DISPC	DISPC_RST	DISPSS_RST	PRCM/DSS	Hardware reset is coming from PRCM, or via a software reset performed at DSS level. For the tree reset description, see Section 10.1.2.2, DSS Resets .

NOTE: If video mode is used, the VPn_PCLK and VPn_CLK clocks must be generated using a CLKIN4DDR clock.

Table 10-24. Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
DISPC	DSS_DISPC_IRQ	MM_IRQ_	Cortex-M3	Display controller interrupt. For information about Cortex-M3 interrupt control, see Chapter 7 .
	DSS_DISPC_IRQ	D_IRQ_58	DSP	Display controller interrupt. For information about DSP interrupt control, see Chapter 5 .
	DSS_DISPC_IRQ	MA_IRQ_25	Cortex-A9	Display controller interrupt. For information about Cortex-A9 interrupt control, see Chapter 4 .

Table 10-24. Hardware Requests (continued)

DMA Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
DISPC	DSS_DISPC_DMA	S_DMA_5	System DMA	The line trigger signal informs the sDMA that a programmable number of lines are output to the LCD, and that the system memory can be updated. For more details, see Section 10.2.4.5, sDMA Requests .

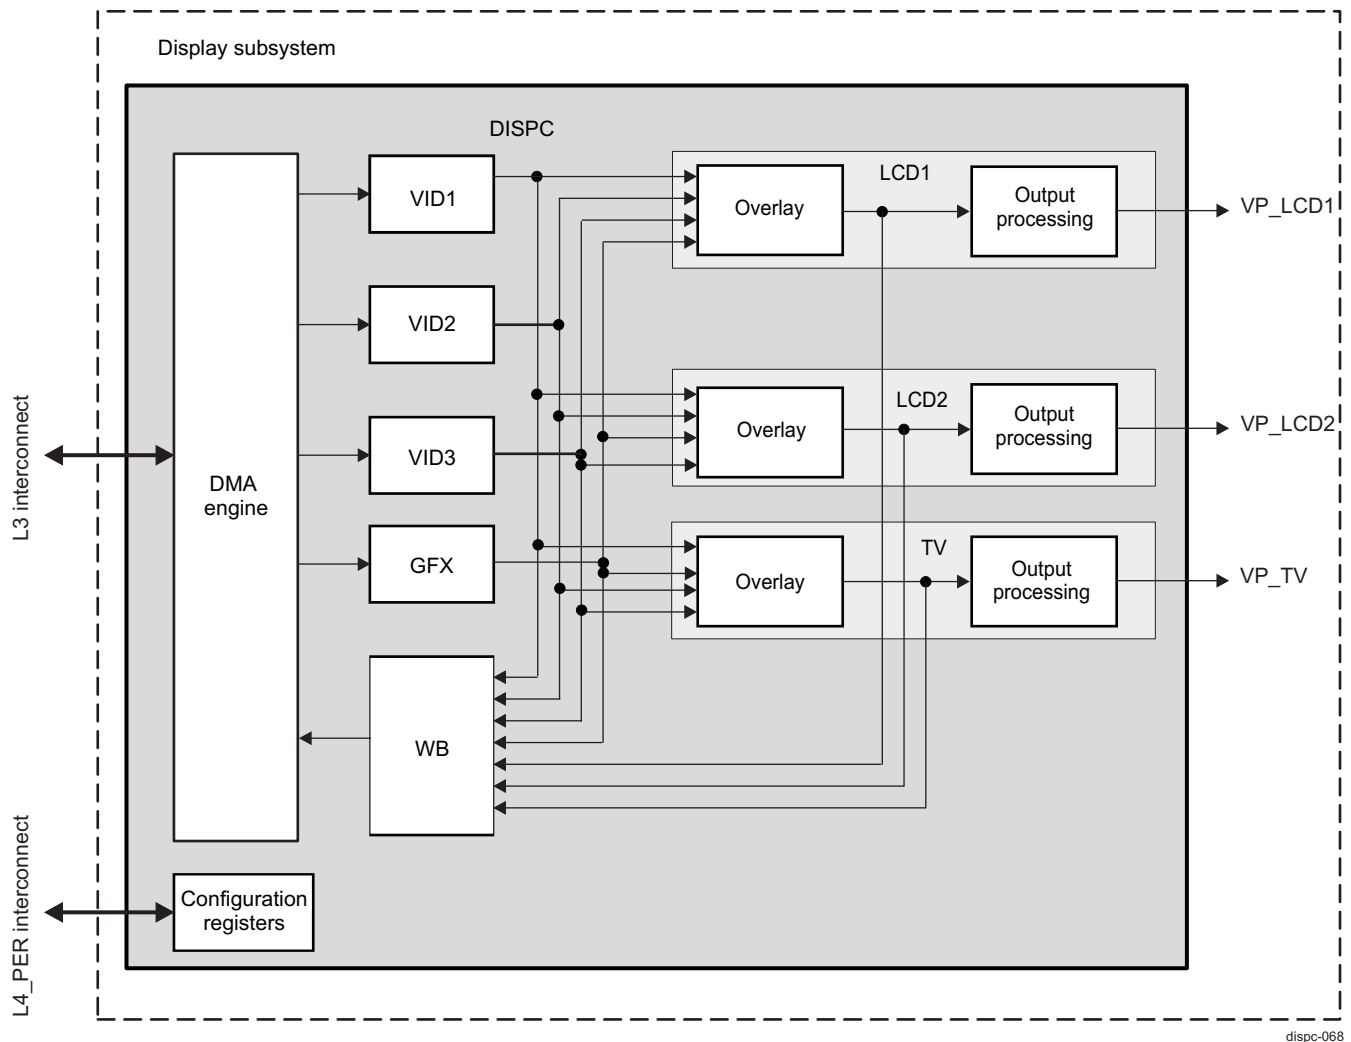

NOTE:

- For a description of interrupt sources, see [Section 10.2.4.4, Interrupt Requests](#).
- For a description of DMA sources, see [Section 10.2.4.5, sDMA Requests](#).

10.2.4 Display Controller Functional Description

The DISPC can read and display the encoded pixel data stored in memory (see [Figure 10-37](#)).

Figure 10-37. DISPC Architecture Overview

The DISPC can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into system memory.

Several processes can be configured to manage the graphics pipeline (palette, antiflicker) and video pipelines (VC-1, color space conversion, scaling, overlay, and transparency ...).

The data coming out of a pipeline is sent to one of the three outputs depending on user configuration. An overlay manager manages inputs of multiple pipelines. Timings user configuration for LCD and TV are available.

The DISPC allows capturing of one output of the pipeline or overlay manager to redirect it into the WB pipeline. It allows to take benefit of the hardware processing available inside the DISPC like color space conversion, rescaling, compositing, etc., to perform memory-to-memory transfer with data processing.

10.2.4.1 Clock Configuration

The PCLK frequency for each LCD output is derived from a dedicated input clock: LCD1_CLK and LCD2_CLK for the primary and secondary LCD outputs, respectively. Each input clock is divided by the values of the [DISPC_DIVISORo\[23:16\]](#) LCD bit field and then the [DISPC_DIVISORo\[7:0\]](#) PCD bit field independently for each LCD pixel clock (see [Figure 10-38](#)). LCD1_PCLK and LCD2_PCLK are independent.

$$\text{LCD1_PCLK} = (\text{LCD1_CLK} / \text{LCD1}) / \text{PCD1}$$

$$\text{LCD2_PCLK} = (\text{LCD2_CLK} / \text{LCD2}) / \text{PCD2}$$

The functional clock of the DISPC (DISPC_CORE_CLK) is derived from DISPC_FCLK by an independent divisor. The dividing value is set in the [DISPC_DIVISOR\[23:16\]](#) LCD bit field.

NOTE: DISPC_CORE_CLK must be higher than or equal to the LCD1_PCLK, LCD2_PCLK, and TV_CLK clocks.

For more information about the DISPC clocks and frequency ratings, see [Section 10.1.2.1, DSS Clocks](#).

For backward compatibility, the divisor value LCD can be set to the value of LCD1. To enable this functionality, the [DISPC_DIVISOR\[0\]](#) ENABLE bit must be set to 1.

Figure 10-38. DISPC Clock Tree Overview

10.2.4.2 Software Reset

To perform a software reset on the DISPC, set the [DISPC_SYSCONFIG\[1\]](#) SOFTRESET bit to 0x1. The [DISPC_SYSSTATUS\[0\]](#) RESETDONE bit indicates that the software reset is complete when its value is 0x1. When the software reset completes, the [DISPC_SYSCONFIG\[1\]](#) SOFTRESET bit is automatically reset. Software must ensure that the software reset completes before doing DISPC operations.

10.2.4.3 Power Management

The DISPC supports the MStandby/Wait, IdleReq/SidleAck, and wake-up protocols as defined in PRCM chapter.

10.2.4.3.1 Idle Mode

The DISPC supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the [DISPC_SYSCONFIG\[4:3\]](#) SIDLEMODE bit field.

Condition of assertion of SIdleAck signal:

- In no-idle mode: In this mode, SIdleAck is never asserted.
- In force-idle mode: In this mode, SIdleAck is asserted unconditionally with a 1-configuration port interface clock cycle delay with respect to IdleReq assertion.

NOTE: A proper use of force-idle mode assumes that no interrupt need to be generated.

- In smart-idle mode: In this mode, SIdleAck is asserted when all at least the following conditions are satisfied:
 - No interrupt is pending.
 - The DISPC no longer uses the interface clock for the slave port.

Once SIdleAck is asserted:

- The DISPC interface lock used by the slave port may be shut down at any time.
- Any transactions on the configuration port (L4_PER interconnect) are ignored.

The condition of deassertion of SIdleAck signal are:

- In force-idle mode: In this mode, SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to IdleReq deassertion.
- In smart-idle mode: In this mode, SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to IdleReq deassertion.

Once SIdleAck is released, the DISPC is fully operational and a DMA request can be processed normally.

10.2.4.3.2 StandBy Mode

The DISPC supports the no-standby mode, the force-standby mode and a single smart-standby mode. The mode is set in MIDLEMODE field [DISPC_SYSCONFIG\[13:12\]](#). The functional clock is always active if the module is enabled. The L3 clock can be shut down at any time independently of the status of MStandby.

The condition of assertion of MStandby signal are:

- In no-standby mode: In this mode, MStandby is never asserted.
- In force-standby mode: In this mode, MStandby is asserted when the module is disabled.
- In smart-standby: In the case of one of the following conditions:
 - GFX pipeline is disabled, or GFX pipeline is enabled but the data fetch is completed for GFX window, or GFX pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
 - VID1 pipeline is disabled, or VID1 pipeline is enabled but the data fetch is completed for VID1 window, or VID1 pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
 - VID2 pipeline is disabled, or VID2 pipeline is enabled but the data fetch is completed for VID2 window, or VID2 pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
 - VID3 pipeline is disabled, or VID3 pipeline is enabled but the data fetch is completed for VID3 window, or VID3 pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
 - WB pipeline is disabled, or WB pipeline is enabled but the data store to memory is completed for WB picture, or WB pipeline is enabled and the data storage did not complete but data in the DMA buffer is lower than low threshold value.

MStandby signal asserts whenever all five events have occurred or the DISPC is disabled. While the MStandby is asserted, the DISPC does not generate any transaction on the L3 master port.

The condition of deassertion of the MStandby signal are:

- In force-standby mode: In this mode, MStandby is deasserted only when the DISPC is enabled.
- In smart-standby mode: In the case of one of the following conditions:
 - GFX pipeline is enabled and the data fetch did not complete for GFX window and the data in the DMA buffer is less than low threshold value.
 - VID1 pipeline is enabled and the data fetch did not complete for VID1 window and the data in the DMA buffer is less than low threshold value.
 - VID2 pipeline is enabled and the data fetch did not complete for VID2 window and the data in the DMA buffer is less than low threshold value.
 - VID3 pipeline is enabled and the data fetch did not complete for VID3 window and the data in the DMA buffer is less than low threshold value.
 - WB pipeline is enabled and the data store did not complete for WB picture and the data in the DMA buffer more than high threshold value.

Detection of the deassertion conditions assumes that the interface clocks are active.

10.2.4.3.3 Wakeup

The DISPC supports wake-up signaling. The mode can be selected by programming the appropriate value in the [DISPC_SYSCONFIG](#)[2] ENAWAKEUP bit. The SWakeup signal is asynchronous so it does not require the interface clock.

The conditions of assertion of the SWakeup signal are:

- GFX pipeline is enabled and the data fetch did not complete for the GFX window and the data in DMA buffer are less than low threshold value.
- VID1 pipeline is enabled and the data fetch did not complete for the VID1 window and the data in DMA buffer are less than low threshold value.
- VID2 pipeline is enabled and the data fetch did not complete for the VID2 window and the data in DMA buffer are less than low threshold value.
- VID3 pipeline is enabled and the data fetch did not complete for the VID3 window and the data in DMA buffer are less than low threshold value.
- WB pipeline is enabled and the data in DMA buffer are more than high threshold value.
- The last pixel displayed into LCD1 panel if it is not the last frame
- The last pixel displayed into LCD2 panel if it is not the last frame
- The last pixel displayed into TV panel if it is not the last frame

SWakeup signal is asserted whenever any one of eight events occurs and IdleAck is asserted.

When one of the active pipelines reaches the low threshold and must refill its DMA buffer for the current frame, all other pipelines refill their own DMA buffer even if their low threshold has not been reached. The [DISPC_CONFIG](#)[17] BUFFERFILLING bit field is used to increase the probability that the time increases, where there is no access to the L3 interconnect.

The condition of deassertion of SWakeup signal is:

- Immediately after deassertion of IdleReq

10.2.4.4 Interrupt Requests

[Table 10-25](#) details the interrupts generated for the DISPC.

The interrupt line, DSS_DISPC_IRQ, indicates when one or more events are detected by the hardware. Each event is independently maskable by setting the [DISPC_IRQENABLE](#) register.

To check when a particular interrupt event occurs and to reset a particular event, the [DISPC_IRQSTATUS](#) register must be accessed. This register regroups all the status of the module internal events that generate an interrupt (read 0: No interrupt occurred; read 1: Interrupt occurred; write 1: Status bit reset). See *Display Subsystem Register Manual*, for more information on checking and clearing interrupt events.

[Table 10-25](#) lists the DISPC interrupt events.

Table 10-25. DISPC Interrupts

Interrupt Name	Description
FRAMEDONE1_IRQ	Frame Done for LCD1 output: Active frame related to the LCD1 has completed and LCD1 output of the DISPC is disabled.
FRAMEDONE2_IRQ	Frame Done for LCD2 output: Active frame related to the LCD2 has completed and LCD2 output of the DISPC is disabled.
FRAMEDONETV_IRQ	Frame Done for TV output: Active frame related to the TV output has completed and TV output of the DISPC is disabled.
FRAMEDONEWB_IRQ	Frame Done for WB output: Active frame related to the WB has completed. First, it is used when the WB channel is connected to one of the pipelines to determine when the memory-to-memory transfer through DISPC is completed. Second, it is used when the WB channel is connected to one of the overlay output in nonreal-time mode to determine when the memory-to-memory transfer with overlay processing is completed.
VSYN1_IRQ	VSYN for primary LCD output: VSYN interrupt for the primary LCD has occurred at the end of the frame.
VSYN2_IRQ	VSYN for secondary LCD output: VSYN interrupt for the secondary LCD has occurred at the end of the frame.
EVSYN1_EVEN_IRQ	VSYN for even field: EVSYN1_EVEN interrupt has occurred at the end of the frame (EVSYN1 received and the field polarity is even) (VENC/HDMI)
EVSYN1_ODD_IRQ	VSYN for odd field: EVSYN1_ODD interrupt has occurred at the end of the frame (EVSYN1 received and the field polarity is odd) (VENC/HDMI)
ACBIASCOUNTSTATUS1_IRQ	AC Bias Count Status for LCD1 output: AC Bias transition counter has decremented to 0.
ACBIASCOUNTSTATUS2_IRQ	AC Bias Count Status for LCD2 output: AC Bias transition counter has decremented to 0
PROGRAMMEDLINENUMBER_IRQ	Programmed Line Number: The primary LCD has reached the user programmed line number.
VID1ENDWINDOW_IRQ	End of the VID1 window: The DMA engine has fetched all the data from memory for the VID1 for the current frame.
VID2ENDWINDOW_IRQ	End of the VID2 window: The DMA engine has fetched all the data from memory for the VID2 for the current frame.
VID3ENDWINDOW_IRQ	End of the VID3 window: The DMA engine has fetched all the data from memory for the VID3 for the current frame.
GFXENDWINDOW_IRQ	End of the graphics window: The DMA engine has fetched all the data from memory for the graphics for the current frame.
VID1BUFFERUNDERFLOW_IRQ	VID1 DMA buffer underflow: The input VID1 DMA buffer goes underflow.
VID2BUFFERUNDERFLOW_IRQ	VID2 DMA buffer underflow: The input VID2 DMA buffer goes underflow.
VID3BUFFERUNDERFLOW_IRQ	VID3 DMA buffer underflow: The input VID3 DMA buffer goes underflow.
WBUFFEROVERFLOW_IRQ	WB DMA buffer overflow: The output WB DMA buffer goes overflow. It cannot occur when WB channel is used in memory-to-memory transfer mode but only in capture mode. In capture mode the timings are defined by the timer associated with the output. In memory-to-memory mode, there is timing constraint.
GFXBUFFERUNDERFLOW_IRQ	GFX DMA buffer underflow: The input Graphics DMA buffer goes underflow.
PALETTEGAMMALOADING_IRQ	Palette/Gamma Table Loading: The palette/Gamma table in the graphics pipeline has been loaded using the DISPC DMA engine.
WBUNCOMPLETEERROR_IRQ	The write back buffer has been flushed before been fully drained. In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that, and will trigger every frame.

Table 10-25. DISPC Interrupts (continued)

Interrupt Name	Description
OCPELLOW_IRQ	OCP Error: L3 interconnect has sent SResp = ERR
SYNCLAST1_IRQ	Synchronization Lost on LCD1 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLAST2_IRQ	Synchronization Lost on LCD2 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output).
SYNCLASTTV_IRQ	Synchronization Lost on TV output: Occurs when porches are not wide enough to load the pipelines with data (TV output connected to the video NTSC/PAL encoder or HDMI).
WAKEUP_IRQ	Wakeup: Occurs when the SWakeup signal is asserted.

10.2.4.5 sDMA Requests

The DMA synchronization line, DSS_DISPC_DMA, is connected to the sDMA. This DMA request is not a classical one but rather a synchronization signal between the DISPC and sDMA. The sDMA is informed that a programmable number of lines are output to the LCD, and that a system memory can be updated. This request is related to the interrupt event PROGRAMMEDLINENUMBER_IRQ described in [Table 10-25](#). This allows the sDMA channel to be synchronized with the display subsystem internal DMA controller.

In other words, it allows to synchronize a memory-to-memory frame buffer update based on the scan line of the frame buffer in system memory (SDRAM or SRAM) by the DISPC. The DSS_DISPC_DMA DMA request is generated at a programmable line number defined in the [DISPC_LINE_NUMBER\[10:0\]](#) LINENUMBER bit field. This process allows an application to use a single frame buffer and update it after a certain number of lines has been read by the DISPC.

10.2.4.6 DMA Engine

The DMA engine:

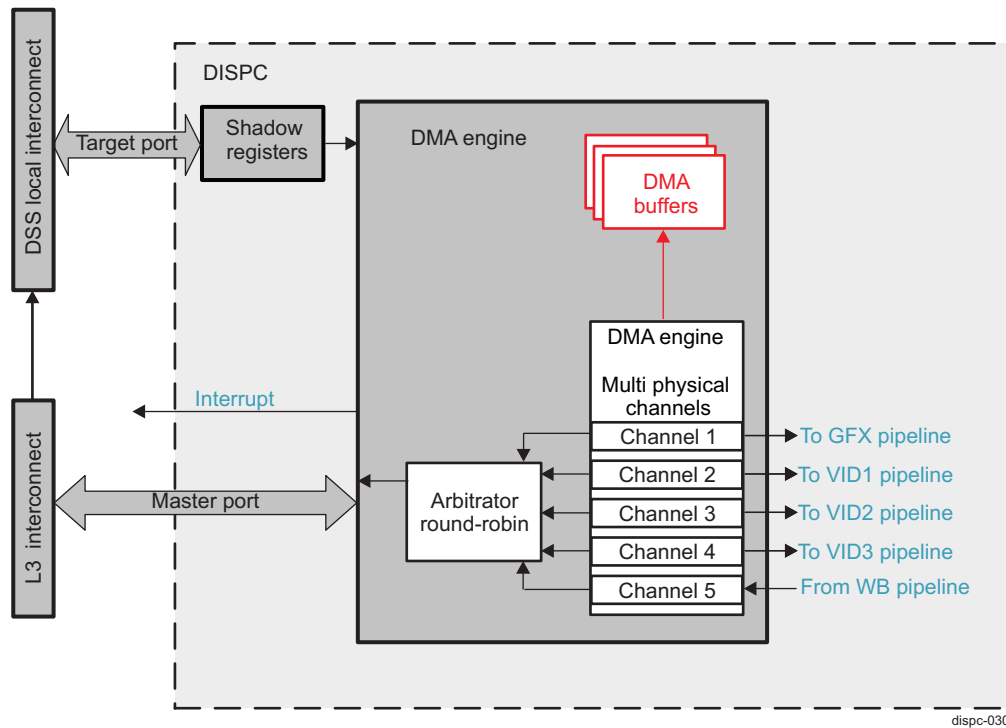

- Supplies data (encoded pixel data, palette, and gamma curve) from memories to GFX, VID1, VID2, and VID3 pipelines through the interconnect based on the configuration of the DISPC and pipelines settings.
- Stores (encoded pixel data) from GFX/VID pipelines or overlays to memories through the WB pipeline and interconnect based on the configuration of the DISPC and WB pipeline settings.

Each pipeline has a dedicated buffer and a channel with independent settings. The default size and allocation of the DMA buffer is detailed in [Table 10-26](#). Each DMA buffer is divided into two spaces, top and bottom buffer. Depending on the application, a DMA buffer space can be associated to a pipeline or merged with other spaces. The total number of spaces for each individual pipeline is from 0 (pipeline inactive) to number of pipelines x2 (in that case, all the DMA buffers are associated to a single pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum number of spaces available. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum number of spaces required to support the throughput and the system latency. The space assignment are done in the [DISPC_GLOBAL_BUFFER](#) register.

[Figure 10-39](#) shows an overview of the DMA engine.

Table 10-26. DMA Buffer Size

Pipelines	DMA Buffer Size
GFX	2 lines x 640 x 128 bits
VID1	2 lines x 1024 x 128 bits
VID2	2 lines x 1024 x 128 bits
VID3	2 lines x 1024 x 128 bits
WB	2 lines x 1024 x 128 bits

Figure 10-39. DMA Engine Overview**10.2.4.6.1 Addressing and Bursts**

For each line to be fetched/stored, the DMA engine:

- Calculates the pixel address.
- Aligns the address.
- Defines the burst structure:
 - Type of the burst (1D or 2D burst structure).
 - Length of the burst.

The DMA engine generates scan addresses to read/write data from/to system memory. The base address defines the start address of the first pixel, then the address is incremented based on the number of pixels per line, offset between two consecutive lines and number of lines. The byte address of each pixel in the frame buffer in the system memory is determined by:

$$\text{Pixel address} = \text{Base address} + x \times \text{bpp} + (y \times ((\text{width} \times \text{bpp}) + \text{increment}))$$

where:

- Base address corresponds to the base address (for YUV–NV12 format) defined by:
 - DISPC_GFX_BA_0[31:0], BA bit field
 - DISPC_GFX_BA_1[31:0], BA bit field
 - DISPC_VIDp_BA_0[31:0], BA bit field
 - DISPC_VIDp_BA_1[31:0], BA bit field
 - DISPC_VIDp_BA_UV_0[31:0], BA bit field
 - DISPC_VIDp_BA_UV_1[31:0], BA bit field
- bpp corresponds to the number of bits per pixel defined by the [DISPC_GFX_ATTRIBUTES\[4:1\] FORMAT](#) bit field or [DISPC_VIDp_ATTRIBUTES\[4:1\] FORMAT](#) bit field.
- width corresponds to the number of pixels per line defined by [DISPC_GFX_SIZE\[10:0\] SIZE+1](#) bit field or [DISPC_VIDp_SIZE\[10:0\] SIZE+1](#) bit field.
- increment corresponds to the number of bytes to skip between two contiguous lines defined by

[DISPC_GFX_ROW_INC](#)[31:0] ROWINC –1 bit field or [DISPC_VIDp_ROW_INC](#)[31:0] ROWINC –1 bit field.

- x corresponds to the pixel position on the x-axis.
- y corresponds to the pixel position on the y-axis.

NOTE: For YUV format, the pixel values are defined in two separated buffers (Y and UV). The Y buffers base address are defined in the [DISPC_VIDp_BA_j](#)[31:0] BA bit field. The UV buffers base address are defined in the [DISPC_VIDp_BA_UV_j](#)[31:0] BA bit field.

Table 10-27 resumes the registers settings for a simple access of a picture in system memory.

Table 10-27. Register Settings for Accessing Image in Internal Memory

Registers	Value
DISPC_GFX_BA_j / DISPC_VIDp_BA_j / DISPC_WB_BA_j	PBA, the physical base address of image in the memory
DISPC_VIDp_BA_UV_j / DISPC_WB_BA_UV_j	PBA, the physical base address of UV buffers image in the memory
DISPC_GFX_PIXEL_INC / DISPC_VIDp_PIXEL_INC / DISPC_WB_PIXEL_INC	1 or other in pixel incremental value
DISPC_GFX_ROW_INC / DISPC_VIDp_ROW_INC / DISPC_WB_ROW_INC	1 or other in row incremental value

An interconnect request, 128-bits, corresponds to one or several pixels depending on bits per pixels. Therefore, the DMA engine determines the appropriate burst sequence to optimize each new line fetching/storing. The DMA engine must prevent a single burst from crossing two lines. The DMA engine supports bursts of 2 × 128 bits, 4 × 128 bits, and 8 × 128 bits. The default burst size at reset time is 8 × 128 bits. The maximum burst size can be configured for each pipeline by setting the [DISPC_GFX_ATTRIBUTES](#)[7:6] BURSTSIZE bit field or [DISPC_VIDp_ATTRIBUTES](#)[15:14] BURSTSIZE bit field. Because the burst size must be aligned to the burst boundary, in case of misalignment, the DMA engine may issue single and/or smaller burst requests. Two types of burst are present:

- 1D-burst is used if the fetch/storage is linear in memory through the TILER. There is no rotation of the frame buffer. The frame buffer is not tiled.
- 2D-burst is used if the frame buffer is tiled.

Even if the [DISPC_VIDp_ROW_INC](#) does not equal 1, the 2D-burst can be selected by the user. It is used when the DISPC is configured to read one field of a frame by accessing only the even and odd lines.

NOTE: The burst size is initialized once at configuration and can be changed when the DISPC is disabled.

10.2.4.6.2 DMA Buffers

10.2.4.6.2.1 READ DMA Buffers (GFX and VID Pipelines)

When the vertical front porch (VFP) period starts after the last horizontal front porch (HFP) of the last line or the external VSYNC is received, the DMA buffers are flushed according to the selected output associated with the pipeline. The DMA engine restarts fetching data from the memory through the L3 Interconnect. Enabling/disabling the DISPC flushes the DMA buffers (except WB DMA buffers).

Programmable high and low thresholds, independent for each DMA buffer, are used by the DMA engine to start and stop requesting data to the L3 interconnect.

- When low threshold (set in the [DISPC_GFX_BUF_THRESHOLD](#)[15:0] BUFLOWTHRESHOLD bit field or [DISPC_VIDp_BUF_THRESHOLD](#)[15:0] BUFLOWTHRESHOLD bit field) is reached, the DMA engine starts a request on the L3 interconnect to fill the DMA buffer.
- When high threshold (set in the [DISPC_GFX_BUF_THRESHOLD](#)[31:16] BUFHIGHTHRESHOLD bit field or [DISPC_VIDp_BUF_THRESHOLD](#)[31:16] BUFHIGHTHRESHOLD bit field) is reached, the DMA engine stops requesting encoded pixels.

To avoid underflow at the beginning of a frame and have sufficient encoded pixel data to start some processing, a preloading of the DMA buffer is configurable between a fixed value of bytes or the high threshold value. The preload ensures a minimum number of pixels present in the buffer. When the preload value is reached, the associated channel must start pulling pixels out of the DMA buffer. To enable the preload based on the value entered in the [DISPC_GFX_PRELOAD](#)[11:0] PRELOAD bit field or [DISPC_VIDp_PRELOAD](#)[11:0] PRELOAD bit field, the [DISPC_GFX_BUF_THRESHOLD](#)[11]BUFPRELOAD bit, or [DISPC_VIDp_BUF_THRESHOLD](#)[19]BUFPRELOAD bit must be set to 0x0.

NOTE: When self-refresh mode is selected, meaning the data in the DMA buffers are used for multiple frames, and at the end of each frame, the DMA buffers are not flushed.

10.2.4.6.2.2 WRITE DMA Buffer (WB Pipeline)

Two modes are supported by the WB channel, selectable through the [DISPC_WB_ATTRIBUTES](#)[19]WRITEBACKMODE bit:

- Capture mode, WRITEBACKMODE bit set to 0: One of the overlay outputs going to LCD or TV outputs is captured and at the same time the data are sent on the output. The WB timings are controlled by the LCD or TV timings.
- Memory-to-memory mode, WRITEBACKMODE bit set to 1: One of the overlay outputs or one of the pipelines is captured in order to perform memory-to-memory transfer with some processing by the DISPC (rescaling, overlaying, color space conversion, etc.)

In capture mode: The WB DMA buffers are flushed when the VFP period starts after the HFP following the last line, or when the external VSYNC is received, depending on which output (LCD/TV) the WB pipeline is capturing data, if the programmed value in [DISPC_WB_ATTRIBUTES2](#)[7:0]WBDELAYCOUNT bit field is set to 0. If the programmed value in [DISPC_WB_ATTRIBUTES2](#)[7:0]WBDELAYCOUNT bit field is set to N (1:255), the write buffers DMA are flushed N lines later. The DMA engine starts storing data to memory through the L3-based interconnect as soon as enough data is available for the programmed burst size. When enabling/disabling the DISPC, the DMA buffers are flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3 interconnect.

NOTE: If [DISPC_WB_ATTRIBUTES2](#)[7:0]WBDELAYCOUNT bit field is set to 0, the WB is reinitialized just at the end of the last line of a frame at the beginning of the VFP signal. To let the WB complete the data write to the external memory, the highest possible value compatible with the vertical blanking period must be set.

NOTE: In WB capture mode, if a new frame starts before the contents of the WB DMA buffers are fully written onto external memory, then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). The [DISPC_IRQSTATUS](#)[26]WBUNCOMPLETEERROR_IRQ interrupt bit indicates this situation and will trigger every frame. The WBUNCOMPLETEERROR interrupt can be enabled through the [DISPC_IRQENABLE](#)[26]WBUNCOMPLETEERROR_EN bit. Software can avoid this by delaying the flush of WB DMA buffers through proper programming of the [DISPC_WB_ATTRIBUTES2](#)[7:0]WBDELAYCOUNT bit field.

In memory-to-memory mode: The WB pipeline is not synchronized to any internal or external timing generator. The WB pipeline stores the output of one of the overlay outputs or one of the pipelines. When enabling/disabling the DISPC, the DMA buffers are flushed. The programmable thresholds low and high are used by the DMA engine to start and stop sending data to the L3 interconnect.

Programmable high and low thresholds are used by the DMA engine to start and stop sending data to the L3 interconnect.

- When high threshold (set in the [DISPC_WB_BUF_THRESHOLD](#)[31:16]BUFHIGHTHRESHOLD bit field) is reached, the DMA engines start sending data on the L3 interconnect to empty buffer.
- When low threshold (set in the [DISPC_WB_BUF_THRESHOLD](#)[15:0]BUFLOWTHRESHOLD bit field)

is reached, the DMA engine stops sending encoded pixels.

At the end of the frame, in order to drain the DMA buffer, some smaller bursts (even single requests) must be issued to completely empty the DMA buffer. To limit the number of interconnect requests from the DISPC, a number of IDLE cycles between requests can be inserted. IDLE cycles can be inserted only when WB is used in memory-to-memory mode. It is ignored when WB is in capture mode.

The number of idle between requests can be activated and determined by :

- Setting the [DISPC_WB_ATTRIBUTES\[27\]](#) IDLESIZE bit to 0x0 (default value) and entering the number of idles between requests in the [DISPC_WB_ATTRIBUTES\[31:28\]](#) IDLENUMBER bit field. Idle numbers vary from 0 to 15.
- Setting the [DISPC_WB_ATTRIBUTES\[27\]](#) IDLESIZE bit to 0x1, which considers the size of the burst (the field [DISPC_WB_ATTRIBUTES\[15:14\]](#) BURSTSIZE bit field) to determine the number of idles.
 - If BURSTSIZE = 0x0, then idle equals IDLENUMBER (0 to 15).
 - If BURSTSIZE = 0x1, then idle equals IDLENUMBER * 4 (0 to 60).
 - If BURSTSIZE = 0x2, then idle equals IDLENUMBER * 8 (0 to 120).

10.2.4.6.3 Predecimation

The predecimation process consists of downscaling an image by fetching only the necessary pixels in the memory. Vertical and horizontal predecimation are possible:

- Vertical predecimation: The picture store in memory can be predecimated vertically by skipping lines. Burst mode is used to fetch the data when skipping lines. Only the lines that will be used by the DISPC are fetched from memory; the other lines are skipped. The DMA engine sends requests only for the useful lines using 1D burst or 2D burst, depending on the setting. The base address indicates the first valid pixel to fetch from memory. The number of lines to skip is set in the [DISPC_GFX_ROW_INC\[31:0\]](#) ROWINC bit field or [DISPC_VIDp_ROW_INC\[31:0\]](#) ROWINC bit field.

NOTE: When 2D burst mode is used, the access to data in memory is performed through the TILER module of DMM (see [Section 15.2.3.6, TILER](#), for more details), and as a result a maximum of one line can be skipped.

- Horizontal predecimation: When fetching data from memory, it is possible to skip 1 out of 2 pixel data containers, up to 1 out of 16 pixel data containers, by setting the [DISPC_GFX_PIXEL_INC\[7:0\]](#) PIXELINC bit field or [DISPC_VIDp_PIXEL_INC\[7:0\]](#) PIXELINC bit field to the number of pixel data containers to skip (n), multiplied by the size of a pixel data container (in bytes), + 1. See the following note for more details.

NOTE: The restriction to horizontal predecimation is that there is at least one useful pixel per 128-bit request. In that case, the DMA engine uses burst mode instead of singles to optimize the requests in terms of latency and SDRAM efficiency.

No decimation is supported when the input format is 1, 2, 4, 8 BITMAP.

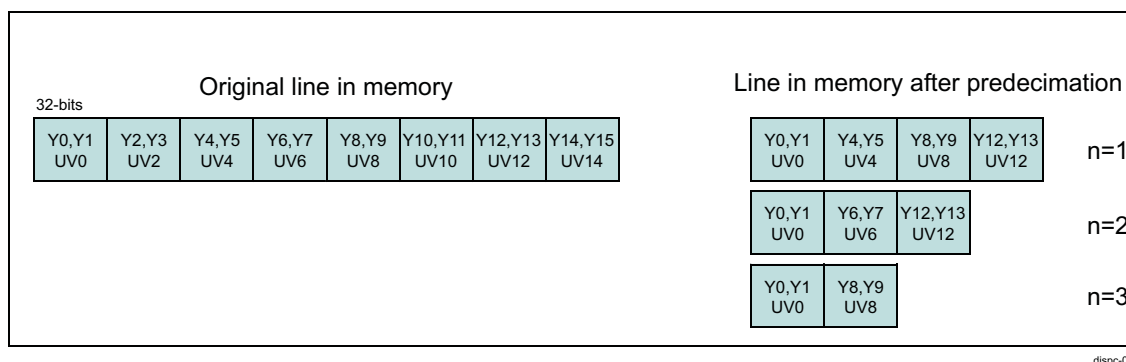

For RGB and YUV4:2:0 data formats, each pixel data container in memory holds 1 pixel. Thus, when configuring the PIXELINC bit field, the value of n equals the number of pixels to skip:

- For RGB format, one pixel data container = 32 bits = 1 pixel
- For YUV format:
 - One Y pixel data container = 8 bits = 1 pixel
 - One UV pixel data container = 16 bits = 1 pixel

For YUV4:2:2 format, each 32-bit pixel data container holds the Luma components for 2 pixels and the Chrominance component of 1 pixel (see the graphic representation in [Figure 10-40](#)). Therefore, for the valid values of the PIXELINC bit field in the following YUV4:2:2 format, caution must be taken, because n does not equal the number of pixels, but instead the number of pixel data containers to skip:

- For n = 1, PIXELINC = 5
- For n = 2, PIXELINC = 9
- For n = 3, PIXELINC = 13
- For n = 4, PIXELINC = 17, etc.

Figure 10-40. YUV4:2:2 Predecimation

10.2.4.6.4 Progressive-to-Interlaced Format Conversion

The DMA engine can be used to perform YUV4:2:0 NV12 progressive-to-interlaced data conversion with 0-degree orientation. This section provides generic approach details.

Two possible configurations are available, depending on the setting of the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit, which defines the stride of each pixel value buffer for the YUV format. The following must be considered for both configurations:

- Bit [31] in the DISPC_VIDn_BA_j and DISPC_VIDn_BA_UV_j[31:0] BA bit fields, and the DISPC_VIDn_ATTRIBUTES[13:12] ROTATION bit field must be set to 0x0 to indicate 0-degree orientation.

Configuration 1 – YUV4:2:0 progressive to interlaced conversion

The DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit is set to 0x1. The CbCr container is twice the size of the Y container. All Luma and Chroma lines for even and odd fields are fetched from memory. The scaler unit of the respective pipeline can be used to downscale by 2 (through filtering) the fetched data to create the interlaced output. For more information about the scaler configuration, see [Section 10.2.4.10.4, Scaler Unit](#).

Configuration 2 – YUV4:2:0 progressive to YUV4:2:2 interlaced conversion

The DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit is set to 0x0. The CbCr container is the same size as the Y container. The DISPC_VIDn_ROW_INC register for the respective pipeline must be configured so that only the Y data is vertically predecimated by 2 (see [Section 10.2.4.6.3, Predecimation](#), for more information). The CbCr data must not be predecimated. As a result, only the even Luma lines for the even field and the odd Luma lines for the odd field are fetched from memory. To create the interlaced output, the Chroma lines are all fetched from memory.

10.2.4.6.5 Arbitration

The requests (reads or writes) sent to the L3 interconnect are pipelined and are arbitrated in a round-robin scheme. The default arbitration scheme must be modified by setting the priority attribute of each pipeline as defined in the [DISPC_GFX_ATTRIBUTES\[14\] ARBITRATION](#) bit, [DISPC_VIDp_ATTRIBUTES\[14\] ARBITRATION](#) bit, or [DISPC_WB_ATTRIBUTES\[14\] ARBITRATION](#) bit.

By default, all pipelines have the same priority (normal), which means all pipelines requests are treated in a round-robin order manner. If one or more pipelines require a higher number of requests going to the L3 interconnect, its priority can be moved up to high priority. In this case, the high-priority pipeline is granted access before any pipeline in normal priority. If more than one active pipeline is in high priority, the behavior is the same as all active pipelines in normal priority. Normal active pipelines are not treated until all high active pipelines are finished. The ARBITRATION bit cannot be modified during the entire frame.

This functionality balances the bandwidth of the pipeline depending on its constraint. It can be used to give higher priority to the pipelines with real-time constraints versus non-real-time pipelines. For example, pipelines associated with the LCD output in stall mode must have lower priority than pipelines associated with TV output.

10.2.4.6.6 DMA Power Modes

10.2.4.6.6.1 Low-Power Mode

Each DMA buffer is divided into two spaces. Each space can be associated with the pipeline or merged with other spaces. The total number of spaces for each individual pipeline is from 0 (pipeline inactive) to the number of pipelines \times 2 (in that case all the DMA buffers are associated with a single pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum available. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum required to support the throughput and the system latency.

NOTE: When the number of spaces is changed, the thresholds must be reprogrammed to reflect the new DMA buffer configuration.

10.2.4.6.6.2 Ultralow-Power Mode

In low-power mode, the L3 interconnect is used to fill up the DMA buffers to store all the data required to display a full frame. The L3 interconnect is not used to fetch the new pixels for the following frames. The data in the DMA buffer are reused to display on the screen.

The setting of the mode is independent for each pipeline. One pipeline may have all the frame pixels in its DMA buffer and the other pipelines may have to refill their respective DMA buffers along the display scan because the frame buffer is too big to be stored in the DMA buffer.

The DMA buffers can be merged to optimize the L3 interconnect off time. Merging the DMA buffers into a single buffer can be used at the same time to improve ultralow-power mode (see [Section 10.2.4.6.6.1, Low-Power Mode](#)).

During the time in which the frames are fetched in the internal DMA buffer, MStandby must be asserted if the [DISPC_SYSCONFIG\[13:12\] MIDDLEMODE](#) bit field is set to 0x2 (smart-standby mode).

Two ultralow power modes can be entered manually or automatically:

- Self-refresh mode: Starting self-refresh mode is done manually by setting the [DISPC_GFX_ATTRIBUTES\[15\] SELFREFRESH](#) bit or [DISPC_VIDp_ATTRIBUTES\[15\]](#)

SELFREFRESH bit to 0x1 after capturing a frame in the DMA buffers. Stopping self-refresh mode is done by setting the SELFREFRESH bit to 0x0.

- Automatic self-refresh mode: By setting the [DISPC_GFX_ATTRIBUTES\[17\]](#) SELFREFRESHAUTO bit or [DISPC_VIDp_ATTRIBUTES\[17\]](#) SELFREFRESHAUTO bit to 0x1, the transition from OFF to ON self-refresh mode is done by hardware after capturing the first frame. The hardware reflects the status of the self-refresh mode by setting the SELFREFRESH bit to 0x1, which means that the data are read inside the DMA buffer without accessing the interconnect and system memory during the frame. Setting the SELFREFRESH bit to 0x0 updates the DMA buffer.

NOTE: The WB pipeline does not support ultralow-power mode.

10.2.4.7 Rotation and Mirroring

The DISPC provides flexible mechanisms for an efficient implementation of rotation using the DISPC, its DMA engine, and the rotation engine of the TILER module. The rotation is handled only through the TILER module, which supplies the encoded pixels to the DISPC.

NOTE: No rotation or mirroring is supported when accessing internal SDRAM directly .

The TILER supports:

- Rotation 0-, 90-, 180-, 270-degree views
- Mirroring
- Any combination of the two previous (for example, Rot-90 + mirroring, etc.)

Figure 10-41. 90-Degree Rotation With Mirroring

When accessing YUV4:2:2 data, each 32-bit value loaded into the DMA buffer can represent either:

- Two consecutive pixels on the same line (for instance, 0-/180-degree rotation)
- Two pixels adjacent vertically (for instance, 90-/270-degree rotation)

The reading from the DMA buffer supports the extraction of the two pixels regardless of the rotation. When the pixels are not consecutive on the same line (90-/270-degree rotation), the chrominance sample of the first pixel of each 32-bit value is duplicated for the second pixel in the same 32-bit value.

The rotation flag [DISPC_VIDn_ATTRIBUTES\[13:12\]](#) ROTATION and the [DISPC_VIDn_ATTRIBUTES\[4:1\]](#) FORMAT bit fields define the processing to extract the pixels from YUV4:2:2 32-bit values. Software must ensure that the settings of the ROTATION and FORMAT bit fields are coherent with the rotation/mirroring defined through the address format in the TILER-specific address map. For more information, see [Section 15.2.3.6.2, TILER Macro-Architecture](#), in [Section 15.2, Dynamic Memory Manager](#).

[Table 10-28](#) describes the register settings of the DISPC when accessing, rotating, and mirroring an image using the TILER. A physical base address (PBA) for each rotation is determined and set as the buffer address (BA). The row incremental is determined and set in ROW_INC. The value of the pixel increment, PIXEL_INC, is set to 0x1 (contiguous pixels).

Table 10-28. Register Settings for Rotation Using TILER

Rotation	Registers	Rotation With and Without Mirroring
0 degree	DISPC_GFX_BA_j / DISPC_VIDp_BA_j / DISPC_WB_BA_j DISPC_GFX_PIXEL_INC / DISPC_VIDp_PIXEL_INC / DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC / DISPC_VIDp_ROW_INC / DISPC_WB_ROW_INC	PBA0 1 to 16 ROW0
90 degrees	DISPC_GFX_BA_j / DISPC_VIDp_BA_j / DISPC_WB_BA_j DISPC_GFX_PIXEL_INC / DISPC_VIDp_PIXEL_INC / DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC / DISPC_VIDp_ROW_INC / DISPC_WB_ROW_INC	PBA90 1 to 16 ROW90
180 degrees	DISPC_GFX_BA_j / DISPC_VIDp_BA_j / DISPC_WB_BA_j DISPC_GFX_PIXEL_INC / DISPC_VIDp_PIXEL_INC / DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC / DISPC_VIDp_ROW_INC / DISPC_WB_ROW_INC	PBA180 1 to 16 ROW180
270 degrees	DISPC_GFX_BA_j / DISPC_VIDp_BA_j / DISPC_WB_BA_j DISPC_GFX_PIXEL_INC / DISPC_VIDp_PIXEL_INC / DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC / DISPC_VIDp_ROW_INC / DISPC_WB_ROW_INC	PBA270 1 to 16 ROW270

NOTE: For YUV format, in addition to the DISPC_VIDp_BA_j register used for the Y component, the DISPC_VIDp_BA_UV_j register must be set to define the base address of the UV frame buffer in memory.

The PBA rotation is determined by:

- $PBA0 = PBA \mid (\text{mode} \ll 27) \mid (\text{orientation} \ll 29) \mid (1 \ll 32)$
- $PBA90 = PBA \mid (\text{mode} \ll 27) \mid (\text{orientation} \ll 29) \mid (1 \ll 32)$
- $PBA180 = PBA \mid (\text{mode} \ll 27) \mid (\text{orientation} \ll 29) \mid (1 \ll 32)$
- $PBA270 = PBA \mid (\text{mode} \ll 27) \mid (\text{orientation} \ll 29) \mid (1 \ll 32)$

Where PBA is the physical base address of image in the memory.

The ROW rotation is determine by:

- If 8 bits per pixel:
 - ROW0 = 16384: Width of the video picture in memory (in bytes) + 1
 - ROW90 = 8192: Width of the video picture in memory (in bytes) + 1
 - ROW180 = 16384: Width of the video picture in memory (in bytes) + 1
 - ROW270 = 8192: Width of the video picture in memory (in bytes) + 1
- If 16 bits per pixel:
 - ROW0 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW90 = 8192: Width of the video picture in memory (in bytes) + 1
 - ROW180 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW270 = 8192: Width of the video picture in memory (in bytes) + 1
- If 32 bits per pixel:
 - ROW0 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW90 = 16384: Width of the video picture in memory (in bytes) + 1
 - ROW180 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW270 = 16384: Width of the video picture in memory (in bytes) + 1

Table 10-29. Mode Definition

	8-Bit Tiled	16-Bit Tiled	32-Bit Tiled	Page Tiled
Mode	0	1	2	3

Table 10-30. Orientation Definition

Type of Orientation	Value
0-degree view	0x0
180-degree view with mirroring	0x1
0-degree view with mirroring	0x2
180-degree view	0x3
270-degree view with mirroring	0x4
270-degree view	0x5
90-degree view	0x6
90-degree view with mirroring	0x7

NOTE: For YUV4:2:0 progressive pixel format, because the value of the DISPC_VIDp_ROW_INC register is defined for the Y buffer, the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit field must be set to 1 when rotating the picture by 0 and 180 degrees and must be reset to 0 when rotating the picture by 90 and 270 degrees.

For YUV4:2:0 interlaced pixel format, because the value of the DISPC_VIDp_ROW_INC register is defined for the Y buffer, the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit field must be set to 1 when rotating the picture by 0 and 180 degrees. Rotations of 90 and 270 degrees are not supported with this pixel format.

10.2.4.8 Memory Format

The graphic and video pipelines support various types of memory format. [Table 10-31](#) list all supported formats for each pipeline. The nibble mode is enabled by setting the [DISPC_GFX_ATTRIBUTES\[9\]](#) NIBBLEMODE bit to 0x1 and applies only to BITMAP format for the GFX pipeline.

Table 10-31. Memory Formats Supported

Formats	GFX	VID1	VID2	VID3	WB

10.2.4.9 Graphics Pipeline

The graphics pipeline is connected to the GFX FIFO for the input port and to the three overlay managers for the output or WB pipeline. The pixel output is directed to an LCD, TV, or WB path by setting the [DISPC_GFX_ATTRIBUTES\[8\] CHANNELOUT](#) bit and the [DISPC_GFX_ATTRIBUTES\[31:30\] CHANNELOUT2](#) bit field. [Table 10-50](#) resumes the bit field settings to orient a pipeline to an LCD/TV or WB output. The default value directs the GFX pipeline to LCD1. The GFX pipeline can be enabled by setting the [DISPC_GFX_ATTRIBUTES\[0\] ENABLE](#) bit to 0x1.

NOTE: It is not possible to change the direction of the graphics pipeline on the fly. If the graphics pipeline connection needs to be changed to connect to a different overlay manager, then the following steps must be performed:

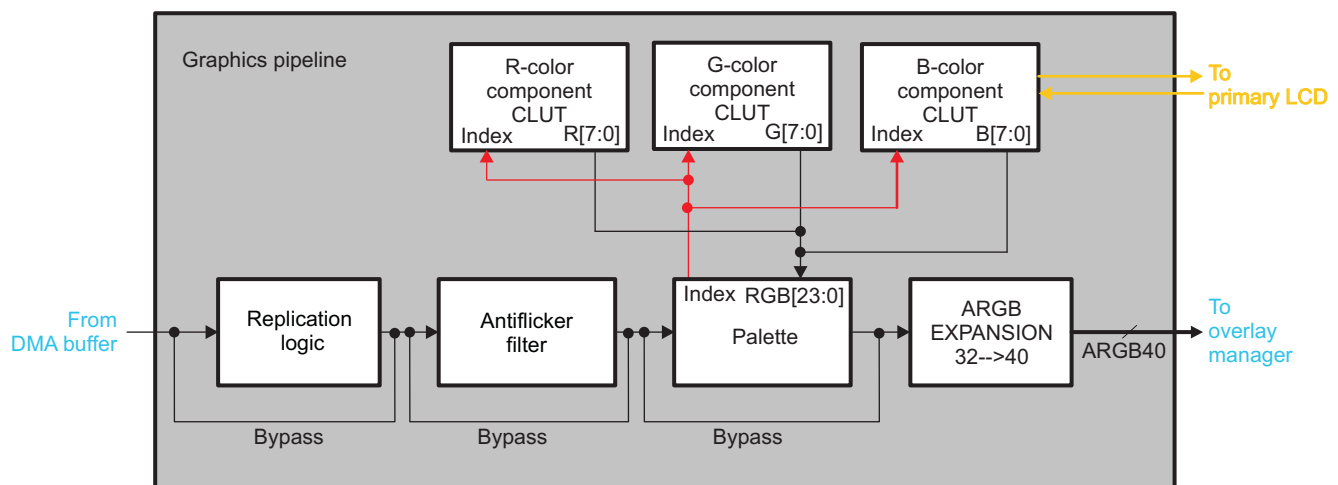

1. Disable the GFX pipeline by setting the [DISPC_GFX_ATTRIBUTES\[0\] ENABLE](#) bit to 0x0.
2. Modify bits [8] CHANNELOUT and [31:30] CHANNELOUT2 in the [DISPC_GFX_ATTRIBUTES](#) register, so that the GFX pipeline is directed to the new required overlay manager.
3. Disable the new overlay manager (the manager which the GFX pipeline will be connected next) by disabling the corresponding DISPC output. This is done by setting the [0] LCDENABLE bit to 0x0 in the [DISPC_CONTROL1](#) register (for LCD1 output) or the [DISPC_CONTROL2](#) register (for LCD2 output), or by setting the [DISPC_CONTROL1\[1\] TVENABLE](#) bit to 0x0 for (TV output).
4. Enable the GFX pipeline by setting the [DISPC_GFX_ATTRIBUTES\[0\] ENABLE](#) bit to 0x1.
5. Enable the new overlay manager (the manager which the GFX pipeline will be connected next) by enabling the corresponding DISPC output. This is done by setting the [0] LCDENABLE bit to 0x1 in the [DISPC_CONTROL1](#) register (for LCD1 output) or the [DISPC_CONTROL2](#) register (for LCD2 output), or by setting the [DISPC_CONTROL1\[1\] TVENABLE](#) bit to 0x1 for (TV output).

The pipeline consists of programmable replication logic, an antiflicker filter, and one 256-entry palette table. The replication logic is used to convert the RGB pixel formats into an ARGB40-based format. The antiflicker filter processes the graphics data in RGB format to remove some of the vertical flicker. The 256-entry palette is used to convert bitmap formats into RGB formats or for gamma corrections when RGB format is inputted.

[Table 10-31](#) lists the input formats supported by the graphics pipeline.

[Figure 10-42](#) shows the graphics pipeline.

Figure 10-42. Graphics Pipeline

dispc-001

10.2.4.9.1 Replication Logic

The replication logic increases the color depth of the graphics-encoded pixels (from true color RGB 12, and 16 to 40 BPP).

- When the replication logic is enabled by setting the [DISPC_GFX_ATTRIBUTES\[5\]](#) REPLICATIONENABLE bit to 0x1, the MSBs are copied to the missing LSB. [Table 10-34](#) describes the remapping of the RGB pixels into ARGB 40-bit values.

Table 10-32. Replication Enabled: RGB Pixel Formats Remapping Into ARGB40-10.10.10.10

Formats	A[9:0]	R[9:0]	G[9:0]	B[9:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB
xRGB12-4444	1111111111	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGBx12-4444	1111111111	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGB16-565	1111111111	R[4:0]R[4:0]	G[5:0]G[5:2]	B[4:0]B[4:0]
xRGB16-1555	1111111111	R[4:0]R[4:0]	G[4:0]G[4:0]	B[4:0]B[4:0]
ARGB16-1555	AAAAAAAAAA	R[4:0]R[4:0]	G[4:0]G[4:0]	B[4:0]B[4:0]
ARGB16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]
RGBA16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]R[3:0]R[3:2]	G[3:0]G[3:0]G[3:2]	B[3:0]B[3:0]B[3:2]

- When the replication logic is disabled by setting the [DISPC_GFX_ATTRIBUTES\[5\]](#) REPLICATIONENABLE bit to 0x0, the encoded pixel values are shifted to the MSB boundary of the 24-bit format. The missing bit values are filled with 0s. [Table 10-35](#) describes the remapping of the RGB pixels into ARGB 40-bit values.

Table 10-33. Replication Disabled: RGB Pixel Formats Remapping Into ARGB40-10.10.10.10

ARGB16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]000000	G[3:0]000000	B[3:0]000000
RGBA16-4444	A[3:0]A[3:0]A[3:2]	R[3:0]000000	G[3:0]000000	B[3:0]000000

10.2.4.9.2 Antiflicker Filter

The antiflicker filter processes the graphics data to remove some of the vertical flicker. It is based on 3-tap FIR filter with fixed coefficients. For each pixel to be output from the graphics pipeline, the pixel above and the pixel below the current line must be read from the DMA graphics FIFO. Therefore, three lines of pixels must be stored in the DMA graphics FIFO.

The antiflickering equations for A, R, G, and B components are:

$$A_{out}(x,y) = 0.25 \cdot A_{in}(x,y-1) + 0.5 \cdot A_{in}(x,y) + 0.25 \cdot A_{in}(x,y+1)$$

$$R_{out}(x,y) = 0.25 \cdot R_{in}(x,y-1) + 0.5 \cdot R_{in}(x,y) + 0.25 \cdot R_{in}(x,y+1)$$

$$G_{out}(x,y) = 0.25 \cdot G_{in}(x,y-1) + 0.5 \cdot G_{in}(x,y) + 0.25 \cdot G_{in}(x,y+1)$$

$$B_{out}(x,y) = 0.25 \cdot B_{in}(x,y-1) + 0.5 \cdot B_{in}(x,y) + 0.25 \cdot B_{in}(x,y+1)$$

For the first line of processing, because there is no pixel above, the value (x, y) is duplicated.

$$Out(x,y) = 0.25 \cdot In(x,y) + 0.5 \cdot In(x,y) + 0.25 \cdot In(x,y+1)$$

For the last line of processing, because there is no pixel below, the value (x, y) is duplicated.

$$Out(x,y) = 0.25 \cdot In(x,y-1) + 0.5 \cdot In(x,y) + 0.25 \cdot In(x,y)$$

NOTE: Antiflicker filtering is supported only in RGB formats and not in BITMAP formats.

Antiflickering is not supported for pictures with fewer than two lines. In this case, the user must disable the antiflickering processing.

By default, the antiflicker filtering is disabled. It can be enabled by setting the [DISPC_GFX_ATTRIBUTES\[24\]](#) ANTIFLICKER bit to 0x1.

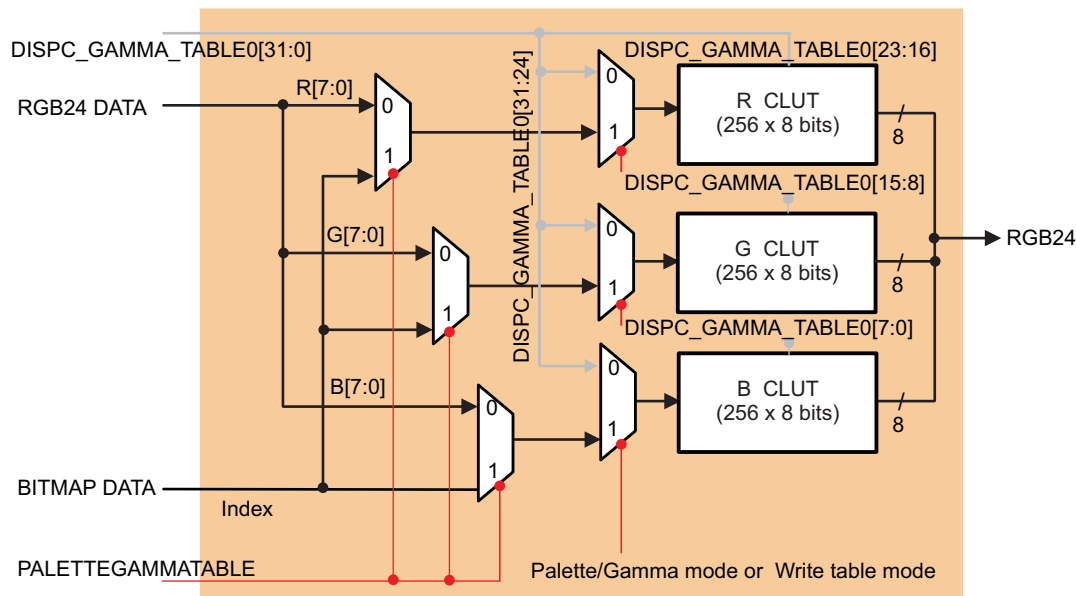

10.2.4.9.3 Color Look-Up Table (CLUT)

The graphics pipeline supports conversion of the BITMAP formats into RGB24 formats through a palette table. To enable palette mode, the [DISPC_CONFIG1\[3\]](#) PALETTEGAMMATABLE bit must be set to 0x0. [Figure 10-43](#) shows the internal architecture of the color look-up/gamma table.

The palette is split into three memories of 256-bit × 8-bit entries. For bitmap (CLUT) indexes, the same value (1-, 2-, 4-, or 8-BPP) indexes the three memories. The table can be reloaded every frame, once, or never (at the beginning of the frame before fetching pixels for the graphics). The table is loaded dynamically at the beginning of the frame by the DISPC DMA engine. The base address of the table buffer is set in the [DISPC_GFX_TABLE_BA\[31:0\]](#) TABLEBA bit field. It is possible to load the table for every frame or only for a specific frame by setting the [DISPC_CONFIG1\[2:1\]](#) LOAD MODE bit field.

The table can be loaded without fetching data for the graphics pipeline. The DMA buffer associated with the graphics pipeline is used to fetch the table from memory. Regardless of the mode (color or monochrome) for each entry into the table, one 32-bit value is fetched from memory.

Figure 10-43. Palette/Gamma Correction Architecture

dispc-002

The palette mode uses the encoded pixel values from the input graphics FIFO as pointers to index the 24-bit-wide palette: 1-BPP pixels address 2 palette entries, 2-BPP pixels address 4 palette entries, 4-BPP pixels address 16 palette entries, and 8-BPP pixels address 256 palette entries. In color mode, the value within the palette is made up of three 8-bit fields, one for each color component: red, green, and blue (see [Figure 10-44](#)). For color operation, an individual frame is limited to a selection of 256 colors (the number of palette entries). In monochrome mode, only one 8-bit value is present. 256 grayscales and 16,777,216 colors are obtained after passing through the palette (see [Figure 10-45](#)).

Figure 10-44. Data Memory Organization: Color Mode

dispc-025

Figure 10-45. Data Memory Organization: Gray Mode

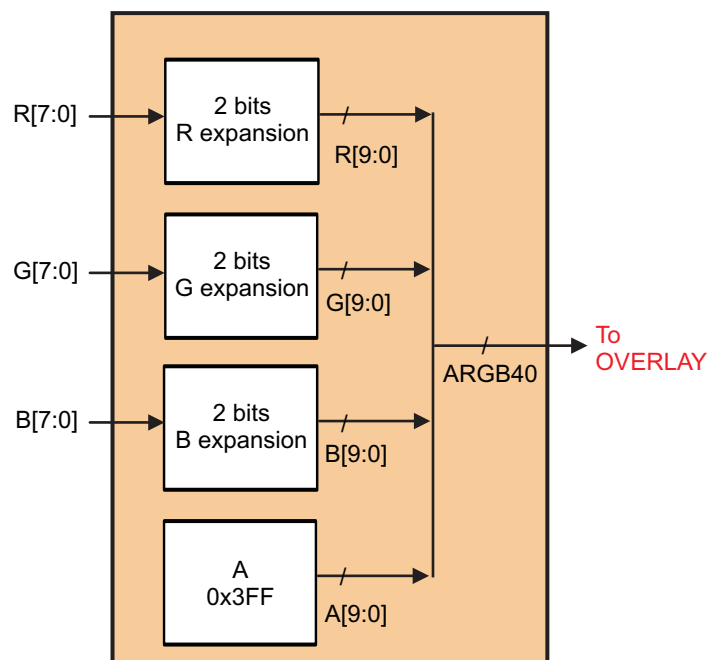

dispc-026

When a palette entry is selected by the encoded pixel value, both the content of the entry and the index are sent to the LCD1 overlay manager.

10.2.4.9.4 Expansion to ARGB40

When the GFX pipeline input data is in a RGB pixel format, the expansion to ARGB40 format is done as described in [Section 10.2.4.9.1, Replication Logic](#).

When the GFX pipeline input data is in BITMAP format, the expansion module takes in its inputs the RGB24 pixel format outputted from the palette module. The expansion module automatically replicates the 2 MSBs of each color component to create an ARGB40 pixel with the A component set to 0x3FF (see [Figure 10-46](#)).

Figure 10-46. Expansion to ARGB40

dispc-092

10.2.4.10 Video Pipelines

Three identical video pipelines are available, VID1, VID2, and VID3. Each video pipeline is connected to its video FIFO controller for the input port and to the three overlay managers LCD 1, LCD2, and TV or WB pipeline. The pixel output is directed to the LCD, TV, or WB path by setting the DISPC_VIDp_ATTRIBUTES[16] CHANNELOUT bit and the DISPC_VIDp_ATTRIBUTES[31:30] CHANNELOUT2 bit field. [Table 10-50](#) resumes the bit field settings to orient a pipeline to an LCD/TV or WB output. The default value directs all video pipelines to LCD1.

NOTE: It is not possible to change the direction of the video pipelines on the fly. If a video pipeline connection needs to be changed to connect to a different overlay manager, then the following steps must be performed:

1. Disable the VIDp pipeline by setting the DISPC_VIDp_ATTRIBUTES[0] ENABLE bit to 0x0.
2. Modify bits [16] CHANNELOUT and [31:30] CHANNELOUT2 in the DISPC_VIDp_ATTRIBUTES register, so that the VIDp pipeline is directed to the new required overlay manager.
3. Disable the new overlay manager (the manager which the VIDp pipeline will be connected next) by disabling the corresponding DISPC output. This is done by setting the [0] LCDENABLE bit to 0x0 in the [DISPC_CONTROL1](#) register (for LCD1 output) or the [DISPC_CONTROL2](#) register (for LCD2 output), or by setting the [DISPC_CONTROL1](#)[1] TVENABLE bit to 0x0 (for TV output).
4. Enable the VIDp pipeline by setting the DISPC_VIDp_ATTRIBUTES[0] ENABLE bit to 0x1.
5. Enable the new overlay manager, (the manager which the VIDp pipeline will be connected next) by enabling the corresponding DISPC output. This is done by setting the [0] LCDENABLE bit to 0x1 in the [DISPC_CONTROL1](#) register (for LCD1 output) or the [DISPC_CONTROL2](#) register (for LCD2 output), or by setting the [DISPC_CONTROL1](#)[1] TVENABLE bit to 0x1 (for TV output).

A video pipeline consists of a scaler unit, a color space conversion unit (CSC), a VC-1 range mapping unit, and some programmable replication logic. The video pipeline unit order can be configured in two manners (see [Figure 10-47](#) and [Figure 10-48](#)):

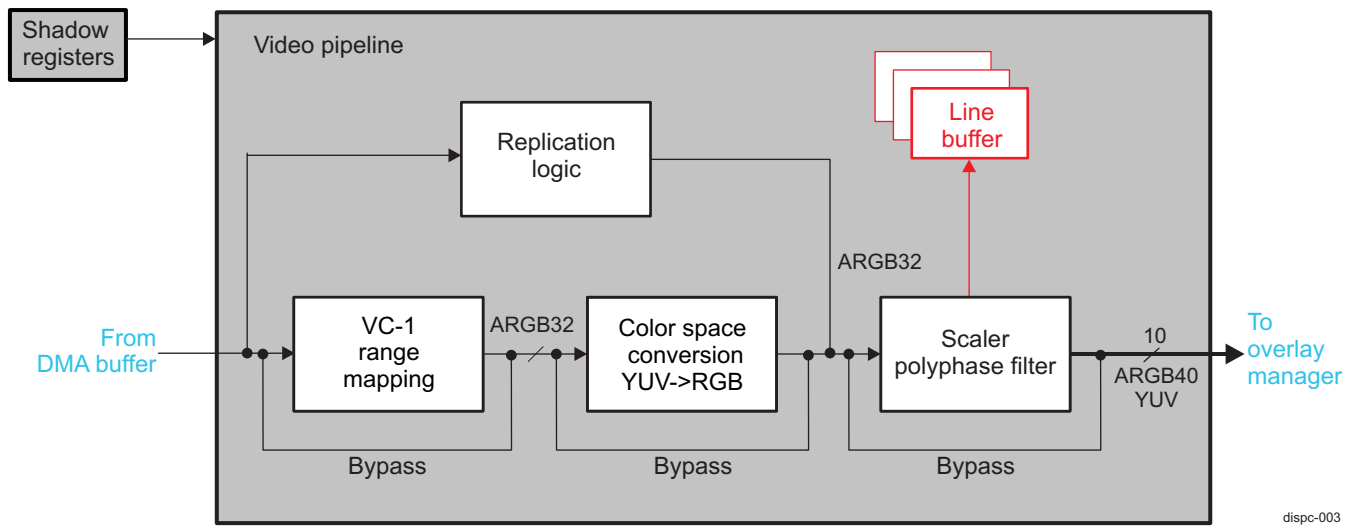

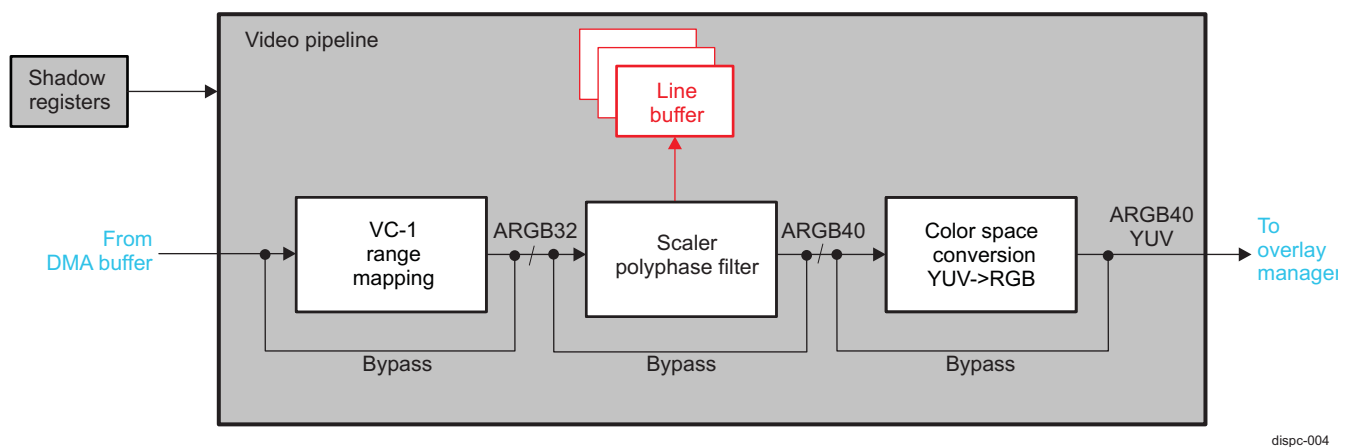

- Configuration 1: VC-1 range mapping unit followed by a CSC unit and then a scaler unit. The configuration is used to support RGB, ARGB, and RGBA formats, and YUV4:2:2 in backward mode for both data types. Each block can be independently bypassed.
- Configuration 2: VC-1 range mapping unit followed by scaler unit, and then a CSC unit. The configuration is used to support RGB, ARGB, and RGBA formats, and YUV4:2:2 format and YUV420-NV12 formats taking advantage of the scaler to resample the chrominance using five taps horizontally and three or five taps vertically. Each block can be independently bypassed.

The DISPC_VIDn_ATTRIBUTES2[8] YUVCHROMARESAMPLING bit controls the order of the scaler unit in the video pipeline:

- When YUVCHROMARESAMPLING is set to 0x0, the video pipeline is in configuration 1, and the scaler is after the CSC unit. In case of YUV input data in 4:2:2 format, the chrominance resampling (4:2:2 to 4:4:4 format) is done by averaging the chrominance adjacent samples for only 0 degrees (zero rotation), because other rotation (90/180/270 degrees) is not supported in this mode. For more information about the supported chrominance resampling methods, see [Section 10.2.4.10.3.1, Chrominance Resampling](#).
- When YUVCHROMARESAMPLING is set to 0x1, the video pipeline is in configuration 2, and the scaler is before the CSC unit.
 - In case of YUV4:2:2 input data with 90-/270-degree rotation, the data is preprocessed by duplicating the missing chrominance samples.
 - In case of YUV4:2:2 input data with 0-/180-degree rotation, the chroma upsampling is performed in the scaler unit.

[Table 10-31](#) lists the input formats supported by the video pipelines.

The video pipeline is enabled by setting ENABLE bit DISPC_VIDp_ATTRIBUTES[0] to 0x1.

Figure 10-47. Configuration 1: Video Pipeline**Figure 10-48. Configuration 2: Video Pipeline**

10.2.4.10.1 Replication Logic

The replication logic increases the color depth of the video-encoded pixels (from true color RGB 12, and 16 to 32 BPP) and available only in configuration 1.

The expansion from 8 to 10 bits color component is done by:

- The CSC unit, when the scaler is after the CSC module and when the vertical scaler is disabled.
- The vertical scaler, when the scaler is after the CSC unit and enabled.
- The replication bit module, when both the CSC unit and scaler are disabled.
- When the replication logic is enabled by setting the DISPC_VIDp_ATTRIBUTES[10] REPLICATIONENABLE bit to 0x1, the MSBs are copied to the missing LSBs. [Table 10-34](#) describes the remapping of the RGB pixels into ARGB 32-bit values.

Table 10-34. Replication Enabled: RGB Pixel Formats Remapping Into ARGB32-8888

10.2.4.10.2 VC-1 Range Mapping Unit

The VC-1 range mapping unit is used when the video frame picture is decoded using a VC-1 codec by the video accelerator. It remaps the Y, Cb, and Cr components. The unit is used primarily for YUV4:2:0-NV12 pixel format but also can be applied to YUV4:2:2 pixel formats (YUV2 and UYVY).

The VC-1 range mapping unit is enabled by setting the DISPC_VIDp_ATTRIBUTES2[0] VC1ENABLE bit to 0x1. The DISPC_VIDp_ATTRIBUTES2[3:1] VC1_RANGE_Y and DISPC_VIDp_ATTRIBUTES2[6:4] VC1_RANGE_CBCR bit fields are two 3-bit values programmed by the user and are independent for each video pipeline. The module is governed by the equations:

$$Y_{out} = \text{CLIP}((((Y_{int} - 128) \times (VC1_RANGE_Y + 9) + 4) / 8) + 128)$$

$$C_b = \text{CLIP}((((C_b - 128) \times (VC1_RANGE_CBCR + 9) + 4) / 8) + 128)$$

$$C_r = \text{CLIP}((((C_r - 128) \times (VC1_RANGE_CBCR + 9) + 4) / 8) + 128)$$

NOTE: The input and output pixel values are unsigned (Y, Cr, and Cb).

The function CLIP () clips to 0 or 255 when min or max are reached respectively otherwise resulting output stay identical.

10.2.4.10.3 CSC Unit YUV to RGB

The CSC unit converts the video-encoded pixel values from YUV4:4:4 format into RGB24 or RGB30 format. The output format depends on the video pipeline configuration selected:

- Configuration 1: RGB24 output format, with 8-bit value per component: red, green, and blue
- Configuration 2: RGB30 output format, with 10-bit value per component: red, green, and blue

In case of YUV4:2:0 or YUV4:2:2 formats, a chrominance resampling to YUV4:4:4 is required before converting the YUV into RGB values (see [Section 10.2.4.10.3.1, Chrominance Resampling](#)). YUV4:2:2 or YUV4:2:0 to YUV4:4:4 chrominance resampling is a preprocessing to the color space conversion.

[Figure 10-49](#) to [Figure 10-52](#) show the 3 × 3 11-bit coefficients used to convert from YUV4:4:4 into RGB24. The coefficients are set according to the standard used to encode the pixel data in YUV color space. [Table 10-36](#) resumes the coefficients with their respective bit fields.

Table 10-36. Color Space Conversion YUV to RGB Bit Field Setting

Coefficients	Bit Field Registers
R _Y	RY field DISPC_VIDp_CONV_COEF0[10:0]
R _{Cr}	RCR field DISPC_VIDp_CONV_COEF0[26:16]
R _{Cb}	RCB field DISPC_VIDp_CONV_COEF1[10:0]
G _Y	GY field DISPC_VIDp_CONV_COEF1[26:16]
G _{Cr}	GCR field DISPC_VIDp_CONV_COEF2[10:0]
G _{Cb}	GCB field DISPC_VIDp_CONV_COEF2[26:16]
B _Y	BY field DISPC_VIDp_CONV_COEF3[10:0]
B _{Cr}	BCR field DISPC_VIDp_CONV_COEF3[26:16]
B _{Cb}	BCB field DISPC_VIDp_CONV_COEF4[10:0]

- For configuration 1 with an RGB24 output:

If the active range for the luminance samples (Y) is [16:235] and [16:240] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [0:255].

NOTE: The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

Figure 10-49. YCbCr to RGB Registers (FULLRANGE = 0), 8-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 16 \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-005

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:255], the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [0:255].

Figure 10-50. YCbCr to RGB Registers (FULLRANGE = 1), 8-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-006

- For configuration 2 with an RGB30 output:

If the active range for the luminance samples (Y) is [64:940] and [64:960] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [0:1023].

NOTE: The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

Figure 10-51. YCbCr to RGB Registers (FULLRANGE = 0), 10-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 64 \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-074

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:1023], the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [0:1023].

Figure 10-52. YCbCr to RGB Registers (FULLRANGE = 1), 10-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-075

10.2.4.10.3.1 Chrominance Resampling

Two methods are supported to resample chrominance:

- Averaging of the chrominance is done by software followed by hardware conversion when the video pipeline is in configuration 1.
- Filtering of the chrominance using the scaler unit (chrominance resampling and rescaling can be combined to support native rescaling of YUV format) when the video pipeline is in configuration 2.

To convert the YUV4:2:2 encoded pixel values into YUV4:4:4 format, the averaging of the chrominance technique can be used as shown in Figure 10-53. The missing chrominance samples (Cb and Cr) are interpolated using the average values of the two closest values on the same line (,) or are repeated from the second pixel in the same 32-bit container (see Figure 10-54). For the last pixel, the chrominance samples are duplicated using the values from the previous pixel; otherwise, the chrominance samples are averaged using the two adjacent values. Figure 10-55 shows the flow of the pixel.

Figure 10-53. Averaging of the Chrominance Formula

$$Cb_n(YCbCr\ 444) = \frac{Cb_{n-1}(YCbCr\ 422) + Cb_{n+1}(YCbCr\ 422)}{2} \text{ (n odd)}$$

$$Cr_n(YCbCr\ 444) = \frac{Cr_{n-1}(YCbCr\ 422) + Cr_{n+1}(YCbCr\ 422)}{2} \text{ (n odd)}$$

dispc-010

Figure 10-54. Averaging of the Chrominance Representation

Figure 10-55. YUV4:2:2 to RGB30 Using Averaging of the Chrominance

The scaler unit can be used to resample the chrominance of YUV4:2:0 and YUV4:2:2, as shown in [Figure 10-56](#) and [Figure 10-57](#), respectively. The settings of the scaler unit to perform chrominance resampling are described in [Section 10.2.4.10.4, Scaler Unit](#).

Figure 10-56. YUV4:2:0 to RGB30 Using Scaler Unit for Resampling Chrominance**Figure 10-57. YUV4:2:2 to RGB30 Using Scaler Unit for Resampling Chrominance**

NOTE: If rotation must be supported, YUV4:2:2 and YUV4:2:0 (0-/180-degree rotation) chrominance resampling is done as shown in [Figure 10-57](#) and [Figure 10-56](#), respectively. For YUV4:2:2 (90-/270-degree rotation) data are preprocessed to present YUV4:4:4 on the scaler input (duplication of the missing chroma), as shown in [Figure 10-55](#).

10.2.4.10.4 Scaler Unit

All video formats are supported, including formats with alpha blending. Alpha blending is scaled with the same parameters as RGB color components. For the YUV formats, Y and Cb/Cr are processed independently. The filter is based on a finite impulse response (FIR) filter. The filtering can be used for different processing:

- Upsampling of the picture
- Downsampling of the picture
- Antiflicker reduction
- De-interlacing using "bob" algorithm
- Chrominance resampling in case of YUV data formats

NOTE: The user must ensure the resizing frame displays in the LCD/screen boundaries.

[Figure 10-58](#) shows an example of video upsampling.

Figure 10-58. Video Upsampling

The up/downsampling filter is a polyphase filter with five taps and eight phases for the horizontal filter, and a programmable number of taps (three or five) and eight phases for vertical filter. The input buffer has five input memory lines. The following limitations must be considered:

- The upsampling ratio is up to x8.
- The downsampling ratio using 3-tap configuration is down to x0.5 for RGB format.
- The downsampling ratio using 5-tap configuration is down to x0.25 for RGB format.
- If the input format is changed from YUV4:2:2 to YUV4:2:0 (WB pipeline), the downsampling ratio is further reduced:
 - Using 5-tap configuration, the ratio is down to x0.5 for RGB format.
 - Using 3-tap configuration, no downscaling is available.

For the vertical up/downsampling in 3-tap configuration, the equations are:

For RGB formats	For YUV formats
$A_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * A_{in}(n+i)) >> 5$	$Y_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi_y) * Y_{in}(n+i)) >> 5$
$R_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * R_{in}(n+i)) >> 5$	$Cr_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\Phi_c) * Cb_{in}(n+i)) >> 5$
$G_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * G_{in}(n+i)) >> 5$	$Cb_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\Phi_c) * Cr_{in}(n+i)) >> 5$
$B_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * B_{in}(n+i)) >> 5$	

dispc-013

(7)

For the vertical up/downsampling in 5-tap configuration, the equations are:

For RGB formats	For YUV formats
$A_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * A_{in}(n+i)) >> 5$	$Y_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi_y) * Y_{in}(n+i)) >> 5$
$R_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * R_{in}(n+i)) >> 5$	$Cb_{out}(n) = (\sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cb_{in}(n+i)) >> 5$
$G_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * G_{in}(n+i)) >> 5$	$Cr_{out}(n) = (\sum_{i=-2}^{i=2} C_{vci}(\Phi_c) * Cr_{in}(n+i)) >> 5$
$B_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * B_{in}(n+i)) >> 5$	

dispc-012

(8)

For the horizontal up/downsampling in 5-tap configuration, the equations are:

For RGB formats	For YUV formats
$A_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * A_{in}(n+i) \right) >> 7$	$Y_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi_y) * Y_{in}(n+i) \right) >> 7$
$R_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * R_{in}(n+i) \right) >> 7$	$Cb_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hcb}(\Phi_c) * Cb_{in}(n+i) \right) >> 7$
$G_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * G_{in}(n+i) \right) >> 7$	$Cr_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hcb}(\Phi_c) * Cr_{in}(n+i) \right) >> 7$
$B_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * B_{in}(n+i) \right) >> 7$	

dispc-014

(9)

NOTE: The pixel (n + 1) is the previous pixel with respect to pixel (n). The line (n + 1) is the previous line with respect to line (n).

The coefficients $Ci()$ depend on the phase between input and output pixels.

NOTE: The coefficients are different for Y and Cr, Cb filtering because the calculations are independent due to the chrominance resampling for YUV4:2:2 and YUV4:2:0.

First, the vertical filter is applied to the encoded input pixel data, and then the horizontal filter is applied on the resulting pixel values to generate the output pixel values. The vertical input of the filter consists of five lines of 2048 × 32 bits for both 3-tap and 5-tap configurations (see [Table 10-37](#)).

Table 10-37. Line Buffer Width for Scaler Unit

Vertical Taps	Maximum Input Width (Pixels)
3, 5	2048 × 32 bits

At the beginning of frame scaling processing, the first line is duplicated to fill the first two lines in 3-tap configuration and the first three lines in 5-tap configuration.

At the end of frame scaling processing, the last line is duplicated if the scaling logic requires loading more lines and the last line has been reached.

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The video scalers have an 8-bit input and a 10-bit output. The vertical scaling changes the 8-bit input into a 10-bit clipped output and the horizontal scaling takes the 10-bit input.

[Figure 10-59](#) and [Figure 10-60](#) show the scaler macro-architecture for the component A, R, G, B and Y. [Figure 10-61](#) and [Figure 10-62](#) show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [0:1023] or [64:960] by configuring the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit.

NOTE: The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

	Chc(1)		FIRHC1	DISPC_VIDp_FIR_COE_F_H2_i
	Chc(2)		FIRHC0	DISPC_VIDp_FIR_COE_F_H2_i

The VID scaler unit vertical or/and horizontal sampling is defined by setting/resetting the DISPC_VIDp_ATTRIBUTES[6:5] RESIZEENABLE bit.

A set of configurations must be valid before enabling the video up/downsampling block.

The following fields define the configuration of the video up/downsampling block for VIDp:

- Vertical up/downsampling increment value DISPC_VIDp_FIR[28:16] FIRVINC bit field. The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left(\frac{ORG\text{SIZEY}}{SIZEY} \right) \quad \text{dispc-066} \quad (10)$$

NOTE:

- If the value of the DISPC_VIDp_FIR[28:16] FIRVINC bit field is greater than 4096, it is clipped to 4096.
- If DISPC_VIDp_SIZE[26:16] SIZEY equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
- The values of the DISPC_VIDp_PICTURE_SIZE[26:16] ORGSIZEY and DISPC_VIDp_SIZE[26:16] SIZEY bit fields must be programmed with the value desired minus 1.

- Horizontal up/downsampling increment value DISPC_VIDp_FIR[12:0] FIRHINC bit field: The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left(\frac{ORGSIZE^X}{SIZE^X} \right) \quad \text{dispc-067} \quad (11)$$

NOTE:

- If the value of the DISPC_VIDp_FIR[12:0] FIRHINC bit field is greater than 4096, it is clipped to 4096.
 - If DISPC_VIDp_SIZE[10:0] SIZE equals 1, DISPC_VIDp_SIZE[10:0] SIZE is replaced by 2 in the previous equation.
 - The values of the DISPC_VIDp_PICTURE_SIZE[10:0] ORGSIZE and DISPC_VIDp_SIZE[10:0] SIZE bit field must be programmed with the value desired minus 1.
-
- Vertical up/downsampling accumulator value DISPC_VIDp_ACCU_j[26:16] VERTICALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the vertical filtering starts. The register DISPC_VIDp_ACCU_0 is used for progressive output and for interlace output; the DISPC_VIDp_ACCU_0 and DISPC_VIDp_ACCU_1 registers are used. Similarly, DISPC_VIDp_ACCU2_0 and DISPC_VIDp_ACCU2_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
 - Vertical up/downsampling line buffer configuration DISPC_VIDp_ATTRIBUTES[21] VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
 - Horizontal up/downsampling accumulator value DISPC_VIDp_ACCU_j[10:0] HORIZONTALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the horizontal filtering starts. The register DISPC_VIDp_ACCU_0 is used for progressive output and for interlace output; the DISPC_VIDp_ACCU_0 and DISPC_VIDp_ACCU_1 registers are used. Similarly, DISPC_VIDp_ACCU2_0 and DISPC_VIDp_ACCU2_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.

Table 10-40. Vertical/Horizontal Accumulator Phase

Accumulator Value	Phases f
0	0
128 or −896	1
256 or −768	2
384 or −640	3
512 or −512	4
640 or −384	5
768 or −256	6
896 or −128	7

- Vertical up/downsampling coefficients:
 - The 3-tap vertical up/downsampling coefficients are defined in the DISPC_VIDp_FIR_COEF_HV_i registers. There are eight registers for the eight phases with three coefficients for each, or a total of 24 programmable coefficients for the vertical up/downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
 - The 5-tap vertical up/downsampling coefficients: Two extra-tap vertical up/downsampling coefficients are defined in the DISPC_VIDp_FIR_COEF_V_i registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical up/downsampling block are used in addition to the 3-tap registers previously defined. Four YUV vertical up/downsampling coefficients are set in DISPC_VIDp_FIR_COEF_HV2_i and DISPC_VIDp_FIR_COEF_V2_i registers. [Table 10-38](#) and [Table 10-39](#) resume all coefficients and their respective registers.
- Horizontal up/downsampling coefficients:

- The DISPC_VIDp_FIR_COEF_H_i and DISPC_VIDp_FIR_COEF_HV_i registers define the 5-tap horizontal up/downsampling coefficients. Each DISPC_VIDp_FIR_COEF_H_i register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each DISPC_VIDp_FIR_COEF_HV_i register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal up/downsampling block are used. Four YUV horizontal up/downsampling coefficients are set in the DISPC_VIDp_FIR_COEF_HV2_i and DISPC_VIDp_FIR_COEF_H2_i registers. [Table 10-38](#) and [Table 10-39](#) resume all coefficients and their respective registers.

10.2.4.10.4.1 Scaling Algorithms

[Figure 10-63](#) and [Figure 10-64](#) show details of the up/downsampling finite state-machines (FSM).

[Figure 10-64](#) shows the horizontal up/downsampling FSM.

Figure 10-64. Horizontal Up/Downsampling Algorithm

dispc-087

10.2.4.10.4.2 Scaling Limitations

Table 10-41 through Table 10-44 list the minimum ratio between the pixel clock frequency (PCLK) and the functional clock (DISPC_CORE_CLK) in the input pixel format when using the scaler unit. PCLK and FCLK are asynchronous. For each LCD output, there is a dedicated LCD clock that is programmable with the LCD and PCD divisor values in DISPC_DIVISORo[23:16][7:0].

NOTE: The DISPC_CORE_CLK is derived from DISPC_FCLK through the LCD divisor.

NOTE: The downscaling ratio is not an integer, but it is the ratio DISPC_CORE_CLK/LCDn_PCLK, meaning if the ratio is 2.7, then the downscaling ratio is 2.7 and not 2.

Table 10-41. Pixel Clock Frequency Limitations (Any Pixel Format) – Active Matrix Display

DISPC_CORE_CLK/LCDn_PCLK Minimum Ratio	Horizontal Resampling				
	Off	Up	1:1–1:2	1:2–1:3	1:3–1:4
	2(1 ⁽¹⁾)	2(1 ⁽¹⁾)	2	3	4

(1) The minimum ratio can be 1 if the data are output on the rising edge of the PCLK (DISPC_POL_FREQo.IPC = 0); otherwise, the minimum ratio must be 2.

Table 10-42. Pixel Clock Frequency Limitations (Any Pixel Format) Passive Matrix Display – Mono4

DISPC_CORE_CLK/LCDn_PCLK Minimum Ratio	Horizontal Resampling				
	Off	Up	1:1–1:2	1:2–1:3	1:3–1:4

	Off	Up	1:1–1:2	1:2–1:3	1:3–1:4
	8	8	16	24	32

Table 10-44. Pixel Clock Frequency Limitations (Any Pixel Format) Passive Matrix Display – Color

DISPC_CORE_CLK/LCDn_PCLK Minimum Ratio	Horizontal Resampling				
	Off	Up	1:1–1:2	1:2–1:3	1:3–1:4
	8	8	16	24	32

10.2.4.11 Write-Back Pipeline

The write-back pipeline is used to store in the system memory the capture of the overlay output or the output of one of the pipelines. The WB pipeline consists of a CSC unit, a scaler unit, and an RGB truncation logic. Because the overlay works on ARGB32-8888 format and the video accelerator works on YUV format, the color space conversion from RGB to YUV is used to directly output to memory the format that can be encoded with no extra processing.

The write-back pipeline is connected to all the pipeline outputs (GFX, VD1, VID2, and VID3 pipelines) and to the output of the three overlay managers (LCD1, LCD2, and TV). The input is selected by setting the [DISPC_WB_ATTRIBUTES\[18:16\]](#) CHANNELIN bit field, and the capture frame rate is set in the [DISPC_WB_ATTRIBUTES\[26:24\]](#) CAPTUREMODE bit field.

Because the output format of the TV overlay manager is ARGB40, the graphics pipeline output is ARGB40, the video pipeline outputs are YUV4:2:2, YUV4:2:0, or ARGB40, and the WB input is ARGB32, the WB input does not consider the 2 LSBs of each ARGB component.

The WB pipeline is enabled by setting the [DISPC_WB_ATTRIBUTES\[0\]](#) ENABLE bit to 0x1.

[Figure 10-65](#) shows the graphics pipeline.

Figure 10-65. Write-Back Pipeline

dispc-016

10.2.4.11.1 CSC Unit RGB to YUV

The RGB-to-YUV CSC unit converts the encoded pixel values from RGB24 into YUV4:4:4 format. For YUV4:2:0 or YUV4:2:2 formats, a chrominance subsampling is required after converting the RGB into YUV values. Because of the subsampling, the following limitations must be considered:

- When converting RGB into YUV4:2:0 NV12 format:
 - Maximum horizontal downscale = x0.5
 - Maximum vertical downscale = x0.5
- When converting RGB into YUV4:2:2 format:
 - Maximum horizontal downscale = x0.5
 - Maximum vertical downscale = x0.25

Figure 10-66 and Figure 10-67 show the 3 × 3 11-bit coefficients used to convert from RGB24 into YUV4:4:4. The user sets the coefficients according to the standard used to encode the pixel data in YUV color space. Table 10-45 resumes the coefficients with their respective bit fields.

Table 10-45. CSC RGB to YUV Bit Field Setting

Coefficients	Bit Fields
Y_R	DISPC_WB_CONV_COEF0[10:0] YR
Y_G	DISPC_WB_CONV_COEF0[26:16] YG
Y_B	DISPC_WB_CONV_COEF1[10:0] YB
Cr_R	DISPC_WB_CONV_COEF1[26:16] CRR
Cr_G	DISPC_WB_CONV_COEF2[10:0] CRG
Cr_B	DISPC_WB_CONV_COEF2[26:16] CRB
Cb_R	DISPC_WB_CONV_COEF3[10:0] CBR
Cb_G	DISPC_WB_CONV_COEF3[26:16] CBG
Cb_B	DISPC_WB_CONV_COEF4[10:0] CBB

If the active range for the luminance samples (Y) is [16:235] and [16:240] for the chrominance samples (Cb and Cr), the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the DISPC_WB_ATTRIBUTES[11] FULLRANGE bit to 0x0.

Figure 10-66. RGB to YCbCr (FULLRANGE = 0)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix}$$

dispc-017

If the active range for the luminance samples (Y) and or the chrominance samples (Cb and Cr) is [0:255], the values of Y, Cb, and Cr output components are clipped to the range [0:255]. The range selection is done by setting the DISPC_WB_ATTRIBUTES[11] FULLRANGE bit to 0x1.

Figure 10-67. RGB to YCbCr (FULLRANGE = 1)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-018

10.2.4.11.2 Scaler Unit

The functional aspect of the WB pipeline scaler unit is identical to the video pipeline scaler unit (see [Section 10.2.4.10.4](#)), except in the output width when scaling ARGB components. The resulting output format is ARGB32 instead of ARGB40. In addition, the scaling limitations described in [Section 10.2.4.10.4.2, Scaling Limitations](#), are relevant only to the video pipelines scaler units. In WB memory-to-memory mode there are no limitations on the DISPC_CORE_CLK/LCDn_PCLK ratio for horizontal resampling.

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The WB scaler component has an 8-bit input and an 8-bit output.

[Figure 10-68](#) and [Figure 10-69](#) show the scaler macro-architecture for the component A, R, G, B, and Y. [Figure 10-70](#) and [Figure 10-71](#) show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [0:255] or [16:240] by configuring the [DISPC_WB_ATTRIBUTES\[11\] FULLRANGE](#) bit.

	Cvc(2)		FIRVC00	DISPC_WB_FIR_COEF_V2_i
Horizontal	Chc(-2)	N/A	FIRHC4	DISPC_WB_FIR_COEF_HV2_i
	Chc(-1)		FIRHC3	DISPC_WB_FIR_COEF_H2_i
	Chc(0)		FIRHC2	DISPC_WB_FIR_COEF_H2_i
	Chc(1)		FIRHC1	DISPC_WB_FIR_COEF_H2_i
	Chc(2)		FIRHC0	DISPC_WB_FIR_COEF_H2_i

The WB scaler unit vertical or/and horizontal sampling is defined by setting/resetting the [DISPC_WB_ATTRIBUTES\[6:5\] RESIZEENABLE](#) bit.

A set of configuration must be valid before enabling the video up/downsampling block.

The following fields define the configuration of the video up/downsampling block for WB:

- Vertical up/downsampling increments the value of the [DISPC_WB_FIR\[28:16\] FIRVINC](#) bit field. The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left(\frac{ORGSIZEY}{SIZEY} \right)$$

dispc-066

(12)

NOTE:

- If the value of the [DISPC_WB_FIR](#)[28:16] FIRVINC bit field is greater than 4096, it is clipped to 4096.
 - If the [DISPC_WB_SIZE](#)[26:16] SIZEY bit field equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
 - The values of the [DISPC_WB_PICTURE_SIZE](#)[26:16] ORGSIZEY and [DISPC_WB_SIZE](#)[26:16] SIZEY bit fields must be programmed with the value desired minus 1.
-

- Horizontal up/downsampling increments the value of the [DISPC_WB_FIR\[12:0\]](#) FIRHINC bit field: The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left(\frac{ORGSIZE^X}{SIZE^X} \right) \quad \text{dispc-067} \quad (13)$$

NOTE:

- If the value of the [DISPC_WB_FIR\[12:0\]](#) FIRHINC bit field is greater than 4096, it is clipped to 4096.
 - If the [DISPC_WB_SIZE\[10:0\]](#) SIZEX bit field equals 1, the [DISPC_WB_SIZE\[10:0\]](#) SIZEX bit field is replaced by 2 in the previous equation.
 - The value of the [DISPC_WB_PICTURE_SIZE\[10:0\]](#) ORGSIZEX and [DISPC_WB_SIZE\[10:0\]](#) SIZEX bit fields must be programmed with the value desired minus 1.
- Vertical up/downsampling accumulator value [DISPC_WB_ACCU_j\[26:16\]](#) VERTICALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the vertical filtering starts. The register [DISPC_WB_ACCU_0](#) is used for progressive output and for interlace output; the [DISPC_WB_ACCU_0](#) and [DISPC_WB_ACCU_1](#) registers are used. Similarly, [DISPC_WB_ACCU2_0](#) and [DISPC_WB_ACCU2_1](#) are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
 - Vertical up/downsampling line buffer configuration [DISPC_WB_ATTRIBUTES\[21\]](#) VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
 - Horizontal up/downsampling accumulator value [DISPC_WB_ACCU_j\[10:0\]](#) HORIZONTALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the horizontal filtering starts. The register [DISPC_WB_ACCU_0](#) is used for progressive output and for interlace output; the [DISPC_WB_ACCU_0](#) and [DISPC_WB_ACCU_1](#) registers are used. Similarly, [DISPC_WB_ACCU2_0](#) and [DISPC_WB_ACCU2_1](#) are used in progressive or interlace output to set the accumulator value of Cb and Cr components when scaling YUV format.

Table 10-48. Vertical/Horizontal Accumulator Phase

Accumulator Value	Phases f
0	0
128 or −896	1
256 or −768	2
384 or −640	3
512 or −512	4
640 or −384	5
768 or −256	6
896 or −128	7

- Vertical up/downsampling coefficients:
 - The 3-tap vertical up/downsampling coefficients are defined in the [DISPC_WB_FIR_COEF_HV_i](#) registers. There are 8 registers for the 8 phases with 3 coefficients for each, or a total of 24 programmable coefficients for the vertical up/downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
 - The 5-tap vertical up/downsampling coefficients: Two extra-tap vertical up/downsampling coefficients are defined in the [DISPC_WB_FIR_COEF_V_i](#) registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical up/downsampling block are used in addition to the 3-tap registers previously defined. Four YUV vertical up/downsampling coefficients are set in the [DISPC_WB_FIR_COEF_HV2_i](#) and [DISPC_WB_FIR_COEF_V2_i](#) registers. [Table 10-46](#) and [Table 10-47](#) resume all coefficients and their respective registers.
- Horizontal up/downsampling coefficients:

- The [DISPC_WB_FIR_COEF_H_i](#) and [DISPC_WB_FIR_COEF_HV_i](#) registers define the 5-tap horizontal up/downsampling coefficients. Each [DISPC_WB_FIR_COEF_H_i](#) register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each [DISPC_WB_FIR_COEF_HV_i](#) register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal up/downsampling block are used. Four YUV horizontal up/downsampling coefficients are set in the [DISPC_WB_FIR_COEF_HV2_i](#) and [DISPC_WB_FIR_COEF_H2_i](#) registers. [Table 10-46](#) and [Table 10-47](#) resume all coefficients and their respective registers.

10.2.4.11.3 RGB Truncation Logic

Truncation logic is used to convert a pixel from ARGB 32-bit format into a lower color depth: 12-or 16-bit format based. Setting the [DISPC_WB_ATTRIBUTES\[10\]](#) TRUNCATIONENABLE bit to 0x1 enables the truncation to the pixel format defined by the [DISPC_WB_ATTRIBUTES\[4:1\]](#) FORMAT bit field. The truncation is done by removing the necessary LSB of each component to match the output format. [Table 10-49](#) describes the truncation done on each component of the pixel.

Table 10-49. Truncation Logic

Output Formats	A[7:0]	R[7:0]	G[7:0]	GB[7:0]
	MSB LSB	MSB LSB	MSB LSB	MSB LSB
xRGB12-4444	Ignored	R[7:4]	G[7:4]	B[7:4]
RGBx12-4444	Ignored	R[7:4]	G[7:4]	B[7:4]
RGB16-565	Ignored	R[7:3]	G[7:2]	B[7:3]
xRGB16-1555	Ignored	R[7:3]	G[7:3]	B[7:3]
ARGB16-4444	A[7:4]	R[7:4]	G[7:4]	B[7:4]
RGBA16-4444	A[7:4]	R[7:4]	G[7:4]	B[7:4]
ARGB16-1555	A[7]	R[7:3]	G[7:3]	B[7:3]

NOTE: If there is no alpha field in the pixel format description, 0s or 1s must fill the container. 0s must be used for transparent and 1s for opaque. For example, in xRGB12 pixel format, the upper 4 bits are set to 0s because the RGB value is only 12 bits inside a 16-bit container.

10.2.4.12 LCD Outputs

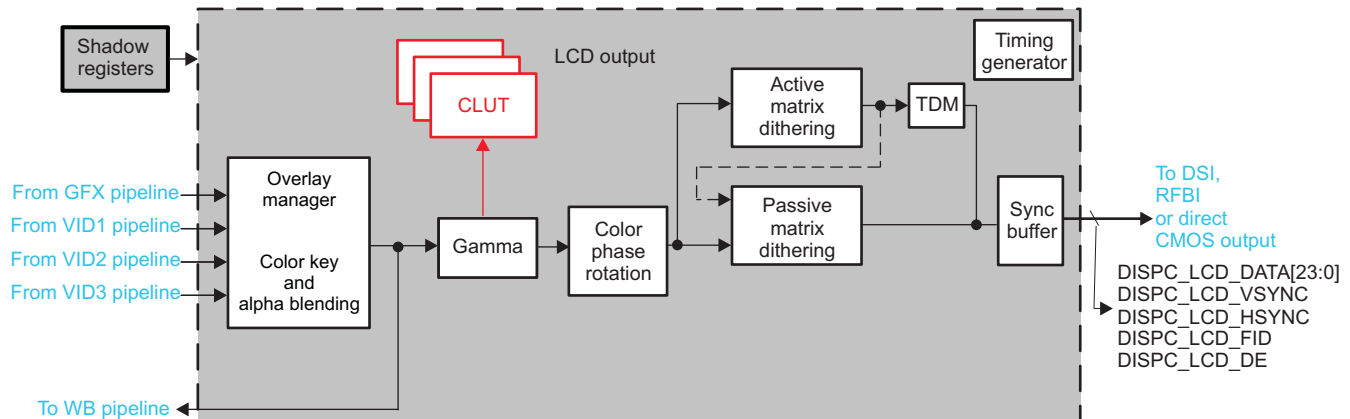

The LCD1 and LCD2 output paths consist of several processing blocks (see [Figure 10-72](#)):

- Overlay manager
- Gamma correction unit
- Color phase rotation (CPR) is also used for RGB-to-YUV conversion.
- Active matrix dithering with TDM
- Passive matrix dithering
- Synchronization buffer
- Timing generator

The display subsystem supports two types of display technologies (both monochrome and color modes):

- Passive matrix displays: supporting up to 16, 256, or 3375 colors to be displayed in each frame, depending on the color depth. The monochrome LCD has 15 grayscale levels available.
- Active matrix displays: the configuration of colors depends on the color depth:
 - 24 BPP supports 16,777,216 colors.
 - 18 BPP supports 262,144 colors.
 - 16 BPP supports 65,536 colors.
 - 12 BPP supports 4096 colors.

Figure 10-72. LCD Output Architecture

dispc-028

10.2.4.12.1 Overlay Manager

The overlay mechanism consists of displaying more than one layer (GFX, VID1 to VID3 layers) using:

- A priority rule based on a Z-order: Application can set the ordering layer of the frames.
- Transparency color keys: Destination and source transparency color keys can be set.
- Alpha blending values: Using the A component of a pixel or a blending set by the user for a layer, a level of transparency can be determined.

Each pipeline (GFX, VID1, VID2, and VID3) is assigned to a single overlay and, as a consequence, to a single display controller output, LCD1, LCD2, TV, or WB pipeline. An overlay manager can be connected to all four pipelines outputs simultaneously. The pipeline output is directed using the [DISPC_GFX_ATTRIBUTES\[8\]](#) CHANNELOUT bit and the [DISPC_VIDp_ATTRIBUTES\[31:30\]](#) CHANNELOUT2 bit field. [Table 10-50](#) resumes the bit field settings to direct a pipeline to an LCD/TV or WB output. The default value directs all pipelines to LCD1.

Table 10-50. Pipeline Connection to LCD, TV, or WB Output

Overlay Manager/Output	DISPC_GFX_ATTRIBUTES/DISPC_VIDp_ATTRIBUTES	
	CHANNELOUT Bit	CHANNELOUT2 Bit Field
LCD1	0x0	0x0
LCD2	0x0	0x1
WB	0x0	0x3
TV	0x1	0x0

NOTE: The settings CHANNELOUT = 0x1 and CHANNELOUT2 = 0x1, 0x2, and 0x3 are reserved.

The output of each LCD overlay manager is connected to CPR block through the palette unit in the case of Gamma correction.

NOTE:

- When the pixel format is ARGB or RGBA, the color key match logic uses only the RGB value defined by ARGB or RGBA. The alpha blending factor is ignored.
- For LCD1 output, the same CLUT is used for BITMAP support by the graphics pipeline and for Gamma correction. In case of BITMAP format for graphics, Gamma correction is not available on the primary LCD output.

10.2.4.12.1.1 Priority Rule

The overlay manager is configured using the Z-order parameter. The Z-order value defined for each pipeline indicates the visibility order to the window on the screen. If the Z-order value of window A is lower than the Z-order to layer B, layer A is displayed below layer B. The transparency color keys and the alpha blending factors are then used to blend the layers together (see [Section 10.2.4.12.1.2](#) and [Section 10.2.4.12.1.3](#)). The Z-order is enabled by setting the `DISPC_GFX_ATTRIBUTES[25]` `ZORDERENABLE` bit or the `DISPC_VIDp_ATTRIBUTES[25]` `ZORDERENABLE` bit to 0x1 and by defining the Z-order in the `DISPC_GFX_ATTRIBUTES[27:26]` and `DISPC_VIDp_ATTRIBUTES[27:26]` `ZORDER` bit fields. [Table 10-51](#) resumes the register settings to enable and set the Z-order of a pipeline. [Table 10-51](#) shows the default Z-order values when `LCDALPHABLENDERENABLE` and `ZORDERENABLE` are disabled.

Table 10-51. Z-Order Register Settings and Default Configuration

Pipeline	LCDALPHA BLENDERENABLE ⁽¹⁾	ZORDERENABLE	ZORDER	Resulting Z-Order Number
GFX	0	0	Don't care	0
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	3
VID1	0	0	Don't care	1
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	0
VID2	0	0	Don't care	2
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	1
VID3	0	0	Don't care	3
	0	1	ZORDER	ZORDER
	1	Don't care	Don't care	2

⁽¹⁾ Applies only to LCD1

[Figure 10-73](#) shows the architecture of the priority rule.

NOTE:

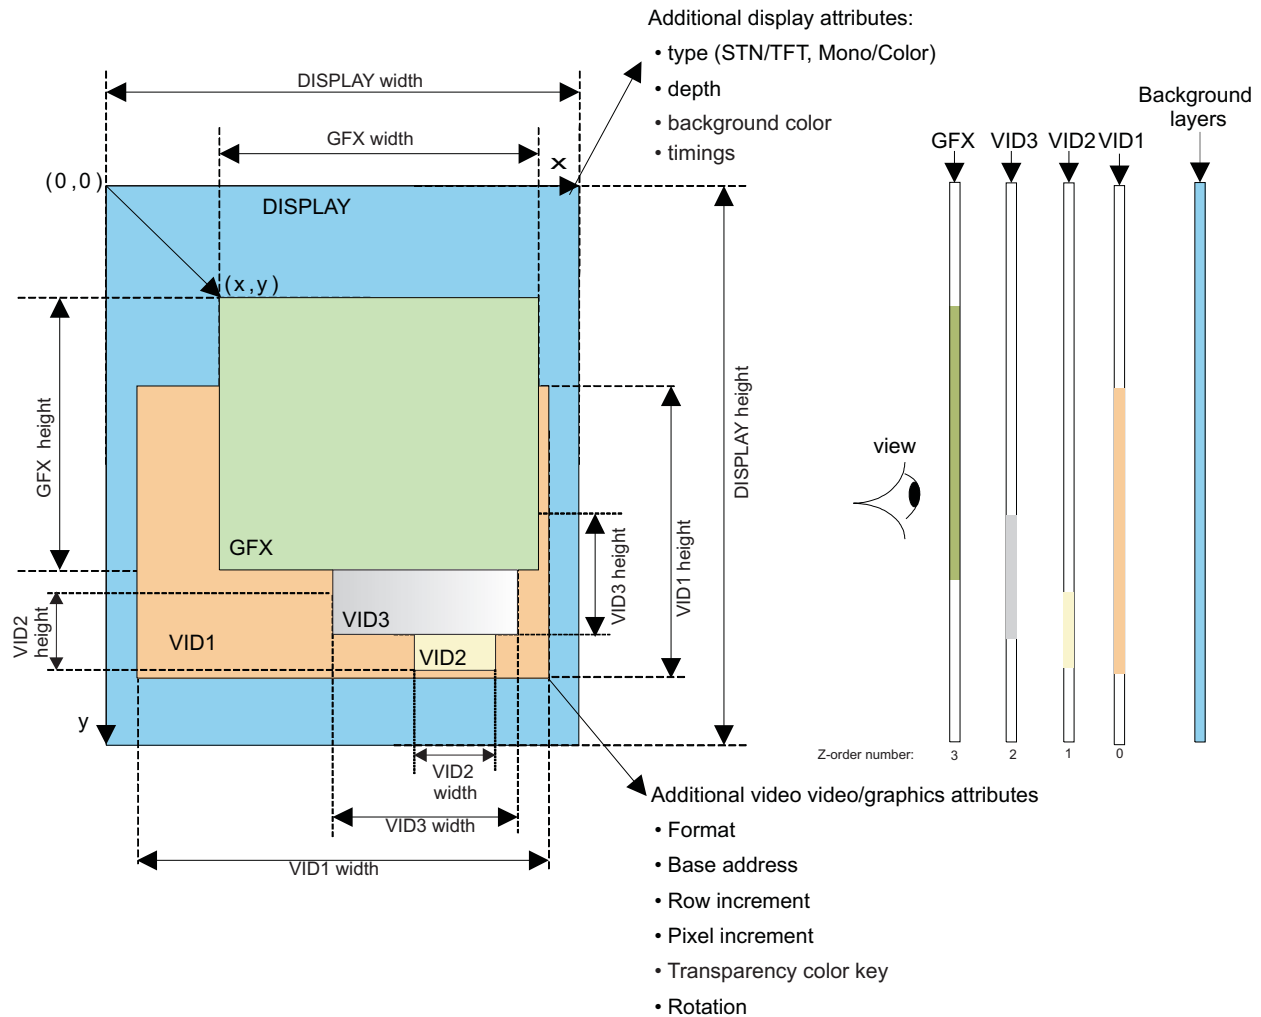

- If `ZORDERENABLE` = 1, each Z-order must be different for each active pipeline. It is not possible to use the same value for more than one pipeline.
- Two modes are maintained for backward compatibility with OMAP3430:
 - `LCDALPHABLENDERENABLE` = 0 and `ZORDERENABLE` = 0 equivalent to the normal mode overlay settings
 - `LCDALPHABLENDERENABLE` = 1 equivalent to the alpha mode overlay settings
- When OMAP3430 backward compatibility mode is to be used, the following must be considered:
 - If Z-order is disabled for the VID1 and VID2 pipelines, the pipeline data is output on the LCD1/LCD2/TV overlay.
 - If Z-order is disabled for the VID3 pipeline, the pipeline data is output only on the LCD2 overlay.

Figure 10-73. Priority Rule Architecture

The height and width of each enabled layer (pipeline) must be defined in the SIZEX and SIZEY bit fields [DISPC_GFX_SIZE\[26:16\]\[10:0\]](#)/ [DISPC_VIDp_SIZE\[26:16\]\[10:0\]](#), and its x and y positions defined in the POSX and POSY bit fields [DISPC_GFX_POSITION\[26:16\]\[10:0\]](#)/[DISPC_VIDp_POSITION\[26:16\]\[10:0\]](#). If there are no graphics or video-encoded pixels at a specific position, the programmable, solid background color appears. The solid background color is set in the [DISPC_DEFAULT_COLOR\[23:0\]](#) DEFAULTCOLOR bit field. [Figure 10-74](#) is an example of priority rule.

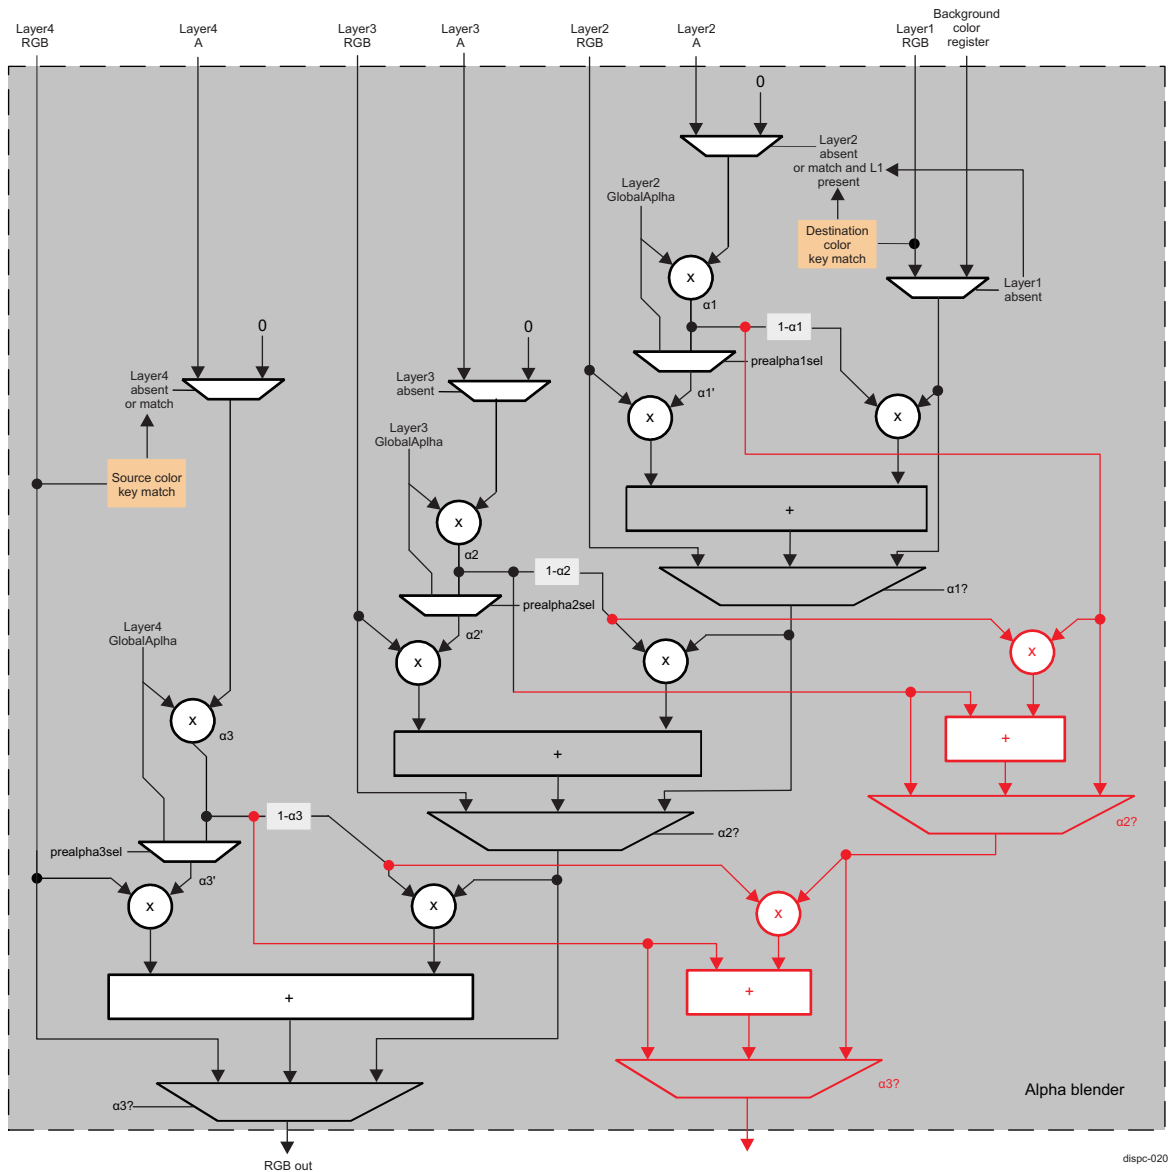

The Z-order reordering block must always map the pipelines to the blender logic in the same order—from background to foreground.

Figure 10-74. Example of Priority Rule: From Lower to Higher VID1, VID2, VID3, GFX

dispc-019

10.2.4.12.1.2 Alpha Blender

Figure 10-75 shows the alpha blending processing in detail.

Figure 10-75. Alpha Blending Architecture With Premultiplied Alpha Support

NOTE: "1-alpha" operator corresponds to the basic 1s-complement operation.

The alpha blending value is defined by:

- The component value A when using an ARGB or RGBA pixel format.
 - For ARGB-1555, the alpha blending is defined using a 1-bit value. It is converted into an 8-bit value by duplicating the 1-bit value (see [Table 10-52](#)).
 - For ARGB-4444, the alpha blending is defined using a 4-bit value. It is converted into an 8-bit value by duplicating the 4-bit value (see [Table 10-52](#)).
 - If the pixel format contains no alpha blending value, the pixel alpha value is considered to be 0xFF and if alpha is equal to 0xFF, there is no multiplication.
 - For BITMAP or YUV formats, there is no alpha blending factor associated with each pixel value. Only the global alpha blending factor associated with the window displaying the BITMAP or YUV format is used.
- The global alpha blending value set in the individual bit fields of the [DISPC_GLOBAL_ALPHA\[31:0\]](#)

register for LCD:

- VID3GLOBALALPHA
- VID2GLOBALALPHA
- VID1GLOBALALPHA
- GFXGLOBALALPHA
- A total alpha blending value can be used when a combination of the pixel alpha blending value A and a global alpha blending is present. The resulting alpha value is determined as : $\text{Alpha} = (\text{Pixel Alpha} * \text{Global Alpha}) / 256$.

Table 10-52 lists the percentage of alpha blending in the function of the alpha blending value on 8 bits.

Table 10-52. Alpha Blending – ARGB

Alpha Blending 1-Bit Value	Alpha Blending 4-Bit Value	Alpha Blending 8-Bit Value (Converted Value or Resulting Alpha)	% Blending
0x0	0x0	0x00	100% (transparent)
N/A	0x1	0x11	93.33%
N/A	0x2	0x22	86.6%
N/A
N/A	0xE	0xEE	6.6%
0x1	0xF	0xFF	0% (opaque)

Premultiplied Alpha

The image ARGB may have its RGB component already premultiplied with the alpha (ARGB) where:

- $R = A * R$
- $G = A * G$
- $B = A * B$

In that case, the processing is as follows:

- Color component of premultiplied layers are multiplied with the Global Alpha, if Global Alpha is not equal to 0.
- Color component of the composed underlying layers are multiplied with $(1-A) * \text{Global Alpha}$

The additional premultiplied alpha option is associated with the pipelines GFX, VID1, VID2, and VID3. The option is accessible through the [28] PREMULIPLYALPHA bit for the respective pipeline register:

- [DISPC_GFX_ATTRIBUTES](#)
- [DISPC_VID1_ATTRIBUTES](#)
- [DISPC_VID2_ATTRIBUTES](#)
- [DISPC_VID3_ATTRIBUTES](#)

The following settings are available:

- PREMULIPLYALPHA bit = 0: Source is not premultiplied with alpha. Full blending is done in the DISPC.
- PREMULIPLYALPHA bit = 1: Source is premultiplied with alpha. Partial blending is done.

NOTE: The *prealphasel* controls in [Figure 10-75](#), correspond to the PREMULIPLYALPHA of the pipelines mapped on the respective layers.

The logic marked in red color in [Figure 10-75](#) corresponds to the alpha value, computed when the Write Back channel copies back to memory the premultiplied color component: $A(\text{destination}) = A(\text{source}) + (1 - A(\text{source}) * A(\text{destination}))$

When [DISPC_WB_ATTRIBUTES\[7\]](#) ALPHAENABLE bit is cleared, or when the overlay channel is not selected for WB, the computation of the A(destination) is disabled. The default value for [DISPC_WB_ATTRIBUTES\[7\]](#) ALPHAENABLE bit is 0x0. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available:

- ALPHAENABLE bit is set to 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay.
- ALPHAENABLE bit is set to 0x0: The alpha value is not written back.

NOTE: The [DISPC_WB_ATTRIBUTES\[7\]](#) ALPHAENABLE bit is effective only when one of the output channels is written back, otherwise it is ignored.

10.2.4.12.1.3 Transparency Color Keys

The two transparency color keys are the source transparency color key and the destination transparency color key. The transparency color key can be used only with BITMAP formats (1-, 2-, 4-, and 8-bits per pixel) and RGB formats (ARGB, RGB, RGBA, and RGBx). In this case the A information is ignored for the comparison between the pixel value and the color key value. It is possible to use YUV formats with some care because the comparison is between the input pixel value of the overlay manager from pipeline (GFX or one of the VID pipelines depending on the Z-order) and the color key value. The YUV data is converted to RGB format. If the original format is YUV, the user must consider the color space conversion processing to define the RGB color key value used for the comparison.

The transparency color key is enabled by setting the following bits to 0x1:

- [DISPC_CONFIG1\[10\]](#) TCKLCDENABLE for LCD1
- [DISPC_CONFIG2\[10\]](#) TCKLCDENABLE for LCD2
- [DISPC_CONFIG1\[12\]](#) TCKTVENABLE for TV

The transparent color key is determined in the following bit fields.

- [DISPC_TRANS_COLOR0\[23:0\]](#) TRANSCOLORKEY for LCD1
- [DISPC_TRANS_COLOR2\[23:0\]](#) TRANSCOLORKEY for LCD2
- [DISPC_TRANS_COLOR1\[23:0\]](#) TRANSCOLORKEY for TV

NOTE:

- The video source transparency color key and graphics destination transparency color key cannot be active at the same time.
 - For CLUT bitmaps, the palette index is compared to the transparency color key and not to the palette value pointed out by the palette index.
-
- Video source transparency color key
The video source transparency color key value defines the encoded pixel data considered as transparent pixel. The encoded pixel values with the source color key value are not visible and the under layers encoded pixel values or solid background color are visible (the pixel alpha blending value of layer 4 is forced to 0x00, fully transparent).

The scaler can be enabled as a preprocessing in the VID pipeline. But it is necessary to consider the pixel scaling preprocessing in order to define the color key value to be used after the rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The source transparency color key mode is selected by setting the following bits to 0x1:

- [DISPC_CONFIG1\[11\]](#) TCKLCDSELECTION bit for LCD1
- [DISPC_CONFIG2\[11\]](#) TCKLCDSELECTION bit for LCD2
- [DISPC_CONFIG1\[13\]](#) TCKTVENABLE bit for TV

[Figure 10-76](#) shows an example of source color key. The pixels with the transparency color key are not displayed; instead, pixels of the resulting layer underneath are shown.

Figure 10-76. Source Transparency Color Key Example

dispc-021

- Graphics destination transparency color key value

The graphics destination transparency color key value defines the encoded pixels in layer 1 which are not displayed. Other layer 1 pixels (nonequal to destination transparency color key) are displayed over layer 2. The encoded pixel values with the destination color key value are pixels not visible on the screen because pixels at the same position in layer 2 are visible otherwise encoded pixels are visible above layer 2. The destination transparency color key is applicable only if layer 1 overlaps layer 2 (refer to the Z-order section for details on layer position depending on the Z-order parameter, [Section 10.2.4.12.1.1, Priority Rule](#)); otherwise, the destination transparency color key is ignored.

The scaler can be enabled as a preprocessor in the VID pipeline. It is necessary, however, to consider the pixel scaling preprocessing to define the color key value to be used after rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The destination transparency color key mode is selected by setting the following bits to 0x0:

- [DISPC_CONFIG1\[11\]](#) TCKLCDSELECTION bit for LCD
- [DISPC_CONFIG2\[11\]](#) TCKLCDSELECTION bit for LCD2
- [DISPC_CONFIG1\[13\]](#) TCKTVSELECTION bit for TV

[Figure 10-77](#) shows an example of the destination color key. The pixels, equal to the transparency color key, are not displayed and are replaced by layer 2 pixels. All other layer 1 pixels, different from the transparency color key, are displayed over layer 2.

Figure 10-77. Destination Transparency Color Key Example

dispc-022

10.2.4.12.1.4 Overlay Optimization

The overlay optimization consists in fetching only the required pixels meaning pixels that contribute to the final picture to be displayed (LCD1, LCD2, or TV). The decision to fetch the pixel from memory is based on the information available in the registers and on the following rules:

- The layer is enabled.
- The global alpha blending factor for the layer is different than 0x00.
- The current layer is behind a nonopaque layer (global alpha blending factor is different than 0xFF for the layer in the preceding).

The result of the overlay optimization is a reduction of the bandwidth by fetching only the mandatory pixels. The overlay mechanism is independent for each overlay: LCD1, LCD2, and TV. Because each layer (GFX, VID1, VID2, and VID3) can be associated to only one overlay at a time, it is possible to optimize the fetch of the pixels for each layer based on the overlay information. The overlay optimization must be run on the DMA engine time window and not on the display time window. The pixels are fetched by the DMA engine before the display processing.

The overlay optimization is enabled by setting the following bits to 0x1:

- [DISPC_CONTROL1](#)[12] OVERLAYOPTIMIZATION bit for LCD1
- [DISPC_CONTROL2](#)[12] OVERLAYOPTIMIZATION bit for LCD2
- [DISPC_CONTROL2](#)[13] TVOVERLAYOPTIMIZATION bit for TV

NOTE:

- The overlay optimization is not functional when a layer is using BITMAP1, BITMAP2, or BITMAP4 pixel formats.
 - The pixel alpha blending factor in case of ARGB and RGBA formats cannot be used to take advantage of the pixel fully transparent (alpha blending factor equals 0x00).
-

10.2.4.12.2 Gamma Correction Unit

In gamma curve mode, the selected encoded pixel values based on the color keys by the overlay manager from the video or graphics paths are sent to the gamma curve table. Each component of encoded pixel value is used as a pointer to index one out of 256 24-bit gamma curve entries in the table. Each 8-bit component is replaced with the 8-bit table value corresponding to R, G, or B component. The table is loaded by software. It is possible to load only part of the table. For each access to the table, the 24-bit value is associated with index in the table by concatenating the 24-bit value (LSB of 32-bit access) and the 8-bit index value (MSB of the 32-bit access). [Figure 10-78](#) describes the format of one of the gamma curve values in the memory.

NOTE: If the CLUT is used in the GFX pipeline for palette, the gamma correction unit is not available on the primary LCD.

Figure 10-78. Data Memory Organization for Gamma Mode in LCD Output

10.2.4.12.3 CPR Unit

The CPR unit can be used to correct the LCD output colorimetry in case of nonpure white backlight.

The CPR is enabled by setting the DISPC_CONFIG0[15] CPR bit to 0x1. The coefficients are programmed in the following registers:

- Red 10-bit signed coefficients in DISPC_CPRo_COEF_R
- Green 10-bit signed coefficients in DISPC_CPRo_COEF_G
- Blue 10-bit signed coefficients in DISPC_CPRo_COEF_B

The color phase rotation can be selected for passive and active matrix panel. The logic is integrated after the LCD overlay manager or the palette while using the gamma correction and before the spatial/temporal dithering. The color phase rotation can be selected to correct the nonpure white backlight of the LCD module by using a programmable matrix to convert the 24-bit RGB pixel value into a new 24-bit RGB pixel value. The matrix is programmed through a set of nine 10-bit signed coefficients. The output of the calculation is clipped to [0:255]. The color phase rotation is processed by the equation shown in [Figure 10-79](#). [Table 10-53](#) lists all coefficients with their respective bit field registers for settings.

Figure 10-79. Color Phase Rotation Matrix

$$\begin{bmatrix} R_{out} \\ G_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} R_r & R_g & R_b \\ G_r & G_g & G_b \\ B_r & B_g & B_b \end{bmatrix} * \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix}$$

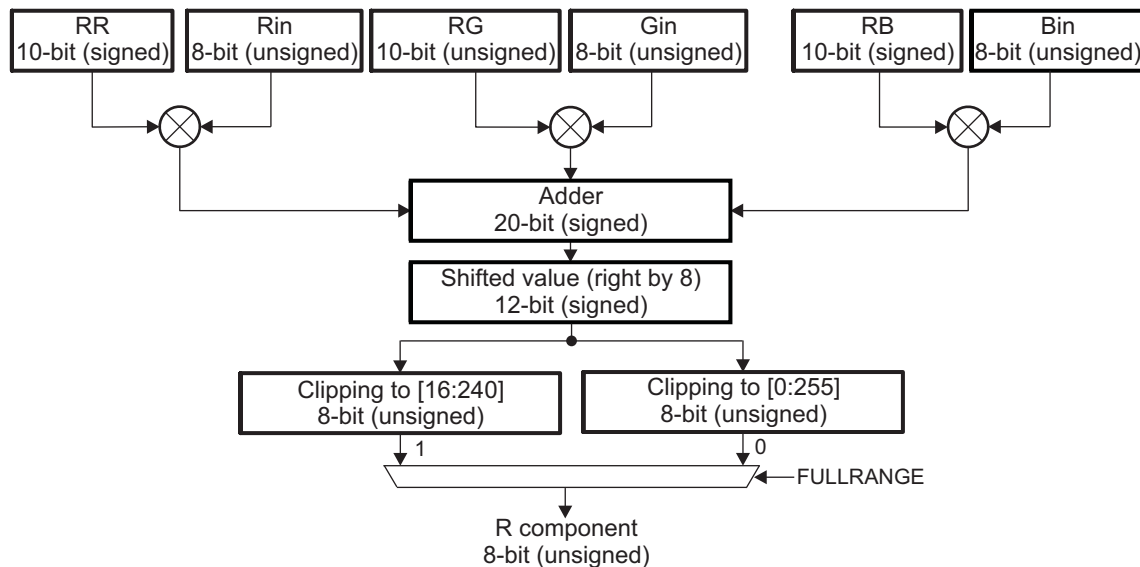

dispc-023

Table 10-53. CPR or RGB to YUV Coefficients With Associated Bit Fields

dispc-024

10.2.4.12.4 Passive Matrix

The passive matrix display supports 16, 256, or 3375 colors to be displayed in each frame, depending on the color depth. The monochrome LCD has 15 grayscale levels available. To enable a passive matrix output, the DISPC_CONTROLo[3] STNTFT bit must be set to 0x0.

Spatial/temporal dithering is performed when using the passive matrix data path. The spatial/temporal dithering logic can be selected to enhance the quality of the passive matrix. When selected, the pixels are preprocessed by the spatial/temporal dithering logic before the passive matrix display dithering logic. The output format of the spatial/temporal dithering logic is RGB 12-bit (not configurable). The dithering logic is integrated after the color phase rotation. The dithering algorithm is based on the frame rate control. The dithering logic can process the pixels one frame, two frames, or four frames. The number of frames is selected by setting the DISPC_CONTROLo[31:30] SPATIALTEMPORALDITHERINGFRAMES bit field. The temporal dithering logic is enabled by setting the DISPC_CONTROLo [7] STDITHERENABLE bit to 0x1. The output format of the dithering logic is RGB 12-bit (not configurable).

After the pixels, from GFX, VID pipelines, are merged depending on the transparency status and overlay, the result is sent to a color/grayscale temporal dither generator. The monochrome data or each RGB color component are encoded on 4 bits, which are the 4 MSBs of 8-bit pixel-encoded component defined by the merge of the graphics data and the video data.

These 4-bit values are used to select on the 16 intensity levels. The gray/color intensity is controlled by turning individual pixels on and off at varying period rates, making the average time the pixel is off longer than the average time the pixel is on, thus producing more intense grays/colors. The dithering generator also uses the intensity of adjacent pixels in the calculation to give the screen image a smooth appearance. The proprietary dither algorithm is optimized to provide a range of intensity values that matches the visual perception of color/gray graduations.

Single-panel monochrome screens use four or eight data lines; single-panel color screens use eight data pins. The output width is configured by setting the DISPC_CONTROLo[4] M8B bit, and the monochrome or color mode is selected by the DISPC_CONTROLo[2] MONOCOLOR bit.

10.2.4.12.5 Active Matrix

Depending on the color depth, the active matrix output:

- 24 BPP supports 16,777,216 colors.
- 18 BPP supports 262,144 colors.

- 16 BPP supports 65,536 colors.
- 12 BPP supports 4096 colors.

When in active matrix path configuration, after setting the DISPC_CONTROLo[3] STNTFT bit to 0x1, two submodules must be configured:

- Spatial/temporal dithering
- Multiple cycle output format (TDM)

10.2.4.12.5.1 Spatial/Temporal Dithering

When the active matrix path is used, the spatial/temporal dithering logic can be selected to enhance the quality of the active matrix outputs. The encoded pixel values are used by spatial/temporal dithering logic to display the data in a lower color depth on the LCD panel. The dithering logic is integrated after the CPR and before the TDM. The spatial/temporal dithering algorithm is based on the (x,y) pixel position and frame rate control. The dithering logic can process the pixels over one frame, two frames, or four frames. The number of frames is selected by setting the DISPC_CONTROLo[31:30] SPATIALTEMPORALDITHERINGFRAMES bit field. In the case of a single frame, only spatial processing is applied, and in multiple frames, spatial and temporal processing are applied to the pixels. The spatial/temporal dithering logic is enabled by setting the DISPC_CONTROLo[7] STDITHERENABLE bit to 0x1.

NOTE:

- If the interface data bus is smaller than the pixel format size and spatial/temporal dithering is not enabled, the MSBs of the pixel color components are output on the interface data bus.
 - If the interface data bus is wider than the pixel format size, by programming the pixel components replication active/inactive, the MSB is replicated to the LSB of the interface data bus or the LSB is filled with 0s.
-

10.2.4.12.5.2 Multiple Cycle Output Format (TDM)

The pixels, after the active matrix display processing, are formatted on one or multiple cycles (from one to three cycles). The number of bits for each cycle is set in the DISPC_DATAo_CYCLE1 for the first cycle, DISPC_DATAo_CYCLE2 for the second cycle, and DISPC_DATAo_CYCLE3 for the third cycle. The interface data bus width can be 8, 9, 12, or 16 bits. The configuration of the data bus is done in the DISPC_CONTROLo[9:8] TFTDATALINES bit field.

When the TDM is disabled, the DISPC outputs the pixels using the conventional formats: Passive matrix display/active matrix display monochrome/color.

NOTE: The passive matrix dithering logic is always bypassed in active matrix display.

Figure 10-81 through Figure 10-84 show various examples of TDM settings in the function of pixel data formats and the interface data bus width.

10.2.4.12.6 Synchronized Buffer Update

A synchronization mismatch between the frame buffer and the display refreshes, named tearing effect, can lead to images that appear to be stretched on the screen. To avoid it, a synchronization mechanism is used between the DISPC and the process that updates the buffer. An interrupt is generated when the display reaches a predefined line number. The PROGRAMMEDLINENUMBER_IRQ interrupt ([DISPC_IRQSTATUS](#) and [DISPC_IRQENABLE](#)) is a level signal and stays active during the programmed line of the display.

10.2.4.12.7 Timing Generator and Panel Settings

The size of and panel is defined by:

- Number of lines, DISPC_SIZE_LCD0[26:16] LPP bit field, with a value from 1 to 2048
- Number of pixels per line, DISPC_SIZE_LCD0[10:0]PPL bit field, with a value from 1 to 2048

Standard HSYNC/VSYNC timing generation are programmable for each LCD outputs independently:

- Horizontal front porch is set in the DISPC_TIMING_Ho[19:8] HFP bit field.
- Horizontal back porch is set in the DISPC_TIMING_Ho[31:20] HBP bit field.
- Horizontal synchronization pulse width is set in the DISPC_TIMING_Ho[7:0] HSW bit field.
- Vertical front porch is set in the DISPC_TIMING_Vo[19:8] VFP bit field.
- Vertical back porch is set in the DISPC_TIMING_Vo[31:20] VBP bit field.
- Vertical synchronization pulse width is set in the DISPC_TIMING_Vo[7:0] VSW bit field.

Horizontal/vertical synchronization and ACBIAS signals polarity are programmable by setting the DISPC_POL_FREQ0[12] IVS, DISPC_POL_FREQ0[13] IHS, and DISPC_POL_FREQ0[15] IEO bits. These signals can be gated by setting the DISPC_CONFIG0[7] VSYNCGATED and DISPC_CONFIG0[6] HSYNCGATED bits.

The latch of data can be driven on the rising or falling edge of the pixel clock by setting the DISPC_POL_FREQ0[14] IPC bit. The drive of the SYNC and VSYNC signals in the function of the pixel clock is done by setting the DISPC_POL_FREQ0[16] RF bit.

Table 10-54 describes the programming rules for LCD timing.

Table 10-54. Programming Rules

	No Downsampling	Downsampling H or V	Downsampling H + V
$(HBP + HSW + HFP) * PCD$	>8	>10	>20

Figure 10-85 shows the timing values description in the case of an active matrix display.

Figure 10-85. Timing Values (Active Matrix Display)

dispc-031

The 8-bit pixel clock divider (the [DISPC_DIVISOR](#)[7:0] PCD bit field) selects the pixel clock frequency. This bit field generates a range of pixel clock frequencies from LC/2 to LC/256, where LC is the logic clock from the divided functional clock of the DISPC by the [DISPC_DIVISOR](#)[23:16] LCD bit field.

The pixel clock is defined by the following equation:

$$\text{Pixel Clock} = (\text{FunctionalClock}/\text{LCD}[7:0])/\text{PCD}[7:0]$$

The pixel clock can be gated by setting the [DISPC_CONFIG0](#)[5] [PIXELCLOCKGATED](#) bit to 0x1.

The LCD output can be configured in progressive output or interlace output. The selection is done by writing into the [DISPC_CONFIG0](#)[22] [OUTPUTMODEENABLE](#) bit. The reset value is 0x0, which means progressive mode. When the progressive mode is selected, the FID signal associated to the LCD output is driven low (INACTIVE state). The selection can be changed only if the corresponding LCD output is disabled. The configuration is independent for each LCD output.

When in interlaced mode, the [DISPC_CONFIG0](#)[23] [FIDFIRST](#) bit indicates which field is output first:

- 0x0: Even field first (FID = 0)
- 0x1: Odd field first (FID = 1)

10.2.4.12.8 Stall Mode

Stall mode is used to indicate when the DISPC must stop sending data on the corresponding LCD output interface to avoid an overflow on the interface level. Stall mode is available when RFBI and DSI interface are used. The Interface asserts the stall signal to stop data output by the DISPC. It is deasserted by the interface to indicate when new data must be output by the DISPC. [Figure 10-86](#) shows the RFBI data stall mode activated.

Stall mode is selected by setting the [DISPC_CONTROL0](#)[11] [STALLMODE](#) bit.

NOTE: The [DISPC_CONTROL0](#)[5] [GOLCD](#) bit must not be set, but the DISPC configuration (DMA engine, pipelines associated with the LCD output) must be set before enabling the LCD output by setting the [DISPC_CONTROL0](#)[1] [LCDENABLE](#) bit.

Figure 10-86. RFBI Data Stall Signal Diagram

To avoid an underflow of the DMA buffer, the DMA buffer handshake must be enabled by setting the [DISPC_CONFIG0](#)[16] [BUFFERHANDCHECK](#) bit. The fullness of the buffers associated to the pipelines used for the LCD output is checked before providing data to the pipeline when the STALL signal is inactive. It prevents emptying the DMA buffer when the RFBI or DSI module requests data and there is not enough data in the DMA buffer of the DISPC. This feature must be enabled only when stall mode is used (STALLMODE set to 0x1). When the DMA buffer handshake is activated, the pixel transfer to the RFBI or DSI module, outside a STALL period, can be stopped and restarted when there are enough data in the DMA buffer. The DMA buffer handshake ensures that the underflow does not occur for the pipelines associated with the LCD output when RFBI/DSI interfaces are used. The rate of the data transfer to the RFBI or DSI is, then, fully dependent on the state of the DMA buffer. [Figure 10-87](#) shows the RFBI data stall with FIFO handcheck mode activated.

Figure 10-87. RFBI Data Stall Signal Diagram With Handcheck

Stall mode is independently used when the RFBI or DSI protocol engines are connected to the LCD outputs and receive the pixels to reformat the data.

The STALL signals from the RFBI and DSI interfaces are merged into a single signal in the display subsystem. Only one signal for each LCD output is connected to the DISPC. [Figure 10-88](#) shows the STALL signal implementation.

One STALL signal is generated by the RFBI. The RFBI module asserts the stall signal when no more data must be output by the DISPC. It is deasserted to indicate when new data must be output by the DISPC.

Two STALL signals are generated by the DSI1 protocol engine IP. It is used by the DSI1 protocol engine when data are provided from the DISPC to the DSI1 protocol engine using the two video ports in command mode only. If one of the two video ports is in video mode, the STALL signal associated with the video port from the DSI1 protocol engine is not used (must be in INACTIVE state from the DSI1 protocol engine IP).

One STALL signal is generated by the DSI2 P\protocol engine IP. It is used by the DSI2 protocol engine when data are provided from the DISPC to the DSI2 protocol engine using the single video port in command mode only. If the video port is in video mode, the STALL signal associated with the video port from the DSI2 protocol engine is not used (must be in INACTIVE state from the DSI2 protocol engine IP).

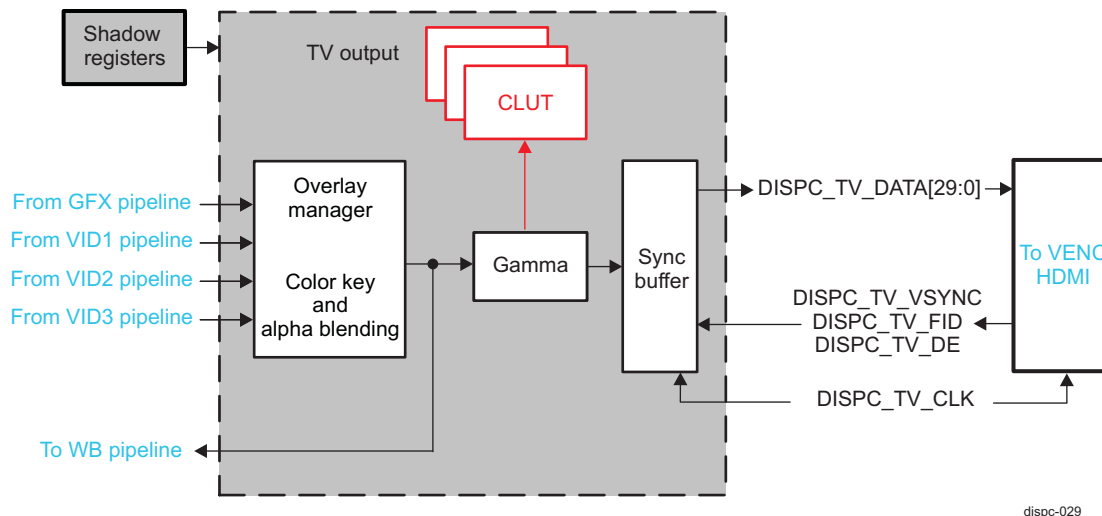

Figure 10-88. STALL Signal

10.2.4.13 TV Output

The TV output paths consist of several processing blocks (see [Figure 10-89](#)):

- Overlay manager
- Gamma correction unit
- Synchronization buffer

Figure 10-89. TV Output Architecture

dispc-029

The TV output is connected to the VENC or HDMI. In analog output or HDMI, the DISPC TV output receives an external clock, DISPC_TV_CLK, and based on the VSYNC generated by the VENC or HDMI, hold time, vertical offset, and horizontal offset, outputs the pixels synchronously. The size of the field/frame to output defines the number of pixels to output on each line and the number of lines for each field/frame.

10.2.4.13.1 Overlay Manager

The overlay mechanism is identical in LCD1 and LCD2 (see [Section 10.2.4.12.1, Overlay Manager](#)).

10.2.4.13.2 Gamma Correction Unit

The gamma correction unit works as described in [Section 10.2.4.12.2, Gamma Correction Unit](#). The only difference resides in the input pixel format RGB30. Each component of encoded pixel value is used as a pointer to index one out of 1024 30-bit gamma curve entries in the table. Each 10-bit component is replaced with the 10-bit table value corresponding to R, G, or B component. The table is loaded by software, through the [DISPC_GAMMA_TABLE2](#) register. It is possible to load only part of the table. For each write access to the table, the 30-bit gamma value is associated with bit[31] INDEX to indicate that a new table is defined. Setting bit[31] INDEX to 0x1 for the first time, resets the internal index counter. All the following accesses are considered to be for incremented index addressing in the table (bit [31] INDEX set to 0 for each subsequent access). [Figure 10-90](#) shows the format of one of the gamma curve values in the memory.

Figure 10-90. Data Memory Organization for Gamma Mode in TV Output

dispc-084

10.2.4.13.3 Synchronized Buffer Update

The synchronized buffer update is identical in LCD1 and LCD2 (see [Section 10.2.4.12.6, Synchronized Buffer Update](#)).

10.2.4.13.4 Timing and TV Format Settings

[Figure 10-91](#) shows the TV formats supported.

Figure 10-91. TV Formats

The size of a TV output format is defined by:

- Number of lines, [DISPC_SIZE_TV\[26:16\]](#) LPP bit field, with a value from 1 to 2048
- Number of pixels per line, [DISPC_SIZE_TV\[10:0\]](#) PPL bit field, with a value from 1 to 2048
- Delta size between odd/even field, [DISPC_SIZE_TV\[15:14\]](#) DELTA_LPP bit field. This bit field controls only the output channel and not the size of the data field fetched from the frame buffer in memory.

The hold time of the pixels on the data bus is determined in clock cycles by the [DISPC_CONTROL1\[19:17\]](#) HT bit field. The default value at reset time is 0x0 (one cycle).

- When connected to the video NTSC/PAL encoder in field mode, [Table 10-56](#) indicates the [DISPC_SIZE_TV](#) (PPL and LPP) value for each standard PAL and NTSC.

Table 10-55. PPL and LLP Value for TV Standard

Standards		Active Pixels/Line	Active Lines	Digital Clock	DISPC_SIZE_TV
ITU-R BT.601	NTSC(J, M, 4.43)	720	480	13.5 MHz	0x00EF02CF
	PAL(B, D, G, H, I, N)	720	576	13.5 MHz	0x011F02CF
	PAL(M)	720	480	13.5 MHz	0x00EF02CF
Square Pixel	NTSC(J, M, 4.43)	640	480	12.2727 MHz	0x00EF027F
	PAL(B, D, G, H, I, N)	768	576	14.75 MHz	0x011F02FF
	PAL(M)	640	480	12.2727 MHz	0x00EF027F

- When connected to the HDMI encoder, [Table 10-56](#) indicates the [DISPC_SIZE_TV](#) (PPL and LPP) value for each HD standard.

Table 10-56. PPL and LLP Value for HD Standard

Standards		Active Pixels/Line	Active Lines	Digital Clock	DISPC_SIZE_TV
HD standard	720p	1280	720	74.25/74.125 MHz (60/59.99..frames/s)	0x02CF04FF
	1080i	1920	540	74.25/74.125 MHz (60/59.99..frames/s)	0x021B07FF
	1080p	1920	1080	148.5/148.25 MHz (60/59.99..frames/s)	0x043707FF

- When connected to the HDMI encoder, to output any of the 3D frame-packing formats (720p@50 Hz and 720@60Hz, as defined in the HDMI v1.4 specification) supported by the device, [Table 10-57](#) lists the [DISPC_SIZE_TV](#) (PPL and LPP) value for each 3D standard.

Table 10-57. PPL and LLP Value for 3D Standard

Standards		Active Pixels/Line	Active Lines	Digital Clock	DISPC_SIZE_TV
3D standard	720p	1280	1470	148.5 MHz (50; 60 frames/s)	5BD04FF

NOTE: When configuring the DISPC for outputting any supported 3D frame-packing format, the following generic details must be considered:

- As defined by the HDMI v1.4 specification, Section 8.2.3.2, 3D frame-packing is a video format structure composed of two stereoscopic pictures: left and right.
- The stereoscopic pictures can be processed through any two of the three video pipelines (VID1, VID2, or VID3). For more information about the configuration of video pipelines, see [Section 10.2.4.10, Video Pipelines](#).
- The 3D frame is generated by setting the TV overlay manager to combine the outputs of the selected video pipelines that hold the pictures. One video pipeline must carry the top field of the 3D frame (left stereoscopic picture), and the other pipeline must carry the bottom field of the frame (right stereoscopic picture). The top and bottom fields are separated by an active space area. For more information, see the HDMI v1.4 specification, Section 8.2.3.2.
- The pipeline carrying each field (top and bottom) of the 3D frame must have its height and width parameters defined in the [26:16] SIZEY and [10:0] SIZEX bit fields of DISPC_VIDp_SIZE register, and its Y and X positions defined in the [26:16] POSY and [10:0] POSX bit fields of the DISPC_VIDp_POSITION register. The active space area of the 3D frame can be encoded by setting the solid background color for the TV output ([DISPC_DEFAULT_COLOR1\[23:0\] DEFAULTCOLOR](#) bit field). For more information about the overlay mechanism, see [Section 10.2.4.13.1, Overlay Manager](#).

10.2.4.14 Shadow Registers

Some DISPC registers are termed *shadow registers*. A shadow register change has no direct effect on the configuration of the DISPC. The registers are shadow registers to allow software to change the values of the registers at any time. When all the registers for a given configuration are into the registers, software must set 1 bit only in order to validate the configuration. When the hardware reaches the end of the current frame and sees that the bit field has been set by software, the new configuration is now the configuration used by the hardware.

The bits enabling the hardware to use the new configuration are:

- [DISPC_CONTROL1\[5\]](#) GOLCD bit for all the registers associated to the LCD1 output, and for all registers of WB and DMA, if the LCD1 channel is captured. The update of the registers of the WB and DMA is further delayed by the [DISPC_WB_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field or done when the next frame is captured (the [DISPC_WB_ATTRIBUTES\[26:24\]](#) CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- [DISPC_CONTROL1\[6\]](#) GOTV bit for all the registers associated to the TV output, and for all registers of WB and DMA, if the TV channel is captured. The update of the registers of the WB and DMA is further delayed by the [DISPC_WB_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field or done when the next frame is captured (the [DISPC_WB_ATTRIBUTES\[26:24\]](#) CAPTUREMODE bit field must be

different from 0). The update of the registers occurs at the external EVSYNC.

- [DISPC_CONTROL2](#)[5] GOLCD bit for all the registers associated to the LCD2 output, and for all registers of WB and DMA, if the LCD2 channel is captured. The update of the registers of the WB and DMA is further delayed by the [DISPC_WB_ATTRIBUTES2](#)[7:0] WBDELAYCOUNT bit field or done when the next frame is captured (the [DISPC_WB_ATTRIBUTES](#)[26:24] CAPTUREMODE bit field must be different from 0). The update of the registers occurs at the VFP start period.
- [DISPC_WB_ATTRIBUTES](#)[0] ENABLE bit for all the registers associated to the WB, if the transfer memory-to-memory is not associated with a channel out.
- The [DISPC_CONTROL2](#)[6] GOWB bit and the [5]GOLCD and [6]GOTV bits in the [DISPC_CONTROL1](#)/[DISPC_CONTROL2](#) registers, combined with the synchronization event of the channel output selected for write back. This applies to all registers associated with the selected channel out and further delayed by the setting in the [DISPC_WB_ATTRIBUTES2](#)[7:0] WBDELAYCOUNT bit field for all registers of the write back and DMA. The GOWB bit is required to be set only in WB capture mode; it is not required when WB memory-to-memory mode is used.

NOTE: Before setting the GOLCD, GOTV, or GOWB bits, the user must ensure that the bits are cleared. The hardware resets the bit when the update completes.

[Table 10-58](#) lists the shadow registers. Registers that do not have a mark in any column are not shadowed.

10.2.5 Display Controller Programming Guide

10.2.5.1 Display Controller Low-Level Programming Models

This section covers the low-level hardware programming sequences for the configuration and use of the module.

10.2.5.1.1 Global Initialization

10.2.5.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the DISPC module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DISPC. See the DISPC Module Integration and Environment Sections for more information.

Table 10-59. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management .
Control Module	Module-specific pad muxing and configuration must be set in the control module. See Chapter 18, Control Module .
MPU INTC or DSP INTC	MPU and/or DSP interrupt controller configuration must be done to enable the interrupts from DISPC module. See Chapter 17, Interrupt Controller .
Interconnect	See Chapter 13, Interconnect , for more information about the interconnect configuration.

10.2.5.1.2 Operational Modes Configuration

Table 10-60. DISPC Configuration

Step	Register / Bit Field / Programming Model
For a GFX pipeline configuration	
Configure the GFX DMA channel	Refer to Table 10-61
Configure the GFX pipeline	Refer to Table 10-64
Configure the LCD or TV output	For LCD output, refer to Table 10-82
	For TV output, refer to Table 10-88
For a Video pipeline configuration	
Configure the video DMA channel	Refer to Table 10-62
Configure the video pipeline	Refer to Table 10-69
Configure the LCD or TV output	For LCD output, refer to Table 10-82
	For TV output, refer to Table 10-88
For a WB pipeline configuration	
Configure the WB DMA channel	Refer to Table 10-63
Configure the WB pipeline	For video pipelines, refer to Table 10-77

10.2.5.1.2.1 DMA Configuration

10.2.5.1.2.1.1 Main Sequence - DISPC DMA Channel Configuration

This subsequence describes the parameters of the GFX, video, or WB DMA channel parameters.

Table 10-61. Configure the GFX DMA Channel

Step	Register / Bit Field / Programming Model	Value
Set the base address for RGB pixel format or BITMAP component format according to memory access type, rotation, mirroring (refer to section DMA)	DISPC_GFX_BA_j [31:0] BA	0x—
Set the rotation flag	DISPC_GFX_ATTRIBUTES [13:12] ROTATION	0x—
Set the number of bytes to increment at the end of the row	DISPC_GFX_ROW_INC [31:0] ROWINC	0x—
Set the number of bytes to increment between two pixels	DISPC_GFX_PIXEL_INC [7:0] PIXELINC	0x—
Determine the FIFO preload mode	DISPC_GFX_ATTRIBUTES [11] BUFPRELOAD	0x—
Set the preload value	DISPC_GFX_PRELOAD [11:0] PRELOAD	0x—
Determine the burst type	DISPC_GFX_ATTRIBUTES [29] BURSTTYPE	0x—
Set the burst size	DISPC_GFX_ATTRIBUTES [7:6] BURSTSIZE	0x—
Set the high level of DMA FIFO threshold	DISPC_GFX_BUF_THRESHOLD [31:16] BUFHIGHTRESHOLD	0x—
Set the low level of DMA FIFO threshold	DISPC_GFX_BUF_THRESHOLD [15:0] BUFLOWTRESHOLD	0x—
Enable Selfrefresh	DISPC_GFX_ATTRIBUTES [24] SELFREFRESH	0x—
Select priority over the other pipeline	DISPC_GFX_ATTRIBUTES [23] ARBITRATION	0x—

Table 10-62. Configure the Video DMA Channel

Step	Register / Bit Field / Programming Model	Value
Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (refer to section DMA)	DISPC_VIDp_BA_j [31:0] BA	0x—

Table 10-62. Configure the Video DMA Channel (continued)

Step	Register / Bit Field / Programming Model	Value
Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (refer to section DMA) ⁽¹⁾	DISPC_VIDp_BA_UV_j[31:0] BA	0x—
Set the rotation flag	DISPC_VIDp_ATTRIBUTES[13:12] ROTATION	0x—
Set the number of bytes to increment at the end of the row	DISPC_VIDp_ROW_INC[31:0] ROWINC	0x—
Set the number of bytes to increment between two pixels	DISPC_VIDp_PIXEL_INC[7:0] PIXELINC	0x—
Set the X original image size	DISPC_VIDp_PICTURE_SIZE[10:0] ORGSIZE_X	0x—
Set the Y original image size	DISPC_VIDp_PICTURE_SIZE[26:16] ORGSIZE_Y	0x—
Determine the FIFO preload mode	DISPC_VIDp_ATTRIBUTES[19] BUFPRELOAD	0x—
Set the preload value	DISPC_VIDp_PRELOAD[11:0] PRELOAD	0x—
Determine the burst type	DISPC_VIDp_ATTRIBUTES[29] BURSTTYPE	0x—
Set the burst size	DISPC_VIDp_ATTRIBUTES[15:14] BURSTSIZE	0x—
Set the high level of DMA FIFO threshold	DISPC_VIDp_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x—
Set the low level of DMA FIFO threshold	DISPC_VIDp_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x—
Enable Selfrefresh	DISPC_VIDp_ATTRIBUTES[24] SELFREFRESH	0x—
Select priority over the other pipeline	DISPC_VIDp_ATTRIBUTES[23] ARBITRATION	0x—

⁽¹⁾ Applicable only for YUV pixel format

Table 10-63. Configure the WB DMA Channel

Step	Register / Bit Field / Programming Model	Value
Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (refer to section DMA)	DISPC_WB_BA_j[31:0] BA	0x—
Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (refer to section DMA) ⁽¹⁾	DISPC_WB_BA_UV_j[31:0] BA	0x—
Set the stride of CbCr component ⁽²⁾	DISPC_WB_ATTRIBUTES[22] DOUBLESTRIDE	0x—
Set the rotation flag	DISPC_WB_ATTRIBUTES[13:12] ROTATION	0x—
Set the number of bytes to increment at the end of the row	DISPC_WB_ROW_INC[31:0] ROWINC	0x—
Set the number of bytes to increment between two pixels	DISPC_WB_PIXEL_INC[7:0] PIXELINC	0x—
Set the X final image size in system memory	DISPC_WB_PICTURE_SIZE[10:0] ORGSIZE_X	0x—
Set the Y final image size in system memory	DISPC_WB_PICTURE_SIZE[26:16] ORGSIZE_Y	0x—
Set the burst size	DISPC_WB_ATTRIBUTES[15:14] BURSTSIZE	0x—
Set the high level of DMA FIFO threshold	DISPC_WB_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD	0x—
Set the low level of DMA FIFO threshold	DISPC_WB_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD	0x—
Select priority over the other pipeline	DISPC_WB_ATTRIBUTES[23] ARBITRATION	0x—

⁽¹⁾ Applicable only for YUV pixel format

⁽²⁾ Applicable only for YUV pixel format

10.2.5.1.2.2 GFX Pipeline Configuration

10.2.5.1.2.2.1 Main Sequence - Configure the GFX Pipeline

This procedure details the steps for a GFX pipeline configuration described in [Table 10-64](#)

Table 10-64. Configure the GFX Pipeline

Step	Register / Bit Field / Programming Model	Value
Configure the GFX Window	Refer to Table 10-65	
Configure the GFX pipeline processing	Refer to Table 10-66	
Configure the GFX pipeline layer output	Refer to Table 10-68	
Validate the GFX configuration according to outputs associated to the pipeline	DISPC_CONTROL1 [5] GOLCD	
	DISPC_CONTROL2 [5] GOLCD	
	DISPC_CONTROL2 [6] GOWB	
	DISPC_CONTROL1 [6] GOTV	
Enable the GFX pipeline	DISPC_GFX_ATTRIBUTES [0] ENABLE	0x1

10.2.5.1.2.2.2 Subsequence - Configure the GFX Window

This subsequence describes the parameters of the image to be displayed on the LCD panel.

Table 10-65. Configure the GFX Window

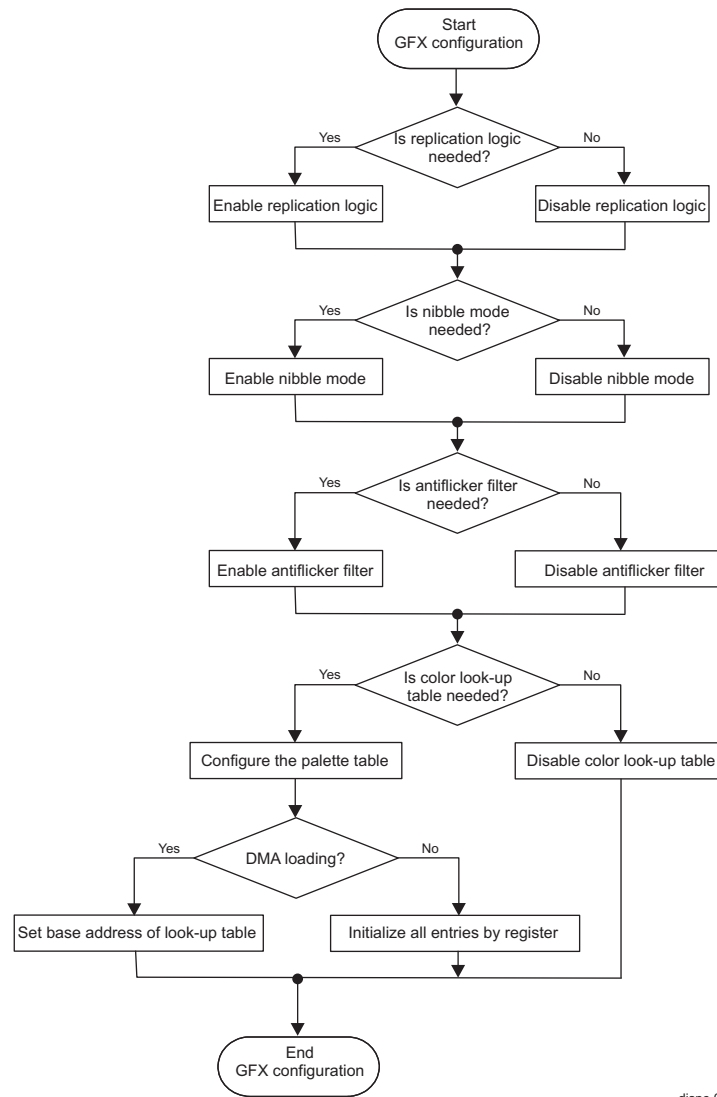

Step	Register / Bit Field / Programming Model	Value
Select the format of image	DISPC_GFX_ATTRIBUTES [4:1] FORMAT	0x–
Set the X size of image to be displayed onto LCD panel	DISPC_GFX_SIZE [10:0] SIZEX	0x–
Set the Y size of image to be displayed onto LCD panel	DISPC_GFX_SIZE [26:16] SIZEY	0x–
Set the X position of image in respect to LCD panel	DISPC_GFX_POSITION [10:0] POSX	0x–
Set the Y position of image in respect to LCD panel	DISPC_GFX_POSITION [26:16] POSY	0x–

10.2.5.1.2.2.3 Subsequence - Configure the GFX Pipeline Processing

Table 10-66. Configure the GFX Pipeline Processing

Step	Register / Bit Field / Programming Model	Value
Enable replication logic	DISPC_GFX_ATTRIBUTES [5] REPLICATIONENABLE	0x1
Enable nibble mode	DISPC_GFX_ATTRIBUTES [9] NIBBLEMODE	0x1
Enable anti flicker filter	DISPC_GFX_ATTRIBUTES [24] ANTIFLICKER	0x1
Configure the palette table	Refer to Table 10-67	0x–

Figure 10-92. Video Pipeline Processing Configuration

10.2.5.1.2.2.4 Subsequence - Configure the Palette Table

This subsequence resumes the settings for configuring the Color Look-Up table as palette for GFX pipeline,

NOTE:

- Software must ensure there is no visible effect when modifying the table since it is not under hardware control and the synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.
- If GFX pipeline is in BITMAP pixel format, gamma corrections is not available for LCD1.

Table 10-67. Configure the Palette Table

Step	Register / Bit Field / Programming Model	Value
Set look up table as palette table	DISPC_CONFIG1[3] PALETTEGAMMATABLE	0x0
Select the load mode of the palette look-up table	DISPC_CONFIG1[2:1] LOADMODE	0x–

Table 10-67. Configure the Palette Table (continued)

Step	Register / Bit Field / Programming Model	Value
DMA loading		
Set base address of look-up table	DISPC_GFX_TABLE_BA[31:0] TABLEBA	0x–
Initialize all entries by register		
Initialize all entries for the palette table by setting the table index and the RGB values associated to this index	DISPC_GAMMA_TABLE0[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

10.2.5.1.2.2.5 Subsequence - Configure the GFX Pipeline Layer Output

This subsequence resume the video layer settings available at the pipeline level necessary when using the overlay manager.

Table 10-68. Configure the GFX Pipeline Layer Output

Step	Register / Bit Field / Programming Model	Value
Set the LCD/TV output	DISPC_GFX_ATTRIBUTES[8] CHANNELOUT	0x–
If DISPC_GFX_ATTRIBUTES[8]=0, set the LCD output	DISPC_GFX_ATTRIBUTES[31:30] CHANNELOUT2	0x–
Set the Z-order priority of the layer for overlay manager	DISPC_GFX_ATTRIBUTES[27:26] ZORDER	0x–
Enable the video pipeline Z-order	DISPC_GFX_ATTRIBUTES[25] ZORDERENABLE	0x–
Set the Global Alpha value for the Alpha blender unit	DISPC_GLOBAL_ALPHA[7:0] GFXGLOBALALPHA	0x–

10.2.5.1.2.3 Video Pipeline Configuration

10.2.5.1.2.3.1 Main Sequence - Configure the Video Pipeline

This procedure details the steps for a video pipeline configuration described in [Table 10-69](#).

Table 10-69. Configure the Video Pipeline

Step	Register / Bit Field / Programming Model	Value
Configure the video window	Refer to Table 10-70	
Configure the video pipeline processing	Refer to Table 10-71	
Configure the video pipeline layer output	Refer to Table 10-76	
Validate the video configuration according to outputs associated to the pipeline	DISPC_CONTROL1[5] GOLCD	
	DISPC_CONTROL2[5] GOLCD	
	DISPC_CONTROL2[6] GOWB	
	DISPC_CONTROL1[6] GOTV	
Enable video pipeline	DISPC_VIDp_ATTRIBUTES[0] ENABLE	0x1

10.2.5.1.2.3.2 Subsequence - Configure the Video Window

This subsequence describes the parameters of the image to be displayed on the LCD panel.

Table 10-70. Configure the Video Window

Step	Register / Bit Field / Programming Model	Value
Select the format of image	DISPC_VIDp_ATTRIBUTES[4:1] FORMAT	0x–
Set the X size of image to be displayed onto LCD panel	DISPC_VIDp_SIZE[10:0] SIZE_X	0x–

Table 10-70. Configure the Video Window (continued)

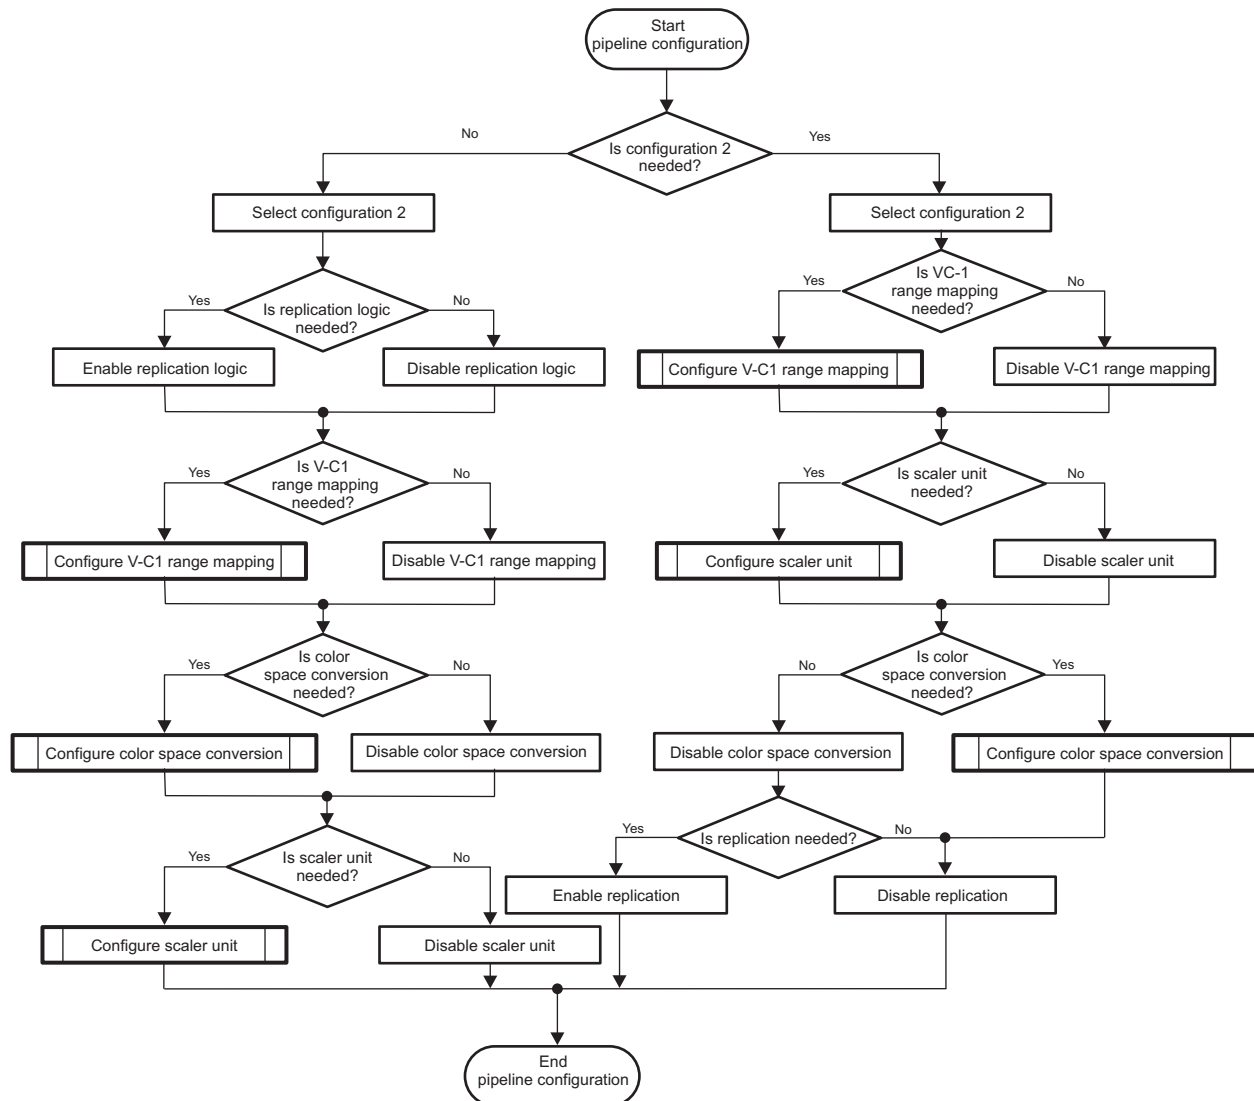

Step	Register / Bit Field / Programming Model	Value
Set the Y size of image to be displayed onto LCD panel	DISPC_VIDp_SIZE[10:0] SIZEY	0x–
Set the X position of image in respect to LCD panel	DISPC_VIDp_POSITION[10:0] POSX	0x–
Set the Y position of image in respect to LCD panel	DISPC_VIDp_POSITION[26:16] POSY	0x–

10.2.5.1.2.3.3 Subsequence - Configure the Video Pipeline Processing

Table 10-71. Configure the Video Pipeline Processing

Step	Register / Bit Field / Programming Model	Value
Select the video pipeline configuration 1 or 2	DISPC_VIDp_ATTRIBUTES2[8] YUVCHROMARESAMPLING	0x–
Enable/disable Replication Logic ⁽¹⁾	DISPC_VIDp_ATTRIBUTES[10] REPLICATIONENABLE	0x1
Configure the VC-1 range mapping ⁽¹⁾	Refer to Section 10.2.5.1.2.3.4	
Configure the video Color Space Conversion ⁽¹⁾	Refer to Section 10.2.5.1.2.3.5	
Configure the video Scaler Unit ⁽¹⁾	Refer to Section 10.2.5.1.2.3.6	

- ⁽¹⁾ This module configuration can be optional depending on:
- The video mode configuration selected, refer to [Figure 10-93](#)
 - The video format and application needs

Figure 10-93. Video Pipeline Processing Configuration

dispc-089

10.2.5.1.2.3.4 Subsequence - Configure the VC-1 Range Mapping**Table 10-72. Configure the VC-1 Range Mapping**

Step	Register / Bit Field / Programming Model	Value
Set the Y component VC-1 range mapping	DISPC_VIDp_ATTRIBUTES2[3:1] VC1_RANGE_Y	0x–
Set the Cb and Cr component VC-1 range mapping	DISPC_VIDp_ATTRIBUTES2[6:4] VC1_RANGE_CBCR	0x–
Enable VC-1 range mapping	DISPC_VIDp_ATTRIBUTES2[0] VC1ENABLE	0x1

10.2.5.1.2.3.5 Subsequence - Configure the Video Color Space Conversion

Table 10-73. Configure the Video Color Space Conversion

Step	Register / Bit Field / Programming Model	Value
Select the range of the Color Space Conversion	DISPC_VIDp_ATTRIBUTES[11] FULLRANGE	0x–
Set the RCr and RY coefficients	DISPC_VIDp_CONV_COEF0[26:16][10:0] RCR, RY	0x–
Set the GY and RCB coefficients	DISPC_VIDp_CONV_COEF1[26:16][10:0] GY, RCB	0x–
Set the GCb and GCr coefficients	DISPC_VIDp_CONV_COEF2[26:16][10:0] GCB, GCR	0x–
Set the BCr and BY coefficients	DISPC_VIDp_CONV_COEF3[26:16][10:0] BCR, BY	0x–
Set the BCb coefficient	DISPC_VIDp_CONV_COEF4[10:0] BCB	0x–
Enable Color Space Conversion	DISPC_VIDp_ATTRIBUTES[9] COLORCONVENABLE	0x1

10.2.5.1.2.3.6 Subsequence - Configure the Video Scaler Unit

This subsequence configures the video scaler unit. [Table 10-74](#) is applicable for RGB pixel format. [Table 10-74](#) and [Table 10-75](#) are applicable for YUV pixel format.

Table 10-74. Configure the Video Scaler Unit for RGB Pixel Formats or Y Component

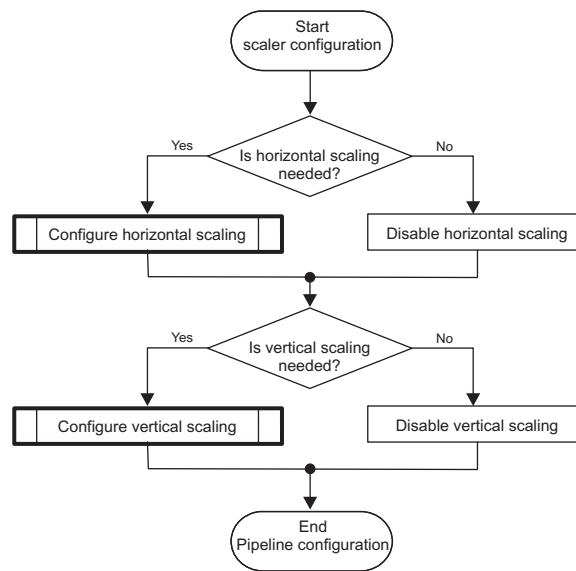

Step	Register / Bit Field / Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio	DISPC_VIDp_FIR[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients	DISPC_VIDp_FIR_COEF_H_i[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_VIDp_FIR_COEF_HV_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value	DISPC_VIDp_ACCU_i[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Select number of vertical taps	DISPC_VIDp_ATTRIBUTES[21] VERTICALTAPS	0x–
Set the vertical resizing ratio	DISPC_VIDp_FIR[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for RGB pixel format or Y component	DISPC_VIDp_FIR_COEF_HV_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for RGB pixel format or Y component	DISPC_VIDp_ACCU_j[26:16] VERTICALACCU	0x–
Enable horizontal and vertical Scaler Unit	DISPC_VIDp_ATTRIBUTES[6:5] RESIZEENABLE	0x–

Table 10-75. Configure the Video Scaler Unit for Cb and Cr Components

Step	Register / Bit Field / Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio for Cb and Cr components	DISPC_VIDp_FIR2[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients for Cb and Cr components	DISPC_VIDp_FIR_COEF_H2_i[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_VIDp_FIR_COEF_HV2_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value for Cb and Cr components	DISPC_VIDp_ACCU2_i[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Set the vertical resizing ratio for Cb and Cr components	DISPC_VIDp_FIR2[28:16] FIRVINC	0x–

Table 10-75. Configure the Video Scaler Unit for Cb and Cr Components (continued)

Step	Register / Bit Field / Programming Model	Value
Set the vertical FIR coefficients for Cb and Cr components	DISPC_VIDp_FIR_COEF_HV2_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V2_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for Cb and Cr components	DISPC_VIDp_ACCU2_i[26:16] VERTICALACCU	0x–

Figure 10-94. Scaler Unit Programming Flow

dispc-090

10.2.5.1.2.3.7 Subsequence - Configure the Video Pipeline Layer Output

This subsequence resume the video layer settings available at the pipeline level necessary when using the overlay manager.

Table 10-76. Configure the Video Pipeline Layer Output

Step	Register / Bit Field / Programming Model	Value
Set the LCD/TV output	DISPC_VIDp_ATTRIBUTES[16] CHANNELOUT	0x–
If DISPC_VIDp_ATTRIBUTES[16]=0, set the LCD output	DISPC_VIDp_ATTRIBUTES[31:30] CHANNELOUT2	0x–
Set the Z-order priority of the layer for overlay manager	DISPC_VIDp_ATTRIBUTES[27:26] ZORDER	0x–
Enable the video pipeline Z-order	DISPC_VIDp_ATTRIBUTES[25] ZORDERENABLE	0x–
Set the Global Alpha value for the Alpha blender unit	DISPC_GLOBAL_ALPHA[31:24][23:16][15:8] VID3GLOBALALPHA, VID2GLOBALALPHA , VID1GLOBALALPHA	0x–

10.2.5.1.2.4 WB Pipeline Configuration

10.2.5.1.2.4.1 Main Sequence - Configure the WB Pipeline

This procedure details the steps for a WB pipeline configuration described in [Table 10-77](#).

Table 10-77. Configure the WB Pipeline

Step	Register / Bit Field / Programming Model	Value
Configure the Capture window	Refer to Table 10-78	
Configure the WB Scaler unit	Refer to Table 10-79	
Enable truncation logic to match pixel size defined in the format of image DISPC_WB_ATTRIBUTES [4:1] FORMAT	DISPC_WB_ATTRIBUTES [10] TRUNCATIONENABLE	0x–
if DISPC_WB_ATTRIBUTES [10] != , Configure the WB Color Space Conversion unit	Refer to Table 10-81	
Validate the configuration according to the registers modification. ⁽¹⁾	DISPC_CONTROL2 [6] GOWB	
Enable WB pipeline	DISPC_WB_ATTRIBUTES [0] ENABLE	0x1

⁽¹⁾ Setting the GOWB bit is required only in WB capture mode; it is not required in WB memory-to-memory mode.

10.2.5.1.2.4.2 Subsequence - Configure the Capture Window

This subsequence describes the parameters of the image to be captured in the system memory.

Table 10-78. Configure the Capture Window

Step	Register / Bit Field / Programming Model	Value
Set the input source	DISPC_WB_ATTRIBUTES [18:16] CHANNELIN	0x–
Select the format of image	DISPC_WB_ATTRIBUTES [4:1] FORMAT	0x–
Set the X size of image to be captured	DISPC_WB_SIZE [10:0] SIZEX	0x–
Set the Y size of image to be captured	DISPC_WB_SIZE [10:0] SIZEY	0x–

10.2.5.1.2.4.3 Subsequence - Configure the WB Scaler Unit

This subsequence configures the scaler unit. [Table 10-74](#) is applicable for RGB pixel format. [Table 10-74](#) and [Table 10-75](#) are applicable for YUV pixel format.

Table 10-79. Configure the WB Scaler Unit for RGB Pixel Formats or Y Component

Step	Register / Bit Field / Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio	DISPC_WB_FIR [12:0] FIRHINC	0x–
Set the horizontal FIR coefficients	DISPC_WB_FIR_COEF_H_i [31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_WB_FIR_COEF_HV_i [7:0] FIRHC4	0x–
Set the horizontal accumulators value	DISPC_WB_ACCU_j [10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Select number of vertical taps	DISPC_WB_ATTRIBUTES [21] VERTICALTAPS	0x–
Set the vertical resizing ratio	DISPC_WB_FIR [28:16] FIRVINC	0x–
Set the vertical FIR coefficients for RGB pixel format or Y component	DISPC_WB_FIR_COEF_HV_i [31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_WB_FIR_COEF_V_i [15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for RGB pixel format or Y component	DISPC_WB_ACCU_j [26:16] VERTICALACCU	0x–
Enable horizontal and vertical Scaler Unit	DISPC_WB_ATTRIBUTES [6:5] RESIZEENABLE	0x–

Table 10-80. Configure the WB Scaler Unit for Cb and Cr Components

Step	Register / Bit Field / Programming Model	Value
Configure horizontal scaling		
Set the horizontal resizing ratio for Cb and Cr components	DISPC_WB_FIR2[12:0] FIRHINC	0x–
Set the horizontal FIR coefficients for Cb and Cr components	DISPC_WB_FIR_COEF_H2_i[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0	0x–
	DISPC_WB_FIR_COEF_HV2_i[7:0] FIRHC4	0x–
Set the horizontal accumulators value for Cb and Cr components	DISPC_WB_ACCU2_i[10:0] HORIZONTALACCU	0x–
Configure vertical scaling		
Set the vertical resizing ratio for Cb and Cr components	DISPC_WB_FIR2[28:16] FIRVINC	0x–
Set the vertical FIR coefficients for Cb and Cr components	DISPC_WB_FIR_COEF_HV2_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0	0x–
	Only for 5-taps vertical: DISPC_WB_FIR_COEF_V2_i[15:8][7:0] FIRVC22, FIRVC00	0x–
Set the vertical accumulators value for Cb and Cr components	DISPC_WB_ACCU2_i[26:16] VERTICALACCU	0x–

10.2.5.1.2.4.4 Subsequence - Configure the WB Color Space Conversion Unit

Table 10-81. Configure the WB Color Space Conversion Unit

Step	Register / Bit Field / Programming Model	Value
Select the range of the Color Space Conversion	DISPC_WB_ATTRIBUTES[11] FULLRANGE	0x–
Set the RCr and RY coefficients	DISPC_WB_CONV_COEF0[26:16][10:0] YG, YR	0x–
Set the GY and RCb coefficients	DISPC_WB_CONV_COEF1[26:16][10:0] CRR, YB	0x–
Set the GCb and GCr coefficients	DISPC_WB_CONV_COEF2[26:16][10:0] CRB, CRG	0x–
Set the BCr and BY coefficients	DISPC_WB_CONV_COEF3[26:16][10:0] CBG, CBR	0x–
Set the BCb coefficient	DISPC_WB_CONV_COEF4[10:0] CBB	0x–
Enable Color Space Conversion	DISPC_WB_ATTRIBUTES[9] COLORCONVENABLE	0x1

10.2.5.1.2.5 LCD Output Configuration

10.2.5.1.2.5.1 Main Sequence - Configure the LCD Output

This procedure details the LCD output configuration.

Table 10-82. Configure the LCD Output

Step	Register / Bit Field / Programming Model
Configure the LCD overlay manager	Table 10-83
Configure the gamma table for gamma correction	Section 10.2.5.1.2.5.3
Configure the Color Phase Rotation	Table 10-86
Configure the LCD panel timings and parameters	Table 10-87
Validate the LCD output configuration according	DISPC_CONTROL1[5] GOLCD
	DISPC_CONTROL2[5] GOLCD
Enable LCD output	DISPC_CONTROL1[0] LCDENABLE
	DISPC_CONTROL2[0] LCDENABLE

10.2.5.1.2.5.2 Subsequence - Configure the Overlay Manager

This subsequence resumes the overlay manager settings and transparency color key configuration.

Table 10-83. Configure the LCD Overlay Manager

Step	Register / Bit Field / Programming Model	Value
Set the LCD panel background color	DISPC_DEFAULT_COLORo[23:0] DEFAULTCOLOR	0x–
Enable/Disable overlay optimization	DISPC_CONTROLo[12] OVERLAYOPTIMIZATION	0x–
Enable the Alpha blender ⁽¹⁾	DISPC_CONFIG1[18] LCDALPHABLENDERENABLE	0x1
Configure the transparency color key		
Set source or destination transparency color key mode	DISPC_CONFIGo[11] TCKLCDSELECTION	0x–
Set the transparency color value	DISPC_TRANS_COLORo[23:0] TRANSCOLORKEY	0x–
Enable transparency color key mode	DISPC_CONFIGo[10] TCKLCDENABLE	0x–

⁽¹⁾ Backward compatibility with OMAP34xx only available for LCD1.

10.2.5.1.2.5.3 Subsequence - Configure the Gamma Table for Gamma Correction

This subsequence resumes the settings for configuring the gamma correction for LCD1, see [Table 10-84](#) and LCD2, see [Table 10-85](#).

NOTE:

- Software must ensure there is no visible effect when modifying the table because it is not under hardware control and the synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.
- If GFX pipeline is in BITMAP pixel format, gamma corrections is not available for LCD1.

Table 10-84. Configure the Gamma Table for LCD1

Step	Register / Bit Field / Programming Model	Value
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index	DISPC_GAMMA_TABLE0[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–
Set look up table as gamma table	DISPC_CONFIG1[3] PALETTEGAMMATABL	0x1
Select the load mode of the Gamma look-up table	DISPC_CONFIG1[2:1] LOADMODE	0x–

Table 10-85. Configure the Gamma Table for LCD2

Step	Register / Bit Field / Programming Model	Value
Enable Gamma table for LCD2 and TV	DISPC_CONFIG1[9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index.	DISPC_GAMMA_TABLE1[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

10.2.5.1.2.5.4 Subsequence - Configure the Color Phase Rotation

[Table 10-86](#) resumes the settings for the Color Phase Rotation unit.

Table 10-86. Configure the Color Phase Rotation

Step	Register / Bit Field / Programming Model	Value
Set the Red coefficients	DISPC_CPRo_COEF_R [31:22][20:11][9:0] RR, RG, RB	0x–
Set the Green coefficients	DISPC_CPRo_COEF_G [31:22][20:11][9:0] GR, GG, GB	0x–

Table 10-86. Configure the Color Phase Rotation (continued)

Step	Register / Bit Field / Programming Model	Value
Set the Blue coefficients	DISPC_CPRo_COEF_B [31:22][20:11][9:0] BR, BG, BB	0x–
Disable Color Phase Rotation unit in RGB to YUV conversion	DISPC_CONFIGo[24] COLORCONVENABLE	0x0
Enable Color Phase Rotation unit	DISPC_CONFIGo[15] CPR	0x1

10.2.5.1.2.5.5 Subsequence - Configure the LCD Panel Timings and Parameters

This subsequence resumes the setting for horizontal and vertical synchronization and also the signals polarity.

Table 10-87. Configure the LCD Panel Timings and Parameters

Step	Register / Bit Field / Programming Model	Value
Configure Spatial/Temporal Dithering		
Select Spatial/Temporal number of frames	DISPC_CONTROLo[31:30] SPATIALTEMPORALDITHERINGFRAMES	0x–
Enable Spatial/Temporal dithering	DISPC_CONTROLo[7] STDITHERENABLE	0x–
Configure AC-bias		
Configure the VSYNC, HSYNC and AC bias polarity	DISPC_POL_FREQo	0x–
Configure the gating of AC bias polarity	DISPC_CONFIGo[8] ACBIASGATED	0x–
Configure the AC bias polarity	DISPC_POL_FREQo[15] IEO	0x–
Set the AC bias frequency	DISPC_POL_FREQo[7:0] ACB	0x–
Set the number of AC bias transitions per interrupt	DISPC_POL_FREQo[11:8] ACBI	0x–
Configure the pixel clock		
Set the DISPC logic clock divisor	DISPC_DIVISORo[23:16] LCD	0x–
Set the pixel clock divisor	DISPC_DIVISORo[7:0] PCD	0x–
Configure the gating of Pixel clock	DISPC_CONFIGo[5] PIXELCLOCKGATED	0x–
Configure the data		
Set the pixel clock edge to drive data output	DISPC_POL_FREQo[14] IPC	0x–
Configure the gating of data output	DISPC_CONFIGo[4] PIXELDATAGATED	0x–
Set the data output mode	DISPC_CONFIGo[22] OUTPUTMODEENABLE	0x–
Configure the panel parameters		
Set the vertical TV size	DISPC_SIZE_LCDo[26:16] LPP	0x–
Set the horizontal TV size	DISPC_SIZE_LCDo[10:0] PPL	0x–
Set the panel type	DISPC_CONTROLo[3] STNTFT	0x–
Configure the refresh rate and horizontal and vertical parameters		
Set the vertical synchronization timing	DISPC_TIMING_Vo[31:20][19:8][7:0], VBP, VFP, VSW	0x–
Configure the VSYNC polarity	DISPC_POL_FREQo[12] IVS	0x–
Configure the gating of VSYNC	DISPC_CONFIGo[7] VSYNCGATED	0x–
Set the horizontal synchronization timing	DISPC_TIMING_Ho[31:20][19:8][7:0], HBP, HFP, HSW	0x–
Configure the HSYNC polarity	DISPC_POL_FREQo[13] IHS	0x–
Configure the gating of HSYNC	DISPC_CONFIGo[6] HSYNCGATED	0x–
Set the opposition of HSYNC and VSYNC driving	DISPC_POL_FREQo[17] ONOFF	0x–
If DISPC_POL_FREQo[17] = 1, set the pixel clock edge to drive HSYNC and VSYNC	DISPC_POL_FREQo[16] RF	0x–
Set the alignment of HSYNC and VSYNC	DISPC_POL_FREQo[18] ALIGN	0x–

10.2.5.1.2.6 TV Output Configuration

Main Sequence - Configure the TV Output

This procedure details the TV output configuration.

Table 10-88. Configure the TV Output

Step	Register / Bit Field / Programming Model
Configure the TV overlay manager	Refer to Table 10-89
Configure the gamma table for gamma correction	Refer to Table 10-90
Configure the TV panel timings and parameters	Refer to Table 10-91
Validate the TV output configuration according	DISPC_CONTROL1 [6] GOTV
Enable TV output	DISPC_CONTROL1 [1] TVENABLE

10.2.5.1.2.6.1 Subsequence - Configure the TV Overlay Manager

This subsequence resumes the overlay manager settings and transparency color key configuration.

Table 10-89. Configure the TV Overlay Manager

Step	Register / Bit Field / Programming Model	Value
Set the TV panel background color	DISPC_DEFAULT_COLOR1 [23:0] DEFAULTCOLOR	0x–
Enable/Disable overlay optimization	DISPC_CONTROL2 [13] TVOVERLAYOPTIMIZATION	0x–
Enable the Alpha blender ⁽¹⁾	DISPC_CONFIG1 [19] TVALPHABLENDERENABLE	0x1
Configure the transparency color key		
Set source or destination transparency color key mode	DISPC_CONFIG1 [13] TCKTVSELECTION	0x–
Set the transparency color value	DISPC_TRANS_COLOR1 [23:0] TRANSCOLORKEY	0x–
Enable transparency color key mode	DISPC_CONFIG1 [10] TCKTVENABLE	0x–

⁽¹⁾ Backward compatibility with OMAP34xx.

10.2.5.1.2.6.2 Subsequence - Configure the Gamma Table for Gamma Correction

NOTE:

- Software must ensure there is no visible effect when modifying the table since it is not under hardware control and the synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.

Table 10-90. Configure the Gamma Table for TV Output

Step	Register / Bit Field / Programming Model	Value
Enable Gamma table for LCD2 and TV	DISPC_CONFIG1 [9] GAMATABLEENABLE	0x1
Initialize all entries for the gamma table by setting the table index and the RGB values. For more information, see Section 10.2.4.13.2, Gamma Correction Unit .	DISPC_GAMMA_TABLE2 [31][29:20][19:10][9:0], INDEX, VALUE_R, VALUE_G, VALUE_B	0x–

10.2.5.1.2.6.3 Subsequence - Configure the TV Panel Timings and Parameters

This subsequence resumes the setting for horizontal and vertical synchronization and also the signals polarity.

Table 10-91. Configure the TV Panel Timings and Parameters

Step	Register / Bit Field / Programming Model	Value
Set the hold time for TV data outputs	DISPC_CONFIG1[19:17]	0x–
Set the vertical TV size	DISPC_SIZE_TV[26:16] LPP	See Table 10-92 for NTSC/PAL and HD standards
Set the horizontal TV size	DISPC_SIZE_TV[10:0] PPL	

Table 10-92. DISPC_SIZE_TV Values NTSC/PAL and HD Standard

Standards		Active Pixels/line (PPL)	Active Lines (LPP)	Digital clock (DISPC_CONTROL1. HT=0)	DISPC_SIZE_TV
ITU-R BT.601	NTSC(J, M, 4.43)	720	480	13.5 MHz	0x00EF02CF
	PAL(B, D, G, H, I, N)	720	576	13.5 MHz	0x011F02CF
	PAL(M)	720	480	13.5 MHz	0x00EF02CF
Square Pixel	NTSC(J, M, 4.43)	640	480	12.2727 MHz	0x00EF027F
	PAL(B, D, G, H, I, N)	768	576	14.75 MHz	0x011F02FF
	PAL(M)	640	480	12.2727 MHz	0x00EF027F
HDTV	720p	1280	720	74.25/74.125 MHz (60/59.99..frames/s)	0x02CF04FF
	1080i	1920	540	74.25/74.125 MHz (60/59.99..fields/s)	0x021B07FF
	1080p	1920	1080	148.5/148.25 MHz (60/59.99..frames/s)	0x043707FF

10.2.6 Display Controller Use Cases and Tips

10.2.6.1 Hardware Cursor

The video layer or graphics layer can be used to display the hardware cursor. The encoded pixel data for the cursor image are in xRGB12-4444, ARGB16-4444, RGBx12-4444, RGBA16-4444, ARGB16-1555, RGB16-565, RGB24-888, xRGB24-88888, RGBA32-8888 or ARGB32-8888 formats if the source transparency color key is used; otherwise, any pixel format can be used for the cursor image considering the limitation in term of pixel supported by the pipeline used to display the cursor image. To display nonrectangle cursor, the transparency color key can be used or the alpha blending (pixel alpha blending); see Section 10.2.4.12.1.3. The global alpha blending can be used in addition to the transparency source color key to make some fading effect when the cursor (with a nonrectangle shape) appears and disappears on the screen. The image of the cursor can be stored totally inside the DMA buffer in order to use the self-refresh mode (see Section 10.2.4.6.6.2). In that case, the image is loaded once and then displayed without accessing the system memory for loading the image for each frame. This saves bandwidth on interconnect and memory.

10.2.7 Display Controller Register Manual

CAUTION

The main access to all DISPC registers is through the L3 interconnect.
The access through L4_PER interconnect is provided for back software compatibility.

10.2.7.1 Display Controller Instance Summary

Table 10-93. DISPC Instance Summary

Module Name	L4_PER Base Address	L3 Base Address	Size
DISPC	0x4804 1000	0x5800 1000	4KB

10.2.7.2 Display Controller Logical Register Mapping

Table 10-94. DISPC_VIDp_BA_j Logical Register Mapping

Table 10-118. DISPC_CONFIGo Logical Register Mapping

Hardware Register	Description
DISPC_CONFIG1	Configuration of the LCD1 and TV.
DISPC_CONFIG2	Configuration of the LCD2.

Table 10-119. DISPC_DEFAULT_COLORo Logical Register Mapping

Hardware Register	Description
DISPC_DEFAULT_COLOR0	Configuration of the background color for LCD1.
DISPC_DEFAULT_COLOR1	Configuration of the background color for LCD2.

Table 10-120. DISPC_TRANS_COLORo Logical Register Mapping

Hardware Register	Description
DISPC_TRANS_COLOR0	Configuration of the transparency color key for LCD1.
DISPC_TRANS_COLOR1	Configuration of the transparency color key for LCD2.

Table 10-121. DISPC_GAMMA_TABLEo Logical Register Mapping

Hardware Register	Description
DISPC_GAMMA_TABLE0	Configuration of the palette table for GFX or the gamma table for LCD1.
DISPC_GAMMA_TABLE1	Configuration of the gamma table for LCD2.
DISPC_GAMMA_TABLE2	Configuration of the gamma table for TV output.

Table 10-122. DISPC_TIMING_Ho Logical Register Mapping

Hardware Register	Description
DISPC_TIMING_H1	Configuration of the horizontal timing for LCD1.
DISPC_TIMING_H2	Configuration of the horizontal timing for LCD2.

Table 10-123. DISPC_TIMING_Vo Logical Register Mapping

Hardware Register	Description
DISPC_TIMING_V1	Configuration of the vertical timing for LCD1.
DISPC_TIMING_V2	Configuration of the vertical timing for LCD2.

Table 10-124. DISPC_POL_FREQo Logical Register Mapping

Hardware Register	Description
DISPC_POL_FREQ1	Configuration of the output signals for LCD1.
DISPC_POL_FREQ2	Configuration of the output signals for LCD2.

Table 10-125. DISPC_DIVISORo Logical Register Mapping

Hardware Register	Description
DISPC_DIVISOR1	Configuration of the divisors for LCD1.
DISPC_DIVISOR2	Configuration of the divisors for LCD2.

Table 10-126. DISPC_SIZE_LCDo Logical Register Mapping

Hardware Register	Description
DISPC_SIZE_LCD1	Configuration of the divisors for LCD1.
DISPC_SIZE_LCD2	Configuration of the divisors for LCD2.

Table 10-127. DISPC_SIZE Logical Register Mapping

Hardware Register	Description
DISPC_SIZE_LCD1	Configuration of the LCD size on LCD1.
DISPC_SIZE_LCD2	Configuration of the LCD size on LCD2.

Table 10-128. DISPC_DATAo_CYCLE1 Logical Register Mapping

Hardware Register	Description
DISPC_DATA1_CYCLE1	Configuration of the output data format for 1st cycle on LCD1.
DISPC_DATA2_CYCLE1	Configuration of the output data format for 1st cycle on LCD2.

Table 10-129. DISPC_DATAo_CYCLE2 Logical Register Mapping

Hardware Register	Description
DISPC_DATA1_CYCLE2	Configuration of the output data format for 2nd cycle on LCD1.
DISPC_DATA2_CYCLE2	Configuration of the output data format for 2nd cycle on LCD2.

Table 10-130. DISPC_DATAo_CYCLE3 Logical Register Mapping

Hardware Register	Description
DISPC_DATA1_CYCLE3	Configuration of the output data format for 3rd cycle on LCD1.
DISPC_DATA2_CYCLE3	Configuration of the output data format for 3rd cycle on LCD2.

Table 10-131. DISPC_CPRo_COEF_R Logical Register Mapping

Hardware Register	Description
DISPC_CPR1_COEF_R	Configuration of the CPR matrix coefficients for the Red component on LCD1.
DISPC_CPR2_COEF_R	Configuration of the CPR matrix coefficients for the Red component on LCD2.

Table 10-132. DISPC_CPRo_COEF_G Logical Register Mapping

Hardware Register	Description
DISPC_CPR1_COEF_G	Configuration of the CPR matrix coefficients for the Green component on LCD1.
DISPC_CPR2_COEF_G	Configuration of the CPR matrix coefficients for the Green component on LCD2.

Table 10-133. DISPC_CPRo_COEF_B Logical Register Mapping

Hardware Register	Description
DISPC_CPR1_COEF_B	Configuration of the CPR matrix coefficients for the Blue component on LCD1.
DISPC_CPR2_COEF_B	Configuration of the CPR matrix coefficients for the Blue component on LCD2.

10.2.7.3 Display Controller Registers

10.2.7.3.1 Display Controller Register Summary

Table 10-134. Display Controller Registers Mapping Summary

Table 10-137. DISPC_SYSCONFIG

Address Offset	0x0000 0010		
Physical Address	0x4804 1010 0x5800 1010	Instance	DISPC_PER_L4 DISPC_L3
Description	This register allows to control various parameters of the OCP interface.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RESERVED																MIDLEMODE		RESERVED		CLOCKACTIVITY		RESERVED		WARMRESET		SIDLEMODE		ENWAKEUP		SOFTRESET		AUTOIDLE	

Bits	Field Name	Description	Type	Reset
31:14	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x000000
13:12	MIDLEMODE	Master interface power management, standby/wait control 0x0: Force-standby. MStandby is only asserted when the module is disabled. MStandby is only asserted when the module is disabled. 0x1: No-Standby: MStandby is never asserted. 0x2: Smart-Standby. MStandby is asserted based on the internal activity of the module 0x3: Reserved	RW	0x0
11:10	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x0

Bits	Field Name	Description	Type	Reset
9:8	CLOCKACTIVITY	Clocks activity during wake up mode period 0x0: OCP and Functional clocks can be switched off 0x1: Functional clocks can be switched off and OCP clocks are maintained during wake up period 0x2: OCP clocks can be switched off and Functional clocks are maintained during wake up period 0x3: OCP and Functional clocks are maintained during wake up period	RW	0x0
7:6	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x0
5	WARMRESET	Warm reset. Set this bit to 1 triggers a module warm reset. The bit is automatically reset by the hardware. During reads, it always returns 0. The warm reset keep the configuration registers unchanged. 0x0: Normal mode 0x1: the warmreset is set	RW	0
4:3	SIDLEMODE	Slave interface power management, Idle req/ack control 0x0: Force-idle. An idle request is acknowledged unconditionally 0x1: No-idle. An idle request is never acknowledged 0x2: Smart-idle. Acknowledgment to an idle request is given based on the internal activity of the module. 0x3: Reserved	RW	0x0
2	ENWAKEUP	WakeUp feature control 0x0: Wakeup is disabled 0x1: Wakeup is enabled	RW	0
1	SOFTRESET	Software reset. Set this bit to 1 to trigger a module reset. The bit is automatically reset by the hardware. During reads, it always returns 0. 0x0: Normal mode 0x1: The module is reset	RW	0
0	AUTOIDLE	Internal OCP clock gating strategy 0x0: OCP clock is free-running 0x1: Automatic OCP L3 and L4 clocks gating strategy is applied, based on the OCP interface activity. Automatic functional clock gating is also applied to the functional clock based on the module activity (for instance DISPC_<pipe>_ATTRIBUTES.ENABLE)	RW	1

Bits	Field Name	Description	Type	Reset
31:27	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x00
26	WBUNCOMPLETEER ROR_IRQ	Write-back DMA buffer is flushed before it is completely drained. In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that case and will trigger every frame. 0x0 READS: Event is false. 0x0 WRITES: Status bit unchanged. 0x1 READS: Event is true (Pending). 0x1 WRITES: Status bit is reset.	RW W1toClr	0
25	WBBUFFER OVERFLOW_IRQ	Write-back DMA Buffer Overflow. The DMA buffer is full. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
24	FRAME DONETV_IRQ	Frame Done for the TV. The TV output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
23	FRAME DONEWB_IRQ	Frame Done for the write-back channel. The write-back channel has output the frame. All the data of the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. It is available only when the write-back pipeline transfers back to memory the output of one of the pipelines. In case of overlay capture, the interrupt is not generated and the user shall use the FrameDone for the corresponding captured output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
22	FRAME DONE2_IRQ	Frame Done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
21	ACBIASCOUNT STATUS2_IRQ	AC Bias Count Status for the secondary LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
20	VID3BUFFER UNDERFLOW_IRQ	Video 3 DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
19	VID3END WINDOW_IRQ	The end of the video 3 Window has been reached. It is detected by the overlay manager when the full video 3 has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
18	VSYNC2_IRQ	Vertical Synchronization for the secondary LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
17	SYNC LOST2_IRQ	Synchronization Lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
16	WAKEUP_IRQ	Wake-up 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
15	SYNCLOST TV_IRQ	Synchronization Lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
14	SYNC LOST1_IRQ	Synchronization Lost on the primary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the primary LCD output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
13	VID2END WINDOW_IRQ	The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
12	VID2BUFFER UNDERFLOW_IRQ	Video 2 DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
11	VID1END WINDOW_IRQ	The end of the video 1 Window has been reached. It is detected by the overlay manager when the full video 1 has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
10	VID1BUFFER UNDERFLOW_IRQ	Video 1 DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
9	OCPERROR_IRQ	OCP Error. L3 Interconnect has sent SResp=ERR. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
8	PALETTEGAMMA LOADING_IRQ	Palette Gamma Loading status. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
7	GFXEND WINDOW_IRQ	The end of the graphics Window has been reached. It is detected by the overlay manager when the full graphics has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
6	GFXBUFFER UNDERFLOW_IRQ	Graphics DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
5	PROGRAMMED LINENUMBER_IRQ	Programmed Line Number. It indicates that the scan of the primary LCD has reached the programmed user line number. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
4	ACBIASCOUNT STATUS1_IRQ	AC Bias Count Status for the primary LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
3	EVSYNC_ODD_IRQ	VSYNC for odd field from the TV encoder (VENC or HDMI) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
2	EVSYNC_EVEN_IRQ	VSYNC for even field from the TV encoder (VENC or HDMI) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
1	VSYNC1_IRQ	Vertical Synchronization for the primary LCD. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0
0	FRAME_DONE1_IRQ	Frame Done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
31:27	RESERVED	Write 0s for future compatibility. Reads returns 0	R	0x00
26	WBUNCOMPLETEERR_OR_EN	The write back buffer has been flushed before it has been fully drained. Enable. 0x0: Interrupt is masked. 0x1: Interrupt is enabled.	RW	0

Display Controller

www.ti.com

Bits	Field Name	Description	Type	Reset
25	WBBUFFER OVERFLOW_EN	Write-back DMA Buffer Overflow. The DMA buffer is full 0x0: WBBufferOverflow is masked 0x1: WBBufferOverflow generates an interrupt when it occurs	RW	0
24	FRAME DONETV_EN	Frame Done for the TV. The TV output has been disabled by user. All the data have been sent. 0x0: Frame Done for the TV output is masked 0x1: Frame Done for the TV output generates an interrupt when it occurs	RW	0
23	FRAME DONEYB_EN	Frame Done for the write-back channel. The write-back channel has output the frame. All the data have been sent for the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. 0x0: Frame Done for the write-back is masked 0x1: Frame Done for the write-back generates an interrupt when it occurs	RW	0
22	FRAME DONE2_EN	Frame Done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent. 0x0: Frame Done for the secondary LCD is masked 0x1: Frame Done for the secondary LCD generates an interrupt when it occurs	RW	0
21	ACBIASCOUNT STATUS2_EN	AC Bias Count Status for the secondary LCD 0x0: ACBiasCountStatus for the secondary LCD output is masked 0x1: ACBiasCountStatus for the secondary LCD output generates an interrupt when it occurs	RW	0
20	VID3BUFFER UNDERFLOW_EN	Video 3 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid3BufferUnderflow is masked 0x1: Vid3BufferUnderflow generates an interrupt when it occurs	RW	0
19	VID3END WINDOW_EN	The end of the video 3 Window has been reached. It is detected by the overlay manager when the full video 3 has been displayed. 0x0: Vid3EndWindow is masked 0x1: Vid3EndWindow generates an interrupt when it occurs	RW	0
18	VSYNC2_EN	Vertical Synchronization for the secondary LCD 0x0: VSYNC for the secondary LCD output is masked 0x1: VSYNC for the secondary LCD output generates an interrupt when it occurs	RW	0
17	SYNC LOST2_EN	Synchronization Lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output. 0x0: Synchronization Lost on the secondary LCD output is masked 0x1: Synchronization Lost on the secondary LCD output generates an interrupt when it occurs	RW	0
16	WAKEUP_EN	Wake Up Mask 0x0: WakeUp is masked 0x1: WakeUp generates an interrupt when it occurs	RW	0
15	SYNC LOSTTV_EN	Synchronization Lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output. 0x0: Synchronization Lost on the TV output is masked 0x1: Synchronization Lost on the TV output generates an interrupt when it occurs	RW	0
14	SYNC LOST1_EN	Synchronization Lost for the primary LCD 0x0: SyncLost for the primary LCD output is masked 0x1: SyncLost for the primary LCD output generates an interrupt when it occurs	RW	0

Bits	Field Name	Description	Type	Reset
13	VID2END WINDOW_EN	The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed. 0x0: Vid2EndWindow is masked 0x1: Vid2EndWindow generates an interrupt when it occurs	RW	0
12	VID2BUFFER UNDERFLOW_EN	Video 2 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid2BufferUnderflow is masked 0x1: Vid2BufferUnderflow generates an interrupt when it occurs	RW	0
11	ENDVID1 WINDOW_EN	The end of the video 1 Window has been reached. It is detected by the overlay manager when the full video 1 has been displayed. 0x0: EndVid1Window is masked 0x1: EndVid1Window generates an interrupt when it occurs	RW	0
10	VID1BUFFER UNDERFLOW_EN	Video 1 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid1BufferUnderflow is masked 0x1: Vid1BufferUnderflow generates an interrupt when it occurs	RW	0
9	OCPEERROR_EN	OCP Error. L3 Interconnect has sent SResp=ERR. 0x0: OCPEError is masked 0x1: OCPEError generates an interrupt when it occurs	RW	0
8	PALETTE GAMMA_EN	Palette Gamma Loading mask. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully. 0x0: PaletteGamma is masked 0x1: PaletteGamma generates an interrupt when it occurs	RW	0
7	GFXEND WINDOW_EN	The end of the graphics Window has been reached. It is detected by the overlay manager when the full graphics has been displayed. 0x0: GfxEndWindow is masked 0x1: GfxEndWindow generates an interrupt when it occurs	RW	0
6	GFXBUFFER UNDERFLOW_EN	Graphics DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: GfxBufferUnderflow is masked 0x1: GfxBufferUnderflow generates an interrupt when it occurs	RW	0
5	PROGRAMMED LINENUMBER_EN	Programmed Line Number. It indicates that the scan of the primary LCD has reached the programmed user line number. 0x0: ProgrammedLineNumber is masked 0x1: ProgrammedLineNumber generates an interrupt when it occurs	RW	0
4	ACBIASCOUNT STATUS1_EN	AC Bias Count Status for the primary LCD 0x0: ACBiasCountStatus for the primary LCD output is masked 0x1: ACBiasCountStatus for the primary LCD output generates an interrupt when it occurs	RW	0
3	EVSYNC_ODD_EN	VSYNC for odd field from the TV encoder (VENC or HDMI) 0x0: EVSYNC_ODD for the TV output is masked 0x1: EVSYNC_ODD for the TV output generates an interrupt when it occurs	RW	0
2	EVSYNC_EVEN_EN	VSYNC for even field from the TV encoder (VENC or HDMI) 0x0: EVSYNC_EVEN for the TV output is masked 0x1: EVSYNC_EVEN for the TV output generates an interrupt when it occurs	RW	0

Bits	Field Name	Description	Type	Reset
1	VSYNC1_EN	Vertical Synchronization for the primary LCD. 0x0: VSYNC for the primary LCD output is masked 0x1: VSYNC for the primary LCD output generates an interrupt when it occurs	RW	0
0	FRAMEDONE_EN	Frame Done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent. 0x0: FrameDone for the primary LCD output is masked 0x1: FrameDone for the primary LCD output generates an interrupt when it occurs	RW	0

27	PCKFREEENABLE	Write 0s for future compatibility. Reads return 0.	R	0

Bits	Field Name	Description	Type	Reset
26:25	TDMUNUSEDBITS	State of unused bits (TDM mode only) for the primary LCD output. wr: VFP start period of primary LCD 0x0: low level (0) 0x1: high level (1) 0x2: unchanged from previous state 0x3: reserved	RW	0x0
24:23	TDMCYCLEFORMAT	Cycle format (TDM mode only) for the primary LCD output wr: VFP start period of primary LCD 0x0: 1 cycle for 1 pixel 0x1: 2 cycles for 1 pixel 0x2: 3 cycles for 1 pixel 0x3: 3 cycles for 2 pixels	RW	0x0
22:21	TDMPARALLELMODE	Output Interface width (TDM mode only) for the primary LCD output wr: VFP start period of primary LCD 0x0: 8-bit parallel output interface selected 0x1: 9-bit parallel output interface selected 0x2: 12-bit parallel output interface selected 0x3: 16-bit parallel output interface selected	RW	0x0
20	TDMENABLE	Enable the multiple cycle format (TDM mode only used for TFT mode with the RFBI enable bit off) for the primary LCD output. wr: VFP start period of primary LCD 0x0: TDM disabled 0x1: TDM enabled	RW	0
19:17	HT	Hold Time for TV output wr: EVSYNC Encoded value (from 1 to 8) to specify the number of external digital clock periods to hold the data (programmed value = value minus 1)	RW	0x0
16	GPOUT1	General Purpose Output Signal wr:immediate 0x0: The GPout1 is reset 0x1: The GPout1 is set	RW	0
15	GPOUT0	General Purpose Output Signal wr:immediate 0x0: The GPout0 is reset 0x1: The GPout0 is set	RW	0
14	GPIN1	General Purpose Input Signal wr: immediately Read 0x0: The GPin1 has been reset Read 0x1: The GPin1 has been set	R	0
13	GPIN0	General Purpose Input Signal wr: immediately Read 0x0: The GPin0 has been reset Read 0x1: The GPin0 has been set	R	0
12	OVERLAYOPTIMIZATION	Overlay Optimization for the primary LCD output wr: VFP start period of the primary LCD 0x0: All the data for all the enabled pipelines are fetched from memory regardless of the overlay/alpha blending configuration. 0x1: The data not used by the overlay manager because of overlap between layers with no alpha blending between them shall not be fetched from memory in order to optimize the bandwidth.	RW	0
11	STALLMODE	STALL Mode for the primary LCD output wr: VFP start period of primary LCD 0x0: Normal mode selected 0x1: STALL mode selected. The Display Controller sends the data without considering the VSYNC/HSYNC. The LCD output is disabled at the end of the transfer of the frame. The S/W has to re-enable the LCD output in order to generate a new frame. The stall mode is used in RFBI and DSI command modes.	RW	0

Display Controller

www.ti.com

Bits	Field Name	Description	Type	Reset
10	RESERVED	Reserved	R	0
9:8	TFTDATALINES	Number of lines of the primary LCD interface wr: VFP start period of primary LCD 0x0: 12-bit output aligned on the LSB of the pixel data interface 0x1: 16-bit output aligned on the LSB of the pixel data interface 0x2: 18-bit output aligned on the LSB of the pixel data interface 0x3: 24-bit output aligned on the LSB of the pixel data interface	RW	0x0
7	STDITHERENABLE	Spatial Temporal dithering enable for the primary LCD output wr: VFP start period of primary LCD 0x0: Spatial/Temporal dithering logic disabled 0x1: Spatial/Temporal dithering logic enabled	RW	0
6	GOTV	GO Command for the TV output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the TV output. wr: immediate 0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) associated with the TV output using the user values. The hardware resets the bit when the update is completed. 0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the TV output and the hardware can update the internal registers at the external VSYNC.	RW	0
5	GOLCD	GO Command for the primary LCD output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the primary LCD output. wr: immediate 0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) connected to the LCD output using the user values. The hardware resets the bit when the update is completed. 0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the LCD output and the hardware can update the internal registers at the VFP start period	RW	0
4	M8B	Mono 8-bit mode of the primary LCD wr: VFP start period of primary LCD output 0x0: Pixel data [3:0] is used to output four pixel values to the panel at each pixel clock transition. (only in Passive Mono 4-bit mode). 0x1: Pixel data [7:0] is used to output eight pixel values to the panel each pixel clock transition. (only in Passive Mono 8-bit mode).	RW	0
3	STNTFT	LCD Display type of the primary LCD wr: VFP start period of primary LCD output 0x0: Passive or STN display operation enabled. STN dither logic is enabled. 0x1: Active or TFT display operation enabled. STN Dither logic and output FIFO bypassed.	RW	0
2	MONOCOLOR	Monochrome/Color selection for the primary LCD wr: VFP start period of primary LCD output 0x0: Color operation enabled (STN mode only) 0x1: Monochrome operation enabled (STN mode only)	RW	0
1	TVENABLE	Enable the TV output wr: immediate effect only occurs at the end of the current frame. 0x0: TV output disabled (at the end of the current field if interlace output when the bit is reset) 0x1: TV output enabled	RW	0
0	LCDENABLE	Enable the primary LCD outputs wr: immediate Effect only occurs at the end of the current frame 0x0: LCD output disabled (at the end of the frame when the bit is reset) 0x1: LCD output enabled	RW	0

Table 10-181. DISPC_GFX_ATTRIBUTES

Address Offset	0x0000 00A0	Instance	DISPC_PER_L4 DISPC_L3
Physical Address	0x4804 10A0 0x5800 10A0		
Description	The register configures the graphics attributes. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2 .GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CHANNELOUT2	BURSTTYPE	PREMULTIPLYALPHA	ZORDER	ZORDERENABLE	ANTIFLICKER	RESERVED						SELFREFRESHAUTO	RESERVED	SELFREFRESH	ARBITRATION	ROTATION	BUFPRELOAD	RESERVED	NIBBLEMODE	CHANNELOUT	BURSTSIZE	REPLICATIONENABLE	FORMAT				ENABLE				

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should set to zero) wr: immediate 0x0: primary LCD output selected. 0x1: Secondary LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. (It does not apply to the palette loading OCP requests using INCR burst only) 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC GFX to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplied alpha data color component 0x1: Premultiplied alpha data color component	RW	0

Bits	Field Name	Description	Type	Reset
27:26	ZORDER	Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0. 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3	RW	0x0
25	ZORDERENABLE	Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled. 0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).	RW	0
24	ANTIFLICKER	Antiflicker filtering using a 3-tap filter with hardcoded coefficients (1/4, 1/2, 1/4) 0x0: Antiflicker disabled. 0x1: Antiflicker enabled.	RW	0
23:18	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
17	SELFREFRESHAUTO	Automatic self-refresh mode 0x0: The transition from Selfrefresh "disabled" to "enabled" is controlled by software 0x1: The transition from Selfrefresh "disabled" to "enabled" is controlled only by hardware	RW	0
16	RESERVED		R	0
15	SELFREFRESH	Enables the self refresh of the graphics window from its own DMA buffer. This bit should be set only after having set the GO bit of the channel and read back a zero in its field. 0x0: The graphics pipeline accesses the interconnect to fetch data from the system memory. 0x1: The graphics pipeline does not need anymore to fetch data from memory. Only the graphics DMA buffer is used. It takes effect after the frame has been loaded in the DMA buffer.	RW	0
14	ARBITRATION	Determines the priority of the graphics pipeline. When the graphics pipeline is one of the high priority pipelines. The arbitration wheel gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The graphics pipeline is one of the normal priority pipeline. 0x1: The graphics pipeline is one of the high priority pipeline.	RW	0
13:12	ROTATION	Graphics Rotation Flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0

Display Controller

www.ti.com

Bits	Field Name	Description	Type	Reset
11	BUFPRELOAD	Graphics Preload Value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value	RW	0
10	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0
9	NIBBLEMODE	Graphics Nibble Mode (only for 1-, 2- and 4-bpp) 0x0: Nibble mode is disabled 0x1: Nibble mode is enabled	RW	0
8	CHANNELOUT	Graphics Channel Out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
7:6	BURSTSIZE	Graphics DMA Burst Size 0x0: 2x128bit bursts 0x1: 4x128bit bursts 0x3: Reserved 0x2: 8x128bit bursts	RW	0x2
5	REPLICATIONENABLE	Graphics Replication Enabled: RGB, ARGB, and RGBA formats are converted into ARGB32-8888 using replication of the MSBs or '0s 0x0: Disable Graphics replication logic. The conversion to ARGB32-8888 is done by adding 0s for the LSBs 0x1: Enable Graphics replication logic. The conversion to ARGB32-8888 is done by duplicating the MSBs for the LSBs	RW	1
4:1	FORMAT	Graphics format. It defines the pixel format when fetching the graphics picture into memory. 0x6: RGB16-565 0x1: BITMAP2 (CLUT is required to be used) 0xA: RGBx12-4444 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: BITMAP1 (CLUT is required to be used) 0x2: BITMAP4 (CLUT is required to be used) 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: RGBA12-4444 0x4: xRGB12-4444 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x3: BITMAP8 (CLUT is required to be used) 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Graphics Enable 0x0: Graphics disabled (graphics pipeline inactive and graphics window not present) 0x1: Graphics enabled (graphics pipeline active and graphics window present on the screen)	RW	0

23	ARBITRATION	<p>Determines the priority of the video pipeline.</p> <p>The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.</p> <p>0x0: The video pipeline is one of the normal priority pipeline.</p> <p>0x1: The video pipeline is one of the high priority pipeline.</p>	RW	0
22	DOUBLESTRIDE	<p>Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride.</p> <p>It is only used in case of YUV4:2:0.</p> <p>0x0: The CbCr stride value is equal to the Y stride.</p> <p>0x1: The CbCr stride value is double to the Y stride.</p>	RW	0
21	VERTICALTAPS	<p>Video Vertical Resize Tap Number. The vertical polyphase filter can be configured in 3-tap or 5-tap configuration.</p> <p>According to the number of taps, the maximum input picture width is double while using 3-tap compared to 5-tap.</p> <p>0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used.</p> <p>The associated bit fields for the 2 other taps coefficients do not need to be initialized.</p> <p>0x1: 5 taps are used for the vertical filtering logic.</p>	RW	0
20	DMAOPTIMIZATION	<p>Write 0s for future compatibility.</p> <p>Reads return 0.</p>	R	0
19	BUFPRELOAD	<p>Video Preload Value</p> <p>0x0: Hardware prefetches pixels up to the preload value defined in the preload register</p> <p>0x1: Hardware prefetches pixels up to high threshold value</p>	RW	0
18	RESERVED	<p>Write 0s for future compatibility.</p> <p>Reads return 0.</p>	R	0

Table 10-207. DISPC_VID1_PIXEL_INC

Address Offset	0x0000 00DC															
Physical Address	0x4804 10DC 0x5800 10DC															
Instance	DISPC_PER_L4 DISPC_L3															
Description	The register configures the number of bytes to increment between two pixels for the buffer associated with the video window 2. For more information, see Section 10.2.4.6.3, Predecimation . The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory

BA																															

Bits	Field Name	Description	Type	Reset
31:0	BA	Video base address Base address of the video buffer (aligned on pixel size boundary except in case of RGB24 packed format, 4-pixel alignment is required; in case of YUV4:2:2, 2-pixel alignment is required, and YUV4:2:0, byte alignment is supported)). It case of YUV4:2:0 format, it indicates the base address of the Y buffer. When the TILER is addressed, the bits: [28:27] = 0x0 for 8-bit tiled [28:27] = 0x1 for 16-bit tiled [28:27] = 0x2 for 32-bit tiled [28:27] = 0x3 for page mode [31:29] = 0x0 for 0-degree view [31:29] = 0x1 for 180-degree view + mirroring [31:29] = 0x2 for 0-degree view + mirroring [31:29] = 0x3 for 180-degree view [31:29] = 0x4 for 270-degree view + mirroring [31:29] = 0x5 for 270-degree view [31:29] = 0x6 for 90-degree view [31:29] = 0x7 for 90-degree view + mirroring Otherwise the bits indicated the corresponding bit address to access the SDRAM.	RW	0x0000 0000

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should set to zero) wr: immediate. 0x0: primary LCD output selected. 0x1: Secondary LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC VID2 to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplied alpha data color component 0x1: Premultiplied alpha data color component	RW	0

Bits	Field Name	Description	Type	Reset
27:26	ZORDER	<p>Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value.</p> <p>If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.</p> <p>0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values.</p> <p>0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3</p> <p>0x3: Z-order 3: layer above all the other layers</p> <p>0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3</p>	RW	0x0
25	ZORDERENABLE	<p>Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled.</p> <p>0x0: Z-order disabled. The Z-order of the layer is 0.</p> <p>0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).</p>	RW	0
24	SELFREFRESH	<p>Enables the self refresh of the video window from its own DMA buffer only.</p> <p>0x0: The video pipeline accesses the interconnect to fetch data from the system memory.</p> <p>0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video2 is used. It takes effect after the frame has been loaded in the DMA buffer.</p>	RW	0
23	ARBITRATION	<p>Determines the priority of the video pipeline.</p> <p>The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.</p> <p>0x0: The video pipeline is one of the normal priority pipeline.</p> <p>0x1: The video pipeline is one of the high priority pipeline.</p>	RW	0
22	DOUBLESTRIDE	<p>Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride.</p> <p>It is only used in case of YUV4:2:0.</p> <p>0x0: The CbCr stride value is equal to the Y stride.</p> <p>0x1: The CbCr stride value is double to the Y stride.</p>	RW	0
21	VERTICALTAPS	<p>Video Vertical Resize Tap Number</p> <p>0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used.</p> <p>The associated bit fields for the 2 other taps coefficients do not need to be initialized.</p> <p>0x1: 5 taps are used for the vertical filtering logic.</p>	RW	0
20	DMAOPTIMIZATION	<p>Write 0s for future compatibility.</p> <p>Reads return 0.</p>	R	0
19	BUFPRELOAD	<p>Video Preload Value</p> <p>0x0: Hardware prefetches pixels up to the preload value defined in the preload register</p> <p>0x1: Hardware prefetches pixels up to high threshold value</p>	RW	0
18	RESERVED	<p>Write 0s for future compatibility.</p> <p>Reads return 0.</p>	R	0

Bits	Field Name	Description	Type	Reset
17	SELFREFRESHAUTO	Automatic self-refresh mode 0x0: The transition from SELFREFRESH "disabled" to "enabled" is controlled by SW. 0x1: The transition from SELFREFRESH "disabled" to "enabled" is controlled only by hardware.	RW	0
16	CHANNELOUT	Video Channel Out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA Burst Size 0x0: 2x128bit bursts 0x1: 4x128bit bursts 0x3: Reserved 0x2: 8x128bit bursts	RW	0x2
13:12	ROTATION	Video Rotation Flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication Enable 0x0: Disable Video replication logic 0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion YUV to RGB 0x1: Enable Color Space Conversion YUV to RGB	RW	0
8	VRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video Resize Enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0

Bits	Field Name	Description	Type	Reset
4:1	FORMAT	Video Format. It defines the pixel format when fetching the video 2 picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	VidEnable 0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

Description	The register configures the size of the video picture associated with the video layer 2 before up/down-scaling. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								ORGSIZEY								RESERVED								ORGSIZEX							

Bits	Field Name	Description	Type	Reset
31:27	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
26:16	ORGSIZEY	Number of lines of the video picture Encoded value (from 1 to 2048) to specify the number of lines of the video picture in memory (program to value minus 1). When predecimation is set, the value represents the size of the image after predecimation but the max size of the unpredecimated image size in memory is still bounded 2^{11} .	RW	0x000
15:11	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x00
10:0	ORGSIZEX	Number of pixels of the video picture Encoded value (from 1 to 2048) to specify the number of pixels of the video picture in memory (program to value minus 1). The size is limited to the size of the line buffer of the vertical sampling block in case the video picture is processed by the vertical filtering unit. (program to value minus 1). When predecimation is set, the value represents the size of the image after predecimation but the max size of the unpredecimated image size in memory is still bounded 2^{11} .	RW	0x000

Physical Address	0x4804 1350 + (0x4 * i) 0x5800 1350 + (0x4 * i)	Instance	DISPC_PER_L4 DISPC_L3
Description	The bank of registers configure the down/up/down-scaling coefficients for the vertical resize of the video picture associated with the video window 3 for the phases from 0 to 7. It is used for ARGB and Y setting. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory

Address Offset	0x0000 0370	Instance	DISPC_PER_L4 DISPC_L3
Physical Address	0x4804 1370 0x5800 1370		
Description	The register configures the attributes of the video window 3. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																		
CHANNELOUT2		BURSTTYPE		PREMULTIPLYALPHA		ZORDER		ZORDERENABLE		SELFREFRESH		ARBITRATION		DOUBLESTRIDE		VERTICALTAPS		DMAOPTIMIZATION		BUFPRELOAD		RESERVED		SELFREFRESHAUTO		CHANNELOUT		BURSTSIZE		ROTATION		FULLRANGE		REPLICATIONENABLE		COLORCONVENABLE		VRESIZECONF		HRESIZECONF		RESIZEENABLE		FORMAT				ENABLE	

Bits	Field Name	Description	Type	Reset
31:30	CHANNELOUT2	It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should be set to zero) wr: immediate 0x0: primary LCD output selected. 0x1: Secondary LCD output selected. 0x3: Write-back output to the memory selected.	RW	0x0
29	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
28	PREMULTIPLYALPHA	The field configures the DISPC VID3 to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplied alpha data color component 0x1: Premultiplied alpha data color component	RW	0

Bits	Field Name	Description	Type	Reset
27:26	ZORDER	<p>Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.</p> <p>0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values.</p> <p>0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3</p> <p>0x3: Z-order 3: layer above all the other layers</p> <p>0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3</p>	RW	0x0
25	ZORDERENABLE	<p>Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled.</p> <p>0x0: Z-order disabled. The Z-order of the layer is 0.</p> <p>0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).</p>	RW	0
24	SELFREFRESH	<p>Enables the self refresh of the video window from its own DMA buffer only.</p> <p>0x0: The video pipeline accesses the interconnect to fetch data from the system memory.</p> <p>0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video3 is used. It takes effect after the frame has been loaded in the DMA buffer.</p>	RW	0
23	ARBITRATION	<p>Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.</p> <p>0x0: The video pipeline is one of the normal priority pipeline.</p> <p>0x1: The video pipeline is one of the high priority pipeline.</p>	RW	0
22	DOUBLESTRIDE	<p>Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0.</p> <p>0x0: The CbCr stride value is equal to the Y stride.</p> <p>0x1: The CbCr stride value is double to the Y stride.</p>	RW	0
21	VERTICALTAPS	<p>Video Vertical Resize Tap Number</p> <p>0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized.</p> <p>0x1: 5 taps are used for the vertical filtering logic.</p>	RW	0
20	DMAOPTIMIZATION	<p>Write 0s for future compatibility. Reads return 0.</p>	R	0
19	BUFPRELOAD	<p>Video Preload Value</p> <p>0x0: Hardware prefetches pixels up to the preload value defined in the preload register</p> <p>0x1: Hardware prefetches pixels up to high threshold value</p>	RW	0
18	RESERVED	<p>Write 0s for future compatibility. Reads return 0.</p>	R	0

Bits	Field Name	Description	Type	Reset
17	SELFREFRESHAUTO	Automatic self-refresh mode 0x0: The transition from SELFREFRESH "disabled" to "enabled" is controlled by SW. 0x1: The transition from SELFREFRESH "disabled" to "enabled" is controlled only by hardware.	RW	0
16	CHANNELOUT	Video Channel Out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected	RW	0
15:14	BURSTSIZE	Video DMA Burst Size 0x0: 2x128bit bursts 0x1: 4x128bit bursts 0x3: Reserved 0x2: 8x128bit bursts	RW	0x2
13:12	ROTATION	Video Rotation Flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	REPLICATIONENABLE	Replication Enable 0x0: Disable Video replication logic 0x1: Enable Video replication logic	RW	1
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion YUV to RGB 0x1: Enable Color Space Conversion YUV to RGB	RW	0
8	VRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
7	HRESIZECONF	Write 0s for future compatibility. Reads return 0.	R	0
6:5	RESIZEENABLE	Video Resize Enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0

Bits	Field Name	Description	Type	Reset
4:1	FORMAT	Video Format. It defines the pixel format when fetching the video 3 picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: RGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Video Enable 0x0: Video disabled (video pipeline inactive and window not present) 0x1: Video enabled (video pipeline active and window present on the screen)	RW	0

Bits	Field Name	Description	Type	Reset
31:28	IDLENUMBER	<p>Determines the number of idles between requests on the L3 interconnect.</p> <p>It is only used when the write-back pipeline does data transfer from memory to memory.</p> <p>When the output of an overlay is stored in memory through the write-back pipeline in capture mode, the bit field IDLENUMBER is ignored since a timing generator is used to time the transfer.</p> <p>The number of IDLE cycles is IDLENUMBER (from 0 to 15) if IDLESIZE=0.</p> <p>The number of IDLE cycles is IDLENUMBERx8 (from 0 to 120) if IDLESIZE=1 and BURSTSIZE=2.</p> <p>The number of IDLE cycles is IDLENUMBERx4 (from 0 to 60) if IDLESIZE=1 and BURSTSIZE=1.</p> <p>The number of IDLE cycles is IDLENUMBERx2 (from 0 to 30) if IDLESIZE=1 and BURSTSIZE=0.</p>	RW	0x0
27	IDLESIZE	<p>Determines if the IDLENUMBER corresponds to a number of bursts or singles.</p> <p>0x0: The number of idles between requests is defined by IDLENUMBER as number of cycles.</p> <p>0x1: The number of idles between requests is defined by IDLENUMBER multiplied by burst size as number of cycles.</p>	RW	0
26:24	CAPTUREMODE	<p>Defines the frame rate capture.</p> <p>0x6: Only one out of six frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x1: Only one frame is captured.</p> <p>0x7: Only one out of seven frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x0: All frames are captures until the write-back channel is disabled or there is no more data generated by the overlay or the pipeline attached to the write-back channel.</p> <p>0x2: Only one out of two frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x4: Only one out of four frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x5: Only one out of five frames is captured. The first one is captured then the second one is skipped and so on.</p> <p>0x3: Only one out of three frames is captured. The first one is captured then the second one is skipped and so on.</p>	RW	0x0

Bits	Field Name	Description	Type	Reset
23	ARBITRATION	Determines the priority of the write-back pipeline. The write-back pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The write-back pipeline is one of the normal priority pipeline. 0x1: The write-back pipeline is one of the high priority pipeline.	RW	0
22	DOUBLESTRIDE	Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0. 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride.	RW	0
21	VERTICALTAPS	Video Vertical Resize Tap Number 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. 0x1: 5 taps are used for the vertical filtering logic.	RW	0
20	RESERVED	Write 0s for future compatibility. Reads return 0.	R	0x0
19	WRITEBACKMODE	When connected to the overlay output of a channel the write back can operate as a simple transfer from memory to memory (composition engine) or as a capture channel. 0x0: Capture mode (default mode) 0x1: Memory-to-memory mode	RW	0x0
18:16	CHANNELIN	Video Channel In configuration wr: immediate 0x6: Video3 pipeline output 0x1: Secondary LCD output 0x0: Primary LCD overlay output 0x2: TV overlay output 0x4: Video1 pipeline output 0x5: Video2 pipeline output 0x3: Graphics pipeline output	RW	0x0
15:14	BURSTSIZE	Write-back DMA Burst Size 0x0: 2x128bit bursts 0x1: 4x128bit bursts 0x3: Reserved 0x2: 8x128bit bursts	RW	0x2
13:12	RESERVED	RESERVED	RW	0x0
11	FULLRANGE	Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion	RW	0
10	TRUNCATIONENABLE	It applies only when the input format to the write-back pipeline from the overlay or directly from one of the pipelines is ARGB32. If the format is one of the YUV supported formats, the bit field is ignored. 0x0: Disable truncation logic 0x1: Enable truncation logic from ARGB32 to the pixel format defined in the field FORMAT.	RW	0

Display Controller

www.ti.com

Bits	Field Name	Description	Type	Reset
9	COLORCONVENABLE	Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV	RW	0
8	BURSTTYPE	The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used.	RW	0
7	ALPHAENABLE	Premultiplied alpha enable Read 0x1: Enabled Read 0x0: Disabled. This bit also disable the logic present in the associated channel out that compute the alpha component sent to the WB pipe. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available: 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay. 0x0: The alpha value is not written back.	RW	0
6:5	RESIZEENABLE	Resize Enable 0x0: Disable the resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing	RW	0x0
4:1	FORMAT	Write-back Format. It defines the pixel format when storing the write-back picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container)	RW	0x0
0	ENABLE	Write-back Enable. wr: immediate 0x0: Write-back disabled 0x1: Write-back enabled	RW	0

Description	The register configures the base address of the UV buffer for the write-back pipeline. (DISPC_WB_BA_UV_0 and DISPC_WB_BA_UV_1 for ping-pong mechanism with external trigger, based on the field polarity otherwise only DISPC_WB_BA_UV_0 is used)). Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2 .GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory

Address Offset	0x0000 064C + (0x8 * i)	Index	i = 0 to 7
Physical Address	0x4804 164C + (0x8 * i) 0x5800 164C + (0x8 * i)	Instance	DISPC_PER_L4 DISPC_L3
Description	The bank of registers configure the down/up/down-scaling coefficients for the vertical and horizontal resize of the video picture associated with the video window 1 for the phases from 0 to 7. It is used for Crb and Cr setting. It is used only when the pixel format at the input of the filter is one of the YUV formats. If the pixel format at the input of the filter is ARGB (all ARGB, RGB, RGBA are converted to ARGB32-8888 by the color space conversion before going to the filter is the color space conversion is done before the filter). When the register is not used by the hardware, any value can be used for the bit fields. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory

Address Offset	0x0000 0790		
Physical Address	0x4804 1790 0x5800 1790	Instance	DISPC_PER_L4 DISPC_L3
Description	The register configures the resize factors for horizontal and vertical up/downsampling of the write-back pipeline. It is used for Crb and Cr setting. It is used only when the pixel format at the input of the filter is one of the YUV formats. If the pixel format at the input of the filter is ARGB (all ARGB, RGB, RGBA are converted to ARGB32-8888 by the color space conversion before going to the filter is the color space conversion is done before the filter). When the register is not used by the hardware, any value can be used for the bit fields. Shadow register, updated when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline) when the WB pipeline is directly connected to one of the pipelines (graphics or video), otherwise updated on VFP start period of primary LCD or VFP start period of secondary LCD or EVSYNC depending on which overlay output is selected as an input to the WB pipeline

10.3 MIPI Display Serial Interface

This section describes the MIPI® display serial interface (DSI) module for the device.

NOTE: This section contains information that is Copyright © 2005-2008 MIPI Alliance, Inc. All rights reserved.

MIPI Alliance Member Confidential.

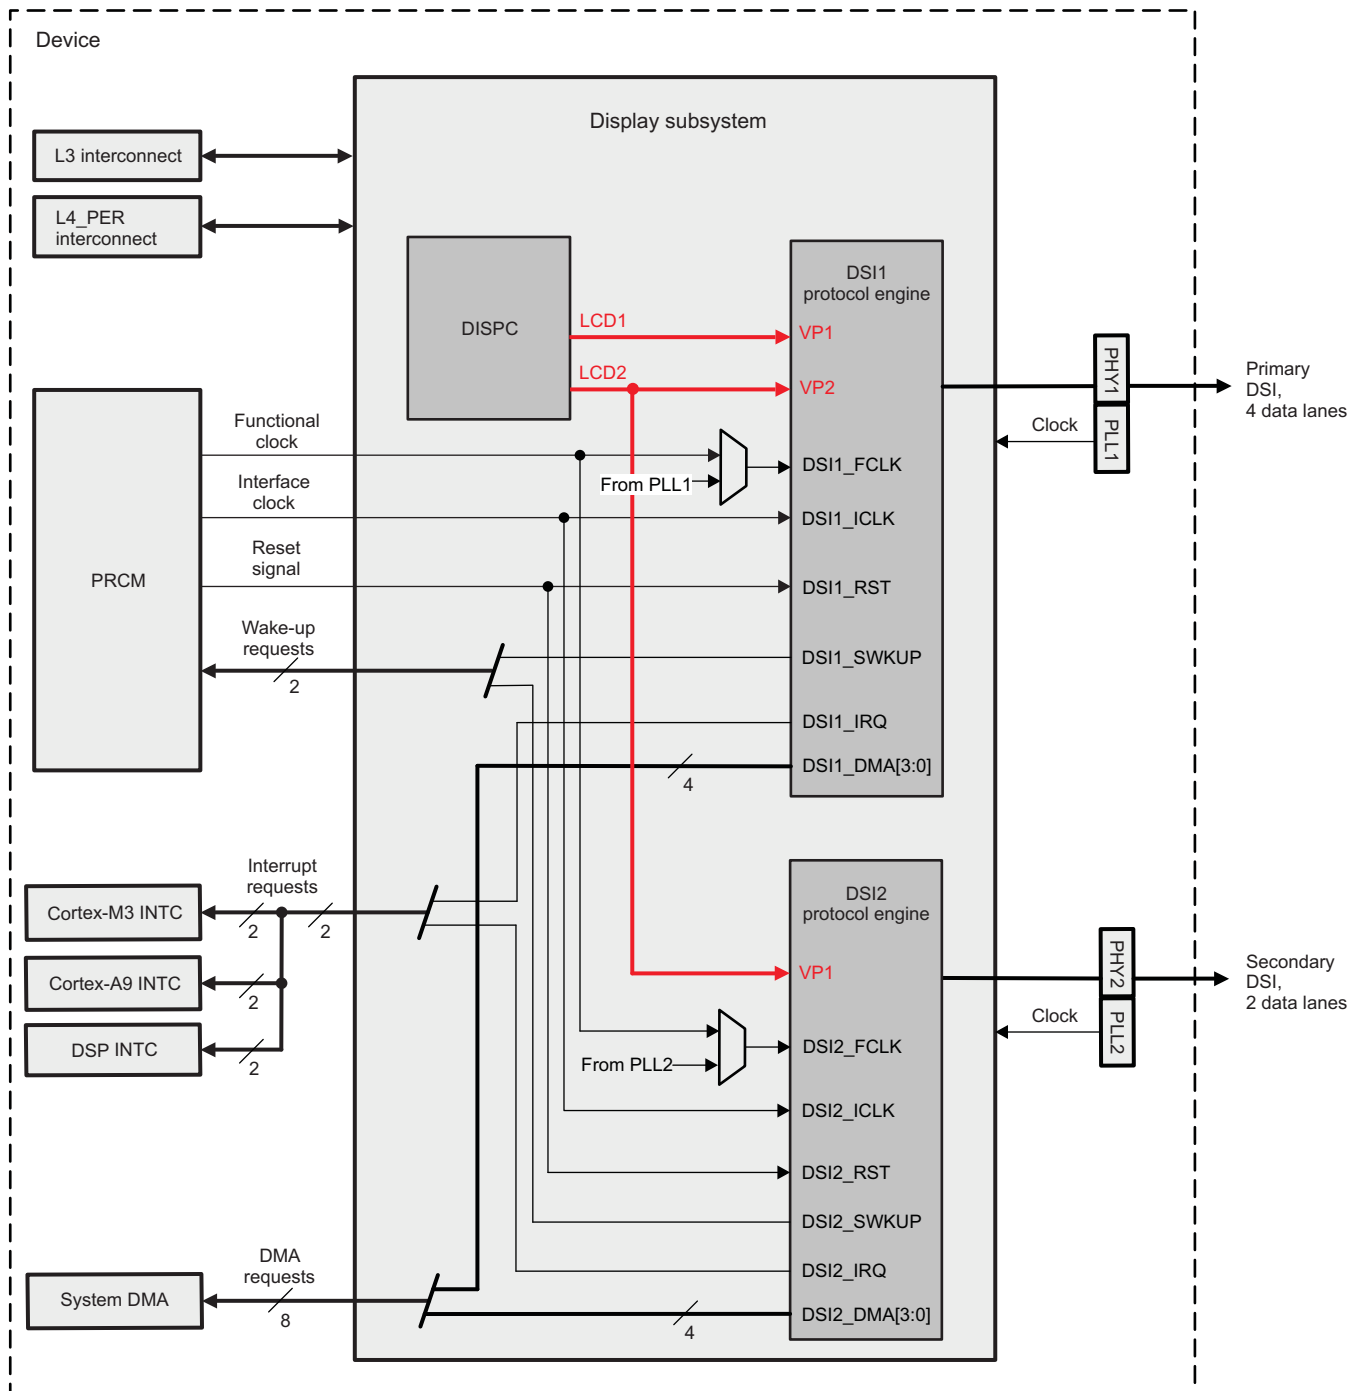

All rights reserved. This material is reprinted with the permission of the MIPI Alliance, Inc. No part(s) of this document may be disclosed, reproduced or used for any purpose other than as needed to support the use of the products of TI.

See [OMAP4430 MIPI Disclaimer](#) for details.

10.3.1 MIPI DSI Overview

The display serial interface (DSI) module connects to a DSI display module directly or through an external DSI bridge. The DSI module is connected to DISPC and L3/L4_PER interconnects

[Figure 10-95](#) is a block diagram of the DSI module.

Figure 10-95. DSI Overview

dsi-001

There are two DSI modules in the display subsystem (DSS) that provide the following main features:

- DSI 1 (primary)
 - Supports MIPI-DSI (up to four data lanes + one clock lane)
 - Supports video mode and command mode
 - Support multiple displays (one video mode and one command mode). In command mode, pixel data are provided from the level 3 (L3) interface or from one of the overlay manager outputs.
 - Bidirectional data link support for command mode (only one data lane is used in reverse direction)

- RGB16, RGB18 nonpacked, and RGB24 formats supported for command mode
- RGB16, RGB18 packed and nonpacked, and RGB24 formats supported for video mode
- Burst support for the video mode
- Supports up to four data-configurable lanes, in addition to the clock signaling
- Maximum data rate of 824 Mbps per data pair for four-data lane configuration, and 900 Mbps for up to three-data lane configuration
- Data splitter for 2-data, 3-data and 4-data lane configurations
- Data interleaving support for one synchronous stream (video mode) from the DISPC and up to three asynchronous streams (command mode) from the interconnect concurrently, or up to four asynchronous streams (command mode) from the interconnect
- Transfer of pixels and data received on the video port or L3 interconnect to the display through DSI DSI_PHY
- Serial configuration port (SCP) for the DSI_PHY complex input/output (I/O) and DSI phase-locked loop (PLL)
- Connection to the DSI_PHY complex I/O through PPI
- Error-correction code (ECC) and checksum generation
- MIPI DCS support
- DSI 2 (secondary)
 - Supports MIPI-DSI (up to two data lanes + one clock lane)
 - Supports video mode and command mode
 - Support multiple displays (one video mode and one command mode). In command mode, pixel data are provided from the L3 interface or from one of the overlay manager outputs.
 - Bidirectional data link support for command mode (only one data lane is used in reverse direction)
 - RGB16, RGB18 nonpacked, and RGB24 formats supported for command mode
 - RGB16, RGB18 packed and nonpacked, and RGB24 formats supported for video mode
 - Burst support for the video mode
 - Supports one data-configurable lane, in addition to the clock signaling
 - Maximum data rate of 900 Mbps per data pair
 - Data splitter for 2-data lane configuration
 - Data interleaving support for one synchronous stream (video mode) from the DISPC and up to three asynchronous streams (command mode) from the interconnect concurrently, or up to four asynchronous streams (command mode) from the interconnect
 - Transfer pixels and data received on the video port or Interface interconnect to the display through DSI DSI_PHY
 - Serial configuration port (SCP) for the DSI_PHY complex I/O and DSI PLL
 - Connection to the DSI_PHY complex I/O through the physical layer (PHY) protocol interface (PPI)
 - ECC and checksum generation
 - MIPI DCS support

10.3.2 DSI Environment

NOTE: Copyright 2005-2008 MIPI Alliance, Inc. All rights reserved. MIPI Alliance Member Confidential.

This section describes the DSI application fields from an environment point of view (external connections). It describes the DSI connectivity options, lists all possible interfaces, and describes the protocol and data format used in each case.

Figure 10-96 is a block diagram of the DSI environment.

Figure 10-96. DSI Environment

dsi-002

The DSI is a bidirectional differential serial interface with data/clock for the PHY (configured in unidirectional link in case the display module is only unidirectional). The maximum capacity of a DSI data transfer is 824 Mbps for four data lanes. The speed of the link can be configured by software only when the DSI_PHY is in STOP state or ULTRALOW-POWER state (ULPS).

Figure 10-97 shows the high-level data flow of the DSI transmitter/receiver.

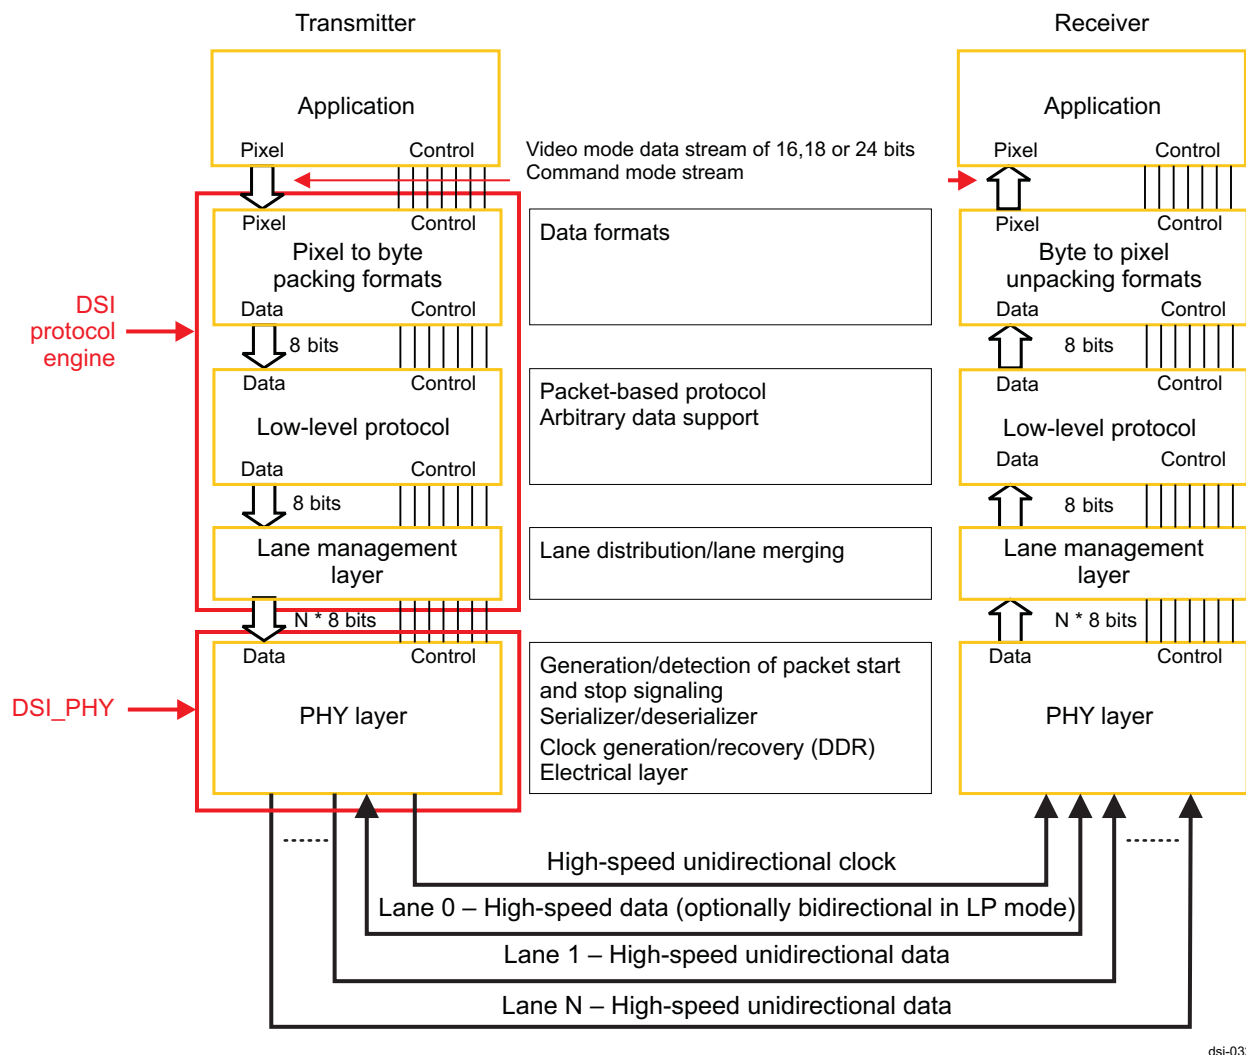

Figure 10-97. DSI Transmitter/Receiver Data Flow**10.3.2.1 DSI PHY**

Table 10-459 lists the DSI1 I/Os.

Table 10-459. I/O Description of DSI1

Signal Name		I/O ⁽¹⁾	Description	Value at Reset
dsi1_dx0	lane 1	I/O	Serial data/clock lane	N/A
dsi1_dy0				
dsi1_dx1	lane 2	I/O	Serial data/clock lane	N/A
dsi1_dy1				
dsi1_dx2	lane 3	I/O	Serial data/clock lane	N/A
dsi1_dy2				
dsi1_dx3	lane 4	I/O	Serial data/clock lane	N/A
dsi1_dy3				
dsi1_dx4	lane 5	I/O	Serial data lane only	N/A
dsi1_dy4				
dsi1_te0	te0	I	DSI1 tearing effect (TE) input 0	N/A

⁽¹⁾ I = Input; O = Output; I/O = Bidirectional

Table 10-459. I/O Description of DSI1 (continued)

Signal Name		I/O ⁽¹⁾	Description	Value at Reset
dsi1_te1	te1	I	DSI1 TE input 1	N/A

NOTE: Each serial lane (lane 1 through lane 5) can be used as a data lane. Serial lanes 1 through 4 can be used as clock lanes (lane 5 can never be a clock lane). All polarities on all lanes are supported. The MIPI DSI 1.01 protocol requires at least one clock lane and one data lane.

Table 10-460 lists the DS2 I/Os.

Table 10-460. I/O Description of DSI2

Signal Name		I/O ⁽¹⁾	Description	Value at Reset
dsi2_dx0 dsi2_dy0	lane 1	I/O	Serial data/clock lane	N/A
dsi2_dx1 dsi2_dy1	lane 2	I/O	Serial data/clock lane	N/A
dsi2_dx2 dsi2_dy2	lane 3	I/O	Serial data/clock lane	N/A
dsi2_te0	te0	I	DSI2 TE input 0	N/A
dsi2_te1	te1	I	DSI2 TE input 1	N/A

⁽¹⁾ I = Input; O = Output; I/O = Bidirectional

NOTE: Each serial lane (lane 1 through lane 3) can be used as a clock lane or a data lane. All polarities on all lanes are supported. The MIPI DSI 1.01 protocol requires at least one clock lane and one data lane.

Lanes support four operating modes:

- HS mode: High-speed transmit mode
- LP mode: Low-power transmit mode (also called low-power state [LPS])
- ULPS: ULTRALOW-POWER state used between two transmissions
- Off mode: Lane is off.

NOTE: The CONTROL_DSIPHY register in the control module of the device provides the following control over the DSI lanes:

- Enable and disable each lane (the DSI2_LANEENABLE[31:29] and DSI1_LANEENABLE[28:24] bit fields).
- Pulldown enable and disable on each lane (the DSI1_PIPD[23:19] and DSI2_PIPD[18:14] bit fields)

For more information, see [Section 18.6.6, SYSCTRL_PADCONF_CORE Register Summary](#), in [Chapter 18, Control Module](#).

10.3.2.1.1 Data/Clock Configuration

Data-clock signaling consists of one to four data pairs and one clock pair. The minimum configuration is one data pair and one clock pair.

- The data signal carries the bit serial data. The DSI transmitter in the host sends the data in-quadrature with the dual data rate (DDR) clock in HS mode; otherwise, the clock is extracted from the received data in LS mode. The data is transmitted byte-wise LSB first.
- The clock signal carries the DDR clock signal in HS transmission.
- Software users must configure the order of the data lanes to indicate the byte order while splitting the

byte stream for each DSI_PHY into bytes.

Table 10-461 lists some of the DSI lane configurations.

NOTE: All combinations for the order of the clock and data lanes are supported (except clock cannot be on lane 5) but not explicitly described in Table 10-461.

Table 10-461. DSI Lane Configuration

DSI_PHY Lane Configuration	Data/Clock Lane Position					Description
	1	2	3	4	5	
Mode CLK + DATA1						Single data lane
	CLK	DATA1				
	DATA1	CLK				
Mode CLK + DATA1 + DATA2						Two data lanes
	CLK	DATA1	DATA2			
	CLK	DATA2	DATA1			
	DATA1	CLK	DATA2			
	DATA2	CLK	DATA1			
	DATA1	DATA2	CLK			
	DATA2	DATA1	CLK			
Mode CLK + DATA1 + DATA2 + DATA3						Three data lanes
	CLK	DATA1	DATA2	DATA3		
	CLK	DATA3	DATA2	DATA1		
	DATA1	CLK	DATA2	DATA3		
	DATA1	CLK	DATA3	DATA2		
	DATA2	CLK	DATA1	DATA3		
	DATA2	CLK	DATA3	DATA1		
	DATA3	CLK	DATA1	DATA2		
	DATA3	CLK	DATA2	DATA1		
	DATA3	DATA1	CLK	DATA2		
	DATA3	DATA2	CLK	DATA1		
	DATA3	DATA2	CLK	DATA1		
	DATA1	DATA2	CLK	DATA3		
	DATA2	DATA3	CLK	DATA1		
	DATA1	DATA3	CLK	DATA2		
	DATA1	DATA2	DATA3	CLK		
	DATA3	DATA2	DATA1	CLK		
Mode CLK + DATA1 + DATA2 + DATA3 + DATA4						Four data lanes
	CLK	DATA1	DATA2	DATA3	DATA4	
	DATA3	DATA1	CLK	DATA2	DATA4	
	DATA4	DATA2	CLK	DATA1	DATA3	
	DATA2	DATA1	CLK	DATA3	DATA4	
	DATA4	DATA3	CLK	DATA1	DATA2	
	DATA3	DATA4	CLK	DATA2	DATA1	
	DATA1	DATA2	CLK	DATA4	DATA3	
	DATA1	DATA4	CLK	DATA3	DATA2	
	DATA1	DATA3	CLK	DATA4	DATA2	

NOTE:

- The byte on Dn is sent before the byte on Dn + 1; all the combinations of data and clock are supported through programming of the [DSI_COMPLEXIO_CFG1](#) register. The CLOCK_POSITION and CLOCK_POL bit fields configure which lane transmits the clock and define its polarity. Eight bit fields (DATA1_POSITION and DATA1_POL, through DATA4_POSITION and DATA4_POL) configure the data lanes and their polarity. The DATA2_POSITION through DATA4_POSITION bit fields can be set to 0; in this case, only the data lane defined in the DATA1_POSITION bit field is used, and data is transmitted on only one clock lane and one data lane.
- Only DATA1 is bidirectional in command mode. The low-power received information is always sent by the display panel using DATA1. Because any lane of the DSI complex I/O can be configured as data lane DATA1, all lanes of the complex I/O are bidirectional.

10.3.2.1.2 ULPS

Each lane can be put in ULPS by software configuration. The ULPS mode requires the following conditions:

- The lane must be in ULP state.
- For data lanes, no data must be pending in the DSI module.
- For data lane 1, no bus turnaround (BTA) should have been sent. The DSI module must have control of the bus.

For more information on ULPS configuration, see [Section 10.3.4.4.16, Ultralow-Power State Configuration](#).

10.3.2.2 DSI Protocol Layer

Low-level protocol (LLP) is a byte-oriented protocol. It supports short and long packet formats. The DSI protocol layer defines how the display data is transported onto the PHY. Packets can be sent using HS mode or low-speed (LS) mode. LLP is selected through DSI registers. The features of the DSI protocol layer are:

- Transport of arbitrary data (payload independent)
- 8-bit word size
- Support for up to four interleaved VCs on the same link
- Special packets for frame start, frame end, line start, and line end information
- Descriptor for the type, pixel depth, and format of application-specific payload data
- ECC for 1-bit or 2-bit error detection in the header
- 16-bit checksum code for error detection

[Figure 10-98](#) shows the protocol layer with short and long packets.

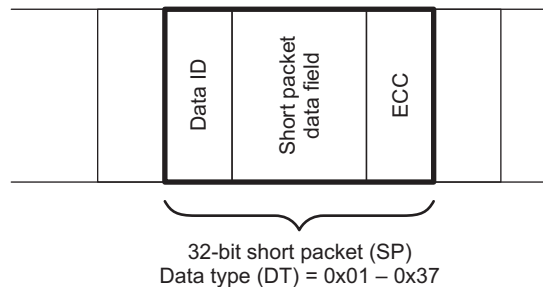

dsi-004

10.3.2.2.1 Short Packet

Figure 10-99 shows the structure of the short packet. A short packet must contain an 8-bit data ID followed by two command or data bytes and an 8-bit ECC. No packet footer (PF) should be present. Short packets must be 4 bytes long. The ECC byte allows correction of single-bit errors and detection of 2-bit errors in the short packet.

Figure 10-99. Short Packet Structure

dsi-005

NOTE: The short packets can be sent in LP mode or HS mode.

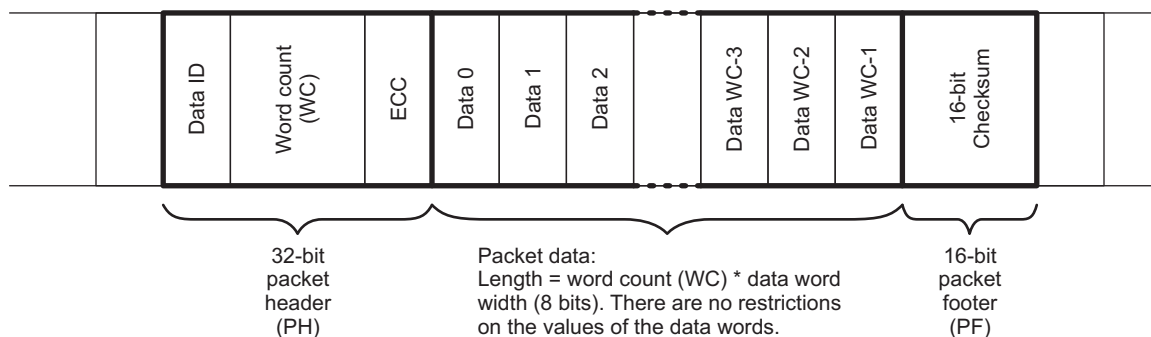

The `DSI_VC_SHORT_PACKET_HEADER_i` register is used to send only short packets (ECC can be calculated by hardware or by software users for debug purposes). This register is not used for video mode data because the short packets are generated by hardware based on the following events:

- Synchronization events received on the video port (assertion/deassertion of the HSYNC and VSYNC input signals)
- `DSI_CTRL[18]` VP_HSYNC_END
- `DSI_CTRL[17]` VP_HSYNC_START
- `DSI_CTRL[16]` VP_VSYNC_END
- `DSI_CTRL[15]` VP_VSYNC_START
- `DSI_CTRL[11]` VP_VSYNC_POL
- `DSI_CTRL[10]` VP_HSYNC_POL
- `DSI_VC_CTRL_i[1]` SOURCE

10.3.2.2.2 Long Packet

Figure 10-100 shows the structure of the long packet. A long packet must consist of three elements: 32-bit packet header (PH), application-specific data payload with a variable number of bytes, and 16-bit PF.

Figure 10-100. Long Packet Structure

dsi-006

The PH is further composed as follows:

- 8-bit data identifier: The data identifier defines the VC for the data and the DT for the application-

specific payload data.

- 16-bit word count: The word count defines the number of bytes in the data payload between the end of the PH and the start of the PF. The PH and the PF must not be included in the word count.
- 8-bit ECC: The ECC byte allows single-bit errors to be corrected and 2-bit errors to be detected in the PH. This includes the data identifier and the word count fields.

After the end of the PH, the receiver reads the next word count \times bytes of the data payload. There are no limitations on the value of a data word within the data payload block (that is, no embedded codes are used). Once the receiver has read the data payload, it reads the checksum in the PF. The host processor must always calculate and transmit a checksum in the PF. Peripherals are not required to calculate a checksum. In the special case of a 0-byte data payload, if the payload length is 0, the checksum calculation results in (0xFFFF). If the checksum is not calculated, the PF must consist of 2 bytes of 0s (0x0000). In the generic case, the length of the data payload must be a multiple of bytes. In addition, each data format can impose additional restrictions on the length of the payload data (that is, a multiple of 4 bytes). Each byte is transmitted LSB first. Payload data can be transmitted in any byte order, restricted only by data format requirements. Multibyte elements, such as word count and checksum, must be transmitted least-significant byte (LSByte) first.

NOTE: Long packets can be sent in LP or HS mode.

The [DSI_VC_LONG_PACKET_HEADER_i](#) register provides headers for long packets (ECC is always calculated by hardware). The register is used for video and command modes.

If video mode is enabled for a virtual channel, it is not possible to transfer data concurrently (interleaved in a frame) using long packets received on the video and L3 interconnect ports because the [DSI_VC_LONG_PACKET_HEADER_i](#) register is used by the video mode. The register can be unprogrammed by the user to send long packets received on the L3 interconnect port only when there is no expected data on the video port. Software must program the register correctly to send sequentially long packets in video and command modes.

The word count (WC) defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register for the VC associated with the video port indicates the number of bytes to receive (one line or two lines can be used, depending on the WC and the size of the line buffer). The total size defined in the WC of the header register cannot exceed the size of the line buffer multiplied by the number of buffer lines.

The [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register is used to provide payload data for long packets (checksum is calculated by hardware when [DSI_VC_CTRL_i\[7\]](#) CS_TX_EN is set to 1; otherwise, the value is 0x00). The register is not used in video mode because payload data are provided by the video port.

Software must ensure that the following sequence for write accesses to the header and payload registers ([DSI_VC_LONG_PACKET_HEADER_i](#) and [DSI_VC_LONG_PACKET_PAYLOAD_i](#), respectively) is followed:

- A long PH value with WC = 0 written in the [DSI_VC_LONG_PACKET_HEADER_i](#) register can be followed by any access.
- A long PH value with WC > 0 written in the [DSI_VC_LONG_PACKET_HEADER_i](#) register must be followed by one or more writes to the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register defined by the WC value before writing again to the same [DSI_VC_LONG_PACKET_HEADER_i](#) register.

CAUTION

If this sequence is not followed, no error is generated. Access to other DSI registers during this sequence is allowed.

10.3.2.2.3 Data Identifier

The data identifier byte contains the values for the virtual channel ID and data type, as shown in [Figure 10-101](#). The virtual channel ID is contained in the 2 MSBs of the data identifier byte and identify the data as directed to one of four virtual channels. The value of the data type is contained in the 6 LSBs of the data identifier byte.

Figure 10-101. Data Identifier Structure

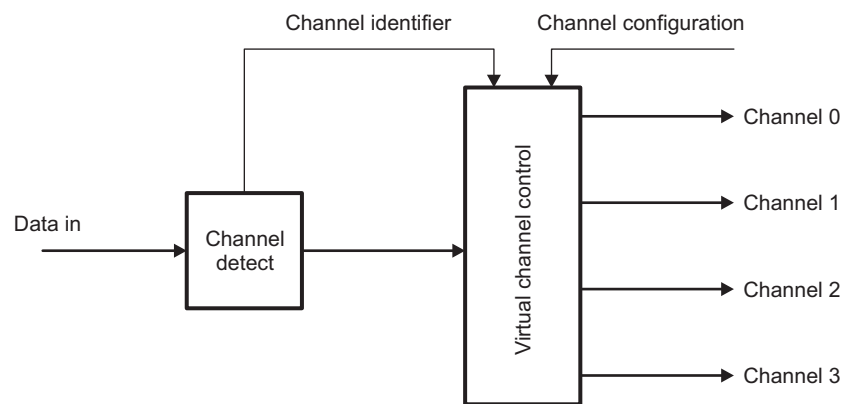

dsi-007

10.3.2.2.3.1 VC ID – VC Field, DI[7:6]

The host can service up to four peripherals with tagged commands or blocks of data using the VC ID field of the header for packets targeted at different peripherals. The VC ID enables one serial stream to service two or more virtual peripherals by multiplexing packets onto a common transmission channel. Each packet sent in a single transmission has its own VC assignment and can be directed to different peripherals. The VC ID is defined in the [DSI_VC_SHORT_PACKET_HEADER_i](#) and [DSI_VC_LONG_PACKET_HEADER_i](#) registers for short and long packets, respectively. It will not be modified by hardware. There is one set of registers for each VC. Each set of registers defines the characteristics of the traffic between the host and the display associated with the VC.

[Figure 10-102](#) shows the VC controller.

Figure 10-102. VC Controller

dsi-008

10.3.2.2.3.2 Data Type Field DT[5:0]

The data type field specifies whether the packet is long or short and the packet format. The data type field, and the word count field for long packets, informs the receiver about how many bytes to expect in the rest of the packet. This is necessary because the beginning and end of a packet are not indicated by special packet start/end sync codes. This permits packets to convey arbitrary data, but it also requires the PH to specify the size of the packet.

10.3.2.2.4 Synchronization Codes

Each frame can be identified by two synchronization codes:

- For the start of the vertical synchronization (VSSC) pulse

- For the end of the vertical synchronization (VSEC) pulse

Each line can be identified by two synchronization codes:

- For the start of the horizontal synchronization (HSSC) pulse
- For the end of the horizontal synchronization (HSEC) pulse

The synchronization events are not required by the display (peripheral): they are optional. Users can program which synchronization events are generated to the display from the timings received from the DISPC in video mode. When data are received on the L3 interconnect port, the synchronization codes are not automatically generated by the protocol engine. They can be provided on the L3 interconnect port by writing to the registers with limited timing control. It is highly recommended to use the video port from the DISPC to receive the synchronization events to automatically generate short synchronization packets to the peripheral.

When the DSI protocol engine detects that the VSYNC signal from the DISPC transitions from inactive to active state, the VSSC short packet replaces the following HSSC corresponding to the following HSYNC synchronization short packet (if the generation is enabled).

When the transition from active to inactive state is detected, the VSEC short packet is generated (if the generation is enabled) replacing the HSEC synchronization packet corresponding to the following HSYNC.

When the DSI protocol engine detects that the HSYNC signal from the DISPC transitions from inactive to active state, the HSSC short packet is generated (if the generation is enabled).

When the transition from active to inactive state is detected, the HSEC short packet is generated (if generation is enabled).

For the first frame, any HSYNC and data received on the video port before the first VSYNC must be ignored. Because the first VSYNC sent to the display is also recognized as an HSYNC for the first line, there is no HSYNC sent for the first line. To send the synchronization codes, the DSI protocol engine uses the short packets. [Table 10-462](#) lists the 6-bit DT synchronization code values.

Table 10-462. Synchronization Codes

Synchronization Code	Value	Comments
Vertical sync start code (VSSC)	0x1	Optional
Vertical sync end code (VSEC)	0x11	Optional
Horizontal sync start code (HSSC)	0x21	Optional
Horizontal sync end code (HSEC)	0x31	Optional

10.3.2.2.5 Blanking

To keep the DSI link in HS state while using video mode, during blanking periods, long blanking packets are sent to the display. The DSI_VM_TIMINGx (where x = 1 to 8) registers define the size of the long blanking packets after:

- Horizontal sync start code (short packet)
- Horizontal sync end code (short packet)
- Vertical sync start code (short packet)
- Vertical sync end code (short packet)
- Pixels (long packet)

[Table 10-463](#) defines the short packet values for the synchronization packets:

Table 10-463. Sync Short Packet Values

VC ID	Sync Code	Header (First Byte)	Header (Second Byte): Data Field LSB	Header (Third Byte): Data Field MSB	Header (ECC)
0x0	0x1	0x1	0x0	0x0	See Notes following this table.
	0x11	0x11			
	0x21	0x21			
	0x31	0x31			
0x1	0x1	0x41			
	0x11	0x51			
	0x21	0x61			
	0x31	0x91			
0x2	0x1	0x81			
	0x11	0x81			
	0x21	0xA1			
	0x31	0xB1			
0x3	0x1	0xC1			
	0x11	0xD1			
	0x21	0xC1			
	0x31	0xF1			

NOTE:

- If the ECC is enabled by setting the [DSI_VC_CTRL_i\[8\] ECC_TX_EN](#) bit to 1 for the VC in video mode, the ECC value is calculated; otherwise, 0x00 is used for the blanking long packets and sync short packets. If the CRC is enabled by setting the [DSI_VC_CTRL_i\[7\] CS_TX_EN](#) bit to 1 for the VC in video mode, the checksum value is calculated; otherwise, 0x00 is used for the blanking long packets.
- In other cases, when the [DSI_VC_CTRL_i\[7\] CS_TX_EN](#) bit is set to 0, the value 0x00 is always used for the CRC (long packets). When the [DSI_VC_CTRL_i\[8\] ECC_TX_EN](#) bit is set to 0, the value 0x00 is used for the ECC for short and long packets, except when the header is provided by the register, because the ECC field is available in the register. It can be used to generate invalid ECC values when the header is provided by the register.

The DSI link (lanes and clock separately) can be put in ULPS. While using the blanking values formerly defined, the packets (short and long) are considered in HS mode.

Timing parameters VSA, VBP, VFP, HSA, HBP, HFP, VACT, and t_L are defined in the [DSI_VM_TIMING1](#) through [DSI_VM_TIMING8](#) registers. HSA, HBP, HFP, and t_L are defined using the byte clock unit (TXBYTECLKHS - HS transmit byte clock generated by DSI_PHY) and also in low-power clock cycles (TxClkEsc). VSA, VBP, VFP, and VACT are defined by the number of lines. When the HS blanking packets are sent during the blanking periods, the parameters are used to determine the blanking packet payload size (taking into account the 4-byte header and the 2-byte checksum).

The configuration of the DISPC timing generator must be used when the DISPC timings are used to generate DSI HS video mode transfer.

Special care must be taken in the case of the last line of the frame. The LPS transition is required when the link is in HS mode for the whole frame.

When BTA is sent for the data packets, the following blanking period cannot be used for sending any data from the TX FIFO. When the blanking period starts with one HS packet from one VC, it can be followed only by another HS packet from the same VC, or by a trigger (for example, BTA). When there is no more HS data to send for this VC, the lane is in LPS.

When the blanking period starts with one LP packet from one VC, it can be followed only by another LP packet from the same VC, by another VC, by trigger (BTA, for example), or by extra LP NULL packets. If the trigger is sent, it is not possible to send any more data. When there is no more data from the TX FIFO to send in LP mode or the trigger has been sent, the lane is put into LPS. If the lanes must be kept in HS mode during blanking periods (except for the last blanking period of the frame), the HS blanking packets must be used. If one trigger is sent at the beginning of the blanking period, the rest of the blanking period is in LPS.

Figure 10-103 and Figure 10-104 show a nonburst transfer in DSI video mode with and without VE and HE, respectively. Figure 10-105 shows a burst transfer in DSI video mode without VE and HE.

Figure 10-103. DSI Video Mode: Nonburst Transfer With VE and HE

dsi-009

Figure 10-104. DSI Video Mode: Nonburst Transfer Without VE and HE

dss-010

NOTE: HSA timing is not used and does not have to be programmed when HE short packet is not generated.

Figure 10-105. DSI Video Mode: Burst Transfer Without VE and HE

dsi-011

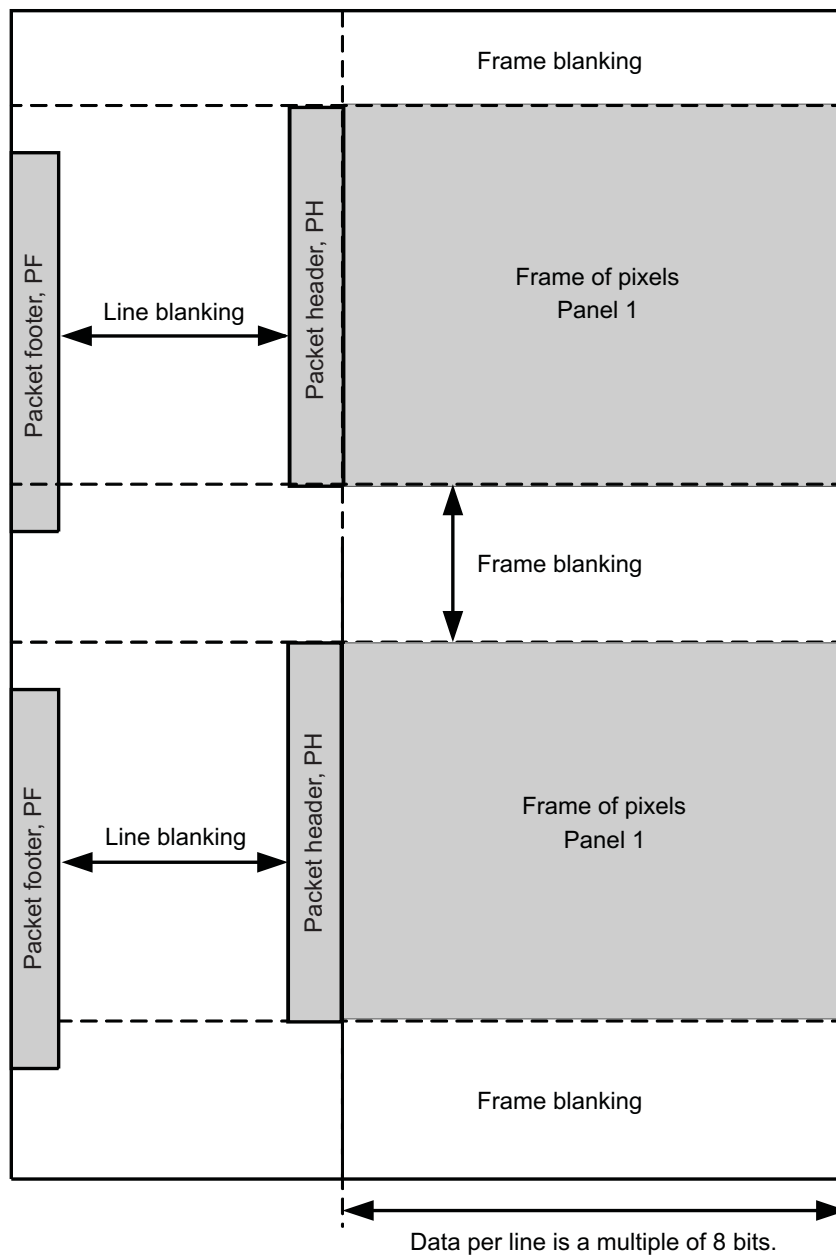

NOTE: HSA timing is not used and does not have to be programmed when HE short packet is not generated.

In [Figure 10-104](#) and [Figure 10-105](#), if HSYNC end short packet is not generated (HSA does not exist), HBP must not be 0.

10.3.2.2.6 Frame Structures

NOTE: The figures in this section show only pixel packets and blanking periods; they do not show synchronization packets.

10.3.2.2.7 VCs

The DSI protocol layer transports VCs. VCs separate different data flows, which are interleaved in the same data stream. Each VC is identified by a unique channel identification number in the PH. The channel identification number is encoded in 2 bits. The DSI protocol engine determines the channel identifier number to be used for generating the PH and multiplexes the interleaved data streams. The DSI protocol engine supports multiple (up to 4) concurrent VCs. [Table 10-464](#) summarizes the VC values used for each channel.

Table 10-464. VC Values

VC Number	Value
VC 0	0x0
VC 1	0x1
VC 2	0x2
VC 3	0x3

If multiple displays are connected to a single DSI port on the host, a hub can be used to route the data stream to the appropriate display based on the VC ID. Typically, VC ID 0x0 is used for the primary display and 0x1 for the secondary. The hub may have its own VC ID to provide communication capability between the host and the hub.

There is one set of registers for each VC. The attributes of the VC define the following characteristics:

- Transfer mode ([DSI_VC_CTRL_i\[4\]](#) MODE bit):
 - Video mode
 - Command mode
- Data type
- Source ([DSI_VC_CTRL_i\[1\]](#) SOURCE bit)
 - Video port
 - Slave interconnect port
- HS or LP forward transmission
- Automatic BTA generation
 - Short packets ([DSI_VC_CTRL_i\[2\]](#) BTA_SHORT_EN bit)
 - Long packets ([DSI_VC_CTRL_i\[3\]](#) BTA_LONG_EN bit)
- DMA request configurations for RX and TX
 - DMA request number ([DSI_VC_CTRL_i\[29:27\]](#) DMA_RX_REQ_NB bit field for RX FIFO and [DSI_VC_CTRL_i\[23:21\]](#) DMA_TX_REQ_NB bit field for TX FIFO)
 - DMA threshold ([DSI_VC_CTRL_i\[26:24\]](#) DMA_RX_THRESHOLD bit field for RX FIFO and [DSI_VC_CTRL_i\[19:17\]](#) DMA_TX_THRESHOLD bit field for TX FIFO)
- Mode speed ([DSI_VC_CTRL_i\[9\]](#) MODE_SPEED bit)
- ECC transmission ([DSI_VC_CTRL_i\[8\]](#) ECC_TX_EN bit)
- CS transmission ([DSI_VC_CTRL_i\[7\]](#) CS_TX_EN bit)

NOTE: The VC ID is not calculated by the DSI module but is provided while writing into the [DSI_VC_SHORT_PACKET_HEADER_i](#) and [DSI_VC_LONG_PACKET_HEADER_i](#) registers.

10.3.2.3 DSI Multilane Layer

A layer consists of lane splitter logic to split the incoming byte stream into a serial stream. The bits are sent with the LSB first. The number of active lanes is configurable through a register. The order of the lanes is configurable. The number of lanes can be changed only in ULPS or when all data lanes are in STOP state.

10.3.2.3.1 SoT and EoT in Multilane Configurations

Because a HS transmission is composed of an arbitrary number of bytes that may not be an integer multiple of the number of lanes, some lanes may run out of data before others. Therefore, the lane management layer, as it buffers up the final set of less-than-N bytes, deasserts its valid data signal into lanes for which there is no further data. Although all lanes start simultaneously with parallel start-of-transmissions (SoTs), each lane operates independently and may complete the HS transmission before the other lanes, sending an end-of-transmission (EoT) one cycle (byte) earlier.

10.3.2.3.2 Lane Splitter

The lane splitter can split the byte stream into two, three, or four lanes (for one lane, the splitter is bypassed). Figure 10-109 through Figure 10-112 show the byte position in each serial link for one-, two-, three-, and four-data lane configurations. The byte stream always starts from lane 1. It finishes on one of the lanes, depending on the number of bytes to send and the number of lanes. The splitter module is used only when packets are sent using HS mode. In LS mode, only data lane 1 is used.

Figure 10-109. Four-Data Lane Configuration

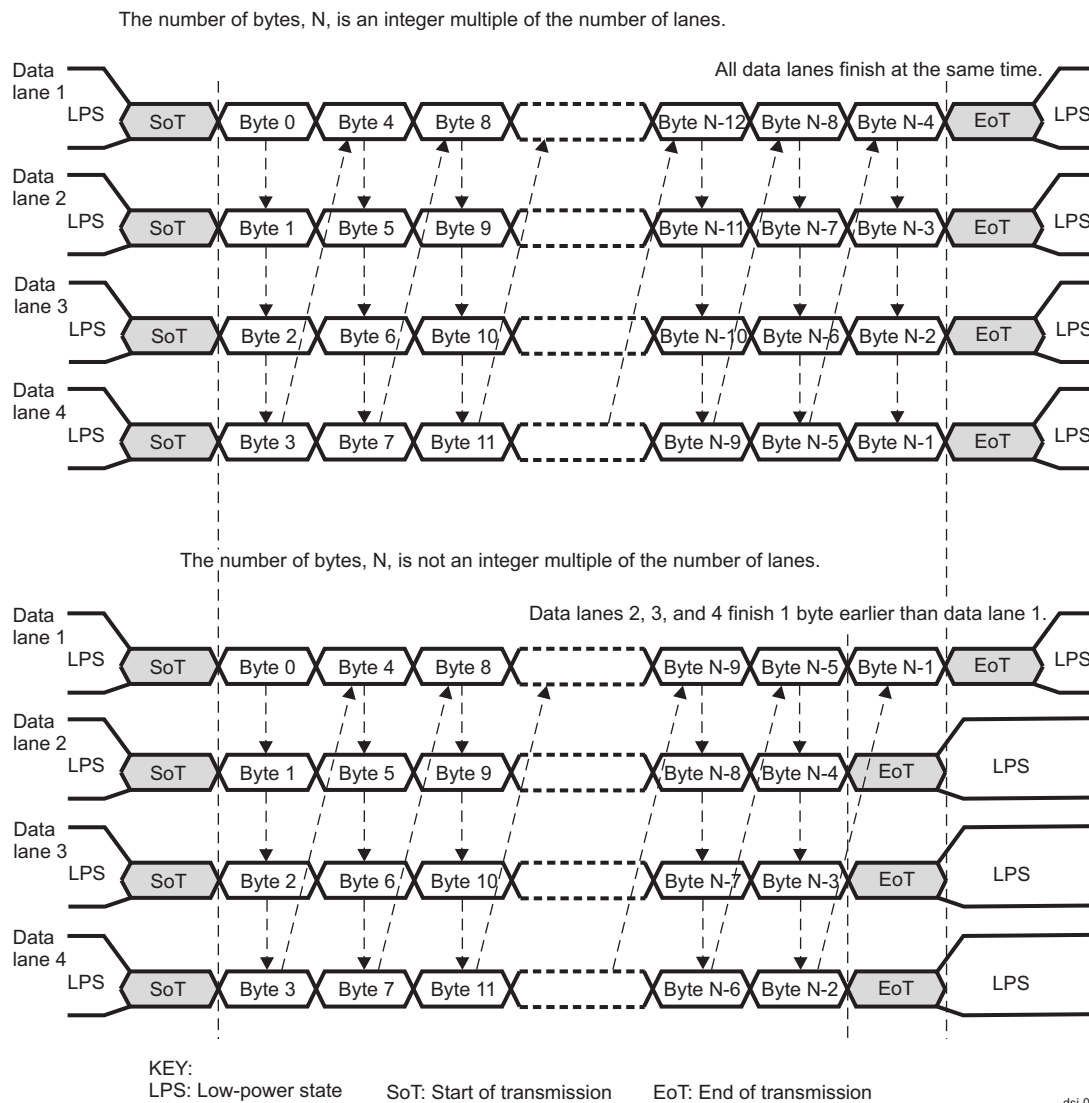

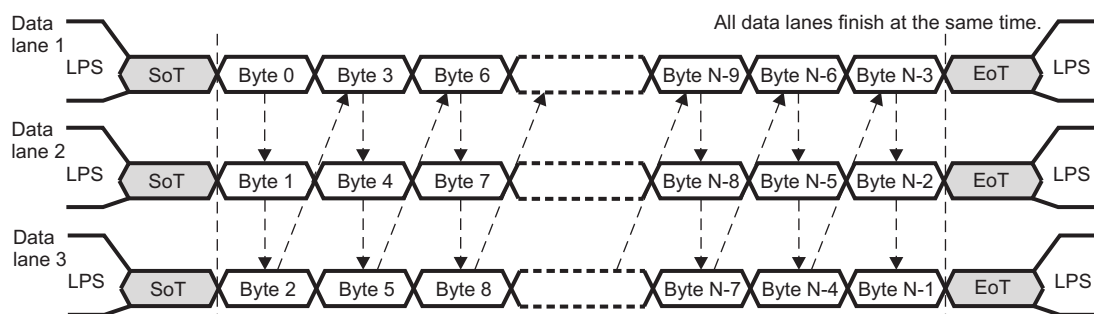

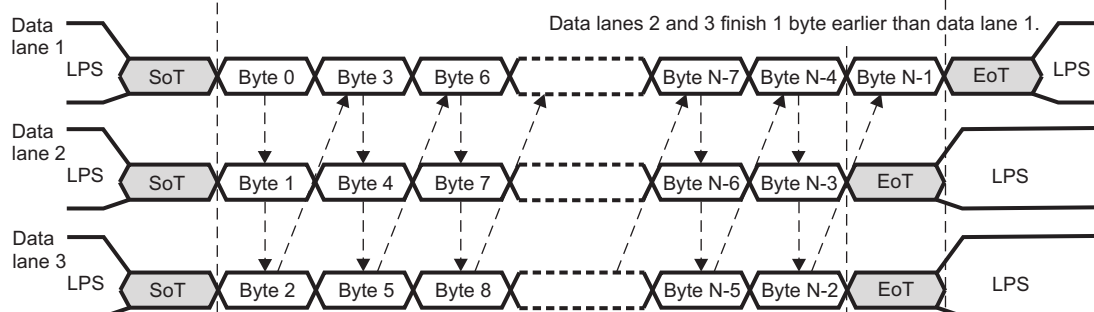

Figure 10-110. Three-Data Lane Configuration

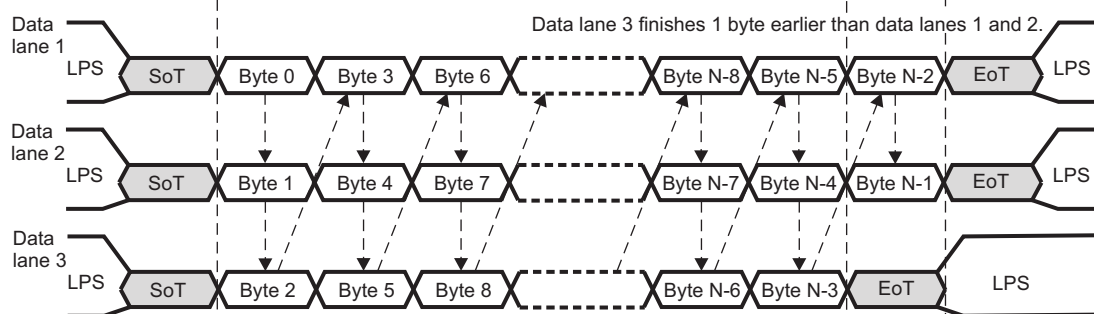

The number of bytes, N, is an integer multiple of the number of lanes.

The number of bytes, N, is not an integer multiple of the number of lanes (Example 1).

The number of bytes, N, is not an integer multiple of the number of lanes (Example 2).

Key:
LPS: Low-power state SoT: Start of transmission EoT: End of transmission

dsi-015

Figure 10-111. Two-Data Lane Configuration

The number of bytes, N, is an integer multiple of the number of lanes (2).

The number of bytes, N, is not an integer multiple of the number of lanes (2).

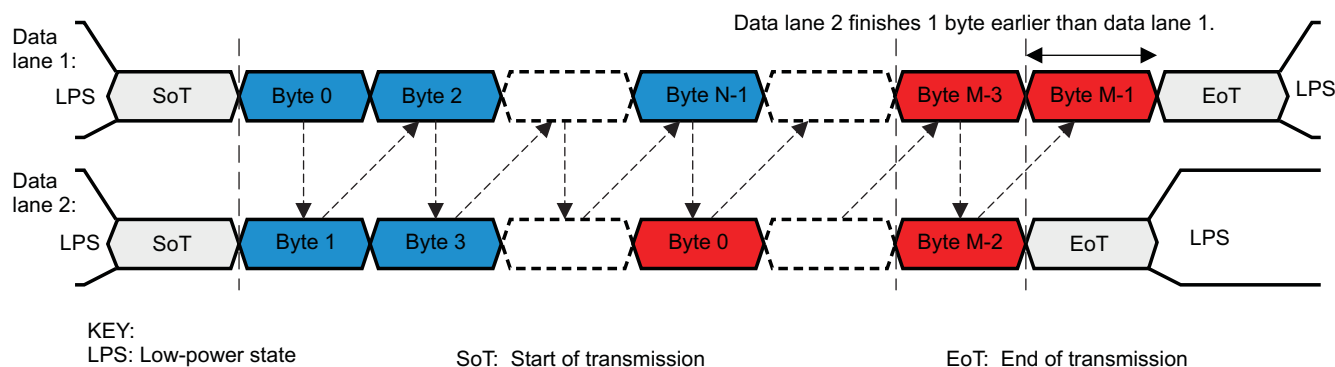

Key:

dsi-016

Figure 10-112. One-Data Lane Configuration

dsi-017

For back-to-back packets, the byte stream is considered as a single packet by the splitter module. [Figure 10-113](#) shows an example of two packets sent back-to-back. N bytes are used for the first packet and M bytes for the second packet.

Figure 10-113. Two Packets Using Two-Data Lane Configuration (Example)

dsi-019

10.3.2.4 DSI Pixel Data Formats

This section describes how the DSI-supported pixel data formats in video mode are transmitted over the serial interface. The DSI protocol engine can cope with all data formats if the data line length sent through the DSI physical protocol is a multiple of a pixel. This condition is required for the DSI protocol engine to work properly.

10.3.2.4.1 Pixel Data Formats in Video Mode

The host can send different pixel formats in video mode. [Table 10-465](#) lists the pixel formats supported by the DSI in video mode.

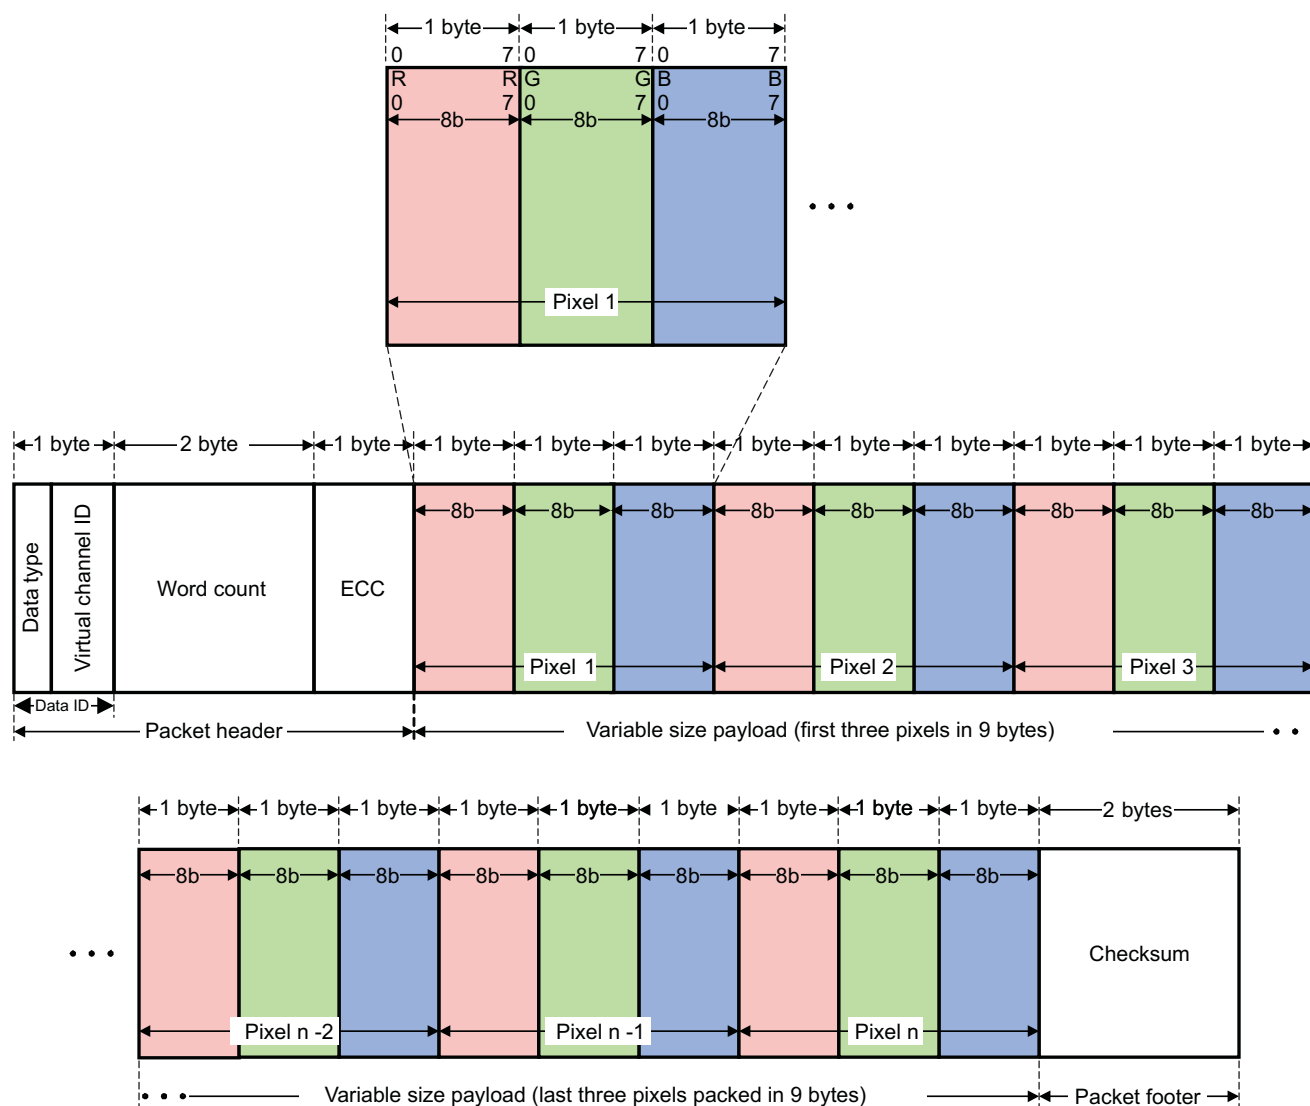

Table 10-465. Pixel Data Format in Video Mode

Mode	Description
RGB888 (using 24-bit container)	RGB888
RGB666 (using 24-bit container)	RGB666
RGB666 (18-bit packet using 18-bit container)	RGB666_PACKET
RGB565 (using 16-bit container)	RGB565

10.3.2.4.2 24 bpp – RGB Color Format, Long Packet (Video Mode)

Figure 10-114 shows the RGB888 format.

Figure 10-114. 24-bpp RGB Color Format, Long Packet (Video Mode)

dsi-020

Packed-pixel stream, 24-bit format is a long packet used to transmit image data formatted as 24-bit pixels to a video-mode display module. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (8 bits), G (8 bits), and B (8 bits), in that order. Each color component occupies 1 byte in the pixel stream; no components are split across byte boundaries. Within a color component, the LSB is sent first and the MSB last.

10.3.2.4.3 24 Bits per Pixel - RGB Color Format, Long Packet (Command Mode)

Figure 10-115 shows the RGB888 format.

Figure 10-115. 24-bpp RGB Color Format, Long Packet (Command Mode)

dsi-021

This format is the same as the packed pixel stream format.

10.3.2.4.4 18 bpp (Loosely Packed) – RGB Color Format, Long Packet (Transparent for DSI Protocol Engine) (Video Mode)

Figure 10-116 shows the RGB666 format.

Figure 10-116. 18-bpp (Loosely Packed) RGB Color Format, Long Packet (Transparent for DSI Protocol Engine) (Video Mode)

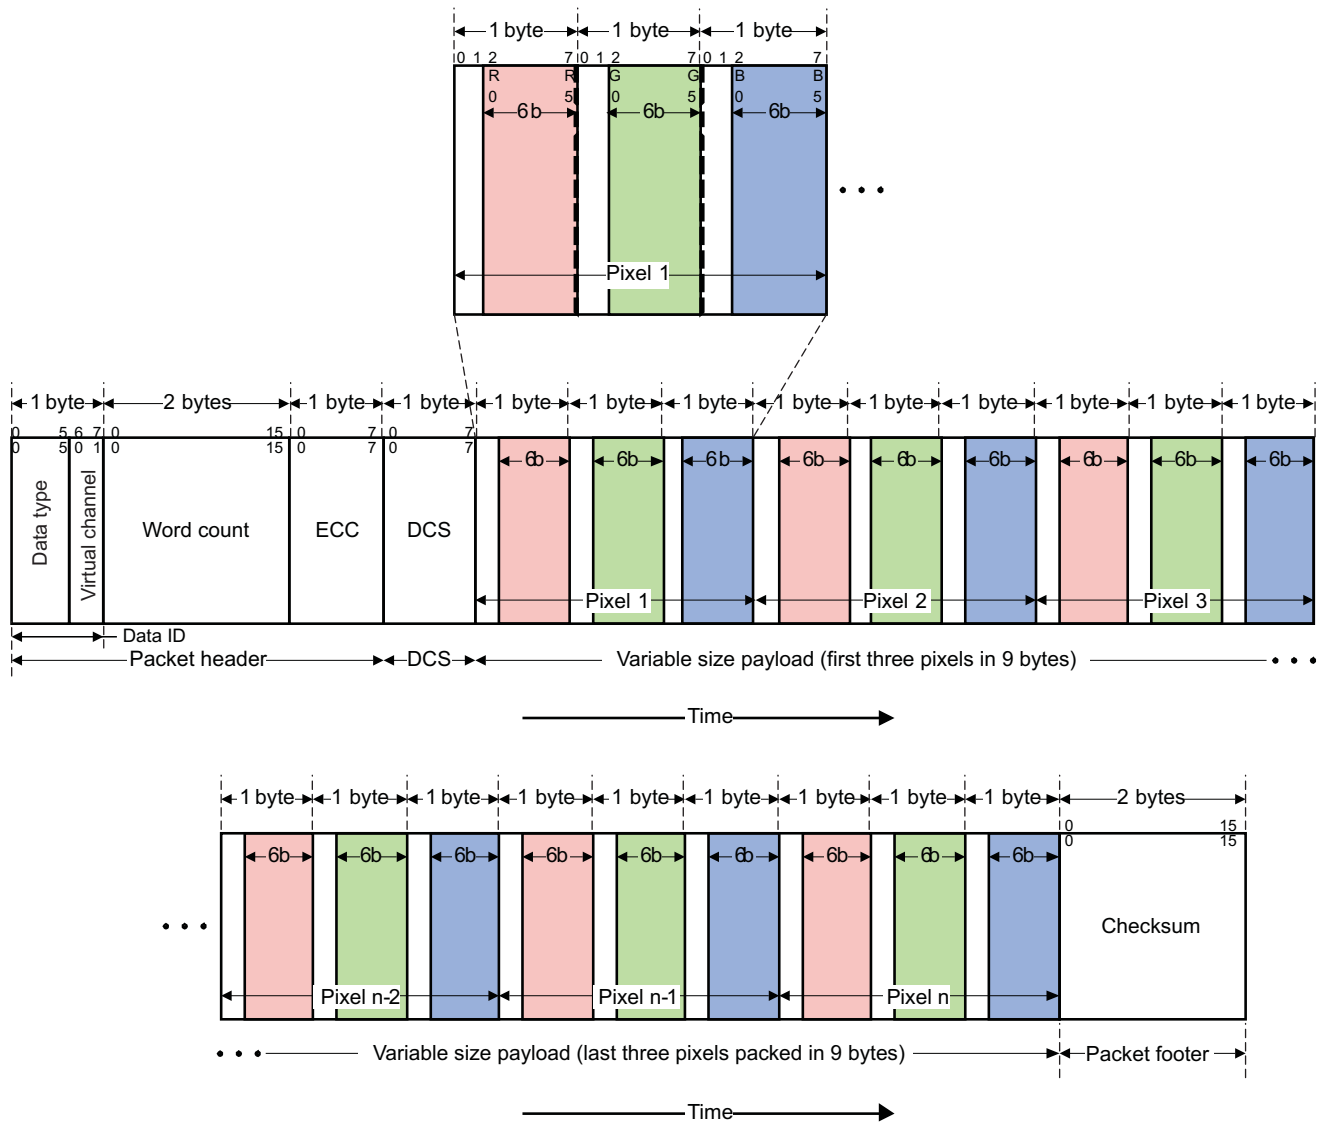

dsi-022

In 18-bit loosely packed pixel format, each R, G, and B color component is 6 bits but is shifted to the upper bits of the byte, such that the valid pixel bits occupy bits [7:2] of each byte. Bits [1:0] of each payload byte representing active pixels are ignored. As a result, each pixel requires 3 bytes as it is transmitted across the link. This requires more bandwidth than packed format but requires less shifting and multiplexing logic in the packing and unpacking functions on each end of the link. This format is used to transmit RGB image data formatted as pixels to a video mode display module that displays 18-bit pixels. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (6 bits), G (6 bits), and B (6 bits), in that order. Within a color component, the LSB is sent first and the MSB last.

10.3.2.4.5 18-bpp (Loosely Packed) – RGB Color Format, Long Packet (Command Mode)

Figure 10-117 shows the RGB666 format.

Figure 10-117. 18-bpp (Loosely Packed) RGB Color Format, Long Packet (Command Mode)

ds1-023

This format is the same as the packed-pixel stream format.

10.3.2.4.6 18-bpp (Packed) – RGB Color Format, Long Packet (Video Mode)

Figure 10-118 shows the RGB666_PACKED format.

Figure 10-118. 18-bpp (Packed) RGB Color Format, Long Packet (Video Mode)

dsi-024

Packed pixel stream 18-bit format is a long packet. It is used to transmit RGB image data formatted as pixels to a video mode display module that displays 18-bit pixels. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (6 bits), G (6 bits), and B (6 bits), in that order. Within a color component, the LSB is sent first and the MSB last. With this format, it is strongly recommended that the total line width be a multiple of 4 pixels (9 bytes). This format is not supported in command mode.

10.3.2.4.7 16 bpp – RGB Color Format, Long Packet (Video Mode)

Figure 10-119 shows the RGB565 format.

Figure 10-119. 16-bpp RGB Color Format, Long Packet (Video Mode)

dsi-025

Packed-pixel stream, 16-bit format is a long packet used to transmit image data formatted as 16-bit pixels to a video mode display module. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (5 bits), G (6 bits; split across 2 bytes), and B (5 bits), in that order. Within a color component, the LSB is sent first and the MSB last.

10.3.2.4.8 16 bpp – RGB Color Format, Long Packet (Command Mode)

Figure 10-120 shows the RGB565 format.

Figure 10-120. 16-bpp RGB Color Format, Long Packet (Command Mode)

dsi-026

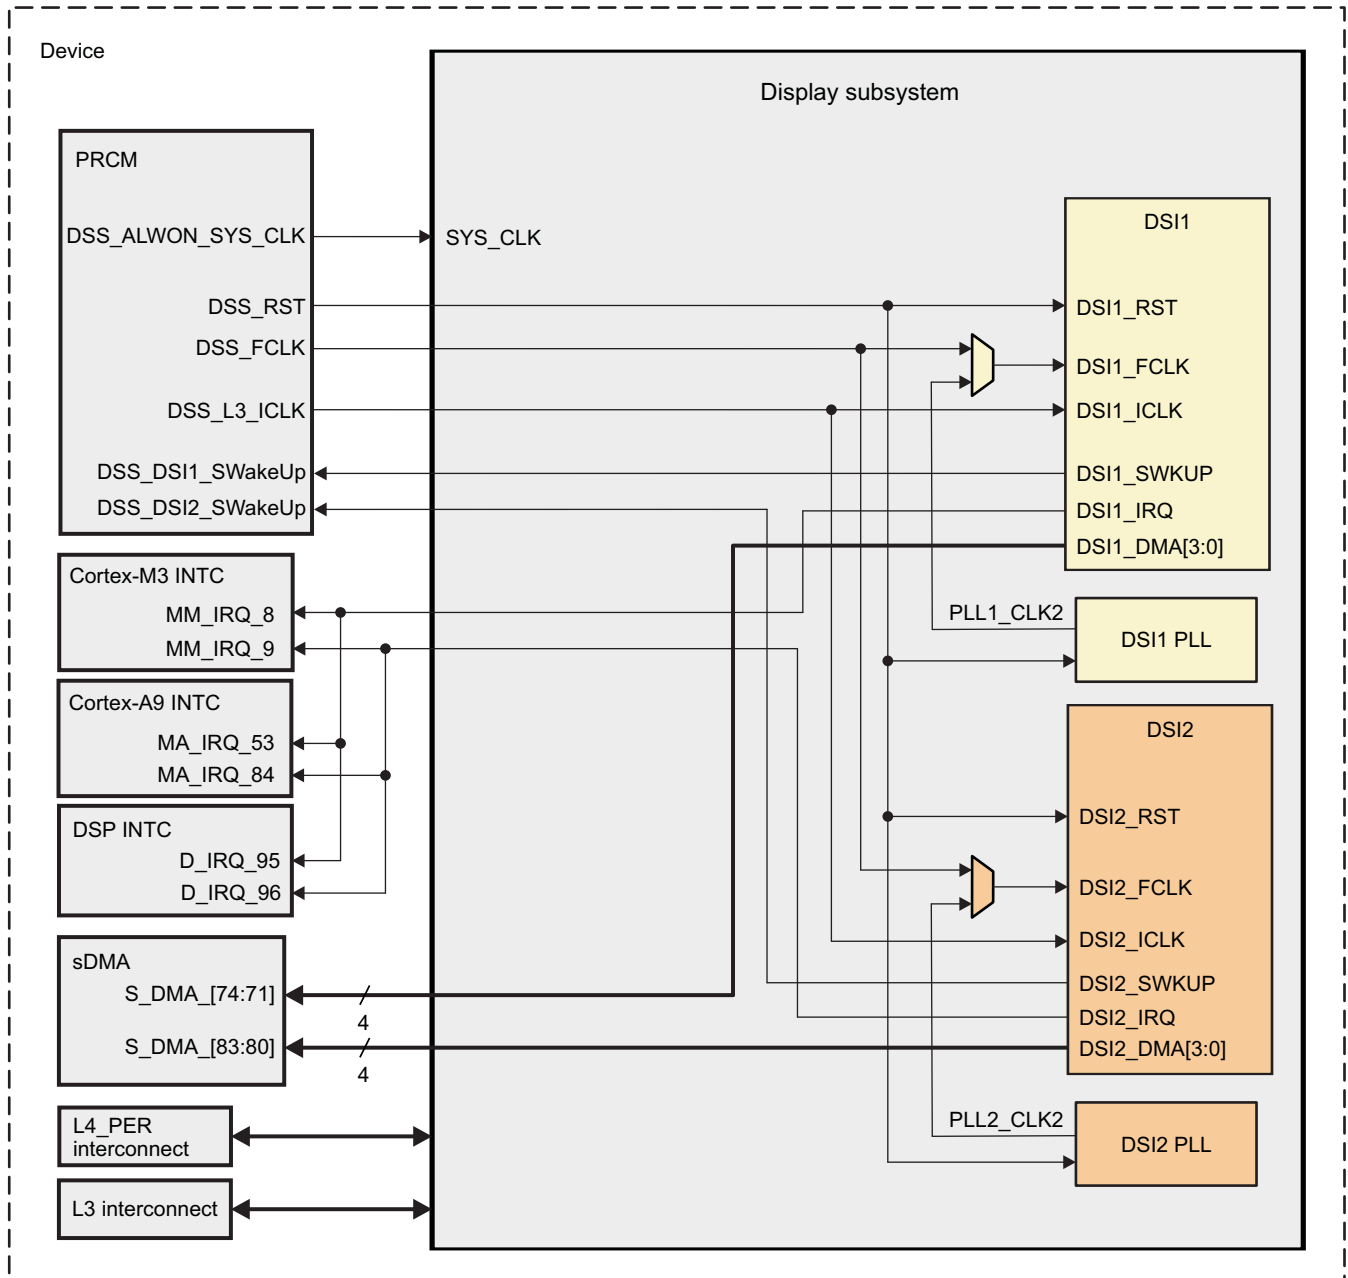

This is the opposite byte order from the packed pixel stream format. To retain flexibility, the byte order is made programmable using [DSI_VC_CTRL_i\[12\] RGB565_ORDER](#) bit, with this order the default for command mode through the video port.

10.3.3 DSI Integration

This section describes the integration of the DSI in the device, including information about clocks, resets, and hardware requests.

Figure 10-121 shows the integration of the DSI in the device.

Figure 10-121. DSI Integration

ds1-027

NOTE: For more information about the wake-up request, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 10-466 through Table 10-469 summarize the integration of the DSI module in the device.

Table 10-466. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
MIPI DSI1	PD_DSS	L3 for data L4_PER for configuration
MIPI DSI2	PD_DSS	L3 for data L4_PER for configuration

NOTE: L3 interconnect is used primarily for data.

L4_PER interconnect is used primarily for configuration but is also used for backward software compatibility.

Table 10-467. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
	SYS_CLK	DSS_ALWON_SYS_CLK	PRCM module	Functional clock for the DSI PLLs
MIPI DSI1	DSI1_FCLK	DSS_FCLK PLL1_CLK2	PRCM module DSI1 PLL	Functional clock
	DSI1_ICLK	DSS_L3_ICLK	PRCM module	Interface clock
MIPI DSI2	DSI2_FCLK	DSS_FCLK PLL2_CLK2	PRCM module DSI2 PLL	Functional clock
	DSI2_ICLK	DSS_L3_ICLK	PRCM module	Interface clock
Resets				
MIPI DSI1	DSI1_RST	DISPSS_RST	PRCM module	Nonretention reset
MIPI DSI2	DSI2_RST	DISPSS_RST	PRCM module	Nonretention reset

NOTE: If video mode is used, the VPn_PCLK and VPn_CLK clocks must be generated using a CLKIN4DDR clock.

NOTE: For information about clock distribution and configuration inside the module, see [Section 10.3.4.2, DSI Clock Configuration](#).

Table 10-468. Interrupt Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
MIPI DSI1	DSS_DSI1_IRQ	D_IRQ_95	DSP INTC	Display DSI1 interrupt request
	DSS_DSI1_IRQ	MA_IRQ_53	Cortex-A9 INTC	Display DSI1 interrupt request
	DSS_DSI1_IRQ	MM_IRQ_8	Cortex-M3 INTC	Display DSI1 interrupt request
MIPI DSI2	DSS_DSI2_IRQ	D_IRQ_96	DSP INTC	Display DSI2 interrupt request
	DSS_DSI2_IRQ	MA_IRQ_84	Cortex-A9 INTC	Display DSI2 interrupt request
	DSS_DSI2_IRQ	MM_IRQ_9	Cortex-M3 INTC	Display DSI2 interrupt request

NOTE: For a description of the interrupt source, see [Section 10.3.4.3, DSI Interrupt Requests](#).

Table 10-469. DMA Requests

DMA Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
MIPI DSI1	DSS_DSI1_DMA0	S_DMA_71	sDMA	DSI1 DMA request 0
	DSS_DSI1_DMA1	S_DMA_72	sDMA	DSI1 DMA request 1
	DSS_DSI1_DMA2	S_DMA_73	sDMA	DSI1 DMA request 2
	DSS_DSI1_DMA3	S_DMA_74	sDMA	DSI1 DMA request 3
MIPI DSI2	DSS_DSI2_DMA0	S_DMA_80	sDMA	DSI2 DMA request 0
	DSS_DSI2_DMA1	S_DMA_81	sDMA	DSI2 DMA request 1
	DSS_DSI2_DMA2	S_DMA_82	sDMA	DSI2 DMA request 2
	DSS_DSI2_DMA3	S_DMA_83	sDMA	DSI2 DMA request 3

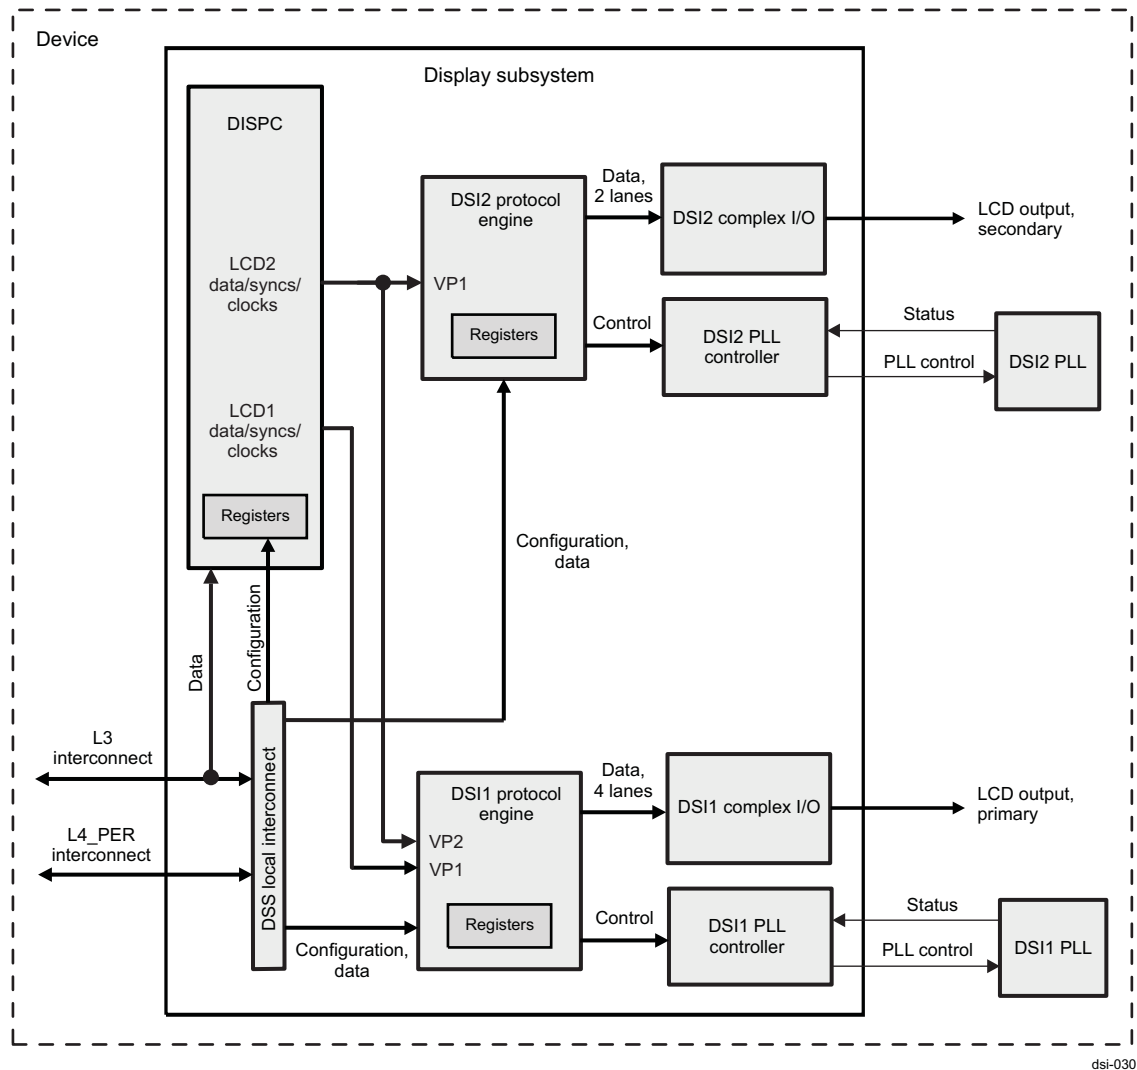

10.3.4 DSI Functional Description

This section describes the functions of the DSI1 and DSI2 modules.

10.3.4.1 DSI Block Diagram

Figure 10-122 is a schematic of DSI1 and DSI2.

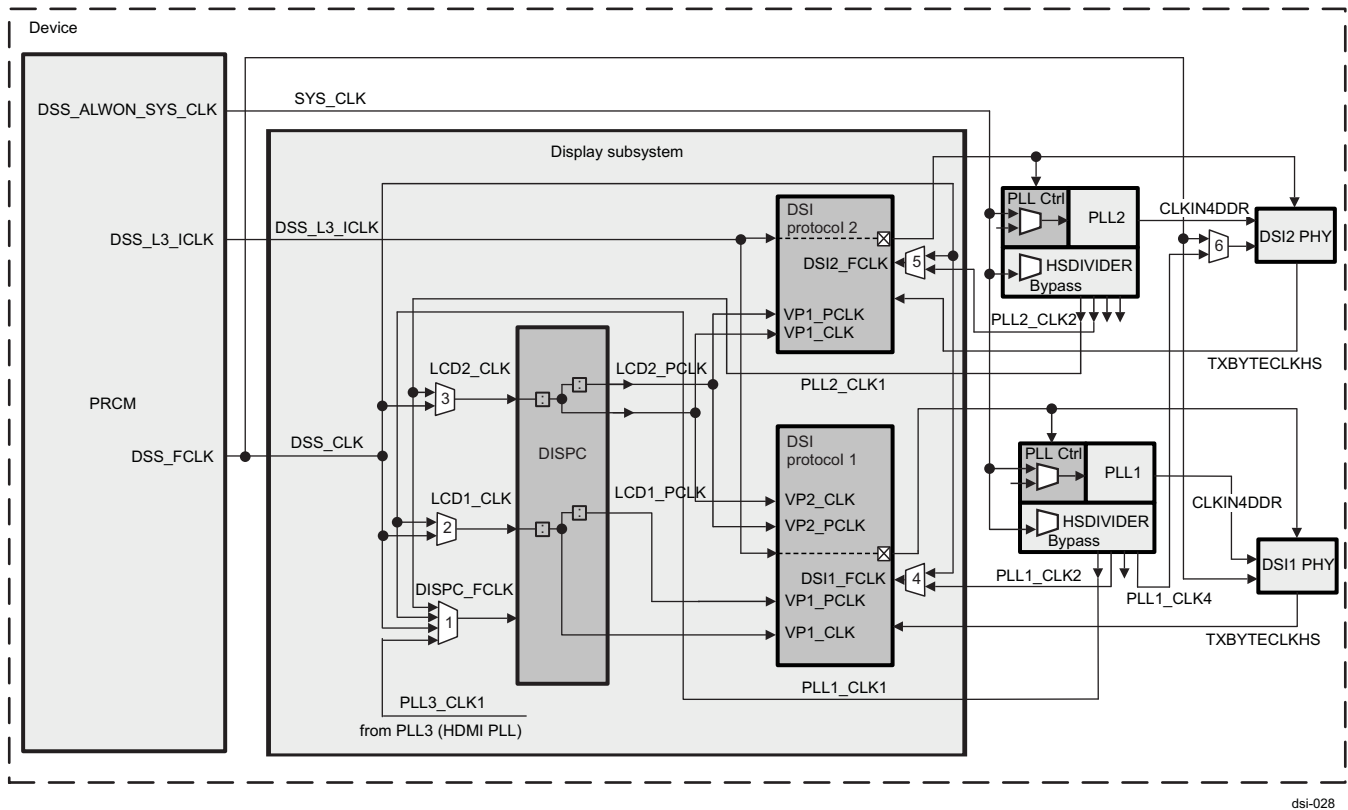

Figure 10-122. DSI Schematic

10.3.4.2 DSI Clock Configuration

Figure 10-123 shows the clock tree for DSI1 and DSI2.

Figure 10-123. DSI Clock Tree

dsi-028

Table 10-470 shows the controls for clock multiplexers.

Table 10-470. DSI Multiplexer Controls

Destination	Source Signal Name	Source	Multiplexer Number	DSS Register Bit Field
DISPC functional clock (DISPC_FCLK)	DSS_CLK	DPLL_PER (PRCM)	1	For more information, see Section 10.1.2 , <i>DSS Integration</i> .
	PLL1_CLK1	PLL1	1	
	PLL2_CLK1	PLL2	1	
	PLL3_CLK1	PLL3	1	
DSI1 functional clock (LCD1_CLK)	DSS_CLK	DPLL_PER (PRCM)	2	For more information, see Section 10.1.2 , <i>DSS Integration</i> .
	PLL1_CLK1	PLL1	2	
DSI2 functional clock (LCD2_CLK)	DSS_CLK	DPLL_PER (PRCM)	3	For more information, see Section 10.1.2 , <i>DSS Integration</i> .
	PLL2_CLK1	PLL2	3	
DSI1 protocol engine functional clock (DSI1_FCLK)	DSS_CLK	DPLL_PER (PRCM)	4	For more information, see Section 10.1.2 , <i>DSS Integration</i> .
	PLL1_CLK2	PLL1	4	
DSI2 protocol engine functional clock (DSI2_FCLK)	DSS_CLK	DPLL_PER (PRCM)	5	For more information, see Section 10.1.2 , <i>DSS Integration</i> .
	PLL2_CLK2	PLL2	5	

NOTE: For more information about the DSI1 and DSI2 video port clocks (VPn_CLK and VPn_PCLK, where n = 1 or 2), see [Section 10.3.4.4.5, Video Port Interface](#).

NOTE: For the frequency ratings of the various DSI clocks, see [Section 10.1.2.1, DSS Clocks](#).

NOTE: Multiplexer 6, shown in [Figure 10-123](#), allows the DSS_FCLK or PLL1_CLK4 clock to be sent on DSI2 PHY bypass input. The use of the bypassed clock allows both DSI modules to run on DSS_FCLK or on a single PLL (DSI1 PLL).

- To select the clock source for the DSI2 PHY bypass input, configure the CONTROL.CONTROL_DSS_CONTROL[0] DSS_MUX6_SELECT bit in the device control module. See [Chapter 18, Control Module](#).
 - To enable the bypass input for the DSI1 PHY or DSI2 PHY module, set the [DSI_PLL_CONFIGURATION2\[15\] BYPASSEN](#) bit to 1.
-

10.3.4.3 DSI Interrupt Requests

The DSI protocol engine requires a single interrupt line. The [DSI_IRQSTATUS](#) register indicates the general interrupt events. Each VC and complex I/O has a dedicated interrupt register: [DSI_VC_IRQSTATUS_i](#) and [DSI_COMPLEXIO_IRQSTATUS](#), respectively.

[Table 10-471](#) lists the DSI global interrupt events.

Table 10-471. DSI Global Interrupts

IRQ Name	Description
Resynchronization_IRQ	Resynchronization in video mode
TA_TO_IRQ	Turnaround timer expired
SYNC_LOST_IRQ	Synchronization with video port is lost (video mode only).
ACK_TRIGGER_IRQ	Acknowledge trigger is received.
TE_TRIGGER_IRQ	TE PHY trigger is received.
WAKEUP_IRQ	Occurs when the SWakeUp signal is asserted.
HS_TX_TO_IRQ	HS TX time-out Interrupt
LP_RX_TO_IRQ	LS RX time-out Interrupt
COMPLEXIO_ERR_IRQ	Error signaling from complex I/O: The interrupt is triggered when an error is received from the complex I/O (events are defined in DSI_COMPLEXIO_IRQSTATUS).
PLL_RECAL_IRQ	PLL recalibration event (assertion of DSIRecal signal from the DSI PLL control module)
PLL_UNLOCK_IRQ	PLL un-lock event (deassertion of DSILock signal from the DSI PLL control module)
PLL_LOCK_IRQ	PLL lock event (assertion of DSILock signal from the DSI PLL control module)
VIRTUAL_CHANNEL3_IRQ	VC 3 error signaling from DSI VC 3: The interrupt is triggered when an error is received from DSI VC 3 (events are defined in DSI_VC_IRQENABLE_i register, where i = 3).
VIRTUAL_CHANNEL2_IRQ	VC 2 error signaling from DSI VC 2: The interrupt is triggered when an error is received from DSI VC 2 (events are defined in DSI_VC_IRQENABLE_i register, where i = 2).
VIRTUAL_CHANNEL1_IRQ	VC 1 error signaling from DSI VC 1: The interrupt is triggered when an error is received from DSI VC 1 (events are defined in DSI_VC_IRQENABLE_i register, where i = 1).
VIRTUAL_CHANNEL0_IRQ	VC 0 error signaling from DSI VC 0: The interrupt is triggered when an error is received from DSI VC 0 (events are defined in DSI_VC_IRQENABLE_i register, where i = 0).
TE0_LINE_IRQ	TE detected on TE0 CMOS input signal
TE1_LINE_IRQ	TE detected on TE1 CMOS input signal

NOTE: For information about other internal DSI interrupt events, see [Table 10-489](#) and [Table 10-496](#).

10.3.4.4 DSI Protocol Engine

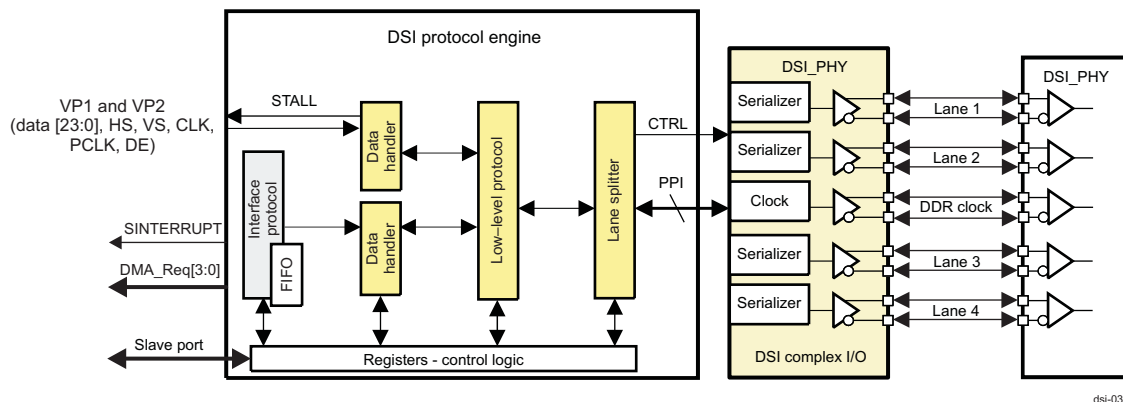

NOTE: Copyright 2005-2008 MIPI Alliance, Inc. All rights reserved. MIPI Alliance Member Confidential.

The DSI protocol engine integrates the DSI with the display through the DSI_PHY module, local interconnect interface, and video interface from the DISPC. The DSI_PHY or complex I/O module is described in [Section 10.3.4.6, DSI Complex I/O](#). The DSI transmitter (protocol engine + PHY) port can be connected to multiple displays using a single DSI host port. The DSI protocol engine controls the DSI PLL control module described in [Section 10.3.4.5, DSI PLL Controllers](#). The DSI transmitter port can be used in video mode or/and command mode.

10.3.4.4.1 DSI Protocol Overview

The DSI protocol engine receives data from the DISPC video port and/or the L3 interconnect slave port, encapsulates them with the VC ID, generates the ECC and checksum, and splits the data into byte streams to the DSI_PHY to be sent using LS or HS protocol. The DSI protocol engine receives data and acknowledges from the panel using the same DSI link in case of bidirectional panel. Multiple data streams can be interleaved to support multiple panels connected to the same host DSI port. [Figure 10-124](#) shows the DSI protocol engine, with an example of data lane and clock lane ordering. It is possible to configure other orders through registers as described in [Section 10.3.2.1.1, Data/Clock Configuration](#).

Figure 10-124. DSI Protocol Engine

NOTE: [Figure 10-124](#) gives information for DSI1 with its four data lanes. DSI2 has only two data lanes.

NOTE: The order of the PHY pairs (clock and data lanes) is informative. Each PHY pair can be clock or data. DSI complex I/O receives the configuration for the pin order and the differential \pm in a pair from the settings in the [DSI_COMPLEXIO_CFG1](#) register.

10.3.4.4.2 DSI Global Register Controls

Before receiving data from the DSI complex I/O, the DSI_PHY SCP registers in the DSI complex I/O must be configured. [Table 10-472](#) lists the register access width limitations for all the DSI modules.

Table 10-472. Register Access Width Limitations

Register Name	Register Access Width
All DSI complex I/O registers (DSI_PHY SCP)	32-bit only
All DSI PLL control module registers	32-bit only
DSI_VC_LONG_PACKET_HEADER_i	32-bit only
DSI_VC_SHORT_PACKET_HEADER_i	32-bit only
DSI_VC_LONG_PACKET_PAYLOAD_i	16- and 32-bit
All other DSI protocol engine registers	8-, 16-, and 32-bit

CAUTION

If a different access width than listed in [Table 10-472](#) is used, an interface error is generated in response to the write using SResp = ERR.

The DSI protocol engine is globally controlled by the [DSI_CTRL](#) register. The interface to the complex I/O is enabled by setting the [DSI_CTRL\[0\] IF_EN](#) bit. When the interface is disabled, it is possible to provide data to the TX FIFO and read pending data in the RX FIFO. When the [DSI_CTRL\[0\] IF_EN](#) bit is set to 1, the pending packets are sent to the DSI complex I/O, and the data transfer from the video port is ignored until the first vertical sync event is received.

When the [DSI_CTRL\[0\] IF_EN](#) bit is reset by software, the DSI protocol engine must finish the transfer of the pending data in the TX FIFO and wait for a response if BTA has been sent (the protocol engine is in receive mode); hardware then resets the [DSI_CTRL\[0\] IF_EN](#) bit. When using video mode, the VC associated with the video port must be enabled before enabling the interface according to the following sequence:

1. The [DSI_CTRL\[0\] IF_EN](#) bit is equal to 0.
2. Enable the VC associated with video mode by setting the [DSI_VC_CTRL_i\[0\] VC_EN](#) bit.
3. Set the [DSI_CTRL\[0\] IF_EN](#) bit to 1.

10.3.4.4.3 DSI Transfer Modes

Two main transfer modes are supported by the DSI modules:

- Video mode: Pixels are received from the video port (VP1 or VP2.) There are some real-time constraints (pixels must be sent at the pixel frequency required by the panel module).
- Command mode: Pixels can be received from the video port or from the L3 interconnect slave port. There are no real-time constraints except that the TE must be avoided by starting the transfer at the correct time during the scan of the display and that it must be fast enough.

10.3.4.4.3.1 Video Mode

Video mode refers to the MIPI display pixel interface (DPI) standard. The sync events and pixels must be sent according to the display mode timings. Data is received from the video ports. The DISPC fetches the data from the system memory and provides it to the DSI protocol engine through VP1 or VP2. The short packets used for the sync event use precalculated 32-bit values. The long packets are constructed using the header defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) registers. In case of synchronization short packets for video mode, because hardware generates short packets without using the [DSI_VC_SHORT_PACKET_HEADER_i](#) register, if the [DSI_VC_CTRL_i\[8\] ECC_TX_EN](#) bit is set, the ECC is calculated; otherwise, 0 is used. The feature is used to generate incorrect ECC for debug purpose and to ease the check of the link and peripheral error detection and correction.

The [DSI_VM_TIMING1](#) through [DSI_VM_TIMING8](#) registers define the timings of the video mode.

The [DSI_VM_TIMING2\[27:24\] WINDOW_SYNC](#) bit field defines the synchronization period. The recommended value is 0x4 based on the implementation of the resynchronization scheme.

The [DSI_CTRL\[20\] BLANKING_MODE](#) bit defines whether long blanking packets or LPS are used during the blanking periods (except HFP, HBP, and HSA defined by other bits) when there is no pending data in TX FIFO ready to be sent. Software must ensure that there is no data in the TX FIFO, no BTA, no RESET trigger sent, and the [DSI_VC_CTRL_i\[9\] MODE_SPEED](#) bit is set to 1 (HS mode) to keep the video mode transfer in HS mode during blanking periods (except for the last blanking period, because it is required to go to LPS at least once per frame).

The [DSI_CTRL\[21\] HFP_BLANKING_MODE](#), [DSI_CTRL\[22\] HBP_BLANKING_MODE](#), and [DSI_CTRL\[23\] HSA_BLANKING_MODE](#) bits define whether during these blanking packets data from TX FIFO or long blanking packets are sent.

To ensure that the writes to the [DSI_VC_LONG_PACKET_HEADER_i](#) register are handled correctly as header information for video mode long packets, the following registers must be programmed:

- [DSI_VC_CTRL_i\[0\] VC_EN](#) bit set to 0
- [DSI_VC_CTRL_i\[4\] MODE](#) bit set to 1
- [DSI_VC_LONG_PACKET_HEADER_i](#) register access
- [DSI_VC_CTRL_i\[0\] VC_EN](#) bit set to 1

NOTE: The hardware ignores [DSI_VC_CTRL_i\[1\] SOURCE](#) and [DSI_VC_CTRL_i\[9\] MODE_SPEED](#) bits when video mode is selected (the [DSI_VC_CTRL_i\[4\] MODE](#) bit set to 1).

The [SYNC_LOST_IRQ](#) and [RESYNCHRONIZATION_IRQ](#) interrupt events indicate whether the DSI protocol engine has not been able to resynchronize the video port timing to its own timing base or if it has been done. The [RESYNCHRONIZATION_IRQ](#) indicates to the software user that the video port works but the configuration of the timings for the DISPC and for DSI protocol engine may need to be modified to avoid the resynchronization. The [SYNC_LOST_IRQ](#) and [RESYNCHRONIZATION_IRQ](#) events can be respectively monitored in [DSI_IRQSTATUS\[18\] SYNC_LOST_IRQ](#) and [DSI_IRQSTATUS\[5\] RESYNCHRONIZATION_IRQ](#) status bits.

10.3.4.4.3.2 Command Mode

The command mode refers to the MIPI display command set (DCS) standard. The commands, parameters, and pixels are sent to the display module with limited real-time constraints (as defined in [Section 10.3.4.4.3.1, Video Mode](#)). The pixels can be provided on one of the two video ports by the DISPC or on the L3 interconnect slave port.

The [DSI_VC_LONG_PACKET_HEADER_i](#) registers are used for the header of long packets; the [DSI_VC_SHORT_PACKET_HEADER_i](#) registers are used for the short packets.

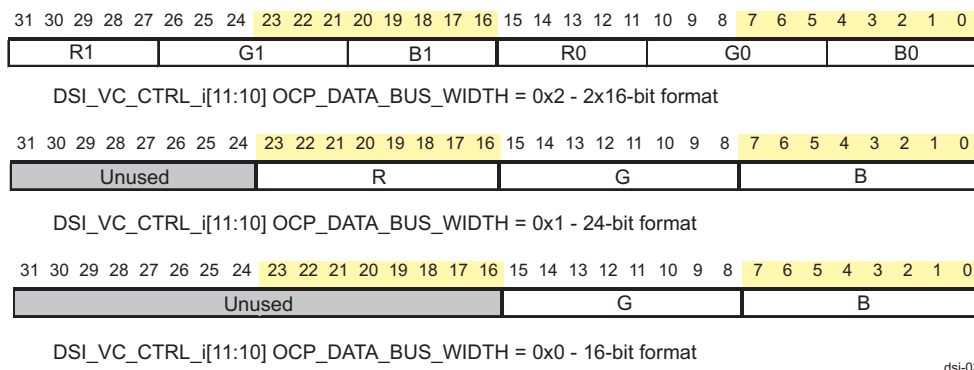

For the payload, the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register is used. Each 32-bit payload data is written to the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register from the MPU subsystem or sDMA. It is buffered to send packets with higher rate than the L3 interconnect frequency can provide. If [DSI_VC_CTRL_i\[30\] DCS_CMD_ENABLE = 1](#), the word count defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register is used to determine the number of bytes to be sent using the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register minus the size of the DCS command header added by the protocol engine at the beginning of the payload (also sent using the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register). If [DSI_VC_CTRL_i\[30\] DCS_CMD_ENABLE = 0](#), the word count defined in the register [DSI_VC_LONG_PACKET_HEADER_i](#) register is used to determine the number of bytes to be sent using the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register.

The [DSI_VC_CTRL_i\[11:10\] OCP_DATA_BUS_WIDTH](#) bit field is used to define the size of the data on the L3 interconnect slave port for the write access (read access to the RX FIFO is not affected by the bit field value):

- 0x0: 16-bit data width (LSB of the 32-bit interface port data bus)
- 0x1: 24-bit data width (LSB of the 32-bit interface port data bus)
- 0x2: 2x16-bit data width (first pixel on the LSB of the 32-bit Interface port data bus and second pixel on the MSB of the 32-bit interface port data bus for the same interface access)
- 0x3: 32-bit data width (no bit, no byte, no pixel manipulation)

Figure 10-125 shows the different data width configurations of the L3 interconnect slave port.

Figure 10-125. Interface Data Configuration

NOTE: To provide 18-bit pixel loosely packed format to the L3 interconnect slave port, the [DSI_VC_CTRL_i\[11:10\] OCP_DATA_BUS_WIDTH](#) bit field must be set to 0x1. The 18-bit pixel packed format is not supported in case of command mode on the L3 interconnect slave port.

The write into the [DSI_VC_LONG_PACKET_HEADER_i](#) register is required before accessing the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register. The DSI protocol engine must extract the length of the payload and discard the extra data sent using the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register. Writes into the [DSI_VC_LONG_PACKET_HEADER_i](#) register are valid only if the VC is enabled; otherwise, the write is ignored. When receiving pixels on the video port, only the [DSI_VC_LONG_PACKET_HEADER_i](#) register is used. The video port pixels are used for the payload.

10.3.4.4.3.2.1 Command Mode TX FIFO

The single TX FIFO is used to store data from the L3 interconnect before sending it to the panel. The configuration of the FIFO for a specific VC must be done only when the VC is disabled.

The VC must not be enabled when data is still pending in the TX FIFO for the corresponding space allocated for the VC from the previous active period. When the VC space in the TX FIFO is empty, the VC can be enabled.

For each VC, two dedicated registers ([DSI_VC_LONG_PACKET_HEADER_i](#) and [DSI_VC_LONG_PACKET_PAYLOAD_i](#)) are used to provide data for long packets. The [DSI_VC_SHORT_PACKET_HEADER_i](#) register is used to provide data for short packets (32 bits long).

For each long packet, the [DSI_VC_LONG_PACKET_HEADER_i](#) register must be written first, and then the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register. The only exception is when the word count defined in the header equals 0. In that case, it is not required to write into the payload register. For consecutive long packets, the header must be written into the [DSI_VC_LONG_PACKET_HEADER_i](#) register even if the value remains the same.

The TX FIFO stores all the pending bytes to be sent to the peripheral(s). Multiple receivers can be addressed using the VC capability.

The 32-bit write requests for each VC to the TX FIFO are kept in order while sending the data to the DSI_PHY inside the VC requests. The only exception is the last 32-bit write for the last bytes of the payload data, because it can be 1, 2, 3, or 4 bytes.

When the last transfer is a 32-bit write, but the number of valid bytes is only 1, 2, or 3 (calculated using the header word count and the number of bytes are received for the payload), hardware stores the 32-bit value into the TX FIFO but the invalid bytes are not sent and are discarded.

When the word count defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register is not a multiple of the request threshold value defined in the [DSI_VC_CTRL_i\[19:17\] DMA_TX_THRESHOLD](#) bit field, 32-bit requests and/or bytes are discarded by hardware to store in FIFO only the exact number of valid bytes.

The triggering event to send data to the DSI link is one of the following events:

- All bytes have been received in the FIFO (header + payload).
- The space of the FIFO allocated for the VC is full.
- The space of the FIFO allocated for the VC is not enough to request more data using DMA request (the threshold value is bigger than the space left in the TX FIFO for the VC).
- When the VC is disabled, the remaining bytes in the FIFO are sent to the DSI link.

NOTE: In case video mode is active, the blanking period must be large enough to allow the transfer of the packet(s).

Sequential arbitration must be set ([DSI_CTRL\[3\]](#) bit TX_FIFO_ARBITRATION = 0x1) if only one VC is used to send multiple packets during the same blanking period.

When consecutive packets should be sent in HS mode, to ensure that there is no LP transition between them, at least one of the following conditions must be valid:

- Packets from the same VC
- Short packets or long packets with a payload size multiple of 4 bytes

To stop a transfer immediately when packets are being transferred from the TX FIFO to DSI_PHY, a flush of the FIFO is necessary. It can be required in a dead-lock situation to flush the FIFO even if bytes are still in the FIFO. In that case, it is necessary to ensure having a known state of the whole DSI protocol engine module (software reset may be required) to start of new transfer through the TX FIFO.

To flush the FIFO (discard the data) for some pending bytes:

1. Change the size of the space of FIFO to 0 by writing [DSI_TX_FIFO_VC_SIZE](#) [VCi_FIFO_SIZE](#) bit fields (where i is the VC number from 0 to 3).
2. Disable the VC by resetting the [DSI_VC_CTRL_i\[0\]](#) VC_EN bit to 0.
3. Wait for [DSI_VC_CTRL_i\[15\]](#) VC_BUSY = 0 (VC_BUSY is set to 0 after TX FIFO flush is done).

It is necessary to check that there is no pending request before changing the size of the allocated FIFO for the VC by reading the relevant [DSI_VC_CTRL_i\[15\]](#) VC_BUSY bit or by using the interrupt PACKET_SENT_IRQ. This interrupt is monitored by reading the [DSI_VC_IRQSTATUS_i\[2\]](#) PACKET_SENT_IRQ status bit.

The [DSI_CTRL\[3\]](#) TX_FIFO_ARBITRATION bit defines the arbitration scheme:

- Round-robin between enabled VCs with pending ready requests (that is, all bytes for the packets are in the FIFO or the space of the FIFO for the VC is full) starting from the VC that has the lowest VC ID number.
- Sequential: All the pending ready requests for one VC are sent before moving to another VC. The condition of "space of the FIFO is full" is evaluated after the end of each packet.

To use in-order for all requests for all channels, a single VC must be used. (The VC ID defined in the header provided to hardware using the [DSI_VC_LONG_PACKET_HEADER_i](#) or [DSI_VC_SHORT_PACKET_HEADER_i](#) register is not used and not modified by the DSI protocol engine.)

The [DSI_TX_FIFO_VC_SIZE](#) register defines the allocated number of 33-bit values for each VC in the TX FIFO and the start address for each VC. The size of the space allocated in the TX FIFO is defined by the [DSI_TX_FIFO_VC_SIZE](#) register - [VCi_FIFO_SIZE](#) bit fields. It must be a multiple of the threshold defined in the [DSI_VC_CTRL_i\[19:17\]](#) DMA_TX_THRESHOLD bit field. To change the size of the space of the memory allocated for a specific VC, the VC must be disabled by setting the [DSI_VC_CTRL_i\[0\]](#) VC_EN bit to 0. The whole FIFO cannot be used by all the VCs at the same time because a VC can be disabled to change one or multiple parameters. Software users must configure the start address and size for each VC correctly.

[Table 10-473](#) lists the corresponding values for the size of the space allocated in the FIFO.

Table 10-473. VC TX FIFO Size Values

DSI_TX_FIFO_VC_SIZE.VCi_FIFO_SIZE (where i = 0, 3)	Space Size (up to the Size of the FIFO)
0	0 x 33 bits
1	32 x 33 bits
2	64 x 33 bits
3	96 x 33 bits
4	128 x 33 bits

NOTE: TX FIFO is 128 x 33 bits. Therefore, the sum of all VC FIFO allocations cannot exceed 128 x 33 bits.

CAUTION

Bit 32 of each location in the FIFO is used by the DSI protocol engine to tag the data in the TX FIFO. It is for internal use only.

Table 10-474 lists the start address of the space in the FIFO.

Table 10-474. VC TX FIFO Start Address

DSI_TX_FIFO_VC_SIZE.VCx_FIFO_ADD (where x = 0, 2)	Start Address
0	0
1	32
2	64
3	96
4	128

CAUTION

The different VC spaces must not overlap.

When the TX FIFO is full:

- The overflow interrupt (FIFO_TX_OVF_IRQ) is generated in the [DSI_VC_IRQSTATUS_i\[3\]](#) FIFO_TX_OVF_IRQ status bit.
- There is no L3 interconnect error generated.
- The interface commands are accepted but the data are not written into the FIFO.

To ensure that all writes are stored correctly in the TX FIFO, the FIFO must not be full. The room in the space allocated for the VC in the TX FIFO is given in the [DSI_TX_FIFO_VC_EMPTYNESS](#) register. When there is no space allocated in the TX FIFO for the VC, the [DSI_TX_FIFO_VC_EMPTYNESS](#) register indicates a value of 0 for the VC space emptiness.

While waiting to receive the first VSYNC event on the video port to start video mode on the DSI link, no command data from TX FIFO is sent on the interface. This is required to ensure that, when receiving the VSYNC event, there is no ongoing command mode transfer that could delay the start of video mode on the the DSI link.

10.3.4.4.3.2.2 Command Mode RX FIFO

The RX FIFO stores the data received from the DSI complex I/O. The data are always packed in the RX FIFO (single or multiple packets received during single or multiple BTA periods).

The read requests (single or burst) can be less than, equal to, or greater than the packet size. If the packet size is smaller than the read request, the following packet(s) is also transferred. If the packet size is longer than the read request, only part of the packet is transferred. In that case, the logic keeps the VC information to provide the rest of the data during the next read request(s).

The [DSI_RX_FIFO_VC_SIZE](#) register defines the allocated number of 33-bit values for each VC in the RX FIFO and the start address for each VC. Only the enabled VCs are considered.

To change the size of the memory space allocated for a specific VC, the VC must be disabled by resetting the [DSI_VC_CTRL_i\[0\]](#) VC_EN bit to 0. The entire FIFO cannot be used by the entire VC at the same time because a VC can be disabled to change one or multiple parameters. Software users must configure the start address and size for each VC correctly.

[Table 10-475](#) lists the corresponding values for the size of the space allocated in the FIFO:

Table 10-475. VC RX FIFO Size Values

DSI_RX_FIFO_VC_SIZE .VCi_FIFO_SIZE (where i = 0, 3)	Space Size (up to the size of the FIFO)
0	0 x 33 bits
1	32 x 33 bits
2	64 x 33 bits
3	96 x 33 bits
4	128 x 33 bits

NOTE: RX FIFO is 128 x 33 bits. Therefore, the sum of all VC FIFO allocations cannot exceed 128 x 33 bits.

CAUTION

Bit 32 of each location in the FIFO is used by the DSI protocol engine to tag the data in the RX FIFO. It is for internal use only.

[Table 10-476](#) lists the start address of the space in the FIFO.

Table 10-476. VC RX FIFO Start Address

DSI_RX_FIFO_VC_SIZE .VCx_FIFO_ADD (where x = 0, 2)	Start Address
0	0
1	32
2	64
3	96
4	128

CAUTION

The different VC spaces must not overlap.

While reading the received bytes in the RX FIFO, only the [DSI_VC_SHORT_PACKET_HEADER_i](#) register is used, because hardware does not keep track of the header position for long packets and the start/end of each packet. Software must extract the information from the bytes read from the RX FIFO. There is no specific hardware to track the received bytes in the RX FIFO. The [DSI_VC_LONG_PACKET_HEADER_i](#) and [DSI_VC_LONG_PACKET_PAYLOAD_i](#) registers are not used.

The ECC is used only by the first header when receiving multiple packets during the same LP RX transfer from the peripheral because the DSI protocol engine does not parse the header to identify the length of the packets. In case of multiple packets, the checksum is not enabled because hardware checks the checksum considering a single packet. The ECC in the first header is used to correct and check the header. For the following headers in the same LP RX transfer, hardware does not detect a header and cannot check and/or detect errors in the headers of the packets except for the first packet.

When the RX FIFO is empty:

- No interface error is generated.
- Commands are accepted and the data for the responses are 0s.

10.3.4.4.3.2.3 Command Mode DMA Requests

The DMA requests (DSI_DMA_REQ) are used to allow automatic transfer by the sDMA or MPU (with less efficiency and throughput capability) from the DSI RX FIFO to the system memory and from the system memory to the DSI TX FIFO. Two independent DMA requests for RX FIFO and TX FIFO for the same VC are supported. The read and write accesses can use burst structure.

The thresholds used for requests for the TX FIFO and RX FIFO are programmable through the [DSI_VC_CTRL_i\[19:17\] DMA_TX_THRESHOLD](#) and [DSI_VC_CTRL_i\[26:24\] DMA_RX_THRESHOLD](#) bit fields for TX FIFO and RX FIFO, respectively. DMA requests are asserted on the threshold value. The size of the space allocated in TX FIFO for each VC must be a multiple of the value of the [DSI_VC_CTRL_i\[19:17\] DMA_TX_THRESHOLD](#) bit field.

In the case of TX FIFO, if all the bytes defined by the word count field in the [DSI_VC_LONG_PACKET_HEADER_i](#) register are received, the DMA request is no longer asserted. Even during the last transfer, less than the DMA_TX_THRESHOLD number of bytes are received because the word count is not a multiple of the DMA_TX_THRESHOLD value.

In the case of RX FIFO, while the DMA request is used to transfer the data from the RX FIFO to the system memory, the sDMA must be programmed to read the exact number of received bytes in the FIFO. If users do not know the size of the received bytes, the direct access of the RX FIFO through the [DSI_VC_SHORT_PACKET_HEADER_i](#) register is performed until the [DSI_VC_CTRL_i\[20\] RX_FIFO_NOT_EMPTY](#) bit goes to 0.

The only exception is when the LP data transfer finishes and the threshold value is not reached. In this case, the DMA request is asserted. The drain of the FIFO is supported in that configuration to empty the FIFO even if the number of data received is not a multiple of the threshold value.

The use of each DMA request is programmable by software. The [DSI_VC_CTRL_i\[23:21\] DMA_TX_REQ_NB](#) bit field is dedicated to DMA request numbering for the TX FIFO. The [DSI_VC_CTRL_i\[29:27\] DMA_RX_REQ_NB](#) bit field is dedicated to DMA request numbering for the RX FIFO.

When the DMA request is used to indicate the number of 32-bit values ready in the RX FIFO that BTA has received from the peripheral, which indicates an end of the transfer from the peripheral to the host for a transfer to the system memory, the DMA request that corresponds to the VC ID is generated.

The sDMA transfers the number of 32-bit values defined in the threshold register or the exact number of bytes received from the peripheral (the user must know the number of expected received bytes to program the sDMA correctly). When the sDMA transfers a multiple number of threshold values, the DSI protocol engine sends 0s for the data when there is no more received data in the RX FIFO for the VC. Software users must parse the data and determine the valid bytes.

The size of the DMA transfer can be determined by reading the [DSI_RX_FIFO_VC_FULLNESS](#) register. The BTA interrupt (BTA_IRQ) must be used to know when to read the number of received bytes. The BTA interrupt must be monitored by reading the [DSI_VC_IRQSTATUS_i\[5\] BTA_IRQ](#) status bit. The DMA request must not be enabled until the sDMA is programmed with the correct number of data to read from RX FIFO.

This method must also be used when the RX FIFO space for the VC is expected to overflow because the expected number of data to be received is greater than the space allocated for the VC. Instead, the DMA request is asserted as soon as the threshold is reached or when BTA is received.

When the DMA request is used to indicate the number of 33-bit entries empty in the TX FIFO for a transfer from the system memory, the DMA request corresponding to the VC ID is generated.

NOTE: For the most efficient transfer, the size of the request (read or write, single or burst) must be aligned with the threshold value.

Concurrent access using interlaced requests (read/write) to the TX and RX FIFO is supported for the same VC ID or different VC IDs.

10.3.4.4.3.3 Video + Command Mode

The two modes can be interlaced to send two DSI streams to two types of panels: video or command. The number of concurrent video streams is limited to one. The number of concurrent command mode streams is limited to four when there is no video stream, and three when there is a video stream.

- For DSI1, which has two video ports (see [Section 10.3.4.4.5, Video Port Interface](#)), it is possible to send video or command mode streams from DISPC to DSI1 primary video port (VP1), and a command stream on the secondary VP (VP2) for interleaving. In addition, it is also possible to send concurrently a command mode stream on the L3 Interconnect slave port for interleaving.
- For DSI2, which has one video port, it is possible to send a video stream or a command mode stream from DISPC to DSI2 primary VP (VP1). There is no secondary VP. Interleaving of command mode transfers is only possible through L3 Interconnect slave port.

10.3.4.4.3.4 Burst Mode

Frequency and transparent burst modes are supported:

- Frequency burst mode is used to reduce the HS period by increasing the clock frequency on the DSI link. In some cases, it reduces power consumption on the link. The non-HS period used typically to drive the main panel can be used to send data to the secondary panel or to allow feedback (acknowledge) from the primary and secondary panels. The DSI protocol engine must buffer a full line before sending the HS packets for the line. A double-buffering mechanism is required to send a line while the following one is being received on the video port. For more information about double-buffering, see [Section 10.3.4.4.5.4, Ping-Pong Buffer](#).
- The transparent burst mode is used by increasing the pixel clock frequency generated by the DISPC with an increase of the horizontal blanking period.

10.3.4.4.3.5 Interleaving Mode

Video mode can output command mode packets, which are provided to DSI through the L3 interconnect, during the blanking periods of the video stream sequence on the PPI link. These command mode packets can be programmed as HS packets or low-power packets.

During a video stream sequence on the PPI link, four types of gap exist:

- BLLP gap: Blanking period during VSA, VBP, and VFP lines
- HSA gap: Blanking period during VACT lines; always between HS and HE short packet
- HBP gap: Blanking period during VACT lines; always between HS/HE short packet and data pixel long packet
- HFP gap: Blanking period during VACT lines; always between data pixel long packet and the end of the current VACT line

To perform interleaving in a particular gap, video mode must be set to go into LPS during the blanking gap. Each type of gap has separate configurable register bits that determine whether a blanking long packet will be sent or the link will go into LPS during the gap on the PPI link. If LPS is set during a gap, the DSI module performs interleaving during that period.

Two set of registers are available for:

- HS interleaving (when HS command mode packets must be sent during a video stream on the PPI link)
- Low-power interleaving (when low-power command mode packets must be sent during a video stream)

on the PPI link)

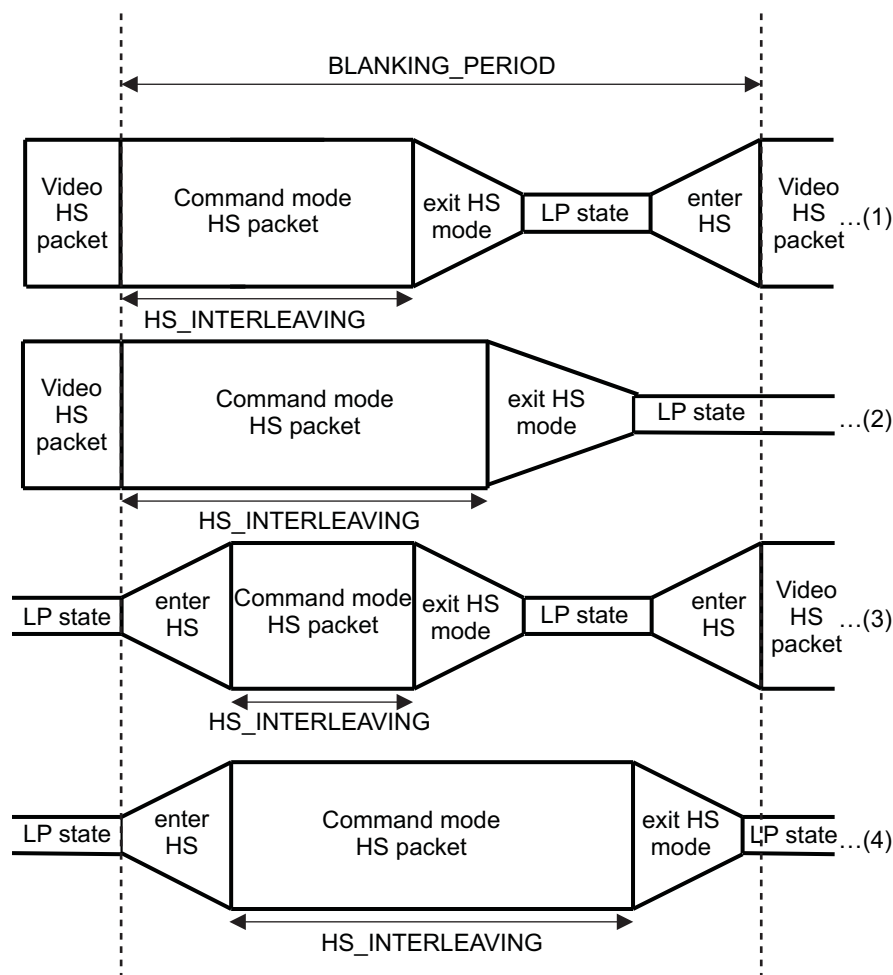

10.3.4.4.3.5.1 HS Command Mode Interleaving

Figure 10-126 shows the various HS mode scenarios in interleaving mode during a blanking gap. For each type of blanking gap, a dedicated bit field determines the number of TXBYTECLKHS clock cycles used for interleaving in HS command mode packets.

- The [DSI_VM_TIMING6](#)[31:16] BL_HS_INTERLEAVING bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during a BLLP gap.
- The [DSI_VM_TIMING4](#)[7:0] HBP_HS_INTERLEAVING bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during an HBP gap.
- The [DSI_VM_TIMING4](#)[15:8] HFP_HS_INTERLEAVING bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during an HFP gap.
- The [DSI_VM_TIMING4](#)[23:16] HSA_HS_INTERLEAVING bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during an HSA gap.

These programmable values must be programmed to satisfy the timings for the clock and data lane to enter and exit HS mode latency. According to the scenario, different equations must be considered when calculating the register values.

Figure 10-126. HS Command Mode Interleaving

dsi-327

NOTE: For calculations and equations, the following abbreviations are used: EXIT_CLK_HS_MODE represents the exit HS mode latency for the clock lane. There is no dedicated register for this value but the programmer must know this value for further calculations:

$$\text{EXIT_CLK_HS_MODE} = T_{\text{CLK-TRAIL}} + T_{\text{HS-EXIT}}$$

NOTE: For more information about other timing parameters used in the following equations, see [Section 10.3.4.4.4.1, Timing Parameters for an LP to HS Transaction](#), and [Section 10.3.4.4.4.2, Timing Parameters for an HS to LP Transaction](#).

For the following equations, BLANKING_PERIOD represents the BLLP, HSA, HBP, or HFP blanking periods. The HS_INTERLEAVING period represents the maximal period HS command mode packets. Its value is set in the BL_HS_INTERLEAVING, HSA_HS_INTERLEAVING, HBP_HS_INTERLEAVING, or HFP_HS_INTERLEAVING bit fields, depending on the blanking type.

In each scenario, two calculations are present, depending on the value of the [DSI_CLK_CTRL\[13\]](#) DDR_CLK_ALWAYS_ON bit:

- DDR_CLK_ALWAYS_ON = 1: Clock lane is always active.
- DDR_CLK_ALWAYS_ON = 0: Clock lane is activated only when there are HS packets to be sent on the PPI link.

CAUTION

When the DDR_CLK_ALWAYS_ON bit is programmed to 1, the following must be considered:

- LP state can be achieved on the PPI link only if the data lane has enough time to go out from HS mode and enter a new HS mode during a period inside which the PPI link is meant to be in LP state.
- This can be expressed with the following equation:

$$\text{EXIT_HS_MODE_LATENCY} + \max\{\text{ENTER_HS_MODE_LATENCY}, 2\} + 1 \leq \text{BLANKING_PERIOD}$$
- If the equation cannot be satisfied, because the LP state period is too short, software must program the DSI module in a way that during this blanking period a HS blanking packet is sent.

When the DDR_CLK_ALWAYS_ON bit is programmed to 0, the following must be considered:

- LP state can be achieved on the PPI link only if the data and clock lanes have enough time to go out from HS mode and enter a new HS mode during a period inside which the PPI link is meant to be in LP state.
- This can be expressed with the following equations:

$$\text{EXIT_HS_MODE_LATENCY} + \max\{\text{ENTER_HS_MODE_LATENCY}, 2\} + 1 \leq \text{BLANKING_PERIOD}$$

$$\text{DDR_CLK_POST} + \text{EXIT_CLK_HS_MODE} + \text{DDR_CLK_PRE} + \text{ENTER_HS_MODE_LATENCY}(\text{data lane}) + 1 \leq \text{BLANKING_PERIOD}$$
- If both equations cannot be satisfied, because the LP state period is too short, software must program the DSI module in a way that during this blanking period a HS blanking packet is sent.

- Scenario 1: The gap for interleaving starts and ends with a regular video stream HS packet.
 - DDR_CLK_ALWAYS_ON = 1

$$\text{HS_INTERLEAVING} = \text{BLANKING_PERIOD} - (\text{EXIT_HS_MODE_LATENCY} + \max\{\text{ENTER_HS_MODE_LATENCY}, 2\} + 1)$$
 - DDR_CLK_ALWAYS_ON = 0

$$HS_INTER1 = BLANKING_PERIOD - (EXIT_HS_MODE_LATENCY + \max\{ENTER_HS_MODE_LATENCY, 2\} + 1)$$

$$HS_INTER2 = BLANKING_PERIOD - (DDR_CLK_POST + EXIT_CLK_HS_MODE + DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + 1)$$

$$HS_INTERLEAVING = \min\{HS_INTER1, HS_INTER2\}$$

- Scenario 2: The gap for interleaving starts with a regular video stream HS packet and ends in LPS.
 - $DDR_CLK_ALWAYS_ON = 1$
 $HS_INTERLEAVING = BLANKING_PERIOD - (EXIT_HS_MODE_LATENCY + 3)$
 - $DDR_CLK_ALWAYS_ON = 0$
 $HS_INTER1 = BLANKING_PERIOD - (EXIT_HS_MODE_LATENCY + 3)$
 $HS_INTER2 = BLANKING_PERIOD - (DDR_CLK_POST + EXIT_CLK_HS_MODE + 3)$
 $HS_INTERLEAVING = \min\{HS_INTER1, HS_INTER2\}$
- Scenario 3: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.
 - $DDR_CLK_ALWAYS_ON = 1$
 $HS_INTERLEAVING = BLANKING_PERIOD - (ENTER_HS_MODE_LATENCY + EXIT_HS_MODE_LATENCY + \max\{ENTER_HS_MODE_LATENCY, 2\} + 1)$
 - $DDR_CLK_ALWAYS_ON = 0$
 $HS_INTER1 = BLANKING_PERIOD - (DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + EXIT_HS_MODE_LATENCY + \max\{ENTER_HS_MODE_LATENCY, 2\} + 1)$
 $HS_INTER2 = BLANKING_PERIOD - (DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + DDR_CLK_POST + EXIT_CLK_HS_MODE + DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + 1)$
 $HS_INTERLEAVING = \min\{HS_INTER1, HS_INTER2\}$
- Scenario 4: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.
 - $DDR_CLK_ALWAYS_ON = 1$
 $HS_INTERLEAVING = BLANKING_PERIOD - (ENTER_HS_MODE_LATENCY + EXIT_HS_MODE_LATENCY + 3)$
 - $DDR_CLK_ALWAYS_ON = 0$
 $HS_INTER1 = BLANKING_PERIOD - (DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + EXIT_HS_MODE_LATENCY + 3)$
 $HS_INTER2 = BLANKING_PERIOD - (DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + DDR_CLK_POST + EXIT_CLK_HS_MODE + 1)$
 $HS_INTERLEAVING = \min\{HS_INTER1, HS_INTER2\}$

10.3.4.4.3.5.2 LP Command Mode Interleaving

Figure 10-127 shows the various LP mode scenarios in interleaving mode during a blanking gap. For each type of blanking gap, a dedicated bit field determines the number of bytes of LP command mode packets that can be sent during a blanking period.

- The [DSI_VM_TIMING6](#)[15:0] BL_LP_INTERLEAVING bit field defines the number of bytes of LP command mode packets that can be sent during a BLLP gap.
- The [DSI_VM_TIMING5](#)[7:0] HBP_LP_INTERLEAVING bit field defines the number of bytes of LP command mode packets that can be sent during an HBP gap.
- The [DSI_VM_TIMING5](#)[15:8] HFP_LP_INTERLEAVING bit field defines the number of bytes of LP command mode packets that can be sent during an HFP gap.
- The [DSI_VM_TIMING5](#)[23:16] HSA_LP_INTERLEAVING bit field defines the number of bytes of LP command mode packets that can be sent during an HSA gap.

These values must be programmed to satisfy the timings for clock and data lane enter and exit LP mode latency. Clock lane timings do not affect LP command mode interleaving, because the clock lane can be controlled separately, compared with the data lane HS and low-power mutually exclusive control. Clock lanes can be in HS mode while the data lanes are in HS data transfer mode, low-power data transfer mode, or in LPS.

According to this scenario, different equations must be considered for calculating register values.

Figure 10-127. LP Command Mode Interleaving

dsi-328

For the following equations, BLANKING_PERIOD represents the BLLP, HSA, HBP, or HFP blanking periods. The LP_INTERLEAVING period represents the maximal period in LP command mode packets. Its value is set in the BL_LP_INTERLEAVING, HSA_LP_INTERLEAVING, HBP_LP_INTERLEAVING, or HFP_LP_INTERLEAVING bit fields, depending on the blanking type.

ALLOWED_HSBYTE_CLOCKS_FOR_LP represents the number of TXBYTECLKHS clock cycles during which LP interleaving can appear.

To calculate the LP_INTERLEAVING value:

1. Calculate how many TXBYTECLKHS clock cycles can be reserved for LP interleaving during the appropriate blanking video mode gap.
2. Calculate the value of LP_INTERLEAVING according to the results of Step 1.

Step 1:

- Scenario 1: The gap for interleaving starts and ends with a regular video stream HS packet.

ALLOWED_HSBYTE_CLOCKS_FOR_LP = BLANKING_PERIOD – (EXIT_HS_MODE_LATENCY + max{ENTER_HS_MODE_LATENCY, 2} + 1)

- Scenario 2: The gap for interleaving starts with a regular video stream HS packet and ends in LPS.
ALLOWED_HSBYTE_CLOCKS_FOR_LP = BLANKING_PERIOD – (EXIT_HS_MODE_LATENCY + 1)
- Scenario 3: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.
ALLOWED_HSBYTE_CLOCKS_FOR_LP = BLANKING_PERIOD – (max{ENTER_HS_MODE_LATENCY, 2} + 1)
- Scenario 4: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.
ALLOWED_HSBYTE_CLOCKS_FOR_LP = BLANKING_PERIOD – 1

After finishing Step 1, the time period available for LP interleaving is known:

$$T_{lp_available} = \text{ALLOWED_HSBYTE_CLOCKS_FOR_LP} * T_{TXBYTECLKHS}$$

Step 2:

The resulting value must be programmed in the appropriate video mode register for LP interleaving.

$$\text{LP_INTERLEAVING} < \left\lceil \frac{\frac{T_{lp_available} - 8 * T_{hsbyte_clk} - 5 * T_{dsif_clk}}{T_{txclkesc}} - 26}{16} \right\rceil$$

dsi-E124

T_{hsbyte_clk} : Period of TXBYTECLKHS clock of DSI_PHY module

T_{dsif_clk} : Period of DSI functional clock

$T_{txclkesc}$: Period of LP transmit escape clock

10.3.4.4.4 Clock Requirements

The serial clock generated by the DSI host and sent to the display can be a continuous clock. The clock lane supports clock transmission even if there is no data to send for displays that require continuous clock. It is software-programmed through the [DSI_CLK_CTRL\[13\] DDR_CLK_ALWAYS_ON](#) bit: This bit can be programmed only when the interface is disabled (the [DSI_CTRL\[0\] IF_EN](#) bit set to 0).

The peripheral can use two different kinds of clocks. The first one is the DDR clock provided on the clock lane. The second clock is some transitions on the data lane 1 even if there is no valid data to send using LP mode.

The LP clock (TxClkEsc) frequency provided to the DSI complex I/O is in the range of 67 percent to 150 percent of the peripheral low-power (LP) clock frequency. It is generated internally by the DSI protocol engine module using the DSI functional clock. The DSI functional clock is divided by 1, 2, 3, up to 8191 using the value programmed in the [DSI_CLK_CTRL\[12:0\] LP_CLK_DIVISOR](#) bit field. The LP clock generated from the DSI functional clock must be in the range of 20 MHz to 32 kHz. The duty cycle must be 50/50 (minimum high time = 24ns). LP clock frequency visible on the pads (DP x or DN) is half the frequency of TxClkEsc.

The [DSI_CLK_CTRL\[20\] LP_CLK_ENABLE](#) bit is used to enable or disable the clock. When disabled, the value of the [DSI_CLK_CTRL\[12:0\] LP_CLK_DIVISOR](#) bit field is ignored and does not have to be programmed by software users.

10.3.4.4.4.1 Timing Parameters for an LP to HS Transaction

[Figure 10-128](#) shows the timing requirement when switching the data and clock lane state from LP to HS. lists the LP to HS timing parameters.

Figure 10-128. LP to HS Timing

dsi-325

Table 10-477. LP to HS Timing Parameters

Timings	Description	Registers/Associated Bit Fields	Register Settings	Timing Seen on the Line
T_{LPX}	Length of any low-power state period	DSI_PHY_REGISTER1 [20:16] REG_TLPXBY2 The value set in this bit field is half of the T_{LPX}	CEIL (25 ns / DDR_Clock_Period)	CEIL (2 * $REG_TLPXBY2/4$) * 4 * DDR_Clock_Period
$T_{CLK-PREPARE}$	Time to drive the CLK lane to LP-00 state, to prepare for HS clock transmission	DSI_PHY_REGISTER2 [7:0] REG_TCLKPREPARE	CEIL (65 ns / DDR_Clock_Period)	$REG_TCLKPREPARE * DDR_Clock_Period + (\sim 25\text{ ns} - +5\text{ ns})$
$T_{CLK-ZERO}$	Time to drive the CLK lane to HS-0 state, before starting the clock	DSI_PHY_REGISTER1 [7:0] REG_TCLKZERO	CEIL (265 ns / DDR_Clock_Period)	{CEIL [($REG_TCLKZERO + 3/4$) * 4 + CEIL ($REG_TCLKPREPARE/4$) * 4 – $REG_TCLKPREPARE + 2$] * $DDR_Clock_Period + (\sim 0\text{ ns} - +5\text{ ns})$
$T_{CLK-PRE}$	Time that the HS clock must be driven before any associated data lane begins the transition from LP to HS mode	N/A	N/A	$DDR_CLK_PRE - T_{LPX} - T_{CLK-PREPARE} - T_{CLK-ZERO}$
$T_{HS-PREPARE}$	Time to drive the data lane to LP-00 state, to prepare for HS packet transmission	DSI_PHY_REGISTER0 [31:24] REG_THSPREPARE	CEIL (70 ns / DDR_Clock_Period) + 2	$REG_THSPREPARE * DDR_Clock_Period + (\sim 26.5\text{ ns} - +4\text{ ns})$
$T_{HS-ZERO} + T_{HS-PREPARE}$	$T_{HS-ZERO}$: Time to drive the data lane to HS-0 state before the synchronous sequence.	DSI_PHY_REGISTER0 [23:16] REG_THSPRPR_THSZERO	CEIL (175 ns / DDR_Clock_Period) + 2	{CEIL [($N + 3/4$) * 4 + CEIL ($M/4$) * 4 + 3] * $DDR_Clock_Period + (\sim -29\text{ ns} - 0\text{ ns})$. Where N = $REG_THSPREPARE_T_{HSZERO} - REG_THSPREPARE$ M = $REG_THSPREPARE$
$T_{DDR_CLK_PRE}$	Time between the CLK lane request assertion and the data request assertion to switch the data lanes to HS	DSI_CLK_TIMING [15:8] DDR_CLK_PRE	CEIL [($T_{LPX} + T_{CLK-PREPARE} + T_{CLK-ZERO} + T_{CLK-PRE}$) / $T_{TXBYTECLKHS}$] ⁽¹⁾⁽²⁾	
$T_{ENTER_HS_MODE_LATENCY}$ ⁽³⁾	Time to enter data lane into HS mode.	DSI_VM_TIMING7 [31:6] ENTER_HS_MODE_LATENCY	CEIL [($T_{LPX} + T_{HS-PREPARE} + T_{HS-ZERO}$) / $T_{TXBYTECLKHS}$] ⁽¹⁾	

⁽¹⁾ The timings seen on the line should be used to determine the register value.

⁽²⁾ See the MIPI D-PHY specification for the $T_{CLK-PRE}$ value.

⁽³⁾ $ENTER_HS_MODE_LATENCY$ timing applies only to video mode. It does not need to be programmed in command mode.

In the example in [Table 10-478](#), the DDR clock = 400 MHz; $TxByteClkHS$ = 100 MHz.

Table 10-478. LP to HS Timing Parameters Example for 400-MHz DDR Clock

Timings	Registers/Associated Bit Fields	Default Register Settings (Programmed at Reset)	Timing Seen on the Line
T_{LPX}	DSI_PHY_REGISTER1 [20:16] REG_TLPXBY2	10	50 ns
$T_{CLK-PREPARE}$	DSI_PHY_REGISTER2 [7:0] REG_TCLKPREPARE	26	40–70 ns

Table 10-478. LP to HS Timing Parameters Example for 400-MHz DDR Clock (continued)

Timings	Registers/Associated Bit Fields	Default Register Settings (Programmed at Reset)	Timing Seen on the Line
$T_{\text{CLK-ZERO}}$	DSI_PHY_REGISTER1 [7:0] REG_TCLKZERO	106	280–285 ns
$T_{\text{CLK-PRE}}$ ⁽¹⁾	N/A	N/A	80 ns
$T_{\text{HS-PREPARE}}$	DSI_PHY_REGISTER0 [31:24] REG_THSPREPARE	30	48.5–79 ns
$T_{\text{HS-ZERO}}$	DSI_PHY_REGISTER0 [23:16] REG_THSPRPR_THSZERO	72	178.5–207.5 ns
$T_{\text{DDR_CLK-PRE}}$	DSI_CLK_TIMING [15:8] DDR_CLK_PRE	45–49 ⁽²⁾	450–490 ns
$T_{\text{ENTER_HS_MODE_LATENCY}}$	DSI_VM_TIMING7 [31:16] ENTER_HS_MODE_LATENCY	24 * $T_{\text{TXBYTECLKHS}}$ or 96 * DDR_CLOCK 34 * $T_{\text{TXBYTECLKHS}}$ or 136 * DDR_CLOCK ⁽²⁾	277–336.5 ns

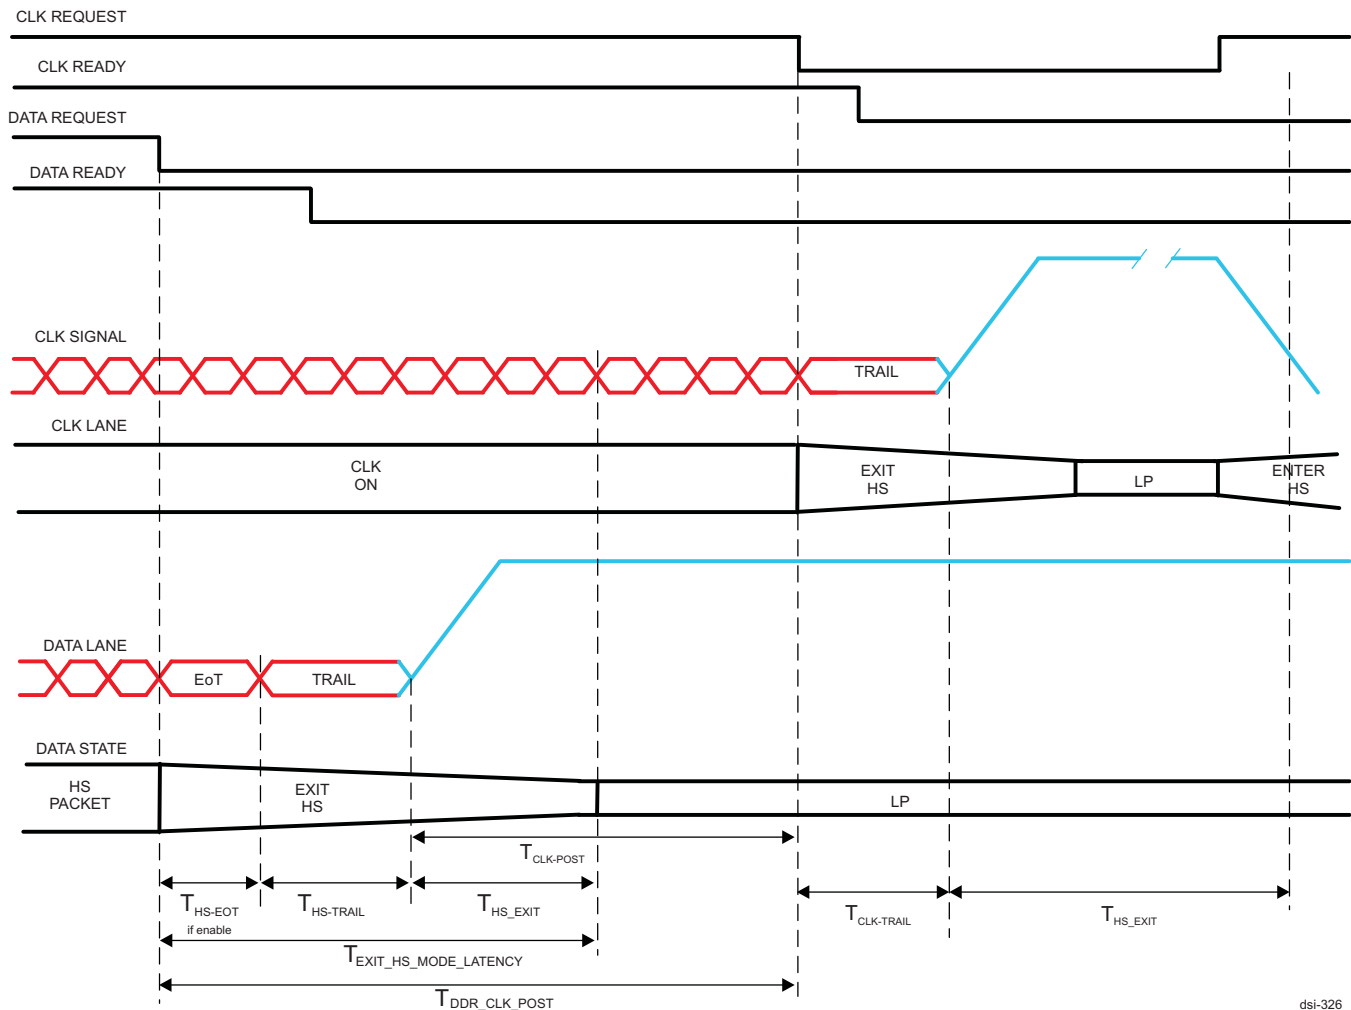

⁽¹⁾ See the MIPI D-PHY specification for the $T_{\text{CLK-PRE}}$ value.

⁽²⁾ Register setting calculated based on the values in the Timing Seen on the Line column.

10.3.4.4.2 Timing Parameters for an HS to LP Transaction

Figure 10-129 shows the timing requirement when switching the state of the data and clock lanes from HS to LP. lists the HS to LP timing parameters.

Figure 10-129. HS to LP Timing

dsi-326

Table 10-479. HS to LP Timing Parameters

Timings	Description	Registers/Associated Bit Fields	Register Settings	Timing Seen on the Line
T_{HS-EOT}	If EoT is enabled, a delay is added to EXIT_HS_MODE_LATENCY to send the EoT packet. The EoT period depends on the number of data lanes.	N/A	N/A	DIVROUNDUP (4, NB_DATA_LANES) Thus: One data lane = Four DDR clocks Two data lanes = Two DDR clocks
$T_{HS-TRAIL}$	Time to drive flipped differential state after last payload data bit of an HS transmission burst	DSI_PHY_REGISTER0 [15:8] REG_THSTRAIL	CEIL (60 ns / DDR_Clock_Period) + 5	{CEIL [(REG_THSTRAIL + 3)/4] * 4 – 2.75} * DDR_Clock_Period + (~0 ns – 5 ns)
$T_{HS-EXIT}$	Time to drive data lane to LP-11 state, after HS burst	DSI_PHY_REGISTER0 [7:0] REG_THSEXIT	CEIL (145 ns / DDR_Clock_Period)	[CEIL (REG_THSEXIT/4) * 4] * DDR_Clock_Period – (~3 ns – 45 ns)
$T_{CLK-POST}$	Time that the transmitter must continue sending HS clock after the last associated data lane has transitioned to LP mode	N/A	N/A	DDR_CLK_POST - T_{HS-EOT} - $T_{HS-TRAIL}$
$T_{CLK-TRAIL}$	Time to drive HS differential state after last payload clock bit of an HS transmission burst	DSI_PHY_REGISTER1 [15:8] REG_TCLKTRAIL	CEIL (60 ns / DDR_Clock_Period) + 2	{CEIL [(REG_TCLKTRAIL + 3)/4] * 4 – 1.5} * DDR_Clock_Period + (~0 ns – 5 ns)
$T_{DDR_CLK_POST}$	Time between the data lane request deassertion and the CLK request deassertion to switch the data lanes into LP mode. The DDR_CLK_POST value must follow the rule: $T_{DDR_CLK_POST} \geq T_{HS-TRAIL} + T_{HS-EOT} + T_{CLK-POST}$	DSI_CLK_TIMING [7:0] DDR_CLK_POST	CEIL [($T_{HS-TRAIL} + T_{HS-EOT}$) + $T_{CLK-POST}$] / $T_{TXBYTECLKHS}$ ^{(2) (3)}	
$T_{EXIT_HS_MODE_LATENCY}$ ⁽⁴⁾	Time to exit HS mode	DSI_VM_TIMING7 [15:0] EXIT_HS_MODE_LATENCY	CEIL [($T_{HS-TRAIL} + T_{HS-EXIT} + T_{HS-EOT}$) / $T_{TXBYTECLKHS}$] ⁽²⁾	

⁽¹⁾ If T_{HS-EOT} is enabled

⁽²⁾ The timings seen on the line should be used to determine the register value.

⁽³⁾ See the MIPI D-PHY specification for the $T_{CLK-POST}$ value.

⁽⁴⁾ EXIT_HS_MODE_LATENCY timing applies only to video mode. It does not need to be programmed in command mode.

In the example in [Table 10-480](#), the DDR clock = 400 MHz; TxByteClkHS = 100 MHz; two data lanes.

Table 10-480. HS to LP Timing Parameters Example for 400-MHz DDR Clock and Two Data Lanes

Timings	Registers/Associated Bit Fields	Default Register Settings (Programmed at Reset)	Timing Seen on the Line (T_{HS-EOT} Enabled)	Timing Seen on the Line (T_{HS-EOT} Disabled)
T_{HS-EOT}	N/A	N/A	5 ns	N/A
$T_{HS-TRAIL}$	DSI_PHY_REGISTER0 [15:8] REG_THSTRAIL	29	73.125–78.125 ns	73.125–78.125 ns

T _{CLK-POST} ⁽¹⁾	N/A	N/A	585 ns	580 ns
T _{CLK-TRAIL}	DSI_PHY_REGISTER1 [15:8] REG_TCLKTRAIL	26	76.25–81.25 ns	76.25–81.25 ns
DDR_CLK_POST	DSI_CLK_TIMING [7:0] DDR_CLK_POST	66 * TxByteClkHS or 264 * DDR_CLOCK 67 * TxByteClkHS or 268 * DDR_CLOCK ⁽²⁾	658.125–663.125 ns	653.125–658.125 ns
EXIT_HS_MODE_LATE NCY	DSI_VM_TIMING7 [15:0] EXIT_HS_MODE_LATE NCY	19 * TxByteClkHS or 76 * DDR_CLOCK 24 * TxByteClkHS or 96 * DDR_CLOCK ⁽²⁾	183.125–230.125 ns	178.125–225.125 ns

⁽¹⁾ See the MIPI D-PHY specification.

⁽²⁾ Register setting calculated based on the values in Timing Seen on the Line (T_{HS-EOT} Enabled) column.

10.3.4.4.3 Extra LP Transitions

Some DSI receivers require extra clock cycles in LP mode to process the data. The DSI protocol engine can be programmed to send automatically one NULL long packet. It applies only when no more data are ready to be sent from the internal FIFO to the peripheral on the last LS transfer. The same value is used for all the VCs sending packets in LS mode.

The size of the payload is defined by the [DSI_CLK_CTRL](#)[17:16] LP_CLK_NULL_PACKET_SIZE bit field. The header value depends on the size of the payload as described in [Table 10-481](#) and [Table 10-482](#).

NOTE: In [Table 10-481](#) and [Table 10-482](#), ECC and checksum are enabled.

Table 10-481. Extra NULL PH

VC ID	Payload size (DSI_CLK_CTRL [17:16] LP_CLK_NULL_PACKET_SIZE)	Header (1st Byte)	Header (2nd Byte): WC LSB	Header (3rd Byte): WC MSB	Header (ECC)
0x0	0	0x9	0x0	0x0	0x9

10.3.4.4.5 Video Port Interface

NOTE: The signals described in this section are internal and not bounded outside the device. This section describes the internal connections between the DISPC and the DSI protocol engine.

[Table 10-483](#) and [Table 10-484](#) summarize the video interface signals.

- DSI1 has two video ports (VP1 and VP2):
 - VP1 is connected to the LCD1 output of DISPC.
 - VP2 is connected to the LCD2 output of DISPC.
- DSI2 has one video port (VP1):
 - VP1 is connected to the LCD2 output of DISPC.

These interfaces are used to connect the DISPC outputs to the DSI protocol engine to send real-time data streams. For video mode, only the active matrix timings are supported by DSI protocol engine.

When the two video ports of DSI1 are used for two video mode transfers, only the synchronization signals on video port 1 are used by the DSI protocol engine. The synchronization signals on video port 2 are ignored. When only one video mode is enabled, it must be connected to video port 1. It is not possible to enable video mode on video port 2 without enabling video mode on video 1 (dual-video mode). The HSYNC/VSNC/DE/DATA signals are driven on the rising or falling edge of the pixel clock (VP_PCLK).

Table 10-483. Video Port 1 Signals for DSI1 and DSI2 Protocol Engines

Signal Name	Type ⁽¹⁾	Description
VP1_HSYNC	I	Horizontal synchronization signal
VP1_VSYNC	I	Vertical synchronization signal
VP1_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP1_PCLK	I	Pixel clock. In case of STALL configuration, it is used to indicate when new data is on the data bus during the clock period of VP1_CLK. The VP1_PCLK is generated from VP1_CLK through division inside the DISPC. The clock ratio is indicated in the DSI_CTRL [4] VP_CLK_RATIO bit and must be aligned with the configuration of the clock divisor in the display controller (DISPC_DIVISOR1[7:0] PCD bit field for DISPC LCD1 output, and the DISPC_DIVISOR2[7:0] PCD bit field for DISPC LCD2 output). The source of the VP1_PCLK for DSI1 is the LCD1_PCLK. The source of the VP1_PCLK for DSI2 is LCD2_PCLK. For more information, see Section 10.2.4.1, Clock Configuration , and Section 10.3.4.2, DSI Clock Configuration .

⁽¹⁾ I = Input; O = Output

Table 10-483. Video Port 1 Signals for DSI1 and DSI2 Protocol Engines (continued)

Signal Name	Type ⁽¹⁾	Description
VP1_DE	I	Data enable
VP1_STALL	O	The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in STALL mode; in that mode, HSYNC and VSYNC are not generated).
VP1_CLK	I	DISPC internal clock. It is a free-running clock. The source of VP1_CLK for DSI1 is LCD1_CLK, divided down. The source of VP1_CLK for DSI2 is LCD2_CLK, divided down. For more information, see Section 10.2.4.1, Clock Configuration , and Section 10.3.4.2, DSI Clock Configuration .

Table 10-484. Video Port 2 Signals for DSI1 Protocol Engine

Signal Name	Type ⁽¹⁾	Description
VP2_HSYNC	I	Horizontal synchronization signal
VP2_VSYNC	I	Vertical synchronization signal
VP2_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP2_PCLK	I	Pixel clock. In case of STALL configuration, it is used to indicate when new data is on the data bus during the clock period of VP2_CLK. The VP2_PCLK is generated from VP2_CLK through division inside the DISPC. The clock ratio is indicated in the DSI_CTRL2[4] VP_CLK_RATIO bit and must be aligned with the configuration of the clock divisor in the display controller (DISPC_DIVISOR2[7:0] PCD bit field for DISPC LCD2 output). The source of the VP2_PCLK for DSI1 is LCD2_PCLK. For more information, see Section 10.2.4.1, Clock Configuration , and Section 10.3.4.2, DSI Clock Configuration .
VP2_DE	I	Data enable
VP2_STALL	O	The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in STALL mode; in that mode, HSYNC and VSYNC are not generated).
VP2_CLK	I	DISPC internal clock. It is a free-running clock. The source of the VP2_CLK for DSI1 is LCD2_CLK, divided down. For more information, see Section 10.2.4.1, Clock Configuration , and Section 10.3.4.2, DSI Clock Configuration .

⁽¹⁾ I = Input; O = Output

NOTE:

- The polarities of VP_HSYNC and VP_VSYNC are programmable by setting the [DSI_CTRL](#) and [DSI_CTRL2](#) registers.
- Clocks VP_CLK and VP_PCLK can have the same frequency.
- The number of bits to be captured on the video port (the width of the data bus) is defined in the [DSI_CTRL\[7:6\] VP_DATA_BUS_WIDTH](#) bit field for DSI1 and the [DSI_CTRL2\[7:6\] VP_DATA_BUS_WIDTH](#) for DSI2. The supported formats are 16, 18, and 24 bits.
- For the 18-bit pixel format using 24 bits on the DSI link, the format to be used by the DSI protocol engine is 24-bit because the DISPC must convert the 18-bit pixels into 24-bit pixels. There is no logic inside the DSI protocol engine to convert from 18-bit format to 24-bit format.

The data received on the video port can be stored in the line buffer memories or sent directly on the DSI interface in two cases:

- The line buffer size is too small compared to the line from the DISPC.
- There is no line buffer instantiated. If there is no line buffer, the burst mode, defined as frequency burst mode, cannot be used. Only transparency burst mode is supported.

NOTE: The [DSI_CTRL\[13:12\] LINE_BUFFER](#) and [DSI_CTRL2\[13:12\] LINE_BUFFER](#) bit fields define the number of lines to be used for transferring data from the video port to the DSI1 and DSI2 link.

10.3.4.4.5.1 Video Port Used for Video Mode

If the video port is used for video mode, VP_STALL is not used. [Table 10-485](#) and [Table 10-486](#) list the active signals on the video port.

Table 10-485. Video Port 1 for DSI1 and DSI2 in the Context of Video Mode

Signal Name	Type ⁽¹⁾	Description
VP1_HSYNC	I	Horizontal synchronization signal
VP1_VSYNC	I	Vertical synchronization signal
VP1_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP1_PCLK	I	Pixel clock
VP1_DE	I	Data enable
VP1_CLK	I	It is a free-running clock used as the DISPC functional clock.

⁽¹⁾ I = Input; O = Output

Table 10-486. Video Port 2 for DSI1 in the Context of Video Mode

Signal Name	Type ⁽¹⁾	Description
VP2_HSYNC	I	Horizontal synchronization signal
VP2_VSYNC	I	Vertical synchronization signal
VP2_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP2_PCLK	I	Pixel clock
VP2_DE	I	Data enable
VP2_CLK	I	It is a free-running clock used as the DISPC functional clock.

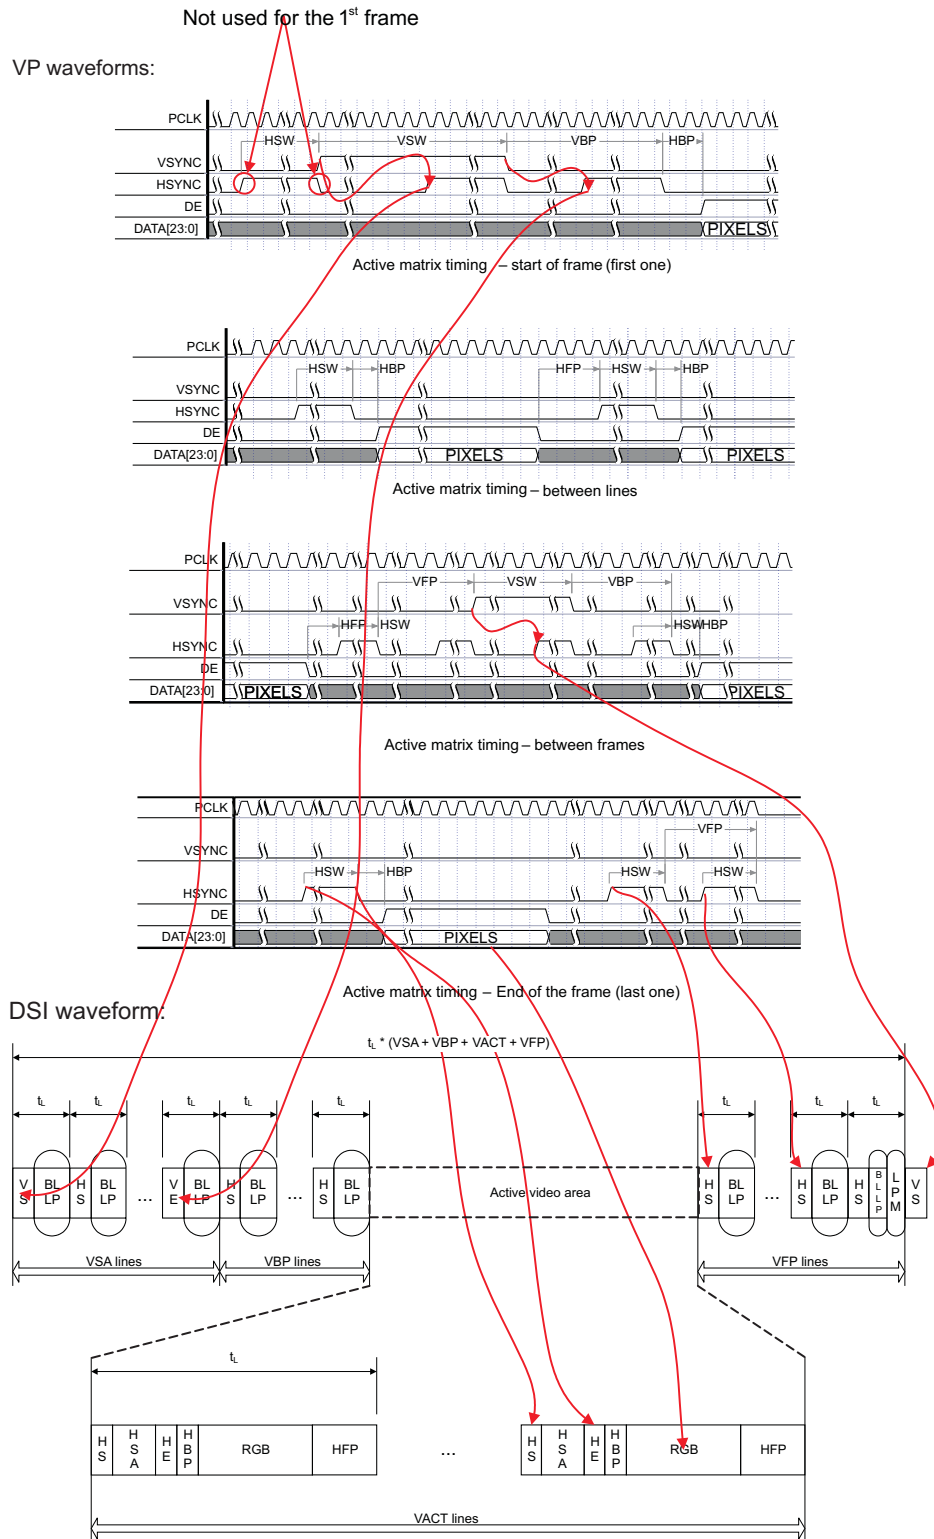

⁽¹⁾ I = Input; O = Output

Three video modes are available:

- No-line buffer: The data received on the video port are directly outputted to the DSI port without buffering. The ratio of VP_PCLK and the DSI HS clock period must ensure the same throughput on the two ports (the two clocks must be generated using the same PLL; the subsystem must provide this configuration).
- One-line buffer:
 - The data can be transferred as described in the no-line buffer configuration.
 - The data are first stored in the line buffer; and then when all the data for one line are received, the DSI protocol engine sends the entire line. Software must adjust timings to let enough time for storing all line data into the line buffer before sending to DSI outputs. The synchronization packets are never stored in the line buffer.
- Two-line buffers:
 - The data can be transferred as described in the one-line buffer configuration.
 - One line is stored when the second line is output on the DSI port. This allows burst capability. While receiving the first line of the frame, no RGB packets are sent, because the line buffers are empty. To send the last line of the frame, a dummy line must be provided by the display controller to flush the line buffers. The synchronization packets are never stored in the line buffer.

NOTE: If more active lines are received on the video port than the number of lines defined in the [DSI_VM_TIMING3\[15:0\]](#) VACT bit field, the extra lines are discarded by the DSI protocol engine. These lines are treated as blanking lines.

[Figure 10-130](#) through [Figure 10-132](#) show these three video modes.

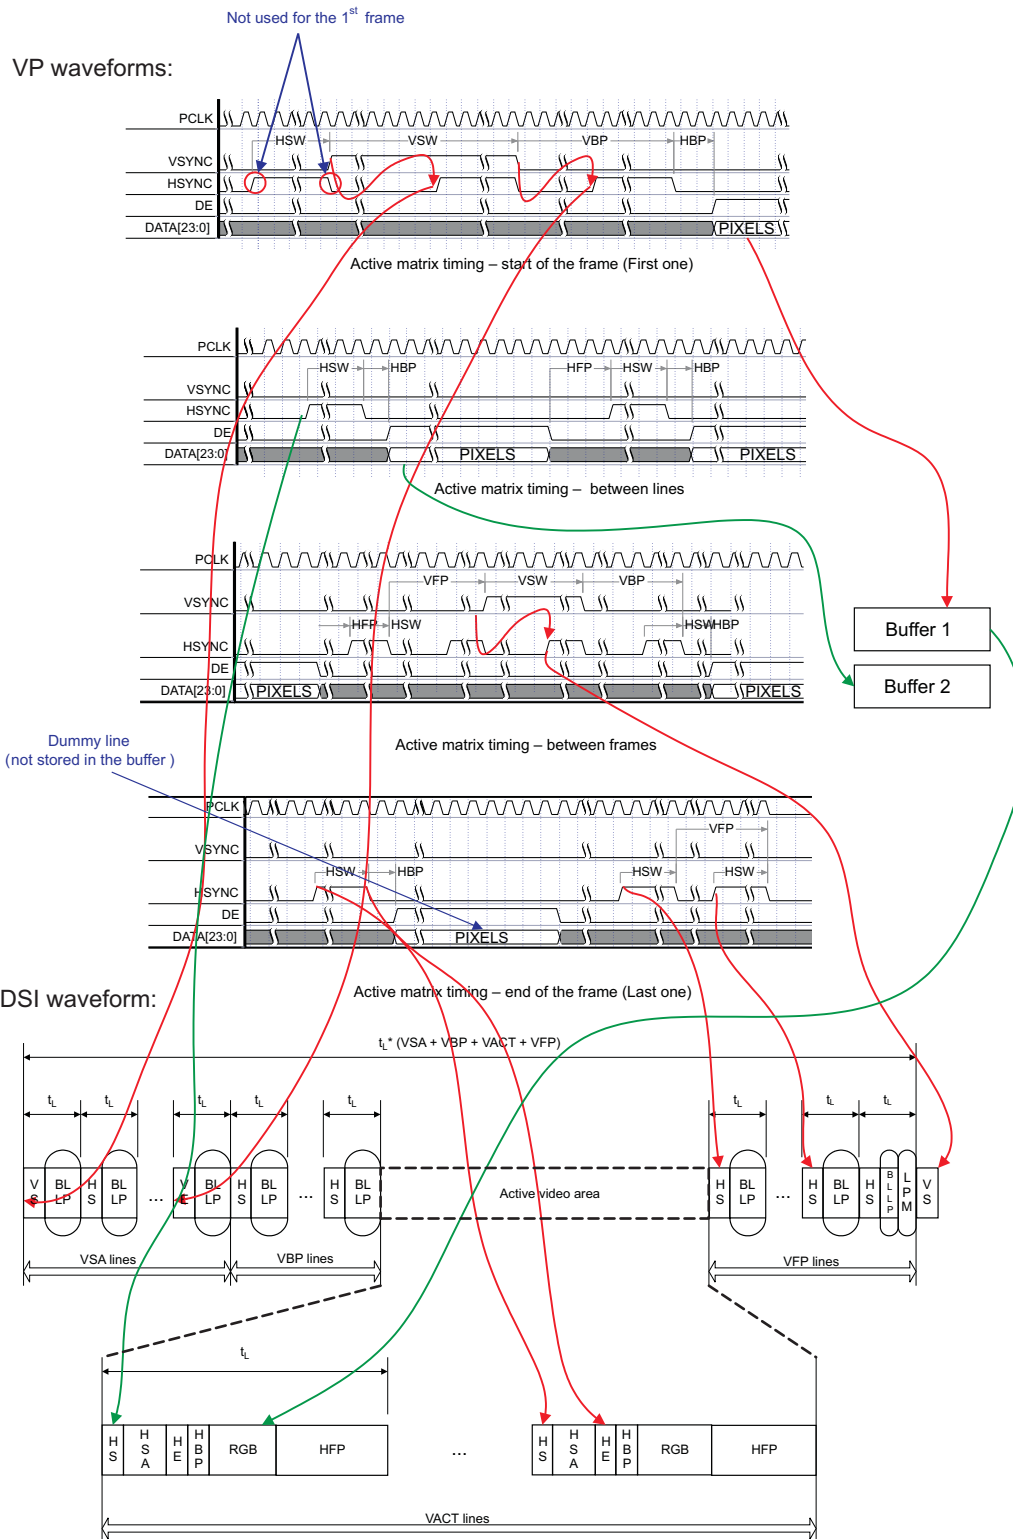

Figure 10-130. DSI Video Mode Without Burst (No-Line Buffer)

dsI-035

Figure 10-131. DSI Video Mode Without Burst (One-Line Buffer)

dsi-036

Figure 10-132. DSI Video Mode With Burst (Two-Line Buffers)

ds1-037

NOTE: In [Figure 10-130](#) through [Figure 10-132](#):

- When HSYNC start and HSYNC end short packets are not generated (HSA does not exist), the HBP signal must not be 0.
- Software must ensure that VBP is always defined so that there is at least one HSYNC during VBP.
- In blanking low-power mode (BL-LP), two options are possible:
 - The lane remains in ULPS, and the [DSI_CTRL\[20\]](#) BLANKING_MODE bit is set to 0x0.
 - Dummy bytes are sent during LP with the [DSI_CTRL\[20\]](#) BLANKING_MODE bit set to 0x1; the number of sent bytes is determined by the [DSI_VM_TIMING6\[15:0\]](#) BL_LP_INTERLEAVING bit field.

In DSI video mode, if the VSA bit field in [DSI_VM_TIMING2](#) is set to 0x0, no vertical synchronization packet will be sent even if VP_VSYNC_START is set to 0x1 in [DSI_CTRL](#).

If the signal VP_DE is not asserted during enough VP_PCLK cycles to be able to capture the number of bytes defined in the word count of the header, the module must send the valid data received on the video port followed by bytes of 0s to match the required number of bytes to transmit. The VP_PCLK must be present during all extra cycles where the DSI protocol engine is expecting pixels.

If the VP_DE signal is asserted for too many VP_PCLK cycles, the module stops capturing the data on the video port while the number of bytes to capture, as defined in the word count field of the header, is reached.

The HS checks that the received synchronization events on the video port (VSYNC and HSYNC) are within the synchronization window based on expected timings. If the timings (internal and received) are out of sync, the interrupt for out-of-sync is generated and the interface is disabled (the [DSI_CTRL\[0\]](#) IF_EN bit is automatically reset by hardware). The unsynchronization window is defined by the [DSI_VM_TIMING2\[27:24\]](#) WINDOW_SYNC bit field.

10.3.4.4.5.2 Video Port Used for Command Mode

If the video port is used for command mode, the VP_HSYNC, VP_VSYNC, and VP_DE signals are not used. [Table 10-487](#) and [Table 10-488](#) describe the active signals on video port 1 and video port 2, respectively .

Table 10-487. Video Port 1 for DSI1 and DSI2 in the Context of Command Mode

Signal Name	Type ⁽¹⁾	Description
VP1_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP1_PCLK	I	One pulse is generated every time new data is output on the data bus.
VP1_STALL	O	The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in stall mode; in that mode, HSYNC and VSYNC are not generated).
VP1_CLK	I	DISPC internal clock: It is a free-running clock used as the DISPC functional clock.

⁽¹⁾ I = Input; O = Output

Table 10-488. Video Port 2 for DSI1 in the Context of Command Mode

Signal Name	Type ⁽¹⁾	Description
VP2_DATA[23:0]	I	Parallel output data: Bits 0 to 23
VP2_PCLK	I	One pulse is generated every time new data is output on the data bus.
VP2_STALL	O	The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in stall mode; in that mode, HSYNC and VSYNC are not generated).
VP2_CLK	I	DISPC internal clock: It is a free running-clock used as the DISPC functional clock.

⁽¹⁾ I = Input; O = Output

NOTE: The stall signal must be deasserted to receive pixels and asserted to stop receiving pixels.

Figure 10-133 and Figure 10-134 show the VP_STALL signal assertion and deassertion on rising and falling edges, respectively.

Figure 10-133. Stall Timing With Pixel on Rising Edge

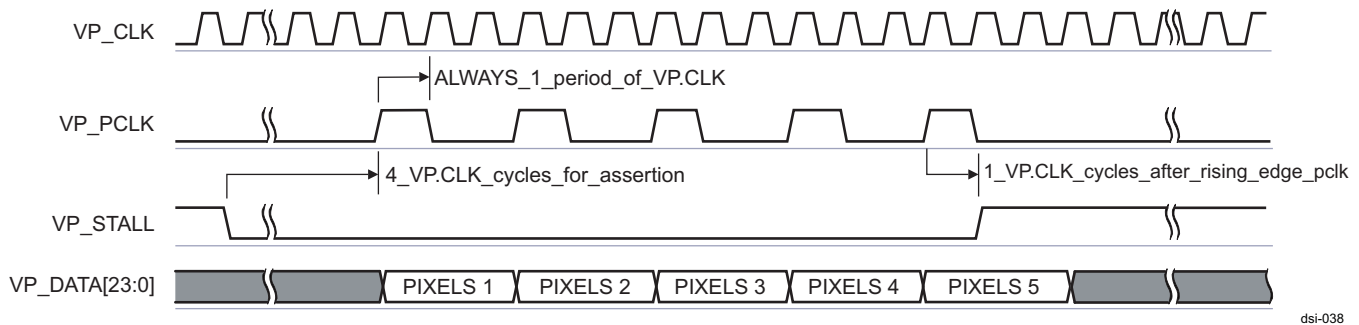

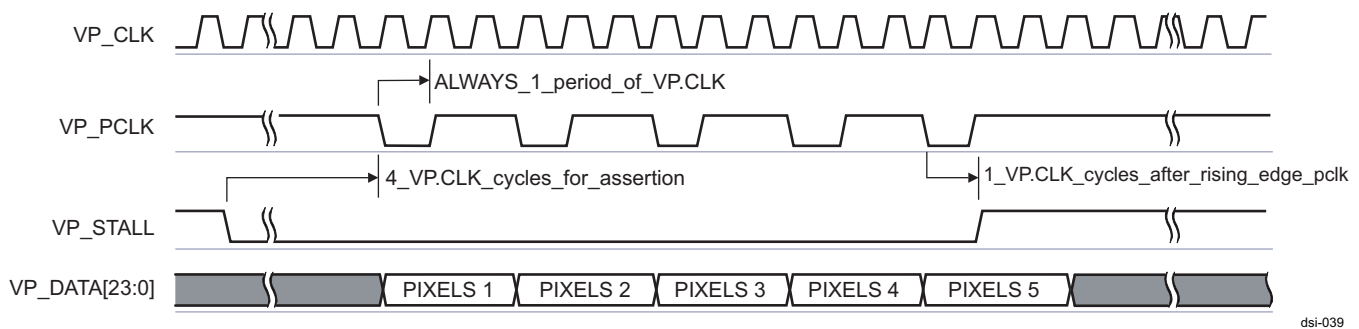

Figure 10-134. Stall Timing With Pixel on Falling Edge

The VP_STALL signal is asserted to stop the transfer when the last data is output. The data can be output on the rising or falling edge of the VP_PCLK through registers in the DISPC module. Data output on the falling edge of VP_PCLK is supported by the DSI protocol engine.

The VP_PCLK clock is generated from VP_CLK; these two clocks are balanced. Assertion and deassertion of VP_PCLK is done on the rising edge of VP_CLK. The width of the VP_PCLK pulse depends on the configuration of the clock divisor in the DISPC. For more information, see [Section 10.2, Display Controller](#). In the DSI protocol engine, the information is defined in the [DSI_CTRL\[4\] VP_CLK_RATIO](#) bit and must be aligned with the DISPC configuration.

Deassertion of the VP_STALL signal occurs at least four VP_CLK cycles before assertion of VP_PCLK. Assertion of VP_STALL occurs one cycle VP_CLK after deassertion of VP_PCLK for the last pixel to be transferred. The VP_CLK clock is generated by the DISPC under software control. It can be kept running between assertion and deassertion of VP_STALL.

The stall assertion/deassertion depends on the number of bytes to be received considering the size of the video port bus defined in the [DSI_CTRL\[7:6\] VP_DATA_BUS_WIDTH](#) bit field for video port 1 and the [DSI_CTRL2\[7:6\] VP_DATA_BUS_WIDTH](#) bit field for video port 2.

Figure 10-135 shows the data flow in command mode using the video port.

Figure 10-135. Data Flow in Command Mode Using the Video Port

dsi-040

Two command modes are available:

- One-line buffer: The data are stored in the line buffer before being sent.
- Two-line buffers: The two lines are used if the word count defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register is bigger than the line size; otherwise, one-line buffer must be used.

NOTE: In command mode, the video port can be used only in one- or two-line buffer configuration. No-line buffer configuration is not allowed.

The packets can be sent using high speed or low speed.

The DCS command in the payload can be inserted automatically using the [DSI_VC_CTRL_i\[30\]](#) DCS_CMD_ENABLE bit. If TE is used, hardware automatically inserts the DCS Write Start command for the first packet of the frame transfer and DCS Write Continue command for all subsequent packets. The [DSI_VC_CTRL_i\[31\]](#) DCS_CMD_CODE bit is ignored.

10.3.4.4.5.3 Burst Mode

When burst mode is enabled, the video port receives data from the DISPC at the pixel clock. The DSI protocol engine buffers the data in its own line FIFO (double-line buffer size). The read speed of the line can be twice the pixel clock to increase the blanking time of the video mode and to allow command mode traffic to be interleaved during the blanking period. Burst mode uses a dual-line buffer.

The DSI port can output data from one line buffer while the second line buffer is accessed by the video port. The two processes are concurrent but they do not access the same line at the same time. The DSI transfer can start only when the entire video port line is transferred into a line buffer. The switch is controlled by the VP_HS signal on the video port side and by an internal signal on the DSI port indicating that the last data for the current line has been written into the line buffer.

NOTE: The line buffers are used to store only the pixels. The synchronization codes are not stored in the line buffers; they must be sent according to the video port timings.

NOTE: The number of line buffers to be used while receiving data on the video port can be selected by setting the [DSI_CTRL\[13:12\]](#) LINE_BUFFER bit field.

10.3.4.4.5.4 Ping-Pong Buffer

The ping-pong buffer stores data incoming from the DISPC in one of the two line buffers. When one line buffer is used to store the pixels received on the video port, the second line buffer is used to provide data on the DSI link. The ping-pong buffer is supported in command mode, provided the size of the packet defined in the header register is less than the size of each line buffer (768 x 32 bits for VP1 of DSI2 and VP2 of DSI1, and 960 x 32 bits for VP1 of DSI1). If the size of the packet is greater than the size of the line buffer, the ping-pong mechanism cannot be used (both lines are used as a single line).

Figure 10-136 shows the video port used in ping-pong mode.

The ping-pong buffer status can be checked by the [DSI_VC_CTRL_i\[14\]](#) PP_BUSY bit.

- When PP_BUSY equals 1, the ping-pong buffer is active and the line buffers are not ready to receive data; therefore, a new header cannot be updated.
- When PP_BUSY equals 0, at least one line buffer is empty; therefore, a new header can be updated. PP_BUSY is then set to 0x1. If both line buffers are empty, two headers can be written, one following the other. PP_BUSY remains at 0x0 after the first header is written, and is set to 0x1 after second header is written.

An IRQ is available to update header on events. The IRQ is enabled by setting the [DSI_VC_IRQENABLE_i\[8\]](#) PP_BUSY_CHANGE_IRQ bit to 0x1, and its status is accessible on the [DSI_VC_IRQSTATUS_i\[8\]](#) PP_BUSY_CHANGE_IRQ bit.

10.3.4.4.6 SCP Interface

The SCP interface is used to transfer register values from the DSI protocol engine to the DSI PLL control module and to the DSI complex I/O. It spends several cycles to serialize the data to be sent. Software users must consider the delay in processing the transfer of the data from/to the L3 Interconnect slave port to/from the module.

10.3.4.4.6.1 Shadowing Register

The first three SCP registers for the DSI complex I/O address map must be implemented as shadow registers. The shadowing mechanism is enabled and disabled using the [DSI_COMPLEXIO_CFG1\[31\]](#) SHADOWING bit:

- When setting the [DSI_COMPLEXIO_CFG1\[31\]](#) SHADOWING bit to 1, the transfer of the values from the three first local interconnect port registers into the three first registers of the DSI complex I/O ([DSI_PHY_REGISTER0](#) through [DSI_PHY_REGISTER2](#)) is done only when the DISPC_UPDATE_SYNC signal from the DISPC is active and the [DSI_COMPLEXIO_CFG1\[30\]](#) GOBIT bit is set to 1. If there is no pending update for the three registers when the DISPC_UPDATE_SYNC signal is asserted, the [DSI_COMPLEXIO_CFG1\[30\]](#) GOBIT bit is reset by hardware and there is no SCP transfer.
 - If there is only one register to update, only the corresponding new value is transferred. The second

and third registers in the DSI complex I/O are not updated. When the transfer completes, the [DSI_COMPLEXIO_CFG1\[30\]](#) GOBIT bit is reset by hardware.

- If the two registers need to be updated, the register with the lower address is transferred first, followed by the second register. When the transfers complete, the [DSI_COMPLEXIO_CFG1\[30\]](#) GOBIT bit is reset by hardware.
- If the three registers need to be updated, the register with the lowest address is transferred first, and then the other registers are transferred according to incremental address. When the transfers complete, the GOBIT bit is reset by hardware.

When there is an on-going transfer (read or write) to any SCP register, the transfer must complete before updating the shadowing registers.

- When unsetting the [DSI_COMPLEXIO_CFG1\[31\]](#) SHADOWING bit to 0, if the transfer into the first two DSI complex I/O registers has already started, it should be finished.

NOTE: When reading the shadow registers, the local value stored in the DSI protocol engine is returned if the update is pending; otherwise, the values stored in the DSI complex I/O are returned.

10.3.4.4.6.2 Busy Signal

The SCPBusy signal indicates there is still activity using the SCPClk clock provided by the PRCM module. The SCPClk clock is the divided DSS_L3_ICLK/4 clock.

10.3.4.4.7 Timers

NOTE: Among the timers described in this section, only the HS TX, LP RX, and TurnRequests timers generate interrupts immediately when the timer value is null. The ForceTxStopMode timer ends counting instantly and ForceTxStopMode is not asserted.

10.3.4.4.7.1 T_{wakeUp} Timer

The T_{wakeUp} timer is not implemented in the DSI protocol engine. The general-purpose (GP) timer must be used to handle wakeup. This timer is used for exiting ULP status mode for the active lanes (clock and/or data lanes). The sequence to exit ULP state is:

1. Change the state of TxULPSExit for each lane to ACTIVE.
2. Wait for the interrupt that indicates all lanes with TxULPSExit ACTIVE have acknowledged by asserting ULPSActiveNot. This is done by reading the [DSI_COMPLEXIO_IRQSTATUS](#) register - ULPSACTIVENOT_ALLi_IRQ bit fields (where i = 0, 1).
3. Start the application wake-up timer (GP timer).
4. Wait for the time-out.
5. Change the TxUlpsClk signals to INACTIVE state for the clock lane and/or TxRequestEsc INACTIVE state for the data lane(s).

NOTE: The minimum time for the wake-up period is 1 ms.

To enter ULPS mode for clock lane, TxUlpsClk state must be changed to ACTIVE state. To enter ULPS mode for data lane, TxRequestEsc state must be changed to ACTIVE state (also TxUlpsEsc, if it is not in ACTIVE state already).

10.3.4.4.7.2 ForceTxStopMode FSM

The ForceTxStopMode signal is used at initialization time (DSI complex I/O). [Figure 10-137](#) shows the ForceTxStopMode finite state-machine (FSM) to assert and deassert the ForceTxStopMode signal.

Figure 10-137. ForceTxStopMode FSM

The DSI protocol engine asserts the ForceTxStopMode signal by setting the **DSI_TIMING1[15] FORCE_TX_STOP_MODE_IO** bit to 1. Asserting the **FORCE_TX_STOP_MODE_IO** bit allows the lanes to be initialized. The lanes are in STOP state when the ForceTxStopMode signal is high.

No data can be sent before the ForceTxStopMode signal is deasserted. The deassertion time is defined by the **STOP_STATE_COUNTER_IO**, **STOP_STATE_X4_IO** and **STOP_STATE_X16_IO** bit fields in **DSI_TIMING1[14:0]** register. The **DSI_TIMING1[15:0] FORCE_TX_STOP_MODE_IO** bit is reset by hardware when the time is reached.

This bit can be reset by software.

The calculation of the number of DSI_CLK functional clock cycles assertion period is defined by:

Total period in DSI_FCLK cycles = $\text{STOP_STATE_COUNTER_IO} \times ((\text{STOP_STATE_X16_IO} \times 15) + 1) \times ((\text{STOP_STATE_X4_IO} \times 3))$.

10.3.4.4.7.3 TurnRequest FSM

The TurnRequest signal is used to request a turnaround. It is valid only for the data lane 1 because the other data lanes cannot be used in reverse direction to receive data from the DSI receiver. When the TurnRequest signal is asserted, the **TA_TO** timer is started. Figure 10-138 shows the TurnRequest FSM to assert and deassert the TurnRequest signal.

Figure 10-138. TurnRequest FSM

dsi-049

The DSI protocol engine asserts the TurnRequest signal during one TxClkEsc cycle when turnaround is enabled through the [DSI_VC_CTRL_i\[6\] BTA_EN](#) bit (for more information, see [Section 10.3.4.4.8, Bus Turnaround](#)). The [DSI_TIMING1\[31\] TA_TO](#) bit is set/reset by software to enable or disable the timer for turnaround procedure failure. It can be reset by software or automatically by hardware when the time-out occurs.

The timer is loaded with the value in the number of DSI_FCLK cycles:

$$\text{DSI_TIMING1}[28:16] \text{ TA_TO_COUNTER} \times ((\text{DSI_TIMING1}[30] \text{ TA_TO_X16} \times 15) + 1) \times ((\text{DSI_TIMING1}[29] \text{ TA_TO_X8} \times 7) + 1).$$

When the TA_TO_IRQ interrupt is generated (the turnaround timer expired and the procedure failed), hardware automatically resets the [DSI_TIMING1\[31\] TA_TO](#) bit and asserts the ForceTXStopMode signal (see [Section 10.3.4.4.7.2, ForceTxStopMode FSM](#)) for the DSI_PHY to drive the LP-11 STOP state. The ForceTXStopMode timer is used to define the minimum duration of the LP-11 state. The STOP state can be longer if there is no activity.

Hardware resets the [DSI_TIMING1\[15\] FORCE_TX_STOP_MODE_IO](#) bit, followed by an internal logic reset except for all register values and TX FIFO content, and then resets the [DSI_CTRL\[0\] IF_EN](#) bit. Software must take action to recover (for example, by resetting the peripheral if it is not responding). It must wait for the [DSI_CTRL\[0\] IF_EN](#) bit to be reset to 0 before starting the recovery sequence.

10.3.4.4.7.4 Peripheral Reset Timer

The peripheral reset timer is not implemented in the DSI protocol engine module. Instead, a GP timer must be used in case of reset of the peripheral to determine when the peripheral is ready to operate again.

10.3.4.4.7.5 HS TX Timer

The HS TX timer is used to detect when the host has been in TX mode for too long. When time-out occurs, the EOT is forced. The timer is reloaded when a start of HS transmission occurs. It is enabled and disabled by software through the [DSI_TIMING2\[31\] HS_TX_TO](#) bit. The interrupt HS_TX_TO_IRQ is generated when the timer expires. The [DSI_IRQSTATUS\[14\] HS_TX_TO_IRQ](#) bit is set to 1 when the HS TX time-out occurs.

The maximum time supported is 20 ms. It can be used to determine that at least once per frame in video mode, the HS mode is stopped to enter ULPS.

The timer is loaded with the value in the number of TXBYTECLKHS:

$DSI_TIMING2[28:16] HS_TX_TO_COUNTER \times (1 + (DSI_TIMING2[30] HS_TX_TO_X64 \times 63) \times (1 + (DSI_TIMING2[29] HS_TX_TO_X16 \times 15)))$

Figure 10-139 shows the HS TX timer FSM.

Figure 10-139. HS TX Timer FSM

When the time-out occurs, hardware sends an EOT request for the DSI complex I/O to drive LP-11 STOP state. This is followed by the generation of the interrupt. Hardware performs an internal logic reset including the TX FIFO content but excluding the register values, and then resets the [DSI_CTRL\[0\] IF_EN](#) bit.

Software must take action to recover (for example, by resetting the peripheral if it is not responding). It must wait for the [DSI_CTRL\[0\] IF_EN](#) bit to be reset to 0 before taking any recovery action.

10.3.4.4.7.6 LP RX Timer

When the host is in low-power receive mode after a BTA, the LP RX timer is loaded. When the timer expires, the host requests the DSI complex I/O to drive LP-11. The interrupt [LP_RX_TO_IRQ](#) is generated when the timer expires. The [DSI_IRQSTATUS\[15\] LP_RX_TO_IRQ](#) bit is set to 1 when the LP RX time-out occurs.

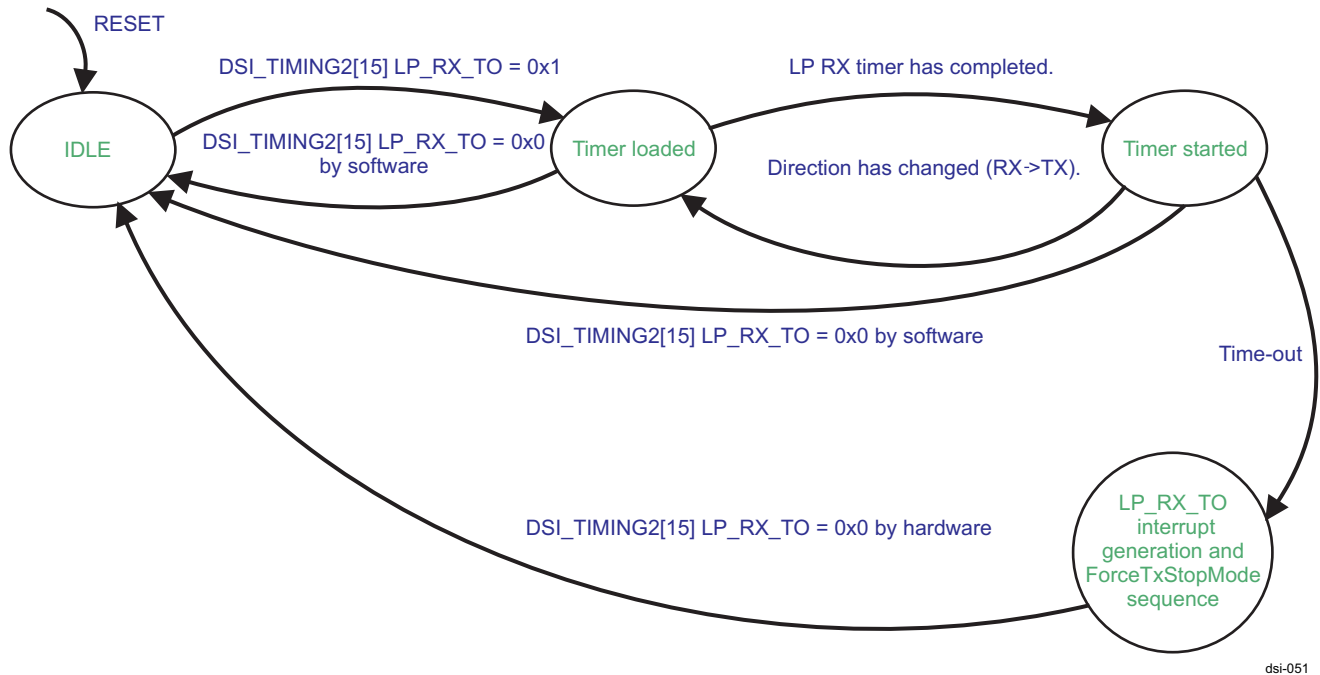

The [DSI_TIMING2\[15\] LP_RX_TO](#) bit is set/reset by software to enable or disable the timer.

The timer is loaded with the value in the number of DSI_CLK functional clock cycles:

$DSI_TIMING2[12:0] LP_RX_TO_COUNTER \times ((DSI_TIMING2[14] LP_RX_TO_X16 \times 15) + 1) \times ((DSI_TIMING2[13] LP_RX_TO_X4 \times 3) + 1)$

Figure 10-140 shows the LP RX timer FSM.

Figure 10-140. LP RX Timer FSM

When the interrupt is generated, hardware automatically resets the [DSI_TIMING2\[15\] LP_RX_TO](#) bit and then asserts ForceTxStopMode for the DSI complex I/O to drive LP-11 STOP state. The ForceTxStopMode timer is used to define the minimum duration of the LP-11 state. The STOP state can be longer if there is no activity.

Hardware resets the ForceTxStopMode bit, followed by an internal logic reset except for all register values and TX FIFO content, and then resets the [DSI_CTRL\[0\] IF_EN](#) bit. Software must take action to recover (for example, by resetting the peripheral if it is not responding). It must wait for the [DSI_TIMING1\[15\] FORCE_TX_STOP_MODE_IO](#) and [DSI_CTRL\[0\] IF_EN](#) bits to be reset before starting the recovery sequence. The TX FIFO is not flushed (the FIFO is flushed only when [DSI_VC_CTRL\[i\]\[0\] VC_EN](#) is set to 1).

10.3.4.4.8 Bus Turnaround

The bus turnaround (BTA) is not automatically sent by default after each packet is sent to the panel(s). It is programmable independently for each VC ID. BTA generation can be enabled when the [DSI_VC_CTRL\[i\]\[6\] BTA_EN](#) bit is set to 1 by software. Software must ensure that when the BTA is sent to the peripheral, enough time is allocated for the response and for the BTA from the peripheral to the host. For more information about possible DSI PHY timing adjustments during the turnaround procedure, see [Section 10.3.4.6.5.3, Turnaround Request in Transmit Mode](#), and [Section 10.3.4.6.5.4, Turnaround Request in Receive Mode](#).

When setting the [DSI_VC_CTRL\[i\]\[6\] BTA_EN](#) bit to 1, one BTA is sent manually to the peripheral. This manual mode can be used for packets in command or video mode.

Acknowledgment from the peripheral for successful BTA is indicated by asserting the BTA_IRQ interrupt, if it is enabled in the [DSI_VC_IRQENABLE_i\[5\] BTA_IRQ_EN](#) bit. To monitor the BTA interrupt, the user must read the [DSI_VC_IRQSTATUS_i\[5\] BTA_IRQ](#) status bit.

CAUTION

The BTA should be sent when the RX FIFO is empty. Users must empty the RX FIFO before sending BTA to the peripheral to ensure that when receiving new data from the peripheral, the allocated spaces for all the VCs are empty.

In automatic mode, the BTA is sent automatically at the end of short or long packet transmission, if the [DSI_VC_CTRL_i\[2\]](#) BTA_SHORT_EN or [DSI_VC_CTRL_i\[3\]](#) BTA_LONG_EN bit is set to 1.

Two modes can be used for each VC ID:

- Automatic: After each packet, a BTA is sent. To determine the size of the long packet, the protocol engine on the host side reads the word count defined in the header (in the [DSI_VC_LONG_PACKET_HEADER_i](#) register) and uses it to determine the last data to be sent on the DSI link. For short packets, the size is always 4 bytes. The BTA is then sent to the peripheral. The word count is also used to determine how many bytes are to be transferred from the 32-bit write access to the payload register ([DSI_VC_LONG_PACKET_PAYLOAD_i](#)).
- Manual:
 - Data transfer through L3 interconnect: When transferring data using the L3 interconnect port, while all data have been provided to the DSI protocol engine, users can select the BTA for the last packet provided to the L3 interconnect port only by setting the [DSI_VC_CTRL_i\[6\]](#) BTA_EN bit, or for the last packets and the following ones by setting automatic mode.
 - Data transfer through video port: In the case of data transfer using the video port, the [DSI_VC_CTRL_i\[6\]](#) BTA_EN bit can be selected at any time during the transfer of the packet.
- For video mode packets (data and synchronization events), it is not possible to determine when the BTA is sent; therefore, it is highly recommended to use manual BTA mode only in command mode. It is possible, however, to use the BTA for a VC in video mode.

For data provided on the video port, an interrupt for end of packet transfer [PACKET_SENT_IRQ](#) is provided to indicate when the packet is completely sent by the DSI complex I/O. [PACKET_SENT_IRQ](#) can be monitored in the [DSI_VC_IRQSTATUS_i\[2\]](#) [PACKET_SENT_IRQ](#) status bit. The BTA is available even if the space allocated in the TX FIFO for the corresponding VC is empty. It must be sent later even if no packet was sent before the BTA request. The [DSI_VC_CTRL_i\[6\]](#) BTA_EN bit must be reset if the BTA request was sent, even if automatic mode for this specific type of packets is enabled.

The BTA is supported for video and command mode packets. It is not possible to send the BTA during the blanking periods of video mode when HS blanking packets should be sent; that is, when one of the following bits is set to 1:

- [DSI_CTRL\[20\]](#) BLANKING_MODE
- [DSI_CTRL\[21\]](#) HFP_BLANKING_MODE
- [DSI_CTRL\[22\]](#) HBP_BLANKING_MODE
- [DSI_CTRL\[23\]](#) HSA_BLANKING_MODE

Therefore, in video mode, the BTA request is delayed until there is a blanking period without HS blanking packets.

When the TurnRequest signal is asserted (always only for data lane 1), the TA_TO timer is started. If the direction signal is not changed according to the turnaround request, the TA_TO interrupt is generated. When the direction signal is in output mode, any data on the input data bus is ignored because the DSI is in transmission mode (data and triggers must be ignored). For more information about the TA_TO timer, see [Section 10.3.4.4.7.3, TurnRequest FSM](#).

10.3.4.4.9 PHY Triggers

The DSI protocol engine uses three triggers that are supported only for data lane 1:

- Reset trigger from host to display
- Tearing effect (TE) trigger from display to host
- Acknowledge trigger from display to host

CAUTION

Each trigger is associated with a dedicated user-configurable receive or transmit pattern, which is loaded in the [DSI_PHY_REGISTER3](#) or [DSI_PHY_REGISTER4](#) bit fields. The default (reset) values of the bit fields are aligned with the *MIPI D-PHY Specification v1.0*. If any of these values need to be changed, the following must be considered:

- If any of the bit fields is written with a nondefault value, the other bit fields in the same register must also be configured with different values. This is to ensure that two different trigger bit fields are not programmed with the same pattern.
- If two or more bit fields are written with equal values, unpredictable behavior of the DSI PHY module may occur.

10.3.4.4.9.1 Reset

The DSI protocol engine can use one of the triggers of the DSI_PHY to send a reset to the display. The reset trigger pattern is configurable through the [DSI_PHY_REGISTER3](#)[31:24] REG_TXTRIGGERESC3 bit field. To send the reset pattern to the peripheral, the [DSI_CTRL](#)[5] TRIGGER_RESET bit must be set to 1. When software requires the trigger reset pattern to be sent, the DSI protocol engine resets its own logic, but not the registers. Software can select between two reset modes:

- Immediate reset: All pending requests in TX FIFO not already considered for transfer scheduling, the RX FIFO requests, and the data from video port are ignored. Only the current transfer on the DSI link and those already scheduled are transmitted. All the other transfers are discarded.
- Synchronized reset: The mode is valid only if there is VC using the video mode and if it is active. The principle is to wait for the current video frame to be transferred on the link. Any data on the video port after the current frame are ignored.

To select reset mode, the [DSI_CTRL](#)[14] TRIGGER_RESET_MODE bit must be programmed.

CAUTION

For both reset modes, the DSI protocol engine flushes the FIFOs, synchronization buffers, and line buffers before resetting the [DSI_CTRL](#)[0] IF_EN bit.

10.3.4.4.9.2 Tearing Effect

TE on the display is avoided by having synchronization information from the display. It is used only in command mode and is not functional in video mode.

There are two types of TE triggers:

- DSI PHY TE trigger
- CMOS TE line (one of the two input signals can be selected for the TE trigger of a VC; the signal is asynchronous).

Software must set and send the appropriate sequence to receive the TE trigger pattern from the peripheral on the DSI link, or use the CMOS TE line. The value of the expected TE trigger pattern can be configured through the [DSI_PHY_REGISTER4](#)[23:16] REG_RXTRIGGERESC2 bit field.

When the TE PHY trigger pattern is received, the DSI protocol engine generates the TE_TRIGGER_IRQ interrupt with a TE event, if the interrupt is enabled. To enable the interrupt, the [DSI_IRQENABLE](#)[16] TE_TRIGGER_IRQ_EN bit must be set to 1. The [DSI_IRQSTATUS](#)[16] TE_TRIGGER_IRQ status bit indicates whether the interrupt event has been generated.

When using the TE CMOS signal, the DSI protocol engine generates the TE0_LINE or TE1_LINE interrupt, if it is enabled, depending on which line is used. One or multiple VCs can be synchronized using the same TE line. Both lines can be active at the same time for different VCs.

The [DSI_VC_TE_i\[30\]](#) TE_EN bit must be set and the [DSI_VC_TE_i\[29\]](#) TE_LINE bit must be reset to indicate that hardware must use the TE PHY trigger to start the transfer of the data from the related VC. TE_EN is reset when all the data are sent to the peripheral.

The [DSI_VC_TE_i\[30\]](#) TE_EN, [DSI_VC_TE_i\[29\]](#) TE_LINE, and [DSI_VC_TE_i\[28\]](#) TE_LINE_NB bits must be set to select between the TE0 and TE1 line to indicate that hardware must use the TE0 line or TE1 line to start the transfer of the data from the related VC. The bits are reset when all the data are sent to the peripheral.

The [DSI_TE_VSYNC_WIDTH_j](#), [DSI_TE_HSYNC_WIDTH_j](#), and [DSI_TE_HSYNC_NUMBER_j](#) registers indicate which mode is used to detect the start of the transfer:

- If [DSI_TE_HSYNC_NUMBER_j\[10:0\]](#) LINE_NUMBER = 0, [DSI_TE_HSYNC_WIDTH](#) is ignored. When a pulse on the TE line is detected to be wider than the [DSI_TE_VSYNC_WIDTH_j\[19:8\]](#) MIN_VSYNC_PULSE_WIDTH bit field, data transfer starts from the protocol engine to the peripheral at the falling edge of the TE CMOS line.
- If the [DSI_TE_HSYNC_NUMBER_j\[10:0\]](#) LINE_NUMBER bit field is greater than 0, [DSI_TE_HSYNC_WIDTH_j](#) is used. The DSI protocol engine waits until it detects a pulse wider than the [DSI_TE_VSYNC_WIDTH_j\[19:8\]](#) MIN_VSYNC_PULSE_WIDTH bit field, and then counts each pulse wider than [DSI_TE_HSYNC_WIDTH_j\[19:8\]](#) MIN_HSYNC_PULSE_WIDTH but smaller than [DSI_TE_VSYNC_WIDTH_j\[19:8\]](#) MIN_VSYNC_PULSE_WIDTH. When the number of HSYNC pulses is reached, data transfer from the DSI protocol engine to the peripheral starts. In case the number of HSYNC pulses is not reached due to a new VSYNC pulse being detected, the counter of HSYNC pulses restarts from 0.

NOTE: [DSI_TE_HSYNC_WIDTH_j\[19:8\]](#) MIN_HSYNC_PULSE_WIDTH is always programmed with a value smaller than [DSI_TE_VSYNC_WIDTH_j\[19:8\]](#) MIN_VSYNC_PULSE_WIDTH.

NOTE: The following must always be set before [DSI_VC_TE_i\[30\]](#) TE_EN is enabled:

- [DSI_TE_HSYNC_WIDTH_j\[19:8\]](#) MIN_HSYNC_PULSE_WIDTH
 - [DSI_TE_VSYNC_WIDTH_j\[19:8\]](#) MIN_VSYNC_PULSE_WIDTH
 - [DSI_VC_TE_i\[29\]](#) TE_LINE
 - [DSI_VC_TE_i\[28\]](#) TE_LINE_NB
-

The [DSI_VC_TE_i\[31\]](#) TE_START bit must be used when automatic mode is disabled ([DSI_VC_TE_i\[30\]](#) TE_EN bit = 0). It allows users to start the transfer manually based on application events or based on the TE trigger interrupt (TE_TRIGGER_IRQ).

The number of bytes to be transferred is defined by using the [DSI_VC_TE_i\[23:0\]](#) TE_SIZE bit field. The TE_SIZE bit field is decremented for each payload byte (it does not include checksum) sent on the DSI link. The register content must not be modified by software during a transfer. The [DSI_VC_TE_i\[23:0\]](#) TE_SIZE bit field must be set first to indicate that the following accesses to the [DSI_VC_LONG_PACKET_HEADER_i](#) register must be used for TE transfer.

The data can be provided from two sources (select by setting the [DSI_VC_CTRL_i\[1\]](#) SOURCE bit):

- L3 interconnect slave port using DMA request: The DMA request [DSI_DMA_REQ_i](#) must be asserted only when the TE trigger is received or when the [DSI_VC_TE_i\[31\]](#) TE_START bit is set by the user and must no longer be asserted when all the bytes defined in the [DSI_VC_TE_i\[23:0\]](#) TE_SIZE bit field are sent on the DSI link. The VC is associated with a DMA request by programming the number in the [DSI_VC_CTRL_i\[23:21\]](#) DMA_TX_REQ_NB bit field. The [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register is used to provide the number of bytes defined by the [DSI_VC_TE_i\[23:0\]](#) TE_SIZE bit field (the checksum value is not provided in the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register). The size of the header is not considered in the number of bytes to transfer. The [DSI_VC_SHORT_PACKET_HEADER_i](#) register is not used.

NOTE: All DMA requests associated to a VC must be disabled when they are not used ([DSI_VC_CTRL_i\[23:21\]](#) DMA_TX_REQ_NB = 0x4).

- Video port: The DMA request is not asserted. The data are captured in the line buffer using the STALL mechanism. If no line buffer is instantiated (that is, the [DSI_CTRL\[13:12\] LINE_BUFFER](#) bit field is set to 0), it is not possible to use the video port to provide data. The line buffer is filled according to the word count defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register header. The value must be written before the TE trigger event is received or before the [DSI_VC_TE_i\[31\] TE_START](#) bit is set to 1 by software. If the total number of bytes defined by the [DSI_VC_TE_i\[23:0\] TE_SIZE](#) bit field is not a multiple of the word count defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register, all the packets are the same size defined by the WC of the header, except the last transfer. The size of the last transfer is defined by the remaining bytes to send. Because the [DSI_VC_TE_i\[23:0\] TE_SIZE](#) bit field is modified after each packet transfer, the size of the last packet is equal to the value of the [DSI_VC_TE_i\[23:0\] TE_SIZE](#) bit field before the last transfer (the header and the payload checksum sizes are not included in the [DSI_VC_TE_i\[23:0\] TE_SIZE](#) bit field).

When the transfer completes, the value of the [DSI_VC_TE_i\[23:0\] TE_SIZE](#) bit field is equal to 0. Software must ensure that the pending data in the TX FIFO for the corresponding VC using TE are related to the TE transfer. Any data in the TX FIFO that must be sent before the reception of the TE trigger must be sent before the TE. This is done by not enabling the TE trigger until all data for the corresponding VC are sent to the peripheral. Software can check that the space allocated for the VC in the TX FIFO is empty by reading the [DSI_VC_CTRL_i\[5\] TX_FIFO_NOT_EMPTY](#) status bit.

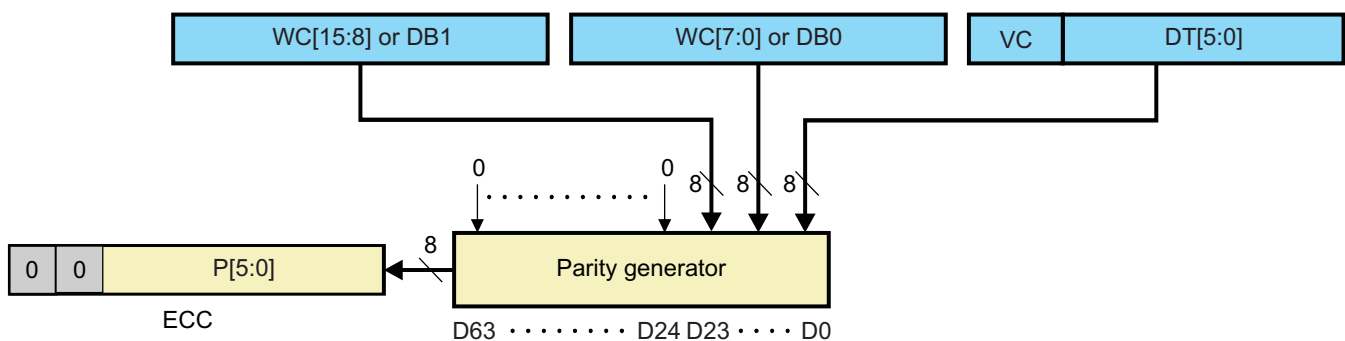

10.3.4.4.9.3 Acknowledge

The corresponding acknowledge interrupt (ACK_TRIGGER_IRQ) is generated when the acknowledge trigger is received. The value of the expected acknowledge trigger pattern can be configured through the [DSI_PHY_REGISTER4\[15:8\] REG_RXTRIGGERESC1](#) bit field. To enable the acknowledge interrupt, set the [DSI_IRQENABLE\[17\] ACK_TRIGGER_IRQ_EN](#) bit to 1. When the interrupt is generated, the [DSI_IRQSTATUS\[17\] ACK_TRIGGER_IRQ](#) status bit is set to 1.

10.3.4.4.10 ECC Generation

The DSI protocol uses a 4-byte PH. Because ECC generation requires a fixed word length of 64-bits, the packet headers must be padded with additional bits to form a full 8-byte value for ECC generation and checking. The PH minus the ECC byte should occupy bits D[23:0], and the pad bits should occupy bits D[63:24]. All padding bits must be 0 to generate the ECC byte. ECC can be generated using a parallel approach, as shown in [Figure 10-141](#).

Figure 10-141. 64-Bit ECC Generation on TX Side

dsi-052

The ECC generation/check can be enabled and disabled by software. It is defined by a common bit for all the VCs:

- The [DSI_CTRL\[2\] ECC_RX_EN](#) bit enables and disables ECC generation in the receive direction.
- The [DSI_VC_CTRL_i\[8\] ECC_TX_EN](#) bit enables and disables ECC generation in the transmit direction.

The ECC can be provided while writing the ECC value directly into the [DSI_VC_LONG_PACKET_HEADER_i](#) and [DSI_VC_SHORT_PACKET_HEADER_i](#) registers. The [DSI_VC_CTRL_i\[8\] ECC_TX_EN](#) bit indicates whether the ECC value will be calculated or whether the value written in the register will be used instead for command and video modes.

10.3.4.4.11 Checksum Generation for Long Packet Payloads

Long packets are comprised of a PH protected by an ECC byte and a payload of 0 to $2^{16} - 1$ bytes. To detect the errors during the transmission of long packets, a checksum is calculated over the payload portion of the data packet. For the special case of a 0-length payload, the 2-byte checksum is set to 0xFFFF. The checksum can only indicate the presence of one or more errors in the payload. Unlike ECC, the checksum does not enable error correction. For this reason, checksum calculation is not useful for some unidirectional DSI implementations, because the peripheral has no way to report errors to the host processor. Checksum generation and transmission is mandatory for host processors sending long packets to peripherals; it is optional for peripherals transmitting long packets to the host processor. However, the format of long packets is fixed; the peripherals that do not support checksum generation must transmit 2 bytes with a value of 0x0000 in place of the checksum bytes when sending long packets to the host processor. The host processor must disable checksum checking for received long packets from peripherals that do not support checksum generation.

Checksum must be realized as a 16-bit CRC with a generator polynomial of $x^{16} + x^{12} + x^5 + x^0$. The LSByte is sent first, followed by the MSByte. Within the byte, the LSB is sent first.

Figure 10-142 shows the checksum transmission.

Figure 10-142. Checksum Transmission

dsi-053

Figure 10-143 shows the CRC implementation. The CRC shift register is initialized to 0xFFFF before packet data enters. Packet data not including the PH then enters as a bitwise data stream from the left, LSB first. Each bit is fed through the CRC shift register before it is passed to the output for transmission to the peripheral. After all bytes in the packet payload have passed through the CRC shift register, the shift register contains the checksum. C15 contains the MSB of the checksum, and C0 contains the LSB of the 16-bit checksum. The checksum is then appended to the data stream and sent to the receiver.

Figure 10-143. 16 Bit CRC Generation Using a Shift Register

dsi-054

Checksum generation/check can be enabled and disabled by software. It is defined by a common bit for all the VCs:

- The [DSI_CTRL\[1\]](#) CS_RX_EN bit enables and disables checksum generation in the receive direction.
- The [DSI_VC_CTRL_i\[7\]](#) CS_TX_EN bit enables and disables checksum generation in the transmit direction

10.3.4.4.12 EOT Packet

A new packet type allows the DSI protocol (rather than the DSI_PHY) at the display to detect the HS EOT. This is a fixed short packet (4 bytes) that is added at every HS to LP transition. This function is enabled by the [DSI_CTRL\[19\]](#) EOT_ENABLE bit.

The EOT packet has a fixed format:

- Data Type = DI [5:0] = 0b001000
- Virtual Channel = DI [7:6] = 0b00
- Payload Data [15:0] = 0x0F0F
- ECC [7:0] = 0x01

When more than one data lane is used, the EOT packet bytes are distributed across the multiple lanes. EOT packet generation is supported only for the end of HS transmissions. No EOT packet is added at the end of LP transmissions. For LP reception, any EOT packet received is simply passed through as any other packet, but no internal decode or use is made of the EOT information.

10.3.4.4.13 Software Reset

The DSI protocol engine can be reset by software. This reset can be done for debug purposes or after a protocol error and has the same effect as the hardware reset. The DSI protocol engine can be reset by setting the [DSI_SYSCONFIG\[1\]](#) SOFT_RESET bit to 1. Software can monitor the [DSI_SYSSTATUS\[0\]](#) RESET_DONE status bit to wait for the reset to complete. If after five reads the [DSI_SYSSTATUS\[0\]](#) RESET_DONE status bit still returns 0, it can be assumed that an error occurred during the reset stage.

NOTE: This software reset is optional because a hardware reset is always performed on the DSI protocol engine at device reset.

10.3.4.4.14 Power Management

The power-management behavior of the DSI protocol engine is controlled by the [DSI_SYSCONFIG](#) register. This register controls the way the module interacts with the PRCM module. The [DSI_SYSCONFIG\[0\]](#) AUTO_IDLE bit must be set to 1 (default value) to enable automatic clock gating in the module.

The DSI protocol engine implements a handshake protocol on the L3 interconnect slave port with the PRCM module. The protocol engine provides control signal CIO_CLK_ICG to gate the SCPClk (DSS_L3_ICLK/4). It allows reduction of the power consumption of the complex I/O while the DSI link is not in use ([DSI_CLK_CTRL\[14\]](#) CIO_CLK_ICG).

10.3.4.4.15 Power Control of DSI PHY Complex I/O and DSI PLL

The DSI protocol engine can control and send power commands for the DSI complex I/O and DSI PLL controller modules.

10.3.4.4.15.1 Complex I/O Power Control Commands

10.3.4.4.15.1.1 Complex I/O Power Control Commands

The DSI complex I/O can be set in three modes:

- OFF: In this power state, the complete DSI_PHY circuit is powered down. The internal LDO is OFF.
- ON: In this power state, the complete DSI_PHY circuit is powered on and functional.
- ULPS: In this power state, the ULPS exit detection circuit power switch is ON for the lanes that are in receive ULPS. For the lanes that are in transmit ULPS, the circuitry for weak pulldown is ON. The ULTRALOW POWER state must be used only when all the three lanes are in ULPS (transmit or receive).

10.3.4.4.15.1.2 Complex I/O Power FSM

[Figure 10-144](#) shows the FSM to control the power state of the complex I/O.

Figure 10-144. Complex I/O Power FSM

dsi-045

The PwrCmdOff, PwrCmdUlp, and PwrCmdOn commands control the state transition of the DSI complex I/O. The [DSI_COMPLEXIO_CFG1\[28:27\] PWR_CMD](#) bit field allows the state to be modified. The allowed transitions are: OFF - ON, and ON - ULPS, and ULPS - OFF. The [DSI_COMPLEXIO_CFG1\[26:25\] PWR_STATUS](#) bit field gives a status on the current state of the DSI complex I/O.

CAUTION

- In automatic mode, software must ensure that the DSI complex I/O is in ON state (that is, ON command already sent) before sending requests to the complex I/O.
- In a command request to change to a state that is the current one (acknowledge has been received), the command is ignored (nothing is sent to the DSI complex I/O).
- To change the state to ULPS, all ULPSActiveNot signals must be low. The ULPSActiveNot_ALL0_IRQ interrupt indicates the state of the ULPSActiveNot signals. The change from ULPS to ON state is required before starting the ULP exit sequence (for information, see [Section 10.3.4.4.7.1, *T_{wakeup}* Timer](#)).

10.3.4.4.15.2 DSI PLL Power Control Commands

The DSI PLL controller module can be set in four modes:

- OFF: DSI PLL and HSDIVIDER are OFF.
- ON ALL: Both DSI PLL and HSDIVIDER are ON. The CLKIN4DDR clock is provided to the DSI complex I/O and the second clock output is provided to the HSDIVIDER.
- ON HSCLK: The DSI PLL is ON. The HSDIVIDER is OFF. The CLKIN4DDR clock is provided to the DSI complex I/O, but the second clock output is not provided to the HSDIVIDER.
- ON DIV: DSI PLL and HSDIVIDER are ON. The CLKIN4DDR clock is not provided to the DSI complex I/O, but the second clock output is provided to the HSDIVIDER.

10.3.4.4.15.2.1 DSI-PLL Power FSM

[Figure 10-145](#) shows the DSI PLL power FSM.

Figure 10-145. DSI PLL Power FSM

- 1 = DSI_CLK_CTRL[31:30] PLL_PWR_CMD = 0x0 (STATE_OFF)
 2 = DSI_CLK_CTRL[31:30] PLL_PWR_CMD = 0x1 (STATE_ON_HSCLK)
 3 = DSI_CLK_CTRL[31:30] PLL_PWR_CMD = 0x2 (STATE_ON_ALL)
 4 = DSI_CLK_CTRL[31:30] PLL_PWR_CMD = 0x3 (STATE_ON_DIV)

dsi-046

The following commands control the state transition of the DSI PLL control module:

- PLLPwrCmdOff
- PLLPwrCmdOnAll
- PLLPwrCmdOnDIV
- PLLPwrCmdOnHSClk

Setting the [DSI_CLK_CTRL\[31:30\] PLL_PWR_CMD](#) bit field modifies the state. The [DSI_CLK_CTRL\[29:28\] PLL_PWR_STATUS](#) bit field gives a status on the current state of the DSI PLL controller.

NOTE: If a command requests to change to a state that is the current one (acknowledge has been received), the command is ignored (nothing is sent to the DSI PLL control module).

10.3.4.4.15.2.1.1 DSI PLL HS Clock Signals

The DSISopClk signal is provided to the DSI PLL control module. It indicates when the DSI protocol engine does not need to use the HS mode and the PLL HS output (CLKIN4DDR clock) can be stopped. The following conditions must also be met when DISPC_UPDATE_SYNC may be generated by the DISPC, because that must result in the PLL HS output being stopped.

When the interface is disabled ([DSI_CTRL\[0\] IF_EN](#) bit set to 0) and the clock lane is stopped ([DSI_CLK_CTRL\[13\] DDR_CLK_ALWAYS_ON](#) = 0), the signal DSISopClk is asserted.

Assertion of the DSISopClk depends on the following conditions:

- Clock lane TxRequestHS is deasserted (the DDR clock on the clock lane is no longer required). For TxRequestHS deassertion, the following conditions are required:

- The [DSI_CLK_CTRL\[13\]](#) `DDR_CLK_ALWAYS_ON` bit must be reset to 0 and no HS data transfer must be on-going or already scheduled.
- No VC ACTIVE in video mode. No VC using the video mode is enabled. If the VC is enabled, the mode is command mode only (the [DSI_VC_CTRL_i\[0\]](#) `VC_EN` bit set to 1 and [DSI_VC_CTRL_i\[4\]](#) `MODE` bit set to 0).
- No command mode requiring HS transfer (one or more VCs using command mode can be active)
- Or [DSI_CTRL\[0\]](#) `IF_EN` bit is reset to 0 (the previous conditions are not all required, except the [DSI_CLK_CTRL\[13\]](#) `DDR_CLK_ALWAYS_ON` bit must be set to 0 after resetting the [DSI_CTRL\[0\]](#) `IF_EN` bit)

The deassertion of the `DSISetupClk` depends on one of the following conditions (the DSI interface is enabled by setting the [DSI_CTRL\[0\]](#) `IF_EN` bit to 1):

- Clock lane `TxRequestHS` must be asserted (the DDR clock on the clock lane is required).
- One video mode VC ACTIVE
- At least one VC in command mode requiring HS transfer
- The [DSI_CLK_CTRL\[13\]](#) `DDR_CLK_ALWAYS_ON` bit is set to 1 by software users (the [DSI_CTRL\[0\]](#) `IF_EN` bit must be reset to 0 for updating the value of the `DDR_CLK_ALWAYS_ON` bit).

Automatic assertion/deassertion is enabled by using the [DSI_CLK_CTRL\[18\]](#) `HS_AUTO_STOP_ENABLE` bit.

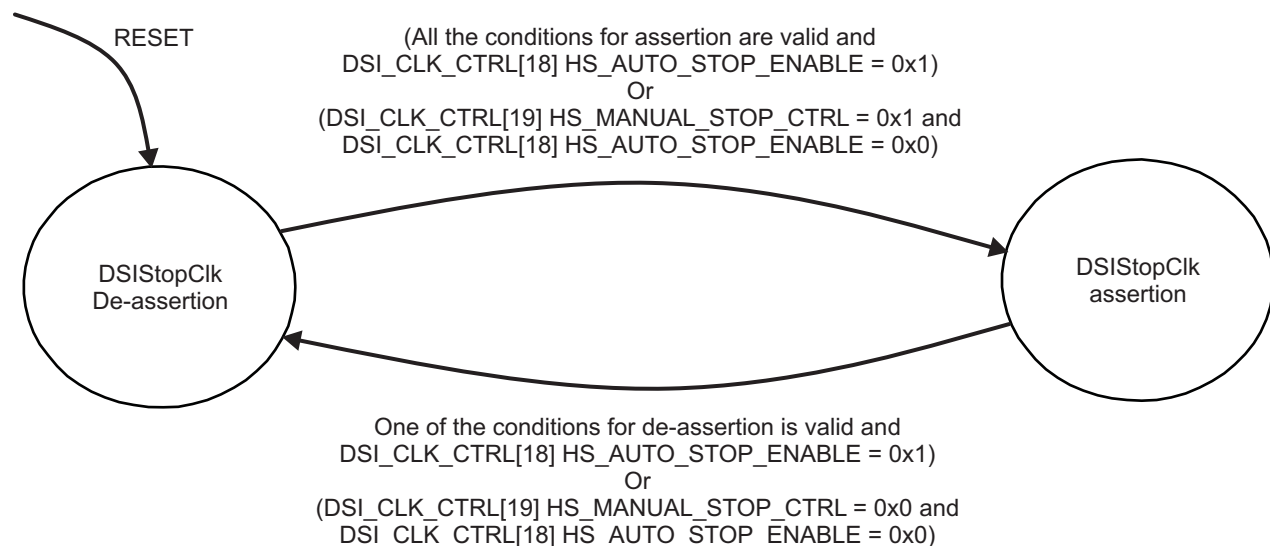

Manual mode can be used by setting/resetting the [DSI_CLK_CTRL\[19\]](#) `HS_MANUAL_STOP_CTRL` bit to assert/deassert the `DSISetupClk` signal.

NOTE: Setting the [DSI_CTRL\[24\]](#) `DISPC_UPDATE_SYNC` bit to 0x1 enables the use of the `Dispc_Update_Sync` signal to synchronize.

10.3.4.4.15.2.1.2 DSI-PLL HS Clock FSM

Figure 10-146 shows the DSI PLL HS clock FSM.

Figure 10-146. DSI PLL HS Clock FSM

When `DSISetupClk` is used there is a latency through other modules (DSI PLL controller and `DSI_PHY`) before `TXBYTECLKHS` is stopped. This latency must be considered to prevent any issue when `DSISetupClk` is deasserted soon after being asserted. This is done using a hardware timer programmed using the [DSI_STOPCLK_TIMING\[7:0\]](#) `DSI_STOPCLK_LATENCY` bit field. This timer is programmed in number of periods of the DSI protocol functional clock (`DSI_FCLK`). At reset value, the timer is programmed with value 0x80 (128).

CAUTION

The programmed value in the [DSI_STOPCLK_TIMING\[7:0\]](#) [DSI_STOPCLK_LATENCY](#) bit field must be greater than $((3 \times L3_ICLK \text{ period}) + (5 \times CLKIN4DDR \text{ period})) / (DSI_FCLK \text{ period})$.

10.3.4.4.16 Ultralow-Power State Configuration

This section describes how to enter/exit to/from ULTRALOW-POWER state (ULPS).

NOTE: The [DSI_COMPLEXIO_CFG2\[9:0\]](#) [LANEx_ULPS_SIGy](#) bits (x range is 1 to 5, corresponding to lane 1 to lane 5 for DSI1, and 1 to 3, corresponding to lane 1 to lane 3 for DSI2; y range is 1 to 2) must be read back after writing to verify that the write operations are effective before proceeding to the next step. This is to take latency at low TxClkEsc frequencies into account.

10.3.4.4.16.1 Entering ULPS

To enter into ULPS for a clock lane, the following sequence is required:

1. Wait for [DSI_COMPLEXIO_CFG2\[16\]](#) [HS_BUSY](#) and [DSI_COMPLEXIO_CFG2\[17\]](#) [LP_BUSY](#) bits to be reset to 0 and ensure that the [DSI_CLK_CTRL\[13\]](#) [DDR_CLK_ALWAYS_ON](#) bit is 0.
2. TxUlpsClk state should change from inactive to active by setting the [DSI_COMPLEXIO_CFG2\[9:5\]](#) [LANEx_ULPS_SIG2](#) bit to 1.

To enter into ULPS for a data lane, the following sequence is required:

1. Wait for all TX_FIFOs for all VCs working in HS are empty, for video mode is not active, and for [DSI_COMPLEXIO_CFG2\[16\]](#) [HS_BUSY](#) bit is reset to 0 (in addition for data lane 1, [DSI_COMPLEXIO_CFG2\[17\]](#) [LP_BUSY](#) bit is reset to 0)
2. TxRequestEsc state should change from inactive to active by setting the [DSI_COMPLEXIO_CFG2\[9:5\]](#) [LANEx_ULPS_SIG2](#) bit to 1.

10.3.4.4.16.2 Exiting ULPS

To exit from ULPS for a clock lane, the following sequence is required:

1. Change the state of TxUlpsExit for each lane to ACTIVE by setting the [DSI_COMPLEXIO_CFG2\[4:0\]](#) [LANEx_ULPS_SIG1](#) bit to 1.
2. Wait for the [ULPSACTIVENOT_ALL1_IRQ](#) interrupt indicating that all lanes with TxUlpsExit active have acknowledged by asserting [UlpsActiveNot](#). This is performed by monitoring the [DSI_COMPLEXIO_IRQSTATUS\[31\]](#) [ULPSACTIVENOT_ALL1_IRQ](#) status bit.
3. Start the wake-up timer (GPTimer).
4. Wait for the time-out.
5. Change TxUlpsClk signals to INACTIVE state for the clock lane by resetting the [DSI_COMPLEXIO_CFG2\[9:5\]](#) [LANEx_ULPS_SIG2](#) bit to 0.
6. Reset the [DSI_COMPLEXIO_CFG2\[4:0\]](#) [LANEx_ULPS_SIG1](#) bit to 0.

NOTE: When the [DSI_COMPLEXIO_CFG2\[9:5\]](#) [LANEx_ULPS_SIG2](#) and [DSI_COMPLEXIO_CFG2\[4:0\]](#) [LANEx_ULPS_SIG1](#) bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

To exit from ULPS for a clock lane, in case the complex I/O is in OFF state (the DSI protocol engine sends the complex I/O to OFF state (PWROFF command) by setting [DSI_COMPLEXIO_CFG1\[28:27\]](#) [PWR_CMD](#) = 0x0), the sequence is:

1. Change TxUlpsClk signals to INACTIVE state for the clock lane by resetting the

[DSI_COMPLEXIO_CFG2](#)[9:5] LANEx_ULPS_SIG2 bit to 0.

2. Change the state of TxUlpsExit for clock lane to INACTIVE state by resetting the [DSI_COMPLEXIO_CFG2](#)[4:0] LANEx_ULPS_SIG1 bit to 0. This step is necessary only in case a PWROFF command (the command for power control of the complex I/O) is issued while the sequence for exiting is in progress (TxUlpsExit signal is already in ACTIVE state).

NOTE: When the [DSI_COMPLEXIO_CFG2](#) LANEx_ULPS_SIG2[9:5] and [DSI_COMPLEXIO_CFG2](#)[4:0] LANEx_ULPS_SIG1 bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

To exit from ULPS for a data lane, the following sequence is required:

1. Change the state of TxUlpsExit for each lane to ACTIVE by setting the [DSI_COMPLEXIO_CFG2](#)[4:0] LANEx_ULPS_SIG1 bit to 1.
2. Wait for the ULPSACTIVENOT_ALL1_IRQ interrupt indicating that all lanes with TxUlpsExit active have acknowledged by asserting UlpsActiveNot. This is performed by monitoring the [DSI_COMPLEXIO_IRQSTATUS](#)[31] ULPSACTIVENOT_ALL1_IRQ status bit.
3. Start the application wake-up timer (GPTimer).
4. Wait for the time-out.
5. Change TxRequestEsc signals to INACTIVE state for the data lane by resetting the [DSI_COMPLEXIO_CFG2](#)[9:5] LANEx_ULPS_SIG2 bit to 0.
6. Reset the [DSI_COMPLEXIO_CFG2](#)[4:0] LANEx_ULPS_SIG1 bit to 0.

NOTE: When the [DSI_COMPLEXIO_CFG2](#)[9:5] LANEx_ULPS_SIG2 and [DSI_COMPLEXIO_CFG2](#)[4:0] LANEx_ULPS_SIG1 bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

To exit from ULPS for a data lane, in case the complex I/O is in OFF state (the DSI protocol engine sends the complex I/O into OFF state by setting [DSI_COMPLEXIO_CFG1](#)[28:27] PWR_CMD = 0x0), the sequence is:

1. Change TxRequestEsc signals to INACTIVE state by resetting the [DSI_COMPLEXIO_CFG2](#)[9:5] LANEx_ULPS_SIG2 bit to 0.
2. Change the state of TxUlpsExit to INACTIVE state by resetting the [DSI_COMPLEXIO_CFG2](#)[4:0] LANEx_ULPS_SIG1 bit to 0. This step is necessary only in case a PWROFF command is issued while the sequence for exiting is in progress (TxUlpsExit signal is already in ACTIVE state).

NOTE: When the [DSI_COMPLEXIO_CFG2](#)[9:5] LANEx_ULPS_SIG2 and [DSI_COMPLEXIO_CFG2](#)[4:0] LANEx_ULPS_SIG1 bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

When the sequence for entering/exiting into/from ULP state is started for specific lanes, users should wait for the completion of the sequence before changing the state of the same or other lanes.

10.3.4.4.17 Interrupts

There is a single interrupt request generated by each DSI: DSI_IRQ. This interrupt line is merged with another interrupt line from the DISPC_IRQ into a single interrupt request IRQ. The DSI_IRQ events are generated only for the enabled VC(s). Two registers are used to enable and monitor the DSI interrupt events:

- **DSI_IRQENABLE:** This register enables and disables interrupt event reporting for the VCs. Each event for the VC is configured in the [DSI_VC_IRQENABLE_i](#) register dedicated to the VC number. In addition, it includes 1 bit to enable error reporting for the complex I/O. The interrupt is triggered when any error is received from the complex I/O.

- **DSI_IRQSTATUS:** The register flags which VC(s) have generated an interrupt. Based on the VC number, the **DSI_VC_IRQSTATUS_i** register indicates the event generating the interrupt. In addition, it includes 1 bit for the status of error reporting for the complex I/O.

Table 10-489 lists the DSI VC interrupt events

Table 10-489. DSI VC Interrupts

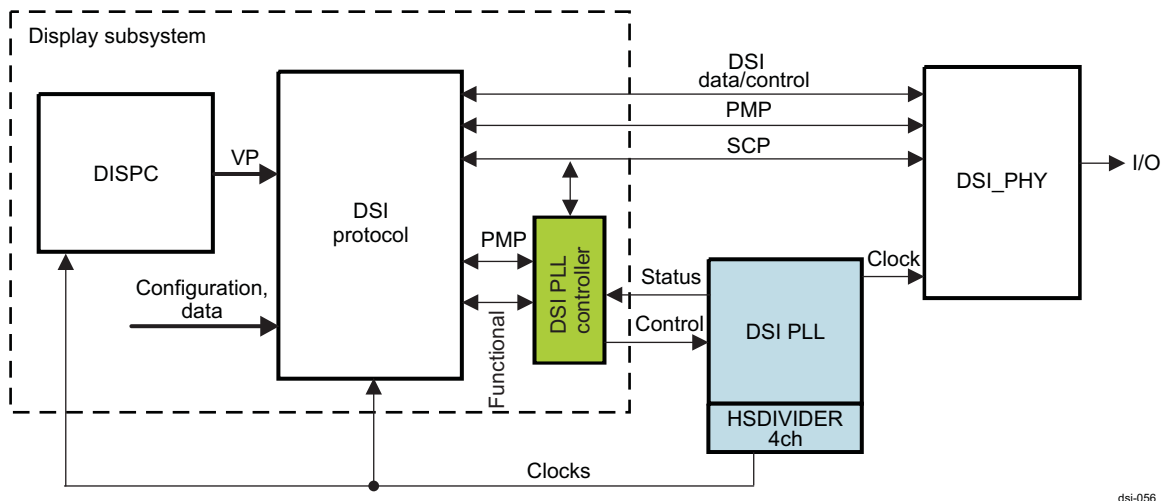

IRQ Name	Description
ECC_CORRECTION_IRQ	Indicates whether a 1-bit error correction has occurred using ECC (short and long packets).
PACKET_SENT_IRQ	Indicates that a packet has been sent. It is used when BTA manual mode is used.
CS_IRQ	Virtual channel. Checksum of the payload mismatch detection.
FIFO_RX_OVF_IRQ	RX FIFO overflow. The FIFO used on the L3 interconnect slave port for buffering the data received on the DSI link has overflowed.
FIFO_TX_OVF_IRQ	TX FIFO overflow. The FIFO used on the L3 interconnect slave port for buffering the data received on the interface slave port has overflowed.
BTA_IRQ	BTA is received from the peripheral (the VC ID used for the last BTA request transfer to the peripheral will be used to determine which VC will be used to flag the interrupt).
ECC_NO_CORRECTION_IRQ	ECC error (short and long packets). No correction of the header because of more than 1-bit error.
FIFO_TX_UDF_IRQ	TX FIFO underflow. The FIFO used on the slave port for buffering the data received on the L3 interconnect slave port has underflowed in the middle of a packet transfer.

10.3.4.5 DSI PLL Controllers

10.3.4.5.1 DSI PLL Controllers Overview

Two DSI PLL controller modules are part of the DSS. They use the SCP (see [Section 10.3.4.4.6, Serial Configuration Port Interface](#)) and power-management port (PMP) as the primary interfaces to the DSI protocol engines. The SCP interface is used to set the configuration of the digital phase-locked loop (DPLL) and HSDIVIDER modules, primarily the various counter values. The PMP is used to control the power state of the DPLL and HSDIVIDER modules. [Figure 10-147](#) is an overview of a single DSI PLL controller module in the display subsystem.

Figure 10-147. DSI PLL Controller Overview

NOTE: The DSI PLL controller modules do not have an interface to L3/L4_PER interconnects. The programmable features are managed by registers mapped into the DSI protocol engines.

10.3.4.5.2 DSI PLL Controllers Architecture

The DSI PLLs use instances of the DPLL modules of type A. For more information regarding various DPLL types within the device, see [Section 3.6.3.3, Generic DPLL Overview](#), in [Chapter 3, Power, Reset, and Clock Management](#).

[Figure 10-148](#) shows the internal reference diagram of a single DSI PLL.

Figure 10-148. DSI PLL Reference Diagram

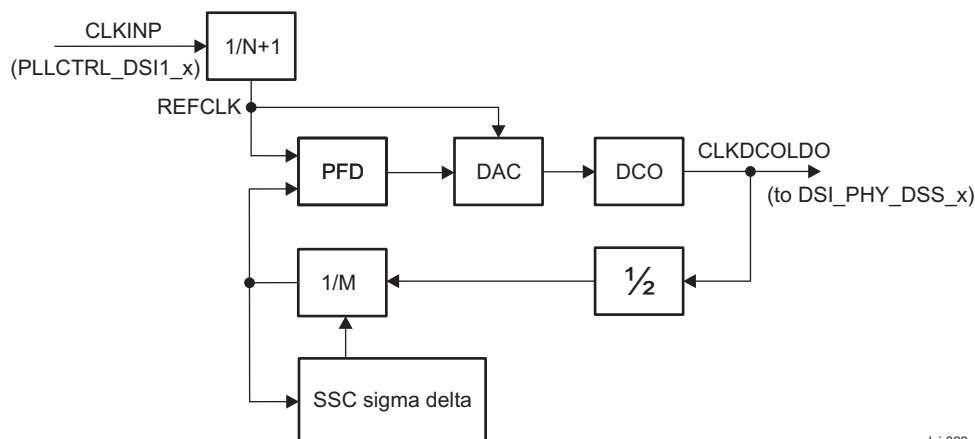

dsi-057

The DSI PLL clock output (CLKDCOLDO) corresponds to the CLKIN4DDR clock of a DSI complex I/O (DSI_PHY) module.

Only the SYS_CLK clock is used as an input reference clock for the DSI PLL. The DSI PLL controller can gate this clock by setting the [DSI_PLL_CONFIGURATION2\[13\] PLL_REFEN](#) bit.

[Figure 10-149](#) is a simplified block diagram of the DSI PLL instance used for the DSI modules.

Figure 10-149. DSI PLL Functional Block Diagram

dsi-029

The input clock CLKINP goes to a predivider $N + 1$. The entire loop runs on the REFCLK clock after this predivider. The value of $N + 1$ is controlled through the [DSI_PLL_CONFIGURATION1\[8:1\]](#) PLL_REGN bit field. The frequency range for the CLKINP and REFCLK clocks is 0.032 MHz to 52 MHz.

The output clock CLKDCOLDO is synthesized by digitally controlled oscillator (the DCO block), that automatically detects the frequency range. The CLKDCOLDO frequency can be given with $\text{CLKDCOLDO} = \text{CLKINP} \times 2 \times M / (N + 1)$. For that purpose the feedback multiplier M must be configured through the [DSI_PLL_CONFIGURATION1\[20:9\]](#) PLL_REGM bit field.

The module also supports spread spectrum clocking (SSC) on its output clocks. SSC is used to spread the spectral peaking of the clock to reduce electromagnetic interference (EMI). When SSC is enabled, the clock spectrum is spread by the amount of frequency spread, and the attenuation is given by the ratio of the frequency spread (df) and the modulation frequency (fm); that is, $\{10 \times \log_{10}(\text{df}/\text{fm})\} - 10$ dB.

The SSC is performed by changing the feedback divider (M) in a triangular pattern, which means the frequency of the output clock varies in a triangular pattern. The frequency of the triangular pattern is modulation frequency (fm). The peak (dM) or the amplitude of the triangular pattern as a percent of M is equal to the percent of the frequency spread (df) (that is, $\text{dM}/M = \text{df}/\text{Fout}$).

Because this is in band modulation for the DSI PLL, the modulation frequency (fm) must be within the bandwidth of the PLL (lowest BW of REFCLK/70; that is, REFCLK must be $> \text{fm} \times 70$). A higher modulation frequency results in less spreading in the output clock.

The SSC can be enabled and disabled by asserting the [DSI_PLL_SSC_CONFIGURATION1\[0\]](#) EN_SSC bit. The acknowledge signal SSCACK, observed by the [DSI_PLL_STATUS\[12\]](#) SSC_EN_ACK bit, notifies the exact start and end of SSC. When EN_SSC is deasserted, SSC is disabled only after completion of one full cycle of the triangular pattern given by the modulation frequency. This is done to maintain the average frequency.

The modulation frequency (fm) can be programmed as a ratio of REFCLK/4; that is, the value of ModFreqDivider programmed in the [DSI_PLL_SSC_CONFIGURATION2\[29:20\]](#) MODFREQDIVIDER bit field must be $= \text{REFCLK}/(4 \times \text{fm})$. The ModFreqDivider is split into Mantissa and 2^{Exponent} ($\text{ModFreqDivider} = \text{ModFreqDividerMantissa} \times 2^{\text{ModFreqDividerExponent}}$).

- The Mantissa is controlled by bits [29:23] of the MODFREQDIVIDER bit field.
- The Exponent is controlled by bits [22:20] of the MODFREQDIVIDER bit field.

Although the same value of ModFreqDivider can be obtained by different combinations of Mantissa and Exponent values, it is preferred to get the target ModFreqDivider by programming maximum Mantissa and minimum Exponent values.

To define the frequency spread (df), M must be controlled as explained previously. To define M , the step size of M for each REFCLK during the triangular pattern must be programmed (that is, $M = \text{ModFreqDivider} \times \text{DeltaMStep}$). DeltaMStep is controlled by the [DSI_PLL_SSC_CONFIGURATION2\[19:0\]](#) DELTAM bit field. DeltaMStep is split into an integer part and a fractional part:

- The integer part is controlled by bits [19:18] of the DELTAM bit field.
- The fractional part is controlled by bits [17:0] of the DELTAM bit field.

The frequency spread achieved, however, has an overshoot of 20% or an inaccuracy of +20%.

If the [DSI_PLL_SSC_CONFIGURATION1\[2\]](#) DOWNSPREAD bit is set to 1, the frequency spread on the lower side is twice the programmed value. The frequency spread on the higher side is 0 (except for the overshoot, as described above).

NOTE: There is a restriction in the range of M values. The restriction is that $(M - \text{dM})$ must be ≥ 20 . Also, $M + \text{dM}$ must be ≤ 2045 . If the [DSI_PLL_SSC_CONFIGURATION1\[2\]](#) DOWNSPREAD bit is set to 1, then $(M - 2 \times \text{dM})$ must be ≥ 20 and $M \leq 2045$.

10.3.4.5.3 DSI PLL Operations

The DSI PLL configuration signals operate according to [Table 10-490](#), which indicates the operation when the PLLs are not locked.

Table 10-490. DSI PLL Operation Modes When Not Locked

DSI PLL Operation Mode	Stop Mode Low Power ⁽¹⁾	Stop Mode Fast Relock ⁽¹⁾	Idle Bypass
Mode Description	Output clocks stopped Lowest power standby	Output clocks stopped Fastest start-up time	Selects when PLLs and HSDIVIDERS bypass clocks are used
DSI_PLL_CONFIGURATION2[0] PLL_IDLE	0	0	1
DSI_PLL_CONFIGURATION2[6] PLL_LOWCURRSTBY	1	0	1
DSI_PLL_CONFIGURATION1[0] PLL_STOPMODE	1	1	x

⁽¹⁾ This mode must be used for better performance.

When locked, the PLL output frequency is: Input frequency * 2 * M/(N + 1), where:

- M multiplier is programmed in the [DSI_PLL_CONFIGURATION1\[20:9\]](#) PLL_REGM bit field.
- N divider is programmed in the [DSI_PLL_CONFIGURATION1\[8:1\]](#) PLL_REGN bit field.

10.3.4.5.4 DSI PLL Controllers Shadowing Mechanism

The configuration registers are accessed through the DSI protocol engine register spaces using the SCP interface. This includes all the configuration signals and returning status signals.

CAUTION

All writes must be 32-bit operations, because the SCP interface always transfers 32 bits; 16-or 8-bit operations may lead to unpredictable errors.

A shadow mechanism is implemented for appropriate register values so that configurations can optionally be updated in synchronization with the DISPC and DSI protocol engines. The front porch time from the DISPC indicates the time when making the update of the value. All the required updated values must be written before this signal is asserted. For more information, see [Section 10.3.4.4.6.1, Shadowing Register](#).

10.3.4.5.5 Error Handling

The PLL lock and recalibration signals can be monitored to detect the loss of lock or the requirement to recalibrate (caused by a large temperature change since the last lock request):

- The [DSI_PLL_STATUS\[1\]](#) PLL_LOCK status bit gives the DSI PLL lock state.
- The [DSI_PLL_STATUS\[2\]](#) PLL_RECAL status bit informs whether the PLL must be uncalibrated.

These signals can also generate interrupts at the DSI protocol engine level:

- The PLL_LOCK_IRQ interrupt indicates that the DSI PLL control module has sent a lock request to the DSI PLL. To monitor this event, read the [DSI_IRQSTATUS\[7\]](#) PLL_LOCK_IRQ bit. Set this bit to 1 to clear the status bit.
- The PLL_UNLOCK_IRQ interrupt indicates that the DSI PLL control module has sent an unlock request to the DSI PLL. To monitor this event, read the [DSI_IRQSTATUS\[8\]](#) PLL_UNLOCK_IRQ bit. Set this bit to 1 to clear the status bit.
- The PLL_RECAL_IRQ interrupt indicates that the DSI PLL control module has sent a recalibration request to the DSI PLL. To monitor this event, read the [DSI_IRQSTATUS\[9\]](#) PLL_RECAL_IRQ bit. Set this bit to 1 to clear the status bit.

The PLL reference loss and limp status signals can also be monitored:

- The [DSI_PLL_STATUS\[3\]](#) PLL_LOSSREF status bit informs whether the DSI PLL has lost the reference.
- The [DSI_PLL_STATUS\[4\]](#) PLL_LIMP bit informs about the DSI PLL limp status.

10.3.4.5.6 Software Reset

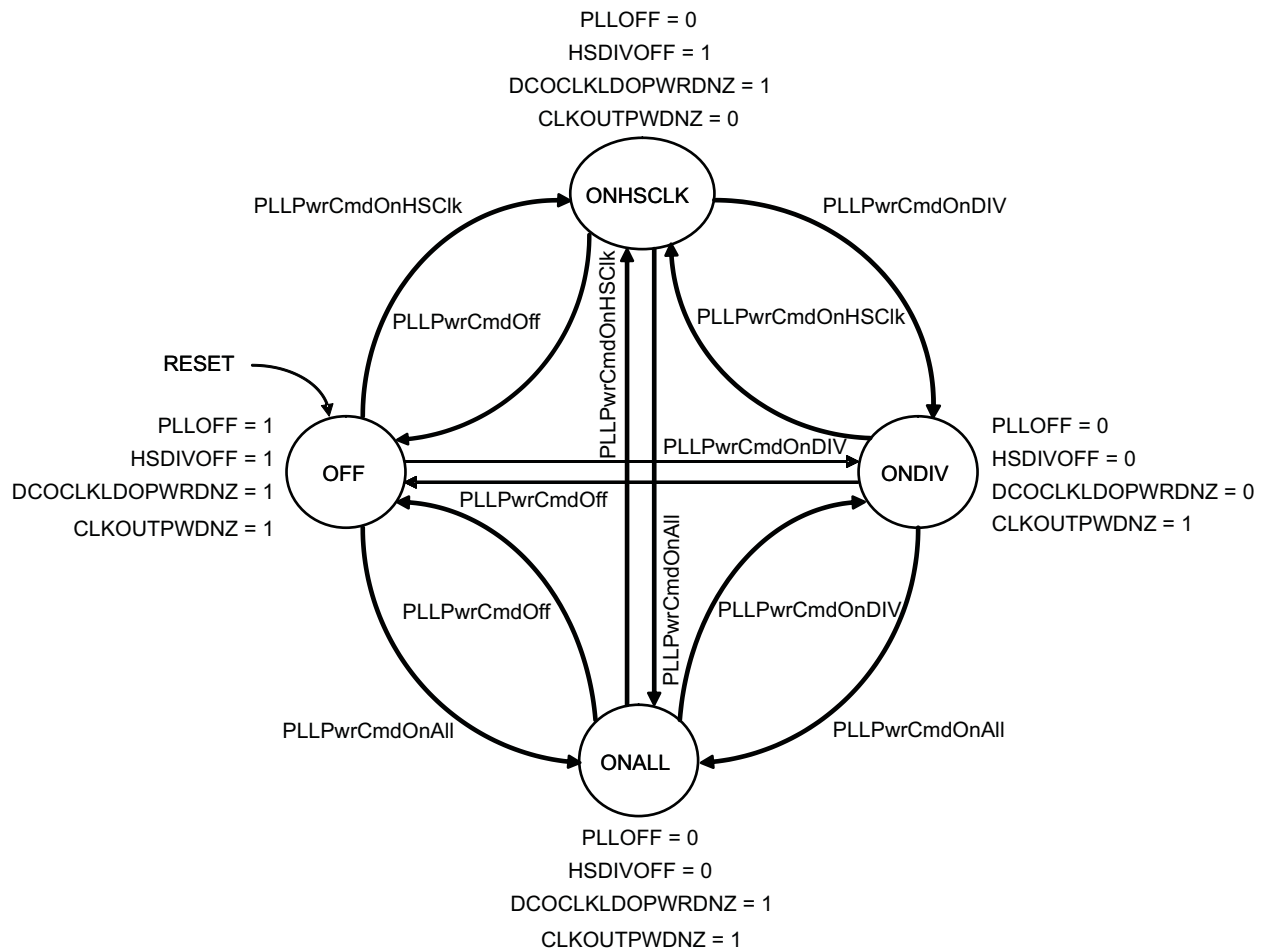

The DSI PLL control modules do not have their own software reset. They are reset by the global DSS_RST signal at PRCM module level. See [Section 10.1.2.2, DSS Resets](#). Nevertheless, software users can monitor the reset statuses of the DSI PLL control modules by reading the [DSI_PLL_STATUS\[0\]](#) PLLCTRL_RESET_DONE status bits.

10.3.4.5.7 Power Management

The PLLCTRL manages only the LDO power of the DSI PLL and HSDIVIDER; this is done by overriding the SYSRESET signals. All other power-management signals are integrated with the display subsystem power management..

[Figure 10-150](#) shows the power states that are controlled through the PMP.

Figure 10-150. Power State Diagram

dsi-058

10.3.4.5.8 DSI PLL Clock-Gating Sequence

Clock gating can be used to reduce system power consumption when the DSI protocol engine indicates that it does not need the clock. If the HSDIVIDER is not used, the PLL can also be stopped (at the cost of additional unstarting latency).

The DSI protocol engines must verify when the PLLs have unstarted by inspecting the LOCK signal (the [DSI_PLL_STATUS\[1\]](#) PLL_LOCK status bit), because the TXBYTECLKHS clocks are stopped when the CLKIN4DDR clocks generated by the DSI PLL are stopped. This eliminates the need for any explicit feedback that the clock has been unstarted. This flow chart should run even if the [DSI_PLL_GO\[0\]](#) PLL_GO bit is not set.

Figure 10-151 shows the DSI PLL gated mode sequence.

Figure 10-151. Gated Mode Sequence

dsi-064

(1) All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

(2) HSDIVIDER is used if any of the following bits is set to 1:

- DSS_CTRL[12] LCD2_CLK_SWITCH
- DSS_CTRL[0] LCD1_CLK_SWITCH
- DSS_CTRL[1] DSI1_CLK_SWITCH
- DSS_CTRL[10] DSI2_CLK_SWITCH

(3) For more information, see [Section 10.1 Display Subsystem Overview](#).

Table 10-491. Register Call Summary for Gated Mode Sequence

Register Name	Register Name	Register Name
DSI_PLL_CONFIGURATION2	DSI_PLL_CONTROL	DSI_PLL_GO

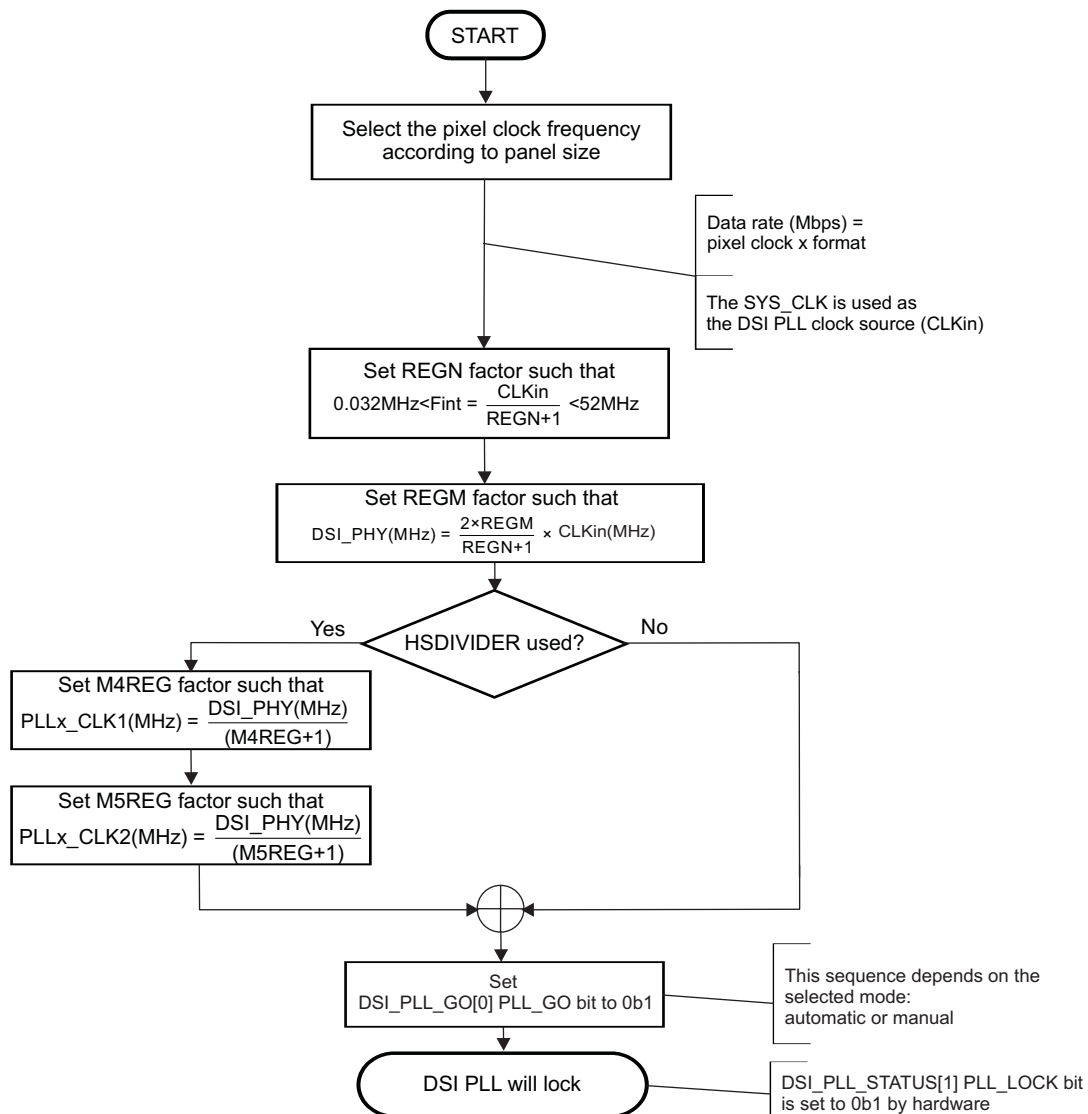

10.3.4.5.9 DSI PLL Clock Sequence

The two DSI PLLs generate the CLKIN4DDR clocks. Each HSDIVIDER outputs two clocks: PLLx_CLK1, connected to the DISPC; and PLLx_CLK2, connected to the DSI protocol engine (where x is the number of the dedicated DSI PLLs [1 or 2]). If these two clocks are not used, the HSDIVIDER functions are not required. In addition, the HSDIVIDER of the DSI1 PLL generates one more clock, PLL1_CLK4, which is used as bypass input for DSI2_PHY.

The CLKIN4DDR clocks are twice the data rate and four times the DSI output clock frequency. The DSI PLL factors must be calculated based on the required input and output frequencies, keeping the PLL internal reference frequency in the appropriate range:

- REGM factor is programmed by the [DSI_PLL_CONFIGURATION1](#)[20:9] PLL_REGM bit field.
- REGN factor is programmed by the [DSI_PLL_CONFIGURATION1](#)[8:1] PLL_REGN bit field.
- M4REG factor is programmed by the [DSI_PLL_CONFIGURATION1](#)[25:21] M4_CLOCK_DIV bit field, and applies to PLLx_CLK1.
- M5REG factor is programmed by the [DSI_PLL_CONFIGURATION1](#)[30:26] M5_CLOCK_DIV bit field, and applies to PLLx_CLK2.
- M7 factor is programmed by the [DSI_PLL_CONFIGURATION3](#)[9:5] M7_CLOCK_DIV field, and applies to PLL1_CLK4.

[Figure 10-152](#) shows the programming sequence.

Figure 10-152. DSI PLL Programming Sequence

dsi-067

NOTE:

- The M4REG and M5REG factors must be set respecting the following conditions:
 - The PLLx_CLK1 frequency must be a multiple of PCLK frequency (for proper settings of the PCD and LCD factors in the DISPC).
 - The PLLx_CLK1 and PLLx_CLK2 frequencies must be lower than 186 MHz. For more information about clock frequency ratings, see [Section 10.1.2.1, DSS Clocks](#).
- Most of the other DSI PLL programming values are available for software flexibility, but it is not recommended to update the values in normal use. For the recommended DSI PLL values, see [Section 10.3.4.5.11, DSI PLL Recommended Values](#).

Table 10-492. Register Call Summary for DSI PLL Programming Sequence

Register Name	Register Name	Register Name
DSI_PLL_CONFIGURATION2	DSI_PLL_GO	DSI_PLL_STATUS

10.3.4.5.10 DSI PLL Go Sequence

In manual mode (the [DSI_PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 0), the DPLL requires a sequence on TINITZ, TENABLE, and TENABLEDIV to update the configuration values and start the locking sequence.

When all the configuration values are programmed into the registers, the GO bit must be set. The appropriate sequence is then sent on the TINITZ, TENABLE, and TENABLEDIV pins, respecting the timing requirements of the DSI PLL. The [DSI_PLL_GO\[0\]](#) PLL_GO bit is cleared to 0 at the end of the sequence.

The TENABLEDIV signal is shared with the HSDIVIDER module so that it is programmed at the same time. In this mode, software must deassert CLKINEN by unsetting the [DSI_PLL_CONFIGURATION2\[14\]](#) PHY_CLKINEN to 0 and assert HSDIVBYPASS correctly by setting the [DSI_PLL_CONFIGURATION2\[20\]](#) HSDIVBYPASS bit to 1 to prevent uncontrolled frequencies affecting DSI_PHY and the display subsystem during PLL locking. In manual mode, the shadow register is updated anyway so that valid values are present when later selecting automatic mode.

[Figure 10-153](#) shows the DSI PLL Go flow chart in manual mode (the [DSI_PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 0).

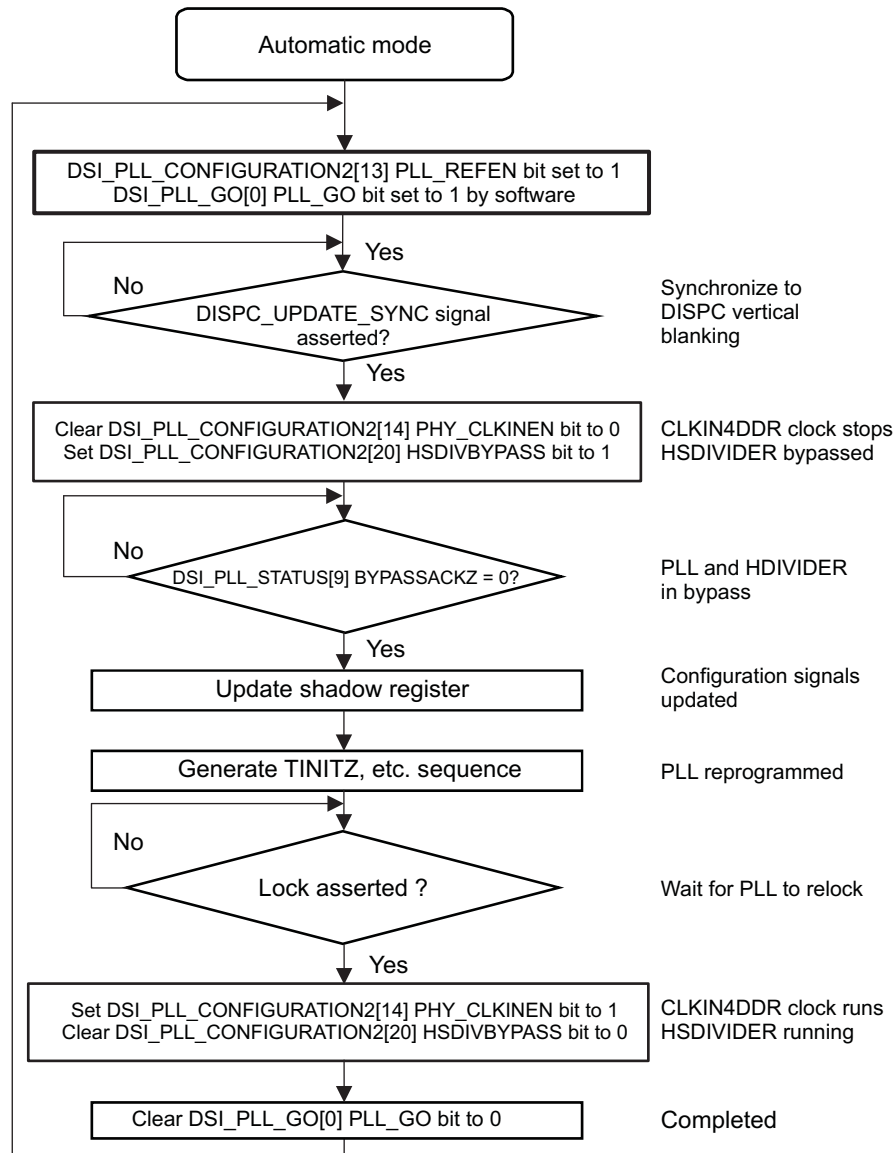

Figure 10-153. DSI PLL Go Sequence (Manual Mode)

- (1) All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

In automatic mode (the [DSI_PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 1), the TINITZ, TENABLE, and TENABLEDIV sequence and the update of the PLL configuration from the [DSI_PLL_CONFIGURATION2](#) register are deferred until the time of the front porch time signal sent by the DISPC module. This is intended to simplify the software to implement a configuration change (such as a frequency change to support a different link bandwidth). In this mode, CLKINEN, HSDIVBYPASS, and REFEN are automatically controlled and the register value is overridden.

[Figure 10-154](#) shows the DSI PLL Go flow chart in automatic mode (the [DSI_PLL_CONTROL\[0\]](#) PLL_AUTOMODE bit is set to 1).

Figure 10-154. DSI PLL Go Sequence (Automatic Mode)

- (1) All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

Table 10-493. Register Call Summary for DSI PLL Go Sequence (Automatic Mode)

10.3.4.5.11 DSI PLL Recommended Values

[Table 10-494](#) shows the DSI PLL recommended values.

Table 10-494. Recommended Programming Values

Field Name	Value	Description
DSI_PLL_CONTROL [4] HSDIV_SYSRESET	0	Allow power FSM to control
DSI_PLL_CONTROL [3] PLL_SYSRESET	0	Allow power FSM to control

Table 10-494. Recommended Programming Values (continued)

Field Name	Value	Description
DSI_PLL_CONTROL[2] PLL_HALTMODE	-	For information, see Section 10.3.4.5.8, DSI PLL Clock-Gating Sequence .
DSI_PLL_CONTROL[1] PLL_GATEMODE	-	For information, see Section 10.3.4.5.8, DSI PLL Clock-Gating Sequence .
DSI_PLL_CONTROL[0] PLL_AUTOMODE	-	For information, see Section 10.3.4.5.8, DSI PLL Clock-Gating Sequence .
DSI_PLL_GO[0] PLL_GO	1 -> 0	Write 1 when PLL is to be (re)locked with new parameters. This bit is cleared by hardware when the PLL request completes.
DSI_PLL_CONFIGURATION1[30:36] M5_CLOCK_DIV	See ⁽¹⁾ .	DSI protocol engine clock divider
DSI_PLL_CONFIGURATION1[25:21] M4_CLOCK_DIV	See ⁽¹⁾ .	DSS clock divider
DSI_PLL_CONFIGURATION1[20:9] PLL_REGM	See ⁽¹⁾ .	Feedback clock divider
DSI_PLL_CONFIGURATION1[8:1] PLL_REGN	See ⁽²⁾ .	Reference clock divider
DSI_PLL_CONFIGURATION1[0] PLL_STOPMODE	1	Required to use the GATEMODE bit
DSI_PLL_CONFIGURATION2[20] HSDIVBYPASS	0	PLL controls HSDIVIDER bypass
DSI_PLL_CONFIGURATION2[19] M5_CLOCK_PWDN	0	If PLL/HSDIVIDER is used as the DSI protocol clock source
DSI_PLL_CONFIGURATION2[18] M5_CLK_EN	1	If PLL/HSDIVIDER is used as the DSI protocol clock source
DSI_PLL_CONFIGURATION2[17] M4_CLOCK_PWDN	0	If PLL/HSDIVIDER is used as the clock source
DSI_PLL_CONFIGURATION2[16] M4_CLOCK_EN	1	If PLL/HSDIVIDER is used as the clock source
DSI_PLL_CONFIGURATION2[15] BYPASSEN	0	To use PLL as the clock source. For small displays, it may be possible to use the display subsystem functional clock, DSS_CLK, in which case this bit must be set to 1. See Section 10.3.4.2, DSI Clock Configuration .
DSI_PLL_CONFIGURATION2[14] PHY_CLKINEN	1	Enable CLKIN4DDR clock
DSI_PLL_CONFIGURATION2[13] PLL_REFEN	1	Enable PLL reference
DSI_PLL_CONFIGURATION2[10:9] PLL_LOCKSEL	0x0	Phase lock criteria to lock the PLL
DSI_PLL_CONFIGURATION2[8] PLL_DRIFTGUARDEN	0x0	The RECAL status/interrupt must be used to decide when to perform a PLL uncalibration. No automatic uncalibration is performed
DSI_PLL_CONFIGURATION2[6] PLL_LOWCURRSTDBY	0/1	Set to 0 for fast PLL unlock, but higher standby current. Set to 1 for leakage level standby current, but longer unlock time.
DSI_PLL_CONFIGURATION2[5] PLLLPMODE	0	Normal operation. For smaller display sizes, it may be possible to set to 1.
DSI_PLL_CONFIGURATION2[0] PLL_IDLE	0	PLL active

⁽¹⁾ The value of the bit field must be set according to the desired clock frequency.

⁽²⁾ The value of the bit field must be set according to the desired clock frequency.

10.3.4.5.12 How to Configure the DSI PLL in Video Mode

Figure 10-155 is a global overview of the DSI1 and DSI2 clock trees when used in video mode.

Figure 10-155. DSI Clock Tree in Video Mode

dsi-100

The settings of the DSI PLL registers can be summarized by the following equations.

Equation 1

$$N \times T_{VP_CLK} = T_L \times T_{TXBYTECLKHS}$$

dsi-e101

where

- $T_L = T_{HS} + HSA_{DSI} + T_{HE} + HFP_{DSI} + \text{ceiling}((WC + 6) / NDL) + HBP_{DSI}$
- N is an integer.
- NDL: Number of data lanes
- WC: Word count or payload in bytes
- HSA_{DSI} is HSA period in video mode.
- HBP_{DSI} is HBP period in video mode.
- HFP_{DSI} is HFP period in video mode.

T_{HS} is the length of HSYNC start short packet in the number of byte clock cycles (TXBYTECLKHS).

- The generation of this packet can be enabled by setting the [DSI_CTRL\[17\]](#) VP_HSYNC_START bit to 1.
- T_{HS} is equal to $\text{ceiling}(4 / NDL)$, if VP_HSYNC_START = 1; else, it is 0.

T_{HE} is the length of HSYNC end short packet in the number of byte clock cycles (TXBYTECLKHS).

- The generation of this packet can be enabled by setting the [DSI_CTRL\[18\]](#) VP_HSYNC_END bit to 1.
- T_{HE} is equal to 1, if (VP_HSYNC_START = 1, VP_HSYNC_END = 1, $HSA_{DSI} = 0$, and NDL = 3), else
- T_{HE} is equal to $\text{ceiling}(4 / NDL)$, if (VP_HSYNC_START = 1 and VP_HSYNC_END = 1); else, it is 0.

NOTE: HSA_{DSI} timing is not used and does not have to be programmed when HE short packet is not generated.

Equation 2

$$R = T_{TXBYTECLKHS} / T_{VP_PCLK}$$

dsi-e102

To synchronize the DISPC and DSI protocol engines, users must follow the ratio R between TXBYTECLKHS and VP_PCLK, as listed in [Table 10-495](#).

Table 10-495. Ratio R

Number of Data Lanes (Up to 4 Data Lanes for DSI1) (Up to 2 Data Lanes for DSI2)	Pixel Format	Ratio R
1	16-bit pixel	1/2
1	18-bit pixel	4/9
1	24-bit pixel	1/3
2	16-bit pixel	1
2	18-bit pixel	8/9
2	24-bit pixel	2/3
3	16-bit pixel	3/2
3	18-bit pixel	4/3
3	24-bit pixel	1
4	16-bit pixel	2
4	18-bit pixel	16/9
4	24-bit pixel	4/3

All cases are covered by:

$$F_{VP_PCLK} \times \text{bits_per_pixel} = F_{TXBYTECLKHS} \times NDL \times 8$$

dsi-e110

Equation 3

$$(HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times T_{VP_PCLK} = (4/NDL + HFP_{DSI} + (WC + 6)/NDL + HBP_{DSI}) \times T_{TXBYTECLKHS}$$

dsi-e103

Equation 4

$$HFP_{DSI} = ((HFP_{DISPC} \times \text{bits_per_pixel}) / (NDL \times 8)) - (2 / NDL)$$

dsi-e109

Example

The desired performances are:

- Clock lane at 150 MHz
- RGB24-888
- 1-data lane
- LCD size 480 × 640 with $HSA_{DISP} = HFP_{DISP} = HBP_{DISP} = 20$, $VSA_{DISP} = VFP_{DISP} = VBP_{DISP} = 2$

Step 1. Determine REGM and REGN.

To obtain correct stability, F_{int} must be kept between 0.032 MHz and 52 MHz. In this case, F_{int} is maintained at 2 MHz. For more information, see [Section 10.3.4.5.2, DSI PLL Controllers Architecture](#), [Section 10.3.4.5.9, DSI PLL Clock Sequence](#), and [Section 10.3.5.2.1.1, Main Sequence – DSI PLL Setup](#).

$$REGN = (F_{SYS_CLK} / F_{int}) - 1$$

$$REGN = 12$$

$$REGM = (REGN + 1) \times F_{CLKIN4DDR} / (2 \times F_{SYS_CLK})$$

$$REGM = 150$$

dsi-e113

where

- $SYS_CLK = 26$ MHz is used as a reference clock.

Step 2. Determine VP_PCLK and TXBYTECLKHS clocks.

TXBYTECLKHS frequency is equal to 37.5 MHz. With ratio R equal to 1/3, VP_PCLK frequency is equal to 12.5 MHz. The frame rate can be estimated by:

$$\text{Frame rate} = F_{VP_PCLK} / (HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times (VSA_{DISPC} + LPP + VBP_{DISPC})$$

$$\text{Frame rate} = 12.5 \text{ MHz} / (540) \times (646)$$

$$\text{Frame rate} = 35.83 \text{ frame/sec}$$

dsi-e123

Step 3. Determine LCD, PCD, and M4REG.

$$T_{CLKIN4DDR} = T_{TXBYTECLKHS} / 16 = T_{VP_PCLK} / ((M4REG + 1) \times LCD \times PCD)$$

$$((M4REG + 1) \times LCD \times PCD) = 16 \times 3$$

dsi-e115

If LCD and PCD are set to 1 and 3, respectively, M4REG is equal to 15.

Step 4. Verify N as integer.

First, TL must be determined:

$$(HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times T_{VP_PCLK} / T_{TXBYTECLKHS} = T_L = 1620$$

dsi-e116

From **Equation 1** follows:

$$N \times T_{VP_CLK} = T_L \times T_{TXBYTECLKHS}$$

$$N = T_{TXBYTECLKHS} \times T_L / T_{VP_CLK} = T_L / (R \times PCD)$$

$$N = 14580$$

N is an integer.

Step 5. Determine HFP and HBP of the DSI protocol engine.

From **Equation 3** follows:

$$((HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times T_{VP_PCLK} / T_{TXBYTECLKHS}) - (4/NDL + (WC + 6)/NDL) = HFP_{DSI} + HBP_{DSI}$$

$$HFP_{DSI} + HBP_{DSI} = 170$$

dsi-e117

From **Equation 4** follows:

$$HFP_{DSI} = ((HFP_{DISP} \times \text{bits_per_pixel}) / NDL \times 8) - (2/NDL)$$

$$HFP_{DSI} = 58$$

$$HBP_{DSI} = 170 - 58 = 112$$

dsi-e121

10.3.4.6 DSI Complex I/O

10.3.4.6.1 DSI Complex I/O Overview

DSI_PHY is a complex I/O with five unidirectional (HS) lane modules. This includes four data lane modules and one clock lane module. Each lane module has two data pads (DX, DY). These data pads are connected with a complementary lane module on the DSI receiver device using a point-to-point interconnect.

Lane modules support HS burst mode. Forward direction and reverse direction escape modes are also supported. Escape modes can be used for low-power data transmission, among other things.

The maximum data rate supported in HS mode is 824 Mbps for four data lanes, and 900 Mbps for up to three data lanes. The lane module function and position are configurable; that is, any lane module can be chosen as a clock lane module, and the DX/DY data pad for each lane module can be configured as a DP or DN pin defined by the D-PHY specification.

DSI_PHY interacts with the higher layers of the DSI link through the PPI. DSI_PHY does not include a PLL; a high-frequency clock input is expected in HS mode (CLKIN4DDR). DSI_PHY also supports the SCP interface to set various configuration and control registers.

10.3.4.6.2 Software Reset

The clock domain using the TXBYTECLKHS byte clock from the DSI complex I/O has dedicated reset-done information in the [DSI_COMPLEXIO_CFG1](#)[29] RESET_DONE bit. The [DSI_SYSCONFIG](#)[1] SOFT_RESET bit is used to reset the byte clock power domain. A dummy read using the SCP interface to any DSI_PHY register is required after DSI_PHY reset to complete the reset of the DSI complex I/O.

10.3.4.6.3 Reset-Done Bits

The DSI complex I/O has several clock domains. The reset status for each clock domain is provided in the [DSI_PHY_REGISTER5](#) register:

- [DSI_PHY_REGISTER5](#)[31] RESETDONETXBYTECLK bit: Reset done for the TXBYTECLK domain.
- [DSI_PHY_REGISTER5](#)[28:24] RESETDONETXCLKESC_i bit field: Reset done for the TXCLKESC domain for lane *i* (where *i* = 0 to 4).
- [DSI_PHY_REGISTER5](#)[30] RESETDONESCPCCLK bit: Reset done for the SCP clock domain. Software users must perform a dummy read on this bit to initiate the reset sequence of the SCP FSM. When the reset sequence completes, the RESETDONESCPCCLK signal goes high, and software users can read again the [DSI_PHY_REGISTER5](#)[30] RESETDONESCPCCLK bit to ensure that the value is now 1.

NOTE: Software must not write in the DSI_PHY SCP registers before the [DSI_PHY_REGISTER5](#)[30] RESETDONESCPCCLK bit is set to 1.

- [DSI_PHY_REGISTER5](#)[29] RESETDONEPWRCLK bit: Reset done for the PWR clock domain. The reset sequence of the PWR FSM is complete when the RESETDONEPWRCLK signal goes high.

10.3.4.6.4 Pad Configuration

The number of lanes is configurable through the [DSI_COMPLEXIO_CFG1](#) register.

It is not allowed to change on the fly the position (by modifying the DATA_x_POSITION, where *x* = 1 through 4, and CLOCK_POSITION fields), the P/N order (positive/negative order of the differential pair by modifying the DATA_y_POL, where *y* = 1 through 4, and CLOCK_POL), or the number of active data lanes (by modifying the [DSI_COMPLEXIO_CFG1](#)[10:8] DATA2_POSITION, [DSI_COMPLEXIO_CFG1](#)[14:12] DATA3_POSITION, and [DSI_COMPLEXIO_CFG1](#)[18:16] DATA4_POSITION bit fields). To add or remove lanes 2, 3, or 4, it is required to be in OFF mode for the DSI complex I/O.

The configuration of the DSI complex I/O (number of data lanes, position, differential order) must not be changed while the [DSI_CLK_CTRL](#)[20] LP_CLK_ENABLE bit is set to 1. For hardware to recognize a new configuration of the complex I/O (done in the [DSI_COMPLEXIO_CFG1](#) register), the following sequence shall be followed:

1. Set the [DSI_CTRL](#)[0] IF_EN bit to 1.
 2. Reset the [DSI_CTRL](#)[0] IF_EN bit to 0.
 3. Set [DSI_CLK_CTRL](#)[20] LP_CLK_ENABLE bit to 1.
 4. Set again the [DSI_CTRL](#)[0] IF_EN bit to 1.
- If the sequence is not followed, the DSI complex I/O configuration is undetermined.

The minimum requirement for the number of lanes is one clock lane and one data lane. By default, data lanes 2, 3, and 4 are not connected (the reset value of the DATA_x_POSITION bit fields is 0).

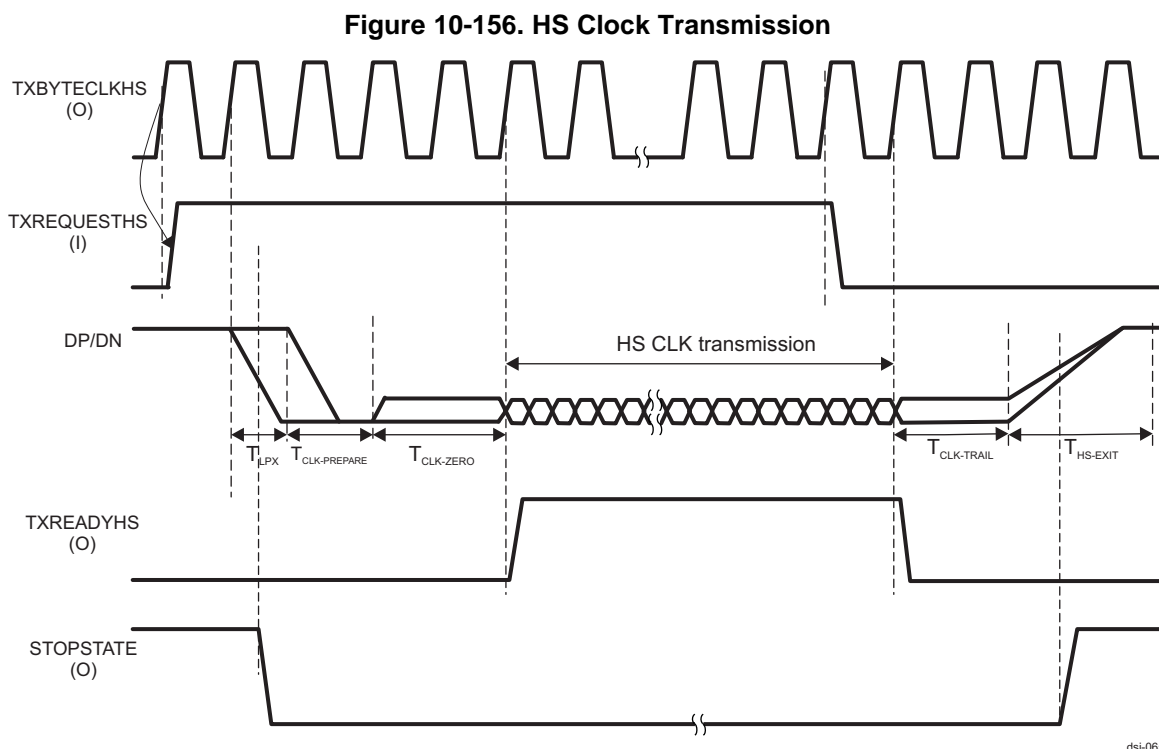

10.3.4.6.5 Display Timing Configuration

NOTE: Copyright 2005-2008 MIPI Alliance, Inc. All rights reserved. MIPI Alliance Member Confidential.

Depending on the CLKIN4DDR clock frequency settings programmed with the DSI PLL control module, software users must program accordingly the timing parameters in the DSI complex I/O registers.

10.3.4.6.5.1 High-Speed Clock Transmission

Figure 10-156 shows an example of HS clock transmission.

TXBYTECLKHS is an output clock that is derived by dividing CLKIN4DDR by 16.

The TXBYTECLKHS clock is driven by DSI_PHY when:

- The CLKIN4DDR is running and [DSI_PLL_CONFIGURATION2\[14\]](#) PHY_CLKINEN bit is set to '1'.
- DSI_PHY is in ON power state ([DSI_COMPLEXIO_CFG1\[28:27\]](#) PWR_CMD bit = 1) and at least one lane is enabled.

To begin transmission, the protocol drives TXREQUESTHS high on a rising edge of TXBYTECLKHS. The PHY detects this signal on the next rising edge, after which it initiates the LP SoT procedure.

During an HS clock transmission, these parameters are defined in multiples of CLKIN4DDR and are programmed by the following bit fields:

- TLPX timing is programmed by [DSI_PHY_REGISTER1\[20:16\]](#) TLPXBY2.
- THS-PREPARE timing is programmed by [DSI_PHY_REGISTER0\[31:24\]](#) THSPREPARE.
- TCLK-ZERO timing is programmed by [DSI_PHY_REGISTER1\[7:0\]](#) TCLKZERO.

TCLK-ZERO is extended, if required, so that the entire LP SoT procedure lasts an integer number of TXBYTECLKHS cycles.

At the end of the SoT procedure, HS clock transmission begins. At the same time, TXREADYHS is made high.

To stop clock transmission, the protocol drives TXREQUESTHS low on a rising edge of TXBYTECLKHS. The DSI_PHY detects this change in TXREQUESTHS on the next edge and stops clock transmission. TXREADYHS is made low.

The DSI_PHY then goes through the LP EoT procedure. The TCLK-TRAIL and THS-EXIT parameters are also multiples of CLKIN4DDR and are programmed by the following bit fields:

- TCLK-TRAIL timing is programmed by [DSI_PHY_REGISTER1](#)[15:8] TCLKTRAIL.
- THS-EXIT timing is programmed by [DSI_PHY_REGISTER0](#)[7:0] THSEXIT.

The DSI_PHY completes the SoT and EoT procedures, once begun, regardless of any change in the PPI signals. If TXREQUESTHS goes low during the SoT procedure, the PHY starts the EoT procedure immediately after finishing the SoT procedure and no clock is transmitted.

STOPSTATE is high whenever the line is in LP-11 state, as determined by the outputs of the low-power receivers. This signal is not synchronized with TXBYTECLKHS.

The HS clock must be present for a period of time before (TCLK-PRE) and after (TCLK-POST) HS data transmission. The protocol must ensure that these timings are met by asserting and deasserting TXREQUESTHS appropriately.

The PHY ensures that the clock signal has a quadrature phase with respect to a toggling bit sequence on any data lane, and a rising edge in the center of the first transmitted bit of each data byte. These relations are not described in the timing diagram.

CLKIN4DDR can be shut off 300 ns after the clock lane goes to STOPSTATE. Alternatively, CLKIN4DDR can be shut down after TCLK-Trail + THS-Exit + 2 Tbyteclk periods after the TxRequestHS falling edge is received by DSI_PHY.

The DSI protocol engine must ensure that TXREQUESTESC, TXULPSCLK, and TURNREQUEST are low whenever TXREQUESTHS is asserted.

10.3.4.6.5.2 High-Speed Data Transmission

[Figure 10-157](#) shows an example of HS data transmission.

Figure 10-157. HS Data Transmission

dsi-066

To begin transmission, the protocol drives TXDATAHS with the first byte of data on a rising edge of TXBYTECLKHS. It also makes TXREQUESTHS high on the same rising edge. The PHY detects TXREQUESTHS going high on the next rising edge of TXBYTECLKHS, following which it initiates the LP SoT procedure.

During an HS data transmission, these timings are multiples of CLKIN4DDR and are programmed by the following bit fields:

- TLPX timing is programmed by [DSI_PHY_REGISTER1](#)[20:16] TLPXBY2.
- THS-PREPARE + THS-ZERO timing is programmed by [DSI_PHY_REGISTER0](#)[23:16] THSPRPR_THSZERO.

THS-ZERO is extended, if required, so that the entire LP SoT procedure lasts an integer number of TXBYTECLKHS cycles. THS-SYNC corresponds to the length of the sync pattern (8 HS bits), and can be configured through the [DSI_PHY_REGISTER2](#)[31:24] HSSYNCPATTERN bit field.

Toward the end of the SoT procedure, the PHY makes TXREADYHS high on a positive edge of TXBYTECLKHS and then starts accepting data from TXDATAHS from the next positive edge onward. The protocol is expected to provide (new) valid data on TXDATAHS on every positive edge of TXBYTECLKHS if TXREADYHS is high.

At the end of the SoT procedure, HS data transmission begins. HS data transmission happens LSB first.

To stop data transmission, the protocol drives TXREQUESTHS low on a rising edge of TXBYTECLKHS. The PHY detects this change in TXREQUESTHS on the next edge and stops data transmission. TXREADYHS is made low and data on TXDATAHS, from that point, is ignored.

The PHY then goes through the LP EoT procedure. THS-TRAIL and THS-EXIT are also multiples of CLKIN4DDR and are programmed by the following bit fields:

- THS-TRAIL timing is programmed by [DSI_PHY_REGISTER0](#)[15:8] THSTRAIL.

- THS-EXIT timing is programmed by [DSI_PHY_REGISTER0\[7:0\] THSEXIT](#).

The PHY completes the SoT and EoT procedures, once begun, regardless of any change in PPI signals. If TXREQUESTHS goes low during the SoT procedure, the PHY starts the EoT procedure immediately after finishing the SoT procedure and no data is transmitted.

STOPSTATE is high whenever the line is in LP-11 state, as determined by the outputs of the low-power receivers. This signal is not synchronized with TXBYTECLKHS.

The protocol must ensure that TXREQUESTESC, TXULPSCLK, and TURNREQUEST are low whenever TXREQUESTHS is asserted.

10.3.4.6.5.3 Turnaround Request in Transmit Mode

When the DSI PHY is in transmit mode, the DSI protocol engine can request a turnaround by making the TurnRequest signal high for at least one clock cycle of TxClkEsc (see [Section 10.3.4.4.7.3, TurnRequest FSM](#)).

The DSI PHY transmits the turnaround request pattern (LP 11-10-00-10-00-00-00-00) (see [Figure 10-158](#)). The number of 00 states at the end of the pattern is defined by the T_{TA-GO} timing parameter and is programmable through the [DSI_PHY_REGISTER1\[31:29\] REG_TTAGO](#) bit field, in number of TxClkEsc clocks. Following the transmission of the pattern, the DSI PHY disables its LP transmitters and waits for an acknowledgment from the remote device. The remote device detects the turnaround request and acknowledges it by driving LP 10, followed by the STOP state. When this acknowledgment is received (BTA_IRQ is asserted, as described in [Section 10.3.4.4.8, Bus Turnaround](#)), the DSI PHY switches to receive mode and indicates the completion of the turnaround procedure by changing the direction (BTA_EN = 0).

Figure 10-158. Turnaround Request in Transmit Mode

dsi-028

The DSI protocol engine must not stop TxClkEsc after the turnaround process completes (the [DSI_CLK_CTRL\[20\] LP_CLK_ENABLE](#) bit must be kept at 1), because TxClkEsc is also used in handling a turnaround request transmitted by a remote slave device (see [Section 10.3.4.6.5.4, Turnaround Request in Receive Mode](#)).

10.3.4.6.5.4 Turnaround Request in Receive Mode

When DSI PHY is in receive mode, an LP pattern of 11-10-00-10-00 on DP/DN lines indicates a turnaround request from the remote device (see [Figure 10-159](#)).

Figure 10-159. Turnaround Request in Receive Mode

dsi-029

If the line stays in LP-00 for a time $T_{TA-SURE}$, the DSI PHY accepts the turnaround request, changes the direction, transmits LP-00 for a time T_{TA-GET} , and then transmits the acknowledgment pattern LP-10, followed by the STOP state.

This completes the turnaround procedure (BTA_IRQ is asserted, as described in [Section 10.3.4.4.8, Bus Turnaround](#)). The $T_{TA-SURE}$ and T_{TA-GET} timing parameters are programmable through [DSI_PHY_REGISTER1](#) in number of TxClkEsc clocks:

- $T_{TA-SURE}$ can be configured in the [28:27] REG_TTASURE bit field.
- T_{TA-GET} can be configured in the [26:24] REG_TTAGET bit field.

10.3.4.6.5.5 Other DSI PHY Transmission and Reception

The timings of the following sequences defined in the DSI_PHY protocol cannot be programmed by the user:

- Low-power data transmission
- Escape mode trigger command transmission
- ULPS command transmission on data lanes
- ULPS transmission on clock lane
- Low-power data in receive mode
- Low-power trigger in receive mode
- ULPS command on clock lane in receive mode
- ULPS command on data lane in receive mode

10.3.4.6.6 Power Management

Power management of the DSI_PHY analog circuitry is done through the internal power FSM, which is controlled by the subsystem. The control interface is a basic command and acknowledge protocol. The subsystem is the master of the interface. There is a dedicated command pin for each power state of DSI_PHY and a common acknowledge pin. The subsystem sends the power command and clock. The internal FSM does the sequencing and control generation of internal power domains. It then asserts the acknowledge, which signals the completion of the power state transition. The internal power control FSM is powered by a constant power supply.

The main features of the power control interface are:

- One dedicated command line per power state
- Only one command line can be asserted at a time.
- One acknowledge signal common to all command lines
- The command line cannot be cleared unless the acknowledge has been returned.
- All the command lines and the acknowledge signal must be cleared before triggering a new command.

DSI_PHY supports three power states:

- OFF/GPIO mode (OFF): The entire analog circuit is powered down. Internal LDO is OFF. All analog circuitry on 1.8-V supply is powered down. The ULPS exit detection circuit power switch is OFF. DSI_PHY takes leakage level current.
- ON: Complete analog circuit is powered on and functional. LDO is ON. (DSI_PHY calibrates every time the module enters power on state.)
- ULPS: Only the DSI_PHY mode ULPS exit detection circuit power switch is ON. All the other analog circuitry is switched OFF. LDO is OFF.

NOTE: ULPS must be entered only when all used lane modules go into ULPS state. PHY power state must be returned to ON power state when any one of the used modules goes out of ULPS. No PPI signal except TXULPSEXIT must be toggled when in this power state.

Figure 10-160 shows the power states of the DSI complex I/O

Figure 10-160. Power State Diagram

dsi-060

10.3.4.6.7 Error Handling

A dedicated register for the DSI complex I/O ([DSI_COMPLEXIO_IRQSTATUS](#)) indicates the state of each error provided by the DSI complex I/O error signals. The DSI_PHY reports the following errors:

- [DSI_COMPLEXIO_IRQSTATUS](#)[9:5] ERRESCi_IRQ: ERRESC is asserted if an unrecognized Escape entry command is received. This remains high until the next change in the line state.
- [DSI_COMPLEXIO_IRQSTATUS](#)[4:0] ERRSYNCESCi_IRQ: If the number of bits received during a low-power data transmission is not a multiple of 8 when the transmission ends, ERRSYNCESC is made high and remains high until the next change in line state.
- [DSI_COMPLEXIO_IRQSTATUS](#)[14:10] ERRCONTROLi_IRQ: ERRCONTROL is asserted if an incorrect line state sequence is detected. For example, if a turnaround request or escape mode request is immediately followed by a STOP state instead of the required BRIDGE state, this signal is asserted and remains asserted until the next change in the line state.
- [DSI_COMPLEXIO_IRQSTATUS](#) ERRCONTENTIONLP0_i_IRQ: ERRCONTENTION0LPDX and ERRCONTENTION0LPDY are asserted when the lane module detects a contention situation on lines DX and DY, respectively, while trying to drive the lines low. Contention is detected only if it lasts at least 50 ns.
- [DSI_COMPLEXIO_IRQSTATUS](#) ERRCONTENTIONLP1_i_IRQ: ERRCONTENTION1LPDX and ERRCONTENTION1LPDY are asserted when the lane module detects a contention situation on lines DX and DY, respectively, while trying to drive the lines high. Contention is detected only if it lasts at least 50 ns.

The ULPSACTIVENOT signal goes low, which indicates to the protocol that the PHY has entered ULPS. When all the ULPSActiveNot signals are low, the [DSI_COMPLEXIO_IRQSTATUS](#)[30] ULPSACTIVENOT_ALL0_IRQ event is generated. When all the ULPSActiveNot signals are high, the [DSI_COMPLEXIO_IRQSTATUS](#)[31] ULPSACTIVENOT_ALL1_IRQ event is generated.

When any of the events defined in the [DSI_COMPLEXIO_IRQSTATUS](#) register happen, the [DSI_IRQSTATUS](#)[10] COMPLEXIO_ERR_IRQ bit is set to 1 at DSI protocol engine level.

[Table 10-496](#) lists the DSI complex I/O interrupt events.

Table 10-496. DSI Complex I/O Interrupts

IRQ Name	Description
ULPSActiveNot_ALL0_IRQ	All the ULPSActiveNOT signals are 0.
ULPSActiveNot_ALL1_IRQ	All the ULPSActiveNOT signals corresponding to the lanes with TXULPSExit being high are high.
STATEULPM5_IRQ	Lane 5 in ULPS
STATEULPM4_IRQ	Lane 4 in ULPS
STATEULPM3_IRQ	Lane 3 in ULPS
STATEULPM2_IRQ	Lane 2 in ULPS
STATEULPM1_IRQ	Lane 1 in ULPS
ERRCONTROL5_IRQ	Control error for lane 5
ERRCONTROL4_IRQ	Control error for lane 4
ERRCONTROL3_IRQ	Control error for lane 3
ERRCONTROL2_IRQ	Control error for lane 2
ERRCONTROL1_IRQ	Control error for lane 1
ERRESC5_IRQ	Escape entry error for lane 5 (edge trigger interrupt)
ERRESC4_IRQ	Escape entry error for lane 4 (edge trigger interrupt)
ERRESC3_IRQ	Escape entry error for lane 3 (edge trigger interrupt)
ERRESC2_IRQ	Escape entry error for lane 2 (edge trigger interrupt)
ERRESC1_IRQ	Escape entry error for lane 1 (edge trigger interrupt)
ERRCONTENTIONLP1_1_IRQ	Contention LP1 error for lane 1
ERRCONTENTIONLP0_1_IRQ	Contention LP0 error for lane 1
ERRCONTENTIONLP1_2_IRQ	Contention LP1 error for lane 2

Table 10-496. DSI Complex I/O Interrupts (continued)

IRQ Name	Description
ERRCONTENTIONLP0_2_IRQ	Contention LP0 error for lane 2
ERRCONTENTIONLP1_3_IRQ	Contention LP1 error for lane 3
ERRCONTENTIONLP0_3_IRQ	Contention LP0 error for lane 3
ERRCONTENTIONLP1_4_IRQ	Contention LP1 error for lane 4
ERRCONTENTIONLP0_4_IRQ	Contention LP0 error for lane 4
ERRCONTENTIONLP1_5_IRQ	Contention LP1 error for lane 5
ERRCONTENTIONLP0_5_IRQ	Contention LP0 error for lane 5
ERRSYNCE5_IRQ	Low-power data transmission synchronization error for lane 5
ERRSYNCE4_IRQ	Low-power data transmission synchronization error for lane 4
ERRSYNCE3_IRQ	Low-power data transmission synchronization error for lane 3
ERRSYNCE2_IRQ	Low-power data transmission synchronization error for lane 2
ERRSYNCE1_IRQ	Low-power data transmission synchronization error for lane 1

Software must take appropriate action when receiving the interrupt indicating the error from the complex I/O. The action can be:

- Reset the DSI protocol engine module
- Reset the peripheral through the reset trigger or directly driving the hardware reset pin of the display module
- Ignore the error

10.3.5 DSI Programming Model

This section describes the low-level hardware programming sequences for the configuration and use of the DSI module.

10.3.5.1 DSI Global Initialization

10.3.5.1.1 Surrounding Modules Global Initialization

This section describes the requirements to initialize the surrounding modules when the DSI module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DSI. For more information, see [Section 10.3.3, DSI Integration](#), and [Section 10.3.2, DSI Environment](#).

[Table 10-497](#) describes the global initialization of the surrounding modules.

Table 10-497. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	DSI module interface and functional clocks must be enabled. The module power management (idle and sleep modes) must be configured. For more information, see Chapter 3, Power, Reset, and Clock Management .
MPU INTC	MPU interrupt controller (INTC) configuration must be done to enable interrupts from the DSI module. For more information about the module configuration, see Chapter 17, Interrupt Controllers .
DSP INTC	DSP INTC configuration must be done to enable interrupts from the DSI module. For more information about the module configuration, see Chapter 5, DSP Subsystem .
sDMA	DMA configuration must be done to enable DSI module DMA channel requests. For more information about the configuration, see Chapter 16, sDMA .
L3 / L4_PER Interconnect	For information about the interconnect configuration, see Chapter 13, Interconnect .

10.3.5.1.2 DSI Global Initialization

10.3.5.1.2.1 Main Sequence - DSI Global Initialization

This procedure initializes the DSI after a power on or software reset.

[Table 10-498](#) summarizes the DSI global initialization.

Table 10-498. DSI Global Initialization

Steps	Registers	Value
Reset IRQ status.	DSI_IRQSTATUS [31:0]	0x0
Set clock activity.	DSI_SYSCONFIG [9:8] CLOCKACTIVITY	x
Configure power management.	DSI_SYSCONFIG [4:3] SIDLEMODE	x
Reset DSI protocol engine.	DSI_SYSCONFIG [1] SOFT_RESET	0x1
Wait until five reads of reset status?	Software test condition	
Read reset status.	DSI_SYSSTATUS [0] RESET_DONE	
IF: Is reset ongoing?	DSI_SYSSTATUS [0] RESET_DONE	= 0x0
Error occurred during reset stage ⁽¹⁾		
ENDIF		

10.3.5.2 DSI Operational Modes Configuration

10.3.5.2.1 DSI Video Mode Using the DISPC Video Port

10.3.5.2.1.1 Main Sequence - DSI PLL Setup

Table 10-499 lists the steps required to configure DSI PLL.

Table 10-499. DSI PLL Configuration Registers

Steps	Registers	Value
Turn ON/OFF the PLL and HSDIVIDER.	DSI_CLK_CTRL [31:30] PLL_PWR_CMD	x
Wait until the status of the PLL is set (value according to the previous step)?	DSI_CLK_CTRL [29:28] PLL_PWR_STATUS	= x
Set the divider value for DSI protocol engine clock source M5REG.	DSI_PLL_CONFIGURATION1 [30:26] M5_CLOCK_DIV	x
Set the divider value for clock source M4REG.	DSI_PLL_CONFIGURATION1 [25:21] M4_CLOCK_DIV	x
Set the value for M divider for PLL.	DSI_PLL_CONFIGURATION1 [20:9] DSI_PLL_REGM	x
Set the value for N divider for PLL.	DSI_PLL_CONFIGURATION1 [8:1] DSI_PLL_REGN	x
Enable/disable PLL STOPMODE.	DSI_PLL_CONFIGURATION1 [0] PLL_STOPMODE	x
Enable/disable DSI protocol engine clock divider.	DSI_PLL_CONFIGURATION2 [18] M5_CLOCK_EN	x
Enable/disable M4 clock source divider.	DSI_PLL_CONFIGURATION2 [16] M4_CLOCK_EN	x
Enable/disable DSI PHY clock.	DSI_PLL_CONFIGURATION2 [14] PHY_CLKINEN	x
Enable/disable PLL reference clock.	DSI_PLL_CONFIGURATION2 [13] PLL_REFEN	x
Set PLL automatic update mode.	DSI_PLL_CONTROL [0] PLL_AUTOMODE	x
Request PLL locking sequence.	DSI_PLL_GO [0] PLL_GO	0x1
Read until PLL_GO bit = 0?	DSI_PLL_GO [0] PLL_GO	= 0x0
Wait until PLL is locked?	DSI_PLL_STATUS [1] PLL_LOCK	= 0x1
Set the ratio for the LP clock.	DSI_CLK_CTRL [12:0] LP_CLK_DIVISOR	x
Enable/disable DSS_L3_ICLK clock gating to DSI_PHY and PLL module.	DSI_CLK_CTRL [14] CIO_CLK_ICG	x
Enable/disable the automatic assertion/deassertion of DSISetupClk.	DSI_CLK_CTRL [18] HS_AUTO_STOP_ENABLE	x
Configure the DSI functional clock synchronization and clock speed.	DSI_CLK_CTRL [21] LP_RX_SYNCHRO_ENABLE	x
Turn ON/OFF PLL and HSDIVIDER.	DSI_CLK_CTRL [31:30] PLL_PWR_CMD	x

10.3.5.2.1.2 Main Sequence - Set Up DSI Protocol Engine

10.3.5.2.1.2.1 Set Up DSI Control Registers

Table 10-500 lists the steps to set up the DSI control registers. Table 10-501 lists the steps to set up the DSI complex I/O registers.

Table 10-500. DSI Control Registers

Steps	Registers	Value
Enable the interrupt event for lost synchronization with the video port.	DSI_IRQENABLE [18] SYNC_LOST_IRQ_EN	0x1
Enable interrupt event for sent packet on desired VC.	DSI_VC_IRQENABLE_i [2] PACKET_SENT_IRQ_EN	x
Enable HSYNC END pulse detection (short packet generation).	DSI_CTRL [17] VP_HSYNC_START	0x1
Enable VSYNC START pulse detection (short packet generation).	DSI_CTRL [15] VP_VSYNC_START	0x1

Table 10-500. DSI Control Registers (continued)

Steps	Registers	Value
Select trigger reset mode.	DSI_CTRL[14] TRIGGER_RESET_MODE	x
Set the number of line buffers.	DSI_CTRL[13:12] LINE_BUFFER	x
Set video port HSYNC signal polarity.	DSI_CTRL[10] VP_HSYNC_POL	x
Set video port VSYNC signal polarity.	DSI_CTRL[11] VP_VSYNC_POL	x
Set video port data enable signal polarity.	DSI_CTRL[9] VP_DE_POL	x
Set the size of the video port data bus.	DSI_CTRL[7:6] VP_DATA_BUS_WIDTH	x
Set the arbitration scheme for granting the VC pending ready requests in the TX FIFO.	DSI_CTRL[3] TX_FIFO_ARBITRATION	x
Enable/disable the ECC check for the received header.	DSI_CTRL[2] ECC_RX_EN	0x1

Table 10-501. DSI Complex I/O Registers

Steps	Registers	Value
Configure synchronized update on the shadow register.	DSI_COMPLEXIO_CFG1[30] GOBIT	x
Set the complex I/O power state.	DSI_COMPLEXIO_CFG1[28:27] PWR_CMD	x
Set the position of data lane 1.	DSI_COMPLEXIO_CFG1[6:4] DATA1_POSITION	x
Set the position of the clock lane.	DSI_COMPLEXIO_CFG1[2:0] CLOCK_POSITION	x
Clear the Interrupt status register.	DSI_COMPLEXIO_IRQSTATUS	0xFFFF FFFF
Disable all interrupt events.	DSI_COMPLEXIO_IRQENABLE	0x0
Enable the DSI protocol engine.	DSI_CTRL[0] IF_EN	0x1
Disable the DSI protocol engine.	DSI_CTRL[0] IF_EN	0x0
Wait until the interface is disabled?	DSI_CTRL[0] IF_EN	= 0x0
Enable the low-power clock (TXCLKESC).	DSI_CLK_CTRL[20] LP_CLK_ENABLE	0x1
Wait until reset is done?	DSI_COMPLEXIO_CFG1[29] RESET_DONE	= 0x1
Check if power control is ON?	DSI_COMPLEXIO_CFG1[26:25] PWR_STATUS	= 0x1
Wait until internal module reset is complete?	DSI_SYSSTATUS[0] RESETDONE	= 0x1

10.3.5.2.1.2.2 Configure DSI Timing and VCs

[Table 10-502](#) lists the steps to configure DSI timing and the VCs.

Table 10-502. DSI Timing Registers

Steps	Registers	Value
Determine the number of DSI_FCLK clock cycles for the STOP-STATE counter.	DSI_TIMING1[12:0] STOP_STATE_COUNTER_IO	0x-
Determine the number of BYTE_CLK clock cycles for the HS RX timer.	DSI_TIMING2[28:16] HS_TX_TO_COUNTER	0x-
Enable/disable the multiplication factor of 16 for the number of BYTE_CLK clock cycles for the HS TX timer.	DSI_TIMING2[29] HS_TX_TO_X16	0x-
Determine the number of DSI_FCLK clock cycles for the LP RX timer.	DSI_TIMING2[12:0] LP_RX_TO_COUNTER	0x-
Enable/disable the multiplication factor of 16 for the number of DSI_FCLK clock cycles for the LP RX timer.	DSI_TIMING2[14] LP_RX_TO_X16	0x-
Set the horizontal sync active period.	DSI_VM_TIMING1[31:24] HSA	0x-
Set the horizontal front porch.	DSI_VM_TIMING1[23:12] HFP	0x-
Set the horizontal back porch.	DSI_VM_TIMING1[11:0] HBP	0x-

Table 10-502. DSI Timing Registers (continued)

Steps	Registers	Value
Set the number of BYTE clock cycles for the sync window.	DSI_VM_TIMING2 [27:24] WINDOW_SYNC	0x-
Set the vertical sync active period.	DSI_VM_TIMING2 [23:16] VSA ⁽¹⁾	0x-
Set the vertical front porch.	DSI_VM_TIMING2 [15:8] VFP	0x-
Set the vertical back porch.	DSI_VM_TIMING2 [7:0] VBP	0x-
Set the line length.	DSI_VM_TIMING3 [31:16] TL	0x-
Set the number of active lines.	DSI_VM_TIMING3 [15:0] VACT	0x-
Set the number of TXBYTECLKHS clock cycles for entering HS mode.	DSI_VM_TIMING7 [31:16] ENTER_HS_MODE_LATENCY	0x-
Set the number of TXBYTECLKHSe clock cycles for exiting HS mode.	DSI_VM_TIMING7 [15:0] EXIT_HS_MODE_LATENCY	0x-
Set the number of TXBYTECLKHS clock cycles between the start of the DDR clock and the assertion of the data request signal.	DSI_CLK_TIMING [15:8] DDR_CLK_PRE	0x-
Set the number of TXBYTECLKHS clock cycles after the deassertion of the data request signal and the stop of the DDR clock.	DSI_CLK_TIMING [7:0] DDR_CLK_POST	0x-
Configure the RX FIFO DMA request.	DSI_VC_CTRL_i [29:27] DMA_RX_REQ_NB	0x-
Configure the TX FIFO DMA request.	DSI_VC_CTRL_i [23:21] DMA_TX_REQ_NB	0x-
Enable/disable the ECC generation for the transmit header.	DSI_VC_CTRL_i [8] ECC_TX_EN	0x-
Enable/disable the checksum generation for the transmit payload.	DSI_VC_CTRL_i [7] CS_TX_EN	0x-
Select video mode.	DSI_VC_CTRL_i [4] MODE	0x-

⁽¹⁾ In DSI video mode, if the VSA bit field in [DSI_VM_TIMING2](#) is set to 0x0, no vertical synchronization packet will be sent even if VP_VSYNC_START is set to 0x1 in [DSI_CTRL](#).

10.3.5.2.1.3 Main Sequence - Configure DSI_PHY

[Table 10-503](#) summarizes the timing in the functions of DDR_CLK_P. For more information about the timing calculation, see [Section 10.3.4.4.4, Clock Requirements](#).

Table 10-503. Calculate DSI_PHY Timing

Steps	Registers	Value
Settings of the DSI protocol timing. For a complete description of the timing specifications, see Section 10.3.4.4.4, Clock Requirements .	DSI_PHY_REGISTER0 [31:24] REG_THSPREPARE	ceil(70ns/DDR clock period) + 2
	DSI_PHY_REGISTER0 [23:16] REG_PRPR_THSZERO	ceil(175ns/DDR clock period) + 2
	DSI_PHY_REGISTER0 [7:0] REG_THSEXIT	ceil(145ns/DDR clock period)
	DSI_PHY_REGISTER0 [15:8] REG_THSTRAIL	ceil(60ns/DDR clock period) + 5
	DSI_PHY_REGISTER2 [7:0] REG_TCLKPREPARE	ceil(65ns/DDR clock period)
	DSI_PHY_REGISTER1 [7:0] REG_TCLKZERO	ceil(265ns/DDR clock period)
	DSI_PHY_REGISTER1 [15:8] REG_TCLKTRAIL	ceil(60ns/DDR clock period) + 2
	DSI_PHY_REGISTER1 [20:16] REG_TLPXBY2	ceil(25ns/DDR clock period)

10.3.5.2.1.4 Main Sequence - Drive STOP State

Table 10-504 lists the steps to drive STOP state.

Table 10-504. Drive STOP State

Steps	Registers	Value
Force TX stop mode.	DSI_TIMING1 [15] FORCE_TX_STOP_MODE_IO	0x1
Wait until FORCE_TX_STOP_MODE_IO = 0?	DSI_TIMING1 [15] FORCE_TX_STOP_MODE_IO	= 0x0

10.3.5.2.1.5 Main Sequence - Enable Video Mode

Table 10-504 lists the steps to enable video mode.

Table 10-505. Enable Video Mode

Steps	Registers	Value
Set up long packet header.	DSI_VC_LONG_PACKET_HEADER_i	0x-
Enable desired VC.	DSI_VC_CTRL_i [1] VC_EN	0x1
Enable DSI module.	DSI_CTRL [0] IF_EN	0x1
Wait until IF_EN = 1?	DSI_CTRL [0] IF_EN	= 0x1

10.3.5.2.2 DSI Command Mode Using the DISPC Video Port

This section explains the basic programming model of command mode using the DISPC video port.

10.3.5.2.2.1 Main Sequence - Configure DSI PLL

Table 10-506 lists the steps required to configure the DSI PLL.

Table 10-506. Configure DSI PLL

Steps	Register/Bit Field/Programming	Value
Set PLL and HSDIVIDER to ON state.	DSI_CLK_CTRL [31:30] PLL_PWR_CMD	0x2
Wait until PLL and HSDIVIDER are enabled?	DSI_CLK_CTRL [29:28] PLL_PWR_STATUS	= 0x2
Set the M5REG value.	DSI_PLL_CONFIGURATION1 [30:26] M5_CLK_DIV	x
Set the M4REG value.	DSI_PLL_CONFIGURATION1 [25:21] M4_CLOCK_DIV	x
Set the REGN value.	DSI_PLL_CONFIGURATION1 [8:1] PLL_REGN	x
Set the REGM value.	DSI_PLL_CONFIGURATION1 [20:9] PLL_REGM	x
Select PLL STOPMODE.	DSI_PLL_CONFIGURATION1 [0] PLL_STOPMODE	0x1
Enable/disable PLL reference clock control.	DSI_PLL_CONFIGURATION2 [13] PLL_REFEN	x
Enable/disable CLKIN4DDR control.	DSI_PLL_CONFIGURATION2 [14] PHY_CLKINEN	x
Enable/disable DSS clock divider.	DSI_PLL_CONFIGURATION2 [16] M4_CLOCK_EN	x
Enable/disable DSI protocol engine clock divider.	DSI_PLL_CONFIGURATION2 [18] M5_CLOCK_EN	x
Configure synchronization of configuration update with DISPC_UPDATE_SYNC.	DSI_PLL_CONTROL [0] PLL_AUTOMODE	x
Start PLL locking sequence.	DSI_PLL_GO [0] PLL_GO	0x1
Wait until there is no pending action?	DSI_PLL_GO [0] PLL_GO	= 0x0
Check whether PLL is locked?	DSI_PLL_STATUS [1] PLL_LOCK	= 0x1
Set the LP mode clock ratio.	DSI_CLK_CTRL [12:0] LP_CLK_DIVISOR	x
Configure DSS_L3_ICLK clock to the DSI complex I/O.	DSI_CLK_CTRL [14] CIO_CLK_ICG	x
Enable/disable the automatic assertion/deassertion of the DSISopClk signal.	DSI_CLK_CTRL [18] HS_AUTO_STOP_ENABLE	x

Table 10-506. Configure DSI PLL (continued)

Steps	Register/Bit Field/Programming	Value
Define the DSI functional clock value and synchronization.	DSI_CLK_CTRL[21] LP_RX_SYNCHRO_ENABLE	x
Turn on PLL and HSDIVIDER.	DSI_CLK_CTRL[31:30] PLL_PWR_CMD	0x2

10.3.5.2.2.2 Main Sequence - Switch to DSI PLL Clock Source

[Table 10-507](#) lists the sequence to switch the DSI and DISPC module clocks to DSI PLL clock source.

Table 10-507. Switch to DSI PLL Clock Source

Steps	Reference	Value
Switch DISPC clock to PLL1_CLK1.	For more information, see Section 10.1.2, DSS Integration	
Switch DSI clock to PLL1_CLK2.	For more information, see Section 10.1.2, DSS Integration .	

10.3.5.2.2.3 Main Sequence - Configure DSI Protocol Engine

10.3.5.2.2.3.1 Set Up DSI Control Registers

[Table 10-508](#) lists the steps required to set up the DSI control registers. [Table 10-509](#) lists the steps to set up the DSI complex I/O registers.

Table 10-508. DSI Control Registers

Steps	Register/Bit Field/Programming	Value
Enable IRQ for lost synchronization with video port.	DSI_IRQENABLE[18] SYNC_LOST_IRQ_EN	0x1
Enable IRQ to indicate that packet has been sent on desired VC.	DSI_VC_IRQENABLE_i[2] PACKET_SENT_IRQ_EN	0x1
Set the trigger reset mode.	DSI_CTRL[14] TRIGGER_RESET_MODE	x
Configure the number of active line buffers.	DSI_CTRL[13:12] LINE_BUFFER	x
Set the size of the video port data bus.	DSI_CTRL[7:6] VP_DATA_BUS_WIDTH	x
Define the ratio between VP_CLK and VP_PCLK.	DSI_CTRL[4] VP_CLK_RATIO	x
Set the arbitration scheme for granting the VC pending ready requests in the TX FIFO.	DSI_CTRL[3] TX_FIFO_ARBITRATION	x
Enable/disable the ECC check for the received header.	DSI_CTRL[2] ECC_RX_EN	x

Table 10-509. DSI Complex I/O Registers

Steps	Register/Bit Field/Programming	Value
Determine the position of the clock lane.	DSI_COMPLEXIO_CFG1[2:0] CLOCK_POSITION	x
Set the position of data lane 1.	DSI_COMPLEXIO_CFG1[6:4] DATA1_POSITION	x
Configure the power state of the complex I/O.	DSI_COMPLEXIO_CFG1[28:27] PWR_CMD	x
Enable the synchronization of the shadow registers with DISPC_UPDATE_SYNC.	DSI_COMPLEXIO_CFG1[30] GOBIT	0x1
Clear the complex I/O IRQ status.	DSI_COMPLEXIO_IRQSTATUS	0xFFFF FFFF
Disable all complex I/O IRQ events.	DSI_COMPLEXIO_IRQENABLE	0x0
Enable the DSI protocol engine interface.	DSI_CTRL[0] IF_EN	0x1
Disable the DSI protocol engine interface.	DSI_CTRL[0] IF_EN	0x0
Wait until interface is disabled?	DSI_CTRL[0] IF_EN	= 0x0
Enable the LP clock.	DSI_CLK_CTRL[20] LP_CLK_ENABLE	0x1

Table 10-509. DSI Complex I/O Registers (continued)

Steps	Register/Bit Field/Programming	Value
Check whether internal reset is complete?	DSI_COMPLEXIO_CFG1 [29] RESET_DONE	= 0x1
Check whether power state of complex I/O is ON?	DSI_COMPLEXIO_CFG1 [26:25] PWR_STATUS	= 0x1
Check whether reset is complete?	DSI_SYSSTATUS [0] RESETDONE	= 0x1

10.3.5.2.2.3.2 Configure DSI Timing and VCs

[Table 10-510](#) lists the steps to configure DSI timing and the VCs.

Table 10-510. DSI Timing Registers

Steps	Register/Bit Field/Programming	Value
Determine the number of DSI_FCLK clock cycles for the STOP-STATE counter.	DSI_TIMING1 [12:0] STOP_STATE_COUNTER_IO	0x-
Enable/disable the multiplication factor of 4 for the number of DSI_FCLK clock cycles for the STOP-STATE counter.	DSI_TIMING1 [13] STOP_STATE_X4_IO	0x-
Enable/disable the multiplication factor of 16 for the number of DSI_FCLK clock cycles for the STOP-STATE counter.	DSI_TIMING1 [14] STOP_STATE_X16_IO	0x-
Clear turnaround timer settings.	DSI_TIMING1 [30:16]	0x0
Determine the number of DSI_FCLK clock cycles for the LP RX timer.	DSI_TIMING2 [12:0] LP_RX_TO_COUNTER	0x-
Enable/disable the multiplication factor of 4 for the number of DSI_FCLK clock cycles for the LP RX timer.	DSI_TIMING2 [13] LP_RX_TO_X4	0x-
Enable/disable the multiplication factor of 16 for the number of DSI_FCLK clock cycles for the LP RX timer.	DSI_TIMING2 [14] LP_RX_TO_X16	0x-
Determine the number of BYTE_CLK clock cycles for the HS RX timer.	DSI_TIMING2 [28:16] HS_TX_TO_COUNTER	0x-
Enable/disable the multiplication factor of 16 for the number of BYTE_CLK clock cycles for the HS TX timer.	DSI_TIMING2 [29] HS_TX_TO_X16	0x-
Enable/disable the multiplication factor of 64 for the number of BYTE_CLK clock cycles for the HS TX timer.	DSI_TIMING2 [30] HS_TX_TO_X64	0x-
Set the number of TXBYTECLKHS clock cycles	DSI_CLK_TIMING [15:8] DDR_CLK_PRE and DSI_CLK_TIMING [7:0] DDR_CLK_POST	0x-
Configuration of VCi		
Select source of data and enable VP_STALL.	DSI_VC_CTRL_i [1] SOURCE	0x1
Enable/disable the checksum generation for the transmit payload.	DSI_VC_CTRL_i [7] CS_TX_EN	0x-
Enable/disable the ECC generation for the transmit header.	DSI_VC_CTRL_i [8] ECC_TX_EN	0x-
Enable/disable HS mode to send short and long packets to the peripheral.	DSI_VC_CTRL_i [9] MODE_SPEED	0x-
Configure DMA request for TX FIFO.	DSI_VC_CTRL_i [23:21] DMA_TX_REQ_NB	0x-
Configure DMA request for RX FIFO.	DSI_VC_CTRL_i [29:27] DMA_RX_REQ_NB	0x-
Configuration TX and RX FIFO		
Set size of the RX FIFO allocated for used VC.	DSI_RX_FIFO_VC_SIZE	0x-
Set size of the TX FIFO allocated for used VC.	DSI_TX_FIFO_VC_SIZE	0x-

10.3.5.2.2.4 Main Sequence - Configure DSI_PHY Timing

Table 10-511 summarizes DSI_PHY timing settings. For more information about timing calculation, see Section 10.3.4.4.4, *Clock Requirements*.

Table 10-511. Configure DSI_PHY Timing

Steps	Register/Bit Field/Programming	Value
Settings of the DSI protocol timing. For a complete description of timing specifications, see Section 10.3.4.4.4, <i>Clock Requirements</i> .	DSI_PHY_REGISTER0[31:24] REG_THSPREPARE	ceil(70ns/DDR clock period) + 2
	DSI_PHY_REGISTER0[23:16] REG_THSPRPR_THSZERO	ceil(175ns/DDR clock period) + 2
	DSI_PHY_REGISTER0[7:0] REG_THSEXIT	ceil(145ns/DDR clock period)
	DSI_PHY_REGISTER0[15:8] REG_THSTRAIL	ceil(60ns/DDR clock period) + 5
	DSI_PHY_REGISTER2[7:0] REG_TCLKPREPARE	ceil(65ns/DDR clock period)
	DSI_PHY_REGISTER1[7:0] REG_TCLKZERO	ceil(265ns/DDR clock period)
	DSI_PHY_REGISTER1[15:8] REG_TCLKTRAIL	ceil(60ns/DDR clock period) + 2
	DSI_PHY_REGISTER1[20:16] REG_TLPXBY2	ceil(25ns/DDR clock period)

10.3.5.2.2.5 Main Sequence - Drive STOP State

Table 10-512 lists the steps to drive the STOP state.

Table 10-512. Drive STOP State

Steps	Register/Bit Field/Programming	Value
Force TX stop mode.	DSI_TIMING1[15] FORCE_TX_STOP_MODE_IO	0x1
Wait until the end of TX stop mode assertion?	DSI_TIMING1[15] FORCE_TX_STOP_MODE_IO	= 0x1

10.3.5.2.2.6 Main Sequence - Enable Command Mode Using DISPC Video Port

Table 10-513 lists the steps to enable DISPC to send frames continuously. Two BTAs must be generated:

- The first BTA gives bus possession to the display module.
- The second BTA obtains the TE trigger.

Table 10-513. Enable Command Mode and Automatic TE

Steps	Register/Bit Field/Programming	Value
Insert DCS write memory continue/start code.	DSI_VC_CTRL_i[31] DCS_CMD_CODE	0x-
Enable/disable automatic insertion of DCS command codes when data is sourced by the video port.	DSI_VC_CTRL_i[30] DCS_CMD_ENABLE	0x-
Enable used VC.	DSI_VC_CTRL_i[0] VC_EN	0x1
Enable DSI protocol engine interface.	DSI_CTRL[0] IF_EN	0x1
Wait until interface is enabled?	DSI_CTRL[0] IF_EN	= 0x0
Send the sequence to receive the TE trigger from the peripheral.	DSI_VC_SHORT_PACKET_HEADER_i[31:0] HEADER	0x-
Wait until packet is sent?	DSI_VC_IRQSTATUS_i[2] PACKET_SENT_IRQ	= 0x1
Write 1 to reset the status bit.	DSI_VC_IRQSTATUS_i[2] PACKET_SENT_IRQ	0x1

NOTE: Keep Reserved bits at reset value in [DSI_PHY_REGISTER1](#) and [DSI_PHY_REGISTER2](#).

10.3.5.2.2.7 Main Sequence - Send Frame Data to LCD Panel Using Automatic TE

[Table 10-514](#) summarizes the steps to send a frame data to the LCD panel using automatic TE.

Table 10-514. Send Frame Data to LCD Panel Using Automatic TE

Steps	Register/Bit Field/Programming	Value
Enable the transfer between DISPC and DSI. Reset after the transfer is done.	For more information, see Section 10.2 , <i>Display Controller</i> chapter.	
Specify the number of bytes to send. When DCS insertion is used, word count (WC) must include this one DCS byte.	DSI_VC_TE_i[23:0] TE_SIZE	(WC+1)*LPP
Set up long packet header.	DSI_VC_LONG_PACKET_HEADER_i[31:0] HEADER	0x-
Enable/disable TE control.	DSI_VC_TE_i[30] TE_EN	0x1
Wait until RX FIFO is empty?	DSI_VC_CTRL_i[20] RX_FIFO_NOT_EMPTY	= 0x0
Wait until TX FIFO is not full?	DSI_VC_CTRL_i[16] TX_FIFO_FULL	= 0x0
Enable first BTA to give bus possession to the display module.	DSI_VC_CTRL_i[6] BTA_EN	0x1
Wait until BTA IRQ event occurs?	DSI_VC_IRQSTATUS_i[5] BTA_IRQ	= 0x1
Write 1 to clear BTA IRQ status bit.	DSI_VC_IRQSTATUS_i[5] BTA_IRQ	0x1
Enable the second BTA to get the TE trigger.	DSI_VC_CTRL_i[6] BTA_EN	0x1
Wait until BTA IRQ event occurs?	DSI_VC_IRQSTATUS_i[5] BTA_IRQ	= 0x1
Write 1 to clear BTA IRQ status bit.	DSI_VC_IRQSTATUS_i[5] BTA_IRQ	0x1
Wait until transfer is complete?	DSI_VC_TE_i[30] TE_EN	= 0x0

10.3.6 DSI Register Manual

This section describes the DSI module registers.

CAUTION

The main access to all DSI registers is through the L3 interconnect.
The access through L4_PER interconnect is provided for back software compatibility.

10.3.6.1 DSI Instance Summary

Table 10-515 summarizes the DSI module instances.

Table 10-515. DSI Instance Summary

Module Name	L3 Base Address	L4_PER Base Address	Size
DSI1_PROTOCOL_ENGINE	0x5800 4000	0x4804 4000	512 bytes
DSI1_PHY	0x5800 4200	0x4804 4200	64 bytes
DSI1_PLLCTRL	0x5800 4300	0x4804 4300	32 bytes
DSI2_PROTOCOL_ENGINE	0x5800 5000	0x4804 5000	512 bytes
DSI2_PHY	0x5800 5200	0x4804 5200	64 bytes
DSI2_PLLCTRL	0x5800 5300	0x4804 5300	32 bytes

MIPI Display Serial Interface

www.ti.com

Bits	Field Name	Description	Type	Reset
31:25	RESERVED		R	0x00
24	DISPC_UPDATE_SYNC	Determines if the Dispc_Update_Sync signal from the display controller is used. 0x0: Dispc_Update_Sync signal is not used. 0x1: Dispc_Update_Sync signal is used.	RW	0
23	HSA_BLANKING_MODE	Blanking mode 0x0: Packets in TX FIFO are sent during HSA blanking period of video mode or LPS is used. 0x1: LONG BLANKING PACKETS only are used during HSA blanking period of video mode.	RW	0
22	HBP_BLANKING_MODE	Blanking mode 0x0: Packets in TX FIFO are sent during HBP blanking period of video mode or LPS is used. 0x1: LONG BLANKING PACKETS only are used during HBP blanking period of video mode.	RW	0
21	HFP_BLANKING_MODE	Blanking mode 0x0: Packets in TX FIFO are sent during HFP blanking period of video mode or LPS is used. 0x1: LONG BLANKING PACKETS only are used during HFP blanking period of video mode.	RW	0
20	BLANKING_MODE	Blanking mode 0x0: LPS is used during blanking periods of video mode (except HSA, HBP, HFP defined in HSA_BLANKING_MODE, HBP_BLANKING_MODE AND HFP_BLANKING_MODE respectively) when there is no command mode data in TX FIFO ready to be sent. So blanking periods can be different during the frame depending on the TX FIFO. 0x1: LONG BLANKING PACKETS are used during blanking periods of video mode (except HSA, HBP, HFP defined in HSA_BLANKING_MODE, HBP_BLANKING_MODE AND HFP_BLANKING_MODE respectively) regardless of the packets present in the TX FIFO ready to be sent	RW	0
19	EOT_ENABLE	Enable EOT packets at the end of HS transmission. 0x0: No EOT packets 0x1: EOT packet is sent at all HS to LP transitions.	RW	0
18	VP_HSYNC_END	HSYNC end pulse. 0x0: Disabled. No HSYNC END short packet is generated. 0x1: Enabled. While the HSYNC END pulse is detected, the associated short packet HSYNC END is generated.	RW	0
17	VP_HSYNC_START	HSYNC start pulse. 0x0: Disabled. No HSYNC START short packet is generated. 0x1: Enabled. While the HSYNC start pulse is detected, the associated short packet HSYNC START is generated.	RW	0
16	VP_VSYNC_END	VSYNC end pulse. 0x0: Disabled. No VSYNC END short packet is generated. 0x1: Enabled. While the VSYNC END pulse is detected, the associated short packet VSYNC END is generated.	RW	0

Bits	Field Name	Description	Type	Reset
15	VP_VSYNC_START	<p>VSYNC start pulse.</p> <p>0x0: Disabled. No VSYNC START short packet is generated.</p> <p>0x1: Enabled. While the VSYNC START pulse is detected, the associated short packet VSYNC START is generated.⁽¹⁾</p>	RW	0
14	TRIGGER_RESET_MODE	<p>Selection of the trigger reset mode</p> <p>0x0: Synchronized: the mode is only valid if there is virtual channel using the video mode and it is active. The principal is to wait for the current video frame to be transferred on the link. Any data received after the VSYNC are ignored.</p> <p>0x1: Immediate: all pending requests in TX FIFO are taken into account for transfer scheduling, the RX FIFO is ignored, and the data from video port are ignored as soon as possible. Only the current transfer on DSI link and already scheduled ones are transmitted. All the other transfers are discarded.</p>	RW	0
13:12	LINE_BUFFER	<p>Number of line buffers to be used while receiving data on the video port. The valid values are from 0 to DSI_GNQ[17:16] VP1_NB_LINE_BUFFER.</p> <p>0x0: No line buffer</p> <p>0x1: 1 line buffer</p> <p>0x2: 2 line buffers</p>	RW	0x0
11	VP_VSYNC_POL	<p>VP vertical synchronization signal polarity</p> <p>0x0: VSYNC signal on the video port is active low.</p> <p>0x1: VSYNC signal on the video port is active high.</p>	RW	0
10	VP_HSYNC_POL	<p>VP horizontal synchronization signal polarity</p> <p>0x0: HSYNC signal on the video port is active low.</p> <p>0x1: HSYNC signal on the video port is active high.</p>	RW	0
9	VP_DE_POL	<p>VP data enable signal polarity</p> <p>0x0: DE signal on the video port is active low.</p> <p>0x1: DE signal on the video port is active high.</p>	RW	0
8	VP_CLK_POL	<p>VP pixel clock polarity</p> <p>0x0: The DSI Protocol Engine module captures the data on the VP on the pixel clock falling edge. The module connected to the VP shall drive the data on the pixel clock rising edge.</p> <p>0x1: The DSI Protocol Engine module captures the data on the VP on the pixel clock raising edge. The module connected to the VP shall drive the data on the pixel clock falling edge.</p>	RW	1
7:6	VP_DATA_BUS_WIDTH	<p>Defines the size of the video port data bus</p> <p>0x0: 16-bits data width (LSB of the 24-bit video port data bus)</p> <p>0x1: 18-bits data width (LSB of the 24-bit video port data bus)</p> <p>0x2: 24-bits data width (LSB of the 24-bit video port data bus)</p>	RW	0x0

⁽¹⁾ In DSI video mode, if the VSA bit field in DSI_VM_TIMING2 is set to 0x0, no vertical synchronization packet will be sent even if VP_VSYNC_START is set to 0x1 in DSI_CTRL.

Bits	Field Name	Description	Type	Reset
5	TRIGGER_RESET	Send the reset trigger to the peripheral. 0x0: READS: Reset trigger generation is completed. It is reset by hardware when it is completed. WRITES: Cancellation of the request for Reset trigger generation (maybe too late since it is already on going) 0x1: READS: Generation of the reset trigger has been requested by user (could be on going but not completed yet). WRITES: Request for Reset trigger to be sent to the peripheral.	RW	0
4	VP_CLK_RATIO	The field indicates the clock ratio between VP_CLK and VP_PCLK. The clock VP_PCLK is generated from VP_CLK. It is divided down. The information is only used when the video port is used to provide data in command mode. In the case of video mode, it is not used. 0x0: The clock VP_PCLK is the clock VP_CLK divided by 2. The duty cycle of VP_PCLK is 50/50. 0x1: The clock VP_PCLK is the clock VP_CLK divided by 3 or more. The duty cycle of VP_PCLK is not 50/50 for odd ratio numbers (3,5,7,...).	RW	0
3	TX_FIFO_ARBITRATION	Defines the arbitration scheme for granting the virtual channel pending ready requests in the TX FIFO 0x0: Round-Robin Scheme is used 0x1: Sequential Scheme is used	RW	0
2	ECC_RX_EN	Enables the Error Correction Code check for the received header (short and long packets for all virtual channel ids). 0x0: Disabled 0x1: Enabled	RW	0
1	CS_RX_EN	Enables the checksum check for the received payload (long packet only for all virtual channel ids). 0x0: Disabled 0x1: Enabled	RW	0
0	IF_EN	Enables the module. When the module is disabled the signals from the complex I/O are gated (no updates of the interrupt status register). It is not possible to change the bit fields in the register DSI_CTRL except IF_EN when it is enabled. All the other registers can be changed except the ones that require DSI_VC_CTRL_i[0] VC_EN to be equal to 0 to be modified. 0x0: The interface is disabled. If one of the virtual channel uses the video mode with the video port to receive the data, the DSI protocol engines is disabled when the next VSYNC is received and all the data in the FIFO for the other virtual channels in command mode are sent to the peripherals (if BTA_EN is enabled, the DSI protocol needs to wait for the response and BTA from the peripheral before disabling all the internal logic since an acknowledge is requested). 0x1: The interface is enabled immediately, the data acquisition on the video port starts on the next VSYNC (video mode) or first data received in the Slave port FIFO (command mode).	RW	0

MIPI Display Serial Interface

www.ti.com

Bits	Field Name	Description	Type	Reset
31:25	RESERVED		R	0x00
24	NB_VIDEO_PORTS	Number of video ports Read 0x0: Video port 1 only is present Read 0x1: Video port 1 and video port 2 are present	R	0
23:22	VP2_NB_LINE_BUFFER	Determines the number of video buffer lines associated to video port 2. Read 0x0: No line buffer Read 0x1: 1 line buffer of the size defined in LINE_BUFFER_SIZE Read 0x2: 2 line buffers of the size defined in LINE_BUFFER_SIZE	R	0x2 for DSI1 0x0 for DSI2
21	RESERVED		R	0
20:18	VP2_LINE_BUFFER_SIZE	Determines the video line buffer size associated to video port 2 . Read 0x1: 512x24-bits, 682x18-bits, 768x16bits (memory of 384x32-bits) Read 0x2: 682x24-bits, 910x18-bits, 1024x16bits (memory of 512x32-bits) Read 0x3: 853x24-bits, 1137x18-bits, 1280x16bits (memory of 640x32-bits) Read 0x4: 1024x24-bits, 1365x18-bits, 1536x16bits (memory of 768x32-bits) Read 0x5: 1194x24-bits, 1592x18-bits, 1792x16bits (memory of 896x32-bits) Read 0x6: 1365x24-bits, 1820x18-bits, 2048x16bits (memory of 1024x32-bits)	R	0x4 for DSI1 0x1 for DSI2
17:16	VP1_NB_LINE_BUFFER	Determines the number of video buffer lines associated to video port 1. Read 0x0: No line buffer Read 0x1: 1 line buffer of the size defined in LINE_BUFFER_SIZE Read 0x2: 2 line buffers of the size defined in LINE_BUFFER_SIZE	R	0x2
15	RESERVED		R	0
14:12	VP1_LINE_BUFFER_SIZE	Determines the video line buffer size associated to video port 1 . Read 0x1: 512x24-bits, 682x18-bits, 768x16bits (memory of 384x32-bits) Read 0x2: 682x24-bits, 910x18-bits, 1024x16bits (memory of 512x32-bits) Read 0x3: 853x24-bits, 1137x18-bits, 1280x16bits (memory of 640x32-bits) Read 0x4: 1024x24-bits, 1365x18-bits, 1536x16bits (memory of 768x32-bits) Read 0x5: 1194x24-bits, 1592x18-bits, 1792x16bits (memory of 896x32-bits) Read 0x6: 1365x24-bits, 1820x18-bits, 2048x16bits (memory of 1024x32-bits)	R	0x6 for DSI1 0x4 for DSI2
11:9	NB_DATA_LANES	Determines the number of data lanes supported by the DSI protocol engine . Read 0x1: 1 Data lane Read 0x2: 2 Data lanes Read 0x3: 3 Data lanes Read 0x4: 4 Data lanes	R	0x4 for DSI1 0x2 for DSI2

Bits	Field Name	Description	Type	Reset
8:6	NB_DMA_REQUEST	Determines the number of DMA_REQ signals. Read 0x0: No DMA request Read 0x1: 1 DMA request Read 0x2: 2 DMA requests Read 0x3: 3 DMA requests Read 0x4: 4 DMA requests	R	0x4
5:3	RX_FIFODEPTH	Determines the data RX FIFO depth (32-bit words) on the slave port. Read 0x4: 32x 33 bits Read 0x5: 64x 33 bits Read 0x6: 128 x 33 bits Read 0x7: 256 x 33 bits	R	0x6
2:0	TX_FIFODEPTH	Determines the data TX FIFO depth (33-bit words) on the slave port. Read 0x4: 32x 33 bits Read 0x5: 64x 33 bits Read 0x6: 128 x 33 bits Read 0x7: 256 x 33 bits	R	0x6

Table 10-532. DSI_COMPLEXIO_CFG1

Address Offset	0x0000 0048	Instance	DSI1_PROTOCOL_ENGINE_L3 DSI1_PROTOCOL_ENGINE_PE R_L4 DSI2_PROTOCOL_ENGINE_L3 DSI2_PROTOCOL_ENGINE_PE R_L4
Physical Address	0x5800 4048 0x4804 4048 0x5800 5048 0x4804 5048		
Description	COMPLEXIO CONFIGURATION REGISTER for the complex I/O This register contains the lane configuration for the order and position of the lanes (clock and data) and the polarity order for the control of the PHY differential signals in addition to the control bit for the power FSM.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SHADOWING	GOBIT	RESET_DONE	PWR_CMD	PWR_STATUS	RESERVED	RESERVED	RESERVED	DATA4_POL	DATA4_POSITION	DATA3_POL	DATA3_POSITION	DATA2_POL	DATA2_POSITION	DATA1_POL	DATA1_POSITION	CLOCK_POL	CLOCK_POSITION														

Bits	Field Name	Description	Type	Reset
31	SHADOWING	Shadowing configuration. 0x0: Disabled. The writes to the DSI_PHY_REGISTER0 through DSI_PHY_REGISTER2 registers is done like the other SCP registers. 0x1: Enabled. The writes to the DSI_PHY_REGISTER0 through DSI_PHY_REGISTER2 registers is done only when the GOBIT is set and when the signal DISPCUpdateSync from the display controller module is active.	RW	0
30	GOBIT	Allows the synchronized update of the shadow registers when the signal DISPCUpdateSync is active. 0x0: Resets the GOBIT. The hardware has finished the update of the shadow SCP registers. The bit is reset by Hardware. The software can reset the bit in case the user decides to abort it. There is no guarantee that the software reset is done before the transfer of the values to the complex IO. 0x1: Set the GOBIT. Only when the transfer of the new values for the three first registers is completed (3, 2, 1, or 0 transfers are performed based on the number of registers to update), the GOBIT is reset. The DISPCUpdateSync signal is used to synchronize the update. The bit shall be set only when it is in reset state.	RW	0
29	RESET_DONE	Internal reset monitoring of the power domain using the TXBYTECLKHS clock from the complex I/O Read 0x0: Internal module reset is on going. Read 0x1: Reset completed.	R	1
28:27	PWR_CMD	Command for power control of the complex I/O 0x0: Command to change to OFF state 0x1: Command to change to ON state 0x2: Command to change to ULTRALOW-POWER state	RW	0x0
26:25	PWR_STATUS	Status of the power control of the complex I/O Read 0x0: Complex I/O in OFF state Read 0x1: Complex I/O in ON state Read 0x2: Complex I/O in ULTRALOW-POWER state	R	0x0
24:22	RESERVED	Reserved	R	0x0
21	RESERVED	Reserved	R	0
20	RESERVED	Reserved	RW	0
19	DATA4_POL	+/- differential pin order of DATA lane 4. Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: +/- pin order (DSi.DX=+ and DSi.DY=-) 0x1: -/+ pin order (DSi.DX=- and DSi.DY=+)	RW	0
18:16	DATA4_POSITION	Position and order of the DATA lane 4. Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: Not used/connected 0x1: Data lane 4 is at the position 1 (lane 1). 0x2: Data lane 4 is at the position 2 (lane 2). 0x3: Data lane 4 is at the position 3 (lane 3). 0x4: Data lane 4 is at the position 4 (lane 4). 0x5: Data lane 4 is at the position 5 (lane 5).	RW	0x0
15	DATA3_POL	+/- differential pin order of DATA lane 3. Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: +/- pin order (DSi.DX=+ and DSi.DY=-) 0x1: -/+ pin order (DSi.DX=- and DSi.DY=+)	RW	0

Bits	Field Name	Description	Type	Reset
14:12	DATA3_POSITION	Position and order of the DATA lane 3. Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: Not used/connected 0x1: Data lane 3 is at the position 1 (lane 1). 0x2: Data lane 3 is at the position 2 (lane 2). 0x3: Data lane 3 is at the position 3 (lane 3). 0x4: Data lane 3 is at the position 4 (lane 4). 0x5: Data lane 3 is at the position 5 (lane 5).	RW	0x0
11	DATA2_POL	+/- differential pin order of DATA lane 2. 0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+)	RW	0
10:8	DATA2_POSITION	Position and order of the DATA lane 2. 0x0: Not used/connected 0x1: Data lane 2 is at the position 1 (lane 1). 0x2: Data lane 2 is at the position 2 (lane 2). 0x3: Data lane 2 is at the position 3 (lane 3). 0x4: Data lane 2 is at the position 4 (lane 4). 0x5: Data lane 2 is at the position 5 (lane 5).	RW	0x0
7	DATA1_POL	+/- pin differential pin order of DATA lane 1 0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+)	RW	0
6:4	DATA1_POSITION	Position and order of the DATA lane 1. The data lane 1 is always present. 0x0: Not used/connected 0x1: Data lane 1 is at the position 1 (lane 1). 0x2: Data lane 1 is at the position 2 (lane 2). 0x3: Data lane 1 is at the position 3 (lane 3). 0x4: Data lane 1 is at the position 4 (lane 4). 0x5: Data lane 1 is at the position 5 (lane 5).	RW	0x0
3	CLOCK_POL	+/- differential pin order of CLOCK lane. 0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+)	RW	0
2:0	CLOCK_POSITION	Position and order of the CLOCK lane. 0, 5, 6 and 7 are reserved. The clock lane is always present but cannot be at the position 5 even if the COMPLEX I/O consists of 5 lanes. 0x0: Not used/connected 0x1: Clock lane is at the position 1 (lane 1). 0x2: Clock lane is at the position 2 (lane 2). 0x3: Clock lane is at the position 3 (lane 3). 0x4: Clock lane is at the position 4 (lane 4). 0x5: Reserved 0x6: Reserved 0x7: Reserved	RW	0x0

Bits	Field Name	Description	Type	Reset
31	ULPSACTIVENOT_ALL1_IRQ	All the ULPSActiveNOT signals corresponding to the lanes with TXULPSExit being high are high. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
30	ULPSACTIVENOT_ALL0_IRQ	All signals ULPSActiveNOT are 0 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
29	ERRCONTENTIONLP1_5_IRQ	Contention LP1 error for lane 5 Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0

Bits	Field Name	Description	Type	Reset
28	ERRCONTENTIONLP0_5_IRQ	Contention LP0 error for lane 5 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
27	ERRCONTENTIONLP1_4_IRQ	Contention LP1 error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
26	ERRCONTENTIONLP0_4_IRQ	Contention LP0 error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
25	ERRCONTENTIONLP1_3_IRQ	Contention LP1 error for lane 3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
24	ERRCONTENTIONLP0_3_IRQ	Contention LP0 error for lane 3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
23	ERRCONTENTIONLP1_2_IRQ	Contention LP1 error for lane 2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
22	ERRCONTENTIONLP0_2_IRQ	Contention LP0 error for lane 2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
21	ERRCONTENTIONLP1_1_IRQ	Contention LP1 error for lane 1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
20	ERRCONTENTIONLP0_1_IRQ	Contention LP0 error for lane 1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
19	STATEULPS5_IRQ	lane 5 in ULTRALOW-POWER State Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0

Bits	Field Name	Description	Type	Reset
18	STATEULPS4_IRQ	lane 4 in ultralow-power mode Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
17	STATEULPS3_IRQ	lane 3 in ULTRALOW-POWER state 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
16	STATEULPS2_IRQ	lane 2 in ULTRALOW-POWER state 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
15	STATEULPS1_IRQ	lane 1 in ULTRALOW-POWER state 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
14	ERRCONTROL5_IRQ	Control error for lane 5 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
13	ERRCONTROL4_IRQ	Control error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
12	ERRCONTROL3_IRQ	Control error for lane 3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
11	ERRCONTROL2_IRQ	Control error for lane 2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
10	ERRCONTROL1_IRQ	Control error for lane 1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
9	ERRESC5_IRQ	Escape entry error for lane 5 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0

Bits	Field Name	Description	Type	Reset
8	ERRESC4_IRQ	Escape entry error for lane 4 Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
7	ERRESC3_IRQ	Escape entry error for lane 3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
6	ERRESC2_IRQ	Escape entry error for lane 2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
5	ERRESC1_IRQ	Escape entry error for lane 1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
4	ERRSYNCESC5_IRQ	Low power Data transmission synchronization error for lane 5 Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
3	ERRSYNCESC4_IRQ	Low power Data transmission synchronization error for lane 4 Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
2	ERRSYNCESC3_IRQ	Low power Data transmission synchronization error for lane 3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
1	ERRSYNCESC2_IRQ	Low power Data transmission synchronization error for lane 2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
0	ERRSYNCESC1_IRQ	Low power Data transmission synchronization error for lane 1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0

Physical Address	0x5800 4054 0x4804 4054 0x5800 5054 0x4804 5054		
Description	CLOCK CONTROL This register controls the CLOCK GENERATION. The register can be modified only when IF_EN is reset.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PLL_PWR_CMD		PLL_PWR_STATUS		RESERVED				LP_RX_SYNCHRO_ENABLE		LP_CLK_ENABLE		HS_MANUAL_STOP_CTRL		HS_AUTO_STOP_ENABLE		LP_CLK_NULL_PACKET_SIZE		LP_CLK_NULL_PACKET_ENABLE		CIO_CLK_ICG		DDR_CLK_ALWAYS_ON		LP_CLK_DIVISOR							

Bits	Field Name	Description	Type	Reset
31:30	PLL_PWR_CMD	Command for power control of the DSI PLL Control module 0x0: Command to change to OFF state 0x1: Command to change to ON state for PLL only (HSDIVISER is OFF) 0x2: Command to change to ON state for both PLL and HSDIVISER 0x3: Command to change to ON state for both PLL and HSDIVISER (no clock output to the DSI complex I/O)	RW	0x0

Bits	Field Name	Description	Type	Reset
29:28	PLL_PWR_STATUS	Status of the power control of the DSI PLL Control module Read 0x0: DSI PLL Control module in OFF state Read 0x1: DSI PLL Control module in ON state for PLL only (HSDIVISER is OFF) Read 0x2: DSI PLL Control module in ON state for both PLL and HSDIVISER Read 0x3: DSI PLL Control module in ON state for both PLL and HSDIVISER (no clock output to the DSI complex I/O)	R	0x0
27:22	RESERVED		R	0x00
21	LP_RX_SYNCHRO_ENABLE	Defines if the functional is higher or lower than 30 MHz. The information is used to define synchronization to be used for RxValidEsc. 0x0: The DSI functional clock is equal or slower than 30 MHz. The synchronization is falling/rising. 0x1: The DSI functional clock is higher than 30 MHz. The synchronization is rising/rising.	RW	0
20	LP_CLK_ENABLE	Controls the gating of the TXCLKESC clock. 0x0: Disabled. The clock is not generated. The value of LP_CLK_DIVISOR is not used and does not need to be programmed. 0x1: Enabled. The clock is generated. The value of LP_CLK_DIVISOR is used and needs to be programmed.	RW	0
19	HS_MANUAL_STOP_CTRL	In case HS_AUTO_STOP_ENABLE=0, the bit field allows manual control of the assertion/de-assertion of the signal DSISStopClk by the user. 0x0: DSISStopClk de-assertion unconditionally. 0x1: DSISStopClk assertion unconditionally.	RW	0
18	HS_AUTO_STOP_ENABLE	Enables the automatic assertion/de-assertion of DSISStopClk signal. 0x0: Auto mode disabled. 0x1: Auto mode enabled.	RW	0
17:16	LP_CLK_NULL_PACKET_SIZE	Indicates the size of LP NULL Packets to be sent automatically when after the last LP packet transfer. It is used by the receiver to drain its internal pipeline. The valid values are from 0 to 3 bytes for the payload size.	RW	0x0
15	LP_CLK_NULL_PACKET_ENABLE	Enables the generation of NULL packet in low speed. 0x0: Disabled. The NULL packet is not sent in LP mode after the last LP packet. 0x1: Enabled. The NULL packet is sent in LP mode after the last LP packet.	RW	0
14	CIO_CLK_ICG	Gates SCPClk clock provided to DSI_PHY and PLL-CTRL module. 0x0: Disabled. SCPClk is not generated. It remains at 0. 0x1: Enabled. SCPClk is generated (OCP_CLK/4)	RW	0
13	DDR_CLK_ALWAYS_ON	Defines if the DDR clock is also sent when there is no HS packets sent to the peripheral (low-power mode). So TXRequest for the clock lane is not de-asserted. 0x0: Disabled. The DDR clock is only provided when HS packets are sent. 0x1: Enabled. The DDR clock is always sent to the peripheral regardless of the state of the data lanes (HS or LS mode).	RW	0
12:0	LP_CLK_DIVISOR	Defines the ratio to be used for the generation of the low-power mode clock from DSI functional clock. The supported values are from 1 to 8191(the value 0 is invalid). The output frequency shall be in the range between 20 MHz and 32 kHz.	RW	0x0001

Address Offset	0x0000 0058		
Physical Address	0x5800 4058 0x4804 4058 0x5800 5058 0x4804 5058	Instance	DSI1_PROTOCOL_ENGINE_L3 DSI1_PROTOCOL_ENGINE_PE R_L4 DSI2_PROTOCOL_ENGINE_L3 DSI2_PROTOCOL_ENGINE_PE R_L4
Description	TIMING1 REGISTER This register controls the DSI Protocol Engine module timers. Any bit field can be modified while DSI_CTRL[0] IF_EN is set to '1'. It is used to indicate the number of DSI1_CLK and DSI2_CLK functional clocks cycles for the timers FORCE_TX_STOP_TIMER and TA_TO_TIMER		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TA_TO	TA_TO_X16	TA_TO_X8	TA_TO_COUNTER													FORCE_TX_STOP_MODE_IO	STOP_STATE_X16_IO	STOP_STATE_X4_IO	STOP_STATE_COUNTER_IO												

Bits	Field Name	Description	Type	Reset
31	TA_TO	Enables the turn-around timer 0x0: Turn-around counter is disabled. 0x1: Turn-around counter is enabled (required to receive TA interrupt in case the turn-around procedure is not successful).	RW	0
30	TA_TO_X16	Multiplication factor for the number of DSI_CLK functional clocks cycles defined in TA_TO_COUNTER bit field 0x0: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 1x 0x1: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 16x	RW	1

Bits	Field Name	Description	Type	Reset
29	TA_TO_X8	Multiplication factor for the number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER bit field 0x0: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 1x 0x1: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 8x	RW	1
28:16	TA_TO_COUNTER	Turn around counter. It indicates the number of DSI_CLK function clock to wait for the change of the Direction PPI signal according to the TurnRequest signal The value is from 0 to 8191.	RW	0x1FFF
15	FORCE_TX_STOP_MODE_IO	Control of ForceTxStopMode signal 0x0: De-assertion of ForceTxStopMode. The hardware reset the bit at the end of the ForceTXStopMode assertion. The software can reset the bit in order to stop the assertion of the ForceTXStopMode signal prior to the completion of the period. 0x1: Assertion of ForceTxStopMode	RW	0
14	STOP_STATE_X16_IO	Multiplication factor for the number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO bit field 0x0: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO is multiplied by 1x 0x1: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO is multiplied by 16x	RW	1
13	STOP_STATE_X4_IO	Multiplication factor for the number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO bit field 0x0: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER is multiplied by 1x 0x1: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO is multiplied by 4x	RW	1
12:0	STOP_STATE_COUNTER_IO	Stop state counter. It indicates the number of DSI_CLK function clock to assert ForceTXStopMode signal. The value is from 0 to 8191.	RW	0x1FFF

Description	VIDEO MODE TIMING REGISTER This register defines the video mode timing.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED				WINDOW_SYNC				VSA								VFP								VBP							

Bits	Field Name	Description	Type	Reset
31:28	RESERVED		R	0x0
27:24	WINDOW_SYNC	Number of BYTE clock cycles for the synchronization window. An interrupt for synchronization lost is generated when the received synchornization on video port is not inside the window. DSI does not change its own timings if the synch is inside the window. The valid values are from 4 to 15.	RW	0x0
23:16	VSA	Defines the vertical Sync active period used in video mode in number of lines. The supported values are from 0 to 255 It is used to generate the short packet for End of Vertical synchronization. ⁽¹⁾	RW	0x00
15:8	VFP	Defines the vertical front porch used in video mode in number of lines. The supported values are from 0 to 255	RW	0x00
7:0	VBP	Defines the vertical back porch used in video mode in number of lines. The supported values are from 0 to 255	RW	0x00

⁽¹⁾ In DSI video mode, if the VSA bit field in DSI_VM_TIMING2 is set to 0x0, no vertical synchronization packet will be sent even if VP_VSYNC_START is set to 0x1 in DSI_CTRL.

RESERVED																DDR_CLK_PRE								DDR_CLK_POST							

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0000
15:8	DDR_CLK_PRE	Indicates the number of TXBYTECLKHS clock cycles between the start of the DDR clock and the assertion of the data request signal. The values from 1 to 255 are valid. The value 0 is reserved. The value is not used if DSI_CLK_CTRL[13] DDR_CLK_ALWAYS_ON is set to '1' since the DDR clock is always present.	RW	0x01

Bits	Field Name	Description	Type	Reset
7:0	DDR_CLK_POST	Indicates the number of TXBYTECLKHS clock cycles after the de-assertion of the data request signal and the stop of the DDR clock. The values from 1 to 255 are valid. The value 0 is reserved. The value is not used if DSI_CLK_CTRL [13] DDR_CLK_ALWAYS_ON is set to '1' since the DDR clock is always present.	RW	0x01

Address Offset	0x0000 008C		
Physical Address	0x5800 408C 0x4804 408C 0x5800 508C 0x4804 508C	Instance	DSI1_PROTOCOL_ENGINE_L3 DSI1_PROTOCOL_ENGINE_P R_L4 DSI2_PROTOCOL_ENGINE_L3 DSI2_PROTOCOL_ENGINE_P R_L4
Description	VIDEO MODE TIMING REGISTER This register defines the video mode timing.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BL_HS_INTERLEAVING																BL_LP_INTERLEAVING															

Bits	Field Name	Description	Type	Reset
31:16	BL_HS_INTERLEAVING	Defines the number of TXBYTECLKHS clock cycles that can be used for interleaving High Speed command mode packet into Video Mode stream during blanking periods during VSA, VBP, VFP periods inside one video frame on PPI link. The supported values are from 0 to 65535 .	RW	0x0000
15:0	BL_LP_INTERLEAVING	Defines the maximum number of bytes of Low Power command mode packets that can be sent on PPI link during blanking periods during VSA, VBP or VFP periods inside one video frame on PPI link. The supported values are from 0 to 65535	RW	0x0000

Description	Defines the minimum number of HS bytes clock cycles that are required to allow for the delays in entering and exiting HS mode. The supported values are from 0 to 65535		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ENTER_HS_MODE_LATENCY																EXIT_HS_MODE_LATENCY															

Bits	Field Name	Description	Type	Reset
31:16	ENTER_HS_MODE_LATENCY	Defines the number of TXBYTECLKHS clock cycles necessary for entering to HS mode. It corresponds to the delay in number of HS clock cycles from assertion of TxRequestHS signal to 1 until assertion of TxReadyHS signal to 1. The supported values are from 0 to 65535 .	RW	0x0000

Bits	Field Name	Description	Type	Reset
15:0	EXIT_HS_MODE_LATENCY	Defines the number of TXBYTECLKHS clock cycles necessary for exiting from HS mode. It corresponds to the maximum delay in number of TXBYTECLKHS clock from de-assertion of TxRequestHS signal until PPI link is in LP-11 state from which a new entrance to HS mode can be initiated which does not take more than ENTER_HS_MODE_LATENCY clock cycles. The supported values are from 0 to 65535	RW	0x0000

RESERVED																LINE_BUFFER						VP_DATA_BUS_WIDTH		RESERVED	VP_CLK_RATIO		RESERVED							
																VP_VSYNC_POL		VP_HSYNC_POL		VP_DE_POL		VP_CLK_POL												

Bits	Field Name	Description	Type	Reset
31:14	RESERVED		R	0x00000
13:12	LINE_BUFFER	Number of line buffers to be used while receiving data on the video port. The valid values are from 0 to DSI_GNQ[23:22] VP2_NB_LINE_BUFFER. 0x0: No line buffer 0x1: 1 line buffer 0x2: 2 line buffers	RW	0x0
11	VP_VSYNC_POL	VP vertical synchronization signal polarity 0x0: VSYNC signal on the video port is active low. 0x1: VSYNC signal on the video port is active high.	RW	0
10	VP_HSYNC_POL	VP horizontal synchronization signal polarity 0x0: HSYNC signal on the video port is active low. 0x1: HSYNC signal on the video port is active high.	RW	0
9	VP_DE_POL	VP data enable signal polarity 0x0: DE signal on the video port is active low. 0x1: DE signal on the video port is active high.	RW	0
8	VP_CLK_POL	VP pixel clock polarity 0x0: The DSI Protocol Engine module captures the data on the VP on the pixel clock falling edge. The module connected to the VP shall drive the data on the pixel clock rising edge. 0x1: The DSI Protocol Engine module captures the data on the VP on the pixel clock raising edge. The module connected to the VP shall drive the data on the pixel clock falling edge.	RW	1
7:6	VP_DATA_BUS_WIDTH	Defines the size of the video port data bus 0x0: 16-bits data width (LSB of the 24-bit video port data bus) 0x1: 18-bits data width (LSB of the 24-bit video port data bus) 0x2: 24-bits data width (LSB of the 24-bit video port data bus)	RW	0x0
5	RESERVED		R	0

Bits	Field Name	Description	Type	Reset
4	VP_CLK_RATIO	The field indicates the clock ratio between VP_CLK and VP_PCLK. The clock VP_PCLK is generated from VP_CLK. It is divided down. The information is only used when the video port is used to provide data in command mode. In the case of video mode, it is not used. 0x0: The clock VP_PCLK is the clock VP_CLK divided by 2. The duty cycle of VP_PCLK is 50/50. 0x1: The clock VP_PCLK is the clock VP_CLK divided by 3 or more. The duty cycle of VP_PCLK is not 50/50 for odd ratio numbers (3,5,7,...).	RW	0
3:0	RESERVED		R	0x0

MIPI Display Serial Interface

www.ti.com

Bits	Field Name	Description	Type	Reset
31	DCS_CMD_CODE	DCS command code value to insert between header and video port or Interface slave data when enabled by DCS_CMD_ENABLE (only when TE mechanism is not used otherwise the bit field DCS_CMD_CODE is ignored by DSI protocol engine). 0x0: DCS write memory continue code is inserted. 0x1: DCS write memory start code is inserted.	RW	0
30	DCS_CMD_ENABLE	Enables automatic insertion of DCS command codes when data is sourced by the video port. 0x0: DCS command code is NOT inserted when command mode traffic is coming from the Video Port or Interface slave port. 0x1: DCS command code is inserted automatically when command mode traffic is coming from the Video Port or Interface slave port.	RW	0
29:27	DMA_RX_REQ_NB	Selection of the use of the DMA request (associated to the RX FIFO) 0x0: DMA_req0 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 0) 0x1: DMA_req1 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 1) 0x2: DMA_req2 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 2) 0x3: DMA_req3 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is equal to 3) 0x4: No DMA req selected	RW	0x0
26:24	DMA_RX_THRESHOLD	Defines the threshold value for the DMA request (associated to the RX FIFO) 0x0: 1x 32 bits 0x1: 2 x 32 bits 0x2: 4 x 32 bits 0x3: 8 x 32 bits 0x4: 16 x 32 bits 0x5: 32 x 32 bits	RW	0x0
23:21	DMA_TX_REQ_NB	Selection of the use of the DMA request (associated to the TX FIFO) 0x0: DMA_req0 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 0) 0x1: DMA_req1 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 1) 0x2: DMA_req2 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 2) 0x3: DMA_req3 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is equal to 3) 0x4: No DMA req selected	RW	0x0
20	RX_FIFO_NOT_EMPTY	FIFO status in command mode. Otherwise, this bit can be ignored. Read 0x0: The RX FIFO is empty (the FIFO does not contain any data for the virtual channel) Read 0x1: The RX FIFO is not empty (the FIFO contains at least one byte for the virtual channel)	R	0

Bits	Field Name	Description	Type	Reset
19:17	DMA_TX_THRESHOLD	Defines the threshold value for the DMA request (associated to the TX FIFO) 0x0: 1x 32 bits 0x1: 2 x 32 bits 0x2: 4 x 32 bits 0x3: 8 x 32 bits 0x4: 16 x 32 bits 0x5: 32 x 32 bits	RW	0x0
16	TX_FIFO_FULL	FIFO status in command mode. Otherwise, this bit can be ignored. Read 0x0: The TX FIFO is not full (the FIFO can accept at least one more 32-bit value) Read 0x1: The TX FIFO is full	R	0
15	VC_BUSY	Indicates if previously scheduled activities (packets, BTA) are still being processed. Forced to 1 if VC is enabled. Software should check this bit is 0 before changing channel configuration. Read 0x0: No pending operations for this VC Read 0x1: Pending operations for this VC	R	0
14	PP_BUSY	Ping-pong buffer busy status. Read 0x0: Software is permitted to write a new header for VP command mode traffic. Read 0x1: Software is NOT permitted to write a new header for VP command mode traffic.	R	0
13	VP_SOURCE	Selection between video port 1 and video port 2. If DSI_GNQ[24] NB_VIDEO_PORTS = 0, the bit field is ignored since only video port 1 is present. 0x0: The video port 1 is selected. 0x1: The video port 2 is selected. Note: This selection applies only to DSI1. For DSI2 to work properly, the VP_SOURCE bit must always be set to 0x0.	RW	0
12	RGB565_ORDER	Byte order for RGB565 0x0: Byte order as for DBI compliance 0x1: Byte order as for video mode	RW	0
11:10	OCP_DATA_BUS_WIDTH	Defines the size of the Interface data bus 0x0: 16-bits data width (LSB of the 32-bit Interface port data bus) 0x1: 24-bits data width (LSB of the 32-bit Interface port data bus) 0x2: 2x16-bits data width (first pixel on the LSB of the 32-bit Interface port data bus and second pixel on the MSB of the 32-bit Interface port data bus for the same Interface access) 0x3: 32-bits data width	RW	0x0
9	MODE_SPEED	Selection of the mode. The information is used by hardware only if MODE=COMMAND_MODE otherwise it is ignored. 0x0: Low-power mode (CMOS) is used to send short and long packets to the peripheral. 0x1: High Speed mode (SLVS) is used to send short and long packets to the peripheral.	RW	0

MIPI Display Serial Interface

www.ti.com

Bits	Field Name	Description	Type	Reset
8	ECC_TX_EN	Enables the Error Correction Code generation for the transmit header (short and long packets). 0x0: Disabled 0x1: Enabled	RW	0
7	CS_TX_EN	Enables the checksum generation for the transmit payload (long packet only). 0x0: Disabled. The value 0x00 is used. 0x1: Enabled. The checksum value is calculated by HW.	RW	0
6	BTA_EN	Send the bus turn around to the peripheral. It can be used when the automatic mode is enabled (BTA_SHORT_EN=1 or/and BTA_LONG_EN=1). In that case only one BTA is sent to the peripheral. The manual mode is used to allow the user to define for which packets, the turn around is required for example getting acknowledge from the peripheral. 0x0: READS: BTA generation is completed. It is reset by hardware when it is completed. WRITES: Cancellation of the BTA generation (not guarantee since it could already on going, shall not be used). 0x1: READS: BTA generation has been requested by user (it could be on going but not completed). WRITES: Request for BTA generation.	RW	0
5	TX_FIFO_NOT_EMPTY	FIFO status Read 0x0: The TX FIFO is empty (the FIFO does not contain any data for the virtual channel) Read 0x1: The TX FIFO is not empty (the FIFO contains at least one byte for the virtual channel)	R	0
4	MODE	Selection of the mode 0x0: Command mode. 0x1: Video mode. The bit fields MODE_SPEED and SOURCE are not used by hardware. The bit field VP_SOURCE is used to select between video port 1 and video port 2 when two video ports are present.	RW	0
3	BTA_LONG_EN	Enables the automatic bus turn-around after completion of each long packet transmission. 0x0: Disabled 0x1: Enabled	RW	0
2	BTA_SHORT_EN	Enables the automatic bus turn-around after completion of each short packet transmission. 0x0: Disabled 0x1: Enabled	RW	0

Bits	Field Name	Description	Type	Reset
1	SOURCE	<p>Selection of the source between Interface and the Video port(s) (used by the hardware only if MODE=COMMAND MODE (0x0) otherwise it is ignored). The number of available video ports is defined in DSI_GNQ[24] NB_VIDEO_PORTS bit.</p> <p>0x0: All the data are provided by the slave port. Any transfer on the video port is ignored for this virtual channel.</p> <p>0x1: If MODE=VIDEO_MODE, the data received on the video port 1 or video port 2, selected using VP_SOURCE (pixels and enabled synchronization events using DSI_CTRL[17] VP_HSYNC_START, DSI_CTRL[18] VP_HSYNC_END, DSI_CTRL[15] VP_VSYNC_START, DSI_CTRL[16] VP_VSYNC_END for video port 1 and DSI_CTRL2[] VP_HSYNC_START, DSI_CTRL2[] VP_HSYNC_END, DSI_CTRL2[] VP_VSYNC_START, DSI_CTRL2[] VP_VSYNC_END for video port 2) are sent on the virtual channel (only one virtual channel can be associated with the video port, it is the software responsibility to ensure that no more than one virtual channel is enabled with the video port as the main source for data).</p> <p>If MODE=COMMAND_MODE, the VP.STALL signal is used by the protocol engine to indicate when new data are required. The synchronization signals are not generated by the display controller. Regardless of the MODE, no data can be provided on the Interface slave port.</p>	RW	0
0	VC_EN	<p>Enables the virtual channel.</p> <p>0x0: Disabled. The virtual channel shall be disabled for any register change in the DSI_VC_... registers to the corresponding VC ID (except for setting the DSI_VC_CTRL_i[6] BTA_EN, DSI_VC_TE_i[23:0] TE_SIZE and DSI_VC_TE_i[31] TE_START bit fields, and DSI_VC_LONG_..., DSI_VC_SHORT_..., DSI_VC_IRQ... registers).</p> <p>0x1: Enabled. No change is allowed to the virtual channel registers expect resetting the VC_EN.</p>	RW	0

Table 10-584. DSI_VC_TE_i

Address Offset	0x0000 0104 + (0x20 * i)	Index	i = 0 to 3
Physical Address	0x5800 4104 + (0x20 * i) 0x4804 4104 + (0x20 * i) 0x5800 5104 + (0x20 * i) 0x4804 5104 + (0x20 * i)	Instance	DSI1_PROTOCOL_ENGINE_L3 DSI1_PROTOCOL_ENGINE_PE R_L4 DSI2_PROTOCOL_ENGINE_L3 DSI2_PROTOCOL_ENGINE_PE R_L4
Description	CONTROL REGISTER - Virtual channel This register controls the tearing effect logic. It defines the size of the transfer when TE occurs and enables the automatic TE mode.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TE_START	TE_EN	TE_LINE	TE_LINE_NB	RESERVED				TE_SIZE																							

Bits	Field Name	Description	Type	Reset
31	TE_START	<p>Manual control of the start of the transfer. The user can use the TE interrupt in order to know that the TE trigger has been received prior to set the TE_START bit field. It is not mandatory to use the TE interrupt.</p> <p>0x0: Indicates the end of the transfer. The bit can be used by user to cancel the transfer if not already started. The FIFO shall be flushed by software to ensure there is no data remaining in it.</p> <p>0x1: Starts the transfer of the data. The size is defined in TE_SIZE. The bit field is set until the transfer is completed. It is reset by hardware when the transfer is completed.</p>	RW	0
30	TE_EN	<p>Tearing Effect Control</p> <p>0x0: Disables the automatic transfer. The user shall use the interruption in order to know when TE PHY trigger is received or when the TE is detected on the input CMOS signals. The hardware reset the bit field when the transfer is completed (TE_SIZE=0).</p> <p>0x1: Enables the automatic transfer of the data using the TE PHY trigger or one of the TE input signals as a synchronization event. The bit field TE_LINE defines if the CMOS signal is used or if the PHY trigger is used.</p>	RW	0
29	TE_LINE	<p>0x0: Disabled the TE CMOS signalling for the automatic data transfer. The DSI PHY trigger is used for the automatic data transfer.</p> <p>0x1: Enables the TE CMOS signalling for the automatic data transfer. The DSI PHY trigger is not used for the automatic data transfer.</p>	RW	0
28	TE_LINE_NB	<p>Selection between TE0 and TE1 CMOS signals.</p> <p>0x0: TE0 CMOS input line is selected</p> <p>0x1: TE1 CMOS input line is selected</p>	RW	0
27:24	RESERVED		R	0x0
23:0	TE_SIZE	<p>Defines the number of byte (payload data excluding the check -sum) to be sent. The write into the register DSI_VC_LONG_PACKET_HEADER_i shall be performed by the user before sending data from the register DSI_VC_LONG_PACKET_PAYLOAD_i. The register value is decremented for every byte sent of the DSI link. At the end of the transfer (TE_SIZE=0), the bit field TE_EN is reset by hardware. The DMA request will be asserted when the trigger is received in order to receive data in the TX FIFO. It should not be deasserted until all data (TE_SIZE) have been received in the FIFO.</p>	RW	0x000000

Description	INTERRUPT STATUS REGISTER - Virtual channel This register regroups all the events related to the virtual channel.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RESERVED																PP_BUSY_CHANGE_IRQ		FIFO_TX_UDF_IRQ		ECC_NO_CORRECTION_IRQ		BTA_IRQ		FIFO_RX_OVF_IRQ		FIFO_TX_OVF_IRQ		PACKET_SENT_IRQ		ECC_CORRECTION_IRQ		CS_IRQ	

Bits	Field Name	Description	Type	Reset
31:9	RESERVED		R	0x000000
8	PP_BUSY_CHANGE_IRQ	Video Port ping-pong buffer busy status. PP_BUSY has changed from 1 to 0. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0

Bits	Field Name	Description	Type	Reset
7	FIFO_TX_UDF_IRQ	FIFO underflow status. The FIFO used on the L3 interconnect slave port for buffering the data for the virtual channel has underflowed which means that the data for the current packet have not been received in time since the transfer of the packet are already started (transfer started since the packet size is bigger than space allocated in the FIFO). 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
6	ECC_NO_CORRECTION_IRQ	ECC error status (short and long packets). No correction of the header because of more than 1-bit error. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
5	BTA_IRQ	Virtual channel - BTA status. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
4	FIFO_RX_OVF_IRQ	FIFO overflow error status. The FIFO used on the L3 interconnect slave port for buffering the data received on the DSI link for the virtual channel has overflowed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
3	FIFO_TX_OVF_IRQ	FIFO overflow error status. The FIFO used on the L3 interconnect slave port for buffering the data for the virtual channel has overflowed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
2	PACKET_SENT_IRQ	Indicates that a packet has been sent. It is used when BTA manual mode is used. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
1	ECC_CORRECTION_IRQ	Virtual channel - ECC has been used to do the correction of the only 1-bit error status (short and long packet). 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0
0	CS_IRQ	Virtual channel - checksum mismatch status. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset.	RW	0

Bits	Field Name	Description	Type	Reset
31:29	REG_TTAGO	TTA-GO timing in terms of number of TXCLKESC clocks. 0x0: 2 cycles 0x1: 3 cycles 0x2: 4 cycles 0x3: 5 cycles 0x4: 6 cycles 0x5: 7 cycles 0x6: 8 cycles 0x7: 9 cycles Default value: 4 cycles	RW	0x2
28:27	REG_TTASURE	TTA-SURE timing in terms of number of TXCLKESC clocks.	RW	0x0

Bits	Field Name	Description	Type	Reset
		0x0: 2 cycles 0x1: 1 cycles 0x2: 3 cycles 0x3: 4 cycles Default value: 2 cycles		
26:24	REG_TTAGET	TTA-GET timing in terms of number of TXCLKESC clocks. 0x0: 3 cycles 0x1: 4 cycles 0x2: 5 cycles 0x3: 6 cycles 0x4: 7 cycles 0x5: 8 cycles 0x6: 9 cycles 0x7: 10 cycles Default value: 5 cycles	RW	0x2
23:21	RESERVED	Reserved	R	0x0
20:16	REG_TLPXBY2	(TLPX)/2 timing parameter in multiples of DDR clock frequency. DDR clock = CLKIN4DDR/4. Default value is programmed for 400 MHz. This is the internal timer value. The value seen on line will have variance due to rise/fall mismatch effects. Note: TLPX is used to define the length of LP-01 state in HS start of Transmission sequences on clock and data lanes. For all other purposes TLPX is defined by the period of TXLPESC	RW	0x0A
15:8	REG_TCLKTRAIL	REG_TCLKTRAIL timing parameter in multiples of DDR clock frequency. DDR clock = CLKIN4DDR/4. D-PHY specification: > 60 ns. Default value is programmed for 400 MHz	RW	0x1A
7:0	REG_TCLKZERO	REG_TCLKZERO timing parameter in multiples of DDR clock period. DDR clock = CLKIN4DDR/4. D-PHY specification: (REG_TCLKPREPARE + REG_TCLKZERO) > 300 ns. Derived specification for REG_TCLKZERO (Min REG_TCLKPREPARE = 38 ns): REG_TCLKZERO > 262 ns. Default value is programmed for 400 MHz	RW	0x6A

10.4 High-Definition Multimedia Interface

This section introduces the high-definition multimedia interface (HDMI) module. It also describes its main functions and connections in the device.

10.4.1 High-Definition Multimedia Interface (HDMI) Overview

Figure 10-161 shows an overview of the HDMI module.

Figure 10-161. HDMI Overview

hdmi-001

10.4.1.1 HDMI Main Features

The HDMI module provides the following main features:

- HDMI 1.3, HDCP 1.2, and DVI 1.0 compliant
 - Including support for the 3D stereoscopic frame-packing formats of the HDMI v1.4 standard (720p,50Hz and 720p,60Hz)
- EIA/CEA-861-D video format support (refer to [Table 10-628](#) for more details)
- VESA DMT video format support (refer to [Table 10-629](#) for more details)
- Support for deep-color mode:
 - 10-bit/component color depth up to 1080p @60Hz
 - 12-bit/component color depth up to 720p/1080i @60Hz
 - 16-bit/component color depth is not supported

- Supports up to 148.5 MHz pixel clock (1920 x 1080p @60Hz) with deep-color mode
- Supports 154 MHz pixel clock (for VESA DMT 1920x1200p @60Hz) and 162 MHz pixel clock (for VESA DMT 1600x1200p @60Hz) with no deep-color mode
- Video formats: 24-bit RGB
- Uncompressed multi-channel (up to 8 channels) audio (L-PCM) support
- Master I2C interface for Display Data Channel (DDC) connection
- Consumer Electronic Control (CEC) interface
- Integrated High-bandwidth Digital Content Protection (HDCP) encryption engine for transmitting protected audio and video content (authentication performed by software)
- Integrated Transition Minimized Differential Signaling (TMDS) and TMDS Error Reduction Coding (TERC4) encoders for data island support
- Integrated TMDS PHY (3 TMDS differential data lanes + TMDS differential clock lane)
 - Up to 1,85625 Gbps per lane at (1080p @60Hz at 10 bits/component, lower resolutions at 12 bits/component)
 - 928,125Mbps per lane at (720p/1080i @60Hz 10 bits/component, lower resolutions at 12 bits/component)
 - 337,5 Mbps at (576p @50Hz/480p @60Hz 10 bits/component)

10.4.1.2 HDMI Video Formats and Timings

10.4.1.2.1 CEA-861-D video formats and timings

[Table 10-628](#) presents the video timings supported by the HDMI module, according to the CEA-861-D standard:

Table 10-628. HDMI Video Timings (CEA-861-D)

Refresh Rate	Resolution
24 Hz (Low field rate)	1920 x 1080p
	1920 x 1080i
50 Hz	1920 x 1080i
	1280 x 720p
	2880 x 576p

	1920 x 1200p ⁽¹⁾

⁽¹⁾ Only available without deep color mode

10.5 Remote Frame Buffer Interface

This section describes the remote frame buffer interface (RFBI).

10.5.1 Remote Frame Buffer Interface Overview

The RFBI module is part of the display subsystem that provides the logic to display a picture from the memory frame buffer (SDRAM or SRAM) on a LCD panel.

The RFBI is connected to the L3 and L4_PER interconnect through the display subsystem local interconnect. It is preferred from a performance point of view to use the L4_PER interconnect for configuration and the L3 interconnect for data transfer.

Figure 10-162 shows an overview of the RFBI.

Figure 10-162. RFBI Highlight

rfbi-001

The RFBI supports the MIPI DBI protocol with the following features:

- Access to RFB direct MPU interface
 - Sends commands to the RFB panel through the slave port interconnect
 - Sends data, received from the DISPC or from the MPU through the DISPC pixel data bus, to the RFB panel
 - Reads data/status from the RFB to the slave port interconnect
- RFB interface
 - 8-/9-/16-bit parallel interface
 - One programmable configuration for one LCD connected to the RFBI
- Data formats

- Programmable pixel modes (12-/16-/18-/24-BPP modes in RGB format)
- Programmable output formats on one/multiple cycles per pixel (data from the DISPC and the L3 interconnect)
- FIFO
 - One slave port with DMA request and interconnect FIFO of 24 × 32-bit depth (for write access to the [RFBI_DATA](#) register only)
 - One video port FIFO of 8 × 24-bit depth receiving data from the DISPC through [RFBI_DATA](#)

10.5.2 RFBI Environment

In the display subsystem, data are read by the DISPC from the memory frame buffer (SDRAM, SRAM, IVA-HD SL2, etc.), and sent through the RFBI to the external LCD/RFB.

The DISPC associated with the RFBI implements the MIPI DBI protocol.

The DISPC provides the required control signals to interface the memory frame buffer (SDRAM, SRAM or IVAHD-SL2) directly to the external displays. The RFBI is connected to the memory through the L3 interconnect and has its own DMA (with embedded FIFOs) to read data from the system memory. There is one master port (L3 interconnect) and two slave ports (one for L4_PER interconnect and the other for L3 interconnect).

The DISPC_CONTROL1[16] GPOUT[1] and DISPC_CONTROL1[15] GPOUT[0] bits control selection of the display subsystem modules (see [Table 10-630](#)).

Table 10-630. I/O Pad Mode Selection

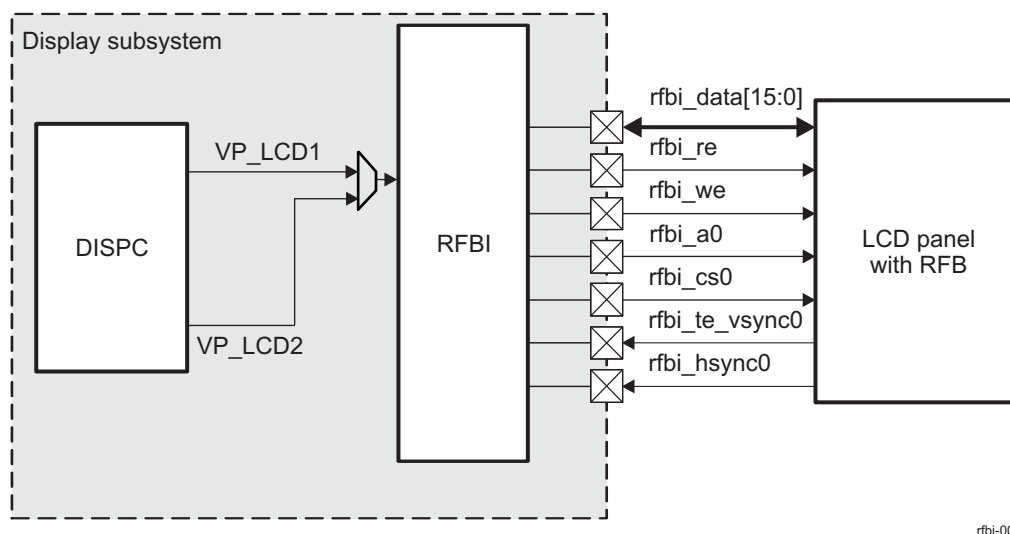

DSS.DISPC_CONTROL[16] GPOUT1	DSS.DISPC_CONTROL[15] GPOUT0	Mode
0	0	Reset
0	1	RFBI mode
1	0	Invalid
1	1	Bypass mode

The RFB of the LCD panel is directly connected to the RFBI of the device. The RFBI controls the reads/writes from/to the RFB. The RFBI receives data from its slave port or output from the DISPC and generates the signals to control the LCD panel. Through the RFBI, the MPU can send commands or parameter/display data to the LCD panel and directly set the DISPC registers to read/write data from/to the memory in the LCD panel. The RFBI can manage only one LCD panel.

10.5.2.1 RFBI Parallel Interface (MIPI DBI Protocol)

[Figure 10-163](#) shows the LCD support parallel interface in RFBI mode.

Figure 10-163. RFBI LCD Support Interface

[Table 10-631](#) describes the interface signals to/from the LCD panel.

Table 10-631. LCD Interface Signals

Signal Name	Type ⁽¹⁾	Description
rfbi_data[15:0]	I/O	RFBI I/O data

⁽¹⁾ I = Input; O = Output; I/O = Input/Output

Table 10-631. LCD Interface Signals (continued)

Signal Name	Type ⁽¹⁾	Description
rfbi_re	O	Read access signal
rfbi_we	O	Write access signal
rfbi_a0	O	Command/data selection signal
rfbi_cs0	O	Chip-select (CS) signal for LCD 1
rfbi_te_vsync0	I	Tearing effect (TE) synchronization signal (TE or VSYNC for LCD panel 1)
rfbi_hsync0	I	HSYNC from LCD panel 1

- **rfbi_data[15:0]:** The pixel data comprises the RFBI pixel data (bits 15:0). A write/read command must be sent to the LCD panel to send/read the data.
Before any data access, the application must send commands and parameters when it is necessary to configure an LCD panel. The data is used as input in read operations during production test and also to read the status of the registers in the LCD panel and pixels from the embedded frame buffer in the LCD panel.
- **rfbi_re:** This is the read-enable signal used to indicate when a read from the embedded memory in the LCD panel is ongoing. The RFBI registers describe the behavior of the read signal (off/on/cycle time). The polarity of the read-enable signal is programmable. The read is used to get status/data information from the LCD panel.
- **rfbi_we:** The write-enable signal is used to indicate when a write is ongoing. The RFBI registers allow flexible behavior of the write signal (programmable off/on/cycle times and signal polarity).
- **rfbi_a0:** The signal is asserted to indicate its status: Command or data. The polarity is programmable and the status of the signal depends on the RFBI registers written by the application (CMD/READ/STATUS/PARAM/PIXEL). The register in use by the hardware defines the status of rfbi_a0. The order of the writes/reads to the RFBI registers CMD/READ/STATUS/PARAM/PIXEL defines the transitions of A0.
- **rfbi_cs0:** The signal is the chip-select (CS0) asserted to indicate which LCD panel is selected and must be ready to receive/transmit commands and data. When RE or WE is on, CS0 must not be changed.
To select the trigger mode, configure the [RFBI_CONFIG\[3:2\]](#) TRIGGERMODE bit field (0x0: Internal trigger mode with the [RFBI_CONTROL\[4\]](#) ITE bit, 0x1: External trigger mode with the TE signal rfbi_te_vsync0, 0x2: External trigger mode with the rfbi_te_vsync0, and rfbi_hsync0 signals with the programmable line counter).
- **rfbi_te_vsync0** (only used by RFBI if [RFBI_CONFIG\[3:2\]](#) TRIGGERMODE = 0x1 or 0x2, otherwise ignored): Based on the trigger mode selected, the signal is the TE pulse signal or the LCD panel vertical synchronization (VSYNC) pulse signal. rfbi_te_vsync0 is used by the TE logic as the synchronization signal to send the pixel to the LCD panel.
- **rfbi_hsync0** (only used by RFBI if [RFBI_CONFIG\[3:2\]](#) TRIGGERMODE = 0x2, otherwise ignored): The HSYNC pulse signals indicate to the RFBI when horizontal synchronization occurs. The polarity of the HSYNC signals is programmable. The minimum pulse width of the signal is two RFBI_ICLK clock cycles. rfbi_hsync0 is used by the TE logic as a synchronization signal to send the pixel to the LCD panel.

10.5.2.1.1 Description of the Tearing Effect Pulse Signal

The TE signal can be generated externally by the RFBI depending on the value of the [RFBI_CONFIG\[3:2\]](#) TRIGGERMODE bit field:

- TRIGGERMODE = 0x1: external trigger mode with TE signal. TE signal corresponds to rfbi_te_vsync0 pad.
- TRIGGERMODE = 0x2: external trigger mode with HSYNC/VSYNC signals. HSYNC signal corresponds to rfbi_hsync0 pad and VSYNC signal to rfbi_te_vsync0 pad.

The externally generated TE synchronization signal is a logical OR or AND operation between the HSYNC and VSYNC signals (see [Figure 10-164](#)). The logical operation (OR or AND) depends on the HSYNC and VSYNC signals polarity. The VSYNC signal indicates to the RFBI when vertical synchronization occurs; the HSYNC signal indicates to the RFBI when horizontal synchronization occurs.

Figure 10-164. External Generation of TE Signal Based on Logical OR Operation Between HSYNC and VSYNC (Active-High)

- TE signal is connected to rfb_te_vsync0 external pad when the [RFBI_CONFIG\[3:2\]](#) TRIGGERMODE bit field is set to 0x1.
- HSYNC and VSYNC signals are connected to rfb_hsync0 and rfb_te_vsync0, respectively, when the [RFBI_CONFIG\[3:2\]](#) TRIGGERMODE bit field is set to 0x2.

The RFBI module detects the VSYNC and HSYNC pulses embedded in the received signal. VSYNC is detected based on the minimum pulse width defined by the [RFBI_VSYNC_WIDTH](#) register. VSYNC is not triggered by an inactive-to-active edge.

HSYNC is detected based on the minimum pulse width defined by the [RFBI_HSYNC_WIDTH](#) register. HSYNC is not triggered by an inactive-to-active edge.

The signal is generated from external logic based on VSYNC and HSYNC of the LCD panel. The automatic trigger can be programmed based on the external RFBI_TE signal or use the [RFBI_CONTROL\[4\]](#) ITE bit to start data capture (internal trigger mode).

The polarity of the TE signal is programmable in the [RFBI_CONFIG](#) register. HSYNC and VSYNC pulses embedded in the TE signal have the same polarity, which is active high for an ORed signal and active low for an ANDed signal. The minimum pulse width of the signal is two RFBI_ICLK clock cycles. Hardware resets the line counter when VSYNC occurs and increments it at every HSYNC. Transfer to the LCD panel begins when the line counter reaches the programmable line number.

10.5.2.2 Transaction Timing Diagrams

[Table 10-632](#) lists the programmable timing fields. [Figure 10-165](#) through [Figure 10-167](#) show timing diagrams of read/write transactions to the LCD panel for the RFBI. In these figures, the polarity 0 (active low) is used to describe the RFBI_A0, RFBI_CSi, RFBI_RE, and RFBI_WE signals.

Table 10-632. Programmable Timing Fields in RFBI Mode

Timing Name	Register Field	Description
CSOnTime	RFBI_ONOFF_TIME [3:0] CSONTIME bit field	CS assertion time from start access time
CSOffTime	RFBI_ONOFF_TIME [9:4] CSOFFTIME bit field	CS deassertion time from start access time
WECycleTime	RFBI_CYCLE_TIME [5:0] WECYCLETIME bit field	The time when A0 becomes valid until write cycle completion
WEOnTime	RFBI_ONOFF_TIME [13:10] WEONTIME bit field	WE assertion delay time from start access time
WEOffTime	RFBI_ONOFF_TIME [19:14] WEOFFTIME bit field	WE deassertion delay time from start access time
RECycleTime	RFBI_CYCLE_TIME [11:6] RECYCLETIME bit field	The time when A0 becomes valid until read cycle completion
REOnTime	RFBI_ONOFF_TIME [23:20] REONTIME bit field	RE assertion delay time from start access time
REOffTime	RFBI_ONOFF_TIME [29:24] REOFFTIME bit field	RE deassertion delay time from start access time
CSPulseWidth	RFBI_CYCLE_TIME [17:12] CSPULSEWIDTH bit field	The time when write cycle time or read cycle time completes

10.5.3 RFBI Integration

This section describes the RFBI integration in the device, including information about clocks, resets, and hardware requests.

Figure 10-168 shows the RFBI module integration.

Figure 10-168. RFBI Integration

NOTE: For more information about the IDLE hardware handshake, see [Section 3.1.1.1.2, Module-Level Clock Management, Chapter 3, Power, Reset, and Clock Management](#).

Table 10-633 through Table 10-635 summarize the integration of the module in the device.

Table 10-633. Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
RFBI	PD_DSS	No	L3 L4_PER

Table 10-634. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
RFBI	RFBI_FCLK1	DISPC_LCDx_FCLK	DISPC	Logic clock used by the RFBI when capturing data on the video port and for the generation of the RFBI_STALL signal
	RFBI_FCLK2	DISPC_LCDx_PCLK	DISPC	Pixel clock used by the RFBI to capture the pixels
	RFBI_ICLK	DSS_L3_ICLK	PRCM	L3 interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
RFBI	RFBI_RST	DSS_RST	PRCM	Display subsystem global hardware reset

NOTE: If video mode is used, the VPn_PCLK and VPn_CLK clocks must be generated using a CLKIN4DDR clock.

Table 10-635. Hardware Requests

DMA Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
RFBI	DSS_RFBI_DMA	S_DMA_13	sDMA	RFBI DMA request

NOTE: For DMA source description, see [Section 10.5.3.1, DMA Requests](#).

10.5.3.1 DMA Requests

All peripherals internal to the device use the transition-sensitive scheme for DMA requests. For more information about the transition-sensitive scheme, see [Chapter 16, sDMA](#).

[Table 10-636](#) describes the RFBI DMA request.

Table 10-636. RFBI DMA Request Description

DMA	Source	Description	Sensitivity ⁽¹⁾
RFBI_DMA	DSS_RFBI_DMA	The DMA request can be used to transfer data using the sDMA T from memory to RFBI interconnect slave FIFO.	T

⁽¹⁾ T: Transition-sensitive (fixed in hardware) active low request

10.5.4 RFBI Functional Description

This section describes the functions of the RFBI.

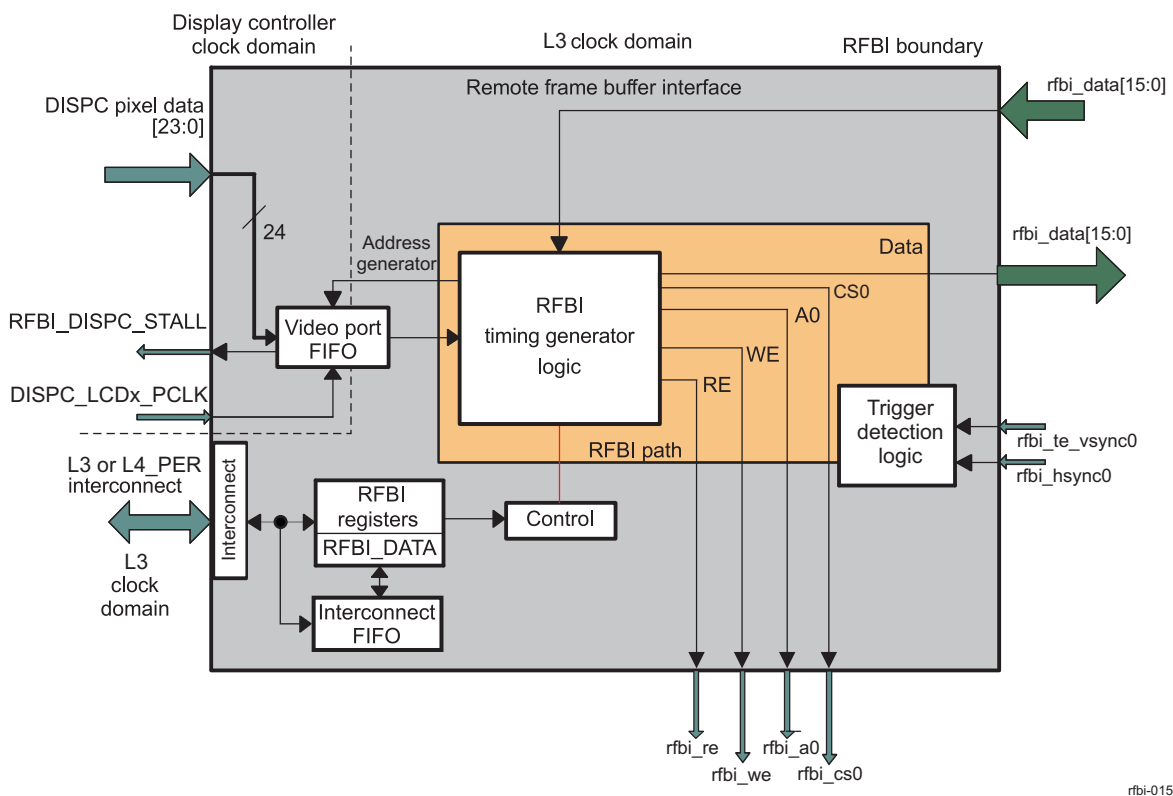

10.5.4.1 Block Diagram

The RFBI can capture the output pixel from the DISPC and send the data to the RFB in the LCD panel. The application configures the RFBI, sends commands, reads data, and configures the DISPC to send data fetched from the system memory by the DISPC DMA engine. The commands/data are sent using an 8-, 9-, or 16-bit parallel interface.

The DISPC is configured to send the data in 12-, 16-, 18-, or 24-BPP format. In the video port FIFO, the encoded pixel values are in an LSB alignment independent of the endianness in system memory.

Figure 10-169 is an overview of the RFBI architecture.

Figure 10-169. RFBI Architecture Overview

10.5.4.2 Clock Configuration

The RFBI functional clocks (RFBI_FCLK1 and RFBI_FCLK2) are provided internally to the display subsystem by the DISPC. For more details about the DISPC clocks, see, [Section 10.2 Display Controller](#).

10.5.4.3 Software Reset

To perform a software reset, set the [RFBI_SYSCONFIG\[1\] SOFTRESET](#) bit to 1. The [RFBI_SYSSTATUS\[0\] RESETDONE](#) bit indicates that the software reset is complete when its value is 1. When the software reset completes, the [RFBI_SYSCONFIG\[1\] SOFTRESET](#) bit is automatically reset. Software must ensure that the software reset completes before performing any RFBI operation.

10.5.4.4 Power Management

[Table 10-637](#) describes power-management features available for the RFBI.

NOTE: For information about source clock gating description, see [Section 3.1.1.1.2, Module-Level Clock Management](#) in [Chapter 3, Power, Reset and Clock Management](#).

Table 10-637. Local Power Management Features

Feature	Registers	Description
Clock autogating	RFBI_SYSCONFIG [0] AUTOIDLE bit	This bit allows a local power optimization inside the module by gating functional clocks (RFBI_FCLK1, RFBI_FCLK2) and interface clock (RFBI_ICLK) upon the internal activity.
Slave idle modes	RFBI_SYSCONFIG [4:3] SIDLEMODE bit field	Force-idle, no-idle, and smart-idle. For more details, see below.
Clock activity	N/A	Feature not available
Master standby modes	N/A	Feature not available
Global wake-up enable	N/A	Feature not available
Wake-up sources enable	N/A	Feature not available

As shown in [Table 10-637](#), the RFBI supports the No-Idle, Force-idle, and Smart-Idle modes.

The conditions of assertion of the SIdleAck signal are:

- No-idle mode: SIdleAck is never asserted.
- Force-idle mode: SIdleAck is asserted unconditionally after one RFBI_ICLK clock cycle delay with respect to assertion of IdleReq.
- Smart-idle mode: SIdleAck is asserted when the following conditions are satisfied:
 - The RFBI stops using the RFBI_ICLK clock and all the data have been sent to the RFB (LCD panel).

Once SIdleAck signal is asserted:

- The RFBI_ICLK (DSS_L3_ICLK) clock can shutdown at any time.
- Any transaction on the RFBI configuration port is ignored

The conditions of deassertion of the SIdleAck signal are:

- Force-idle mode: In this mode SIdleAck is deasserted after one RFBI_ICLK clock cycle delay with respect to deassertion of IdleReq.
- Smart-idle mode: In this mode SIdleAck is deasserted after one RFBI_ICLK clock cycle delay with respect to deassertion of IdleReq.

Once SIdleAck is released, the RFBI is fully operational (guaranteed only in the case of smart-idle mode).

10.5.4.5 Interrupt Requests

The RFBI does not generate interrupts but the following DISPC interrupts can be enabled depending on which LCD output of DISPC is currently used for connection to the RFBI:

- FRAMEDONE1_IRQ
- PROGRAMMEDLINENUMBER_IRQ
- GFXFIFOUNDERFLOW_IRQ
- GFXENDWINDOW_IRQ
- PALETTEGAMMALOADING_IRQ
- OCPERROR_IRQ
- VID1FIFOUNDERFLOW_IRQ
- VID1ENDWINDOW_IRQ
- VID2FIFOUNDERFLOW_IRQ
- VID2ENDWINDOW_IRQ

- SYNCLOST1_IRQ
- WAKEUP_IRQ
- SYNCLOST2_IRQ
- VID3FIFOUNDERFLOW_IRQ
- VID3ENDWINDOW_IRQ
- FRAMEDONE2_IRQ

NOTE: For more details about DISPC interrupts, see, [Section 10.2 Display Controller](#).
The other DISPC interrupts are not used in the RFBI.

10.5.4.6 DMA Requests

[Table 10-638](#) lists event flags and their mask, that can cause RFBI DMA requests.

Table 10-638. DMA Requests Events

DMA Request Name	DMA Request Mask	Map to	Description
DSS_RFBI_DMA	RFBI_CONTROL [7] DISABLE_DMA_REQ	S_DMA_XX	DMA request used to transfer data using the sDMA from memory to the RFBI interconnect FIFO

NOTE: For more details about DMA requests, see [Figure 10-175](#).

10.5.4.7 Video Port FIFO

10.5.4.7.1 Description

The input video port FIFO receives data from the DISPC at the pixel clock. The data in the video port FIFO are read by the RFBI and sent to the LCD panel. The video port FIFO is 24 bits wide and each pixel in 12-, 16-, 18-, and 24-BPP format is stored in the video port FIFO using one 24-bit value aligned on the 24-bit LSB. [Section 10.5.4.9, RFBI Output Parallel Modes](#), provides examples of various output configurations based on the interface width (up to 16 bits) and pixel format output (up to 24 bits). Setting the [RFBI_CONTROL](#)[1] RFBIMODE bit to 0 directs the MPU to send commands, parameters, and data from the input video port FIFO.

10.5.4.7.2 RFBI Input Formats

The encoded pixel formats supported at the RFBI input interface connected to the DISPC are: RGB12-444, RGB16-565, RGB18-666, and RGB24-888. This input data width is controlled by the [RFBI_CONFIG](#)[6:5] DATATYPE bit field. The following graphics describe the bit representation of each format in the video port FIFO. The output of the DISPC is aligned on the LSB of the interface. The pixels are then formatted in accordance with the configuration of the output interlaces (multiple cycles); for more details, see [Section 10.5.4.9.1, Cycle Mode Selection](#).

- RGB12-444 format:

- RGB16-565 format:

- RGB18-666 format:

- RGB24-888 format:

NOTE: These pixel formats are also supported when data are provided from the slave port interconnect (for writing parameters).

10.5.4.7.3 Stall Mechanism

The stall signal (RFBI_STALL) is generated by the video port FIFO and used to indicate when the DISPC must stop sending data on the corresponding LCD output interface. This stall signal is used for both LCD outputs (DISPC_LCD1_DATA_STALL and DISPC_LCD2_DATA_STALL) only when the DISPC is configured in stall mode. The stall mode is activated by setting the DISPC_CONTROLo[11] STALLMODE bit to 1 for the primary LCD output and DISPC_CONTROLo[11] STALLMODE bit to 1 for the secondary LCD output.

NOTE: When the DISPC is configured in stall mode, the minimum transfer size is 1 byte.

The RFBI_STALL signal allows the RFBI to reformat the data.

RFBI_STALL is asserted when at least one of the following cases occurs:

- Default status when there is no data to capture from the DISPC
- High FIFO threshold reached
- End of transfer (number of data to output)
- RFBI reset
- [RFBI_CONTROL\[0\] ENABLE](#) bit reset to 0x0

RFBI_STALL is deasserted when the [RFBI_CONTROL\[0\] ENABLE](#) bit is set to 0x1 and at least one of the following cases occurs:

- Low FIFO threshold reached
- External TE occurs and the [RFBI_CONFIG\[3:2\] TRIGGERMODE](#) bit field is set to 0x1 for automatic external trigger (start of the transfer, the FIFO pointers are reset, the FIFO is empty).
- [RFBI_CONTROL\[4\] ITE](#) bit set to 0x1 by users (start of transfer, the FIFO pointers are reset, the FIFO is empty)

NOTE: This stall mechanism is also used by the DSI protocol engines. When multiple modules are connected to the same LCD output (RFBI and DSI protocol engines), the STALL signals from the modules are merged into a single DISPC_LCDx_DATA_STALL signal inside the display subsystem. Only one signal for each LCD output is connected the DISPC (two signals total for the two LCD outputs). In that case, only one module can control the STALL assertion/deassertion. The module which is not using the LCD output interface at that time is not disturbed because the STALL signal is asserted/deasserted by another module. For more details, see chapter *Display Subsystem*.

The RFBI asserts the STALL signal to stop data output by the DISPC. It is deasserted to indicate when new data must be output by the DISPC.

10.5.4.7.3.1 Data Stall Diagram Without DMA Buffer Handshake

[Figure 10-170](#) shows the RFBI data stall diagram when DISPC_DIVISOR[7:0] PCD bit field is set to 3.

Figure 10-170. RFBI Data Stall Signal Diagram With PCD=3

10.5.4.7.3.2 Data Stall Diagram with DMA Buffer Handshake

To avoid underflow of the DMA buffer, the DMA buffer handshake feature can be enabled by setting the DISPC_CONFIG0[16] BUFFERHANDCHECK bit to 1. The fullness of the FIFOs associated with the pipelines used for the LCD output is checked when the STALL signal is inactive before providing data to the pipeline. This prevents emptying the FIFO when the RFBI requests data and there is not enough data in the DISPC DMA buffer. This feature must be enabled only when stall mode is used (DISPC_CONTROL0[11] STALLMODE bit set to 1).

When the DMA buffer handshake feature is activated, the pixel transfer to the RFBI during STALL inactivity period can be stopped (no DISPC_LCD1_PCLK or DISPC_LCD2_PCLK pulse) and restarted when there is enough data in the DMA buffer. The DMA buffer handshake ensures that underflow cannot occur for the pipelines associated with the LCD output in stall mode. Figure 10-171 shows the RFBI data stall with DMA buffer handshake mode activated (PCD=3).

Figure 10-171. RFBI Data Stall Signal Diagram With Handshake With PCD=3

10.5.4.8 Interconnect FIFO

10.5.4.8.1 Description

The interconnect FIFO receives the data from RFBI_DATA write requests to the slave port interconnect slave port. The data in the interconnect FIFO are read by the RFBI and sent to the LCD panel. The interconnect FIFO is 32 bits wide. The size of the interconnect FIFO is 24 words of 32 bits (that is, 24 words of RFBI_DATA). The address of the RFBI_DATA register is used to access the interconnect FIFO. The DSS_RFBI_DMA DMA request can be used to transfer data using the system DMA from memory to interconnect FIFO.

10.5.4.8.2 Using DMA Request With Interconnect FIFO

10.5.4.8.2.1 Threshold for DMA Request Generation

The RFBI_CONTROL[6:5] HIGHTHRESHOLD bit field is used to define the threshold to be used for the generation of the DMA request to receive data into the interconnect FIFO (24 x 32 FIFO depth) through the address of the register RFBI_DATA. The sDMA configuration regarding the size of the burst depends on the value of the RFBI_CONTROL[6:5] HIGHTHRESHOLD bit field. The supported values are 4 x 32, 8 x 32 and 16 x 32. When for example, 4 words of 32 bits are set for the threshold, the sDMA sends a burst of 4 x 32 bits only. The sDMA receives the DMA request and is in charge of providing the correct number of bytes.

10.5.4.8.2.2 Disabling DMA Request

If the [RFBI_CONTROL](#)[7] `DISABLE_DMA_REQ` bit is reset, the DMA request is generated when there is enough room in the interconnect FIFO to accept the full burst. In case the RFBI receives writes slave port requests to the [RFBI_DATA](#) location when the interconnect FIFO is full, the request is not accepted. The RFBI waits for a free entry in the interconnect FIFO to accept the slave port request.

If the [RFBI_CONTROL](#)[7] `DISABLE_DMA_REQ` bit is set, the DMA request is not generated. The threshold value is ignored.

NOTE: Software users can access the [RFBI_DATA](#) location without using the DMA request and without programming the high threshold value (backward compatibility mode).

10.5.4.8.2.3 Smart DMA Request Mode

If the [RFBI_CONTROL](#)[8] `SMART_DMA_REQ` bit is reset (smart DMA mode disabled), the DMA request is asserted and deasserted depending on the interconnect FIFO space even if `Midlereq` is high in smart-idle/no-idle mode and the entire burst gets error responses from the RFBI. The RFBI waits for a free entry in the interconnect FIFO to accept the burst request.

If the [RFBI_CONTROL](#)[8] `SMART_DMA_REQ` bit is set (smart DMA mode enabled), the DMA request is deasserted after two [RFBI_ICLK](#) clock cycles if it has been asserted for more than or equal to two [RFBI_ICLK](#) clock cycles and `Midlereq` is high in smart-idle or no-idle mode. If asserting time is less than two [RFBI_ICLK](#) clock cycles, no more burst requests are accepted even if the space is available in the interconnect FIFO.

10.5.4.9 RFBI Output Parallel Modes

10.5.4.9.1 Cycle Mode Selection

The [RFBI_CONFIG](#)[10:9] CYCLEFORMAT bit field defines the number of cycles to output a pixel. The number of cycles determines the number of registers used to format the data in the interconnect FIFO with the appropriate number of bits (starting from the LSB) and with the alignment on the interface. The data are formatted based on the configuration of the [RFBI_DATA_CYCLEi](#) registers.

- One cycle: [RFBI_CONFIG](#)[10:9] CYCLEFORMAT bit field = 0x00 and the [RFBI_DATA_CYCLE1](#) register
- Two cycles: [RFBI_CONFIG](#) [10:9] CYCLEFORMAT bit field = 0x01 and the [RFBI_DATA_CYCLE1](#) and [RFBI_DATA_CYCLE2](#) registers
- Three cycles: [RFBI_CONFIG](#)[10:9] CYCLEFORMAT bit field = 0x10 and the [RFBI_DATA_CYCLE1](#), [RFBI_DATA_CYCLE2](#), and [RFBI_DATA_CYCLE3](#) registers

[Figure 10-172](#) through [Figure 10-174](#) list the bits position of the pixel during the cycles for an 8-, 9- and 16-bit parallel output, respectively.

10.5.4.9.2 Unmodified Bits

In a cycle, if every bit in the interface does not have a pixel value, the status of the unused bits can be programmed to be 0, 1, or the previous value (I/O power consumption optimization). Based on the configuration, the undefined bits for each cycle are defined with the previous values of the bits at the same position in the previous cycle, 0s, or 1s (the unused bits can be at any position). The [RFBI_CONFIG\[12:11\] UNUSEDBITS](#) bit field is used.

10.5.4.9.3 Number of Pixels to Transfer

The [RFBI_PIXEL_CNT](#)[31:0] PIXELCNT bit field indicates the number of pixels to be transferred to the LCD panel. The value can be changed only when the [RFBI_CONTROL](#)[0] ENABLE bit is reset.

During the transfer, the hardware decrements the register when a pixel is sent to the RFB. When the [RFBI_CONTROL](#)[0] ENABLE bit is set and a new value is written in the [RFBI_PIXEL_CNT](#) register, and the current value in the register is a not 0 (the remaining number of pixels to transfer), the ongoing transfer is aborted.

10.5.4.10 RFBI Timing Generator

10.5.4.10.1 Configuration Selection

The [RFBI_CONTROL](#)[3:2] CONFIGSELECT bit field selects the chip select.

10.5.4.10.2 Read/Write

Depending on the status of A0, WE, and RE, the commands and display/parameter data are written to the panel (handled by the state-machine for the commands/parameter data and stored in memory for the display data), or the display data/status values are read from the LCD panel (status and display data in the LCD panel memory). The polarity of A0 (RFBI_A0 signal), WE (RFBI_WE signal), RE (RFBI_RE signal), and CS0 (RFBI_CS0 signal) is programmable.

[Table 10-639](#) describes the read/write function.

Table 10-639. Read/Write Function Description

A0 (RFBI_A0)	WE (RFBI_WE)	RE (RFBI_RE)	Function Description
1	0	1	Display data write, parameter data write
1	1	0	Display data read
0	1	0	Status read
0	0	1	Command data write

A minimum of RFBI_Cs cycle time, as defined in [Table 10-640](#), is required to keep the RFBI_CS0 signal asserted between write transfers of multiple pixels.

[Table 10-640](#) lists the minimum cycle time for RFBI_CS0, depending on the source of pixels (DISPC or slave port) and the cycle format (1 pixel/cycle, 1 pixel/2 cycles, or 1 pixel/3 cycles).

Table 10-640. Minimum Cycle Time for CS0/WE Always Asserted

RFBI Performance	RFBI_CONFIG [10:9] CYCLEFORMAT	RFBI_CONFIG [8:7] PORTFORMAT	Minimum Cycle Time (in Number of RFBI_ICLK Clock Cycles)
Slave port interconnect	1 pixel/cycle	1 pixel	5
	1 pixel/2 cycles	1 pixel	4
	1 pixel/3 cycles	1 pixel	4
	1 pixel/cycle	2 pixels	4
	1 pixel/2 cycles	2 pixels	4
	1 pixel/3 cycles	2 pixels	4
DISPC	1 pixel/cycle	N/A	4
	1 pixel/2 cycles	N/A	3
	1 pixel/3 cycles	N/A	3
	2 pixel/3 cycles	N/A	6

10.5.4.10.3 RFBI State-Machine

The RFBI_A0, RFBI_RE, and RFBI_WE signals are asserted and deasserted based on the register accessed (RFBI_CMD, RFBI_PARAM, RFBI_DATA, RFBI_READ, or RFBI_STATUS). (See Table 10-639.) When the RFBI_SYSSTATUS[8] BUSY bit is set by hardware, any access to the registers is stalled, except for the RFBI_DATA register.

The RFBI_SYSSTATUS[9] BUSYRFBIDATA bit indicates whether there are still pending data in the interconnect FIFO associated with the RFBI_DATA register only.

- Command register
Write one command at a time by writing through the slave port interconnect into the RFBI_CMD register. If the previous command is not processed, the RFBI_SYSSTATUS[8] BUSY bit is set by hardware and the access to writing a new command is stalled.
- Parameter register
Write one parameter at a time by writing in the RFBI_PARAM register.
If the previous parameter is not processed, the RFBI_SYSSTATUS[8] BUSY bit is set by hardware and the access to writing a new parameter is stalled.
- Data register
Write one or two pixels at a time by writing in the RFBI_DATA register.
The pixels are formatted based on the specified cycle format. If two pixels are written into the 32-data register, the RFBI_CONFIG[8:7] PORTFORMAT bit field indicates the number of pixels for each slave port access to the register and the order of the pixels.
If the previous data are not processed, the RFBI_SYSSTATUS[8] BUSY bit is set by hardware and any access for writing new data is stalled. When the RFBI_SYSSTATUS[8] BUSY bit is reset by hardware, the access is not stalled.
- Read/status register
Send through the command and parameter registers the correct information to receive data in the data or status register. The read data from the LCD panel is initiated by writing into the RFBI_READ or RFBI_STATUS registers. In this case, the RFBI_SYSSTATUS[8] BUSY bit is set until the data are available in the register.
When the RFBI_SYSSTATUS[8] BUSY bit is set by hardware, the read or write access is stalled until the register is updated with a new value from the LCD panel. To avoid the stall, the software can poll the RFBI_SYSSTATUS[8] BUSY bit until it is reset by hardware. To receive the data, send the appropriate command/parameters.

10.5.4.10.4 RFBI Timings

The timing registers can be accessed only when there is no transaction in progress (based on the value of the RFBI_CONTROL[3:2] CONFIGSELECT bit field). Granularity is defined using the RFBI_CONFIG[4] TIMEGRANULARITY bit. This feature allows the extension of programmable ranges of timing parameters for the RFBI interface. See Table 10-641 for the configuration values of the timing bits.

- Chip-select assertion/deassertion time (CSOnTime/CSOffTime)
RFBI_A0 setup time to chip-select assertion is assured by the programmable chip-select assertion time from the start access time:
RFBI_ONOFF_TIME[3:0] CSONTIME bit field.
The chip-select deassertion time from the start access time is programmable:
RFBI_ONOFF_TIME[9:4] CSOFFTIME bit field

CAUTION

Configuring RFBI_ONOFF_TIME[3:0] CSONTIME = RFBI_ONOFF_TIME[9:4] CSOFFTIME = 0 is not supported and must be avoided. This configuration creates contention on the bus and progressively damages the LCD panel.

- Chip-select pulse width (CSPulseWidth)

The total chip-select pulse width is the time when write cycle time or read cycle time has completed and is programmable:

[RFBI_CYCLE_TIME](#)[17:12] CSPULSEWIDTH bit field

It applies on the read-to-write, write-to-read, read-to-read, and write-to-write access based on:

- The [RFBI_CYCLE_TIME](#)[19] RRENABLE bit: Read-to-read access
- The [RFBI_CYCLE_TIME](#)[20] WWENABLE bit: Write-to-write access
- The [RFBI_CYCLE_TIME](#)[18] RWENABLE bit: Read-to-write access
- The [RFBI_CYCLE_TIME](#)[21] WRENABLE bit: Write-to-read access

By default, it applies to any access (read-to-read, read-to-write, write-to-read, write-to-write) when the chip-select CS0 is activated by setting the [RFBI_CONTROL](#)[3:2] CONFIGSELECT bit field to 0x1.

- Access time

Access time is the time delay between A0 assertion to data sampling before RE signal deassertion; access time is programmable:

[RFBI_CYCLE_TIME](#)[27:22] ACCESTIME bit field

When reading the data on the bus, the data are sampled at the end of the access time, which occurs before the end of the read off time ([RFBI_ONOFF_TIME](#)[29:24] REOFFTIME).

- Write-enable cycle time (WECycleTime)

The total write-enable cycle time is the time when A0 becomes valid until write cycle completion; the write-enable cycle time is programmable:

The [RFBI_CYCLE_TIME](#)[5:0] WECYCLETIME bit field

- Write-enable assertion/deassertion time (WEOnTime/WEOffTime)

The WE assertion delay time from start access time is programmable:

[RFBI_ONOFF_TIME](#)[13:10] WEONTIME bit field

The WE deassertion delay time from the start access time is programmable:

[RFBI_ONOFF_TIME](#)[19:14] WEOFFTIME bit field

- Read-enable cycle time (RECycleTime)

The total read-enable cycle time is the time when A0 becomes valid until read cycle completion; the read-enable cycle time is programmable:

The [RFBI_CYCLE_TIME](#)[11:6] RECYCLETIME bit field

- Read-enable assertion/deassertion time (REOnTime/REOffTime)

The RE assertion delay time from the start access time is programmable:

[RFBI_ONOFF_TIME](#)[23:20] REONTIME bit field

The RE deassertion delay time from the start access time is programmable:

[RFBI_ONOFF_TIME](#)[29:24] REOFFTIME bit field

At cycle time completion (read access or write access), all control signals (RFBI_CS0, RFBI_WE, and RFBI_RE) are deasserted regardless of their deassertion time parameter values, if they are not deasserted already.

However, an exception to this forced deassertion exists when a pipelined request to CS0 is pending. Also, a control signal with deassertion time parameters equal to the cycle time parameter is not necessarily deasserted when a pipelined request to the same chip-select or different chip-select is pending. This prevents any unnecessary glitch transitions.

If no inactive cycles are required between successive accesses to the same chip-select (the [RFBI_CYCLE_TIME](#)[17:12] CSPULSEWIDTH bit field = 0), and if assertion time parameters associated with the following access equal 0, the asserted control signals (RFBI_CS0, RFBI_WE, and RFBI_RE) stay asserted. This applies only to write-to-write access combination. In case of read-to-write, read-to-read, or write-to-read sequences, the RFBI_CS0, RFBI_WE, and RFBI_RE signals are always deasserted.

[Table 10-641](#) lists the configuration values for each timing bit.

Table 10-641. RFBI Timings Configuration

Timing Configuration Bits	Granularity ⁽¹⁾	
	One	Two
RFBI_ONOFF_TIME [3:0] CSONTIME	0 to 15	0 to 30
RFBI_ONOFF_TIME [9:4] CSOFTIME	0 to 63	0 to 126
RFBI_CYCLE_TIME [17:12] CSPULSEWIDTH	0 to 63	0 to 126
RFBI_CYCLE_TIME [27:22] ACCESSTIME	0 to 63	0 to 126
RFBI_CYCLE_TIME [5:0] WECYCLETIME	0 to 63	0 to 126
RFBI_ONOFF_TIME [13:10] WEONTIME	0 to 15	0 to 30
RFBI_ONOFF_TIME [19:14] WEOFFTIME	0 to 63	0 to 126
RFBI_CYCLE_TIME [11:6] RECYCLETIME	0 to 63	0 to 126
RFBI_ONOFF_TIME [23:20] REONTIME	0 to 15	0 to 30
RFBI_ONOFF_TIME [29:24] REOFFTIME	0 to 63	0 to 126

⁽¹⁾ Number of RFBI_ICLK clock cycles. The granularity can be configured using the [RFBI_CONFIG](#)[4] TIMEGRANULARITY bit.

10.5.4.11 Trigger Detection Logic

10.5.4.11.1 Trigger Mode

Setting the [RFBI_CONFIG](#)[3:2] TRIGGERMODE bit field configures the different trigger modes:

- Internal trigger mode with the internal programmable [RFBI_CONTROL](#)[4] ITE bit
- External trigger mode with external TE signal ([RFBI_TE_VSYNC](#))
- External trigger mode with external VSYNC/HSYNC signals

10.5.4.11.2 Internal Trigger Mode

10.5.4.11.2.1 ITE Bit

Set the [RFBI_CONTROL](#)[4] ITE bit to start capturing the data from the DISPC. The DISPC must be configured in the RFBI mode to account for the [RFBI_DISPC_STALL](#) signal. Setting the trigger mode to external ([RFBI_CONFIG](#)[3:2] TRIGGERMODE bit field set to 0x1 or 0x2) causes the [RFBI_CONTROL](#)[4] ITE bit to be ignored. The chip-select CS0 must be selected ([RFBI_CONTROL](#)[3:2] CONFIGSELECT set to 0x1) when this bit is set by users.

10.5.4.11.3 External Trigger Mode

There are two external trigger modes:

- TE only: VSYNC and HSYNC are merged by logical OR operation, and are detected through VSYNC and HSYNC pulse widths.
- HSYNC/VSYNC: This mode uses the two external signals which are detected through VSYNC and HSYNC pulse widths.

10.5.4.11.3.1 Programmable Line Number

When the trigger mode is set to external trigger mode with HSYNC and VSYNC or the TE, hardware resets the line counter when the VSYNC occurs and, after a programmable number of lines programmed by the user in the [RFBI_LINE_NUMBER](#)[10:0] LINENUMBER bit field (the HSYNC pulse occurs for every line), the transfer to the LCD panel begins. When the programmable line number is 0, only the VSYNC pulse indicates the beginning of the transfer in both modes: HSYNC/VSYNC and TE (logical OR operation between HSYNC and VSYNC).

10.5.4.11.3.2 VSYNC Pulse Width (Minimum Value)

The [RFBI_VSYNC_WIDTH](#)[15:0] MINVSYNCPULSEWIDTH bit field defines the minimum number of RFBI_ICLK clock cycles of the VSYNC pulse for detection on VSYNC. It allows differentiation between VSYNC and HSYNC, which are ORed on the same signal, and is also used in HSYNC/VSYNC mode on the two separate input lines.

- The VSYNC pulse width must be equal to at least two RFBI_ICLK clock cycles when HSYNC is not present (TE trigger mode only).
- The VSYNC pulse width must be equal to at least four RFBI_ICLK clock cycles when HSYNC is present (TE trigger mode only).

10.5.4.11.3.3 HSYNC Pulse Width (Minimum Value)

The [RFBI_HSYNC_WIDTH](#)[15:0] MINHSYNCPULSEWIDTH bit field defines the minimum number of RFBI_ICLK clock cycles of the HSYNC pulse for detection on HSYNC. It allows differentiation between VSYNC and HSYNC, which are ORed on the same signal, and is also used in VSYNC/HSYNC mode on the separate two input lines. To be detected, the HSYNC/VSYNC pulse width must always be equal to at least two RFBI_ICLK clock cycles. See [Table 10-642](#).

Table 10-642. Minimum Pulse Width (HSYNC/VSYNC)

Configuration Bits	TE Mode	HSYNC/VSYNC Mode
RFBI_HSYNC_WIDTH [15:0] MINHSYNCPULSEWIDTH field value	2	2
RFBI_VSYNC_WIDTH [15:0] MINVSYNCPULSEWIDTH field value	4	2

The pulse received by the RFBI must be at least two RFBI_ICLK clock cycles to be detected. In case of TE mode, since the minimum value for differentiate VSYNC and HSYNC is two RFBI_ICLK clock cycles, the VSYNC pulse width must be at least four RFBI_ICLK clock cycles and the HSYNC pulse width must be at least two RFBI_ICLK clock cycles

10.5.5 RFBI Programming Guide

10.5.5.1 RFBI Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and use of the RFBI.

10.5.5.1.1 Global Initialization

10.5.5.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the RFBI is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the RFBI. For more information, see [Section 10.5.2, RFBI Environment](#), and [Section 10.5.3, RFBI Integrator](#).

[Table 10-643](#) describes the global initialization of surrounding modules.

Table 10-643. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	RFBI_ICLK interface clock must be enabled. See Chapter 3, Power, Reset, and Clock Management .
DISPC	RFBI_FCLK1 and RFBI_FCLK2 functional clocks must be enabled. See Section 10.2.1, Display Controller .
Control module	rfb_i_re pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_we pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_cs0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_te_vsync0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_data[15:0] pads muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_hsync0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_a0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. See Chapter 18, Control Module .
MPU INTC	MPU interrupt controller configuration must be done to enable the interrupts from the DISPC module. See Chapter 17, Interrupt Controllers .
sDMA	DMA configuration must be done to enable the RFBI module DMA channel requests. See Chapter 16, Direct Memory Access .
Interconnect	See Chapter 13, Interconnect , for more information about the interconnect configuration.

NOTE: The MPU INTC and the sDMA configurations are necessary if the interrupt- and DMA-based communication modes are used.

10.5.5.1.1.2 RFBI Global Initialization

10.5.5.1.1.2.1 Main Sequence RFBI Global Initialization

This procedure initializes the RFB and DISPC after a power on or software reset. See [Table 10-644](#).

Table 10-644. RFBI Global Initialization

Step	Register/Bit Field Programming Model	Value
DISPC configuration in RFBI mode	See Section 10.5.5.1.1.2.2 , <i>Subsequence: DISPC Configuration</i> .	
RFBI configuration	See Section 10.5.5.1.1.2.3 , <i>Subsequence: RFBI Configuration</i> .	
LCD panel configuration	See Section 10.5.5.1.1.2.4 , <i>Subsequence: LCD Panel Configuration</i> .	

10.5.5.1.1.2.2 Subsequence: DISPC Configuration

This procedure configures the DISPC registers in RFBI mode. See [Table 10-645](#).

Table 10-645. DISPC Configuration in RFBI Mode

Step	Register/Bit Field Programming Model	Value
DISPC pipeline configuration	Configuration of the pipeline associated to the LCD output (DMA engine, pipelines associated to the LCD output, etc.). See Section 10.2.4 , <i>Display Controller Functional Description</i>	
Enable TFT mode.	DISPC_CONTROL0[3] STNTFT	0x1
Program the DISPC in RFBI mode.	DISPC_CONTROL0[11] STALLMODE	0x1
Reset the DISPC signal configuration to default value.	DISPC_POL_FREQ0	0x00
Select the RFBI data path.	DISPC_CONTROL1[16:15] GPOUT	0x1
Enable the hardware handshake to avoid the DISPC FIFO underflow (applies to the pipeline connected to the LCD output).	DISPC_CONFIG0[16] BUFFERHANDCHECK	0x1

NOTE: In RFBI mode, the DISPC_CONTROL0[5] GOLCD bit must not be set to 1. It must be disabled before resetting the DISPC_CONTROL0[11] STALLMODE bit to 0.

The hardware handshake applies to the pipelines connected to the LCD output. It must be disabled before resetting the DISPC_CONTROL0[11] STALLMODE bit to 0.

10.5.5.1.1.2.3 Subsequence: RFBI Configuration

This procedure configures the RFBI registers. See [Table 10-646](#).

CAUTION

The RFBI configuration registers for CS0 configuration can be accessed only when the configuration is not in use (that is, when the [RFBI_CONTROL\[3:2\] CONFIGSELECT](#) is set to 0x0).

Table 10-646. RFBI Configuration – Main Sequence

Step	Register/Bit Field Programming Model	Value
Enable the RFBI data path.	RFBI_CONTROL[1] RFBIMODE	0x0
DMA mode configuration	See Section 10.5.5.1.1.2.3.1 , <i>Subsequence: DMA Mode Configuration</i> .	

Table 10-646. RFBI Configuration – Main Sequence (continued)

Step	Register/Bit Field Programming Model	Value
Disable the chip-select and configuration (this step is necessary to configure the timing registers).	RFBI_CONTROL[3:2] CONFIGSELECT	0x0
Timing and polarity signals configuration	See Section 10.5.5.1.1.2.3.2, Subsequence: Timing and Polarity Signals Configuration .	
Configure the parallel input data width.	RFBI_CONFIG[6:5] DATATYPE	x ⁽¹⁾
Configure the number of cycles.	RFBI_CONFIG[10:9] CYCLEFORMAT	x ⁽¹⁾
Trigger mode settings	See Section 10.5.5.1.1.2.3.3, Subsequence: Trigger Mode Settings .	
Program the data format per cycle.	RFBI_DATA_CYCLE_1	xxx ⁽¹⁾
	RFBI_DATA_CYCLE_2	xxx ⁽¹⁾
	RFBI_DATA_CYCLE_3	xxx ⁽¹⁾
Select the configuration of CS0	RFBI_CONTROL[3:2] CONFIGSELECT	0x1

⁽¹⁾ Values depend on the application

10.5.5.1.1.2.3.1 Subsequence: DMA Mode Configuration

[Figure 10-175](#) shows DMA mode configuration.

Figure 10-175. DMA Mode Configuration

rfbi-024

[Table 10-647](#) describes DMA mode configuration.

Table 10-647. Register Call Summary for Subsequence: DMA Mode Configuration

Register Name
RFBI_CONTROL

10.5.5.1.1.2.3.2 Subsequence: Timing and Polarity Signals Configuration

[Table 10-648](#) describes timing and polarity signals configuration.

Table 10-648. Timing and Polarity Signals Configuration

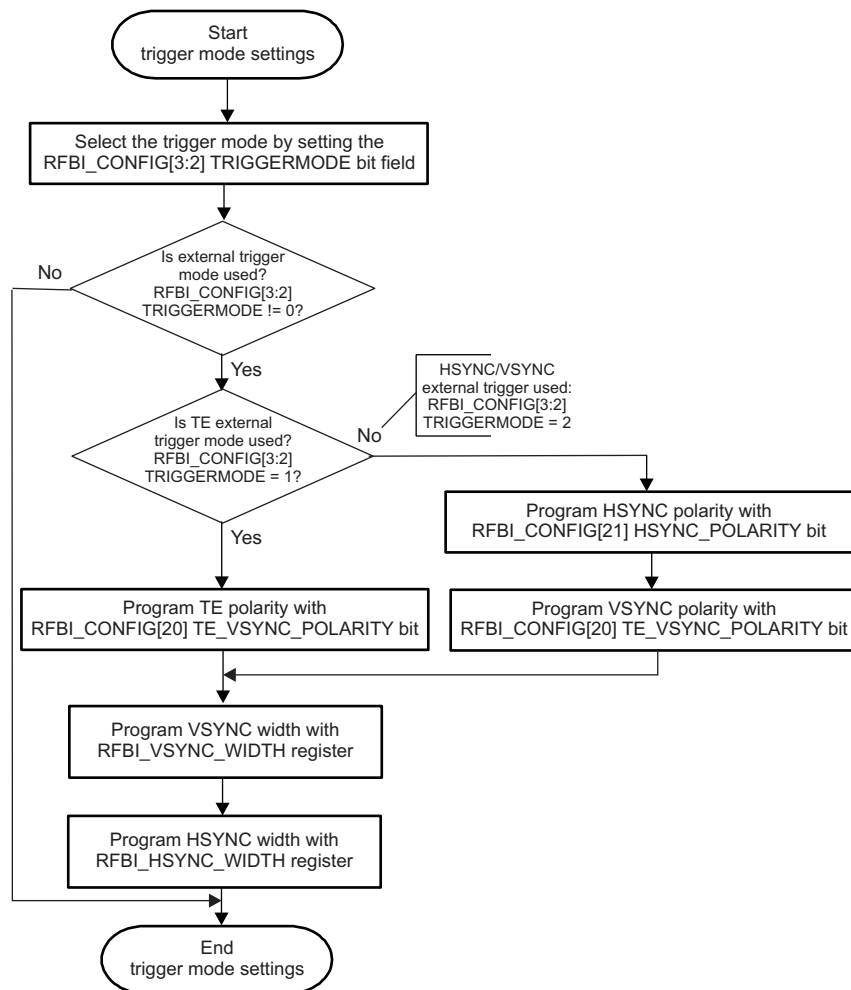

Step	Register/Bit Field Programming Model	Value
Program ON/OFF timings.	RFBI_ONOFF_TIME	xxx ⁽¹⁾
Program cycle timings.	RFBI_CYCLE_TIME	xxx ⁽¹⁾
Program CS polarity.	RFBI_CONFIG[19] CSPOLARITY	x ⁽¹⁾
Program WE polarity.	RFBI_CONFIG[18] WEPOLARITY	x ⁽¹⁾
Program RE polarity.	RFBI_CONFIG[17] REPOLARITY	x ⁽¹⁾
Program A0 polarity.	RFBI_CONFIG[16] A0POLARITY	x ⁽¹⁾
Program unused bits.	RFBI_CONFIG[12:11] UNUSEDBITS	x ⁽¹⁾
Program the factor x2 latency.	RFBI_CONFIG[4] TIMEGRANULARITY	x ⁽¹⁾

⁽¹⁾ Values depend on the application.

10.5.5.1.1.2.3.3 Subsequence: Trigger Mode Settings

Figure 10-176 shows trigger mode settings.

Figure 10-176. Trigger Mode Settings

rfbi-025

Table 10-649 describes register call summary for subsequence: trigger mode settings

Table 10-649. Register Call Summary for Subsequence: Trigger Mode Settings

Register Name		
RFBI_CONFIG	RFBI_VSYNC_WIDTH	RFBI_HSYNC_WIDTH

10.5.5.1.1.2.4 Subsequence: LCD Panel Configuration

This procedure consists of sending and receiving commands. See Table 10-650 and Table 10-651.

Table 10-650. RFBI Command Interface: Writing Command to the LCD Panel

Step	Register/Bit Field Programming Model	Value
Write command to the LCD panel.	RFBI_CMD[8:0] CMD	0x ⁽¹⁾
Wait until BUSY != 1.	RFBI_SYSSTATUS[8] BUSY	

⁽¹⁾ Value depends on the command sent to the LCD panel.

Table 10-651. RFBI Command Interface: Reading Command From the LCD Panel

Step	Register/Bit Field Programming Model	Value
Initialize reading command.	RFBI_STATUS[8:0] STATUS	0x
Initialize reading command.	RFBI_READ [8:0] READ	0x
Wait until BUSY != 1.	RFBI_SYSSTATUS[8] BUSY	
Read command from the LCD panel.	RFBI_STATUS[8:0] STATUS	0x ⁽¹⁾
	RFBI_READ [8:0] READ	0x ⁽¹⁾

⁽¹⁾ Value depends on the command read from the LCD panel.

10.5.5.1.2 Operational Modes Configuration

10.5.5.1.2.1 RFBI Start Transfer

10.5.5.1.2.1.1 Main Sequence: RFBI Start Transfer With Polling Method

Table 10-652 describes the RFBI start transfer polling method.

Table 10-652. RFBI Start Transfer With Polling Method

Step	Register/Bit Field Programming Model	Value
Enable DISPC module output.	See Section 10.5.5.1.2.1.4, Subsequence: DISPC Output Enable.	
Enable RFBI module output.	See Section 10.5.5.1.2.1.5, Subsequence: RFBI Interrupts Enable.	
Detect event.	See Table 10-658.	

10.5.5.1.2.1.2 Main Sequence: RFBI Start Transfer With Interrupts and DMA Method

Table 10-653 describes the RFBI start transfer interrupts method.

Table 10-653. RFBI Start Transfer With Interrupts Method

Step	Register/Bit Field Programming Model	Value
Enable DISPC interrupts.	See Table 10-654.	
Enable DISPC module output.	See Section 10.5.5.1.2.1.4, Subsequence: DISPC Output Enable.	
Enable RFBI module output.	See Section 10.5.5.1.2.1.5, RFBI Interrupts Enable.	
Detect Event.	See Table 10-658.	

10.5.5.1.2.1.3 Subsequence: DISPC Interrupts Enable

This procedure enables the DISPC interrupts used in RFBI mode. See Table 10-654.

Table 10-654. DISPC Interrupts Enable

Step	Register/Bit Field Programming Model	Value
Clears all interrupts	DISPC_IRQSTATUS	0xFFFF
Enable the FRAMEDONEi IRQ.	DISPC_IRQENABLE FRAMEDONEi_EN	0x1
Enable the BUFFERUNDERFLOW IRQ.	DISPC_IRQENABLE BUFFERUNDERFLOW_EN	0x1
Enable the SYNCLOSTi IRQ.	DISPC_IRQENABLE SYNCLOSTi_EN	0x1

NOTE: The other interrupts requests (see [Section 10.5.4.5, Interrupt Requests](#)) can also be enabled, depending on the application.

10.5.5.1.2.1.4 Subsequence: DISPC Output Enable

This procedure enables the DISPC output. See [Table 10-655](#).

Table 10-655. DISPC Output Enable

Step	Register/Bit Field Programming Model	Value
Enable the video or GFX pipeline.	DISPC_VIDp_ATTRIBUTES[0] ENABLE	0x1
	DISPC_GFX_ATTRIBUTES[0] ENABLE	0x1
Enable the DISPC output.	DISPC_CONTROL[0] LCDENABLE	0x1

10.5.5.1.2.1.5 Subsequence: RFBI Output Enable

This procedure enables the RFBI output. [Figure 10-177](#) details the settings for this subsequence.

Figure 10-177. RFBI Output Enable Flow Chart

rfbi-022

[Table 10-656](#) describes RFBI output enable.

Table 10-656. Register Call Summary for Subsequence: RFBI Output Enable

Register Name		
RFBI_CONFIG	RFBI_CONTROL	RFBI_LINE_NUMBER
RFBI_PIXEL_CNT		

[Table 10-657](#) describes the RFBI behavior depending on the RFBI output enable.

Table 10-657. RFBI Behavior

RFBI_CONTROL [0] ENABLE Bit Value	RFBI Behavior
0	Slave port interconnect can write command/parameter/data and read data/status from the RFB. Slave port interconnect access can only be done to the active CS0.
1	The DISPC sends pixels to the RFB.

NOTE: The LCD output is disabled at the end of the transfer of the frame. The software must reenble the LCD output to generate a new frame by setting the DISPC_CONTROLo[0] LCDENABLE bit to 1.

CAUTION

The following registers must not be modified when the module is enabled (the [RFBI_CONTROL](#)[0] ENABLE bit set to 1):

- [RFBI_CONTROL](#)
- [RFBI_PIXEL_CNT](#)
- [RFBI_LINE_NUMBER](#)
- [RFBI_STATUS](#)
- [RFBI_CONFIG](#)
- [RFBI_ONOFF_TIME](#)
- [RFBI_CYCLE_TIME](#)
- [RFBI_DATA_CYCLEi](#) (i = 1 to 3)
- [RFBI_VSYNC_WIDTH](#)
- [RFBI_HSYNC_WIDTH](#)

NOTE: The RFBI_STALL STALL signal is asserted when the RFBI is disabled. Through the slave port, pixels can be sent to the LCD panel only when the pixel count has reached 0x0.

10.5.5.1.2.1.6 Subsequence: Detect Event

[Table 10-658](#) describes the detect event.

Table 10-658. Detect Event

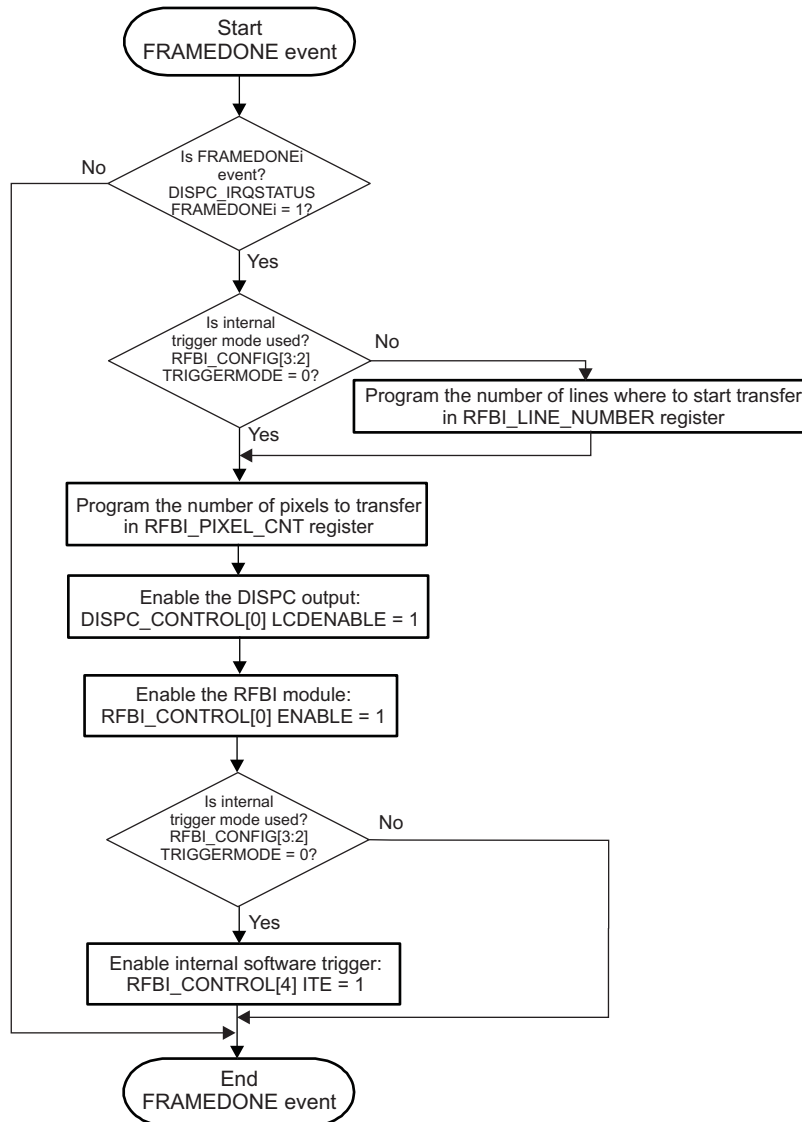

Step	Register/Bit Field Programming Model	Value
Wait until DISPC_IRQSTATUS != 0.	DISPC_IRQSTATUS	
Service event.	See Section 10.5.5.1.3, RFBI Events Servicing .	

10.5.5.1.3 RFBI Events Servicing

10.5.5.1.3.1 FRAMEDONE Interrupt Servicing

The FRAMEDONE event occurs each time a frame has been transferred to the LCD panel. [Figure 10-178](#) details how to serve this event.

Figure 10-178. FRAMEDONE Event Servicing Flow Chart

rfbi-023

[Table 10-659](#) describes FRAMEDONE interrupt servicing.

Table 10-659. Register Call Summary for RFBI Events Servicing: FRAMEDONE Interrupt Servicing

Register Name		
DISPC_IRQSTATUS	RFBI_CONFIG	RFBI_LINE_NUMBER
RFBI_PIXEL_CNT	DISPC_CONTROL	RFBI_CONTROL

10.5.6 RFBI Hardware Status Features

Table 10-660 lists the RFBI hardware status features.

Table 10-660. RFBI Hardware Status Features

Feature	Type	Register/Bit Field/Observability Control	Description
Data pending	Status	RFBI_SYSTATUS[9] BUSYRFBIDATA	It is set to 1 when some data are pending to be processed from interconnect FIFO.
Slave port bus busy	Status	RFBI_SYSTATUS[9] BUSY	It is set to 1 when the slave port bus is busy and access of some RFBI registers (RFBI_CMD , RFBI_STATUS , RFBI_PARAM , and RFBI_READ) is stalled.

10.5.7 RFBI Register Manual

CAUTION

The main access to all RFBI registers is through the L3 interconnect.
The access through L4_PER interconnect is provided for back software compatibility.

10.5.7.1 RFBI Instance Summary

Table 10-661. RFBI Instance Summary

Module Name	L3 Base Address	L4_PER Base Address	Size
RFBI	0x5800 2000	0x4804 2000	4KB

10.5.7.2 RFBI Registers

10.5.7.2.1 RFBI Register Summary

Table 10-662. RFBI Registers Mapping Summary

Register Name	Type	Register Width (Bits)	Address Offset	RFBI L3 Physical Address	RFBI L4_PER Physical Address

Table 10-665. RFBI_SYSCONFIG

Address Offset	0x0000 0010	Instance	RFBI
Physical Address	See Table 10-662 .		
Description	This register controls various parameters of the slave port interface.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																							RESERVED	RESERVED	SIDLEMODE	RESERVED	SOFTRESET	AUTOIDLE			

Bits	Field Name	Description	Type	Reset
31:7	RESERVED	Write 0's for future compatibility. Reads returns 0.	RO	0x00000000
6	RESERVED	Write 0's for future compatibility. Reads returns 0.	RO	0
5	RESERVED	Write 0's for future compatibility. Reads returns 0.	RO	0
4:3	SIDLEMODE	Slave interface power management, Idle req/ack control. 0x0: Force-idle. An idle request is acknowledged unconditionally. 0x1: No-idle. An idle request is never acknowledged 0x2: Smart-idle. Acknowledgement to an idle request is given based on the internal activity of the module.	RW	0x0
2	RESERVED	Write 0's for future compatibility. Reads returns 0.	RO	0
1	SOFTRESET	Software reset Sets this bit to 1 to trigger a module reset. The bit is automatically reset by the hardware. During reads, it always returns 0. 0x0: Normal mode 0x1: The module is reset	RW	0

Bits	Field Name	Description	Type	Reset
0	AUTOIDLE	Internal clock gating strategy (RFBI_ICLK clock and DISPC clock) 0x0: RFBI_ICLK clock and DISPC clock are free-running 0x1: Automatic clock gating strategy is applied for the RFBI_ICLK clock and DISPC clock, based on the slave port interface and internal activity.	RW	1

Table 10-669. RFBI_CONTROL

Address Offset	0x0000 0040	Instance	RFBI
Physical Address	See Table 10-662 .		
Description	The register configures the RFBI module.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SMART_DMA_REQ		DISABLE_DMA_REQ		HIGHTHRESHOLD		ITE		CONFIGSELECT		RFBIMODE		ENABLE			

Bits	Field Name	Description	Type	Reset
31:9	RESERVED	Write 0's for future compatibility. Reads return 0.	RO	0x000000
8	SMART_DMA_REQ	Smart DMA request 0x0: The dmareq is asserted and deasserted depending on FIFO space even if Mldlreq is high in smart-idle/no-idle mode and the entire burst gets error responses from the module. 0x1: The dmareq is deasserted after 2 clock cycles if it has been asserted for more than or equal to 2 clock cycles and Mldlreq is high in smart-idle or no-idle mode. No more burst requests will be given even if the space is available in the FIFO.	RW	0
7	DISABLE_DMA_REQ	Disable DMA request 0x0: The dmareq is enabled and the signal is generated based on the space available and the request coming into the data register. 0x1: The dmareq is disabled and the signal is not generated at all based on space in FIFO. It stays high until the DISABLE DM AREQ is high even if there is space in FIFO to take requests.	RW	0
6:5	HIGHTHRESHOLD	Defines the FIFO high threshold used by hardware to assert DMA request. Used only if data written to RFBI_DATA are sent using system DMA. 0x0: Size of the transfer of 4 words of 32-bit wide 0x1: Size of the transfer of 8 words of 32-bit wide 0x2: Size of the transfer of 16 words of 32-bit wide	RW	0x0
4	ITE	Internal Trigger 0x0: Hardware waits for ITE bit to be set if in internal trigger mode for the configuration in use. 0x1: User sets the ITE bit to start the transfer, when hardware takes into account the bit, the hardware resets it.	RW	0

Bits	Field Name	Description	Type	Reset
3:2	CONFIGSELECT	Select the CS and configuration 0x0: No CS selected 0x1: CS0 selected 0x2: Reserved 0x3: Reserved	RW	0x0
1	RFBIMODE	RFBI Mode 0x0: The RFBI mode is selected. 0x1: The RFBI mode is not selected.	RW	1
0	ENABLE	Enable/Disable flag 0x0: Disable the RFBI module. 0x1: Enable the RFBI module.	RW	0

10.6 Video Encoder

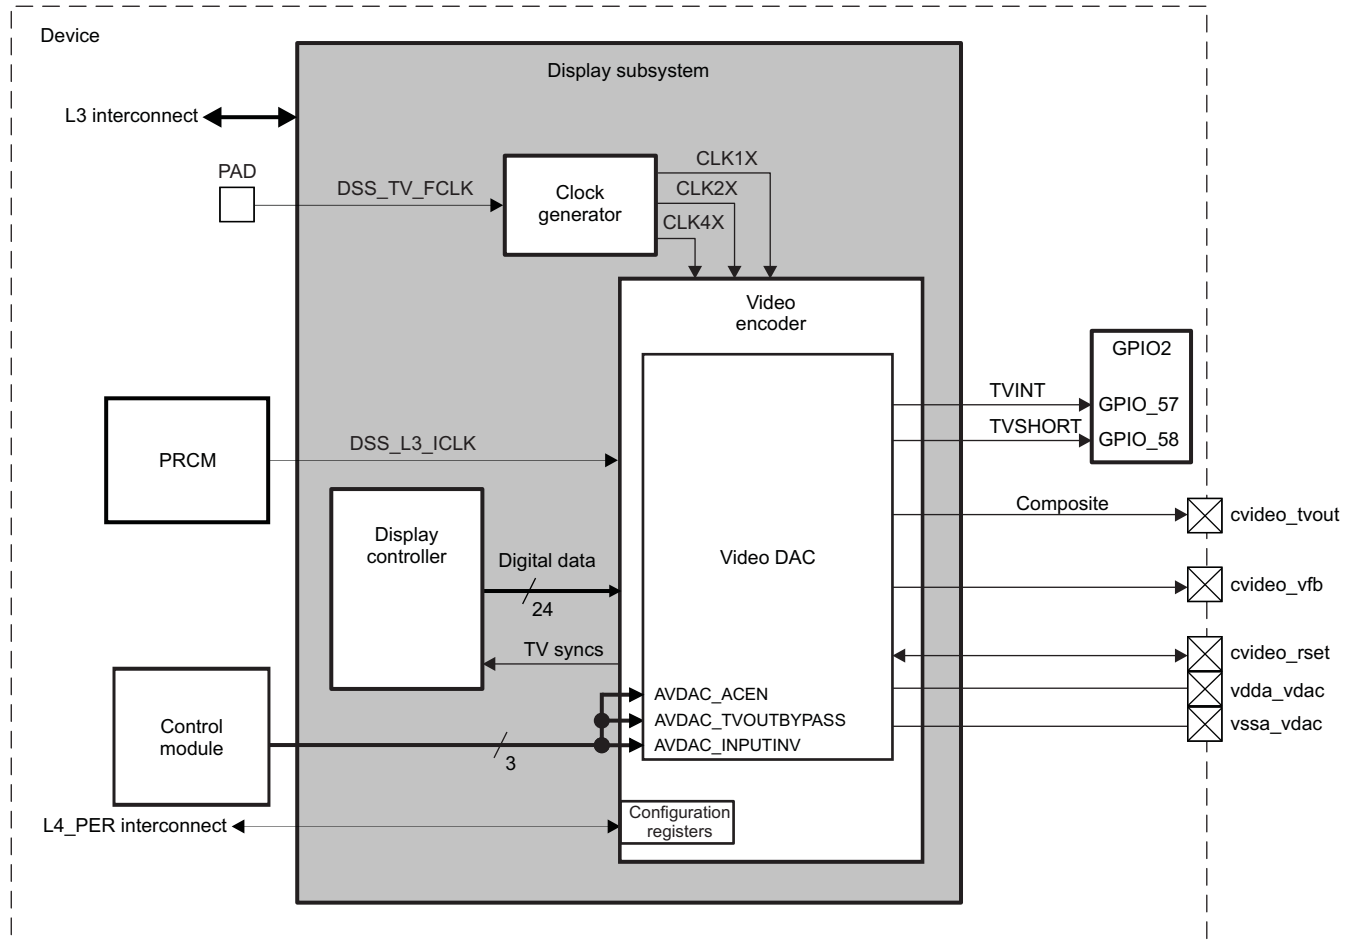

This section describes the video encoder for the device.

10.6.1 Video Encoder Overview

The display subsystem provides the logic to display a video frame from the memory frame buffer (either SDRAM or SRAM) on a TV set.

Figure 10-179 shows a block diagram of the display subsystem.

Figure 10-179. Video Encoder Overview

Venc-001

The video encoder includes the following features:

- Supports the following standards for composite video (CVBS) :
 - NTSC-J, M
 - PAL-B, D, G, H, I
 - PAL-M
- Input data interface compatible with the following protocols:
 - 24-bit input bus compatible with external sync
 - RGB 4:4:4
- 10-bit interface for internal digital-to-analog converter (DAC) that supports:
 - 1.1V digital power supply, 1.8V analog power supply
 - 10-bit resolution

- DNL within 1 LSB and INL within 1 LSB
- Sample rate of up to 60 megasamples per second (MSPS)
- Supports composite video standard output
- Supports TVOUT buffer bypass mode (DAC only mode)
- Full-scale voltage output: 1.2 V_{pp} with a 75-Ω load
- Internal TV detect feature
- Signal-to-noise ratio (SNR) is 54 dB (taking into account the ac coupling)
- Suitable for low-power wireless applications
- Power-down mode with less than 12-μA standby current
- Differential gain error and differential phase error: within 3% and 1°, respectively
- TV output data supports ITU-R BT 470-7 recommendation standard for consumer market
- Master clock input 13.5 MHz, 27 MHz (supports ITU-R 601 sampling for NTSC/PAL), and 54 MHz
- Programmable horizontal sync, vertical timing, and waveforms
- Programmable subcarrier frequency and SCH
- Internal test pattern generation (color bar, flat field, color burst)
- 2x/4x oversampling
- TV detection gating pulse generation
- Supports square pixel sampling (NTSC: 12.27 MHz, 24.54 MHz, 49.09 MHz PAL: 14.75 MHz, 29.5 MHz, 59 MHz)

CAUTION

In square pixel mode, an external clock generator is required to provide sampling frequencies.

10.6.2 Video Encoder Environment

To display on a TV, the path used is as follow:

- Display controller
- Video encoder
- 10-bit DAC with video amplifiers

The display controller module receives synchronization signals from the video encoder and synchronously sends pixel data to the video encoder with these signals. The digital output of the display controller is always a 24-bit RGB value based on a pixel request from the video encoder. For more information on the display controller settings and features, see [Section 10.2, Display Controller](#).

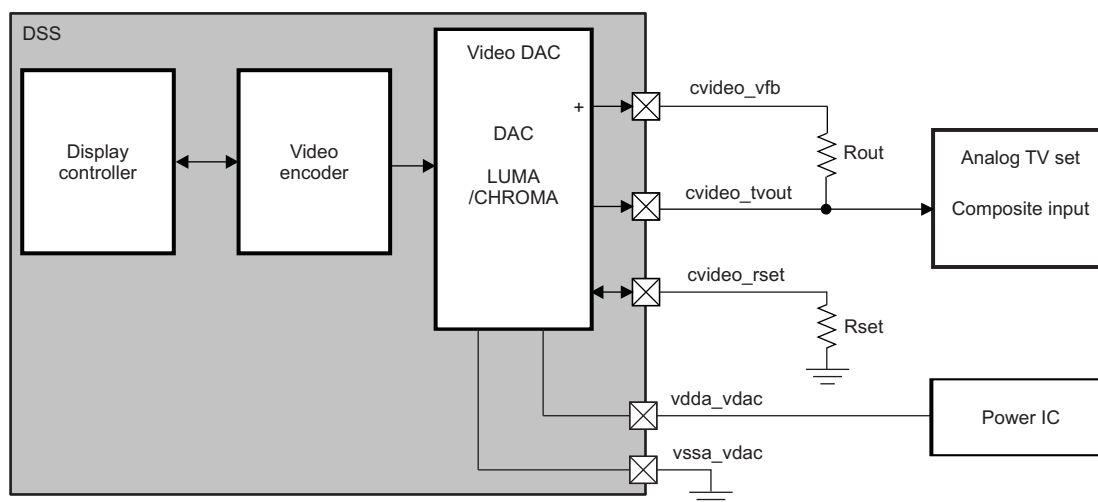

The video encoder converts RGB video signals to conform to the NTSC/PAL standard analog video. The video encoder includes an integrated synchronization signal generator and a video digital-to-analog converter (DAC) with video amplifiers, data manager, luma stage, chroma stage, modulator, and a control interface.

The video encoder also provides the synchronization signals to the display controller: VSYNC, active VIDEo (AVID), and field ID (FID).

NOTE: To enhance the TV color display, it is highly recommended to set the DSS_CONTROL[4] DAC_DEMEN bit.

[Figure 10-180](#) through [Figure 10-182](#) show the TV display interface in composite mode.

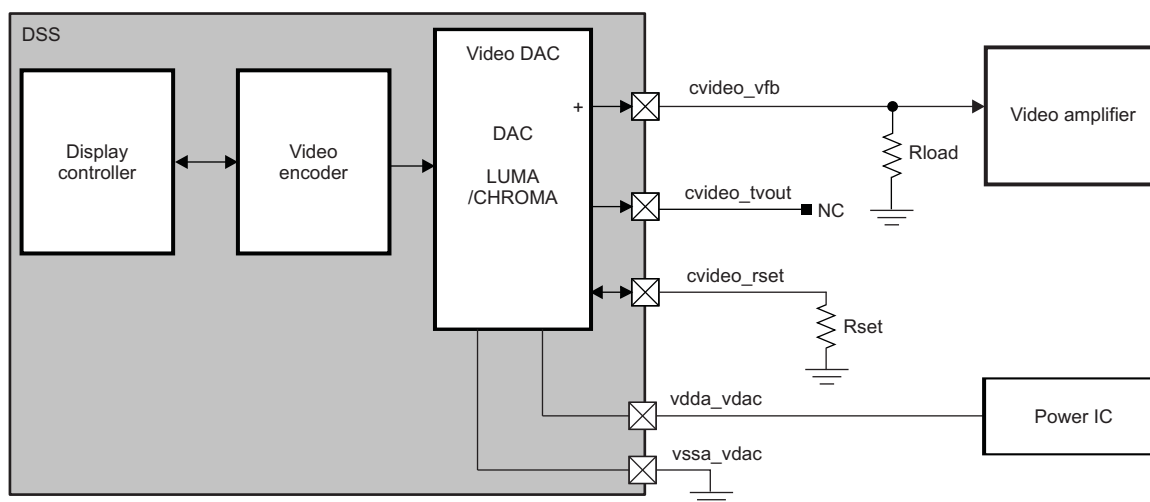

Figure 10-180. Video Encoder Environment, Normal Mode DC-Coupling

Venc-003

Figure 10-181. Video Encoder Environment, Normal Mode AC-Coupling

venc-015

Figure 10-182. Video Encoder Environment, Bypass Mode

venc-016

Table 10-697 describes the interface signals to/from the TV set for TV display support.

Table 10-697. TV Display Interface Pins

Pin Name	Type ⁽¹⁾	Description
cvideo_tvout	O	Analog luma or composite video output. An external resistor (Rout) is connected between this node and the cvideo_vfb pin. The nominal value of Rout is 2700 Ω. This is the output node that drives the load (75 Ω). In AC-coupling mode, a series capacitor (Cout) must be connected. The nominal value for Cout is ≥ 200 μF.
cvideo_vfb	O	In Normal mode (video DAC+Buffer), it acts as the buffer feedback node. An external resistor (Rout) shall be connected between this node and cvideo_tvout pin. In TVOUT Bypass mode, it acts as the video DAC output. A load resistor (Rload) shall be connected to the pin to ground. The nominal value of Rload is 1500 Ω.

⁽¹⁾ I = input; O = output; power = power pin

Table 10-697. TV Display Interface Pins (continued)

Pin Name	Type ⁽¹⁾	Description
cvideo_rset	I/O	External resistor (Rset) shall be connected to this pin to set the reference current of the video DAC. The value of the resistor depends on the mode of operation (Normal or TVOUT Bypass). In Normal mode, the nominal value for Rset is 4700 Ω . In TVOUT Bypass mode, the nominal value for Rset is 10000 Ω .
vdda_vdac	Power	Analog supply voltage for the video DAC
vssa_vdac	Power	Analog ground for the video DAC

CAUTION

- *cvideo_tvout* is a very high-frequency analog signal and must be routed with extreme care. As a result, the path of this signal must be as short as possible, and as isolated as possible from other interfering signals.
- During board design, the onboard traces and parasites must be matched for the channel. *cvideo_vfb* pin is the most sensitive pins in the TV out system. Low onboard resistance is required for the traces that connect the Rout to the *cvideo_vfb* and *cvideo_tvout* pins. The resistance on those trace affects output impedance matching. Therefore, Rout resistor is suggested to be placed as close as possible to the device pins. The onboard traces lead to the TV OUT pin must have a characteristic impedance of 75 Ohm starting from the closest possible place to the device pin output.
- If the TV output is not used, the following configuration for the VDAC pins must be applied:
 - vdda_vdac (connected to the vdda_hdmi_vdac ball, commonly used with the HDMI module):
 - If the HDMI module is used, then the vdda_hdmi_vdac ball is supplied. Respectively, the vdda_vdac pin is also supplied. The VDAC must be maintained in total power-down mode by software. For more information, see [Section 10.6.4.6.7, Video DAC Power Management](#).
 - If the HDMI module is not used, the vdda_vdac pin must be grounded.
 - vssa_vdac: Must be grounded
 - cvideo_rset: Must be floating, left unconnected
 - cvideo_tvout: Must be floating, left unconnected
 - cvideo_vfb: Must be floating, left unconnected
- To avoid current leakage, the following bits must be set to 0:
 - DSS.DSS_CONTROL[5] DAC_POWERDN_BGZ
 - [VENC_OUTPUT_CONTROL\[1\] COMPOSITE_ENABLE](#)
 - PRCM.CM_DSS_DSS_CLKCTRL[11] OPTFCLKEN_TV_FCLK
 - CONTROL.CONTROL_AVDAC[30] AVDAC_TVOUTBYPASS

[Table 10-698](#) lists the typical values of the external components for different modes of the TV display interface.

Table 10-698. Typical Values for Rout, Rset, Rload, and Cout

	Composite, DC-Coupled	Composite, AC-Coupled	Bypass Mode	Unit
Rout	2700	2700	N/A	Ω
Rset	4700	4700	10,000	Ω

Table 10-698. Typical Values for Rout, Rset, Rload, and Cout (continued)

	Composite, DC-Coupled	Composite, AC-Coupled	Bypass Mode	Unit
Rload	N/A	N/A	1500	Ω
Cout	N/A	≥ 220	N/A	μF

10.6.3 Video Encoder Integration

This section describes the integration of the display subsystem and details clocks, resets, hardware requests, and power modes.

Figure 10-183 shows the integration of the display subsystem in the device.

Figure 10-183. Video Encoder Integration

Table 10-699 describes the different clocks with their possible frequency values.

Table 10-699. Clocks

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
Video encoder	VENC_CLK	DSS_L3_ICLK	PRCM	For information about PRCM clock gating and management, see Chapter 3, Power, Reset, and Clock Management .
Clock generator	CLKGEN	DSS_TV_FCLK	PAD	Functional clock provided on pad. Controlled by the PRCM module.
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
Video encoder DAC	DSS_RST	DSS_RST	PRCM	Reset signal of the display subsystem power domain, from the PRCM module.

- Video encoder clock:
The CLKGEN is divided into three balanced clocks (see [Table 10-700](#)), depending on the clock mode selected through the DSS.DSS_CTRL[2] VENC_CLOCK_MODE bit (see [Section 10.1.3, DSS Register Manual](#)).

Table 10-700. Digital Clock Division for the Video Encoder

Clock Output	Clock Mode	
	Clock mode 0	Clock mode 1
CLK4X	DSS_TV_FCLK	DSS_TV_FCLK or 0 (gated)
CLK2X	DSS_TV_FCLK/2	DSS_TV_FCLK
CLK1X	DSS_TV_FCLK/4	DSS_TV_FCLK/2

NOTE: The DSS_TV_CLK clock is derived from the SYS_ALTCLK clock.

The source for the SYS_ALTCLK clock can be the `fref_xtal_in` or `fref_slicer_in` device pad.

An external clock generator must be connected to the `fref_slicer_in` or `fref_xtal_in` pad. A 54-MHz clock is needed for PAL or NTSC 601, a 49.04-MHz clock is needed for NTSC square pixel, and a 59-MHz clock is needed for the PAL square pixel.

The selection of the input source pad for the SYS_ALTCLK clock:

- Depends on the configuration of the `sys_boot[7:6]` device pads. For more information, see [Section 27.2.4.1, Clock Source Selection](#), in [Chapter 27, Initialization](#).
- Depends on the required use case:
 - If `DSS_TV_FCLK = 27 MHz` is required, then the `fref_slicer_in` or `fref_xtal_in` pad can be used as the source for SYS_ALTCLK.
 - If `DSS_TV_FCLK = 49.04, 54 MHz, or 59 MHz` is required, then the `fref_xtal_in` pad must be used as the source for SYS_ALTCLK.

Gating control over SYS_ALTCLK is provided in PRCM module registers. For more information, see [Section 3.6.14.4, Clock Domain Module Attributes](#), in [Chapter 3, Power, Reset, and Clock Management](#).

NOTE: Clock mode 1 can be used with both an external clock 27 MHz provided to VENC, but also with a 27-MHz clock generated internally by the HDMI PLL module. The source of the TV_CLK can be either DSS_TV_FCLK or PLL3_CLK1 clock signals (see [Section 10.1.2.1, DSS Clocks](#)).

After device reset, clock mode 0 is selected by default, and DSS_TV_FCLK clock is disabled.

For proper Video DAC configuration in both clock mode 0 or clock mode 1, clock output CLK4X shall always be active by setting the DSS.DSS_CTR[3] VENC_CLOCK_4X_ENABLE bit to 1 (see [Section 10.1.3, DSS Register Manual](#)).

The TV_CLK/4 in clock mode 0, or TV_CLK/2 in clock mode 1, is used into the DISPC to send data to the VENC.

- Video DAC clocks:
The video data are latched on the positive edge of the DSS_TV_FCLK clock.

10.6.4 Video Encoder Functional Description

Figure 10-184 shows an overview of the video encoder architecture.

Figure 10-184. Video Encoder Architecture Overview

venc-006

10.6.4.1 Data Manager

The data manager allows user to select two sources of data inputs:

- Data coming from the Display Controller.
- Data coming from the test pattern generation.

The source is selected by programming SVDS field [VENC_F_CONTROL\[7:6\]](#).

10.6.4.1.1 Color Space Converter

In the display subsystem, the input format from the display controller is always 24-bit RGB coming from the display controller or the test pattern generation. The RGB-to-YCbCr color space converter converts the 24-bit RGB pixel data into 16-bit YCbCr 4:2:2 data.

10.6.4.1.2 Test Pattern Generation

For diagnostic purposes, the data manager can be forced to output 100/100 color bar RGB/YCbCr data. To use the test pattern generation, SVDS [VENC_F_CONTROL\[7:6\]](#) field shall be set to 0x1. If FMT field [VENC_F_CONTROL\[1:0\]](#) is set to 0x0 then the 24-bits RGB test pattern data will be converted into 16-bit YCbCr 4:2:2 data by the Color Space Converter. Otherwise if FMT field [VENC_F_CONTROL\[1:0\]](#) is set to 0x2 then 16-bit YCbCr 4:2:2 test pattern data are outputted directly, the color space converted is bypassed. [Table 10-701](#) resume the test pattern generator datas.

Table 10-701. 100/100 Color Bar Table

COLOR	R	G	B	Y	Cb	Cr
White	255	255	255	235	128	128
Yellow	255	255	0	210	16	146
Cyan	0	255	255	170	166	16

Table 10-701. 100/100 Color Bar Table (continued)

Green	0	255	0	145	54	34
Magenta	255	0	255	106	202	222
Red	255	0	0	81	90	240
Blue	0	0	255	41	240	110
Black	0	0	0	16	128	128

10.6.4.2 Luma Stage

The luma stage includes a luma pipeline delay, luma shaping, 2x interpolation filter, and luma variable delay. The luma pipeline delay block is used to match luma path length to chroma path length. In the luma gain shaper, a programmable gain is first applied to the luminance data output. The luminance gain is defined by the [VENC_GAIN_Y](#) register. Horizontal sync, vertical sync, and setup insertion are then performed.

Black level and blank level are programmable through the [VENC_BLACK_LEVEL](#) and [VENC_BLANK_LEVEL](#) registers. All the transition edges of the luminance signal, such as sync edges and active video edges, are properly shaped and filtered to keep the bandwidth within the standards.

After all required components of the luminance signal are added, the resulting signal is low-passed and interpolated to 2x-pixel rate. This 2x interpolation simplifies the external analog reconstruction filter design and improves the signal-to-noise ratio.

10.6.4.3 Chroma Stage

The chroma stage includes a low-pass filter, first-stage 2x interpolation, chroma gain shaper, and second-stage 2x interpolation. A pair of programmable gains adjusts the time-multiplexed U/V signal. The gains for U and V are independently controlled by the [VENC_GAIN_U](#) and [VENC_GAIN_V](#) register bits.

10.6.4.4 Subcarrier and Burst Generation

The encoder uses a 32-bit subcarrier increment to synthesize the subcarrier. The value of the subcarrier increments required to generate the desired subcarrier frequency for NTSC and PAL format is found by:

$$S_CARR = \text{ROUND} ([F_{sc}/F_{CLK2X}] \times 2^{32})$$

where:

F_{sc} = Frequency of the subcarrier

F_{CLK2X} = Frequency of the internal video encoder

The [VENC_S_CARR](#) register controls the subcarrier frequency. The [VENC_C_PHASE](#) register controls the phase of the subcarrier. The phase of the color subcarrier is reset to [VENC_C_PHASE](#). [Table 10-702](#) presents the [VENC_S_CARR](#) register values depending the standard and pixel type used.

Table 10-702. VENC_S_CARR Register Recommended Values

Standard	Pixel Type	Subcarrier Frequency (Fsc) (MHz)	Fclkenc (MHz)	VENC_S_CARR Register Value (hexa)
NTSC-M, J	ITU-R601	3.579545	27	0x21F07C1F
PAL-M	ITU-R601	3.5756083125	27	0x21E6EFE3
PAL-B, D, G, H, I	ITU-R601	4.43361875	27	0x2A098ACB
NTSC-M, J	Square pixel	3.579545	24.5454 ⁽¹⁾	0x25555555
PAL-M	Square pixel	3.579561149	24.5454 ⁽¹⁾	0x1F15C01E
PAL-B, D, G, H, I	Square pixel	4.43361875	29.50 ⁽¹⁾	0x26798C0C

⁽¹⁾ In square pixel mode, an external clock generator is needed to provide sampling frequencies (49.09 MHz for NTSC square pixel or 59 MHz for PAL square pixel).

The color subcarrier reset has four modes:

- No reset
- Reset every two lines
- Reset every two fields
- Reset every eight fields

The [VENC_C_PHASE](#) register can be used to adjust the SCH (subcarrier to horizontal sync phase). The [VENC_BSTAMP_WSS_DATA](#)[6:0] BSTAP bit field sets the amplitude of the color burst.

Phase alternation line refers to the encoding scheme in which the subcarrier alternates between two phases every scan line. Setting to 0x1, the [VENC_M_CONTROL](#)[1] PAL bit enables phase alternation line encoding. Otherwise, a normal subcarrier is generated. Two possible alternation sequences are possible by setting the [VENC_M_CONTROL](#)[5] PALPHS bit.

10.6.4.5 Vertical Blanking Interval

10.6.4.5.1 Closed Caption Encoding

The encoder can be programmed to encode closed-caption data and extended data in the selected line. The closed-caption data are sent to the encoder through the L4_PER interconnect. The data stream consists of 7-bit US-ASCII code and 1 odd-parity bit (see [Table 10-703](#)).

Table 10-703. Closed-Caption Data Format

MSB						LSB	
Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Odd parity

The standard service encodes closed caption in both fields; the extended service encodes closed caption in even fields. When set to 1, the [VENC_L21_WC_CTL](#) L21EN[0] bit enables closed-caption encoding in odd fields. When set to 1, the [VENC_L21_WC_CTL](#) L21EN[1] bit enables closed-caption encoding in even fields.

To select the scan line where the CC data are encoded, program the [VENC_LN_SEL](#)[4:0] SLINE bit field.

CAUTION

The setting of the SLINE[4:0] bit field value depends on the video standard:

- PAL mode: Because there is a one-line offset, program the desired line number – 1. To activate the closed caption on line 21 (0x15), program the value $0x15 - 1 = 0x14$. The default value is $0x15 + 1 = 0x16$ (line 22).
- NTSC mode: Because there is a four-line offset, program the desired line number – 4. To activate the closed caption on line 21 (0x15), program the value $0x15 - 4 = 0x11$. The default value is $0x15 + 4 = 0x19$ (line 25).

The [VENC_LN_SEL](#)[25:16] LN21_RUNIN bit field should be kept at reset value (0x10B). Four closed-caption data registers contain the data to be encoded. The [VENC_LINE21](#)[15:8] L21O and [VENC_LINE21](#)[7:0] L21O bit fields contain the first and the second bytes, respectively, of closed-caption data to be encoded in the odd field. The [VENC_LINE21](#)[31:24] L21E and [VENC_LINE21](#)[23:16] L21E bit fields contain the first and the second bytes, respectively, of data to be encoded in the even field.

Immediately after the closed-caption data is written to the registers, in either the odd field or even field, the corresponding closed-caption status bit ([VENC_STATUS](#)[4] CCE or [VENC_STATUS](#)[3] CCO) is reset to 0 to indicate that the closed-caption data is available in the closed-caption data registers and yet to be encoded.

Immediately after the closed-caption data is encoded, the [VENC_STATUS](#)[4] CCE bit or the [VENC_STATUS](#)[3] CCO bit is set to 1 to indicate that the closed-caption data has been encoded and is ready to accept new data. As seen in [Figure 10-185](#), a null character is automatically inserted if the closed-caption data is not written to the closed-caption data registers in time for encoding.

The running clock frequency is controlled by the [VENC_CC_CARR_WSS_CARR\[15:0\]](#) FCC bit field which should be kept at reset value (0x2631) to get 5034960.5Hz (32xfline) for NTSC-601. The closed-caption running clock common frequencies are detailed in [Table 10-704](#).

Table 10-704. Closed-Caption RunClock Frequency Settings

	NTSC-601	PAL-601	NTSC Square Pixel	PAL Square Pixel
VENC_CC_CARR_WSS_CARR[15:0] FCC bit field value	0x2631	0x25ED	0x2A03	0x22B6

The closed-caption data is encoded in nonreturn-to-zero (NRZ) format. Additionally, the data translates to the IRE scale as follows:

- 0 = 0 IRE
- Sync pulse = -40 IRE
- 1 = 50 IRE

[Figure 10-185](#) shows the parameters of closed-caption line data implemented in different standards.

Figure 10-185. Closed Captioning Timing

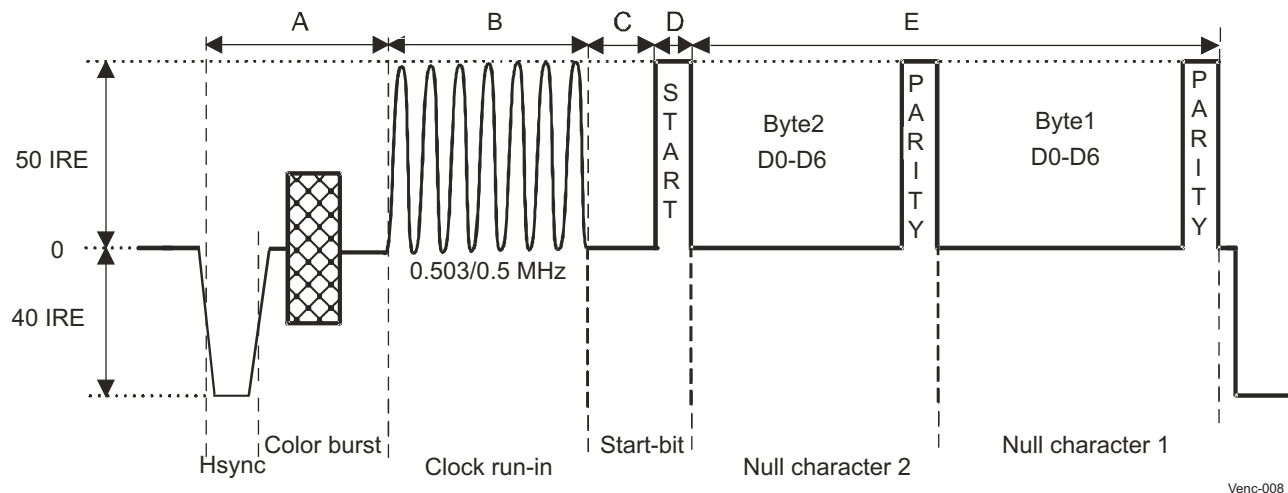

Table 10-705. Closed-Caption Standard Timing Values

Intervals	Description	Timing Values for Encoding			Timing Values for Decoding		
		Minimal	Nominal	Maximal	Lower Bound	Nominal	Upper Bound
A	HSYNC to clock running	10.250 μ s	10.500 μ s	10.750 μ s	10.000 μ s	10.500 μ s	11.000 μ s
B	Clock running		12.910 μ s			12.910 μ s	
C	Clock running to third start bit		3.972 μ s			3.972 μ s	
D	Start bit		1.986 μ s			1.986 μ s	
E	Data characters		31.778 μ s			31.778 μ s	

NOTE:

- The interval A is controlled by the [VENC_LN_SEL\[25:16\]](#) LN21_RUNIN bit field.
- The interval B is controlled by [VENC_CC_CARR_WSS_CARR\[15:0\]](#) FCC bit field.

All timing values listed in [Table 10-705](#) are measured from the mid-point (half amplitude) on all edges.

For a complete description of closed-caption standard including CGMS-A copy protection, see the CEA-608-x standard.

10.6.4.5.2 Wide-Screen Signaling (WSS) Encoding

The encoder can embed data, encoded in accordance with the IEC61880 and ITU-R 1119 data insertion standard, within the vertical blanking interval.

The encoder supports WSS data insertion on line 20 of every frame in the NTSC format. WSS data insertion is enabled by activating the [VENC_L21_WC_CTL\[14:13\]](#) EVEN_ODD_EN bit and by programming the [VENC_BSTAMP_WSS_DATA\[27:8\]](#) WSS_DATA bit field.

The running clock frequency is controlled by the [VENC_CC_CARR_WSS_CARR\[31:16\]](#) FWSS bit field. The wide-screen signaling running clock common frequencies are detailed in [Table 10-706](#)

Table 10-706. Wide-Screen Signaling RunClock Frequency Settings

	NTSC-601	PAL-601	NTSC Square Pixel	PAL Square Pixel
VENC_CC_CARR_WSS_CARR[31:16] FWSS bit field value	0x043F	0x2F72	0x04AC	0x2B6D

To select the line where the WSS data are encoded, program the [VENC_L21_WC_CTL\[12:8\]](#) LINE bit field.

CAUTION

The setting of the [LINE\[12:8\]](#) bit field value depends on the video standard:

- PAL mode: Because there is a one-line offset, program the desired line number – 1. The recommended value on line 23 is $0x16 + 1 = 0x17$. The default value is $0x14 + 1 = 0x15$ (line 21).
- NTSC mode: Because there is a four-line offset, program the desired line number – 4. The recommended value on line 20 is $0x10 + 4 = 0x14$. The default value is $0x14 + 4 = 0x18$ (line 24).

The WSS encoding block assumes that a full 10-bit video range is used to determine the 70 percent of peak-white amplitude of a logic-1 bit. The encoder also supports WSS data insertion on line 23 in the PAL format. Both waveforms are shown in [Figure 10-186](#).

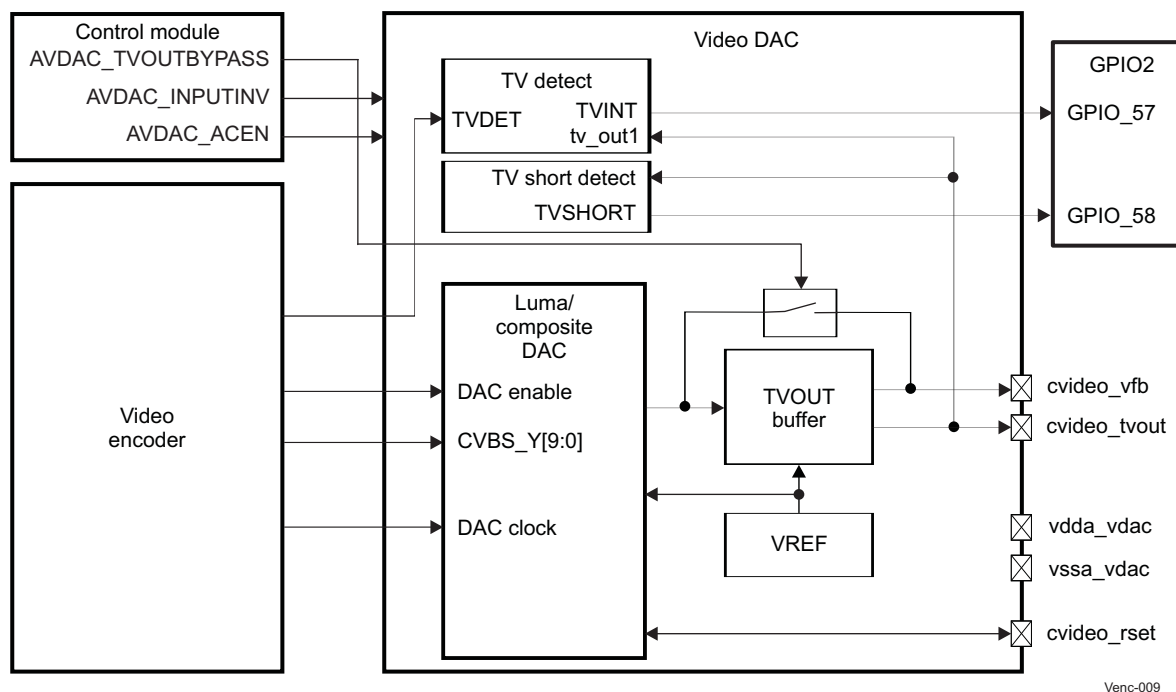

Figure 10-186. WSS Timing

Venc-007

10.6.4.6 Video DAC

Figure 10-187 shows the architecture of the 10-bit video DAC.

Figure 10-187. 10-Bit Video DAC Architecture

The display subsystem provides the necessary control signals to interface the memory frame buffer directly to external displays (TV sets). A 10-bit current steering DAC is used to generate the video analog signal. The video mode DAC also includes the TV detection/disconnection and power-down mode features.

10.6.4.6.1 Video DC/AC Coupled TV Load

The 10-bit video DAC supports both dc-coupled and ac-coupled TV loads. The CONTROL.CONTROL_AVDAC[31] AVDAC_ACEN bit is used to define which output coupling is used. This bit is the first one to be programmed according to the TV load on the PCB board.

NOTE: When dc coupling is used, note that there is a 385-mV dc offset at the TVOUT output.

10.6.4.6.2 TV Detection/Disconnection Pulse Generation and Use

10.6.4.6.2.1 TV Detection/Disconnection Pulse Generation

The TV detect block is an integral part of the video DAC module.

NOTE:

- The TV detection/disconnection feature is supported on the video DAC.
- The TV disconnection feature is recommended for power saving purpose. The TV detection/disconnection is only operational when video out is active. Therefore to detect cable connection automatically, it is necessary to periodically activate the video out to test for cable presence.

This block compares the output (*cvideo_tvout*) to reference voltage, to sense the condition of the load. To operate, the TV detect requires two digital signals, TVACEN and TVDET. The TVACEN signal indicates to both TVOUT buffer and the TV detect circuit if the load is ac or dc coupling to adjust accordingly. TVDET is a digital pulse at the frequency of the TV sync pulses. The operation of the circuit is based on the difference in voltage levels in the output of the buffer depending of the load status. The TV detect block compares the output against a couple of references and the result is latched at the start of every sync pulse. The status is read later in with the TVDET pulse rising edge.

The following registers are used to set the TV detection/disconnection pulse:

- The [VENC_TVDETGPI_INT_START_STOP_X](#) register defines which pixels are used to start and stop the pulse inside their respective line.
- The [VENC_TVDETGPI_INT_START_STOP_Y](#) register defines which lines are used to start and stop the pulse.
- The [VENC_GEN_CTRL\[0\]](#) EN bit enables or disables the TVDET pulse (0: Disable; 1: Enable).
- The [VENC_GEN_CTRL\[16\]](#) TVDP bit sets the TVDET pulse polarity (0: Active low; 1: Active high).

10.6.4.6.2.2 Recommended TV Detection/Disconnection Pulse Waveform

To enable the detection/disconnection of the load, the circuit requires that the TVDET pulse resembles the following waveform. By using the video encoder registers, the TVDET pulse polarity, start and stop is programmable. The only critical parameter is *Tdm*, which should be longer than the delay through the DAC and TVOUT buffer, which is at least 750 ns.

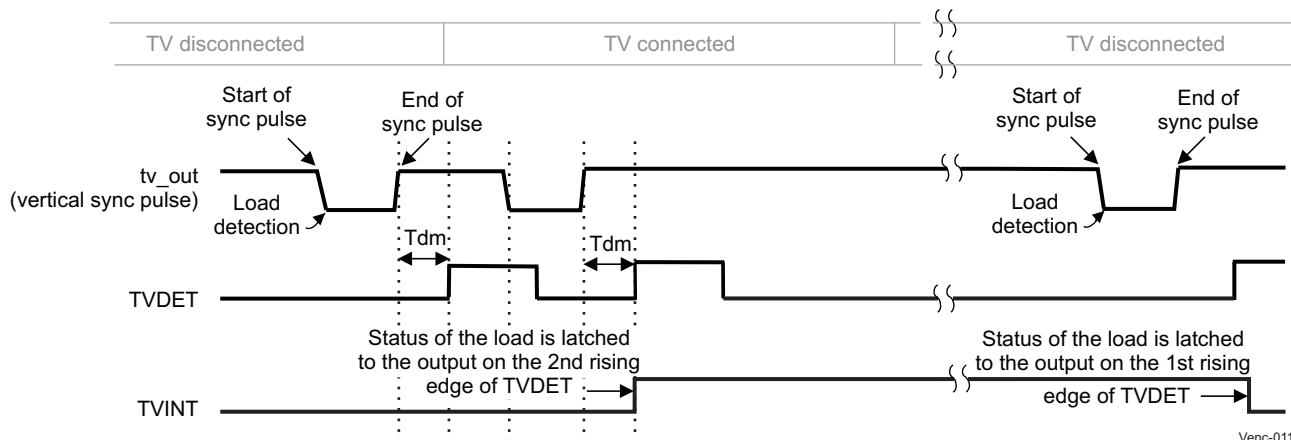

If dc-coupling is selected, the TVINT output signal for TV detection is latched at the rising edge of the first TVDET signal but the TVINT output signal for TV disconnection is latched after the next rising edge of the TVDET signal that happens during the next VSYNC timing. [Figure 10-188](#) shows the waveforms for the dc-coupling TV detect pulse (TVDET) when load is connected and disconnected.

Figure 10-188. DC-Coupling TV Detect Waveforms for TV Connected and Disconnected

If ac-coupling is selected, the TVINT output signal for TV detection is latched after the next rising edge of the TVDET signal that happens during the next VSYNC timing but the TVINT output signal for TV disconnection is latched at the rising edge of the first TVDET signal. [Figure 10-189](#) shows the waveforms for the ac-coupling TV detect pulse (TVDET) when load is connected and disconnected.

Figure 10-189. AC-Coupling TV Detect Waveforms for TV Connected and Disconnected

NOTE:

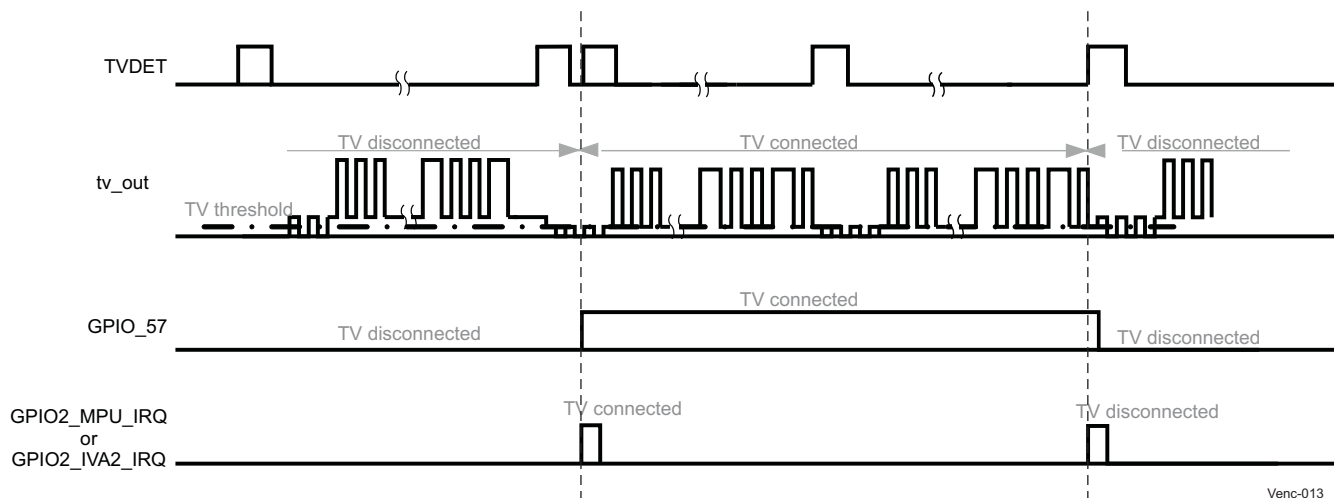

- When setting the `VENC_TVDETGPI_INT_START_STOP_X` register, software users must ensure that the `TVDET` signal is in the active area. To avoid any problem, the `TVDET` signal must not be longer than one line.
- The activation of the `TVDET` signal will not have a visual impact on the `cvideo_tvout` output signal.

10.6.4.6.2.3 TV Detection/Disconnection Use

The TV-detection/TV-disconnection is based on the difference in voltage levels in the output of the TV buffer depending on the load status. The operation is slightly different for ac and for dc operation. For dc operation, the `cvideo_tvout` voltage is compared against a voltage reference that makes the comparator trigger in each sync pulse while the load is connected. For ac operation, the `cvideo_tvout` voltage is compared against a voltage reference that makes the comparator trigger in each sync pulse while the load is disconnected. In both cases, the `TVINT` output signal produces a logic 1 when a load is connected and a logic 0 when a load is disconnected.

For dc-coupling mode, see [Figure 10-190](#) and for ac-coupling mode, see [Figure 10-191](#)

NOTE: Because the video DAC and the video encoder must be awake for connection detection, consider that the video DAC can take up to 10 μ s to wake up.

Figure 10-190. GPIO Signal Waveform Proposal for TV Detection/Disconnection in DC-Coupling Mode**Figure 10-191. GPIO Signal Waveform Proposal for TV Detection/Disconnection in AC-Coupling Mode****10.6.4.6.3 TV Short Detection**

A TV short-detection circuit, which can detect a short circuit condition at `cvideo_tvout` output during the vertical sync pulse, is integrated in the video DAC module (see [Figure 10-187](#)).

When the output is shorted to ground, the TVSHORT signal turns to logic high. The TVSHORT signal is internally mapped in the device to the GPIO_58 signal (channel 26 of the GPIO2 module), which allows interrupt generation on this channel (see [Chapter 25, General-Purpose Interface](#)). TV short detection is valid after two video frames pass with the short/no-short condition.

TV short detection has priority over TV load detection (see [Section 10.6.4.6.2.2, TV Detection/Disconnection Pulse Generation and Use](#)). Whenever a short is detected (with load or no-load), TVINT output is masked as long as the short remains. When released, TV load detection resumes (see [Section 10.6.4.6.2.2, TV Detection/Disconnection Pulse Generation and Use](#)).

CAUTION

If TV short is detected, the video DAC must be powered down by setting the `DSS.DSS_CTRL[5] DAC_POWERDN_BGZ` bit to 0.

10.6.4.6.4 Video DAC Normal Mode

The normal mode of operation (DAC + TVOUT buffer) is the default mode of the video DAC, with the CONTROL.CONTROL_AVDAC[30] AVDAC_TVOUTBYPASS bit set to 0 at device reset. The output of the DAC is internally connected to the TVOUT buffer, which can drive the composite video signal to 75 Ω load directly. For information about external connectivity, see [Section 10.6.2, Video Encoder Environment](#).

In normal mode, higher input values of the DAC code result in lower output voltage levels by default, because of the inverting configuration of the TVOUT buffer. The CONTROL.CONTROL_AVDAC[29] AVDAC_INPUTINV bit provides inversion control over the data input of the DAC, to allow alignment of the output voltage with VENC data. If the AVDAC_INPUTINV bit is set to 1, the DAC input code is inverted. Thus, higher DAC code values provided by the VENC result in higher output voltage.

10.6.4.6.5 Video DAC Bypass Mode

The 10-bit video DAC has a TVOUT buffer bypass mode that turns off the TVOUT buffer and redirects directly the DAC output to the *cvideo_vfb* pin.

This bypass mode is activated by setting the CONTROL.CONTROL_AVDAC[30] AVDAC_TVOUTBYPASS bit to 1. The reset value of the CONTROL.CONTROL_AVDAC[30] AVDAC_TVOUTBYPASS bit is 0 (that is, the TVOUT buffer is not bypassed).

NOTE: In bypass mode:

- *cvideo_rset* pin requires a Rset resistor connected to the ground. The typical value of the Rset resistor is 10000 Ω .
- *cvideo_vfb* pin require a Rload resistor connected to the ground. The typical value of the Rload resistor is 1500 Ω .

CAUTION

- The TV detect feature is not available in bypass mode.
- In bypass mode, an external amplifier is needed on the *cvideo_vfb* pin.

10.6.4.6.6 Video DAC Test Mode

10-bit external or internal datas values can be used to stimulate the DAC in debug, see [Figure 10-192](#).

Figure 10-192. DAC Test Mode in Composite Video Mode

Venc-014

- Setting to 0x1 the VENC_OUTPUT_CONTROL[4] TEST_MODE bit will place the DAC under test.
- By setting the value of the VENC_OUTPUT_CONTROL[6] COMPOSITE_SOURCE bit to:
 - 0x0: the DAC input is coming from VENC_OUTPUT_TEST[9:0] COMPOSITE_TEST bit field
 - 0x1: the DAC input is coming from the display controller G[1:0], B[7:0]. To perform this

configuration, the video encoder shall be configured to generate correct timing signals with the display controller even if the video encoder is bypassed from the data path perspective.

10.6.4.6.7 Video DAC Power Management

After device reset, the DSS.DSS_CTRL[5] DAC_POWERDN_BGZ bit is set to 0, and the video DAC is in power-down state.

Table 10-707 lists the possible power-management configurations and the corresponding register settings.

Table 10-707. Video DAC Power-Management Configurations

Power Management Controls				
DSS_CTRL[5] DAC_POWERDN_BGZ	VENC_OUTPUT_CONTROL[1] COMPOSITE_ENABLE	CONTROL_AVDAC[30] AVDAC_TVOUTBYPASS	CONTROL_AVDAC[31] AVDAC_ACEN	Power State
0	x	x	x	Total power down. Bandgap powered down.
1	0	x	x	Standby (analog in power down except bandgap/LDO)
1	1	0	0	Full power up in DC normal mode
1	1	0	1	Full power up in AC normal mode
1	1	1	x	Full power up in TVOUT bypass mode (DAC-only mode)

10.6.5 Video Encoder Programming Guide

10.6.5.1 Video Encoder Low-level Programming Models

10.6.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the video emodule is to be used for the first time after a device reset. This initialization of the surrounding modules is based on the integration and environment of the video encoder (for more information, see [Section 10.6.2](#) and [Section 10.6.3](#)).

Table 10-708. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management
Control module	Module-specific pad muxing and configuration must be set in the control module. See Chapter 18, Control Module .
Display controller	See Section 10.2, Display Controller , for more information about the configuration.

10.6.5.1.2 Video Encoder Global Initialization

10.6.5.1.2.1 Main Sequence—Start Video Encoder

[Table 10-709](#) details the procedure to initialize the video encoder after a power-on or software reset.

Table 10-709. Start Video Encoder

Step	Register/Bit Field/Programming Model	Value
Perform a video encoder reset.	See Section 10.6.5.1.2.3 .	
Save the DSS IRQ enable register value (DSS interrupts context).	DISPC_IRQENABLE	
Reset all DSS IRQ.	DISPC_IRQENABLE	0x00
Configure the video encoder registers for PAL 601 or NTSC 601.	See Table 10-716 .	0x--
Set the input video source and format.	VENC_F_CONTROL	See Table 10-716 .
Set the synchronization modes.	VENC_SYNC_CTRL	See Table 10-716 .
Configure the TV connection detection (optional).	See Section 10.6.5.1.2.4 .	
Enable the composite video signal output.	See Section 10.6.5.1.2.6 .	
Enable the display controller pipeline	See the display controller programming guide.	
Wait until the first VSYNC pulse signal.		
Clear the SYNCLOSTDIGITAL interrupt.	DISPC_IRQSTATUS[15] SYNCLOSTDIGITAL	0x1
Restore the DSS IRQ enable register.	DISPC_IRQENABLE	0x--

10.6.5.1.2.2 Main Sequence—Stop Video Encoder

[Table 10-710](#) details the procedure to stop the output of the composite signal.

Table 10-710. Start Video Encoder

Step	Register/Bit Field/Programming Model	Value
Perform TV disconnection detection (optional).	See Section 10.6.5.1.2.5 .	
Disable the composite video signal output.	See Section 10.6.5.1.2.7 .	

10.6.5.1.2.3 Subsequence—Video Encoder Software Reset

Table 10-711 details the reset procedure.

Table 10-711. Reset Video Encoder

Step	Register/Bit Field/Programming Model	Value
Activate reset.	VENC_F_CONTROL[8] RESET	0x1
Wait until reset is complete.	VENC_F_CONTROL[8] RESET	0x0

NOTE: Before changing the standard (NTSC or PAL) and related registers, a software reset is required to properly initialize the VENC module.

10.6.5.1.2.4 Subsequence—TV Connection Detection

Table 10-712 details the TV connection detection procedure.

Table 10-712. TV Connection Detection Subsequence

Step	Register/Bit Field/Programming Model	Value
Set the pixel TV detection start and stop value.	VENC_TVDETGP_INT_START_STOP_X	0x--
Set the line TV detection start and stop value.	VENC_TVDETGP_INT_START_STOP_Y	0x--
Set the polarity of TV detection.	VENC_GEN_CTRL[16] TVDP	0x--
Enable TV detection.	VENC_GEN_CTRL[0] EN	0x1
Enable the composite video signal output.	See Section 10.6.5.1.2.6.	
Wait until TVINT = 1.	See the GPIO programming guide.	

CAUTION

- If ac coupling is selected, two TVDET pulses are required to set high the TVINT signal. Due to the internal logic of the video DAC, the TVINT signal is generated after the next positive edge of the TVDET signal that happens during the next VSYNC timing.
- If dc coupling is selected, only one TVDET pulse is required to set high the TVINT signal.

10.6.5.1.2.5 Subsequence—TV Disconnection Detection

Table 10-713 details the TV disconnection detection procedure.

Table 10-713. TV Disconnection Detection Subsequence

Step	Register/Bit Field/Programming Model	Value
Set the pixel TV detection start and stop value.	VENC_TVDETGP_INT_START_STOP_X	0x--
Set the line TV detection start and stop value.	VENC_TVDETGP_INT_START_STOP_Y	0x--
Set the polarity of TV detection.	VENC_GEN_CTRL[16] TVDP	0x--
Enable TV disconnection.	VENC_GEN_CTRL[0] EN	0x1
Wait until TVINT = 0.	See the GPIO programming guide.	

CAUTION

- If dc coupling is selected, two TVDET pulses are required to set low the TVINT signal. Because of the internal logic of the video DAC, the TVINT signal is generated after the next positive edge of the TVDET signal that happens during the next VSYNC timing.
- If ac coupling is selected, only one TVDET pulse is required to set low the TVINT signal.

10.6.5.1.2.6 Subsequence—Enable Video Composite Signal Output

Table 10-714 details the procedure to enable the video composite signal output.

Table 10-714. Enable Video Composite Signal Output

Step	Register/Bit Field/Programming Model	Value
Enable the composite video signal output.	VENC_OUTPUT_CONTROL	0x0000 000A
Power up the vdda_vdac voltage for VDAC and the TVOUT buffer.		

10.6.5.1.2.7 Subsequence—Disable Video Composite Signal Output

Table 10-715 details the procedure to enable the video composite signal output.

Table 10-715. Disable Video Composite Signal Output

Step	Register/Bit Field/Programming Model	Value
Disable the composite video signal output.	VENC_OUTPUT_CONTROL	0x00000000
Power down the vdda_vdac voltage for VDAC and the TVOUT buffer.		

10.6.6 Video Encoder Use Case and Tips

10.6.6.1 Video Encoder Register Settings

Table 10-716 lists the register values to use in typical video encoder applications.

These values are validated programming values only for NTSC 601 and PAL 601 standards with a TV display resolution of 720*488 and 720*576, respectively.

Table 10-716. Video Encoder Register Programming Values

Register Name	NTSC 601	PAL 601
VENC_F_CONTROL	0x00000000	0x00000000
VENC_VIDOUT_CTRL	0x00000001	0x00000001

VENC_OUTPUT_CONTROL	0x0000000A	0x0000000A
VENC_OUTPUT_TEST	0x00000000	0x00000000

NOTE: The following display controller fields must be programmed to the NTSC 601 video standard:

- DISPC_SIZE_DIG[10:0] PPL = $720 - 1 = 719 = 0x2CF$
- DISPC_SIZE_DIG[26:16] LPP = $(488/2) - 1 = 243 = 0xF3$

The following display controller fields must be programmed to the PAL 601 video standard:

- DISPC_SIZE_DIG[10:0] PPL = $720 - 1 = 719 = 0x2CF$
- DISPC_SIZE_DIG[26:16] LPP = $(576/2) - 1 = 287 = 0x11F$

For both standard, the base addresses should be handle as follow:

- DISPC_GFX_BA0 or DISPC_VIDn_BA0 = Base address of even bit field data
- DISPC_GFX_BA1 or DISPC_VIDn_BA1 = Base address of odd bit field data

10.6.7 Video Encoder Register Manual

CAUTION

The main access to all Video Encoder registers is through the L3 interconnect.
The access through L4_PER interconnect is provided for back software compatibility.

10.6.7.1 Video Encoder Instance Summary

Table 10-717. Video Encoder Instance Summary

Module Name	L3 Base Address	L4_PER Base Address	Size
VENC	0x5800 3000	0x4804 3000	4 KB

CAUTION

The VENC registers have no register data width access restriction and can be accessed in 8-bit, 16-bit and 32-bit access.

10.6.7.2 Video Encoder Registers

10.6.7.2.1 Video Encoder Register Summary

2D/3D Graphics Accelerator

This chapter describes the 2D/3D graphics accelerator (SGX) for the device.

NOTE: The SGX subsystem is an instantiation by Texas Instruments of the POWERVR™ SGX540 core from Imagination Technologies Ltd.

This document contains materials that are © Imagination Technologies Ltd.

POWERVR and USSE are trademarks or registered trademarks of Imagination Technologies Ltd.

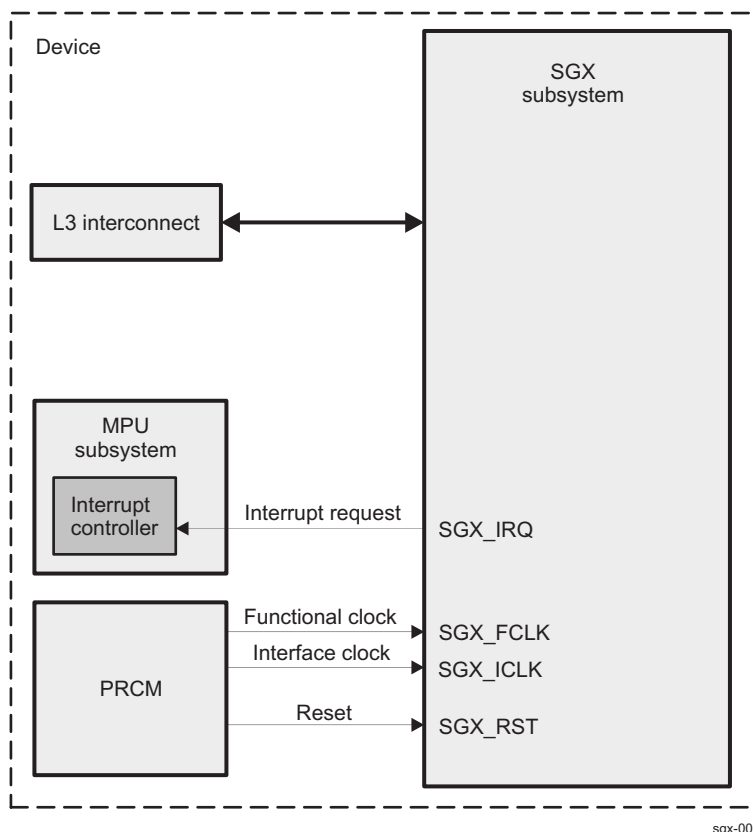

Topic	Page
11.1 SGX Overview	2684
11.2 SGX Integration	2687
11.3 SGX Functional Description	2689
11.4 SGX Register Manual	2692

11.1 SGX Overview

The 2D/3D graphics accelerator (SGX) subsystem accelerates 2-dimensional (2D) and 3-dimensional (3D) graphics applications. The SGX subsystem is based on the POWERVR® SGX core from Imagination Technologies. SGX is a new generation of programmable POWERVR graphics IP cores. The POWERVR SGX540 v1.2.0 architecture is scalable and can target all market segments from mainstream mobile devices to high-end desktop graphics. Targeted applications include feature phones, PDAs, and handheld gaming applications.

Figure 11-1 shows the SGX subsystem.

Figure 11-1. SGX Overview

The SGX graphics accelerator efficiently processes a number of various multimedia data types concurrently:

- Pixel data
- Vertex data
- General-purpose processing

The multithreaded architecture uses two levels of scheduling and data partitioning to enable zero overhead task switching.

11.1.1 POWERVR SGX Main Features

- 3D graphics, vector graphics, and video supported on common hardware
- Tile-based architecture
- Universal scalable shader engine (USSE™): a multithreaded engine that incorporates pixel and vertex shader functionality and reduces die area
- Advanced shader feature set in excess of Microsoft VS3.0, PS3.0, and OpenGL™2.0
- Industry standard application programming interface (API) support: OpenGL ES 1.1 and 2.0, OpenVG v1.1
- Fine-grained task switching, load balancing, and power management
- Advanced geometry, direct memory access (DMA)-driven operation for minimum CPU interaction
- Programmable high-quality image antialiasing
- Fully virtualized memory addressing for operating system (OS) operation in a unified memory architecture

11.1.2 SGX 3D Features

- Deferred pixel shading
- On-chip tile floating-point depth buffer
- 8-bit stencil with on-chip tile stencil buffer
- Scissor test
- Texture support:
 - Cube map
 - Projected textures
 - Nonsquare textures
- Texture formats:
 - RGBA 8888, 565, 1555
 - Monochromatic 8, 16, 16f, 32f, 32int
 - Dual channel, 8:8, 16:16, 16f:16f
 - Compressed textures PVR-TC1, PVR-TC2, ETC1
 - Programmable support for all YUV formats
- Resolution support:
 - Frame buffer maximum size = 2048 x 2048
 - Texture maximum size = 2048 x 2048
- Texture filtering:
 - Bilinear, trilinear
 - Independent minimum and maximum control
- Antialiasing:
 - 4x multisampling
 - Programmable sample positions
- Indexed primitive list support
 - Bus mastered
- Programmable vertex DMA
- Render to texture:
 - Including twiddled formats
 - Auto MipMap generation
- Multiple on-chip render targets (MRTs)

NOTE: Performance is limited when on-chip memory is not available for the SGX core.

11.1.3 SGX Universal Scalable Shader Engine – Key Features

The USSE is the engine core of the POWERVR SGX architecture and supports a broad range of instructions.

- Single programming model:
 - Multithreaded with 16 simultaneous execution threads and up to 64 simultaneous data instances
 - Zero-cost swapping in and out of threads
 - Cached program execution model
 - Dedicated pixel processing instructions
 - Dedicated vertex processing instructions
- SIMD execution unit supporting operations in:
 - 32-bit IEEE float
 - 2-way 16-bit fixed point
 - 4-way 8-bit integer
 - 32-bit bit-wise (logical only)
- Static and dynamic flow control:
 - Subroutine calls
 - Loops
 - Conditional branches
 - Zero-cost instruction predication
- Procedural geometry:
 - Allows generation of primitives
 - Effective geometry compression
 - High-order surface support
- External data access:
 - Permits reads from main memory using cache
 - Permits writes to main memory
 - Data fence facility
 - Dependent texture reads

11.2 SGX Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 11-2 shows SGX integration.

Figure 11-2. SGX Integration

The SGX subsystem is connected to the level 3 (L3) interconnect by a 128-bit master and a 64-bit slave interface.

Table 11-1 through Table 11-3 summarize the integration of the module in the device.

Table 11-1. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
SGX	PD_GFX	L3

Table 11-2. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SGX	SGX_ICLK	SGX_L3_ICLK	PRCM	SGX interface clock
SGX	SGX_FCLK	SGX_FCLK	PRCM	SGX functional clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
SGX	SGX_RST	SGX_RST	PRCM	SGX reset signal

Table 11-3. Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
SGX	SGX_IRQ	MA_IRQ_21	Cortex-A9 INTC	SGX interrupt request to the MPU interrupt controller (INTC)

NOTE:

- For a description of the interrupt source, see [Section 11.3.5, Interrupt Requests](#).

11.3 SGX Functional Description

11.3.1 SGX Block Diagram

The SGX subsystem is based on the POWERVR SGX540 core from Imagination Technologies. The architecture uses both programmable and hard-coded pipelines to perform various processing tasks required in 2D, 3D, and video processing. The SGX architecture comprises the following elements:

- Coarse grain scheduler (CGS)
 - Programmable data sequencer (PDS)
 - Data master selector (DMS)
- Vertex data master (VDM)
- Pixel data master (PDM)
- General-purpose data master
- USSE
- Tiling coprocessor
- Pixel coprocessor
- Texturing coprocessor
- Multilevel cache

Figure 11-3 shows the SGX block diagram.

Figure 11-3. SGX Block Diagram

sgx-003

11.3.1.1 CGS

The CGS is the main system controller for the POWERVR SGX architecture and consists of two stages: the DMS and the PDS. The DMS processes requests from the data masters and determines which tasks can be executed given the resource requirements. The PDS then controls the loading and processing of data on the USSE.

11.3.1.2 Data Masters

The SGX core includes three data masters:

- **VDM:** the initiator of transform and lighting processing within the system. The VDM reads an input control stream, which contains triangle index data and state data. The state data indicates the PDS program, the size of the vertices, and the amount of USSE output buffer resource available to the VDM. The triangle data is parsed to determine unique indices that must be processed by the USSE. These are grouped together based on the configuration provided by the driver and presented to the DMS.
- **PDM:** the initiator of the rasterization processing within the system. Each pixel pipeline processes pixels for a different half of a given tile, which allows for optimum efficiency within each pipe due to the locality of the data. For each task it determines the amount of resource required within the USSE. It merges this with the state address and issues a request for execution on the USSE to the DMS.
- **General-purpose data master:** responds to events within the system (such as the end of a pass of triangles from the ISP, end of a tile from the ISP, end of a render, or parameter stream breakpoint event). Each event causes either an interrupt to the host or the synchronized execution of a program on the PDS. The program might or might not cause a subsequent task to be executed on the USSE.

11.3.1.3 USSE

The USSE is a user-programmable processing unit. Although general in nature, its instructions and features are optimized for three types of task: processing vertices (vertex shading), processing pixels (pixel shading), and video/imaging processing.

11.3.1.4 Multilevel Cache

The multilevel cache is a 2-level cache consisting of two modules: the main cache and the mux/arbitrator/demux/decompression unit (MADD). The MADD is a wrapper around the main cache module designed to manage and format requests to and from the cache as well as provide level 0 caching for texture and USSE requests.

The MADD can accept requests from the PDS, USSE, and texture address generator modules. Arbitration is performed between the three data streams; any required texture decompression is also performed.

11.3.1.5 Texturing Coprocessor

The texturing coprocessor performs texture address generation and formatting of texture data. It receives requests from the iterators or the USSE modules and translates these into requests to the multilevel cache. Data returned from the cache are then formatted based on the texture format selected and sent to the USSE for pixel-shading operations.

11.3.1.6 Tiling Coprocessor

To process pixels in a tiled manner, the screen is divided into tiles and arranged as groups of tiles by the tiling coprocessor. An inherent advantage of tiling architecture is that a large amount of vertex data can be rejected at this stage, thus reducing both the memory storage requirements and the amount of pixel processing performed.

11.3.1.7 Pixel Coprocessor

The pixel coprocessor is the final stage of the pixel-processing pipeline and controls the format of the final pixel data sent to the memory. It supplies the USSE with an address to the output buffer, and the USSE returns the relevant pixel data. The address order is determined by the mode of the frame buffer. The pixel coprocessor contains a dithering and packing function.

11.3.2 SGX Clock Configuration

The SGX subsystem operates from two clocks: an interface clock (SGX_ICLK) and a functional clock (SGX_FCLK). The power, reset, and clock management (PRCM) module generates and distributes both clocks inside the device.

- The SGX_ICLK interface clock manages the data transfer on the L3 master and slave ports.
The SGX_ICLK frequency is selected based on the whole device L3 interconnect clock frequency. For more information on the interface clock, see [Section 3.6.12, CD_SGX Clock Domains](#).
When no longer required by the SGX subsystem, SGX_ICLK can be disabled by software at the PRCM level. For more information, see [Section 3.7.8, PD_SGX Description](#).

NOTE: SGX_ICLK is cut only if the SGX is ready to go into IDLE state.

- SGX_FCLK is the functional clock and is used inside the SGX subsystem to generate clock signals to multiple SGX clock domains.
Depending on the clock source selection and the DPLL settings, SGX_FCLK can support a frequency of up to 307 MHz.
The SGX_FCLK clock is provided by either the PRCM module or the peripheral DPLL, as described in [Section 3.6.12, CD_SGX Clock Domains](#). Selection is made at the PRCM level.
When no longer needed by the SGX subsystem, SGX_FCLK can be cut by software at the PRCM level, if the module is ready to enter the IDLE state. For more information, see [Section 3.7.8, PD_SGX Description](#).

11.3.3 SGX Software Reset

The SGX subsystem has its own reset domain. Global reset of the SGX is performed by activating the SGX_RST signal in the SGX_RST domain.

NOTE: The APIs delivered with the SGX provide a software reset functionally equivalent to a hardware reset.

11.3.4 SGX Power Management

The SGX subsystem has its own power domain (SGX power domain). For additional information about the SGX power domain, see [Section 3.7.8, PD_SGX Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).

NOTE: The SGX handles automatic clock gating performed on the multiple internal module clock domains.

In addition, software-controlled clock gating is managed inside the SGX and handled by the related API delivered with the module.

11.3.5 SGX Interrupt Requests

The SGX subsystem can generate one interrupt signal to the MPU INTC mapped to SGX_IRQ.

11.4 SGX Register Manual

CAUTION

All SGX registers are limited to 32-bit data accesses; 8- and 16-bit accesses are not allowed because they can corrupt register content.

Audio Back End

This chapter describes the audio back end (ABE) module.

Topic	Page
12.1 ABE Overview	2709

12.1 ABE Overview

The audio back end (ABE) module is a subsystem that manages various audio and voice uplink and downlink streams between the initiator (the Cortex™-A9 microprocessor unit [MPU], digital signal processor [DSP], or direct memory access [DMA] controller) and the peripheral physical interfaces (multichannel buffered serial port [McBSP], SLIMbus®, digital microcontroller [DMIC], multichannel pulse density modulation [McPDM], and multichannel audio serial port [McASP]).

The ABE module handles the audio processing for the applications. It receives voice or audio samples from the initiator or the external audio chip (TWL6040 or other) and sends them to the peripheral interfaces or memories after processing. The ABE can perform buffering of audio samples, mix audio with a voice down stream and/or a microphone up stream (sidetone), and can apply some post-processing.

The ABE integrates the following modules:

- Peripheral physical interfaces:
 - Three McBSP modules
 - One McASP module
 - One mobile industry processor interface (MIPI) SLIMbus interface
 - One DMIC module to support up to six mono and up to three stereo digital microphones
 - One MCPDM module to support interconnect with an external audio chip.
- Audio engine (AE):
 - Performs real-time signal processing like sample rate conversion, filtering, equalizing, and side-tone
 - Audio traffic controller (ATC):
 - Performs data move in the ABE
 - Generates interrupt requests to the DSP and Cortex-A9 interrupt controllers
 - On-chip memory:
 - 64KB of RAM; 32-bit data memory (DMEM)
 - 6KB for coefficient memory RAM (CMEM)
 - 18KB for sample memory RAM (SMEM)
- Local L4 interconnect (L4_ABE) to:
 - L3 interconnect
 - Cortex-A9 MPU
 - DSP

The Cortex-A9 MPU and the DSP have private access to the L4_ABE interconnect. All other initiators (sDMA) can access the L4_ABE only through the L3 interconnect.
- Timers:
 - Four general-purpose (GP) timers
 - One watchdog timer
- Clock and reset management: Receives clock and reset signals from the device PRCM module. The audio engine operates from the DPLL_ABE, which is in the PRCM module. The ABE modules can be supplied with clock signals from the DPLL_ABE or the DPLL_PER. The ABE has its own hardware reset domain (AUDIO_RST).
- Power management: The ABE module is power-independent. It has its own dedicated power domain (PD_ABE) and can execute audio processing with the rest of the device in retention or in off mode.
- Each peripheral in the ABE can be accessed directly by the initiator when the AE is bypassed (legacy mode, for old software compatability).

Figure 12-1 is a high-level overview of the ABE.

Figure 12-1. Audio Back End

12.1.1 AE Subsystem

The AE is the core of the ABE subsystem. It performs the real-time audio processing within the ABE: mixing, muxing, volume control, smooth muting, sampling rate conversion, and side-tone equalization. The AE subsystem also processes and executes all data transfers. To optimize the global processing, the ATC moves the data. An IRQ/DMA controller controls system IRQ and DMA requests. Input DMA requests come from the ABE peripherals, and output DMA requests and IRQ are generated and sent to the system (Cortex-A9 MPU interrupt controller, DSP interrupt controller, system DMA [sDMA], and the DSP enhanced direct memory access controller [eDMA]).

The AE subsystem contains:

- AE: processes the sample in SMEM with help of CMEM.
 - SMEM
 - CMEM
- DMEM contains the audio buffer and communication circular buffer.
- ATC: Transfers data between all modules in the ABE
- IRQ DMA controller

For more information about the audio engine, see the *Hardware Abstraction Layer (HAL) Addendum*.

12.1.2 Local Audio Interconnect

The ABE has its own audio local interconnect (L4_ABE), which interconnects and manages the data flow among all ABE modules.

L4_ABE main features are:

- Initiator ports: Cortex-A9 MPU, DSP, L3 interconnect, and AE subsystem. The sDMA operates with the L4_ABE interconnect through the L3 interconnect initiator port. The eDMA operates with the L4_ABE interconnect through the DSP initiator port.
- Target ports: AE subsystem, McBSP1/2/3, DMIC, McPDM, McASP, GPTIMER5/6/7/8, WDT3, and SLIMBUS1
- 8-, 16-, or 32-bit data, single access
- 4-bit x 32-bit initiator ports for each interconnect instance
- Auto clock-gating feature
- Little-endian transaction assumed for all packing/unpacking operations
- Nonblocking architecture with fair arbitration between threads
- Target interconnect interfaces support fully synchronous and divided synchronous accesses.

For more information, see [Chapter 13, Interconnect](#).

12.1.3 GP Timers

The ABE embeds four GP timers: GPTIMER5 through GPTIMER8. All GP timers have interrupts connected to the Cortex-A9 MPU, DSP, and AE subsystems.

GP timer controllers have the following functions:

- Interconnect slave interface (L4) supports:
 - 32-bit data bus width
 - 16-/32-bit access supported
 - 10-bit address bus width
 - Burst not supported
 - WNP (Write-Non-Posted) supported
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Supported modes:
 - Compare and capture modes
 - Auto-reload mode
 - Start-stop mode
- Programmable divider clock source
- Dedicated input trigger for capture mode and dedicated OUT trigger/PWM signal
- On-the-fly read/write register
- Supports disconnect protocol

For more information, see [Section 22.2, General-Purpose Timers](#).

12.1.4 Watchdog Timer

The ABE embeds one watchdog timer, WDT3, that generates an interrupt condition to the Cortex-A9 MPU on overflow, which can be used by the application software through the PRCM module to indirectly trigger a global warm reset.

WDT3 main features are:

- Interconnect slave interface (L4) supports:
 - 32-bit data bus width

- 16- and 32-bit access supported
- 11-bit address bus width
- Burst not supported
- WNP supported
- Free-running 32-bit upward counter
- Programmable divider clock source
- Watchdog is reset on power up or after a warm reset and then starts counting.
- Reset or interrupt actions on a timer overflow condition and according to the watchdog timer source
- Support of disconnect protocol

For more information, see [Section 22.3](#), *Watchdog Timers*.

12.1.5 Digital Microphone Controller

The DMIC allows support of up to three digital stereo microphones that send it a pulse-density modulated stream of bits, transferred on one period or one half-period of the clock (over-sampling clock) provided to the DMIC. Each microphone is directly connected to the TX filter decimator to extract the audio samples with a maximum OF 96 db SNR with a frequency sampling set to 96 kHz.

The DMIC has the following features:

- Six external pin connections (three data lines and three clock lines)
- Delivers one common clock (on the three clock lines) for all digital microphones
- Supports idle request/acknowledge protocol
- Supports stereo and mono digital microphones (up to three)
- Rising or falling edge configuration for the clock signal sampling
- DMIC-clock-programmable
- Interconnect slave interface (internal interconnect) supports 32-bit data bus width.
- One DMA request capability on a programmable FIFO threshold
- One RX FIFO (16-bit x 24-bit word depth) per microphone
- Complies with PRCM interrupts to the Cortex-A9 MPU and DSP subsystems
- Interconnect sample format: 32 bits (only 24 are significant)
- Supports idle request/acknowledge PRCM protocol

For more information, see [Section 23.7](#), *DMIC*.

12.1.6 SLIMbus

There is one SLIMbus module instantiation inside the ABE, SLIMbus1. The SLIMbus controller provides a bidirectional, multidrop, multichannel 2-line serial interface between the ABE and up to seven off-chip components in a system such as an audio codec, a Bluetooth® module, or an FM radio receiver/transmitter. Because of its versatility, SLIMbus can accommodate a wide range of peripherals and clocked frame-oriented protocols (I2S, pulse code modulation [PCM], time division multiplexing [TDM]).

SLIMbus has the following features:

- Supports idle request/acknowledge PRCM protocol
- Complies with MIPI SLIMbus standard version 1.0
- Interconnect slave interface (L4) supports:
 - 32-bit data bus width
 - 8-, 16-, and 32-bit access supported
 - 11-bit address bus width
 - Burst not supported
 - WNP supported
- Support of seven SLIMbus devices:

- One manager
- One framer
- One interface
- Four generic
- Message protocol partially implemented in SLIMbus module hardware:
 - Information elements are not stored in the module.
 - Message interpretation is not processed in the module.
 - FIFO size: 32 bytes for TX, 32 bytes for RX
- Support for eight TX and eight RX independent ports (data channels):
 - Supported transport protocols: Isochronous, pulled, pushed, asynchronous
 - Programmable segment data length (sample size) from 8 to 32 bits (8, 12, 16, 20, 24, 28, 32), including DATA and AUX
 - Programmable FIFO sizes
 - Programmable port assignment to any of the four generic devices
 - One DMA request line per port
- Operating frequencies of 0 to 24.576 MHz
- Supports disconnect protocol

For more information, see [Section 23.9](#), *Serial Low-Power Inter-Chip Media Bus Controller*.

12.1.7 Multichannel Audio Serial Port

The multichannel audio serial port (McASP) is a GP audio serial port. It is useful for intercomponent (DIT) transmission. The McASP is intended to be flexible enough so that it may connect gluelessly to audio A/D, D/A, CODEC and SPDIF transmit physical layer components.

McASP has the following features:

- 2-interconnect slave interface supports:
 - One interconnect configuration slave interface
 - One interconnect DMA slave interface
 - 32-bit data bus width
 - 16- and 32-bit access
 - 10-bit address bus width
 - Burst not supported
 - WNP
- Supports idle request/acknowledge protocol
- Buffers for transmit/receive operations
- DMA requests (one per direction) link with the 32-bit register
- Up to four transmit channels
- Four serializers implemented
- Support of disconnect protocol

For more information, see [Section 23.8](#), *McASP*.

12.1.8 Multichannel Buffered Serial Port

There are three McBSP instantiations: McBSP1 through McBSP3. They provide a full-duplex direct serial interface between the ABE and external devices, such as other modems, BT chips, or codecs. Because of its versatility, a McBSP can accommodate a wide range of peripherals and clocked frame-oriented protocols (I2S, PCM, TDM).

List of recommended usage per McBSP:

- MCBSP1: BT voice/audio data
- MCBSP2: Digital baseband (DBB) voice data
- MCBSP3: MIDI FM data

The McBSP has the following features:

- Interconnect slave interface (internal interconnect) supports:
 - 32-bit data bus width
 - 8-, 16-, and 32-bit access
 - 10-bit address bus width
 - Burst not supported
 - WNP
- Buffers for transmit/receive operations: 128/128 32-bit words (McBSP1, 2, 3)
- Interrupts configurable in legacy mode (two requests) or PRCM-compliant (one request)
- DMA requests (one per direction) triggered with programmable FIFO thresholds
- Multidrop support
- Serial interface description
- Four-pin configuration (McBSP1, 2, 3)
- Full-duplex communication
- Multichannel selection modes
- Support to enable or block transfers in each channel
- Up to 128 channels for transmission and for reception
- Supported protocols
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected A/D and D/A devices:
 - I2S-compliant devices
 - TDM bus devices
 - PCM devices
- A wide selection of data sizes: 8, 12, 16, 20, 24, and 32 bits
- Supports idle request/acknowledge protocol
- Clock generation support:
 - Independent clocking and framing for reception and for transmission up to 48 MHz
 - Support for external generation of clock signals and frame-synchronization (frame-sync) signals
 - A programmable sample rate generator for internal generation and control of clock signals and frame-sync signals
- Support of disconnect protocol

For a complete description, see [Section 23.5](#), *Multichannel Buffered Serial Port*.

12.1.9 Multichannel Pulse Density Modulation Module

The McPDM is a proprietary interface based on multichannel pulse density modulation. The module consists of five downlinks and three uplinks. Two other uplink channels are reserved for status communication.

The McPDM has the following features:

- Interconnect slave interface (L4_ABE internal interconnect) supports:
 - 32-bit data bus width
 - 10-bit address bus width
 - Burst not supported
 - WNP

- Full-duplex communication:
 - Five audio downstream channels
 - three audio upstream channels
- RX/TX FIFO operations: 32-bit words per channels
- Complies with PRCM interrupts:
 - One to the MPU subsystem
 - One to the DSP subsystem
- DMA requests (one per direction) triggered with programmable FIFO thresholds; depending on the FIFO implementation, one per channel or one per direction
- Decimation filter for embedded uplink paths (five paths if two status paths)
- Oversampling for embedded uplinks (five paths)
- Sigma delta for embedded downlinks (three paths)
- Deserializers for the two status upstream channels
- Support of disconnect protocol

For more information, see [Section 23.6](#), *Multichannel PDM Controller*.

Interconnect

This chapter describes the device interconnect.

Topic	Page
13.1 Interconnect Overview	2717
13.2 L3 Interconnect	2725
13.3 L4 Interconnects	2844

13.1 Interconnect Overview

13.1.1 Terminology

The following terminology is critical to understanding the interconnect:

- **Initiator:** Module able to initiate read and write requests to the chip interconnect (typically: processors, DMA, etc.).
- **Target:** Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers).

NOTE: A module can have several separate ports; therefore, a module can be an initiator and a target.

- **Agent:** Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).
- **Interconnect:** The decoding, routing, and arbitration logic that enables the connection between multiple initiator modules and multiple target modules connected on it.
- **Register target (RT):** Special TA used to access the interconnect internal configuration registers
- **Data-flow signal:** Any signal that is part of a clearly identified transfer or data flow (typically: command, address, byte enables, etc.). Signal behavior is defined by the protocol semantics.
- **Sideband signal:** Any signal whose behavior is not associated to a precise transaction or data flow.
- **Out-of-band error:** Any signal whose behavior is associated to a device error-reporting scheme, as opposed to in-band errors.

NOTE: Interrupt requests and DMA requests are not routed by the interconnect in the device.

- **Firewall:** A programmable feature integrated in a TA or L4 interconnect to prevent unauthorized access to or from a module. A firewall can be configured using three criteria:
 - Initiator requesting access
 - Address space access
 - Type of access
- **ConnID:** Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted in band with the request and is used for firewall and error-logging mechanism.
- **Firewall comparison mechanism:** A comparison made in the firewall between access in-band qualifiers and access permissions that are programmed in the firewall configuration registers. If the comparison is successful, access is allowed; otherwise, access is denied.
- **MCcmd qualifier:** Command bus that indicates the type of transfer requested. [Table 13-1](#) lists the commands encoded. For information specific to L3 Interconnect Error Logging, see [Table 13-26](#)

Table 13-1. MCcmd Qualifier Description

MCcmd[2:0]	Transaction Type
0 0 0	Idle
0 0 1	Write
0 1 0	Read
0 1 1	ReadEx
1 0 0	Not used
1 0 1	Write nonposted
1 1 0	Not used
1 1 1	Not used

- MReqInfo qualifier: Three MReqInfo qualifiers describe the access during the use of the firewall comparison mechanism, as described in [Table 13-2](#).

Table 13-2. MReqInfo Qualifier Description

Qualifiers	Description
MReqType	0: Data access
	1: Opcode fetch
MReqSupervisor	0: User mode
	1: Supervisor mode
MReqDebug	0: Functional access
	1: Debug access

- Register that configures the combination of the MReqInfo, allowing access permission to the TM based on the MReqInfo in-band qualifier values.
- SError: Target that indicates an error condition to the initiator.
- SResp qualifier: Response from the target to the initiator concerning the transaction, as described in [Table 13-3](#).

Table 13-3. SResp Qualifier Description

SResp[1:0]	Description
0 0	No response
0 1	Data valid/accept
1 0	Not used
1 1	Error

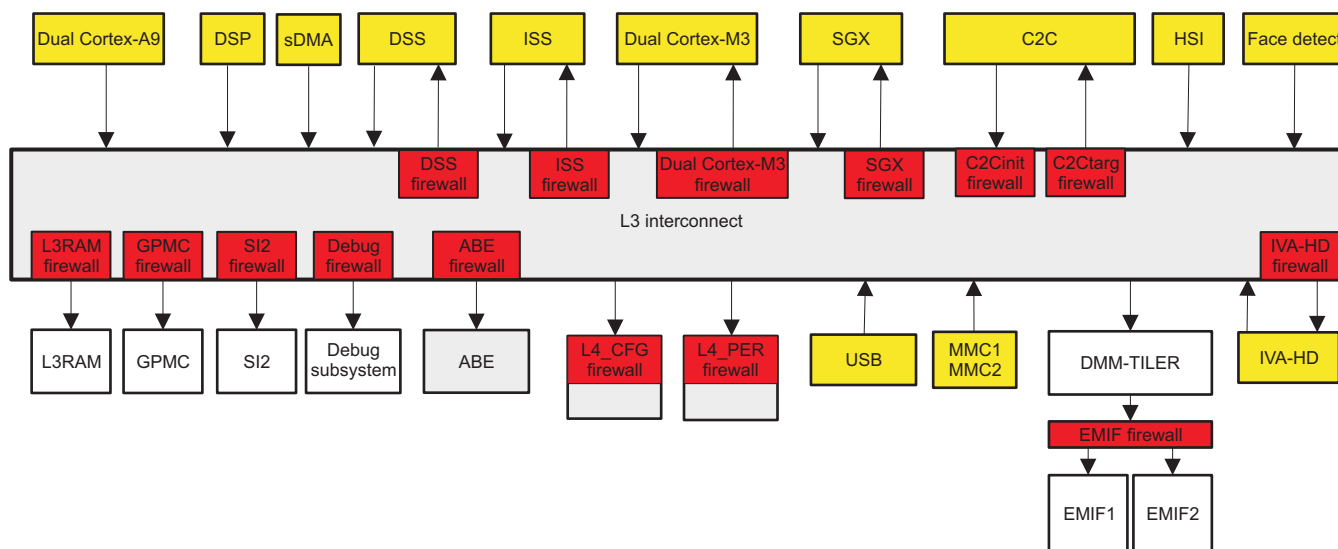

13.1.2 Architecture Overview

The device memory hierarchy includes four levels:

- Level 1 (L1) is internal to the central processing units (CPUs). It concerns data exchange with the internal Level1 cache memory subsystem, and it is the closest memory to the microprocessor unit (MPU) core and the IVAHD core.
- Level 2 (L2) is included in the IVAHD subsystem and the MPU subsystem.
- The chip-level interconnect consists of one level 3 (L3) interconnect and four level 4 (L4) interconnects. It enables communication among the modules and subsystems in the device.

Figure 13-1 shows an overview of the L3 and L4 interconnect architecture.

Figure 13-1. Interconnect Overview

i3-012

- L3 handles many types of data transfers, especially exchanges with system-on-chip (SoC)/external memories. L3 transfers data with a maximum width of 128 bits from the initiator to the target. The L3 interconnect is a little-endian platform.
- The L4 is composed of the following:
 - L4_CFG: Includes the majority of the configuration interface for L3 system modules and peripheral interconnect; L4_PER: Includes the main peripherals that require system direct memory access (sDMA) access.
 - L4_WKUP: Includes peripherals attached to the WKUP power domain.

Modules are connected to the interconnect through an IA for the initiator module and a TA for target modules. Each module/subsystem connection is statically configured to tune the access, depending on the characteristics of the module.

To unauthorized a module or L4 interconnect access, some TAs include configurable firewalls (FWs). A firewall restricts or filters the accesses allowed to an initiator according to different access criteria. The firewalls can usually be configured by software.

The L3 and L4 interconnect default settings are fully functional; they enable all possible functional data paths and a minimal default protection setting. However, the interconnect parameters can be modified to fit user expectations.

13.1.3 Module Distribution

IAs and TAs provide the interface to connect the different modules and the interconnect.

[Table 13-4](#) through [Table 13-11](#) list the device modules, subsystems, and associated agents. The agents are listed for each interconnect domain:

- L3 initiator (master network interface units [NIUs] – MN) and target (slave NIUs – SN) agents
- L4_PER initiator and target agents
- L4_CFG initiator and target agents
- L4_WKUP initiator and target agents

13.1.3.1 L3 Interconnect Module Distribution

[Table 13-4](#) and [Table 13-5](#) list the IAs and TAs, respectively, of the L3 interconnect.

Table 13-4. Master NIUs

Master NIU Name	Description
L3_MN_CORTEXA9	Cortex™-A9 microprocessor unit subsystem
L3_MN_DSP	DSP subsystem
L3_MN_DSS	Display subsystem
L3_MN_MMC1/2	Multimedia controller
L3_MN_IVAHD	Video accelerator subsystem
L3_MN_SGX	Graphic accelerator
L3_MN_ISS	Imaging accelerator subsystem
L3_MN_CORTEXM3	Cortex™-M3 microprocessor subsystem
L3_MN_FACEDETECT	Face detection module
L3_MN_SDMA_rd	System DMA
L3_MN_SDMA_wr	System DMA
L3_MN_HSI	High-speed synchronous serial interface controller
L3_MN_FSUSB	Full-speed USB host controller
L3_MN_HSUSBOTG	High-speed (HS) on-the-go (OTG) USB controller
L3_MN_HSUSBHOST	Multiport USB host controller
L3_MN_C2C	Chip-to-chip (C2C)
L3_MN_DAP	JTAG®/emulation access to system resources

Table 13-5. Slave NIUs

Slave NIU Name	Description
L3_SN_OCM_RAM	On-chip memory controller
L3_SN_GPMC	General-purpose memory controller (GPMC)
L3_SN_C2C	Chip-to-chip
L3_SN_DMM1	Dynamic memory management

Table 13-5. Slave NIUs (continued)

Slave NIU Name	Description
L3_SN_DMM2	Dynamic memory management
L3_SN_SGX	Graphic accelerator
L3_SN_ISS	Imaging accelerator subsystem
L3_SN_IVAHD_CFG	Video accelerator subsystem configuration
L3_SN_IVAHD_SL2	Video accelerator subsystem shared memory
L3_SN_DSP	DSP subsystem
L3_SN_CORTEXM3	Cortex-M3 MPU subsystem
L3_SN_DSS	Display subsystem
L3 interconnect	L3 internal registers
L3_SN_ABE	Audio back end
L3_SN_L4_CFG	L4 interconnect configuration
L3_SN_L4_PER0/1/2/3	L4 interconnect peripherals
L3_SN_L4_EMU	L4 interconnect EMU subsystem

13.1.3.2 L4 Interconnect Module Distribution

IAs and TAs provide the interface to connect the different modules to their associated interconnect.

[Table 13-6](#) through [Table 13-11](#) list all modules and subsystems with their associated agents. The agents are listed for each L4 interconnect domain.

13.1.3.2.1 L4_PER Interconnect Agents

The L4_PER interconnect handles transfers only to peripherals in the PER power domain. [Table 13-6](#) lists the PER TAs.

Table 13-6. L4_PER TAs

Module Target Name	Description
PER_TA_UART1	Universal asynchronous receiver transmitter (UART) port 1 module
PER_TA_UART2	UART port 2 module
PER_TA_UART3	UART port 3 module
PER_TA_UART4	UART port 4 module
PER_TA_GPTIMER2	General-purpose timer 2 (GPTIMER2) module
PER_TA_GPTIMER3	GPTIMER3 module
PER_TA_GPTIMER4	GPTIMER4 module
PER_TA_GPTIMER9	GPTIMER9 module
PER_TA_GPTIMER10	GPTIMER10 module
PER_TA_GPTIMER11	GPTIMER11 module
PER_TA_DSS	Display subsystem configuration module
PER_TA_GPIO2	General-purpose input/output 2 (GPIO2) module
PER_TA_GPIO3	GPIO3 module
PER_TA_GPIO4	GPIO4 module
PER_TA_GPIO5	GPIO5 module
PER_TA_GPIO6	GPIO6 module
PER_TA_I2C1	Multimaster inter-integrated circuit 1 (I2C1) module
PER_TA_I2C2	Multimaster I2C2 module
PER_TA_I2C3	Multimaster I2C3 module
PER_TA_I2C4	Multimaster I2C4 module

Table 13-6. L4_PER TAs (continued)

Module Target Name	Description
PER_TA_SLIMBUS2	Silmbus 2 module
PER_TA_ELM	Error location module
PER_TA_MCBSP4	Multichannel buffered serial port 4 (McBSP4) module
PER_TA_MCSPI1	Multichannel serial peripheral interface 1 (McBSP1) module
PER_TA_MCSPI2	McSPI2 module
PER_TA_MCSPI3	McSPI3 module
PER_TA_MCSPI4	McSPI4 module
PER_TA_HSMMC1	Multimedia card (MMC) controller 1 module
PER_TA_HSMMC2	MMC controller 2 module
PER_TA_HSMMC3	MMC controller 3 module
PER_TA_HSMMC4	MMC controller 4 module
PER_TA_HSMMC5	MMC controller 5 module
PER_TA_HDQ	Single-wire serial link low-rate module

Four ports communicate between the L3 interconnect and the L4_PER interconnect to allow the L3 initiators to access the L4_PER targets. [Table 13-7](#) lists the L4_PER initiator TAs.

For the list of initiators authorized to access the L4 peripheral peripherals, see [Section 13.2.3.2.2, Connectivity Matrix](#).

Table 13-7. L4_PER IAs

Module Initiator Name	Description
PER_IA_0	L3 sDMA RD interconnect port
PER_IA_1	L3 sDMA WR interconnect port
PER_IA_2	L3 MPU subsystem interconnect port
PER_IA_3	L3 others interconnect port

13.1.3.2.2 L4_CFG Interconnect Agents

The L4_CFG interconnect handles only transfers to peripherals in the CORE power domain. [Table 13-8](#) lists the TAs.

Table 13-8. L4_CFG TAs

Module Target Name	Description
CFG_TA_SYSCTRL_GENERAL_CORE	System control general core module
CFG_TA_SYSCTRL_PADCONF_CORE	System control padconf core module
CFG_TA_CM1	Clock manager 1 module
CFG_TA_CM2	Clock manager 1 module
CFG_TA_SDMA	sDMA module
CFG_TA_HSI	HS synchronous serial interface (SSI) module
CFG_TA_SAR_ROM	Save-and-restore ROM
CFG_TA_HSUSBOTG	HS universal serial bus (USB) OTG module
CFG_TA_FSUSBHOST	FS USB OTG module
CFG_TA_HSUSBHOST	HS USB host module
CFG_TA_HSUSBPHY	HS USB PHY module
CFG_TA_HSUSBTLL	USB TTL module
CFG_TA_DSP	Digital signal processor (DSP) subsystem

Table 13-8. L4_CFG TAs (continued)

Module Target Name	Description
CFG_TA_SR1	SmartReflex1 module
CFG_TA_SR2	SmartReflex2 module
CFG_TA_SR3	SmartReflex3 module
CFG_TA_MAILBOX	Mailbox module
CFG_TA_SPINLOCK	Spinlock module
CFG_TA_FACEDETECT	Face detect module
CFG_TA_EMIFFW	EMIF firewall
CFG_TA_GPMCFW	GPMC firewall
CFG_TA_OCMRAMFW	RAM firewall
CFG_TA_SGXFW	SGX firewall
CFG_TA_ISSF	ISS firewall
CFG_TA_CORTEXM3FW	Cortex-M3 firewall
CFG_TA_DSSF	Display subsystem (DSS) firewall
CFG_TA_SL2FW	SL2 firewall
CFG_TA_IVAHDFW	Image and video accelerator high-definition (IVA-HD) firewall
CFG_TA_EMUSF	EMU subsystem firewall
CFG_TA_ABEFW	Audio back-end (ABE) firewall
CFG_TA_L4WKUP	L4_WKUP connection

A unique port, CFG_IA_0, communicates between the L3 interconnect and the L4_CFG interconnect to allow the L3 initiators to access the L4_CFG targets (see [Table 13-9](#)).

For the list of initiators authorized to access the L4_CFG peripherals, see [Section 13.2.3.2.2, Connectivity Matrix](#).

Table 13-9. L4_CFG IAs

Module Initiator Name	Description
CFG_IA_0	L3 interconnect port

13.1.3.2.3 L4_WKUP Interconnect Agents

The L4_WKUP interconnect handles transfers only to peripherals in the WKUP power domain. [Table 13-10](#) lists the TAs. [Table 13-11](#) lists the L4_WKUP IAs.

Table 13-10. L4_WKUP TAs

Module Target Name	Description
WKUP_TA_GPIO1	GPIO1 module
WKUP_TA_32KTIMER	32-kHz timer module
WKUP_TA_SAR_RAM	Save-and-restore RAM
WKUP_TA_KEYBOARD	Keyboard module
WKUP_TA_SYSCTRL_GENERAL_WKUP	System control general WKUP module
WKUP_TA_SYSCTRL_PADCONF_WKUP	System control padconf WKUP module
WKUP_TA_PRM	Power reset management module
WKUP_TA_SCRM	System clock and reset management module
WKUP_TA_WDTIMER2	WDTIMER2 module
WKUP_TA_GPTIMER1	GPTIMER1 module

13.2 L3 Interconnect

This section describes the L3 interconnect and its components. With the exception of register points, each component includes functions for the request and response networks.

13.2.1 L3 Interconnect Overview

The L3 interconnect links cores in a flexible topology that couples low power with high performance. Innovative physical structures and advanced protocols ensure bandwidth and latency to individual IP cores, providing dedicated connections between IP cores and logical connections over a shared interconnect.

The main features of the L3 interconnects are:

- NIUs: Master NIUs for the IAs and slave NIUs for the TAs
- A partially depleted crossbar exchange network
- A special internal slave NIU for accessing L3 interconnect configuration registers
- True little-endian platform
- Transaction errors tracking and logging registers
- All signaling support for chip-level power-management infrastructure

[Figure 13-3](#) is an overview of the L3 interconnect and the peripherals attached to it.

Figure 13-3. L3 Interconnect Overview

i3-012

13.2.2 L3 Interconnect Integration

Table 13-12 through Table 13-14 summarize the integration of the module in the device.

Table 13-12. Integration Attributes

Module Instance	Attributes
	Power Domain
L3	PD_CORE

Table 13-13. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L3	L3_CLK2	L3_ICLK2	PRCM	Functional and interface clock
	L3_CLK1	L3_ICLK1	PRCM	Functional and interface clock
	L3_CLK3	INSTR_L3_ICLK	PRCM	Functional and interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description

13.2.3 L3 Interconnect Functional Description

13.2.3.1 Module Use in L3 Interconnect

The L3 interconnect network components have ConnID values for each master NIU or slave NIU. The ID uniquely identifies the master NIU or the slave NIU for an interconnect transfer. The interconnect uses ConnIDs for a number of purposes, including the following:

- Slave NIUs for error logging
- Power disconnect slave NIU for error logging
- FLAGMUX to mask interrupts: Three, one for each clock domain
- STATCOLL for configuring and monitoring: The STATCOLL components compute the traffic statistics within a user-defined window and periodically report to the user through the debug interface.
- Bandwidth regulator for configuration: The bandwidth critical masters are IVAHD, ISS, DSS, and SGX.
- Some rate adapters for configuration of throughput ratio

13.2.3.2 Module Distribution

Master NIUs and slave NIUs provide the interface to connect the different modules to their associated interconnect.

[Table 13-15](#) and [Table 13-16](#) list all the modules and subsystems with their associated agents. The agents are listed for each L3 interconnect domain.

13.2.3.2.1 L3 Interconnect Agents

Any initiator or target core is connected to the L3 interconnect through an NIU. NIUs act as entry points to the L3 interconnect, and also include various programming registers. [Table 13-15](#) lists the supported master NIU ports.

Table 13-15. Master NIUs

Master NIU	Description
L3_MN_CORTEXA9	Cortex-A9 MPU subsystem
L3_MN_DSP	DSP subsystem
L3_MN_DSS	Display subsystem
L3_MN_MMC1/2	Multimedia controller
L3_MN_IVAHD	Video accelerator subsystem
L3_MN_SGX	Graphic accelerator
L3_MN_ISS	Imaging accelerator subsystem
L3_MN_CORTEXM3	Cortex-M3 MPU subsystem
L3_MN_FACEDETECT	Face detection module
L3_MN_SDMA_rd	sDMA
L3_MN_SDMA_wr	sDMA
L3_MN_HSI	HS synchronous serial interrupt controller (INTC)
L3_MN_FSUSB	Full-speed USB host controller
L3_MN_HSUSBOTG	HS OTG USB controller
L3_MN_HSUSBHOST	Multiport USB host controller
L3_MN_C2C	C2C
L3_MN_DAP	JTAG/emulation access to system resources

[Table 13-16](#) lists the supported slave NIU ports.

Table 13-16. Slave NIUs

Slave NIU	Description
L3_SN_OCM_RAM	On-chip memory controller
L3_SN_GPMC	GPMC
L3_SN_C2C	C2C
L3_SN_DMM1	Dynamic memory management
L3_SN_DMM2	Dynamic memory management
L3_SN_SGX	Graphic accelerator
L3_SN_ISS	Imaging accelerator subsystem
L3_SN_IVAHD_CFG	Video accelerator subsystem configuration
L3_SN_IVAHD_SL2	Video accelerator subsystem shared memory
L3_SN_DSP	DSP subsystem
L3_SN_CORTEXM3	Cortex-M3 MPU subsystem
L3_SN_DSS	Display subsystem
L3 interconnect	L3 internal registers
L3_SN_ABE	Audio back end
L3_SN_L4_CFG	L4 interconnect configuration
L3_SN_L4_PER0/1/2/3	L4 interconnect peripherals
L3_SN_L4_EMU	L4 interconnect EMU subsystem

13.2.3.2.2 L3 Connectivity Matrix

The L3 interconnect is divided into three subclock domains:

- L3_CLK1: Low-power domain
- L3_CLK2: Peripherals and multimedia
- L3_CLK3: Instrumentation (debug)

Each is implemented in a different clock domain.

13.2.3.2.2.1 Clock Domain Mapping of the L3 Interconnect Modules

Each clock domain (CLK1, CLK2, and CLK3) has its own host, flag mux, slave NIUs, and bandwidth regulators.

Table 13-17. L3 Clock Domains and Elements

Domain	Elements
CLK1	HOST_CLK1
	DMM1/2
	ABE
	L4_CFG
	FLAGMUX
	DSS_BW
	PWR_DISK

I3-001

13.2.3.2.3 Master NIU Identification

An master NIU ID (ConnID) is assigned to every module in the device. The ID uniquely identifies the master NIU for an interconnect transfer (see Table 13-18). The interconnect uses ConnID values for a number of purposes, including:

- Master source identification for the protection mechanism
- Response route generation
- Firewall error logging
- L3 interconnect error logging

Table 13-18. ConnID Values

ConnID	Master NIU
0x0	Cortex-A9
0x4	DAP
0x8	DSP
0xC	IVAHD
0x10	ISS
0x11	Cortex-M3
0x12	FaceDetect
0x14	sDMA_rd
0x15	sDMA_wr
0x18	SGX
0x1C	DSS
0x20	C2C
0x22	Reserved
0x23	Reserved
0x24	HSI
0x28	MMC1
0x29	MMC2
0x2C	Reserved
0x30	HSUSBHOST
0x31	HSUSBOTG
0x32	FSUSB
0x34	Reserved

13.2.3.3 Bandwidth Regulators

The bandwidth regulators prevent master NIUs from consuming too much bandwidth of a link, or a slave NIU that is shared between several data flows: packets are then transported at a slower rate. The value of a bandwidth can be programmed in the bandwidth regulator. When the bandwidth is below the programmed value, the pressure bit is set to 1, giving priority to this master. When the bandwidth is above the programmed value, the pressure bit is set to 0 and the concerned master has the same weight as others.

The bandwidth registers regulate the packet flow by applying flow control on the RX port, thus ensuring that the traffic does not exceed the allocated bandwidth. The next packet is sent only when an internal timer expires. The registers in this group are:

- [L3_BW_R_WATERMARK](#): Gives the amount of data allowed to exceed the average bandwidth during a short time period
- [L3_BW_R_PRESS](#): Describes the pressure applied to outgoing packets
- [L3_BW_R_CLEARHISTORY](#): Resets the traffic counter when set to 1. It is used after an update in the [L3_BW_R_BANDWIDTH](#) and [L3_BW_R_WATERMARK](#) registers (see [Section 13.2.5.1.6](#), *L3 BW Regulator Register Summary and Description*).

13.2.3.4 Flag Mux Generators

The flag mux generator collects information such as errors and interrupts from slave NIUs and the interconnect firewall. The result signals are then sent to the MPU INTC without interfering with the interconnect traffic. The [L3_FLAGMUX_MASK](#) registers can be used to prevent the flag mux from seeing certain events.

The unit has a standard COREG register for identification of the attached core type. The [L3_FLAGMUX_STDHOSTHDR_VERSIONREG](#) register identifies the characteristics of the attached core. The unit-specific registers (MASK bit 0 or bit 1 of the flag inputs, and L3_FLAGMUX_REGERR bit 0 or bit 1) are used to read the input errors. Each register is dedicated to reporting the bit corresponding to the register number; for example, [L3_FLAGMUX_REGERR0](#) reports on bit 0, and [L3_FLAGMUX_REGERR1](#) reports on bit 1. Any given L3_FLAGMUX_REGERR register reports the same bit for all flag source inputs (see [Table 13-163](#)).

13.2.3.5 Rate Adapter Generators

The rate adapter generators give the option to configure the L3 interconnect to work in auto-adaptive mode or pipeline mode for sending the packets by using the CNF register. The rate adapter can be configured in store-and-forward mode when the throughput ratio is not well defined, or in auto-adaptive mode when the throughput ratio is predictable. Because the ratios are predictable in the L3 interconnect, the rate adapters are always used in auto-adaptive mode, except for the rate adapter on the L4_CFG and L4_ABE responses path. L4_CFG and L4_ABE are configured in store-and-forward mode. The main rate adapt registers are:

- CLK1_RATE_ADAPT_RESP_32TO128_CLK1: Removes WAIT cycles on responses coming from ABE, L4CFG, and power disconnect to host
- CLK2_RATE_ADAPT_RESP_32TO128_CLK2: Removes WAIT cycles on responses coming from CLK2 32-bit slaves (see [Table 13-193](#))

13.2.3.6 Statistic Collectors Group

Statistic collectors are internal masters that share the same master address as the master NIUs. These components compute the traffic statistics within a defined window and periodically report through the DEBUG interface. The key features of the statistic collector are:

- Nonintrusive monitoring
- Programmable filters and counters
- Collects results at a programmable time interval

Event detectors are programmed through the [L3_STCOL_REQEVT](#) and [L3_STCOL_RSPEVT](#) configuration registers for request and response ports, respectively. The following events can be identified:

- Word transfer
- WAIT cycles
- Flow control
- Payload transfers
- Latency measurements

Performance monitoring is enabled through the [L3_STCOL_EN](#) register. The [L3_STCOL_SOFTEN](#) register enables software to monitor the performance. Event muxes are programmed through the [L3_STCOL_EVTMUX_SELO](#) configuration register, which determines which port will be monitored by a filter configured by the filter registers (see).

Filters are programmed through the configuration register, along with additional selection criteria programmed through the mask/match registers (see [Table 13-202](#)). A filter can be configured to accept or reject:

- Read operations
- Write operations
- Errors
- Addresses

Filter operation is programmed through the L3_STCOL_OP registers (see [Table 13-202](#)).

13.2.3.7 L3 Protection and Firewalls

Device protection relies on L3 firewalls and their configuration.

13.2.3.7.1 L3 Firewall Reset

The values of L3 firewall registers on reset are tied in hardware or exported from the control module registers.

Values exported from the control module are intended to give defined rights to the firewalls at reset and thus ensure the content after going out of reset. Because the control module consists of retention flip-flops (RFFs), which immunize it against register content loss during retention power state, the registers of the control module storing the exported values are not subject to a soft reset.

The L3 firewall registers are also retention-capable and are immune against content loss during CORE RETENTION power state. The control module registers are reset by a cold reset only, whereas the L3 firewall registers are reset by clearing the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit. When the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit comes back automatically to 1, the exported values are loaded.

CAUTION

Before reprogramming the firewall registers and/or before using the FW_LOAD_REQ mechanism, the request must be asserted by configuring the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit.

To load the exported values at run time:

1. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x1 to ensure that no transaction can reach the slave NIU (suspend).
2. Clear the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit by writing 0x1 to it.
3. Wait until the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit is reset to 0x1 by hardware.
4. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x0 to allow transactions to reach the slave NIU (resume).

To reprogram the firewall registers at run time:

1. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x1 to ensure that no transaction can reach the slave NIU (suspend).
2. Upload the new values to all firewall registers.
3. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x0 to allow transactions to reach the slave NIU (resume).

NOTE: Hardware reset values can be modified by exported values from the control module at reset.

13.2.3.7.1.1 L3 Firewall – Exported Reset Values

[Table 13-19](#) and [Table 13-20](#) list the exported reset values and mapping, respectively.

Table 13-19. L3 Firewall Exported Reset Values

MRM_PERMISSION_REGION_LOW_j [15:12]	MRM_PERMISSION_REGION_LOW_j [11:0]
0x0	0xFFFF
0xF	0xFFFF
0x0	0x038
0x2	0x038

[8] and [24]	IVA-HD
[11] and [27]	EMIF
[12] and [28]	DEBUG
[13] and [29]	L4 AUDIO

For more information, see [Chapter 18, Control Module](#).

13.2.3.7.2 Power Management

As part of the system-wide power-management scheme, the L3 interconnect goes into IDLE state after receiving a request from the power, reset, and clock management (PRCM) module after all commands are serviced. This function is handled by hardware.

To reduce power consumption, the L3 interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

Retention is performed on all software-accessible registers:

- Statistic collectors
- Internal rate adapters
- Bandwidth regulators
- TAs
- Firewalls

This process prevents reconfiguration after a clock domain switches off.

13.2.3.7.3 L3 Firewall Functionality

The access to the slave NIUs is granted only to master NIUs according to in-band attributes sent in each transaction crossing the L3 interconnect, such as:

- MCMD: Specifies the type of access (read or write) required by the master NIU
- ConnID: Used to determine the permission of the master NIU
- MReqInfo: Transaction attribute adding information about the access type

[Table 13-21](#) lists the MReqInfo Values.

Table 13-21. MReqInfo Values

Qualifier	Access Definition	Access Description
MReqType	0: Data 1: Opcode	Indicates whether the request is for instruction fetch or data access
MReqDebug	0: Functional 1: Debug	When set, indicates that the request has been issued by a master NIU in DEBUG state
MReqSupervisor	0: User 1: Privilege	When set, indicates that the request is qualified with the supervisor attribute. It can be provided by a processor running in supervisor mode or by a module that inherited this attribute from the processor (DMA channel with a supervisor attribute).

The firewall comparison mechanism enables access to a protected slave NIU only when a correct combination of three MReqInfo in-band parameters is transmitted.

MReqInfo is a combination of a fixed 3-bit pattern that corresponds to a combination of the parameters MReqDebug, MReqType, and MReqSupervisor. See [Table 13-22](#).

Table 13-22. L3 ReqInfo Mapping

ReqInfo Name		MReqDebug	MReqType	MReqSupervisor
Master NIUs	L3_MN_CORTEXA9	x	x	x
	L3_MN_CORTEXM3	x	x	x

	L3_SN_C2C	x	x	x

13.2.3.7.3.1 Protection Regions

Each slave NIU address space is subdivided into protection regions (maximum of 10). The regions are configurable with a size of 4-KB granularity. The firewalls can also be multiport while using the description of the same regions for dual access memories or to support interleaving mechanisms on several memories.

[Table 13-23](#) lists the number of protected regions and ports for each slave NIU.

Table 13-23. Slave NIU Firewall and Region Configuration

Slave NIU	Firewall	Number of Regions	Number of Ports
L3 RAM	L3 RAM	10	1
GPMC	PMC	8	1
SL2	SL2	1	1
SGX	SGX	1	1
C2C	C2CTARG	1	1
L3 interconnect	C2CINIT	4	2
ISS	ISS	1	1
Dual Cortex-M3 subsystem	Dual Cortex-M3	1	1
DSS	DSS	1	1
IVA-HD	IVA-HD	1	1
DEBUG subsystem	DEBUG	2	1
ABE	ABE	1	1
EMIF	EMIF	8	3

Two types of regions are distinguished in a slave NIU firewall:

- Default region: Available in all slave NIUs. It covers the entire slave NIU address range and must be reset or overlaid by other firewall configured regions, because it always has the lowest priority.
- Normal region: The number of normal regions varies in a slave NIU; they have identical capabilities (see [Table 13-23](#)).

Each region has the following characteristics:

- Start address: Physical slave NIU start address
- End address: Physical slave NIU end address
- Specific access rights (see [Section 13.2.3.7.3.3, Protection Mechanism per Region Examples](#))
- Priority level from 0 (lowest) to 10 (highest)

Depending on its priority level, a region can override the settings of another region; the access rights of the region with the highest priority apply. All regions have a fixed (not configurable) priority level that corresponds to their number: Region 1 has priority level 1, region 2 has priority level 2, and so on.

[Figure 13-5](#) shows the priority level with associated regions. This priority level scheme allows multiplying the flexibility and capability of the firewall. [Figure 13-5](#) shows a 7-region firewall setting that creates 13 regions (twice the number of regions created than originally available).

Figure 13-5. L3 Interconnect Region Overlay and Priority Level Overview

13-003

The address range covered by the regions is defined in the [START_REGION_i](#) and [END_REGION_i](#) registers. The boundary checks are done on a minimum size of 4-KB pages; thus, bits [11:0] of those 32-bit registers are not checked.

The address space size of the slave NIUs ([bits [31:12]]) depends on the size of the slave NIU to protect (that is, if a memory is only 48KB, then the size is defined through bits [16:12] of the slave NIU start/end address registers of the firewall region ([START_REGION_i\[16:12\]](#) and [END_REGION_i\[16:12\]](#)).

NOTE: The EMIF firewall sees only the 4GB that require protection.

Bit [31] is replaced by bit [32] of the EMIF address space seen by firewalls to have 2GB of LPDDR2-SDRAM and 2GB of LPDDR2-NVM contiguous.

For more information, see [Section 15.3, EMIF Controller](#).

On multiport firewalls (EMIF), the checking of each REGION {0, n} can be activated on one or several ports at the same time. However, if interleaving is not desired on some parts of the protected memory space, it is possible to apply or not apply region checking on selected ports using the region enable/disable on port instance capability of the [END_REGION_i](#) register.

Most slave NIUs support only one input port (port 0) except:

- The EMIF module protected by the EMIF firewall has three ports:
 - Port 0 for Cortex-A9 accesses
 - Port 1 for the first L3 interconnect accesses

- Port 2 for the second L3 interconnect accesses

A region can be applied or not to each port independently. To enable and disable the regions:

- For port 0: Set/clear the [END_REGION_i\[0\]](#) REGION_ENABLE_PORT0 bit (for all L3 firewalls).
- For port 1: Set/clear the [END_REGION_i\[1\]](#) REGION_ENABLE_PORT1 bit (only for EMIF firewalls).
- For port 2: Set/clear the [END_REGION_i\[2\]](#) REGION_ENABLE_PORT2 bit (only for EMIF firewalls).

13.2.3.7.3.2 L3 Firewall Registers Overview

[Table 13-24](#) and [Table 13-25](#) list the L3 firewall permission-setting registers.

Table 13-24. L3 Firewall Read/Write Permission-Setting Register

Register Name	Bits	Field Name	Description (see Table 13-18)	Field Modifiability
MRM_PERMISSION_REGION_HIGH_i	31	RESERVED	Reserved	–
	30	RESERVED	Reserved	–
	29	RESERVED	Reserved	–
	28	RESERVED	Reserved	–
	27	RESERVED	Reserved	–
	26	RESERVED	Reserved	–
	25	W12	ConnID = 12 write permission	RW
	24	R12	ConnID = 12 read permission	RW
	23	RESERVED	Reserved	–
	22	RESERVED	Reserved	–
	21	W10	ConnID = 10 write permission	RW
	20	R10	ConnID = 10 read permission	RW
	19	W9	ConnID = 9 write permission	RW
	18	R9	ConnID = 9 read permission	RW
	17	W8	ConnID = 8 write permission	RW
	16	R8	ConnID = 8 read permission	RW
	15	W7	ConnID = 7 write permission	RW
	14	R7	ConnID = 7 read permission	RW
	13	W6	ConnID = 6 write permission	RW
	12	R6	ConnID = 6 read permission	RW
	11	W5	ConnID = 5 write permission	RW
	10	R5	ConnID = 5 read permission	RW
	9	W4	ConnID = 4 write permission	RW
	8	R4	ConnID = 4 read permission	RW
	7	W3	ConnID = 3 write permission	RW
	6	R3	ConnID = 3 read permission	RW
	5	W2	ConnID = 2 write permission	RW
	4	R2	ConnID = 2 read permission	RW
	3	W1	ConnID = 1 write permission	RW
	2	R1	ConnID = 1 read permission	RW
	1	W0	ConnID = 0 write permission	RW
	0	R0	ConnID = 0 read permission	RW

Table 13-25. L3 Firewall Permission-Setting Register

Register name	Type of Permission	Bits	Field Name	Description	Field Modifiability
MRM_PERMISSION_REGION_LOW_j	DEBUG	15	PUB_PRV_DEBUG	Privilege debug allowed	RW
		14	PUB_USR_DEBUG	User debug allowed	RW
	Access	13:12	Reserved	Reserved	RW
		11	PUB_PRV_WRITE	Privilege write allowed	RW
		10	PUB_PRV_READ	Privilege read allowed	RW
		9	PUB_PRV_EXE	Privilege exe allowed	RW
		8	PUB_USR_WRITE	User write access allowed	RW
		7	PUB_USR_READ	User read access allowed	RW
		6	PUB_USR_EXE	User exe access allowed	RW

13.2.3.7.3.3 Protection Mechanism per Region Examples

The access permission of each region is configurable and defined through the [MRM_PERMISSION_REGION_HIGH_j](#) and [MRM_PERMISSION_REGION_LOW_j](#) registers (see [Section 13.2.3.7.3.2, L3 Firewall Registers Overview](#)).

Master NIU permissions:

1. To give read access to the master NIU with ConnID = n, set the [MRM_PERMISSION_REGION_HIGH_j\[n * 2\]](#) Rn bit.
2. To give write access to the master NIU with ConnID = n, set the [MRM_PERMISSION_REGION_HIGH_j\[n * 2 + 1\]](#) Wn bit.

Debug permissions:

1. To give privilege debug access, set the [MRM_PERMISSION_REGION_LOW_j\[15\]](#) PUB_PRV_DEBUG bit.
2. To give user debug access, set the [MRM_PERMISSION_REGION_LOW_j\[14\]](#) PUB_USR_DEBUG bit.

User, read/write/executable permissions:

1. To give privilege write access, set the [MRM_PERMISSION_REGION_LOW_j\[11\]](#) PUB_PRV_WRITE bit.
2. To give privilege read access, set the [MRM_PERMISSION_REGION_LOW_j\[10\]](#) PUB_PRV_READ bit.
3. To give privilege exe access, set the [MRM_PERMISSION_REGION_LOW_j\[9\]](#) PUB_PRV_EXE bit.
4. To give user write access, set the [MRM_PERMISSION_REGION_LOW_j\[8\]](#) PUB_USR_WRITE bit.
5. To give user read access, set the [MRM_PERMISSION_REGION_LOW_j\[7\]](#) PUB_USR_READ bit.
6. To give user exe access, set the [MRM_PERMISSION_REGION_LOW_j\[6\]](#) PUB_USR_EXE bit.

Example: To provide debug write privilege access to the master NIU ConnID = 7, the following bits must be set:

- [MRM_PERMISSION_REGION_HIGH_j\[15\]](#) W7
- [MRM_PERMISSION_REGION_LOW_j\[15\]](#) PUB_PRV_DEBUG

13.2.3.7.3.4 L3 Firewall Error Logging

If a protection violation error is detected, the following signals are generated:

- An in-band error is generated to the master NIU of the access.
- An interrupt is generated to the Cortex-A9 and DSP INTCs.

The L3 interconnect does not differentiate errors generated by firewalls from all other supported types of errors.

An in-band error is generated by modules each time an access is not allowed. When an in-band error is sent back into the transaction it is seen as an external prefetch or data abort by the initiator, depending on whether the transaction was an instruction fetch or a data access.

Information about in-band errors is logged into two registers:

- **ERROR_LOG_k**: Logs the information about the start/end address of the hit region and the qualifiers of the transaction
- **LOGICAL_ADDR_ERRLOG_k[31:12]**: Logs the address of the failed access

NOTE: When a multiport firewall is implemented, these registers are duplicated for each port.

Table 13-26 lists the L3 firewall error-logging registers.

Table 13-26. L3 Firewall Error-Logging Registers

Register Name	Register Field Name	Field Modifiability	Parameter Comments
ERROR_LOG_k	RESERVED[31:24]	Read only	Reads return 0s.
	BLK_BURST_VIOLATION[23]	Read/write	Read 0x1: 2D burst not allowed or exceeds allowed size. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	RESERVED[22]	Read only	Reads return 0s.
	REGION_START_ERRLOG[21:17]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	REGION_END_ERRLOG[16:12]	Read/write	Read: Wrong access hit this region number. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers.
	REQINFO_ERRLOG[11:0]	Read/write	Mapping of the error according to the reqinfo vector: [11:8] ConnID [3:0] [7] MCMD [0] [3] MReqDebug [1] MReqSupervisor [0] MReqType

L3 firewall errors can be cleared by writing to the **ERROR_LOG_k** register in the firewall that recorded the error. Clearing the **ERROR_LOG_k** register deasserts the corresponding error if it exists.

The L3 firewall register **ERROR_LOG_k** must be cleared before clearing the **CONTROL_CORE_SEC_ERR_STATUS_FUNC** and **CONTROL_CORE_SEC_ERR_STATUS_DEBUG** registers in the control module.

When a protection violation occurs, an interrupt is sent to the MPU and IVAHD INTC (if enabled). An in-band error is sent back, and an error is logged in the **CONTROL_SEC_ERR_STATUS_FUNC** and **CONTROL_SEC_ERR_STATUS_DEBUG** registers, depending on the functional mode:

- In application mode:
 - **CONTROL_SEC_ERR_STATUS_FUNC[01]** – L3 RAM protection violation
 - **CONTROL_SEC_ERR_STATUS_FUNC[02]** – GPMC protection violation
 - **CONTROL_SEC_ERR_STATUS_FUNC[03]** – EMIF protection violation
 - **CONTROL_SEC_ERR_STATUS_FUNC[04]** – IVAHD protection violation

- CONTROL_SEC_ERR_STATUS_FUNC[05] – Cortex-M3 protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[06] – SL2 protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[12] – C2C slave NIU protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[13] – SGX protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[14] – DSS protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[15] – ISS protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[18] – DEBUG protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[19] – ABE protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[20] – C2C init protection violation
- In debug mode:
 - CONTROL_SEC_ERR_STATUS_DEBUG[01] – L3 RAM protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[02] – GPMC protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[03] – EMIF protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[04] – IVAHD protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[05] – Cortex-M3 protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[06] – SL2 protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[12] – C2C slave NIU protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[13] – SGX protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[14] – DSS protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[15] – ISS protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[18] – DEBUG protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[19] – ABE protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[20] – C2C init protection violation

For more information, see [Chapter 18, Control Module](#).

13.2.3.7.3.5 L3 Firewall Default Configuration

[Table 13-27](#) summarizes the configuration of the L3 firewalls.

Table 13-27. L3 Firewalls Default Configurations

Device/Region: 0						
Permission Type	Reset Value	Reset Value	Reset Type	Run Time	Firewall Register (where j = 0)	Control Module Register
ACCESS_PERMISSION	All	0xFFFF	Exported	Configurable	MRM_PERMISSION_REGION_LOW_j[11:0]	CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF[k]
DEBUG_PERMISSION	All	0xF	Exported	Configurable	MRM_PERMISSION_REGION_LOW_j[15:12]	CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF[l] CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF[k]
INITIATOR_PERMISSION	All	0xFFFF FFFFFF	Tied	Configurable	MRM_PERMISSION_REGION_HIGH_j[31:0]	N/A

NOTE: For the values of k and l, see [Table 13-28](#).

Table 13-28. Control Module Register – Factorization

Variable Value		Module Name	Regions
k	l		
3	19	L3 RAM firewall	Regions 1 to 9
0	16	GPMC firewall	Regions 1 to 7

Table 13-28. Control Module Register – Factorization (continued)

Variable Value		Module Name	Regions
7	23	SL2 firewall	Regions 1 to 7
6	22	SGX firewall	Regions 1 to 7
5	21	ISS firewall	Regions 1 to 7
5	21	Cortex-M3 firewall	Regions 1 to 7
4	20	DSS firewall	Regions 1 to 7
8	24	IVAHD firewall	Regions 1 to 7
12	28	DEBUG firewall	Region 1
13	29	ABE firewall	Region 1
1	17	C2C slave NIU firewall	Region 1
9	25	C2C init firewall	Regions 1 to 3
11	27	EMIF firewall	Regions 1 to 7

13.2.3.8 L3 Interconnect Error Handling

Error logging is enabled in the L3 interconnect. The three major types of errors are:

- Slave NIU errors
- Firewall errors (see [Section 13.2.3.7.3.4, L3 Firewall Error Logging](#))
- Flag mux errors

13.2.3.8.1 Global Error-Routing Scheme

[Figure 13-6](#) shows the L3 global error-routing scheme.

Figure 13-6. L3 Global Error-Routing Scheme

13-005

13.2.3.8.2 Slave NIU Error Logging

Error logging is implemented only at slave NIUs. Because the interconnect does not support master NIU error logging, an erroneous packet must be created and sent to one of the slave NIUs. The slave NIU that receives an erroneous packet is predictable but can change per master (see [Table 13-29](#)).

Table 13-29. L3 Connectivity and Holes Error Routing

Master	Connectivity and Holes Errors Logged Into Slave NIUs
L3_MN_DAP	L3_SN_GPMC
L3_MN_CORTEXM3	
L3_MN_CORTEXA9	
L3_MN_SDMA_RD	
L3_MN_SDMA_WR	
L3_MN_DSP	
L3_MN_IVANHD	L3_SN_DMM1
L3_MN_MMC1	
L3_MN_MMC2	
L3_MN_SGX	
L3_MN_DSS	L3_SN_DMM2
L3_MN_ISS	
L3_MN_FACEDETECT	
L3_MN_FSUSB	
L3_MN_HSUSBOTG	L3_SN_OCM_RAM
L3_MN_HSI	L3_SN_ABE
L3_MN_HSUSBHOST	
L3_MN_C2C	L3_SN_L4_PER3

The slave NIU can be configured to report standard errors (errors generated within the interconnect):

- Firewall error: Protection violation; this error indicates that a request was rejected by a firewall and is reported to the control module. For more information, see [Section 13.2.3.7.3.4, L3 Firewall Error Logging](#).
- Address hole: This error reports an unknown address for a request. The address map is local to each master NIU; therefore, an address hole error is reported each time a master NIU requests an access to a slave NIU to which it is not logically connected, even if this address exists in the global L3 address map. This error is detected only once per burst.
- Unsupported commands: This error reports that the master NIU sent a command that cannot be processed, because the slave NIU cannot accept it and no conversion to another command is possible. This error is detected only once per burst.
- Report custom errors: Basically, when the slave answer is SResp = ERR
- Report severity level, for standard error and custom errors:
 - None: Error logging for this type of error is disabled.
 - Error: Error is logged for this type of error.
 - Fault: Error is logged and interrupt is generated for this type of error.
- Generate interrupt on 2 bits depending on the MReqDebug qualifier:
 - Application error -> Fault[0]
 - Debug error -> Fault[1]

By default, all slave NIUs are configured with standard and custom error levels set to FAULT. The errors are reported on the two flag muxes (see [Figure 13-6](#)), depending on the access type, application or debug. For more information, see [Section 13.2.3.8.3, Flag Mux Error Logging](#).

The slave NIU power-disconnect component also has error logging enabled. This is because the slave NIU in this case is in a clock domain that is switched off and therefore cannot catch the error. By nature, this component can generate only standard errors. By default, it is configured with the error level set to FAULT.

Wake up on demand: If an error packet reaches a slave NIU that is set with MDiscBehave = 1 (wake up on demand), then the active signal is asserted and L3 processes the error generation when the slave is awake. This is inefficient but it simplifies NIU implementation and should not be a problem, because errors are supposed to occur only during software debug.

13.2.3.8.3 Flag Mux Error Logging

All fault signals are sent to a flag mux component. There are four important FLAGMUX registers:

- [L3_FLAGMUX_MASK0](#): Masks application error sources
- [L3_FLAGMUX_MASK1](#): Masks debug error sources
- [L3_FLAGMUX_REGERR0](#): Checks which application error sources are active
- [L3_FLAGMUX_REGERR1](#): Checks which debug error sources are active

The two L3_FLAGMUXMASK registers mask bit 0 or bit 1 of the flag inputs, and the L3_FLAGMUX_REGERR registers read input errors. Each register is dedicated to reporting the bit corresponding to the register number.

[Table 13-30](#) describes the mapping of the flags to the corresponding sources.

Table 13-30. Interconnect Flag Mapping

	Flag Mux Input	Source
CLK1 flag mux	0	L3_SN_DMM1
	1	L3_SN_DMM2
	2	L3_SN_ABE
	3	L3_SN_L4CFG
	4	CLK2 PWR DISC
CLK2 flag mux	0	L3_SN_Cortex-M3
	1	L3_SN_DSS
	2	L3_SN_GPMC
	3	L3_SN_ISS
	4	L3_SN_IVAHD
	5	Reserved
	6	L3_SN_L4PER0
	7	L3_SN_OCMCRAM
	8	L3_SN_GPMC
	9	L3_SN_SGX
	10	L3_SN_SL2
	11	L3_SN_C2C
	12	CLK1 PWR DISC
	13	Reserved
	14	Reserved
	15	L3_SN_L4PER3
	16	L3_SN_L4PER1
	17	L3_SN_L4PER2
CLK3 flag mux	0	DEBUGSS

13.2.3.8.4 Severity Level of Standard and Custom Errors

The slave NIU registers are important for error logging.

- The [L3_TARG_STDERRLOG_SVRTSTDLVL](#) register shows the severity level for standard errors. According to the severity level, error logging is disabled, enabled with level ERROR, or enabled with level ERROR and flag FAULT.
- The [L3_TARG_STDERRLOG_SVRTCUSTOMLVL](#) register shows the severity level for custom errors (see).
- The [L3_TARG_STDERRLOG_MAIN](#) register is the main register for error-logging management. It shows the validity of the logged information, standard or custom.
- The [L3_TARG_STDERRLOG_HDR](#) register stores packets in case of a standard error.

- The [L3_TARG_STDERRLOG_MSTADDR](#) register returns the MSTADDR field of the logged packet.
- The [L3_TARG_STDERRLOG_SLVADDR](#) register returns the SLVADDR field of the stored packet.
- The [L3_TARG_STDERRLOG_INFO](#) register saves the information field of the logged packet.

13.2.4 L3 Interconnect Programming Guide

13.2.4.1 L3 Interconnect Low-Level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L3 interconnect module.

13.2.4.1.1 Global Initialization

13.2.4.1.1.1 Global Initialization of Surrounding Modules

This section identifies the requirements for initializing the surrounding modules when the L3 interconnect module is to be used for the first time after a device reset. The initialization of surrounding modules is based on the integration and environment of the L3 interconnect. For more information, see [Section 13.2.2, L3 Interconnect Integration](#).

Table 13-31. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	For information about the configuration of the PRCM module, see Chapter 3, Power, Reset, and Clock Management .
Control module	For information about the configuration of the control module, see Chapter 18, Control Module .
MPU INTC	The MPU INTC must be configured to enable interrupts from the L3 interconnect module. See Chapter 17, Interrupt Controllers .
sDMA	For information about the configuration of the sDMA, see Chapter 16, sDMA .
L3 interconnect	For information about the interconnect configuration, see Chapter 13, Interconnect .

13.2.4.2 Operational Modes Configuration

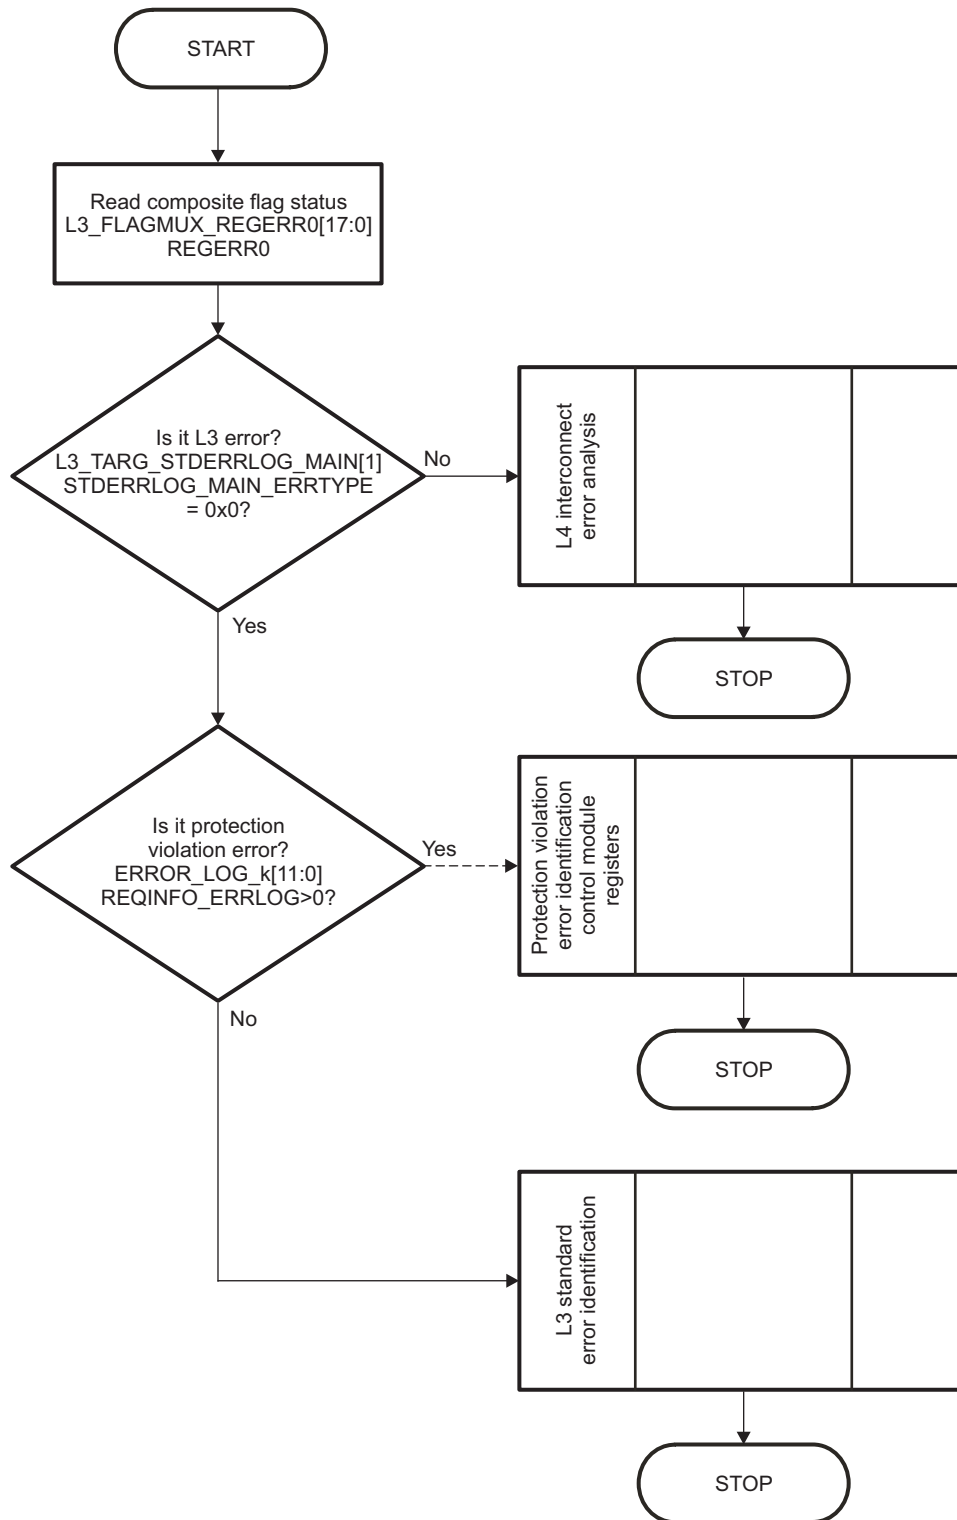

13.2.4.2.1 L3 Interconnect Error Analysis Mode

13.2.4.2.1.1 Main Sequence: L3 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 13-7](#) shows the software sequence required in most cases.

Figure 13-7. Typical Error Analysis Sequence

I3-013

Table 13-32 lists the register call summary for error analysis mode in the main sequence.

Table 13-32. Register Call Summary: Main Sequence – Error Analysis Mode

Register Name	Register Name	Register Name
ERROR_LOG_k	L3_FLAGMUX_REGERR0	L3_FLAGMUX_REGERR1
L3_TARG_STDERRLOG_MAIN	CONTROL.CONTROL_SEC_ERR_STAT US_FUNC	CONTROL.CONTROL_SEC_ERR_STAT US_DEBUG

[Table 13-33](#) lists the subprocess call summary for error analysis mode in the main sequence.

Table 13-33. Subprocess Call Summary for Main Sequence – Error Analysis Mode

Subprocess	Cross-Reference
L4 interconnect error analysis	See Section 13.2.4.2.1 , <i>L4 Interconnect Error Analysis Mode</i> .
L3 interconnect protection violation error identification	See Section 13.2.4.2.1.1.2 , <i>Subsequence: L3 Interconnect Protection Violation Error Identification</i> .
L3 interconnect unsupported command/address hole error identification	See Section 13.2.4.2.1.1.3 , <i>Subsequence: L3 Interconnect Unsupported Command/Address Hole Error Identification</i> .
L3 interconnect reset FLAGMUX and module	See Section 13.2.4.2.1.1.4 , <i>Subsequence: L3 Interconnect Reset FLAGMUX and Module</i> .

13.2.4.2.1.1.1 L3 Custom Error Identification

[Table 13-34](#) demonstrates custom error identification.

Table 13-34. Custom Error Identification

Step	Register	Value
IF: Is CustomError detected?	L3_TARG_STDERRLOG_MAIN [1] STDERRLOG_MAIN_ERRTYPE	= 0x1
Read info field of the response packet.	L3_TARG_STDERRLOG_CUSTOMINFO_INFO [7:0] STDERRLOG_CUSTOMINFO_INFO	xxx
Read the address of the initiator that caused the error.	L3_TARG_STDERRLOG_CUSTOMINFO_MSTADDR [7:0] STDERRLOG_CUSTOMINFO_MSTADDR	xxx
Read the type of the operation (read/write).	L3_TARG_STDERRLOG_CUSTOMINFO_OPCODE [1:0] STDERRLOG_CUSTOMINFO_OPCODE	xxx
ENDIF		

NOTE: To understand why the target IP has returned an error, the user must read the target IP registers.

13.2.4.2.1.1.2 Subsequence: L3 Interconnect Protection Violation Error Identification

The procedure listed in [Table 13-35](#) describes protection violation error identification and where it is logged in the control module registers. Two types of errors are logged: application errors and debug errors.

Table 13-35. Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read the burst violation.	ERROR_LOG_k [23] BLK_BURST_VIOLATION	xxx
Read the initiator ID.	ERROR_LOG_k [11:8] CONNID	xxx
Read the command that caused the error.	ERROR_LOG_k [7] MCMD	xxx
Read the address of the request that caused the error.	LOGICAL_ADDR_ERRLOG_k [31:12] SLVOFS_LOGICAL	xxx
IF: Is it an application error?	L3_FLAGMUX_REGERR0 [17:0] REGERROR0	= 0x0
Read the status bits to see which module firewall has worked.	CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[20:0]	xxx
Clear the status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[20:0]	xxx

Table 13-35. Protection Violation Error Identification (continued)

Step	Register/Bit Field/Programming Model	Value
Clear the status bit.	L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_MAIN_CLRLOG	0x0
ELSE IF	L3_FLAGMUX_REGERR1 [17:0] REGERROR1	= 0x1
Read the status bits to see the module.	CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG[20:0]	xxx
Clear the status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG[20:0]	xxx
Clear the status bit.	L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_MAIN_CLRLOG	0x0
ENDIF		
Clear the burst violation.	ERROR_LOG_k [23] BLK_BURST_VIOLATION	0x0
Clear the error status.	ERROR_LOG_k [21:17] REGION_START_ERRLOG	0x00

13.2.4.2.1.1.3 Subsequence: L3 Interconnect Standard Error Identification

The procedure listed in [Table 13-36](#) describes the identification of standard errors inside the L3 interconnect. The standard errors are: unsupported command, address hole, and disconnect.

Table 13-36. L3 Standard Error Identification

Step	Register/Bit Field/Programming Model	Value
IF: Is an error detected?	L3_TARG_STDERRLOG_MAIN [18] STDERRLOG_MAIN_ERRCNT	= 0x1
Read the corresponding flag.	L3_FLAGMUX_REGERR0 [17:0] REGERROR0	xxx
Read the corresponding flag.	L3_FLAGMUX_REGERR1 [17:0] REGERROR1	xxx
Localize the slave NIU that generated the error.	See Table 13-30 , <i>Interconnect Flag Mapping</i> .	
ELSE		
Clear the error log.	L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_MAIN_CLRLOG	0x0
Clear the severity error status.	L3_TARG_STDERRLOG_SVRTSTDLVL [1:0] STDERRLOG_SVRTSTDLVL_0	0x2
ENDIF		

13.2.4.2.1.1.4 Subsequence: L3 Interconnect FLAGMUX Configuration

The procedure listed in [Table 13-37](#) gives information about the configuration of FLAGMUX masks.

Table 13-37. FLAGMUX Configuration

Step	Register/Bit Field/Programming Model	Value
Set the FLAGMUX masks to mask an event.	L3_FLAGMUX_MASK0 [17:0] MASK0 L3_FLAGMUX_MASK1 [17:0] MASK1	xxx
Read the REGERR bits to see if an error is recorded.	L3_FLAGMUX_REGERR0 [17:0] REGERR0 L3_FLAGMUX_REGERR1 [17:0] REGERR1	xxx
Clear the slave NIU error log and the FLAGMUX error.	L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_SVRTSTDLVL_0	0x2

13.2.5 L3 Interconnect Register Manual

13.2.5.1 L3 Register Group Summary

The registers in the L3 interconnect are divided into eight groups:

- Firewall registers [Table 13-39](#)
- HOST registers [Table 13-62](#)
- TARG registers [Table 13-98](#)
- PWR_DISK registers [Table 13-140](#)
- FLAGMUX registers [Table 13-164](#)
- BW registers [Table 13-179](#)
- RA registers [Table 13-194](#)
- STATCOLL registers [Table 13-202](#)

13.2.5.1.1 L3 Firewall Registers Summary and Description

Table 13-38. L3 Firewall Instance Summary

Module Name	Base Address	Size
C2C-Master NIU Firewall	0x4A20 4000	4KB
C2C-Slave NIU Firewall	0x4A20 6000	4KB
EMIF Firewall	0x4A20 C000	4KB
GPMC Firewall	0x4A21 0000	4KB
L3 RAM Firewall	0x4A21 2000	4KB
SGX Firewall	0x4A21 4000	4KB
ISS Firewall	0x4A21 6000	4KB

Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																RESERVED				STDHOSTHDR_MAINCTLREG_CM		STDHOSTHDR_MAINCTLREG_FLT		RESERVED		STDHOSTHDR_MAINCTLREG_EN					

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Reserved	R	0x00000000
4	RESERVED	Reserved	R	0
3	STDHOSTHDR_MAINCTLREG_CM	Reserved for internal testing. Must be set to 0. Type: Control. Reset value: 0x0.	R	0
2	STDHOSTHDR_MAINCTLREG_FLT	Asserted when a Fault condition is detected: if the unit includes Error Logging, Flt is asserted when the FltCnt register field indicates a Fault, and deasserted when FltCnt is reset. If no Error Logging is implemented, this bit becomes unit-dependent. In all cases, Flt bit and Flt pin (service network) have the same logical level. Type: Status. Reset value: X.	R	0
1	RESERVED	Reserved	R	0
0	STDHOSTHDR_MAINCTLREG_EN	Sets the global core enable. Note: A disabled master does not generate any NTTP requests, and a disabled slave replies with an error packet to any request it receives. Type: Control. Reset value: 0x1.	RW	1

13.3 L4 Interconnects

This section details the device L4 interconnects.

13.3.1 L4 Interconnect Overview

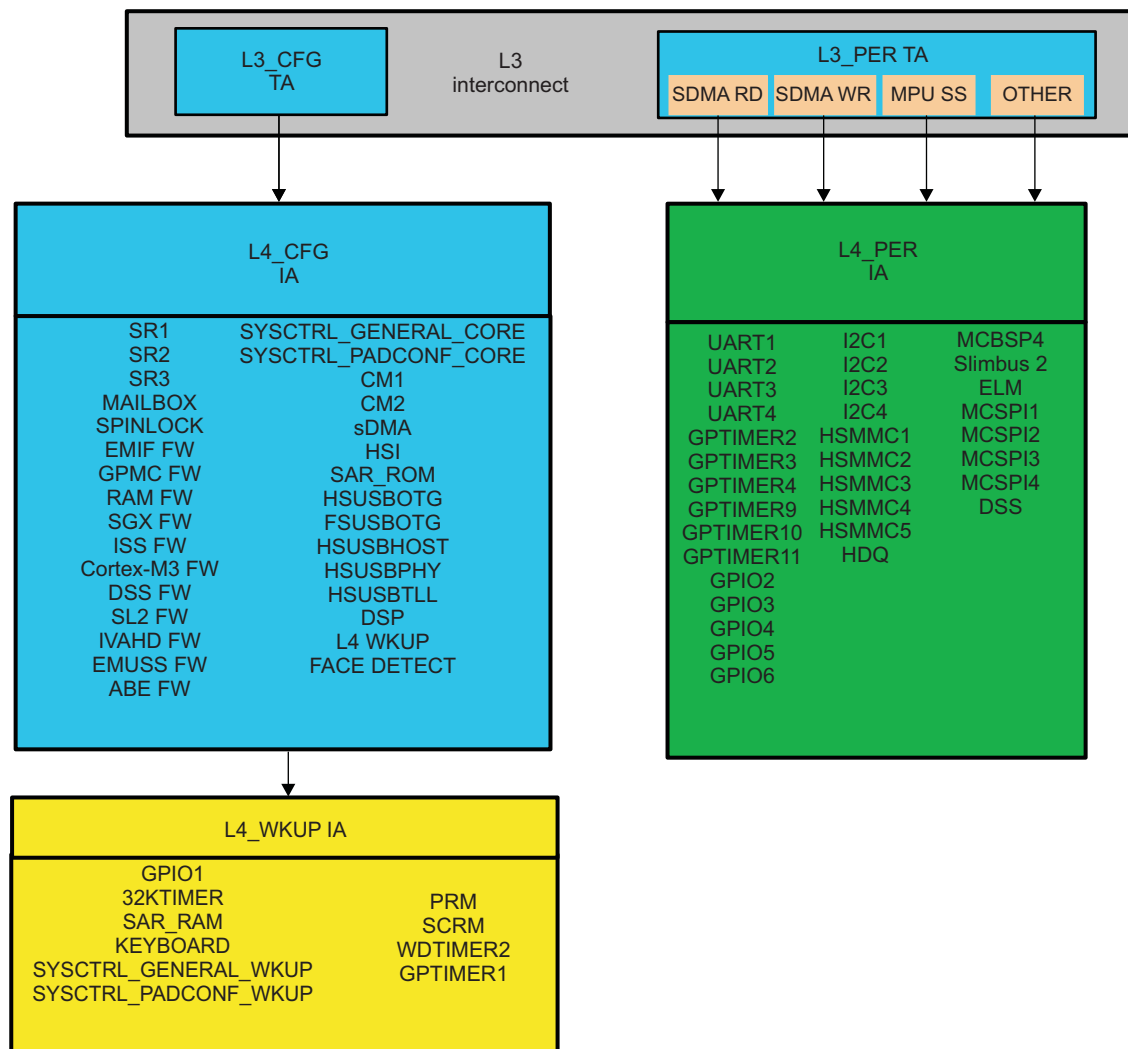

The device uses three separate L4 interconnect structures to connect peripheral modules. All L4s handle transfers with peripherals but are located in distinct power domains.

Figure 13-8 is an overview of the L4 interconnects and the peripherals attached to them.

The L4 interconnect is composed of the following interconnects:

- L4_CFG: Includes the majority of the configuration interface for L3 system modules and peripheral interconnect
- L4_PER: Includes the main peripherals that require sDMA access
- L4_WKUP: Includes peripherals attached to the WKUP power domain

Figure 13-8. L4 Interconnect Overview

icnt-013

The main features of the L4 interconnects are:

- From one to four 32-bit initiator ports for each L4 interconnect instance.
- 8-, 16-, or 32-bit data, single, or burst transactions
- Little endian

- Nonblocking architecture with fair arbitration between threads
- Target interfaces: Fully synchronous or divided synchronous
- L4_CFG and L4_PER frequency equal half of L3 frequency
- Protection logic that provides user-configurable access control to targets by each initiator
- Implementation of RFFs to support low-voltage dynamic power switching

13.3.2 L4 Interconnect Integration

Table 13-273 and Table 13-274 summarize the integration of the module in the device.

Table 13-273. Integration Attributes

Module Instance	Attributes
	Power Domain
L4_PER	PD_L4_PER
L4_CFG	PD_CORE
L4_WKUP	PD_WKUP

Table 13-274. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L4_PER	L4_PER_CLK	PER_L4_ICLK	PRCM module	Functional and interface clock
L4_CFG	L4_CFG_CLK	CFG_L4_ICLK	PRCM module	Functional and interface clock
L4_WKUP	L4_WKUP_CLK	WKUP_L4_ICLK ₂	PRCM module	Functional and interface clock
Resets				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
L4_PER	L4_PER_RST	L4_PER_RST	PRCM module	Reset of L4_PER interconnect
	L4_PER_RET_RST	L4_PER_RET_RST	PRCM module	Reset of L4_PER interconnect retention registers. For information about retention reset, see Chapter 3, Power, Reset, and Clock Management .
L4_CFG	L4_CFG_RST	CORE_RST	PRCM module	Reset of L4_CFG interconnect
	L4_CFG_RET_RST	CORE_RET_RST	PRCM module	Reset of L4_CFG interconnect retention registers. For information about retention reset, see Chapter 3, Power, Reset, and Clock Management .
L4_WKUP	L4_WKUP_RST	WKUP_RST	PRCM module	Reset of L4_WKUP interconnect

13.3.3 L4 Interconnect Functional Description

13.3.3.1 Module Distribution

IAs and TAs provide the interface to connect the different modules to their associated interconnect.

[Table 13-275](#) through [Table 13-280](#) list all the modules and subsystems with their associated agents. The agents are listed for each L4 interconnect domain.

13.3.3.1.1 L4_PER Interconnect Agents

The L4_PER interconnect handles transfers only to peripherals in the PER power domain. [Table 13-275](#) lists the PER TAs.

Table 13-275. L4 PER TAs

Module Target Name	Description
PER_TA_UART1	UART port 1 module
PER_TA_UART2	UART port 2 module
PER_TA_UART3	UART port 3 module
PER_TA_UART4	UART port 4 module
PER_TA_GPTIMER2	GPTIMER2 module
PER_TA_GPTIMER3	GPTIMER3 module
PER_TA_GPTIMER4	GPTIMER4 module
PER_TA_GPTIMER9	GPTIMER9 module
PER_TA_GPTIMER10	GPTIMER10 module
PER_TA_GPTIMER11	GPTIMER11 module
PER_TA_DSS	Display subsystem configuration module
PER_TA_GPIO2	General-purpose input/output 2 (GPIO2) module
PER_TA_GPIO3	GPIO3 module
PER_TA_GPIO4	GPIO4 module
PER_TA_GPIO5	GPIO5 module
PER_TA_GPIO6	GPIO6 module
PER_TA_I2C1	I2C1 module
PER_TA_I2C2	Multimaster I2C2 module
PER_TA_I2C3	Multimaster I2C3 module
PER_TA_I2C4	Multimaster I2C4 module
PER_TA_SLIMBUS2	Silmbus 2 module
PER_TA_ELM	Error location module
PER_TA_MCBSP4	McBSP4 module
PER_TA_MCSPI1	McSPI1 module
PER_TA_MCSPI2	MCSP12 module
PER_TA_MCSPI3	MCSP13 module
PER_TA_MCSPI4	MCSP14 module
PER_TA_HSMMC1	MMC controller 1 module
PER_TA_HSMMC2	MMC controller 2 module
PER_TA_HSMMC3	MMC controller 3 module
PER_TA_HSMMC4	MMC controller 4 module
PER_TA_HSMMC5	MMC controller 5 module
PER_TA_HDQ	Single-wire serial link low-rate module

Four ports communicate between the L3 interconnect and the L4_PER interconnect to allow the L3 initiators to access the L4_PER targets. [Table 13-276](#) lists the L4_PER initiator TAs.

For the list of initiators authorized to access the L4 peripheral peripherals, see [Section 13.2.3.2.2, Connectivity Matrix](#).

Table 13-276. L4_PER IAs

Module Initiator Name	Description
PER_IA_0	L3 system direct memory access (sDMA) RD interconnect port
PER_IA_1	L3 sDMA WR interconnect port
PER_IA_2	L3 MPU subsystem interconnect port
PER_IA_3	L3 others interconnect port

13.3.3.1.2 L4_CFG Interconnect Agents

The L4_CFG interconnect handles only transfers to peripherals in the core power domain. [Table 13-277](#) lists the TAs.

Table 13-277. L4_CFG TAs

Module Target Name	Description
CFG_TA_SYSCTRL_GENERAL_CORE	System control general core module
CFG_TA_SYSCTRL_PADCONF_CORE	System control padconf core module
CFG_TA_CM1	Clock manager 1 module
CFG_TA_CM2	Clock manager 1 module
CFG_TA_SDMA	sDMA module
CFG_TA_HSI	HS SSI module
CFG_TA_SAR_ROM	Save-and-restore ROM
CFG_TA_HSUSBOTG	HS USB OTG module
CFG_TA_FSUSBHOST	FS USB OTG module
CFG_TA_HSUSBHOST	HS USB host module
CFG_TA_HSUSBPHY	HS USB PHY module
CFG_TA_HSUSBTLL	USB TTL module
CFG_TA_DSP	DSP subsystem
CFG_TA_SR1	SmartReflex1 module
CFG_TA_SR2	SmartReflex2 module
CFG_TA_SR3	SmartReflex3 module
CFG_TA_MAILBOX	Mailbox module
CFG_TA_SPINLOCK	Spinlock module
CFG_TA_FACEDETECT	Face detect module
CFG_TA_EMIFFW	EMIF firewall
CFG_TA_GPMCFW	GPMC firewall
CFG_TA_OCMRAMFW	RAM firewall
CFG_TA_SGXFW	SGX firewall
CFG_TA_ISSFW	ISS firewall
CFG_TA_CORTEXM3FW	Cortex-M3 firewall
CFG_TA_DSSFW	Display subsystem (DSS) firewall
CFG_TA_SL2FW	SL2 firewall
CFG_TA_IVAHDFW	IVA-HD firewall
CFG_TA_EMUSSFW	EMU subsystem firewall
CFG_TA_ABEFW	ABE firewall
CFG_TA_L4WKUP	L4_WKUP connection

A unique port, CFG_IA_0, communicates between the L3 interconnect and the L4_CFG interconnect to allow the L3 initiators to access the L4_CFG targets (see [Table 13-278](#)).

For the list of initiators authorized to access the L4_CFG peripherals, see [Section 13.2.3.2.2, Connectivity Matrix](#).

Table 13-278. L4_CFG IAs

Module Initiator Name	Description
CFG_IA_0	L3 interconnect port

13.3.3.1.3 L4_WKUP Interconnect Agents

The L4-WKUP interconnect handles transfers only to peripherals in the WKUP power domain. [Table 13-279](#) lists the TAs. [Table 13-280](#) lists the L4 WKUP initiator agents.

Table 13-279. L4_WKUP TAs

Module Target Name	Description
WKUP_TA_GPIO1	GPIO1 module
WKUP_TA_32KTIMER	32-kHz timer module
WKUP_TA_SAR_RAM	Save-and-restore RAM
WKUP_TA_KEYBOARD	Keyboard module
WKUP_TA_SYSCTRL_GENERAL_WKUP	System control general WKUP module
WKUP_TA_SYSCTRL_PADCONF_WKUP	System control padconf WKUP module
WKUP_TA_PRM	Power reset management module
WKUP_TA_SCRM	System clock and reset management module
WKUP_TA_WDTIMER2	WDTIMER2 module
WKUP_TA_GPTIMER1	GPTIMER1 module

Table 13-280. L4_WKUP IAs

Module Initiator Name	Description
WKUP_IA_0	L4_CFG interconnect port

13.3.3.2 Power Management

As part of the system-wide power-management scheme, the L4 interconnects go into IDLE state after receiving a request from the PRCM module after all commands are serviced. This function is handled by hardware. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

To reduce power consumption, each L4 interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

Retention is performed on all software-accessible registers at IAs, TAs, and firewalls. This process prevents reconfiguration after a clock domain switches off. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

13.3.3.3 L4 Firewalls

[Figure 13-9](#) is an internal view of the L4 interconnects in the overall interconnect. This architecture, with one initiator subsystem centralizing all initiator master requests and distributing them to all target modules (peripherals), enables the L4 interconnect firewall functions to be centralized at the L4 initiator subsystem level. The L4 firewall filters the accesses based on the configurable protection groups defined in the L4 address protection (AP) registers. Each module or TA is assigned to a protection group. The configuration is also defined in the L4 AP and is programmable on a module-per-module basis.

Figure 13-9. L4 Initiator-Target Connectivity

icnt-014

NOTE: As Figure 13-9 shows, targets are attached to branches. Branches do not impact the function of the L4 interconnect but are present to simplify timing closure and reduce active power consumption.

Because of the large address spaces and the number of peripherals connected to an L4 interconnect, two parameters are used to set up access permission:

- Programmable groups for initiators
 - Eight protection groups for L4_PER and L4_CFG interconnect
- Segments divided into regions of 4KB
 - 100 regions for the L4_PER interconnect
 - 104 regions for the L4_CFG interconnect

NOTE:

- Regions and segments are present for the L4_WKUP interconnect but cannot be programmed.
- L4_WKUP protection is done through the L4_CFG interconnect.

Protection group members are TAs with the same protection settings. A region is programmed to allow access to a unique selectable protection group. For better protection, different regions are grouped into protection group regions and associated with a protection group member.

All L4 interconnect information, such as numbers of protection groups, regions, and segments, is available in the [L4_LA_INITIATOR_INFO_L](#) register.

13.3.3.3.1 Protection Group

A protection group is defined by its initiators and REQ_INFO is allowed. Two registers define these two settings:

- The CONNID_BIT_VECTOR field [L4_AP_PROT_GROUP_MEMBERS_k_L](#) is a 1-bit vector that defines which initiator belongs to a group. A protection group is accessible by an initiator when the bit position corresponding to its ConnID is set to 1 in the CONNID_BIT_VECTOR field. [Table 13-281](#) lists all the ConnID available at the L4 levels.
- The ENABLE field [L4_AP_PROT_GROUP_ROLES_k_L](#) lists all possible REQ_INFO combinations associated with the [L4_AP_PROT_GROUP_MEMBERS_k_L](#) register. Setting a Req bit in this register determines the initiators type of access. For more information, see [Section 13.2.3.7.3, L3 Firewall Functionality](#). Two REQ_INFOS are used in L4 interconnects: MReqDebug and MReqSupervisor.

NOTE: Permissions are identical for read and write accesses in L4 interconnect.

k indicates the protection group number.

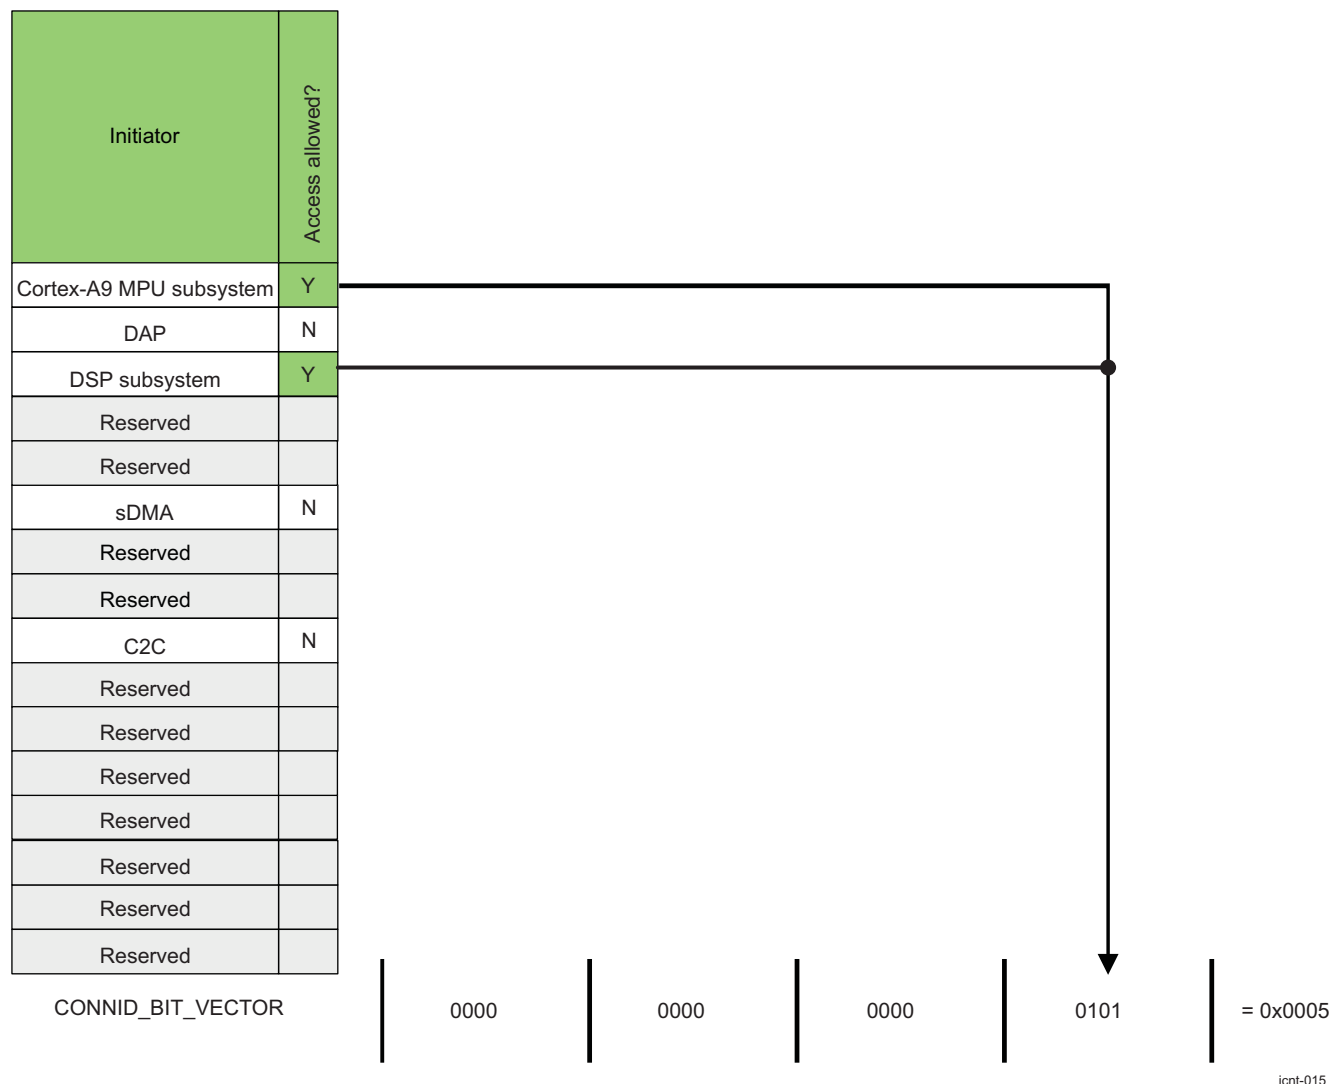

L indicates the region number.

Table 13-281. L4 ConnID Definition

ConnID	Initiator
0	Cortex™-A9 MPU subsystem
1	DAP
2	DSP subsystem
3	Reserved
4	Reserved
5	sDMA
6	Reserved
7	Reserved
8	C2C
9	Reserved
A	Reserved
B	Reserved
C	Reserved
D	Reserved
E	Reserved
F	Reserved

Figure 13-10 is an example of CONNID_BIT_VECTOR.

Figure 13-10. Example of CONNID_BIT_VECTOR L4_AP_PROT_GROUP_MEMBERS_k

Setting bits 0 and 2 in the PROT_GROUP_ID_1 register defines a group initiator that can access targets in protection group 1, and includes the following:

- Cortex-A9 MPU subsystem
- DSP subsystem

Protection group 1 can be applied to multiple protection regions with no limitation. Each protection region that is configured with protection group 1 enables permission access only to the two initiators.

The L4_AP_REGION_I_H PROT_GROUP_ID field determines the region to which the protection group member is attached.

The values of some CONNID_BIT_VECTOR and ENABLE fields are exported by the SCM at reset or are user writable (see Table 13-404 for more information).

Table 13-282 and Table 13-283 list the default configuration of the various groups for each L4 interconnect. For each group, some modules/regions are associated with it with default initiator members.

Table 13-282. L4_PER Firewall Default Configuration

Group	Default Modules Associated With Group	Register	Modifiability	Default Value
Group 0 AP registers	AP registers	L4_AP_PROT_GROUP_ROL ES_0_L	No	0xFFFF FFFF (all)
		L4_AP_PROT_GROUP_MEM BERS_0_L	No	0xFFFF (all)
Group 1	Reserved	L4_AP_PROT_GROUP_ROL ES_1_L	No	0xFFFF FFFF (all)
		L4_AP_PROT_GROUP_MEM BERS_1_L	No	0xFFFF (all)
Group 2	Reserved	L4_AP_PROT_GROUP_ROL ES_2_L	No	0xFFFF FFFF (all)
		L4_AP_PROT_GROUP_MEM BERS_2_L	No	0xFFFF (All)
Group 3–6 Free	No modules attached	L4_AP_PROT_GROUP_ROL ES_3_L L4_AP_PROT_GROUP_ROL ES_4_L L4_AP_PROT_GROUP_ROL ES_5_L L4_AP_PROT_GROUP_ROL ES_6_L	Yes	0xFFFF FFFF (all)
		L4_AP_PROT_GROUP_MEM BERS_3_L L4_AP_PROT_GROUP_MEM BERS_4_L L4_AP_PROT_GROUP_MEM BERS_5_L L4_AP_PROT_GROUP_MEM BERS_6_L	Yes	0xFFFF (all)

		L4_AP_PROT_GROUP_ME MBERS_7_L	Yes	0xFFFF (all)

13.3.3.3.2 Segments and Regions

The protection mechanism for L4 interconnects is based on a hierarchical segmentation, as shown in [Figure 13-11](#). By default, some regions are attached to specific protection group members. This specificity lets users set up the permission access to certain types of modules requiring the same access protection without managing region allocation.

Figure 13-11. L4 Segmentation

All interconnect address spaces are covered by regions. [Table 13-284](#) through [Table 13-286](#) list the module mapping with their addresses, region numbers, and default protection group allocated to them.

NOTE: Module refers to the configuration registers of the module.

TA refers to the interconnect configuration registers of the TA associated with the module.

13.3.3.3 L4 Firewall Address and Protection Register Settings

Table 13-287 lists the settings of the AP registers relative to an L4 interconnect firewall. These values are computed based on the physical implementation of each L4 interconnect.

Table 13-287. L4 Firewall Register Description Overview

Register Type	Register Name	Bits	Field	Description
Segment	L4_AP_SEGMENT_i_L ⁽¹⁾	23:0	BASE	Segment base address
	L4_AP_SEGMENT_i_H ⁽¹⁾	4:0	SIZE	Segment size equals to 2 ^{SIZE}
Protection groups	L4_AP_PROT_GROUP_MEMBERS_k_L ⁽²⁾	15:0	CONNID_BIT_VECTOR	For L4ConnID, see Table 13-281 .
	L4_AP_PROT_GROUP_ROLES_k_L ⁽²⁾	31:0	ENABLE	See Section 13.2.3.7.3 for REQ_INFO description ⁽³⁾
Region setting	L4_AP_REGION_l_L ⁽⁴⁾	23:0	BASE	Defines the base address of region with respect to its segment base address
	L4_AP_REGION_l_H ⁽⁴⁾	27:24	SEGMENT_ID	Segment ID number of the region
		22:20	PROT_GROUP_ID	Protection group member attached to the region
		19:17	BYTE_DATA_WIDTH_EXP	Determines the number of byte in an access
		5:1	SIZE	Size of the region equals to 2 ^{SIZE}
		0	ENABLE	Enables the region protection

⁽¹⁾ i = 0 to 1 for PER_AP
i = 0 to 6 for CFG_AP

⁽²⁾ k = 0 to 7 for PER_AP
k = 0 to 7 for CFG_AP

⁽³⁾ For L interconnects, only MReqDebug and MReqSupervisor are available.

⁽⁴⁾ l = 0 to 96 for PER_AP
l = 0 to 113 for CFG_AP

13.3.3.4 L4 Error Detection and Reporting

13.3.3.4.1 IA and TA Error Detection and Logging

The L4 interconnect provides mechanisms for handling internally detected errors or errors reported by modules attached to the L4 target ports.

NOTE: L4_IA denotes the IA for all L4 interconnects: L4_PER, L4_CFG, and L4_WKUP.

L4_TA denotes the TA for all L4 interconnects: L4_PER, L4_CFG, and L4_WKUP.

The L4 interconnects handle four types of errors:

- No target core found or address hole, detected and logged at IA
- Unsupported command, detected and logged at IA
- Protection violation, detected and logged at IA (see [Section 13.3.3.3](#), *L4 Firewalls*)
- Target does not service a request before a time-out expires. The error is detected and logged at TA (see [Section 13.3.3.4.2](#), *Time-Out*).

[Table 13-288](#) lists the value of the L4_IA_ERROR_LOG_L[25:24] CODE bit field stored when an error occurs.

Table 13-288. L4 CODE Bit Field Definition

CODE (bits 1:0)	Error Type	REQ_INFO	Secondary	ConnID	CMD
0	No error				
1	Unsupported command	x	x	x	x
2	Address hole	x	x	x	x
3	Protection violation	x		x	x

- No target core found/address hole: This error indicates that a request was addressed to a hole in the L4 address map. When this error occurs, an in-band error response is returned to the L3 level. The error is also logged into the [L4_IA_AGENT_STATUS_L\[27\]](#) INBAND_ERROR bit. Additionally, an address hole error code is logged to the [L4_IA_ERROR_LOG_L\[25:24\]](#) CODE bit field.
- Unsupported command: This error indicates that the command type of the request is not supported by the accessed target register. The error is logged into the [L4_IA_AGENT_STATUS_L\[27\]](#) INBAND_ERROR bit. An unsupported command error code is written to the [L4_IA_ERROR_LOG_L\[25:24\]](#) CODE bit field for the initiator interface.
- Protection violation: This error indicates that a request is not issued from an allowed initiator member or is issued with the inappropriate ReqInfo qualifiers associated with the target region. This error is reported using an in-band error and is written to the [L4_IA_AGENT_STATUS_L\[27\]](#) INBAND_ERROR bit. A protection violation error code is saved into the [L4_IA_ERROR_LOG_L\[25:24\]](#) CODE bit field for the same initiator interface. A protection violation is also logged in the [L4_IA_AGENT_STATUS_L\[31\]](#) PROT_ERROR_SECONDARY or [30] PROT_ERROR_PRIMARY bit when in debug or applicative mode, respectively.

The [L4_IA_ERROR_LOG_L\[30\]](#) SECONDARY bit indicates whether the error occurred in application or debug.

The [L4_IA_ERROR_LOG_H\[15:0\]](#) REQ_INFO bit field returns the type access (REQ_INFO qualifier) that caused the error.

The [L4_IA_ERROR_LOG_L\[11:8\]](#) CONNID bit field returns the ID of the initiator that caused the error.

The [L4_IA_ERROR_LOG_ADDR_L\[31:0\]](#) register logs the address for error conditions.

A [L4_IA_ERROR_LOG_L\[31\]](#) MULTI bit is asserted when multiple errors are detected. In this case, the error code corresponds to the first error that occurs.

13.3.3.4.2 Time-Out

A time-out mechanism can be enabled at the interconnect level and on a per-target basis. If the mechanism is enabled for a TA and interconnect and commands are not accepted or responses are not returned within the expected delay, the L4 interconnect generates an error event.

NOTE: The time-out mechanism is not available on the L4_WKUP interconnect, but L4_WKUP timeouts are detected in CFG_TA_L4WKUP of the L4_CFG interconnect.

The error is logged in the [L4_TA_AGENT_STATUS_L\[8\]](#) REQ_TIMEOUT bit. The affected TA enters an error state that causes it to send an error response to any new request targeted at it. To recover from this state, the TA must be reset by the system software. The time-out is counted starting from the moment a command is presented to the target, regardless of the target response to this command.

The L4 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected TAs. The time-base circuit offers four possible sets of four time-base signals. Selection is done by programming the [L4_LA_NETWORK_CONTROL_L\[10:8\]](#) TIMEOUT_BASE bit field.

The selected time-base signals are available at any TA. Each TA can be programmed to refer to one of these four time-base signals, using the [L4_TA_AGENT_CONTROL_L\[10:8\]](#) REQ_TIMEOUT bit field. These four signals are referred to as 1X time-base, 4X time-base, 16X time-base, and 64X time-base.

[Table 13-289](#) lists all values in number of L4 clock cycles.

Table 13-289. L4 Time-Out Link and TA Programming

L4_TA_AGENT_CONTROL_L REQ_TIMEOUT[2:0]					
L4_LA_NETWORK_CON TROL_L TIMEOUT_BASE[2:0]	0	1	2	3	4
0	All L4 time-out features are disabled.				

Table 13-289. L4 Time-Out Link and TA Programming (continued)

		L4_TA_AGENT_CONTROL_L REQ_TIMEOUT[2:0]			
L4_LA_NETWORK_CONTROL_L TIMEOUT_BASE[2:0]	0	1	2	3	4
1	Locally disabled	64	256	1024	4096
2		256	1024	4096	16,384
3		1024	4096	16,384	65,536
4		4096	16,384	65,536	262,144

The default reset value is 0x2 for REQ_TIMEOUT and 0x4 for TIMEOUT_BASE, implying 16,384 clock cycles.

A time-out condition is detected when the command acceptance or the response is not received after a delay of from one to three time-base periods.

Example:

- L4 frequency = 65 MHz
- TIMEOUT_BASE = 4 in the L4_LA_NETWORK_CONTROL_L register
- REQ_TIMEOUT = 2 in the L4_TA_AGENT_CONTROL_L for TA A
- REQ_TIMEOUT = 4 in the L4_TA_AGENT_CONTROL_L for TA B

At agent A, the time-base unit is 16,384 cycles. A time-out is issued when a request to the attached module is not accepted, or no response is sent after a delay of 252 μ s to 756 μ s.

At agent B, the time-base unit is 262,144 cycles. A time-out is issued when a request to the attached module is not accepted or no response is sent after a delay of 4 ms to 12 ms.

On detection of a time-out condition, the TA logs the error in the L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT bit, and it also reports the error to the IA, which forward it to the L3 interconnects.

After the time-out is detected and logged, the behavior of the attached module is ignored. A new request targeting the module arriving at the timed-out TA receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

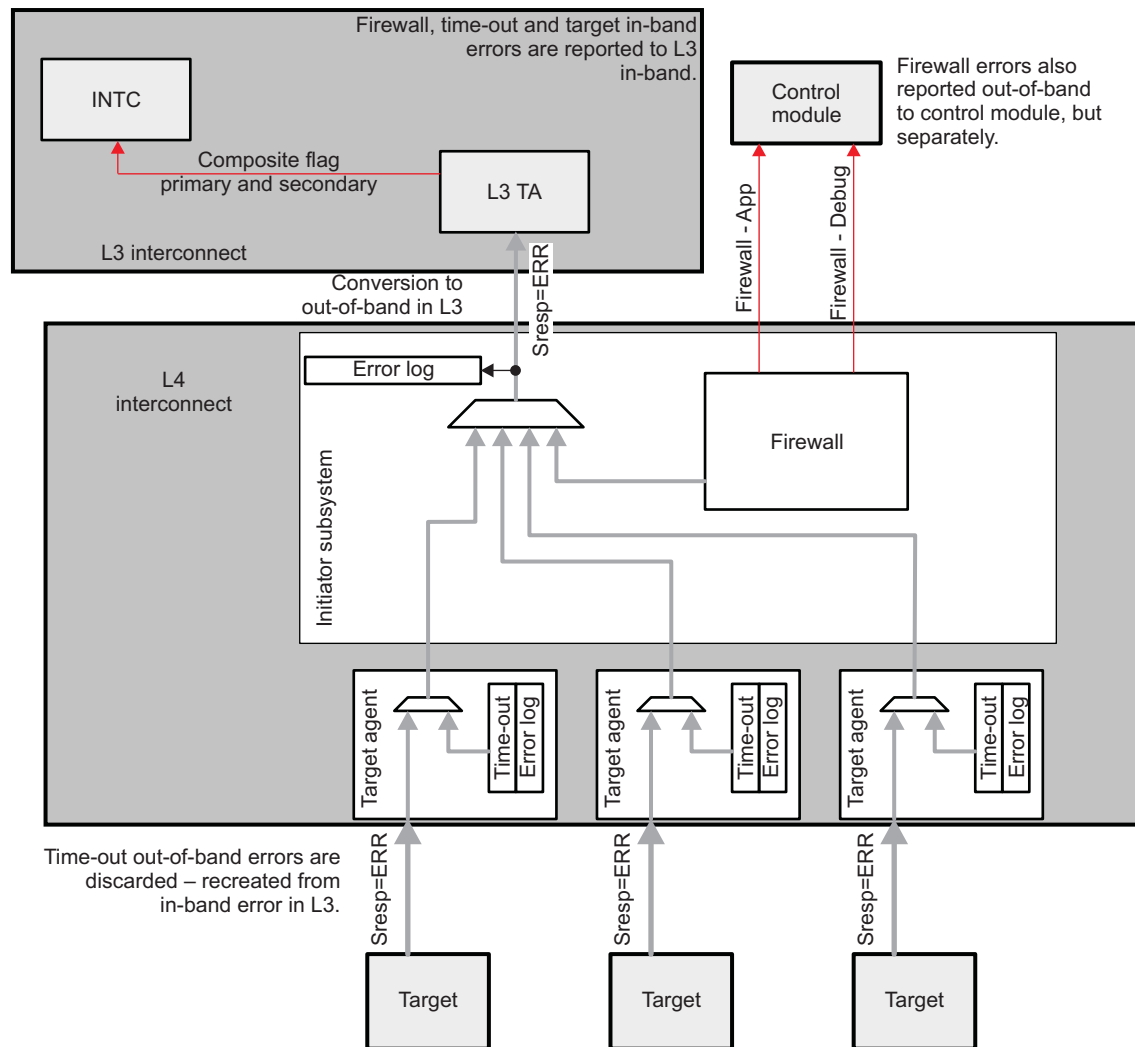

To recover from a time-out error, software is assumed to first reset the faulty module and then the TA using the L4_TA_AGENT_CONTROL_L[0] OCP_RESET bit.

13.3.3.4.3 Error Reporting

Figure 13-12 shows the error-reporting scheme used in the L4 interconnects. All L4 in-band errors are reported to their respective L3 TA, where errors are converted in an out-of band error signal (the L3 applicative and debug composite flags) going to the L3 Interrupt controllers.

Two levels of mask are present to report the error at INTC level:

- At the applicative and debug composite flag, to enable interrupt reporting, the following bits must be set:
 - L4 CFG in L3_CLK1_FLAG_MASK_0[3] and L3_CLK1_FLAG_STATUS_1[3]
 - L4 PER in L3_CLK2_FLAG_MASK_0[17][16][15][6] and L3_CLK2_FLAG_STATUS_1[17][16][15][6]
- At the L3 TA level, see Section 13.2, L3 Interconnect.

Figure 13-12. L4 Error Reporting

icnt-017

13.3.3.4.4 Error Recovery

Writing 1 to the `L4_TA_AGENT_CONTROL_L[0] OCP_RESET` bit initiates the software reset period. Software reset must be asserted for at least 16 cycles of the target module interface clock, which can be a divided clock with respect to the L4 clock.

During the software reset period:

- Requests sent to the target module receive error responses. Therefore, if the faulty request is part of a DMA transfer, it is necessary to stop the DMA to prevent unwanted errors.
- Requests sent to the TA register block are processed as usual.
- The `L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT` status bit is cleared.

Writing 0 to the `L4_TA_AGENT_CONTROL_L[0] OCP_RESET` bit terminates the software reset period.

The attached module must then be reset to complete the recovery.

13.3.3.4.5 Firewall Error Logging in the Control Module

When a protection violation occurs, an interrupt is sent to the INTCs (if enabled). An in-band error is sent back to L3 IA and an out-band error can also be logged in the CONTROL.CONTROL_SEC_ERR_STATUS register in the system control module (SCM). These out-band errors are enabled/disabled at the L4 IA level by setting the [L4_IA_AGENT_CONTROL_L\[31\]\[30\]](#) PROT_ERROR_SECONDARY_REP or PROT_ERROR_PRIMARY_REP bit to 1 for debug and application mode, respectively.

At the control module level, two logging registers are used, depending on the mode:

- In application mode or primary error reporting:
 - CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[16] = L4_CFG protection violation
 - CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[17] = L4_PER protection violation
- In debug mode or secondary error reporting:
 - CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG[16] = L4_CFG protection violation
 - CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG[17] = L4_PER protection violation

NOTE: The CONTROL.CONTROL_SEC_ERR_STATUS_xxx registers are only readable.

Figure 13-13 shows the global protection error reporting to at the control module.

Figure 13-13. Protection Violation Out-of-Band Error Reporting

13.3.4 L4 Interconnect Programming Guide

13.3.4.1 L4 Interconnect Low-level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L4 interconnect module.

13.3.4.1.1 Global Initialization

13.3.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the L4 interconnect module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the L4 interconnect. For more information, see [Section 13.3.2, L4 Interconnect Integration](#).

Table 13-290. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	For more information about the configuration of the module, see Chapter 3, Power, Reset, and Clock Management .
Control module	For more information about the configuration of the module, see Chapter 18, Control Module .
MPU INTC	The MPU INTC must be configured to enable the interrupts from L4 interconnect module. See Chapter 17, Interrupt Controllers .
sDMA	For more information about the configuration of the sDMA, see Chapter 16, sDMA .
L3 interconnect	For more information about the interconnect configuration, see Chapter 13, Interconnect .

13.3.4.1.2 Operational Modes Configuration

13.3.4.1.2.1 L4 Interconnect Error Analysis Mode

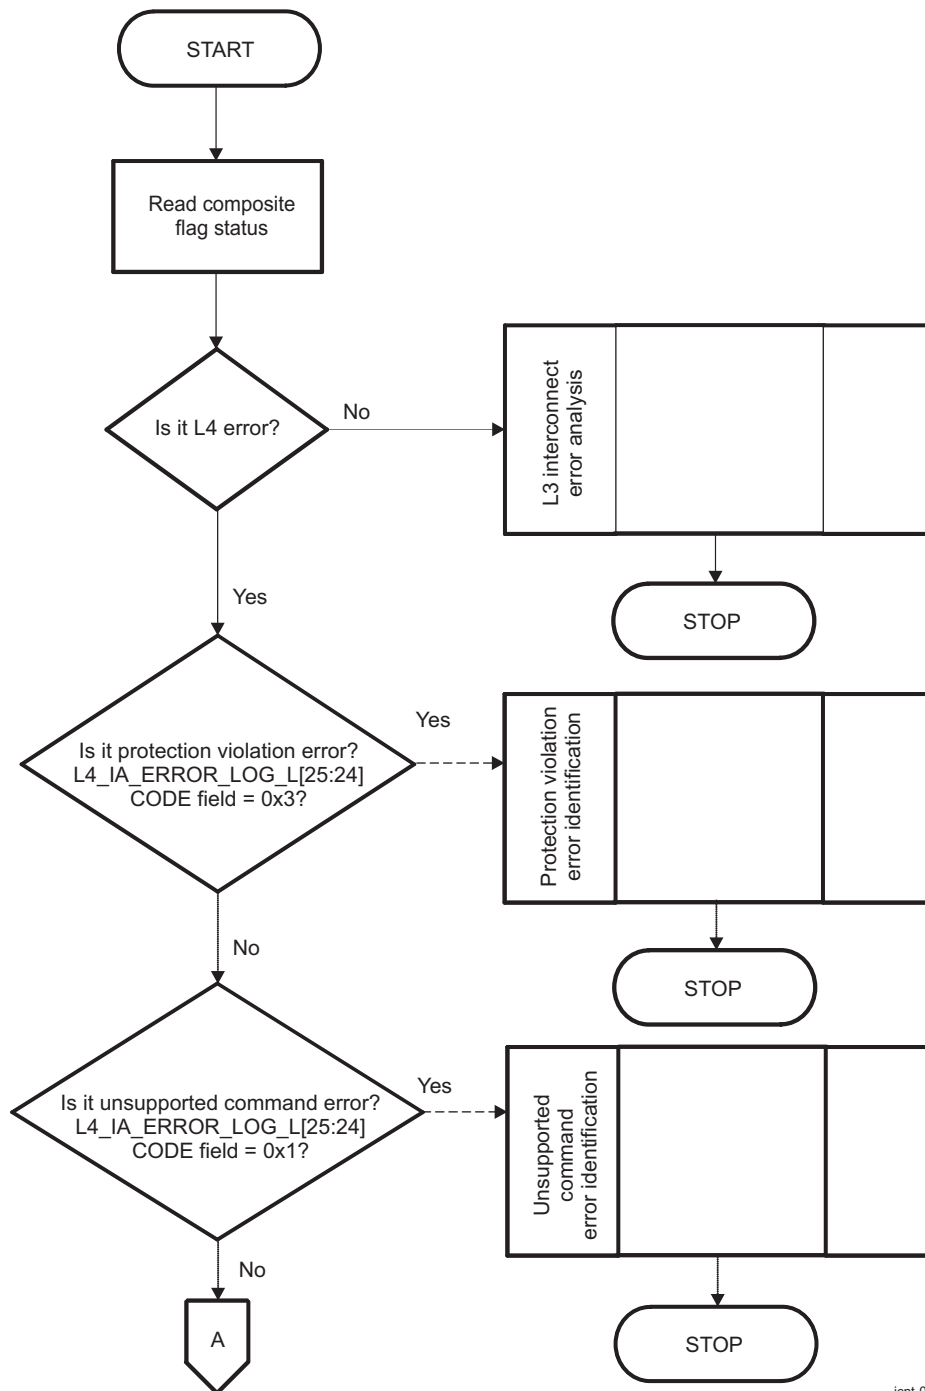

13.3.4.1.2.1.1 Main Sequence: L4 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 13-14](#) and [Figure 13-15](#) show the software sequence required in most cases.

[Table 13-291](#) and [Table 13-292](#) show the main sequence for error analysis mode and its subprocess call summary, respectively.

Figure 13-14. Typical Error Analysis Sequence

icnt-019

Figure 13-15. Typical Error Analysis Sequence

L4_TA_AGENT_STATUS_L		

Table 13-292. Subprocess Call Summary for Main Sequence – Error Analysis Mode

Subprocess	Cross-Reference
L3 interconnect error analysis	Section 13.2.3.8, L3 Interconnect Error Handling
L4 interconnect protection violation error identification	Section 13.3.4.1.2.1.2, Subsequence: L4 Interconnect Protection Violation Error Identification
L4 interconnect unsupported command/address hole error identification	Section 13.3.4.1.2.1.3, Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification
L4 interconnect reset TA and module	Section 13.3.4.1.2.1.4, Subsequence: L4 Interconnect Reset TA and Module

13.3.4.1.2.1.2 Subsequence: L4 Interconnect Protection Violation Error Identification

This procedure describes the protection violation error identification (see [Table 13-293](#)).

Table 13-293. Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	
Read initiator ID.	L4_IA_ERROR_LOG_L[11:8] CONNID	
Read command that cause the error.	L4_IA_ERROR_LOG_L[2:0] CMD	
Read address of request that caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	
IF: Is it a primary error?	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	=0x1
Read status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_FUN C[17:16]	
Write 1 to clear status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_FUN C[17:16]	0x3
Write 1 to clear IA status bit.	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	0x1
ELSE		
Read status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_DEB UG[17:16]	
Write 1 to clear status bits.	CONTROL.CONTROL_SEC_ERR_STATUS_DEB UG[17:16]	0x3
Write 1 to clear IA status bit	L4_IA_AGENT_STATUS_L[31] PROT_ERROR_SECONDARY	0x1
ENDIF		
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear in-band error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

13.3.4.1.2.1.3 Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification

This procedure describes the identification of unsupported command/address hole error (see [Table 13-294](#)).

Table 13-294. Unsupported Command/Address Hole Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	
Read initiator ID.	L4_IA_ERROR_LOG_L[11:8] CONNID	
Read command that caused the error.	L4_IA_ERROR_LOG_L[2:0] CMD	
Read address of request that caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	
Read secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	
Write 1 to clear secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	0x1
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear inband error status.	L4_IA_AGENT_STATUS_L[24] INBAND_ERROR	0x1

13.3.4.1.2.1.4 Subsequence: L4 Interconnect Reset TA and Module

This procedure resets the TA and module (see [Table 13-295](#)).

Table 13-295. Reset TA and Module

Step	Register/Bit Field/Programming Model	Value
Reset TA.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x1
Wait until target module clock = 16 cycles.		

Table 13-295. Reset TA and Module (continued)

Step	Register/Bit Field/Programming Model	Value
Write 0 to clear TA time - out status.	L4_TA_AGENT_CONTROL_L [10:8] REQ_TIMEOUT	0x0
Write 0 to clear TA reset.	L4_TA_AGENT_CONTROL_L [0] OCP_RESET	0x0
Reset the attached module. ⁽¹⁾		

⁽¹⁾ For more information, see the respective module chapter.

13.3.4.1.2.2 L4 Interconnect Time-Out Configuration Mode

13.3.4.1.2.2.1 Main Sequence: L4 Interconnect Time-Out Configuration Mode

This procedure describes the time-out configuration sequence (see [Table 13-296](#)).

Table 13-296. Time-Out Configuration

Step	Register/Bit Field/Programming Model	Value
Disable time-out.	L4_LA_NETWORK_CONTROL_L [10:8] TIMEOUT_BASE	0x0
Clear TA time-out error status. ⁽¹⁾	L4_TA_AGENT_STATUS_L [8] REQ_TIMEOUT	0x1
Set time-out at TA level. ⁽¹⁾	L4_TA_AGENT_CONTROL_L [10:8] REQ_TIMEOUT	xxx
Set time-out base.	L4_LA_NETWORK_CONTROL_L [10:8] TIMEOUT_BASE	xxx

⁽¹⁾ Must be done for each TA.

13.3.4.1.2.3 L4 Interconnect Firewall Configuration Mode

13.3.4.1.2.3.1 Main Sequence: L4 Interconnect Firewall Configuration Mode

This procedure describes the firewall configuration sequence (see [Table 13-297](#)).

Table 13-297. Firewall Configuration

Step	Register/Bit Field/Programming Model	Value
Define the members of protection group k. ⁽¹⁾	L4_AP_PROT_GROUP_MEMBERS_k_L [15:0] CONNID_BIT_VECTOR	xxx
Define the access type of a protection group k. ⁽¹⁾	L4_AP_PROT_GROUP_ROLES_k_L [15:0] ENABLE	xx
Set region affiliation to protection group. ⁽²⁾	L4_AP_REGION_I_L [22:20] PROT_GROUP_ID	xxx

⁽¹⁾ Must be done for each protection group.

⁽²⁾ Must be done for each region.

13.3.5 L4 Interconnects Register Manual

Table 13-298 through Table 13-300 list all L4 register blocks for IA, TA, AP, and LA. Each module instance is shown with the module register mapping and bit and bit field definitions.

Table 13-390. L4_LA_NETWORK_CONTROL_H

Address Offset	0x0000 0024
Physical Address	0x4800 0824 0x4A00 0824 0x4A30 0824
Description	Control interconnect global power control
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CLOCK_GATE_DISABLE	RESERVED		THREAD0_PRI	RESERVED								EXT_CLOCK	RESERVED										

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Read returns 0.	R	0x00
24	CLOCK_GATE_DISABLE	When set to 1 this field disables all clock gating.	RW	0
23:21	RESERVED	Read returns 0.	R	0x0
20	THREAD0_PRI	Sets thread priority. If the field is set to 0, the default, all initiator threads are treated the same. Setting the THREAD0_PRI field to 1 assigns a higher arbitration priority to thread 0 of the first initiator OCP interface. To avoid starvation, arbitration is imposed by the initiator subsystem. When multiple requests from different initiator threads are dispatched to targets simultaneously, the oldest request is dispatched first. If thread 0 is assigned a higher priority, a request on thread 0 always wins arbitration. Assigning thread 0 of the first initiator OCP the highest priority on a request or response can result in the starvation of other threads.	R	1
19:9	RESERVED	Read returns 0.	R	0x000
8	EXT_CLOCK	When set to 1, the ext_clk_off_i signal on the initiator subsystem instructs the entire L4 to shut off.	R	1
7:0	RESERVED	Read returns 0.	R	0x00

Address Offset	0x300 + (0x08*I)	Index	I = 0 to 96 for PER_AP I = 0 to 113 for CFG_AP
Physical address	0x4800 0300 + (0x08*I) 0x4A00 0300 + (0x08*I)		
Description	Define the base address of the region in respect to the segment it belongs to.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved								BASE																							

Bits	Field Name	Description	Type	Reset
31:24	Reserved	Read returns 0.	R	0x00
23:0	BASE	Sets the base address of the region relative to its segment base.	R	See Table 13-416 to Table 13-417

Table 13-414. L4_AP_REGION_I_H

Address Offset	0x304 + (0x08*I)	Index	I = 0 to 99 for CORE_AP
Physical address	0x4800 0304 + (0x08*I) 0x4A00 0304 + (0x08*I)		
Description	Define the size, protection group and segment ID of the region		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved				SEGMENT_ID				Reserved	PROT_GROUP_ID			BYTE_DATA_WIDTH_EXP				Reserved								SIZE					ENABLE		

Bits	Field Name	Description	Type	Reset
31:28	Reserved	Read returns 0	R	0x0
27:24	SEGMENT_ID	The segment associated to the region.	R	See Table 13-416 and Table 13-417 .
23	Reserved	Read returns 0.	R	0
22:20	PROT_GROUP_ID	The protection group associated to the region.	RW	See Table 13-416 and Table 13-417 .
19:17	BYTE_DATA_WIDTH_EXP	The target data byte width is 2 ^(BYTE_DATA_WIDTH_EXP) bytes.	R	See Table 13-416 and Table 13-417 .
16:6	Reserved	Read returns 0.	R	0x0
5:1	SIZE	Define the size of the region in bytes. 2 ^{SIZE} equals the region.	R	See Table 13-416 and Table 13-417 .

Bits	Field Name	Description	Type	Reset
0	ENABLE	0x0: Disable the region, no access allows 0x1: Enable the region, with access as define in registers	R	0x1

Chip-to-Chip Interface (C2C)

This chapter describes the C2C interconnection of the device.

Topic	Page
14.1 C2C Overview	2912
14.2 C2C Integration	2914
14.3 C2C Power, Reset, and Clock Management	2915
14.4 C2C L3 Interconnect	2940
14.5 C2C SSCM	2945
14.6 Intersystem Communication Register Module	2947
14.7 C2C Register Manual	2955

14.1 C2C Overview

The chip-to-chip (C2C) is a serial, low-latency, peer-to-peer communication protocol that enables the extension of an internal protocol bus to one physical device over a printed circuit board (PCB). The C2C accomplishes this function by serializing local bus transactions in one device. The serialized transactions are transferred between devices through C2C ports, and the remote bus transactions are deserialized.

The C2C includes three main functional submodules:

- The Arteris® interconnect (NoC_C2C_Device), including the interface ports and the C2C port
- The physical interface (PHY_C2C_Device)
- The subsystem control module (SSCM), which supports the clock division during operating performance point (OPP) changes, wake-up and sleep sequences, and sideband signal protocol encapsulation

Figure 14-1 shows an example of the C2C implementation mirror mode.

Figure 14-1. C2C Implementation Mirror Mode Example

c2c-001

The C2C includes the following general features:

- Low-pin-count interface
- Scalability up to 16 inputs/16 outputs (The device supports up to 8 inputs/16 outputs or 16 inputs/8 outputs only.)
- No mandatory 3-state signals
- All signals driven using source synchronous clocking (two dual data rate [DDR] clock signals per direction for TX and RX paths)
- Supports two PHY voltages: 1.2 and 1.8 V
- Supports symmetric (peer-to-peer) and asymmetric (host/peripheral) communication operations
- Protocol support of in-band flow control
- No extra pins needed
- All request packets, response packets, and flow control information multiplexed and sent across the same physical pins
- Supports multiple outstanding transaction reads, writes, and interrupts
- Supports mirror mode to enable self-test with identical device

- Provides signals for system power management

14.2 C2C Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Table 14-1 through Table 14-3 summarize the integration of the module in the device.

Table 14-1. Integration Attributes

Module Instance	Attributes
	Power Domain
C2C	PD_CORE

Table 14-2. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
C2C	C2C_L3_ICLK	C2C_L3_ICLK	PRCM	L3 interconnect clock enable
C2C	C2C_L3X2_ICLK	C2C_L3X2_ICLK	PRCM	Functional clock
Resets				
C2C	C2C_RST	CORE_RST	PRCM	Global warm

Table 14-3. Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
C2C	C2C_SSCM_IRQ0	MA_IRQ_27	Cortex™-A9 INTC	Interrupt request to the Cortex-A9 interrupt controller (INTC)
	C2C_SSCM_IRQ1	MA_IRQ_88	Cortex-A9 INTC	Interrupt request to the Cortex-A9 INTC
	C2C_SSCM_IRQ0	MM_IRQ_46	Cortex™-M3 INTC	Interrupt request to the Cortex-M3 INTC
	C2C_SSCM_IRQ1	MM_IRQ_47	Cortex-M3 INTC	Interrupt request to the Cortex-M3 INTC
	C2C_SSCM_IRQ0	D_IRQ_85	DSP INTC	Interrupt request to the digital signal processor (DSP) INTC
	C2C_SSCM_IRQ1	D_IRQ_86	DSP INTC	Interrupt request to the DSP INTC
DMA Requests				
C2C	C2C_SSCM_GPO_0	S_DMA_20	sDMA	Destination is system DMA (sDMA)
	C2C_SSCM_GPO_1	S_DMA_21	sDMA	Destination is sDMA
	C2C_SSCM_GPO_2	S_DMA_67	sDMA	Destination is sDMA
	C2C_SSCM_GPO_3	S_DMA_68	sDMA	Destination is sDMA

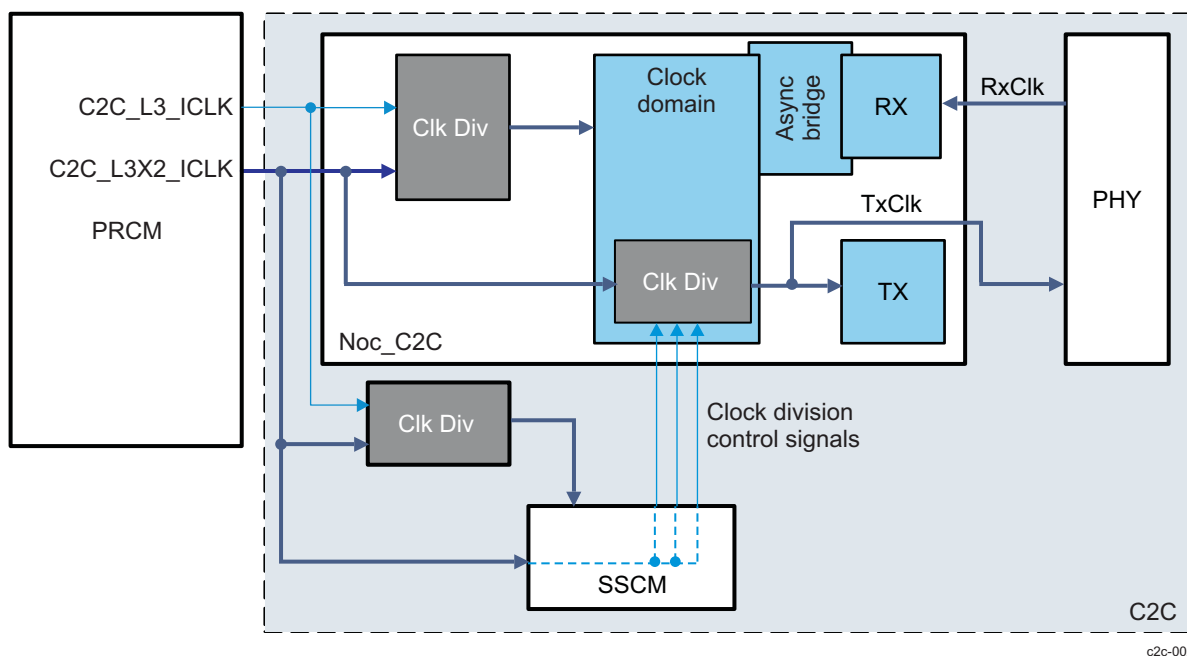

14.3 C2C Power, Reset, and Clock Management

14.3.1 PRCM Overview

The power, reset, and clock management (PRCM) module provides device-level clock, reset, and power control for other modules, as well as clock and reset signals to the C2C.

Figure 14-2 shows the C2C mode-specific overview of the PRCM.

Figure 14-2. PRCM Overview

c2c-002

14.3.2 Reset Manager Functional Description

14.3.2.1 Reset Sources

This section describes the reset sources triggering the reset managers in the power and reset manager (PRM).

14.3.2.1.1 Global Reset Sources

Table 14-4 lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the reset triggering bit is identified.

Table 14-4. Global Reset Sources

Type	Name	Source/Control	Description
Hardware	C2C_WARM_RST	C2C module	Global hardware warm reset

14.3.2.2 Reset Domains

A power domain can receive power-on reset (PWRON_RST) and/or normal reset (RST) signals. These signals reset nonretention logic and behave as follows:

- RST and PWRON_RST are asserted on any global or local cold reset.
- Only RST is asserted on any global or local warm reset.

A power domain can receive two additional retention logic reset signals: power-on retention reset (PWRON_RET_RST) and/or retention reset (RET_RST). These signals behave as follows:

- RET_RST and PWRON_RET_RST are asserted on any global cold reset or wakeup from OFF state to ON-ACTIVE state.
- Only RET_RST is asserted on any global warm reset.
- These signals are not asserted on wakeup from RETENTION state.

This section presents the trigger sources and attributes for all reset domains of the device. See [Section 14.3.2.1, Reset Sources](#), for an explanation of each reset trigger source for the device.

[Table 14-5](#) identifies the associated power and reset domains for each module.

Table 14-5. C2C Power and Reset Domain Association

Module	Power Domain	Reset Domains
C2C	PD_CORE	CORE_RET_RST, CORE_RST
C2C_FW	PD_CORE	CORE_PWRON_RET_RST, CORE_RST

[Table 14-6](#) lists the reset sources that trigger the reset domains of the device.

14.3.3 Clock Manager Functional Description

14.3.3.1 CD_C2C Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits, and their dependencies on other device clock domains.

14.3.3.1.1 Overview

Figure 14-3 shows an overview of the clock domain.

Figure 14-3. CD_C2C Overview

14.3.3.1.2 Clock Domain Modes

Table 14-7 lists the clock domain modes supported by the clock domain.

Table 14-7. CD_C2C Clock Domain Modes

NO_SLEEP	SW_SLEEP	SW_WKUP	HW_AUTO
Available	Not available	Available	Available

Table 14-8 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 14-8. CD_C2C Control and Status Parameters

Parameter Name	Control/Status Bit Field
C2C_L3_ICLK clock status	CM_C2C_CLKSTCTRL[8] CLKACTIVITY_L3_C2C_ICLK
C2C_L4_ICLK clock status	CM_C2C_CLKSTCTRL[9] CLKACTIVITY_L4_C2C_ICLK
Clock domain state transition control	CM_C2C_CLKSTCTRL[1:0] CLKTRCTRL

14.3.3.1.3 Clock Domain Dependency

CD_C2C has no module wake-up dependency on any other device clock domains.

14.3.3.1.3.1 Static Dependency

Table 14-9 lists the static dependency of the clock domain on other device clock domains.

Table 14-9. CD_C2C Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_ABE	Disabled	CM_C2C_STATICDEP[3] ABE_STATDEP	Read/write
CD_IVAHD	Disabled	CM_C2C_STATICDEP[2] IVAHD_STATDEP	Read/write
CD_L3_1	Disabled	CM_C2C_STATICDEP[5] L3_1_STATDEP	Read/write
CD_L3_2	Disabled	CM_C2C_STATICDEP[6] L3_2_STATDEP	Read/write
CD_L3_INIT	Disabled	CM_C2C_STATICDEP[7] L3INIT_STATDEP	Read/write
CD_L4_CFG	Disabled	CM_C2C_STATICDEP[12] L4CFG_STATDEP	Read/write
CD_L4_PER	Disabled	CM_C2C_STATICDEP[13] L4PER_STATDEP	Read/write
CD_EMIF	Enabled	CM_C2C_STATICDEP[4] MEMIF_STATDEP	Read/write

14.3.3.1.3.2 Dynamic Dependency

Table 14-10 lists the dynamic dependency of the clock domain on other device clock domains.

Table 14-10. CD_C2C Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_L3_2	Always enabled	CM_C2C_DYNAMICDEP[6] L3_2_DYNDEP	Read only
CD_EMIF	Always enabled	CM_C2C_DYNAMICDEP[4] MEMIF_DYNDEP	Read only

14.3.3.1.4 Clock Domain Module Attributes

Table 14-11 lists the clocks received by each module of the clock domain and their role (that is, as a functional or interface clock).

Table 14-11. CD_C2C Module Clocks Association

Module	Clock	Clock Type
C2C	C2C_L3_ICLK	Interface
C2C_FW	C2C_L3_ICLK	Interface
	C2C_L4_ICLK	Interface

Table 14-12 lists the supported wake-up request generation capability for each module of the clock domain.

Table 14-12. CD_C2C Module Wake-Up Request

Module	Wake-Up Feature
C2C	Master wake-up request
C2C_FW	None

Table 14-13 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 14-13. CD_C2C Module Clock Management Modes and Control

Module	Clock Mgmt. Protocol	Status Bit Field	Role
C2C	Master/slave	CM_C2C_C2C_CLKCTRL[18] STBYST	Standby status
		CM_C2C_C2C_CLKCTRL[17:16] IDLEST	Idle status
C2C_FW	Slave	CM_C2C_C2C_FW_CLKCTRL [17:16] IDLEST	Idle status

Table 14-14 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 14-14. CD_C2C Modules Slave Clock Management Modes and Control

Module	Disabled	Auto	Enabled	Control Bit Field	Access Type
C2C	N/A	Available	N/A	CM_C2C_C2C_CLKCTRL[1:0] MODULEMODE	Read only
C2C_FW	N/A	Available	N/A	CM_C2C_C2C_FW_CLKCTRL[1:0] MODULEMODE	Read only

14.3.3.2 CD_CORTEXA9 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits, and their dependencies on other device clock domains.

14.3.3.2.1 Clock Domain Dependency

CD_CORTEXA9 has no module wake-up dependency on any other device clock domain.

14.3.3.2.1.1 Static Dependency

Table 14-15 lists the static dependency of the clock domain on other device clock domains.

Table 14-15. CD_CORTEXA9 Static Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_C2C	Always disabled	CM_MPU_STATICDEP[18] C2C_STATDEP	Read only

14.3.3.3 CD_L4_CFG Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits, and their dependencies on other device clock domains.

14.3.3.3.1 Clock Domain Dependency

CD_L4_CFG has no static or module wake-up dependency on any other device clock domain.

14.3.3.3.1.1 Dynamic Dependency

Table 14-16 lists the dynamic dependency of the clock domain on other device clock domains.

Table 14-16. CD_L4_CFG Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_C2C	Always enabled	CM_L4CFG_DYNAMICDEP[18] C2C_DYNDEP	Read only

14.3.3.4 CD_L3_2 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits, and their dependencies on other device clock domains.

14.3.3.4.1 Clock Domain Dependency

CD_L3_2 has no static or module wake-up dependency on any other device clock domain.

14.3.3.4.1.1 Dynamic Dependency

Table 14-17 identifies the dynamic dependency of the clock domain on other device clock domains.

Table 14-17. CD_L3_2 Dynamic Dependency Association Parameters

Clock Domain Name	Default Setting	Control Bit Field	Access Type
CD_C2C	Always enabled	CM_L3_2_DYNAMICDEP[18] C2C_DYNDEP	Read only

14.3.4 Power Management Functional Description

The section highlights the functional concepts of power-domain-level power management in the device.

The PD_CORE power domain supports the DPS with switching times of less than 5 μ s.

14.3.4.1 PD_CORE Description

PD_CORE contains the following clock domains:

- CD_C2C
- CD_DMA
- CD_CORTEXM3
- CD_EMIF
- CD_L3_1
- CD_L3_2
- CD_L3_INSTR
- CD_L4_CFG

Table 14-18 lists the logic retention capability for each module of the power domain.

Table 14-18. PD_CORE C2C Power Attributes

Module	Logic Retention	DFF Context Status	RFF Context Status
C2C	Partial	RM_C2C_C2C_CONTEXT[0] LOSTCONTEXT_DFF	RM_C2C_C2C_CONTEXT[1] LOSTCONTEXT_RFF
C2C_FW	Partial	RM_C2C_C2C_FW_CONTEXT[0] LOSTCONTEXT_DFF	RM_C2C_C2C_FW_CONTEXT[1] LOSTCONTEXT_RFF

14.3.5 PRCM Register Manual

14.3.5.1 PRM Instance Summary

Table 14-19 lists the PRCM registers and their addresses and sizes.

Table 14-19. PRM Instance Summary

Module Name	L4 Base Address	Size

14.3.5.3.2 CORE_CM2 Register Description

[Table 14-26](#) through [Table 14-36](#) describe the individual CORE_CM2 registers in detail.

Table 14-26. CM_C2C_CLKSTCTRL

Address Offset	0x0000 0500	Instance	CORE_CM2
Physical Address	See Table 14-25 .		
Description	This register enables the domain power state transition. It controls the hardware-supervised domain power state transition between On-Active and On-Inactive states. It also holds 1 status bit per clock input of the domain.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
RESERVED																CCLKACTIVITY_L3X2_C2C_ICLK						CLKACTIVITY_L4_C2C_ICLK		CLKACTIVITY_L3_C2C_ICLK		RESERVED							CLKTRCTRL	

Bits	Field Name	Description	Type	Reset
31:11	RESERVED		R	0x000000
10	CCLKACTIVITY_L3X2_C2C_ICLK	This field indicates the state of the L3X2_C2C_ICLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated. Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing.	R	0
9	CLKACTIVITY_L4_C2C_ICLK	This field indicates the state of the L4_C2C_ICLK clock in the domain. [warm reset insensitive] Read 0x0: On-Inactive is definitely gated. Read 0x1: On-Inactive is running or gating/ungating transition is ongoing.	R	0
8	CLKACTIVITY_L3_C2C_ICLK	This field indicates the state of the L3_C2C_ICLK clock in the domain. [warm reset insensitive] Read 0x0: On-Inactive is definitely gated. Read 0x1: On-Inactive is running or gating/ungating transition is ongoing.	R	0
7:2	RESERVED		R	0x00
1:0	CLKTRCTRL	Controls the clock state transition of the C2C clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may occur. Read 0x1: Reserved 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transitions are based upon hardware conditions.	RW	0x3

14.3.5.5.2 SCRM Register Description

Table 14-40 through Table 14-50 describe the individual SCRM registers in detail.

Table 14-40. C2CCLKM

Address Offset	0x0000 011C		
Physical Address	0x4A30 A11C	Instance	SCRM
Description	This register controls the clocks of the external C2C interface.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SYSCLK		CLK_32KHZ													

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Reads return 0.	R	0x0000 0000
1	SYSCLK	This bit allows to enable and disable the system clock version of the external C2C interface. 0x0: The system clock version for the external C2C interface is disabled. 0x1: The system clock version for the external C2C interface is enabled.	RW	0
0	CLK_32KHZ	This bit allows to enable and disable the 32-kHz clock version of the external C2C interface. 0x0: The 32-kHz clock version for the external C2C interface is disabled. 0x1: The 32-kHz clock version for the external C2C interface is enabled.	RW	0

Table 14-42. C2CCLKREQ

Address Offset	0x0000 0234		
Physical Address	0x4A30 A234	Instance	SCRM
Description	This register holds qualifiers for the external C2C interface clock request.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																ACCURACY		POLARITY													

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Reads return 0.	R	0x0000 0000
1	ACCURACY	This bit qualifies the external C2C interface clock request as an accurate clock request. 0x0: An active external C2C interface clock request does not generate an accurate clock request. 0x1: An active external C2C interface clock request generates an accurate clock request.	RW	0
0	POLARITY	This bit defines the active level of the external C2C interface clock request. 0x0: The external C2C interface clock request is active low. 0x1: The external C2C interface clock request is active high.	RW	1

14.4 C2C L3 Interconnect

NOTE: The L3 interconnect is an instantiation of the Arteris interconnect from Arteris, Inc.

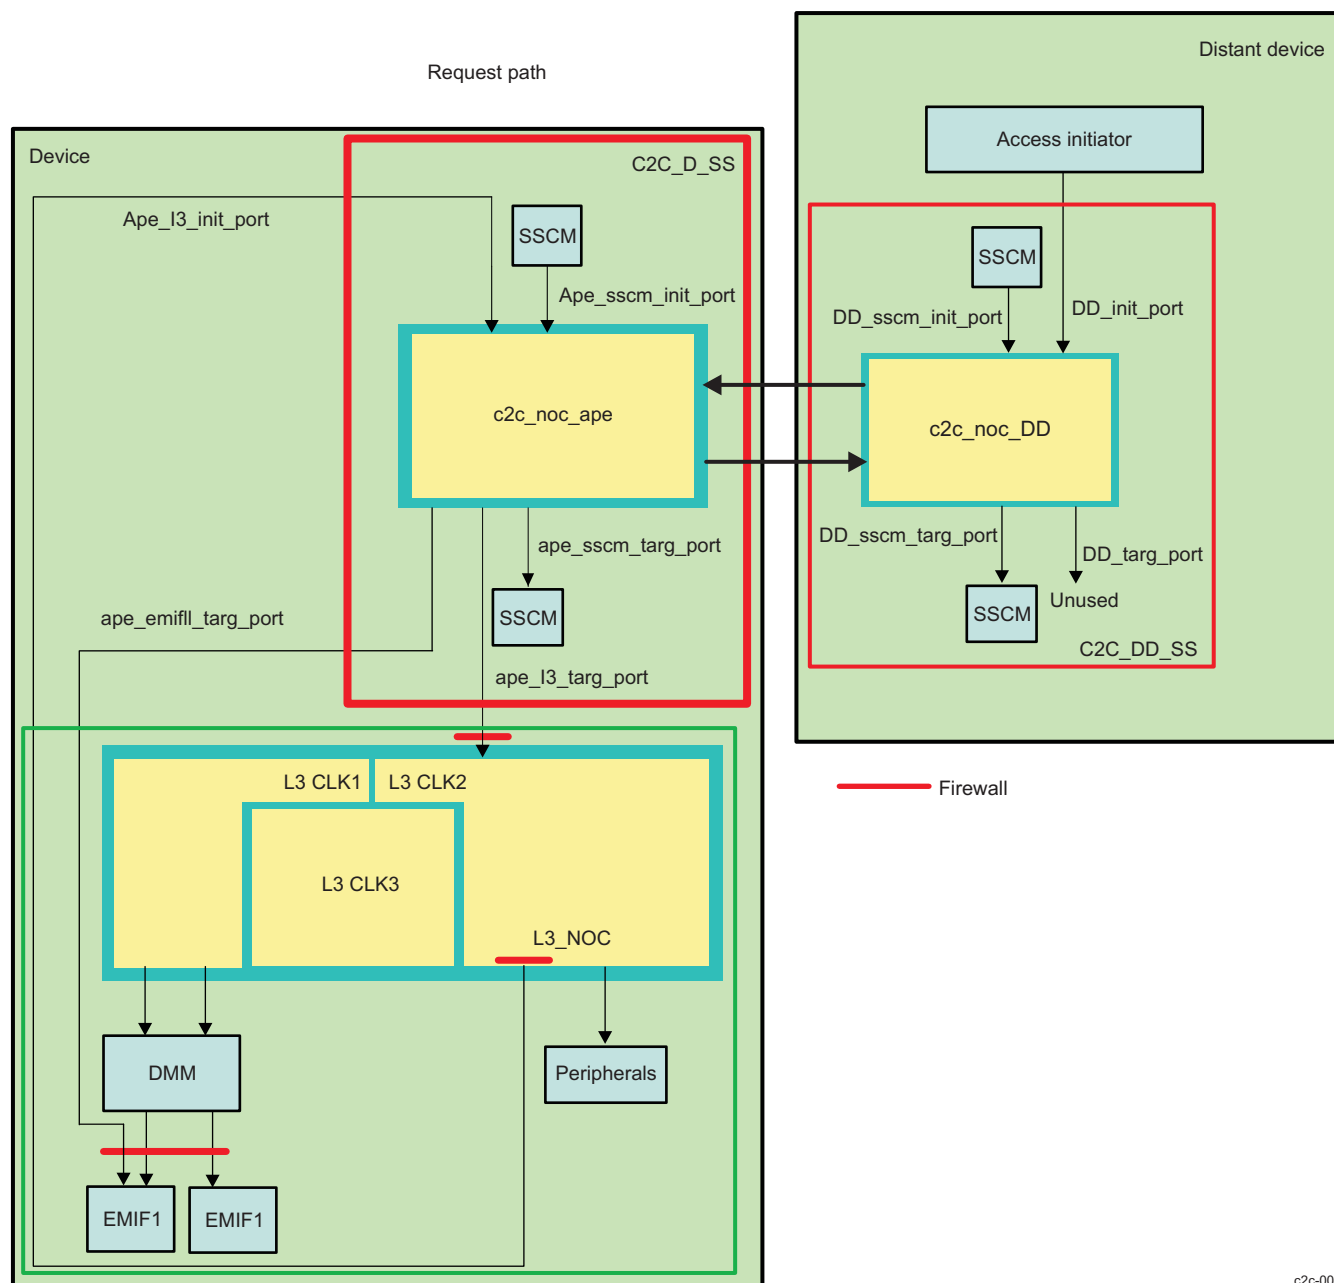

This document contains materials that are ©2003–2009 Arteris, Inc., and that constitute proprietary information of Arteris, Inc.

All materials and trademarks are used under license from Arteris, Inc. For additional information, see the Arteris reference manuals, or contact Arteris, Inc.

NoC is an abbreviation for network on chip.

14.4.1 C2C Interconnect Overview

[Figure 14-4](#) shows the L3 interconnect interface.

Figure 14-4. C2C L3 Interface

c2c-004

The C2C L3 interface includes the following main features:

- Network interface units (NIUs): Master NIUs for the initiator agents (IAs) and slave NIUs for the target agents (TAs)
- A partially depleted crossbar exchange network
- A special internal slave NIU to access L3 interconnect configuration registers
- True little-endian platform
- Transaction errors tracking and logging registers
- Provides all signaling support for the chip-level, power-management infrastructure

14.4.2 C2C Interconnect Integration

14.4.2.1 Clocking, Reset, and Power-Management Scheme

14.4.2.1.1 Clocks

Table 14-52 lists the C2C L3 interconnect clocks. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 14-52. Clocks

Module	Type	Name	Source	Description
C2C L3	Interface	C2C_L3_ICLK	PRCM	Interface/functional clock for the C2C

14.4.2.1.2 Resets

Table 14-53 lists the C2C L3 interconnect resets. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 14-53. Resets

Module	Name	Source	Description
C2C L3	CORE_RST	PRCM	Global warm reset

14.4.2.1.3 Power Management

The L3 interconnect ports belong to the CORE power domain. As part of the system-wide power-management scheme, the L3 ports go into IDLE state after receiving a request from the PRCM module and after all commands are serviced. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

14.4.3 C2C Interconnect Functional Description

14.4.3.1 Slave NIU Configuration

All external subsystem master NIUs can initiate transactions to the L3 applicative slave NIUs listed in [Table 14-54](#) through the C2C port link, as shown in [Table 14-54](#).

Table 14-54. C2C Connectivity

Master NIUs	Slave NIUs				
	APE_L3_SN	APE_emifll_SN	APE_SSCM	DD_L3_SN	DD_SSCM
APE_L3_MN			0	0 ⁽¹⁾	0 ⁽²⁾
APE_SSCM_MN					0
DD_SSCM_MN			0		
DD_L3_MN	0	0	0 ⁽²⁾		0

⁽¹⁾ This connection must be assessed according to system requirements on a case-by-case basis.

⁽²⁾ These connections are present only for debugging purposes.

[Table 14-55](#) lists the mapping of the C2C required information.

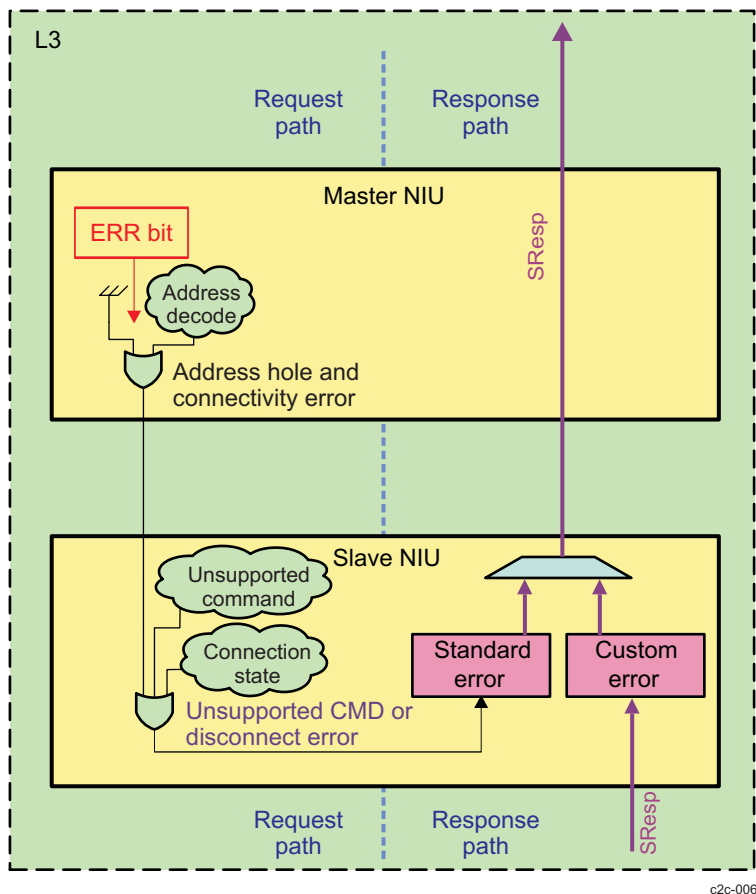

Table 14-55. C2C ReqInfo Mapping

	ReqInfo Name	MReqDebug	MReqType	MReqSupervisor
MNs	APE_L3	x	0	x
	APE_SSCM			
	DD_L3	x	0	x
SNs	APE_L3	x	0	x
	APE_EMIF1	x	0	x
	APE_SSCM			
	DD_SSCM			
	DD_MNs	x	0	x

14.4.3.2 Global Error Routing Scheme

Error logging is not enabled on the C2C because it is already enabled in the L3 interconnect. The C2C L3 only reports in-band errors. For more information about L3 interconnect error logging, see [Section 13.2, L3 Interconnect](#).

[Figure 14-5](#) shows the C2C global error routing scheme.

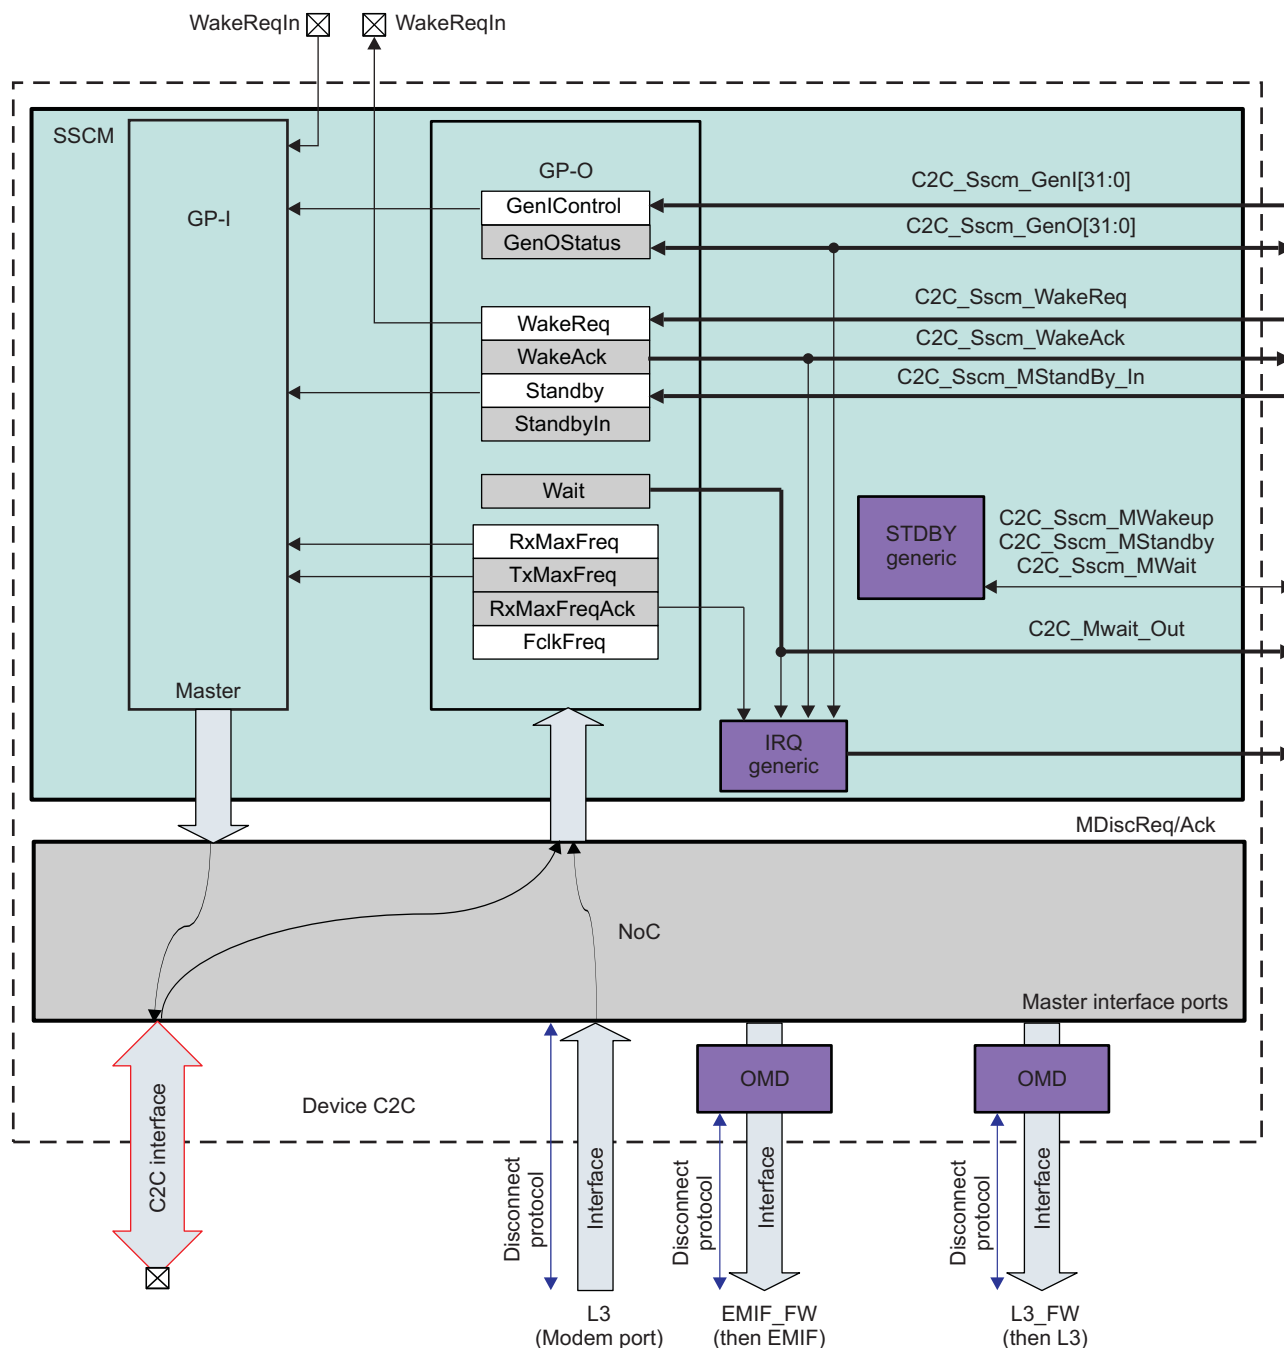

Figure 14-5. C2C Global Error Routing Scheme

14.5 C2C SSCM

14.5.1 SSCM Overview

The SSCM supports clock division during OPP changes, the wake-up and sleep sequences, and interrupts signaling. Figure 14-7 shows the C2C SSCM block diagram.

Figure 14-6. C2C SSCM Block Diagram

c2c-003

The C2C SSCM supports:

- Different handshakes for local and distant OPP changes
- Sleep and wake-up sequences initiated locally or from a remote side

- TX clock automatic division
- Transport of general-purpose signals to and from distant C2C
- GPI and GPO submodules

14.5.2 SSCM Interrupts

14.5.2.1 SSCM GPI Interrupt Mapping

Table 14-56 lists the SSCM GPI interrupt mapping.

Table 14-56. SSCM GPI Interrupt Mapping

C2C_SSCM_GPI	Source	Description
C2C_SSCM_GPI[0]	SYS.IRQ1n	External interrupt
C2C_SSCM_GPI[1]	MAIL_U3_C2C_IRQ	Device to DD mailbox interrupt
C2C_SSCM_GPI[2]	MODEM_ICR_IRQ	Distant (Modem) ICR Interrupt
C2C_SSCM_GPI[3]	UART1_IRQ	UART module 1
C2C_SSCM_GPI[4]	UART2_IRQ	UART module 2
C2C_SSCM_GPI[5]	UART3_IRQ	UART module 3
C2C_SSCM_GPI[6]	GPT6_IRQ	General-purpose timer 6

C2C_SSCM_GPI[14]	HS_USB_MC_NINT	Module HS USB OTG
C2C_SSCM_GPI[15]	HS_USB_DMA_NINT	Module HS USB OTG DMA controller interrupt
C2C_SSCM_GPI[16]	FSUSB_IRQ	FS USB-HOST controller interrupt
C2C_SSCM_GPI[17]	FSUSB_SMI_IRQ	FS USB-HOST controller SMI
C2C_SSCM_GPI[18]	L3_APP_IRQ	Application errors on L3
C2C_SSCM_GPI[19]	ONCHI_IRQ	HSUSB MP host interrupt
C2C_SSCM_GPI[20]	EHCI_IRQ	HSUSB MP host interrupt
C2C_SSCM_GPI[21]	TLL_IRQ	TLL interrupt
C2C_SSCM_GPI[22]	SYS.IRQ2n	External interrupt
C2C_SSCM_GPI[23:29]	Reserved	Reserved
C2C_SSCM_GPI[30]	Modem_shutdown_irqModem_wake_irq	PRCM Modem_shutdown_irq
C2C_SSCM_GPI[31]	Modem_wake_irq	PRCM Modem_wake_irq

14.5.3 SSCM GPO

The interrupts described in [Section 14.1, C2C Overview](#), are active in GPO mode.

14.6 Intersystem Communication Register Module

14.6.1 intersystem Communication Register Overview

The intersystem communication register (ICR) module synchronizes microprocessor unit (MPU) and modem activity, relying on flag mechanisms that are shared by both systems. Basically, the MPU sets a flag that is reset by the modem and vice versa. For a given direction, all flags are set by the source subsystem and are reset by the destination subsystem when it wants to. Each subsystem can read flags without resetting them. To avoid continuous polling on the ICRs, each subsystem can receive an interrupt when an operation that is related to it (set or reset) completes.

14.6.2 ICR Functional Description

The ICR is used when the device is connected to an external initiator device connected on the C2C port. Otherwise, the ICR is not used. The MPU and the external systems communicate with the help of two ICRs. One ICR (**G_ICR**) is used by the external system to inform the device MPU subsystem of an event and to send commands to the MPU-S. In the same way, the other ICR (**M_ICR**) is used by the device MPU subsystem to inform the external system of an event and to send commands to the MPU subsystem. The bits definition of the **G_ICR** and **M_ICR** registers are defined by software.

Figure 14-7. ICR Block Diagram

c2c-005

14.6.2.1 ICR Clocking Scheme

The ICR function operates from the L4-core interface clock.

14.6.2.2 Flag Management

Flags are used to notify the other subsystem of an event. Software determines the meaning of each flag. The following communication sequence from the MPU-S to the modem-S is typical:

- The MPU-S writes one or more flags in the **M_ICR** register.
- An interrupt is sent to the modem-S (if enabled).
- The modem-S reads the **M_ICR** register to check which flags are set.
- The modem-S resets one or more flags in the **M_ICR** register.
- An interrupt is sent to the MPU-S (if enabled).
- The MPU-S reads the **M_ICR** register to check which flags are reset.

14.6.2.3 Setting and Resetting a Flag

To set a flag, the MPU-S must set the desired bit of the [M_ICR](#) register to 1. Setting a bit of [M_ICR](#) to 0 does not change its content (that is, if previous value was 1, bit value remains 1 after the write access, [modem-S does the same thing with [G_ICR](#) register]).

To reset a flag, the MPU-S must set the desired bit of the [G_ICR](#) register to 1 (that is, if previous value of the bit was 1, then it becomes 0 else it remains 0, [modem-S does the same thing with [M_ICR](#) register]).

14.6.2.4 Interrupt Management

Interrupt behavior is the same on both sides (MPU and modem).

Two kinds of events can generate an interrupt to the MPU:

- The modem sets a flag in [G_ICR](#) register.
- The modem resets a flag in [M_ICR](#) register.

Interrupt generation is controlled by the [M_CTL](#) register.

Interrupt generation mechanism to the modem is exactly the same as on the MPU side:

- The MPU sets a flag in the [M_ICR](#) register.
- The MPU resets a flag in the [G_ICR](#) register.

Interrupt generation is controlled by the [G_CTL](#) register. To acknowledge an interrupt, the MPU must clear the [M_IRQ_STATUS](#) register by setting to 1 the bits that caused the interrupt. Acknowledgment on the modem side follows the same procedure with the [G_IRQ_STATUS](#) register.

14.6.3 ICR Register Manual

14.6.3.1 ICR Instance Summary

Table 14-57. C2C Instance Summary

Module Name	Module Base Address	Size

31	GENO_IRQ_31	Reading 1 indicates C2c_Sscm_GENO (31) signal and GENO_31 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
30	GENO_IRQ_30	Reading 1 indicates C2c_Sscm_GENO (30) signal and GENO_30 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
29	GENO_IRQ_29	Reading 1 indicates C2c_Sscm_GENO (29) signal and GENO_29 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
28	GENO_IRQ_28	Reading 1 indicates C2c_Sscm_GENO (28) signal and GENO_28 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
27	GENO_IRQ_27	Reading 1 indicates C2c_Sscm_GENO (27) signal and GENO_27 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
26	GENO_IRQ_26	Reading 1 indicates C2c_Sscm_GENO (26) signal and GENO_26 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
25	GENO_IRQ_25	Reading 1 indicates C2c_Sscm_GENO (25) signal and GENO_25 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
24	GENO_IRQ_24	Reading 1 indicates C2c_Sscm_GENO (24) signal and GENO_24 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0

Bits	Field Name	Description	Type	Reset
23	GENO_IRQ_23	Reading 1 indicates C2c_Sscm_GENO (23) signal and GENO_23 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
22	GENO_IRQ_22	Reading 1 indicates C2c_Sscm_GENO (22) signal and GENO_22 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
21	GENO_IRQ_21	Reading 1 indicates C2c_Sscm_GENO (21) signal and GENO_21 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
20	GENO_IRQ_20	Reading 1 indicates C2c_Sscm_GENO (20) signal and GENO_20 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
19	GENO_IRQ_19	Reading 1 indicates C2c_Sscm_GENO (19) signal and GENO_19 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
18	GENO_IRQ_18	Reading 1 indicates C2c_Sscm_GENO (18) signal and GENO_18 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
17	GENO_IRQ_17	Reading 1 indicates C2c_Sscm_GENO (17) signal and GENO_17 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
16	GENO_IRQ_16	Reading 1 indicates C2c_Sscm_GENO (16) signal and GENO_16 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
15	GENO_IRQ_15	Reading 1 indicates C2c_Sscm_GENO (15) signal and GENO_15 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
14	GENO_IRQ_14	Reading 1 indicates C2c_Sscm_GENO (14) signal and GENO_14 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
13	GENO_IRQ_13	Reading 1 indicates C2c_Sscm_GENO (13) signal and GENO_13 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0

Bits	Field Name	Description	Type	Reset
12	GENO_IRQ_12	Reading 1 indicates C2c_Sscm_GENO (12) signal and GENO_12 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
11	GENO_IRQ_11	Reading 1 indicates C2c_Sscm_GENO (11) signal and GENO_11 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
10	GENO_IRQ_10	Reading 1 indicates C2c_Sscm_GENO (10) signal and GENO_10 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
9	GENO_IRQ_9	Reading 1 indicates C2c_Sscm_GENO (9) signal and GENO_9 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
8	GENO_IRQ_8	Reading 1 indicates C2c_Sscm_GENO (8) signal and GENO_8 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
7	GENO_IRQ_7	Reading 1 indicates C2c_Sscm_GENO (7) signal and GENO_7 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
6	GENO_IRQ_6	Reading 1 indicates C2c_Sscm_GENO (6) signal and GENO_6 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
5	GENO_IRQ_5	Reading 1 indicates C2c_Sscm_GENO (5) signal and GENO_5 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
4	GENO_IRQ_4	Reading 1 indicates C2c_Sscm_GENO (4) signal and GENO_4 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
3	GENO_IRQ_3	Reading 1 indicates C2c_Sscm_GENO (3) signal and GENO_3 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
2	GENO_IRQ_2	Reading 1 indicates C2c_Sscm_GENO (2) signal and GENO_2 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0

Bits	Field Name	Description	Type	Reset
1	GENO_IRQ_1	Reading 1 indicates C2c_Sscm_GENO (1) signal and GENO_1 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0
0	GENO_IRQ_0	Reading 1 indicates C2c_Sscm_GENO (0) signal and GENO_0 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect.	RW W1toSet	0

Table 14-95. C2C_IRQ_ENABLE_STATUS_1

Address Offset		0x0000 0020	
Physical Address		0x5C000020	Instance C2C
Description			
Type		RW	

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
GENO_IRQ_31	GENO_IRQ_30	GENO_IRQ_29	GENO_IRQ_28	GENO_IRQ_27	GENO_IRQ_26	GENO_IRQ_25	GENO_IRQ_24	GENO_IRQ_23	GENO_IRQ_22	GENO_IRQ_21	GENO_IRQ_20	GENO_IRQ_19	GENO_IRQ_18	GENO_IRQ_17	GENO_IRQ_16	GENO_IRQ_15	GENO_IRQ_14	GENO_IRQ_13	GENO_IRQ_12	GENO_IRQ_11	GENO_IRQ_10	GENO_IRQ_9	GENO_IRQ_8	GENO_IRQ_7	GENO_IRQ_6	GENO_IRQ_5	GENO_IRQ_4	GENO_IRQ_3	GENO_IRQ_2	GENO_IRQ_1	GENO_IRQ_0

Bits	Field Name	Description	Type	Reset
31	GENO_IRQ_31	Reading 1 indicates C2c_Sscm_GENO (31) signal and GENO_31 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
30	GENO_IRQ_30	Reading 1 indicates C2c_Sscm_GENO (30) signal and GENO_30 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
29	GENO_IRQ_29	Reading 1 indicates C2c_Sscm_GENO (29) signal and GENO_29 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
28	GENO_IRQ_28	Reading 1 indicates C2c_Sscm_GENO (28) signal and GENO_28 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
27	GENO_IRQ_27	Reading 1 indicates C2c_Sscm_GENO (27) signal and GENO_27 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
26	GENO_IRQ_26	Reading 1 indicates C2c_Sscm_GENO (26) signal and GENO_26 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
25	GENO_IRQ_25	Reading 1 indicates C2c_Sscm_GENO (25) signal and GENO_25 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
24	GENO_IRQ_24	Reading 1 indicates C2c_Sscm_GENO (24) signal and GENO_24 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
23	GENO_IRQ_23	Reading 1 indicates C2c_Sscm_GENO (23) signal and GENO_23 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
22	GENO_IRQ_22	Reading 1 indicates C2c_Sscm_GENO (22) signal and GENO_22 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
21	GENO_IRQ_21	Reading 1 indicates C2c_Sscm_GENO (21) signal and GENO_21 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
20	GENO_IRQ_20	Reading 1 indicates C2c_Sscm_GENO (20) signal and GENO_20 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
19	GENO_IRQ_19	Reading 1 indicates C2c_Sscm_GENO (19) signal and GENO_19 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
18	GENO_IRQ_18	Reading 1 indicates C2c_Sscm_GENO (18) signal and GENO_18 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
17	GENO_IRQ_17	Reading 1 indicates C2c_Sscm_GENO (17) signal and GENO_17 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
16	GENO_IRQ_16	Reading 1 indicates C2c_Sscm_GENO (16) signal and GENO_16 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
15	GENO_IRQ_15	Reading 1 indicates C2c_Sscm_GENO (15) signal and GENO_15 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
14	GENO_IRQ_14	Reading 1 indicates C2c_Sscm_GENO (14) signal and GENO_14 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
13	GENO_IRQ_13	Reading 1 indicates C2c_Sscm_GENO (13) signal and GENO_13 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
12	GENO_IRQ_12	Reading 1 indicates C2c_Sscm_GENO (12) signal and GENO_12 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
11	GENO_IRQ_11	Reading 1 indicates C2c_Sscm_GENO (11) signal and GENO_11 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
10	GENO_IRQ_10	Reading 1 indicates C2c_Sscm_GENO (10) signal and GENO_10 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0

Bits	Field Name	Description	Type	Reset
9	GENO_IRQ_9	Reading 1 indicates C2c_Sscm_GENO (9) signal and GENO_9 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
8	GENO_IRQ_8	Reading 1 indicates C2c_Sscm_GENO (8) signal and GENO_8 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
7	GENO_IRQ_7	Reading 1 indicates C2c_Sscm_GENO (7) signal and GENO_7 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
6	GENO_IRQ_6	Reading 1 indicates C2c_Sscm_GENO (6) signal and GENO_6 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
5	GENO_IRQ_5	Reading 1 indicates C2c_Sscm_GENO (5) signal and GENO_5 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
4	GENO_IRQ_4	Reading 1 indicates C2c_Sscm_GENO (4) signal and GENO_4 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
3	GENO_IRQ_3	Reading 1 indicates C2c_Sscm_GENO (3) signal and GENO_3 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
2	GENO_IRQ_2	Reading 1 indicates C2c_Sscm_GENO (2) signal and GENO_2 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
1	GENO_IRQ_1	Reading 1 indicates C2c_Sscm_GENO (1) signal and GENO_1 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0
0	GENO_IRQ_0	Reading 1 indicates C2c_Sscm_GENO (0) signal and GENO_0 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect.	RW W1toClr	0

Memory Subsystem

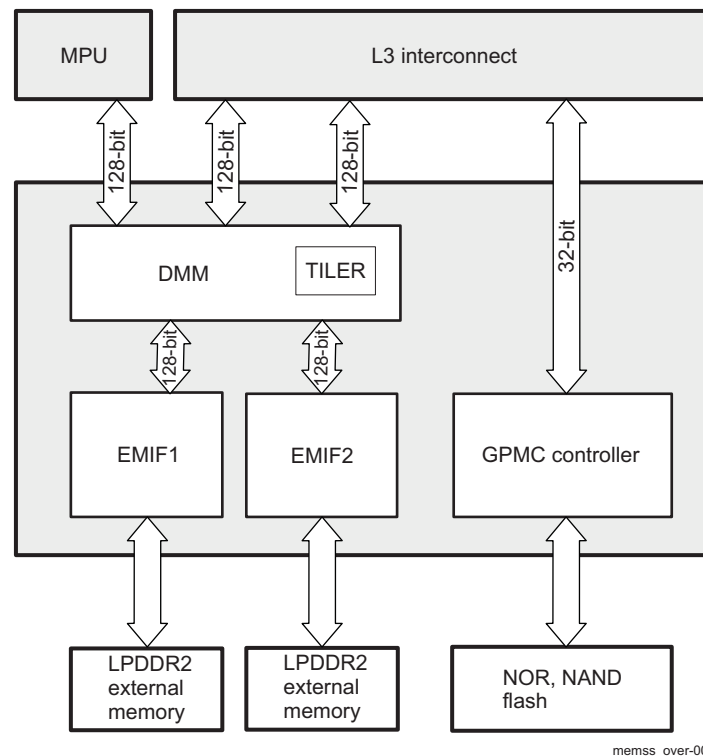

This chapter introduces the memory subsystem of the device.

Topic	Page
15.1 Memory Subsystem Overview	2986
15.2 Dynamic Memory Manager	2991
15.3 EMIF Controller	3071
15.4 General-Purpose Memory Controller	3143
15.5 Error Location Module	3284
15.6 On-Chip Memory (OCM) Subsystem	3311

15.1 Memory Subsystem Overview

Figure 15-1 shows a functional diagram of all memory subsystems in the device.

Figure 15-1. Memory Subsystem Functional Diagram

15.1.1 DMM Overview

The dynamic memory manager (DMM) module is typically located immediately in front of the synchronous dynamic random access memory (SDRAM) memory controller, as shown in Figure 15-1.

In a broad sense, the DMM manages various aspects of memory accesses such as:

- Initiator-indexed priority generation
- Multizone SDRAM memory interleaving configuration
- Block object transfer optimization – tiling
- Centralized low-latency page translation – MMU-like feature

The dynamic qualifier for memory management highlights the software configurability, and hence the runtime nature, of the four aspects of memory management handled by the DMM.

15.1.1.1 DMM Features

From a functional perspective, the role of the DMM is to:

- Add initiator-based priority to any incoming requests
- Perform to/from tiling conversions of tiled requests
- Make on-the-fly basic transforms, such as quadrant rotations and mirroring
- Optionally, provide a low-latency page-based translation to handle memory fragmentation – MMU
- Distribute the traffic on all attached memory controllers according to the interleaving configuration

The DMM main features are:

- Programmable multizone DRAM memory mapping and interleaving configuration
- Programmable initiator-based request priority extension

- Multichannel memory transfer optimization
- Single SDRAM page request generation
- Low-latency interconnect port
- Page-grained address translation to manage memory fragmentation
- Automatic synchronized reloading of the address translation table

15.1.2 TILER Overview

The tiling and isometric lightweight engine for rotation (TILER) is a submodule of DMM (see [Figure 15-1](#)) and is therefore described in [Section 15.2, Dynamic Memory Manager](#).

The TILER is intended to improve bidimensional (tiled) block transfer efficiency. It is, therefore, a module aimed at:

- Primarily, efficient handling of 2-dimension (2D) data mapped in tiles, such as video or graphics macroblocks
- Optionally, managing the memory fragmentation and zero-copy physical frame-buffer swapping through a page-grained translation
- Making isometric (distance preserving) transforms, such as 90-, 180-, or 270-degree rotations, with a horizontal or vertical reflection

The lightweight qualifier of this engine highlights its limited support of isometric transforms, as:

- Rotation performs only basic quadrant rotations by some multiple of 90 degrees.
- Reflection is limited to horizontal and vertical flip.
- Translation is restricted to a 4-KB page granularity.

Written differently, the functionality of the TILER is to map a 2D virtually addressed interconnect request into one or more physically addressed interconnect requests by:

- Transforming the virtual address, data, and byte-enable to match the requested 0-, 90-, 180-, or 270-degree orientation in a tiled 2D addressing space
- Optionally translating the oriented tiled address by a page-specific vector to manage memory fragmentation and physical object aliasing

15.1.2.1 TILER Features

The main features of the TILER are:

- Efficiency improvement of 2D block access on SDRAMs
- Optimized interlaced access on tiled frames
- 2D virtual-to-physical address translation of SDRAM bidimensional objects to handle rotation
- Page-grained address translation to manage memory fragmentation and physical buffer aliasing
- Unlimited number of 2D tiled objects supported in any (0, 90, 180, or 270 degrees) orientation
- Full bandwidth use by minimizing the size of raster-based initiator buffers
- Optimization of multichannel memory transfers
- Interconnect request granularity balance (in X and Y directions)

15.1.3 EMIF Overview

The extended memory interface (EMIF) module is typically located near the DMM module, as shown in [Figure 15-1](#).

The EMIF provides connectivity between the device and LPDDR2-type memory. It manages data bus read/write accesses between external memories, the microprocessor unit (MPU), and the direct memory access (DMA) controller. It acts as the primary interface between SDRAM and all functional blocks, such as the ARM®, IVA-HD, imaging subsystem (ISS), GFX, and DMA controllers.

15.1.3.1 Main Features

The EMIF has the following capabilities:

- Supports JEDEC standard-compliant LPDDR2-SDRAM (S2 and S4) and LPDDR2-NVM devices
- 2-GB SDRAM address range over two chip selects (CSs) (configurable with the DMM; see [Section 15.2, Dynamic Memory Manager](#), for more information)
- Supports two independent CSs, with their corresponding register sets, and independent page tracking
- Both CSs must have the same memory type and size if they are both SDRAM or both nonvolatile memory (NVM). LPDDR2-SDRAM can be used in parallel with LPDDR2-NVM and can have a different size.
- Flexible address muxing scheme which permits choosing different bank-mapping allocation by configuring the bank, column, and row-address decoding ordering
- 16- or 32-bit data path to external SDRAM
- Supports LPDDR2 devices with 1, 2, 4, or 8 internal banks
- Supports the following data bus widths:
 - 128-bit level 3 (L3) interconnect data bus width
 - 16- and 32-bit SDRAM data bus width
- Supports the following CAS latencies: 3, 4, 5, 6, 7, and 8
- Supports 256-, 512-, 1024-, and 2048-word page sizes
- Supports the following burst lengths: 8
- Supports sequential burst type
- SDRAM auto-initialization from reset or configuration change
- Supports bank interleaving across both CSs if same memory type
- Supports self-refresh and precharge power-down modes for low power (per CS, manual entry/exit self-refresh, and deep power-down modes)
- Supports deep power-down mode for low power
- Supports partial array self-refresh and temperature-controlled self-refresh modes for low power. Temperature-controlled self-refresh is supported only for mobile SDRAM having an on-chip temperature sensor.
- Supports prioritized refresh
- Programmable SDRAM refresh rate and backlog counter
- Supports ZQ calibration
- Supports temperature monitoring

15.1.4 GPMC Overview

The general-purpose memory controller (GPMC) is an unified memory controller dedicated to interfacing external memory devices:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (available only in nonmuxed mode) burst NOR flash devices
- NAND flash
- Pseudo-SRAM devices

15.1.4.1 GPMC Features

The GPMC is the external memory controller of the device. The GPMC data access engine provides a flexible programming model for communication with all standard memories. The GPMC supports various accesses:

- Asynchronous read/write access
- Asynchronous read page access (4, 8, and 16 Word16)

- Synchronous read/write access
- Synchronous read/write burst access without wrap capability (4, 8, and 16 Word16)
- Synchronous read/write burst access with wrap capability (4, 8, and 16 Word16)
- Address/data-multiplexed access
- Little- and big-endian access

The GPMC can communicate with a wide range of external devices:

- External asynchronous or synchronous 8-bit wide memory or device (nonburst device)
- External asynchronous or synchronous 16-bit wide memory or device
- External 16-bit nonmultiplexed device with limited address range (2KB)
- External 16-bit address/data-multiplexed NOR flash device
- External 8-bit and 16-bit NAND flash device
- External 16-bit pseudo-SRAM (pSRAM) device

The main features of the GPMC are:

- 8- or 16-bit-wide data path to external memory device
- Supports up to eight CS regions of programmable size and programmable base addresses in a total address space of 1GB
- Supports transactions controlled by a firewall
- On-the-fly error code detection using the Bose-Chaudhuri-Hocquenghem (BCH) ($t = 4, 8, \text{ or } 16$) or Hamming code to improve the reliability of NAND with a minimum effect on software (NAND flash with 512-byte page size or greater)
- Fully pipelined operation for optimal memory bandwidth use
- External device clock provided from the L3 clock divided by 1, 2, 3, or 4
- Supports programmable autoclock gating when no access is detected
- Independent and programmable control signal timing parameters for setup and hold time on a per-chip basis. Parameters are set according to the memory device timing parameters, with a timing granularity of one L3 clock cycle.
- Flexible internal access time control (WAIT state) and flexible handshake mode using external WAIT pin monitoring
- Support bus keeping
- Support bus turnaround
- Prefetch and write posting engine associated with system DMA (sDMA) to achieve full performance from the AND device with minimum effect on NOR/SRAM concurrent access

NOTE: Page mode is available only in nonmultiplexed mode.

15.1.5 ELM Overview

NAND flash memories are dense and nonvolatile, but error-prone. Whenever NAND flash memories are read from, some level of error correction is required. In the case of NAND modules with no internal correction capability, sometimes referred to as bare NAND, the correction process is delegated to the memory controller.

The error location module (ELM) must be used in conjunction with the GPMC. The GPMC probes data read from an external NAND flash and uses them to compute checksum-like information, called syndrome polynomials, on a per-block basis. Each syndrome polynomial gives a status of the read operations for a full block, including 512 bytes of data, parity bits, and an optional spare area data field, with a maximum block size of 1023 bytes. Computation is based on the BCH algorithm. The ELM extracts error addresses from these syndrome polynomials.

Based on the syndrome polynomial value, the ELM can detect errors, compute the number of errors, and give the location of each error bit. The actual data is not required to complete the error correction algorithm. Errors can be reported anywhere in the NAND flash block, including in the parity bits.

The maximum acceptable number of errors that can be corrected depends on a configuration parameter. Error correction levels of 4, 8, and 16 bits are supported. The ELM relies on a static definition of the generator polynomial for each error correction level that corresponds to the generator polynomials defined in the GPMC. A larger number of errors can be detected, but the ELM cannot correct them all. The offending block is then tagged as uncorrectable.

When the error location process completes, an interrupt is triggered to inform a central processing unit (CPU) that its status can be checked. The error locations for the NAND page can be retrieved from the module through register accesses.

15.1.5.1 ELM Features

The ELM features:

- 4, 8, and 16 bits per 512-byte block error location based on BCH algorithm
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation when error location process completes:
 - When the full page has been processed in page mode
 - For each syndrome polynomial in continuous mode

15.1.6 OCM Overview

The on-chip memory (OCM) subsystem consists of the following OCM controllers: one connected to an on-chip ROM (SAR ROM), one connected to an on-chip RAM (SAR RAM), and one connected to an on-chip SRAM (L3 SRAM). Each memory controller has its own dedicated interface to the L3 interconnect.

15.1.6.1 SAR ROM

This on-chip ROM contains 4KB of memory and a linked list of descriptors used by sDMA during the restore context operation (when the device transitions from off to on mode).

The device-embedded SAR ROM has the following characteristics:

- 4-KB ROM
- 32-bit access per cycle
- Support for single- and burst-access transactions

15.1.6.2 SAR RAM

The on-chip SAR RAM contains 8K bytes and is mapped as 4 blocks with irregular region sizes. This memory content is preserved when the device goes into off mode (as long as the wake-up voltage domain remains supplied). It is used as context-saving memory to be written by software so that sDMA restores its saved content when the device transitions from off to on mode.

The device-embedded SAR RAM has the following characteristics:

- Support for single-access transactions
 - Operates at full L4-PER interconnect clock frequency
 - 32-bit access per cycle

15.1.6.3 L3 OCM_RAM

The on-chip L3 OCM_RAM contains 56KB of RAM, and partitioning is defined by the L3 firewall logic. The device-embedded L3 OCM_RAM has the following characteristics:

- Support for single and burst access transactions:
 - Operates at full L3 interconnect clock frequency
 - Fully pipelined, one 32-bit access per cycle
- Restricted access support

15.2 Dynamic Memory Manager

15.2.1 DMM Overview

This section describes the dynamic memory manager (DMM) and its Tiling and Isometric Lightweight Engine for Rotation (TILER) submodule.

The DMM is introduced in *Memory Overview* in [Chapter 15, Memory Subsystem](#).

On a purely functional perspective, the role of the DMM is to:

- Add initiator-based priority to any incoming requests
- Perform to-and-from tiling conversions of "tiled" requests
- Make on-the-fly basic itransforms such as quadrant rotations and mirroring
- Optionally provide a low-latency page-based translation to handle memory fragmentation – MMU
- Distribute the traffic on all attached memory controllers according to the interleaving configuration

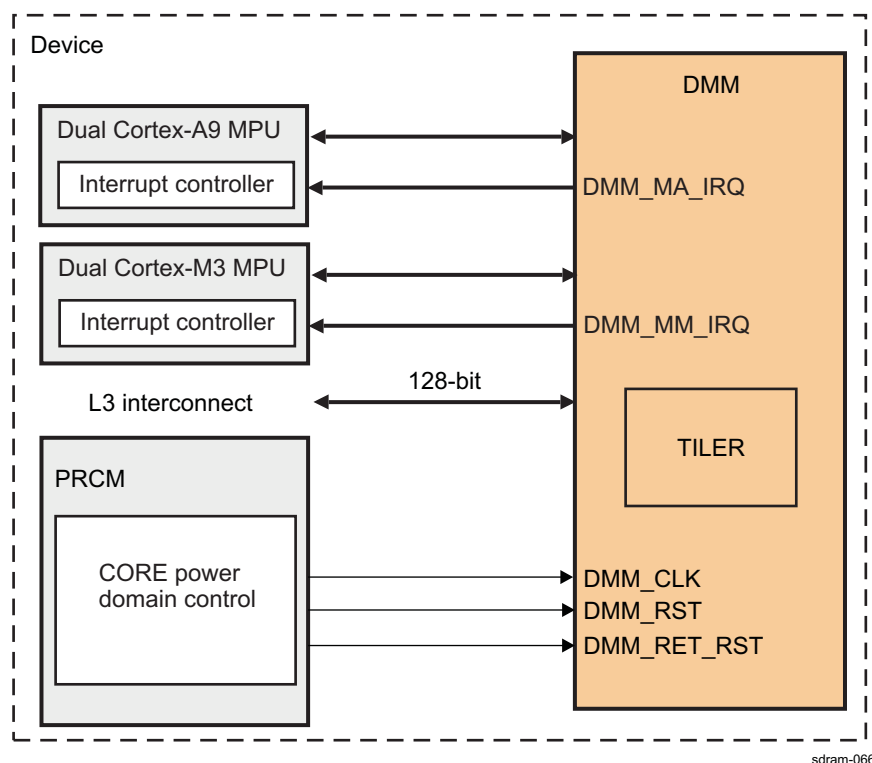

The TILER is also introduced in *Memory Overview* in [Chapter 15, Memory Subsystem](#).

It is a module aimed at:

- Primary handling efficiently 2-dimensional data mapped in tiles, such as video or graphics macroblocks
- Optionally managing the memory fragmentation and zero-copy physical frame buffers swapping through a page-grained translation
- Allowing optimized interlaced accesses on tiled frames
- Making distance-preserving transforms, such as 90°, 180°, or 270° rotations, with either a horizontal or vertical reflection
- Interleaving the memory accesses among the two memory controllers (also named EMIF, see [Section 15.3, EMIF Controller](#), for more information on it)

Figure 15-2 shows DMM and Tiler overview in the device.

Figure 15-2. DMM and Tiler Overview

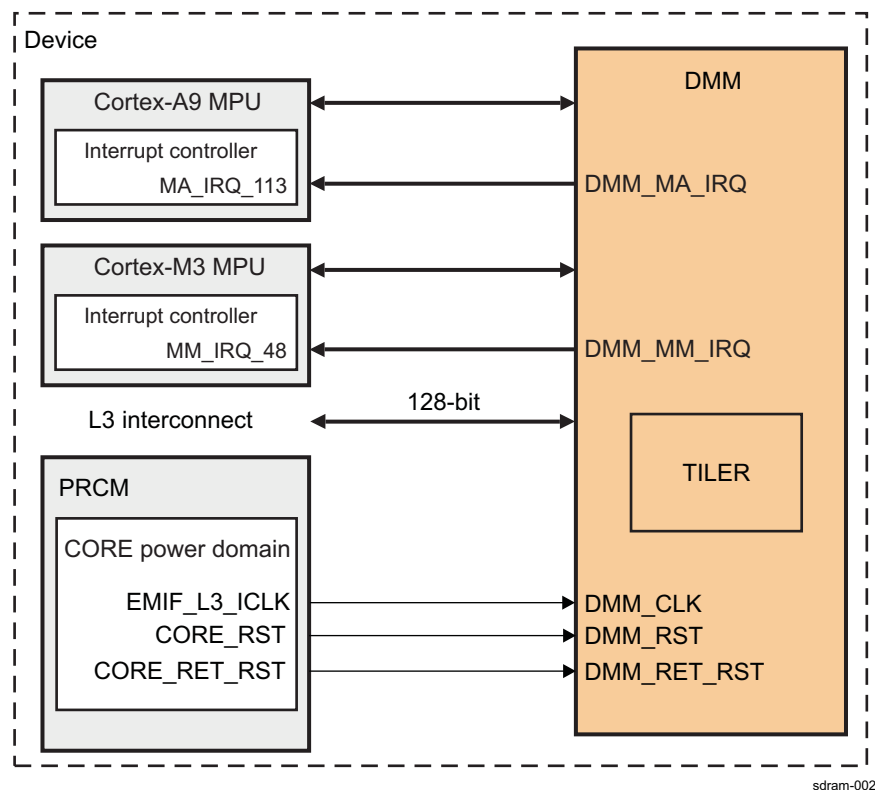

15.2.2 DMM Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

- IDLE hardware handshake (the DMM only supports the smart-idle mode)
- No STANDBY hardware handshake
- No wake-up request
- No system direct memory access (sDMA) requests
- One interrupt line for interrupt request (IRQ)
- One functional clock

Figure 15-3 shows DMM integration.

Figure 15-3. DMM Integration

NOTE: For more information about the IDLE hardware handshake, see [Chapter 3, Power, Reset, and Clock Management](#).

[Table 15-1](#) and [Table 15-3](#) summarize the DMM integration in the device.

Table 15-1. DMM Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-up Capability	Interconnect
DMM	PD_CORE	No	N/A

Table 15-2. DMM Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
DMM	DMM_CLK	EMIF_L3_ICLK	PRCM	DMM interface and functional clock. For information about PRCM clock gating and management, see Chapter 3, Power, Reset, and Clock Management .

15.2.3 DMM Functional Description

15.2.3.1 DMM Block Diagram

[Figure 15-4](#) shows the DMM macro architecture. The DMM consists of six blocks:

- Two Tiling and Isometric Lightweight Engine for Rotation (TILER), having each their own interconnect slave port, for converting requests to-and-fro between the input virtual addressing mode and the output physical tiledaddressing mode. Note that, the tiling conversions of requests, write data and responses is fully performed in the TILER blocks.
- Two Re-Ordering Buffer and Initiator Nodes (ROBIN), having each their own interconnect master port, to initiate requests to the SDRAM controller and allow tiled data, tiled response and split response reconstruction. The ROBIN block is only managing the re-ordering buffer and performing the data re-ordering due to the orientation.
- One Extra Low Latency Access (ELLA), having its own interconnect slave port, for providing lower latency accesses to the memory
- A Physical Address Translator (PAT) for managing the memory fragmentation
- A Priority Extension Generator (PEG) to generate priorities required by the SDRAM controller, note that these priorities are not used in the DMM
- A Local Interconnect and Synchronisation Agent (LISA) to synchronize all DMM subsystems and provide access to their configuration registers

Figure 15-4. DMM Block Diagram

CAUTION

It is the interconnect duty to ensure that virtually-addressed requests only target a TILER port and that only physically-addressed requests target an ELLA port.

15.2.3.2 DMM Clock Configuration

Table 15-5 describes the DMM clocks.

Table 15-5. DMM Clocks

Signal	I/O ⁽¹⁾	Description
DMM_CLK	I	Functional and interface clock

⁽¹⁾ I = Input; O = Output

The DMM is about SDRAM controller management and naturally sits in the MEMIF clock domain among the SDRAM controllers. The DMM is a fully synchronous module, which uses the clock and clock enable signals provided in the MEMIF clock domain for generating its interface and functional clocks.

To configure DMM_CLK control and settings, see Table 15-2.

15.2.3.3 DMM Power Management

DMM power is supplied by the CORE power domain, and DMM power management complies with system power-management guidelines.

Table 15-6 describes power-management features available for the DMM module.

Table 15-6. DMM Local Power Management Features

Feature	Registers	Description
Clock Auto Gating	N/A	Feature not available
Slave Idle Modes	DMM_SYSCONFIG [3:2] SIDLEMODE bit field	Only Smart-idle wakeup mode is available
Clock Activity	N/A	Feature not available
Master Standby Modes	N/A	Feature not available
Global Wake-up Enable	N/A	Feature not available
Wake-up Sources Enable	N/A	Feature not available

Some of the DMM module's registers are impacted by the Save And Restore (SAR) mechanism. For more information about SAR, see [Chapter 3, Power, Reset, and Clock Management](#).

15.2.3.4 DMM Interrupt Requests

Errors in PAT area refill registers are reported through the [DMM_PAT_STATUS_i](#)[15:10] ERROR bit field, as shown in [Table 15-7](#).

Table 15-7. DMM Hardware Status Features

Feature	Type	Register	Description
PAT error flags	Read only	DMM_PAT_STATUS_i [15:10] ERROR (i = 0 to 3)	Unexpected update of the PAT area refill registers

[Table 15-8](#) lists the event flags, and their masks, that can cause module interrupts.

Table 15-8. Events

Interrupt	Event Flag	Event Mask
ERR_LUT_MISS3	DMM_PAT_IRQSTATUS [31] EVENT0 DMM_PAT_IRQSTATUS_RAW [31] EVENT0	DMM_PAT_IRQENABLE_SET [31] EVENT0 DMM_PAT_IRQENABLE_CLR [31] EVENT0

15.2.3.5 DMM

15.2.3.5.1 DMM Concepts

The DMM introduces the concepts of dynamic mapping and DMM atomic units.

15.2.3.5.1.1 Dynamic Mapping

The DMM manages its internal memory space as an ordered set of up to four sections. [Figure 15-5](#) shows DMM sections and memory mapping.

Figure 15-5. DMM Sections and Memory Mapping

In the DMM, a section is:

- A segment of 16 MiB to 2 GiB, which is power-of-two in size and aligned to that size in the system map
- An area with a constant interleaving scheme - constant interleaving granularity on a constant set of SDRAM controller (EMIF) targets
- Given a priority equal to its index - the higher the index, the higher the priority.

NOTE: Whenever a request hits more than one DMM section, it follows the interleaving scheme of the section having the highest index.

The interleaving configuration of the DMM, its section-based dynamic memory mapping, is shown in the right hand side of [Figure 15-5](#). In this example, a request at the system address Addr will follow the interleaving scheme of section 3, although hitting sections 1, 2 and 3. Similarly, the DMM configuration given in this example prevents any request to use the interleaving scheme of section 0, since section 0 is fully masked by section 1 - which has a higher priority.

Each of the four sections is configured through a [DMM_LISA_MAP_i](#) register, where $i = 0$ to 3.

NOTE: The DMM and SDRAM controller registers ([Table 15-88](#) and EMIF registers, see [Section 15.3, EMIF Controller](#)) are actually declared in two extra static DMM sections of the highest priority so that they cannot be masked by any standard programmable DMM section.

NOTE: The DMM atomic size is:

- 1 kiB in non interleaved sections
 - equal to the interleaving granularity (128 bytes, 256 bytes or 512 bytes) in interleaved sections
-

15.2.3.5.1.2 Address Mapping

The address mapping inside the DMM is configurable through up to four sections. A DMM section description fits in a single register ([DMM_LISA_MAP_i](#)). Each section is defined based on:

- Its system address: the base address of the decoding range for the section.
- Its size: the encoding is the number of bits actually used in the upper 8-bits of the incoming system address.
- Its physical address: the base address of the memory range access in the external memory controller.
- Its address space: the address space used on the external (for the DMM) memory controller when hitting this section. See [Section 15.3.4.1.1, L3 Interface](#), for details.
- The target memory controller: a section may hit a single or pair of controllers.
- Its interleaving definition.

The address decoding is priority-based. In case of overlapping sections, only the highest-order one is hit. Register memory spaces have priority over regular memory sections. In case of four sections, the priority order is therefore:

1. Registers
2. DMM_LISA_MAP_3
3. DMM_LISA_MAP_2
4. DMM_LISA_MAP_1
5. DMM_LISA_MAP_0

All register-related addresses are reserved and fixed in the overall address mapping:

- DMM registers: 0x4E00_0000 to 0x4FFF_FFFF
- EMIF1 registers: 0x4C00_0000 to 0x4CFF_FFFF
- EMIF2 registers: 0x4D00_0000 to 0x4DFF_FFFF

There is no overlapping between register sections.

NOTE: Section decoding happens after PAT address translation in the case of TILER. In non-bypass mode, the system address considered for TILER accesses is actually the virtual address computed based on the PAT translation tables.

The [DMM_LISA_LOCK](#) register is used to lock the configuration once set. If written to one, the LOCK bit prevents further writes to all [DMM_LISA_MAP_i](#) registers. The LOCK itself cannot be written back to 0. A reset is required to reprogram the sections.

15.2.3.5.1.3 Address Translation

The physical address translation engine (PAT) of the DMM is composed of a 32-k entry physical address translation vector table and of one or two refill engines. The refill engine is a specialised DMA aimed at refilling the content of the physical address translation table.

The address translation mechanism is only available when the incoming request is hitting a page mode or tiled mode container, that is, when the incoming address is targeting the TILER or its aliased view in the system addressing space. Otherwise the physical address translation logic is bypassed so that the resulting physical address corresponds to the input address.

The PAT is supporting multiple address translation schemes, called views, which can be bound to one or more initiator through a view mapping mechanism.

15.2.3.5.1.3.1 PAT View Mappings

The PAT can have up to 16 groups of initiators sharing a set of 4 PAT views. The connection from an initiator to a PAT view is made through the DMM_PAT_VIEW register. Given that each PAT view index is coded on four bits, the DMM_PAT_VIEW register is a 64-bit register split in two 32-bit registers named [DMM_PAT_VIEW0](#) for the first eight PAT view indexes and [DMM_PAT_VIEW1](#) for the last eight PAT view indexes.

The PAT view index corresponding to the initiator having the value *i* as the four MSB of its L3 ConnID, will be using the view referenced in the entry *i* of the DMM_PAT_VIEW. For instance the initiator 0xC4 will be using the 13th view index of the DMM_PAT_VIEW register, the 5th in the [DMM_PAT_VIEW1](#) register.

The PAT view index of the initiator *i* is found in the *Vi* field. The *Wi* field is aimed at writing the corresponding *Vi*. When writing to the `DMM_PAT_VIEW` registers, the only *Vi* view indexes that are updated are those having their corresponding *Wi* bit - and byte enable - set. The *Wi* bits are always read as 0. For instance, to set the PAT view indexes *V3* and *V7* to respectively 2 and 1, the `DMM_PAT_VIEW0` register shall be written with 5000 6000h.

15.2.3.5.1.3.2 PAT View Map Base Address

The PAT view map base address is defining the base address of all PAT translated addresses.

The bit 31 of all PAT translated address is set to `BASE_ADDR`. For instance if the `DMM_PAT_VIEW_MAP_BASE` register is set to 8000 0000h then all PAT translated addresses will have the bit 31 set to 1 so that the translated addresses were ranging from 8000 0000h to FFFF FFFFh. All reserved bits of this DMM PAT base address register are read to 0.

15.2.3.5.1.3.3 PAT Views

A PAT view is defining the kind of physical address translation to perform for each mode accesses (page, 8-bit, 16-bit and 32-bit). Each mode of each PAT view can be configured to either use a container-grained translation or a page-mode translation.

15.2.3.5.1.3.3.1 PAT Direct Access Translation

The container-grained translation is named the direct access. In this mode, the translation vector is directly given by the `CONT_x` field corresponding to the accessed mode. A page mode access is using the vector contained in the `DMM_PAT_VIEW_MAP_i[27:24]` `CONT_PAGE` field, a 32-bit mode access is using the vector contained in the `DMM_PAT_VIEW_MAP_i[19:16]` `CONT_32` field, a 16-bit mode access is using the vector contained in the `DMM_PAT_VIEW_MAP_i[11:8]` `CONT_16` field and an 8-bit mode access is using the vector contained in the `DMM_PAT_VIEW_MAP_i[3:0]` `CONT_8` field. See Figure 15-6.

Figure 15-6. PAT Direct Access Translation

15.2.3.5.1.3.3.2 PAT Indirect Access Translation

The page-grained translation is named the indirect access. In this mode the translation vector is found in the internal 32-k entry physical address translation vector table at the index given by bits 12 to 26 of the input virtual address, and the `DMM_PAT_VIEW_MAP_i` `CONT_x` field is referencing the internal physical address translation table to use. Given that the DMM is only using one of such table, in this mode the `CONT_x` field shall be written as 0. See Figure 15-7.

Figure 15-7. PAT Indirect Access Translation

Each entry of the physical address translation lookup table is a 19-bit vector that will replace bits 12 to 30 of the input virtual address. The PAT index aimed at selecting the vector in the table consists of bits 12 to 26 of the input virtual address.

15.2.3.5.1.3.3.3 PAT View Configuration

There are four different views in a DMM each view has its own `DMM_PAT_VIEW_MAP_i` register aimed at defining the kind of address translation to perform.

The PAT view type of each mode is selected by the `ACCESS_x` field in the `DMM_PAT_VIEW_MAP_i` register, *i* being the index of the considered view. When this field is set to one then the indirect access scheme is used, otherwise the PAT is performing the address translation in a direct way with the corresponding `CONT_x` vector.

When configuring a mode in a view to use the indirect access, the corresponding `CONT_x` field shall be filled with 0.

15.2.3.5.1.3.3.4 PAT Address Translation Lookup Table

The PAT address translation lookup table has the same geometry as the DMM container. It has 128 lines of 256 entries of 19-bit each. See Figure 15-8.

Figure 15-8. Physical Address Translation Table

$E_{0,0}$	$E_{1,0}$	$E_{2,0}$	$E_{3,0}$	$E_{4,0}$	$E_{251,0}$	$E_{252,0}$	$E_{253,0}$	$E_{254,0}$	$E_{255,0}$
$E_{0,1}$	$E_{1,1}$	$E_{2,1}$	$E_{3,1}$	$E_{4,1}$	$E_{251,1}$	$E_{252,1}$	$E_{253,1}$	$E_{254,1}$	$E_{255,1}$
$E_{0,2}$	$E_{1,2}$	$E_{2,2}$	$E_{3,2}$	$E_{4,2}$	$E_{251,2}$	$E_{252,2}$	$E_{253,2}$	$E_{254,2}$	$E_{255,2}$
$E_{0,125}$	$E_{1,125}$	$E_{2,125}$	$E_{3,125}$	$E_{4,125}$	$E_{251,125}$	$E_{252,125}$	$E_{253,125}$	$E_{254,125}$	$E_{255,125}$
$E_{0,126}$	$E_{1,126}$	$E_{2,126}$	$E_{3,126}$	$E_{4,126}$	$E_{251,126}$	$E_{252,126}$	$E_{253,126}$	$E_{254,126}$	$E_{255,126}$
$E_{0,127}$	$E_{1,127}$	$E_{2,127}$	$E_{3,127}$	$E_{4,127}$	$E_{251,127}$	$E_{252,127}$	$E_{253,127}$	$E_{254,127}$	$E_{255,127}$

$E_{x,y}$ 4-KB page entry

sdram-074

Each entry of the PAT address corresponds to the page in the DMM container that has the same location. The entry (74, 42) in the table corresponds to the page (74, 42) in any DMM container.

15.2.3.5.1.3.3.5 **Direct Access to the PAT Physical Address Translation Table Vectors**

The PAT physical address translation table is typically refilled with specialised DMA called refill engines. Still some direct read and write access to the content of this table is granted when disabling the use of one or the other refill engine by writing a 1 in the MODE_i field of the [DMM_PAT_CONFIG](#) corresponding to the refill engine *i* to disable.

In this mode, often called the debug mode, the data read in or written to the [DMM_PAT_DATA_i](#) register corresponds to the vector contained in the physical address translation table which index is found in the X0 and Y0 fields of the [DMM_PAT_AREA_i](#) register.

15.2.3.5.1.3.3.6 **Automatic Refill Through the Refill Engines**

See [Section 15.2.4.1](#), *PAT Use Cases*.

15.2.3.5.2 **DMM Transaction Flows**

15.2.3.5.2.1 **Non-Tiled Transaction Flow**

Each non-tiled interconnect transaction reaching the DMM, either on a TILER port or on an extra low-latency access port (ELLA), is subject to the same processing.

The TILER and ELLA blocks consider separated request, data and response paths. An overview of each path is given below, and more detailed information is given in [Section 15.2.3.5.3](#), *DMM Internal Macro-Architecture*.

On the request path, the flow consists of:

- Allocating a TILER / ELLA response context to timely generate the appropriate responses
- Splitting 2D requests in a collection of 1D requests - TILER ports only
- Splitting requests at DMM unit boundaries - the split granularity being provided by LISA mapping registers
- Allocating an available buffer in the appropriate ROBIN, for both read and write requests
- In case of a write request, allocating and updating a TILER / ELLA write context to subsequently direct the incoming write data into the relevant re-ordering buffer
- Generating the initiator-indexed priority extension - via the PEG block

On the write data path, the flow consists of forwarding incoming data to the relevant re-ordering buffer in accordance with the corresponding TILER / ELLA write context.

On the response path, responses are returned as soon as:

- At least one response have entered each related buffers, in case of read requests
- All related responses have returned from the SDRAM controller, in case of write requests
- No other previous pending response exists with the same tag

15.2.3.5.2.2 **Tiled Transaction Flow**

Similarly each tiled interconnect transaction reaching the DMM is subject to the same processing.

The TILER blocks consider separated request, data and response paths. An overview of each path is given below, more detailed information being given in [Section 15.2.3.5.3](#), *DMM Internal Macro-Architecture*.

On the request path, the processing phase consists of:

- Decoding the address to qualify whether the request targets the TILER or the memory directly
- Transforming TILER-specific requests to their natural representation - address, width and height are modified accordingly

On the request path, the generation phase consists of:

- Allocating a TILER response context to timely generate the appropriate responses
- Splitting malformed - request's stride is different from the container stride and from the double of this container stride - tiled 2D requests in a collection of 1D requests
- Splitting tiled requests at tile boundaries
- Performing the page-based address translation - via the PAT block
- Allocating an available buffer in the appropriate ROBIN, for both read and write requests
- In case of a write request, allocating and updating a TILER write context to subsequently direct the incoming write data into the relevant re-ordering buffer
- Generating the initiator-indexed priority extension - via the PEG block

On the data path, any incoming data is transformed in accordance with the corresponding TILER write context and sent to the appropriate re-ordering buffer.

On the response path, responses are returned as soon as:

- A minimal number of responses have entered the corresponding buffers, in case of read requests
- All related responses have returned from the SDRAM controllers, in case of write requests
- No other previous pending response exists with the same tag

15.2.3.5.3 DMM Internal Macro-Architecture

This sub-section describes the DMM internal macro-architecture, specifically:

- Input request decoding,
- Physical address translation and synchronized translation table reloading,
- Output request and response generation,
- Memory mapping in the system addressing space - including interleaving,
- Tag management,
- Priority handling,
- Contexts,
- Maximum allowed burst size,
- Reconstruction buffer dimensioning.

15.2.3.5.3.1 ELLA Description

The Extra Low Latency Access (ELLA) block is basically a TILER block which has been simplified to reduce the latency. In this respect, the ELLA block:

- Is limited to 1D bursts only
- Is not capable of performing tiling conversions
- Does not interact with the PAT block

The ELLA block main role is to split incoming requests at DMM atomic unit boundaries to ensure that requests sent to the SDRAM controller fit in a single SDRAM page. More precisely, the ELLA block is responsible for:

- Allocating an internal response context to timely generate the appropriate responses
- Splitting requests at DMM atomic section boundaries
- Requesting buffer allocation in the appropriate ROBIN
- In case of a write request, allocating and updating an internal write context to subsequently direct the incoming write data into the relevant re-ordering buffer.

15.2.3.5.3.2 LISA Description

The Local Interconnect and Synchronisation Agent (LISA) is a full crossbar aimed at setting priorities, managing tags and memory mapping.

The interconnect routes:

- TILER requests on the ROBIN initiator nodes
- TILER write data on the ROBIN write buffers
- ROBIN read data to the relevant TILER initiators.

The LISA block registers are [DMM_LISA_MAP_i](#) (i = 0 to 3) and [DMM_LISA_LOCK](#).

The priority is given to the low-latency port (ELLA). When 2 ROBIN are in use, it interleaves the two ports at a programmable boundary from 128 Bytes or more (configurable with [DMM_LISA_MAP_i\[19:18\]](#) SDRC_INTL bit field).

15.2.3.5.3.3 PAT Description

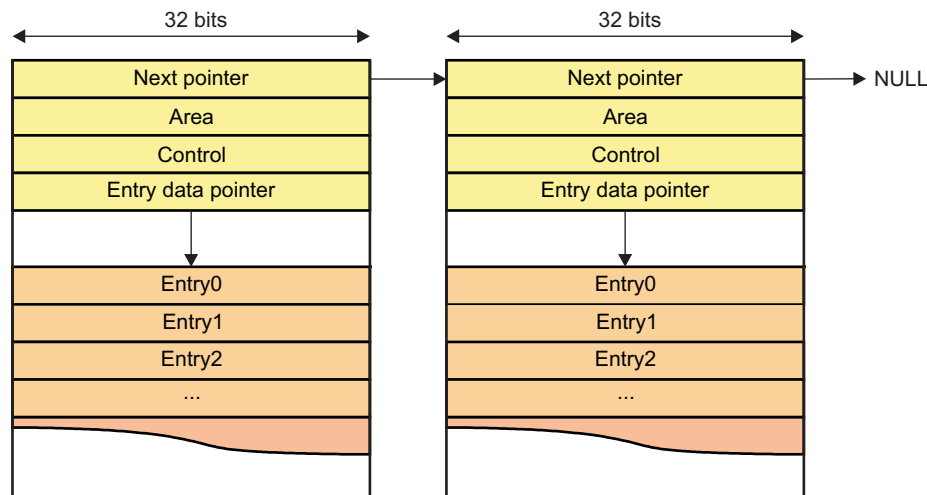

The Physical Address Translator (PAT) block is responsible for mapping physical pages to each TILER container page. The internal address translation memories used in the PAT block are designed with retention flip-flops. It consists of:

- a memory-based LUT which has the same geometry as the container pages
- a refill engine for modifying entries in a given area of the internal LUT

A PAT descriptor is a singly-linked list node as shown [Figure 15-9](#), containing:

- a description of the LUT area to reload
- a description of how to reload the defined LUT area
- a pointer to the location where the corresponding LUT entries are stored

Figure 15-9. PAT Descriptors

sdram-065

PAT descriptors are chained and processed until a NULL pointer is encountered. The PAT bank allocation scheme allows the update of 4 consecutive entries of a line in a single cycle whatever the refilling orientation.

The PAT descriptor structure directly maps the [DMM_PAT_DESCR_i](#), [DMM_PAT_AREA_i](#), [DMM_PAT_CTRL_i](#) and [DMM_PAT_DATA_i](#) registers (i = 0 to 3).

The PAT refill engine can be started by:

- filling manually all the necessary registers: the [DMM_PAT_AREA_i](#) register with the (x0, y0) (x1, y1) area definition, the [DMM_PAT_DATA_i](#) with the physical address of the corresponding area entry table, the [DMM_PAT_CTRL_i\[6:4\]](#) DIRECTION with the relevant (S, Y, X) direction of the area refill and the [DMM_PAT_CTRL_i\[0\]](#) START with a 1.
- writing the physical address of a memory-mapped PAT descriptor in the [DMM_PAT_DESCR_i](#) which will update: the [DMM_PAT_AREA_i](#) with the area value of the descriptor, the [DMM_PAT_DATA_i](#) with the data value of the descriptor, the [DMM_PAT_CTRL_i](#) with the ctrl value of the descriptor and the

[DMM_PAT_DESCR_i](#) with the next value of the descriptor.

- In any case the data part of the PAT refill only starts when [DMM_PAT_CTRL_i\[0\]](#) START is asserted.

The [DMM_PAT_STATUS_i](#) register can be used to see if the process has completed without errors.

15.2.3.5.3.4 PEG Description

The priority extension generator (PEG) is a dynamic software-programmable initiator-ConnID-indexed table of priorities. Its role is to change on the fly the priority of an initiator, for initiators that do not generate their own per-transaction priority. The mapping of each initiator to the table (split into eight registers) is based on its 6-MSB group ConnID (see [Table 28-20, ConnID Mapping \(Debug View\)](#), in [Chapter 28, On-Chip Debug Support](#).

When an interconnect request enters the DMM, its priority is extracted from the PEG lookup table and set in its MReqInfo field.

The 64 priority entries are software-programmable with eight [DMM_PEG_PRIO_k](#) registers ([DMM_PEG_PRIO_k](#)).

Each of these eight registers is split in eight 4-bit fields, each field mapping an entry of the lookup table with:

- The 3-bit priority coded on the 3 least-significant bits (LSBs): Px field. A priority of 0 defines the highest priority and a priority of 7 defines the lowest priority. The priority of a request with ConnID equal to y is written in the (8.n + x) P field, where n is the number of the priority register (n = 0 to 7) and x is the number of the P field in the corresponding register (x = 0 to 7). If the ConnID is 0x16, its priority is written in the third priority register (n = 2), in the P4 bit field ([18:16]), because x = 4.
- A \overline{W} x field-specific active-low local write enable bit, always read as 0, on the most-significant bit (MSB). The role of the \overline{W} bit is to allow the modification of a single entry without requiring a read-modify-write sequence. As its \overline{W} bits are always read as 0, writing back the modified register updates all priority fields of the register.

Although this priority information is generated prior to entering the LISA block, it is not used internally in the local interconnect arbitration, but forwarded to the SDRAM controller as an MReqInfo, where it indicates the command priority.

It is also possible to give a priority for the internal PAT engine thanks to the [DMM_PEG_PRIO_PAT](#) register.

15.2.3.5.3.5 ROBIN Description

The reordering buffer and initiator node (ROBIN) is a block aimed at providing some working buffering for:

- Converting data and responses to-and-fro between raster and tiled organizations and a master port to connect to the SDRAM controller.

The ROBIN block does:

- Request Forwarding
- Write data and Response buffering
- Keeps write data ordering
- Intra-word tiling and orientation transforms
- Tag handling

15.2.3.5.3.6 TILER Description

The tiling and isometric lightweight engine for rotation (TILER) main functionality is the request conversion due to the tiling. The TILER block is then responsible for:

- Decoding the address to qualify whether the request targets the TILER or the memory directly
- Converting TILER-specific requests to their natural representation – address, width and height are modified accordingly
- Allocating an internal response context to timely generate the appropriate responses

- Splitting tiled requests at tile boundaries and not tiled requests at DMM atomic section boundaries
- Requesting the page-based address translation
- Requesting buffer allocation in the appropriate ROBIN
- In case of a write request, allocating and updating an internal write context to subsequently direct the incoming write data into the relevant reordering buffer.

The interdependent tiling and isometric transform concepts introduced in the TILER are fully described in the following section.

15.2.3.6 TILER

15.2.3.6.1 TILER Concepts

This section describes all concepts behind the TILER transforms, through a top-down approach starting from the main object container.

15.2.3.6.1.1 TILER Rationale

This section is a synthesis of all TILER concepts, giving one rule per TILER structure level.

[Figure 15-10](#) shows the TILER address space structure for tiled modes.

Figure 15-10. TILER Address Space Structure for Tiled Modes

sdram-005_public

15.2.3.6.1.1.1 The TILER is a 4-GiB Virtual Address Space Composed of Eight Views

There is one view for each of the eight possible way of scanning a frame-buffer:

1. From left to right then from top to bottom

2. From right to left then from top to bottom
3. From left to right then from bottom to top
4. From right to left then from bottom to top
5. From top to bottom then from left to right
6. From top to bottom then from right to left
7. From bottom to top then from left to right
8. From bottom to top then from right to left

15.2.3.6.1.1.2 A View is a 512-MiB Virtual Address Space Composed of Four Containers

There is one container per element size to allow correct access patterns in any of the eight possible orientations. The container is the entity where all objects of a given element type are allocated.

The element is the entity of maximum size - 8 bits, 16 bits, 32 bits or page-sized - which is invariant in any orientation.

15.2.3.6.1.1.3 A Container is a 128-MiB Virtual Address Space

A container is composed of an array of 128 lines of 256 pages of 4 kiB each.

The page defines the granularity of physical memory allocation through a physical address translation unit - MMU.

15.2.3.6.1.1.4 A Page is a 4-kiB Virtual Address Space

A page is composed of two lines. Each line consists of two tiles.

15.2.3.6.1.1.5 A Tile is a 1-kiB Address Space

The tile is designed to offer bi-dimensional data locality in a single SDRAM page. In this respect, it has been sized to 1 kiB, that is, to the size of the smallest SDRAM page.

15.2.3.6.1.2 TILER Modes

The TILER is supporting three major modes - bypass, page and tiled - each having a specific output request generation.

15.2.3.6.1.2.1 Bypass Mode

As stated in its name, this mode is transparent at the TILER perspective. Still, at the DMM perspective,

- 2D block bursts are broken down on a line-basis in a set of incremental bursts
- Incremental bursts - including those issued by a 2D block burst breakdown - are split at the DMM atomic unit of the section hit by the burst at:
 - at the interleaving granularity of the section - 128 byte, 256 byte or 512 byte - in interleaved sections
 - at 1-kiB boundary in non-interleaved sections

15.2.3.6.1.2.2 Page Mode

The purpose of this mode is to use the DMM address translation mechanism for non-tiled accesses. In this respect it is similar to the bypass mode,

- 2D block bursts are broken down on a line-basis in a set of incremental bursts
- Incremental bursts - including those issued by a 2D block burst breakdown - are split at:
 - the interleaving granularity of the section - 128 byte, 256 byte or 512 byte - in interleaved sections
 - 1-kiB boundary in non-interleaved sections

15.2.3.6.1.2.3 Tiled Mode

The tiled mode has two major breakdown algorithms,

- One for well formed 2D block requests - conforming to the orientation, mode and stride given in [Table 15-9](#)
- One for 1D incremental requests and ill-formed 2D block requests.

Table 15-9. Well Formed Tiled Mode 2D Block Requests

Orientation			Mode		Stride	Description
S	Y	X	M1	M0	(bytes)	
0	x	x	0	0	16384	Plain access to an 8-bit progressive frame in 0° or 180°
					32768	Field access to an 8-bit interlaced frame 0° or 180°
			0	1	32768	Plain access to a 16-bit progressive frame in 0° or 180°
					65536	Field access to a 16-bit interlaced frame 0° or 180°
			1	0	32768	Plain access to a 32-bit progressive frame in 0° or 180°
					65536	Field access to a 32-bit interlaced frame 0° or 180°
1	x	x	0	0	8192	Plain access to an 8-bit progressive frame in 90° or 270°
					16384	Field access to an 8-bit interlaced frame 90° or 270°
			0	1	8192	Plain access to a 16-bit progressive frame in 90° or 270°
					16384	Field access to a 16-bit interlaced frame 90° or 270°
			1	0	16384	Plain access to a 32-bit progressive frame in 90° or 270°
					32768	Field access to a 32-bit interlaced frame 90° or 270°

Similarly to the bypass and page modes, ill formed 2D block requests are broken down on a line basis in a set of incremental bursts. In tiled mode however, these incremental virtual bursts do not translate to 1D physical burst requests.

15.2.3.6.1.3 Object Container Definition

The object container is the unique addressable entry point of the TILER. It is a 128-MiB virtual address space, where all objects of a same kind - and orientation - are allocated.

Four main types of containers are present in the TILER, each one being referred by a mode:

- A 8-bit element mode, for efficiently accessing bi-dimensional arrays of 8-bit data
- A 16-bit element mode, for efficiently accessing bi-dimensional arrays of 16-bit data
- A 32-bit element mode, for efficiently accessing bi-dimensional arrays of 32-bit data
- A page mode, for efficient 1D accesses

[Figure 15-11](#) shows the TILER object containers and views

Figure 15-11. TILER Object Containers and Views

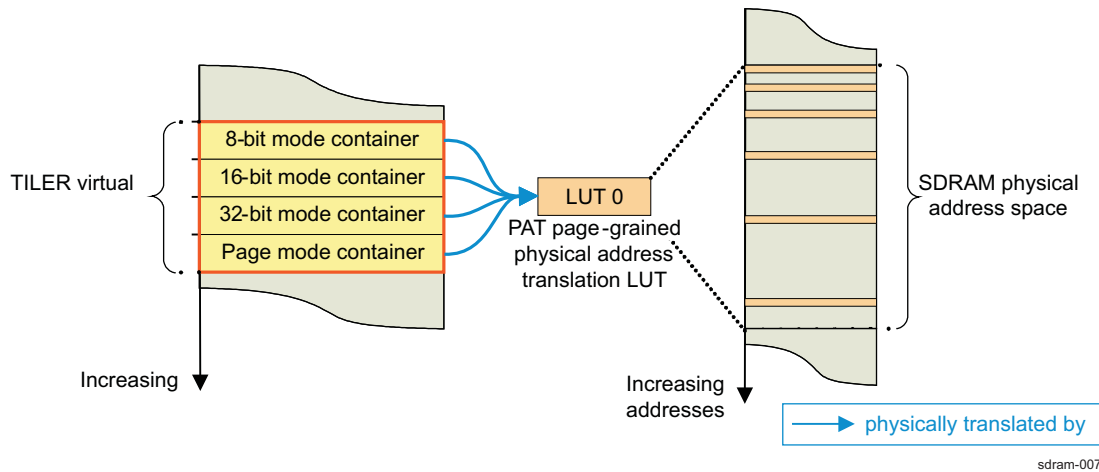

The 512-MiB virtual address space composed of four 128-MiB object containers of different modes is called a view. Given that 8 orientations are available per mode, the TILER is actually managing 32 kinds of containers.

The physical memory footprint of a 512-MiB TILER view is directly subject to the nature of the physical address translator unit - PAT.

A unique physical address translation table - LUT (Look Up Table) is instantiated in the DMM. This table is shared by all TILER modes. Hence, each of the four modes can not be given their own private page-grained physical address translation table - LUT. A maximum of 128 MiB of objects among all TILER modes can be managed as illustrated in [Figure 15-12](#).

Figure 15-12. TILER Memory Footprint with PAT and Shared Physical Address Translation LUT

If the four modes have all their own separated virtual 128-MiB object containers, these containers are all mapped to the same piecewise 128-MiB physical address space, and are then not physically separated. Consequently, a memory-related system constraints is that no more than 128-MiB of objects can be available simultaneously in a TILER view.

NOTE: It is a software duty to ensure that any object allocated in a mode do not physically overlap with any other object, even in another mode.

15.2.3.6.1.4 Page Definition

A TILER page defines the granularity of object allocation in virtual TILER containers.

Given that the sub-page structure is mode specific, the page is the smallest granularity common to all modes, making it the granularity to consider in the TILER resource manager for object allocation.

15.2.3.6.1.4.1 Container Geometry with 4-kiB Pages

As pages size is 4-kiB, any 128-MiB object container is a set of 32768 pages, organized in an array of 256 columns and 128 rows, as shown in [Figure 15-13](#).

Figure 15-13. Object Container Geometry with 4-kiB Pages

This array of pages is mapped to the system address space as shown in [Figure 15-14](#).

Figure 15-14. TILER Page Mapping when Using 4-kiB Pages

In any 128-MiB object container, the 4-kiB page $P_{x,y}$ at column x ($0 \leq x < 256$) and row y ($0 \leq y < 128$), is found at an offset of $4096 \cdot (x + 256 \cdot y)$ bytes from the base address of the related object container.

Similarly, the page $P_{x,y}$ at column x ($0 \leq x < 256$) and row y ($0 \leq y < 128$), is translated by the LUT entry $E_{x+256 \cdot y}$ found at the index $x + 256 \cdot y$.

15.2.3.6.1.4.2 Container Geometry and Page Mapping Summary

The TILER has a page size of 4096 bytes. The page $P_{x,y}$:

- has $\max_x = 256$ and $\max_y = 128$.
- is found at an offset of: $4096 \cdot (x + \max_x \cdot y)$ bytes from the base address of the related object container
- is translated by the entry found at the index $(x + \max_x \cdot y)$ of the LUT table

15.2.3.6.1.5 Orientation

This section describes the eight on-the-fly orientation-related isometric transforms, corresponding to all available changes of orthonormal basis in the TILER container bi-dimensional space.

Figure 15-15 shows isometric transforms in the TILER container

Figure 15-15. Isometric Transforms in the TILER Container

sdram-010

Mathematically speaking, all these transforms correspond to the composition of a 0° , 90° , 180° , or 270° rotation with an optional reflection. The nature of this orientation is based on the three following binary parameters:

- X to change the direction of the x axis of the TILER container;
- Y to change the direction of the y axis of the TILER container;
- S to swap the modified x and y axis.

From now on, and in the rest of this document, the term orientation refers to any composition of a "quadrant" rotation with an optional horizontal - flip-flop - or vertical mirroring.

15.2.3.6.1.6 Tile Definition

A tile is a subdivision of a page, aimed at:

- Representing a 2D block to better balance the accesses in both directions
- Ensuring that any "tiled" access that fits within a tile is made atomic in the SDRAM controller, and fits in a single SDRAM memory page
- Minimising the number of SDRAM page openings per 2D block transfer

The tile is defined as a 1-kiB 2D block, and a 4-kiB page as an array of 2 lines of 2 tiles each.

When the considered page is in an interleaved DMM section, it is necessary that:

- the DMM memory interleaving size of tiled accesses is set to 1 kiB - a tile size - so that any tiled request that fits within a tile, fits in a single SDRAM memory page
- any request that spans over 2 or 4 tiles, is distributed on a maximum number of SDRAM memory controllers

15.2.3.6.1.7 TILER Virtual Addressing

The TILER can be virtually accessed in four different modes, namely 8-bit, 16-bit, 32-bit and page modes. Each mode defines the element granularity to apply isometric transforms, as summarized in Table 15-10.

Table 15-10. Coding and Description of TILER Modes

Mode	Name	Granularity (element size)
0	8-bit tiled mode	8 bits
1	16-bit tiled mode	16 bits
2	32-bit tiled mode	32 bits
3	Page mode	4096 bytes

For instance, making a vertical mirroring of a 16-byte horizontal line containing the word 000102030405060708090A0B0C0D0E0Fh, leads to:

- 0F0E0D0C0B0A09080706050403020100h in 8-bit tiled mode
- 0E0F0C0D0A0B08090607040502030001h in 16-bit tiled mode
- 0C0D0E0F08090A0B0405060700010203h in 32-bit tiled mode
- 000102030405060708090A0B0C0D0E0Fh in page mode - unchanged as the element granularity is 4 KB.

Besides, as each of the eight orientations is available for any of the four modes, this gives 32 TILER addressing possibilities, as summarized in [Table 15-11](#).

Table 15-11. Coding and Description of TILER Orientations

S	Y	X	Description	Alternate description
0	0	0	0° view	Natural view
0	0	1	0° view with vertical mirror	180° view with horizontal mirror
0	1	0	0° view with horizontal mirror	180° view with vertical mirror
0	1	1	180° view	
1	0	0	90° view with vertical mirror	270° view with horizontal mirror
1	0	1	270° view	
1	1	0	90° view	
1	1	1	90° view with horizontal mirror	270° view with vertical mirror

15.2.3.6.1.7.1 Page Mode Virtual Addressing and Characteristics

When used in page mode, the 128-MiB TILER space is seen as an orientation-specific sequence of 32768 pages of 4 kiB each. The access sequence inside a page is left unchanged.

Therefore, in page mode, the TILER is accessed similarly to any 128-MiB memory, with a 27-bit byte-based address.

NOTE: From now on the address is noted "a".

Figure 15-16. Page Mode Virtual Addressing

sdram-027

15.2.3.6.1.7.2 Tiled Mode Virtual Addressing and Characteristics

When used in tiled mode, the 128-MiB TILER space is seen as a giant frame-buffer - the container. The addressing and characteristics of this giant frame-buffer depends on:

- The tiled mode, which defines the considered atomic element size.
- The orientation, which potentially swaps its x and y axis - and hence the container geometry.

[Table 15-12](#) summarizes tiled mode container characteristics.

Table 15-12. Tiled Mode Container Characteristics

Orientation S	Υ	\bar{X}	Element size (bits)	Width (elements)	Height (elements)	Stride (bytes)	
						Progressive	Interlaced
0	x	x	8	16384	8192	16384	32768
			16	16384	4096	32768	65536
			32	8192	4096	32768	65536
1	x	x	8	8192	16384	8192	16384
			16	4096	16384	8192	16384
			32	4096	8192	16384	32768

As a result, the coordinate (x_0, y_0) of a pixel in an oriented view is translated in a virtual address as shown in [Figure 15-17](#) and [Figure 15-18](#).

Figure 15-17. Tiled Mode Addressing in 0° or 180° Orientations (S=0)**Figure 15-18. Tiled Mode Addressing in 90° or 270° Orientations (S=1)**

15.2.3.6.1.7.3 Element Ordering in the TILER Container

This section highlights how elements - 8-bit data, 16-bit data, 32-bit data or 4-kiB page - are ordered in the container. In other words, this section highlights how the path of incrementing virtual addresses is mapped in the container.

It is interesting to note that whatever the mode, and hence the element size, the sequence for ordering the elements in their related container is strictly similar and only depends on the related orientation. In other words:

- Mode is about element granularity
- Orientation is about change of orthonormal basis for ordering the elements in the mode-specific container.

A corollary to the previous statements is that in a given mode the internal structure of an element is unchanged whatever the orientation. In page mode for instance, the offset of a word inside a page is invariant by orientation; the content of a page is always accessed in the same manner.

In the next sections, the natural container orthonormal basis is referenced as:

$$(\vec{x}_N, \vec{y}_N)$$

sdram-030

and the oriented orthonormal basis as:

$$(\vec{x}_O, \vec{y}_O)$$

sdram-031

15.2.3.6.1.7.3.1 Natural View or 0° View (orientation 0)

This orientation defined by $S=0$, $\bar{Y}=0$ and $\bar{X}=0$ and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{x}_N \\ \vec{y}_O = \vec{y}_N \end{cases}$$

sdram-032

In any TILER mode, the elements are then ordered from left-to-right and then from top-to-bottom in their container, as shown in Figure 15-19 and Figure 15-20.

Figure 15-19. Tiled Mode Ordering of Elements in Natural View

sdram-033

Figure 15-20. Page Mode Ordering of Elements in Natural View

sdram-034

15.2.3.6.1.7.3.2 0° View with Vertical Mirror or 180° View with Horizontal Mirror (Orientation 1)

This orientation defined by $S=0$, $\bar{Y}=0$ and $\bar{X}=1$ and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{x}_N \\ \vec{y}_O = \vec{y}_N \end{cases}$$

sdram-035

In any TILER mode, the elements are then ordered from right-to-left and then from top-to-bottom in their container, as shown in [Figure 15-21](#) and [Figure 15-22](#).

Figure 15-21. Tiled Mode Ordering of Elements in 0° View with Vertical Mirror

Figure 15-22. Page Mode Ordering of Elements in 0° View with Vertical Mirror

15.2.3.6.1.7.3.3 0° View with Horizontal Mirror or 180° View with Vertical Mirror (Orientation 2)

This orientation defined by $S=0$, $\bar{Y}=1$ and $\bar{X}=0$ and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{x}_N \\ \vec{y}_O = -\vec{y}_N \end{cases}$$

sdram-038

In any TILER mode, the elements are then ordered from left-to-right and then from bottom-to-top in their container, as shown in Figure 15-23 and Figure 15-24.

Figure 15-23. Tiled Mode Ordering of Elements in 0° View with Horizontal Mirror

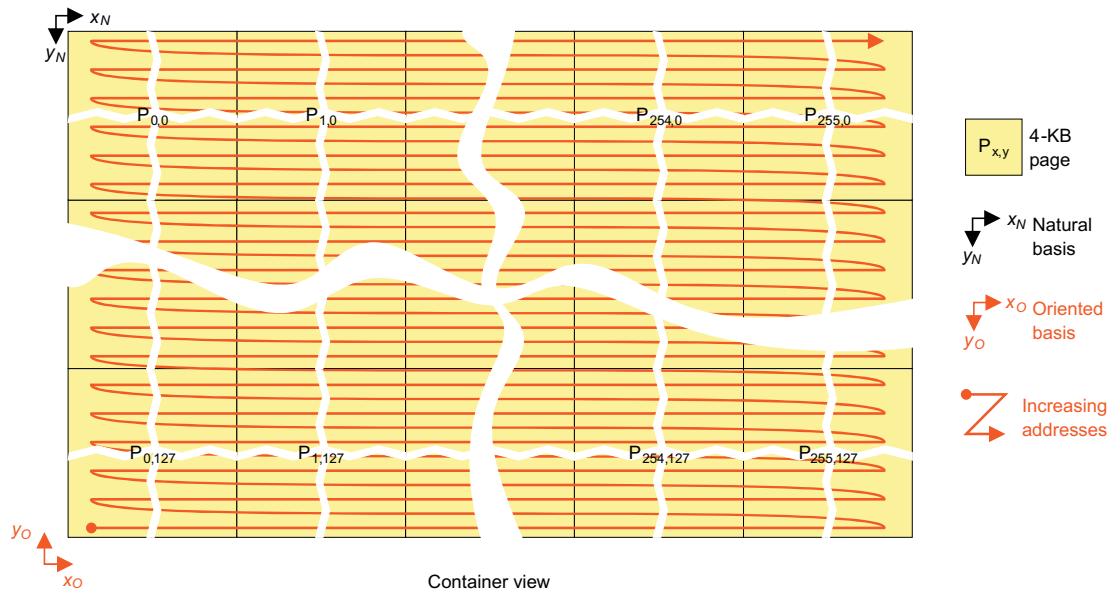

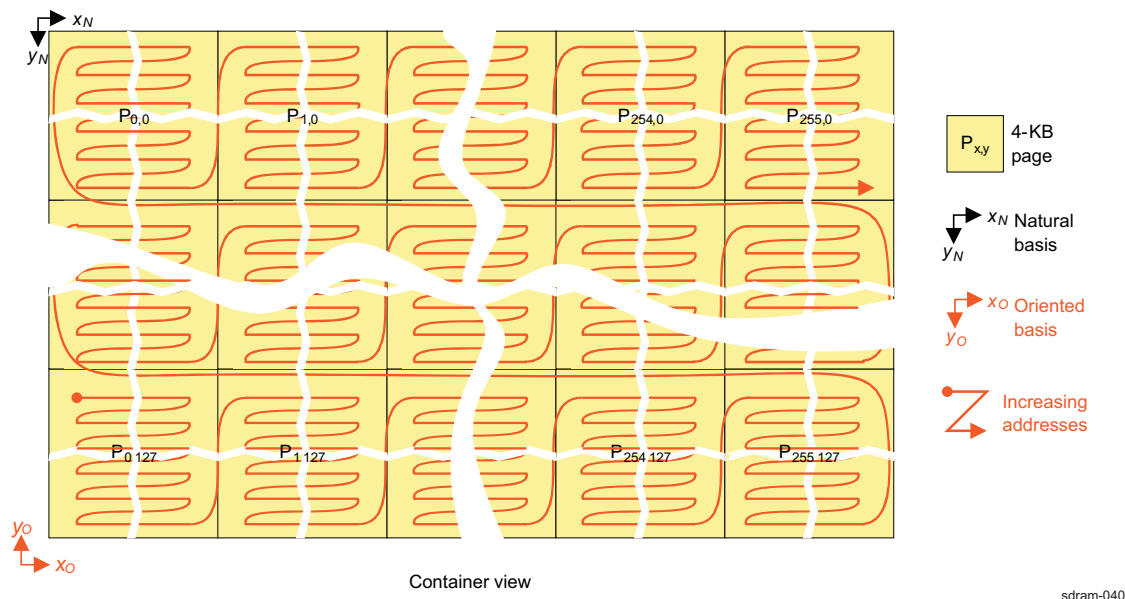

Figure 15-24. Page Mode Ordering of Elements in 0° View with Horizontal Mirror

15.2.3.6.1.7.3.4 180° View (Orientation 3)

This orientation defined by $S=0$, $\bar{Y}=1$ and $\bar{X}=1$ and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{x}_N \\ \vec{y}_O = -\vec{y}_N \end{cases}$$

sdram-041

In any TILER mode, the elements are then ordered from right-to-left and then from bottom-to-top in their container, as shown in Figure 15-25 and Figure 15-26.

Figure 15-25. Tiled Mode Ordering of Elements in 180° View

Figure 15-26. Page Mode Ordering of Elements in 180° View

15.2.3.6.1.7.3.5 90° View with Vertical Mirror or 270° View with Horizontal Mirror (Orientation 4)

This orientation defined by $S=1$, $\bar{Y}=0$ and $\bar{X}=0$ and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{y}_N \\ \vec{y}_O = \vec{x}_N \end{cases}$$

sdram-044

In any TILER mode, the elements are then ordered from top-to-bottom and then from left-to-right in their container, as shown in Figure 15-27 and Figure 15-28.

Figure 15-27. Tiled Mode Ordering of Elements in 90° View with Vertical Mirror

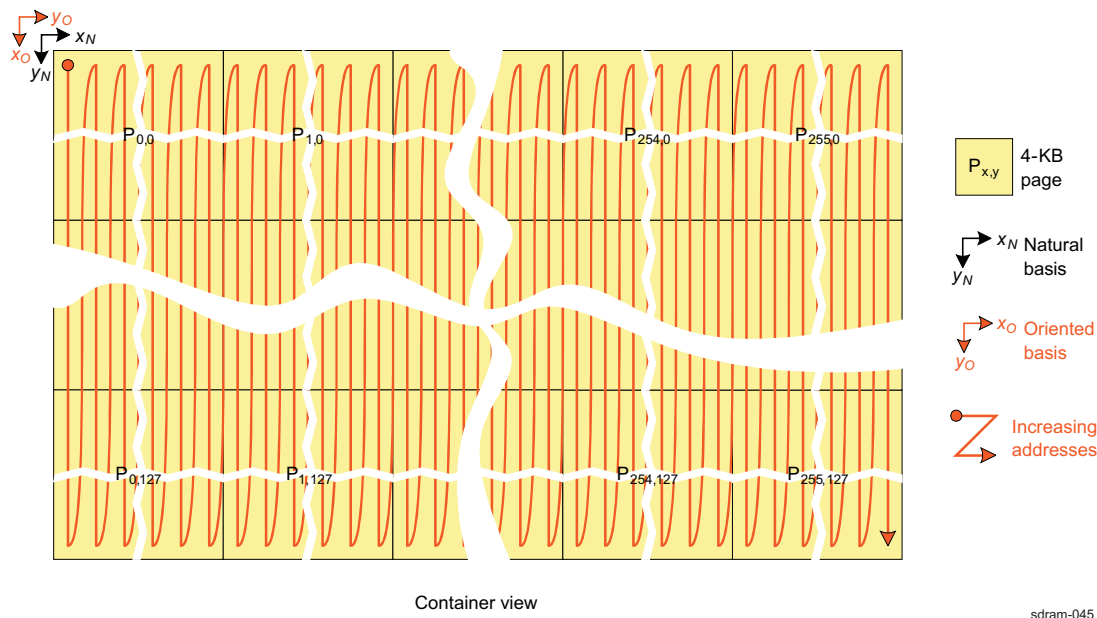

Figure 15-28. Page Mode Ordering of Elements in 90° View with Vertical Mirror

15.2.3.6.1.7.3.6 270° View (Orientation 5)

This orientation defined by $S=1$, $\bar{Y}=0$ and $\bar{X}=1$ and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{y}_N \\ \vec{y}_O = -\vec{x}_N \end{cases}$$

sdram-047

In any TILER mode, the elements are then ordered from top-to-bottom and then from right-to-left in their container, as shown in Figure 15-29 and Figure 15-30.

Figure 15-29. Tiled Mode Ordering of Elements in 270° View

Figure 15-30. Page Mode Ordering of Elements in 270° View

15.2.3.6.1.7.3.7 90° View (Orientation 6)

This orientation defined by $S=1$, $\bar{Y}=1$ and $\bar{X}=0$ and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{y}_N \\ \vec{y}_O = \vec{x}_N \end{cases}$$

sdram-050

In any TILER mode, the elements are then ordered from bottom-to-top and then from left-to-right in their container, as shown in Figure 15-31 and Figure 15-32.

Figure 15-31. Tiled Mode Ordering of Elements in 90° View

Figure 15-32. Page Mode Ordering of Elements in 90° View

This orientation defined by $S=1$, $\bar{Y}=1$ and $\bar{X}=1$ and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{y}_N \\ \vec{y}_O = -\vec{x}_N \end{cases}$$

sdram-053

In any TILER mode, the elements are then ordered from bottom-to-top and then from right-to-left in their container, as shown in [Figure 15-33](#) and [Figure 15-34](#).

Figure 15-33. Tiled Mode Ordering of Elements in 90° View with Horizontal Mirror

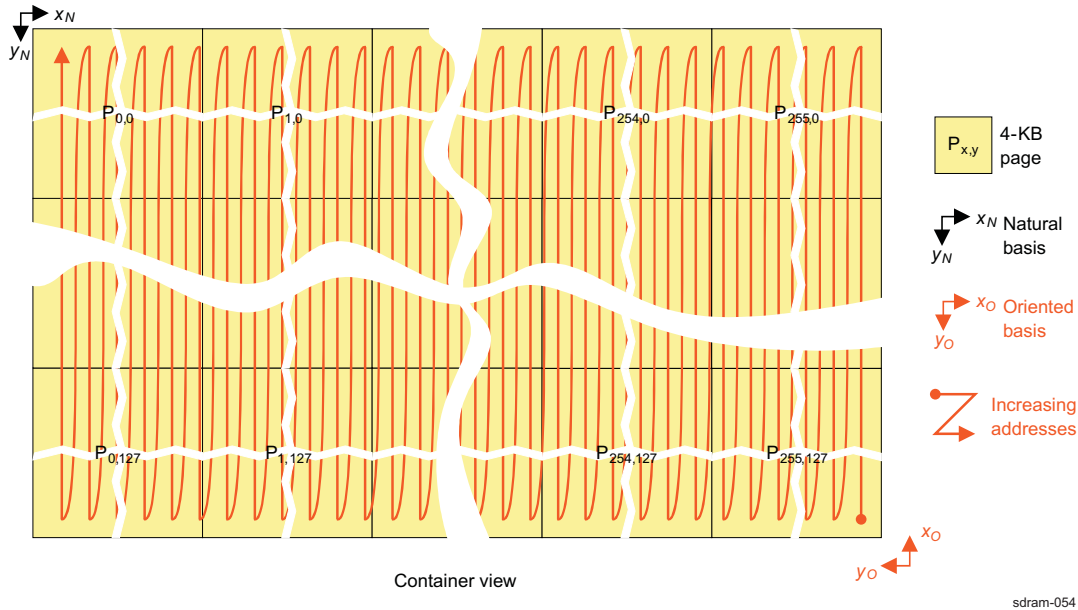

Figure 15-34. Page Mode Ordering of Elements in 90° View with Horizontal Mirror

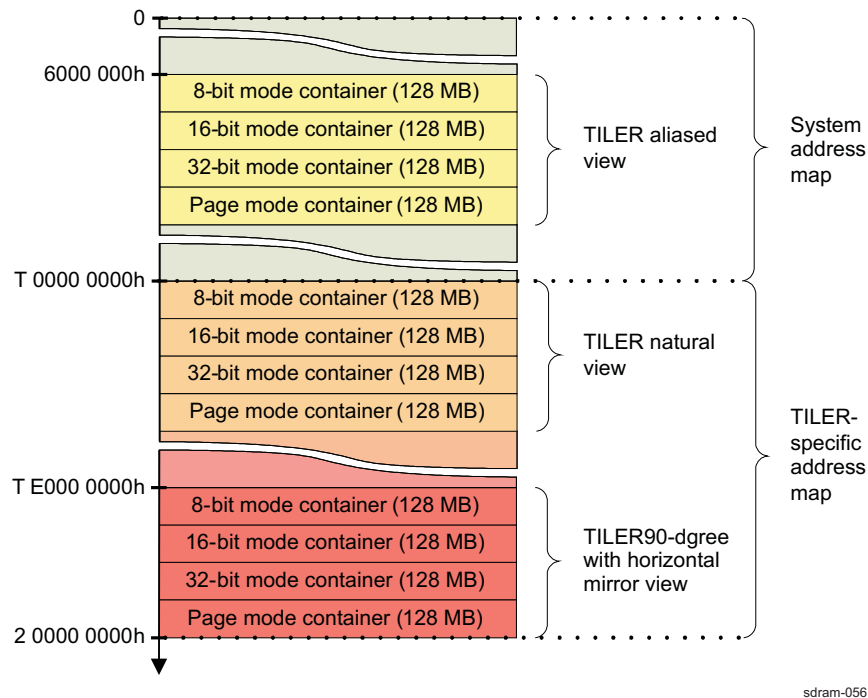

15.2.3.6.2 TILER Macro-Architecture

The TILER requires a 4-GiB addressing space to map its 128-MiB physical container in 4 modes and 8 orientations. As its addressing space fills along the 4-GiB global system address map, the TILER addressing space cannot enter as-is in the system address map. Besides, putting in place a register-based mechanism per initiator to specify the orientation of the following accesses and then reduce the TILER addressing space to a single 512-MiB view is not an option, given that most of the bandwidth-hungry initiators require simultaneous accesses to the TILER container in different views.

As a result 32 bits are not enough to address all these requests, since the TILER port must convey virtually-addressed requests to the "oriented" TILER containers, but also physically-addressed requests to the attached SDRAM controllers. A 33rd address bit is necessary to distinguish the two separated address map as illustrated in Figure 15-35.

Figure 15-35. TILER Port Address Map

Still, having separated system and TILER-specific address maps is not sufficient. In a system, many existing and external IP blocks still rely on a 32-bit address, and would then be limited to one or the other 4-GiB addressing space. To overcome this limitation, one 512-MiB view is aliased in the system address map as described in table and fig.

Table 15-13. TILER Aliased View in the L3 Interconnect Mapping

Start address (hex)	End address (hex)	Size
0x6000_0000	0x7FFF_FFFF	512MB

From all incoming requests, TILER requests are filtered as having an address that fits:

- The address format in the TILER-specific address map given in Table 15-14, or
- The address format of the aliased view in the system address map given in Table 15-15, other requests are forwarded directly to the SDRAM controller in a TILER bypass mode.

Table 15-14. Address Format in the TILER-Specific Address Map

32	31	30	29	28	27	26 ... 4	3 ... 0
T	Orientation			Mode		Virtual address	
1	S	Y	X	M1	M0	A26 ... A4	0

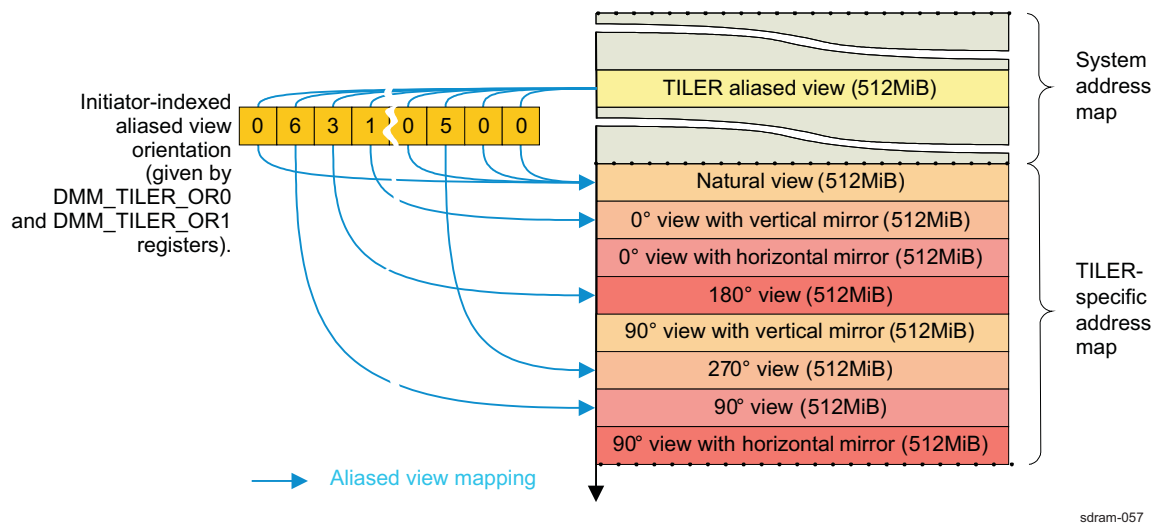

Table 15-15. Address Format of the TILER Aliased View in the System Address Map

32	31	30	29	28	27	26 ... 4	3 ... 0
T	TILER aliasing			Mode		Virtual address	
0	0	1	1	M1	M0	A26 ... A4	0

In these address formats:

- The 33rd bit, noted T, is aimed at distinguishing the standard 4-GiB system address map from the 4-GiB TILER-specific address map
- The orientation bits, noted S, \bar{Y} and \bar{X} , define the request orientation as specified in [Table 15-11](#)
- The mode bits, noted M1 and M0, define the request mode as specified in [Table 15-10](#)
- The remaining 27 bits, noted A0 to A26, define the mode and orientation specific virtual address as defined in [Figure 15-16](#), [Figure 15-17](#), and [Figure 15-18](#).

The orientation of the aliased TILER view is extracted from an initiator-indexed look-up table, as shown in [Figure 15-36](#).

Figure 15-36. TILER Aliased View Orientation

As illustrated in [Figure 15-36](#), an internal initiator-indexed lookup table is storing the current orientation of the aliased view for each initiator.

When an interconnect request hits the TILER aliased view in the system address map, the request initiator orientation is extracted from the lookup table and the request address is translated accordingly to this orientation - the T bit is set and bits [31:29] are replaced with the orientation.

Regarding the dimensioning of this lookup table, given that:

- Initiators accessing simultaneously multiple views use the TILER-specific address map,
- Many initiators either do not need to access any view or can be restricted to only accessing the natural view,

only a limited number of initiators are likely to dynamically modify the orientation of its aliased TILER view. Then, the orientation lookup table is limited to 16 entries. These 16 orientation entries are mapped on the two 32-bit [DMM_TILER_OR0](#) and [DMM_TILER_OR1](#) registers.

The first eight entries of the lookup table are mapped in the [DMM_TILER_OR0](#) register, and the last eight entries in the [DMM_TILER_OR1](#) register. Therefore, given an index x, the orientation related to this index is given in the ORx field.

Each of these two registers is split in eight 4-bit fields, each field mapping an entry of the lookup table with:

- A S, \bar{Y} , \bar{X} orientation code on the 3 LSBs

- A \overline{W} field-specific active-low local write enable bit, always read as 0, on the MSB

The registers fields that correspond to initiators not needing any dynamic configuration of their aliased view orientation must be specified as reserved fields, and only written with zeros.

The role of the \overline{W} bit is to allow the modification of a single entry without requiring a read-modify-write sequence. This approach is then much friendlier:

- In a system where multiple initiators are capable of modifying their own fields in the registers
- With initiators unable to make the read-modify-write sequence such as DMA.

Still, the \overline{W} bit is active-low to keep the compatibility with the usual read-modify-write sequence. When reading an aliased view orientation register, as all its \overline{W} bits are read as 0, if these bits are untouched by the modification - as they should be -, writing back the modified register updates all orientation fields of the register.

15.2.3.6.3 TILER Guidelines for Initiators

15.2.3.6.3.1 Buffered Raster-Based Initiators

15.2.3.6.3.1.1 Buffer Size

The necessary minimum buffer size depends on the initiator support in terms of:

- Element size
- Orientation
- Maximum number of elements per line in all supported element sizes and orientations and on the SDRAM memory pre-fetch size.

Let N be the maximum number of elements per line for a given mode - element size - and orientation, P be the SDRAM memory pre-fetch size in bytes, and max be the function returning the maximum of the two parameters, the minimum necessary line buffer size to handle all resolutions in a given mode and orientation is given in [Table 15-16](#).

Table 15-16. Minimum Buffer Size to Efficiently Handle Lines of up to N Elements

	0° or 180° orientation ($S=0$)	90° or 270° orientation ($S=1$)
8-bit mode	4 x N bytes	$max(4, P/4) \times N$ bytes
16-bit mode	None	$max(8, P/2) \times N$ bytes
32-bit mode	None	$max(8, P/2) \times N$ bytes

This minimal buffer size can only be reached with an advanced FIFO management scheme. The standard ping-pong buffer requires twice this buffer size.

NOTE: Given their nature, field accesses to an interlaced frame-buffer require buffers twice as small as in the standard progressive case.

For instance, an initiator that shall handle only a single progressive frame-buffer in any orientation of:

- Up to 1920x1080 in YUV 4:2:0
- Up to 1600x1200 in 16-bit RGB565
- Up to 800x600 in 32-bit ARGB

requires a line buffer of at least 15360 bytes since:

- $4 \times 1920 + 4 \times 2960 = 15360$ bytes are required for a 3-plane YUV 4:2:0 frame of 1920x1080
 - $4 \times 1920 + 8 \times 960 = 15360$ bytes are required for a 2-plane YUV 4:2:0 frame of 1920x1080
 - $8 \times 1600 = 12800$ bytes are required for a 16-bit RGB565 frame of 1600x1200
 - $8 \times 800 = 6400$ bytes are required for a 32-bit ARGB frame of 800x600
- and a line buffer of at least 30720 bytes when using a simple ping-pong buffer scheme.

15.2.3.6.3.1.2 Performance

[Table 15-17](#) gives the ratio of effective data to transferred data at the external memory interface for these buffered raster-based initiators in each mode and orientation, when using an up-to-32-bit DDR, lpDDR or lpDDR2 SDRAM memory - or an up-to-16-bit DDR2 memory.

Table 15-17. Memory Data Payload for Buffered Raster-Based Initiators on up-to-32-bit DDR, lpDDR, or lpDDR2

	0° or 180° Orientation (S = 0)		90° or 270° Orientation (S = 1)	
	Progressive	Interlaced	Progressive	Interlaced
8-bit mode	100%	100%	100%	50%
16-bit mode	100%	100%	100%	50%
32-bit mode	100%	100%	100%	50%
Page mode	100%	N/A	100%	100%

When using 32-bit DDR, lpDDR or lpDDR2 SDRAM memories - or even 16-bit DDR, DDR2, lpDDR or lpDDR2 memories -, whenever all previous guidelines are fulfilled, then there is no penalty of any kind for these initiators to access a tiled object in any orientation, except for accesses to an interlaced frame in a 90° or 270° orientation where the memory bandwidth is twice the requested bandwidth.

When using up-to-32-bit DDR, lpDDR, lpDDR2 - or also up-to-16-bit DDR2 - SDRAM memories, all accesses, except interlaced accesses in a 90° or 270° orientation, are equally efficient and offer the full possible memory bandwidth.

Given its progressive nature, the page mode does not introduce any performance hit.

[Table 15-18](#) gives the ratio of effective data to transferred data at the external memory interface for these buffered raster-based initiators in each mode and orientation, when using a 32-bit DDR2 or DDR3 memory.

Table 15-18. Memory Data Payload for Buffered Raster-Based Initiators on 32-bit DDR2 or DDR3

	0° or 180° Orientation (S = 0)		90° or 270° Orientation (S = 1)	
	Progressive	Interlaced	Progressive	Interlaced
8-bit mode	100%	50%	100%	50%
16-bit mode	100%	50%	100%	50%
32-bit mode	100%	50%	100%	50%
Page mode	100%	N/A	100%	100%

When using 32-bit DDR2 or DDR3 SDRAM memories, whenever all previous guidelines are fulfilled, then there is no penalty of any kind for these initiators to access a tiled object in any orientation, except for accesses to an interlaced frame in any orientation where the memory bandwidth is twice the requested bandwidth.

When using DDR2 or DDR3 SDRAM memories, all accesses, except interlaced accesses, are equally efficient and offer the full possible memory bandwidth.

Similarly, the page mode does not introduce any performance hit.

15.2.4 DMM Use Cases and Tips

15.2.4.1 PAT Use Cases

There are five ways of using PAT:

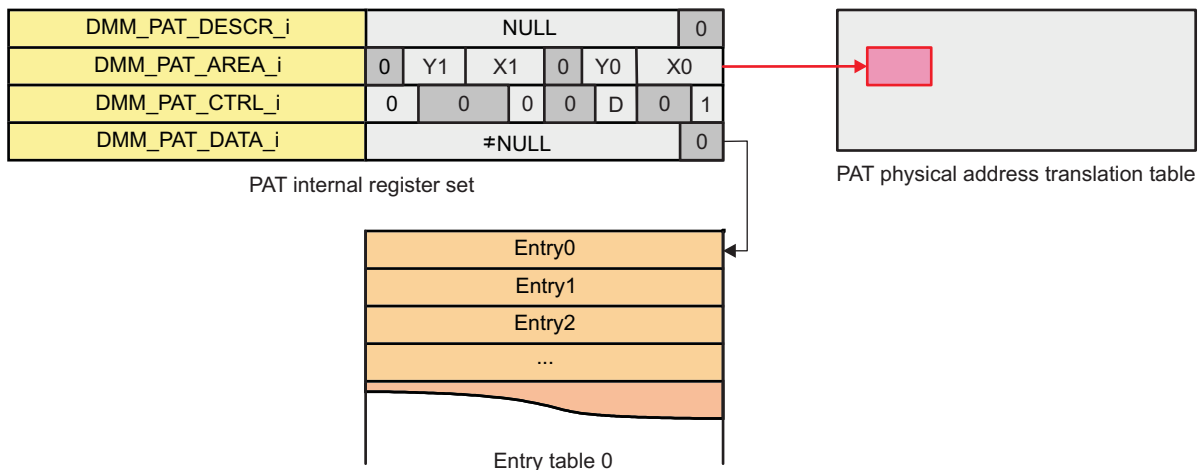

- Simple manual area refill
- Single auto-configured area refill
- Chained auto-configured area refill
- Synchronised auto-configured area refill
- Cyclic synchronized auto-configured area refill

15.2.4.1.1 Simple Manual Area Refill

These steps have to be performed to create the 16-byte aligned memory-mapped entry table containing all entries of the defined area (see [Figure 15-37](#)):

- Write the [DMM_PAT_AREA_i](#) register with the relevant (x0, y0) (x1, y1) area definition
- Write the [DMM_PAT_DATA_i](#) register with the physical address of the created entry table
- Write the [DMM_PAT_CTRL_i](#) register with the requested refill direction and assert the [DMM_PAT_CTRL_i\[0\]](#) START bit
- The refill is done when the [DMM_PAT_STATUS_i\[3\]](#) DONE bit is set
- A new refill can be initiated when the [DMM_PAT_STATUS_i\[0\]](#) READY bit is set

Figure 15-37. Simple Manual Area Refill Scheme

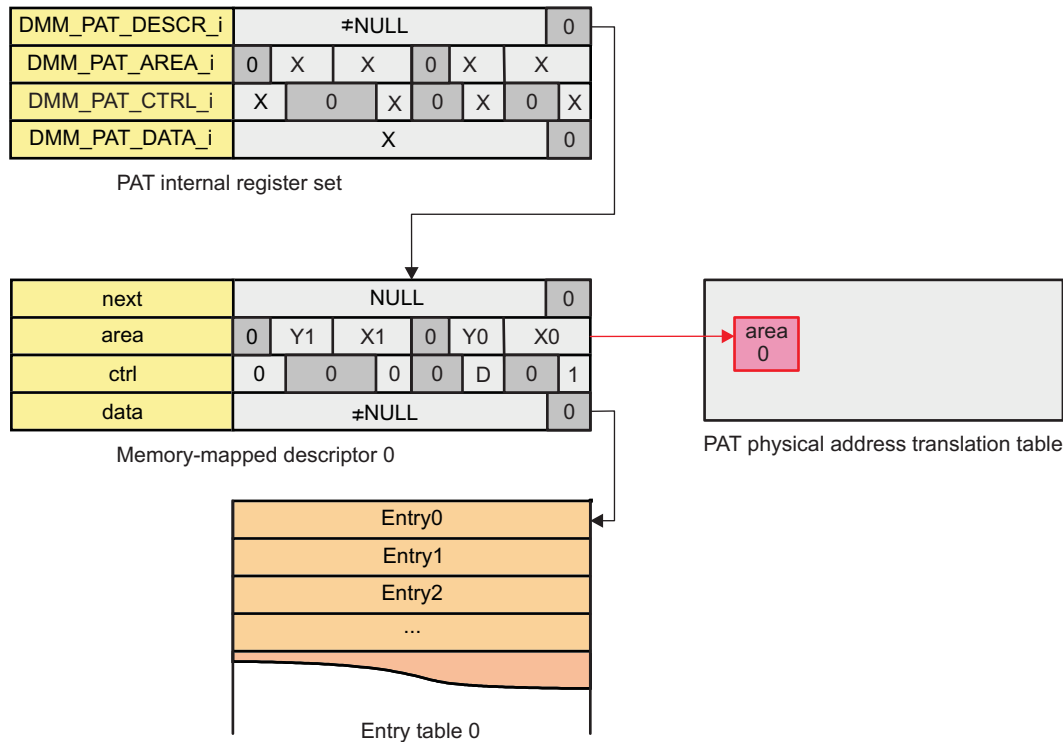

sdram-067

15.2.4.1.2 Single Auto-Configured Area Refill

These steps have to be performed to create the 16-byte aligned memory-mapped entry table containing all entries of the defined area (see [Figure 15-38](#)):

- Create a 16-byte aligned memory-mapped descriptor structure where:
 - the next field is set to NULL
 - the area field is set with the relevant (x0, y0) (x1, y1) area definition
 - the ctrl field is set with the requested direction D and the start bit asserted to start refilling as soon as this descriptor enters the PAT refill engine
 - the data field is set to the physical address of the created entry table
- The [DMM_PAT_DESCR_i](#) register with the physical address of the created descriptor
- The refill is done when the [DMM_PAT_STATUS_i\[3\]](#) DONE bit is set
- A new refill can be initiated when the [DMM_PAT_STATUS_i\[0\]](#) READY bit is set

Figure 15-38. Single Auto-Configured Area Refill Scheme

sdram-068

15.2.4.1.3 Chained Auto-Configured Area Refill

These steps have to be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see [Figure 15-39](#)):

- Create one 16-byte aligned memory-mapped descriptor structures per area where:
 - the next field is set to the physical address of the next descriptor or NULL for the last one
 - the area field is set with the relevant (x0, y0) (x1, y1) area definition
 - the ctrl field is set with the requested direction D and the START bit asserted to start refilling as soon as the previous area refill is done
 - the data field is set to the physical address of the corresponding entry table
- Write the `DMM_PAT_DESCR_i` register with the physical address of the first created descriptor
- Each area refill is done when the `DMM_PAT_STATUS_i[3]` DONE bit is set
- All area refills are done when the `DMM_PAT_STATUS_i[0]` READY bit is set
- A new refill can be initiated when the `DMM_PAT_STATUS_i[0]` READY bit is set

Figure 15-39. Chained Auto-Configured Area Refill Scheme

sdram-069

15.2.4.1.4 Synchronized Auto-Configured Area Refill

These steps have to be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see Figure 15-40):

- Create one 16-byte aligned memory-mapped descriptor structures per area where:
 - the next field is set to the physical address of the next descriptor or NULL for the last one
 - the area field is set with the relevant (x0, y0) (x1, y1) area definition
 - the ctrl field is set with the synchronising initiator identifier I, the SYNC bit asserted, the requested direction D, and the START bit asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area
 - the data field is set to the physical address of the corresponding entry table
- Write the DMM_PAT_DESCR_i register with the physical address of the first created descriptor
- Each area refill is done when the DMM_PAT_STATUS_i[3] DONE bit is set
- All area refills are done when the DMM_PAT_STATUS_i[0] READY bit is set
- A new refill can be initiated when the DMM_PAT_STATUS_i[0] READY bit is set

Figure 15-40. Synchronised Auto-Configured Area Refill Scheme

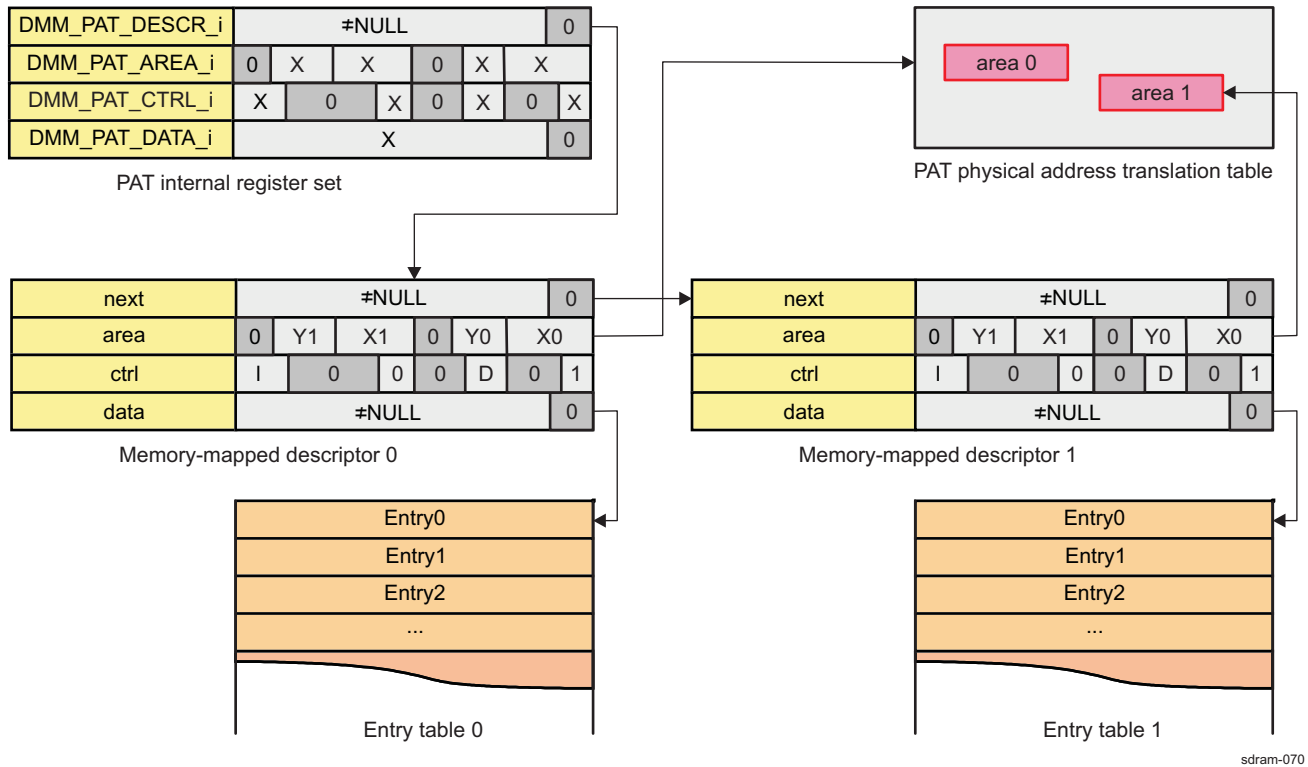

sdram-071

15.2.4.1.5 Cyclic Synchronized Auto-Configured Area Refill

These steps have to be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see [Figure 15-41](#)):

- Create one 16-byte aligned memory-mapped descriptor structures per area where:
 - the next field is set to the physical address of the next descriptor in the circular list
 - the area field is set with the relevant (x0, y0) (x1, y1) area definition
 - the ctrl field is set with the synchronising initiator identifier I, the SYNC bit asserted, the requested direction D, and the START bit asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area
 - the data field is set to the physical address of the corresponding entry table
- Write the [DMM_PAT_DESCR_i](#) register with the physical address of the initial descriptor
- Each area refill is done when the [DMM_PAT_STATUS_i\[3\]](#) DONE bit is set
- A new refill can be initiated by writing any value to the [DMM_PAT_DESCR_i](#) to abort the current one

Figure 15-41. Cyclic Synchronized Auto-Configured Area Refill Scheme

NOTE: Never use circular lists of descriptors where all descriptors have the `DMM_PAT_CTRL_i[0]` START bit set and no synchronisation. This leads to an endless continuous refill.

15.2.4.2 Addressing Management with LISA

15.2.4.2.1 Case 1: Use of Only One Memory Controller

In this example, we assume that we have 1 GB of external memory evenly spread onto two address spaces. We also want the address range for address space 0 to start at offset 0x2000_0000.

Table 15-19. Address Definition

Address Range	Memory Controller	Memory Controller Address Space ⁽¹⁾	Memory Controller Address Range
0x8000_0000 to 0x9FFF_FFFF	EMIF1	0x1	0x0000_0000 to 0x1FFF_FFFF
0xA000_0000 to 0xBFFF_FFFF	EMIF1	0x0	0x2000_0000 to 0x3FFF_FFFF

⁽¹⁾ For memory controller address spaces, see [Section 15.3.4.1.1, L3 Interface](#).

This configuration requires two non-overlapping sections to be set. They may be defined in any order since there is no concern with priority in this case, see [Table 15-20](#):

Table 15-20. Configuration

Bit Field	Section 0 (DMM_LISA_MAP_0)	Section 1 (DMM_LISA_MAP_1)
[31:24] SYS_ADDR	0x80	0xA0
[22:20] SYS_SIZE	0x5	0x5
[19:18] SDRC_INTL	0x0 (not applicable)	0x0 (not applicable)

Table 15-20. Configuration (continued)

Bit Field	Section 0 (DMM_LISA_MAP_0)	Section 1 (DMM_LISA_MAP_1)
[17:16] SDRC_ADDRSPC	0x1	0x0
[8] SDRC_MAP	0x1 (only one controller)	0x1 (only one controller)
[7:0] SDRC_ADDR	0x00	0x20

To check if an address hits a section, use the eight upper address bits of the address and mask them with the hit mask: $2^8 - 2^{\text{SYS_SIZE}}$. If the result is equal to SYS_ADDR, the section is hit.

To define the physical address to be issued to the memory controller, use the eight upper address of the system address, mask them with the address mask: $2^{\text{SYS_SIZE}} - 1$, and OR them with SDRC_ADDR. This will give you the resulting eight upper physical address bits. All lower address bits are forwarded unchanged.

Request to address 0x99AE_37F0:

- Upper address bits: 0x99
- Hit mask: $2^8 - 2^5 = 0xE0$
- Masked upper address bits: 0x80 -> hits section 0
- Address mask: $2^5 - 1 = 0x1F$
- Masked upper address bits: 0x19
- OR with SDRC_ADDR: 0x19
- Physical address: 0x19AE_37F0

This request will be forwarded to address 0x19AE_37F0, address space 1 of the memory controller.

Request to address 0xB7FF_0340:

- Upper address bits: 0xB7
- Hit mask: $2^8 - 2^5 = 0xE0$
- Masked upper address bits: 0xA0 -> hits section 1
- Address mask: $2^5 - 1 = 0x1F$
- Masked upper address bits: 0x17
- OR with SDRC_ADDR: 0x57
- Physical address: 0x57FF_0340

This request will be forwarded to address 0x57FF_0340, address space 0 of the memory controller.

15.2.4.2.2 Case 2: Use of the Two Memory Controllers

In the case of 512 MB interleaved at 128-byte boundaries and 256 MB noninterleaved on a second memory controller, one address space per memory controller, we have the following scenario:

Table 15-21. Address Definition

Address Range	Memory Controller	Memory Controller Address Space ⁽¹⁾	Memory Controller Address Range
0x8000_0000 to 0x9FFF_FFFF	EMIF1 and EMIF2, interleaved at 128-byte boundaries	0x0 on both controllers	0x0000_0000 to 0x0FFF_FFFF on both controllers
0xA000_0000 to 0xAFFF_FFFF	EMIF2 only	0x0	0x1000_0000 to 0x1FFF_FFFF

⁽¹⁾ For memory controller address spaces, see [Section 15.3.4.1.1, L3 Interface](#).

Two sections are used to map such a configuration, see [Table 15-22](#):

Table 15-22. Configuration

Bit Field	Section 0 (DMM_LISA_MAP_0)	Section 1 (DMM_LISA_MAP_1)
[31:24] SYS_ADDR	0x80	0xA0
[22:20] SYS_SIZE	0x5	0x4

Table 15-22. Configuration (continued)

Bit Field	Section 0 (DMM_LISA_MAP_0)	Section 1 (DMM_LISA_MAP_1)
[19:18] SDRC_INTL	0x1	0x0 (not applicable)
[17:16] SDRC_ADDRSPC	0x0	0x0
[8] SDRC_MAP	0x3	0x2
[7:0] SDRC_ADDR	0x00	0x10

Detecting a section hit is the same for the interleaved case as for the single controller case: to check if an address hits a section, use the eight upper address bits of the address and mask them with the hit mask: $2^8 - 2^{\text{SYS_SIZE}}$. If the result is equal to SYS_ADDR, the section is hit.

The physical address generation is modified for the interleaved case though. In case of a 256 bytes interleaving, the first chunk of 256 bytes is mapped to the first controller, the second chunk to the second controller, and so on. This results in system address bit 8 to be decoded as the controller indicator, 0 for the first controller and 1 for the second one (system address bit 7 would be used for interleaving at 128 bytes boundary, and bit 9 for 512 bytes). This bit is not included in the computed physical address, meaning the upper system address bits 9 to 31 are shifted to bits 8 to 30 when generating the physical address.

The rest of the address generation is handled the same as for the single controller case: to define the physical address to be issued to the memory controller, use the eight upper address of the system address, mask them with the address mask: $2^{\text{SYS_SIZE}} - 1$, and OR them with SDRC_ADDR. This will give you the resulting eight upper physical address bits. All lower address bits are forwarded unchanged.

Request to address 0x99AE_37F0:

- Upper address bits: 0x99
- Hit mask: $2^8 - 2^5 = 0xE0$
- Masked upper address bits: 0x80 -> hits section 0
- Address mask: $2^5 - 1 = 0x1F$
- Masked upper address bits: 0x19
- Full masked address: 0x19AE_37F0
- Bit 7 is 1 -> targets the second memory controller
- Full masked shifted address (suppressing bit 7): 0x0CD7_1BF0 (see [Section 15.2.4.2.2.1](#))
- OR upper physical address bits with SDRC_ADDR: 0x0CD7_1BF0
- Physical address: 0x0CD7_1BF0

This request will be forwarded to address 0x0CD7_1BF0, address space 0, of the second memory controller.

15.2.4.2.2.1 Address Upper Bits Shifting**Table 15-23. Address Upper Bits Shifting**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15.2.5 DMM Basic Programming Model

The programming model section:

- Describes how objects can be addressed in all TILER modes and orientations
- Explains how the physical containers and physical address translation (PAT) look-up table (LUT) can be shared between different modes
- Does not give an exhaustive description of all TILER and DMM registers, because these are described in [Section 15.2.3.5, DMM](#) and [Section 15.2.3.6, TILER](#).

15.2.5.1 Global Initialization

This section identifies the requirements of initializing the surrounding modules when the DMM module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DMM.

Table 15-24. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
Power, Reset and Clock Management (PRCM)	The module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management .
Dual Cortex™ - M3 microprocessor unit (MPU)	Cortex-M3 interrupt controller (INTC) configuration must be done to enable the interrupts from DMM module. See Chapter 17, Interrupt Controllers .
Dual Cortex™ - A9 MPU	Cortex-A9 INTC configuration must be done to enable the interrupts from DMM module. See, Chapter 17, Interrupt Controllers .
L3 Interconnect	Data Interface

15.2.5.2 DMM Module Global Initialization

This procedure initializes the DMM after a power-on reset.

Table 15-25. DMM Global Initialization

Step	Register/ Bit Field / Programming Model	Value
Configure the DMM for Smart-Idle power management mode	DMM_SYSCONFIG [3:2] IDLE_MODE	0x2

15.2.5.3 DMM Operational Modes Configuration

15.2.5.3.1 Different Operational Modes

The TILER can be virtually accessed in four different modes, namely 8-bit, 16-bit, 32-bit and page modes. Each mode defines the element granularity to apply isometric transforms, as summarized in [Table 15-28](#)

Table 15-26. Coding and Description of TILER Modes

Mode	Name	Granularity (element size)
0	8 - bit tiled mode	8 bits
1	16 - bit tiled mode	16 bits
2	32 - bit tiled mode	32 bits
3	Page mode	4096 bytes

15.2.5.3.2 Configuration Settings and LUT Refill

Table 15-27. Configuration Settings and LUT Refill

Step	Register/Bit Field/Programming Model	Value
PAT configuration refill Engine 0	DMM_PAT_CONFIG[0] MODE0	xxx
PAT configuration refill Engine 1	DMM_PAT_CONFIG[1] MODE1	xxx
Set DMM PAT View register value for each initiator	DMM_PAT_VIEW0 Vx DMM_PAT_VIEW1 Vx	xxx
Set DMM PAT Write enable for the initiators	DMM_PAT_VIEW0 Wx DMM_PAT_VIEW1 Wx	xxx
Choosing container type and access method	DMM_PAT_VIEW_MAP_i	xxx
Define the base address of all view mappings	DMM_PAT_VIEW_MAP_BASE[31] BASE_ADDR	xxx
Set area definition for DMM physical address translator	DMM_PAT_AREA_i	xxx
Set physical address of the current table refill entry data or entry data when in manual mode	DMM_PAT_DATA_i[31:4] ADDR	xxx
Define the direction of this PAT table refill (S Y X), different from 0x011	DMM_PAT_CTRL_i[6:4] DIRECTION	xxx
Start a PAT table refill	DMM_PAT_CTRL_i[0] START	0x1

15.2.5.3.3 Interleaving Settings

Table 15-28. Interleaving Settings

Step	Register/Bit Field/Programming Model	Value
Set DMM system section address MSB	DMM_LISA_MAP_i[31:24] SYS_ADDR	xxx
Set DMM system section size	DMM_LISA_MAP_i[22:20] SYS_SIZE	xxx
Set SDRAM controller interleaving mode	DMM_LISA_MAP_i[19:18] SDRC_INTL	xxx
Set SDRAM controller address space	DMM_LISA_MAP_i[17:16] SDRC_ADDRSPC	xxx
Set SDRAM controller mapping	DMM_LISA_MAP_i[9:8] SDRC_MAP	xxx
Set SDRAM controller address MSB	DMM_LISA_MAP_i[7:0] SDRC_ADDR	xxx

15.2.5.3.4 Aliased Tiled View Orientation Settings and LUT Refill

Table 15-29. Aliased Tiled View Orientation Settings and LUT Refill

Step	Register/Bit Field/Programming Model	Value
Set DMM TILER orientation for each initiator	DMM_TILER_OR0 ORx DMM_TILER_OR1 ORx	xxx
Set DMM TILER write enable for the initiators	DMM_TILER_OR0 Wx DMM_TILER_OR1 Wx	xxx
Define the base address of all view mappings	DMM_PAT_VIEW_MAP_BASE[31] BASE_ADDR	xxx
DMM PAT initiator for synchronisation	DMM_PAT_CTRL_i[31:28] INITIATOR	xxx
Set DMM PAT table reload synchronisation	DMM_PAT_CTRL_i[16] SYNC	xxx
Set DMM PAT LUT index	DMM_PAT_CTRL_i[9:8] LUT_ID	xxx
Define the direction of this PAT table refill (S Y X)	DMM_PAT_CTRL_i[6:4] DIRECTION	xxx
Start a PAT table refill	DMM_PAT_CTRL_i[0] START	0x1

15.2.5.3.5 Priority Settings

Table 15-30. Priority Settings

Step	Register/Bit Field/Programming Model	Value
Set priority for each initiator	DMM_PEG_PRIO_k Px	xxx
Set write enable for P_PAT field	DMM_PEG_PRIO_PAT[4]W_PAT	xxx
Set priority for PAT engine	DMM_PEG_PRIO_PAT[2:0]P_PAT	xxx

15.2.5.3.6 Error Handling

Table 15-31. Error Handling

Step	Register/Bit Field/Programming Model	Value
Enable interrupt for selected type of error	DMM_PAT_IRQENABLE_SET[15:9] DMM_PAT_IRQENABLE_SET[7:0]	xxx
when interrupt occurs		
Disable type of error to handle	DMM_PAT_IRQENABLE_CLR[15:9] DMM_PAT_IRQENABLE_CLR[7:0]	xxx
Check error status	DMM_PAT_IRQSTATUS[15:9] DMM_PAT_IRQSTATUS[7:0]	xxx

15.2.5.3.7 PAT Programming Model

The purpose of the PAT is to map the tiled data anywhere in the 4GB physical address range, with a PAGE granularity. (The TILER page is the granularity of physical memory allocation in TILER container. Each page is 4kiB).

A PAT view is defining the kind of physical address translation to perform for each of the page, 8-bit, 16-bit and 32-bit mode accesses. Each mode in each PAT view can be programmed in 2 different modes (direct translation and indirect translation).

15.2.5.3.7.1 PAT in Direct Translation Mode

In this mode, the PAT performs a translation of the 128MB virtual container as a whole in the physical address space (that is, in the SDRAM). This mode is used only for debug or in case of a DMM without PAT module.

15.2.5.3.7.2 PAT in Indirect Translation Mode

This is the most commonly mode used. In this mode, the PAT performs a translation of each 4kB page individually. In this way the 128MB virtual address space can be scattered in the whole 2GB of the physical address space. This is achieved by using a 32678-word look-up table (LUT) which converts each page index (32768 possible values) into 19 address bits representing this page address in the physical memory. The main characteristic of this mode is: no constraint on the use of the physical memory except that it is using a multiple of 4kB areas located at 4kB boundaries in the physical memory.

In this mode the translation vector is found in the internal 32-k entry physical address translation vector table at the index given by bits 12 to 26 of the input virtual address, and the CONT_x = 0.

Programming sequence:

- Set in [DMM_PAT_VIEW0](#) (or [DMM_PAT_VIEW1](#) depending on the L3 CONN_ID of the initiator which is supposed to perform the tiled accesses) with the appropriate value. For example, if the L3 CONN_ID equals 0, then the register [DMM_PAT_VIEW0](#) should be programmed with the value 0x0000_0001 (PAT view 1 selected for initiator 0)
- [DMM_PAT_VIEW_MAP_BASE\[31\]](#) = 0x8000_0000 (should always be programmed at 1 to select the upper 2GB of the physical address space which corresponds to the external memory)
- set all 16bit tiled accesses in indirect translation mode by setting at least the field ACCESS_16 at 1 ([DMM_PAT_VIEW_MAP_1](#) = 0x0000_8000), program [DMM_PAT_VIEW_MAP_1](#) at 0x8080_8080.

15.2.5.4 Addressing an Object in Tiled Mode

The purpose of this sub-section is to describe how a frame-buffer with a top-left pixel located at (x₀,y₀) in the natural view container and a bottom right pixel located at (x₁,y₁) in the natural view container is addressed in any tiled mode and orientation.

15.2.5.4.1 Frame Buffer Addressing

NOTE: In this sub-section, the (x,y) coordinates are given in pixel units.

Given a (S, \bar{Y} , \bar{X}) orientation, the (x,y) coordinates of the first pixel of the frame in the oriented view (with W the width and H the height in pixels of the container in the considered frame mode) is:

(x,y) = (x_{or}, y_{or}) when S, (y_{or}, x_{or}) otherwise
with:

x_{or} = x₀ when \bar{X} , W-1-x₁ otherwise

y_{or} = y₀ when \bar{Y} , H-1-y₁ otherwise

Given a (M₁, M₀) TILER mode where M₁ ≠ 0 or M₀ ≠ 0, the size in bytes of a pixel is 2^{2M₁+M₀}.

Therefore, given a (S, \bar{Y} , \bar{X}) orientation and a (M₁, M₀) TILER mode where M₁ ≠ 0 or M₀ ≠ 0, the byte offset of the base address of the considered oriented frame in its container is:

base_address((x₀, y₀), (x₁, y₁), (S, \bar{Y} , \bar{X}), (M₁, M₀)) = (y_{or}W + x_{or}) P₅ when S, (x_{or}H + y_{or}) P₅ otherwise
with:

x_{or} = x₀ when \bar{X} , W-1-x₁ otherwise

y_{or} = y₀ when \bar{Y} , H-1-y₁ otherwise

P₅ = 2^{2M₁+M₀}

In its natural orientation, the TILER container consists of 8192 lines of 16384 pixels of 8 bits, or 4096 lines of 16384 pixels of 16 bits, or 4096 lines of 8192 pixels of 32-bits.

Figure 15-42. Example of 8-Bit Frame-Buffer Addressing in any Orientation

sdram-075

This frame-buffer address generation is independent from the page size. For instance, the 8-bit frame-buffer described in Figure 15-42 and ranging from the top-left pixel located at (16, 32) to the bottom-right pixel located at (223, 159) in the natural orientation view, corresponds to the 29-bit view address offsets and full 33-bit TILER addresses given in Table 15-32.

Table 15-32. 29-Bit View Address Offset and 33-Bit Full TILER Address for an 8-Bit Frame-Buffer

S	Y	X	x _{or}	y _{or}	29-bit address offset in view	Full 33-bit TILER address
0	0	0	16	32	00080010h	100080010h
0	0	1	16160	32	00083F20h	120083F20h
0	1	0	16	8032	07D80010h	147D80010h
0	1	1	16160	8032	07D83F20h	167D83F20h
1	0	0	16	32	00020020h	180020020h
1	0	1	16160	32	07E40020h	1A7E40020h
1	1	0	16	8032	00021F60h	1C0021F60h
1	1	1	16160	8032	07E41F60h	1E7E41F60h

In this example the TILER is addressed in 8-bit mode, which translates to addresses with all mode bits - bits 27 and 28 - cleared in both the 29-bit address offset in view and full 33-bit TILER address.

15.2.5.4.2 TILER Page Mapping

Let:

- c (c = 0, 1 or 2) be the TILER page configuration (0 for 4 kiB, 1 for 16 kiB and 2 for 64 kiB pages)
- (x₀, y₀) be the top left pixel and (x₁, y₁) be the bottom right pixel of a frame in its natural orientation

W be the width and H the height in pixels of the container in the considered frame mode
The top left page coordinate (P_{x0}, P_{y0}) and bottom right page coordinates (P_{x1}, P_{y1}) corresponding to the frame are given by: $P_{x0} = (64 \cdot x_0 \cdot 2^{2-c}) / W$, $P_{y0} = (32 \cdot y_0 \cdot 2^{2-c}) / H$, $P_{x1} = (64 \cdot x_1 \cdot 2^{2-c}) / W$ and $P_{y1} = (32 \cdot y_1 \cdot 2^{2-c}) / H$.

In its natural orientation, the TILER container consists of 8192 lines of 16384 pixels of 8 bits, or 4096 lines of 16384 pixels of 16 bits, or 4096 lines of 8192 pixels of 32-bits.

NOTE: The page area type has the exact same structure as the [DMM_PAT_AREA_i](#) registers. For instance, the 8-bit frame-buffer described in [Figure 15-42](#) and ranging from the top-left pixel located at (16, 32) to the bottom-right pixel located at (223, 159) in the natural orientation view, is mapped from the top-left page located at P0,0 to the bottom-right page located at P3,2.

15.2.5.5 Addressing an Object in Page Mode

In page mode, the orientation only modifies the sequence of accessed pages, not their content. In this respect the orientation shall be seen as a way to optimise the 1D object allocation in a TILER container by allowing a 1D object spanning on multiple pages to map a set of adjacent pages in any direction. For instance, a 1.25 MiB object, mapped on 320 pages of 4 kiB can be allocated in a TILER container in any of the eight orientations, see [Section 15.2.3.6.1.7.3, Element Ordering in the TILER Container](#).

The initial page can be chosen freely among all pages. In this respect, the address offset of a page in a TILER container is expressed as:

Let:

- c (c = 0, 1 or 2) be the TILER page configuration (0 for 4 kiB, 1 for 16 kiB and 2 for 64 kiB pages)
- (S, Y, X) be the orientation of the considered 1D object in page mode
- (P_x, P_y) be the coordinate of the initial page in the natural orientation view

The byte offset of the base address of the considered initial page in its oriented container is:
base_address((P_x, P_y), (S, Y, X)) = 4096.(64.y_{or}.2^{2-c} + x_{or}).2^{2-c} when S, 4096.(32.x_{or}.2^{2-c} + y_{or}).2^{2-c} otherwise
with:

x_{or} = P_x when X, 64.2^{2-c}-1-P_x otherwise

y_{or} = P_y when Y, 32.2^{2-c}-1-P_y otherwise

For instance, a 1-D object starting from the page P32,63 in the natural orientation view on a DMM using 4-kiB pages, corresponds to the 29-bit view address offsets and full 33-bit TILER addresses given in [Table 15-33](#).

Table 15-33. 29-Bit View Address Offset and 33-Bit Full TILER Address for a 1D Object

S	Y	X	x _{or}	y _{or}	29-bit address offset in view	Full 33-bit TILER address
0	0	0	32	63	1BF20000h	11BF20000h
0	0	1	223	63	1BFDF000h	13BFDF000h

In this example the TILER is addressed in page mode, which translates to addresses with mode bits - bits 27 and 28 - set in both the 29-bit address offset in view and full 33-bit TILER address.

15.2.5.6 Sharing Containers Between Different Modes

When allocating objects in TILER containers, some care must be taken to ensure that any two objects do not physically overlap.

In this respect, and to ease the object allocation and de-allocation, it is strongly advised to only share a TILER page for different objects that:

- Belong to the same mode and
- That have the exact same lifetime - that are allocated and de-allocated simultaneously.

Two objects of different modes can physically overlap if:

- One physical page is mapped twice in two different locations of the DMM LUT
- The two objects share the DMM LUT and the intersection of their two page set is non empty.

These two issues can be easily avoided by only allocating a physical page once in the DMM LUT.

The second issue is a bit trickier, especially if the allocation of objects in the various TILER containers has to be dynamic. Managing the fragmentation within a flat memory model in a space-constrained system is not straightforward - and is the main reason for the existence of memory management units in most current processors - but adding yet another constraint to the problem - the y dimension - makes it really difficult.

Coming back to the CPU-analogy, the memory fragmentation issue has been mostly solved by:

- Using a virtual memory space much larger than the actual physical memory space,
- Using virtual-to-physical translation system

to allow contiguous virtual memory allocation when:

- Sufficient physical memory is available,
- The larger contiguous physical buffer is smaller than the requested memory allocation.

Similarly, the DMM answer to this object allocation in the TILER containers is two-folds:

1. The DMM has to be dimensioned to have sufficient virtual address space in all modes to permit a static allocation of a pool of virtual buffers in all TILER modes for all TILER-aware initiators
2. Each TILER-aware initiator has to dynamically manage its own pool of virtual buffers.

15.2.6 DMM Register Manual

This section provides information about the DMM instance in this product. [Table 15-35](#) provides a summary of the DMM registers. The remaining parts of this section describe the registers within the module instance.

15.3 EMIF Controller

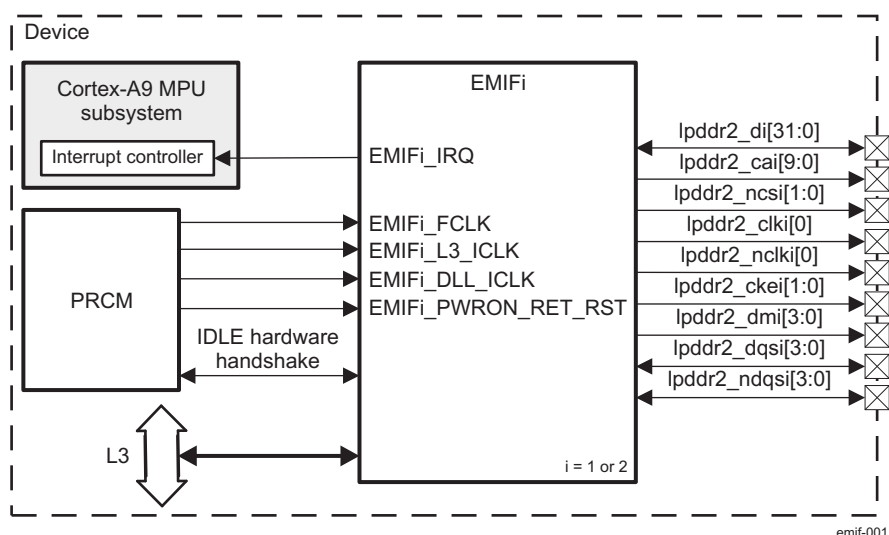

This section describes the features and functions of the external memory interface (EMIF) module of the device.

15.3.1 EMIF Module Overview

The EMIF module provides connectivity between the device and the LPDDR2-type memories and manages data bus read/write accesses between external memories, the microprocessor unit (MPU), and the direct memory access (DMA) controller.

The device includes two EMIF controllers. [Figure 15-43](#) shows an overview of the EMIF module.

Figure 15-43. EMIF Module Overview

15.3.1.1 EMIF Module Main Features

The EMIF module supports the following features:

- JEDEC standard compliant LPDDR2-SDRAM (S2 and S4) and LPDDR2-NVM devices.
- Two GB SDRAM address range over two chip-selects (1GB per CS) (configurable with the DMM module, see [Section 15.2, Dynamic Memory Manager](#) for more information)
- Two independent chip-selects with their corresponding register sets and independent page tracking
- Both chip-selects must have the same memory type and size if they are both SDRAM or both NVM. LPDDR2-SDRAM can be used in parallel with LPDDR2-NVM and can have a different size.
- Flexible address muxing scheme which permit to choose different bank mapping allocation by configuring the bank, column and row address decoding ordering
- 16 or -32-bit data path to external SDRAM memory
- LPDDR2 devices with 1, 2, 4 or 8 of internal banks
- Data bus widths:
 - 128-bit L3 interconnect Data Bus Width
 - 16 and 32-bit SDRAM Data Bus Width
- CAS latencies: 3, 4, 5, 6, 7 and 8
- 256, 512, 1024, and 2048-word page sizes
- Burst lengths: 8
- Sequential burst type
- SDRAM auto initialization from reset or configuration change
- Bank Interleaving across both the chip-selects if same memory type

- Self Refresh and Precharge Power-down modes for low power (per chip-select, manual entry/exit Self-Refresh and Deep Power-down modes)
- Deep Power-down mode for low power
- Partial Array Self Refresh and Temperature Controlled Self Refresh modes for low power. Temperature Controlled Self Refresh is only supported for mobile SDRAM having on-chip temperature sensor.
- Prioritized refresh
- Programmable SDRAM refresh rate and backlog counter
- Output impedance (ZQ) calibration
- Temperature monitoring

15.3.1.2 Not supported Features

EMIF module does not support :

- Interleave burst type
- Auto precharge
- Active Power-down
- Per-bank refreshes for LPDDR2-SDRAM

15.3.1.3 EMIF Overall Architecture

Figure 15-44 shows the EMIF connection with the surrounding modules.

Figure 15-44. EMIF Overall Architecture

emif-007

15.3.2 EMIF Environment

This section describes the EMIF application fields from an environment point of view (external connections).

Figure 15-45 shows an the EMIF generic configuration.

Figure 15-45. EMIF Generic Configuration

emif-006

15.3.2.1 EMIF Signals

Table 15-92 describes the module signals and specifies their links to functions.

Table 15-92. I/O Signals

Signal	I/O ⁽¹⁾	Description
EMIF1		
$lpddr21_dq[31:0]$	I/O	Data bus
$lpddr21_ca[9:0]$	O	Double data rate command/address
$lpddr21_ncs[1:0]$	O	Chip-selects 1-0 (active low)
$lpddr21_clk$	O	Clock
$lpddr21_nclk$	O	Clock invert
$lpddr21_ckej[1:0]$	O	Clock enables 1-0
$lpddr21_dm[3:0]$	I/O	Data mask
$lpddr21_dqs[3:0]$	I/O	Data strobe
$lpddr21_ndqs[3:0]$	I/O	Data strobe invert

⁽¹⁾ I = Input; O = Output

Table 15-92. I/O Signals (continued)

Signal	I/O ⁽¹⁾	Description
EMIF2		
lpddr22_dq[31:0]	I/O	Data bus
lpddr22_ca[9:0]	O	Double data rate command/address
lpddr22_ncs[1:0]	O	Chip-selects 1-0 (active low)
lpddr22_clk	O	Clock
lpddr22_nclk	O	Clock invert
lpddr22_cke[1:0]	O	Clock enables 1-0
lpddr22_dm[3:0]	I/O	Data mask
lpddr22_dqs[3:0]	I/O	Data strobe
lpddr22_ndqs[3:0]	I/O	Data strobe invert

CKE memory pin is dynamically driven by the SDRAM controller according to the memory interface activity. Each chip-select has its own CKE pin, so that each chip-select can be independently controlled in terms of power-down mode, deep power-down mode and self refresh.

Each LPDDR2 channel, that is, each EMIF controller may be connected to two external LPDDR2 memories. See [Section 15.2](#), *DMM* of the device for more information.

15.3.3 EMIF Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 15-46 shows the EMIF1 module integration in the device.

Figure 15-46. EMIF1 Integration

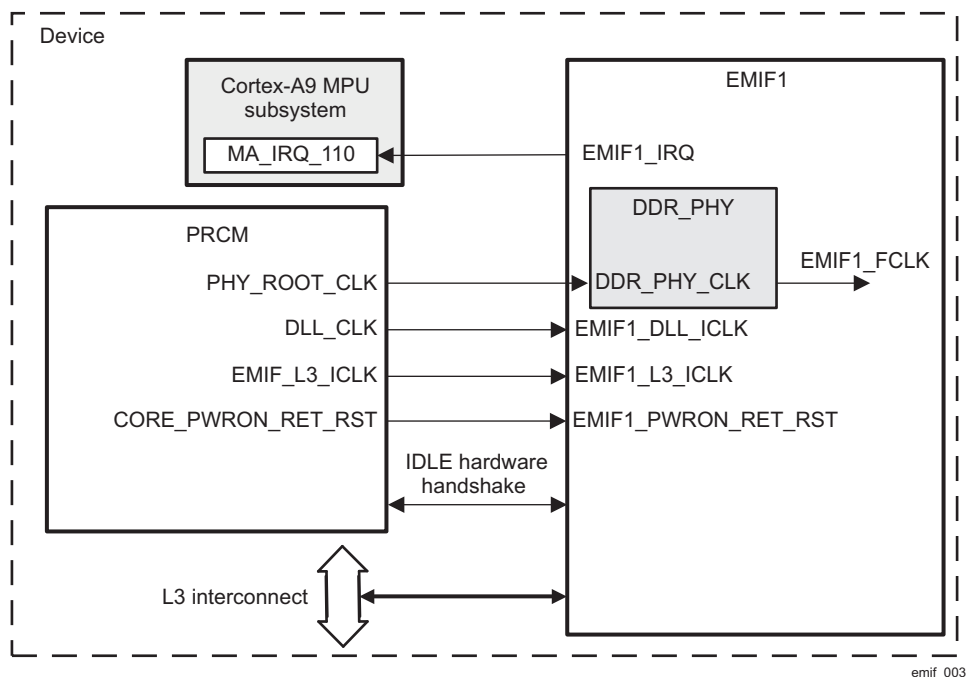

Figure 15-47 shows the EMIF2 module integration in the device.

Figure 15-47. EMIF2 Integration

NOTE: DDR_PHY_CLK is equal to PHY_ROOT_CLK divided by 2. EMIF_i_FCLK is equal to DDR_PHY_CLK divided by 2.

For more information about the EMIF clocking scheme, see [Chapter 3, Power, Reset, and Clock Management](#).

NOTE: For more information about the IDLE hardware handshake, see [Chapter 3, Power, Reset, and Clock Management](#) of the device.

Table 15-93 through Table 15-95 summarize the integration of the module in the device.

Table 15-93. Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-up Capability	Interconnect
EMIF1	PD_CORE	No	L3
EMIF2	PD_CORE	No	L3

Table 15-94. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description
EMIF1	EMIF1_FCLK	EMIF_FCLK	PRCM	EMIF1 core functional clock
	EMIF1_DLL_ICLK	DLL_CLK	PRCM	interface clock
	EMIF1_L3_ICLK	EMIF_L3_ICLK	PRCM	Interface clock
EMIF2	EMIF2_FCLK	EMIF_FCLK	PRCM	EMIF2 core functional clock

EMIF2	EMIF2_IRQ	MA_IRQ_111	Cortex-A9 INTC	Interrupt to the MPU subsystem
No DMA Requests				

NOTE: About interrupt source description, see [Section 15.3.4.5, Interrupt Requests](#).

15.3.4 EMIF Functional Description

15.3.4.1 Block Diagram

EMIF is a L3-bus peripheral providing an interface to LPDDR2 memories.

Figure 15-48 shows the interconnection between the EMIF module and the other modules.

DLLs are used to delay the input DQS signals during reads, so that these strobe signals can be used to latch incoming data on the DQ pins, as required by the LPDDR2 standard.

PHYs are hard macros that convert single data rate (SDR) signals to double data rate (DDR).

Figure 15-48. EMIF Block Diagram

15.3.4.1.1 L3 Interface

EMIF supports two local interfaces - one that connects to the System Interconnect and the other that connects to a Low-latency Master. These interfaces are used to request all external memory device accesses, to access the EMIF registers, and to transfer all data to/from the EMIF controller. Table 15-96 shows the MAddrSpace mapping to different chip-selects.

Table 15-96. MAddrSpace Mapping to Chip-Selects

MAddrSpace ⁽¹⁾	Chip-Select	Description
0x0	CS[1:0]	SDRAM(s)
0x1	CS1	LPDDR2-NVM (can be connected to CS1 only)
0x2	N/A	Reserved
0x3	N/A	Internal registers

⁽¹⁾ See DMM_LISA_MAP_i [17:16] SDRC_ADDRSPC register in Section 15.2, Dynamic Memory Manager.

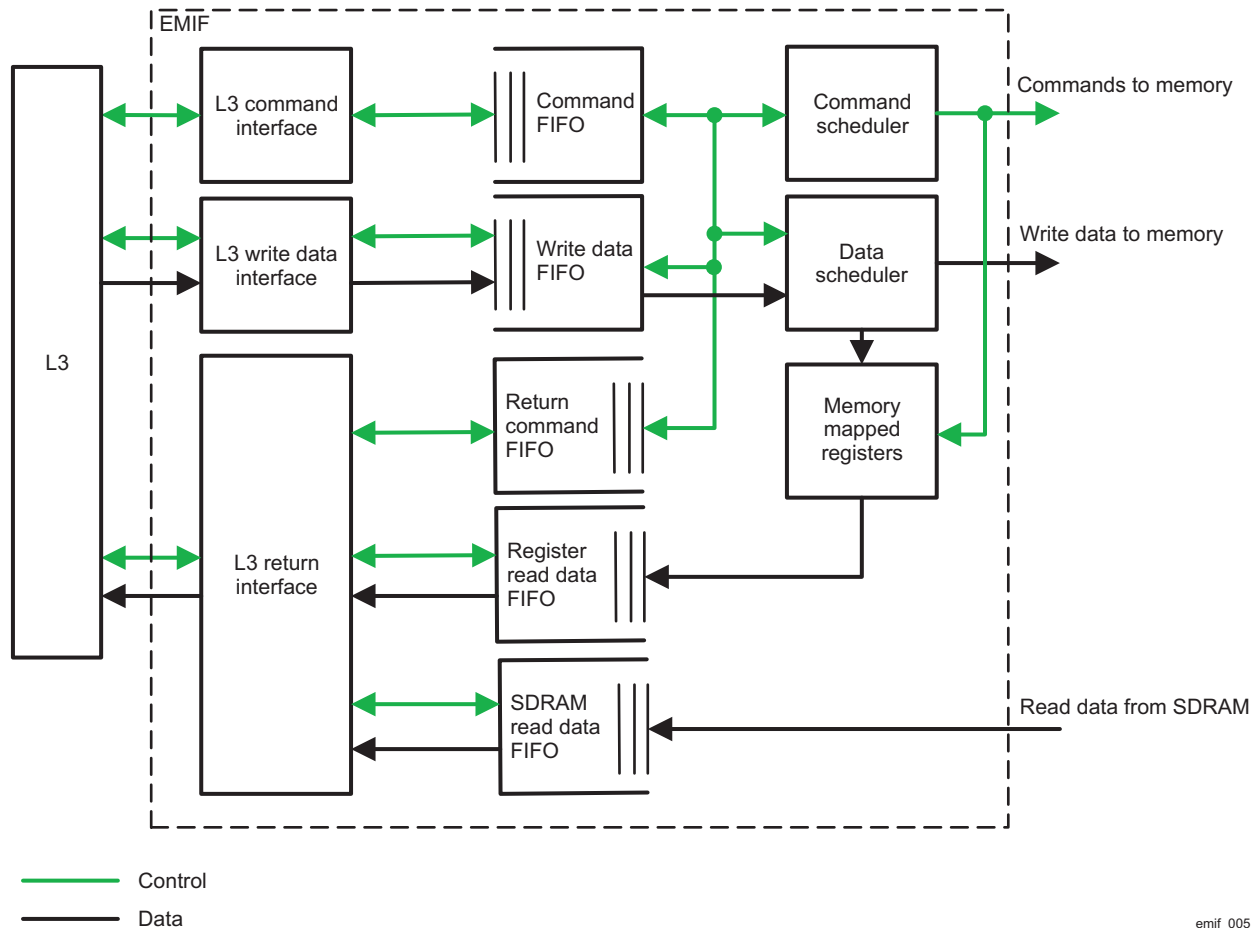

15.3.4.1.2 FIFOs Description

EMIF contains the following FIFOs:

- Command FIFO
- Write Data FIFO
- Return Command FIFO
- Two Read Data FIFOs

Figure 15-49 shows the overall architecture of the EMIF module.

Figure 15-49. FIFO Block Diagram

The System (128-bit) L3 interface being the main interface has higher allocation of FIFO slots than the Low-latency (64-bit) L3 interface. The entries allocation is shown in Table 15-97.

Table 15-97. FIFO Allocation

Parameter	System L3-Interface entries	Low-Latency L3-Interface entries
Command FIFO	Programmable ⁽¹⁾	Programmable ⁽¹⁾
Write Data FIFO	20	5
Return Command FIFO	22	17
SDRAM Read Data FIFO	22	17
Register read Data FIFO	2	2

⁽¹⁾ The total number of entries in the command FIFO is 10.

The command FIFO is shared between the two L3 interfaces, whereas there are two different FIFOs for each other type, one dedicated to each L3 interface.

The Command FIFO stores all the commands coming in on the L3 command interface. The allocation of entries in the Command FIFO is programmable per L3 interface using the [EMIF_L3_CONFIG\[27:24\]REG_SYS_THRESH_MAX](#) and [EMIF_L3_CONFIG\[19:16\]REG_LL_THRESH_MAX](#) bit fields.

If the addition of the [EMIF_L3_CONFIG\[27:24\]REG_SYS_THRESH_MAX](#) and [EMIF_L3_CONFIG\[19:16\]REG_LL_THRESH_MAX](#) fields is greater than the number of entries in the Command FIFO, the allocation would depend on the traffic on the interfaces. For example, if both the fields are programmed to 7, then either of the interfaces can use 7 entries in the Command FIFO if the other interface is idle. If both the interfaces have traffic, then the EMIF would start gradually allocating entries to both interfaces until it settles down to 7 entries for the low-latency interface and 3 for system interface since the low-latency interface has higher priority. If low-latency interface has no traffic, the system interface can use 7 entries.

The allocation would also depend on the traffic on the interfaces, if the [EMIF_L3_CONFIG\[27:24\]REG_SYS_THRESH_MAX](#) and [EMIF_L3_CONFIG\[19:16\]REG_LL_THRESH_MAX](#) fields are both programmed to be equal to or greater than the number of entries in the Command FIFO. For example, if both the fields are programmed to 10, then the low-latency port can use all the entries if there is no traffic on the system interface. However, if there is no traffic on the low-latency interface, the system interface can use all but one entry. This is because the low-latency interface has higher priority than the system interface. The only way for the system interface to use all command FIFO entries is to set the [EMIF_L3_CONFIG\[19:16\]REG_LL_THRESH_MAX](#) to zero. Writing a zero will reserve no space for the associated interface. In the event the value is set to zero and a request is seen for that interface, the command FIFO will assume a value of 1 for that interface.

The Write Data FIFO stores the write data for all the write transactions coming in on the L3 write data interface (when the Write Data FIFO is not full).

The Return Command FIFO stores all the return transactions that are to be issued to the L3 return interface. These include the write status return and the read data return commands.

There are two Read Data FIFOs that store the read data to be sent to the L3 return interface. One Read Data FIFO stores read data from the memory mapped registers. The other Read Data FIFO stores read data from external memory.

A write command is executed only when four L3 words of the corresponding data is received in the Write Data FIFO, or when it is the last data, and if there is space in the Return Command FIFO. The EMIF will schedule a read only if the results can fit into both the Return Command FIFO and the corresponding Read Data FIFOs.

15.3.4.1.3 Arbitration

The EMIF looks at all the commands stored in the Command FIFO to schedule commands to the external memory. All commands with the same MConnID on a particular L3 interface will complete in order. The EMIF does not guarantee ordering between commands with different MConnID or between commands from two L3 interfaces. For more information about L3 interconnect terms (MConnID, MCMD, MADDR, ...) see [Section 13.2, L3 Interconnect](#)

However, the EMIF will maintain data coherency. Therefore, the EMIF will block a command, regardless of priority or L3 interface, if that command is to the same block address (2048 bytes) as an older command which has not completed.

Thus, the EMIF might have one pending read or write for each MConnID. Among all pending reads, the EMIF selects all reads that have their corresponding SDRAM banks already open. Similarly, among all pending writes, the EMIF selects all writes that have their corresponding SDRAM banks already open. Accesses to memory mapped registers are treated as accesses that have open banks.

As a result of the above reordering, the EMIF might now have several pending reads and writes that have their corresponding banks open. The EMIF then selects the highest priority read from pending reads, and the highest priority write from pending writes. Commands from the low-latency L3 interface have higher priority over the commands from the system L3 interface. If two or more commands have the highest priority, the EMIF selects the oldest command. As a result, the EMIF might now have the next read and a write command. If the Return Command FIFO and the Read Data FIFO has space and the external bus conflict is resolved, the EMIF performs the final read command before the final write command. If the Return Command FIFO has space but the Read Data FIFO is full, the EMIF performs the final write command before the final read command.

Resolution of external bus conflict means all the SDRAM command to command counters are satisfied and the read to write or write to read turn around time is met.

The EMIF does not support tag interleaving. In other words, for a L3 interface, the EMIF completes executing a L3 command before it switches to another command. The EMIF can however interleave execution between commands from two L3 interfaces.

The data coherency inside the EMIF is only guaranteed in a single level of L3 infrastructure. For example, if a write from a secondary L3 bus segment is blocked by a bridge element, the read from a tertiary bus can still beat the write to the EMIF. In such a case, in order to confirm that a write from master A has landed before a read from master B is performed, master A must wait for the write status from the EMIF before indicating to master B that the data is ready to be read. If master A does not use the L3 wait status, it must perform the following sequence of operations:

1. Perform the required write
 2. Perform a dummy write to the [EMIF_MOD_ID_REV](#) register
 3. Perform a dummy read to the [EMIF_MOD_ID_REV](#) register
 4. Indicate to the master B that the data is ready to be read after completion of read in step 3. The completion of read in step 3 ensures that the previous writes were done
- Apart from reads and writes the EMIF also needs to open and close SDRAM banks, and maintain the refresh counts for a SDRAM. The priority of SDRAM commands with respect to refresh levels are as follows:

1. SDRAM Refresh request when Refresh-Must level is reached (highest priority)
 2. L3 request for a read without a higher priority write
 3. SDRAM Refresh request when Refresh-Need level is reached
 4. L3 request for a write
 5. SDRAM Activate commands
 6. SDRAM Deactivate commands
 7. SDRAM Deep Power-Down request
 8. SDRAM Refresh request when Refresh-May level is reached
 9. SDRAM Self-refresh or SDRAM Power-Down request (lowest priority).
- While performing the above listed scheduling algorithm, the EMIF might run into following two conditions:
1. A continuous stream of high priority commands can block lower priority commands
 2. A continuous stream of SDRAM commands to a row in an open bank can block commands to another row in the same bank

To avoid a continuous blocking effect, the EMIF momentarily raises the priority of the oldest command over all other commands when the number of memory accesses equals to the value programmed in the [EMIF_L3_CONFIG\[7:0\] REG_PR_OLD_COUNT](#) field.

On top of the above scheduling, the highest priority condition is a reset command. If this condition occurs, the EMIF abandons whatever it is currently doing and begins its start-up sequence. In this case, commands and data stored in the FIFOs are lost. The EMIF also starts its start-up sequence whenever the [EMIF_SDRAM_CONFIG](#) is written and [EMIF_SDRAM_REF_CTRL\[31\] REG_INITREF_DIS](#) is set to 0. In this case, commands and data stored in the FIFOs are not lost. The EMIF will ensure that in-flight read or write transactions to the SDRAM are complete before starting the initialization sequence.

All the accesses to a SDRAM are pipelined to maximize the external bus utilization. All of these are done while fulfilling the access timing requirements of a SDRAM.

15.3.4.2 Clock Management

The EMIF can gate off the EMIF_FCLK. There is an internal mechanism which can stop the EMIF_FCLK automatically.

EMIF_FCLK can only be stopped after the SDRAM is put into Self Refresh Mode and the power-idle protocol on the L3 bus is complete.

The EMIF waits for the DLL lock before performing any memory access.

The EMIF_FCLK frequency can be changed only after putting the external SDRAM in self-refresh mode.

EMIF_i_FCLK frequency is equal to half of the DDR_PHY_CLK frequency. DDR_PHY_CLK is equal to half of the PHY_ROOT_CLK frequency.

15.3.4.3 Software Reset

EMIF does not support a software reset.

EMIF supports the global warm reset mode during which the EMIF keeps the the SDRAM content. Upon a request from the PRCM module indicating a need to enter global warm reset mode, the EMIF executes the following:

- Completes the on-going access and then puts the SDRAM in self-refresh mode
- Clears all its FIFO contents and deasserts sys_SCmdAccept and sys_SDataAccept ports

When the global warm reset must terminate:

- The PRCM block deasserts its request signal to the EMIF.
- EMIF exits Self Refresh state once it receives host accesses from the MPU to the external memory.

15.3.4.4 System Power Management

15.3.4.4.1 Read Idle Window

The [EMIF_READ_IDLE_CTRL](#) register allows the ability to force idle time between consecutive reads to allow the DDR PHY to recalibrate the DLL delays during gradual voltage and frequency change.

The [EMIF_READ_IDLE_CTRL](#)[8:0] REG_READ_IDLE_INTERVAL field determines the maximum interval ((REG_READ_IDLE_INTERVAL - 1) * 64 EMIF_FCLK clock cycles) between read idle detections or force read idle time. A value of 0 disables the read idle function.

The [EMIF_READ_IDLE_CTRL](#)[19:16] REG_READ_IDLE_LEN bit field determines the minimum size of idle window for the read idle detection as well as the force read idle time. The EMIF only introduces idle time if it does not see at least REG_READ_IDLE_LEN - 1 number of idle EMIF_FCLK cycles in REG_READ_IDLE_INTERVAL. Any command other than a read command is considered idle for this purpose. Force read idle occurs when the data bus is busy transferring read data and the read idle interval expires.

15.3.4.4.2 LPDDR2-SDRAM Power-Down Mode

The EMIF supports power-down mode for low power. The EMIF automatically puts the SDRAM into power-down after the EMIF is idle for [EMIF_PWR_MGMT_CTRL](#)[15:12] REG_PD_TIM number of EMIF_FCLK cycles and the [EMIF_PWR_MGMT_CTRL](#)[10:8] REG_LP_MODE field is set to 0x4. In power-down mode, the EMIF does not stop the clocks to the SDRAM. The EMIF maintains [lpddr2i_cke\[j\]](#)[1:0] (i = 1 or 2 and j = 0 or 1) low to maintain the power-down state.

When the SDRAM is in power-down, the EMIF services register accesses as normal. The EMIF also services LPDDR2-NVM accesses as normal provided when it is not in power-down (in the case of the SDRAM memories are connected to the same EMIF through two different chip-selects).

If the the LPDDR2-SDRAM is in power-down mode and:

1. [EMIF_PWR_MGMT_CTRL](#)[10:8] REG_LP_MODE field is changed from 0x4 to some other value or
 2. A SDRAM access is requested or
 3. The Refresh Must level is reached
- then the EMIF will bring the SDRAM out of power-down mode.

For LPDDR2-SDRAM, the EMIF module:

1. Drives [lpddr2i_cke\[j\]](#)[1:0] (i = 1 or 2 and j = 0 or 1) high
2. Waits for [EMIF_SDRAM_TIM_2](#)[30:28] REG_T_XP + 1 cycles
3. Enters its idle state and can issue any commands.

15.3.4.4.3 LPDDR2-SDRAM Deep Power-Down Mode

For ultimate power savings, the EMIF supports deep power-down mode for LPDDR2-SDRAM.

The SDRAM can be forced into deep power-down state through software by setting the [EMIF_PWR_MGMT_CTRL\[11\] REG_DPD_EN](#) field to 0x1. In this case, the EMIF continues normal operation until all SDRAM memory access requests are serviced. At this point the EMIF issues a DEEP POWER-DOWN command. The EMIF then maintains [lpddr2i_cke\[j\]\[1:0\]](#) ($i = 1$ or 2 and $j = 0$ or 1) low to maintain the deep power-down state. In deep power-down mode, the EMIF automatically stops the clocks to the SDRAM.

Setting the [EMIF_PWR_MGMT_CTRL\[11\] REG_DPD_EN](#) bit to 1 overrides the setting of [EMIF_PWR_MGMT_CTRL\[10:8\] REG_LP_MODE](#) bit field. Therefore, if the SDRAM is in self refresh or power-down mode, and [EMIF_PWR_MGMT_CTRL\[11\] REG_DPD_EN](#) bit is set to 1, the EMIF exits those modes and go into deep power-down mode.

When the SDRAM is in deep power-down, the EMIF services register accesses as normal. The EMIF also services LPDDR2-NVM accesses as normal provided it is not in power-down (in the case of a SDRAM and a NVM memories are connected to the same EMIF through two different chip-selects).

If the [EMIF_PWR_MGMT_CTRL\[11\] REG_DPD_EN](#) bit is set to 0x0, the EMIF brings the SDRAM out of deep power-down state.

For LPDDR2-SDRAM, the EMIF controller:

1. Drives [lpddr2i_cke\[j\]\[1:0\]](#) ($i = 1$ or 2 and $j = 0$ or 1) high
2. Issues a RESET command to LPDDR2 (MRW)
3. Enters its IDLE state and can issue any commands.
4. Software must perform initialization as specified in the LPDDR2 Initialization section, see [Section 15.3.4.13](#)

15.3.4.4.4 LPDDR2-NVM Power-Down Mode

The EMIF supports power-down mode for LPDDR2-NVM. The EMIF automatically puts the LPDDR2-NVM into power-down after the EMIF is idle for [EMIF_PWR_MGMT_CTRL\[15:12\] REG_PD_TIM](#) number of EMIF_FCLK cycles and the [EMIF_PWR_MGMT_CTRL\[10:8\] REG_LP_MODE](#) bit field is set to 0x4. The EMIF will maintain [lpddr2i_cke\[j\]\[1:0\]](#) ($i = 1$ or 2 and $j = 0$ or 1) low to maintain the power-down state.

When LPDDR2-NVM is in power-down, the EMIF services register accesses as normal. The EMIF also services SDRAM accesses as normally, provided it is not in self-refresh or power-down (in the case of the NVM memories are connected to the same EMIF through two different chip-selects).

When the LPDDR2-NVM is in power-down mode and:

1. [EMIF_PWR_MGMT_CTRL\[10:8\] REG_LP_MODE](#) field is changed from 0x4 to some other value or
 2. A LPDDR2-NVM access is requested or
- then the EMIF brings the LPDDR2-NVM out of power-down mode.

For LPDDR2-NVM, the EMIF module:

1. Drives [lpddr2i_cke\[j\]\[1:0\]](#) ($i = 1$ or 2 and $j = 0$ or 1) high
2. Waits for [EMIF_SDRAM_TIM_2\[30:28\] REG_T_XP + 1](#) cycles
3. Enters its IDLE state and can issue any commands

15.3.4.4.5 LPDDR2-SDRAM Self-Refresh Mode

The EMIF supports self-refresh mode for low power. The EMIF automatically puts the SDRAM into self-refresh after the EMIF is idle for [EMIF_PWR_MGMT_CTRL\[3:0\] REG_CS_TIM](#) number of EMIF_FCLK cycles and the [EMIF_PWR_MGMT_CTRL\[10:8\] REG_LP_MODE](#) bit field is set to 0x2. In self-refresh mode, the EMIF automatically stops the clocks to the SDRAM. The EMIF maintains [lpddr2i_cke\[j\]\[1:0\]](#) ($i = 1$ or 2 and $j = 0$ or 1) low to maintain the self-refresh state.

When the SDRAM is in self-refresh, the EMIF services register accesses as normal. The EMIF also services LPDDR2-NVM accesses as normal provided it is not in power-down (in the case of a SDRAM and a NVM memories are connected to the same EMIF through two different chip-selects).

If the LPDDR2-SDRAM is in self refresh mode and:

1. [EMIF_PWR_MGMT_CTRL](#)[10:8] REG_LP_MODE bit field is changed from 0x2 to some other value or
2. A SDRAM access is requested or
3. [EMIF_SDRAM_TIM_2](#)[2:0] REG_T_CKE + 1 cycles have elapsed since the SELF-REFRESH command was issued

then the EMIF brings the SDRAM out of self-refresh mode.

For LPDDR2-SDRAM, the EMIF:

1. Enables clocks
2. Drives [lpddr2i_cke](#)[1:0] (i = 1 or 2 and j =0 or 1) high
3. Waits for [EMIF_SDRAM_TIM_2](#)[24:16] REG_T_XSNR + 1 cycles
4. Starts an auto-refresh cycle in the next cycle
5. Enters its IDLE state and can issue any commands

15.3.4.4.6 Save and Restore

The EMIF supports save and restore mechanism to completely switch off power to the EMIF.

See [Chapter 3, Power, Reset, and Clock Management](#) of the device for more information on *off-mode sequence* and *restore power to the EMIF sequence* of operations.

15.3.4.4.7 Retention Mode

EMIF supports full-retention mode.

15.3.4.5 Interrupt Requests

The EMIF sources two interrupts: one for the System L3 interface and the other for the Low-latency L3 interface. The pulse and level interrupt signals for a particular interface are both sorced from the same raw interrupt internal to the module.

The EMIF will set the [EMIF_IRQSTATUS_RAW_SYS](#)[0] REG_RAW_SYS / [EMIF_IRQSTATUS_RAW_LL](#)[0] REG_RAW_LL bit (depending on which interface sent the errored command) to 1, if an access request to an unsupported MAddrSpace is received. If such an error occurs, it is due to a bad programming of the DMM. See [Section 15.2, Dynamic Memory Manager](#) for more information on addressing.

The interrupts can be cleared once serviced by writing a 1 to the corresponding bits either in the [EMIF_IRQSTATUS_RAW_SYS](#) / [EMIF_IRQSTATUS_RAW_LL](#) or [EMIF_IRQSTATUS_SYS](#) / [EMIF_IRQSTATUS_LL](#) registers.

[Table 15-98](#) lists the event flags, and their mask, that can cause module interrupts.

Table 15-98. Events

Event Flag	Event Mask	Description
EMIF_IRQSTATUS_RAW_SYS [1] REG_TA_SYS / EMIF_IRQSTATUS_SYS [1] REG_TA_SYS	EMIF_IRQENABLE_SET_SYS [1] REG_EN_TA_SYS / EMIF_IRQENABLE_CLR_SYS [1] REG_EN_TA_SYS	System L3 interrupt for SDRAM temperature alert.
EMIF_IRQSTATUS_RAW_LL [1] REG_TA_LL / EMIF_IRQSTATUS_LL [1] REG_TA_LL	EMIF_IRQENABLE_SET_LL [1] REG_EN_TA_LL / EMIF_IRQENABLE_CLR_LL [1] REG_EN_TA_LL	Low-latency L3 interrupt for SDRAM temperature alert.
EMIF_IRQSTATUS_RAW_SYS [0] REG_ERR_SYS / EMIF_IRQSTATUS_SYS [0] REG_ERR_SYS	EMIF_IRQENABLE_SET_SYS [0] REG_EN_ERR_SYS / EMIF_IRQENABLE_CLR_SYS [0] REG_EN_ERR_SYS	System L3 interrupt for command or address error.
EMIF_IRQSTATUS_RAW_LL [0] REG_ERR_LL / EMIF_IRQSTATUS_LL [0] REG_ERR_LL	EMIF_IRQENABLE_SET_LL [0] REG_EN_ERR_LL / EMIF_IRQENABLE_CLR_LL [0] REG_EN_ERR_LL	Low-latency L3 interrupt for command or address error.

15.3.4.6 SDRAM Output Impedance Calibration

The EMIF supports automatic output impedance calibration. The ZQ calibration can be enabled per chip-select by setting [EMIF_ZQ_CONFIG\[31\] REG_ZQ_CS1EN](#) and [EMIF_ZQ_CONFIG\[30\] REG_ZQ_CS0EN](#) bits. The EMIF supports following three types of ZQ calibration commands:

- ZQINIT - ZQ calibration command during initialization
- ZQCS - ZQ calibration short command
- ZQCL - ZQ calibration long command

The EMIF periodically issues a ZQCS command every time [EMIF_ZQ_CONFIG\[15:0\] REG_ZQ_REFINTERVAL](#) expires. In other words, the [REG_ZQ_REFINTERVAL](#) defines the interval between ZQCS commands. The EMIF will wait and block any other command for ([EMIF_SDRAM_TIM_3\[20:15\] REG_ZQ_ZQCS+1](#)) number of clock DDR clock cycles every time a ZQCS command is issued.

If [EMIF_ZQ_CONFIG\[28\] REG_ZQ_SFEXITEN](#) field is set to a 1, the EMIF will issue a ZQCL command every time it exits Self-Refresh, Active Power-Down, and Precharge Power-Down. The EMIF will wait and block any other command for ([EMIF_ZQ_CONFIG\[17:16\] REG_ZQ_ZQCL_MULT+1](#))*([EMIF_SDRAM_TIM_3\[20:15\] REG_ZQ_ZQCS+1](#)) number of clock DDR clock cycles every time a ZQCL command is issued.

If a separate calibration resistor is used per device, the ZQ calibration can be preformed simultaneously over both the chip-selects. To enable ZQ calibration to be performed simultaneously over both chip-selects, the [EMIF_ZQ_CONFIG\[27\] REG_ZQ_DUALCALEN](#) filed must be set to a 1. If [REG_ZQ_DUALCALEN](#) is set to a 0, the EMIF will perform ZQ calibration per chip-select serially.

15.3.4.7 SDRAM Temperature Monitoring

The EMIF supports automatic temperature monitoring to facilitate the software to update the refresh rate according to the LPDDR2 device temperature changes. The temperature monitoring can be enabled per chip-select by setting [EMIF_TEMP_ALERT_CONFIG\[31\] REG_TA_CS1EN](#) and [EMIF_TEMP_ALERT_CONFIG\[30\] REG_TA_CS0EN](#) bits.

The EMIF periodically polls the temperature of LPDDR2 (issues a MRR command to Mode Register 4) every time [EMIF_TEMP_ALERT_CONFIG\[21:0\] REG_TA_REFINTERVAL](#) expires. In other words, the [REG_TA_REFINTERVAL](#) defines the interval between temperature alert polls. If the EMIF sees a 1 on bit 7 of the read data value from MRR, indicating that the temperature has changed, the [EMIF_IRQSTATUS_SYS\[1\] REG_TA_SYS](#) bit (for L3 interconnect), respectively, the [EMIF_IRQSTATUS_LL\[1\] REG_TA_LL](#) bit for the Low-Latency L3 connected LPDDR2-NVM is set and the module sends an interrupt both on the system and low-latency interrupt lines. On receipt of the interrupt, the software will update the [EMIF_SDRAM_REF_CTRL\[15:0\] REG_REFRESH_RATE](#) field to the required value as per the temperature change.

If [EMIF_TEMP_ALERT_CONFIG\[28\] REG_TA_SFEXITEN](#) field is set to a 1, the EMIF will poll for temperature change every time it exits Self-Refresh, Active Power-Down, and Precharge Power-Down.

Since the EMIF is performing a MRR, it needs information on how the LPDDR2 are connected. The [EMIF_TEMP_ALERT_CONFIG\[27:26\] REG_TA_DEVWDT](#) and [EMIF_TEMP_ALERT_CONFIG\[25:24\] REG_TA_DEVCNT](#) bits provides the necessary information to the EMIF for MRR data compare. For example, if [REG_TA_DEVWDT](#) is set to 0 indicating 8-bit devices used, and if [REG_TA_DEVCNT](#) is set to 2 indicating four devices used to form a 32-bit bus, the mask used for checking would be 4'b1111, that is, the EMIF would expect data on each of the byte lanes on a 32-bit bus.

15.3.4.8 SDRAM Refresh Scheduling

The EMIF uses two counters to schedule AUTO REFRESH commands: a 13-bit decrementing **refresh interval counter** and a 4-bit refresh **backlog counter**. The *interval counter* is used to define the rate at which connected SDRAM devices will be refreshed. It is loaded with the [EMIF_SDRAM_REF_CTRL\[15:0\] REG_REFRESH_RATE](#) field value at reset (only the 13 Lsb bits are taken). The interval counter decrements by one each cycle until it reaches zero at which point it reloads from [EMIF_SDRAM_REF_CTRL\[15:0\] REG_REFRESH_RATE](#) and restarts decrementing. The counter also reloads and restarts decrementing whenever the [EMIF_SDRAM_REF_CTRL\[15:0\] REG_REFRESH_RATE](#) field is updated.

The refresh *backlog counter* records the number of AUTO REFRESH commands the EMIF currently has outstanding. The backlog counter increments by one each time the interval counter reloads (unless it has reached its maximum value of 15). The backlog counter decrements by one each time the EMIF issues an AUTO REFRESH command (unless it is already at zero). For the range of values that the backlog counter can take, there are four levels of urgency with which the EMIF should perform an auto refresh cycle (in which it issues AUTO REFRESH commands), as follows:

- Refresh May level is reached whenever the backlog count is greater than 0, to indicate that there is a refresh backlog, so if the EMIF is not busy and none of the SDRAM banks are open, it should perform an auto refresh cycle.
- Refresh Release level is reached whenever the backlog count is greater than 4, to indicate that the refresh backlog is getting high, so if the EMIF is not busy it should perform an auto refresh cycle even if any banks are open.
- Refresh Need level is reached whenever the backlog count is greater than 5, to indicate that the refresh backlog is getting high and the EMIF should raise the priority of performing an auto refresh cycle above that of servicing new memory write requests. The EMIF starts servicing new memory accesses after Refresh Release level is cleared.
- Refresh Must level is reached whenever the backlog count is greater than 7, to indicate that the refresh backlog is getting excessive and the EMIF should perform an auto refresh cycle before servicing any new memory access requests. The EMIF starts servicing new memory accesses after Refresh Release level is cleared.

The refresh counters do not operate when SDRAM has been put into self-refresh mode.

The EMIF issues AUTO REFRESH commands within auto refresh cycles. An auto refresh cycle consists of issuing an AUTO REFRESH command and waiting T_{RFC} (refer to the SDRAM Timing 3 register, [EMIF_SDRAM_TIM_3](#)) cycles before rechecking the refresh levels. If the Refresh Release level is not reached, the EMIF starts another auto refresh cycle, otherwise it returns to the idle state where it can issue any command. The EMIF ensures that no more than eight AUTO REFRESH commands are issued in any rolling $tREFBW (= 4 * 8 * tRFC)$ window.

15.3.4.8.1 Performance Counters Description

The [EMIF_PERF_CNT_1](#) and [EMIF_PERF_CNT_2](#) registers can be used to monitor or calculate the EMIF bandwidth and efficiency. These counters can count events such as total SDRAM accesses, SDRAM activates, reads, writes, etc. Each counter counts events independent of the other counters. In addition to the ability to count events, the counters can also filter the events from a particular master or address space. The events to be counted and the filter enabling can be configured using the [EMIF_PERF_CNT_CFG](#) register. The filter value to be used can be configured using the [EMIF_PERF_CNT_SEL](#) register. Each counter can be configured independently.

[Table 15-99](#) shows all the events that can be counted and whether a filter can be applied to a particular event. A filter can be applied to an event if the following bits in the Performance Counter 1 or Performance Counter 2 register can be set equal to 0x1 for that particular event:

- Performance Counter 1 register: [EMIF_PERF_CNT_CFG](#)[15] [REG_CNTR1_MCONNID_EN](#) and [EMIF_PERF_CNT_CFG](#)[14] [REG_CNTR1_REGION_EN](#)
- Performance Counter 2 register: [EMIF_PERF_CNT_CFG](#)[31] [REG_CNTR2_MCONNID_EN](#) and [EMIF_PERF_CNT_CFG](#)[30] [REG_CNTR2_REGION_EN](#)

[Table 15-99](#) shows the possible filter configurations for the two performance counters. These filter configurations can be used in conjunction with a L3 master ID and/or external chip-select to obtain performance statistics for a particular L3 master and/or external chip-select.

Table 15-99. Performance Counter Filter Configuration

CNTRn_CFG (1)	CNTRn_REGION_EN (1)	CNTRn_MCONNID_EN (1)	Description
0x0 (2)	0x0	0x0 or 0x1	Count total SDRAM accesses

(1) n = 1 or 2

(2) When MReqDebug is set to a 1 for a particular L3 command, the performance counters will not be incremented for that command.

Table 15-99. Performance Counter Filter Configuration (continued)

CNTRn_CFG (1)	CNTRn_REGION_EN (1)	CNTRn_MCONNID_EN (1)	Description
0x1 ⁽²⁾	0x0	0x0 or 0x1	Count total SDRAM activates
0x2 ⁽²⁾	0x0 or 0x1	0x0 or 0x1	Count total L3 reads. CPU cache based operations are 32 bytes. DMA burst is 128 bytes.
0x3 ⁽²⁾	0x0 or 0x1	0x0 or 0x1	Count total L3 writes. CPU cache based operations are 32 bytes. DMA burst is 128 bytes.
0x4	0x0	0x0	Count number of EMIF FCLK clock cycles L3 Command FIFO is full
0x5	0x0	0x0	Count number of EMIF FCLK clock cycles L3 Write Data FIFO is full
0x6	0x0	0x0	Count number of EMIF FCLK clock cycles L3 Read Data FIFO is full
0x7	0x0	0x0	Count number of EMIF FCLK clock cycles L3 Return Command FIFO is full
0x8	0x0 or 0x1	0x0 or 0x1	Count number of priority elevations
0x9	0x0	0x0	Count number of EMIF FCLK clock cycles that a command was pending
0xA ⁽³⁾	0x0	0x0	Count number of EMIF FCLK clock cycles for which the memory data bus was transferring data.
0xA ⁽³⁾	0x0	0x1	Count number of L3 commands for which the memory data bus was transferring data.
0xB to 0xF	0x0	0x0	Reserved for future use.

⁽³⁾ When MReqDebug is set to a 1 for a particular L3 command, the performance counters will not be incremented for that command.

When CNTRn_CFG = 0xA and CNTRn_MCONNID_EN=0x1, the following guidelines must apply:

- Count of 1 implies OCP command up to 32 bytes for all the initiators except for Cortex-A9 MPU
- Count of 1 implies OCP command up to 16 bytes for Cortex-A9 MPU when all the other initiators are not generating traffic on SDRAM.
- When ConnID is set to a value other than 0x00, the performance counter reflects the traffic generated by the initiator associated with that ConnID. In case of ConnID=0x00 (MPU), the performance counter reflects combined traffic by all active initiators. Therefore, if there are multiple initiators generating traffic, the traffic generated by MPU must be calculated using the formula:

$$\text{Actual MPU Count} = \text{Count value} - \sum_{i=0}^{\text{all_initiators-MPU}} \text{Count}_i$$

where i is different initiators and Count_i is the Count value for each of those initiators. Then:

- Actual MPU count of 1 implies OCP command up to 16 bytes for Cortex-A9 MPU
- Bandwidth for all other initiators except MPU is Count × 32 bytes
- Bandwidth calculation for MPU is MPU Count × 16 bytes

15.3.4.8.2 Performance Counters General Examples

15.3.4.8.2.1 PERF_CNT_1 General Example for Counting Write Accesses

The Performance Counter 1 register needs to count all write accesses from the dual Cortex-M3 MPU subsystem:

- To enable counting writes, the [EMIF_PERF_CNT_CFG\[3:0\]](#) REG_CNTR1_CFG bit field must be set to 0x3.
- The [EMIF_PERF_CNT_SEL\[15:8\]](#) REG_MCONNID1 bit field must be set to 0x44. The values

programmed into the REG_MCONNIDx bit fields are those listed in [Table 28-20, ConnID Mapping \(Debug View\)](#), in [Chapter 28, On-Chip Debug Support](#), left-shifted by 2 bits.

- To enable filtering, the [EMIF_PERF_CNT_CFG\[15\]](#) REG_CNTR1_MCONNID_EN bit must be set to 0x1.

With this configuration, Counter 1 counts every write made to the EMIF from master 0x44 to any address space. This does not include accesses from other masters, or commands other than writes.

15.3.4.8.2.2 PERF_CNT_2 General Example for Counting Total Access

The Performance Counter 2 register needs to count total accesses to SDRAM regardless of the masters or address space.

- To enable counting all SDRAM accesses, the [EMIF_PERF_CNT_CFG\[19:16\]](#) REG_CNTR2_CFG bit field must be set to 0x0.
- To disable filtering, the [EMIF_PERF_CNT_CFG\[31\]](#) REG_CNTR2_MCONNID_EN and [EMIF_PERF_CNT_CFG\[30\]](#) REG_CNTR2_REGION_EN bits must be set to 0x0.

With this configuration, Counter 2 counts every access made to the EMIF. This includes all accesses from all masters and to any address space.

15.3.4.8.2.3 PERF_CNT_3 General Example for Counting all Read Accesses

The Performance Counter 1 register needs to count all read accesses from the dual Cortex-M3 MPU subsystem to address space 0x0.

- To enable counting reads, the [EMIF_PERF_CNT_CFG\[3:0\]](#) REG_CNTR1_CFG bit field must be set to 0x2.
- The [EMIF_PERF_CNT_SEL\[15:8\]](#) REG_MCONNID1 and [EMIF_PERF_CNT_SEL\[1:0\]](#) REG_REGION_SEL1 bit fields must be set to 0x44 and 0x0, respectively.
- To enable filtering, the [EMIF_PERF_CNT_CFG\[15\]](#) REG_CNTR1_MCONNID_EN and [EMIF_PERF_CNT_CFG\[14\]](#) REG_CNTR1_REGION_EN bits must be set to 0x1.

With this configuration, Counter 1 counts every read made to the EMIF from master 0x44 to address space 0x0. This does not include accesses from other masters or accesses to other address space and does not include commands other than reads.

15.3.4.9 EMIF Access Cycles

By default the EMIF keeps SDRAM chip-selects active. To direct a command to just one of the SDRAMs it deasserts the chip-select to the other SDRAM for the duration of the command. If [EMIF_SDRAM_CONFIG\[3\]](#) REG_EBANK field in the SDRAM Config register is set to 0, chip-select 1 is always driven high except during initialization and for refresh, power down, self refresh, and deep power down commands.

The EMIF always performs burst accesses to SDRAM. Multiple SDRAM bursts may be needed to service a single L3 burst request. [Table 15-103](#) to [Table 15-104](#) show a few examples on how EMIF accesses SDRAM for a linear incrementing transaction type. T0, T1, etc. are clock cycles. R0 is read starting at column 0, R8 is read starting at column 8, and R16 is read starting at column 16. D0-1 is the data from column 0 and 1, D2-3 is the data from column 2 and 3, and so on.

Table 15-104. 64-Byte Linear Read Starting at Address 0x18

T0	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12	T13
R6		R8					R16						
				D6-7	Unused	D8-9	D10-11	D12-13	D14-15	D16-17	D18-19	D20-21	Unused

EMIF will use the unused data phases in the above figure by issuing successive read commands if there are reads to open banks pending in the command FIFO.

The write data conversion from single data rate to double data rate is done outside the EMIF.

15.3.4.9.1 SDRAM Read

A read access to a SDRAM is initiated with a READ command. The EMIF provides the internal bank address and the column address on pad_ca_o with the READ command. The EMIF registers the first read data from lpddr2i_dj (i = 1 or 2 and j = 0 or 1) after (read_latency + 3) DDR clock cycles. Read latency is programmed in the PHY Control 1 register, [EMIF_DDR_PHY_CTRL_1](#).

15.3.4.9.2 SDRAM Write

A write access to a SDRAM is initiated with a WRITE command. The EMIF provides the internal bank address and the column address on pad_ca_o with the WRITE command.

EMIF delays the write data by the appropriate write latency minus one. Subsequent data words are provided on lpddr2i_dj (i = 1 or 2 and j = 0 or 1) along with the appropriate data mask on lpddr2i_dmj (i = 1 or 2 and j = 0 or 1) on each successive clock cycles. The DDR PHY then adds one more clock cycle delay to the write data to appropriately center the write data to the outgoing DQS.

15.3.4.10 Turn Around Time

[Table 15-105](#) shows the turn around time that the EMIF introduces on the data bus for various back-to-back accesses. The EMIF takes advantage of the CAS latencies and packs the commands as close as possible on the control bus to introduce the following turn around time on the data bus.

Table 15-105. Turn Around Time

Previous Access	Next Access	Turn Around Time (number of DDR clock cycles)
SDRAM read	SDRAM read to same chip-select	0

Table 15-105. Turn Around Time (continued)

Previous Access	Next Access	Turn Around Time (number of DDR clock cycles)
SDRAM read	SDRAM read to different chip-select	2
SDRAM read	SDRAM write	2
SDRAM write	SDRAM write	0
SDRAM write	SDRAM read	2

15.3.4.11 SDRAM Address Mapping

The EMIF interleaves the internal banks for SDRAM connected to both the chip-selects (see [Table 15-106](#) for the SDRAM addressing space), according to the DMM (see [Section 15.2, Dynamic Memory Manager](#) for more information). From the system point of view, the external SDRAM is seen as one block of SDRAM. If two external 64-MB devices are used, a 128-MB memory block is observed. If two external 32-MB devices are used, a 64-MB block is observed.

Table 15-106. SDRAM Addressing Space

Module Name	Base Address	Size
EMIF1 EMIF2 -CS0-SDRAM ⁽¹⁾	0x8000 0000	0 to 1 GB - programmable in DMM (see Section 15.2, Dynamic Memory Manager)
EMIF1 EMIF2 -CS1-SDRAM ⁽²⁾	0xC000 0000	0 to 1 GB - programmable in DMM (see Section 15.2, Dynamic Memory Manager)

⁽¹⁾ The addressing space is interleaved on two LPDDR memory controllers (EMIF1, EMIF2), each activating their CS0 line. These CSs can address 64, 128, 256, 512, 1024, or 2048MBs. Interleaving occurs at 128-byte granularity. Both memories must be of the same kind (SDRAM or NVM). EMIF1-CS0 base address is always 0x8000 0000 at reset, and occupies a 1-GB address space at reset (interleaving disabled at reset).

⁽²⁾ The addressing space is interleaved on two LPDDR memory controllers (EMIF1, EMIF2), each activating its CS1 line. These CSs are programmable to 64, 128, 256, 512, or 1024MBs. Interleaving occurs at 128-byte granularity. EMIF1-CS1 and EMIF2-CS1 are disabled at reset. Their base address is programmable to achieve a continuous address space with the respective CS0, regardless of the programmed address range. EMIF1-CS1 is disabled if the EMIF1-CS0 memory density is set to 2048MB (2GB) when interleaving is disabled, or if the EMIF1-CS0 + EMIF2-CS0 memory density is set to 1024MB (1GB) when interleaving is enabled.

When addressing SDRAM, if the [EMIF_SDRAM_CONFIG\[28:27\] REG_IBANK_POS](#) field is set to 0, the EMIF uses the following 3-bit fields, to determine the mapping from source address to SDRAM row, column, bank, and chip-select:

- [EMIF_SDRAM_CONFIG\[6:4\] REG_IBANK](#)
- [EMIF_SDRAM_CONFIG\[3\] REG_EBANK](#)
- [EMIF_SDRAM_CONFIG\[2:0\] REG_PAGESIZE](#)

If the [EMIF_SDRAM_CONFIG\[28:27\] REG_IBANK_POS](#) field is set to 1, 2, or 3, the EMIF uses the 4 fields to determine the mapping from source address to SDRAM row, column, bank, and chip-select:

- [EMIF_SDRAM_CONFIG\[6:4\] REG_IBANK](#)
- [EMIF_SDRAM_CONFIG\[3\] REG_EBANK](#)
- [EMIF_SDRAM_CONFIG\[2:0\] REG_PAGESIZE](#)
- [EMIF_SDRAM_CONFIG\[9:7\] REG_ROWSIZE](#)

In all cases the EMIF considers its SDRAM address space to be a single logical block regardless of the number of physical devices or whether the devices are mapped across 1 or 2 EMIF chip-selects.

For [EMIF_SDRAM_CONFIG\[28:27\] REG_IBANK_POS = 0](#), [Table 15-107](#) and [Table 15-108](#) show which source address bits, MAddr, map to the SDRAM row, column, bank, and chip-select bits for all combinations of [REG_IBANK](#), [REG_EBANK](#) and [REG_PAGESIZE](#).

For [EMIF_SDRAM_CONFIG\[28:27\] REG_IBANK_POS != 0](#), [Table 15-110](#) to [Table 15-111](#) shows which source address bits, MAddr, map to the SDRAM row, column, bank, and chip-select bits for all combinations of [REG_IBANK](#), [REG_EBANK](#), [REG_PAGESIZE](#), and [REG_ROWSIZE](#).

4096	0	3	3	row								bank					col	

For **EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 0**, the effect of the address-mapping scheme is that as the source address increments across SDRAM page boundaries, the EMIF moves onto the same page in the next bank in the current device (lpddr2i_cs1[0]n, i = 1 or 2). This movement along the banks of the current device continues until the page has been accessed in all banks in the current device. The EMIF then proceeds to the same page in the next device (if **EMIF_SDRAM_CONFIG[3] REG_EBANK = 1**, lpddr2i_cs1[1]n, i = 1 or 2) and proceeds through the same page in all its banks before moving over to the next page in the first device (lpddr2i_cs1[0]n, i = 1 or 2). The EMIF exploits this traversal across internal banks and chip-selects while remaining on the same page to maximize the number of open SDRAM banks within the overall SDRAM space.

Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip-selects) open at a time, and can interleave among all of them.

In [Table 15-109](#), [Table 15-110](#), and [Table 15-111](#), the L3 Address to SDRAM Address Mapping is given. In each case, we will have x bits for bank, followed by y bits for row, followed by z bit for CS, followed by s bit for bank and t bit for col in MAddr[31:N] (x, y, z, s and t are given depending on the [EMIF_SDRAM_CONFIG](#) bit field values).

**Table 15-109. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27]
REG_IBANK_POS = 1 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 0**

MAddr[31:N]				
Bank Address	Row Address	Chip-Select	Bank Address	Column Address
Number of bits defined by EMIF_SDRAM_CONFIG [6] REG_IBANK	Number of bits defined by EMIF_SDRAM_CONFIG [9:7] REG_ROWSIZE	Number of bits defined by EMIF_SDRAM_CONFIG [3] REG_EBANK	Number of bits defined by EMIF_SDRAM_CONFIG [5:3] REG_IBANK	Number of bits defined by EMIF_SDRAM_CONFIG [2:0] REG_PAGESIZE
= 0: 0 bit	= 0: 9 bits	= 0: 0 bit	= 0: 0 bit	= 0: 8 bits
= 1: 0 bit	= 1: 10 bits	= 1: 1 bit	= 1: 1 bit	= 1: 9 bits
	= 2: 11 bits		= 2: 2 bits	= 2: 10 bits
	= 3: 12 bits		= 3: 2 bits	= 3: 11 bits
	= 4: 13 bits			
	= 5: 14 bits			
	= 6: 15 bits			
	= 7: 16 bits			

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

There are 2 times the REG_IBANK bit field because it gives the number of bank bits depending on their place in the MAddr.

For [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS=1, the EMIF interleaves banks the same as [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS = 0, but the interleaving of banks within a device (per chip-select) is limited to 4 banks. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip-selects) open at a time, but can only interleave among 8 of them.

**Table 15-110. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27]
REG_IBANK_POS = 2 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 0**

MAddr[31:N]				
Bank Address	Row Address	Chip-Select	Bank Address	Column Address
Number of bits defined by EMIF_SDRAM_CONFIG [6:5] REG_IBANK	Number of bits defined by EMIF_SDRAM_CONFIG [9:7] REG_ROWSIZE	Number of bits defined by EMIF_SDRAM_CONFIG [3] REG_EBANK	Number of bits defined by EMIF_SDRAM_CONFIG [4] REG_IBANK	Number of bits defined by EMIF_SDRAM_CONFIG [2:0] REG_PAGESIZE
= 0: 0 bit	= 0: 9 bits	= 0: 0 bit	= 0: 0 bit	= 0: 8 bits
= 1: 0 bit	= 1: 10 bits	= 1: 1 bit	= 1: 1 bit	= 1: 9 bits
= 2: 1 bit	= 2: 11 bits			= 2: 10 bits
= 3: 2 bits	= 3: 12 bits			= 3: 11 bits
	= 4: 13 bits			
	= 5: 14 bits			
	= 6: 15 bits			
	= 7: 16 bits			

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

For [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS = 2, the EMIF interleaves banks the same as [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS = 0, but the interleaving of banks within a device (per chip-select) is limited to 2 banks. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip-selects) open at a time, but can only interleave among 4 of them.

Table 15-111. L3 Address to SDRAM Address Mapping for [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS = 3 and [EMIF_SDRAM_CONFIG_2\[27\]](#) REG_EBANK_POS = 0

MAddr[31:N]			
Bank Address	Row Address	Chip-Select	Column Address
Number of bits defined by EMIF_SDRAM_CONFIG[6:4] REG_IBANK	Number of bits defined by EMIF_SDRAM_CONFIG[9:7] REG_ROWSIZE	Number of bits defined by EMIF_SDRAM_CONFIG[3] REG_EBANK	Number of bits defined by EMIF_SDRAM_CONFIG[2:0] REG_PAGESIZE
= 0: 0 bit	= 0: 9 bits	= 0: 0 bit	= 0: 8 bits
= 1: 1 bit	= 1: 10 bits	= 1: 1 bit	= 1: 9 bits
= 2: 2 bits	= 2: 11 bits		= 2: 10 bits
= 3: 3 bits	= 3: 12 bits		= 3: 11 bits
	= 4: 13 bits		
	= 5: 14 bits		
	= 6: 15 bits		
	= 7: 16 bits		

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

For [EMIF_SDRAM_CONFIG](#)[28:27] REG_IBANK_POS = 3, the EMIF cannot interleave banks within a device (per chip-select). However, it can still interleave banks between the two chip-selects. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across 2 chip-selects) open at a time, but can only interleave among 2 of them.

Since the EMIF interleave among less number of banks when [EMIF_SDRAM_CONFIG](#)[28:27] REG_IBANK_POS != 0, these cases are lower in performance than the [EMIF_SDRAM_CONFIG](#)[28:27] REG_IBANK_POS = 0 case. Thus these cases are only recommended to be used along with partial array self-refresh where performance can be traded off for power savings.

Table 15-112. L3 Address to SDRAM Address Mapping for [EMIF_SDRAM_CONFIG](#)[28:27] REG_IBANK_POS = 1 and [EMIF_SDRAM_CONFIG_2](#)[27] REG_EBANK_POS = 1

MAddr[31:N]

= 0: 0 bit	= 0: 0 bit	= 0: 9 bits	= 0: 0 bit	= 0: 8 bits
= 1: 1 bit	= 1: 0 bit	= 1: 10 bits	= 1: 1 bit	= 1: 9 bits
	= 2: 0 bit	= 2: 11 bits	= 2: 2 bits	= 2: 10 bits
	= 3: 1 bit	= 3: 12 bits	= 3: 2 bits	= 3: 11 bits
		= 4: 13 bits		
		= 5: 14 bits		
		= 6: 15 bits		
		= 7: 16 bits		

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

The interleaving of banks within a device (per chip-select) is limited to four banks. The EMIF cannot interleave banks between the two chip-selects. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip-selects) open at a time, but can interleave among only 4 of them.

Table 15-113. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 2 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 1

MAddr[31:N]				
Chip-Select	Bank Address	Row Address	Bank Address	Column Address
Number of bits defined by EMIF_SDRAM_CONFIG[3] REG_EBANK	Number of bits defined by EMIF_SDRAM_CONFIG[6:4] REG_IBANK	Number of bits defined by EMIF_SDRAM_CONFIG[9:7] REG_ROWSIZE	Number of bits defined by EMIF_SDRAM_CONFIG[6:4] REG_IBANK	Number of bits defined by EMIF_SDRAM_CONFIG[2:0] REG_PAGESIZE
= 0: 0 bit	= 0: 0 bit	= 0: 9 bits	= 0: 0 bit	= 0: 8 bits
= 1: 1 bit	= 1: 0 bit	= 1: 10 bits	= 1: 1 bit	= 1: 9 bits
	= 2: 1 bit	= 2: 11 bits	= 2: 1 bit	= 2: 10 bits
	= 3: 2 bits	= 3: 12 bits	= 3: 1 bit	= 3: 11 bits
		= 4: 13 bits		
		= 5: 14 bits		
		= 6: 15 bits		
		= 7: 16 bits		

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

The interleaving of banks within a device (per chip-select) is limited to two banks. The EMIF cannot interleave banks between the two chip-selects. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip-selects) open at a time, but can interleave among only 2 of them.

**Table 15-114. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27]
REG_IBANK_POS = 3 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 1**

MAddr[31:N]			
Chip-Select	Bank Address	Row Address	Column Address
Number of bits defined by EMIF_SDRAM_CONFIG[3] REG_EBANK	Number of bits defined by EMIF_SDRAM_CONFIG[6:4] REG_IBANK	Number of bits defined by EMIF_SDRAM_CONFIG[9:7] REG_ROWSIZE	Number of bits defined by EMIF_SDRAM_CONFIG[2:0] REG_PAGESIZE
= 0: 0 bit	= 0: 0 bit	= 0: 9 bits	= 0: 8 bits
= 1: 1 bit	= 1: 1 bit	= 1: 10 bits	= 1: 9 bits
	= 2: 2 bits	= 2: 11 bits	= 2: 10 bits
	= 3: 3 bits	= 3: 12 bits	= 3: 11 bits
		= 4: 13 bits	
		= 5: 14 bits	
		= 6: 15 bits	
		= 7: 16 bits	

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

The EMIF cannot interleave banks within a device (per chip-select) or between the two chip-selects. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip-selects) open at a time, but cannot interleave among them.

Because the EMIF interleaves among fewer banks when REG_IBANK_POS != 0 or REG_EBANK_POS = 1, these cases are lower in performance than the REG_IBANK_POS = 0 case. Thus, these cases are recommended to be used only along with partial array self-refresh, where performance can be traded for power savings.

15.3.4.12 NVM Address Mapping

NVM are always decoded CS - bank - row - column, and cannot be interleaved.

15.3.4.13 LPDDR2 SDRAM Initialization

On coming out of reset if the [EMIF_SDRAM_CONFIG](#)[31:29] REG_SDRAM_TYPE field in the SDRAM Config register is equal to 4 or 5, the EMIF performs a LPDDR2 initialization sequence as follows:

1. Drives `lpddr2i_cke[j][1:0]` (i = 1 or 2 and j = 0 or 1) high and starts to continuously issues NOP commands.
2. After 16 SDRAM refresh rate intervals, issues a PRECHARGE-ALL command. The SDRAM refresh rate is as defined in the [EMIF_SDRAM_REF_CTRL](#)[15:0] REG_REFRESH_RATE field description.
3. Issues a RESET command.
4. The software then performs the LPDDR2 initialization using the EMIF's [EMIF_LPDDR2_MODE_REG_CFG](#) and [EMIF_LPDDR2_MODE_REG_DATA](#) registers. The software must enable refreshes by setting the [EMIF_LPDDR2_MODE_REG_CFG](#)[30] REG_REFRESH_EN bit field to 1 during the last MRW command.

The EMIF also performs the initialization sequence whenever the [EMIF_SDRAM_CONFIG](#) is written and the LPDDR2 initialization was not performed previously because SDRAM_REF_CTRL[31] REG_INITREF_DIS was set to 0. Once the EMIF performs initialization, rewriting the SDRAM Config register will not cause re-initialization.

NOTE: The values of the different bit fields in the [EMIF_SDRAM_CONFIG](#) and [EMIF_SDRAM_CONFIG_2](#) registers are fixed by the System Control Module (SCM) at reset. These values must be modified by the header feature in the ROM code configuration or by the initial boot image running from an external XIP booting memory or internal RAM (see [Section 27.4.8, Image Format](#)). They must not be modified during run time as they reflect the used hardware LPDDR2 SDRAM and/or NVM memory configurations.

The EMIF does not perform any transactions until the LPDDR2 initialization sequence is complete.

When the EMIF comes out of reset, the delay time in step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately $16 * \text{EMIF_SDRAM_REF_CTRL}[15:0] \text{ REG_REFRESH_RATE} / \text{input frequency}$.

15.3.5 External Memory Interface (EMIF) Programming Guide

15.3.5.1 EMIF Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the EMIF module.

Please, have in mind that the following programming sequences are double as there are two EMIF modules (EMIF1 and EMIF2) with the same register mapping but with different register addresses.

15.3.5.1.1 Global Initialization

Table 15-115. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
Power, Reset and Clock Management (PRCM)	The module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management .
Interrupt sub-module of the MPU	The Interrupt requests from the EMIF have to be enabled (unmasked), see Chapter 17, Interrupt Controllers .
DMM (Dynamic Memory Management)	The EMIF is a slave to the DMM module. The DMM should be enabled and configured for communication with LPDDR2 memories. See Section 15.2, DMM

15.3.5.1.1.1 EMIF Module Global Initialization

This procedure initializes the EMIF after a power-on reset. It works only with LPDDR2 (Low Power Double Data Rate 2) SDRAM or NVM types. The unused bits in all registers should be written with zeros. The values of the Shadow Registers are loaded in their corresponding registers a frequency update sequence is performed.

NOTE: The values of the different bit fields in the [EMIF_SDRAM_CONFIG](#) and [EMIF_SDRAM_CONFIG_2](#) registers are fixed by the Control Module at reset. These values must be modified by the header feature in the ROM code configuration or by the initial boot image running from an external XIP booting memory or internal RAM (see [Section 27.4.8, Image Format](#)). They must not be modified during run time because they reflect the used hardware LPDDR2 SDRAM and/or NVM memory configurations.

Table 15-116. EMIF Global Initialization

Step	Register/ Bit Field / Programming Model	Value
IF : RAM = SDRAM		
(Optional) Remove NVM mode on CS1 in order to select the two CSs of DDRAM for each EMIF instance.	EMIF_SDRAM_CONFIG_2 [30] REG_CS1NVMEN	0
Assign the external bank address bits from lower or higher OCP address as shown in Table 15-109 , Table 15-110 , Table 15-111 , Table 15-112 , Table 15-113 , and Table 15-114 .	EMIF_SDRAM_CONFIG_2 [27] REG_EBANK_POS	0x-
ELSE : (RAM = NVM)		
Enable CS1 for LPDDR2-NVM.	EMIF_SDRAM_CONFIG_2 [30] REG_CS1NVMEN	1
Define the number of the row buffers inside connected LPDDR2-NVM device.	EMIF_SDRAM_CONFIG_2 [5:4] REG_RDBNUM	0x-
Define the row data buffer size of connected LPDDR2-NVM device.	EMIF_SDRAM_CONFIG_2 [2:0] REG_RDBSIZE	0x-
Assign the external bank address bits from lower or higher OCP address as shown in Table 15-109 , Table 15-110 , Table 15-111 , Table 15-112 , Table 15-113 , and Table 15-114 .	EMIF_SDRAM_CONFIG_2 [27] REG_EBANK_POS	0x-
ENDIF		
Select the SDRAM type (S2 or S4)	EMIF_SDRAM_CONFIG [31:29] REG_SDRAM_TYPE	0x-
Assign internal bank address bits from L3 address as shown in Table 15-107 , Table 15-108 , Table 15-109 , Table 15-110 , Table 15-111 , Table 15-112 , Table 15-113 , and Table 15-114 .	EMIF_SDRAM_CONFIG [28:27] REG_IBANK_POS	0x-
Enable/disable DLL.	EMIF_SDRAM_CONFIG [20] REG_DDR_DISABLE_DLL	0x-
Choose between 32-bit or 16-bit wide SDRAM data bus.	EMIF_SDRAM_CONFIG [15:14] REG_NARROW_MODE	0x-
Define CAS latency when accessing connected SDRAM devices.	EMIF_SDRAM_CONFIG [13:10] REG_CL	0x-

Table 15-116. EMIF Global Initialization (continued)

Step	Register/ Bit Field / Programming Model	Value
Define the number of row address bits of connected SDRAM device.	EMIF_SDRAM_CONFIG[9:7] REG_ROWSIZE	0x-
Define the number of banks inside connected SDRAM device.	EMIF_SDRAM_CONFIG[6:4] REG_IBANK	0x-
Define whether SDRAM accesses use 1 or 2 chip-select lines.	EMIF_SDRAM_CONFIG[3] REG_EBANK	0x-
Define the internal page size of connected SDRAM device.	EMIF_SDRAM_CONFIG[2:0] REG_PAGESIZE	0x-
Configure the DDR PHY physical layer to the SDRAM (Read Latency for the read data from SDRAM in number of DDR clock cycles)	EMIF_DDR_PHY_CTRL_1 ⁽¹⁾	0x-----
Write the Shadow register of the EMIF_DDR_PHY_CTRL_1 with the same value.	EMIF_DDR_PHY_CTRL_1_SHDW ⁽¹⁾	EMIF_DDR_PHY_CTRL_1
Initialize MR LPDDR2 registers.	External LPDDR2 initialization, see Table 15-119	
Configure the DDR PHY physical layer to the SDRAM parameters.	EMIF_DDR_PHY_CTRL_2	0x-----
Define timings and clock parameters	EMIF Timing Initialization, see Table 15-117	
Configure the SDRAM Output Impedance Calibration parameters	EMIF Output Impedance Calibration Mode, see Table 15-120	
Configure the Temperature Alert parameters	EMIF Temperature Monitoring Mode, see Table 15-129	
(Optional) Configure the Performance Counter Config Register	EMIF_PERF_CNT_CFG	0x-00--00-
(Optional) Configure the Performance Counter Master Region Select Register	EMIF_PERF_CNT_SEL	0x--0---0-
(Optional) Configure the System and Low-Latency L3 Threshold Maxima and the priority counter of an old command.	EMIF_L3_CONFIG	0x0-0-00--
Clear all eventual previous indications of treated interrupts.	EMIF_IRQSTATUS_SYS , EMIF_IRQSTATUS_LL	0x-
(Optional) Enable System L3 interrupt for Command or Address Error.	EMIF_IRQENABLE_SET_SYS [0] REG_EN_ERR_SYS	0x1
(Optional) Enable Low-Latency L3 interrupt for Command or Address Error.	EMIF_IRQENABLE_SET_LL [0] REG_EN_ERR_LL	0x1

⁽¹⁾ Values loaded in these registers depend on OPP.

⁽¹⁾ Values loaded in these registers depend on OPP.

Table 15-118. Subsequence - EMIF Timing Initialization (continued)

Step	Register/ Bit Field / Programming Model	Value
Define minimum number of DDR clock cycles from Preactive to Activate, minus one.	EMIF_LPDDR2_NVM_TIM[23:20] REG_NVM_T_RP	0x-
Define minimum number of DDR clock cycles from last Write transfer to Activate, minus one.	EMIF_LPDDR2_NVM_TIM[19:16] REG_NVM_T_WRA	0x-
Define Minimum number of DDR clock cycles from Activate to Activate for a different bank, minus one.	EMIF_LPDDR2_NVM_TIM[15:8] REG_NVM_T_RRD	0x--
Define Minimum number of DDR clock cycles from Activate to Read or Write, minus one.	EMIF_LPDDR2_NVM_TIM[7:0] REG_NVM_T_RCDMIN	0x--
Write the Shadow register of the EMIF_LPDDR2_NVM_TIM ⁽¹⁾ with the same value.	EMIF_LPDDR2_NVM_TIM_SHDW ⁽¹⁾	0x-----
ENDIF		
Define the rate at which the connected SDRAM devices are refreshed.	EMIF_SDRAM_REF_CTRL[15:0] REG_REFRESH_RATE	0x----
Write the Shadow register of the EMIF_SDRAM_REF_CTRL with the same value.	EMIF_SDRAM_REF_CTRL_SHDW	EMIF_SDRAM_REF_CTRL

15.3.5.1.1.3 Subsequence - External LPDDR2 Initialization

Table 15-119. Subsequence - External LPDDR2 Initialization

Step	LPDDR2 mode registers (MR)	Value
Wait until MR0[0]=0 (MR0[0] = 0 indicates that memory auto – initialization is completed).	MR0[0]	=0
Issue ZQINIT calibration command.	MR10	0xFF
Configure BT, BL, WC.	MR1	0x--
Configure the memory latency settings (RL and WL).	MR2 ⁽¹⁾	0x--
Unmask memory banks.	MR16	0x--
Unmask memory segments.	MR17	0x--

⁽¹⁾ Memory latency settings (RL and WL) depend on OPP.

15.3.5.1.2 Operational Modes Configuration

15.3.5.1.2.1 EMIF Output Impedance Calibration Mode

Table 15-120. EMIF Output Impedance Calibration Mode

Step	Register/ Bit Field / Programming Model	Value
IF : Calibration per CS		
Determine on which chip select 1 or 0 the calibration is enabled.	EMIF_ZQ_CONFIG[31:30] REG_ZQ_CS1/0EN	0x-
ELSE : (Calibration on both the CS0 and CS1)		
Enable automatic output impedance calibration for both the chip selects simultaneously.	EMIF_ZQ_CONFIG[29] REG_ZQ_DUALCALEN	0x1
ENDIF		
Define the interval (number of refresh periods) between ZQCS commands.	EMIF_ZQ_CONFIG[15:0] REG_ZQ_REFINTERVAL	0x----
Define the number of ZQCL durations that build the ZQINIT duration.	EMIF_ZQ_CONFIG[19:18] REG_ZQ_ZQINIT_MULT	0x-
Define the number of ZQCS intervals that build the ZQCL duration.	EMIF_ZQ_CONFIG[17:16] REG_ZQ_ZQCL_MULT	0x-

Table 15-120. EMIF Output Impedance Calibration Mode (continued)

Step	Register/ Bit Field / Programming Model	Value
Enable the issuing of ZQ-Long Command on Self-Refresh, Active Power-Down, and Precharge Power-Down exit.	EMIF_ZQ_CONFIG[28] REG_ZQ_SFEXITEN	0x1

15.3.5.1.2.2 EMIF MR Read

Table 15-121. EMIF RM Read

Step	Register/ Bit Field / Programming Model	Value
Choose chip-select 0 or 1 to issue mode register read command	EMIF_LPDDR2_MODE_REG_CFG[31] REG_CS	0x-
Write the mode register (MR) address	EMIF_LPDDR2_MODE_REG_CFG[7:0] REG_ADD RESS	0x-
Initiate Read command by reading the register	EMIF_LPDDR2_MODE_REG_DATA[7:0]	

15.3.5.1.2.3 EMIF MR Write

Table 15-122. EMIF MR Write

Step	Register/ Bit Field / Programming Model	Value
Choose chip-select 0 or 1 to issue mode register write command	EMIF_LPDDR2_MODE_REG_CFG[31] REG_CS	0x-
Write the mode register (MR) address	EMIF_LPDDR2_MODE_REG_CFG[7:0] REG_ADD RESS	0x----
Supply the Data Byte to be written and initiate Write command by writing the register	EMIF_LPDDR2_MODE_REG_DATA[7:0] REG_VALUE_0	0x--

15.3.5.1.2.4 EMIF SDRAM Self-Refresh

Table 15-123. EMIF SDRAM Self-Refresh Entering

Step	Register/ Bit Field / Programming Model	Value
Define the number of DDR clock cycles after which the EMIF puts the external SDRAM in Self Refresh mode, when EMIF is idle.	EMIF_PWR_MGMT_CTRL[7:4] REG_SR_TIM	0x-
Enable the Self-Refresh mode	EMIF_PWR_MGMT_CTRL[10:8] REG_LP_MODE	0x2
Write the shadow register of EMIF_PWR_MGMT_CTRL .	EMIF_PWR_MGMT_CTRL_SHDW	0x-

Table 15-124. EMIF SDRAM Self-Refresh Exiting

Step	Register/ Bit Field / Programming Model	Value
Change REG_LP_MODE bitfield from 0x2 to any value.	EMIF_PWR_MGMT_CTRL[10:8] REG_LP_MODE	0x-
Write the shadow register of EMIF_PWR_MGMT_CTRL .	EMIF_PWR_MGMT_CTRL_SHDW	0x-----

15.3.5.1.2.5 EMIF LPDDR2 (SDRAM or NVM) Power-Down Mode

Table 15-125. EMIF SDRAM Power-Down Mode Entering

Step	Register/ Bit Field / Programming Model	Value
Define the number of DDR clock cycles after which the EMIF puts the external SDRAM in Power Down mode, when EMIF is idle.	EMIF_PWR_MGMT_CTRL [15:12] REG_PD_TIM	0x-
Enable (enter) the Power-down mode	EMIF_PWR_MGMT_CTRL [10:8] REG_LP_MODE	0x4
Write the shadow register of EMIF_PWR_MGMT_CTRL .	EMIF_PWR_MGMT_CTRL_SHDW	0x-----

Table 15-126. EMIF SDRAM Power-Down Mode Exiting

Step	Register/ Bit Field / Programming Model	Value
Change REG_LP_MODE bitfield from 0x4 to any value.	EMIF_PWR_MGMT_CTRL [10:8] REG_LP_MODE	0x-
Write the shadow register of EMIF_PWR_MGMT_CTRL .	EMIF_PWR_MGMT_CTRL_SHDW	0x-----

15.3.5.1.2.6 EMIF LPDDR2-SDRAM Deep Power-Down Mode

Table 15-127. EMIF LPDDR2-SDRAM Deep Power-Down Mode Entering

Step	Register/ Bit Field / Programming Model	Value
Define the number of DDR clock cycles after which the EMIF puts the external SDRAM in Power saving mode, when EMIF is idle.	EMIF_PWR_MGMT_CTRL [3:0] REG_CS_TIM	0x-
Enable (enter) the Deep Power-Down mode	EMIF_PWR_MGMT_CTRL [11] REG_DPD_EN	0x1
Write the shadow register of EMIF_PWR_MGMT_CTRL .	EMIF_PWR_MGMT_CTRL_SHDW	0x-----

Table 15-128. EMIF LPDDR2-SDRAM Deep Power-Down Mode Exiting

Step	Register/ Bit Field / Programming Model	Value
Clear REG_DPD_EN bit.	EMIF_PWR_MGMT_CTRL [11] REG_DPD_EN	0
Write the shadow register of EMIF_PWR_MGMT_CTRL .	EMIF_PWR_MGMT_CTRL_SHDW	0x-----

NOTE: After Deep Power-Down exit, software must perform initialization as specified in [Table 15-119](#).

15.3.5.1.2.7 EMIF Temperature Monitoring Mode

Table 15-129. EMIF Temperature Monitoring Mode

Step	Register/ Bit Field / Programming Model	Value
Determine which chip-select 1 or 0 is used for Temperature Alert Polling	EMIF_TEMP_ALERT_CONFIG [31:30] REG_TA_CS1/0EN	0x-
Define the interval (number of refresh periods) between temperature alert polls.	EMIF_TEMP_ALERT_CONFIG [21:0] REG_TA_REFINTERVAL	0x-----
Define the width of the physical memory device	EMIF_TEMP_ALERT_CONFIG [27:26] REG_TA_DEVWDT	0x-
Define which external byte lanes contain a device for temperature monitoring (which devices to be polled).	EMIF_TEMP_ALERT_CONFIG [25:24] REG_TA_DEVCNT	0x-

Table 15-129. EMIF Temperature Monitoring Mode (continued)

Step	Register/ Bit Field / Programming Model	Value
(Optional) Enable the issuing of a temperature alert poll on Self-Refresh exit (poll for temperature change every time EMIF exits Self-Refresh, Active Power-Down, and Precharge Power-Down modes).	EMIF_TEMP_ALERT_CONFIG [28] REG_TA_SFEXITEN	0x1
Enable System L3 interrupt for SDRAM temperature alert.	EMIF_IRQENABLE_SET_SYS [1] REG_EN_TA_SYS	0x1
Enable Low-Latency L3 interrupt for SDRAM temperature alert.	EMIF_IRQENABLE_SET_LL [1] REG_EN_TA_LL	0x1

15.3.5.1.3 EMIF Events Servicing

15.3.5.1.3.1 Interrupt Servicing

This section covers the event servicing (interrupt treatment) of the EMIF module.

Please, have in mind that the following Interrupt mechanism is double as there are two EMIF modules with different register addresses and 2 Interrupt lines - EMIF1_IRQ and EMIF2_IRQ.

Table 15-130. EMIF Event Servicing

Step	Register/ Bit Field / Programming Model	Value
Read the status registers:	EMIF_IRQSTATUS_SYS , EMIF_IRQSTATUS_LL	
IF :	EMIF_IRQSTATUS_SYS [0]	=1
Read the Error Log register and determine the Addressing mode, Command type and the Connection ID of the first errored transaction.	EMIF_L3_ERR_LOG	
Clear corresponding status flag	EMIF_IRQSTATUS_SYS [0] REG_ERR_SYS	0x1
ELSE IF :	EMIF_IRQSTATUS_SYS [1]	=1
Update the REFRESH_RATE to the required value as per the temperature change.	EMIF_SDRAM_REF_CTRL [15:0] REG_REFRESH_RATE	0x----
Clear corresponding status flag	EMIF_IRQSTATUS_SYS [1] REG_TA_SYS	0x1
ELSE IF:	EMIF_IRQSTATUS_LL [0]	=1
Read the error log register and determine the addressing mode, command type, and connection ID of the first errored transaction.	EMIF_L3_ERR_LOG	
Clear corresponding status flag	EMIF_IRQSTATUS_LL [0] REG_ERR_LL	0x1
ELSE IF:	EMIF_IRQSTATUS_LL [1]	=1
Update the REFRESH_RATE to the required value as per the temperature change.	EMIF_SDRAM_REF_CTRL [15:0] REG_REFRESH_RATE	0x----
Clear corresponding status flag	EMIF_IRQSTATUS_LL [1] REG_TA_LL	0x1
ENDIF		
Disable interrupts if needed	EMIF_IRQENABLE_CLR_SYS [0] REG_EN_ERR_SYS or EMIF_IRQENABLE_CLR_LL [0] REG_EN_ERR_LL	0x1

15.3.6 EMIF Register Manual

15.3.6.1 EMIF Instance Summary

Table 15-131. EMIF Instance Summary

Module Name	Base Address	Size

NOTE: The values of the different bit fields in the [EMIF_SDRAM_CONFIG](#) and [EMIF_SDRAM_CONFIG2](#) registers are fixed by the Control Module (CM) at reset. These values must be modified by the header feature in the ROM code configuration or by the initial boot image running from an external XIP booting memory or internal RAM (see [Section 27.4.8, Image Format](#)). They must not be modified during run time as they reflect the used hardware LPDDR2 SDRAM and/or NVM memory configurations.

15.3.6.2.2 EMIF Register Description

Table 15-133. EMIF_MOD_ID_REV

Address Offset	0x0000 0000		
Physical Address	0x4C00 0000 0x4D00 0000	Instance	EMIF1 EMIF2
Description	Revision number register		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 15-135. EMIF_STATUS

Address Offset	0x0000 0004		
Physical Address	0x4C00 0004 0x4D00 0004	Instance	EMIF1 EMIF2
Description	SDRAM Status Register (STATUS)		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REG_BE	REG_DUAL_CLK_MODE	REG_FAST_INIT	RESERVED																										REG_PHY_DLL_READY	RESERVED	

Bits	Field Name	Description	Type	Reset
31	REG_BE	Big endian mode select for 8 and 16-bit devices, set to 1 for big endian or 0 for little endian operation.	R	0
30	REG_DUAL_CLK_MODE	Dual Clock mode. Defines whether the L3_clk and EMIF_FCLK are asynchronous. L3_clk and EMIF_FCLK are asynchronous, if set to 1.	R	1
29	REG_FAST_INIT	Fast Init. Defines whether the EMIF fast initialization mode has been enabled. Fast initialization is enabled if set to 1.	R	0
28:3	RESERVED	Reserved	R	0x0000000
2	REG_PHY_DLL_READY	DDR PHY Ready. Reflects the value on the phy_ready port (active high) that defines whether the DDR PHY is ready for normal operation. The DDR PHY is ready for normal operation, if set to 1.	R	1
1:0	RESERVED	Reserved	R	0x0

Bits	Field Name	Description	Type	Reset
31:29	REG_SDRAM_TYPE	SDRAM Type selection. Set to 4 for LPDDR2-S4, Set to 5 for LPDDR2-S2 All other value are reserved.	RW	0x- ⁽¹⁾
28:27	REG_IBANK_POS	Internal bank position. Set to 0 to assign internal bank address bits from L3 address as shown in Table 15-107 and Table 15-108 . Set to 1, 2, or 3 to assign internal bank address bits from L3 address as shown in Table 15-109 , Table 15-110 , and Table 15-111 .	RW	0x- ⁽¹⁾
26:24	RESERVED	Reserved	RW	0x0
23	REG_DDR2_DDQS	DDR2 differential DQS enable. Set to 0 for single-ended DQS. Set to 1 for differential DQS. This bit is only for DDR2 mode; because the device supports LPDDR2, this bit is don't care.	RW	0x- ⁽¹⁾
22:21	RESERVED	Reserved	RW	0x- ⁽¹⁾
20	REG_DDR_DISABLE_DLL	Disable DLL select. Set to 1 to disable DLL inside SDRAM.	RW	0x- ⁽¹⁾
19:16	RESERVED	Reserved	RW	0x0
15:14	REG_NARROW_MODE	SDRAM data bus width. Set to 0 for 32-bit and set to 1 for 16-bit. All other values are reserved.	RW	0x- ⁽¹⁾
13:10	REG_CL	CAS Latency (referred to as read latency (RL) in some SDRAM specs). The value of this field defines the CAS latency to be used when accessing connected SDRAM devices. Value of 3, 4, 5, 6, 7, and 8 (CAS latency of 3, 4, 5, 6, 7, and 8) are supported for LPDDR2-SDRAM. All other values are reserved. Also program the EMIF_DDR_PHY_CTRL_1 [3:0] REG_READ_LATENCY	RW	0x- ⁽¹⁾

⁽¹⁾ Value loaded by the control module at reset (see [Section 18.6.4, SYSCTRL_GENERAL_WKUP Register Summary](#)).

Bits	Field Name	Description	Type	Reset
9:7	REG_ROWSIZE	Row Size. Defines the number of row address bits of connected SDRAM devices. Set to 0 for 9 row bits, Set to 1 for 10 row bits, Set to 2 for 11 row bits, Set to 3 for 12 row bits, Set to 4 for 13 row bits, Set to 5 for 14 row bits, Set to 6 for 15 row bits, Set to 7 for 16 row bits. This field is only used when EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS field is set to 1, 2, or 3 or REG_EBANK_POS field in EMIF_SDRAM_CONFIG_2 register is set to 1.	RW	0x- ⁽²⁾
6:4	REG_IBANK	Internal Bank setup. Defines number of banks inside connected SDRAM devices. Set to 0 for 1 bank, Set to 1 for 2 banks, Set to 2 for 4 banks, Set to 3 for 8 banks. All other values are reserved.	RW	0x- ⁽²⁾
3	REG_EBANK	External chip-select setup. Defines whether SDRAM accesses will use 1 or 2 chip-select lines. Set to 0 to use pad_cs_o_n[0] only. Set to 1 to use pad_cs_o_n[1:0]. This bit will automatically be set to 0 if EMIF_SDRAM_CONFIG_2[30] REG_CS1NVMEN field is set to 1.	RW	0x- ⁽²⁾
2:0	REG_PAGESIZE	Page Size. Defines the internal page size of connected SDRAM devices. Set to 0 for 256-word page (8 column bits), Set to 1 for 512-word page (9 column bits), Set to 2 for 1024-word page (10 column bits), Set to 3 for 2048-word page (11 column bits). All other values are reserved.	RW	0x- ⁽²⁾

⁽²⁾ Value loaded by the control module at reset (see [Section 18.6.4](#), [SYSCTRL_GENERAL_WKUP Register Summary](#)).

Address Offset	0x0000 0010	Instance	EMIF1 EMIF2
Physical Address	0x4C00 0010 0x4D00 0010		
Description	SDRAM Refresh Control Register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REG_INITREF_DIS	RESERVED															REG_REFRESH_RATE															

Bits	Field Name	Description	Type	Reset
31	REG_INITREF_DIS	Initialization and Refresh disable. When set to 1, EMIF will disable SDRAM initialization and refreshes, but will carry out SDRAM write/read transactions.	RW	0
30:16	RESERVED	Reserved	R	0
15:0	REG_REFRESH_RATE	Refresh Rate. Value in this field is used to define the rate at which connected SDRAM devices will be refreshed. SDRAM refresh rate = $\text{DDR_PHY_CLK} / \text{REG_REFRESH_RATE}$. If $\text{REG_REFRESH_RATE} < (8 \times \text{REG_T_RFC}) + \text{REG_T_RP} + \text{REG_T_RCD} + 20$, then it will be loaded with $(8 \times \text{REG_T_RFC}) + \text{REG_T_RP} + \text{REG_T_RCD} + 20$. This is done to avoid lock-up situations when illegal values are programmed. For a description of DDR_PHY_CLK, see Section 15.3.3 , <i>EMIF Integration</i> .	RW	0x0000

Description	Power Management Control Register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RESERVED																REG_PD_TIM				REG_DPD_EN	REG_LP_MODE				REG_SR_TIM				REG_CS_TIM			

Bits	Field Name	Description	Type	Reset
31:16	RESERVED		R	0x0000
15:12	REG_PD_TIM	Power Mangement timer for Power-Down. The EMIF will put the external SDRAM in Power-Down mode after the EMIF is idle for these number of DDR clock cycles and if reg_lp_mode field is set to 4. Set to 0 to immediately enter Power-Down mode. Set to 1 for 16 clocks, set to 2 for 32 clocks, set to 3 for 64 clocks, set to 4 for 128 clocks, set to 5 for 256 clocks, set to 6 for 512 clocks, set to 7 for 1024 clocks, set to 8 for 2048 clocks, set to 9 for 4096 clocks, set to 10 for 8192 clocks, set to 11 for 16384 clocks, set to 12 for 32768 clocks, set to 13 for 65536 clocks, set to 14 for 131072 clocks, and set to 15 for 262144 clocks.	RW	0x0
11	REG_DPD_EN	Deep Power Down enable. Set to 0 for normal operation. Set to 1 to enter deep power-down mode. This mode will override the reg_lp_mode field setting.	RW	0
10:8	REG_LP_MODE	Automatic Power Management enable Set to 1: Reserved Set to 2: Self-refresh mode Set to 4: Power-down mode All other values will disable automatic power management.	RW	0x0
7:4	REG_SR_TIM	Power Mangement timer for Self Refresh. The EMIF will put the external SDRAM in Self Refresh mode after the EMIF is idle for these number of DDR clock cycles and if reg_lp_mode field is set to 2. Set to 0 to immediately enter Self Refresh mode. Set to 1 for 16 clocks, set to 2 for 32 clocks, set to 3 for 64 clocks, set to 4 for 128 clocks, set to 5 for 256 clocks, set to 6 for 512 clocks, set to 7 for 1024 clocks, set to 8 for 2048 clocks, set to 9 for 4096 clocks, set to 10 for 8192 clocks, set to 11 for 16384 clocks, set to 12 for 32768 clocks, set to 13 for 65536 clocks, set to 14 for 131072 clocks, and set to 15 for 262144 clocks.	RW	0x0
3:0	REG_CS_TIM	Power Mangement timer for Clock Stop. The EMIF will put the external SDRAM in Clock Stop mode after the EMIF is idle for these number of DDR clock cycles and if reg_lp_mode field is set to 1. Set to 0 to immediately enter Clock Stop mode. Set to 1 for 16 clocks, set to 2 for 32 clocks, set to 3 for 64 clocks, set to 4 for 128 clocks, set to 5 for 256 clocks, set to 6 for 512 clocks, set to 7 for 1024 clocks, set to 8 for 2048 clocks, set to 9 for 4096 clocks, set to 10 for 8192 clocks, set to 11 for 16384 clocks, set to 12 for 32768 clocks, set to 13 for 65536 clocks, set to 14 for 131072 clocks, and set to 15 for 262144 clocks.	RW	0x0

Table 15-169. EMIF_L3_CONFIG

Address Offset	0x0000 0054	Instance	EMIF1 EMIF2
Physical Address	0x4C00 0054 0x4D00 0054		
Description	Config Register		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								RESERVED				RESERVED				RESERVED								REG_PR_OLD_COUNT							

Bits	Field Name	Description	Type	Reset
31:28	RESERVED	Reserved for future use.	R	0x0
27:24	REG_SYS_THRESH_MAX	System L3 Threshold Maximum. The number of commands the system interface can consume in the command FIFO. The value is used to determine when to stop future request, writing a zero will reserve no space for the associated interface. In the event the value is set to zero and a request is seen for that interface, the command FIFO will assume a value of 1. Since the low-latency interface has effectively a higher priority, the only way for the system interface to use all command FIFO entries is to set the REG_LL_THRESH_MAX to zero.	RW	0x7
23:20	RESERVED	Reserved for future use.	R	0x0
19:16	REG_LL_THRESH_MAX	Low-latency L3 Threshold Maximum. The number of commands the low latency interface can consume in the command FIFO. The value is used to determine when to stop future request, writing a zero will reserve no space for the associated interface. In the event the value is set to zero and a request is seen for that interface, the command FIFO will assume a value of 1.	RW	0x7
15:8	RESERVED	Reserved for future use.	R	0x0
7:0	REG_PR_OLD_COUNT	Priority Raise Old Counter. Number of memory transfers after which the EMIF momentarily raises the priority of old commands in the L3 Command FIFO.	RW	0xFF

Table 15-211. EMIF_DDR_PHY_CTRL_1

Address Offset	0x0000 00E4	Instance	EMIF1 EMIF2
Physical Address	0x4C00 00E4 0x4D00 00E4		
Description	DDR PHY Control 1 Register. This register is used to control the DDR PHY. The bit field definitions are DDR PHY specific.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
DLL_MASTER_SENSITIVITY								REG_PHY_FREEZE_DELAY_CODE_POSTAMBLE								REG_PHY_FREEZE_DELAY_CODE_PREAMBLE								REG_DLL_MASTER_SW_CODE_CTRL								REG_DLL_SLAVE_DLY_CTRL								REG_READ_LATENCY							

Bits	Field Name	Description	Type	Reset
31:30	DLL_MASTER_SENSITIVITY	This field defines the level of sensitivity of the DLL master: the lower the value, the more sensitive the DLL is to PVT variation. The recommended setting is 0x2.	RW	0x0
29:26	REG_PHY_FREEZE_DELAY_CODE_POSTAMBLE	Postamble time respected by the DATA PHY freezing the DLL slave code after reads. Use the TI-validated value of 0x1.	RW	0x0
25:22	REG_PHY_FREEZE_DELAY_CODE_PREAMBLE	Preamble time respected by the DATA PHY before freezing the DLL slave code during reads. Use the TI-validated value of 0x2.	RW	0x0
21:12	REG_DLL_MASTER_SW_CODE_CTRL	DLL delay code when in software override mode, typically at OPP_BOOT. Keep at maximum delay (0x1FF) for this case. Override mode is controlled through DLL_OVERRIDE register fields in PRCM.	RW	0x1FF
11:4	REG_DLL_SLAVE_DLY_CTRL	DLL slave delay ratio control For the typical SDRAM frequency of 400-MHz and DLL reference clock frequency of 100-MHz, this number must be set to 0x40 (1/4-th of 0xFF). 0x40: DLL ratio of 4 0x80: DLL ratio of 2 0xFF: DLL ratio of 1	RW	0xFF
3:0	REG_READ_LATENCY	This field defines the read latency for the read data from SDRAM in number of DDR clock cycles. This field is used by the EMIF as well as the PHY. The EMIF will expect the first read data to arrive (reg_read_latency + 3) DDR clock cycles from the read command. The REG_READ_LATENCY must be set to RL + EMIF_SDRAM_TIM_3[14:13] REG_T_TDQSCMAX, where REG_T_TDQSCMAX = ceiling(tDQSCmax / tCKavg) – 1 The write latency (WL) is tied to the RL. See the LPDDR SDRAM standard.	RW	0x0

15.4 General-Purpose Memory Controller

15.4.1 GPMC Overview

The general-purpose memory controller (GPMC) is an unified memory controller dedicated to interfacing external memory devices:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (only available in non-muxed mode) burst NOR flash devices
- NAND Flash
- Pseudo-SRAM devices

15.4.2 GPMC Environment

This section describes the GPMC application fields from an environment point of view (external connections). It describes GPMC connectivity options, and gives three possible interfaces.

15.4.2.1 GPMC Modes

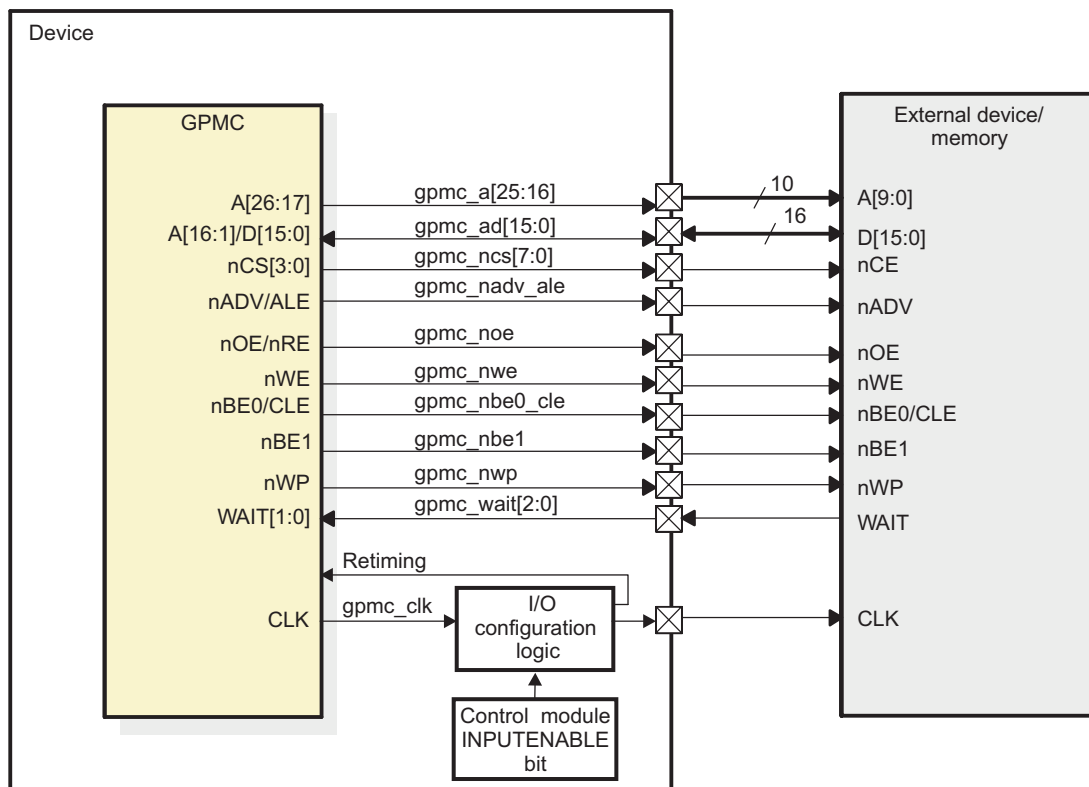

This section shows three GPMC external connections options:

- [Figure 15-50](#) shows a connection between the GPMC and a 16-bit synchronous address/data-multiplexed (or AAD-multiplexed, but this protocol use less address pins) external memory device ([Figure 15-50](#)).
- [Figure 15-50](#) shows a connection between the GPMC and a 16-bit synchronous nonmultiplexed external memory device ([Figure 15-51](#)).
- [Figure 15-52](#) shows a connection between the GPMC and a 16-bit NAND device ([Figure 15-52](#)).

NOTE: The device does not provide the A0 byte address line required for random-byte addressable 8-bit wide device interfacing (for multiplexed and nonmultiplexed protocol). Hence, an 8-bit device must be connected to the D[7:0] / gpmc_ad[7:0] data bus (rather than D[15:8] / gpmc_ad[15:8]) of the GPMC controller. This limits the use of 8-bit wide device interfacing to byte-alias access.

gpmc-002

Figure 15-51. GPMC to 16-Bit Nonmultiplexed Memory

gpmc-045

Figure 15-52. GPMC to 8-Bit NAND Device

gpmc-003

15.4.2.2 GPMC Signals

Table 15-215 lists the GPMC subsystem I/O pins.

Table 15-215. GPMC I/O Description

Pin Name	I/O	Description
gpmc_a[25:16]	O	Address
gpmc_ad[15:0]	I/O	Data
gpmc_ncs[7:0]	O	Chip-selects (active low)
gpmc_clk	O ⁽¹⁾	Clock generated for the external memory or device
gpmc_nadv_ale	O	Address valid (active low). Also used as address latch enable (active high) for NAND protocol memories.
gpmc_noe_nre	O	Output enable (active low). Also used as read enable (active low) for NAND protocol memories.
gpmc_nwe	O	Write enable (active low)
gpmc_nbe0_cle	O	Lower-byte enable (active low). Also used as command latch enable for NAND protocol memories.
gpmc_nbe1	O	Upper-byte enable (active low).
gpmc_nwp	O	Write protect (active low)
gpmc_wait[2:0]	I	External wait signal for NOR and NAND protocol memories. The wait signals can be mapped on any of the chip-select.
gpmc_io_dir	O	gpmc_ad[15:0] signal direction control: Low during transmit (for write access: data OUT from GPMC to memory), High during receive (for read access: data IN from memory to GPMC)

⁽¹⁾ This output signal is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

Table 15-216 shows the use of address and data GPMC controller pins based on the type of external device.

Table 15-216. GPMC Pin Multiplexing Options

GPMC Pin	Multiplexed Address Data 16-Bit Device	Nonmultiplexed Address Data 16-Bit Device With LIMITED- ADDRESS Bit Enabled	16-Bit NAND Device	8-Bit NAND Device

When using non-multiplexed memories, it is recommended to enable [GPMC_CONFIG\[1\] LIMITEDADDRESS](#). This bit forces A[26:11] to 1 on the GPMC I/O side. Thus, only 2Kbytes of memory address space is accessible regardless of the memory size.

With all device types, the GPMC does not drive unnecessary address lines. They stay at their reset value of 0x00.

Address mapping supports address/data-multiplexed 16-bit wide devices:

- The NOR flash memory controller still supports non-multiplexed address and data memory devices.
- Multiplexing mode can be selected through the [GPMC_CONFIG1_i\[9:8\] MUXADDDATA](#) bit field (i = 0 to 7).
- Asynchronous page mode is not supported for multiplexed address and data devices.

NOTE: The numbering for A (address) is starting from 1 instead of 0 such as D (data) because the A0 signal is handled within the GPMC but is not driven to any pad. The signal is only relevant to 8-bit accesses and this configuration is not recommended. If such a memory or device is connected, only every second word in the memory is accessible, that is, each 16-bit aligned 8-bit word is mapped but not the non-16-bit aligned ones. Any access to a non-aligned one will actually result in accessing the associated aligned one, at address A1 instead of address A.

15.4.3 GPMC Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

- No STANDBY hardware handshake
- No wake-up request
- One system direct memory access (sDMA) request
- One interrupt request to the Cortex-A9 MPU Interrupt Controller (MA_IRQ) and to DSP subsystem (D_IRQ)
- One clock for functional and interface domains

Figure 15-53 shows GPMC integration.

Figure 15-53. GPMC Integration

Table 15-217, Table 15-218 and Table 15-219 summarize the integration of the module in the device.

Table 15-217. GPMC Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-up Capability	Interconnect
GPMC	PD_CORE	No	L3

NOTE:

- For information about operation performance point (OPP) configuration description, see [Section 3.1.1.1.2, Module Level Clock Management](#) in [Chapter 3, Power, Reset, and Clock Management](#).

Table 15-218. GPMC Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal Name	Source	Description

- For DMA source description, see [Section 15.4.4.6, GPMC DMA Requests](#).

15.4.4 GPMC Functional Description

The GPMC basic programming model offers maximum flexibility to support various access protocols for each of the eight configurable chip-selects. Use optimal chip-select settings, based on the characteristics of the external device:

- Different protocols can be selected to support generic asynchronous or synchronous random-access devices (NOR flash, SRAM) or to support specific NAND devices.
- The address and the data bus can be multiplexed on the same external bus.
- Read and write access can be independently defined as asynchronous or synchronous.
- System requests (byte, 16-bit word, burst) are performed through single or multiple accesses. External access profiles (single, multiple with optimized burst length, native- or emulated-wrap) are based on external device characteristics (supported protocol, bus width, data buffer size, native-wrap support).
- System burst read or write requests are synchronous-burst (multiple-read or multiple-write). When neither burst nor page mode is supported by external memory or ASIC devices, system burst read or write requests are translated to successive single synchronous or asynchronous accesses (single reads or single writes). 8-bit wide devices are supported only in single synchronous or single asynchronous read or write mode.
- To simulate a programmable internal-wait state, an external wait pin can be monitored to dynamically control external access at the beginning (initial access time) of and during a burst access.

Each control signal is controlled independently for each chip-select. The internal functional clock of the GPMC (GPMC_FCLK) is used as a time reference to specify the following:

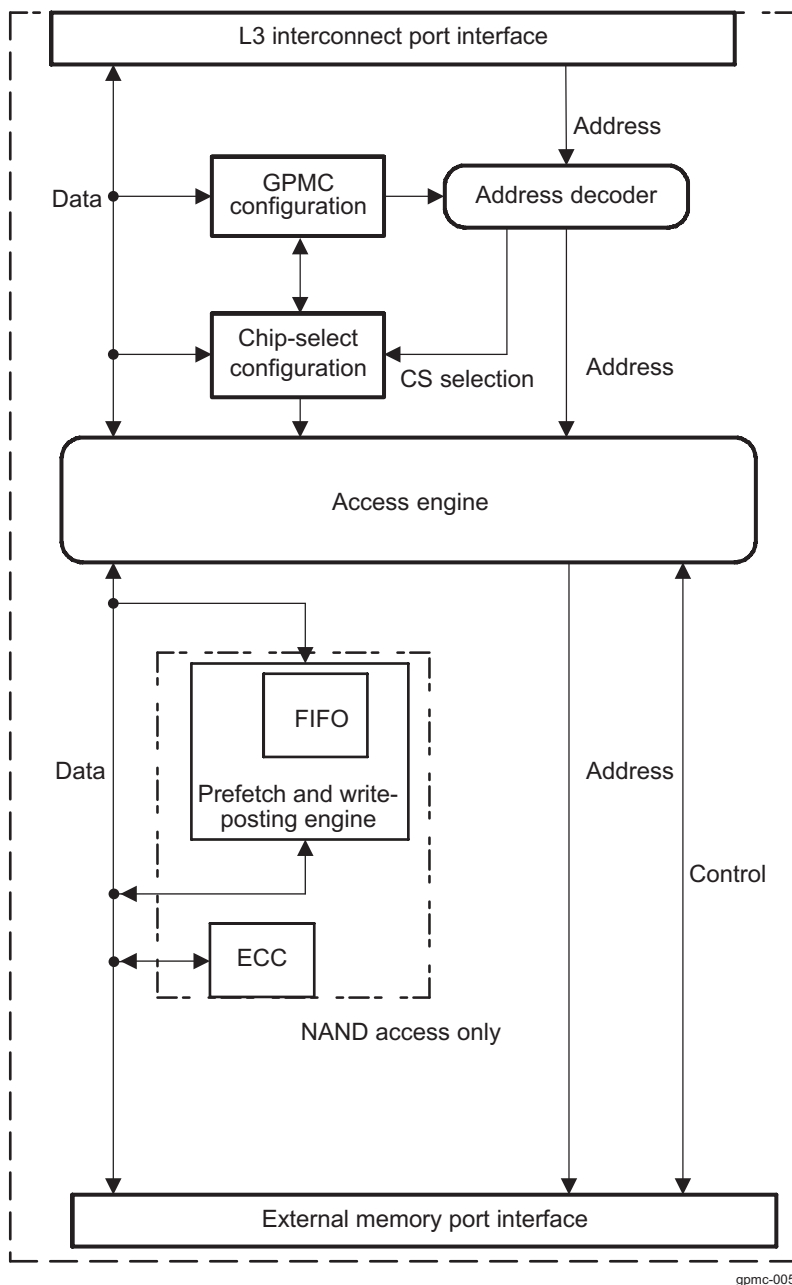

- Read- and write-access duration
- Most GPMC external interface control-signal assertion and deassertion times
- Data-capture time during read access
- External wait-pin monitoring time
- Duration of idle time between accesses, when required

15.4.4.1 GPMC Block Diagram

[Figure 15-54](#) shows the GPMC functional block diagram. The GPMC consists of six blocks:

- L3 interconnect port interface
- Address decoder, GPMC configuration, and chip-select configuration register file
- Access engine
- Prefetch and write-posting engine
- Error correction code engine (ECC)
- External device/memory port interface

Figure 15-54. GPMC Block Diagram

The GPMC can access various external devices through the L3 Interconnect. The flexible programming model allows a wide range of attached device types and access schemes.

Based on the programmed configuration bit fields stored in the GPMC registers, the GPMC is able to generate all control signals timing depending on the attached device and access type.

Given the chip-select decoding and its associated configuration registers, the GPMC selects the appropriate device type control signals timing.

15.4.4.2 GPMC Clock Configuration

Table 15-220 describes the GPMC clocks.

Table 15-220. GPMC Clocks

Signal	I/O ⁽¹⁾	Description
GPMC_FCLK	I	Functional and interface clock
gpmc_clk	O	External clock provided to synchronous external memory devices.

⁽¹⁾ I = Input; O = Output

The gpmc_clk is generated by the GPMC from the internal GPMC_FCLK clock. The source of the GPMC_FCLK is described in [Table 15-218](#). The gpmc_clk is configured via the [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER field (for i = 0 to 7) as shown in [Table 15-221](#).

Table 15-221. gpmc_clk Configuration

Source Clock	GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER	gpmc_clk Generated Clock Provided to External Memory Device
GPMC_FCLK	00	GPMC_FCLK
	01	GPMC_FCLK/2
	10	GPMC_FCLK/3
	11	GPMC_FCLK/4

15.4.4.3 GPMC Software Reset

The GPMC can be reset by software through the [GPMC_SYSCONFIG\[1\]](#) SOFTRESET bit. Setting the bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Hardware and software resets initialize all GPMC registers and the finite state-machine (FSM) immediately and unconditionally. The [GPMC_SYSSTATUS\[0\]](#) RESETDONE bit indicates that the software reset is complete when its value is 1. The software must ensure that the software reset completes before doing GPMC operations.

15.4.4.4 GPMC Power Management

GPMC power is supplied by the CORE power domain, and GPMC power management complies with system power-management guidelines.

[Table 15-222](#) describes power-management features available for the GPMC module.

NOTE:

- For information about source clock gating and sleep/wake-up transitions description, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.6, Clock Management Functional Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 15-222. GPMC Local Power Management Features

Feature	Registers	Description
Clock Auto Gating	GPMC_SYSCONFIG[0] AUTOIDLE bit	This bit allows a local power optimization inside the module, by gating the GPMC_FCLK clock upon the internal activity.
Slave Idle Modes	GPMC_SYSCONFIG[4:3] SIDLEMODE bit field	Force-idle, No-idle and Smart-idle wakeup modes are available
Clock Activity	N/A	Feature not available
Master Standby Modes	N/A	Feature not available
Global Wake-up Enable	N/A	Feature not available
Wake-up Sources Enable	N/A	Feature not available

15.4.4.5 GPMC Interrupt Requests

The GPMC generates one interrupt event as shown in [Figure 15-53](#) :

- The interrupt request goes from GPMC (GPMC_IRQ) to the Cortex-A9 MPU subsystem : MA_IRQ_20 and to the DSP subsystem : D_IRQ_59.

[Table 15-223](#) lists the event flags, and their mask, that can cause module interrupts.

Table 15-223. GPMC Interrupt Events

Event Flag	Event Mask	Sensitivity	Map to	Description
GPMC_IRQSTATUS [10] WAIT2EDGE DETECTIONSTATUS	GPMC_IRQENABLE [10] WAIT2EDGE DETECTIONENABLE	Edge	D_IRQ_59 and MA_IRQ_20	Wait2 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait2 signal. The rising or falling edge detection of Wait2 is selected through GPMC_CONFIG [10] WAIT2PINPOLARITY
GPMC_IRQSTATUS [9] WAIT1EDGE DETECTIONSTATUS	GPMC_IRQENABLE [9] WAIT1EDGE DETECTIONENABLE	Edge	D_IRQ_59 and MA_IRQ_20	Wait1 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait1 signal. The rising or falling edge detection of Wait1 is selected through GPMC_CONFIG [9] WAIT1PINPOLARITY
GPMC_IRQSTATUS [8] WAIT0EDGE DETECTIONSTATUS	GPMC_IRQENABLE [8] WAIT0EDGE DETECTIONENABLE	Edge	D_IRQ_59 and MA_IRQ_20	Wait0 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait0 signal. The rising or falling edge detection of Wait0 is selected through GPMC_CONFIG [8] WAIT0PINPOLARITY
GPMC_IRQSTATUS [1] TERMINAL COUNTSTATUS	GPMC_IRQENABLE [1] TERMINAL COUNTENABLE	Level	D_IRQ_59 and MA_IRQ_20	Terminal count event: Triggered on prefetch process completion, that is when the number of currently remaining data to be requested reaches zero
GPMC_IRQSTATUS [0] FIFOEVENTSTATUS	GPMC_IRQENABLE [0] FIFOEVENTENABLE	Level	D_IRQ_59 and MA_IRQ_20	FIFO event interrupt: Indicates FIFO levels availability for in Write-Posting mode and prefetch mode. GPMC_PREFETCH_CONFIG1 [2] DMAMODE shall be set to 0.

15.4.4.6 GPMC DMA Requests

The GPMC generates one DMA event as shown in [Figure 15-53](#) :

- From GPMC (GPMC_DMA_REQ) to the system DMA (sDMA) : S_DMA_3.

15.4.4.7 L3 Interconnect Interface

The GPMC L3 interconnect interface is a pipelined interface including an 16 x 32-bit word write buffer.

Any system host can issue external access requests through the GPMC.

The device system can issue the following requests through this interface:

- One 8-bit / 16-bit / 32-bit interconnect access (read/write)
- Two incrementing 32-bit interconnect accesses (read/write)
- Two wrapped 32-bit interconnect accesses (read/write)
- Four incrementing 32-bit interconnect accesses (read/write)
- Four wrapped 32-bit interconnect accesses (read/write)
- Eight incrementing 32-bit interconnect accesses (read/write)
- Eight wrapped 32-bit interconnect accesses (read/write)

Only linear burst transactions are supported; interleaved burst transactions are not supported. Only power-of-two-length precise bursts 2 x 32, 4 x 32, 8 x 32 or 16 x 32 with the burst base address aligned on the total burst size are supported (this limitation applies to incrementing bursts only).

This interface also provides one interrupt and one DMA request line, for specific event control.

It is recommended to program the ATTACHEDDEVICEPAGELENGTH field ([GPMC_CONFIG1_i\[24:23\]](#)) according to the effective attached device page length and to enable WRAPBURST bit ([GPMC_CONFIG1_i\[31\]](#)) if the attached device supports wrapping burst.

However, it is possible to emulate wrapping burst on a non-wrapping memory by providing relevant addresses within the page or splitting transactions. Bursts larger than the memory page length are chopped into multiple bursts transactions. Due to the alignment requirements, a page boundary is never crossed.

15.4.4.8 GPMC Address and Data Bus

The current application supports GPMC connection to NAND devices and to address/data-multiplexed memories or devices. Connection to address/data-nonmultiplexed memories or devices is supported with a limited address range of 2 Kbytes.

Depending on the GPMC configuration of each chip-select, address and data bus lines that are not required for a particular access protocol are not updated (changed from current value) and are not sampled when input (input data bus).

- When the [GPMC_CONFIG\[1\]](#) LIMITEDADDRESS bit is set to 1, A26-A11 are not modified during an external memory access. This limits the memory address space to 2K-byte regardless of the memory size.
- For address/data-multiplexed and AAD-multiplexed NOR devices, the address is multiplexed on the data bus.
- 8-bit wide NOR devices do not use GPMC I/O: gpmc_ad[15:8] for data (they are used for address if needed).
- 16-bit wide NAND devices do not use GPMC I/O: gpmc_a[25:16].
- 8-bit wide NAND devices do not use GPMC I/O: gpmc_a[25:16] and GPMC I/O: gpmc_ad[15:8].

CAUTION

Before accessing a chip-select configured with a nonmultiplexed protocol, set the LIMITEDADDRESS bit control.

15.4.4.8.1 GPMC I/O Configuration Setting

NOTE: In this section and next sections, the *i* in GPMC_CONFIGx_i stands for the GPMC chip-select *i* where *i* = 0 to 7.

To select a NAND device, program the following register fields:

- [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE field = 0b10
- [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit = 0b00

To select an address/data-multiplexed device, program the following register fields:

- [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE field = 0b00
- [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit = 0b10

To select an address/address/data-multiplexed device, program the following register fields:

- [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE field = 0b00
- [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit = 0b01

To select an address/data-nonmultiplexed device (limited to a 2K-byte address range), program the following register fields:

- [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE field = 0b00
- [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit = 0b00
- [GPMC_CONFIG\[1\]](#) LIMITEDADDRESS bit = 1

NOTE: The [GPMC_CONFIG1](#)[1] LIMITEDADDRESS bit only applies to address/data-nonmultiplexed devices; it has no effect on other device types (NAND, address/data-multiplexed).

15.4.4.8.2 GPMC CS0 Default Configuration at IC Reset

To ensure a correct external boot with a GPMC access from IC reset time on CS0, several external pins are sampled:

- The sys_boot[4:0] pins (device boundary) define the sequence of interfaces and devices to use for booting.
- The sys_boot[5] pin defines which group of booting sequences is preferred: memory booting (sys_boot[5] = 0) or peripheral booting (sys_boot[5] = 1).
- Additional pins are used to configure reset values in the [GPMC_CONFIG1_i](#) register (where i = 0) as detailed below and in [Table 15-224](#):
 - The *bootdevicesize* input pin (at the GPMC boundary) defines the size of the attached device on chip-select 0 and is used to configure the [GPMC_CONFIG1_i](#)[13:12] DEVICESIZE bits (where i = 0). The BOOT_DEVICE_TYPE signal is propagated from the system control module (SCM). Its value is fixed for the device at 0x1 at IC reset, which means that only 16-bit memories are supported for booting.
 - The *cs0muxdevice* input pin (at the GPMC boundary) selects whether the attached device to chip-select 0 is an address/data-multiplexed device or not. The input pin is used to configure the [GPMC_CONFIG1_i](#)[9:8] MUXADDDATA bit (where i = 0). The CS0_MUX_DEVICE signal is propagated from the SCM. Its value is fixed for the device at 0x2 at IC reset, which means that only address/data-multiplexed memories are supported for booting (that is, in a standalone way from memories connected to CS0).
 - The *bootwaiten* input pin (at the GPMC boundary) enables the monitoring on chip-select 0 of the WAIT pin at IC reset release time for read accesses. The input pin is used to configure the [GPMC_CONFIG1_i](#)[22] WAITREADMONITORING bit (where i = 0). The BOOT_WAIT_ENABLE signal is propagated from the system control module (SCM). When sys_boot[5:0] = 0b11 1111, the BOOT_WAIT_ENABLE signal is activated, causing the wait pin to be monitored for read accesses.
 - The *bootwaitselect* input pin selects the WAIT signal at IC reset release time between WAIT0 input pin, WAIT1 input pin or WAIT2 input pin. At IC reset release time, these three pins have different polarity.

Table 15-224. Boot Control Interface Input Signals Description

Signal Name	Width	Description
<i>bootdevicesize</i>	2	Size of the device attached on CS0 0b00: 8-bit 0b01: 16-bit 0b10: Reserved 0b11: Reserved
<i>cs0muxdevice</i>	2	Multiplexing mode of the device on CS0 0b00: Nonmultiplexed device on CS0 0b01: AAD-multiplexed device on CS0 (address-address-data) 0b10: Address/Data-multiplexed device on CS0 0b11: Reserved
<i>bootwaiten</i>	1	Wait monitoring on CS0 at IC reset release time for read accesses 0: Wait pin is not monitored 1: Wait pin is monitored
<i>bootwaitselect</i>	1	Selection of the wait pin 0: WAIT0 input pin 1: WAIT1 input pin 2: WAIT2 input pin

CAUTION

Using the internal boot code, the entire CS0 configuration can be modified before the first CS0 access. This modification of internal boot code is necessary for two external devices:

- NAND device attached to CS0
- Nonmultiplexed 2 Kbytes address range device attached to CS0

At reset time, the IC may boot from the internal ROM.

Reset values of the timing control parameters are defined to cope with direct boot on address and data multiplexed NOR Flash device, on non-multiplexed NOR Flash device or on any asynchronous device with large timing margins assuming a low GPMC_FCLK frequency (for example, 19.2Mhz) at boot time.

For a multiplexed access, the address 16 low-order bits are presented onto gpmc_ad[15:0] while the high-order bits are presented both onto gpmc_a[26:16]. If the external chip interface to the memories uses a 16-bit data bus, the high-order address bits are sampled on the address bus.

The reset values of timing parameters used at boot time are:

- CSONTIME = 1
- CSRDOFFTIME = 16
- ADVONTIME = 4
- ADVRDOFFTIME = 5
- OEONTIME = 6
- OEOFFTIME = 16
- RDACCESSTIME = 15
- RDCYCLETIME = 17

For an AAD-multiplexed access, all address bits are passed onto the data bus using two nADV rising edge. The first rising edge latches the address MSB down to bit 17 while the second rising edge latches address bits 16 down to 1. This configuration is only used for 16-bit memories.

The reset values of these timing parameters used at boot time are:

- ADVAADMUXONTIME = 1
- ADVAADMUXRDOFFTIME = 2
- OEAADMUXONTIME = 1
- OEAADMUXRDOFFTIME = 3

15.4.4.9 Address Decoder and Chip-Select Configuration

Addresses are decoded accordingly with the address request of the chip-select and the content of the chip-select base address register file, which includes a set of global GPMC configuration registers and eight sets of chip-select configuration registers.

The GPMC configuration register file is memory-mapped and can be read or written with byte, 16-bit word, or 32-bit word accesses. The register file should be configured as a noncacheable, nonbufferable region to prevent any desynchronization between host execution (write request) and the completion of register configuration (write completed with register updated). [Section 15.4.7, GPMC Register Manual](#) provides the GPMC register locations. For the map of GPMC memory locations, see [Chapter 2, Memory Mapping](#).

After the chip-select is configured, the access engine accesses the external device, drives the external interface control signals, and applies the interface protocol based on user-defined timing parameters and settings.

15.4.4.9.1 Chip-Select Base Address and Region Size

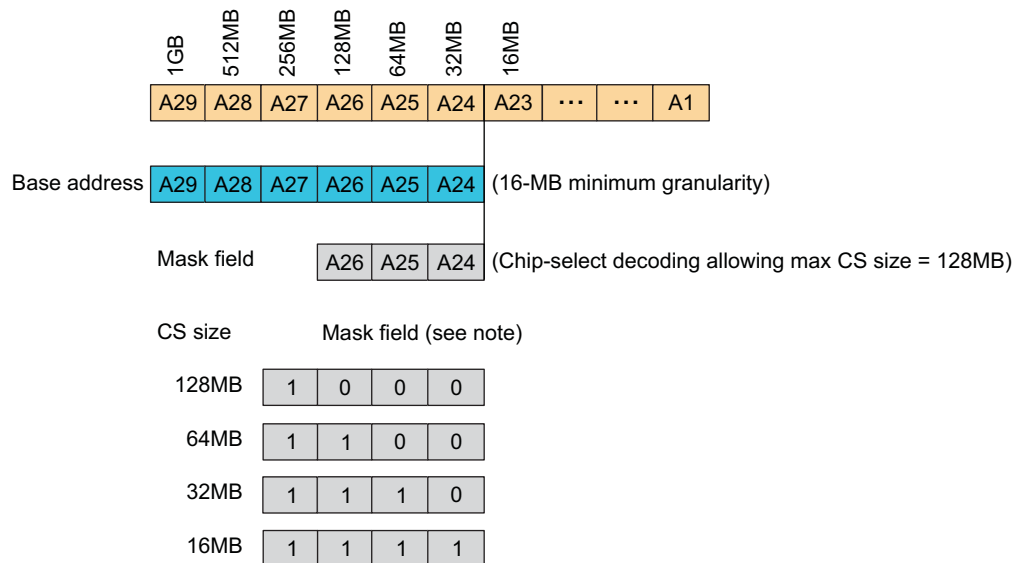

Any external memory or ASIC device attached to the GPMC external interface can be accessed by any device system host within the GPMC 1 Gbyte contiguous address space. For details, see [Chapter 2, Memory Mapping](#).

The GPMC 1G byte address space can be divided into a maximum of eight chip-select regions with programmable base address and programmable CS size. The CS size is programmable from 16M bytes to 128M bytes (must be a power-of-2) and is defined by the mask field. Attached memory smaller than the programmed CS region size is accessed through the entire CS region (aliasing).

Each chip-select has a 6-bit base address encoding and a 4-bit decoding mask, which must be programmed according to the following rules:

- The programmed chip-select region base address must be aligned on the chip-select region size address boundary and is limited to a power-of-2 address value. During access decoding, the register base address value is used for address comparison with the address-bit line mapping as described in [Figure 15-55](#) (with A0 as the device system byte-address line). Base address is programmed through the `GPMC_CONFIG7_i[5:0]` BASEADDRESS bit field
- The register mask is used to exclude some address lines from the decoding. A register mask bit field set to 0 suppresses the associated address line from the address comparison (incoming address bit line is don't care). The register mask value must be limited to the subsequent value, based on the desired chip-select region size. Any other value has an undefined result. When multiple chip-select regions with overlapping addresses are enabled concurrently, access to these chip-select regions is cancelled and a GPMC access error is posted. The mask field is programmed through the `GPMC_CONFIG7_i[11:8]` MASKADDRESS bit field.

Figure 15-55. Chip-Select Address Mapping and Decoding Mask

gpmc-006

Chip-select configuration (base and mask address or any protocol and timing settings) must be performed while the associated chip-select is disabled through the `GPMC_CONFIG7_i[6]` CSVALID bit (where i stands for the GPMC chip-select value, i = 0 to 7). In addition, a chip-select configuration can only be disabled if there is no ongoing access to that chip-select. This requires activity monitoring of the prefetch or write-posting engine if the engine is active on the chip-select. Also, the write buffer state must be monitored to wait for any posted write completion to the chip-select.

Any access attempted to a nonvalid GPMC address region (CSVALID disabled or address decoding outside a valid chip-select region) is not propagated to the external interface and a GPMC access error is posted. In case of chip-selects overlapping, an error is generated and no access will occur on either chip-select.

Chip-select 0 is the only chip-select region enabled after either a power-up or a GPMC reset.

CAUTION

Although the GPMC interface can drive up to 4 chip-selects, the frequency specified for this interface is for a specific load. If this load is exceeded, the maximum frequency cannot be reached. One solution is to implement a board with buffers, to allow the slowest device to maintain the total load on the lines.

15.4.4.9.2 Access Protocol**15.4.4.9.2.1 Supported Devices**

The access protocol of each chip-select can be independently specified through the [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE parameter (where i = 0 to 7) for:

- Random-access synchronous or asynchronous memory like NOR flash, SRAM
- NAND flash asynchronous devices

NOTE: For more information about the NAND flash GPMC basic programming model and NAND support, see [Section 15.4.4.13](#), *NAND Device Basic Programming Model*, and [Section 15.4.4.13.1](#), *NAND Memory Device in Byte or Word 16 Stream Mode*.

15.4.4.9.2.2 Access Size Adaptation and Device Width

Each chip-select can be independently configured through the [GPMC_CONFIG1_i\[13:12\]](#) DEVICESIZE field (i = 0 to 7) to interface with a 16-bit wide device or an 8-bit wide device. System requests with data width greater than the external device data bus width are split into successive accesses according to both the external device data-bus width and little-endian data organization.

NOTE: The device does not provide the A0 byte address line required for random-byte addressable 8-bit wide device interfacing (for both multiplexed and nonmultiplexed protocol). It limits the use of 8-bit wide device interfacing to byte-alias accesses. This limitation is not applicable to NAND device interfacing (8-bit wide or 16-bit wide devices).

15.4.4.9.2.3 Address/Data-Multiplexing Interface

For random synchronous or asynchronous memory interfacing (DEVICETYPE = 0b00), an address- and data-multiplexing protocol can be selected through the [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit field (i = 0 to 7). The nADV signal must be used as the external device address latch control signal. For the associated chip-select configuration, nADV assertion and deassertion time and nOE assertion time must be set to the appropriate value to meet the address latch setup/hold time requirements of the external device. See [Section 15.4.3](#), *GPMC Integration*.

NOTE: This address/data-multiplexing interface is not applicable to NAND device interfacing. NAND devices require a specific address, command, and data multiplexing protocol. See [Section 15.4.4.13](#), *NAND Device Basic Programming Model*.

15.4.4.9.3 External Signals**15.4.4.9.3.1 WAIT Pin Monitoring Control**

GPMC access time can be dynamically controlled using an external gpmc_wait pin when the external device access time is not deterministic and cannot be defined and controlled only using the GPMC internal RDACCESSTIME, WRACCESSTIME and PAGEBURSTACCESSTIME wait state generator.

The GPMC features three input wait pins: gpmc_wait2, gpmc_wait1 and gpmc_wait0. These pins allow control of external devices with different wait-pin polarity. They also allow the overlap of wait-pin assertion from different devices without affecting access to devices for which the wait pin is not asserted.

- The [GPMC_CONFIG1_i\[17:16\]](#) WAITPINSELECT field (i = 0 to 7) selects which input gpmc_wait pin is used for the device attached to the corresponding chip-select.
- The polarity of the wait pin is defined through the WAITxPINPOLARITY bit of the [GPMC_CONFIG](#) register. A wait pin configured to be active low means that low level on the WAIT signal indicates that the data is not ready and that the data bus is invalid. When WAIT is inactive, data is valid.

The GPMC access engine can be configured per CS to monitor the wait pin of the external memory device or not, based on the access type: read or write.

- The [GPMC_CONFIG1_i\[22\]](#) WAITREADMONITORING bit defines whether the wait pin should be monitored during read accesses or not.
- The [GPMC_CONFIG1_i\[21\]](#) WAITWRITEMONITORING bit defines whether the wait pin should be monitored during write accesses or not.

The GPMC access engine can be configured to monitor the wait pin of the external memory device asynchronously or synchronously with the GPMC_CLK clock, depending on the access type: synchronous or asynchronous (the [GPMC_CONFIG1_i\[29\]](#) READTYPE and [GPMC_CONFIG1_i\[27\]](#) WRITETYPE bits).

15.4.4.9.3.1.1 Wait Monitoring During an Asynchronous Read Access

When wait-pin monitoring is enabled for read accesses (WAITREADMONITORING), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the wait-deasserted state.

During asynchronous read accesses with wait-pin monitoring enabled, the wait pin must be at a valid level (asserted or deasserted) for at least two GPMC clock cycles before RDACCESSTIME completes, to ensure correct dynamic access-time control through wait-pin monitoring. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

In this context, RDACCESSTIME is used as a WAIT invalid timing window and is set to such a value that the wait pin is at a valid state two GPMC clock cycles before RDACCESSTIME completes.

Similarly, during a multiple-access cycle (for example, asynchronous read page mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-deasserted state. Wait-monitoring pipelining is also applicable to multiple accesses (access within a page).

- WAIT monitored as active freezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as asserted extends the current access time in the page. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as inactive completes the current access time and starts the next access phase in the page. The data bus is considered valid, and data are captured during this clock cycle. In case of a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their related control timing value and according to the CYCLETIME counter status.

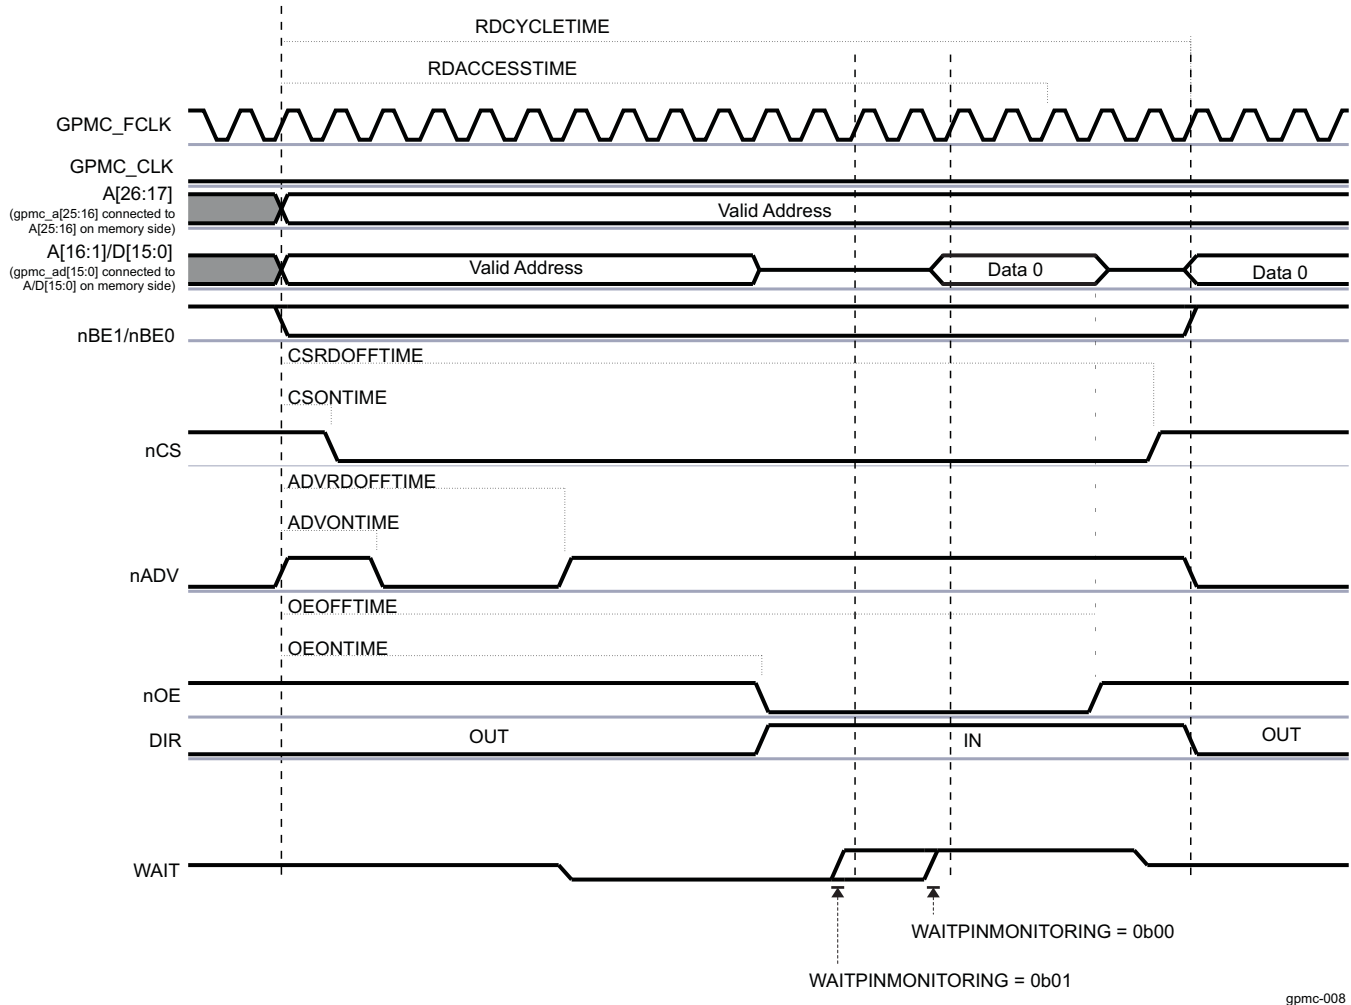

When a delay larger than two GPMC clocks must be observed between wait-pin deactivation time and data valid time (including the required GPMC and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data-capture time and the effective unlock of the CYCLETIME counter. This extra delay can be programmed in the [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME field (i = 0 to 7).

NOTE:

- The WAITMONITORINGTIME parameter does not delay the wait-pin active or inactive detection, nor does it modify the two GPMC clocks pipelined detection delay.
- This extra delay is expressed as a number of GPMC_CLK clock cycles, even though the access is defined as asynchronous, and no GPMC_CLK clock is provided to the external device. Still, GPMCFCLKDIVIDER is used as a divider for the GPMC clock, so it must be programmed to define the correct WAITMONITORINGTIME delay.

Figure 15-56 shows wait behavior during an asynchronous single read access.

Figure 15-56. Wait Behavior During an Asynchronous Single Read Access (GPMCFCLKDivider = 1)

NOTE: The WAIT signal is active low. [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME = 0b00, or 0b01.

15.4.4.9.3.1.2 Wait Monitoring During an Asynchronous Write Access

When wait-pin monitoring is enabled for write accesses ([GPMC_CONFIG1_i\[21\]](#) WAITWRITEMONITORING bit = 0x1), the WAIT-invalid timing window is defined by the WRACCESSTIME field. WRACCESSTIME must be set so that the wait pin is at a valid state two GPMC clock cycles before WRACCESSTIME completes. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

- WAIT monitored as active freezes the CYCLETIME counter. This informs the GPMC that the data bus

is not captured by the external device. The control signals are kept in their current state. The data bus still drives the data.

- WAIT monitored as inactive unfreezes the CYCLETIME counter. This informs that the data bus is correctly captured by the external device. All signals, including the data bus, are controlled according to their related control timing value and to the CYCLETIME counter status.

When a delay larger than two GPMC clock cycles must be observed between wait-pin deassertion time and the effective data write into the external device (including the required GPMC data setup time and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data write time into the external device and the effective unfreezing of the CYCLETIME counter. This extra delay can be programmed in the [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME fields ($i = 0$ to 7).

NOTE:

- The WAITMONITORINGTIME parameter does not delay the wait-pin assertion or deassertion detection, nor does it modify the two GPMC clock cycles pipelined detection delay.
 - This extra delay is expressed as a number of GPMC_CLK clock cycles, even though the access is defined as asynchronous, and even though no clock is provided to the external device. Still, [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER is used as a divider for the GPMC clock and so it must be programmed to define the correct WAITMONITORINGTIME delay.
-

15.4.4.9.3.1.3 Wait Monitoring During a Synchronous Read Access

During synchronous accesses with wait-pin monitoring enabled, the wait pin is captured synchronously with GPMC_CLK, using the rising edge of this clock.

The WAIT signal can be programmed to apply to the same clock cycle it is captured in. Alternatively, it can be sampled one or two GPMC_CLK cycles ahead of the clock cycle it applies to. This pipelining is applicable to the entire burst access, and to all data phase in the burst access. This WAIT pipelining depth is programmed in the [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME field (where $i = 0$ to 7), and is expressed as a number of GPMC_CLK clock cycles.

In synchronous mode, when wait-pin monitoring is enabled ([GPMC_CONFIG1_i\[22\]](#) WAITREADMONITORING bit), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the WAIT deasserted-state detection.

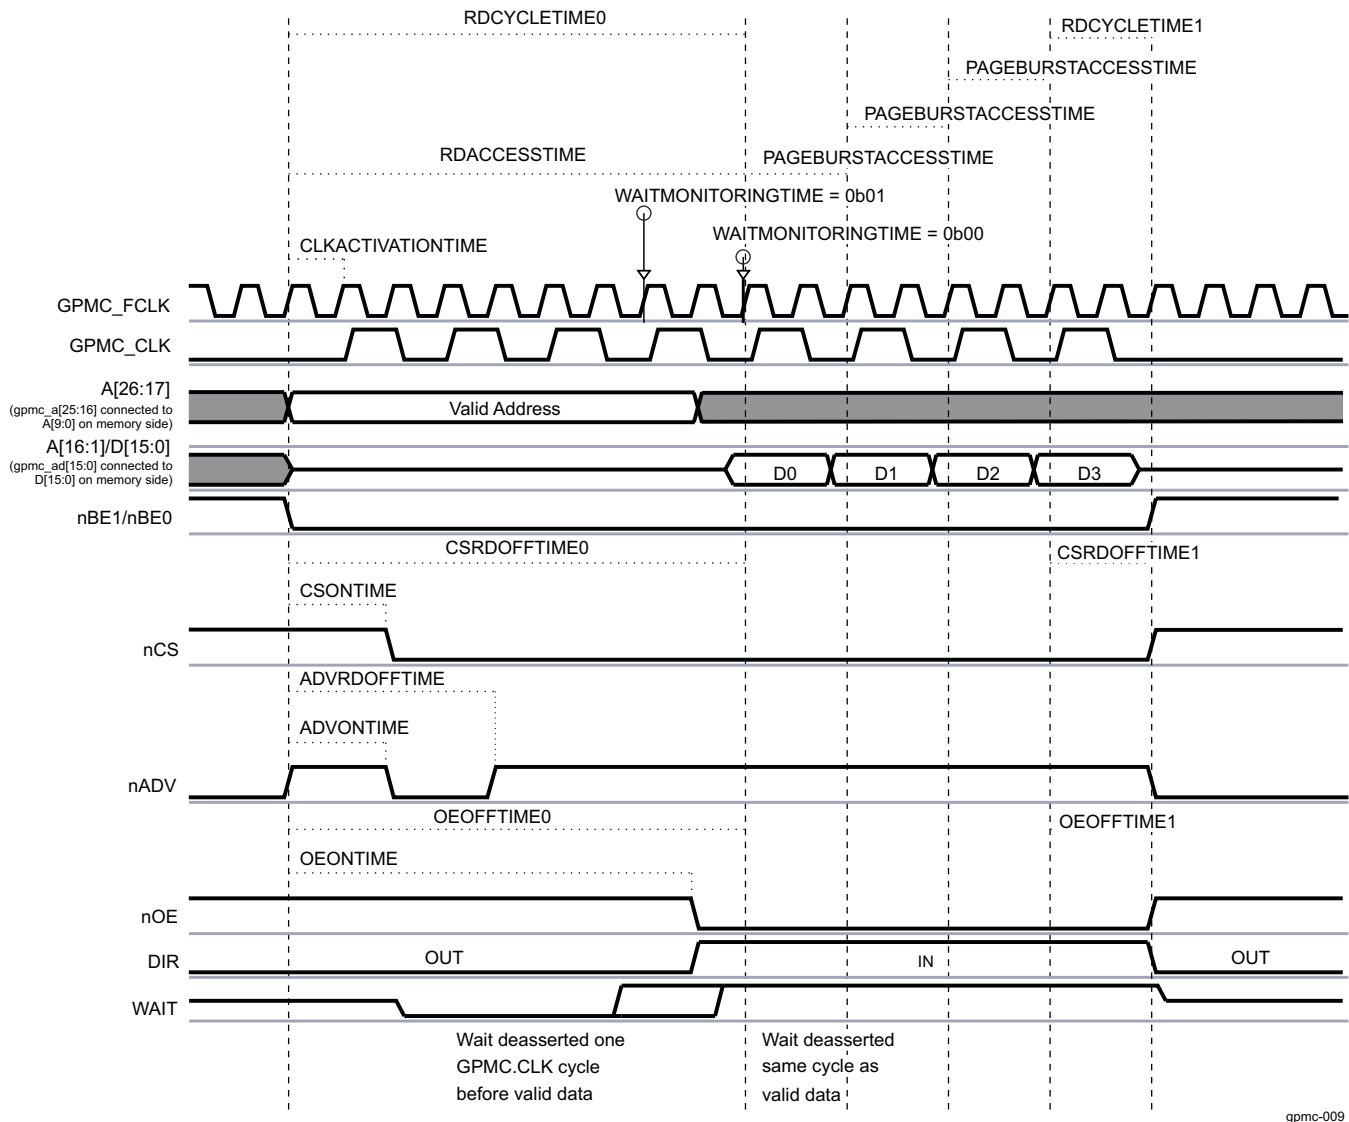

Depending on the programmed WAITMONITORINGTIME value, the wait pin should be at a valid level, either asserted or deasserted:

- In the same clock cycle the data is valid if WAITMONITORINGTIME = 0 (at RDACCESSTIME completion)
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC_FCLK clock cycles before RDACCESSTIME completion if WAITMONITORINGTIME not equal to 0

Similarly, during a multiple-access cycle (burst mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-inactive state. The Wait pipelining depth programming applies to the whole burst access.

- WAIT monitored as active freezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in a lock state), WAIT monitored as active extends the current access time in the burst. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in lock state), WAIT monitored as inactive completes the current access time and starts the next access phase in the burst. The data bus is considered valid, and data are captured during this clock cycle. In a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their relative control timing value and the CYCLETIME counter status.

[Figure 15-57](#) shows wait behavior during a synchronous read burst access.

Figure 15-57. Wait Behavior During a Synchronous Read Burst Access

NOTE: The WAIT signal is active low. WAITMONITORINGTIME = 00, 01.

15.4.4.9.3.1.4 Wait Monitoring During a Synchronous Write Access

During synchronous accesses with wait-pin monitoring enabled (the WAITWRITEMONITORING bit), the wait pin is captured synchronously with GPMC_CLK, using the rising edge of this clock.

If enabled, external wait-pin monitoring can be used in combination with WRACCESSTIME to delay the effective memory device GPMC_CLK capture edge.

Wait-monitoring pipelining depth is similar to synchronous read access:

- At WRACCESSTIME completion if WAITMONITORINGTIME = 0
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC_FCLK cycles before WRACCESSTIME completion if WAITMONITORINGTIME not equal to 0.

Wait-monitoring pipelining definition applies to whole burst accesses:

- WAIT monitored as active freezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as active indicates that the data

bus is not being captured by the external device. Control signals are kept in their current state. The data bus is kept in its current state.

- WAIT monitored as inactive unfreezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as inactive indicates the effective data capture of the bus by the external device and starts the next access of the burst. In case of a single access or if this was the last access in a multiple access cycle, all signals, including the data bus, are controlled according to their related control timing value and the CYCLETIME counter status.

NOTE: Wait monitoring is supported for all configurations except for [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME = 0x0 (where i = 0 to 7) for write bursts with a clock divider of 1 or 2 ([GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER field equal to 0x0 or 0x1 respectively).

15.4.4.9.3.1.5 WAIT with NAND Device

For details about the use of the wait pin for communication with a NAND flash external device, see [Section 15.4.4.13.2, NAND Device-Ready Pin](#).

15.4.4.9.3.1.6 Idle Cycle Control Between Successive Accesses

15.4.4.9.3.1.6.1 Bus Turnaround (BUSTURNAROUND)

To prevent data-bus contention, an access that follows a read access to a slow memory/device must be delayed (in other words, control the nCS/nOE de-assertion to data bus in high-impedance delay).

The bus turnaround is a time-out counter starting after nCS or nOE de-assertion time, whichever occurs first, and delays the next access start-cycle time. The counter is programmed through the [GPMC_CONFIG6_i\[3:0\]](#) BUSTURNAROUND bit field (where i = 0 to 7).

After a read access to a chip-select with a non zero BUSTURNAROUND, the next access is delayed until the BUSTURNAROUND delay completes, if the next access is one of the following:

- A write access to any chip-select (same or different from the chip-select data was read from)
- A read access to a different chip-select from the chip-select data was read access from
- A read or write access to a chip-select associated with an address/data-multiplexed device

NOTE: Bus keeping starts after bus turnaround completion so that DIR changes from IN to OUT after bus turnaround. The bus will not have enough time to go into high-impedance even though it could be driven with the same value before bus turnaround timing.

BUSTURNAROUND delay runs in parallel with [GPMC_CONFIG6_i\[3:0\]](#) CYCLE2CYCLEDELAY delays. It should be noted that BUSTURNAROUND is a timing parameter for the ending chip-select access while CYCLE2CYCLEDELAY is a timing parameter for the following chip-select access. The effective minimum delay between successive accesses is driven by these delay timing parameters and by the access type of the following access. See [Figure 15-58](#) to [Figure 15-60](#).

Another way to prevent bus contention is to define an earlier nCS or nOE deassertion time for slow devices or to extend the value of RDCYCLETIME. Doing this prevents bus contention, but affects all accesses of this specific chip-select.

Figure 15-58. Read to Read for an Address-Data Multiplexed Device, on Different CS, without Bus Turnaround (nCS0 attached to a fast device)

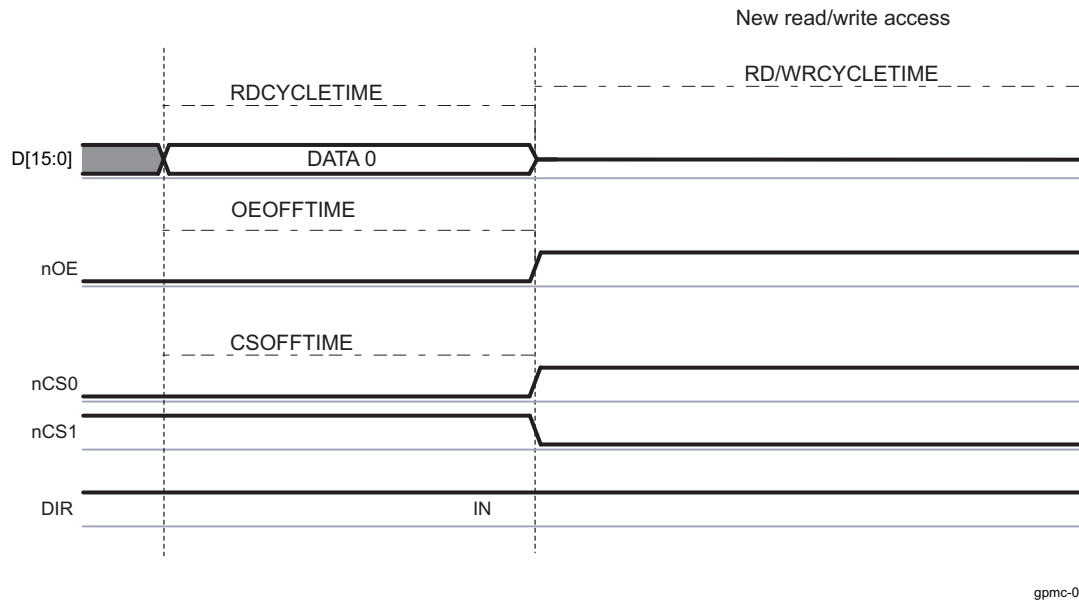

Figure 15-59. Read to Read / Write for an Address-Data Multiplexed Device, on Different CS, with Bus Turnaround

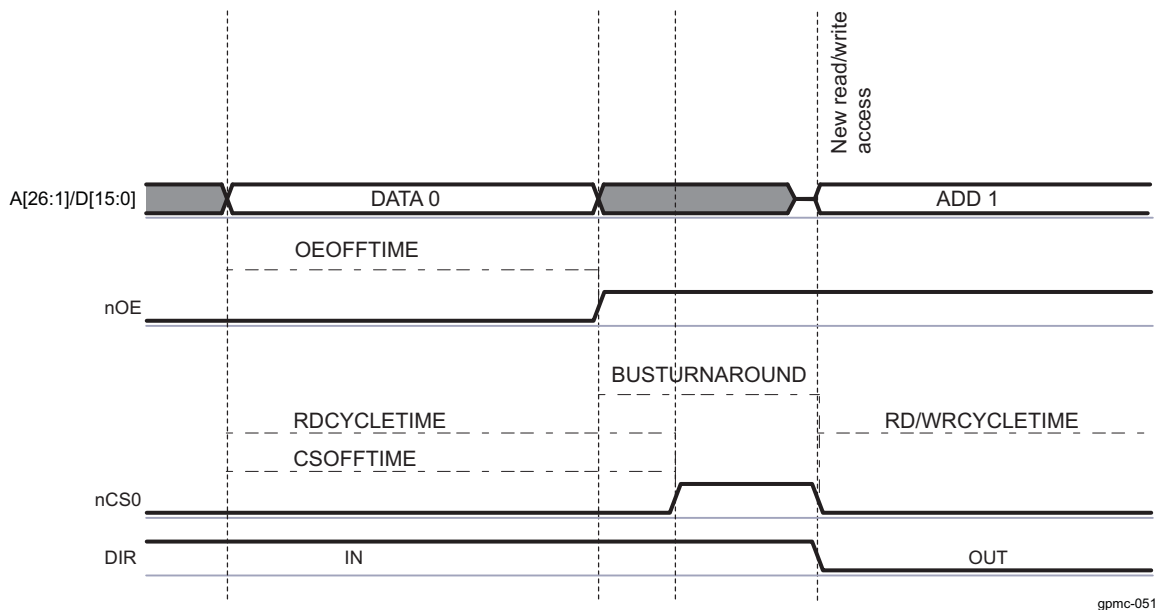

Figure 15-60. Read to Read / Write for a Address-Data or AAD-multiplexed device, on the Same CS, with Bus Turnaround

15.4.4.9.3.1.6.2 Idle Cycles Between Accesses to Same Chip-Select (CYCLE2CYCLESAMECSSEN, CYCLE2CYCLEDELAY)

Some devices require a minimum chip-select signal inactive time between accesses. The [GPMC_CONFIG6_i\[7\]](#) CYCLE2CYCLESAMECSSEN bit ($i = 0$ to 7) enables insertion of a minimum number of GPMC_FCLK cycles, defined by the [GPMC_CONFIG6_i\[11:8\]](#) CYCLE2CYCLEDELAY field, between successive accesses of any type (read or write) to the same chip-select.

If CYCLE2CYCLESAMECSSEN is enabled, any subsequent access to the same chip-select is delayed until its CYCLE2CYCLEDELAY completes. The CYCLE2CYCLEDELAY counter starts when CSRDOFFTIME/CSWROFFTIME completes.

The same applies to successive accesses occurring during 32-bit word or burst accesses split into successive single accesses when the single-access mode is used ([GPMC_CONFIG1_i\[30\]](#) READMULTIPLE = 0 or [GPMC_CONFIG1_i\[28\]](#) WRITEMULTIPLE = 0).

All control signals (CS, ADV#/ALE, BE0#/CLE, WE#, and GPMC.CLK) are kept inactive (ADV#/ALE, BE0#/CLE, and GPMC.CLK at low level; and CS, OE#/RE, and WE at high level) during the idle GPMC_FCLK cycles. This prevents back-to-back accesses to the same chip-select without idle cycles between accesses.

15.4.4.9.3.1.6.3 Idle Cycles Between Accesses to Different Chip-Select (CYCLE2CYCLEDIFFCSSEN, CYCLE2CYCLEDELAY)

Because of the pipelined behavior of the system, successive accesses to different chip-selects can occur back-to-back with no idle cycles between accesses. Depending on the control signals (nCS, nADV/ALE, nBE0/CLE, nOE/RE, nWE) assertion and de-assertion timing parameters and on the IC timing parameters, some control signals assertion times may overlap between the successive accesses to different CS. Similarly, some control signals (WE, OE/RE) may not respect required transition times.

To work around the overlapping and to observe the required control-signal transitions, a minimum of CYCLE2CYCLEDELAY inactive cycles is inserted between the access being initiated to this chip-select and the previous access ending for a different chip-select. This applies to any type of access (read or write).

If [GPMC_CONFIG6_i\[6\]](#) CYCLE2CYCLEDIFFCSEN is enabled, the chip-select access is delayed until CYCLE2CYCLEDELAY cycles have expired since the end of a previous access to a different chip-select. CYCLE2CYCLEDELAY count starts at CSRDOFFTIME/CSWROFFTIME completion. All control signals are kept inactive during the idle GPMC_FCLK cycles.

NOTE: CYCLE2CYCLESAMECSEN and CYCLE2CYCLEDIFFCSEN should be set in [GPMC_CONFIG6_i](#) registers to respectively get idle cycles inserted between accesses on this chip-select and after accesses to a different chip-select.

The CYCLE2CYCLEDELAY delay runs in parallel with the BUSTURNAROUND delay. It should be noted that BUSTURNAROUND is a timing parameter defined for the ending chip-select access, whereas CYCLE2CYCLEDELAY is a timing parameter defined for the starting chip-select access. The effective minimum delay between successive accesses is based on the larger delay timing parameter and on access type combination, since bus turnaround does not apply to all access types. See [Section 15.4.4.9.3.1.6.1, Bus Turnaround \(BUSTURNAROUND\)](#) for more details on bus turnaround.

[Table 15-225](#) describes the configuration required for idle cycle insertion.

Table 15-225. Idle Cycle Insertion Configuration

1st Access Type	BUSTURN AROUND Timing Parameter	Second Access Type	Chip-Select	Add/Data Multiplexed	CYCLE2 CYCLE SAMECSEN Parameter	CYCLE2 CYCLE DIFFCSEN Parameter	Idle Cycle Insertion Between the Two Accesses
R/W	= 0	R/W	Any	Any	0	x	No idle cycles are inserted if the two accesses are well pipelined.
R	> 0	R	Same	Nonmuxed	x	0	No idle cycles are inserted if the two accesses are well pipelined.
R	> 0	R	Different	Nonmuxed	0	0	BUSTURNAROUND cycles are inserted.
R	> 0	R/W	Any	Muxed	0	0	BUSTURNAROUND cycles are inserted.
R	> 0	W	Any	Any	0	0	BUSTURNAROUND cycles are inserted.
W	> 0	R/W	Any	Any	0	0	No idle cycles are inserted if the two accesses are well pipelined.
R/W	= 0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted.
R/W	= 0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted.
R/W	> 0	R/W	Same	Any	1	x	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is max (BUSTURNAROUND, CYCLE2CYCLEDELAY).
R/W	> 0	R/W	Different	Any	x	1	CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is maximum (BUSTURNAROUND, CYCLE2CYCLEDELAY).

15.4.4.9.3.1.7 Slow Device Support (TIMEPARAGRANULARITY Parameter)

All access-timing parameters can be multiplied by 2 by setting the [GPMC_CONFIG1_i\[4\]](#) TIMEPARAGRANULARITY bit (where i stands for the GPMC chip-select value, i = 0 to 7). Increasing all access timing parameters allows support of slow devices.

15.4.4.9.3.2 gpmc_io_dir Pin

The gpmc_io_dir pin is used to control I/O direction on the GPMC data bus gpmc_ad[15:0]. Depending on top-level pad multiplexing, this signal can be output and used externally to the device, if required.

The gpmc_io_dir pin is low during transmit (OUT) and high during receive (IN).

For write accesses, the gpmc_io_dir pin stays OUT from start-cycle time to end-cycle time.

For read accesses, the gpmc_io_dir pin goes from OUT to IN at nOE assertion time and stays IN until:

- BUSTURNAROUND is enabled:
 - The gpmc_io_dir pin goes from IN to OUT at end-cycle time plus programmable bus turnaround time.
- BUSTURNAROUND is disabled:
 - After an asynchronous read access, the gpmc_io_dir pin goes from IN to OUT at RDACCESSTIME + 1 GPMC_FCLK cycle or when RDCYCLETIME completes, whichever occurs last.
 - After a synchronous read access, the gpmc_io_dir pin goes from IN to OUT at RDACCESSTIME + 2 GPMC_FCLK cycles or when RDCYCLETIME completes, whichever occurs last.

Because of the bus-keeping feature of the GPMC, after a read or write access and with no other accesses pending, the default value of the gpmc_io_dir pin is OUT (see [Section 15.4.4.10.10, Bus Keeping Support](#)).

In nonmultiplexed devices, the gpmc_io_dir pin stays IN between two successive read accesses to prevent unnecessary toggling (nonmultiplexed 16-bit wide devices support is limited to 2 Kbytes).

15.4.4.9.3.3 Reset

No reset signal is sent to the external memory device by the GPMC. For more information about external-device reset, see [Chapter 3, Power, Reset, and Clock Management](#).

The PRCM module provides an input pin, global_rst_n, to the GPMC:

- The global_rst_n pin is activated during device warm reset and cold reset.
- The global_rst_n pin initializes the internal state-machine and the internal configuration registers.

15.4.4.9.3.4 Write Protect Signal (nWP)

When connected to the attached memory device, the write protect signal can enable or disable the lockdown function of the attached memory.

The gpmc_nwp output pin value is controlled through the [GPMC_CONFIG\[4\]](#) WRITEPROTECT bit, which is common to all CS.

15.4.4.9.3.5 Byte Enable (nBE1/nBE0)

Byte enable signals (nBE1/nBE0) are:

- Valid (asserted or nonasserted according to the incoming system request) from access start to access completion for asynchronous and synchronous single accesses
- Asserted low from access start to access completion for asynchronous and synchronous multiple read accesses
- Valid (asserted or nonasserted, according to the incoming system request) synchronously to each written data for synchronous multiple write accesses

15.4.4.9.4 Error Handling

When an error occurs in the GPMC, the error information is stored in the [GPMC_ERR_TYPE](#) register and the address of the illegal access is stored in the [GPMC_ERR_ADDRESS](#) register. The GPMC only keeps the first error abort information until the [GPMC_ERR_TYPE](#) register is reset. Subsequent accesses that cause errors are not logged until the error is cleared by hardware with the [GPMC_ERR_TYPE\[0\]](#) ERRORVALID bit.

- **ERRORNOTSUPPADD** occurs when an incoming system request address decoding does not match any valid chip-select region, or if two chip-select regions are defined as overlapped, or if a register file access is tried outside the valid address range of 1 Kbyte.
- **ERRORNOTSUPPMCMD** occurs when an unsupported command request is decoded at the L3 interconnect interface.
- **ERRORTIMEOUT**: A time-out mechanism prevents the system from hanging. The start value of the 9-bit time-out counter is defined in the [GPMC_TIMEOUT_CONTROL](#) register and enabled with the [GPMC_TIMEOUT_CONTROL\[0\]](#) **TIMEOUTENABLE** bit. When enabled, the counter starts at start-cycle time until it reaches 0 and data is not responded to from memory, then a time-out error occurs. When data are sent from memory, this counter is reset to its start value. With multiple accesses (asynchronous page mode or synchronous burst mode), the counter is reset to its start value for each data access within the burst.

The GPMC does not generate interrupts on these errors. True abort to the MPU or interrupt generation is handled at interconnect level.

15.4.4.10 Timing Setting

The GPMC offers the maximum flexibility to support various access protocols. Most of the timing parameters of the protocol access used by the GPMC to communicate with attached memories or devices are programmable on a chip-select basis. Assertion and deassertion times of control signals are defined to match the attached memory or device timing specifications and to get maximum performance during accesses. For more information on GPMC_CLK and GPMC_FCLK see [Section 15.4.4.10.6](#), [GPMC_CLK](#).

NOTE: In the following sections, the start access time refer to the time at which the access begins.

15.4.4.10.1 Read Cycle Time and Write Cycle Time (RDCYCLETIME / WRCYCLETIME)

The [GPMC_CONFIG5_i\[4:0\]](#) **RDCYCLETIME** and [GPMC_CONFIG5_i\[12:8\]](#) **WRCYCLETIME** fields ($i = 0$ to 7) define the address bus and byte enables valid times for read and write accesses. To ensure a correct duty cycle of GPMC_CLK between accesses, **RDCYCLETIME** and **WRCYCLETIME** are expressed in GPMC_FCLK cycles and must be multiples of the GPMC_CLK cycle. **RDCYCLETIME** and **WRCYCLETIME** bit fields can be set with a granularity of 1 or 2 through [GPMC_CONFIG1_i\[4\]](#) **TIMEPARAGRANULARITY**.

When either **RDCYCLETIME** or **WRCYCLETIME** completes, if they are not already deasserted, all control signals (**nCS**, **nADV/ALE**, **nOE/RE**, **nWE**, and **BE0/CLE**) are deasserted to their reset values, regardless of their deassertion time parameters.

An exception to this forced deassertion occurs when a pipelined request to the same chip-select or to a different chip-select is pending. In such a case, it is not necessary to deassert a control signal with deassertion time parameters equal to the cycle-time parameter. This exception to forced deassertion prevents any unnecessary glitches. This requirement also applies to BE signals, thus avoiding an unnecessary BE glitch transition when pipelining requests.

NOTE: All control signals (**CS**, **ADV#/ALE**, **BE0#/CLE**, **WE#**, and **GPMC.CLK**) are kept inactive (**ADV#/ALE**, **BE0#/CLE**, and **GPMC.CLK** at low level; and **CS**, **OE#/RE**, and **WE** at high level) during the idle GPMC.FCLK cycles.

If no inactive cycles are required between successive accesses to the same or to a different chip-select ([GPMC_CONFIG6_i\[7\]](#) **CYCLE2CYCLESAMECSSEN** = 0 or [GPMC_CONFIG6_i\[6\]](#) **CYCLE2CYCLEDIFFCSSEN** = 0, where $i = 0$ to 7), and if assertion-time parameters associated with the pipelined access are equal to 0, asserted control signals (**nCS**, **nADV/ALE**, **nBE0/CLE**, **nWE**, and **nOE/RE**) are kept asserted. This applies to any read/write to read/write access combination.

If inactive cycles are inserted between successive accesses, that is, **CYCLE2CYCLESAMECSSEN** = 1 or **CYCLE2CYCLEDIFFCSSEN** = 1, the control signals are forced to their respective default reset values for the number of GPMC_FCLK cycles defined in **CYCLE2CYCLEDELAY**.

15.4.4.10.2 nCS: Chip-Select Signal Control Assertion/Deassertion Time (CSONTIME / CSRDOFFTIME / CSWROFFTIME / CSEXTRADELAY)

The [GPMC_CONFIG2_i\[3:0\]](#) CSONTIME field (where i = 0 to 7) defines the nCS signal-assertion time relative to the start access time. It is common for read and write accesses.

[GPMC_CONFIG2_i\[12:8\]](#) CSRDOFFTIME (read access) and [GPMC_CONFIG2_i\[20:16\]](#) CSWROFFTIME (write access) bit fields define the nCS signal deassertion time relative to start access time.

CSONTIME, CSRDOFFTIME and CSWROFFTIME parameters are applicable to synchronous and asynchronous modes. CSONTIME can be used to control an address and byte enable setup time before chip-select assertion. CSRDOFFTIME and CSWROFFTIME can be used to control an address and byte enable hold time after chip-select deassertion.

nCS signal transitions as controlled through CSONTIME, CSRDOFFTIME, and CSWROFFTIME can be delayed by half a GPMC_FCLK period by enabling the [GPMC_CONFIG2_i\[7\]](#) CSEXTRADELAY bit. This half of a GPMC_FCLK period provides more granularity on the nCS assertion and deassertion time to guarantee proper setup and hold time relative to GPMC_CLK. CSEXTRADELAY is especially useful in configurations where GPMC_CLK and GPMC_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, CSEXTRADELAY applies to all parameters controlling nCS transitions.

The CSEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than the nCS signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

15.4.4.10.3 nADV/ALE: Address Valid/Address Latch Enable Signal Control Assertion/Deassertion Time (ADVONTIME / ADVRDOFFTIME / ADVWROFFTIME / ADVEXTRADELAY/ADVAADMUXONTIME/ADVAADMUXRDOFFTIME/ADVAADMUXWROFFTIME)

The [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME field (where i = 0 to 7) defines the nADV/ALE signal-assertion time relative to start access time. It is common to read and write accesses.

[GPMC_CONFIG3_i\[12:8\]](#) ADVRDOFFTIME (read access) and [GPMC_CONFIG3_i\[20:16\]](#) ADVWROFFTIME (write access) bit fields define the nADV/ALE signal-deassertion time relative to start access time.

ADVONTIME can be used to control an address and byte enable valid setup time control before nADV/ALE assertion. ADVRDOFFTIME and ADVWROFFTIME can be used to control an address and byte enable valid hold time control after nADV/ALE de-assertion. ADVRDOFFTIME and ADVWROFFTIME are applicable to both synchronous and asynchronous modes.

nADV/ALE signal transitions as controlled through ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME can be delayed by half a GPMC_FCLK period by enabling the [GPMC_CONFIG3_i\[7\]](#) ADVEXTRADELAY bit. This half of a GPMC_FCLK period provides more granularity on nADV/ALE assertion and deassertion time to guarantee proper setup and hold time relative to GPMC_CLK. The ADVEXTRADELAY configuration parameter is especially useful in configurations where GPMC_CLK and GPMC_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, ADVEXTRADELAY applies to all parameters controlling nADV/ALE transitions.

ADVEXTRADELAY must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than nADV/ALE signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

[GPMC_CONFIG3_i\[6:4\]](#) ADVAADMUXONTIME, [GPMC_CONFIG3_i\[26:24\]](#) ADVAADMUXRDOFFTIME, and [GPMC_CONFIG3_i\[30:28\]](#) ADVAADMUXWROFFTIME parameters have the same functions as ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME, but apply to the first address phase in the AAD-multiplexed protocol. It is the user responsibility to make sure ADVAADMUXxxOFFTIME is programmed to a value lower than or equal to ADVxxOFFTIME. Functionality in AAD-mux mode is undefined if the settings do not comply with this requirement. ADVAADMUXxxOFFTIME can be programmed to the same value as ADVONTIME if no high nADV pulse is needed between the two AAD-mux address phases, which is the typical case in synchronous mode. In this configuration, nADV is kept low until it reaches the correct ADVxxOFFTIME.

See [Section 15.4.4.13](#), *NAND Access Description* for more details on ADVONTIME, ADVRDOFFTIME, ADVWROFFTIME, and ADVAADMUXRDOFFTIME, ADVAADMUXWROFFTIME usage for CLE and ALE (Command / Address Latch Enable) usage for a NAND Flash interface.

15.4.4.10.4 nOE/nRE: Output Enable / Read Enable Signal Control Assertion / Deassertion Time (OEONTIME / OEOFFTIME / OEEXTRADELAY / OEAADMUXONTIME / OEAADMUXOFFTIME)

The [GPMC_CONFIG4_i\[3:0\]](#) OEONTIME field (where i = 0 to 7) defines the nOE/nRE signal assertion time relative to start access time. It is applicable only to read accesses.

The [GPMC_CONFIG4_i\[12:8\]](#) OEOFFTIME field defines the nOE/nRE signal deassertion time relative to start access time. It is applicable only to read accesses. nOE/nRE is not asserted during a write cycle.

OEONTIME, OEOFFTIME, OEAADMUXONTIME and OEAADMUXOFFTIME parameters are applicable to synchronous and asynchronous modes. OEONTIME can be used to control an address and byte enable valid setup time control before nOE/nRE assertion. OEOFFTIME can be used to control an address and byte enable valid hold time control after nOE/nRE assertion.

OEAADMUXONTIME and OEAADMUXOFFTIME parameters have the same functions as OEONTIME and OEOFFTIME, but apply to the first OE assertion in the AAD-multiplexed protocol for a read phase, or to the only OE assertion for a write phase. It is the user responsibility to make sure OEAADMUXOFFTIME is programmed to a value lower than OEONTIME. Functionality in AAD-mux mode is undefined if the settings do not comply with this requirement. OEAADMUXOFFTIME shall never be equal to OEONTIME because the AAD-mux protocol requires a second address phase with the nOE signal deasserted before nOE can be asserted again to define a read command.

The nOE/RE signal transitions as controlled through OEONTIME, OEOFFTIME, OEAADMUXONTIME and OEAADMUXOFFTIME can be delayed by half a GPMC_FCLK period by enabling the [GPMC_CONFIG4_i\[7\]](#) OEEXTRADELAY bit. This half of a GPMC_FCLK period provides more granularity on nOE/RE assertion and deassertion time to guaranty proper setup and hold time relative to GPMC_CLK. If enabled, OEEXTRADELAY applies to all parameters controlling nOE/nRE transitions.

OEEXTRADELAY must be used carefully, to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program RDCYCLETIME and WRCYCLETIME to be greater than nOE/RE signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

NOTE: When the GPMC generates a read access to an address-/data-multiplexed device, it drives the address bus until nOE assertion time.

15.4.4.10.5 nWE: Write Enable Signal Control Assertion / Deassertion Time (WEONTIME / WEOFFTIME / WEEXTRADELAY)

The [GPMC_CONFIG4_i\[19:16\]](#) WEONTIME field (where i = 0 to 7) defines the nWE signal-assertion time relative to start access time. The [GPMC_CONFIG4_i\[28:24\]](#) WEOFFTIME field defines the nWE signal-deassertion time relative to start access time. These bit fields only apply to write accesses. nWE is not asserted during a read cycle.

WEONTIME can be used to control an address and byte enable valid setup time control before nWE assertion. WEOFFTIME can be used to control an address and byte enable valid hold time control after nWE assertion.

nWE signal transitions as controlled through WEONTIME, and WEOFFTIME can be delayed by half a GPMC_FCLK period by enabling the [GPMC_CONFIG4_i\[23\]](#) WEEXTRADELAY bit. This half of a GPMC_FCLK period provides more granularity on nWE assertion and deassertion time to guaranty proper setup and hold time relative to GPMC_CLK. If enabled, WEEXTRADELAY applies to all parameters controlling nWE transitions.

The WEEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the WRCYCLETIME bit field to be greater than the nWE signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

15.4.4.10.6 GPMC_CLK

GPMC_CLK is the external clock provided to the attached synchronous memory or device.

- The GPMC_CLK clock frequency is the GPMC_FCLK functional clock frequency divided by 1, 2, 3, or 4, depending on the [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER bit field (where $i = 0$ to 7), with a guaranteed 50-percent duty cycle.
- The GPMC_CLK clock is only activated when the access in progress is defined as synchronous (read or write access).
- The [GPMC_CONFIG1_i\[26:25\]](#) CLKACTIVATIONTIME field ($i = 0$ to 7) defines the number of GPMC_FCLK cycles from start access time to GPMC_CLK activation.
- The GPMC_CLK clock is stopped when cycle time completes and is asserted low between accesses.
- The GPMC_CLK clock is kept low when access is defined as asynchronous.

CAUTION

When cycle time completes, the GPMC_CLK may be high because of the GPMCFCLKDIVIDER bit field. To ensure correct stoppage of the GPMC_CLK clock within the 50-percent required duty cycle, it is the user's responsibility to extend the RDCYCLETIME or WRCYCLETIME value.

NOTE: To ensure a correct external clock cycle, the following rules must be applied:

- (RDCYCLETIME CLKACTIVATIONTIME) must be a multiple of (GPMCFCLKDIVIDER + 1).
- The PAGEBURSTACCESSTIME value must be a multiple of (GPMCFCLKDIVIDER + 1).

15.4.4.10.7 GPMC_CLK and Control Signals Setup and Hold

Control-signal transition (assertion and deassertion) setup and hold values with respect to the GPMC_CLK edge can be controlled in the following ways:

- For the GPMC_CLK signal, the [GPMC_CONFIG1_i\[26:25\]](#) CLKACTIVATIONTIME field ($i = 0$ to 7) allows setup and hold control of control-signal assertion time.
- The use of a divided GPMC_CLK allows setup and hold control of control-signal assertion and deassertion times.
- When GPMC_CLK runs at the GPMC_FCLK frequency so that GPMC_CLK edge and control-signal transitions refer to the same GPMC_FCLK edge, the control-signal transitions can be delayed by half of a GPMC_FCLK period to provide minimum setup and hold times. This half-GPMC_FCLK delay is enabled with the CSEXTRADelay, ADVEXTRADelay, OEEXTRADelay, or WEEXTRADelay parameter. This delay must be used carefully to prevent control-signal overlap between successive accesses to different chip-selects. This implies that the RDCYCLETIME and WRCYCLETIME are greater than the last control-signal deassertion time, including the extra half-GPMC_FCLK cycle.

15.4.4.10.8 Access Time (RDACCESSTIME / WRACCESSTIME)

The read access time and write access time durations can be programmed independently through [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME and [GPMC_CONFIG6_i\[28:24\]](#) WRACCESSTIME ($i = 0$ to 7). This allows nOE and GPMC data capture timing parameters to be independent of nWE and memory device data capture timing parameters. RDACCESSTIME and WRACCESSTIME bit fields can be set with a granularity of 1 or 2 through [GPMC_CONFIG1_i\[4\]](#) TIMEPARAGRANULARITY.

15.4.4.10.8.1 Access Time on Read Access

In asynchronous read mode, for single and paged accesses, [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME field ($i = 0$ to 7) defines the number of GPMC_FCLK cycles from start access time to the GPMC_FCLK rising edge used for the first data capture. RDACCESSTIME must be programmed to the rounded greater value (in GPMC_FCLK cycles) of the read access time of the attached memory device.

In synchronous read mode, for single or burst accesses, RDACCESSTIME defines the number of GPMC_FCLK cycles from start access time to the GPMC_FCLK rising edge corresponding to the GPMC_CLK rising edge used for the first data capture.

GPMC_CLK which is sent to the memory device for synchronization with the GPMC controller, is internally retimed to correctly latch the returned data. [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME must be greater than RDACCESSTIME in order to let the GPMC latch the last return data using the internally retimed GPMC_CLK.

The external WAIT signal can be used in conjunction with RDACCESSTIME to control the effective GPMC data-capture GPMC_FCLK edge on read access in both asynchronous mode and synchronous mode. For details about wait monitoring, see [Section 15.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

15.4.4.10.8.2 Access Time on Write Access

In asynchronous write mode, the [GPMC_CONFIG6_i\[28:24\]](#) WRACCESSTIME timing parameter is not used to define the effective write access time. Instead, it is used as a WAIT invalid timing window, and must be set to a correct value so that the gpmc_wait pin is at a valid state two GPMC_CLK cycles before WRACCESSTIME completes. For details about wait monitoring, see [Section 15.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

In synchronous write mode, for single or burst accesses, WRACCESSTIME defines the number of GPMC_FCLK cycles from start access time to the GPMC_CLK rising edge used by the memory device for the first data capture.

The external WAIT signal can be used in conjunction with WRACCESSTIME to control the effective memory device data capture GPMC_CLK edge for a synchronous write access. For details about wait monitoring, see [Section 15.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

15.4.4.10.9 Page Burst Access Time (PAGEBURSTACCESSTIME)

[GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESSTIME bit field (i = 0 to 7) can be set with a granularity of 1 or 2 through [GPMC_CONFIG1_i\[4\]](#) TIMEPARAGRANULARITY.

15.4.4.10.9.1 Page Burst Access Time on Read Access

In asynchronous page read mode, the delay between successive word captures in a page is controlled through the PAGEBURSTACCESSTIME bit field. The PAGEBURSTACCESSTIME parameter must be programmed to the rounded greater value (in GPMC_FCLK cycles) of the read access time of the attached device.

In synchronous burst read mode, the delay between successive word captures in a burst is controlled through the PAGEBURSTACCESSTIME field.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective GPMC data capture GPMC_FCLK edge on read access. For details about wait monitoring, see [Section 15.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

15.4.4.10.9.2 Page Burst Access Time on Write Access

Asynchronous page write mode is not supported. PAGEBURSTACCESSTIME is irrelevant in this case.

In synchronous burst write mode, PAGEBURSTACCESSTIME controls the delay between successive memory device word captures in a burst.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective memory-device data capture GPMC_CLK edge in synchronous write mode. For details about wait monitoring, see [Section 15.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

15.4.4.10.10 Bus Keeping Support

At the end-cycle time of a read access, if no other access is pending, the GPMC drives the bus with the last data read after RDCYCLETIME completion time to prevent bus floating and reduce power consumption.

After a write access, if no other access is pending, the GPMC keeps driving the data bus after WRCYCLETIME completes with the same data to prevent bus floating and power consumption.

15.4.4.11 NOR Access Description

For each chip-select configuration, the read access can be specified as either asynchronous or synchronous access through the [GPMC_CONFIG1_i\[29\]](#) READTYPE bit ($i = 0$ to 7). For each chip-select configuration, the write access can be specified as either synchronous or asynchronous access through the [GPMC_CONFIG1_i\[27\]](#) WRITETYPE bit ($i = 0$ to 7).

Asynchronous and synchronous read and write access time and related control signals are controlled through timing parameters that refer to GPMC_FCLK. The primary difference of synchronous mode is the availability of a configurable clock interface (GPMC_CLK) to control the external device. Synchronous mode also affects data-capture and wait-pin monitoring schemes in read access.

For details about asynchronous and synchronous access, see the descriptions of GPMC_CLK, RdAccessTime, WrAccessTime, and wait-pin monitoring.

For more information about timing-parameter settings, see the sample timing diagrams in this chapter.

NOTE: The address bus and nBE[1:0] are fixed for the duration of a synchronous burst read access, but they are updated for each beat of an asynchronous page-read access.

15.4.4.11.1 Asynchronous Access Description

This section describes:

- Asynchronous single-read operation on an address/data multiplexed device
- Asynchronous single write operation on an address/data-multiplexed device
- Asynchronous single read operation on an AAD-multiplexed device
- Asynchronous single write operation on an AAD-multiplexed device
- Asynchronous multiple (page) read operation on a non-multiplexed device

In asynchronous operations GPMC_CLK is not provided outside the GPMC and is kept low.

15.4.4.11.1.1 Access on Address/Data Multiplexed Devices

15.4.4.11.1.1.1 Asynchronous Single-Read Operation on an Address/Data Multiplexed Device

Figure 15-61 shows an asynchronous single read operation on an address/data-multiplexed device.

Figure 15-61. Asynchronous Single Read on an Address/Data-Multiplexed Device

See [Section 15.4.5.6.1, GPMC Timing Parameters Formulas](#) for formulas to calculate timing parameters.

[Table 15-257](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For details, see [Section 15.4.4.9.2.3, Address/Data-Multiplexing Interface](#).

Address bits (A[16:1] from a GPMC perspective, A[15:0] from an external device perspective) are placed on the address/data bus, and the remaining address bits gpmc_a[25:16] are placed on the address bus. The address phase ends at nOE assertion, when the DIR signal goes from OUT to IN.

- Chip-select signal nCS:
 - nCS assertion time is controlled by the [GPMC_CONFIG2_i\[3:0\]](#) CS ONTIME field. It controls the address setup time to nCS assertion.
 - nCS deassertion time is controlled by the [GPMC_CONFIG2_i\[12:8\]](#) CSRD OFFTIME field. It controls the address hold time from nCS deassertion.
- Address valid signal nADV:
 - nADV assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADV ONTIME field.
 - nADV deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\]](#) ADV RD OFFTIME field.
- Output enable signal nOE:
 - nOE assertion indicates a read cycle.
 - nOE assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\]](#) OE ONTIME field.

- nOE deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\] OEOFFTIME](#) field.
- Read data is latched when RDACCESSTIME completes. Access time is defined in the [GPMC_CONFIG5_i\[20:16\] RDACCESSTIME](#) field.
- Direction signal DIR: DIR goes from OUT to IN at the same time that nOE is asserted.
- The end of the access is defined by the [GPMC_CONFIG5_i\[4:0\] RDCYCLETIME](#) parameter.

In the GPMC, when a 16-bit wide device is attached to the controller, a 32-bit word write access is split into two 16-bit word write accesses. For more information about GPMC access size and type adaptation, see [Section 15.4.4.11.5, System Burst Versus External Device Burst Support](#).

Between two successive accesses, if an nCS pulse is needed:

- The [GPMC_CONFIG6_i\[11:8\] CYCLE2CYCLEDELAY](#) field can be programmed with [GPMC_CONFIG6_i\[7\] CYCLE2CYCLESAMEECSEN](#) enabled.
- The CSWROFFTIME and CSONTIME parameters also allow a chip-select pulse, but this affects all other types of access.

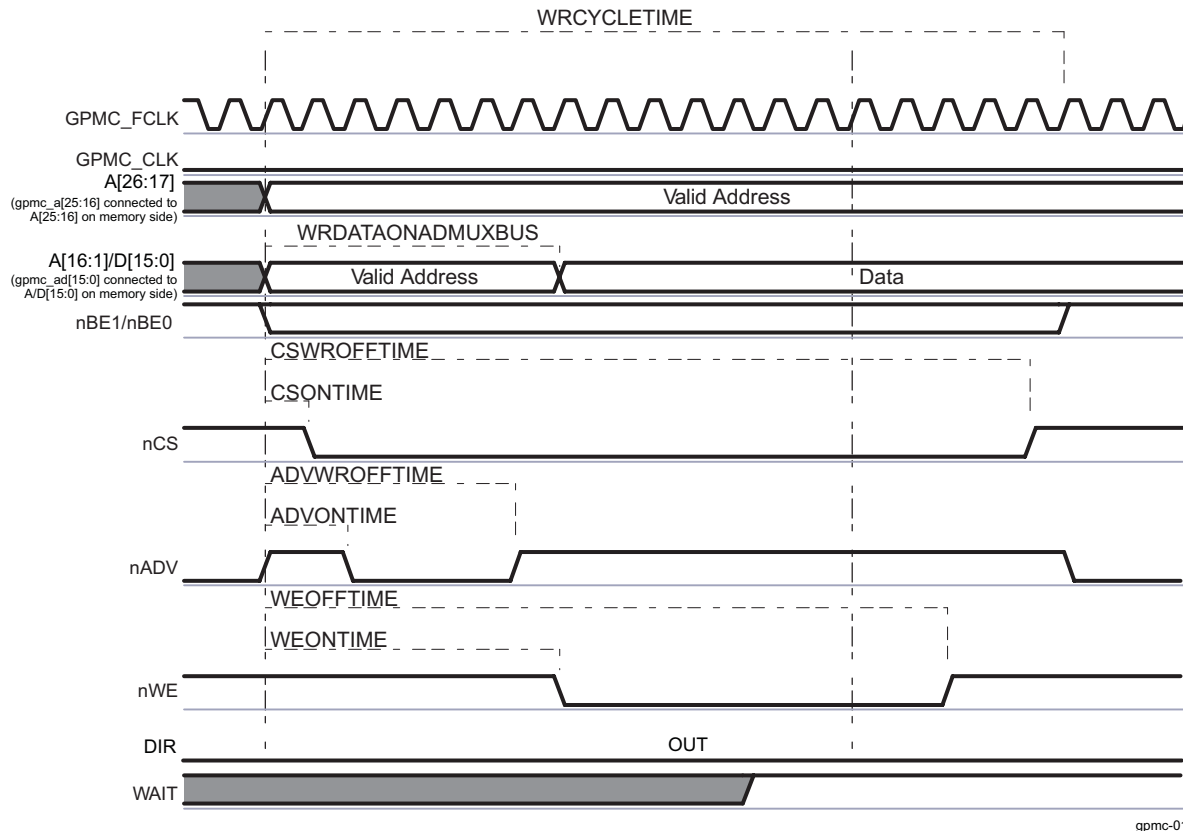

Figure 15-62. Two Asynchronous Single Read Accesses on an Address/Data Multiplexed Device (32-bit read split into 2 x 16-bit read)

gpmc-044

15.4.4.11.1.2 Asynchronous Single Write Operation on an Address/Data-Multiplexed Device

Figure 15-63 shows an asynchronous single write operation on an address/data-multiplexed device.

Figure 15-63. Asynchronous Single Write on an Address/Data-Multiplexed Device

gpmc-013

See [Section 15.4.5.6.1, GPMC Timing Parametersss Formulas](#) for formulas to calculate timing parameters.

[Table 15-257](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode.

When the GPMC generates a write access to an address/data-multiplexed device, it drives the address bus until nWE assertion time. For more information, see [Section 15.4.4.9.2.3, Address/Data-Multiplexing Interface](#).

The nCS, and nADV signals are controlled in the same way as for asynchronous single read operation on an address/data-multiplexed device.

- Write enable signal nWE:
 - nWE assertion indicates a write cycle.
 - nWE assertion time is controlled by the [GPMC_CONFIG4_i\[19:16\] WEONTIME](#) field.
 - nWE deassertion time is controlled by the [GPMC_CONFIG4_i\[28:24\] WEOFFTIME](#) field.
- Direction signal DIR: DIR signal is OUT during the entire access.
- The end of the access is defined by the [GPMC_CONFIG5_i\[12:8\] WRCYCLETIME](#) parameter.

Address bits A[16:1] (GPMC point of view) are placed on the address/data bus at the start of cycle time, and the remaining address bits A[26:17] are placed on the address bus.

Data is driven on the address/data bus at a [GPMC_CONFIG6_i\[19:16\] WRDATAONADMUXBUS](#) time.

NOTE: Write multiple access in asynchronous mode is not supported. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

After a write operation, if no other access (read or write) is pending, the data bus keeps its previous value. See [Section 15.4.4.10.10](#), *Bus Keeping Support*.

15.4.4.11.1.1.3 Asynchronous Multiple (Page) Write Operation on an Address/Data-Multiplexed Device

Write multiple (page) access in asynchronous mode is not supported for address/data-multiplexed devices.

If [GPMC_CONFIG1_i\[28\]](#) WRITEMULTIPLE is enabled (0x1) with [GPMC_CONFIG1_i\[27\]](#) WRITETYPE as asynchronous (0x0), the GPMC processes single asynchronous accesses.

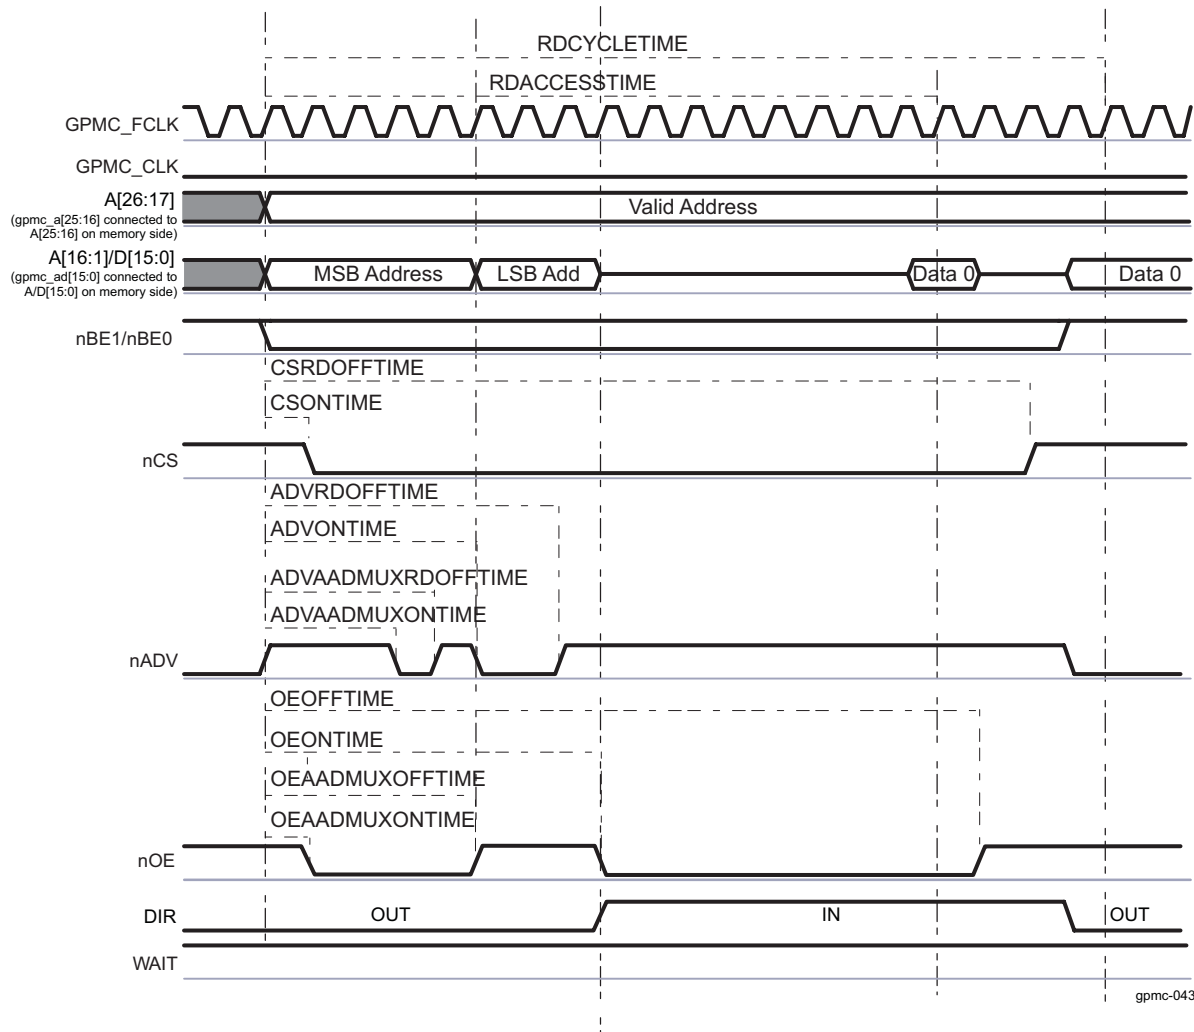

For accesses on non-multiplexed devices refer to [Section 15.4.4.11.3](#), *Asynchronous and Synchronous Accesses in Nonmultiplexed Mode*.

15.4.4.11.1.2 Access on Address/Address/Data Multiplexed Devices

15.4.4.11.1.2.1 Asynchronous Single Read Operation on an AAD-Multiplexed Device

Figure 15-64 shows an asynchronous single read operation on an AAD-multiplexed device.

Figure 15-64. Asynchronous Single Read on an AAD-Multiplexed Device

See [Section 15.4.5.6.1, GPMC Timing Parameters Formulas](#) for formulas to calculate timing parameters.

[Table 15-257](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode.

When the GPMC generates a read access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with **nOE** driven low. The first address phase ends at the first **nOE** deassertion time. The second phase for LSB address is qualified with **nOE** driven high. The second address phase ends at the second **nOE** assertion time, when the **DIR** signal goes from OUT to IN.

The **nCS**, and **DIR** signals are controlled in the same way as for asynchronous single read operation on an address/data-multiplexed device.

- Address valid signal **nADV**. **nADV** is asserted and deasserted twice during a read transaction:
 - nADV** first assertion time is controlled by the [GPMC_CONFIG3_i\[6:4\] ADVAADMUXONTIME](#) field.
 - nADV** first deassertion time is controlled by the [GPMC_CONFIG3_i\[26:24\] ADVAADMUXRDOFFTIME](#) field.

- nADV second assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME field.
- nADV second deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\]](#) ADVRDOFFTIME field.
- Output Enable signal nOE. nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
 - nOE first assertion time is controlled by the [GPMC_CONFIG4_i\[6:4\]](#) OEAADMUXONTIME field.
 - nOE first deassertion time is controlled by the [GPMC_CONFIG3_i\[15:13\]](#) OEAADMUXOFFTIME field.
 - nOE second assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\]](#) OEONTIME field.
 - nOE second deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\]](#) OEOFFTIME field.

15.4.4.11.1.2.2 Asynchronous Single Write Operation on an AAD-Multiplexed Device

Figure 15-65 shows an asynchronous single write operation on an AAD-multiplexed device.

Figure 15-65. Asynchronous Single Write on an AAD-Multiplexed Device

See [Section 15.4.5.6.1, GPMC Timing Parameters Formulas](#) for formulas to calculate timing parameters.

[Table 15-257](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS, nWE, and DIR signals are controlled in the same way as for asynchronous single write operation on an address/data-multiplexed device. See [Table 15-248](#).

- Address valid signal nADV is asserted and deasserted twice during a write transaction:
 - nADV first assertion time is controlled by the [GPMC_CONFIG3_i\[6:4\]](#) ADVAADMUXONTIME field.
 - nADV first deassertion time is controlled by the [GPMC_CONFIG3_i\[30:28\]](#) ADVAADMUXWROFFTIME field.
 - nADV second assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME field.
 - nADV second deassertion time is controlled by the [GPMC_CONFIG3_i\[20:16\]](#) ADVWROFFTIME field.
- Output Enable signal nOE is asserted during the address phase of a write transaction:
 - nOE assertion time is controlled by the [GPMC_CONFIG4_i\[6:4\]](#) OEAADMUXONTIME field.
 - nOE deassertion time is controlled by the [GPMC_CONFIG3_i\[15:13\]](#) OEAADMUXOFFTIME field.

The address bits for the first address phase are driven onto the data bus until nOE deassertion. Data is driven onto the address/data bus at the clock edge defined by the [GPMC_CONFIG6_i\[19:16\]](#) WRDATAONADMUXBUS parameter.

15.4.4.11.1.2.3 Asynchronous Multiple (Page) Read Operation on an AAD-Multiplexed Device

Write multiple (page) access in asynchronous mode is not supported for AAD-multiplexed devices.

If [GPMC_CONFIG1_i\[28\]](#) WRITEMULTIPLE is enabled (0x1) with [GPMC_CONFIG1_i\[27\]](#) WRITETYPE as asynchronous (0x0), the GPMC processes single asynchronous accesses.

For accesses on non-multiplexed devices refer to [Section 15.4.4.11.3](#), *Asynchronous and Synchronous Accessed in Nonmultiplexed Mode*.

15.4.4.11.2 Synchronous Access Description

This section details read and write synchronous accesses on address/data multiplexed. All information in this section can be applied to any type of memory - non-multiplexed, address and data multiplexed or AAD-multiplexed - with a difference limited to the address phase. For accesses on non-multiplexed devices refer to [Section 15.4.4.11.3](#), *Asynchronous and Synchronous Accessed in Nonmultiplexed Mode*.

In synchronous operations:

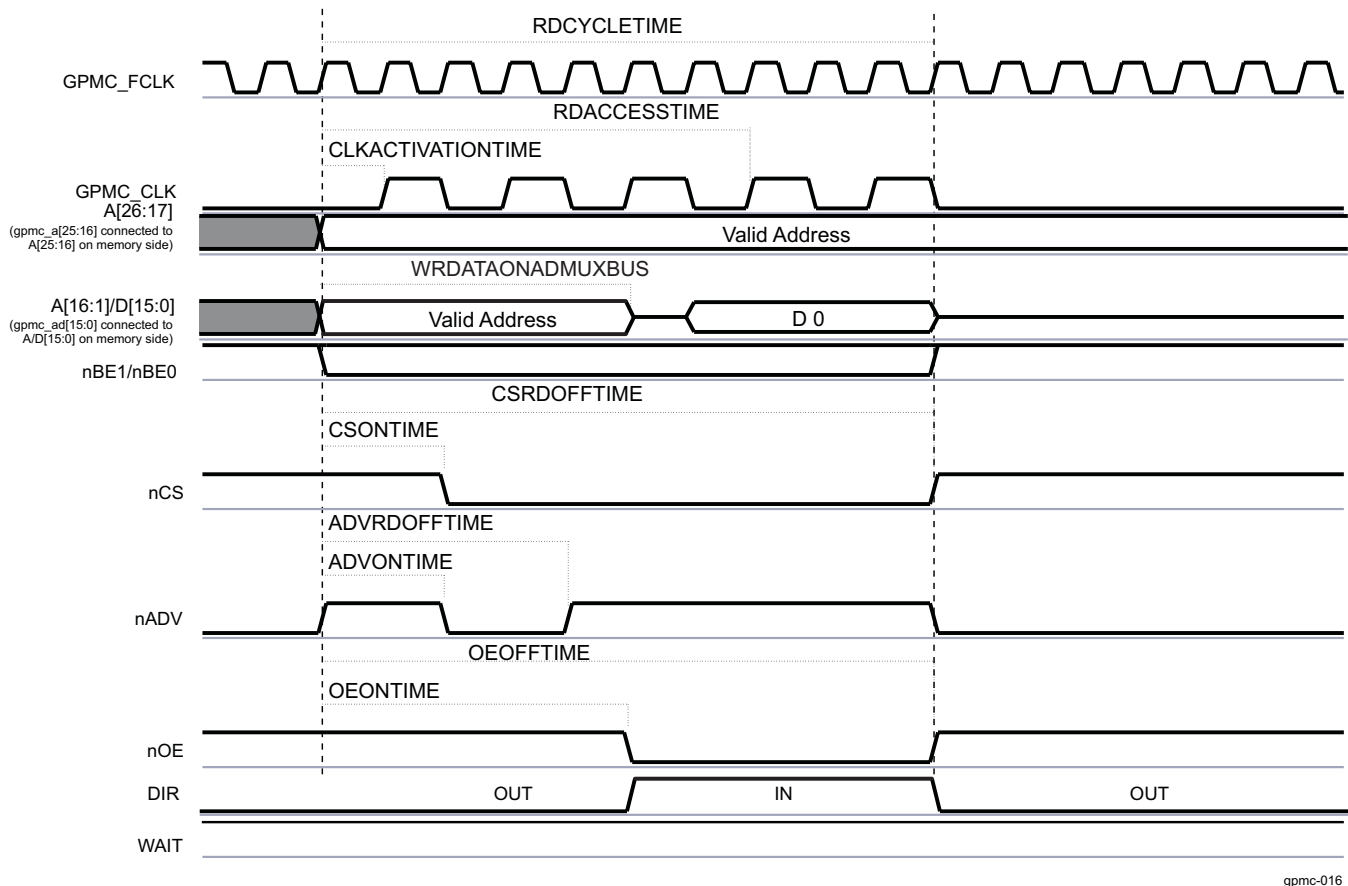

- The GPMC_CLK clock is provided outside the GPMC when accessing the memory device.
- The GPMC_CLK clock is derived from the GPMC_FCLK clock using the [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER field. In the following section i stands for the chip-select number, i = 0 to 7.
- The [GPMC_CONFIG1_i\[26:25\]](#) CLKACTIVATIONTIME field specifies that the GPMC_CLK is provided outside the GPMC 0, 1, or 2 GPMC_FCLK cycles after start access time until RDCYCLETIME or WRCYCLETIME completion.

15.4.4.11.2.1 Synchronous Single Read

[Figure 15-66](#) and [Figure 15-67](#) show a synchronous single-read operation with GPMCFCLKDIVIDER equal to 0 and 1, respectively.

Figure 15-66. Synchronous Single Read (GPMCFCLKDIVIDER = 0)

gpmc-015

Figure 15-67. Synchronous Single Read (GPMCFCLKDIVIDER = 1)

gpmc-016

See [Section 15.4.5.6.1, GPMC Timing Parameters Formulas](#) for formulas to calculate timing parameters.

[Table 15-257](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For details, see [Section 15.4.4.9.2.3, Address/Data-Multiplexing Interface](#).

- Chip-select signal nCS:
 - nCS assertion time is controlled by the [GPMC_CONFIG2_i\[3:0\] CSONTIME](#) field and ensures address setup time to nCS assertion.
 - nCS deassertion time is controlled by the [GPMC_CONFIG2_i\[12:8\] CSRDOFFTIME](#) field and ensures address hold time to nCS deassertion.
- Address valid signal nADV:
 - nADV assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\] ADVONTIME](#) field.
 - nADV deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\] ADVRDOFFTIME](#) field.
- Output enable signal nOE:
 - nOE assertion indicates a read cycle.
 - nOE assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\] OEONTIME](#) field.
 - nOE deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\] OEOFFTIME](#) field.
- Initial latency for the first read data is controlled by [GPMC_CONFIG5_i\[20:16\] RDACCESSTIME](#) or by monitoring the WAIT signal.
- Total access time ([GPMC_CONFIG5_i\[4:0\] RDCYCLETIME](#)) corresponds to RDACCESSTIME plus the address hold time from nCS deassertion, plus time from RDACCESSTIME to CSRDOFFTIME.
- Direction signal DIR: DIR goes from OUT to IN at the same time as nOE assertion.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS_i and DIR signals are controlled in the same way as for synchronous single read operation on an address/data-multiplexed device.

- Address valid signal nADV is asserted and deasserted twice during a read transaction:
 - nADV first assertion time is controlled by the [GPMC_CONFIG3_i\[6:4\]](#) ADVAADMUXONTIME field.
 - nADV first deassertion time is controlled by the [GPMC_CONFIG3_i\[26:24\]](#) ADVAADMUXRDOFFTIME field.
 - nADV second assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME field.
 - nADV second deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\]](#) ADVRDOFFTIME field.
- Output Enable signal nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
 - nOE first assertion time is controlled by the [GPMC_CONFIG4_i\[6:4\]](#) OEAADMUXONTIME field.
 - nOE first deassertion time is controlled by the [GPMC_CONFIG3_i\[15:13\]](#) OEAADMUXOFFTIME field.
 - nOE second assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\]](#) OEONTIME field.
 - nOE second deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\]](#) OEOFFTIME field.

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 15.4.4.10.10](#), *Bus Keeping Support*.

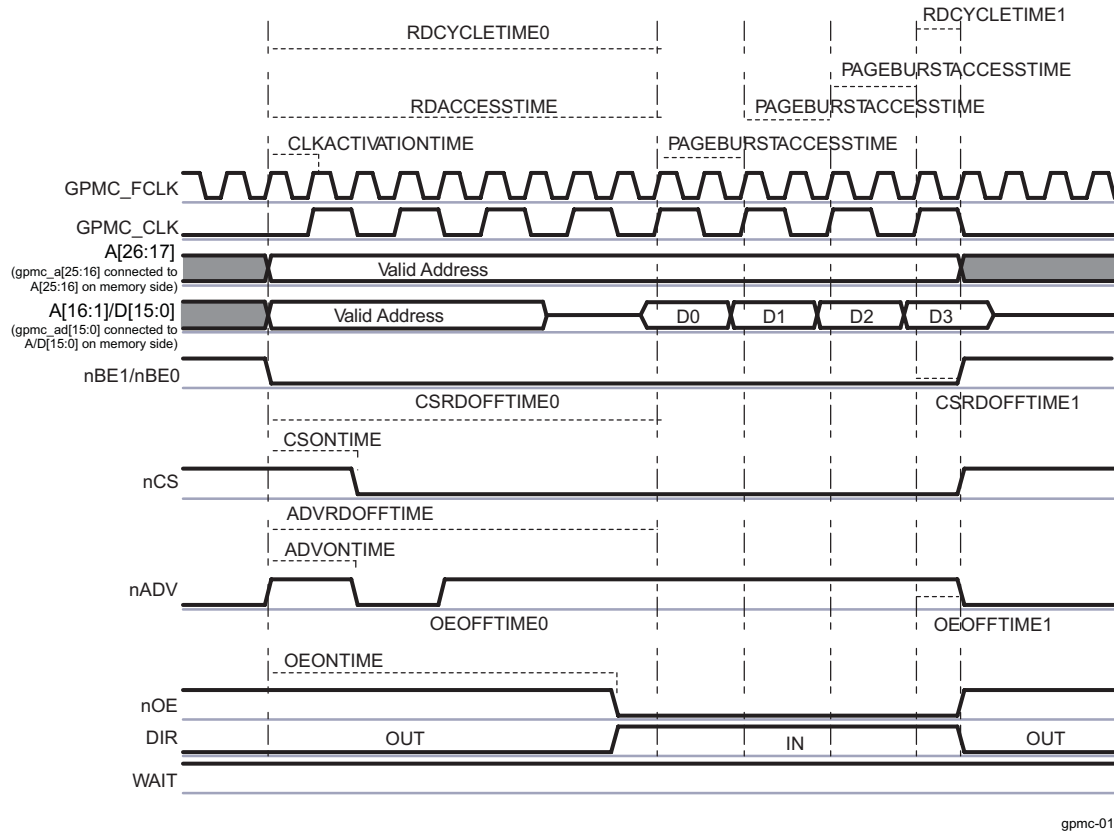

15.4.4.11.2.2 Synchronous Multiple (Burst) Read (4-, 8-, 16-Word16 Burst With Wraparound Capability)

[Figure 15-68](#) and [Figure 15-69](#) show a synchronous multiple read operation with GPMCFCLKDivider equal to 0 and 1, respectively.

Figure 15-68. Synchronous Multiple (Burst) Read (GPMC_FCLKDIVIDER = 0)

gpmc-018

Figure 15-69. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 1)

When [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to [GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

The nCS, nADV, nOE and DIR signals are controlled in the same way as for synchronous single read operation. See [Table 15-243](#).

Initial latency for the first read data is controlled by RDACCESSTIME or by monitoring the WAIT signal. Successive read data are provided by the memory device each one or two GPMC_CLK cycles. The PAGEBURSTACCESSTIME parameter must be set accordingly with [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER and the memory-device internal configuration. Depending on the device page length, the GPMC checks device page crossing during a new burst request and purposely insert initial latency (of RDACCESSTIME) when required.

Total access time [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME corresponds to RDACCESSTIME plus the address hold time from nCS deassertion. In [Figure 15-69](#), RDCYCLETIME programmed value equals to RDCYCLETIME0 + RDCYCLETIME1.

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 15.4.4.10.10, Bus Keeping Support](#).

Burst wraparound is enabled through the [GPMC_CONFIG1_i\[31\]](#) WRAPBURST bit and allows a 4-, 8-, or 16-Word16 linear burst access to wrap within its burst-length boundary through [GPMC_CONFIG1_i\[24:23\]](#) ATTACHEDDEVICEPAGELENGTH.

15.4.4.11.2.3 Synchronous Single Write

Burst write mode is used for synchronous single or burst accesses.

Figure 15-70. Synchronous Single Write on an Address/Data-Multiplexed Device

When the GPMC generates a write access to an address/data-multiplexed device, it drives the data bus (with address bits A[16:1]) until **GPMC_CONFIG6_i[19:16]** WRDATAONADMUXBUS time. First data of the burst is driven on the address/data bus at WRDATAONADMUXBUS time.

15.4.4.11.2.4 Synchronous Multiple (Burst) Write

Synchronous burst write mode provides synchronous single or consecutive accesses.

Figure 15-71 shows a synchronous burst write access when the chip-select is configured in address/data-multiplexed mode.

Figure 15-71. Synchronous Multiple Write (Burst Write) in Address/Data-Multiplexed Mode

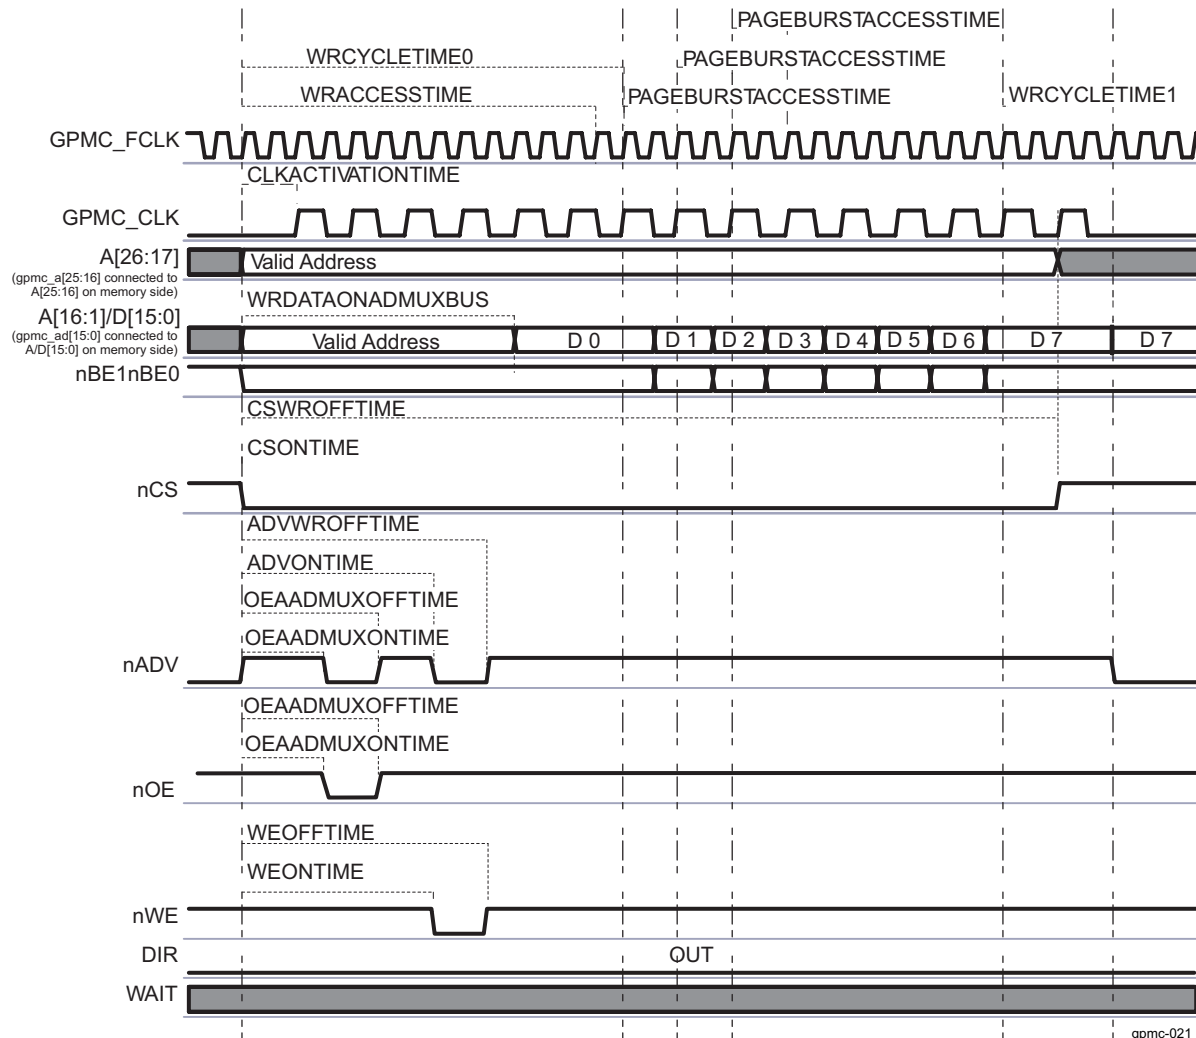

Figure 15-72 shows the same synchronous burst write access when the chip-select is configured in address/address/data-multiplexed (AAD-multiplexed) mode.

Figure 15-72. Synchronous Multiple Write (Burst Write) in Address/Address/Data-Multiplexed Mode
