Driving a Stepper Motor With a TM4C123 Microcontroller

Design Features

- The TM4C123 Microcontroller (MCU) Uses Four GPIO Pins to Control the Output of the H-Bridge Drivers in DRV8833 Driven by a General-Purpose Timer.
- The TM4C123GXL LaunchPad™ Uses Buttons to Control the Direction, Speed, Starting, and Stopping of the Stepper Motor.
- The Stepper Motor can be Driven in Full Step and Half Step Modes.
- The Software is Designed to Work With an EK-TM4C123GXL LaunchPad and DRV8833 EVM.

Featured Applications

- Industrial Applications
- Speed Control Applications
- Precision Motor Control

An IMPORTANT NOTICE at the end of this TI reference design addresses authorized use, intellectual property matters and other important disclaimers and information.
1 System Description

This system example shows how to control a stepper motor with the TM4C123 high-performance MCU and DRV8833 motor driver. The direction, speed, starting, and stopping of stepper motor can be controlled by buttons on the EK-TM4C123GXL LaunchPad. This example uses a general-purpose timer to control 4 GPIO pins to generate the PWM signals for driving the motor.

1.1 TM4C123GH6PM MCU

The TM4C123GH6PM microcontroller is targeted for industrial applications including the following: remote monitoring, electronic point-of-sale machines, test equipment, measurement equipment, network appliances, switches, factory automation, HVAC, building control, gaming equipment, motion control, transportation, and security.

The TM4C123GH6PM MCU has up to 43 GPIOs with programmable control for GPIO interrupts, pad configuration, and pin muxing. The MCU is integrated with six 32-bit general-purpose timers (up to twelve 16-bit), eight UARTs, four synchronous serial interface (SSI) modules, four inter-integrated circuit (I2C) modules, two 12-bit analog-to-digital converters (ADC) with 12 analog input channels and a sample rate of one million samples per second, eight pulse width modulation (PWM) generator blocks, and two quadrature encoder interface (QEI) modules. The universal serial bus (USB) controller supports the USB OTG/Host/Device modes. The ARM® PrimeCell 32-channel configurable μDMA controller is also integrated to provide a method to offload data transfer tasks from the Cortex-M4® processor and to more efficiently use the processor and the bus bandwidth.

See Figure 1 for a high-level overview of the TM4C123GH6PM MCU.

1.2 **DRV8833 Stepper Motor Driver**

The DRV8833 device has two H-bridge drivers to drive a bipolar stepper motor, two DC brush motors, or other inductive loads. Aimed at driving 3.3-V and 5-V motors, this stepper driver has integrated field-effect transistors (FETs) to support up to 1.5 A (rms) with a low-power sleep mode to conserve power for battery-powered applications. This device offers internal shutdown functions with a fault output pin that provide for overcurrent protection, short-circuit protection, undervoltage lockout, and overtemperature. See Figure 2 for an overview of the block diagram of the DRV8833 stepper motor drive.

2 Getting Started Hardware

The hardware used in this example is the EK-TM4C123GXL LaunchPad and the DRV8833 motor driver. The EK-TM4C123GXL LaunchPad board is connected to the DRV8833 motor driver EVM board through the connectors on the EK-TM4C123GXL. Table 1 lists the signal mapping.

The block diagram in Figure 3 shows the TM4C123/DRV8833 interface. TM4C123 controls the output of DRV8833.

![Figure 3. General Setup for Stepper Motor Drive](image)

The following TM4C123 peripherals are also enabled in the system.

- Timer 0 interrupt to drive motor
- Timer 1 interrupt to sample button states
- GPIO input pins PF0 and PF4 to sample the button states
- GPIO input pin PB5 to enable full or half step mode
3 Getting Started Software

Figure 4 shows the architecture of the TM4C123 software. The TI TivaWare™ library controls the hardware on TM4C123. This design has two timers. One timer drives the motor and interrupts the CPU at predetermined intervals. In the timer interrupt service routine (ISR), the CPU changes the states of the four GPIO pins to drive the motor.

The second timer reads the status of the buttons on the LaunchPad at regular intervals. The CPU checks how long the button is pressed. If SW1 is pressed briefly, this command starts or stops the motor. If SW1 is held down, this command increases the rotation speed. If SW2 is pressed briefly, this command changes the direction of the rotation. If SW2 is held down, this command decreases the rotation speed. Changing the period of the timer that drives the motor controls the rotation speed.

![Figure 4. TM4C123 Software Architecture Block Diagram](image)

TI developed the software as an extension of TivaWare examples. The demonstration has additional files (buttons.c) containing APIs for controlling the peripherals. The stepper_motor.c file contains the stepper motor control. The software is provided in a zip file.
4 Installing the Demo

To rebuild the demo, install the following TI tools and software packages.

- Code Composer Studio™ (CCS) v6.0.1 or above
- TivaWare v2.1.0.12573 or above
- Stepper motor control software provided in the zip file

Figure 5 shows where to place the extracted directory.

![Figure 5. Placement of the Extracted Directories](Image)
Figure 6 shows the project directory.
Figure 7 shows the linked path for compiling the project. Install the software in the default location to ensure the paths match Figure 7. If you fail to install the software in the default location, the linked paths must be modified to match the actual installation.

Figure 7. The Linked Paths of the Project.
5 Executing the Demonstration

The LaunchPad buttons control the state and speed of the motor. Pressing button SW1 once turns the motor on or off. Pressing and holding SW1 increases the speed of the motor until SW1 is released or until the motor reaches the maximum speed. Pressing button SW2 changes the direction of the motor. Pressing and holding SW2 decreases the speed of the motor until SW2 is released or until minimum speed is reached.

The CPU loading increases with higher rotation speed because the timer interrupts are generated more frequently at a higher rotation speed. This is a fraction of CPU capability. The real minimum and maximum rotation speed is determined by the characteristics of the motor. The developers chose the minimum and maximum rotation speed limit to demonstrate the change in the rotation speed.

IMPORTANT NOTICE FOR TI REFERENCE DESIGNS

Texas Instruments Incorporated (“TI”) reference designs are solely intended to assist designers (“Buyers”) who are developing systems that incorporate TI semiconductor products (also referred to herein as “components”). Buyer understands and agrees that Buyer remains responsible for using its independent analysis, evaluation and judgment in designing Buyer’s systems and products.

TI reference designs have been created using standard laboratory conditions and engineering practices. **TI has not conducted any testing other than that specifically described in the published documentation for a particular reference design.** TI may make corrections, enhancements, improvements and other changes to its reference designs.

Buyers are authorized to use TI reference designs with the TI component(s) identified in each particular reference design and to modify the reference design in the development of their end products. **HOWEVER, NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY THIRD PARTY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT, IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used.**

Information published by TI regarding third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

**TI REFERENCE DESIGNS ARE PROVIDED “AS IS”. TI MAKES NO WARRANTIES OR REPRESENTATIONS WITH REGARD TO THE REFERENCE DESIGNS OR USE OF THE REFERENCE DESIGNS, EXPRESS, IMPLIED OR STATUTORY, INCLUDING ACCURACY OR COMPLETENESS. TI DISCLAIMS ANY WARRANTY OF TITLE AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, QUIET ENJOYMENT, QUIET POSSESSION, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS WITH REGARD TO TI REFERENCE DESIGNS OR USE THEREOF. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY BUYERS AGAINST ANY THIRD PARTY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON A COMBINATION OF COMPONENTS PROVIDED IN A TI REFERENCE DESIGN. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, SPECIAL, INCIDENTAL, CONSEQUENTIAL OR INDIRECT DAMAGES, HOWEVER CAUSED, ON ANY THEORY OF LIABILITY AND WHETHER OR NOT TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES, ARISING IN ANY WAY OUT OF TI REFERENCE DESIGNS OR BUYER’S USE OF TI REFERENCE DESIGNS.**

TI reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques for TI components are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

Reproduction of significant portions of TI information in TI data books, data sheets or reference designs is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards that anticipate dangerous failures, monitor failures and their consequences, lessen the likelihood of dangerous failures and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in Buyer’s safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed an agreement specifically governing such use.

Only those TI components that TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components that have not been so designated is solely at Buyer’s risk, and Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
