OMAP4460 Multimedia Device Silicon Revision 1.x

Texas Instruments OMAP™ Family of Products

Version AB

Technical Reference Manual

Literature Number: SWPU235AB
February 2011–Revised April 2014

WARNING: EXPORT NOTICE

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from Disclosing party under this Agreement, or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorisation from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws. This provision shall survive termination or expiration of this Agreement.

According to our best knowledge of the state and end-use of this product or technology, and in compliance with the export control regulations of dual-use goods in force in the origin and exporting countries, this technology is classified as follows:

US ECCN: 3E991

EU ECCN: EAR99

And may require export or re-export license for shipping it in compliance with the applicable regulations of certain countries.

Contents

Preface	259
1 Introduction	273
1.1 Overview	274
1.2 Environment	275
1.3 Description	276
1.3.1 Cortex-A9 MPU Subsystem Description	278
1.3.2 DSP Subsystem Description	278
1.3.3 IVA-HD Subsystem Description	278
1.3.4 Cortex-M3 MPU Subsystem Description	279
1.3.5 Display Subsystem Description	280
1.3.6 ABE Subsystem Description	281
1.3.7 ISS Description	281
1.3.8 2D/3D Graphics Accelerator Description	283
1.3.9 Face Detect Module Description	283
1.3.10 On-Chip Debug Support Description	283
1.3.11 Power, Reset, and Clock Management Description	284
1.3.12 On-Chip Memory Description	285
1.3.13 Memory Management Description	285
1.3.14 External Memory Interface Description	285
1.3.15 System and Connection Peripherals	285
1.3.15.1 System Peripherals	285
1.3.15.2 Connection Peripherals	286
1.4 Package-On-Package Concept	287
1.5 OMAP4460 Family and Device Identification	288
2 Memory Mapping	290
2.1 Introduction	291
2.2 L3 Memory Space Mapping	293
2.2.1 L3_EMU Memory Space Mapping	295
2.3 L4 Memory Space Mapping	296
2.3.1 L4_CFG Memory Space Mapping	296
2.3.2 L4_WKUP Memory Space Mapping	298
2.3.3 L4_PER Memory Space Mapping	299
2.3.4 L4_ABE Memory Space Mapping	301
2.4 Dual Cortex-M3 Subsystem Memory Space Mapping	305
2.5 DSP Subsystem Memory Space Mapping	306
2.6 Display Subsystem Memory Space Mapping	308
2.6.1 L3 Interconnect View of the Display Memory Space	308
2.6.2 L4 Interconnect View of the Display Memory Space	308
3 Power, Reset and Clock Management	309
3.1 Device Power Management Introduction	310
3.1.1 Device Power-Management Architecture Building Blocks	310
3.1.1.1 Clock Management	310
3.1.1.1.1 Module Interface and Functional Clocks	310

3.1.1.1.2	Module-Level Clock Management	311
3.1.1.1.3	Clock Domain.....	316
3.1.1.1.4	Clock Domain-Level Clock Management	317
3.1.1.1.5	Clock Domain HW_AUTO Mode Sequences	319
3.1.1.1.6	Clock Domain Sleep/Wakeup	322
3.1.1.1.7	Clock Domain Dependency.....	322
3.1.1.2	Power Management.....	325
3.1.1.2.1	Power Domain.....	325
3.1.1.2.2	Module Logic and Memory Context	327
3.1.1.2.3	Retention-Till-Access Memory Feature	327
3.1.1.2.4	Power Domain Management	327
3.1.1.3	Voltage Management	329
3.1.1.3.1	Voltage Domain	329
3.1.1.3.2	Voltage Domain Management.....	331
3.1.1.3.3	AVS Overview	332
3.1.2	Power-Management Techniques	334
3.1.2.1	Standby Leakage Management	334
3.1.2.2	Dynamic Voltage and Frequency Scaling	335
3.1.2.3	Dynamic Power Switching.....	336
3.1.2.4	Adaptive Voltage Scaling.....	336
3.1.2.5	Adaptive Body Bias	337
3.1.2.6	Combining Power-Management Techniques	337
3.1.2.6.1	DPS Versus SLM	338
3.2	PRCM Subsystem Overview	339
3.2.1	Introduction	339
3.2.2	Power-Management Framework Features	340
3.3	PRCM Subsystem Environment	341
3.3.1	External Clock Signals	341
3.3.2	External Boot Signals	342
3.3.3	External Reset Signals.....	342
3.3.4	External Power Control Signals.....	343
3.3.5	External Voltage Inputs	343
3.4	PRCM Subsystem Integration.....	345
3.4.1	Device Power-Management Layout	345
3.4.2	Power-Management Scheme, Reset, and Interrupt Requests.....	348
3.4.2.1	Power Domain	348
3.4.2.2	Resets.....	348
3.4.2.3	Interrupt Requests.....	348
3.5	Reset Management Functional Description	349
3.5.1	Overview	349
3.5.1.1	SCRM Reset Management Functional Description	349
3.5.1.1.1	Power-On Reset	349
3.5.1.1.2	Warm Reset	349
3.5.1.2	PRM Reset Management Functional Description	350
3.5.2	General Characteristics of Reset Signals	350
3.5.2.1	Scope	350
3.5.2.2	Occurrence	350
3.5.2.3	Source Type.....	351
3.5.2.4	Retention Type.....	351
3.5.3	Reset Sources.....	351
3.5.3.1	Global Reset Sources.....	351
3.5.3.2	Local Reset Sources	352
3.5.4	Reset Domains.....	352

3.5.5	Reset Logging	366
3.5.5.1	PRCM Module Reset Logging Mechanism.....	366
3.5.6	Reset Sequences	366
3.5.6.1	SCRM Power-on Reset Sequence	366
3.5.6.2	PRCM Module Power-On Reset Sequence.....	367
3.5.6.3	Cortex-A9 MPU Subsystem Power-On Reset Sequence	369
3.5.6.4	Cortex-A9 MPU Subsystem Warm Reset Sequence	370
3.5.6.5	Cortex-A9 MPU Subsystem Reset Sequence On Sleep and Wake-Up Transitions From RETENTION or OFF State	371
3.5.6.6	IVAHD Subsystem Power-On Reset Sequence	371
3.5.6.7	IVAHD Subsystem Software Warm Reset Sequence	372
3.5.6.8	DSP Subsystem Power-On Reset Sequence.....	373
3.5.6.9	DSP Subsystem Software Warm Reset Sequence	374
3.5.6.10	DSP Subsystem Reset Sequence On Wake-Up Transitions From OSWR RETENTION State	374
3.5.6.11	Cortex-M3 MPU Subsystem Power-On Reset Sequence.....	375
3.5.6.12	Cortex-M3 MPU Subsystem Software Warm Reset Sequence	376
3.5.6.13	Global Warm Reset Sequence	378
3.6	Clock Management Functional Description	380
3.6.1	Overview	380
3.6.2	External Clock Inputs.....	381
3.6.2.1	sys_32k Clock Input.....	381
3.6.2.2	High-Frequency System Clock Input.....	381
3.6.3	Internal Clock Sources/Generators	381
3.6.3.1	PRM Clock Source	381
3.6.3.2	CM Clock Source	384
3.6.3.2.1	CM1 Clock Generator	384
3.6.3.2.2	CM1_USB Clock Generator	385
3.6.3.2.3	CM1_ABE Clock Generator	387
3.6.3.2.4	CM2 Clock Generator	388
3.6.3.3	Generic DPLL Overview	391
3.6.3.3.1	DPLLs Output Clocks Parameters	392
3.6.3.3.2	Enable Control, Status, and Low-Power Operation Mode	394
3.6.3.3.3	DPLL Power Modes	394
3.6.3.3.4	DPLL Recalibration	395
3.6.3.3.5	DPLL Spread Spectrum Clocking.....	396
3.6.3.3.6	DPLL Output Power Down.....	403
3.6.3.3.7	DPLL Output Clock Gating.....	403
3.6.3.4	DPLL_PER Description	403
3.6.3.4.1	Overview	403
3.6.3.4.2	Synthesized Clock Parameters	404
3.6.3.4.3	Power Modes	405
3.6.3.4.4	Recalibration.....	406
3.6.3.4.5	Spread Spectrum Clocking	406
3.6.3.4.6	Output Power Down	406
3.6.3.4.7	DPLL_PER Preferred Settings	407
3.6.3.5	DPLL_CORE Description.....	409
3.6.3.5.1	Overview	409
3.6.3.5.2	Synthesized Clock Parameters	409
3.6.3.5.3	Power Modes	410
3.6.3.5.4	Recalibration.....	411
3.6.3.5.5	Spread Spectrum Clocking	411
3.6.3.5.6	Output Power-Down	412
3.6.3.5.7	DPLL_CORE Preferred Settings.....	413
3.6.3.6	DPLL_ABE Description	415

3.6.3.6.1	Overview	415
3.6.3.6.2	Synthesized Clock Parameters	415
3.6.3.6.3	Power Modes	416
3.6.3.6.4	Recalibration	416
3.6.3.6.5	Spread Spectrum Clocking	416
3.6.3.6.6	DPLL_ABE Preferred Settings	417
3.6.3.7	DPLL_MPU Description	418
3.6.3.7.1	Overview	418
3.6.3.7.2	Tactical Clocking Adjustment	419
3.6.3.7.3	Synthesized Clock Parameters	419
3.6.3.7.4	Power Modes	420
3.6.3.7.5	Recalibration	420
3.6.3.7.6	Spread Spectrum Clocking	420
3.6.3.7.7	DPLL_MPU Preferred Settings	421
3.6.3.8	DPLL_IVA Description	422
3.6.3.8.1	Overview	422
3.6.3.8.2	Synthesized Clock Parameters	423
3.6.3.8.3	Power Modes	423
3.6.3.8.4	Recalibration	424
3.6.3.8.5	Spread Spectrum Clocking	424
3.6.3.8.6	Output Power Down	424
3.6.3.8.7	DPLL_IVA Preferred Settings	424
3.6.3.9	DPLL_USB Description	426
3.6.3.9.1	Overview	426
3.6.3.9.2	Synthesized Clock Parameters	426
3.6.3.9.3	Power Modes	427
3.6.3.9.4	Spread Spectrum Clocking	427
3.6.3.9.5	DPLL_USB Preferred Settings	427
3.6.3.10	DPLLs Cascading	429
3.6.4	CD_WKUP Clock Domain	430
3.6.4.1	Overview	430
3.6.4.2	Clock Domain Modes	430
3.6.4.3	Clock Domain Dependency	431
3.6.4.3.1	Wake-Up Dependency	431
3.6.4.4	Clock Domain Module Attributes	431
3.6.5	CD_DSP Clock Domain	433
3.6.5.1	Overview	433
3.6.5.2	Clock Domain Modes	434
3.6.5.3	Clock Domain Dependency	434
3.6.5.3.1	Static Dependency	434
3.6.5.3.2	Dynamic Dependency	435
3.6.5.4	Clock Domain Module Attributes	435
3.6.6	CD_STD_EFUSE Clock Domain	436
3.6.6.1	Overview	436
3.6.6.2	Clock Domain Module Attributes	436
3.6.7	CD_CORTEXA9 Clock Domain	437
3.6.7.1	Overview	437
3.6.7.2	Clock Domain Modes	437
3.6.7.3	Clock Domain Dependency	438
3.6.7.3.1	Static Dependency	438
3.6.7.3.2	Dynamic Dependency	438
3.6.7.4	Clock Domain Module Attributes	439
3.6.8	CD_L4_PER Clock Domain	439

3.6.8.1	Overview	439
3.6.8.2	Clock Domain Modes	440
3.6.8.3	Clock Domain Dependency	441
3.6.8.3.1	Dynamic Dependency	441
3.6.8.3.2	Wake-Up Dependency	441
3.6.8.4	Clock Domain Module Attributes	446
3.6.9	CD_L4_SEC Clock Domain	452
3.6.9.1	Overview	452
3.6.9.2	Clock Domain Modes	452
3.6.9.3	Clock Domain Dependency	452
3.6.9.3.1	Static Dependency	452
3.6.9.3.2	Dynamic Dependency	453
3.6.9.4	Clock Domain Module Attributes	453
3.6.10	CD_L3_INIT Clock Domain	454
3.6.10.1	Overview	454
3.6.10.2	Clock Domain Modes	454
3.6.10.3	Clock Domain Dependency	455
3.6.10.3.1	Static Dependency	455
3.6.10.3.2	Dynamic Dependency	456
3.6.10.3.3	Wake-Up Dependency	456
3.6.10.4	Clock Domain Module Attributes	457
3.6.11	CD_IVAHD Clock Domain	460
3.6.11.1	Overview	460
3.6.11.2	Clock Domain Modes	460
3.6.11.3	Clock Domain Dependency	461
3.6.11.3.1	Static Dependency	461
3.6.11.3.2	Dynamic Dependency	461
3.6.11.4	Clock Domain Module Attributes	461
3.6.12	CD_SGX Clock Domain	462
3.6.12.1	Overview	462
3.6.12.2	Clock Domain Modes	462
3.6.12.3	Clock Domain Dependency	463
3.6.12.3.1	Static Dependency	463
3.6.12.3.2	Dynamic Dependency	463
3.6.12.4	Clock Domain Module Attributes	463
3.6.13	CD_EMU Clock Domain	464
3.6.13.1	Overview	464
3.6.13.2	Clock Domain Modes	465
3.6.13.3	Clock Domain Dependency	466
3.6.13.3.1	Dynamic Dependency	466
3.6.13.4	Clock Domain Module Attributes	466
3.6.14	CD_DSS Clock Domain	466
3.6.14.1	Overview	466
3.6.14.2	Clock Domain Modes	467
3.6.14.3	Clock Domain Dependency	467
3.6.14.3.1	Static Dependency	467
3.6.14.3.2	Dynamic Dependency	468
3.6.14.3.3	Wake-Up Dependency	468
3.6.14.4	Clock Domain Module Attributes	469
3.6.15	CD_L4_CFG Clock Domain	470
3.6.15.1	Overview	470
3.6.15.2	Clock Domain Modes	471
3.6.15.3	Clock Domain Dependency	471

3.6.15.3.1	Dynamic Dependency	471
3.6.15.4	Clock Domain Module Attributes	472
3.6.16	CD_L3_INSTR Clock Domain.....	473
3.6.16.1	Overview.....	473
3.6.16.2	Clock Domain Modes	473
3.6.16.3	Clock Domain Dependency	474
3.6.16.4	Clock Domain Module Attributes	474
3.6.17	CD_L3_2 Clock Domain	475
3.6.17.1	Overview.....	475
3.6.17.2	Clock Domain Modes	475
3.6.17.3	Clock Domain Dependency	476
3.6.17.3.1	Dynamic Dependency	476
3.6.17.4	Clock Domain Module Attributes	476
3.6.18	CD_L3_1 Clock Domain	477
3.6.18.1	Overview.....	477
3.6.18.2	Clock Domain Modes	477
3.6.18.3	Clock Domain Dependency	478
3.6.18.3.1	Dynamic Dependency	478
3.6.18.4	Clock Domain Module Attributes	478
3.6.19	CD_EMIF Clock Domain.....	479
3.6.19.1	Overview.....	479
3.6.19.2	Clock Domain Modes	479
3.6.19.3	Clock Domain Dependency	480
3.6.19.4	Clock Domain Module Attributes	480
3.6.20	CD_CORTEXM3 Clock Domain	481
3.6.20.1	Overview.....	481
3.6.20.2	Clock Domain Modes	482
3.6.20.3	Clock Domain Dependency	482
3.6.20.3.1	Static Dependency.....	482
3.6.20.3.2	Dynamic Dependency	483
3.6.20.4	Clock Domain Module Attributes	483
3.6.21	CD_DMA Clock Domain	484
3.6.21.1	Overview.....	484
3.6.21.2	Clock Domain Modes	484
3.6.21.3	Clock Domain Dependency	484
3.6.21.4	Clock Domain Module Attributes	484
3.6.22	CD_CAM Clock Domain	485
3.6.22.1	Overview.....	485
3.6.22.2	Clock Domain Modes	486
3.6.22.3	Clock Domain Dependency	486
3.6.22.3.1	Static Dependency.....	486
3.6.22.3.2	Dynamic Dependency	486
3.6.22.4	Clock Domain Module Attributes	486
3.6.23	CD_ABE Clock Domain.....	487
3.6.23.1	Overview.....	487
3.6.23.2	Clock Domain Modes	488
3.6.23.3	Clock Domain Dependency	488
3.6.23.3.1	Wake-Up Dependency	488
3.6.23.4	Clock Domain Module Attributes	491
3.6.24	CD_L4_ALWON_CORE Clock Domain	494
3.6.24.1	Overview.....	494
3.6.24.2	Clock Domain Modes	494
3.6.24.3	Clock Domain Dependency	494

3.6.24.3.1	Wake-Up Dependency	494
3.6.24.4	Clock Domain Module Attributes	495
3.7	Power Management Functional Description.....	496
3.7.1	PD_WKUP Description.....	496
3.7.1.1	Power Domain Modes	497
3.7.2	PD_DSP Description	497
3.7.2.1	Power Domain Modes	497
3.7.2.1.1	Logic and Memory Area Power Modes	497
3.7.2.1.2	Logic and Memory Area Power Modes Control and Status	498
3.7.3	PD_STD_EFUSE Description	498
3.7.3.1	Power Domain Modes	499
3.7.4	PD_MPU Description.....	499
3.7.4.1	Power Domain Modes	499
3.7.4.1.1	Logic and Memory Area Power Modes	499
3.7.4.1.2	Logic and Memory Area Power Modes Control and Status	500
3.7.5	PD_L4_PER Description.....	500
3.7.5.1	Power Domain Modes	502
3.7.5.1.1	Logic and Memory Area Power Modes	502
3.7.5.1.2	Logic and Memory Area Power Modes Control and Status	503
3.7.6	PD_L3_INIT Description	504
3.7.6.1	Power Domain Modes	504
3.7.6.1.1	Logic and Memory Area Power Modes	504
3.7.6.1.2	Logic and Memory Area Power Modes Control and Status	505
3.7.7	PD_IVAHD Description	505
3.7.7.1	Power Domain Modes	506
3.7.7.1.1	Logic and Memory Area Power Modes	506
3.7.7.1.2	Logic and Memory Area Power Modes Control and Status	506
3.7.8	PD_SGX Description	507
3.7.8.1	Power Domain Modes	507
3.7.8.1.1	Logic and Memory Area Power Modes	508
3.7.8.1.2	Logic and Memory Area Power Modes Control and Status	508
3.7.9	PD_EMU Description.....	508
3.7.9.1	Power Domain Modes	509
3.7.9.1.1	Logic and Memory Area Power Modes	509
3.7.9.1.2	Logic and Memory Area Power Modes Control and Status	509
3.7.10	PD_DSS Description	510
3.7.10.1	Power Domain Modes	510
3.7.10.1.1	Logic and Memory Area Power Modes	510
3.7.10.1.2	Logic and Memory Area Power Modes Control and Status	510
3.7.11	PD_CORE Description	511
3.7.11.1	Power Domain Modes	512
3.7.11.1.1	Logic and Memory Area Power Modes	512
3.7.11.1.2	Logic and Memory Area Power Modes Control and Status	513
3.7.12	PD_CAM Description.....	514
3.7.12.1	Power Domain Modes	515
3.7.12.1.1	Logic and Memory Area Power Modes	515
3.7.12.1.2	Logic and Memory Area Power Modes Control and Status	515
3.7.13	PD_AUDIO Description	516
3.7.13.1	Power Domain Modes	516
3.7.13.1.1	Logic and Memory Area Power Modes	516
3.7.13.1.2	Logic and Memory Area Power Modes Control and Status	517
3.7.14	PD_ALWON_MPU Description	518
3.7.14.1	Power Domain Modes	518

3.7.15	PD_ALWON_DSP Description	518
3.7.15.1	Power Domain Modes	518
3.7.16	PD_ALWON_CORE Description	518
3.7.16.1	Power Domain Modes	519
3.8	Voltage Management Functional Description	520
3.8.1	Overview	520
3.8.2	Voltage-Control Architecture	521
3.8.3	VDD_MPU_L, VDD_CORE_L, and VDD_IVA_L Control.....	522
3.8.3.1	PRM Dedicated I ² C Control	522
3.8.3.2	Adaptive Voltage Scaling	523
3.8.3.2.1	SmartReflex in the Device	523
3.8.3.2.2	SmartReflex Module	524
3.8.3.2.3	SmartReflex Submodules	525
3.8.3.2.4	SmartReflex Convergence Verification.....	528
3.8.3.2.5	Status Register	529
3.8.3.2.6	SmartReflex Parameters Set After Silicon Characterization	529
3.8.3.2.7	Voltage Processor Module.....	530
3.8.3.2.8	SMPS-Dependent Parameter Configuration	532
3.8.3.2.9	Communication Between SmartReflex, Voltage Processor, Voltage Controller, and SMPS.....	533
3.8.4	Internal LDOs Control	533
3.8.4.1	Memory LDOs.....	533
3.8.4.2	LDO_WAKEUP	534
3.8.4.3	ABB LDOs Control	534
3.8.4.3.1	ABB Strategy for the Cortex-A9 MPU Operating at OPP_TURBO.....	535
3.8.4.3.2	ABB Strategy for the IVA-HD Operating at OPP_TURBO.....	535
3.8.4.4	Bandgap control	535
3.8.5	Voltage Domain State Transitions	535
3.8.5.1	VDD_x_L Transitions	535
3.8.5.2	Memory LDOs Transitions.....	536
3.8.5.3	LDO_WAKEUP Transitions	536
3.8.6	DVFS	537
3.8.6.1	EMIF Clocks Frequency Scaling Constraints	537
3.8.6.2	GPMC Clocks Frequency Scaling Constraints	539
3.8.6.3	CORE DVFS Versus Subsystem Functionality	540
3.8.6.3.1	Display Subsystem	540
3.8.6.3.2	IVAHD	540
3.8.6.3.3	Imaging Subsystem.....	540

15.4.4.13.2	NAND Device-Ready Pin	3467
15.4.4.13.3	ECC Calculator	3468
15.4.4.13.4	Prefetch and Write-Posting Engine	3485
15.4.5	GPMC Basic Programming Model	3493
15.4.5.1	GPMC High-Level Programming Model Overview	3493
15.4.5.2	GPMC Initialization	3495
15.4.5.3	GPMC Configuration in NOR Mode	3495
15.4.5.4	GPMC Configuration in NAND Mode	3496
15.4.5.5	Set Memory Access	3498
15.4.5.6	GPMC Timing Parameters	3499
15.4.5.6.1	GPMC Timing Parameters Formulas	3502
15.4.6	GPMC Use Cases And Tips	3510
15.4.6.1	How to Set GPMC Timing Parameters for Typical Accesses	3510
15.4.6.1.1	External Memory Attached to the GPMC Module	3510
15.4.6.1.2	Typical GPMC Setup	3510
15.4.6.2	How to choose a suitable memory to use with the GPMC	3516
15.4.6.2.1	Supported Memories or Devices	3516
15.4.6.2.2	GPMC Features and Settings	3518
15.4.7	GPMC Register Manual	3519
15.4.7.1	GPMC Register Summary	3519
15.4.7.2	GPMC Register Descriptions	3520
15.5	Error Location Module	3550
15.5.1	Error Location Module Overview	3550
15.5.1.1	ELM Features	3550
15.5.2	ELM Integration	3551
15.5.3	ELM Functional Description	3552
15.5.3.1	ELM Software Reset	3552
15.5.3.2	ELM Power Management	3552
15.5.3.3	ELM Interrupt Requests	3553
15.5.3.4	Processing Initialization	3553
15.5.3.5	Processing Sequence	3554
15.5.3.6	Processing Completion	3555
15.5.4	ELM Basic Programming Model	3555
15.5.4.1	ELM Low Level Programming Model	3555
15.5.4.1.1	Processing Initialization	3555
15.5.4.1.2	Read Results	3556
15.5.4.2	Use Case: ELM Used in Continuous Mode	3557
15.5.4.3	Use Case: ELM Used in Page Mode	3558
15.5.5	ELM Register Manual	3560
15.5.5.1	ELM Instance Summary	3560
15.5.5.2	ELM Registers	3560
15.5.5.2.1	ELM Register Summary	3560
15.5.5.2.2	ELM Register Description	3561
15.6	On-Chip Memory (OCM) Subsystem	3577
15.6.1	OCM Subsystem Overview	3577
15.6.2	OCM Subsystem Integration	3577
15.6.3	OCM Subsystem Functional Description	3579
15.6.3.1	SAR ROM	3579
15.6.3.2	SAR RAM	3579

15.6.3.3	L3 OCM_RAM	3580

22.3.1	Watchdog Timers Overview	4509
22.3.1.1	Watchdog Timers Features	4510
22.3.2	Watchdog Timer Environment	4510
22.3.3	Watchdog Timer Integration	4511
22.3.4	Watchdog Timers Functional Description	4513
22.3.4.1	Power Management	4513
22.3.4.1.1	Wake-Up Capability	4513
22.3.4.2	Interrupts	4513
22.3.4.3	General Watchdog Timer Operation.....	4514
22.3.4.4	Reset Context	4514
22.3.4.5	Overflow/Reset Generation	4515
22.3.4.6	Prescaler Value/Timer Reset Frequency	4515
22.3.4.7	Triggering a Timer Reload	4516
22.3.4.8	Start/Stop Sequence for Watchdog Timers (Using the WDT_WSPR Register)	4517
22.3.4.9	Modifying Timer Count/Load Values and Prescaler Setting.....	4517
22.3.4.10	Watchdog Counter Register Access Restriction (WDT_WCRR Register)	4517
22.3.4.11	Watchdog Timer Interrupt Generation	4517
22.3.4.12	Watchdog Timers Under Emulation	4518
22.3.4.13	Accessing Watchdog Timer Registers	4518
22.3.5	Watchdog Timer Low-Level Programming Model.....	4519
22.3.5.1	Global Initialization	4519
22.3.5.1.1	Surrounding Modules Global Initialization.....	4519
22.3.5.1.2	Watchdog Timer Module Global Initialization.....	4521
22.3.5.2	Operational Mode Configuration	4521
22.3.5.2.1	Watchdog Timer Basic Configuration.....	4521
22.3.6	Watchdog Timer Register Manual	4522
22.3.6.1	Watchdog Timer Instance Summary	4522
22.3.6.2	Watchdog Timer Registers	4522
22.3.6.2.1	Watchdog Timer Register Summary.....	4522
22.3.6.2.2	Watchdog Timer Register Description.....	4524
22.4	32-kHz Synchronized Timer	4537
22.4.1	32-kHz Synchronized Timer Overview	4537
22.4.1.1	32-kHz Synchronized Timer Features.....	4537
22.4.2	32-kHz Synchronized Timer Environment	4537
22.4.3	32-kHz Synchronized Timer Integration.....	4537
22.4.4	32-kHz Synchronized Timer Functional Description.....	4538
22.4.4.1	Reading the 32-kHz Synchronized Timer.....	4539
22.4.5	32KTimer Register Manual	4540
22.4.5.1	32KTimer Register Mapping Summary	4540
22.4.5.2	32KTimer Register Description.....	4540
23	Serial Communication Interface	4542
23.1	Multimaster High-Speed I ² C Controller	4543
23.1.1	HS I ² C Overview.....	4543
23.1.2	HS I ² C Environment.....	4546
23.1.2.1	HS I ² C in I ² C Mode.....	4546
23.1.2.1.1	HS I ² C Pins for Typical Connections in I ² C Mode.....	4546
23.1.2.1.2	HS I ² C Interface Typical Connections	4546
23.1.2.1.3	HS I ² C Typical Connection Protocol and Data Format	4547

23.1.2.2	HS I ² C in SCCB Mode.....	4551
23.1.2.2.1	HS I ² C Pins for Typical Connections in SCCB Mode.....	4552
23.1.2.2.2	HS I ² C SCCB Interface Typical Connections.....	4553
23.1.2.2.3	HS I ² C SCCB Typical Connection Protocol and Data Format.....	4554
23.1.2.3	HS I ² C for Communication With Power Chip(s).....	4556
23.1.2.3.1	HS I ² C I2C5 Pins for Typical Connections.....	4556
23.1.2.3.2	HS I ² C I2C5 Interface Typical Connections.....	4556
23.1.2.3.3	HS I ² C Typical Connections Protocol and Data Format for I2C5.....	4557
23.1.3	HS I ² C Integration.....	4560
23.1.4	HS I ² C Functional Description.....	4563
23.1.4.1	HS I ² C Block Diagram.....	4563
23.1.4.2	HS I ² C Clocks.....	4564
23.1.4.2.1	HS I ² C Clocking.....	4564
23.1.4.2.2	HS I ² C Automatic Blocking of the I ² C Clock Feature (I ² C Mode Only).....	4568
23.1.4.3	HS I ² C Software Reset.....	4568
23.1.4.4	HS I ² C Power Management.....	4568
23.1.4.5	HS I ² C Interrupt Requests.....	4569
23.1.4.6	HS I ² C DMA Requests.....	4570
23.1.4.7	HS I ² C Programmable Multislave Channel Feature (I ² C Mode Only).....	4571
23.1.4.8	HS I ² C FIFO Management.....	4571
23.1.4.8.1	HS I ² C FIFO Interrupt Mode.....	4571
23.1.4.8.2	HS I ² C FIFO Polling Mode.....	4573
23.1.4.8.3	HS I ² C FIFO DMA Mode (I ² C Mode Only).....	4573
23.1.4.8.4	HS I ² C Draining Feature (I ² C Mode Only).....	4575
23.1.4.9	HS I ² C Noise Filter.....	4575
23.1.4.10	HS I ² C Write and Read Operations in SCCB Mode.....	4575
23.1.4.11	HS I ² C System Test Mode.....	4576
23.1.5	HS I ² C Programming Guide.....	4577
23.1.5.1	HS I ² C Low-Level Programming Models.....	4577
23.1.5.1.1	HS I ² C Programming Model in I ² C Mode.....	4577
23.1.5.1.2	HS I ² C (I2C5) Programming Model for Communication With Power Chips.....	4593
23.1.5.1.3	HS I ² C Basic Programming Model in SCCB Mode.....	4594
23.1.6	HS I ² C Register Manual.....	4603
23.1.6.1	HS I ² C Instance Summary.....	4603
23.1.6.2	HS I ² C Registers.....	4603
23.1.6.2.1	HS I ² C Register Summary.....	4603
23.1.6.2.2	HS I ² C Register Description.....	4605
23.2	HDQ/1-Wire.....	4635
23.2.1	HDQ/1-Wire Overview.....	4635
23.2.2	HDQ/1-Wire Environment.....	4636
23.2.2.1	HDQ/1-Wire Functional Modes.....	4636
23.2.2.2	HDQ and 1-Wire (SDQ) Protocols.....	4636
23.2.2.2.1	HDQ Protocol Initialization (Default).....	4636
23.2.2.2.2	1-Wire (SDQ) Protocol Initialization.....	4637
23.2.2.2.3	Communication Sequence (HDQ and 1-Wire Protocols).....	4637
23.2.3	HDQ/1-Wire Integration.....	4639
23.2.4	HDQ/1-Wire Functional Description.....	4640
23.2.4.1	HDQ/1-Wire Block Diagram.....	4640
23.2.4.2	HDQ/1-Wire Clocking Configuration.....	4641
23.2.4.2.1	HDQ/1-Wire Clocks.....	4641
23.2.4.3	HDQ/1-Wire Hardware and Software Reset.....	4642
23.2.4.4	HDQ/1-Wire Power Management.....	4642
23.2.4.4.1	Auto-Idle Mode.....	4642

23.2.4.4.2	Power-Down Mode	4642
23.2.4.5	HDQ Interrupt Requests	4643
23.2.4.6	HDQ Mode (Default)	4643
23.2.4.6.1	HDQ Mode Features	4643
23.2.4.6.2	Description	4643
23.2.4.6.3	Single-Bit Mode	4644
23.2.4.6.4	Interrupt Conditions	4644
23.2.4.7	1-Wire Mode	4645
23.2.4.7.1	1-Wire Mode Features	4645
23.2.4.7.2	Description	4645
23.2.4.7.3	1-Wire Single-Bit Mode Operation	4645
23.2.4.7.4	Interrupt Conditions	4646
23.2.4.7.5	Status Flags	4646
23.2.5	HDQ/1-Wire Programming Models	4647
23.2.5.1	Global Initialization	4647
23.2.5.1.1	Surrounding Modules Global Initialization	4647
23.2.5.1.2	HDQ/1-Wire Module Global Initialization	4647
23.2.5.2	HDQ Operational Modes Configuration	4647
23.2.5.2.1	Main Sequence – HDQ Write Operation Mode	4647
23.2.5.2.2	Main Sequence - HDQ Read Operation Mode	4648
23.2.5.3	1-Wire Operational Modes Configuration	4648
23.2.5.3.1	Main Sequence - 1-Wire Write Operation Mode	4648
23.2.5.3.2	Main Sequence - 1-Wire Read Operation Mode	4649
23.2.5.3.3	Sub-sequence - Initialize 1-Wire Slave	4649
23.2.6	HDQ/1-Wire Register Manual	4650
23.2.6.1	HDQ/1-Wire Instance Summary	4650
23.2.6.2	HDQ/1-Wire Registers	4650
23.2.6.2.1	HDQ/1-Wire Register Summary	4650
23.2.6.2.2	HDQ/1-Wire Register Description	4650
23.3	UART/IrDA/CIR	4656
23.3.1	UART/IrDA/CIR Overview	4656
23.3.1.1	UART Features	4656
23.3.1.2	IrDA Features	4657
23.3.1.3	CIR Features	4658
23.3.2	UART/IrDA/CIR Environment	4659
23.3.2.1	System Using UART Communication With Hardware Handshake	4659
23.3.2.2	System Using IrDA Communication Protocol	4659
23.3.2.3	System Using CIR Communication Protocol With Remote Control	4659
23.3.2.4	UART Interface	4660
23.3.2.4.1	Description	4660
23.3.2.4.2	UART Protocol and Data Format	4660
23.3.2.5	IrDA Functional Interfaces	4661
23.3.2.5.1	UART3 Interface Description	4661
23.3.2.5.2	IrDA Protocol and Data Format	4662
23.3.2.6	CIR Functional Interfaces	4668
23.3.2.6.1	CIR Interface Description	4668
23.3.2.6.2	CIR Protocol and Data Format	4668
23.3.3	UART/IrDA/CIR Integration	4673
23.3.4	UART/IrDA/CIR Functional Description	4675
23.3.4.1	Block Diagram	4675
23.3.4.2	Clock Configuration	4676
23.3.4.3	Software Reset	4676
23.3.4.4	Power Management	4676

23.3.4.4.1	UART Mode Power Management	4676
23.3.4.4.2	IrDA Mode Power Management (UART3 Only)	4677
23.3.4.4.3	CIR Mode Power Management (UART3 Only)	4677
23.3.4.4.4	Local Power Management	4678
23.3.4.5	Interrupt Requests	4678
23.3.4.5.1	UART Mode Interrupt Management	4678
23.3.4.5.2	IrDA Mode Interrupt Management	4679
23.3.4.5.3	CIR Mode Interrupt Management	4680
23.3.4.6	FIFO Management	4681
23.3.4.6.1	FIFO Trigger	4683
23.3.4.6.2	FIFO Interrupt Mode	4684
23.3.4.6.3	FIFO Polled Mode Operation	4685
23.3.4.6.4	FIFO DMA Mode Operation	4685
23.3.4.7	Mode Selection	4692
23.3.4.7.1	Register Access Modes	4692
23.3.4.7.2	UART/IrDA (SIR, MIR, FIR)/CIR Mode Selection	4694
23.3.4.8	Protocol Formatting	4698
23.3.4.8.1	UART Mode	4698
23.3.4.8.2	IrDA Mode (UART3 Only)	4704
23.3.4.8.3	CIR Mode (UART3 Only)	4708

13-292. L4 Firewall Register Description Overview	3198
13-293. L4 CODE Bit Field Definition	3198
13-294. L4 Time-Out Link and TA Programming	3199
13-295. Global Initialization of Surrounding Modules	3203
13-296. Main Sequence – Error Analysis Mode	3205
13-297. Subprocess Call Summary for Main Sequence – Error Analysis Mode	3205
13-298. Protection Violation Error Identification	3206
13-299. Unsupported Command/Address Hole Error Identification	3206
13-300. Reset TA and Module	3206
13-301. Time-Out Configuration	3207
13-302. Firewall Configuration	3207
13-303. L4_PER Instance Summary	3208
13-304. L4_CFG Instance Summary	3208
13-305. L4_WKUP Instance Summary	3209
13-306. IA Registers Mapping Summary	3210
13-307. L4_IA_COMPONENT_L	3210
13-308. Register Call Summary for Register L4_IA_COMPONENT_L.....	3211
13-309. L4_IA_COMPONENT_H.....	3211
13-310. Register Call Summary for Register L4_IA_COMPONENT_H	3211
13-311. L4_IA_CORE_L	3211
13-312. Register Call Summary for Register L4_IA_CORE_L.....	3212
13-313. L4_IA_CORE_H.....	3212
13-314. Register Call Summary for Register L4_IA_CORE_H	3212
13-315. L4_IA_AGENT_CONTROL_L	3212
13-316. Register Call Summary for Register L4_IA_AGENT_CONTROL_L	3213
13-317. L4_IA_AGENT_CONTROL_H	3213
13-318. Register Call Summary for Register L4_IA_AGENT_CONTROL_H.....	3213
13-319. L4_IA_AGENT_STATUS_L	3213
13-320. Register Call Summary for Register L4_IA_AGENT_STATUS_L.....	3214
13-321. L4_IA_AGENT_STATUS_H.....	3214
13-322. Register Call Summary for Register L4_IA_AGENT_STATUS_H	3214

13-323. L4_IA_ERROR_LOG_L	3215
13-324. Register Call Summary for Register L4_IA_ERROR_LOG_L	3215
13-325. L4_IA_ERROR_LOG_H	3215
13-326. Register Call Summary for Register L4_IA_ERROR_LOG_H	3216
13-327. L4_IA_ERROR_LOG_ADDR_L	3216
13-328. Register Call Summary for Register L4_IA_ERROR_LOG_ADDR_L	3216
13-329. L4_IA_ERROR_LOG_ADDR_H	3216
13-330. Register Call Summary for Register L4_IA_ERROR_LOG_ADDR_H	3216
13-331. CFG_TA Register Mapping Summary 1	3217
13-332. CFG_TA Register Mapping Summary 2	3217
13-333. CFG_TA Register Mapping Summary 3	3217
13-334. CFG_TA Register Mapping Summary 4	3218
13-335. CFG_TA Register Mapping Summary 5	3218
13-336. CFG_TA Register Mapping Summary 6	3219
13-337. CFG_TA Register Mapping Summary 7	3219
13-338. CFG_TA Register Mapping Summary 8	3219
13-339. CFG_TA Register Mapping Summary 9	3220
13-340. CFG_TA Register Mapping Summary 10	3220
13-341. CFG_TA Register Mapping Summary 11	3220
13-342. CFG_TA Register Mapping Summary 12	3221
13-343. CFG_TA Register Mapping Summary 13	3221
13-344. PER_TA Register Mapping Summary 1	3221
13-345. PER_TA Register Mapping Summary 2	3222
13-346. PER_TA Register Mapping Summary 3	3222
13-347. PER_TA Register Mapping Summary 4	3222
13-348. PER_TA Register Mapping Summary 5	3223
13-349. PER_TA Register Mapping Summary 6	3223
13-350. PER_TA Register Mapping Summary 7	3224
13-351. PER_TA Register Mapping Summary 8	3224
13-352. PER_TA Register Mapping Summary 9	3224
13-353. PER_TA Register Mapping Summary 10	3225
13-354. PER_TA Register Mapping Summary 11	3225
13-355. PER_TA Register Mapping Summary 12	3225
13-356. PER_TA Register Mapping Summary 13	3226
13-357. WKUP_TA Register Mapping Summary 1	3226
13-358. WKUP_TA Register Mapping Summary 2	3227
13-359. WKUP_TA Register Mapping Summary 3	3227
13-360. WKUP_TA Register Mapping Summary 4	3227
13-361. WKUP_TA Register Mapping Summary 5	3228
13-362. L4_TA_COMPONENT_H	3228
13-363. Register Call Summary for Register L4_TA_COMPONENT_H	3228
13-364. L4_TA_COMPONENT_L	3229
13-365. Register Call Summary for Register L4_TA_COMPONENT_L	3229
13-366. L4_TA_CORE_L	3229
13-367. Register Call Summary for Register L4_TA_CORE_L	3229
13-368. L4_TA_CORE_H	3229
13-369. Register Call Summary for Register L4_TA_CORE_H	3230
13-370. L4_TA_AGENT_CONTROL_L	3230
13-371. Register Call Summary for Register L4_TA_AGENT_CONTROL_L	3230

13-372. L4_TA_AGENT_CONTROL_H.....	3231
13-373. Register Call Summary for Register L4_TA_AGENT_CONTROL_H	3231
13-374. L4_TA_AGENT_STATUS_L.....	3231
13-375. Register Call Summary for Register L4_TA_AGENT_STATUS_L	3232
13-376. L4_TA_AGENT_STATUS_H	3232
13-377. Register Call Summary for Register L4_TA_AGENT_STATUS_H.....	3232
13-378. LA Register Mapping Summary	3232
13-379. L4_LA_COMPONENT_L.....	3233
13-380. Register Call Summary for Register L4_LA_COMPONENT_L	3233
13-381. L4_LA_COMPONENT_H	3233
13-382. Register Call Summary for Register L4_LA_COMPONENT_H.....	3233
13-383. L4_LA_NETWORK_L	3233
13-384. Register Call Summary for Register L4_LA_NETWORK_L.....	3234
13-385. L4_LA_NETWORK_H.....	3234
13-386. Register Call Summary for Register L4_LA_NETWORK_H	3234
13-387. L4_LA_INITIATOR_INFO_L.....	3234
13-388. Register Call Summary for Register L4_LA_INITIATOR_INFO_L	3235
13-389. Reset value for L4_LA_INITIATOR_INFO_L.....	3235
13-390. L4_LA_INITIATOR_INFO_H	3235
13-391. Register Call Summary for Register L4_LA_INITIATOR_INFO_H.....	3236
13-392. Reset value for L4_LA_INITIATOR_INFO_H	3236
13-393. L4_LA_NETWORK_CONTROL_L.....	3236
13-394. Register Call Summary for Register L4_LA_NETWORK_CONTROL_L	3237
13-395. L4_LA_NETWORK_CONTROL_H	3237
13-396. Register Call Summary for Register L4_LA_NETWORK_CONTROL_H.....	3238
13-397. L4 AP Register Summary	3238
13-398. L4_AP_COMPONENT_L	3238
13-399. Register Call Summary for Register L4_AP_COMPONENT_L.....	3239
13-400. L4_AP_COMPONENT_H.....	3239
13-401. Register Call Summary for Register L4_AP_COMPONENT_H	3239
13-402. L4_AP_SEGMENT_i_L	3239
13-403. Register Call Summary for Register L4_AP_SEGMENT_i_L.....	3239
13-404. L4_AP_SEGMENT_i_H.....	3240
13-405. Register Call Summary for Register L4_AP_SEGMENT_i_H	3240
13-406. Reset Value for L4_AP_SEGMENT_i.....	3240
13-407. L4_AP_PROT_GROUP_MEMBERS_k_L.....	3240
13-408. Register Call Summary for Register L4_AP_PROT_GROUP_MEMBERS_k_L	3242
13-409. Reset Value for L4_AP_PROT_GROUP_MEMBERS_k	3242
13-410. L4_AP_PROT_GROUP_MEMBERS_k_H	3242
13-411. Register Call Summary for Register L4_AP_PROT_GROUP_MEMBERS_k_H.....	3242
13-412. L4_AP_PROT_GROUP_ROLES_k_L	3243
13-413. Register Call Summary for Register L4_AP_PROT_GROUP_ROLES_k_L.....	3243
13-414. Reset Value for L4_AP_PROT_GROUP_ROLES_k.....	3243
13-415. L4_AP_PROT_GROUP_ROLES_k_H.....	3243
13-416. Register Call Summary for Register L4_AP_PROT_GROUP_ROLES_k_H	3244
13-417. L4_AP_REGION_I_L	3244
13-418. Register Call Summary for Register L4_AP_REGION_I_L.....	3244
13-419. L4_AP_REGION_I_H.....	3244
13-420. Register Call Summary for Register L4_AP_REGION_I_H	3245

13-421. L4_AP_REGION_I Reset Value for L4 PER	3245
13-422. L4_AP_REGION_I Reset Value for L4 CFG	3247
15-1. DMM Integration Attributes.....	3259
15-2. DMM Clocks and Resets	3259
15-3. Hardware Requests	3260
15-4. DMM TILER Container Geometry.....	3260
15-5. DMM Clocks	3262
15-6. DMM Local Power-Management Features.....	3262
15-7. DMM Hardware Status Features	3262
15-8. Events.....	3262
15-9. ConnIDs Vs PEG Priority Register Fields.....	3271
15-10. Well-Formed Tiled Mode 2D Block Requests	3275
15-11. Coding and Description of TILER Modes	3279
15-12. Coding and Description of TILER Orientations.....	3279
15-13. Tiled Mode Container Characteristics	3280
15-14. TILER Aliased View in the L3 Interconnect Mapping.....	3290
15-15. Address Format in the TILER-Specific Address Map	3290
15-16. Address Format of the TILER Aliased View in the System Address Map	3290
15-17. Minimum Buffer Size to Efficiently Handle Lines of up to N Elements	3292
15-18. Memory Data Payload for Buffered Raster-Based Initiators on Up-to-32-Bit DDR, lpDDR, or lpDDR2	3293
15-19. Memory Data Payload for Buffered Raster-Based Initiators on 32-Bit DDR2 or DDR3.....	3293
15-20. Address Definition	3298
15-21. Configuration.....	3298
15-22. Address Definition	3299
15-23. Configuration.....	3300
15-24. Address Upper Bits Shifting.....	3301
15-25. Global Initialization of Surrounding Modules	3302
15-26. DMM Global Initialization.....	3302
15-27. Coding and Description of TILER Modes	3302
15-28. Configuration Settings and LUT Refill	3303
15-29. Interleaving Settings	3303
15-30. Aliased Tiled View Orientation Settings and LUT Refill	3303
15-31. Priority Settings.....	3304
15-32. Error Handling	3304
15-33. 29-Bit View Address Offset and 33-Bit Full TILER Address for an 8-Bit Frame-Buffer	3306
15-34. 29-Bit View Address Offset and 33-Bit Full TILER Address for a 1D Object.....	3307
15-35. DMM Instance Summary	3308
15-36. DMM Registers Mapping Summary.....	3308
15-37. DMM_REVISION	3309
15-38. Register Call Summary for Register DMM_REVISION	3309
15-39. DMM_HWINFO	3309
15-40. Register Call Summary for Register DMM_HWINFO	3309
15-41. DMM_LISA_HWINFO.....	3310
15-42. Register Call Summary for Register DMM_LISA_HWINFO	3310
15-43. DMM_SYSCONFIG	3310
15-44. Register Call Summary for Register DMM_SYSCONFIG	3311
15-45. DMM_LISA_LOCK	3311
15-46. Register Call Summary for Register DMM_LISA_LOCK.....	3311
15-47. DMM_LISA_MAP_i.....	3311

15-48. Register Call Summary for Register DMM_LISA_MAP_i	3312
15-49. DMM_TILER_HWINFO	3312
15-50. Register Call Summary for Register DMM_TILER_HWINFO	3313
15-51. DMM_TILER_OR0	3313
15-52. Register Call Summary for Register DMM_TILER_OR0	3314
15-53. DMM_TILER_OR1	3314
15-54. Register Call Summary for Register DMM_TILER_OR1	3315
15-55. DMM_PAT_HWINFO	3315
15-56. Register Call Summary for Register DMM_PAT_HWINFO	3316
15-57. DMM_PAT_GEOMETRY	3316
15-58. Register Call Summary for Register DMM_PAT_GEOMETRY	3317
15-59. DMM_PAT_CONFIG	3317
15-60. Register Call Summary for Register DMM_PAT_CONFIG	3317
15-61. DMM_PAT_VIEW0	3317
15-62. Register Call Summary for Register DMM_PAT_VIEW0	3319
15-63. DMM_PAT_VIEW1	3319
15-64. Register Call Summary for Register DMM_PAT_VIEW1	3320
15-65. DMM_PAT_VIEW_MAP_i	3320
15-66. Register Call Summary for Register DMM_PAT_VIEW_MAP_i	3321
15-67. DMM_PAT_VIEW_MAP_BASE	3321
15-68. Register Call Summary for Register DMM_PAT_VIEW_MAP_BASE	3322
15-69. DMM_PAT_IRQSTATUS_RAW	3322
15-70. Register Call Summary for Register DMM_PAT_IRQSTATUS_RAW	3324
15-71. DMM_PAT_IRQSTATUS	3324
15-72. Register Call Summary for Register DMM_PAT_IRQSTATUS	3326
15-73. DMM_PAT_IRQENABLE_SET	3327
15-74. Register Call Summary for Register DMM_PAT_IRQENABLE_SET	3329
15-75. DMM_PAT_IRQENABLE_CLR	3329
15-76. Register Call Summary for Register DMM_PAT_IRQENABLE_CLR	3331
15-77. DMM_PAT_STATUS_i	3332
15-78. Register Call Summary for Register DMM_PAT_STATUS_i	3332
15-79. DMM_PAT_DESCR_i	3333
15-80. Register Call Summary for Register DMM_PAT_DESCR_i	3333
15-81. DMM_PAT_AREA_i	3333
15-82. Register Call Summary for Register DMM_PAT_AREA_i	3334
15-83. DMM_PAT_CTRL_i	3334
15-84. Register Call Summary for Register DMM_PAT_CTRL_i	3334
15-85. DMM_PAT_DATA_i	3335
15-86. Register Call Summary for Register DMM_PAT_DATA_i	3335
15-87. DMM_PEG_HWINFO	3335
15-88. Register Call Summary for Register DMM_PEG_HWINFO	3335
15-89. DMM_PEG_PRIO_k	3336
15-90. Register Call Summary for Register DMM_PEG_PRIO_k	3336
15-91. DMM_PEG_PRIO_PAT	3337
15-92. Register Call Summary for Register DMM_PEG_PRIO_PAT	3337
15-93. I/O Signals	3340
15-94. Integration Attributes	3343
15-95. Clocks and Resets	3343
15-96. Hardware Requests	3344

15-97. MAddrSpace Mapping to Chip-Selects	3345
15-98. FIFO Allocation	3346
15-99. Events.....	3351
15-100. Performance Counter Filter Configuration	3353
15-101. 64-Byte Linear Read Starting at Address 0x0	3355
15-102. 64-Byte Linear Read Starting at Address 0x8 (LPDDR2-S2)	3356
15-103. 64-Byte Linear Read Starting at Address 0x8 (LPDDR2-S4)	3356
15-104. 64-Byte Linear Read Starting at Address 0x10	3356
15-105. 64-Byte Linear Read Starting at Address 0x18	3356
15-106. Turnaround Time.....	3356
15-107. SDRAM Addressing Space	3357
15-108. L3 Address to SDRAM Address Mapping for 16-Bit SDRAM (EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 0).....	3359
15-109. L3 Address to SDRAM Address Mapping for 32-Bit SDRAM (EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 0).....	3360
15-110. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 1 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 0	3362
15-111. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 2 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 0	3363
15-112. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 3 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 0	3364
15-113. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 1 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 1	3365
15-114. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 2 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 1	3366
15-115. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 3 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 1	3367
15-116. Global Initialization of Surrounding Modules	3369
15-117. EMIF Global Initialization	3369
15-118. Subprocess Call Summary for Main Sequence – EMIF Global Initialization.....	3370
15-119. Subsequence – EMIF Timing Initialization.....	3370
15-120. Subsequence - External LPDDR2 Initialization	3372
15-121. EMIF Output Impedance Calibration Mode.....	3372
15-122. EMIF MR Read.....	3372
15-123. EMIF MR Write	3373
15-124. EMIF SDRAM Self-Refresh Entering.....	3373
15-125. EMIF SDRAM Self-Refresh Exiting.....	3373
15-126. EMIF SDRAM Power-Down Mode.....	3373
15-127. EMIF SDRAM Power-Down Mode Exiting.....	3373
15-128. EMIF LPDDR2-SDRAM Deep Power-Down Mode Entering.....	3374
15-129. EMIF LPDDR2-SDRAM Deep Power-Down Mode Exiting.....	3374
15-130. EMIF Temperature Monitoring Mode.....	3374
15-131. EMIF Event Servicing	3374
15-132. EMIF Instance Summary.....	3375
15-133. EMIF Registers Mapping Summary	3375
15-134. EMIF_MOD_ID_REV	3377
15-135. Register Call Summary for Register EMIF_MOD_ID_REV	3377
15-136. EMIF_STATUS.....	3378
15-137. Register Call Summary for Register EMIF_STATUS	3378
15-138. EMIF_SDRAM_CONFIG.....	3378
15-139. Register Call Summary for Register EMIF_SDRAM_CONFIG	3380

15-140. EMIF_SDRAM_CONFIG_2.....	3380
15-141. Register Call Summary for Register EMIF_SDRAM_CONFIG_2	3381
15-142. EMIF_SDRAM_REF_CTRL	3381
15-143. Register Call Summary for Register EMIF_SDRAM_REF_CTRL.....	3382
15-144. EMIF_SDRAM_REF_CTRL_SHDW.....	3382
15-145. Register Call Summary for Register EMIF_SDRAM_REF_CTRL_SHDW	3382
15-146. EMIF_SDRAM_TIM_1.....	3382
15-147. Register Call Summary for Register EMIF_SDRAM_TIM_1	3383
15-148. EMIF_SDRAM_TIM_1_SHDW	3383
15-149. Register Call Summary for Register EMIF_SDRAM_TIM_1_SHDW	3384
15-150. EMIF_SDRAM_TIM_2.....	3384
15-151. Register Call Summary for Register EMIF_SDRAM_TIM_2	3385
15-152. EMIF_SDRAM_TIM_2_SHDW	3385
15-153. Register Call Summary for Register EMIF_SDRAM_TIM_2_SHDW	3385
15-154. EMIF_SDRAM_TIM_3.....	3386
15-155. Register Call Summary for Register EMIF_SDRAM_TIM_3	3386
15-156. EMIF_SDRAM_TIM_3_SHDW	3386
15-157. Register Call Summary for Register EMIF_SDRAM_TIM_3_SHDW	3387
15-158. EMIF_LPDDR2_NVM_TIM	3387
15-159. Register Call Summary for Register EMIF_LPDDR2_NVM_TIM.....	3388
15-160. EMIF_LPDDR2_NVM_TIM_SHDW	3388
15-161. Register Call Summary for Register EMIF_LPDDR2_NVM_TIM_SHDW	3389
15-162. EMIF_PWR_MGMT_CTRL.....	3389
15-163. Register Call Summary for Register EMIF_PWR_MGMT_CTRL	3390
15-164. EMIF_PWR_MGMT_CTRL_SHDW	3390
15-165. Register Call Summary for Register EMIF_PWR_MGMT_CTRL_SHDW.....	3391
15-166. EMIF_LPDDR2_MODE_REG_DATA	3391
15-167. Register Call Summary for Register EMIF_LPDDR2_MODE_REG_DATA.....	3391
15-168. EMIF_LPDDR2_MODE_REG_CFG.....	3391
15-169. Register Call Summary for Register EMIF_LPDDR2_MODE_REG_CFG	3392
15-170. EMIF_L3_CONFIG	3392
15-171. Register Call Summary for Register EMIF_L3_CONFIG	3393
15-172. EMIF_L3_CFG_VAL_1.....	3393
15-173. Register Call Summary for Register EMIF_L3_CFG_VAL_1	3394
15-174. EMIF_L3_CFG_VAL_2.....	3394
15-175. Register Call Summary for Register EMIF_L3_CFG_VAL_2	3394
15-176. EMIF_PERF_CNT_1	3394
15-177. Register Call Summary for Register EMIF_PERF_CNT_1.....	3394
15-178. EMIF_PERF_CNT_2	3395
15-179. Register Call Summary for Register EMIF_PERF_CNT_2.....	3395
15-180. EMIF_PERF_CNT_CFG	3395
15-181. Register Call Summary for Register EMIF_PERF_CNT_CFG.....	3396
15-182. EMIF_PERF_CNT_SEL.....	3396

18-12. Recommended Configuration For Unconnected Device Pads	3717
18-13. PBIAS Cell and Extended-Drain I/O Pin CONTROL_PBIAS_LITE Bit Control	3720
18-14. Power Supplies	3721
18-15. PBIAS/Extended-Drain I/O Cells Control Signals	3724
18-16. Voltage Configuration	3725
18-17. PBIAS Error Signal Truth Table	3726
18-18. Band Gap Voltage and Temperature Sensor Signal Description	3728
18-19. General Core Control Thermal Logic Outputs Description	3729
18-20. Bandgap Counter Programming Examples	3732

18-21. ADC Code Versus Temperature	3739
18-22. CORE Power Domain Observability Signals Multiplexing	3746
18-23. DPLL Signal Observability Controls	3750
18-24. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 0	3753
18-25. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 1	3754
18-26. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 2	3754
18-27. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level - Mode 3.....	3755
18-28. CPU0/CPU1 PM Profiling Bus Observable Signals Description	3756
18-29. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 4	3756
18-30. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 5	3757
18-31. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 6	3758
18-32. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 7	3758
18-33. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 8	3759
18-34. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 9	3759
18-35. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 10.....	3760
18-36. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 11.....	3760
18-37. Observability Signals at IVA-HD Subsystem Level	3760
18-38. Observability Signals at Display Subsystem Level	3761
18-39. Observability Signals Multiplexing at DSP Subsystem Level – Mode 0	3762
18-40. Observability Signals Multiplexing at DSP Subsystem Level – Mode 1	3763
18-41. Observability Signals Multiplexing at DSP Subsystem Level – Mode 2 through Mode 11	3763
18-42. Observability Signals Multiplexing at DSP Subsystem Level – Mode 12	3764
18-43. Observability Signals Multiplexing at DSP Subsystem Level – Mode 13	3764
18-44. Observability Signals Multiplexing at DSP Subsystem Level – Mode 14	3765
18-45. Observability Signals Multiplexing at DSP Subsystem Level – Mode 15	3765
18-46. Observability Signals at ABE Subsystem Level	3765
18-47. CM2 Observable Signals	3766
18-48. CM1 Observable Signals	3798
18-49. PRM Observable Signals.....	3818
18-50. SAR FSM State Description	3855
18-51. DPLLCtrl FSM State Description	3856
18-52. EMIF FSM State Description	3858
18-53. I/O Controller FSM State Description.....	3859
18-54. PM FSM State Description	3860
18-55. Warm Reset FSM State Description	3862
18-56. CM FSM State Description	3862
18-57. Different DPLL Observable Clock Output Signals	3863
18-58. Other CORE DPLL Observability Signals.....	3863
18-59. Other ABE DPLL Observability Signals	3864
18-60. Other PERIPH DPLL Observability Signals.....	3864
18-61. Other DSI1 DPLL Observability Signals.....	3864
18-62. Other DSI2 DPLL Observability Signals.....	3865
18-63. Other USB DPLL Observability Signals	3865
18-64. DSP Boot Address Register	3866
18-65. PBIAS Control Register	3866
18-66. Temperature Sensor Register	3866
18-67. CSI Receiver Control Register	3867
18-68. Protection Status Registers	3867
18-69. Protection SDRAM Configuration Registers for EMIF1 and EMIF2	3868

18-70. LPDDR2IO Buffer Control Register	3869
18-71. LPDDR2 Internal Reference Configuration	3870
18-72. LPDDR2 Vref Cell Decoupling Cap Selection	3871
18-73. LPDDR2 Vref Cells State Description	3871
18-74. Internal VREF Generators CCAP and TAP Controls versus LPDDR2IO Receiver Pads	3872
18-75. EMIF DLL Slave Offset Compensation Registers.....	3875
18-76. EMIF DLL Master Code-Monitoring Registers.....	3875
18-77. Force MPU Write Nonposted Transactions Control Register	3875
18-78. Signal Integrity Parameter Control Registers.....	3876
18-79. Weak Driver PUPD/Latch Mode.....	3879
18-80. Slew Control Mode (Coarse) Settings	3880
18-81. Load Bit (Fine) Settings	3880
18-82. Software Controls for I/Os With Combined Mode and Load Settings	3881
18-83. SDMMC2 or GPMC Vref Cell State Description	3884
18-84. SDMMC2 or GPMC Vref Cell Decoupling Cap Selection	3884
18-85. EMIF (LPDDR2IO) Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3886
18-86. GPMC I/O Signal Group Parameter Controls to Different Interface I/O Pads Mapping.....	3888
18-87. CAMERA I/O Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3889
18-88. USBB1 I/O Signal Group Parameter Controls to Different Interface I/O Pads Mapping.....	3890
18-89. USBB2 I/O Signal Group Parameter Controls to Different Interface I/O Pads Mapping.....	3891
18-90. USBC1 I/O Signal Group Parameter Controls to Different Interface I/O Pads Mapping.....	3891
18-91. KEYPAD I/O Signal Group Parameter Controls to Different Interface I/O Pads Mapping.....	3892
18-92. HDQ I/O Signal Group Parameter Controls to Different Interface I/O Pads Mapping.....	3892
18-93. GPIO Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3892
18-94. SDMMC1 Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3892
18-95. SDMMC5 Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3893
18-96. ABE McBSP1 Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3894
18-97. ABE McBSP2 Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3894
18-98. ABE McPDM Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3894
18-99. ABE DMIC Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3894
18-100. ABE Shared Signal Group Parameter Controls to Different Interface I/O Pads Mapping.....	3895
18-101. UART2 Signal Group Parameter Controls to Different Interface I/O Pads Mapping.....	3895
18-102. UART3 Signal Group Parameter Controls to Different Interface I/O Pads Mapping.....	3895
18-103. UART4 Signal Group Parameter Controls to Different Interface I/O Pads Mapping.....	3895
18-104. McSPI1 Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3895
18-105. McSPI4 Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3896
18-106. I2C1 Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3896
18-107. I2C2 Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3897
18-108. I2C3 Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3897
18-109. I2C4 Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3897
18-110. SR Signal Group Parameter Controls to Different Interface I/O Pads Mapping	3898
18-111. System Signals Group Parameter Controls to Different Interface I/O Pads Mapping	3898
18-112. DPM Signals Group Parameter Controls to Different Interface I/O Pads Mapping	3899
18-113. Dual-Voltage Peripheral Control Bits vs Pad Mapping.....	3901
18-114. Global Initialization of Surrounding Modules	3903
18-115. Configure Clock Gating for Different Control Module Instances	3903
18-116. Control Module AVDAC Configuration	3904
18-117. Register Settings for Configuring the MMC1_PBIAS and MMC1 I/O Cells	3905
18-118. Register Settings for Configuring the PBIAS1 Cell, USBC1_ICUSB and gpio_wk0gpio_wk2 Associated	

I/O Cells	3906
18-119. Configure Hardware Observability Features	3907
18-120. Setting Pad Off Mode Through Padconfiguration Registers	3908

About This Manual

FCC Warning

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

Information About Cautions and Warnings

This book may contain cautions and warnings.

CAUTION

This is an example of a caution statement.

A caution statement describes a situation that could potentially damage your software or equipment.

WARNING

This is an example of a warning statement.

A warning statement describes a situation that could potentially cause harm to you.

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

Register, Field, and Bit Calls

The naming convention applied for a call consists of:

- For a register call: `<Module name>.<Register name>`; for example: UART.UASR
- For a bit field call:
 - `<Module name>.<Register name>[End:Start] <Field name> field`; for example, UART.UASR[4:0] SPEED bit field
 - `<Field name> field <Module name>.<Register name>[End:Start]`; for example, SPEED bit field UART.UASR[4:0]
- For a bit call:
 - `<Module name>.<Register name>[pos] <Bit name> bit`, for example, UART.UASR[5] BIT_BY_CHAR bit
 - `<Bit name> bit <Module name>.<Register name>[pos]`; for example, BIT_BY_CHAR bit UART.UASR[5]

To help the reader navigate the document, each register call is hyperlinked to its register description in the register manual section. After each register description, a table summarizes all hyperlinked register calls.

To navigate in the PDF documents, see [Acrobat Reader Tips](#).

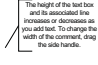

Coding Rules

The programming models or code listings follow the rules:

Type	Definition	Example
File	Starts with the module name	PRCM_test1.c MCBSP1_init.h
Variable	Global variables are prefixed by "g_" Pointers are prefixed by "p" Global pointers are prefixed by "g_p"	g_SDMA_LogicalChan pAddrCounter g_pSDMA_LogicalChan
Function	Starts with the module name	PRCM_SetupClocks() ArmIntC_MaskInterrupts()
Typedef	Ends with "_t"	PRCM_Struct_t
Definition	Starts with the module name and is followed by the register name	#define SMS_ERR_TYPE *((volatile Uint32*)0x680080F4) #define MCBSP2_RCR1_REG *((volatile Uint32*)0x4807401C)
Enumeration	Starts with the module name	Typedef enum DMA_Mode_Label { INPUT_MODE OUTPUT_MODE } DMA_Mode_t;

Flow Chart Rules

Flow charts follow the following rules:

Shape	Name	Definition
	Process	Any computational steps or processing function of a program; defined operation(s) causing change in value, form, or location of information
	Decision	A decision or switching-type operation that determines which of a number of alternate paths is followed
	Predefined process or sub-process	One or more named operations or program steps specified in a subroutine or another set of flow charts
	Data or I/O	General I/O function; information available for processing (input) or recording of processed information (output)
	Terminator	Terminal point in a flow chart: start, stop, halt, delay, or interrupt; may show exit from a closed subroutine
	Annotation	Additional descriptive clarification, comment
	On page connector (reference)	Exit to, or entry from, another part of chart in the same page
	Off page connector (reference)	The flow continues on a different page.
	Summing Junction	Logical AND
	Or	Logical OR
	Parallel mode (ISO)	Beginning or end of two or more simultaneous operations
	Flow Line	Lines indicate the sequence of steps and the direction of flow.

Acrobat Reader Tips

Acrobat includes two methods to search for words in a PDF:

- The Find toolbar provides a basic set of options to locate a word in the current PDF.
- The Search window lists words or partial words that match your text in the current PDF.

These guidelines apply to Acrobat Reader 5.x, 6.0, and 7.0.

For more information on Acrobat Reader search features, see the Adobe Reader Help.

To search for words in a document using the Find dialog box:

1. Open the document.
2. To display the Find toolbar, right-click in the toolbar area and select Find.
3. In the Find box, type the word, words, or partial words for which you want to search.
4. From the Find Options menu, select options as desired.
5. To view each search result, click the Find toolbar, the Find Previous button, or the Find Next button to go backward or forward through the document.

To search for words in a document using the Search PDF window:

1. Open the document.
2. Click the Search button on the File toolbar or right-click on your document and select Search.
3. Type the word, words, or part of a word for which you want to search.
4. Click Search.
5. The results appear in page order and, if applicable, show a few words of context. Each result displays an icon to identify the type of occurrence. All other searchable areas display the Search Result icon.
6. To display the page that contains a search result, click an item in the Results list. The occurrence is highlighted.
7. To navigate to the next result, choose Edit > Search Results > Next Result (or Ctrl+G).
8. To navigate to the previous result, choose Edit > Search Results > Previous Result (or Shift+Ctrl+G).

Navigate through your previous view

To retrace your path within an Adobe PDF document:

- For the previous view: Choose View > Go To > Previous View or Alt+Left Arrow.
- For the next view: Choose View > Go To > Next View or Alt+Right Arrow. The Next View command is available only if you have chosen Previous View.

If you view the PDF document in a browser, use options on the Navigation toolbar to move between views.

- Right-click the toolbar area, and then choose *Navigation*.
- Click the Go To Previous View button or the Go To Next View button.

NOTE: This navigation tip is useful to return to your previous view after clicking on a register call hyperlink.

History

The following table summarizes the OMAP4460 Public TRM versions.

Version	Literature Number	Date	Notes
B	SWPU235	February 2011	See ⁽¹⁾
C	SWPU235	March 2011	See ⁽²⁾
D	SWPU235	April 2011	See ⁽³⁾
E	SWPU235	May 2011	See ⁽⁴⁾
F	SWPU235	June 2011	See ⁽⁵⁾

⁽¹⁾ Public Version of *OMAP4440 Multimedia Device Silicon Revision 1.0 Technical Reference Manual*, version B (SWPU235B) - Initial release to the public domain.

⁽²⁾ Public Version of *OMAP4460 Multimedia Device Silicon Revision 1.0 Technical Reference Manual*, version C (SWPU235C) Chapters impacted between version B and version C:

- TI has shifted from OMAP4440 to OMAP4460 naming as OMAP4 adoption expands in new markets worldwide.
- Chapter 1: Introduction
- Chapter 2: Memory Mapping
- Chapter 3: Power, Reset, and Clock Management
- Chapter 8: Imaging Subsystem
- Chapter 10: Display Subsystem
- Chapter 15: Memory Subsystem
- Chapter 16: sDMA
- Chapter 18: Control Module
- Chapter 22: Timers
- Chapter 23: Serial Communication Interfaces - High-Speed USB OTG Controller section
- Chapter 23: Serial Communication Interfaces - Full-Speed USB Host Controller section
- Chapter 27: Initialization

⁽³⁾ Public Version of *OMAP4460 Multimedia Device Silicon Revision 1.0 Technical Reference Manual*, version D (SWPU235D) Chapters impacted between version C and version D:

- Chapter 1: Introduction
- Chapter 8: Imaging Subsystem
- Chapter 10: Display Subsystem
- Chapter 15: Memory Subsystem
- Chapter 18: Control Module
- Chapter 23: Serial Communication Interfaces - Multimaster High-Speed I²C Controller section
- Chapter 23: Serial Communications Interfaces - Multichannel Buffered Serial Port (McBSP) section
- Chapter 23: Serial Communication Interfaces - Multichannel Audio Serial Port section
- Chapter 24: MMC/SD/SDIO

⁽⁴⁾ Public Version of *OMAP4460 Multimedia Device Silicon Revision 1.0 Technical Reference Manual*, version E (SWPU235E) Chapters impacted between version D and version E:

- Chapter 3: Power, Reset, and Clock Management
- Chapter 6: IVA-HD Subsystem
- Chapter 8: Imaging Subsystem
- Chapter 10: Display Subsystem
- Chapter 15: Memory Subsystem
- Chapter 18: Control Module
- Chapter 20: Memory Management Units
- Chapter 23: Serial Communication Interfaces - Multichannel Audio Serial Port section
- Chapter 24: MMC/SD/SDIO
- Chapter 27: Initialization

⁽⁵⁾ Public Version of *OMAP4460 Multimedia Device Silicon Revision 1.0 Technical Reference Manual*, version F (SWPU235F) Chapters impacted by update to version F:

- Chapter 3: Power, Reset, and Clock Management
- Chapter 4: Dual Cortex-A9 MPU Subsystem
- Chapter 8: Imaging Subsystem
- Chapter 10: Display Subsystem
- Chapter 15: Memory Subsystem
- Chapter 16: sDMA
- Chapter 18: Control Module
- Chapter 23: Serial Communication Interfaces - Multichannel Audio Serial Port section
- Chapter 24: MMC/SD/SDIO
- Chapter 27: Initialization

Version	Literature Number	Date	Notes
G	SWPU235	July 2011	See ⁽⁶⁾
H	SWPU235	August 2011	See ⁽⁷⁾
I	SWPU235	September 2011	See ⁽⁸⁾
J	SWPU235	October 2011	See ⁽⁹⁾
K	SWPU235	November 2011	See ⁽¹⁰⁾

⁽⁶⁾ Public Version of *OMAP4460 Multimedia Device Silicon Revision 1.x Technical Reference Manual*, version G (SWPU235G)
Chapters impacted by update to version G:

- Chapter 1: Introduction
- Chapter 3: Power, Reset, and Clock Management
- Chapter 4: Dual Cortex-A9 MPU Subsystem
- Chapter 10: Display Subsystem
- Chapter 11: 2D/3D Graphics Accelerator
- Chapter 15: Memory Subsystem
- Chapter 18: Control Module
- Chapter 23: Serial Communication Interfaces - Multimaster High-Speed I²C Controller section
- Chapter 23: Serial Communication Interfaces - UART/IrDA/CIR section
- Chapter 23: Serial Communication Interfaces - Multichannel Serial Port Interface section
- Chapter 23: Serial Communication Interfaces - Multichannel PDM Controller section
- Chapter 23: Serial Communication Interfaces - MIPI-HSI section
- Chapter 26: Keyboard Controller
- Chapter 27: Initialization

⁽⁷⁾ Public Version of *OMAP4460 Multimedia Device Silicon Revision 1.x Technical Reference Manual*, version H (SWPU235H)
Chapters impacted by update to version H:

- Chapter 1: Introduction
- Chapter 2: Memory Mapping
- Chapter 3: Power, Reset, and Clock Management
- Chapter 10: Display Subsystem
- Chapter 15: Memory Subsystem
- Chapter 18: Control Module
- Chapter 23: Serial Communication Interfaces
- Chapter 25: General-Purpose Interface
- Chapter 27: Initialization

⁽⁸⁾ Public Version of *OMAP4460 Multimedia Device Silicon Revision 1.x Technical Reference Manual*, version I (SWPU235I).
Chapters impacted by update to version I:

- Chapter 1: Introduction
- Chapter 3: Power, Reset, and Clock Management
- Chapter 10: Display Subsystem
- Chapter 15: Memory Subsystem
- Chapter 18: Control Module
- Chapter 23: Serial Communication Interface
- Chapter 28: On-Chip Debug Support

⁽⁹⁾ Public Version of *OMAP4460 Multimedia Device Silicon Revision 1.x Technical Reference Manual*, version J (SWPU235J).
Chapters impacted by update to version J:

Introduction

This chapter introduces the features, subsystems, and architecture of the OMAP4460 high-performance multimedia device.

Topic	Page
1.1 Overview	274
1.2 Environment	275
1.3 Description	276
1.4 Package-On-Package Concept	287
1.5 OMAP4460 Family and Device Identification	288

1.1 Overview

The OMAP4460 high-performance multimedia application device is based on enhanced OMAP™ architecture and uses 45-nm technology.

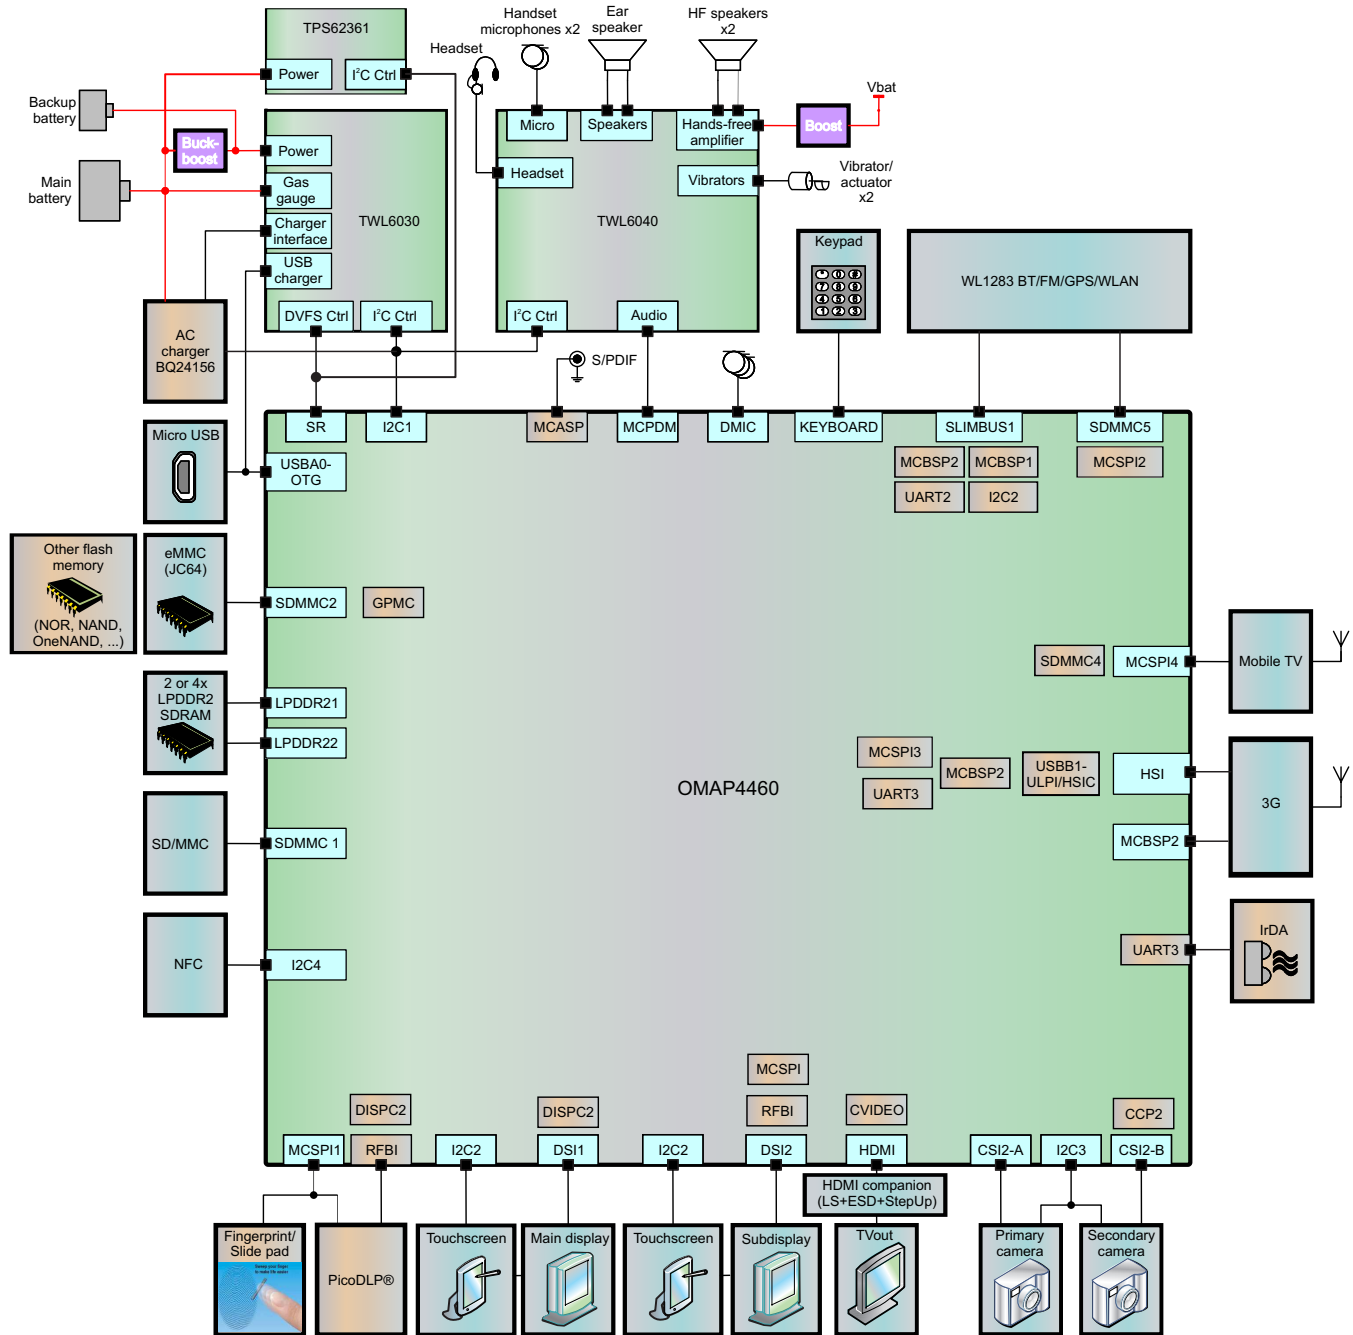

- The architecture is designed to provide best-in-class video, image, and graphics processing for 2.5/3G wireless terminals, high-performance personal digital assistants (PDAs). For that purpose, the device supports the following functions:
 - Streaming video up to full high definition (HD) (1920 × 1080 p, 30 fps)
 - 2-dimensional (2D)/3-dimensional (3D) mobile gaming
 - Video conferencing
 - High-resolution still image (up to 16 Mp)
- The device supports high-level operating systems (OSs) such as:
 - Linux®
 - Palm OS™
 - Symbian OS™
 - Windows™ CE, WinMobile™
- The device is composed of the following subsystems:
 - Cortex™-A9 microprocessor unit (MPU) subsystem, including two ARM® Cortex-A9 cores
 - Digital signal processor (DSP) subsystem
 - Image and video accelerator high-definition (IVA-HD) subsystem
 - Cortex™-M3 MPU subsystem, including two ARM Cortex-M3 microprocessors
 - Display subsystem
 - Audio back-end (ABE) subsystem
 - Imaging subsystem (ISS), consisting of image signal processor (ISP) and still image coprocessor (SIMCOP) block
 - 2D/3D graphic accelerator (SGX) subsystem
 - Emulation (EMU) subsystem
- The device includes state-of-art power-management techniques required for high-performance mobile products.
- Comprehensive power management is integrated into the device.
- The device also integrates:
 - On-chip memory
 - External memory interfaces
 - Memory management
 - Level 3 (L3) and level 4 (L4) interconnects
 - System and connecting peripherals

1.2 Environment

This section provides an overview of the OMAP environment. The device is associated with power and audio integrated circuits (ICs). TI provides a global solution with the TWL6030/TWL6040 devices.

Figure 1-1 is an overview of a nonexhaustive environment for the high-tier OMAP4460 device.

Figure 1-1. OMAP4460 High-Tier Environment

intro-002

1.3 Description

The device is offered in a 547-ball, 12 × 12 × 0.73-mm, 0.4-mm (bottom) ball pitch package. Some balls are available at the top of the device to allow memory stacking.

[Figure 1-2](#) is the block diagram of the OMAP4460 device.

1.3.1 Cortex-A9 MPU Subsystem Description

The Cortex-A9 MPU subsystem integrates the following submodules:

- ARM Cortex-A9 MPCore
 - Two ARM Cortex-A9 central processing units (CPUs)
 - ARM Version 7 ISA™: Standard ARM instruction set plus Thumb®-2, Jazelle® RCT and Jazelle DBX Java™ accelerators
 - Neon™ SIMD coprocessor and VFPv3 per CPU
 - Interrupt controller (Cortex-A9 MPU INTC) with up to 128 interrupt requests
 - One general-purpose timer and one watchdog timer per CPU
 - Debug and trace features
 - 32-KB instruction and 32-KB data level 1 (L1) caches per CPU
- Shared 1-MB level 2 (L2) cache
- 48 KB bootable ROM
- Local power, reset, and clock management (PRCM) module
- Emulation features
- Digital phase-locked loop (DPLL)

1.3.2 DSP Subsystem Description

The DSP subsystem contains the following submodules:

- TMS320C64x™ DSP core for audio processing and general-purpose imaging and video processing. It is backward compatible with existing C64x™ video codecs. The DSP CPU is a 32-bit, fixed-point media processor.
 - 32-KB L1 4-way set associative cache
 - 128-KB L2 8-way set associative cache
- Enhanced direct memory access (eDMA) engine for video/audio data transfer between IVA3 local memories and external SDRAM memories or peripherals
- Interrupt controller (INTC) with up to 128 interrupt requests
- Memory management unit (MMU) for address management. It translates virtual addresses handled by the DSP CPU into physical addresses.
- DPLL

The DSP subsystem allows direct access to the external ABE module and IVA-HD, and has emulation capabilities.

1.3.3 IVA-HD Subsystem Description

The IVA-HD subsystem is a set of video encoder/decoder hardware accelerators. It supports up to 1080p × 30 fps, slow-motion camcorder, triple play (HD and SD capture and JPEG capture), real-time transcoding of up to 720p, and video conferencing up to 720p.

The IVA-HD subsystem is composed of:

- Improved motion estimation acceleration engine (iME3), which is used in encoding processing
- Improved loop filter acceleration engine (iLF3), which performs deblocking filtering
- Improved sequencer (iCONT1) based on the ARM968E-S™ microcontroller. It includes memory and INTC and is used as a primary sequencer.
- Intraprediction estimation engine (iPE3). It is used in encoding processing.
- Calculation engine (CALC3), which performs transform and quantization calculations
- Motion compensation engine (MC3), which creates an interprediction macroblock with given motion vectors and modes from the reference data
- Entropy coder/decoder (ECD3), which uses Huffman and arithmetic codes during the process of encoding and decoding the stream

- Video DMA processor (iCONT2), which is also based on the ARM968E-S microcontroller and can be used as secondary sequencer
- Video DMA engine (vDMA), which is a DMA engine for data transmission between external memories and shared L2 memory
- Synchronization box (SyncBox) embedded in each hardware accelerator and in both iCONTs
- Mailbox for communication between IVA-HD and external to it processors (DSP, Cortex-A9, and Cortex-M3)
- Shared L2 interface and memory
- Video local interconnect for connection between the submodules of the IVA-HD, and between the IVA-HD and DSP subsystems
- IVA-HD system control module (SYSCTRL), which controls the clocks in the subsystem and PRCM handshaking

The IVA-HD subsystem can process three data formats for internal data: picture or slice, macroblock header, and residual data.

The IVA-HD supports the following formats:

- MPEG-1/-2/-4 such as MPEG-2 MP, ML, and MPEG-4 as SP/ASP
- Divx 5.02 and above
- Sorenson Spark (decode)
- H.263 P0 (encode and decode) and P3 (decode)
- H.264 Annex G (scalable baseline profile up to 720p)
- H.264 BL/MP/HP
- H.264 Annex H (partial)
- Stereoscopic video
- JPEG (encode/decode)
- VC-1 SP/MP/AP
- AVS-1.0
- RealVideo® 8/9/10 (decode only)
- On2® VP6.2/VP7 (decode only)

1.3.4 Cortex-M3 MPU Subsystem Description

The Cortex-M3 MPU subsystem includes the following components:

- Two Cortex-M3 CPUs: One for SIMCOP control, and the other for RTOS, ISP, and display subsystem control
- ARMv7-M and Thumb-2 instruction set architecture
- Dedicated INTC with up to 64 physical interrupt events
- Two-level memory subsystem hierarchy
 - L1
 - 32-KB shared cache memory
 - L2 ROM + RAM
 - 64-KB RAM
 - 16-KB bootable ROM
- Cortex-M3 system bus directly connected to the ISS interconnect
- MMU for address translation
- Integrated power management
- Emulation feature embedded in the Cortex-M3

1.3.5 Display Subsystem Description

The display subsystem provides the control signals required to interface the OMAP system memory frame buffer (SDRAM) directly to the displays. It supports hardware cursor, independent gamma curve on all interfaces, multiple-buffer, and programmable color phase rotation. The display subsystem allows low-power display refresh and arbitration between normal and low-priority pipelines.

The display subsystem consists of the following sections:

- Display controller: It can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into the system memory. It supports the following components:
 - Three video pipelines, one graphic pipeline, and one write-back pipeline. The graphic pipeline supports pixel formats such as: ARGB16-4444, RGB16-565, ARGB16-1555, ARGB32-8888, RGBA32-8888, RGB24-888, and BITMAP (1, 2, 4, or 8 bits per pixel). It allows selection of the color-depth expansion.
 - Write-back pipeline: it uses poly-phase filtering for independent horizontal and vertical resampling (upsampling and downsampling). It allows programmable color space conversion of RGB24 into YUV4:2:2-UYYV, YUV4:2:2-YUV2, or YUV4:2:0-NV12, and selection of color-depth reduction from RGB24 to RGB16.
 - Two LCD outputs, each one with dedicated overlay manager, for support of passive matrix color and monochrome displays (up to 8-bit interface) and active matrix color displays (up to 24-bit interface). Secondary LCD output is available through parallel CMOS interface for MIPI®-DPI 1.0 support.
 - One TV output with dedicated overlay manager
 - Own direct memory access (DMA) engine
- Remote frame buffer interface (RFBI) module.
 - Support for MIPI-DBI protocol
 - 8-/9-/16-bit parallel interface
 - Programmable pixel modes and output formats
- Two MIPI display serial interfaces (DSIs) with the following main features:
 - Support for MIPI-DSI (four data-lane complex inputs/outputs (I/Os) for DSI1 and two data-lane complex I/Os for DSI2)
 - Support for video mode and command mode
 - Data interleaving support for synchronous and asynchronous streams
 - Bidirectional data link support
- High-definition multimedia interface (HDMI) encoder with the following main features:
 - HDMI 1.3, HDCP 1.2, and DVI 1.0 compliant
 - Including support for the 3D Stereoscopic frame-packing formats of HDMI v1.4 standard (720p, 50Hz, 720p, 60Hz and 1080p, 24Hz)
 - Deep-color mode support (10-bit for up to 1080p and up to 12-bit for 1080i/720p)
 - Support for uncompressed multichannel audio
 - Integrated high-bandwidth digital content protection (HDCP) encryption engine for transmitting protected audio and video content
 - Integrated transition minimized differential signaling (TMDS) and TERC4 encoders for data island support
- NTSC/PAL video encoder with the following main features:
 - Output to on-chip video digital-to-analog converter (VDAC) providing composite analog output signal: NTSC-J, M; PAL-B, D, G, H, I; PAL-M
 - Support for square pixel sampling
 - Programmable horizontal synchronization, vertical timing, and waveforms

NOTE: The NTSC/PAL video encoder and VDAC function are not supported.

1.3.6 ABE Subsystem Description

The ABE subsystem handles audio processing for the application. It manages the audio and voice streams between the Cortex-A9 MPU subsystem and/or DSP, and the physical interfaces.

The ABE subsystem allows:

- Buffering of audio samples
- Mixing audio with voice downstream and/or microphone upstream (sidetone)
- Postprocessing of equalization, 3D effects, bass-boost

The ABE subsystem consists of:

- Audio engine (AE) subsystem, which performs real-time signal processing such as:
 - Muxing and mixing voice and data streams
 - Postprocessing operations such as sampling rate conversion, volume control, 3D effects
 - Execution of whole data transfers in the ABE subsystem using audio traffic controller (ATC)

The AE subsystem includes an AE and has the following on-chip memories available: 64-KB data memory (DMEM); 6-KB coefficient memory (CMEM); and 18-KB sample memory (SMEM).

The ATC manages the data movement in the ABE subsystem and is in charge of interrupt generation to the DSP and Cortex-A9 MPU subsystems.
- Four general-purpose timers (GPTIMERS) and one watchdog timer (WDTIMER)
- Peripheral interfaces:
 - Three multichannel buffered serial ports (McBSPs) for inter-IC sound (I²S™) external connectivity
 - One multichannel audio serial port (McASP) supporting Sony/Philips digital interconnect format (S/PDIF) output
 - One MIPI SLIMbus interface to support new generations of MIPI-compliant components
 - One digital microphone (DMIC) for three stereo digital microphones support
 - One multichannel pulse-density modulation (McPDM) interface, which ensures communication with the TWL6040 audio companion chip
- Internal interfaces for connection with the DSP and Cortex-A9 MPU subsystems and other modules in the device
- Dedicated power domain (ABE power domain)

1.3.7 ISS Description

The ISS processes data coming from the image sensor, memory, and IVA-HD subsystem. The ISS is responsible for multimedia applications such as: camera viewfinder; video record with up to 1080 p at 30 fps with digital zoom and still image processing, such as image capture up to 16 Mp with digital zoom and rotation. The ISS supports a pixel throughput of up to 200 Mp/s. It assures good performance with sensors up to 16 Mp and more (higher resolution can be achieved through multiple passes). The ISS can implement third-party algorithms for further flexibility when working with image sensors.

The ISS consists of:

- The ISP, which deals with on-the-fly or memory-to-memory data processing. It allows data collection for autoexposure, autowhite balance, autofocus, resizing, and histogram generation. The ISP consists of:
 - Image pipe interface (IPIPEIF) for synchronization signals (HD, VD) for the ISIF, IPIPE, RSZ, and hardware 3A (H3A) modules, and data transfer from video port, SDRAM, ISIF. Various pixel data manipulation functions.
 - Image pipe (IPIPE) front-end and back-end modules for raw data processing and RGB and YUV data processing, respectively. They support:
 - Sensor data linearization for dynamic range extension

- Programmable 2D lens shading compensation correction
- Black-level compensation
- Gamma correction
- RGB color correction
- RGB to YUV4:2:2 color conversion
- 3D look up table (LUT) for color correction
- 2D edge enhancement
- False chroma suppression
- H3A for autowhite balance, autoexposure, and autofocus
- Pattern generator (PG) for internal data generation for test purposes. It provides the ability to test some of the ISP submodules without the use of an external image sensor.
- Two independent resizers, which allow YUV4:2:2 to YUV4:2:0 planar Chroma filtering and downsampling. The resizers support input and output flows with up to 200 Mp/s, and memory-to-memory rescaling in the range $\times 1/4096$ scale down, and $\times 20$ scale up.
- Image sensor interface (ISIF) can process the incoming data and supports the following main functions:
 - Sensor data linearization
 - Supports VGA read out mode
 - Color space conversion
 - Digital clamp with horizontal/vertical offset drift compensation
 - Vertical line defect correction
 - Programmable 2D-matrix lens shading correction
 - 10-to-8 bits A-Law compression table inside
- Buffer logic (BL), which processes and manages the requests to the module and memory subsystem
- Peripheral serial interfaces for connection with sensors and memories:
 - Two PHYs, CSIPHY1 and CSIPHY2, for physical connection to external sensors
 - Peripheral serial interfaces CSI2-A and CSI2-B/CCP2 for image data transfer from sensors to memory or ISP
- Peripheral 16-bit parallel interface, BT656 and SYNC mode
- SIMCOP module for memory-to-memory operation; JPEG encode/decode hardware acceleration; high-ISO filtering; block-based rotation; warping and fusion; and general-purpose imaging acceleration. The SIMCOP includes the following main submodules:
 - Two imaging extension (iMX) modules – programmable image and video processing engines
 - Noise filter 2 (NSF2) – for advanced noise filtering and edge-enhancement
 - Variable-length coder/decoder for JPEG (VLCDJ) module
 - Discrete cosine transform (DCT) module
 - Lens distortion correction (LDC) module
 - Rotation accelerator (ROT) engine
 - Hardware sequencer, which offloads sequencing tasks from the MPU
 - Shared buffers/memories
 - DMA controller
- Timing control module for CAM global reset control, CAM flash strobe, and CAM shutter
- System interfaces and interconnects comprising:
 - Two configuration interfaces
 - One 128-bit master data interface
 - Internal ISS interconnects for image data and configuration

- On-chip RAM interface
- Circular buffer (CBUFF) and burst-translation engine (BTE) for efficient communication with external memory (SDRAM/TILER support)

1.3.8 2D/3D Graphics Accelerator Description

The 2D/3D graphics accelerator subsystem is based on POWERVR® SGX540 core from Imagination Technologies. It supports phone/PDA and handheld gaming applications. The SGX can process different data types simultaneously, such as: pixel data, vertex data, video data, and general-purpose data processing.

The SGX subsystem has the following features:

- Universal scalable shader engine (USSE™), multithreaded engine incorporating pixel and vertex shader functionality to reduce die area
- Advanced shader feature set in excess of Microsoft VS3.0, PS3.0, and OGL2.0
- Industry-standard API supports Direct3D™ Mobile, OGL-ES 1.1 and 2.0, OpenVG™ 1.1, and OpenMAX™
- Fine-grained task switching, load balancing, and power management
- Programmable high-quality image antialiasing
- Advanced geometry DMA driven operation for minimum CPU interaction
- Fully virtualized memory addressing for OS operation in a unified memory architecture
- Advanced and standard 2D operations, such as vector graphics, BLTs, ROPs, etc.
- Programmable video encode and decode support for H.264, H.263, MPEG-4 (SP), WMV9, and JPEG

1.3.9 Face Detect Module Description

The face detect module is a stand-alone module that performs face detection and tracking on a picture stored in the SDRAM memory. It communicates with the Cortex-A9 MPU, DSP, and Cortex-M3 MPU subsystems.

Face detect is typically used on:

- Video encoding
- Face-based priority auto-focusing
- Red-eye removal

The face detect module comprises:

- Face detection core with embedded DMA engine for data memory access
- RAM and ROM memories
- L3 and L4 port interfaces

1.3.10 On-Chip Debug Support Description

The on-chip debug support has the following features:

- Multiprocessor debugging lets users control multiple CPU cores embedded in the device, such as:
 - Global starting and stopping of individual or multiple processors
 - Each processor can generate triggers that can be used to alter the execution flow of other processors
 - System clocking and power down
 - Interconnection of multiple devices
 - Channel triggering
- Target debugging, using IEEE1149.1 (JTAG®), or IEEE1149.7 (complementary superset of JTAG) port
- Reduction of power consumption in normal operating mode
- Real-time software trace allows the OMAP software masters to transmit trace data from OS processes or tasks on 256 different channels.

The debug subsystem includes:

- IEEE1149.7 adapter
- Generic TAP for emulation and test control (ICEPick-D™)
- Debug access port (DAP)
- Processor trace subsystem
- System trace subsystem
- EMU configuration interconnect
- Cross-triggering unit (XTRIGGER)
- Debug resource manager (DRM)

ICEMelter:

- Controls the wake-up and power-down of the emulation power domain

CORE instrumentation interconnect:

- Initiator ports:
 - L3 interconnect (for software instrumentation and performance probes)
 - OCP-WP
 - IVA-HD instrumentation (HWA profiling)
 - CM2 instrumentation
- Target port:
 - EMU instrumentation interconnect

OCP watch-point (OCP-WP):

- Monitors L3 interconnect transaction when target transaction attributes match the user-defined attributes or trigger on external debug event
- Only one instance, shared among the following L3 targets:
 - GPMC
 - L4_PER
 - L4_CFG

Power management events profiler (PM instrumentation)

Clock management events profiler (CM instrumentation)

Statistics collector (performance probes)

1.3.11 Power, Reset, and Clock Management Description

The PRCM module allows efficient control of clocks and power according to the required performance, and reduction of power consumption.

The PRCM module is divided into:

- Power and reset management (PRM), based on the SmartReflex™ framework with the following features:
 - Dynamic clock gating
 - Dynamic voltage and frequency scaling (DVFS)
 - Dynamic power switching (DPS)
 - Static leakage management (SLM)
 - Adaptive body bias (ABB)
 - Retention-till-access (RTA) for memories
- Clock management 1 (CM1) for clock generation, distribution, and management for the Cortex-A9 MPU, DSP, ABE, and CORE always-on power domains. The clock management allows reduction of dynamic consumption.
- Clock management 2 (CM2) for clock generation, distribution, and management for other modules

1.3.12 On-Chip Memory Description

The on-chip memory is divided into L3 OCM RAM, SAR ROM, SAR RAM, and memories in the subsystems (Cortex-A9, DSP, Cortex-M3, ABE, and IVA-HD).

- The L3 OCM RAM consists of 56KB of on-chip SRAM.
- The save-and-restore (SAR) ROM consists of 4KB and contains a linked list of descriptors used by the system DMA (sDMA).
- The SAR RAM consists of 8KB divided into four blocks. It is used as context-saving memory when the device goes into off mode.

1.3.13 Memory Management Description

The memory management is performed from:

- sDMA controller with up to 127 requests, 32 prioritizable logical channels, and 256 × 64-bit FIFO
- Dynamic memory management (DMM) module, which performs global address translation, address rotation (tiling), and access interleaving

1.3.14 External Memory Interface Description

There are two main interfaces for connection to external memories: general-purpose memory controller (GPMC) and dual-channel SDRAM controller (SDRC).

The GPMC supports:

- Asynchronous SRAM memories
- Asynchronous/synchronous NOR flash memories
- NAND flash memories
- Pseudo-SRAM devices

The SDRC/EMIF allows:

- Connection between the device and LPDDR2-type memory. It supports double-data rate (DDR) and single-data rate (SDR) protocols. The EMIF is the interface between LPDDR2 SDRAM and the Cortex-A9 MPU subsystem, ISS, IVA-HD subsystem, SGX, and DMA controllers.
- PHY is the DDR physical interface, which implements data-rate conversion in compliance with LPDDR2 JEDEC requirements.

1.3.15 System and Connection Peripherals

The OMAP device supports a comprehensive set of peripherals to provide flexible and high-speed (HS) interfacing and on-chip programming resources.

1.3.15.1 System Peripherals

- Seven general-purpose timers (GPTIMER)
- One watchdog timer (WDTIMER)
- One 32-kHz synchronization timer (32KTIMER)
- System control module, which contains registers for the following functions:
 - Static device configuration
 - Debug and observability
 - Status
 - Pad configuration
 - I/O configuration
 - eFuse logic
 - Analog function control
 - System boot decoding logic
- System mailbox with eight mailbox message queues

- One SPINLOCK module with 32 hardware semaphores, which can service tasks between the Cortex-A9 MPU, DSP, and Cortex-M3 MPU subsystems

1.3.15.2 Connection Peripherals

- Three universal asynchronous receiver/transmitter (UART) modules as serial-communication interfaces
- One UART + IrDA SIR up to FIR + TV remote control interface (CIR)
- McBSP module to provide full-duplex serial communication between the OMAP and other applications chips and codecs
- Five HS I²C™ controller modules; four of them are general-purpose modules with rates up to 3.4 Mbps, and the fifth one, in the PRCM module, performs dynamic voltage control and power sequencing with an external power IC.
- HDQ™/1-Wire® – Benchmarq HDQ and Dallas Semiconductor 1-Wire protocols interface
- Two HS MMC/SD/SDIO modules with 8-bit data bus interface, that can act as an initiator on L3 interconnect thanks to an embedded DMA
- Three HS MMC/SD/SDIO modules with 4-bit data bus interface
- Six general-purpose input/output (GPIO) modules with 32 I/Os each
- One keyboard controller, which supports up to 9 × 9 matrix keypads
- One MIPI SLIMbus interface
- Four multichannel serial peripheral interface (MCSPi) modules
- One HS universal serial bus (USB) On-The-Go (OTG) module with embedded PHY, compliant with the USB2.0 (up to 480 Mbps) standard for HS functions and with the OTG supplement
- One HS multiport USB host module, which can be used for interchip connection or with an off-chip transceiver. It is compliant with the USB2.0 standard. The USB host module allows communication with USB peripherals with data rates up to 480 Mbps for HS, up to 12 Mbps for full-speed, and up to 1.5 Mbps for low-speed.
- One full-speed USB module compliant with the USB1.1 standard for full-speed functions
- One MIPI high-speed synchronous serial interface (HSI) module with two full-duplex serial communication interfaces. It is used for communication between the OMAP device and an external device, with data rates up to 192 Mbps for transmission, and up to 225 Mbps for reception. The MIPI HSI supports 16 logical channels on each destination (RX/TX).

1.4 Package-On-Package Concept

The OMAP4460 die uses flip-chip technology. The OMAP4460 package-on-page (POP) device supports memory stacking using a POP implementation.

The OMAP4460 die provides two LPDDR2 interfaces. Because each interface supports up to two chip-selects (CSs), up to four LPDDR2 memory dies are supported. Those interfaces are available only on device top ball out.

The two stacked memory packages are directly connected to the two LPDDR2 EMIF4D interfaces of the OMAP4460 die.

Figure 1-3 shows the concept of the POP solution, and Figure 1-4 shows stacked memory package on the POP device.

Figure 1-3. POP Concept

intro-003

Figure 1-4. Stacked Memory Package on the POP Device

intro-004

Two types of LPDDR-SDRAM memories are supported in the POP package: S4 and S2, with size up to 2GB and 32-bit data width.

The POP device includes feedthroughs. The feedthroughs are defined from the bottom ball-grid array (BGA) to the stacked memory. The purpose of some of the feedthroughs is to provide power supply to the stacked memories.

1.5 OMAP4460 Family and Device Identification

The OMAP4460 family is composed of the following devices:

- OMAP4460-1200
- OMAP4460-1500

Table 1-1 describes the identification registers.

The identification registers include the data registers listed in Table 1-2 and Table 1-3. These registers are read-only accessed ports that are programmed into eFuses FARM FROM.

Table 1-1. Device Identification Registers

Register Name	Alias Name	Physical Address	Address Offset	Size
STD_FUSE_DIE_ID_0[31:0]	DIE_ID[31:0]	0x4A00 2200	0x200	32
ID_CODE[31:0]	ID_CODE[31:0]	0x4A00 2204	0x204	32
STD_FUSE_DIE_ID_1[31:0]	DIE_ID[63:32]	0x4A00 2208	0x208	32
STD_FUSE_DIE_ID_2[31:0]	DIE_ID[95:64]	0x4A00 220C	0x20C	32
STD_FUSE_DIE_ID_3[31:0]	DIE_ID[127:96]	0x4A00 2210	0x210	32
STD_FUSE_PROD_ID_0[31:0]	PROD_ID[31:0]	0x4A00 2214	0x214	32
STD_FUSE_PROD_ID_1[31:0]	PROD_ID[63:32]	0x4A00 2218	0x218	32

Table 1-2. STD_FUSE_DIE_ID

Field	Alias Name	Bits	Value
STD_FUSE_DIE_ID_0[31:0]	DIE_ID[31:0]	–	Single die identifier
STD_FUSE_DIE_ID_1[31:0]	DIE_ID[63:32]	–	Single die identifier
STD_FUSE_DIE_ID_2[31:0]	DIE_ID[95:64]	–	Single die identifier
STD_FUSE_DIE_ID_3[31:0]	DIE_ID[127:96]	–	Single die identifier

The product type can be read in the value of the RAMP_SYSTEM bit field of the Table 1-3 register. The silicon revision can be read in the value of the VERSION bit field of the Table 1-3 register.

Table 1-3. ID_CODE

Field	Bits	Value	Comment
ID_CODE[31:28]	VERSION	See Table 1-5.	Revision number
ID_CODE[27:12]	RAMP_SYSTEM	See Table 1-4.	Ramp system number
ID_CODE[11:1]	TI_IDM	0x17	Manufacturer identity (TI)
ID_CODE[0]	–	0x1	Always set to 1

The ramp system number is hardcoded in the design. Table 1-4 lists the ramp system number values, and Table 1-5 lists the revision number values.

Table 1-4. Ramp System Number Values

Silicon Type	Field	Value
OMAP4460 ES1.0 and ES1.1	ID_CODE[27:12]	0xB94E

Table 1-5. Revision Number Values

Silicon Type	Field	Value
OMAP4460 ES1.0	ID_CODE[31:28]	0x0
OMAP4460 ES1.1	ID_CODE[31:28]	0x2

Memory Mapping

This chapter describes the memory mapping in the device.

Topic	Page
2.1 Introduction	291
2.2 L3 Memory Space Mapping	293
2.3 L4 Memory Space Mapping	296
2.4 Dual Cortex-M3 Subsystem Memory Space Mapping	305
2.5 DSP Subsystem Memory Space Mapping	306
2.6 Display Subsystem Memory Space Mapping	308

2.1 Introduction

The Cortex™-A9 microprocessor unit (MPU) has a 32-bit address port, which allows it to handle a 4-GB space divided into several regions, depending on the target type.

The memory map comprises the following features that are shared among the initiators (for example, the Cortex-A9 MPU subsystem or the image and video accelerator [IVA-HD] subsystem).

- Memory space: General-purpose memory controller (GPMC)
- Dynamic memory management controller (DMM)
- Register spaces: Level 3 (L3) and level 4 (L4) interconnects
- Dedicated spaces: IVA-HD subsystem, graphic accelerator (SGX), etc.

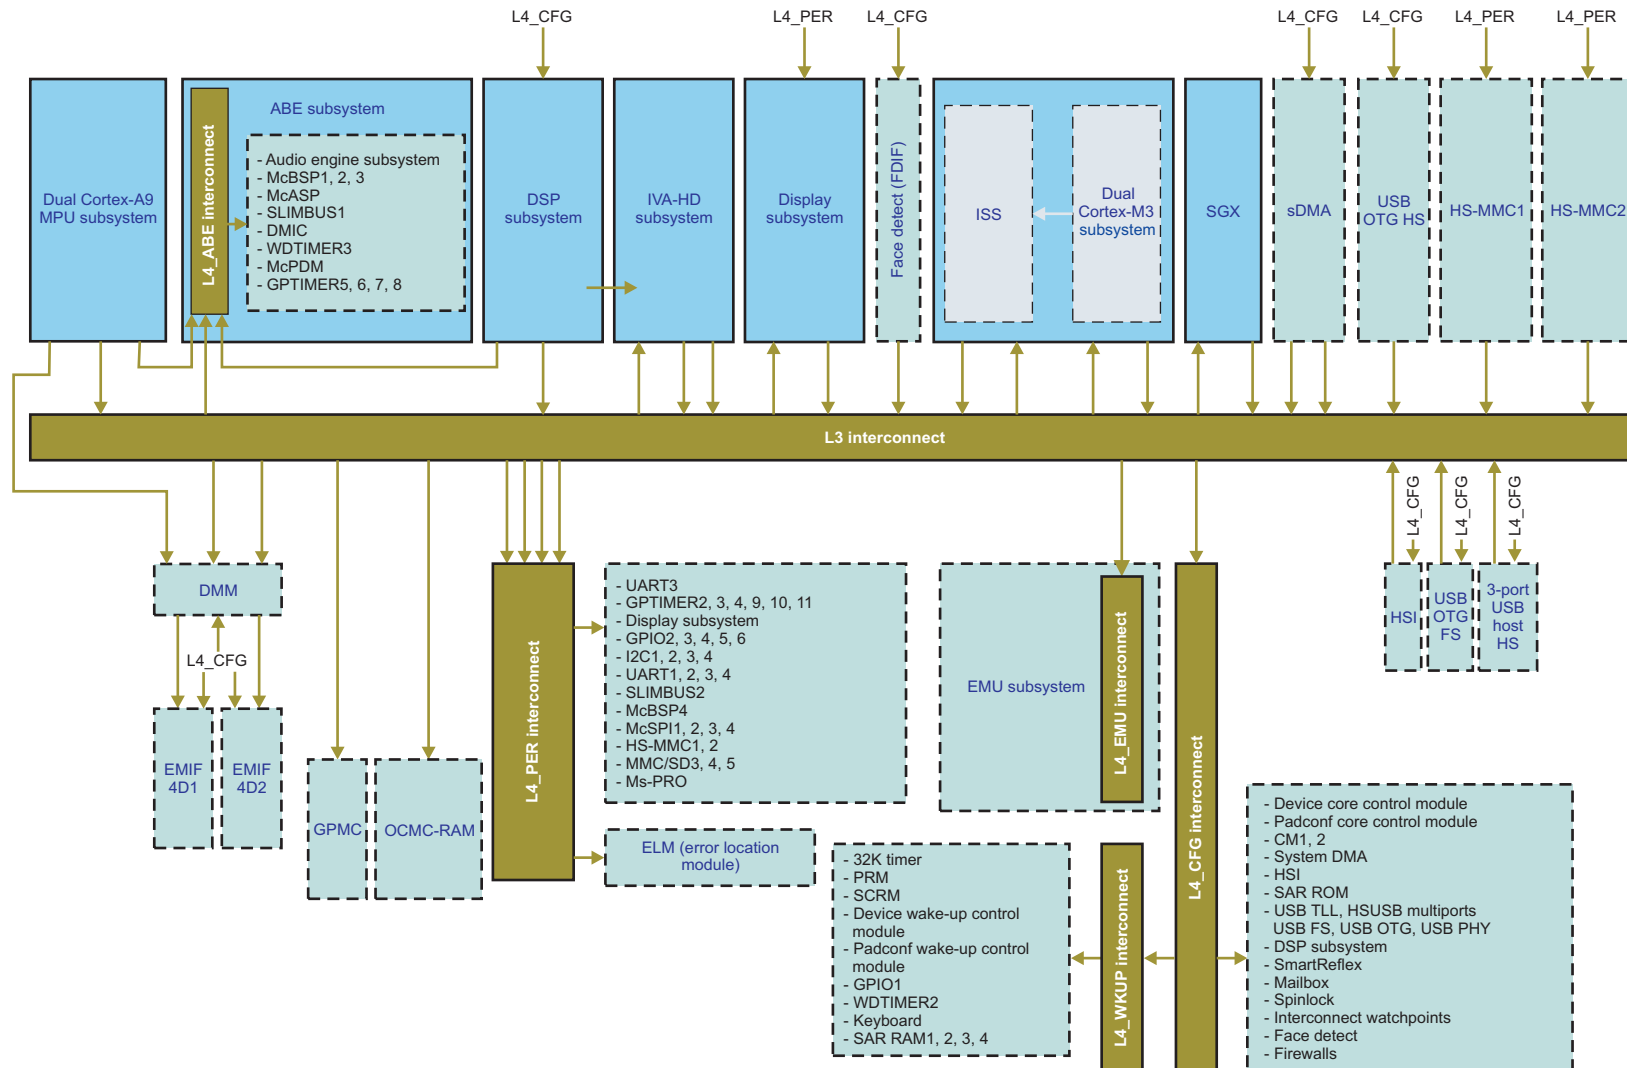

The GPMC and DMM are dedicated to memory connection. The GPMC is used for NOR/NAND flash and static RAM (SRAM) memories. The DMM is used for synchronous dynamic random access memory (SDRAM) memories, such as regular SDR (single-data rate)-SDRAM or mobile DDR (double-data rate)-SDRAM. For more information, see [Section 15.2, *Dynamic Memory Manager*](#), and [Section 15.3, *EMIF Controller*](#).

The L3 interconnect allows the sharing of resources, such as peripherals and external or on-chip memories, among all the initiators of the platform. The L4 interconnects control access to the peripherals.

Transfers across the platform between initiators and targets are physically conditioned by the chip interconnect and can be logically conditioned by firewalls. For more information about the intercommunication (L3 and L4 interconnects) and protection mechanisms implemented in the device, see [Section 13.2, *L3 Interconnect*](#), and [Section 13.3, *L4 Interconnects*](#).

[Figure 2-1](#) shows the interconnect of the device and the main modules and subsystems in the platform.

Figure 2-1. Interconnect Overview

memmap-001

2.2 L3 Memory Space Mapping

The memory space system is hierarchical: level 1 (L1), level 2 (L2), L3, and L4. L1 and L2 are memories in the Cortex-A9 MPU, Cortex™-M3 MPU, and the digital signal processor (DSP) subsystems. L3 handles many types of data transfers, including data exchange with system on-chip/external memories. The chip-level interconnect, which consists of one L3 and four L4s, enables communication among all modules and subsystems.

This section provides a global view of the memory mapping of the device at the L3 interconnect and describes the boot, GPMC, and SDRAM controller (SDRC) (EMIF/DMM) spaces.

The system memory mapping is flexible, with two levels of granularity for target address space allocation:

- L1: Four quarters are labeled Q0, Q1, Q2, and Q3. Each quarter corresponds to a 1-GB address space (total address space is 4GB).
- L2: Each quarter is divided into eight blocks of 32MB, with target spaces mapped in the blocks.

This organization allows all target spaces to be decoded based on the 7 most-significant bits (MSBs) of the 32-bit address ([31:25]).

- Boot space:

The system has a 48-KB boot space in the on-chip boot ROM or on the GPMC space.

When booting from the on-chip ROM with the appropriate external `sys_boot` pin configuration, the 48-KB memory space is redirected to the on-chip boot ROM address space [0x4002 0000–0x4002 BFFF].

When booting from the GPMC with the appropriate external `sys_boot` pins configuration, the memory space is part of the GPMC space. At reset, the 0x0000 0000 address is available on chip-select 0 (CS0) for a memory size of 16MB.

For more information about `sys_boot` pins configuration, see [Section 15.4, General-Purpose Memory Controller](#), and [Chapter 27, Initialization](#).

- GPMC space:

Eight independent GPMC chip-selects (`gpmc_ncs0` to `gpmc_ncs7`) are available in the first quarter (Q0) of the addressing space to access NOR/NAND flash and SRAM. The chip-selects have a programmable start address and programmable size (16MB, 32MB, 64MB, or 128MB) in a total memory space of 1GB.

- EMIF1/EMIF2 CS0 space:

Q2 addressing space is interleaved on two LPDDR-memory controllers (EMIF1|EMIF2), each activating its CS0 line (`lpddr21_ncs0` and `lpddr22_ncs0`). These chip-selects can address 64, 128, 256, 512, 1024, and 2048MBs. Interleaving occurs from 128-byte granularity up to 512-byte granularity.

The EMIF1-CS0 base address is always 0x8000 0000 at reset, and occupies a 1-GB address space at reset (interleaving disabled at reset).

- EMIF1/EMIF2 CS1 space:

Q3 addressing space is interleaved on two LPDDR-memory controllers (EMIF1|EMIF2), each activating its CS1 line (`lpddr21_ncs1` and `lpddr22_ncs1`). These chip-selects can be programmed to 64, 128, 256, 512, and 1024MBs. Interleaving occurs at 128-MB granularity.

EMIF1-CS1 and EMIF2-CS1 are disabled at reset. Their base address is programmable to achieve a continuous address space with the respective CS0, regardless of the address range programmed.

EMIF1-CS1 is disabled if EMIF1-CS0 memory density is set to 2048MB (2GBs) when interleaving is disabled, or if EMIF1-CS0 + EMIF2-CS0 memory density are set to 1024MB (1GB) when interleaving is enabled.

- Tiler space:

Q3 addressing space is also used to access the Tiler system. This space is visible only for the imaging subsystem (ISS) and display subsystem.

[Table 2-1](#) describes the global memory space mapping.

Table 2-1. Global Memory Space Mapping

2.2.1 L3_EMU Memory Space Mapping

The L3_EMU interconnect is a 2-MB space composed of the L3_EMU interconnect configuration registers and module registers.

[Table 2-2](#) describes the mapping of the registers for the L3_EMU interconnect.

Table 2-2. L3_EMU Memory Space Mapping

2.3 L4 Memory Space Mapping

Four L4 interconnects handle transfers with peripherals. Each interconnect is in a distinct power domain:

- L4_CFG: CORE power domain
- L4_WKUP: WKUP power domain
- L4_PER: PER power domain
- L4_ABE: ABE power domain

As with the L3 interconnect, the L4 interconnect can be configured to tune the access according to the characteristics of each module.

The following sections describe the register mapping of the L4 interconnect. Software configures these registers.

2.3.1 L4_CFG Memory Space Mapping

The L4_CFG interconnect is a 16-MB space composed of the L4_CFG interconnect configuration registers and the module registers.

Table 2-3 describes the mapping of the registers for the L4_CFG interconnect.

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4_CFG interconnect. All other accesses are internal to the L4_CFG interconnect.

Table 2-3. L4_CFG Memory Space Mapping

Module Name	Start Address (hex)	End Address (hex)	Size	Description

2.3.4 L4_ABE Memory Space Mapping

The L4_ABE interconnect is a 16-MB space composed of the L4_ABE interconnect configuration registers and the module registers.

ABE modules are dual-mapped inside the Cortex-A9 MPU/DSP address space:

- Mapped in L3 as the L4 ABE space
- Mapped in Cortex-A9 MPU and DSP nonshared device map

NOTE: All memory spaces described as modules provide direct access to the module registers outside the L4_ABE interconnect. All other accesses are internal to the L4_ABE interconnect.

Table 2-6 describes the mapping of the registers for the L4_ABE interconnect in the Cortex-A9 MPU nonshared (private) device address range (L4_ABEP).

Table 2-6. ABE Cortex-A9 MPU Memory Space Mapping

Module Name	Start Address (hex)	End Address (hex)	Size	Description

2.5 DSP Subsystem Memory Space Mapping

The DSP subsystem can access the ABE and IVA-HD blocks.

ABE has three different address spaces:

- ABE NC: This region is for accesses to registers in ABE. For more information about ABE peripheral memory mapping, see [Table 2-6](#).
- ABE: This region is for accesses to memory in ABE. Memory in the ABE subsystem can be cached in DSP L1 and L2. When enhanced direct memory access (eDMA) tries to access this space, L1/L2 is snooped and if data is present in DSP subsystem caches, data is provided to eDMA from DSP caches. However, if data is not present in DSP caches, the shared cache sends the access to ABE and data returned is not allocated into DSP cache; instead, it is sent to eDMA.
- ABE locked region: This region is similar to the ABE region, except that data from ABE is allocated into DSP caches and returned to eDMA.

The IVA-HD region is for accesses to IVA-HD accelerator memories and registers in IVA-HD. SL2 is the L2 cache in IVA-HD. There are three ways to access the IVA-HD accelerator memories:

- SL2 - L1 region: This region is for accesses to SL2 memory that can be mapped to DSP L1. When eDMA tries to access this space, L1/L2 is snooped and if data is present in DSP caches, the data is provided to eDMA from DSP caches. However, if data is not present in DSP caches, the shared cache sends the access to SL2 and data returned is not allocated into DSP L1 cache; instead, it is sent to eDMA.
- SL2 - L2 region: This region is for accesses to SL2 memory that can be mapped to DSP L2. When eDMA tries to access this space, L1/L2 is snooped and if data is present in DSP caches, the data is provided to eDMA from DSP caches. However, if data is not present in DSP caches, the shared cache sends the access to SL2 and data returned is not allocated into DSP L2 cache; instead, it is sent to eDMA.
- SL2 locked region: This region is similar to the previous regions, except that data is allocated into DSP caches and returned to eDMA.

[Table 2-10](#) describes the mapping of the registers for the DSP subsystem.

Table 2-10. DSP Subsystem Memory Space Mapping

2.6 Display Subsystem Memory Space Mapping

The display subsystem integrates a display controller (DISPC), a remote frame buffer interface (RFBI), two MIPI® display serial interfaces (DSI1 with four data lanes, and DSI2 with two data lanes), an HDMI link with its PHY (high-definition multimedia interface, digital part), and a video PAL/NTSC encoder (VENC) with video DAC (and TV out buffer).

The DISPC is connected through an interconnect master port to the L3 interconnect and has its own DMAs to fetch the data from the system memory.

There are two views (from the L3_PER and L4_PER interconnects) of the display subsystem memory space mapping.

NOTE: The video DAC (VDAC) function is not supported.

2.6.1 L3 Interconnect View of the Display Memory Space

Table 2-11 lists the display subsystem memory space mapping from the perspective of the Cortex-A9 MPU subsystem through the L3 interconnect.

Table 2-11. L3 Access – Display Subsystem Space Mapping

3.1 Device Power Management Introduction

Power management (efficient use of the limited battery resources on a mobile device) is one of the most important design aspects of any mobile system. It imposes strong control over limited available power resources to ensure they function for the longest possible length of time.

The device power-management architecture ensures maximum performance and operation time for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements.

This introduction contains the following information:

- Power-management architecture building blocks for the device
- State-of-the-art power-management techniques supported by the power-management architecture of the device

3.1.1 Device Power-Management Architecture Building Blocks

To provide a versatile architecture supporting multiple power-management techniques, the power-management framework is built with three levels of resource management: clock, power, and voltage management.

These management levels are enforced by defining the managed entities or building blocks of the power-management architecture, called the clock, power, and voltage domains.

A domain is a group of modules or subsections of the device that share a common entity (for example, common clock source, common voltage source, or a common power switch). The group forming the domain is managed by a policy manager. For example, a clock for a clock domain is managed by a dedicated clock manager within the power, reset, and clock management (PRCM) module. The clock manager takes into consideration the joint clocking constraints of all the modules belonging to that clock domain (and, hence, receiving that clock).

NOTE: In the following sections, the term *module* is used to represent the device IPs (that is, modules or subsystems), other than the PRCM module, that receive clock, reset, or power signals from the PRCM module.

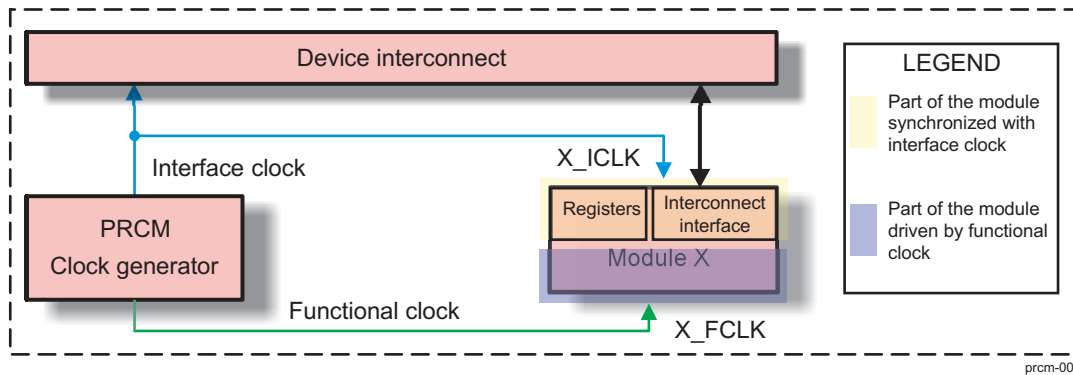

3.1.1.1 Clock Management

The PRCM module manages the gating (that is, switching off) and enabling of the clocks to the device modules. The clocks are managed based on the requirement constraints of the associated modules. The following sections identify the module clock characteristics, management policy, clock domains, and clock domain management.

3.1.1.1.1 Module Interface and Functional Clocks

Each module within the device has specific clock input characteristics requirements. Based on the characteristics of the clocks delivered to the modules, the clocks are divided into two categories: interface clocks and functional clocks (see [Figure 3-1](#)).

Figure 3-1. Functional and Interface Clocks

The interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and the interconnect.
- In most cases, they supply the system interconnect interface and registers of the module.
- A typical module has one interface clock, but modules with multiple interface clocks may also exist (that is, when connected to multiple interconnect buses).
- Interface clock management is done at the device level.
- From the standpoint of the PRCM module, an interface clock is identified with an `_ICLK` suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or a subsystem.
- A module can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A module needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the module activity (for example, the clock for the camera).
- From the standpoint of the PRCM module, a functional clock is directly distributed to the related modules through a dedicated clock tree. It is identified with an `_FCLK` suffix.

NOTE: At the module level, the interface clocks are always fed by the interface clock outputs of the PRCM module. The functional clocks are fed either by a PRCM module functional clock output, or by a PRCM module interface clock output. In the latter case, the functional and interface module clocks inherit the clock-management features (autoidle features) of the PRCM module interface clock.

3.1.1.1.2 Module-Level Clock Management

Each module in the device may also have specific clock requirements. Certain module clocks must be *active* when operating in specific modes, or may be gated otherwise. Globally, the activation and gating of the module clocks are managed by the PRCM module. Hence, the PRCM module must be aware of when to activate and when to gate the module clocks.

The PRCM module differentiates the clock-management behavior for device modules based on whether the module can initiate transactions on the device interconnect (called master module) or it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based power-management protocols are used:

- Master standby protocol: Clock-management protocol between the PRCM and master modules
- Slave idle protocol: Clock-management protocol between the PRCM and slave modules

Master standby protocol:

This protocol is used to indicate that a master module must initiate a transaction on the device interconnect and requests specific (functional and interface) clocks for the purpose. The PRCM module ensures that the required clocks are active when the master module requests the PRCM module to enable them. This is called a module wake-up transition and the module is said to be functional after this transition completes.

Similarly, when the master module no longer requires the clocks, it informs the PRCM module, and the PRCM module can then gate the clocks to the module. The master module is then said to be in standby mode.

Although the protocol is completely hardware-controlled, the software must configure the clock management behavior for the module. This is done by setting the module register bit field **<Module>_SYSCONFIG.MIDDLEMODE** or **<Module>_SYSCONFIG.STANDBYMODE**, as presented in [Table 3-1](#). The behavior, identified by standby mode values, must be configured.

Table 3-1. Master Module Standby Mode Settings

Standby Mode Value	Selected Mode	Description
0x0	Force-standby	The module unconditionally asserts the standby request to the PRCM module, regardless of its internal operations. The PRCM module may gate the functional and interface clocks to the module. This mode must be used carefully because it does not prevent any loss of data at the time the clocks are gated.
0x1	No-standby	The module never asserts the standby request to the PRCM module. This mode is safe from a module point of view as it ensures that the clocks remain active; however, it is not efficient from a power-saving perspective because it never allows the PRCM module output clocks to be gated.
0x2	Smart-standby	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idled. The PRCM module can then gate the clocks to the module.
0x3	Smart-standby wakeup-capable mode	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idle. The PRCM module can then gate the clocks to the module. The module may generate (master-related) wake-up events when in standby state. The mode is relevant only if the appropriate module mwakeup output is implemented.

NOTE:

- Smart-standby mode is the preferred mode of operation, while forced-standby and no-standby modes are intended for debugging purposes.
- A master module may support all or some of the standby modes listed in [Table 3-1](#). See the power management section in the module chapter to identify the supported standby mode.

The standby status of a master module is indicated by the **CM_<Power domain>_<Module>_CLKCTRL[x].STBYST** bit in the PRCM module. [Table 3-2](#) describes the master module standby status.

Table 3-2. Master Module Standby Status

STBYST Bit Value	Description
0x0	The module is functional.
0x1	The module is in standby mode.

[Table 3-3](#) lists the enabling conditions for the master module clocks managed by the standby protocol.

Table 3-3. Master Module Clock Enabling Conditions

Relation		Condition
AND		Clock domain is ready.
	OR	Master module standby request is deasserted. Master module wake-up request is asserted.

Slave idle protocol:

This hardware protocol allows the PRCM module to control the state of a slave module. The PRCM module informs the slave module, through assertion of an idle request, when its clocks (interface and functional) can be gated. The slave can then acknowledge the request from the PRCM module and the PRCM module is then allowed to gate the clocks to the module. A slave module is said to be in IDLE state when its clocks are gated by the PRCM module.

Similarly, an idled slave module may need to be woken up because of a service request from a master module or as a result of an event (called a wake-up event, for example, interrupt or DMA request) received by the slave module. In this situation the PRCM module enables the clocks to the module and then deasserts the idle request to signal the module to wake up.

Although the protocol is completely hardware-controlled, software must configure the clock management behavior for the slave module. This is done by setting the module register bit field <Module>_SYSCONFIG.SIDLEMODE or <Module>_SYSCONFIG.IDLEMODE, as presented in [Table 3-4](#). The behavior, identified by the Idle Mode Value column, must be configured by software.

Table 3-4. Module Idle Mode Settings

Idle Mode Value	Selected Mode	Description
0x0	Force-idle	The module unconditionally acknowledges the idle request from the PRCM module, regardless of its internal operations. This mode must be used carefully because it does not prevent any loss of data at the time the clock is switched off.
0x1	No-idle	The module never acknowledges any idle request from the PRCM module. This mode is safe from a module point of view as it ensures the clocks remain active; however it is not efficient from a power-saving perspective because it does not allow the PRCM module output clock to be shut off, and thus the power domain to be set to a lower power state.
0x2	Smart-idle	The module acknowledges the idle request basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or direct memory access (DMA) requests are processed. This is the best approach to an efficient system power management.
0x3	Smart-idle wakeup-capable mode	The module acknowledges the idle request basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management. The module may generate (IRQ- or DMA-request-related) wake-up events when in idle state. The mode is relevant only if the appropriate module wakeup output(s) is implemented.

NOTE:

- Smart-idle mode is the preferred mode of operation, while forced-idle and no-idle modes are intended for debugging purposes.
- A slave module may support all or some of the idle modes listed in [Table 3-4](#). See the power-management section in the module chapter to identify the supported idle modes.

The idle status of a slave module is indicated by the CM_<Power domain>_<Module>_CLKCTRL[x] IDLEST bit field in the PRCM module. [Table 3-5](#) lists the possible idle statuses for a slave module.

Table 3-5. Slave Module Idle Status

IDLEST Bit Value	Idle Status	Description
0x0	Functional	The module is fully functional. The interface and functional clocks are active.

Table 3-5. Slave Module Idle Status (continued)

IDLEST Bit Value	Idle Status	Description
0x1	In transition	The module is performing a wake-up or a sleep transition.
0x2	Interface idle	The module interface clock is idled. The module may remain functional if using a separate functional clock.
0x3	Full idle	The module is fully idle. the interface and functional clocks are gated.

When configured in smart-idle mode, the slave module may acknowledge the idle request of the PRCM module based on the activity of its interface and/or functional clocks. To define which module clocks (that is, interface and/or functional) should be considered when responding to the PRCM module request, the software must configure the <Module>_SYSCONFIG[x] CLOCKACTIVITY bit field.

The CLOCKACTIVITY setting is used internally by the module to determine on which part of the module the conditions to acknowledge the PRCM module idle request is tested. As an example, if the functional clock must remain active when the module is in idle mode, then the module must acknowledge PRCM module idle request by only considering the interface clock gating conditions (that is, there is no pending activity on the interconnect).

NOTE: See the power-management section in the module chapter to identify whether this feature is configurable.

Using the CLOCKACTIVITY setting along with the smart-idle mode ensures that the clock remains active for the module features that must remain available during the module idle mode. [Table 3-6](#) describes the possible CLOCKACTIVITY settings for a module:

Table 3-6. Slave Module Clock Activity Settings

CLOCKACTIVITY Bit Value	Module Interface Clock	Module Functional Clock	Description
0x0	Gated	Gated	The interface and functional clocks are considered when generating the acknowledgement. This setting also means both clocks may be gated upon a PRCM module idle request.
0x1	Active	Gated	The interface clock is not shut down and is not considered when generating the acknowledgement to the PRCM module idle request. Only the functional clock is considered.
0x2	Gated	Active	The functional clock is not shut down and is not considered when generating the acknowledgement to the PRCM module idle request. Only the interface clock is considered.
0x3	Active	Active	The interface and functional clocks are not shut down. The module can acknowledge the idle request without checking the internal functionalities linked to its clocks.

NOTE:

- The software configuration of the CLOCKACTIVITY settings may not be available for a given module. For some modules, the CLOCKACTIVITY settings can be hardwired.
- A slave module may support all or some of the CLOCKACTIVITY settings listed in [Table 3-6](#).

See the power-management section in the specific module chapter to identify the supported idle feature and settings.

CAUTION

The PRCM module does not have any hardware means to read the CLOCKACTIVITY settings of the module. Software must ensure a consistent programming between the CLOCKACTIVITY settings of the module and the PRCM module clock gating control bits. The PRCM module must be configured (where software control is available) not to gate the module clock, which should remain active according to the CLOCKACTIVITY settings of the module.

For the idle protocol management on the PRCM module side, the behavior of PRCM module is configured in the CM_<Power domain>_<module>_CLKCTRL[x] MODULEMODE bit field. Based on the configured behavior, the PRCM module asserts the idle request to the module either unconditionally (that is, immediately when the software requests), or through hardware control when the module idle conditions are satisfied. [Table 3-7](#) describes the configurable behavior of MODULEMODE.

Table 3-7. Slave Module Mode Settings in PRCM

MODULEMODE Bit Value	Selected Mode	Description
0x0	Disabled	The PRCM module unconditionally asserts the module idle request. This request applies to the gating of the functional and interface clocks to the module. If acknowledged by the module, the PRCM module can gate all clocks to the module (that is, the module is completely disabled). It can only react to an asynchronous wake-up event (that is, a wake-up event that does not require the module functional clock to be active).
0x1	Auto	This mode applies to a module when the PRCM module only manages its interface clock and not its functional clock. The PRCM module automatically asserts/deasserts the module idle request based on the clock-domain transitions. If acknowledged by the module, the PRCM module can gate the interface clock to the module.
0x2	Enabled	This mode applies to a module when the PRCM module manages its interface and functional clocks. The functional clock to the module remains active unconditionally, while the PRCM module automatically asserts/deasserts the module idle request based on the clock-domain transitions. If acknowledged by the module, the PRCM module can only gate the interface clock to the module.
0x3	Reserved	Not available.

NOTE: The PRCM module may support all or some of the MODULEMODE module settings listed in [Table 3-7](#). See the CM_<Power domain>_<module>_CLKCTRL[x] MODULEMODE bit field description for the module to identify the supported settings.

[Table 3-8](#) and [Table 3-9](#) list the enabling conditions for the slave module clocks managed by the Idle protocol.

Table 3-8. Slave Module Interface Clock Enabling Conditions

Relation	Condition
AND	Clock domain is ready.
OR	Slave module idle status is 0x0 (fully functional).
	Slave module idle status is 0x1 (in transition).
	Slave module wake-up request is asserted.

Table 3-9. Slave Module Functional Clock Enabling Conditions

Relation	Condition
AND	Clock domain is ready.
OR	Slave module idle status is 0x0 (fully functional).

Table 3-9. Slave Module Functional Clock Enabling Conditions (continued)

Relation	Condition
	Slave module idle status is 0x1 (in transition).
	Slave module idle status is 0x2 (interface clock is idled).
	Slave module wake-up request is asserted.

The module clock domain must be ready for the optional clocks to the module, and any associated clock-enable control is asserted.

NOTE: A given clock can be used by more than one module. Clock enabling conditions are then ORed together (that is, the clock is provided as soon as one of the enabling conditions is true). As a consequence, the clock is disabled only when all related enabling conditions are false.

Module wake-up request:

In IDLE state, a slave module may have to wake-up to generate an interrupt or a DMA request. This may be the result of an external request (for example, to the I/O port of a general-purpose input/output [GPIO] module) or an internally generated event (for example, WDTIMER time-up). The slave module, with wake-up capability, sends a wake-up request to the PRCM module. The PRCM module then activates the module clocks and acknowledges the module wake-up request.

In IDLE state, some slave modules may require functional clock(s) to generate a wake-up event. Such requests are called synchronous wake-up events on the PRCM module side, while the events generated when the functional or interface module clocks are gated are called asynchronous wake-up events.

NOTE: See the power-management section in the module chapter to identify whether its wake-up event is synchronous or asynchronous.

The standby and idle clock-management protocols allow the configuration of the module-level clock-management interaction between the PRCM module and individual modules of the device. However, the PRCM module may not necessarily gate the clock to the module immediately after the module switches to standby or idle mode at the end of this interaction. This is because the same clock can be shared by other modules that are active and need this shared clock to complete their activity. As a result, the PRCM module provides a second level of clock management called the clock domain level, as explained in [Section 3.1.1.1.3](#).

3.1.1.1.3 Clock Domain

A clock domain is a group of modules fed by clock signals controlled by the same clock manager in the PRCM module (see [Figure 3-2](#)). By gating the clocks in a clock domain, the clocks to all the modules belonging to that clock domain can be cut to lower their active power consumption (that is, the device is on and the clocks to the modules are dynamically switched to ACTIVE or INACTIVE (Gated) states). Thus, a clock domain allows control of the dynamic power consumption of the device.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated clock manager within the PRCM module. This allows the PRCM module to individually activate and gate each clock domain of the device.

Figure 3-2. Generic Clock Domain

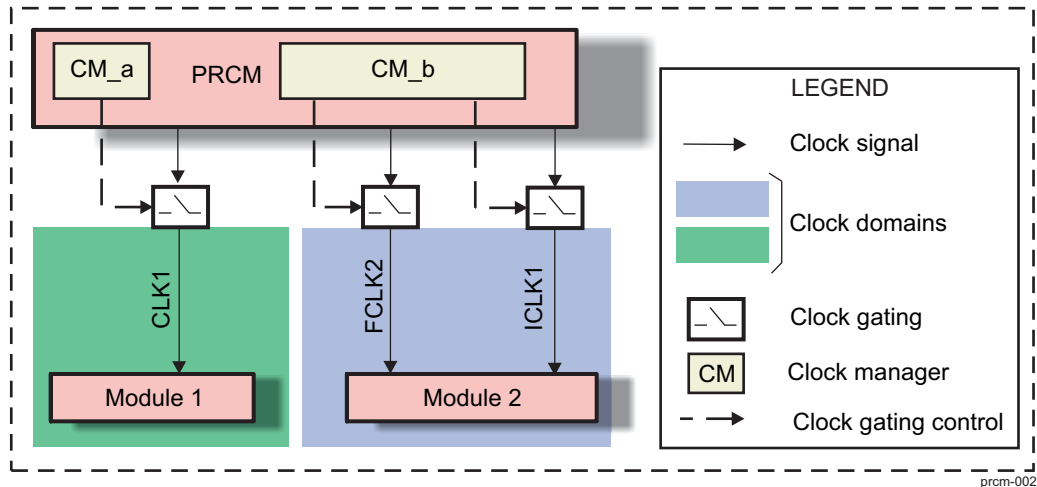

Figure 3-2 presents an example of two clock managers: CM_a and CM_b. Each clock manager manages a clock domain. The clock domain of CM_b is composed of two clocks: a functional clock (FCLK2) and an interface clock (ICLK1), while that of CM_a consists of a clock (CLK1) that is used by the module as functional and interface clock. The clocks to Module 2 can be gated independently of the clock to Module 1, thus ensuring power savings when Module 2 is not in use.

The PRCM module lets software check the status of the clock domain functional clocks. The CM_<Clock domain>_CLKSTCTRL[x] CLKACTIVITY_<FCLK/Clock name_FCLK> bit in the PRCM module identifies the state of the functional clock(s) within the clock domain. Table 3-10 lists the two possible states of the functional clock.

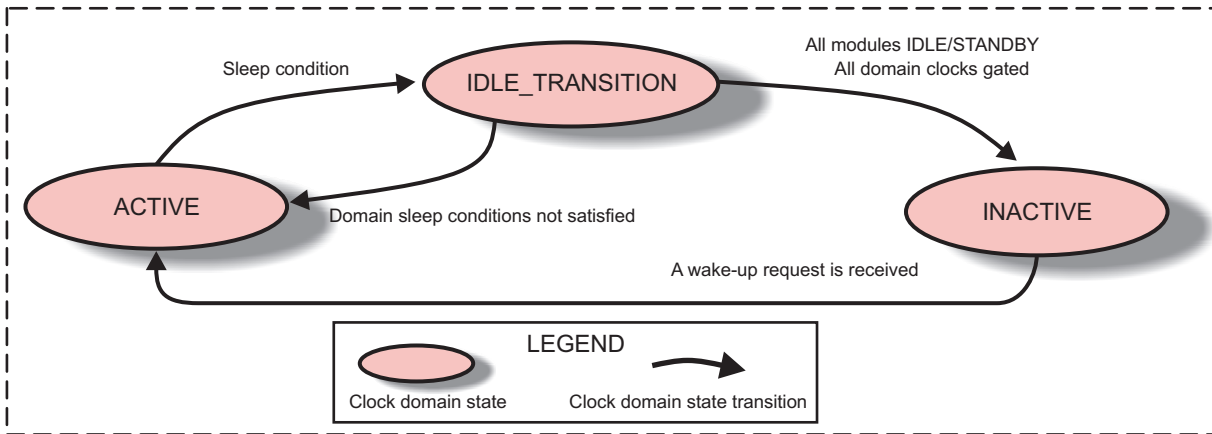

Table 3-10. Clock Domain Functional Clock States

CLKACTIVITY Bit Value	Status	Description
0x0	Gated	The functional clock of the clock domain is inactive.
0x1	Active	The functional clock of the clock domain is running.

3.1.1.1.4 Clock Domain-Level Clock Management

The domain clock manager can automatically (that is, based on hardware conditions) and jointly manage the interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

A clock domain can switch between three possible states: ACTIVE, IDLE_TRANSITION, or INACTIVE. Figure 3-3 identifies the sleep and wake-up transitions of the clock domain between the ACTIVE and INACTIVE states.

Figure 3-3. Clock Domain State Transitions

prcm-003

Table 3-11 defines the clock domain states.

Table 3-11. Clock Domain Clock States

State	Description
ACTIVE	<ul style="list-style-type: none"> Every nondisabled slave module (that is, those whose MODULEMODE value is not set to disabled) is put out of IDLE state. All functional clocks to the active slave modules (that is, not idled) of the clock domain are provided. All interface clocks to the nondisabled slave modules in the clock domain are provided. All functional and interface clocks to the active master modules (that is, not in STANDBY state) in the clock domain are provided. Every enabled optional clocks to the modules in the clock domain are provided.
IDLE_TRANSITION	<p>This is a transitory state.</p> <ul style="list-style-type: none"> Every master module in the clock domain is in STANDBY state. Every idle request to all the slave modules in the clock domain is asserted. The functional clocks to the slave module in enabled state (that is, those whose MODULEMODE values are set to enabled) remain active. Every enabled optional clocks to the modules in the clock domain are provided.
INACTIVE	<p>All clocks within the clock domain are gated.</p> <ul style="list-style-type: none"> Every slave module in the clock domain (that is, those whose MODULEMODE is set to disabled or auto) is in IDLE state and set to disabled or auto mode. Every master module in the clock domain is in STANDBY state. Every optional functional clock in the clock domain is gated.

Each clock domain transition behavior is managed by an associated register bit field in the CM_<Clock domain>_CLKSTCTRL[x] CLKTRCTRL PRCM module.

Table 3-12 describes the clock domain clock transition mode settings.

Table 3-12. Clock Domain Clock Transition Mode Settings

CLKTRCTRL Bit Value	Selected Mode	Description
0x0	NO_SLEEP	A clock domain sleep transition is never initiated, irrespective of the hardware conditions.
0x1	SW_SLEEP	A software-forced sleep transition. The transition is initiated when the associated hardware conditions are satisfied (see Table 3-14).
0x2	SW_WKUP	A software-forced clock domain wake-up transition is initiated, irrespective of the hardware conditions identified in Table 3-13.

Table 3-12. Clock Domain Clock Transition Mode Settings (continued)

CLKTRCTRL Bit Value	Selected Mode	Description
0x3	HW_AUTO	Hardware-controlled automatic sleep and wake-up transition is initiated by the PRCM module when the associated hardware conditions are satisfied (see Table 3-14 and Table 3-13).

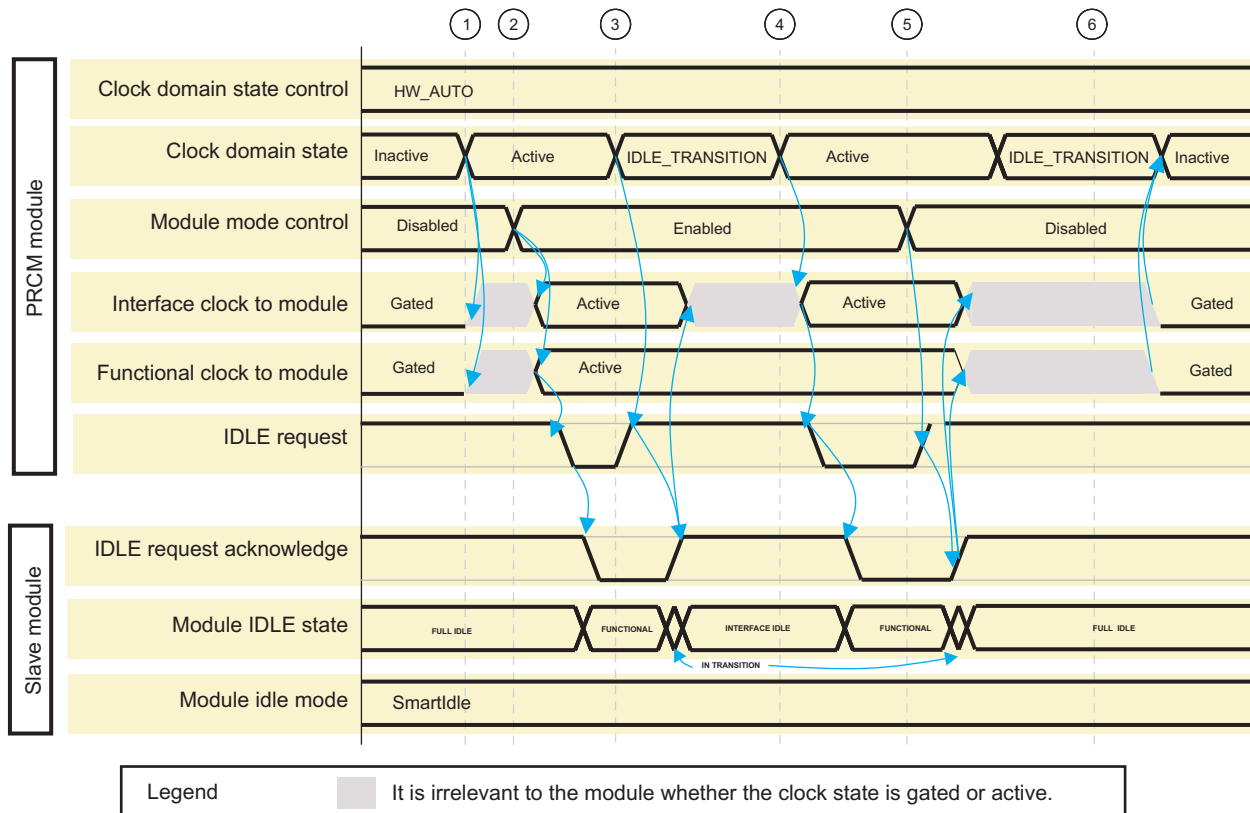

NOTE: Depending on the characteristics of a clock domain, it may or may not support all the clock transition mode settings described in [Table 3-12](#). See the clock domain clock management section of the specific clock domain to identify the supported clock transition mode settings.

3.1.1.1.5 Clock Domain HW_AUTO Mode Sequences

The sequence diagrams in [Figure 3-4](#) through [Figure 3-6](#) identify the PRCM module hardware-controlled enabling and gating of the functional and interface clocks to the module. They highlight the changes in the module state based on the changes to the clock domain state and module mode settings.

[Figure 3-4](#) highlights the behavior of a slave module receiving the interface and functional clocks and having two configurable module modes: Disabled and Enabled.

Figure 3-4. Clock Domain/Slave Module Clock-Management Interaction Sequence 1

prcm-004

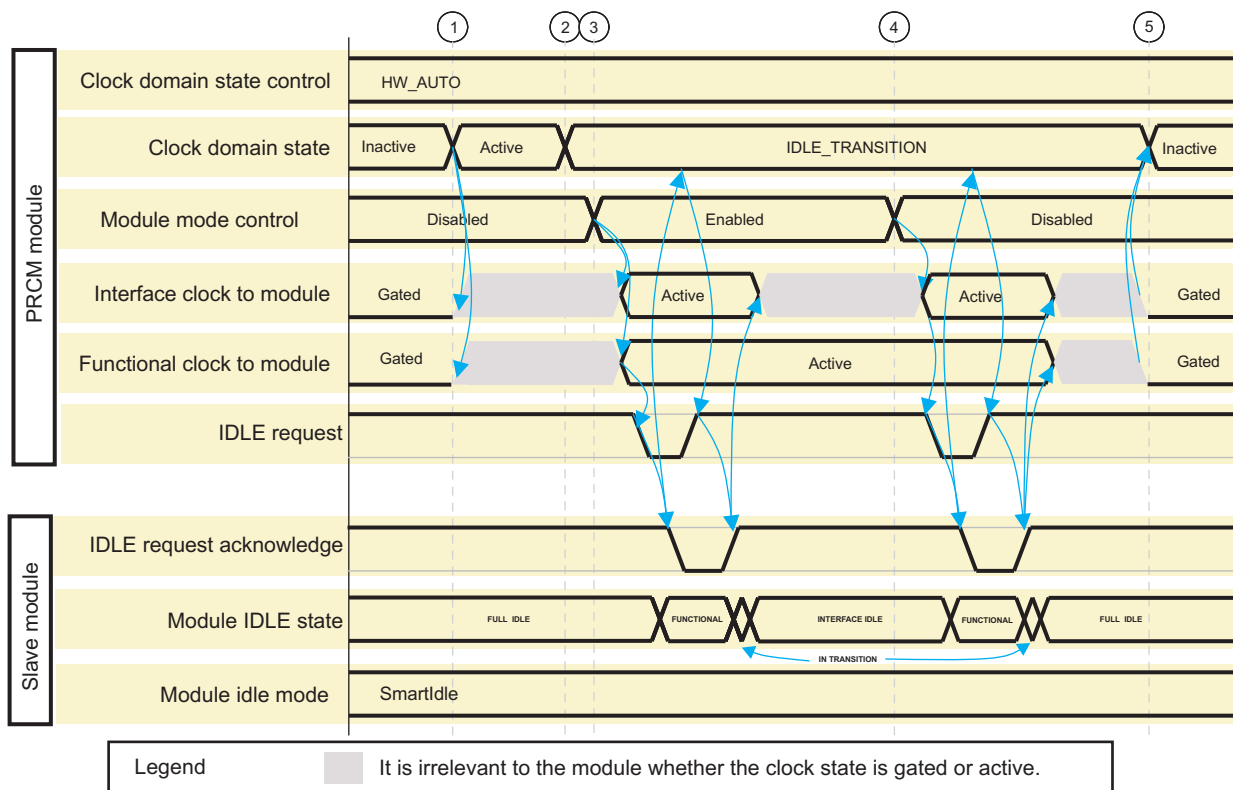

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL-IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes state to Active. As the Module Mode control is still Disabled, this event has no effect on the module state. The functional and interface clocks may still be restarted automatically, based on the requirements of other modules sharing these clocks.

2. Software changes the module mode to Enabled. The clocks to the module are restarted automatically. The PRCM module then deasserts a hardware idle request signal to the module. The module sends an idle request acknowledge to the PRCM module. The module is now effectively awake. The module Idle state is functional. If the module is enabled before the clock domain wakes up, Steps 1 and 2 are simultaneous.
3. The clock domain switches to IDLE_TRANSITION state. In turn, the PRCM module requests the module to go into IDLE state by asserting the idle request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock. The functional clock of the module remains enabled as the module is in Enabled mode.
4. The clock domain does not have all conditions to complete the sleep transition, and wakes up again. In turn, the interface clock to the module is automatically restarted, if applicable, then the module is put out of IDLE state.
5. Software disables the module. The PRCM module requests the module to go to IDLE state by asserting the idle request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock.
6. The clock domain switches to the IDLE_TRANSITION state. When the clock domain sleep transition conditions are satisfied, the clocks (functional and interface) are gated. The clock domain then switches to INACTIVE state. This has no effect on the module, which is already in FULL-IDLE state.

Figure 3-5 highlights the behavior of the same slave module, receiving the interface and functional clocks, when the module mode is changed while the clock domain state is Idle_Transition.

Figure 3-5. Clock Domain/Slave Module Clock-Management Interaction Sequence 2

prcm-005

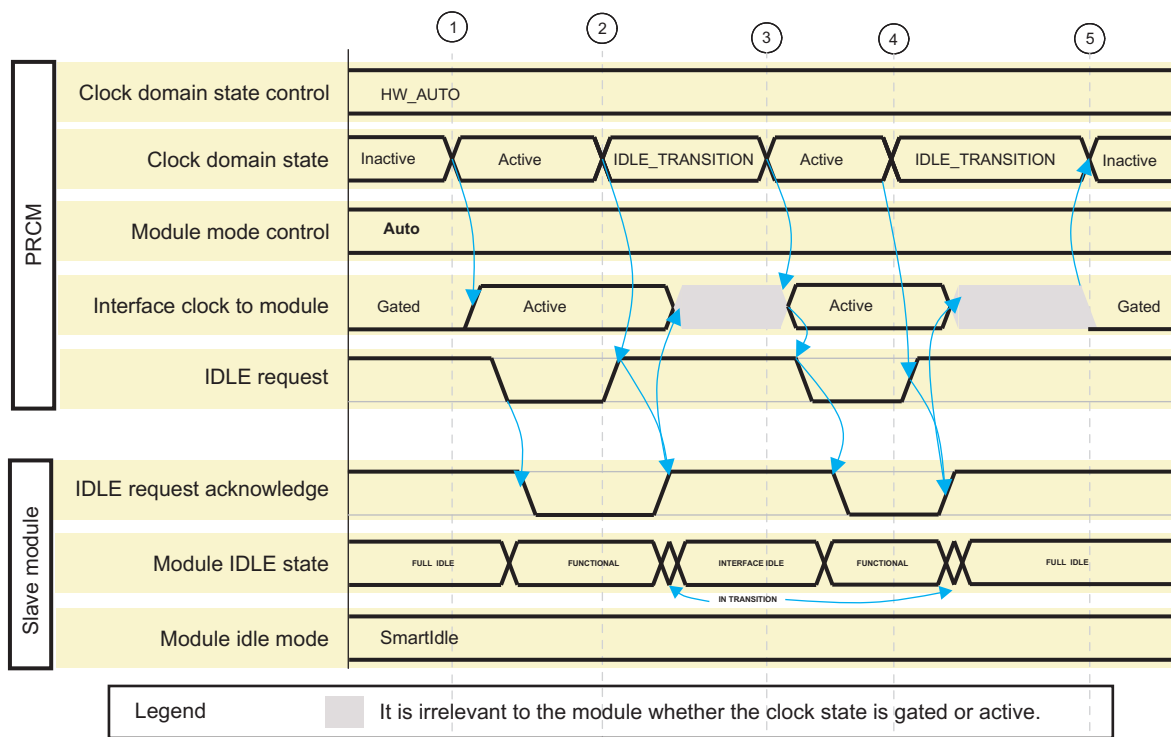

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL-IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes state to Active. As the Module Mode control is Disabled, this event has no effect on the module state. The functional and interface clocks may still be restarted automatically, based on the requirements of other modules sharing these clocks.
2. The clock domain goes into the IDLE_TRANSITION state. As the Module Mode control is Disabled, this event has no effect on the module state.

3. Software changes the module mode to Enabled. The clocks to the module are restarted automatically and then the module is put out of IDLE state. As soon as acknowledged, the module is requested to go back to IDLE state with gating of the interface clock only (that is, the INTERFACE IDLE state). The interface clock to the module can be gated, depending on other modules sharing the same clocks.
4. Software disables the module. The interface clock to the module is restarted automatically. The PRCM module requests the module to go to IDLE state by asserting the idle request signal. When acknowledged, the interface and the functional clocks to the module can be gated, depending on other modules sharing the same clock.
5. When the clock domain sleep transition conditions are satisfied and the functional and interface clocks are gated, the clock domain switches to INACTIVE state. This has no effect on the module, which is already in FULL-IDLE state.

Figure 3-6 highlights the behavior of a slave module receiving only interface clock and supporting the configurable Auto module mode.

Figure 3-6. Clock Domain/Slave Module Clock-Management Interaction Sequence 3

prcm-006

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL-IDLE state and its interface clock is gated.

1. The clock domain wakes up and changes state to Active. In turn, the interface clock to the module is automatically restarted. The PRCM module then deasserts a hardware idle request signal to the module. The module sends an idle request acknowledge to the PRCM module. The module is now effectively awake, that is, the module Idle state is functional.
2. The clock domain switches to the IDLE_TRANSITION state. The PRCM module requests the module to go to IDLE state by asserting the idle request signal. When acknowledged, the interface clock to the module can be gated, depending on other modules sharing the same clock.
3. The clock domain does not have all conditions to complete the sleep transition, and wakes up again. In turn, the interface clock to the module is automatically restarted if applicable, then the module is put out of IDLE state.
4. Same as Step 2.
5. The clock domain has all conditions to complete the sleep transition. The module is under IDLE state and its clock is gated.

3.1.1.1.6 Clock Domain Sleep/Wakeup

The clock domain manager initiates a domain wake-up transition when the conditions listed in [Table 3-13](#) are satisfied.

Table 3-13. Clock Domain Wake-Up Conditions

Relation	Condition
OR	The SW_WKUP clock transition mode for the clock domain is set. (CLKTRCTRL = 0x2)
	At least one wake-up request asserted by one of the modules of the clock domain.
	At least one dynamic dependency ⁽¹⁾ from another clock domain is active.
	At least one static dependency ⁽¹⁾ from another clock domain is active.
	At least one wake-up dependency ⁽¹⁾ from a module in another clock domain is active.

⁽¹⁾ The dynamic, static dependency and the wake-up dependency are explained in [Section 3.1.1.1.7, Clock Domain Dependency](#).

The clock domain manager initiates a domain sleep transition when the conditions listed in [Table 3-14](#) are satisfied.

Table 3-14. Clock Domain Sleep Conditions

Relation		Condition
AND		All master modules in the clock domain are in STANDBY state.
		No wake-up request is asserted by any module of the clock domain.
		No dynamic domain dependency ⁽¹⁾ from any other domain is active.
		No wake-up dependency ⁽¹⁾ from any module in another domain is active.
	OR	The SW_SLEEP clock transition mode is set for the clock domain (CLKTRCTRL = 0x1).
	AND	The HW_AUTO clock transition mode is set for the clock domain (CLKTRCTRL = 0x3).
		No static domain dependency ⁽¹⁾ from any other domain is active

⁽¹⁾ The dynamic, static dependency and the wake-up dependency are explained in [Section 3.1.1.1.7, Clock Domain Dependency](#).

3.1.1.1.7 Clock Domain Dependency

A domain dependency is a binary relationship between two clock domains. A clock domain A is said to depend on a clock domain B when a module in clock domain B provides services to a module in clock domain A. As a result, clock domain B must be active when clock domain A is active so that the module in clock domain B is accessible by the module in clock domain A.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two modules (for example, the clock domain of the device interconnect).

Thus, a clock domain may support the types of clock domain dependencies described in the following subsections.

3.1.1.1.7.1 Static Dependency

If clock domain A has a master module that can access a slave module in clock domain B, then clock domain A can have a static dependency with clock domain B. Similarly, a static dependency can also exist between domain A and B if domain B conveys the transactions from domain A module toward a module in any other domain. For example, CD_DSP can have a static dependency with CD_L3_1 because this domain has the L3 interconnect to carry the transactions from the DSP module.

This static dependency consists of forcing clock domain B to stay active, as long as there is at least one master module of clock domain A that is not in STANDBY state. If clock domains A and B are initially in GATED state, then clock domain B becomes active as soon as clock domain A becomes active when a wake-up request from the master module is received by the PRCM module.

Similarly, as a result of the static dependency, clock domain B can only be gated if all the master modules of clock domain A that can access the slave modules in clock domain B are in STANDBY state.

The static dependency between a source clock domain and a destination clock domain is configured in the PRCM module by setting CM_<Source Clock domain>_STATICDEP[x] <Destination Clock domain>_STATDEP bit. As a result, the source clock domain forces the destination clock domain to become active and stay active as long as the source clock domain is active.

3.1.1.1.7.2 Dynamic Dependency

When clock domains A and B contain modules directly linked to a common device interconnect, these clock domains can have a dynamic dependency.

A dynamic dependency consists of forcing clock domain B to stay active as long as a module from clock domain A is communicating with the module in clock domain B through the interconnect. Clock domain B becomes active as soon as the communication is initiated. This is automatically managed by the PRCM module by monitoring the communication on the interconnect between the modules of the two clock domains.

Similarly, the inverse condition of this dependency can be stated: Clock domain B can be inactive only if all modules between clock domains A and B are quiet for a given sampling delay, identified as a sliding window duration on the interconnect activity status.

The size of the sliding window is based on the number of cycles of a prescaled L4 clock whose frequency is configured by setting the CM_DYN_DEP_PRESCAL[5:0] PRESCAL bit field. The prescaled clock frequency is given as:

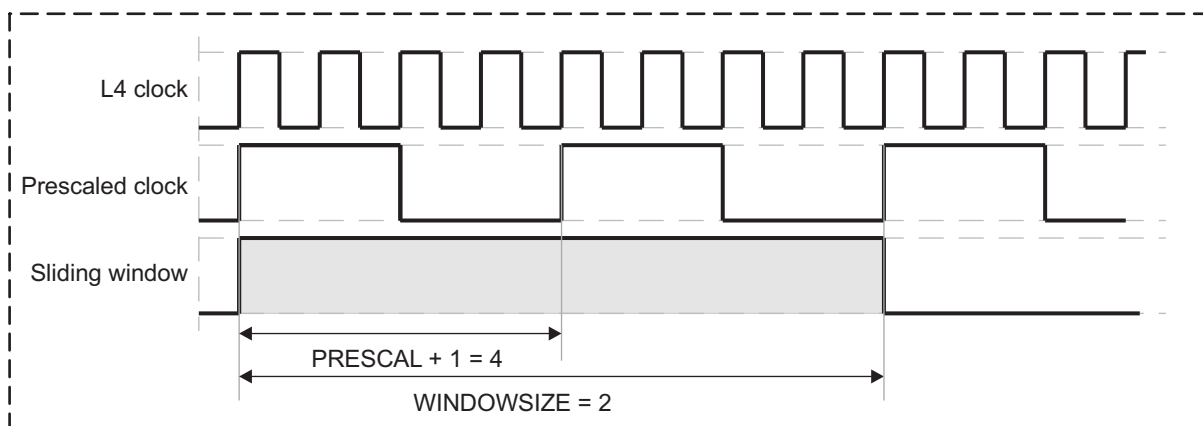

$$\text{Prescaled clock frequency} = \text{L4 interface clock frequency} / (\text{PRESCAL} + 1)$$

The size of the sliding window is fixed by setting the CM_<Clock domain>_DYNAMICDEP[27:24] WINDOWSIZE bit field. It is given as:

$$\text{Sliding window duration} = \text{WINDOWSIZE} \times \text{Period of Prescaled clock cycle}$$

Figure 3-7 presents an example of the sliding window duration equal to eight clock cycles of L4 clock when PRESCAL is set to 3 and WINDOWSIZE is set to 2.

Figure 3-7. Sliding window for Dynamic Dependency

prcm-007

This dynamic dependency is also referred to as the autosleep/autowake-up feature.

NOTE:

- The static dependency between two clock domains can be configured by software (PRCM module registers) or hardwired in the PRCM module.
- The dynamic dependency between two clock domains is hardwired in the PRCM module.

A dynamic dependency is said to be active when:

- At least one master module or a slave interconnect module from clock domain A to domain B is active (that is, the master module is not in STANDBY state and/or the interconnect slave module is not in IDLE state), and
- There has been one or more transaction on the interconnect within the sliding window duration.

It is said to be inactive otherwise.

The dynamic dependency between a source clock domain and a destination clock domain can be read in the PRCM module from the corresponding read-only CM_<Source Clock domain>_DYNAMICDEP[x] <Destination Clock domain>_DYNDEP bit.

3.1.1.1.7.3 Wake-Up Dependency

A wake-up dependency is a dependency between the clock domain of a module that owns one or several wake-up signals, toward the clock domain of another module needed to service the associated wake-up event. As a result of this dependency, the wake-up event to a module not only activates its clock domain, but also the clock domain of the servicing module.

NOTE: The wake-up signal that triggers a wake-up dependency stays active as long as the source of the event is not serviced, to ensure that clock domain of the servicing module remains active.

Wake-up dependencies allow acceleration of the wake-up transition of multiple domains needed to service the wake-up event by initiating their transition in parallel. The static and dynamic dependencies can allow the wake-up of related domains but the complete wake-up transition of all the associated domains is slower because of the sequential cascading of their wake-up transitions.

In the device, the source event of the wake-up signal to a slave module can be one of following types:

- Interrupt request to microprocessor (MPU) or digital signal processor (DSP) interrupt controller (INTC)
- DMA request to a DMA controller

Upon wakeup by these types of wake-up events, and for as long as they remain asserted, the PRCM module takes the following actions:

- The power domain of the servicing module (for example, MPU, DSP, or DMA) is forced to POWER ON state and the clock domain becomes active.
- The power domain of the device interconnect between servicing module and the module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The power domain of the slave module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The slave module originator of the wake-up event is switched from IDLE to ACTIVE state.

On assertion of a wake-up event of a standalone master module, and as long as it remains asserted, the PRCM module takes the following action:

- The power domain of the master module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active

NOTE: For slave modules, the static and dynamic dependencies of a clock domain are not impacted by its wake-up dependency settings. For master modules, the static dependencies are not impacted.

Hence, in addition to the activation of the clock domains identified in [Section 3.1.1.1.7.3](#) above, all clock domains associated by static dependencies are also activated.

However, the clock domains associated with the waking up clock domain through dynamic dependencies are only activated if a transaction is initiated to these clock domains.

For each wake-up signal coming from a slave module, the type of the corresponding event can be configured in the PM_<Power domain>_<Originator Module>_WKDEP[x] WKUPDEP_<Originator Module>_<Servicing Module> bit of the PRCM module. Where <Power domain> is the name of the power domain of the originator module of the wake-up event identified as <Originator Module>. <Servicing Module> refers to the module servicing the wake-up event.

NOTE: When only one event type is associated with the wake-up signal of a slave module, the WKUPDEP wake-up dependency for the module clock domain is not be configurable and may be hardwired in the PRCM module.

In case of the master modules, there is no configurable wake-up dependency. Their power domain is switched on and their clock domain is activated by the PRCM module when they assert their wake-up signal.

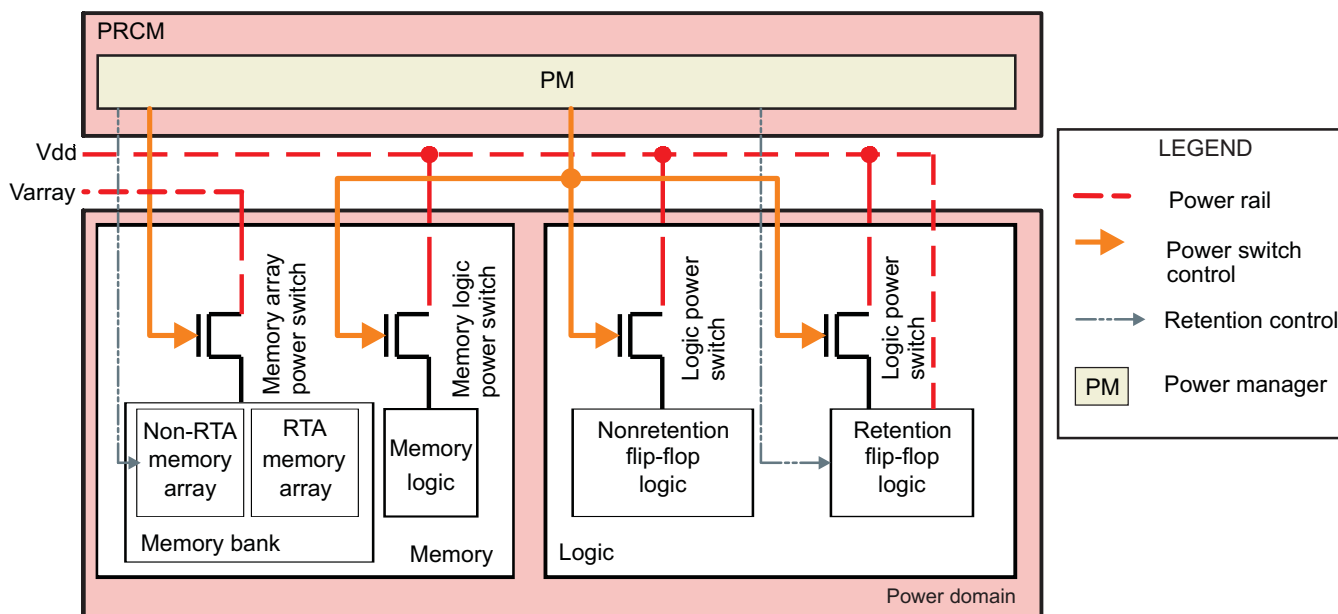

3.1.1.2 Power Management

The PRCM module manages the switching on and off of the power supply to the device modules. The power to the modules can be switched off when they are not in use to minimize device power consumption. Independent power control of sections of the device allow the PRCM module to turn on and off specific sections of the device without affecting the others.

3.1.1.2.1 Power Domain

A power domain is a section (that is, a group of modules) of the device with independent and dedicated power manager (see Figure 3-8). A power domain can be turned on and off without affecting the other parts of the device.

Figure 3-8. Generic Power Domain

prcm-008

To minimize device power consumption, the modules are grouped into power domains. A power domain can be split into some logic area and some memory area.

The memory area contains two entities:

- Memory bank: The memory bank is composed of memory arrays. It is powered by a dedicated voltage rail and an associated power switch (for example, Varray and memory array power switches). The memory array within the memory bank can be of RTA (retention-till-access), see Section 3.1.1.2.3, *Module Logic and Memory Context* or non-RTA type.
- Memory logic: The memory logic is powered by the same voltage source as the logic area of the power

domain, but has its dedicated power switch (for example, Vdd and memory logic power switches).

The logic area in the power domain can also be split between retention flip-flops (RFFs) or nonretention flip-flops (DFFs).

Table 3-15 lists the possible states and substates of the logic area in a power domain.

Table 3-15. States of a Logic Area in a Power Domain

State	Substate	Description
ON	ON-ACTIVE	Logic is fully powered and at least one enclosed clock domain is active.
	ON-INACTIVE	Logic is fully powered and all enclosed clock domains are idled.
RETENTION	CSWR (close switch retention)	Logic is fully powered and all enclosed clock domains are idled.
	OSWR (open switch retention)	Logic is powered down, except the RFF-based logic retains its value. The DFF is lost and reset. Vdd can be lowered to its retention voltage level if all power domains associated are in this or lower states.
OFF		Logic power switches are off. All the logic (DFF and RFF) is lost except for the context, which has been saved in the scratchpad memory of an always-on power domain. Vdd can be set to 0 V if all associated power domains are in this state.

NOTE: A power domain that does not have RFF logic may still support the open-switch retention power state. In this case, all its logic context is lost, yet its memory area context may remain valid if programmed to retention mode (see Table 3-16 and Table 3-19).

The RETENTION state is useful for quick switching to low-power idle mode (in which the domain clocks are gated and the domain voltage is less than the on-voltage level) without losing the context, and then quickly switching back to ON-ACTIVE state when necessary. In RETENTION state power consumption is less than in On Power state.

Similarly, in RETENTION state the CSWR state has the advantage of faster turn-on times over the OSWR state, because in the latter case the entire context is maintained. However, CSWR state has the disadvantage of higher leakage currents over OSWR state.

The behavior of the memory array power switch and memory logic power switch can be selected through software settings in the PRCM module, or can be hardwired. Once the behavior is selected, the PRCM module hardware automatically handles these elements to ensure correct power transition sequencing between the power domain states.

Software can also initiate the memory array power state changes when the associated power domain is in On Power state. This allows the memory array to be turned off and on as needed.

The memory area can be configured to any of the power states identified in Table 3-16.

Table 3-16. States of a Memory Area in a Power Domain

State	Description
ON	The memory array is powered and fully functional. Additionally, the RTA feature may put part or all of the memory array automatically into retention when not accessed, if this feature exists and is enabled on a given memory instance.
RETENTION	The memory array is fully powered, but memory is not accessible. The array can be put into retention either through applicable direct retention control signal, or automatically if the RTA feature exists and is enabled on a given memory instance. Data in memory are always retained.
OFF	The memory array is powered down. Data in memory are lost.

3.1.1.2.2 **Module Logic and Memory Context**

In case of a power state transition in the logic area or the memory area, the context of the module may no longer be valid. This can also be the case when the domain resets are asserted by the device. A specific RM_<Clock Domain Name>_<Module Name>_CONTEXT register provides the status of the device logic and memory context.

- The module logic context is made of simple flip-flops (DFFs) if module has no logic RFFs.
- If module has logic retention (full or partial), it is assumed that the context is made only of RFFs.

NOTE: The display subsystem (DSS) is an exception where the status of DFF and RFF context is presented, because only HMDI keys are retained, while most of the DSS is nonretained.

These context status bits must be cleared by software.

3.1.1.2.3 **Retention-Till-Access Memory Feature**

Most high-density memories within the device support the RTA feature. It consists of automatically putting part of or the entire memory array into retention when no access is made to the corresponding locations. This is managed within the memory bank by hardware and is completely transparent to the user software. As a consequence, RTA memories do not have any retention mode control signal coming from the PRCM module.

The RTA feature is controlled (enabled and disabled) from:

- eFuse bits configuration in the system control module, automatically loaded to the PRCM module.
- Software-controlled override capability through a bit field per voltage domain in the PRCM module (that is, PRM_LDO_SRAM_<Memory Voltage Domain>_SETUP[0] DISABLE_RT_A_EXPORT).
- Hardware override capability controlled by the PRCM module through control of embedded static random-access memory (SRAM) low-dropout linear regulator (LDO) controller.

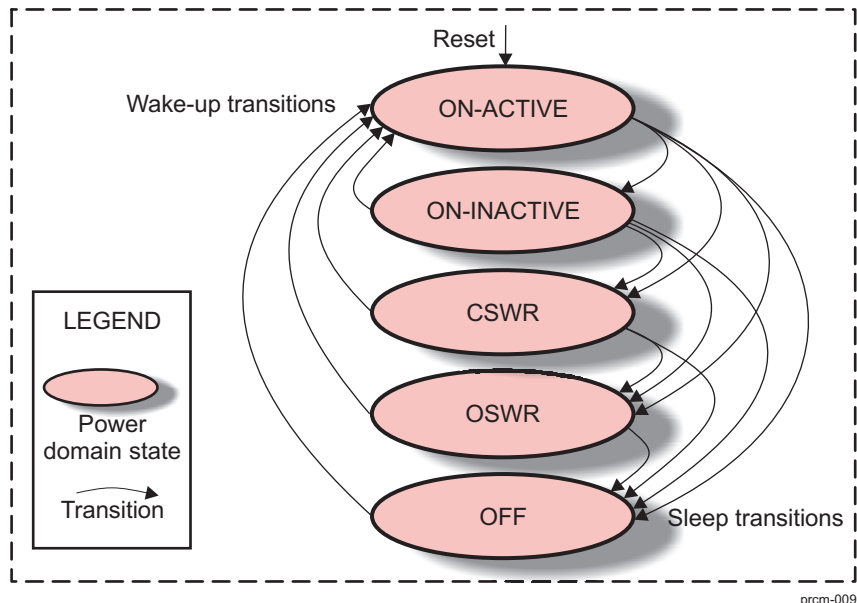

3.1.1.2.4 **Power Domain Management**

The power manager associated with each power domain is assigned the task of managing the domain power transitions. It ensures that all hardware conditions are satisfied before it can initiate a power domain transition from a source to a target power state (for example, from ON-ACTIVE state to OSWR RETENTION state).

The hardware condition for power domain transition from ON-ACTIVE to any other transition state is:

- All clock domain managers in the power domain are in INACTIVE state: All modules in the domain are in IDLE or STANDBY state, and there is no constraining dependency (static, dynamic, or wake-up dependency) between the clock domains blocking the clock domain sleep transition.

Figure 3-9 shows all possible power domain state transitions.

Figure 3-9. Power Domain Transitions

Successive power-down transitions can be performed by lowering the power state from ON-ACTIVE to ON-INACTIVE to RETENTION, and then to OFF, as long as the hardware condition is satisfied.

However, the power domain wake-up transition from any low-power state (ON-INACTIVE, CSWR, OSWR, or OFF) to ON-ACTIVE is always direct. For example, user software cannot request a power domain transition from OSWR state to CSWR state, but only to ON-ACTIVE state.

The power domain manager initiates a power domain wake-up transition when the conditions listed in [Table 3-17](#) are satisfied.

Table 3-17. Power Domain Wake-Up Conditions

Relation	Condition
AND	Voltage domain is on.
OR	There is at least a wake-up condition for one enclosed functional clock domain.
	There is a request for clock generation or distribution enclosed in the power domain.
	There is a PRCM module service request (applicable only to power domains, including PRCM module logic).

The power domain manager initiates a domain sleep transition when the conditions listed in [Table 3-18](#) are satisfied.

Table 3-18. Power Domain Sleep Conditions

Relation	Condition
AND	All functional clock domains enclosed in the power domain are idled.
	All clock generation or distribution enclosed in the power domain is quiet, and corresponding input clocks are gated. For example, DPLL, if present, must be in stop mode.
	There is no PRCM module service request (applicable only to power domains, including PRCM module logic).

[Table 3-19](#) lists the PRCM module power domain control and status features.

Table 3-19. Power Domain Control and Status Registers

Register/Bit Field	Type	Description
PM_<Power domain>_PWRSTCTRL[1:0] POWERSTATE	Control	Selects the target power state of the power domain among OFF, ON-ACTIVE, ON-INACTIVE, and RETENTION.
PM_<Power domain>_PWRSTCTRL[x] LOWPOWERSTATECHANGE	Control	Power state change request when domain has already performed a sleep transition. Allows going into deeper LOW-POWER state without waking up the power domain.
PM_<Power domain>_PWRSTCTRL[2] LOGICRETSTATE	Control	Selects whether the Power domain logic is in CSWR or OSWR RETENTION state when the domain transitions to RETENTION state.
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_RETSTATE	Control	Selects whether the memory bank in the power domain is in ON or RETENTION state when the power domain is in RETENTION state. The memory bank can not be in ON state when the power domain is in RETENTION state.
PM_<Power domain>_PWRSTCTRL[x] <memory bank>_ONSTATE	Control	Selects whether the memory bank is in ON, RETENTION, or OFF state when the power domain is in ON state.
PM_<Power domain>_PWRSTST[1:0] POWERSTATEST	Status	Identifies the current state of the power domain. It can be OFF, RETENTION, ON-INACTIVE, or ON-ACTIVE.
PM_<Power domain>_PWRSTST[2] LOGICSTATEST	Status	Identifies the current state of the logic area in the power domain. It can be OFF or ON.
PM_<Power domain>_PWRSTST[20] INTRANSITION	Status	Identifies whether a power domain power state transition is in progress or there is no ongoing transition.
PM_<Power domain>_PWRSTST[x] <memory bank>_STATEST	Status	Identifies the current power state of the memory bank in the power domain. It can be OFF, RETENTION, or ON. For memory with RTA feature, the ON and RETENTION memory states are equivalent.

3.1.1.3 Voltage Management

The PRCM module controls the voltage scaling (that is, switching the voltage in discrete steps or in a continuum within a range of possible values) of the power sources of the device. This allows control of the device power consumption according to the performance criteria defined. Higher performance is ensured with higher voltage and clock frequencies (and hence higher power consumption), while lower performance can be supported with lowered power consumption by reducing or completely gating the power supply to specific areas of the device and gating the associated clocks.

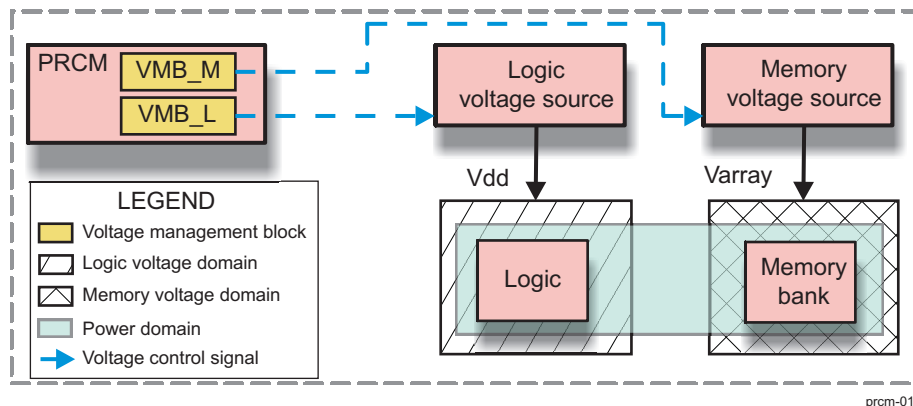

3.1.1.3.1 Voltage Domain

A voltage domain is a section of the device supplied by a dedicated voltage source (that is, an internal LDO or external switch mode power supply [SMPS]). A voltage domain may or may not be controlled by the PRCM module. When a voltage domain is controlled by the PRCM module, a dedicated voltage manager is associated. The voltage manager allows regulation of the voltage level of the source for the voltage domain, independently of other voltage domains of the device.

The voltage managers in the PRCM module can be of two types:

- Dynamically configurable by software to scale the domain voltage level to specific values within the device operational voltage range. This is called adaptive voltage scaling (AVS).
- Hardware controlled to automatically switch the domain voltage levels according to the associated hardware conditions.

Figure 3-10 shows a voltage domain.

Figure 3-10. Generic Voltage Domain

By partitioning the device into independent voltage domains, different operating voltages can be assigned to the different sections of the device (that is, group of modules or memory banks). The independent voltage control allows voltage scaling of device subsections to ensure that each module or memory bank operates at the optimized operating voltage level based on the application performance requirements. When all modules within a voltage domain are idle (that is, have no ongoing transaction), the domain voltage can be lowered to reduce power consumption and then switched back to normal operating voltage level when a wake-up event is received by one of the modules of the voltage domain. Similarly, when a memory bank is not in use, it may be switched to retention or off voltage levels to ensure power savings.

Table 3-20 describes the different states of the logic voltage domain.

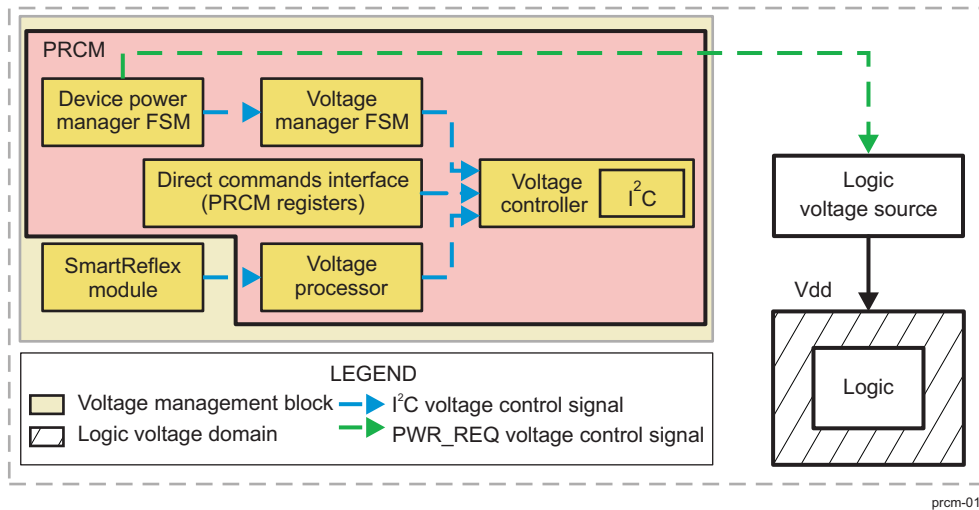

Table 3-20. States of Logic Voltage Domain

State	Description
ON	The voltage regulator source for the voltage domain is active and operating in its normal voltage range for the current operating performance point (OPP) and can deliver up to the maximum load current defined for the current OPP.
SLEEP	The voltage regulator source is operating in its normal voltage range but it can only deliver a limited load current (no logic activity on this voltage domain). In sleep mode, regulator power consumption is reduced.
RETENTION	The voltage regulator source is operating at retention voltage level. It delivers the minimal load current required to maintain the voltage domain logic context.
OFF	The voltage regulator source is inactive and its output voltage is 0 volts. No supply current is provided in this mode.

3.1.1.3.2 Voltage Domain Management

Figure 3-11 highlights the different voltage control paths available within a generic logic voltage management block to control the voltage supply to the device logic voltage domains.

Figure 3-11. Generic Logic Voltage Management

3.1.1.3.2.1 Logic Voltage PWR_REQ Voltage Control

A PWR_REQ signal is deasserted when the device enters the OFF state. The external power integrated circuit (IC) can use it to properly manage turn-off or turn-on of the logic voltage source.

3.1.1.3.2.2 Logic Voltage I²C Voltage Control

The PRCM module allows three voltage control paths to a dedicated inter-integrated circuit (I²C™) interface for the logic voltage domains managed by it.

1. The PRCM module hardware-managed voltage changes from device power manager voltage finite state-machine (FSM) through voltage manager FSM based on hardware conditions. It sends the voltage commands when the device enters in RETENTION or OFF state and upon device wakeup.
2. Direct control by user software through the PRCM module registers for voltage scaling.
3. Adaptive voltage scaling (see Section 3.1.1.3.3, AVS Overview) with SmartReflex™ voltage control commands through the voltage processor.

NOTE: An I²C host module (not controlled by the PRCM module) can be used to program the external power IC. Because this procedure completely bypasses PRCM module, see Section 23.1 I²C.

Figure 3-12 highlights the voltage control path available within a generic memory voltage management block to control the voltage supply to the device memory voltage domains.

Figure 3-12. Generic Memory Voltage Management

The PRCM hardware supports automatic scaling down of the memory array supply whenever they transition to RETENTION or OFF power state. The device power manager FSM manages the voltage scaling of memory voltage domains through memory voltage controller (or LDO).

3.1.1.3.3 AVS Overview

SmartReflex is a power-management technique used for controlling the operating voltage of a device to reduce its active power consumption.

With SmartReflex, the power-supply voltage is adapted to the silicon performance in two ways:

- Statically adapted to the manufacturing process of a given device
- Dynamically adapted to the temperature-induced current performance of the device

SmartReflex achieves optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variations.

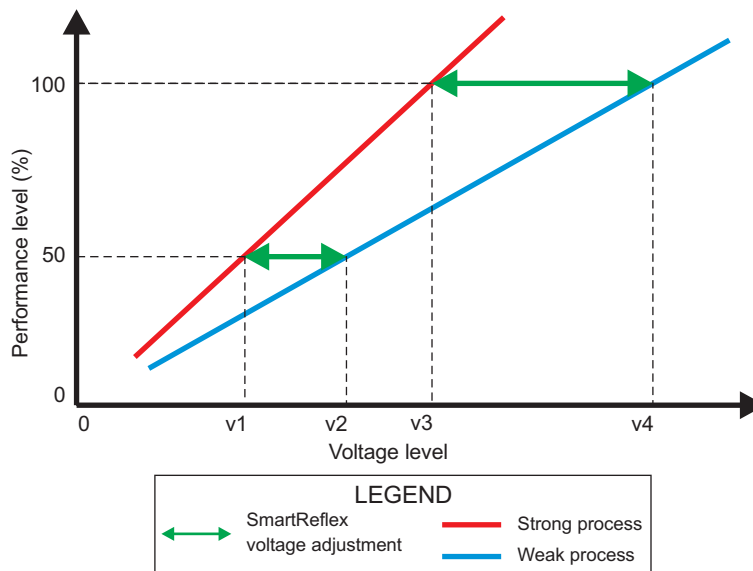

The static correction of the device voltage level (see [Figure 3-13](#)) is based on the desired performance level and silicon performance characteristics of the device. Due to process dispersion, each die has its specific silicon performance. The range of the process distribution defines the weak devices (low-performance silicon) and the strong devices (high-performance silicon).

A weak device is a device with the lowest performance tolerated for a process distribution; that is, at the typical voltage, the inherent maximum frequency is the lowest frequency of the chip distribution. Considered as the worst case, weak devices are used to constrain the target frequency of all the chips (OPP definition).

A strong device is a device with the highest performance tolerated for a process distribution. The inherent maximum frequency at the typical voltage is greater than the targeted frequency.

[Figure 3-13](#) identifies the fact that, with SmartReflex voltage-control architecture, it is possible to compensate for the device silicon characteristics and obtain optimal performance characteristics. Based on the device characteristics, the device voltage level can be adjusted for specific performance level.

Figure 3-13. SmartReflex Static Voltage Adjustment

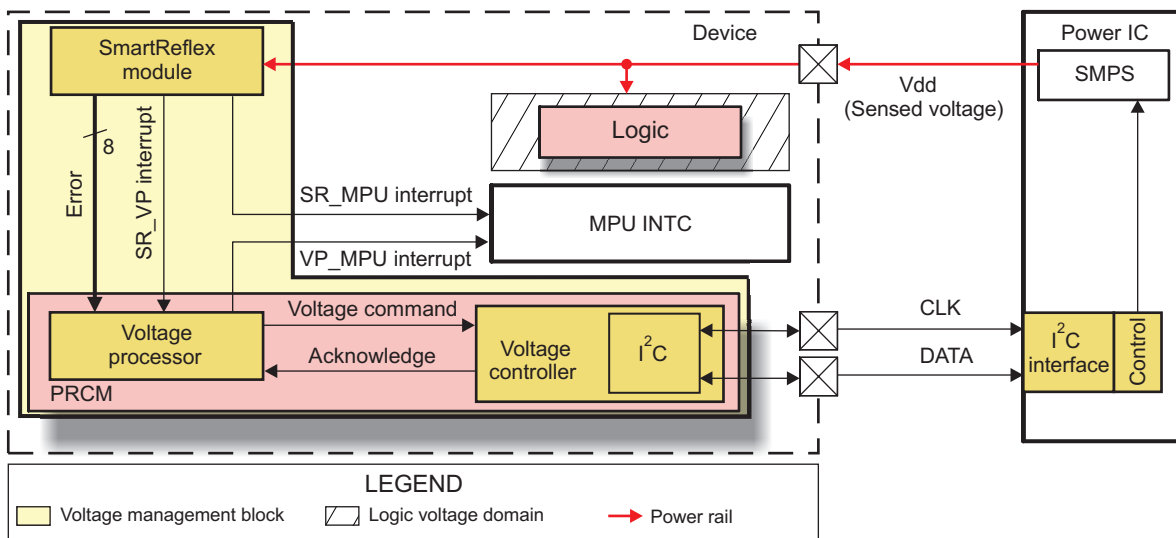

prcm-013

The dynamic correction of the device voltage is based on the real-time comparison of predefined performance points to the on-chip measured performance level. The device voltage level is raised or lowered to compensate for temperature-induced performance variations.

Without SmartReflex, the voltage variation is around the nominal voltage level and not controlled through any active dynamic compensation. This leads to power waste.

Figure 3-14 is a functional overview of the SmartReflex voltage-control architecture of the device connected to an external power IC.

Figure 3-14. SmartReflex Voltage Control Functional Overview

prcm-015

SmartReflex voltage control consists of the following modules:

- SmartReflex
- MPU INTC
- Voltage processor
- Voltage controller

- I²C interface
- SMPS

The SmartReflex module senses input voltage (V_{dd}) and generates an error value that identifies the difference between the desired optimal voltage and the actual value of the SMPS. This error value is set in an internal register (for software read, if necessary) and is also passed to the voltage processor.

The voltage processor converts the error value to a voltage command that defines the change in the output voltage of the SMPS required to bring it to the desired voltage level.

The voltage command is sent to the voltage controller, which passes it to the power IC through the dedicated I²C interface. The power IC then adjusts the output voltage of the SMPS according to the command.

In this way, the SmartReflex module dynamically adjusts the SMPS voltage to compensate for voltage variations.

The device supports two operational modes for SmartReflex voltage control:

- Class-1.5 or software-controlled
- Class-3 or hardware-controlled

3.1.1.3.3.1 Class-1.5 SmartReflex Voltage Control

In SmartReflex Class-1.5, the calibration procedure is triggered by the user software (for example, once per day or week) to account for device aging. In this class, the user software should include additional temperature margins. .

NOTE: For detailed information about these additional temperature margins, see the device *Data Manual Operating Condition Addendum*.

3.1.1.3.3.2 Class-3 SmartReflex Voltage Control

In SmartReflex Class-3 (hardware voltage control), very frequent adjustment is typical, as the device silicon is continuously monitored for temperature, aging and every OPP change. The SmartReflex module interrupts the voltage processor when the voltage level crosses the defined voltage limits (minimum/maximum). The voltage processor reads the error value and determines the new voltage command to be sent to the SMPS to return the voltage to within the limits. The new voltage command is sent to the voltage controller, which passes the command to the SMPS and acknowledges its reception.

In SmartReflex Class-3, there is no need for additional temperature margins to be included by the user software, as the silicon is continuously monitored, and the voltage is adjusted accordingly.

In class-3 mode, the software does not intervene in voltage control; the entire loop is handled by the hardware modules.

3.1.2 Power-Management Techniques

The following sections describe the state-of-the-art power-management techniques supported by the device.

NOTE: The values in [Figure 3-15](#) through [Figure 3-17](#), which show power-management techniques, are hypothetical. They do not represent valid test results on the device.

3.1.2.1 Standby Leakage Management

Standby leakage management (SLM) is a power-management technique that reduces standby power consumption by reducing power leakage.

With SLM, the device switches into low-power system modes automatically or in response to user requests during system standby (that is, in situations when no application is started and system activity is negligible or limited).

When applying SLM, the system remains in the lowest static power mode compatible with the system response time requirement.

This technique trades static power consumption for wake-up latency.

3.1.2.2 Dynamic Voltage and Frequency Scaling

Dynamic voltage and frequency scaling (DVFS) consists of minimizing the idle time of the system. The DVFS technique uses dynamic selection of the optimal operating frequency and voltage to allow a task to be performed in the required length of time. This reduces the active power consumption (power consumed while executing a task) of the device while still meeting task requirements.

NOTE: The values in [Figure 3-15](#) are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

Figure 3-15. Comparison of Energy Consumed With/Without DVFS

prcm-016

[Figure 3-15](#) shows the DVFS technique by comparing a process executed at maximum frequency and operating voltage without applying DVFS to the same process executed at optimal frequency and voltage using DVFS, based on the task requirements. If a task that must terminate in 4 seconds is performed at maximum operating frequency (left side of the figure), it terminates in 1 second, and the remaining 3 seconds are spent in idle mode. With DVFS (right side of the figure), the operating frequency is reduced to an optimal level; the task takes the full 4 seconds to complete, but power consumption is reduced. In addition, the voltage can be reduced further to save power so the dynamic and leakage power consumption are reduced.

DVFS requires control over the clock frequency and the operating voltage of the device elements. By intelligently switching the individual elements of the device to their OPPs, the power consumption of the device for a given task can be minimized.

For practical reasons related to device making (flow, tools), DVFS can be used only for a few discrete steps, not over a continuum of voltage and frequency values. Each step, or OPP, is composed of a voltage (V) and frequency (F) pair. For an OPP, the frequency corresponds to the maximum frequency allowed at a voltage, or reciprocally; the voltage corresponds to the minimum voltage allowed for a frequency.

When applying DVFS, a processor or system always runs at the lowest OPP that meets the performance requirement at a given time. The user determines the optimal OPP for a given task and then switches to that OPP to save power.

3.1.2.3 Dynamic Power Switching

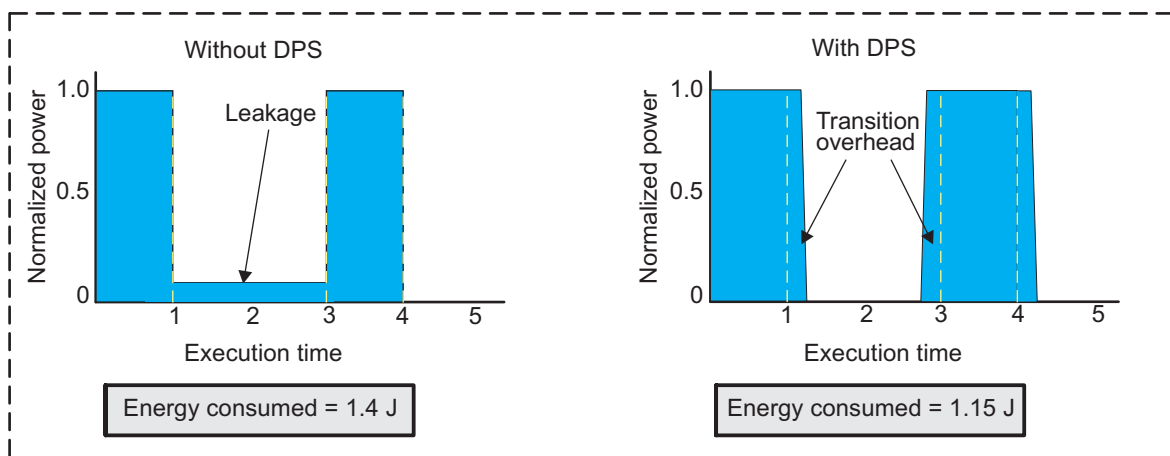

Like DVFS, dynamic power switching (DPS) is a power-management technique aimed at reducing active power consumption of a device. However, whereas DVFS reduces the dynamic and leakage power consumption, DPS reduces only leakage power consumption, at the expense of a slight overhead in dynamic power consumption.

With DPS, the system switches dynamically between high- and low-consumption system power modes during system active time. When DPS is applied, a processor or system runs at the highest OPP (maximum frequency and voltage) to complete its tasks quickly, followed by an automatic switch to a low-power mode, for minimum power consumption. DPS is useful when a real-time application is waiting for an event. The system can switch into a low-power system mode if the wake-up latency conditions allow it.

This technique consists of maximizing the idle period of the system to reduce its power consumption.

NOTE: The values in [Figure 3-16](#) are hypothetical. They are meant to clarify the concept only and do not represent valid test results on the device.

Figure 3-16. Comparison of Energy Consumed With/Without DPS

prom-017

[Figure 3-16](#) compares the behavior of power consumption for the same device operation without DPS (left side of the figure) and with DPS (right side of the figure). When operating without DPS, the device has a constant leakage current in idle mode. By using DPS, the system reduces the leakage current to zero. However, the transitions between system power modes may require storing the information before entering a low-power inactive state and restoring the information after a wake-up event (see [Figure 3-16](#)). This results in additional dynamic power consumption, referred to as the transition overhead (see [Figure 3-16](#)). Transition overhead must be considered for a DPS operation.

For efficient deployment of DPS techniques, it is necessary to predict dynamically the performance requirement of the applications running on the processor. The DPS controller must account for the overhead of wake-up latencies related to domain switching and ensure that they do not significantly affect the performance of the device. Even with transition overhead, however, the user can identify an optimal idle-time limit, after which the DPS is useful for dynamic power-saving.

3.1.2.4 Adaptive Voltage Scaling

SmartReflex-based AVS is a power-management technique for automatic control of the operating voltages of the device to reduce active power consumption.

With SmartReflex, power-supply voltage is adapted to silicon performance, either statically (based on performance points predefined in the manufacturing process of a given device) or dynamically (based on the temperature-induced real-time performance of the device). A comparison of these predefined performance points to the real-time on-chip measured performance determines whether to raise or lower the power-supply voltage.

AVS achieves the optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variation. The device voltage is automatically adapted to maintain performance of the device. This ensures optimal power consumption for a given OPP.

With AVS, the frequency steps are identified and the voltage is adapted according to the silicon performance of the device. In this case, instead of a voltage step for each frequency step, there is a corresponding range of voltages. The range depends on the fabrication process of the device and its real-time operating state (temperature) at a given frequency.

3.1.2.5 Adaptive Body Bias

The device implements transistor body bias techniques for optimizing the performance and power of some operating points.

Adaptive body bias (ABB) is based on the process corner and the current OPP. This is configured in the efuse at the device characterization and is not continuously updated. A dedicated LDO, that is, VBBLDO, is used to produce the voltage bias.

3.1.2.6 Combining Power-Management Techniques

The power-management techniques previously described have specific features and are most effective when used under the specific operating conditions of the device. Hence, the best active power savings are obtained by combining the DVFS, DPS, SLM, and AVS techniques. For a given operating state, one or more of the power-saving techniques can be applied to ensure optimal operation with maximum power saving.

AVS can be used at boot time to adapt the voltage to device process characteristics (strong/weak) and then used continuously to compensate temperature variations. AVS can also ensure maximum available application performance of the device at a given OPP.

When medium application performance is required, or when application performance requirements vary, DVFS can be applied. The voltage and frequency can be scaled to match the closest OPP that meets the performance requirement.

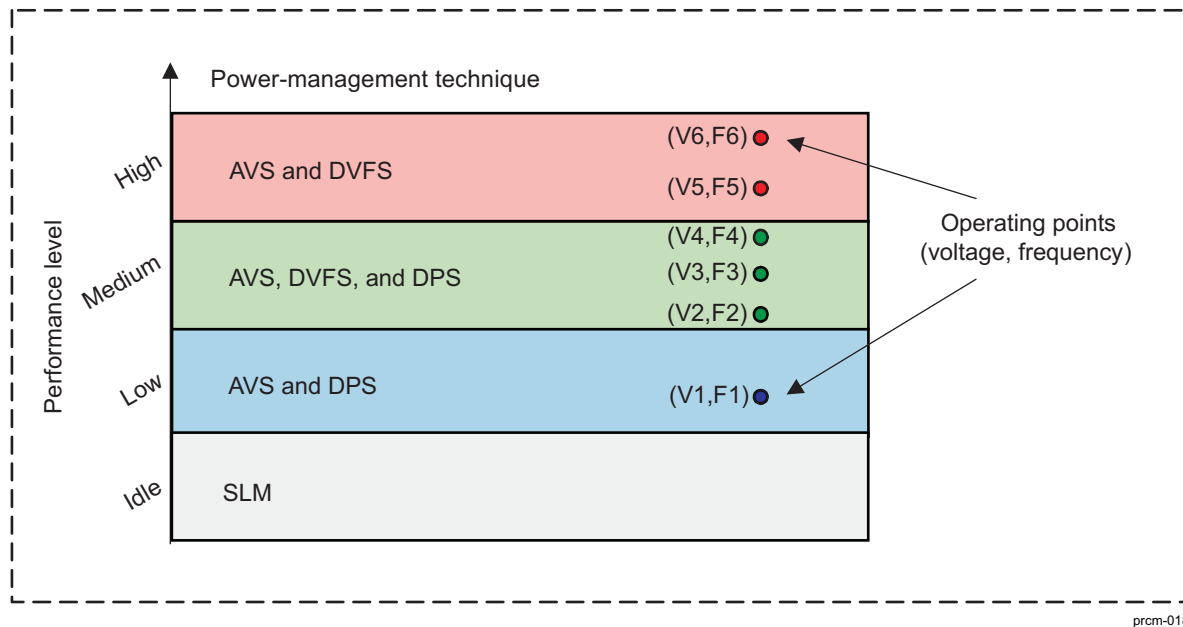

When application performance requirements fall between two OPPs, or when a low application performance is required that is below the lowest performance OPP, DPS can be applied to switch to low-power mode.

When combining DVFS and DPS, the operating frequency must not be scaled to match the performance requirement without scaling the voltage. Lower operating frequency increases task completion time and reduces idle time. This prevents DPS or reduces its efficiency (DPS becomes more effective as idle time increases). Unless DPS cannot be applied for other reasons, for a given operating point of DVFS the operating frequency must always be set to the maximum allowed at a given voltage. This ensures optimal process completion time and application of DPS.

If DPS cannot be applied in a given context, scaling the frequency while keeping the voltage constant does not save energy; it does, however, reduce peak power consumption. This can have a positive effect on temperature dissipation and battery life.

SLM must be used when no applications are running and performance requirement drops to zero.

NOTE: The OPPs shown in [Figure 3-17](#) are only for indication and clarity of text. They do not correspond to validated OPPs of the device.

Figure 3-17. Performance Level and Applied Power-Management Techniques

3.1.2.6.1 DPS Versus SLM

DPS and SLM are similar concepts: they consist of switching the system between high- and low-power consumption modes. However, their operating timescales differ, principally in the latency allowed for mode transitions.

DPS is generally used in an applicative context (tasks are started). Therefore, mode transitions are related to system performance requirements or the processor load. DPS transition latencies must be small (typically between 10 μ s and 100 μ s) compared to the time constraints or deadlines of the application so that they do not degrade application performance. DPS requires performance prediction to ensure that transition latencies do not deteriorate device performance to the point that real-time application deadlines are missed or the user experience degrades too much for an interactive application.

SLM is not used in an applicative context (no task started). Mode transitions are related more to system responsiveness, and the transition latencies must be small compared to user sensitivity so that they do not degrade the user experience. For SLM, transition latencies are typically 1 ms to 10 ms or more.

DPS and SLM also differ in the type of wake-up event used to exit low-power idle mode. For DPS, wake-up events are application-related (timer, DMA request, peripheral interrupt, etc.); for SLM, wake-up events are user-related (touch screen, key pressed, peripheral connections, etc.).

3.2 PRCM Subsystem Overview

3.2.1 Introduction

The power-management framework of the device significantly reduces dynamic power consumption and static leakage current to extend the life of the battery in the end product. This framework incorporates support for state-of-the-art power-management techniques. It ensures optimal device operation with significantly reduced power consumption. The power-management framework (PMFW) of the device is split over following modules:

- SCRM: Handles system-level (with one or more devices) clock and reset distribution and management.
- PRCM: A logical module composed of following three physical submodules:
 - PRM: Handles device-level power and reset management. It also handles some clocks in the device. This module always remains on, unless no power is supplied to the device pads.
 - CM1: Handles device-level clock management 1. This module remains always on unless either the device is switched to off mode or no power is supplied to the device pads.
 - CM2: Handles device-level clock management 2. This module does not remain always on. It is switched to full-retention mode when its power domain (PD_CORE) is in RETENTION state. It is off when either the device is switched to off mode or no power is supplied to the device pads.
- SR_MPU, SR_IVA, and SR_CORE (SmartReflex): Handle AVS features

Together, these modules provide enhanced power-management features with the centralized control for the clock, reset, and power-management signals in the device.

The device supports the power-management techniques with the following features:

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows any combination of domain on/off states
- Clock tree with selective clock-gating conditions
- Hardware-controlled reset sequencing management
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Support for hardware-controlled autogating of module clocks
- Memory retention capability for preserving memory contents in low-power sleep mode
- DVFS support for the processor and peripherals
- AVS support for the processor and peripherals, for real-time performance adjustments
- Support for low-power device off mode input/output (I/O) pad configuration for minimum power consumption when in OFF power state

The PMFW interfaces with all the components of the device for power, clock, and reset management through associated control signals. It integrates enhanced features to let the device adapt energy consumption dynamically according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

The power-management modules are fully configurable through their level 4 (L4) interface ports.

[Figure 3-18](#) is an overview of the power-management modules and their internal connections with a generic power domain.

Figure 3-18. PMFW Overview

prcm-019

3.2.2 Power-Management Framework Features

The power-management modules have the following features:

- Manage independent power domains
- Control scalable logic voltage domains and selectable voltage modes for memory voltage domains
- Handle standby, idle, and wake-up procedures for the modules of the device
- Allow software and partial hardware control
- Monitor and handle wake-up events
- Control system clock and reset input sources
- Manage and distribute clocks and resets with high control granularity
- Handle power-up sequences
- Debug and emulation features
- Allow adaptive and dynamic voltage scaling feature through dedicated high-speed (HS) master I²C interface
- Control of RFF of device modules to support DPS

3.3 PRCM Subsystem Environment

The modules of the PMFW receive the external reset, clock, and power signals. See [Figure 3-18](#).

NOTE: In the remainder of this chapter, power IC refers to a peripheral power source IC that is interfaced with the device. It receives power control commands (voltage scaling and power switching) from the device and provides the necessary voltages and reset signals.

The following sections describe the interfaces for external clock, reset, and power sources.

3.3.1 External Clock Signals

The SCRM module receives a low-frequency clock input, `sys_32k`, at 32-kHz frequency. It can receive high-frequency system clock through two possible inputs: `fref_slicer_in` or `fref_xtal_in`. The `fref_slicer_in` supplies the input clock to an on-chip slicer, while `fref_xtal_in` can be used as external crystal connection for internal high-frequency clock generation through an on-chip oscillator.

The SCRM can output six alternate clocks, `fref_clk[0:5]_out`. Output clocks 1 to 4 can be gated or enabled through associated clock request signals, `fref_clk[1:4]_req`.

[Table 3-21](#) lists the external clock pins, signal names, their direction, associated modules, description, and reset values of the signals. If the signal is input to the device, the module is the destination module for the signal. If the signal is an output from the device, the module is the source module of the signal.

Table 3-21. External Clock Signals

Pin	Signal	I/O ⁽¹⁾	PMFW Module	Description	Module Reset Value
<code>sys_32k</code>	<code>SYS_32K</code>	I	SCRM	32-kHz clock input	Z
<code>fref_clk_ioreq</code>	<code>SYSCLK_REQ</code>	I/O	SCRM	System clock request. Input when pins <code>sysboot6=0</code> and <code>sysboot7=0</code> . Otherwise output.	Z
<code>fref_slicer_in</code>	<code>SLICER_IN</code>	I	SCRM	System clock input to the slicer. It can be sinusoidal or square input signal. Otherwise, it may serve as alternate clock input (<code>SYS_ALTCLK</code>) to internal peripheral (for example, video DAC [VDAC]). ⁽²⁾	Z
<code>fref_slicer_AZ</code>	<code>SLICER_AZ</code>	I	SCRM	Connected to ground at package level	Z
<code>fref_xtal_in</code>	<code>XTAL_IN</code>	I/O	SCRM	Oscillator drive input from crystal or alternate square clock input (<code>SYS_ALTCLK</code>). ⁽²⁾	Z
<code>fref_xtal_out</code>	<code>XTAL_OUT</code>	O	SCRM	Oscillator drive output to crystal	Unknown
<code>fref_clk[1:4]_req</code>	<code>CLK[1:4]_REQ</code>	I	SCRM	Auxiliary clocks request	Z
<code>fref_clk[0:5]_out</code>	<code>CLK[0:5]_OUT</code>	O	SCRM	Auxiliary clocks outputs 0 to 5	0

⁽¹⁾ I = Input; O = Output; I/O = Bidirectional

⁽²⁾ `SYS_ALTCLK` can be sourced by `fref_slicer_in` or `fref_xtal_in` based on `SYSBOOT[7:6]` settings. For more information, see [Section 27.2.4.1, Clock Source Selection](#).

The auxiliary clocks are controlled by the configuration of the `SCRM.AUXCLK <clock id>` (where `<clock ID>` can be 0 to 5); for example, `fref_clk1_out` is controlled by the `SCRM.AUXCLK0` register. It controls the following features:

- Select the clock off output polarity
- Source clock input:
 - System clock
 - Clock from `DPLL_CORE`
 - Clock from `DPLL_PER`
- Initiate software generated request
- Software-controlled clock gating
- Divide factor configuration between 1 and 16

The bidirectional `fref_clk_ioreq` pad can be used to manage the external system clock request and auxiliary clock request 0. With this implementation, it is not expected to externally drive the system clock request when the SOC is the clock requester. This implementation requires programming the SCRM accordingly, in case the SOC needs the external system clock request. The programming consists in setting `AUXCLK0[9] DISABLECLK = 1` and `AUXCLKREQ0[4:2] MAPPING = 0`. Without these settings the SCRM would incorrectly interpret an external clock request as an auxiliary clock request 0.

The SCRM must enable the output buffer of this bidirectional pad as long as it needs to request the external clock source, and the output buffer must be put in high-Z when it no longer needs the system clock source.

If the device enters OFF mode while `fref_clk[1:4]_req` is still active, `fref_clk[0:5]_out` will be kept running from the system clock (SYS_CLK). LDO_WAKEUP stays in Active mode.

If `fref_clk[1:4]_req` is deasserted while in OFF mode, `fref_clk[0:5]_out` will be gated and LDO_WAKEUP will enter Sleep mode. SYS_CLK can be stopped.

If `fref_clk[1:4]_req` is reasserted while in OFF mode, `fref_clk[0:5]_out` will stay gated waiting for wake-up event that will trigger transition of LDO_WAKEUP to Active mode.

3.3.2 External Boot Signals

PRM receives SYSBOOT[5:0] information by external pins `sys_boot[5:0]`. They are used to select interfaces or devices for the booting list. For more information, see [Section 27.2.4.2, Booting Device Order Selection](#).

PRM receives SYSBOOT[7:6] information by external pins `sys_boot[7:6]`. It defines device source clock configuration. For more information, see [Section 27.2.4.1, Clock Source Selection](#).

[Table 3-22](#) lists the external boot pins, signal names, their direction, associated modules, description, and reset values of the signals. If the signal is input to the device, the module is the destination module for the signal. If the signal is an output from the device, the module is the source module of the signal.

Table 3-22. External Boot Signals

Pin	Signal	I/O ⁽¹⁾	PMFW Module	Description	Module Reset Value
<code>sys_boot0</code>	<code>SYSBOOT0</code>	I	PRM	System boot configuration pin 0	Z
<code>sys_boot1</code>	<code>SYSBOOT1</code>	I	PRM	System boot configuration pin 1	Z
<code>sys_boot2</code>	<code>SYSBOOT2</code>	I	PRM	System boot configuration pin 2	Z
<code>sys_boot3</code>	<code>SYSBOOT3</code>	I	PRM	System boot configuration pin 3	Z
<code>sys_boot4</code>	<code>SYSBOOT4</code>	I	PRM	System boot configuration pin 4	Z
<code>sys_boot5</code>	<code>SYSBOOT5</code>	I	PRM	System boot configuration pin 5	Z
<code>sys_boot6</code>	<code>SYSBOOT6</code>	I	SCRM	System boot configuration pin 6	Z
<code>sys_boot7</code>	<code>SYSBOOT7</code>	I	SCRM	System boot configuration pin 7	Z

⁽¹⁾ I = Input; O = Output; I/O = Bidirectional

3.3.3 External Reset Signals

The SCRM manages three reset signals:

- Power-on reset input on `sys_nrespwron` pin
- Power-on reset output on `sys_pwron_reset_out` pin
- Warm reset on `sys_nreswarm` pin

`sys_nrespwron` is asserted at device power up to reset the full logic in the device. The SCRM asserts the `sys_pwron_reset_out` signal to reset any associated external peripherals.

`sys_nreswarm` is a bidirectional pin. It can be activated at any time by an external device or an external reset push button action to cause a global warm reset event. The SCRM then holds `sys_nreswarm` to be driven out and maintained for a limited length of time at the boundary of the device. In this way, the device and its related peripherals are reset together.

The sys_reswarm and sys_nrespwron signals are active low. The sys_pwron_reset_out signal is also active low, and active means that the peripheral is under reset.

Table 3-23 lists the external reset pins, signal names, their direction, associated modules, description and reset values of the signals. If the signal is input to the device, the module is the destination module for the signal. If the signal is an output from the device, the module is the source module of the signal.

Table 3-23. External Reset Signals

Pin	Signal	I/O ⁽¹⁾	PMFW Module	Description	Module Reset Value
sys_nreswarm	SYS_WARM_RST	I/O	SCRM	Warm reset input and output	0
sys_nrespwron	SYS_PWRON_RST_IN	I	SCRM	Power-on reset input	Z
sys_pwron_reset_out	SYS_PWRON_RST_OUT	O	SCRM	Power-on reset to external peripherals	0

(1) I = Input; O = Output; I/O = Bidirectional

3.3.4 External Power Control Signals

The power control signals let the PMFW modules control the device voltage levels.

The voltage level of the scalable voltage sources in the external power IC can be scaled by sending commands to the power IC through a PRCM module dedicated I²C interface. The sr_scl and sr_sda are the clock and data pins, respectively, for this I²C interface.

The PRCM module can also command the external power IC to switch the device voltages to off level when the device is in off mode and reactivate them when it wakes up. This is managed through the signal on the sys_pwr_req pin.

Table 3-24 lists the signals, I/Os, and module reset values for the signals to the external power IC.

Table 3-24. Power Control Interface

Pin	Signal	I/O ⁽¹⁾	PMFW Module	Description	Module Reset Value
sr_scl	SR_SCL	I/O	PRM	The SmartReflex dedicated I ² C interface clock line	1
sr_sda	SR_SDA	I/O	PRM	The SmartReflex dedicated I ² C interface data line	1
sys_pwr_req	PWR_REQ	O	PRM	Power request to external power IC, to exit device off mode.	1

(1) I = Input; O = Output; I/O = Bidirectional

3.3.5 External Voltage Inputs

Table 3-25 lists the external voltage sources related to the PRCM module.

NOTE: Table 3-25 highlights only the voltage sources that are either directly managed by the PRCM module or are received by parts of the PRCM module (for example, DPLLs, LDOs, etc.). It does not give the device voltage sources not directly associated with the PRCM module.

Table 3-25. Voltage Sources

Pin	Signal	Managed by the PRCM	Description
vdd	VDD_CORE_L	Yes (AVS and DVFS)	Supplies VDD_CORE_L logic voltage domain
vdd_mpu	VDD_MPU_L	Yes (AVS and DVFS)	Supplies VDD_MPU_L logic voltage domain

Table 3-25. Voltage Sources (continued)

Pin	Signal	Managed by the PRCM	Description
vdd_iva_audio	VDD_IVA_L	Yes (AVS and DVFS)	Supplies VDD_IVA_L logic voltage domain (that is, DSP and IVAHD)
vdda_dpll_core	VDDA_DPLL_CORE	No (fixed)	DPLL_CORE analog power supply
vdda_dpll_mpu	VDDA_DPLL_MPU	No (fixed)	DPLL_MPU analog power supply
vdda_dpll_iva	VDDA_DPLL_IVA	No (fixed)	DPLL_IVA analog power supply
vdda_dpll_per	VDDA_DPLL_PER	No (fixed)	DPLL_PER analog power supply
vdda_dpll_audio	VDDA_DPLL_AUDIO	No (fixed)	DPLL_AUDIO analog power supply
vdda_slicer	VDDA_SLICER	No (fixed)	Clock slicer power supply
vdd_osc	VDD_OSC	No (fixed)	Clock oscillator core power supply
vdda_ldo_sram_mpu	VDDA_LDO_SRAM_MPU	No	Supplies LDO_MPU_M for MPU Cortex-A9 SRAM
vdda_ldo_sram_iva_audio	VDDA_LDO_SRAM_IVA_AUDIO	No	Supplies LDO_IVA_M for IVA SRAM
vdda_ldo_sram_core	VDDA_LDO_SRAM_CORE	No	Supplies LDO_CORE_M for CORE SRAM
vdda_ldo_emu_wkup	VDDA_LDO_EMU_WKUP	No	Supplies LDO_WAKEUP for WAKEUP/EMU logic
vdda_bdgp	VDDA_BDGP	No (fixed)	Bandgap supply input
vdda_vbldo_mpu	VDDA_VBBLDO_MPU	No	MPU VBB LDO supply input
vdda_vbldo_iva_audio	VDDA_VBBLDO_IVA	No	IVA VBB LDO supply input

3.4 PRCM Subsystem Integration

The internal configuration registers of the power-management modules can be accessed for configuration and control through their respective WKUP_L4 interconnect. In addition to the L4 interconnect, the internal modules interface contains the following interfaces and signals:

- A set of signals for idle/wake-up control for each module
- Clocks and reset signals for the modules
- Power control signals (switches and memories) to the power domains
- Interrupts to the MPU Cortex-A9, MPU Cortex-M3, and DSP INTCs
- Voltage error commands from the SmartReflex modules to the external power IC
- Phase-locked loop (PLL) control commands for recalibration and bypass of the digital phase-locked loops (DPLLs)

Figure 3-18 shows details of the control interface to a generic power domain.

3.4.1 Device Power-Management Layout

The PMFW sees the device split into voltage domains, power domain, and clock domains. Table 3-26 lists the device-level view with modules association to clock domains, power domains, and voltage domains.

Table 3-26. PMFW Device-Level Layout

Voltage Domain	Power Domain	Clock Domain	Module

3.4.2 Power-Management Scheme, Reset, and Interrupt Requests

3.4.2.1 Power Domain

Table 3-27 lists the PMFW modules and their associated power domains.

Table 3-27. PMFW Module Power Domains

PMFW Module	Power Domain
SCRM	PD_WKUP
PRM	PD_WKUP
CM1	PD_ALWON_CORE
CM2	PD_CORE
SR_MPU	PD_ALWON_CORE
SR_IVA	PD_ALWON_CORE
SR_CORE	PD_ALWON_CORE

The PRM part of the PRCM module is in the PD_WKUP power domain, which is continuously active. It is composed of the logic that must be permanently supplied to manage domain power-state transitions and detect wake-up events.

The CM1 part of the PRCM module is in the PD_ALWON_CORE power domain, which is an always-on power domain, while the CM2 part of the PRCM module is in the PD_CORE power domain, which can be activated and deactivated according to the requirements of the executing applications.

3.4.2.2 Resets

The PMFW modules are reset by independent reset signals (see Table 3-28).

Table 3-28. PMFW Module Reset Signals

PMFW Module	Reset Signal
SCRM	SYS_PWRON_RST_IN
PRM	SYS_PWRON_RST_IN
CM1	ALWON_CM1_PWRON_RST ALWON_CM1_RST
CM2	CM2_PWRON_RET_RST CM2_RET_RST
SR_MPU	ALWON_CORE_RST
SR_IVA	ALWON_CORE_RST
SR_CORE	ALWON_CORE_RST

NOTE: See Section 3.5.3, *Reset Sources* for details on the reset trigger sources and assertion conditions.

3.4.2.3 Interrupt Requests

The PMFW modules can generate following interrupts listed in Table 3-29.

Table 3-29. PMFW Module Interrupts

Source PMFW Module	Source Signal Name	Destination Interrupt Controller	Destination Signal Name
PRCM	PRCM_MPU_IRQ	CORTEX-A9_MPU_INTC	MA_IRQ_11
PRCM	PRCM_M3_IRQ	CORTEX-M3_MPU_INTC	MM_IRQ_31
PRCM	PRCM_DSP_IRQ	DSP_INTC	D_IRQ_57

Table 3-29. PMFW Module Interrupts (continued)

Source PMFW Module	Source Signal Name	Destination Interrupt Controller	Destination Signal Name
SR_IVA	SR_IVA_IRQ	CORTEX-A9_MPU_INTC	MA_IRQ_102
SR_MPU	SR_MPU_IRQ	CORTEX-A9_MPU_INTC	MA_IRQ_18
SR_CORE	SR_CORE_IRQ	CORTEX-A9_MPU_INTC	MA_IRQ_19

3.5 Reset Management Functional Description

3.5.1 Overview

In the device the reset scheme is managed by the following modules:

- SCRM: System-level reset management. It provides correct reset routing and sequencing when one or more devices are stacked together in the same package.
- PRM: Device-level reset management

3.5.1.1 SCRM Reset Management Functional Description

The SCRM handles the device power-on and warm reset pads: sys_nrespwron and sys_nreswarm resets. Its tasks basically consist of:

- Extending reset duration beyond the pad reset release
- Routing the device pad resets to the reset manager in the PRM module

The SCRM is functionally sensitive to the device power-on reset. However, some of the register bits of SCRM registers are reset when a device warm reset occurs.

3.5.1.1.1 Power-On Reset

The SCRM receives the device power-on reset on the sys_nrespwron reset pad of the device. It extends the power-on reset duration to the device PRM module at least until a stable 32-kHz clock can be provided to it. The 32-kHz clock version of the device is active once the SCRM releases the internal power-on reset. The SCRM automatically deasserts the reset.

The SCRM automatically requests the system clock under a power-on reset condition. This mechanism is functionally active on the 32-kHz clock.

The power-on reset can also be asserted through software control. Software must enable the software reset assertion feature by setting the SCRM.[EXTPWONRSTCTRL](#)[0] ENABLE bit and then by setting the SCRM.[EXTPWONRSTCTRL](#)[1] PWRONRST bit to assert the reset.

3.5.1.1.2 Warm Reset

The device warm reset can be received from an external source through warm reset pad sys_nreswarm or from the device PRM module as a result of internal event.

The SCRM extends the device pad warm reset duration to the device PRM module.

The SCRM routes a warm reset source (that is, sys_nreswarm pad/PRM module) to a warm reset destination (that is, PRM module).

This routing of reset from the device pad to the PRM is enabled and disabled using the SCRM.[EXTWARMRSTCTRL](#) register. It is enabled by default.

The status of a warm reset source, for each destination is logged in the corresponding SCRM.[EXTWARMRSTST_REG](#)[0] [EXTWARMRSTST](#) bit when the destination reset is released. This is done at 32-kHz clock.

Software must clear the reset status bit.

3.5.1.2 PRM Reset Management Functional Description

The PRM module manages the resets to all power domains inside the device.

NOTE: The PRM module has no knowledge or control over resets generated locally within a module (for example, through configuration register bit <Module name>_SYSCONFIG[x] SOFTRESET). Software reset has the same effect on the module logic as a hardware reset.

All PRM reset outputs are asynchronously asserted, while the deassertion is synchronous to the SYS_CLK clock. The reset managers in PRM use this clock for internal stall (delay) counter to delay deassertion of reset when the input reset source is deasserted.

In each power domain, one or more reset domains are defined. A reset domain is defined by a unique reset signal that originates from the reset manager and is connected to one or more modules of the device. All the connected modules of the reset domain are reset simultaneously when the reset signal is asserted. Independent control of these reset domains allows sequencing of the release of resets and ensures a safe reset of the entire power domain.

NOTE: All internal reset signals are active low, except for the DPLL reset signals, which are active high.

3.5.2 General Characteristics of Reset Signals

Reset signals can be categorized based on four criteria:

- Scope: Global or local reset
- Occurrence: Cold or warm reset
- Source type: Software or hardware triggered reset
- Retention type: Retention reset or nonretention reset

3.5.2.1 Scope

A reset signal can be categorized according to its scope (the area of the device affected by the reset):

- Global reset: Affects the entire logic of the device; all modules are reset. Generally, occurs when the device powers up or an abnormal operation is detected (the eFuse bad device is detected, etc.).
- Local reset: Affects one power domain, reset domain, or module. Generally, when a power domain transitions from off mode to active mode, or when a software-reset control bit for a domain is set, only the group of modules within that domain is affected.

3.5.2.2 Occurrence

A reset signal can be categorized depending on when the reset occurs:

- Cold reset: Occurs only on device power up or in certain emulation modes. The cold reset is a global reset that affects every module in the device. It usually corresponds to the initial power-on reset.
- Warm reset: Occurs when the device is in normal operating state. A module may use a warm reset to reset a subset of its logic. This is often done to speed up reset recovery time; that is, the time to transition to a safe operating state, compared to the time required upon receipt of a cold reset. Warm reset events include software-triggered reset per power domain, watchdog time-out, externally triggered and emulation initiated.

Modules that behave differently in cold reset and warm reset have two reset signals: RST and PWRON_RST. These reset signals reconstruct warm reset and cold reset in modules that require them.

The following modules are reset upon global cold reset events and not upon global warm reset events:

- All DPLLs associated with the PRCM
- All eFuses
- EMIF

- Control module – All the module instances in the PD_WKUP power domain

NOTE: For information about the PRCM module registers affected by the global warm reset, see the register description in [Section 3.11](#), *PRCM Register Manual*.

3.5.2.3 Source Type

A reset can be categorized depending on whether it is software-controlled or hardware-triggered:

- Software reset: Triggered by setting a bit in a configuration register of the PRCM module
- Hardware reset: Triggered by a signal from a hardware module inside or outside the PRCM module

3.5.2.4 Retention Type

The Power Domain Manager in PRM controls the assertion of two types of local cold reset sources, retention and nonretention reset. They are identified by the naming convention <Power Domain>_DOM_RET_RST and <Power Domain>_DOM_RST, respectively.

Upon transitioning a power domain to the ON-ACTIVE power state from the OFF power state:

- Retention type reset source is always asserted.
- Nonretention type reset source is always asserted.

Upon transitioning a power domain to the ON-ACTIVE power state from the RETENTION power state:

- Retention type reset source is never asserted.
- Nonretention type reset source is optionally asserted. The software-selectable option enables the PRM to support two retention mechanisms: CSWRET and OSWRET. Nonretention type reset source has following behavior:
 - It is asserted in-case of power domain state transition from OSWR-RETENTION state.
 - It is not asserted in-case of power domain state transition from CSWR-RETENTION state.

3.5.3 Reset Sources

The reset sources triggering the reset managers in the PRM are listed in this section.

3.5.3.1 Global Reset Sources

[Table 3-30](#) lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all the device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the reset triggering bit is identified.

Table 3-30. Global Reset Sources

Type ⁽¹⁾	Name	Source/Control	Description
H/C	SYS_PWRON_RST	Received from SCRM through input pin or through software control	The entire device is reset on power up.
H/W	SYS_WARMIN_RST	Received from SCRM through input pin or through software control	External hardware warm reset
S/C	GLOBAL_COLD_SW_RST	PRCM module.PRM_RSTCTRL[1] RST_GLOBAL_COLD_SW	Global software cold reset
S/W	GLOBAL_WARM_SW_RST	PRCM module.PRM_RSTCTRL[0] RST_GLOBAL_WARM_SW	Global software warm reset
H/W	VDD_CORE_VOLT_MGR_RST	PRCM	Asserted by the voltage manager FSMs when no response from the power IC is received during wake-up transition from retention or off mode
H/W	VDD_IVA_VOLT_MGR_RST	PRCM	
H/W	VDD_MPU_VOLT_MGR_RST	PRCM	
H/W	ICEPICK_RST	ICEPick module	It is used in emulation mode only.
H/W	ICEPICKPOR_RST	ICEPick module	It is used in emulation mode only.
H/W	CORTEXA9_WDT_RST	Either WDTIMER2 or MPU_A9 subsystem	It is triggered by a time-out event.

(1) H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

3.5.3.2 Local Reset Sources

In addition to the global reset sources the device can have a number of local reset sources for each power domain. The local reset sources can be cold or warm reset sources. They can be software or hardware triggered. [Table 3-31](#) identifies the possible types of hardware-triggered local cold reset sources. Some power domains may support one or both of these local cold reset sources. The table does not highlight the software-triggered local warm reset sources which are listed in the reset management section of the respective power domains. A local reset source signal received by the reset manager resets only a specific part of the device (for example, some modules/subsystems within the power domain).

Table 3-31. Local Reset Sources

Type ⁽¹⁾	Name	Source/Control	Description
H/C	<Power domain>_RET_RST	PRCM	Asserted only for a power domain state transition from OFF to ON-ACTIVE state
H/C	<Power domain>_RST	PRCM	Asserted for any power domain transition from OFF or OSWR-RETENTION state to ON-ACTIVE state

(1) H = Hardware reset, C = Cold reset

3.5.4 Reset Domains

A power domain may receive power-on reset (PWRON_RST) and/or normal reset (RST) signals. These signals reset nonretention logic and behave as follows:

- On any global or local cold reset, RST and PWRON_RST are asserted.
- On any global or local warm reset, only RST is asserted.

A power domain may receive two additional retention logic reset signals: power-on retention reset (PWRON_RET_RST) and/or retention reset (RET_RST). These signals behave as follows:

- On any global cold reset or wakeup from OFF state to ON-ACTIVE state, RET_RST and PWRON_RET_RST are asserted.
- On any global warm reset, only RET_RST is asserted.
- On wakeup from RETENTION state, these signals are not asserted.

This section presents the trigger sources and attributes for all reset domains of the device. See [Section 3.5.3, Reset Sources](#), for an explanation of each reset trigger source of the device.

[Table 3-32](#) identifies the associated power and rest domains for each module.

Table 3-32. Modules, Power Domains and Reset Domains Association

Table 3-34 lists the attributes of the reset manager associated with the reset domains. The clock to the reset manager, the delay count before release of reset, and the reset release stall conditions for the reset domains are listed. Apart from the identified reset release stall conditions, a universal release stall condition (that is, applicable to all reset signals) is the eFuse scan completion.

Table 3-34. Reset Domains Attributes

Reset Domain	RM Clock	RM Clock Count	Release Stall Conditions

WKUP_PWRON_RST	SYS_CLK	0x0	None
WKUP_RST	SYS_CLK	0x0	None
WKUP_SYS_PWRON_RST	None	N/A	None

(1) ResetTime2 is set in the [PRM_RSTTIME](#)[14:10] RSTTIME2 bit field.

NOTE: WKUP_SYS_PWRON_RST is directly connected to SYS_PWRON_RST source reset.

3.5.5 Reset Logging

A reset of the device is logged in two ways. First, dedicated registers in the PRCM module (the RM_<Power domain>_RSTST) log the reset sources to power domain. Second, the Control Module logs the device reset activity in dedicated registers.

3.5.5.1 PRCM Module Reset Logging Mechanism

The reset status registers RM_<power domain>_RSTST and RM_RSTST are reset asynchronously on assertion of a global cold reset. However, a reset status bit is always logged when the reset is released to the domain.

For this reason, after the assertion of a global cold reset, the reset status register is cleared to 0. When the domain reset is released, the register bit to log the global cold reset (the RM_<Power domain>_RSTST[0] GLOBALCOLD_RST bit) is updated to 1. For the same reason, the reset status register of domains released from reset by software is updated only when software releases the domain reset.

The assertion of a global cold reset prevents logging any other source of reset until after the release of the domain reset. This is valid in the following situations:

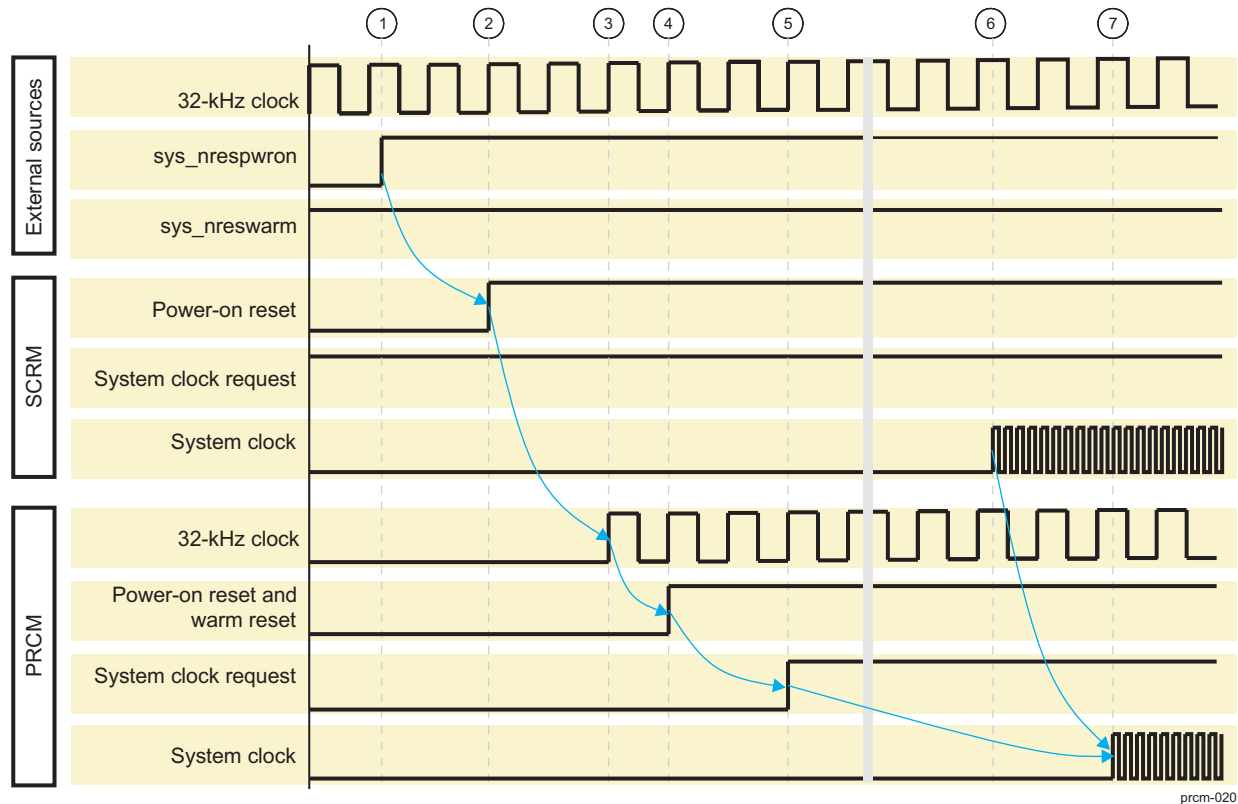

- A source of reset other than global cold reset is asserted before, during, or after the active period of a global cold source of reset and before the release of the domain reset signal.
- A source of reset other than global cold reset was asserted and then released, but a global cold reset source was asserted before the release of the domain reset signal.

3.5.6 Reset Sequences

3.5.6.1 SCRM Power-on Reset Sequence

[Figure 3-19](#) shows the power-on reset sequence as the reset is received by the SCRM and resulting interaction between SCRM and PRCM modules. [Figure 3-20](#) shows the power-on reset sequence within the PRCM module.

Figure 3-19. SCRM Power-On Reset Sequence

1. The power-on reset pad is released from reset while the 32 kHz is already active.
2. SCRM releases its internal power-on reset clocked at the 32-kHz clock.
3. SCRM delays the release of PRCM module resets to account for the stabilization time of the system clock source. It routes the 32-kHz clock to the PRCM module.
4. SCRM releases from reset (both power-on and warm reset) the PRCM module.
5. The PRCM module asserts a system clock request to the SCRM.
6. Once the system clock setup time counter overflows, the internal system clock version of SCRM is stable.
7. SCRM ungates the system clock to the PRCM module.

3.5.6.2 PRCM Module Power-On Reset Sequence

Figure 3-20 shows the power-on reset sequence.

Figure 3-20. PRCM Module Power-On Reset Sequence

The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The SCRM module is supplying the 32-kHz clock to the PRCM module and the clock is stable.
- The power-on reset SYS_PWRON_RST_IN has been released by the external power IC.

The power-up sequence is:

1. The SCRM releases global power-on reset to the PRCM module (that is, PRCM_SYS_PWRON_RST). As a result, the PRCM module starts the power-on reset sequence.
2. The PRCM module releases the SYS_NRES_WARM_OUT to the SCRM (only after all voltage domains have ramped-up) after some 32-kHz clock cycles, and it also asserts the APE_PRCM_SYS_CLKREQ to the SCRM module to request the system clock.

3. SCRM provides the system clock to the PRCM module when the system clock source is stable.
4. Once the Standard eFuse controller clock has been enabled by the PRCM module, the PRM releases the standard eFuse controller domain from reset. This starts the eFuse sensing sequence. Upon completion of the eFuse auto load sequence, the PRM turns off the Standard eFuse controller clock. It also powers down the standard efuse controller power domain PD_STD_EFUSE.
5. The PRM logic is then released from reset. The PRM provides the CM1 with a version of the system clock and releases the CM1 from reset.
6. The CM1 starts the reference clock (and also bypass clock) of the CORE DPLL. In turn, the CORE DPLL, which is configured in bypass mode, generates the L3 clock (running at the system clock frequency at this stage). Now the CM1 logic is fully operational: CM1 logic is released from reset and L3 clock is running.
7. The CM1 starts the L4 clock version for the CM2 and the PRM deasserts the reset of the CM2.
8. The DPLLs are released from reset. The DPLLs can be released from reset before the L3 clock is running. The DPLL being under reset does not prevent the output clock from running. The CM1 starts the reference and bypass clocks to the DPLL_MPU.
9. The CORE is released from reset, provided the L3 clock is running. The EMIF comes out of reset as soon as CORE power domain power on retention reset (CORE_PWRON_RET_RST, see [Table 3-34](#)) is released by the PRCM module. The PRCM module also releases the EMIF_DDR_PHY_PWRON_RST. The PHY_ROOT_CLK is not running at this point, hence all the PHYs are asynchronously reset at the same time. The DDR_PHY_CLK clock is started later.
10. The PRCM module releases the idle request signal to the EMIF module once the EMIF functional clock is enabled. The EMIF then acknowledges the deassertion of idle request and becomes active.
11. The Cortex-A9 MPU subsystem is released from reset provided its clock is active and the L3 interconnect is operational.

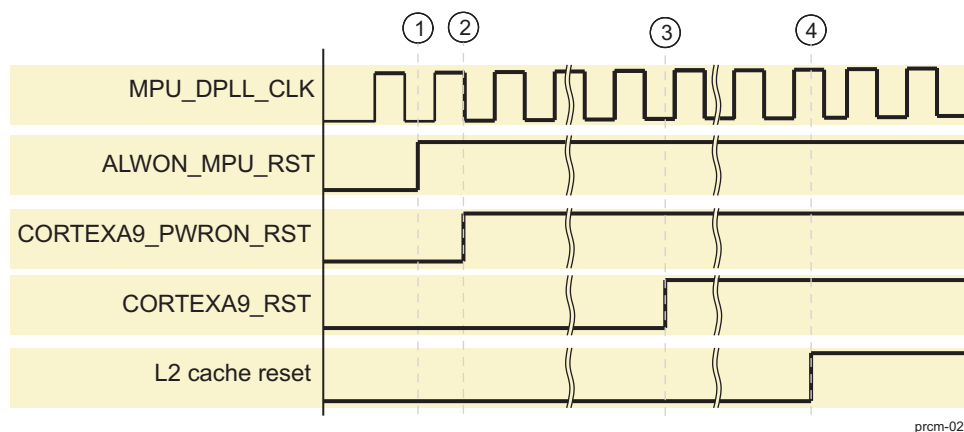

NOTE:

- PD_DSP and PD_IVAHD power domains are held under reset after power up by the assertion of software source of reset.
- PD_DSS, PD_SGX, PD_AUDIO, and PD_CAM are held under reset after power up until the PRCM module enables their interface clock.

3.5.6.3 Cortex-A9 MPU Subsystem Power-On Reset Sequence

Figure 3-21 shows the power-on reset sequence of the Cortex-A9 MPU subsystem.

Figure 3-21. Cortex-A9 MPU Power-On Reset Sequence

The assumptions after power-on reset assertion are:

- The PRCM module provides the DPLL_MPU reference clock and the bypass clock.
- The PRCM module has released DPLL_MPU reset and the DPLL_MPU is in bypass mode providing the clock (that is, bypass clock) to all the modules inside the Cortex-A9 MPU subsystem.

The power-on reset sequence is:

1. The PRCM module releases asynchronously in PD_ALWON_MPU the ALWON_MPU_RST reset to the CORTEXA9_MPU_INTC module inside the Cortex-A9 MPU subsystem.
2. The PRCM module releases in PD_MPU the CORTEXA9_PWRON_RST (only after the MPU_DPLL_CLK is active) to the Cortex-A9 MPU subsystem and waits until the subsystem completes its internal reset sequence.
3. Once the Cortex-A9 MPU subsystem internal reset sequence completes, the PRCM module releases in PD_MPU the CORTEXA9_RST signal and the Cortex-A9 MPU starts booting.
4. The PRCM module releases the reset to L2 cache memory in the Cortex-A9 MPU subsystem 16 MPU_DPLL_CLK cycles after the release of CORTEXA9_PWRON_RST and CORTEXA9_RST.

NOTE:

- The reset to the L2 cache memory in the Cortex-A9 MPU subsystem is asserted during initial power-on reset (that is, when the PD_MPU wakes-up from OFF state). It is also asserted during local or global warm reset. However, it is not asserted when the PD_MPU wakes-up from RETENTION state, that is (when the logic is off and L2 memory is in RETENTION state). This ensures that the L2 cache is retained on wake-up.
- The L1 cache memory in the Cortex-A9 MPU subsystem is not retained on PD_MPU wake-up.

3.5.6.4 Cortex-A9 MPU Subsystem Warm Reset Sequence

Figure 3-22 shows the warm reset sequence of the Cortex-A9 MPU subsystem.

Figure 3-22. Cortex-A9 MPU Warm Reset Sequence

The assumptions are:

- The DPLL_MPU is locked and providing the clock to the Cortex-A9 MPU subsystem.
- A global or local warm reset to the Cortex-A9 MPU subsystem is asserted.

The warm reset sequence is:

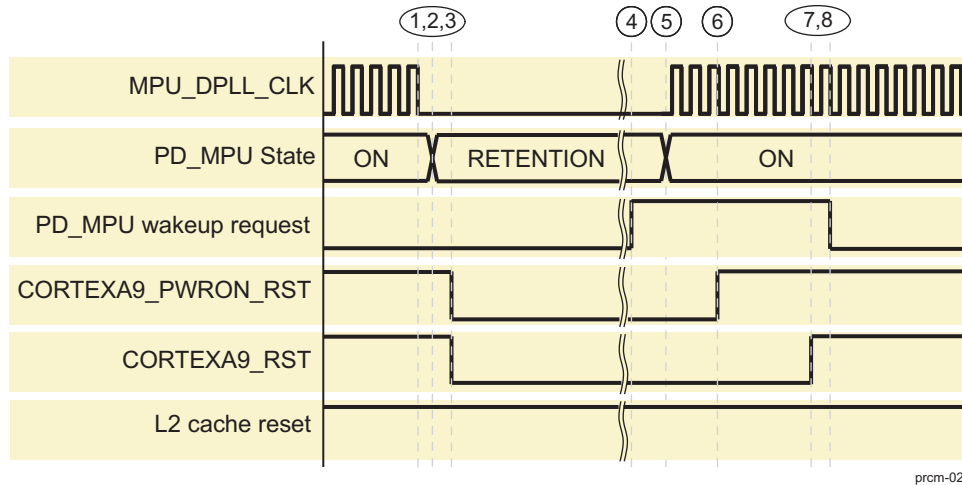

1. The PRCM module asserts in PD_ALWON_MPU the ALWON_MPU_RST reset to the CORTEXA9_MPU_INTC module inside Cortex-A9 MPU subsystem.
2. The PRCM module asserts in PD_MPU the CORTEXA9_RST reset to the Cortex-A9 MPU subsystem.
3. The PRCM module resets the L2 cache memory in the Cortex-A9 MPU subsystem by asserting its reset.
4. The PRCM module releases the ALWON_MPU_RST reset to the CORTEXA9_MPU_INTC module.
5. The PRCM module releases the CORTEXA9_RST, only after the DPLL_MPU is in bypass mode and MPU_DPLL_CLK is stable and active.
6. The PRCM module releases the reset to L2 cache memory in the Cortex-A9 MPU subsystem 16

MPU_DPLL_CLK cycles after the release of CORTEXA9_RST.

3.5.6.5 Cortex-A9 MPU Subsystem Reset Sequence On Sleep and Wake-Up Transitions From RETENTION or OFF State

Figure 3-22 shows the sleep and wake-up transitions reset sequence from RETENTION or OFF state of the Cortex-A9 MPU subsystem.

Figure 3-23. Cortex-A9 MPU Reset Sequence on Sleep and Wake-Up Transition

The assumption is:

- The DPLL_MPU is locked and providing the clock to the Cortex-A9 MPU subsystem.

The sleep and wake-up transitions reset sequence is:

1. The PRCM module gates the MPU_DPLL_CLK to Cortex-A9 MPU subsystem.
2. The PRCM module switches the PD_MPU to RETENTION state.
3. The PRCM module asserts CORTEXA9_PWRON_RST and CORTEXA9_RST resets to Cortex-A9 MPU subsystem. The entire logic in the PD_MPU is held in reset. The reset to the L2 cache memory in the Cortex-A9 MPU subsystem is not asserted if the logic in the PD_MPU is held in reset.
4. The PRCM module resets the L2 cache memory in the Cortex-A9 MPU subsystem by asserting its reset.
5. The PRCM module releases the ALWON_MPU_RST reset to the CORTEXA9_MPU_INTC module.
6. The PRCM module releases the CORTEXA9_RST, only after the DPLL_MPU is in bypass mode and MPU_DPLL_CLK is stable and active.
7. The PRCM module releases the reset to L2 cache memory in the Cortex-A9 MPU subsystem 16 MPU_DPLL_CLK cycles after the release of CORTEXA9_RST.

3.5.6.6 IVAHD Subsystem Power-On Reset Sequence

Figure 3-24 shows the power-on reset sequence of the IVAHD subsystem.

Figure 3-24. IVAHD Power-On Reset Sequence

The power-on reset to IVAHD is applied when PD_IVAHD is powered. The assumptions after power-on reset assertion are:

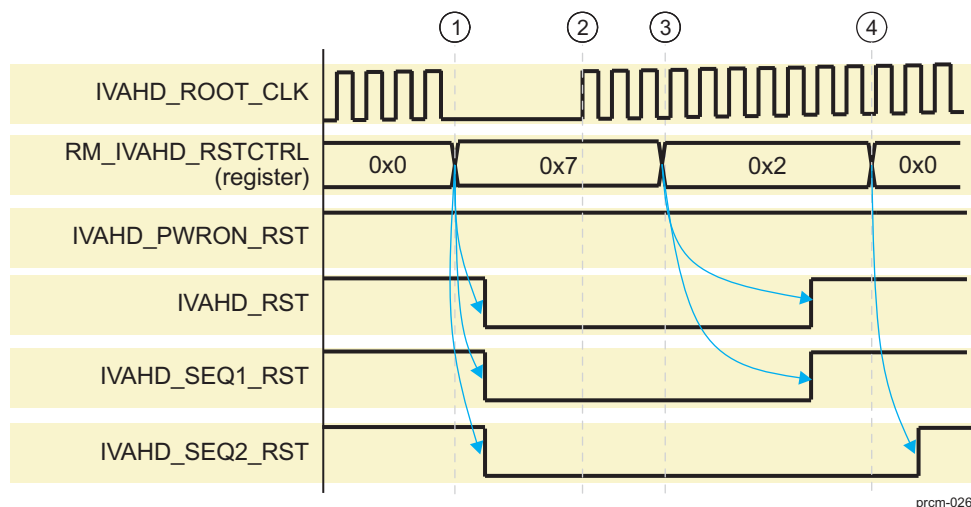

- The PRCM module provides the functional clock IVAHD_ROOT_CLK to the IVAHD subsystem and it has been enabled by the software control.

The power-on reset sequence is:

1. Software clears the [RM_IVAHD_RSTCTRL\[2\]](#) RST3 bit. This causes the PRCM module to release the IVAHD_PWRON_RST reset used inside IVAHD to reset mainly the emulation logic and the IVAHD_RST reset used to reset all logic inside IVAHD. Then software can download data into TCM memory while keeping the sequencer CPUs under reset.
2. Software clears the [RM_IVAHD_RSTCTRL\[0\]](#) RST1 bit. This releases the IVAHD_SEQ1_RST reset to the Sequencer1 CPU.
3. Similarly, software can clear the [RM_IVAHD_RSTCTRL\[1\]](#) RST2 bit. This releases the IVAHD_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.7 IVAHD Subsystem Software Warm Reset Sequence

[Figure 3-25](#) shows the software warm reset sequence of the IVAHD Subsystem.

Figure 3-25. IVAHD Software Warm Reset Sequence

Before asserting the software reset to the IVAHD subsystem the MPU software must ensure that:

- IVAHD sequencer CPUs are in IDLE state ([CM_IVAHD_IVAHD_CLKCTRL\[17:16\]](#) IDLEST).
- The IVA HD subsystem is in STANDBY state ([CM_IVAHD_IVAHD_CLKCTRL\[18\]](#) STBYST).
- The functional clock to the IVAHD subsystem has been gated by the PRCM module ([CM_IVAHD_CLKSTCTRL\[8\]](#) CLKACTIVITY_IVAHD_CLK).

The software reset sequence is:

1. The MPU software sets the [RM_IVAHD_RSTCTRL\[2\]](#) RST3, [RM_IVAHD_RSTCTRL\[1\]](#) RST2, and [RM_IVAHD_RSTCTRL\[0\]](#) RST1 bits. This causes the PRCM module to assert the IVAHD_RST, IVAHD_SEQ1_RST, and IVAHD_SEQ2_RST resets to the IVAHD subsystem. The IVAHD_PWRON_RST remains deasserted.
2. The MPU software enables the functional clock to the IVAHD subsystem.
3. The MPU software clears the [RM_IVAHD_RSTCTRL\[2\]](#) RST3 and [RM_IVAHD_RSTCTRL\[0\]](#) RST1 bits. This causes the PRCM module to release the IVAHD_RST and IVAHD_SEQ1_RST resets to the IVAHD subsystem.
4. The MPU software clears the [RM_IVAHD_RSTCTRL\[1\]](#) RST2 bit. This releases the IVAHD_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.8 DSP Subsystem Power-On Reset Sequence

Figure 3-26 shows the power-on reset sequence of the DSP subsystem.

Figure 3-26. DSP Subsystem Power-On Reset Sequence

The assumptions on power-on reset assertion are:

- The PD_DSP is on.
- The MPU software sets the [CM_DSP_DSP_CLKCTRL\[1:0\]](#) MODULEMODE bit field to Auto.
- The MPU software sets the [CM_DSP_CLKSTCTRL\[1:0\]](#) CLKTRCTRL bit field to SW_WKUP or HW_AUTO.
- The DPLL_IVA is active and providing the DSP_ROOT_CLK. It can be locked prior to this sequence.

The power-on reset sequence is:

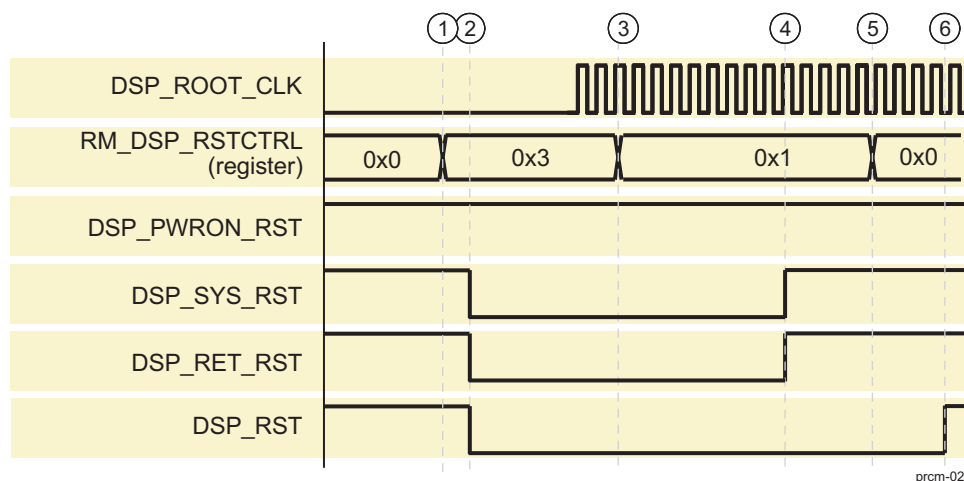

1. The MPU software clears the [RM_DSP_RSTCTRL\[1\]](#) RST2 bit in the PRCM module register to release from reset the DSP, MMU, and CACHE interface.
2. The PRCM module releases DSP_PWRON_RST once the reset manager counter ([PRM_RSTTIME\[14:10\]](#) RSTTIME2) has reached its limit. Upon the deassertion of power-on reset signal, the DSP subsystem starts the initialization sequence. During this initialization sequence all the internal registers inside DSP are properly reset and it also completes the reset for DSP, MMU, and CACHE interface.
3. Once the reset sequence of Step 2 completes and the reset manager counter ([PRM_RSTTIME\[14:10\]](#) RSTTIME2) has expired, the PRCM module releases DSP_SYS_RST and DSP_RET_RST signals.

4. The MPU software must configure the MMU once the MMU is out of reset. After MMU configuration is done, the MPU software clears the [RM_DSP_RSTCTRL\[0\]](#) RST1 bit in the PRCM module register.
5. The PRCM module releases DSP_RST, which causes the DSP to start booting.

3.5.6.9 DSP Subsystem Software Warm Reset Sequence

[Figure 3-27](#) shows the software warm reset sequence of the DSP subsystem.

Figure 3-27. DSP Subsystem Software Warm Reset Sequence

The assumptions on power-on reset assertion are:

- The DSP is in IDLE state.
- The DSP_ROOT_CLK is gated.

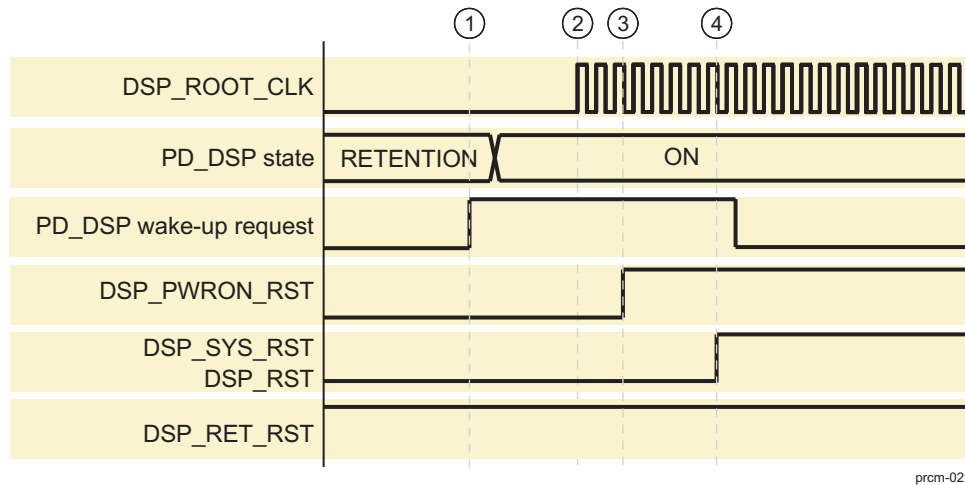

The power-on reset sequence is:

1. The MPU software sets the [RM_DSP_RSTCTRL\[1\]](#) RST2 and [RM_DSP_RSTCTRL\[0\]](#) RST1 bits.
2. The PRCM module asserts the DSP_SYS_RST, DSP_RET_RST, and DSP_RST reset signals. DSP_PWRON_RST remains deasserted in this case.
3. The MPU software re-enables the DSP_ROOT_CLK and clears the [RM_DSP_RSTCTRL\[1\]](#) RST2 bit in the PRCM module register to reset DSP, MMU, and CACHE interface. The DSP subsystem starts the partial initialization sequence for the warm reset.
4. Once the reset sequence of Step 3 completes and the reset manager counter ([PRM_RSTTIME\[14:10\]](#) RSTTIME2) has expired, the PRCM module releases the DSP_SYS_RST and DSP_RET_RST signals.
5. The MPU software clears the [RM_DSP_RSTCTRL\[0\]](#) RST1 bit in the PRCM module register.
6. The PRCM module releases DSP_RST, which causes the DSP to start booting.

3.5.6.10 DSP Subsystem Reset Sequence On Wake-Up Transitions From OSWR RETENTION State

[Figure 3-28](#) shows the reset sequence of the DSP subsystem on wake-up transitions from OSWR RETENTION state.

Figure 3-28. DSP Subsystem Reset Sequence On Wake-Up Transitions From OSWR RETENTION State

The assumptions on power-on reset assertion are:

- The DSP is in INACTIVE state.
- The DSP_ROOT_CLK is gated.
- The PD_DSP is in OSWR RETENTION state.
- The DSP_PWRON_RST, DSP_SYS_RST, and DSP_RST resets are held asserted, while DSP_RET_RST is not asserted by the PRCM module.

The power-on reset sequence is:

1. A wake-up request is received by the PRCM module and it switches the PD_DSP to ON state
2. The PRCM module then enables the DSP_ROOT_CLK and switches the CD_DSP to ACTIVE state.
3. The PRCM module releases DSP_PWRON_RST once the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) has reached its limit. Upon the deassertion of the power-on reset signal, the DSP subsystem starts the initialization sequence.
4. Once the reset sequence of Step 3 completes the PRCM module releases the DSP_SYS_RST and DSP_RST signals.

3.5.6.11 Cortex-M3 MPU Subsystem Power-On Reset Sequence

Figure 3-29 shows the power-on reset sequence of the Cortex-M3 MPU subsystem.

Figure 3-29. Cortex-M3 MPU Power-On Reset Sequence

The assumptions on power-on reset assertion are:

- The Cortex-M3 MPU subsystem is held in reset by the PRCM module and the CORTEXM3_PWRON_RST, CORTEXM3_RET_RST, CORTEXM3_RST1, CORTEXM3_RST2, and CORTEXM3_RST3 are asserted.

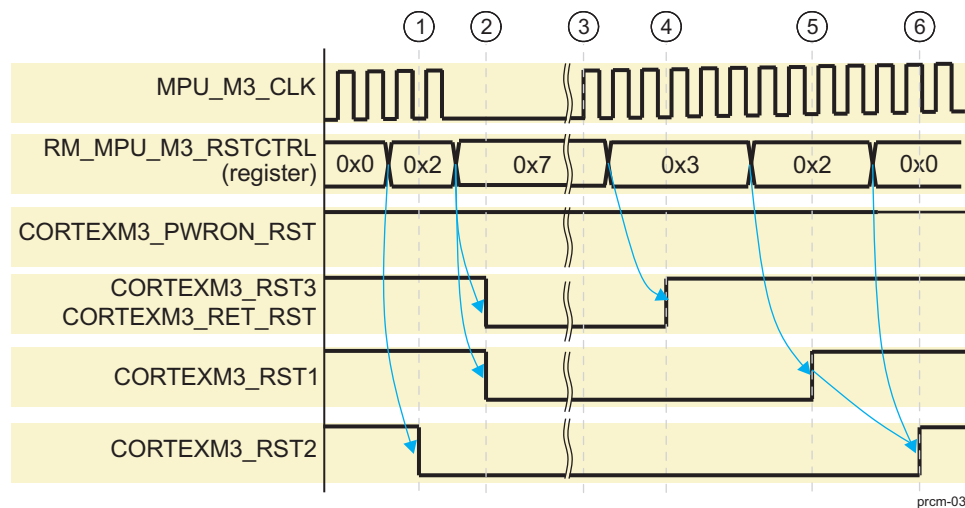

The power-on reset sequence is:

1. Software clears the [RM_MPU_M3_RSTCTRL\[2\]](#) RST3 bit in the PRCM module register to release from reset the MPU M3 Cache and MMU.
2. The PRCM module releases CORTEXM3_PWRON_RST once the reset manager counter ([PRM_RSTTIME\[14:10\]](#) RSTTIME2) has reached its limit and the MPU_M3_CLK is running. Upon the deassertion of the power-on reset signal, the Cortex-M3 MPU subsystem starts the CPU and MMU initialization sequence.
3. Once the reset sequence of Step 2 completes and the reset manager counter ([PRM_RSTTIME\[14:10\]](#) RSTTIME2) has expired, the PRCM module releases the CORTEXM3_RST3 and CORTEXM3_RET_RST signals.
4. The MPU software must configure the MMU once the MMU is out of reset. After MMU configuration and cache initialization is done, the MPU software clears the [RM_MPU_M3_RSTCTRL\[0\]](#) RST1 bit in the PRCM module register.
5. The PRCM module releases CORTEXM3_RST1, which causes the Cortex-M3 MPU Core 1 to start booting.
6. The MPU software can clear the [RM_MPU_M3_RSTCTRL\[1\]](#) RST2 bit in the PRCM module register so that the PRCM module releases the CORTEXM3_RST2 to the Cortex-M3 MPU Core 2.

3.5.6.12 Cortex-M3 MPU Subsystem Software Warm Reset Sequence

Figure 3-30 shows the software warm reset sequence of the Cortex-M3 MPU subsystem.

Figure 3-30. Cortex-M3 MPU Subsystem Software Warm Reset Sequence

The assumptions on power-on reset assertion are:

- The Cortex-M3 MPU Core 2 is in Idle state.

The power-on reset sequence is:

1. The Cortex-M3 MPU Core 1 software or Cortex-A9 MPU software sets the [RM_MPU_M3_RSTCTRL\[1\]](#) RST2 bit. The PRCM module asserts the CORTEXM3_RST2 reset signal to the Cortex-M3 Core 2.
2. The Cortex-A9 MPU cuts the MPU_M3_CLK and software sets the [RM_MPU_M3_RSTCTRL\[2\]](#) RST3 and [RM_MPU_M3_RSTCTRL\[0\]](#) RST1 bits.
3. The PRCM module asserts the CORTEXM3_RST3, CORTEXM3_RET_RST, and CORTEXM3_RST1 reset signals. The CORTEXM3_PWRON_RST remains deasserted in this case.
4. The MPU software re-enables the MPU_M3_CLK and the initialization sequence starts inside Cortex-

M3 subsystem. Software clears the [RM_MPU_M3_RSTCTRL\[2\]](#) RST3 bit in the PRCM module register.

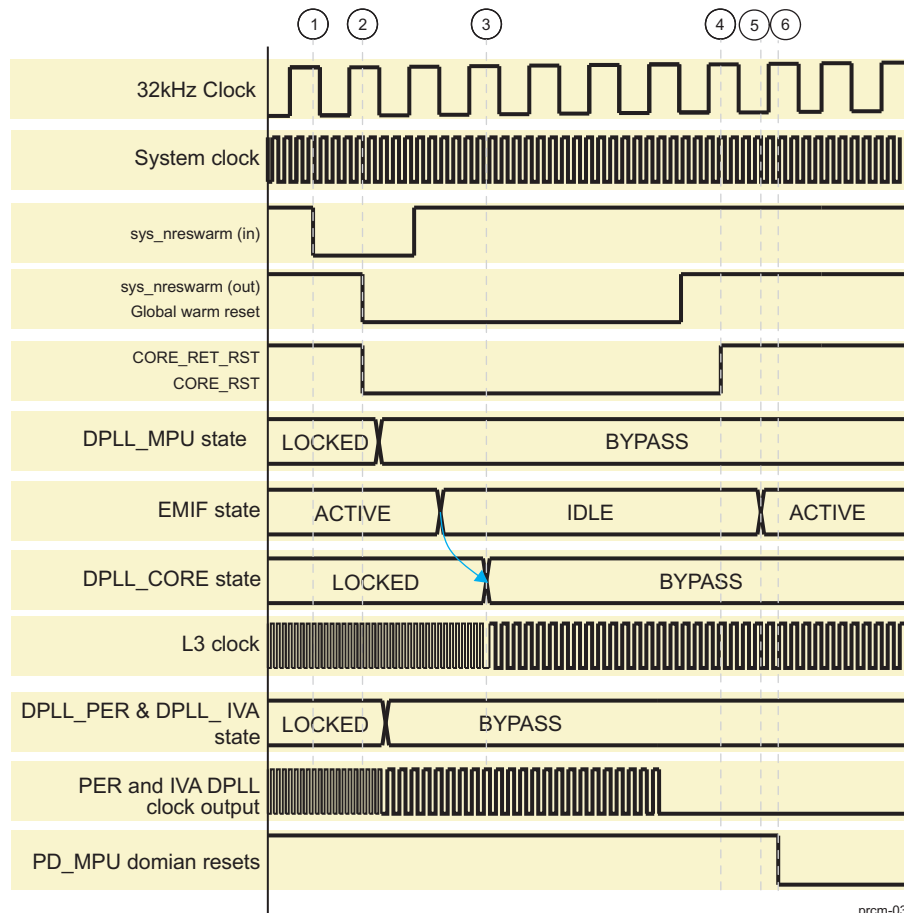

5. Once the reset sequence of Step 4 completes and the reset manager counter ([PRM_RSTTIME\[14:10\]](#) RSTTIME2) has expired, the PRCM module releases CORTEXM3_RST3, CORTEXM3_RET_RST, and CORTEXM3_RST1 reset signals. The Cortex-M3 MPU Core 1 starts rebooting.
6. Software can then clear the [RM_MPU_M3_RSTCTRL\[1\]](#) RST2 bit in the PRCM module register.. The PRCM module releases the CORTEXM3_RST2 reset signal to the Cortex-M3 MPU Core 2 to start booting.

3.5.6.13 Global Warm Reset Sequence

This section describes the global warm reset sequence.

Figure 3-31 shows the global warm reset sequence.

Figure 3-31. Global Warm Reset Sequence

The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The device is active:
 - All resets are released.
 - MPU, CORE, and DSP DPLLs are locked.

The steps of a global warm reset sequence are:

1. On assertion of any global warm reset source the PRM signals the EMIF that a global warm reset event has occurred. The EMIF initiates IDLE state transition. The PRCM module delays global warm reset to the device for minimum 16 L3 clock cycles so that the EMIF switches to IDLE state and switches the external SDRAM memory to self-refresh mode.
2. The reset managers in PRM assert the following resets:
 - The external warm reset SYS_WARM_RST (output) to the SCRM.
 - All power domain warm resets are asserted.
 - DPLL resets are not asserted.
 - DPLL_MPU transitions to bypass mode.
 - DPLL_CORE transitions to bypass mode once the EMIF has switched to IDLE state.
 - DPLL_IVA and DPLL_PER transition to bypass mode.

- DPLL_ABE configuration is not changed.
 - The system clock remains active.
 - The PRM and CM registers, sensitive to warm reset, are asynchronously reset.
 - CM gates the clocks not needed, as per their default reset setting in the associated registers.
3. After the warm reset source is released, the global warm reset and extended until the following conditions are met:
- Device reset manager counter overflows. It is set up by the [PRM_RSTTIME\[9:0\]](#) RSTTIME1 bit field.
- During this time, the DPLL_ABE control registers are reset and DPLL_ABE transitions to bypass mode when the system clock restarts and the DPLL_ABE outputs are no longer used.
- All logic voltage sources (VDD_IVA, VDD_MPU, and VDD_CORE) are stable.

NOTE: Voltage stabilization is an additional condition if voltage scaling was performed before the assertion of the warm reset.

4. The CORE power domain is released from reset (that is, warm reset sensitive modules in the CORE power domain).
5. The PRCM module switches the EMIF back to ACTIVE state from IDLE state.
6. PD_MPU is released from reset when the clocks to the Cortex-A9 MPU subsystem are active. The Cortex-A9 MPU reboots.

NOTE:

- PD_DSP and PD_IVAHD power domains are held under reset after global warm reset by assertion of the software source of the reset.
 - PD_L4_PER, PD_L3_INIT, PD_DSS, PD_SGX, and PD_CAM are held under reset after global warm reset until the PRCM module enables their interface clock.
 - The reset to the standard eFuse power domain, PD_STD_EFUSE, is not asserted on a global warm reset.
-

3.6 Clock Management Functional Description

3.6.1 Overview

The PRCM module provides control for clock generation, division, distribution, synchronization, and gating. It distributes the clock sources to all modules in the device. See [Section 3.1.1.1, Clock Management](#), for information on the clock-management functional architecture of the device.

The high-frequency system clock is received by the device from an external source or generated within the device (internal oscillator) by the SCRM. The SCRM also receives the 32-kHz low-frequency clock from the external source.

The stable versions of the system and 32-kHz clock are provided by the SCRM to the PRCM module. The PRCM module provides clocks to the internal DPLLs for internal high-frequency clocks generation. Clock division and gating are handled by the PRM, the CM1 and CM2 sections of the PRCM module. [Figure 3-32](#) shows the high-level clock-management scheme in the device.

Figure 3-32. PRCM Module Clock Manager Overview

prcm-033

3.6.2 External Clock Inputs

3.6.2.1 sys_32k Clock Input

The 32-kHz frequency is used for low-frequency operation (timer, debouncing, etc.). It supplies the wake-up domain for operation in lowest power mode and as clock source to the DPLL_ABE module (for audio back-end [ABE]).

3.6.2.2 High-Frequency System Clock Input

The system clock, SYS_CLK, is the main source clock of the device. SYS_CLK is received directly from the SCRM by the PRM subsection of the PRCM module. It is supplied as the reference clock to the DPLLs as well as functional clock to several modules.

3.6.3 Internal Clock Sources/Generators

The PRCM module clock sources/generators are split into the following parts:

- PRM clock source that receives the 32-kHz and system clocks from SCRM
- CM1 and CM2 clock sources that distribute high-frequency clocks
- DPLL clock generators that synthesize high-frequency clocks for the device

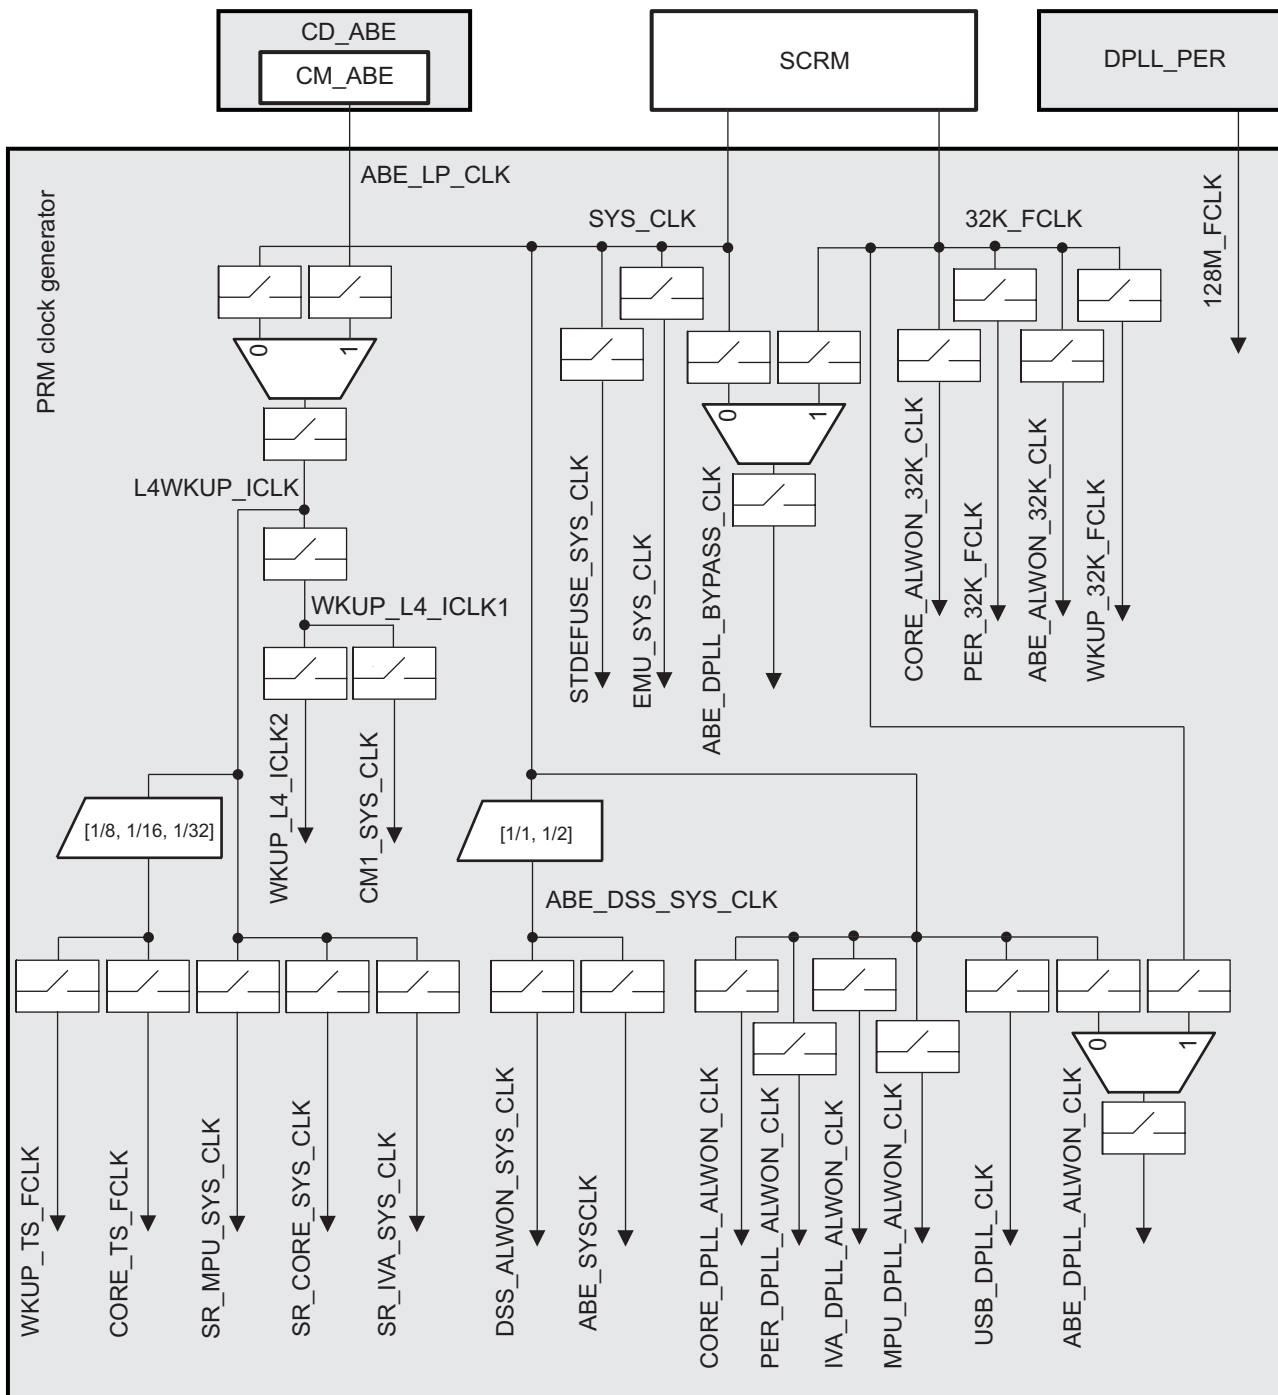

3.6.3.1 PRM Clock Source

The PRM clock source receives the SYS_32K and SYS_CLK clocks from the SCRM. It sources various versions (through gating controls) of these clocks to supply:

- PRCM-managed DPLLs with a reference clock, which is permanently supplied with always-on buffers
- The SR modules with a reference clock, which is permanently supplied with always-on buffers
- The DSS with a reference clock, which is permanently supplied with always-on buffers
- eFuse controller clocks (gated SYS_CLK clock), which are permanently supplied with always-on buffers
- The clocks for CM clock generator and the CORE power domain
- A version of SYS_CLK to ABE supplied by always-on buffers

[Figure 3-33](#) and [Figure 3-34](#) present a logical representation of the PRM clock source.

NOTE: For clock signals control (gating/ungating management), see Section 3.1.1.1, *Clock Management*

PRM provides 32-kHz gated and ungated clock for use by portions of PD_WKUP power domain and some peripherals outside the PD_WKUP power domain.

It also provides the system clock to the display subsystem (DSS), and gated and buffered version to L4WKUP_ICLK interconnect clock, and the DPLLs controlled by the PRCM module. The gated version of the SYS_CLK is also provided to the SmartReflex modules of the device.

3.6.3.2 CM Clock Source

The clock manager (CM) is primarily responsible for generating interface and functional clocks from the internal clocks provided by DPLL_CORE and DPLL_PER. The CM is physically divided into two independent entities, CM1 placed in PD_ALWON_CORE always-on power domain and CM2 placed in PD_CORE switchable power domain. The split is done to provide control over various entities like modules, DPLLs and clocks during low power use case scenarios when the PD_CORE power domain can be switched to RETENTION state.

3.6.3.2.1 CM1 Clock Generator

CM1 receives system clock from the PRM, which serves as its functional clock. CM1 provides gated clock to PD_AUDIO and some DPLLs. It also provides clock to the L3 and L4 interconnects in the device.

Figure 3-35 shows the various functional and interface clocks generated by CM1:

Figure 3-35. CM1 Overview

prcm-036

Table 3-36 identifies controls for clock dividers or muxes in the CM1 clock source.

NOTE: For clock signals control (gating/ungating management), see [Section 3.1.1.1, Clock Management](#)

3.6.3.2.2 CM1_USB Clock Generator

CM_USB receives system clock from USBPHY and DPLL_USB. It provides gated clock to CD_L3_INIT.

[Figure 3-36](#) shows the various functional and interface clocks generated by CM1_USB:

Mux MCBSP3_INT_FCLK	CM1_ABE_MCBSP3_CLKCTRL[27:26] CLKSEL_INTERNAL_SOURCE

(1) ABE_ICLK2 depends on the divider settings of the AESS_FCLK and is always divided by 2 of the ABE_CLK. So when AESS_FCLK divider is set to 1, then ABE_ICLK2 divider is set to 2 and vice versa.

NOTE: For the ABE subsystem, functional clock DPLL_ABE_X2_CLK must be set to 196.608 MHz in DPLL_ABE. ABE_CLK, which is sourced by the DPLL_ABE_X2_CLK, can be configured in the CM_CLKSEL_ABE[1:0] CLKSEL_OPP bit field according to the OPP. AESS_FCLK can be the same as ABE_CLK or ABE_CLK divided by 2, depending on the CM1_ABE_AESS_CLKCTRL[24] CLKSEL_AESS_FCLK bit.

For more information about setting DPLL parameters, see Section [Section 3.6.3.3.1](#).

NOTE: For clock signals control (gating/ungating management), see [Section 3.1.1.1, Clock Management](#)

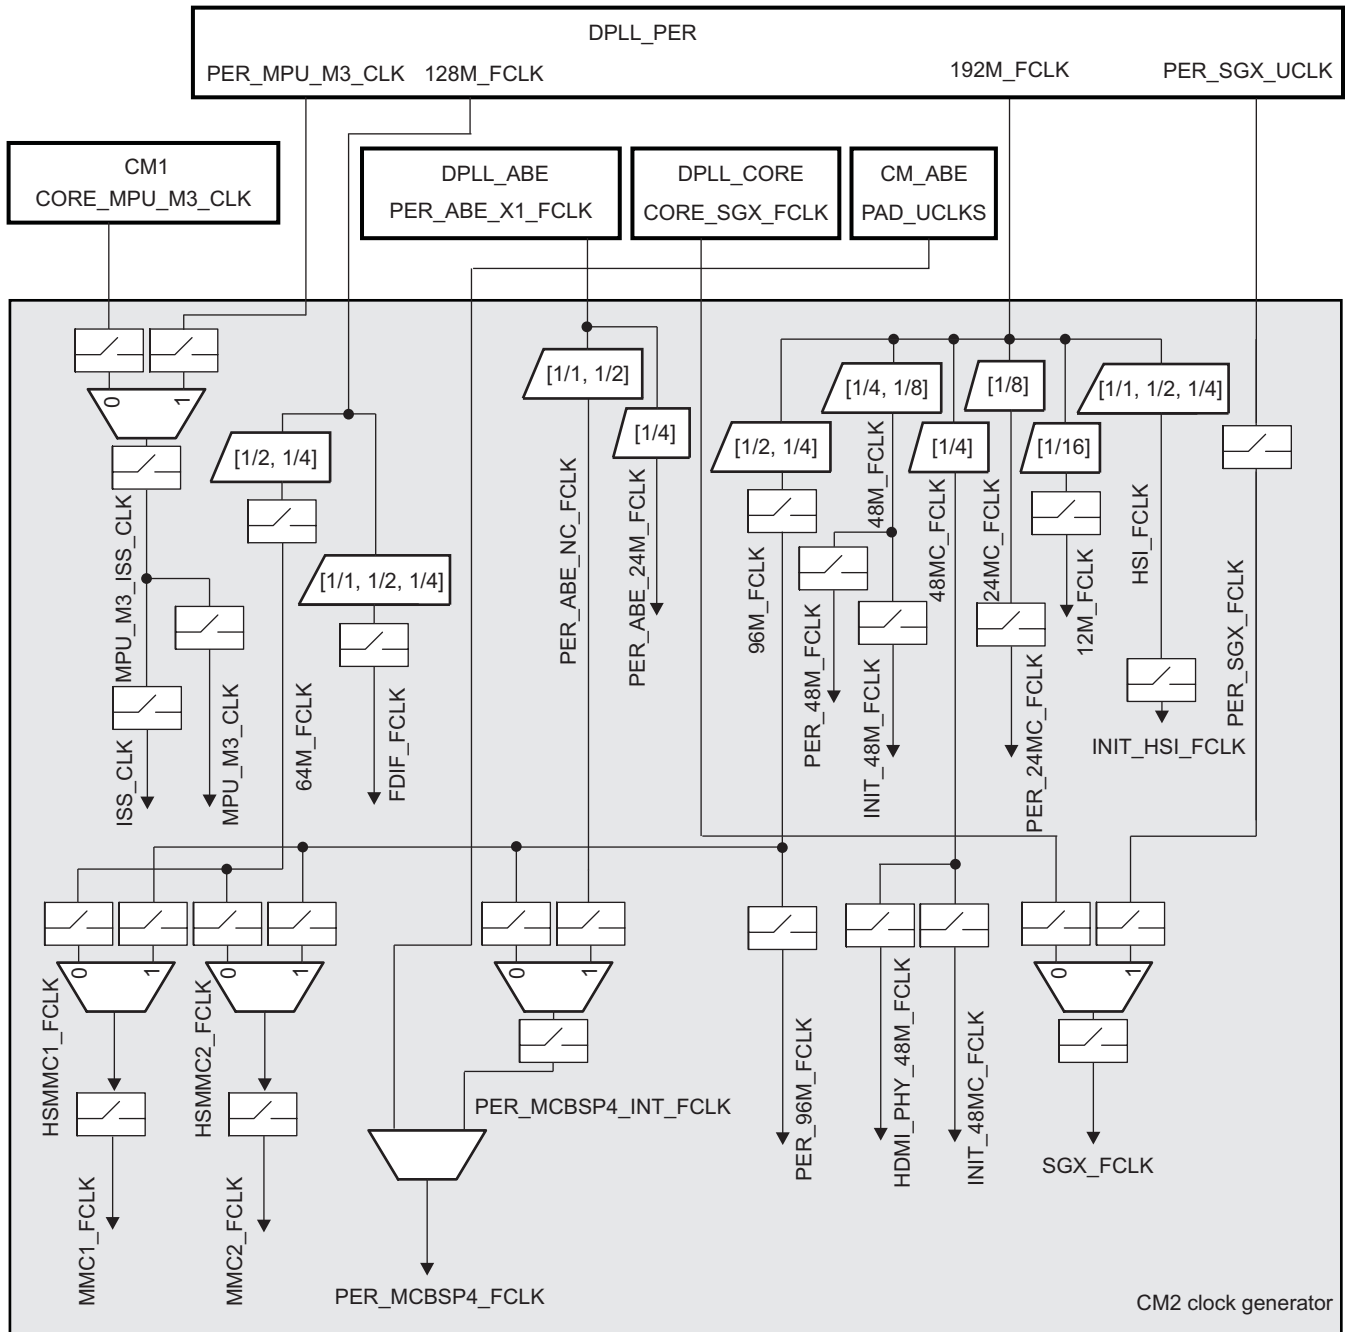

NOTE: For information about the CM1_ABE clock signals control and status, see [Section 3.6.23, CD_ABE Clock Domain](#).

3.6.3.2.4 CM2 Clock Generator

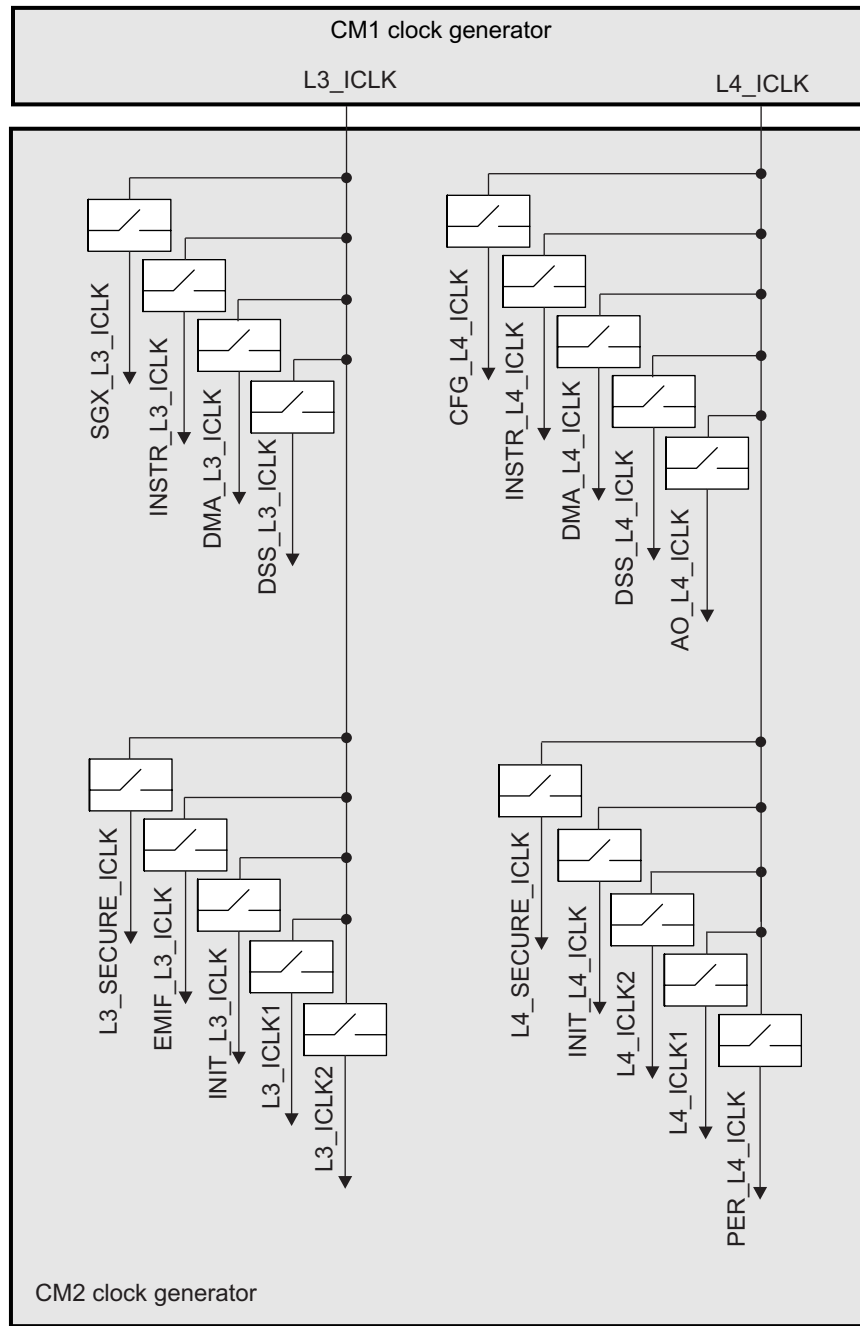

CM2 provides gated functional clocks to various modules of the device.

[Figure 3-38](#) and [Figure 3-39](#) show the various functional and interface clocks generated by CM2:

3.6.3.3 Generic DPLL Overview

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types, identified as type A and type B DPLLs.

Following DPLLs belong to type A:

- DPLL_MPU
- DPLL_IVA
- DPLL_CORE
- DPLL_PER
- DPLL_ABE

Following DPLL belongs to type B:

- DPLL_USB

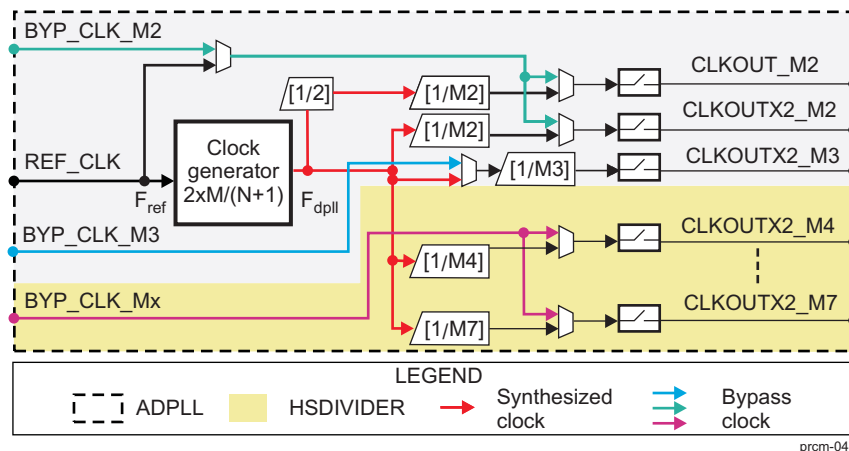

All DPLLs support the features presented in the following sections, unless identified otherwise.

NOTE: This chapter discusses only the DPLLs that are directly controlled by the PRCM module. The other DPLLs embedded in and managed by other subsystems are covered in the description of their respective subsystems. For example, [Chapter 10, Display Subsystem](#), discusses the DPLL in the display subsystem.

3.6.3.3.1 DPLLs Output Clocks Parameters

Figure 3-40 shows the functional architecture of a generic DPLL.

Figure 3-40. Generic DPLL Functional Diagram

The DPLL has three input clocks:

- REF_CLK: used to generate the synthesized clock but can also be used as the bypass clock for two outputs of the DPLL, whenever the DPLL enters a bypass mode. It is mandatory for the DPLL clock synthesis.
- BYP_CLK_M2: Selectable bypass clock for the output of an M2 post-divider (optional).
- BYP_CLK_M3: Selectable bypass clock for the output of an M3 post-divider (optional).

The DPLL can be programmed to be locked at any frequency given by the following equation:

- $F_{dpll} = F_{ref} \times 2 \times M / (N + 1)$ or
- $F_{dpll} = F_{ref} \times 2 \times (4 \times M / (N + 1))$ in case REGM4XEN bit field is set (only applicable to DPLL_ABE).

Where:

- F_{dpll} is the DPLL lock frequency.
- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

It internally generates three main clocks: CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 as presented in Table 3-40.

Table 3-40. CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 Frequencies With DPLL State

Output	Equation	DPLL Mode
CLKOUT_M2	$F_{dpll} / (2 \times M2)$	Locked
	F_{ref} or BYP_CLK_M2	Before lock or during relock
CLKOUTX2_M2	$F_{dpll} / M2$	Locked
	F_{ref} or BYP_CLK_M2	Before lock or during relock
CLKOUTX2_M3	$F_{dpll} / M3$ or $BYP_CLK_M3 / M3$	Locked
	0	Before lock or during relock

Where:

- M2 is the software-configured division ratio binary value.
- M3 is the software-configured division ratio binary value.
- CLKOUT_M2 and CLKOUTX2_M2 bypass clock input can be switched when the DPLL is not in locked state, using the M2 Bypass Clock Select Control bit.

- CLKOUTX2_M3 output clock can be switched when the DPLL is in locked state, using the M3 Clock Select Control bit.

NOTE:

- Zero-value for M2 and M3 division ratios is not allowed. They are set to 1 after reset.
 - CLKOUT_M2 is generated based on a fix divide-by-2 ratio, except in bypass mode.
-

NOTE: The following rules apply for the DPLL internal clock, $F_{int} = CLKINP / (N + 1)$:

- $CLKINP / (N + 1)$ must be between 0.032 and 52 MHz for DPLL_MPU, DPLL_IVA, DPLL_ABE, DPLL_CORE, and DPLL_PER.
 - $CLKINP / (N + 1)$ must be between 0.5 and 2.5 MHz for DPLL_USB.
-

The DPLL may contain an HSDIVIDER module to produce more clocks with divided ratio based on the DPLL synthesized clock frequency. HSDIVIDER provides four extra post-dividers from M4 to M7. The HSDIVIDER output clocks frequency is given by the equations in [Table 3-41](#):

Table 3-41. CLKOUTX2_Mn Frequencies With DPLL State

Equation	DPLL Mode
$CLKOUTX2_Mn = F_{dpll} / (Mn + 1)$	Locked
$CLKOUTX2_Mn = BYP_CLK_Mx$	Before lock or during relock

Where:

- F_{dpll} is the DPLL lock frequency.
- $Mn + 1$ is the software configured division ratio binary value.
- n is in the range from 4 to 7.

NOTE: $Mn + 1$ division ratio is set to 1 after reset and 31 (0x1f) is an illegal value.

All clock outputs of the DPLL can be gated. The PRCM module provides the DPLL with a clock gating control signal to enable or disable the clock, and the DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated.

The type B DPLL (only DPLL_USB) has two outputs: CLKOUT and CLKDCOLDO. The DPLL can be programmed to be locked with the output clock frequencies given by the following equation:

- $F_{clkout} = F_{ref} \times (M / (N + 1)) \times (1 / M2)$
- $F_{clkcoldo} = F_{ref} \times (M / (N + 1))$

Where:

- F_{clkout} is the frequency of the clock at output CLKOUT.
- $F_{clkcoldo}$ is the frequency of the clock at output CLKDCOLDO.
- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.
- $M2$ is the software-configured division ratio binary value.

CLKOUT supports the same bypass modes as identified earlier. CLKDCOLDO does not support bypass mode.

3.6.3.3.2 Enable Control, Status, and Low-Power Operation Mode

The DPLL has a Manual Mode Control bit field, which allows the setting of the different operating modes of the DPLL. When the DPLL is switched to lock mode the current values of the multiplication ratio (M) and the division ratio (N) are latched in the DPLL. The DPLL then starts the lock or relock sequence, to synthesize the corresponding output frequency clock.

The status of the synthesized clock output of the DPLL is represented by the CLKOUT status bit. It can be gated or active.

The DPLL can be switched to low-power operation mode (also called LPMODE) to optimize DPLL power consumption when the input and output clock frequencies are low. This mode can be software enabled using the low-power mode control bit of the DPLL.

It must only be enabled if both of the following operating conditions are satisfied:

- $F_{ref}/(N+1)$ is less than or equal to 1 MHz.
- $F_{ref} \times M/(N+1)$ is less than or equal to 100 MHz.

With:

- Fref is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

3.6.3.3.3 DPLL Power Modes

DPLL may supports several power modes. Each mode results in a tradeoff between power savings and relock time.

Table 3-42 shows the DPLL power modes.

Table 3-42. DPLL Power Modes

Power Mode	CLKOUT State	Logic Current (mA)	Analog Current (mA)	Freq Lock Time	Phase Lock Time
Low-power stop	Clock stopped	0.05 (leakage)	0.001 (leakage)	$1.5 \mu\text{s} + (20 \times 1/F_{ref})$	$1.5 \mu\text{s} + (100 \times 1/F_{ref})$
Fast-relock stop	Clock stopped	0.05 (leakage)	0.25 (leakage)	$0.05 \mu\text{s} + (20 \times 1/F_{ref})$	$0.05 \mu\text{s} + (100 \times 1/F_{ref})$
MN bypass	Bypass clock	0.05 (leakage)	0.001 (leakage)	$1.5 \mu\text{s} + (350 \times 1/F_{ref})$	$1.5 \mu\text{s} + (500 \times 1/F_{ref})$
Low-power bypass	Bypass clock/Clock stopped	0.05 (leakage)	0.001 (leakage)	$1.5 \mu\text{s} + (20 \times 1/F_{ref})$	$1.5 \mu\text{s} + (100 \times 1/F_{ref})$
Fast-relock bypass	Bypass clock/Clock stopped	0.05 (leakage)	0.25 (leakage)	$0.05 \mu\text{s} + (20 \times 1/F_{ref})$	$0.05 \mu\text{s} + (100 \times 1/F_{ref})$
Lock	Synthesized clock	0.55 (active)	1.95 (active)	N/A	N/A

Where:

- Fref is the REF_CLK frequency.

A DPLL power mode can be achieved on a software request (manual) and/or automatically (automatic), depending on the specific hardware conditions.

A DPLL can switch from one mode to the other as a result of the following:

- Software-programmed transition (manual): The software configures the dedicated DPLL Manual Mode Control feature for the next desired DPLL mode. It must ensure that the transition can be performed based on the clock activity on the device.
- Combined software-programmed and hardware-conditions-based transition (auto): This mode allows the DPLL to automatically transition to a low-power state (that is, any state other than MN BYPASS and the LOCK state) when the output clocks are gated or the destination clock domain is inactive. And to switch back to the LOCK state when the output clock is needed (that is, the clock is ungated or the clock domain becomes active). The desired low-power state for the automatic transition is configured in

dedicated Auto Mode Control parameter of the DPLL.

NOTE: With REF_CLK period = $1/F_{ref} = (N + 1)/CLKINP$; ($F_{ref} = CLKINP/(N + 1)$):

This formula indicates that a smaller N divider value provides a smaller time for switching the clock after an M2 post-divider change.

A compromise is necessary between the clock switching latency and power consumption. Having a smaller N value:

- Requires a higher M2 post-divider value to obtain the same target frequency.
 - Results in a higher DPLL lock frequency, and then higher power consumption.
-

NOTE:

- A manual transition can be performed from any power mode to any other power mode.
 - An automatic transition can be performed from lock mode to any low-power mode, except for the MN bypass mode.
-

3.6.3.3.4 DPLL Recalibration

Each time the DPLL is reset or performs a lock sequence (following a change in multiplier M or divider N value), it performs a recalibration of the output frequency, based on voltage and temperature conditions. In the locked mode the DPLL maintains a steady lock frequency output by compensating for voltage and temperature changes within a certain range. However, if the voltage or temperature drifts outside the range or shows a significant or fast change, the DPLL may not be able to track and compensate it. It would need a recalibration, which is signaled by assertion of a recalibration flag.

NOTE:

- The recalibration mechanism is active only while the DPLL is in locked mode. When the DPLL is in off or bypass mode (low-power or fast-relock), it does not assert the recalibration flag.
 - If the DPLL drifts out of the operating range limits while not locked, then when it tries to relock it fails to lock within the normal delay and recalibrates automatically before eventually locking. The only difference between this case and a standard relock is the recalibration delay.
-

During recalibration, the DPLL loses lock and output clock switches to the bypass clock.

The DPLL can automatically start recalibration when the recalibration flag is asserted, or recalibration can be triggered by software control. The trigger setting of the recalibration can be configured by the corresponding registers of the DPLL in the PRCM module. The software-controlled recalibration mode is selected by default.

Software-controlled recalibration: The DPLL continues its tracking mechanism as long as the recalibration is not triggered by software (that is, by enabling the Recalibration-Enable control parameter). If the DPLL reaches upper or lower bounds of the DCO control code and software has still not triggered recalibration, the DPLL stops its tracking mechanism. The output clock remains active, but frequency and jitter are not ensured to meet the requirement.

Automatic recalibration: The DPLL immediately starts the recalibration as soon as the recalibration flag is asserted.

NOTE: Automatic recalibration of the DPLL can start at any time. While relocking, the DPLL switches to bypass mode, which introduces a frequency change. For modules that are sensitive to frequency change while operating, this can introduce operational instability. For example, the external memory (EMIF) controller is sensitive to a frequency change on the DPLL because its embedded DLL relocks on a frequency change. Any EMIF access during this DLL relock period can be corrupted. It is, therefore, important to stall EMIF access during DPLL recalibration.

To allow the software to recalibrate the DPLL at the correct time depending on the device activity, the PRCM module can generate a wake-up event on processor power domain followed by an interrupt on the processor subsystem when the DPLL recalibration flag is asserted.

Table 3-43 shows the DPLL recalibration and control parameters.

Table 3-43. DPLL Recalibration Control Parameters

Parameter	Description
Recalibration-Enable control	Enable/disable the DPLL automatic recalibration feature.
Recalibration-Interrupt mask control	Mask/unmask the DPLL recalibration interrupt to processor.
Recalibration-Interrupt status	Status of the DPLL recalibration interrupt to processor

3.6.3.3.5 DPLL Spread Spectrum Clocking

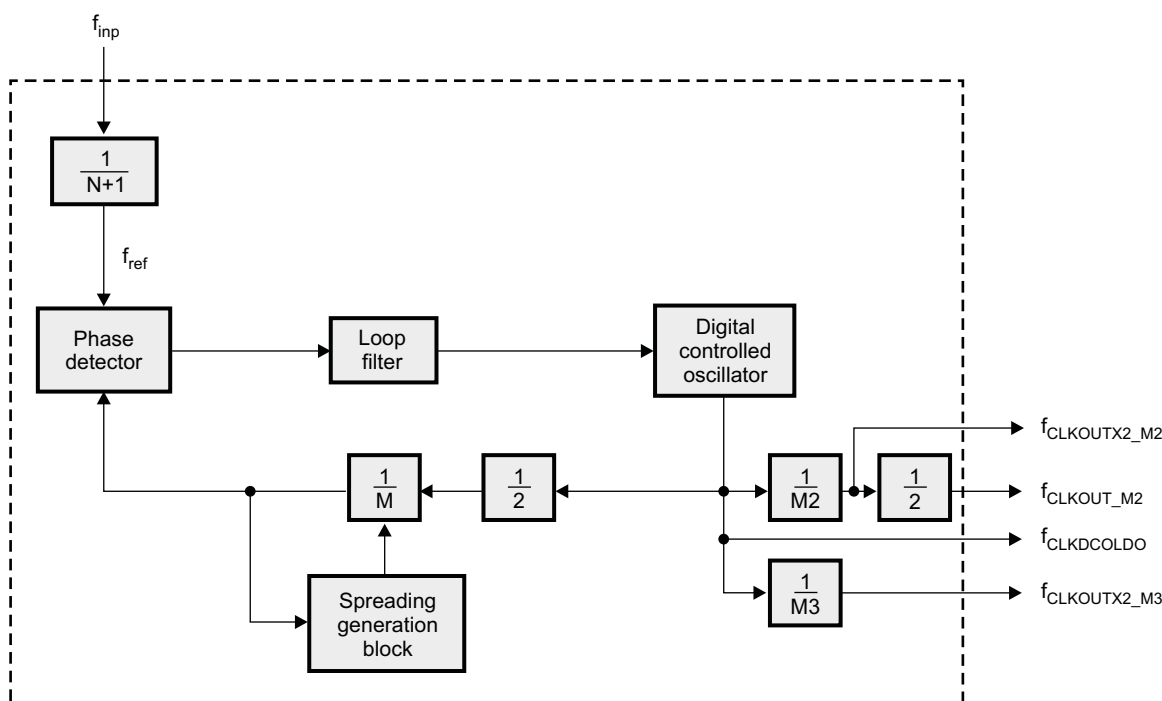

The synthesized clock output of the DPLL has a stable frequency. This periodicity generates a significant power peak at the selected frequency, which in turn causes an electromagnetic interference (EMI) disturbance to the environment. In communication devices, this clock signal generates unwanted spurious signals that interfere with the decoding of information received. It results in performance degradation, for example, in the form of high bit-error rates in case of a wireless communication interface.

To reduce the power peaks (and the electromagnetic noise generated at a specific frequency), an internal frequency modulation of the DPLL is used to distribute the energy to many different frequencies, thus reducing the power peaks. This is called spread spectrum clocking (SSC).

SSC in the DPLL is performed by changing the feedback divider (M) in a triangular pattern. This varies the frequency of the output clock in a triangular pattern. The frequency of this pattern is the modulation frequency (f_m). It is programmed as a ratio of the REF_CLK/4. This frequency modulation feature is integrated directly into some DPLLs of the device.

Figure 3-41 is a diagram of a DPLL that supports the SSC feature.

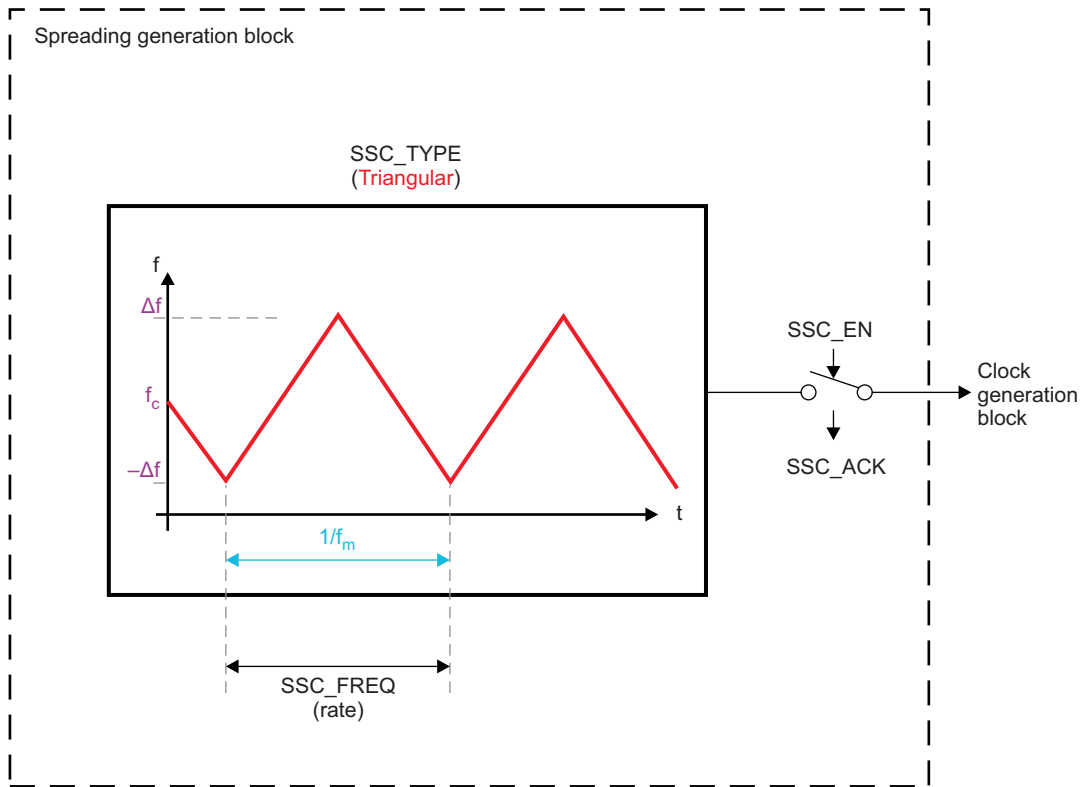

Figure 3-41. DPLL With SSC Reduction Feature

prcm-079

Figure 3-42 shows the spreading generation block diagram.

Figure 3-42. Spreading Generation Block Diagram

prcm-080

NOTE: Δf is the deviation from the center frequency. The total spreading deviation is equal to twice Δf . The peak (ΔM) or the amplitude of the triangular/square pattern as a percent of M is equal to the percent of the frequency spread (Δf), $\Delta M/M = \Delta f/f_c$.

f_c is the original output clock frequency.

f_m is the spreading frequency.

This additional block generates the required waveform used to reduce EMI. This waveform is then modulated with the initial signal to add some controlled deviation to the clock signal frequency, which spreads the energy of the clock and its harmonics into a band of frequencies, and then reduces EMI. $SSC_DOWNSPREAD$ can control the position of the generated signal. It is controlled by the $CM_CLKMODE_DPLL_<module>[14] DPLL_SSC_DOWNSPREAD$ bit of the corresponding registers (where $<module>$ is the name of the concerned DPLLs). If the $DOWNSPREAD$ bit is set to 1, the frequency spread on the lower side is twice the programmed value. The frequency spread on the higher side is 0.

The value of SSC_FREQ controls the rate of the generated signal. It can be programmed as a ratio of the reference clock: $f_{ref}/4$. The value that must be programmed is calculated as follows:

$$ModFreqDivider = f_{ref}/(4 \times f_m)$$

where $f_m < f_{ref}/70$, $f_{ref} = f_{inp}/(1 + N)$, and f_{inp} is the input clock for the DPLL

The $ModFreqDivider$ is split into mantissa and exponent:

$$ModFreqDivider = Mantissa \times 2^{Exponent}$$

The same value of ModFreqDivider can be obtained by different combinations of mantissa and exponent values. However, it is recommended to set the target ModFreqDivider by programming a maximum mantissa and a minimum exponent. This is controlled by the CM_SSC_MODFREQDIV_DPLL_<module>[10:8] MODFREQDIV_EXPONENT and CM_SSC_MODFREQDIV_DPLL_<module>[6:0] MODFREQDIV_MANTISSA bit fields of the corresponding registers (where <module> is the name of the concerned DPLL).

To define the modulation-frequency divider step size (ΔM) for triangular SSC, a DeltaMStep parameter must be programmed. DeltaMStep is split into integer and fractional parts. The step size can be calculated as follows:

$$\Delta M = \text{ModFreqDivider} \times \text{DeltaMStep}, \text{ if Exponent} \leq 3$$

$$\Delta M = 8 \times \text{Mantissa} \times \text{DeltaMStep}, \text{ if Exponent} > 3$$

It is controlled by the PRCM.CM_SSC_DELTAMSTEP_DPLL_<module>[19:0] DELTAMSTEP bit field of the corresponding register (where <module> is the name of the concerned DPLL). The PRCM.CM_SSC_DELTAMSTEP_DPLL_<module>[19:18] bit field defines the integer part, while the PRCM.CM_SSC_DELTAMSTEP_DPLL_<module>[17:0] bit field defines the fractional part. The DeltaMStep parameter must be programmed to define the modulation-frequency divider step size for trapezoidal SSC. It is split into integer and fractional parts. The step size can be calculated as follows:

$$\Delta M = \text{DeltaMStep}$$

The DeltaMStep integer part is controlled by the CM_SSC_DELTAMSTEP_DPLL_<module>[19:14] bit field, while the fractional part is controlled by the CM_SSC_DELTAMSTEP_DPLL_<module>[13:0] bit field (where <module> is the name of the concerned DPLL).

The SSC_EN signal enables and disables the frequency modulation feature of the DPLL. It is controlled by the PRCM.CM_CLKMODE_DPLL_<module>[12] DPLL_SSC_EN bit of the corresponding registers (where <module> is the name of the concerned DPLL).

The SSC_ACK signal notifies of the exact start and SSC end of the DPLL. It can be read by the PRCM.CM_CLKMODE_DPLL_<module>[13] DPLL_SSC_ACK bit of the corresponding registers (where <module> is the name of the concerned DPLL).

The following restriction applies to the range of M values: $M - \Delta M$ must be ≥ 20 . Also, $M + \Delta M$ must be ≤ 2045 . If DOWNSPREAD is enabled, $M - 2 \times \Delta M$ must be ≥ 20 , and $M \leq 2045$. In any case, the frequency modulation is programmed and does not generally have to be changed in real time.

Table 3-44 shows the DPLL SSC control parameters.

Table 3-44. DPLL SSC Control Parameters

Parameter	Description
SSC enable control	Enable/disable the DPLL SSC feature. When set to disable, SSC is disabled only after completion of one full cycle of the modulation pattern to maintain the average frequency.
SSC acknowledge	Notifies the exact start and end of SSC
Modulation Frequency Divider setting (Mantissa and Exponent)	Set the ratio of the modulation frequency with respect to the REF_CLK/4 frequency.
M step size setting (DeltaMStepInteger and DeltaMStepFraction)	Set the feedback divider variation step-size.

3.6.3.3.5.1 Definition

The SSC adds a variation to the frequency of an original clock, which spreads the generated interference over a larger band of frequencies.

In theory, SSC means that the clock signal is varied around the desired frequency. For example, for a 1-GHz clock, the frequency may be 999.5 MHz at one time and 1.0005 GHz at another time. Doing this constantly causes the power of the tone to be spread out more over a broader band of tight frequencies (centered at the desired tone). To realize this constant variation on the original signal, a modulation with an additional signal (called spreading waveform) is realized.

Creating an SSC by spreading the initial clock frequency is done by defining the following parameters:

- The spreading frequency (deviation), which is the ratio of the range of spreading frequency over the original clock frequency
- The modulation rate (f_m), which is used to determine the clock-frequency spreading-cycling rate, and is the time during which the generated clock frequency varies through f and returns to the original frequency
- The modulation waveform, which describes the variation curve over time

The spectral power reduction in the DPLL clocks is dependent on the modulation index (K), which is a ratio of spreading frequency, calculated from the frequency deviation (f) and the modulation rate (f_m).

3.6.3.3.5.2 Modulation Waveforms

The shape (profile) of the generated clock signal depends on the modulation waveform used during the frequency modulation. Several profiles can be used, according to the desired shaping for the energy spreading.

Figure 3-43 shows three examples of modulation waveforms and the spectrum of the corresponding modulated clock signal.

Figure 3-43. Modulation Profiles

prcm-081

The triangular wave gives a relatively flat spectrum and is easy to generate.

3.6.3.3.5.3 Effects on the Clock Signal

Figure 3-44 shows an example of the effect of triangular spreading on a clock signal.

Figure 3-44. Effect of the SSC in Frequency

Spectrum of signal without spreading

Spectrum of signal with triangular spreading

prcm-082

Figure 3-44 shows the power reduction of the main peak, and also the flatter aspect of the modulated signal. The minimum level of the second signal is higher than the first one. This effect is normal and is due to the noise added for the modulation.

NOTE: The spreading technique scatters the energy of the peaks on the other frequencies, which reduces the power of the peaks, but also increases the global noise of the signal.

Figure 3-45 shows the effect of triangular spreading on a clock signal in the time domain.

Figure 3-45. Effect of the SSC in the Time Domain

prcm-083

3.6.3.3.5.4 Estimation of the EMI Reduction Level

Figure 3-46 shows the effect of spreading on a clock and its harmonics.

Figure 3-46. Peaks Reduction Due to Spreading Spectrum

EMI reduction can be estimated using the following equation:

$$(1) \text{Peak_power_reduction} = 10 \times \log \left(\frac{\text{Deviation} \times f_c}{f_m} \right) - 10$$

Where:

- Peak_power_reduction in dB
- Deviation in percentage of the initial clock frequency (f_c), is equal to $\Delta f/f_c$.
- f_c is the original clock frequency, in MHz.
- f_m is the spreading frequency, in MHz.

According to equation (1), the deviation can also be calculated, and then f for a required reduction in peak-power:

$$(2) \text{Deviation} = \left(\frac{f_m}{f_c} \right) \times 10^{((\text{Peak_power_reduction} + 10)/10)}$$

Example:

For $f_c = 160$ MHz, Deviation = 1% peak from f_c ($\Delta f = 1.6$ MHz) and $f_m = 16$ kHz, the estimated peak power reduction is 10 dB.

3.6.3.3.5.5 Bandwidth Calculation (Carson's Bandwidth Rule)

Carson's bandwidth rule defines the approximate bandwidth requirements of communications system components for a carrier signal that is frequency-modulated by a continuous or broad spectrum of frequencies rather than by a single frequency.

Carson's bandwidth rule is expressed by the relation $CBR = 2 \times (f + f_m)$, where CBR is the bandwidth requirement, f is the peak frequency deviation, and f_m is the highest frequency in the modulating signal. For example, an FM signal with a 5-kHz peak deviation and a maximum audio frequency of 3 kHz requires an approximate bandwidth of $2 \times (5 + 3) = 16$ kHz.

Theoretically, any FM signal has an infinite number of sidebands and, hence, an infinite bandwidth. In practice, all significant sideband energy (98 percent or more) is concentrated within the bandwidth defined by Carson's bandwidth rule.

3.6.3.3.5.6 SSC Configuration

The configuration of the spreading feature is not mandatory when programming the DPLL. This feature is usually enabled when the DPLL clocks generate harmonics, which can potentially interfere with the GSM carrier frequencies.

Once the clock generation control registers are configured, the spreading on the clock signal can be configured as follows:

1. Calculate ModFreqDivider and DeltaMStep based on the desired peak-power reduction.
2. Configure the MODFREQDIV_EXPONENT, MODFREQDIV_MANTISSA, and DELTAMSTEP bit fields according to the calculated values.
3. Enable the spreading using the DPLL_SSC_EN bit.

NOTE: Spreading on a clock must be carefully configured to avoid adding noise on frequencies that are used by another module. For example, adding spreading on a clock to reduce noise on GSM frequencies can move the generated noise to the frequency of the memory controller and thus degrade its performance.

Example:

For $f_c = 160$ MHz, Deviation = 1% peak from f_c ($\Delta f = 1.6$ MHz) and $f_m = 16$ kHz, the estimated peak power reduction is 10 dB.

The output clock can be calculated using the following equation: $f_c = (f_{inp} \times M) / ((N + 1) \times M2)$ (where M is a software-controlled multiplier, N is a software-controlled divider, $M2$ is a software-controlled output divider, f_c stands for f_{CLKOUT_M2} ; for the calculation of other output clock frequencies and for more information, see *DPLLs Output Clocks Parameters*, and the Clock Tree Tool).

The input clock is $f_{inp} = 38.4$ MHz. The following settings of the DPLL are required to have $f_c = 160$ MHz: $M = 25$, $N = 2$, $M2 = 2$. The value of M satisfies the restrictions: $M - \Delta M \geq 20$. Also, $M + \Delta M \leq 2045$.

f_{ref} can be calculated using the following equation:

$$f_{ref} = f_{inp} / (1 + N) = 12.8 \text{ MHz}$$

ModFreqDivider can be calculated using the following equation:

$$\text{ModFreqDivider} = f_{ref} / (4 \times f_m) = 200$$

The exponent and mantissa of ModFreqDivider can now be calculated (where ModFreqDivider = Mantissa $\times 2^{\text{Exponent}}$ and it must be used as the minimal value for the exponent):

$$\text{Mantissa} = 100, \text{Exponent} = 1$$

Knowing the deviation and M , ΔM can now be calculated:

$$\Delta M / M = 1\% \geq \Delta M = 0.01 \times 25 = 0.25$$

DeltaMStep can be calculated as follows:

$$\text{DeltaMStep} = \Delta M / \text{ModFreqDivider} = 0.00125$$

The integer and fractional part of DeltaMStep can now be determined:

Integer part = 0, Fractional part = $0.00125 \times 2^{18} = 327$ (for an 18-bit fractional part)

The DPLL can be configured as follows:

- MODFREQDIV_EXPONENT = 1
- MODFREQDIV_MANTISSA = 100
- DELTAMSTEP = 327

The state of the modulation feature can be monitored with the DPLL_SSC_ACK bit of the corresponding register.

NOTE: Because this is in-band modulation for the DPLL, the modulation frequency must be within the DPLL loop bandwidth ($f_m < f_{ref}/70$). A higher modulation frequency results in less spreading in the output clock.

When deactivating the spreading (DPLL_SSC_EN = 0), the end-of-spreading is synchronous to the internal spreading cycle. Thus, there is no residual average frequency error.

3.6.3.3.6 DPLL Output Power Down

The DCO clock LDO (DCOCLKLDO) of the DPLL can be powered down if all output dividers of the DPLL are powered down. The PRCM module automatically re-enables the power to the LDO when an output divider is powered up or the DPLL switches to bypass mode.

Similarly, all the output dividers (M2, M3, and the Mn) can be powered down when their output clocks are gated and powered up when the clocks are needed again.

Table 3-45. DPLL Power-Down Control Parameters

Parameter	Description
DCO clock LDO power down control	Enable/disable automatic power-down feature if the all the output dividers are powered down.
M2, M3, and Mn (where n = 4 to 7)	Enables/disables automatic power-down feature of the corresponding output divider if the output clocks of the divider are gated.

3.6.3.3.7 DPLL Output Clock Gating

A clock gating control for DPLL output clocks allows selection between automatic clock gating and forcing the clock state. This control is done by the DPLL_CLKOUT_GATE_CTRL bit of the CM_DIV_Mn_DPLL name registers.

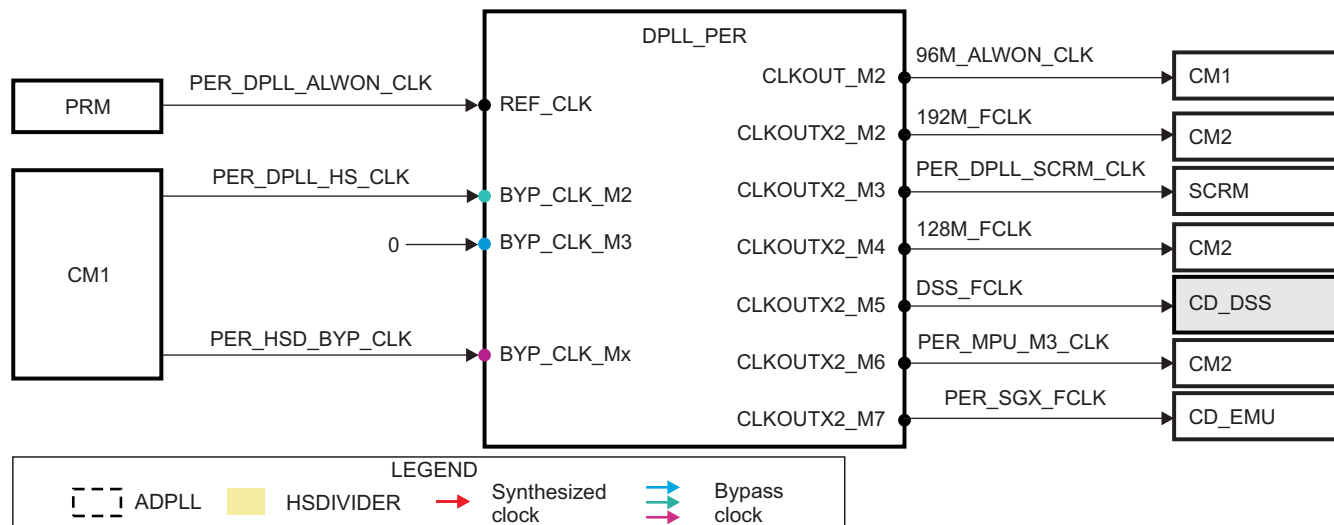

These bits are used for debug purposes. They are not required by any high-level operating system (HLOS). This does not apply to the [CM_DIV_M3_DPLL_CORE\[8\]](#) DPLL_CLKOUTHIF_GATE_CTRL and [CM_DIV_M3_DPLL_PER\[8\]](#) DPLL_CLKOUTHIF_GATE_CTRL bits. They enable the CORE_DPLL_SCRM_CLK and PER_DPLL_SCRM_CLK clocks that can be used as an SCRM auxiliary clock source.

3.6.3.4 DPLL_PER Description

3.6.3.4.1 Overview

[Figure 3-47](#) shows the overview of the DPLL. See [Section 3.6.3.3, Generic DPLL Overview](#), for a functional overview of a generic DPLL module.

Figure 3-47. DPLL_PER Overview

3.6.3.4.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identify the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Modes](#), for an explanation of the DPLL operating modes, and associated control and status features.

[Table 3-48](#) lists the operating modes supported by the DPLL.

Table 3-48. DPLL_PER Modes

Low-Power Stop	Fast-Relock Stop	MN Bypass	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available (default)	Available	Available	Available

[Table 3-49](#) lists the control bit fields for the operating mode control of the DPLL.

Table 3-49. DPLL_PER Mode Control Parameters

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_PER[10] DPLL_LP_MODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_PER[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_PER[2:0] AUTO_DPLL_MODE

3.6.3.4.4 Recalibration

Table 3-50 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See Section 3.6.3.3.4, *DPLL Recalibration*, for an explanation of the DPLL recalibration feature.

Table 3-50. DPLL_PER Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration - Enable Control	CM_CLKMODE_DPLL_PER[8] DPLL_DRIFTGUARD_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_A9[3] DPLL_PER_RECAL_ST
Recalibration - Interrupt MASK Control	PRM_IRQENABLE_MPU_A9[3] DPLL_PER_RECAL_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_M3[3] DPLL_PER_RECAL_ST
Recalibration - Interrupt MASK Control	PRM_IRQENABLE_MPU_M3[3] DPLL_PER_RECAL_EN

3.6.3.4.5 Spread Spectrum Clocking

Table 3-51 lists the control bit fields associated with the SSC features of the DPLL. See Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*, for an explanation of the DPLL SSC feature.

Table 3-51. DPLL_PER Spread-Spectrum Clocking Feature Parameters

Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_PER[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_PER[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_PER[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_PER[19:0] DELTAMSTEP
Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_PER[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_PER[6:0] MODFREQDIV_MANTISSA

3.6.3.4.6 Output Power Down

Table 3-52 lists the control bit fields for the output power down features of the DPLL. See Section 3.6.3.3.6, *DPLL Output Power-Down*, for an explanation of the DPLL output power down feature.

Table 3-52. DPLL_PER Clock Output Power-down Parameters

Parameter Name	Control/Status Bit Field
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M4_DPLL_PER[12] HSDIVIDER_CLKOUT1_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M5_DPLL_PER[12] HSDIVIDER_CLKOUT2_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M6_DPLL_PER[12] HSDIVIDER_CLKOUT3_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M7_DPLL_PER[12] HSDIVIDER_CLKOUT4_PWDN

3.6.3.4.7 DPLL_PER Preferred Settings

For SYS_CLK = 38.4 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x7), the DPLL_PER preferred settings are listed in [Table 3-53](#).

Table 3-53. DPLL_PER Preferred Settings for SYS_CLK = 38.4 MHz

3.6.3.5.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identifies the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Modes](#), for an explanation of the DPLL operating modes, and associated control and status features.

[Table 3-60](#) lists the operating modes supported by the DPLL.

Table 3-60. DPLL_CORE Modes

Low-Power Stop	Fast-Relock Stop	MN Bypass	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available (default)	Available	Available	Available

[Table 3-61](#) lists the control bit fields for the operating mode control of the DPLL.

Table 3-61. DPLL_CORE Mode Control Parameters

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_CORE[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_CORE[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_CORE[2:0] AUTO_DPLL_MODE
Low-Power Mode Control (Restore)	CM_CLKMODE_DPLL_CORE_RESTORE[10] DPLL_LPMODE_EN
Manual Mode Control (Restore)	CM_CLKMODE_DPLL_CORE_RESTORE[2:0] DPLL_EN
Auto Mode Control (Restore)	CM_AUTOIDLE_DPLL_CORE_RESTORE[2:0] AUTO_DPLL_MODE

3.6.3.5.4 Recalibration

Table 3-62 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See Section 3.6.3.3.4, *DPLL Recalibration*, for an explanation of the DPLL recalibration feature.

Table 3-62. DPLL_CORE Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration - Enable Control	CM_CLKMODE_DPLL_CORE[8] DPLL_DRIFTGUARD_EN
Recalibration - Enable Control	CM_CLKMODE_DPLL_CORE_RESTORE[8] DPLL_DRIFTGUARD_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_A9[0] DPLL_CORE_RECAL_ST
Recalibration - Interrupt mask Control	PRM_IRQENABLE_MPU_A9[0] DPLL_CORE_RECAL_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_M3[0] DPLL_CORE_RECAL_ST
Recalibration - Interrupt Mask Control	PRM_IRQENABLE_MPU_M3[0] DPLL_CORE_RECAL_EN

3.6.3.5.5 Spread Spectrum Clocking

Table 3-63 lists the control bit fields associated with the SSC features of the DPLL. See Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*, for an explanation of the DPLL SSC feature.

Table 3-63. DPLL_CORE Spread-Spectrum Clocking Feature Parameters

Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_CORE[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_CORE[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_CORE[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_CORE[19:0] DELTAMSTEP
Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_CORE[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_CORE[6:0] MODFREQDIV_MANTISSA
Restore Modulation Step Size setting	CM_SSC_DELTAMSTEP_DPLL_CORE_RESTORE[19:0] DELTAMSTEP
Restore Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_CORE_RESTORE[10:8] MODFREQDIV_EXPONENT
Restore Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_CORE_RESTORE[6:0] MODFREQDIV_MANTISSA
Restore SSC Downspread	CM_CLKMODE_DPLL_CORE_RESTORE[14] DPLL_SSC_DOWNSPREAD
Restore SSC Acknowledge	CM_CLKMODE_DPLL_CORE_RESTORE[13] DPLL_SSC_ACK
Restore SSC Enable Control	CM_CLKMODE_DPLL_CORE_RESTORE[12] DPLL_SSC_EN

3.6.3.5.6 Output Power-Down

Table 3-64 lists the control bit fields for the output power down features of the DPLL. See Section 3.6.3.3.6, *DPLL Output Power Down*, for an explanation of the DPLL output power-down feature.

Table 3-64. DPLL_CORE Clock Output Power-Down Parameters

Parameter Name	Control/Status Bit Field
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M4_DPLL_CORE [12] HSDIVIDER_CLKOUT1_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M5_DPLL_CORE [12] HSDIVIDER_CLKOUT2_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M6_DPLL_CORE [12] HSDIVIDER_CLKOUT3_PWDN
Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M7_DPLL_CORE [12] HSDIVIDER_CLKOUT4_PWDN
Restore Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M4_DPLL_CORE_RESTORE [12] HSDIVIDER_CLKOUT1_PWDN
Restore Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M5_DPLL_CORE_RESTORE [12] HSDIVIDER_CLKOUT2_PWDN
Restore Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M6_DPLL_CORE_RESTORE [12] HSDIVIDER_CLKOUT3_PWDN
Restore Clock Divider - HSDIVIDER-Power Down Control	CM_DIV_M7_DPLL_CORE_RESTORE [12] HSDIVIDER_CLKOUT4_PWDN

3.6.3.5.7 DPLL_CORE Preferred Settings

For SYS_CLK = 38.4 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x7), the DPLL_CORE preferred settings are listed in [Table 3-65](#).

Table 3-65. DPLL_CORE Preferred Settings for SYS_CLK = 38.4 MHz

3.6.3.6 DPLL_ABE Description

3.6.3.6.1 Overview

Figure 3-49 shows the overview of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for a functional overview of a generic DPLL module.

Figure 3-49. DPLL_ABE Overview

prcm-044

3.6.3.6.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See Section 3.6.3.3, *Generic DPLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-70 lists the clock synthesis parameters of the DPLL.

Table 3-70. DPLL_ABE Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_ABE[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_ABE[6:0] DPLL_DIV

Table 3-71 lists the clock output divider parameters of the DPLL.

Table 3-71. DPLL_ABE Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_ABE[9] ST_DPLL_CLKOUT
CLKOUT_M2	Gating Control	CM_DIV_M2_DPLL_ABE[8] DPLL_CLKOUT_GATE_CTRL
CLKOUT_M2	Divider Acknowledge	CM_DIV_M2_DPLL_ABE[5] DPLL_CLKOUT_DIVCHACK
CLKOUTX2_M2	Status	CM_DIV_M2_DPLL_ABE[11] ST_DPLL_CLKOUTX2
CLKOUTX2_M2	Gating Control	CM_DIV_M2_DPLL_ABE[10] DPLL_CLKOUTX2_GATE_CTRL
CLKOUT_M2	Divider Control	CM_DIV_M2_DPLL_ABE[4:0] DPLL_CLKOUT_DIV
CLKOUTX2_M3	Status	CM_DIV_M3_DPLL_ABE[9] ST_DPLL_CLKOUTHIF
CLKOUTX2_M3	Gating Control	CM_DIV_M3_DPLL_ABE[8] DPLL_CLKOUTHIF_GATE_CTRL
CLKOUTX2_M3	Divider Acknowledge	CM_DIV_M3_DPLL_ABE[5] DPLL_CLKOUTHIF_DIVCHACK

Table 3-71. DPLL_ABE Clock Output Parameters (continued)

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUTX2_M3	Divider Control	CM_DIV_M3_DPLL_ABE[4:0] DPLL_CLKOUTHIF_DIV

3.6.3.6.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identify the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Mode](#), for an explanation of the DPLL operating modes, and associated control and status features.

[Table 3-72](#) lists the operating modes supported by the DPLL.

Table 3-72. DPLL_ABE Modes

Low-Power Stop	Fast-Relock Stop	MN Bypass	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available (Default)	Available	Available	Available

[Table 3-73](#) lists the control bit fields for the operating mode control of the DPLL.

Table 3-73. DPLL_ABE Mode Control Parameters

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_ABE[10] DPLL_LP_MODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_ABE[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_ABE[2:0] AUTO_DPLL_MODE

3.6.3.6.4 Recalibration

[Table 3-74](#) lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See [Section 3.6.3.3.4, DPLL Recalibration](#), for an explanation of the DPLL recalibration feature.

Table 3-74. DPLL_ABE Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration - Enable Control	CM_CLKMODE_DPLL_ABE[8] DPLL_DRIFTGUARD_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_A9[4] DPLL_ABE_RECAL_ST
Recalibration - Interrupt Mask Control	PRM_IRQENABLE_MPU_A9[4] DPLL_ABE_RECAL_EN

3.6.3.6.5 Spread Spectrum Clocking

[Table 3-75](#) lists the control bit fields associated with the SSC features of the DPLL. See [Section 3.6.3.3.5, DPLL Spread Spectrum Clocking](#), for an explanation of the DPLL SSC feature.

Table 3-75. DPLL_ABE Spread-Spectrum Clocking Feature Parameters

Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_ABE[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_ABE[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_ABE[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_ABE[19:0] DELTAMSTEP
Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_ABE[10:8] MODFREQDIV_EXPONENT

Table 3-75. DPLL_ABE Spread-Spectrum Clocking Feature Parameters (continued)

Parameter Name	Control Bit Field
Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_ABE[6:0] MODFREQDIV_MANTISSA

3.6.3.6.6 DPLL_ABE Preferred Settings

NOTE: Because the preferred settings for DPLL_ABE are actual for the SYS_32K (32.768KHz) clock as the clock input, the register [CM_CLKMODE_DPLL_ABE\[11\]](#) DPLL_REGM4XEN is set to 0x1.

For SYS_CLK = 38.4 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x7), the DPLL_ABE preferred settings are listed in [Table 3-76](#).

Table 3-76. DPLL_ABE Preferred Settings for SYS_CLK = 38.4 MHz

IVA OPPs	ABE DPLL			ABE Clocks				
	OPPs	DPLL Locked Freq (MHz)	M	N	M2	DPLL_ABE_X2_CLK Actual Freq (MHz) – M2X2 o/p	M3	CORE_DPLL_HS_CLK Actual Freq (MHz)
OPP_NTSB		196.6	750	0	1	196.6	1	196.6
OPP_NITRO		196.6	750	0	1	196.6	1	196.6

Divider EOC_P_MA_ICLK	CM_MPU_MPU_CLKCTRL[24] CLKSEL_EMIF_DIV_MODE

NOTE: For more information about setting the [CM_MPU_MPU_CLKCTRL\[24\]](#) CLKSEL_EMIF_DIV_MODE and [CM_MPU_MPU_CLKCTRL\[25\]](#) CLKSEL_ABE_DIV_MODE bits, see the *Data Manual Operating Condition Addendum*.

3.6.3.7.2 Tactical Clocking Adjustment

[Figure 3-50](#) includes the clocking adjustment scheme for DPLL_MPU. To obtain MPU_DPLL_CLK frequency higher than 1 GHz, the CLKOUTX2_M3 output is used instead of the CLKOUT_M2 output. The M3 output divider is hardwired to value 1 and a duty cycle correction circuit (DCC) is used to recover a correct duty cycle (48–52 percent maximum). The [CM_CLKSEL_DPLL_MPU\[22\]](#) DCC_EN bit must be set for DPLL_MPU for the DCC to be used.

There is a subsequent clock gating element after the DCC instance. The selection between CLKOUT_M2 and CLKOUTX2_M3 source clock is performed in a glitch-free manner using an OR gate and non-overlapping input clock technique. Additional FSM is added into the CM1 to control the clock switching sequence. The FSM includes a counter for a clock ramp step (configured by the [CM_CLKSEL_DPLL_MPU\[31:24\]](#) DCC_COUNT_MAX bit field) during which the output frequency is $F_{dpll}/(2 \cdot M2)$. This clock ramp step is used for two purposes:

- Allows enough time for DCC to lock (2.5 μ s)
- Eventually avoids a transient load issue on the power IC by programming a bigger value (up to 81.6 μ s)

Principles:

- When operating below 1GHz, DCC_EN = 0, the DCC FSM is transparent and the CLKOUTX2_M3 gating element and the gating element after the DCC instance are off.
- When operating at or above 1GHz, DCC_EN = 1:
 - CLKOUT_M2 is ungated as soon as the MPU clock is requested. The two other gating elements are off.
 - CLKOUTX2_M3 is ungated as soon as the DPLL is locked and the FSM starts the counter.
 - When the counter ends, CLKOUT_M2 is gated, and the DCC clock output is ungated with an assured 10-ns minimal nonoverlap time.
 - In case MPU clock is no longer requested, the DCC clock output is gated, and then the CLKOUTX2_M3 is gated.

CAUTION

A direct transition from a locked mode with DCC_EN=1 to a manual bypass mode is not allowed, because DPLL CLKOUTX2_M3 output does not support bypass mode. An intermediate state, with DCC_EN=0 and DPLL locked, must be programmed between these modes.

3.6.3.7.3 Synthesized Clock Parameters

This section describes the clock synthesis and clock out divider parameters of the DPLL. See [Section 3.6.3.3, Generic DPLL Overview](#), for an explanation of the clock synthesis and output divider parameters of the DPLL module.

[Table 3-82](#) lists the clock synthesis parameters of the DPLL.

Table 3-82. DPLL_MPU Clock Synthesis Parameters

Parameter Name	Control Bit Field
M	CM_CLKSEL_DPLL_MPU[18:8] DPLL_MULT
N	CM_CLKSEL_DPLL_MPU[6:0] DPLL_DIV

Table 3-83 lists the clock output divider parameters of the DPLL.

Table 3-83. DPLL_MPU Clock Output Parameters

Clock Output/Divider	Parameter Name	Control/Status Bit Field
CLKOUT_M2	Status	CM_DIV_M2_DPLL_MPU[9] ST_DPLL_CLKOUT
CLKOUT_M2	Gating Control	CM_DIV_M2_DPLL_MPU[8] DPLL_CLKOUT_GATE_CTRL
CLKOUT_M2	Divider Acknowledge	CM_DIV_M2_DPLL_MPU[5] DPLL_CLKOUT_DIVCHACK
CLKOUT_M2	Divider Control	CM_DIV_M2_DPLL_MPU[4:0] DPLL_CLKOUT_DIV

3.6.3.7.4 Power Modes

This section identifies the operating modes supported by the DPLL and also identify the control bit fields to set its operating modes. See Section 3.6.3.3.2, *Enable Control, Status and Low-Power Operation Mode*, and Section 3.6.3.3.3, *DPLL Power Modes*, for an explanation of the DPLL operating modes and associated control and status features.

Table 3-84 lists the operating modes supported by the DPLL.

Table 3-84. DPLL_MPU Modes

Low-Power Stop	Fast-Relock Stop	MN Bypass	Low-Power Bypass	Fast-Relock Bypass	Lock
Not available	Not available	Available (Default)	Available	Available	Available

Table 3-85 lists the control bit fields for the operating mode control of the DPLL.

Table 3-85. DPLL_MPU Mode Control Parameters

Parameter Name	Control Bit Field
Low-Power Mode Control	CM_CLKMODE_DPLL_MPU[10] DPLL_LPMODE_EN
Manual Mode Control	CM_CLKMODE_DPLL_MPU[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_MPU[2:0] AUTO_DPLL_MODE

3.6.3.7.5 Recalibration

Table 3-86 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See Section 3.6.3.3.4, *DPLL Recalibration*, for an explanation of the DPLL recalibration feature.

Table 3-86. DPLL_MPU Recalibration Feature Parameters

Parameter Name	Control/Status Bit Field
Recalibration - Enable Control	CM_CLKMODE_DPLL_MPU[8] DPLL_DRIFTGUARD_EN
Recalibration - Interrupt Status	PRM_IRQSTATUS_MPU_A9[1] DPLL_MPU_RECAL_ST
Recalibration - Interrupt Mask Control	PRM_IRQENABLE_MPU_A9[1] DPLL_MPU_RECAL_EN

3.6.3.7.6 Spread Spectrum Clocking

Table 3-87 lists the control bit fields associated with the SSC features of the DPLL. See Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*, for an explanation of the DPLL SSC feature.

Table 3-87. DPLL_MPU Spread-Spectrum Clocking Feature Parameters

Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_MPU[14] DPLL_SSC_DOWNSPREAD
SSC Acknowledge	CM_CLKMODE_DPLL_MPU[13] DPLL_SSC_ACK
SSC Enable Control	CM_CLKMODE_DPLL_MPU[12] DPLL_SSC_EN
Modulation Step Size Setting	CM_SSC_DELTAMSTEP_DPLL_MPU[19:0] DELTAMSTEP
Modulation Frequency Divider - Exponent	CM_SSC_MODFREQDIV_DPLL_MPU[10:8] MODFREQDIV_EXPONENT
Modulation Frequency Divider - Mantissa	CM_SSC_MODFREQDIV_DPLL_MPU[6:0] MODFREQDIV_MANTISSA

3.6.3.7.7 DPLL_MPU Preferred Settings

For SYS_CLK = 38.4 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x7), the DPLL_MPU preferred settings are listed in [Table 3-88](#).

Table 3-88. DPLL_MPU Preferred Settings for SYS_CLK = 38.4 MHz

MPU OPPs	MPU DPLL			MPU			
OPPs	DPLL Locked Freq (MHz)	M	N	M2		M3	MPU_DPLL_CLK Actual Freq (MHz)
OPP_NTSB	1497.6	39	1		Use M3 output + Duty Cycle Correction	1	1497.6

CLKOUT_M2	Divider Control	CM_DIV_M2_DPLL_USB[6:0] DPLL_CLKOUT_DIV

3.6.3.9.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identifies the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Modes](#), for an explanation of the DPLL operating modes, and associated control and status features.

[Table 3-107](#) lists the operating modes supported by the DPLL.

Table 3-107. DPLL_USB Modes

Low-Power Stop	Fast-Relock Stop	MN Bypass	Low-Power Bypass	Fast-Relock Bypass	Lock
Available	Not available	Available (Default)	Available	Not available	Available

NOTE: It is prohibited to program USB DPLL automatic idle mode with a PD_L3_INIT low power state equal to OFF.

Moreover, USB DPLL programming can be done only when PD_L3_INIT power domain is ON.

[Table 3-108](#) lists the control bit fields for the operating mode control of the DPLL.

Table 3-108. DPLL_USB Mode Control Parameters

Parameter Name	Control Bit Field
Manual Mode Control	CM_CLKMODE_DPLL_USB[2:0] DPLL_EN
Auto Mode Control	CM_AUTOIDLE_DPLL_USB[2:0] AUTO_DPLL_MODE

3.6.3.9.4 Spread Spectrum Clocking

[Table 3-109](#) lists the control bit fields associated with the SSC features of the DPLL. See [Section 3.6.3.3.5, DPLL Spread Spectrum Clocking](#), for an explanation of the DPLL SSC feature.

Table 3-109. DPLL_USB Spread-Spectrum Clocking Feature Parameters

Parameter Name	Control Bit Field
SSC Downspread	CM_CLKMODE_DPLL_USB[14] DPLL_SSC_DOWNSPREAD

OPP50	960	400	4	2	480, 0

3.6.3.10 DPLLs Cascading

To reduce the device power consumption in certain low-power use cases of the device, the DPLLs in the device can be cascaded so that functional clock to a power domain is provided by a DPLL upstream without locking the DPLL associated with the domain. In such a case, the unlocked DPLLs can be kept in the low-power bypass mode shows the scheme for cascading DPLLs.

Figure 3-53 shows a generic scheme for cascading DPLLs.

Figure 3-53. DPLLs Cascading Overview

prcm-049

The sequence of enabling the DPLL cascading is given below:

1. DPLL_ABE is locked by software request. Other DPLLs down stream must not be moved to bypass mode before DPLL_ABE is locked. This ensures that the output clocks of these DPLLs are not stopped when they switch to the DPLL_ABE output clock.
2. Internal EMIF shadow registers are set to take PHY clock and DLL reference clock derived from DPLL_ABE.
3. Bypass paths for DPLL_IVA is set up by configuring the programmable dividers in CM1 responsible for providing the bypass clock. The setting is based upon the OPP requirements.
4. DPLL_IVA is put into bypass mode by software (any of the bypass mode is allowed) and the output of the DPLL, if already enabled, switches from locked clock to bypass clock from DPLL_CORE
5. DPLL_PER is put into bypass mode as well by software, if required. The outputs of the DPLL, if enabled, switch to the divided clock of DPLL_ABE CLKOUTX2_M3.
6. DPLL_CORE is set in bypass mode by configuring the bypass clocks input mux and the [CM_SHADOW_FREQ_CONFIG1\[10:8\]](#) DPLL_CORE_DPLL_EN bit field to a bypass mode in the DVFS shadow register in CM1 and setting [CM_SHADOW_FREQ_CONFIG1\[0\]](#) FREQ_UPDATE = 1 by software. This step triggers the handshake with EMIF to safely unlock the DPLL and move the output clock of DPLL_CORE to CORE_DPLL_HS_CLK. Ensure that the CORE_CLK divider in CM1 is correctly programmed to handle the OPP needs of the CORE power domain before this step.
7. Software can then switch the L4_WKUP interface clock from SYS_CLK to ABE_LP_CLK to allow for deasserting of the SYS_CLK request line to SCRM, if SYS_CLK is not requested by any other

dependency.

The sequence of disabling the DPLL cascading is given below:

1. Software switches the L4_WKUP interface clock from ABE_LP_CLK to SYS_CLK requesting the restart of SYS_CLK by the SCRM, if not already present.
2. Software programs the EMIF internal shadow registers to prepare the switchback of EMIF interface from using DPLL_ABE clock to DPLL_CORE clock.
3. DPLL_IVA bypass path is correctly set for the targeted DPLL_CORE frequency by programming the bypass dividers for the DPLL in CM1.
4. DPLL_CORE is relocked using the DVFS shadow register in CM1. The PRCM module ensures that this step is executed with proper handshake with EMIF to allow for a frequency update on the EMIF interface.
5. Other DPLLs are locked as well if required, to fully exit from the DPLL cascading mode.
6. DPLL_ABE might be forced into STOPMODE or bypass mode by software or may enter one of the auto modes if so programmed.

3.6.4 CD_WKUP Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.1 Overview

Figure 3-54 shows the overview of the clock domain.

Figure 3-54. CD_WKUP Overview

prcm-050

3.6.4.2 Clock Domain Modes

Table 3-115 lists the clock domain modes supported by the clock domain.

Table 3-115. CD_WKUP Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-116 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-116. CD_WKUP Control and Status Parameters

Parameter Name	Control/Status Bit Field
ABE_LP_CLK clock status	CM_WKUP_CLKSTCTRL[9] CLKACTIVITY_ABE_LP_CLK
WKUP_L4_ICLK2 clock status	CM_WKUP_CLKSTCTRL[12] CLKACTIVITY_WKUP_L4_ICLK2
SYS_CLK clock status	CM_WKUP_CLKSTCTRL[8] CLKACTIVITY_SYS_CLK
WKUP_32K_FCLK clock status	CM_WKUP_CLKSTCTRL[11] CLKACTIVITY_WKUP_32K_FCLK
Clock Domain State Transition Control	CM_WKUP_CLKSTCTRL[1:0] CLKTRCTRL

3.6.4.3 Clock Domain Dependency

CD_WKUP has no static dependency or dynamic dependency with any other clock domain of the device.

3.6.4.3.1 Wake-Up Dependency

Table 3-117 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-117. CD_WKUP Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
GPIO1	CD_WKUP	CD_DSP	Always enabled	PM_WKUP_GPIO1_WKDEP[6] WKUPDEP_GPIO1_IRQ2_DSP	Read only
GPIO1	CD_WKUP	CD_CORTEXM3	Disabled	PM_WKUP_GPIO1_WKDEP[1] WKUPDEP_GPIO1_IRQ1_MPU_M3	Read/Write
GPIO1	CD_WKUP	CD_CORTEXA9	Disabled	PM_WKUP_GPIO1_WKDEP[0] WKUPDEP_GPIO1_IRQ1_MPU	Read/Write
KEYBOARD	CD_WKUP	CD_CORTEXA9	Always enabled	PM_WKUP_KEYBOARD_WKDEP[0] WKUPDEP_KEYBOARD_MPU	Read only
GPTIMER1	CD_WKUP	CD_CORTEXA9	Always enabled	PM_WKUP_GPTIMER1_WKDEP[0] WKUPDEP_TIMER1_MPU	Read only
WDTIMER2	CD_WKUP	CD_CORTEXM3	Disabled	PM_WKUP_WDTIMER2_WKDEP[1] WKUPDEP_WDT2_MPU_M3	Read/Write
WDTIMER2	CD_WKUP	CD_CORTEXA9	Disabled	PM_WKUP_WDTIMER2_WKDEP[0] WKUPDEP_WDT2_MPU	Read/Write

3.6.4.4 Clock Domain Module Attributes

Table 3-118 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-118. CD_WKUP Modules Clocks Association

Module	Clock	Clock Type
SYSCTRL_PADCONF_WKUP	WKUP_L4_ICLK2	Functional
BANDGAP	WKUP_TS_FCLK	Functional
SYSCTRL_GENERAL_WKUP	WKUP_L4_ICLK2	Functional
GPIO1	WKUP_L4_ICLK2	Interface
	WKUP_32K_FCLK	Functional
Keyboard	WKUP_L4_ICLK2	Interface
	WKUP_32K_FCLK	Functional
SAR_RAM	WKUP_L4_ICLK2	Interface
32KTIMER	32K_FCLK	Functional
	WKUP_L4_ICLK2	Interface

L4_WKUP interconnect	N/A	Available	N/A	CM_WKUP_L4WKUP_CLKCTRL[1:0] MODULEMODE	Read only

3.6.5 CD_DSP Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.5.1 Overview

[Figure 3-55](#) shows the overview of the clock domain.

Figure 3-55. CD_DSP Overview

3.6.5.2 Clock Domain Modes

Table 3-122 lists the clock domain modes supported by the clock domain.

Table 3-122. CD_DSP Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-123 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-123. CD_DSP Control and Status Parameters

Parameter Name	Control/Status Bit Field
DSP_ROOT_CLK clock status	CM_DSP_CLKSTCTRL[8] CLKACTIVITY_DSP_ROOT_CLK
Clock Domain State Transition Control	CM_DSP_CLKSTCTRL[1:0] CLKTRCTRL

3.6.5.3 Clock Domain Dependency

CD_DSP has no module wake-up dependency with any other clock domain of the device.

3.6.5.3.1 Static Dependency

Table 3-124 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-124. CD_DSP Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_DSP_STATICDEP[3] ABE_STATDEP	Read/Write
CD_CAM	Always disabled	CM_DSP_STATICDEP[9] ISS_STATDEP	Read only
CD_IVAHD	Disabled	CM_DSP_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Disabled	CM_DSP_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Disabled	CM_DSP_STATICDEP[6] L3_2_STATDEP	Read/Write

Table 3-124. CD_DSP Static Dependency Association Parameters (continued)

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_INIT	Disabled	CM_DSP_STATICDEP[7] L3INIT_STATDEP	Read/Write
CD_L4_CFG	Disabled	CM_DSP_STATICDEP[12] L4CFG_STATDEP	Read/Write
CD_L4_PER	Disabled	CM_DSP_STATICDEP[13] L4PER_STATDEP	Read/Write
CD_EMIF	Disabled	CM_DSP_STATICDEP[4] MEMIF_STATDEP	Read/Write

3.6.5.3.2 Dynamic Dependency

Table 3-125 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-125. CD_DSP Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Always enabled	CM_DSP_DYNAMICDEP[3] ABE_DYNDEP	Read only
CD_IVAHD	Always enabled	CM_DSP_DYNAMICDEP[2] IVAHD_DYNDEP	Read only
CD_L3_1	Always enabled	CM_DSP_DYNAMICDEP[5] L3_1_DYNDEP	Read only

3.6.5.4 Clock Domain Module Attributes

Table 3-126 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-126. CD_DSP Modules Clocks Association

Module	Clock	Clock Type
DSP	DSP_ROOT_CLK	Interface and functional

Table 3-127 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-127. CD_DSP Modules Wake-Up Request

Module	Wake-Up Feature
DSP	Master wake-up request

Table 3-128 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-128. CD_DSP Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
DSP	Master/Slave	CM_DSP_DSP_CLKCTRL[18] STBYST	Standby status

DSP	Available	Available	N/A	CM_DSP_DSP_CL KCTRL[1:0] MODULEMODE	Read/Write

3.6.6 CD_STD_EFUSE Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.6.1 Overview

Figure 3-56 shows the overview of the clock domain.

Figure 3-56. CD_STD_EFUSE Overview

CD_STD_EFUSE is hardware-controlled by the PRCM module and has no software control or status bit fields. Similarly, it has no static, dynamic and wake-up dependency with respect to other clock domains of the device

3.6.6.2 Clock Domain Module Attributes

The STD_EFUSE module of the clock domain is automatically controlled by the PRCM module hardware and has no software configurable module mode control or status bit fields.

Table 3-130 identifies for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-130. CD_STD_EFUSE Modules Clocks Association

Module	Clock	Clock Type
STD_EFUSE	STDEFUSE_SYS_CLK	Functional

Table 3-131 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-131. CD_STD_EFUSE Modules Wake-Up Request

Module	Wake-Up Feature
STD_EFUSE	None

3.6.7 CD_CORTEXA9 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.7.1 Overview

Figure 3-57 shows the overview of the clock domain.

Figure 3-57. CD_CORTEXA9 Overview

3.6.7.2 Clock Domain Modes

Table 3-132 lists the clock domain modes supported by the clock domain.

Table 3-132. CD_CORTEXA9 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-133 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-133. CD_CORTEXA9 Control and Status Parameters

Parameter Name	Control/Status Bit Field
MPU_DPLL_CLK clock status	CM_MPU_CLKSTCTRL[9] CLKACTIVITY_MPU_DPLL_CLK
Clock Domain State Transition Control	CM_MPU_CLKSTCTRL[1:0] CLKTRCTRL

3.6.7.3 Clock Domain Dependency

CD_CORTEXA9 has no module wake-up dependency with any other clock domain of the device.

3.6.7.3.1 Static Dependency

Table 3-134 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-134. CD_CORTEXA9 Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_MPU_STATICDEP[3] ABE_STATDEP	Read/Write
CD_DSS	Disabled	CM_MPU_STATICDEP[8] DSS_STATDEP	Read/Write

UART3	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional
UART4	PER_L4_ICLK	Interface
	PER_48M_FCLK	Functional

Table 3-145 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-145. CD_L4_PER Modules Wake-Up Request

Module	Wake-Up Feature
GPTIMER10	Slave wake-up request (MPU_A9 -IRQ)
GPTIMER11	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
GPTIMER2	Slave wake-up request (MPU_A9 -IRQ)
GPTIMER3	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
GPTIMER4	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
GPTIMER9	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
ELM	None
GPIO2	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ)
GPIO3	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)

Table 3-145. CD_L4_PER Modules Wake-Up Request (continued)

Module	Wake-Up Feature
GPIO4	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)
GPIO5	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)
GPIO6	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ)
HDQ	None
I2C1	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
I2C2	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
I2C3	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
I2C4	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
L4_PER interconnect	None
MCBSP4	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
MCSPI1	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ, sDMA -DMA)
MCSPI2	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
MCSPI3	Slave wake-up request (MPU_A9 -IRQ, sDMA -DMA)
MCSPI4	Slave wake-up request (MPU_A9 -IRQ, sDMA -DMA)
HSMMC3	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
HSMMC4	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
HSMMC5	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, sDMA -DMA)
SLIMBUS2	Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
UART1	Slave wake-up request (MPU_A9 -IRQ, sDMA -DMA)
UART2	Slave wake-up request (MPU_A9 -IRQ, sDMA -DMA)
UART3	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ and DMA, sDMA -DMA)
UART4	Slave wake-up request (MPU_A9 -IRQ, sDMA -DMA)

Table 3-146 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-146. CD_L4_PER Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
GPTIMER10	Slave	CM_L4PER_GPTIMER10_CLK_CTRL[17:16] IDLEST	Idle status
GPTIMER11	Slave	CM_L4PER_GPTIMER11_CLK_CTRL[17:16] IDLEST	Idle status
GPTIMER2	Slave	CM_L4PER_GPTIMER2_CLK_CTRL[17:16] IDLEST	Idle status
GPTIMER3	Slave	CM_L4PER_GPTIMER3_CLK_CTRL[17:16] IDLEST	Idle status
GPTIMER4	Slave	CM_L4PER_GPTIMER4_CLK_CTRL[17:16] IDLEST	Idle status
GPTIMER9	Slave	CM_L4PER_GPTIMER9_CLK_CTRL[17:16] IDLEST	Idle status

Table 3-146. CD_L4_PER Modules Clock-Management Modes and Control (continued)

Module	Clock-Management Protocol	Status Bit Field	Role
ELM	Slave	CM_L4PER_ELM_CLKCTRL [17:16] IDLEST	Idle status
GPIO2	Slave	CM_L4PER_GPIO2_CLKCTRL [17:16] IDLEST	Idle status

UART1	Available	N/A	Available	CM_L4PER_UART1_CLKCTRL[1:0] MODULEMODE	Read/Write
UART2	Available	N/A	Available	CM_L4PER_UART2_CLKCTRL[1:0] MODULEMODE	Read/Write
UART3	Available	N/A	Available	CM_L4PER_UART3_CLKCTRL[1:0] MODULEMODE	Read/Write
UART4	Available	N/A	Available	CM_L4PER_UART4_CLKCTRL[1:0] MODULEMODE	Read/Write

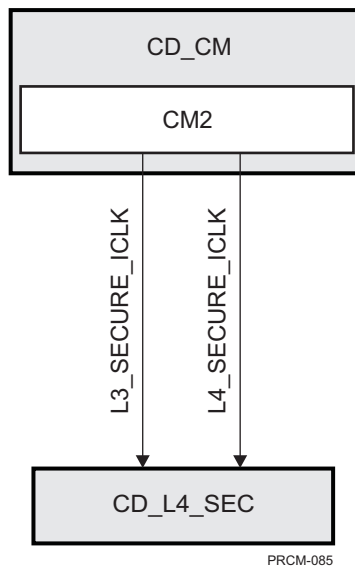

3.6.9 CD_L4_SEC Clock Domain

This section identifies the modes supported by the clock domain, the associated control, and status bits. It also identifies its dependencies upon other clock domains of the device.

3.6.9.1 Overview

Figure 3-59 shows the overview of the clock domain.

Figure 3-59. CD_L4_SEC Overview

3.6.9.2 Clock Domain Modes

Table 3-148 lists the clock domain modes supported by the clock domain.

Table 3-148. CD_L4_SEC Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-149 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-149. CD_L4_SEC Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3_SECURE_ICLK clock status	CM_L4SEC_CLKSTCTRL[8] CLKACTIVITY_L3_SECURE_GICLK
L4_SECURE_ICLK clock status	CM_L4SEC_CLKSTCTRL[9] CLKACTIVITY_L4_SECURE_GICLK
Clock Domain State Transition Control	CM_L4SEC_CLKSTCTRL[1:0] CLKTRCTRL

3.6.9.3 Clock Domain Dependency

CD_L4_SEC has no module wake-up dependency with any other clock domain of the device.

3.6.9.3.1 Static Dependency

Table 3-150 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-150. CD_L4_SEC Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4_PER	Disabled	CM_L4SEC_STATICDEP[13] L4PER_STATDEP	Read/Write
CD_L3_2	Always enabled	CM_L4SEC_STATICDEP[6] L3_2_STATDEP	Read only
CD_L3_1	Disabled	CM_L4SEC_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_EMIF	Disabled	CM_L4SEC_STATICDEP[4] MEMIF_STATDEP	Read/Write

3.6.9.3.2 Dynamic Dependency

Table 3-151 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-151. CD_L4_SEC Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_2	Always disabled	CM_L4SEC_DYNAMICDEP[6] L3_2_DYNDEP	Read only

3.6.9.4 Clock Domain Module Attributes

Table 3-152 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-152. CD_L4_SEC Modules Clocks Association

Module	Clock	Clock Type
AES1	L3_SECURE_ICLK	Interface and Functional
AES2	L3_SECURE_ICLK	Interface and Functional
SHA2MD5	L3_SECURE_ICLK	Interface and Functional
CryptoDMA	L3_SECURE_ICLK	Interface and Functional
	L4_SECURE_ICLK	Interface
DES3DES	L4_SECURE_ICLK	Interface and Functional
RNG	L4_SECURE_ICLK	Interface
FPKA	L4_SECURE_ICLK	Interface and Functional

Table 3-153 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-153. CD_L4_SEC Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
AES1	Slave	CM_L4SEC_AES1_CLKCTRL[17:16] IDLEST	Idle status
AES2	Slave	CM_L4SEC_AES2_CLKCTRL[17:16] IDLEST	Idle status
SHA2MD5	Slave	CM_L4SEC_SHA2MD5_CLKCTRL[17:16] IDLEST	Idle status
CryptoDMA	Master/Slave	CM_L4SEC_CRYPTODMA_CLKCTRL[18] STBYST	Standby status
		CM_L4SEC_CRYPTODMA_CLKCTRL[17:16] IDLEST	Idle status
DES3DES	Slave	CM_L4SEC_DES3DES_CLKCTRL[17:16] IDLEST	Idle status
RNG	Slave	CM_L4SEC_RNG_CLKCTRL[17:16] IDLEST	Idle status
FPKA	Slave	CM_L4SEC_PKA_CLKCTRL[17:16] IDLEST	Idle status

Table 3-154 lists the supported slave clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-154. CD_L4_SEC Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
AES1	Available	N/A	Available	CM_L4SEC_AES1_CLKCTRL[1:0] MODULEMODE	Read/Write
AES2	Available	N/A	Available	CM_L4SEC_AES2_CLKCTRL[1:0] MODULEMODE	Read/Write
SHA2MD5	Available	N/A	Available	CM_L4SEC_SHA2MD5_CLKCTRL[1:0] MODULEMODE	Read/Write
CryptoDMA	N/A	Available	N/A	CM_L4SEC_CRYPTODMA_CLKCTRL[1:0] MODULEMODE	Read only
DES3DES	Available	N/A	Available	CM_L4SEC_DES3DES_CLKCTRL[1:0] MODULEMODE	Read/Write
RNG	Available	Available	N/A	CM_L4SEC_RNG_CLKCTRL[1:0] MODULEMODE	Read/Write
FPKA	Available	N/A	Available	CM_L4SEC_PKA_CLKCTRL[1:0] MODULEMODE	Read/Write

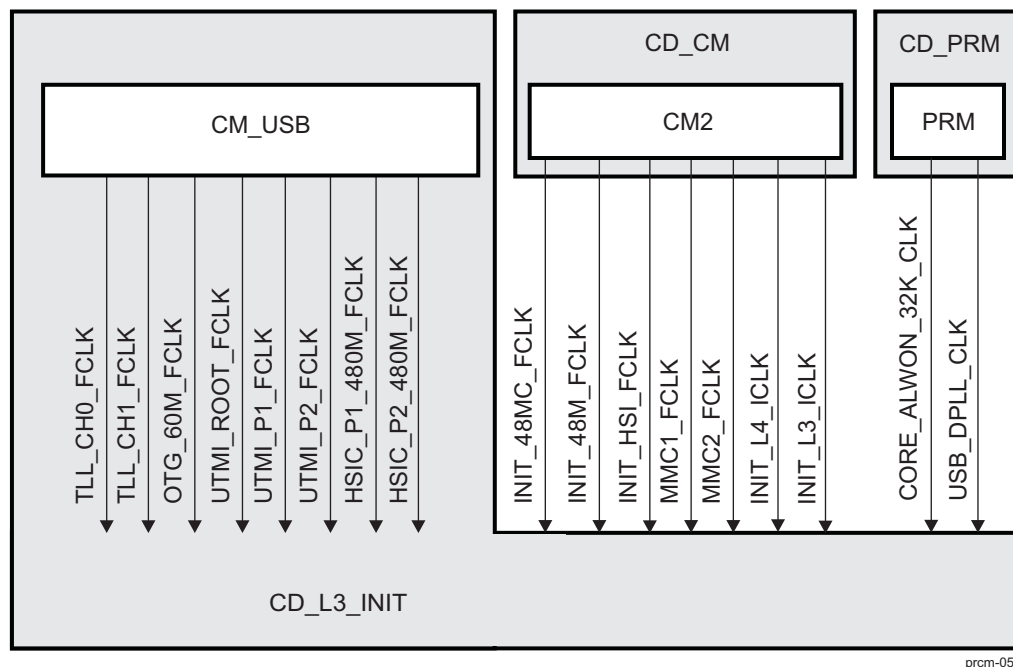

3.6.10 CD_L3_INIT Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.10.1 Overview

Figure 3-60 shows the overview of the clock domain.

Figure 3-60. CD_L3_INIT Overview

3.6.10.2 Clock Domain Modes

Table 3-155 lists the clock domain modes supported by the clock domain.

Table 3-155. CD_L3_INIT Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-156 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-156. CD_L3_INIT Control and Status Parameters

Parameter Name	Control/Status Bit Field
HSIC_P1_480M_FCLK clock status	CM_L3INIT_CLKSTCTRL[20] CLKACTIVITY_HSIC_P1_480M_FCLK
HSIC_P1_FCLK clock status	CM_L3INIT_CLKSTCTRL[26] CLKACTIVITY_HSIC_P1_FCLK
HSIC_P2_480M_FCLK clock status	CM_L3INIT_CLKSTCTRL[21] CLKACTIVITY_HSIC_P2_480M_FCLK
HSIC_P2_FCLK clock status	CM_L3INIT_CLKSTCTRL[27] CLKACTIVITY_HSIC_P2_FCLK
INIT_48MC_FCLK clock status	CM_L3INIT_CLKSTCTRL[12] CLKACTIVITY_INIT_48MC_FCLK
INIT_48M_FCLK clock status	CM_L3INIT_CLKSTCTRL[13] CLKACTIVITY_INIT_48M_FCLK
INIT_60M_P1_FCLK clock status	CM_L3INIT_CLKSTCTRL[28] CLKACTIVITY_INIT_60M_P1_FCLK
INIT_60M_P2_FCLK clock status	CM_L3INIT_CLKSTCTRL[29] CLKACTIVITY_INIT_60M_P2_FCLK
INIT_HSI_FCLK clock status	CM_L3INIT_CLKSTCTRL[16] CLKACTIVITY_INIT_HSI_FCLK
MMC1_FCLK clock status	CM_L3INIT_CLKSTCTRL[17] CLKACTIVITY_INIT_HSMMC1_FCLK
MMC2_FCLK clock status	CM_L3INIT_CLKSTCTRL[18] CLKACTIVITY_INIT_HSMMC2_FCLK
INIT_L3_ICLK clock status	CM_L3INIT_CLKSTCTRL[8] CLKACTIVITY_INIT_L3_ICLK
INIT_L4_ICLK clock status	CM_L3INIT_CLKSTCTRL[9] CLKACTIVITY_INIT_L4_ICLK
TLL_CH0_FCLK clock status	CM_L3INIT_CLKSTCTRL[22] CLKACTIVITY_TLL_CH0_FCLK
TLL_CH1_FCLK clock status	CM_L3INIT_CLKSTCTRL[23] CLKACTIVITY_TLL_CH1_FCLK
UTMI_ROOT_FCLK clock status	CM_L3INIT_CLKSTCTRL[25] CLKACTIVITY_UTMI_ROOT_FCLK
Clock Domain State Transition Control	CM_L3INIT_CLKSTCTRL[1:0] CLKTRCTRL

3.6.10.3 Clock Domain Dependency

3.6.10.3.1 Static Dependency

Table 3-157 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-157. CD_L3_INIT Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_L3INIT_STATICDEP[3] ABE_STATDEP	Read/Write
CD_IVAHD	Disabled	CM_L3INIT_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Always enabled	CM_L3INIT_STATICDEP[5] L3_1_STATDEP	Read only
CD_L3_2	Always enabled	CM_L3INIT_STATICDEP[6] L3_2_STATDEP	Read only
CD_L4_CFG	Disabled	CM_L3INIT_STATICDEP[12] L4CFG_STATDEP	Read/Write
CD_L4_PER	Disabled	CM_L3INIT_STATICDEP[13] L4PER_STATDEP	Read/Write

Table 3-157. CD_L3_INIT Static Dependency Association Parameters (continued)

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L4_SEC	Disabled	CM_L3INIT_STATICDEP[14] L4SEC_STATDEP	Read/Write
CD_EMIF	Disabled	CM_L3INIT_STATICDEP[4] MEMIF_STATDEP	Read/Write

3.6.10.3.2 Dynamic Dependency

Table 3-158 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-158. CD_L3_INIT Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_1	Always disabled	CM_L3INIT_DYNAMICDEP[5] L3_1_DYNDEP	Read only
CD_L3_2	Always disabled	CM_L3INIT_DYNAMICDEP[6] L3_2_DYNDEP	Read only

3.6.10.3.3 Wake-Up Dependency

Table 3-159 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-159. CD_L3_INIT Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
HSI	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_HSI_WKDEP[8] WKUPDEP_WGM_HSI_WAKE_MPU	Read/Write
HSI	CD_L3_INIT	CD_DSP	Always enabled	PM_L3INIT_HSI_WKDEP[6] WKUPDEP_HSI_DSP_DSP	Read only
HSI	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_HSI_WKDEP[1] WKUPDEP_HSI_MCU_MPU_M3	Read/Write
HSI	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_HSI_WKDEP[0] WKUPDEP_HSI_MCU_MPU	Read/Write
HSMMC1	CD_L3_INIT	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_L3INIT_MMC1_WKDEP[3] WKUPDEP_MMC1_SDMA	Read/Write
HSMMC1	CD_L3_INIT	CD_DSP	Disabled	PM_L3INIT_MMC1_WKDEP[2] WKUPDEP_MMC1_DSP	Read/Write
HSMMC1	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_MMC1_WKDEP[1] WKUPDEP_MMC1_MPU_M3	Read/Write
HSMMC1	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_MMC1_WKDEP[0] WKUPDEP_MMC1_MPU	Read/Write

Table 3-159. CD_L3_INIT Wake-Up Dependency Association Parameters (continued)

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
HSMMC2	CD_L3_INIT	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_L3INIT_MMC2_WKDEP[3] WKUPDEP_MMC2_SDMA	Read/Write
HSMMC2	CD_L3_INIT	CD_DSP	Disabled	PM_L3INIT_MMC2_WKDEP[2] WKUPDEP_MMC2_DSP	Read/Write
HSMMC2	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_MMC2_WKDEP[1] WKUPDEP_MMC2_MPU_M3	Read/Write
HSMMC2	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_MMC2_WKDEP[0] WKUPDEP_MMC2_MPU	Read/Write
FSUSB	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_FSUSB_WKDEP[1] WKUPDEP_FSUSB_MPU_M3	Read/Write
FSUSB	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_FSUSB_WKDEP[0] WKUPDEP_FSUSB_MPU	Read/Write
HSUSBHOST	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_HSUSB_HOST_WKDEP[1] WKUPDEP_HSUSB_HOST_MPU_M3	Read/Write
HSUSBHOST	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_HSUSB_HOST_WKDEP[0] WKUPDEP_HSUSB_HOST_MPU	Read/Write
HSUSBOTG	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_HSUSB_OTG_WKDEP[1] WKUPDEP_HSUSB_OTG_MPU_M3	Read/Write
HSUSBOTG	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_HSUSB_OTG_WKDEP[0] WKUPDEP_HSUSB_OTG_MPU	Read/Write
HSUSBTLL	CD_L3_INIT	CD_CORTEXM3	Disabled	PM_L3INIT_HSUSB_TLL_WKDEP[1] WKUPDEP_HSUSB_TLL_MPU_M3	Read/Write
HSUSBTLL	CD_L3_INIT	CD_CORTEXA9	Disabled	PM_L3INIT_HSUSB_TLL_WKDEP[0] WKUPDEP_HSUSB_TLL_MPU	Read/Write

3.6.10.4 Clock Domain Module Attributes

Table 3-160 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-160. CD_L3_INIT Modules Clocks Association

Module	Clock	Clock Type
HSI	INIT_HSI_FCLK	Interface and functional
	INIT_L3_ICLK	Interface

Table 3-160. CD_L3_INIT Modules Clocks Association (continued)

Module	Clock	Clock Type
HSMMC1	INIT_L4_ICLK	Interface
	MMC1_FCLK	Functional
	INIT_L3_ICLK	Interface
HSMMC2	INIT_L4_ICLK	Interface
	MMC2_FCLK	Functional
	INIT_L3_ICLK	Interface
USBPHY	INIT_L4_ICLK	Interface
	CORE_ALWON_32K_FCLK	Functional
	INIT_48M_FCLK	Functional
	INIT_960M_FCLK	Functional
FSUSB	INIT_L4_ICLK	Interface
	INIT_L3_ICLK	Interface
	INIT_48MC_FCLK	Functional
HSUSBHOST	HSIC_P1_480M_FCLK	Functional
	HSIC_P1_FCLK	Functional
	HSIC_P2_480M_FCLK	Functional
	HSIC_P2_FCLK	Functional
	INIT_48MC_FCLK	Functional (mandatory)
	INIT_48MC_FCLK	Functional (optional)
	INIT_L3_ICLK	Interface
	INIT_L4_ICLK	Interface
	UTMI_P1_FCLK	Functional
	UTMI_P2_FCLK	Functional
	UTMI_ROOT_FCLK	Functional
HSUSBOTG	INIT_L3_ICLK	Interface
	INIT_L4_ICLK	Interface
	OTG_60M_FCLK	Functional
HSUSBTLL	INIT_L4_ICLK	Interface
	TLL_CH0_FCLK	Functional
	TLL_CH1_FCLK	Functional

Table 3-161 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-161. CD_L3_INIT Modules Wake-Up Request

Module	Wake-Up Feature
HSI	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ)/Master wake-up request
HSMMC1	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ, sDMA -DMA)
HSMMC2	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ, sDMA -DMA)
USBPHY	None
FSUSB	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)/Master wake-up request
HSUSBHOST	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
HSUSBOTG	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
HSUSBTLL	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)

Table 3-162 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-162. CD_L3_INIT Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
HSI	Slave/Master	CM_L3INIT_HSI_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSI_CLKCTRL[17:16] IDLEST	Idle status
HSMMC1	Master/Slave	CM_L3INIT_HSMMC1_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSMMC1_CLKCTRL[17:16] IDLEST	Idle status
HSMMC2	Master/Slave	CM_L3INIT_HSMMC2_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSMMC2_CLKCTRL[17:16] IDLEST	Idle status
USBPHY	Slave	CM_L3INIT_USBPHY_CLKCTRL[17:16] IDLEST	Idle status
FSUSB	Slave/Master	CM_L3INIT_FSUSB_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_FSUSB_CLKCTRL[17:16] IDLEST	Idle status
HSUSBHOST	Slave/Master	CM_L3INIT_HSUSBHOST_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSUSBHOST_CLKCTRL[17:16] IDLEST	Idle status
		CM_L3INIT_HSUSBHOST_CLKCTRL_RESTORE[18] STBYST	Standby status
		CM_L3INIT_HSUSBHOST_CLKCTRL_RESTORE[17:16] IDLEST	Idle status
HSUSBOTG	Slave/Master	CM_L3INIT_HSUSBOTG_CLKCTRL[18] STBYST	Standby status
		CM_L3INIT_HSUSBOTG_CLKCTRL[17:16] IDLEST	Idle status
HSUSBTLL	Slave	CM_L3INIT_HSUSBTLL_CLKCTRL[17:16] IDLEST	Idle status
		CM_L3INIT_HSUSBTLL_CLKCTRL_RESTORE[17:16] IDLEST	Idle status

Table 3-163 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-163. CD_L3_INIT Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
HSI	Available	Available	N/A	CM_L3INIT_HSI_CLKCTRL[1:0] MODULEMODE	Read/Write
HSMMC1	Available	N/A	Available	CM_L3INIT_HSMMC1_CLKCTRL[1:0] MODULEMODE	Read/Write
HSMMC2	Available	N/A	Available	CM_L3INIT_HSMMC2_CLKCTRL[1:0] MODULEMODE	Read/Write

Table 3-163. CD_L3_INIT Modules Slave Clock-Management Modes and Control (continued)

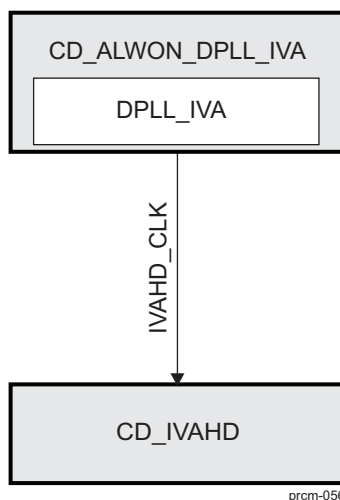

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
USBPHY	Available	Available	N/A	CM_L3INIT_USBPHY_CLKCTRL[1:0] MODULEMODE	Read/Write
FSUSB	Available	N/A	Available	CM_L3INIT_FSUSB_CLKCTRL[1:0] MODULEMODE	Read/Write
HSUSBHOST	Available	N/A	Available	CM_L3INIT_HSUSBHOST_CLKCTRL[1:0] MODULEMODE	Read/Write
HSUSBOTG	Available	Available	N/A	CM_L3INIT_HSUSBOTG_CLKCTRL[1:0] MODULEMODE	Read/Write
HSUSBTLL	Available	Available	N/A	CM_L3INIT_HSUSBTLL_CLKCTRL[1:0] MODULEMODE	Read/Write

3.6.11 CD_IVAHD Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.11.1 Overview

Figure 3-61 shows the overview of the clock domain.

Figure 3-61. CD_IVAHD Overview

3.6.11.2 Clock Domain Modes

Table 3-164 lists the clock domain modes supported by the clock domain.

Table 3-164. CD_IVAHD Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-165 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-165. CD_IVAHD Control and Status Parameters

Parameter Name	Control/Status Bit Field
IVAHD_ROOT_CLK clock status	CM_IVAHD_CLKSTCTRL[8] CLKACTIVITY_IVAHD_CLK
Clock Domain State Transition Control	CM_IVAHD_CLKSTCTRL[1:0] CLKTRCTRL

3.6.11.3 Clock Domain Dependency

CD_IVAHD has no module wake-up dependency with any other clock domain of the device

3.6.11.3.1 Static Dependency

Table 3-166 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-166. CD_IVAHD Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_1	Disabled	CM_IVAHD_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Always enabled	CM_IVAHD_STATICDEP[6] L3_2_STATDEP	Read only
CD_EMIF	Disabled	CM_IVAHD_STATICDEP[4] MEMIF_STATDEP	Read/Write

3.6.11.3.2 Dynamic Dependency

Table 3-167 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-167. CD_IVAHD Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_2	Always disabled	CM_IVAHD_DYNAMICDEP[6] L3_2_DYNDEP	Read only

3.6.11.4 Clock Domain Module Attributes

Table 3-168 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-168. CD_IVAHD Modules Clocks Association

Module	Clock	Clock Type
IVAHD	IVAHD_ROOT_CLK	Interface and Functional
SL2	IVAHD_ROOT_CLK	Interface

Table 3-169 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-169. CD_IVAHD Modules Wake-Up Request

Module	Wake-Up Feature
IVAHD	None
SL2	None

Table 3-170 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-170. CD_IVAHD Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
IVAHD	Master/Slave	CM_IVAHD_IVAHD_CLKCTRL [18] STBYST	Standby status
		CM_IVAHD_IVAHD_CLKCTRL [17:16] IDLEST	Idle status
SL2	Slave	CM_IVAHD_SL2_CLKCTRL[17:16] IDLEST	Idle status

Table 3-171 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-171. CD_IVAHD Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
IVAHD	Available	Available	N/A	CM_IVAHD_IVAHD_CLKCTRL[1:0] MODULEMODE	Read/Write
SL2	Available	Available	N/A	CM_IVAHD_SL2_CLKCTRL[1:0] MODULEMODE	Read/Write

3.6.12 CD_SGX Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.12.1 Overview

Figure 3-62 shows the overview of the clock domain.

Figure 3-62. CD_SGX Overview

3.6.12.2 Clock Domain Modes

Table 3-172 lists the clock domain modes supported by the clock domain.

Table 3-172. CD_SGX Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-173 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-173. CD_SGX Control and Status Parameters

Parameter Name	Control/Status Bit Field
SGX_L3_ICLK clock status	CM_SGX_CLKSTCTRL[8] CLKACTIVITY_SGX_L3_ICLK
SGX_FCLK clock status	CM_SGX_CLKSTCTRL[9] CLKACTIVITY_SGX_FCLK
Clock Domain State Transition Control	CM_SGX_CLKSTCTRL[1:0] CLKTRCTRL

3.6.12.3 Clock Domain Dependency

CD_SGX has no module wake-up dependency with any other clock domain of the device.

3.6.12.3.1 Static Dependency

Table 3-174 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-174. CD_SGX Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVAHD	Disabled	CM_SGX_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Disabled	CM_SGX_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Always enabled	CM_SGX_STATICDEP[6] L3_2_STATDEP	Read only
CD_EMIF	Disabled	CM_SGX_STATICDEP[4] MEMIF_STATDEP	Read/Write

3.6.12.3.2 Dynamic Dependency

Table 3-175 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-175. CD_SGX Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_2	Always disabled	CM_SGX_DYNAMICDEP[6] L3_2_DYNDEP	Read only

3.6.12.4 Clock Domain Module Attributes

Table 3-176 identifies for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-176. CD_SGX Modules Clocks Association

Module	Clock	Clock Type
SGX	SGX_L3_ICLK	Interface
	SGX_FCLK	Functional

Table 3-177 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-177. CD_SGX Modules Wake-Up Request

Module	Wake-Up Feature
SGX	None

Table 3-178 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-178. CD_SGX Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
SGX	Master/Slave	CM_SGX_SGX_CLKCTRL[18] STBYST	Standby status
		CM_SGX_SGX_CLKCTRL[17:16] IDLEST	Idle status

Table 3-179 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-179. CD_SGX Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
SGX	Available	N/A	Available	CM_SGX_SGX_CLKCTRL[1:0] MODULEMODE	Read/Write

3.6.13 CD_EMU Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.13.1 Overview

Figure 3-63 shows the overview of the clock domain.

Figure 3-63. CD_EMU Overview

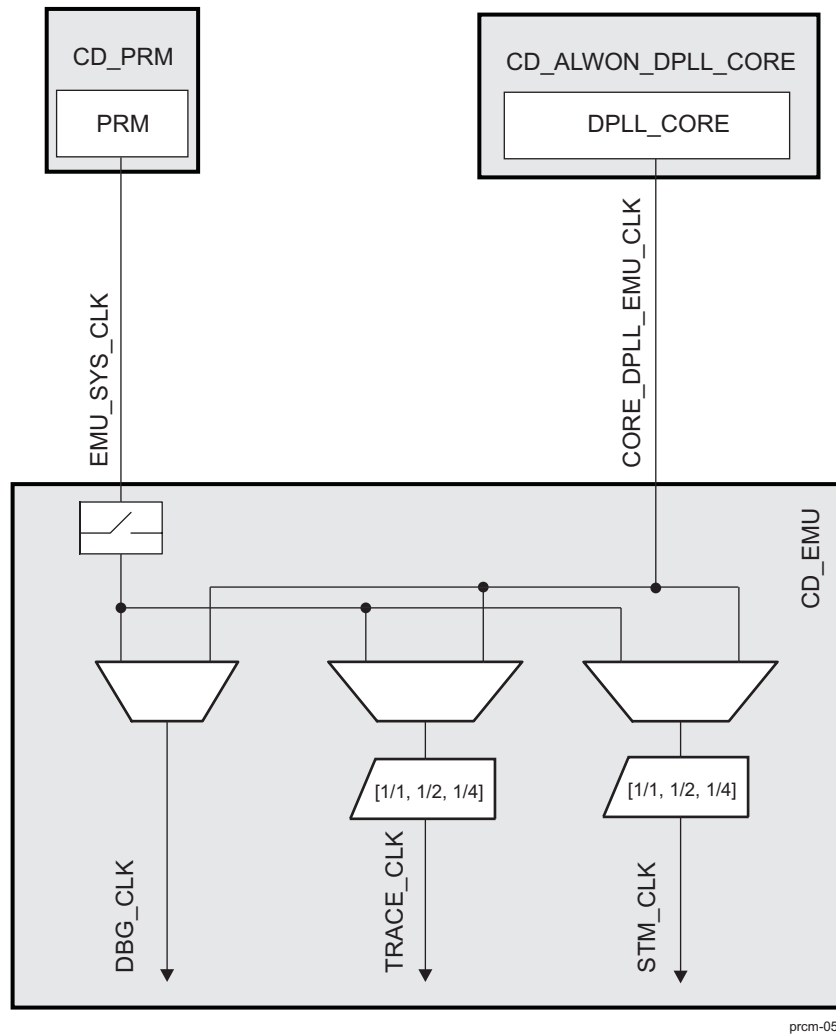

Table 3-180 lists controls for clock dividers or muxes in the clock domain.

Table 3-180. CD_EMU Clock Division and Muxing Control

Divider/Mux	Control Bit Field
Divider STM_CLK	CM_EMU_DEBUGSS_CLKCTRL[29:27] CLKSEL_PMD_STM_CLK
Divider TRACE_CLK	CM_EMU_DEBUGSS_CLKCTRL[26:24] CLKSEL_PMD_TRACE_CLK

3.6.13.2 Clock Domain Modes

Table 3-181 lists the clock domain modes supported by the clock domain.

Table 3-181. CD_EMU Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Not available	Not available	Available	Available

Table 3-182 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-182. CD_EMU Control and Status Parameters

Parameter Name	Control/Status Bit Field
CORE_DPLL_EMU_CLK clock status	CM_EMU_CLKSTCTRL[9] CLKACTIVITY_CORE_DPLL_EMU_CLK
EMU_SYS_CLK clock status	CM_EMU_CLKSTCTRL[8] CLKACTIVITY_EMU_SYS_CLK
Clock Domain State Transition Control	CM_EMU_CLKSTCTRL[1:0] CLKTRCTRL

3.6.13.3 Clock Domain Dependency

CD_EMU has no static or module wake-up dependency with any other clock domain of the device.

3.6.13.3.1 Dynamic Dependency

Table 3-183 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-183. CD_EMU Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_2	Always enabled	CM_EMU_DYNAMICDEP[6] L3_2_DYNDEP	Read only

3.6.13.4 Clock Domain Module Attributes

Table 3-184 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-184. CD_EMU Modules Clocks Association

Module	Clock	Clock Type
DEBUG	DBG_CLK	Interface
	EMU_SYS_CLK	Interface and Functional
	STM_CLK	Interface and Functional
	TRACE_CLK	Interface and Functional

Table 3-185 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-185. CD_EMU Modules Wake-Up Request

Module	Wake-Up Feature
DEBUG	Master wake-up request

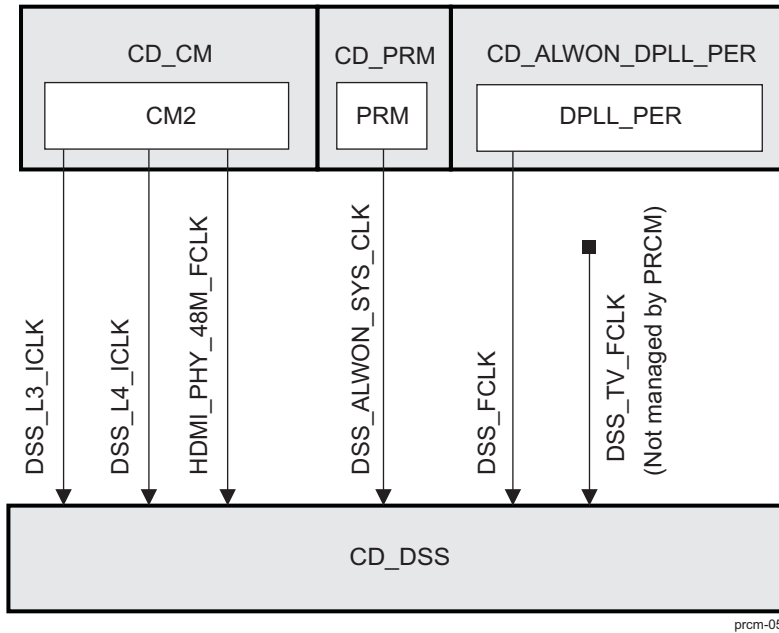

3.6.14 CD_DSS Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.14.1 Overview

Figure 3-64 shows the overview of the clock domain.

Figure 3-64. CD_DSS Overview

3.6.14.2 Clock Domain Modes

Table 3-186 lists the clock domain modes supported by the clock domain.

Table 3-186. CD_DSS Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-187 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-187. CD_DSS Control and Status Parameters

Parameter Name	Control/Status Bit Field
DSS_ALWON_SYS_CLK clock status	CM_DSS_CLKSTCTRL[10] CLKACTIVITY_DSS_ALWON_SYS_CLK
DSS_FCLK clock status	CM_DSS_CLKSTCTRL[9] CLKACTIVITY_DSS_FCLK
HDMI_PHY_48M_FCLK clock status	CM_DSS_CLKSTCTRL[11] CLKACTIVITY_HDMI_PHY_48M_FCLK
DSS_L3_ICLK clock status	CM_DSS_CLKSTCTRL[8] CLKACTIVITY_DSS_L3_ICLK ⁽¹⁾
Clock Domain State Transition Control	CM_DSS_CLKSTCTRL[1:0] CLKTRCTRL

⁽¹⁾ The VDAC function is not supported.

3.6.14.3 Clock Domain Dependency

3.6.14.3.1 Static Dependency

Table 3-188 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-188. CD_DSS Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVAHD	Disabled	CM_DSS_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Always enabled	CM_DSS_STATICDEP[5] L3_1_STATDEP	Read only
CD_L3_2	Disabled	CM_DSS_STATICDEP[6] L3_2_STATDEP	Read/Write
CD_EMIF	Disabled	CM_DSS_STATICDEP[4] MEMIF_STATDEP	Read/Write

3.6.14.3.2 Dynamic Dependency

Table 3-189 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-189. CD_DSS Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_1	Always disabled	CM_DSS_DYNAMICDEP[5] L3_1_DYNDEP	Read only

3.6.14.3.3 Wake-Up Dependency

Table 3-190 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-190. CD_DSS Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
DSS-DSI1	CD_DSS	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_DSS_DSS_WK DEP[7] WKUPDEP_DSI1_S DMA	Read/Write
DSS-DSI1	CD_DSS	CD_DSP	Disabled	PM_DSS_DSS_WK DEP[6] WKUPDEP_DSI1_D SP	Read/Write
DSS-DSI1	CD_DSS	CD_CORTEXM3	Disabled	PM_DSS_DSS_WK DEP[5] WKUPDEP_DSI1_ MPU_M3	Read/Write
DSS-DSI1	CD_DSS	CD_CORTEXA9	Disabled	PM_DSS_DSS_WK DEP[4] WKUPDEP_DSI1_ MPU	Read/Write
DSS-DSI2	CD_DSS	CD_CORTEXM3	Disabled	PM_DSS_DSS_WK DEP[9] WKUPDEP_DSI2_ MPU_M3	Read/Write
DSS-DSI2	CD_DSS	CD_CORTEXA9	Disabled	PM_DSS_DSS_WK DEP[8] WKUPDEP_DSI2_ MPU	Read/Write
DSS-DSI2	CD_DSS	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_DSS_DSS_WK DEP[11] WKUPDEP_DSI2_S DMA	Read/Write

Table 3-190. CD_DSS Wake-Up Dependency Association Parameters (continued)

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
DSS-DSI2	CD_DSS	CD_DSP	Disabled	PM_DSS_DSS_WK DEP[10] WKUPDEP_DSI2_D SP	Read/Write
DSS-HDMI	CD_DSS	CD_DMA, CD_L3_1, CD_L3_2	Enabled	PM_DSS_DSS_WK DEP[19] WKUPDEP_HDMID MA_SDMA	Read/Write
DSS-HDMI	CD_DSS	CD_DSP	Disabled	PM_DSS_DSS_WK DEP[14] WKUPDEP_HDMII RQ_DSP	Read/Write
DSS-HDMI	CD_DSS	CD_CORTEXM3	Disabled	PM_DSS_DSS_WK DEP[13] WKUPDEP_HDMII RQ_MPU_M3	Read/Write
DSS-HDMI	CD_DSS	CD_CORTEXA9	Disabled	PM_DSS_DSS_WK DEP[12] WKUPDEP_HDMII RQ_MPU	Read/Write
DSS-DISPC	CD_DSS	CD_CORTEXM3	Disabled	PM_DSS_DSS_WK DEP[1] WKUPDEP_DISPC _MPU_M3	Read/Write
DSS-DISPC	CD_DSS	CD_CORTEXA9	Disabled	PM_DSS_DSS_WK DEP[0] WKUPDEP_DISPC _MPU	Read/Write
DSS-DISPC	CD_DSS	CD_DSP	Disabled	PM_DSS_DSS_WK DEP[2] WKUPDEP_DISPC _DSP	Read/Write
DSS-DISPC	CD_DSS	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_DSS_DSS_WK DEP[3] WKUPDEP_DISPC _SDMA	Read/Write

3.6.14.4 Clock Domain Module Attributes

Table 3-191 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-191. CD_DSS Modules Clocks Association

Module	Clock	Clock Type
DSS	DSS_ALWON_SYS_CLK	Functional
	DSS_FCLK	Functional
	DSS_TV_FCLK	Functional
	HDMI_PHY_48M_FCLK	Functional
	DSS_L3_ICLK ⁽¹⁾	Interface
	DSS_L4_ICLK	Interface

⁽¹⁾ The VDAC function is not supported.

NOTE: DSS_TV_FCLK is sourced from `fref_slicer_in` input pin. To enable DSS_TV_FCLK it must be ungated in `ALTCLKSRC[3] ENABLE_EXT` and must be enabled in `CM_DSS_DSS_CLKCTRL[11] OPTFCLKEN_TV_FCLK`.

Table 3-192 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-192. CD_DSS Modules Wake-Up Request

Module	Wake-Up Feature
DSS	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ, sDMA -DMA)

Table 3-193 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-193. CD_DSS Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
DSS	Master/Slave	<code>CM_DSS_DSS_CLKCTRL[18] STBYST</code>	Standby status
		<code>CM_DSS_DSS_CLKCTRL[17:16] IDLEST</code>	Idle status

Table 3-194 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-194. CD_DSS Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
DSS	Available	N/A	Available	<code>CM_DSS_DSS_CLKCTRL[1:0] MODULEMODE</code>	Read/Write

3.6.15 CD_L4_CFG Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.15.1 Overview

Figure 3-65 shows the overview of the clock domain.

Figure 3-65. CD_L4_CFG Overview

3.6.15.2 Clock Domain Modes

Table 3-195 lists the clock domain modes supported by the clock domain.

Table 3-195. CD_L4_CFG Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-196 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-196. CD_L4_CFG Control and Status Parameters

Parameter Name	Control/Status Bit Field
CFG_L4_ICLK clock status	CM_L4CFG_CLKSTCTRL[8] CLKACTIVITY_CFG_L4_ICLK
Clock Domain State Transition Control	CM_L4CFG_CLKSTCTRL[1:0] CLKTRCTRL

3.6.15.3 Clock Domain Dependency

CD_L4_CFG has no static or module wake-up dependency with any other clock domain of the device.

3.6.15.3.1 Dynamic Dependency

Table 3-197 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-197. CD_L4_CFG Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_DSS	Always enabled	CM_L4CFG_DYNAMICDEP[8] DSS_DYNDP	Read only
CD_CAM	Always disabled	CM_L4CFG_DYNAMICDEP[9] ISS_DYNDP	Read only
CD_L3_1	Always enabled	CM_L4CFG_DYNAMICDEP[5] L3_1_DYNDP	Read only
CD_L3_2	Always enabled	CM_L4CFG_DYNAMICDEP[6] L3_2_DYNDP	Read only
CD_L3_INIT	Always enabled	CM_L4CFG_DYNAMICDEP[7] L3INIT_DYNDP	Read only
CD_EMIF	Always enabled	CM_L4CFG_DYNAMICDEP[4] MEMIF_DYNDP	Read only

Table 3-197. CD_L4_CFG Dynamic Dependency Association Parameters (continued)

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_DMA	Always enabled	CM_L4CFG_DYNAMICDEP[11] SDMA_DYNDEP	Read only
CD_DSP	Always enabled	CM_L4CFG_DYNAMICDEP[1] DSP_DYNDEP	Read only

3.6.15.4 Clock Domain Module Attributes

Table 3-198 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-198. CD_L4_CFG Modules Clocks Association

Module	Clock	Clock Type
SYSCTRL_PADCONF_CORE	CFG_L4_ICLK	Functional
SYSCTRL_GENERAL_CORE	CFG_L4_ICLK	Functional
	CORE_TS_FCLK	Functional
SPINLOCK	CFG_L4_ICLK	Interface
L4_CFG interconnect	CFG_L4_ICLK	Interface
MAILBOX	CFG_L4_ICLK	Interface
SAR_ROM	CFG_L4_ICLK	Interface

Table 3-199 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-199. CD_L4_CFG Modules Wake-Up Request

Module	Wake-Up Feature
SYSCTRL_PADCONF_CORE	None
SYSCTRL_GENERAL_CORE	None
SPINLOCK	None
L4_CFG interconnect	None
MAILBOX	None
SAR_ROM	None

Table 3-200 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-200. CD_L4_CFG Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
SPINLOCK	Slave	CM_L4CFG_SPINLOCK_CLK CTRL[17:16] IDLEST	Idle status
L4_CFG interconnect	Slave	CM_L4CFG_L4_CFG_CLKCT RL[17:16] IDLEST	Idle status
MAILBOX	Slave	CM_L4CFG_MAILBOX_CLKC TRL[17:16] IDLEST	Idle status
SAR_ROM	Slave	CM_L4CFG_SAR_ROM_CLKC TRL[17:16] IDLEST	Idle status

Table 3-201 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-201. CD_L4_CFG Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
SPINLOCK	N/A	Available	N/A	CM_L4CFG_SPINLOCK_CLKCTRL[1:0] MODULEMODE	Read only
L4_CFG interconnect	N/A	Available	N/A	CM_L4CFG_L4_CFG_CLKCTRL[1:0] MODULEMODE	Read only
MAILBOX	N/A	Available	N/A	CM_L4CFG_MAILBOX_CLKCTRL[1:0] MODULEMODE	Read only
SAR_ROM	N/A	Available	N/A	CM_L4CFG_SAR_ROM_CLKCTRL[1:0] MODULEMODE	Read only

3.6.16 CD_L3_INSTR Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.16.1 Overview

Figure 3-66 shows the overview of the clock domain.

Figure 3-66. CD_L3_INSTR Overview

3.6.16.2 Clock Domain Modes

Table 3-202 lists the clock domain modes supported by the clock domain.

Table 3-202. CD_L3_INSTR Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Not available	Not available	Not available	Available

Table 3-203 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-203. CD_L3_INSTR Control and Status Parameters

Parameter Name	Control/Status Bit Field
INSTR_L3_ICLK clock status	CM_L3INSTR_CLKSTCTRL[8] CLKACTIVITY_L3_INSTR_ICLK
Clock Domain State Transition Control	CM_L3INSTR_CLKSTCTRL[1:0] CLKTRCTRL

3.6.16.3 Clock Domain Dependency

CD_L3_INSTR has no static, dynamic, or module wake-up dependency with any other clock domain of the device

3.6.16.4 Clock Domain Module Attributes

Table 3-204 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-204. CD_L3_INSTR Modules Clocks Association

Module	Clock	Clock Type
L3_3 interconnect	INSTR_L3_ICLK	Interface
	INSTR_L4_ICLK	Interface
L3_INSTR interconnect	INSTR_L3_ICLK	Interface
OCP_WP1	INSTR_L3_ICLK	Interface
	INSTR_L4_ICLK	Interface

Table 3-205 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-205. CD_L3_INSTR Modules Wake-Up Request

Module	Wake-Up Feature
L3_3 interconnect	None
L3_INSTR interconnect	None

Table 3-206 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-206. CD_L3_INSTR Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
L3_3 interconnect	Slave	CM_L3INSTR_L3_3_CLKCTRL[17:16] IDLEST	Idle status
		CM_L3INSTR_L3_3_CLKCTRL_RESTORE[17:16] IDLEST	Idle status
L3_INSTR interconnect	Slave	CM_L3INSTR_L3_INSTR_CLKCTRL[17:16] IDLEST	Idle status
		CM_L3INSTR_L3_INSTR_CLKCTRL_RESTORE[17:16] IDLEST	Idle status

Table 3-207 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-207. CD_L3_INSTR Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
L3_3 interconnect	Available	Available	N/A	CM_L3INSTR_L3_3_CLKCTRL[1:0] MODULEMODE	Read/Write
L3_3 interconnect	Available	Available	N/A	CM_L3INSTR_L3_3_CLKCTRL_RESTORE[1:0] MODULEMODE	Read/Write
L3_INSTR interconnect	Available	Available	N/A	CM_L3INSTR_L3_INSTR_CLKCTRL[1:0] MODULEMODE	Read/Write

Table 3-207. CD_L3_INSTR Modules Slave Clock-Management Modes and Control (continued)

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
L3_INSTR interconnect	Available	Available	N/A	CM_L3INSTR_L3_INSTR_CLKCTRL_RESTORE[1:0] MODULEMODE	Read/Write

3.6.17 CD_L3_2 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.17.1 Overview

Figure 3-67 shows the overview of the clock domain.

Figure 3-67. CD_L3_2 Overview

3.6.17.2 Clock Domain Modes

Table 3-208 lists the clock domain modes supported by the clock domain.

Table 3-208. CD_L3_2 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-209 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-209. CD_L3_2 Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3_ICLK2 clock status	CM_L3_2_CLKSTCTRL[8] CLKACTIVITY_L3_2_ICLK
Clock Domain State Transition Control	CM_L3_2_CLKSTCTRL[1:0] CLKTRCTRL

3.6.17.3 Clock Domain Dependency

CD_L3_2 has no static or module wake-up dependency with any other clock domain of the device.

3.6.17.3.1 Dynamic Dependency

Table 3-210 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-210. CD_L3_2 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_DSS	Always enabled	CM_L3_2_DYNAMICDEP[8] DSS_DYNDEP	Read only
CD_CORTEXM3	Always enabled	CM_L3_2_DYNAMICDEP[0] MPU_M3_DYNDEP	Read only
CD_SGX	Always enabled	CM_L3_2_DYNAMICDEP[10] SGX_DYNDEP	Read only
CD_CAM	Always disabled	CM_L3_2_DYNAMICDEP[9] ISS_DYNDEP	Read only
CD_IVAHD	Always enabled	CM_L3_2_DYNAMICDEP[2] IVAHD_DYNDEP	Read only
CD_L3_1	Always enabled	CM_L3_2_DYNAMICDEP[5] L3_1_DYNDEP	Read only
CD_L3_INIT	Always enabled	CM_L3_2_DYNAMICDEP[7] L3INIT_DYNDEP	Read only
CD_L4_PER	Always enabled	CM_L3_2_DYNAMICDEP[13] L4PER_DYNDEP	Read only
CD_L4_SEC	Always enabled	CM_L3_2_DYNAMICDEP[14] L4SEC_DYNDEP	Read only

3.6.17.4 Clock Domain Module Attributes

Table 3-211 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-211. CD_L3_2 Modules Clocks Association

Module	Clock	Clock Type
GPMC	L3_ICLK2	Interface
L3_2 interconnect	L3_ICLK2	Interface
	L4_ICLK2	Interface
OCMC_RAM	L3_ICLK2	Interface

Table 3-212 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-212. CD_L3_2 Modules Wake-Up Request

Module	Wake-Up Feature
GPMC	None
L3_2 interconnect	None
OCMC_RAM	None

Table 3-213 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-213. CD_L3_2 Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
GPMC	Slave	CM_L3_2_GPMC_CLKCTRL[17:16] IDLEST	Idle status
L3_2 interconnect	Slave	CM_L3_2_L3_2_CLKCTRL[17:16] IDLEST	Idle status
OCMC_RAM	Slave	CM_L3_2_OCMC_RAM_CLKCTRL[17:16] IDLEST	Idle status

Table 3-214 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 3-214. CD_L3_2 Modules Slave Clock Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
GPMC	Available	Available	N/A	CM_L3_2_GPMC_CLKCTRL[1:0] MODULEMODE	Read/Write
L3_2 interconnect	N/A	Available	N/A	CM_L3_2_L3_2_CLKCTRL[1:0] MODULEMODE	Read only
OCMC_RAM	N/A	Available	N/A	CM_L3_2_OCMC_RAM_CLKCTRL[1:0] MODULEMODE	Read only

3.6.18 CD_L3_1 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.18.1 Overview

Figure 3-68 shows the overview of the clock domain.

Figure 3-68. CD_L3_1 Overview

3.6.18.2 Clock Domain Modes

Table 3-215 lists the clock domain modes supported by the clock domain.

Table 3-215. CD_L3_1 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Not available	Available

Table 3-216 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-216. CD_L3_1 Control and Status Parameters

Parameter Name	Control/Status Bit Field
L3_ICLK1 clock status	CM_L3_1_CLKSTCTRL[8] CLKACTIVITY_L3_1_ICLK
Clock Domain State Transition Control	CM_L3_1_CLKSTCTRL[1:0] CLKTRCTRL

3.6.18.3 Clock Domain Dependency

CD_L3_1 has no static or module wake-up dependency with any other clock domain of the device.

3.6.18.3.1 Dynamic Dependency

Table 3-217 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-217. CD_L3_1 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Always enabled	CM_L3_1_DYNAMICDEP[3] ABE_DYNDEP	Read only
CD_L3_2	Always enabled	CM_L3_1_DYNAMICDEP[6] L3_2_DYNDEP	Read only
CD_L4_CFG	Always enabled	CM_L3_1_DYNAMICDEP[12] L4CFG_DYNDEP	Read only
CD_EMIF	Always enabled	CM_L3_1_DYNAMICDEP[4] MEMIF_DYNDEP	Read only

3.6.18.4 Clock Domain Module Attributes

Table 3-218 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-218. CD_L3_1 Modules Clocks Association

Module	Clock	Clock Type
L3_1 interconnect	L3_ICLK1	Interface
	L4_ICLK1	Interface

Table 3-219 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-219. CD_L3_1 Modules Wake-Up Request

Module	Wake-Up Feature
L3_1 interconnect	None

Table 3-220 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 3-220. CD_L3_1 Modules Clock Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
L3_1 interconnect	Slave	CM_L3_1_L3_1_CLKCTRL[17:16] IDLEST	Idle status

Table 3-221 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 3-221. CD_L3_1 Modules Slave Clock Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
L3_1 interconnect	N/A	Available	N/A	CM_L3_1_L3_1_CLKCTRL[1:0] MODULEMODE	Read only

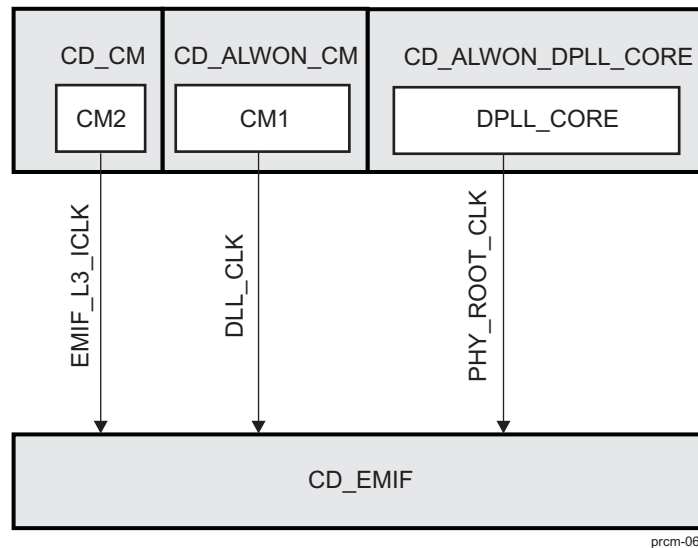

3.6.19 CD_EMIF Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.19.1 Overview

Figure 3-69 shows the overview of the clock domain.

Figure 3-69. CD_EMIF Overview

3.6.19.2 Clock Domain Modes

Table 3-222 lists the clock domain modes supported by the clock domain.

Table 3-222. CD_EMIF Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-223 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-223. CD_EMIF Control and Status Parameters

Parameter Name	Control/Status Bit Field
DLL_CLK clock status	CM_MEMIF_CLKSTCTRL[9] CLKACTIVITY_DLL_CLK
EMIF_L3_ICLK clock status	CM_MEMIF_CLKSTCTRL[8] CLKACTIVITY_L3_EMIF_ICLK
PHY_ROOT_CLK clock status	CM_MEMIF_CLKSTCTRL[10] CLKACTIVITY_PHY_ROOT_CLK
Clock Domain State Transition Control	CM_MEMIF_CLKSTCTRL[1:0] CLKTRCTRL

3.6.19.3 Clock Domain Dependency

CD_EMIF has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

3.6.19.4 Clock Domain Module Attributes

Table 3-224 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-224. CD_EMIF Modules Clocks Association

Module	Clock	Clock Type
DLL	DLL_CLK	Functional
DMM	EMIF_L3_ICLK	Interface
EMIF1	DLL_CLK	Interface
	EMIF_L3_ICLK	Interface
	EMIF_FCLK ⁽¹⁾	Functional
	EOCP_MA_ICLK ⁽²⁾	Interface
	EOCP_L3_ICLK ⁽²⁾	Interface
EMIF2	DLL_CLK	Interface
	EMIF_L3_ICLK	Interface
	EMIF_FCLK ⁽¹⁾	Functional
	EOCP_MA_ICLK ⁽²⁾	Interface
	EOCP_L3_ICLK ⁽²⁾	Interface
EMIF_FW	EMIF_L3_ICLK	Interface
	EMIF_L4_ICLK	Interface

⁽¹⁾ PHY_ROOT_CLK goes into DDRPHY. EMIF_FCLK comes out of DDRPHY and is PHY_ROOT_CLK divided by 4. DDR_PHY_CLK is PHY_ROOT_CLK divided by 2.

⁽²⁾ EMIF modules are clocked by EOCP_MA_ICLK when MPU is active, otherwise EOCP_L3_ICLK clock is used.

Table 3-225 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-225. CD_EMIF Modules Wake-Up Request

Module	Wake-Up Feature
DDRPHY	None
DLL	None
DMM	None
EMIF1	None
EMIF2	None
EMIF_FW	None

Table 3-226 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-226. CD_EMIF Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
DMM	Slave	CM_MEMIF_DMM_CLKCTRL[17:16] IDLEST	Idle status
EMIF1	Slave	CM_MEMIF_EMIF_1_CLKCTRL[17:16] IDLEST	Idle status
EMIF2	Slave	CM_MEMIF_EMIF_2_CLKCTRL[17:16] IDLEST	Idle status
EMIF_FW	Slave	CM_MEMIF_EMIF_FW_CLKCTRL[17:16] IDLEST	Idle status

Table 3-227 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-227. CD_EMIF Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
DMM	N/A	Available	N/A	CM_MEMIF_DMM_CLKCTRL[1:0] MODULEMODE	Read only
EMIF1	Available	Available	N/A	CM_MEMIF_EMIF_1_CLKCTRL[1:0] MODULEMODE	Read/Write
EMIF2	Available	Available	N/A	CM_MEMIF_EMIF_2_CLKCTRL[1:0] MODULEMODE	Read/Write
EMIF_FW	N/A	Available	N/A	CM_MEMIF_EMIF_FW_CLKCTRL[1:0] MODULEMODE	Read only

3.6.20 CD_CORTEXM3 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.20.1 Overview

Figure 3-70 shows the overview of the clock domain.

Figure 3-70. CD_CORTEXM3 Overview

prcm-065

3.6.20.2 Clock Domain Modes

Table 3-228 lists the clock domain modes supported by the clock domain.

Table 3-228. CD_CORTEXM3 Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-229 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-229. CD_CORTEXM3 Control and Status Parameters

Parameter Name	Control/Status Bit Field
MPU_M3_CLK clock status	CM_MPU_M3_CLKSTCTRL[8] CLKACTIVITY_MPU_M3_CLK
Clock Domain State Transition Control	CM_MPU_M3_CLKSTCTRL[1:0] CLKTRCTRL

3.6.20.3 Clock Domain Dependency

CD_CORTEXM3 has no module wake-up dependency with any other clock domain of the device.

3.6.20.3.1 Static Dependency

Table 3-230 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-230. CD_CORTEXM3 Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_MPU_M3_STATICDEP[3] ABE_STATDEP	Read/Write
CD_DSS	Disabled	CM_MPU_M3_STATICDEP[8] DSS_STATDEP	Read/Write
CD_SGX	Disabled	CM_MPU_M3_STATICDEP[10] SGX_STATDEP	Read/Write
CD_CAM	Always disabled	CM_MPU_M3_STATICDEP[9] ISS_STATDEP	Read only
CD_IVAHD	Disabled	CM_MPU_M3_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Enabled	CM_MPU_M3_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Enabled	CM_MPU_M3_STATICDEP[6] L3_2_STATDEP	Read/Write
CD_L3_INIT	Disabled	CM_MPU_M3_STATICDEP[7] L3INIT_STATDEP	Read/Write
CD_L4_CFG	Enabled	CM_MPU_M3_STATICDEP[12] L4CFG_STATDEP	Read/Write
CD_L4_PER	Disabled	CM_MPU_M3_STATICDEP[13] L4PER_STATDEP	Read/Write
CD_L4_SEC	Disabled	CM_MPU_M3_STATICDEP[14] L4SEC_STATDEP	Read/Write
CD_EMIF	Enabled	CM_MPU_M3_STATICDEP[4] MEMIF_STATDEP	Read/Write
CD_DMA	Always disabled	CM_MPU_M3_STATICDEP[11] SDMA_STATDEP	Read only
CD_DSP	Disabled	CM_MPU_M3_STATICDEP[1] DSP_STATDEP	Read/Write

3.6.20.3.2 Dynamic Dependency

Table 3-231 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-231. CD_CORTEXM3 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_CAM	Always disabled	CM_MPU_M3_DYNAMICDEP[9] ISS_DYNDEP	Read only
CD_L3_2	Always enabled	CM_MPU_M3_DYNAMICDEP[6] L3_2_DYNDEP	Read only

3.6.20.4 Clock Domain Module Attributes

Table 3-232 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-232. CD_CORTEXM3 Modules Clocks Association

Module	Clock	Clock Type
CORTEXM3	MPU_M3_CLK	Interface and functional

Table 3-233 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-233. CD_CORTEXM3 Modules Wake-Up Request

Module	Wake-Up Feature
CORTEXM3	Master wake-up request

Table 3-234 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-234. CD_CORTEXM3 Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
CORTEXM3	Master/Slave	CM_MPU_M3_MPU_M3_CLK_CTRL[18] STBYST	Standby status
		CM_MPU_M3_MPU_M3_CLK_CTRL[17:16] IDLEST	Idle status

Table 3-235 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-235. CD_CORTEXM3 Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
CORTEXM3	Available	Available	N/A	CM_MPU_M3_MPU_M3_CLKCTRL[1:0] MODULEMODE	Read/Write

3.6.21 CD_DMA Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.21.1 Overview

Figure 3-71 shows the overview of the clock domain.

Figure 3-71. CD_DMA Overview

3.6.21.2 Clock Domain Modes

Table 3-236 lists the clock domain modes supported by the clock domain.

Table 3-236. CD_DMA Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 3-237 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-237. CD_DMA Control and Status Parameters

Parameter Name	Control/Status Bit Field
DMA_L3_ICLK clock status	CM_SDMA_CLKSTCTRL[8] CLKACTIVITY_DMA_L3_ICLK
Clock Domain State Transition Control	CM_SDMA_CLKSTCTRL[1:0] CLKTRCTRL

3.6.21.3 Clock Domain Dependency

CD_DMA has a permanently enabled static dependency to the CD_L3_2 clock domain. It has no dynamic or module wake-up dependency with any other clock domain of the device.

3.6.21.4 Clock Domain Module Attributes

Table 3-238 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-238. CD_DMA Modules Clocks Association

Module	Clock	Clock Type
sDMA	DMA_L3_ICLK	Interface and Functional
	DMA_L4_ICLK	Interface

Table 3-239 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-239. CD_DMA Modules Wake-Up Request

Module	Wake-Up Feature
sDMA	Master wake-up request

Table 3-240 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-240. CD_DMA Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
sDMA	Master/Slave	CM_SDMA_SDMA_CLKCTRL[18] STBYST	Standby status
		CM_SDMA_SDMA_CLKCTRL[17:16] IDLEST	Idle status

Table 3-241 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 3-241. CD_DMA Modules Slave Clock Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
sDMA	N/A	Available	N/A	CM_SDMA_SDMA_CLKCTRL[1:0] MODULEMODE	Read only

3.6.22 CD_CAM Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.22.1 Overview

Figure 3-72 shows the overview of the clock domain.

Figure 3-72. CD_CAM Overview

3.6.22.2 Clock Domain Modes

Table 3-242 lists the clock domain modes supported by the clock domain.

Table 3-242. CD_CAM Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-243 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-243. CD_CAM Control and Status Parameters

Parameter Name	Control/Status Bit Field
CAM_PHY_CTRL_CLK clock status	CM_CAM_CLKSTCTRL[9] CLKACTIVITY_CAM_PHY_CTRL_CLK
FDIF_FCLK clock status	CM_CAM_CLKSTCTRL[10] CLKACTIVITY_FDIF_FCLK
ISS_CLK clock status	CM_CAM_CLKSTCTRL[8] CLKACTIVITY_ISS_CLK
Clock Domain State Transition Control	CM_CAM_CLKSTCTRL[1:0] CLKTRCTRL

3.6.22.3 Clock Domain Dependency

CD_CAM has no module wake-up dependency with any other clock domain of the device.

3.6.22.3.1 Static Dependency

Table 3-244 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-244. CD_CAM Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_IVAHD	Disabled	CM_CAM_STATICDEP[2] IVAHD_STATDEP	Read/Write
CD_L3_1	Disabled	CM_CAM_STATICDEP[5] L3_1_STATDEP	Read/Write
CD_L3_2	Always enabled	CM_CAM_STATICDEP[6] L3_2_STATDEP	Read only
CD_EMIF	Disabled	CM_CAM_STATICDEP[4] MEMIF_STATDEP	Read/Write

3.6.22.3.2 Dynamic Dependency

Table 3-245 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-245. CD_CAM Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_2	Always disabled	CM_CAM_DYNAMICDEP[6] L3_2_DYNDP	Read only

3.6.22.4 Clock Domain Module Attributes

Table 3-246 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-246. CD_CAM Modules Clocks Association

Module	Clock	Clock Type
FACE DETECT	FDIF_FCLK	Interface and Functional
ISS	CAM_PHY_CTRL_CLK	Functional
	ISS_CLK	Interface and Functional

Table 3-247 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-247. CD_CAM Modules Wake-Up Request

Module	Wake-Up Feature
FACE DETECT	None
ISS	None

Table 3-248 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-248. CD_CAM Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
FACE DETECT	Master/Slave	CM_CAM_FDIF_CLKCTRL[18] STBYST	Standby status
		CM_CAM_FDIF_CLKCTRL[17:16] IDLEST	Idle status
ISS	Master/Slave	CM_CAM_ISS_CLKCTRL[18] STBYST	Standby status
		CM_CAM_ISS_CLKCTRL[17:16] IDLEST	Idle status

Table 3-249 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-249. CD_CAM Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
FACE DETECT	Available	N/A	Available	CM_CAM_FDIF_CLKCTRL[1:0] MODULEMODE	Read/Write
ISS	Available	N/A	Available	CM_CAM_ISS_CLKCTRL[1:0] MODULEMODE	Read/Write

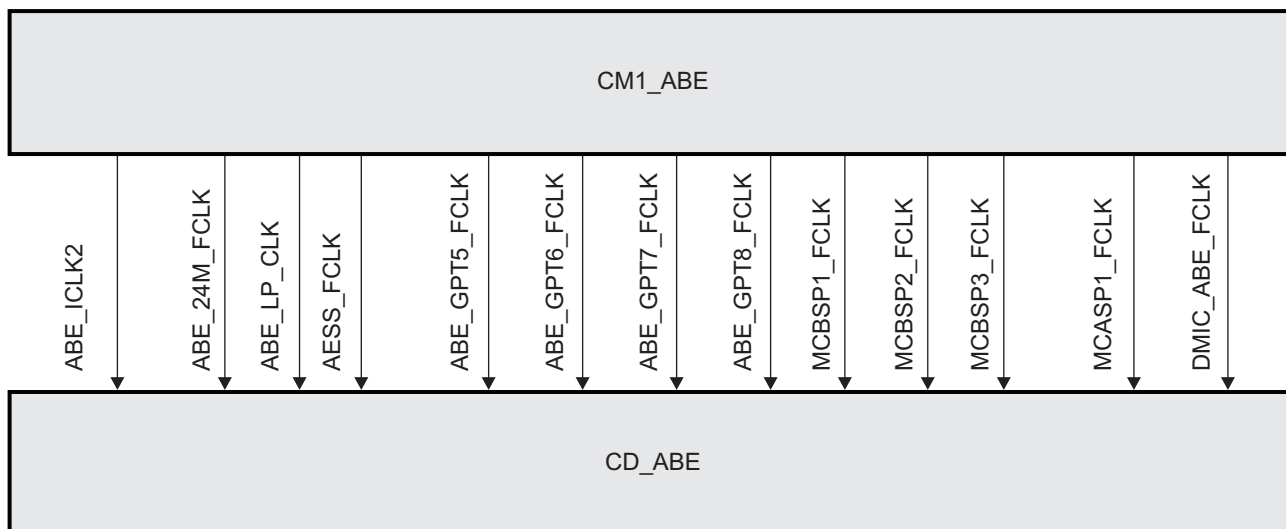

NOTE: To enable and access the ISS module, first the Cortex-M3 module must be enabled and the reset for Cortex-M3 CACHE and MMU must be cleared.

3.6.23 CD_ABE Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.23.1 Overview

Figure 3-73 shows the overview of the clock domain.

Figure 3-73. CD_ABE Overview

prcm-069

3.6.23.2 Clock Domain Modes

Table 3-250 lists the clock domain modes supported by the clock domain.

Table 3-250. CD_ABE Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Available	Available	Available

Table 3-251 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-251. CD_ABE Control and Status Parameters

Parameter Name	Control/Status Bit Field
ABE_24M_FCLK clock status	CM1_ABE_CLKSTCTRL[13] CLKACTIVITY_ABE_24M_FCLK
ABE_ALWON_32K_CLK clock status	CM1_ABE_CLKSTCTRL[12] CLKACTIVITY_ABE_ALWON_32K_CLK
ABE_SYSCCLK clock status	CM1_ABE_CLKSTCTRL[11] CLKACTIVITY_ABE_SYSCCLK
ABE_X2_CLK clock status	CM1_ABE_CLKSTCTRL[8] CLKACTIVITY_ABE_X2_CLK
24M_FCLK clock status	CM1_ABE_CLKSTCTRL[10] CLKACTIVITY_24M_FCLK
ABE_ICLK2 clock status	CM1_ABE_CLKSTCTRL[9] CLKACTIVITY_ABE_ICLK2
Clock Domain State Transition Control	CM1_ABE_CLKSTCTRL[1:0] CLKTRCTRL

3.6.23.3 Clock Domain Dependency

CD_ABE has no static or dynamic dependency with any other clock domain of the device.

3.6.23.3.1 Wake-Up Dependency

Table 3-252 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-252. CD_ABE Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
DMIC	CD_ABE	CD_DMA, CD_L3_1, CD_L3_2	Disabled	PM_ABE_DMIC_WKDEP[7] WKUPDEP_DMIC_DMA_SDMA	Read/Write

3.6.24 CD_L4_ALWON_CORE Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.24.1 Overview

Figure 3-74 shows the overview of the clock domain.

Figure 3-74. CD_L4_ALWON_CORE Overview

3.6.24.2 Clock Domain Modes

CD_L4_ALWON_CORE is an always-on clock domain and has no software-controlled clock domain modes management associated.

3.6.24.3 Clock Domain Dependency

CD_L4_ALWON_CORE has no static or dynamic dependency with any other clock domain of the device.

3.6.24.3.1 Wake-Up Dependency

Table 3-257 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-257. CD_L4_ALWON_CORE Wake-Up Dependency Association Parameters

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
SR_CORE	CD_L4_ALWON_C ORE	CD_CORTEXM3	Disabled	PM_ALWON_SR_C ORE_WKDEP[1] WKUPDEP_SR_CO RE_MPU_M3	Read/Write

Table 3-257. CD_L4_ALWON_CORE Wake-Up Dependency Association Parameters (continued)

Originator Module	Originator Clock Domain	Servicing Clock Domain	Default Setting	Control Bit Field	Access Type
	CD_L4_ALWON_CORE	CD_CORTEXA9	Disabled	PM_ALWON_SR_CORE_WKDEP[0] WKUPDEP_SR_CORE_MPU	Read/Write
SR_IVA	CD_L4_ALWON_CORE	CD_CORTEXM3	Disabled	PM_ALWON_SR_IVA_WKDEP[1] WKUPDEP_SR_IVA_MPU_M3	Read/Write
	CD_L4_ALWON_CORE	CD_CORTEXA9	Disabled	PM_ALWON_SR_IVA_WKDEP[0] WKUPDEP_SR_IVA_MPU	Read/Write
SR_MPU	CD_L4_ALWON_CORE	CD_CORTEXA9	Always enabled	PM_ALWON_SR_MPU_WKDEP[0] WKUPDEP_SR_MPU_MPU	Read only

3.6.24.4 Clock Domain Module Attributes

Table 3-258 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-258. CD_L4_ALWON_CORE Modules Clocks Association

Module	Clock	Clock Type
SR_CORE	AO_L4_ICLK	Interface
	SR_CORE_SYS_CLK	Functional
SR_IVA	AO_L4_ICLK	Interface
	SR_IVA_SYS_CLK	Functional
SR_MPU	AO_L4_ICLK	Interface
	SR_MPU_SYS_CLK	Functional

Table 3-259 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-259. CD_L4_ALWON_CORE Modules Wake-Up Request

Module	Wake-Up Feature
SR_CORE	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
SR_IVA	Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ)
SR_MPU	Slave wake-up request (MPU_A9 -IRQ)

Table 3-260 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-260. CD_L4_ALWON_CORE Modules Clock-Management Modes and Control

Module	Clock-Management Protocol	Status Bit Field	Role
SR_CORE	Slave	CM_ALWON_SR_CORE_CLK_CTRL[17:16] IDLEST	Idle status
SR_IVA	Slave	CM_ALWON_SR_IVA_CLKCTRL[17:16] IDLEST	Idle status
SR_MPU	Slave	CM_ALWON_SR_MPU_CLKCTRL[17:16] IDLEST	Idle status

Table 3-261 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-261. CD_L4_ALWON_CORE Modules Slave Clock-Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
SR_CORE	Available	N/A	Available	CM_ALWON_SR_CORE_CLKCTRL[1:0] MODULEMODE	Read/Write
SR_IVA	Available	N/A	Available	CM_ALWON_SR_IVA_CLKCTRL[1:0] MODULEMODE	Read/Write
SR_MPU	Available	N/A	Available	CM_ALWON_SR_MPU_CLKCTRL[1:0] MODULEMODE	Read/Write

3.7 Power Management Functional Description

This section highlights the functional concepts of power domain level power management in the device.

The following power domains support the DPS with switching times of less than 5 μ s.

- PD_CORE
- PD_DSP
- PD_MPU

3.7.1 PD_WKUP Description

PD_WKUP contains the following reset domains:

- WKUP_PWRON_RST
- WKUP_RST
- WKUP_SYS_PWRON_RST

PD_WKUP contains CD_WKUP clock domain.

Table 3-262 lists the logic retention capability for each module of the power domain.

Table 3-262. PD_WKUP Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
SYSCTRL_PADCONF_WKUP	No	None	None
BANDGAP	No	None	None
SYSCTRL_GENERAL_WKUP	No	None	None
GPIO1	No	RM_WKUP_GPIO1_CONTEXT[0] LOSTCONTEXT_DFF	None
KEYBOARD	No	RM_WKUP_KEYBOARD_CONTEXT[0] LOSTCONTEXT_DFF	None
PRM	No	None	None
SAR_RAM	No	RM_WKUP_SARRAM_CONTEXT[0] LOSTCONTEXT_DFF	None
SCRM	No	None	None
32KTIMER	No	RM_WKUP_32KTIMER_CONTEXT[0] LOSTCONTEXT_DFF	None
GPTIMER1	No	RM_WKUP_GPTIMER1_CONTEXT[0] LOSTCONTEXT_DFF	None
WDTIMER2	No	RM_WKUP_WDTIMER2_CONTEXT[0] LOSTCONTEXT_DFF	None
L4_WKUP interconnect	No	RM_WKUP_L4WKUP_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.1.1 Power Domain Modes

The PD_WKUP power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD_WKUP power domain has no memory banks.

3.7.2 PD_DSP Description

PD_DSP contains the following reset domains:

- DSP_RST
- DSP_PWRON_RST
- DSP_RET_RST
- DSP_SYS_RST

PD_DSP contains the CD_DSP clock domain.

[Table 3-263](#) lists the logic retention capability for each module of the power domain.

Table 3-263. PD_DSP Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DSP	Partial	RM_DSP_DSP_CONTEXT[0] LOSTCONTEXT_DFF	RM_DSP_DSP_CONTEXT[1] LOSTCONTEXT_RFF

3.7.2.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#), for a functional description of the power-management architecture of a generic power domain.

3.7.2.1.1 Logic and Memory Area Power Modes

[Table 3-264](#) lists the power modes supported by the logic area of the power domain.

Table 3-264. PD_DSP Logic Area Power Modes

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available	Available

[Table 3-265](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-265. PD_DSP Memory Area Power Modes

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
DSP_EDMA		ON	RETENTION	OFF	
	DSP - DSP_EDMA	always_on	always_retention		always_enabled
DSP_L1		ON	OFF, RETENTION	OFF	
	DSP - DSP_L1	always_on	software_control		None
DSP_L2		ON	OFF, RETENTION	OFF	
	DSP - DSP_L2	always_on	software_control		always_enabled

3.7.2.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-266 lists the power modes controls for the power domain.

Table 3-266. PD_DSP Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	DSP_L2	PM_DSP_PWRSTCTRL[9] DSP_L2_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention state)	DSP_L1	PM_DSP_PWRSTCTRL[8] DSP_L1_RETSTATE	Read/Write
Power Domain - Low Power State Change Control		PM_DSP_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Memory Area - State Control (Logic in On state)	DSP_EDMA	PM_DSP_PWRSTCTRL[21:20] DSP_EDMA_ONSTATE	Read only
Logic Area - Retention State Control		PM_DSP_PWRSTCTRL[2] LOGICRETSTATE	Read/Write
Memory Area - State Control (Logic in On state)	DSP_L2	PM_DSP_PWRSTCTRL[19:18] DSP_L2_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	DSP_L1	PM_DSP_PWRSTCTRL[17:16] DSP_L1_ONSTATE	Read only
Memory Area - State Control (Logic in Retention state)	DSP_EDMA	PM_DSP_PWRSTCTRL[10] DSP_EDMA_RETSTATE	Read only
Power Domain - State Transition Control		PM_DSP_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-267 lists the power modes status for the power domain.

Table 3-267. PD_DSP Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_DSP_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	DSP_EDMA	PM_DSP_PWRSTST[9:8] DSP_EDMA_STATEST
Memory Area - State Status	DSP_L2	PM_DSP_PWRSTST[7:6] DSP_L2_STATEST
Memory Area - State Status	DSP_L1	PM_DSP_PWRSTST[5:4] DSP_L1_STATEST
Power Domain - State Transition Status		PM_DSP_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_DSP_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_DSP_PWRSTST[1:0] POWERSTATEST

3.7.3 PD_STD_EFUSE Description

PD_STD_EFUSE contains the STD_EFUSE_PWRON_RST reset domain.

PD_STD_EFUSE contains the CD_STD_EFUSE clock domain.

Table 3-268 lists the logic retention capability for each module of the power domain.

Table 3-268. PD_STD_EFUSE Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
STD_EFUSE	No	None	None

3.7.3.1 Power Domain Modes

The PD_STD_EFUSE power domain is hardware-controlled by the PRCM module and has no software control associated. It is switched to ON power state when the device is powered on and switched to OFF power state after the power-up sequence of the device.

The PD_STD_EFUSE power domain has no memory banks.

3.7.4 PD_MPU Description

PD_MPU contains the following reset domains:

- CORTEXA9_PWRON_RST
- CORTEXA9_RST

PD_MPU contains the CD_CORTEXA9 clock domain.

[Table 3-269](#) lists the logic retention capability for each module of the power domain.

Table 3-269. PD_MPU Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CORTEXA9	No	RM_MPU_MPU_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.4.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.4.1.1 Logic and Memory Area Power Modes

[Table 3-270](#) lists the power modes supported by the logic area of the power domain.

Table 3-270. PD_MPU Logic Area Power Modes

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Not Available	Available	Available	Available	Available

[Table 3-271](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-271. PD_MPU Memory Area Power Modes

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
MPU_L1		ON	OFF, RETENTION	OFF	
	CORTEXA9 - MPU_L1	always_on	software_control		None
MPU_L2		ON	OFF, RETENTION	OFF	
	CORTEXA9 - MPU_L2	always_on	software_control		always_enabled
MPU_RAM		ON	RETENTION	OFF	
	CORTEXA9 - MPU_RAM	always_on	always_retention		always_enabled

3.7.4.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-272 lists the power modes controls for the power domain.

Table 3-272. PD_MPU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	MPU_L2	PM_MPU_PWRSTCTRL[9] MPU_L2_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention state)	MPU_L1	PM_MPU_PWRSTCTRL[8] MPU_L1_RETSTATE	Read/Write
Power Domain - Low Power State Change Control		PM_MPU_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read only
Memory Area - State Control (Logic in On state)	MPU_RAM	PM_MPU_PWRSTCTRL[21:20] MPU_RAM_ONSTATE	Read only
Logic Area - Retention State Control		PM_MPU_PWRSTCTRL[2] LOGICRETSTATE	Read/Write
Memory Area - State Control (Logic in On state)	MPU_L2	PM_MPU_PWRSTCTRL[19:18] MPU_L2_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	MPU_L1	PM_MPU_PWRSTCTRL[17:16] MPU_L1_ONSTATE	Read only
Memory Area - State Control (Logic in Retention state)	MPU_RAM	PM_MPU_PWRSTCTRL[10] MPU_RAM_RETSTATE	Read only
Power Domain - State Transition Control		PM_MPU_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-273 lists the power modes status for the power domain.

Table 3-273. PD_MPU Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_MPU_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	MPU_RAM	PM_MPU_PWRSTST[9:8] MPU_RAM_STATEST
Memory Area - State Status	MPU_L2	PM_MPU_PWRSTST[7:6] MPU_L2_STATEST
Memory Area - State Status	MPU_L1	PM_MPU_PWRSTST[5:4] MPU_L1_STATEST
Power Domain - State Transition Status		PM_MPU_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_MPU_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_MPU_PWRSTST[1:0] POWERSTATEST

3.7.5 PD_L4_PER Description

PD_L4_PER contains the following reset domains:

- L4_PER_PWRON_RET_RST
- L4_PER_RET_RST
- L4_PER_RST

PD_L4_PER contains the CD_L4_PER and CD_L4_SEC clock domains.

- Table 3-274 lists the logic retention capability for each module of the power domain.

Table 3-274. PD_L4_PER Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
GPTIMER10	No	RM_L4PER_GPTIMER10_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.5.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.5.1.1 Logic and Memory Area Power Modes

[Table 3-275](#) lists the power modes supported by the logic area of the power domain.

Table 3-275. PD_L4_PER Logic Area Power Modes

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available	Available

[Table 3-276](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-276. PD_L4_PER Memory Area Power Modes

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
NONRETAINED_BANK		ON	OFF	OFF	
	MCBSP4 - MCBSP_BANK	always_on	always_off		None
	HSMMC3 - MMCHSSRAM	always_on	always_off		None

Table 3-276. PD_L4_PER Memory Area Power Modes (continued)

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
	SLIMBUS2 - SLIMBUS_BANK	always_on	always_off		None
RETAINED_BANK		ON	RETENTION	OFF	
	UART1 - UART_MEM	always_on	always_retention		None
	CryptoDMA - DMA_CRYPTOME M	always_on	always_retention		None
	FPKA - PKA_MEM	always_on	always_off		Yes

3.7.5.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-277 lists the power modes controls for the power domain.

Table 3-277. PD_L4_PER Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	NONRETAINED_BANK	PM_L4PER_PWRSTCTRL[9] NONRETAINED_BANK_RETS TATE	Read only
Memory Area - State Control (Logic in Retention state)	RETAINED_BANK	PM_L4PER_PWRSTCTRL[8] RETAINED_BANK_RETSTAT E	Read only
Power Domain - Low Power State Change Control		PM_L4PER_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Logic Area - Retention State Control		PM_L4PER_PWRSTCTRL[2] LOGICRETSTATE	Read/Write
Memory Area - State Control (Logic in On state)	NONRETAINED_BANK	PM_L4PER_PWRSTCTRL[19: 18] NONRETAINED_BANK_ONST ATE	Read only
Memory Area - State Control (Logic in On state)	RETAINED_BANK	PM_L4PER_PWRSTCTRL[17: 16] RETAINED_BANK_ONSTATE	Read only
Power Domain - State Transition Control		PM_L4PER_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-278 lists the power modes status for the power domain.

Table 3-278. PD_L4_PER Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_L4PER_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	NONRETAINED_BANK	PM_L4PER_PWRSTST[7:6] NONRETAINED_BANK_STATEST
Memory Area - State Status	RETAINED_BANK	PM_L4PER_PWRSTST[5:4] RETAINED_BANK_STATEST
Power Domain - State Transition Status		PM_L4PER_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_L4PER_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_L4PER_PWRSTST[1:0] POWERSTATEST

3.7.6 PD_L3_INIT Description

PD_L3_INIT contains the following reset domains:

- DPPLL_L3_INIT_PWRON_RET_RST
- L3_INIT_PWRON_RST
- L3_INIT_RET_RST
- L3_INIT_RST

PD_L3_INIT contains the CD_L3_INIT clock domain.

[Table 3-279](#) lists the logic retention capability for each module of the power domain.

Table 3-279. PD_L3_INIT Modules Power Attributes

Module	Logic Retention	DDF Context Status	RFF Context Status
CM1_USB	No	None	None
DPPLL_USB	Full	None	None
HSI	Full	None	RM_L3INIT_HSI_CONTEXT[1] LOSTCONTEXT_RFF
HSMMC1	Full	None	RM_L3INIT_MMC1_CONTEXT [1] LOSTCONTEXT_RFF
HSMMC2	Full	None	RM_L3INIT_MMC2_CONTEXT [1] LOSTCONTEXT_RFF
USBPHY	No	RM_L3INIT_USBPHY_CONTE XT[0] LOSTCONTEXT_DFF	None
FSUSB	Full	None	RM_L3INIT_USB_HOST_FS_ CONTEXT[1] LOSTCONTEXT_RFF
HSUSBHOST	Full	None	RM_L3INIT_USB_HOST_CON TEXT[1] LOSTCONTEXT_RFF
HSUSBOTG	Full	None	RM_L3INIT_USB_OTG_CONT EXT[1] LOSTCONTEXT_RFF
HSUSBTLL	Full	None	RM_L3INIT_HSUSBTLL_CON TEXT[1] LOSTCONTEXT_RFF

3.7.6.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.6.1.1 Logic and Memory Area Power Modes

[Table 3-280](#) lists the power modes supported by the logic area of the power domain.

Table 3-280. PD_L3_INIT Logic Area Power Modes

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available	Available

[Table 3-281](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-281. PD_L3_INIT Memory Area Power Modes

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
L3INIT_BANK1		ON	OFF	OFF	
	HSI - HSI_DMAFIFO	always_on	always_off		None
	HSMC1 - HSMC1SRAM	always_on	always_off		None
	HSUSBOTG - USBMEM	always_on	always_off		always_enabled

3.7.6.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-282 lists the power modes controls for the power domain.

Table 3-282. PD_L3_INIT Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	L3INIT_BANK1	PM_L3INIT_PWRSTCTRL[8] L3INIT_BANK1_RETSTATE	Read only
Power Domain - Low Power State Change Control		PM_L3INIT_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Logic Area - Retention State Control		PM_L3INIT_PWRSTCTRL[2] LOGICRETSTATE	Read/Write
Memory Area - State Control (Logic in On state)	L3INIT_BANK1	PM_L3INIT_PWRSTCTRL[17:16] L3INIT_BANK1_ONSTATE	Read only
Power Domain - State Transition Control		PM_L3INIT_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-283 lists the power modes status for the power domain.

Table 3-283. PD_L3_INIT Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_L3INIT_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	L3INIT_BANK1	PM_L3INIT_PWRSTST[5:4] L3INIT_BANK1_STATEST
Power Domain - State Transition Status		PM_L3INIT_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_L3INIT_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_L3INIT_PWRSTST[1:0] POWERSTATEST

3.7.7 PD_IVAHD Description

PD_IVAHD contains the following reset domains:

- IVAHD_PWRON_RST
- IVAHD_RST
- IVAHD_SEQ1_RST
- IVAHD_SEQ2_RST

PD_IVAHD contains the CD_IVAHD clock domain.

Table 3-284 lists the logic retention capability for each module of the power domain.

Table 3-284. PD_IVAHD Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
IVAHD	No	RM_IVAHD_IVAHD_CONTEX T[0] LOSTCONTEXT_DFF	None
SL2	No	RM_IVAHD_SL2_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.7.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.7.1.1 Logic and Memory Area Power Modes

[Table 3-285](#) lists the power modes supported by the logic area of the power domain.

Table 3-285. PD_IVAHD Logic Area Power Modes

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Not available	Available	Available

[Table 3-286](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-286. PD_IVAHD Memory Area Power Modes

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
HWA_MEM		ON	OFF	OFF	
	IVAHD - HWA_MEM	always_on	always_off		always_enabled
SL2_MEM		ON	OFF, RETENTION	OFF	
	SL2 - SL2MEM	always_on	software_control		always_enabled
TCM1_MEM		ON	OFF, RETENTION	OFF	
	IVAHD - TCM_1	always_on	software_control		always_enabled
TCM2_MEM		ON	OFF, RETENTION	OFF	
	IVAHD - TCM_2	always_on	software_control		always_enabled

3.7.7.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-287](#) lists the power modes controls for the power domain.

Table 3-287. PD_IVAHD Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	SL2_MEM	PM_IVAHD_PWRSTCTRL[9] SL2_MEM_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention state)	HWA_MEM	PM_IVAHD_PWRSTCTRL[8] HWA_MEM_RETSTATE	Read only
Power Domain - Low Power State Change Control		PM_IVAHD_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Memory Area - State Control (Logic in On state)	TCM2_MEM	PM_IVAHD_PWRSTCTRL[23: 22] TCM2_MEM_ONSTATE	Read only

Table 3-287. PD_IVAHD Power Modes Control Parameters (continued)

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in On state)	TCM1_MEM	PM_IVAHD_PWRSTCTRL[21:20] TCM1_MEM_ONSTATE	Read only
Logic Area - Retention State Control		PM_IVAHD_PWRSTCTRL[2] LOGICRETSTATE	Read only
Memory Area - State Control (Logic in On state)	SL2_MEM	PM_IVAHD_PWRSTCTRL[19:18] SL2_MEM_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	HWA_MEM	PM_IVAHD_PWRSTCTRL[17:16] HWA_MEM_ONSTATE	Read only
Memory Area - State Control (Logic in Retention state)	TCM2_MEM	PM_IVAHD_PWRSTCTRL[11] TCM2_MEM_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention state)	TCM1_MEM	PM_IVAHD_PWRSTCTRL[10] TCM1_MEM_RETSTATE	Read/Write
Power Domain - State Transition Control		PM_IVAHD_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-288 lists the power modes status for the power domain.

Table 3-288. PD_IVAHD Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_IVAHD_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	TCM1_MEM	PM_IVAHD_PWRSTST[9:8] TCM1_MEM_STATEST
Memory Area - State Status	SL2_MEM	PM_IVAHD_PWRSTST[7:6] SL2_MEM_STATEST
Memory Area - State Status	HWA_MEM	PM_IVAHD_PWRSTST[5:4] HWA_MEM_STATEST
Power Domain - State Transition Status		PM_IVAHD_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_IVAHD_PWRSTST[2] LOGICSTATEST
Memory Area - State Status	TCM2_MEM	PM_IVAHD_PWRSTST[11:10] TCM2_MEM_STATEST
Power Domain - State Status		PM_IVAHD_PWRSTST[1:0] POWERSTATEST

3.7.8 PD_SGX Description

PD_SGX contains the SGX_RST reset domain.

PD_SGX contains the CD_SGX clock domain.

Table 3-289 lists the logic retention capability for each module of the power domain.

Table 3-289. PD_SGX Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
SGX	No	RM_SGX_SGX_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.8.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See Section 3.1.1.2.1 for a functional description of the power-management architecture of a generic power domain.

3.7.8.1.1 Logic and Memory Area Power Modes

Table 3-290 lists the power modes supported by the logic area of the power domain.

Table 3-290. PD_SGX Logic Area Power Modes

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Not available	Available	Available

Table 3-291 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-291. PD_SGX Memory Area Power Modes

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
	SGX - SGX_MEM	always_on	always_off		always_enabled

3.7.8.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-292 lists the power modes controls for the power domain.

Table 3-292. PD_SGX Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain - Low Power State Change Control		PM_SGX_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Memory Area - State Control (Logic in On state)	SGX_MEM	PM_SGX_PWRSTCTRL[17:16] SGX_MEM_ONSTATE	Read only
Power Domain - State Transition Control		PM_SGX_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-293 lists the power modes status for the power domain.

Table 3-293. PD_SGX Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area - State Status	SGX_MEM	PM_SGX_PWRSTST[5:4] SGX_MEM_STATEST
Power Domain - State Transition Status		PM_SGX_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_SGX_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_SGX_PWRSTST[1:0] POWERSTATEST

3.7.9 PD_EMU Description

PD_EMU contains the following reset domains:

- EMU_EARLY_PWRON_RST
- EMU_PWRON_RST
- EMU_RST

PD_EMU contains the CD_EMU clock domain.

Table 3-294 lists the logic retention capability for each module of the power domain.

Table 3-294. PD_EMU Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CM1_EMU	No	None	None
DEBUG	No	None	None

3.7.9.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.9.1.1 Logic and Memory Area Power Modes

[Table 3-295](#) lists the power modes supported by the logic area of the power domain.

Table 3-295. PD_EMU Logic Area Power Modes

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Not available	Not available	Available

[Table 3-296](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-296. PD_EMU Memory Area Power Modes

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
	DEBUG - DebugSS_MEM	always_on	always_off		always_enabled

3.7.9.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-297](#) lists the power modes controls for the power domain.

Table 3-297. PD_EMU Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in On state)	EMU_BANK	PM_EMU_PWRSTCTRL[17:16] EMU_BANK_ONSTATE	Read only
Power Domain - State Transition Control		PM_EMU_PWRSTCTRL[1:0] POWERSTATE	Read only

[Table 3-298](#) lists the power modes status for the power domain.

Table 3-298. PD_EMU Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area - State Status	EMU_BANK	PM_EMU_PWRSTST[5:4] EMU_BANK_STATEST
Power Domain - State Transition Status		PM_EMU_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_EMU_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_EMU_PWRSTST[1:0] POWERSTATEST

3.7.10 PD_DSS Description

PD_DSS contains the following reset domains:

- DSS_RET_RST
- DSS_RST

PD_DSS contains the CD_DSS clock domain.

[Table 3-299](#) lists the logic retention capability for each module of the power domain.

Table 3-299. PD_DSS Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DSS	Partial	RM_DSS_DSS_CONTEXT[0] LOSTCONTEXT_DFF	RM_DSS_DSS_CONTEXT[1] LOSTCONTEXT_RFF

3.7.10.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.10.1.1 Logic and Memory Area Power Modes

[Table 3-300](#) lists the power modes supported by the logic area of the power domain.

Table 3-300. PD_DSS Logic Area Power Modes

Off	Retention-OSWR	On-Inactive	On-Active
Available	Available	Available	Available

[Table 3-301](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-301. PD_DSS Memory Area Power Modes

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
DSS_MEM		ON	OFF	OFF	
	DSS - DSSMEM	always_on	always_off		always_enabled

3.7.10.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-302](#) lists the power modes controls for the power domain.

Table 3-302. PD_DSS Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	DSS_MEM	PM_DSS_PWRSTCTRL[8] DSS_MEM_RETSTATE	Read only
Power Domain - Low Power State Change Control		PM_DSS_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Logic Area - Retention State Control		PM_DSS_PWRSTCTRL[2] LOGICRETSTATE	Read only
Memory Area - State Control (Logic in On state)	DSS_MEM	PM_DSS_PWRSTCTRL[17:16] DSS_MEM_ONSTATE	Read only

Table 3-302. PD_DSS Power Modes Control Parameters (continued)

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain - State Transition Control		PM_DSS_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-303 lists the power modes status for the power domain.

Table 3-303. PD_DSS Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area - State Status	DSS_MEM	PM_DSS_PWRSTST[5:4] DSS_MEM_STATEST
Power Domain - State Transition Status		PM_DSS_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_DSS_PWRSTST[2] LOGICSTATEST
Power Domain - State Status		PM_DSS_PWRSTST[1:0] POWERSTATEST

3.7.11 PD_CORE Description

PD_CORE contains the following reset domains:

- CM2_PWRON_RET_RST
- CM2_RET_RST
- CORE_PWRON_RET_RST
- CORE_RET_RST
- CORE_RST
- DLL_RST
- CORTEXM3_PWRON_RST
- CORTEXM3_RET_RST
- CORTEXM3_RST1
- CORTEXM3_RST2
- CORTEXM3_RST3
- EMIF_PWRON_RST
- SDMA_RET_RST

PD_CORE contains the following clock domains:

- CD_DMA
- CD_CORTEXM3
- CD_EMIF
- CD_L3_1
- CD_L3_2
- CD_L3_INSTR
- CD_L4_CFG

Table 3-304 lists the logic retention capability for each module of the power domain.

Table 3-304. PD_CORE Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
SYSCTRL_PADCONF_CORE	Full	None	None
CM2	Full	None	None
DDRPHY	No	None	None

Table 3-304. PD_CORE Modules Power Attributes (continued)

Module	Logic Retention	DFF Context Status	RFF Context Status
SYSCTRL_GENERAL_CORE	Full	None	None
DLL	No	None	None
DMM	Partial	RM_MEMIF_DMM_CONTEXT[0] LOSTCONTEXT_DFF	RM_MEMIF_DMM_CONTEXT[1] LOSTCONTEXT_RFF

3.7.11.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.11.1.1 Logic and Memory Area Power Modes

[Table 3-305](#) lists the power modes supported by the logic area of the power domain.

Table 3-305. PD_CORE Logic Area Power Modes

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Available	Available	Available

Table 3-306 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-306. PD_CORE Memory Area Power Modes

Memory Bank	Module - Memory	Logic On	Logic Retention	logic off	RTA Feature
CORE_NRET_BANK		ON	OFF	OFF	
	DMM - DMM_MEMBANK2	always_on	always_off		None
CORE_OCMRAM		OFF, RETENTION, ON	OFF, RETENTION	OFF	
	OCMC_RAM - OCMC_RAM_Bank 1	software_control	software_control		always_enabled
CORE_OTHER_BANK		ON	RETENTION	OFF	
	sDMA - DMA_MEM	always_on	always_retention		None
	DMM - DMM_MEMBANK1	always_on	always_retention		always_enabled
MPU_M3_L2RAM		ON	OFF, RETENTION	OFF	
	CORTEXM3 - MPU_M3_L2RAM_MEM	always_on	software_control		always_enabled
MPU_M3_UNICACHE		ON	OFF, RETENTION	OFF	
	CORTEXM3 - MPU_M3_Uncache_mem	always_on	software_control		None

3.7.11.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-307 lists the power modes controls for the power domain.

Table 3-307. PD_CORE Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	CORE_OCMRAM	PM_CORE_PWRSTCTRL [9] CORE_OCMRAM_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention state)	CORE_OTHER_BANK	PM_CORE_PWRSTCTRL [8] CORE_OTHER_BANK_RETSTATE	Read only
Memory Area - State Control (Logic in On state)	CORE_NRET_BANK	PM_CORE_PWRSTCTRL [25:24] INTRCONN_NRET_BANK_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	MPU_M3_UNICACHE	PM_CORE_PWRSTCTRL [23:22] MPU_M3_UNICACHE_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	MPU_M3_L2RAM	PM_CORE_PWRSTCTRL [21:20] MPU_M3_L2RAM_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	CORE_OCMRAM	PM_CORE_PWRSTCTRL [19:18] CORE_OCMRAM_ONSTATE	Read/Write

Table 3-307. PD_CORE Power Modes Control Parameters (continued)

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in On state)	CORE_OTHER_BANK	PM_CORE_PWRSTCTRL[17:16] CORE_OTHER_BANK_ONSTATE	Read only
Memory Area - State Control (Logic in Retention state)	CORE_NRET_BANK	PM_CORE_PWRSTCTRL[12] INTRCONN_NRET_BANK_RETSTATE	Read only
Memory Area - State Control (Logic in Retention state)	MPU_M3_UNICACHE	PM_CORE_PWRSTCTRL[11] MPU_M3_UNICACHE_RETSTATE	Read/Write
Memory Area - State Control (Logic in Retention)	MPU_M3_L2RAM	PM_CORE_PWRSTCTRL[10] MPU_M3_L2RAM_RETSTATE	Read/Write
Logic Area - Retention State Control	N/A	PM_CORE_PWRSTCTRL[2] LOGICRETSTATE	Read/Write
Power Domain - Low Power State Change Control	N/A	PM_CORE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Power Domain - State Transition Control	N/A	PM_CORE_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-308 lists the power modes status for the power domain.

Table 3-308. PD_CORE Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_CORE_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	MPU_M3_L2RAM	PM_CORE_PWRSTST[9:8] MPU_M3_L2RAM_STATEST
Memory Area - State Status	CORE_OCMRAM	PM_CORE_PWRSTST[7:6] CORE_OCMRAM_STATEST
Memory Area - State Status	CORE_OTHER_BANK	PM_CORE_PWRSTST[5:4] CORE_OTHER_BANK_STATEST
Memory Area - State Status	CORE_NRET_BANK	PM_CORE_PWRSTST[13:12] INTRCONN_NRET_BANK_STATEST
Memory Area - State Status	MPU_M3_UNICACHE	PM_CORE_PWRSTST[11:10] MPU_M3_UNICACHE_STATEST
Logic Area - State Status		PM_CORE_PWRSTST[2] LOGICSTATEST
Power Domain - State Transition Status		PM_CORE_PWRSTST[20] INTRTRANSITION
Power Domain - State Status		PM_CORE_PWRSTST[1:0] POWERSTATEST

3.7.12 PD_CAM Description

PD_CAM contains the CAM_RST reset domain.

PD_CAM contains the CD_CAM clock domain.

Table 3-309 lists the logic retention capability for each module of the power domain.

Table 3-309. PD_CAM Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
FACE DETECT	No	RM_CAM_FDIF_CONTEXT[0] LOSTCONTEXT_DFF	None
ISS	No	RM_CAM_ISS_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.12.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for functional description of the power-management architecture of a generic power domain.

3.7.12.1.1 Logic and Memory Area Power Modes

[Table 3-310](#) lists the power modes supported by the logic area of the power domain.

Table 3-310. PD_CAM Logic Area Power Modes

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Not available	Not available	Available	Available

[Table 3-311](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-311. PD_CAM Memory Area Power Modes

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
	FACE DETECT - FDIFMEM	always_on	always_off		always_enabled
	ISS - ISSMEM	always_on	always_off		always_enabled

3.7.12.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-312](#) lists the power modes controls for the power domain.

Table 3-312. PD_CAM Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Power Domain - Low Power State Change Control		PM_CAM_PWRSTCTRL [4] LOWPOWERSTATECHANGE	Read/Write
Memory Area - State Control (Logic in On state)	CAM_MEM	PM_CAM_PWRSTCTRL [17:16] CAM_MEM_ONSTATE	Read only
Power Domain - State Transition Control		PM_CAM_PWRSTCTRL [1:0] POWERSTATE	Read/Write

[Table 3-313](#) lists the power modes status for the power domain.

Table 3-313. PD_CAM Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Memory Area - State Status	CAM_MEM	PM_CAM_PWRSTST [5:4] CAM_MEM_STATEST
Power Domain - State Transition Status		PM_CAM_PWRSTST [20] INTRANSITION
Logic Area - State Status		PM_CAM_PWRSTST [2] LOGICSTATEST
Power Domain - State Status		PM_CAM_PWRSTST [1:0] POWERSTATEST

3.7.13 PD_AUDIO Description

PD_AUDIO contains the following reset domains:

- AUDIO_PWRON_RST
- AUDIO_RST

PD_AUDIO contains the CD_ABE clock domain.

[Table 3-314](#) lists the logic retention capability for each module of the power domain.

Table 3-314. PD_AUDIO Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
AUDIO ENGINE	No	RM_ABE_AESS_CONTEXT[0] LOSTCONTEXT_DFF	None
CM1_ABE	No	None	None
DMIC	No	RM_ABE_DMIC_CONTEXT[0] LOSTCONTEXT_DFF	None
L4_ABE interconnect	No	None	None
MCASP1	No	RM_ABE_MCASP_CONTEXT[0] LOSTCONTEXT_DFF	None
MCBSP1	No	RM_ABE_MCBSP1_CONTEXT[0] LOSTCONTEXT_DFF	None
MCBSP2	No	RM_ABE_MCBSP2_CONTEXT[0] LOSTCONTEXT_DFF	None

3.7.13.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.13.1.1 Logic and Memory Area Power Modes

[Table 3-315](#) lists the power modes supported by the logic area of the power domain.

Table 3-315. PD_AUDIO Logic Area Power Modes

Off	Retention-OSWR	Retention-CSWR	On-Inactive	On-Active
Available	Available	Not available	Available	Available

Table 3-316 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-316. PD_AUDIO Memory Area Power Modes

Memory Bank	Module - Memory	Logic On	Logic Retention	Logic Off	RTA Feature
AESSMEM		ON	RETENTION	OFF	
	AUDIO ENGINE - AESS_MemBank1	always_on	always_retention		always_enabled
PERIPHEM		ON	OFF	OFF	
	DMIC - DMIC_BANK	always_on	always_off		None
	MCBSP1 - MCBSP_BANK	always_on	always_off		None
	MCPDM - MCPDM_BANK	always_on	always_off		None
	SLIMBUS1 - SLIMBUS_BANK	always_on	always_off		None

3.7.13.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-317 lists the power modes controls for the power domain.

Table 3-317. PD_AUDIO Power Modes Control Parameters

Parameter Name	Memory Bank	Control Bit Field	Access Type
Memory Area - State Control (Logic in Retention state)	AESSMEM	PM_ABE_PWRSTCTRL[8] AESSMEM_RETSTATE	Read only
Memory Area - State Control (Logic in On state)	PERIPHEM	PM_ABE_PWRSTCTRL[21:20] PERIPHEM_ONSTATE	Read only
Memory Area - State Control (Logic in On state)	AESSMEM	PM_ABE_PWRSTCTRL[17:16] AESSMEM_ONSTATE	Read only
Memory Area - State Control (Logic in Retention state)	PERIPHEM	PM_ABE_PWRSTCTRL[10] PERIPHEM_RETSTATE	Read only
Logic Area - Retention State Control		PM_ABE_PWRSTCTRL[2] LOGICRETSTATE	Read only
Power Domain - Low Power State Change Control		PM_ABE_PWRSTCTRL[4] LOWPOWERSTATECHANGE	Read/Write
Power Domain - State Transition Control		PM_ABE_PWRSTCTRL[1:0] POWERSTATE	Read/Write

Table 3-318 lists the power modes status for the power domain.

Table 3-318. PD_AUDIO Power Modes Status Parameters

Parameter Name	Memory Bank	Status Bit Field
Power Domain - Last Power State Entered Status		PM_ABE_PWRSTST[25:24] LASTPOWERSTATEENTERED
Memory Area - State Status	PERIPHEM	PM_ABE_PWRSTST[9:8] PERIPHEM_STATEST
Memory Area - State Status	AESSMEM	PM_ABE_PWRSTST[5:4] AESSMEM_STATEST
Power Domain - State Transition Status		PM_ABE_PWRSTST[20] INTRANSITION
Logic Area - State Status		PM_ABE_PWRSTST[2] LOGICSTATEST

Table 3-318. PD_AUDIO Power Modes Status Parameters (continued)

Parameter Name	Memory Bank	Status Bit Field
Power Domain - State Status		PM_ABE_PWRSTST [1:0] POWERSTATEST

3.7.14 PD_ALWON_MPU Description

PD_ALWON_MPU contains the following reset domains:

- ALWON_MPU_RST
- DPLL_MPU_PWRON_RST

PD_ALWON_MPU has no associated clock domains.

[Table 3-319](#) lists the logic retention capability for each module of the power domain.

Table 3-319. PD_ALWON_MPU Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_MPU	No	None	None
CORTEXA9_MPU_INTC	No	None	None

3.7.14.1 Power Domain Modes

The PD_ALWON_MPU power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD_ALWON_MPU power domain has no memory banks.

3.7.15 PD_ALWON_DSP Description

PD_ALWON_DSP contains the following reset domains:

- ALWON_IVA_RST
- DPLL_IVA_PWRON_RST

PD_ALWON_DSP has no clock domains associated.

[Table 3-320](#) lists the logic retention capability for each module of the power domain.

Table 3-320. PD_ALWON_DSP Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
DPLL_IVA	No	None	None
DSP_WKUPGEN	No	None	None

3.7.15.1 Power Domain Modes

The PD_ALWON_DSP power domain is an always-on power domain and does not switch to retention state. There is no logic power state control or status bit field for this power domain.

The PD_ALWON_DSP power domain has no memory banks.

3.7.16 PD_ALWON_CORE Description

PD_ALWON_CORE contains the following reset domains:

- ALWON_CM1_PWRON_RST
- ALWON_CM1_RST
- ALWON_CORE_PWRON_RST

- ALWON_CORE_RST

PD_ALWON_CORE contains the following clock domains:

- CD_ALWON_CM
- CD_L4_ALWON_CORE

Table 3-321 lists the logic retention capability for each module of the power domain.

Table 3-321. PD_ALWON_CORE Modules Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
CM1	No	None	None
DPLL_ABE	No	None	None
DPLL_CORE	No	None	None
DPLL_PER	No	None	None
CORTEXM3_WKUPGEN	No	None	None
SDMA_WKUPGEN	No	None	None
SR_CORE	No	RM_ALWON_SR_CORE_CONTEXT[0] LOSTCONTEXT_DFF	None
SR_IVA	No	RM_ALWON_SR_IVA_CONTEXT[0] LOSTCONTEXT_DFF	None
SR_MPU	No	RM_ALWON_SR_MPU_CONTEXT[0] LOSTCONTEXT_DFF	None
SPINNER	No	None	None

3.7.16.1 Power Domain Modes

The PD_ALWON_CORE power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD_ALWON_CORE power domain has no memory banks.

3.8 Voltage Management Functional Description

This section describes the voltage domains and voltage control architecture. It also explains the interactions between the device and the external power IC.

3.8.1 Overview

The voltage management architecture of the device is based on voltage sources managed by the PRCM module. They define the voltage domains within the device (see [Section 3.1.1.3, Voltage Management](#)). This partition of the voltage domains ensures independent voltage control of each voltage domain through dedicated SMPS or LDO. The following voltage domains are managed by the PRCM module:

- VDD_CORE_L
- VDD_MPU_L
- VDD_IVA_L
- LDO_CORE_M
- LDO_IVA_M
- LDO_MPU_M
- LDO_IVA_ABB
- LDO_MPU_ABB
- LDO_WAKEUP

NOTE: See [Table 3-25](#) for device power supply pin association to the power domain.

The PRCM module supports the AVS technique on the VDD_MPU_L, VDD_CORE_L and VDD_IVA_L voltage domains, through automatic monitoring and adjustments of voltages by their dedicated SmartReflex modules. The VDD_MPU_L and VDD_IVA_L voltage domains support five DVFS OPPs. The VDD_CORE_L voltage domain supports three DVFS OPPs.

The PRCM module also supports ABB technique on the MPU and IVA voltage domains, through the LDO_MPU_ABB and LDO_IVA_ABB biasing voltages.

The PRCM module automatically scales down the LDO_MPU_M, LDO_CORE_M, and LDO_IVA_M to retention voltage level whenever all memory banks on these domain have transitioned to the RETENTION or OFF power state.

[Table 3-322](#) lists the supported DVFS OPPs for each voltage domain. The exact values depend on the silicon; for more information, see the *Data Manual Operating Condition Addendum*.

Table 3-322. Supported DVFS OPPs Summary

Voltage Domain	Operating Point	Control
VDD_MPU_L (vdd_mpu)	OFF RETENTION OPP50 OPP100 OPP_TURBO OPP_NITRO OPP_NTSB	Hardware and software
VDD_IVA_L (vdd_iva)	OFF RETENTION OPP50 OPP100 OPP_TURBO OPP_NITRO OPP_NTSB	Hardware and software

Table 3-322. Supported DVFS OPPs Summary (continued)

Voltage Domain	Operating Point	Control
VDD_CORE_L (vdd)	OFF RETENTION OPP50 OPP100 OPP119	Hardware and software

NOTE: For the supported OPPs for each device in the OMAP4460 family, see the *Data Manual Operating Condition Addendum*.

DVFS OPPs Dependencies

For detailed information about DVFS OPP dependencies, see the *Data Manual Operating Condition Addendum*.

For more information, see [Section 3.8.6.4, DVFS Voting Mechanism \(VDD_CORE_L and VDD_IVA_L Voltage Domains\)](#).

3.8.2 Voltage-Control Architecture

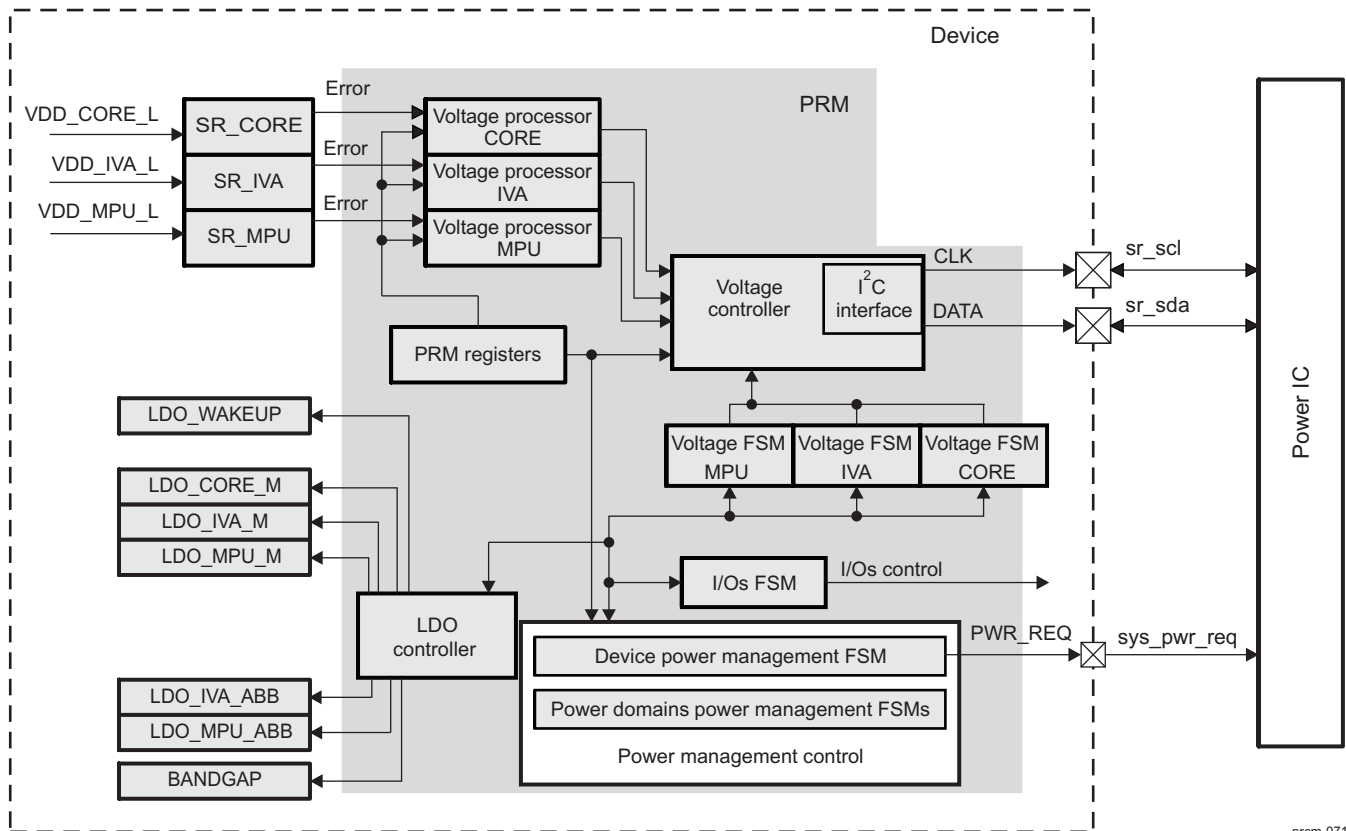

The PRM is split over several blocks that manage the different voltage sources.

- Voltage processors for converting SmartReflex data to voltage values before sending to the voltage controller
- Voltage FSMs for hardware control of voltages. They either send commands to the voltage controller (I²C mode).
- A voltage controller for gathering commands from the PRCM module register (direct access), voltage processors and voltage PRCMs. It then handles communication with the external power IC through the dedicated I²C interface.
- A device PRCM for managing the voltage PRCMs and I/O wake-up control and system clock control sequencing during device sleep and wake-up transitions.
- LDO regulator controllers for ABB management, memory arrays voltage management and WAKEUP logic.
- Bandgap reference voltage sleep control

NOTE: The SmartReflex module allows dynamic voltage adjustments around an OPP voltage level to ensure target performance. It also allows switching from one OPP to another. However, it does not control voltage switching of the voltage domain to RETENTION or OFF level when all power domains within the power domain are in RETENTION or OFF power states. This is handled by the voltage PRCMs.

[Figure 3-75](#) shows the architecture for PRM voltage control.

Figure 3-75. PRM Voltage Control Architecture

prcm-071

3.8.3 VDD_MPU_L, VDD_CORE_L, and VDD_IVA_L Control

These power supply sources can be controlled using PRM dedicated I²C control.

3.8.3.1 PRM Dedicated I²C Control

The PRM I²C interface is dedicated to SmartReflex voltage control. It enables the voltage controller to send voltage commands to the external power IC. To reduce latency of voltage changes, the voltage controller is configurable to run in HS I²C mode. The PRM I²C interface supports multimaster mode.

The voltage controller receives voltage control commands from following input ports:

- Voltage processors ports: Each voltage processor sends voltage change commands to the voltage controller depending on the information received from the associated SmartReflex module.
- Voltage PRCMs ports: Each voltage PRCM sends commands to the voltage controller when the device enters RETENTION or OFF power state, and also when the device wakes up.
- PRM register port: The PRM registers give direct software control over the voltage levels of the external voltage sources.

An arbitration scheme in the voltage controller manages concurrent requests on different ports.

Each internal port has a handshake to indicate when the I²C frame resulting from the request on that port has been acknowledged by the external Power IC.

The PRM can also send external voltage source sleep commands that can be used to activate power IC sleep mode, where the voltage regulator maintains output voltage but only a small load is supported. This lets the external power IC reduce its power consumption as well.

NOTE: An I²C interface not controlled by the PRM can be used to program voltage levels of the external power IC. Because it is not a hardware-controlled interface its use is restricted to move the voltage level from one OPP to another.

In this case, the control software must operate voltage transition when the device activity allows one.

3.8.3.2 Adaptive Voltage Scaling

As explained in [Section 3.1.2.4, Adaptive Voltage Scaling](#), SmartReflex is a technology that uses adaptive power supply to achieve the goal of reducing active power consumption. With SmartReflex, the power supply voltage can be adapted to the silicon performance either statically (for example, adapted to the manufacturing process of a given device), or dynamically (for example, adapted to the temperature-induced current performance of the device).

SmartReflex voltage control in the device is based on the dedicated SmartReflex modules and the voltage processors, in addition to the voltage controller with dedicated I²C interface, which are shared with the voltage PRCM modules and voltage control registers.

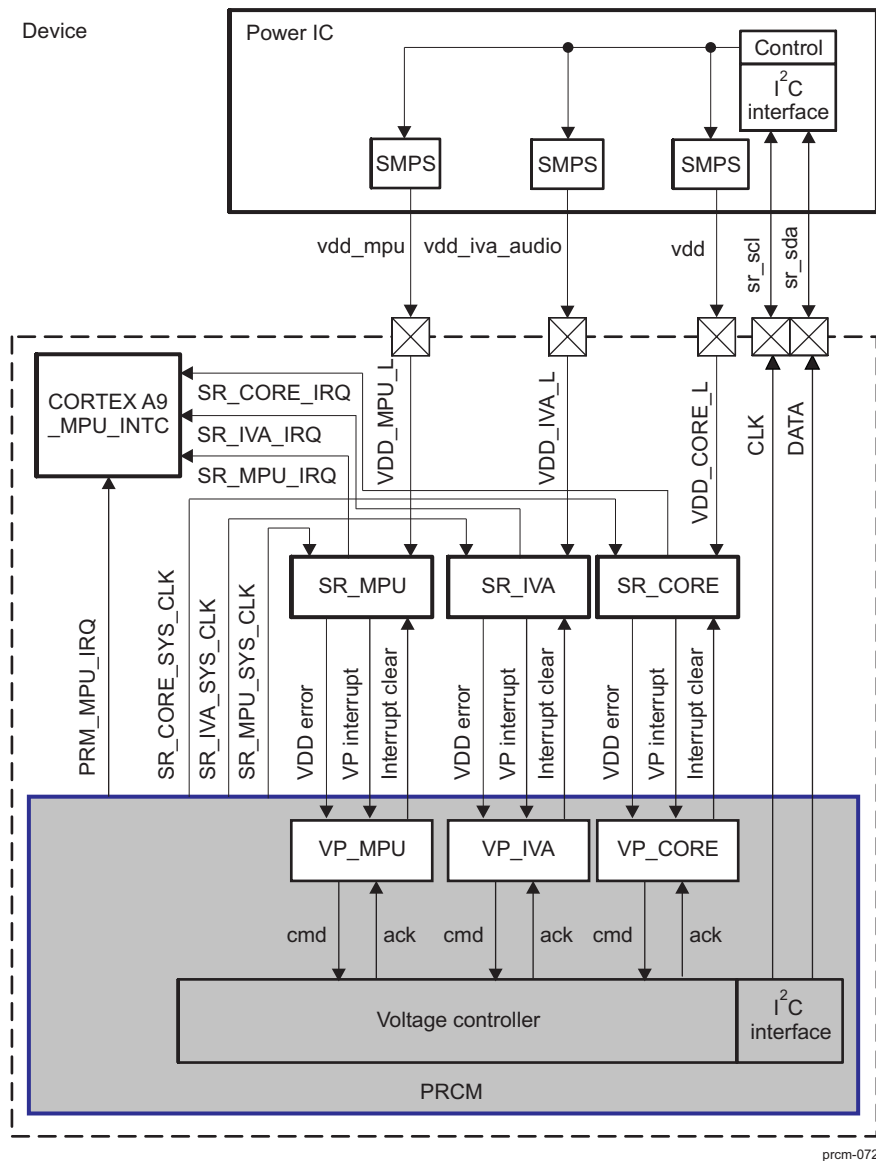

The SmartReflex modules allow a continuous real-time monitoring of voltage supply and device performance to do the following:

- Minimize the supply voltage to reduce the device power consumption.
- Maintain the desired device performance (by dynamically adjusting the device voltage) as the temperature of the device varies.

Because the SmartReflex modules and the voltage processors are dedicated to SmartReflex voltage control, they are described together in this section.

3.8.3.2.1 SmartReflex in the Device

[Figure 3-76](#) shows the SmartReflex integration.

Figure 3-76. SmartReflex Integration

prcm-072

SmartReflex voltage control in the device is implemented for simultaneous control of three independent voltage sources. One SmartReflex module controls the VDD_CORE_L voltage, the second one is dedicated to VDD_IVA_L control, and the third controls the VDD_MPU_L voltage. Each SmartReflex module is connected to a voltage processor. Voltage commands from all voltage processors are passed to a voltage control, which sends them through a dedicated I²C master interface to the power IC.

SmartReflex modules are in the PD_ALWON_CORE power domain and supplied by the VDD_CORE_L voltage domain. Each module senses its own voltage domain (VDD_CORE_L, VDD_IVA_L, or VDD_MPU_L).

3.8.3.2.2 SmartReflex Module

Figure 3-77 is a functional overview of the SmartReflex module.

Figure 3-77. SmartReflex Module Functional Overview

3.8.3.2.3 SmartReflex Submodules

NOTE: In this and following section SR_n refers to SR_IVA, SR_MPU, and SR_CORE SmartReflex modules.

The SmartReflex module is enabled by setting the SR_n.SRCONFIG[11] SR_EN bit. The SmartReflex module is composed of six blocks:

- Clock generator
- Sensor core
- Accumulator
- Minimum/maximum/average
- Error generator
- Interrupt generator

Clock Generator

The clock generator provides the internal SR_CLK sampling clock to the sensor core of the module. The SR_n.SRCONFIG[21:12] SRCLKLENGTH bit field allows the setting of the frequency divider ratio between the SR_n_SYS_CLK and the SR_CLK. It is calculated using Equation 1:

$$\text{SR}_n.\text{SRCONFIG}[21:12] \text{ SRCLKLENGTH} = f_{\text{SR}_n.\text{SYS_CLK}} / (2^* f_{\text{SR_CLK}}) \quad (1)$$

Where $f_{\text{SR}_n.\text{SYS_CLK}}$ is the frequency of the SR_<x>_SYS_CLK, and $f_{\text{SR_CLK}}$ is the desired SR_CLK frequency.

To accurately use the target values programmed for SmartReflex modules in the device, the SRCLKLENGTH parameter must be set correctly. The target values for the SmartReflex modules are calculated with the SR_CLK frequency set at 100 kHz. It is thus mandatory that the value of the SRCLKLENGTH parameter is calculated from Equation 1-1 with $f_{\text{SR_CLK}}$ set at 100 kHz.

For example, if the system clock has a frequency of 38.4 MHz, and the target SR_CLK frequency is 100 kHz, the SRn.SRCONFIG[21:12] SRCLKLENGTH bit field is 192 (0x0C0).

Sensor Core

The sensor core receives the SR_CLK sampling clock and the voltage to be sensed. It generates sensor value samples proportional to the voltage sensed. For accuracy, a sensor core is composed of two sensors and generates two values per sample (one from each sensor).

The two sample values generated by the sensor core output can be read from the SRn.SENVAL[15:0] SENVAL and SRn.SENVAL[31:16] SENPVAL bit fields.

The sensor core is enabled by the SRn.SRCONFIG[10] SENENABLE bit.

Accumulator

The accumulator consists of two stacks that store multiple samples of the two sensor values received from the sensor core.

The SRn.SRCONFIG[31:22] ACCUMDATA bit field defines the size of the accumulator in the number of samples to be stored. The allowable range is from 2 to 1023. The value of SRn.SRCONFIG[31:22] ACCUMDATA value is related to the desired sampling time window ($T_{\text{TimeWindow}}$) and the SR_CLK frequency ($f_{\text{SR_CLK}}$). It can be calculated using [Equation 2](#):

$$\text{SRn.SRCONFIG[31:22] ACCUMDATA} = T_{\text{TimeWindow}} * f_{\text{SR_CLK}} \quad (2)$$

For example, for an accumulator time window of 10 ms and SR_CLK frequency of 32 kHz, the value of SRn.SRCONFIG[31:22] ACCUMDATA is 320 (0x140). The accumulation window must be large enough so that the minimum, maximum, and average counter values are accurate.

Minimum/Maximum/Average

The minimum/maximum/average block reads the samples stored in the accumulator and returns the minimum, maximum, and average values of the samples. Because the accumulator contains two separate groups of samples (one from each sensor of the sensor core), the minimum/maximum/average block also generates two sets of minimum, maximum, and average values.

The minimum, maximum, and average values of the samples of the first sensor can be read from the SRn.SENMIN[15:0] SENNMIN, SRn.SENMAX[15:0] SENNMAX, and SRn.SENAVG[15:0] SENNAVG bit fields.

For the sample values of the second sensor, the minimum, maximum, and average values can be read from the SRn.SENMIN[31:16] SENPMIN, SRn.SENMAX[31:16] SENPMAX, and SRn.SENAVG[31:16] SENPAVG bit fields.

The minimum/maximum/average block is enabled by the SRn.SRCONFIG[8] MINMAXAVGENABLE bit.

Error Generator

The error generator block reads the sample value generated by the sensor core and compares it with a reference value to calculate the error. This error is then passed to the voltage processor and the internal interrupt generator block.

The reference value for a given OPP of the device is configured by setting the SRn.NVALUERECIPROCAL[23:20] SENPGAIN, SRn.NVALUERECIPROCAL[19:16] SENNGAIN, SRn.NVALUERECIPROCAL[15:8] RSENENP, and SRn.NVALUERECIPROCAL[7:0] RSENEN bit fields by reading corresponding values from the eFuses (see [Section 3.8.3.2.6, SmartReflex Parameters Set After Silicon Characterization](#)).

The error generator sets the SRn.SRSTATUS[1] ERRGEN_VALID status bit when a valid error value is set in the SRn.SENERROR register.

The SRn.SENERROR register contains the average error (SRn.SENERROR[15:8] AVGERRORE) and the percentage of error (SRn.SENERROR[7:0] SENERROR).

The error generator block is enabled by the SRn.SRCONFIG[9] ERRORGENERATORENABLE bit.

Interrupt Generator

The interrupt generator block generates interrupts to the MPU INTC and the voltage processor module (if the corresponding interrupts are enabled) to indicate errors.

[Table 3-323](#) and [Table 3-324](#) list the interrupt events in the SmartReflex module and their enable and status bits.

Table 3-323. SmartReflex Interrupt Events

Interrupt Type	Description
Accumulator	The minimum/maximum/average module has completed computation over the accumulator data.
Valid	The average error is less than 2 percent of the true average error.
Disable acknowledge	The SmartReflex module is disabled and has cleared all MPU INTC and VP interrupts (internal registers are reset). This interrupt indicates to the software that the SmartReflex module is available for programming.
Bounds	The frequency error has crossed the maximum limit (ERRMAXLIMIT) or the minimum limit (ERRMINLIMIT). It is mapped to the voltage processor also.

The SRn_CORTEX_M3_IRQs from SR_IVA and SR_CORE are mapped to the MM_IRQ_47 interrupt line of the CORTEXM3_MPU_INTC.

Table 3-324. SmartReflex Interrupt Events Enable and Status Bits

Interrupt Type	Enable Bit	Status Bit
Accumulator	SRn.IRQENABLE_SET[3] MCUACCUMINTENSET	SRn.IRQSTATUS[3] MCUACCUMINTSTATENA
	SRn.IRQENABLE_CLR[3] MCUACCUMINTENCLR	
Valid	SRn.IRQENABLE_SET[2] MCUVALIDINTENSET	SRn.IRQSTATUS[2] MCUVALIDINTSTATENA
	SRn.IRQENABLE_CLR[2] MCUVALIDINTENCLR	
Disable acknowledge	SRn.IRQENABLE_SET[0] MCUDISABLEACKINTENSET	SRn.IRQSTATUS[0] MCUDISABLEACKINTSTATENA
	SRn.IRQENABLE_CLR[0] MCUDISABLEACKINTENCLR	
Bounds	SRn.IRQENABLE_SET[1] MCUBOUNDSINTENSET	SRn.IRQSTATUS[1] MCUBOUNDSINTSTATENA
	SRn.IRQENABLE_CLR[1] MCUBOUNDSINTENCLR	
	SRn.ERRCONFIG[22] VPBOUNDSINTENABLE	SRn.ERRCONFIG[23] VPBOUNDSINTSTATENA

The minimum and maximum error limits for the bounds interrupt are configured in the SRn.ERRCONFIG[15:8] ERRMAXLIMIT and SRn.ERRCONFIG[7:0] ERRMINLIMIT bit fields.

With automatic (also called hardware or Class-3) voltage control, the voltage processor interrupt (SRn.ERRCONFIG[31] VPBOUNDINTEN) is enabled and the SmartReflex module interrupts the voltage processor when the error crosses the error limits. In this case, the CORTEXM3 interrupts can also be enabled to allow software to monitor the behavior of the SmartReflex module.

Writing 1 to a bit in the **IRQSTATUS** register clears the interrupt pending status of each interrupt source whose corresponding bit is 1 in the value written. Other interrupt pending status bits are not affected (writing 0 to that bit does not affect the status).

3.8.3.2.4 SmartReflex Convergence Verification

SmartReflex convergence verification is mandatory for the MPU, IVA, and CORE power domains. The goal of this verification is that the VSR (Voltage SmartReflex) is calibrated with SmartReflex within the expected error range. If VSR is calibrated within the expected error range, the calibration is converged without issue. If VSR is not calibrated within the expected error range, the following issues may occur:

- If the calibration of VSR is high, there is a convergence issue that could lead to an increase in power consumption.
- Low VSR (near the VMIN) could lead to platform instability.

Convergence verification requires the following steps, with at least one sample on the customer product with customer software:

1. Set the device to the desired OPP (for more information, see [Section 3.10.4.3, Changing OPP](#)).
2. Enable the SmartReflex in the [SRCONFIG\[11\]](#) SRENABLE register.
3. Wait for the SmartReflex to converge.
4. Retrieve the required SmartReflex registers to verify that the error percentage (%error) per calculation is in the expected range.

NOTE: Convergence verification must be done in the listed sequence for each power rail and each OPP.

The following registers exist for each power rail (the appropriate register must be used):

1. The following registers must be retrieved after SmartReflex has converged to verify that the convergence is within the expected range:
 - [SR.SENVAL](#)
 - [SR.NVALUERECPROCAL](#)
 - [SR.ERRCONFIG](#)
2. The following calculations are used to verify that the obtained voltage is converged:

(a) Extract the following values from the listed registers:

NCOUNT:

- COUNT of SENP = [SR.SENVAL](#)[31:16] SENPVAL
- COUNT of SENN = [SR.SENVAL](#)[15:0] SENNVAL

TARGET:

$$\text{TARGET OF SENP} = \frac{2^{[\text{hex2dec}(\text{SR.NVALUERECPROCAL}[23:20] \text{ SENPGAIN} + 8)]}}{\text{hex2dec}(\text{SR.NVALUERECPROCAL}[15:8] \text{ SENPRN})}$$

- prcm-100

$$\text{TARGET OF SENN} = \frac{2^{[\text{hex2dec}(\text{SR.NVALUERECPROCAL}[19:16] \text{ SENNGAIN} + 8)]}}{\text{hex2dec}(\text{SR.NVALUERECPROCAL}[7:0] \text{ SENNRN})}$$

- prcm-101

ERRMINLIMIT:

- ERRMINLIMIT = [SR.ERRCONFIG](#)[7:0] ERRMINLIMIT

ERRMAXLIMIT:

- ERRMAXLIMIT = [SR.ERRCONFIG](#)[15:8] ERRMAXLIMIT

(b) Calculate %error:

$$\text{SENP}\%error = \frac{\text{TARGET of SENP} - \text{COUNT of SENP}}{\text{TARGET of SENP}}$$

- prcm-102

$$\text{SENN}\%error = \frac{\text{TARGET of SENN} - \text{COUNT of SENN}}{\text{TARGET of SENN}}$$

- prcm-103
- $\%error = \max(\text{SENP}\%error, \text{SENN}\%error)$

NOTE: To be successfully converged, %error must be within the following range:
 ERRMINLIMIN < %error < ERRMAXLIMIT

NOTE: If the %error is not within the expected range, check the SmartReflex parameters that are used in customer software.

3.8.3.2.5 Status Register

The status register (**SRSTATUS**) indicates the validity of the minimum/maximum/average and error generator output values.

SRSTATUS has the following bits and bit fields:

- SRn.**SRSTATUS**[3] **AVGERRVALID**: Indicates the validity of the value in the SRn.**SENERREG**[15:8] **AVGERROR** bit field. When the value is 0, the average error is not valid. When the value is 1, the average error is within 2 percent of the valid average error.
- SRn.**SRSTATUS**[2] **MINMAXAVGVALID**: Indicates the validity of the SRn.**SEINVAL**, SRn.**SENMIN**, SRn.**SENMAX**, and SRn.**SENAV** registers. When the value is 0, the registers are not valid. When the value is 1, the registers contain valid values, although the values are not necessarily fully accumulated.
- SRn.**SRSTATUS**[1] **ERRGEN_VALID**: Indicates the validity of the value in the SRn.**SENERREG**[7:0] **SENERREG** bit field. When the value is 0, the error value is invalid. When the value is 1, the error value is valid.
- SRn.**SRSTATUS**[0] **MINMAXAVGACCUMVALID**: Indicates that the SRn.**SEINVAL**, SRn.**SENMIN**, SRn.**SENMAX**, and SRn.**SENAV** registers contain their final values accumulated over the defined sample time period.

3.8.3.2.6 SmartReflex Parameters Set After Silicon Characterization

Certain parameters of the SmartReflex module are characterized and calibrated after silicon testing. These values are then either set in the eFuse farm of the device or provided separately. Users must configure these parameters according to their given values to ensure correct functioning of the module.

The values for the following parameters (explained in [Section 3.8.3.2.3, SmartReflex Submodules](#)) are set in the device eFuse after device silicon characterization:

- SRn.**SRCONFIG**[6:5] **SENNENABLE**
- SRn.**SRCONFIG**[4:3] **SENPENABLE**
- SRn.**NVALUERECPROCAL**[23:20] **SENP**GAIN
- SRn.**NVALUERECPROCAL**[19:16] **SENN**GAIN
- SRn.**NVALUERECPROCAL**[15:8] **RNSNP**
- SRn.**NVALUERECPROCAL**[7:0] **RNSENN**

The eFuse values of these parameters must be read from the corresponding registers of the control module.

Information about the following parameters of the SmartReflex module is provided after silicon characterization:

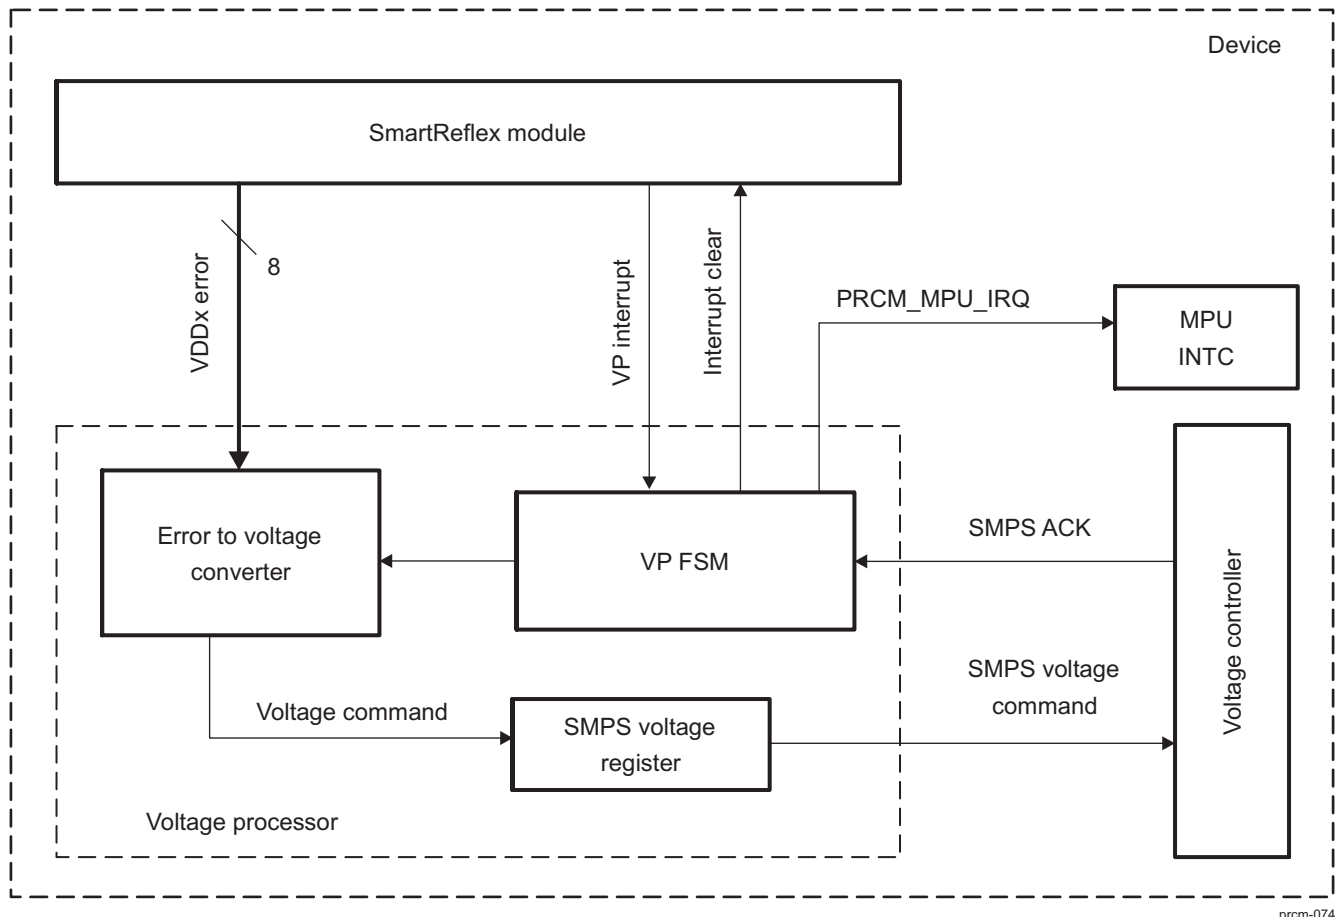

- SRn.**AVGWEIGHT**[3:2] **SENP**AVGWEIGHT
- SRn.**AVGWEIGHT**[1:0] **SENN**AVGWEIGHT
- SRn.**ERRCONFIG**[18:16] **ERR**WEIGHT

- SRn.ERRCONFIG[15:8] ERRMAXLIMIT
- SRn.ERRCONFIG[7:0] ERRMINLIMIT

3.8.3.2.7 Voltage Processor Module

Figure 3-78 is a functional overview of the voltage processor.

Figure 3-78. Voltage Processor Functional Overview

prcm-074

The voltage processor receives an error value and a VP interrupt signal from the SmartReflex module. Each time a new error value is sent, the SmartReflex module triggers an interrupt to inform the voltage processor. The voltage processor consists of an error-to-voltage command converter and a state controller. It processes an error and sends a voltage command to the voltage controller. It receives an acknowledge signal from the voltage controller when the SMPS receives the command. The voltage processor then acknowledges the SmartReflex module by clearing its interrupt.

The voltage processor is enabled by the PRM_VPn_CONFIG[0] VPENABLE bit.

Voltage Processor Interrupts

The voltage processor uses the PRCM_CORTEXM3_MPU_IRQ (MM_IRQ_46 of CORTEXM3_MPU_INTC) interrupt line of the CORTEXM3. [Table 3-325](#) and [Table 3-326](#) list the interrupt events in the voltage processor module and their enable and status bits.

Table 3-325. Voltage Processor Interrupt Events

Interrupt Type	Description
Transaction done	Voltage processor transaction is complete.
Equal value	Voltage requested in the new voltage command is the same as the current SMPS voltage.
No SMPS acknowledge	SMPS has not responded in a defined time interval to the transmitted voltage command.
Maximum VDD	New voltage requested in the voltage command is equal to or greater than maximum VDD.
Minimum VDD	New voltage requested in the voltage command is equal to or less than minimum VDD.
OPP change done	The average error is within the desired limit.

NOTE: Transaction done and OPP change done interrupt events are generated under the same conditions (after voltage change).

Table 3-326. Voltage Processor Interrupt Event Enable and Status Bits

Interrupt Type	Enable Bit	Status Bit
Transaction done	PRM_IRQENABLE_MPU_M3[21] VP_CORE_TRANXDONE_EN	PRM_IRQSTATUS_MPU_M3[21] VP_CORE_TRANXDONE_ST
	PRM_IRQENABLE_MPU_M3[29] VP_IVA_TRANXDONE_EN	PRM_IRQSTATUS_MPU_M3[29] VP_IVA_TRANXDONE_ST
Equal value	PRM_IRQENABLE_MPU_M3[20] VP_CORE_EQVALUE_EN	PRM_IRQSTATUS_MPU_M3[20] VP_CORE_EQVALUE_ST
	PRM_IRQENABLE_MPU_M3[28] VP_CORE_EQVALUE_EN	PRM_IRQSTATUS_MPU_M3[28] VP_IVA_EQVALUE_ST
No SMPS acknowledge	PRM_IRQENABLE_MPU_M3[19] VP_CORE_NOSMPSACK_EN	PRM_IRQSTATUS_MPU_M3[19] VP_CORE_NOSMPSACK_ST
	PRM_IRQENABLE_MPU_M3[27] VP_IVA_NOSMPSACK_EN	PRM_IRQSTATUS_MPU_M3[27] VP_IVA_NOSMPSACK_ST
Maximum VDD	PRM_IRQENABLE_MPU_M3[18] VP_CORE_MAXVDD_EN	PRM_IRQSTATUS_MPU_M3[18] VP_CORE_MAXVDD_ST
	PRM_IRQENABLE_MPU_M3[26] VP_IVA_MAXVDD_EN	PRM_IRQSTATUS_MPU_M3[26] VP_IVA_MAXVDD_ST
Minimum VDD	PRM_IRQENABLE_MPU_M3[17] VP_CORE_MINVDD_EN	PRM_IRQSTATUS_MPU_M3[17] VP_CORE_MINVDD_ST
	PRM_IRQENABLE_MPU_M3[25] VP_IVA_MINVDD_EN	PRM_IRQSTATUS_MPU_M3[25] VP_IVA_MINVDD_ST
OPP change done	PRM_IRQENABLE_MPU_M3[16] VP_CORE_OPPCHANGEDONE_EN	PRM_IRQSTATUS_MPU_M3[16] VP_CORE_OPPCHANGEDONE_ST
	PRM_IRQENABLE_MPU_M3 [24] VP_IVA_OPPCHANGEDONE_EN	PRM_IRQSTATUS_MPU_M3[24] VP_IVA_OPPCHANGEDONE_ST

Voltage Processor Status

The status of the voltage processor is represented by the following:

Bit/Bit Field	Parameter	Description
PRCM module.PRM_VPn_VOLTAGE[7:0] VPVOLTAGE	Current voltage for SMPS	Value of the current voltage level requested by the voltage processor
PRCM module.PRM_VPn_STATUS[0] VPINIDLE	Voltage processor in INACTIVE state	The voltage processor is in idle mode.

Voltage Processor Parameters

The following parameters of the voltage processor must be configured:

Bit/Bit Field	Parameter	Description
PRCM.PRM_VPn_CONFIG[31:24] ERROROFFSET	Error offset	Error in voltage offset value
PRCM.PRM_VPn_CONFIG[23:16] ERRORGAIN	Error gain	Error in voltage gain value
PRCM.PRM_VPn_CONFIG[3] TIMEOUTEN	Time-out enable	Enables/disables the time-out set by the time-out delay parameter. 0: Timeout is disabled VP FSM will wait indefinitely. 1: Timeout is enabled. Time out will occurs when the programmed timeout value have elapsed.
PRCM.PRM_VPn_VSTEPMIN[7:0] VSTEPMIN	Minimum step size	Minimum voltage step size
PRCM.PRM_VPn_VSTEPMAX[7:0] VSTEPMAX	Maximum step size	Maximum voltage step size
PRCM.PRM_VPn_VLIMITTO[31:24] VDDMAX	Maximum VDD limit	Maximum voltage limit of the VDD. The VDDMAX registers are the maximum allowable voltage levels of the SMPS. This value is determined by the SMPS specification as well as the application specification. The upper bound on the SMPS voltage is VddMax.
PRCM.PRM_VPn_VLIMITTO[23:16] VDDMIN	Minimum VDD limit	Minimum voltage limit of the VDD. The VDDMIN registers are the minimum allowable voltage levels of the SMPS. This value is determined by the SMPS specification as well as the application specification. The the lower bound on the SMPS voltage is VddMin.
PRCM.PRM_VPn_VLIMITTO[15:0] TIMEOUT	Time-out delay	Maximum delay between a voltage change command and its acknowledge. The Timeout register determines the number of SYS_CLK cycles that the Voltage Controller state machine will wait for the rising edge of SMPS VP_acknowledge, when PRCM.PRM_VPn_CONFIG[3] TIMEOUTEN = 1. If PRCM.PRM_VPn_CONFIG[3] TIMEOUTEN = 0, the loop will wait indefinitely.
PRCM.PRM_VPn_CONFIG[15:8] INITVDD	Initial VDD voltage	Initial voltage set in the voltage processor
PRCM.PRM_VPn_CONFIG[2] INITVDD	Initialize VDD	Set initial voltage given in initial VDD voltage parameter in the voltage processor
PRCM.PRM_VPn_VSTEPMIN[23:8] SMPSWAITTIMEMIN	Minimum SMPS wait time	Slew rate for negative voltage steps
PRCM.PRM_VPn_VSTEPMAX[28:8] SMPSWAITTIMEMAX	Maximum SMPS wait time	Slew rate for positive voltage steps
PRCM.PRM_VPn_CONFIG[1] FORCEUPDATE	Force update	Sends the value of the VP current voltage parameter as the new voltage command to SMPS

3.8.3.2.8 SMPS-Dependent Parameter Configuration

The values of the following parameters of the voltage processor module depend on the characteristics of the SMPS used:

- PRCM.PRM_VPn_CONFIG[31:24] ERROROFFSET
- PRCM.PRM_VPn_CONFIG[23:16] ERRORGAIN
- PRCM.PRM_VPn_VSTEPMIN[7:0] VSTEPMIN
- PRCM.PRM_VPn_VSTEPMAX[7:0] VSTEPMAX
- PRCM.PRM_VPn_VLIMITTO[31:24] VDDMAX
- PRCM.PRM_VPn_VLIMITTO[23:16] VDDMIN
- PRCM.PRM_VPn_VLIMITTO[15:0] TIMEOUT
- PRCM.PRM_VPn_VSTEPMIN[23:8] SMPSWAITTIMEMIN
- PRCM.PRM_VPn_VSTEPMAX[28:8] SMPSWAITTIMEMAX

For information about the values of these parameters, see the specification document of the SMPS used.

3.8.3.2.9 Communication Between SmartReflex, Voltage Processor, Voltage Controller, and SMPS

The SmartReflex module, voltage processor, voltage controller, and SMPS implement a simple handshake protocol based on a request/acknowledge mechanism (see Figure 3-79):

1. The SmartReflex module generates a VP interrupt (clears to 0) when the average error crosses the minimum or maximum error bounds.
2. The average VDDx error is passed to the voltage processor when automatic voltage control is enabled.
3. The voltage processor reads the error and generates the voltage command for the SMPS. It then informs the voltage controller that a new voltage command is ready for the SMPS. The voltage controller sends the voltage command to the SMPS (external power IC) through the dedicated I²C interface.
4. The SMPS responds to the reception of the voltage command with an acknowledgement to the voltage controller.
5. The voltage controller sends the acknowledgement to the voltage processor.
6. The voltage processor sends the interrupt-clear signal to the SmartReflex module.
7. The SmartReflex module clears the VP interrupt. It is now again ready to send a new frequency-error interrupt to the voltage processor.

Figure 3-79. SmartReflex – SMPS Communication for Automatic Voltage Adjustments

prcm-075

3.8.4 Internal LDOs Control

3.8.4.1 Memory LDOs

Embedded SRAM LDOs (that is, LDO_CORE_M, LDO_IVA_M and LDO_MPU_M) are used to supply power to the split-rail memory arrays. The PRM generates the controls used to select LDO operating mode: on-active, on-retention, or off.

Split-rail type SRAMs are used in the device to implement the larger memories. These SRAMs feature memory array and periphery logic which are on separate supplies to allow independent power management. Proper memory operation, however, requires the SRAM array voltage to never be operated at a level lower than the SRAM periphery logic.

Memory LDO can switch to on, retention and off mode:

- On mode: 1.2 V is the normal voltage reference used through all functional OPPs, whenever memories must be functional. When logic voltage level VDD_x_L (where x can be MPU, CORE or IVA) becomes higher than the associated memory voltage level VDD_x_M, the LDO operates in the tracking mode

and follows its respective the VDD_x_L voltage level.

- Retention mode: 0.6 V is set when software allows and when all memories banks belonging to the LDO memory voltage are in Retention or Off state. In this mode, the output voltage is generated from the corresponding VDD_x_L logic voltage source.
- Off mode: 0 V is set when the device switches to off mode.

[Section 3.8.5.1](#), *Memory LDOs Transitions*, presents the state transition conditions and sequences for the memory LDOs.

NOTE: The voltage levels associated with the different modes may depend on the device characteristics.

3.8.4.2 LDO_WAKEUP

LDO_WAKEUP supports three voltage states depending on the PD_WKUP and PD_EMU activity:

- EMULATION overdrive: 1.2 V is voltage level and the LDO is set in bypass mode.
- ON: 1.06 V is the voltage reference (default state).
- SLEEP: 0.83 V is the voltage reference. It is set when the device enters sleep mode.

[Section 3.8.5.3](#), *LDO_WAKEUP Transitions*, presents the state transition conditions and sequences for the LDO_WKUP.

NOTE: The voltage levels associated with the different modes may depend on the device characteristics.

At boot time, the LDO_WAKEUP LDO is started in emulation mode. It is a software command (that is, from OS or ROM code) to set it to a different mode.

3.8.4.3 ABB LDOs Control

The ABB LDO supports three voltage modes:

- Bypass mode: In this mode the x_ABB LDO is bypassed and outputs the VDD_x_L voltages (x refers to MPU and IVA). This mode is activated when ABB is not required, or when voltage domain enters low-power mode.
- ABB Set1: This mode is enabled at OPP_NITRO.
- ABB Set2: This mode is enabled at OPP_TURBO.

The PRCM module provides [PRM_LDO_ABB_MPU_SETUP](#) and [PRM_LDO_ABB_IVA_SETUP](#) registers for configuration with the following controls:

- SR2EN – To enable or bypass the ABB power management
- ACTIVE_RBB_SEL – To enable or bypass ABB Set2 mode
- ACTIVE_FBB_SEL – To enable or bypass ABB Set1 mode
- SR2_WTCNT_VALUE – LDO settling delay on OPP change. The delay is in number of system clock cycles.

The PRCM module provides [PRM_LDO_ABB_MPU_CTRL](#) and [PRM_LDO_ABB_IVA_CTRL](#) register for control:

- OPP_SEL – Current operational OPP
- OPP_CHANGE – Initiate an OPP based ABB LDO setting change
- SR2_STATUS – Current mode of operation of ABB LDO
- SR2_IN_TRANSITION – ABB LDO is in transition.

For the ABB LDO state change programming sequence, see [Section 3.10.4.3](#), *Changing OPP*.

3.8.4.3.1 ABB Strategy for the Cortex-A9 MPU Operating at OPP_TURBO

The ABB Set2 technique is used for leakage current reduction for operation at OPP_TURBO (VDD_MPU_L). The ABB Set2 voltage is trimmed to be used at OPP_TURBO. Software should do the following:

If (CONTROL_STD_FUSE_OPP_DPLL_1[20] MPU_RBB_TURBO == 1) **then** enable ABB Set2 at OPP_TURBO (PRM_LDO_ABB_MPU_SETUP[1] ACTIVE_RBB_SEL = 0x1)
Else if (CONTROL_STD_FUSE_OPP_DPLL_1[19:18] MPU_DPLL_TRIM_FREQ = 0x1 or 0x3) **then** enable ABB Set1 at OPP_TURBO (PRM_LDO_ABB_MPU_SETUP[2] ACTIVE_FBB_SEL = 0x1)
Else no ABB is available for OPP_TURBO

3.8.4.3.2 ABB Strategy for the IVA-HD Operating at OPP_TURBO

The ABB Set2 technique is used for leakage current reduction for operation at OPP_TURBO (VDD_IVA_L). The ABB Set2 voltage is trimmed to be used at OPP_TURBO. Software should do the following:

If (CONTROL_STD_FUSE_OPP_DPLL_1[21] IVA_RBB_TURBO == 1) **then** enable ABB Set2 at OPP_TURBO (PRM_LDO_ABB_IVA_SETUP[1] ACTIVE_RBB_SEL = 0x1)

3.8.4.4 Bandgap control

Bandgap provides voltage reference for internal LDOs. The PRCM module automatically controls the switching between ON and OFF states of the bandgap, based on the device power state. It is completely transparent to user software.

The PRM_LDO_BANDGAP_CTRL[0] OFF_ENABLE bit controls whether the bandgap remains on or is shut off when the device switches to OFF power state.

3.8.5 Voltage Domain State Transitions

In [Section 3.1.1.3.1, Voltage Domain](#), the supported states of a voltage domain were presented. This section describes the trigger conditions to enable and perform sleep and wake-up transitions on PRCM module-controlled voltage domains:

- VDD_MPU_L
- VDD_IVA_L
- VDD_CORE_L
- LDO_MPU_M
- LDO_IVA_M
- LDO_CORE_M

It also identifies state transition sequences for these voltage domains.

When the voltage domain state transition control is set to automatic, the PRCM module initiates the voltage domain state transition when the required hardware conditions are satisfied. These hardware conditions can be based on the power domain state conditions and/or system clock state conditions. The PRCM module prevents any transition when the associated conditions are not satisfied.

The LDO_MPU_M, LDO_IVA_M, or LDO_CORE_M memory voltage domain is automatically transitioned to the retention level whenever all memory arrays in the domain reach the RETENTION or OFF power state. Similarly, a transition back to the ON state is triggered upon one or more domain memory arrays requiring a transition back to the ON power state.

If a voltage command acknowledgement is not received within an allowed response time window (communications error over the I²C interface), an error status is logged, a global warm reset is generated, and the transition is skipped.

3.8.5.1 VDD_x_L Transitions

Transition trigger conditions for sleep transition from ON to SLEEP or RETENTION state are:

- Software setting: PRM_VOLTCTRL[a:b] AUTO_CTRL_VDD_x_L = SLEEP (0x1) or RETENTION (0x2)

- Power states conditions:
 - For voltage domain SLEEP state transition – all power domains in the voltage domain must be in ON-INACTIVE, RETENTION, or OFF state.
 - For voltage domain Retention state transition – all power domains in the voltage domain must be in RETENTION or OFF state.
- Clock states conditions: No clock activity on voltage domain

NOTE:

- In case of VDD_CORE_L sleep transition from ON to SLEEP state, the PD_CORE can be either ON-INACTIVE or in RETENTION only.
- In case of VDD_MPU_L and VDD_IVAL sleep transition from ON to SLEEP state, the reference and bypass clocks to their respective DPLLs must also be gated.

Transition trigger conditions for wake-up transition from SLEEP or RETENTION state to ON state is:

- Any wake-up event occurs on the voltage domain.

The State transition sequence:

1. All transition trigger conditions are met.
2. The voltage controller sends an On, SLEEP, or Retention command sequence over the I²C interface.
3. The PRCM module waits for I²C command sequence acknowledge.
4. The PRCM module starts the voltage transition counter.
5. When the counter expires, a voltage transition completion state is reached.

3.8.5.2 Memory LDOs Transitions

The transition trigger conditions for on to retention mode are:

- At least one memory bank associated with the LDO is in RETENTION state and the rest of the memory banks may either be in RETENTION or OFF states.

The transition trigger conditions for on/retention mode to off mode transition:

- Device is switching to OFF state.

Transition sequence:

1. Transition trigger conditions are true (that is, satisfied).
2. Switch LDO reference to:
 - Retention mode value if on-to-retention mode transition
 - Off mode value if on/retention-to-off mode transition
3. Start counter for LDO stabilization.
4. When counter expires voltage transition completion state is reached.

3.8.5.3 LDO_WAKEUP Transitions

The ON-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY or OFF state) and PD_EMU power domain is off.
- Clock states: Only the 32K clock is active in CD_WKUP (and system clock is gated at SCRUM level)

The SLEEP-to-ON transition trigger conditions are:

- Any device wake-up event other than emulation wake-up event

The EMULATION-to-ON transition trigger conditions are:

- Power domain states: PD_EMU is Off and device is in active mode OR
- Clock states: PD_EMU is Off and any clock other than 32K clock is active in PD_WKUP

The EMULATION-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY or OFF state) and PD_EMU power domain is off.
- Clock states: Only the 32K clock is active in CD_WKUP (and system clock is gated at SCRM level)

The SLEEP or ON-to-EMULATION transition trigger condition is:

- Any wake-up event on PD_EMU

Transition sequence:

1. Transition trigger conditions are met.
2. LDO_WAKEUP initiates the transition.
3. Starts a counter for LDO_WAKEUP transition.
4. LDO_WAKEUP transition completes.

3.8.6 DVFS

Dynamic voltage and frequency scaling is a technique that can be used on the logic voltage domains (VDD_MPU_L, VDD_IVA-L, and VDD_CORE_L), independently of each other. Upon current or predictive performance request, determined by software according to ad hoc algorithms or heuristics, software can configure the PRCM module to change the OPP of a voltage domain. For an increase of performance, voltage is first raised, and then frequency is increased. For a decrease of performance, frequency is first decreased, and then voltage is dropped.

3.8.6.1 EMIF Clocks Frequency Scaling Constraints

CD_EMIF is inside the PD_CORE. The EMIF subsystem is getting several clocks:

- L3 interface clock
- DLL_CLK clock (that is, DLL clock): For the DLL only
- EMIF_FCLK clock: For external memory access and source of functional clock to EMIF. EMIF_FCLK frequency is DDR_PHY_CLK/2. DDR_PHY_CLK frequency is PHY_ROOT_CLK/2.

L3 interface clock frequency can be changed on the fly without affecting EMIF operations as long as DLL_CLK and PHY_ROOT_CLK clocks are not affected. EMIF has internal asynchronous bridge to handle different interface and functional clocks.

When DDR PHY clock frequency is to be changed, EMIF must be put into IDLE state. This ensures that external memory is in self-refresh mode.

Similarly, DLL frequency change implies that DLL must relock. It can be done only when EMIF is in IDLE state. Relock time is 400 DLL clock cycles.

The EMIF clocking scheme allows for change of OPP without DLL relock (that is, DLL is clocked by a relatively low frequency supported in all OPPs). Then change of OPP consists only in changing the DDR PHY clock frequency (and eventually L3 interface clock frequency).

NOTE: Software must ensure that no master module tries to access the registers of the EMIF during this sequence.

EMIF clocks control requirements in the PRCM module:

- EMIF clock frequency setting should be done through the following shadow registers for the DLL_CLK and DDR_PHY clocks:
 - [CM_SHADOW_FREQ_CONFIG1](#) for setting M2
 - [CM_SHADOW_FREQ_CONFIG2](#) for setting M5
- EMIF clock frequency update bit field should be used to copy shadow register value as current values.
- The PRCM module hardware manages automatic EMIF clock frequency update sequence:
 - Put the EMIF into IDLE state.
 - Upload shadow register values in corresponding current register and wait for new EMIF clocks to

be stable.

- Put the EMIF module back into ACTIVE state

NOTE: The PRCM module should not gate the DLL_CLK and DDR_PHY clocks during automatic EMIF frequency change.

Programming model to perform automatic EMIF frequency change as part or not of an OPP change (DVFS). The automatic EMIF frequency change must always be performed while CD_EMIF is under software-forced wakeup (SW_WKUP).

VDD_CORE_L voltage fixed and only clock frequency switching

Changing EMIF clock frequency without voltage change (example, change of SYS_CLK divider value while DPLL_CORE is in bypass, change of DPLL_CORE mode between bypass and lock)

- Software writes new EMIF timing parameters in shadow registers of the EMIF.
- It then configures the clock selection and frequency setting the following shadow registers in the PRCM module: [CM_SHADOW_FREQ_CONFIG1](#) for setting M2 and [CM_SHADOW_FREQ_CONFIG2](#) for setting M5.
- The PRCM module sends an idle request to the EMIF (overriding the software settings of the MODULEMODE bit field for EMIF).
- EMIF stalls transactions on internal interconnect, completes all committed transaction to the external memory and then puts the external memory in self-refresh mode
- EMIF module then acknowledges the idle request of the PRCM module.
- The PRCM module uploads the values configured in the shadow register bit fields to the corresponding current register bit fields.
- The PRCM module waits for stabilization of the PHY_ROOT_CLK and DLL_CLK clocks through hardware monitoring, according to new settings.
- The PRCM module requests the EMIF to exit idle (stops the overriding of the software settings of the MODULEMODE bit field for EMIF).
- The PRCM module clears the frequency update field.
- The EMIF copies the timing parameter configured in the shadow register as the current values.
- The EMIF acknowledges that the PRCM module is functional, and starts accepting the transactions on the internal interconnect.
- If DLL clock was changed, EMIF waits for DLL to be relocked and transactions on internal interconnect, if required. The PRCM module is not aware of the DLL operations.
- Accesses to SDRAM are serviced again:
Software execution can be stalled during the frequency change without harm as the critical hardware sequence is performed without software intervention. After having set the frequency update field, software should only poll for its clearing.
Accesses to external SDRAM are stalled during following duration:
 - 2 μ s maximum due to EMIF entering and exiting idle
 - + 400 DLL clock cycles in case DLL clock frequency has changed.
 - + DPLL lock time in case DPLL has been locked.

VDD_CORE_L voltage change for OPP switching

It is assumed that DLL clock frequency is not changed and that the DPLL_CORE mode is not changed and stays locked. Only the DDR_PHY clock frequency is changed using the post divider. L3 clock is likely also changed, but it does not affect the EMIF.

Accesses to external SDRAM must be stalled at maximum during 2 μ s due to this sequence.

Voltage scaling up consists of:

Software indicates to EMIF that voltage change operation has started to allow EMIF to ensure regular code updates from DLL masters.

Software disables SmartReflex for core voltage

Software performs direct VDD_CORE setting to new noncorrected value (for weak silicon) and wait for voltage stabilization.

Software configures SmartReflex for corresponding OPP.

Software re-enables SmartReflex for core voltage.

Software indicates to EMIF that voltage change operation is complete and it does not need to control the code update from DLL masters directly.

3.8.6.2 GPMC Clocks Frequency Scaling Constraints

CD_L3_2 is inside the PD_CORE. It supplies the L3_ICLK2 clock to the general-purpose memory controller (GPMC) module, which is used as interface and functional clock. GPMC timing parameters are supposed be programmed at boot for the nominal OPP. These timing parameters can be used for lower L3 frequency, at the downside of having slower access to external memory.

External memory connected to GPMC may not support on-the-fly L3 frequency changes. Following is the sequence to perform L3 frequency change as part or not of an OPP change (DVFS).

Hardware-controlled sequence

1. Software writes new L3 clock settings in the shadow register and sets the frequency update field.
2. The PRCM module requests idle to GPMC.
3. GPMC requests disconnection of its interconnect port and completes all outstanding transactions.
4. GPMC acknowledges idle. Any access to GPMC is then stalled.
5. The PRCM module uploads the values of the shadow register bit field in the corresponding current bit field.
6. The PRCM module waits for stabilization of the L3 clocks by monitoring the DPLL_CORE lock and/or divider acknowledge signals according to new settings.
7. The PRCM module clears the frequency update field.
8. The PRCM module requests the GPMC to exit idle.
9. GPMC re-allows interconnect connection and acknowledges it is functional.
10. Accesses to external memory are serviced again.

NOTE:

- The frequency update field is the same as the one for EMIF clock change. The same hardware in the PRCM module handles the frequency change of L3, DDR_PHY, and DLL clocks.
 - If the GPMC supports on-the-fly L3 frequency change, then the [CM_SHADOW_FREQ_CONFIG2\[0\] GPMC_FREQ_UPDATE](#) bit can allow bypassing of the sequence.
-

Software-controlled sequence

1. Software configures the PRCM module to disable GPMC.
2. The PRCM module requests idle to GPMC.
3. GPMC requests disconnection of its interconnect port and completes all outstanding transactions.
4. GPMC acknowledges idle. Any access to GPMC is then stalled.
5. Software programs the PRCM module to change L3 frequency and wait for L3 stabilization.
6. Software configures the PRCM module to re-enable GPMC.
7. GPMC re-allows interconnect connection and acknowledges it is functional.
8. Accesses to external memory are serviced again.

3.8.6.3 CORE DVFS Versus Subsystem Functionality

3.8.6.3.1 Display Subsystem

The display subsystem is part of the CORE voltage domain. It has internal FIFOs that are sized to sustain a change of OPP on the CORE voltage domain with no DPLL relock and no DLL frequency change. Accesses to external SDRAM are stalled at maximum during 2 μ s in these conditions. DSS functional clock is not affected by the change of OPP on CORE voltage domain. Hence, DSS supports on the fly DVFS of the CORE voltage domain, assuming selected OPP remains compatible with the current DSS processing.

3.8.6.3.2 IVAHD

IVAHD is part of the IVA voltage domain. It can sustain a temporary stall of external SDRAM accesses because it is not real-time processing. IVAHD functional clock is not affected by the change of OPP on the CORE voltage domain; therefore, IVAHD supports on-the-fly DVFS of the CORE voltage domain.

3.8.6.3.3 Imaging Subsystem

The Imaging subsystem (ISS) is part of the CORE voltage domain. It is real-time processing (or data flow). It cannot support a 2- μ s stall of external SDRAM access, due to the heavy data throughput (FIFO size increase is prohibitive). As a consequence, ISS does not support on-the-fly change of OPP on CORE voltage domain. However, the CORE DVFS can be synchronized to the interframe idle window of ISS. During this window, ISS does not initiate transaction to external SDRAM. Core OPP can be changed safely assuming selected OPP remains compatible with the current ISS processing. ISS functional clock frequency can either remain unchanged, or be scaled according to the OPP change, assuming it remains compatible with the current ISS processing. This is the responsibility of software.

Example: CORE OPP change OPP50→OPP100, with functional clock frequency unchanged – OPP is 50%, ISS functional clock is at 50 MHz, clock coming from CORE DPLL, ISS clock divider is set to 4

Software performs OPP change: OPP50→OPP100, – ISS is now at 100 MHz – SW sets the ISS clock divider to 8. - ISS functional clock is back at 50 MHz

3.8.6.4 DVFS Voting Mechanism (VDD_CORE_L and VDD_IVA_L Voltage Domains)

3.8.6.4.1 CORE OPP Voting Architecture

Core voltage domain operating point can be determined based on the following system masters:

- APE DSP processor
- APE Cortex-M3 MPU processor
- Modem

The PRCM module provides:

- Four read/write voting registers (that is, `CM_CORE_DVFS_PERFn`, where $n = 1$ to 4). Software can use these, to specify the performance level of the CORE voltage domain as requested by each system master (likely EMIF bandwidth only). Software must encode the bit fields; encoding is not interpreted by hardware.
- One read/write register (that is, `CM_CORE_DVFS_CURRENT`) to identify the current CORE voltage domain OPP setting. Software must configure this register based on current OPP setting of the register. It is not managed by hardware.

See [Section 3.8.6.4.3, Voting Mechanism](#), to understand the voting mechanism for DVFS on the voltage domain.

3.8.6.4.2 IVA OPP Voting Architecture

IVA voltage domain operating point can be determined based on the following subsystems performing different type of processing:

- DSP processor

- IVAHD accelerator
- ABE

The PRCM module provides:

- A read/write voting register (that is, `CM_IVA_DVFS_PERF_<Subsystem name>`) for each subsystem. Software can use these, to specify the performance level of the IVA voltage domain as requested by each subsystem. Software must encode the bit fields; encoding is not interpreted by hardware.
- One read/write register, that is, `CM_IVA_DVFS_CURRENT`, to identify the current IVA voltage domain OPP setting. It is again the software's responsibility to configure this register based on current OPP setting of the register. It is not managed by hardware.

See [Section 3.8.6.4.3, Voting Mechanism](#), to understand the voting mechanism for DVFS on the voltage domain.

3.8.6.4.3 Voting Mechanism

The operating point change for the CORE and IVA voltage domains can be performed by the respective masters or subsystems by executing the following steps:

1. Obtain ownership of the voltage domain DVFS semaphore using the SPINLOCK module.
2. Write new performance requirement value in its voting register.
3. Read the current OPP and the voting registers.
4. Compute the result of the voting using ad hoc algorithm (for example, sum of performance requirements).
5. If the current OPP does not match the voting result (that is, either the OPP must be decreased in case of low performance demand, or the OPP must be increased in case of high performance demand) then the system master performs voltage domain OPP change to best match the voting result.
6. When change of OPP is completed, update the current voltage domain OPP register accordingly.
7. Release the voltage domain DVFS semaphore, using the SPINLOCK module.

3.9 Device Low-Power States

The device low-power states are the result of any valid combination of power domain states in which all the power domains are no longer in the ACTIVE state. In such a situation the PRCM module hardware can trigger events to further lower the consumption of the device and the system.

Typically, the PRCM module can lower or even turn off the SMPS, shut down the system clock supplier, and allow the external power IC to turn off its internal resources.

These device low-power states are characterized by the system power consumption, the wake-up latency, and the required functionality.

The low-power states are:

- RETENTION: All the logic voltage domain (VDD_IVA_L and VDD_CORE_L) are in Retention state
- OFF: All the logic voltage domains are in Off state
- LOW POWER: Any combination of logic voltage domains states (ON, SLEEP, and RETENTION state), other than those identified above.

Once the PRCM module hardware detects any valid combination of power domain state and if a proper programming model of the PRCM module has been set, the PRCM module automatically triggers the transition into the device low-power mode.

3.9.1 Device Wake-Up Source Summary

Each power domain in the device may contain modules that can generate the wake-up events. However, when the device is in OFF power state and all the logic voltage domains are off, only the modules with wake-up capability and that are in the PD_WKUP or PD_EMU power domain can generate the wake-up event. Modules in the other power domains require that their voltage domain be in RETENTION, SLEEP, or ON state to generate a wake-up event. Some modules may have a further constraint that their power domain should be ON-INACTIVE or in CSWR RETENTION state to generate the wake-up event.

The wake-up events can be asynchronous or synchronous. Synchronous wake-up events require the 32-kHz clock or the system clock to be active, while asynchronous wake-up events do not require any active clock.

The Modules Attributes subsection of each clock domain in [Section 3.6](#), *Clock Management Functional Description*, presents the wake-up capability support for each module of the corresponding power domain.

While the device is in STANDBY mode, additional asynchronous wakeup events from other domains are able to wake up the device.

[Table 3-327](#) identifies which modules in which power domains can be configured to generate a wake-up while the device is in a low power mode.

Table 3-327. Wake-up Sources during Device Low Power Mode

Device Power Mode	VDD_CORE_L state	VDD_MPU_L state	VDD_IVA_L state	Domain able to generate wakeup	Wakeup source
OFF	OFF	OFF	OFF	PD_WKUP	GPIO1 ⁽¹⁾ , Keyboard, GPTIMER1, WDT2, PRM interrupt requests towards Cortex-A9 MPU
				PD_EMU	Any FORCEACTIVE directive
STANDBY	Any combination of RET or SLEEP state			PD_AUDIO ⁽²⁾	DMIC, McASP, WDT3,
					McBSP1, McBSP2, McBSP3
					McPDM, SLIMBUS1
				PD_CORE	Cortex-M3 MPU ⁽¹⁾⁽³⁾
					SDMA ⁽¹⁾⁽³⁾
				PD_L3_INIT	HSMMC1, HSMMC2
					HSI
					HSUSBOTG ⁽⁴⁾ , FSUSB ⁽⁴⁾
					HSUSBHOST, HSUSBTLL
				PD_L4_PER	GPIO2, GPIO3, GPIO4, GPIO5, GPIO6
					I2C1, I2C2, I2C3, I2C4
					McBSP4
					McSPI1, McSPI2, McSPI3, McSPI4
					HSMMC3, HSMMC4, HSMMC5
					SLIMBUS2
					UART1, UART2, UART3, UART4
				PD_MPU	Cortex-A9 MPU ⁽¹⁾⁽³⁾
				PD_DSP	DSP ⁽¹⁾⁽³⁾
				PD_WKUP	GPIO1, Keyboard
					GPTIMER1, WDT2
PRM interrupt request towards Cortex-A9 MPU, Cortex-M3 MPU, or DSP					
PD_EMU	Any FORCEACTIVE directive				
	Dynamic dependency towards CD_L3_2				

⁽¹⁾ True in every domain power state

⁽²⁾ Only modules able to generate asynchronous wake-up have to be taken into account, and only when domain is in INACT or CSWRET state.

⁽³⁾ These modules have master wake-up (mwakeup) capability

⁽⁴⁾ These modules have both master wake-up and slave wake-up capability

Table 3-327. Wake-up Sources during Device Low Power Mode (continued)

Device Power Mode	VDD_CORE_L state	VDD_MPU_L state	VDD_IVA_L state	Domain able to generate wakeup	Wakeup source
				PD_ALWON_CORE	SR_CORE, SR_IVA, SR_MPU

NOTE: Any GPIO module can be a source of wake-up from OFF mode. For more information, see [Section 3.9.4, I/O Management](#).

3.9.2 Device RETENTION State Management

In Retention state, the voltages to the device are lowered to their minimum value to retain only the logic build with RFFs, while all DFF logic is lost. The memory area may be retained, depending on software configuration.

The device integrates enhanced device wake-up management while in Retention state. This allows:

- Triggering wake-up with limited capabilities from almost all programmed input pads all around the device.
- Triggering wake-up with full capabilities by using few GPIO inputs in the PD_WKUP power domain.

The logic voltages VDD_CORE_L, VDD_MPU_L, and VDD_IVA_L can transition to their retention value independently. Once the voltage domain state transition conditions are met in compliance with the software configuration, the PRCM module hardware initiates the transition into Retention state by sending an I²C command for the corresponding SMPS.

When all the logic voltages are transitioned to their Retention state, the PRCM module hardware can, depending on a software configuration, toggle its system clock request and/or its power request to allow the SCRM to shut down the system clock source and to request the external power IC to shut down internal resources.

The PRCM module, SCRM, and the external power IC can also be programmed so that the voltage VDD_CORE_L is managed by the power request signal. This means the following:

- The power IC manages the ramp-down and ramp-up time of the VDD_CORE_L SMPS upon toggle of the power request.
- The SCRM accounts for the overall setup of the PMIC resources (internal PMIC resources and VDD_CORE_L SMPS).
- The PRCM module sends Retention and On commands through the I²C interface. Indeed, the retention voltage value must be equal to the current voltage value and the value of the On voltage must be set to the expected voltage value following the wakeup. Also, the setup time periods corresponding to the SMPS ramp-up and ramp-down must be set to a zero value.

3.9.3 Device OFF State Management

The off mode is the device mode where all power domains except for PD_WKUP are in OFF state and the logic voltage domains (VDD_MPU_L, VDD_IVA_L and VDD_CORE_L) are shut down by the external power IC. Other power sources, such as the DPLL supplies, can be shut down by the external power IC during the off mode period.

The device integrates enhanced device wake-up management while in Retention state. This allows:

- Saving I/Os leakage by settings pads in the lowest power state compatible with the device environment.
- Triggering wake-up with limited capabilities from almost all programmed input pads all around the device.
- Triggering wake-up with full capabilities by using few GPIO inputs in the PD_WKUP power domain.

This section details the way the PRM manages and sequences the control of the various off mode contributors:

- LDO_WAKEUP
- Memory LDOs
- ABB LDOs
- Voltage controller
- Hardware save-and-restore mechanism
- Hardware power request signal

NOTE: For more information about the save-and-restore mechanism, see [Section 16.4.21](#), *Auto-Restore Feature*, in [Chapter 16](#).

Once the hardware conditions is met and according to the software configuration the PRCM module hardware initiates the transition into off mode by sending I²C commands for each SMPS and by respecting required sequencing between the voltage domains.

When all the logic voltages are transitioned to their Retention state, the PRCM module hardware can, depending on a software configuration, toggle its system clock request and/or its power request to allow the SCRM to shut down the system clock source and to request the external power IC to shut down internal resources.

The PRCM module, SCRM and the external power IC can also be programmed so that the voltage VDD_CORE_L is managed by the power request signal. This means the following:

- The power IC manages the ramp-down and ramp-up time of the VDD_CORE_L SMPS upon toggle of the power request.
- The SCRM accounts for the overall setup of the PMIC resources (internal PMIC resources and VDD_CORE_L SMPS).
- The PRCM module sends Off and On commands through the I²C interface. Indeed, the Off voltage value must be equal to the current voltage value and the value of the On voltage must be set to the expected voltage value following the wakeup. Also, the setup time periods corresponding to the SMPS ramp-up and ramp-down shall be set to a zero value.

3.9.3.1 Device Off Mode Sleep Sequence

This section describes the main steps of the device off mode sleep sequence. The Off command to shut down the voltages VDD_MPU_L, VDD_IVA_L, and VDD_CORE_L can be sent through the I²C interface. The VDD_CORE_L may also be controlled independently using the power request signal.

NOTE: The power request signal can be used to turn off other resources of the power-management IC, even when it is not used for the VDD_CORE_L management.

NOTE: LDOs in the power companion device (TWL60xx), which are turned off in ACTIVE state, are switched on when entering into SLEEP state with the default value.

After the first power on, all resources must be configured, especially the power resources that are not part of the power-up sequence. This must be done by sending a command through the I²C interface.

1. Software has completed preliminary settings such as:
 - Settings in the external power IC
 - Voltage transition settling time settings in PRCM
 - Context save for the relevant modules
 - System control module is configured with valid I/O pads off mode configuration.
 - Enable/disable the wake-up feature for each pad by programming the system control module.
 - Enable/disable the automatic gating of the system clock (PRCM).
 - Enable the I/O wake-up scheme (PRCM).

- Program a consistent power state for each power domain (that is, Off state for domains without hardware restored modules and OSWR state for domains with hardware restored modules build with RFF logic).
 - All modules in the PD_WKUP power domain must have their interrupts to Cortex-M3 and DSP, and their DMA requests to sDMA disabled.
 - Program automatic transition of the CD_WKUP clock domain.
 - Enable the off mode scheme (PRCM).
 - Configure the VDD_CORE_L management option:
 - Disable the option if power request signal is not used for VDD_CORE_L management.
 - Enable the option if power request signal is used for VDD_CORE_L management.
2. The PRCM module initiates the transition into off mode upon all following conditions:
- All the programmable power domains have reached their targeted Low-Power state which can either be Off or OSWRET. It does not apply to always-on power domains and to the EMU power domain.
 - The CD_WKUP clock domain is idled.
 - The off mode has been enabled by software.
- At this stage the I/O wake-up scheme through the I/O pad daisy-chain is already enabled. The I/O isolation scheme is managed in parallel with the following sequence (see [Section 3.9.4, I/O Management](#)).
3. The PRCM module triggers in parallel:
- Switch off all SRAM LDOs.
 - Bypass all ABB LDOs.
 - Isolate the analog area from digital supply removal.
4. The PRCM module then sends in a row the Off command for the voltages VDD_IVA_L and the VDD_MPU_L, once the following conditions are met:
- I/O isolation scheme is complete.
 - SRAM LDOs have ramped down to 0 V.
 - ABB LDOs have switched in bypass.
- The order between the two Off commands is irrelevant and managed by the voltage controller.
5. Once the voltages VDD_IVA_L and VDD_MPU_L are ramped down to 0 V the PRCM module sends the Off command for the voltage VDD_CORE_L:
- If power request signal is not used for VDD_CORE_L management then the VDD_CORE_L is ramped down to 0 V.
 - If power request signal is used for VDD_CORE_L management then the Off command for the voltage VDD_CORE_L, through the I²C interface, has no effect and the voltage VDD_CORE_L remains unchanged.
6. Once the Off command for VDD_CORE_L is sent and acknowledged, the PRCM module gates locally its system clock.
7. The PRCM module then deassert the signal system clock request to the SCRM, if so configured by the software. Similarly, it deasserts the signal power request if configured by software.
- If power request signal is used for VDD_CORE_L management, then VDD_CORE_L is ramped down to 0 V.
8. The SCRM then acknowledges the power request to the PRCM module. This acknowledge is required by the PRCM module before toggling again the signal power request.
9. The SCRM informs the PRCM module that all versions of the system clock have been gated; hence the PRCM module can transition the LDO_WAKEUP to SLEEP state if the PD_EMU power domain is in OFF state.
10. The DEVICE_OFFWKUP_CORERSTACTST signal intended for the core control module is asserted. The EMIF1_DEVICE_OFFWKUP_CORERSTACTST and EMIF2_DEVICE_OFFWKUP_CORERSTACTST signals intended for EMIF1 and EMIF2, respectively, are asserted according to their associated register bit fields, EMIF1_OFFWKUP_DISABLE and

EMIF1_OFFWKUP_DISABLE.

3.9.3.2 Device Off Mode Wake-Up Sequences

The wake-up sequence includes a phase of hardware restore. Depending on the wake-up event source the restore sequence completes in one or two phases. The first phase always happens and is sufficient to serve some type of wake-up events; for other sources of event a second phase is required and occurs immediately after the first phase. Phase 2 is also split into two subphases (phase 2a and phase 2b). The device returns to off mode after the first phase completes.

Table 3-328 lists the device off wake-up and hardware restore phases.

Table 3-328. Device Off Wake-Up and Hardware Restore Phases

Wake-Up Event	Phase 1	Phase 2	Comment
Wake-up request from PD_WKUP	Yes	Yes	This event must wake up the PD_MPU power domain by dependency.
PRM interrupt toward MPU-A9 (includes I/O wake-up detection)	Yes	Yes	This event wakes up the PD_WKUP power domain. The PD_MPU power domain is woken up by broadcast of the wake-up event and the MPU-A9 boots up.
Global warm reset	Yes	No	After voltage stabilization, phase 1 restoration is performed. Then MPU-A9 reboots, because global warm reset is a source of PD_MPU power domain wakeup.

3.9.3.2.1 Wake Up From a Wake-Up Event

This section describes the main steps of the wake-up sequence to exit the device from off mode. The ON command to ramp-up the voltages VDD_MPU_L, VDD_IVA_L, and VDD_CORE_L can be sent through the I²C interface. VDD_CORE_L can also be controlled independently using the power request signal.

NOTE: The power request signal can be used to turn on other resources of the power-management IC, even when it is not used for the VDD_CORE_L management.

Additionally it is assumed in this sequence that the wake-up source is not a global warm reset.

1. The PRCM module switches the LDO_WAKEUP from SLEEP to ON state and waits for the setup time of the LDO_WAKEUP (that is, four clock cycles of the 32-kHz clock).
2. The PRCM module asserts the system clock request signal to SCRM, which in turn sends the request to the external power IC. The SCRM accounts for the system clock stabilization time before enabling the clock to the PRCM module.
3. The PRCM module also asserts the power request signal to the SCRM. The PRCM module waits for the acknowledge of its power request signal and activation of the system clock before sending an I²C command for the voltage ramp-up sequence.
 - If power request signal is used for VDD_CORE_L management, then the power-management IC ramps up the voltage VDD_CORE_L.
 - If power request signal is not used for VDD_CORE_L management, then the voltage VDD_CORE_L is unchanged.
4. The PRCM module sends the ON command for the VDD_CORE_L voltage ramp up, through the I²C interface and waits for the setup time of the SMPS.
 - If power request signal is used for VDD_CORE_L management, then the voltage VDD_CORE_L is unchanged.
 - If power request signal is not used for VDD_CORE_L management, then the power-management IC ramps up the voltage VDD_CORE_L.
5. The PRCM module sends in a row the ON commands for the voltages VDD_MPU_L and VDD_IVA_L and waits for the setup time of the two SMPS.
6. The PRCM module enables the system clock to the eFuse controller and releases its reset line. It holds the other asserted resets until completion of the EFUSE bits sensing.

7. The PRCM module waits for the stabilization of the bandgap, memory LDOs and ABB LDOs stabilization.
8. Hardware restore phase 1 starts:
 - (a) The PRCM module ensures that:
 - CORTEXA9, CORTEXM3, and DSP are held in reset.
 - sDMA receives the restore request.
 - Phase 1 descriptor start address is sent to the sDMA.
 - MODULEMODE bit field of the L3_3 module is overridden to auto mode. This ensures the successful restoration of its firewalls during phase 1 of the restore.
 - (b) The PRCM module generates a wake-up event on the CD_SDMA clock domain. As a result, the PD_CORE power domain and CD_SDMA wakeup. This causes the CD_L3_1, CD_L3_2, CD_L4_CFG, CD_MEMIF, CD_L4_PER, and CD_L3_INIT to wake up because of the wake-up broadcast due to static dependency and their respective reset are released once their clock is active. The clock domain L4_WKUP is woken up (due to a wake-up broadcast on static dependency).
 - (c) The sDMA switches from STANDBY to ACTIVE state and performs phase 1 of the hardware restore:
 - Firewalls
 - System control module
 - EMIF
 - Part of the CM1 and part of the CM2 (core clock configuration, registers CLKTRCTRL of the CD_MPU, CD_L3_1, CD_L3_2, CD_L4_CFG, CD_MEMIF, CD_L4_PER, and CD_L3_INIT clock domains)

The sDMA make the last write into the PRCM module end of phase 1 bit field. The PRCM module then switches it to STANDBY state and resets it.
 - (d) The PRCM module releases I/O isolation of the EMIF. The other I/Os stay isolated.
 - (e) The PRCM module checks and waits if necessary for the DPLL_CORE to be in a stable state.
 - (f) The PRCM module releases the override of the MODULEMODE bit field of the L3_3 module.
9. Upon a need to perform phase 2 of the hardware automatic restore (according to the wake-up source), the following sequence occurs:
 - (a) Phase 2a sequence.
 - (i) The PRCM module drives the phase 2a descriptor start address to the sDMA.
 - (ii) The PRCM module releases the sDMA from reset.
 - (iii) The PRCM module generates a wake-up event on the CD_SDMA clock domain (same as in Step 2 of phase 1).
 - (iv) The sDMA performs phase 2a of the hardware restore:
 - The MODULEMODE bit field of each module to be restored during phase 2b is set to Enabled or Auto and the SARMODE bit field is enable if applicable. Only modules that have just interface clock(s) can be restored automatically.
 - Register [CM_SDMA_STATICDEP](#) is set to enable all necessary static dependency To wake up all power domains having modules to be restored during phase 2b

The sDMA makes the last write into the PRCM module at the end of phase 2a bit field. The PRCM module then switches it to Standby state and resets it. This completes phase 2a.
 - (b) Phase 2b sequence.
 - (i) The PRCM module drives the phase 2b descriptor start address to the sDMA.
 - (ii) The PRCM module releases the sDMA from reset.
 - (iii) The PRCM module generates a wake-up event on the CD_SDMA clock domain (same as in Step 2 of phase 1).
 - (iv) The sDMA performs phase 2b of the hardware restore:
 - Restore of the relevant modules

The sDMA makes the last write into the PRCM module at the end of the phase 2b bit field. The

PRCM module then switches it to STANDBY state and resets it. This completes phase 2b.

10. The PRCM module releases I/O isolation of the remaining I/O, only if the [PRM_IO_PMCTRL.ISOOVR_EXTEND](#) bit field is not set.
11. The PRCM module releases the reset stall conditions holding CORTEXA9, CORTEXM3, and DSP in reset.
12. The PD_MPU power domain is woken up if required according to the wake-up source.

3.9.3.2.2 Wakeup Upon Global Warm Reset

When global warm reset is the source of the device wakeup, the sequence referred in [Section 3.9.3.2.1, Wake up From a Wake-Up Event](#), is modified as follows:

Steps 4 and 5 are replaced by:

- The PRCM module waits for the three voltages VDD_MPU_L, VDD_IVA_L, and VDD_CORE_L stabilization time. It uses the [PRM_VOLTSETUP_WARMRESET](#) register for that purpose.

Step 6 is replaced by:

- The PRCM module enables the system clock to the eFuse controller and releases its reset line. In parallel, the device reset manager counts for global reset extension (setup by the [PRM_RSTTIME\[9:0\] RSTTIME1](#) bit field). The PRCM module holds the other asserted resets until completion of the eFuse bits sensing and the global reset counter overflow.

Phase 2 of the hardware restore sequence is skipped.

The hardware blocks and modifies the [FREQ_UPDATE](#) bit field of [CM_SHADOW_FREQ_CONFIG1](#) register during phase 1.

3.9.3.3 Global Warm Reset During a Device Wake-Up Sequence

If a global warm reset occurs before the PRCM module completes voltage stabilization count, the global warm reset is applied immediately. As a consequence, the sequence described in [Section 3.9.3.2.2, Wake up Upon Global Warm Reset](#), is performed.

If the global warm reset occurs after the PRCM module completes voltage stabilization (during eFuse sensing or during phase 1 of automatic restore):

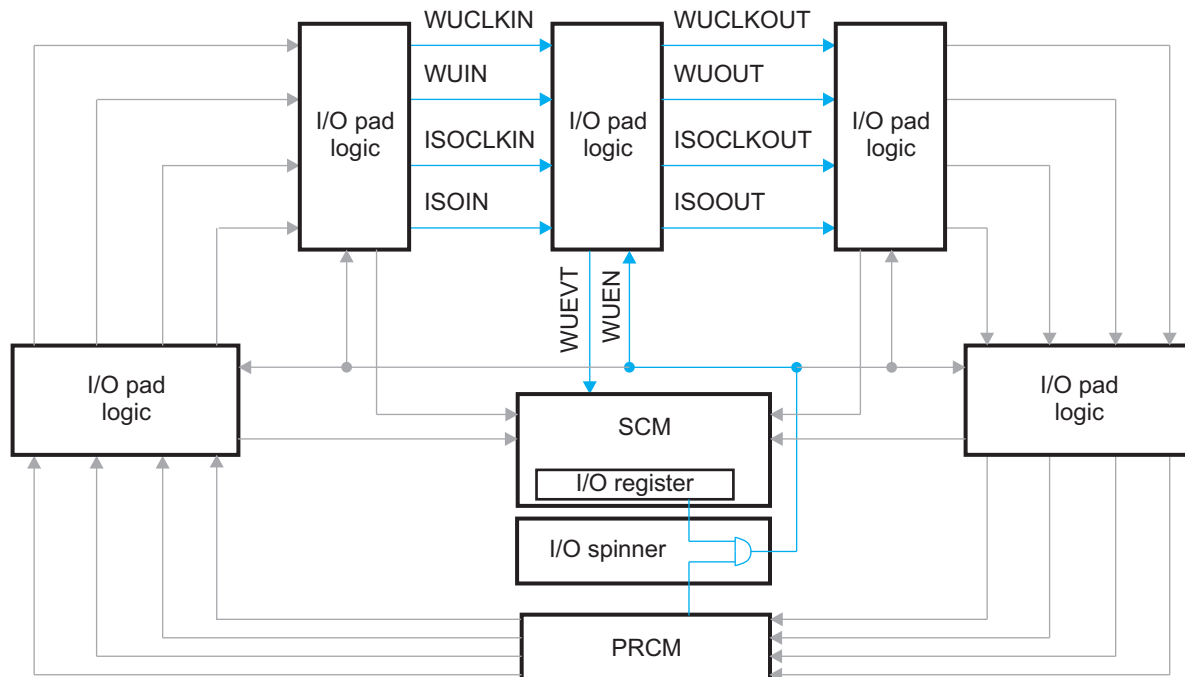

- Global warm reset is delayed and applied after of phase 1 restore completes.
- Phase 2 of restore is discarded.
- MPU boots after the warm reset sequence completes.

If the global warm reset occurs during phase 2 of automatic restore:

- Global warm reset is applied immediately.
- Phase 2 of restore is discarded.
- MPU boots after the warm reset sequence completes.

3.9.4 I/O Management

[Figure 3-80](#) is an overview of the power-management modules and their internal connections with a generic power domain.

Figure 3-80. I/O Pads Daisy-Chain Configuration

prcm-076

Any I/O pad of the device can be configured to generate a wake-up event when the device is in off mode. This is managed by the configurations in the system control module and the PRM.

In the off mode, the I/O pads of the device form a daisy chain with the I/O pad logic output of one pad connected to the I/O pad logic input of the next one. The I/O pad logic at the two ends of the chain is connected to the PRM.

The I/O pad wake-up scheme must be enabled (WUEN signal) globally by setting the [PRM_IO_PMCTRL\[16\]](#) GLOBAL_WUEN bit and by also setting I/O pad wake-up enabled/disabled individually (WUEN signal) by writing to the following bit fields in the control module:

- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y [14] WAKEUPENABLE
- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y [30] WAKEUPENABLE

NOTE: For more information, refer to [Section 18.4.8, Pad Functional Multiplexing and Configuration](#), in [Chapter 18, Control Module](#).

Once configured, the wake-up scheme within each I/O pad is enabled and disabled by triggering a control (WUCLKIN signal) of the I/O daisy chain. This is done thanks to a dedicated PRM module register bit [PRM_IO_PMCTRL\[8\]](#) WUCLK_CTRL. The software must enable the I/O wakeup prior entering a low-power mode and disable it following a wake-up event.

Writing the [PRM_IO_PMCTRL\[8\]](#) WUCLK_CTRL bit to 1 asserts signal WUCLKIN high to reset spurious wake-up event and to latch the current pad input value. PRM module register [PRM_IO_PMCTRL\[9\]](#) WUCLK_STATUS logs the signal WUCLKOUT of the last pad of the I/O ring. Once this status is set to 1, the software may clear the [PRM_IO_PMCTRL\[8\]](#) WUCLK_CTRL bit to effectively enable or disable the wake-up feature within each pad.

Additionally, it is required that the WUCLKIN is forced to 1 during global power-on reset. The I/O wake-up feature is enabled or disabled depending on a control (WUEN) for each I/O pad. This control is generated by the Spinner logic resulting of the combination of a local enable/disable bit per pad located in the control module and a global enable/disable bit located in the PRM module, that is, [PRM_IO_PMCTRL\[16\]](#) GLOBAL_WUEN.

When a wake-up event is detected by a wake-up enabled I/O pad in the daisy chain, it is logged within the I/O and is conveyed to the system control module (WUEVT signal). All the I/O wake-up event statuses are mapped on memory-mapped registers in the system control module.

When the device wakes up, the MPU can determine all sources of the current wake-up event logged into the corresponding bit fields in the control module.

- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y [15] WAKEUPEVENT
- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y [31] WAKEUPEVENT

For information about the control module, see [Chapter 18, Control Module](#).

I/Os have two associated buffers, that is, 1.2 V and 1.8 V. A software configuration determines which one is used in normal operation. However, in the device off mode, the 1.2-V buffer is always disabled, and the 1.8-V buffer stays on but is powered by 1.2 V instead of 1.8 V to minimize leakage, if pad configure to drive the output.

3.9.4.1 Hardware-Controlled I/O Isolation Sequences

I/Os have two buffers: 1.2 V and 1.8 V.

The software configuration determines whether the 1.2-V buffer or the 1.8-V buffer is used. Regardless of the buffer used, in off mode the 1.2-V buffer is always disabled and the 1.8-V buffer stays on but is powered by 1.2 V instead of 1.8 V to minimize leakage (if the pad is configure to drive the output).

In addition to this, I/Os support the following features:

- Wake-up override: The PRCM module can control the I/Os that are wakened; that is, brought out of isolation from device off mode based on the source of wakeup.
- Wakeup phased wakeup: The I/Os support a phased wake-up approach; that is, the I/Os can be brought out of off mode isolation in two phases without affecting the functional operation of the I/Os already out of isolation. This feature is used to wake up the I/Os still held in isolation without affecting the EMIF operations when a full device wakeup is requested.

The I/O transitions are:

- Full on to full isolation: Pad output controls are stable (A, GZ). Pad off mode configuration is activated.
- Full Isolation to EMIF on: EMIF I/O interface is brought out of isolation. Partial device context is restored.
- EMIF on to full on: EMIF I/O interface are already out of isolation and a new wake-up event requires a full device wakeup.
- EMIF on to full Isolation: EMIF I/O interface and some nonrestore sensitive I/Os are already out of isolation. The PRCM module puts the device back in off mode.

3.9.4.2 Software-Controlled I/O Isolation

In addition to the hardware-controlled I/O transitions, there is a dedicated PRCM module register bit, [PRM_IO_PMCTRL\[0\] ISOCLK_OVERRIDE](#), that can be used by the software to force ISOCLKIN signal to the I/O pad. It is then propagated from one pad to the other in the wake-up enabled daisy chain of I/Os. The PRCM module register [PRM_IO_PMCTR\[1\] ISOCLK_STATUS](#) logs the signal ISOCLKOUT of the last pad of the I/O daisy chain.

NOTE: Override is used at boot time only when software needs to change the mode of an I/O from 1.8-V default mode to 1.2-V mode. When not overridden, this signal is controlled only by hardware.

[PRM_IO_PMCTRL\[4\] ISOOVR_EXTEND](#) bit allows extending the non-EMIF I/O isolation. This feature can be used by software to restore modules driving output such as GPIO while non-EMIF I/Os are still isolated. Once software completes the relevant module restore, it clears the bit and hardware performs the full-isolation-to-EMIF transition on hardware-controlled I/O transition.

The [PRM_IO_PMCTRL\[5\] IO_ON_STATUS](#) status bit is available for software to check completion of the EMIF on transition.

3.10 PRCM Module Programming Guide

3.10.1 DPLLs Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and use of the module.

3.10.1.1 Global Initialization

3.10.1.1.1 Surrounding Module Global Initialization

This section identifies the requirements of initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

[Table 3-329](#) shows the global initialization of the surrounding modules.

Table 3-329. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Ensure that the DPLL reference clock (gated version of system clock) is active.

3.10.1.1.2 DPLL Global Initialization

3.10.1.1.2.1 Main Sequence – DPLL Global Initialization

This procedure initializes the DPLL after a power-on or software reset and then locks it to the desired synthesized clock frequency.

Table 3-330. DPLL Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure SSC parameters	See Section 3.10.1.1.2.2 .	
Configure Recalibration parameters	See Section 3.10.1.1.2.3 .	
Set DPLL automatic idle mode	CM_AUTOIDLE_<DPLL name>[2:0] AUTO_DPLL_MODE	xx ⁽¹⁾
Configure synthesized clock parameters	See Section 3.10.1.1.2.4 .	
Configure output clocks parameters	See Section 3.10.1.1.2.5 .	
Lock DPLL	CM_CLKMODE_<DPLL name>[0] DPLL_EN	0x7

(1) It depends on the desired auto idle mode. See [Section 3.6.3.3.3](#), *DPLL Power Modes*.

3.10.1.1.2.2 Subsequence – SSC Parameter Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

Table 3-331. DPLL SSC Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Configure M Step Size	CM_SSC_DELTAMSTEP_<DPLL name>[19:0] DELTAMSTEP	xx ⁽¹⁾
Configure modulation frequency divider exponent part	CM_SSC_MODFREQDIV_<DPLL name>[10:8] MODFREQDIV_EXPONENT	xx ⁽¹⁾
Configure modulation frequency divider mantissa part	CM_SSC_MODFREQDIV_<DPLL name>[6:0] MODFREQDIV_MANTISSA	xx ⁽¹⁾
Enable/disable frequency downspread	CM_CLKMODE_<DPLL name>[14] DPLL_SSC_DOWNSPREAD	xx ⁽²⁾

Table 3-331. DPLL SSC Parameter Configuration (continued)

Step	Register/Bit Field/Programming Model	Value
Enable SSC feature	CM_CLKMODE_<DPLL name>[12] DPLL_SSC_EN	0x1
Wait until SSC start acknowledge	CM_CLKMODE_<DPLL name>[13] DPLL_SSC_ACK	0x1

- (1) See SSC description in [Section 3.6.3.3.5, DPLL Spread Spectrum Clocking](#).
(2) The selected value depends on the desired SSC feature settings.

3.10.1.1.2.3 Subsequence – Recalibration Parameter Configuration

This procedure enables the recalibration feature and the associated processor interrupt flag.

Table 3-332. DPLL Recalibration Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Clear recalibration interrupt status	PRM_IRQSTATUS_<Processor name>[x] <DPLL name>_RECAL_ST	0x0
Unmask recalibration interrupt flag	PRM_IRQENABLE_<Processor name>[x] <DPLL name>_RECAL_EN	0x1
Enable recalibration feature	CM_CLKMODE_<DPLL name>[8] DPLL_DRIFTGUARD_EN	0x1

3.10.1.1.2.4 Subsequence – Synthesized Clock Parameter Configuration

This procedure configures the settings for the synthesized clock of the DPLL.

Table 3-333. DPLL Synthesized Clock Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Set DPLL clock synthesis multiplier	CM_CLKSEL_<DPLL name>[2:0] DPLL_MULT	xx ⁽¹⁾
Set DPLL clock synthesis divider	CM_CLKSEL_<DPLL name>[2:0] DPLL_DIV	xx ⁽¹⁾
IF : Low-power mode operation conditions satisfied?	Software test condition. See Section 3.6.3.3.2 .	
Enable DPLL low-power operation mode	CM_CLKMODE_<DPLL name>[10] DPLL_LPMODE_EN	0x1
ENDIF		

- (1) It depends on the desired synthesized clock frequency. See [Section 3.6.3.3, Generic DPLL Overview](#).

3.10.1.1.2.5 Subsequence – Output Clock Parameter Configuration

This procedure configures the settings for the output clocks of the DPLL.

Table 3-334. DPLL Output Clock Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Set output clock dividers (that is, M2, M3 and Mn), where n is from 4 to 7. It depends on the available clock output of the DPLL.	CM_DIV_M2_<DPLL name>[4:0] DPLL_CLKOUT_DIV CM_DIV_M3_<DPLL name>[4:0] DPLL_CLKOUTHIF_DIV CM_DIV_Mn_<DPLL name>[4:0] HSDIVIDER_CLKOUTn-3_DIV	xx ⁽¹⁾

Table 3-334. DPLL Output Clock Parameter Configuration (continued)

Step	Register/Bit Field/Programming Model	Value
Wait until divider change acknowledged	CM_DIV_M2_<DPLL name>[5] DPLL_CLKOUT_DIVCHACK CM_DIV_M3_<DPLL name>[5] DPLL_CLKOUTHIF_DIVCHACK CM_DIV_Mn_<DPLL name>[5] HSDIVIDER_CLKOUTn-3_DIVCHACK	Bit toggled ⁽²⁾
Enable/disable output clock dividers auto power-down feature. It applies to M2, M3, and Mn dividers, where n is from 4 to 7. It depends on the available clock output dividers of the DPLL.	CM_DIV_M2_<DPLL name>[12] DPLL_M2_PWDN CM_DIV_M3_<DPLL name>[12] DPLL_CLKOUTHIF_PWDN CM_DIV_Mn_<DPLL name>[12] HSDIVIDER_CLKOUTn-3_PWDN	xx ⁽³⁾
Enable/disable output clocks automatic gating feature. It applies to M2, M3, and Mn clock outputs, where n is from 4 to 7. It depends on the available clock output of the DPLL.	CM_DIV_M2_<DPLL name>[8] DPLL_CLKOUT_GATE_CTRL CM_DIV_M3_<DPLL name>[8] DPLL_CLKOUTHIF_GATE_CTRL CM_DIV_Mn_<DPLL name>[8] HSDIVIDER_CLKOUTn-3_GATE_CTRL	xx ⁽⁴⁾

(1) It depends on the desired output clock frequency. See [Section 3.6.3.3, Generic DPLL Overview](#).

(2) It is toggled only if the programmed divider value differs from the previous one.

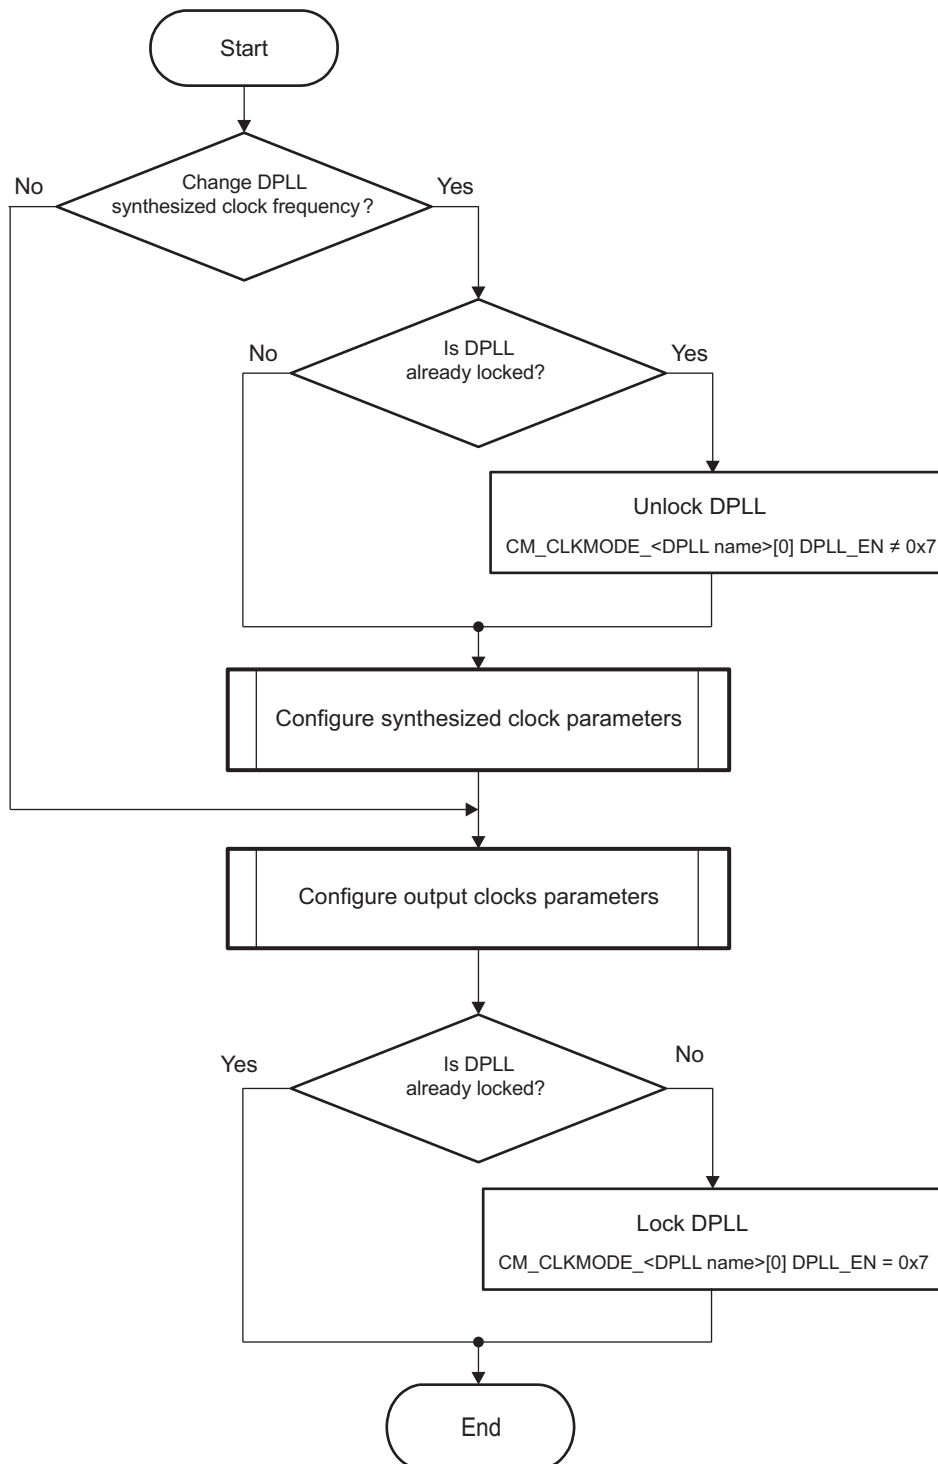

(3) It depends on whether output clock divider automatic power down feature is to be enabled or not. See [Section 3.6.3.3.6, DPLL Output Power-Down](#).

(4) It depends on whether output clock automatic gating feature is to be enabled or not.

3.10.1.2 DPLL Output Frequency Change

[Figure 3-81](#) shows the DPLL output-frequency change.

Figure 3-81. DPLL Output-Frequency Change

prcm-077

To unlock a DPLL, a mode other than the Lock Mode (0x7) should be programmed in the CM_CLKMODE_<DPLL name>[2:0] DPLL_EN bit field. The modes that can be programmed in the DPLL_EN bit field and unlock the DPLL are:

- For type A DPLLs:
 - MN bypass mode (0x4)

- Idle Low Power bypass mode (0x5)
- Idle Fast Relock bypass mode (0x6)
- For type B DPLLs:
 - Low Power Stop mode (0x1)
 - MN bypass mode (0x4)
 - Idle Low Power bypass mode (0x5)

NOTE: DPLL_IVA does not support Idle Fast Relock bypass mode (0x6).

Table 3-335. Register Call Summary for Sequence – DPLL Output Frequency Change

Register Name
CM_CLKMODE_<DPLL name>

Table 3-336. Subprocess Call Summary for Sequence – DPLL Output Frequency Change

Subprocess Name	Cross-reference
Configure synthesized clock parameters	See Section 3.10.1.1.2.4.
Configure output clocks parameters	See Section 3.10.1.1.2.5.

3.10.2 Clock Management Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and use of the clocks in the device.

3.10.2.1 Global Initialization

3.10.2.1.1 Surrounding Module Global Initialization

This section identifies the requirements of initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

[Table 3-337](#) shows the global initialization of the surrounding modules.

Table 3-337. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM DPLLs	Ensure that the DPLLs managed by the PRCM module are initialized.

3.10.2.1.2 Clock Management Global Initialization

3.10.2.1.2.1 Main Sequence – Clock Domain Global Initialization

This procedure initializes the clock domain of the device after a power-on or software reset.

Table 3-338. Clock Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure module clock-management feature of master modules in the clock domain	<Module name>_SYSCONFIG[x] MIDDLEMODE <Module name>_SYSCONFIG[x] STANDBYMODE	xx ⁽¹⁾
Configure module clock-management feature of slave modules in the clock domain	See Section 3.10.3.3.	
Enable/disable Static Sleep Dependency with other clock domains (that is, destination clock domains). Not all dependencies are configurable.	CM_<Clock Domain name>_STATICDEP [x] <Destination Clock Domain name>_STATDEP	0x0 to Disable 0x1 to Enable
Set Dynamic Dependency window size	CM_<Clock Domain name>_DYNAMICDEP[27:24] WINDOWSIZE	xx ⁽²⁾
Enable/disable module wake-up dependency for the modules of the clock domain. It is available when the module can generate an interrupt or a DMA request to a service provider module (for example, a processor or DMA).	PM_<Clock Domain name>_<Module name>_WKDEP[x] WKUPDEP_<Module name>_<DMA/IRQ request>_<DMA/Processor name>	0x0 to disable 0x1 to enable
Set clock domain state transition feature	CM_<Clock Domain name>_CLKSTCTRL[1:0]11 CLKTRCTRL	xx ⁽³⁾

- (1) See the module register for valid modes.
- (2) It depends on the desired size of the window. See [Section 3.1.1.1.7.2, Clock Domain Dependency](#).
- (3) It depends on the desired state of the clock domain. See [Table 3-11](#).

3.10.2.1.2.2 Subsequence – Slave Module Clock-Management Parameters Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

Table 3-339. Slave Module Clock-Management Parameter Configuration

Step	Register/Bit Field/Programming Model	Value
Configure module idle mode feature	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	xx ⁽¹⁾
IF : Smart-idle mode is selected	<Module name>_SYSCONFIG[x] SIDLEMODE <Module name>_SYSCONFIG[x] IDLEMODE	0x10
Configure module clock requirement feature	<Module name>_SYSCONFIG[x] CLOCKACTIVITY	x ⁽¹⁾
ENDIF		
Configure module management behavior on the PRCM module side	CM_<Clock Domain name>_<Module name>_CLKCTRL[1:0] MODULEMODE	xx ⁽²⁾

- (1) See the module register for valid settings.
- (2) The selected value depends on the desired clock-management behavior.

3.10.2.2 Clock Domain Sleep Transition and Troubleshooting

This procedure initiates a sleep transition on a clock domain and allows to debug if the transition does not occur.

Table 3-340. Clock Domain Sleep Transition and Troubleshooting

Step	Register/Bit Field/Programming Model	Value
Set clock domain sleep transition state	CM_<Clock Domain name>_CLKSTCTRL[1:0]11 CLKTRCTRL	0x1: SW_SLEEP 0x3: HW_AUTO
IF : Clock domain sleep transition not initiated?		
Check all clock domain master modules are in standby mode	CM_<Clock Domain name>_<Module name>_CLKCTRL[18] STBYST	0x1: Module in standby
Check all clock domain slave modules are in idle mode	CM_<Clock Domain name>_<Module name>_CLKCTRL[17:16] IDLEST	0x1: In transition 0x2: Interface clock idled 0x3: Module idled
ENDIF		

3.10.2.3 Enable/Disable Software-Programmable Static Dependency

To change the setting of a software-programmable static dependency use the procedure described in [Table 3-341](#).

Table 3-341. Enable/Disable Software-Programmable Static Dependency

Step	Register/Bit Field/Programming Model	Value
Force destination domain to be awake (SW_WKUP)	CM_<Dest_CDname>_CLKSTCTRL[1:0] CLKTRCTRL	0x2
Wait until power domain which encloses the destination domain is ON	PM_<Dest_PDname>_PWRSTST	=0x3
Change the static dependency	CM_<Src_CDname>_STATICDEP[x] <Dest_CDname>_STATDEP	0x0 (Disable) 0x1 (Enable)
Put destination domain back to automatic transition (HW_AUTO)	CM_<Dest_CDname>_CLKSTCTRL[1:0] CLKTRCTRL	0x3

3.10.3 Power Management Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and control of the power domain in the device.

3.10.3.1 Global Initialization

3.10.3.1.1 Surrounding Module Global Initialization

It does not require any initialization sequence of any surrounding modules within the device. The external power IC and the device clocks should be active.

3.10.3.1.2 Power Management Global Initialization

3.10.3.1.2.1 Main Sequence – Power Domain Global Initialization and Setting

This procedure initializes the power domain of the device after a power-on or software reset.

Table 3-342. Power Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Configure memory area power state when the power domain is on. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x0: Off 0x1: RETAINED 0x3: On
Configure memory area power state when the power domain transitions to RETENTION state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_RETSTATE	0x0: Off 0x1: RETAINED
Configure logic area RETENTION power state when the power domain transitions to RETENTION state.	PM_<Power Domain name>_PWRSTCTRL[2] LOGICRETSTATE	0x0: OSWR 0x1: CSWR
Select target power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x0: OFF 0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE
Wait until power state change is complete	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x0: OFF 0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE

3.10.3.2 Forced Memory Area State Change With Power Domain ON

This procedure initiates a forced memory area state change while the power domain is ON.

Table 3-343. Forced Memory Area State Change With Power Domain ON

Step	Register/Bit Field/Programming Model	Value
Configure memory area target power state. Not all memory area states are programmable.	PM_<Power Domain name>_PWRSTCTRL[x] <Memory Bank name>_ONSTATE	0x0: OFF 0x1: RETAINED 0x3: ON
Get memory area current state	PM_<Power Domain name>_PWRSTST[x] <Memory Bank name>_STATEST	0x0: OFF 0x1: RETAINED 0x3: ON

3.10.3.3 Forced Power Domain Low-Power State Transition

This procedure initiates a power state transition on a power domain from current low-power state (ON-INACTIVE or RETENTION) to a lower power state (RETENTION, OFF).

Table 3-344. Forced Power Domain Low-Power State Transition

Step	Register/Bit Field/Programming Model	Value
Select target low-power state of the power domain. Not all states are programmable.	PM_<Power Domain name>_PWRSTCTRL[1:0] POWERSTATE	0x0: Off 0x1: Retention
Force power domain low-power state transition.	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x1: Force change
Wait until state change is complete	PM_<Power Domain name>_PWRSTCTRL[4] LOWPOWERSTATECHANGE	0x0: Change complete
Get current power state.	PM_<Power Domain name>_PWRSTST[1:0] POWERSTATEST	0x0: Off 0x1: Retention

3.10.4 Voltage Management Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and management of the voltage domains of the device.

3.10.4.1 Global Initialization

3.10.4.1.1 Surrounding Module Global Initialization

It does not require any initialization sequence of any surrounding modules within the device. The external power IC and the device clocks should be active.

3.10.4.1.2 Voltage Management Global Initialization

3.10.4.1.2.1 Main Sequence – Voltage Management Global Initialization and Setting

This procedure initializes the voltage management framework in the device.

Table 3-345. Power Domain Global Initialization

Step	Register/Bit Field/Programming Model	Value
Initialize SmartReflex modules	See Section 3.10.4.1.3 .	
Initialize voltage processor modules	See Section 3.10.4.1.4 .	
Initialize voltage controller module	See Section 3.10.4.1.5 .	

3.10.4.1.3 SmartReflex Module Initialization

This procedure initializes the SmartReflex module.

Table 3-346. SmartReflex Module Configuration

Step	Register/Bit Field/Programming Model	Value
Configure clock	See Section 3.10.4.1.3.1 .	
Configure sensor	See Section 3.10.4.1.3.2 .	
Configure accumulator and min/max/avg	See Section 3.10.4.1.3.3 .	
Configure error generator	See Section 3.10.4.1.3.4 .	
Configure interrupt generator	See Section 3.10.4.1.3.5 .	
Enable module	SRn.SRCONFIG[11] SR_EN	0x1

3.10.4.1.3.1 Subsequence – Clock Configuration

This procedure configures the clock for the SmartReflex module.

Table 3-347. SmartReflex Module Clock Configuration

Step	Register/Bit Field/Programming Model	Value
Configure desired clock frequency	SRn.SRCONFIG[21:12] SRCLKLENGTH	xx ⁽¹⁾
Configure desired idle mode	SRn.ERRCONFIG[25:24] IDLEMODE	0x0: Forced-idle 0x1: No-idle 0x2: Smart-idle 0x3: Smart-idle Wakeup
Enable/disable wake-up feature	SRn.ERRCONFIG[26] WAKEUPENABLE	0x0: Disable 0x1: Enable
Enable clock	CM_ALWON_<SR name>_CLKCTRL[1:0] MODULEMODE	0x2: Enable

⁽¹⁾ See [Equation 1](#) for clock frequency calculation.

3.10.4.1.3.2 Subsequence – Sensor Configuration

This procedure configures the sensor in the SmartReflex module.

Table 3-348. SmartReflex Module Sensor Configuration

Step	Register/Bit Field/Programming Model	Value
Enable sensor core A	SRn.SRCONFIG[1] SENNENABLE	0x1
Enable sensor core B	SRn.SRCONFIG[0] SENPENENABLE	0x1
Enable sensor core	SRn.SRCONFIG[10] SENENABLE	0x1

3.10.4.1.3.3 Subsequence – Accumulator and Min/Max/Avg Configuration

This procedure configures the accumulator and min/max/avg part of the SmartReflex module.

Table 3-349. Accumulator and Min/Max/Avg Configuration

Step	Register/Bit Field/Programming Model	Value
Set size of the accumulator	SRn.SRCONFIG[31:22] ACCUMDATA	xxx ⁽¹⁾
Set average weight parameter for the sensor A	SRn.AVGWEIGHT[1:0] SENNAVGWEIGHT	x ⁽¹⁾
Set average weight parameter for the sensor B	SRn.AVGWEIGHT[3:2] SENPAVGWEIGHT	x ⁽¹⁾
Enable minimum/maximum/average	SRn.SRCONFIG[8] MINMAXAVGENABLE	0x1

⁽¹⁾ These parameters are calculated as given in [Section 3.8.3.2.3, SmartReflex Submodules](#).

3.10.4.1.3.4 Subsequence – Error Generator Configuration

This procedure configures the error generator part of the SmartReflex module.

Table 3-350. Error Generator Configuration

Step	Register/Bit Field/Programming Model	Value
Configure four reference value parameters	SRn.NVALUEREIPROCAL[23:20] SENPGAIN	x ⁽¹⁾
	SRn.NVALUEREIPROCAL[19:16] SENNGAIN	x ⁽¹⁾
	SRn.NVALUEREIPROCAL[15:8] SENPRN	xx ⁽¹⁾
	SRn.NVALUEREIPROCAL[7:0] SENNRN	xx ⁽¹⁾
Enable the error generator	SRn.SRCONFIG[9] ERRORGENERATORENABLE	0x1

⁽¹⁾ Configured according to the values read for the current operating voltage level from the control module register in [Section 3.8.3.2.3, SmartReflex Submodules](#).

3.10.4.1.3.5 Subsequence – Interrupt Generator Configuration

This procedure configures the interrupt generator part of the SmartReflex module.

Table 3-351. Interrupt Generator Configuration

Step	Register/Bit Field/Programming Model	Value
Set the four reference value parameters	SRn.ERRCONFIG[18:16] ERRWEIGHT	x
	SRn.ERRCONFIG[15:8] ERRMAXLIMIT	xx
	SRn.ERRCONFIG[7:0] ERRMINLIMIT	xx
IF : Automatic voltage control using voltage processor	Software test condition	
Clear voltage processor bounds interrupt status	SRn.ERRCONFIG[23] VPBOUNDSINTSTATENA	0x1
Unmask voltage processor bounds interrupt	SRn.ERRCONFIG[22] VPBOUNDSINTENABLE	0x1
ELSE-IF : Software-controlled voltage management	Software test condition	
Unmask <Processor> interrupt events	SRn.IRQENABLE_SET[3] MCUACCUMINTENASET	0x1
	SRn.IRQENABLE_SET[2] MCUVALIDINTENASET	0x1
	SRn.IRQENABLE_SET[1] MCUBOUNDSINTENASET	0x1
ENDIF		

3.10.4.1.4 Voltage Processor Initialization

This procedure initializes the voltage processor.

Table 3-352. Voltage Processor Module Initialization

Step	Register/Bit Field/Programming Model	Value
Configure error-to-voltage converter	See Section 3.10.4.1.4.1 .	
Configure PRCM	See Section 3.10.4.1.4.2 .	
Mask/unmask interrupt events	PRCM.PRM_IRQENABLE_<Processor name>	
Enable module	PRCM.PRM_<Voltage Processor name>_CONFIG[0] VPENABLE	0x1

3.10.4.1.4.1 Subsequence – Error-to-Voltage Converter Configuration

This procedure configures the error-to-voltage converter of the voltage processor.

Table 3-353. Error-to-Voltage Converter Configuration

Step	Register/Bit Field/Programming Model	Value
Set error offset. Offset value in the Error to Voltage converter (8-bit signed two's complement number) ⁽¹⁾ . The default value for ERROROFFSET is zero.	PRCM.PRM_VP_<Voltage Processor name>_CONFIG[31:24] ERROROFFSET	xx ⁽²⁾
Set error gain. Gain value in the Error to Voltage converter (8-bit signed two's complement number). $ERRORGAIN = ((Error2voltageGain^{(3)}) \times 100 / SMPSstepsz)$	PRCM.PRM_VP_<Voltage Processor name>_CONFIG[23:16] ERRORGAIN	xx ⁽²⁾
Set SMPS negative voltage step slew rate (in number of cycles per SMPS step).	PRCM.PRM_VP_<Voltage Processor name>_VSTEPMIN[23:8] SMPSWAITTIMEMIN	xx ⁽²⁾
Set SMPS minimum voltage (VDD) step size. $0 \leq \Delta VDD^{(4)} \leq VStepMin$	PRCM.PRM_VP_<Voltage Processor name>_VSTEPMIN[7:0] VSTEPMIN	xx ⁽²⁾
Set SMPS positive voltage step slew rate (in number of cycles per SMPS step).	PRCM.PRM_VP_<Voltage Processor name>_VSTEPMAX[23:8] SMPSWAITTIMEMAX	xx ⁽²⁾

⁽¹⁾ ErrorOffset is an 8-bit two's complement signed frequency error, and adding 1 bit is equivalent to adding 0.79% to the frequency error.

⁽²⁾ Depends on the characteristics of the SMPS.

⁽³⁾ Recommended value for Error2voltageGain is approximately 0.004V / % error.

⁽⁴⁾ $\Delta VDD = (FreqError + ErrorOffset) \times Error2VoltageGain$. FreqError is a two-complement value fixed-point fraction; MSB is a signed bit.

Table 3-353. Error-to-Voltage Converter Configuration (continued)

Step	Register/Bit Field/Programming Model	Value
Set SMPS maximum voltage (VDD) step size $\Delta VDD^{(4)} > VStepMax$	PRCM.PRM_VP_<Voltage Processor name>_VSTEPMAX[7:0] VSTEPMAX	xx ⁽²⁾
Set SMPS minimum voltage supply level	PRCM.PRM_VP_<Voltage Processor name>_VLIMITTO[23:16] VDDMIN	xx ⁽²⁾
Set SMPS maximum voltage supply level	PRCM.PRM_VP_<Voltage Processor name>_VLIMITTO[31:24] VDDMAX	xx ⁽²⁾

For more details on the interaction between the Voltage processor and SmartReflex, see [Figure 3-78](#), and [Section 3.8.3.2.8, SMPS-Dependent Parameter Configuration](#).

3.10.4.1.4.2 Subsequence – FSM Configuration

Ensure the VP voltage value is aligned with the current PMIC (external power IC) voltage value and, if required, perform the procedure in [Table 3-354](#).

Table 3-354. FSM Configuration

Step	Register/Bit Field/Programming Model	Value
Set target initial voltage level of the SMPS	PRCM.PRM_<Voltage Processor name>_CONFIG[15:8] INITVOLTAGE	xx
Assert the initial voltage into the voltage processor FSM	PRCM.PRM_<Voltage Processor name>_CONFIG[2] INITVDD	0x1
Clear the initialize bit	PRCM.PRM_<Voltage Processor name>_CONFIG[2] INITVDD	0x0

3.10.4.1.5 Voltage Controller Initialization

This procedure initializes the voltage controller.

Table 3-355. Voltage Controller Module Initialization

Step	Register/Bit Field/Programming Model	Value
Configure external power IC device I ² C slave addresses. 7 bits for each SMPS IC: (20:14) SMPS2, (13:7) SMPS1, (6:0) SMPS0.	PRCM.PRM_VC_SMPS_SA[x] SA_<Voltage Domain name>	xx ⁽¹⁾
Configure voltage configuration register addresses for the VDD channels. Voltage values – 8 bits for each SMPS IC: (23:16) SMPS2, (15:8) SMPS1, (7:0) SMPS0.	PRCM.PRM_VC_VAL_SMPS_RA_VOL[x] VOLRA_<Voltage Domain name>	xx ⁽¹⁾
Configure command configuration register addresses. Command (ON/ON-Low-Power/Retention/OFF). Command values – 8 bits for each SMPS IC: (23:16) SMPS2, (15:8) SMPS1, (7:0) SMPS0.	PRCM.PRM_VC_VAL_SMPS_RA_CMD[x] CMDRA_<Voltage Domain name>	xx ⁽¹⁾⁽²⁾
Configure voltage domain command values. ON/ON-Low-Power/Retention/OFF, command values are 8 bits for each channel.	PRCM.PRM_VC_VAL_CMD_<Voltage Domain name>[x] <Command name>	xx ⁽¹⁾
Configure pointers for the VDD channels	See Section 3.10.4.1.5.1 .	
Configure I ² C interface	See Section 3.10.4.1.5.2 .	

⁽¹⁾ Depends on the characteristics of the external SMPS device. For more information, see the corresponding SMPS reference documents.

⁽²⁾ Second Register Address values are useful when the SMPS IC(s) have different configuration register to switch ON/OFF, then VDD voltage configuration register.

3.10.4.1.5.1 Subsequence – VDD Channels Pointers Configuration

This procedure configures the FSM of the voltage processor.

Table 3-356. VDD Channel Pointer Configuration

Step	Register/Bit Field/Programming Model	Value
Set slave address pointer for each VDD channel (1 bit per VDD channel) – (0) VDD0, (1) VDD1, (2)VDD2.	PRCM.PRM_VC_CFG_CHANNEL[x] SA_<Voltage Domain name>	
Set voltage configuration register address pointer for each VDD channel (1 bit per VDD channel) - (0) VDD0, (1) VDD1, (2)VDD2.	PRCM.PRM_VC_CFG_CHANNEL[x] RAV_<Voltage Domain name>	
Set command (ON/Retention/OFF) configuration register address pointer for each VDD channel (1 bit per VDD channel) - (0) VDD0, (1) VDD1, (2)VDD2.	PRCM.PRM_VC_CFG_CHANNEL[x] RAC_<Voltage Domain name>	
Select voltage or command configuration register for FSM commands. Enables bits for PIREGSCHRAC usage (1 bit per VDD channel) - (0) VDD0, (1) VDD1, (2) VDD2.	PRCM.PRM_VC_CFG_CHANNEL[x] RACEN_<Voltage Domain name>	
Set command voltage level selection pointer. ON/ON-Low-Power/Retention/OFF voltage values set selection for each VDD channel (1 bit per VDD channel) (2)VDD2, (1)VDD1, (0)VDD0.	PRCM.PRM_VC_CFG_CHANNEL[x] CMD_<Voltage Domain name>	

3.10.4.1.5.2 Subsequence – I²C Configuration

This procedure configures the I²C in the voltage controller.

Table 3-357. I²C Configuration

Step	Register/Bit Field/Programming Model	Value
Enable/disable I ² C bus double digital filter	PRCM.PRM_VC_CFG_I2C_MODE[6] DFILTEREN	
Set master code value for I ² C HS preamble	PRCM.PRM_VC_CFG_I2C_MODE[2:0] HSMCODE	
Enable/disable I ² C HS mode	PRCM.PRM_VC_CFG_I2C_MODE[3] HSMODEEN	0x0: Disable 0x1: Enable
Enable/disable repeated start operation.	PRCM.PRM_VC_CFG_I2C_MODE[4] SRMODEEN	0x0: Disable 0x1: Enable

3.10.4.2 Disable Sequence for AVS (SmartReflex) and VP

3.10.4.2.1 Disable the Error Generator Module

Table 3-358. Disable the Error Generator

Step	Register/Bit Field/Programming Model	Value
Disable the VP BOUND IRQ ⁽¹⁾	SRn.ERRCONFIG[22] VPBOUNDSINTENABLE	0x0
Disable the sensors	SRn.SRCONFIG[10] SENENABLE	0x0
Disable the Error Generator module	SRn.SRCONFIG[9] ERRORGENERATORENABLE	0x0

⁽¹⁾ At this stage, it is important to not write 0x1 on bit SRn.ERRCONFIG[23] VPBOUNDSINTSTATENA

3.10.4.2.2 Disable the Voltage Processor

Table 3-359. Disable the Voltage Processor

Step	Register/Bit Field/Programming Model	Value
Disable the VP module	PRCM.PRM_Voltage Processor name_CONFIG[0] VPENABLE	0x0
Wait for VP being idled by pooling bit VPINIDLE to 0x1	PRCM.PRM_Voltage Processor name_STATUS[0] VPINIDLE	==0x1

3.10.4.2.3 Disable AVS (SmartReflex)

Table 3-360. Disable the SmartReflex Module

Step	Register/Bit Field/Programming Model	Value
Enable the MPU Disable Acknowledge IRQ	SRn.IRQENABLE_SET[0] MCUDISABLEACTINTENASET	0x1
Disable the SmartReflex module	SRn.SRCONFIG[11] SRENABLE	0x0
Clear the VP BOUND IRQ status bit only if it is set	SRn.ERRCONFIG[23] VPBOUNDSINTSTATENA	0x1
Disable the following MPU IRQs or at least check these IRQs are not enabled: ACCUM IRQ, VALID IRQ and BOUND IRQ	SRn.IRQENABLE_CLR[3] MCUACCUMINTENACL SRn.IRQENABLE_CLR[2] MCUVALIDINTENACL SRn.IRQENABLE_CLR[1] MCUBOUNDSINTENACL	0x1
Clear the following MPU IRQ statuses: ACCUM IRQ, VALID IRQ and BOUND IRQ	SRn.IRQSTATUS[3] MCUACCUMINTSTATENA SRn.IRQSTATUS[2] MCUVALIDINTSTATENA SRn.IRQSTATUS[1] MCUBOUNDSINTSTATENA	0x1
Wait for the MPU Disable Acknowledge IRQ	SRn.IRQSTATUS[0] MCUDISABLEACKINTSTATENA	==0x1
Clear the MPU Disable Acknowledge IRQ status	SRn.IRQSTATUS[0] MCUDISABLEACKINTSTATENA	0x1
Disable the MPU Disable Acknowledge IRQ status	SRn.IRQENABLE_CLR[0] MCUDISABLEACKINTENACL	0x1

3.10.4.3 Changing OPP

This procedure allows changing of the voltage of the external SMPS from one OPP to the other. It also covers the programming sequence for ABB LDO if the OPP change requires a change in state of the ABB LDO.

NOTE: When switching from the current OPP to a target OPP, if the clock frequency of the target OPP is less than that of the current OPP, the clock frequency is first switched to the lower frequency of target OPP, and only then is the voltage scaling initiated. However, if the clock frequency of the target OPP is greater than that of the current OPP, voltage scaling is initiated before frequency scaling.

Table 3-361. Initial Settings

Step Description	Register/Bit Field/Programming Model	Value
Initial setting for activating ABB in OPP_NITRO mode	PRM_LDO_ABB_MPU_SETUP[2] or PRM_LDO_ABB_IVA_SETUP[2] ACTIVE_FBB_SEL	0x1
Initial setting for activating ABB in OPP_TURBO mode	PRM_LDO_ABB_MPU_SETUP[1] or PRM_LDO_ABB_IVA_SETUP[1] ACTIVE_RBB_SEL	0x1
Enable ABB power management of the ABB LDO	PRM_LDO_ABB_MPU_SETUP[0] or PRM_LDO_ABB_IVA_SETUP[0] SR2EN	0x1

The above settings are sampled by activating OPP_CHANGE (that is, [PRM_LDO_ABB_MPU_CTRL\[2\]](#) OPP_CHANGE = 0x1 or [PRM_LDO_ABB_IVA_CTRL\[2\]](#) OPP_CHANGE = 0x1).

The programming steps in [Table 3-362](#) and [Table 3-363](#) assume the above settings are applied during the initialization phase.

Table 3-362. Transition From Lower OPP to Higher OPP

Step ID	Step Description	Register/Register Bit Field/Programming Model	Value
1	Disable the SmartReflex module.	SRn.SRCONFIG[11] SR_EN	0x0
2	Mask SmartReflex interrupts		
3	Disable the voltage processor module	PRM_<Voltage Processor name>_CONFIG[0] VPENABLE	0x0
4	Set the new OPP voltage value	PRM_<Voltage Processor name>_CONFIG[15:8] INITVOLTAGE	
5	Triggers a write of the value in the INITVOLTAGE into the voltage processor	PRM_<Voltage Processor name>_CONFIG[2] INITVDD	0x1
6	Force update of the SMPS	PRM_<Voltage Processor name>_CONFIG[1] FORCEUPDATE	0x1
7	Wait for voltage convergence to new OPP voltage (that is, wait for interrupt PRM_IRQSTATUS_MPU_A9_2[5] VP_MPU_TRANXDONE_ST = 0x1	PRM_IRQSTATUS_MPU_A9_2[0] VP_MPU_OPPCHANGEDONE_ST	
8	Select the next OPP for the ABB LDO (Fast in case of ABB Set1) (Slow in case of ABB Set2)	PRM_LDO_ABB_MPU_CTRL[1:0] or PRM_LDO_ABB_IVA_CTRL[1:0] OPP_SEL	0x1 for fast OPP 0x3 for slow OPP
9	Initiate the state change for the ABB LDO	PRM_LDO_ABB_MPU_CTRL[2] or PRM_LDO_ABB_IVA_CTRL[2] OPP_CHANGE	0x1
10	Wait until ABB LDO state transition completes	Pool PRM_LDO_ABB_MPU_CTRL[6] / PRM_LDO_ABB_IVA_CTRL[6] SR2_IN_TRANSITION Or wait for interrupt PRM_IRQSTATUS_MPU_A9_2[0] VP_MPU_OPPCHANGEDONE_ST	
11	Change MPU/IVA/CORE frequency to the new OPP frequency		
12	Enable the SmartReflex module and interrupts	SRn.SRCONFIG[11] SR_EN	0x1

NOTE: In [Table 3-362](#), steps 8 to 10 are only needed in case of ABB LDO state change. Steps 11 and 12 can be swapped.

Table 3-363. Transition From Higher OPP to Lower OPP

Step ID	Step Description	Register/Register Bit Field/Programming Model	Value
1	Change MPU/IVA/CORE frequency to new OPP frequency		
2	Disable the SmartReflex module.	SRn.SRCONFIG[11] SR_EN	0x0
3	Mask SmartReflex interrupts		
4	Disable the voltage processor module	PRM_<Voltage Processor name>_CONFIG[0] VPENABLE	0x0
5	Select the next OPP for the ABB LDO (Slow in case of ABB Set2) (Nominal in case of bypass)	PRM_LDO_ABB_MPU_CTRL[1:0] or PRM_LDO_ABB_IVA_CTRL[1:0] OPP_SEL	0x0 for nominal OPP 0x3 for slow OPP
6	Initiate the state change for the ABB LDO	PRM_LDO_ABB_MPU_CTRL[2] or PRM_LDO_ABB_IVA_CTRL[2] OPP_CHANGE	0x1

Table 3-363. Transition From Higher OPP to Lower OPP (continued)

Step ID	Step Description	Register/Register Bit Field/Programming Model	Value
7	Wait until ABB LDO state transition completes	Pool PRM_LDO_ABB_MPU_CTRL[6] / PRM_LDO_ABB_IVA_CTRL[6] SR2_IN_TRANSITION Or wait for interrupt PRM_IRQSTATUS_MPU_A9_2[0] VP_MPU_OPPCHANGEDONE_ST	
8	Set the new OPP voltage value	PRM_<Voltage Processor name>_CONFIG[15:8] INITVOLTAGE	
9	Triggers a write of the value in the INITVOLTAGE into the voltage processor	PRM_<Voltage Processor name>_CONFIG[2] INITVDD	0x1
10	Force update of the SMPS	PRM_<Voltage Processor name>_CONFIG[1] FORCEUPDATE	0x1
11	Wait for voltage convergence to new OPP voltage (that is, wait for interrupt PRM_IRQSTATUS_MPU_A9_2 [5] VP_MPU_TRANXDONE_ST = 0x1)	PRM_IRQSTATUS_MPU_A9_2[0] VP_MPU_OPPCHANGEDONE_ST	
12	Enable the SmartReflex module and interrupts	SRn.SRCONFIG[11] SR_EN	0x1

NOTE: In [Table 3-363](#), steps 5 to 7 are only needed in case of ABB LDO state change.

3.11 PRCM Register Manual

3.11.1 PRM Instance Summary

Table 3-364. PRM Instance Summary

Module Name	L4 Base Address	Size
INTRCONN_SOCKET_PRM	0x4A30 6000	256 bytes
CKGEN_PRM	0x4A30 6100	256 bytes
MPU_PRM	0x4A30 6300	256 bytes
DSP_PRM	0x4A30 6400	256 bytes
ABE_PRM	0x4A30 6500	256 bytes
ALWAYS_ON_PRM	0x4A30 6600	256 bytes
CORE_PRM	0x4A30 6700	2KB
IVAHD_PRM	0x4A30 6F00	256 bytes
CAM_PRM	0x4A30 7000	256 bytes
DSS_PRM	0x4A30 7100	256 bytes
SGX_PRM	0x4A30 7200	256 bytes

Bits	Field Name	Description	Type	Reset
31	ABB_IVA_DONE_ST	IVA ABB mode change done. This status is set when OPP_CHANGE bit is cleared by hardware in PRM_LDO_ABB_IVA_CRTL register. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
30	VC_IVA_VPACK_ST	Voltage Controller IVA voltage processor command acknowledge status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
29	VP_IVA_TRANXDONE_ST	Voltage Processor IVA transaction completion status. This status is set when a transaction is completed in the voltage processor, including ABB mode change done if applicable (OPP_CHANGE bit cleared in PRM_LDO_ABB_IVA_CRTL). It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
28	VP_IVA_EQVALUE_ST	Voltage Processor IVA voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
27	VP_IVA_NOSMPSACK_ST	Voltage Processor IVA timeout event status. This status is set when the timeout occurred before the SMPS acknowledge. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
26	VP_IVA_MAXVDD_ST	Voltage Processor IVA voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
25	VP_IVA_MINVDD_ST	Voltage Processor IVA voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
24	VP_IVA_OPPCHANGEDONE_ST	Voltage Processor IVA OPP change done status, including ABB mode change done if applicable (OPP_CHANGE bit cleared in PRM_LDO_ABB_IVA_CRTL). It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
23	RESERVED		R	0
22	VC_CORE_VPACK_ST	Voltage Controller CORE voltage processor command acknowledge status 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
21	VP_CORE_TRANXDONE_ST	Voltage Processor CORE transaction completion status. This status is set when a transaction is completed in the voltage processor. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
20	VP_CORE_EQVALUE_ST	Voltage Processor CORE voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
19	VP_CORE_NOSMPSACK_ST	Voltage Processor CORE timeout event status. This status is set when the timeout occurred before the SMPS acknowledge. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
18	VP_CORE_MAXVDD_ST	Voltage Processor CORE voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
17	VP_CORE_MINVDD_ST	Voltage Processor CORE voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
16	VP_CORE_OPPCHANGEDONE_ST	Voltage Processor CORE OPP change done status. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
15	Reserved		R	0
14	VC_BYPASSACK_ST	Voltage Controller bypass command acknowledge status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
13	VC_TOERR_ST	Voltage Controller timeout error event status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
12	VC_RAERR_ST	Voltage Controller register address acknowledge error event status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
11	VC_SAERR_ST	Voltage Controller slave address acknowledge error event status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0x0
10	RESERVED		R	0
9	IO_ST	I/O pad event interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
8	TRANSITION_ST	Software supervised transition completed event interrupt status (any domain). Asserted upon completion of any clock domain force wakeup transition or upon completion of any power domain sleep transition with at least one enclosed clock domain configured in forced-sleep. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
7:5	RESERVED		R	0x0
4	DPLL_ABE_RECAL_ST	ABE DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
3	DPLL_PER_RECAL_ST	PER DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
2	DPLL_IVA_RECAL_ST	IVA DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
1	DPLL_MPU_RECAL_ST	MPU DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
0	DPLL_CORE_RECAL_ST	CORE DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
31	ABB_IVA_DONE_ST	IVA ABB mode change done. This status is set when OPP_CHANGE bit is cleared by hardware in PRM_LDO_ABB_IVA_CRTL register. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
30	VC_IVA_VPACK_ST	Voltage Controller IVA voltage processor command acknowledge status 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
29	VP_IVA_TRANXDONE_ST	Voltage Processor IVA transaction completion status. This status is set when a transaction is completed in the voltage processor, including ABB mode change done if applicable (OPP_CHANGE bit cleared in PRM_LDO_ABB_IVA_CRTL). It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
28	VP_IVA_EQVALUE_ST	Voltage Processor IVA voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
27	VP_IVA_NOSMPSACK_ST	Voltage Processor IVA timeout event status. This status is set when the timeout occurred before the SMPS acknowledge. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
26	VP_IVA_MAXVDD_ST	Voltage Processor IVA voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
25	VP_IVA_MINVDD_ST	Voltage Processor IVA voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
24	VP_IVA_OPPCHANGEDONE_ST	Voltage Processor IVA OPP change done status, including ABB mode change done if applicable (OPP_CHANGE bit cleared in PRM_LDO_ABB_IVA_CRTL). It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
23	RESERVED		R	0
22	VC_CORE_VPACK_ST	Voltage Controller CORE voltage processor command acknowledge status 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
21	VP_CORE_TRANXDONE_ST	Voltage Processor CORE transaction completion status. This status is set when a transaction is completed in the voltage processor. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
20	VP_CORE_EQVALUE_ST	Voltage Processor CORE voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
19	VP_CORE_NOSMPSACK_ST	Voltage Processor CORE timeout event status. This status is set when the timeout occurred before the SMPS acknowledge. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
18	VP_CORE_MAXVDD_ST	Voltage Processor CORE voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
17	VP_CORE_MINVDD_ST	Voltage Processor CORE voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
16	VP_CORE_OPPCHANGEDONE_ST	Voltage Processor CORE OPP change done status. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
15	RESERVED		R	0
14	VC_BYPASSACK_ST	Voltage Controller bypass command acknowledge status 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
13	VC_TOERR_ST	Voltage Controller timeout error event status 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
12	VC_RAERR_ST	Voltage Controller register address acknowledge error event status 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
11	VC_SAERR_ST	Voltage Controller slave address acknowledge error event status 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
10	FORCEWKUP_ST	CORTEXM3 domain software supervised wakeup transition completed event interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
9	IO_ST	I/O pad event interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
8	TRANSITION_ST	Software supervised transition completed event interrupt status (any domain). Asserted upon completion of any clock domain force wakeup transition or upon completion of any power domain sleep transition with at least one enclosed clock domain configured in forced-sleep. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
7:5	RESERVED		R	0x0
4	DPLL_ABE_RECAL_ST	ABE DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
3	DPLL_PER_RECAL_ST	PER DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
2	DPLL_IVA_RECAL_ST	IVA DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0
1	RESERVED		R	0
0	DPLL_CORE_RECAL_ST	CORE DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending	RW W1toClr	0

Table 3-420. PM_ABE_PWRSTST

Address Offset	0x0000 0004	Instance	ABE_PRM
Physical Address	0x4A30 6504		
Description	This register provides a status on the ABE domain current power domain state. [warm reset insensitive]		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED				LASTPOWERSTATEENTERED		RESERVED		INTRANSITION		RESERVED								PERIPHEM_STATEST		RESERVED		AESSMEM_STATEST		RESERVED		LOGICSTATEST		POWERSTATEST			

Bits	Field Name	Description	Type	Reset
31:26	RESERVED		R	0x00
25:24	LASTPOWERSTATEENTERED	Last low power state entered. Set to 0x3 upon write of the same only. This register is intended for debug purpose only. Read 0x3: Power domain was previously ON-ACTIVE Read 0x2: Power domain was previously ON-INACTIVE Read 0x1: Power domain was previously in RETENTION Read 0x0: Power domain was previously OFF	RW W1toSet	0x0
23:21	RESERVED		R	0x0
20	INTRANSITION	Domain transition status Read 0x0: No ongoing transition on power domain Read 0x1: Power domain transition is in progress.	R	0
19:10	RESERVED		R	0x000
9:8	PERIPHEM_STATEST	PERIPHEM memory state status Read 0x0: Memory is OFF Read 0x1: Reserved Read 0x2: Reserved Read 0x3: Memory is ON	R	0x3
7:6	RESERVED		R	0x0
5:4	AESSMEM_STATEST	AESSMEM memory state status Read 0x0: Memory is OFF Read 0x1: Memory is RETENTION Read 0x2: Reserved Read 0x3: Memory is ON	R	0x3
3	RESERVED		R	0
2	LOGICSTATEST	Logic state status Read 0x0: Logic in domain is OFF Read 0x1: Logic in domain is ON	R	1
1:0	POWERSTATEST	Current power state status Read 0x0: Power domain is OFF Read 0x1: Power domain is in RETENTION Read 0x2: Power domain is ON-INACTIVE Read 0x3: Power domain is ON-ACTIVE	R	0x3

4	LOWPOWERSTATECHANGE	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.	RW WSpecial	0
3	RESERVED		R	0
2	LOGICRETSTATE	Logic state when power domain is RETENTION 0x0: Only retention registers are retained and remaining logic is off when the domain is in RETENTION state. 0x1: Whole logic is retained when domain is in RETENTION state.	RW	1
1:0	POWERSTATE	Power state control 0x0: OFF state 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State	RW	0x0

3.11.14.2 L4PER_PRM Register Description
Table 3-604. PM_L4PER_PWRSTCTRL

Address Offset	0x0000 0000	Instance	L4PER_PRM
Physical Address	0x4A30 7400		
Description	This register controls the L4PER power state to reach upon a domain sleep transition		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								NONRETAINED_BANK_ONSTATE		RETAINED_BANK_ONSTATE		RESERVED				NONRETAINED_BANK_RETSTATE		RETAINED_BANK_RETSTATE		RESERVED		LOWPOWERSTATECHANGE		RESERVED		LOGICRETSTATE		POWERSTATE			

Bits	Field Name	Description	Type	Reset
31:20	RESERVED		R	0x000
19:18	NONRETAINED_BANK_ONSTATE	NONRETAINED_BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R Rreturns 1s	0x3
17:16	RETAINED_BANK_ONSTATE	RETAINED_BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON.	R Rreturns 1s	0x3
15:10	RESERVED		R	0x00
9	NONRETAINED_BANK_RETSTATE	NONRETAINED_BANK state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state.	R	0
8	RETAINED_BANK_RETSTATE	RETAINED_BANK state when domain is RETENTION. Read 0x1: Memory bank is retained when domain is in RETENTION state.	R Rreturns 1s	1
7:5	RESERVED		R	0x0
4	LOWPOWERSTATECHANGE	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.	RW WSpecial	0
3	RESERVED		R	0
2	LOGICRETSTATE	Logic state when power domain is RETENTION 0x0: Only retention registers are retained and remaining logic is off when the domain is in RETENTION state. 0x1: Whole logic is retained when domain is in RETENTION state.	RW	1

Bits	Field Name	Description	Type	Reset
1:0	POWERSTATE	Power state control 0x0: Reserved 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State	RW	0x3

Table 3-813. PRM_IO_PMCTRL

Address Offset	0x0000 0020		
Physical Address	0x4A30 7B20	Instance	DEVICE_PRM
Description	This register allows overriding ISOCKLK signal towards I/O pad ring.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																GLOBAL_WUEN	RESERVED				WUCLK_STATUS	WUCLK_CTRL	RESERVED	IOON_STATUS	ISOOVR_EXTEND	RESERVED	ISOCKLK_STATUS	ISOCKLK_OVERRIDE			

Bits	Field Name	Description	Type	Reset
31:17	RESERVED		R	0x0000
16	GLOBAL_WUEN	Global I/O wakeup enable. This is a gating condition to all individual I/O WUEN coming from control module. Gating is done in the Spinner logic. 0x0: All individual I/O WUEN are gated in the Spinner logic (overridden to 0). 0x1: All individual I/O WUEN from control module are going to IOs.	RW	0
15:10	RESERVED		R	0x00
9	WUCLK_STATUS	Gives value of WUCLKOUT signal coming back from I/O pad ring.	R	0
8	WUCLK_CTRL	Direct control on WUCLKIN signal to I/O pad ring. 0x0: WUCLKIN signal is driven to 0. I/O wakeup daisy chain is functional as well as I/O whose wakeup feature is enabled. 0x1: WUCLKIN signal is driven to 1. I/O wakeup daisy chain is reset and is latching current pad states and WUEN inputs.	RW	0
7:6	RESERVED		R	0x0
5	IOON_STATUS	Gives the functional status of the I/O ring. Read 0x0: Part or all of the IOs are not in the ON state, that is are in isolation state Read 0x1: All IOs are in the ON state	R	1
4	ISOOVR_EXTEND	Control non-EMIF I/O isolation extension upon a device wakeup from OFF mode. 0x0: Non-EMIF I/O isolation is not extended. "EMIF_ON" I/O transition happens as soon as automatic restore is completed 0x1: Non-EMIF I/O isolation is extended. "EMIF_ON" I/O transition is stalled	RW	0
3:2	RESERVED		R	0x0
1	ISOCLK_STATUS	Gives value of ISOCLKOUT signal coming back from I/O pad ring.	R	0
0	ISOCLK_OVERRIDE	Override control on ISOCLKIN signal to I/O pad ring. Override should be used at boot time only when it is needed to change the mode of an I/O from 1.8-V default mode to 1.2-V mode. When not overridden, this signal is controlled by hardware only. 0x0: ISOCLKIN signal is not overridden. 0x1: ISOCLKIN signal is overridden to active value (1).	RW	0

Table 3-819. PRM_VOLTSETUP_MPU_OFF

Address Offset	0x0000 002C	Instance	DEVICE_PRM
Physical Address	0x4A30 7B2C		
Description	This register provides bit fields for specifying voltage ramp-up and ramp-down times for PRM managed external regulators. These values are used for VDD_MPU_L domain transitions to or from OFF state. [warm reset insensitive]		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								RAMP_DOWN_PRESCAL	RESERVED	RAMP_DOWN_COUNT								RESERVED	RAMP_UP_PRESCAL	RESERVED	RAMP_UP_COUNT										

Bits	Field Name	Description	Type	Reset
31:26	RESERVED		R	0x00
25:24	RAMP_DOWN_PRESCAL	Determines prescaler for ramp-down duration counting. 0x0: Ramp-down counter is incremented every 64 system clock cycles 0x1: Ramp-down counter is incremented every 256 system clock cycles 0x2: Ramp-down counter is incremented every 512 system clock cycles 0x3: Ramp-down counter is incremented every 2048 system clock cycles	RW	0x0
23:22	RESERVED		R	0x0
21:16	RAMP_DOWN_COUNT	Determines the ramp-down duration of VDD_MPU_L regulators. The duration is computed according to Ramp_Down_Prescal.	RW	0x00
15:10	RESERVED		R	0x00
9:8	RAMP_UP_PRESCAL	Determines prescaler for ramp-up duration counting. 0x0: Ramp-up counter is incremented every 64 system clock cycles 0x1: Ramp-up counter is incremented every 256 system clock cycles 0x2: Ramp-up counter is incremented every 512 system clock cycles 0x3: Ramp-up counter is incremented every 2048 system clock cycles	RW	0x0
7:6	RESERVED		R	0x0
5:0	RAMP_UP_COUNT	Determines the ramp-up duration of VDD_MPU_L regulators. The duration is computed according to Ramp_Up_Prescal. At cold reset, PRCM assumes that VDD_MPU_L will be at a valid ON voltage before SYS_NRESPWRON is de-asserted.	RW	0x00

Table 3-853. PRM_VP_IVA_CONFIG

Address Offset	0x0000 0070	Instance	DEVICE_PRM
Physical Address	0x4A30 7B70		
Description	This register allows the configuration of the Voltage Processor dedicated to IVA Voltage Domain (VDD_IVA_L).		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ERROROFFSET								ERRORGAIN								INITVOLTAGE								RESERVED				TIMEOUTEN	INITVDD	FORCEUPDATE	VPENABLE

Bits	Field Name	Description	Type	Reset
31:24	ERROROFFSET	Offset value in the Error to Voltage converter (two's complement number).	RW	0x00
23:16	ERRORGAIN	Gain value in the Error to Voltage converter (two's complement number).	RW	0x00
15:8	INITVOLTAGE	Set the initial voltage level of the SMPS. It must be reconfigured before enable the SmartReflex around a new OPP.	RW	0x00
7:4	RESERVED	Write 0's for future compatibility. Read is undefined.	R	0x0
3	TIMEOUTEN	Enable or disable the timeout capability of the Voltage Controller State Machine. 0x0: Timeout is disabled. Loop will wait indefinitely. 0x1: Timeout will occur when TIMEOUT cycles have elapsed.	RW	0
2	INITVDD	Initializes the voltage in the Voltage Processor. 0x0: Reset the initialization bit. 0x1: The positive edge of InitVdd triggers a write of the value in the InitVoltage into the Voltage Processor.	RW	0
1	FORCEUPDATE	Forces an update of the SMPS. 0x0: Reset the force bit. 0x1: The positive edge of ForceUpdate triggers an update of the voltage to the SMPS.	RW	0
0	VPENABLE	Enables or disables the Voltage Processor updates on SR_SInterruptz. 0x0: Disables the Voltage Processor. 0x1: Enables the Voltage Processor.	RW	0

Description	I2C Interface clock configuration parameters. [warm reset insensitive]		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HSSCLL								HSSCLH								SCLL								SCLH							

Bits	Field Name	Description	Type	Reset
31:24	HSSCLL	Number of the system clock cycles, necessary to count the low period of the I2C clock signal, when the I2C interface runs in high-speed mode of operation. The value of the bit field is automatically increased by 7.	RW	0x00
23:16	HSSCLH	Number of the system clock cycles, necessary to count the high period of the I2C clock signal, when the I2C interface runs in high-speed mode of operation. The value of the bit field is automatically increased by 5.	RW	0x00

Bits	Field Name	Description	Type	Reset
15:8	SCLL	Number of the system clock cycles, necessary to count the low period of the I2C clock signal, when the I2C interface runs in fast mode of operation. The value of the bit field is automatically increased by 7.	RW	0x00
7:0	SCLH	Number of the system clock cycles, necessary to count the high period of the I2C clock signal, when the I2C interface runs in fast mode of operation. The value of the bit field is automatically increased by 5.	RW	0x00

Table 3-885. PRM_SRAM_COUNT

Address Offset	0x0000 00B0	Instance	DEVICE_PRM
Physical Address	0x4A30 7BB0		
Description	Common setup for SRAM LDO transition counters. Applies to all voltage domains. [warm reset insensitive]		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
STARTUP_COUNT								SLPCNT_VALUE								VSETUPCNT_VALUE								RESERVED	PCHARGE CNT_VALUE							

Bits	Field Name	Description	Type	Reset
31:24	STARTUP_COUNT	Determines the start-up duration of SRAM and ABB LDO. The duration is computed as 16 x NbCycles of system clock cycles. Target is 50us.	RW	0x78
23:16	SLPCNT_VALUE	Delay between retention/off assertion of last SRAM bank and SRAMALLRET signal to LDO is driven high. Counting on system clock. Target is 2us.	RW	0x00
15:8	VSETUPCNT_VALUE	SRAM LDO rampup time from retention to active mode. The duration is computed as 8 x NbCycles of system clock cycles. Target is 30us.	RW	0x00
7:6	RESERVED		R	0x0
5:0	PCHARGE CNT_VALUE	Delay between de-assertion of standby_rta_ret_on and standby_rta_ret_good. Counting on system clock. Target is 600ns.	RW	0x17

Table 3-911. PRM_DEVICE_OFF_CTRL

Address Offset	0x0000 00E4	Instance	DEVICE_PRM
Physical Address	0x4A30 7BE4		
Description	This register is used to control device OFF transition.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EMIF2_OFFWKUP_DISABLE		EMIF1_OFFWKUP_DISABLE		RESERVED										DEVICE_OFF_ENABLE	

Bits	Field Name	Description	Type	Reset
31:10	RESERVED		R	0x0000 00
9	EMIF2_OFFWKUP_DISABLE	Controls the EMIF2_DEVICE_OFFWKUP_CORESRTACTST notifier sent to EMIF2 upon a device wakeup from off mode. (Warm reset insensitive) 0x0: Notifier is activated. 0x1: Notifier is not activated – stays low.	RW	0
8	EMIF1_OFFWKUP_DISABLE	Controls the EMIF1_DEVICE_OFFWKUP_CORESRTACTST notifier sent to EMIF1 upon a device wakeup from off mode. (Warm reset insensitive) 0x0: Notifier is activated. 0x1: Notifier is not activated – stays low.	RW	0
7:1	RESERVED		R	0x00
0	DEVICE_OFF_ENABLE	Controls transition to device OFF mode. 0x0: Device is not allowed to perform transition to off mode 0x1: Device is allowed to perform transition to off mode as soon as all power domains in MPU, IVA and CORE voltage are in OFF or OsoftwareRET state (open switch retention)	RW	0

Table 3-951. CM_CLKMODE_DPLL_CORE

Address Offset	0x0000 0020	Instance	CKGEN_CM1
Physical Address	0x4A00 4120		
Description	This register allows controlling the DPLL modes.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																DPLL_SSC_DOWNSPREAD	DPLL_SSC_ACK	DPLL_SSC_EN	DPLL_REGM4XEN	DPLL_LP_MODE_EN	RESERVED	DPLL_DRIFTGUARD_EN	RESERVED					DPLL_EN			

Bits	Field Name	Description	Type	Reset
31:15	RESERVED		R	0x00000
14	DPLL_SSC_DOWNSPREAD	Control if only low frequency spread is required 0x0: When SSC is enabled, clock frequency is spread on both sides of the programmed frequency 0x1: When SSC is enabled, clock frequency is spread only on the lower side of the programmed frequency	RW	0
13	DPLL_SSC_ACK	Acknowledgement from the DPLL regarding start and stop of Spread Spectrum Clocking feature Read 0x0: SSC has been turned off on PLL o/ps Read 0x1: SSC has been turned on on PLL o/ps	R	0
12	DPLL_SSC_EN	Enable or disable Spread Spectrum Clocking 0x0: SSC disabled 0x1: SSC enabled	RW	0
11	DPLL_REGM4XEN	Enable the REGM4XEN mode of the DPLL. Please check the DPLL documentation to check when this mode can be enabled. Read 0x0: REGM4XEN mode of the DPLL is disabled	R	0
10	DPLL_LP_MODE_EN	Set the DPLL in low-power mode. Check the DPLL documentation to see when this can be enabled. 0x0: Low-power mode of the DPLL is disabled 0x1: Low-power mode of the DPLL is enabled	RW	0
9	RESERVED		RW	0
8	DPLL_DRIFTGUARD_EN	This bit allows to enable or disable the automatic recalibration feature of the DPLL. The DPLL will automatically start a recalibration process upon assertion of the DPLL's RECAL flag if this bit is set. 0x0: DRIFTGUARD feature is disabled 0x1: DRIFTGUARD feature is enabled	RW	0
7:3	RESERVED		RW	0x00
2:0	DPLL_EN	DPLL control. Upon Warm Reset, the PRCM DPLL control state machine updates this register to reflect MN bypass mode. 0x0: Reserved 0x1: Reserved 0x2: Reserved 0x3: Reserved 0x4: Put the DPLL in MN bypass mode. The DPLL_MULT register bits are reset to 0 automatically by putting the DPLL in this mode. 0x5: Put the DPLL in Idle bypass low-power mode. 0x6: Put the DPLL in Idle bypass fast-relock mode. 0x7: Enables the DPLL in lock mode	RW	0x4

Table 3-957. CM_CLKSEL_DPLL_CORE

Address Offset	0x0000 002C	Instance	CKGEN_CM1
Physical Address	0x4A00 412C		
Description	This register provides controls over the DPLL.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								DPLL_BYP_CLKSEL	RESERVED	DPLL_CLKOUTHIF_CLKSEL	RESERVED	DPLL_MULT								RESERVED	DPLL_DIV										

Bits	Field Name	Description	Type	Reset
31:24	RESERVED		R	0x00
23	DPLL_BYP_CLKSEL	Allows control of the BYPASS clock of the PLL and the associated HSDIVIDER. Same as ULOWCLKEN on DPLL. In DPLL locked mode, 0 - No impact 1 - No impact In DPLL bypass mode, 0 - CLKINP is selected as the BYPASS clock for CLKOUT/CLKOUTX2 1 - CLKINPULOW is selected as the BYPASS clock for CLKOUT/CLKOUTX2	RW	0
22:21	RESERVED		R	0x0
20	DPLL_CLKOUTHIF_CLKSEL	Selects the source of the DPLL CLKOUTHIF clock. Same as CLKINPHIFSEL pin on the DPLL 0x0: CLKOUTHIF is generated from the DPLL oscillator (DCO) 0x1: CLKOUTHIF is generated from CLKINPHIF	RW	0
19	RESERVED		R	0
18:8	DPLL_MULT	DPLL multiplier factor (2 to 2047). This register is automatically cleared to 0 when the DPLL_EN field in the *CLKMODE_DPLL* register is set to select MN bypass mode. (equal to input M of DPLL; M=2 to 2047 = DPLL multiplies by M). 0x0: Reserved 0x1: Reserved	RW	0x000
7	RESERVED		R	0
6:0	DPLL_DIV	DPLL divider factor (0 to 127) (equal to input N of DPLL; actual division factor is N+1).	RW	0x00

Description	This register provides controls over the DPLL.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DCC_COUNT_MAX								DPLL_BYP_CLKSEL	DCC_EN	RESERVED				DPLL_MULT								RESERVED	DPLL_DIV								

Bits	Field Name	Description	Type	Reset
31:24	DCC_COUNT_MAX	The value "NbCycles" set in this field determines the duration of the clock ramp step during which the output frequency is $F_{dpll}/(2^M2)$. The duration is computed as $32 \times \text{NbCycles}$ of L4 clock cycles (100 MHz). Duration should be 2.5 μ s to allow enough time for DCC to lock. This bit field is relevant only when DCC_EN = 1.	RW	0x05
23	DPLL_BYP_CLKSEL	Only CLKINPULOW bypass clock supported for this PLL	R Returns 1s	1
22	DCC_EN	Enable or disable duty cycle correction. Must be enabled only for frequency 1 GHz.	RW	0

Bits	Field Name	Description	Type	Reset
		When enabled, the CLKOUTHIF output of the DPLL is used after duty cycle correction instead of CLKOUT. The M3 divider is hard-wired to 1 so the lock frequency Fdpll is directly provided to MPU. 0x0: DCC disabled 0x1: DCC enabled		
21:19	RESERVED		R	0x0
18:8	DPLL_MULT	DPLL multiplier factor (2 to 2047). This register is automatically cleared to 0 when the DPLL_EN field in the *CLKMODE_DPLL* register is set to select MN bypass mode. (equal to input M of DPLL; M=2 to 2047 = DPLL multiplies by M). 0x0: Reserved 0x1: Reserved	RW	0x000
7	RESERVED		R	0
6:0	DPLL_DIV	DPLL divider factor (0 to 127) (equal to input N of DPLL; actual division factor is N+1).	RW	0x00

3.11.35.2 CAM_CM2 Register Description

Table 3-1295. CM_CAM_CLKSTCTRL

Address Offset	0x0000 0000	Instance	CAM_CM2
Physical Address	0x4A00 9000		
Description	This register enables the domain power state transition. It controls the hardware supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLKACTIVITY_FDIF_FCLK			CLKACTIVITY_CAM_PHY_CTRL_CLK			CLKACTIVITY_ISS_CLK			RESERVED					CLKTRCTRL	

Bits	Field Name	Description	Type	Reset
31:11	RESERVED		R	0x000000
10	CLKACTIVITY_FDIF_FCLK	This field indicates the state of the FDIF_FCLK clock input of the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
9	CLKACTIVITY_CAM_PHY_CTRL_CLK	This field indicates the state of the CAM_PHY_CTRL_CLK clock input of the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
8	CLKACTIVITY_ISS_CLK	This field indicates the state of the ISS_CLK clock input of the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
7:2	RESERVED		R	0x00
1:0	CLKTRCTRL	Controls the clock state transition of the CAM clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x3

3.11.38.2 L3INIT_CM2 Register Description

Table 3-1324. CM_L3INIT_CLKSTCTRL

Address Offset	0x0000 0000
Physical Address	0x4A00 9300
Instance	L3INIT_CM2
Description	This register enables the domain power state transition. It controls the hardware supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain.
Type	RW

Table 3-1338. CM_L3INIT_HSUSBOTG_CLKCTRL

Address Offset	0x0000 0060	Instance	L3INIT_CM2
Physical Address	0x4A00 9360		
Description	This register manages the USB_OTG_HS clocks.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CLKSEL_60M	RESERVED				STBYST	IDLEST	RESERVED								OPTFCLKEN_XCLK	RESERVED				MODULEMODE			

Bits	Field Name	Description	Type	Reset
31:25	RESERVED		R	0x00
24	CLKSEL_60M	Selects the source of the 60MHz functional clock. 0x0: The 60MHz clock is sourced from on die UTMI PHY 0x1: The 60MHz clock is sourced from the external ULPI PHY	RW	0
23:19	RESERVED		R	0x00
18	STBYST	Module standby status. [warm reset insensitive] Read 0x0: Module is functional (not in standby) Read 0x1: Module is in standby	R	1
17:16	IDLEST	Module idle status. [warm reset insensitive] Read 0x0: Module is fully functional, including INTRCONN Read 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion Read 0x2: Module is in idle mode (only INTRCONN part). It is functional if using separate functional clock Read 0x3: Module is disabled and cannot be accessed	R	0x3

Bits	Field Name	Description	Type	Reset
15:9	RESERVED		R	0x00
8	OPTFCLKEN_XCLK	USB_OTG optional clock control: XCLK (60MHz clock) 0x0: Optional functional clock is disabled 0x1: Optional functional clock is enabled	RW	0
7:2	RESERVED		R	0x00
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x0: Module is disable by software. Any INTRCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: Module is managed automatically by hardware according to clock domain transition. A clock domain sleep transition put module into idle. A wakeup domain transition put it back into function. If CLKTRCTRL=3, any INTRCONN access to module is always granted. Module clocks may be gated according to the clock domain state. Read 0x2: Reserved Read 0x3: Reserved	RW	0x0

3.11.39.2 L4PER_CM2 Register Description

Table 3-1347. CM_L4PER_CLKSTCTRL

Address Offset	0x0000 0000	Instance	L4PER_CM2
Physical Address	0x4A00 9400		
Description	This register enables the domain power state transition. It controls the hardware supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds 1 status bit per clock input of the domain.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
31:26	RESERVED		R	0x00
25	CLKACTIVITY_PER_ABE_24M_FCLK	This field indicates the state of the PER_ABE_24M_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
24	RESERVED		R	0
23	RESERVED		R	0
22	CLKACTIVITY_PER_MCBSP4_FCLK	This field indicates the state of the PER_MCBSP4_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
21:20	RESERVED		R	0
19	CLKACTIVITY_PER_96M_FCLK	This field indicates the state of the PER_96M_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
18	CLKACTIVITY_PER_48M_FCLK	This field indicates the state of the PER_48M_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
17	CLKACTIVITY_PER_32K_FCLK	This field indicates the state of the PER_32K_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
16	CLKACTIVITY_PER_24MC_FCLK	This field indicates the state of the PER_24MC_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
15	CLKACTIVITY_12M_FCLK	This field indicates the state of the FUNC_12M_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0

Bits	Field Name	Description	Type	Reset
14	CLKACTIVITY_GPT9_FCLK	This field indicates the state of the DMT9_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
13	CLKACTIVITY_GPT4_FCLK	This field indicates the state of the DMT4_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
12	CLKACTIVITY_GPT3_FCLK	This field indicates the state of the DMT3_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
11	CLKACTIVITY_GPT2_FCLK	This field indicates the state of the DMT2_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
10	CLKACTIVITY_GPT11_FCLK	This field indicates the state of the DMT11_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
9	CLKACTIVITY_GPT10_FCLK	This field indicates the state of the DMT10_FCLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
8	CLKACTIVITY_L4_PER_ICLK	This field indicates the state of the L4_PER_GICLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing	R	0
7:2	RESERVED		R	0x00
1:0	CLKTRCTRL	Controls the clock state transition of the L4PER clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x0

Description	This register manages the I2C2 clocks.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED														IDLEST	RESERVED														MODULEMODE		

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0000
17:16	IDLEST	Module idle status. [warm reset insensitive] Read 0x0: Module is fully functional, including INTRCONN Read 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion Read 0x2: Module is in idle mode (only INTRCONN part). It is functional if using separate functional clock Read 0x3: Module is disabled and cannot be accessed	R	0x3
15:2	RESERVED		R	0x0000
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x0: Module is disable by software. Any INTRCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). Read 0x1: Reserved 0x2: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guarantied to stay present. As long as in this configuration, power domain sleep transition cannot happen. Read 0x3: Reserved	RW	0x0

Description	This register manages the UART3 clocks.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED												IDLEST	RESERVED												MODULEMODE						

Bits	Field Name	Description	Type	Reset
31:18	RESERVED		R	0x0000
17:16	IDLEST	Module idle status. [warm reset insensitive] Read 0x0: Module is fully functional, including INTRCONN Read 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion Read 0x2: Module is in idle mode (only INTRCONN part). It is functional if using separate functional clock Read 0x3: Module is disabled and cannot be accessed	R	0x3
15:2	RESERVED		R	0x0000
1:0	MODULEMODE	Control the way mandatory clocks are managed. 0x0: Module is disable by software. Any INTRCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). Read 0x1: Reserved 0x2: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. Read 0x3: Reserved	RW	0x0

Table 3-1413. CM_L4SEC_CLKSTCTRL

Address Offset	0x0000 0180	Instance	L4PER_CM2
Physical Address	0x4A00 9580		
Description	This register enables the domain power state transition. It controls the hardware-supervised domain power state transition between ON-ACTIVE and ON-INACTIVE states. It also holds one status bit per clock input of the domain.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLKACTIVITY_L4_SECURE_GICLK		CLKACTIVITY_L3_SECURE_GICLK		RESERVED						CLKTRCTRL					

Bits	Field Name	Description	Type	Reset
31:10	RESERVED	Reserved	R	0x000000
9	CLKACTIVITY_L4_SECURE_GI CLK	This field indicates the state of the L4_SECURE_GICLK clock in the domain. Read 0: Corresponding clock is definitely gated Read 1: Corresponding clock is running or gating/ungating transition is on-going	R	0
8	CLKACTIVITY_L3_SECURE_GI CLK	This field indicates the state of the L3_SECURE_GICLK clock in the domain. Read 0: Corresponding clock is definitely gated Read 1: Corresponding clock is running or gating/ungating transition is on-going	R	0
7:2	RESERVED	Reserved	R	0x00
1:0	CLKTRCTRL	Controls the clock state transition of the L4SEC clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.	RW	0x3
