**Texas Instruments Jacinto6 Ex, Jacinto6 EP, and Jacinto6  
Infotainment Families of Products**

## **Technical Reference Manual**

<b>Revision History</b> .....	<b>356</b>
<b>Preface</b> .....	<b>357</b>
<b>1 Introduction</b> .....	<b>364</b>
1.1 DRA75x, DRA74x Overview .....	365
1.2 DRA75x, DRA74x Environment .....	367
1.3 DRA75x, DRA74x Description .....	368
1.3.1 MPU Subsystem .....	369
1.3.2 DSP Subsystems .....	369
1.3.3 EVE Subsystems .....	369
1.3.4 IPU Subsystems .....	369
1.3.5 IVA-HD Subsystem .....	370
1.3.6 Display Subsystem .....	370
1.3.7 Video Processing Subsystem .....	370
1.3.8 Video Capture .....	371
1.3.9 3D GPU Subsystem .....	371
1.3.10 BB2D Subsystem .....	372
1.3.11 On-Chip Debug Support .....	372
1.3.12 Power, Reset, and Clock Management .....	373
1.3.13 On-Chip Memory .....	373
1.3.14 Memory Management .....	373
1.3.15 External Memory Interfaces .....	373
1.3.16 System and Connectivity Peripherals .....	374
1.3.16.1 System Peripherals .....	374
1.3.16.2 Media Connectivity Peripherals .....	374
1.3.16.3 Car Connectivity Peripherals .....	375
1.3.16.4 Audio Connectivity Peripherals .....	375
1.3.16.5 Serial Control Peripherals .....	375
1.3.16.6 Radio Accelerators .....	376
1.4 DRA75x, DRA74x Family .....	377
1.5 DRA75x, DRA74x Device Identification .....	377
1.6 DRA75x, DRA74x Package Characteristics Overview .....	380
<b>2 Memory Mapping</b> .....	<b>381</b>
2.1 Introduction .....	382
2.2 L3_MAIN Memory Map .....	384
2.2.1 L3_INSTR Memory Map .....	387
2.3 L4 Memory Map .....	389
2.3.1 L4_CFG Memory Map .....	389
2.3.2 L4_WKUP Memory Map .....	393
2.4 L4_PER Memory Map .....	394
2.4.1 L4_PER1 Memory Space Mapping .....	394
2.4.2 L4_PER2 Memory Map .....	396
2.4.3 L4_PER3 Memory Map .....	398
2.5 MPU Memory Map .....	401
2.6 IPU Memory Map .....	403
2.7 DSP Memory Map .....	405

2.8	EVE Memory Map .....	406
2.9	TILER View Memory Map .....	407
<b>3</b>	<b>Power, Reset, and Clock Management.....</b>	<b>408</b>
3.1	Device Power Management Introduction .....	409
3.1.1	Device Power-Management Architecture Building Blocks.....	410
3.1.1.1	Clock Management.....	410
3.1.1.1.1	Module Interface and Functional Clocks .....	410
3.1.1.1.2	Module-Level Clock Management .....	411
3.1.1.1.3	Clock Domain.....	416
3.1.1.1.4	Clock Domain-Level Clock Management .....	417
3.1.1.1.5	Clock Domain HW_AUTO Mode Sequences .....	418
3.1.1.1.6	Clock Domain Sleep/Wake-up .....	421
3.1.1.1.7	Clock Domain Dependency.....	422
3.1.1.2	Power Management.....	429
3.1.1.2.1	Power Domain.....	429
3.1.1.2.2	Module Logic and Memory Context .....	431
3.1.1.2.3	Power Domain Management .....	431
3.1.1.3	Voltage Management .....	433
3.1.1.3.1	Voltage Domain .....	433
3.1.1.3.2	Voltage Domain Management.....	434
3.1.1.3.3	AVS Overview .....	434
3.1.2	Power-Management Techniques .....	436
3.1.2.1	Standby Leakage Management .....	436
3.1.2.2	Dynamic Voltage and Frequency Scaling .....	437
3.1.2.3	Dynamic Power Switching.....	438
3.1.2.4	Adaptive Voltage Scaling .....	438
3.1.2.5	Adaptive Body Bias .....	439
3.1.2.6	SR3-APG (Automatic Power Gating) .....	439
3.1.2.7	Combining Power-Management Techniques .....	439
3.1.2.7.1	DPS Versus SLM .....	440
3.2	PRCM Subsystem Overview .....	441
3.2.1	Introduction .....	441
3.2.2	Power-Management Framework Features .....	442
3.3	PRCM Subsystem Environment .....	444
3.3.1	External Clock Signals .....	444
3.3.2	External Boot Signals .....	444
3.3.3	External Reset Signals.....	445
3.3.4	External Voltage Inputs .....	446
3.4	PRCM Subsystem Integration.....	447
3.4.1	Device Power-Management Layout .....	447
3.4.2	Power-Management Scheme, Reset, and Interrupt Requests.....	451
3.4.2.1	Power Domain .....	451
3.4.2.2	Resets.....	451
3.4.2.3	PRCM Interrupt Requests .....	451
3.5	Reset Management Functional Description .....	453
3.5.1	Overview .....	453
3.5.1.1	PRCM Reset Management Functional Description .....	453
3.5.1.1.1	Power-On Reset .....	453
3.5.1.1.2	Warm Reset .....	453
3.5.1.2	PRM Reset Management Functional Description .....	453
3.5.2	General Characteristics of Reset Signals .....	453
3.5.2.1	Scope .....	454
3.5.2.2	Occurrence .....	454

3.5.2.3	Source Type.....	454
3.5.2.4	Retention Type.....	454
3.5.3	Reset Sources.....	455
3.5.3.1	Global Reset Sources.....	455
3.5.3.2	Local Reset Sources .....	455
3.5.4	Reset Logging .....	456
3.5.5	Reset Domains.....	456
3.5.6	Reset Sequences .....	479
3.5.6.1	MPU Subsystem Power-On Reset Sequence .....	479
3.5.6.2	MPU Subsystem Warm Reset Sequence .....	480
3.5.6.3	MPU Subsystem Reset Sequence on Sleep and Wake-Up Transitions From RETENTION State.....	481
3.5.6.4	IVA Subsystem Power-On Reset Sequence.....	482
3.5.6.5	IVA Subsystem Software Warm Reset Sequence .....	483
3.5.6.6	DSP1 Subsystem Power-On Reset Sequence .....	484
3.5.6.7	DSP1 Subsystem Software Warm Reset Sequence.....	484
3.5.6.8	DSP2 Subsystem Power-On Reset Sequence .....	485
3.5.6.9	DSP2 Subsystem Software Warm Reset Sequence.....	486
3.5.6.10	IPU1 Subsystem Power-On Reset Sequence .....	486
3.5.6.11	IPU1 Subsystem Software Warm Reset Sequence.....	487
3.5.6.12	IPU2 Subsystem Power-On Reset Sequence .....	488
3.5.6.13	IPU2 Subsystem Software Warm Reset Sequence.....	489
3.5.6.14	EVE1 Subsystem Power-On Reset Sequence .....	490
3.5.6.15	EVE1 Subsystem Software Warm Reset Sequence.....	491
3.5.6.16	EVE2 Subsystem Power-On Reset Sequence .....	492
3.5.6.17	EVE2 Subsystem Software Warm Reset Sequence.....	492
3.5.6.18	Global Warm Reset Sequence .....	493
3.6	Clock Management Functional Description .....	495
3.6.1	Overview .....	495
3.6.2	External Clock Inputs.....	496
3.6.2.1	FUNC_32K_CLK Clock .....	496
3.6.2.2	High-Frequency System Clock Input.....	496
3.6.2.3	External Reference Clock Input .....	496
3.6.3	Internal Clock Sources and Generators .....	496
3.6.3.1	PRM Clock Source .....	496
3.6.3.2	CM Clock Source .....	498
3.6.3.2.1	CM_CORE_AON Clock Generator .....	498
3.6.3.2.2	CM_CORE_AON_CLKOUTMUX Overview .....	504
3.6.3.2.3	CM_CORE_AON_TIMER Overview .....	509
3.6.3.2.4	CM_CORE_AON_MCASP Overview .....	513
3.6.3.3	Generic DPLL Overview .....	516
3.6.3.3.1	Generic APLL Overview.....	516
3.6.3.3.2	DPLLs Output Clocks Parameters.....	517
3.6.3.3.3	Enable Control, Status, and Low-Power Operation Mode.....	519
3.6.3.3.4	DPLL Power Modes .....	519
3.6.3.3.5	DPLL Recalibration .....	521
3.6.3.3.6	DPLL Output Power Down.....	522
3.6.3.4	DPLL_PER Description .....	522
3.6.3.4.1	DPLL_PER Overview.....	522
3.6.3.4.2	DPLL_PER Synthesized Clock Parameters .....	522
3.6.3.4.3	DPLL_PER Power Modes .....	523
3.6.3.4.4	DPLL_PER Recalibration .....	523
3.6.3.5	DPLL_CORE Description.....	524
3.6.3.5.1	DPLL_CORE Overview .....	524

3.6.3.5.2	DPLL_CORE Synthesized Clock Parameters .....	524
3.6.3.5.3	DPLL_CORE Power Modes .....	525
3.6.3.5.4	DPLL_CORE Recalibration .....	526
3.6.3.6	DPLL_ABE Description .....	526
3.6.3.6.1	DPLL_ABE Overview .....	526
3.6.3.6.2	DPLL_ABE Synthesized Clock Parameters .....	527
3.6.3.6.3	DPLL_ABE Power Modes .....	527
3.6.3.6.4	DPLL_ABE Recalibration .....	527
3.6.3.7	DPLL_MPU Description .....	528
3.6.3.7.1	DPLL_MPU Overview .....	528
3.6.3.7.2	DPLL_MPU Tactical Clocking Adjustment.....	528
3.6.3.7.3	DPLL_MPU Synthesized Clock Parameters .....	528
3.6.3.7.4	DPLL_MPU Power Modes .....	529
3.6.3.7.5	DPLL_MPU Recalibration.....	529
3.6.3.8	DPLL_IVA Description .....	530
3.6.3.8.1	DPLL_IVA Overview .....	530
3.6.3.8.2	DPLL_IVA Synthesized Clock Parameters .....	530
3.6.3.8.3	DPLL_IVA Power Modes.....	531
3.6.3.8.4	DPLL_IVA Recalibration .....	531
3.6.3.9	DPLL_USB Description .....	531
3.6.3.9.1	DPLL_USB Overview.....	531
3.6.3.9.2	DPLL_USB Synthesized Clock Parameters .....	532
3.6.3.9.3	DPLL_USB Power Modes .....	532
3.6.3.9.4	DPLL_USB Recalibration .....	533
3.6.3.10	DPLL_EVE Description .....	533
3.6.3.10.1	DPLL_EVE Overview.....	533
3.6.3.10.2	DPLL_EVE Synthesized Clock Parameters .....	533
3.6.3.10.3	DPLL_EVE Power Modes .....	533
3.6.3.10.4	DPLL_EVE Recalibration .....	534
3.6.3.11	DPLL_DSP Description .....	534
3.6.3.11.1	DPLL_DSP Overview .....	534
3.6.3.11.2	DPLL_DSP Synthesized Clock Parameters .....	535
3.6.3.11.3	DPLL_DSP Power Modes .....	535
3.6.3.11.4	DPLL_DSP Recalibration .....	535
3.6.3.12	DPLL_GMAC Description .....	536
3.6.3.12.1	DPLL_GMAC Overview .....	536
3.6.3.12.2	DPLL_GMAC Synthesized Clock Parameters .....	536
3.6.3.12.3	DPLL_GMAC Power Modes.....	537
3.6.3.12.4	DPLL_GMAC Recalibration .....	537
3.6.3.13	DPLL_GPU Description.....	538
3.6.3.13.1	DPLL_GPU Overview .....	538
3.6.3.13.2	DPLL_GPU Synthesized Clock Parameters .....	538
3.6.3.13.3	DPLL_GPU Power Modes .....	539
3.6.3.13.4	DPLL_GPU Recalibration.....	539
3.6.3.14	DPLL_DDR Description.....	540
3.6.3.14.1	DPLL_DDR Overview .....	540
3.6.3.14.2	DPLL_DDR Synthesized Clock Parameters .....	540
3.6.3.14.3	DPLL_DDR Power Modes .....	540
3.6.3.14.4	DPLL_DDR Recalibration.....	541
3.6.3.15	DPLL_PCIE_REF Description .....	541
3.6.3.15.1	DPLL_PCIE_REF Overview .....	541
3.6.3.15.2	DPLL_PCIE_REF Synthesized Clock Parameters .....	542
3.6.3.15.3	DPLL_PCIE_REF Power Modes .....	542

3.6.3.16	APLL_PCIE Description .....	542
3.6.3.16.1	APLL_PCIE Overview .....	542
3.6.3.16.2	APLL_PCIE Synthesized Clock Parameters .....	543
3.6.3.16.3	APLL_PCIE Power Modes.....	543
3.6.4	Clock Domains .....	544
3.6.4.1	CD_WKUPAON Clock Domain .....	544
3.6.4.1.1	Overview .....	544
3.6.4.1.2	Clock Domain Modes.....	544
3.6.4.1.3	Clock Domain Dependency.....	545
3.6.4.1.4	Clock Domain Module Attributes.....	548
3.6.4.2	CD_DSP1 Clock Domain .....	550
3.6.4.2.1	Overview .....	550
3.6.4.2.2	Clock Domain Modes.....	550
3.6.4.2.3	Clock Domain Dependency.....	551
3.6.4.2.4	Clock Domain Module Attributes.....	552
3.6.4.3	CD_DSP2 Clock Domain .....	553
3.6.4.3.1	Overview .....	553
3.6.4.3.2	Clock Domain Modes.....	553
3.6.4.3.3	Clock Domain Dependency.....	554
3.6.4.3.4	Clock Domain Module Attributes.....	555
3.6.4.4	CD_CUSTEFUSE Clock Domain.....	556
3.6.4.4.1	Overview .....	556
3.6.4.4.2	Clock Domain Modes.....	556
3.6.4.4.3	Clock Domain Dependency.....	557
3.6.4.4.4	Clock Domain Module Attributes.....	557
3.6.4.5	CD_MPU Clock Domain .....	557
3.6.4.5.1	Overview .....	557
3.6.4.5.2	Clock Domain Modes.....	558
3.6.4.5.3	Clock Domain Dependency.....	558
3.6.4.5.4	Clock Domain Module Attributes.....	560
3.6.4.6	CD_L4PER1 Clock Domain .....	560
3.6.4.6.1	Overview .....	560
3.6.4.6.2	Clock Domain Modes.....	561
3.6.4.6.3	Clock Domain Dependency.....	562
3.6.4.6.4	Clock Domain Module Attributes.....	585
3.6.4.7	CD_L4PER2 Clock Domain .....	590
3.6.4.7.1	Overview .....	590
3.6.4.7.2	Clock Domain Modes.....	591
3.6.4.7.3	Clock Domain Dependency.....	592
3.6.4.7.4	Clock Domain Module Attributes.....	600
3.6.4.8	CD_L4PER3 Clock Domain .....	604
3.6.4.8.1	Overview .....	604
3.6.4.8.2	Clock Domain Modes.....	604
3.6.4.8.3	Clock Domain Dependency.....	605
3.6.4.8.4	Clock Domain Module Attributes.....	605
3.6.4.9	CD_L4SEC Clock Domain .....	606
3.6.4.9.1	Overview .....	606
3.6.4.9.2	Clock Domain Modes.....	607
3.6.4.9.3	Clock Domain Dependency.....	607
3.6.4.9.4	Clock Domain Module Attributes.....	608
3.6.4.10	CD_L3INIT Clock Domain .....	609
3.6.4.10.1	Overview .....	609
3.6.4.10.2	Clock Domain Modes.....	610

3.6.4.10.3	Clock Domain Dependency .....	611
3.6.4.10.4	Clock Domain Module Attributes.....	615
3.6.4.11	CD_IVA Clock Domain.....	619
3.6.4.11.1	Overview .....	619
3.6.4.11.2	Clock Domain Modes.....	619
3.6.4.11.3	Clock Domain Dependency .....	620
3.6.4.11.4	Clock Domain Module Attributes.....	620
3.6.4.12	CD_GPU Description .....	621
3.6.4.12.1	Overview .....	621
3.6.4.12.2	Clock Domain Modes.....	621
3.6.4.12.3	Clock Domain Dependency .....	622
3.6.4.12.4	Clock Domain Module Attributes.....	622
3.6.4.13	CD_EMU Clock Domain .....	623
3.6.4.13.1	Overview .....	623
3.6.4.13.2	Clock Domain Modes.....	624
3.6.4.13.3	Clock Domain Dependency .....	624
3.6.4.13.4	Clock Domain Module Attributes.....	625
3.6.4.14	CD_DSS Clock Domain .....	625
3.6.4.14.1	Overview .....	625
3.6.4.14.2	Clock Domain Modes.....	625
3.6.4.14.3	Clock Domain Dependency .....	626
3.6.4.14.4	Clock Domain Module Attributes.....	630
3.6.4.15	CD_L4_CFG Clock Domain.....	631
3.6.4.15.1	Overview .....	631
3.6.4.15.2	Clock Domain Modes.....	632
3.6.4.15.3	Clock Domain Dependency .....	632
3.6.4.15.4	Clock Domain Module Attributes.....	633
3.6.4.16	CD_L3_INSTR Clock Domain .....	635
3.6.4.16.1	Overview .....	635
3.6.4.16.2	Clock Domain Modes.....	636
3.6.4.16.3	Clock Domain Dependency .....	636
3.6.4.16.4	Clock Domain Module Attributes.....	636
3.6.4.17	CD_L3_MAIN1 Clock Domain .....	638
3.6.4.17.1	Overview .....	638
3.6.4.17.2	Clock Domain Modes.....	639
3.6.4.17.3	Clock Domain Dependency .....	639
3.6.4.17.4	Clock Domain Module Attributes.....	640
3.6.4.18	CD_EMIF Clock Domain .....	642
3.6.4.18.1	Overview .....	642
3.6.4.18.2	Clock Domain Modes.....	643
3.6.4.18.3	Clock Domain Dependency .....	643
3.6.4.18.4	Clock Domain Module Attributes.....	643
3.6.4.19	CD_IPU Clock Domain .....	644
3.6.4.19.1	Overview .....	644
3.6.4.19.2	Clock Domain Modes.....	645
3.6.4.19.3	Clock Domain Dependency .....	645
3.6.4.19.4	Clock Domain Module Attributes.....	647
3.6.4.20	CD_IPU1 Clock Domain .....	649
3.6.4.20.1	Overview .....	649
3.6.4.20.2	Clock Domain Modes.....	649
3.6.4.20.3	Clock Domain Dependency .....	649
3.6.4.20.4	Clock Domain Module Attributes.....	651
3.6.4.21	CD_IPU2 Clock Domain .....	651

3.6.4.21.1	Overview .....	651
3.6.4.21.2	Clock Domain Modes.....	652
3.6.4.21.3	Clock Domain Dependency .....	652
3.6.4.21.4	Clock Domain Module Attributes.....	654
3.6.4.22	CD_DMA Clock Domain .....	654
3.6.4.22.1	Overview .....	654
3.6.4.22.2	Clock Domain Modes.....	655
3.6.4.22.3	Clock Domain Dependency .....	655
3.6.4.22.4	Clock Domain Module Attributes.....	656
3.6.4.23	CD_ATL Clock Domain .....	657
3.6.4.23.1	Overview .....	657
3.6.4.23.2	Clock Domain Modes.....	657
3.6.4.23.3	Clock Domain Module Attributes.....	658
3.6.4.24	CD_CAM Clock Domain .....	659
3.6.4.24.1	Overview .....	659
3.6.4.24.2	Clock Domain Modes.....	659
3.6.4.24.3	Clock Domain Dependency .....	659
3.6.4.24.4	Clock Domain Module Attributes.....	660
3.6.4.25	CD_GMAC Clock Domain .....	661
3.6.4.25.1	Overview .....	661
3.6.4.25.2	Clock Domain Modes.....	662
3.6.4.25.3	Clock Domain Dependency .....	662
3.6.4.25.4	Clock Domain Module Attributes.....	663
3.6.4.26	CD_VPE Clock Domain.....	664
3.6.4.26.1	CD_VPE Overview .....	664
3.6.4.26.2	Clock Domain Modes.....	664
3.6.4.26.3	Clock Domain Dependency .....	665
3.6.4.26.4	Clock Domain Module Attributes.....	665
3.6.4.27	CD_EVE1 Clock Domain .....	666
3.6.4.27.1	CD_EVE1 Overview .....	666
3.6.4.27.2	Clock Domain Modes.....	667
3.6.4.27.3	Clock Domain Dependency .....	667
3.6.4.27.4	Clock Domain Module Attributes.....	668
3.6.4.28	CD_EVE2 Clock Domain .....	669
3.6.4.28.1	CD_EVE2 Overview .....	669
3.6.4.28.2	Clock Domain Modes.....	669
3.6.4.28.3	Clock Domain Dependency .....	669
3.6.4.28.4	Clock Domain Module Attributes.....	670
3.6.4.29	CD_RTC Clock Domain .....	671
3.6.4.29.1	CD_RTC Overview .....	671
3.6.4.29.2	Clock Domain Modes.....	671
3.6.4.29.3	Clock Domain Dependency .....	672
3.6.4.29.4	Clock Domain Module Attributes.....	673
3.6.4.30	CD_PCIE Clock Domain.....	674
3.6.4.30.1	CD_PCIE Overview.....	674
3.6.4.30.2	Clock Domain Modes.....	674
3.6.4.30.3	Clock Domain Dependency .....	675
3.6.4.30.4	Clock Domain Module Attributes.....	677
3.7	Power Management Functional Description.....	679
3.7.1	PD_WKUPAON Description .....	679
3.7.1.1	Power Domain Modes .....	680
3.7.1.1.1	Logic and Memory Area Power Modes .....	680
3.7.2	PD_DSP1 Description.....	680

3.7.2.1	Power Domain Modes .....	681
3.7.2.1.1	Logic and Memory Area Power Modes .....	681
3.7.2.1.2	Logic and Memory Area Power Modes Control and Status .....	681
3.7.3	PD_DSP2 Description.....	682
3.7.3.1	Power Domain Modes .....	682
3.7.3.1.1	Logic and Memory Area Power Modes .....	682
3.7.3.1.2	Logic and Memory Area Power Modes Control and Status .....	683
3.7.4	PD_CUSTEFUSE Description .....	683
3.7.4.1	Power Domain Modes .....	684
3.7.4.1.1	Logic and Memory Area Power Modes .....	684
3.7.4.1.2	Logic and Memory Area Power Modes Control and Status .....	684

## Revision History

<b>Changes from October 9, 2018 to July 1, 2019 (from F Revision (October 2018) to G Revision)</b>	<b>Page</b>
• Updated Speed Grade in Table DRA75x, DRA74x Part Number Identifier .....	378
• Updated EffectiveResolution Parameter Value .....	3259
• Updated Table EMIF Configuration Sequence .....	3641
• Updated GPMC XIP Timing Parameters .....	3770
• Updated GPMC Subsection Chip-Select Base Address and Region Size .....	3770
• Updated Section Write Nonposting Synchronization Mode and Reset Value of TSICR[2] POSTED Bit .....	5759
• Updated Figure in Multimaster High-Speed I2C Controller .....	5897
• Removed Caution from HS I2C Registers.....	5904
• Updated Subsection McSPI Programming Guide .....	6112
• Updated Description about the WDCNT Bit Field Behavior.....	6159
• Updated Note for MMCHS_HCTL[2] HSPE Bit and Added Note for MMCHS_CAPA[21] HSS Bit.....	7138
• Added Footnote for Genx and Genm .....	7195
• Added MEM_DLL_PHINT_RATE to Low-Level Programming Sequence .....	7195
• Fixed Typo in Number of GPIO Interrupt Lines.....	7287
• Updated GPMC XIP Timing Parameters .....	7632

Established to assist developers using the many Embedded Processors from Texas Instruments to get started, help each other innovate, and foster the growth of general knowledge about the hardware and software surrounding these devices.

## About This Manual

### Information About Cautions and Warnings

This book may contain cautions and warnings.

#### **CAUTION**

This is an example of a caution statement.

A caution statement describes a situation that could potentially damage your software or equipment.

#### **WARNING**

**This is an example of a warning statement.**

**A warning statement describes a situation that could potentially cause harm to you.**

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

## Register, Field, and Bit Calls

The naming convention applied for a call consists of:

- For a register call: *<Module name>.<Register name>*; for example: UART.UASR
- For a bit field call:
  - *<Module name>.<Register name>[End:Start] <Field name> field*; for example, UART.UASR[4:0] SPEED bit field
  - *<Field name> field <Module name>.<Register name>[End:Start]*; for example, SPEED bit field UART.UASR[4:0]
- For a bit call:
  - *<Module name>.<Register name>[pos] <Bit name> bit*, for example, UART.UASR[5] BIT\_BY\_CHAR bit
  - *<Bit name> bit <Module name>.<Register name>[pos]*; for example, BIT\_BY\_CHAR bit UART.UASR[5]

To help the reader navigate the document, each register call is hyperlinked to its register description in the register manual section. After each register description, a table summarizes all hyperlinked register calls.

## Coding Rules

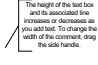

The programming models or code listings follow the rules:

Type	Definition	Example
File	Starts with the module name	PRCM_test1.c MCBSP1_init.h
Variable	Global variables are prefixed by "g_" Pointers are prefixed by "p" Global pointers are prefixed by "g_p"	g_SDMA_LogicalChan pAddrCounter g_pSDMA_LogicalChan
Function	Starts with the module name	PRCM_SetupClocks() ArmIntC_MaskInterrupts()
Typedef	Ends with "_t"	PRCM_Struct_t
Definition	Starts with the module name and is followed by the register name	#define SMS_ERR_TYPE *((volatile Uint32*)0x680080F4) #define MCBSP2_RCR1_REG *((volatile Uint32*)0x4807401C)
Enumeration	Starts with the module name	Typedef enum DMA_Mode_Label { INPUT_MODE OUTPUT_MODE } DMA_Mode_t;

## Flow Chart Rules

Flow charts follow the following rules:

Shape	Name	Definition
	Process	Any computational steps or processing function of a program; defined operation(s) causing change in value, form, or location of information
	Decision	A decision or switching-type operation that determines which of a number of alternate paths is followed
	Predefined process or sub-process	One or more named operations or program steps specified in a subroutine or another set of flow charts
	Data or I/O	General I/O function; information available for processing (input) or recording of processed information (output)
	Terminator	Terminal point in a flow chart: start, stop, halt, delay, or interrupt; may show exit from a closed subroutine
 <small>The height of the text box and its associated line increases or decreases as you add text. To change the width of the comment, drag the side handle.</small>	Annotation	Additional descriptive clarification, comment
	On page connector (reference)	Exit to, or entry from, another part of chart in the same page
	Off page connector (reference)	The flow continues on a different page.
	Summing Junction	Logical AND
	Or	Logical OR
	Parallel mode (ISO)	Beginning or end of two or more simultaneous operations
	Flow Line	Lines indicate the sequence of steps and the direction of flow.

## 1.1 DRA75x, DRA74x Overview

The DRA75x, DRA74x is a high-performance, infotainment application device, based on enhanced OMAP™ architecture integrated on a 28-nm technology.

- The architecture is designed for advanced graphical HMI and Navigation, Digital and Analog Radio, Rear Seat Entertainment and Multimedia playback, providing Advanced Driver Assistance integration capabilities with Video analytics support, and best-in-class CPU performance, video, image, and graphics processing sufficient to support, among others:
  - Streaming video up to full high definition (Full-HD) (1920×1080p, 60 fps)
  - 2-dimensional (2D) and 3-dimensional (3D) graphics and composition
  - Decode of digital radio standards (DAB, HD Radio™), and analog AM/FM/RDS radio
  - Efficient web browsing

---

**NOTE:** The supported set of features and peripherals is device part number dependent. Refer to device-specific Data Manual, for more information.

---

- The device is composed of the following subsystems:
  - Cortex®-A15 microprocessor unit (MPU) subsystem, including two ARM® Cortex-A15 cores
  - Two Digital Signal Processor (DSP) C66x subsystems
  - Image and video accelerator high-definition (IVA-HD) subsystem
  - Two Cortex®-M4 image processing unit (IPU) subsystems, each including two ARM Cortex-M4 microprocessors available for general purpose usage
  - Two Embedded Vision Engine (EVE) subsystems
  - Display subsystem (DSS)
  - Video Processing subsystem (VPE)
  - Video Input Capture (VIP)
  - 3D-graphics processing unit (GPU) subsystem, including POWERVR™ SGX544 dual-core
  - 2D-graphics accelerator (BB2D) subsystem, including Vivante™ GC320 core
  - Three pulse-width modulation (PWM) subsystems
  - Real-time clock (RTC) subsystem
  - Debug subsystem
- The device provides a rich set of connectivity peripherals, including among others:
  - One USB3.0 and three USB2.0 subsystems
  - SATA 2 subsystem
  - Two PCI Express Gen2 subsystems
  - 3-port Gigabit Ethernet Switch subsystem
  - Two Controller Area Network (DCAN) subsystems
- The device includes support for:
  - Error Detection and Correction:
    - Parity bit per byte on C66x DSP L1 program cache and Single-Error Correction Dual-Error Detection (SECEDED) on L2 memories on the DSP
    - SECEDED on Large L3 memory
    - EVE: Error detection for all internal data memories (DMEM, WBUF, IBUFLA, IBUFLB, IBUFHA, IBUFHB):
      - Single bit error detection (parity bit per byte) on DMEM, WBUF and IBUFs
      - Double bit error detection (distance 3, 10-bit hamming code) and parity on VCOP accesses to memory and working/image buffers in EVE
    - SECEDED on external DDR memory interface (EMIF1 only)
  - MMU/MPU

- MMU used for key masters (Cortex-A15 MPU, Cortex-M4 IPU, C66x DSP, EVE, EDMA)
- Memory protection of C66x cores
- MMU inside the Dynamic Memory Manager
- The device includes state-of-the-art integrated power-management techniques required for high-performance infotainment products.
- The device also integrates:
  - On-chip memory
  - External memory interfaces
  - Memory management
  - Level 3 (L3) and level 4 (L4) interconnects
  - System peripherals
  - Car, audio and media peripherals
  - Radio accelerators

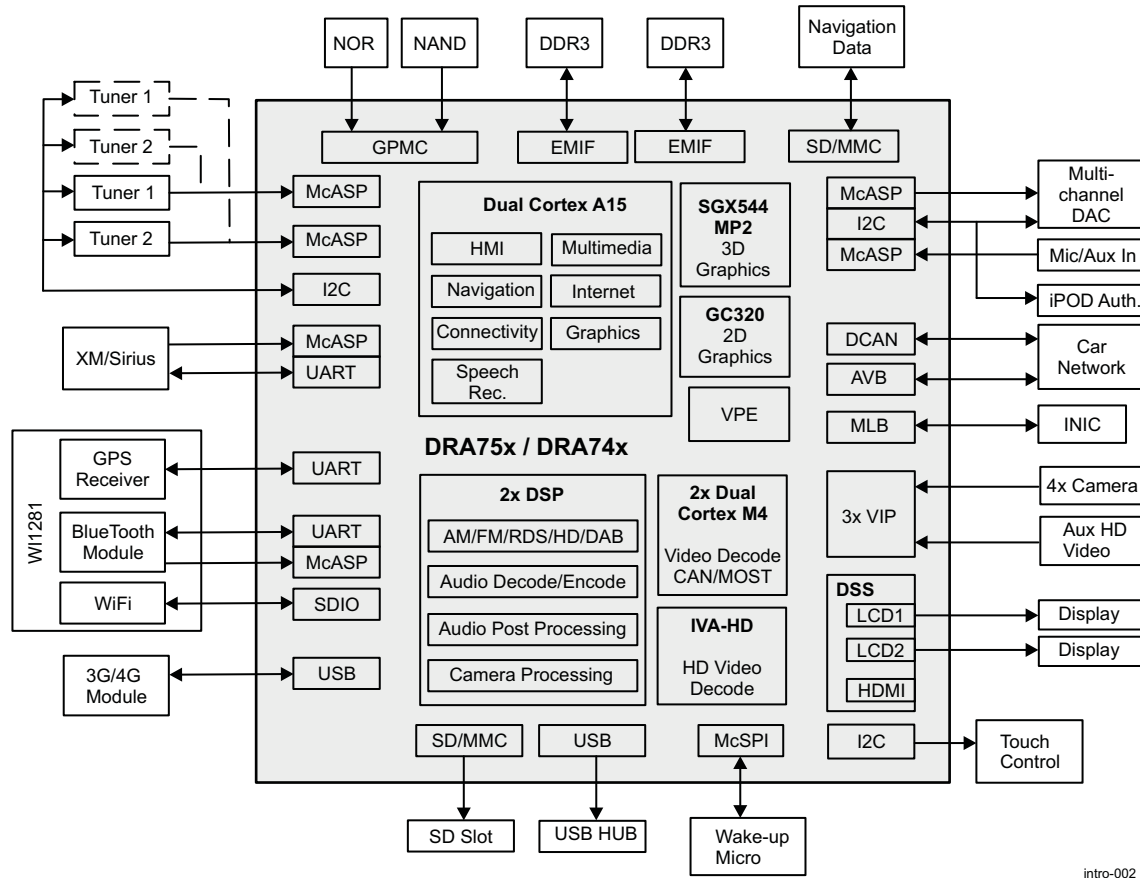

## 1.2 DRA75x, DRA74x Environment

This section provides an overview of the DRA75x, DRA74x environment.

Figure 1-1 is an example of a non-exhaustive environment for the DRA75x, DRA74x device.

**NOTE:** The supported set of features and peripherals is device part number dependent. Refer to device-specific Data Manual, for more information.

### 1.3 DRA75x, DRA74x Description

The DRA75x, DRA74x device is offered in a 760-ball, 23×23-mm, 0.8-mm ball pitch with Via Channel™ Array (VCA) technology, ball grid array (BGA) package.

Figure 1-2 is the block diagram of the DRA75x, DRA74x device.

**NOTE:** The supported set of features and peripherals is device part number dependent. Refer to device-specific Data Manual, for more information.

### 1.3.1 MPU Subsystem

The Cortex-A15 MPU subsystem integrates the following submodules:

- ARM Cortex-A15 MPCore
  - Two central processing units (CPUs)
  - ARM Version 7 ISA: Standard ARM instruction set plus Thumb®-2, Jazelle® RCT Java™ accelerator, hardware virtualization support, and large physical address extensions (LPAE)
  - Neon™ SIMD coprocessor and VFPv4 per CPU
  - Interrupt controller with up to 160 interrupt requests
  - One general-purpose timer and one watchdog timer per CPU
  - Debug and trace features
  - 32-KiB instruction and 32-KiB data level 1 (L1) cache per CPU
- Shared 2-MiB level 2 (L2) cache
- 48-KiB bootable ROM
- Local power, reset, and clock management (PRCM) module
- Emulation features
- Digital phase-locked loop (DPLL)

### 1.3.2 DSP Subsystems

There are two DSP subsystems in the device. Each DSP subsystem contains the following submodules:

- TMS320C66x™ VLIW DSP core for audio processing, and general-purpose imaging and video processing. It extends the performance of existing C64x+™ and C647x™ DSPs through enhancements and new features.
  - 32-KiB L1D cache, and 32-KiB L1P cache or addressable SRAM
  - 288-KiB L2 cache
    - 256-KiB configurable as cache or SRAM
    - 32-KiB SRAM
- Enhanced direct memory access (EDMA) engine for video and audio data transfer
- Memory management units (MMU) for address management.
- Interrupt controller (INTC)
- Emulation capabilities

### 1.3.3 EVE Subsystems

The Embedded Vision Engine (EVE) module is a programmable imaging and vision processing engine, intended to be used in devices that serve consumer electronics imaging and vision applications. Its programmability allows late in-development or post-silicon processing requirements to be met by addition of differentiating features in imaging and vision products.

There are two EVE subsystems in the device, each consisting of:

- ARP32 scalar core, with 32-KiB direct mapped program cache, and 32-KiB data memory
- VCOP vector core, with 16 processing elements, 32-KiB working buffer, and four 16-KiB image buffers
- Internal Mailboxes for EVE to EVE, and EVE to MPU/IPU/DSP communication
- Integrated EDMA controller and memory management units

### 1.3.4 IPU Subsystems

There are two Cortex-M4 IPU subsystems in the device available for general purpose usage.

Each IPU subsystem includes the following components:

- Two Cortex-M4 CPUs
- ARMv7E-M and Thumb-2 instruction set architectures

- Hardware division and single-cycle multiplication acceleration
- Dedicated INTC with up to 63 physical interrupt events with 16-level priority
- Two-level memory subsystem hierarchy
  - L1
    - 32-KiB shared cache memory
  - L2 ROM + RAM
    - 64-KiB RAM
    - 16-KiB bootable ROM
- MMU for address translation
- Integrated power management
- Emulation feature embedded in the Cortex-M4

### 1.3.5 IVA-HD Subsystem

The IVA-HD subsystem is a set of video encoder and decoder hardware accelerators.

The list of supported codecs can be found in the software development kit (SDK) documentation.

### 1.3.6 Display Subsystem

The display subsystem provides the control signals required to interface the device system memory frame buffer (SDRAM) directly to the displays. It supports hardware cursor, independent gamma curve on all interfaces, multiple-buffer, and programmable color phase rotation. The display subsystem allows low-power display refresh and arbitration between normal and low-priority pipelines.

The display subsystem consists of the following components:

- **Display controller:** Reads and displays the encoded pixel data stored in memory and writes the output of one of the overlays or one of the pipelines into the system memory. The display controller supports the following components:
  - Three video pipelines, one graphic pipeline, and one write-back pipeline. The graphic pipeline supports pixel formats such as: ARGB16-4444, RGB16-565, ARGB16-1555, ARGB32-8888, RGBA32-8888, RGB24-888. It allows selection of the color-depth expansion.
  - Write-back pipeline: Uses poly-phase filtering for independent horizontal and vertical resampling (upsampling and downsampling). It allows programmable color space conversion of RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, or YUV4:2:0-NV12 or NV21, and selection of color-depth reduction from RGB24 to RGB16.
  - Three LCD outputs, each one with dedicated overlay manager, for support of active matrix color displays (up to 24-bit interface). Maximum listed resolutions are not supported concurrently on all outputs.
    - First main LCD output delivered on MIPI® DPI 1.0 LCD pixel interface, supporting up to WUXGA (1920 x 1200) with reduced blanking periods.
    - Second and third LCD outputs delivered on MIPI DPI 2.0 LCD pixel interfaces, supporting up to WUXGA (1920 x 1200) with reduced blanking periods.
  - One TV output with dedicated overlay manager to support HDMI v1.4a interface (1080p @ 60 fps video and multichannel audio)
  - Own direct memory access (DMA) engine
- **High-definition multimedia interface (HDMI) encoder** with the following main features:
  - HDMI 1.4a and DVI 1.0 compliant

### 1.3.7 Video Processing Subsystem

The video processing engine (VPE) module provides support for the following memory-to-memory operations:

- Reads of raster or tiled YUV420 coplanar, YUV422 coplanar, or YUV422 interleaved video

- Deinterlacing up to two 1080i video streams
- Scaling up to 1080p (1920x1080 resolution) of the input video
- Chroma up- and downsampling
- VC-1 Range Mapping and Range Reduction
- Color space conversion
- Writes of the resulting video in YUV420 coplanar (raster or tiled), YUV422 coplanar (raster or tiled), YUV422 interleaved (raster or tiled), YUV444 single plane (raster only), or RGB888 (raster only).

### 1.3.8 Video Capture

There are three Video Input Port (VIP) modules in the device, providing video capture functions.

VIP1 and VIP2 modules support each up to:

- Two separate 24-bit video ports for parallel RGB/YUV/RAW (or BT656/1120) data, up to 165 MHz
- Two separate 8-bit video ports for YUV/RAW (or BT656) data, up to 165 MHz

VIP3 module supports up to two separate 16-bit video ports for parallel RGB/YUV/RAW (or BT656/1120) data, up to 165MHz.

Each VIP module supports:

- Embedded Sync (multiplexed sources) and Discrete Sync (single source) data interface modes
- Color space conversion and scaling:
  - Up to 2047 pixels wide input with scaling
  - Up to 3840 pixels wide input - when chroma up/down sampling, without scaling
  - Up to 4095 pixels wide input - without scaling and chroma up/down sampling
  - Maximum supported input resolution is further limited by:
    - Pixel clock and feature-dependent constraints
    - For RGB24-bit format (RAW data), the maximum frame width is limited to 2730 pixels
- Embedded DMA engine, supporting tiled (2D) and raster addressing

### 1.3.9 3D GPU Subsystem

The 3D graphics processing unit (GPU) subsystem is based on POWERVR® SGX544 subsystem from Imagination Technologies. It supports phone, PDA, and handheld gaming applications. The GPU can process different data types simultaneously, such as: pixel data, vertex data, video data, and general-purpose data.

The GPU subsystem has the following features:

- Multicore GPU architecture: two SGX544 cores. Shared system level cache of 128 KiB
- Tile-based deferred rendering architecture
- Second-generation universal scalable shader engines (USSE2), multithreaded engines incorporating pixel and vertex shader functionality
- Present and texture load accelerators
  - Enables to move, rotate, twiddle, and scale texture surfaces.
  - Supports RGB, ARGB, YUV422, and YUV420 surface formats.
  - Supports bilinear upscale.
  - Supports source colorkey.
- Industry-standard API supports DirectX® 9, OpenVG™ 1.1, and OpenCL™1.1 Embedded Profile
- Fine-grained task switching, load balancing, and power management
- Programmable high-quality image antialiasing
- Bilinear, trilinear, anisotropic texture filtering
- Advanced geometry DMA driven operation for minimum CPU interaction

- Fully virtualized memory addressing for OS operation in a unified memory architecture (MMU)

### 1.3.10 **BB2D Subsystem**

The 2D BitBlt (BB2D) graphics accelerator subsystem is based on the GC320 core from Vivante Corporation and has the following features:

- API support:
  - OpenWF™, DirectFB
  - GDI/DirectDraw
  - Adobe® Flash®
- BB2D architecture:
  - BitBlt and StretchBlt
  - DirectFB hardware acceleration
  - ROP2, ROP3, ROP4 full alpha blending and transparency
  - Clipping rectangle support
  - Alpha blending includes Java 2 Porter-Duff compositing rules
  - 90-, 180-, 270-degree rotation on every primitive
  - YUV-to-RGB color space conversion
  - Programmable display format conversion with 14 source and 7 destination formats
  - High-quality, 9-tap, 32-phase filter for image and video scaling at 1080p
  - Monochrome expansion for text rendering
  - 32 K × 32 K coordinate system

### 1.3.11 **On-Chip Debug Support**

The on-chip debug support has the following features:

- Multiprocessor debugging lets users control multiple CPU cores embedded in the device, such as:
  - Global starting and stopping of individual or multiple processors
  - Each processor can generate triggers that can be used to alter the execution flow of other processors
  - System clocking and power down
  - Interconnection of multiple devices
  - Channel triggering
- Target debugging, using IEEE1149.1 (JTAG®)
- Reduction of power consumption in normal operating mode

The debug subsystem includes:

- Generic TAP for emulation and test control (ICEPick-D™)
- Debug access port (DAP)
- Embedded Trace Macro (ETM)
- Trace Port Interface Unit (TPIU)
- Embedded Trace Buffer (ETM)
- Emulation Pin Manager (EPM)
- Cross triggering (XTRIG)

The debug subsystem provides also:

- ICEMelter, for controlling the wake-up and power-down of the emulation power domain
- L3\_INSTR CORE instrumentation interconnect
- OCP watch-point (OCP-WP), for monitoring L3 interconnect transaction when target transaction attributes match the user-defined attributes or trigger on external debug event

- Power-management events profiler (PM instrumentation)
- Clock-management events profiler (CM instrumentation)
- Statistics collector (performance probes)

### 1.3.12 **Power, Reset, and Clock Management**

The PRCM module allows efficient control of clocks and power according to the required performance, and reduction of power consumption.

The PRCM module is divided into:

- Power and reset management (PRM) with the following features:
  - Dynamic clock gating
  - Dynamic voltage and frequency scaling (DVFS)
  - Dynamic power switching (DPS)
  - Static leakage management (SLM)
- Clock management (CM) for clock generation and distribution, allowing reduction of dynamic consumption.

### 1.3.13 **On-Chip Memory**

- The device can include up to three instantiations of an On-Chip Memory Controller (OCMC) with associated RAM with ECC, with total size up to 2.5 MiB. OCMC\_RAM2 (1MiB) and OCMC\_RAM3 (1MiB) are not present on DRA74x devices, but are included in some of the DRA75x devices. For details, see the device data manual.
- Circular buffer feature for each OCMC RAM (8-MiB virtual address space required) allowing on-the-fly processing of VIP data by EVE
- Save and Restore Memory / Scratch Pad in the wake-up domain

### 1.3.14 **Memory Management**

The memory management is performed from:

- System DMA controller with up to 128 hardware requests, 32 prioritizable logical channels, and 256 × 64-bit FIFO dynamically allocable between active channels.
- Enhanced DMA controller supporting two simultaneous read and two simultaneous write physical channels, and up to 64 programmable logical channels.
- Dynamic memory management (DMM) module, which performs global address translation, address rotation (tiling), and access interleaving between the two EMIF channels.
- Two memory management units (MMU), with 4KiB, 64KiB, 1MiB, 16MiB programmable page sizes, and 32 entries TLB.
  - MMU1 dedicated to EDMA
  - MMU2 dedicated to PCIe\_SS1 and PCIe\_SS2

### 1.3.15 **External Memory Interfaces**

- Two 32-bit DDR2 / DDR3 EMIF controllers, each of which with the following features:
  - Dual-port controller for efficient memory sharing between applications
  - 32-bit data path, one chip-select per memory controller
  - Memory density up to 2 GiB supported over one chip-select providing a total SDRAM space of 4 GiB addressable by the MPU extended address range.
  - EMIF1 controller supports Single bit Error Correction and Dual Error Detection (SECEDED)
    - SECEDED supported in both 32-bit and 16-bit/Narrow mode
    - Programmable address ranges to define SECEDED protected region
    - Parity bits calculated and stored on all writes to SECEDED protected address region

- Parity bits verified on all reads from SECDED protected address region
- Statistics for 1-bit and 2-bit errors
- General-purpose memory controller (GPMC) supporting connection with:
  - Asynchronous SRAM memories
  - Asynchronous and synchronous NOR flash memories
  - NAND flash memories, with up to 16-bit ECC via the Error Location Module (ELM)
  - Pseudo-SRAM devices
- Quad SPI module, supporting 1 to 4 address bytes for SPI NOR flash, and up to 66-MHz single data rate

### 1.3.16 System and Connectivity Peripherals

The device supports a comprehensive set of peripherals to provide flexible and high-speed interfacing and on-chip programming resources.

#### 1.3.16.1 System Peripherals

- Sixteen general-purpose timers (two timer modules supporting 1-ms tick generation)
- One watchdog timer (WDT)
- One 32-kHz synchronization timer
- System control module, which contains registers for the following functions:
  - Static device configuration
  - Debug and observability
  - Status
  - Pad configuration
  - I/O configuration
  - eFuse logic
  - Analog function control
  - System boot decoding logic
- Thirteen system Mailboxes for communication between MPU, DSP and IPU subsystems.
- SpinLock module for hardware semaphore between the MPU, DSP, and IPU subsystems
- Inter-processor Communication Register
- Three Pulse Width Modulation Subsystems (PWMSS), each containing Enhanced High Resolution Pulse Width Modulator (eHRPWM), Enhanced Capture (eCAP), and Enhanced Quadrature Encoded Pulse (eQEP) modules.
- Real-Time-Clock Subsystem (RTCSS), supporting four external wake-up inputs and one power enable output, all of which are 3.3- or 1.8-V multivoltage I/Os.
- Eight general-purpose input/output (GPIO) modules with 32 I/Os each. One GPIO module supporting wake-up request generation.
- HDQ/1-Wire® – HDQ and Maxim Integrated Products 1-Wire protocols interface
- Keyboard controller, supporting up to 9 × 9 matrix keypads

#### 1.3.16.2 Media Connectivity Peripherals

- Four HS-MMC/SD/SDIO modules:
  - Two modules acting as HS-MMC/SD initiator controllers, supporting JEDEC JESD84 v4.5-A441 and SD3.0 physical layer with SDA3.00 standards
    - One controller with 8-bit interface for JESD84 memories with dual voltage I/Os (1.8 or 3.3 V). Another controller with 4-bit interface for external card support with embedded dual voltage I/Os (1.8 or 3 V) and supporting UHS-I rates.
    - Each controller including its DMA controller compliant to ADMA2 (SDA3.00 Part A2 DMA)

controller)

- Two modules acting as SDIO interface controllers. One controller supporting 4-bit data bus width. Another controller supporting up to 8-bit data bus width.
- One SuperSpeed Universal Serial Bus (USB) Dual-Role-Device (DRD) subsystem with embedded HS and SS PHYs, compatible with the USB2.0 (up to 480 Mbps) and USB3.0 (5 Gbps) standards
- Three High Speed USB subsystems:
  - One HS USB subsystem with embedded HS PHY, supporting up to 480 Mbps.
  - Two HS USB subsystems, each with ULPI (SDR) interface to external HS PHY, supporting up to 480 Mbps.
- One SATA subsystem, providing interface for solid-state drive (SSD) or hard-disk drive (HDD) mass storage. Supports one HBA port with SATA-2 generation speed of 3 Gbps.

### 1.3.16.3 Car Connectivity Peripherals

- One Media Local Bus (MLB) subsystem for connection to MOST® optical ring. The module supports both 3-pin (up to MOST50, 1024×Fs) and 6-pin (up to MOST150, 2048×Fs ) versions of MediaLB® Physical Layer Specification v4.0, and all types of transfer (Synchronous, Isochronous, Asynchronous/Packet, Control) over 64 logical channels.
- One 3-port Gigabit Ethernet Switch subsystem (10, 100, or 1000 Mbps). The switch provides two external Ethernet ports and one internal CPPI interface port with AVB/Industrial Ethernet and 802.1ae support. Included support for 3.3-V RMII/MII and 1.8- or 3.3-V RGMII.
- Two DCAN controllers, supporting bitrates up to 1 Mbit/s and compliant to the Controller Area Network (CAN) 2.0B protocol specification.
- Two PCI Express subsystems, one providing Gen2 compliant 2-lane port, and the other providing Gen2 compliant 1-lane port, up to 5.0 Gbps per lane. Both PCIe subsystems provide support for either Root Complex or Endpoint. The two PCIe subsystems share common 2-lane PCIe PHY, configurable to operate either as 2-lane to one controller (PCIe\_SS1) or two separate lanes to two controllers (PCIe\_SS1 and PCIe\_SS2).

### 1.3.16.4 Audio Connectivity Peripherals

- Eight multichannel audio serial ports (McASP):
  - Two McASP supporting up to 16 channels each and independent TX/RX clock/sync domains
  - Six McASP supporting up to 4 channels each and unified clock/sync domain
  - Features list of the McASP include:
    - Independent transmit and receive modules, each including programmable clock and frame sync generator, TDM streams from 2 to 32, support for time slot sizes up to 32 bits, data formatter for bit manipulation
    - Glueless connection to audio analog-to-digital converters (ADC), digital-to-analog converters (DAC), codec, digital audio interface receiver (DIR), and S/PDIF transmit physical layer components.
    - Wide variety of I2S and similar bit-stream formats
    - Integrated digital audio interface transmitter (DIT) supporting S/PDIF, IEC60958-1, AES-3 formats, and enhanced channel status/user data RAM
    - 384-slot TDM with external digital audio interface receiver (DIR) device
    - Extensive error checking and recovery

### 1.3.16.5 Serial Control Peripherals

- Ten universal asynchronous receiver/transmitter (UART) modules as serial-communication interfaces, 16C750 compatible.
  - One UART module supporting extended modem control signals
  - One UART module with IrDA features
- Four general purpose multichannel serial peripheral interface (McSPI) modules

- Five multimaster HS I<sup>2</sup>C controller modules, compliant with Philips I<sup>2</sup>C specification version 2.1.
  - I2C1 and I2C2 controllers support Fast-mode, with rates up to 400 Kbps
  - I2C3, I2C4 and I2C5 controllers support High-speed mode, with rates up to 3.4 Mbps

#### 1.3.16.6 Radio Accelerators

- One Audio Tracking Logic (ATL) module, containing four ATL instances, for HD-Radio support and asynchronous sample rate conversion assistance. Each ATL instance supports error tracking between two reference signals, and generation of modulated clock (using software controlled cycle stealing)
- Two Viterbi Co-Processor (VCP) modules, providing acceleration of digital radio processing (decoding of convolutional encoded data).

## 1.4 DRA75x, DRA74x Family

The DRA75x, DRA74x family is composed of the following:

- DRA75x (Jacinto6 Ex family of devices):
  - DRA756
  - DRA755
  - DRA754
- DRA75x (Jacinto6 EP family of devices):
  - DRA752
  - DRA751
  - DRA750
- DRA74x (Jacinto6 family of devices):
  - DRA746
  - DRA745
  - DRA744

The supported set of features and peripherals is device part number dependent. Refer to device Data Manual, for more information.

## 1.5 DRA75x, DRA74x Device Identification

[Table 1-1](#) describes the identification registers.

The identification registers include the data registers listed in [Table 1-2](#) and [Table 1-4](#). These registers are read-only accessed ports that are programmed into eFuses FARM FROM.

**Table 1-1. Device Identification Register Fields**

## 1.6 DRA75x, DRA74x Package Characteristics Overview

The DRA75x, DRA74x die will be offered with the following characteristics:

- Body: 23 × 23mm
- Technology: Ball Grid Array (BGA) package
- Ball pitch: 0.8-mm ball pitch with Via Channel™ Array (VCA) technology
- Pattern: partial grid
- Pins: 760 total device pins

For more information refer to device Data Manual.

## 2.1 Introduction

The microprocessor unit (MPU) has a 32-bit address port, which allows it to handle a 4-GiB space divided into several regions, depending on the target type.

The memory map has the following features that are shared among the initiators, such as the MPU subsystem:

- Memory space: General-purpose memory controller (GPMC)
- Dynamic memory management (DMM) controller
- Register spaces: Level 3 (L3) and level 4 (L4) interconnects
- Dedicated spaces: EVE/IPU/DSP subsystem.

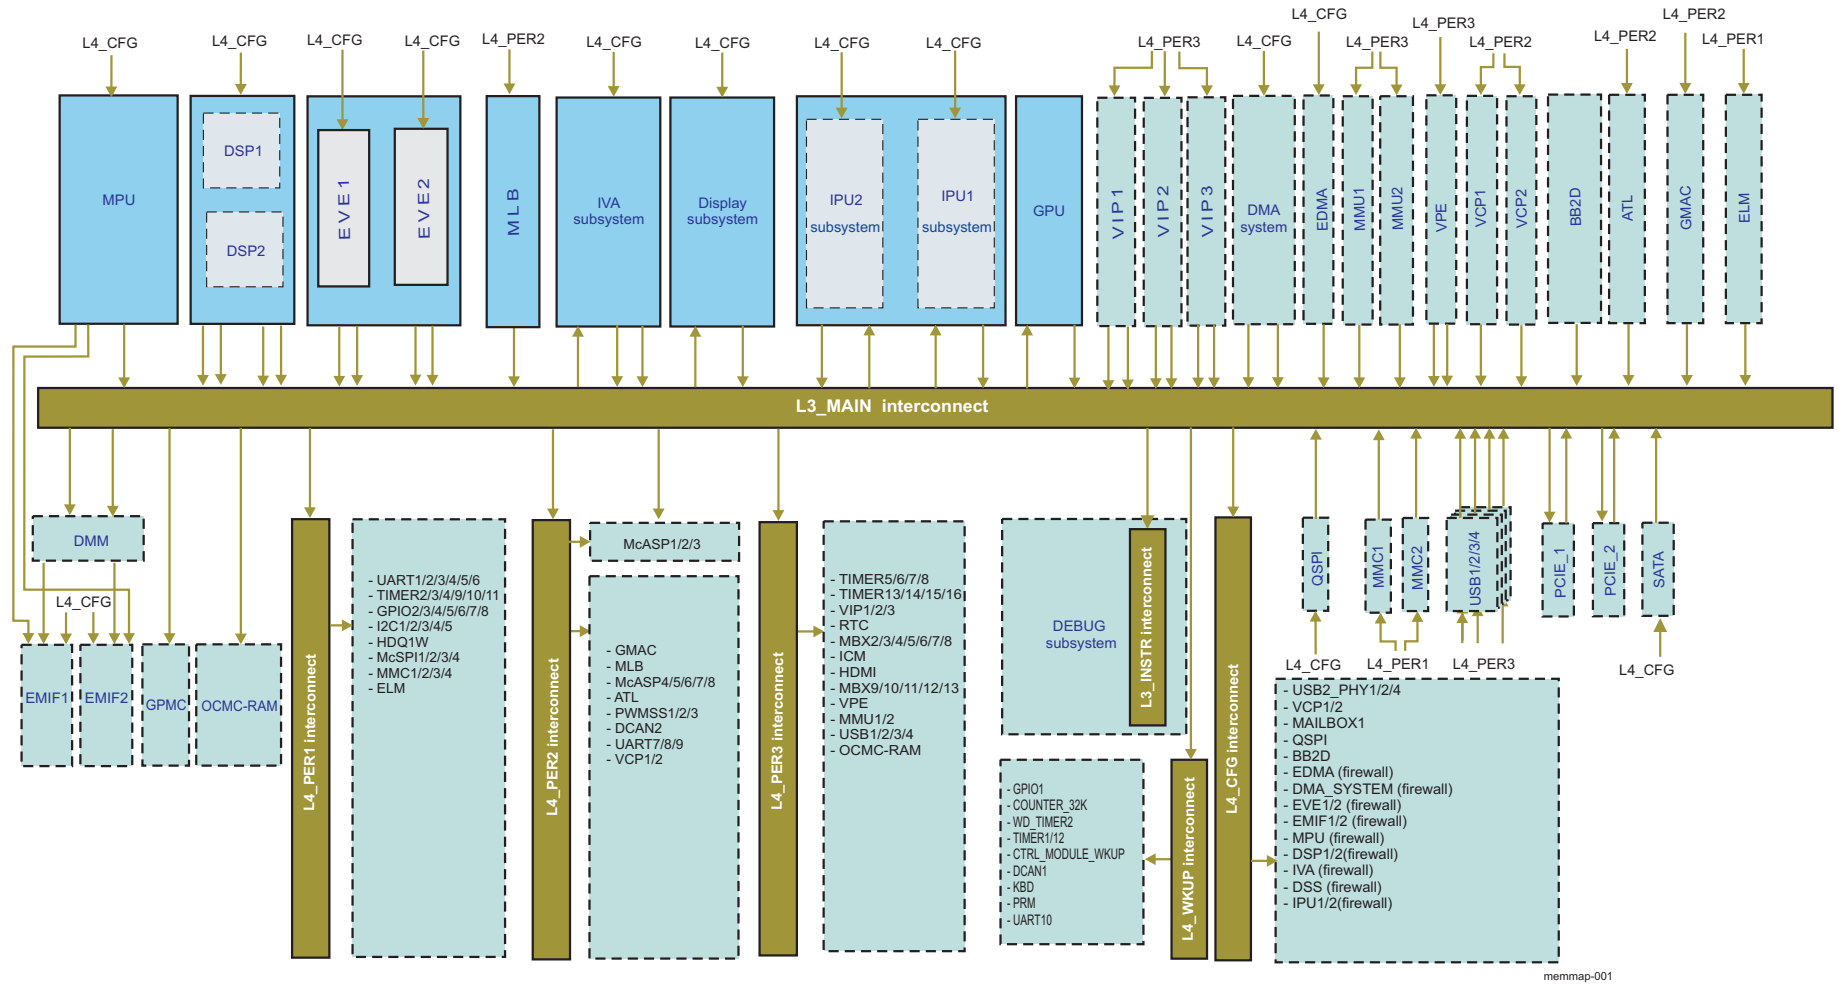

The GPMC and DMM are dedicated to memory connection. The GPMC is used for NOR and NAND flash and static random access memories (SRAMs). The DMM is used for synchronous dynamic random access memories (SDRAMs), such as DDR. For more information, see [Section 15.2, \*Dynamic Memory Manager\*](#), and [Section 15.3, \*EMIF Controller\*](#).

The L3 interconnect allows the sharing of resources, such as peripherals and external or on-chip memories, among all the initiators of the platform. The L4 interconnects control access to the peripherals.

Transfers across the platform between initiators and targets are physically conditioned by the chip interconnect and can be logically conditioned by firewalls. For more information about the intercommunication (L3 and L4 interconnects) and protection mechanisms implemented in the device, see [Section 14.2, \*L3 Interconnect\*](#), and [Section 14.3, \*L4 Interconnect\*](#).

[Figure 2-1](#) shows the interconnect of the device and the main modules and subsystems in the platform.

## 2.2 L3\_MAIN Memory Map

The memory space system is hierarchical: level 1 (L1), level 2 (L2), L3\_MAIN, and L4. L1 and L2 are memories in the MPU, IPU, and digital signal processor (DSP) subsystems. L3\_MAIN handles many types of data transfers, including data exchange with system on-chip/external memories. The chip-level interconnect, which consists of one L3\_MAIN and five L4s, enables communication among all modules and subsystems.

This section provides a global view of the memory mapping of the device at the L3\_MAIN interconnect and describes the boot, GPMC, and SDRAM controller (SDRC) (EMIF/DMM) spaces.

The system memory mapping is flexible, with two levels of granularity for target address space allocation:

- L1: The four quarters are labeled Q0, Q1, Q2, and Q3. Each quarter corresponds to a 1-GiB address space (the total low-address space is 4 GiB, 32-bit). The CPU extended address range is labeled as high memory (Q8 – Q15) and provides a total of 8 GiB.
- L2: Each quarter is divided into eight blocks of 32 MiB, with target spaces mapped in the blocks.

This organization allows the decoding of all target spaces based on the 7 most-significant bits (MSBs) of the 32-bit address ([31:25]).

- Boot space:

When booting from the on-chip ROM with the appropriate external `sys_boot` pin configuration, the lowest 1-MiB memory space [0x0000 0000–0x000F FFFF] is redirected to the on-chip boot ROM address space [0x4000 0000–0x400F FFFF].

When booting from the GPMC, the memory space is part of the GPMC address space. At reset, the 0x0000 0000 address is available on chip-select 0 (CS0) for a memory size of 16 MiB.

For more information about the `sys_boot` pins configuration, see [Section 15.4, General-Purpose Memory Controller](#), and [Chapter 32, Initialization](#).

- GPMC space:

Eight independent GPMC chip-selects (CS0 to CS7) are available in the first quarter (Q0) of the addressing space to access NOR/NAND flash and SRAM. The chip-selects have a programmable start address and programmable size (up to 128 MiB) in a total memory space of (Q0) 1GiB, but limited now to 512 MiB.

- EMIF1/EMIF2 CS0 space:

Q2 addressing space is interleaved on two DDR-memory controllers (EMIF1 and EMIF2), each activating its CS0 line. These chip-selects can be programmed to 64, 128, 256, 512, 1024, and 2048 MiB. Interleaving occurs at 128-byte granularity.

The EMIF1-CS0 base address is always 0x8000 0000 at reset, and occupies a 1-GiB address space at reset (interleaving is disabled at reset).

Q3 addressing space is interleaved on two SDRAM controllers (EMIF1 and EMIF2), each activating its CS0 line. These chip-selects can be programmed to 64, 128, 256, 512, and 1024 MiB. Interleaving occurs at 128-byte granularity.

EMIF1-CS0 and EMIF2-CS0 in Q3 space are disabled at reset. Their base address is programmable to achieve a continuous address space with the respective CS0 in Q2 space, regardless of the address range programmed.

- TILER space:

Q3 addressing space is also used to access the TILER system. This space is visible only for the Display Subsystem (DSS). See [Table 2-12](#).

- 8 GiB of SDRAM virtualization (only 4 GiB are physically available; the other 4 GiB are reserved):

This is a high address range (Q8 – Q15) that requires an address greater than 32 bits. This space is visible only for the MPU Subsystem. See [Table 2-8](#).

[Table 2-1](#) describes the global memory map.

- Allocated only to EMIF2\_SDRAM\_CS0
- Shared between EMIF1\_SDRAM\_CS0 and EMIF2\_SDRAM\_CS0 but not interleaved
- Interleaved between EMIF1\_SDRAM\_CS0 and EMIF2\_SDRAM\_CS0

The same applies to the Q3 address space.

### 2.2.1 L3\_INSTR Memory Map

The L3\_INSTR interconnect is a 8-MiB space composed of the L3\_INSTR interconnect configuration registers and module registers.

## 2.3 L4 Memory Map

The L4 interconnects handle transfers with peripherals. The L4 interconnect comprises the following interconnects:

- L4\_CFG
- L4\_WKUP
- L4\_PER1
- L4\_PER2
- L4\_PER3

The L4 interconnect can be configured to tune the access according to the characteristics of each module.

The following sections describe the register mapping of the L4 interconnect. Software configures these registers.

### 2.3.1 L4\_CFG Memory Map

The L4\_CFG interconnect is a 12-MiB space composed of the L4\_CFG interconnect configuration registers and the module registers.

[Table 2-3](#) describes the mapping of the registers for the L4\_CFG interconnect.

---

**NOTE:** All memory spaces described as modules provide direct access to module registers outside the L4\_CFG interconnect. All other accesses are internal to the L4\_CFG interconnect.

## 2.4 L4\_PER Memory Map

The L4\_PER interconnect has three memory spaces:

- L4\_PER1 memory space ([Table 2-5](#))
- L4\_PER2 memory space ([Table 2-6](#))
- L4\_PER3 memory space ([Table 2-7](#))

The L4\_PER interconnects are composed of the L4\_PER interconnect configuration registers and the module registers.

**NOTE:** All memory spaces described as modules provide direct access to the module registers outside the L4\_PER interconnects. All other accesses are internal to the L4\_PERs interconnects.

<sup>(1)</sup> Boot space location depends on the external sys\_boot [5:0] pins.

<sup>(2)</sup> Ex = Executable

<sup>(3)</sup> Only 4 GiB are physically available within this 8-GiB address range.

<sup>(4)</sup> Interleaving is configurable with one setting in the MPU memory adapter (MPU\_MA) for all 8 GiB of SDRAM high memory. For more information about interleaving, see Section 4.3.4, *Memory Adapter*.

<sup>(5)</sup> As Q10 is alias of Q2, depending on the DMM\_LISA\_MAP\_j settings the Q10 address space can be configured in the following ways:

- Allocated only to EMIF1\_SDRAM\_CS0
- Allocated only to EMIF2\_SDRAM\_CS0
- Shared between EMIF1\_SDRAM\_CS0 and EMIF2\_SDRAM\_CS0 but not interleaved
- Interleaved between EMIF1\_SDRAM\_CS0 and EMIF2\_SDRAM\_CS0

The same applies to the Q11 address space, as it is alias of Q3.

<sup>(6)</sup> Because of the fixed MPU-to-EMIF address mapping with high-order interleaving enabled only 512MiB of this address space are used by EMIF1\_SDRAM\_CS0. The other 512MiB are used by EMIF2\_SDRAM\_CS0.

## 2.6 IPU Memory Map

The device implements two IPU subsystems (IPU1, IPU2). For more information about IPU, see [Chapter 7](#).

[Table 2-9](#) describes the IPU memory mapping.

---

**NOTE:** Some of the system (L3) resources, such as EVE and EDMA, are not directly accessible by IPU, as they are overlapping with IPU's own resources in its memory space. In such cases, software must properly configure IPU AMMU / L2 MMU so that IPU can access these system resources.

Figure 3-1. Clock Tree Tool (CTT)

prcm-095

The Clock Tree Tool (CTT) is a Java™-based, stand-alone application. The CTT is interactive clock tree configuration software for the device. The CTT lets the user:

- Visualize the device clock tree
- Interact with clock tree elements and view the effect on PRCM registers
- Interact with the PRCM registers and view the effect on the device clock tree
- View a trace of all the device registers affected by the user interaction with clock tree
- Extract registers and register dumps for Code Composer Studio™ and Lauterbach

The advantage of the CTT is that the user can visualize the clock tree state of the device on power-on reset and then customize the configuration of the clock tree for the specific use case and identify the device register settings associated to that configuration. Furthermore, the user can dump and read in register settings for the specific scenarios.

Being an interactive visual tool, the CTT gives the user a global view of the device clock tree architecture and allows determining the exact register settings to obtain the specific configuration.

### 3.1 Device Power Management Introduction

Power management is one of the most important design aspects of any system.

The device power-management architecture ensures maximum performance and operation time for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements.

This introduction contains the following information:

- Power-management architecture building blocks for the device
- State-of-the-art power-management techniques supported by the power-management architecture of the device

### 3.1.1 Device Power-Management Architecture Building Blocks

To provide a versatile architecture that supports multiple power-management techniques, the power-management framework is built with three levels of resource management: clock, power, and voltage.

These management levels are enforced by defining the managed entities or building blocks of the power-management architecture, called the clock, power, and voltage domains.

A domain is a group of modules or subsections of the device that share a common entity (for example, common clock source, common voltage source, or common power switch). The group forming the domain is managed by a policy manager. For example, a clock for a clock domain is managed by a dedicated clock manager within the power, reset, and clock management (PRCM) module. The clock manager considers the joint clocking constraints of all the modules belonging to that clock domain (and, hence, receiving that clock).

**NOTE:** In the following sections, the term *<module>* is used to represent the device IPs (that is, modules or subsystems), other than the PRCM module, that receive clock, reset, or power signals from the PRCM module.

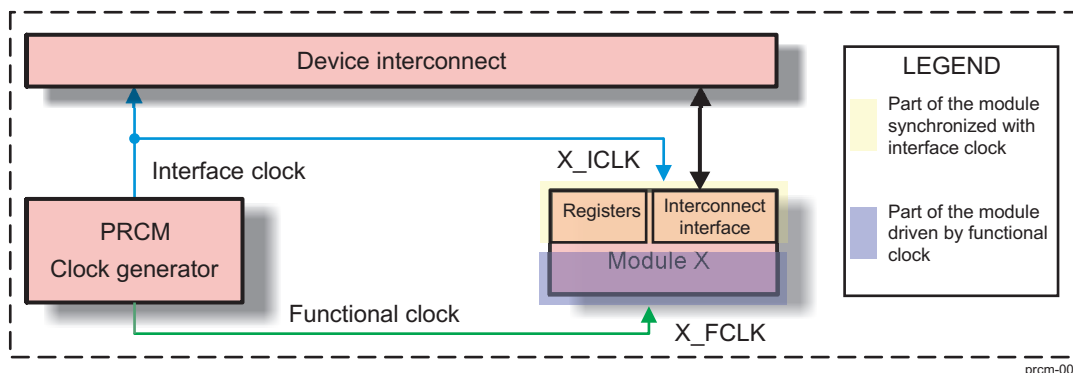

#### 3.1.1.1 Clock Management

The PRCM module manages the gating (that is, switching off) and enabling of the clocks to the device modules. The clocks are managed based on the requirement constraints of the associated modules. The following sections identify the module clock characteristics, management policy, clock domains, and clock domain management.

##### 3.1.1.1.1 Module Interface and Functional Clocks

Each module within the device has specific clock input characteristics requirements. Based on the characteristics of the clocks delivered to the modules, the clocks are divided into two categories: interface clocks and functional clocks (see Figure 3-2).

Figure 3-2. Functional and Interface Clocks

The interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and the interconnect.
- In most cases, they supply the system interconnect interface and registers of the module.
- A typical module has one interface clock, but modules with multiple interface clocks may also exist (that is, when connected to multiple interconnect buses).
- Interface clock management is done at the device level.

- From the standpoint of the PRCM module, an interface clock is identified with an `_ICLK` suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or subsystem.
- A module can have one or more functional clocks. Some functional clocks are mandatory, while others are optional. A module needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the module activity (for example, the clock for the camera).
- From the standpoint of the PRCM module, a functional clock is distributed directly to the related modules through a dedicated clock tree. It is identified with an `_FCLK` suffix.

Some clocks are qualified as permanent clocks. They are functional clocks, that can stay active while the corresponding entity manages them.

---

**NOTE:** At the module level, the interface clocks are always fed by the interface clock outputs of the PRCM module. The functional clocks are fed by a PRCM module functional clock output or a PRCM module interface clock output. In the latter case, the functional and interface module clocks inherit the clock-management features (autoidle features) of the PRCM module interface clock.

---

### 3.1.1.1.2 Module-Level Clock Management

Each module in the device may also have specific clock requirements. Certain module clocks must be active when operating in specific modes, or they may be gated. Globally, the activation and gating of the module clocks are managed by the PRCM module. Hence, the PRCM module must be aware of when to activate and when to gate the module clocks.

The PRCM module differentiates the clock-management behavior for device modules based on whether the module can initiate transactions on the device interconnect (called master module) or it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based power-management protocols are used:

- Master standby protocol: Clock-management protocol between the PRCM and master modules
- Slave idle protocol: Clock-management protocol between the PRCM and slave modules

#### Master standby protocol

This protocol is used to indicate that a master module must initiate a transaction on the device interconnect and requests specific (functional and interface) clocks for that purpose. The PRCM module ensures that the required clocks are active when the master module requests the PRCM module to enable them. This is called a module wake-up transition and the module is said to be functional after this transition completes.

Similarly, when the master module no longer requires the clocks, it informs the PRCM module, which can then gate the clocks to the module. The master module is then said to be in standby mode.

Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the module. This is done by setting the `<Module>_SYSCONFIG.MIDLEMODE` or `<Module>_SYSCONFIG.STANDBYMODE` bit fields, as described in [Table 3-1](#). The behavior, identified in the `STANDBYMODE` Bit Value column, must be configured.

**Table 3-1. Master Module Standby Mode Settings**

STANDBYMODE Bit Value	Selected Mode	Description
0x0	Force-standby	The module unconditionally asserts the standby request to the PRCM module, regardless of its internal operations. The PRCM module may gate the functional and interface clocks to the module. This mode must be used carefully because it does not prevent loss of data at the time the clocks are gated.

**Table 3-1. Master Module Standby Mode Settings (continued)**

STANDBYMODE Bit Value	Selected Mode	Description
0x1	No-standby	The module never asserts the standby request to the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active; however, it is not efficient from a power-saving perspective because it never allows the PRCM module output clocks to be gated.
0x2	Smart-standby	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idled. The PRCM module can then gate the clocks to the module.
0x3	Smart-standby wake-up-capable mode	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idle. The PRCM module can then gate the clocks to the module. The module may generate (master-related) wake-up events when in standby state. The mode is relevant only if the appropriate module mwakeup output is implemented.

**NOTE:**

- Smart-standby mode is the preferred mode of operation, while force-standby and no-standby modes are intended for debugging purposes.
- A master module may support all or some of the standby modes listed in [Table 3-1](#). See the power-management section in the module chapter to identify the supported standby mode.

The standby status of a master module is indicated by the CM\_<Power domain>\_<Module>\_CLKCTRL[x]. STBYST bit in the PRCM module. [Table 3-2](#) describes the master module standby status.

**Table 3-2. Master Module Standby Status**

STBYST Bit Value	Description
0x0	The module is functional.
0x1	The module is in standby mode.

[Table 3-3](#) lists the enabling conditions for the master module clocks managed by the standby protocol.

**Table 3-3. Master Module Clock Enabling Conditions**

Relation		Condition
AND	OR	Clock domain is ready.
		Master module standby request is deasserted.
		Master module wake-up request is asserted.

**Slave idle protocol**

This hardware protocol allows the PRCM module to control the state of a slave module. The PRCM module informs the slave module, through assertion of an IDLE request, when its clocks (interface and functional) can be gated. The slave can then acknowledge the request from the PRCM module, and the PRCM module is then allowed to gate the clocks to the module. A slave module is said to be in IDLE state when its clocks are gated by the PRCM module.

Similarly, an idled slave module may need to be woken up because of a service request from a master module or because the slave module receives a wake-up event (for example, an interrupt or a direct memory access [DMA] request). In this situation the PRCM module enables the clocks for the module, and then signals the module to wake up by deasserting the IDLE request.

Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the slave module. This is done by setting the `<Module>_SYSCONFIG.IDLEMODE` or `<Module>_SYSCONFIG.IDLEMODE` bit field, as described in [Table 3-4](#). The behavior, identified in the IDLEMODE Bit Value column, must be configured by software.

**Table 3-4. Module Idle Mode Settings**

IDLEMODE Bit Value	Selected Mode	Description
0x0	Force-idle	The module unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully because it does not prevent loss of data at the time the clock is switched off.
0x1	No-idle	The module never acknowledges any IDLE request from the PRCM module. This mode is safe from a module point of view because it ensures the clocks remain active; however, it is not efficient from a power-saving perspective because it does not allow the PRCM module output clock to be shut off, and thus the power domain to be set to a lower power state.
0x2	Smart-idle	The module acknowledges the IDLE request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management.
0x3	Smart-idle wake-up-capable mode	The module acknowledges the IDLE request, basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management. The module may generate (IRQ- or DMA-request-related) wake-up events when in IDLE state. The mode is relevant only if the appropriate module wakeup output(s) is implemented.

**NOTE:**

- Smart-idle mode is the preferred mode of operation, while force-idle and no-idle modes are intended for debugging purposes.
- A slave module may support all or some of the idle modes listed in [Table 3-4](#). See the power-management section in the module chapter to identify the supported idle modes.

The idle status of a slave module is indicated by the `CM_<Power domain>_<Module>_CLKCTRL[x]IDLEST` bit field in the PRCM module. [Table 3-5](#) lists the possible idle statuses for a slave module.

**Table 3-5. Slave Module Idle Status**

IDLEST Bit Value	Idle Status	Description
0x0	Functional	The module is fully functional. The interface and functional clocks are active.
0x1	In transition	The module is performing a wake-up or a sleep transition.
0x2	Interface idle	The module interface clock is idled. The module may remain functional if using a separate functional clock.
0x3	Full idle	The module is fully idle. The interface and functional clocks are gated.

When configured in smart-idle mode, the slave module may acknowledge the IDLE request of the PRCM module based on the activity of its interface and/or functional clocks. To define which module clocks (that is, interface and/or functional) should be considered when responding to the PRCM module request, software must configure the `<Module>_SYSCONFIG[x]CLOCKACTIVITY` bit field.

The `CLOCKACTIVITY` setting is used internally by the module to determine the part of the module on which the conditions to acknowledge the PRCM module IDLE request are tested. As an example, if the functional clock must remain active when the module is in idle mode, the module must acknowledge a PRCM module IDLE request by considering only the interface clock gating conditions (that is, there is no pending activity on the interconnect).

**NOTE:** See the power-management section in the module chapter to identify whether this feature is configurable.

Using the CLOCKACTIVITY setting along with smart-idle mode ensures that the clock remains active for the module features that must remain available during the module idle mode. [Table 3-6](#) describes the possible CLOCKACTIVITY settings for a module.

**Table 3-6. Slave Module Clock Activity Settings**

CLOCKACTIVITY Bit Value	Module Interface Clock	Module Functional Clock	Description
0x0	Gated	Gated	The interface and functional clocks are considered when generating the acknowledgment. This setting also means both clocks may be gated upon a PRCM module IDLE request.
0x1	Active	Gated	The interface clock is not shut down and is not considered when generating the acknowledgment to the PRCM module IDLE request. Only the functional clock is considered.
0x2	Gated	Active	The functional clock is not shut down and is not considered when generating the acknowledgment to the PRCM module IDLE request. Only the interface clock is considered.
0x3	Active	Active	The interface and functional clocks are not shut down. The module can acknowledge the IDLE request without checking the internal functions linked to its clocks.

**NOTE:**

- The software configuration of the CLOCKACTIVITY settings may not be available for a given module. For some modules, the CLOCKACTIVITY settings can be hardwired.
- A slave module may support all or some of the CLOCKACTIVITY settings listed in [Table 3-6](#).

See the power-management section in the specific module chapter to identify the supported idle feature and settings.

**CAUTION**

The PRCM module does not have any hardware means to read the CLOCKACTIVITY settings of the module. Software must ensure consistent programming between the CLOCKACTIVITY settings of the module and the clock-gating control bits in the PRCM module. The PRCM module must be configured (where software control is available) not to gate the module clock, which should remain active according to the CLOCKACTIVITY settings of the module.

For idle protocol management on the PRCM module side, the behavior of the PRCM module is configured in the CM\_<Clock domain>\_<module>\_CLKCTRL[1:0] MODULEMODE bit field. Based on the configured behavior, the PRCM module asserts the IDLE request to the module unconditionally (that is, immediately when software requests) or through hardware control when the module idle conditions are satisfied. [Table 3-7](#) describes the configurable behavior of MODULEMODE.

**Table 3-7. Slave Module Mode Settings in PRCM**

MODULEMODE Bit Value	Selected Mode	Description
0x0	Disabled	The PRCM module unconditionally asserts the module IDLE request. This request applies to the gating of the functional and interface clocks to the module. If acknowledged by the module, the PRCM module can gate all clocks to the module (that is, the module is completely disabled). It can react only to an asynchronous wake-up event (that is, a wake-up event that does not require the module functional clock to be active).

**Table 3-7. Slave Module Mode Settings in PRCM (continued)**

MODULEMODE Bit Value	Selected Mode	Description
0x1	Auto	This mode applies to a module when the PRCM module manages only its interface clock and not its functional clock. The PRCM module automatically asserts/deasserts the module IDLE request based on the clock domain transitions. If acknowledged by the module, the PRCM module can gate the interface clock to the module.
0x2	Enabled	This mode applies to a module when the PRCM module manages its interface and functional clocks. The functional clock to the module remains active unconditionally, while the PRCM module automatically asserts/deasserts the module IDLE request based on the clock domain transitions. If acknowledged by the module, the PRCM module can gate only the interface clock to the module.
0x3	Reserved	Not available

**NOTE:** The PRCM module may support all or some of the MODULEMODE module settings listed in [Table 3-7](#). See the CM\_<Clock domain>\_<module>\_CLKCTRL[1:0] MODULEMODE bit field description for the module to identify the supported settings.

**NOTE:** Modules, which can be configured with DISABLED or AUTO values of ModuleMode, cannot go from IDLE to DISABLED state if ModuleMode is changed from AUTO to DISABLED while module is in IDLE state. Once the CM\_<Clock domain>\_CLKSTCTRL[1:0] CLKTRCTRL has been set to SW\_WKUP, then SW has to poll for PM\_<Clock domain>\_PWRSTST[1:0] PowerStateSt = 0x03 and PM\_<Clock domain>\_PWRSTST[20] InTransition = 0x00 before update MODULEMODE bit field.

[Table 3-8](#) and [Table 3-9](#) list the enabling conditions for the slave module clocks managed by the idle protocol.

**Table 3-8. Slave Module Interface Clock Enabling Conditions**

Relation		Condition
AND	OR	Clock domain is ready.
		Slave module idle status is 0x0 (fully functional).
		Slave module idle status is 0x1 (in transition).
		Slave module wake-up request is asserted.

**Table 3-9. Slave Module Functional Clock Enabling Conditions**

Relation		Condition
AND	OR	Clock domain is ready.
		Slave module idle status is 0x0 (fully functional).
		Slave module idle status is 0x1 (in transition).
		Slave module idle status is 0x2 (interface clock is idled).
		Slave module wake-up request is asserted.

The module clock domain must be ready for the optional clocks to the module, and any associated clock-enable control is asserted.

**NOTE:** A given clock can be used by more than one module. Clock-enabling conditions are then ORed together (that is, the clock is provided as soon as one of the enabling conditions is true). As a consequence, the clock is disabled only when all related enabling conditions are false.

### Module wake-up request

In IDLE state, a slave module may have to wake up to generate an interrupt or a DMA request. This can be the result of an external request (for example, to the input/output [I/O] port of a general-purpose input/output [GPIO] module) or an internally generated event (for example, WD\_TIMER time up). The slave module, with wake-up capability, sends a wake-up request to the PRCM module. The PRCM module then activates the module clocks and acknowledges the module wake-up request.

In IDLE state, some slave modules may require functional clock(s) to generate a wake-up event. Such requests are called synchronous wake-up events on the PRCM module side, while the events generated when the functional or interface module clocks are gated are called asynchronous wake-up events.

**NOTE:** See the power-management section in the module chapter to identify whether its wake-up event is synchronous or asynchronous.

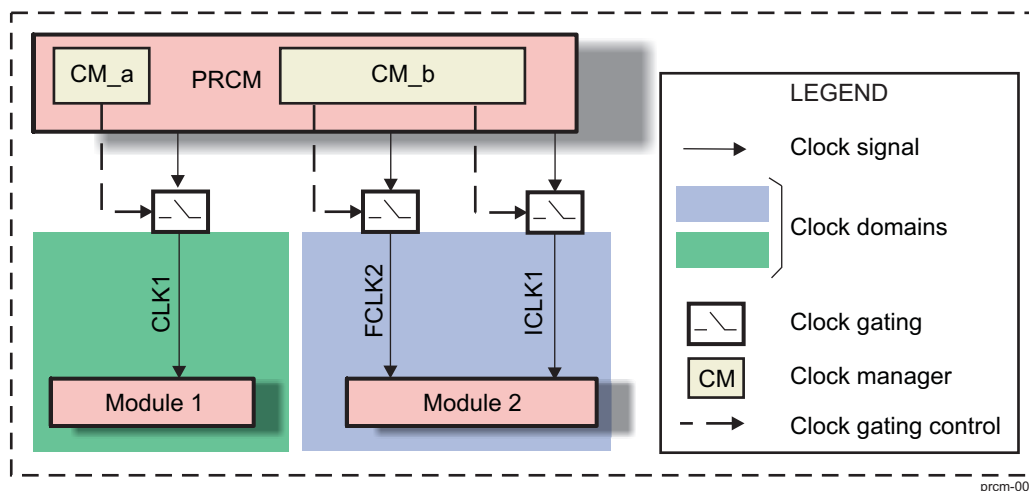

The standby and idle clock-management protocols allow the configuration of the module-level clock-management interaction between the PRCM module and individual modules of the device. However, the PRCM module may not necessarily gate the clock to the module immediately after the module switches to standby or idle mode at the end of this interaction. This is because the same clock can be shared by other modules that are active and need this shared clock to complete their activity. As a result, the PRCM module provides a second level of clock management called the clock-domain level, as explained in [Section 3.1.1.1.3, Clock Domain](#).

#### 3.1.1.1.3 Clock Domain

A clock domain is a group of modules fed by clock signals controlled by the same clock manager in the PRCM module (see [Figure 3-3](#)). By gating the clocks in a clock domain, the clocks to all the modules belonging to that clock domain can be cut to lower their active power consumption (that is, the device is on and the clocks to the modules are dynamically switched to ACTIVE or INACTIVE [gated] state). Thus, a clock domain allows control of the dynamic power consumption of the device.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated clock manager within the PRCM module. This allows the PRCM module to activate and gate individually each device clock domain.

**Figure 3-3. Generic Clock Domain**

[Figure 3-3](#) is an example of two clock managers: CM\_a and CM\_b. Each clock manager manages a clock domain. The clock domain of CM\_b is composed of two clocks, a functional clock (FCLK2) and an interface clock (ICLK1), while that of CM\_a consists of a clock (CLK1) that is used by the module as functional and interface clock. The clocks to Module 2 can be gated independently of the clock to Module 1, thus ensuring power savings when Module 2 is not in use.

The PRCM module lets software check the status of the clock domain functional clocks. The CM\_<Clock domain>\_CLKSTCTRL[x] CLKACTIVITY\_FCLK/<Clock name>\_FCLK bit in the PRCM module identifies the state of the functional clock(s) within the clock domain. Table 3-10 lists the two possible states of the functional clock.

**Table 3-10. Clock Domain Functional Clock States**

CLKACTIVITY Bit Value	Status	Description
0x0	Gated	The functional clock of the clock domain is inactive.
0x1	Active	The functional clock of the clock domain is running.

**Table 3-11. Clock Domain Interface Clock States**

CLKACTIVITY Bit Value	Status	Description
0x0	Gated	The interface clock of the clock domain is inactive.
0x1	Active	The interface clock of the clock domain is running.

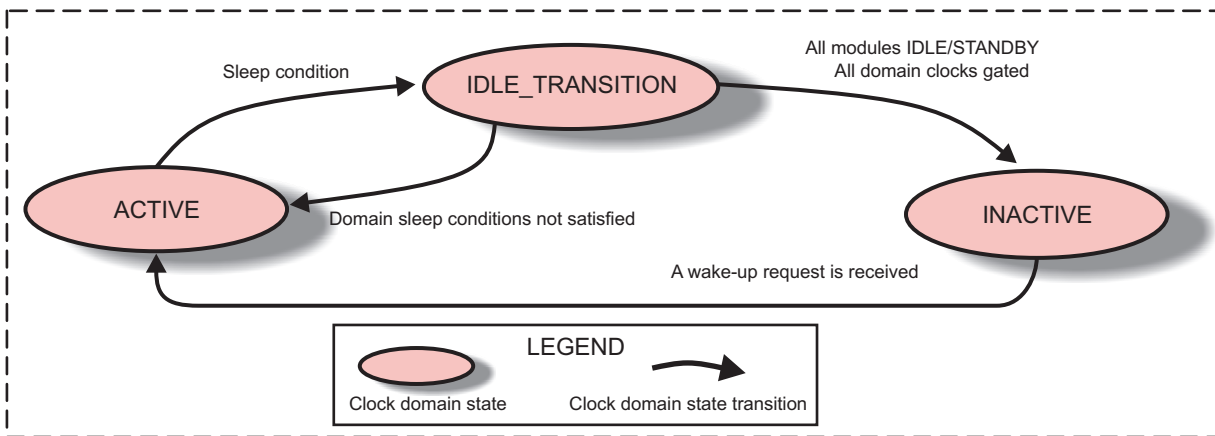

All Clock Domains are summarized and described in Section 3.6.4, *Clock Domains*.

**3.1.1.1.4 Clock Domain-Level Clock Management**

The domain clock manager can automatically (that is, based on hardware conditions) and jointly manage the interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

A clock domain can switch between three possible states: ACTIVE, IDLE\_TRANSITION (IDLEREQ), and INACTIVE (IDLE). Figure 3-4 shows the sleep and wake-up transitions of the clock domain between ACTIVE and INACTIVE states.

**Figure 3-4. Clock Domain State Transitions**

prcm-003

Table 3-12 defines the clock domain states.

**Table 3-12. Clock Domain Clock States**

State	Description
ACTIVE	<ul style="list-style-type: none"> <li>• Every nondisabled slave module (that is, those whose MODULEMODE value is not set to disabled) is put out of IDLE state.</li> <li>• All mandatory functional clocks to the active slave modules (that is, not idled) of the clock domain are provided.</li> <li>• All interface clocks to the nondisabled slave modules in the clock domain are provided.</li> <li>• All mandatory functional and interface clocks to the active master modules (that is, not in STANDBY state) in the clock domain are provided.</li> <li>• Every enabled optional clock to the modules in the clock domain is provided.</li> </ul>
IDLE_TRANSITION	This is a transitory state. <ul style="list-style-type: none"> <li>• Every master module in the clock domain is in STANDBY state.</li> <li>• Every IDLE request to all the slave modules in the clock domain is asserted.</li> <li>• The functional clocks to the slave module in enabled state (that is, those whose MODULEMODE values are set to enabled) remain active.</li> <li>• Every enabled optional clock to the modules in the clock domain is provided.</li> </ul>
INACTIVE	All clocks within the clock domain are gated. <ul style="list-style-type: none"> <li>• Every slave module in the clock domain (that is, those whose MODULEMODE value is set to disabled or auto) is in IDLE state and set to disabled or auto mode.</li> <li>• Every master module in the clock domain is in STANDBY state.</li> <li>• Every optional functional clock in the clock domain is gated.</li> </ul>

Each clock domain transition behavior is managed by an associated register bit field in the CM\_<Clock domain>\_CLKSTCTRL[x] CLKTRCTRL PRCM module.

Table 3-13 describes the clock transition mode settings of the clock domain.

**Table 3-13. Clock Domain Clock Transition Mode Settings**

CLKTRCTRL Bit Value	Selected Mode	Description
0x0	NO_SLEEP	A clock domain sleep transition is never initiated, regardless of the hardware conditions.
0x1	SW_SLEEP	A software-forced sleep transition. The transition is initiated when the associated hardware conditions are satisfied (see Table 3-15).
0x2	SW_WKUP	A software-forced clock domain wake-up transition is initiated, regardless of the hardware conditions identified in Table 3-14.
0x3	HW_AUTO	Hardware-controlled automatic sleep and wake-up transition is initiated by the PRCM module when the associated hardware conditions are satisfied (see Table 3-14 and Table 3-15).

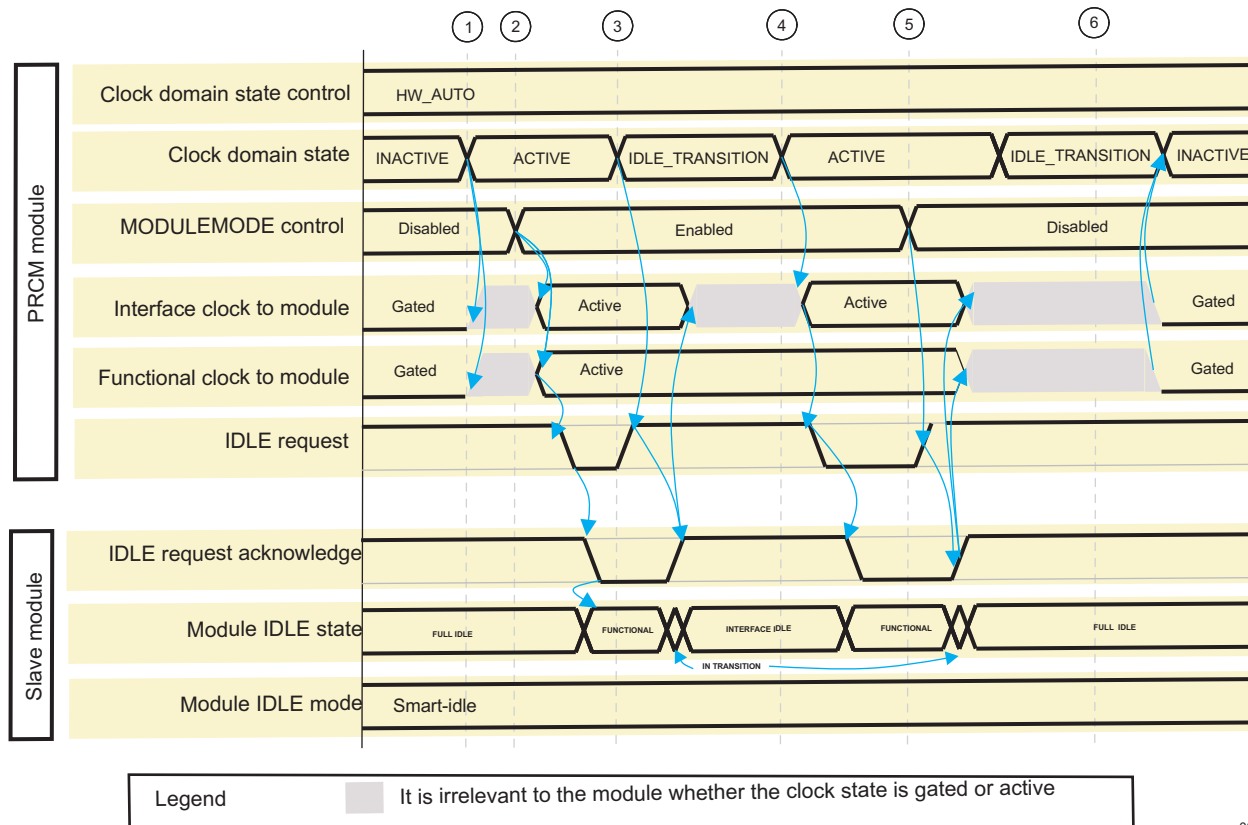

**NOTE:** Depending on its characteristics, a clock domain may or may not support all the clock transition mode settings described in Table 3-13. See the clock domain clock management section of the specific clock domain to identify the supported clock transition mode settings.

### 3.1.1.1.5 Clock Domain HW\_AUTO Mode Sequences

The sequence diagrams in Figure 3-5 through Figure 3-7 identify the PRCM module hardware-controlled enabling and gating of the functional and interface clocks to the module. They show the changes in the state of the module based on the changes to the clock domain state and module mode settings.

Figure 3-5 shows the behavior of a slave module receiving the interface and functional clocks and having two configurable module modes: disabled and enabled.

**Figure 3-5. Clock Domain/Slave Module Clock-Management Interaction Sequence 1**

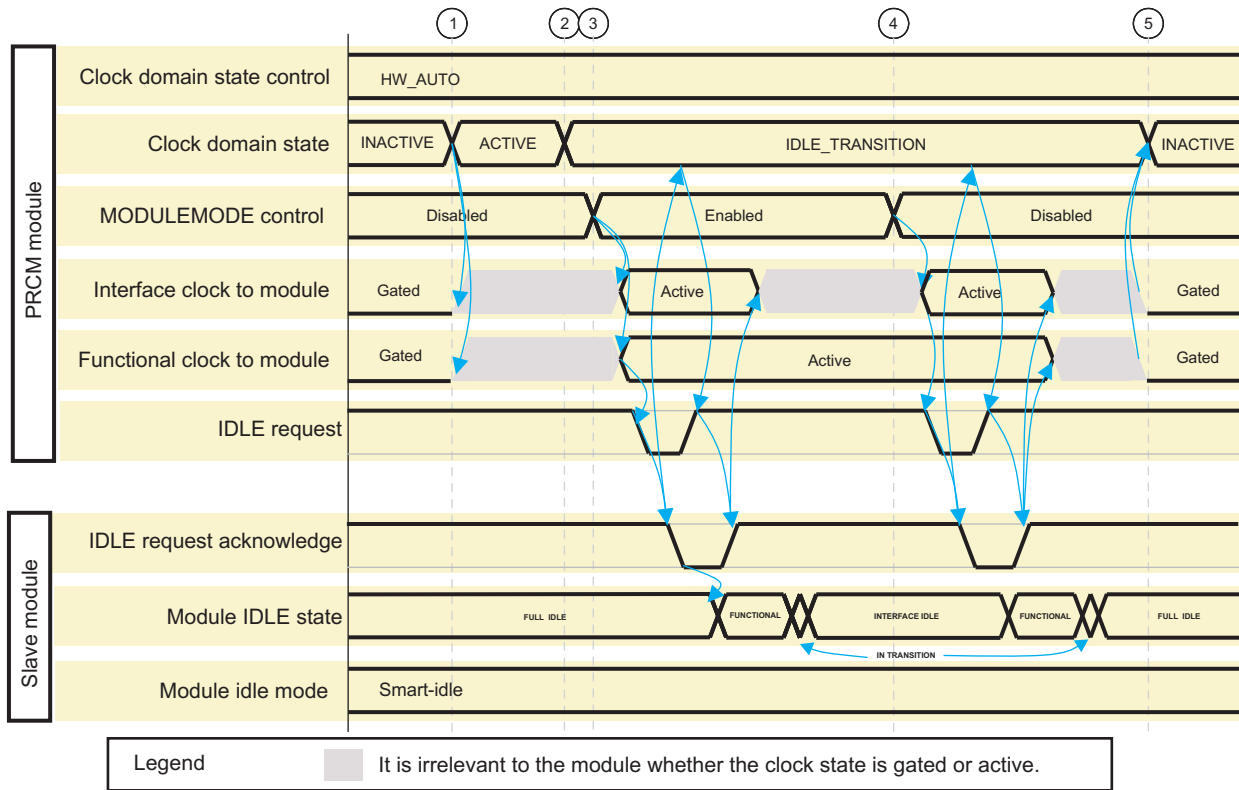

prcm-004

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes its state to ACTIVE. Because the MODULEMODE control is still disabled, this event has no effect on the state of the module. The functional and interface clocks can still be restarted automatically, based on the requirements of other modules sharing these clocks.
2. Software changes the module mode to ENABLED. The clocks to the module are automatically restarted. The PRCM module then deasserts a hardware IDLE request signal to the module. The module sends an IDLE request acknowledge to the PRCM module. The module is now effectively awake. The module IDLE state is functional.
3. The clock domain switches to IDLE\_TRANSITION state. In turn, the PRCM module requests the module to go into IDLE state by asserting the IDLE request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock. The functional clock of the module remains enabled because the module is in enabled mode.
4. The clock domain does not have all conditions to complete the sleep transition and wakes up again. In turn, the interface clock to the module is automatically restarted, and then the module is put out of IDLE state.
5. Software disables the module. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock.
6. The clock domain switches to IDLE\_TRANSITION state. When the sleep transition conditions of the clock domain are satisfied, the clocks (functional and interface) are gated. The clock domain then switches to INACTIVE state. This has no effect on the module, which is already in FULL IDLE state.

Figure 3-6 shows the behavior of the same slave module, receiving the interface and functional clocks, when the module mode is changed while the clock domain state is IDLE\_TRANSITION.

**Figure 3-6. Clock Domain/Slave Module Clock-Management Interaction Sequence 2**

prcm-005

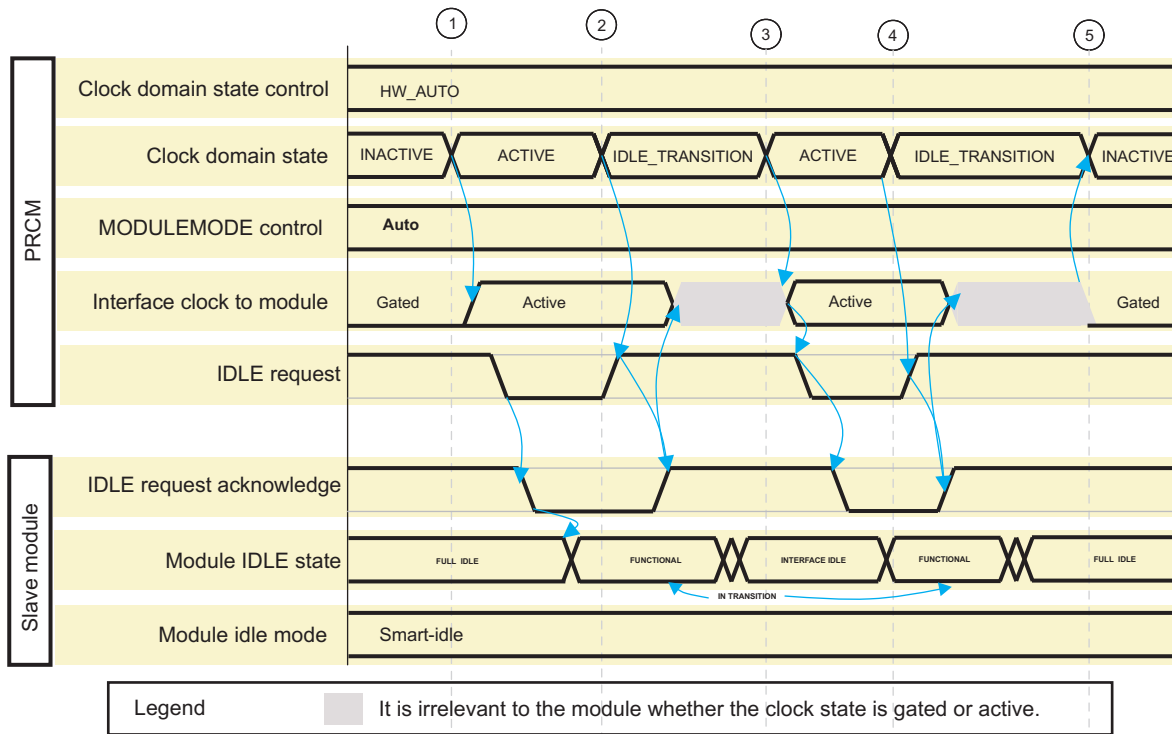

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes its state to ACTIVE. Because the MODULEMODE control is disabled, this event has no effect on the state of the module. The functional and interface clocks can still be restarted automatically, based on the requirements of other modules sharing these clocks.
2. The clock domain goes into the IDLE\_TRANSITION state. Because the module mode control is disabled, this event has no effect on the module state.
3. Software changes the module mode to ENABLED. The clocks to the module are restarted automatically and then the module is put out of IDLE state. As soon as acknowledged, the module is requested to go back to IDLE state with gating of the interface clock only (that is, the INTERFACE IDLE state). The interface clock to the module can be gated, depending on other modules sharing the same clocks.
4. Software disables the module. The interface clock to the module is restarted automatically. The PRCM module requests the module to go out of IDLE state by asserting the IDLE request signal. As IDLE request acknowledge is de-asserted, PRCM set back the module to IDLE state. When acknowledged, the interface and the functional clocks to the module can be gated, depending on other modules sharing the same clock.
5. When the clock domain sleep transition conditions are satisfied and the functional and interface clocks are gated, the clock domain switches to INACTIVE state. This has no effect on the module, which is already in FULL IDLE state.

Figure 3-7 shows the behavior of a slave module receiving only interface clock and supporting the configurable auto module mode.

**Figure 3-7. Clock Domain/Slave Module Clock-Management Interaction Sequence 3**

prcm-006

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL IDLE state and its interface clock is gated.

1. The clock domain wakes up and changes its state to ACTIVE. In turn, the interface clock to the module is automatically restarted. The PRCM module then deasserts a hardware IDLE request signal to the module. The module sends an IDLE request acknowledge to the PRCM module. The module is now effectively awake; that is, the module IDLE state is functional.
2. The clock domain switches to IDLE\_TRANSITION state. The PRCM module requests the module to go to IDLE state by asserting the IDLE request signal. When acknowledged, the interface clock to the module can be gated, depending on other modules sharing the same clock.
3. The clock domain does not have all conditions to complete the sleep transition and wakes up again. In turn, the interface clock to the module is automatically restarted, and then the module goes out of IDLE state.
4. This step is the same as Step 2.
5. The clock domain has all conditions to complete the sleep transition. The module is in IDLE state and its clock is gated.

### 3.1.1.1.6 Clock Domain Sleep/Wake-up

The clock domain manager initiates a domain wake-up transition when the conditions listed in [Table 3-14](#) are satisfied.

**Table 3-14. Clock Domain Wake-Up Conditions**

Relation	Condition
OR	The SW_WKUP clock transition mode for the clock domain is set (CLKTRCTRL = 0x2).
	At least one wake-up request is asserted by one of the modules of the clock domain.
	At least one dynamic dependency <sup>(1)</sup> from another clock domain is active.
	At least one static dependency <sup>(1)</sup> from another clock domain is active.

<sup>(1)</sup> The dynamic, static, and wake-up dependencies are explained in [Section 3.1.1.1.7, Clock Domain Dependency](#).

**Table 3-14. Clock Domain Wake-Up Conditions (continued)**

Relation	Condition
	At least one wake-up dependency <sup>(1)</sup> from a module in another clock domain is active.

The clock domain manager initiates a domain sleep transition when the conditions listed in [Table 3-15](#) are satisfied.

**Table 3-15. Clock Domain Sleep Conditions**

Relation	Condition
AND	All master modules in the clock domain are in STANDBY state.
	No wake-up request is asserted by any module of the clock domain.
	No dynamic domain dependency <sup>(1)</sup> from any other domain is active.
	No wake-up dependency <sup>(1)</sup> from any module in another domain is active.
	No static domain dependency <sup>(1)</sup> from any other domain is active.
OR	The SW_SLEEP clock transition mode is set for the clock domain (CLKTRCTRL = 0x1).
	The HW_AUTO clock transition mode is set for the clock domain (CLKTRCTRL = 0x3).

<sup>(1)</sup> The dynamic, static, and wake-up dependencies are explained in [Section 3.1.1.1.7](#), *Clock Domain Dependency*.

### 3.1.1.1.7 Clock Domain Dependency

A domain dependency is a binary relationship between two clock domains. A clock domain A is said to depend on a clock domain B when a module in clock domain B provides services to a module in clock domain A. As a result, clock domain B must be active when clock domain A is active so that the module in clock domain B is accessible by the module in clock domain A.

Dependency between two clock domains can also exist if one clock domain serves to ensure communication between two modules (for example, the clock domain of the device interconnect).

Thus, a clock domain can support the types of clock domain dependencies described in the following sections.

[Table 3-16](#) and [Table 3-17](#) detail all the domain dependencies:

- **NA/NA**: if no dependency can exist because no corresponding interconnect path exists in the device
- When cell is different than NA/NA, the cell contains two attributes:
  - First attribute for the presence and control method of a static dependency:
    - **SW**: Static dependency is controlled by a software bit. This is the most generic way of control. Depending on the use case and on latency requirement for accessing target domain, software can enable or not the static dependency. When not enabled, access to those domains is performed using dynamic dependencies.
    - **1**: Static dependency is always enabled (hard-wired). This is relevant for a domain that has an "exact standby" system initiator with the target domain being the domain containing the interconnect module to which the initiator is connected.
    - **0**: Static dependency is never enabled (hard-wired). This is relevant for domains that do not have strong access latency requirements, or for which a static dependency is not desired for specific reasons (for example, dependencies with emulation domain). Access to those domains is performed using dynamic dependencies.
    - **NA**: Nonapplicable (means domain has no system initiator able to access the other domain)
  - Second attribute for the presence and control method of a dynamic dependency:
    - **1..n**: Dynamic dependency is always enabled (hard-wired). The number of corresponding interconnect interfaces is also specified. This is relevant for most of the domain-to-domain direct interconnect connection.
    - **0**: Dynamic dependency is never enabled (hard-wired). This is relevant only when a static

dependency is always enabled between same domains, or when the target domain cannot support the wakeup on access feature.

- **NA:** Nonapplicable (means that both domains are not directly linked by an OCP interface)

When a static dependency is hardware-coded between two domains directly linked by one or several interconnect interfaces, then the corresponding dynamic dependency is useless.

Emulation domain (DAP initiator) has no static dependency with any other domain. It has, however, a dynamic dependency with the L3\_MAIN2 interconnect. A domain that can access an emulation domain does not have static or dynamic dependency with it.

Domain dependencies are chosen such that any access (even from EMU/DAP) towards a nondisabled target is always completed normally. Using static dependencies allows having minimal access latencies by keeping necessary domains on whenever the initiator is not standby. This may be at the expense of additional power consumption because some domains may stay on while not in use for a long time. By disabling static dependencies, applicative access is still completed normally by waking up, if applicable, the necessary domain on the path from the initiator to the target. Power consumption can be optimized at the expense of additional access latencies.

---

**NOTE:** Once the CM\_<Clock domain>\_CLKSTCTRL[1:0] CLKTRCTRL has been set to SW\_WKUP, then SW has to poll for PM\_<Clock domain>\_PWRSTST[1:0] PowerStateSt = 0x03 and PM\_<Clock domain>\_PWRSTST[20] InTransition = 0x00 before update MODULEMODE bit field.

---

### 3.1.1.1.7.1 Static Dependency

If clock domain A has a master module that can access a slave module in clock domain B, then clock domain A can have a static dependency with clock domain B. Similarly, a static dependency can also exist between domain A and B if domain B conveys the transactions from a domain A module toward a module in any other domain. For example, CD\_DSP can have a static dependency with CD\_L3\_MAIN1 because this domain has a level 3 (L3) interconnect to carry the transactions from the digital signal processor (DSP) module.

This static dependency consists of forcing clock domain B to stay active as long as there is at least one master module of clock domain A that is not in STANDBY state. If clock domains A and B are initially in GATED state, then clock domain B becomes active as soon as clock domain A becomes active when a wake-up request from the master module is received by the PRCM module.

Similarly, as a result of the static dependency, clock domain B can be gated only if all the master modules of clock domain A that can access the slave modules in clock domain B are in STANDBY state.

The static dependency between a source clock domain and a destination clock domain is configured in the PRCM module by setting the CM\_<Source Clock domain>\_STATICDEP[x] <Destination Clock domain>\_STATDEP bit. As a result, the source clock domain forces the destination clock domain to become active and stay active as long as the source clock domain is active.

The destination domain must be put into forced wake-up (CM\_<X>\_CLKSTCTRL[1:0] CLKTRCTRL = SW\_WKUP) before changing a configurable static dependency.

### 3.1.1.1.7.2 Dynamic Dependency

When clock domains A and B contain modules directly linked to a common device interconnect, these clock domains can have a dynamic dependency.

A dynamic dependency consists of forcing clock domain B to stay active as long as a module from clock domain A is communicating with the module in clock domain B through the interconnect. Clock domain B becomes active as soon as the communication is initiated. This is automatically managed by the PRCM module by monitoring the communication on the interconnect between the modules of the two clock domains.

Similarly, the inverse condition of this dependency can be stated: Clock domain B can be inactive only if there has not been transactions from clock domain A to clock domain B, identified as a sliding window duration on the interconnect activity status.

The size of the sliding window is based on the number of cycles of a prescaled level 4 (L4) clock whose frequency is configured by setting the CM\_DYN\_DEP\_PRESCAL[5:0] PRESCAL bit field. The prescaled clock frequency is given as:

$$\text{Prescaled clock frequency} = \text{L4 interface clock frequency} / (\text{PRESCAL} + 1)$$

The size of the sliding window is fixed by setting the CM\_<Clock domain>\_DYNAMICDEP[27:24] WINDOWSIZE bit field. It is given as:

$$\text{Sliding window duration} = \text{WINDOWSIZE} \times \text{Period of Prescaled clock cycle}$$

**Figure 3-8** is an example of the sliding window duration equal to eight clock cycles of an L4 clock when PRESCAL is set to 3 and WINDOWSIZE is set to 2.

**Figure 3-8. Sliding Window for Dynamic Dependency**

This dynamic dependency is also referred to as the autosleep/autowakeup feature.

**NOTE:**

- The static dependency between two clock domains can be configured by software (PRCM module registers) or hardwired in the PRCM module.
- The dynamic dependency between two clock domains is hardwired in the PRCM module.

A dynamic dependency is said to be active when both of the following conditions are met:

- There has been one or more transaction on the interconnect within the sliding window duration.

Otherwise, a dynamic dependency is said to be inactive.

The dynamic dependency between a source clock domain and a destination clock domain can be read in the PRCM module from the corresponding read-only `CM_<Source Clock domain>_DYNAMICDEP[x]` `<Destination Clock domain>_DYNDEP` bit.

**NOTE:** It is recommended to use dynamic dependencies. They give better power results. Static dependencies should be rarely used (in some cases they can be used as they give shorter latency for a system initiator to access slave).

### 3.1.1.1.7.3 Wake-Up Dependency

A wake-up dependency is a dependency between the clock domain of a module that owns one or several wake-up signals toward the clock domain of another module needed to service the associated wake-up event. As a result of this dependency, the wake-up event to a module activates not only its clock domain but also the clock domain of the servicing module.

**NOTE:** To ensure that the clock domain of the servicing module remains active, the wake-up signal that triggers a wake-up dependency stays active as long as the source of the event is not serviced.

Wake-up dependencies allow acceleration of the wake-up transition of multiple domains needed to service the wake-up event by initiating their transition in parallel. The static and dynamic dependencies can allow the wake-up of related domains, but the complete wake-up transition of all the associated domains is slower because of the sequential cascading of their wake-up transitions.

In the device, the source event of the wake-up signal to a slave module can be either of following types:

- Interrupt request to the microprocessor unit (MPU), DSP, or image processor unit (IPU) interrupt controller (INTC)

- DMA request to a DMA controller

Upon wake-up by these types of wake-up events, and for as long as they remain asserted, the PRCM module takes the following actions:

- The power domain of the servicing module (for example, MPU, DSP, IPU, or DMA) is forced to POWER ON state and the clock domain becomes active.
- The power domain of the device interconnect between the servicing module and the module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The power domain of the slave module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The slave module originator of the wake-up event is switched from IDLE to ACTIVE state.

On assertion of a wake-up event of a stand-alone master module, and as long as it remains asserted, the PRCM module takes the following action:

- The power domain of the master module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.

---

**NOTE:** For slave modules, the static and dynamic dependencies of a clock domain are not affected by its wake-up dependency settings. For master modules, the static dependencies are not affected.

Hence, in addition to the activation of the clock domains previously described, all clock domains associated by static dependencies are also activated.

However, the clock domains associated with the wake-up clock domain through dynamic dependencies are activated only if a transaction is initiated to these clock domains.

---

For each wake-up signal coming from a slave module, the type of the corresponding event can be configured in the PM\_<Power domain>\_<Originator Module>\_WKDEP[x] WKUPDEP\_<Originator Module>\_[IRQ/DMA]\_<Servicing Module> bit of the PRCM module, where <Power domain> is the name of the power domain of the originator module of the wake-up event identified as <Originator Module>. Servicing Module refers to the module servicing the wake-up event.

---

**NOTE:** When only one event type is associated with the wake-up signal of a slave module, the wake-up dependency (WKUPDEP) for the module clock domain is not configurable and may be hardwired in the PRCM module.

For the master modules, there is no configurable wake-up dependency. Their power domain is switched on and their clock domain is activated by the PRCM module when they assert their wake-up signal.

---

### 3.1.1.2 Power Management

The PRCM module manages the switching on and off of the power supply to the device modules. To minimize device power consumption, the power to the modules can be switched off when they are not in use. Independent power control of sections of the device lets the PRCM module turn on and off specific sections of the device without affecting other sections.

#### 3.1.1.2.1 Power Domain

A power domain is a section (that is, a group of modules) of the device with an independent and dedicated power manager (see [Figure 3-9](#)). A power domain can be turned on and off without affecting other parts of the device.

Figure 3-9. Generic Power Domain

prcm-008

To minimize device power consumption, the modules are grouped into power domains. A power domain can be split into logic and memory areas.

The memory area contains two entities:

- Memory bank: Composed of memory arrays. It is powered by a dedicated voltage rail and an associated power switch (for example, Varray and memory array power switches).
- Memory logic: Powered by the same voltage source as the logic area of the power domain, but has its dedicated power switch (for example, Vdd and memory logic power switches)

The logic area in the power domain can also be split between retention flip-flops (RFFs) and nonretention flip-flops (DFFs).

Table 3-18 lists the possible states and substates of the logic area in a power domain.

Table 3-18. States of a Logic Area in a Power Domain

State	Substate	Description
ON	ON-ACTIVE	Logic is fully powered and at least one enclosed clock domain is active.
	ON-INACTIVE	Logic is fully powered and all enclosed clock domains are idled.
RETENTION	CSWR (close switch retention)	Logic is fully powered and all enclosed clock domains are idled.
OFF		Logic power switches are off. All the logic (DFF and RFF) is lost except for the context, which has been saved in the scratchpad memory of an always-on power domain. Vdd can be set to 0 V if all associated power domains are in this state.

RETENTION state is useful for quickly switching to low-power idle mode (in which the domain clocks are gated and the domain voltage is less than the on-voltage level) without losing the context, and then quickly switching back to ON-ACTIVE state when necessary. In RETENTION state, power consumption is less than in ON power state.

The behavior of the memory array power switch and memory logic power switch can be selected through software settings in the PRCM module or can be hardwired. Once the behavior is selected, the PRCM module hardware automatically handles these elements to ensure correct power transition sequencing between the power domain states.

Software can also initiate power state changes of the memory array when the associated power domain is in ON power state. This allows the memory array to be turned off and on as needed.

The memory area can be configured to any of the power states listed in [Table 3-19](#).

**Table 3-19. States of a Memory Area in a Power Domain**

State	Description
ON	The memory array is powered and fully functional.
RETENTION	The memory array is fully powered, but memory is not accessible. The array can be put into retention through an applicable direct retention control signal. Data in memory are always retained.
OFF	The memory array is powered down. Data in memory are lost.

### 3.1.1.2.2 *Module Logic and Memory Context*

In case of a power state transition in the logic or memory areas, the context of the module may no longer be valid. This can also be the case when the domain resets are asserted by the device. A specific RM\_<Clock Domain Name>\_<Module Name>\_CONTEXT register provides the status of the device logic and memory context.

- The module logic context consists of simple flip-flops (DFFs) if the module has no logic RFFs.
- If the module has logic retention (full or partial), it is assumed that the context consists of: only RFFs, only DFFs or both RFFs and DFFs.

---

**NOTE:** The display subsystem is an exception where the status of DFF and RFF context is given, because only HMDI keys are retained, while most of the display subsystem is not retained.

---

These context status bits must be cleared by software.

### 3.1.1.2.3 *Power Domain Management*

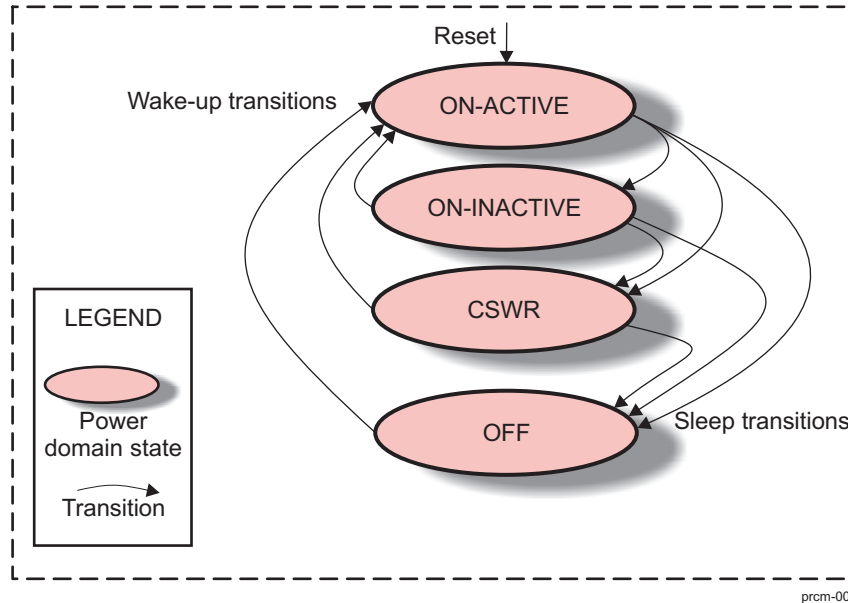

The power manager associated with each power domain is assigned the task of managing the domain power transitions. It ensures that all hardware conditions are satisfied before it can initiate a power domain transition from a source to a target power state (for example, from ON-ACTIVE state to CSWR RETENTION state).

The hardware condition for power domain transition from ON-ACTIVE to any other transition state is:

- All clock domain managers in the power domain are in IDLE state.

[Figure 3-10](#) shows all possible power domain state transitions.

**Figure 3-10. Power Domain Transitions**

Successive power-down transitions can be performed by lowering the power state from ON-ACTIVE to ON-INACTIVE to RETENTION, and then to OFF and LOWPOWERSTATECHANGE, as long as the hardware condition is satisfied.

However, the power domain wake-up transition from any low-power state (ON-INACTIVE or CSWR) to ON-ACTIVE state is always direct.

The power domain manager initiates a power domain wake-up transition when the conditions listed in [Table 3-20](#) are satisfied.

**Table 3-20. Power Domain Wake-Up Conditions**

Relation	Condition
AND	Voltage domain is on.
OR	There is at least a wake-up condition for one enclosed functional clock domain.
	There is a request for clock generation or distribution enclosed in the power domain.
	There is a PRCM module service request (applicable only to power domains, including PRCM module logic).

The power domain manager initiates a domain sleep transition when the conditions listed in [Table 3-21](#) are satisfied.

**Table 3-21. Power Domain Sleep Conditions**

Relation	Condition
AND	All functional clock domains enclosed in the power domain are idled.
	All clock generation or distribution enclosed in the power domain is quiet, and corresponding input clocks are gated. For example, DPLL, if present, must be in stop mode.
	There is no PRCM module service request (applicable only to power domains, including PRCM module logic).

[Table 3-22](#) lists the control and status features of the PRCM module power domain.

**Table 3-22. Power Domain Control and Status Registers**

Register/Bit Field	Type	Description
PM_<Power domain>_PWRSTCTRL[1:0] POWERSTATE	Control	Selects the target power state of the power domain among OFF, ON-ACTIVE, ON-INACTIVE, and RETENTION
PM_<Power domain>_PWRSTCTRL[x] LOWPOWERSTATECHANGE	Control	Power state change request when domain has already performed a sleep transition. Allows going into deeper low-power state without waking up the power domain.
PM_<Power domain>_PWRSTCTRL[2] LOGICRETSTATE	Control	Selects whether the power domain logic is in CSWR RETENTION state when the domain transitions to RETENTION state
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_RETSTATE	Control	Selects whether the memory bank in the power domain is in ON, or RETENTION state when the power domain is in RETENTION state. The memory bank cannot be in ON state when the power domain is in RETENTION state.
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_ONSTATE	Control	Selects whether the memory bank is in ON, RETENTION or OFF state when the power domain is in ON state
PM_<Power domain>_PWRSTST[1:0] POWERSTATEST	Status	Identifies the current state of the power domain. It can be OFF, RETENTION, ON-INACTIVE, or ON-ACTIVE.
PM_<Power domain>_PWRSTST[2] LOGICSTATEST	Status	Identifies the current state of the logic area in the power domain. It can be OFF or ON.
PM_<Power domain>_PWRSTST[20] INTRANSITION	Status	Identifies whether a power state transition in the power domain is in progress or there is no ongoing transition
PM_<Power domain>_PWRSTST[x] <memory bank>_STATEST	Status	Identifies the current power state of the memory bank in the power domain. It can be OFF, RETENTION, or ON.
PM_<Power domain>_PWRSTST[25:24] LASTPOWERSTATEENTERED	Status	Identifies the last (previous) power state of the power domain. It can be OFF, RETENTION, ON-INACTIVE, or ON-ACTIVE.

### 3.1.1.3 Voltage Management

The PRCM module do not provide controls over the Voltage management. All OPP changes will be handled by Application software directly without any PRCM intervention.

#### 3.1.1.3.1 Voltage Domain

A voltage domain is a section of the device supplied by a dedicated voltage source (that is, an internal LDOs or external switch mode power supply [SMPS]). A voltage domain may or may not be controlled by the PRCM module.

The voltage managers in the PRCM module is one type:

- Dynamically configurable by software to scale the domain voltage level to specific values within the operational voltage range of the device. This is called adaptive voltage scaling (AVS).

Figure 3-11 shows a voltage domain.

**Figure 3-11. Generic Voltage Domain**

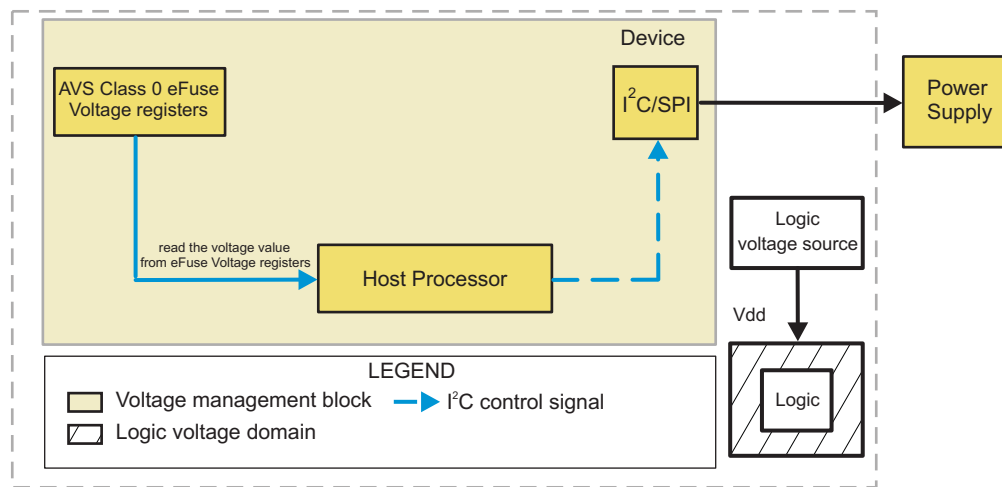

prcm-010

By partitioning the device into independent voltage domains, different operating voltages can be assigned to the different sections of the device (that is, a group of modules or memory banks). The independent voltage control allows voltage scaling of device subsections to ensure that each module or memory bank operates at the optimized operating voltage level based on the application performance requirements. Similarly, when a memory bank is not in use, it can be switched to retention voltage levels to ensure power savings.

### 3.1.1.3.2 Voltage Domain Management

Figure 3-12 shows the different voltage control paths available within a generic logic voltage management block to control the voltage supply to the logic voltage domains of the device.

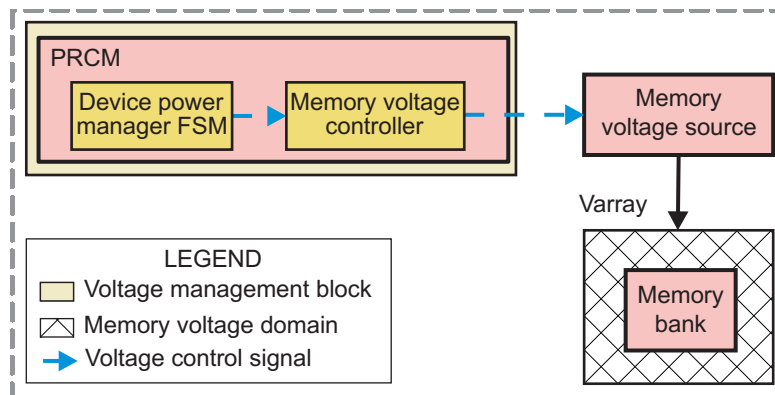

Figure 3-12. Generic Logic Voltage Management

prcm-011

Figure 3-13 shows the voltage control path available within a generic memory voltage management block to control the voltage supply to the memory voltage domains of the device.

Figure 3-13. Generic Memory Voltage Management

prcm-012

The PRCM hardware supports automatic scaling down of the memory array supply whenever the memory domains transition to RETENTION power state. The device power manager FSM manages the voltage scaling of memory voltage domains through the memory voltage controller (or LDO).

### 3.1.1.3.3 AVS Overview

SmartReflex is a power-management technique used to control the operating voltage of a device to reduce its active power consumption.

With SmartReflex, the power supply voltage is adapted to the silicon performance in one way:

- Statically adapted to the manufacturing process of a given device

SmartReflex achieves optimal performance/power trade-off for all devices across the technology process spectrum.

The static correction of the device voltage level (see [Figure 3-14](#)) is based on the desired performance level and silicon performance characteristics of the device. As a result of process dispersion, each die has its specific silicon performance. The range of the process distribution defines the weak devices (low-performance silicon) and the strong devices (high-performance silicon).

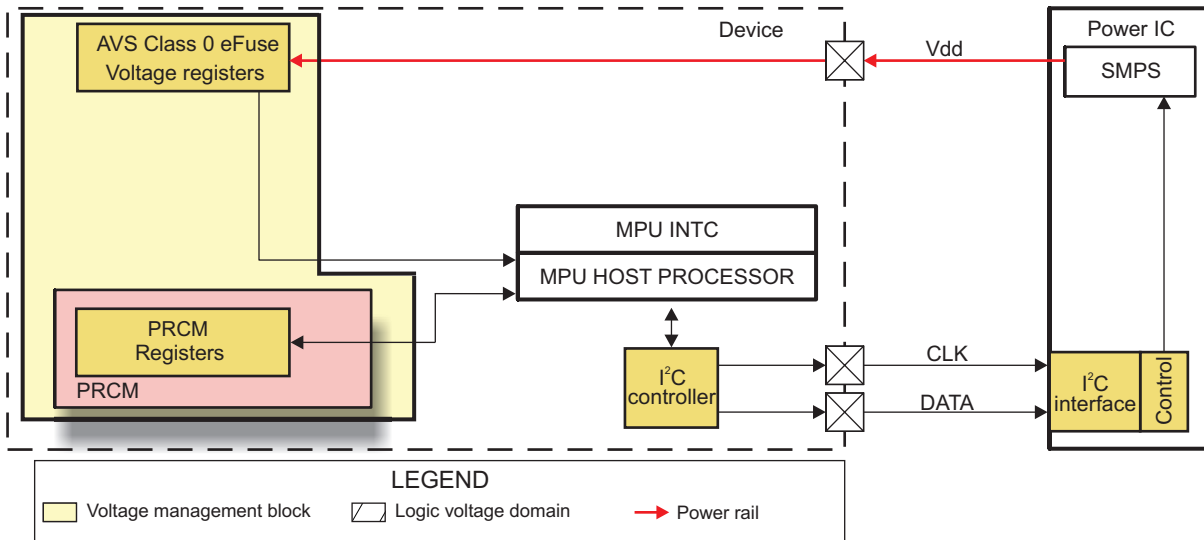

A weak device is a device with the lowest performance tolerated for a process distribution; that is, at the typical voltage, the inherent maximum frequency is the lowest frequency of the chip distribution. Considered as the worst case, weak devices are used to constrain the target frequency of all the chips (OPP definition).

A strong device is a device with the highest performance tolerated for a process distribution. The inherent maximum frequency at the typical voltage is greater than the targeted frequency.

[Figure 3-14](#) shows that with the SmartReflex voltage-control architecture, it is possible to compensate for the device silicon characteristics and obtain optimal performance characteristics. Based on the device characteristics, the device voltage level can be adjusted for specific performance level.

[Figure 3-15](#) is a functional overview of the SmartReflex voltage-control architecture of the device connected to an external power IC.

**Figure 3-15. SmartReflex Voltage Control Functional Overview**

SmartReflex voltage control consists of the following modules:

- MPU HOST Processor
- I<sup>2</sup>C interface
- SMPS

The SmartReflex module senses the frequency of internal ring oscillator and generates an error value that identifies the difference between the desired optimal voltage and the actual value and outputs this directly on dedicated hardware interface. This error value is set in an internal register (for software read, if necessary) and is also generated an interrupt to indicate error values outside acceptable limits.

The processor converts the error value to a command that defines the change in the output voltage required to bring it to the desired voltage level.

The device supports one operational mode for SmartReflex voltage control:

- Class 0: Manufacturing Test Calibration

### 3.1.1.3.3.1 AVS Class 0 (SmartReflex™) Voltage Control

Adaptive Voltage Scaling (AVS) Class 0 (also referred to as SmartReflex™) is a procedure for lowering the voltage on certain device power rails. AVS Class 0 attempts to normalize the power consumption across all devices. The optimal voltage for each AVS supported rail of each device is determined after analysis in the factory. This value is written in the device eFuse where it can be read through dedicated registers. These registers reside in the control module. For more information, see [Section 18.4.6.12, AVS Class 0 Associated Registers](#), in [Chapter 18, Control Module](#).

## 3.1.2 Power-Management Techniques

The following sections describe the power-management techniques supported by the device.

**NOTE:** The values in [Figure 3-16](#) through [Figure 3-18](#), which show the power-management techniques, are hypothetical. They do not represent valid test results on the device.

### 3.1.2.1 Standby Leakage Management

Standby leakage management (SLM) is a power-management technique that reduces standby power consumption by reducing power leakage.

With SLM, the device switches into low-power system modes automatically or in response to user requests during system standby (that is, in situations when no application is started and system activity is negligible or limited).

When applying SLM, the system remains in the lowest static power mode compatible with the system response time requirement.

This technique trades static power consumption for wake-up latency.

### 3.1.2.2 Dynamic Voltage and Frequency Scaling

Dynamic voltage and frequency scaling (DVFS) consists of minimizing the idle time of the system. The DVFS technique uses dynamic selection of the optimal operating frequency and voltage to allow a task to be performed in the required length of time. This reduces the active power consumption (power consumed while executing a task) of the device while still meeting task requirements.

**NOTE:** The values in [Figure 3-16](#) are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

**Figure 3-16. Comparison of Energy Consumed With/Without DVFS**

[Figure 3-16](#) shows the DVFS technique by comparing a process executed at maximum frequency and operating voltage without applying DVFS to the same process executed at optimal frequency and voltage using DVFS, based on the task requirements. If a task that must terminate in 4 seconds is performed at maximum operating frequency (see the left side of the figure), it terminates in 1 second, and the remaining 3 seconds are spent in idle mode.

With DVFS (see the right side of the figure), the operating frequency is reduced to optimal level; the task takes the full 4 seconds to complete, but power consumption is reduced. In addition, the voltage can be reduced further to save power so the dynamic and leakage power consumption are reduced.

DVFS requires control over the clock frequency and the operating voltage of the device elements. By intelligently switching the individual elements of the device to their OPPs, the power consumption of the device for a given task can be minimized.

For practical reasons related to the development of the device (flow, tools), DVFS can be used only for a few discrete steps, not over a continuum of voltage and frequency values. Each step, or OPP, is composed of a voltage (V) and frequency (F) pair. For an OPP, the frequency corresponds to the maximum frequency allowed at a voltage, or reciprocally; the voltage corresponds to the minimum voltage allowed for a frequency.

When applying DVFS, a processor or system always runs at the lowest OPP that meets the performance requirement at a given time. The user determines the optimal OPP for a given task and then switches to that OPP to save power.

### 3.1.2.3 Dynamic Power Switching

Like DVFS, dynamic power switching (DPS) is a power-management technique intended to reduce the active power consumption of a device. However, whereas DVFS reduces dynamic and leakage power consumption, DPS reduces only leakage power consumption, at the expense of a slight overhead in dynamic power consumption.

With DPS, the system switches dynamically between high- and low-consumption system power modes during system active time. When DPS is applied, a processor or system runs at the highest OPP (maximum frequency and voltage) to complete its tasks quickly, followed by an automatic switch to a low-power mode for minimum power consumption. DPS is useful when a real-time application is waiting for an event. The system can switch into a low-power system mode if the wake-up latency conditions allow it.

This technique consists of maximizing the idle period of the system to reduce its power consumption.

**NOTE:** The values in Figure 3-17 are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

**Figure 3-17. Comparison of Energy Consumed With/Without DPS**

prcm-017

Figure 3-17 compares the behavior of power consumption for the same operation of the device without DPS (see the left side of the figure) and with DPS (see the right side of the figure). When operating without DPS, the device has a constant leakage current in idle mode. By using DPS, the system reduces the leakage current to 0. However, the transitions between system power modes may require storing the information before entering a low-power inactive state and restoring the information after a wake-up event (see Figure 3-17). This results in additional dynamic power consumption, referred to as transition overhead (see Figure 3-17). Transition overhead must be considered for a DPS operation.

For efficient deployment of DPS techniques, it is necessary to predict dynamically the performance requirement of the applications running on the processor. The DPS controller must account for the overhead of wake-up latencies related to domain switching and ensure that they do not significantly affect the performance of the device. Even with transition overhead, the user can identify an optimal idle-time limit, after which the DPS is useful for dynamic power saving.

### 3.1.2.4 Adaptive Voltage Scaling

With SmartReflex, power-supply voltage is adapted to silicon performance, statically (based on performance points predefined in the manufacturing process of a given device).

AVS achieves the optimal performance/power trade-off for all devices across the technology process spectrum. This ensures optimal power consumption for a given OPP.

### 3.1.2.5 Adaptive Body Bias

The device implements transistor body bias techniques for forward body bias (FBB) to boost the operating clock frequency for operation at higher OPPs.

Adaptive body bias (ABB) is based on the process corner and the current OPP. This is configured in the EFUSE\_CTRL\_CUST bit field at the device characterization and is not continuously updated. A dedicated LDO (VBBLDO) is used to produce the voltage bias.

ABB is supported only for MPU, IVAHD, DSPEVE, GPU voltage domains.

### 3.1.2.6 SR3-APG (Automatic Power Gating)

In addition to power-management techniques supported in the device, the MPU subsystem also employs SR3-APG power-management technology to reduce leakage. This technology allows for full logic and memory retention on MPU\_C0 and MPU\_C1 when required conditions are satisfied. It is controlled by the PRCM\_MPU. For more information, see [Chapter 4, Dual Cortex-A15 MPU Subsystem](#).

### 3.1.2.7 Combining Power-Management Techniques

The power-management techniques previously described have specific features and are most effective when used under the specific operating conditions of the device. Hence, the best active power savings are obtained by combining the DVFS, DPS, SLM, and AVS techniques. For a given operating state, one or more of the power-saving techniques can be applied to ensure optimal operation with maximum power saving.

AVS must be used at boot time to adapt the voltage to the process characteristics (strong/weak) of the device and then be used continuously to compensate temperature variations. AVS can also ensure the maximum available application performance of the device at a given OPP.

When medium application performance is required, or when application performance requirements vary, DVFS can be applied. The voltage and frequency can be scaled to match the closest OPP that meets the performance requirement.

When application performance requirements fall between two OPPs, or when a low application performance is required that is below the lowest performance OPP, DPS can be applied to switch to low-power mode.

When combining DVFS and DPS, the operating frequency must not be scaled to match the performance requirement without scaling the voltage. Lower operating frequency increases task completion time and reduces idle time. This prevents DPS or reduces its efficiency (DPS becomes more effective as idle time increases). Unless DPS cannot be applied for other reasons, for a given operating point of DVFS the operating frequency must always be set to the maximum allowed at a given voltage. This ensures optimal process completion time and application of DPS.

If DPS cannot be applied in a given context, scaling the frequency while keeping the voltage constant does not save energy; it does, however, reduce peak power consumption. This can have a positive effect on temperature dissipation and battery life.

SLM must be used when no applications are running and performance requirement drops to 0.

---

**NOTE:** The OPPs shown in [Figure 3-18](#) are only for indication and clarity of text. They do not correspond to validated OPPs of the device.

---

**Figure 3-18. Performance Level and Applied Power-Management Techniques**

### 3.1.2.7.1 DPS Versus SLM

DPS and SLM are similar concepts: they consist of switching the system between high- and low-power consumption modes. However, their operating timescales differ, principally in the latency allowed for mode transitions.

DPS is generally used in an applicative context (tasks are started). Therefore, mode transitions are related to system performance requirements or the processor load. DPS transition latencies must be small (typically between 10  $\mu$ s and 100  $\mu$ s) compared to the time constraints or deadlines of the application so that they do not degrade application performance. DPS requires performance prediction to ensure that transition latencies do not deteriorate device performance to the point that real-time application deadlines are missed or the user experience degrades too much for an interactive application.

SLM is not used in an applicative context (no task started). Mode transitions are related more to system responsiveness, and the transition latencies must be small compared to user sensitivity so that they do not degrade the user experience. For SLM, transition latencies are typically 1–10 ms or more.

DPS and SLM also differ in the type of wake-up event used to exit low-power idle mode. For DPS, wake-up events are application-related (timer, DMA request, peripheral interrupt, etc.); for SLM, wake-up events are user-related (touch screen, key pressed, peripheral connections, etc.).

## 3.2 PRCM Subsystem Overview

### 3.2.1 Introduction

The power-management framework of the device significantly reduces dynamic power consumption and static leakage current. This framework incorporates support for state-of-the-art power-management techniques. It ensures optimal device operation with significantly reduced power consumption. The power-management framework (PMFW) of the device is handled by the PRCM which is a logical module composed of the following three physical submodules:

- PRM: Handles device-level power and reset management. It also handles some clocks in the device. This module always remains on, unless no power is supplied to the device pads.
- CM\_CORE\_AON: Handles device-level clock management of the MPU, DSP1, DSP2, COREAON, CORE, IPU, L4PER, DSS, VPE, L3INIT, CAM, IVAHD, CUSTEFUSE, EVE1, EVE2, RTC and GPU power domains. This module always remains on, unless no power is supplied to the device pads.
- CM\_CORE: Handles device-level clock management of the MMR block.

The device supports the power-management techniques with the following features:

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows any combination of domain ON/OFF states
- Clock tree with selective clock-gating conditions
- Hardware-controlled reset sequencing management
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of the power domains
- Support for hardware-controlled autogating of module clocks
- Memory retention capability for preserving memory contents in low-power sleep mode
- DVFS support for the processor and peripherals

The PMFW interfaces with all the components of the device for power, clock, and reset management through associated control signals. It integrates enhanced features to let the device adapt energy consumption dynamically according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

The power-management modules are fully configurable through their L4 interface ports.

[Figure 3-19](#) is an overview of the power-management modules and their internal connections with a generic power domain.

Figure 3-19. PMFW Overview

prcm-019

**NOTE:** The device I/O logic maps the module signals to the different pads of the device. For more information, see the *Pad Configuration Registers* and sections in [Section 18.1, Control Module](#).

### 3.2.2 Power-Management Framework Features

The power-management modules:

- Manage independent power domains
- Control scalable logic voltage domains and selectable voltage modes for memory voltage domains
- Handle standby, idle, and wake-up procedures for the modules of the device
- Allow software and partial hardware control
- Monitor and handle wake-up events
- Control system clock and reset input sources
- Manage and distribute clocks and resets with high control granularity
- Handle power-up sequences

- Have debug and emulation features
- Control RFFs of device modules to support DPS

### 3.3 PRCM Subsystem Environment

The modules of the PMFW receive the external reset, clock, and power signals. See [Figure 3-19](#).

The following sections describe the interfaces for external clock, reset, and power sources.

#### 3.3.1 External Clock Signals

[Table 3-23](#) lists the external clock pins, signal names, their direction, associated module, and description of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

**Table 3-23. External Clock Signals**

Pin	Signal	I/O <sup>(1)</sup>	PMFW Module	Description
rtc_osc_xi_clk32	RTC_32K_CLK	I	Primary Input to SoC	RTC clock input. Optional external 32k clock
rtc_osc_xo	32K_CTRL	O	Primary Output	External 32k oscillator clock control (optional)
xi_osc0	XI_OSC0	I	Primary Input to SoC	System Oscillator OSC0 Crystal Input. This is the main system clock of the device.
xo_osc0	XO_OSC0	O	Primary Output	System Oscillator OSC0 Crystal output.
xi_osc1	XI_OSC1	I	Primary Input to SoC	Auxiliary Oscillator OSC1 Crystal input .
xo_osc1	XO_OSC1	O	Primary Output	Auxiliary Oscillator OSC1 Crystal output .
clkout1	CLKOUTMUX1_CLK	O	Primary Output	Device Clock output 1. Can be used as a system clock for other devices.
clkout2	CLKOUTMUX2_CLK	O	Primary Output	Device Clock output 2. Can be used as a system clock for other devices.
clkout3	CLKOUTMUX0_CLK	O	Primary Output	Device Clock output 3. Can be used as a system clock for other devices.
xref_clk0	XREF_CLK0	I	Primary Input to SoC	External Reference Clock 0. For Audio and other Peripherals.
xref_clk1	XREF_CLK1	I	Primary Input to SoC	External Reference Clock 1. For Audio and other Peripherals.
xref_clk2	XREF_CLK2	I	Primary Input to SoC	External Reference Clock 2. For Audio and other Peripherals.
xref_clk3	XREF_CLK3	I	Primary Input to SoC	External Reference Clock 3. For Audio and other Peripherals.

<sup>(1)</sup> I = Input; O = Output; I/O = Bidirectional

#### 3.3.2 External Boot Signals

The PRM receives SYSBOOT[15:0] information from external pins sys\_boot[15:0]. They are used to select interfaces or devices for the booting list. For more information, see [Chapter 32, Initialization, Section 32.2.4, Sysboot Configuration](#) .

[Table 3-24](#) lists the external boot pins, signal names, their direction, the associated modules, description, and reset values of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

**Table 3-24. External Boot Signals**

Pin	Signal	I/O <sup>(1)</sup>	PMFW Module	Description	Module Reset Value
sys_boot0	SYSBOOT0	I	PRM	System boot configuration pin 0: Latched at power-on reset (POR)	Z
sys_boot1	SYSBOOT1	I	PRM	System boot configuration pin 1: Latched at POR	Z
sys_boot2	SYSBOOT2	I	PRM	System boot configuration pin 2: Latched at POR	Z

<sup>(1)</sup> I = Input; O = Output; I/O = bidirectional

**Table 3-24. External Boot Signals (continued)**

sys_boot11	SYSBOOT11	I	PRM	System boot configuration pin 11: Latched at POR	Z
sys_boot12	SYSBOOT12	I	PRM	System boot configuration pin12: Latched at POR	Z
sys_boot13	SYSBOOT13	I	PRM	System boot configuration pin 13: Latched at POR	Z
sys_boot14	SYSBOOT14	I	PRM	System boot configuration pin 14: Latched at POR	Z
sys_boot15	SYSBOOT15	I	PRM	System boot configuration pin15: Latched at POR	Z

**NOTE:** For proper device operation, sysboot14 must be tied to vss. For SR1.1, sysboot15 must be tied to vdd, but for SR2.0 it is configurable. For more information, see [Section 18.4.6.1.1.1, Permanent PU/PD disabling \(SR 2.0 only\)](#) in [Chapter 18, Control Module](#).

### 3.3.3 External Reset Signals

The PRM drives the SYS\_WARM\_OUT\_RST reset output signal which is directly mapped as RESETOUT device pin.

The PRM asserts SYS\_WARM\_OUT\_RST output upon the assertion of any source of global reset (warm or cold). SYS\_WARM\_OUT\_RST assertion results in the assertion of device pin RESETOUT. This reset signal keeps external peripherals under reset while the device is under reset.

[Table 3-25](#) lists the external reset pins, signal names, their direction, associated module, and description of the signals. If the signal is input to the device, the module is the destination module for the signal; if the signal is an output from the device, the module is the source module of the signal.

**Table 3-25. External Reset Signals**

Pin	Signal	I/O <sup>(1)</sup>	PMFW Module	Description	Module Reset Value
resetsn	SYS_WARM_IN_RST	I	PRCM	Device Reset Input	Z
rstoutn	SYS_WARM_OUT_RST	O	PRCM	Reset out	Z
porz	SYS_PWRON_RST	I	PRCM	Power on Reset	Z

<sup>(1)</sup> I = Input; O = Output; I/O = bidirectional

### 3.3.4 External Voltage Inputs

Table 3-26 lists the external voltage sources related to the PRCM module.

**NOTE:** Table 3-26 lists only the voltage sources that are directly managed by the PRCM module or received by parts of the PRCM module (for example, DPLLs, LDOs, etc.). It does not give the device voltage sources not directly associated with the PRCM module.

### 3.4 PRCM Subsystem Integration

The internal configuration registers of the power-management modules can be accessed for configuration and control through their respective L4\_WKUP interconnect. In addition to the L4 interconnect, the internal module interface contains the following interfaces and signals:

- A set of signals for idle/wake-up control for each module
- Clocks and reset signals for the modules
- Power control signals (switches and memories) to the power domains
- Interrupts to the MPU, IPU, and DSP INTCs
- Phase-locked loop (PLL) control commands for recalibration and bypass of the digital phase-locked loops (DPLLs)

Figure 3-19 shows details of the control interface to a generic power domain.

#### 3.4.1 Device Power-Management Layout

The PMFW sees the device split into voltage domains, power domains, and clock domains. Table 3-27 provides the device-level view with module association to the clock, power, and voltage domains.

### 3.4.2 Power-Management Scheme, Reset, and Interrupt Requests

#### 3.4.2.1 Power Domain

Table 3-28 lists the PMFW modules and their associated power domains.

**Table 3-28. PMFW Module Power Domains**

PMFW Module	Power Domain
PRM	PD_WKUPAON
CM_CORE_AON	PD_COREAON
CM_CORE	PD_CORE

The PRM part of the PRCM module is in the PD\_WKUPAON power domain, which is continuously active. It is composed of the logic that must be permanently supplied to manage domain power-state transitions and detect wake-up events.

The CM\_CORE\_AON part of the PRCM module is in the PD\_COREAON power domain, which is an always-on power domain, while the CM\_CORE part of the PRCM module is in the PD\_CORE power domain, which can be activated and deactivated according to the requirements of the executing applications.

#### 3.4.2.2 Resets

The PMFW modules are reset by independent reset signals (see Table 3-29).

**Table 3-29. PMFW Module Reset Signals**

PMFW Module	Reset Signal
PRM	SYS_PWRON_RST_IN
CM_CORE_AON	CM_CORE_AON_PWRON_RST

CM_CORE	CM_CORE_PWRON_RET_RST
	CM_CORE_RET_RST

---

**NOTE:** For more information about the reset trigger sources and assertion conditions, see Section 3.5.3, *Reset Sources*.

---

#### 3.4.2.3 PRCM Interrupt Requests

The PMFW modules can generate the interrupts listed in Table 3-30.

**Table 3-30. PMFW Hardware Requests**

Interrupt Requests				
Module Instance	Source Signal Name	Destination IRQ_CROSSBAR Input	Default Mapping	Description
PRM	PRM_IRQ_MPU	IRQ_CROSSBAR_6	MPU_IRQ_11 DSP1_IRQ_37 DSP2_IRQ_37	PRM MPU interrupt request
	PRM_IRQ_IPU1	IRQ_CROSSBAR_133	IPU1_IRQ_47 IPU2_IRQ_47	PRM IPU1 interrupt request
	PRM_IRQ_IPU2	IRQ_CROSSBAR_386	-	This IRQ source signal is not mapped by default to any device INTC.

**NOTE:** The “**Default Mapping**” column in [Table 3-30 PMFW Hardware Requests](#) shows the default mapping of module IRQ source signals. These module IRQ source signals can also be mapped to other lines of each device Interrupt controller through the IRQ\_CROSSBAR module, respectively.  
 For more information about the IRQ\_CROSSBAR module, see [Section 18.4.6.4, IRQ\\_CROSSBAR Module Functional Description](#), in [Chapter 18, Control Module](#).  
 For more information about the device interrupt controllers, see [Chapter 17, Interrupt Controllers](#).

## 3.5 Reset Management Functional Description

### 3.5.1 Overview

In the device, the reset scheme is managed by the PRM, device-level reset manager.

#### 3.5.1.1 PRCM Reset Management Functional Description

The PRM handles the device power-on and warm reset pads: porz, resetn, and rstoutn. The PRM:

- Extends the reset duration beyond the porz pad release
- Provides the reset duration period after the resetn pad assertion
- Routes the device pad resets

The PRM is functionally sensitive to the device POR.

##### 3.5.1.1.1 Power-On Reset

The PRM receives the device POR on the porz reset pad of the device. It extends the duration of the POR module until at least stable 32-kHz clock and SYS\_CLK1 are provided to it. The 32-kHz clock and SYS\_CLK1 of the device are propagated once the PRCM releases the internal POR.

##### 3.5.1.1.2 Warm Reset

The device warm reset can be received from an external source or the device PRM module as a result of an internal event.

The PRCM can generate the global reset used by the domain Reset Managers from these warm reset input sources:

- SYS\_WARM\_IN\_RST
- MPU\_WDT\_RST
- GLOBAL\_SW\_WARM\_RST

#### 3.5.1.2 PRM Reset Management Functional Description

The PRM module manages the resets to all power domains inside the device.

---

**NOTE:** The PRM module has no knowledge or control over resets generated locally within a module (for example, through the <Module name>\_SYSCONFIG[x] SOFTRESET configuration register bit). A software reset has the same effect on the module logic as a hardware reset.

---

All PRM reset outputs are asynchronously asserted, while the deassertion is synchronous to the SYS\_CLK1 clock. The reset managers in PRM use this clock to stall, or delay, deassertion of reset upon source deactivation.

In each power domain one or more reset domains are defined by a unique reset signal that originates from the reset manager and is connected to one or more modules of the device. All the connected modules of the reset domain are reset simultaneously when the reset signal is asserted. Independent control of these reset domains allows sequencing of the release of resets and ensures a safe reset of the entire power domain.

### 3.5.2 General Characteristics of Reset Signals

Reset signals can be categorized based on four criteria:

- Scope: Global or local reset
- Occurrence: Cold or warm reset
- Source type: Software-controlled or hardware-triggered reset
- Retention type: Retention reset or nonretention reset

### 3.5.2.1 Scope

A reset signal can be categorized according to its scope (the area of the device affected by the reset):

- Global reset: Affects the entire logic of the device; all modules are reset. Generally, occurs when the device powers up (POR) or an abnormal operation is detected (watchdog timeout, thermal shutdown, etc.)
- Local reset: Affects one power domain, reset domain, or module.

### 3.5.2.2 Occurrence

A reset signal can be categorized depending on when the reset occurs:

- Cold reset: Occurs on device power up (POR), or in certain emulation modes. Also, it can be software-initiated. Upon cold reset, it is assumed the device is being powered up, and therefore, everything in the device is being reset. That is, cold resets must be considered as global resets.
- Warm reset: Warm reset types are not necessarily applied globally within device. Also, a module can use a warm reset to reset a subset of its logic. This is often done to speed up reset recovery time; that is, the time to transition to a safe operating state, compared to the time required upon receipt of a cold reset. Warm reset events include software-triggered reset per power domain, watchdog time-out, externally triggered and emulation initiated.

Modules that behave differently in cold reset and warm reset have two reset signals: RST and PWRON\_RST. These reset signals reconstruct warm reset and cold reset in modules that require them.

The following modules are reset upon global cold reset events and not upon global warm reset events:

- All DPLLs associated with the PRCM module
- EMIF
- Control module: CTRL\_MODULE\_CORE, CTRL\_MODULE\_WKUP

---

**NOTE:** The DPLLs state will change after warm reset even though they are not warm reset-sensitive, refer to [Section 3.5.6.18](#), *Global Warm Reset Sequence* for more details.

---

---

**NOTE:** For information about the PRCM module registers affected by the global warm reset, see the register description in [Section 3.12](#), *PRCM Register Manual*.

---

### 3.5.2.3 Source Type

A reset can be categorized depending on whether it is software-controlled or hardware-triggered:

- Software reset: Triggered by setting a bit in a configuration register of the PRCM module
- Hardware reset: Triggered by a signal from a hardware module inside or outside the PRCM module

### 3.5.2.4 Retention Type

The power domain manager in PRM controls the assertion of two types of local cold reset sources, retention and nonretention reset. They are identified by the naming convention <PowerDomain>\_DOM\_RET\_RST and <PowerDomain>\_DOM\_RST, respectively.

Upon transitioning a power domain to the ON-ACTIVE power state from the OFF power state:

- Retention type reset source is always asserted.
- Nonretention type reset source is always asserted.

Upon transitioning a power domain to the ON-ACTIVE power state from the RETENTION power state:

- Retention type reset source is never asserted.
- Nonretention type reset source is optionally asserted. The software-selectable option enables the PRM to support CSWRET mechanism. Nonretention type reset source has the following behavior:
  - It is not asserted if the power domain state transitions from the CSWR-RETENTION state.

### 3.5.3 Reset Sources

The reset sources triggering the reset managers in the PRM are described in this section.

#### 3.5.3.1 Global Reset Sources

Table 3-31 lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all the device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the bit triggering the reset is identified.

**Table 3-31. Global Reset Sources**

Type <sup>(1)</sup>	Name	Source/Control	Description
H/C	SYS_PWRON_RST	porz input pin	The entire device is held in reset during porz pin assertion. porz pin is typically asserted by external PMIC at POR. PMIC keeps porz asserted until all voltage rails are ramped-up and stable. PRM extends device internal reset after porz release. Refer to Power Supply Sequences in Device Data Manual.
H/W	SYS_WARMIN_RST	resetn input pin	Warm reset from external device. Internal warm reset is triggered by the active (falling) edge of this signal and is extended with RstTime1.
S/C	GLOBAL_COLD_SW_RST	PRM_RSTCTRL[1] RST_GLOBAL_COLD_SW	Global software cold reset
S/W	GLOBAL_WARM_SW_RST	PRM_RSTCTRL[0] RST_GLOBAL_WARM_SW	Global software warm reset
H/W	TSHUT_MPU_RST	MPU voltage domain thermal sensor	Asserted when measured temperature is greater than shutdown temperature threshold
H/W	TSHUT_IVA_RST	IVAHD voltage domain thermal sensor	
H/W	TSHUT_CORE_RST	Device thermal sensor, placed close to the ISS, DSP, and IVA	
H/W	TSHUT_DSPEVE_RST	DSPEVE voltage domain thermal sensor	
H/W	TSHUT_GPU_RST	GPU voltage domain thermal sensor	
H/W	ICEPICK_RST	ICEPick™ module	ICEPick warm reset. It is used only in emulation mode.
H/C	ICEPICK_POR_RST	ICEPick module	ICEPick cold reset. It is used only in emulation mode.
H/W	MPU_WDT_RST	WD_TIMER2 or MPU subsystem WDT	It is triggered by a time-out event.

<sup>(1)</sup> H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

#### 3.5.3.2 Local Reset Sources

In addition to the global reset sources the device can have a number of local reset sources for each power domain. The local reset sources can be cold or warm reset sources. They can be software-controlled or hardware-triggered. Table 3-32 identifies the possible types of hardware-triggered local cold reset sources. Some power domains can support one or both of these local cold reset sources. The table does not list the software-triggered local warm reset sources that are listed in the reset management section of the respective power domains. A local reset source signal received by the reset manager resets only a specific part of the device (for example, some modules/subsystems within the power domain).

**Table 3-32. Local Reset Sources**

Type <sup>(1)</sup>	Name	Source/Control	Description
H/C	<Power domain>_RET_RST	PRCM	Asserted only for a power domain state transition from OFF to ON-ACTIVE state
H/C	<Power domain>_RST	PRCM	Asserted for any power domain transition from OFF to ON-ACTIVE state

<sup>(1)</sup> H = Hardware reset, C = Cold reset

### 3.5.4 Reset Logging

The reset status registers RM\_<power domain>\_RSTST and PRM\_RSTST are reset asynchronously on assertion of a global cold reset. However, a reset status bit is always logged when the reset is released to the domain.

For this reason, after the assertion of a global cold reset, the reset status register is cleared to 0. When the domain reset is released, the register bit to log the global cold reset (the PRM\_RSTST[0] GLOBAL\_COLD\_RST bit) is updated to 1. For the same reason, the reset status register of domains released from reset by software is updated only when software releases the domain reset.

The assertion of a global cold reset prevents logging any other source of reset until after the release of the domain reset. This is valid in the following situations:

- A source of reset other than global cold reset is asserted before, during, or after the active period of a global cold source of reset and before the release of the domain reset signal.
- A source of reset other than global cold reset is asserted and then released, but a global cold reset source is asserted before the release of the domain reset signal.

### 3.5.5 Reset Domains

A power domain can receive power-on reset (PWRON\_RST) and/or normal reset (RST) signals. These signals reset nonretention logic and behave as follows:

- On any global or local cold reset, RST and PWRON\_RST are asserted.
- On any global or local warm reset, only RST is asserted.
- On wakeup from OFF, PWRON\_RST is asserted.

A power domain can receive two additional retention logic reset signals: power-on retention reset (PWRON\_RET\_RST) and/or retention reset (RET\_RST). These signals behave as follows:

- On any global cold reset, RET\_RST and PWRON\_RET\_RST are asserted.
- On any global cold reset or wakeup from an off (no power supply) state to the ON-ACTIVE state, RET\_RST and PWRON\_RET\_RST are asserted.
- On any global warm reset, only RET\_RST is asserted.

This section discusses the trigger sources and attributes for all reset domains of the device. For an explanation of each reset trigger source of the device, see [Section 3.5.3, Reset Sources](#).

[Table 3-33](#) identifies the associated power and rest domains for each module.

**NOTE:** The DPLLs state will change after warm reset even though their registers are not warm reset-sensitive, refer to [Section 3.5.6.18, Global Warm Reset Sequence](#) for more details.

### 3.5.6 Reset Sequences

#### 3.5.6.1 MPU Subsystem Power-On Reset Sequence

Figure 3-20 shows the POR sequence of the MPU subsystem.

**Figure 3-20. MPU Power-On Reset Sequence**

prcm-022

The assumptions after power-on reset assertion are:

- The PRCM module provides the DPLL\_MPU reference clock and the bypass clock.
- The PRCM module has released DPLL\_MPU reset and DPLL\_MPU is in bypass mode providing the clock (that is, bypass clock) to all the modules in the MPU subsystem.

The POR sequence is:

1. The PRCM module releases asynchronously in PD\_MPUAON the MPUAON\_RST reset to the INTC\_MPU module in the MPU subsystem.
2. The PRCM module releases in PD\_MPU the MPU\_PWRON\_RST (only after MPU\_DPLL\_CLK is active) to the MPU subsystem and waits until the subsystem completes its internal reset sequence. MA\_MPU (Memory-adapter) dedicated reset signals (MPU\_MA\_RST, MPU\_MA\_RET\_RST, and MPU\_MA\_PWRON\_RET\_RST) are released when MPU\_DPLL\_CLK is running (at the same time as MPU\_PWRON\_RST). When PRCM receive active MPU\_RSTDONE signal from MPU, it de-asserts MPU\_RST.
3. When the MPU subsystem internal reset sequence completes, the PRCM module releases in PD\_MPU the MPU\_RST signal and the MPU starts booting.
4. The PRCM module drives the MPU\_L2RSTDISABLE signal low a minimum of 32 SYS\_CLK cycles after MPU\_RST is deasserted. The PRCM module keeps the MPU\_L2RSTDISABLE signal low until the next power domain transition.

**NOTE:**

- The reset to the L2 cache memory (MPU\_L2RSTDISABLE) in the MPU subsystem is asserted during initial POR (that is, when the PD\_MPU wakes up from OFF state). It is also asserted during local or global warm reset. However, it is not asserted when the PD\_MPU wakes up from RETENTION state (that is, when the logic is OFF and L2 memory is in RETENTION state). This ensures that the L2 cache is retained on wakeup.
- The L1 cache memory in the MPU subsystem is not retained on PD\_MPU wakeup.

**3.5.6.2 MPU Subsystem Warm Reset Sequence**

Figure 3-21 shows the warm reset sequence of the MPU subsystem.

Figure 3-21. MPU Warm Reset Sequence

prcm-023

The assumptions are:

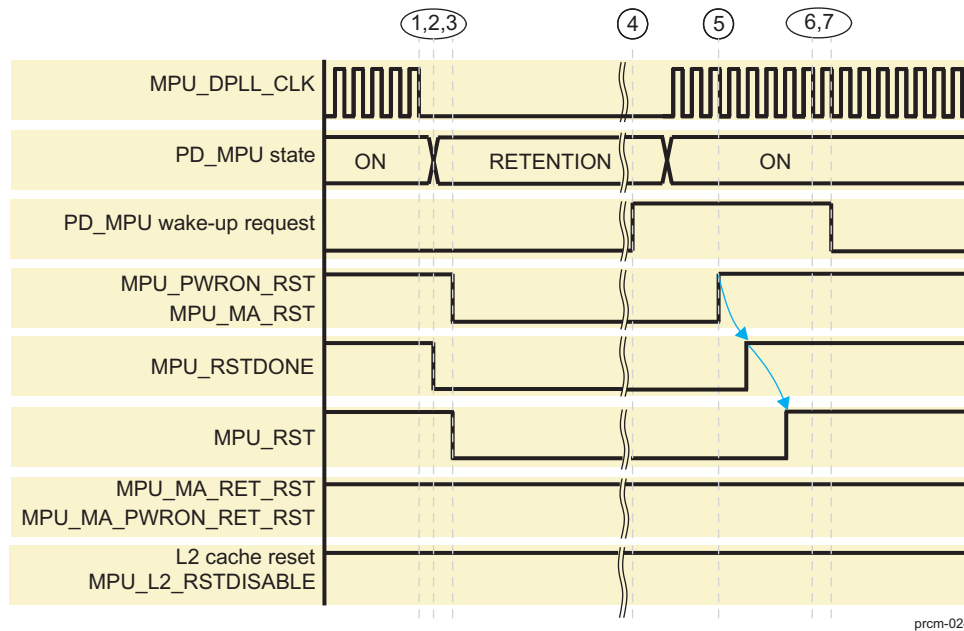

- The DPLL\_MPU is locked and is providing the clock to the MPU subsystem.
- A global warm reset to the MPU subsystem is asserted.

The warm reset sequence is:

1. The PRCM module asserts in PD\_MPUAON the MPUAON\_RST reset to the INTC\_MPU module in the MPU subsystem. The MPU DPLL is locked.
2. The PRCM module asserts in PD\_MPU the MPU\_RST reset to the MPU subsystem and also asserts MPU\_MA\_RST and MPU\_MA\_RET\_RST resets to the MA\_MPU module.
3. The PRCM module resets the L2 cache memory in the MPU subsystem by asserting its reset.
4. The PRCM module releases the MPUAON\_RST reset to the INTC\_MPU module. The MPU DPLL is in bypass mode.
5. The PRCM module releases MPU\_RST, MPU\_MA\_RST, and MPU\_MA\_RET\_RST only after DPLL\_MPU is in bypass mode and MPU\_DPLL\_CLK is stable and active.
6. The PRCM module drives the MPU\_L2RSTDISABLE signal low a minimum of 32 SYS\_CLK cycles after MPU\_RST is deasserted. The PRCM keeps the MPU\_L2RSTDISABLE signal low until the next power domain transition.

### 3.5.6.3 MPU Subsystem Reset Sequence on Sleep and Wake-Up Transitions From RETENTION State

Figure 3-21 shows the sleep and wake-up transitions reset sequence from the RETENTION state of the MPU subsystem.

**Figure 3-22. MPU Reset Sequence on Sleep and Wake-Up Transition**

The assumption is:

- The DPLL\_MPU is locked and is providing the clock to the MPU subsystem.

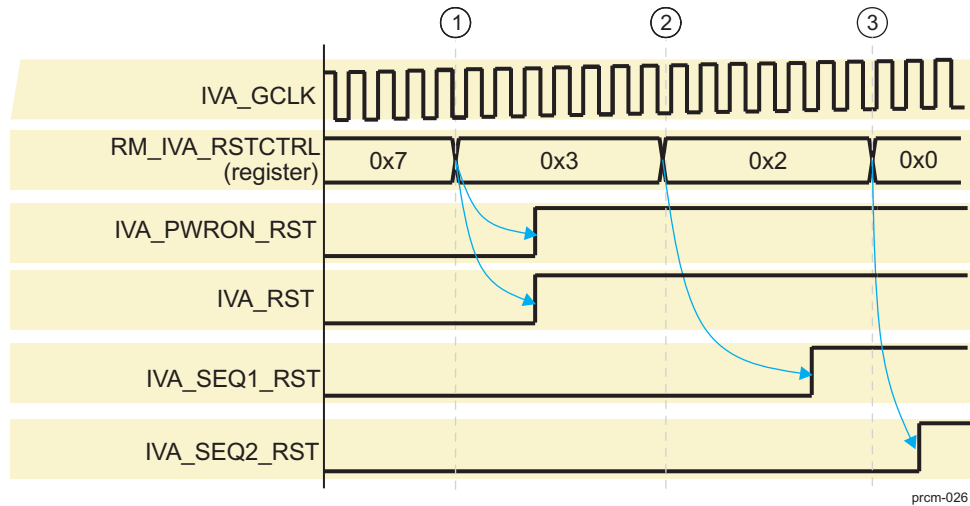

The sleep and wake-up transitions reset sequence is:

1. The PRCM module gates MPU\_DPLL\_CLK to the MPU subsystem.
2. The PRCM module switches PD\_MPU to OSWR state.
3. The PRCM module asserts MPU\_PWRON\_RST and MPU\_RST resets to the MPU subsystem, and asserts MPU\_MA\_RST to the MA\_MPU module. The entire logic in the PD\_MPU is held in reset. The reset to the L2 cache memory in the MPU subsystem is not asserted if the logic in PD\_MPU is held in reset.
4. The PRCM module resets the L2 cache memory in the MPU subsystem by asserting its reset.
5. The PRCM module releases MPU\_RST when the MPU\_DPLL\_CLK is stable and active. The PRCM deasserts the MPU\_PWRON\_RST, MPU\_MA\_RST. When PRCM receives active MPU\_RSTDONE signal from MPU, it de-asserts MPU\_RST.
6. During the wakeup from RET state, the MPU\_L2RSTDISABLE signal must be maintained at active high so the L2 cache will not be reset when the MPU is reset.

#### 3.5.6.4 IVA Subsystem Power-On Reset Sequence

Figure 3-23 shows the power-on reset sequence of the IVA subsystem.

Figure 3-23. IVA Power-On Reset Sequence

The power-on reset to IVA is applied when PD\_IVA is powered. The assumptions after power-on reset assertion are:

- The PRCM module provides the IVA\_GCLK functional clock to the IVA subsystem, and it has been enabled by MPU software control.

The power-on reset sequence is:

1. Software clears the [RM\\_IVA\\_RSTCTRL\[2\]](#) RST\_LOGIC bit. This causes the PRCM module to release the IVA\_PWRON\_RST reset used inside IVA mainly to reset the emulation logic and the IVA\_RST reset used to reset all logic inside IVA. Then software can download data into TCM memory while keeping the sequencer CPUs under reset.
2. When the TCM memory is initialized, software clears the [RM\\_IVA\\_RSTCTRL\[0\]](#) RST\_SEQ1 bit. This releases IVA\_SEQ1\_RST reset to the Sequencer1 CPU.
3. Similarly, software can clear the [RM\\_IVA\\_RSTCTRL\[1\]](#) RST\_SEQ2 bit. This releases IVA\_SEQ2\_RST reset to the Sequencer2 CPU.

### 3.5.6.5 IVA Subsystem Software Warm Reset Sequence

Figure 3-24 shows the software warm reset sequence of the IVA subsystem.

Figure 3-24. IVA Software Warm Reset Sequence

Before asserting the software reset to the IVA subsystem the MPU software must ensure that:

- IVA sequencer CPUs are in IDLE state ([CM\\_IVA\\_IVA\\_CLKCTRL\[17:16\]](#) IDLEST).
- The IVA subsystem is in STANDBY state ([CM\\_IVA\\_IVA\\_CLKCTRL\[18\]](#) STBYST).
- The functional clock to the IVA subsystem has been gated by the PRCM module ([CM\\_IVA\\_CLKSTCTRL\[8\]](#) CLKACTIVITY\_IVA\_GCLK).

The software reset sequence is:

1. The MPU software sets the [RM\\_IVA\\_RSTCTRL\[2\]](#) RST\_LOGIC, [RM\\_IVA\\_RSTCTRL\[1\]](#) RST\_SEQ2, and [RM\\_IVA\\_RSTCTRL\[0\]](#) RST\_SEQ1 bits. This causes the PRCM module to assert the IVA\_RST, IVA\_SEQ1\_RST, and IVA\_SEQ2\_RST resets to the IVA subsystem. The IVA\_PWRON\_RST remains deasserted.
2. The MPU software enables the functional clock to the IVA subsystem.
3. The MPU software clears the [RM\\_IVA\\_RSTCTRL\[2\]](#) RST\_LOGIC and [RM\\_IVA\\_RSTCTRL\[0\]](#) RST\_SEQ1 bits. This causes the PRCM module to release the IVA\_RST and IVA\_SEQ1\_RST resets to the IVA subsystem.
4. The MPU software clears the [RM\\_IVA\\_RSTCTRL\[1\]](#) RST\_SEQ2 bit. This releases the IVA\_SEQ2\_RST reset to the Sequencer2 CPU.

### 3.5.6.6 DSP1 Subsystem Power-On Reset Sequence

Figure 3-25 shows the power-on reset sequence of the DSP1 subsystem.

**Figure 3-25. DSP1 Subsystem Power-On Reset Sequence**

The power-on reset to DSP1 is applied when PD\_DSP1 is powered. The assumptions after power-on reset assertion are:

- PD\_DSP1 is on.
- The PRCM module provides DSP1\_GCLK functional clock to the DSP subsystem, and it has been enabled by MPU software control.

The Power-On Reset sequence is:

1. Software clears the [RM\\_DSP1\\_RSTCTRL\[1\]](#) RST\_DSP1 bit. This causes the PRCM module to release the DSP1\_PWRON\_RST used inside DSP1 mainly to reset the emulation logic and the DSP1\_RST used to reset all logic inside DSP1. Then software can download data into TCM memory while keeping the CPU under reset.
2. When the memory is initialized, software clears the [RM\\_DSP1\\_RSTCTRL\[0\]](#) RST\_DSP1\_LRST bit. This release DSP1\_LRST to the local CPU inside DSP subsystem.

### 3.5.6.7 DSP1 Subsystem Software Warm Reset Sequence

Figure 3-26 shows the software warm reset sequence of the DSP1 subsystem.

**Figure 3-26. DSP1 Subsystem Software Warm Reset Sequence**

prcm-028

Before asserting the software reset to the DSP subsystem, the MPU software must ensure that:

- The DSP CPUs are in IDLE state ([CM\\_DSP1\\_DSP1\\_CLKCTRL\[17:16\] IDLEST](#)).
- The DSP subsystem is in STANDBY state ([CM\\_DSP1\\_DSP1\\_CLKCTRL\[18\] STBYST](#)).
- The functional clock to the DSP subsystem has been gated by the PRCM module ([CM\\_DSP1\\_CLKSTCTRL\[8\] CLKACTIVITY\\_DSP1\\_GFCLK](#))

The software reset sequence is:

1. MPU software sets the [RM\\_DSP1\\_RSTCTRL\[1\] RST\\_DSP1](#) = 0 and [RM\\_DSP1\\_RSTCTRL\[0\] RST\\_DSP1\\_LRST](#) = 1. This causes the PRCM module to assert DSP1\_RST, DSP1\_LRST to the DSP subsystem. The DSP1\_PWRON\_RST remains deasserted.
2. The MPU software enables the functional clock to the DSP subsystem.
3. The MPU software clears the [RM\\_DSP1\\_RSTCTRL\[1\] RST\\_DSP1](#) and [RM\\_DSP1\\_RSTCTRL\[0\] RST\\_DSP1\\_LRST](#) bits. This causes the PRCM module to release DSP1\_RST and DSP1\_LRST to the DSP subsystem.

### 3.5.6.8 DSP2 Subsystem Power-On Reset Sequence

Figure 3-27 shows the power-on reset sequence of the DSP2 subsystem.

**Figure 3-27. DSP2 Subsystem Power-On Reset Sequence**

prcm-025a

The power-on reset to DSP2 is applied when PD\_DSP2 is powered. The assumptions after power-on reset assertion are:

- PD\_DSP2 is on.
- The PRCM module provides DSP2\_GCLK functional clock to the DSP subsystem, and it has been

enabled by MPU software control.

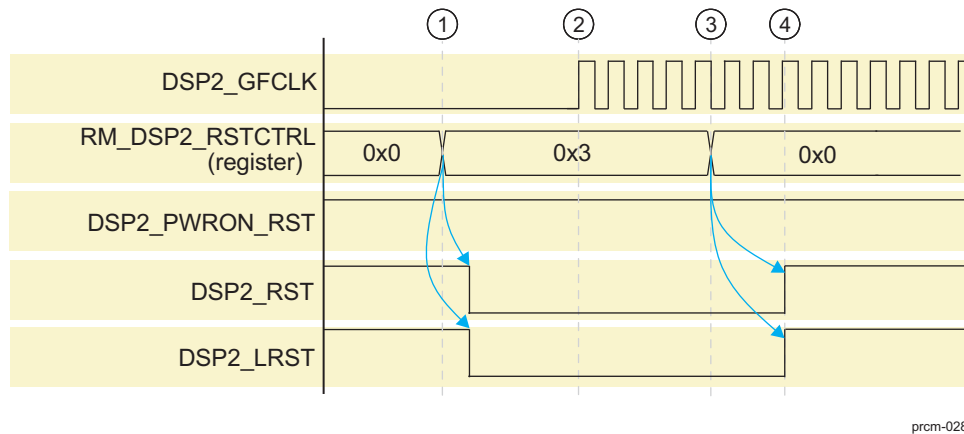

The Power-On Reset sequence is:

1. Software clears the [RM\\_DSP2\\_RSTCTRL\[1\]](#) RST\_DSP2 bit. This causes the PRCM module to release the DSP2\_PWRON\_RST used inside DSP2 mainly to reset the emulation logic and the DSP2\_RST used to reset all logic inside DSP2. Then software can download data into TCM memory while keeping the CPU under reset.
2. When the memory is initialized, software clears the [RM\\_DSP2\\_RSTCTRL\[0\]](#) RST\_DSP2\_LRST bit. This release DSP2\_LRST to the local CPU inside DSP subsystem.

### 3.5.6.9 DSP2 Subsystem Software Warm Reset Sequence

Figure 3-26 shows the software warm reset sequence of the DSP2 subsystem.

**Figure 3-28. DSP2 Subsystem Software Warm Reset Sequence**

prcm-028a

Before asserting the software reset to the DSP subsystem, the MPU software must ensure that:

- The DSP CPUs are in IDLE state ([CM\\_DSP2\\_DSP2\\_CLKCTRL\[17:16\]](#) IDLEST).
- The DSP subsystem is in STANDBY state ([CM\\_DSP2\\_DSP2\\_CLKCTRL\[18\]](#) STBYST).
- The functional clock to the DSP subsystem has been gated by the PRCM module ([CM\\_DSP2\\_CLKSTCTRL\[8\]](#) CLKACTIVITY\_DSP2\_GFCLK)

The software reset sequence is:

1. MPU software sets the [RM\\_DSP2\\_RSTCTRL\[1\]](#) RST\_DSP2 = 0 and [RM\\_DSP2\\_RSTCTRL\[0\]](#) RST\_DSP2\_LRST = 1. This causes the PRCM module to assert DSP2\_RST, DSP2\_LRST to the DSP subsystem. The DSP2\_PWRON\_RST remains deasserted.
2. The MPU software enables the functional clock to the DSP subsystem.
3. The MPU software clears the [RM\\_DSP2\\_RSTCTRL\[1\]](#) RST\_DSP2 and [RM\\_DSP2\\_RSTCTRL\[0\]](#) RST\_DSP2\_LRST bits. This causes the PRCM module to release DSP2\_RST and DSP2\_LRST to the DSP subsystem.

### 3.5.6.10 IPU1 Subsystem Power-On Reset Sequence

Figure 3-29 shows the power-on reset sequence of the IPU1 subsystem.

Figure 3-29. IPU1 Power-On Reset Sequence

The assumptions on power-on reset assertion are:

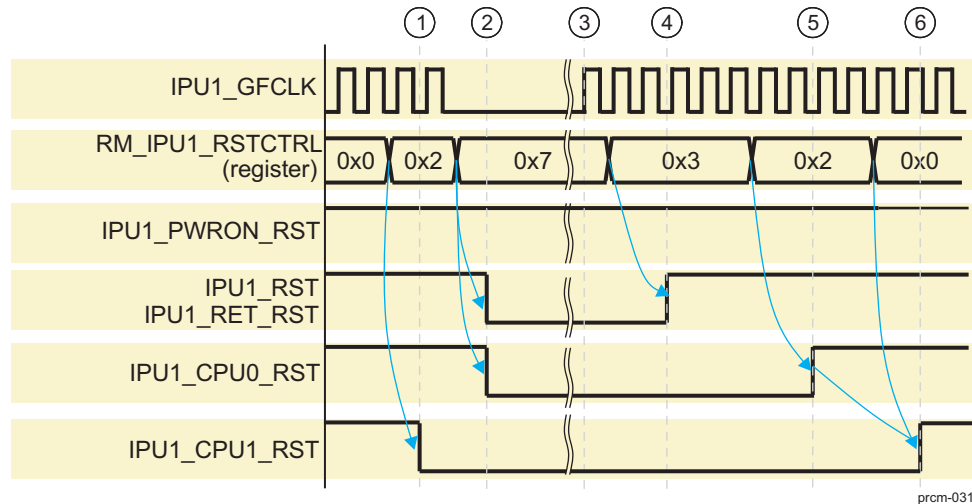

- The IPU subsystem is held in reset by the PRCM module and the following are asserted:
  - IPU1\_PWRON\_RST
  - IPU1\_RET\_RST
  - IPU1\_CPU0\_RST
  - IPU1\_CPU1\_RST
  - IPU1\_RST

The power-on reset sequence is:

1. Software clears the [RM\\_IPU1\\_RSTCTRL\[2\]](#) RST\_IPU bit in the PRCM module register to release the IPU shared cache and CACHE\_MMU\_IPU from reset.
2. The PRCM module releases IPU1\_PWRON\_RST once the reset manager counter ([PRM\\_RSTTIME\[14:10\]](#) RSTTIME2) reaches its limit and the IPU1\_GFCLK is running. Upon deassertion of the POR signal, the IPU subsystem starts the CPU and CACHE\_MMU\_IPU initialization sequence.
3. When the reset sequence of Step 2 completes and the reset manager counter ([PRM\\_RSTTIME\[14:10\]](#) RSTTIME2) expires, the PRCM module releases the IPU1\_RST and IPU1\_RET\_RST signals.
4. MPU software must configure CACHE\_MMU\_IPU once CACHE\_MMU\_IPU is out of reset. After CACHE\_MMU\_IPU configuration and cache initialization is done, MPU software clears the [RM\\_IPU1\\_RSTCTRL\[0\]](#) RST\_CPU0 bit in the PRCM module register.
5. The PRCM module releases IPU\_CPU0\_RST, which causes IPU\_C0 to start booting.
6. MPU software can clear the [RM\\_IPU1\\_RSTCTRL\[1\]](#) RST\_CPU1 bit in the PRCM module register so that the PRCM module releases the IPU\_CPU1\_RST to IPU\_C1.

### 3.5.6.11 IPU1 Subsystem Software Warm Reset Sequence

Figure 3-30 shows the software warm reset sequence of the IPU1 subsystem.

**Figure 3-30. IPU1 Subsystem Software Warm Reset Sequence**

For doing the software reset of IPU1, the MPU software must ensure that IPU CPUs (IPU1\_C0 and IPU1\_C1) are in IDLE state and clock is gated

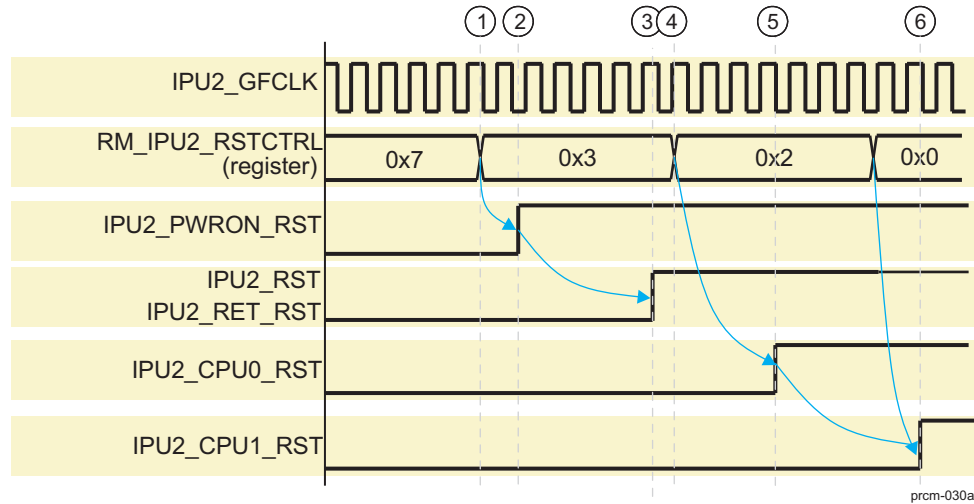

The software warm reset sequence is:

1. When IPU1\_C1 is in IDLE state, IPU1\_C0 software or MPU software sets the [RM\\_IPU1\\_RSTCTRL\[1\]](#) RST\_CPU1 bit. The PRCM module asserts the IPU1\_CPU1\_RST reset signal to IPU1\_C1.
2. When IPU1\_C0 is in IDLE state, the MPU software sets the [RM\\_IPU1\\_RSTCTRL\[2\]](#) RST\_IPU and [RM\\_IPU1\\_RSTCTRL\[0\]](#) RST\_CPU0 bits.
3. The PRCM module asserts the IPU1\_RST, IPU1\_RET\_RST, and IPU1\_CPU0\_RST reset signals. The IPU1\_PWRON\_RST remains deasserted in this case.
4. The MPU software reenables the IPU1\_GFCLK and the initialization sequence starts inside the IPU subsystem. Software clears the [RM\\_IPU1\\_RSTCTRL\[2\]](#) RST\_IPU bit and [RM\\_IPU1\\_RSTCTRL\[0\]](#) RST\_CPU0 bit in the PRCM module register.
5. When the reset sequence of Step 4 completes and the reset manager counter ([PRM\\_RSTTIME\[14:10\]](#) RSTTIME2) expires, the PRCM module releases the IPU1\_RST, IPU1\_RET\_RST, and IPU1\_CPU0\_RST reset signals. IPU1\_C0 starts rebooting.
6. Software can then clear the [RM\\_IPU1\\_RSTCTRL\[1\]](#) RST\_CPU1 bit in the PRCM module register. The PRCM module releases the IPU1\_CPU1\_RST reset signal to IPU1\_C1 to start booting.

### 3.5.6.12 IPU2 Subsystem Power-On Reset Sequence

[Figure 3-31](#) shows the power-on reset sequence of the IPU2 subsystem.

Figure 3-31. IPU2 Power-On Reset Sequence

The assumptions on power-on reset assertion are:

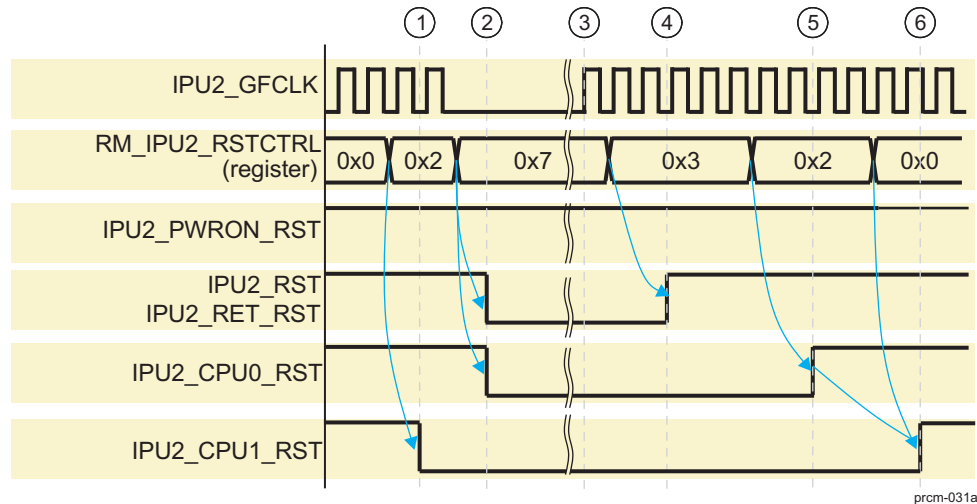

- The IPU subsystem is held in reset by the PRCM module and the following are asserted:
  - IPU2\_PWRON\_RST
  - IPU2\_RET\_RST
  - IPU2\_CPU0\_RST
  - IPU2\_CPU1\_RST
  - IPU2\_RST

The power-on reset sequence is:

1. Software clears the [RM\\_IPU2\\_RSTCTRL\[2\]](#) RST\_IPU bit in the PRCM module register to release the IPU shared cache and CACHE\_MMU\_IPU from reset.
2. The PRCM module releases IPU2\_PWRON\_RST once the reset manager counter ([PRM\\_RSTTIME\[14:10\]](#) RSTTIME2) reaches its limit and the IPU2\_GFCLK is running. Upon deassertion of the POR signal, the IPU subsystem starts the CPU and CACHE\_MMU\_IPU initialization sequence.
3. When the reset sequence of Step 2 completes and the reset manager counter ([PRM\\_RSTTIME\[14:10\]](#) RSTTIME2) expires, the PRCM module releases the IPU\_MMU\_CACHE\_RST and IPU2\_RET\_RST signals.
4. MPU software must configure CACHE\_MMU\_IPU once CACHE\_MMU\_IPU is out of reset. After CACHE\_MMU\_IPU configuration and cache initialization is done, MPU software clears the [RM\\_IPU2\\_RSTCTRL\[0\]](#) RST\_CPU0 bit in the PRCM module register.
5. The PRCM module releases IPU2\_CPU0\_RST, which causes IPU\_C0 to start booting.
6. MPU software can clear the [RM\\_IPU2\\_RSTCTRL\[1\]](#) RST\_CPU1 bit in the PRCM module register so that the PRCM module releases the IPU2\_CPU1\_RST to IPU\_C1.

### 3.5.6.13 IPU2 Subsystem Software Warm Reset Sequence

Figure 3-32 shows the software warm reset sequence of the IPU2 subsystem.

**Figure 3-32. IPU2 Subsystem Software Warm Reset Sequence**

For doing the software reset of IPU2, the MPU software must ensure that IPU CPUs (IPU2\_C0 and IPU2\_C1) are in IDLE state and clock is gated

The software warm reset sequence is:

1. When IPU2\_C1 is in IDLE state, IPU2\_C0 software or MPU software sets the [RM\\_IPU2\\_RSTCTRL\[1\]](#) RST\_CPU1 bit. The PRCM module asserts the IPU2\_CPU1\_RST reset signal to IPU2\_C1.
2. When IPU2\_C0 is in IDLE state, the MPU software sets the [RM\\_IPU2\\_RSTCTRL\[2\]](#) RST\_IPU and [RM\\_IPU2\\_RSTCTRL\[0\]](#) RST\_CPU0 bits.
3. The PRCM module asserts the IPU2\_RST, IPU2\_RET\_RST, and IPU2\_CPU0\_RST reset signals. The IPU2\_PWRON\_RST remains deasserted in this case.
4. The MPU software reenables the IPU2\_GFCLK and the initialization sequence starts inside the IPU subsystem. Software clears the [RM\\_IPU2\\_RSTCTRL\[2\]](#) RST\_IPU bit and [RM\\_IPU2\\_RSTCTRL\[0\]](#) RST\_CPU0 bit in the PRCM module register.
5. When the reset sequence of Step 4 completes and the reset manager counter ([PRM\\_RSTTIME\[14:10\]](#) RSTTIME2) expires, the PRCM module releases the IPU2\_RST, IPU2\_RET\_RST, and IPU2\_CPU0\_RST reset signals. IPU2\_C0 starts rebooting.
6. Software can then clear the [RM\\_IPU2\\_RSTCTRL\[1\]](#) RST\_CPU1 bit in the PRCM module register. The PRCM module releases the IPU2\_CPU1\_RST reset signal to IPU2\_C1 to start booting.

#### 3.5.6.14 EVE1 Subsystem Power-On Reset Sequence

[Figure 3-33](#) shows the power-on reset sequence of the EVE1 subsystem.

**Figure 3-33. EVE1 Subsystem Power-On Reset Sequence**

The power-on reset to EVE1 is applied when PD\_EVE1 is powered. The assumptions on power-on reset assertion are:

- The PRCM module provides the EVE1\_GFCLK functional clock to the EVE subsystem, and it has been enabled by MPU software control.

The power-on reset sequence is:

1. Software clears the [RM\\_EVE1\\_RSTCTRL\[1\]](#) RST\_EVE1 bit. This causes the PRCM module to release the EVE1\_PWRON\_RST and the EVE1\_RST signals. Then software can download data into TCM memory while keeping the sequencer CPUs under reset.
2. When the TCM memory is initialized, software clears the [RM\\_EVE1\\_RSTCTRL\[0\]](#) RST\_EVE1\_LRST bit. This release EVE1\_LRST to the local CPU inside EVE subsystem.

### 3.5.6.15 EVE1 Subsystem Software Warm Reset Sequence

Figure 3-34 shows the software warm reset sequence of the EVE1 subsystem.

**Figure 3-34. EVE1 Subsystem Software Warm Reset Sequence**

For doing the software reset of EVE1 the MPU software must ensure that EVE1 CPU is in IDLE state and EVE1 is in STANDBY state and the functional clock to EVE1 has been gated.

The software warm reset sequence is:

1. MPU software sets the [RM\\_EVE1\\_RSTCTRL](#) register to 0x1. This causes the PRCM module to assert the EVE1\_RST, EVE1\_LRST to the EVE subsystem. The EVE1\_PWRON\_RST remains deasserted.
2. The MPU software enables the functional clock to the EVE1 subsystem.
3. The MPU software clears the [RM\\_EVE1\\_RSTCTRL\[1\]](#) RST\_EVE1 and [RM\\_EVE1\\_RSTCTRL\[0\]](#) RST\_EVE1\_LRST bits. This causes the PRCM module to release EVE1\_RST and EVE1\_LRST to the

EVE subsystem.

### 3.5.6.16 EVE2 Subsystem Power-On Reset Sequence

Figure 3-35 shows the power-on reset sequence of the EVE2 subsystem.

**Figure 3-35. EVE2 Subsystem Power-On Reset Sequence**

The power-on reset to EVE2 is applied when PD\_EVE2 is powered. The assumptions on power-on reset assertion are:

- The PRCM module provides the EVE2\_GFCLK functional clock to the EVE subsystem, and it has been enabled by MPU software control.

The power-on reset sequence is:

1. Software clears the [RM\\_EVE2\\_RSTCTRL\[1\]](#) RST\_EVE2 bit. This causes the PRCM module to release the EVE2\_PWRON\_RST used inside EVE2 to reset mainly the emulation logic and EVE2\_RST used to reset all logic inside EVE2. Then software can download data into TCM memory while keeping the CPU under reset.
2. When the TCM memory is initialized, software clears the [RM\\_EVE2\\_RSTCTRL\[0\]](#) RST\_EVE2\_LRST bit. This releases EVE2\_LRST to the local CPU inside EVE subsystem.

### 3.5.6.17 EVE2 Subsystem Software Warm Reset Sequence

Figure 3-36 shows the software warm reset sequence of the EVE2 subsystem.

**Figure 3-36. EVE2 Subsystem Software Warm Reset Sequence**

For doing the software reset of EVE2 the MPU software must ensure that EVE2 CPU is in IDLE state and EVE2 is in STANDBY state and the functional clock to EVE2 has been gated.

The software warm reset sequence is:

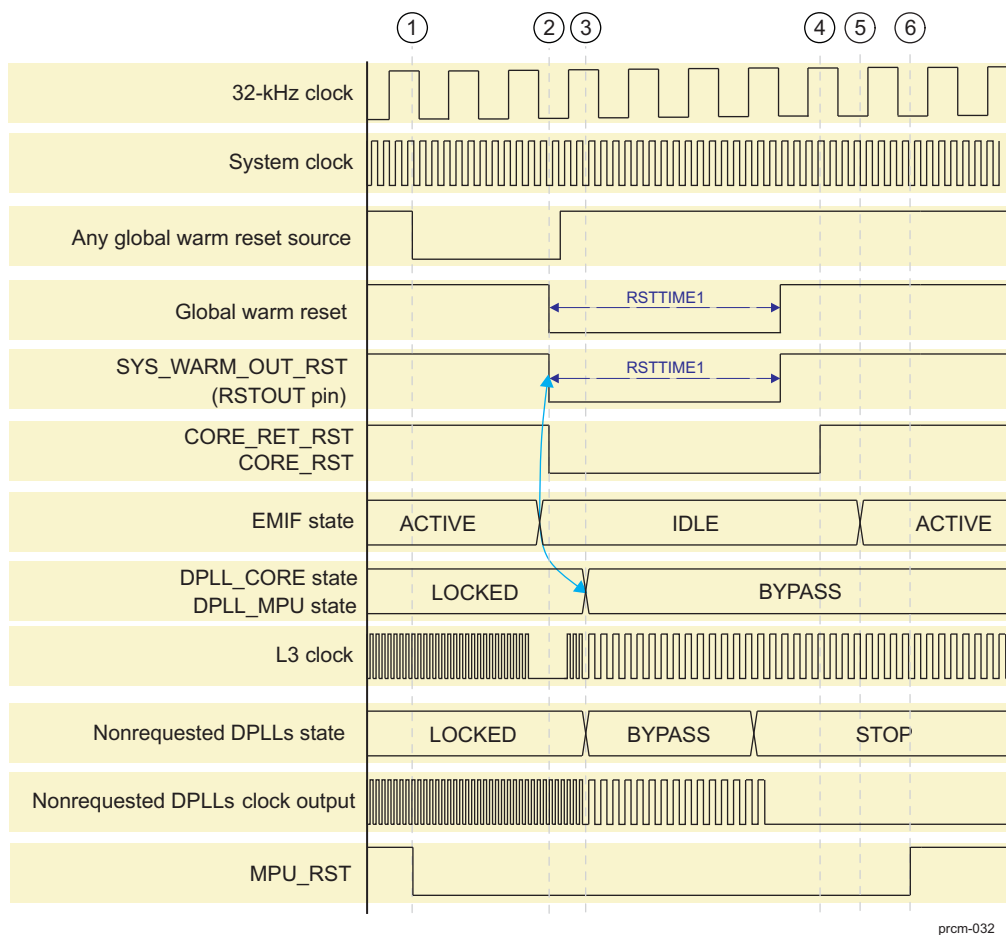

1. MPU software sets the `RM_EVE2_RSTCTRL` register to 0x1. This causes the PRCM module to assert the `EVE2_RST`, `EVE2_LRST` to the EVE subsystem. The `EVE2_PWRON_RST` remains deasserted.
2. The MPU software enables the functional clock to the EVE2 subsystem.
3. The MPU software clears the `RM_EVE2_RSTCTRL[1]` `RST_EVE2` and `RM_EVE2_RSTCTRL[0]` `RST_EVE2_LRST` bits. This causes the PRCM module to release `EVE2_RST` and `EVE2_LRST` to the EVE subsystem.

### 3.5.6.18 Global Warm Reset Sequence

This section describes the global warm reset sequence.

Figure 3-37 shows the global warm reset sequence.

Figure 3-37. Global Warm Reset Sequence

prcm-032

The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The device is active:
  - All resets are released.
  - MPU, CORE, and IVA DPLLs are locked.

The steps of a global warm reset sequence are:

1. On assertion of any global warm reset source the PRCM signals the EMIF that a global warm reset event has occurred. The EMIF initiates the transition to IDLE state. The PRCM module delays global warm reset to the device for a minimum of 16 L3 clock cycles so that the EMIF switches to IDLE state and switches the external SDRAM to self-refresh mode.

2. The reset managers in the PRM assert the following resets:
  - The external warm reset SYS\_WARM\_RST (rstoutn pin).
  - All power domain warm resets are asserted.
  - The PRM and CM registers, sensitive to warm reset, are asynchronously reset.
  - DPLL hardware resets are not asserted.
    - DPLL\_MPU transitions to bypass mode.
    - DPLL\_CORE transitions to bypass mode once the EMIF switches to IDLE state.
    - DPLL\_IVA, DPLL\_PER, DPLL\_USB, DPLL\_DSP, DPLL\_EVE, DPLL\_GPU and DPLL\_DDR transition to idle bypass low-power mode. Then, as clock signals are no more requested, they are gated and these DPLLs go to stop mode.
    - DPLL\_ABE configuration is not changed.
    - DPLL\_GMAC configuration is not changed.
  - CM gates the clocks that are not needed, as per their default reset setting in the associated registers.
3. The device warm reset (internal and rstoutn pin) duration is set up by the [PRM\\_RSTTIME\[9:0\]](#) RSTTIME1 bit field. It defines the global warm reset duration in number of FUNC\_32K\_CLK clock cycles. Default value loaded after POR is 6 clock cycles. During this time, the DPLL\_ABE control registers are reset and DPLL\_ABE transitions to bypass mode when the system clock restarts and the DPLL\_ABE outputs are no longer used.
4. The CORE power domain is released from reset (that is, warm reset-sensitive modules in the CORE power domain).
5. The PRCM module switches the EMIF from IDLE state back to ACTIVE state.
6. PD\_MPU is released from reset when the clocks to the MPU subsystem are active. The MPU reboots.

---

**NOTE:**

- The PD\_DSP and PD\_IVA, PD\_EVE, PD\_IPU2 power domains are held under reset after global warm reset by assertion of the software source of the reset.
  - The following are held under reset after global warm reset until the PRCM module enables their interface clock:
    - PD\_L4PER
    - PD\_L3INIT
    - PD\_DSS
    - PD\_GPU
    - PD\_CAM

### 3.6 Clock Management Functional Description

#### 3.6.1 Overview

The PRCM module provides the control for clock generation, division, distribution, synchronization, and gating. It distributes the clock sources to all modules in the device. For information about the clock-management functional architecture of the device, see [Section 3.1.1.1, Clock Management](#).

The PRCM module provides clocks to the internal DPLLs for internal high-frequency clock generation. Clock division and gating are handled by the PRM, CM\_CORE\_AON, and CM\_CORE sections of the PRCM module. [Figure 3-38](#) shows the high-level clock-management scheme in the device.

**Figure 3-38. PRCM Module Clock Manager Overview**

## 3.6.2 External Clock Inputs

### 3.6.2.1 FUNC\_32K\_CLK Clock

The 32-kHz frequency is used for low-frequency operation. FUNC\_32K\_CLK is derived from SYS\_CLK1. It supplies the always-on wake-up domain for operation in lowest power mode and as the clock source to the DPLL\_ABE.

### 3.6.2.2 High-Frequency System Clock Input

The system clocks SYS\_CLK1 and SYS\_CLK2, are the main source clocks of the device. SYS\_CLK1 and SYS\_CLK2 are received directly from internal oscillators (OSC0 and OSC1) of the PRCM module. They are supplied as the reference clock to the DPLLs and as functional clock to several modules.

### 3.6.2.3 External Reference Clock Input

The external reference clocks xref\_clk0, xref\_clk1, xref\_clk2, and xref\_clk3 are received directly from external reference clock source for the device. They are supplied as the functional clock to the TIMERS, and as reference clock to the McASP and other peripherals.

## 3.6.3 Internal Clock Sources and Generators

The PRCM module clock sources/generators are split into the following parts:

- PRM clock source that receives system clocks SYS\_CLK1 and SYS\_CLK2 inputs.
- CM\_CORE\_AON and CM\_CORE clock sources that distribute high-frequency clocks
- DPLL clock generators that synthesize high-frequency clocks for the device

**Table 3-36. Internal Clock Sources**

CORE_CLK	DPLL_CORE	532 MHz	See <a href="#">Figure 3-10, DPLL_CORE Description</a>

<sup>(1)</sup> The OSC\_32K\_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

### 3.6.3.1 PRM Clock Source

---

**NOTE:** The audio back end (ABE) module is not supported for this family of devices, but the ABE name is still present in some clock or DPLL names.

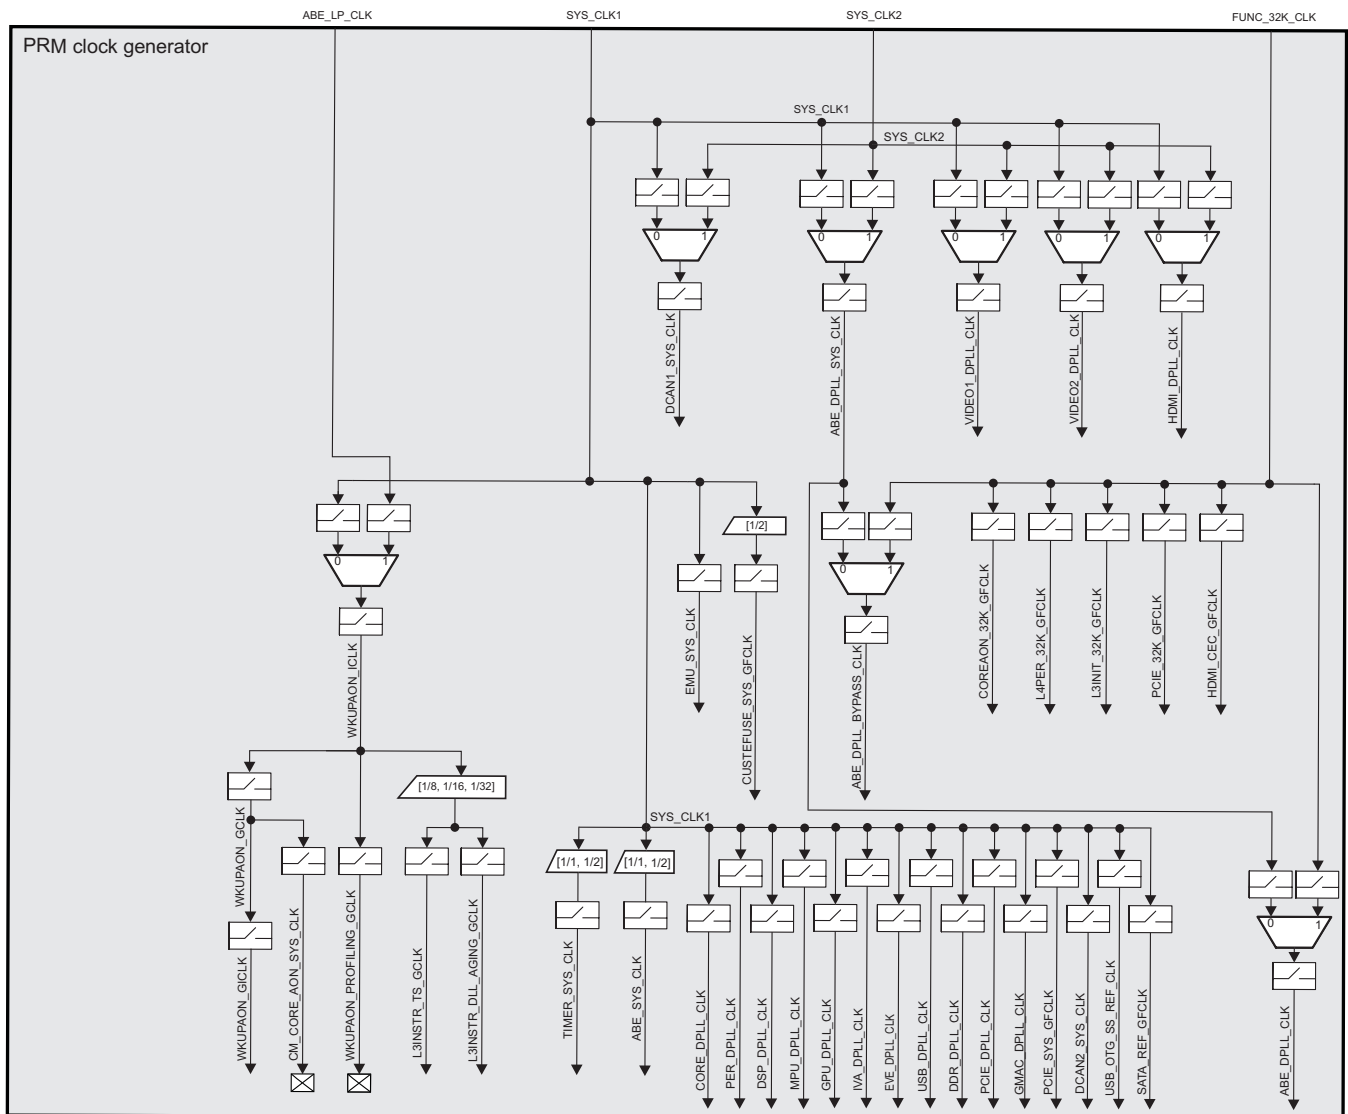

---

The PRM clock source receives the SYS\_CLK1 and SYS\_CLK2 clocks from external input pins. Along with these clocks, it receives a clock ABE\_LP\_CLK, divided version of DPLL\_ABE\_X2\_CLK, which is generated by DPLL\_ABE. The PRM manages the low-frequency clocks associated with these four (counting also FUNC\_32K\_CLK as an input clock) input clocks. The PRM sources various versions (through gating controls) of these externally sourced clocks to supply:

- PRCM-managed DPLLs with a reference clock, which is permanently supplied with always-on buffers
- The DSS with a reference clock, which is permanently supplied with always-on buffers
- The various timers and watchdog timers with clocks supplied by always-on buffers
- The clocks for the CM clock generator and the CORE power domain
- Timer functional clocks
- The bandgap and control module for thermal sensor feature
- Reference clock for various modules:
  - USB\_OTG\_SS
  - SATA

Figure 3-39 is a logical representation of the PRM clock source.

**NOTE:** For clock signals control (gating/ungating management), see [Section 3.1.1.1, Clock Management](#).

The PRM provides a 32-kHz gated and ungated clock for use by portions of the PD\_WKUPAON power domain and some peripherals outside the PD\_WKUPAON power domain.

The PRM creates COREAON\_32K\_GFCLK (gated version of FUNC\_32K\_CLK) to provide 32kHz clock to peripherals outside of PD\_WKUPAON.

It also provides the system clock to the DSS, a gated and buffered version to the WKUPAON\_GICLK interconnect clock, and the DPLLs controlled by the PRCM module.

### 3.6.3.2 CM Clock Source

The clock manager (CM) is primarily responsible for generating interface and functional clocks from the internal clocks provided by DPLL\_CORE and DPLL\_PER. The CM is physically divided into two independent entities: CM\_CORE\_AON, which is placed in the PD\_COREAON always-on power domain, and CM\_CORE, which is placed in the PD\_CORE switchable power domain. The split is done to provide control over various entities, such as modules, DPLLs, and clocks, during low-power use case scenarios when the PD\_CORE power domain can be switched to RETENTION state.

#### 3.6.3.2.1 CM\_CORE\_AON Clock Generator

CM\_CORE\_AON receives a system clocks (SYS\_CLK1 and SYS\_CLK2) from the PRM, which serves as its functional clock. CM\_CORE\_AON provides a gated clock to

- PD\_CAM
- PD\_CORE
- PD\_CUSTEFUSE

  - DPLL\_IVA
  - DPLL\_EVE
  - DPLL\_GPU
  - DPLL\_DDR
  - DPLL\_GMAC
  - DPLL\_DSP
  - DPLL\_PER
  - DPLL\_ABE
  - DPLL\_CORE
- and its associated HSDivider.

[Figure 3-42](#) is an overview of the CM\_CORE\_AON\_CLKOUTMUX

Figure 3-42. CM\_CORE\_AON\_CLKOUTMUX Clock Manager Overview (CLKOUTMUX0)

---

**NOTE:** There is no dedicated register to enable CLKOUTMUX0\_CLK clock to propagate to clkout3 device pad. CLKOUTMUX0\_CLK will stay gated until one of the TIMER5/6/7/8 is enabled and CLKOUTMUX0\_CLK is selected as the source clock for the timer functional clock.

The CLKOUTMUX0\_CLK clock is propagated to clkout3 device pad only when at least one of the following registers is configured: CM\_IPU\_TIMER5/6/7/8\_CLKCTRL[27:24] CLKSEL (value: 0xB).

In addition, if there is a need to propagate MPU\_GCLK to device pad (clkout3), the user needs to write 0x1 to the hardware observability control register:

[CTRL\\_CORE\\_HWOBS\\_CONTROL\[0\]](#) HWOBS\_MACRO\_ENABLE.

**NOTE:** The OSC\_32K\_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

**NOTE:** In order to enable CLKOUTMUX1\_CLK and CLKOUTMUX2\_CLK clocks to propagate to the corresponding device pads (clkout1 and clkout2), the user needs to configure registers: [CM\\_COREAON\\_CLKOUTMUX1\\_CLKCTRL\[8\]](#) OPTFCLKEN\_CLKOUTMUX1\_CLK (value: 0x1) and [CM\\_COREAON\\_CLKOUTMUX2\\_CLKCTRL\[8\]](#) OPTFCLKEN\_CLKOUTMUX2\_CLK (value: 0x1).

In addition, if there is a need to propagate MPU\_GCLK to device pad (clkout1 or clkout2), the user needs to write 0x1 to the hardware observability control register: [CTRL\\_CORE\\_HWOBS\\_CONTROL\[0\]](#) HWOBS\_MACRO\_ENABLE.

### 3.6.3.3 Generic DPLL Overview

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types: type A and type B DPLLs.

The following DPLLs belong to type A:

- DPLL\_MPU
- DPLL\_IVA
- DPLL\_CORE
- DPLL\_PER
- DPLL\_ABE
- DPLL\_DSP
- DPLL\_EVE
- DPLL\_GMAC
- DPLL\_GPU
- DPLL\_DDR

The following DPLLs belong to type B:

- DPLL\_USB
- DPLL\_PCIE\_REF

All DPLLs (type A and type B) support the features described in the following sections, unless otherwise identified.

---

**NOTE:** This chapter discusses only the DPLLs that are directly controlled by the PRCM module. The other DPLLs embedded in and managed by other subsystems are described in their respective subsystems.

---

#### 3.6.3.3.1 Generic APLL Overview

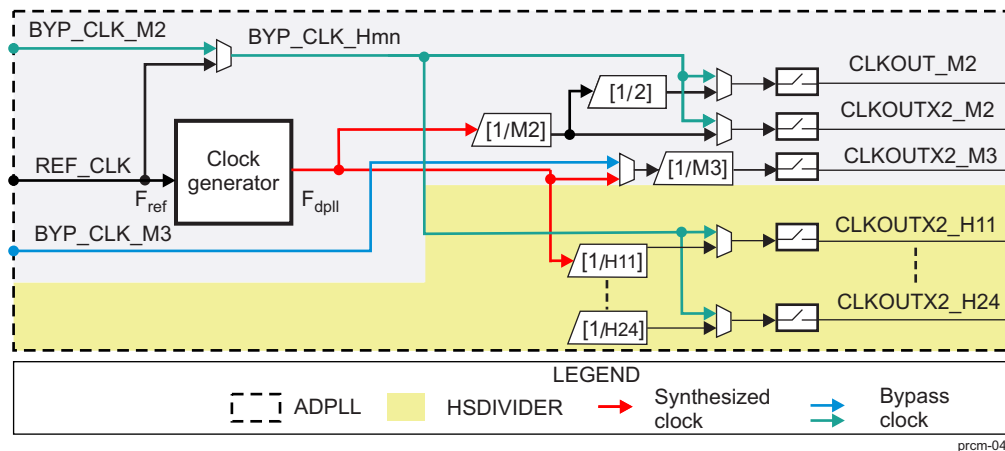

APLL\_PCIE is an analog PLL which supplies high speed clock to PCI Express. APLL\_PCIE is controlled directly by the PRCM module.

All the feature support by APLL\_PCIE are described in [Section 3.6.3.16, APLL\\_PCIE Description](#)

### 3.6.3.3.2 DPLLs Output Clocks Parameters

Figure 3-51 shows the functional architecture of a generic DPLL.

Figure 3-51. Generic DPLL Functional Diagram

The DPLL has three input clocks:

- REF\_CLK: Used to generate the synthesized clock but can also be used as the bypass clock for some outputs of the DPLL whenever the DPLL enters bypass mode. It is mandatory for the DPLL clock synthesis.
- BYP\_CLK\_M2: Selectable bypass clock for the output of an M2 post-divider (optional)
- BYP\_CLK\_M3: Selectable bypass clock for the output of an M3 post-divider (optional)

The DPLL provides the bypass clock used by HSDIVIDER: BYP\_CLK\_Hmn, which is output by the multiplexer between the BYP\_CLK\_M2 and REF\_CLK clock signals.

**NOTE:** The [1/2] divider located after the M2 post-divider is not valid when the [CM\\_CLKSEL\\_DPLL\\_MPU\[22\]](#) DCC\_EN bit is set (applies only to DPLL\_MPU when a frequency higher than 1.4 GHz is needed).

The DPLL can be programmed to be locked at any frequency given by one of the following equations:

- $F_{dpll} = F_{ref} \times 2 \times M / (N + 1)$
- $F_{dpll} = F_{ref} \times 2 \times (4 \times M / (N + 1))$  in case the [CM\\_CLKMODE\\_DPLL\\_ABE\[11\]](#) DPLL\_REGM4XEN bit is set (applies only to DPLL\_ABE)
- $F_{dpll} = F_{ref} \times (M / (N + 1))$  in case the [CM\\_CLKSEL\\_DPLL\\_MPU\[22\]](#) DCC\_EN bit is set (applies only to DPLL\_MPU when frequency higher than 1.4GHz is needed).

Where:

- $F_{dpll}$  is the DPLL lock frequency.
- $F_{ref}$  is the REF\_CLK frequency.  $F_{ref}$  is also known as CLKINP.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

**NOTE:** It is preferred to minimize the value for N parameter (it minimizes lock time and jitter). Then M should be chosen to provide correct frequency (with lowest delta as possible).

It internally generates three main clocks: CLKOUT\_M2, CLKOUTX2\_M2, and CLKOUTX2\_M3 as shown in [Table 3-43](#).

**Table 3-43. CLKOUT\_M2, CLKOUTX2\_M2, and CLKOUTX2\_M3 Frequencies With DPLL State**

Output	Equation	DPLL Mode
CLKOUT_M2	$F_{dpll} / (2 \times M2)$	Locked (typical case)
	$F_{ref}$ or $BYP\_CLK\_M2$	Before lock or during relock
	$F_{dpll} / M2$	DC corrector logic is used (DCC_EN bit is set) with M2 set to 0x1.
CLKOUTX2_M2	$F_{dpll} / M2$	Locked (typical case)
	$F_{ref}$ or $BYP\_CLK\_M2$	Before lock or during relock
	$F_{dpll} / M2$	DC corrector logic is used (DCC_EN bit is set).
CLKOUTX2_M3	$F_{dpll} / M3$ or $BYP\_CLK\_M3/M3$	Locked (typical case)
	0	Before lock or during relock
	$F_{dpll} / M3$ or $BYP\_CLK\_M3/M3$	DC corrector logic is used (DCC_EN bit is set).

Where:

- M2 is the software-configured division ratio binary value.
- M3 is the software-configured division ratio binary value.
- CLKOUT\_M2 and CLKOUTX2\_M2 bypass clock input can be switched when the DPLL is not in locked state by using the M2 bypass clock select control bit.
- CLKOUTX2\_M3 output clock can be switched when the DPLL is in locked state by using the M3 clock select control bit.

**NOTE:**

- A value of 0 for M2 and M3 division ratios is not allowed. They are set to 1 after reset.
- CLKOUT\_M2 is generated based on a fixed divide-by-2 ratio, except in bypass mode.

The DPLL can contain one or two HSDIVIDER modules to produce more clocks with divided ratio based on the DPLL synthesized clock frequency. HSDIVIDER1 provides four extra post-dividers from H11 to H14 (the output clocks are CLKOUTX2\_H11 through CLKOUTX2\_H14). HSDIVIDER2 provides four extra post-dividers from H21 through H24 (the output clocks are CLKOUTX2\_H21 through CLKOUTX2\_H24). The HSDIVIDER output clock frequency is given by the equations in [Table 3-44](#).

**Table 3-44. CLKOUTX2\_Hmn Frequencies With DPLL State**

Equation	DPLL Mode
$CLKOUTX2\_Hmn = F_{dpll} / Hmn$	Locked
$CLKOUTX2\_Hmn = BYP\_CLK\_Hmn$	Before lock or during relock

Where:

- $F_{dpll}$  is the DPLL lock frequency.
- Hmn is the software-configured division ratio binary value.
- n is in the range from 1 to 4.
- m is equal to 1 or 2.

**NOTE:** Hmn division ratio is set to 1 after reset.

All clock outputs of the DPLL can be gated. The PRCM module provides the DPLL with a clock-gating control signal to enable or disable the clock. DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated. The PRCM module provides a CM\_IDLEST\_DPLL\_dppll\_name[0] ST\_DPLL\_CLK status bit, which indicates the lock state or nonlock state of the DPLL.

The type B DPLL (DPLL\_USB) has two outputs: CLKOUT and CLKDCOLDO. The DPLL can be programmed to be locked with the output clock frequencies given by the following equation:

- $F_{\text{clkout}} = F_{\text{ref}} \times (M / (N + 1)) \times (1 / M2)$
- $F_{\text{clkdcoldo}} = F_{\text{ref}} \times (M / (N + 1))$

Where:

- $F_{\text{clkout}}$  is the frequency of the clock at output CLKOUT.
- $F_{\text{clkdcoldo}}$  is the frequency of the clock at output CLKDCOLDO.
- $F_{\text{ref}}$  is the REF\_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.
- M2 is the software-configured division ratio binary value.

CLKOUT supports the same bypass modes as previously identified. CLKDCOLDO does not support bypass mode.

The type B DPLL output clock is synthesized by an internal oscillator that is phase-locked to the REF\_CLK. Two oscillators are built within a type B DPLL. The oscillators are user-selectable based on the synthesized output clock frequency requirement. If the required frequency is greater than or equal to 1500 MHz, the user must program a value of 1 in the CM\_CLKSEL\_DPLL\_dppll\_name[21] DPLL\_SELFREQDCO bit. This drives a value of 100 on the SELFREQDCO input of the corresponding type B DPLL. If the required frequency is less than 1500 MHz, the user must program a value of 0 in the CM\_CLKSEL\_DPLL\_dppll\_name[21] DPLL\_SELFREQDCO bit. This drives a value of 010 on the SELFREQDCO input of the corresponding type B DPLL.

### 3.6.3.3.3 Enable Control, Status, and Low-Power Operation Mode

The DPLL has a manual mode control bit field, which allows the setting of the different operating modes of the DPLL. When the DPLL is switched to lock mode, the current values of the multiplication ratio (M) and the division ratio (N) are latched in the DPLL. The DPLL then starts the lock or relock sequence to synthesize the corresponding output frequency clock.

The status of the synthesized clock output of the DPLL is represented by the CLKOUT status bit. It can be gated or active.

The type A DPLLs can be switched to low-power operation mode (also called LPMODE) to optimize DPLL power consumption when the input and output clock frequencies are low. This mode can be software-enabled using the low-power mode control bit of the DPLL.

It must be enabled only if both of the following operating conditions are satisfied:

- $F_{\text{ref}} / (N + 1)$  is less than or equal to 1 MHz.
- $F_{\text{ref}} \times M / (N + 1)$  is less than or equal to 100 MHz.

Where:

- $F_{\text{ref}}$  is the REF\_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

### 3.6.3.3.4 DPLL Power Modes

DPLL supports several power modes for type A and only one power mode for type B. Each mode results in a tradeoff between power savings and relock time. The PRCM module allows only a few modes for each DPLL, depending on the use of the DPLL.

Table 3-45 lists the DPLL power modes.

**Table 3-45. DPLL Power Modes**

Power Mode	CLKOUT State	Logic Current (mA)	Analog Current (mA)	Freq Lock Time	Phase Lock Time
Low-power stop	Clock stopped	0.065 (leakage)	0.009 (leakage)	$2.5 \mu\text{s} + (70 \times (N+1) / F_{\text{ref}})$	$2.5 \mu\text{s} + (120 \times (N+1) / F_{\text{ref}})$
Fast-relock stop	Clock stopped	0.065 (leakage)	0.009 (leakage)	$2.5 \mu\text{s} + (70 \times (N+1) / F_{\text{ref}})$	$2.5 \mu\text{s} + (120 \times (N+1) / F_{\text{ref}})$
Low-power bypass	Bypass clock/clock stopped	0.065 (leakage)	0.009 (leakage)	$2.5 \mu\text{s} + (70 \times (N+1) / F_{\text{ref}})$	$2.5 \mu\text{s} + (120 \times (N+1) / F_{\text{ref}})$
Fast-relock bypass	Bypass clock/clock stopped	0.065 (leakage)	0.5 (leakage)	$0.05 \mu\text{s} + (70 \times (N+1) / F_{\text{ref}})$	$0.05 \mu\text{s} + (120 \times (N+1) / F_{\text{ref}})$
Lock	Synthesized clock	0.95 (active)	3 (active)	N/A	N/A

Where:

- $F_{\text{ref}}$  is the REF\_CLK frequency.

A DPLL power mode can be achieved on a software request (manual) and/or automatically (automatic), depending on the specific hardware conditions.

A DPLL can switch from one mode to another as a result of the following:

- Software-programmed transition (manual): Software configures the dedicated DPLL manual mode control feature for the next desired DPLL mode. It must ensure that the transition can be performed based on the clock activity on the device.
- Combined software-programmed and hardware-conditions-based transition (auto): This mode allows the DPLL to automatically transition to a low-power state (that is, any state other than the LOCK state) when the output clocks are gated or the destination clock domain is inactive, and to switch back to the LOCK state when the output clock is needed (that is, the clock is ungated or the clock domain becomes active). The desired low-power state for the automatic transition is configured in the dedicated Auto Mode Control parameter of the DPLL.

---

**NOTE:** With  $T_{\text{ref}} = 1 / F_{\text{ref}} = (N + 1) / \text{CLKINP}$ ; ( $F_{\text{ref}} = \text{CLKINP} / (N + 1)$ ):

$T_{\text{ref}}$  is the REF\_CLK period.

This formula indicates that a smaller N divider value provides a smaller time for switching the clock after an M2 post-divider change.

A compromise is necessary between the clock switching latency and power consumption.

Having a smaller N value:

- Requires a higher M2 post-divider value to obtain the same target frequency.
  - Results in a higher DPLL lock frequency, and then higher power consumption.
- 

**NOTE:**

- A manual transition can be performed from any power mode to any other power mode.
  - An automatic transition can be performed from lock mode to any low-power mode.
- 

**NOTE:** When the DPLL is in Low-Power bypass mode, Auto-idle mode is disabled and no clock is requested, the DPLL makes a transition to Low-power stop mode.

---

### 3.6.3.3.5 DPLL Recalibration

The DPLL recalibration applies only to type-A DPLLs. Each time the DPLL is reset or performs a lock sequence (following a change in the value of multiplier M or divider N), it performs a recalibration of the output frequency, based on voltage and temperature conditions. In lock mode, the DPLL maintains a steady lock frequency output by compensating for voltage and temperature changes within a certain range. However, if the voltage or temperature drifts outside the range or shows a significant or fast change, the DPLL may not be able to track and compensate it. It would need a recalibration, which is signaled by assertion of a recalibration flag.

---

**NOTE:**

- The recalibration mechanism is active only while the DPLL is in lock mode. When the DPLL is in off or bypass mode (low-power or fast-relock), it does not assert the recalibration flag.
  - If the DPLL drifts out of the operating range limits while not locked, and then when it tries to relock, it fails to lock within the normal delay and recalibrates automatically before eventually locking. The only difference between this case and a standard relock is the recalibration delay.
- 

During recalibration, the DPLL loses lock and output clock switches to the bypass clock.

The DPLL can automatically start recalibration when the recalibration flag is asserted, or recalibration can be triggered by software control. The trigger setting of the recalibration can be configured by the corresponding registers of the DPLL in the PRCM module. The software-controlled recalibration mode is selected by default.

Software-controlled recalibration: The DPLL continues its tracking mechanism as long as the recalibration is not triggered by software (that is, by enabling the recalibration-enable control parameter). If the DPLL reaches upper or lower bounds of the DCO control code and software has still not triggered recalibration, the DPLL stops its tracking mechanism. The output clock remains active, but frequency and jitter are not ensured to meet the requirement.

Automatic recalibration: The DPLL immediately starts the recalibration as soon as the recalibration flag is asserted.

- 
- NOTE:** Automatic recalibration of the DPLL can start at any time. While relocking, the DPLL switches to bypass mode, which introduces a frequency change. For modules that are sensitive to frequency change while operating, this can introduce operational instability. For example, the external memory EMIF controller is sensitive to a frequency change on the DPLL because its embedded DLL relocks on a frequency change. Any EMIF access during this DLL relock period can be corrupted. It is, therefore, important to stall EMIF access during DPLL recalibration.
- 

To allow software to recalibrate the DPLL at the correct time depending on the device activity, the PRCM module can generate a wake-up event on the processor power domain, followed by an interrupt on the processor subsystem when the DPLL recalibration flag is asserted.

Table 3-46 lists the DPLL recalibration and control parameters.

### 3.6.3.7 DPLL\_MPU Description

#### 3.6.3.7.1 DPLL\_MPU Overview

Figure 3-55 is an overview of the DPLL. For a functional overview of a generic DPLL module, see Section 3.6.3.3, *Generic DPLL Overview*.

**Figure 3-55. DPLL\_MPU Overview**

#### 3.6.3.7.2 DPLL\_MPU Tactical Clocking Adjustment

Figure 3-55 includes the clocking adjustment scheme for DPLL\_MPU. Another clock is requested by the EMIF1/2 modules and this clock must be dynamically switched between L3\_EOCP\_GICLK clock and MA\_EOCP\_GICLK clock coming from the MPU subsystem (namely from Memory Adapter part of it), depending on the respective activity of MPU and EMIF clock domain.

#### 3.6.3.7.3 DPLL\_MPU Synthesized Clock Parameters

This section describes the clock synthesis and clock out divider parameters of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-63 lists the clock synthesis parameters of the DPLL.

**Table 3-63. DPLL\_MPU Clock Synthesis Parameters**

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_MPU[18:8] DPLL_MULT

### 3.6.3.7.4 DPLL\_MPU Power Modes

This section identifies the operating modes supported by the DPLL and the control bit fields to set its operating modes. For an explanation of the DPLL operating modes, and associated control and status features, see [Section 3.6.3.3.3, Enable Control, Status, and Low-Power Operation Mode](#), and [Section 3.6.3.3.4, DPLL Power Modes](#).

Table 3-65 lists the operating modes supported by the DPLL.

**Table 3-65. DPLL\_MPU Modes**

Low-Power Stop	Fast-Relock Stop	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available	Available	Available

Table 3-66 lists the control bit fields for the operating mode control of the DPLL.

**Table 3-66. DPLL\_MPU Mode Control Parameters**

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_MPU[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_MPU[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_MPU[2:0] AUTO_DPLL_MODE

**NOTE:** The user software must ensure that the MPU voltage domain is on before programming DPLL\_MPU. This can be ensured by performing a forced wakeup (CLKCTRL= SW\_WKUP) on MPU domain. When software detects that the domain is "ON", DPLL\_MPU can be programmed.

### 3.6.3.7.5 DPLL\_MPU Recalibration

Table 3-67 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. For an explanation of the DPLL recalibration feature, see [Section 3.6.3.3.5, DPLL Recalibration](#).

### 3.6.3.16.3 APLL\_PCIE Power Modes

This section identifies the operating modes supported by the APLL and the control bit fields to set its operating modes.

**NOTE:** In order to disable the APLL\_PCIE, the user needs to disable PCIe\_SSx (where x = 1 or 2) using the CM\_PCIE\_PCISSx\_CLKCTRL[1:0] MODULEMODE registers. When PCIe\_SS is disabled, the PRCM module automatically disables the APLL\_PCIE. Please note that setting CM\_CLKMODE\_APLL\_PCIE[1:0] MODE\_SELECT bitfield to 0x0 does not disable the APLL\_PCIE.

Table 3-105 lists the operating modes supported by the DPLL.

### 3.6.4 Clock Domains

In this sections are summarized and described all Clock Domains in the device.

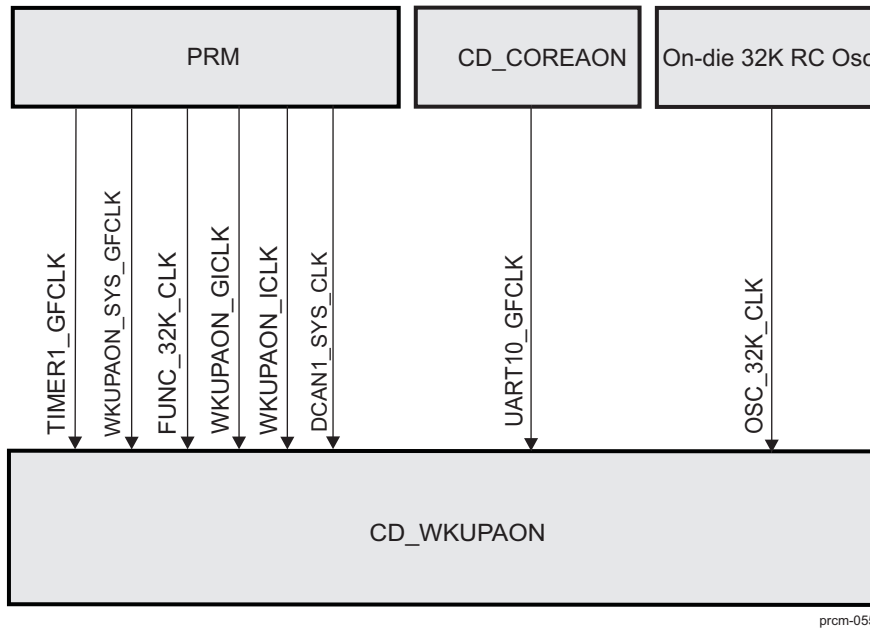

#### 3.6.4.1 CD\_WKUPAON Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

##### 3.6.4.1.1 Overview

Figure 3-65 is an overview of the clock domain.

**Figure 3-65. CD\_WKUPAON Overview**

**NOTE:** The OSC\_32K\_CLK clock, provided by the On-die 32K RC Osc is not accurate 32KHz clock. The frequency may vary with temperature and silicon characteristics.

##### 3.6.4.1.2 Clock Domain Modes

Table 3-110 lists the clock domain modes supported by the clock domain.

### 3.6.4.7 CD\_L4PER2 Clock Domain

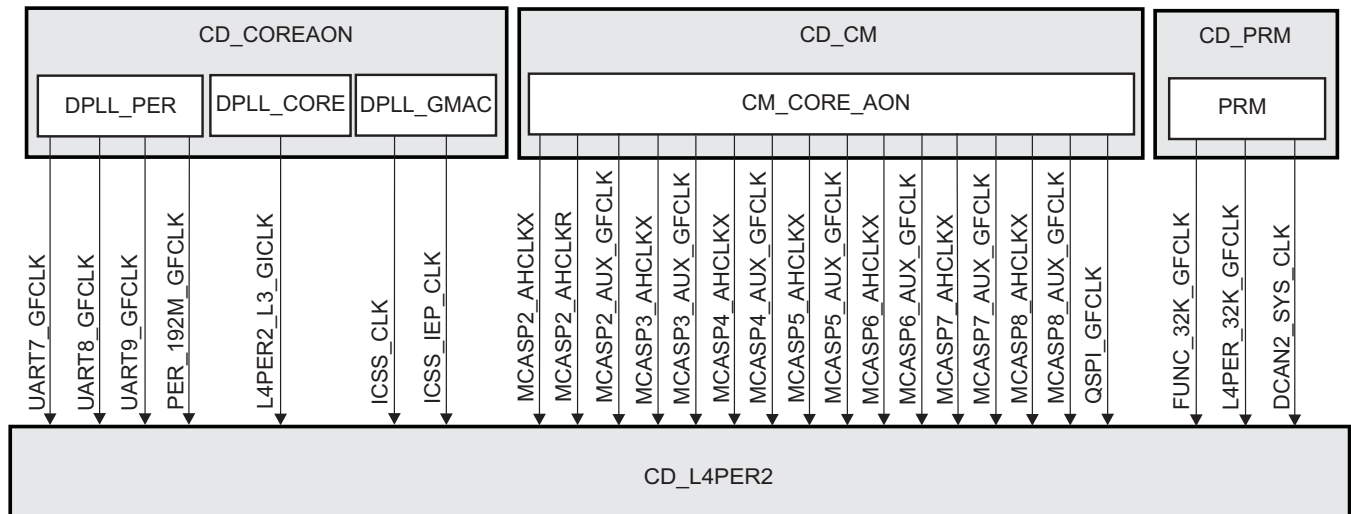

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.4.7.1 Overview

[Figure 3-71](#) is an overview of the clock domain.

### 3.6.4.7.3 Clock Domain Dependency

CD\_L4PER2 has no static dependency with any other clock domain of the device.

#### 3.6.4.7.3.1 Dynamic Dependency

[Table 3-157](#) lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

#### 3.6.4.10.4 Clock Domain Module Attributes

Table 3-182 lists for each module of the clock domain the clocks the module receives and their role (that is, functional or interface clock).

**Table 3-182. CD\_L3INIT Modules Clocks Association**

Module	Clock	Clock Type
MMC1	MMC1_GFCLK	Functional
	L3INIT_32K_GFCLK	Functional
	L3INIT_L3_GICLK	Interface <sup>(1)</sup>
MMC2	MMC2_GFCLK	Functional
	L3INIT_32K_GFCLK	Functional

USB1	L3INIT_960M_GFCLK	Functional
	L3INIT_L3_GICLK	Interface <sup>(1)</sup>
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
	USB_LFPS_TX_GFCLK	Interface
USB2	L3INIT_960M_GFCLK	Functional
	L3INIT_L3_GICLK	Interface <sup>(1)</sup>
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
USB3	L3INIT_L3_GICLK	Interface
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
USB4	L3INIT_L3_GICLK	Interface <sup>(1)</sup>
	USB_OTG_SS_REF_CLK	Reference clock for the DPLL_USB_OTG_SS (not managed by the PRCM module)
USB2PHY1	COREAON_32K_GFCLK	Functional
USB2PHY2	COREAON_32K_GFCLK	Functional
USB3_PHY	COREAON_32K_GFCLK	Functional
SATA	L3INIT_L3_GICLK	Interface
	L3INIT_48M_GFCLK	Functional
	SATA_REF_GFCLK	Functional
IEEE1500_2_OCP	L3INIT_L3_GICLK	Interface and functional
	L3INIT_L4_GICLK	Interface
OCP2SCP1	L3INIT_L4_GICLK	Interface

### 3.6.4.16 CD\_L3\_INSTR Clock Domain

This section identifies the modes supported by the clock domain and the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

#### 3.6.4.16.1 Overview

[Figure 3-80](#) is an overview of the clock domain.

### 3.6.4.16.3 Clock Domain Dependency

CD\_L3\_INSTR has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

For aging, DLL requires a low-frequency clock that must run as long as the CORE power domain is on. To match this requirement, the DLL\_AGING module has been created and instantiated in this clock domain, which is the last to transition in low-power state.

**NOTE:** In order to disable the APLL\_PCIE, the user needs to disable PCIe\_SSx (where x = 1 or 2) using the CM\_PCIE\_PCISSx\_CLKCTRL[1:0] MODULEMODE registers. When PCIe\_SS is disabled, the PRCM module automatically disables the APLL\_PCIE. Please note that setting [CM\\_CLKMODE\\_APLL\\_PCIE](#)[1:0] MODE\_SELECT bitfield to 0x0 does not disable the APLL\_PCIE.

[Table 3-333](#) lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

### 3.7 Power Management Functional Description

**NOTE:** Only the MPU Subsystem supports memory retention.

MPU subsystem does not support OFF state. Only CPU1 supports FORCED\_OFF state with no subsequent recovery to ON/active state - this is very application specific and may not be available in all TI standard software offerings.

**NOTE:** In the L3INIT power domain OFF state is only allowed in systems where Ethernet RGMII is NOT used in the system - this is very application specific and may not be available in all TI standard software offerings.

This section describes the functional concepts of power management at the power domain level in the device.

The following power domains support dynamic power switching (DPS) with switching times of less than 5  $\mu$ s.

- PD\_CORE
- PD\_MPU

#### 3.7.1 PD\_WKUPAON Description

PD\_WKUPAON contains the following reset domains:

- WKUPAON\_PWRON\_RST
- WKUPAON\_RST
- WKUPAON\_SYS\_PWRON\_RST
- PRM\_PWRON\_RST
- PRM\_RST
- LPRM\_PWRON\_RST
- LPRM\_RST

PD\_WKUPAON contains the CD\_WKUPAON clock domain.

[Table 3-334](#) lists the logic retention capability for each module of the power domain.

### 3.7.1.1 Power Domain Modes

The PD\_WKUPAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD\_WKUPAON power domain has two memory banks(UART\_MEM, DCAN\_MEM) which are related to UART10 and DCAN1.

#### 3.7.1.1.1 Logic and Memory Area Power Modes

[Table 3-335](#) lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention and Logic Off columns in the table identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
WKUP_BANK		ON	RETENTION	
	UART10 - UART_MEM	always_on	always_retention	
	DCAN1 - DCAN_MEM	always_on	always_retention	

### 3.7.2 PD\_DSP1 Description

PD\_DSP1 contains the following reset domains:

- DSP1\_RST
- DSP1\_PWRON\_RST
- DSP1\_RET\_RST
- DSP1\_SYS\_RST

PD\_DSP1 contains the CD\_DSP1 clock domain.

[Table 3-336](#) lists the logic retention capability for each module of the power domain.

### 3.7.5 PD\_MPU Description

PD\_MPU contains the following reset domains:

- MPU\_PWRON\_RST
- MPU\_RST

- MPU\_MA\_RST
- MPU\_MA\_RET\_RST
- MPU\_MA\_PWRON\_RET\_RST

PD\_MPU contains the CD\_MPU clock domain.

### 3.7.5.1.3 Power State Override

The PRCM module controls the power state of the MPU subsystem, whereas the PRCM\_MPU controls the power state of each CPU (CPU0 and CPU1). The MPU subsystem requires that the MPU power domain can transition only to a low-power mode when CPU0 and CPU1 are in a lower power mode than is specified in the [PM\\_MPU\\_PWRSTCTRL](#) register. The power mode of the CPUs is communicated to the PRCM module by the PRCM\_MPU through two dedicated internal signals. These two signals specify the lowest power state that the MPU can enter and, if necessary, override the low-power state programmed in the [PM\\_MPU\\_PWRSTCTRL](#) register.

Table 3-355 lists the low-power modes allowed by the MPU.

**Table 3-355. MPU Allowed Low-Power Mode**

MPU Allowed Low-Power Mode	Comment
CSWRET	CPUs are in SR3-APG mode and L1\$ is in RETENTION state.
INACTIVE	CPUs are in SR3-APG mode and L1\$ is in ON state, or CPUs are in INACTIVE state.
ON	CPUs are in ON state.

If [PM\\_MPU\\_PWRSTCTRL](#) is programmed to a lower power state than allowed (specified by the two signals), then it is overwritten by the hardware. The value of the [PM\\_MPU\\_PWRSTCTRL](#) register is not changed (that is, not overwritten).

### 3.7.6 PD\_IPU Description

PD\_IPU contains the following reset domains:

- IPU1\_PWRON\_RST
- IPU1\_RST
- IPU1\_RET\_RST
- IPU\_RST

- IPU\_RET\_RST
- IPU1\_CPU0\_RST
- IPU1\_CPU1\_RST

PD\_IPU contains the CD\_IPU and CD\_IPU1 clock domain.

### 3.7.13.1 Power Domain Modes

This section describes the various power modes supported by the logic and memory areas of the power domain. It also identifies the associated software control and status bit fields. For a functional description of the power-management architecture of a generic power domain, see [Section 3.1.1.2.1, Power Domain](#).

#### 3.7.13.1.1 Logic and Memory Area Power Modes

[Table 3-392](#) lists the power modes supported by the logic area of the power domain.

**Table 3-392. PD\_CORE Logic Area Power Modes**

Off	Retention-CSWR	On-Inactive	On-Active
N/A	Available	Available	Available

Table 3-393 lists the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module – Memory column).

**Table 3-393. PD\_CORE Memory Area Power Modes**

Memory Bank	Module – Memory	Logic On	Logic Retention	Logic Off
CORE_NRET_BANK		ON	OFF	
	DMM – DMM_MEMBANK1	always_on	always_retention	
	OCP_WP_NOC – OCPWP_BANK	always_on	always_off	
CORE_OCMRAM		ON	RETENTION	
	OCMC_RAM1 – OCMC_RAM_Bank1	always_on	always_retention

### 3.7.15 PD\_MPUAON Description

PD\_MPUAON contains the following reset domains:

- MPUON\_RST
- DPLL\_MPU\_PWRON\_RST

PD\_MPUAON has no associated clock domains.

[Table 3-401](#) lists the logic retention capability for each module of the power domain.

**Table 3-401. PD\_MPUAON Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_MPU	No	None	None

#### 3.7.15.1 Power Domain Modes

The PD\_MPUAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power-state control or status bit field for this power domain.

The PD\_MPUAON power domain has no memory banks.

### 3.7.16 PD\_MMAON Description

PD\_MMAON contains the following reset domains:

- MMAON\_RST
- DPLL\_DSP\_PWRON\_RST
- DPLL\_EVE\_PWRON\_RST

PD\_MMAON has no associated clock domains.

[Table 3-402](#) lists the logic retention capability for each module of the power domain.

**Table 3-402. PD\_MMAON Module Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_DSP	No	None	None
DPLL_EVE	No	None	None

#### 3.7.16.1 Power Domain Modes

The PD\_MMAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power-state control or status bit field for this power domain.

The PD\_MMAON power domain has no memory banks.

### 3.7.17 PD\_COREAON Description

PD\_COREAON contains the following reset domains:

- CM\_CORE\_AON\_PWRON\_RST

- CM\_CORE\_AON\_RST
- COREAON\_PWRON\_RST
- COREAON\_RST
- DPLL\_IVA\_PWRON\_RST

PD\_COREAON contains the CD\_COREAON\_L4 clock domain.

[Table 3-403](#) lists the logic retention capability for each module of the power domain.

SPINNER	No	None	None

### 3.7.17.1 Power Domain Modes

The PD\_COREAON power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power-state control or status bit field for this power domain.

The PD\_COREAON power domain has no memory banks.

### 3.7.18 PD\_VPE Description

PD\_VPE contains the following reset domains:

- VPE\_RST

PD\_VPE contains the CD\_VPE clock domain.

[Table 3-404](#) lists the logic retention capability for each module of the power domain.

**Table 3-404. PD\_VPE Modules Power Attributes**

Module	Logic Retention	DFF Context Status	RFF Context Status

### 3.7.19 PD\_EVE1 Description

PD\_EVE1 contains the following reset domains:

- EVE1\_CPU\_RST
- EVE1\_PWRON\_RST
- EVE1\_RST

PD\_EVE1 contains the CD\_EVE1 clock domain.

Table 3-409 lists the logic retention capability for each module of the power domain.

There is no memory bank implemented for the PD\_RTC.

## 3.8 Voltage-Management Functional Description

This section describes the voltage domains and voltage control architecture. It also explains the interactions between the device and the external power IC.

### 3.8.1 Overview

The voltage-management architecture of the device is based on voltage sources managed by the PRCM module. They define the voltage domains within the device (see [Section 3.1.1.3, Voltage Management](#)). This partition of the voltage domains ensures independent voltage control of each voltage domain through dedicated LDO. The following voltage domains are managed by the PRCM module:

- VDD\_CORE\_L
- VDD\_MPU\_L
- VDD\_IVAHD\_L
- VDD\_DSPEVE\_L
- VDD\_GPU\_L
- VDD\_RTC\_L

---

**NOTE:** For the association of the device power supply pin to the power domain, see [Table 3-26](#).

---

The PRCM module supports the AVS technique on the VDD\_MPU\_L, VDD\_CORE\_L, and VDD\_IVAHD\_L, VDD\_DSPEVE\_L, VDD\_GPU\_L, VDD\_RTC\_L voltage domains.

The PRCM module also supports the ABB technique on the MPU, IVAHD, DSPEVE and GPU voltage domains through the VDD\_MPU\_ABB and VDD\_IVA\_ABB, VDD\_DSPEVE\_ABB, VDD\_GPU\_ABB biasing voltages.

At boot time, the device is set with all five voltage domains (VDD\_MPU\_L, VDD\_GPU\_L, VDD\_CORE\_L, VDD\_DSPEVE\_L, VDD\_IVAHD\_L) at OPP\_NOM.

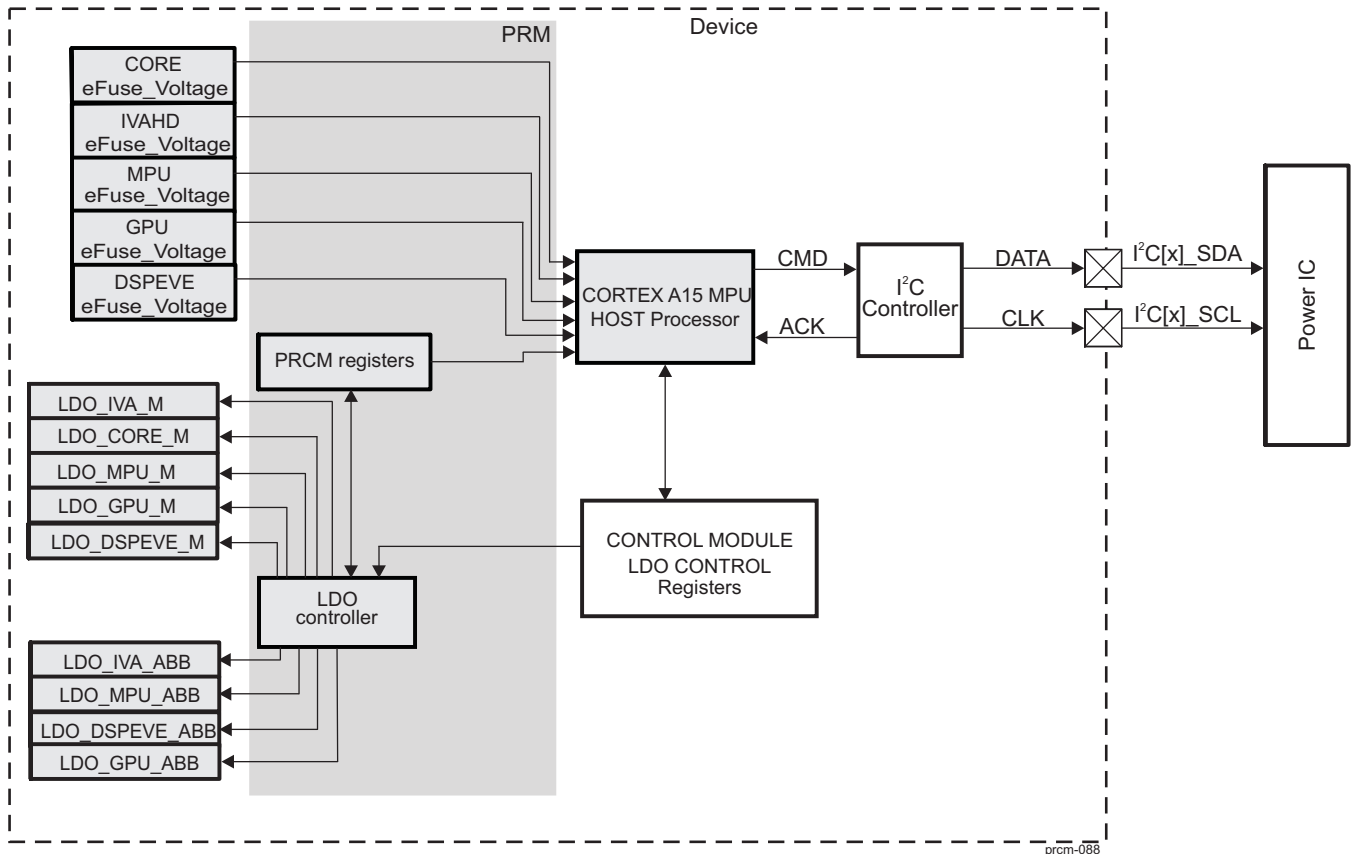

### 3.8.2 Voltage-Control Architecture

The PRM is split over several blocks that manage the different voltage sources.

- A device PRCM for managing the I/O wake-up control and system clock control sequencing during device sleep and wake-up transitions.
- LDO regulator controllers for ABB management, memory arrays voltage management, and WAKEUP logic.
- BANDGAPs reference voltage sleep control

[Figure 3-95](#) shows the architecture for PRM voltage control. This figure represents an example in which the I<sup>2</sup>C interface is used to control the PMIC.

#### 3.8.3.1 VDD\_MPU\_L, VDD\_CORE\_L, and VDD\_IVAHD\_L, VDD\_GPU\_L, VDD\_DSPEVE\_L Control

##### 3.8.3.1.1 Adaptive Voltage Scaling

As explained in [Section 3.1.2.4, Adaptive Voltage Scaling](#) with the SmartReflex technology the power supply voltage can be adapted to the silicon performance statically (for example, adapted to the manufacturing process of a given device).

##### 3.8.3.1.1.1 SmartReflex in the Device

[Figure 3-96](#) shows the SmartReflex integration.

**Figure 3-96. SmartReflex Integration**

### 3.8.3.2 Memory LDOs

Embedded SRAM LDOs are used to supply power to the split-rail memory arrays. The PRM generates the controls used to select LDO operating mode: on-active, on-retention, or off.

Split-rail type SRAMs are used in the device to implement the larger memories. These SRAMs feature memory array and periphery logic, which are on separate supplies to allow independent power management. Proper memory operation, however, requires the SRAM array voltage never to be operated at a level lower than the SRAM periphery logic.

Memory LDO can switch to on and retention mode:

- On (active) mode: 1.15 V is the normal voltage reference used through all functional OPPs whenever memories must be functional. When logic voltage level VDD\_x\_L (where x can be MPU, CORE, or IVAHD) becomes higher than the associated memory voltage level VDD\_x\_M, the LDO operates in tracking mode and follows its respective VDD\_x\_M or VDD\_x\_ABB voltage level.
- Retention mode: 0.6 V is set when software allows and when all memory banks belonging to the LDO memory voltage are in RETENTION state. In this mode, the output voltage is generated from the corresponding VDD\_WKUP\_L logic voltage source.

, *Memory LDOs Transitions*, describes the state transition conditions and sequences for the memory LDOs.

**NOTE:** The voltage levels associated with the different modes may depend on the device characteristics.

### 3.8.3.3 ABB LDOs Control

The ABBLDO supports three voltage modes:

- Bypass mode: In this mode, the ABBLDO\_x is bypassed and outputs the VDD\_x\_L voltages (x refers to the MPU and IVA). This mode is activated when FBB is not required, or when the voltage domain enters low-power mode.
- FBB mode is enabled when the device is a weak process device at the highest OPP.

The PRCM module provides the [PRM\\_ABBLDO\\_MPU\\_SETUP](#) and [PRM\\_ABBLDO\\_GPU\\_SETUP](#) registers for configuration with the following controls:

- SR2EN: To enable or bypass the ABB power management
- ACTIVE\_FBB\_SEL: To enable or bypass FBB mode
- SR2\_WTCNT\_VALUE: LDO settling delay on OPP change. The delay is in the number of system clock cycles.

The PRCM module provides the [PRM\\_ABBLDO\\_MPU\\_CTRL](#) and [PRM\\_ABBLDO\\_GPU\\_CTRL](#) registers for control:

- OPP\_SEL: Current operational OPP
- OPP\_CHANGE: Initiate an OPP-based ABBLDO setting change
- SR2\_STATUS<sup>0</sup>: Current mode of operation of ABBLDO
- SR2\_IN\_TRANSITION: ABBLDO in transition

### 3.8.3.4 ABB LDO Programming Sequence

Anytime the user enters or leaves one of the ABB required OPPs, the appropriate procedure must be followed to enable or disable the ABB LDO.

#### 3.8.3.4.1 ABB LDO Enable Sequence

The following steps turn on the ABB LDO after the voltage change when entering an OPP that requires ABB (FBB):

1. If set, clear the status of the PRCM interrupt for the ABB LDO transition completion:
  - The [PRM\\_IRQSTATUS\\_MPU\[x\]](#) ABB<Voltage\_Domain\_Name>\_DONE\_ST bit should be set to 0x1.
2. Based on which ABB voltage mode (Bypass or FBB) is selected for the OPP (single write), configure the ABB transition:
  - To enter in Forward Body Bias (FBB) mode, set the [PRM\\_ABBLDO\\_<Voltage\\_Domain\\_Name>\\_SETUP\[2\]](#) ACTIVE\_FBB\_SEL bit to 0x1.
3. The user should set the [PRM\\_ABBLDO\\_<Voltage\\_Domain\\_Name>\\_CTRL\[2\]](#) OPP\_CHANGE bit to 0x0.
4. [PRM\\_ABBLDO\\_MPU\\_CTRL\[1:0\]](#) OPP\_SEL bits should be set to 0x1, which select 'Fast' or Forward Body Bias mode.
5. The user should set the ABB voltage value in [CTRL\\_<CORE|WKUP>\\_LDOVBB\\_<Voltage\\_Domain\\_Name>\\_VOLTAGE\\_CTRL\[4:0\]](#) LDOVBB<Voltage\_Domain\_Name>\_FBB\_VSET\_OUT.
  - To use the override value, set the [CTRL\\_<CORE|WKUP>\\_LDOVBB\\_<Voltage\\_Domain\\_Name>\\_VOLTAGE\\_CTRL\[10\]](#) LDOVBB<Voltage\_Domain\_Name>\_FBB\_MUX\_CTRL bit to 0x1.
6. To enable the ABB LDO OPP change, set the [PRM\\_ABBLDO\\_<Voltage\\_Domain\\_Name>\\_CTRL\[2\]](#) OPP\_CHANGE bit to 0x1.
  - Wait until the transaction is complete: the [PRM\\_IRQSTATUS\\_MPU\[x\]](#) ABB\_<Voltage\_Domain\_Name>\_DONE\_ST bit should be set to 0x1.

- Clear interrupt status: the [PRM\\_IRQSTATUS\\_MPU\[x\]](#) ABB\_<Voltage\_Domain\_Name>\_DONE\_ST bit should be set to 0x0.

### 3.8.3.4.2 ABB LDO Disable Sequence (Entering in Bypass Mode)

The following steps turn off the ABB LDO after the voltage change when entering an OPP that requires ABB (FBB):

1. If set, clear the status of the PRCM interrupt for the ABB LDO transition completion:
  - The [PRM\\_IRQSTATUS\\_MPU\[x\]](#) ABB<Voltage\_Domain\_Name>\_DONE\_ST bit should be set to 0x1.
2. Based on which ABB voltage mode (Bypass) is selected for the OPP (single write), configure the ABB transition:
  - To enter nominal (Bypass) mode, set the [PRM\\_ABBLDO\\_<Voltage\\_Domain\\_Name>\\_SETUP\[2\]](#) ACTIVE\_FBB\_SEL bit to 0x0.
3. The user should set the [PRM\\_ABBLDO\\_<Voltage\\_Domain\\_Name>\\_CTRL\[2\]](#) OPP\_CHANGE bit to 0x0.
4. [PRM\\_ABBLDO\\_MPU\\_CTRL\[1:0\]](#) OPP\_SEL bits should be set to 0x0, which select Bypass mode.
5. To enable the ABB LDO OPP change, set the [PRM\\_ABBLDO\\_<Voltage\\_Domain\\_Name>\\_CTRL\[2\]](#) OPP\_CHANGE bit to 0x1.
  - Wait until the transaction is complete: the [PRM\\_IRQSTATUS\\_MPU\[x\]](#) ABB\_<Voltage\_Domain\_Name>\_DONE\_ST bit should be set to 0x1.
  - Clear interrupt status: the [PRM\\_IRQSTATUS\\_MPU\[x\]](#) ABB\_<Voltage\_Domain\_Name>\_DONE\_ST bit should be set to 0x1.
6. The user should set ABB voltage value in [CTRL\\_<CORE|WKUP>\\_LDOVBB\\_<Voltage\\_Domain\\_Name>\\_VOLTAGE\\_CTRL\[4:0\]](#) LDOVBB<Voltage\_Domain\_Name>\_VSET\_OUT to 0x0.

To use the eFuse voltage value, the user should set the [CTRL\\_<CORE|WKUP>\\_LDOVBB\\_<Voltage\\_Domain\\_Name>\\_VOLTAGE\\_CTRL\[10\]](#) LDOVBB<Voltage\_Domain\_Name>\_FBB\_MUX\_CTRL bit to 0x0.

### 3.8.3.5 BANDGAPs Control

BANDGAPs provides voltage reference for internal LDOs. The PRCM module automatically controls the switching between ON and OFF states of the BANDGAPs, based on the power state of the device. It is completely transparent to user software.

BANDGAPs startup time is 100  $\mu$ s. The [PRM\\_BANDGAP\\_SETUP\[7:0\]](#) STARTUP\_COUNT bit field must be set accordingly.

### 3.8.3.6 Memory LDO Transitions

The transition trigger condition for on-to-retention mode is:

- At least all memory banks associated with the LDO are in RETENTION state.

The transition sequence is:

1. Transition trigger conditions are true (that is, satisfied).
2. Switch LDO reference to:
  - Retention mode value if on-to-retention mode transition
3. Start counter for LDO stabilization.
4. When counter expires, voltage transition is complete.

### 3.8.3.7 VDD\_WKUP\_L Transitions

The ON-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY).

- Clock states: Only the 32K clock is active in CD\_WKUPAON.

The SLEEP-to-ON transition trigger conditions are:

- Any device wake-up event other than emulation wake-up event

The EMULATION-to-ON transition trigger conditions are:

- Power domain states: device is in active mode.
- Clock states: any clock other than 32K clock is active in PD\_WKUPAON.

The EMULATION-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY).
- Clock states: Only the 32K clock is active in CD\_WKUPAON.

The SLEEP or ON-to-EMULATION transition trigger condition is:

- Any wake-up event on PD\_EMU

The transition sequence is:

1. Transition trigger conditions are met.
2. VDD\_WKUP\_L initiates the transition.
3. Starts a counter for VDD\_WKUP\_L transition.
4. VDD\_WKUP\_L transition completes.

### 3.8.4 DVFS

Dynamic voltage and frequency scaling is a technique that can be used on the logic voltage domains (VDD\_MPU\_L, VDD\_IVAHD\_L, VDD\_DSPEVE\_L and VDD\_GPU\_L), independently of one another. Upon a current or predictive performance request, determined by software according to ad hoc algorithms or heuristics, software can configure the PRCM module to change the OPP of a voltage domain. For an increase in performance, the voltage is first raised, and then the frequency is increased. For a decrease in performance, the frequency is first decreased, and then the voltage is dropped.

### 3.9 Device Low-Power States

The device low-power states are the result of any valid combination of power domain states in which all the power domains are no longer in ACTIVE state. In such a situation the PRCM module hardware can trigger events to further lower the consumption of the device and the system.

These device low-power states are characterized by the system power consumption, wake-up latency, and required functionality.

The low-power states are:

- **"RTC mode"** : All logic voltage domains (VD\_CORE, VD\_MPU, VD\_GPU, VD\_IVAHD, VD\_DSPEVE) are into OFF state except for the VD\_RTC domain which is ON.

---

**NOTE:** The VD\_RTC remains always ON regardless of the low power state. RTC\_SS is the only wake-up event source in the lowest power mode - "RTC mode".

---

- **"STANDBY"** : Any combination of logic voltage domain states (SLEEP or RETENTION) other than ACTIVE state.

For more details on the wakeup-sources from the "RTC mode" and the "STANDBY" low-power modes, refer to the [Table 3-421](#).

Once the PRCM module hardware detects any valid combination of power domain states, and if a proper programming model of the PRCM module is set, the PRCM module automatically triggers the transition into the device low-power mode.

#### 3.9.1 Device Wake-Up Source Summary

The wake-up events can be asynchronous or synchronous. Synchronous wake-up events require the 32-kHz clock or the system clock to be active, while asynchronous wake-up events do not require an active clock.

The *Modules Attributes* subsection of each clock domain in [Section 3.6, Clock Management Functional Description](#), describes the wake-up capability support for each module of the corresponding power domain.

While the device is in STANDBY mode, additional asynchronous wakeup events from other domains are able to wake up the device.

[Table 3-421](#) identifies which modules in which power domains can be configured to generate a wake-up while the device is in a low-power mode.

**Table 3-421. Wake-Up Sources During Device Low Power Mode**

### 3.9.2 Wakeup Upon Global Warm Reset

When global warm reset is the source of the device wakeup, the sequence is modified as follows:

- The PRCM module releases its reset line. In parallel, the device reset manager counts for global reset extension (set up by the [PRM\\_RSTTIME\[9:0\]](#) RSTTIME1 bit field). The PRCM module holds the other asserted resets until the global reset counter overflows.

The hardware blocks and modifies the [CM\\_SHADOW\\_FREQ\\_CONFIG1\[0\]](#) FREQ\_UPDATE and [CM\\_MPU\\_CLKSTCTRL\[1:0\]](#) CLKTRCTRL bit fields.

### 3.9.3 Global Warm Reset During a Device Wake-Up Sequence

If a global warm reset occurs before the PRCM module completes the voltage stabilization count, the global warm reset is applied immediately. As a consequence, the sequence described in [Section 3.9.2, Wakeup Upon Global Warm Reset](#), is performed.

If the global warm reset occurs after the PRCM module completes voltage stabilization (during phase 1 of automatic restore):

1. Global warm reset is delayed and applied after phase 1 restore completes.
2. Phase 2 of restore is discarded.
3. MPU boots after the warm reset sequence completes.

If the global warm reset occurs during phase 2 of automatic restore:

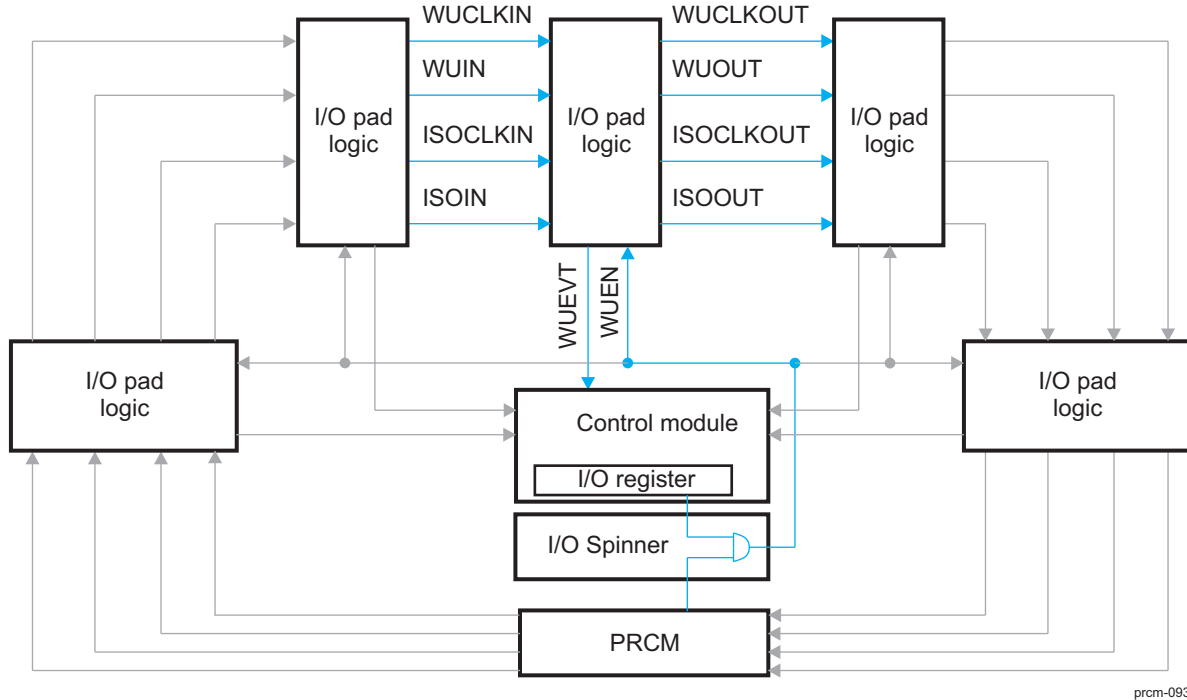

1. Global warm reset is applied immediately.
2. Phase 2 of restore is discarded.
3. MPU boots after the warm reset sequence completes.

### 3.9.4 I/O Management

[Figure 3-97](#) is an overview of the power-management modules and their internal connections with a generic power domain.

ISOIN, ISOCLKIN, WUCLKIN, WUIN, ISOOOUT, ISOCLKOUT, WUCLKOUT and WUOUT connections are built with daisy chaining approach and are all VDD\_WKUP\_L level signals driven by PRM. WUEN and WUEVNT are VDD level signals driven by the control module and/or IO control module. ISOOVR and ISOBYPASS (for DDR IO only) are VDD level signals driven by the PRM.

Figure 3-97. I/O Pads Daisy-Chain Configuration

**NOTE:** ISOBYPASS control from PRM is routed to all the EMIF i/f IOs and ISOOVR control from PRM is routed to all the remaining IOs. These control signals are routed using ALWON VDD buffers. The ISOOVR pin on EMIF IOs is tied to 0 using ALWON tie-off cells. PRM also provides an output status "IO\_ISO\_ACTIVE" which is set when EMIF IOs are isolated or transitioning between isolation and functional mode, and which is cleared when EMIF IOs are functional.

it is required that the ISOCLKIN is forced to 1 during global power-on reset (PRM\_PWRON\_RST\_n = 0).

### 3.9.4.1 Isolation / Wakeup Sequence

#### Enabling Wake-Up Feature:

- Program Control module MMR to assert "WKEN" for each IO (To enable Wakeup feature of IO)
- Write the bit [PRM\\_IO\\_PMCTRL\[8\] WUCLK\\_CTRL](#) to 1 to assert high the signal WUCLKIN.
- Write the bit [PRM\\_IO\\_PMCTRL\[8\] WUCLK\\_CTRL](#) to 0 to assert low the signal WUCLKIN.
- This will latch WKEN, Latch the current pad input value.
- The PRCM register [PRM\\_IO\\_PMCTRL\[9\] WUCLK\\_STATUS](#) logs the signal WUCLK of the last pad of the IO ring.(Should be 0).

**Device goes into sleep mode** (There is no need to put IO in ISOLATION and hence no need to toggle ISOCLKIN and ISOIN (As core supply is still ON)) :

- WKUP event is generated by one of the IOs
- WUOUT of the last IO is asserted HIGH.
- Because of #9, PRM interrupt is generated towards MPU/Host processor
- MPU/Host processor disables the WUKP feature of each IO and power up the required domains.

#### DISABLING WKUP feature:

- Write the bit [PRM\\_IO\\_PMCTRL\[8\] WUCLK\\_CTRL](#) to 1 to assert high the signal WUCLKIN.
- Write the bit [PRM\\_IO\\_PMCTRL\[8\] WUCLK\\_CTRL](#) to 0 to assert low the signal WUCLKIN.

- The PRCM register [PRM\\_IO\\_PMCTRL](#)[9] WUCLK\_STATUS logs the signal WUOUT of the last pad of the IO ring.

#### 3.9.4.1.1 Software-Controlled I/O Isolation

The [PRM\\_IO\\_PMCTRL](#)[4] ISOOVR\_EXTEND bit allows extending the non-EMIF I/O isolation. This feature can be used by software to restore modules driving output, such as GPIO, while non-EMIF I/Os are still isolated. Once software completes the relevant module restore, it clears the bit and hardware performs full-isolation-to-EMIF on the hardware-controlled I/O transition.

The [PRM\\_IO\\_PMCTRL](#)[5] IO\_ON\_STATUS bit is available for software to check completion of the EMIF on transition.

Set clock domain state transition feature.	CM_<Clock Domain name>_CLKSTCTRL[1:0] CLKTRCTRL	xx <sup>(3)</sup>

<sup>(3)</sup> It depends on the desired state of the clock domain. See [Table 3-12](#).

### 3.10.2.1.2.2 Subsequence – Slave Module Clock-Management Parameters Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

**Table 3-431. Slave Module Clock-Management Parameter Configuration**

Step	Register/Bit Field/Programming Model	Value
Configure module idle mode feature.	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	xx <sup>(1)</sup>
<b>IF</b> : Smart-idle mode is selected	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	0x10
Configure module clock requirement feature.	<Module name>_SYSCONFIG[x] CLOCKACTIVITY	x <sup>(1)</sup>
<b>ENDIF</b>		
Configure module management behavior on the PRCM module side.	CM_<Clock Domain name>_<Module name>_CLKCTRL[1:0] MODULEMODE	xx <sup>(2)</sup>

<sup>(1)</sup> See the module register for valid settings.

<sup>(2)</sup> The selected value depends on the desired clock-management behavior.

### 3.10.2.2 Clock Domain Sleep Transition and Troubleshooting

This procedure initiates a sleep transition on a clock domain and allows debugging if the transition does not occur.

**Table 3-432. Clock Domain Sleep Transition and Troubleshooting**

Step	Register/Bit Field/Programming Model	Value
Set clock domain sleep transition state.	CM_<Clock Domain name>_CLKSTCTRL[1:0] CLKTRCTRL	0x1: SW_SLEEP 0x3: HW_AUTO
<b>IF</b> : Clock domain sleep transition not initiated?		
Check that all clock domain master modules are in standby mode.	CM_<Clock Domain name>_<Module name>_CLKCTRL[18] STBYST	0x1: Module in standby
Check that all clock domain slave modules are in idle mode.	CM_<Clock Domain name>_<Module name>_CLKCTRL[17:16] IDLEST	0x1: In transition 0x2: Interface clock idled 0x3: Module idled
<b>ENDIF</b>		

### 3.10.2.3 Enable/Disable Software-Programmable Static Dependency

To change the setting of a software-programmable static dependency, use the procedure described in [Table 3-433](#).

**Table 3-433. Enable/Disable Software-Programmable Static Dependency**

Step	Register/Bit Field/Programming Model	Value
Force destination domain to be awake (SW_WKUP).	CM_<Dest_CDname>_CLKSTCTRL[1:0] CLKTRCTRL	0x2

**Table 3-433. Enable/Disable Software-Programmable Static Dependency (continued)**

Step	Register/Bit Field/Programming Model	Value
Wait until power domain that encloses the destination domain is ON.	PM_<Dest_PDname>_PWRSTST	=0x3
Change the static dependency.	CM_<Src_CDname>_STATICDEP[x] Dest_CDname_STATDEP	0x1
Put destination domain back to automatic transition (HW_AUTO).	CM_<Dest_CDname>_CLKSTCTRL[1:0] CLKTRCTRL	0x3

### 3.10.3 Power Management Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and control of the power domain in the device.

#### 3.10.3.1 Global Initialization

##### 3.10.3.1.1 Surrounding Module Global Initialization

Initialization of any surrounding modules within the device is not required. The external power IC and the device clocks should be active.

##### 3.10.3.1.2 Power Management Global Initialization

###### 3.10.3.1.2.1 Main Sequence – Power Domain Global Initialization and Setting

This procedure initializes the power domain of the device after a POR or software reset.

**Table 3-434. Power Domain Global Initialization**

Step	Register/Bit Field/Programming Model	Value
Configure memory area power state when the power domain is on. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x1: RETAINED 0x3: ON
Configure memory area power state when the power domain transitions to RETENTION state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_RETSTATE	0x1: RETAINED
Configure logic area RETENTION power state when the power domain transitions to RETENTION state.	PM_<Power Domain name>_PWRSTCTRL[2] LOGICRETSTATE	0x1: CSWR
Select target power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE
Wait until power state change is complete.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE

#### 3.10.3.2 Forced Memory Area State Change With Power Domain ON

This procedure initiates a forced memory area state change while the power domain is ON.

**Table 3-435. Forced Memory Area State Change With Power Domain ON**

Step	Register/Bit Field/Programming Model	Value
Configure memory area target power state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x1: RETAINED 0x3: ON
Get memory area current state.	PM_<Power Domain name>_PWRSTST[x] <Memory Bank name>_STATEST	0x1: RETAINED 0x3: ON

### 3.10.3.3 Forced Power Domain Low-Power State Transition

**Table 3-436. Forced Power Domain Low-Power State Transition**

Step	Register/Bit Field/Programming Model	Value
Select target low-power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x1: RETENTION
Force power domain low-power state transition.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x1: Force change
Wait until state change is complete.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x0: Change complete
Get current power state.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x1: RETENTION

<b>Address Offset</b>	0x0000 0000	<b>Instance</b>	CM_CORE__CAM
<b>Physical Address</b>	0x4A00 9000		
<b>Description</b>	This register enables the domain power state transition. It controls the HW supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.		
<b>Type</b>	RW

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0
17:16	IDLEST	Module idle status. [warm reset insensitive] 0x0: Module is fully functional, including OCP 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3: Module is disabled and cannot be accessed	R	0x3
15:2	RESERVED		R	0x0
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x1: Module is managed automatically by HW according to clock domain transition. A clock domain sleep transition put module into idle. A wakeup domain transition put it back into function. If CLKTRCTRL=3, any OCP access to module is always granted. Module clocks may be gated according to the clock domain state.	R	0x1
