Top: nonsynchronous buck converter, step down converter
Device: TPS40200; cost effective, no bootstrap diode – needs PMOS FET

RevA: achieved loop exactly as calculated, bw 10kHz
RevB: tuned loop to bw 15kHz; decreased sense resistor from 68 to 50milliOhm *
RevC: low noise, added input filter, added RC snubber

*functionality OK, but no startup at full load and low input 8V:

**solution #1:**
increase softstart capacitor to lower peak current during startup;
wanted to keep startup around 2ms.

**solution #2:**
decrease sense resistor to allow more current, here 2Amps DC;
inductor is OK up to 2Amps, went for 50milliOhm;
startup at full load 1A and low input 8V OK, current limit 2Amps (200%).
1 Startup

The startup waveform is shown in the Figure 1. The input voltage was set at 12V, with 1A load at the output. Startup w/in 1.5ms, calculated 2.02ms:

![Figure 1](image1)

2 Shutdown

The shutdown waveform is shown in the Figure 2. The input voltage was set at 12V, with 1A load on the output.

![Figure 2](image2)
3 Efficiency

The efficiency is shown in the Figure 3 below. The input voltage was set to 12V.

**Figure 3**

Full load effcy 92.2%, calculated 91.9%; deviation by self heating of Schottky rectifier and less switching losses (due to rise time/fall time 10ns).

Maximum effcy 92.5% at 600mA..700mA, so around 2/3 of full load 1A, perfect.

Effcy ≥90% in a range 200mA to 1A, so 20% load to 100% load

Power stage as calculated before:

- Cin 2x 22uF/25V/X7R/1210
- Sense resistor 50 milliOhm
- PMOS FET Fairchild FDC654P
- Schottky 30V/3A Diodes B330
- Inductor 47uF/99mOhm/2.2Adc/2.5Asat Wuerth 744 77 14 470
- Cout 2x 100uF/6.3V/X5R/1210 (max. size 1210 because of cracking)
4 Load Regulation
The load regulation of the output is shown in the Figure 4 below. The input voltage was set to 12V.

Min. Vout 5.0074V (DCM), max Vout 5.009V (NoLoad, Cout catches noise),

**Output voltage variation 1.6mV, so 0.03%, negligible.**
5 Ripple Voltage

The output ripple voltage is shown in Figure 5. The image was taken with 1A load 12V at the input. Due to low ESR MLCCs at the output almost no output ripple voltage:

![Figure 5](image)

The input ripple voltage is shown in Figure 6. The image was taken with 1A load 12V at the input.

![Figure 6](image)

Simply paralleling a bulk capacitor is not a very big benefit – check impedances, use PSPICE!
Reflected ripple = conducted emissions, EMI, with 220uF electrolytic & 2x 22uF MLCC: 50mVpp

Separating electrolytic and MLCCs by filterinductor 2.2uH, decoupling pulsed currents from input; Ripple voltage across MLCCs:
Finally the input voltage by using PI filter 220uF – 3.3uH – 2x 22uF;
A small ceramic capacitor 100nF was added to the electrolytic to suppress glitches:

A tremendous reduction of reflected ripple resulted in better EMI behavior!
The inductor prevents the source from seeing the pulse currents – less conducted emissions.
6 Control Loop Frequency Response

Figures below shows the loop response with 1A load and 12V input – RevA 10kHz, RevB 15kHz:

- **PMP7154 RevA** w/ calculated values:
  - gain 0.316,
  - two Zeros @ 2kHz, two Poles @ 150kHz,
  - Fco 10.53kHz, slope -1.19, PM 58.49degs

- **PMP7154 RevB** w/ optimized values:
  - gain 0.402,
  - two Zeros @2kHz, two Poles @ 130kHz,
  - Fco 14.37kHz, slope -1.14, PM 70.46degs
The bandwidth is measured with NWA Venable #3120. The crossover frequency 10.5kHz for RevA fits exactly to the first calculation by hand, the phase margin is slightly bigger. Slope at crossover is close to -1, here -1.19.

For RevB the bandwidth was optimized to 15kHz, the crossover frequency fits exactly to the calculation and the EXCEL spreadsheet Fco 14.4kHz; again PM is bigger, slope is -1.14.

**REMEMBER:**
This analysis is a small signal analysis, shows the small signal behavior of the power supply. The only true analysis is a large signal analysis, the system response on a load transient!

Below the typical test method, load transient 50%, means half the load to full load:

### 7 Load Transients
The Figure 7 shows the response to load transients. The load is switching from 0.5A to 1A. with 400Hz frequency. The input voltage was set to 12V

![Figure 7](image)

The voltage drop caused by di 500mA is around 70mV, so less than 2% of the output voltage 5V; The combination output capacitor to loop bandwidth matches.

*An proper calculation of the error amplifier compensation results in a stable design. For series production a phase margin >60 degrees and a gain margin <-15dB is recommended.*
8 Miscellaneous Waveforms

8.1 Switch node (D1)

With input voltage set to 12V and 1A Iout results in the waveform shown in Figure 8.

The overshoot of less than 3V is negligible. Maximum input voltage is 16V, Vds rating of FDC654P is -30V – enough margin. To fight the 149MHz ringing further (close to 2m band) a RC snubber circuit was implemented to demonstrate RF suppression:
Measure ringing frequency at switch node w/ RF probe (no GND leads, use GND clip), here 148.8MHz – could cause trouble, radiated emissions:

1) **add capacitor from switch node to GND to achieve half of the prior frequency**, here 470pF resulted in 83MHz

2) **add resistor in series to achieve half of the prior overshoot**, here 3.3 Ohm reduced overshoot from 3V to 1.2V:

Clamping network 470pF / 3.3 Ohm reduces RF content at the switch node, less EMI!
It has to be stated that this hard clamping of the switch node causes a drop in efficiency of 0.5%, so roughly 25mW losses at the snubber resistor.

By experience could be said that a drop in efficiency from 0.2% to 0.5% is typically caused by adding the RC snubber circuit. For a low power design like PMP7154 geometry 0603 or 0805 might fit, but for high power designs be aware of losses up to 500mW:

- 0603  <100mW
- 0805  <150mW
- 1206  <200mW
- 1210  <250mW
- 1812  <500mW
- 2010  <750mW
- 2512  <1W
8.2 Gate-Source of MOS-FET

With input voltage set to 12V and 1A Iout results in the waveform shown in Figure 8.

![Waveform](image)

Right handed = SWITCH ON:

To reach the Miller plateau around 4V it needs around 20ns, switching the Miller capacitance Crss from drain to source causes a drop of 1V. The 300mA driver fits only for very small FETs w/ lowest gate charge (<10nC). Passing the Miller plateau happens in less than 10ns – which could be seen at the drain-source voltage, too. Rise and fall time here around 10ns – this fast switching ensures low switching losses. Those switching losses are in the same region as the conducted losses at RdsON 70milliOhm typ. So both types of losses are well balanced, the FET selection is excellent. Looking for lowest RdsON only must not result in best efficiency!
Thermal image at 12V input and full load 1Amp after 1hour continuous operation [Rt = 23°C]:

<table>
<thead>
<tr>
<th>Name</th>
<th>Temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>D1</td>
<td>36.9°C</td>
</tr>
<tr>
<td>Q2</td>
<td>36.0°C</td>

</tbody>
</table>

Temperature rise is below 15K, a proper design of the power stage with maximum efficiency results in relaxed thermal stress; this means higher reliability, best MTBF.

Filter inductor and RC snubber have been placed externally
IMPORTANT NOTICE FOR TI REFERENCE DESIGNS

Texas Instruments Incorporated ('TI') reference designs are solely intended to assist designers ('Designer(s)') who are developing systems that incorporate TI products. TI has not conducted any testing other than that specifically described in the published documentation for a particular reference design.

TI's provision of reference designs and any other technical, applications or design advice, quality characterization, reliability data or other information or services does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such reference designs or other items.

TI reserves the right to make corrections, enhancements, improvements and other changes to its reference designs and other items. Designer understands and agrees that Designer remains responsible for using its independent analysis, evaluation and judgment in designing Designer's systems and products, and has full and exclusive responsibility to assure the safety of its products and compliance of its products (and of all TI products used in or for such Designer's products) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to its applications, it has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any systems that include TI products, Designer will thoroughly test such systems and the functionality of such TI products as used in such systems. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

Designers are authorized to use, copy and modify any individual TI reference design only in connection with the development of end products that include the TI product(s) identified in that reference design. HOWEVER, NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of the reference design or other items described above may require a license from a third party under the patents or other intellectual property of TI.

TI REFERENCE DESIGNS AND OTHER ITEMS DESCRIBED ABOVE ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING THE REFERENCE DESIGNS OR USE OF THE REFERENCE DESIGNS, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNERS AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS AS DESCRIBED IN A TI REFERENCE DESIGN OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF THE REFERENCE DESIGNS OR USE OF THE REFERENCE DESIGNS, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

TI's standard terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products. Additional terms may apply to the use or sale of other types of TI products and services. Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
