

TI Technology Days 2010

How to drive your AD-Converter?

Carsten Schlegel

Analog to Digital Conversion

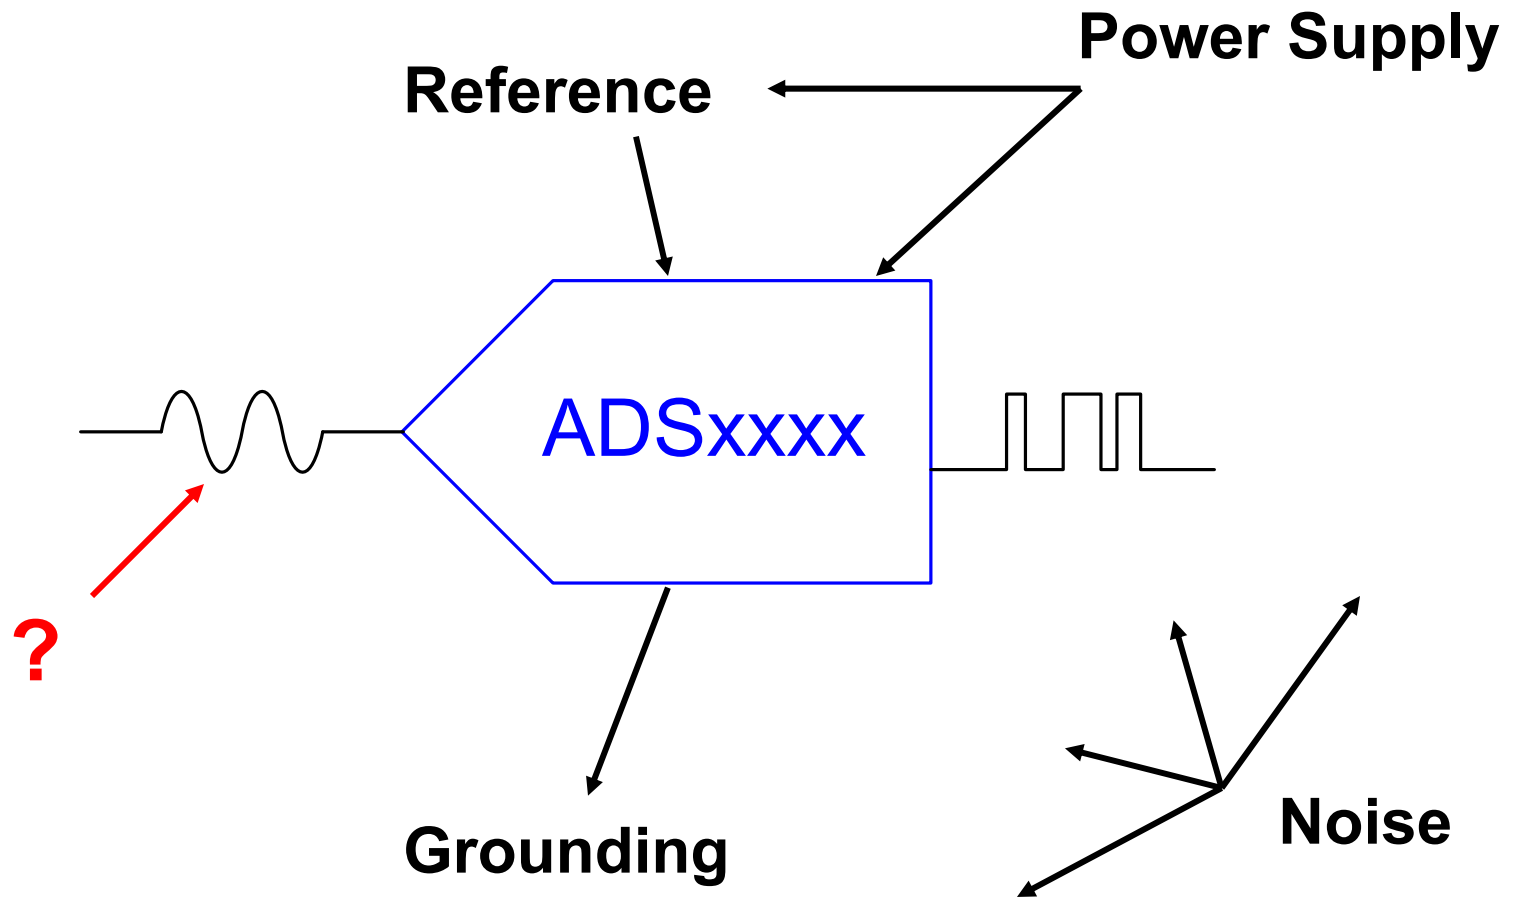

The Size of the Least Significant Bit (LSB)

RESOLUTION N	2^N	VOLTAGE of LSB (10V FS)	ppm FS	% FS	dB FS
2-bit	4	2.5 V	250,000	25	-12
4-bit	16	625 mV	62,500	6.25	-24
6-bit	64	156 mV	15,625	1.56	-36
8-bit	256	39.1 mV	3,906	0.39	-48
10-bit	1,024	9.77 mV (10 mV)	977	0.098	-60
12-bit	4,096	2.44 mV	244	0.024	-72
14-bit	16,384	610 μ V	61	0.0061	-84
16-bit	65,536	153 μ V	15	0.0015	-96
18-bit	262,144	38 μ V	4	0.0004	-108
20-bit	1,048,576	9.54 μ V (10 μ V)	1	0.0001	-120
22-bit	4,194,304	2.38 μ V	0.24	0.000024	-132
24-bit	16,777,216	596 nV*	0.06	0.000006	-144

*600nV is the Johnson Noise in a 10kHz BW of a 2.2k Ω Resistor @ 25°C

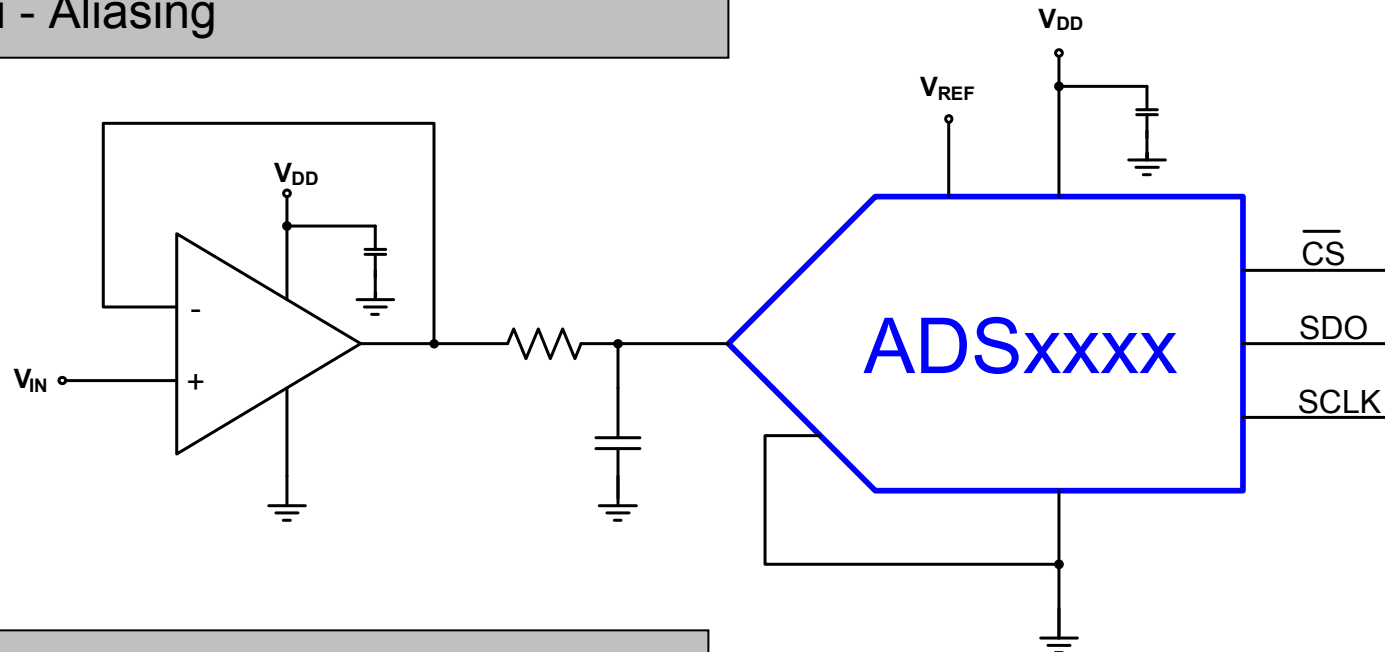

Remember: 10-bits and 10V FS yields an LSB of 10mV, 1000ppm, or 0.1%.
All other values may be calculated by powers of 2.

Analog to Digital Conversion

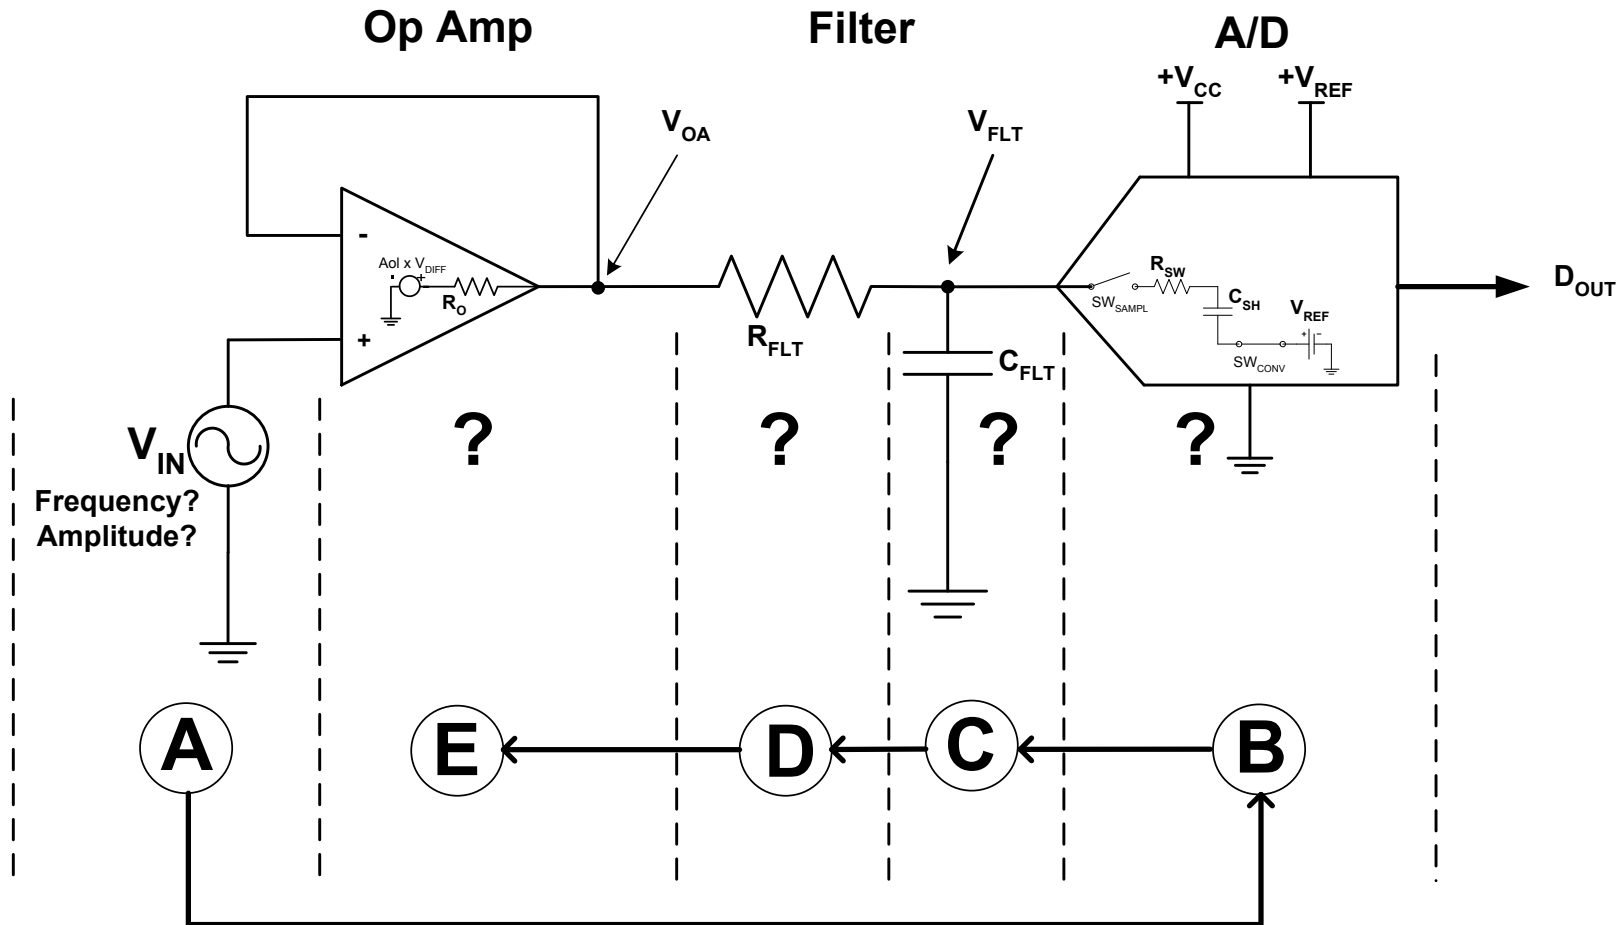

Typical ADC Input Drive Circuit

- Signal conditioning
- Adaptation to ADC input range
- MUX, Range extension
- Anti - Aliasing

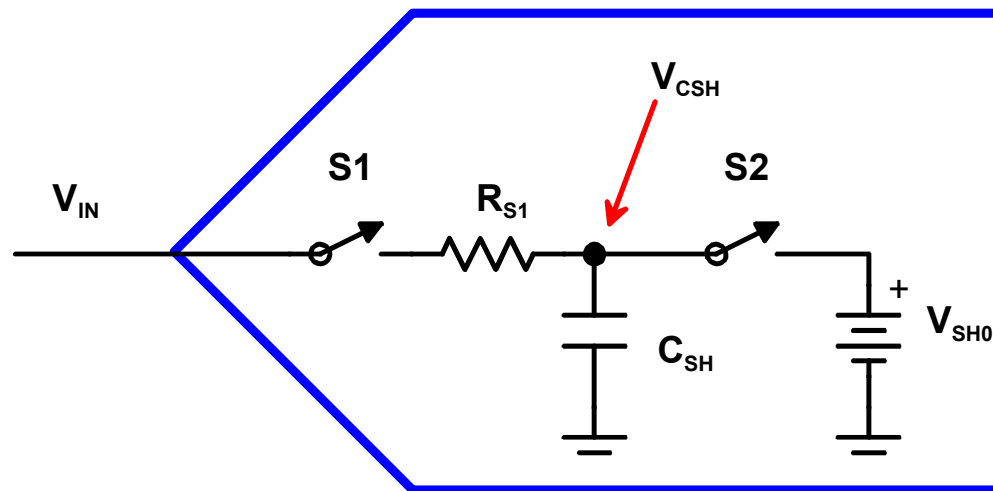

- Buffer for Impedance Matching
- Dynamic Load (Switched Capacitor)
- Acquisition Time

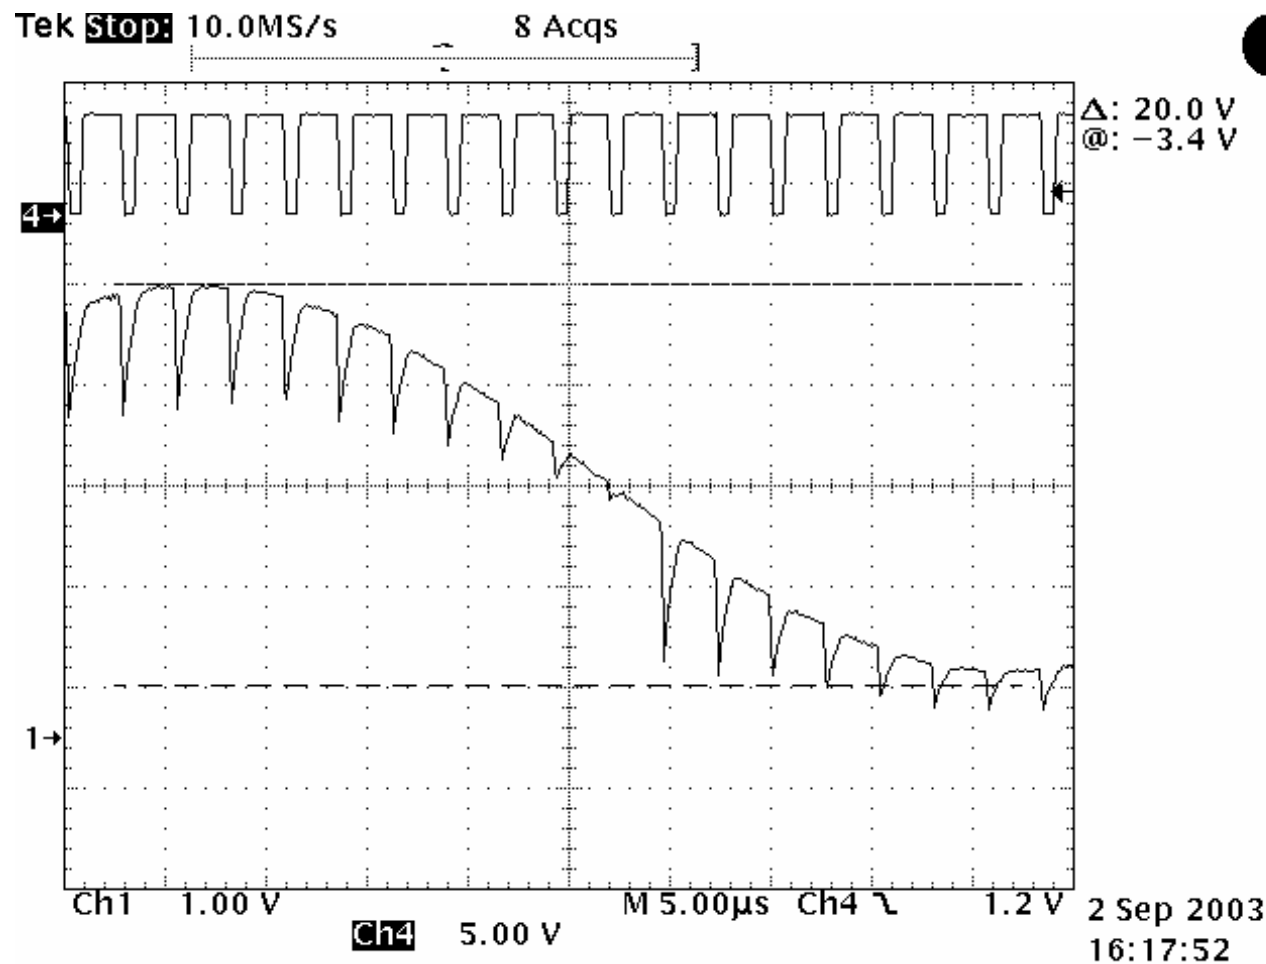

CDAC SAR ADC Input Buffer and Filter Selection

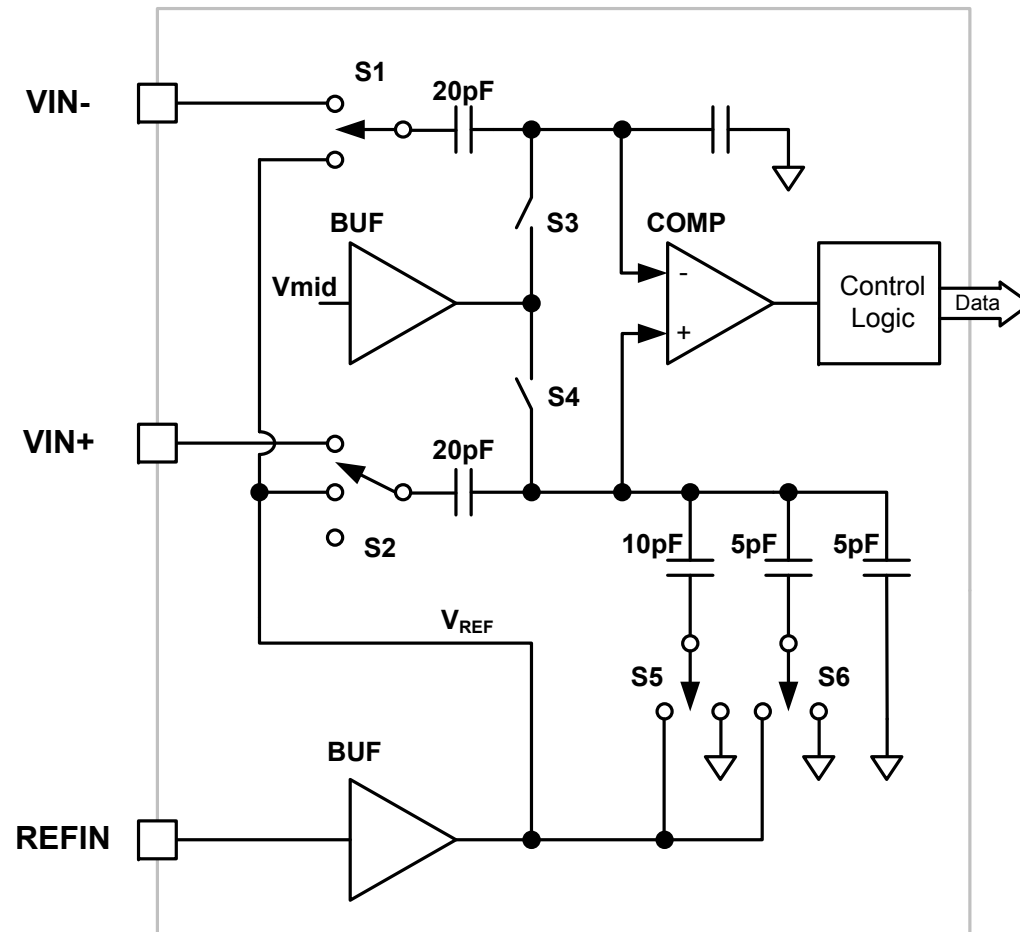

Simplified Model of SAR-ADC Input Stage

SAR ADC Input Voltage during Sampling

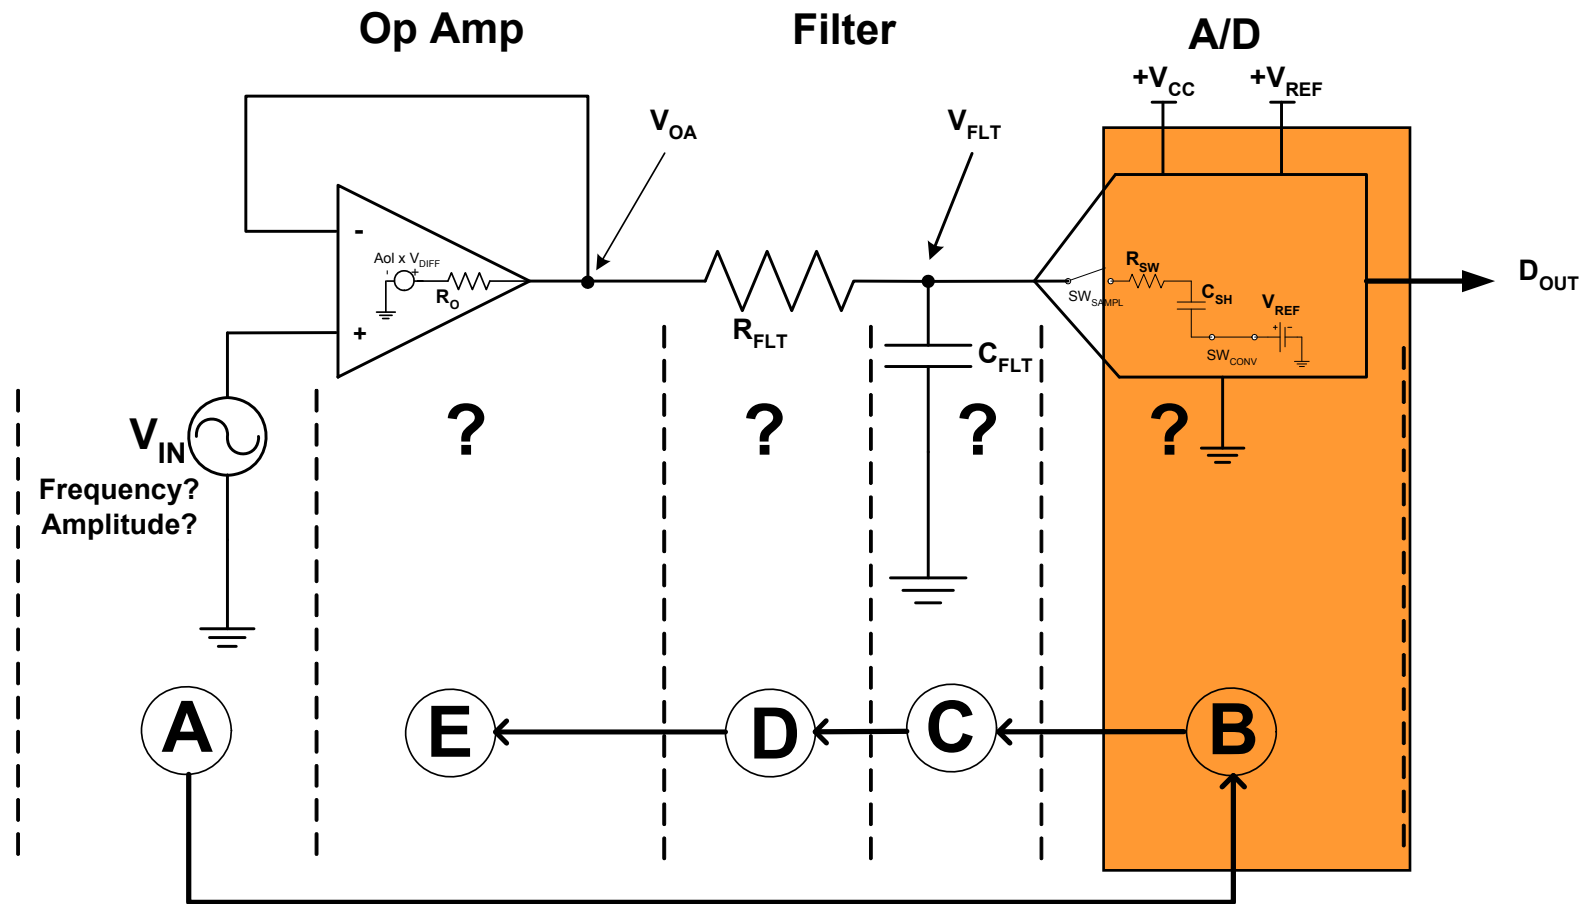

More detailed SAR Input Stage

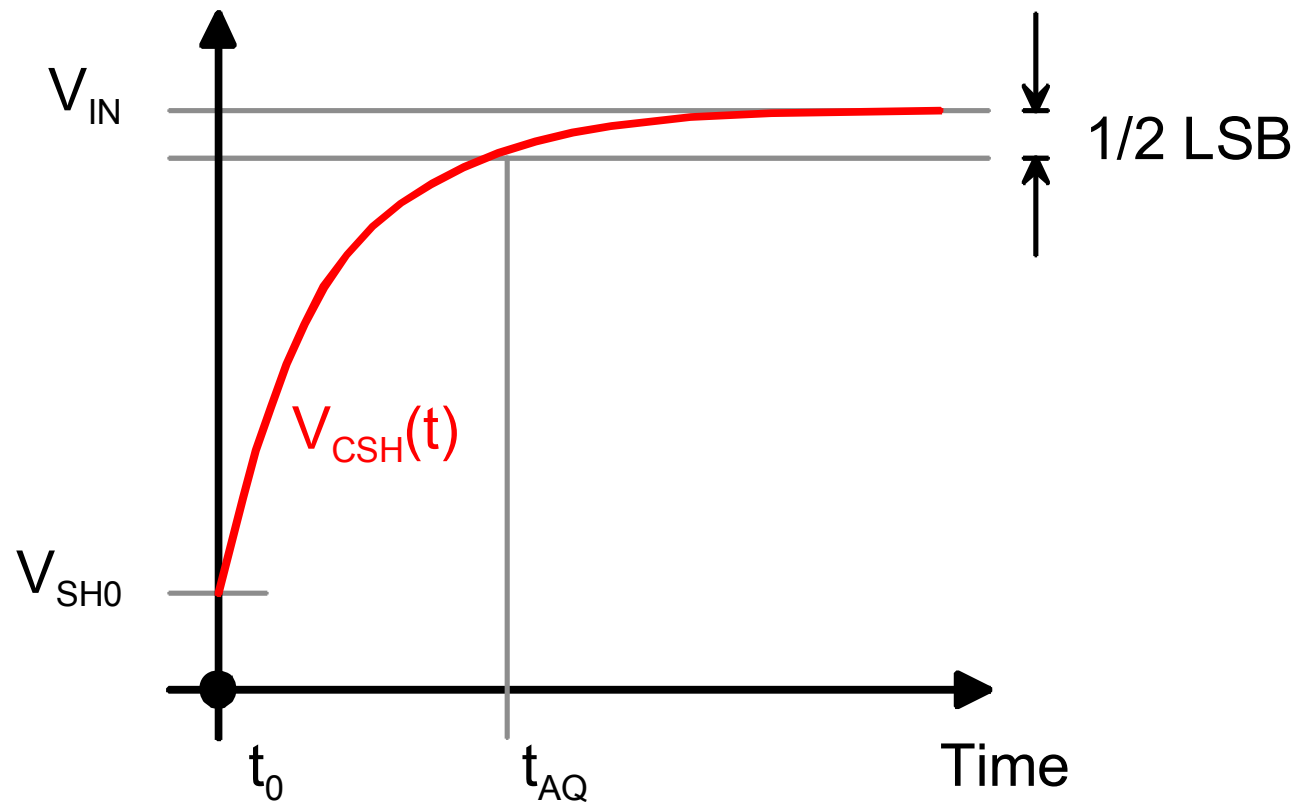

3 bits of ADS8361

CDAC SAR ADC Input Buffer and Filter Selection

Voltage Across the Sampling Capacitor

Voltage Across Sampling Capacitor

$$V_{CSH}(t) = V_{CSH}(t_0) + (V_{IN} - V_{CSH}(t_0)) \times (1 - e^{-\frac{t}{\tau}})$$

$V_{CSH}(t)$ is voltage in time across the sampling capacitor, C_{SH}

$V_{CSH}(t_0)$ is voltage across the C_{SH} , at beginning of acquisition time

V_{IN} is the input voltage to the ADC

τ is acquisition time constant and equal to $R_{S1} \times C_{SH}$

t is a time variable in seconds

Settling Time as Function of τ

$$V_{IN} - V_{CSH}(t_{AQ}) \leq \frac{1}{2} LSB$$

$V_{CSH}(t_{AQ})$ is voltage across the C_{SH} , at the end of the sampling period

t_{AQ} is acquisition time, the time from the beginning of the sampling period (t_0) to the end of the sampling period

$$\frac{1}{2} LSB = \frac{FSR}{2^{N+1}}$$

(LSB = Least Significant Bit, FSR is the full-scale range of the N-Bit converter)

$$t_{AQ} \geq k_1 \times \tau$$

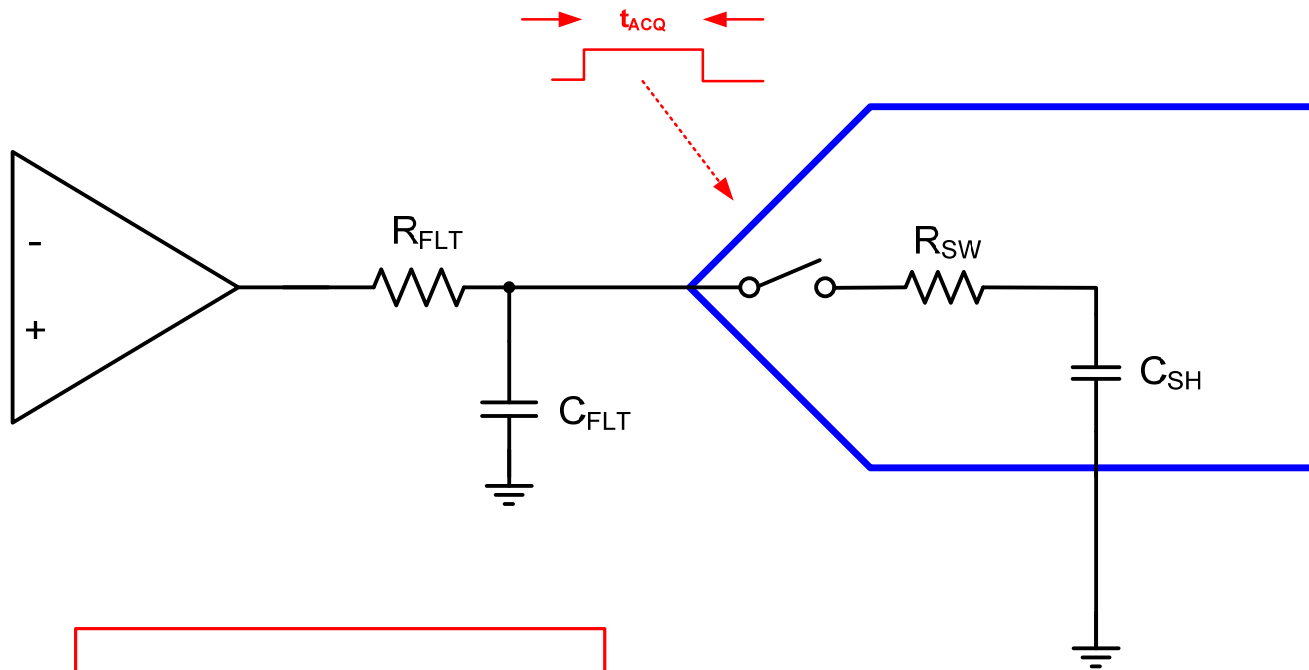

$$k_1 = \ln\left(\frac{V_{IN} - V_{SH0}}{FSR} \cdot 2^{N+1}\right)$$

Time-Constant-Multiplier for SAR ADC

ADC Resolution	k1 time-constant-multiplier 1/2 LSB accuracy, $1/2^{N+1}$
8	6.2
10	7.6
12	<u>9.0</u>
14	10.4
16	<u>11.8</u>
18	13.2
20	14.6

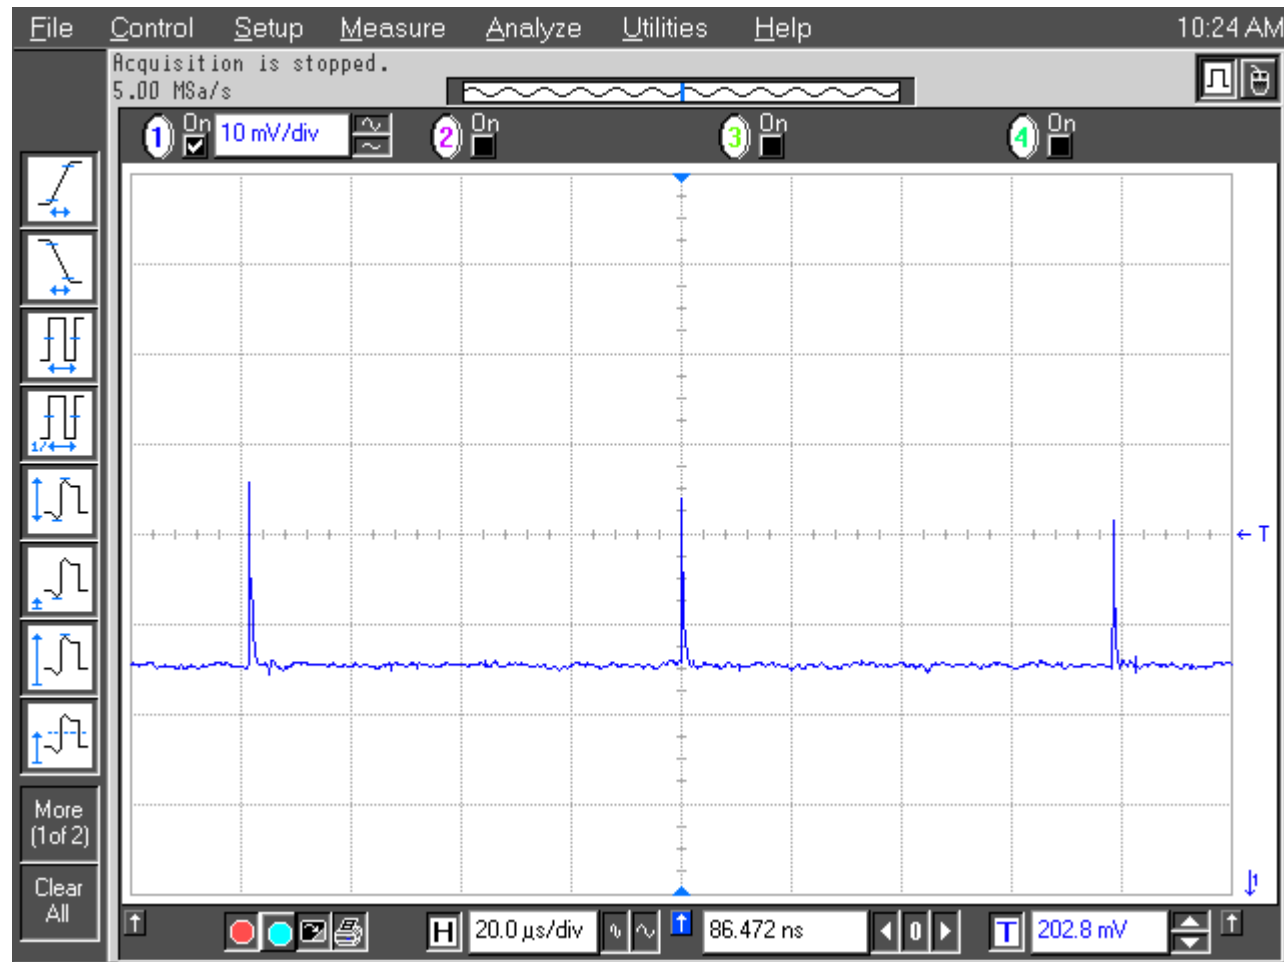

*note – using worst case values: V_{IN} = full-scale voltage or 2^N , $V_{SH0} = 0V$

Data Acquisition Time

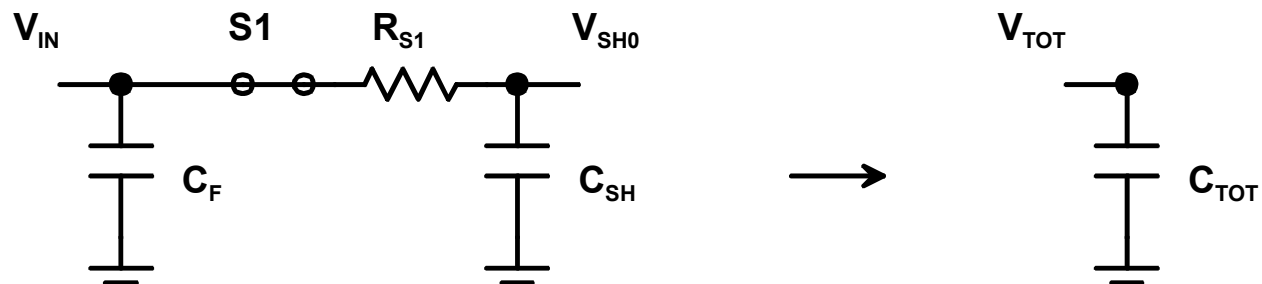

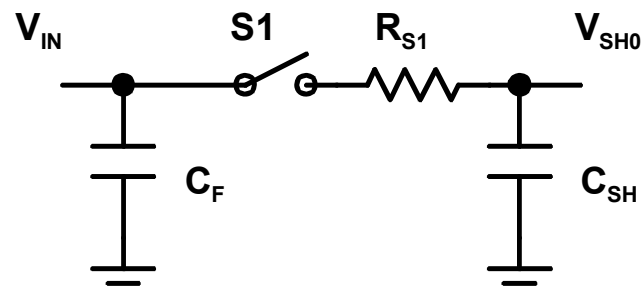

$$t_{AQ} \geq k_1 \times \tau$$

Charge Injection

External and Internal Acquisition Capacitors

Charge Distribution between C_F and C_{SH}

$$Q_{IN} = C_F \times V_{IN}$$

$$Q_{SH} = C_{SH} \times V_{SH0}$$

After the closure of S1, the charge on C_F and C_{SH} distributes.

$$C_{TOT} = C_F + C_{SH}$$

$$Q_{TOT} = Q_{IN} + Q_{SH}$$

$$V_{TOT} = \frac{C_F}{C_F + C_{SH}} \cdot V_{IN} + \frac{C_{SH}}{C_F + C_{SH}} \cdot V_{SH0}$$

$$V_{TOT} = \frac{a}{a+1} \cdot V_{IN} + \frac{1}{a+1} \cdot V_{SH0} \quad a = \frac{C_F}{C_{SH}}$$

New Time Constant Multiplier

$$k_2 = \ln \left[\frac{\left(1 - \frac{a}{a+1}\right) \cdot V_{IN} - \frac{1}{a+1} \cdot V_{SH0}}{FSR} \cdot 2^{N+1} \right]$$

“ k ” is not only function of the initial charge V_{SH0} , but it is also a function of the value of the applied external capacitor C_F . In the case of the lower frequency input signal ($\sim f_s/10$) the calculation of the initial charge V_{SH0} of the C_{SH} is $\frac{1}{2}$ FSR. On the other hand, for the multiplexed signal at the input to the converter, we need to use 0V for V_{SH0} .

$$k_2 = \ln \left(\frac{1}{a+1} \cdot 2^{N+1} \right)$$

New Time-Constant-Multiplier for SAR ADC

ADC Resolution	C_F [pF]	a C_F/C_{SH}	k_2 time-constant-multiplier 1 LSB accuracy, $1/2^N$	R_F [Ω]
16	200	8	9.6	1,576
16	400	16	9.0	894
16	1000	40	8.1	411
16	4000	160	6.7	126

*note – using worst case values: V_{IN} = full-scale voltage or 2^N , $V_{SH0} = 0V$

Assumed: $t_{AQ}=3.4\mu s$ and $C_{SH}=25pF$

Charge Bucket I

- Charge Transfer Equation: $Q = CV$
- Charge required to charge C_{SH} to V_{REF}
 - $Q_{SH} = C_{SH} V_{REF}$
 - $Q_{SH} = 25\text{pF} \cdot 4.096\text{V} = 102\text{pC}$
- IDEAL C_{FLT}
 - “Charge Bucket” to fill C_{SH} with only a $31.25\mu\text{V}$ (1/2LSB) droop on C_{FLT}
 - $Q_{FLT} = Q_{SH}$
 - $Q_{FLT} = C_{FLT} (31.35\mu\text{V})$
 - $102\text{pC} = C_{FLT} (31.25\mu\text{V}) \rightarrow C_{FLT} = 3.3\mu\text{F}$
- IDEAL $C_{FLT} = 3.3\mu\text{F}$
 - Not a good, small, cheap high frequency capacitor
 - Not practical for Op Amp to drive directly (stability, transient current)
 - Isolation resistor likely not large enough to help isolate Cload and still meet necessary filter time constant

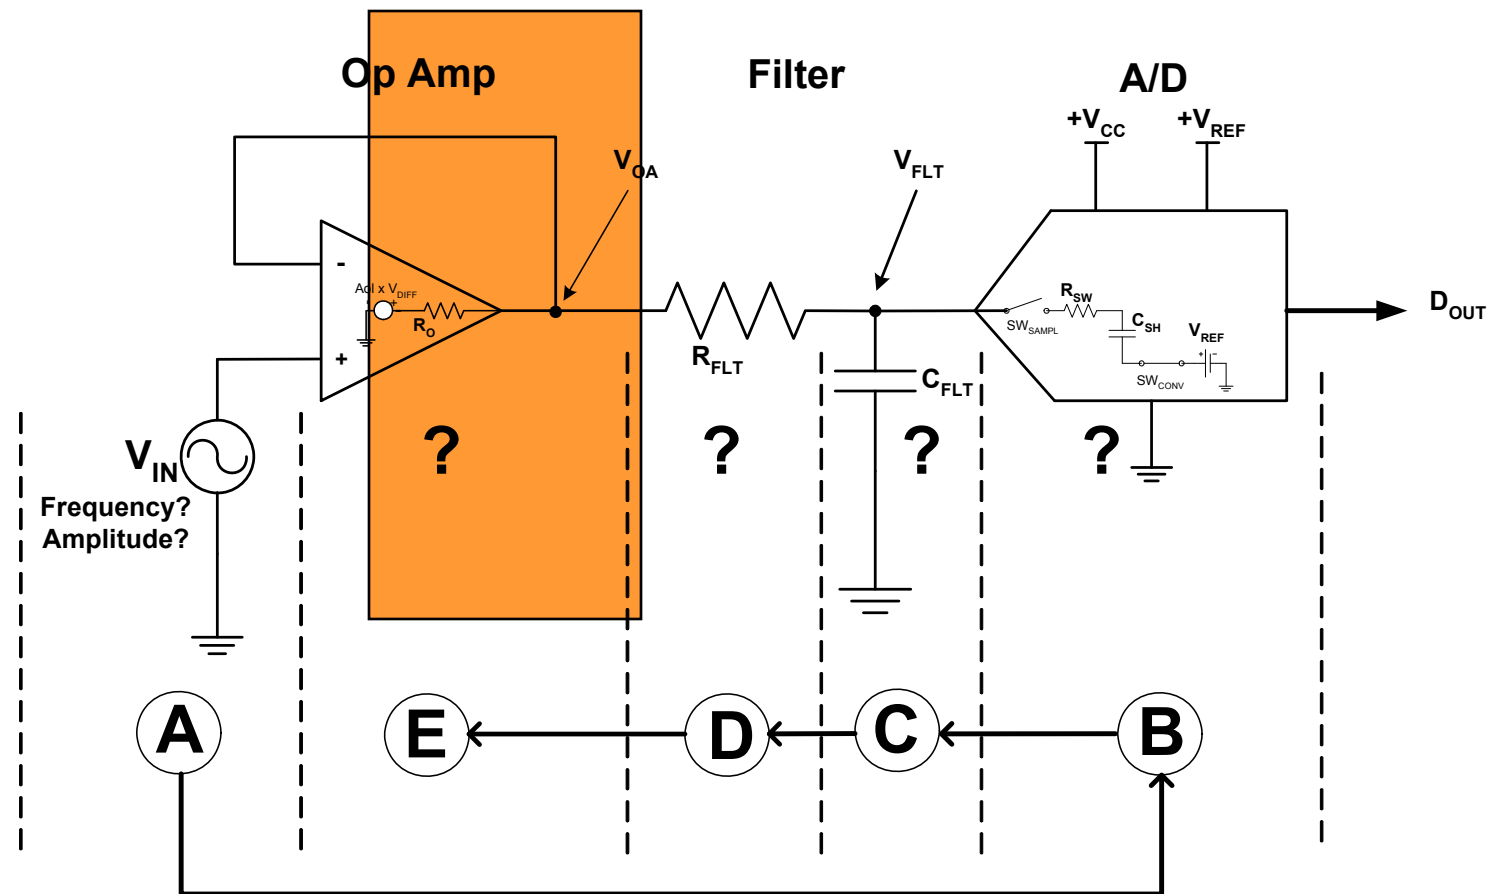

Charge Bucket II

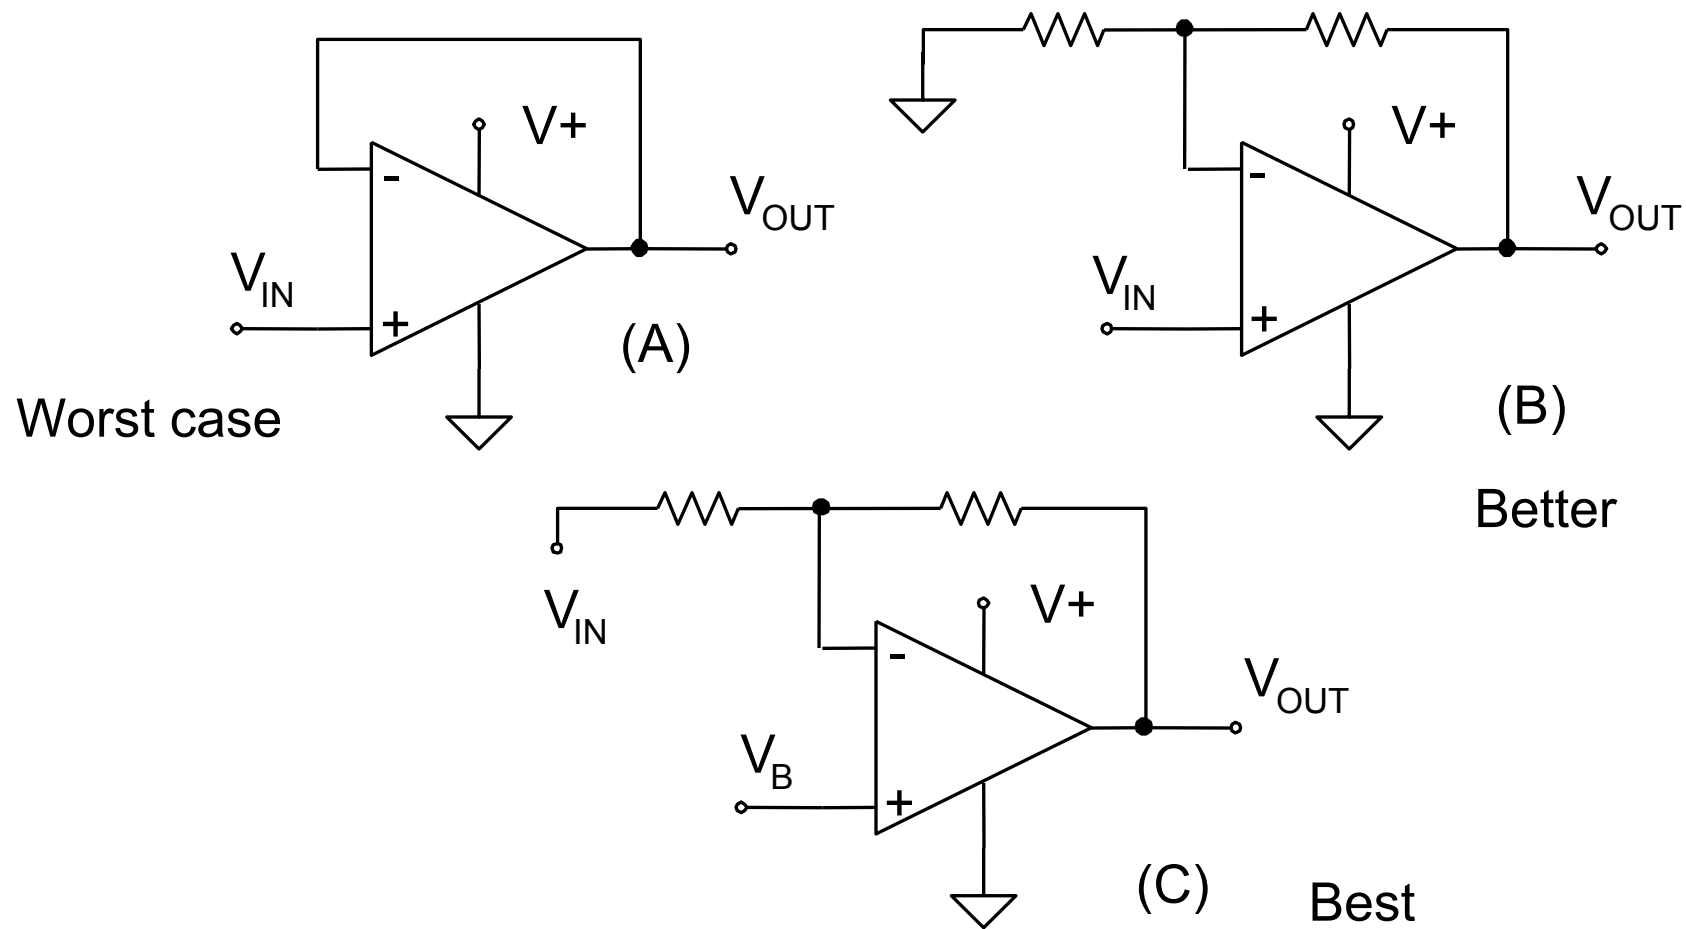

- **Partition the “Charge Bucket”**
 - 95% from C_{FLT}
 - 5% from Op Amp
- **C_{FLT} value required to provide Q_{SH} with <5% droop on C_{FLT}**
 - $Q_{FLT} = Q_{SH}$
 - $Q_{FLT} = C_{FLT} (0.05V_{REF})$
 - $102\text{pC} = C_{FLT} (0.05 \cdot 4.096\text{V}) \rightarrow C_{FLT} = 500\text{pF}$
- **During t_{ACQ} the Op Amp must replace 5% V_{REF} on C_{FLT}**
 - Ensure C_{FLT} is at least $10 \times C_{SH}$
 - This implies dominant load for Op Amp Buffer is C_{FLT}
 - $500\text{pF} = 20 \times 25\text{pF} \rightarrow C_{FLT} > 20 \times C_{SH}$

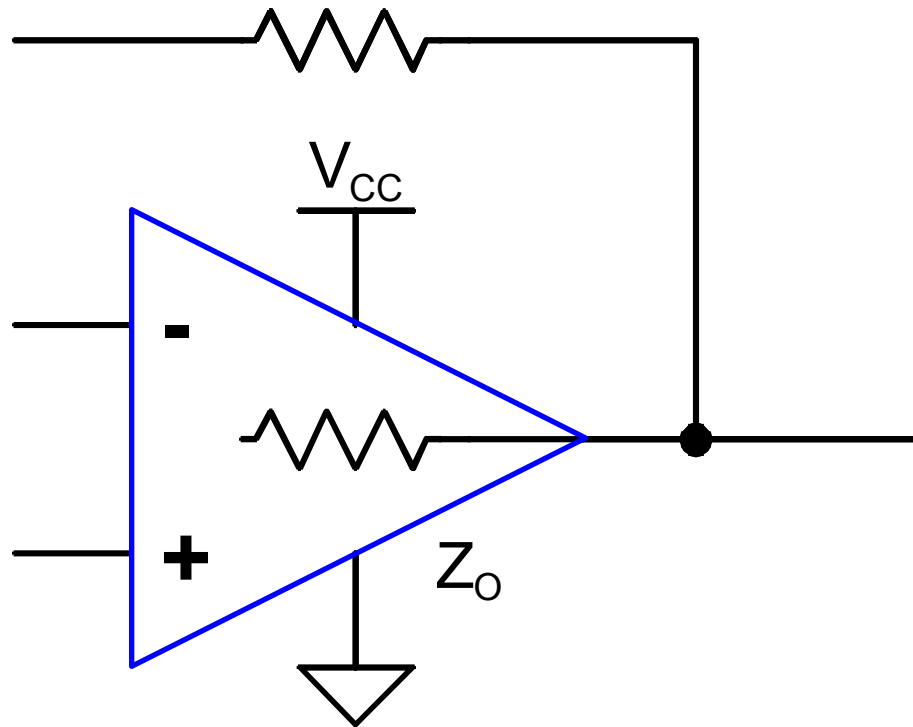

CDAC SAR ADC Input Buffer and Filter Selection

Buffer Output Impedance

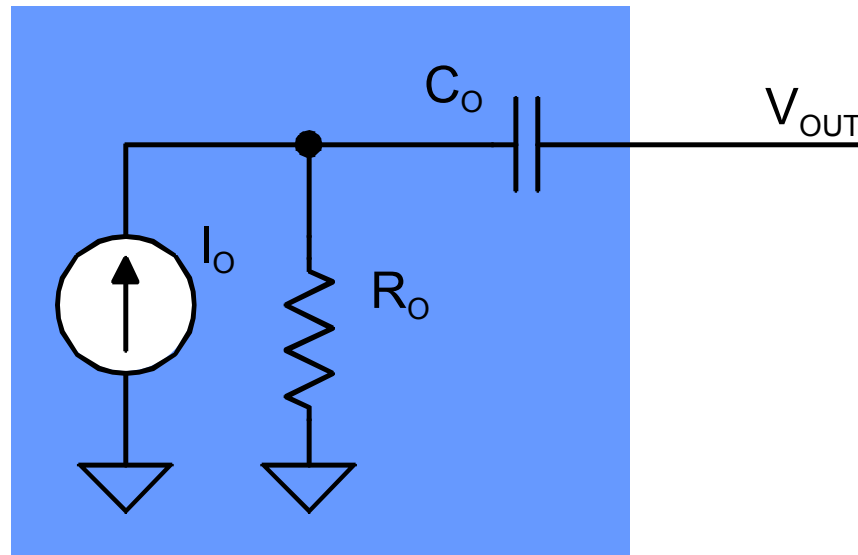

OPA364 Open-Loop Output Impedance

R_O Open-Loop output resistance

f_{ZO} Frequency of Zero in the Open-Loop output impedance

OPA364 Open-Loop Output Impedance

Values from Tina model

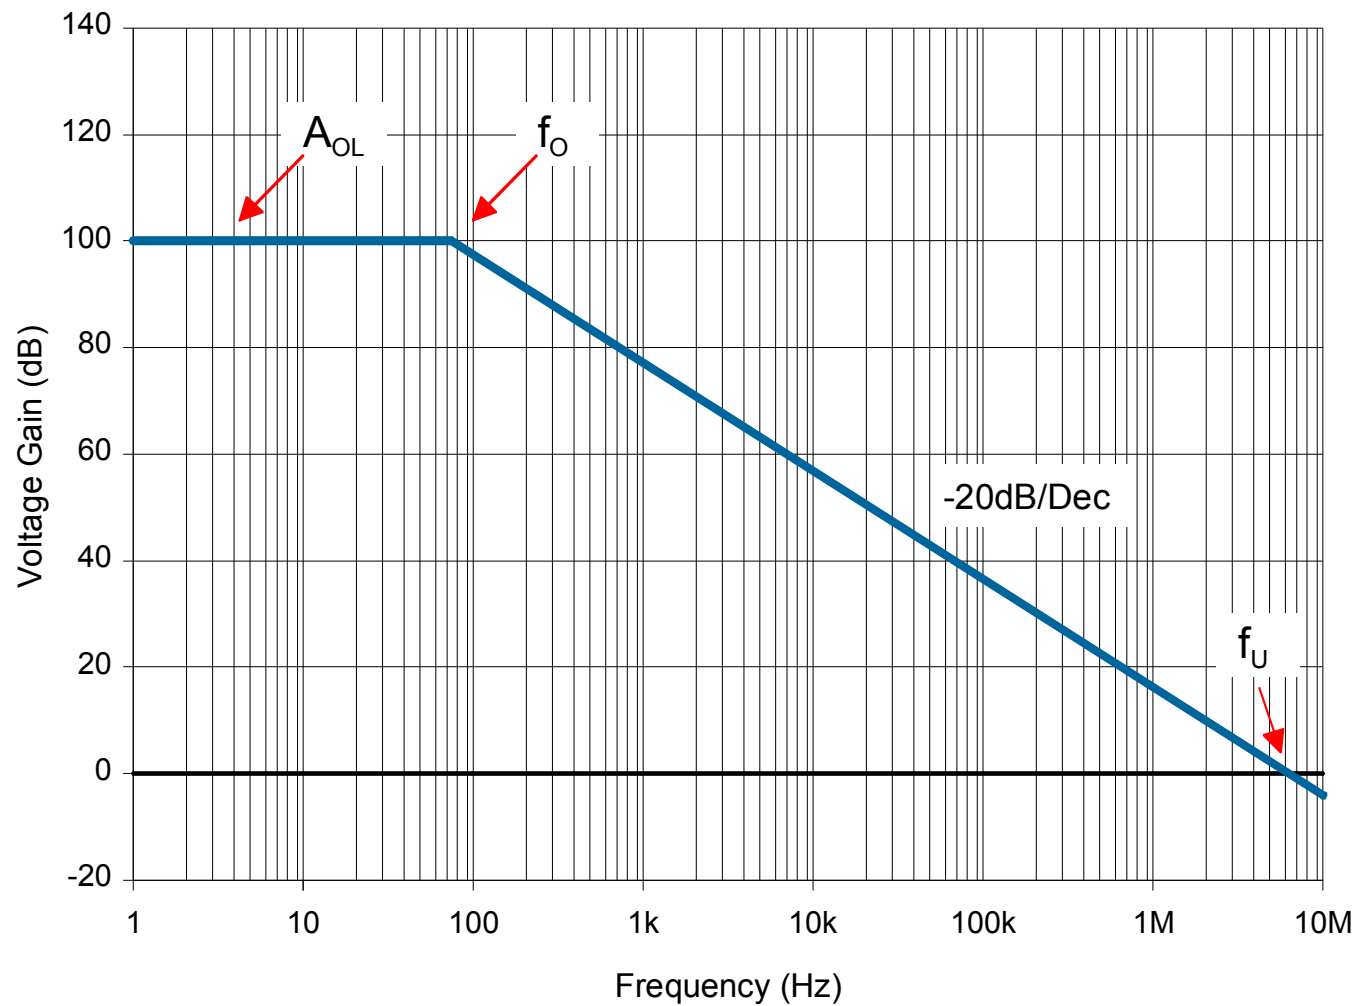

$$R_o = 107.3\Omega$$

$$f_{zo} = 6.32kHz$$

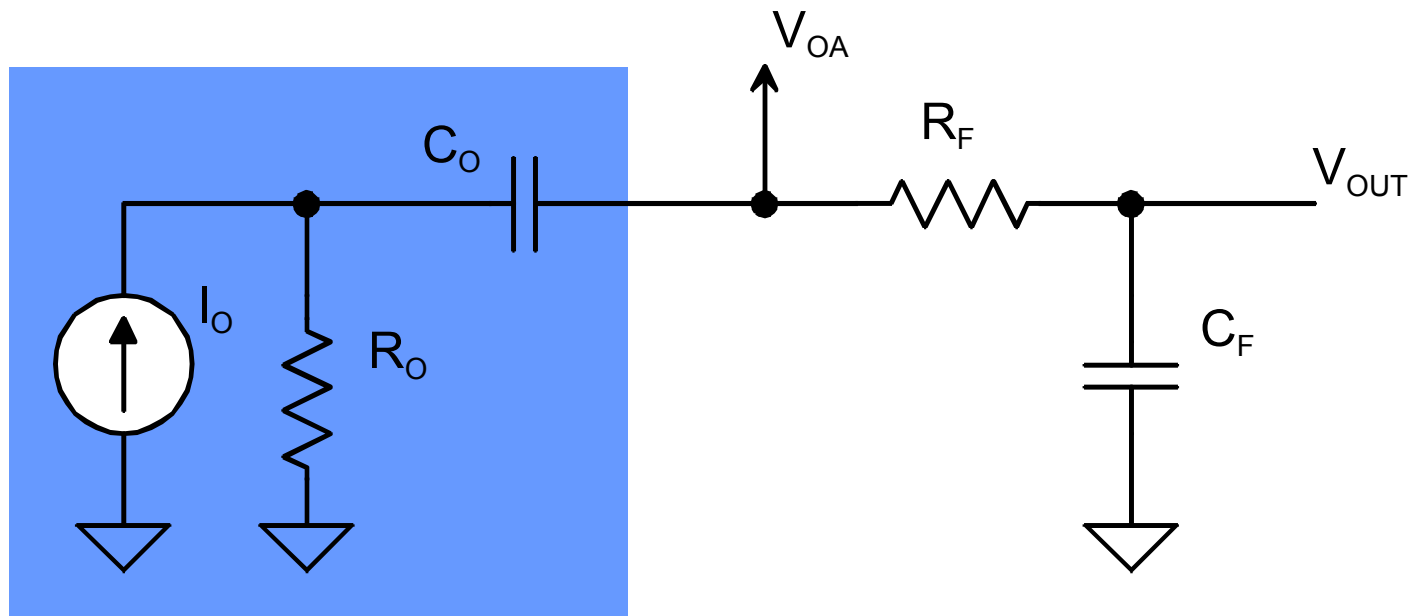

$$f_{zo} = \frac{1}{2\pi \cdot R_o \cdot C_o}$$

$$C_o = 0.235\mu F$$

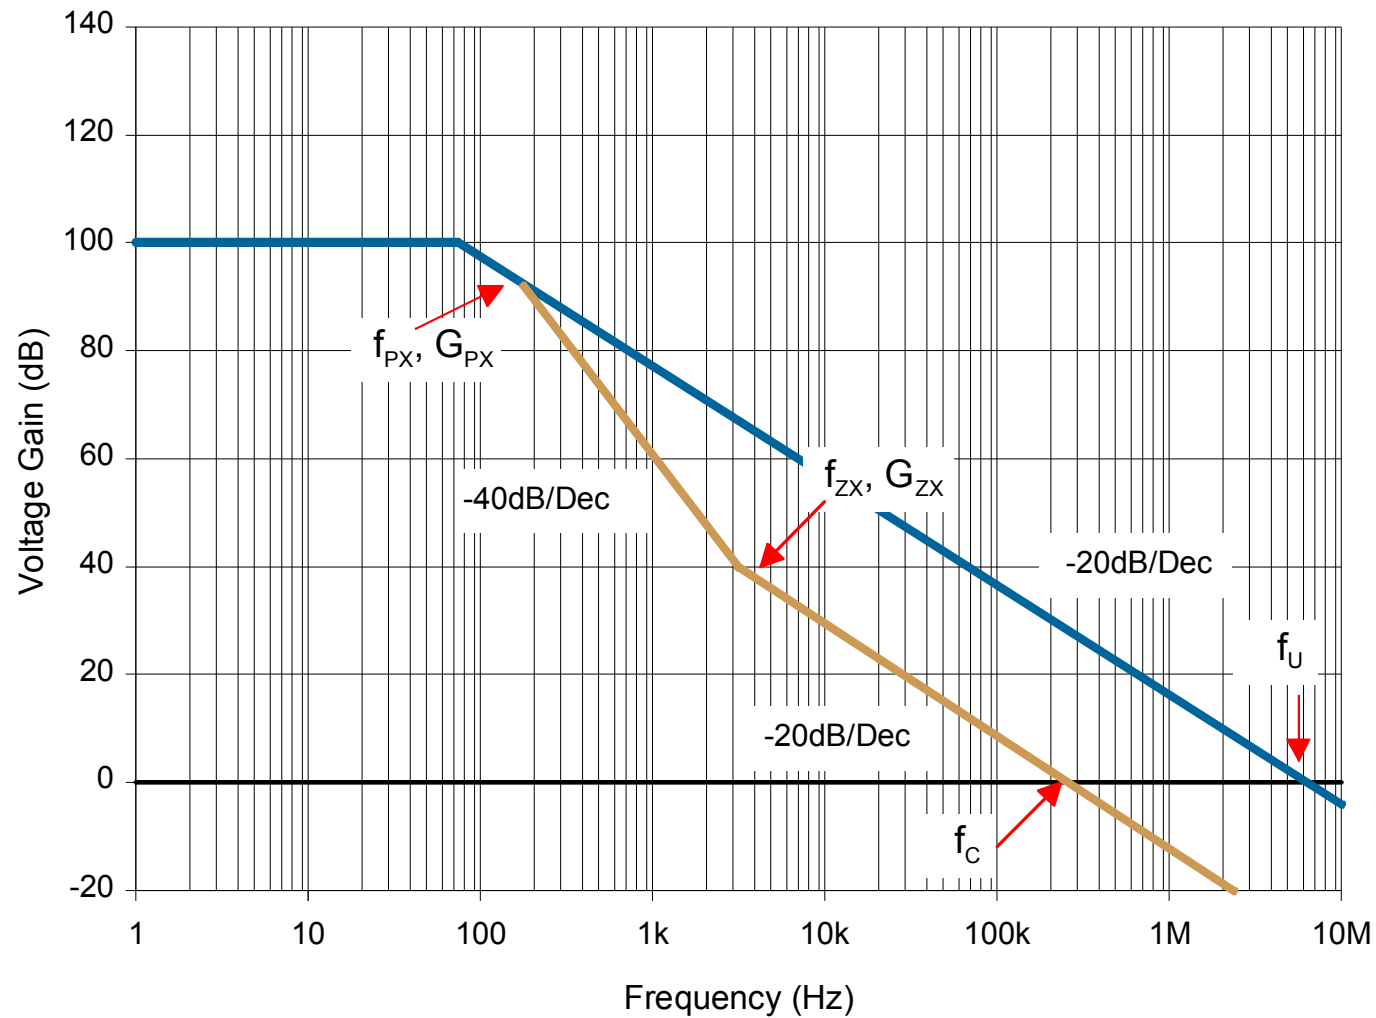

OPA364 Open-Loop Voltage Gain

Op Amp with external RC-Filter

Op Amp with External RC Filter

Added Pole and Zero

**BiPOLAR
OpAmp**

$$f_{PX} = \frac{1}{2\pi \cdot (R_O + R_F) \cdot C_F}$$

$$f_{ZX} = \frac{1}{2\pi \cdot R_F \cdot C_F}$$

**2-Stage CMOS RRO
OpAmp**

$$f_{PX} = \frac{1}{2\pi \cdot (R_O + R_F) \cdot \left[\frac{C_O \cdot C_F}{C_O + C_F} \right]}$$

$$f_{ZX} = \frac{1}{2\pi \cdot R_F \cdot C_F}$$

Gain of Added Pole and Zero

Gain of added pole

$$G_{PX} = -20 \cdot \log \left[\frac{f_{PX}}{f_U} \right]$$

Gain of added zero

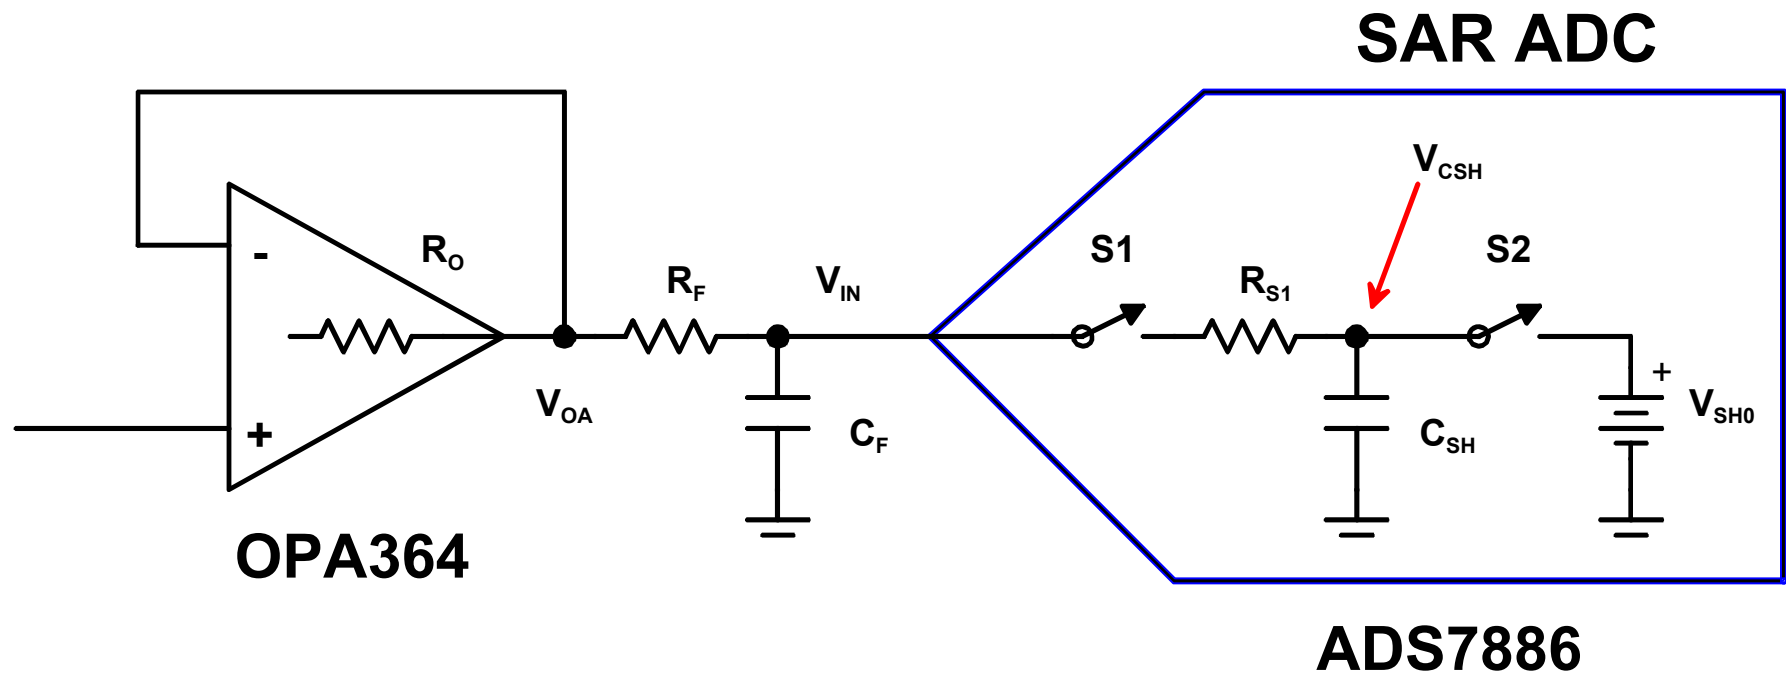

$$G_{ZX} = G_{PX} - 40 \cdot \log \left[\frac{f_{ZX}}{f_{PX}} \right]$$

Modify close-loop
unity gain frequency

$$G_C = 0dB = G_{ZX} - 20 \cdot \log \left[\frac{f_C}{f_{ZX}} \right]$$

$$f_C = f_{ZX} \cdot 10^{G_{ZX}/20}$$

Test Circuit

Design Criteria (w/o Phase Margin)

1) Critically stable:

$$f_{ZX} = f_c (-40dB / decade)$$

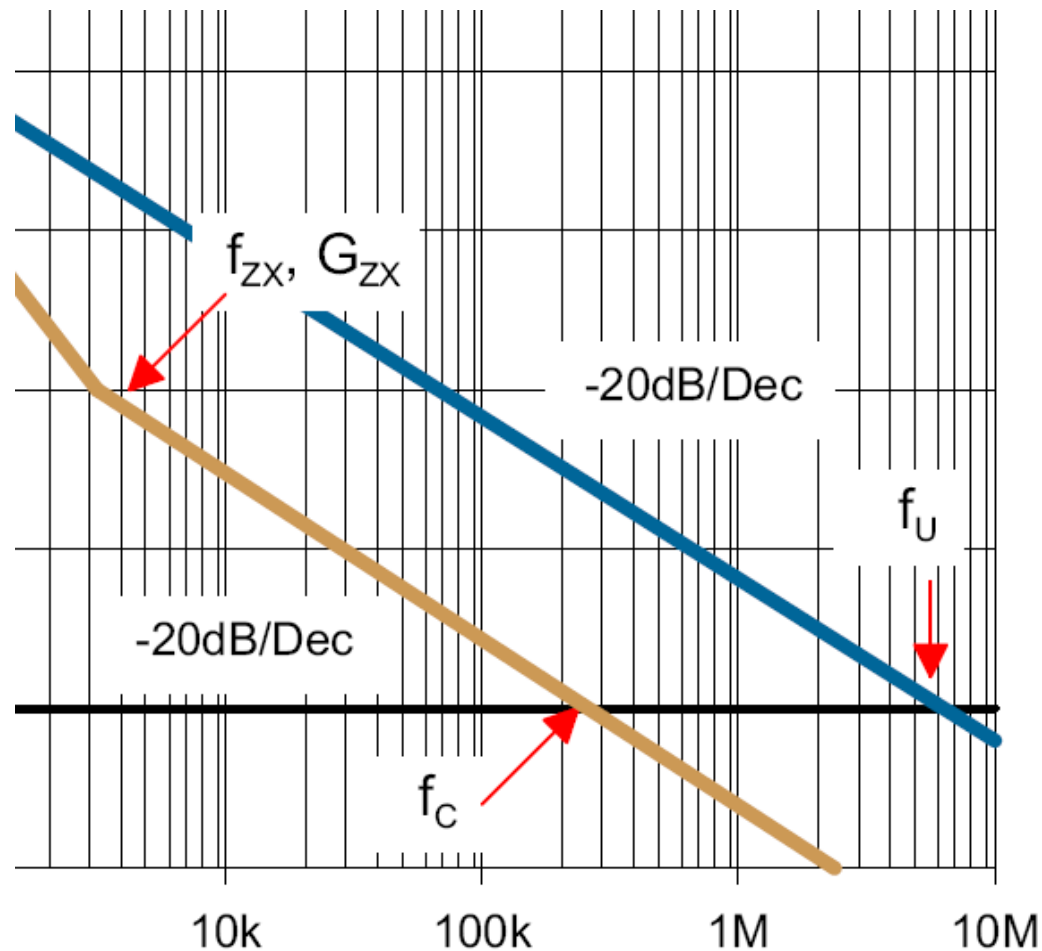

2) Marginally stable:

$$G(f_{ZX}) = 3dB \quad or \quad f_{ZX} = \frac{f_c}{1.41}$$

3) Good design:

$$G(f_{ZX}) = 6dB \quad or \quad f_{ZX} = \frac{f_c}{2}$$

A Good Design Guideline

$$f_c \leq \frac{1}{2} f_u$$

$$f_{ZX} \leq \frac{1}{2} f_c$$

or

$$f_{ZX} \leq \frac{1}{4} f_u$$

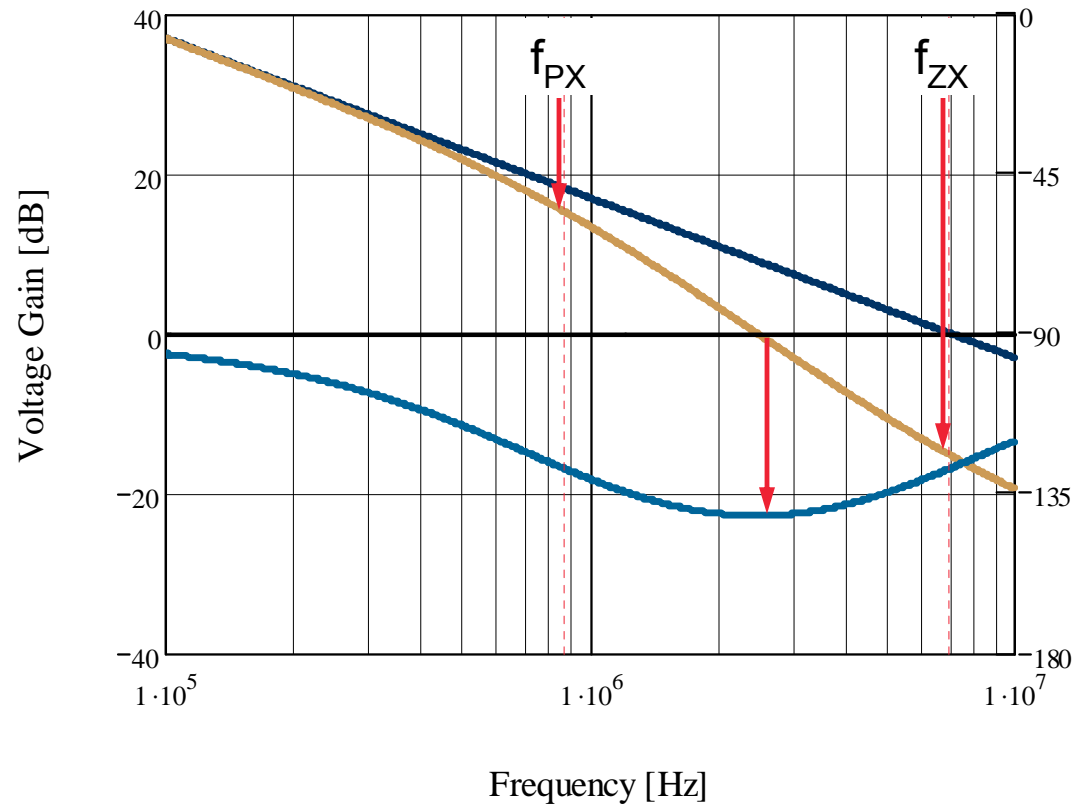

$$G_{ZX} \geq +6dB$$

- Phase Shift -

$$f_{PX} > \frac{1}{10} f_{ZX}$$

$$R_F \geq \frac{R_O}{9}$$

OPA364 with $R_F=15\Omega$ and $C_F=1,500pF$

- Open-Loop voltage gain
- Modify Open-Loop voltage gain
- 0 dB
- Phase Shift

$$f_{PX} = 873kHz$$

$$G_{PX} = 15.3dB$$

$$f_{ZX} = 7.07MHz$$

$$G_{ZX} = -5.2dB$$

$$f_C = 2.49MHz$$

$$\theta(f_C) = -141.3^\circ$$

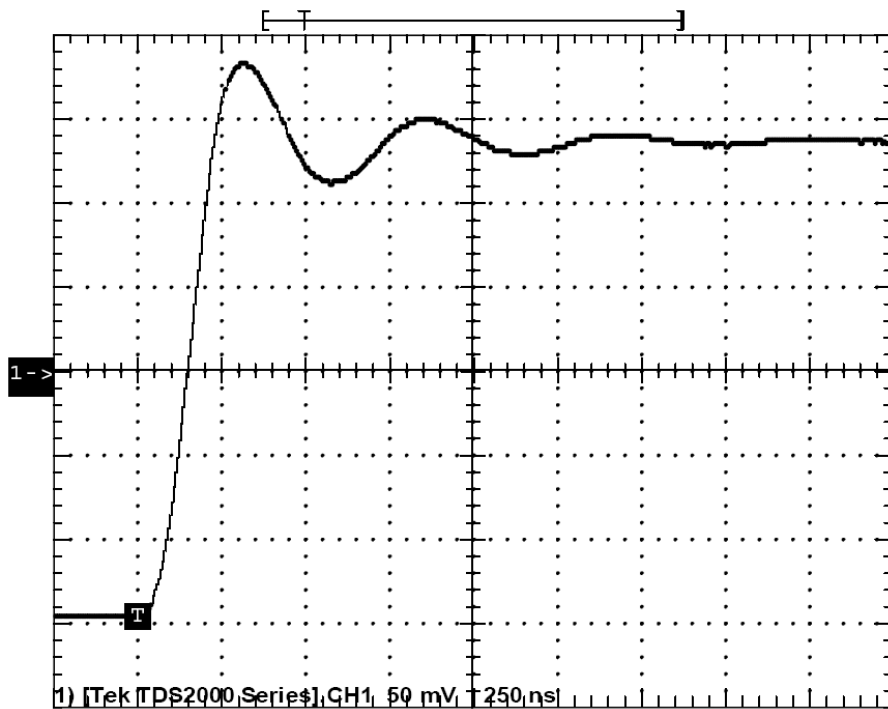

Phase Margin

$$\psi(f_C) = 180^\circ - \theta(f_C)$$

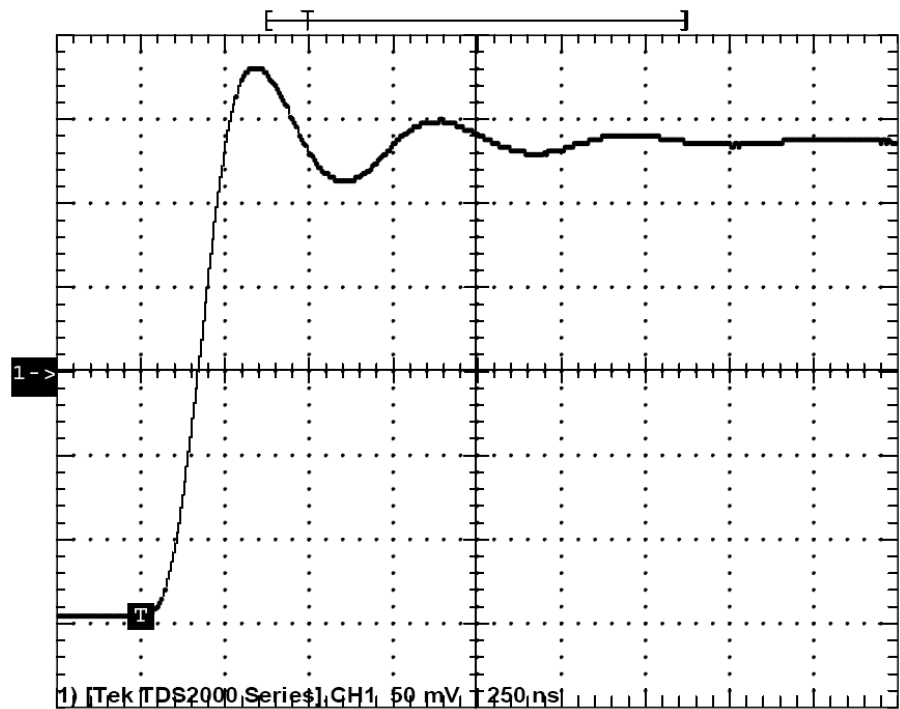

$$\psi(f_C) = 38.7^\circ$$

Small Signal Step Response

$R_F = 15\Omega$ and $C_F = 1,500\text{pF}$
50mV/div 250ns/div

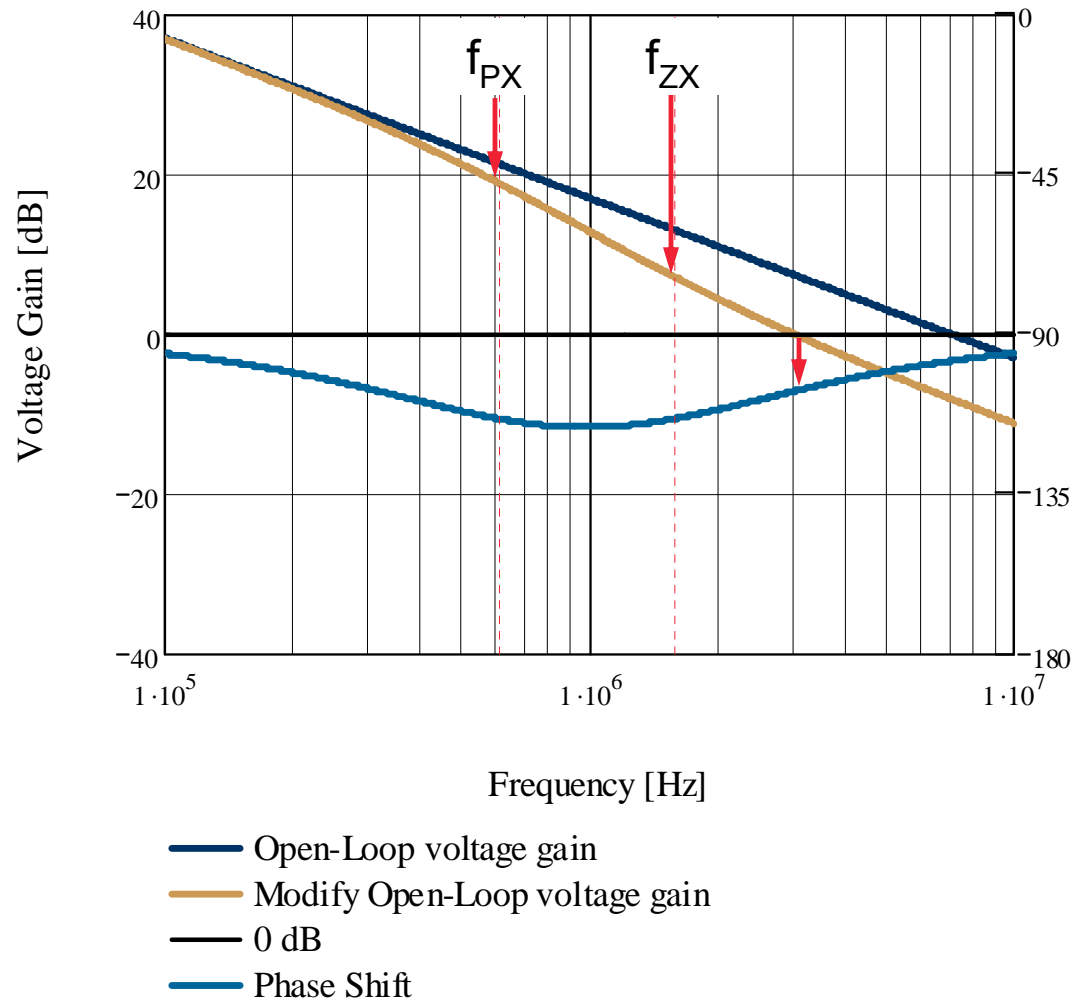

OPA364 Output

ADC Input

OPA364 with $R_F=66.5\Omega$ and $C_F=1,500pF$

$$f_{PX} = 616kHz$$

$$G_{PX} = 18.9dB$$

$$f_{ZX} = 1.59MHz$$

$$G_{ZX} = 7.12dB$$

$$f_C = 3.04MHz$$

$$\theta(f_C) = -106.3^\circ$$

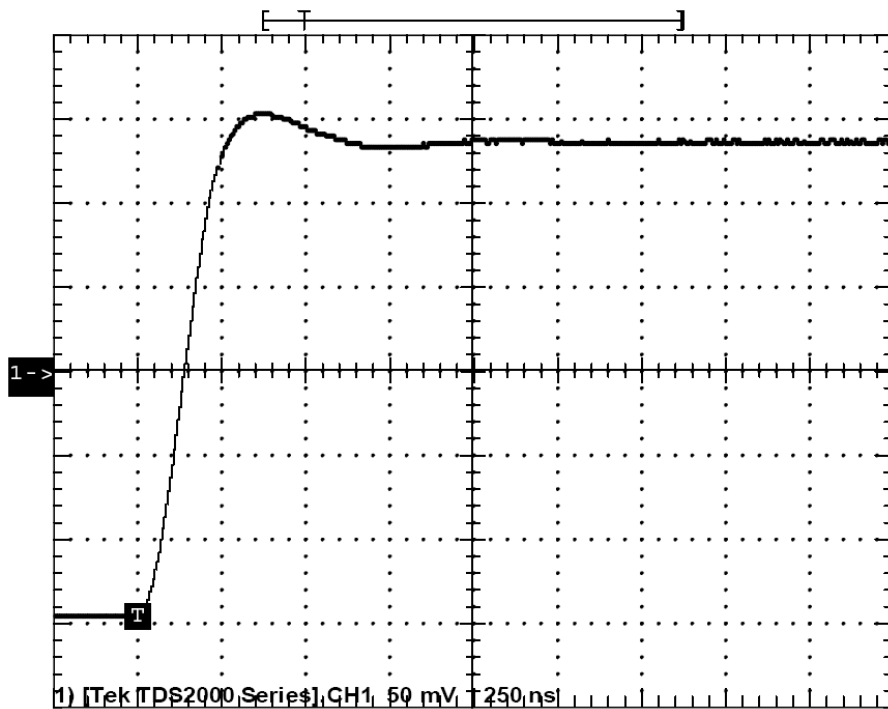

Phase Margin

$$\psi(f_C) = 180^\circ - \theta(f_C)$$

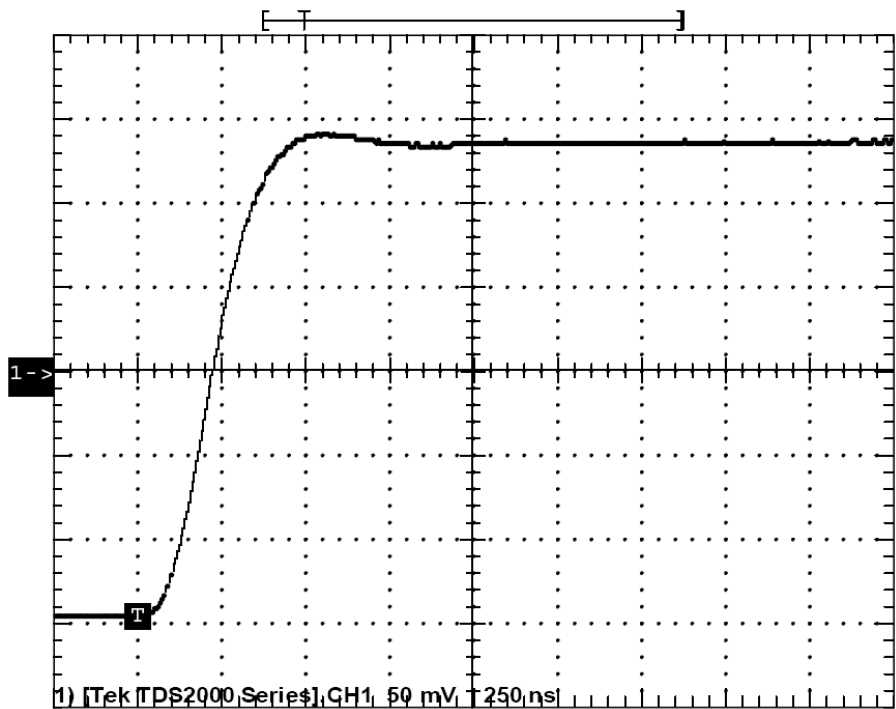

$$\psi(f_C) = 73.7^\circ$$

Small-Signal Step Response

$R_F = 66.5\Omega$ and $C_F = 1,500\text{pF}$

Minimum Acquisition Time and OpAmp's GBW

1) Find Unity Gain Bandwidth

$$f_U = GBW$$

2) Calculate frequency of added zero

$$f_{ZX} = \frac{1}{4} f_U$$

3) Determine minimum time-constant

$$\tau = \frac{1}{2\pi \cdot f_{ZX}}$$

4) Calculate time-constant multiplier

$$k = \ln\left(\frac{1}{a+1} \cdot 2^{N+1}\right) \quad a = \frac{C_F}{C_{SH}}$$

5) Find minimum acquisition time

$$t_{AQ} \geq k \cdot \tau$$

Minimum Acquisition Time for Some OpAmp's

		GBW (MHz)	f _z (MHz)	τ (ns)	12 Bit t _{AQ} (ns)	16 Bit t _{AQ} (ns)
INA155	Medium Speed, Precision INA	0.55	0.14	1,157	5,672	8,881
INA128	High Precision, 120dB CMRR	1.3	0.33	490	2,400	3,757
INA331	High Bandwidth, Single Supply	5.0	1.25	127	624	977

OPA358	CMOS, 3V Operation, SC70	80.0	20.00	8	39	61

After selecting ADC and Op Amp

1) Determine C_F

$$20 \cdot C_{SH} \leq C_F \leq 60 \cdot C_{SH}$$

2) Calculate “a”

$$a = \frac{C_F}{C_{SH}}$$

3) Calculate time-constant multiplier

$$k = \ln\left(\frac{1}{a+1} \cdot 2^{N+1}\right)$$

4) Calculate frequency of added zero

$$f_{ZX} = \frac{t_{AQ}}{k}$$

5) Verify frequency of added zero

$$f_{ZX} \leq \frac{1}{4} f_U$$

After selecting ADC and OpAmp

1) Calculate R_F

$$R_F = \frac{1}{2\pi \cdot C_F \cdot f_{ZX}}$$

2) Verify value R_F

$$R_F \geq \frac{R_O}{9}$$

3) Calculate frequency of added pole

$$f_{PX} = \frac{1}{2\pi \cdot (R_F + R_O) \cdot C_F}$$

4) Keep added pole and zero
less then decade a part

$$f_{PX} \geq \frac{1}{10} f_{ZX}$$

5) Verify gain of added zero

$$+6dB \leq G_{ZX} = -20 \cdot \log \left[\frac{f_{PX}}{f_U} \right] - 40 \cdot \log \left[\frac{f_{ZX}}{f_{PX}} \right]$$
