

When an error occurs in the GPMC, the error information is stored in the [GPMC\\_ERR\\_TYPE](#) register and the address of the illegal access is stored in the [GPMC\\_ERR\\_ADDRESS](#) register. The GPMC keeps only the first error abort information until the [GPMC\\_ERR\\_TYPE](#) register is reset. Subsequent accesses that cause errors are not logged until the error is cleared by hardware with the [GPMC\\_ERR\\_TYPE\[0\]](#) `ERRORVALID` bit.

- `ERRORNOTSUPPADD` occurs when an incoming system request address decoding does not match any valid chip-select region, or if two chip-select regions are defined as overlapped, or if a register file access is tried outside the valid address range of 1KiB.
- `ERRORNOTSUPPMCMD` occurs when an unsupported command request is decoded at the L3 interconnect interface.
- `ERRORTIMEOUT`: A time-out mechanism prevents the system from hanging. The start value of the 9-bit time-out counter is defined in the [GPMC\\_TIMEOUT\\_CONTROL](#) register and enabled with the [GPMC\\_TIMEOUT\\_CONTROL\[0\]](#) `TIMEOUTENABLE` bit. When enabled, the counter starts at start-cycle time until it reaches 0 and data is not responded to from memory, and then a time-out error occurs. When data are sent from memory, this counter is reset to its start value. With multiple accesses (asynchronous page mode or synchronous burst mode), the counter is reset to its start value for each data access within the burst.

The GPMC does not generate interrupts on these errors. True abort to the MPU or interrupt generation is handled at interconnect level.

#### 15.4.4.9 Timing Setting

The GPMC offers maximum flexibility to support various access protocols. Most of the timing parameters of the protocol access used by the GPMC to communicate with attached memories or devices are programmable on a chip-select basis. Assertion and deassertion times of control signals are defined to match the attached memory or device timing specifications and to get maximum performance during accesses. For more information about `GPMC_CLK` and `GPMC_FCLK` see [Section 15.4.4.9.6, GPMC\\_CLK](#).

---

**NOTE:** In the following sections, the start access time refers to the time at which the access begins.

---

#### 15.4.4.9.1 Read Cycle Time and Write Cycle Time (RDCYCLETIME / WRCYCLETIME)

The [GPMC\\_CONFIG5\\_i\[4:0\]](#) RDCYCLETIME and [GPMC\\_CONFIG5\\_i\[12:8\]](#) WRCYCLETIME bit fields (where  $i = 0$  to 7) define the address bus and byte-enable valid times for read and write accesses. To ensure a correct duty cycle of GPMC\_CLK between accesses, RDCYCLETIME and WRCYCLETIME are expressed in GPMC\_FCLK cycles and must be multiples of the GPMC\_CLK cycle. The RDCYCLETIME and WRCYCLETIME bit fields can be set with a granularity of 1 or 2 through the [GPMC\\_CONFIG1\\_i\[4\]](#) TIMEPARAGRANULARITY bit.

When RDCYCLETIME or WRCYCLETIME completes, if they are not already deasserted, all control signals (nCS, nADV/ALE, nOE/RE, nWE, and BE0/CLE) are deasserted to their reset values, regardless of their deassertion time parameters.

An exception to this forced deassertion occurs when a pipelined request to the same chip-select or to a different chip-select is pending. In such a case, it is not necessary to deassert a control signal with deassertion time parameters equal to the cycle-time parameter. This exception to forced deassertion prevents any unnecessary glitches. This requirement also applies to BE signals, thus avoiding an unnecessary BE glitch transition when pipelining requests.

---

**NOTE:** All control signals (CS, ADV#/ALE, BE0#/CLE, WE#, and GPMC.CLK) are kept inactive (ADV#/ALE, BE0#/CLE, and GPMC.CLK at low level; and CS, OE#/RE, and WE at high level) during the idle GPMC.FCLK cycles.

---

If no inactive cycles are required between successive accesses to the same chip-select or a different chip-select ([GPMC\\_CONFIG6\\_i\[7\]](#) CYCLE2CYCLESAMECSEN = 0 or [GPMC\\_CONFIG6\\_i\[6\]](#) CYCLE2CYCLEDIFFCSEN = 0, where  $i = 0$  to 7), and if assertion-time parameters associated with the pipelined access are equal to 0, asserted control signals (nCS, nADV/ALE, nBE0/CLE, nWE, and nOE/RE) are kept asserted. This applies to any read/write to read/write access combination.

If inactive cycles are inserted between successive accesses (that is, CYCLE2CYCLESAMECSEN = 1 or CYCLE2CYCLEDIFFCSEN = 1), the control signals are forced to their respective default reset values for the number of GPMC\_FCLK cycles defined in CYCLE2CYCLEDELAY.

#### 15.4.4.9.2 nCS: Chip-Select Signal Control Assertion/Deassertion Time (CSONTIME / CSRDOFFTIME / CSWROFFTIME / CSEXTRADELAY)

The [GPMC\\_CONFIG2\\_i\[3:0\]](#) CSONTIME bit field (where  $i = 0$  to 7) defines the nCS signal-assertion time relative to the start access time. It is common for read and write accesses.

The [GPMC\\_CONFIG2\\_i\[12:8\]](#) CSRDOFFTIME (read access) and [GPMC\\_CONFIG2\\_i\[20:16\]](#) CSWROFFTIME (write access) bit fields define the nCS signal deassertion time relative to start access time.

The CSONTIME, CSRDOFFTIME, and CSWROFFTIME parameters apply to synchronous and asynchronous modes. CSONTIME can be used to control an address and byte-enable setup time before chip-select assertion. CSRDOFFTIME and CSWROFFTIME can be used to control an address and byte-enable hold time after chip-select deassertion.

nCS signal transitions, as controlled through CSONTIME, CSRDOFFTIME, and CSWROFFTIME, can be delayed by a half-GPMC\_FCLK period by enabling the [GPMC\\_CONFIG2\\_i\[7\]](#) CSEXTRADELAY bit. This half-GPMC\_FCLK period provides more granularity on the nCS assertion and deassertion time to ensure proper setup and hold time relative to GPMC\_CLK. CSEXTRADELAY is especially useful in configurations where GPMC\_CLK and GPMC\_FCLK have the same frequency, but it can also be used for all GPMC configurations. If enabled, CSEXTRADELAY applies to all parameters that control nCS transitions.

The CSEXTRADELAY bit must be used carefully to avoid control signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than the nCS signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

#### 15.4.4.9.3 nADV/ALE: Address Valid/Address Latch Enable Signal Control Assertion/Deassertion Time (ADVONTIME / ADVRDOFFTIME / ADVWROFFTIME /

**ADVEXTRADELAY/ADVAADMUXONTIME/ADVAADMUXRDOFFTIME/ADVAADMUXWROFFTIME)**

The [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME field (where  $i = 0$  to 7) defines the nADV/ALE signal-assertion time relative to start access time. It is common to read and write accesses.

The [GPMC\\_CONFIG3\\_i\[12:8\]](#) ADVRDOFFTIME (read access) and [GPMC\\_CONFIG3\\_i\[20:16\]](#) ADVWROFFTIME (write access) bit fields define the nADV/ALE signal-deassertion time relative to start access time.

ADVONTIME can be used to control an address and byte-enable valid setup time control before nADV/ALE assertion. ADVRDOFFTIME and ADVWROFFTIME can be used to control an address and byte-enable valid hold time control after nADV/ALE deassertion. ADVRDOFFTIME and ADVWROFFTIME apply to synchronous and asynchronous modes.

The nADV/ALE signal transitions as controlled through ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME can be delayed by a half-GPMC\_FCLK period by enabling the [GPMC\\_CONFIG3\\_i\[7\]](#) ADVEXTRADELAY bit. This half-GPMC\_FCLK period provides more granularity on nADV/ALE assertion and deassertion time to ensure proper setup and hold time relative to GPMC\_CLK. The ADVEXTRADELAY configuration parameter is especially useful in configurations where GPMC\_CLK and GPMC\_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, ADVEXTRADELAY applies to all parameters controlling nADV/ALE transitions.

ADVEXTRADELAY must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than nADV/ALE signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

[GPMC\\_CONFIG3\\_i\[6:4\]](#) ADVAADMUXONTIME, [GPMC\\_CONFIG3\\_i\[26:24\]](#) ADVAADMUXRDOFFTIME, and [GPMC\\_CONFIG3\\_i\[30:28\]](#) ADVAADMUXWROFFTIME parameters have the same functions as ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME, but apply to the first address phase in the AAD-multiplexed protocol. The user must ensure that ADVAADMUXxxOFFTIME is programmed to a value less than or equal to ADVxxOFFTIME. Functionality in AAD-multiplexed mode is undefined if the settings do not comply with this requirement. ADVAADMUXxxOFFTIME can be programmed to the same value as ADVONTIME if no high nADV pulse is needed between the two AAD-multiplexed address phases, which is the typical case in synchronous mode. In this configuration, nADV is kept low until it reaches the correct ADVxxOFFTIME.

For more information about the use of ADVONTIME, ADVRDOFFTIME, ADVWROFFTIME, and ADVAADMUXRDOFFTIME and ADVAADMUXWROFFTIME for command latch enable (CLE) and address latch enable (ALE) use for a NAND flash interface, see [Section 15.4.4.12, NAND Access Description](#).

**15.4.4.9.4 nOE/nRE: Output Enable/Read Enable Signal Control Assertion/Deassertion Time (OEONTIME / OEOFFTIME / OEEXTRADELAY / OEAADMUXONTIME / OEAADMUXOFFTIME)**

The [GPMC\\_CONFIG4\\_i\[3:0\]](#) OEONTIME bit field (where  $i = 0$  to 7) defines the nOE/nRE signal assertion time relative to start access time. It applies only to read accesses.

The [GPMC\\_CONFIG4\\_i\[12:8\]](#) OEOFFTIME bit field defines the nOE/nRE signal deassertion time relative to start access time. It applies only to read accesses. nOE/nRE is not asserted during a write cycle.

The OEONTIME, OEOFFTIME, OEAADMUXONTIME, and OEAADMUXOFFTIME parameters apply to synchronous and asynchronous modes. OEONTIME can be used to control an address and byte enable valid setup time control before nOE/nRE assertion. OEOFFTIME can be used to control an address and byte-enable valid hold time control after nOE/nRE assertion.

The OEAADMUXONTIME and OEAADMUXOFFTIME parameters have the same functions as OEONTIME and OEOFFTIME, but apply to the first OE assertion in the AAD-multiplexed protocol for a read phase, or to the only OE assertion for a write phase. The user must ensure that OEAADMUXOFFTIME is programmed to a value less than OEONTIME. Functionality in AAD-multiplexed mode is undefined if the settings do not comply with this requirement. OEAADMUXOFFTIME must never be equal to OEONTIME because the AAD-multiplexed protocol requires a second address phase with the nOE signal deasserted before nOE can be asserted again to define a read command.

The nOE/RE signal transitions as controlled through OEONTIME, OEOFFTIME, OEAADMUXONTIME, and OEAADMUXOFFTIME can be delayed by a half-GPMC\_FCLK period by enabling the [GPMC\\_CONFIG4\\_j\[7\]](#) OEEXTRADELAY bit. This half-GPMC\_FCLK period provides more granularity on the nOE/RE assertion and deassertion time to ensure proper setup and hold time relative to GPMC\_CLK. If enabled, OEEXTRADELAY applies to all parameters controlling nOE/nRE transitions.

OEEXTRADELAY must be used carefully, to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program RDCYCLETIME and WRCYCLETIME to be greater than the nOE/RE signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

---

**NOTE:** When the GPMC generates a read access to an address-/data-multiplexed device, it drives the address bus until nOE assertion time.

---

#### 15.4.4.9.5 nWE: Write Enable Signal Control Assertion/Deassertion Time (WEONTIME / WEOFFTIME / WEEXTRADELAY)

The [GPMC\\_CONFIG4\\_i\[19:16\]](#) WEONTIME bit field (where  $i = 0$  to  $7$ ) defines the nWE signal-assertion time relative to start access time. The [GPMC\\_CONFIG4\\_i\[28:24\]](#) WEOFFTIME bit field defines the nWE signal-deassertion time relative to start access time. These bit fields apply only to write accesses. nWE is not asserted during a read cycle.

WEONTIME can be used to control an address and byte-enable valid setup time control before nWE assertion. WEOFFTIME can be used to control an address and byte-enable valid hold time control after nWE assertion.

nWE signal transitions as controlled through WEONTIME, and WEOFFTIME can be delayed by a half-GPMC\_FCLK period by enabling the [GPMC\\_CONFIG4\\_j\[23\]](#) WEEXTRADELAY bit. This half-GPMC\_FCLK period provides more granularity on nWE assertion and deassertion time to ensure proper setup and hold time relative to GPMC\_CLK. If enabled, WEEXTRADELAY applies to all parameters controlling nWE transitions.

The WEEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the WRCYCLETIME bit field to be greater than the nWE signal-deassertion time, including the extra half-GPMC\_FCLK-period delay.

#### 15.4.4.9.6 GPMC\_CLK

GPMC\_CLK is the external clock provided to the attached synchronous memory or device.

- The GPMC\_CLK clock frequency is the GPMC\_FCLK functional clock frequency divided by 1, 2, 3, or 4, depending on the [GPMC\\_CONFIG1\\_j\[1:0\]](#) GPMCFCLKDIVIDER bit field (where  $i = 0$  to  $7$ ), with a guaranteed 50-percent duty cycle. For information about the duty cycle error, see the device data manual.
- The GPMC\_CLK clock is activated only when the access in progress is defined as synchronous (read or write access).
- The [GPMC\\_CONFIG1\\_j\[26:25\]](#) CLKACTIVATIONTIME bit field (where  $i = 0$  to  $7$ ) defines the number of GPMC\_FCLK cycles from start access time to GPMC\_CLK activation.
- The GPMC\_CLK clock is stopped when cycle time completes and is asserted low between accesses.
- The GPMC\_CLK clock is kept low when access is defined as asynchronous.

#### CAUTION

When the cycle time completes, the GPMC\_CLK may be high because of the GPMCFCLKDIVIDER bit field. To ensure correct stoppage of the GPMC\_CLK clock within the required 50-percent duty cycle, the user must extend the RDCYCLETIME or WRCYCLETIME value.

**NOTE:** To ensure a correct external clock cycle, the following rules must be applied:

- (RDCYCLETIME CLKACTIVATIONTIME) must be a multiple of (GPMCFCLKDIVIDER + 1).
- The PAGEBURSTACCESSTIME value must be a multiple of (GPMCFCLKDIVIDER + 1).

#### 15.4.4.9.7 GPMC\_CLK and Control Signals Setup and Hold

Control-signal transition (assertion and deassertion) setup and hold values with respect to the GPMC\_CLK edge can be controlled in the following ways:

- For the GPMC\_CLK signal, the [GPMC\\_CONFIG1\\_i\[26:25\]](#) CLKACTIVATIONTIME bit field (where i = 0 to 7) allows setup and hold control of control-signal assertion time.
- The use of a divided GPMC\_CLK allows setup and hold control of the control-signal assertion and deassertion times.
- When GPMC\_CLK runs at the GPMC\_FCLK frequency so that GPMC\_CLK edge and control-signal transitions refer to the same GPMC\_FCLK edge, the control-signal transitions can be delayed by a half-GPMC\_FCLK period to provide minimum setup and hold times. This half-GPMC\_FCLK delay is enabled with the CSEXTRADelay, ADVEXTRADelay, OEXTRADelay, or WEEXTRADelay parameter. This delay must be used carefully to prevent control-signal overlap between successive accesses to different chip-selects. This implies that the RDCYCLETIME and WRCYCLETIME are greater than the last control-signal deassertion time, including the extra half-GPMC\_FCLK cycle.

#### 15.4.4.9.8 Access Time (RDACCESSTIME / WRACCESSTIME)

The read/write access time durations can be programmed independently through the [GPMC\\_CONFIG5\\_i\[20:16\]](#) RDACCESSTIME and [GPMC\\_CONFIG6\\_i\[28:24\]](#) WRACCESSTIME bit fields (where i = 0 to 7). This allows nOE and GPMC data-capture timing parameters to be independent of nWE and memory device data capture timing parameters. The RDACCESSTIME and WRACCESSTIME bit fields can be set with a granularity of 1 or 2 through the [GPMC\\_CONFIG1\\_i\[4\]](#) TIMEPARAGRANULARITY bit.

##### 15.4.4.9.8.1 Access Time on Read Access

In asynchronous read mode, for single and paged accesses, the [GPMC\\_CONFIG5\\_i\[20:16\]](#) RDACCESSTIME bit field (where i = 0 to 7) defines the number of GPMC\_FCLK cycles from start access time to the GPMC\_FCLK rising edge used for the first data capture. RDACCESSTIME must be programmed to the rounded greater value (in GPMC\_FCLK cycles) of the read access time of the attached memory device.

In synchronous read mode, for single or burst accesses, RDACCESSTIME defines the number of GPMC\_FCLK cycles from the start access time to the GPMC\_FCLK rising edge corresponding to the GPMC\_CLK rising edge used for the first data capture.

GPMC\_CLK, which is sent to the memory device for synchronization with the GPMC controller, is internally retimed to correctly latch the returned data. The [GPMC\\_CONFIG5\\_i\[4:0\]](#) RDCYCLETIME bit field must be greater than RDACCESSTIME to let the GPMC latch the last return data using the internally retimed GPMC\_CLK.

The external WAIT signal can be used in conjunction with RDACCESSTIME to control the effective GPMC data-capture GPMC\_FCLK edge on read access in asynchronous and synchronous modes. For more information about wait monitoring, see [Section 15.4.4.8.3.1, Wait Pin Monitoring Control](#).

##### 15.4.4.9.8.2 Access Time on Write Access

In asynchronous write mode, the [GPMC\\_CONFIG6\\_i\[28:24\]](#) WRACCESSTIME timing parameter is not used to define the effective write access time. Instead, it is used as a wait invalid timing window and must be set to a correct value so that the gpmc\_wait pin is at a valid state two GPMC\_CLK cycles before WRACCESSTIME completes. For more information about wait monitoring, see [Section 15.4.4.8.3.1, Wait Pin Monitoring Control](#).

In synchronous write mode, for single or burst accesses, WRACCESSTIME defines the number of GPMC\_FCLK cycles from the start access time to the GPMC\_CLK rising edge used by the memory device for the first data capture.

The external WAIT signal can be used in conjunction with WRACCESSTIME to control the effective memory device data-capture GPMC\_CLK edge for a synchronous write access. For more information about wait monitoring, see [Section 15.4.4.8.3.1, Wait Pin Monitoring Control](#).

#### 15.4.4.9.9 Page Burst Access Time (PAGEBURSTACCESSTIME)

The [GPMC\\_CONFIG5\\_i\[27:24\]](#) PAGEBURSTACCESSTIME bit field (where  $i = 0$  to 7) can be set with a granularity of 1 or 2 through the [GPMC\\_CONFIG1\\_i\[4\]](#) TIMEPARAGRANULARITY bit.

##### 15.4.4.9.9.1 Page Burst Access Time on Read Access

In asynchronous page read mode, the delay between successive word captures in a page is controlled through the PAGEBURSTACCESSTIME bit field. The PAGEBURSTACCESSTIME parameter must be programmed to the rounded greater value (in GPMC\_FCLK cycles) of the read access time of the attached device.

In synchronous burst read mode, the delay between successive word captures in a burst is controlled through the PAGEBURSTACCESSTIME bit field.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective GPMC data-capture GPMC\_FCLK edge on read access. For more information about wait monitoring, see [Section 15.4.4.8.3.1, Wait Pin Monitoring Control](#).

##### 15.4.4.9.9.2 Page Burst Access Time on Write Access

Asynchronous page write mode is not supported. PAGEBURSTACCESSTIME is irrelevant in this case.

In synchronous burst write mode, PAGEBURSTACCESSTIME controls the delay between successive memory device word captures in a burst.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective memory device data capture GPMC\_CLK edge in synchronous write mode. For more information about wait monitoring, see [Section 15.4.4.8.3.1, Wait Pin Monitoring Control](#).

##### 15.4.4.9.10 Bus Keeping Support

At the end cycle time of a read access, if no other access is pending, the GPMC drives the bus with the last data read after RDCYCLETIME completes to prevent bus floating and reduce power consumption.

After a write access, if no other access is pending, the GPMC keeps driving the data bus after WRCYCLETIME completes with the same data to prevent bus floating and power consumption.

#### 15.4.4.10 NOR Access Description

For each chip-select configuration, the read access can be specified as asynchronous or synchronous access through the [GPMC\\_CONFIG1\\_i\[29\]](#) READTYPE bit (where  $i = 0$  to 7). For each chip-select configuration, the write access can be specified as synchronous or asynchronous access through the [GPMC\\_CONFIG1\\_i\[27\]](#) WRITETYPE bit where ( $i = 0$  to 7).

Asynchronous and synchronous read and write access time and related control signals are controlled through timing parameters that refer to GPMC\_FCLK. The primary difference of synchronous mode is the availability of a configurable clock interface (GPMC\_CLK) to control the external device. Synchronous mode also affects data-capture and wait-pin monitoring schemes in read access.

For more information about asynchronous and synchronous access, see the descriptions of GPMC\_CLK, RdAccessTime, WrAccessTime, and wait pin monitoring.

For more information about timing-parameter settings, see the sample timing diagrams in this chapter.

**NOTE:** The address bus and nBE[1:0] are fixed for the duration of a synchronous burst read access, but they are updated for each beat of an asynchronous page-read access.

---

#### **15.4.4.10.1 Asynchronous Access Description**

This section describes:

- Asynchronous single-read operation on an address/data multiplexed device
- Asynchronous single write operation on an address/data-multiplexed device
- Asynchronous single read operation on an AAD-multiplexed device
- Asynchronous single write operation on an AAD-multiplexed device
- Asynchronous multiple (page) read operation on a non-multiplexed device

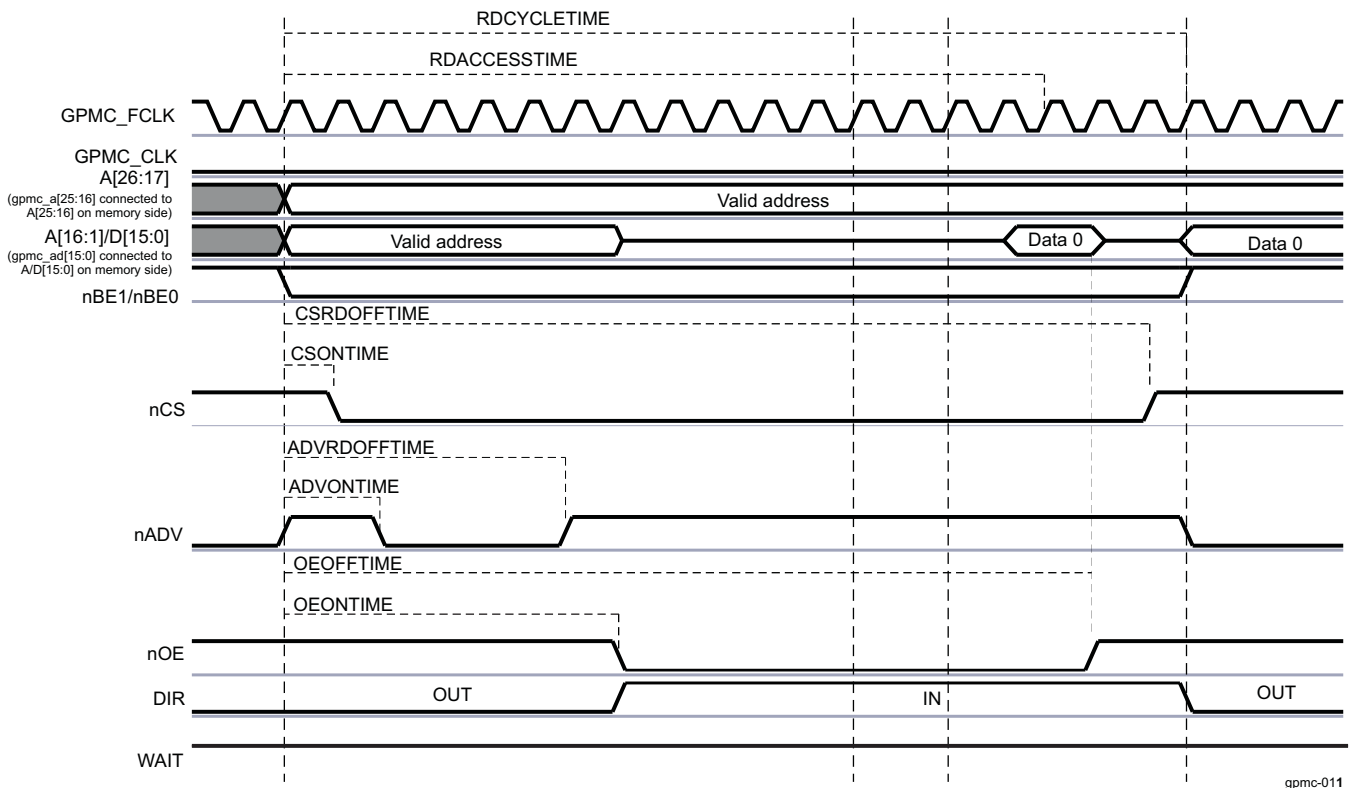

In asynchronous operations GPMC\_CLK is not provided outside the GPMC and is kept low.

### 15.4.4.10.1.1 Access on Address/Data Multiplexed Devices

#### 15.4.4.10.1.1.1 Asynchronous Single-Read Operation on an Address/Data Multiplexed Device

Figure 15-65 shows an asynchronous single read operation on an address/data-multiplexed device.

**Figure 15-65. Asynchronous Single Read on an Address/Data-Multiplexed Device**

For formulas to calculate timing parameters, see [Section 15.4.5.6.1, GPMC Timing Parameters Formulas](#).

[Table 15-486](#) lists the timing bit fields to set up to configure the GPMC in asynchronous single-read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For more information, see [Section 15.4.4.8.2.3, Address/Data-Multiplexing Interface](#).

Address bits (A[16:1] from a GPMC perspective, A[15:0] from an external device perspective) are placed on the address/data bus, and the remaining address bits gpmc\_a[27:16] are placed on the address bus. The address phase ends at nOE assertion, when the DIR signal goes from OUT to IN.

- Chip-select signal nCS:
  - nCS assertion time is controlled by the [GPMC\\_CONFIG2\\_i\[3:0\] CSONTIME](#) bit field. It controls the address setup time to nCS assertion.
  - nCS deassertion time is controlled by the [GPMC\\_CONFIG2\\_i\[12:8\] CSRDOFFTIME](#) bit field. It controls the address hold time from nCS deassertion.
- Address valid signal nADV:
  - nADV assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[3:0\] ADVONTIME](#) bit field.
  - nADV deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[12:8\] ADVRDOFFTIME](#) bit field.
- Output enable signal nOE:
  - nOE assertion indicates a read cycle.
  - nOE assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[3:0\] OEONTIME](#) bit field.
  - nOE deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[12:8\] OEOFFTIME](#) bit field.

- Read data is latched when RDACCESSTIME completes. Access time is defined in the [GPMC\\_CONFIG5\\_i\[20:16\]](#) RDACCESSTIME bit field.
- Direction signal DIR: DIR goes from OUT to IN at the same time that nOE is asserted.
- The end of the access is defined by the [GPMC\\_CONFIG5\\_i\[4:0\]](#) RDCYCLETIME parameter.

In the GPMC, when a 16-bit wide device is attached to the controller, a 32-bit word write access is split into two 16-bit word write accesses. For more information about GPMC access size and type adaptation, see [Section 15.4.4.10.5, System Burst Versus External Device Burst Support](#).

Between two successive accesses, if an nCS pulse is needed:

- The [GPMC\\_CONFIG6\\_i\[11:8\]](#) CYCLE2CYCLEDELAY bit field can be programmed with the [GPMC\\_CONFIG6\\_i\[7\]](#) CYCLE2CYCLESAMECSSEN bit enabled.
- The CSWROFFTIME and CSONTIME parameters also allow a chip-select pulse, but this affects all other types of access.

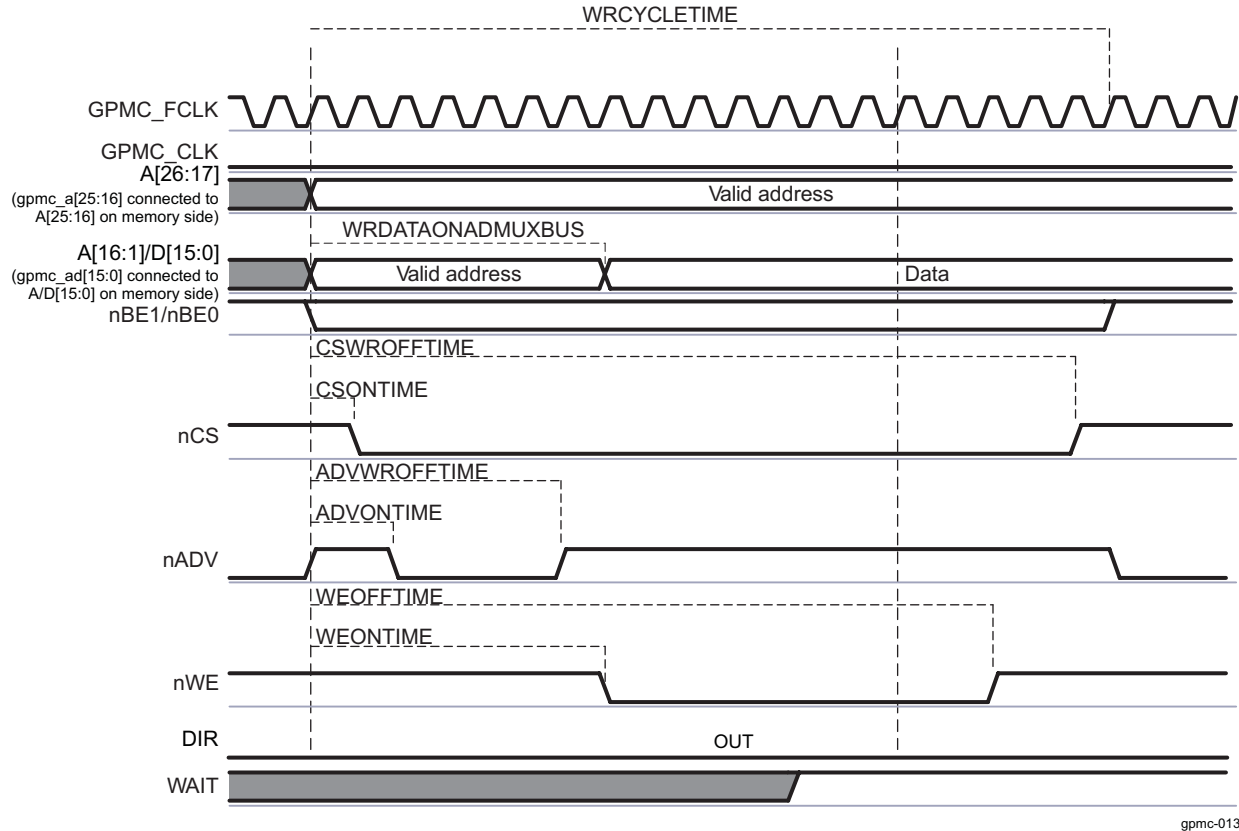

**Figure 15-66. Two Asynchronous Single-Read Accesses on an Address/Data-Multiplexed Device (32-Bit Read Split Into 2 x 16-Bit Read)**

gpmc-044

#### 15.4.4.10.1.1.2 Asynchronous Single-Write Operation on an Address/Data-Multiplexed Device

Figure 15-67 shows an asynchronous single-write operation on an address/data-multiplexed device.

**Figure 15-67. Asynchronous Single-Write on an Address/Data-Multiplexed Device**

For formulas to calculate timing parameters, see [Section 15.4.5.6.1, GPMC Timing Parameters Formulas](#).

[Table 15-486](#) lists the timing bit fields to set up to configure the GPMC in asynchronous single-write mode.

When the GPMC generates a write access to an address/data-multiplexed device, it drives the address bus until nWE assertion time. For more information, see [Section 15.4.4.8.2.3, Address/Data-Multiplexing Interface](#).

The nCS and nADV signals are controlled in the same way as for a asynchronous single-read operation on an address/data-multiplexed device.

- Write enable signal nWE:
  - nWE assertion indicates a write cycle.
  - nWE assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[19:16\] WEONTIME](#) bit field.
  - nWE deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[28:24\] WEOFFTIME](#) bit field.
- Direction signal DIR: DIR signal is OUT during the entire access.
- The end of the access is defined by the [GPMC\\_CONFIG5\\_i\[12:8\] WRCYCLETIME](#) parameter.

Address bits A[16:1] (GPMC point of view) are placed on the address/data bus at the start of cycle time, and the remaining address bits A[26:17] are placed on the address bus.

Data is driven on the address/data bus at a [GPMC\\_CONFIG6\\_i\[19:16\] WRDATAONADMUXBUS](#) time.

---

**NOTE:** Write multiple access in asynchronous mode is not supported. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

---

After a write operation, if no other access (read or write) is pending, the data bus keeps its previous value. See [Section 15.4.4.9.10, Bus Keeping Support](#).

#### **15.4.4.10.1.1.3 Asynchronous Multiple (Page) Write Operation on an Address/Data-Multiplexed Device**

Write multiple (page) access in asynchronous mode is not supported for address/data-multiplexed devices.

If the [GPMC\\_CONFIG1\\_i\[28\]](#) WRITEMULTIPLE bit is enabled (0x1) with the [GPMC\\_CONFIG1\\_i\[27\]](#) WRITETYPE bit as asynchronous (0x0), the GPMC processes single asynchronous accesses.

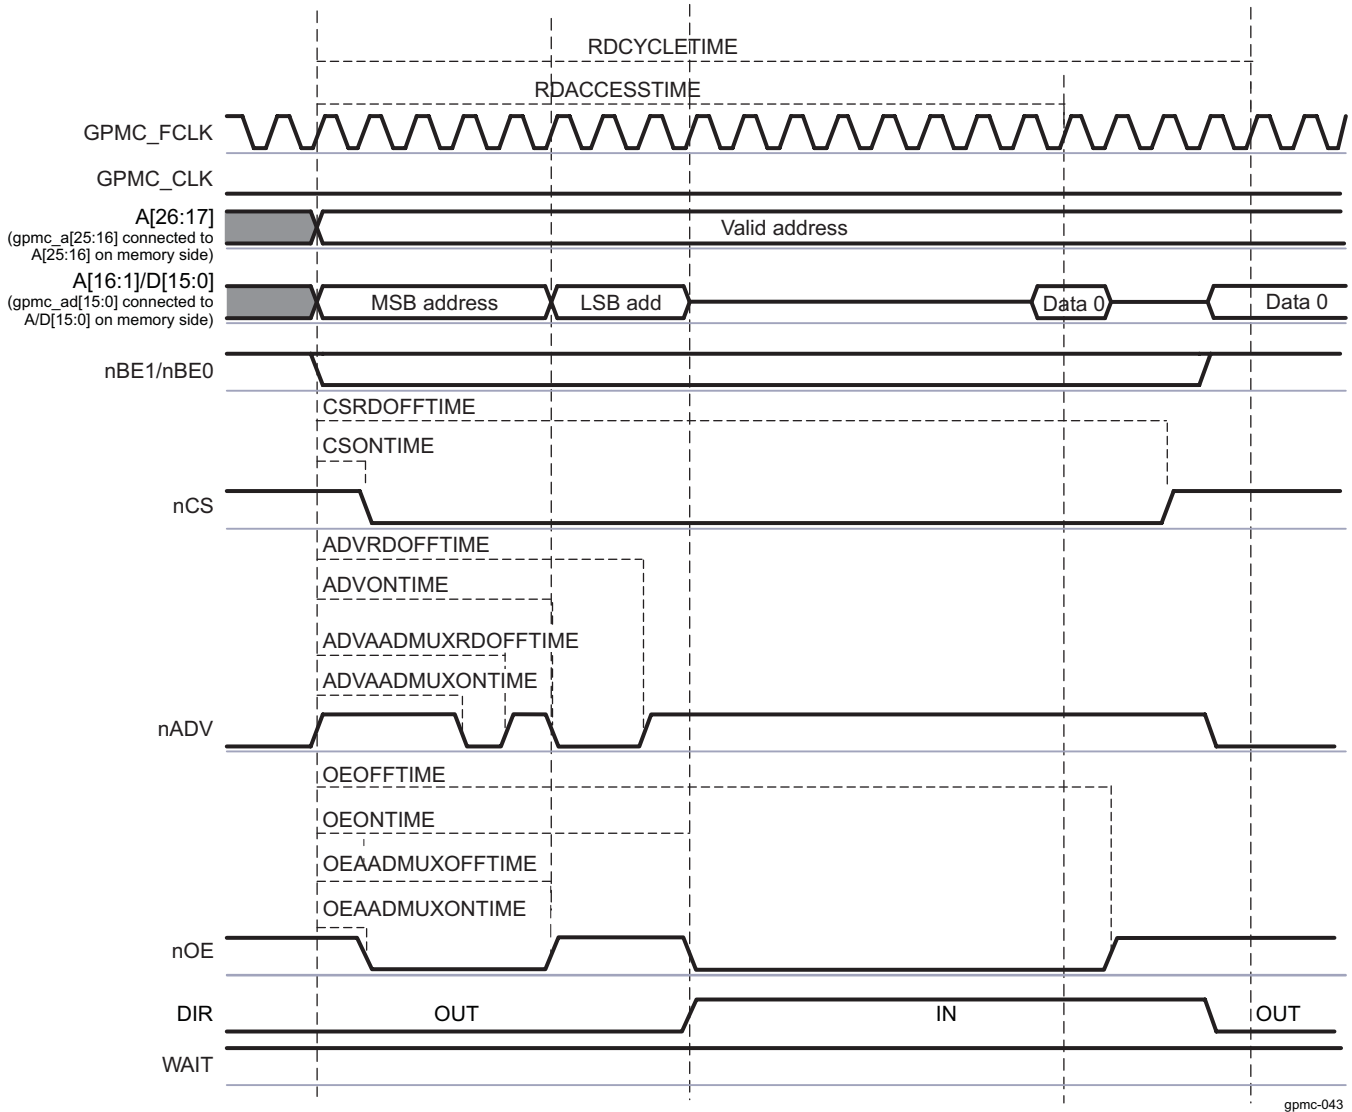

For accesses on nonmultiplexed devices, see [Section 15.4.4.10.3, Asynchronous and Synchronous Accesses in Nonmultiplexed Mode](#).

15.4.4.10.1.2 Access on Address/Address/Data-Multiplexed Devices

15.4.4.10.1.2.1 Asynchronous Single Read Operation on an AAD-Multiplexed Device

Figure 15-68 shows an asynchronous single-read operation on an AAD-multiplexed device.

Figure 15-68. Asynchronous Single Read on an AAD-Multiplexed Device

For formulas to calculate timing parameters, see Section 15.4.5.6.1, GPMC Timing Parameters Formulas.

Table 15-486 lists the timing bit fields to set up to configure the GPMC in asynchronous single write mode.

When the GPMC generates a read access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The first address phase ends at the first nOE deassertion time. The second phase for LSB address is qualified with nOE driven high. The second address phase ends at the second nOE assertion time, when the DIR signal goes from OUT to IN.

The nCS and DIR signals are controlled in the same way as for an asynchronous single-read operation on an address/data-multiplexed device.

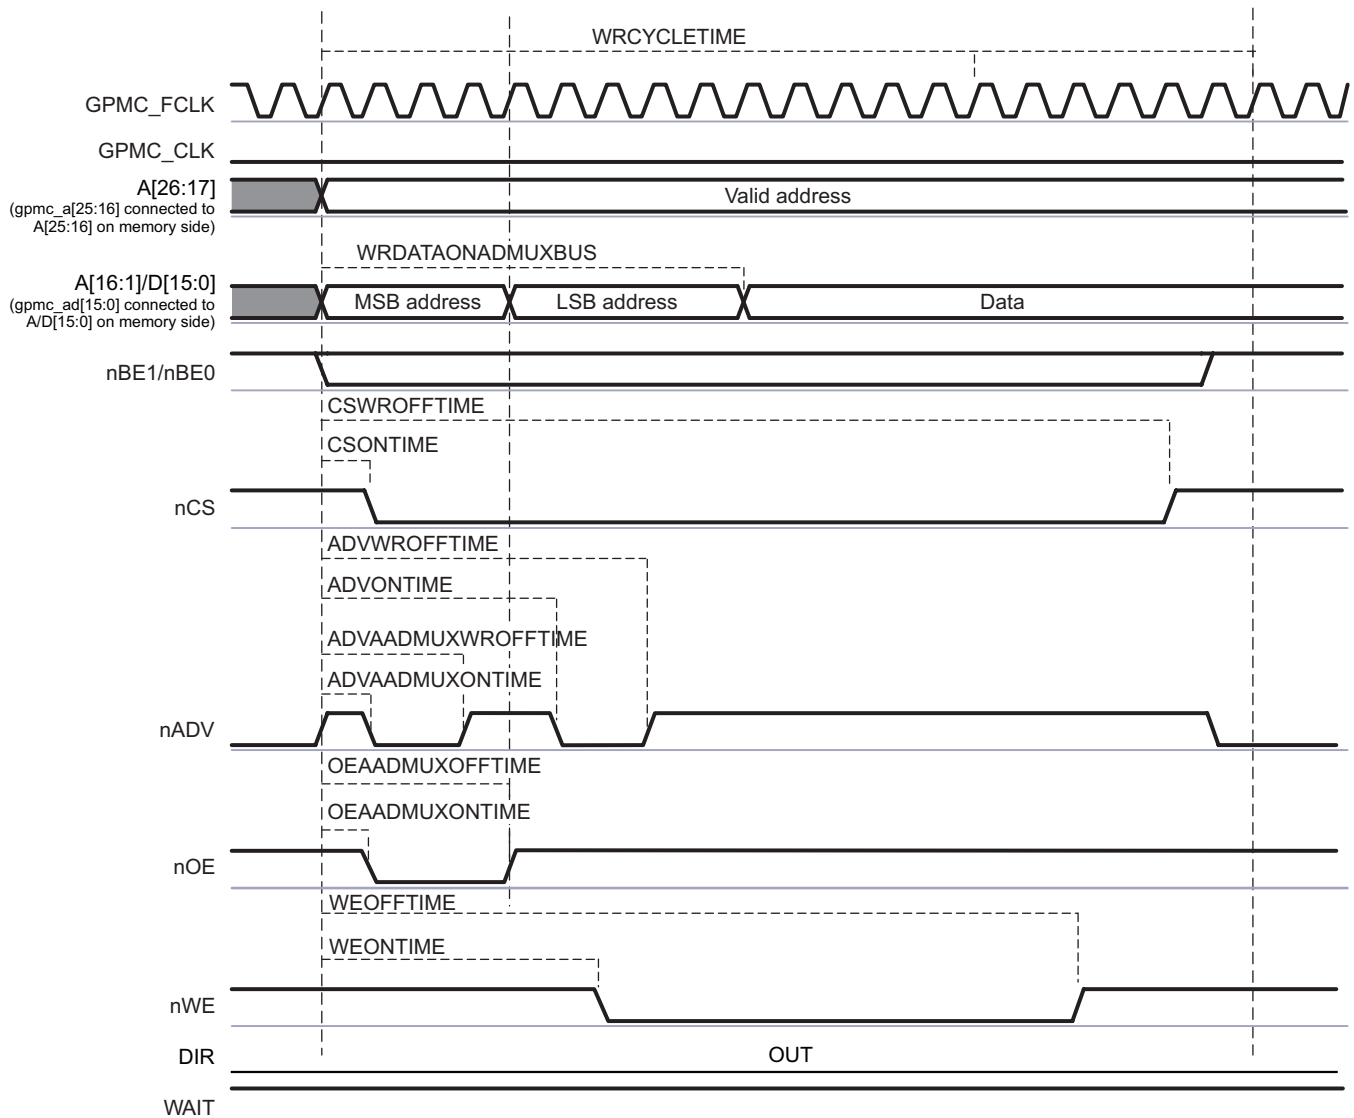

- Address valid signal nADV. nADV is asserted and deasserted twice during a read transaction:
  - nADV first assertion time is controlled by the GPMC\_CONFIG3\_i[6:4] ADVAADMUXONTIME bit field.

- nADV first deassertion time is controlled by the GPMC\_CONFIG3\_i[26:24] ADVAADMUXRD OFFTIME bit field.
- nADV second assertion time is controlled by the GPMC\_CONFIG3\_i[3:0] ADVONTIME bit field.
- nADV second deassertion time is controlled by the GPMC\_CONFIG3\_i[12:8] ADVRDOFFTIME bit field.
- Output Enable signal nOE. nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
  - nOE first assertion time is controlled by the GPMC\_CONFIG4\_i[6:4] OEAADMUXONTIME bit field.
  - nOE first deassertion time is controlled by the GPMC\_CONFIG3\_i[15:13] OEAADMUXOFFTIME bit field.
  - nOE second assertion time is controlled by the GPMC\_CONFIG4\_i[3:0] OEONTIME bit field.
  - nOE second deassertion time is controlled by the GPMC\_CONFIG4\_i[12:8] OEOFFTIME bit field.

**15.4.4.10.1.2.2 Asynchronous Single-Write Operation on an AAD-Multiplexed Device**

Figure 15-69 shows an asynchronous single-write operation on an AAD-multiplexed device.

**Figure 15-69. Asynchronous Single Write on an AAD-Multiplexed Device**

gpmc-042

For formulas to calculate timing parameters, see [Section 15.4.5.6.1, GPMC Timing Parameters Formulas](#).

[Table 15-486](#) lists the timing bit fields to set up to configure the GPMC in asynchronous single-write mode.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS, nWE, and DIR signals are controlled in the same way as for an asynchronous single-write operation on an address/data-multiplexed device. See [Table 15-477](#).

- Address valid signal nADV is asserted and deasserted twice during a write transaction:
  - nADV first assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[6:4\]](#) ADVAADMUXONTIME bit field.
  - nADV first deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[30:28\]](#) ADVAADMUXWROFFTIME bit field.
  - nADV second assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME bit field.
  - nADV second deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[20:16\]](#) ADVWROFFTIME bit field.
- Output enable signal nOE is asserted during the address phase of a write transaction:
  - nOE assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[6:4\]](#) OEAADMUXONTIME bit field.
  - nOE deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[15:13\]](#) OEAADMUXOFFTIME bit field.

The address bits for the first address phase are driven onto the data bus until nOE deassertion. Data is driven onto the address/data bus at the clock edge defined by the [GPMC\\_CONFIG6\\_i\[19:16\]](#) WRDATAONADMUXBUS parameter.

#### 15.4.4.10.1.2.3 Asynchronous Multiple (Page) Read Operation on an AAD-Multiplexed Device

Write multiple (page) access in asynchronous mode is not supported for AAD-multiplexed devices.

If the [GPMC\\_CONFIG1\\_i\[28\]](#) WRITEMULTIPLE bit is enabled (0x1) with the [GPMC\\_CONFIG1\\_i\[27\]](#) WRITETYPE bit as asynchronous (0x0), the GPMC processes single asynchronous accesses.

For accesses on nonmultiplexed devices, see [Section 15.4.4.10.3, Asynchronous and Synchronous Accessed in Nonmultiplexed Mode](#).

#### 15.4.4.10.2 Synchronous Access Description

This section describes read and write synchronous accesses on address/data-multiplexed devices. All information in this section can be applied to any type of memory (nonmultiplexed, address and data-multiplexed, or AAD-multiplexed) with the difference limited to the address phase. For accesses on nonmultiplexed devices, see [Section 15.4.4.10.3, Asynchronous and Synchronous Accessed in Nonmultiplexed Mode](#).

In synchronous operations:

- The GPMC\_CLK clock is provided outside the GPMC when accessing the memory device.
- The GPMC\_CLK clock is derived from the GPMC\_FCLK clock using the [GPMC\\_CONFIG1\\_i\[1:0\]](#) GPMCFCLKDIVIDER bit field. In the following section i stands for the chip-select number, i = 0 to 7.
- The [GPMC\\_CONFIG1\\_i\[26:25\]](#) CLKACTIVATIONTIME bit field specifies that the GPMC\_CLK is provided outside the GPMC for 0 to 2 GPMC\_FCLK cycles after start access time until RDCYCLETIME or WRCYCLETIME completes.

#### 15.4.4.10.2.1 Synchronous Single Read

[Figure 15-70](#) and [Figure 15-71](#) show a synchronous single-read operation with GPMCFCLKDIVIDER equal to 0 and 1, respectively.

Figure 15-70. Synchronous Single Read (GPMCFCLKDIVIDER = 0)

gpmc-015

**Figure 15-71. Synchronous Single Read (GPMCFCLKDIVIDER = 1)**

gpmc-016

For formulas to calculate timing parameters, see [Section 15.4.5.6.1, GPMC Timing Parameters Formulas](#).

[Table 15-486](#) lists the timing bit fields to set up to configure the GPMC in asynchronous single-read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For more information, see [Section 15.4.4.8.2.3, Address/Data-Multiplexing Interface](#).

- Chip-select signal nCS:
  - nCS assertion time is controlled by the [GPMC\\_CONFIG2\\_i\[3:0\]](#) CSONTIME bit field and ensures address setup time to nCS assertion.
  - nCS deassertion time is controlled by the [GPMC\\_CONFIG2\\_i\[12:8\]](#) CSRDOFFTIME bit field and ensures address hold time to nCS deassertion.
- Address valid signal nADV:
  - nADV assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME bit field.
  - nADV deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[12:8\]](#) ADVRDOFFTIME bit field.
- Output enable signal nOE:
  - nOE assertion indicates a read cycle.
  - nOE assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[3:0\]](#) OEONTIME bit field.
  - nOE deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[12:8\]](#) OEOFFTIME bit field.
- Initial latency for the first read data is controlled by [GPMC\\_CONFIG5\\_i\[20:16\]](#) RDACCESSTIME bit field or by monitoring the WAIT signal.
- Total access time (the [GPMC\\_CONFIG5\\_i\[4:0\]](#) RDCYCLETIME bit field) corresponds to RDACCESSTIME plus the address hold time from nCS deassertion, plus time from RDACCESSTIME to CSRDOFFTIME.

- Direction signal DIR: DIR goes from OUT to IN at the same time as nOE assertion.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

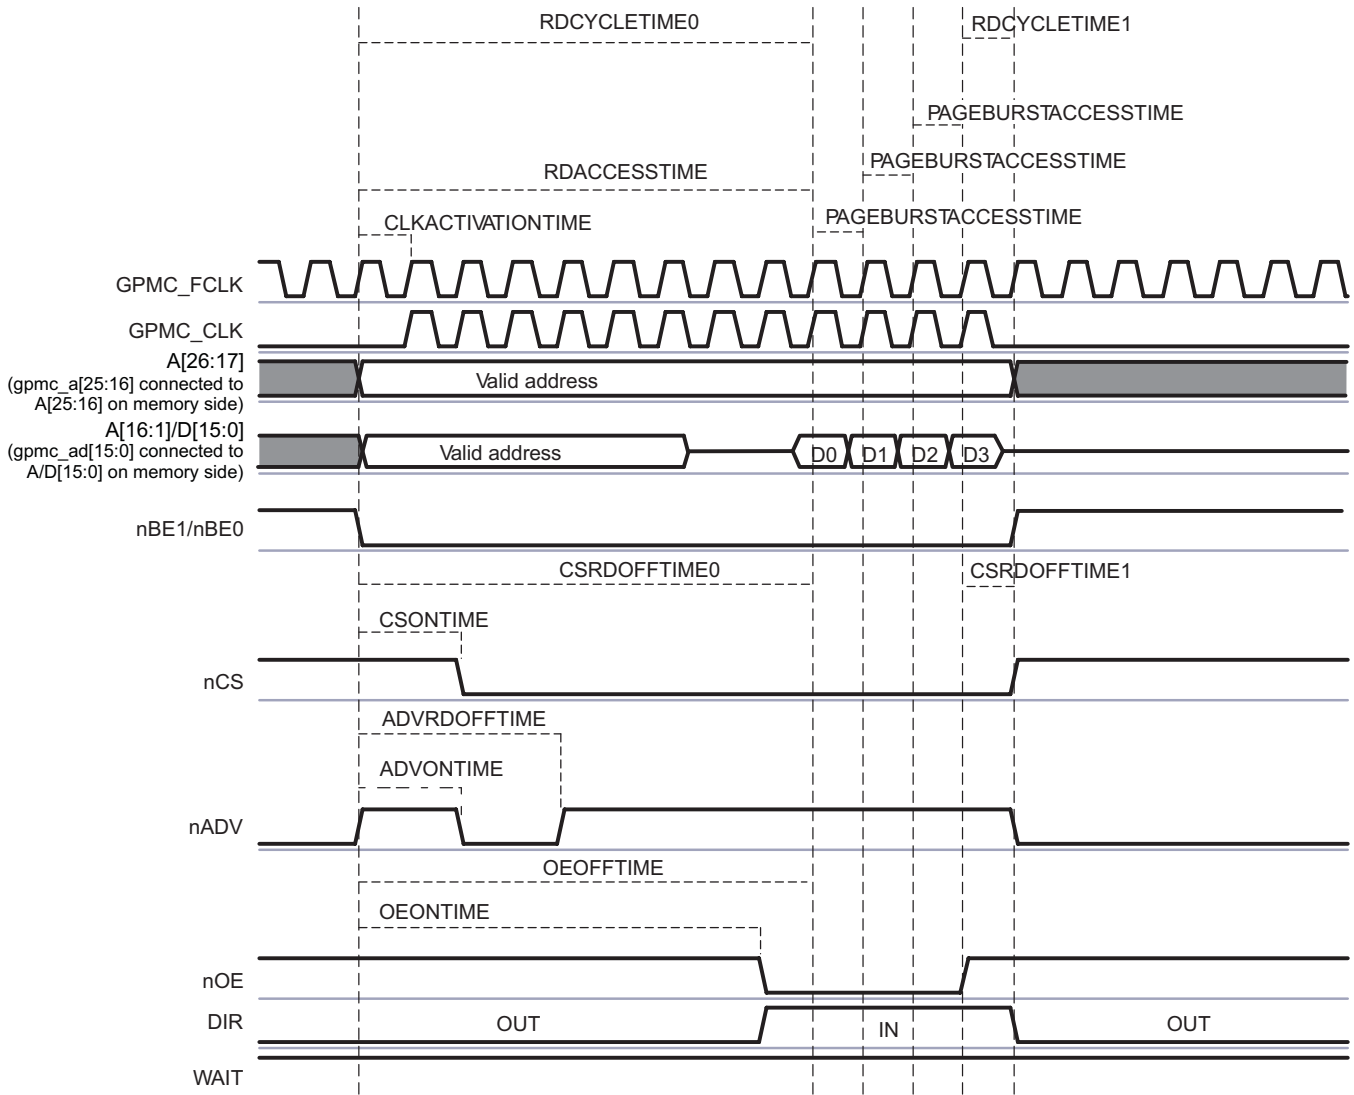

The nCS and DIR signals are controlled in the same way as for a synchronous single-read operation on an address/data-multiplexed device.

- Address valid signal nADV is asserted and deasserted twice during a read transaction:
  - nADV first assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[6:4\]](#) ADVAADMUXONTIME bit field.
  - nADV first deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[26:24\]](#) ADVAADMUXRD OFFTIME bit field.
  - nADV second assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME bit field.
  - nADV second deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[12:8\]](#) ADVRDOFFTIME bit field.
- Output Enable signal nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
  - nOE first assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[6:4\]](#) OEAADMUXONTIME bit field.
  - nOE first deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[15:13\]](#) OEAADMUXOFFTIME bit field.
  - nOE second assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[3:0\]](#) OEONTIME bit field.
  - nOE second deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[12:8\]](#) OE OFFTIME bit field.

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 15.4.4.9.10](#), *Bus Keeping Support*.

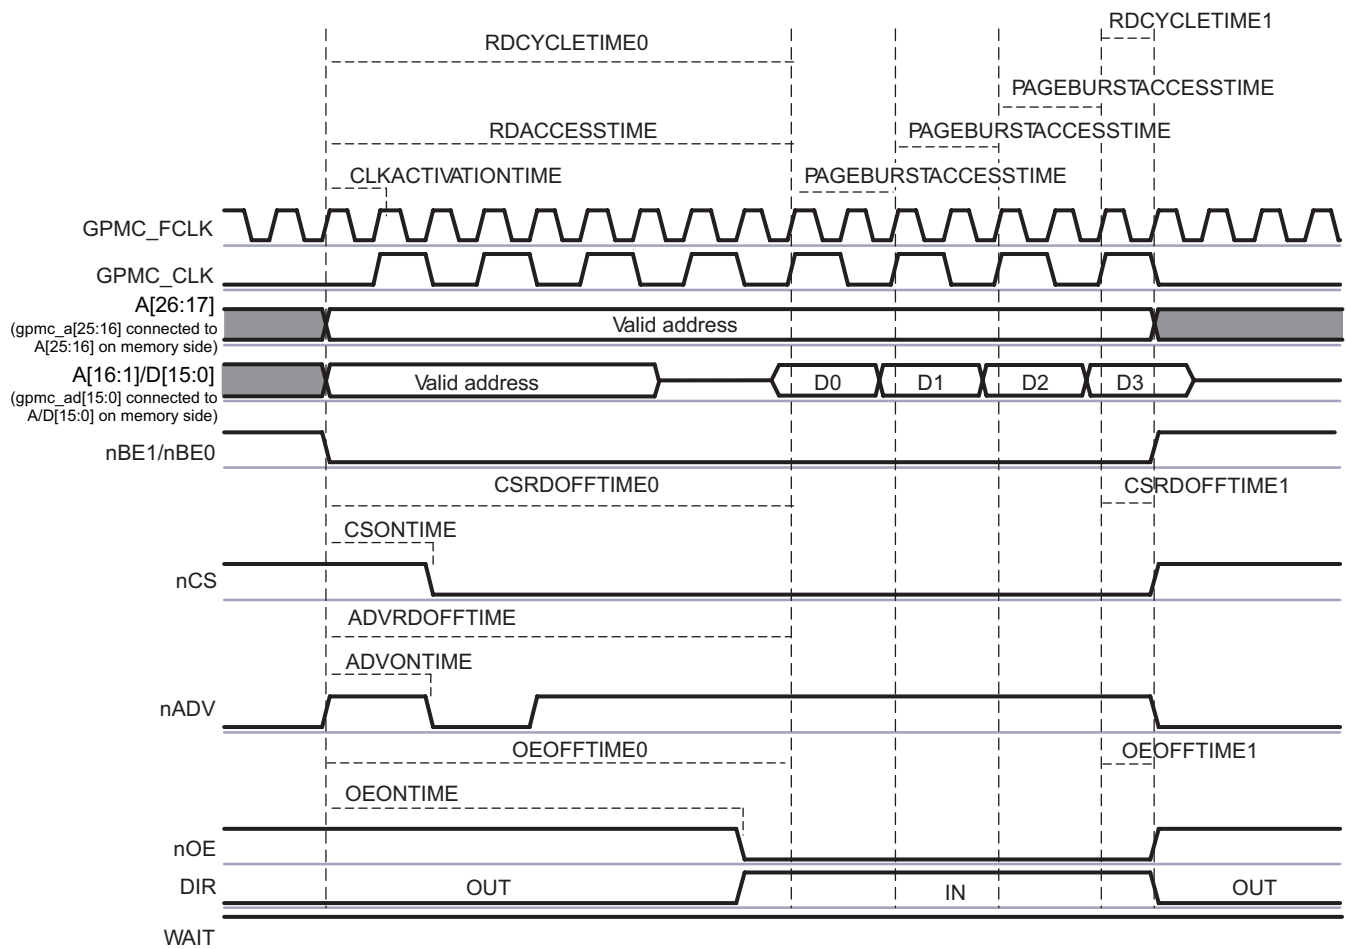

#### **15.4.4.10.2.2 Synchronous Multiple (Burst) Read (4-, 8-, 16-Word 16 Burst With Wraparound Capability)**

[Figure 15-72](#) and [Figure 15-73](#) show a synchronous multiple-read operation with GPMCFCLKDivider equal to 0 and 1, respectively.

**Figure 15-72. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 0)**

gpmc-018

Figure 15-73. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 1)

gpmc-019

When the [GPMC\\_CONFIG5\\_i\[20:16\]](#) RDACCESSTIME bit field completes, control-signal timings are frozen during the multiple data transactions, corresponding to the [GPMC\\_CONFIG5\\_i\[27:24\]](#) PAGEBURSTACCESSTIME bit field multiplied by the number of remaining data transactions.

The nCS, nADV, nOE, and DIR signals are controlled in the same way as for a synchronous single-read operation. See [Table 15-472](#).

Initial latency for the first read data is controlled by RDACCESSTIME or by monitoring the WAIT signal. Successive read data are provided by the memory device every one or two GPMC\_CLK cycles. The PAGEBURSTACCESSTIME parameter must be set accordingly with the [GPMC\\_CONFIG1\\_i\[1:0\]](#) GPMCFCLKDIVIDER bit field and the memory-device internal configuration. Depending on the device page length, the GPMC checks the device page crossing during a new burst request and purposely inserts initial latency (of RDACCESSTIME) when required.

Total access time [GPMC\\_CONFIG5\\_i\[4:0\]](#) RDCYCLETIME corresponds to RDACCESSTIME plus the address hold time from nCS deassertion. In [Figure 15-73](#), the programmed value of RDCYCLETIME equals RDCYCLETIME0 + RDCYCLETIME1.

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 15.4.4.9.10, Bus Keeping Support](#).

Burst wraparound is enabled through the [GPMC\\_CONFIG1\\_i\[31\]](#) WRAPBURST bit and allows a 4-, 8-, or 16-Word16 linear burst access to wrap within its burst-length boundary through the [GPMC\\_CONFIG1\\_i\[24:23\]](#) ATTACHEDDEVICEPAGELENGTH bit field.

### 15.4.4.10.2.3 Synchronous Single Write

Burst write mode is used for synchronous single or burst accesses.

**Figure 15-74. Synchronous Single Write on an Address/Data-Multiplexed Device**

When the GPMC generates a write access to an address/data-multiplexed device, it drives the data bus (with address bits A[16:1]) until the [GPMC\\_CONFIG6\\_i\[19:16\]](#) WRDATAONADMUXBUS bit field time. The first data of the burst is driven on the address/data bus at WRDATAONADMUXBUS time.

### 15.4.4.10.2.4 Synchronous Multiple (Burst) Write

Synchronous burst write mode provides synchronous single or consecutive accesses.

[Figure 15-75](#) shows a synchronous burst write access when the chip-select is configured in address/data-multiplexed mode.

Figure 15-75. Synchronous Multiple Write (Burst Write) in Address/Data-Multiplexed Mode

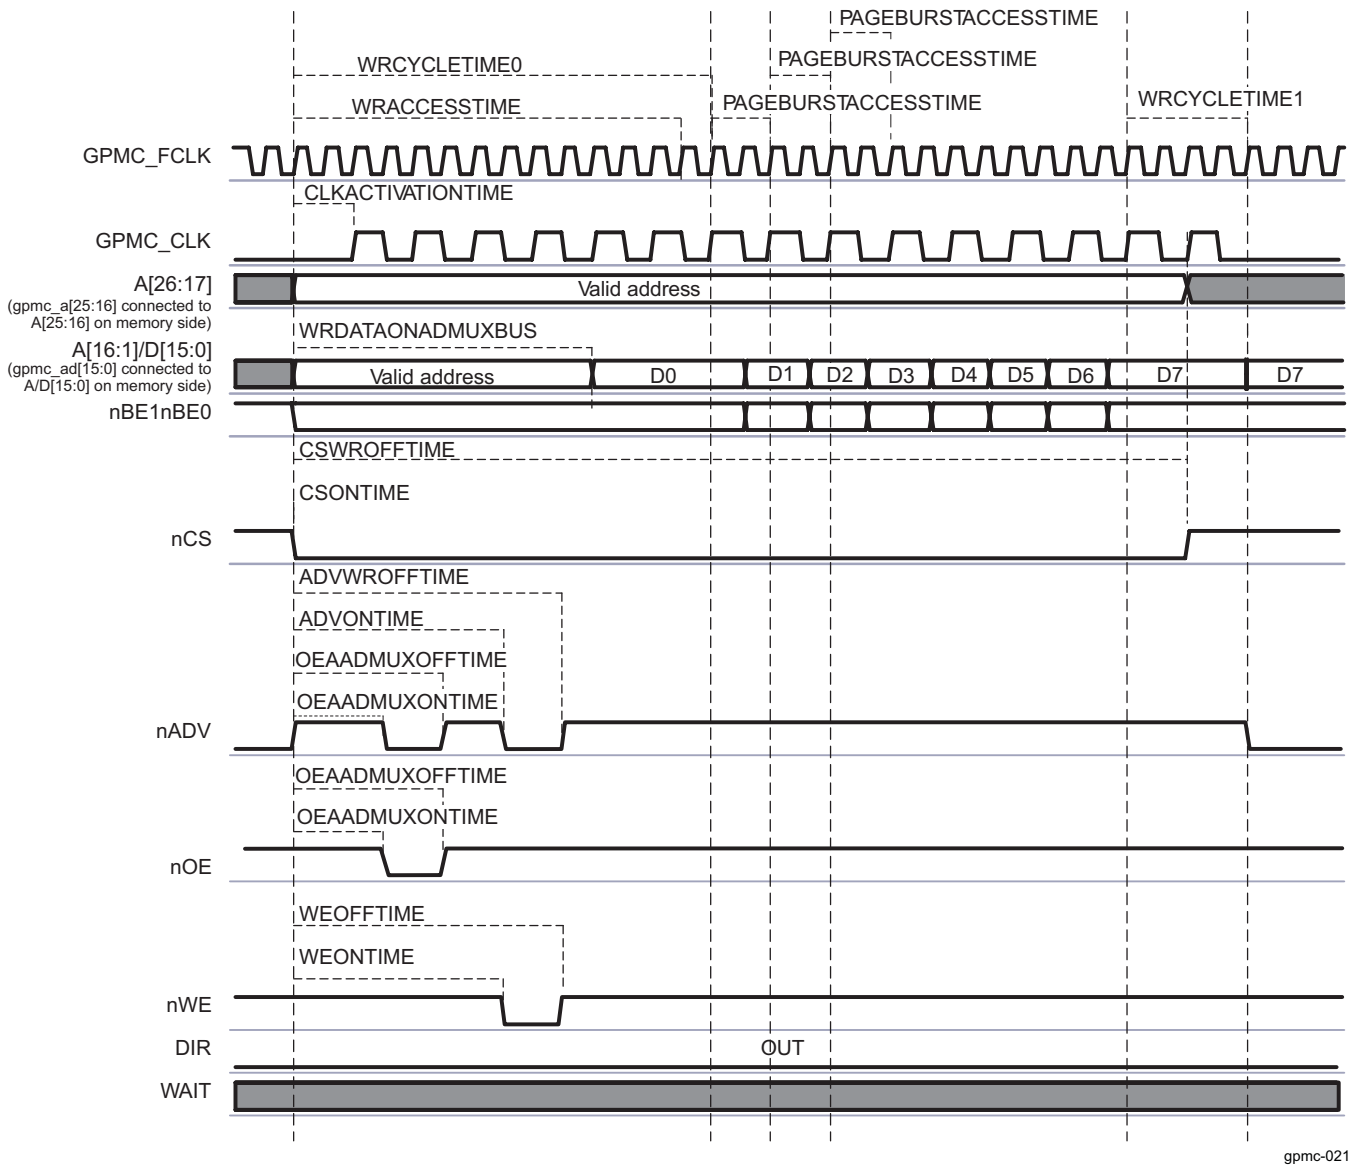

Figure 15-76 shows the same synchronous burst write access when the chip-select is configured in address/address/data-multiplexed (AAD-multiplexed) mode.

gpmc-020

**Figure 15-76. Synchronous Multiple Write (Burst Write) in Address/Address/Data-Multiplexed Mode**

gpmc-021

The first data of the burst is driven on the A/D bus at the [GPMC\\_CONFIG6\\_i\[19:16\]](#) WRDATAONADMUXBUS bit field.

When WRACCESTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to the [GPMC\\_CONFIG5\\_i\[27:24\]](#) PAGEBURSTACCESTIME bit field multiplied by the number of remaining data transactions.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For more information, see [Section 15.4.4.8.2.3, Address/Data-Multiplexing Interface](#).

- Chip-select signal nCS:
  - nCS assertion time is controlled by the [GPMC\\_CONFIG2\\_i\[3:0\]](#) CSONTIME bit field (where  $i = 0$  to 7) and ensures address setup time to nCS assertion.
  - nCS deassertion time controlled by the [GPMC\\_CONFIG2\\_i\[20:16\]](#) CSWROFFTIME bit field and ensures address hold time to nCS deassertion.
- Address valid signal nADV:
  - nADV assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME bit field.

- nADV deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[20:16\]](#) ADVWROFFTIME bit field.
- Write enable signal nWE:
  - nWE assertion indicates a read cycle.
  - nWE assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[19:16\]](#) WEONTIME bit field.
  - nWE deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[28:24\]](#) WEOFFTIME bit field.

---

**NOTE:** The nWE falling edge must not be used to control the time when the burst first data is driven in the address/data bus, because some new devices require the nWE signal to be low during the address phase.

---

- Direction signal DIR is OUT during the entire access.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS, and DIR signals are controlled as previously described..

- Address valid signal nADV is asserted and deasserted twice during a read transaction:
  - nADV first assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[6:4\]](#) ADVAADMUXONTIME bit field.
  - nADV first deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[26:24\]](#) ADVAADMUXRDOFFTIME bit field.
  - nADV second assertion time is controlled by the [GPMC\\_CONFIG3\\_i\[3:0\]](#) ADVONTIME bit field.
  - nADV second deassertion time is controlled by the [GPMC\\_CONFIG3\\_i\[12:8\]](#) ADVRDOFFTIME bit field.
- Output Enable signal nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
  - nOE first assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[6:4\]](#) OEAADMUXONTIME bit field.
  - nOE first deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[15:13\]](#) OEAADMUXOFFTIME bit field.
  - nOE second assertion time is controlled by the [GPMC\\_CONFIG4\\_i\[3:0\]](#) OEONTIME bit field.
  - nOE second deassertion time is controlled by the [GPMC\\_CONFIG4\\_i\[12:8\]](#) OEOFFTIME bit field.

First write data is driven by the GPMC at [GPMC\\_CONFIG6\\_i\[19:16\]](#) WRDATAONADMUXBUS, when in address/data-multiplexed configuration. The next write data of the burst is driven on the bus at  $WRACCESSTIME + 1$  during [GPMC\\_CONFIG5\\_i\[27:24\]](#) PAGEBURSTACCESSTIME GPMC\_FCLK cycles. The last data of the synchronous burst write is driven until [GPMC\\_CONFIG5\\_i\[12:8\]](#) WRCYCLETIME completes.

- WRACCESSTIME is defined in the [GPMC\\_CONFIG6\\_i\[28:24\]](#) bit field.
- The PAGEBURSTACCESSTIME parameter must be set accordingly with GPMCFCLKDIVIDER and the memory-device internal configuration.

Total access time [GPMC\\_CONFIG5\\_i\[12:8\]](#) WRCYCLETIME corresponds to WRACCESSTIME plus the address hold time from nCS deassertion. In [Figure 15-75](#), the programmed value of WRCYCLETIME equals  $WRCYCLETIME0 + WRCYCLETIME1$ . WRCYCLETIME0 and WRCYCLETIME1 delays are not actual parameters and are only a graphical representation of the full WRCYCLETIME value.

After a write operation, if no other access (read or write) is pending, the data bus keeps the previous value. See [Section 15.4.4.9.10, Bus Keeping Support](#).

### 15.4.4.10.3 Asynchronous and Synchronous Accesses in Nonmultiplexed Mode

Page mode is available only in nonmultiplexed mode.

- Asynchronous single-read operation on a nonmultiplexed device
- Asynchronous single-write operation on a nonmultiplexed device
- Asynchronous multiple- (page mode) read operation on a nonmultiplexed device

- Synchronous operations on a nonmultiplexed device

#### 15.4.4.10.3.1 Asynchronous Single-Read Operation on Nonmultiplexed Device

Figure 15-77 shows an asynchronous single-read operation on a nonmultiplexed device.

**Figure 15-77. Asynchronous Single Read on an Address/Data-Nonmultiplexed Device**

The 27-bit address (For a 16-bit data memory device, hence GPMC A[0] is not necessary to be output) is driven onto the address bus A[27:1] and the 16-bit data is driven onto the data bus D[15:0].

Read data is latched at `GPMC_CONFIG1_5[20:16]` RDACCESSTIME completion time. The end of the access is defined by the `GPMC_CONFIG1_5[4:0]` RDCYCLETIME parameter.

The nCS, nADV, nOE, and DIR signals are controlled in the same way as address/data-multiplexed accesses (see [Table 15-477](#)).

#### 15.4.4.10.3.2 Asynchronous Single-Write Operation on Nonmultiplexed Device

Figure 15-78 shows an asynchronous single-write operation on a nonmultiplexed device.

**Figure 15-78. Asynchronous Single Write on an Address/Data-Nonmultiplexed Device**

The nCS, nADV, nWE, and DIR signals are controlled in the same way as address/data-multiplexed accesses (see [Table 15-477](#)).

#### 15.4.4.10.3.3 Asynchronous Multiple (Page Mode) Read Operation on Nonmultiplexed Device

[Figure 15-79](#) shows an asynchronous multiple-read operation on a nonmultiplexed device in which two word32 host read accesses to the GPMC are split into one multiple- (page mode of 4 word16) read access to the attached device.

**Figure 15-79. Asynchronous Multiple (Page Mode) Read**

**NOTE:** The WAIT signal is active low.

The nCS, nADV, nOE, and DIR signals are controlled in the same way as address/data-multiplexed accesses (see [Table 15-477](#)).

When RDACCESSTIME completes, control signal timings are frozen during the multiple data transactions, corresponding to PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

Read data is latched at [GPMC\\_CONFIG5\\_i\[20:16\]](#) RDACCESSTIME completion time (where  $i = 0$  to 7). The end of the access is defined by the [GPMC\\_CONFIG5\\_j\[4:0\]](#) RDCYCLETIME parameter.

During consecutive accesses, the GPMC increments the address after each data read completes.

Delay between successive read data in the page is controlled by the [GPMC\\_CONFIG5\\_i\[27:24\]](#) PAGEBURSTACCESSTIME parameter. Depending on the device page length, the GPMC can control device page crossing during a burst request and insert initial RDACCESSTIME latency. Page crossing is possible only with a new burst access, meaning a new initial access phase is initiated.

Total access time RDCYCLETIME corresponds to RDACCESSTIME, plus the address hold time, starting from the nCS deassertion.

- The read cycle time is defined in the [GPMC\\_CONFIG5\\_j\[4:0\]](#) RDCYCLETIME bit field.
- In [Figure 15-79](#), the programmed value of RDCYCLETIME equals RDCYCLETIME0 (before paged accesses) + RDCYCLETIME1 (after paged accesses).

#### 15.4.4.10.3.4 Synchronous Operations on a Nonmultiplexed Device

All information for this section is equivalent to similar operations for address/data-multiplexed or AAD-multiplexed accesses. The only difference resides in the address phase. See [Section 15.4.5.3, GPMC Configuration in NOR Mode](#).

#### 15.4.4.10.4 Page and Burst Support

Each chip-select can be configured to process system single or burst requests into successive single accesses or asynchronous page/synchronous burst accesses, with appropriate access size adaptation.

Depending on the external device page or burst capability, read and write accesses can be independently configured through the GPMC. The [GPMC\\_CONFIG1\\_i\[30\]](#) READMULTIPLE and [GPMC\\_CONFIG1\\_i\[28\]](#) WRITMULTIPLE bits (where  $i = 0$  to 7) are associated with the READTYPE and WRITETYPE parameters.

---

**NOTE:**

- Asynchronous write page mode is not supported.
  - 8-bit-wide device support is limited to nonburstable devices (READMULTIPLE and WRITEMULTIPLE are ignored).
  - Not applicable to NAND device interfacing
- 

#### 15.4.4.10.5 System Burst vs External Device Burst Support

The device system can issue the following requests to the GPMC:

- Byte, 16-bit word, 32-bit word requests (byte-enable-controlled). This is always a single request from the interconnect point of view.
- Incrementing fixed-length bursts of two, four, and eight words
- Wrapped (critical word access first) fixed-length burst of two, four, or eight words

To process a system request with the optimal protocol, the READMULTIPLE (and READTYPE) and WRITEMULTIPLE (and WRITETYPE) parameters must be set according to the burstable capability (synchronous or asynchronous) of the attached device.

The GPMC access engine issues only fixed-length bursts. The maximum length that can be issued is defined per chip-select by the [GPMC\\_CONFIG1\\_i\[24:23\]](#) ATTACHEDDEVICEPAGELENGTH bit field (where  $i = 0$  to 7). When the value of ATTACHEDDEVICEPAGELENGTH is less than the length of the system burst request (including the appropriate access size adaptation according to the device width), the GPMC splits the system burst request into multiple bursts. Within the specified 4-, 8-, or 16-word value, the value of the ATTACHEDDEVICEPAGELENGTH bit field must correspond to the maximum length burst supported by the memory device configured in fixed-length burst mode (as opposed to continuous burst mode).

To get optimal performance from memory devices that natively support 16 Word16-length-wrapping burst capability (critical word access first), the ATTACHEDDEVICEPAGELENGTH parameter must be set to 16 words and the [GPMC\\_CONFIG1\\_i\[31\]](#) WRAPBURST bit (where  $i = 0$  to 7) must be set to 1. Similarly DEVICEPAGELENGTH is set to 4 and 8 for memories supporting 4 and 8 Word16-length-wrapping burst, respectively.

When the memory device does not offer (or is not configured to offer) native 16 Word16-length-wrapping burst, the WRAPBURST parameter must be cleared, and the GPMC access engine emulates the wrapping burst by issuing the appropriate burst sequences according to the value of ATTACHEDDEVICEPAGELENGTH.

When the memory device does not support native-wrapping burst, there is usually no difference in behavior between a fixed-burst length mode and a continuous-burst mode configuration (except for a potential power increase from a memory-speculative data prefetch in a continuous burst read). However, even though continuous burst mode is compatible with GPMC behavior, because the GPMC access engine issues only fixed-length burst and does not benefit from continuous burst mode, it is best to configure the memory device in fixed-length burst mode.

The memory device maximum-length burst (configured in fixed-length burst wrap or nonwrap mode) usually corresponds to the memory device data buffer size. Memory devices with a minimum of 16 half-word buffers are the most appropriate (especially with wrap support), but memory devices with smaller buffer size (4 or 8) are also supported, assuming that the [GPMC\\_CONFIG1\\_i\[24:23\]](#) ATTACHEDDEVICEPAGELENGTH bit field is set accordingly to 4 or 8 words.

The device system issues only requests with addresses or starting addresses for nonwrapping burst requests; that is, the request size boundary is aligned. In case of an eight-word-wrapping burst, the wrapping address always occurs on the eight-word boundary. As a consequence, all words requested must be available from the memory data buffer when the buffer size is equal to or greater than the value of ATTACHEDDEVICEPAGELENGTH. This usually means that data can be read from or written to the buffer at a constant rate (number of cycles between data) without wait-states between data accesses. If the memory does not behave this way (nonzero wait-state burstable memory), wait pin monitoring must be enabled to dynamically control data access completion within the burst.

---

**NOTE:** When the system burst request length is less than the value of ATTACHEDDEVICEPAGELENGTH, the GPMC proceeds with the required accesses.

---

#### 15.4.4.11 pSRAM Access Specificities

pSRAM devices are SRAM-pin-compatible low-power memories that contain a self-refreshed DRAM memory array. The [GPMC\\_CONFIG1\\_i\[11:10\]](#) DEVICETYPE bit field (where  $i = 0$  to 7) must be set to 0b00.

The pSRAM device uses the NOR protocol. It supports the following operations:

- Asynchronous single read
- Asynchronous page read
- Asynchronous single write
- Synchronous single read and write
- Synchronous burst read
- Synchronous burst write (not supported by NOR flash memory)

pSRAM devices must be powered up and initialized in a predefined manner according to the specifications of the attached device.

pSRAM devices can be programmed to use either mode: fixed or variable latency. pSRAM devices can automatically schedule autorefresh operations, which force the GPMC to use its WAIT signal capability when read or write operations occur during an internal self-refresh operation, or they can automatically include the autorefresh operation in the access time. These devices do not require additional WAIT signal capability or a minimum nCS high pulse width between consecutive accesses to ensure that the correct internal refresh operation is scheduled.

#### 15.4.4.12 NAND Access Description

NAND (8-bit and 16-bit) memory devices using a standard NAND asynchronous address/data-multiplexing scheme can be supported on any chip-select with the appropriate asynchronous configuration settings.

As for any other type of memory compatible with the GPMC interface, accesses to a chip-select allocated to a NAND device can be interleaved with accesses to chip-selects allocated to other external devices.

This interleaved capability limits the system to *chip enable don't care* NAND devices, because the chip-select allocated to the NAND device must be deasserted if accesses to other chip-selects are requested.

##### 15.4.4.12.1 NAND Memory Device in Byte or 16-bit Word Stream Mode

NAND devices require correct command and address programming before data array read or write accesses. The GPMC does not include specific hardware to translate a random address system request into a NAND-specific multiphase access. In that sense, GPMC NAND support, as opposed to random memory-map device support, is data stream-oriented (byte or 16-bit word).

The GPMC NAND programming model relies on a software driver for address and command formatting with the correct data address pointer value according to the block and page structure. Because of NAND structure and protocol interface diversity, the GPMC does not support automatic command and address phase programming, and software drivers must access the NAND device ID to ensure that correct command and address formatting are used for the identified device.

NAND device data read and write accesses are achieved through an asynchronous read or write access. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Any chip-select region can be qualified as a NAND region to constrain the nADV/ALE signal as ALE (ALE active high, default state value at low) during address program access, and the nBE0/CLE signal as CLE (CLE active high, default state value at low) during command program access. GPMC address lines are not used (the previous value is not changed) during NAND access.

#### 15.4.4.12.1.1 Chip-Select Configuration for NAND Interfacing in Byte or Word Stream Mode

The [GPMC\\_CONFIG7\\_i](#) register (where  $i = 0$  to 7) associated with a NAND device region interfaced in byte or word stream mode can be initialized with a minimum size of 16MiB, because any address location in the chip-select memory region can be used to access a NAND data array. The NAND flash protocol specifies an address sequence where address bits are passed through the data bus in a series of write accesses with the ALE pin asserted. After this address phase, all operations are streamed and the system requests address is irrelevant.

#### CAUTION

To allow correct command, address, and data-access controls, the [GPMC\\_CONFIG1\\_i](#) register associated with a NAND device region must be initialized in asynchronous read and write modes with the parameters listed in [Table 15-455](#). Failure to comply with these settings corrupts the NAND interface protocol.

**Table 15-455. Chip-Select Configuration for NAND Interfacing**

Bit Field	Register	Value	Comments
WRAPBURST	<a href="#">GPMC_CONFIG1_i</a> [31] <sup>(1)</sup>	0	No wrap
READMULTIPLE	<a href="#">GPMC_CONFIG1_i</a> [30]	0	Single access
READTYPE	<a href="#">GPMC_CONFIG1_i</a> [29]	0	Asynchronous mode
WRITEMULTIPLE	<a href="#">GPMC_CONFIG1_i</a> [28]	0	Single access
WRITETYPE	<a href="#">GPMC_CONFIG1_i</a> [27]	0	Asynchronous mode
CLKACTIVATIONTIME	<a href="#">GPMC_CONFIG1_i</a> [26:25]	0b00	
ATTACHEDDEVICEPAGELENGTH	<a href="#">GPMC_CONFIG1_i</a> [24:23]	Don't care	Single-access mode
WAITREADMONITORING	<a href="#">GPMC_CONFIG1_i</a> [22]	0	Wait not monitored by GPMC access engine
WAITWRITEMONITORING	<a href="#">GPMC_CONFIG1_i</a> [21]	0	Wait not monitored by GPMC access engine
WAITMONITORINGTIME	<a href="#">GPMC_CONFIG1_i</a> [19:18]	Don't care	Wait not monitored by GPMC access engine
WAITPINSELECT	<a href="#">GPMC_CONFIG1_i</a> [17:16]		Select which wait is monitored by edge detectors
DEVICESTYPE	<a href="#">GPMC_CONFIG1_i</a> [13:12]	0b00 or 0b01	8- or 16-bit interface
DEVICETYPE	<a href="#">GPMC_CONFIG1_i</a> [11:10]	0b10	NAND device in stream mode
MUXADDDATA	<a href="#">GPMC_CONFIG1_i</a> [9:8]	0b00	Nonmultiplexed mode

<sup>(1)</sup>  $i = 0$  to 7

**Table 15-455. Chip-Select Configuration for NAND Interfacing (continued)**

Bit Field	Register	Value	Comments
TIMEPARAGRANULARITY	<a href="#">GPMC_CONFIG1_i[4]</a>	0	Timing achieved with best GPMC clock granularity
GPMCFCLKDIVIDER	<a href="#">GPMC_CONFIG1_i[1:0]</a>	Don't care	Asynchronous mode

The [GPMC\\_CONFIG1\\_i](#) to [GPMC\\_CONFIG4\\_i](#) registers (where  $i = 0$  to  $7$ ) associated with a NAND device region must be initialized with the correct control-signal timing value according to the NAND device timing parameters.

#### 15.4.4.12.1.2 NAND Device Command and Address Phase Control

NAND devices require multiple address programming phases. The MPU software driver must issue the correct number of command and address program accesses, according to the device command set and the device address-mapping scheme.

NAND device-command and address-phase programming is achieved through write requests to the [GPMC\\_NAND\\_COMMAND\\_i](#) and [GPMC\\_NAND\\_ADDRESS\\_i](#) register locations (where  $i = 0$  to  $7$ ) with the correct command and address values. These locations are mapped in the associated chip-select register region. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Command and address values are not latched during the access and cannot be read back at the register location.

- Only write accesses must be issued to these locations, but the GPMC does not discard any read access. Accessing a NAND device with nOE and CLE or ALE asserted (read access) can produce undefined results.
- Write accesses to the [GPMC\\_NAND\\_COMMAND\\_i](#) and [GPMC\\_NAND\\_ADDRESS\\_i](#) register locations must be posted for faster operations (where  $i = 0$  to  $7$ ). The [GPMC\\_CONFIG\[0\]](#) NANDFORCEPOSTEDWRITE bit enables write accesses to these locations as posted, even if they are defined as nonposted.

A write buffer is used to store write transaction information before the external device is accessed:

- Up to eight consecutive posted write accesses can be accepted and stored in the write buffer.
- For nonposted write, the pipeline is one deep.
- An [GPMC\\_STATUS\[0\]](#) EMPTYWRITEBUFFERSTATUS bit stores the empty status of the write buffer.

The [GPMC\\_NAND\\_COMMAND\\_i](#) and [GPMC\\_NAND\\_ADDRESS\\_i](#) registers (where  $i = 0$  to  $7$ ) are 32-bit word locations, which means any 32- or 16-bit word access is split into 4- or 2-byte accesses if an 8-bit-wide NAND device is attached. For multiple-command phase or multiple-address phase, the software driver can use 32- or 16-bit word access to these registers, but it must consider the splitting and little-endian ordering scheme. When only one byte command or address phase is required, only byte write access to the [GPMC\\_NAND\\_COMMAND\\_i](#) and [GPMC\\_NAND\\_ADDRESS\\_i](#) registers can be used, and any of the four byte locations of the registers is valid.

The same applies to a [GPMC\\_NAND\\_COMMAND\\_i](#) and a [GPMC\\_NAND\\_ADDRESS\\_i](#) (where  $i = 0$  to  $7$ ) 32-bit word write access to a 16-bit-wide NAND device (split into two 16-bit word accesses). In the case of a 16-bit word write access, the MSByte of the 16-bit word value must be set according to the NAND device requirement (usually 0). Either 16-bit word location or any one of the four byte locations of the registers is valid.

#### 15.4.4.12.1.3 Command Latch Cycle

Writing data at the [GPMC\\_NAND\\_COMMAND\\_i](#) location (where  $i = 0$  to  $7$ ) places the data as the NAND command value on the bus, using a regular asynchronous write access.

- nCE is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- CLE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.
- nWE is controlled by the WEONTIME and WEOFFTIME timing parameters.

- ALE and nRE (nOE) are maintained inactive.

Figure 15-80 shows the NAND command latch cycle.

**Figure 15-80. NAND Command Latch Cycle**

**NOTE:** CLE is shared with the nBE0 output signal and has an inverted polarity from BE0. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, nBE0 (also nBE1) must not toggle, because it is shared with CLE.

NAND flash memories do not use byte-enable signals.

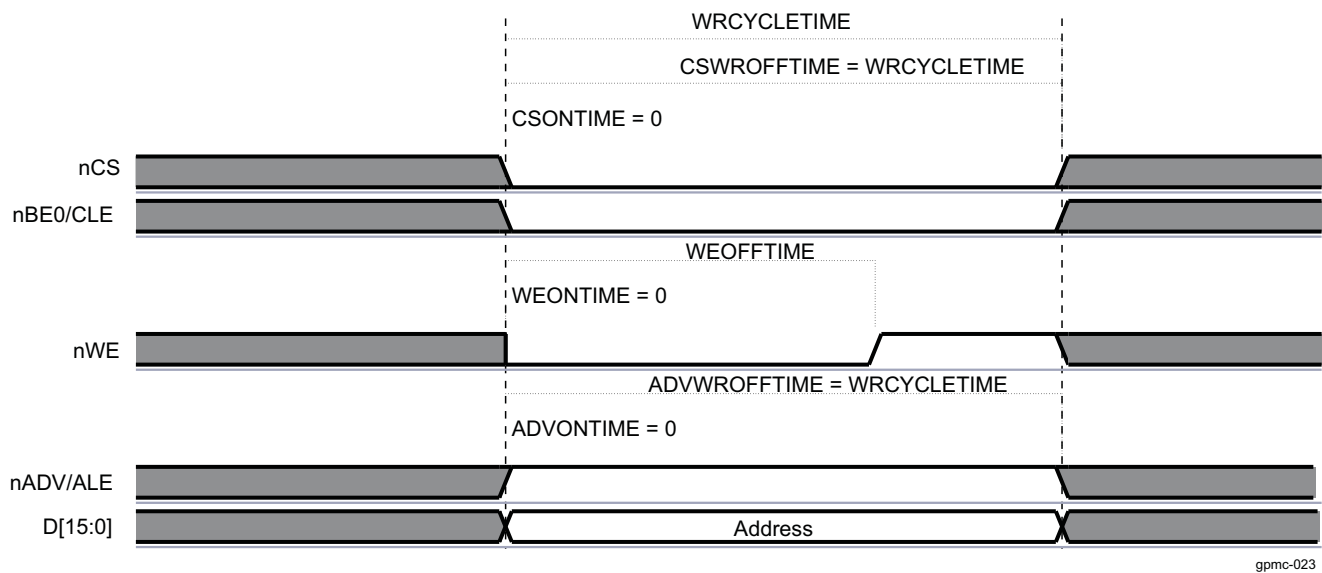

gpmc-022

#### 15.4.4.12.1.4 Address Latch Cycle

Writing data at the [GPMC\\_NAND\\_ADDRESS\\_i](#) location (where  $i = 0$  to 7) places the data as the NAND partial address value on the bus, using a regular asynchronous write access.

- nCS is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- ALE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.
- nWE is controlled by the WEONTIME and WEOFFTIME timing parameters.
- CLE and nRE (nOE) are maintained inactive.

Figure 15-81 shows the NAND address latch cycle.

**Figure 15-81. NAND Address Latch Cycle**

**NOTE:** ALE is shared with the nADV output signal and has an inverted polarity from ADV. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, ALE is kept stable.

#### 15.4.4.12.1.5 NAND Device Data Read and Write Phase Control in Stream Mode

NAND device data read and write accesses are achieved through a read or write request to the chip-select-associated memory region at any address location in the region or through a read or write request to the `GPMC_NAND_DATA_i` location (where  $i = 0$  to  $7$ ) mapped in the chip-select-associated control register region. `GPMC_NAND_DATA_i` is not a true register, but an address location to enable nRE or nWE signal control. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Reading data from the `GPMC_NAND_DATA_i` location or from any location in the associated chip-select memory region activates an asynchronous read access.

- nCS is controlled by the CSONTIME and CSRDOFFTIME timing parameters.
- nRE is controlled by the OEONTIME and OEOFFTIME timing parameters.
- To take advantage of nRE high-to-data invalid minimum timing value, RDACCESSTIME can be set so that data are effectively captured after nRE deassertion. This allows optimization of NAND read access cycle time completion. For optimal timing parameter settings, see the NAND device and the device timing parameters.

ALE, CLE, and nWE are maintained inactive.

Figure 15-82 shows the NAND data read cycle.

Figure 15-82. NAND Data Read Cycle

gpmc-024

Writing data to the [GPMC\\_NAND\\_DATA\\_i](#) location or to any location in the associated chip-select memory region activates an asynchronous write access.

- nCS is controlled by the CS ONTIME and CSWROFFTIME timing parameters.
- nWE is controlled by the WE ONTIME and WEOFFTIME timing parameters.
- ALE, CLE, and nRE (nOE) are maintained inactive.

Figure 15-83 shows the NAND data write cycle.

Figure 15-83. NAND Data Write Cycle

gpmc-025

#### 15.4.4.12.1.6 NAND Device General Chip-Select Timing Control Requirement

For most NAND devices, read data access time is dominated by nCS-to-data-valid timing and has faster nRE-to-data-valid timing. Successive accesses with nCS deassertions between accesses are affected by this timing constraint. Because accesses to a NAND device can be interleaved with other chip-select accesses, there is no certainty that nCS always stays low between two accesses to the same chip-select. Moreover, an nCS deassertion time between the same chip-select NAND accesses is likely to be required as follows: the nCS deassertion requires programming CYCLETIME and RDACCESSTIME according to the nCS-to-data-valid critical timing.

To get full performance from NAND read and write accesses, the prefetch engine can dynamically reduce the following on back-to-back NAND accesses (to the same memory) and suppress the minimum nCS high pulse width between accesses:

- RDCYCLETIME
- WRCYCLETIME
- RDACCESSTIME
- WRACCESSTIME
- CSRDOFFTIME
- CSWROFFTIME
- ADVRDOFFTIME
- ADVWROFFTIME
- OEOFFTIME
- WEOFFTIME

For more information about optimal prefetch engine access, see [Section 15.4.4.12.4](#), *Prefetch and Write-Posting Engine*.

Some NAND devices require minimum write-to-read idle time, especially for device-status read accesses following status-read command programming (write access). If such write-to-read transactions are used, a minimum nCS high pulse width must be set. For this, CYCLE2CYCLESAMEECSEN and CYCLE2CYCLEDELAY must be set according to the appropriate timing requirement to prevent any timing violation.

NAND devices usually have an important nRE high-to-data bus in three-state mode. This requires a bus turnaround setting (BUSTURNAROUND = 1) so that the next access to a different chip-select is delayed until the BUSTURNAROUND delay completes. Back-to-back NAND read accesses to the same NAND flash are not affected by the programmed bus turnaround delay.

#### **15.4.4.12.1.7 Read and Write Access Size Adaptation**

##### **15.4.4.12.1.7.1 8-Bit-Wide NAND Device**

Host 16- and 32-bit word read and write access requests to a chip-select associated with an 8-bit-wide NAND device are split into successive read and write byte accesses to the NAND memory device. Byte access is ordered according to little-endian organization. A NAND 8-bit-wide device must be interfaced on the D0D7 interface bus lane. GPMC data accesses are justified on this bus lane when the cs is associated with an 8-bit-wide NAND device.

##### **15.4.4.12.1.7.2 16-Bit-Wide NAND Device**

Host 32-bit word read and write access requests to a chip-select associated with a 16-bit-wide NAND device are split into successive read and write 16-bit word accesses to the NAND memory device. 16-bit word access is ordered according to little-endian organization.

Host byte read and write access requests to a 16-bit-wide NAND device are completed as 16-bit accesses on the device itself, because there is no byte-addressing capability on 16-bit-wide NAND devices. This means that the NAND device address pointer is incremented on a 16-bit word basis and not on a byte basis. For a read access, only the requested byte is given back to the host, but the remaining byte is not stored or saved by the GPMC, and the next byte or 16-bit word read access gets the next 16-bit word NAND location. For a write access, the invalid byte part of the 16-bit word is driven to FF, and the next byte or 16-bit word write access programs the next 16-bit word NAND location.

Generally, byte access to a 16-bit-wide NAND device must be avoided, especially when ECC calculation is enabled. 8- or 16-bit ECC-based computations are corrupted by a byte read to a 16-bit-wide NAND device, because the nonrequested byte is considered invalid on a read access (not captured on the external data bus; FF is fed to the ECC engine) and is set to FF on a write access.

Host requests (read/write) issued in the chip-select memory region are translated in successive single or split accesses (read/write) to the attached device. Therefore, incrementing 32-bit burst requests are translated in multiple 32-bit sequential accesses following the access adaptation of the 32-bit to 8- or 16-bit device.

#### 15.4.4.12.2 NAND Device-Ready Pin

The NAND memory device provides a ready pin to indicate data availability after a block/page opening and to indicate that data programming is complete. The ready pin can be connected to one of the wait GPMC input pins; data read accesses must not be tried when the ready pin is sampled inactive (device is not ready) even if the associated chip-select WAITREADMONITORING bit field is set. The duration of the NAND device busy state after the block/page opening is so long (up to 50 micro second) that accesses occurring when the ready pin is sampled inactive can stall GPMC access and eventually cause a system time-out.

---

**NOTE:** If a read access to a NAND flash is done using wait monitoring mode, the device is blocked during a page opening, and so is the GPMC. If the correct settings are used, other chip-selects can be used while the memory processes the page opening command.

To avoid a time-out caused by a block/page opening delay in NAND flash, disable the wait pin monitoring for read and write accesses (that is, set the [GPMC\\_CONFIG1\\_i\[21\]](#) WAITWRITEMONITORING and [GPMC\\_CONFIG1\\_i\[22\]](#) WAITREADMONITORING bits to 0, where  $i = 0$  to 7), and use one of the following methods instead:

- Use software to poll the WAITxSTATUS bit (where  $x = 0$  to 2) of the [GPMC\\_STATUS](#).
- Configure an interrupt that is generated on the WAIT signal change (through the [GPMC\\_IRQENABLE](#) register bits[11:8]).

Even if the READWAITMONITORING bit is not set, the external memory nR/B pin status is captured in the programmed wait bit in the [GPMC\\_STATUS](#) register.

The READWAITMONITORING bit method must be used for other memories than NAND flash, if they require the use of a WAIT signal.

---

##### 15.4.4.12.2.1 Ready Pin Monitored by Software Polling

The ready signal state can be monitored through the [GPMC\\_STATUS](#) WAITxSTATUS bit (where  $x = 0$  to 2). Software must monitor the ready pin only when the signal is declared valid. Refer to the NAND device timing parameters to set the correct software temporization to monitor ready only after the invalid window is complete from the last read command written to the NAND device.

##### 15.4.4.12.2.2 Ready Pin Monitored by Hardware Interrupt

Each gpmc\_wait input pin can generate an interrupt when a wait-to-no-wait transition is detected. Depending on whether the [GPMC\\_CONFIG](#) WAITxPINPOLARITY bits (where  $x = 0$  to 2) is active low or active high, the wait-to-no-wait transition is a low-to-high external WAIT signal transition or a high-to-low external WAIT signal transition, respectively.

The wait transition pin detector must be cleared before any transition detection. This is done by writing 1 to the WAITxEDGEDETECTIONSTATUS bit (where  $x = 0$  to 2) of the [GPMC\\_IRQSTATUS](#) register according to the gpmc\_wait pin used for the NAND device-ready signal monitoring. To detect a wait-to-no-wait transition, the transition detector requires a wait active time detection of a minimum of two [GPMC\\_FCLK](#) cycles. Software must incorporate precautions to clear the wait transition pin detector before wait (busy) time completes.

A wait-to-no-wait transition detection can issue a GPMC interrupt if the WAITxEDGEDETECTIONENABLE bit in the [GPMC\\_IRQENABLE](#) register is set and if the WAITxEDGEDETECTIONSTATUS bit field in the [GPMC\\_IRQSTATUS](#) register is set.

The WAITMONITORINGTIME bit field does not affect wait-to-no-wait transition time detection.

It is also possible to poll the WAITxEDGEDETECTIONSTATUS bit field in the [GPMC\\_IRQSTATUS](#) register according to the gpmc\_wait pin used for NAND device ready signal monitoring.

### 15.4.4.12.3 ECC Calculator

The GPMC includes an error code correction (ECC) calculator circuitry that enables ECC calculation on the fly during data read or data program (that is, write) operations. The page size supported by the ECC calculator in one calculation/context is 512 bytes.

The user can choose from two different algorithms with different error correction capabilities through the [GPMC\\_ECC\\_CONFIG\[16\]](#) ECCALGORITHM bit:

1. Hamming code for 1-bit error code correction on 8- or 16-bit NAND flash organized with page size greater than 512 bytes
2. Bose-Chaudhuri-Hocquenghem (BCH) code for 4- to 16-bit error correction

The GPMC does not handle the error code correction directly. During writes, the GPMC computes parity bits. During reads, the GPMC provides enough information for the processor to correct errors without reading the data buffer all over again.

The Hamming code ECC is based on a 2-dimensional (2D) (row and column) bit parity accumulation. This parity accumulation is accomplished on the programmed number of bytes or 16-bit words read from the memory device, or is written to the memory device in stream mode.

Because the ECC engine includes only one accumulation context, it can be allocated to only one chip-select at a time through the [GPMC\\_ECC\\_CONFIG\[3:1\]](#) ECCCS bit field. Even if two chip-selects use different ECC algorithms, one the Hamming code and the other a BCH code, they must define separate ECC contexts because some of the ECC registers are common to all types of algorithms.

#### 15.4.4.12.3.1 Hamming Code

All references to ECC in this subsection refer to the 1-bit error correction Hamming code.

The ECC is based on a 2D (row and column) bit parity accumulation known as the Hamming code. The parity accumulation is done for a programmed number of bytes or 16-bit word read from the memory device or written to the memory device in stream mode.

There is no automatic error detection or correction, and the software NAND driver must read the multiple ECC calculation results, compare them to the expected code value, and take the appropriate corrective actions according to the error handling strategy (ECC storage in spare byte, error correction on read, block invalidation).

The ECC engine includes a single accumulation context. It can be allocated to a single designated chip-select at a time, and parallel computations on different chip-selects are not possible. Because it is allocated to a single chip-select, the ECC computation is not affected by interleaved GPMC accesses to other chip-selects and devices. The ECC accumulation is sequentially processed in the order of data read from or written to the memory on the designated chip-select. The ECC engine does not differentiate read accesses from write accesses and does not differentiate data from command or status information. Software must ensure that only relevant data are passed to the NAND flash memory while the ECC computation engine is active.

The starting NAND page location must be programmed first, followed by an ECC accumulation context reset with an ECC enabling, if required. The NAND device accesses discussed in the following sections must be limited to data read or write until the specified number of ECC calculations is complete.

#### 15.4.4.12.3.1.1 ECC Result Register and ECC Computation Accumulation Size

The GPMC includes up to nine ECC result registers ([GPMC\\_ECCj\\_RESULT](#), where  $j = 1$  to 9) to store ECC computation results when the specified number of bytes or 16-bit words has been computed.

The ECC result registers are used sequentially: one ECC result is stored in one ECC result register on the list, the next ECC result is stored in the next ECC result register on the list, and so forth, until the last ECC computation. The value of the [GPMC\\_ECCj\\_RESULT](#) register is valid only when the programmed number of bytes or 16-bit words has been accumulated, which means that the same number of bytes or 16-bit words has been read from or written to the NAND device in sequence.

The [GPMC\\_ECC\\_CONTROL\[3:0\]](#) ECCPOINTER bit field must be set to the correct value to select the ECC result register to be used first in the list for the incoming ECC computation process. The ECCPointer can be read to determine which ECC register is used in the next ECC result storage for the ongoing ECC computation. The value of the [GPMC\\_ECCj\\_RESULT](#) register (where j = 1 to 9) can be considered valid when ECCPOINTER equals j + 1. When the [GPMC\\_ECCj\\_RESULT](#) register (where j = 9) is updated, ECCPOINTER is frozen at 10, and ECC computing is stopped (ECCENABLE = 0).

The ECC accumulator must be reset before any ECC computation accumulation process. The [GPMC\\_ECC\\_CONTROL\[8\]](#) ECCCLEAR bit must be set to 1 (nonpersistent bit) to clear the accumulator and all ECC result registers.

For each ECC result (each [GPMC\\_ECCj\\_RESULT](#) register, where j = 1 to 9), the number of bytes or 16-bit words used for ECC computing accumulation can be selected from between two programmable values.

The ECCjRESULTSIZES bits (where j = 1 to 9) in the [GPMC\\_ECC\\_SIZE\\_CONFIG](#) register select which programmable size value (ECCSIZE0 or ECCSIZE1) must be used for this ECC result (stored in the [GPMC\\_ECCj\\_RESULT](#) register).

The ECCSIZE0 and ECCSIZE1 bit fields allow selection of the number of bytes or 16-bit words used for ECC computation accumulation. Any even values from 2 to 512 are allowed.

Flexibility in the number of ECCs computed and the number of bytes or 16-bit words used in the successive ECC computations enables different NAND page error-correction strategies. Usually based on 256 or 512 bytes and on 128 or 256 16-bit word, the number of ECC results required is a function of the NAND device page size. Specific ECC accumulation size can be used when computing the ECC on the NAND spare byte.

For example, with a 2-KiB data page, 8-bit-wide NAND device, eight ECCs accumulated on 256 bytes can be computed and added to one extra ECC computed on the 24 spare bytes area where the eight ECC results used for comparison and correction with the computed data page ECC are stored. The GPMC then provides nine [GPMC\\_ECCj\\_RESULT](#) registers (j = 1 to 9) to store the results. In this case, ECCSIZE0 is set to 256, and ECCSIZE1 is set to 24; the ECC[1:8] RESULTSIZES bits are set to 0, and the ECC9RESULTSIZES bit is set to 1.

#### 15.4.4.12.3.1.2 ECC Enabling

The [GPMC\\_ECC\\_CONFIG\[3:1\]](#) ECCCS bit field selects the allocated chip-select. The [GPMC\\_ECC\\_CONFIG\[0\]](#) ECCENABLE bit enables ECC computation on the next detected read or write access to the selected chip-select.

The following fields must not be changed or cleared while an ECC computation is in progress:

- CCPOINTER
- ECCCLEAR
- ECCSIZE
- ECCjRESULTSIZES (where j = 1 to 9)
- ECC16B
- ECCCS

The ECC accumulator and ECC result register must not be changed or cleared while an ECC computation is in progress.

[Table 15-456](#) describes the ECC enable settings.

**Table 15-456. ECC Enable Settings**

Bit Field	Register	Value	Comments
ECCCS	<a href="#">GPMC_ECC_CONFIG</a>	0–3	Selects the chip-select where ECC is computed
ECC16B	<a href="#">GPMC_ECC_CONFIG</a>	0/1	Selects column number for ECC calculation
ECCCLEAR	<a href="#">GPMC_ECC_CONTROL</a>	0–7	Clears all ECC result registers
ECCPOINTER	<a href="#">GPMC_ECC_CONTROL</a>	0–7	A write to this bit field selects the ECC result register where the first ECC computation is stored. Set to 1 by default.

**Table 15-456. ECC Enable Settings (continued)**

Bit Field	Register	Value	Comments
ECCSIZE1	GPMC_ECC_SIZE_CONFIG	0x00–0xFF	Defines ECCSIZE1
ECCSIZE0	GPMC_ECC_SIZE_CONFIG	0x00–0xFF	Defines ECCSIZE0
ECCjRESULTSIZE (j from 1 to 9)	GPMC_ECC_SIZE_CONFIG	0/1	Selects the size of ECCn result register
ECCENABLE	GPMC_ECC_CONFIG	1	Enables the ECC computation

**15.4.4.12.3.1.3 ECC Computation**

The ECC algorithm is a multiple parity bit accumulation computed on the odd and even bit streams extracted from the byte or Word16 streams. The parity accumulation is split into row and column accumulations, as shown in Figure 15-84 and Figure 15-85. The intermediate row and column parities are used to compute the upper level row and column parities. Only the final computation of each parity bit is used for ECC comparison and correction.

P1o = bit7 XOR bit5 XOR bit3 XOR bit1 on each byte of the data stream

P1e = bit6 XOR bit4 XOR bit2 XOR bit0 on each byte of the data stream

P2o = bit7 XOR bit6 XOR bit3 XOR bit2 on each byte of the data stream

P2e = bit5 XOR bit4 XOR bit1 XOR bit0 on each byte of the data stream

P4o = bit7 XOR bit6 XOR bit5 XOR bit4 on each byte of the data stream

P4e = bit3 XOR bit2 XOR bit1 XOR bit0 on each byte of the data stream

Each column parity bit is XORed with the previous accumulated value.

**Figure 15-84. Hamming Code Accumulation Algorithm (1/2)**

gpmc-026

For line parities, the bits of each new data are XORed together, and line parity bits are computed as described below:

P8e = row0 XOR row2 XOR row4 XOR ... XOR row254

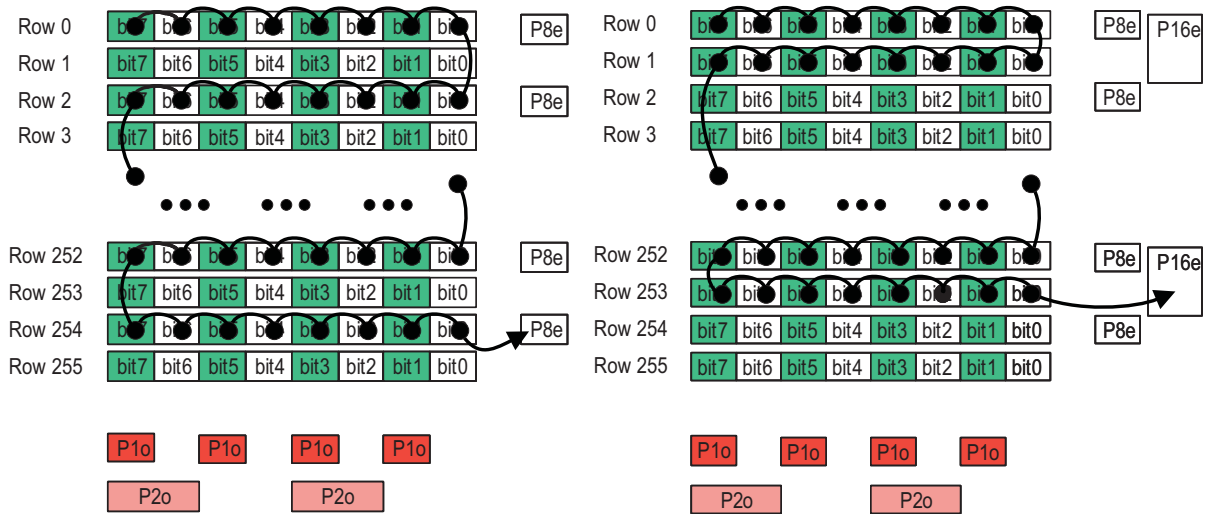

P8o = row1 XOR row3 XOR row5 XOR ... XOR row255

P16e = row0 XOR row1 XOR row4 XOR row5 XOR ... XOR row252 XOR row 253

P16o = row2 XOR row3 XOR row6 XOR row7 XOR ... XOR row254 XOR row 255

Figure 15-85. Hamming Code Accumulation Algorithm (2/2)

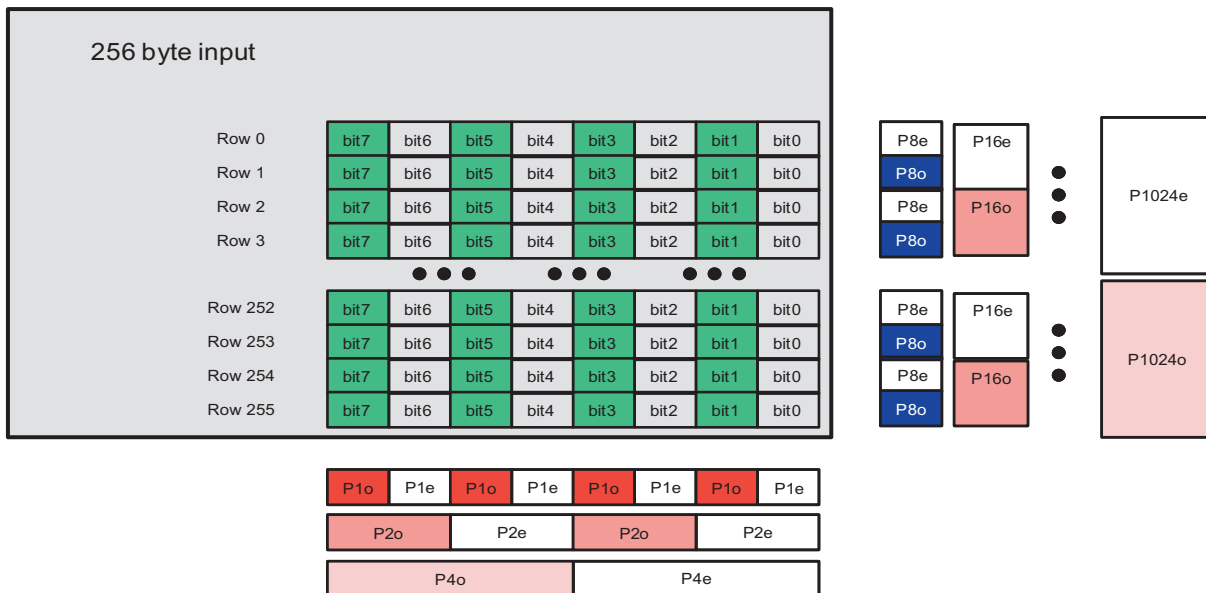

gpmc-027

Unused parity bits in the result registers are set to 0.

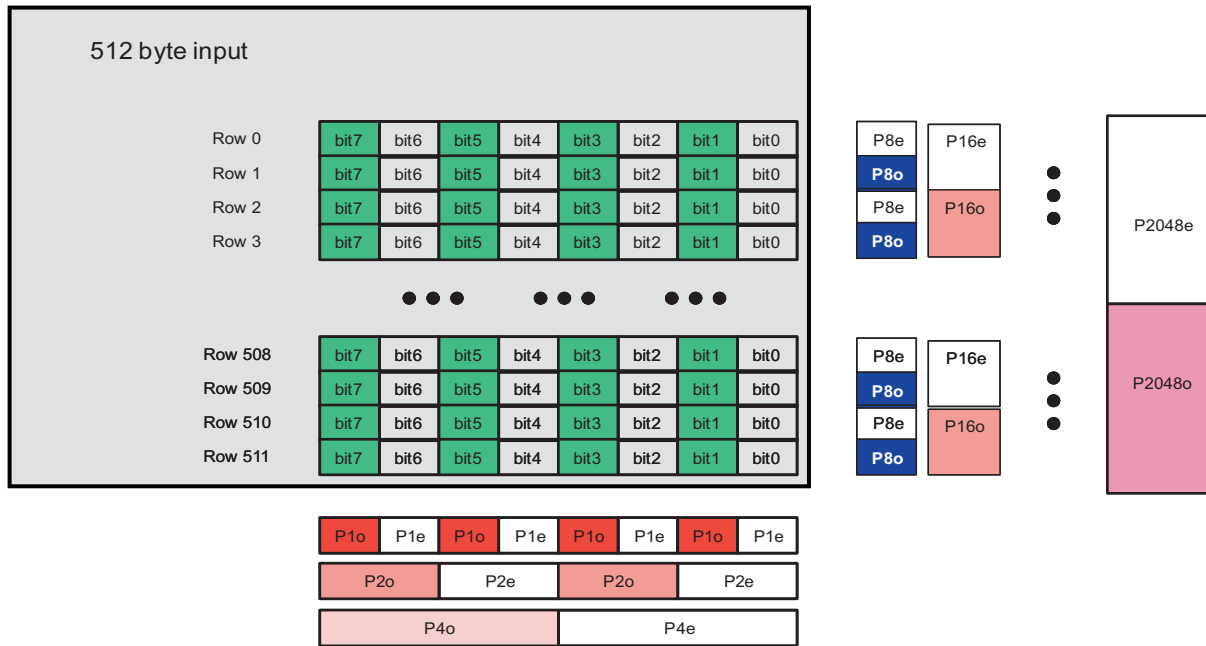

Figure 15-86 shows ECC computation for a 256-byte data stream (read or write). The result includes six column parity bits (P1o-P2o-P4o for odd parities, and P1e-P2e-P4e for even parities) and sixteen row parity bits (P8o-P16o-P32o--P1024o for odd parities, and P8e-P16e-P32e--P1024e for even parities).

Figure 15-86. ECC Computation for a 256-Byte Data Stream (Read or Write)

gpmc-028

Figure 15-87 shows ECC computation for a 512-byte data stream (read or write). The result includes six column parity bits (P1o-P2o-P4o for odd parities, and P1e-P2e-P4e for even parities) and eighteen row parity bits (P8o-P16o-P32o--P1024o- - P2048o for odd parities, and P8e-P16e-P32e--P1024e- P2048e for even parities).

**Figure 15-87. ECC Computation for a 512-Byte Data Stream (Read or Write)**

gpmc-029

For a 2-KiB page, four 512 bytes ECC calculations plus 1 for the spare area are required. Results are stored in the [GPMC\\_ECCj\\_RESULT](#) registers (where  $j = 1$  to 9).

#### 15.4.4.12.3.1.4 ECC Comparison and Correction

To detect an error, the computed ECC result must be XORed with the parity value stored in the spare area of the accessed page.

- If the result of this logical XOR is all 0s, no error is detected and the read data is correct.
- If every second bit in the parity result is a 1, 1 bit is corrupted and is located at bit address (P2048o, P1024o, P512o, P256o, P128o, P64o, P32o, P16o, P8o, P4o, P2o, P1o). Software must correct the corresponding bit.
- If only 1 bit in the parity result is 1, it is an ECC error and the read data is correct.

#### 15.4.4.12.3.1.5 ECC Calculation Based on 8-Bit Word

The 8-bit-based ECC computation is used for 8-bit-wide NAND device interfacing.

The 8-bit-based ECC computation can be used for 16-bit-wide NAND device interfacing to get backward compatibility on the error-handling strategy used with 8-bit-wide NAND devices. In this case, the 16-bit-wide data read from or written to the NAND device is fragmented into 2 bytes. According to little-endian access, the LSB of the 16-bit-wide data is ordered first in the byte stream used for 8-bit-based ECC computation.

#### 15.4.4.12.3.1.6 ECC Calculation Based on 16-Bit Word

ECC computation based on an 16-bit word is used for 16-bit-wide NAND device interfacing. This ECC computation is not supported when interfacing an 8-bit-wide NAND device, and the [GPMC\\_ECC\\_CONFIG\[7\]](#) ECC16B bit must be set to 0 when interfacing an 8-bit-wide NAND device.

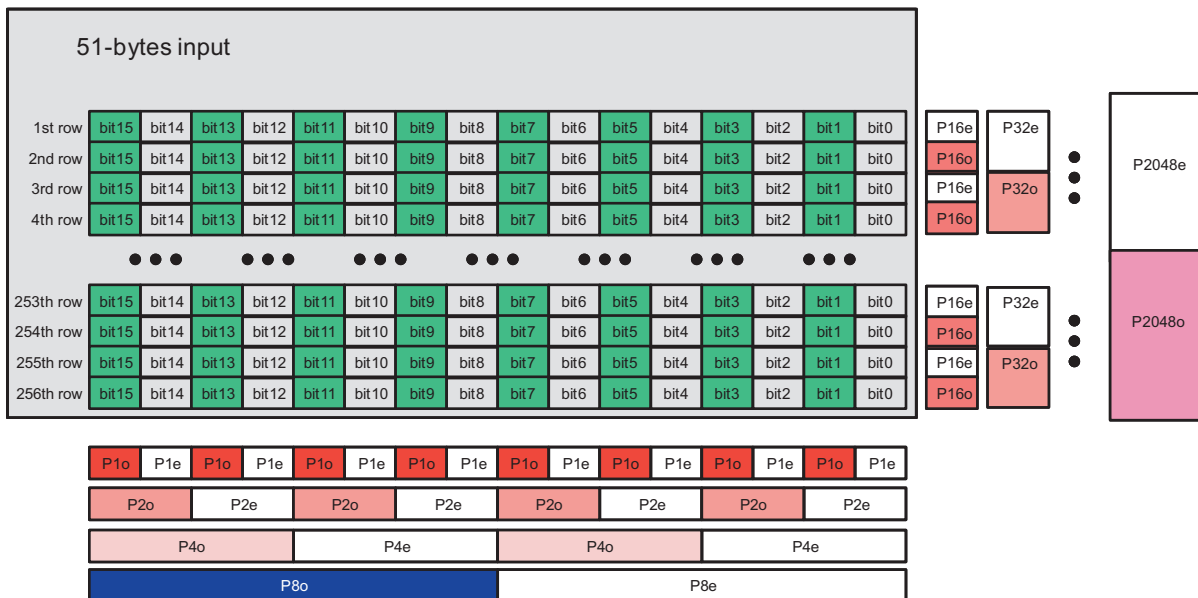

The parity computation based on 16-bit words affects the row and column parity mapping. The main difference is that the odd and even parity bits P8o and P8e are computed on rows for an 8-bit-based ECC and on columns for a 16-bit based ECC. [Figure 15-88](#) and [Figure 15-89](#) show a 128 Word16 ECC computation scheme and a 256 16-bit word ECC computation scheme.

gpmc-030

Figure 15-89. 256 Word16 ECC Computation

gpmc-031

### 15.4.4.12.3.2 BCH Code

All references to ECC in this subsection refer to the 4- to 16-bit error correction BCH code.

#### 15.4.4.12.3.2.1 Requirements

1. Read and write accesses to a NAND flash take place by whole pages, in a predetermined sequence: first the data byte page itself, and then some spare bytes, including the BCH ECC (and other information). The NAND device can cache a full page, including spares, for read and write accesses.
  - Typical page write sequence:
    - Sequential write to NAND cache of main data plus spare data, for a page. ECC is calculated on the fly. Calculated ECC can be inserted on the fly in the spares or replaced by dummy

- accesses.
- When the calculated ECC is replaced by dummy accesses, it must be written to the cache in a second, separate phase. The ECC module is disabled during that time.
  - NAND writes its cache line (page) to the array.
- Typical page read sequence:
    - Sequential read of a page. ECC is calculated on the fly.
    - The status of the ECC module buffers determines the presence of errors.
2. Accesses to several memories can be interleaved by the GPMC, but only one of those memories at a time can be a NAND using the BCH engine; in other words, only one BCH calculation (for example, for a single page) can be ongoing at any time. The sequential nature of NAND accesses ensures that the data is always written or read out in the same order. BCH-relevant accesses are selected by the chip-selects of the GPMC.
  3. Each page can hold up to 4KiB of data, spare bytes not included. This means up to  $8 \times 512$ -byte BCH messages. Because all the data is written or read out first, followed by the BCH ECC, the BCH engine must be able to hold eight 104-bit remainders or syndromes (or smaller, 52-bit ones) at the same time. The BCH module can store all remainders internally. After the page start, an internal counter is used to detect the 512-byte sector boundaries. On those boundaries, the current remainder is stored and the divider reset for the next calculation. At the end of the page, the BCH module contains all remainders.
  4. NAND access cycles hold 8 or 16 bits of data each (1 or 2 bytes); Each NAND cycle takes at least four cycles of the GPMC internal clock. This means the NAND flash timing parameters must define a RDCYCLETIME and a WRCYCLETIME of at least four clock cycles after optimization when using the BCH calculator.
  5. The spare area is assumed to be large enough to hold the BCH ECC; that is, to have a message of at least 13 bytes available per 512-byte sector of data. The zone of unused spare area by the ECC may or may not be protected by the same ECC scheme, by extending the BCH message beyond 512 bytes (the maximum codeword is 1023 bytes long, ECC included, which leaves much space to cover spare bytes).

#### 15.4.4.12.3.2.2 Memory Mapping of BCH Codeword

BCH encoding considers a block of data to protect as a polynomial message  $M(x)$ . In a standard case, 512 bytes of data (that is,  $2^{12}$  bits = 4096 bits) are seen as a polynomial of degree  $2^{12} - 1 = 4095$ , with parameters ranging from  $M_0$  to  $M_{4095}$ . For 512 bytes of data, 52 bits are required for 4-bit error correction, 104 bits are required for 8-bit error correction, and 207 bits are required for 16-bit error correction. The ECC is a remainder polynomial  $R(x)$  of degree 103 (or 51, depending on the selected mode). The complete codeword  $C(x)$  is the concatenation of  $M(x)$  and  $R(x)$ , as described in [Table 15-457](#).

**Table 15-457. Flattened BCH Codeword Mapping (512 Bytes + 104 Bits)**

Bit Number	Message $M(x)$			ECC $R(x)$		
	$M_{4095}$	...	$M_0$	$R_{103}$	...	$R_0$

If the message is extended by the addition of spare bytes to be protected by the same ECC, the principle is still valid. For example, a 3-byte extension of the message gives a polynomial message  $M(x)$  of degree  $((512 + 3) \times 8) - 1 = 4119$ , for a total of  $3 + 13 = 16$  spare bytes of spare, all protected as part of the same codeword.

The message and the ECC bits are manipulated and mapped in the GPMC byte-oriented system. The ECC bits are stored in the following registers (where  $i = 0$  to 7):

- [GPMC\\_BCH\\_RESULT0\\_i](#)
- [GPMC\\_BCH\\_RESULT1\\_i](#)
- [GPMC\\_BCH\\_RESULT2\\_i](#)
- [GPMC\\_BCH\\_RESULT3\\_i](#)

### 15.4.4.12.3.2.2.1 Memory Mapping of Data Message

The data message mapping must follow the following rules:

- Bit endianness within a byte is little-endian; that is, the bytes LSB is also the lowest-degree polynomial parameter: a byte b7-b0 (with b0 the LSB) represents a segment of polynomial  $b7 * x^{(7+i)} + b6 * x^{(6+i)} + \dots + b0 * x^i$
- The message is mapped in the NAND starting with the highest-order parameters, that is, in the lowest addresses of a NAND page.
- Byte endianness within the 16-bit words in the NAND is big-endian (that is, the same message mapped in 8- and 16-bit memories has the same content at the same byte address).

---

**NOTE:** The BCH module has no visibility over actual addresses. The most important point is the sequence of data words the BCH sees. However, the NAND page is always scanned incrementally in read and write accesses, which produces the mapping patterns described in the following.

---

Table 15-458 and Table 15-459 describe the mapping of the same 512-byte vector (typically, a BCH message) in the NAND memory space. The byte address is only an offset modulo 512 (0x200), because the same page may contain several contiguous 512-byte sectors (BCH blocks). The LSB and MSB are, respectively, the bits M0 and M(2<sup>12</sup>-1) of the codeword mapping discussed previously. In both cases the data vectors are aligned; that is, their boundaries coincide with the RAM data word boundaries.

**Table 15-458. Aligned Message Byte Mapping in 8-Bit NAND**

Byte Offset	8-Bit Word
0x000	(MSB) Byte 511 (0x1FF)
0x001	Byte 510 (0x1FE)
...	...
0x1FF	Byte 0 (0x0) (LSB)

**Table 15-459. Aligned Message Byte Mapping in 16-Bit NAND**

Byte Offset	16-Bit Word MSB	16-Bit Word LSB
0x000	Byte 510 (0x1FE)	(MSB) Byte 511 (0x1FF)
0x002	Byte 508 (0x1FC)	Byte 509 (0x1FD)
...	...	...
0x1FE	Byte 0 (0x0)	(LSB) Byte 1 (0x1)

Table 15-460 through Table 15-465 list the mapping in memory of arbitrarily-sized messages, starting on access (byte or 16-bit word) boundaries for more clarity. Note that message may actually start and stop on arbitrary nibbles. A nibble is a 4-bit entity. The unused nibbles are not discarded, and they can still be used by the BCH module, but as part of the next message section (for example, on the ECC of another sector).

**Table 15-460. Aligned Nibble Mapping of Message in 8-Bit NAND**

Byte Offset	8-Bit Word	
	4-Bit Most Significant Nibble	4-Bit Least Significant Nibble
1	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-3	Nibble S-4
...	...	...
$S/2 - 2$	Nibble 3	Nibble 2
$S/2 - 1$	Nibble 1	Nibble 0 (LSB)

**Table 15-461. Misaligned Nibble Mapping of Message in 8-Bit NAND**

Byte Offset	8-Bit Word	
	4-Bit Most Significant Nibble	4-Bit Least Significant Nibble
1	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-3	Nibble S-4
...	...	...
$(S + 1) / 2 - 2$	Nibble 2	Nibble 1
$(S + 1) / 2 - 1$	Nibble 0 (LSB)	

**Table 15-462. Aligned Nibble Mapping of Message in 16-Bit NAND**

Byte Offset	16-Bit Word			
	4-Bit Most Significant Nibble		4-Bit Least Significant Nibble

	4-Bit Most Significant Nibble		4-Bit Least Significant Nibble	
0	Nibble S-3	Nibble S-4	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
...	...	...	...	...
$(S + 2) / 2 - 4$	Nibble 3	Nibble 2	Nibble 5	Nibble 4
$(S + 2) / 2 - 2$			Nibble 1	Nibble 0 (LSB)

**Table 15-465. Misaligned Nibble Mapping of Message in 16-Bit NAND (3 Unused Nibbles)**

Byte Offset	16-Bit Word			
	4-Bit Most Significant Nibble		4-Bit Least Significant Nibble	
0	Nibble S-3	Nibble S-4	(MSB) Nibble S-1	Nibble S-2
2	Nibble S-7	Nibble S-8	Nibble S-5	Nibble S-6
...	...	...	...	...
$(S + 3) / 2 - 4$	Nibble 2	Nibble 1	Nibble 4	Nibble 3
$(S + 3) / 2 - 2$			Nibble 0 (LSB)	

Many other cases exist than those given in the previous tables; for example, where the message does not start on a word boundary.

#### 15.4.4.12.3.2.2 Memory-Mapping of the ECC

The ECC (or remainder) is presented by the BCH module as a single 104-bit (or 52-bit), little-endian vector. Software must fetch those 13 bytes (or 6 bytes) from the module interface and then store them to the spare area (page write) in the NAND or to an intermediate buffer for comparison with the stored ECC (page read). There are no constraints on the ECC mapping inside the spare area: it is software-controlled.

It is advised, however, to maintain a coherence in the respective formats of the message or the ECC remainder once they have been read out of the NAND. The error correction algorithm works from the complete codeword (concatenated message and remainder) once an error is detected. The creation of this codeword must be made as straightforward as possible.

There are cases in which the same NAND access contains both data and the ECC protecting that data. This is the case when the data/ECC boundary (which can be on any nibble) does not coincide with an access boundary. The ECC is calculated on the fly following the write. In that case, the write must also contain part of the ECC because it is impossible to insert the ECC on the fly. Instead:

- During the initial page write (BCH encoding), the ECC is replaced by dummy bits. The BCH encoder is by definition turned OFF during the ECC section, so the BCH result is unmodified.
- During a second phase, the ECC is written to the correct location, next to the actual data.
- The completed line buffer is then written to the NAND array.

#### 15.4.4.12.3.2.3 Wrapping Modes

For a given wrapping mode, the module automatically goes through a specific number of sections as data is being fed into the module. For each section, the BCH core can be enabled (in which case the data is fed to the BCH divider) or not (in which case the BCH simply counts to the end of the section). When enabled, the data is added to the ongoing calculation for a given sector number (for example, number 0).

Wrapping modes are described as follows. To better understand and see the real-life read and write sequences implemented with each mode, see [Section 15.4.4.12.3.2.3, Supported NAND Page Mappings and ECC Schemes](#).

For each mode:

- A sequence describes the mode in pseudo language, with, for each section, the size and the buffer used for ECC processing (if ON). The programmable lengths are size, size0, and size1.
- A checksum condition is given. If the checksum condition is not respected for a given mode, the module behavior is unpredictable. S is the number of sectors in the page; size0 and size1 are the section sizes programmed for the mode, in nibbles.

Wrapping modes 8 through 11 insert a 1-nibble padding where the BCH processing is OFF. This is intended for  $t = 4$  ECC, where ECC is 6 bytes long and the ECC area is expected to include (at least) 1 unused nibble to remain byte-aligned.

#### 15.4.4.12.3.2.4 Manual Mode (0x0)

This mode is intended for short sequences, added manually to a given buffer through the software data port input. A complete page may be built out of several such sequences.

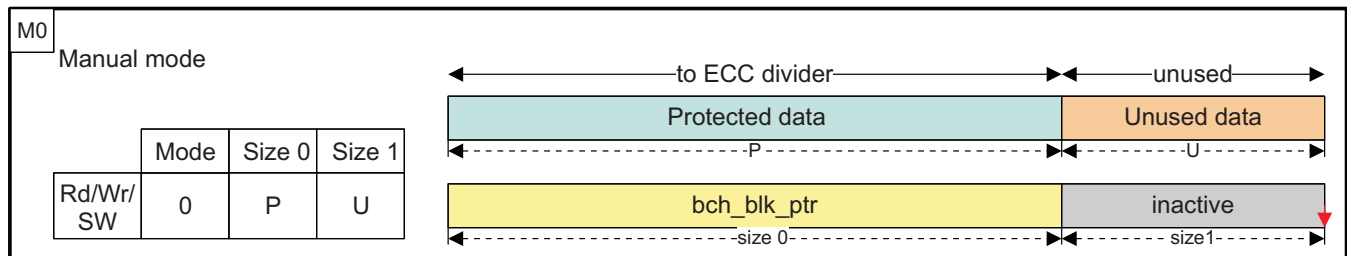

To process an arbitrary sequence of 4-bit nibbles, accesses to the software data port, containing the appropriate data, must be made. If the sequence end does not coincide with an access boundary (for example, to process 5 nibbles = 20 bits in 16-bit access mode) and those nibbles must be skipped, a number of unused nibbles must be programmed in `GPMC_ECC_SIZE_CONFIG[29:22]` `ECCSIZE1`. In the same example, 5 nibbles to process + 3 to discard = 8 nibbles = 2 × 16-bit accesses. Software must set:

- `GPMC_ECC_SIZE_CONFIG[19:12]` `ECCSIZE0` = 0x5
- `GPMC_ECC_SIZE_CONFIG[29:22]` `ECCSIZE1` = 0x3

**NOTE:** In the following figures, size and size0 are the same parameter.

**Figure 15-90. Manual Mode Sequence and Mapping**

gpmc-032

Section processing sequence:

- One time with buffer
  - size0 nibbles of data, processing ON
  - size1 nibbles of unused data, processing OFF

Checksum: size0 + size1 nibbles must fit in a whole number of accesses.

In the following sections, S is the number of sectors in the page.

#### 15.4.4.12.3.2.2.5 Mode 0x1

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S – (size0 + size1)

#### 15.4.4.12.3.2.2.6 Mode 0xA (10)

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
  - 1 nibble pad spare, processing OFF
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S – (size0 + 1 + size1)

#### 15.4.4.12.3.2.2.7 Mode 0x2

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) =  $S - (size0 + size1)$

#### 15.4.4.12.3.2.2.8 Mode 0x3

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) =  $size0 + (S - size1)$

#### 15.4.4.12.3.2.2.9 Mode 0x7

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) =  $size0 + (S - size1)$

#### 15.4.4.12.3.2.2.10 Mode 0x8

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time with buffer 0
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) =  $size0 + (S - (1 + size1))$

#### 15.4.4.12.3.2.2.11 Mode 0x4

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time (no buffer used)

- size0 nibbles spare, processing OFF
  - Repeat with buffer 0 to S-1
    - size1 nibbles spare, processing ON
- Checksum: Spare area size (nibbles) = size0 + (S – size1)

#### **15.4.4.12.3.2.2.12 Mode 0x9**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- One time (no buffer used)
  - size0 nibbles spare, processing OFF
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S – (1 + size1))

#### **15.4.4.12.3.2.2.13 Mode 0x5**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S – (size0 + size1)

#### **15.4.4.12.3.2.2.14 Mode 0xB (11)**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
  - 1 nibble padding spare, processing OFF
  - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S – (size0 + 1 + size1)

#### **15.4.4.12.3.2.2.15 Mode 0x6**

Page processing sequence:

- Repeat with buffer 0 to S-1
  - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
  - size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
  - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) =  $S - (\text{size0} + \text{size1})$

#### 15.4.4.12.3.2.3 Supported NAND Page Mappings and ECC Schemes

The following rules apply to the entire mapping description:

- Main data area (sectors) size is hardcoded to 512 bytes.
- Spare area size is programmable.
- All page sections (of main area data bytes, protected spare bytes, unprotected spare bytes, and ECC) are defined as explained in [Section 15.4.4.12.3.2.2.1, Memory Mapping of Data Message](#).

Each of the following sections gives a NAND page mapping example (per-sector spare mappings, pooled spare mapping, per-sector spare mapping, with ECC separated at the end of the page).

In the mapping diagrams, sections that belong to the same BCH codeword have the same color (blue or green); unprotected sections are not covered (orange) by the BCH scheme.

Below each mapping diagram, a write (encoding) and read (decoding: syndrome generation) sequence is given, with the number of the active buffers at each point in time (yellow). In the inactive zones (grey), no computing is taking place but the data counter is still active.

In [Figure 15-91](#) through [Figure 15-93](#), the tables on the left summarize the mode, size0, and size1 parameters to program for, respectively, write and read processing of a page, with the given mapping, where:

- P is the size of spare byte section Protected by the ECC (in nibbles)
- U is the size of spare byte section Unprotected by the ECC (in nibbles)
- E is the size of the ECC (in nibbles)
- S is the number of Sectors per page (two in the current diagrams)

Each time the processing of a BCH block is complete (ECC calculation for write/encoding, syndrome generation for read/decoding, indicated by red arrows), the update pointer is pulsed. The processing for block 0 can be the first or the last to complete, depending on the NAND page mapping and operation (read or write). All examples show a page size of 1 KiB + spares; that is,  $S = 2$  sectors of 512 bytes. The same principles can be extended to larger pages by adding more sectors.

The actual BCH codeword size is used during the error location work to restrict the search range: by definition, errors can happen only in the codeword that was actually written to the NAND, not in the mathematical codeword of  $n = 2^{13} - 1 = 8191$  bits; that codeword (higher-order bits) is all-zero and implicit during computations.

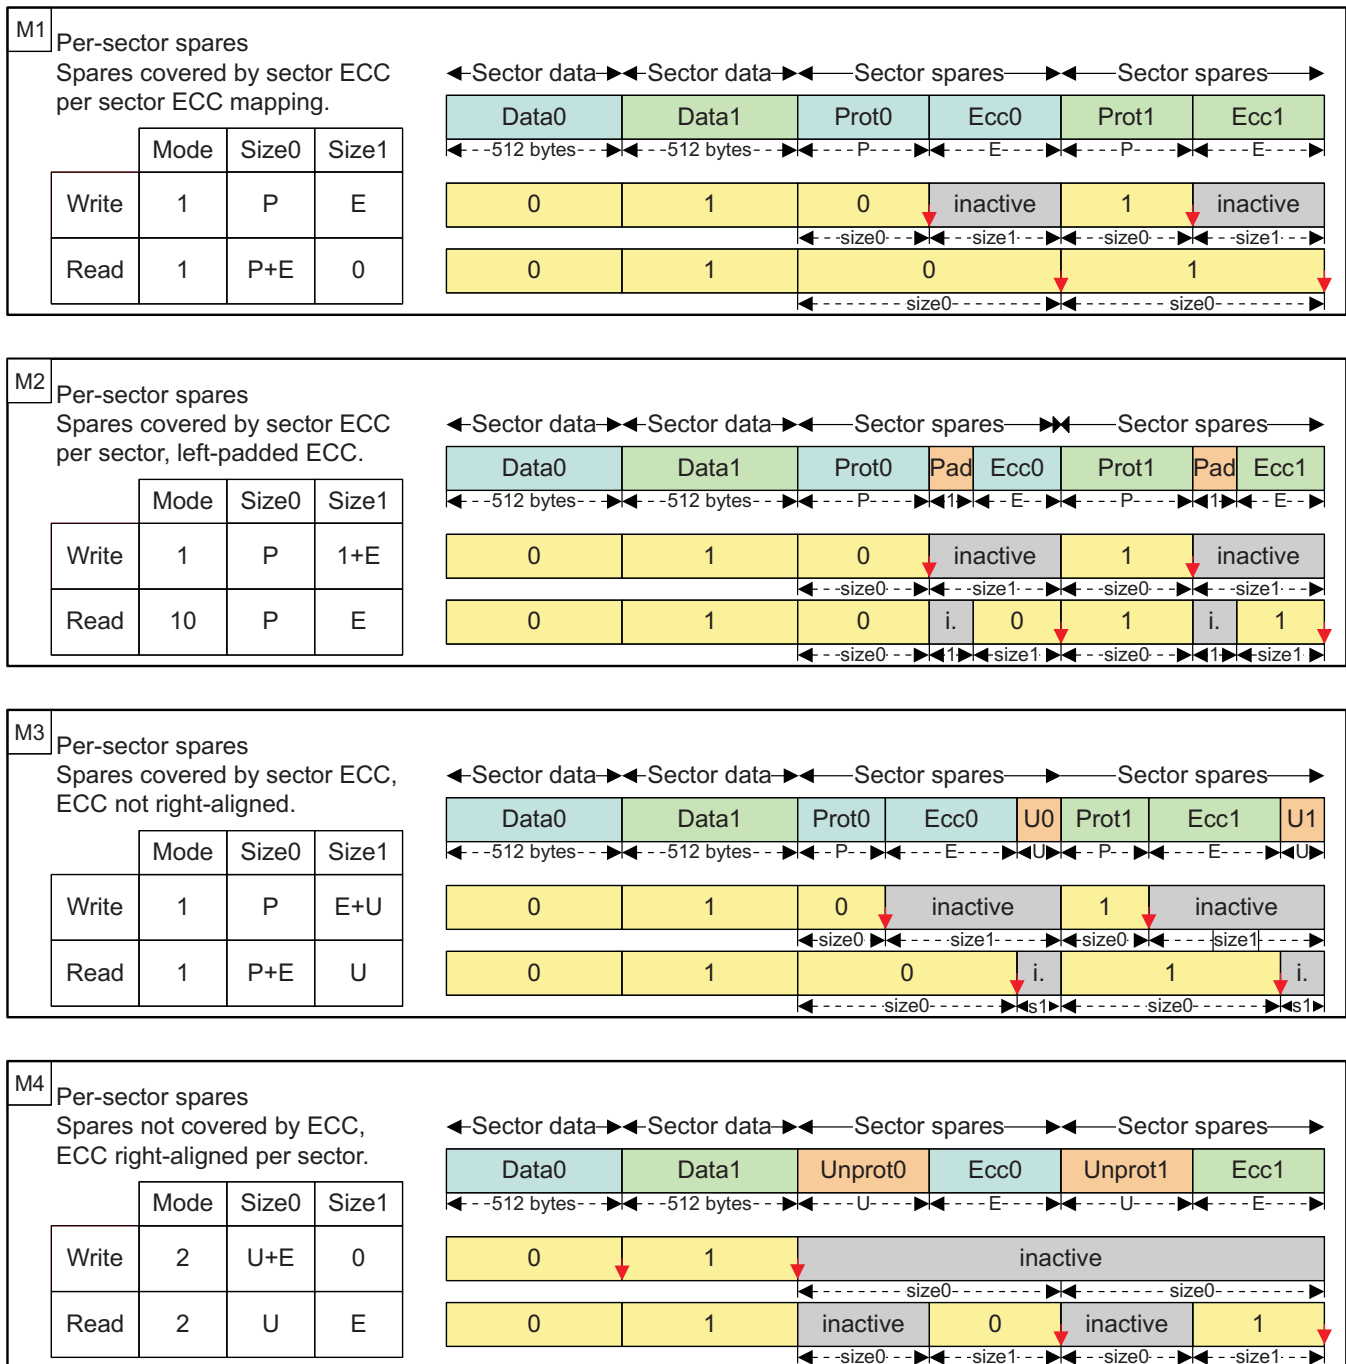

The actual BCH codeword size depends on the mode, the programmed sizes, and the sector number (all sizes in nibbles):

- Spares mapped and protected per sector (below: see M1-M2-M3-M9-M10):
  - All sectors:  $(512) + P + E$
- Spares pooled and protected by sector 0 (below: see M5-M6):
  - Sector 0 codeword:  $(512) + P + E$
  - Other sectors:  $(512) + E$
- Unprotected spares (below: see M4-M7-M8-M11-M12):
  - All codewords  $(512) + E$

##### 15.4.4.12.3.2.3.1 Per-Sector Spare Mappings

In these schemes, each 512-byte sector of the main area has its own dedicated section of the spare area. The spare area of each sector is composed of:

- ECC, which must be located after the data it protects
- Other data, which may or may not be protected by the ECC for its sector.

**Figure 15-91. NAND Page Mapping and ECC: Per-Sector Schemes**

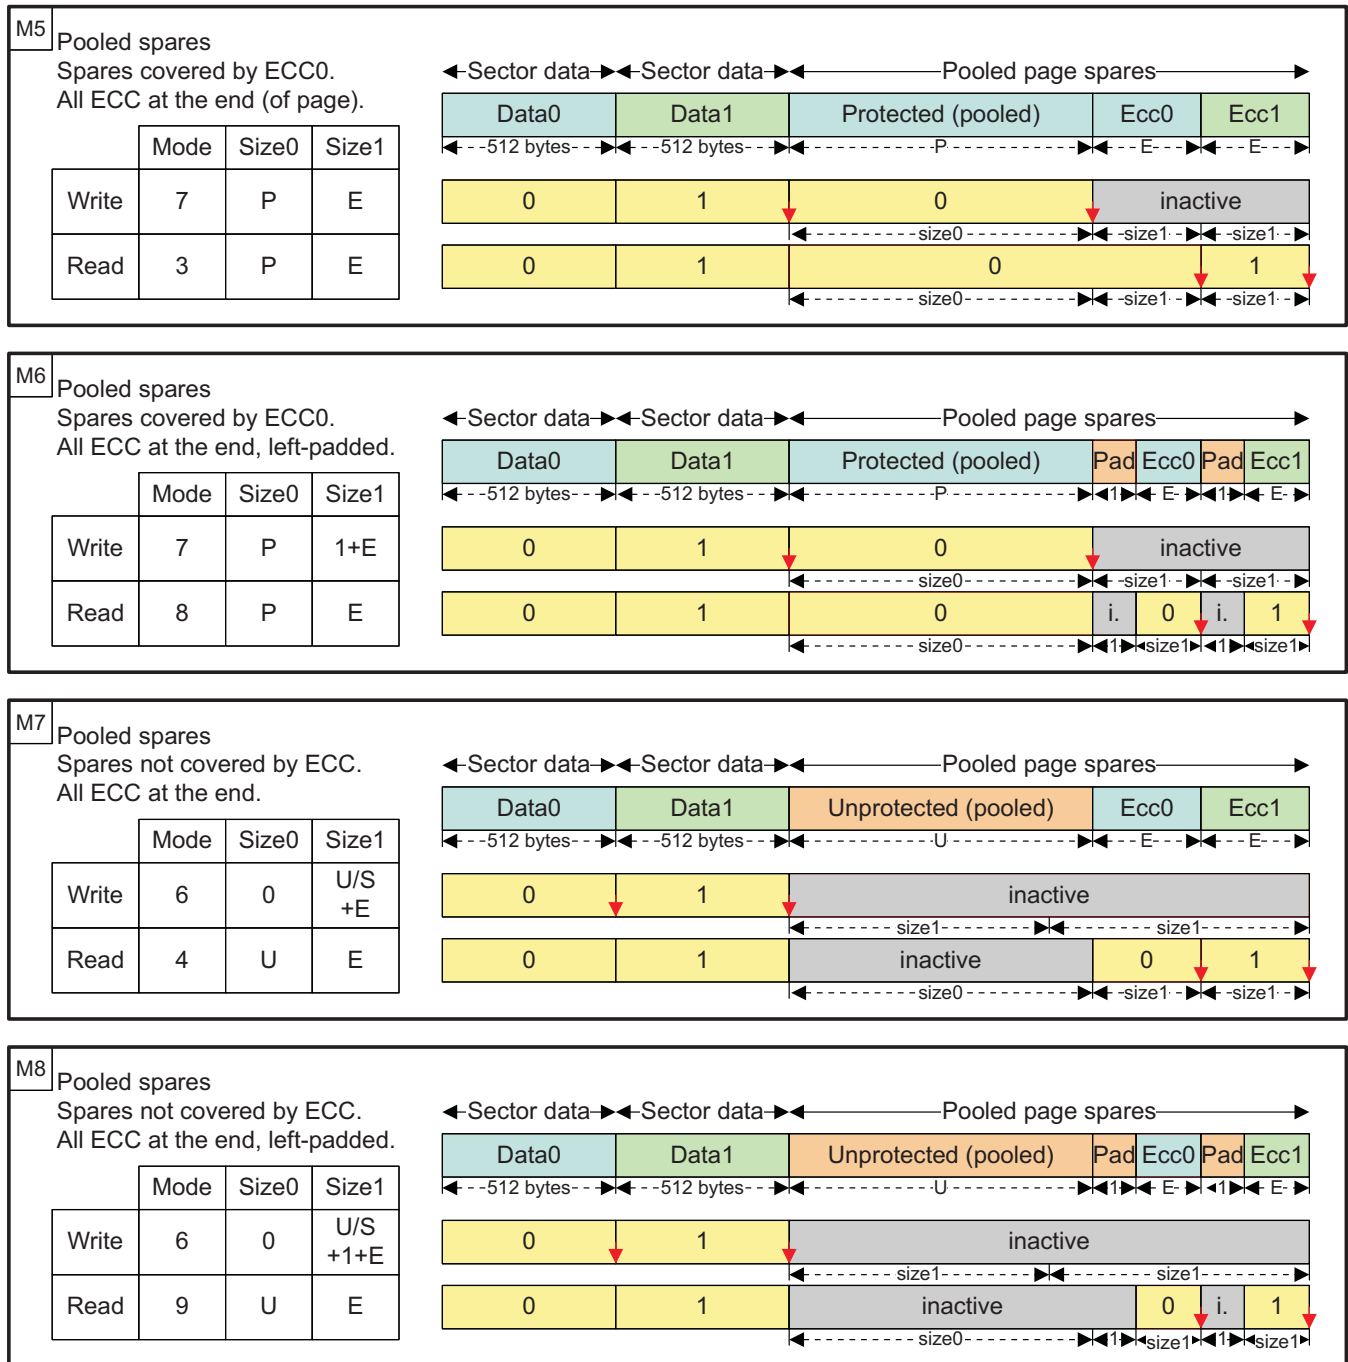

gpmc-033

#### 15.4.4.12.3.2.3.2 Pooled Spare Mapping

In the following schemes, the spare area is pooled for the page.

- The ECC of each sector is aligned at the end of the spare area.
- The non-ECC spare data may or may not be covered by the ECC of sector 0.

Figure 15-92. NAND Page Mapping and ECC: Pooled Spare Schemes

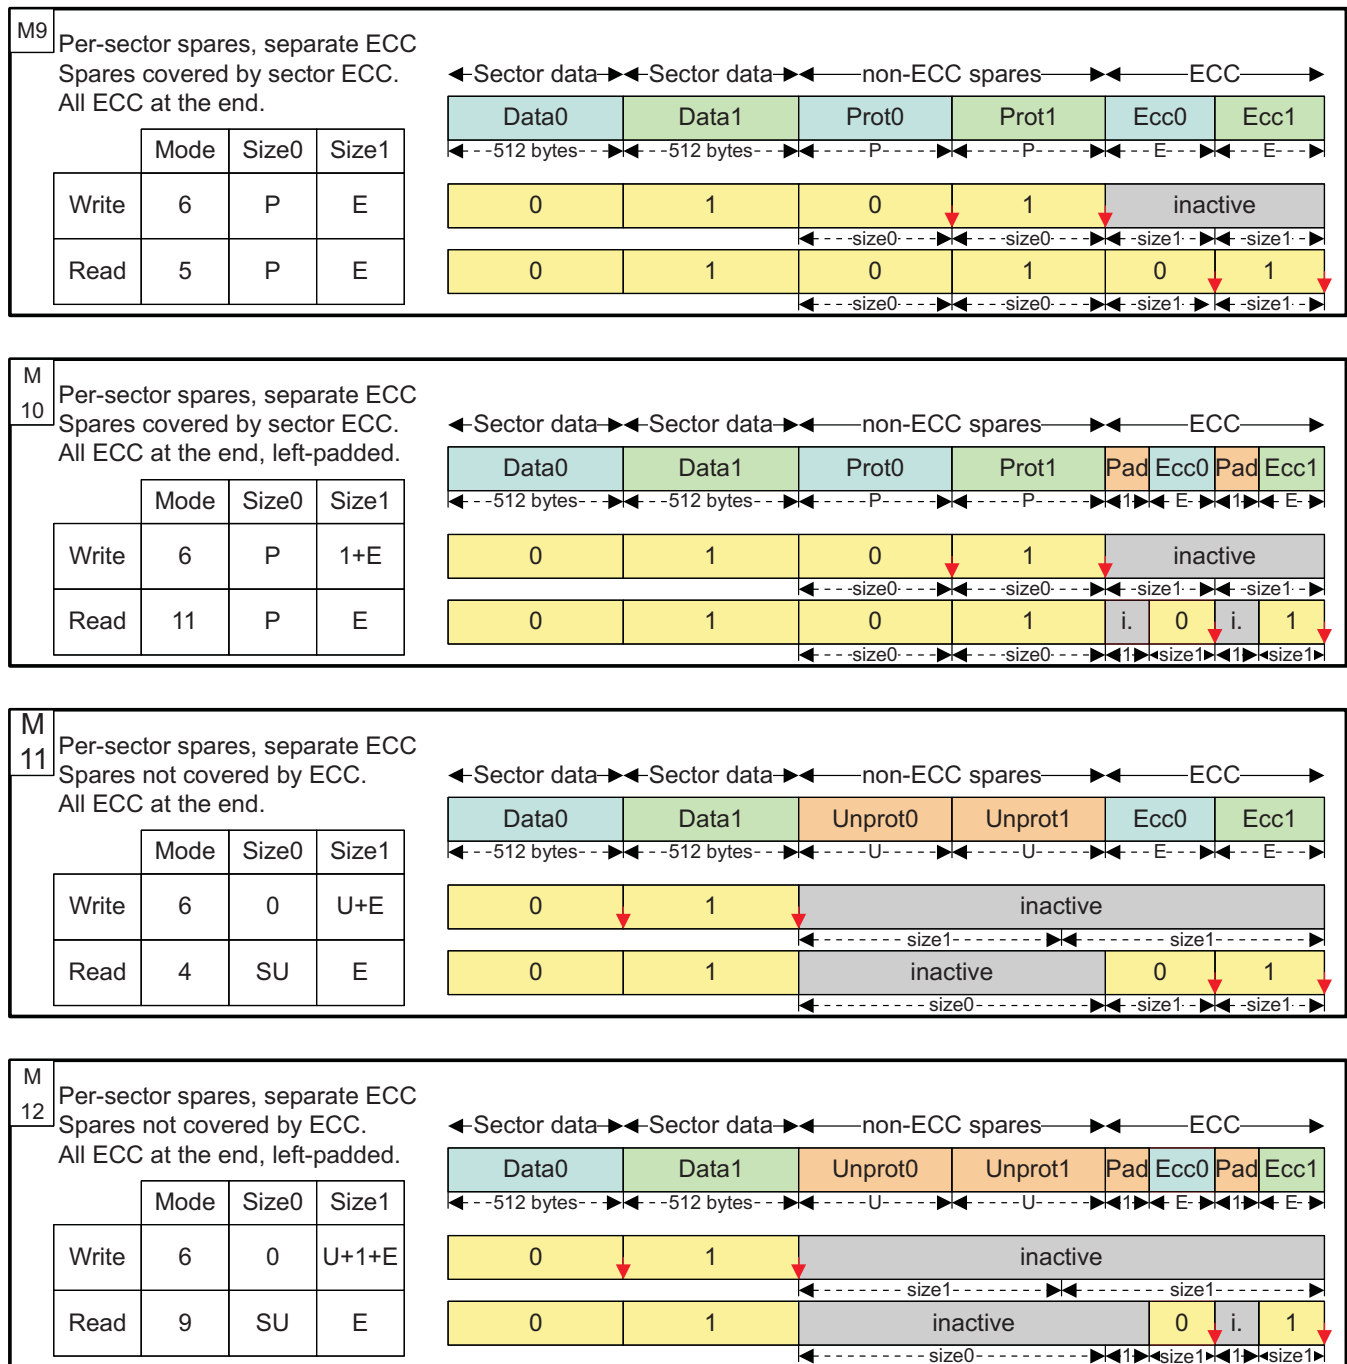

gpmc-034

15.4.4.12.3.2.3.3 Per-Sector Spare Mapping, with ECC Separated at the End of the Page

In these schemes, each 512-byte sector of the main area is associated with two sections of the spare area.

- ECC section, all aligned at the end of the page
- Other data section, aligned before the ECCs, each of which may or may not be protected by the ECC for its sector.

**Figure 15-93. NAND Page Mapping and ECC: Per-Sector Schemes, With Separate ECC**

gpmc\_035

**15.4.4.12.4 Prefetch and Write-Posting Engine**

NAND device data access cycles are usually much slower than the MPU system frequency; such NAND read or write accesses issued by the processor affect the overall system performance, especially considering long read or write sequences required for NAND page loading or programming. To minimize this effect on system performance, the GPMC includes a prefetch and write-posting engine, which can be used to read from or write to any chip-select location in a buffered manner.

The prefetch and write-posting engine is a simplified embedded-access requester that presents requests to the access engine on a user-defined chip-select target. The access engine interleaves these requests with any request coming from the L3 interface; as a default, the prefetch and write-posting engine has the lowest priority.

The prefetch and write-posting engine is dedicated to data-stream access (as opposed to random data access); thus, it is primarily dedicated to NAND support. The engine does not include an address generator; the request is limited to chip-select target identification. It includes a 64-byte FIFO associated with a DMA request synchronization line, for optimal DMA-based use.

The prefetch and write-posting engine uses an embedded 64-byte (32 16-bit word) FIFO to prefetch data from the NAND device in read mode (prefetch mode) or to store host data to be programmed into the NAND device in write mode (write-posting mode). The FIFO draining and filling (read and write) can be controlled by a device host processor through interrupt synchronization (an interrupt is triggered whenever a programmable threshold is reached) or by a device DMA module through DMA request synchronization, with a programmable request byte size in prefetch or posting mode.

The prefetch and write-posting engine includes a single memory pool. Therefore, only one mode, read or write, can be used at any given time. In other words, the prefetch and write-posting engine is a single-context engine that can be allocated to only one chip-select at a time for a read prefetch or a write-posting process.

The engine does not support atomic command and address phase programming and is limited to linear memory read or write access. As a consequence, it is limited to NAND data-stream access. The engine relies on the MPU NAND software driver to control block and page opening with the correct data address pointer initialization, before the engine can read from or write to the NAND memory device.

Once started, engine data read and write sequencing is based solely on FIFO location availability and until the total programmed number of bytes is read or written.

Any host-concurrent accesses to a different chip-select are correctly interleaved with ongoing engine accesses. The engine has the lowest priority access so that host accesses to a different chip-select do not suffer a large latency.

A round-robin arbitration scheme can be enabled to ensure minimum bandwidth to the prefetch and write-posting engine in the case of back-to-back direct memory requests to a different chip-select. If the [GPMC\\_PREFETCH\\_CONFIG1\[23\] PFPWENROUNDROBIN](#) bit is enabled, the arbitration grants the prefetch and write posting engine access to the GPMC bus for a number of requests programmed in the [GPMC\\_PREFETCH\\_CONFIG1\[19:16\] PFPWWEIGHTEDPRIO](#) bit field.

The prefetch/write-posting engine read or write request is routed to the access engine with the chip-select destination ID. After the required arbitration phase, the access engine processes the request as a single access with the data access size equal to the device size specified in the corresponding chip-select configuration.

---

**NOTE:** The destination chip-select configuration must be set to the NAND protocol-compatible configuration for which address lines are not used (the address bus is not changed from its current value). Selecting a different chip-select configuration can produce undefined behavior.

---

#### **15.4.4.12.4.1 General Facts About the Engine Configuration**

The engine can be configured only if the [GPMC\\_PREFETCH\\_CONTROL\[0\] STARTENGINE](#) bit is deasserted.

The engine must be correctly configured in prefetch or write-posting mode and must be linked to a NAND chip-select before it can be started. The chip-select is linked using the [GPMC\\_PREFETCH\\_CONFIG1\[26:24\] ENGINECSSELECTOR](#) bit field.

In prefetch and write-posting modes, the engine uses byte or 16-bit word access requests, respectively, for an 8- or 16-bit-wide NAND device attached to the linked chip-select. The [FIFOTHRESHOLD](#) and [TRANSFERCOUNT](#) bit fields must be programmed accordingly as a number of bytes.

When the [GPMC\\_PREFETCH\\_CONFIG1\[7\] ENABLEENGINE](#) bit is set, the FIFO entry on the L3 interconnect port side is accessible at any address in the associated chip-select memory region. When the [ENABLEENGINE](#) bit is set, any host access to this chip-select is rerouted to the FIFO input. Directly accessing the NAND device linked to this chip-select from the host is still possible through the following registers (where  $i = 0$  to 7):

- [GPMC\\_NAND\\_COMMAND\\_i](#)
- [GPMC\\_NAND\\_ADDRESS\\_i](#)
- [GPMC\\_NAND\\_DATA\\_i](#)

The FIFO entry on the L3 interconnect port can be accessed with byte, 16-bit word, or 32-bit word access size, according to little-endian format, even though the FIFO input is 32 bits wide.

The FIFO control is made easier through the use of interrupts or DMA requests associated with the [FIFOTHRESHOLD](#) bit field. The [GPMC\\_PREFETCH\\_STATUS\[30:24\] FIFOPINTER](#) bit field monitors the number of available bytes to be read in prefetch mode or the number of free empty slots that can be written in write-posting mode. The [GPMC\\_PREFETCH\\_STATUS\[13:0\] COUNTVALUE](#) bit field monitors the number of remaining bytes to be read or written by the engine according to the value of the [TRANSFERCOUNT](#) bit field. The [FIFOPINTER](#) and [COUNTVALUE](#) bit fields are always expressed as a number of bytes even if a 16-bit-wide NAND device is attached to the linked chip-select.

In prefetch mode, when the [FIFOPINTER](#) equals 0 (that is, the FIFO is empty), a host read access receives the byte last read from the FIFO as its response. In case of 32-bit word or 16-bit word read accesses, the last byte read from the FIFO is copied the required number of times to fit the requested word size. In write-posting mode, when the [FIFOPINTER](#) equals 0 (that is, the FIFO is full), a host write overwrites the last FIFO byte location. There is no underflow or overflow error reporting in the GPMC.

#### 15.4.4.12.4.2 Prefetch Mode

The prefetch mode is selected when the [GPMC\\_PREFETCH\\_CONFIG1\[0\] ACCESSMODE](#) bit is cleared.

The MPU NAND software driver must issue the block and page opening (READ) command with the correct data address pointer initialization before the engine can be started to read from the NAND memory device. The engine is started by asserting the [GPMC\\_PREFETCH\\_CONTROL\[0\] STARTENGINE](#) bit. The [STARTENGINE](#) bit automatically clears when the prefetch process completes.

If required, the ECC calculator engine must be initialized (that is, reset, configured, and enabled) before the prefetch engine is started so that the ECC is computed correctly on all data read by the prefetch engine.

When the [GPMC\\_PREFETCH\\_CONFIG1\[3\] SYNCHROMODE](#) bit is cleared, the prefetch engine starts requesting data as soon as the [STARTENGINE](#) bit is set. If using this configuration, the host must monitor the NAND device-ready pin so that it sets the [STARTENGINE](#) bit only when the NAND device is in a ready state (that is, data is valid for prefetching).

When the [SYNCHROMODE](#) bit is set, the prefetch engine starts requesting data when an active-to-inactive [WAIT](#) signal transition is detected. The transition detector must be cleared before any transition detection (see [Section 15.4.4.12.2.2, Ready Pin Monitored by Hardware Interrupt](#)). The [GPMC\\_PREFETCH\\_CONFIG1\[5:4\] WAITPINSELECTOR](#) bit field selects which `gpmc_wait` pin edge detector triggers the prefetch engine in this synchronized mode.

If the [STARTENGINE](#) bit is set after the NAND address phase (page opening command), the engine is effectively started only after the actual NAND address phase completion. To prevent GPMC stall during this NAND address phase, set the [STARTENGINE](#) bit before NAND address phase completion when in synchronized mode. The prefetch engine starts when an active-to-inactive [WAIT](#) signal transition is detected. The [STARTENGINE](#) bit is automatically cleared on prefetch process completion.

The prefetch engine issues a read request to fill the FIFO with the amount of data specified by the [GPMC\\_PREFETCH\\_CONFIG2\[13:0\] TRANSFERCOUNT](#) bit field.

[Table 15-466](#) describes the prefetch mode configuration.

**Table 15-466. Prefetch Mode Configuration**

Bit Field	Register	Value	Comments
STARTENGINE	<a href="#">GPMC_PREFETCH_CONTROL</a> [0]	0	Prefetch engine can be configured only if STARTENGINE is set to 0.
ENGINECSSELECTOR	<a href="#">GPMC_PREFETCH_CONFIG1</a> [26:24]	0 to 3	Selects the chip-select associated with a NAND device where the prefetch engine is active.
ACCESSMODE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [0]	0	Selects prefetch mode
FIFOTHRESHOLD	<a href="#">GPMC_PREFETCH_CONFIG1</a> [14:8]		Selects the maximum number of bytes read or written by the host on DMA or interrupt request
TRANSFERCOUNT	<a href="#">GPMC_PREFETCH_CONFIG2</a> [13:0]		Selects the number of bytes to be read or written by the engine to the selected chip-select
SYNCHROMODE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [3]	0/1	Selects when the engine starts the access to the chip-select
WAITPINSELECT	<a href="#">GPMC_PREFETCH_CONFIG1</a> [17:16]	0 to 1	Selects wait pin edge detector (if <a href="#">GPMC_PREFETCH_CONFIG1</a> [3] SYNCHROMODE = 0x1)
ENABLEOPTIMIZEDACCESS	<a href="#">GPMC_PREFETCH_CONFIG1</a> [27]	0/1	See <a href="#">Section 15.4.4.12.4.6, Optimizing NAND Access Using the Prefetch and Write-Posting Engine</a> .
CYCLEOPTIMIZATION	<a href="#">GPMC_PREFETCH_CONFIG1</a> [30:28]		Number of clock cycle removed to timing parameters
ENABLEENGINE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [7]	1	Engine enabled
STARTENGINE	<a href="#">GPMC_PREFETCH_CONTROL</a> [0]	1	Starts the prefetch engine

#### 15.4.4.12.4.3 FIFO Control in Prefetch Mode

The FIFO can be drained directly by a device host processor or a DMA module channel.

In MPU draining mode, the FIFO status can be monitored through the [GPMC\\_PREFETCH\\_STATUS](#)[30:24] FIFOPINTER bit field or through the [GPMC\\_PREFETCH\\_STATUS](#)[16] FIFOTHRESHOLDSTATUS bit. The FIFOPINTER indicates the current number of available data to be read; FIFOTHRESHOLDSTATUS set to 1 indicates that at least FIFOTHRESHOLD bytes are available from the FIFO.

An interrupt can be triggered by the GPMC if the [GPMC\\_IRQENABLE](#)[0] FIFOEVENTENABLE bit is set. The FIFO interrupt event is logged, and the [GPMC\\_IRQSTATUS](#)[0] FIFOEVENTSTATUS bit is set. To clear the interrupt, the MPU must read all the available bytes, or at least enough bytes to get below the programmed FIFO threshold, and the FIFOEVENTSTATUS bit must be cleared to enable further interrupt events. The FIFOEVENTSTATUS bit must always be reset before asserting the FIFOEVENTENABLE bit to clear any out-of-date logged interrupt event. This interrupt generation must be enabled after enabling the STARTENGINE bit.

Prefetch completion can be monitored through the [GPMC\\_PREFETCH\\_STATUS](#)[13:0] COUNTVALUE bit field. COUNTVALUE indicates the number of currently remaining data to be requested according to the TRANSFERCOUNT value. An interrupt can be triggered by the GPMC when the prefetch process is complete (that is, COUNTVALUE equals 0) if the [GPMC\\_IRQENABLE](#)[1] TERMINALCOUNTEVENTENABLE bit is set. At prefetch completion, the TERMINALCOUNT interrupt event is also logged, and the [GPMC\\_IRQSTATUS](#)[1] TERMINALCOUNTSTATUS bit is set. To clear the interrupt, the MPU must clear the TERMINALCOUNTSTATUS bit. The TERMINALCOUNTSTATUS bit must always be cleared prior to asserting the TERMINALCOUNTEVENTENABLE bit to clear any out-of-date logged interrupt event.

---

**NOTE:** The COUNTVALUE value is valid only when the prefetch engine is active (started), and an interrupt is only triggered when COUNTVALUE reaches 0, that is, when the prefetch engine automatically goes from an active to an inactive state.

---

The number of bytes to be prefetched (programmed in TRANSFERCOUNT) must be a multiple of the programmed FIFOTHRESHOLD to trigger the correct number of interrupts allowing a deterministic and transparent FIFO control. If this guideline is respected, the number of ISR accesses is always required and the FIFO is always empty after the last interrupt is triggered. In other cases, the TERMINALCOUNT interrupt must be used to read the remaining bytes in the FIFO (the number of remaining bytes being lower than the FIFOTHRESHOLD value).

In DMA draining mode, the [GPMC\\_PREFETCH\\_CONFIG1\[2\]](#) DMAMODE bit must be set so that the GPMC issues a DMA hardware request when at least FIFOTHRESHOLD bytes are ready to be read from the FIFO. The DMA channel that owns this DMA request must be programmed so that the number of bytes programmed in FIFOTHRESHOLD is read from the FIFO during the DMA request process. The DMA request is kept active until this number of bytes has effectively been read from the FIFO, and no other DMA request can be issued until the ongoing active request is complete.

In prefetch mode, the TERMINALCOUNT event is also a source of DMA requests if the number of bytes to be prefetched is not a multiple of FIFOTHRESHOLD, the remaining bytes in the FIFO can be read by the DMA channel using the last DMA request. This assumes that the number of remaining bytes to be read is known and controlled through the DMA channel programming model.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive-to-active prefetch (the STARTENGINE bit is set to 1). The associated DMA channel must always be enabled by the MPU after setting the STARTENGINE bit so that the out-of-date active DMA request does not trigger spurious DMA transfers.

#### 15.4.4.12.4.4 Write-Posting Mode

The write-posting mode is selected when the [GPMC\\_PREFETCH\\_CONFIG1\[0\]](#) ACCESSMODE bit is set.

The MPU NAND software driver must issue the correct address pointer initialization command (page program) before the engine can start writing data into the NAND memory device. The engine starts when the [GPMC\\_PREFETCH\\_CONTROL\[0\]](#) STARTENGINE bit is set to 1. The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the MPU NAND software driver must issue the second cycle program command and monitor the status for programming process completion (adding ECC handling, if required).

If used, the ECC calculator engine must be started (configured, reset, and enabled) before the posting engine is started so that the ECC parities are calculated properly on all data written by the prefetch engine to the associated chip-select.

In write-posting mode, the [GPMC\\_PREFETCH\\_CONFIG1\[3\]](#) SYNCHROMODE bit must be cleared so that posting starts as soon as the STARTENGINE bit is set and the FIFO is not empty.

If the STARTENGINE bit is set after the NAND address phase (page program command), the STARTENGINE setting is effective only after the actual NAND command completion. To prevent GPMC stall during this NAND command phase, set the STARTENGINE bit field before the NAND address completion and ensure that the associated DMA channel is enabled after the NAND address phase.

The posting engine issues a write request when valid data are available from the FIFO and until the programmed [GPMC\\_PREFETCH\\_CONFIG2\[13:0\]](#) TRANSFERCOUNT accesses are complete.

The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the MPU NAND software driver must issue the second cycle program command and monitor the status for programming process completion. The closing program command phase must be issued only when the full NAND page has been written into the NAND flash write buffer, including the spare area data and the ECC parities, if used.

[Table 15-467](#) describes the write-posting configuration.

**Table 15-467. Write-Posting Mode Configuration**

Bit Field	Register	Value	Comments
STARTENGINE	<a href="#">GPMC_PREFETCH_CONTROL[0]</a>	0	Write-posting engine can be configured only if STARTENGINE is set to 0.

**Table 15-467. Write-Posting Mode Configuration (continued)**

Bit Field	Register	Value	Comments
ENGINECSSELECTOR	<a href="#">GPMC_PREFETCH_CONFIG1</a> [26:24]	0 to 3	Selects the chip-select associated with a NAND device where the prefetch engine is active
ACCESSMODE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [0]	1	Selects write-posting mode
FIFOTHRESHOLD	<a href="#">GPMC_PREFETCH_CONFIG1</a> [14:8]		Selects the maximum number of bytes read or written by the host on DMA or interrupt request
TRANSFERCOUNT	<a href="#">GPMC_PREFETCH_CONFIG2</a> [13:0]		Selects the number of bytes to be read or written by the engine from/to the selected chip-select
SYNCHROMODE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [3]	0	Engine starts the access to chip-select as soon as STARTENGINE is set.
ENABLEOPTIMIZEDACCESS	<a href="#">GPMC_PREFETCH_CONFIG1</a> [27]	0/1	See <a href="#">Section 15.4.4.12.4.6, Optimizing NAND Access Using the Prefetch and Write-Posting Engine.</a>
CYCLOPTIMIZATION	<a href="#">GPMC_PREFETCH_CONFIG1</a> [30:28]		
ENABLEENGINE	<a href="#">GPMC_PREFETCH_CONFIG1</a> [7]	1	Engine enabled
STARTENGINE	<a href="#">GPMC_PREFETCH_CONTROL</a> [0]	1	Starts the prefetch engine

#### 15.4.4.12.4.5 FIFO Control in Write-Posting Mode

The FIFO can be filled directly by a device host processor or a DMA module channel.

In MPU filling mode, the FIFO status can be monitored through the [FIFOPOINTER](#) or through the [GPMC\\_PREFETCH\\_STATUS](#)[16] [FIFOTHRESHOLDSTATUS](#) bit. [FIFOPOINTER](#) indicates the current number of available free byte places in the FIFO, and the [FIFOTHRESHOLDSTATUS](#) bit, when set, indicates that at least [FIFOTHRESHOLD](#) free byte places are available in the FIFO.

An interrupt can be issued by the GPMC if the [GPMC\\_IRQENABLE](#)[0] [FIFOEVENTENABLE](#) bit is set. When the interrupt is fired, the [GPMC\\_IRQSTATUS](#)[0] [FIFOEVENTSTATUS](#) bit is set. To clear the interrupt, the MPU must write enough bytes to fill the FIFO or to get below the programmed threshold, and the [FIFOEVENTSTATUS](#) bit must be cleared to get further interrupt events. The [FIFOEVENTSTATUS](#) bit must always be cleared before asserting the [FIFOEVENTENABLE](#) bit to clear any out-of-date logged interrupt event. This interrupt must be enabled after enabling the [STARTENGINE](#) bit.

The posting completion can be monitored through the [GPMC\\_PREFETCH\\_STATUS](#)[13:0] [COUNTVALUE](#) bit field. [COUNTVALUE](#) indicates the current number of remaining data to be written based on the value of the [TRANSFERCOUNT](#) bit field. An interrupt is issued by the GPMC when the write-posting process completes (that is, [COUNTVALUE](#) equal to 0) if the [GPMC\\_IRQENABLE](#)[1] [TERMINALCOUNTEVENTENABLE](#) bit is set. When the interrupt is fired, the [GPMC\\_IRQSTATUS](#)[1] [TERMINALCOUNTSTATUS](#) bit is set. To clear the interrupt, the MPU must clear the [TERMINALCOUNTSTATUS](#) bit. The [TERMINALCOUNTSTATUS](#) bit must always be cleared before asserting the [TERMINALCOUNTEVENTENABLE](#) bit to clear any out-of-date logged interrupt event.

---

**NOTE:** The value of the [COUNTVALUE](#) bit field is valid only if the write-posting engine is active and started, and an interrupt is issued only when [COUNTVALUE](#) reaches 0; that is, when the posting engine automatically goes from active to inactive.

---

In DMA filling mode, the [DMAMode](#) bit field in the [GPMC\\_PREFETCH\\_CONFIG1](#)[2] [DMAMODE](#) bit must be set so that the GPMC issues a DMA hardware request when at least [FIFOTHRESHOLD](#) bytes-free places are available in the FIFO. The DMA channel that owns this DMA request must be programmed so that a number of bytes equal to the value programmed in the [FIFOTHRESHOLD](#) bit field are written into the FIFO during the DMA access. The DMA request remains active until the associated number of bytes has effectively been written into the FIFO, and no other DMA request can be issued until the ongoing active request completes.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive-to-active prefetch (STARTENGINE set to 1). The associated DMA channel must always be enabled by the MPU after setting the STARTENGINE bit so that an out-of-date active DMA request does not trigger spurious DMA transfers.

In write-posting mode, the DMA or MPU fills the FIFO with no consideration for the associated byte enables. Any byte stored in the FIFO is written into the memory device.

#### 15.4.4.12.4.6 Optimizing NAND Access Using the Prefetch and Write-Posting Engine

Access time to a NAND memory device can be optimized for back-to-back accesses if the associated nCS signal is not deasserted between accesses. The GPMC access engine can track prefetch engine accesses to optimize the access timing parameter programmed for the allocated chip-select, if no accesses to other chip-selects (that is, interleaved accesses) occur. Similarly, the access engine also eliminates CYCLE2CYCLEDELAY even if CYCLE2CYCLESAMEECSEN is set. This capability is limited to the prefetch and write-posting engine accesses, and MPU accesses to a NAND memory device (through the defined chip-select memory region or through the [GPMC\\_NAND\\_DATA\\_i](#) location, where i = 0 to 7) are never optimized.

The [GPMC\\_PREFETCH\\_CONFIG1](#)[27] ENABLEOPTIMIZEDACCESS bit must be set to enable optimized accesses. To optimize access time, the [GPMC\\_PREFETCH\\_CONFIG1](#)[30:28] CYCLEOPTIMIZATION bit field defines the number of GPMC\_FCLK cycles to be suppressed from the following timing parameters:

- RDCYCLETIME
- WRCYCLETIME
- RDACCESSTIME
- WRACCESSTIME
- CSOFFTIME
- ADVOFFTIME
- OEOFFTIME
- WEOFFTIME

[Figure 15-94](#) shows that in the case of back-to-back accesses to the NAND flash through the prefetch engine, CYCLE2CYCLESAMEECSEN is forced to 0 when using optimized accesses. The first access uses the regular timing settings for this chip-select. All accesses after this one use settings reduced by x clock cycles, x being defined by the [GPMC\\_PREFETCH\\_CONFIG1](#)[30:28] CYCLEOPTIMIZATION bit field.

Figure 15-94. NAND Read Cycle Optimization Timing Description

#### 15.4.4.12.4.7 Interleaved Accesses Between Prefetch and Write-Posting Engine and Other Chip-Selects

Any on-going read or write access from the prefetch and write-posting engine is completed before an access to any other chip-select can be initiated. As a default, the arbiter uses a fixed-priority algorithm, and the prefetch and write-posting engine has the lowest priority. The maximum latency added to access starting time in this case equals the RDCYCLETIME or WRCYCLETIME (optimized or not) plus the requested BUSTURNAROUND delay for bus turnaround completion programmed for the chip-select to which the NAND device is connected.

Alternatively, a round-robin arbitration can be used to prioritize accesses to the external bus. This arbitration scheme is enabled by setting the [GPMC\\_PREFETCH\\_CONFIG1\[23\] PFPWENROUNDROBIN](#) bit. When a request to another chip-select is received while the prefetch and write-posting engine is active, priority is given to the new request. The request processed thereafter is the prefetch and write-posting engine request, even if another interconnect request is passed in the mean time. The engine keeps control of the bus for an additional number of requests programmed in the [GPMC\\_PREFETCH\\_CONFIG1\[19:16\] PFPWWEIGHTEDPRIO](#) bit field. Control is then passed to the direct interconnect request.

As an example, the round-robin arbitration scheme is selected with PFPWWEIGHTEDPRIO set to 0x2. Considering that the prefetch and write-posting engine and the interconnect interface are always requesting access to the external interface, the GPMC grants priority to the direct interconnect access for one request. The GPMC then grants priority to the engine for three requests, and finally back to the direct interconnect access, until the arbiter is reset when one of the two initiators stops initiating requests.

## 15.4.5 GPMC Basic Programming Model

### 15.4.5.1 GPMC High-Level Programming Model Overview

The goal of the basic high-level programming model is to introduce a top-down approach to users that need to configure the GPMC module.

[Figure 15-95](#) and [Table 15-468](#) through [Table 15-470](#) show a programming model top-level diagram for the GPMC, and a description of each step. Each block of the diagram is described in one of the following sections through a set of registers to configure.

Figure 15-95. Programming Model Top-Level Diagram

gpmc-uc-001

**Table 15-468. GPMC Initialization**

Step	Description
Enable GPMC clocks.	Module interface and functional clocks must be enabled. See <a href="#">Chapter 3, Power, Reset, and Clock Management</a> .
Enable GPMC pads.	Module-specific pad multiplexing and configuration must be set in the control module. See <a href="#">Section 18.4.6.1.1, Pad Configuration Registers</a> in <a href="#">Chapter 18, Control Module</a> .
Reset GPMC.	See <a href="#">Table 15-471</a> .

**Table 15-469. GPMC Configuration in NOR Mode**

Step	Description
NOR Memory Type	See <a href="#">Table 15-472</a> .
NOR Chip-Select Configuration	See <a href="#">Table 15-473</a> .
NOR Timings Configuration	See <a href="#">Table 15-474</a> .
Wait Pin Configuration	See <a href="#">Table 15-482</a> .
Enable Chip-Select	See <a href="#">Table 15-483</a> .

**Table 15-470. GPMC Configuration in NAND Mode**

Step	Description
NAND Memory Type	See <a href="#">Table 15-477</a> .
NAND Chip-Select Configuration	See <a href="#">Table 15-478</a> .
Write Operations (Asynchronous)	See <a href="#">Table 15-479</a> .
Read Operations (Asynchronous)	See <a href="#">Table 15-479</a> .
ECC Engine	See <a href="#">Table 15-480</a> .
Prefetch and Write-Posting Engine	See <a href="#">Table 15-481</a> .
Wait Pin Configuration	See <a href="#">Table 15-482</a> .
Enable Chip-Select	See <a href="#">Table 15-483</a> .

### 15.4.5.2 GPMC Initialization

[Table 15-499](#) describes the settings required to prepare the GPMC; that is enabling its clock and pads, and proceeding to a GPMC reset.

**Table 15-471. Reset GPMC**

Subprocess Name	Register/Bit Field	Value
Start a software reset.	<a href="#">GPMC_SYSCONFIG</a> [1] SOFTRESET	0x1
Wait until	<a href="#">GPMC_SYSSTATUS</a> [0] RESETDONE =	0x1

### 15.4.5.3 GPMC Configuration in NOR Mode

This section gives a generic configuration for parameters related to the NOR memory connected to the GPMC.

**Table 15-472. NOR Memory Type**

Subprocess Name	Register / Bit Field	Value
Set the NOR protocol.	<a href="#">GPMC_CONFIG1</a> _ <i>i</i> [11:10] DEVICETYPE	0x0
Set a device size.	<a href="#">GPMC_CONFIG1</a> _ <i>i</i> [13:12] DEVICESIZE	x
Select an address and data multiplexing protocol.	<a href="#">GPMC_CONFIG1</a> _ <i>i</i> [9] MUXADDDATA	x
Set the attached device page length.	<a href="#">GPMC_CONFIG1</a> _ <i>i</i> [24:23] ATTACHEDDEVICEPAGELENGTH	x

**Table 15-472. NOR Memory Type (continued)**

Subprocess Name	Register / Bit Field	Value
Set the wrapping burst capabilities.	GPMC_CONFIG1_i[31] WRAPBURST	x
Select a timing signals latencies factor.	GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY	x
Select an output clock frequency <sup>(1)</sup> .	GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER	x
Choose an output clock activation time <sup>(1)</sup> .	GPMC_CONFIG1_i[26:25] CLKACTIVATIONTIME	x
Set a single or multiple access for read operations <sup>(1)</sup> .	GPMC_CONFIG1_i[30] READMULTIPLE	x
Set a synchronous or asynchronous mode for read operations.	GPMC_CONFIG1_i[29] READTYPE	x
Set a single or multiple access for write operations.	GPMC_CONFIG1_i[28] WRITEMULTIPLE	x
Set a synchronous or asynchronous mode for write operations.	GPMC_CONFIG1_i[27] WRITETYPE	x

<sup>(1)</sup> Applies only to synchronous configurations (or nonmultiplexed asynchronous for multiple access one)

**Table 15-473. NOR Chip-Select Configuration**

Subprocess Name	Register/Bit Field	Value
Select the chip-select base address.	GPMC_CONFIG7_i[5:0] BASEADDRESS	x
Select the chip-select mask address.	GPMC_CONFIG7_i[11:8] MASKADDRESS	x

**Table 15-474. NOR Timings Configuration**

Subprocess Name	Register/Bit Field	Value
Configure adequate timing parameters in various memory modes.	See <a href="#">Section 15.4.5.6, GPMC Timing Parameters</a>	

**Table 15-475. Wait Pin Configuration**

Subprocess Name	Register/Bit Field	Value
Enable or disable wait pin monitoring for read operations.	GPMC_CONFIG1_i[22] WAITREADMONITORING	x
Enable or disable wait pin monitoring for write operations.	GPMC_CONFIG1_i[21] WAITWRITEMONITORING	x
Select a wait pin monitoring time.	GPMC_CONFIG1_i[19:18] WAITMONITORINGTIME	x
Choose the input wait pin for the chip-select.	GPMC_CONFIG1_i[17:16] WAITPINSELECT	x

**Table 15-476. Enable Chip-Select**

Subprocess Name	Register/Bit Field	Value
When all parameters are configured, enable the chip-select.	GPMC_CONFIG7_i[6] CSVALID	x

#### 15.4.5.4 GPMC Configuration in NAND Mode

This section gives a generic configuration for parameters related to the NAND memory connected to the GPMC.

**Table 15-477. NAND Memory Type**

Subprocess Name	Register/Bit Field	Value
Set the NAND protocol.	GPMC_CONFIG1_i[11:10] DEVICETYPE	0x2
Set a device size.	GPMC_CONFIG1_i[13:12] DEVICESIZE	x
Set the address and data multiplexing protocol to non-multiplexed attached device.	GPMC_CONFIG1_i[9] MUXADDDATA	0x0
Select a timing signals latencies factor.	GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY	x

**Table 15-477. NAND Memory Type (continued)**

Subprocess Name	Register/Bit Field	Value
Set a synchronous or asynchronous mode and a single or multiple access for read and write operations.	See <a href="#">Section 15.4.5.5, Set Memory Access.</a>	x

**Table 15-478. NAND Chip-Select Configuration**

Subprocess Name	Register/Bit Field	Value
Select the chip-select base address.	<a href="#">GPMC_CONFIG7_i[5:0]</a> BASEADDRESS	x
Select the chip-select minimum granularity (16MiB).	<a href="#">GPMC_CONFIG7_i[11:8]</a> MASKADDRESS	x

**Table 15-479. Asynchronous Read and Write Operations**

Subprocess Name	Register/Bit Field	Value
Configure adequate timing parameters in asynchronous modes	See <a href="#">Section 15.4.5.6, GPMC Timing Parameters.</a>	

**Table 15-480. ECC Engine**

Subprocess Name	Register/Bit Field	Value
Select the ECC result register where the first ECC computation is stored (applies only to Hamming).	<a href="#">GPMC_ECC_CONTROL[3:0]</a> ECCPOINTER	x <sup>(1)</sup>
Clear all ECC result registers.	<a href="#">GPMC_ECC_CONTROL[8]</a> ECCCLEAR	Write 1 to clear.
Define ECCSIZE0 and ECCSIZE1.	<a href="#">GPMC_ECC_SIZE_CONFIG[19:12]</a> ECCSIZE0 and <a href="#">[29:22]</a> ECCSIZE1	x <sup>(2)</sup>
Select the size of each of the 9 result registers (size specified by ECCSIZE0 or ECCSIZE1).	<a href="#">GPMC_ECC_SIZE_CONFIG[j-1]</a> ECCjRESULTSIZE where j = 1 to 9	x
Select the chip-select where ECC is computed.	<a href="#">GPMC_ECC_CONFIG[3:1]</a> ECCCS	x
Select the Hamming code or BCH code ECC algorithm in use.	<a href="#">GPMC_ECC_CONFIG[16]</a> ECCALGORITHM	x
Select word size for ECC calculation.	<a href="#">GPMC_ECC_CONFIG[7]</a> ECC16B	x
If the BCH code is used, Set an error correction capability and Select a number of sectors to process.	<a href="#">GPMC_ECC_CONFIG[13:12]</a> ECCBCHTSEL and <a href="#">GPMC_ECC_CONFIG[6:4]</a> ECCTOPSECTOR	x
Enable the ECC computation.	<a href="#">GPMC_ECC_CONFIG[0]</a> ECCENABLE	0x1

<sup>(1)</sup> This parameter depends on the numbers of sectors in a page.

<sup>(2)</sup> Depends on the size of each sector in the NAND page

**Table 15-481. Prefetch and Write-Posting Engine**

Subprocess Name	Register/Bit Field	Value
Disable the engine before configuration.	<a href="#">GPMC_PREFETCH_CONTROL[0]</a> STARTENGINE	0x0
Select the chip-select associated with a NAND device where the prefetch engine is active.	<a href="#">GPMC_PREFETCH_CONFIG1[26:24]</a> ENGINECSSELECTOR	x
Select access direction through prefetch engine, read or write.	<a href="#">GPMC_PREFETCH_CONFIG1[0]</a> ACCESSMODE	x
Select the threshold used to issue a DMA request.	<a href="#">GPMC_PREFETCH_CONFIG1[14:8]</a> FIFOTHRESHOLD	x
Select DMA synchronized mode or software manual mode.	<a href="#">GPMC_PREFETCH_CONFIG1[2]</a> DMAMODE	x
Select if the engine immediately starts accessing the memory upon STARTENGINE assertion or if hardware synchronization based on a WAIT signal is used.	<a href="#">GPMC_PREFETCH_CONFIG1[3]</a> SYNCHROMODE	x
Select which wait pin edge detector should start the engine in synchronized mode.	<a href="#">GPMC_PREFETCH_CONFIG1[5:4]</a> WAITPINSELECTOR	x

**Table 15-481. Prefetch and Write-Posting Engine (continued)**

Subprocess Name	Register/Bit Field	Value
Enter a number of clock cycles removed to timing parameters (for all back-to-back accesses to the NAND flash except the first one).	<a href="#">GPMC_PREFETCH_CONFIG1</a> [30:28] CYCLOPTIMIZATION	x
Enable the prefetch postwrite engine.	<a href="#">GPMC_PREFETCH_CONFIG1</a> [7] ENABLEENGINE	0x1
Select the number of bytes to be read or written by the engine to the selected chip-select.	<a href="#">GPMC_PREFETCH_CONFIG2</a> [13:0] TRANSFERCOUNT	x
Start the prefetch engine.	<a href="#">GPMC_PREFETCH_CONTROL</a> [0] STARTENGINE	0x1

Subprocess Name	Register/Bit Field	Value
Selects when the engine starts the access to chip-select.	<a href="#">GPMC_PREFETCH_CONFIG1</a> [3] SYNCHROMODE	x
Select which wait pin edge detector should start the engine in synchronized mode.	<a href="#">GPMC_PREFETCH_CONFIG1</a> [5:4] WAITPINSELECTOR	x

**Table 15-483. Enable Chip-Select**

Subprocess Name	Register/Bit Field	Value
When all parameters are configured, enable the chip-select.	<a href="#">GPMC_CONFIG7</a> _[6] CSVALID	x

#### 15.4.5.5 Set Memory Access

This section describes the bit field to configure to set the GPMC in various memory modes. [Table 15-484](#) and [Table 15-485](#) provide check lists for mode parameters and access type parameters, respectively.

**Table 15-484. Mode Parameters Check List**

Register	Bit	Name	Asynchronous				Synchronous			
			Single Read Access	Single Write Access	Multiple Read (Page) Access	Multiple Write (Page) Access	Single Read Access	Single Write Access	Multiple Read (Burst) Access	Multiple Write (Burst) Access
<a href="#">GPMC_CONFIG1_i</a>	30	READMULTIPLE	0x0	–	0x1 <sup>(1)</sup>	N/S	0x0	–	0x1	–
<a href="#">GPMC_CONFIG1_i</a>	29	READTYPE	0x0	–	0x0 <sup>(1)</sup>	N/S	0x1	–	0x1	–
<a href="#">GPMC_CONFIG1_i</a>	28	WRITEMULTIPLE	–	0x0	- <sup>(1)</sup>	N/S	–	0x0	–	0x1
<a href="#">GPMC_CONFIG1_i</a>	27	WRITETYPE	–	0x0	- <sup>(1)</sup>	N/S	–	0x1	–	0x1

<sup>(1)</sup> Multiple read is not supported in address/data-multiplexed and AAD-multiplexed modes. Multiple read is supported in nonmultiplexed mode.

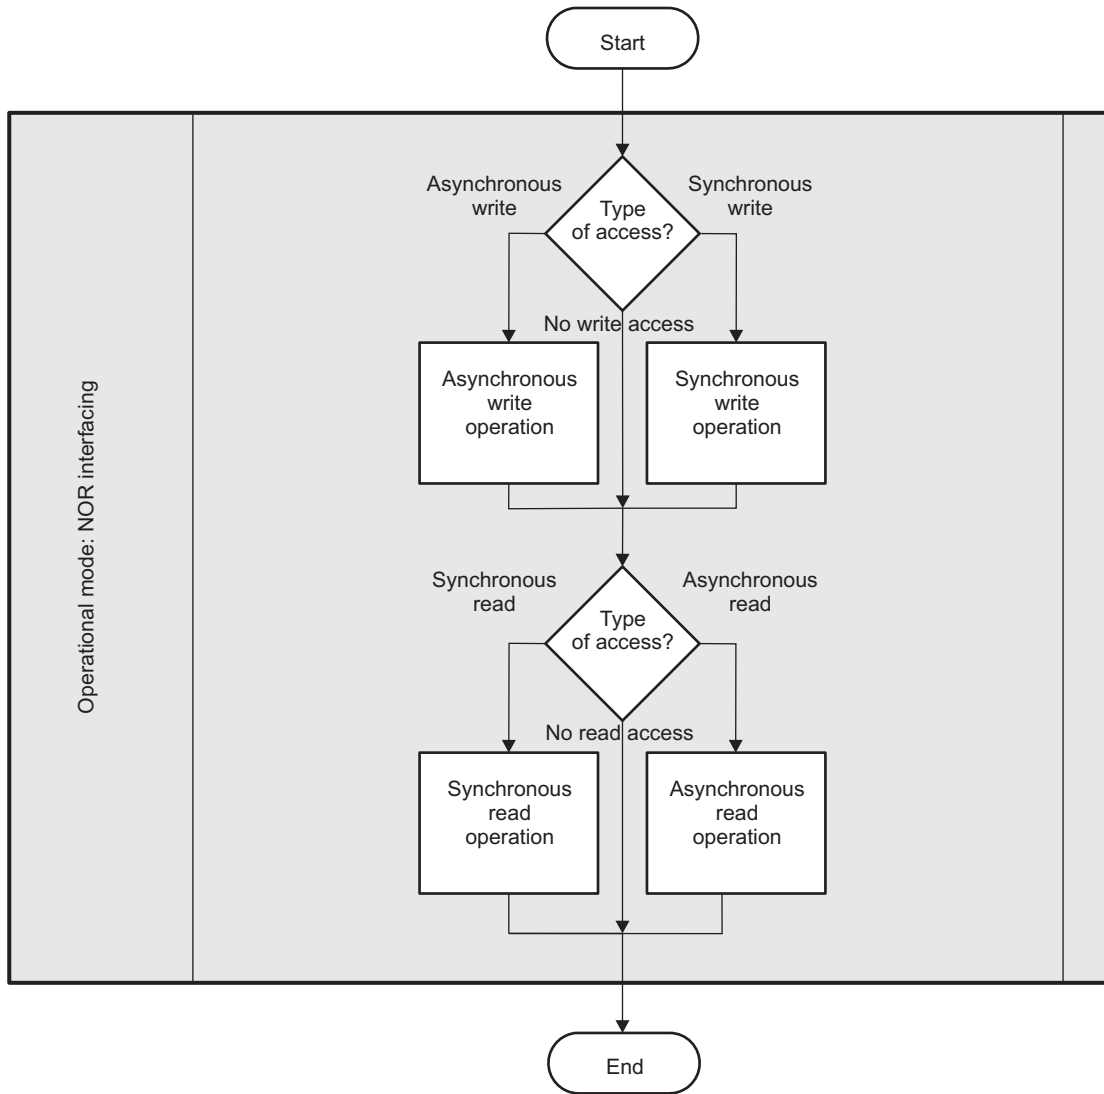

**Table 15-485. Access Type Parameters Check List**

Register	Bit	Name	Access Type		
			Nonmultiplexed	Address/ Data-Multiplexed	AAD-Multiplexed
<a href="#">GPMC_CONFIG1_i</a>	9:8	MUXADDDATA	0x0	0x2	0x1

15.4.5.6 GPMC Timing Parameters

Figure 15-96 shows a programming model diagram for the NOR interfacing timing parameters.

Figure 15-96. NOR Interfacing Timing Parameters Diagram

gpmc-uc-002

Table 15-486 lists the bit fields to configure adequate timing parameters in various memory modes.

**Table 15-486. Timing Parameters**

Register	Bit	Name	Asynchronous			Synchronous				Access Type		
			Single Read Access	Single Write Access	Multiple Read (Page) access	Single Read Access	Single Write Access	Multiple Read (Burst) Access	Multiple Write (Burst) Access	Non-multiple xed	Address / Data-Multiple xed	AAD Multiple xed
GPMC_CONFIG1_i	9	MUXADDDATA	y	y	y	y	y	y	y	y	y	y
GPMC_CONFIG1_i	29	READTYPE	y		y	y		y		y	y	y
GPMC_CONFIG1_i	30	READMULTIPLE	y		y	y		y		y	y	y

### 15.4.5.6.1 GPMC Timing Parameters Formulas

This section is intended to help the user calculate the GPMC timing bit field values. Formulas are not listed exhaustively.

The section describes:

- NAND flash interface timing parameters formulas
- Synchronous NOR flash timing parameters formulas
- Asynchronous NOR flash timing parameters formulas

For complete information, such as OPP and board effects on timings, see the device data manual.

#### 15.4.5.6.1.1 NAND Flash Interface Timing Parameters Formulas

This section lists formulas to calculate NAND timing parameters. This is the case when `GPMC_CONFIG1_i[11:10] DEVICETYPE = 0x2`. [Table 15-487](#) describes the NAND timing parameters.

**Table 15-487. NAND Formulas Description**

Configuration Parameter	Unit	Description
A	ns	Pulse duration – gpmc_wen valid time
B	ns	Delay time – gpmc_cs valid to gpmc_wen valid
C	ns	Delay time – gpmc_ben0/gpmc_advn_ale high to gpmc_wen valid
D	ns	Delay time – gpmc_ad[15:0] valid to gpmc_wen valid
E	ns	Delay time – gpmc_wen invalid to gpmc_ad[15:0] invalid
F	ns	Delay time – gpmc_wen invalid to gpmc_ben0/gpmc_advn_ale invalid
G	ns	Delay time – gpmc_wen invalid to gpmc_cs invalid
H	ns	Cycle time – Write cycle time
I	ns	Delay time – gpmc_cs valid to gpmc_oen_ren valid
J	ns	Setup time – gpmc_ad[15:0] valid to gpmc_oen_ren invalid
K	ns	Pulse duration – gpmc_oen_ren valid time
L	ns	Cycle time – Read cycle time
M	ns	Delay time – gpmc_oen_ren invalid to gpmc_cs invalid

The configuration parameters are calculated through the following formulas. For more information, see the device data manual.

$$A = (\text{WEOffTime} - \text{WEOnTime}) * (\text{TimeParaGranularity} + 1) * \text{GPMC\_FCLK period}$$

$$B = ((\text{WEOnTime} - \text{CSONTime}) * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{WEEExtraDelay} - \text{CSEExtraDelay})) * \text{GPMC\_FCLK period}$$

$$C = ((\text{WEOnTime} - \text{ADVOnTime}) * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{WEEExtraDelay} - \text{ADVExtraDelay})) * \text{GPMC\_FCLK period}$$

$$D = (\text{WEOnTime} * (\text{TimeParaGranularity} + 1) + 0.5 * \text{WEEExtraDelay}) * \text{GPMC\_FCLK period}$$

$$E = (\text{WrCycleTime} - \text{WEOffTime} * (\text{TimeParaGranularity} + 1) - 0.5 * \text{WEEExtraDelay}) * \text{GPMC\_FCLK period}$$

$$F = (\text{ADVWrOffTime} - \text{WEOffTime} * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{ADVExtraDelay} - \text{WEEExtraDelay})) * \text{GPMC\_FCLK period}$$

$$G = (\text{CSWrOffTime} - \text{WEOffTime} * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{CSEExtraDelay} - \text{WEEExtraDelay})) * \text{GPMC\_FCLK period}$$

$$H = \text{WrCycleTime} * (1 + \text{TimeParaGranularity}) * \text{GPMC\_FCLK period}$$

$$I = ((\text{OEOnTime} - \text{CSONTime}) * (\text{TimeParaGranularity} + 1) + 0.5 * (\text{OEEExtraDelay} - \text{CSEExtraDelay})) * \text{GPMC\_FCLK period}$$

$$J = ((\text{RdAccessTime} - \text{OEOffTime}) * (\text{TimeParaGranularity} + 1) - 0.5 * \text{OEEExtraDelay}) * \text{GPMC\_FCLK period}$$

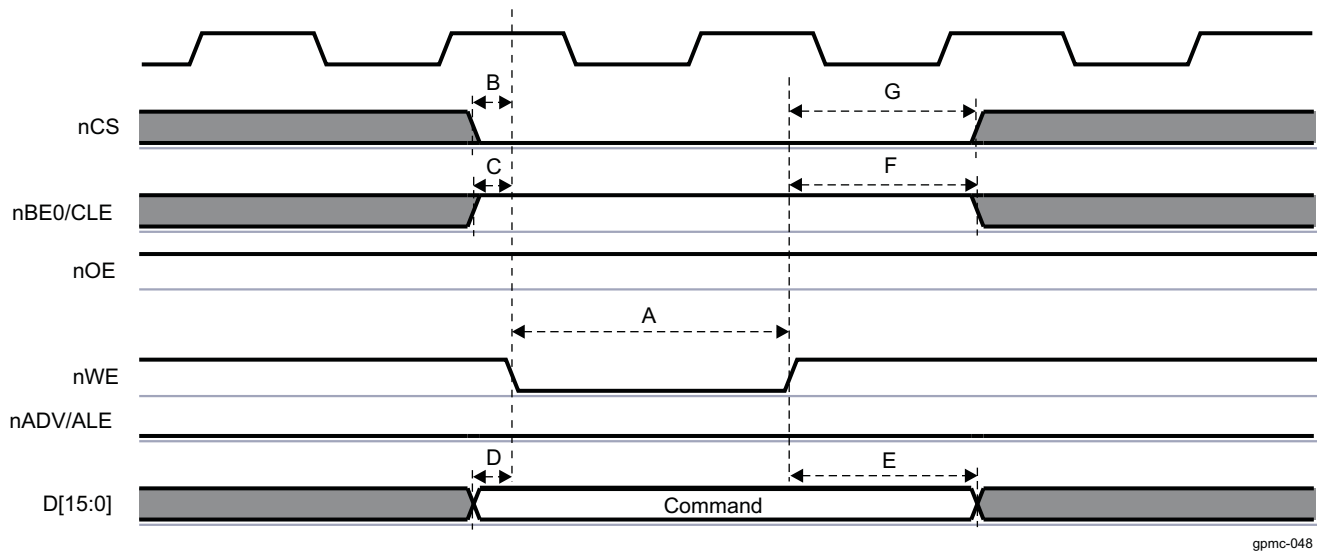

$$K = (OEOffTime - OEOnTime) * (1 + TimeParaGranularity) * GPMC\_FCLK \text{ period}$$

$$L = RdCycleTime * (1 + TimeParaGranularity) * GPMC\_FCLK \text{ period}$$

$$M = (CSRdOffTime - OEOffTime * (TimeParaGranularity + 1) + 0.5 * (CSEExtraDelay - OEEExtraDelay) * GPMC\_FCLK \text{ period}$$

Figure 15-97 shows a simplified example of command latch cycle timing where formulas are associated with signal waves.

Figure 15-97. NAND Command Latch Cycle Timing Simplified Example

### 15.4.5.6.1.2 Synchronous NOR Flash Timing Parameters Formulas

This section lists all formulas to calculate synchronous NOR timing parameters. This is the case when [GPMC\\_CONFIG1\\_i\[11:10\] DEVICETYPE = 0x0](#) and when READTYPE or WRITETYPE are set to synchronous mode. [Table 15-488](#) describes the synchronous NOR formulas.

Table 15-488. Synchronous NOR Formulas Description

Configuration Parameter	Unit	Description
A	ns	Pulse duration – gpmc_cs low
B	ns	Delay time – address bus valid to gpmc_clk first edge Delay time – gpmc_ben0/gpmc_ben1 valid to gpmc_clk first edge
C	ns	Pulse duration – gpmc_ben0/gpmc_ben1 low
D	ns	Delay time – gpmc_clk rising edge to gpmc_ben0/gpmc_ben1 invalid Delay time – gpmc_clk rising edge to gpmc_advn_ale invalid
E	ns	Delay time – gpmc_clk rising edge to gpmc_cs invalid Delay time – gpmc_clk rising edge to gpmc_oen_ren invalid
F	ns	Delay time – gpmc_clk rising edge to gpmc_cs transition
G	ns	Delay time – gpmc_clk rising edge to gpmc_advn_ale transition
H	ns	Delay time – gpmc_clk rising edge to gpmc_oen_ren transition
I	ns	Delay time – gpmc_clk rising edge to gpmc_wen transition
J	ns	Delay time – gpmc_clk rising edge to gpmc_ad data bus transition Delay time – gpmc_clk rising edge to gpmc_ben0/gpmc_ben1 transition
K	ns	Pulse duration – gpmc_advn_ale low
L	ns	Delay time – gpmc_wait invalid to first data latching gpmc_clk edge

The configuration parameters are calculated through the following formulas. For more information, see the device data manual.

1. For single read accesses:

$$A = (\text{CSRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$C = \text{RDCYCLETIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$D = (\text{RDCYCLETIME} - \text{RDACCESSTIME}) * \text{GPMC\_FCLK period}$$

$$E = (\text{CSRDOFFTIME} - \text{RDACCESSTIME}) * \text{GPMC\_FCLK period}$$

2. For burst read accesses (where n is the page burst access number):

$$A = (\text{CSRDOFFTIME} - \text{CSONTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$C = (\text{RDCYCLETIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$D = (\text{RDCYCLETIME} - (\text{RDACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period}$$

$$E = (\text{CSRDOFFTIME} - (\text{RDACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period}$$

3. For burst write accesses (where n is the page burst access number):

$$A = (\text{CSWROFFTIME} - \text{CSONTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$C = (\text{WRCYCLETIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$$

$$D = (\text{WRCYCLETIME} - (\text{RDACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period}$$

$$E = (\text{CSWROFFTIME} - (\text{RDACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC\_FCLK period}$$

4. For all accesses:

For nCS falling edge (chip-select activated):

- Case where [GPMC\\_CONFIG1\\_j\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:

$$F = 0.5 * \text{CSEXTRADelay} * \text{GPMC\_FCLK period}$$

- Case where GPMCFCLKDIVIDER = 0x1:

F = 0.5 \* CSEXTRADelay \* GPMC\_FCLK period, when (CLKACTIVATIONTIME and CSONTIME are odd) or (CLKACTIVATIONTIME and CSONTIME are even)

$$F = (1 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC\_FCLK period otherwise.}$$

- Case where GPMCFCLKDIVIDER = 0x2:

F = 0.5 \* CSEXTRADelay \* GPMC\_FCLK period, when (CSONTIME - CLKACTIVATIONTIME) is a multiple of 3

$$F = (1 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC\_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 1) is a multiple of 3}$$

$$F = (2 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC\_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 2) is a multiple of 3}$$

- Case where GPMCFCLKDIVIDER = 0x3:

F = 0.5 \* CSEXTRADelay \* GPMC\_FCLK period, when (CSONTIME - CLKACTIVATIONTIME) is a multiple of 4

$$F = (1 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC\_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 1) is a multiple of 4}$$

$$F = (2 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC\_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 2) is a multiple of 4}$$

$$F = (3 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC\_FCLK period, when (CSONTIME - CLKACTIVATIONTIME - 3) is a multiple of 4}$$

For nCS rising edge (chip-select deactivated) in reading mode:

- Case where [GPMC\\_CONFIG1\\_j\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:

$$F = 0.5 * \text{CSEXTRADelay} * \text{GPMC\_FCLK period}$$

- Case where GPMCFCLKDIVIDER = 0x1:

F = 0.5 \* CSEXTRADelay \* GPMC\_FCLK period, when (CLKACTIVATIONTIME and CSRDOFFTIME are odd) or (CLKACTIVATIONTIME and CSRDOFFTIME are even)

$$F = (1 + 0.5 * \text{CSEXTRADelay}) * \text{GPMC\_FCLK period otherwise.}$$

- Case where GPMCFCLKDIVIDER = 0x2:  
 $F = 0.5 * CSEXTRADelay * GPMC\_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$   
 $F = (1 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$   
 $F = (2 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
  - Case where GPMCFCLKDIVIDER = 0x3:  
 $F = 0.5 * CSEXTRADelay * GPMC\_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 4$   
 $F = (1 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 4$   
 $F = (2 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 4$   
 $F = (3 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSRDOFFTIME - CLKACTIVATIONTIME - 3) \text{ is a multiple of } 4$
- For nCS rising edge (chip-select deactivated) in writing mode:
- Case where GPMC\_CONFIG1\_j[1:0] GPMCFCLKDIVIDER = 0x0:  
 $F = 0.5 * CSEXTRADelay * GPMC\_FCLK \text{ period}$
  - Case where GPMCFCLKDIVIDER = 0x1:  
 $F = 0.5 * CSEXTRADelay * GPMC\_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } CSWROFFTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } CSWROFFTIME \text{ are even})$   
 $F = (1 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period otherwise.}$
  - Case where GPMCFCLKDIVIDER = 0x2:  
 $F = 0.5 * CSEXTRADelay * GPMC\_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$   
 $F = (1 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$   
 $F = (2 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
  - Case where GPMCFCLKDIVIDER = 0x3:  
 $F = 0.5 * CSEXTRADelay * GPMC\_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 4$   
 $F = (1 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 4$   
 $F = (2 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 4$   
 $F = (3 + 0.5 * CSEXTRADelay) * GPMC\_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 3) \text{ is a multiple of } 4$
- For nADV falling edge (nADV activated):
- Case where GPMC\_CONFIG1\_j[1:0] GPMCFCLKDIVIDER = 0x0:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period}$
  - Case where GPMCFCLKDIVIDER = 0x1:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } ADVONTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } ADVONTIME \text{ are even})$   
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period otherwise.}$
  - Case where GPMCFCLKDIVIDER = 0x2:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$   
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$   
 $G = (2 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
  - Case where GPMCFCLKDIVIDER = 0x3:  
 $G = 0.5 * ADVEXTRADelay * GPMC\_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 4$   
 $G = (1 + 0.5 * ADVEXTRADelay) * GPMC\_FCLK \text{ period, when } (ADVONTIME -$

CLKACTIVATIONTIME – 1) is a multiple of 4

$G = (2 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVONTIME – CLKACTIVATIONTIME – 2) is a multiple of 4

$G = (3 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVONTIME – CLKACTIVATIONTIME – 3) is a multiple of 4

For nADV rising edge (nADV deactivated) in reading mode:

- Case where [GPMC\\_CONFIG1\\_j\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK$  period
- Case where GPMCFCLKDIVIDER = 0x1:  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK$  period, when (CLKACTIVATIONTIME and ADVRDOFFTIME are odd) or (CLKACTIVATIONTIME and ADVRDOFFTIME are even)  
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period otherwise.
- Case where GPMCFCLKDIVIDER = 0x2:  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK$  period, when (ADVRDOFFTIME - CLKACTIVATIONTIME) is a multiple of 3  
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVRDOFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3  
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVRDOFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3
- Case where GPMCFCLKDIVIDER = 0x3:  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK$  period, when (ADVRDOFFTIME – CLKACTIVATIONTIME) is a multiple of 4  
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVRDOFFTIME – CLKACTIVATIONTIME – 1) is a multiple of 4  
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVRDOFFTIME – CLKACTIVATIONTIME – 2) is a multiple of 4  
 $G = (3 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVRDOFFTIME – CLKACTIVATIONTIME – 3) is a multiple of 4

For nADV rising edge (nADV deactivated) in writing mode:

- Case where [GPMC\\_CONFIG1\\_j\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK$  period
- Case where GPMCFCLKDIVIDER = 0x1:  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK$  period, when (CLKACTIVATIONTIME and ADVWROFFTIME are odd) or (CLKACTIVATIONTIME and ADVWROFFTIME are even)  
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period otherwise.
- Case where GPMCFCLKDIVIDER = 0x2:  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK$  period, when (ADVWROFFTIME – CLKACTIVATIONTIME) is a multiple of 3  
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVWROFFTIME – CLKACTIVATIONTIME – 1) is a multiple of 3  
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVWROFFTIME – CLKACTIVATIONTIME – 2) is a multiple of 3
- Case where GPMCFCLKDIVIDER = 0x3:  
 $G = 0.5 * ADVEXTRADELAY * GPMC\_FCLK$  period, when (ADVWROFFTIME – CLKACTIVATIONTIME) is a multiple of 4  
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVWROFFTIME – CLKACTIVATIONTIME – 1) is a multiple of 4  
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVWROFFTIME – CLKACTIVATIONTIME – 2) is a multiple of 4  
 $G = (3 + 0.5 * ADVEXTRADELAY) * GPMC\_FCLK$  period, when (ADVWROFFTIME – CLKACTIVATIONTIME – 3) is a multiple of 4

For nOE falling edge (nOE activated):

- Case where [GPMC\\_CONFIG1\\_j\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:  
 $H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period
- Case where GPMCFCLKDIVIDER = 0x1:  
 $H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period, when (CLKACTIVATIONTIME and OEONTIME are odd) or (CLKACTIVATIONTIME and OEONTIME are even)

- $H = (1 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period otherwise.
- Case where  $GPMCFCLKDIVIDER = 0x2$ :  
 $H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period, when  $(OEONTIME - CLKACTIVATIONTIME)$  is a multiple of 3  
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when  $(OEONTIME - CLKACTIVATIONTIME - 1)$  is a multiple of 3  
 $H = (2 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when  $(OEONTIME - CLKACTIVATIONTIME - 2)$  is a multiple of 3
  - Case where  $GPMCFCLKDIVIDER = 0x3$ :  
 $H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period, when  $(OEONTIME - CLKACTIVATIONTIME)$  is a multiple of 4  
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when  $(OEONTIME - CLKACTIVATIONTIME - 1)$  is a multiple of 4  
 $H = (2 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when  $(OEONTIME - CLKACTIVATIONTIME - 2)$  is a multiple of 4  
 $H = (3 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when  $(OEONTIME - CLKACTIVATIONTIME - 3)$  is a multiple of 4
- For nOE rising edge (nOE deactivated):
- Case where  $GPMC\_CONFIG1\_j[1:0] GPMCFCLKDIVIDER = 0x0$ :  
 $H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period
  - Case where  $GPMCFCLKDIVIDER = 0x1$ :  
 $H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period, when  $(CLKACTIVATIONTIME$  and  $OEOFFTIME$  are odd) or  $(CLKACTIVATIONTIME$  and  $OEOFFTIME$  are even)  
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period otherwise.
  - Case where  $GPMCFCLKDIVIDER = 0x2$ :  
 $H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period, when  $(OEOFFTIME - CLKACTIVATIONTIME)$  is a multiple of 3  
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when  $(OEOFFTIME - CLKACTIVATIONTIME - 1)$  is a multiple of 3  
 $H = (2 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when  $(OEOFFTIME - CLKACTIVATIONTIME - 2)$  is a multiple of 3
  - Case where  $GPMCFCLKDIVIDER = 0x3$ :  
 $H = 0.5 * OEEXTRADELAY * GPMC\_FCLK$  period, when  $(OEOFFTIME - CLKACTIVATIONTIME)$  is a multiple of 4  
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when  $(OEOFFTIME - CLKACTIVATIONTIME - 1)$  is a multiple of 4  
 $H = (2 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when  $(OEOFFTIME - CLKACTIVATIONTIME - 2)$  is a multiple of 4  
 $H = (3 + 0.5 * OEEXTRADELAY) * GPMC\_FCLK$  period, when  $(OEOFFTIME - CLKACTIVATIONTIME - 3)$  is a multiple of 4
- For nWE falling edge (nWE activated):
- Case where  $GPMC\_CONFIG1\_j[1:0] GPMCFCLKDIVIDER = 0x0$ :  
 $I = 0.5 * WEEXTRADELAY * GPMC\_FCLK$  period
  - Case where  $GPMCFCLKDIVIDER = 0x1$ :  
 $I = 0.5 * WEEXTRADELAY * GPMC\_FCLK$  period, when  $(CLKACTIVATIONTIME$  and  $WEONTIME$  are odd) or  $(CLKACTIVATIONTIME$  and  $WEONTIME$  are even)  
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period otherwise.
  - Case where  $GPMCFCLKDIVIDER = 0x2$ :  
 $I = 0.5 * WEEXTRADELAY * GPMC\_FCLK$  period, when  $(WEONTIME - CLKACTIVATIONTIME)$  is a multiple of 3  
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when  $(WEONTIME - CLKACTIVATIONTIME - 1)$  is a multiple of 3  
 $I = (2 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when  $(WEONTIME - CLKACTIVATIONTIME - 2)$  is a multiple of 3
  - Case where  $GPMCFCLKDIVIDER = 0x3$ :  
 $I = 0.5 * WEEXTRADELAY * GPMC\_FCLK$  period, when  $(WEONTIME - CLKACTIVATIONTIME)$  is a multiple of 4

- $I = (1 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when  $(WEONTIME - CLKACTIVATIONTIME - 1)$  is a multiple of 4  
 $I = (2 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when  $(WEONTIME - CLKACTIVATIONTIME - 2)$  is a multiple of 4  
 $I = (3 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when  $(WEONTIME - CLKACTIVATIONTIME - 3)$  is a multiple of 4  
 For nWE rising edge (nWE deactivated):
- Case where `GPMC_CONFIG1_j[1:0] GPMCFCLKDIVIDER = 0x0`:  
 $I = 0.5 * WEEXTRADELAY * GPMC\_FCLK$  period
  - Case where `GPMCFCLKDIVIDER = 0x1`:  
 $I = 0.5 * WEEXTRADELAY * GPMC\_FCLK$  period, when  $(CLKACTIVATIONTIME$  and  $WEOFFTIME$  are odd) or  $(CLKACTIVATIONTIME$  and  $WEOFFTIME$  are even)  
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period otherwise.
  - Case where `GPMCFCLKDIVIDER = 0x2`:  
 $I = 0.5 * WEEXTRADELAY * GPMC\_FCLK$  period, when  $(WEOFFTIME - CLKACTIVATIONTIME)$  is a multiple of 3  
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when  $(WEOFFTIME - CLKACTIVATIONTIME - 1)$  is a multiple of 3  
 $I = (2 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when  $(WEOFFTIME - CLKACTIVATIONTIME - 2)$  is a multiple of 3
  - Case where `GPMCFCLKDIVIDER = 0x3`:  
 $I = 0.5 * WEEXTRADELAY * GPMC\_FCLK$  period, when  $(WEOFFTIME - CLKACTIVATIONTIME)$  is a multiple of 4  
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when  $(WEOFFTIME - CLKACTIVATIONTIME - 1)$  is a multiple of 4  
 $I = (2 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when  $(WEOFFTIME - CLKACTIVATIONTIME - 2)$  is a multiple of 4  
 $I = (3 + 0.5 * WEEXTRADELAY) * GPMC\_FCLK$  period, when  $(WEOFFTIME - CLKACTIVATIONTIME - 3)$  is a multiple of 4
- For `gpmc_nadv` low pulse duration:
- Read operation:  
 $K = (ADVRDOFFTIME - ADVONTIME) * (TIMEPARAGRANULARITY + 1) * GPMC\_FCLK$  period
  - Write operation:  
 $K = (ADVWROFFTIME - ADVONTIME) * (TIMEPARAGRANULARITY + 1) * GPMC\_FCLK$  period
- For `gpmc_wait` invalid to first data latching `gpmc_clk` edge:
- $L = WAITMONITORINGTIME * (GPMCFCLKDIVIDER + 1) * GPMC\_FCLK$  period + `GPMC_CLK` period

Figure 15-98 shows a simplified example of a synchronous NOR single read where formulas are associated with signal waves.

**Figure 15-98. Synchronous NOR Single Read Simplified Example**

gpmc-046

### 15.4.5.6.1.3 Asynchronous NOR Flash Timing Parameters Formulas

This section lists all the formulas to calculate asynchronous NOR timing parameters. This is the case when `GPMC_CONFIG1_i[11:10] DEVICETYPE = 0x0` and when `READTYPE` or `WRITETYPE` are set to asynchronous mode. [Table 15-489](#) describes the asynchronous NOR formulas.

**Table 15-489. Asynchronous NOR Formulas Description**

Configuration Parameter	Unit	Description
A	ns	Pulse duration – gpmc_cs low
B	ns	Delay time – gpmc_cs valid to gpmc_advn_ale invalid
C	ns	Delay time – gpmc_cs valid to gpmc_oen_ren invalid (single read)
D	ns	Pulse duration – address bus valid - 2nd, 3rd and 4th accesses
E	ns	Delay time – gpmc_cs valid to gpmc_wen valid
F	ns	Delay time – gpmc_cs valid to gpmc_wen invalid
G	ns	Address invalid duration between two successive R/W accesses
H	ns	Setup time – read data valid before gpmc_oen_ren high
I	ns	Delay time – gpmc_cs valid to gpmc_oen_ren invalid (burst read)
J	ns	Delay time – address bus valid to gpmc_cs valid Delay time – data bus valid to gpmc_cs valid Delay time – gpmc_ben0/gpmc_ben1 valid to gpmc_cs valid
K	ns	Delay time – gpmc_cs valid to gpmc_advn_ale valid
L	ns	Delay time – gpmc_cs valid to gpmc_oen_ren valid
M	ns	Delay time – gpmc_cs valid to first data latching edge
N	ns	Pulse duration – gpmc_ben0/gpmc_ben1 valid time

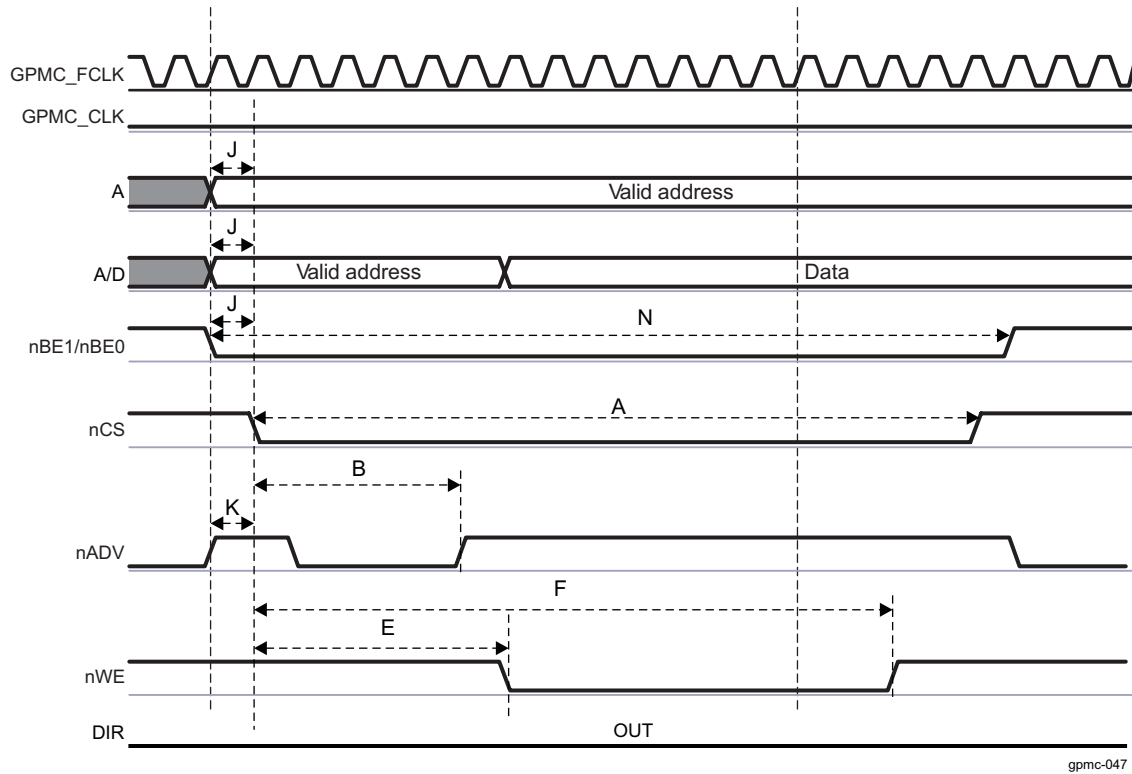

**Table 15-489. Asynchronous NOR Formulas Description (continued)**

Configuration Parameter	Unit	Description
O	ns	Delay time – gpmc_cs valid to gpmc_advn_ale valid

The configuration parameters are calculated through the following formulas. These formulas are not exhaustive. For more information, see the device data manual.

- gpmc\_cs low pulse:  
For single read:  $A = (\text{CSRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$   
For burst read:  $A = (\text{CSRDOFFTIME} - \text{CSONTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$ , where N = page burst access number  
For single write:  $A = (\text{CSWROFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$   
For burst write:  $A = (\text{CSWROFFTIME} - \text{CSONTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$ , where N = page burst access number
- gpmc\_cs valid to gpmc\_advn\_ale invalid delay:  
For reading:  $B = ((\text{ADVRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$   
For writing:  $B = ((\text{ADVWROFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$
- $C = ((\text{OEOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$
- $D = \text{PAGEBURSTACCESSTIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$
- $E = ((\text{WEONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{WEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$
- $F = ((\text{WEOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{WEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$
- $G = \text{CYCLE2CYCLEDELAY} * \text{GPMC\_FCLK period}$
- $H = ((\text{OEOFFTIME} - \text{RDACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * \text{OEEXTRADELAY}) * \text{GPMC\_FCLK period}$
- $I = ((\text{OEOFFTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$ , where N = page burst access number

For burst write:  $N = (\text{WRCYCLETIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC\_FCLK period}$ , where N = page burst access number
- $O = ((\text{WRCYCLETIME} + (N - 1) * \text{PAGEBURSTACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC\_FCLK period}$

Figure 15-99 shows a simplified example of an asynchronous NOR single write where formulas are associated with signal waves.

**Figure 15-99. Asynchronous NOR Single Write Simplified Example**

**NOTE:** Write multiple access is not supported in asynchronous mode. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

## 15.4.6 GPMC Use Cases and Tips

### 15.4.6.1 How to Set GPMC Timing Parameters for Typical Accesses

#### 15.4.6.1.1 External Memory Attached to the GPMC Module

As discussed in the introduction to this chapter, the GPMC module supports the following external memory types:

- Asynchronous or synchronous, 8- or 16-bit-wide memory or device
- 16-bit address/data-multiplexed or not multiplexed NOR flash device
- 8- or 16-bit NAND flash device

The following examples describe how to calculate GPMC timing parameters by showing a typical parameter setup for the access to be performed.

The example is based on a 512-Mb multiplexed NOR flash memory with the following characteristics:

- Type: NOR flash (address/data-multiplexed mode)
- Size: 512M bits
- Data Bus: 16 bits wide
- Speed: 104-MHz clock frequency
- Read access time: 80 ns

#### 15.4.6.1.2 Typical GPMC Setup

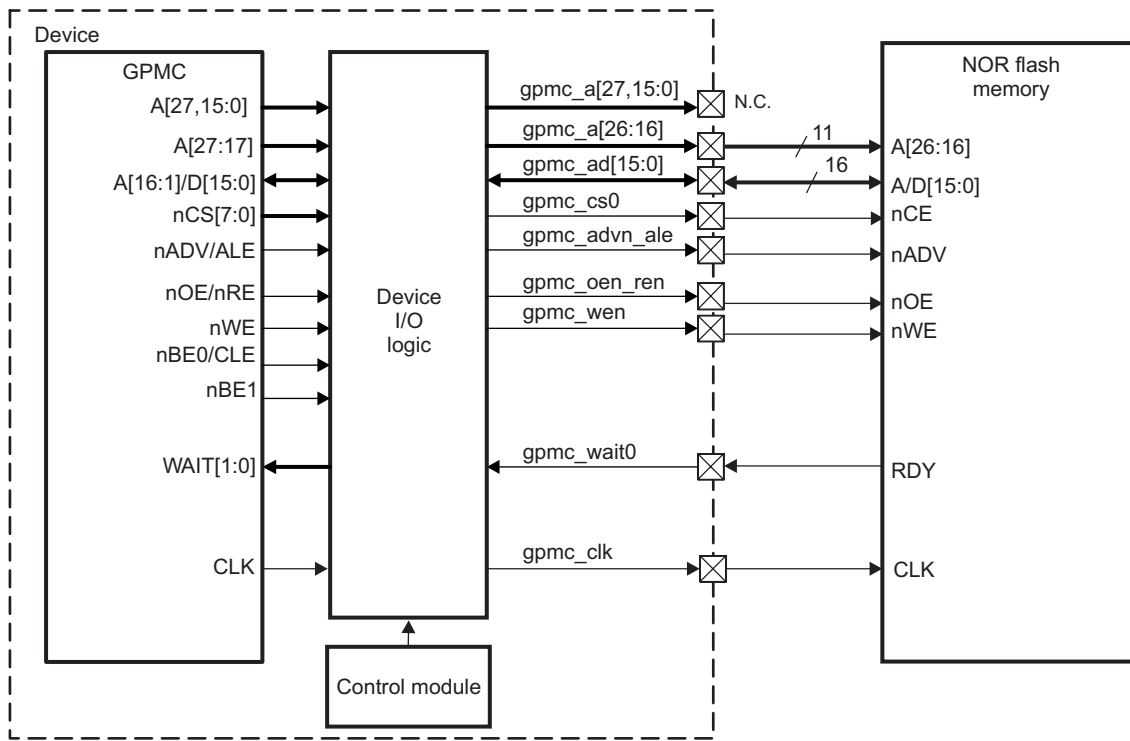

[Table 15-490](#) lists some of the I/Os of the GPMC module.

**Table 15-490. GPMC Signals**

Signal Name	I/O	Description
GPMC_FCLK	Internal	Functional and interface clock. Acts as the time reference.
gpmc_clk	O	External clock provided to the external device for synchronous operations
gpmc_a[26:16]	O	Address
gpmc_ad[15:0]	I/O	Data-multiplexed with addresses A[16:1] on memory side
gpmc_csx	O	Chip-select (where x = 0, or 1)
gpmc_advn_ale	O	Address valid enable
gpmc_oen_ren	O	Output enable (read access only)
gpmc_wen	O	Write enable (write access only)
gpmc_wait[1:0]	I	Ready signal from memory device. Indicates when valid burst data is ready to be read

Figure 15-100 shows the typical connection between the GPMC module and an attached NOR Flash memory.

Figure 15-100. GPMC Connection to an External NOR Flash Memory

gpmc-037

The following sections demonstrate how to calculate GPMC parameters for three access types:

- Synchronous burst read
- Asynchronous read
- Asynchronous single write

#### 15.4.6.1.2.1 GPMC Configuration for Synchronous Burst Read Access

**NOTE:** The examples in Section 15.4.6.1.2.1 through Section 15.4.6.1.2.3 are based on a clock rate of 104 MHz. Refer to the device Data Manual for the maximum frequency appropriate for this device and to the memory datasheet for the maximum frequency for the particular memory device.

The clock runs at 104 MHz (  $f = 104 \text{ MHz}$ ;  $T = 9,615 \text{ ns}$ ).

Table 15-491 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Table 15-492 shows how to calculate timings for the GPMC using the memory parameters.

Figure 15-101 shows the synchronous burst read access.

Table 15-491. Useful Timing Parameters on the Memory Side

AC Read Characteristics on the Memory Side	Description	Duration (ns)
tCES	nCS setup time to clock	0
tACS	Address setup time to clock	3
tIACC	Synchronous access time	80

**Table 15-491. Useful Timing Parameters on the Memory Side (continued)**

AC Read Characteristics on the Memory Side	Description	Duration (ns)
tBACC	Burst access time valid clock to output delay	5,2
tCEZ	Chip-select to High-Z	7
tOEZ	Output enable to High-Z	7
tAVC	nADV setup time	6
tAVD	nAVD pulse	6
tACH	Address hold time from clock	3

The following terms, which describe the timing interface between the controller and its attached device, are used to calculate the timing parameters on the GPMC side:

- Read access time (GPMC side): Time required to activate the clock + read access time requested on the memory side + data setup time required for optimal capture of a burst of data
- Data setup time (GPMC side): Ensures a good capture of a burst of data (as opposed to taking a burst of data out). One word of data is processed in one clock cycle ( $T = 9,615$  ns). The read access time between two bursts of data is  $tBACC = 5.2$  ns. Therefore, data setup time is a clock period –  $tBACC = 4,415$  ns of data setup.
- Access completion (GPMC side): (Different from page burst access time) Time required between the last burst access and access completion: nCS/nOE hold time (nCS and nOE must be released at the end of an access. These signals are held to allow the access to complete).
- Read cycle time (GPMC side): Read access time + access completion
- Write cycle time for burst access: Not supported for NOR flash memory

**Table 15-492. Calculating GPMC Timing Parameters**

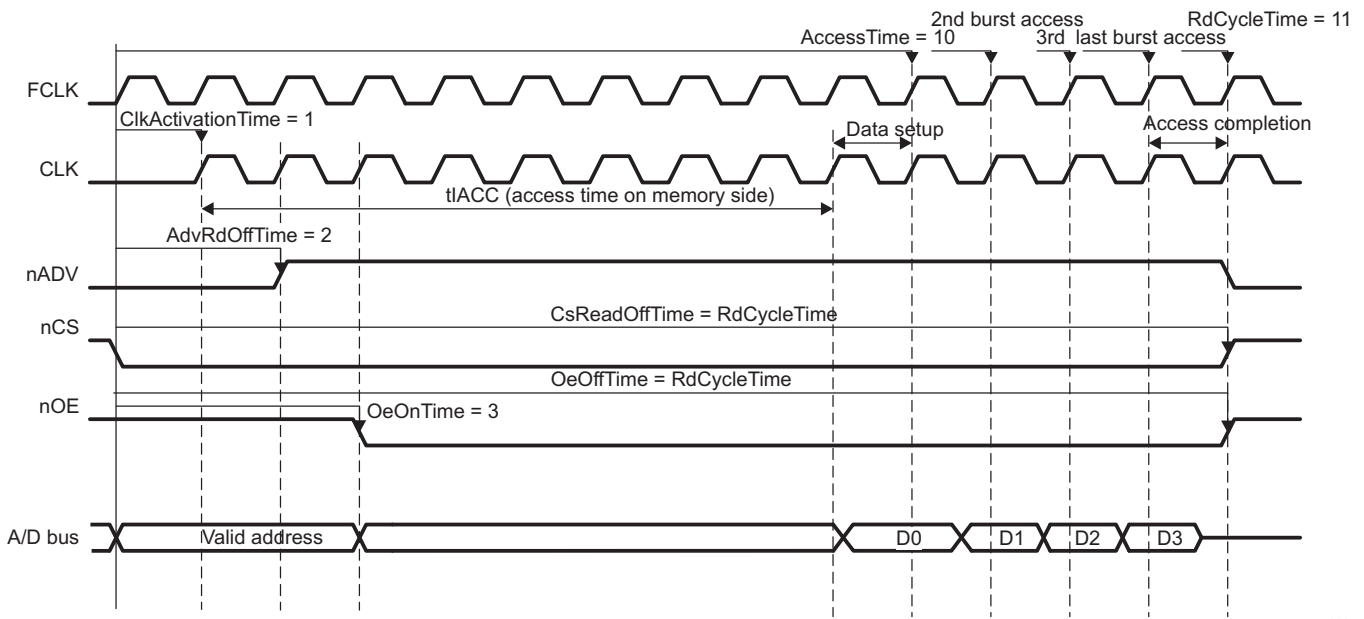

Parameter Name on GPMC Side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Register Configurations
GPMC FCLK Divider	–	–	–	GPMCFCLKDIVIDER = 0x0
ClkActivation Time	$\min ( tCES, tACS )$	3	1	CLKACTIVATIONTIME = 0x1
RdAccessTime	$\text{roundmax} ( \text{ClkActivationTime} + tIACC + \text{DataSetupTime} )$	94.03: (9,615 + 80 + 4,415)	10: $\text{roundmax} ( 94.03 / 9,615 )$	RDACCESSTIME = 0x0A
PageBurst RdAccessTime	$\text{roundmax} ( tBACC )$	$\text{roundmax} ( 5.2 )$	1	PAGEBURSTACCESSTIME = 0x1
RdCycleTime	$\text{RdAccess time} + \max ( tCEZ, tOEZ )$	101.03: (94.03 + 7)	11	RDCYCLETIME = 0x0B
CsOnTime	tCES	0	0	CSONTIME = 0x0
CsReadOffTime	RdCycleTime	-	11	CSRDOFFTIME = 0x0B
AdvOnTime	tAVC <sup>(1)</sup>	0	0	ADVONTIME = 0x0
AdvRdOffTime	$tAVD + tAVC$ <sup>(2)</sup>	12	2	ADVRDOFFTIME = 0x02
OeOnTime <sup>(3)</sup>	$( \text{ClkActivationTime} + tACH ) < \text{OeOnTime} ( \text{ClkActivationTime} + tIACC )$	–	3, for instance	OEONTIME = 0x3
OeOffTime	RdCycleTime	–	11	OEOFFTIME = 0x0B

<sup>(1)</sup> The external clock provided to the NOR flash is not yet available.

<sup>(2)</sup>  $\text{AdvRdOffTime} - \text{AdvOnTime} = tAVD$ ; thus,  $\text{AdvRdOffTime} = tAVD + \text{AdvOnTime} = tAVD + tAVC$ .

<sup>(3)</sup> OeOnTime must ensure that addresses are available. It must not exceed the availability of the first burst of data.

**Figure 15-101. Synchronous Burst Read Access (Timing Parameters in Clock Cycles)**

gpmc-038

**15.4.6.1.2.2 GPMC Configuration for Asynchronous Read Access**

The clock runs at 104 MHz ( f = 104 MHz; T = 9, 615 ns).

Table 15-493 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Table 15-494 shows how to calculate timings for the GPMC using the memory parameters.

Figure 15-102 shows the asynchronous read access.

**Table 15-493. AC Characteristics for Asynchronous Read Access**

AC Read Characteristics on the Memory Side	Description	Duration (ns)
tCE	Read Access time from nCS low	80
tAAVDS	Address setup time to rising edge of nADV	3
tAVDP	nADV low time	6
tCAS	nCS setup time to nADV	0
tOE	Output enable to output valid	6
tOEZ	Output enable to High-Z	7

Use the following formula to calculate the RdCycleTime parameter for this typical access:

$$RdCycleTime = RdAccessTime + AccessCompletion = RdAccessTime + 1 \text{ clock cycle} + tOEZ:$$

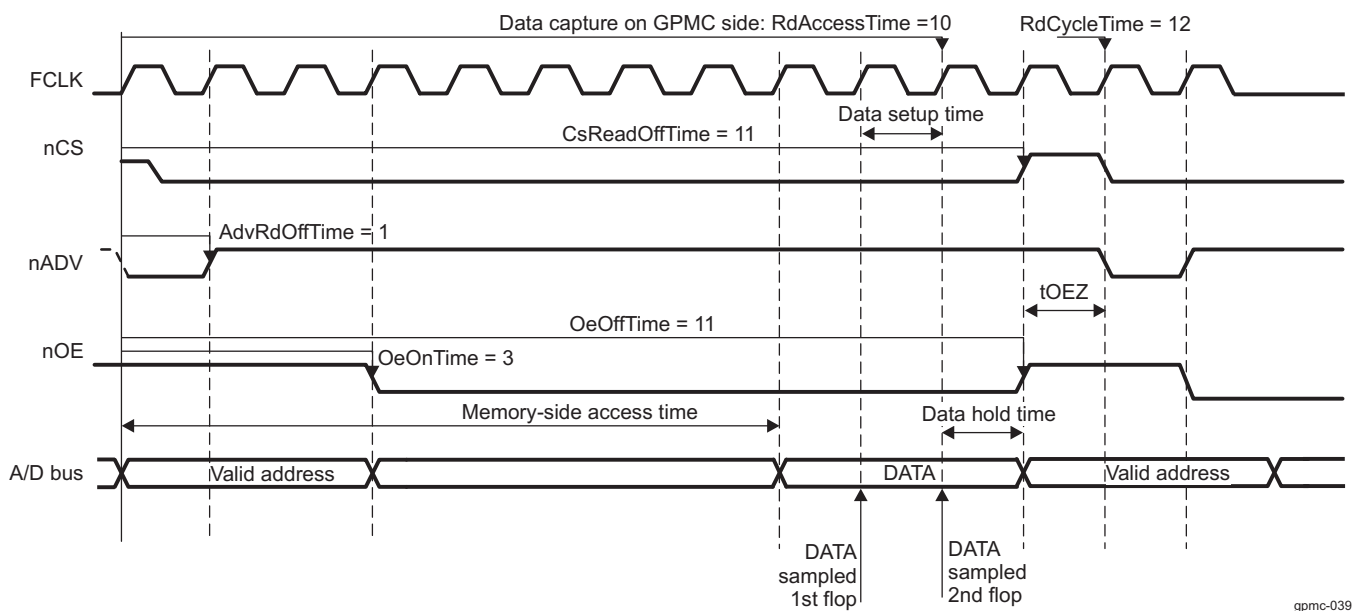

1. On the memory side, the external memory makes the data available to the output bus. This is the memory-side read access time defined in Table 15-493: the number of clock cycles between the address capture (nADV rising edge) and the data valid on the output bus.  
The GPMC requires some hold time to allow the data to be captured correctly and the access to be finished.
2. To read the data correctly, the GPMC must be configured to meet the data setup time requirement of the memory; the GPMC module captures the data on the next rising edge. This is access time on the GPMC side.
3. There must also be a data hold time for correctly reading the data (checking that there is no nOE/nCS deassertion while reading the data). This data hold time is one clock cycle (that is, RdAccessTime + 1).

4. To complete the access, nOE/nCS signals are driven to High-Z. RdAccessTime + 1 + tOEZ is the read cycle time.
5. Addresses can now be relatched and a new read cycle begun.

**Table 15-494. GPMC Timing Parameters for Asynchronous Read Access**

Parameter Name on GPMC Side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Register Configurations
ClkActivationTime		n/a (asynchronous mode)		
RdAccessTime	round max (tCE)	80	10	RDACCESSTIME = 0x0A
PageBurstAccess Time	N/A (single access)			
RdCycleTime	RdAccessTime + 1cycle + tOEZ	96, 615	12	RDCYCLETIME = 0x0C
CsOnTime	tCAS	0	0	CSONTIME = 0x0
CsReadOffTime	RdAccessTime + 1 cycle	89, 615	11	CSRDOFFTIME = 0x0B
AdvOnTime	tAAVDS	3	1	ADVONTIME = 0x1
AdvRdOffTime	tAAVDS + tAVDP	9	1	ADVRDOFFTIME = 0x01
OeOnTime	OeOnTime >= AdvRdOffTime (multiplexed mode)	-	3, for instance	OEONTIME = 0x3
OeOffTime	RdAccessTime + 1cycle	89, 615	11	OEOFFTIME = 0x0B

**Figure 15-102. Asynchronous Single Read Access (Timing Parameters in Clock Cycles)**

gpmc-039

#### 15.4.6.1.2.3 GPMC Configuration for Asynchronous Single Write Access

The clock runs at 104 MHz: (f = 104 MHz; T = 9, 615 ns).

Table 15-496 shows how to calculate timings for the GPMC using the memory parameters.

Table 15-495 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Figure 15-103 shows the synchronous burst write access.

**Table 15-495. AC Characteristics for Asynchronous Single Write ( Memory Side)**

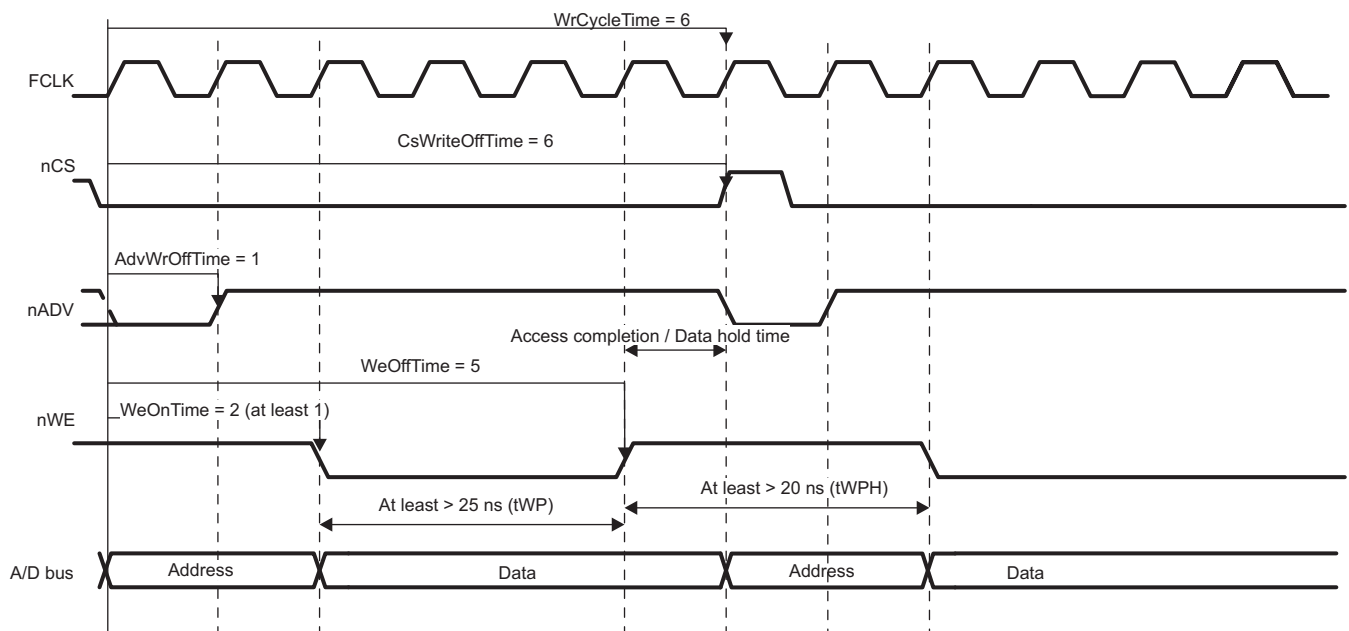

AC Characteristics on the Memory Side	Description	Duration (ns)
tWC	Write cycle time	60
tAVDP	nADV low time	6
tWP	Write pulse width	25
tWPH	Write pulse width high	20
tCS	nCS setup time to nWE	3
tCAS	nCS setup time to nADV	0
tAVSC	nADV setup time	3

For asynchronous single write access, write cycle time is  $WrCycleTime = WeOffTime + AccessCompletion = WeOffTime + 1$ . For the AccessCompletion, the GPMC requires one cycle of data hold time (nCS deassertion). For more information, see the device data manual.

**Table 15-496. GPMC Timing Parameters for Asynchronous Single Write**

Parameter Name on GPMC Side	Formula	Duration (ns)	Number of Clock Cycles (F = 104 MHz)	GPMC Registers Configuration
ClkActivationTime		N/A (asynchronous mode)		
WdAccessTime	Applicable only to WAITMONITORING (the value is the same as for read access)			
PageBurstAccessTime		N/A (single access)		
WrCycleTime	$WeOffTime + AccessCompletion$	57, 615	6	WRCYCLETIME = 0x06
CsOnTime	tCAS	0	0	CSONTIME = 0x0
CsWrOffTime	$WeOffTime + 1$	57, 615	6	CSWROFFTIME = 0x06
AdvOnTime	tAVSC	3	1	ADVONTIME = 0x1
AdvWrOffTime	$tAVSC + tAVDP$	9	1	ADVWROFFTIME = 0x01
WeOnTime	tCS	3	1	WEONTIME = 0x1
WeOffTime	$tCS + tWP + tWPH$	48	5	WEOFFTIME = 0x05

**Figure 15-103. Asynchronous Single Write Access (Timing Parameters in Clock Cycles)**

gpmc-040

### 15.4.6.2 How to Choose a Suitable Memory to Use With the GPMC

This section is intended to help the user select a suitable memory device to interface with the GPMC controller.

#### 15.4.6.2.1 Supported Memories or Devices

NAND flash and NOR flash architectures are the two flash technologies. The GPMC supports various types of external memory or devices, basically any one that supports NAND or NOR protocols:

- 8- and 16-bit-wide asynchronous or synchronous memory or device (only 8-bit: nonburst device)
- 16-bit address and data-multiplexed NOR flash devices (pSRAM, OneNAND™, etc.)
- 8- and 16-bit NAND flash devices

##### 15.4.6.2.1.1 Memory Pin Multiplexing

This section describes the interfacing differences of the GPMC supported memories.

**Table 15-497. Supported Memories Interfaces**

Function	16-Bit Address/ Data-Multiplexed pSRAM or NOR Flash <sup>(1)</sup>	OneNAND	16-Bit NAND	8-Bit NAND

#### 15.4.6.2.1.2 NAND Interface Protocol

NAND flash architecture, introduced in 1989, is a flash technology. NAND is a page-oriented memory device; that is, read and write accesses are done by pages. NAND achieves great density by sharing common areas of the storage transistor, which creates strings of serially connected transistors (in NOR devices, each transistor stands alone). Because of its high density NAND is best suited to devices that require high capacity data storage, such as pictures, music, and data files. NAND nonvolatility makes of it a good storage solution for many applications where mobility, low power, and speed are key factors. Low pin count and simple interface are other advantages of NAND.

Table 15-498 summarizes the NAND interface signals level applied to external device or memories.

**Table 15-498. NAND Interface Bus Operations Summary**

Bus Operation	CLE	ALE	nCE	nWE <sup>(1)</sup>	nRE <sup>(1)</sup>
Read (cmd input)	H	L	L	RE	H
Read (add input)	L	H	L	RE	H

<sup>(1)</sup> RE stands for rising edge; FE stands for falling edge

**Table 15-498. NAND Interface Bus Operations Summary (continued)**

Bus Operation	CLE	ALE	nCE	nWE <sup>(1)</sup>	nRE <sup>(1)</sup>
Write (cmd input)	H	L	L	RE	H
Write (add input)	L	H	L	RE	H
Data input	L	L	L	RE	H
Data output	L	L	L	H	FE
Busy (during read)	x	x	H <sup>(2)</sup>	H <sup>(2)</sup>	H <sup>(2)</sup>
Busy (during program)	x	x	x	x	x
Busy (during erase)	x	x	x	x	x
Standby	x	x	H	x	x

<sup>(2)</sup> Can be nCE high, or WE and nRE high.

#### 15.4.6.2.1.3 NOR Interface Protocol

NOR flash architecture, introduced in 1988, is a flash technology. Unlike NAND, which is a sequential access device, NOR is directly addressable; that is, it is designed to be a random access device. NOR is best suited to devices used to store and run code or firmware, usually in small capacities. While NOR has fast read capabilities, it also has slow write and erase functions when compared to the NAND architecture.

Table 15-499 summarizes the level of the NOR interface signals applied to external devices or memories.

**Table 15-499. NOR Interface Bus Operations Summary**

Bus Operation	CLK	nADV	nCS	nOE	nWE	WAIT	DQ[15:0]
Read (asynchronous)	x	L	L	L	H	Asserted	Output
Read (synchronous)	Running	L	L	L	H	Driven	Output
Read (burst suspend)	Halted	x	L	H	H	Active	Output
Write	x	L	L	H	L	Asserted	Input
Output disable	x	x	L	H	H	Asserted	High-Z
Standby	x	x	H	x	x	High-Z	High-Z

#### 15.4.6.2.1.4 Other Technologies

Other supported device types interact with the GPMC through the NOR interface protocol.

OneNAND is a high-density, low-power memory device. OneNAND is based on single- or multilevel-cell NAND core with SRAM and logic. It interfaces as a synchronous NOR flash and has synchronous write capability. It reads faster than conventional NAND and writes faster than conventional NOR flash. Hence, it is appropriate for mass storage and code storage.

pSRAM (pseudo-static random access memory) is a low-power memory device. pSRAM is based on the DRAM cell with internal refresh and address control features, and interfaces as a synchronous NOR flash. It also has synchronous write capability.

#### 15.4.6.2.1.5 Supported Protocols

The GPMC supports the following interface protocols when communicating with external memory or external devices:

- Asynchronous read/write access
- Asynchronous read page access (4, 8, 16 Word16)
- Synchronous read/write access
- Synchronous read burst access without wrap capability (4, 8, 16 Word16)
- Synchronous read burst access with wrap capability (4, 8, 16 Word16)

### 15.4.6.2.2 GPMC Features and Settings

The features and settings of the GPMC are:

- Supported device type: Up to four NAND or NOR protocol external memories or devices
- Operating voltage: 1.8 V, 3.3 V
- Maximum operating frequency provided externally: See the device data manual for precise information.
- Maximum GPMC addressing capability: 512MiB divided into eight chip-selects
- Maximum supported memory size: 256MiB (must be a power-of-two)
- Minimum supported memory size: 16MiB (must be a power-of-two). Aliasing occurs when addressing smaller memories.
- Data path to external memory or device: 8, 16 bits wide
- Burst and page access: burst of 4, 8, 16 Word16
- Supports bus keeping
- Supports bus turnaround

## 15.4.7 GPMC Register Manual

This section provides information about the GPMC instance in this product. [Table 15-501](#) provides a summary of the GPMC registers. The remaining parts of this section describe the registers within the module instance.

### 15.4.7.1 GPMC Register Summary

**Table 15-500. GPMC Instance Summary**

Module Name	Base Address	Size
GPMC	0x5000 0000	16 MiB

**Table 15-501. GPMC Registers Mapping Summary**
