| Select the number of bytes to be read or written by the engine to the selected chip-select | GPMC_PREFETCH_CONFIG2[13:0] TRANSFERCOUNT | x |
| Start the prefetch engine | GPMC_PREFETCH_CONTROL[0] STARTENGINE | 0x1 |

Table 16-253. Wait Pin Configuration

| Sub-process Name | Register / Bit Field | Value |
|--|---|-------|
| Selects when the engine starts the access to CS | GPMC_PREFETCH_CONFIG1 [3] SYNCHROMODE | x |
| Select which wait pin edge detector should start the engine in synchronized mode | GPMC_PREFETCH_CONFIG1 [5:4] WAITPINSELECTOR | x |

Table 16-254. Enable Chip-Select

| Sub-process Name | Register / Bit Field | Value |
|--|---|-------|
| When all parameters are configured, enable the chip-select | GPMC_CONFIG7 _[6] CSVALID | x |

16.4.5.5 Set Memory Access

This section details the bit field to configure to set the GPMC in various memory modes.

Table 16-255. Mode Parameters Check List Table

| Register | Bit | Bit field name | Asynchronous | | | | Synchronous | | | |
|--------------------------------|-----|----------------|--------------------|---------------------|-----------------------------|------------------------------|--------------------|---------------------|------------------------------|-------------------------------|
| | | | Single Read Access | Single Write Access | Multiple Read (Page) Access | Multiple Write (Page) Access | Single Read Access | Single Write Access | Multiple Read (Burst) Access | Multiple Write (Burst) Access |
| GPMC_CONFIG1_i | 30 | READMULTIPLE | 0x0 | - | 0x1 ⁽¹⁾ | N/S | 0x0 | - | 0x1 | - |
| GPMC_CONFIG1_i | 29 | READTYPE | 0x0 | - | 0x0 ⁽¹⁾ | N/S | 0x1 | - | 0x1 | - |
| GPMC_CONFIG1_i | 28 | WRITEMULTIPLE | - | 0x0 | - ⁽¹⁾ | N/S | - | 0x0 | - | 0x1 |
| GPMC_CONFIG1_i | 27 | WRITETYPE | - | 0x0 | - ⁽¹⁾ | N/S | - | 0x1 | - | 0x1 |

⁽¹⁾ Multiple read is not supported in address/data- and AAD-multiplexed modes. Multiple read is supported in Nonmultiplexed mode.

Table 16-256. Access Type Parameters Check List Table

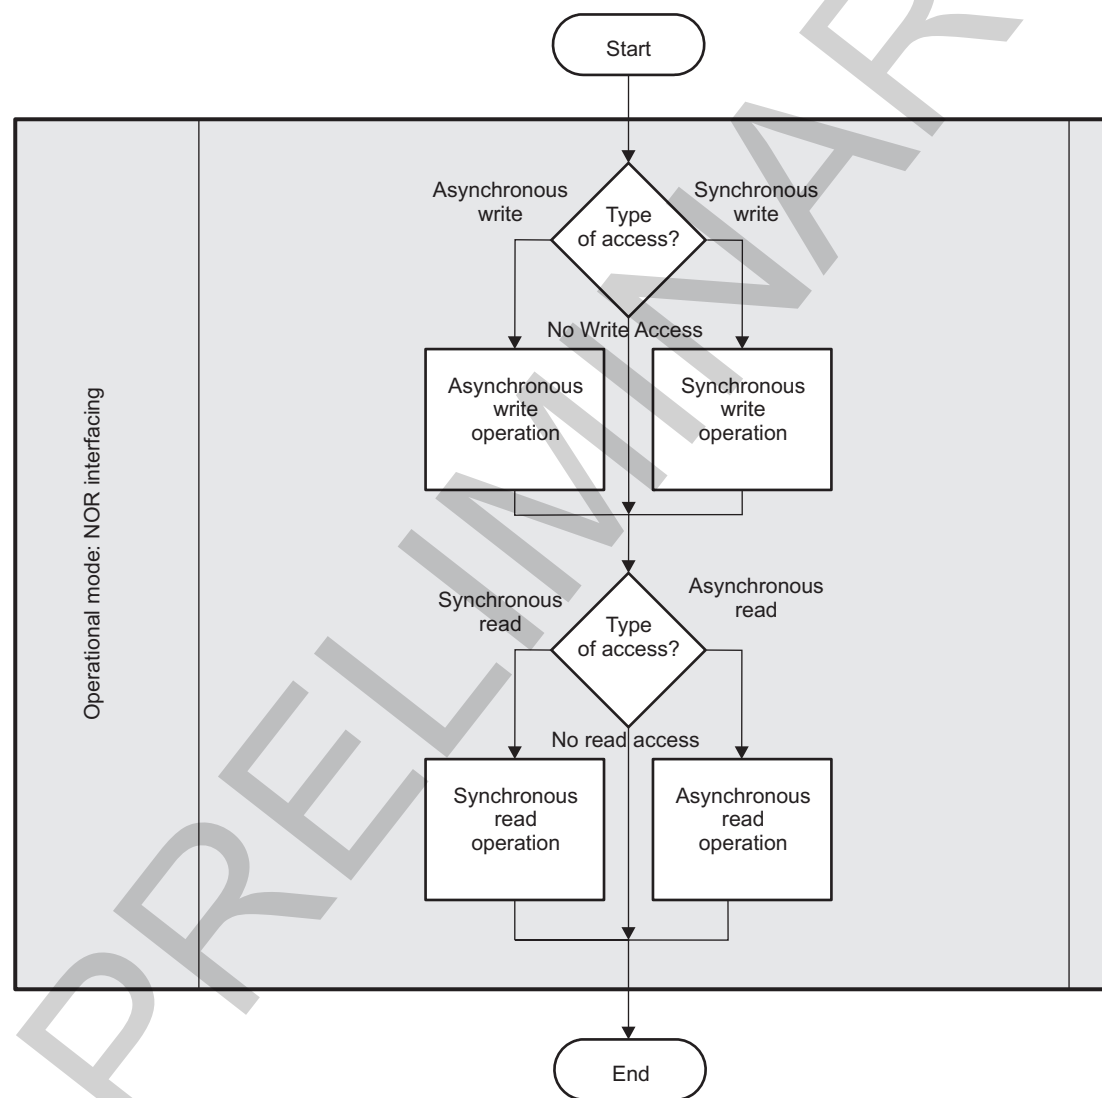

| Register | Bit | Bit field name | Access Type | | |
|--------------------------------|-----|-------------------------------|-------------|-------------------|---------|
| | | | Non-mux | Address /Data Mux | AAD-mux |
| GPMC_CONFIG1_i | 9:8 | MUXADDDATA | 0x0 | 0x2 | 0x1 |
| GPMC_CONFIG | 1 | LIMITEDADDRESS ⁽¹⁾ | 0x1 | 0x0 | 0x0 |

⁽¹⁾ This parameter applies to all chip-selects. There is no per-CS configuration for this parameter.

16.4.5.6 GPMC Timing Parameters

Figure 16-92 shows a programming model diagram for the NOR interfacing timing parameters.

Figure 16-92. NOR Interfacing Timing Parameters Diagram

gpmc-uc-002

Table 16-257 lists bit fields to configure adequate timing parameter in various memory modes.

Table 16-257. Timing Parameters

| Register | Bit | Bit field name | Asynchronous | | | Synchronous | | | | Access Type | | |
|----------------|-------|---------------------|--------------------|---------------------|-----------------------------|--------------------|---------------------|------------------------------|-------------------------------|-----------------|--------------------------|-----------------|
| | | | Single Read Access | Single Write Access | Multiple Read (Page) access | Single Read Access | Single Write Access | Multiple Read (Burst) Access | Multiple Write (Burst) Access | Non-multiplexed | Address/Data-multiplexed | AAD-multiplexed |

16.4.5.6.1 GPMC Timing Parameters Formulas

This section intends to help the user to calculate the GPMC timing bit fields values. Formulas are not listed exhaustively.

The section details:

- NAND Flash Interface Timing Parameters Formulas
- Synchronous NOR Flash Timing Parameters Formulas
- Asynchronous NOR Flash Timing Parameters Formulas

16.4.5.6.1.1 NAND Flash Interface Timing Parameters Formulas

This section lists formulas to use in order to calculate NAND timing parameters. This is the case when [GPMC_CONFIG1_i\[11:10\] DEVICETYPE = 0x2](#). [Table 16-258](#) details NAND timing parameters.

Table 16-258. NAND Formulas Description Table

| Configuration Parameter | Unit | Description |
|-------------------------|------|--|
| A | ns | Pulse duration - gpmc_nwe valid time |
| B | ns | Delay time - gpmc_ncs valid to gpmc_nwe valid |
| C | ns | Delay time - gpmc_nbe0_cle/gpmc_nadv_ale high to gpmc_nwe valid |
| D | ns | Delay time - gpmc_ad[15:0] valid to gpmc_nwe valid |
| E | ns | Delay time - gpmc_nwe invalid to gpmc_ad[15:0] invalid |
| F | ns | Delay time - gpmc_nwe invalid to gpmc_nbe0_cle/gpmc_nadv_ale invalid |
| G | ns | Delay time - gpmc_nwe invalid to gpmc_ncs invalid |
| H | ns | Cycle time - Write cycle time |
| I | ns | Delay time - gpmc_ncs valid to gpmc_noe valid |
| J | ns | Setup time - gpmc_ad[15:0] valid to gpmc_noe invalid |
| K | ns | Pulse duration - gpmc_noe valid time |
| L | ns | Cycle time - Read cycle time |
| M | ns | Delay time - gpmc_noe invalid to gpmc_ncs invalid |

The configuration parameters are calculated through the following formulas.

$$A = (WEOffTime - WEOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK \text{ period}$$

$$B = ((WEOnTime - CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (WEEExtraDelay - CSEExtraDelay)) * GPMC_FCLK \text{ period}$$

$$C = ((WEOnTime - ADVOnTime) * (TimeParaGranularity + 1) + 0.5 * (WEEExtraDelay - ADVExtraDelay)) * GPMC_FCLK \text{ period}$$

$$D = (WEOnTime * (TimeParaGranularity + 1) + 0.5 * WEEExtraDelay) * GPMC_FCLK \text{ period}$$

$$E = (WrCycleTime - WEOffTime * (TimeParaGranularity + 1) - 0.5 * WEEExtraDelay) * GPMC_FCLK \text{ period}$$

$$F = (ADVWrOffTime - WEOffTime * (TimeParaGranularity + 1) + 0.5 * (ADVExtraDelay - WEEExtraDelay)) * GPMC_FCLK \text{ period}$$

$$G = (CSWrOffTime - WEOffTime * (TimeParaGranularity + 1) + 0.5 * (CSEExtraDelay - WEEExtraDelay)) * GPMC_FCLK \text{ period}$$

$$H = WrCycleTime * (1 + TimeParaGranularity) * GPMC_FCLK \text{ period}$$

$$I = ((OEOnTime - CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (OEEExtraDelay - CSEExtraDelay)) * GPMC_FCLK \text{ period}$$

$$J = ((AccessTime - OEOffTime) * (TimeParaGranularity + 1) - 0.5 * OEEExtraDelay) * GPMC_FCLK \text{ period}$$

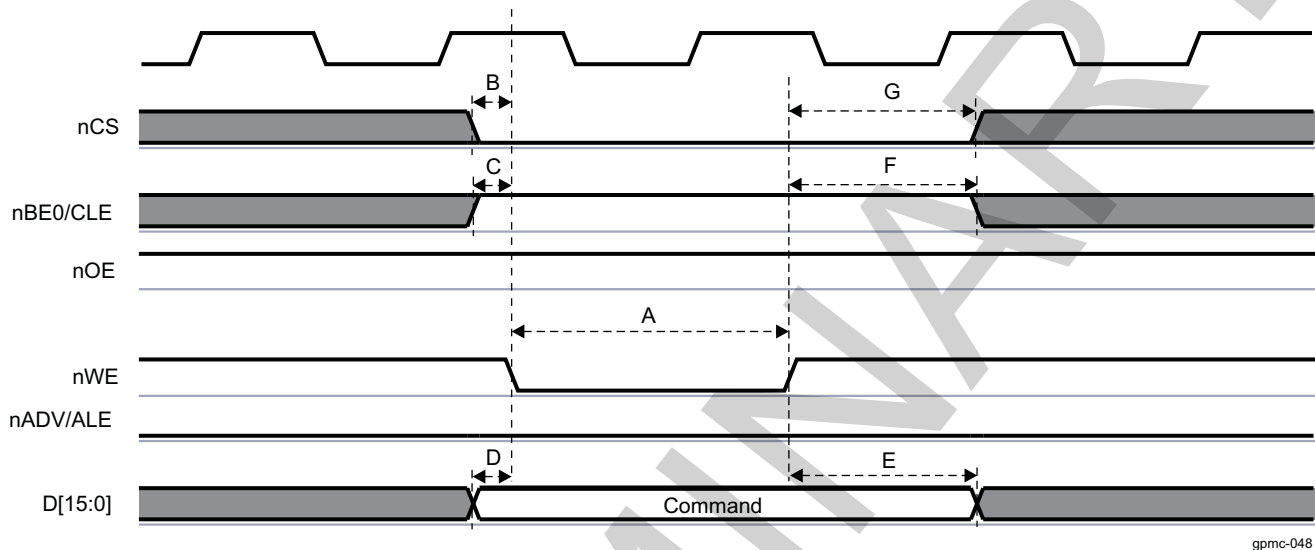

$$K = (OEOffTime - OEOnTime) * (1 + TimeParaGranularity) * GPMC_FCLK \text{ period}$$

$$L = RdCycleTime * (1 + TimeParaGranularity) * GPMC_FCLK \text{ period}$$

$$M = (CSRdOffTime - OEOffTime * (TimeParaGranularity + 1) + 0.5 * (CSEExtraDelay - OEEExtraDelay) * GPMC_FCLK \text{ period}$$

Figure 16-93 shows a command latch cycle timing simplified example where formulas are associated with signal waves.

Figure 16-93. NAND Command Latch Cycle Timing Simplified Example

16.4.5.6.1.2 Synchronous NOR Flash Timing Parameters Formulas

This section lists all formulas to use in order to calculate synchronous NOR timing parameters. This is the case when `GPMC_CONFIG1_[11:10] DEVICETYPE = 0x0` and when `READTYPE` or `WRITETYPE` are set to synchronous mode.

Table 16-259. Synchronous NOR Formulas Description Table

| Configuration Parameter | Unit | Description |
|-------------------------|------|---|
| A | ns | Pulse duration - gpmc_ncs low |
| B | ns | Delay time - address bus valid to gpmc_clk first edge Delay time - gpmc_nbe0_cle/gpmc_nbe1 valid to gpmc_clk first edge |
| C | ns | Pulse duration - gpmc_nbe0_cle/gpmc_nbe1 low |
| D | ns | Delay time - gpmc_clk rising edge to gpmc_nbe0_cle/gpmc_nbe1 invalid Delay time - gpmc_clk rising edge to gpmc_nadv_ale invalid |
| E | ns | Delay time - gpmc_clk rising edge to gpmc_ncs invalid Delay time - gpmc_clk rising edge to gpmc_noe invalid |
| F | ns | Delay time - gpmc_clk rising edge to gpmc_ncs transition |
| G | ns | Delay time - gpmc_clk rising edge to gpmc_nadv_ale transition |
| H | ns | Delay time - gpmc_clk rising edge to gpmc_noe transition |
| I | ns | Delay time - gpmc_clk rising edge to gpmc_nwe transition |
| J | ns | Delay time - gpmc_clk rising edge to gpmc_ad data bus transition Delay time - gpmc_clk rising edge to gpmc_nbe0_cle/gpmc_nbe1 transition |
| K | ns | Pulse duration - gpmc_nadv_ale low |
| L | ns | Delay time - gpmc_wait invalid to first data latching gpmc_clk edge |

The configuration parameters are calculated through the following formulas.

1. For single read accesses:
 $A = (\text{CSRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
 $C = \text{RDCYCLETIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
 $D = (\text{RDCYCLETIME} - \text{ACCESSTIME}) * \text{GPMC_FCLK period}$
 $E = (\text{CSRDOFFTIME} - \text{ACCESSTIME}) * \text{GPMC_FCLK period}$
2. For burst read accesses (where n is the page burst access number):
 $A = (\text{CSRDOFFTIME} - \text{CSONTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
 $C = (\text{RDCYCLETIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
 $D = (\text{RDCYCLETIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC_FCLK period}$
 $E = (\text{CSRDOFFTIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC_FCLK period}$
3. For burst write accesses (where n is the page burst access number):
 $A = (\text{CSWROFFTIME} - \text{CSONTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
 $C = (\text{WRCYCLETIME} + (n - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
 $D = (\text{WRCYCLETIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC_FCLK period}$
 $E = (\text{CSWROFFTIME} - (\text{ACCESSTIME} + (n - 1) * \text{PAGEBURSTACCESSTIME})) * \text{GPMC_FCLK period}$
4. For all accesses:
 For nCS falling edge (CS activated):
 - Case where [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC_FCLK period}$
 - Case where GPMCFCLKDIVIDER = 0x1:
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC_FCLK period}$, when (CLKACTIVATIONTIME and CSONTIME are odd) or (CLKACTIVATIONTIME and CSONTIME are even)
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period}$ otherwise.
 - Case where GPMCFCLKDIVIDER = 0x2:
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC_FCLK period}$, when (CSONTIME - CLKACTIVATIONTIME) is a multiple of 3
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period}$, when (CSONTIME - CLKACTIVATIONTIME - 1) is a multiple of 3
 $F = (2 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period}$, when (CSONTIME - CLKACTIVATIONTIME - 2) is a multiple of 3
 For nCS rising edge (CS deactivated) in reading mode:
 - Case where [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC_FCLK period}$
 - Case where GPMCFCLKDIVIDER = 0x1:
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC_FCLK period}$, when (CLKACTIVATIONTIME and CSRDOFFTIME are odd) or (CLKACTIVATIONTIME and CSRDOFFTIME are even)
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period}$ otherwise.
 - Case where GPMCFCLKDIVIDER = 0x2:
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC_FCLK period}$, when (CSRDOFFTIME - CLKACTIVATIONTIME) is a multiple of 3
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period}$, when (CSRDOFFTIME - CLKACTIVATIONTIME - 1) is a multiple of 3
 $F = (2 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period}$, when (CSRDOFFTIME - CLKACTIVATIONTIME - 2) is a multiple of 3
 For nCS rising edge (CS deactivated) in writing mode:
 - Case where [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC_FCLK period}$
 - Case where GPMCFCLKDIVIDER = 0x1:
 $F = 0.5 * \text{CSEXTRADELAY} * \text{GPMC_FCLK period}$, when (CLKACTIVATIONTIME and CSWROFFTIME are odd) or (CLKACTIVATIONTIME and CSWROFFTIME are even)
 $F = (1 + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period}$ otherwise.

- Case where GPMCFCLKDIVIDER = 0x2:
 $F = 0.5 * CSEXTRADELAY * GPMC_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$
 $F = (1 + 0.5 * CSEXTRADELAY) * GPMC_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$
 $F = (2 + 0.5 * CSEXTRADELAY) * GPMC_FCLK \text{ period, when } (CSWROFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For nADV falling edge (nADV activated):
- Case where [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } ADVONTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } ADVONTIME \text{ are even})$
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK \text{ period otherwise.}$
- Case where GPMCFCLKDIVIDER = 0x2:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK \text{ period, when } (ADVONTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For nADV rising edge (nADV deactivated) in reading mode:
- Case where [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } ADVRDOFFTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } ADVRDOFFTIME \text{ are even})$
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK \text{ period otherwise.}$
- Case where GPMCFCLKDIVIDER = 0x2:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK \text{ period, when } (ADVRDOFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK \text{ period, when } (ADVRDOFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK \text{ period, when } (ADVRDOFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For nADV rising edge (nADV deactivated) in writing mode:
- Case where [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } ADVWROFFTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } ADVWROFFTIME \text{ are even})$
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK \text{ period otherwise.}$
- Case where GPMCFCLKDIVIDER = 0x2:
 $G = 0.5 * ADVEXTRADELAY * GPMC_FCLK \text{ period, when } (ADVWROFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$
 $G = (1 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK \text{ period, when } (ADVWROFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$
 $G = (2 + 0.5 * ADVEXTRADELAY) * GPMC_FCLK \text{ period, when } (ADVWROFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For nOE falling edge (nOE activated):
- Case where [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER = 0x0:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } OEONTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } OEONTIME \text{ are even})$
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC_FCLK \text{ period otherwise.}$

- Case where GPMCFCLKDIVIDER = 0x2:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK \text{ period, when } (OEONTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC_FCLK \text{ period, when } (OEONTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$
 $H = (2 + 0.5 * OEEXTRADELAY) * GPMC_FCLK \text{ period, when } (OEONTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For nOE rising edge (nOE desactivated):
- Case where GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER = 0x0:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } OEOFFTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } OEOFFTIME \text{ are even})$
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC_FCLK \text{ period otherwise.}$
- Case where GPMCFCLKDIVIDER = 0x2:
 $H = 0.5 * OEEXTRADELAY * GPMC_FCLK \text{ period, when } (OEOFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$
 $H = (1 + 0.5 * OEEXTRADELAY) * GPMC_FCLK \text{ period, when } (OEOFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$
 $H = (2 + 0.5 * OEEXTRADELAY) * GPMC_FCLK \text{ period, when } (OEOFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For nWE falling edge (nWE activated):
- Case where GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER = 0x0:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } WEONTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } WEONTIME \text{ are even})$
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC_FCLK \text{ period otherwise.}$
- Case where GPMCFCLKDIVIDER = 0x2:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK \text{ period, when } (WEONTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC_FCLK \text{ period, when } (WEONTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$
 $I = (2 + 0.5 * WEEXTRADELAY) * GPMC_FCLK \text{ period, when } (WEONTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For nWE rising edge (nWE desactivated):
- Case where GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER = 0x0:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK \text{ period}$
- Case where GPMCFCLKDIVIDER = 0x1:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK \text{ period, when } (CLKACTIVATIONTIME \text{ and } WEOFFTIME \text{ are odd}) \text{ or } (CLKACTIVATIONTIME \text{ and } WEOFFTIME \text{ are even})$
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC_FCLK \text{ period otherwise.}$
- Case where GPMCFCLKDIVIDER = 0x2:
 $I = 0.5 * WEEXTRADELAY * GPMC_FCLK \text{ period, when } (WEOFFTIME - CLKACTIVATIONTIME) \text{ is a multiple of } 3$
 $I = (1 + 0.5 * WEEXTRADELAY) * GPMC_FCLK \text{ period, when } (WEOFFTIME - CLKACTIVATIONTIME - 1) \text{ is a multiple of } 3$
 $I = (2 + 0.5 * WEEXTRADELAY) * GPMC_FCLK \text{ period, when } (WEOFFTIME - CLKACTIVATIONTIME - 2) \text{ is a multiple of } 3$
- For gpmc_nadv low pulse duration:
- Read operation:
 $K = (ADVROFFTIME - ADVONTIME) * (TIMEPARAGRANULARITY + 1) * GPMC_FCLK \text{ period}$
- Write operation:
 $K = (ADVWROFFTIME - ADVONTIME) * (TIMEPARAGRANULARITY + 1) * GPMC_FCLK \text{ period}$
- For gpmc_wait invalid to first data latching gpmc_clk edge:
- $L = WAITMONITORINGTIME * (GPMCFCLKDIVIDER + 1) * GPMC_FCLK \text{ period} + GPMC_CLK$

Figure 16-94 shows a synchronous NOR single read simplified example where formulas are associated with signal waves.

Figure 16-94. Synchronous NOR Single Read Simplified Example

16.4.5.6.1.3 Asynchronous NOR Flash Timing Parameters Formulas

This section lists all formulas to use in order to calculate asynchronous NOR timing parameters. This is the case when `GPMC_CONFIG1_[11:10] DEVICETYPE = 0x0` and when `READTYPE` or `WRITETYPE` are set to asynchronous mode.

Table 16-260. Asynchronous NOR Formulas Description Table

| Configuration Parameter | Unit | Description |
|-------------------------|------|--|
| A | ns | Pulse duration - gpmc_ncs low |
| B | ns | Delay time - gpmc_ncs valid to gpmc_nadv_ale invalid |
| C | ns | Delay time - gpmc_ncs valid to gpmc_noe invalid (single read) |
| D | ns | Pulse duration - address bus valid - 2nd, 3rd and 4th accesses |
| E | ns | Delay time - gpmc_ncs valid to gpmc_nwe valid |
| F | ns | Delay time - gpmc_ncs valid to gpmc_nwe invalid |
| G | ns | Address invalid duration between 2 successive R/W accesses |
| H | ns | Setup time - read data valid before gpmc_noe high |
| I | ns | Delay time - gpmc_ncs valid to gpmc_noe invalid (burst read) |
| J | ns | Delay time - address bus valid to gpmc_ncs valid |
| | | Delay time - data bus valid to gpmc_ncs valid |
| | | Delay time - gpmc_nbe0_cle/gpmc_nbe1 valid to gpmc_ncs valid |
| K | ns | Delay time - gpmc_ncs valid to gpmc_nadv_ale valid |

Table 16-260. Asynchronous NOR Formulas Description Table (continued)

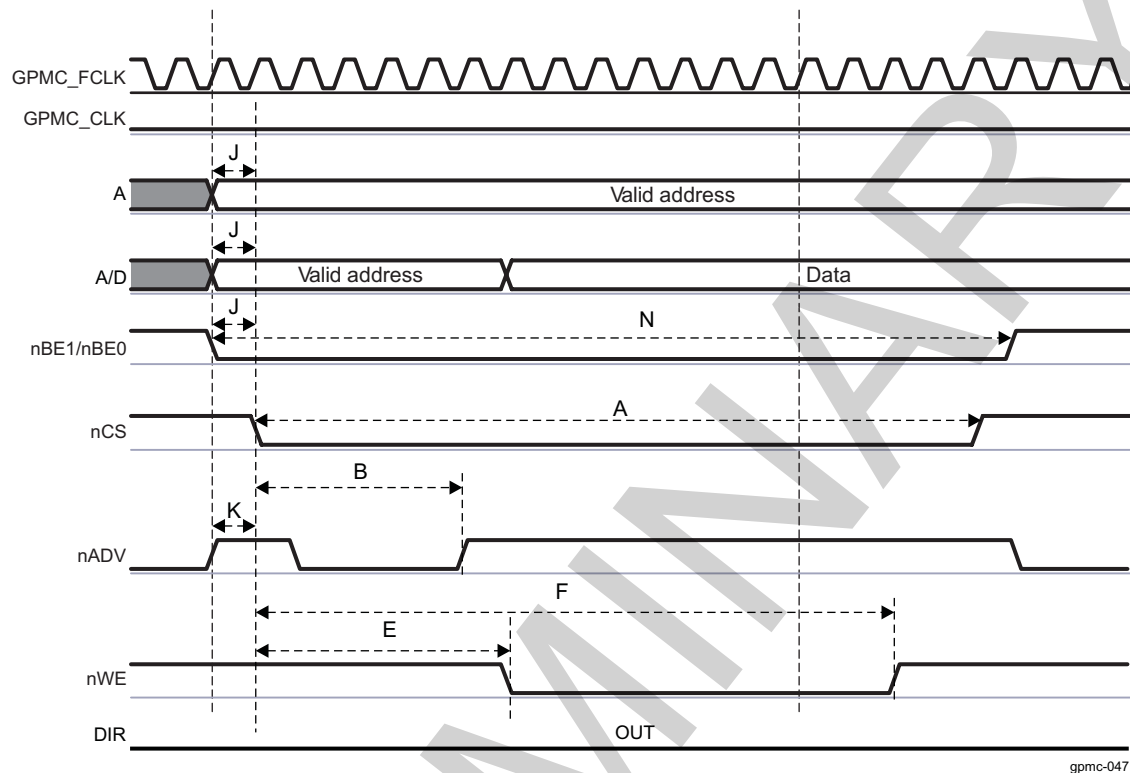

| Configuration Parameter | Unit | Description |
|-------------------------|------|---|
| L | ns | Delay time - gpmc_ncs valid to gpmc_noe valid |
| M | ns | Delay time - gpmc_ncs valid to first data latching edge |
| N | ns | Pulse duration - gpmc_nbe0_cle/gpmc_nbe1 valid time |
| O | ns | Delay time - gpmc_ncs valid to gpmc_nadv_ale valid |

The configuration parameters are calculated through the following formulas. Note that these formulas are not exhaustive.

- gpmc_ncs low pulse:
For single read: $A = (\text{CSRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
For burst read: $A = (\text{CSRDOFFTIME} - \text{CSONTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$, where N = page burst access number
For single write: $A = (\text{CSWROFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
For burst write: $A = (\text{CSWROFFTIME} - \text{CSONTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$, where N = page burst access number
- gpmc_ncs valid to gpmc_nadv_ale invalid delay:
For reading: $B = ((\text{ADVRDOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
For writing: $B = ((\text{ADVWROFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $C = ((\text{OE OFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $D = \text{PAGEBURSTACCESSTIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
- $E = ((\text{WEONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{WEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $F = ((\text{WEOFFTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{WEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $G = \text{CYCLE2CYCLEDELAY} * \text{GPMC_FCLK period}$
- $H = ((\text{OE OFFTIME} - \text{ACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * \text{OEEXTRADELAY}) * \text{GPMC_FCLK period}$
- $I = ((\text{OE OFFTIME} + (N - 1) * \text{PAGEBURSTACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$, where N = page burst access number
- $J = (\text{CSONTIME} * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period}$
- $K = ((\text{ADVONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $L = ((\text{OEONTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{OEEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$
- $M = ((\text{ACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) - 0.5 * \text{CSEXTRADELAY}) * \text{GPMC_FCLK period}$
- gpmc_nbe0_cle/gpmc_nbe1 pulse:
For single read: $N = \text{RDCYCLETIME} * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$
For burst read: $N = (\text{RDCYCLETIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$, where N = page burst access number
For burst write: $N = (\text{WRCYCLETIME} + (N - 1) * \text{PAGEBURSTACCESSTIME}) * (\text{TIMEPARAGRANULARITY} + 1) * \text{GPMC_FCLK period}$, where N = page burst access number
- $O = ((\text{WRCYCLETIME} + (N - 1) * \text{PAGEBURSTACCESSTIME} - \text{CSONTIME}) * (\text{TIMEPARAGRANULARITY} + 1) + 0.5 * (\text{ADVEXTRADELAY} - \text{CSEXTRADELAY})) * \text{GPMC_FCLK period}$

Figure 16-95 shows an asynchronous NOR single write simplified example where formulas are associated with signal waves.

Figure 16-95. Asynchronous NOR Single Write Simplified Example

NOTE: Write multiple access is not supported in asynchronous mode. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

16.4.6 GPMC Use Cases And Tips

16.4.6.1 How to Set GPMC Timing Parameters for Typical Accesses

16.4.6.1.1 External Memory Attached to the GPMC Module

As discussed in the introduction to this chapter, the GPMC module supports the following external memory types:

- Asynchronous or synchronous, 8-bit or 16-bit-width memory or device
- 16-bit address/data-multiplexed or not multiplexed NOR flash device
- 8- or 16-bit NAND flash device

The following examples show how to calculate GPMC timing parameters by showing a typical parameter setup for the access to be performed.

The example is based on a 512-Mb multiplexed NOR flash memory with the following characteristics:

- Type: NOR flash (address/data-multiplexed mode)
- Size: 512M bits
- Data Bus: 16 bits wide
- Speed: 104 MHz clock frequency
- Read access time: 80 ns

16.4.6.1.2 Typical GPMC Setup

Table 16-261 lists some of the I/Os of the GPMC module.

Table 16-261. GPMC Signals

| Signal Name | I/O | Description |
|----------------|----------|--|
| GPMC_FCLK | Internal | Functional and interface clock. Acts as the time reference. |
| gpmc_clk | O | External clock provided to the external device for synchronous operations |
| gpmc_a[25:16] | O | Address |
| gpmc_ad[15: 0] | I/O | Data-multiplexed with addresses A[16:1] on memory side |
| gpmc_ncsx | O | Chip-select (where x = 0, or 1) |
| gpmc_nadv_ale | O | Address valid enable |
| gpmc_noe_nre | O | Output enable (read access only) |
| gpmc_nwe | O | Write enable (write access only) |
| gpmc_wait[2:0] | I | Ready signal from memory device. Indicates when valid burst data is ready to be read |

Figure 16-96 shows the typical connection between the GPMC module and an attached NOR Flash memory.

Figure 16-96. GPMC Connection to an External NOR Flash Memory

gpmc-037

The following sections demonstrate how to calculate GPMC parameters for three access types:

- Synchronous burst read
- Asynchronous read
- Asynchronous single write

16.4.6.1.2.1 GPMC Configuration for Synchronous Burst Read Access

The clock runs at 104 MHz ($f = 104 \text{ MHz}$; $T = 9,615 \text{ ns}$).

Table 16-262 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Table 16-263 shows how to calculate timings for the GPMC using the memory parameters.

Figure 16-97 shows the synchronous burst read access.

Table 16-262. Useful Timing Parameters on the Memory Side

| AC Read Characteristics on the Memory Side | Description | Duration (ns) |
|--|-----------------------------|---------------|
| tCES | nCS setup time to clock | 0 |
| tACS | Address setup time to clock | 3 |
| tIACC | Synchronous access time | 80 |

Table 16-262. Useful Timing Parameters on the Memory Side (continued)

| AC Read Characteristics on the Memory Side | Description | Duration (ns) |
|--|---|---------------|
| tBACC | Burst access time valid clock to output delay | 5,2 |
| tCEZ | Chip-select to High-Z | 7 |
| tOEZ | Output enable to High-Z | 7 |
| tAVC | nADV setup time | 6 |
| tAVD | nAVD pulse | 6 |
| tACH | Address hold time from clock | 3 |

The following terms, which describe the timing interface between the controller and its attached device, are used to calculate the timing parameters on the GPMC side:

- Read Access time (GPMC side): Time required to activate the clock + read access time requested on the memory side + data setup time required for optimal capture of a burst of data
- Data setup time (GPMC side): Ensures a good capture of a burst of data (as opposed to taking a burst of data out). One word of data is processed in one clock cycle ($T = 9,615$ ns). The read access time between 2 bursts of data is $tBACC = 5,2$ ns. Therefore, data setup time is a clock period - $tBACC = 4,415$ ns of data setup.
- Access completion (GPMC side): (Different from page burst access time) Time required between the last burst access and access completion: nCS/nOE hold time (nCS and nOE must be released at the end of an access. These signals are held to allow the access to complete).
- Read cycle time (GPMC side): Read Access time + access completion
- Write cycle time for burst access: Not supported for NOR flash memory

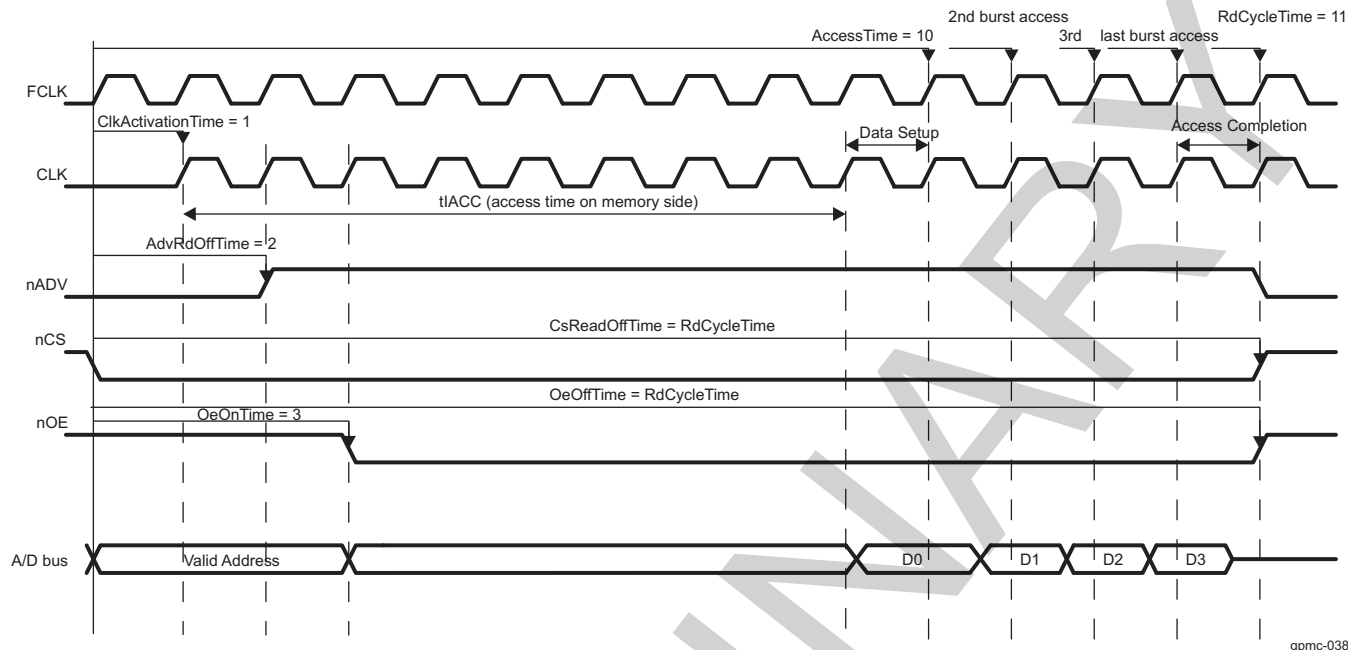

Table 16-263. Calculating GPMC Timing Parameters

| Parameter Name on GPMC Side | Formula | Duration (ns) | Number of Clock Cycles (F = 104 MHz) | GPMC Register Configurations |
|-----------------------------|--|-----------------------------|---------------------------------------|------------------------------|
| GPMC FCLK Divider | - | - | - | GPMCFCLKDIVIDER = 0x0 |
| ClkActivation Time | $\min(tCES, tACS)$ | 3 | 1 | CLKACTIVATIONTIME = 0x1 |
| RdAccessTime | $\text{roundmax}(\text{ClkActivationTime} + tIACC + \text{DataSetupTime})$ | 94,03: (9,615 + 80 + 4,415) | 10 : $\text{roundmax}(94,03 / 9,615)$ | ACCESSTIME = 0x0A |
| PageBurst AccessTime | $\text{roundmax}(tBACC)$ | $\text{roundmax}(5,2)$ | 1 | PAGEBURSTACCESSTIME = 0x1 |
| RdCycleTime | $\text{AccessTime} + \max(tCEZ, tOEZ)$ | 101, 03: (94, 03 + 7) | 11 | RDCYCLETIME = 0x0B |
| CsOnTime | tCES | 0 | 0 | CSONTIME = 0x0 |
| CsReadOffTime | RdCycleTime | - | 11 | CSRDOFFTIME = 0x0B |
| AdvOnTime | tAVC ⁽¹⁾ | 0 | 0 | ADVONTIME = 0x0 |
| AdvRdOffTime | tAVD + tAVC ⁽²⁾ | 12 | 2 | ADVRDOFFTIME = 0x02 |
| OeOnTime ⁽³⁾ | (ClkActivationTime + tACH) OeOnTime (ClkActivationTime + tIACC) | - | 3 for instance. | OEONTIME = 0x3 |
| OeOffTime | RdCycleTime | - | 11 | OEOFFTIME = 0x0B |

⁽¹⁾ The external clock provided to the NOR flash is not yet available.

⁽²⁾ $\text{AdvRdOffTime} - \text{AdvOnTime} = \text{tAVD}$; thus, $\text{AdvRdOffTime} = \text{tAVD} + \text{AdvOnTime} = \text{tAVD} + \text{tAVC}$.

⁽³⁾ OeOnTime must guarantee that addresses are available. It must not exceed the availability of the first burst of data.

Figure 16-97. Synchronous Burst Read Access (Timing Parameters in Clock Cycles)

gpmc-038

16.4.6.1.2.2 GPMC Configuration for Asynchronous Read Access

The clock runs at 104 MHz ($f = 104 \text{ MHz}$; $T = 9,615 \text{ ns}$).

Table 16-264 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Table 16-265 shows how to calculate timings for the GPMC using the memory parameters.

Figure 16-98 shows the asynchronous read access.

Table 16-264. AC Characteristics for Asynchronous Read Access

| AC Read Characteristics on the Memory Side | Description | Duration (ns) |
|--|---|---------------|
| tCE | Read Access time from nCS low | 80 |
| tAAVDS | Address setup time to rising edge of nADV | 3 |
| tAVDP | nADV low time | 6 |
| tCAS | nCS setup time to nADV | 0 |
| tOE | Output enable to output valid | 6 |
| tOEZ | Output enable to High-Z | 7 |

Use the following formula to calculate the RdCycleTime parameter for this typical access:

$$\text{RdCycleTime} = \text{RdAccessTime} + \text{AccessCompletion} = \text{RdAccessTime} + 1 \text{ clock cycle} + \text{tOEZ}$$

- First, on the memory side, the external memory makes the data available to the output bus. This is the memory-side read access time defined in Table 16-264: the number of clock cycles between the address capture (nADV rising edge) and the data valid on the output bus.

The GPMC requires some hold time to allow the data to be captured correctly and the access to be finished.

- To read the data correctly, the GPMC must be configured to meet the data setup time requirement of the memory; the GPMC module captures the data on the next rising edge. This is access time on the GPMC side.
- There must also be a data hold time for correctly reading the data (checking that there is no nOE/nCS

deassertion while reading the data). This data hold time is 1 clock cycle (that is, AccessTime + 1).

- To complete the access, nOE/nCS signals are driven to High-Z. AccessTime + 1 + tOEZ is the read cycle time.
- Addresses can now be relatched and a new read cycle begun.

Table 16-265. GPMC Timing Parameters for Asynchronous Read Access

| Parameter Name on GPMC side | Formula | Duration (ns) | Number of Clock Cycles (F = 104 MHz) | GPMC Register Configurations |
|--------------------------------|---|-------------------------|--|---------------------------------|
| ClkActivationTime | | n/a (asynchronous mode) | | |
| AccessTime | round max (tCE) | 80 | 10 | ACCESSTIME = 0x0A |
| PageBurstAccess Time | n/a (single access) | | | |
| RdCycleTime | AccessTime + 1cycle + tOEZ | 96, 615 | 12 | RDCYCLETIME = 0x0C |
| CsOnTime | tCAS | 0 | 0 | CSONTIME = 0x0 |
| CsReadOffTime | AccessTime + 1 cycle | 89, 615 | 11 | CSRDOFFTIME = 0x0B |
| AdvOnTime | tAAVDS | 3 | 1 | ADVONTIME = 0x1 |
| AdvRdOffTime | tAAVDS + tAVDP | 9 | 1 | ADVROFFTIME = 0x01 |
| OeOnTime | OeOnTime = AdvRdOffTime (multiplexed mode) | - | 3 for instance | OEONTIME = 0x3 |
| OeOffTime | AccessTime + 1cycle | 89, 615 | 11 | OEOFFTIME = 0x0B |

Figure 16-98. Asynchronous Single Read Access (Timing Parameters in Clock Cycles)

gpmc-039

16.4.6.1.2.3 GPMC Configuration for Asynchronous Single Write Access

The clock runs at 104 MHz: (f = 104 MHz; T = 9, 615 ns).

Table 16-267 shows how to calculate timings for the GPMC using the memory parameters.

Table 16-266 shows the timing parameters (on the memory side) that determine the parameters on the GPMC side.

Figure 16-99 shows the synchronous burst write access.

Table 16-266. AC Characteristics for Asynchronous Single Write (Memory Side)

| AC Characteristics on the Memory Side | Description | Duration (ns) |
|---------------------------------------|------------------------|---------------|
| tWC | Write cycle time | 60 |
| tAVDP | nADV low time | 6 |
| tWP | Write pulse width | 25 |
| tWPH | Write pulse width high | 20 |
| tCS | nCS setup time to nWE | 3 |
| tCAS | nCS setup time to nADV | 0 |
| tAVSC | nADV setup time | 3 |

For asynchronous single write access, write cycle time is $WrCycleTime = WeOffTime + AccessCompletion = WeOffTime + 1$. For the AccessCompletion, the GPMC requires 1 cycle of data hold time (nCS deassertion).

Table 16-267. GPMC Timing parameters for Asynchronous Single Write

| Parameter Name on GPMC side | Formula | Duration (ns) | Number of Clock Cycles (F = 104 MHz) | GPMC Registers Configuration |
|-----------------------------|--|-------------------------|--------------------------------------|------------------------------|
| ClkActivationTime | | n/a (asynchronous mode) | | |
| AccessTime | Applicable only to WAITMONITORING (the value is the same as for read access) | | | |
| PageBurstAccessTime | | n/a (single access) | | |
| WrCycleTime | WeOffTime + AccessCompletion | 57, 615 | 6 | WRCYCLETIME = 0x06 |
| CsOnTime | tCAS | 0 | 0 | CSONTIME = 0x0 |
| CsWrOffTime | WeOffTime + 1 | 57, 615 | 6 | CSWROFFTIME = 0x06 |
| AdvOnTime | tAVSC | 3 | 1 | ADVONTIME = 0x1 |
| AdvWrOffTime | tAVSC + tAVDP | 9 | 1 | ADVWROFFTIME = 0x01 |
| WeOnTime | tCS | 3 | 1 | WEONTIME = 0x1 |
| WeOffTime | tCS + tWP + tWPH | 48 | 5 | WEOFFTIME = 0x05 |

Figure 16-99. Asynchronous Single Write Access (Timing Parameters in Clock Cycles)

gpmc-040

16.4.6.2 How to choose a suitable memory to use with the GPMC

This section is intended to help the user select a suitable memory device to interface with the GPMC controller.

16.4.6.2.1 Supported Memories or Devices

NAND flash and NOR flash architectures are the two flash technologies. The GPMC supports various types of external memory or device, basically any one that supports NAND or NOR protocols:

- 8- and 16-bit width asynchronous or synchronous memory or device (8-bit: non burst device only)
- 16-bit address and data multiplexed NOR flash devices (pSRAM, OneNAND™, ...)
- 8- and 16-bit NAND flash device

NOTE: Non-multiplexed NOR flash devices are supported by the GPMC but their usage is highly limited. As only ten address pins are available on the GPMC interface, the maximum device size supported is 2KB.

16.4.6.2.1.1 Memory Pin Multiplexing

This section highlights the interfacing differences of the GPMC supported memories.

Table 16-268. Supported memories interfaces

| Function | 16-bit Address/Data muxed pSRAM or NOR Flash ⁽¹⁾ | OneNAND | 16-bit NAND | 8-bit NAND |
|-------------|--|---------|-------------|------------|
| gpmc_a[25] | A26 | | | |
| gpmc_a[24] | A25 | | | |
| gpmc_a[23] | A24 | | | |

16.4.6.2.1.2 NAND Interface Protocol

NAND flash architecture, introduced in 1989, is a flash technology. NAND is a page-oriented memory device, that is, read and write accesses are done by pages. NAND achieves great density by sharing common areas of the storage transistor, which creates strings of serially connected transistors (in NOR devices, each transistor stands alone). Thanks to its high density NAND is best suited to devices requiring high capacity data storage, such as pictures, music, or data files. NAND non-volatility, makes of it a good storage solution for many applications where mobility, low power, and speed are key factors. Low pin count and simple interface are other advantages of NAND.

Table 16-269 summarizes the NAND interface signals level applied to external device or memories.

Table 16-269. NAND Interface Bus Operations Summary

| Bus operation | CLE | ALE | nCE | nWE ⁽¹⁾ | nRE ⁽¹⁾ | nWP |
|-----------------------|-----|-----|------------------|--------------------|--------------------|--------------------|
| Read (cmd input) | H | L | L | RE | H | x |
| Read (add input) | L | H | L | RE | H | x |
| Write (cmd input) | H | L | L | RE | H | H |
| Write (add input) | L | H | L | RE | H | H |
| Data input | L | L | L | RE | H | H |
| Data output | L | L | L | H | FE | x |
| Busy (during read) | x | x | H ⁽²⁾ | H ⁽²⁾ | H ⁽²⁾ | x |
| Busy (during program) | x | x | x | x | x | H |
| Busy (during erase) | x | x | x | x | x | H |
| Write protect | x | x | x | x | x | L |
| Stand-by | x | x | H | x | x | H/L ⁽³⁾ |

⁽¹⁾ RE stands for rising edge, FE stands for falling edge

⁽²⁾ Can be either nCE high, or WE and nRE high.

⁽³⁾ nWP should be biased to CMOS high or CMOS low for standby

16.4.6.2.1.3 NOR Interface Protocol

NOR flash architecture, introduced in 1988, is a flash technology. Unlike NAND which is a sequential access device, NOR is directly addressable, that is, is designed to be a random access device. NOR is best suited to devices used to store and run code or firmware, usually in small capacities. While NOR has fast read capabilities it has slow write and erase functions compared to NAND architecture.

Table 16-270 summarizes the NOR interface signals level applied to external device or memories.

Table 16-270. NOR Interface Bus Operations Summary

| Bus operation | CLK | nADV | nCS | nOE | nWE | WAIT | DQ[15:0] |
|----------------------|---------|------|-----|-----|-----|----------|----------|
| Read (asynchronous) | x | L | L | L | H | Asserted | Output |
| Read (synchronous) | Running | L | L | L | H | Driven | Output |
| Read (burst suspend) | Halted | x | L | H | H | Active | Output |
| Write | x | L | L | H | L | Asserted | Input |
| Output disable | x | x | L | H | H | Asserted | High-Z |
| Standby | x | x | H | x | x | High-Z | High-Z |

16.4.6.2.1.4 Other Technologies

Other supported device type interact with the GPMC through the NOR interface protocol.

OneNAND™ is a high density and low-power memory device. OneNAND™ is based on single- or multi-level-cell NAND core with SRAM and logic, and interfaces as a synchronous NOR Flash, plus has synchronous write capability. It reads faster than conventional NAND and write faster than conventional NOR flash. Hence, it is appropriate for both mass storage and code storage.

pSRAM stands for pseudo-static random access memory. pSRAM is a low-power memory device for mobile applications. pSRAM is based on the DRAM cell with internal refresh and address control features, and interfaces as a synchronous NOR Flash, plus has synchronous write capability.

16.4.6.2.1.5 Supported Protocols

The GPMC supports the following interface protocols when communicating with external memory or external devices:

- Asynchronous read/write access
- Asynchronous read page access (4-8-16 Word16)
- Synchronous read/write access
- Synchronous read burst access without wrap capability (4-8-16 Word16)
- Synchronous read burst access with wrap capability (4-8-16 Word16)

16.4.6.2.2 GPMC Features and Settings

This section lists GPMC features and settings:

- Supported device type: up to four NAND or NOR protocol external memories or devices
- Operating Voltage: 1.8V;
- Maximum GPMC addressing capability: 1 GByte divided into eight chip-selects
- Maximum supported memory size: 256 MBytes (must be a power-of-2)
- Minimum supported memory size: 16 MBytes (must be a power-of-2). Aliasing occurs when addressing smaller memories.
- Data path to external memory or device: 8- and 16-bit wide
- Burst and page access: burst of 4-8-16 Word16
- Supports bus keeping
- Supports bus turn around

16.4.7 GPMC Register Manual

This section provides information about the GPMC instance in this product. [Table 16-272](#) provides a summary of the GPMC registers. The remaining parts of this section describe the registers within the module instance.

16.4.7.1 GPMC Register Summary

Table 16-271. GPMC Instance Summary

| Module Name | Base Address | Size |
|-------------|--------------|-----------|
| GPMC | 0x5000 0000 | 32 Mbytes |

Table 16-272. GPMC Registers Mapping Summary

| Register Name | Type | Register Width (Bits) | Address Offset | GPMC L3 Physical Address |
|--|------|-----------------------|---------------------------------|---------------------------------|
| GPMC_REVISION | R | 32 | 0x0000 0000 | 0x5000 0000 |

⁽¹⁾ i = 0 to 7 for GPMC

⁽²⁾ j = 0 to 8 for GPMC

16.4.7.2 GPMC Register Descriptions

NOTE: All GPMC registers are aligned to 32-bit address boundaries. All register file accesses, except to `GPMC_NAND_DATA_i` register, are little endian. If the `GPMC_NAND_DATA_i` register location is accessed, the endianness is access-dependent.

In the whole section i corresponds to the chip-select number, $i = 0$ to 7 .

16.5 Error Location Module

16.5.1 Error Location Module Overview

Non-managed NAND flash memories can be dense and nonvolatile in their own nature, but error-prone. When reading from NAND flash memories, some level of error-correction is required. In the case of NAND modules with no internal correction capability, sometimes referred to as *bare NANDs*, the correction process is delegated to the memory controller.

The general-purpose memory controller (GPMC) probes data read from an external NAND flash and uses this to compute checksum-like information, called syndrome polynomials, on a per-block basis. Each syndrome polynomial gives a status of the read operations for a full block, including 512 bytes of data, parity bits, and an optional spare-area data field, with a maximum block size of 1023 bytes. Computation is based on a Bose-Chaudhuri-Hocquenghem (BCH) algorithm. The error-location module (ELM) extracts error addresses from these syndrome polynomials.

Based on the syndrome polynomial value, the ELM can detect errors, compute the number of errors, and give the location of each error bit. The actual data is not required to complete the error-correction algorithm. Errors can be reported anywhere in the NAND flash block, including in the parity bits.

The maximum acceptable number of errors that can be corrected depends on a programmable configuration parameter. 4-, 8-, and 16-bit error-correction levels are supported. The ELM relies on a static and fixed definition of the generator polynomial for each error-correction level that corresponds to the generator polynomials defined in the GPMC (there are three fixed polynomial for the three correction error levels). A larger number of errors than the programmed error-correction level may be detected, but the ELM cannot correct them all. The offending block is then tagged as *uncorrectable* in the associated computation exit status register. If the computation is successful, that is, if the number of errors detected does not exceed the maximum value authorized for the chosen correction capability, the exit status register contains the information on the number of detected errors.

When the error-location process completes, an interrupt is triggered to inform the central processing unit (CPU) that its status can be checked. The number of detected errors and their locations in the NAND block can be retrieved from the module through register accesses.

16.5.1.1 ELM Features

The ELM has the following features:

- 4, 8, and 16 bits per 512-byte block error-location based on BCH algorithms
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation on error-location process completion:
 - When the full page has been processed in page mode
 - For each syndrome polynomial in continuous mode

16.5.2 ELM Integration

The ELM extracts error addresses from generated syndrome polynomials.

The ELM is used with the GPMC. Syndrome polynomials generated on-the-fly when reading a NAND flash page and stored in GPMC registers are passed to the ELM. The microprocessor unit (MPU) can then correct the data block by flipping the bits to which the ELM error-location outputs point.

Figure 16-100 shows the integration of the ELM subsystem in the device.

Figure 16-100. ELM Integration

Table 16-347. Hardware Requests

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|-------------|--|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| ELM | ELM_IRQ | MA_IRQ_4 | Cortex-A9 | BCH error-location module interrupt For information about Cortex-A9 interrupt control, see Section 18.3.2, Interrupt Requests to Cortex-A9 MPU INTG . |
| | | D_IRQ_26 | DSP | BCH error-location module interrupt For information about DSP interrupt control, see , <i>Interrupts Requests</i> . |

16.5.3 ELM Functional Description

The ELM is designed around the error-location engine, which handles the computation based on the input syndrome polynomials.

The ELM maps the error-location engine to a standard interconnect interface by using a set of registers to control inputs and outputs.

16.5.3.1 ELM Software Reset

To perform a software reset, write a 1 to the [ELM_SYSCONFIG\[1\] SOFTRESET](#) bit. The [ELM_SYSSTATUS\[0\] RESETDONE](#) bit indicates that the software reset is complete when its value is 1. When the software reset completes, the [ELM_SYSCONFIG\[1\] SOFTRESET](#) bit is automatically reset.

16.5.3.2 ELM Power Management

[Table 16-348](#) describes the power-management features available to the ELM module.

NOTE:

- For information about source clock gating and sleep/wake-up transitions description, see the , *CD_L4_PER Clock Domain* in [Chapter 3, Power, Reset, and Clock Management](#).
- For a general description of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.6 Clock Management](#) in [Chapter 3, Power, Reset, and Clock Management](#)

Table 16-348. Local Power Management Features

| Feature | Registers | Description |
|------------------|---|--|
| Clock autogating | ELM_SYSCONFIG[0] AUTOGATING bit | This bit allows a local power optimization inside the module by gating the ELM_FCLK clock upon the interface activity. |

Table 16-348. Local Power Management Features (continued)

| Feature | Registers | Description |
|------------------------|--|--|
| Slave idle modes | ELM_SYSCONFIG [4:3] SIDLEMODE bit field | Force-idle, No-idle, and Smart-idle modes are available. |
| Clock activity | ELM_SYSCONFIG [8] CLOCKACTIVITY bit | The clock can be switched-off or maintained during the wake-up period. |
| Master Standby modes | N/A | |
| Global Wake-up Enable | N/A | |
| Wake-up Sources Enable | N/A | |

CAUTION

The PRCM module has no hardware means of reading [CLOCKACTIVITY](#) settings. Thus, software must ensure consistent programming between the [ELM CLOCKACTIVITY](#) and [ELM clock PRCM control bits](#). For a description of the ClockActivity feature, see [Chapter 3, Power, Reset, and Clock Management](#).

16.5.3.3 ELM Interrupt Requests

[Table 16-349](#) lists the event flags, and their masks, that can cause module interrupts.

Table 16-349. Events

| Event Flag | Event Mask | Map to | Description |
|--|--|---------|--|
| ELM_IRQSTATUS [8] PAGE_VALID | ELM_IRQENABLE [8] PAGE_MASK | ELM_IRQ | Page interrupt |
| ELM_IRQSTATUS [7] LOC_VALID_7 | ELM_IRQENABLE [7] LOCATION_MASK_7 | ELM_IRQ | Error-location interrupt for syndrome polynomial 7 |
| ELM_IRQSTATUS [6] LOC_VALID_6 | ELM_IRQENABLE [6] LOCATION_MASK_6 | ELM_IRQ | Error-location interrupt for syndrome polynomial 6 |
| ELM_IRQSTATUS [5] LOC_VALID_5 | ELM_IRQENABLE [5] LOCATION_MASK_5 | ELM_IRQ | Error-location interrupt for syndrome polynomial 5 |
| ELM_IRQSTATUS [4] LOC_VALID_4 | ELM_IRQENABLE [4] LOCATION_MASK_4 | ELM_IRQ | Error-location interrupt for syndrome polynomial 4 |
| ELM_IRQSTATUS [3] LOC_VALID_3 | ELM_IRQENABLE [3] LOCATION_MASK_3 | ELM_IRQ | Error-location interrupt for syndrome polynomial 3 |
| ELM_IRQSTATUS [2] LOC_VALID_2 | ELM_IRQENABLE [2] LOCATION_MASK_2 | ELM_IRQ | Error-location interrupt for syndrome polynomial 2 |
| ELM_IRQSTATUS [1] LOC_VALID_1 | ELM_IRQENABLE [1] LOCATION_MASK_1 | ELM_IRQ | Error-location interrupt for syndrome polynomial 1 |
| ELM_IRQSTATUS [0] LOC_VALID_0 | ELM_IRQENABLE [0] LOCATION_MASK_0 | ELM_IRQ | Error-location interrupt for syndrome polynomial 0 |

16.5.3.4 Processing Initialization

[ELM_LOCATION_CONFIG](#) global setting parameters must be set before using the error-location engine. The [ELM_LOCATION_CONFIG](#)[1:0] [ECC_BCH_LEVEL](#) bit defines the error-correction level used (4-, 8-, or 16-bit error-correction). The [ELM_LOCATION_CONFIG](#)[26:16] [ECC_SIZE](#) bit field defines the maximum buffer length beyond which the engine processing no longer looks for errors.

The CPU can choose to use the ELM in continuous mode or page mode. If all [ELM_PAGE_CTRL](#)[i] [SECTOR_i](#) bits are reset (i is the syndrome polynomial number, i = 0 to 7), continuous mode is used. In any other case, page mode is implicitly selected.

- Continuous mode: Each syndrome polynomial is processed independently – results for a syndrome can be retrieved and acknowledged at any time, whatever the status of the other seven processing contexts.
- Page mode: Syndrome polynomials are grouped into atomic entities – only one page can be processed at any given time, even if all eight contexts are not used for this page. Unused contexts are lost and cannot be affected to any other processing. The full page must be acknowledged and cleared before moving to the next page.

For completion interrupts to be generated correctly, all [ELM_IRQENABLE\[i\]](#) [LOCATION_MASK_i](#) bits ($i = 0$ to 7) must be forced to 0 when in page mode, and set to 1 in continuous mode. Additionally, the [ELM_IRQENABLE\[8\]](#) [PAGE_MASK](#) bit must be set to 1 when in page mode.

The CPU initiates error-location processing by writing a syndrome polynomial into one of the eight possible register sets. Each of these register sets includes seven registers: [ELM_SYNDROME_FRAGMENT_0_i](#) to [ELM_SYNDROME_FRAGMENT_6_i](#). The first six registers can be written in any order, but [ELM_SYNDROME_FRAGMENT_6_i](#) must be written last because it includes the validity bit, which instructs the ELM that this syndrome polynomial must be processed (the [ELM_SYNDROME_FRAGMENT_6_i\[16\]](#) [SYNDROME_VALID](#) bit).

As soon as one validity bit is asserted ([ELM_SYNDROME_FRAGMENT_6_i\[16\]](#) [SYNDROME_VALID](#) = $0x1$, with $i = 0$ to 7), error-location processing can start for the corresponding syndrome polynomial. The associated [ELM_LOCATION_STATUS_i](#) and [ELM_ERROR_LOCATION_0_i](#) to [ELM_ERROR_LOCATION_15_i](#) registers are not reset ($i = 0$ to 7). The software must not consider them until the corresponding [ELM_IRQSTATUS\[i\]](#) [LOC_VALID_i](#) bit is set.

16.5.3.5 Processing Sequence

While the error-location engine is busy processing one syndrome polynomial, further syndrome polynomials can be written. They are processed when the current processing completes.

The engine completes early when:

- No error is detected; that is, when the [ELM_LOCATION_STATUS_i\[8\]](#) [ECC_CORRECTABLE](#) bit is set to 1 and the [ELM_LOCATION_STATUS_i\[4:0\]](#) [ECC_NB_ERRORS](#) bit field is set to $0x0$.
- Too many errors are detected; that is, when the [ELM_LOCATION_STATUS_i\[8\]](#) [ECC_CORRECTABLE](#) bit is set to 0 while the [ELM_LOCATION_STATUS_i\[4:0\]](#) [ECC_NB_ERRORS](#) bit field is set with the value output by the error-location engine. The reported number of errors is not ensured if [ECC_CORRECTABLE](#) is 0.

If the engine completes early, the associated error-location registers [ELM_ERROR_LOCATION_0_i](#) to [ELM_ERROR_LOCATION_15_i](#) are not updated ($i = 0$ to 7).

In all other cases, the engine goes through the entire error-location process. Each time an error-location is found, it is logged in the associated [ECC_ERROR_LOCATION](#) bit field. The first error detected is logged in the [ELM_ERROR_LOCATION_0_i\[12:0\]](#) [ECC_ERROR_LOCATION](#) bit field; the second in the [ELM_ERROR_LOCATION_1_i\[12:0\]](#) [ECC_ERROR_LOCATION](#) bit field, and so on.

Table 16-350. ELM_LOCATION_STATUS_i Value Decoding Table

| ECC_CORRECTABLE Value | ECC_NB_ERRORS Value | Status | Number of Errors Detected | Action Required |
|---------------------------------------|-------------------------------------|--------|-------------------------------|--|
| 1 | 0 | OK | 0 | None |
| 1 | $\neq 0$ | OK | ECC_NB_ERRORS | Correct the data buffer read based on the ELM_ERROR_LOCATION_0_i to ELM_ERROR_LOCATION_15_i results. |
| 0 | Any | Failed | Unknown | Software-dependant |

16.5.3.6 Processing Completion

When the processing for a given syndrome polynomial completes, its [ELM_SYNDROME_FRAGMENT_6_i\[16\]](#) SYNDROME_VALID bit is reset. It must not be set again until the exit status registers, [ELM_LOCATION_STATUS_i](#) ($i = 0$ to 7), for this processing are checked. Failure to comply with this rule leads to potential loss of the first polynomial process data output.

The error-location engine signals the process completion to the ELM. When this event is detected, the corresponding [ELM_IRQSTATUS\[i\]](#) LOC_VALID_i bit is set ($i = 0$ to 7). The processing-exit status is available from the associated [ELM_LOCATION_STATUS_i](#) register, and error locations are stored in order in the ECC_ERROR_LOCATION fields. The software must only read valid error-location registers based on the number of errors detected and located.

Immediately after the error-location engine completes, a new syndrome polynomial can be processed, if any is available, as reported by the [ELM_SYNDROME_FRAGMENT_6_i\[16\]](#) SYNDROME_VALID validity bit, depending on the configured error-correction level. If several syndrome polynomials are available, a round-robin arbitration is used to select one for processing.

In continuous mode (that is, all bits in [ELM_PAGE_CTRL](#) are reset), an interrupt is triggered whenever a [ELM_IRQSTATUS\[i\]](#) LOC_VALID_i bit is asserted. The CPU must read the [ELM_IRQSTATUS](#) register to determine which polynomial is processed and retrieve the exit status and error locations ([ELM_LOCATION_STATUS_i](#) and [ELM_ERROR_LOCATION_0_i](#) to [ELM_ERROR_LOCATION_15_i](#)). When done, the CPU must clear the corresponding [ELM_IRQSTATUS\[i\]](#) LOC_VALID_i bit by writing it to 1. Other status bits must be written to 0 so that other interrupts are not unintentionally cleared. When using this mode, the [ELM_IRQSTATUS\[8\]](#) PAGE_VALID interrupt is never triggered.

In page mode, the module does not trigger interrupts for the processing completion of each polynomial because the [ELM_IRQENABLE\[i\]](#) LOCATION_MASK_i bits are cleared. A page is defined using the [ELM_PAGE_CTRL](#) register. Each SECTOR_i bit set means the corresponding polynomial i is part of the page processing. A page is fully processed when all tagged polynomials have been processed, as logged in the [ELM_IRQSTATUS\[i\]](#) LOC_VALID_i bit fields. The module triggers an [ELM_IRQSTATUS\[8\]](#) PAGE_VALID interrupt whenever it detects that the full page has been processed. To make sure the next page can be correctly processed, all status bits in the [ELM_IRQSTATUS](#) register must be cleared by using a single atomic-write access.

NOTE: Do not modify page setting parameters in the [ELM_PAGE_CTRL](#) register unless the engine is idle, no polynomial input is valid, and all interrupts have been cleared.

Because no polynomial-level interrupt is triggered in page mode, polynomials cleared in the [ELM_PAGE_CTRL\[i\]](#) SECTOR_i bit fields ($i = 0$ to 7) are processed as usual, but are essentially ignored. The CPU must manually poll the [ELM_IRQSTATUS](#) bits to check for their status.

16.5.4 ELM Basic Programming Model

16.5.4.1 ELM Low Level Programming Model

16.5.4.1.1 Processing Initialization

Table 16-351. ELM Processing Initialization

| Step | Register/ Bit Field / Programming Model | Value |
|---|---|-----------|
| Resets the module | ELM_SYSCONFIG[1] SOFTRESET | 0x1 |
| Wait until reset is done. | ELM_SYSSTATUS[0] RESETDONE | 0x1 |
| Configure the slave interface power management. | ELM_SYSCONFIG[4:3] SIDLEMODE | Set value |
| Defines the error-correction level used | ELM_LOCATION_CONFIG[1:0] ECC_BCH_LEVEL | Set value |
| Defines the maximum buffer length | ELM_LOCATION_CONFIG[26:16] ECC_SIZE | Set value |
| Sets the ELM in continuous mode or page mode | ELM_PAGE_CTRL | Set value |
| If continuous mode is used | All ELM_PAGE_CTRL[i] SECTOR_i ($i = 0$ to 7) | 0x0 |
| Enables interrupt for syndrome polynomial i | ELM_IRQENABLE[i] LOCATION_MASK_i | 0x1 |

Table 16-351. ELM Processing Initialization (continued)

| Step | Register/ Bit Field / Programming Model | Value |
|--|--|-----------|
| else (page mode is used) | One syndrome polynomial <i>i</i> is set ELM_PAGE_CTRL[i] SECTOR_ <i>i</i> (<i>i</i> = 0 to 7) | 0x1 |
| Disable all interrupts for syndrome polynomial and enable PAGE_MASK interrupt. | All ELM_IRQENABLE[i] LOCATION_MASK_ <i>i</i> = 0x0 and ELM_IRQENABLE[8] PAGE_MASK = 0x1 | Set value |
| endif | | Set value |
| Set the input syndrome polynomial <i>i</i> . | ELM_SYNDROME_FRAGMENT_0_i | Set value |
| | ELM_SYNDROME_FRAGMENT_1_i | Set value |
| | ELM_SYNDROME_FRAGMENT_5_i | Set value |
| | ELM_SYNDROME_FRAGMENT_6_i | Set value |
| Initiates the computation process | ELM_SYNDROME_FRAGMENT_6_i[16] SYNDROME_VALID | 0x1 |

16.5.4.1.2 Read Results

The engine goes through the entire error-location process and results can be read. [Table 16-352](#) and [Table 16-353](#) describe the processing completion for continuous and page modes, respectively.

Table 16-352. ELM Processing Completion for Continuous Mode

| Step | Register/ Bit Field / Programming Model | Value |
|---|---|-------|
| Wait until process is complete for syndrome polynomial <i>i</i> : Wait until the ELM_IRQ interrupt is generated, or poll the status register. | | |
| Read for which <i>i</i> the error-location process is complete. | ELM_IRQSTATUS[i] LOC_VALID_ <i>i</i> | 0x1 |
| if the process fails (too many errors) | ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE | 0x0 |
| It is software dependant. | | |
| else (process successful, the engine completes) | ELM_LOCATION_STATUS_i[8] ECC_CORRECTABLE | 0x1 |
| Read the number of errors. | ELM_LOCATION_STATUS_i[4:0] ECC_NB_ERRORS | |
| Read the error-location bit addresses for syndrome polynomial <i>i</i> of the ECC_NB_ERRORS first registers. It is the software responsibility to correct errors in the data buffer. | ELM_ERROR_LOCATION_0_i[12:0] ECC_ERROR_LOCATION | |
| | ELM_ERROR_LOCATION_1_i[12:0] ECC_ERROR_LOCATION | |

| | | |
| endif | | |
| End Repeat | | |
| Clear the ELM_IRQSTATUS register. | ELM_IRQSTATUS | 0x1FF |

Next page can be correctly processed after a page is fully processed, when all tagged polynomials have been processed ([ELM_IRQSTATUS](#)[i] LOC_VALID_i = 0x1 for all syndrome polynomials i used in the page).

16.5.4.2 Use Case: ELM Used in Continuous Mode

In this example, the ELM module is programmed for an 8-bit error-correction capability in continuous mode. After reading a 528-byte NAND flash sector (512B data plus 16B spare area) with a 16-bit interface, a non-zero polynomial syndrome is reported from the GPMC (Polynomial syndrome 0 is used in the ELM):

- P = 0x0A16ABE115E44F767BFB0D0980

Table 16-354. Use Case: Continuous Mode

| Step | Register/ Bit Field / Programming Model | Value |
|--|--|------------|
| Resets the module | ELM_SYSCONFIG [1] SOFTRESET | 0x1 |
| Wait until reset is done. | ELM_SYSSTATUS [0] RESETDONE | 0x1 |
| Configure the slave interface power management: Smart idle is used. | ELM_SYSCONFIG [4:3] SIDLEMODE | 0x2 |
| Defines the error-correction level used: 8 bits | ELM_LOCATION_CONFIG [1:0] ECC_BCH_LEVEL | 0x1 |
| Defines the maximum buffer length: 528 bytes (2x528 = 1056) | ELM_LOCATION_CONFIG [26:16] ECC_SIZE | 0x420 |
| Sets the ELM in continuous mode | ELM_PAGE_CTRL | 0 |
| Enables interrupt for syndrome polynomial 0 | ELM_IRQENABLE [0] LOCATION_MASK_0 | 0x1 |
| Set the input syndrome polynomial 0. | ELM_SYNDROME_FRAGMENT_0_i (i=0) | 0xFB0D0980 |
| | ELM_SYNDROME_FRAGMENT_1_i (i=0) | 0xE44F767B |
| | ELM_SYNDROME_FRAGMENT_2_i (i=0) | 0x16ABE115 |
| | ELM_SYNDROME_FRAGMENT_3_i (i=0) | 0x0000000A |
| Initiates the computation process | ELM_SYNDROME_FRAGMENT_6_i [16] SYNDROME_VALID (i=0) | 0x1 |
| Wait until process is complete for syndrome polynomial 0: IRQ_ELM is generated or poll the status register. | | |
| Read that error-location process is complete for syndrome polynomial 0. | ELM_IRQSTATUS [0] LOC_VALID_0 | 0x1 |
| Read the process exit status: All errors were successfully located. | ELM_LOCATION_STATUS_i [8] ECC_CORRECTABLE (i=0) | 0x1 |

Table 16-354. Use Case: Continuous Mode (continued)

| Step | Register/ Bit Field / Programming Model | Value |
|--|---|-------|
| Read the number of errors: Four errors detected. | ELM_LOCATION_STATUS_i [4:0] ECC_NB_ERRORS (i=0) | 0x4 |
| Read the error-location bit addresses for syndrome polynomial 0 of the 4 first registers: Errors are located in the data buffer at decimal addresses 431, 1062, 1909, 3452. | ELM_ERROR_LOCATION_0_i (i=0) | 0x1AF |
| | ELM_ERROR_LOCATION_1_i (i=0) | 0x426 |
| | ELM_ERROR_LOCATION_2_i (i=0) | 0x775 |
| | ELM_ERROR_LOCATION_3_i (i=0) | 0xD7C |
| Clear the corresponding interrupt for polynomial 0. | ELM_IRQSTATUS [0] LOC_VALID_0 | 0x1 |

The NAND flash data in the sector are seen as a polynomial of degree 4223 (number of bits in a 528 byte buffer minus 1), with each data bit being a coefficient in the polynomial. When reading from a NAND flash using the GPMC module, computation of the polynomial syndrome assumes that the first NAND word read at address 0x0 contains the highest-order coefficient in the message. Furthermore, in the 16-bit NAND word, bits are ordered from bit 7 to bit 0, then from bit 15 to bit 8. Based on this convention, an address table of the data buffer can be built. NAND memory addresses in [Table 16-355](#) are given in decimal format.

Table 16-355. 16-bit NAND Sector Buffer Address Map

| NAND Memory Address | Message bit addresses in the memory word | | | | | | | | | | | | | | | |
|---------------------------|--|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0 | 4215 | 4214 | 4213 | 4212 | 4211 | 4210 | 4209 | 4208 | 4223 | 4222 | 4221 | 4220 | 4219 | 4218 | 4217 | 4216 |
| 1 | 4175 | 4174 | 4173 | 4172 | 4171 | 4170 | 4169 | 4168 | 4183 | 4182 | 4181 | 4180 | 4179 | 4178 | 4177 | 4176 |
| ... | | | | | | | | | | | | | | | | |
| 47 | 3463 | 3462 | 3461 | 3460 | 3459 | 3458 | 3457 | 3456 | 3471 | 3470 | 3469 | 3468 | 3467 | 3466 | 3465 | 3464 |
| 48 | 3447 | 3446 | 3445 | 3444 | 3443 | 3442 | 3441 | 3440 | 3455 | 3454 | 3453 | 3452 | 3451 | 3450 | 3449 | 3448 |
| 49 | 3431 | 3430 | 3429 | 3428 | 3427 | 3426 | 3425 | 3424 | 3439 | 3438 | 3437 | 3436 | 3435 | 3434 | 3433 | 3432 |
| 50 | 3415 | 3414 | 3413 | 3412 | 3411 | 3410 | 3409 | 3408 | 3423 | 3422 | 3421 | 3420 | 3419 | 3418 | 3417 | 3416 |
| ... | | | | | | | | | | | | | | | | |
| 255 | 135 | 134 | 133 | 132 | 131 | 130 | 129 | 128 | 143 | 142 | 141 | 140 | 139 | 138 | 137 | 136 |
| 256 | 119 | 118 | 117 | 116 | 115 | 114 | 113 | 112 | 127 | 126 | 125 | 124 | 123 | 122 | 121 | 120 |
| 257 | 103 | 102 | 101 | 100 | 99 | 98 | 97 | 96 | 111 | 110 | 109 | 108 | 107 | 106 | 105 | 104 |
| 258 | 87 | 86 | 85 | 84 | 83 | 82 | 81 | 80 | 95 | 94 | 93 | 92 | 91 | 90 | 89 | 88 |
| 259 | 71 | 70 | 69 | 68 | 67 | 66 | 65 | 64 | 79 | 78 | 77 | 76 | 75 | 74 | 73 | 72 |
| 260 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 |
| 261 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 |
| 262 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| 263 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |

The table can now be used to determine which bits in the buffer were incorrect and must be flipped. In this example, the first bit to be flipped is bit 4 from the 49th byte read from memory. It is up to the processor to correctly map this word to the copied buffer and to flip this bit. The same process must be repeated for all detected errors.

16.5.4.3 Use Case: ELM Used in Page Mode

In this example, the ELM module is programmed for an 16-bit error-correction capability in page mode. After reading a 528-byte NAND flash sector (512B data plus 16B spare area) with a 16-bit interface, four non-zero polynomial syndromes are reported from the GPMC (Polynomial syndrome 0, 1, 2, and 3 are used in the ELM):

- P0 = 0xE8B0 12ADDB5A318E05BE B0693DB28330B5CC A329AA05E0B718EF
- P1 = 0xBAD0 49A0D932C22E6669 0948DF08BE093336 79C6BA10E5F935EB

- P2 = 0x69D9 B86ABCD5EC3697FA A6498FEE54556EA0 1579EF7D60BA3189
- P3 = 0x0

Table 16-356. Use Case: Page Mode

| Step | Register/ Bit Field / Programming Model | Value |
|--|--|------------|
| Resets the module | ELM_SYSCONFIG[1] SOFTRESET | 0x1 |
| Wait until reset is done. | ELM_SYSSTATUS[0] RESETDONE | 0x1 |

16.5.5.2.2 ELM Register Description

Table 16-359. ELM_REVISION

| | | | |
|------------------|---|----------|-----|
| Address Offset | 0x0000 0000 | Instance | ELM |
| Physical Address | 0x4807 8000 | | |
| Description | This register contains the IP revision code. (A write or reset of to this register has no effect.) | | |
| Type | R | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| REVISION | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|------|------------|-------------|------|------------------|
| 31:0 | REVISION | IP Revision | R | TI internal data |

Table 16-361. ELM_SYSCONFIG

| | | | |
|-------------------------|---|-----------------|-----|
| Address Offset | 0x0000 0010 | Instance | ELM |
| Physical Address | 0x4807 8010 | | |
| Description | This register allows controlling various parameters of the OCP interface. | | |
| Type | RW | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------------|----|----------|----|----|-----------|---|----------|---|-----------|---|------------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RESERVED | | | | | | | | | | | | | | | | CLOCKACTIVITYOCP | | RESERVED | | | SIDLEMODE | | RESERVED | | SOFTRESET | | AUTOGATING | | | | |

| Bits | Field Name | Description | Type | Reset |
|------|------------------|--|------|-----------|
| 31:9 | RESERVED | Reserved | R | 0x0000000 |
| 8 | CLOCKACTIVITYOCP | OCP Clock activity when module is in IDLE mode (during wake up mode period) 0x0: OCP Clock can be switch-off 0x1: OCP Clock is maintained during wake up period | RW | 0 |
| 7:5 | RESERVED | Reserved | R | 0x0 |
| 4:3 | SIDLEMODE | Slave interface power management (IDLE req/ack control) 0x0: FORCE Idle. IDLE request is acknowledged unconditionally and immediately (Default <i>Dumb</i> mode for safety) 0x1: NO idle. IDLE request is never acknowledged. 0x2: SMART Idle. The acknowledgment to an IDLE request is given based on the internal activity. 0x3: Reserved - do not use | RW | 0x2 |
| 2 | RESERVED | Reserved | R | 0 |
| 1 | SOFTRESET | Module software reset This bit is automatically reset by hardware (During reads, it always returns 0.) It has same effect as the OCP hardware reset. 0x0: Normal mode 0x1: Start soft reset sequence. | RW | 0 |
| 0 | AUTOGATING | Internal OCP clock gating strategy (no module visible impact other than saving power) 0x0: OCP clock is free-running 0x1: Automatic internal OCP clock gating strategy is applied based on the OCP interface activity. | RW | 1 |

16.6 On-Chip Memory (OCM) Subsystem

16.6.1 OCM Subsystem Overview

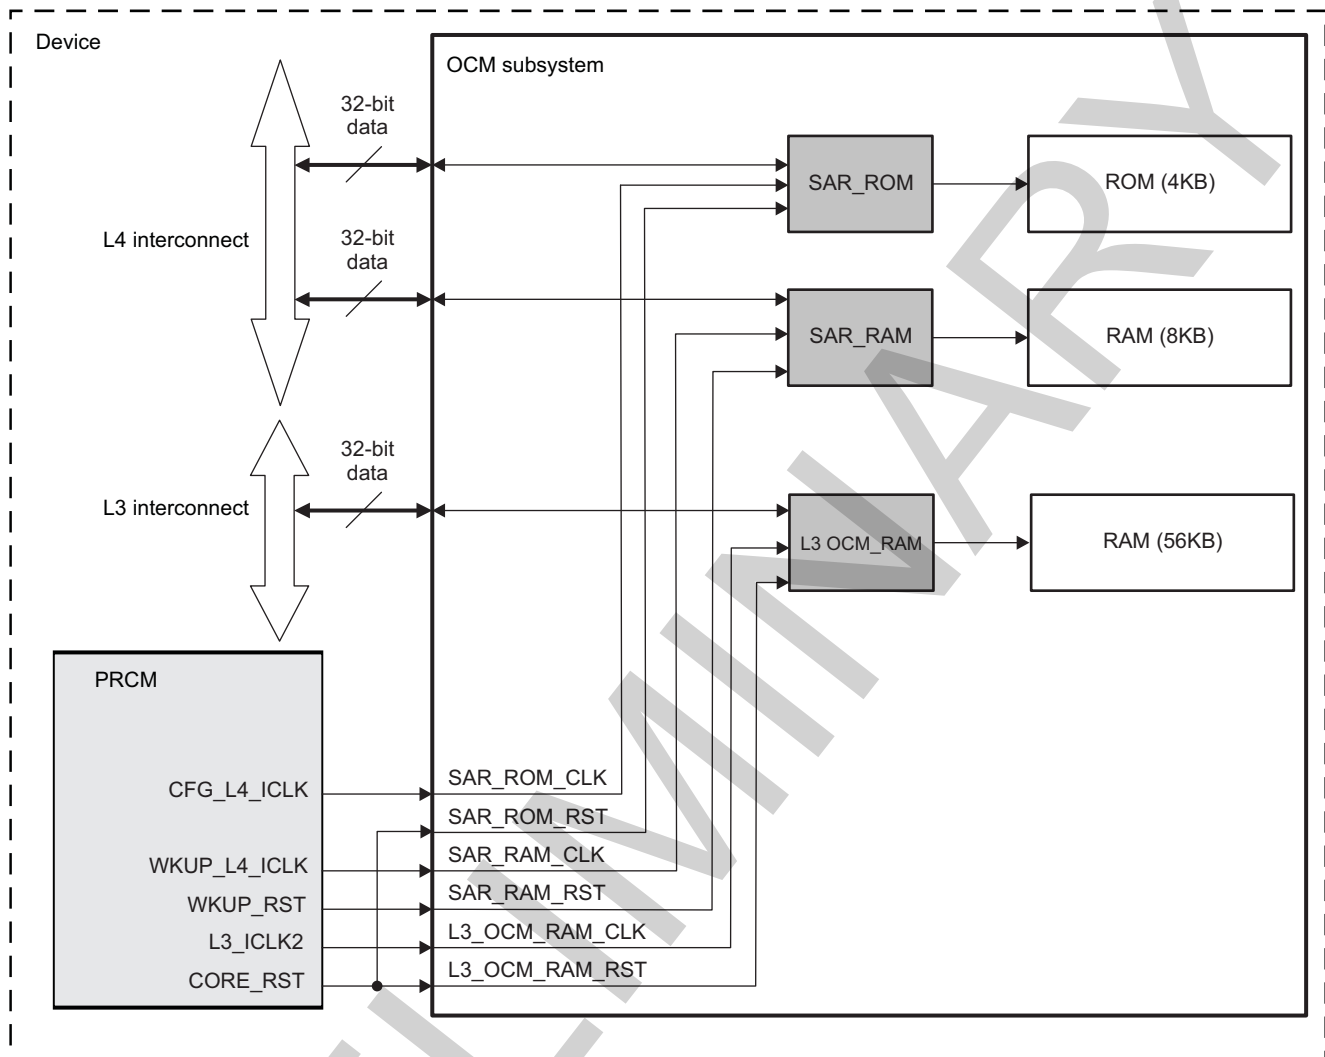

There are three on-chip memories in the device.

- A 4K-byte SAR read-only memory (ROM)
- A 8K-byte SAR random-access memory (RAM)
- A 56K-byte L3 static random-access memory (L3 OCM_RAM)

There are other on-chip memories located inside other subsystems (Cortex-A9 MPU, DSP IVA-HD, ABE, Cortex-M3 MPU) that are not described in the following sections. Refer to each subsystem chapter for more details.

16.6.2 OCM Subsystem Integration

[Figure 16-101](#) shows the integration of the OCM subsystem to the device.

Figure 16-101. OCM Subsystem Integration to the Device

16.6.3 OCM Subsystem Functional Description

16.6.3.1 SAR ROM

This on-chip ROM contains 4K bytes of memory and a linked list of descriptors used by the system DMA (sDMA) during the restore context operation (when device transitions from OFF to ON modes).

The device-embedded SAR ROM has the following characteristics:

- 4K-bytes ROM
- 32-bit access per cycle
- Support for single and burst access transactions

The memory space of the embedded ROM starts at 0x4A05 E000 and ends at 0x4A05 FFFF (8K bytes are reserved, but only 4K bytes are used).

16.6.3.2 SAR RAM

The on-chip SAR RAM contains 8K bytes and is mapped as 4 blocks with irregular region sizes. This memory content is preserved when the device goes into OFF mode (as long as the wake-up voltage domain remains supplied). It is used as context-saving memory to be written by the software, so that the sDMA restores its saved content when the device transitions from OFF to ON mode. Locations not used by the sDMA can be used as a scratch-pad memory by the software. It is mapped on the wake-up voltage domain.

The device-embedded SAR RAM has the following characteristics:

- Support for single-access transactions
 - Operates at full L4-PER interconnect clock frequency
 - 32-bit access per cycle

The SAR RAM space is at the following location:

- SAR space 1 (4KB): Starts at 0x4A32 6000 and ends at 0x4A32 6FFF

- SAR space 2 (1KB): Starts at 0x4A32 7000 and ends at 0x4A32 73FF
- SAR space 3 (2KB): Starts at 0x4A32 8000 and ends at 0x4A32 87FF
- SAR space 4 (1KB): Starts at 0x4A32 9000 and ends at 0x4A32 93FF

16.6.3.3 L3 OCM_RAM

The on-chip L3 OCM_RAM contains 56K bytes of RAM, partitioning is defined by the L3 firewall logic. The device-embedded L3 OCM_RAM has the following characteristics:

- Support for single and burst access transactions:
 - Operates at full L3 interconnect clock frequency
 - Fully pipelined, one 32-bit access per cycle
- Restricted access support based on:
 - A region-based partitioning (refer to L3 firewall description)
 - The module owner of the access, with respect to its read and write permissions to that region
 - The transaction attributes of the access, with respect to the region permission properties. See [Section 14.2, L3 Interconnect](#) for details.

The memory space of the embedded RAM starts at 0x4030 0000 and ends at 0x4030 DFFF.

This chapter describes the system direct memory access (sDMA) module.

| Topic | Page |

| 17.2 sDMA Controller Environment | 3380 |
| 17.3 sDMA Module Integration | 3382 |
| 17.4 sDMA Functional Description | 3387 |
| 17.5 sDMA Basic Programming Model | 3422 |
| 17.6 sDMA Register Manual | 3431 |

17.1 sDMA Module Overview

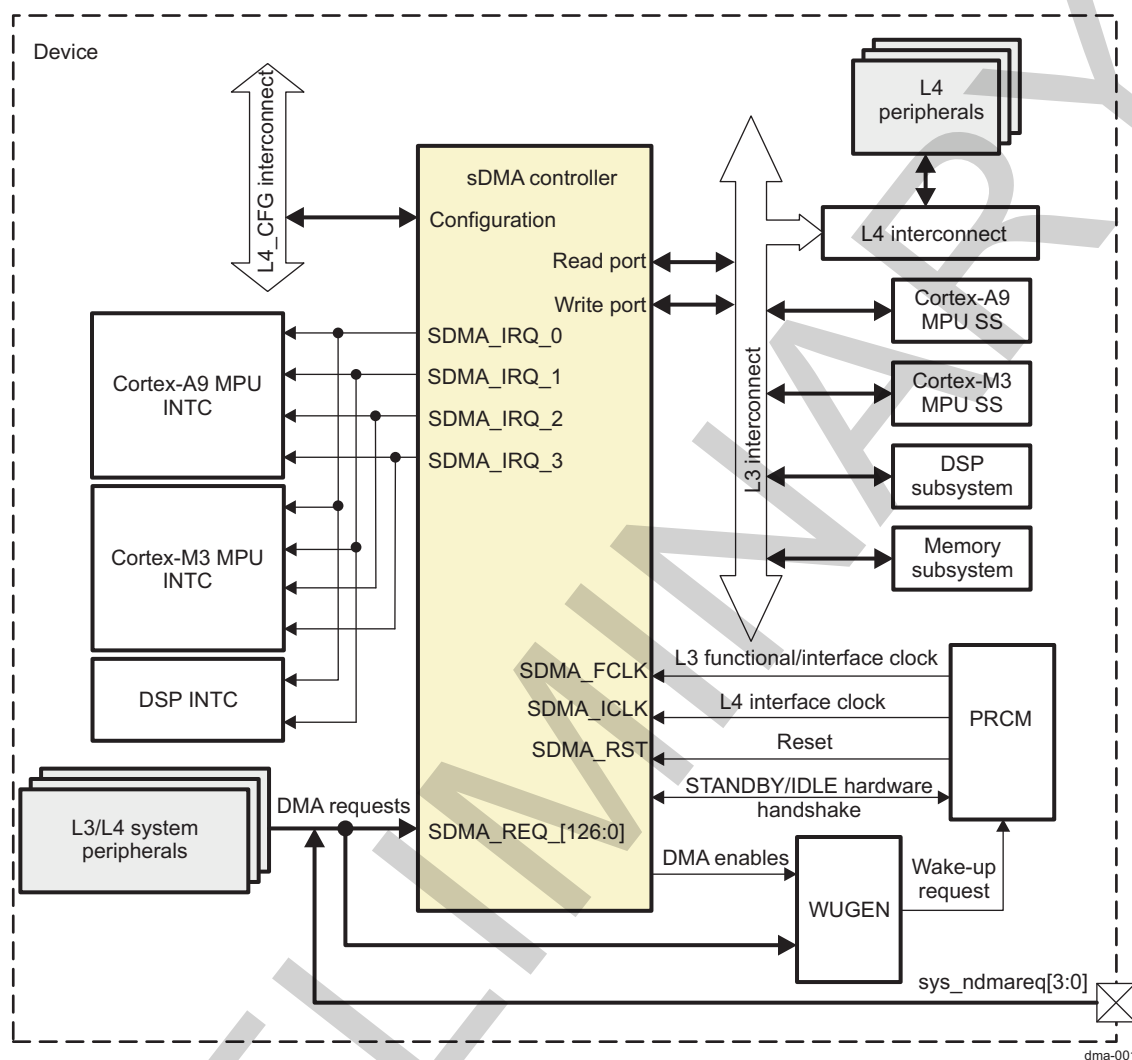

The system direct memory access (sDMA) module, also called DMA4, performs high-performance data transfers between memories and peripheral devices without microprocessor unit (MPU) or digital signal processor (DSP) support during transfer. A DMA transfer is programmed through a logical DMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

The DMA controller includes the following main features:

- Data transfer support in either direction between:
 - Memory and memory
 - Memory and peripheral device
- 32 logical DMA channels supporting:
 - Multiple concurrent transfers
 - Independent transfer profile for each channel
 - 8-bit, 16-bit, or 32-bit data element transfer size
 - Software-triggered or hardware-synchronized transfers
 - Flexible source and destination address generation
 - Burst read and write
 - Chained multiple-channel transfers
 - Endianism conversion
 - Draining
 - Linked-list support for descriptor types 1, 2, and 3
- First-come, first-serve DMA scheduling with fixed priority
- Up to 127 DMA requests
- Constant fill
- Transparent copy
- Four programmable interrupt request output lines
- FIFO depth: 256 × 64-bit
- Data buffering
- FIFO budget allocation
- Power-management support
- Auto-idle power-saving support
- Implementation of retention flip-flops (RFFs) to support dynamic power switching (DPS) between system power modes without MPU involvement. For more information about DPS, see [Section 3.1.2.3, Dynamic Power Switching](#), in [Chapter 3, Power, Reset and Clock Management](#).

Figure 17-1 shows an overview of the sDMA module.

Figure 17-1. sDMA Overview

The sDMA module has three ports: one read, one write, and one configuration port, and provides multiple logical channel support. A dynamically allocated FIFO queue memory pool provides buffering between the read and write ports, which are multithreaded (two threads for the write port and four threads for the read port); this means that each transaction is flagged by a thread ID (0, 1, 2, or 3) in the request direction and in the response direction. This allows the read port to have four outstanding requests at a time. The write port has two threads available.

The MPU (or DSP) configures the sDMA through the L4_CFG interconnect.

17.2 sDMA Controller Environment

The sDMA controller supports external DMA requests through the sys_ndmareq[3:0] pins (see [Table 17-1](#)). A logical channel can be configured to respond to an external synchronization request.

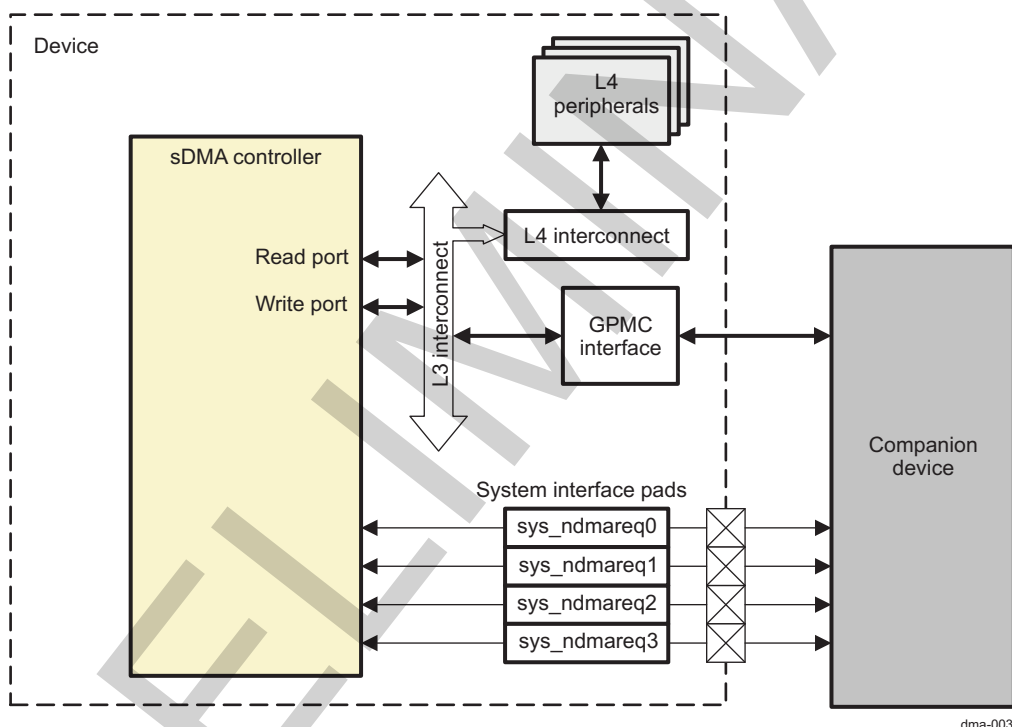

Table 17-1. External sDMA Request Signals

| Signal Name | I/O ⁽¹⁾ | Description | Reset Value |
|--------------|--------------------|---|-------------|
| sys_ndmareq0 | I | External DMA request 0 (system expansion) | Z |
| sys_ndmareq1 | I | External DMA request 1 (system expansion) | Z |
| sys_ndmareq2 | I | External DMA request 2 (system expansion) | Z |
| sys_ndmareq3 | I | External DMA request 3 (system expansion) | Z |

⁽¹⁾ I = Input, O = Output

[Figure 17-2](#) shows an example of how to use the external hardware DMA request pins in the sDMA environment.

Figure 17-2. Example of External DMA Requests Use

An external device can use the external DMA request pins to start a logical channel transfer over the general-purpose memory controller (GPMC) interface. The transfer can be a memory-to-memory transfer in which the source memory is in the external device.

By default, the external DMA request signals are not available on external pins after a cold reset. For more information about multiplexing out the four signal lines to pins, see [Chapter 19, Control Module](#).

All 127 DMA request lines are transition-sensitive.

For a transition-sensitive DMA request (see [Figure 17-3](#)), the line must be maintained low (asserted) until the first DMA access is complete, after which the line must be maintained high (deasserted) for more than one clock cycle (DMA_L3_ICLK):

- When the deassertion time is less than one clock cycle, the sDMA may not detect the deassertion.
- When the channel is enabled one cycle after a DMA request is disabled, the channel detects the DMA request and starts the corresponding transfer.
- When the channel is enabled two cycles after the DMA request is disabled, the channel does not

detect the DMA request.

Figure 17-3. Transition-Sensitive DMA Request Scheme

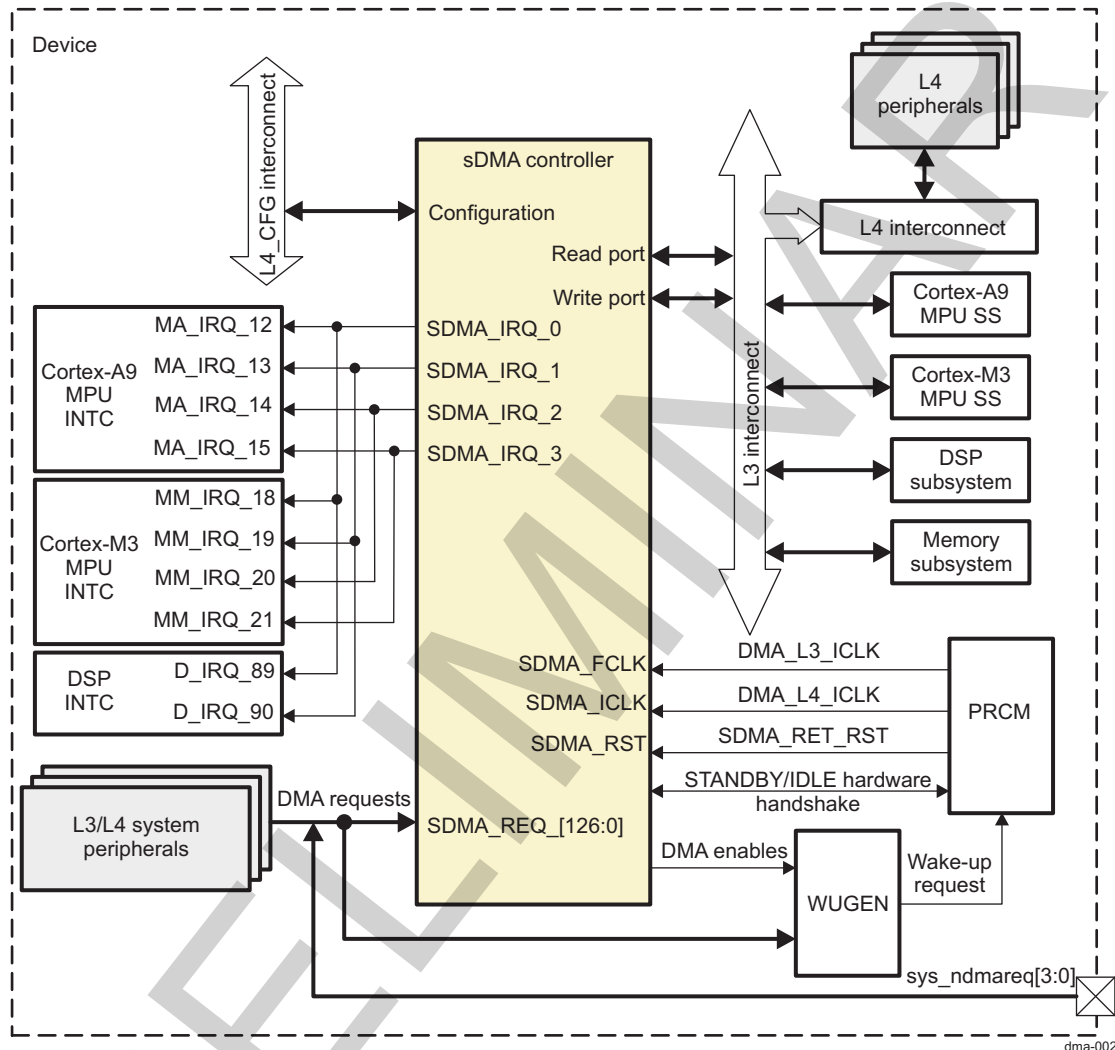

17.3 sDMA Module Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests.

Figure 17-4 shows the sDMA controller integration.

Figure 17-4. sDMA Controller Integration

NOTE: For more information about the wake-up generator (WUGEN), the STANDBY/IDLE hardware handshake, and the wake-up request, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 17-2 through Table 17-4 summarize the integration of the module in the device.

Table 17-2. Integration Attributes

| Module Instance | Attributes | |
|-----------------|--------------|---------------|
| | Power Domain | Interconnect |
| sDMA | PD_CORE | L3 and L4_CFG |

Table 17-3. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|--|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| sDMA | SDMA_FCLK | DMA_L3_ICLK | PRCM | Functional clock for all internal logic and for the two master read and write ports. For information about the power, reset, and clock management (PRCM) clock gating and management, see Chapter 3, Power, Reset, and Clock Management . |
| | SDMA_ICLK | DMA_L4_ICLK | | Interface clock. It supports the configuration port. For information about PRCM clock gating and management, see Chapter 3, Power, Reset, and Clock Management . |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| sDMA | SDMA_RST | SDMA_RET_RST | PRCM | Hardware reset. It initializes all internal logic of the sDMA module, all global registers, and some of the per-channel registers, implemented in flip-flops. However, all remaining per-channel registers are memory-based, and, therefore, are not reset (have undefined values). Thus, when programming a channel for the first time, all bits that have undefined reset values must be configured before enabling the channel. For information about PRCM reset sources and distribution, see Chapter 3, Power, Reset, and Clock Management . |

Table 17-4. Hardware Requests

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|---------------------|--|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| sDMA | SDMA_IRQ_0 | MA_IRQ_12 | Cortex™-A9 MPU INTC | sDMA interrupt request 0. For information about the Cortex-A9 MPU INTC, see Section 18.3.2 . |
| | SDMA_IRQ_1 | MA_IRQ_13 | Cortex-A9 MPU INTC | sDMA interrupt request 1 |
| | SDMA_IRQ_2 | MA_IRQ_14 | Cortex-A9 MPU INTC | sDMA interrupt request 2 |

17.4 sDMA Functional Description

The sDMA module provides high-performance data transfers between memories and peripheral devices with low processor use. A DMA transfer is programmed through a logical DMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

Figure 17-5 shows the sDMA controller top-level block diagram.

Figure 17-5. sDMA Controller Top-Level Block Diagram

dma-005

17.4.1 sDMA Controller Power Management

Table 17-6 describes power-management features available for the sDMA controller.

NOTE:

- For information about source clock gating and sleep/wake-up transitions, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For a description of the EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 17-6. Local Power-Management Features

| Feature | Registers | Description |
|------------------------|--|---|
| Clock auto gating | DMA4_OCP_SYSCONFIG [0] AUTOIDLE bit | This bit allows local power optimization inside the module by gating the SDMA_ICLK clock upon the interface activity. |
| Slave idle modes | DMA4_OCP_SYSCONFIG [4:3] SIDLEMODE bit field | Force-idle, no-idle, and smart-idle modes are available. |
| Clock activity | DMA4_OCP_SYSCONFIG [9:8] CLOCKACTIVITY bit field | For configuration details, see Table 17-7 . |
| Master standby modes | DMA4_OCP_SYSCONFIG [13:12] MIDLEMODE bit field | Force-standby, no-standby, and smart-standby modes are available. |
| Global wake-up enable | N/A | Feature not available |
| Wake-up sources enable | N/A | Feature not available |

[Table 17-7](#) lists the clock states in accordance with the state of the module.

Table 17-7. Clock Activity Settings

| SDMA_CLOCKACTIVITY Values | Clock State When Module is in IDLE State | |
|---------------------------|--|-----------|
| | SDMA_ICLK | SDMA_FCLK |
| 00 | Off | Off |
| 10 | Off | On |
| 01 | On | Off |
| 11 | On | On |

CAUTION

Because the PRCM module cannot read CLOCKACTIVITY settings through hardware, software must ensure consistent programming between the SDMA_CLOCKACTIVITY and sDMA clock PRCM control bits. For a description of the ClockActivity feature, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

17.4.2 sDMA Controller Interrupt Requests

DMA4 has four interrupt lines (L_j, where j = 0, 1, 2, 3). Each logical channel can request an interrupt over any line. The attachment of a channel interrupt event to one of these four external lines is programmable. Software determines whether it attaches a channel interrupt to a single interrupt request (IRQ) line or to multiple IRQ lines.

There are two different registers per interrupt line:

- The [DMA4_IRQSTATUS_Lj](#) CH_31_0_Lj field shows the status of the different sources of interrupt. If the [DMA4_IRQENABLE_Lj](#) bit is 1, channel *i* is the source of interrupt in line *j*. In contrast to the [DMA4_CSRi](#) registers, the [DMA4_IRQSTATUS_Lj](#) registers are updated regardless of the corresponding bits in the [DMA4_IRQENABLE_Lj](#) registers.
- The [DMA4_IRQENABLE_Lj](#) CH_31_0_Lj_EN field masks/unmasks the channel interrupt. If the [DMA4_IRQENABLE_Lj](#) bit is set to 0, channel interrupt *i* of the line *j* is masked.

Each logical channel can generate a number of different interrupt events when enabled (that is, set to 1) in the [DMA4_CICRi](#) register. Each status bit is updated in the [DMA4_CSRi](#) register only when the corresponding enable bit is enabled in the [DMA4_CICRi](#) register.

To determine an interrupt source when an interrupt rises on an interrupt line L_j:

- Identify the channel (LCH_i) generating the interrupt.
Read [DMA4_IRQSTATUS_Lj](#).LCH_i (LCH₀ to LCH₃₁). If LCH_i = 1, channel *i* is the originator of the interrupt.

- Identify the interrupt event.
Read the LCHi [DMA4_CSRi](#). For example, if the drop event (the [DMA4_CSRi\[1\]](#) DROP bit) is 1, a request collision occurs.
The interrupt event status bit in the [DMA4_CSRi](#) register is immediately reset after it is written to 1.
The interrupt status bit in the [DMA4_IRQSTATUS_Lj](#) register is cleared after it is written to 1.

17.4.2.1 Interrupt Generation

The sDMA module has four interrupt request output lines, SDMA_IRQ_0 to SDMA_IRQ_3. One or more logical channels can be programmed to generate an interrupt request on any of these lines when any one of the maskable DMA events listed in [Table 17-8](#) occurs.

Table 17-8. Logical DMA Channel Events

| Event | Description |
|------------------------------|---|
| End of packet | A packet transfer completed. |
| End of block | A block transfer completed. |
| End of frame | A frame transfer completed. |
| End of super block | A super block transfer completed. |
| Half of frame | Half of the current frame transferred. |
| Start of last frame | The first element of the last frame transferred. |
| Transaction error | A transaction error is returned by the interconnect in either the read or write port. |
| Address error | An attempt was made to perform a DMA access to an address not aligned on an ES boundary. Condition to occur: if DMA4_CEN[23:0] CHANNEL_ELMNT_NBR = 0x000000 or DMA4_CFN[15:0] CHANNEL_FRAME_NBR = 0x0000 or DMA4_CSDP[1:0] DATA_TYPE = 0x3. |
| Supervisor transaction error | An error occurred, for example, when an unauthorized initiator (that is, not a supervisor) tries to use a supervisor transfer. |
| Drain end | Drain is completed (DMA4_CCRi[10] WR_ACTIVE becomes 0). |
| Drop error | A drop event interrupt is generated when a DMA request is being serviced while a second one is asserted and a third one arrives before the second DMA request is serviced. |

The logical DMA channels that generate an interrupt on a particular IRQ output are specified through the [DMA4_IRQENABLE_Lj](#) register (where *j* is the IRQ number: 0, 1, 2, or 3). The events that generate an interrupt for a particular channel can be configured through the channel [DMA4_CICRi](#) register.

When an interrupt is detected, the logical DMA channel generating the event can first be identified by reading the [DMA4_IRQSTATUS_Lj](#) register. The event causing the interrupt then can be identified by reading the interrupt status through the relevant DMA channel [DMA4_CSRi](#) register.

17.4.3 Logical Channel Transfer Overview

As [Figure 17-5](#) shows, the sDMA module has one read port and one write port operating independently of one another. Buffering is provided between the read and write ports through a FIFO queue memory pool that is shared dynamically between the active logical channels.

- Logical channel synchronization
A logical channel is described as hardware-synchronized when the DMA transfers are triggered by DMA requests from a hardware device. Alternatively, a logical channel is described as nonsynchronized when the DMA transfer is triggered by software.
- Logical channel activation
A logical channel becomes active as follows:
 - For hardware-synchronized transfers, when the logical channel is enabled and the hardware DMA request line is asserted
 - For software-triggered (nonsynchronized) transfers, as soon as software enables the logical channel
- Logical channel transfer composition

A DMA transfer is divided automatically into a number of transactions. Depending on the logical channel context configured, the transfer size, start address alignment, addressing mode, and configured maximum burst size, each transaction can be a single access or a burst of accesses.

- Logical channel scheduling

When several logical channels are active at the same time, schedulers manage the read and write ports. The scheduling of logical channel transfers is similar for both read and write ports. When a logical channel becomes active, it is added to the end of a scheduling queue. If more than one logical channel becomes active at the same time, the one with the lower number is queued first. This mechanism provides a first-come, first-serve scheduling scheme between the concurrently active logical channels.

In addition, each read and write port has a high-priority queue and a low-priority queue. The priority bits (WRITE_PRIORITY and READ_PRIORITY) in the logical channel [DMA4_CCRi](#) register determine whether a logical channel is queued as high or low priority. A software-configurable 8-bit priority counter gives weighting to the priority write queue. For every N (1 to 255) schedules from the priority write queue, one is scheduled from the regular write queue. A channel that is scheduled goes to the end of the queue after it completes its turn on the port. The relative weighting of the scheduling of the high-priority queue to the low priority queue is programmable from 1:1 to 1:256 through the DMA global channel register using the [DMA4_GCR\[23:16\]](#) ARBITRATION_RATE bit field.

NOTE: The [DMA4_GCR\[23:16\]](#) ARBITRATION_RATE bit field does not depend on the [DMA4_GCR\[13:12\]](#) HI_THREAD_RESERVED bit field. The ARBITRATION_RATE bit field depends on the [DMA4_CCRi\[26\]](#) WRITE_PRIORITY bit and the [DMA4_CCRi\[6\]](#) READ_PRIORITY bit.

- Read/write port access scheduling policy

When either the read or write port becomes available, the port access scheduler selects the next logical channel for which to perform a DMA transaction from either the high- or low-priority queue.

When the current DMA transaction (single or burst access) is complete and the full DMA transfer is not finished, the logical channel returns to the end of the queue. Because the port access scheduling is on a per-transaction basis, a logical channel can be queued repeatedly this way several times during its block transfer.

The sDMA module can have up to four outstanding read transactions and two outstanding write transactions in the system interconnect; four read and two write thread IDs exist. For an arbitration cycle to occur, these two conditions must be met:

- At least one channel is requesting
- At least one free thread ID is available

On an arbitration cycle, the scheduler grants the highest priority channel that has an active request, allocates the thread ID, and tags this thread as busy. At a given time, a channel cannot be allocated for more than one thread ID.

NOTE: If more than one channel is active, each channel is given a thread ID for the current service only, not for the whole channel transfer.

When only one channel is enabled, only one thread is allocated for the channel. In such a situation the channel can have a maximum of four outstanding commands (without getting the responses) without rescheduling the channel at the end of each transaction. Each command can be either single access (8-bit, 16-bit, or 32-bit) or burst access ($2 \times M$, $4 \times M$, $8 \times M$, or $16 \times M$, where M can be 8, 16, or 32 bits).

When nonburst alignment is at the beginning of the transfer, the channel is rescheduled for each smaller access until burst-aligned. When the end of the transfer is not burst-aligned, the channel is rescheduled for each of the remaining smaller accesses.

For a logical channel transfer completion, when the last access is written to the destination, the logical channel becomes inactive. If enabled, an interrupt request is generated (see [Section 17.4.2.1, Interrupt Generation](#)).

17.4.4 FIFO Queue Memory Pool

A FIFO queue memory pool provides buffering between the read and write ports. The hardware allocates the space dynamically to a number of FIFO queues, and each queue is associated with an active logical channel.

To avoid a memory pool overflow, if there are fewer entries in the FIFO queue memory pool than are required for the maximum configured source burst size of the next logical channel to be scheduled, the logical channel is returned to the end of the queue, and the port access scheduler continues to search the queue until it finds a logical channel that can be scheduled.

The maximum FIFO depth that can be allocated to each individual logical channel can be limited globally through the [DMA4_GCR\[7:0\] MAX_CHANNEL_FIFO_DEPTH](#) bit field. This value should be configured to allow a fair allocation of the memory pool between the active channels.

A logical channel is scheduled if it has not yet reached its allocation limit, even if the access to be performed will exceed this limit. This means that the effective number of entries used by a particular logical channel is limited to the configured maximum entries per channel plus the channel maximum configured burst size (in words) 1.

17.4.5 Addressing Modes

A DMA transfer block consists of a number of frames (FN). Each frame consists of a number of elements (EN), and each element can have a size of 8, 16, or 32 bits (ES), as follows:

$$\text{transfer block size} = \text{FN} \times \text{EN} \times \text{ES}$$

The FN, EN, and ES are common for the source and destination. However, the way in which the data is represented (addressing profile/mode) is independently programmable for the source and destination devices, using one of these four addressing modes:

- Constant: The address remains the same for consecutive element accesses.
- Post-increment: The address increases by the ES, even across consecutive frames.
- Single-index: The address increases by the ES plus the element index (EI) value minus 1 (even across consecutive frames).
- Double-index: The address increases by the ES plus the EI value minus 1 within a frame. When a full frame is transferred, the address increases by the ES plus the frame index (FI) value minus 1.

The ES, EI, and FI values are expressed in bytes. The EI and FI values can be positive or negative.

When calculating the EI and FI values, it is critical to note that, after an element is accessed, the logical channel address pointer equals the address of the last byte (highest address) of the accessed element. The correct value for the EI or FI must be such that, when added to the logical channel address pointer, it results in the address of the first byte (lowest address) of the next element to be accessed.

The EI and FI values must be configured so that the address of each element in the transfer is aligned on an ES boundary.

Consequently, the single-index addressing mode with EI = 1 or double-index addressing mode with EI = 1 and FI = 1 is equivalent to post-increment addressing.

NOTE: The source and destination start addresses must also be aligned on an ES boundary.

When the address of an element to be accessed is not aligned on an ES boundary, the transfer is stopped and a misaligned address error interrupt occurs, if enabled (see [Section 17.4.2.1, Interrupt Generation](#)).

The [DMA4_CFNi](#) register configures the FN in a block.

The [DMA4_CENi](#) register configures the EN.

The [DMA4_CSDPi](#) register configures the ES.

The [DMA4_CSSAi](#) and [DMA4_CDSAi](#) registers configure the source and destination start addresses.

The [DMA4_CCRi](#) register configures the source and destination addressing modes.

The [DMA4_CSEIi](#), [DMA4_CSFIi](#), [DMA4_CDEIi](#), and [DMA4_CDFIi](#) registers configure the source EI, source FI, destination EI, and destination FI, respectively.

The addressing profiles are expressed as equations as follows:

Equation 1. Constant addressing:

$$A(n + 1) = A(n)$$

Note: Constant addressing mode with DMA4 to/from DDR memory is not supported on the OMAP4470 device.
To fill DDR memory with a single value, the constant fill feature of DMA4 must be used instead of a constant addressing mode transfer.

Equation 2. Post-increment addressing:

$$A(n + 1) = A(n) + ES$$

Equation 3. Single-indexed addressing:

$$A(n + 1) = A(n) + ES + (EI - 1)$$

Equation 4. Double-indexed addressing:

When not at the end of a frame or transfer (that is, when the element counter $\neq 0$):

$$A(n + 1) = A(n) + ES + (EI - 1)$$

When at the end of a frame but not at the end of the transfer (that is, when the element counter = 0 and the frame counter $\neq 0$):

$$A(n + 1) = A(n) + ES + (FI - 1)$$

Calculate the element and frame index as follows:

Equation 5. Element index

$$EI = [(Stride\ EI - 1) \times ES] + 1$$

Equation 6. Frame index

$$FI = [(Stride\ FI - 1) \times ES] + 1$$

where:

$A(n)$: Byte address of the element n within the transfer.

ES is in bytes, ES{1, 2, 4}.

EI is in bytes, specified in a configuration register, 32768 EI 32767.

Stride EI: The difference in the number of elements between the start of the current element n to the start of next element, $n + 1$.

Element counter: A counter that is (re)initiated with the number of elements per frame or per transfer. Decreased by 1 for each element transferred. The initial value is configured in the register DMA channel element number, [DMA4_CENi](#).

FI is in bytes, specified in a configuration register, 2147483648 FI 2147483647.

Stride FI: The difference in the number of elements between the start of the last element of the current frame and the beginning of the first element of the next frame.

Frame counter: A counter that is (re)initiated with the FN per transfer. Decreased by 1 for each frame transferred. The initial value is configured in the register DMA channel frame number, [DMA4_CFNi](#).

[Figure 17-6](#) shows how a stride EI and FI are defined. When handling complex configurations, using strides can make it easier to calculate EI and FI because you can calculate in elements instead of bytes. (This approach is used in the 90-degree clockwise image rotation example shown in [Figure 17-10](#).) The double-index addressing example shown in [Figure 17-6](#) uses ES = 4, EN = 2, EI = 5, FI = 5, and FN = 2.

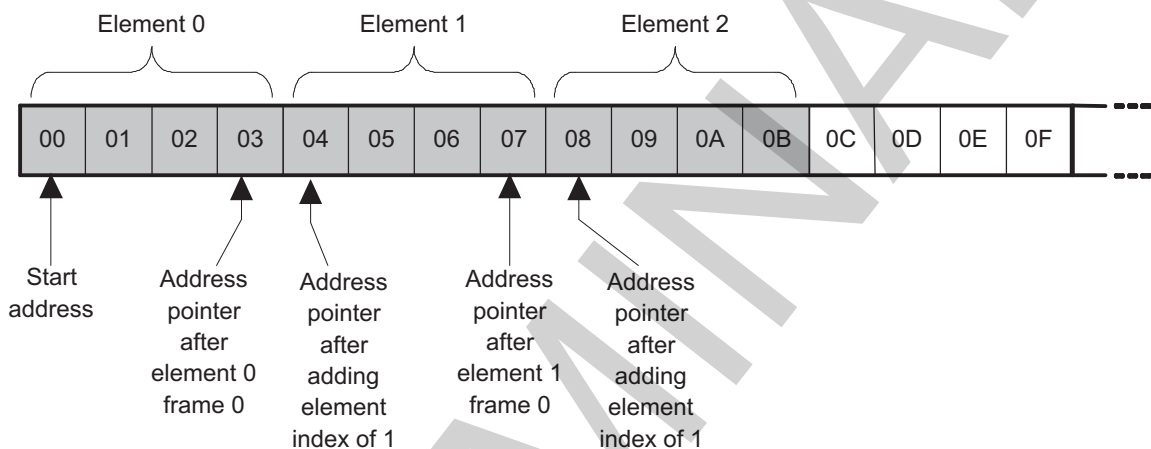

[Figure 17-6](#) through [Figure 17-9](#) show examples of addressing mode configurations. [Table 17-9](#) lists parameter values for the examples.

Figure 17-6. Example Showing Double-Index Addressing, Elements, Frames, and Strides

dma-011

Figure 17-7. Addressing Mode Example (a)

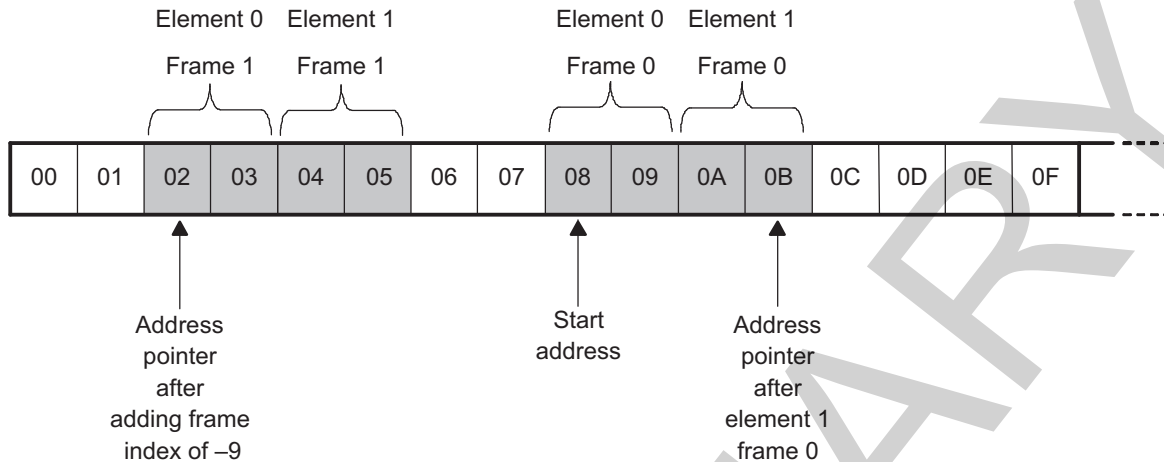

dma-010

Figure 17-8. Addressing Mode Example (b)

dma-009

Figure 17-9. Addressing Mode Example (c)

dma-008

Table 17-9. Parameter Values for Addressing Mode Examples (a), (b), and (c)

| Parameter | Example (a) | Example (b) | Example (c) |
|-----------------|-------------------------------------|--------------|--------------|
| Addressing mode | Single index (or post-increment) | Double index | Double index |
| Start address | 0 | 0 | 8 |
| ES | 4 (32-bit) | 4 (32-bit) | 2 (16-bit) |
| EN | 3 | 2 | 2 |
| EI | 1 | 5 | 1 |
| FN | 1 | 2 | 2 |
| Frame index | N/A | 5 | -9 |

Double indexing can occur on source (read) or destination (write). Equations for rotation of xx degrees on destination are obtained by taking equations for rotation of $(360 - xx)$ degrees on source, and swapping the width (x) and height (y) of the image in them. The opposite is also true. Table 17-10 lists the equations for 90-, 180-, and 270-degree rotations.

Table 17-10. Equations for Rotation

| | | 90-Degree Rotation | 180-Degree Rotation | 270-Degree Rotation |
|--|--------------|--------------------------------------|----------------------------|--------------------------------------|
| Double-indexing on destination (write) | Base address | $ES \cdot (y - 1)$ | $ES \cdot (x \cdot y - 1)$ | $ES \cdot y \cdot (x - 1)$ |
| | EI | $ES \cdot (y - 1) + 1$ | $1 - 2 \cdot ES$ | $1 - ES \cdot (y + 1)$ |
| | FI | $1 - ES \cdot [(x - 1) \cdot y + 2]$ | $1 - 2 \cdot ES$ | $1 + ES \cdot (x - 1) \cdot y$ |
| Double-indexing on source (read) | Base address | $ES \cdot x \cdot (y - 1)$ | $ES \cdot (x \cdot y - 1)$ | $ES \cdot (x - 1)$ |
| | EI | $1 - ES \cdot (x + 1)$ | $1 - 2 \cdot ES$ | $ES \cdot (x - 1) + 1$ |
| | FI | $1 + ES \cdot (y - 1) \cdot x$ | $1 - 2 \cdot ES$ | $1 - ES \cdot [(y - 1) \cdot x + 2]$ |

Table 17-11 and Figure 17-10 show the configuration required to perform a 90-degree clockwise rotation of a 240×160 pixel, 32-bit image. The EI, frame size, and FI values are configured so that the image is rotated line-by-line starting at the left end of the top line.

NOTE: The FI value for the destination is negative so that the first pixel of each subsequent line of the source image is written to the correct location at the destination.

Equation 5 and Equation 6 calculate the destination, EI and FI. The example assumes that the image lines are stored at consecutive addresses in memory, meaning that both EI and FI on the source side are 1.

Rotations:

[Section 17.5.7, 90-Degree Clockwise Image Rotation](#), describes how to program an example of a 90-degree clockwise image rotation.

Observe that:

- One pixel = one element
- One line = one DMA frame
- Pixel size = element size = ES

Table 17-11. Example Parameter Values for a 90-Degree Clockwise Image Rotation

| Parameter | Source Value | Destination Value |
|-----------------------------|-------------------------------------|---|
| Bits per pixel | 32 | 32 |
| ES | 4 | 4 |
| Image width | SW | SH |
| Image height | SH | SW |
| Stride elements (stride EI) | 1 element | SH |
| Stride frames (stride FI) | 1 element | $-(SW-1) \times SH + 1 = 38,241$ elements |
| Start address | 0x100000 | $0x200000 + (SH-1) \times ES = 0x20027C$ |
| EN | SW | SW |
| EI | $[(Stride EI-1) \times ES] + 1 = 1$ | $[(Stride EI-1) \times ES] + 1 = 637$ |
| FN | SH | SH |
| FI | $[(Stride FI-1) \times ES] + 1 = 1$ | $[(Stride FI-1) \times ES] + 1 = 152,967$ |

Figure 17-10. Example of a 90-Degree Clockwise Image Rotation

17.4.6 Packed Accesses

To pack data means to group data to match the bus size, thus optimizing a transfer. When the logical channel ES is less than the DMA module read/write port size, and the addressing profile supports it (post-increment mode or single- or double-index mode with EI = 1), the number of elements to transfer in each read/write port access can be maximized by specifying that the source or destination is packed through the channel [DMA4_CSDPi](#) register. Thus:

- For a read/write port size of 32 bits, the source or destination can be configured as packed for transfer ESs of 8 bits (four elements per access) and 16 bits (two elements per access).

- For a read/write port size of 64 bits, the source or destination can be configured as packed for transfer ESs of 8 bits (eight elements per access), 16 bits (four elements per access), and 32 bits (two elements per access).

Depending on the start address and transfer length, the first or last packed access can be only partially filled. This is indicated to the source or destination using the byte-enable signals.

17.4.7 Burst Transactions

Transfer performance can be improved so that the source or destination and addressing profile supports it. This can be achieved by configuring the logical channel to perform burst transactions consisting of multiple instead of single accesses. The channel can be programmed to use burst sizes equal to 16, 32, or 64 bytes through the [DMA4_CSDPi](#) register, with the read burst size programmable independently of the write burst size. Typically, the optimal burst size is 64 bytes (16 accesses for a 32-bit read/write port size or 8 accesses for a 64-bit read/write port size).

To obtain the maximum benefit from burst transactions, the source and destination start addresses must be aligned with the burst size. If this is not the case, the start of the transfer can consist of a number of smaller (single or burst) transactions until the first burst size boundary is reached.

Similarly, if the end of the transfer is not aligned on a burst size boundary, the final part of the transfer can consist of a number of smaller transactions.

NOTE: If post-incrementing is used, data must be packed to DMA data-port width, to use burst.

17.4.8 Endianism Conversion

The source and destination are each specified as little-endian or big-endian through the [DMA4_CSDPi](#) register for the particular logical channel. If the endianism of the source and destination differ, and if the logical channel ES is less than the sDMA module read/write port size, an endianism conversion is applied to the data before it is written to the destination.

When transferring data between a source and a destination with different endianism, it is important to specify an ES that equals the type of data being transferred to preserve the correct data image at the destination.

In the system, endianism conversion can be performed in more than one place. It is possible to instruct the source and/or destination to lock the endianism (that is, to not perform a conversion) through the logical DMA channel [DMA4_CSDPi](#) register.

NOTE: Because the device is little-endian by construction, the sDMA endianism registers must never be set to big-endian.

If sDMA is used to execute endian conversion by the setting source and destination to different endianism values, it is important to consider that the L3 interconnect also executes endian conversion if the sDMA and the source or destination have a different data bus width.

17.4.9 Transfer Synchronization

A logical channel can be programmed for software-triggered or hardware-synchronized transfers.

17.4.9.1 Software Synchronization

A transfer is software-triggered when the logical channel is set up and started by software. To specify a software-triggered transfer, set the channel DMA [DMA4_CCRi\[4:0\]](#) and [DMA4_CCRi\[20:19\]](#) bit fields to 0. The transfer starts as soon as the DMA [DMA4_CCRi\[7\]](#) bit is set (when it enters the scheduling process).

17.4.9.2 Hardware Synchronization

A transfer is hardware-synchronized if the logical channel activation is driven by hardware requests from the source or destination target. A hardware-synchronized transfer is specified by configuring the DMA request line number in the channel `DMA4_CCRi` register to a value that corresponds to the DMA request line from the source or destination that generates the DMA requests. The DMA request numbers to be configured are specified in the DMA request mapping (see [Table 17-8](#)).

Specify the DMA request number in the `DMA4_CCRi[4:0]` SYNCHRO_CONTROL and `DMA4_CCRi[20:19]` SYNCHRO_CONTROL_UPPER bit fields. After the `DMA4_CCRi[7]` ENABLE bit is set, the logical channel becomes enabled but not activated (it does not enter the scheduling process), which means that channel registers are not updated until the first DMA request is received.

NOTE: The channel synchronization control registers are 1-based. For example, to enable the S_DMA_1 request, the `DMA4_CCRi[4:0]` SYNCHRO_CONTROL bit field must be set to 0x2 (DMA request number + 1).

NOTE: A DMA request line must not be shared between concurrently enabled DMA channels. However, a DMA request line can be shared among several chained logical channels.

For hardware synchronization, the amount of data to be transferred for each assertion of the DMA request line is configured through the frame synchronization (FS) and block synchronization (BS) bits in the logical channel `DMA4_CCRi` register and the `DMA4_CCRi[5]` FS and `DMA4_CCRi[18]` BS bits, respectively.

The amount of data can be any of the following:

- A single element transfer: A complete element defined by data type. For example, 8/16/32 bits are transferred in response to a DMA request.
- A full frame: A complete frame of several elements is transferred in response to a DMA request.
- A full block (a full channel transfer): A complete block of several frames is transferred in response to a DMA request.
- A full packet (a full channel transfer): A complete packet of several elements is transferred in response to a DMA request.

Packets allow the size of each part of the full DMA transfer to be configured independently of the organization of the data to be transferred (typically a number of elements). This can be useful when the source or destination has a buffer (such as a FIFO queue) with a size unrelated to the frame size of the transfer. The packet size then can be set to the size of the buffer.

Packet transfer must be used only where the source or destination is addressed in constant addressing mode, because FI registers are reused to specify the packet size.

To support the burst mode, the logical channel must also be configured in target-port packed access mode.

The packet size is configured based on the `DMA4_CCRi[24]` SEL_SRC_DST_SYNC bit through either the channel `DMA4_CDFli` register (source synchronized) or the `DMA4_CSFl` register (destination synchronized).

When the logical channel transfer block is not an exact multiple of the packet size, the final packet consists of the remaining elements in the transfer, using burst or single accesses to complete the block transfer.

The maximum transfer size, regardless of the packet size, is always as follows:

$$\text{Block_size} = \text{Number_of_Frame_in_Block} \times \text{Number_of_Element_in_Frame} \times \text{Element_Size}$$

- Synchronized at the source

The DMA module optimizes the transfer with respect to the number and size of burst transactions for the given source and destination addressing profiles and configured maximum burst sizes. When writing to the destination is slower than reading from the source, data is buffered in the channel FIFO queue. If the transfer is packet-synchronized at the source, the end-of-packet interrupt is disabled (see [Section 17.4.13, Reprogramming an Active Channel](#)).

For a source synchronized transfer, buffering can be enabled or disabled by setting the [DMA4_CCRi\[25\] BUFFERING_DISABLE](#) bit. For a packet source synchronization with buffering disabled and the packed/burst across the packet boundary, the last packed/burst write transaction is split in optimized smaller accesses to complete the packet transfer size. However, for a packet source synchronized transfer with buffering enabled and with the packed/burst across the packet boundary, the DMA module waits for the next DMA request(s) to read enough data to issue an atomic packed/burst write transaction (assuming that the address is packed/burst aligned).

NOTE: Buffering is not performed between frames, even if it is enabled. If the packed/burst is across the frame boundary, the last packed/burst write transaction is split in optimized smaller accesses to complete the frame transfer size.

- Synchronized at the destination

The performance of a hardware-synchronized transfer can be improved by using the prefetch mode, enabled through the channel [DMA4_CCRi\[23\] PREFETCH](#) bit. Data is prefetched on the read port side before the DMA request received and buffered in the FIFO queue. Up to a full transfer block can be prefetched, although this can be limited by the specified maximum channel FIFO queue depth (see [Section 17.4.4, FIFO Queue Memory Pool](#)).

Buffering disable is not allowed for a destination-synchronized transfer.

NOTE: Behavior is undefined when prefetch is enabled and a transfer is synchronized to the source.

Regardless of whether buffering is enabled, the last transaction in the frame or in the block is write nonposted (WNP) even if the write mode is specified as write last nonposted (WLNP; the [DMA4_CSDPi\[17:16\] WRITE_MODE](#) bit field = 0x2). However, in a packet synchronization mode, the last transaction of each packet in the transfer is WNP only if the buffering disable is on (even if the write mode is specified as WLNP).

Regardless of whether buffering is enabled, the packet interrupt is not generated in the packet source synchronized mode.

CAUTION

The [DMA4_CCRi\[25\] BUFFERING_DISABLE](#) bit must be filled with an allowed value, as specified in [Table 17-12](#).

Table 17-12. Buffering Disable

| | BUFFERING_DISABLE (0: Buffering enable, 1: Buffering disable) | |
|--------------------------|---|-------------|
| Destination synchronized | 0 | Allowed |
| | 1 | Not allowed |
| Source synchronized | 0 | Allowed |
| | 1 | Allowed |

- Synchronized transfer monitoring using CDAC ([DMA4_CDACi](#)):
Context is restored only when the channel becomes active on a DMA request (not at software enable). The channel is software-enabled first, and then a DMA request is asserted followed by the first context restore.
The CDAC register is writable; thus, the CDAC can be initialized to monitor the transfer and determine whether the transfer is started (for more information, see [Section 17.5.4, Synchronized Transfer Monitoring Using CDAC](#)).

NOTE: For 16-bit transactions, start reading from or writing to the least-significant byte (LSByte) first to enable the register update. This is not an issue for 32-bit read-write transactions.

17.4.10 Thread Budget Allocation

When several concurrent channels are latency critical and hardware synchronized, a specific latency cannot be ensured until the target is served. This situation occurs when the number of concurrent channels is greater than the number of available threads.

NOTE: Four threads are available on the read port, and two threads are available on the write port.

For a hardware-synchronized transfer (memory to peripheral), a minimum bandwidth for a latency-critical transfer must be ensured to avoid collisions between two hardware requests.

Because it is latency critical, the software user is responsible for the following:

- Programming the synchronized channel as a high-priority channel
- Reserving one or several threads for high-priority channels

The proposed implementation is as follows (see [Section 17.5.5, Concurrent Software and Hardware Synchronization](#)):

Prevent the regular channel queue from exceeding more than a programmable (3, 2, or 1) number of threads on the read port and no more than one thread on the write port. This number can be set in the global register [DMA4_GCR\[13:12\]](#).

The thread reservation is programmable for maximum use of thread resources for concurrent, low-priority channel transfer. Programmability can also allow a partial throughput control by limiting in software the number of concurrent outstanding requests that break the pipelining.

Depending on the [DMA4_GCR\[13:12\]](#) value, the following threadID on the read/write ports are allocated for a high-priority channel:

Read port priority thread reservation:

- [DMA4_GCR\[13:12\]](#) = 0x0 = No ThreadID is reserved for high-priority channels.
- [DMA4_GCR\[13:12\]](#) = 0x1 = Read ThreadID 0 is reserved for high-priority channels.
- [DMA4_GCR\[13:12\]](#) = 0x2 = Read ThreadID 0 and Read ThreadID 1 are reserved for high-priority channels.
- [DMA4_GCR\[13:12\]](#) = 0x3 = Read ThreadID 0, Read ThreadID 1, and Read ThreadID 2 are reserved for high-priority channels.

Write port priority thread reservation:

- [DMA4_GCR\[13:12\]](#) = 0x0 = No ThreadID is reserved for high-priority channels
- [DMA4_GCR\[13:12\]](#) = 0x1 = Write ThreadID 0 is reserved for high-priority channels.
- [DMA4_GCR\[13:12\]](#) = 0x2 = Write ThreadID 0 is reserved for high-priority channels.
- [DMA4_GCR\[13:12\]](#) = 0x3 = Write ThreadID 0 is reserved for high-priority channels.

Regardless of whether the enabled channels are high priority, only the value of the [DMA4_GCR\[13:12\]](#) setting forces the thread reservation to these values. Set the appropriate value to avoid losing threads using only regular channels.

To have an independent read and write priority context, a per-channel bit ([DMA4_CCRi\[26\]](#)) is added for write priority, and the previous priority bit becomes read priority bit ([DMA4_CCRi\[6\]](#)).

NOTE: The device has one priority bit per logical channel, not one priority bit per port.

17.4.11 FIFO Budget Allocation

To avoid fully occupying the FIFO with a high-priority transfer while low-priority channels wait in the

arbitration queue, two separate FIFO budgets are specified: one for high-priority channels and one for low-priority channels. This is defined in the [DMA4_GCR](#) register, allowing the user to share the FIFO budget between the low- and high-priority channels. The amount of the FIFO allocated by the low- and high-priority channels is fixed by the value set in the [DMA4_GCR\[15:14\] HI_LO_FIFO_BUDGET](#) bit field. The maximum channel FIFO depth is limited by the [HI_LO_FIFO_BUDGET](#) bit field as follows:

If the channel is low priority:

- When [HI_LO_FIFO_BUDGET](#) = 0x1, then low priority cannot exceed 75 percent of the total FIFO.
- When [HI_LO_FIFO_BUDGET](#) = 0x2, then low priority cannot exceed 25 percent of the total FIFO.
- When [HI_LO_FIFO_BUDGET](#) = 0x3, then low priority cannot exceed 50 percent of the total FIFO.

If channel is high priority

- When [HI_LO_FIFO_BUDGET](#) = 0x1, then high priority cannot exceed 25 percent of the total FIFO.
- When [HI_LO_FIFO_BUDGET](#) = 0x2, then high priority cannot exceed 75 percent of the total FIFO.
- When [HI_LO_FIFO_BUDGET](#) = 0x3, then high priority cannot exceed 50 percent of the total FIFO.

The user must perform the following equation:

- For a high-priority channel: $(\text{Per_Channel_Maximum FIFO Depth} + 1) \times \text{Number of High Channel} = \text{High Budget FIFO}$
- For a low-priority channel: $(\text{Per_Channel_Maximum FIFO Depth} + 1) \times \text{Number of Low Channel} = \text{Low Budget FIFO}$

NOTE: Ensure that *Number of High Channel* means *Number of Active High-Priority Channel* and that *Number of Low Channel* means *Number of Active Low-Priority Channel*.

17.4.12 Chained Logical Channel Transfers

Chaining multiple logical channels permits transfers consisting of multiple parts to be executed without repeated software intervention. This results in better performance than the alternative of software setting up and starting each transfer separately. Each part of a chained transfer can have the data addressed in a different manner that permits the programming of a variety of complex transfers. For example:

- Interlaced video data with one logical channel configured to transfer the even lines and another logical channel configured to transfer the odd lines
- Protocol headers with a separate DMA4 channel configured to transfer each field in the header

Channels can be chained through each channel [DMA4_CLNK_CTRLi](#) register. When the transfer for the first channel completes, the next channel in the chain is enabled. The number of channels in the chain that are configured for hardware-synchronized transfers is flexible (although typically it may be all, none, or simply the first one). The DMA request line number must be set to 0 to specify that any or all channels in a chain are software-triggered or nonsynchronized.

The last channel in a chain can be chained to the first channel to create a continuously looping chain. The continuously looping transfer can be stopped on the fly at a specific channel by disabling the [DMA4_CLNK_CTRLi\[15\] ENABLE_LNK](#) bit. The looping transfer stops after the specified channel transfer completes.

NOTE: A DMA request line must not be shared between concurrently enabled DMA channels. However, a DMA request line can be shared between several chained logical channels.

For more information about the programming model, see [Section 17.5, sDMA Basic Programming Model](#).

17.4.13 Reprogramming an Active Channel

A currently active logical DMA channel can be disabled through the [DMA4_CCRi\[7\] ENABLE](#) bit. When an ongoing transaction completes and the read-active and write-active bits in the [DMA4_CCRi](#) register ([DMA4_CCRi\[9\] RD_ACTIVE](#) and [DMA4_CCRi\[10\] WR_ACTIVE](#)) are reset, the channel can be reprogrammed for a new transfer.

17.4.14 Packet Synchronization

A packet transfer notion is related to the behavior of some peripherals, which have certain buffering capability and must transfer the buffer content once an element number threshold is reached (a hardware DMA request is generated). To associate a frame synchronization to each DMA request is possible, but this limits the maximum transfer size. The maximum transfer size is proportional to the FIFO depth of the peripheral:

$$\text{maximum_transfer_size} = \text{peripheral_FIFO_depth} \times \text{number_of_frame_in_block}$$

The packet synchronization allows to dissociate the transfer size from the FIFO depth of the peripheral. Only constant addressing mode is allowed on a read port or a write port if source target or destination target is packet synchronized, respectively.

Example:

Consider a camera interface with a FIFO_depth of 128 words and a FIFO_element_number_threshold of 128, and a picture to transfer with a size 320 lines by 240 columns. If frame synchronization is associated with each DMA request, then the maximum transfer size that can be performed is 128×2^{16} words. In this case, a frame is 128 words long, which does not fit the size of a line, and it is not possible to generate an interrupt at the end of line. However, by introducing the packet transfer notion, which is related to the peripheral FIFO behavior/structure, the maximum transfer size ($\text{maximum_transfer_size} = 2^{24} \times 2^{16}$ words) is independent of both peripheral_FIFO_depth and FIFO_element_number_threshold. This allows a long-enough transfer within one channel context and rotation operation on a large image format.

The main features of DMA packet transfer are as follows:

- DMA Packet_Data_Size for each DMA request: The Peripheral_element_number_threshold (the number of elements in a packet) shares the **DMA4_CSFI** and **DMA4_CDFI** configuration registers. If the peripheral is the source target, the addressing mode is constant, and the **DMA4_CSFI[15:0]** bit field is used to specify the packet data size in the **DMA4_CSFI** register. The user must set the **DMA4_CCRi[24] SEL_SRC_DST_SYNC** bit to 1. If the peripheral is the destination target, the addressing mode is constant, the **DMA4_CDFI[15:0]** bit field, is used to specify the packet data size (PKT_ELNT_NBR), and the bit field [31:16] is unused. To specify the packet data size in the **DMA4_CDFI** register, the user must set the **DMA4_CCRi[24] SEL_SRC_DST_SYNC** bit to 0.

NOTE: The packet size can be a submultiple or nonsubmultiple of a frame size. If DMA Packet_Data_Size is aligned on the DMA channel block data size boundary, then DMA transfers the last data in the channel block boundary and stops at the block boundary for the last packet DMA request. If the Packet_Data_Size is not aligned on the block boundary, the remaining data smaller than a packet size are transferred using burst or single accesses to complete the block.

- DMA Packet_Data_Transfer does not affect DMA channel capabilities in terms of packing and bursting. The packet synchronization mode is active when **DMA4_CCRi[5] FS = DMA4_CCRi[18] BS = 1**. Then:
 - If **DMA4_CCRi[24] SEL_SRC_DST_SYNC = 0**, the **DMA4_CDFI[15:0]** bit field gives the number of elements in the packet and the **DMA4_CDFI[31:16]** bit field is unused for the packet size.
 - If **DMA4_CCRi[24] SEL_SRC_DST_SYNC = 1**, the **DMA4_CSFI[15:0]** bit field gives the number of elements in the packet and the **DMA4_CSFI[31:16]** bit field is unused for the packet size.

NOTE: The maximum transfer size, regardless of the packet size, is always:

$$\text{Block_size} = \text{Number_of_Frame_in_Block} \times \text{Number_of_Element_in_Frame} \times \text{Element_Size}$$

If DMA channel packet/burst access is across the packet boundary, the DMA hardware automatically splits this packing/burst access into multiple smaller accesses that are aligned on the packet boundary. Otherwise, the DMA transfers data as a usual packing/burst access.

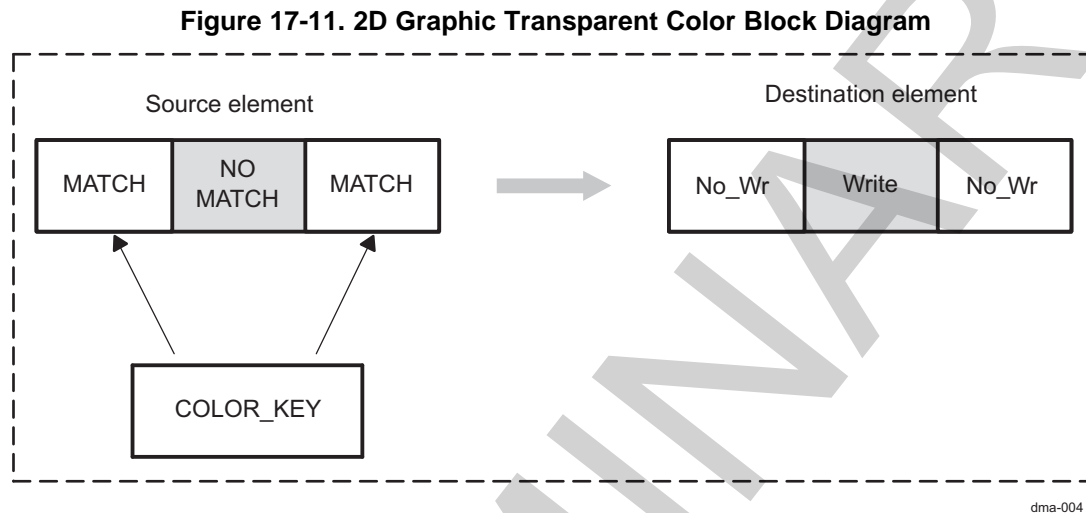

17.4.15 Graphics Acceleration Support

The sDMA supports two graphic acceleration features: transparent copy and constant fill.

Only one of these features at a time can be enabled through the [DMA4_CCRi](#) register for the particular logical DMA channel.

The transparent copy feature enables specification of a particular color through the [DMA4_COLORi](#) register so that when it is recognized in the data from the source, it is not copied to the corresponding location in the destination but instead leaves the data in the corresponding location in the destination as it is.

[Figure 17-11](#) shows the 2-dimensional (2D) graphic transparent color block diagram.

The constant fill feature provides the ability to specify a particular color through the [DMA4_COLORi](#) register for every specified location in the destination. In this case, the transfer consists only of writing to the destination without reading from a source.

Both features support 8, 16, and 24 bpp, depending on what is specified as the DMA transfer ES through the [DMA4_CSDPi](#) register. An ES of 32 bits corresponds to 24 bpp. During a 32-bit (24 bpp) transfer, the 8 most-significant bits (MSBs) ([31:24]) are 0. Both features are compatible with packed and burst transactions.

17.4.16 Supervisor Modes

A logical DMA channel can be configured to operate in supervisor mode through the [DMA4_CCRi](#)[22] SUPERVISOR bit. This must be done using supervisor access. Once a channel is configured in supervisor mode, the channel configuration is protected from nonsupervisor accesses. All DMA transactions on a supervisor channel are supervisor transactions.

17.4.17 Posted and Nonposted Writes

A logical channel can be configured in its [DMA4_CSDPi](#)[17:16] bits to use one of three write access handshake modes for the destination:

- Nonposted write: Each write must complete before transfer can continue or complete.
- Posted write: Transfer continues without waiting for each write to complete (may improve performance with slow devices).
- Posted with final write nonposted: Transfer continues without waiting for each write to complete, but final write completes before transfer can complete.

17.4.18 Disabling a Channel During Transfer

When a channel is disabled during a transfer, the channel undergoes an abort, unless it is hardware-source-synchronized with buffering enabled ([DMA4_CCRi](#)[25] BUFFERING_DISABLE = 0). If this is the case, the FIFO is drained to prevent the loss of data. For more information about this feature, see [Section 17.4.19, FIFO Draining Mechanism](#).

17.4.19 FIFO Draining Mechanism

When a source-synchronized channel is disabled during a transfer, the current hardware request (element/packet/frame/block) service completes and the channel `DMA4_CCRi[9]` `RD_ACTIVE` bit is set to 0, which means the channel is not active on the read port. The remaining data in the corresponding disabled channel FIFO is drained onto the write port and transferred to the programmed destination as in normal transfer.

At the end of the draining the `DMA4_CCRi[10]` `WR_ACTIVE` bit is set to 0 (the channel is no longer active on the write port) and if the `DMA4_CICRi[12]` `DRAIN_END_IE` is set to 1, the `DMA4_CSRI[12]` `DRAIN_END` status bit is updated and an interrupt is generated.

Once a channel is disabled during a transfer, it must wait for the `DMA4_CCRi[9]` `RD_ACTIVE` and `DMA4_CCRi[10]` `WR_ACTIVE` bits to become 0 before being reenabled for a new transfer. The FIFO drain for a channel occurs only in the following cases:

- If the channel is a source-synchronized channel and `DMA4_CCRi[25]` `BUFFERING_DISABLE` = 0 and
- If the channel is not a solid-fill channel and
- If the channel is not a transparent and copy channel and
- If the channel is a hardware, synchronized channel

NOTE: For a self-linked or chain-linked channel, the user must disable the `DMA4_CLNK_CTRLi[15]` `ENABLE_LINK` bit before disabling the channel.

In all other cases, the channel undergoes an abort.

17.4.20 Linked List

17.4.20.1 Overview

The sDMA supports the logical transfer-descriptor loader feature. A transfer descriptor represents a set of values that maps to a set of logical channel configuration registers.

A logical channel transfer descriptor can be loaded by DMA from memories, and then successive transfer descriptors can be autonomously loaded based on a linked-list scheme. This enables DMA4 scatter-gather transfers with minimum MPU support by removing successive channel configuration processing and associated interrupt handling overheads. It also optimizes DMA4 channel resources by enabling efficient transfer serialization on a single logical channel versus concurrent (multiple) logical channel use.

Different types of transfer descriptors are supported (full or partial logical channel configuration registers are set). This optimizes the memory size required for storing a long linked list, because parameter changes are limited to only a few logical channel configuration registers.

17.4.20.2 Link-List Transfer Profile

A linked-list transfer can be seen as a superblock transfer (where the block is composed of FN frames and each frame includes EN elements). The block size ($FN \times EN \times ES$) can be changed in the linked list by loading an updated transfer descriptor.

The end of the super block is signaled in the last descriptor associated with the last block. Generally, for a given link-list transfer, the logical channel is set at the beginning of the transfer and the logical channel configurations for the subsequent blocks are slightly changed. Thus, the descriptor can be limited to an update of only few parameters, such as FN or EN. This assumes that the content of unmodified registers is preserved when a new descriptor is loaded.

A transfer descriptor is composed of a set of channel configuration register values with the addition of the next-descriptor pointer register ([DMA4_CNDPi](#)) and a channel-descriptor parameter register ([DMA4_CDPi](#)). The next-descriptor pointer is the 32-bit address pointer from where the next transfer descriptor is to be loaded. The next-descriptor pointer is mapped depending on the descriptor type (1, 2, or 3).

17.4.20.3 Descriptors

A transfer descriptor is a set of values that maps to a set of logical channel configuration registers. The descriptor contains the parameters associated with a transfer profile (transfer size, source or destination addresses, etc). Four different types of transfer descriptors are supported to optimize the memory size required to store a long linked list and to minimize MPU use to create and maintain the descriptor list.

A transfer descriptor is a list of 32-bit values. A descriptor must be 32-bit aligned in memory. Only the 30 least-significant bits (LSBs) of the next-descriptor address pointer are updated from the descriptor, and the DMA4 forces the 2 LSBs to 0 when the pointer address is generated. The descriptor size is variable, depending on the descriptor type and the `Nxt_Dv` and `Nxt_Sv` bit fields.

Transfer descriptor bit mapping is the same as DMA4 logical-channel configuration register bit mapping, with the following exceptions:

- `Src_Element_index` and `Dst_Element_index` are concatenated in the same 32-bit location.
- [DMA4_CICRi](#) (interrupt event mask)
- CFN (frame number)
- Bit fields:
 - `P`: Corresponds to the `PAUSE_LINK_LIST` bit:
 - When set to 1 in the descriptor, the channel is suspended when the descriptor load completes.
 - The user must not set the `PAUSE_LINK_LIST` bit through the configuration port. Otherwise, behavior is undefined.
 - When set to 0 (through the configuration port) after pause, the linked-list channel resumes its transfer (descriptor load or data load).
 - `B`: Corresponds to the end-of-block enable bit (`BLOCK_IE`) of the [DMA4_CICRi](#) register; valid only for type 3. This value is don't care for descriptor types 1 and 2, where [DMA4_CICRi](#) is fully specified.
 - `Nxt_Dv`, `Nxt_Sv`: Mapped in the [DMA4_CDPi](#) register. They indicate one of the following possibilities:
 - Next descriptor contains an updated destination or source address.
 - Next descriptor does not update the source or destination address, but increments the last source or destination address (from the end of the last transfer).
 - The next source address and/or destination address are the last valid ones in the configuration memory. This means that the corresponding location in the configuration memory is not updated (assuming that they were initialized at least once in the past). This is also called wrapping addressing.
 - `Next_Descriptor_Type`: Specifies the next descriptor type that corresponds to the `NEXT_DESCRIPTOR_TYPE` bit field in the [DMA4_CDPi](#) register

17.4.20.3.1 Type 1

A type 1 descriptor includes the overall channel configuration register value to be loaded (global registers are not part of the type 1 descriptor). This descriptor is used primarily when major changes are required:

- Channel read or write access profiles must be modified; for example, bursting and packing (included in the [DMA4_CSDPi](#) register)
- Attach a new DMA request to the same channel or change the priority or access privilege (included in the [DMA4_CCRi](#) register)
- Enable solid or transparent color fill (included in the [DMA4_CCRi](#) and [DMA4_COLORi](#) registers)
- Enable a channel link (included in the [DMA4_CLNK_CTRLi](#) register)

Table 17-13 shows a type 1 descriptor.

Table 17-13. Type 1

17.4.20.3.2 Type 2

A type 2 descriptor includes the overall logical channel transfer address register and transfer format register to be loaded. This descriptor enables 2D addressing linked-list transfer (for example, a multimedia application where 2D objects are moved in a link). [Table 17-14](#) shows a type 2 descriptor with source and destination address updates. [Table 17-15](#) shows a type 2 descriptor with one source or destination address update.

Table 17-14. Type 2 With Source and Destination Address Updates

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------|---------------------------------|--------|--------|--------|--------|----------------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|-------------------|--------|--------|--------|--------|--------|---|---|---|---|---|---|---|---|---------|---|

17.4.20.3.3 Type 3

A type 3 descriptor is limited to a few logical channel transfer address registers and transfer format registers to be loaded. This descriptor enables simple 1D addressing link transfer (for example, scatter-gather or ping-pong memory movement using a linked list). [Table 17-16](#) shows a type 3 descriptor with source and destination address updates. [Table 17-17](#) shows a type 3 descriptor with one source or address destination update.

Table 17-16. Type 3 With Source and Destination Address Updates

17.4.20.4 Linked-List Control and Monitoring

17.4.20.4.1 Transfer Mode Setting

Four descriptor types are available in the DMA4_CDPi[9:8] TRANSFER_MODE bit field to distinguish the different transfer modes:

- [DMA4_CDPi](#)[9:8] TRANSFER_MODE = 00: The current channel is using normal mode.
- [DMA4_CDPi](#)[9:8] TRANSFER_MODE = 01: The current channel is using link-list channel mode for a type 1, 2, or 3 descriptor.

The reset value is normal mode (DMA4_CDPI[9:8] TRANSFER_MODE = 0).

17.4.20.4.2 Starting a Linked List

Like a nonlinked-list transfer, a link transfer starts under host control by enabling the associated logical channel (set the [DMA4_CCRi\[7\]](#) ENABLE bit to 1). The [DMA4_CDPi\[10\]](#) FAST bit sets the start mode of the link-list transfer:

In nonfast-start mode, the logical channel configuration is fully initialized so that the transfer can start without descriptor loading.

In fast-start mode, the descriptor pointer and other inputs are given. The channel starts by loading the descriptor and then starts the data transfer phase.

17.4.20.4.3 Monitoring a Linked-List Progression

In addition to the [DMA4_CCENi](#) (remaining elements) and [DMA4_CCFNi](#) (remaining frames) registers that are used to monitor the transfer progress, a per-channel register, [DMA4_CCDNi](#) (channel current active descriptor number), monitors which descriptor in the list is active. The user must initialize the [DMA4_CCDNi](#) register to 0 during the initial configuration. When the [DMA4_CCDNi](#) register is updated, the [DMA4_CCFNi](#) and [DMA4_CCENi](#) registers are updated. The user must also initialize the [DMA4_CCFNi](#) and [DMA4_CCENi](#) registers to 0xFFFF and to 0xFFFFFFFF, respectively, to track the effective transfer start of synchronized transfer.

17.4.20.4.4 Interrupt During Linked-List Execution

Any logical channel source of interrupt can be triggered during a linked-list execution, if the interrupt source is enabled during the initial configuration in [CICR](#). The [DMA4_CICRi](#) register can also be updated during the linked-list execution if descriptor types 1 and 2 are used.

The use of an interrupt event in a link execution can be difficult, because the link can progress in parallel with interrupt service routine (ISR) execution. This makes it difficult to synchronize them unless system assumptions are used. The most appropriate synchronization model is to get an interrupt-only on linked-list completion, when the last transfer block completes. This prevents the interrupt from occurring during the link execution. An end-of-superblock interrupt event available in the [DMA4_CICRi](#) and [DMA4_CSRi](#) registers can be enabled at initial configuration or when using descriptor types 1 and 2. To prevent the use of descriptor type 1 or 2 to update BLOCK_IE (full [DMA4_CICRi](#) update), a dedicated BLOCK_IE bit field is also available in a type 3 descriptor.

17.4.20.4.5 Pause a Linked List

When the channel is suspended, it remains enabled.

The pause behaves differently, depending on the transfer mode:

- Normal transfer mode: If the user sets the [DMA4_CDPi\[7\]](#) PAUSE_LINK_LIST bit to 1, the channel completes the current read and write transactions and then suspends the channel. The channel can be resumed by setting the channel [DMA4_CDPi\[7\]](#) PAUSE_LINK_LIST bit to 0.
- Linked-list type 1, 2, or 3 mode: The user must not set the [DMA4_CDPi\[7\]](#) PAUSE_LINK_LIST bit through the configuration port; otherwise, transfer behavior is undefined.

A PAUSE_LINK_LIST bit (P) is set to 1 in the descriptor.

- The channel is suspended after the descriptor load, translation, and configuration memory update are complete.
- The linked list can be resumed by resetting the [DMA4_CDPi\[7\]](#) PAUSE_LINK_LIST bit (through the configuration port).

17.4.20.4.6 Stop a Linked List (Abort or Drain)

The channel can be stopped for a drain or an abort. These cases are exclusive.

17.4.20.4.6.1 Drain

- Drain conditions:

A channel is a drain candidate if it is a hardware-source-synchronized transfer with [DMA4_CCRi\[25\]](#)

BUFFERING_DISABLE = 0 and should not be doing any of the graphics operation (transparent copy or solid-color fill).

- Drain trigger:
A drain candidate channel is drained if it is disabled ([DMA4_CCRi\[7\] ENABLE = 0](#)) or if it receives a transaction error on the read port.
- Drain behavior with a type 1, 2, or 3 descriptor. Drain trigger can occur in two situations:
 - During descriptor loading: Any ongoing current transaction is complete and the channel is aborted.
 - During data loading: The read is completed at the boundary of the request (element/frame/packet/block boundary), the FIFO is drained to the destination, and then a DRAIN_END interrupt can be asserted.

17.4.20.4.6.2 Abort

- Abort condition:
A channel is an abort candidate if it is software-synchronized, hardware-destination-synchronized, solid color-fill, transparent-color fill, or hardware-source-synchronized with [DMA4_CCRi\[25\] BUFFERING_DISABLE = 1](#).
- Abort trigger:
A channel is an abort candidate if it is disabled ([DMA4_CCRi\[7\] ENABLE = 0](#)), if it receives a transaction error on the read or write port, or if there is a MISALIGNMENT_ERROR.
- Abort behavior with a type 1, 2, or 3 descriptor:
If an abort trigger occurs, the channel aborts immediately after current read/write transactions completes, and then the FIFO is cleaned up.
In type 1, 2, or 3, if an abort trigger or drain trigger occurs during the descriptor load phase, the channel aborts.

17.4.20.4.7 Status Bit Behavior

This section describes the behavior of the [DMA4_CSRI\[6\] SYNC](#), [DMA4_CCRi\[9\] RD_ACTIVE](#), and [DMA4_CCRi\[10\] WR_ACTIVE](#) status bits:

- For a hardware-synchronized channel in linked-list mode, the [DMA4_CSRI\[6\] SYNC](#) bit becomes active ([DMA4_CSRI\[6\] SYNC = 1](#)) when the first data load transaction is scheduled and remains active until the last data load transaction in the block (not super block) is descheduled ([DMA4_CSRI\[6\] SYNC = 0](#)). The SYNC bit is not active during the descriptor load phase.
- The [DMA4_CCRi\[9\] RD_ACTIVE](#) bit is active during the data load phase and the descriptor load phase. It becomes active when the first read transaction is scheduled. It becomes inactive:
 - When (during the descriptor load phase) the last descriptor write request is descheduled
 - When (during the data load phase) the last read transaction in the block (not super block) is descheduled for software-synchronized transfer or destination-synchronized transfer with prefetch enabled
 - When (during the data load phase) the last read transaction in the request (element/frame/packet/block sync) is descheduled for hardware-source-synchronized transfer or hardware-destination-synchronized transfer without prefetch
- The [DMA4_CCRi\[10\] WR_ACTIVE](#) bit is active only during the data load phase. It becomes active when the first write transaction is scheduled and becomes inactive:
 - Until the last write transaction in the block (not super block) is descheduled and the FIFO is cleaned up for software-synchronized transfer
 - Until the last write transaction in the request (element/frame/packet/block sync) is descheduled and the FIFO is cleaned up for hardware-source-synchronized transfer (with [DMA4_CCRi\[25\] BUFFERING_DISABLE = 0](#)) or hardware-destination-synchronized transfer.

17.4.20.4.8 Linked-List Channel Linking

Channel linking for inter- and intra-super blocks is supported for type 1, 2, and 3 descriptors.

Assume that CHx and CHz are linked-list channels using generic descriptors. If CHx is composed of N descriptors and CHz is composed of M descriptors, then in nonfast mode:

CHx: CHx[Data1]- CHx[DES1] - . - CHx[DESN]-CHx[DataN + 1]

CHz: CHz[Data1]- CHz[DES1] - . - CHz[DESM]-CHz[DataM + 1]

It is possible to link CHx to CHz or CHx to itself after the completion of the CHx transfer (end of superblock). To do this, the user must set the [DMA4_CLNK_CTRLi\[15\] ENABLE_LNK](#) bit to 1 and the [DMA4_CLNK_CTRLi\[4:0\] NEXTLCH_ID](#) bit field to z (or to x for self-linking) through the last descriptor using a type 1 descriptor. The sequence is:

CHx: CHx[Data1]- CHx[DES1] - . - CHx[DESN]-CHx[DataN+1] - CHz: CHz[Data1]- CHz[DES1] - . - CHz[DESM]-CHz[DataM+1]

It is also possible to link CHx to CHz during the CHx transfer and before the end of super block. The user must set the [DMA4_CLNK_CTRLi\[15\] ENABLE_LNK](#) bit field to 1 and the [DMA4_CLNK_CTRLi\[4:0\] NEXTLCH_ID](#) bit field to z through descriptor p (CHx[DESp]) using a type 1 descriptor. The sequence is:

CHx: CHx[Data1]- CHx[DES1] -.- CHx[DESp]-CHx[Data(p + 1)] - CHz[Data1]- CHz[DES1] - .

The user must continue the linking until channels CHx and CHz complete their superblock transfers; otherwise, the channels remain enabled.

NOTE: In channel linking, the head of a chain can be in fast mode or nonfast mode. All channels that are not in the head of the chain can be in nonfast mode only. In self-linking, the channel cannot be in fast mode.

NOTE: If channel CHx links to CHz in the middle of the superblock transfer (remember link bit can be set through Type-1 descriptor load), CHx is disabled after the corresponding data load and enables the channel CHz.

17.4.21 Auto-Restore Feature

The auto-restore feature is introduced mainly to accelerate the restore process, which otherwise is complex and time and resource consuming. In many system applications, it is required that the modem wake up and use only a few modules to wake up, without the intervention of the main MPU (Cortex-A9 MPU). The MPU still may be in off mode; however, some modules may need to come out of off mode. The sDMA can be used to restore the register contents of these modules. The auto-restore feature consists in saving the register data into a memory (SAR RAM in the WKUP domain) that remains powered even during off mode, and then in automatically retrieving data when returning from off mode.

The restore feature is enabled by default and cannot be disabled.

[Figure 17-12](#) is an overview of the save-and-restore mechanism using SAR RAM and SAR ROM.

Figure 17-12. Overview of Save-and-Restore Mechanism Using SAR RAM and SAR ROM

dma-014

17.4.21.1 Save Process

The save process is done entirely by software; the sDMA module normally is not involved. Software must save the data to be restored in a dedicated location in SAR RAM. To reduce the save sequence execution time, the sDMA can be used with linked-list descriptors. These save descriptors are symmetrical with regards to descriptors in the SAR ROM.

The register content to be saved can be the register value before going into off mode or a value that is required on wake up. This means that the restored register value can differ from the last value of the register before going into off mode.

The following registers are affected:

- CM1 and CM2 configuration
Bits 0 of the CM_SHADOW_FREQ_CONFIG1 register and the CM_SHADOW_FREQ_CONFIG2 register are self-clearing and must be set at restore time. Thus, these data must always be overwritten in the SAR RAM.
- Because USBHOSTHS and USBTLL restore requires a particular sequencing, software must overwrite data read from the following registers implied in phase 2a and phase 2b:
 - CM_L3INIT_HSUSBHOST_CLKCTRL_RESTORE

- CM_L3INIT_HSUSBTLL_CLKCTRL_RESTORE
- CM_SDMA_STATICDEP_RESTORE

The USBHOSTHS and USBTLL modules must be put in a particular mode when saving (and restoring) their context. In the case of context saving, software must:

- Configure the L3INIT clock domain to SW_WKUP to ensure module transitions.
- Disable both modules.
- Assert the SAR_MODE pins.
- Enable back both modules. Optional clocks must be kept gated.
- Save both modules context.
- Disable both modules.
- Deassert SAR_MODE pins.
- At this point, software may enable back both modules and get the L3INIT clock domain out from SW_WKUP state.

17.4.21.2 Restore Process

As explained earlier, every time modem wakes up, the MPU must not necessarily wake up. This needs an automated way of restore. For example, when mobile is in roaming, and not in active use, it must change base stations. For this task, the MPU does not need to wake up, only a few peripherals/subsystems need to be in on mode. Before executing any task, we need to restore their register contents.

17.4.21.2.1 PRCM and sDMA interaction During Restore Phase

Restore is performed during three phases. At the end of each phase, the sDMA stops and waits for the PRCM to perform the next phase transfer. For more information, see [Section 3.9.3.2, Device Off Mode Wake-Up Sequences](#), in [Chapter 3, Power, Reset, and Clock Management](#).

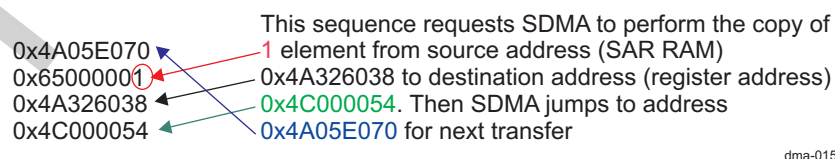

17.4.21.2.2 sDMA Descriptors Description

The restore phase is done automatically by the sDMA. The sDMA gets the register address (destination address), number of elements to transfer, and the address of the data to transfer (source address) from SAR ROM. As mentioned previously, the register data is stored in the SAR RAM.

The SAR ROM contains two types of descriptors the DMA-4 should use:

- Type-1 descriptors:
Type-1 descriptors (48 bytes) are used at the beginning of each phase. In addition to the source and destination address and number of elements, these descriptors contain the required data that initializes the sDMA. [Table 17-13](#) shows the type-1 descriptor structure.
- Type-3 descriptors with source and destination address update:
Type-3 descriptors (16 bytes) are used for subsequent sDMA transfers and mainly contain the source and destination address and number of elements. [Table 17-16](#) shows the type-3 descriptor structure. [Figure 17-13](#) is an example of SAR ROM code (type-3 descriptor).

Figure 17-13. Type-3 SAR ROM Code Example

dma-015

[Figure 17-14](#) is an example of last DMA transfer (Type-3 descriptor). To indicate to the DMA that this is the last transfer, the next descriptor address must be set to 0xFFFFF0FC, as shown in the figure.

Figure 17-14. Type-3 SAR ROM Last Transfer Example

dma-016

17.4.21.3 SAR RAM

The SAR RAM contains the data that must be maintained during off mode. The SAR RAM is split into three banks (see [Table 17-18](#)).

Table 17-18. SAR RAM Allocation

| Access Mode | Bank | Address Range |
|---------------------|---------------|-------------------------------|
| Public | 1 (SAR_RAM_1) | 0x4A32_6000–0x4A32_6FFF (4KB) |
| Public, for I/O pad | 2 (SAR_RAM_2) | 0x4A32_7000–0x4A32_73FF (1KB) |
| Public | 3 (SAR_RAM_3) | 0x4A32_8000–0x4A32_87FF (2KB) |

17.4.21.4 SAR ROM

The SAR ROM contains the list of registers that must be saved before off mode and then restored after off mode, and where the register data is stored in SAR RAM. The SAR ROM start address is 0x4A05_E000.

When exiting off mode, PRCM automatically redirects the sDMA to address:

- 0x4A05_E000 for phase 1 (in SAR ROM)
- 0x4A05_E030 for phase 2a (in SAR ROM)
- 0x4A05_E060 for phase 2b (in SAR ROM)

The SAR ROM is built so that the sDMA performs all the transfers for each phase. At the end of each phase, the sDMA stops. The PRCM module then requests to perform the next phase transfer, depending on the wake-up source.

Remarks:

- Phase 1 is always to happen; the restore mechanism is enabled by default and cannot be disabled.
- Phase 2 (2a and 2b) is to happen depending on the wake-up source from off mode. Phase 2 is not performed if C2C is the wake-up source, but it is performed for all other wake-up sources. Therefore, it is mandatory to fill the SAR RAM locations used for USB restore correctly, even if USB is not used, because the restore sequence will happen.
- The USB host restore is to be performed before the USB TLL restore.

NOTE: Some consecutive address registers cannot be saved/restored with burst. This is the case for:

- CLK2_XXX_BW_LIMITER_BANDWIDTH_FRACTIONAL and CLK2_XXX_BW_LIMITER_BANDWIDTH_INTEGER registers, where XXX = BB2D_M1 and BB2D_M2
- CLK2_XXX_BW_REGULATOR.L3_BW_R_BANDWIDTH and CLK2_XXX_BW_REGULATOR.L3_BW_R_WATERMARK registers, where XXX = IVAHD, SGX_M1, SGX_M2, BB2D_M1, and BB2D_M2
- CLK2_BB2D_M2_BW_LIMITER_WATERMARK_0

To avoid the failure of an sDMA transfer, the transfer of the previous registers is performed using a single sDMA transfer.

17.4.21.5 SAR RAM Memory Allocation Reserved for Save and Restore

The memory size of the SAR RAM reserved for the save-and-restore mechanism is:

- 58 percent (2376 bytes) reserved for the SAR mechanism from SAR_RAM_1. The whole SAR_RAM_1 size is 4KB.
- 40 percent (412 bytes) reserved for the SAR mechanism from SAR_RAM_2. The whole SAR_RAM_2 size is 1KB.
- 59 percent (1204 bytes) reserved for the SAR mechanism from SAR_RAM_3. The whole SAR_RAM_3 size is 2KB.

The free part of the SAR RAM can be used by the user software to store any data that must be in always-on memory.

17.4.21.6 Register Mapping in SAR RAM

Table 17-19 describes the SAR_RAM_1 memory mapping.

Table 17-19. SAR_RAM_1 Memory Mapping

| Order | Register Name | Register Start Address | Register End Address | Size | SAR_RAM_1 Address |
|-------|--------------------------------|------------------------|----------------------|------|-------------------|

17.5 sDMA Basic Programming Model

17.5.1 Setup Configuration

After a hardware reset, program all fields in the logical channel registers to default values for any channels used, because most fields are undefined following reset.

Before programming any DMA transfers, the priority arbitration rate and the maximum FIFO depth must be configured through the [DMA4_GCR](#) register, and any required interrupts must be enabled through the [DMA4_IRQENABLE_Lj](#) registers and the logical channel [DMA4_CICRi](#) registers.

Software clears the [DMA4_CSRi](#) register and the IRQSTATUS bit for the different interrupt lines before enabling the channel.

17.5.2 Software-Triggered (Nonsynchronized) Transfer

To program a software-triggered DMA transfer:

1. Configure the transfer parameters in the logical DMA channel registers:

- [DMA4_CSDPi](#):
 - Transfer ES (8, 16, or 32 bits) in the DMA [DMA4_CSDPi\[1:0\]](#) bit field.
 - Read and write port access types (single/burst), DMA [DMA4_CSDPi\[8:7\]](#) and [DMA4_CSDPi\[15:14\]](#) bit fields
 - Source and destination endianness, DMA [DMA4_CSDPi\[21\]](#) and [DMA4_CSDPi\[19\]](#) bits
 - Write mode (posted or nonposted) and DMA [DMA4_CSDPi\[17:16\]](#) bit field
 - Source or destination packed or nonpacked (if the ES is less than the read/write port size), DMA [DMA4_CSDPi\[6\]](#) and [DMA4_CSDPi\[13\]](#) bits
- [DMA4_CENi](#): EN
- [DMA4_CFNi](#): FN per transfer block
- [DMA4_CSSAi](#) and [DMA4_CDSAi](#): Source and destination start address (aligned with transfer ES)
- [DMA4_CCRi](#):
 - Read and write port addressing modes, DMA [DMA4_CCRi\[13:12\]](#) and [DMA4_CCRi\[15:14\]](#) bit field
 - Priority bit for both read and write ports, DMA [DMA4_CCRi\[6\]](#) and [DMA4_CCRi\[26\]](#) bits
 - DMA request number (set to 0 for a software-triggered transfer) and DMA register bit fields [DMA4_CCRi\[4:0\] = 0](#) and [DMA4_CCRi\[20:19\] = 0](#)
- [DMA4_CSEli](#), [DMA4_CSFli](#), [DMA4_CDEli](#), and [DMA4_CDFli](#): Source and destination element and frame indexes (depending on addressing mode)

2. Start the transfer through the enable bit in the channel [DMA4_CCRi](#) register and DMA [DMA4_CCRi\[7\]](#) bit.

The following example performs a DMA transfer on channel 10 of a 240 × 160 picture from RAM to RAM (0x80C00000 to 0x80F00000):

```
UWORD32 RegVal = 0;
DMA4_t *DMA4;
DMA4 = (DMA4_t
*)malloc(sizeof(DMA4_t));
/* Init. parameters
*/
DMA4->DataType = 0x2; //
DMA4->CSDPi[1:0]
DMA4->ReadPortAccessType = 0; //
DMA4->CSDPi[8:7]
DMA4->WritePortAccessType = 0; //
DMA4->CSDPi[15:14]
DMA4->SourceEndianness = 0; //
DMA4->CSDPi[21]
DMA4->DestinationEndianness = 0; //
```

```

        DMA4_CSDPi[19]
DMA4-WriteMode = 0; //
        DMA4_CSDPi[17:16]
DMA4-SourcePacked = 0; //
        DMA4_CSDPi[6]
DMA4-DestinationPacked = 0; //
        DMA4_CSDPi[13]
DMA4-NumberOfElementPerFrame = 240; //
        DMA4_CENi
DMA4-NumberOfFramePerTransferBlock = 160; //
        DMA4_CFNi
DMA4-SourceStartAddress = 0x80C00000; //
        DMA4_CSSAi
DMA4-DestinationStartAddress = 0x80F00000; //

```

17.5.3 Hardware-Synchronized Transfer

To monitor a hardware-synchronized DMA transfer, initialize the [DMA4_CDACi](#) register before the software enable.

To configure an LCh to synchronize by element, packet, frame, or block, the frame synchronization [DMA4_CCRi\[5\]](#) FS bit and the block synchronization [DMA4_CCRi\[18\]](#) BS bit must be programmed. For all the following synchronized transfers (element, packet, and frame or block-synchronized transfers), the user must first set the [DMA4_CCRi\[24\]](#) SEL_SRC_DST_SYNC bit to 1 when the source triggers on the DMA request and set it the [DMA4_CCRi\[24\]](#) SEL_SRC_DST_SYNC bit to 0 when the destination triggers on the DMA request.

NOTE: The user must take care when setting the [DMA4_CCRi\[23\]](#) PREFETCH bit in conjunction with the [DMA4_CCRi\[24\]](#) SEL_SRC_DST_SYNC bit.

- To configure an LCh to transfer one element per DMA request:
 1. Set the number of DMA request associated with the current LCH in the [DMA4_CCRi\[20:19\]](#) SYNCHRO_CONTROL_UPPER and [DMA4_CCRi\[4:0\]](#) SYNCHRO bit field.
 2. Set the data type, also referenced as element size (ES), in the [DMA4_CSDPi\[1:0\]](#) DATA_TYPE bit field.
 3. Set the Read Port access type (single or burst access) in the [DMA4_CSDPi\[8:7\]](#) SRC_BURST_EN bit field.
 4. Set the Write Port access type (single or burst access) in the [DMA4_CSDPi\[15:14\]](#) DST_BURST_EN bit field.
 5. Set the Read Port addressing mode in the [DMA4_CCRi\[13:12\]](#) SRC_AMODE bit field.
 6. Set the Write Port addressing mode in the [DMA4_CCRi\[15:14\]](#) DST_AMODE bit field.
 7. Set the Read start address in the [DMA4_CSSAi\[31:0\]](#) SRC_START_ADRS bit field.
 8. Set the Write start address in the [DMA4_CDSAi\[31:0\]](#) DST_START_ADRS bit field.
 9. Set both FS and BS to 0 in [DMA4_CCRi\[5\]](#) FS and [DMA4_CCRi\[18\]](#) BS.
 10. Set to 1 the channel enable bit [DMA4_CCRi\[7\]](#) EN.
- To configure an LCh to transfer one frame per DMA request:
 1. Set the number of DMA request associated to the current LCH in the [DMA4_CCRi\[20:19\]](#) SYNCHRO_CONTROL_UPPER and [DMA4_CCRi\[4:0\]](#) SYNCHRO bit field.
 2. Set the data type, also referenced as element size (ES), in the [DMA4_CSDPi\[1:0\]](#) DATA_TYPE bit field.
 3. Set the number of element per frame in the [DMA4_CENi\[23:0\]](#) CHANNEL_ELMNT_NBR bit field.
 4. Set the Read Port access type (single or burst access) in the [DMA4_CSDPi\[8:7\]](#) SRC_BURST_EN bit field.
 5. Set the Write Port access type (single or burst access) in the [DMA4_CSDPi\[15:14\]](#) DST_BURST_EN bit field.
 6. Set the Read Port addressing mode in the [DMA4_CCRi\[13:12\]](#) SRC_AMODE bit field.
 7. Set the Write Port addressing mode in the [DMA4_CCRi\[15:14\]](#) DST_AMODE bit field.
 8. Set the Read start address in the [DMA4_CSSAi\[31:0\]](#) SRC_START_ADRS bit field.
 9. Set the Write start address in the [DMA4_CDSAi\[31:0\]](#) DST_START_ADRS bit field.
 10. Set FS to 1 and BS to 0, respectively, in [DMA4_CCRi\[5\]](#) FS and [DMA4_CCRi\[18\]](#) BS.
 11. Set to 1 the channel enable bit [DMA4_CCRi\[7\]](#) EN.
- To configure an LCh to transfer one block per DMA request:
 1. Set the number of DMA request associated to the current LCH in the [DMA4_CCRi\[20:19\]](#) SYNCHRO_CONTROL_UPPER and [DMA4_CCRi\[4:0\]](#) SYNCHRO bit field.
 2. Set the data type, also referenced as element size (ES), in the [DMA4_CSDPi\[1:0\]](#) DATA_TYPE bit field.
 3. Set the number of elements per frame in the [DMA4_CENi\[23:0\]](#) CHANNEL_ELMNT_NBR bit field.
 4. Set in the [DMA4_CFNi\[15:0\]](#) CHANNEL_FRAME_NBR bit field the number of frame (transfers), to occur before the LCH gets disabled.
 5. Set the Read Port access type (single or burst access) in the [DMA4_CSDPi\[8:7\]](#) SRC_BURST_EN

bit field.

6. Set the Write Port access type (single or burst access) in the [DMA4_CSDPi\[15:14\]](#) DST_BURST_EN bit field.
 7. Set the Read Port addressing mode in the [DMA4_CCRi\[13:12\]](#) SRC_AMODE bit field.
 8. Set the Write Port addressing mode in the [DMA4_CCRi\[15:14\]](#) DST_AMODE bit field.
 9. Set the Read start address in the [DMA4_CSSAi\[31:0\]](#) SRC_START_ADRS bit field.
 10. Set the Write start address in the [DMA4_CDSAi\[31:0\]](#) DST_START_ADRS bit field.
 11. Set FS to 0 and BS to 1, respectively, in [DMA4_CCRi\[5\]](#) FS and [DMA4_CCRi\[18\]](#) BS.
 12. Set to 1 the channel enable bit [DMA4_CCRi\[7\]](#) EN.
- To configure an LCh to transfer one packet per DMA request:
 1. Set the number of DMA request associated to the current LCH in the [DMA4_CCRi\[20:19\]](#) SYNCHRO_CONTROL_UPPER and [DMA4_CCRi\[4:0\]](#) SYNCHRO bit field.
 2. Set the data type, also referenced as element size (ES), in the [DMA4_CSDPi\[1:0\]](#) DATA_TYPE bit field.
 3. Set the number of elements per packet to transfer: If the packet requestor is in the source, set the [DMA4_CCRi\[24\]](#) SEL_SRC_DST_SYNC bit to 1 and set the packet element number in the [DMA4_CSFli](#) register and set the addressing mode of source to constant addressing in [DMA4_CCRi\[13:12\]](#) SRC_AMODE bit field; else, if the packet requestor is in the destination, set the [DMA4_CCRi\[24\]](#) SEL_SRC_DST_SYNC bit to 0 and set the packet element number in the [DMA4_CDFli](#) register and set the addressing mode of destination to constant addressing in [DMA4_CCRi\[15:14\]](#) DST_AMODE bit field.
 4. Set the number of elements per frame in the [DMA4_CENi\[23:0\]](#) CHANNEL_ELMNT_NBR bit field.
 5. Set in the [DMA4_CFNi\[15:0\]](#) CHANNEL_FRAME_NBR bit field the number of frames (transfers), to occur before the LCH gets disabled.
 6. Set the element number in the packet in the [DMA4_CSFli\[15:0\]](#) PKT_ELNT_NBR bit field, if constant addressing or post-incremented addressing modes are used in the source side. However, the number of element in the packet is set in the [DMA4_CDFli\[15:0\]](#) PKT_ELNT_NBR bit field if constant addressing mode is used in the destination side.
 7. Set the Read Port access type (single or burst access) in the [DMA4_CSDPi\[8:7\]](#) SRC_BURST_EN bit field.
 8. Set the Write Port access type (single or burst access) in the [DMA4_CSDPi\[15:14\]](#) DST_BURST_EN bit field.
 9. Set the Read Port addressing mode in the [DMA4_CCRi\[13:12\]](#) SRC_AMODE bit field.
 10. Set the Write Port addressing mode in the [DMA4_CCRi\[15:14\]](#) DST_AMODE bit field.
 11. Set the Read start address in the [DMA4_CSSAi\[31:0\]](#) SRC_START_ADRS bit field.
 12. Set the Write start address in the [DMA4_CDSAi\[31:0\]](#) DST_START_ADRS bit field.
 13. Set FS to 1 and BS to 1, respectively, in [DMA4_CCRi\[5\]](#) FS and [DMA4_CCRi\[18\]](#) BS.
 14. Set to 1 the channel enable bit [DMA4_CCRi\[7\]](#) EN.

NOTE: It is possible to stop a transfer by disabling the channel by resetting the [DMA4_CCRi\[7\]](#) ENABLE bit.

17.5.4 Synchronized Transfer Monitoring Using CDAC

The [DMA4_CDACi](#) register is writable and noninitialized (value undefined). It can be initialized to monitor a transfer by applying the following programming model:

1. Write 0 in the [DMA4_CDACi](#) register.
2. Enable the channel.
3. If a time-out occurs, read the [DMA4_CDACi](#) register.
4. If [DMA4_CDACi](#) != 0 (it is the value configured in [DMA4_CDACi](#)):

This indicates that the corresponding transfer has started. The user can then rely on [DMA4_CCENi](#) and [DMA4_CCFNi](#) element and frame counters.

Otherwise, if [DMA4_CDACi](#) = 0 (it is the value configured in the [DMA4_CDACi](#)):

This indicates that the corresponding transfer did not start.

17.5.5 Concurrent Software and Hardware Synchronization

This section describes thread allocation only; it does not describe the entire transfer. Because synchronized transfers are latency critical, you must allocate a thread at least on the synchronized target side.

Even for multiple concurrent channels, thread reservation ensures that when a hardware DMA request arrives, the read/write scheduler finds available thread(s) to initiate a channel schedule and issue a read/write transaction.

Consider six concurrent channels:

- Channels 0-3 are dedicated to memory-memory transfer; they are software triggered and not synchronized.
- Channel 4 is dedicated to memory-peripheral transfer, hardware triggered, and synchronized on the write side.
- Channel 5 is dedicated to peripheral-memory transfer, hardware triggered, and synchronized on the read side.

To perform thread reservation:

1. Allow thread reservation for priority channel 4 and channel 5:

Reserve one thread (Read ThreadID 0) on the read port and one thread (Write ThreadID 0) on the write port: set the [DMA4_GCR\[13:12\]](#) HI_THREAD_RESERVED bit field to 0x1.

2. Specify channel priority:

Channel 4 is a write high-priority channel: set the [DMA4_CCRi\[26\]](#) WRITE_PRIORITY bit to 1.

Channel 5 is a read high-priority channel: set the [DMA4_CCRi\[6\]](#) READ_PRIORITY bit to 1.

17.5.6 Chained Transfer

A chained DMA transfer can be programmed as follows:

1. Configure the transfer parameters for each logical DMA channel in the chain as in step 1 for either the synchronized or nonsynchronized transfers describe in [Section 17.5.5, Concurrent Software and Hardware Synchronization](#).
2. For each channel in the chain, configure the [DMA4_CLNK_CTRLi](#) register as follows:
 - Next logical DMA channel number (for a looping chained transfer link last channel to first channel number), in the [DMA4_CLNK_CTRLi\[4:0\]](#) NEXTLCH_ID bit field.
 - Include the logical channel to the chain and enable link by setting the [DMA4_CLNK_CTRLi\[15\]](#) ENABLE_LNK bit.
 - For a nonlooping chain, the last logical channel in the chain must have the [DMA4_CLNK_CTRLi\[15\]](#) ENABLE_LNK bit set to 0 to indicate the end of the chain.
3. Enable the transfer through the enable bit in the first logical channel [DMA4_CCRi\[7\]](#) ENABLE bit. All other channels in the chain must be disabled. Each channel is enabled automatically in turn when the previous logical channel transfer completes. A nonsynchronized transfer starts immediately; a hardware-synchronized transfer starts when the DMA request line corresponding to the first DMA channel in the chain is asserted.

To stop a looping chained transfer, disable the [DMA4_CLNK_CTRLi\[15\]](#) ENABLE_LNK bit (by setting it to 0x0) of the final channel transfer.

In the RAM-to-RAM copy example, to copy in loop, it is possible to link channel 10 on itself. The following line can be added in the channel configuration:

```
/* g) Set link for loop */
DMA4_CLNK_CTRL_CH10 =
```

```
0x0000800A;
```

17.5.7 90-Degree Clockwise Image Rotation

The 90-degree clockwise image rotation example described in [Section 17.4.5, Addressing Modes](#), can be programmed as follows:

1. Configure the transfer parameters in the logical DMA channel registers:

- **DMA4_CSDPi:**
 - Transfer ES = 32-bit (32 bpp), **DMA4_CSDPi**[1:0] DATA_TYPE bit field
 - Read and write port access types = maximum burst size supported by memory device, **DMA4_CSDPi**[8:7] SRC_BURST_EN and **DMA4_CSDPi**[15:14] DST_BURST_EN bit fields
 - Source and destination endianness, **DMA4_CSDPi**[21] SRC_ENDIAN and **DMA4_CSDPi**[19] DST_ENDIAN bits
 - Write mode = posted with last element nonposted, **DMA4_CSDPi**[17:16] WRITE_MODE bit field
 - Source and destination packed = Yes (although destination writes do not benefit because EI1), **DMA4_CSDPi**[6] SRC_PACKED and **DMA4_CSDPi**[13] DST_PACKED bits
- **DMA4_CENi:** EN = 240
- **DMA4_CFNi:** FN per transfer block = 160
- **DMA4_CSSAi:** Source start address = 0x100000
- **DMA4_CDSAi:** destination start address = 0x20013E
- **DMA4_CCRi:**
 - Read and write port addressing modes = double-index addressing mode for both or post-increment addressing on source and double-index addressing on destination, **DMA4_CCRi**[13:12] SRC_AMODE and **DMA4_CCRi**[15:14] DST_AMODE bit fields
 - Low or high priority, **DMA4_CCRi**[6] READ_PRIORITY bit
 - DMA request number = 0 (for software-triggered transfer), **DMA4_CCRi**[4:0] SYNCHRO_CONTROL and **DMA4_CCRi**[20:19] SYNCHRO_CONTROL_UPPER bit fields
- **DMA4_CSEIi:** Source EI = 1
- **DMA4_CSFii:** Source frame index = 1
- **DMA4_CDEIi:** destination EI = 637
- **DMA4_CDFii:** destination frame index = 152967

2. Start the transfer through the enable bit in the channel **DMA4_CCRi** register.

The following parameters are used to perform this rotation from 0x80C00000 RAM address to 0x80F00000, with the same code used in [Section 17.5.2, Software-Triggered \(Nonsynchronized\) Transfer](#).

```
/* Init. parameters */
DMA4-DataType = 0x2; //
    DMA4_CSDPi[1:0]
DMA4-ReadPortAccessType = 0x3; // DMA4_CSDPi[8:7]

DMA4-WritePortAccessType = 0x3; // DMA4_CSDPi[15:14]

DMA4-SourceEndiansim = 0; // DMA4_CSDPi[21]

DMA4-DestinationEndianness = 0; // DMA4_CSDPi[19]

DMA4-WriteMode = 0x2; // DMA4_CSDPi[17:16]
DMA4-SourcePacked
    = 0x1; // DMA4_CSDPi[6]
DMA4-DestinationPacked = 0x1; //
    DMA4_CSDPi[13]
DMA4-NumberOfElementPerFrame = 240; // DMA4_CENi

DMA4-NumberOfFramePerTransferBlock = 160; // DMA4_CFNi
```

```

DMA4-SourceStartAddress = 0x80C00000; // DMA4_CSSAi

DMA4-DestinationStartAddress = 0x80F00000; // DMA4_CDSAi

DMA4-SourceElementIndex = 1; // DMA4_CSEIi

DMA4-SourceFrameIndex = 1; // DMA4_CSFii

DMA4-DestinationElementIndex = 637; // DMA4_CDEIi

DMA4-DestinationFrameIndex = -152967; // DMA4_CDFii

DMA4-ReadPortAccessMode = 0x3; // DMA4_CCRi[13:12]

DMA4-WritePortAccessMode = 0x3; // DMA4_CCRi[15:14]

DMA4-ReadPriority = 0; // DMA4_CCRi[6]
DMA4-WritePriority =
    0; // DMA4_CCRi[23]
DMA4-ReadRequestNumber = 0; // DMA4_CCRi[4:0]

DMA4-WriteRequestNumber = 0; // DMA4_CCRi[20:19]

```

17.5.8 Graphic Operations

- Transparent copy:
 1. Set the [DMA4_CCRi\[17\]](#) TRANSPARENT_COPY_ENABLE bit to 1.
 2. Set the [DMA4_CCRi\[16\]](#) CONST_FILL_ENABLE bit to 0.
 3. Set the value of the key color in the [DMA4_COLORi\[15:0\]](#) COLOR_KEY bit field.

To perform this graphic operation, the following lines can be added to the example of [Section 17.5.2, Software-Triggered \(Nonsynchronized\) Transfer](#).

```

DMA4_CCR_CH10 = ~(0x1 16);
DMA4_CCR_CH10 |= 0x1 17;

DMA4_COLOR_CH10 = 0x00000003;

```

- Solid Color fill:
 1. Set the [DMA4_CCRi\[16\]](#) CONST_FILL_ENABLE bit to 1
 2. Set the [DMA4_CCRi\[17\]](#) TRANSPARENT_COPY_ENABLE bit to 0
 3. Set the value of key the color in the [DMA4_COLORi\[15:0\]](#) SOLID_COLOR bit field

To perform this graphic operation, the following lines can be added to the example of [Section 17.5.2, Software-Triggered \(Nonsynchronized\) Transfer](#).

```

DMA4_CCR_CH10 = ~(0x1 17);
DMA4_CCR_CH10 |= 0x1 16;

DMA4_COLOR_CH10 = 0x00000003;

```

17.5.9 Linked-List Programming Guidelines

- With the exception of the [DMA4_CCRi\[7\]](#) ENABLE bit and the [DMA4_CDPi\[7\]](#) PAUSE_LINK_LIST bit during a linked-list transfer (descriptor load phase or data load phase), avoid programming any register through the configuration port.
- Before enabling any linked-list transfer, ensure that all global registers and all registers in the descriptor are initialized. Some static channel registers (registers that are not updated by the descriptor to be loaded) must also be initialized correctly:
 - For type 2, the following registers must be initialized with consistent values:
 - All global registers
 - [DMA4_CCRi](#)
 - [DMA4_CSDPi](#)

- [DMA4_CLNK_CTRLi](#)
- For type 3, the following registers must be initialized with consistent values:
 - All global registers
 - [DMA4_CCRi](#)
 - [DMA4_CSDPi](#)
 - [DMA4_CLNK_CTRLi](#)
 - [DMA4_CICRi](#)
 - [DMA4_CFNi](#)
- In case of a linked list with descriptor types 2 and 3, the content of the [DMA4_CCRi](#) register must not change during superblock life.
- The PAUSE_LINK_LIST bit must not be set in the initialization phase.

17.6 sDMA Register Manual

17.6.1 sDMA Instance Summary

Table 17-22. sDMA Instance Summary

| Module Name | Base Address | Size |
|-------------|--------------|------|
| sDMA | 0x4A05 6000 | 4 KB |

17.6.2 sDMA Registers

17.6.2.1 sDMA Register Summary

Index *i* represents the logical channel number (where *i* = 0 to 31). The offset address for some registers is calculated from the channel *c* number. For example, the DMA4_CCR10 (channel 10) register has an offset address of $10 \times 0x60 = 0x3C0$, and thus a physical address of $0x4A05\ 6080 + 0x3C0 = 0x4A05\ 6440$.

Index *j* represents the interrupt line number (where *j* = 0 to 3). The offset address for some registers is calculated from the channel *c* number. For example, the DMA4_IRQSTATUS_L3 (line 3) register has an offset address of $3 \times 0x4 = 0xC$, and thus a physical address of $0x4A05\ 6008 + 0xC = 0x4A05\ 6014$.

Table 17-23. sDMA Registers Mapping Summary

| Register Name | Type | Register Width (Bits) | Address Offset | sDMA L3 Base Address |

⁽³⁾ i = 0 to 31**17.6.2.2 sDMA Register Description**

NOTE: Some registers have no reset value (marked with –) because of hardware implementation in memory. Software must ensure the correct programming of these registers, if needed.

Shadow registers are used to read run-time registers such as CCEN, CCFN, CDAC, and CSAC. Typically, when accessed in 8-bit or 16-bit access for two consecutive accesses, the value of the previous registers can change. A shadow register holds the entire value to let the next access recover the remaining 24 or 16 bits.

For non-32-bit transactions, start reading or writing from the LSByte first to enable the register update. There is no issue for 32-bit read-write transactions.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----------|----|----|----|----|----|----|----|------------------|----|----|----|----|----|----|----|-------------------|----|--------------------|----|----------|----|---|---|------------------------|---|---|---|---|---|---|---|
| RESERVED | | | | | | | | ARBITRATION_RATE | | | | | | | | HI_LO_FIFO_BUDGET | | HI_THREAD_RESERVED | | RESERVED | | | | MAX_CHANNEL_FIFO_DEPTH | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|--------------------|--|------|-------|
| 31:25 | RESERVED | Write 0's for future compatibility. Read returns 0. | RW | 0x00 |
| 24 | CHANNEL_ID_GATE | Gates the Channel ID bus monitoring on both Read and Write ports 0x0: Gates the Channel ID qualifiers on both Read and Write Ports 0x1: Does not gate the Channel ID qualifiers on both Read and Write Ports | RW | 0x0 |
| 23:16 | ARBITRATION_RATE | Arbitration switching rate between prioritized and regular channel queues | RW | 0x01 |
| 15:14 | HI_LO_FIFO_BUDGET | Allow to have a separate Global FIFO budget for high and low priority channels. For Hi priority Channel: (Per_channel_Maximum FIFO depth + 1) x Number of active High-priority Channel = High Budget FIFO For Low priority channel: (Per_channel_Maximum FIFO depth + 1) x Number of active Low priority Channel = Low Budget FIFO 0x0: no fixed budget for neither higher nor lower priority channel 0x1: 75% of FIFO for low priority and 25% for high-priority channels 0x2: 25% of FIFO for low priority and 75% for high-priority channels 0x3: 50% of FIFO for low priority and 50% for high-priority channels | RW | 0x0 |
| 13:12 | HI_THREAD_RESERVED | Allow thread reservation for high-priority channel on both read and write ports. 0x0: No ThreadID is reserved on the Read Port for high-priority channels. No ThreadID is reserved on the Write Port for high-priority channels. 0x1: Read Port ThreadID 0 is reserved for high-priority channels. Write Port ThreadID 0 is reserved for high-priority channels. 0x2: Read port ThreadID 0 and ThreadID 1 are reserved for high-priority channels. Write Port ThreadID 0 is reserved for high-priority channels. 0x3: Read Port ThreadID 0, ThreadID 1 and ThreadID 2 are reserved for high-priority channels. Write Port ThreadID 0 is reserved for high-priority channels. | RW | 0x0 |
| 11:8 | RESERVED | Write 0's for future compatibility. Read returns 0. | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------------------|--|------|-------|
| 7:0 | MAX_CHANNEL_FIFO_DEPTH | Maximum FIFO depth allocated to one logical channel. Maximum FIFO depth can not be 0x0. It should be at least 0x1 or greater. Note that If channel limit is less than destination burst size enough data will not be accumulated in the data FIFO and it will never be sent out on the WR port. The burst size should be less than the FIFO limit specified in this bit field. | RW | 0x10 |

| RESERVED | | | | RESERVED | | | | WRITE_PRIORITY | BUFFERING_DISABLE | SEL_SRC_DST_SYNC | PREFETCH | SUPERVISOR | RESERVED | SYNCHRO_CONTROL_UPPER | BS | TRANSPARENT_COPY_ENABLE | CONST_FILL_ENABLE | DST_AMODE | SRC_AMODE | RESERVED | WR_ACTIVE | RD_ACTIVE | SUSPEND_SENSITIVE | ENABLE | READ_PRIORITY | FS | SYNCHRO_CONTROL | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|----------------|--|------|-------|
| 31:30 | RESERVED | Write 0's for future compatibility. Read returns 0. | RW | 0x0 |
| 29:27 | RESERVED | Reserved for non-GP devices | RW | 0x0 |
| 26 | WRITE_PRIORITY | Channel priority on the Write side 0x0: Channel has low priority on the write side during the arbitration process. 0x1: Channel has high-priority on write sided during the arbitration process. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------------------|---|------|-------|
| 25 | BUFFERING_DISABLE | This bit allows to disable the default buffering functionality when transfer is source synchronized. 0x0: Buffering is enabled across element/packet when source is synchronized to element, packet, frame or blocks. 0x1: Buffering is disabled across element/packet when source is synchronized to element, packet, frame or blocks. | RW | – |
| 24 | SEL_SRC_DST_SYNC | Specifies that element, packet, frame or block transfer (depending on CCR.bs and CCR.fs) is triggered by the source or the destination on the DMA request 0x0: Transfer is triggered by the destination. If synch on packet the packet element number is specified in the CDFI register. 0x1: Transfer is triggered by the source. If synchronized on packet the packet element number is specified in the CSFI register. | RW | – |
| 23 | PREFETCH | Enables the prefetch mode 0x0: Prefetch mode is disabled. When Sel_Src_Dst_Sync=1 transfers are buffered and pipelined between DMA requests. 0x1: Prefetch mode is enabled. Prefetch mode is active only when destination is synchronized. It is software user responsibility not to have at the same time Prefetch=1 when Sel_Src_Dst_Sync=1. This mode is not supported. | RW | 0 |
| 22 | SUPERVISOR | Enables the supervisor mode 0x0: Supervisor mode is disabled. 0x1: Supervisor mode is enabled. | RW | 0 |
| 21 | RESERVED | Reserved for non-GP devices | RW | 0 |
| 20:19 | SYNCHRO_CONTROL_UPPER | Channel Synchronization control upper (used in conjunction with the 5 bits of synchro channel DMA4_CCRi[4:0]) Used in conjunction, as 2 MSB, with the 5 bits of the synchro channel bit field. | RW | 0b00 |
| 18 | BS | Block synchronization This bit used in conjunction with the fs to see how the DMA request is serviced in a synchronized transfer. | RW | – |
| 17 | TRANSPARENT_COPY_ENABLE | Transparent copy enable 0x0: Transparent copy mode is disabled. 0x1: Transparent copy mode is enabled. | RW | – |
| 16 | CONST_FILL_ENABLE | Constant fill enable 0x0: Constant fill mode is disabled. 0x1: Constant fill mode is enabled. | RW | 0 |
| 15:14 | DST_AMODE | Selects the addressing mode on the Write Port of a channel. 0x0: Constant address mode 0x1: Post-incremented address mode 0x2: Single index address mode 0x3: Double index address mode | RW | 0bxx |
| 13:12 | SRC_AMODE | Selects the addressing mode on the Read Port of a channel. 0x0: Constant address mode 0x1: Post-incremented address mode 0x2: Single index address mode 0x3: Double index address mode | RW | 0bxx |
| 11 | RESERVED | Write 0s for future compatibility. Read returns 0. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------------|--|------|---------|
| 10 | WR_ACTIVE | Indicates if the channel write context is active or not Read 0x0: Channel is not active on the write port. Read 0x1: Channel is currently active on the write port. | R | 0 |
| 9 | RD_ACTIVE | Indicates if the channel read context is active or not Read 0x0: Channel is not active on the read port. Read 0x1: Channel is currently active on the read port. | R | 0 |
| 8 | SUSPEND_SENSITIVE | Logical channel suspend enable bit 0x0: The channel ignores the MSuspend even if EMUFree is set to 0. 0x1: If EMUFree is set to 0 and MSuspend comes in then all current OCP services (single transaction or burst transaction as specified in the corresponding CSDP register) have to be completed before stopping processing any more transactions. | RW | 0 |
| 7 | ENABLE | Logical channel enable. It is SW responsibility to clear the CSR register and the IRQSTATUS bit for the different interrupt lines before enabling the channel. 0x0: The logical channel is disabled. 0x1: The logical channel is enabled. | RW | 0 |
| 6 | READ_PRIORITY | Channel priority on the read side 0x0: Channel has low priority on the read side during the arbitration process. 0x1: Channel has high-priority on read sided during the arbitration process. | RW | 0 |
| 5 | FS | Frame synchronization This bit used in conjunction with the BS to see how the DMA request is serviced in a synchronized transfer FS = 0 and BS = 0: An element is transferred once a DMA request is made. FS = 0 and BS = 1: An entire block is transferred once a DMA request is made. FS = 1 and BS = 0: An entire frame is transferred once a DMA request is made. FS = 1 and BS = 1: A packet is transferred once a DMA request is made. All these different transfers can be interleaved on the port with other DMA requests. | RW | – |
| 4:0 | SYNCHRO_CONTROL | Channel synchronization control This bit field used in conjunction with the second_level_synchro_control_upper (as 2 MSB) 0000000 : Is reserved for non synchronized LCH transfer xxxxxxx (from 1 to 127) There are 127 possible DMA request to assign to any LCH. Note: The channel synchronization control registers are 1-based. For example, to enable the S_DMA_1 request, DMA4_CCR[4:0] SYNCHRO_CONTROL must be set to 0x2 (DMA request number + 1). | RW | 0b00000 |

| 19 | DST_ENDIAN | Channel Destination endianness control 0x0: Destination has Little Endian type 0x1: Destination has Big Endian type | RW | – |
| 18 | DST_ENDIAN_LOCK | Endianness Lock 0x0: Endianness adapt 0x1: Endianness lock | RW | – |
| 17:16 | WRITE_MODE | Used to enable writing mode without posting or with posting 0x0: Write None Posted (WRNP) 0x1: Write (Posted) 0x2: All transaction are mapped on the Write command as posted except for the last transaction in the transfer mapped on a Write None Posted 0x3: Undefined | RW | 0bxx |
| 15:14 | DST_BURST_EN | Used to enable bursting on the Write Port. Smaller burst size than the programmed burst size is also allowed 0x0: single access 0x1: 16 bytes or 4x32-bit / 2x64-bit burst access 0x2: 32 bytes or 8x32-bit / 4x64-bit burst access 0x3: 64 bytes or 16x32-bit / 8x64-bit burst access | RW | 0b00 |
| 13 | DST_PACKED | Destination receives packed data. 0x0: The destination target is non packed 0x1: The destination target is packed | RW | – |
| 12:9 | RESERVED | Write the reset value. Read returns reset value | RW | 0x- |
| 8:7 | SRC_BURST_EN | Used to enable bursting on the Read Port. Smaller burst size than the programmed burst size is also allowed 0x0: single access 0x1: 16 bytes or 4x32-bit / 2x64-bit burst access 0x2: 32 bytes or 8x32-bit / 4x64-bit burst access 0x3: 64 bytes or 16x32-bit / 8x64-bit burst access | RW | 0bxx |
| 6 | SRC_PACKED | Source provides packed data. 0x0: The source target is non packed 0x1: The source target is packed | RW | – |
| 5:2 | RESERVED | Write the reset value. Read returns reset value | RW | 0x- |
| 1:0 | DATA_TYPE | Defines the type of the data moved in the channel. 0x0: 8 bits scalar 0x1: 16 bits scalar 0x2: 32 bits scalar 0x3: Reserved | RW | 0bxx |

Interrupt Controllers

This chapter describes the interrupt controllers (INTCs) in the device.

| Topic | Page |
|--|------|
| 18.1 Interrupt Controller Overview | 3462 |
| 18.2 INTC Environment | 3464 |
| 18.3 INTC Integration | 3465 |
| 18.4 INTC Functional Description | 3471 |
| 18.5 INTC Register Manual | 3472 |

18.1 Interrupt Controller Overview

The device provides three interrupt controller (INTC) modules, which handle interrupts at the device level:

- Cortex™-A9 microprocessor unit (MPU) subsystem INTC: This INTC module is a single functional unit that is integrated in the Cortex-A9 multiprocessor core. It provides the following:
 - 128 hardware interrupt inputs
 - generation of interrupts by software
 - prioritization of interrupts
 - masking of any interrupts
 - distribution of the interrupts to the target Cortex-A9 processor(s)
 - tracking the status of interrupts
 - a wake-up generator (WUGEN) module on external and local interrupts
- Digital signal processor (DSP) subsystem INTC: This module is a specific combination of WUGEN and the C64x+™ DSP INTC. It is used in the device but is not described in detail in this chapter. For detailed information about this module, see [Chapter 5, DSP Subsystem](#).
- Cortex™-M3 MPU subsystem INTC: This module is also called nested vectored interrupt controller (NVIC) and is integrated within each Cortex-M3, so the different interrupt lines are directly connected to each core. To facilitate parallel processing, the interrupt mapping is the same for the two cores. The NVIC supports the following:
 - 64 external interrupts (in addition to 16 Cortex-M3 internal interrupts), which are dynamically prioritized with 16 levels of priority defined for each core
 - low-latency exception and interrupt handling
 - prioritization and handling of exceptions
 - control of the local power management
 - debug accesses to the processor core
 - a WUGEN module on external interrupts, coming from device peripherals

[Figure 18-1](#) shows the internal interrupt scheme of the device.

Figure 18-1. INTC Overview

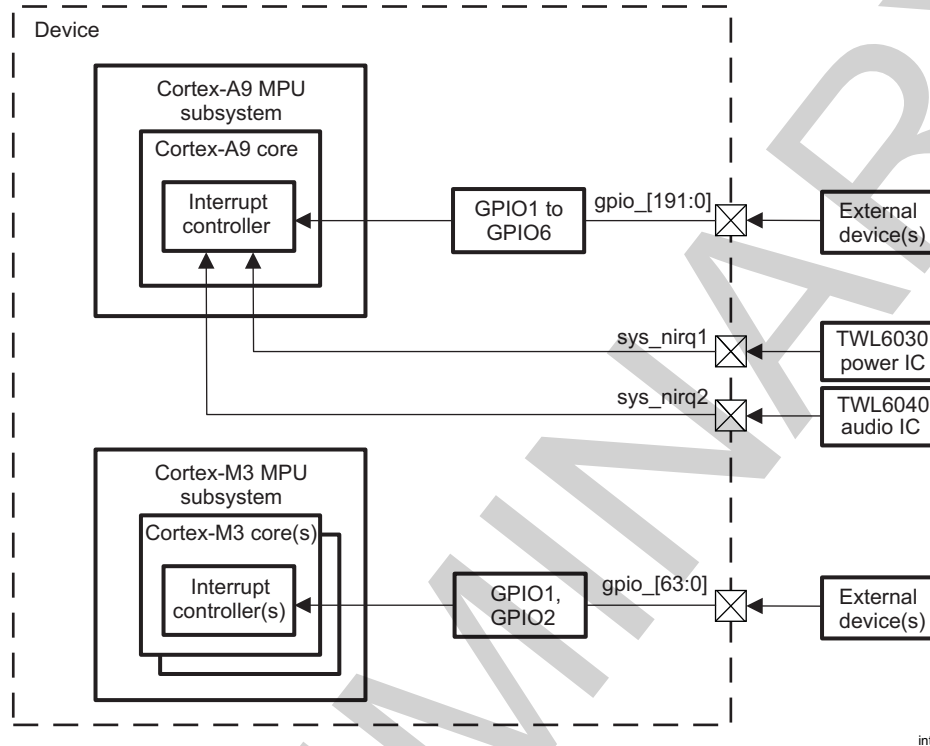

NOTE: For more information about the WUGEN module in the Cortex-A9 MPU subsystem (including integration, functional and register description), see [Chapter 4, Cortex-A9 MPU Subsystem](#).

For more information about the WUGEN module in the Cortex-M3 MPU subsystem (including integration, and functional and register descriptions), see [Chapter 7, Cortex-M3 MPU Subsystem](#).

18.2 INTC Environment

This section describes the INTC application fields from the environment point of view. [Figure 18-2](#) shows the relationship between the module and external interrupts.

Figure 18-2. Interrupts From External Devices

intc-002

[Table 18-1](#) describes the I/O signals that can be used by external devices to generate interrupts to the Cortex-A9 MPU INTC or Cortex-M3 MPU INTC.

Table 18-1. INTC I/O Signals

| Signal Name | I/O ⁽¹⁾ | Reset Value | Description | Cortex-A9 MPU INTC | Cortex-M3 MPU INTC |
|----------------|--------------------|-------------|---|--------------------|--------------------|
| sys_nirq1 | I | 1 | The TWL6030 power IC can use this pin to generate a system wake-up event for Cortex-A9 MPU INTC. | x | — |
| sys_nirq2 | I | 1 | The TWL6040 audio IC can use this pin to generate a system wake-up event for Cortex-A9 MPU INTC. | x | — |
| gpio_[31:0] | I/O | — | External devices can use GPIO modules to generate interrupts to the Cortex-A9 MPU or Cortex-M3 MPU. There are six dedicated interrupt lines (GPIO1 to GPIO6) to the Cortex-A9 MPU INTC, and two dedicated interrupt lines (GPIO1 and GPIO2) to the Cortex-M3 MPU INTC. Each GPIO module can generate a single interrupt whenever there is at least one event in any of the 32 configured GPIO inputs. For more information about GPIO interrupt generation, see Chapter 26, General-Purpose Interface . | x | x |
| gpio_[63:32] | I/O | — | | x | x |
| gpio_[95:64] | I/O | — | | x | — |
| gpio_[127:96] | I/O | — | | x | — |
| gpio_[159:128] | I/O | — | | x | — |
| gpio_[191:160] | I/O | — | | x | — |

⁽¹⁾ I = Input; O = Output; I/O = bidirectional

18.3 INTC Integration

The Cortex-A9 MPU INTC is integrated inside the Cortex-A9 MPU core. For more information about Cortex-A9 MPU INTC integration, see [Chapter 4, Cortex-A9 MPU Subsystem Integration](#).

The Cortex-M3 MPU INTC is integrated inside each Cortex-M3 MPU core. For more information about Cortex-M3 MPU INTC integration, see [Chapter 7, Dual Cortex-M3 MPU Subsystem Integration](#).

18.3.1 Interrupt Mapping

NOTE: All interrupts to device peripherals (external to the Cortex-A9 MPU, DSP, and Cortex-M3 MPU subsystems) are active-high, level-sensitive.

CAUTION

A single interrupt source can be physically mapped to multiple INTCs (Cortex-A9 MPU, DSP, and Cortex-M3 MPU subsystems). With multiple-mapped interrupts, it is strongly recommended to unmask each interrupt source in only one INTC at a time.

18.3.2 Interrupt Requests to Cortex-A9 MPU INTC

[Table 18-2](#) lists the Cortex-A9 MPU INTC interrupt mappings.

Table 18-2. Cortex-A9 MPU INTC Interrupt Mapping

- (1) Internally generated within the Cortex-M3 MPU subsystem
- (2) Shared with DSP INTC
- (3) Shared with Cortex-A9 MPU INTC
- (4) Shared with DSP INTC and Cortex-A9 MPU INTC

NOTE: MM_IRQ_0 triggers exception 16 inside the Cortex-M3 core(s).

NOTE: All Cortex-M3 MPU subsystem internal interrupts are edge interrupts, except the one generated from the MMU (XLATE_MMU_FAULT), which is a level interrupt.

18.4 INTC Functional Description

18.4.1 Cortex-A9 MPU INTC Functional Description

The Cortex-A9 MPU INTC is configured to have the following interrupt sources:

- 16 interprocessor interrupts (IPIs): ID[15:0]
- Two private timer/watchdog interrupts: ID[30:29]
- Two legacy nFIQ nIRQ: one per CPU, bypasses the interrupt distributor logic and drives interrupt requests directly into the CPU, if used in legacy mode (otherwise, they are treated like other interrupts lines with ID28 and ID31, respectively)
- 128 hardware interrupts: ID[159:32] (rising-edge or high-level sensitive). The interrupt mapping of these interrupts is provided in [Table 18-2](#).

CAUTION

Although the hardware interrupts can be configured to be rising-edge or high-level sensitive in the INTC, the device supports only active-high, level-sensitive configuration.

For more information about the functionality of the Cortex-A9 MPU INTC, see the *ARM Cortex-A9 MP Core Technical Reference Manual*.

18.4.2 Cortex-M3 MPU INTC Functional Description

The Cortex-M3 MPU INTC has the following configuration in the device:

- 64 hardware interrupts/16 levels of priority for each Cortex-M3 core. The interrupt mapping of these interrupts is provided in [Table 18-3](#).
- The calibration register, which is used to reload the SYSTICK timer to generate a fixed interval, is not supported in the Cortex-M3 core within the Cortex-M3 MPU subsystem. The TENMS field is not available due to the different frequencies during voltage scaling.
- The SYSRESETREQ reset feature is not supported at the Cortex-M3 processor level. Writing to this bit has no effect.

For more information about the functionality of the Cortex-M3 MPU INTC, see *ARM Cortex-M3 Technical Reference Manual*.

18.5 INTC Register Manual

18.5.1 INTC Instance Summary

For information about the Cortex-A9 MPU INTC and Cortex-M3 MPU INTC instances, see [Chapter 4](#), *Cortex-A9 MPU Subsystem* and [Chapter 7](#), *Dual Cortex-M3 Subsystem*.

18.5.2 Cortex-A9 MPU INTC Registers

For information about the Cortex-A9 MPU INTC registers and their description, see the *ARM Cortex-A9 MP Core Technical Reference Manual*.

18.5.3 Cortex-M3 MPU INTC Registers

For information about the Cortex-M3 MPU INTC registers and their description, see the *ARM Cortex-M3 Technical Reference Manual*.

Control Module

This chapter describes the system control module for the device.

| Topic | Page |
|--|------|
| 19.1 Control Module Overview | 3474 |
| 19.2 Control Module Environment | 3476 |
| 19.3 Control Module Integration | 3477 |
| 19.4 Control Module Functional Description | 3481 |
| 19.5 Control Module Programming Guide | 3697 |
| 19.6 Control Module Register Manual | 3704 |

19.1 Control Module Overview

The control module allows software control of the various static modes supported by the device. It is composed of two control submodules: general control module and device (padconfiguration) control module.

The general control module has the following features:

- General status and control
- Hardware observability input/output (I/O) multiplexing
- Standard eFuse logic

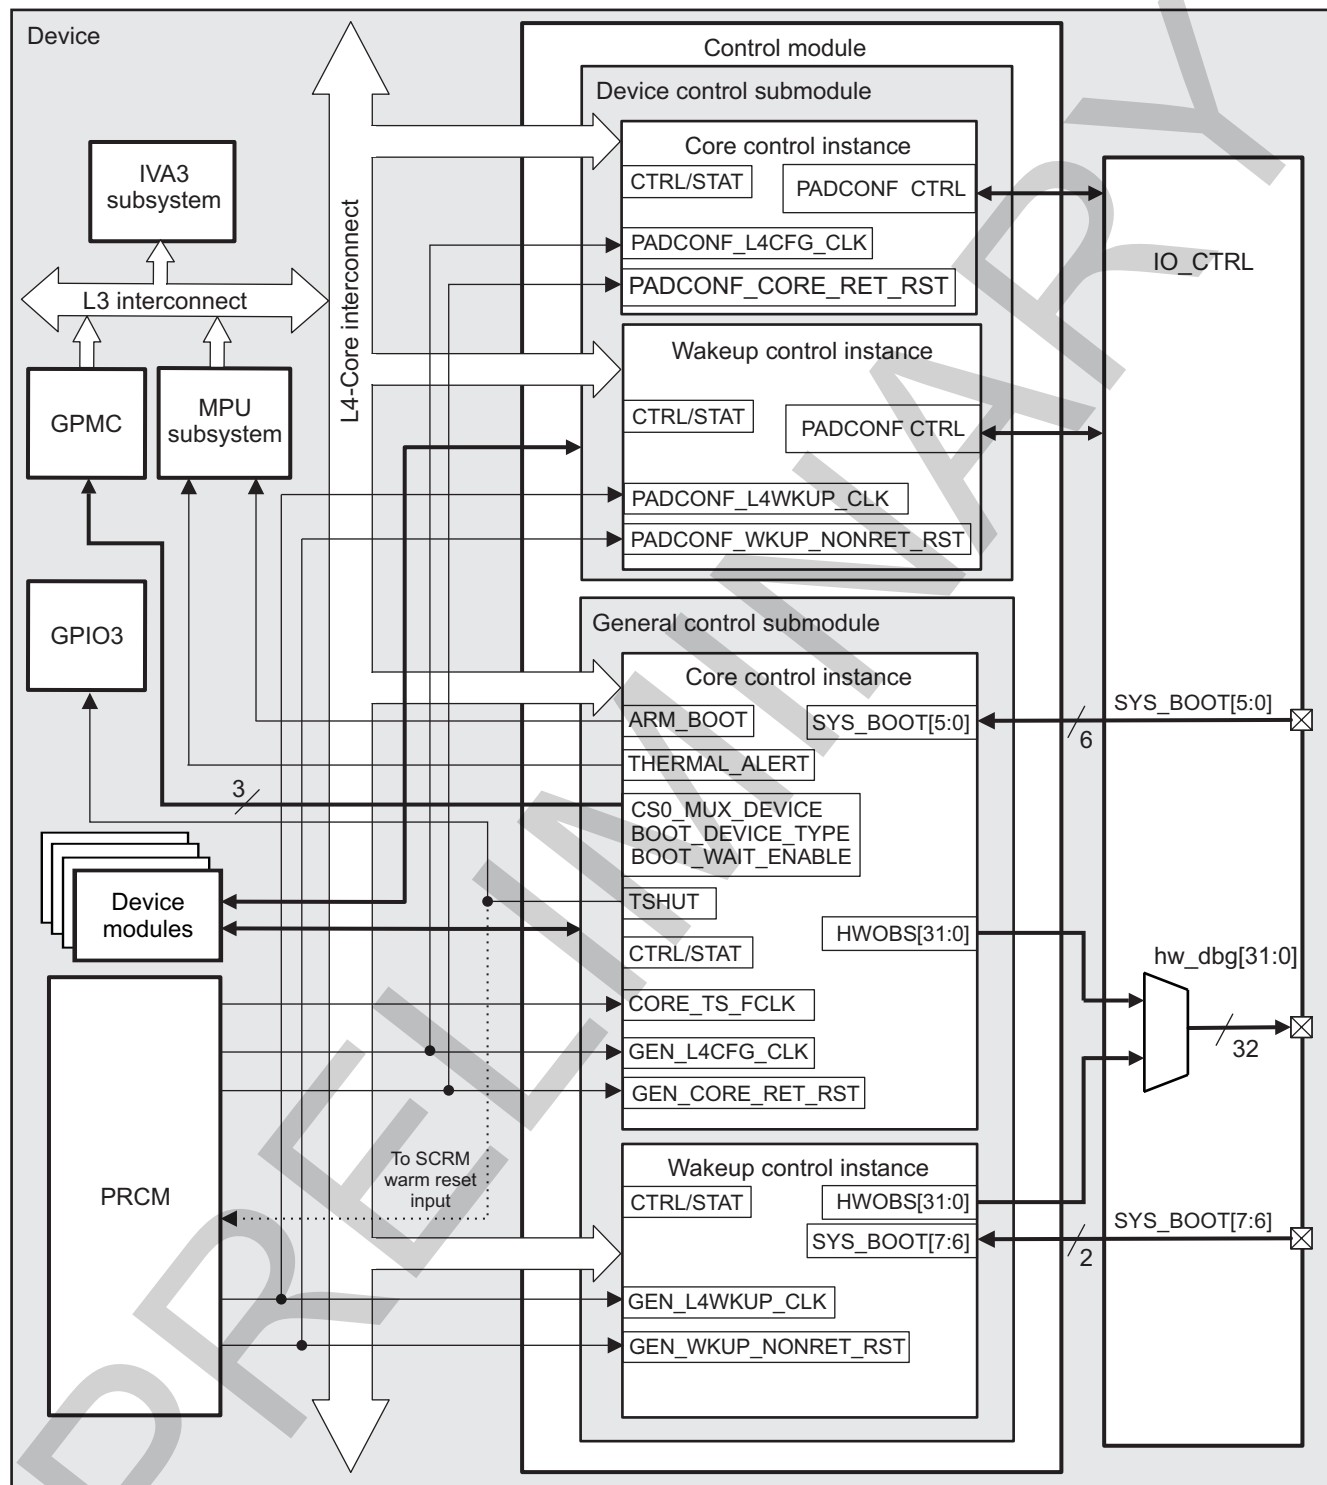

The device control module provides the following features:

- Pad functional I/O multiplexing
- Pad pullup/down configuration
- Pad groups associated signal integrity controls
- Complex I/O configuration
- Analog function control
- Device-specific eFuse registers

Both control submodules are split into two instances: the control core instance within the CORE power domain, and the control wake-up instance within the WKUP power domain. For more information about the four different control module instances, see [Section 19.3, Control Module Integration](#).

[Figure 19-1](#) is an overview of the control module.

Figure 19-1. Control Module Overview

sysctrl-001

19.2 Control Module Environment

The control module controls the multiplexing of device internal module signals routed to the external pins (hw_dbg[31:0]) for hardware debug purposes. For more information, see [Section 19.4.11, Hardware Observability](#), and [Section 19.4.8, PAD Functional Multiplexing and Configuration](#). Using the correct pad configuration, the control module maps these pins at the device boundary to observe the internal signals from the power, reset, and clock management (PRCM) module, direct memory access (DMA) requests, and interrupts. [Figure 19-2](#) is an overview of the control module environment.

Figure 19-2. Control Module Environment

sysctrl-002

19.2.1 Control Module Signals

[Table 19-1](#) lists the control module hardware observability outputs configured to observe the debug signals of the device module. It describes the module signals and specifies their links to functions.

Table 19-1. Control Module I/O Description

| Signal | I/O ⁽¹⁾ | Description | Reset Value ⁽²⁾ |
|--------------|--------------------|---|----------------------------|
| hw_dbg[31:0] | O | Internal hardware observability signals 0 to 31 | hi-Z |

⁽¹⁾ I = Input; O = Output; I/O = Bidirectional

⁽²⁾ hi-Z = High impedance

19.3 Control Module Integration

The control module of the device is on the L4-Core interconnect. It consists of four module instances:

- General core control module (SYSCTRL_GENERAL_CORE)
- General wakeup control module (SYSCTRL_GENERAL_WKUP)
- Device core control module (SYSCTRL_PADCONF_CORE)
- Device wakeup control module (SYSCTRL_PADCONF_WKUP)

For more information about the different control module instances, see [Table 19-4](#).

Each of these four module instances has an associated register set and shares one functional clock and one reset signal with the PRCM module. The exception is general core control module (SYSCTRL_GENERAL_CORE) which also receives a secondary functional clock, CORE_TS_FCLK.

[Table 19-2](#) describes the signals.

Table 19-2. Clocks and Resets

| Clocks | | | | |
|----------------------|-------------------------|--------------------|--------|---|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| SYSCTRL_GENERAL_WKUP | GEN_L4WKUP_CLK | WKUP_L4_ICLK2 | PRCM | L4_WKUP interface/functional clock propagated to the general wakeup control module |
| SYSCTRL_GENERAL_CORE | GEN_L4CFG_CLK | CFG_L4_ICLK | PRCM | L4_CFG interface/functional clock propagated to the general core control module |
| | CORE_TS_FCLK | CORE_TS_FCLK | PRCM | Functional clock for the band gap state-machine instantiated in the general core control module |
| SYSCTRL_PADCONF_WKUP | PADCONF_L4WKUP_CLK | WKUP_L4_ICLK2 | PRCM | L4_WKUP interface/functional clock propagated to the device wakeup control module |
| SYSCTRL_PADCONF_CORE | PADCONF_L4CFG_CLK | CFG_L4_ICLK | PRCM | L4_CFG interface/functional clock propagated to the device core control module |
| Resets | | | | |
| SYSCTRL_GENERAL_WKUP | GEN_WKUP_NONRET_RST | WKUP_PWRON_RST | PRCM | Internal power-on reset (POR) affecting the general wakeup control module |
| SYSCTRL_GENERAL_CORE | GEN_CORE_RET_RST | CORE_PWRON_RET_RST | PRCM | Internal POR affecting the general core control module |
| SYSCTRL_PADCONF_WKUP | PADCONF_WKUP_NONRET_RST | WKUP_PWRON_RST | PRCM | Internal POR affecting the device wakeup control module |
| SYSCTRL_PADCONF_CORE | PADCONF_CORE_RET_RST | CORE_PWRON_RET_RST | PRCM | Internal POR affecting the device core control module |

Table 19-3. Hardware Requests

| Interrupt Requests | | | | |
|----------------------|--------------------|-------------------------|----------------|--|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| SYSCTRL_GENERAL_CORE | THERMAL_ALERT | MA_IRQ_126 | CORTEX-A9 INTC | Interrupt generated by general core control module to CORTEX™-A9 |

NOTE: For a description of the interrupt sources, see [Section 18.3.2, Interrupt Requests to the Cortex-A9 MPU Interrupt Controller](#).

The control module is reset by the internal POR, which is active low. The PRCM module provides a

retention POR signal (CORE_PWRON_RET_RST) duplicated to both of the core control module instances, and a nonretention POR signal (WKUP_PWRON_RST) duplicated to each of the two wake-up control module instances in the control module. For more information, see [Section 3.5.4, Reset Domains](#), in [Chapter 3, Power, Reset, and Clock Management](#). The control module does not respond to a warm reset or to an L4-Core reset.

The main sequential logic within the control module is accessible in a register file through the L4-Core interconnect. The PRCM module provides the CFG_L4_ICLK functional clock signal (L4_CFG clock domain) separately to each of the two core control submodules. In addition, an instantiated inside the general core control, the band gap state-machine receives its functional clock (CORE_TS_FCLK) from the PRCM module. For more information about this signal, see [Section 3.6.3.2.4, CM2 Clock Generator](#) in [Chapter 3, Power, Reset, and Clock Management](#).

The PRCM module also supplies the WKUP_L4_ICLK2 functional clock signal (L4_WKUP clock domain) to each of the two wake-up control module instances. For more information about this signal, see [Section 3.6.3.1, PRM Clock Source](#) in [Chapter 3, Power, Reset, and Clock Management](#).

The PRCM module latches the sys_boot[7:0] pad signals at POR and exports them as vector to the SYSBOOT[7:0] input of the general core control module. It is scanned in the [CONTROL_STATUS\[7:0\]](#) SYS_BOOT bit field. For more information, see [Section 28.2.4.2, Booting Device Order Selection](#), and [Section 28.2.4.1, Clock Source Selection](#) of the chapter, *Initialization*.

The thermal management subsystem inside the general core control module delivers one interrupt request (THERMAL_ALERT) to line MA_IRQ_126 of the MPU subsystem interrupt controller (INTC) (Cortex-A9 INTC), and delivers a thermal shutdown protection output signal (TSHUT) to:

1. the GPIO3 controller instance
2. the device SCRM external warm reset mapping logic to optionally generate a device hardware warm reset upon a TSHUT event

For more information about the functional outputs of the thermal management control module, see [Section 19.4.10](#).

The signal integration of the control module features:

- No IDLE hardware handshake
- No STANDBY hardware handshake
- No SAVE and RESTORE hardware handshake
- No wake-up request generation
- No DMA request generation
- One interrupt request (IRQ) – THERMAL_ALERT to the MPU subsystem
- A thermal shutdown protection signal (TSHUT) delivered to a GPIO3 input and to the SCRM external warm reset mapping logic of the PRCM module
- Three functional clocks: two clocks in the CFG and one in the WKUP clock domains
- One retention and one nonretention internal power-on-based resets

[Figure 19-3](#) shows the integration of the module in the device.

Figure 19-3. Control Module Integration

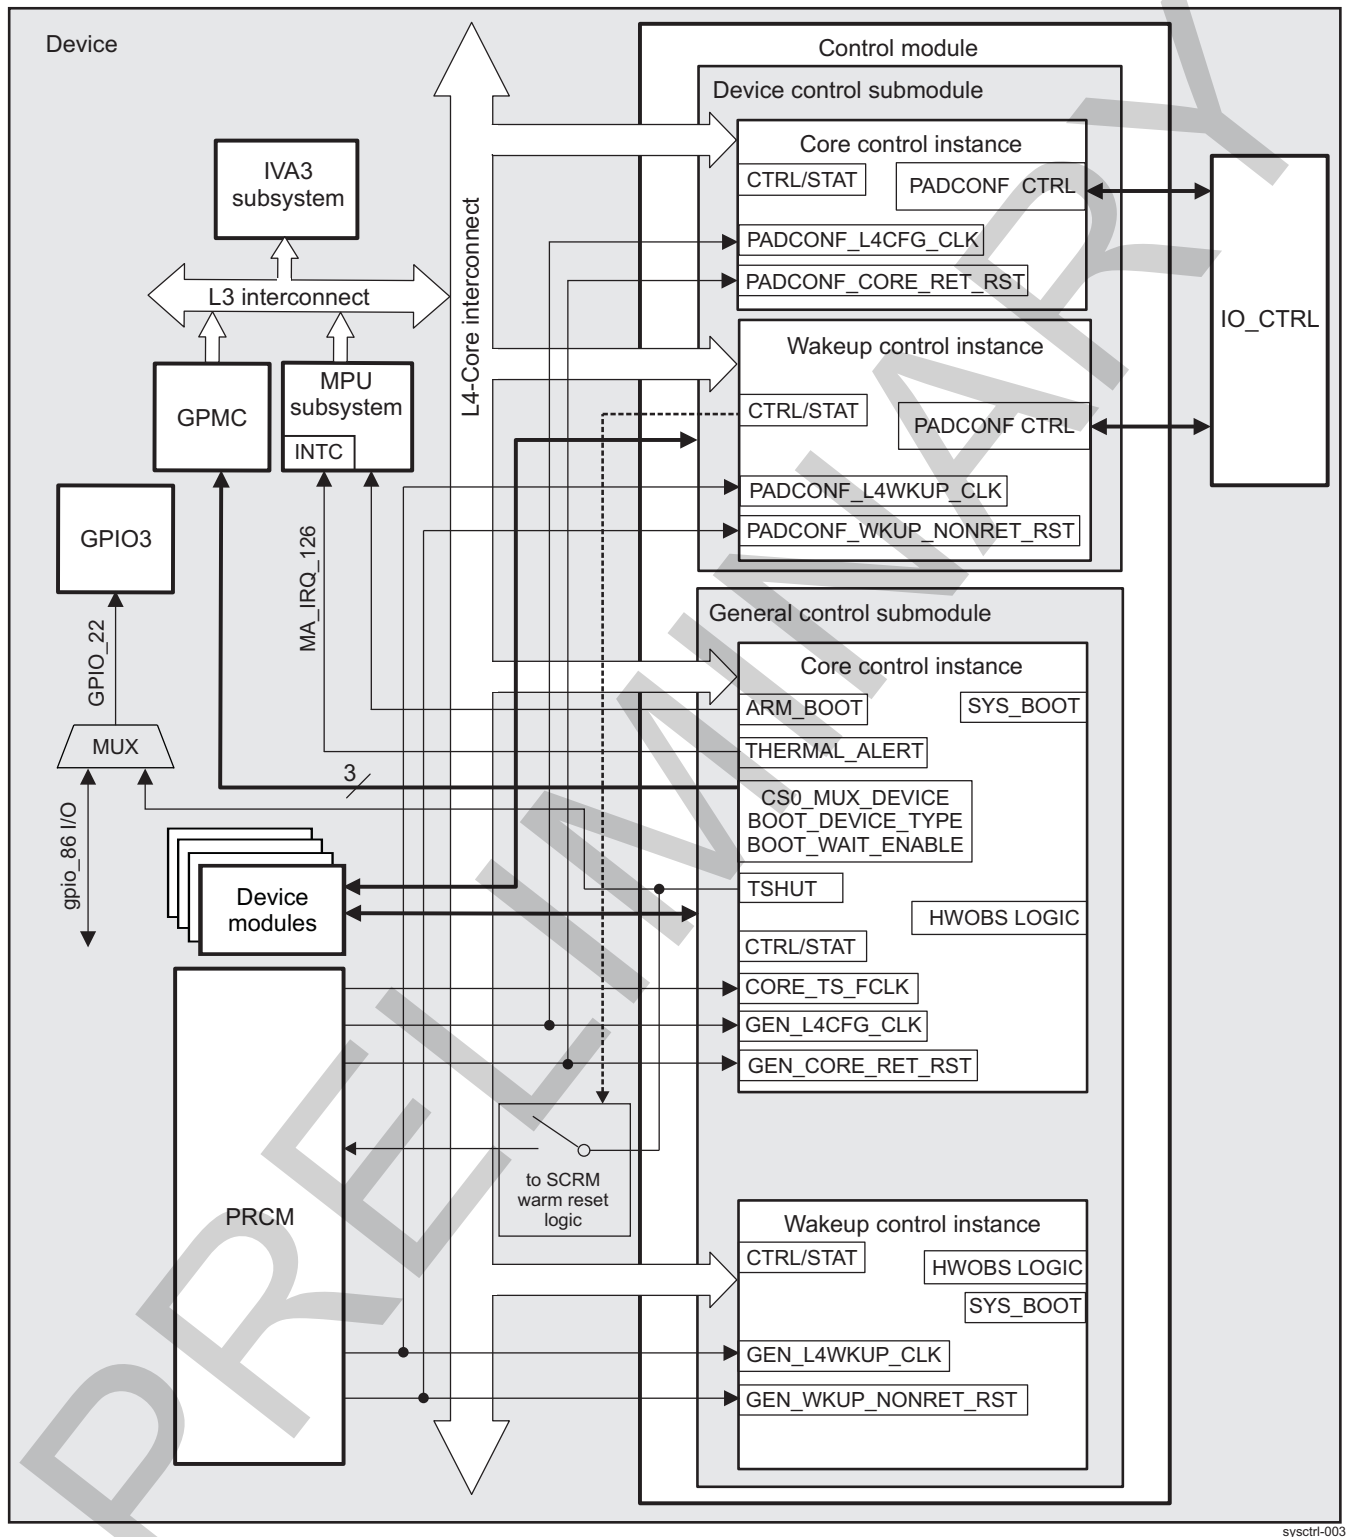

Table 19-4 lists the integration attributes.

Table 19-4. Integration Attributes

| Module Instance | Attributes | |
|----------------------|--------------|--------------|
| | Power Domain | Interconnect |
| SYSCTRL_GENERAL_WKUP | PD_WKUP | L4_WKUP |
| SYSCTRL_GENERAL_CORE | PD_CORE | L4_CFG |
| SYSCTRL_PADCONF_WKUP | PD_WKUP | L4_WKUP |
| SYSCTRL_PADCONF_CORE | PD_CORE | L4_CFG |

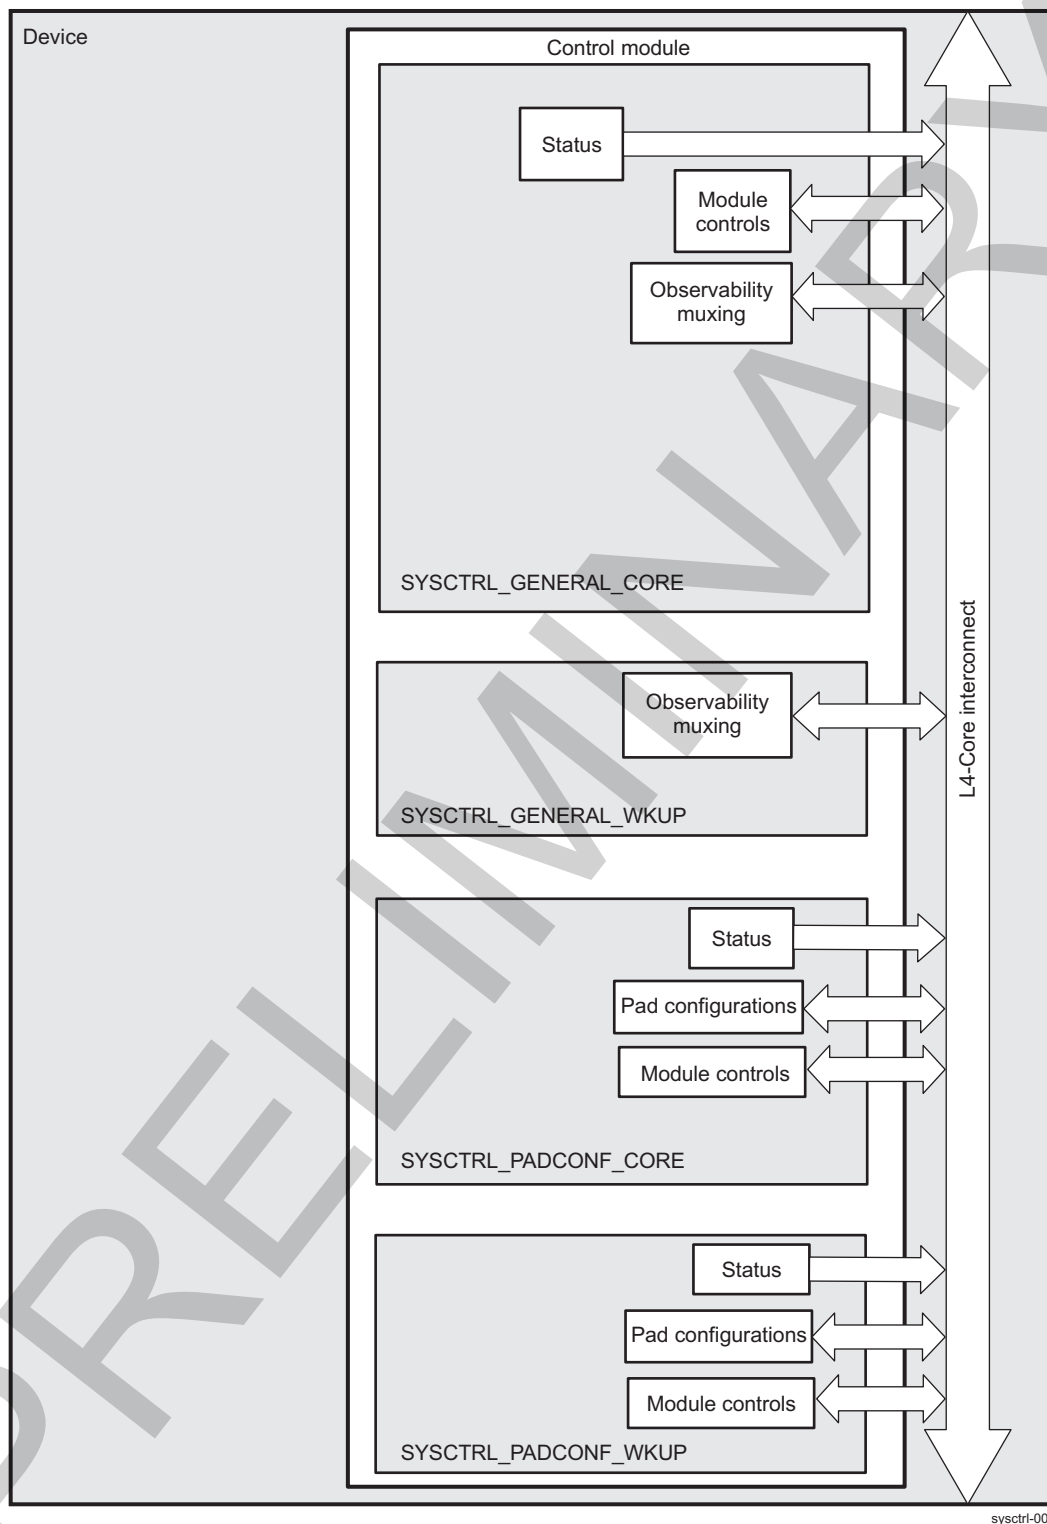

Software sets the configuration registers to the desired values depending on the configuration of the requested device. Static device configuration registers can be set by software any time and are effective immediately.

19.4 Control Module Functional Description

19.4.1 Control Module Block Diagram

The control module controls the settings of various device modules through the register configuration and internal signals. It also controls the pad configuration, pin functional multiplexing, and the routing of internal signals (such as PRCM signals or DMA requests) to output pins configured for hardware observability.

[Figure 19-4](#) is the control module block diagram.

Figure 19-4. Control Module Block Diagram

The control submodules primarily implement a bank of registers accessible (read/write) by software and some read-only registers that provide status information.

The read/write registers in the general control module can be divided into the following classes:

- Hardware observability registers (32-bit read/write registers)

- Status and configuration registers
- Boot registers
- eFuse ROM registers
- Miscellaneous functional registers

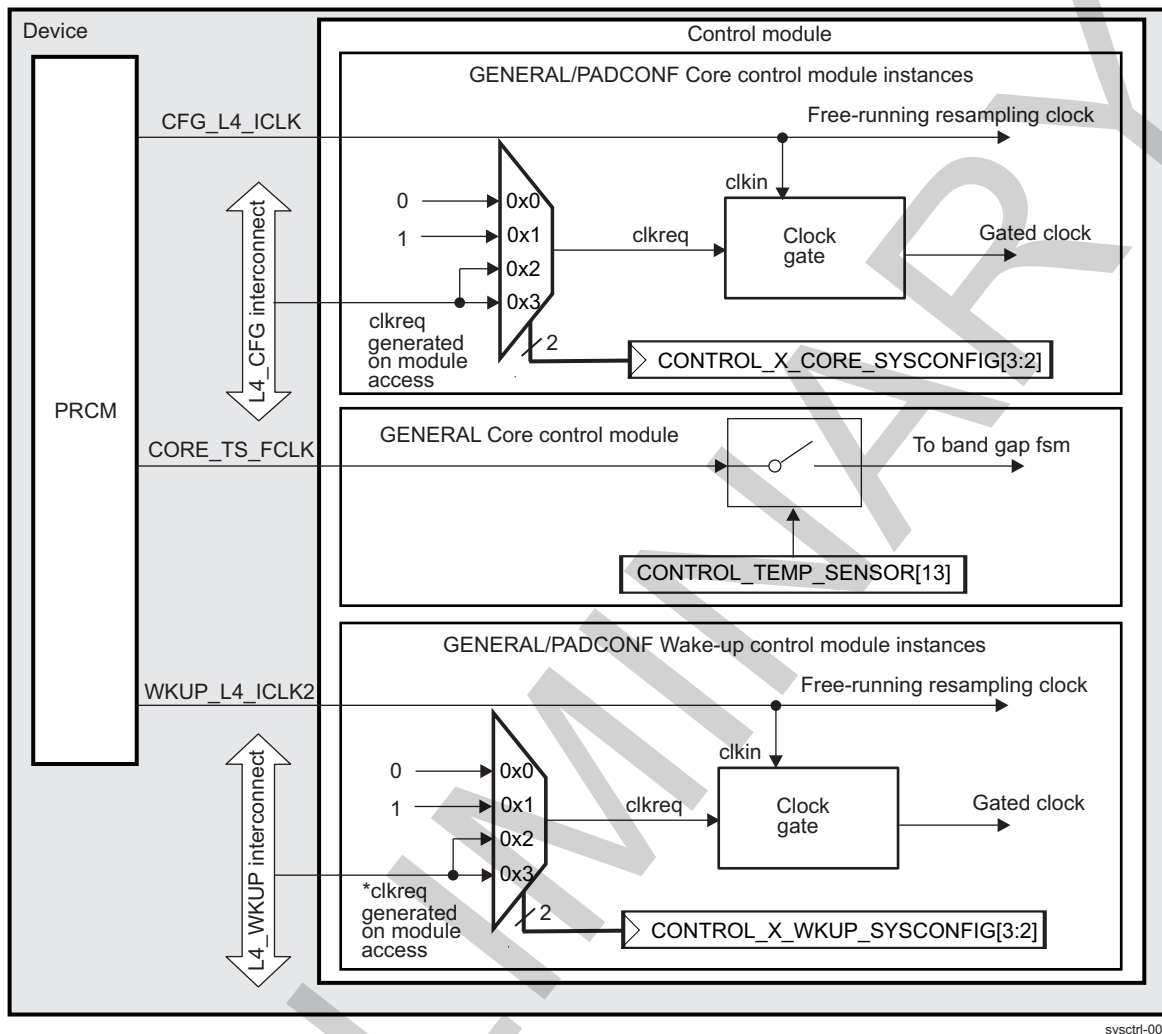

The read/write registers in the device(padconfiguration) control module can be divided into the following classes:

- Pad configuration registers (32-bit registers, one register for two pads)
- Pad groups (not individual per pad) associated registers for signal integrity parameters control (32-bit read/write registers)
- I/O cells associated specific control registers
- Device-specific status and configuration registers
- Miscellaneous functional registers

19.4.2 Control Module Clock Configuration

[Figure 19-5](#) shows the distribution schema of the control module internal clock . Each CFG_L4_ICLK and WKUP_L4_ICLK2 source clock is internally distributed into two clock paths: the first path directly mirrors the source clock and is an always-running clock. It is used to synchronize and resample some of the module inputs. The other clock path can be internally gated within the module.

The CORE_TS_FCLK clock, which drives the general core control band gap state-machine, can also be locally gated through a dedicated bit in the [CONTROL_TEMP_SENSOR](#) register. For more information about the temperature module off mode, see [Figure 19-5, Band Gap Voltage and Temperature Sensor](#).

Figure 19-5. Control Module Internal Clock Paths

sysctrl-005

The clock-gating strategy for L4 clocks is selected through the **CONTROL_SYSCONFIG[3:2]** **IP_SYSCONFIG_IDLEMODE** bit field available in each of the four control module instances. [Table 19-5](#) describes the different possibilities for clock management. There are no PRCM software controls for the **CFG_L4_ICLK** and **WKUP_L4_ICLK2** clocks in the control module. There are, however, clock activity status bits in the PRCM module.

The **CORE_TS_FCLK** has the following software controls: enable, status, and divider ratio, in the PRCM module. See [Section 3.6.4.2, Clock Domain Modes](#), and [Section 3.6.4, CD_WKUP Clock Domain](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 19-5. Internal Clock Gating Options

| Feature | CONTROL_SYSCONFIG[3:2] IP_SYSCONFIG_IDLEMODE Value | Description |
|------------------------|--|---|
| Local clock control | 0b00 | Clock is manually gated. |
| Local clock control | 0b01 | Clock is manually enabled. |
| Local clock autogating | 0b10, 0b11 | Clock is automatically gated when there is no access to the control module through the L4-interconnect. |

19.4.3 Control Module Software Reset

The control module is not sensitive to software reset.

19.4.4 Control Module Power Management

19.4.4.1 Retention

The general core module and device core control module instances are fully built with retention flip-flops (RFFs) and are powered in the CORE power domain; thus, they can be in active or retention mode. The core instances lose their content when the CORE power domain is in off mode. In contrast to the core control instances, the control wake-up instances are always powered and active. For more information about the device low-power states, see [Section 3.9, Device Low-Power States](#), in [Chapter 3, Power, Reset, and Clock Management](#).

19.4.4.2 Power Management Protocols

The control module, which is slave on the L4 interconnect, does not support standby or idle mode protocols.

19.4.4.3 Save-and-Restore Mechanism

The control core module instances lose their contents when the CORE power domain is in off mode. To prevent this, before going to off mode, the core register context is copied by software into a dedicated SAR_RAM in the WKUP voltage domain. The save-and-restore (SAR) mechanism, controlled by the PRCM module, allows restoring registers to the value present before going to off mode. Thus, core domain registers have a correct configuration/state immediately after the core power is on again without requesting a software operation to reconfigure them.

Because the SAR mechanism is managed by software-accessible registers, no hardware-specific requirements exist. For more information about SAR, see [Section 3.9.3, Device OFF State Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

19.4.5 Hardware Requests

The control module does not generate DMA or wake-up requests. The general core control module generates one IRQ (THERMAL_ALERT) to the Cortex-A9 INTC (MA_IRQ_126 line). For more information, see [Section 18.3.2, Interrupt Requests to the Cortex-A9 MPU Interrupt Controller](#).

19.4.6 Control Module Initialization

The control module responds only to the internal POR and device type. At power-on, reset values for the registers define the *safe state* for the device. In the initialization mode, only modules to be used at boot time are associated with the pads. Other module inputs are internally tied and outputs pads are turned off. After POR, software must set the pad functional multiplexing and configuration registers to the desired values according to the requested device configuration. For more information, see [Chapter 28, Initialization](#).

General-purpose (GP) devices include features that are inaccessible or unavailable. These inaccessible registers define the default or fixed device configuration or behavior.

The [CONTROL_STATUS\[7:0\]](#) SYS_BOOT boot field reflects the state of the sys_boot pins captured at POR in the PRCM module.

19.4.7 General Control Module Instances

19.4.7.1 General Core Control Module Instance

The SYSCTRL_GENERAL_CORE instance contains most of the control logic that provides the hardware observability features for different digital phase-locked loop (DPLL) clockout and DPLL-specific signals, DMA requests, IRQs, and other internal hardware signals. The general core control provides the system boot decoding logic and has control over the standard eFuse settings. The system configuration registers, specific function controls, and some peripheral control and status registers are also mapped there.

The register sets available within the SYSCTRL_GENERAL_CORE are:

- Observability control registers:
 - [CONTROL_HWOBS_CONTROL](#)
 - [CONTROL_DEBOBS_FINAL_MUX_SEL](#)
 - [CONTROL_CONF_SDMA_REQ_SELx](#)
 - [CONTROL_CONF_CLK_SELx](#) (where x = 0 to 2)
 - [CONTROL_CONF_DPLL_X_SEL](#) (where X = FREQLOCK, TINITZ, PHASELOCK, TENABLE, TENABLEDIV, BYPASSACK, IDLE)
- Part of the debug view channel selection registers: [CONTROL_CORE_CONF_DEBUG_SEL_TST_X](#)
- MMU address translation-related registers: [CONTROL_CORTEX_M3_MMUADDRTRANSLTR](#) and [CONTROL_CORTEX_M3_MMUADDRLOGICTR](#)
- Standard fuse registers: [CONTROL_STD_FUSE_X](#)
- Clock gating configuration register: [CONTROL_GEN_CORE_SYSCONFIG](#)
- Control status register: [CONTROL_STATUS](#)
- Peripheral control registers:
 - [CONTROL_TEMP_SENSOR](#)
 - [CONTROL_BANDGAP_CTRL](#)
 - [CONTROL_BANDGAP_COUNTER](#)
 - [CONTROL_BANDGAP_THRESHOLD](#)
 - [CONTROL_TSHUT_THRESHOLD](#)
 - [CONTROL_BANDGAP_STATUS](#)
 - [CONTROL_DSS_CONTROL](#)
 - [CONTROL_USBOTGHS_CONTROL](#)
 - [CONTROL_LDOSRAM_MPU_VOLTAGE_CTRL](#)
 - Etc.

19.4.7.2 General Wakeup Control Module Instance

The registers associated with this module are:

- Clock gating configuration register: [CONTROL_GEN_WKUP_SYSCONFIG](#)
- Register with spare bits: [CONTROL_OCPREG_SPARE](#)
- Part of the debug view channel selection registers: [CONTROL_WKUP_CONF_DEBUG_SEL_TST_X](#)

19.4.7.3 Device Core Control Module Instance

The SYSCTRL_PADCONF_CORE instance provides the device-specific pad control features, such as pullup/down I/O configuration and pad functional multiplexing. Wake-up control/status features are also subjects of the device core control.

The registers associated with this module are:

- Clock gating configuration register: [CONTROL_PADCONF_CORE_SYSCONFIG](#)
- Different peripheral pad mode configuration and wake-up status/configuration registers:

- CONTROL_CORE_PAD0_X_PAD1_Y
- CONTROL_PADCONF_WAKEUPEVENTx
- [CONTROL_PADCONF_GLOBAL](#)
- CONTROL_SMARTxIO
- [CONTROL_C2CIO_PADCONF_0](#)
- Etc.
- Peripheral pad voltage-level control register: CONTROL_PADCONF_MODE
- Miscellaneous controls for different device interface modules: CONTROL_X registers, such as the [CONTROL_MMC1](#) register (including the CONTROL_EFUSE registers)

19.4.7.4 Device Wake-Up Control Module Instance

Configuration registers for all pads linked to the wake-up voltage domain are in the WKUP device control module. The registers instantiated are:

- Clock gating configuration register: [CONTROL_PADCONF_WKUP_SYSCONFIG](#)
- CONTROL_WKUP_PAD0_X_PAD1_Y registers for configuring FREF clock oscillator pads, reset signals, and power mode pad configurations

NOTE: SYSCTRL_PADCONF_X alias notifies a device control module instance.

[Table 19-111](#) shows the memory size and base addresses assigned to the different control module instances

19.4.8 Pad Functional Multiplexing and Configuration

After POR, software must set the pad functional multiplexing and configuration registers to the desired values according to the requested device configuration. The configuration is controlled by pads or a group of pads. Each configurable pin has its own configuration register for pullup/down control and for assignment to a given module.

Two sets of 32-bit registers provide the pad functional multiplexing and configuration feature of the control module. The first set of registers (CONTROL_CORE_PAD0_X_PAD1_Y) configures the pads in the CORE power domain. The second set of registers (CONTROL_WKUP_PAD0_X_PAD1_Y) configures the pads in the WKUP power domain.

The pad configuration as defined in this module is used in the IO_CTRL logic along with the gating and protection features. The gating feature is implemented for the output pads. The protection feature is implemented for input lines. These features implement additional control and multiplexing capabilities hard-wired in the IO_CTRL logic and driven by the state and/or logic of the internal device.

The gating feature allows forcing an output pad to a fixed value (Z, pullup, pulldown, 1, 0) or to a given internal signal. Each gating command is defined with a logic equation and the output state or value to be set on the pad when the logic equation is "True."

The protection feature provides control on each input line of the control module when no pad is assigned to this input (protected value). When POR is released, the value on the pad is driven by the default configuration of the control module. This configuration is usually aligned with the default value selected on the I/O cell. The protected value can be logical level (0 or 1) or a signal from a pad; it is selected when none of the pad_x.MuxMod selects a device input.

Each 32-bit pad configuration register controls two pads: the first pad is controlled by the 16 least-significant bits (LSBs), and the second pad is controlled by the 16 most-significant bits (MSBs); thus, one pad configuration register provides control for two different pins. After POR, software sets the pad functional multiplexing and configuration registers to the requested device pad configurations. Data written in these registers directly commands the multiplexing of the pad configuration logic. [Figure 19-6](#) shows the 16-bit-wide pad configuration register field associated with each pin.

Pad configuration register name = pad configuration register field @0xn name

The functional bits of a pad configuration register field are divided into the following five fields:

- MUXMODE (3 bits) defines the multiplexing mode applied to the pin. A mode corresponds to the selection of the function mapped on the pin with seven (0 to 6) possible functional modes for each pin.
- PULL (2 bits) for combinational pullup/down configuration:
 - PULLTYPESELECT: Pullup/down type selection for the pin
 - PULLUDENABLE: Enables pullup/down feature for the pin
- INPUTENABLE (1 bit) drives an input enable signal to the I/O CTRL.
 - INPUTENABLE = 0: Input disable. Pin is configured only in output mode.
 - INPUTENABLE = 1: Input enable. Pin is configured in bidirectional mode.
- Off mode values (1 bit) override the pin state when the OFFMODEENABLE bit in CONTROL_CORE_PAD0_X_PAD1_Y is set and off mode is active. This feature allows having separate configurations (5 bits) for the pins when in off mode:
 - OFFMODEENABLE: Off mode pin state override control. Set to 1 to enable the feature and set to 0 to disable it.
 - OFFMODEOUTENABLE: Off mode output enable value. Set to 0 to enable the feature and set to 1 to disable it.
 - OFFMODEOUTVALUE: Off mode output value.
 - OFFMODEPULLUDENABLE: Off mode pullup/down feature enable
 - OFFMODEPULLTYPESELECT: Off mode pullup/down type selection
- Wake-up bits (2 bits):
 - WAKEUPENABLE: Enable wake-up detection on input. It is also the off mode input enable value.
 - WAKEUPEVENT: Wake-up event status for the pin

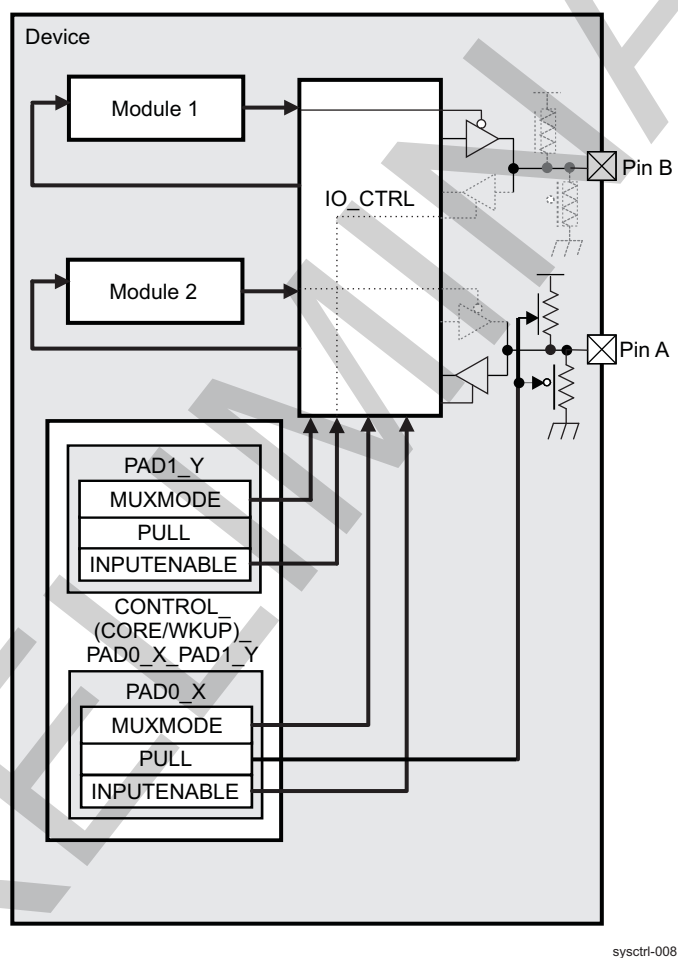

CAUTION

The OFFOUTENABLE and OFFOUTVALUE bits are functional only if the pad configuration supports output mode on at least one MUXMODE. For a pad that supports only the input feature, the OFFOUTENABLE and OFFOUTVALUE bits cannot be configured (they are don't care and read always returns 0).

NOTE: Because off-mode affects pads only in the CORE power domain, OFFMODE-related bits are not present in the pad configuration registers of the WKUP power domain.

Figure 19-7 shows the pad configuration functionality when off mode is inactive. For more information about off mode, see [Section 19.4.8.4, Off Mode PAD Control Overview](#).

Figure 19-7. Pad Configuration Diagram

sysctrl-008

The I/O pads are controlled by software by:

- Writing to the CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y registers in the device control module for I/O and pullup/down configuration
- Writing to the GPIOi.GPIO_OE registers in the GPIO module for I/O configuration

For more information about how to configure the I/O pads, see [Section 19.5.1.2.4, Pad Configuration Programming Points](#).

For more information about the GPIO module, see [Section 26.4.8, General-Purpose Interface Data Input/Output Capabilities](#).

NOTE: For the proper functioning of the following modules, the INPUTENABLE bit in the corresponding pad configuration register must be set to 1 for pads configured to drive output clocks:

- GPMC
- I2Ci
- MMCi
- HSUSB HOST
- McPDM

NOTE: For a correct configuration of each pin direction (input, output, bidirectional), the CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y and GPIOi.GPIO_OE registers must be written.

NOTE: Software INPUTENABLE controls are not available for the lpddr21_x, lpddr22_x, usbb1_hsic_x, and usbb2_hsic_x pads. Once their buffers are enabled they are always bidirectional. For more information, see [Section 19.4.12.8.2, High-Speed I/O Buffers With Impedance, Slew Rate, and Weak Driver Settings](#).

[Table 19-6](#) lists the bit directions of the CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y registers.

Table 19-6. Bit Meanings for CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y Registers

| Pad Configuration Bit | Bit Meaning | |
|-----------------------|--|--|
| | 0 | 1 |
| PULLUDENABLE | Not activated | Activated |
| PULLYPESELECT | Pulldown | Pullup |
| INPUTENABLE | Input enable signal is inactive. | Input enable signal is active. |
| OFFMODEENABLE | Off mode values are invalid. | Off mode values are valid. |
| OFFMODEOUTENABLE | Output | Input |
| OFFMODEOUTVALUE | Low | High |
| OFFMODEPULLUDENABLE | Not activated | Activated |
| OFFMODEPULLYPESELECT | Pulldown | Pullup |
| WAKEUPENABLE | Disable I/O wake-up function. | Enable I/O wake-up function. |
| WAKEUPEVENT | Wake-up event is not detected. | Wake-up event is detected. |
| MUXMODE bits | See Table 19-7, Mode Selection . | See Table 19-7, Mode Selection . |

19.4.8.1 Mode Selection

[Table 19-7](#) lists the multiplexing modes and settings.

Table 19-7. Mode Selection

| MUXMODE | Selected Mode |
|---------|-----------------------|
| 0b000 | Primary mode = Mode 0 |
| 0b001 | Mode 1 |
| 0b010 | Mode 2 |
| 0b011 | Mode 3 |
| 0b100 | Mode 4 |
| 0b101 | Mode 5 |
| 0b110 | Mode 6 |
| 0b111 | Safe mode = Mode 7 |

The MUXMODE field in the CONTROL_CORE_PAD0_X_PAD1_Y and CONTROL_WKUP_PAD0_X_PAD1_Y registers defines the multiplexing mode applied to the pad. Modes are referred to by their decimal (from 0 to 7) or binary (from 0b000 to 0b111) representation. Functional modes are defined from 0b000 to 0b110; mode 0b111 is referred to as the safe mode.

For most pads, the reset value for the MUXMODE field in the CONTROL_CORE_PAD0_X_PAD1_Y and CONTROL_WKUP_PAD0_X_PAD1_Y registers is 0b111. The exceptions are pads to be used at boot time to transfer data from selected peripherals to the external flash memory.

Mode 0 is the primary mode. When mode 0 is set, the function mapped to the pin corresponds to the name of the pin.

Modes 1–6 are possible modes for alternate functions. On each pin, some modes are used effectively for alternate functions, while other modes are unused and correspond to no functional configuration.

Safe mode (Mode 7) avoids any risk of electrical contention by configuring the pin as an input with no functional interface mapped to it. Safe mode is used mainly as the default mode for all pins containing no mandatory interface at the release of POR.

NOTE: When a pad is set into a mux mode that is not defined by pin multiplexing, the pad is actually set undriven (hi-Z) with potential pullup/down.

For more information about the configurable mode on each pin, see [Table 19-10](#) and [Table 19-9](#).

NOTE: Pad names are signal names available in mode 0.

19.4.8.2 Pull Selection

There is no automatic gating control to ensure that internal weak pulldown/pullup resistors on a pad are disconnected whenever pad is configured as output. If a pad is always configured in output mode, it is recommended for user software to disable any internal pull resistor tied to it, to avoid unnecessary consumption.

Table 19-8. Pull Selection

| PULL | | Pin Behavior |
|----------------|--------------|-------------------------------------|
| PULLTYPESELECT | PULLUDENABLE | |
| 0b0 | 0b0 | Pulldown selected but not activated |
| 0b0 | 0b1 | Pulldown selected and activated |
| 0b1 | 0b0 | Pullup selected but not activated |
| 0b1 | 0b1 | Pullup selected and activated |

For more information about the pull available on each pin, see [Table 19-10](#) and [Table 19-9](#).

NOTE: Software controls for internal active mode pullups and pulldowns on the lpddr21_x and lpddr22_x pads are available in the [CONTROL_LPDDR2IO1_0](#) through [CONTROL_LPDDR2IO1_2](#) and [CONTROL_LPDDR2IO2_0](#) through [CONTROL_LPDDR2IO2_2](#) registers, respectively.

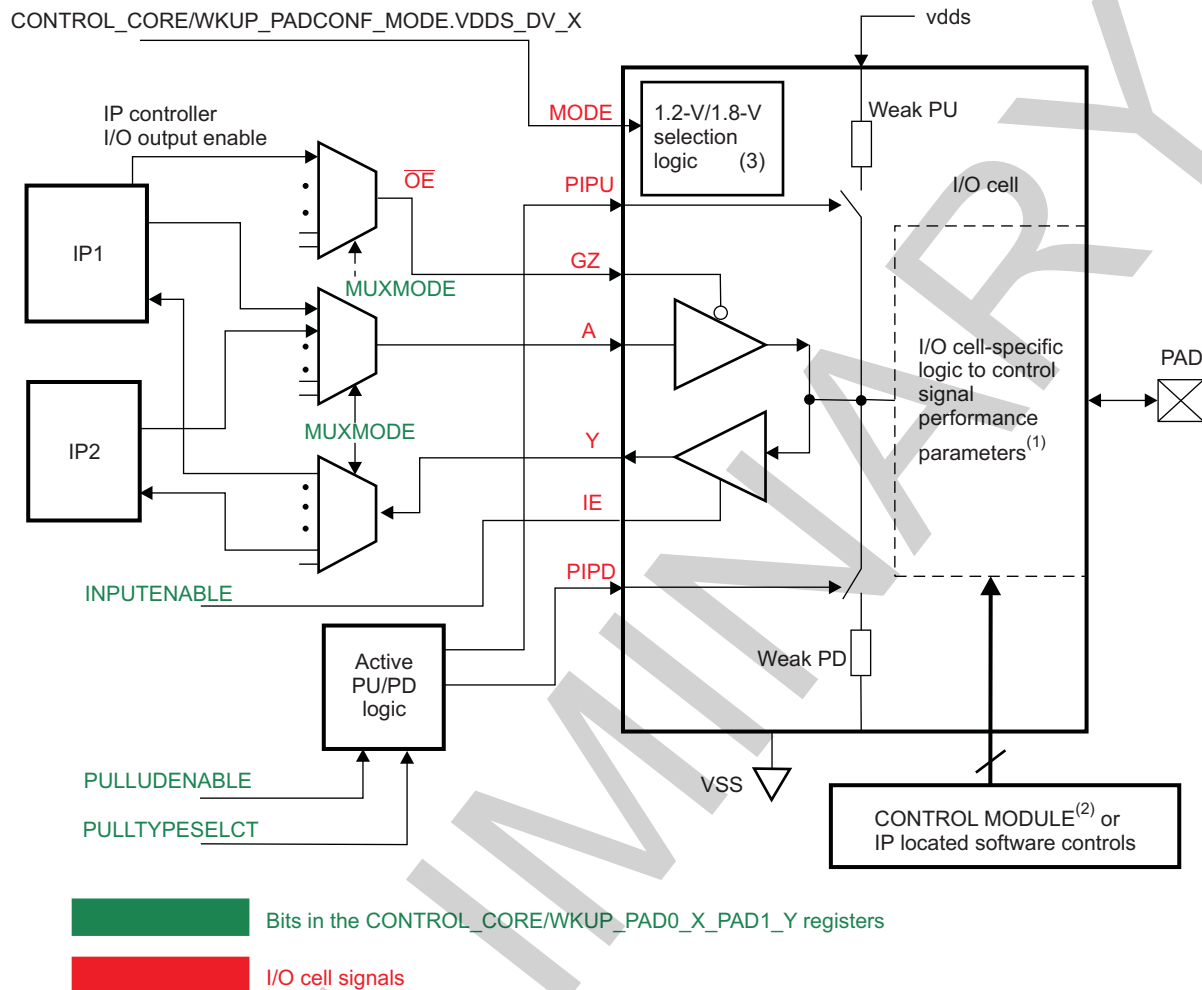

Software controls for internal active mode pullups and pulldowns on the usbb1_hsic_x and usbb2_hsic_x pads are available in the [CONTROL_USBB_HSIC](#) register.

For more information, see [Section 19.4.12.8.2, High-Speed I/O Buffers With Impedance, Slew Rate, and Weak Driver Settings](#).

19.4.8.2.1 Generic Pad Configuration Bit Fields vs I/O Cell Mapping

[Figure 19-8](#) provides a generic view of the relations between the pad configuration controls and I/O cell functions for a pad configured in active mode.

Figure 19-8. Active Mode Pad Configuration Bit Fields vs I/O Cell Mapping

sysctrl-028

- (1) [Section 19.4.12.8, Signal Integrity Parameter Control Registers With Pad Group Assignment](#), summarizes the I/O cell signal performance settings. For more information about the controlled I/O cell electrical parameters and interdependency considerations, see the device data manual.
- (2) For information about the mapping of software controls in the control module versus different device pads, see [Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping](#). For more information about interface-specific signal parameter settings, see the device data manual.
- (3) The `CONTROL_CORE/WKUP_PADCONF_MODE.VDDS_DV_x` bit is available for each I/O that is part of the dual-voltage domain group x. For more information about 1.2-V/1.8-V dual-voltage domain I/Os, see the device data manual. For more information about peripheral dual-voltage software controls versus pad group mapping, see [Section 19.4.12.9, Dual-Voltage-Supplied Peripheral Controls](#).

NOTE: Dynamic switching between 1.2-V and 1.8-V voltage modes on dual-voltage peripheral I/Os is not allowed.

19.4.8.3 Pad Multiplexing Register Fields

Table 19-10 and Table 19-9 provide for each pad configuration register field the address offset and associated signal name for each multiplexing mode (as set by the MUXMODE bit field). Mode 0 is always defined. Modes with no signal name are undefined for the given pad. For more information about default padconfiguration settings (POR values) for pads in the CORE power domain, see Section 19.6.7, *SYSCTRL_PADCONF_CORE Register Description*; for pads in the WKUP power domain, see Section 19.6.9, *SYSCTRL_PADCONF_WKUP Register Description*.

NOTE:

- Table 19-9 lists the pad configuration registers instantiated in the WKUP power domain that drive the pads in the WKUP power domain. Table 19-10 lists the pad configuration registers instantiated in the CORE power domain that drive the pads in the CORE power domain.
- In Table 19-10 and Table 19-9, an empty cell indicates that the mode or pull is not available for this pin.

Table 19-9. Device Wake-Up Control Module Pad Configuration Register Fields

- ⁽¹⁾ This pad is built on an I/O cell of the extended-drain type, which can be configured to operate within the 1.8-V (standard) or 3.0-V (high) I/O power supply voltage range. A PBIAS cell, which acts as a level shifter, is connected to the extended-drain I/O cell of this pad to appropriately bias its voltage according to the externally applied I/O power supply voltage. To ensure I/O safe operation at 1.8 V or 3.0 V and desired signal performance, the extended-drain I/O cell and its corresponding PBIAS cell must be appropriately configured by software prior to signal selection on the pad, regardless of the signal multiplexing mode. For more details on extended-drain I/O cell and PBIAS cell descriptions and settings, see [Section 19.4.9, Extended-Drain I/O and PBIAS Cell](#), and [Section 19.5.1.2.1, Extended-Drain I/Os and PBIAS Cells Programming Guide](#).

19.4.8.4 Off Mode Pad Control Overview

When off mode is selected, which is true when `PRM_DEVICE_OFF_CTRL[0] DEVICE_OFF_ENABLE` from the PRCM module = 0b1 or `CONTROL_PADCONF_GLOBAL[31] FORCE_OFFMODE_ENABLE = 0b1` (force bit to test the value of off mode), the off mode values field `CONTROL_CORE_PAD0_X_PAD1_Y[27,11] OFFMODEOUTVALUE` overrides the pad state when the `CONTROL_CORE_PAD0_X_PAD1_Y[25,9] OFFMODEENABLE` bit is set.

The `CONTROL_CORE_PAD0_X_PAD1_Y[26,10] OFFMODEOUTENABLE` bit is active low.

Figure 19-9 shows the off mode pad control.

Figure 19-9. Off Mode Pad Control Overview

If off mode is active and the `OFFMODEENABLE` bit field is set to 0 (disable the off mode override feature), the pad keeps the AND value of the configuration (input/output, pullup/down) it had before going into off mode:

- For an input, the pad is isolated and the pull remains active.
- For an output, the value is latched before going into off mode, to drive the same value in off mode.

NOTE: Software controls for internal off-mode pullups and pulldowns on the `usbb1_hsic_x` and `usbb2_hsic_x` pads are available in the `CONTROL_USBB_HSIC` register.

No internal off-mode pullups and pulldowns are available for the `lpddr21_x` and `lpddr22_x` pads of the device.

For more information, see [Section 19.4.12.8.2, High-Speed I/O Buffers With Impedance, Slew Rate, and Weak Driver Settings](#).

19.4.8.4.1 Wake-Up Event Detection

In off mode, wake-up event detection can also be enabled on an input pad. The pad wake-up event is latched in the `CONTROL_CORE_PAD0_X_PAD1_Y[31,15]` and `CONTROL_WKUP_PAD0_X_PAD1_Y[31,15] WAKEUPEVENT` bits.

The off mode I/O pads wake-up scheme is enabled by setting the PRM_IO_PMCTRL[16] GLOBAL_WUEN bit from the PRCM module. The wake-up scheme status is transmitted by the WKUP_ENABLE signal. The wake-up event detection capability of each I/O pad of the device is individually enabled or disabled by writing the CONTROL_CORE_PAD0_X_PAD1_Y[30,14] and CONTROL_WKUP_PAD0_X_PAD1_Y[30,14] WAKEUPENABLE bits.

Figure 19-10. Wake-Up Event Detection Overview

NOTE: When wake-up detection is enabled for a pad, the pad must be configured as input to avoid contention between the device output buffer and an external driver. If this pin is already configured as an input in active mode, hardware automatically retains the same input state; no software action is required.

If this pin is configured as an output in active mode, the off override function must be enabled to set the pin as an input during off mode: in the CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y register, set the OFFMODEENABLE bit to 0x1 to enable the off override function and set the OFFMODEOUTENABLE bit to 0x1 to switch this pin to input mode.

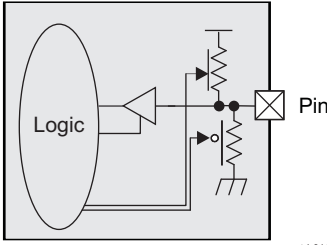

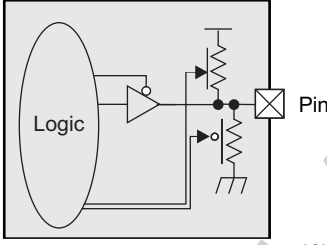

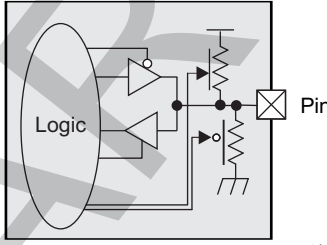

NOTE: Regardless of whether the INPUTENABLE bit is set high or low during active mode, to enable wake-up detection for a pad, user software must set the WAKEUPENABLE bit to 0x1. It is recommended to apply pullup/down resistors at the pad to avoid spurious wake-up detection. User software can optionally enable the pad off-mode internal pullup/down resistors through the appropriate setting of the OFFMODEPULLUDENABLE and OFFMODEPULLTYPESELECT bits in the corresponding pad configuration register.

The CONTROL_PADCONF_WAKEUPEVENT_0 through CONTROL_PADCONF_WAKEUPEVENT_6 registers are dedicated 32-bit registers for a separate capture of the WAKEUPEVENT from different pads. Duplication of the CONTROL_CORE_PAD0_X_PAD1_Y[31,15] and CONTROL_WKUP_PAD0_X_PAD1_Y[31,15] wake-up event bits inside these seven additional registers helps reduce the software latency in identifying which pad has triggered a wake-up event.

19.4.8.4.2 I/O Power Optimization

To optimize I/O power, it is important to avoid unconnected or incorrectly pulled pins. According to the type of pins, the way to reduce power consumption can differ. [Table 19-11](#) shows the three available pin (or ball) types.

Table 19-11. Pin Types

| Input | Output | Bidirectional |
|--|---|--|
|  sysctrl-011 |  sysctrl-012 |  sysctrl-013 |

The configuration differs according to the I/O cell types. The following advice can be useful to avoid extra current leakage:

- For input pins, use a pullup/down when possible.
- For output pins, check existing pulls to avoid conflicts.
- For bidirectional pins, reconfigure the pin as an output driving 0 when possible.

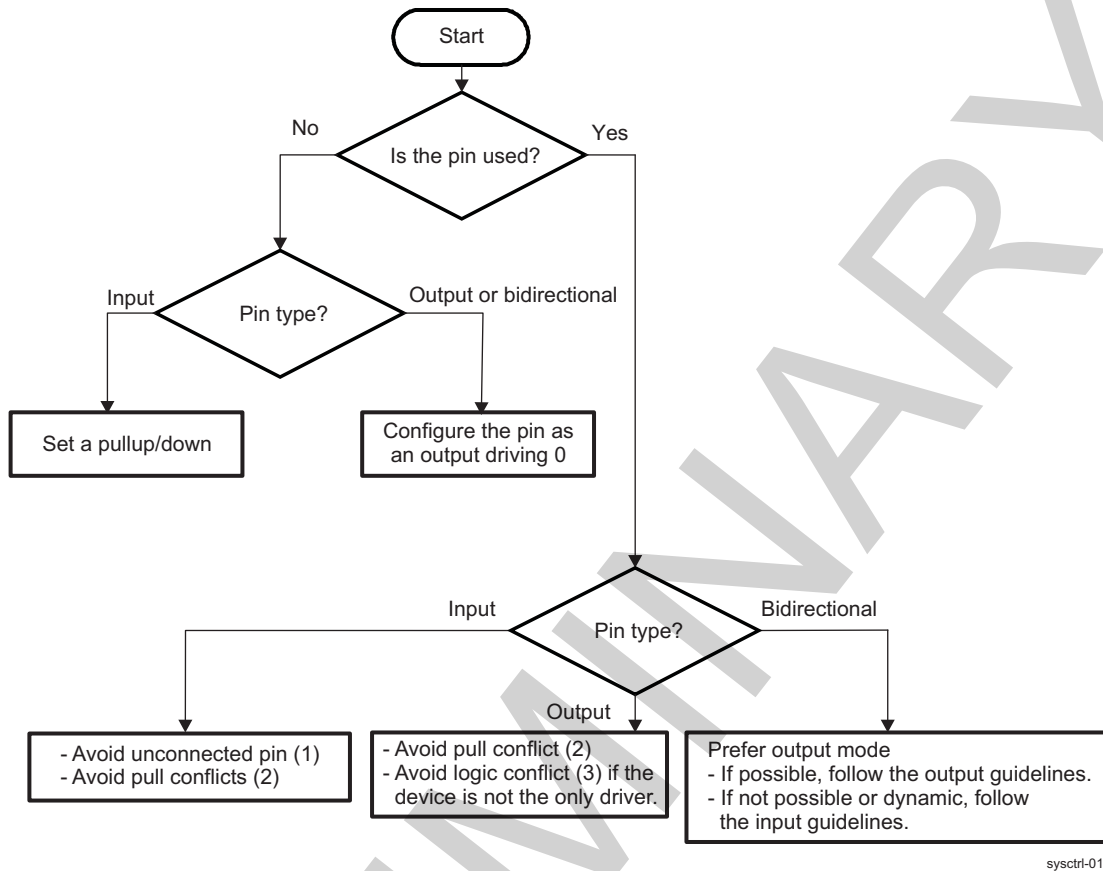

NOTE: If the pad is always configured in output mode, it is recommended for software to disable the internal pull by programming the I/O pad configuration register of the corresponding control module.

NOTE: If a device pad is left unconnected, but power is supplied to the I/O, or the pad is used only as an output during the lifetime of the application, it is recommended to keep its corresponding pad configuration bit `CONTROL_CORE /WKUP_PAD0_X_PAD1_Y.INPUTENABLE` set to 0b0. This keeps the input buffer disabled and reduces static current consumption.

Some I/O configurations involve modifications during the software setup of I/Os and sometimes require several hardware updates.

[Figure 19-11](#) shows how to optimize the power consumption of pads.

Figure 19-11. I/O Power Optimization Flow Chart

The following notes explain more about the pin configuration.

- To avoid unconnected pins, the configuration depends on its use:
 - If the pin is not driven externally, a pullup/down is required.
 - Otherwise, a pullup/down is not necessary.
- Pull conflicts occur when different pulls are on the same line. To configure the pin correctly, avoid having external and internal pulls together.
- Logic conflicts consist in different electrical levels at the same time on the same line. This can occur when several devices are connected to the same line. The two possible cases are:
 - If no external device drives the line, configure the pin to drive 0.
 - If another device drives the line, the same value must be driven or the pin must be disconnected (high-impedance state [Hi-Z]).

NOTE: It is advised to use Hi-Z logical state on the device or on the external component when the line is driven by both components.

For unconnected device pads, safe_mode pad configuration is recommended if available. [Table 19-12](#) summarizes recommendations for the configuration of unconnected pads (in terms of mux mode, input, and output buffer states) for all cases, including those where safe_mode configuration is not available

Table 19-12. Recommended Configuration For Unconnected Device Pads

| Pad MuxMode Set Features | | | Power-on reset default configuration | | Recommended Unconnected Device Pad Configuration | | | | |
|--------------------------|--------------------------|--|--------------------------------------|--------------------------|--|-----------|------------------------|-------------------------|------------------------------|
| Safe Mode Available? | GPIO Function Available? | More Than One (Non-GPIO) Function Available? | Multiplexed Signal Direction at Pad | Pad State ⁽¹⁾ | Multiplexed Signal Direction at Pad | Pad State | Input Buffer Disabled? | Output Buffer Disabled? | MUX Function Selected |
| Yes | N/A | N/A | Input | PU | Safe Mode | PU | Yes ⁽²⁾ | N/A | SAFE MODE ⁽³⁾ |

| No | No | No | Output | 0 | Output | 0 | Yes | N/A | N/A (default) |
| No | No | No | - | Hi-Z | Input | PD | Yes | N/A | N/A (default) |

⁽¹⁾ PU = Pullup; PD = Pulldown; Hi-Z = High impedance

⁽²⁾ If a certain device pad is left unconnected, its associated padconfiguration register INPUTENABLE bit must be explicitly disabled in software (set to 0b0), regardless of pad MUXMODE bit field value.

⁽³⁾ If a certain pad has a defined safe_mode and is left unconnected in an application, it is recommended to keep its padconfiguration MuxMode value at 0x7 (that is, safe_mode).

⁽⁴⁾ There is no software control over the pad associated output buffer in the Control Module. In case of a GPIO function selection, the output buffer is hardware enabled once the user enables corresponding pin output direction in the GPIOx.GPIO_OE control register.

⁽⁵⁾ If a certain pad does not have a safe_mode but has an associated GPIO function, it is recommended to set its padconfiguration register MuxMode to select the GPIO mode.

⁽⁶⁾ If one of the other mux modes available is bidirectional or input-only, then the nondefault mux mode could be used and configured with input disabled.

19.4.9 Extended-Drain I/O and PBIAS Cell

The device primarily supports 1.8-V I/O voltage on its interfaces, with the exception of the MMC/SD/SDIO1 interface, which supports 1.8-V and 3.0-V voltages. The need for embedded extended-drain I/Os on the MMC/SD/SDIO1 interface imposes the use of embedded PBIAS cell - MMC1_PBIAS to provide a 1.8-V or 3.0-V reference.

NOTE: With the appropriate MMC1_PBIAS cell configuration, the different I/Os muxed on the sdmmc1 pads can operate at 1.8-V or 3.0-V power supply.

The MMC1_PBIAS cell and its associated MMC1 extended-drain I/O is software-controlled by bits in the [CONTROL_PBIASLITE](#) and [CONTROL_MMC1](#) registers of the device core control module.

Figure 19-12 shows the functional block diagram with the connections between the MMC1_PBIAS cell and the MMC1 extended-drain I/O cell.

Figure 19-12. Functional Block Diagram

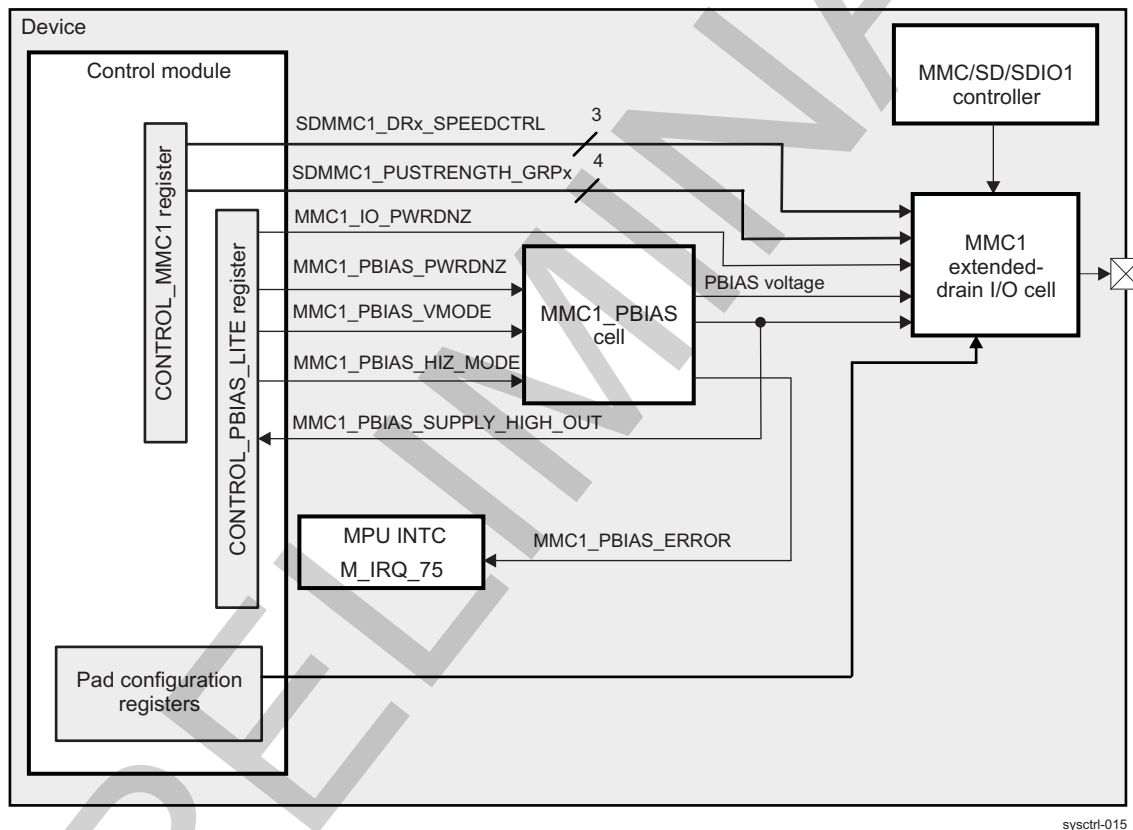

Table 19-13. PBIAS Cell and Extended-Drain I/O Pin CONTROL_PBIAS_LITE Bit Control

| Control Signals for Different PBIAS and Extended-Drain I/O Cells | Description |
|--|---|
| MMC1_PBIAS_PWRDNZ | Protects the MMC1_PBIAS cell when the SDMMC1_VDDS supply voltage is not stable. Software must keep this signal to 0b0 whenever this voltage ramps up/down or changes. When this bit is set to 0, the PBIAS output voltage is equal to SDMMC1_VDDS voltage and the PBIAS supply detector is disabled. |
| MMC1_PBIAS_VMODE | Sets the SDMMC1_VDDS voltage level (MMC1_PBIAS side) according to which MMC1_PBIAS cell generates appropriate biasing levels for the MMC1 extended-drain I/O. The default state of this bit is HIGH, indicating that the voltage level SDMMC1_VDDS is 3.0 V. |

Table 19-13. PBIAS Cell and Extended-Drain I/O Pin CONTROL_PBIAS_LITE Bit Control (continued)

| Control Signals for Different PBIAS and Extended-Drain I/O Cells | Description |
|--|---|
| MMC1_PBIAS_HIZ_MODE | When MMC1_PBIAS_HIZ_MODE is set to 1, the PBIAS output is in high impedance. MMC1_PBIAS_ERROR is automatically set to 1 when MMC1_PBIAS_HIZ_MODE = 1. When MMC1_PBIAS_HIZ_MODE = 0, MMC1_PBIAS cell is in normal operation mode. |
| MMC1_PBIAS_SUPPLY_HIGH_OUT | Output from the internal MMC1_PBIAS voltage supply detector, which indicates whether the SDMMC1_VDDS supply is 3.0 V or 1.8 V |
| MMC1_PBIAS_ERROR | Indicates whether the software-programmed MMC1_PBIAS_VMODE level matches the MMC1_PBIAS_SUPPLY_HI_OUT output signal during normal operation |
| MMC1_IO_PWRDNZ | Protects the MMC1 I/O extended-drain cell when the SDMMC1_VDDS voltage is not stable. Software must keep this signal to 0b0 whenever the SDMMC1_VDDS supply voltage ramps up/down or changes. When this bit is at 0, the pad is floating. |
| SDMMC1_DRx_SPEEDCTRL, x = (0...2) | Speed control signals for three different SDMMC1 pad groups identified within the MMC1 I/O cell |
| SDMMC1_PUSTRENGTH_GRPx, x = (0...3) | Pullup strength controls for four different SDMMC1 pad groups identified within the MMC1 I/O cell |

NOTE: When HIZ_MODE = 1, the PBIAS output (the pbias_mmc1 pin) must be tied to a defined external potential to avoid stress on transistors.

Table 19-14 lists the power supplies for PBIAS and the extended-drain I/O cell.

Table 19-14. Power Supplies

| Name | Description |
|-------------|--|
| VDD2 | Core voltage supply |
| SDMMC1_VDDS | MMC1 I/O cell supply voltage nominal 1.8 V/3.0 V |
| VDDS | 1.8-V supply for the input buffer |

19.4.9.1 PBIAS Cell

The MMC1_PBIAS cell provides a bias for the MMC/SD/SDIO1 extended-drain I/O cell used with high voltage for the MMC/SD/SDIO1 interface. This PBIAS cell provides a voltage reference (PBIAS voltage) for biasing extended-drain in the MMC/SD/SDIO1 cell. In addition to generating the bias voltage, the cell can detect the supply voltage (SDMMC1_VDDS) value (1.8 V or 3.0 V) and update, with its status, the [CONTROL_PBIASLITE](#)[24] MMC1_PBIASLITE_SUPPLY_HI_OUT bit. However, this is possible when the voltage reaches its steady state (the internal PBIAS voltage detector is enabled only when the MMC1_PBIAS_PWRDNZ signal is set to 0b1).

CAUTION

A PBIAS cell lets the peripheral associated with its corresponding extended-drain I/O cells support 1.8-V and 3.0-V voltages. A PBIAS cell is not part of a peripheral, but part of the device I/Os to which this peripheral is internally connected. These device I/Os are not exclusive to one peripheral; through I/O multiplexing they can be connected to other internal signals. It is necessary to configure the PBIAS cell to enable the I/Os, regardless of how I/O multiplexing is configured for these device I/Os. In other words, independently of which signal is internally connected to a device I/O powered by SDMMC1_VDDS, the MMC1_PBIAS cell must be configured.

19.4.9.2 Extended-Drain I/O

The following MMC/SD/SDIO1 interface signals (selected when MuxMode = 0) use the device I/Os associated with the MMC1 extended-drain I/O cell:

- sdmmc1_clk
- sdmmc1_cmd
- sdmmc1_dati (where i = 0 to 7)

The MMC1 I/O cell is powered externally through the vdds_sdmmc1 pad.

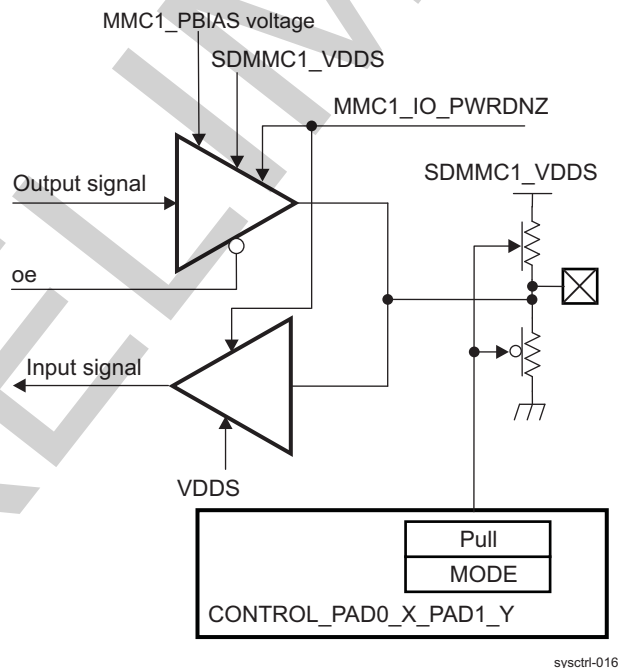

NOTE: The MMC1 I/O cell-associated device I/Os are also shared with other signals. gpio_100 - gpio_109, etc. are available when MuxMode is different than 0x0. If signals other than sdmmc1_x are selected, the MMC1 I/O cell must also be configured.

NOTE: For multiplexed gpio signals on the MMC1 I/O cell (gpio_100 through gpio_109), to function appropriately in standard 1.8-V mode, the [CONTROL_PBIASLITE\[21\]](#) MMC1_PBIASLITE_VMODE through [CONTROL_PBIASLITE\[26\]](#) MMC1_PWRDNZ bits must be set to 0b0. When these bits are set, and the externally-applied I/O cell power supply voltage (1.8 V) is stabilized, gpio signals can be enabled on the pads by setting the [CONTROL_PBIASLITE\[22\]](#) MMC1_PBIASLITE_PWRDNZ bit to 0b1 (power-up MMC1_PBIAS cell) and the [CONTROL_PBIASLITE\[26\]](#) MMC1_PWRDNZ bit to 0b1 (power-up MMC1 extended-drain I/O cell).

For more information about signal multiplexing, see [Table 19-10](#).

[Figure 19-13](#) shows the extended-drain I/O cells.

Figure 19-13. Extended-Drain I/O

The extended-drain I/O cells have the following I/O signals:

- The output signal, input signal, and oe, which comes from the selected I/O module with the correctly configured MUXMODE field within the corresponding CONTROL_CORE_PAD0_X_PAD1_Y or CONTROL_WKUP_PAD0_X_PAD1_Y register

NOTE: The MMC1 extended-drain I/O has associated muxed I/Os with mode and pullup/down configurations programmable in the control module.

- The MMC1_PBIAS voltage is a voltage reference for biasing the extended-drain in the MMC1 I/O cell.
- PWRDNZ signals are used on PBIAS cell and MMC1 I/O cell to protect them when the SDMMC1_VDDS voltage is not stable.

CAUTION

Software must keep the PWRDNZ-related signals to 0b0 whenever the SDMMC1_VDDS signal ramps up/down or changes. When it is set to 0, the pad is floating (the pad may not reflect the state of the output signal, and the input signal may not reflect the state of the pad).

- [CONTROL_PBIASLITE](#)[24] MMC1_PBIASLITE_SUPPLY_HI_OUT is a status bit on the SDMMC1_VDDS value and is used to inform the MMC1 I/O cell about the value of the SDMMC1_VDDS signal.

For more information about the software configurations of the MMC1 associated extended drain I/O and PBIAS cell, see [Section 19.5.1.2.1, Extended-Drain I/O and PBIAS Cell Programming Guide](#).

NOTE: The device can be supplied by an external power IC. TI provides such a global solution to its customers with the TWL60xx power IC.

If the device is associated with the TWL60xx power IC, before using an extended-drain I/O interface, software must program the TWL60xx to enable VMMC1 (for the MMC/SD/SDIO1 or muxed I/O modules) and the LDO to provide 1.8-V/3.0-V voltage. This is done by software through the inter-integrated circuit (I²C™) interface that links the device and the TWL60xx IC.

CAUTION

The power supply voltage generated from the companion power IC and applied on the vdds_sdmmc1 device pad must be programmed according to the recommendations for the currently selected I/O module power supply range.

If the application does not want the I/O interface to run at 3.0 V, software users must then assert the VMODE signal to low for 1.8-V activity: in this case, the PBIAS is connected to ground.

[Table 19-15](#) lists the control signal with the corresponding control bits from the [CONTROL_PBIASLITE](#) and [CONTROL_MMC1](#) registers to configure the MMC1_PBIAS and the MMC1 extended-drain I/O cells. These signals can be controlled by software.

Table 19-15. PBIAS/Extended-Drain I/O Cells Control Signals

| Control Signals for Different PBIAS and Extended-Drain I/O Cells | Bits Used for PBIAS Cell and I/O Cell Configurations for Different I/O Modules | Reset Value |
|--|--|-------------|
| MMC1_PBIAS_PWRDNZ | CONTROL_PBIASLITE [22] MMC1_PBIASLITE_PWRDNZ | 0 |
| MMC1_PBIAS_VMODE | CONTROL_PBIASLITE [21] MMC1_PBIASLITE_VMODE | 1 |
| MMC1_PBIAS_HIZ_MODE | CONTROL_PBIASLITE [25] MMC1_PBIASLITE_HIZ_MODE | 0 |
| MMC1_PBIAS_SUPPLY_HIGH_OUT | CONTROL_PBIASLITE [24] MMC1_PBIASLITE_SUPPLY_HI_OUT | 0 |
| MMC1_PBIAS_ERROR | CONTROL_PBIASLITE [23] MMC1_PBIASLITE_VMODE_ERROR | 0 |
| MMC1_IO_PWRDNZ | CONTROL_PBIASLITE [26] MMC1_PWRDNZ | 0 |
| SDMMC1_DRx_SPEEDCTRL, x = (0...2) | CONTROL_MMC1 [27] SDMMC1_DR0_SPEEDCTRL | 0 |

Table 19-15. PBIAS/Extended-Drain I/O Cells Control Signals (continued)

| Control Signals for Different PBIAS and Extended-Drain I/O Cells | Bits Used for PBIAS Cell and I/O Cell Configurations for Different I/O Modules | Reset Value |
|--|--|-------------|
| SDMMC1_PUSTRENGTH_GRPx, x = (0...3) | CONTROL_MMC1 [26] SDMMC1_DR1_SPEEDCTRL | 0 |
| | CONTROL_MMC1 [25] SDMMC1_DR2_SPEEDCTRL | 0 |
| | CONTROL_MMC1 [31] SDMMC1_PUSTRENGTH_GRP0 | 1 |
| | CONTROL_MMC1 [30] SDMMC1_PUSTRENGTH_GRP1 | 0 |
| | CONTROL_MMC1 [29] SDMMC1_PUSTRENGTH_GRP2 | 1 |
| | CONTROL_MMC1 [28] SDMMC1_PUSTRENGTH_GRP3 | 1 |

The PBIAS cell supports two ranges of SDMMC1_VDDS voltage: 1.8 V, typical for low-voltage applications, and 3.0 V, typical for high-voltage applications. For each supply voltage range, the cell generates suitable bias voltage (PBIAS) for extended-drain PMOS devices.

CAUTION

The PBIAS cell must be programmed according to peripheral power supply voltage. See [Table 19-16](#).

Table 19-16. Voltage Configuration⁽¹⁾

| PBIASLITEVMODE Configuration | SDMMC1_VDDS Voltage | Type of Operation |
|------------------------------|---------------------|---------------------------------------|
| 1.8 V | 1.8 V | Normal 1.8-V operation |
| 1.8 V | 3.0 V | Damaging configuration ⁽²⁾ |
| 3.0 V | 1.8 V | Degraded functionality ⁽²⁾ |
| 3.0 V | 3.0 V | Normal 3.0-V operation |

⁽¹⁾ For damaging configuration, hardware system protection is provided to prevent deterioration of the associated extended-drain I/Os.

⁽²⁾ These modes must not be used.

The MMC1_PBIAS output voltage is the same as SDMMC1_VDDS voltage when the [CONTROL_PBIASLITE](#)[22] MMC1_PBIASLITE_PWRDNZ bit is low. Once the SDMMC1_VDDS supply is stable, software can release the PWRNDZ (setting it high). This starts the PBIAS cell work to generate the PBIAS voltage. During the completion process the corresponding I/Os cannot be used to transmit data. If VMODE is set correctly (compared with supply detector output and found to be the same), then PBIAS output voltage is generated based on the value of VMODE.

NOTE: In the case of a damaging configuration, hardware system protection prevents deterioration of the associated extended-drain I/Os.

CAUTION

The following requirements are critical for an extended-drain I/O cell:

- The VMODE bit must be defined before the PWRNDZ bit is made high (cell is brought out of power-down mode).
- The default state of VMODE bit is high (indicates 3.0-V operation).
- The PWRNDZ bit must be kept low whenever the SDMMC1_VDDS supply ramps up/down or changes. This can be damaging.
- Supply detector is disabled when PWRDNZ = 0, and in this case, supply detector output (SUPPLY_HI_OUT) is initialized to 0.

19.4.9.3 PBIAS Error Generation

If VMODE and supply detector outputs are unequal, it takes 4 μ s for the comparator to process the inputs and generate the VMODE_ERROR flag.

Table 19-17 summarizes the generation of the PBIAS error signal (MMC1_PBIAS_ERROR of the MMC1_PBIAS cell), which depends on the various [CONTROL_PBIASLITE](#) bit combinations. The shaded row in the table indicates a condition that could cause a reliability issue if not detected. To prevent this reliability issue, the PBIAS voltage is tied to SDMMC1_VDDS when the PBIAS error signal is high. This disables the I/Os.

CAUTION

Although asserting VMODE_ERROR to 1 ensures that PBIAS voltage is equal to SDMMC1_VDDS, this does not completely protect the I/O cell. It is recommended that all the I/Os are powered down, setting the PWRDNZ mode bit of the corresponding I/O cell to 0b0 by software as soon as VMODE_ERROR = 0b1.

Table 19-17. PBIAS Error Signal Truth Table

| VMODE | PWRDNZ | HIZ_MODE | SUPPLY_HI_OUT | VMODE_ERROR |
|-------|--------|----------|---------------|-------------|
| 0 | 0 | X | 0 | 0 |
| 0 | 1 | 0 | 0 | 0 |
| 0 | 1 | 0 | 1 | 1 |
| X | 1 | 1 | X | 1 |
| 1 | 0 | X | 0 | 0 |
| 1 | 1 | 0 | 0 | 1 |
| 1 | 1 | 0 | 1 | 0 |

NOTE: VMODE_ERROR = 0b1: VMODE level is not the same as SUPPLY_HI_OUT, or hi-Z mode is selected.

VMODE_ERROR = 0b0: VMODE level is the same as SUPPLY_HI_OUT, or VMODE is not considered (PWRDNZ = 0b0).

The MMC1_PBIAS_ERROR is mapped to the MPU subsystem interrupt controller. The interrupt line MA_IRQ_75 is activated upon error occurrence. For more information about the Cortex™-A9 MPU INTC registers and their description, see the *ARM Cortex-A9 Technical Reference Manual*.

The [CONTROL_PBIASLITE](#)[23] MMC1_PBIASLITE_VMODE_ERROR bit also indicates whether this kind of error occurs.

19.4.9.4 Critical Timing Requirements

It is critical that the PBIAS and I/O cell-related PWRDNZ bits are deasserted (made 1 from 0) only after SDMMC1_VDDS power supply voltage is stable in the device. The I/O cell supports only the case where the 1.8-V input buffer supply voltage VDDS ramps up before VDD2 (core voltage). This power-up sequence is automatically provided upon POR by hardware in the device. Take care to ensure that the externally provided SDMMC1_VDDS voltage (1.8 V/ 3 V) is powered up only after VDD2 and VDDS reach their steady state.

Figure 19-14 shows the only possible power-up sequence, as well as the expected behavior of PWRNDZ mode bit with regard to supplying voltage ramp-up.

Figure 19-14. VDDS Ramps Up Before VDD2

19.4.10 Band Gap Voltage and Temperature Sensor

The device supplies a voltage reference and a temperature sensor feature that are gathered in the band gap voltage and temperature sensor (VBGAPTS) module. The band gap provides current and voltage reference for its internal circuits and other analog IP blocks. The analog-to-digital converter (ADC) produces an output value that is proportional to the silicon temperature.

The main features of the VBGAPTS module are:

- A constant voltage reference output of 0.5 V
- Five constant current reference outputs of 1μA
- Analog supply is a nominal 1.8 V.
- Small ADC with 10-bit digital output
- Off mode compatible

A small finite state-machine (FSM) (band gap FSM) is instantiated inside the general core control module to help the VBGAPTS cell accomplish different measurement modes (see [Section 19.4.10.2, Temperature Sensor](#)). In addition, two programmable comparator blocks inside the general core control module post-process the converted data and provide the following outputs:

- Thermal alert programmable comparator output
- Thermal shutdown programmable comparator output

[Figure 19-15](#) shows the functional block diagram of the band gap and the temperature sensor module.

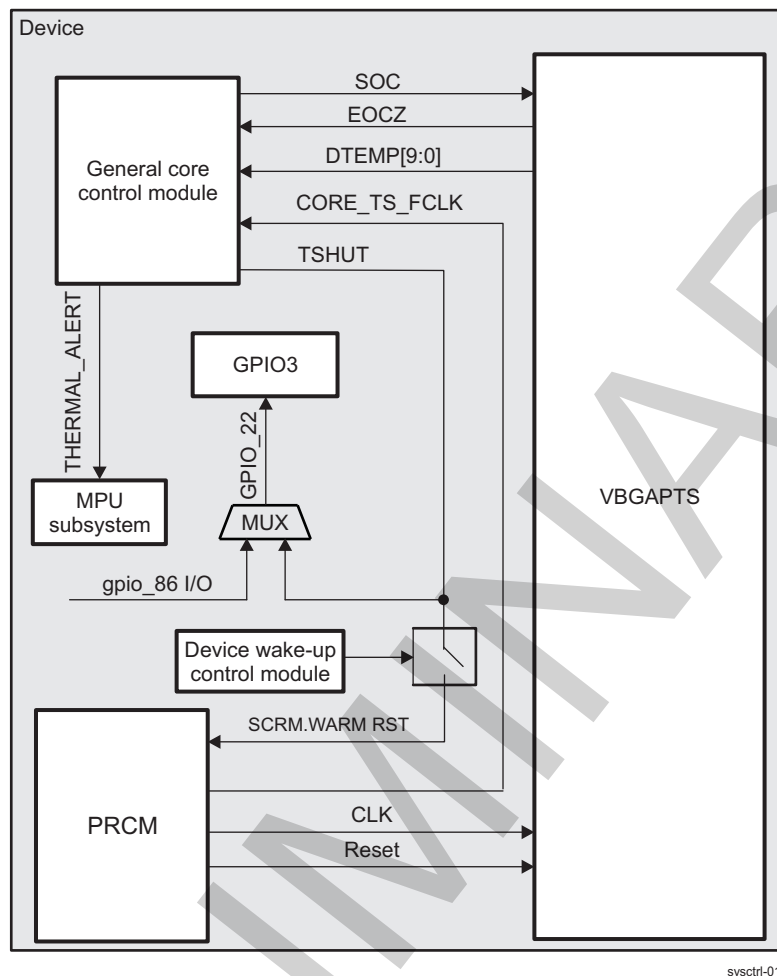

Figure 19-15. Functional Block Diagram

Table 19-18 describes the I/O signals, some of which (SOC, EOCZ, DTEMP[9:0]) build the interface between the VBGAPTS module and the bandgap state-machine of the general core control module.

Table 19-18. Band Gap Voltage and Temperature Sensor Signal Description

| Pin | I/O ⁽¹⁾ | Description |
|------------|--------------------|---|
| SOC | I | Start of Conversion signal. A transition to high starts a new ADC conversion cycle. |
| EOCZ | O | End of Conversion signal. When low, the signal indicates that the value of DTEMP[9:0] is valid. |
| DTEMP[9:0] | O | Temperature data from the temperature sensor. This value is valid when EOCZ is low. |
| CLRZ | I | When low, the temperature sensor is in reset mode. This signal must be low when OFFMODE is high. |
| CLK | I | Functional clock in the range (1–2 MHz) from the WKUP power domain used by the temperature sensor during temperature conversion |

⁽¹⁾ I = Input, O = Output

All the configuration signals of the VBGAPTS temperature conversion logic are available through the [CONTROL_TEMP_SENSOR](#) register.

The bandgap state-machine of the general core control module is driven by a dedicated clock (CORE_TS_FCLK) that shares a common PRCM clock source with the VBGAPTS CLK. For more information about the thermal management clocks, see [Chapter 3, Power, Reset, and Clock Management](#).

NOTE: The VBGAPTS functional clock delivered on CLK input is used only for the temperature sensor. When ADC is not converting, this clock can be switched off (CLK = 0). In this case, DTEMP[9:0] retains the temperature code obtained at the previous conversion.

NOTE: User software must ensure that the [CONTROL_BANDGAP_STATUS\[3\]](#) CLEAN_STOP bit read-only flag is high before switching off the VBGAPTS cell (CLK) and the bandgap state (CORE_TS_FCLK) clocks by programming the [CONTROL_TEMP_SENSOR\[13\]](#) BGAP_TEMPSOFF bit to 1. Status CLEAN_STOP = 1 indicates that the band gap state-machine is in IDLE state, and clocks can be safely switched off.

[Table 19-19](#) describes the functional outputs of the two post-processing comparator blocks integrated in the general core control module.

Table 19-19. General Core Control Thermal Logic Outputs Description

| Functional Output | Description |
|-------------------|--|
| THERMAL_ALERT | General core control module thermal alert output, mapped as an interrupt in the MPU subsystem. It is used by software to implement a thermal management policy of the device. |
| TSHUT | General core control module thermal shutdown comparator output is mapped on a GPIO input and can be configured as a source of SCRM external warm reset signal. This overheat protection signal is low during normal operation and goes high during a thermal shutdown event. |

The configuration bits of the thermal post-processing logic are in several registers of the general core control module. For more information, see [Section 19.4.10.2.3, Thermal Data Post-Processing](#).

19.4.10.1 Band Gap Voltage Reference

The band gap voltage reference feature provides several constant voltage and current references for its internal circuits and for other analog modules.

The voltage reference signal is a 0.5-V output. This output is used internally by the module and is exported for external modules or tests.

The current reference signals consist of five lines, each of which generates a 1-μA current with a 1.8-V voltage. These lines can be used to bias other modules.

19.4.10.2 Temperature Sensor

The temperature sensor feature is used to convert the temperature of the device into a decimal value coded on 10 bits. An internal ADC, which is part of the device embedded bandgap cell, is used for conversion.

For more information about the thermal sensor operating parameters (temperature range, accuracy, etc.), see the *Temperature Sensor* section in the device data manual.

For more information about the device operating junction temperature ranges under different conditions, see the *Recommended Operating Conditions* section in the device *Data Manual*.

NOTE: The temperature measured at the temperature sensor location is lower than the temperature of the hottest spot on the device die. This difference, defined also as the temperature offset between the on-die hottest spot temperature and the temperature registered by the on-die thermal sensor, depends on a number of factors, such as the current system power dissipation, device cooling conditions, etc.

CAUTION

User software must always take care to program thermal thresholds (thermal alert or TSHUT event points) at levels that do not exceed the device hottest spot maximal-allowed temperature minus the device temperature sensor offset estimated at current conditions.

The thermal alert interrupt events are described in [Section 19.4.10.2.4, Thermal Alert Functionality Comparators](#).

The TSHUT signal is connected internally to a GPIO controller pin. For more information, see [Chapter 26, General-Purpose Interface](#).

In addition, the TSHUT signal can be software configured from the device wakeup control module as a source of a hardware warm reset. For more details regarding warm reset description, see [Section 3.5, Reset Management Functional Description](#), in the chapter [Chapter 3, Power, Reset and Clock Management](#).

The bandgap state-machine offers two operating modes for the temperature sensor: single conversion mode and repeated single conversion mode.

19.4.10.2.1 Single Conversion Mode

When the ADC is idle ([CONTROL_TEMP_SENSOR\[10\] BGAP_TEMP_SENSOR_EOCZ](#) = 0) and the [CONTROL_BANDGAP_CTRL\[31\] SINGLE_MODE](#) bit is set to 0, it is possible to ask for a single temperature conversion. To initiate a new conversion, the start of conversion bit ([CONTROL_TEMP_SENSOR\[11\] BGAP_TEMP_SENSOR_SOC](#)) must be asserted and maintained high until the end of conversion flag ([CONTROL_TEMP_SENSOR\[10\] BGAP_TEMP_SENSOR_EOCZ](#)) goes high, after which the SOC signal must be made low by setting the [CONTROL_TEMP_SENSOR\[11\] BGAP_TEMP_SENSOR_SOC](#) bit to 0. Conversion completion is indicated by a negative edge of EOCZ (the [CONTROL_TEMP_SENSOR\[10\] BGAP_TEMP_SENSOR_EOCZ](#) bit).

[Figure 19-16](#) shows the timing sequence of a single temperature conversion. As can be seen in the figure, a single temperature conversion is performed by ADC for 17 band gap clock cycles.

Figure 19-16. Single Conversion Mode

19.4.10.2.2 Repeated Single Conversion Mode

A continuous temperature measurement on the device is performed as a sequence of single ADC conversions automatically initiated at regular intervals. A 24-bit counter inside the general core control module adds flexibility to program the delay between two consecutive SOC pulses generated from the band gap state-machine.

Two scenarios for ADC to work in a repeated single conversion mode are:

- Fixed-delay repeated single conversions
- Programmable-delay repeated single conversions

19.4.10.2.2.1 Fixed-Delay Repeated Single Conversions

The fixed-delay repeated single conversions scenario follows the sequence:

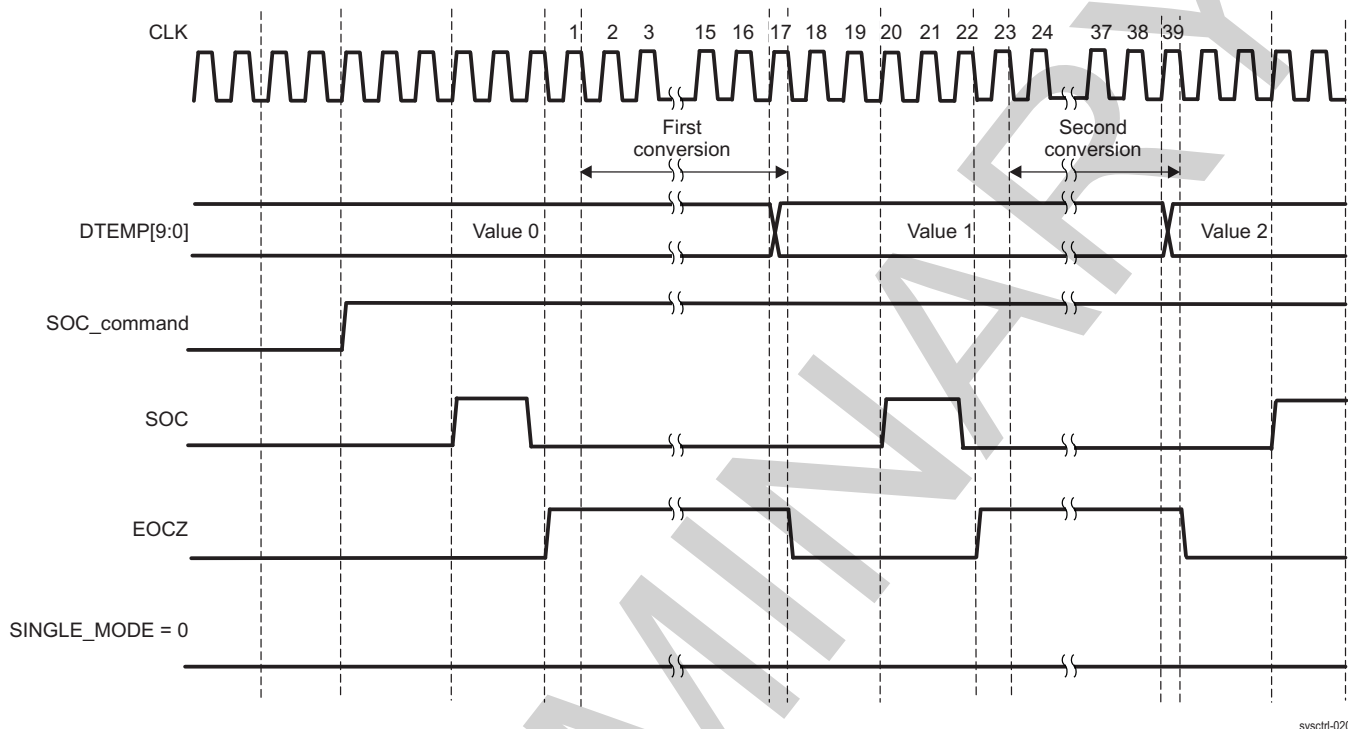

When the ADC is idle ([CONTROL_TEMP_SENSOR\[10\] BGAP_TEMP_SENSOR_EOCZ](#) = 0), and [CONTROL_BANDGAP_CTRL\[31\] SINGLE_MODE](#) = 0, the bandgap state-machine can be forced to generate a series of SOC pulses if the [CONTROL_TEMP_SENSOR\[11\] BGAP_TEMP_SENSOR_SOC](#) bit is asserted high and continuously maintained in this state during the required temperature monitoring period. The user software must deassert the [CONTROL_TEMP_SENSOR\[11\] BGAP_TEMP_SENSOR_SOC](#) bit to 0 when the [CONTROL_TEMP_SENSOR\[10\] BGAP_TEMP_SENSOR_EOCZ](#) status bit is set high for the last temperature measurement.

As described in [Section 19.4.10.2.1, Single Conversion Mode](#), valid data on the DTEMP[9:0] bus upon single conversion completion is indicated by a negative edge of the EOCZ signal. For the software, [CONTROL_TEMP_SENSOR\[10\] BGAP_TEMP_SENSOR_EOCZ](#) = 0 signals that the temperature data [CONTROL_TEMP_SENSOR\[7:0\] BGAP_TEMP_SENSOR_DTEMP](#) bit field is updated.

[Figure 19-17](#) shows the timing sequence for fixed-delay repeated single mode.

In this case, there is no flexibility to control delay between two consecutive SOC pulses, because with [CONTROL_BANDGAP_CTRL](#)[31] SINGLE_MODE = 0 band gap counter logic is disabled. The delay is fixed to 22 bandgap functional clock cycles.

Figure 19-17. Fixed-Delay Repeated Single Conversions

sysctrl-020

19.4.10.2.2.2 Programmable-Delay Repeated Single Conversions

In the programmable-delay repeated single conversions mode the bandgap state-machine uses a 24-bit incremental counter (part of the thermal post-processing logic of the general core control module) to generate a series of SOC pulses with a programmable delay between them.

The programmable-delay repeated single conversions scenario follows this sequence:

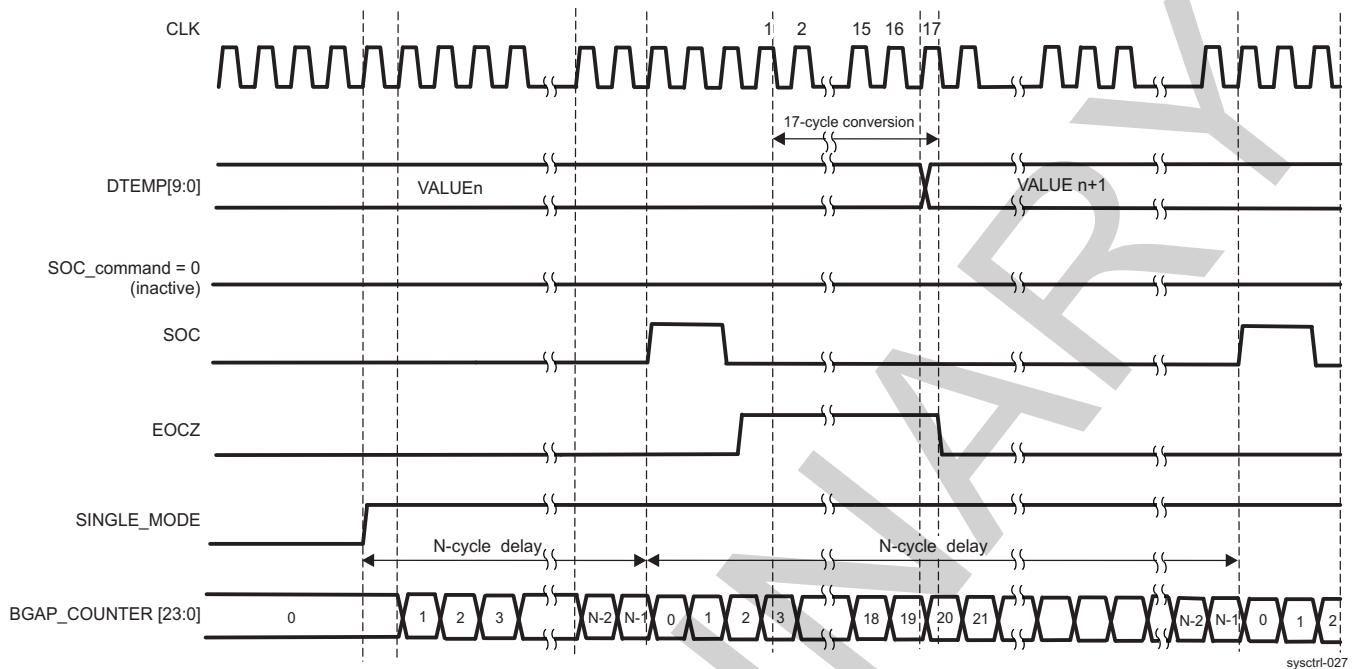

Before enabling this mode, the user must write the desired delay value as the number of bandgap CLK cycles in the [CONTROL_BGAP_COUNTER](#)[23:0] COUNTER bit field. When the ADC is idle ([CONTROL_TEMP_SENSOR](#)[10] BGAP_TEMP_SENSOR_EOCZ = 0) and [CONTROL_TEMP_SENSOR](#)[11] BGAP_TEMP_SENSOR_SOC = 0, the user must assert [CONTROL_BANDGAP_CTRL](#)[31] SINGLE_MODE = 1 to enable programmable-delay repeated single conversions.

Default value of the [CONTROL_BANDGAP_CTRL](#)[31] SINGLE_MODE is "1", which enables continuous conversion mode even during the device booting sequence.

NOTE: The programmable-delay repeated single conversions require that software keeps [CONTROL_TEMP_SENSOR](#)[11] BGAP_TEMP_SENSOR_SOC = 0 during the measurement sequence.

Figure 19-18 shows the timing sequence for a programmable-delay repeated single mode.

Figure 19-18. Programmable-Delay Repeated Single Conversions

As Figure 19-18 shows, the initial SOC pulse of a sequence is generated N-cycles after assertion of the SINGLE_MODE bit, when BGAP_COUNTER reaches N-1. The N-cycle period is repeated for consecutive SOC insertions until the sequence is stopped in software by deasserting the [CONTROL_BANDGAP_CTRL\[31\] SINGLE_MODE](#) bit to 0.

The signal synchronization described in [Section 19.4.10.2.1, Single Conversion Mode](#), applies to each single conversion in a measurement series. The general core control module sends the SOC pulses at regular programmable intervals defined through the value of the BGAP_COUNTER bit field and registers the temperature when EOCZ is asserted low. Software must populate the correct value based on the band gap frequency and monitoring frequency, knowing that the band gap, regardless of the clock frequency, delivers its temperature after 17 clock cycles.

[Table 19-20](#) provides examples for programming SOC pulse generation periods based on minimal (1 MHz) and maximal (2 MHz) band gap clock frequency.

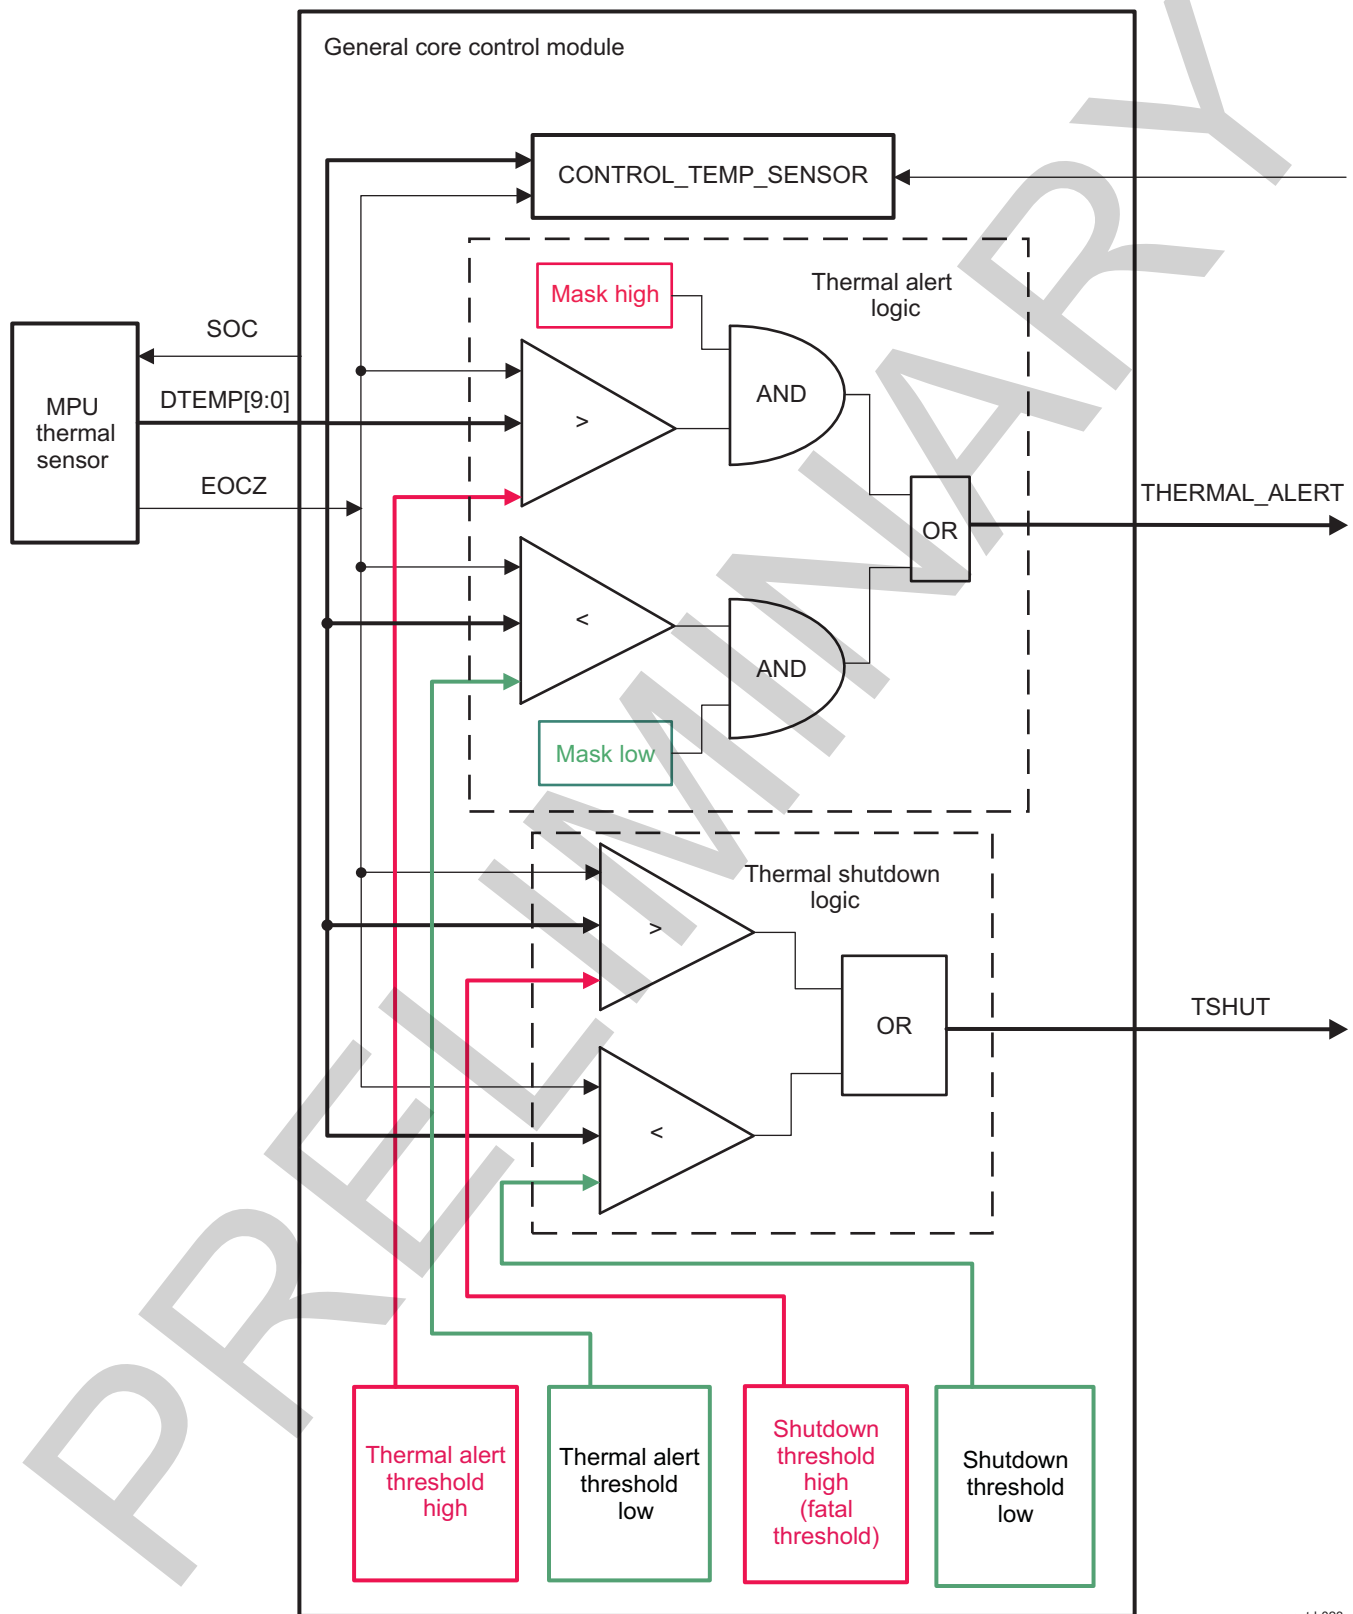

Table 19-20. Bandgap Counter Programming Examples

| Bandgap Clock | Monitoring Period | | | | |
|-----------------|-------------------|---------------|----------------|----------------|------------------|
| | 10 ms | 20 ms | 50 ms | 100 ms | 500 ms |
| 1 MHz – 1000 ns | 10,000 cycles | 20,000 cycles | 50,000 cycles | 100,000 cycles | 200,000 cycles |
| 2 MHz – 500 ns | 20,000 cycles | 40,000 cycles | 100,000 cycles | 200,000 cycles | 1,000,000 cycles |

19.4.10.2.3 Thermal Data Post-Processing Logic

A thermal data post-processing logic with dedicated registers is implemented in the general core control module. The registered ADC value is passed in parallel to the inputs of four comparators (two sets of two comparators). In each set, the temperature data is compared to high- and low-temperature thresholds defined in software, to handle the hysteresis effect when temperature decreases. The two comparator sets provide different thermal management functions.

[Figure 19-19](#) shows the thermal management schema in the device.

Figure 19-19. Thermal Management Schema

sysctrl-023

NOTE: The software settings of the comparator blocks must be applied before starting a single or repeated-single measurement sequence.

19.4.10.2.4 Thermal Alert Functionality Comparators

The first set of comparators provides a thermal alert function output. The high- and low-temperature thresholds for this function are configurable through the 10-bit [CONTROL_BANDGAP_THRESHOLD\[25:16\]](#) T_HOT and [CONTROL_BANDGAP_THRESHOLD\[9:0\]](#) T_COLD bit fields, respectively. Thermal alert logic in the general core control module provides the capability to mask (active low) comparator outputs for hot and cold events through the [CONTROL_BANDGAP_CTRL\[1\]](#) MASK_HOT and [CONTROL_BANDGAP_CTRL\[0\]](#) MASK_COLD bits. [Figure 19-20](#) shows the functional logic of these 2 bits to mask comparator outputs for hot and cold thermal alert events. The masked HOT and COLD point monitoring signals are then ORed in the THERMAL_ALERT signal, which delivers an interrupt to the MPU subsystem on the MA_IRQ_126 input (see [Section 19.3, Control Module Integration](#)). It can be used by software to implement a thermal management policy of the device. For more information about this interrupt, see [Section 18.3.2, Interrupt Requests to the Cortex-A9 MPU Interrupt Controller](#).

The nonmasked outputs of the thermal alert logic comparators are individually registered in the [CONTROL_BANDGAP_STATUS\[1\]](#) HOT_FLAG and [CONTROL_BANDGAP_STATUS\[0\]](#) COLD_FLAG read-only (RO) bits. The masked ORed event (that is, the THERMAL_ALERT signal) is mapped to the [CONTROL_BANDGAP_STATUS\[2\]](#) BGAP_ALERT RO bit. [Figure 19-20](#) shows the behavior of the thermal alert logic.

NOTE: The thermal processing logic of the general core control module generates an interrupt event to the MPU subsystem whenever the registered temperature of on-die thermal sensor crosses a software-configurable threshold.

CAUTION

Users must take care to program the value of the [CONTROL_BANDGAP_THRESHOLD\[25:16\]](#) T_HOT bit field such that its corresponding temperature value does not exceed the maximal-allowed on-die temperature minus the temperature sensor offset estimated for the current conditions. For more information about the sensed temperature value constraints, see [Section 19.4.10.2, Temperature Sensor](#).

Figure 19-20. Thermal Alert Generation Signals

sysctrl-025

19.4.10.2.5 Thermal Shutdown Functionality Comparators

The second set of two comparators in the general core control module is responsible for the thermal shutdown protection of the device. Two 10-bit fields ([CONTROL_TSHUT_THRESHOLD\[25:16\]](#) TSHUT_HOT and [CONTROL_TSHUT_THRESHOLD\[9:0\]](#) TSHUT_COLD) define the high- and low-threshold code values, respectively. These two bitfields can be programmed by the user ONLY once after device power-on reset. The default value of the TSHUT_HOT bit field corresponds to the maximum allowed on the device die temperature. The TSHUT output main purpose is to indicate that the maximum junction temperature of the die is reached, which is true when the temperature measured by the on-die sensor (at sensor location), satisfies the condition:

$$T_{\text{sensor_location_max_tshut}}, ^\circ\text{C} = T_{\text{max_allowed_hottest_spot}}, ^\circ\text{C} - \Delta T_{\text{estimated_temp_offset}}, ^\circ\text{C}$$

CAUTION

User software must always provide that the temperature corresponding to the programmed value of the [CONTROL_TSHUT_THRESHOLD\[25:16\]](#) TSHUT_HOT bit field does not exceed the described $T_{\text{sensor_location_max_tshut}}$ limit value. For more information about the sensed temperature value constraints, see [Section 19.4.10.2, Temperature Sensor](#).

To deactivate TSHUT output, the temperature ADC-encoded value must go below the value of TSHUT_COLD threshold.

[Figure 19-21](#) shows the behavior of the TSHUT logic.

Figure 19-21. Thermal Shutdown Generation Signals

sysctrl-026

The TSHUT output of the general core control module is tied internally to a GPIO3 module input pin (see [Section 19.3, Control Module Integration](#)). For more information about thermal-related GPIO interrupt, see [Chapter 26, General-Purpose Interface](#). The software can use this GPIO interrupt to prevent device malfunction or permanent damage, by taking immediate action to reduce power dissipation by software warm-resetting the device or freezing most internal activities upon its detection.

Additionally, the TSHUT signal can be mapped to the device SCRM external warm reset logic to activate the PRM.SYS_WARMIN_RST input when a **fatal temperature threshold** (TSHUT_HOT) is exceeded. Hence, **a hardware warm reset** can be triggered directly on the device upon a fatal temperature threshold crossing event. For more details regarding external warm reset descriptions, see [Section 3.5, Reset Management Functional Description](#), in the chapter [Chapter 3, Power, Reset and Clock Management](#).

To enable the **fatal threshold hardware warm reset generation**, the user has to set bit SYSCTRL_PADCONF_WKUP.CONTROL_WKUP_CONTROL_SPARE_RW[0] to 0b1. The default (power-on-reset) bit value is 0b0, and TSHUT output is NOT able to generate a hardware warm reset in the device.

The mapping of general core control module TSHUT output inside the device is illustrated on [Figure 19-22](#).

Figure 19-22. TSHUT Output Mapping Diagram

sysctrl-030

NOTE: Besides interrupt generation capability via GPIO3 controller, the TSHUT output can be configured to generate **a hardware thermal-shutdown warm reset** upon device on-die hottest spot temperature crossing a user programmed fatal threshold (TSHUT_HOT value). This warm reset generation is enabled via setting the SYSCTRL_PADCONF_WKUP.CONTROL_WKUP_CONTROL_SPARE_RW[0] bit to 0b1.

NOTE: The [CONTROL_TSHUT_THRESHOLD\[25:16\]](#) TSHUT_HOT and [CONTROL_TSHUT_THRESHOLD\[9:0\]](#) TSHUT_COLD bitfields can be written only once after device power-on reset.

19.4.10.2.6 ADC Codes Versus Temperature

Table 19-21 gives the temperature range that corresponds to each value of the **CONTROL_TEMP_SENSOR[9:0]** BGAP_TEMP_SENSOR_DTEMP bit field.

Table 19-21. ADC Code Versus Temperature

| ADC Code | Temperature °C | | ADC Code | Temperature °C | | ADC Code | Temperature °C | | ADC Code | Temperature °C | |
|----------|----------------|-------|----------|----------------|------|----------|----------------|------|----------|----------------|-------|

19.4.11 Hardware Observability

19.4.11.1 Device Internal Signals Observability Overview

The general control module provides observability features covering different module internal signals related to:

- Power and reset management protocol inside different power domains
- Power domain states/transition indication
- Interrupt requests by different modules
- DMA requests by different modules
- Clocks and clock management

The associated signal multiplexing function is controlled through the hardware observability I/O multiplexing registers (32-bit read/write registers). The selected observable signals are multiplexed between the general control module CORE and/or WKUP power domain and are output on the

po_hw_dbg[31:0] observability bus at the boundaries of the general wake-up control module. The po_hw_dbg[31:0] observability outputs are then exported to the device control module logic to be further multiplexed as their corresponding hw_dbg[31:0] signals on the different pads of the WKUP or CORE power domain of the device control module (see [Section 19.4.11.4, Observability Signals Multiplexing at Device Control Module Level](#)).

NOTE: Each signal po_hw_dbg_i (where i = 0 to 31) of the general control wakeup po_hw_dbg[31:0] bus is propagated by device control module-level logic as its corresponding hw_dbg_i output signal at the device boundary (where i = 0 to 31) for the device CORE power domain pads and where i = 0 to 13 for the device WKUP power domain pads (with the constraint that hw_dbg₀ and hw_dbg₁₁ are multiplexed on the same WKUP power domain pad) described in [Section 19.4.11.4, Observability Signals Multiplexing at Device Control Module Level](#).

[Figure 19-23](#) is an overview of observability multiplexing, which minimizes the number of signals exchanged at the device boundary.

Figure 19-23. Overview of the Hardware Observability Functionality

sysctrl-006

19.4.11.2 Observability Gating Capabilities

The programmer has the option to gate all 32 signals of the observability bus simultaneously at the

observability paths of the CORE and WKUP power domains, keeping them tied to 1 ([CONTROL_HWOBS_CONTROL](#)[1] HWOBS_ALL_ONE_MODE = 0b1) or keeping them tied to 0 ([CONTROL_HWOBS_CONTROL](#)[2] HWOBS_ALL_ZERO_MODE = 0b1). This can be useful to check the path from hardware observability to external pads. These two bits must be set to 0 to enable the observability feature for all observability pads.

Additionally, the [CONTROL_HWOBS_CONTROL](#)[0] HWOBS_MACRO_ENABLE bit provides the gating feature only to observability signals muxed in the CORE power domain that come from the following modules (identified in the so-called MACRO group):

- CORTEX-A9 MPU subsystem
-
- IVA-HD
- BB2D
- CM2
- ABE

When [CONTROL_HWOBS_CONTROL](#)[0] HWOBS_MACRO_ENABLE = 0b0, the observability outputs associated with the MACRO group are gated and forced to 0b0.

NOTE: Do not set the observability gating bits [CONTROL_HWOBS_CONTROL](#)[1] HWOBS_ALL_ONE_MODE and [CONTROL_HWOBS_CONTROL](#)[2] HWOBS_ALL_ZERO_MODE simultaneously to 1 to avoid undefined states of the observability bus.

The clock frequency of the hw_dbg0, hw_dbg1, and hw_dbg2 signals can be optionally divided by 1, 2, 4, 8, or 16 through programming dedicated bit fields in [CONTROL_HWOBS_CONTROL](#).

Assignment of dividers to the hw_dbg0, hw_dbg1, and hw_dbg2 signals applies only in the CORE power domain, as follows:

- [7:3] HWOBS_CLKDIV_SEL for hw_dbg0
- [13:9] HWOBS_CLKDIV_SEL_1 for hw_dbg1
- [18:14] HWOBS_CLKDIV_SEL_2 for hw_dbg2

NOTE: Only the CORE power domain signals hw_dbg0, hw_dbg1, and hw_dbg2 pass through the [CONTROL_HWOBS_CONTROL](#) programmable dividers. These dividers are not available to the corresponding po_hw_dbg(0), po_hw_dbg(1), and po_hw_dbg(2) lines in the WKUP power domain.

NOTE: To enable observability over the po_hw_dbg(0), po_hw_dbg(1), and po_hw_dbg(2) bus lines, the HWOBS_CLKDIV_SEL, HWOBS_CLKDIV_SEL_1, and HWOBS_CLKDIV_SEL_2 bit fields in the [CONTROL_HWOBS_CONTROL](#) register must be set different than 0. The default value (0) is not sufficient to see the observability value at the hw_dbg0, hw_dbg1, and hw_dbg2 pins.

NOTE: The hw_dbg0, hw_dbg1, and hw_dbg2 frequency division and ability to gate the MACRO group observability signals (hw_dbg i, configurable in the [CONTROL_HWOBS_CONTROL](#) register) are limited to the hardware observability signals hw_dbg i (where i = 0 to 31) multiplexed and propagated in the CORE power domain ([CONTROL_DEBOBS_FINAL_MUX_SEL](#)[i] SELECT = 0b1).

These options do not apply to the hardware observability signals, hw_dbg i (where i = 0 to 31), which are muxed in the WKUP power domain ([CONTROL_DEBOBS_FINAL_MUX_SEL](#)[i] SELECT = 0x0).

19.4.11.3 Observability Signals Multiplexing at General Core/Wake-Up Control Level

Most of the observability multiplexers (MACRO group modules/DPLLs/sDMA associated) are configurable in the General Core Control Module, which is part of the switchable CORE power domain. Signal multiplexers are also instantiated in the general wakeup control module (CM1/PRM dedicated), which is part of the WKUP power domain. The [CONTROL_DEBOBS_FINAL_MUX_SEL](#)[31:0] SELECT bit field, instantiated in the CORE power domain, selects a signal to be observed between the outputs at the CORE and WKUP multiplexing levels. A bit from this register set to 1 selects to route a signal from the CORE power domain to a certain po_hw_dbg_n (where n = 0...31) line, and when the bit is set to 0, selects to route a signal from the WKUP power domain to the same line. The output of this top-level multiplexing is further passed to the padconfiguration muxing I/O level within device control module boundaries.

NOTE: Although the [CONTROL_DEBOBS_FINAL_MUX_SEL](#) observability control register is in the CORE power domain, its value is retentioned before the device goes into off mode. Thus, the preserved value is used to control the final observability muxer in the WKUP power domain, even when the PD_CORE supply in the device is switched off. Because the hw_dbg_i signals, which are propagated in the CORE power domain, are not available in off mode, the value of [CONTROL_DEBOBS_FINAL_MUX_SEL](#)[i] SELECT = 0b1 (where i = 0 to 31) in this case means that the hw_dbg_i signal is not available at output.

The module and view-channel selection/reduction layer in the CORE domain is configured through the 4-bit field MODE in the 32 × 32-bit registers [CONTROL_CORE_CONF_DEBUG_SEL_TST_0](#) through [CONTROL_CORE_CONF_DEBUG_SEL_TST_31](#). The following modules can be selected as source of observability signals: Cortex-A9 MPU subsystem, IVA-HD, BB2D, CM2, and ABE (MACRO signal sources).

Some of the [CONTROL_CORE_CONF_DEBUG_SEL_TST](#) registers are responsible for selection of sDMA view channels, different DPLL clock view channels, and other signal view channels.

- 3 x DPLL clockout signal view channels
- 7 x DPLL (other than clkout signal) view channels
- 5 x sDMA signal view channels
- 3 x additional clockout view channels monitoring the hwobs_coredivider_clkout3, hwobs_perdivider_clkout4, and hwobs_pd_l4_per_per32k_gfclk signals.

[Table 19-22](#) summarizes the internal signals multiplexing schema for each of the 32 [CONTROL_CORE_CONF_DEBUG_SEL_TST](#) registers.

A third 1:N selection layer is applied over several signals to route them one-at-a-time to a certain view channel output:

- The [CONTROL_CONF_CLK_SEL0\[2:0\]](#) MULT through [CONTROL_CONF_CLK_SEL2\[2:0\]](#) MULT bit fields control the multiplexing of DPLL CLKOUT signals over three parallel DPLL clockout view channels. The signal source of a certain view channel can be selected to be one of six DPLLs in the device:
 - CORE DPLL
 - ABE DPLL
 - PER DPLL
 - DSI1 DPLL
 - DSI2 DPLL
 - USB DPLL
- The register bit fields associated with the seven different DPLL signal view channels are summarized in [Table 19-23](#). Again, the 3-bit MULT bit field in each of the seven registers makes it possible to choose the source of the DPLL signal to be one of the following device DPLLs:
 - CORE DPLL
 - ABE DPLL
 - PER DPLL
 - DSI1 DPLL

- DSI2 DPLL
- USB DPLL
- There are four independent sDMA request view channels, each of which has a dedicated register ([CONTROL_CONF_SDMA_REQ_SEL0](#) through [CONTROL_CONF_SDMA_REQ_SEL3](#)) with a 7-bit MULT bit field to select one from 127 possible sDMA request signals for observation purposes. For more information, see [Chapter 17, sDMA Controller](#). The fifth channel, sdma_req_view_all, is acquired by applying logical AND reduction over the four currently selected sDMA view channel output signals.
- The General Core observability logic input (hwobs_pd_l4_per_per32k_gfclk) is tied to the PRM output observability signal (pd_l4_per_per_32k_gfclk). The pd_l4_per_per_32k_gfclk signal corresponds to the hardware gated in the L4_PER clock domain clock (PER_32K_FCLK), which is directly sourced by the SCRM clock (32K_FCLK). For more information, see [Section 3.6.3.1, PRM Clock Source](#), in [Chapter 3, Power, Reset, and Clock Management](#). The PER_32K_FCLK and 32K_FCLK clocks are also multiplexed for observability in the WKUP domain when the PRCM.PRM_DEBUG_CFG[6:0] bit field is set to 0x6C. The observable signals are devfsm_I0.clk and gat_per_32k_gfclk_I0.clkGated, respectively. For more information, see [Table 19-42, PRM Observable Signals](#).
- The General Core observability logic input, hwobs_coredivider_clkout3, is tied to the Core DPLL observability output, CLK_FUNC_1_0_3, which is a direct (nongated, nondivided) version of the CORE DPLL clock output, CLKOUTX2_M3. For more information, see [Section 3.6.3.5, DPLL_CORE Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- The General Core observability logic input, hwobs_perdivider_clkout4, is tied to the Core DPLL observability output, CLK_FUNC_1_0_4, which is a direct (nongated, nondivided) version of the PER DPLL clock output, CLKOUTX2_M4. For more information, see [Section 3.6.3.4, DPLL_PER Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).

[Table 19-23](#) lists the DPLL signal observability controls.

Table 19-23. DPLL Signal Observability Controls

| Feature | Type | Register/Bit Field/Observability Control | Description |
|--|---------|---|--|
| Different domain DPLL freqlock observability | Control | CONTROL_CONF_DPLL_FREQLOCK_SEL [2:0] MULT | Selects DPLL freqlock view channel (1:8) |
| Different domain DPLL phaselock observability | Control | CONTROL_CONF_DPLL_PHASELOCK_SEL [2:0] MULT | Selects DPLL phaselock view channel (1:8) |
| Different domain DPLL tinitz observability | Control | CONTROL_CONF_DPLL_TINITZ_SEL [2:0] MULT | Selects to observe DPLL tinitzview channel (1:8) |
| Different domain DPLL tenable observability | Control | CONTROL_CONF_DPLL_TENABLE_SEL [2:0] MULT | Selects to observe DPLL tenableview channel (1:8) |
| Different domain DPLL tenablediv observability | Control | CONTROL_CONF_DPLL_TENABLEDIV_SEL [2:0] MULT | Selects to observe DPLL tenabledivview channel (1:8) |
| Different domain DPLL bypassack observability | Control | CONTROL_CONF_DPLL_BYPASSACK_SEL [2:0] MULT | Selects to observe DPLL bypassackview channel (1:8) |
| Different domain DPLL idle observability | Control | CONTROL_CONF_DPLL_IDLE_SEL [2:0] MULT | Selects to observe DPLL idleview channel (1:8) |

NOTE: Features configured in the following registers are limited to hardware observability signals, hw_dbg i (where i = 0 to 31), multiplexed and propagated in the CORE power domain ([CONTROL_DEBOBS_FINAL_MUX_SEL\[i\] SELECT = 0b1](#)):

- [CONTROL_CORE_CONF_DEBUG_SEL_TST_0](#) through [CONTROL_CORE_CONF_DEBUG_SEL_TST_31](#)
- [CONTROL_CONF_CLK_SEL0\[2:0\] MULT](#) through [CONTROL_CONF_CLK_SEL2\[2:0\] MULT](#)
- [CONTROL_CONF_SDMA_REQ_SEL0](#) through [CONTROL_CONF_SDMA_REQ_SEL3](#)
- [CONTROL_CONF_DPLL_FREQLOCK_SEL](#)
- [CONTROL_CONF_DPLL_TINITZ_SEL](#)
- [CONTROL_CONF_DPLL_PHASELOCK_SEL](#)
- [CONTROL_CONF_DPLL_TENABLE_SEL](#)
- [CONTROL_CONF_DPLL_TENABLEDIV_SEL](#)
- [CONTROL_CONF_DPLL_BYPASSACK_SEL](#)
- [CONTROL_CONF_DPLL_IDLE_SEL](#)

These options are not applicable to hardware observability signals, hw_dbg i (where i = 0 to 31), which at the general control module level are muxed in the WKUP power domain ([CONTROL_DEBOBS_FINAL_MUX_SEL\[i\] SELECT = 0b0](#)).

The [CONTROL_WKUP_CONF_DEBUG_SEL_TST_i\[0\] MODE](#) bit (where i = 0...31) provides the option to choose between observation of power and reset manager signals in the device or observation of signals related to CM1. If [CONTROL_WKUP_CONF_DEBUG_SEL_TST_i\[0\] = 0b1](#), the hwobs_int_prm_i signal is selected. Otherwise, the hwobs_int_cm1_i signal is output.

NOTE: The CM1 and PRM observable signals are multiplexed in the WKUP power domain.

19.4.11.4 Observability Signals Multiplexing at Device Control Module Level

The pads used for the hardware debug must be properly configured by selecting the hardware debug function (hw_dbgn) of the pad.

19.4.11.4.1 Observability Signals Muxed on Pads in Core Power Domain

To map the hw_dbg0 through hw_dbg19 signals to their associated external device pads in the CORE power domain, set the related MUXMODE bit fields within the [CONTROL_CORE_PAD0_SYS_BOOT5_PAD1_DPM_EMU0](#) through [CONTROL_CORE_PAD0_DPM_EMU19_PAD1_CSI22_DX2](#) padconfiguration registers to 0b110 (Mode 6). To make the remaining signals (hw_dbg20 through the hw_dbg31) available at their corresponding device pads in the CORE power domain, set the MUXMODE bit fields within the [CONTROL_CORE_PAD0_CAM_GLOBALRESET_PAD1_USBB1_ULPITLL_CLK](#) through [CONTROL_CORE_PAD0_USBB1_ULPITLL_DAT7_PAD1_USBB1_HSIC_DATA](#) padconfiguration registers to 0b110 (Mode 6).

For more information, see [Table 19-10](#), *Device Core Control Module Pad Configuration Register Fields*.

For more information about hardware observability configuration, see [Table 19-110](#), *ACTIVE PADS Configuration Points*.

NOTE: The hw_dbg i signals (where i = 0 to 31), which are multiplexed and propagated in the CORE power domain, are not visible when the device is set in off mode (PD_CORE supply switched off).

19.4.11.4.2 Observability Signals Muxed on Pads in WKUP Power Domain

To have hw_dbg1 through hw_dbg13 signals multiplexed on the WKUP power domain pads, set MuxMode = 0x6 in the following SYSCTRL_PADCONF_WKUP registers:

- [CONTROL_WKUP_PAD0_GPIO_WK0_PAD1_GPIO_WK1](#) through [CONTROL_WKUP_PAD0_GPIO_WK2_PAD1_GPIO_WK3](#)[31:16] to have the hw_dbg1–hw_dbg4 signals output on the gpio_wk0–gpio_wk3 device pads, respectively
- [CONTROL_WKUP_PAD0_GPIO_WK4_PAD1_SR_SCL](#)[15:0] to have the hw_dbg5 signal output on the gpio_wk4 device pad
- [CONTROL_WKUP_PAD0_FREF_CLK0_OUT_PAD1_FREF_CLK3_REQ](#) through [CONTROL_WKUP_PAD0_FREF_CLK3_OUT_PAD1_FREF_CLK4_REQ](#) to have the hw_dbg6–hw_dbg9 signal output on the fref_clk0_out, fref_clk3_req, fref_clk3_out, and fref_clk4_req device pads, respectively
- [CONTROL_WKUP_PAD0_FREF_CLK4_OUT_PAD1_SYS_32K](#)[15:0] to have the hw_dbg10 signal output on the fref_clk4_out device pad
- [CONTROL_WKUP_PAD0_SYS_PWR_REQ_PAD1_SYS_PWRON_RESET_OUT](#)[31:16] to have the hw_dbg11 signal output on the sys_pwrn_reset_out device pad
- [CONTROL_WKUP_PAD0_SYS_BOOT6_PAD1_SYS_BOOT7](#) to have the hw_dbg12 and hw_dbg13 signals output on the sys_boot6 and sys_boot7 device pads, respectively

The hw_dbg0 signal is available on the sys_pwrn_reset_out pad in WKUP domain, through setting MuxMode=0x5 in

the [CONTROL_WKUP_PAD0_SYS_PWR_REQ_PAD1_SYS_PWRON_RESET_OUT](#)[31:16] register.

Because hw_dbg11 (MuxMode=0x6) and hw_dbg0 (MuxMode=0x5) are muxed on the same pad - sys_pwrn_reset_out, user should make choice between the two observable signals in WKUP domain

See [Table 19-9](#), *Device Wakeup Control Module Pad Configuration Register Fields* for more information.

See [Table 19-110](#), *ACTIVE PADS Configuration Points*, for more details on hardware observability configuration.

NOTE: If multiplexed on corresponding device pads in the WKUP power domain, the hw_dbg i signals (where i = 0 to 31), which are multiplexed and propagated in the WKUP power domain, can be observed even if the device goes into off mode.

19.4.11.5 Observability Signals Sourced at Module Level

Observable signals coming from within different device subsystems are mapped to general core control and general wakeup control observability inputs. Additional multiplexing is also implemented inside some of the observable modules (see [Figure 19-23, Overview of the Hardware Observability Functionality](#)).

19.4.11.5.1 Dual Cortex-A9 Subsystem Observable Signals

[Table 19-24](#) through [Table 19-32](#) list the Cortex-A9 MPU subsystem observable signals available in 12 functional multiplexing modes. The mode is selected at the general core control module level by programming the [CONTROL_DEBOBS_MMR_MPU\[3:0\]](#) SELECT bit field. The SELECT values in range (0xC–0xF) are reserved for future use.

Table 19-24. Observability Signals Multiplexing at Cortex-A9 MPU Subsystem Level – Mode 0

| CONTROL_DEBOBS_MMR_MPU[3:0] SELECT = 0b0000 | | | |
|--|--|--|--|

The POPPROFILING_EVENT2PRM bus signals, observable in modes 0, 1, 2, and 3, monitor the power states of the CPU. There are 6 status bits per Cortex-A9 CPU0 and CPU1, respectively. [Table 19-28](#) describes the encoding of the status bits.

POPPROFILING_EVENT2PRM[5:0] are the status bits for CPU0, and POPPROFILING_EVENT2PRM[11:6] are the status bits for CPU1.

19.4.11.5.3 BB2D Accelerator Observable Signals

The BB2D accelerator observable signals described in [Table 19-38](#) are directly mapped to the BB2D dedicated observability inputs of the SYSCTRL_GENERAL_CORE module, and NO additional multiplexing of observability signals is performed inside the BB2D module.

Table 19-38. Observability Signals at Display Subsystem Level

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to BB2D Signals | BB2D Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|---|--|--|-------------------------------------|
| hwobs_bb2d_sys_interrupt_reqz | BB2D_SYS_INTERRUPT_REQZ | a single aggregate active-low GPU interrupt | 0: interrupt pending 1: no event |
| hwobs_bb2d_mconnect_1 | BB2D_MCONNECT_1 | Not implemented in the BB2D subsystem | – |
| hwobs_bb2d_mconnect_0 | BB2D_MCONNECT_0 | Not implemented in the BB2D subsystem | – |
| hwobs_bb2d_sconnect_2 | BB2D_SCONNECT_2 | BB2D L3 slave (target port) connection bus [2] | – |

|---|--|--------------------------------------|------------------------------|
| hwobs_bb2d_pgoodin | BB2D_PGOODIN | PGOODIN control for the power switch | - |
| hwobs_bb2d_ponin | BB2D_PONIN | PONIN control for the power switch | - |
| hwobs_bb2d_ponout | BB2D_PONOUT | PONOUT control for the power switch | - |

19.4.11.5.4 DSP Subsystem Observable Signals

This information is not available in the public domain.

19.4.11.5.5 ABE Subsystem Observable Signals

The audio backend (ABE) observable signals described in [Table 19-39](#) are directly mapped to the ABE dedicated observability inputs, hwobs_int_abe[31:0] of the SYSCTRL_GENERAL_CORE module, and no additional multiplexing is performed inside the ABE.

Table 19-39. Observability Signals at ABE Subsystem Level

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to Signals Inside ABE subsystem | ABE Level Observability Signals | Signal Description | Logical Value Meaning |
|---|--|---|--|
| hwobs_int_abe[31:26] | — | — | — |
| hwobs_int_abe[25:24] | OPP_DIV | OPP DIVIDER bits [1:0] | — |
| hwobs_int_abe[23] | AESS_to_MPU_IRQ | IRQ sent from AESS to MCU. See Chapter 13, ABE . | — |
| hwobs_int_abe[22] | AESS_to_DSPSS_IRQ | IRQ sent from AESS to DSP. See , Interrupt Requests , and Chapter 13, ABE . | — |
| hwobs_int_abe[21] | Reserved | — | — |
| hwobs_int_abe[20] | GPT_WDT_PWM_INP | PWM received from the GPTIMER or watchdog (OR) | — |
| hwobs_int_abe[19] | AESS_DMAREQ_ALL | (Logical OR with all DMA requests out) | High while outgoing DMA requests from audio engine have not been acknowledged by the host |
| hwobs_int_abe[18] | AESS_DMAREQ_PER | (Logical OR with all DMA requests coming from the peripheral) | High when incoming DMA requests from audio engine are still to be served |
| hwobs_int_abe[17] | AESS_IDLEPO | PO_IDLE AESS output | High when the audio engine executes a wait until an activation of the PI_WAKEUP pin is done |
| hwobs_int_abe[16:0] | RESERVED | — | — |

19.4.11.5.6 USBOTGHS Subsystem Observable Signals

One of the General Wakeup Control observability inputs can be mapped to the USBOTGHS start-of-frame signal (hsusbogt_sofpulse) by setting [CONTROL_CORE_CONF_DEBUG_SEL_TST_11\[3:0\] MODE = 0x1](#).

19.4.11.5.7 CM2 Subsystem Observable Signals

The SYSCTRL_GENERAL_CORE observability inputs hwobs_int_cm2(i), (where i = 0...31) are mapped to the signals debugcm2(i), (where i = 0...31) coming out of the PRCM submodule, clock manager 2 (CM2).

Local multiplexing controls at the CM2 level are in the CM2_DEBUG_CFG register. The CM2 observability output signals are driven on the debugcm2(0) through debugcm2(7) lines. A certain mux set is selected by programming the CM2_DEBUG_CFG[7:0] SEL0 bit field. The remaining debugcm2(8) through debugcm2(31) lines are reserved for future use. For more information about the CM2 observability source select field, see [Section 3.11.30.1, INTRCONN_SOCKET_CM2 Register Summary](#), in [Chapter 3, Power, Reset, and Clock Management](#).

[Table 19-40](#) provides different details about the signals inside the CM 2 that can be monitored on device hw_dbg pins.

19.4.11.5.8 CM1 Subsystem Observable Signals

The General Wakeup Control observability inputs hwobs_int_cm1(i) , (where i = 0...31) are mapped to the signals debugcm1(i), (where i = 0...31) coming out of the PRCM submodule clock manager 1 (CM1).

Local multiplexing controls at the CM1 level are in the CM1_DEBUG_CFG register. The CM1 observability output signals are driven on the debugcm1(0) through debugcm1(7) lines. A certain mux set is selected by programming the CM1_DEBUG_CFG[6:0] SEL0 bit field. The remaining debugcm1(8) through debugcm1(31) lines are reserved for future use. For more information about the CM1 observability source select field, see [Section 3.11.22.1, INTRCONN_SOCKET_CM1 Register Summary](#) in [Chapter 3, Power, Reset, and Clock Management](#).

[Table 19-41](#) provides different details about the signals inside CM1 that can be monitored on device hw_dbg pins.

19.4.11.5.9 PRM Subsystem Observable Signals

The General Wakeup Control observability inputs hwobs_int_prm(i), (where i = 0...31) are mapped to the signals debugprm(i), (where i = 0...31) coming out from the power reset manager (PRM) submodule.

Local multiplexing controls at the PRM level are in the PRM_DEBUG_CFG register. The PRM observability output signals are driven on the debugprm(0) through debugprm(7) lines. A certain mux set is selected by programming the PRM_DEBUG_CFG[6:0] SEL0 bit field. The remaining debugprm(8) through debugprm(31) lines are reserved for future use. For more information about the PRM observability source select field, see [Section 3.11.2.1, INTRCONN_SOCKET_PRM Register Summary](#) in [Chapter 3, Power, Reset, and Clock Management](#).

[Table 19-42](#) provides different details about the signals inside the PRM that can be monitored on device hw_dbg pins.

19.4.11.5.10 PRCM FSM State Observable Signals Description

Some of the observable signals encode the different PRCM finite state-machine (FSM) states. Each state corresponds to a combination of FSM output signal values. The states of the different FSMs associated with the SAR RAM, DPLLs, EMIF, I/O controller, power manager, global reset manager warm reset generator, and clock managers, along with their corresponding output signal values (except for DPLL Ctrl outputs) are described in [Table 19-43](#) through [Table 19-49](#).

Table 19-43. SAR FSM State Description

| hwobs_usbdpll_clkout | PODPLLTESTCLKOUT | USB DPLL | 0x6 |
| reserved | Reserved | – | 0x7 |

19.4.11.5.12 Other CORE DPLL Observable Signals

Table 19-51 describes the mapping of CORE DPLL observability signals (other than CLKOUT) to the SYSCTRL_GENERAL_CORE DPLL observing inputs. The selection of CORE DPLL as the source of the additional DPLL signals is done at the SYSCTRL_GENERAL_CORE level by setting bit field MULT = 0x0 inside each of the eight registers (CONTROL_CONF_DPLL_FREQLOCK_SEL through CONTROL_CONF_DPLL_IDLE_SEL).

Table 19-51. Other CORE DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to CORE DPLL Observable Signals | Other CORE DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|--|--|---|-----------------------|
| hwobs_coredpll_freqlock | COREdpll_freqlock | CORE DPLL frequency lock check | – |
| hwobs_coredpll_tinitz | COREdpll_tinitz | Check CORE DPLL status, lock/relock time | – |
| hwobs_coredpll_phaselock | COREdpll_phaselock | CORE DPLL phase lock check | – |
| hwobs_coredpll_tenable | COREdpll_tenable | CORE DPLL core RegM/N load enable input | – |
| hwobs_coredpll_tenablediv | COREdpll_tenablediv | CORE DPLL core RegM2/N2 load enable input | – |
| hwobs_coredpll_bypassack | COREdpll_bypassack | CORE DPLL bypass status signal | – |
| hwobs_coredpll_idle | COREdpll_idle | CORE DPLL idle mode input | – |

19.4.11.5.13 Other ABE DPLL Observable Signals

Table 19-52 describes the mapping of CORE DPLL observability signals (other than CLKOUT) to the SYSCTRL_GENERAL_CORE DPLL observing inputs. The selection of ABE DPLL as the source of the additional DPLL signals is done at the SYSCTRL_GENERAL_CORE level by setting bit field MULT = 0x1 inside each of the eight registers (CONTROL_CONF_DPLL_FREQLOCK_SEL through CONTROL_CONF_DPLL_IDLE_SEL).

Table 19-52. Other ABE DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to ABE DPLL Observable Signals | Other ABE DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|--|--|--|------------------------------|
| hwobs_abedpll_freqlock | dsdpdll_freqlock | ABE DPLL frequency lock check | – |
| hwobs_abedpll_tinitz | dsdpdll_tinitz | Check ABE DPLL status, lock/relock time. | – |
| hwobs_abedpll_phaselock | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_abedpll_tenable | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_abedpll_tenablediv | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_abedpll_bypassack | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_abedpll_idle | dspDpllPhaseLock | dspDPLL phase lock check | – |

19.4.11.5.14 Other PERIPH DPLL Observable Signals

Table 19-53 describes the mapping of CORE DPLL observability signals (other than CLKOUT) to the SYSCTRL_GENERAL_CORE DPLL observing inputs. The selection of PERIPH DPLL as the source of the additional DPLL signals is done at the SYSCTRL_GENERAL_CORE level by setting bit field MULT = 0x2 inside each of the eight registers ([CONTROL_CONF_DPLL_FREQLOCK_SEL](#) through [CONTROL_CONF_DPLL_IDLE_SEL](#)).

Table 19-53. Other PERIPH DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to PERIPH DPLL Observable Signals | Other PERIPH DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|---|---|---|------------------------------|
| hwobs_perdppll_freqlock | PERIPHDpll_freqlock | PERIPH DPLL frequency lock check | – |
| hwobs_perdppll_tinitz | PERIPHDpll_tinitz | Check PERIPH DPLL status, lock/relock time. | – |
| hwobs_perdppll_phaselock | PERIPHDpllPhaseLock | PERIPH DPLL phase lock check | – |
| hwobs_perdppll_tenable | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_perdppll_tenablediv | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_perdppll_bypassack | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_perdppll_idle | PERIPHDpllPhaseLock | PERIPH DPLL phase lock check | – |

19.4.11.5.15 Other DSI1 DPLL Observable Signals

Table 19-54 describes the mapping of CORE DPLL observability signals (other than CLKOUT) to the SYSCTRL_GENERAL_CORE DPLL observing inputs. The selection of DSI1 DPLL as the source of the additional DPLL signals is done at the SYSCTRL_GENERAL_CORE level by setting bit field MULT = 0x3 inside each of the eight registers ([CONTROL_CONF_DPLL_FREQLOCK_SEL](#) through [CONTROL_CONF_DPLL_IDLE_SEL](#)).

Table 19-54. Other DSI1 DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to DSI1 DPLL Observable Signals | Other DSI1 DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|---|---|---|------------------------------|
| hwobs_dsi1dpll_freqlock | dsdpdll_freqlock | dspDPLL frequency lock check | – |
| hwobs_dsi1dpll_tinitz | dsdpdll_tinitz | Check dspDPLL status, lock/relock time. | – |

Table 19-54. Other DSI1 DPLL Observability Signals (continued)

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to DSI1 DPLL Observable Signals | Other DSI1 DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|---|---|---------------------------|------------------------------|

| hwobs_dsi1dpll_bypassack | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_dsi1dpll_idle | dspDpllPhaseLock | dspDPLL phase lock check | – |

19.4.11.5.16 Other DSI2 DPLL Observable Signals

Table 19-55 describes the mapping of CORE DPLL observability signals (other than CLKOUT) to the SYSCTRL_GENERAL_CORE DPLL observing inputs. The selection of DSI2 DPLL as the source of the additional DPLL signals is done at the SYSCTRL_GENERAL_CORE level by setting bit field MULT = 0x4 inside each of the eight registers ([CONTROL_CONF_DPLL_FREQLOCK_SEL](#) through [CONTROL_CONF_DPLL_IDLE_SEL](#)).

Table 19-55. Other DSI2 DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to DSI2 DPLL Observable Signals | Other DSI2 DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|---|---|---|------------------------------|
| hwobs_dsi2dpll_freqlock | PERIPHDpll_freqlock | PERIPH DPLL frequency lock check | – |
| hwobs_dsi2dpll_tinitz | PERIPHDpll_tinitz | Check PERIPH DPLL status, lock/relock time. | – |

| hwobs_dsi2dpll_tenable | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_dsi2dpll_tenablediv | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_dsi2dpll_bypassack | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_dsi2dpll_idle | PERIPHDpllPhaseLock | PERIPH DPLL phase lock check | – |

19.4.11.5.17 Other USB DPLL Observable Signals

Table 19-56 shows mapping of (other than CLKOUT) CORE dpll observability signals to the SYSCTRL_GENERAL_CORE dpll observing inputs. The selection of USB DPLL as the source of the additional DPLL signals is done at SYSCTRL_GENERAL_CORE level through setting bit field MULT=0x6 inside all of the eight registers - [CONTROL_CONF_DPLL_FREQLOCK_SEL](#) through [CONTROL_CONF_DPLL_IDLE_SEL](#).

Table 19-56. Other USB DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to USB DPLL Observable Signals | Other USB DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability inputs | Signal Description | Logical Value Meaning |
|--|--|---|------------------------------|
| hwobs_usbdpll_freqlock | dsdpdpll_freqlock | dspDPLL frequency lock check | – |
| hwobs_usbdpll_tinitz | dsdpdpll_tinitz | Check dspDPLL status, lock/relock time. | – |
| hwobs_usbdpll_phaselock | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_usbdpll_tenable | dspDpllPhaseLock | dspDPLL phase lock check | – |

Table 19-56. Other USB DPLL Observability Signals (continued)

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to USB DPLL Observable Signals | Other USB DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability inputs | Signal Description | Logical Value Meaning |
|---|---|--------------------------|-----------------------|
| hwobs_usbdpll_tenablediv | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_usbdpll_bypassack | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_usbdpll_idle | dspDpllPhaseLock | dspDPLL phase lock check | – |

19.4.12 Functional Register Description

19.4.12.1 DSP Boot Register

This information is not available in the public domain.

19.4.12.1.1 PBIASLITE Control Register

Table 19-57 describes the [CONTROL_PBIASLITE](#) register, which controls some settings of PBIASLITE cell for the MMC1 I/O interface.

Table 19-57. PBIAS Control Register

| Physical Address | Register Name | Description | Access |
|------------------|-----------------------------------|---------------------------------|--------|
| 0x4A10 0600 | CONTROL_PBIASLITE | Control settings for PBIAS cell | RW |

19.4.12.2 Temperature Sensor Control Registers

Table 19-58 describes the [CONTROL_TEMP_SENSOR](#) registers of the general core control module, which control the temperature sensor, band gap state-machine, and thermal post-processing logic.

Table 19-58. Temperature Sensor Register

| Physical Address | Register Name | Description | Access |
|------------------|---|--|--------|
| 0x4A00 232C | CONTROL_TEMP_SENSOR | Temperature sensor control register | R/W |
| 0x4A00 2378 | CONTROL_BANDGAP_CTRL | Mode selection and mask hot/cold event register | R/W |
| 0x4A00 237C | CONTROL_BANDGAP_COUNTER | Band gap delay counter register | R/W |
| 0x4A00 2380 | CONTROL_BANDGAP_THRESHOLD | Band gap thermal alert threshold register | R/W |
| 0x4A00 2384 | CONTROL_TSHUT_THRESHOLD | Tshut threshold register | R/W |
| 0x4A00 2388 | CONTROL_BANDGAP_STATUS | Thermal alert and band gap idle events status register | RO |

19.4.12.2.1 CSI Receiver Control Register

To enable the physical layer of the camera receiver, the programmer manipulates the bits within the [CONTROL_CAMERA_RX](#) register.

Table 19-59. CSI Receiver Control Register

| Physical Address | Register Name | Description | Access |
|------------------|-----------------------------------|---------------------------------|--------|
| 0x4A10 0608 | CONTROL_CAMERA_RX | Module dedicated configurations | RW |

19.4.12.3 Protection Status Registers

Table 19-60 lists the status registers.

Table 19-60. Protection Status Registers

| Physical Address | Register Name | Description | Access |
|------------------|--|---|-------------|
| 0x4A00 22D0 | CONTROL_SEC_ERR_STATUS_FUNC | Protection firewall error status register | Public (R) |
| 0x4A00 22D4 | CONTROL_SEC_ERR_STATUS_DEBUG | Protection firewall error status register debug | Public (RW) |

These registers do not depend on the device type.

The [CONTROL_PROT_ERR_STATUS_FUNC](#) can be read in public mode, but cannot be written.

The [CONTROL_PROT_ERR_STATUS_DEBUG](#) register is both read and write accessible in GP devices.

These bits are cleared when the L3 and L4 firewall embedded-error log registers are cleared. All bits in these registers reflect internal events in the device related to the device protection.

On a specific event (signal rising edge), the corresponding bit is set. On a rising edge, the input signal must stay high for at least two interface clock periods to be recognized. Software must clear each bit after reviewing the events.

When a protection violation occurs, the following bits are set:

- In application mode
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[01] = L3RAM protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[02] = GPMC protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[03] = EMIF protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[04] = IVA-HD protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[05] = Dual Cortex™-M3 protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[06] = SL2 protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[09] = BB2D protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[12] = C2C protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[13] = SGX protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[14] = DSS protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[15] = ISS protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[16] = L4_PER protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[17] = L4_CFG protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[18] = DEBUGSS protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[19] = L4 AudioBE protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC](#)[20] = C2C INIT protection violation
- In debug mode:
 - [CONTROL_SEC_ERR_STATUS_DEBUG](#)[01] = L3RAM protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG](#)[02] = GPMC protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG](#)[03] = EMIF protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG](#)[04] = IVA-HD protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG](#)[05] = Dual Cortex-M3 protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG](#)[06] = SL2 protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG](#)[09] = BB2D protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG](#)[12] = C2C protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG](#)[13] = SGX protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG](#)[14] = DSS protection violation

- [CONTROL_SEC_ERR_STATUS_DEBUG\[15\]](#) = ISS protection violation
- [CONTROL_SEC_ERR_STATUS_DEBUG\[16\]](#) = L4_PER protection violation
- [CONTROL_SEC_ERR_STATUS_DEBUG\[17\]](#) = L4_CFG protection violation
- [CONTROL_SEC_ERR_STATUS_DEBUG\[18\]](#) = DEBUGSS protection violation
- [CONTROL_SEC_ERR_STATUS_DEBUG\[19\]](#) = L4 AudioBE protection violation
- [CONTROL_SEC_ERR_STATUS_DEBUG\[20\]](#) = C2C INIT protection violation

For more information about L4 firewall protection-violation report mechanisms, see [Firewall Error Logging in the Control Module](#). For more information about L3 firewall protection-violation report mechanisms, see [L3 Interconnect Error Analysis](#).

19.4.12.4 Protection SDRAM Configuration Registers

[Table 19-61](#), *Protection SDRAM Configuration Registers for EMIF1 and EMIF2*, lists the protection SDRAM configuration registers for EMIF1 and EMIF2 that are part of the general wakeup control module. Upon POR, their values are exported as reset values of the EMIF1 and EMIF2 registers (EMIF_SDRAM_CONFIG and EMIF_SDRAM_CONFIG_2, respectively).

Table 19-61. Protection SDRAM Configuration Registers for EMIF1 and EMIF2

| Physical Address | Register Name | Description | Access |
|------------------|---|--|--------|
| 0x4A30C110 | CONTROL_WKUP_PROT_EMIF1_SDRAM_CONFIG_REG | Protection SDRAM configuration register 1, defining bit field reset values of the EMIF1.EMIF_SDRAM_CONFIG register | RW |
| 0x4A30C114 | CONTROL_WKUP_PROT_EMIF1_SDRAM_CONFIG2_REG | Protection SDRAM configuration register 2, defining bit field reset values of the EMIF1.EMIF_SDRAM_CONFIG_2 register | RW |
| 0x4A30C118 | CONTROL_WKUP_PROT_EMIF2_SDRAM_CONFIG_REG | Protection SDRAM configuration register 1, defining bit field reset values of the EMIF2.EMIF_SDRAM_CONFIG register | RW |
| 0x4A30C11C | CONTROL_WKUP_PROT_EMIF2_SDRAM_CONFIG2_REG | Protection SDRAM configuration register 2, defining bit field reset values of the EMIF2.EMIF_SDRAM_CONFIG_2 register | RW |

19.4.12.5 Register Controls for the LPDDR2IO1/LPDDR2IO2 I/O Buffer Modes

Global LPDDR2IO1/LPDDR2IO2 (EMIF1 and EMIF2 associated) phycmd0 and phydata0–phydata3 I/O buffer controls are part of the SYSCTRL_GENERAL_CORE.CONTROL_GEN_CORE_OCPREG_SPARE register. Their functionality is as follows:

- Programming the OCPREG_SPARE[1] and OCPREG_SPARE[3] bits to high brings the PWRDN signal to the I/O buffers driven by the emif1/emif2phydata0 through emif/emif2phydata3 components, respectively, to low; as a consequence, power-down mode for these I/O buffers is activated. The PWRDN software controls do not affect the emif1/emif2phycmd0 components.
- Programming the OCPREG_SPARE[0] and OCPREG_SPARE[2] bits to high enables the low-voltage CMOS buffer logic for the emif1/emif2phydata0-emif1/emif2phydata3 and emif1/emif2phycmd0 components, respectively. Programming the OCPREG_SPARE[0] and OCPREG_SPARE[2] bits to low enables a true differential comparator.
- Upon POR, the value of the register is 0x0. The PWRDN signal is high (power-down mode is inactive) and CMOSEN is low at the pads (differential comparator enable).

CAUTION

The bits in [CONTROL_GEN_CORE_OCPREG_SPARE](#) must not be updated.

[Table 19-62](#) lists the register used to control the described EMIF1 and EMIF2 features.

Table 19-62. LPDDR2IO Buffer Control Register

| Physical Address | Register Name | Description | Access |
|------------------|---|---|--------|
| 0x4A0023FC | CONTROL_GEN_CORE_OCPREG_SPARE | The lower 4 bits of this register are assigned to control the power-down mode and enable the LVCMOS buffers associated with the EMIF1 and EMIF2 PHY components. | RW |

19.4.12.6 EMIF DLL Master/Slave Specific Registers

19.4.12.6.1 EMIF DLL Slaves Individual Offset Compensation

Delays used to time the DQS signals of the LPDDR2 interface vary for the different DDR PHY DLL slaves associated with an EMIF controller instance. An individual offset compensation is provided for each of the four DLL slaves to achieve symmetrical timings.

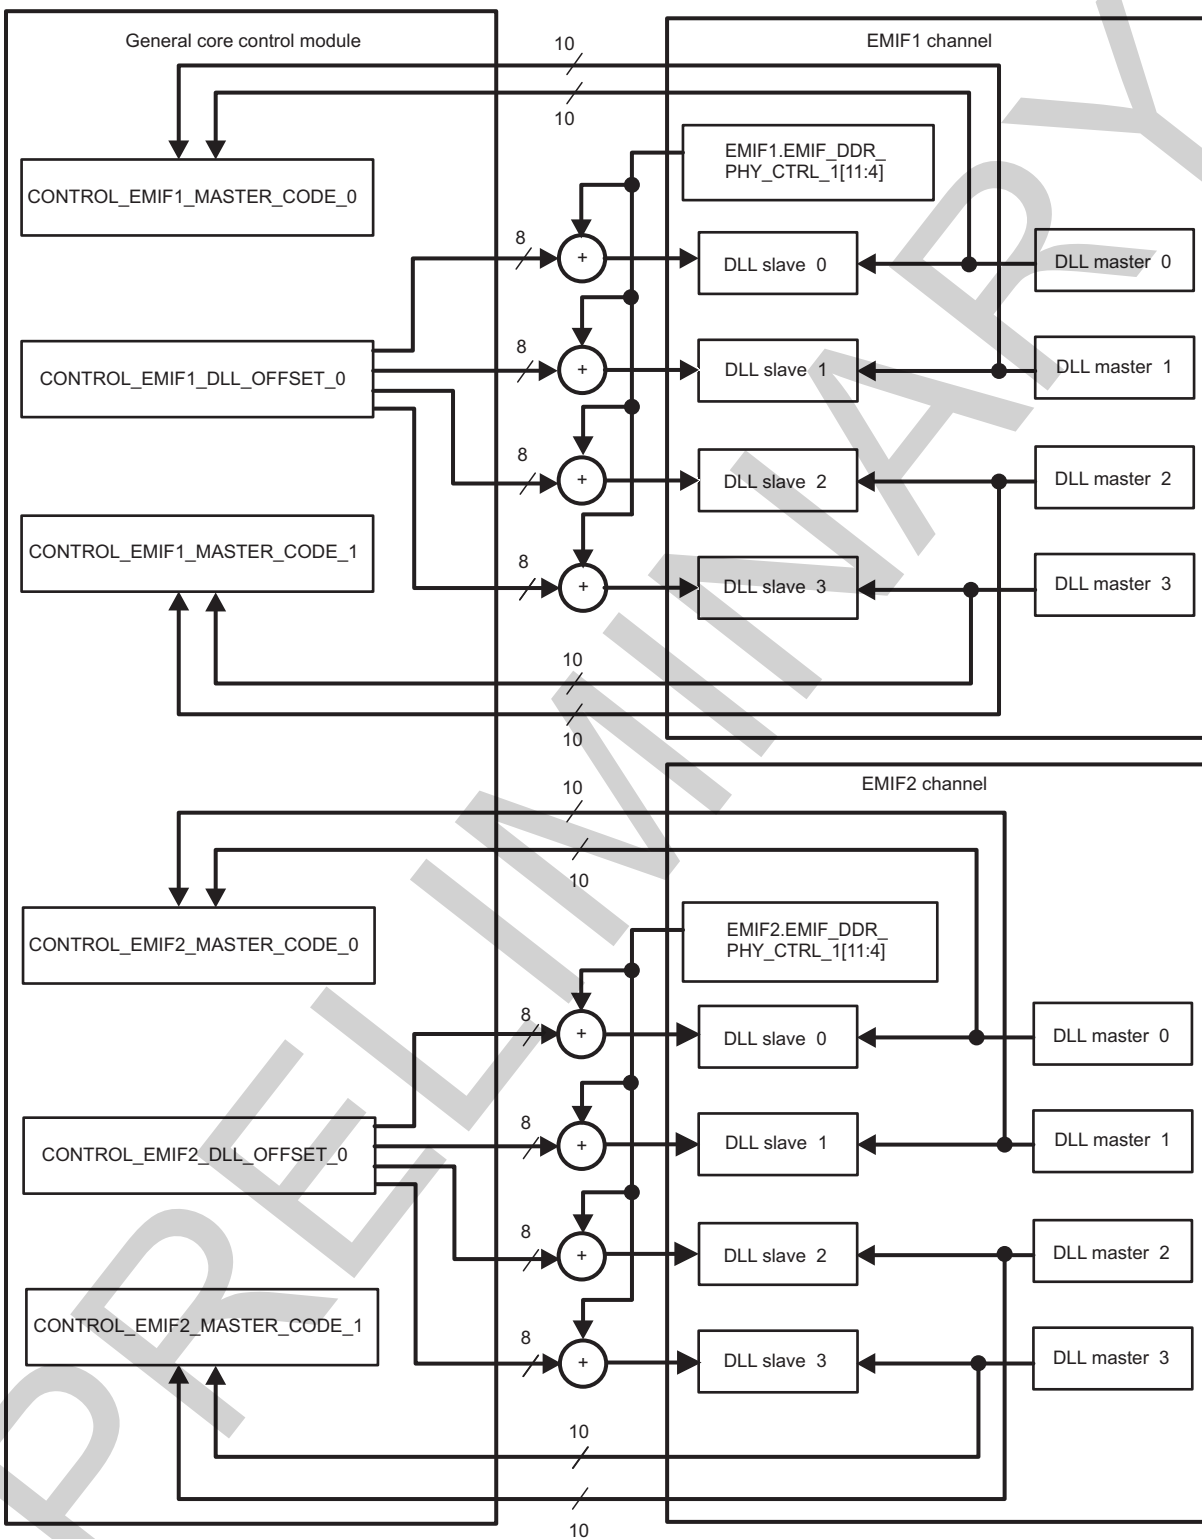

Two 32-bit registers ([CONTROL_EMIF1_OFFSET](#) and [CONTROL_EMIF2_OFFSET](#)) in the general core control module are dedicated to hold four signed-offset programmable values for the EMIF1 and EMIF2 PHY DLL slaves, respectively. The following programming points apply to these registers:

- Offset is stored as 2s complement 8-bit value, ranging from –128 to +127.
- Reset value is 0 (that is, by default, no offset is applied).
- The programmed values are saved and restored during an off mode transition.

The slave delay ratio value also has a single software control for all DLLs associated with an EMIF instance (the EMIF1.EMIF_DDR_PHY_CTRL_1[11:4] REG_DLL_SLAVE_DLY_CTRL bit field in the EMIF1 address space and EMIF2.EMIF_DDR_PHY_CTRL_1[11:4] REG_DLL_SLAVE_DLY_CTRL bit field in the EMIF2 address space). For more information, see [Chapter 16](#), *Memory Subsystem*.

The control sent to each DLL slave is the EMIF1/EMIF2 control (REG_DLL_SLAVE_DLY_CTRL) and the local signed offset, which is stored in the DLL slave corresponding bit field in the [CONTROL_EMIF1_OFFSET](#)/ [CONTROL_EMIF2_OFFSET](#) registers. [DLL Slave Delay Control Schema](#) shows the DLL slave delay control schema.

Figure 19-24. DLL Slave Delay Control Schema

sysctrl-022

Because the adders work in saturation mode, there is no wrap-around on either end of the spectrum:

- Any value higher than 0xFF saturates to 0xFF.
- Any value lower than 0x00 saturates to 0x00.

Table 19-63 describes the control registers in general core control module dedicated to store delay offsets individually for the four DDR PHY DLL slaves.

Table 19-63. EMIF DLL Slave Offset Compensation Registers

| Physical Address | Register Name | Description | Access |
|------------------|--------------------------------------|---|--------|
| 0x4A00 2360 | CONTROL_EMIF1_OFFSET | EMIF1 slaves individual DLL offset controls | R/W |
| 0x4A00 2364 | CONTROL_EMIF2_OFFSET | EMIF2 slaves individual DLL offset controls | R/W |

19.4.12.6.2 EMIF DLL Master Code Monitoring Registers

As can be seen in Figure 19-24, two read-only (RO) registers are provided in the general core control module to monitor DLL master codes for each of the EMIF1 and EMIF2 instances.

The 40 EMIF1 DLL master code monitoring signals are distributed as 20 read-only bits in the [CONTROL_EMIF1_MASTER_CODE_0](#) register and 20 read-only bits in the [CONTROL_EMIF1_MASTER_CODE_1](#) register, respectively.

Similarly, the 40 EMIF2 DLL master code monitoring signals are distributed as 20 read-only bits in the [CONTROL_EMIF2_MASTER_CODE_0](#) register and 20 read-only bits in the [CONTROL_EMIF2_MASTER_CODE_1](#) register, respectively.

Table 19-64 lists the control registers in general core control module dedicated to monitor the master code for the four DDR PHY DLLs.

Table 19-64. EMIF DLL Master Code-Monitoring Registers

| Physical Address | Register Name | Description | Access |
|------------------|---|------------------------|--------|
| 0x4A00 2368 | CONTROL_EMIF1_MASTER_CODE_0 | EMIF1 Master 0, 1 code | RO |
| 0x4A00 236C | CONTROL_EMIF1_MASTER_CODE_1 | EMIF1 Master 2, 3 code | RO |
| 0x4A00 2370 | CONTROL_EMIF2_MASTER_CODE_0 | EMIF2 Master 0, 1 code | RO |
| 0x4A00 2374 | CONTROL_EMIF2_MASTER_CODE_1 | EMIF2 Master 2, 3 code | RO |

19.4.12.7 Force MPU Write Nonposted Transactions Control Register

At the top level, software can force all writes from the MPU subsystem to the L3 interconnect to be nonposted, regardless of the attributes of the transactions coming from the Cortex-A9 CPU. When active-high bit FORCEWRNP = 1, only nonposted write commands are sent to the L3 interconnect. This bit must remain stable for the entire transfer and must not change in between the transfer.

Table 19-65 describes the general core control module register with FORCEWRNP control.

Table 19-65. Force MPU Write Nonposted Transactions Control Register

| Physical Address | Register Name | Description | Access |
|------------------|-----------------------------------|--|--------|
| 0x4A00 03C0 | CONTROL_FORCEWRNP | Forces only nonposted write commands from the MPU subsystem to the L3 interconnect | R/W |

19.4.12.8 Signal Integrity Parameter Control Registers With Pad Group Assignment

19.4.12.8.1 Signal Integrity Parameter Controls Overview

Most of the I/O cells associated with the device pads can be configured to deliver their carried signals to the targeted sink with maximum signal integrity. Configuration of these I/Os is done by pad group assignment and not individually per pad.

The different I/O-specific requirements determine the use of different types of I/O cells for the device I/Os. Software controls associated with the signal integrity parameters are implemented at the SYSCTRL_PADCONF_CORE and SYSCTRL_PADCONF_WKUP level.

The following types of I/O cells associated with pad groups can be identified:

- LPDDR2 high-speed I/O cells with impedance(I), slew rate(SR), and weak driver (WD) settings
- High-speed I/O cells with far-end load (LB) settings
- Low -speed I/O cells with combined slew rate (SC) and load versus transmission line (TL) length (LB) settings
- Two types of I/O cells with mode (MB) controls and load compensation (LB) settings
- I/O cells with control (DS0) of the impedance mode
- C2C I/O cells with LB0 control adjustable according to interface requirement/voltage mode
- I/O cells with pullup strength (PUSTRENGTH) and speed controls
- I2Cx I/O cells with pullup resistance vers capacitance load settings
- JTAG I/O cells with bus-holder enable control

NOTE: I/Os are non-failsafe, which means that voltage must never be applied at a pad before the internal I/O supply voltage VDDS is powered.

The pad group-assigned signal integrity controls are provided through the registers described in [Table 19-66](#).

Table 19-66. Signal Integrity Parameter Control Registers

| Physical Address | Register Name | Description | Access |
|------------------|--|--|--------|
| 0x4A10 05A8 | CONTROL_SMART1IO_PADCONF_0 | Signal integrity pad group assignment control register | R/W |

19.4.12.8.2 High-Speed I/O Buffers With Impedance, Slew Rate, and Weak Driver Settings

The LPDDR2IO (EMIF) buffers are based on high-speed unterminated logic and require excellent driver impedance control to achieve optimal timing–EMI trade-offs. A specific type of device I/O cell with programmable features is used to meet this requirement. These I/O cells also support the high-speed interchip (HSIC) interface.

Three types of software-configurable I/O cells are integrated to support high-speed unterminated logic:

- Single-ended I/O cells
- Two-pad differential I/O cells
- Vref generation cell

Two-pad differential I/O cells are provided with a differential receiver and complementary transmitter. They are used to support the LPDDR2 clock pads (lpddr21_ck, lpddr21_nck, lpddr22_ck, lpddr22_nck) and LPDDR2 strobe pads (lpddr21_dqsi, lpddr21_ndqsi, lpddr22_dqsi, and lpddr22_ndqsi, where i = 0 to 3).

A Vref-generation cell is integrated in the device to supply a Vref-based receiver.

These I/O cells are integrated with the following controls in the SYSCTRL_PADCONF_CORE module:

- Driver output impedance (I) controls
- SR controls
- WD controls to support LPDDR2/HSIC interface and avoid floating pad
- Process-only impedance compensation using 5-bit binary coded schema separately for pullup p1:5 and pulldown n1:5 impedance
- Internal and external reference voltage source selection for the Vref generation cell
- Vref cell decoupling capacitor selection

Programmable bits for impedance and SR control are provided when the I/Os are set to operate in driver mode (outputs).

The bits I[2:0] are used to program the desired impedance value of the driver.

The drive strengths corresponding to the I[2:0] value are aliased as Drv i (where i = 5 to 12) in the CONTROL_LPDDR2IO1_x and CONTROL_LPDDR2IO2_x, (where x = 0 to 2) register tables in [Section 19.6.7, SYSCTRL_PADCONF_CORE Register Description](#).

CAUTION

To ensure the best performance of the LPDDR2 I/Os, it is strongly recommended for user software to always set the impedance controlling bits (I) in the CONTROL_LPDDR2IO1_x and CONTROL_LPDDR2IO2_x registers (where x = 0 to 2) to 0x7, which corresponds to Drv12 mode.

For more information about LPDDR2 I/O-specific driver output impedance (respectively, corresponding drive strength) parameter, see the *Electrical Characteristics/DC Electrical Characteristics/LPDDR2 DC Electrical Characteristics* section in the device data manual.

User software can program the slew rate (turn-on time) of the output signal using the control bits SR[1:0] in the CONTROL_LPDDR2IO1_x and CONTROL_LPDDR2IO2_x (where x = 0 to 2) registers.

For more information about the LPDDR2 I/O slew rate parameter control, SR[1:0], see the *Electrical Characteristics/DC Electrical Characteristics/LPDDR2 DC Electrical Characteristics* section in the device data manual.

Weak pullup/down or a keeper on pad is enabled through the wd0 and wd1 bits. The weak pullup/down option is used to define the pad state (high or low) when no signal is driving the pad. The weak keeper option is used to maintain the previous output value when nothing is driving the pad. [Table 19-67](#) describes the WD controls.

NOTE: The WD[1:0] bit field controls play the role of the PULLTYPESELECT and PULLUDENABLE bits within the standard pad configuration registers, and provides the keeper function to the I/Os with the state WD = 0b11. For LPDDR2 I/Os, the WD controls do not apply during off mode.

Similar to the lpddr1_x and lpddr2_x pads, the usbb1_hsic_data/strobe and usbb2_hsic_data/strobe pads also have weak driver software controls for active-mode internal weak pullups and pulldowns. They are in the [CONTROL_USBB_HSIC](#) register.

In contrast to the LPDDR2 I/Os, the usbb1_hsic and usbb2_hsic pads are also provided with bits in the same register to select weak pullup/down and keeper function during off mode. For a given usbbx_hsic_data/strobe pad (where x = 1, 2) the associated bit to allow an off mode-specific pullup/pulldown/keeper setting is OFFMODE_WD_ENABLE. The off mode option is defined through the OFFMODE_WD[1:0] bit field in the [CONTROL_USBB_HSIC](#) register..

Table 19-67. Weak Driver PUPD/Latch Mode

| WD1 | WD0 | Operation |
|-----|-----|-----------------------|
| 0 | 0 | Pull logic disabled |
| 0 | 1 | Weak pullup enabled |
| 1 | 0 | Weak pulldown enabled |
| 1 | 1 | Weak keeper enabled |

The following sequence is required to program the off-mode pullup/pulldown /latch (keeper) feature of the usbb1_hsic_data/usbb2_hsic_data and usbb1_hsic_strobe/usbb2_hsic_strobe pads:

1. Program the desired values for USBB1_HSIC_DATA_OFFMODE_WD/USBB2_HSIC_DATA_OFFMODE_WD and USBB1_HSIC_STROBE_OFFMODE_WD/USBB2_HSIC_STROBE_OFFMODE_WD in the [CONTROL_USBB_HSIC](#) register.

2. For an off-mode pullup/pulldown configuration different than the active-mode pullup/pulldown configuration, set the USBB1_HSIC_DATA_OFFMODE_WD_ENABLE/USBB2_HSIC_DATA_OFFMODE_WD_ENABLE and USBB1_HSIC_STROBE_OFFMODE_WD_ENABLE/USBB2_HSIC_STROBE_OFFMODE_WD_ENABLE bits to 1.

If USBB1_HSIC_DATA_OFFMODE_WD_ENABLE/USBB2_HSIC_DATA_OFFMODE_WD_ENABLE is set to 0, the applied value of the pullup/pulldown after the device goes to off mode will be same as the value of the active pullup/pulldown (that is, in this case, the value of the OFFMODE PU/PD bit field is disregarded).

If, for example, USBB1_HSIC_DATA_OFFMODE_WD/USBB2_HSIC_DATA_OFFMODE_WD is programmed with the same setting as USBB1_HSIC_DATA_WD/USBB2_HSIC_DATA_WD, then the value of USBB1_HSIC_DATA_OFFMODE_WD_ENABLE/USBB2_HSIC_DATA_OFFMODE_WD_ENABLE does not matter.

Therefore, USBB1_HSIC_DATA_OFFMODE_WD_ENABLE/USBB2_HSIC_DATA_OFFMODE_WD_ENABLE and USBB1_HSIC_STROBE_OFFMODE_WD_ENABLE/USBB2_HSIC_STROBE_OFFMODE_WD_ENABLE apply only to off-mode pullup/pulldown selection.

The eFuse impedance compensation settings are exported upon POR to 10 bits in the [CONTROL_EFUSE_2](#) register of the device control module as follows:

[CONTROL_EFUSE_2](#)[23] LPDDR2_PTV_N1 through [CONTROL_EFUSE_2](#)[19] LPDDR2_PTV_N5 (pulldown impedance trimming)

[CONTROL_EFUSE_2](#)[18] LPDDR2_PTV_P1 through [CONTROL_EFUSE_2](#)[14] LPDDR2_PTV_P5 (pullup impedance trimming)

CAUTION

Do not override the eFuse impedance compensation settings in the [CONTROL_EFUSE_2](#) register.

NOTE: There is no software control (INPUTENABLE) for the input buffer of the high-speed unterminated logic I/Os associated with the lpddr21_x, lpddr22_x, usbb1_hsic_data/strobe, and usbb2_hsic_data/strobe pads. If the CMOS buffer is enabled, it is always bidirectional (that is, the input buffer is always enabled).

Internal LPDDR2IO Vref-based receivers use the output voltage of LPDDR2-associated voltage reference cells. The voltage drive selection bit fields of the LPDDR2 voltage reference cells are in the [CONTROL_LPDDR2IO1_3](#) and [CONTROL_LPDDR2IO2_3](#) registers. Individual VREF_TAP[1:0] control bits set the output drive capability for each of the pads (where x = 1, 2):

- lpddr2x_vref_ca_int
- lpddr2x_vref_ca
- lpddr2x_vref_dq0_int–lpddr2x_vref_dq3_int
- lpddr2x_vref_dq

[Table 19-68](#), *LPDDR2 Internal Reference Configuration*, lists the possible options for internal reference voltage drive selection.

Table 19-68. LPDDR2 Internal Reference Configuration

| VREF_TAP1 | VREF_TAP0 | Description |
|-----------|-----------|---|
| 0 | 0 | Pad/bias2 Connected to internal reference VDDS/2, for 2-μA current load |
| 0 | 1 | Pad/bias2 Connected to internal reference VDDS/2, for 4-μA current load |
| 1 | 0 | Pad/bias2 Connected to internal reference VDDS/2, for 6-μA current load |

Table 19-68. LPDDR2 Internal Reference Configuration (continued)

| VREF_TAP1 | VREF_TAP0 | Description |
|-----------|-----------|---|
| 1 | 1 | Pad/bias2 Connected to internal reference VDDS/2, for 8-μA current load |

When the internal Vref generator is turned on, it supplies voltage reference to the Vref-based receivers associated with the LPDDR2IO DQ and CA interface lines.

In Vref-based receiver mode, the LPDDR2 I/O cell receiver is a true differential comparator with pad connected to the positive terminal and VREF tied to the negative terminal. The Vref-based receiver allows the improvement of speed performance at VDDS = 1.2-V I/O voltage supply.

Setting bit CONTROL_LPDDR2IOx_3[0] LPDDR2x_INT_VREF_AUTO_EN_DQ = 0b1 or CONTROL_LPDDR2IOx_3[1] LPDDR2x_INT_VREF_AUTO_EN_CA = 0b1 (where x = 1, 2) enables the automatic shut off or switch-on of the internal Vref cell generators associated with the LPDDR2x interface, the DQ and CA lines, respectively.

If user software sets the manual control bit CONTROL_LPDDR2IOx_3[2] LPDDR2x_INT_VREF_EN_DQ = 0b1 or CONTROL_LPDDR2IOx_3[3] LPDDR2x_INT_VREF_EN_CA = 0b1, internal Vref cell generators are enabled, regardless of the state of the LPDDR2x_INT_VREF_AUTO_EN_DQ/LPDDR2x_INT_VREF_AUTO_EN_CA bits. Thus, automatic control over LPDDR2 Vref cell generators can always be overridden in the context of enabling the Vref generator.

If the Vref cell generator is enabled, the following pads (where x = 1, 2) act as outputs and can be used to supply reference voltage to external devices:

- lpddr2x_vref_ca_int
- lpddr2x_vref_ca
- lpddr2x_vref_dq0_int–lpddr2x_vref_dq3_int
- lpddr2x_vref_dq (where x = 1, 2)

CAUTION

While using the Vref cell in internal reference mode, nothing else must drive the pad externally, although the pad can be connected to supply a Vref signal to other devices.

When the internal Vref cell generators are disabled and bypassed, which is provided when the bits LPDDR2x_INT_VREF_EN_DQ/CA = 0b0 and LPDDR2x_INT_VREF_AUTO_EN_DQ/CA = 0b0, the following pads (where x = 1, 2) act as inputs that can supply voltage reference to Vref-based receivers from external sources:

- lpddr2x_vref_ca_int
- lpddr2x_vref_ca
- lpddr2x_vref_dq0_int–lpddr2x_vref_dq3_int
- lpddr2x_vref_dq

NOTE: The LPDDR2x_INT_VREF_EN_DQ and LPDDR2x_INT_VREF_AUTO_EN_DQ controls determine the direction of the lpddr2x_vref_dq0_int–lpddr2x_vref_dq3_int and lpddr2x_vref_dq pads. Similarly, the LPDDR2x_INT_VREF_EN_CA and LPDDR2x_INT_VREF_AUTO_EN_CA controls determine the direction of the lpddr2x_vref_ca_int and lpddr2x_vref_ca pads.

Table 19-69 provides different combinations of Vref cell control types, the state of the Vref cell, and the associated voltage reference pad direction.

Table 19-69. LPDDR2 Vref Cells State Description

| LPDDR2x_INT_VREF_EN DQ/CA (Manual Control Bits) | LPDDR2x_INT_VREF_AUTO_ EN_DQ/CA (AUTO Control Bits) | Type of Control | Vref Cell State | Voltage Reference Pad Direction |
|---|---|-----------------|-----------------------------------|------------------------------------|
| 1 | x | Manual | Enabled | O |
| 0 | 1 | AUTO | Automatically enabled/disabled | O |
| 0 | 0 | – | Disabled and bypassed | I |

According to the noise environment, the user can choose to filter the reference voltage, which is supplied at the internal VREF node (receiver comparators Vref input), by the Vref cell generator or by an external source. Two coupling capacitors, internal to the LPDDR2 Vref cell, are available at the internal VREF node, and are configurable as specified in [Table 19-70](#).

Table 19-70. LPDDR2 Vref Cell Decoupling Cap Selection

| VREF_CCAP0 | VREF_CCAP1 | Capacitor |
|------------|------------|---|
| 0 | 0 | No capacitor connected |
| 0 | 1 | Capacitor between internal reference node and VDD5 |
| 1 | 0 | Capacitor between internal reference node and VSS |
| 1 | 1 | Capacitor between internal reference node and VDD5 as well as internal reference node and VSS |

Individual VREF_CCAP0 and VREF_CCAP1 control bits in the [CONTROL_LPDDR2IO1_3](#) and [CONTROL_LPDDR2IO2_3](#) registers set the internal coupling capacitor connection at the internal VREF node for each of the following pads (where x = 1, 2):

- lpddr2x_vref_ca_int
- lpddr2x_vref_ca
- lpddr2x_vref_dq0_int–lpddr2x_vref_dq3_int
- lpddr2x_vref_dq

19.4.12.8.3 Low-Speed I/Os Combined Slew Rate vs TL Length and Load Settings

The low-speed I/O cells slew modes are selectable through the slew mode control SC[1:0] bit field. These settings act like coarse settings for the signal performance behavior of the low-speed I/Os. The slew rate settings determine three target maximal frequencies of I/O operation at maximum load (see [Table 19-71](#)).

The low-speed I/O cells far-end capacitance load can be selected according to the transmission line (TL) length settings by modifying load bits LB[1] and LB[0] appropriately. The four possible load bit settings described in [Table 19-72](#) are fully applicable and have maximum effect only when slew control mode 0 is selected. These settings fine-tune the signal performance.

The pads featuring low-speed I/O cells require different SC[1:0] and LB[1:0] bit field settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have SC[1:0] and LB[1:0] controls and their pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific SC[1:0] and LB[1:0] bit field settings applicable to these interfaces multiplexed to low-speed I/O pads.
- The *Timing Parameters* section of the device data manual provides the exact system conditions (far end load, trace length, etc.) at which pad-multiplexed interface I/O timing parameters reach their boundary values.

Table 19-71. Slew Control Mode (Coarse) Settings

| SC[1] bit | SC[0] bit | Slew Rate Control Mode | Maximum Frequency Achieved at Maximum Load |
|-----------|-----------|------------------------|--|
| 0 | 0 | 0 | 20 MHz |
| 0 | 1 | 1 | 60 MHz |
| 1 | 0 | 2 | 40 MHz |

Table 19-72. Load Bit (Fine) Settings

| LB[1] (CLoad Capacitance Control) | LB[0] (TL-Length Control) | Effective TL Length (cm) | CLoad Capacitance (pF) (per TL) |
|-----------------------------------|---------------------------|--------------------------|---------------------------------|
| 0 | 0 | 2–20 | 1–10 |
| 0 | 1 | 20–40 (dual TL) | 1–10 |
| 1 | 0 | 2–20 | 10–20 |
| 1 | 1 | 20–40 (dual TL) | 10–20 |

NOTE: The load bit modes in [Table 19-72](#) are fully applicable and have maximum effect only in the case of slew control mode 0 (SC[1:0] = 00). For slew control modes 1 and 2, LB[1:0] = 0b11 is recommended.

19.4.12.8.4 I/Os With Combined Mode and Load Settings

There are two subtypes (conditionally described as type 1 and type 2 throughout this chapter) of device I/Os, with combined mode and load settings, that differ primarily in typical output impedance and mode-specific performance. Type 1 I/Os feature a lower typical output impedance than type 2.

Both I/Os have an output buffer with an internal pad voltage SR control mechanism. Each of the type 1 and type 2 corresponding I/O cells is controlled from two mode bits (MB0 and MB1) and a dedicated bit (LB0) for load compensation. LB0 programs the $C_{far\ end\ load}$ for the I/O cell associated pads. [Table 19-73](#) describes the mode bit settings for each mode and lists the load bit settings.

Table 19-73. Software Controls for I/Os With Combined Mode and Load Settings

| Mode | MB1 | MB0 | LB0 |
|--------------------|-----|-----|---|
| Mode 1 – SDMCC/SPI | 0 | 1 | 0 |
| Mode 2 - DMIC/GPIO | 1 | 0 | 0: ($C_{far\ end\ load}^{(1)} < 15\text{pf}$) 1: ($C_{far\ end\ load} \geq 15\text{pf}$) |
| Mode 3 – HIS | 1 | 1 | 0: ($C_{far\ end\ load} < 5\text{pf}$) 1: ($C_{far\ end\ load} \geq 5\text{pf}$) |
| Mode 4 - ULPI | 1 | 1 | 0: ($C_{far\ end\ load} < 4\text{pf}$) 1: ($C_{far\ end\ load} \geq 4\text{pf}$) |

⁽¹⁾ The $C_{far\ end\ load}$ is the external capacitance load applied at the far end of the pad signal transmission line.

The *Electrical Characteristics* / *DC Electrical Characteristics* section of the device data manual provides more information on the specific MB[1:0] and LB[1:0] bit field settings applicable to different interfaces multiplexed to I/O pads with combined mode and load settings. The *Timing Parameters* section of the device data manual provides the exact system conditions (far end load, trace length, etc.) at which pad-multiplexed interface I/O timing parameters reach their boundary values.

The pads featuring type 1 and type 2 I/O cells with combined mode and load settings require different MB[1:0] and LB0 bit field settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have type 1 and type 2 MB and LB0 controls and the type 1 and type 2 I/O cell pad corresponding software control registers.

- The *Electrical Characteristics/DC Electrical Characteristics* section the device data manual provides more information about the specific MB[1:0] and LB0 bit field settings applicable to these interfaces multiplexed to type 1 and type 2 I/O pads with combined mode and load controls.

A process-only compensation using a 4-bit binary-coded schema is used separately for pullup/down output parameter variations.

For type 1 I/Os, only mode 2 does not use such compensation.

For type 2 I/Os, only mode 1 and mode 2 use eFuse process-only compensation to reduce the spread in timing parameters.

The I/Os with combined mode and load controls share the same compensation settings with the I/Os with driver output impedance (DS) settings and with the C2CI/O buffers. They are exported from eFuse upon POR to the following bits in the [CONTROL_EFUSE_2](#) register:

[CONTROL_EFUSE_2\[31\]](#) EFUSE_SMART2TEST_P0 through [CONTROL_EFUSE_2\[28\]](#) EFUSE_SMART2TEST_P3 (pullup output parameters trimming)
[CONTROL_EFUSE_2\[27\]](#) EFUSE_SMART2TEST_N0 through [CONTROL_EFUSE_2\[24\]](#) EFUSE_SMART2TEST_N3 (pulldown output parameters trimming)

CAUTION

Do not override the SMART2TEST_P/SMART2TEST_N eFuse compensation settings in the [CONTROL_EFUSE_2](#) register.

19.4.12.8.5 I/O Cells With Configurable Impedance Mode

The impedance mode at which this type of I/O cell operates is selected by setting a single bit drive strength control, DS0, as follows:

- DS0 = 1 selects mode 1, corresponding to 25-Ω impedance mode
- DS0 = 0 selects mode 2, corresponding to 50-Ω impedance mode

The pads featuring I/O cell with configurable impedance mode require different DS0 bit settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have DS0 impedance mode control and the pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific DS0 bit settings applicable to these interfaces multiplexed to I/O pads with configurable impedance mode.

A process-only compensation using 4-bit binary coded schema is used separately for pullup/down output parameter variations. Only MODE1 and MODE2 use eFuse process-only compensation to reduce spread in timing parameters. The I/Os with DS0 impedance mode control share the same compensation settings with the I/Os with combined mode and load controls (both type 1 and type 2) and with the C2CI/O buffers. They are exported from eFuse upon POR to the following bits in the [CONTROL_EFUSE_2](#) register:

[CONTROL_EFUSE_2\[31\]](#) EFUSE_SMART2TEST_P0 through [CONTROL_EFUSE_2\[28\]](#) EFUSE_SMART2TEST_P3 (pullup output parameters trimming)
[CONTROL_EFUSE_2\[27\]](#) EFUSE_SMART2TEST_N0 through [CONTROL_EFUSE_2\[24\]](#) EFUSE_SMART2TEST_N3 (pulldown output parameters trimming)

19.4.12.8.6 C2C/I/O Cells With Load Setting Adjustable According to Interface Requirement Voltage Mode

To configure this type of I/O cell for different interfaces multiplexed on it, the user must manipulate in software a single bit, LB0, depending on type of multiplexed interface (C2C, GPMC, or SDMMC2) of the pad and the selected I/O voltage supply mode. Like LPDDR2IO, this I/O cell is provided with selectable LVCMOS and Vref-based receiver option. A vref pad is provided to supply reference voltage to the receiver in the 1.2-V mode. To save power at lower frequency operation, the LVCMOS receiver can be selected, and 2 bits, for each of the two C2C pad groups, are used to enable/disable the LVCMOS receiver (CMOSEN_C2C_FRM_CTRL) manually in the [CONTROL_C2CIO_PADCONF_0](#) register.

The pads featuring C2C I/O cells with load setting adjustable according to interface requirement/voltage mode require different LB0 bit settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have the interface type versus voltage mode control (LB0) and the pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific LB0 bit settings applicable to these interfaces multiplexed to I/O pads with configurable impedance mode.

NOTE: No bits are assigned to control the output drive capability of the internal C2C Vref generator (at the c2c_vref pad). It is fixed to a 2-μA current load.

If 1.2-V voltage mode is selected, the user can choose to have the LVCMOS receiver or Vref-based receiver on the C2C I/O cell pads. For the description of the dual-voltage mode settings of the C2C I/O cell pads, see [Section 19.4.12.9, Dual Voltage-Supplied Peripheral Controls](#).

In Vref-based receiver mode, the C2C I/O cell receiver is a true differential comparator with pad connected to the positive terminal and VREF tied to the negative terminal. The Vref-based receiver allows the improvement of speed performance at VDD5 = 1.2-V I/O voltage supply.

NOTE: The Vref-based receiver is not supported in 1.8-V mode. In this mode, the LVCMOS receiver is the only option.

NOTE: While at VDD5 = 1.2 V, the LVCMOS receiver is supported for all C2C I/O cell pads. The Vref-based receiver is supported on only some of these pads.

The [CONTROL_C2CIO_PADCONF_0](#)[12] CMOSEN_C2C_0_FRM_CTRL and [CONTROL_C2CIO_PADCONF_0](#)[11] CMOSEN_C2C_1_FRM_CTRL bits, each related to a separate group of pads, are dedicated to select Vref-based receiver mode or LVCMOS receiver mode when VDD5 = 1.2 V is selected in the [CONTROL_CORE_PADCONF_MODE](#) register.

CMOSEN_C2C_0_FRM_CTRL = 1 enables the 1.2-V mode LVCMOS receiver, and CMOSEN_C2C_0_FRM_CTRL = 0 enables the 1.2-V Vref-based receiver for the following pads:

- gpmc_ad8–gpmc_ad15
- gpmc_ncs4
- gpmc_ncs5

CMOSEN_C2C_1_FRM_CTRL = 1 enables the 1.2-V mode LVCMOS receiver and CMOSEN_C2C_1_FRM_CTRL = 0 enables the 1.2-V Vref-based receiver for the following pads:

- gpmc_a16–gpmc_a23

NOTE: The Vref-based receiver in 1.2-V mode is not supported for the following C2C I/O cell pads:

- gpmc_ad0–gpmc_ad7
- gpmc_a24
- gpmc_a25
- gpmc_ncs0–gpmc_ncs3
- gpmc_clk
- gpmc_nadv_ale
- gpmc_noe
- gpmc_nwe
- gpmc_nbe0_cle
- gpmc_nbe1
- gpmc_wait1
- gpmc_wait2
- gpmc_ncs6
- gpmc_ncs7

When the internal Vref generator is turned on, it supplies voltage reference to the Vref-based receivers supported for some C2C I/O cell pads and can also be used to drive external modules with 1.2-V reference. In this case, the c2c_vref device pad outputs voltage of the internal C2C Vref cell.

Setting bit [CONTROL_C2CIO_PADCONF_0\[7\] C2C_INT_VREF_AUTO_EN](#) = 0b1 enables the automatic shut off or switch-on of the internal Vref cell generator.

If user software sets the manual control bit [CONTROL_C2CIO_PADCONF_0\[8\] C2C_INT_VREF_EN](#) = 0b1, the internal Vref cell generator is enabled, regardless of the state of the [CONTROL_C2CIO_PADCONF_0\[7\] C2C_INT_VREF_AUTO_EN](#) bit. Thus, automatic control over the C2C Vref cell generator can always be overridden in the context of enabling the Vref generator.

If the Vref cell generator is enabled, the c2c_vref pad acts as output and can be used to supply reference voltage to external devices.

NOTE: At VDDS = 1.8-V voltage mode, the internal reference generator is shut off and the internal Vref cell reference node is connected to 0.

For the description of the dual-voltage mode settings of the C2C I/O cell pads, see [Section 19.4.12.9, Dual Voltage-Supplied Peripheral Controls](#).

CAUTION

While using the Vref cell in internal reference mode, nothing else must drive the pad externally, although the pad can be connected to supply the Vref signal to other devices.

When the internal Vref cell generator is disabled and bypassed, which is provided when bits [CONTROL_C2CIO_PADCONF_0\[8\] C2C_INT_VREF_EN](#) = 0b0 and [CONTROL_C2CIO_PADCONF_0\[7\] C2C_INT_VREF_AUTO_EN](#) = 0b0, the c2c_vref pad acts as input that can supply voltage reference to the Vref-based receivers from external sources.

[Table 19-74](#) provides different combinations of Vref cell control types, the state of the Vref cell, and the associated voltage reference pad direction.

Table 19-74. C2C Vref Cell State Description

| C2C_INT_VREF_EN (Manual Control Bits) | C2C_INT_VREF_AUTO_EN (AUTO Control Bits) | Type of Control | Vref Cell State | Voltage Reference Pad Direction |
|--|---|-----------------|--------------------------------|---------------------------------|
| 1 | x | Manual | Enabled | O |
| 0 | 1 | AUTO | Automatically enabled/disabled | O |

Table 19-74. C2C Vref Cell State Description (continued)

| C2C_INT_VREF_EN (Manual Control Bits) | C2C_INT_VREF_AUTO_EN (AUTO Control Bits) | Type of Control | Vref Cell State | Voltage Reference Pad Direction |
|--|---|-----------------|-----------------------|---------------------------------|
| 0 | 0 | – | Disabled and bypassed | I |

CAUTION

The c2c_vref pad must be externally driven only in 1.2-V voltage mode.

According to the noise environment, the user can select to filter the reference voltage, which is supplied at the internal VREF node (receiver comparators Vref input) by the Vref cell generator or by an external source. Two coupling capacitors, internal to the C2C Vref cell, are available at the internal VREF node, which is configurable as specified in [Table 19-75](#).

Table 19-75. C2C Vref Cell Decoupling Cap Selection

| VREF_CCAP0 | VREF_CCAP1 | Capacitor |
|------------|------------|---|
| 0 | 0 | No capacitor connected |
| 0 | 1 | Capacitor between internal reference node and VDD5 |
| 1 | 0 | Capacitor between internal reference node and VSS |
| 1 | 1 | Capacitor between internal reference node and VDD5 as well as internal reference node and VSS |

A process-only compensation using a 4-bit binary-coded schema is used separately for pullup/down output parameter variations. The C2C I/O buffers share the same compensation settings with the I/Os with combined mode and load controls (both with 25- and 50-Ω output) and I/Os with driver output impedance (DS) settings. They are exported from eFuse upon POR to the following bits in the [CONTROL_EFUSE_2](#) register:

[CONTROL_EFUSE_2\[31\]](#) EFUSE_SMART2TEST_P0 through [CONTROL_EFUSE_2\[28\]](#) EFUSE_SMART2TEST_P3 (pullup output parameters trimming)
[CONTROL_EFUSE_2\[27\]](#) EFUSE_SMART2TEST_N0 through [CONTROL_EFUSE_2\[24\]](#) EFUSE_SMART2TEST_N3 (pulldown output parameters trimming)

19.4.12.8.7 SDMMC1 Pullup Strength Control

The SDMMC1_PUSTRENGTH_GRPi (where i = 1 to 3) control bits are added in the [CONTROL_MMC1](#) register to program the pullup strength for the MMC/SD/SDIO1 I/Os group.

- [Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have the pullup strength control and the pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific pullup strength settings applicable to these interfaces multiplexed to I/O pads with configurable pullup strength.

19.4.12.8.8 I2Cx I/Os Group Pullupresx Controls and Load Range Settings

The I2Cx buffer contains internal pullup resistors for F/S and HS modes. LB[1:0] bits are used to select an appropriate pullup resistor for a given load range.

The active high GLFENB[0] bit is implemented for I²C receivers to enable glitch-free operation.

NOTE: The pullup versus load settings applicable to I2Cx FS mode also apply to I2Cx standard speed mode.

The type of the pullup resistor (external or internal) for a certain I2Cx I/O group (where x = 1 to 4) is selected through the I2Cx_SCL_PULLUPRESX and I2Cx_SDA_PULLUPRESX bits, which reside in the [CONTROL_I2C_0](#) register. The SR_SCL_PULLUPRESX and SR_SDA_PULLUPRESX bits reside in the [CONTROL_I2C_2](#) register, which is part of the wakeup voltage domain. .

Internal pullups are activated when I2Cx_SCL_PULLUPRESX / I2Cx_SDA_PULLUPRESX = 0b0 or SR_SCL_PULLUPRESX/SR_SDA_PULLUPRESX = 0b0.

I²C functionality is not ensured if the weak internal pullup or pulldown is activated on any of the I/Os connected to the bus.

NOTE: The user must set PULLUDENABLE = 0b0 in the I2Cx padconf registers (disable internal weak pullup resistors on i2cx pads) to ensure the full I/O cell performance capabilities of the I²C.

The I²C pads require different LB[1:0] and GLFENB[0] bit field settings to achieve optimal electrical performance for the multiplexed (in MuxMode = 0x0) I²C signals. This behavior may depend on various factors:

- [Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping](#), describes the I²C pads and their corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics/I²C DC Electrical Characteristics* section of the device data manual provides more information about the specific LB[1:0] and GLFENB[0] bit settings applicable to I²C I/O pads.

19.4.12.8.9 Device Interfaces Signal Group Controls Mapping

[Table 19-76](#) through [Table 19-103](#) describe the mapping of the signal integrity control bit fields in the different signal integrity control registers described in [Table 19-66](#).

NOTE: The same I/O cell and I/O cell controls assigned to a pad signal available when Muxmode = 0 are shared between signals available on the same pad when Muxmode is selected different than 0. For more information, see [Section 19.4.8.3, Pad Multiplexing Register Fields](#).

19.4.12.9 Dual Voltage-Supplied Peripheral Controls

Some of the peripheral I/Os have the option to be supplied with a 1.2-V or 1.8-V power supply (VDDS through device external pads). The power supply level to the dual-voltage I/Os of different peripherals is configurable through bit fields in the [CONTROL_CORE_PADCONF_MODE](#) register in the CORE domain (EMIF, GPMC, C2C, CAMERA, and SDMMC2 I/Os) and the [CONTROL_WKUP_PADCONF_MODE](#) register in the WKUP domain (EMIF and FREF generator). One control bit in these registers is dedicated to set dual-voltage per group of pads.

NOTE: Dynamic switching between 1.2-V and 1.8-V voltage modes on dual-voltage peripheral I/Os is not allowed.

Table 19-104 describes dual-voltage controls versus the mapping of different pads.

Table 19-104. Dual-Voltage Peripheral Control Bits vs Pad Mapping

| Dual-Voltage VDDS = 1.2-V/1.8-V Control Bits | Pads With Dual-Voltage Settings |
|---|--|

PRELIMINARY

19.5 Control Module Programming Guide

19.5.1 Control Module Low-Level Programming Models

This section describes the low-level programming sequences for the configuration and use of the control module.

19.5.1.1 Global Initialization

19.5.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the control module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the environment and integration of the control module. For more information, see [Section 19.2, Control Module Environment](#), and [Section 19.3, Control Module Integration](#).

Table 19-105. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------|---|
| PRCM | The three clocks coming from the PRCM module (CFG_L4_ICLK , WKUP_L4_ICLK2 , and CORE_TS_FCLK) are not software-controlled by PRCM. For more information about the three clocks, see Section 3.6.3.2.4, CM2 Clock Generator , and Section 3.6.3.1, PRM Clock Source , in Chapter 3, Power, Reset, and Clock Management . |
| L4 interconnect | For information about the L4-CFG interconnect configuration, see Section 14.3, L4 Interconnects , in Chapter 14, Interconnects . |

19.5.1.1.2 Control Module Global Initialization

19.5.1.1.2.1 Software Reset

The control module is not sensitive to a software reset.

19.5.1.1.2.2 Clock Gating Configuration

As described in [Section 19.4.2, Control Module Clock Configuration](#), the programmer can choose a clock-gating strategy individually for each of the four control module instances. [Table 19-106](#) explains the necessary steps.

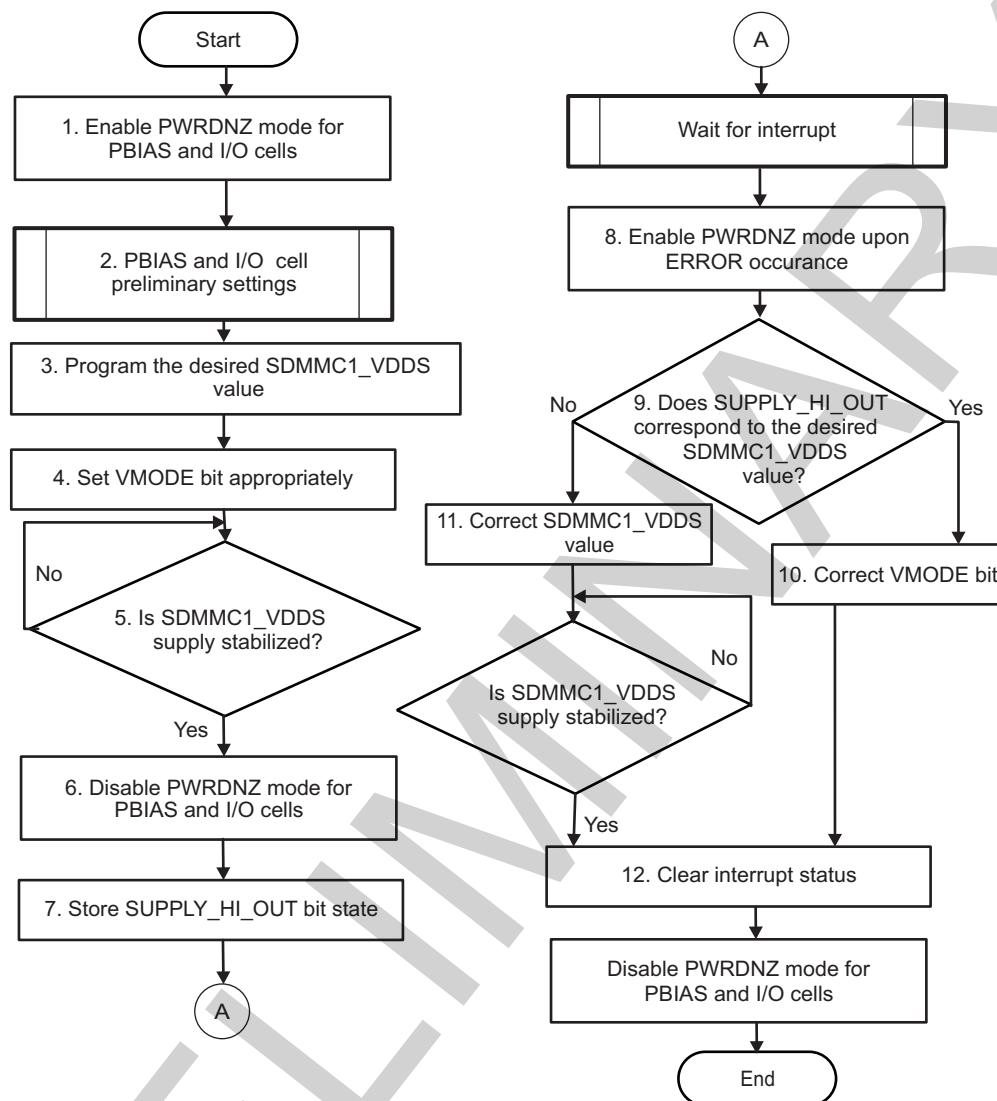

Table 19-106. Configure Clock Gating for Different Control Module Instances

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------|
| Set clock gating for SYSCTRL_PADCONF_CORE. | CONTROL_PADCONF_CORE_SYSCONFIG[3:2] | 0x- |
| Set clock gating for SYSCTRL_PADCONF_WKUP. | CONTROL_PADCONF_WKUP_SYSCONFIG[3:2] | 0x- |
| Set clock gating for SYSCTRL_GENERAL_CORE. | CONTROL_GEN_CORE_SYSCONFIG[3:2] CONTROL_TEMP_SENSOR[13] | 0x- |
| Set clock gating for SYSCTRL_GENERAL_WKUP. | CONTROL_GEN_WKUP_SYSCONFIG[3:2] | 0x- |

19.5.1.2 Operational Modes Configuration

19.5.1.2.1 Extended-Drain I/Os and PBIAS Cells Programming Guide

This section describes the programming flow from 3.0 V to 1.8 V, and vice versa, when operating with the MMC1 extended-drain I/Os and MMC1_PBIAS cell.

Figure 19-25. Configuring PBIAS Cell to Operate in Different Modes, Interrupt Method

sysctrl-021

Table 19-107. Register Settings for Configuring the MMC1_PBIAS and MMC1 I/O Cells

| Procedure Name | Description | Register Settings |
|--|---|--|
| 1. Enable PWRDNZ mode for MMC1_PBIAS cell and MMC/SD/SDIO1 I/O cell. | Software must keep MMC1_PBIAS cell and MMC1_IO cell PWRDNZ signals low whenever SDMMC1_VDDS ramps up/down or changes. This is for cell protection purposes. | 1. Set CONTROL_PBIASLITE [22] MMC1_PBIASLITE_PWRDNZ = 0b0. 2. Set CONTROL_PBIASLITE [26] MMC1_PWRDNZ = 0b0. |

Table 19-107. Register Settings for Configuring the MMC1_PBIAS and MMC1 I/O Cells (continued)

| Procedure Name | Description | Register Settings |
|--|---|---|
| 2. Preliminary MMC1_PBIAS and MMC1 IO cell settings | Enable MMC1_PBIAS cell output and MMC1_PBIAS error associated interrupt. Select desired I/Os within the MMC1 I/O cell and set the corresponding pad configuration fields appropriately. Set the group speed and pullup strength controls for the MMC/SD/SDIO1 pads. | <ol style="list-style-type: none"> 1. Set CONTROL_PBIASLITE[25]MMC1_PBIASLITE_HIZ_MODE = 0b0. 2. For information about setting the MA_IRQ_75 line associated interrupt request PBIAS_IRQ, see Chapter 18, Interrupt Controller. 3. For I/O multiplexing and pad configuration settings, see Section 19.5.1.2.4, Pad Configuration Programming Points. 4. Set the speed control bits for the MMC1 I/O cell pads: <ul style="list-style-type: none"> • CONTROL_MMC1[27] SDMMC1_DR0_SPEEDCTRL = 0b- • CONTROL_MMC1[26] SDMMC1_DR1_SPEEDCTRL = 0b- • CONTROL_MMC1[28] SDMMC1_DR2_SPEEDCTRL = 0b- 5. Set the pullup strength control bits for the MMC1 I/O cell pad groups: <ul style="list-style-type: none"> • CONTROL_MMC1[31] SDMMC1_PUSTRENGTH_GRP0=0b- • CONTROL_MMC1[30] SDMMC1_PUSTRENGTH_GRP1=0b- • CONTROL_MMC1[29] SDMMC1_PUSTRENGTH_GRP2=0b- • CONTROL_MMC1[28] SDMMC1_PUSTRENGTH_GRP3=0b- |
| 3. Program the desired SDMMC1_VDDS voltage for MMC/SD/SDIO1 I/Os. | Program external power supply IC to generate appropriate SDMMC1_VDDS voltage:(3.0 V/ 1.8 V). | For more information about I ² C interface operation, see Section 24.1, Multimaster High-Speed I²C . |
| 4. Set VMODE bit appropriately. | PBIAS voltage generation is based on the value of VMODE, set according to externally applied SDMMC1_VDDS voltage. | Set CONTROL_PBIASLITE [21] MMC1_PBIASLITE_VMODE = 0b ⁽¹⁾ . |
| 5. Check whether the SDMMC1_VDDS supply is stabilized. | Check the state of the externally generated SDMMC1_VDDS voltage, which is provided through communication between the device and external power supply device over the I ² C interface. | For more information about I ² C interface settings, see Section 24.1, Multimaster High-Speed I²C . |
| 6. Disable PWRDNZ mode for MMC1_PBIAS and associated extended-drain MMC1 I/O cell. | This starts the MMC1_PBIAS cell work to generate the PBIAS voltage. | <ol style="list-style-type: none"> 1. Set CONTROL_PBIASLITE[22] MMC1_PBIASLITE_PWRDNZ = 0b1. 2. Set CONTROL_PBIASLITE[26] MMC1_PWRDNZ = 0b1. |
| 7. Store the state of the SUPPLY_HI_OUT bit. | Done as a preliminary step for error handling analysis. (Whenever PWRDNZ = 0b0 , SUPPLY_HI_OUT is unconditionally set to 0b0.) | Store CONTROL_PBIASLITE [24] MMC1_PBIASLITE_SUPPLY_HI_OUT bit in memory. |
| 8.Enable PWRDNZ mode upon error occurrence. | It is recommended that all the I/Os are powered down (PWRDNZ = 0) as soon as VMODE_ERROR is high. | <ol style="list-style-type: none"> 1. Set CONTROL_PBIASLITE[26] MMC1_PWRDNZ = 0b0 . 2. Set CONTROL_PBIASLITE[22]MMC1_PBIASLITE_PWRDNZ = 0b0. |
| 9. Does SUPPLY_HI_OUT correspond to the desired SDMMC1_VDDS? | Test whether the error comes from incorrectly set value of SDMMC1_VDDS or incorrectly set VMODE bit. | Check the SUPPLY_HI_OUT bit stored in memory. |
| 10. Correct VMODE bit. | If the level of SUPPLY_HI_OUT corresponds to the desired value of SDMMC1_VDDS, the correct the value of the VMODE bit | Modify the value of the CONTROL_PBIASLITE [21] MMC1_PBIASLITE_VMODE bit. |
| 11. Correct SDMMC1_VDDS value. | If SUPPLY_HI_OUT is different from expected, correct and set SDMMC1_VDDS value over I ² C again. | For more information about I ² C interface settings, see Section 24.1, Multimaster High-Speed I²C , |
| 12. Clear Interrupt status. | Clear the IRQ_MA_75 interrupt status flag. | For more information about setting the MA_IRQ_75 line associated interrupt request PBIAS_IRQ, see Chapter 18, Interrupt Controller . |

⁽¹⁾ Must be set high when external MMC1_VDDS source is programmed to be 3.0 V, or low when the external MMC1_VDDS source is programmed to be 1.8 V. The reset default value corresponds to 3.0 V.

19.5.1.2.2 Hardware Observability Settings

This section describes the procedures to control the hardware observability features of the device. To configure these features, the programmer must perform the steps listed in [Table 19-108](#).

Table 19-108. Configure Hardware Observability Features

| Step | Register/Bit Field/Programming Model | Value |
|--|--|---|
| 1. Select the hwoobs(0)/hwoobs(1)/hwoobs(2) signal frequency divider value (applies only to po_hw_dbg0, po_hw_dbg1, and po_hw_dbg2 bus signals propagated in the CORE power domain). | CONTROL_HWOBS_CONTROL [7:3] HWOBS_CLKDIV_SEL CONTROL_HWOBS_CONTROL [13:9] HWOBS_CLKDIV_SEL_1 CONTROL_HWOBS_CONTROL [18:14] HWOBS_CLKDIV_SEL_2 | 0x- ⁽¹⁾ |
| 2. Enable/disable gating of hwoobs and alternatively set all hwoobs ports to 0 or 1. | CONTROL_HWOBS_CONTROL [2] HWOBS_ALL_ZERO_MODE CONTROL_HWOBS_CONTROL [1] HWOBS_ALL_ONE_MODE | 0x- ⁽²⁾ |
| 3. Enable/disable hwoobs port gating only for signals coming from IPs identified in the MACRO group (applies only to po_hw_dbg bus signals propagated in the CORE power domain). | CONTROL_HWOBS_CONTROL [0] HWOBS_MACRO_ENABLE | 0x- ⁽³⁾ |
| 4. Associate a certain hwoobs channel to the CORE or WKUP power domain. | Configure each bit from the CONTROL_DEBOBS_FINAL_MUX_SEL [31:0] SELECT bit field appropriately for its corresponding hw_dbg channel. | 0x- |
| 5. Choose the source of a signal or signal view channel in the CORE power domain. | Configure each CONTROL_CORE_CONF_DEBUG_SEL_TST_0 [3:0] MODE through CONTROL_CORE_CONF_DEBUG_SEL_TST_31 [3:0] MODE bit field appropriately for its corresponding hw_dbg channel. | 0x- |
| 6. Choose the source of a signal within the WKUP power domain. | Configure each CONTROL_WKUP_CONF_DEBUG_SEL_TST_i [0] MODE bit, (where i = 0 to 31) appropriately for its corresponding hw_dbg channel i (where i = 0 to 31). | 0x- |
| 7. Choose to associate a certain DPLL signal to a given DPLL signal view channel (applies only to po_hw_dbg bus signals propagated in the CORE power domain). | CONTROL_CONF_DPLL_FREQLOCK_SEL [2:0] MULT CONTROL_CONF_DPLL_TINITZ_SEL [2:0] MULT CONTROL_CONF_DPLL_PHASELOCK_SEL [2:0] MULT CONTROL_CONF_DPLL_TENABLE_SEL [2:0] MULT CONTROL_CONF_DPLL_TENABLEDIV_SEL [2:0] MULT CONTROL_CONF_DPLL_BYPASSACK_SEL [2:0] MULT CONTROL_CONF_DPLL_IDLE_SEL [2:0] MULT | 0x- |
| 8. Choose to associate a certain clockout signal to a given clockview channel (applies only to po_hw_dbg bus signals propagated in the CORE power domain). | CONTROL_CONF_CLK_SEL0 [2:0] MULT through CONTROL_CONF_CLK_SEL2 [2:0] MULT | 0x- |
| 9. Choose to associate an sDMA signal to a given sDMA view channel (applies only to po_hw_dbg bus signals propagated in the CORE power domain). | CONTROL_CONF_SDMA_REQ_SEL0 [6:0] MULT through CONTROL_CONF_SDMA_REQ_SEL3 [6:0] MULT | 0x- |
| 10. Set the appropriate pad configuration bit fields to associate the hw_dbg pad function to output pins and configure additional output pad features. | For more information, see Section 19.4.11, Hardware Observability , and Section 19.4.8, Pad Functional Multiplexing and Configuration . | For more information, see Section 19.4.8, PAD Functional Multiplexing and Configuration . |

⁽¹⁾ To configure the hwoobs(0) channel to operate normally, the value of the HWOBS_CLKDIV_SEL, HWOBS_CLKDIV_SEL_1, or HWOBS_CLKDIV_SEL_2 bit must be set different than 0.

⁽²⁾ Set both bits to 0 to enable hardware observability. Set only one bit to 1 to gate hwoobs ports according to the output state required.

⁽³⁾ The modules that belong to this group are: Cortex-A9 MPU subsystem, IVA-HD, BB2D subsystem, CM2, and ABE.

For more information about the different functions and registers associated with the hardware observability features, see [Section 19.4.11, Hardware Observability](#).

19.5.1.2.3 Off Mode Preliminary Settings

This section describes configurations of pads to work in off mode. The following actions must be performed once, and remain valid for all device off - on transitions.

Table 19-109. Setting Pad Off Mode Through Padconfiguration Registers

| Step | Register/Bit Field/Programming Model | Value |
|---|---|---------|
| Set OFFMODEPULLTYPESELECT bit. | CONTROL_CORE_PAD0_X_PAD1_Y[29,13] – Select pullup/down type when pad in off mode. | 0b- |
| Set OFFMODEPULLUDENABLE bit. | CONTROL_CORE_PAD0_X_PAD1_Y[28,12] – Enable/disable pullup/down feature when pad in off mode. | 0b- |
| Set OFFMODEOUTVALUE bit. | CONTROL_CORE_PAD0_X_PAD1_Y[27,11] – Set off mode pad override value. | 0b- |
| Set OFFMODEENABLE bit (enable/disable pad overriding capability in off mode). | CONTROL_CORE_PAD0_X_PAD1_Y[25,9] – Set pad to keep its previous state (it had before going to off mode) or force pad output to a certain override value (OFFMODEOUTVALUE) when pad in off mode. | 0b- |
| Set OFFMODEOUTENABLE bit. | CONTROL_CORE_PAD0_X_PAD1_Y[26,10] – Enable/disable output in off mode. | 0b- |
| Program a valid device ACTIVE pad configuration. | For more information about ACTIVE pad configuration, see Table 19-110 . | |
| Set clock gating strategy. | . CONTROL_PADCONF_CORE_SYSCONFIG[3:2] IP_SYSCONFIG CONTROL_PADCONF_WKUP_SYSCONFIG[3:2] IP_SYSCONFIG | 0x2,0x3 |
| Enable/disable the wake-up detection capability ⁽¹⁾ . | CONTROL_CORE_PAD0_X_PAD1_Y[30,14] | 0b- |

⁽¹⁾ When the wake-up detection is enabled for a pad, this pad is configured as input. Therefore, be sure to write 0b1 in the OFFOUTENABLE bit to disable the output capability.

19.5.1.2.4 Pad Configuration Programming Points

This section describes through an example the configurations of pads necessary for working in active mode.

To configure the pad, ensure that the following steps are done:

1. Identify signals required on the interface based on the target application.

Example: To configure the UART2 interface on balls, the required signals are uart2_tx, uart2_rts, uart2_cts, and uart2_rx.

2. Choose the pads used for those signals. Some signals may be available on several pads and/or may be multiplexed with other signals needed for another application. See [Section 19.4.8.3, Pad Multiplexing Register Fields](#).

Example: Unlike the UART2 interface signals, uart2_rx and uart2_tx, each of which is available on two pads, the uart2_cts and uart2_rts signals are available only on one pad each (MUXMODE = 0b000). The uart2_cts signal, however, is multiplexed with the MMC I/O signal sdmmc3_clk, and the uart2_rts signal is multiplexed with the MMC I/O signal sdmmc3_cmd on the same pad. Assume that the MMC I/O 3 interface is also required in the system. Therefore, for the MMC I/O interface signals, pads must be used where those signals are not multiplexed with a UART2 signal, if possible. In this case, the solution is to use sdmmc3_clk and sdmmc3_cmd on another two pads of the device (usbb2_ulpitll_dat7 and usbb2_ulpitll_dat6) configuring (MUXMODE = 0b010).

3. Identify the signal integrity parameter settings (drive strength, impedance, slew rate, pullup/pulldown strength, etc.) necessary for the pads associated I/O cells, listed in [Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping](#).

For the register settings of the signal integrity parameters for the uart2_rx, uart2_tx, uart2_cts, and urat2_rts pads (this is the variant when the desired uart2 signals appear in MuxMode = 0x0), see [Table 19-92](#).

For the `uart2_cts`, `uart2_rts`, and `uart2_rx` pads, the following bit fields (Mode and Load bit group settings) must be set:

- [CONTROL_SMART3IO_PADCONF_1](#)[27:26] UART2_DR0_MB
- [CONTROL_SMART3IO_PADCONF_2](#)[13] UART2_DR0_LB

For the `uart2_tx` pad, the following bit fields (Mode and Load bit group settings) must be set:

- [CONTROL_SMART3IO_PADCONF_1](#)[25:24] UART2_DR1_MB
- [CONTROL_SMART3IO_PADCONF_2](#)[12] UART2_DR1_LB

For recommendations about the signal integrity parameter settings of the mentioned pad group, see the device data manual.

NOTE: To identify the signal-associated I/O cell signal parameter settings in [Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping](#), the user must search for the device pad name on which the desired signal is muxed, because the I/O cell settings are designated and listed on a per pad basis. This means that a signal name does not appear (unless MuxMode = 0x0) in [Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping](#), but only the pad on which the signal is muxed.

Pads that do not have software I/O cell signal integrity parameter controls are not listed in [Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping](#).

Assume the user application configures the `sdmmc3_clk` and `sdmmc3_cmd` signals on the `usbb2_ulpitll_dat7` and `usbb2_ulpitll_dat6` pads (MuxMode = 0x2). The I/O cell setting (single-bit group control – SPI3_DR0_DS of driver output impedance) listed in [Table 19-80](#) also applies to the `sdmmc3_clk` and `sdmmc3_cmd` signals, which appear on the same pads, when MuxMode = 0x2.

In this case, the [CONTROL_SMART2IO_PADCONF_2](#)[21] SPI3_DR0_DS bit must be set to configure the I/O cell performance of `sdmmc3_clk` and `sdmmc3_cmd`.

For recommendations about the mentioned pad group signal integrity parameter settings, see the device data manual.

4. Identify and program the peripheral dual-voltage settings, if they apply to the chosen pads:

[Table 19-104](#) lists the corresponding control bits of the pads in the [CONTROL_CORE_PADCONF_MODE](#) and [CONTROL_WKUP_PADCONF_MODE](#) registers. The identification of the I/O dual voltage domains/control bits for a signal must be made on a per-pad basis.

All pads (`uart2_cts`, `uart2_rts`, `uart2_rx`, and `uart2_tx`) fall within the same dual-voltage domain (VDDS_DV_BANK1) and the I/O supply voltage (1.2 V/1.8 V) is configured by setting the [CONTROL_CORE_PADCONF_MODE](#)[30] VDDS_DV_BANK1 bit.

As previously explained, the `sdmmc3_clk` and `sdmmc3_cmd` signals are muxed on the `usbb2_ulpitll_dat7` and `usbb2_ulpitll_dat6` pads. The dual-voltage control bit corresponding to these two pads is [CONTROL_CORE_PADCONF_MODE](#)[26] VDDS_DV_BANK6 (see [Table 19-104](#)).

For more information about pad performance dependencies from I/O dual-voltage supply settings, see the device data manual.

5. Identify the pad configuration registers associated with the pads to be used in the application. See [Section 19.4.8.3, Pad Multiplexing Register Fields](#).

Example: Under the previous hypothesis, the pad configuration registers to program are:

- `uart2_rts`: [CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS](#)[31:16]
- `uart2_cts`: [CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS](#)[15:0]
- `uart2_tx`: [CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX](#)[31:16]
- `uart2_rx`: [CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX](#)[15:0]
- `sdmmc3_clk` (MuxMode = 0x2):
[CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7](#)[31:16]
- `sdmmc3_cmd` (MuxMode = 0x2):
[CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7](#)[15:0]

Table 19-110. ACTIVE PADS Configuration Points

| Step | Register/Bit Field/Programming Model | Value |
|---|---|--|
| 1. Identify the interface signals and map them to the appropriate pads according to the application requirements and the device-specific pad I/O muxing capabilities. See Section 19.4.8.3, Pad Multiplexing Register Fields . | Define the list of I/O signal names: uart2_cts, uart2_rts, uart2_rx, uart2_tx, sdmmc3_clk, and sdmmc3_cmd Define the list of corresponding pads: uart2_cts, uart2_rts, uart2_rx, uart2_tx, usbb2_ulpitll_dat7, and usbb2_ulpitll_dat6 | – |
| 2. Identify the corresponding I/O cell signal integrity parameter controls for the pad (on a per-pad basis). See Section 19.4.12.8.9, Device Interfaces Signal Group Controls Mapping . | (uart2_cts, uart2_rts, uart2_rx pads) CONTROL_SMART3IO_PADCONF_1 [27:26] UART2_DR0_MB CONTROL_SMART3IO_PADCONF_2 [13] UART2_DR0_LB (uart2_tx pad) CONTROL_SMART3IO_PADCONF_1 [25:24] UART2_DR1_MB CONTROL_SMART3IO_PADCONF_2 [12] UART2_DR1_LB (usbb2_ulpitll_dat7, usbb2_ulpitll_dat6) CONTROL_SMART2IO_PADCONF_2 [21] SPI3_DR0_DS | For more information about the recommended I/O settings, see the device data manual |
| 3. Determine whether the pad is associated with a peripheral dual-voltage domain (see the device data manual). Identify its corresponding 1.2-V/1.8-V dual-voltage control bit in the CONTROL_CORE_PADCONF_MO DE or CONTROL_WKUP_PADCONF_MO DE register. See Table 19-104 . | (uart2_cts, uart2_rts, uart2_rx, uart2_tx) CONTROL_CORE_PADCONF_MODE [30] VDDS_DV_BANK1 (usbb2_ulpitll_dat7, usbb2_ulpitll_dat6) CONTROL_CORE_PADCONF_MODE [26] VDDS_DV_BANK6 | For more information about the I/O performance dependency on dual-voltage settings, see the device data manual. |
| 4. Configure MUXMODE field in pad configuration registers associated with the pads used. | CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS [18:16] UART2_RTS_MUXMODE CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS [2:0] UART2_CTS_MUXMODE CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX [18:16] UART2_TX_MUXMODE CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX [2:0] UART2_RX_MUXMODE CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7 [18:16] USBB2_ULPITLL_DAT7_MUXMODE CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7 [2:0] USBB2_ULPITLL_DAT6_MUXMODE | 0b000 0b000 0b000 0b000 0b010 0b010 |
| 5. Select the type of the internal pullup/down resistor ⁽¹⁾ . | CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX [4] UART2_RX_PULLTYPESELECT CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS [2:0] UART2_CTS_PULLTYPESELECT | 0b1 (pullup selected) 0b1 (pullup selected) |
| 6. Enable/disable pullup/down feature of the pad ⁽²⁾ . | CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX [3] UART2_RX_PULLUDENABLE CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS [3] UART2_CTS_PULLUDENABLE | 0b1 (pull feature enabled) 0b1 (pull feature enabled) |
| 7. Set the direction of the pin signal. ⁽²⁾ | CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX [8] UART2_RX_INPUTENABLE CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS [8] UART2_CTS_INPUTENABLE CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX [24] UART2_TX_INPUTENABLE CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS [24] UART2_RTS_INPUTENABLE CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7 [24] USBB2_ULPITLL_DAT7_INPUTENABLE (sdmmc3_clk) CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7 [8] USBB2_ULPITLL_DAT6_INPUTENABLE (sdmmc3_cmd) | 0b1 (input pin) 0b1 (input pin) 0b0 (output pin) 0b0 (output pin) 0b1 (input pin) 0b1 (input pin) |

⁽¹⁾ It is recommended to use internal pullup/down resistor if pad is used as input and external pullup/down is not used.

⁽²⁾ If the pad is configured in output mode, it is recommended for software to disable the internal pullup/pulldown associated with it.

NOTE: The order for setting the previous pad configuration bits is not important.

NOTE: If a device pad is left unconnected, but power is supplied to the I/O, or the pad is used only as an output during the lifetime of the application, it is recommended to keep its corresponding pad configuration bit CONTROL_CORE /WKUP_PAD0_X_PAD1_Y.INPUTENABLE set to 0b0. This keeps the input buffer disabled and reduces static current consumption.

NOTE: I/Os are non-failsafe, which means that voltage must never be applied at a pad before the internal I/O supply voltage VDD5 is powered.

19.6 Control Module Register Manual

19.6.1 Control Module Instance Summary

Table 19-111 lists the base address and address space for the control module instances.

Table 19-111. Control Module Instance Summary

| Module Instance | Base Address | Size | Description |
|--------------------------------------|--------------|------|-------------|
| SYSCTRL_GENERAL_CORE | 0x4A00 2000 | 4KB | Module |
| SYSCTRL_GENERAL_WKUP | 0x4A30 C000 | 4KB | Module |
| SYSCTRL_PADCONF_CORE | 0x4A10 0000 | 4KB | Module |
| SYSCTRL_PADCONF_WKUP | 0x4A31 E000 | 4KB | Module |

NOTE: All module registers are 8-, 16-, or 32-bit accessible through the L4 interconnect (little-endian encoding).

| Bits | Field Name | Description | Type | Reset |
|-------|------------------------------------|---|------|-------------------|
| 31:17 | RESERVED | Reserved | R | 0x0000000 |
| 16 | STD_FUSE_FACE_DETECT_DISABLE | Disables face detect Read 0x0: Enables face detect Read 0x1: Disables face detect | R | 0x ⁽¹⁾ |
| 15 | STD_FUSE_CRYPT_DISABLE | Disables cryptographic modules Read 0x0: Enables cryptographic modules Read 0x1: Disables cryptographic modules | R | 0x- |
| 14 | STD_FUSE_MODEM3G_DISABLE | Disables the 3G modem Read 0x0: Enables 3G modem Read 0x1: Disables 3G modem | R | 0x- |
| 13 | STD_FUSE_CH_SPEEDUP_DISABLE | ROM code settings for configuration header block and speedup block. Only software access (no hardware access). Read 0x0: Enables CH and speedup Read 0x1: Disables CH and speedup | R | 0x- |
| 12 | STD_FUSE_ROM_HIDE | MPU BOOT ROM space (4-KB ROM code protection) Read 0x0: BOOT ROM space is 128KB. Read 0x1: BOOT ROM upper 4-KB region becomes reserved. | R | 0x- |
| 11 | STD_FUSE_DPLL_CLK_TRIMMING_DISABLE | Controls DPLLs Read 0x0: Enables DPLL trimming Read 0x1: Disables DPLL trimming | R | 0x- |

⁽¹⁾ The POR value is exported from Fuse-ROM locations, which are programmed during the manufacturing process.

| Bits | Field Name | Description | Type | Reset |
|------|---------------------------------|---|------|-------|
| 10:9 | RESERVED | Reserved | R | 0x- |
| 8 | STD_FUSE_ISS_EFUSE1_EN | Enables implementation-specific features. Controls ISS.EFUSE1_EN. Sets to 1. Read 0x0: Disables ISS EFUSE1 Read 0x1: Enables ISS EFUSE1 | R | 0x1 |
| 7 | STD_FUSE_ISS_EFUSE2_EN | Enables implementation-specific features. Controls ISS.EFUSE2_EN. Sets to 0. Read 0x0: Disables ISS EFUSE2 Read 0x1: Enables ISS EFUSE2 | R | 0x0 |
| 6 | STD_FUSE_ISS_EFUSE3_EN | Enables implementation specific features. Controls ISS.EFUSE3_EN. Sets to 0. Read 0x0: Disables ISS EFUSE3 Read 0x1: Enables ISS EFUSE3 | R | 0x0 |
| 5 | STD_FUSE_ISS_EFUSE4_EN | Enables implementation-specific features. Controls ISS.EFUSE4_EN. Sets to 0. Read 0x0: Disables ISS EFUSE4 Read 0x1: Enables ISS EFUSE4 | R | 0x0 |
| 4 | STD_FUSE_SGX544_3D_CLOCK_SOURCE | Force 3D graphic engine clock source | R | 0x- |
| 3 | STD_FUSE_SGX544_3D_DISABLE | Disable the 3D Gx engine (SGX544) Read 0x0: Enables SGX Read 0x1: Disables SGX | R | 0x- |
| 2 | STD_FUSE_CORTEXA9_MPU_DISABLE | Configures Cortex-A9 MPU boot mode. It disables one Cortex-A9 core. Read 0x0: Boot SMP mode Read 0x1: Boot IP mode | R | 0x- |
| 1 | BSC_ACCESS_PROTECT | Reserved for bsc_access protect | R | 0x- |
| 0 | CUST_IEEE1500_DISABLE | Customer eFuse control/IEEE1500 access path disable | R | 0x- |

| RESERVED | | | | | | | | | | | | | | | | DISCHRGVBUS | CHRGVBUS | DRVVBUS | IDPULLUP | IDDIG | SESSEND | VBUSVALID | BVALID | AVALID | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|------|-------------|---|------|----------|
| 31:9 | RESERVED | | R | 0x000000 |
| 8 | DISCHRGVBUS | USBOTGHS value for signal dischrgvbus (OTG_PD_VBUS). controls discharging of VBUS for completing SRP. Read 0x0: OTG transceiver does not discharge VBUS Read 0x1: OTG transceiver discharges VBUS | R | 0 |
| 7 | CHRGVBUS | USBOTGHS value for signal chrgvbus (OTG_PU_VBUS). controls charging of VBUS for initiating SRP. Read 0x0: OTG transceiver does not charge VBUS Read 0x1: OTG transceiver charges VBUS | R | 0 |
| 6 | DRVVBUS | USBOTGHS value for signal drvbus (OTG_DRV_VBUS). controls the driving of 5V power on VBUS. Read 0x0: OTG transceiver does not drive VBUS Read 0x1: OTG transceiver drives VBUS | R | 0 |
| 5 | IDPULLUP | USBOTGHS value for signal Idpullup (OTG_PU_ID). Enables sampling of the ID pin of the USB connector. Read 0x0: OTG transceiver does not apply a pullup to ID Read 0x1: OTG transceiver applies a pullup to ID | R | 0 |
| 4 | IDDIG | Sets the USBOTGHS signal iddig (ID). Indicates the value of the ID pin of the USB connector. 0x0: ID pin is grounded 0x1: ID pin is high-impedance | RW | 1 |
| 3 | SESSEND | Sets the USBOTGHS signal sessend (BSESSEND). Indicates if VBUS is above the threshold for normal operation. The threshold Vth is between 0.2V and 0.8V. 0x0: VBUS voltage is above VB_SESS_END 0x1: VBUS voltage is below VB_SESS_END | RW | 1 |
| 2 | VBUSVALID | Sets the USBOTGHS signal vbvalid (VBUSVLD). Indicates if VBUS is above the threshold for normal operation. The threshold Vth is between 4.4V and 4.75V. | RW | 0 |
| 1 | BVALID | Sets the USBOTGHS signal bvalid (BSESSVLD). Signal is currently unconnected (reserved for future use). 0x0: VBUS voltage is below VB_SESS_VLD 0x1: VBUS voltage is above VB_SESS_VLD | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|---|------|-------|
| 0 | AVALID | Sets the USBOTGHS signal avalid (ASESSVLD). Indicates if VBUS is above the A-Device session valid threshold. The threshold Vth is between 0.8V and 2.0V. 0x0: VBUS voltage is below VA_SESS_VLD 0x1: VBUS voltage is above VA_SESS_VLD | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------------------|--|------|-------|
| 31:29 | EMIF1_SDRAM_TYPE | SDRAM type selection: Set to 0x4 for LPDDR2-S4. Set to 0x5 for LPDDR2-S2. All other values are reserved. | RW | 0x4 |
| 28:27 | EMIF1_SDRAM_IBANK_POS | Internal bank position: Set to 0x0 to assign internal bank address bits from the L3 address as shown in Table 16-100 , <i>64-Byte Linear Read Starting at Address 0x0</i> , and Table 16-101 , <i>64-Byte Linear Read Starting at Address 0x8 (LPDDR2-S2)</i> , in Chapter 16 , <i>Memory Subsystem</i> . Set to 0x1, 0x2, or 0x3 to assign internal bank address bits from the L3 address as shown in Table 16-102 , <i>64-Byte Linear Read Starting at Address 0x8 (LPDDR2-S4)</i> , Table 16-103 , <i>64-Byte Linear Read Starting at Address 0x10</i> , and Table 16-104 , <i>64-Byte Linear Read Starting at Address 0x18</i> , in Chapter 16 , <i>Memory Subsystem</i> . | RW | 0x0 |
| 26:24 | RESERVED | | R | 0x0 |
| 23 | EMIF1_SDRAM_DDR2_DDQS | DDR2 differential DQS enable: Set to 0 for single ended DQS. Set to 1 for differential DQS. This bit is only for DDR2 mode; because the device supports LPDDR2, this bit is don't care. | RW | 0x1 |
| 22:21 | RESERVED | | R | 0x0 |
| 20 | EMIF1_SDRAM_DDR_DISABLE_DLL | Disable DLL select: Set to 0x0 to enable DLL inside SDRAM. Set to 0x1 to disable DLL inside SDRAM. | RW | 0x0 |
| 19:16 | RESERVED | | R | 0x0 |
| 15:14 | EMIF1_SDRAM_NARROW_MODE | SDRAM data bus width: Set to 0x0 for 64-bit width. Set to 0x1 for 32-bit width. Set to 0x2 for 16-bit width. All other values are reserved. | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|-------|----------------------|--|------|-------|
| 13:10 | EMIF1_SDRAM_CL | CAS latency (RL latency). The value of this field defines the CAS latency to be used when accessing connected SDRAM devices: Supported for LPDDR2-SDRAM: 0x3: CAS latency of 3 cycles 0x4: CAS latency of 4 cycles 0x5: CAS latency of 5 cycles 0x6: CAS latency of 6 cycles 0x7: CAS latency of 7 cycles 0x8: CAS latency of 8 cycles All other values are reserved. | RW | 0x3 |
| 9:7 | EMIF1_SDRAM_ROWSIZE | Row size. Defines the number of row address bits of connected SDRAM devices: Set to 0x0 for 9 row bits. Set to 0x1 for 10 row bits. Set to 0x2 for 11 row bits. Set to 0x3 for 12 row bits. Set to 0x4 for 13 row bits. Set to 0x5 for 14 row bits. Set to 0x6 for 15 row bits. Set to 0x7 for 16 row bits. This field is used only when the ibank_pos field in the SDRAM Config register is set to 0x1, 0x2, or 0x3. | RW | 0x4 |
| 6:4 | EMIF1_SDRAM_IBANK | Internal bank setup. Defines number of banks inside connected SDRAM devices: Set to 0x0 for 1 bank. Set to 0x1 for 2 banks. Set to 0x2 for 4 banks. Set to 0x3 for 8 banks. All other values are reserved. | RW | 0x3 |
| 3 | EMIF1_SDRAM_EBANK | External CS setup. Defines whether SDRAM accesses will use 1 or 2 CS lines. Set to 0 to use pad_cs_o_n[0] only: Set to 0x0 to use only pad_cs_o_n[0]. Set to 0x1 to use pad_cs_o_n[1:0]. This bit is automatically set to 0 if either the cs0nvmen or cs1nvmen field in the LPDDR2-NVM is set to 1. | RW | 0x0 |
| 2:0 | EMIF1_SDRAM_PAGESIZE | Page size. Defines the internal page size of the connected SDRAM devices: Set to 0x0 for 256-word page (8 column bits). Set to 0x1 for 512-word page (9 column bits). Set to 0x2 for 1024-word page (10 column bits). Set to 0x3 for 2048-word page (11 column bits). All other values are reserved. | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------------------|--|------|-------|
| 31:29 | EMIF2_SDRAM_TYPE | SDRAM type selection: Set to 0x4 for LPDDR2-S4. Set to 0x5 for LPDDR2-S2. All other values are reserved. | RW | 0x4 |
| 28:27 | EMIF2_SDRAM_IBANK_POS | Internal bank position: Set to 0x0 to assign internal bank address bits from the L3 address as shown in Table 16-100 , <i>64-Byte Linear Read Starting at Address 0x0</i> , and Table 16-101 , <i>64-Byte Linear Read Starting at Address 0x8 (LPDDR2-S2)</i> , in Chapter 16 , <i>Memory Subsystem</i> . Set to 0x1, 0x2, or 0x3 to assign internal bank address bits from the L3 address as shown in Table 16-102 , <i>64-Byte Linear Read Starting at Address 0x8 (LPDDR2-S4)</i> , Table 16-103 , <i>64-Byte Linear Read Starting at Address 0x10</i> , and Table 16-104 , <i>64-Byte Linear Read Starting at Address 0x18</i> , in Chapter 16 , <i>Memory Subsystem</i> . | RW | 0x0 |
| 26:24 | RESERVED | | R | 0x0 |
| 23 | EMIF2_SDRAM_DDR2_DDQS | DDR2 differential DQS enable: Set to 0 for single ended DQS. Set to 1 for differential DQS. This bit is only for DDR2 mode; because the device supports LPDDR2, this bit is don't care. | RW | 0x1 |
| 22:21 | RESERVED | | R | 0x0 |
| 20 | EMIF2_SDRAM_DDR_DISABLE_DLL | Disable DLL select: Set to 0x0 to enable DLL inside SDRAM. Set to 0x1 to disable DLL inside SDRAM. | RW | 0x0 |
| 19:16 | RESERVED | | R | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------------------|--|------|-------|
| 15:14 | EMIF2_SDRAM_NARROW_MODE | SDRAM data bus width: Set to 0x0 for 64-bit width. Set to 0x1 for 32-bit width. Set to 0x2 for 16-bit width. All other values are reserved. | RW | 0x0 |
| 13:10 | EMIF2_SDRAM_CL | CAS latency (RL latency). The value of this field defines the CAS latency to be used when accessing connected SDRAM devices: Supported for LPDDR2-SDRAM: 0x3: CAS latency of 3 cycles 0x4: CAS latency of 4 cycles 0x5: CAS latency of 5 cycles 0x6: CAS latency of 6 cycles 0x7: CAS latency of 7 cycles 0x8: CAS latency of 8 cycles All other values are reserved. | RW | 0x3 |
| 9:7 | EMIF2_SDRAM_ROWSIZE | Row size. Defines the number of row address bits of connected SDRAM devices: Set to 0x0 for 9 row bits. Set to 0x1 for 10 row bits. Set to 0x2 for 11 row bits. Set to 0x3 for 12 row bits. Set to 0x4 for 13 row bits. Set to 0x5 for 14 row bits. Set to 0x6 for 15 row bits. Set to 0x7 for 16 row bits. This field is used only when the ibank_pos field in the SDRAM Config register is set to 0x1, 0x2, or 0x3. | RW | 0x4 |
| 6:4 | EMIF2_SDRAM_IBANK | Internal bank setup. Defines number of banks inside connected SDRAM devices: Set to 0x0 for 1 bank. Set to 0x1 for 2 banks. Set to 0x2 for 4 banks. Set to 0x3 for 8 banks. All other values are reserved. | RW | 0x3 |
| 3 | EMIF2_SDRAM_EBANK | External CS setup. Defines whether SDRAM accesses will use 1 or 2 CS lines. Set to 0 to use pad_cs_o_n[0] only: Set to 0x0 to use only pad_cs_o_n[0]. Set to 0x1 to use pad_cs_o_n[1:0]. This bit is automatically set to 0 if either the cs0nvmen or cs1nvmen field in the LPDDR2-NVM is set to 1. | RW | 0x0 |
| 2:0 | EMIF2_SDRAM_PAGESIZE | Page size. Defines the internal page size of the connected SDRAM devices: Set to 0x0 for 256-word page (8 column bits). Set to 0x1 for 512-word page (9 column bits). Set to 0x2 for 1024-word page (10 column bits). Set to 0x3 for 2048-word page (11 column bits). All other values are reserved. | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|-------|--------------------------------|---|------|-------|
| 25 | GPMC_AD1_OFFMODEENABLE | OffMode mode override control for pad gpmc_ad1 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 24 | GPMC_AD1_INPUTENABLE | Input enable value for pad gpmc_ad1 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | GPMC_AD1_PULLTYPESELECT | pullup/down selection for pad gpmc_ad1 0x0: pulldown selected 0x1: pullup selected | RW | 1 |
| 19 | GPMC_AD1_PULLUDENABLE | pullup/down enable for pad gpmc_ad1 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | GPMC_AD1_MUXMODE | Functional multiplexing selection for pad gpmc_ad1 0x0: Select gpmc_ad1 0x1: Select sdmmc2_dat1 | RW | 0x0 |
| 15 | GPMC_AD0_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | GPMC_AD0_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | GPMC_AD0_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad gpmc_ad0 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 12 | GPMC_AD0_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad gpmc_ad0 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 11 | GPMC_AD0_OFFMODEOUTVALUE | OffMode mode output value for pad gpmc_ad0 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 10 | GPMC_AD0_OFFMODEOUTENABLE | OffMode mode output enable value for pad gpmc_ad0. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | GPMC_AD0_OFFMODEENABLE | OffMode mode override control for pad gpmc_ad0 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | GPMC_AD0_INPUTENABLE | Input enable value for pad gpmc_ad0 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | GPMC_AD0_PULLTYPESELECT | pullup/down selection for pad gpmc_ad0 0x0: pulldown selected 0x1: pullup selected | RW | 1 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------------|---|------|-------|
| 3 | GPMC_AD0_PULLUDENABLE | pullup/down enable for pad gpmc_ad0 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 2:0 | GPMC_AD0_MUXMODE | Functional multiplexing selection for pad gpmc_ad0 0x0: Select gpmc_ad0 0x1: Select sdmmc2_dat0 | RW | 0x0 |

| GPMC_A23_WAKEUPEVENT | GPMC_A23_WAKEUPENABLE | GPMC_A23_OFFMODEPULLTYPESELECT | GPMC_A23_OFFMODEPULLUDENABE | GPMC_A23_OFFMODEOUTVALUE | GPMC_A23_OFFMODEOUTENABLE | GPMC_A23_OFFMODEEENABLE | GPMC_A23_INPUTENABLE | RESERVED | | | GPMC_A23_PULLTYPESELECT | GPMC_A23_PULLUDENABE | GPMC_A23_MUXMODE | | | GPMC_A22_WAKEUPEVENT | GPMC_A22_WAKEUPENABLE | GPMC_A22_OFFMODEPULLTYPESELECT | GPMC_A22_OFFMODEPULLUDENABE | GPMC_A22_OFFMODEOUTVALUE | GPMC_A22_OFFMODEOUTENABLE | GPMC_A22_OFFMODEEENABLE | GPMC_A22_INPUTENABLE | RESERVED | | | GPMC_A22_PULLTYPESELECT | GPMC_A22_PULLUDENABE | GPMC_A22_MUXMODE | | |

| Bits | Field Name | Description | Type | Reset |
|------|--------------------------------|---|------|-------|
| 31 | GPMC_A23_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 30 | GPMC_A23_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 29 | GPMC_A23_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad gpmc_a23 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 28 | GPMC_A23_OFFMODEPULLUDENABE | OffMode mode pullup/down enable for pad gpmc_a23 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 27 | GPMC_A23_OFFMODEOUTVALUE | OffMode mode output value for pad gpmc_a23 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 26 | GPMC_A23_OFFMODEOUTENABLE | OffMode mode output enable value for pad gpmc_a23. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|--------------------------------|---|------|-------|
| 25 | GPMC_A23_OFFMODEENABLE | OffMode mode override control for pad gpmc_a23 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 24 | GPMC_A23_INPUTENABLE | Input enable value for pad gpmc_a23 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | GPMC_A23_PULLTYPESELECT | pullup/down selection for pad gpmc_a23 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 19 | GPMC_A23_PULLUDENABLE | pullup/down enable for pad gpmc_a23 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | GPMC_A23_MUXMODE | Functional multiplexing selection for pad gpmc_a23 0x0: Select gpmc_a23 0x1: Select kpd_col7 0x2: Select c2c_datain7 0x3: Select gpio_47 0x7: Select safe_mode | RW | 0x7 |
| 15 | GPMC_A22_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | GPMC_A22_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | GPMC_A22_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad gpmc_a22 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 12 | GPMC_A22_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad gpmc_a22 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 11 | GPMC_A22_OFFMODEOUTVALUE | OffMode mode output value for pad gpmc_a22 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 10 | GPMC_A22_OFFMODEOUTENABLE | OffMode mode output enable value for pad gpmc_a22. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | GPMC_A22_OFFMODEENABLE | OffMode mode override control for pad gpmc_a22 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | GPMC_A22_INPUTENABLE | Input enable value for pad gpmc_a22 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 7:5 | RESERVED | | R | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------------------|---|------|-------|
| 4 | GPMC_A22_PULLTYPESELECT | pullup/down selection for pad gpmc_a22 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 3 | GPMC_A22_PULLUDENABLE | pullup/down enable for pad gpmc_a22 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 2:0 | GPMC_A22_MUXMODE | Functional multiplexing selection for pad gpmc_a22 0x0: Select gpmc_a22 0x1: Select kpd_col6 0x2: Select c2c_datain6 0x3: Select gpio_46 0x7: Select safe_mode | RW | 0x7 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------------|---|------|-------|
| 31 | GPMC_A25_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 30 | GPMC_A25_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|--------------------------------|---|------|-------|
| 29 | GPMC_A25_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad gpmc_a25 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 28 | GPMC_A25_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad gpmc_a25 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 27 | GPMC_A25_OFFMODEOUTVALUE | OffMode mode output value for pad gpmc_a25 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 26 | GPMC_A25_OFFMODEOUTENABLE | OffMode mode output enable value for pad gpmc_a25. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 25 | GPMC_A25_OFFMODEENABLE | OffMode mode override control for pad gpmc_a25 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 24 | GPMC_A25_INPUTENABLE | Input enable value for pad gpmc_a25 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | GPMC_A25_PULLTYPESELECT | pullup/down selection for pad gpmc_a25 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 19 | GPMC_A25_PULLUDENABLE | pullup/down enable for pad gpmc_a25 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | GPMC_A25_MUXMODE | Functional multiplexing selection for pad gpmc_a25 0x0: Select gpmc_a25 0x2: Select c2c_clkout1 0x3: Select gpio_49 0x7: Select safe_mode | RW | 0x7 |
| 15 | GPMC_A24_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | GPMC_A24_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | GPMC_A24_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad gpmc_a24 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 12 | GPMC_A24_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad gpmc_a24 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 11 | GPMC_A24_OFFMODEOUTVALUE | OffMode mode output value for pad gpmc_a24 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------------------------|---|------|-------|
| 10 | GPMC_A24_OFFMODEOUTEN ABLE | OffMode mode output enable value for pad gpmc_a24. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | GPMC_A24_OFFMODEENABLE | OffMode mode override control for pad gpmc_a24 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | GPMC_A24_INPUTENABLE | Input enable value for pad gpmc_a24 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | GPMC_A24_PULLTYPESELECT | pullup/down selection for pad gpmc_a24 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 3 | GPMC_A24_PULLUDENABLE | pullup/down enable for pad gpmc_a24 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 2:0 | GPMC_A24_MUXMODE | Functional multiplexing selection for pad gpmc_a24 0x0: Select gpmc_a24 0x1: Select kpd_col8 0x2: Select c2c_clkout0 0x3: Select gpio_48 0x7: Select safe_mode | RW | 0x7 |

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------------------------|---|------|-------|
| 31 | CAM_STROBE_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 30 | CAM_STROBE_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 29 | CAM_STROBE_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad cam_strobe 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 28 | CAM_STROBE_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad cam_strobe 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 27 | CAM_STROBE_OFFMODEOUTVALUE | OffMode mode output value for pad cam_strobe 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 26 | CAM_STROBE_OFFMODEOUTENABLE | OffMode mode output enable value for pad cam_strobe. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 25 | CAM_STROBE_OFFMODEENABLE | OffMode mode override control for pad cam_strobe 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 24 | CAM_STROBE_INPUTENABLE | Input enable value for pad cam_strobe 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | CAM_STROBE_PULLTYPESELECT | pullup/down selection for pad cam_strobe 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 19 | CAM_STROBE_PULLUDENABLE | pullup/down enable for pad cam_strobe 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | CAM_STROBE_MUXMODE | Functional multiplexing selection for pad cam_strobe 0x0: Select cam_strobe 0x2: Select cam2_vs 0x3: Select gpio_82 0x7: Select safe_mode | RW | 0x7 |
| 15 | CAM_SHUTTER_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | CAM_SHUTTER_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | CAM_SHUTTER_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad cam_shutter 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|---------------------------------|--|------|-------|
| 12 | CAM_SHUTTER_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad cam_shutter 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 11 | CAM_SHUTTER_OFFMODEOUTVALUE | OffMode mode output value for pad cam_shutter 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 10 | CAM_SHUTTER_OFFMODEOUTENABLE | OffMode mode output enable value for pad cam_shutter. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | CAM_SHUTTER_OFFMODEENABLE | OffMode mode override control for pad cam_shutter 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | CAM_SHUTTER_INPUTENABLE | Input enable value for pad cam_shutter 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | CAM_SHUTTER_PULLTYPESELECT | pullup/down selection for pad cam_shutter 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 3 | CAM_SHUTTER_PULLUDENABLE | pullup/down enable for pad cam_shutter 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 2:0 | CAM_SHUTTER_MUXMODE | Functional multiplexing selection for pad cam_shutter 0x0: Select cam_shutter 0x2: Select cam2_hs 0x3: Select gpio_81 0x7: Select safe_mode | RW | 0x7 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------------------------|---|------|-------|
| 31 | SDMMC1_DAT0_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 30 | SDMMC1_DAT0_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 29 | SDMMC1_DAT0_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad sdmmc1_dat0 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|----------------------------------|--|------|-------|
| 28 | SDMMC1_DAT0_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad sdmmc1_dat0 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 27 | SDMMC1_DAT0_OFFMODEOUTVALUE | OffMode mode output value for pad sdmmc1_dat0 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 26 | SDMMC1_DAT0_OFFMODEOUTENABLE | OffMode mode output enable value for pad sdmmc1_dat0. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 25 | SDMMC1_DAT0_OFFMODEENABLE | OffMode mode override control for pad sdmmc1_dat0 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 24 | SDMMC1_DAT0_INPUTENABLE | Input enable value for pad sdmmc1_dat0 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | SDMMC1_DAT0_PULLTYPESELECT | pullup/down selection for pad sdmmc1_dat0 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 19 | SDMMC1_DAT0_PULLUDENABLE | pullup/down enable for pad sdmmc1_dat0 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | SDMMC1_DAT0_MUXMODE | Functional multiplexing selection for pad sdmmc1_dat0 ⁽¹⁾ 0x0: Select sdmmc1_dat0 0x2: Select dpm_emu18 0x3: Select gpio_102 0x7: Select safe_mode | RW | 0x7 |
| 15 | SDMMC1_CMD_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | SDMMC1_CMD_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | SDMMC1_CMD_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad sdmmc1_cmd 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 12 | SDMMC1_CMD_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad sdmmc1_cmd 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 11 | SDMMC1_CMD_OFFMODEOUTVALUE | OffMode mode output value for pad sdmmc1_cmd 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |

⁽¹⁾ To ensure pad safe operation at 1.8 V or 3.0 V and desired signal performance, the corresponding extended-drain I/O cell and PBIAS cell must be appropriately configured by software prior to signal selection on the pad, regardless of the signal multiplexing mode. For more details on extended-drain I/O cells and PBIAS cell descriptions and settings, see [Section 19.4.9, Extended-Drain I/O and PBIAS Cell](#), and [Section 19.5.1.2.1, Extended-Drain I/Os and PBIAS Cells Programming Guide](#).

| Bits | Field Name | Description | Type | Reset |
|------|-----------------------------|---|------|-------|
| 10 | SDMMC1_CMD_OFFMODEOUTENABLE | OffMode mode output enable value for pad sdmmc1_cmd. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | SDMMC1_CMD_OFFMODEENABLE | OffMode mode override control for pad sdmmc1_cmd 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | SDMMC1_CMD_INPUTENABLE | Input enable value for pad sdmmc1_cmd 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | SDMMC1_CMD_PULLTYPESELECT | pullup/down selection for pad sdmmc1_cmd 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 3 | SDMMC1_CMD_PULLUDENABLE | pullup/down enable for pad sdmmc1_cmd 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 2:0 | SDMMC1_CMD_MUXMODE | Functional multiplexing selection for pad sdmmc1_cmd ⁽²⁾ 0x0: Select sdmmc1_cmd 0x2: Select uart1_rx 0x3: Select gpio_101 0x7: Select safe_mode | RW | 0x7 |

⁽²⁾ To ensure pad safe operation at 1.8 V or 3.0 V and desired signal performance, the corresponding extended-drain I/O cell and PBIAS cell must be appropriately configured by software prior to signal selection on the pad, regardless of the signal multiplexing mode. For more details on extended-drain I/O cells and PBIAS cell descriptions and settings, see [Section 19.4.9, Extended-Drain I/O and PBIAS Cell](#), and [Section 19.5.1.2.1, Extended-Drain I/Os and PBIAS Cells Programming Guide](#).

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------------------------|--|------|-------|
| 31 | SDMMC1_DAT6_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 30 | SDMMC1_DAT6_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 29 | SDMMC1_DAT6_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad sdmmc1_dat6 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 28 | SDMMC1_DAT6_OFFMODEPULLUDENABE | OffMode mode pullup/down enable for pad sdmmc1_dat6 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 27 | SDMMC1_DAT6_OFFMODEOUTVALUE | OffMode mode output value for pad sdmmc1_dat6 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 26 | SDMMC1_DAT6_OFFMODEOUTENABLE | OffMode mode output enable value for pad sdmmc1_dat6. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 25 | SDMMC1_DAT6_OFFMODEEENABLE | OffMode mode override control for pad sdmmc1_dat6 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 24 | SDMMC1_DAT6_INPUTENABLE | Input enable value for pad sdmmc1_dat6 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | SDMMC1_DAT6_PULLTYPESELECT | pullup/down selection for pad sdmmc1_dat6 0x0: pulldown selected 0x1: pullup selected | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------------------------|--|------|-------|
| 19 | SDMMC1_DAT6_PULLUDENABLE | pullup/down enable for pad sdmmc1_dat6 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | SDMMC1_DAT6_MUXMODE | Functional multiplexing selection for pad sdmmc1_dat6 ⁽¹⁾ 0x0: Select sdmmc1_dat6 0x3: Select gpio_108 0x7: Select safe_mode | RW | 0x7 |
| 15 | SDMMC1_DAT5_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | SDMMC1_DAT5_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | SDMMC1_DAT5_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad sdmmc1_dat5 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 12 | SDMMC1_DAT5_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad sdmmc1_dat5 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 11 | SDMMC1_DAT5_OFFMODEOUTVALUE | OffMode mode output value for pad sdmmc1_dat5 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 10 | SDMMC1_DAT5_OFFMODEOUTENABLE | OffMode mode output enable value for pad sdmmc1_dat5. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | SDMMC1_DAT5_OFFMODEENABLE | OffMode mode override control for pad sdmmc1_dat5 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | SDMMC1_DAT5_INPUTENABLE | Input enable value for pad sdmmc1_dat5 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | SDMMC1_DAT5_PULLTYPESELECT | pullup/down selection for pad sdmmc1_dat5 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 3 | SDMMC1_DAT5_PULLUDENABLE | pullup/down enable for pad sdmmc1_dat5 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |

⁽¹⁾ To ensure pad safe operation at 1.8 V or 3.0 V and desired signal performance, the corresponding extended-drain I/O cell and PBIAS cell must be appropriately configured by software prior to signal selection on the pad, regardless of the signal multiplexing mode. For more details on extended-drain I/O cells and PBIAS cell descriptions and settings, see [Section 19.4.9, Extended-Drain I/O and PBIAS Cell](#), and [Section 19.5.1.2.1, Extended-Drain I/Os and PBIAS Cells Programming Guide](#).

| Bits | Field Name | Description | Type | Reset |
|------|---------------------|--|------|-------|
| 2:0 | SDMMC1_DAT5_MUXMODE | Functional multiplexing selection for pad sdmmc1_dat5 ⁽²⁾ 0x0: Select sdmmc1_dat5 0x3: Select gpio_107 0x7: Select safe_mode | RW | 0x7 |

| Bits | Field Name | Description | Type | Reset |
|------|------------------------------|---|------|-------|
| 31 | ABE_MCBSP2_CLKX_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 30 | ABE_MCBSP2_CLKX_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------------------------|---|------|-------|
| 29 | ABE_MCBSP2_CLKX_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad abe_mcbbsp2_clkx 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 28 | ABE_MCBSP2_CLKX_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad abe_mcbbsp2_clkx 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 27 | ABE_MCBSP2_CLKX_OFFMODEOUTVALUE | OffMode mode output value for pad abe_mcbbsp2_clkx 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 26 | ABE_MCBSP2_CLKX_OFFMODEOUTENABLE | OffMode mode output enable value for pad abe_mcbbsp2_clkx. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 25 | ABE_MCBSP2_CLKX_OFFMODEENABLE | OffMode mode override control for pad abe_mcbbsp2_clkx 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 24 | ABE_MCBSP2_CLKX_INPUTENABLE | Input enable value for pad abe_mcbbsp2_clkx 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | ABE_MCBSP2_CLKX_PULLTYPESELECT | pullup/down selection for pad abe_mcbbsp2_clkx 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 19 | ABE_MCBSP2_CLKX_PULLUDENABLE | pullup/down enable for pad abe_mcbbsp2_clkx 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | ABE_MCBSP2_CLKX_MUXMODE | Functional multiplexing selection for pad abe_mcbbsp2_clkx 0x0: Select abe_mcbbsp2_clkx 0x1: Select mcspi2_clk 0x2: Select abe_mcaspi_ahclkx 0x3: Select gpio_110 0x4: Select usbb2_mm_rxdm 0x7: Select safe_mode | RW | 0x7 |
| 15 | SDMMC1_DAT7_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | SDMMC1_DAT7_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | SDMMC1_DAT7_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad sdmmc1_dat7 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 12 | SDMMC1_DAT7_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad sdmmc1_dat7 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|----------------------------------|--|------|-------|
| 11 | SDMMC1_DAT7_ OFFMODEOUTVALUE | OffMode mode output value for pad sdmmc1_dat7 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 10 | SDMMC1_DAT7_ OFFMODEOUTENABLE | OffMode mode output enable value for pad sdmmc1_dat7. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | SDMMC1_DAT7_ OFFMODEENABLE | OffMode mode override control for pad sdmmc1_dat7 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | SDMMC1_DAT7_ INPUTENABLE | Input enable value for pad sdmmc1_dat7 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | SDMMC1_DAT7_ PULLTYPESELECT | pullup/down selection for pad sdmmc1_dat7 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 3 | SDMMC1_DAT7_ PULLUDENABLE | pullup/down enable for pad sdmmc1_dat7 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 2:0 | SDMMC1_DAT7_ MUXMODE | Functional multiplexing selection for pad sdmmc1_dat7 ⁽¹⁾ 0x0: Select sdmmc1_dat7 0x3: Select gpio_109 0x7: Select safe_mode | RW | 0x7 |

⁽¹⁾ To ensure pad safe operation at 1.8 V or 3.0 V and desired signal performance, the corresponding extended-drain I/O cell and PBIAS cell must be appropriately configured by software prior to signal selection on the pad, regardless of the signal multiplexing mode. For more details on extended-drain I/O cells and PBIAS cell descriptions and settings, see [Section 19.4.9, Extended-Drain I/O and PBIAS Cell](#), and [Section 19.5.1.2.1, Extended-Drain I/Os and PBIAS Cells Programming Guide](#).

| 31 | ABE_CLKS_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 30 | ABE_CLKS_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 29 | ABE_CLKS_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad abe_clks 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 28 | ABE_CLKS_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad abe_clks 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 27 | ABE_CLKS_OFFMODEOUTVALUE | OffMode mode output value for pad abe_clks 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 26 | ABE_CLKS_OFFMODEOUTENABLE | OffMode mode output enable value for pad abe_clks. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 25 | ABE_CLKS_OFFMODEENABLE | OffMode mode override control for pad abe_clks 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 24 | ABE_CLKS_INPUTENABLE | Input enable value for pad abe_clks 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | ABE_CLKS_PULLTYPESELECT | pullup/down selection for pad abe_clks 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 19 | ABE_CLKS_PULLUDENABLE | pullup/down enable for pad abe_clks 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | ABE_CLKS_MUXMODE | Functional multiplexing selection for pad abe_clks 0x0: Select abe_clks 0x3: Select gpio_118 0x7: Select safe_mode | RW | 0x7 |
| 15 | ABE_PDM_LB_CLK_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | ABE_PDM_LB_CLK_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | ABE_PDM_LB_CLK_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad abe_pdm_lb_clk 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|--|---|------|-------|
| 12 | ABE_PDM_LB_CLK_OFFMODE PULLUDENABLE | OffMode mode pullup/down enable for pad abe_pdm_lb_clk 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 11 | ABE_PDM_LB_CLK_OFFMODE OUTVALUE | OffMode mode output value for pad abe_pdm_lb_clk 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 10 | ABE_PDM_LB_CLK_OFFMODE OUTENABLE | OffMode mode output enable value for pad abe_pdm_lb_clk. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | ABE_PDM_LB_CLK_OFFMODE ENABLE | OffMode mode override control for pad abe_pdm_lb_clk 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | ABE_PDM_LB_CLK_INPUTENA BLE | Input enable value for pad abe_pdm_lb_clk 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | ABE_PDM_LB_CLK_PULLTYPE SELECT | pullup/down selection for pad abe_pdm_lb_clk 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 3 | ABE_PDM_LB_CLK_PULLUDEN ABLE | pullup/down enable for pad abe_pdm_lb_clk 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 2:0 | ABE_PDM_LB_CLK_MUXMODE | Functional multiplexing selection for pad abe_pdm_lb_clk 0x0: Select abe_pdm_lb_clk 0x1: Select abe_mcbasp3_fsx 0x7: Select safe_mode | RW | 0x7 |

| Bits | Field Name | Description | Type | Reset |
|------|--------------------------------|---|------|-------|
| 31 | KPD_ROW4_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 30 | KPD_ROW4_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 29 | KPD_ROW4_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad kpd_row4 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 28 | KPD_ROW4_OFFMODEPULLUDENABE | OffMode mode pullup/down enable for pad kpd_row4 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 27 | KPD_ROW4_OFFMODEOUTVALUE | OffMode mode output value for pad kpd_row4 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 26 | KPD_ROW4_OFFMODEOUTENABLE | OffMode mode output enable value for pad kpd_row4. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 25 | KPD_ROW4_OFFMODEEENABLE | OffMode mode override control for pad kpd_row4 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|--------------------------------|--|------|-------|
| 24 | KPD_ROW4_INPUTENABLE | Input enable value for pad kpd_row4 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | KPD_ROW4_PULLTYPESELECTION | pullup/down selection for pad kpd_row4 0x0: pulldown selected 0x1: pullup selected | RW | 1 |
| 19 | KPD_ROW4_PULLUDENABLE | pullup/down enable for pad kpd_row4 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | KPD_ROW4_MUXMODE | Functional multiplexing selection for pad kpd_row4 0x0: Select kpd_row4 0x1: Select kpd_row1 0x2: Select cam2_d5 0x3: Select gpio_176 0x7: Select safe_mode | RW | 0x7 |
| 15 | KPD_ROW3_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | KPD_ROW3_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | KPD_ROW3_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad kpd_row3 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 12 | KPD_ROW3_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad kpd_row3 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 11 | KPD_ROW3_OFFMODEOUTVALUE | OffMode mode output value for pad kpd_row3 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 10 | KPD_ROW3_OFFMODEOUTENABLE | OffMode mode output enable value for pad kpd_row3. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | KPD_ROW3_OFFMODEENABLE | OffMode mode override control for pad kpd_row3 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | KPD_ROW3_INPUTENABLE | Input enable value for pad kpd_row3 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------------------|--|------|-------|
| 7:5 | RESERVED | | R | 0x0 |
| 4 | KPD_ROW3_PULLTYPESELECT | pullup/down selection for pad kpd_row3 0x0: pulldown selected 0x1: pullup selected | RW | 1 |
| 3 | KPD_ROW3_PULLUDENABLE | pullup/down enable for pad kpd_row3 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 2:0 | KPD_ROW3_MUXMODE | Functional multiplexing selection for pad kpd_row3 0x0: Select kpd_row3 0x1: Select kpd_row0 0x2: Select cam2_d4 0x3: Select gpio_175 0x7: Select safe_mode | RW | 0x7 |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------------------|--|------|-------|
| 31 | DPM_EMU12_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 30 | DPM_EMU12_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 29 | DPM_EMU12_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad dpm_emu12 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 28 | DPM_EMU12_OFFMODEPULLUDENABE | OffMode mode pullup/down enable for pad dpm_emu12 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 27 | DPM_EMU12_OFFMODEOUTVALUE | OffMode mode output value for pad dpm_emu12 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 26 | DPM_EMU12_OFFMODEOUTENABLE | OffMode mode output enable value for pad dpm_emu12. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 25 | DPM_EMU12_OFFMODEEENABLE | OffMode mode override control for pad dpm_emu12 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 24 | DPM_EMU12_INPUTENABLE | Input enable value for pad dpm_emu12 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | DPM_EMU12_PULLTYPESELE CT | pullup/down selection for pad dpm_emu12 0x0: pulldown selected 0x1: pullup selected | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------------------|---|------|-------|
| 19 | DPM_EMU12_PULLUDENABLE | pullup/down enable for pad dpm_emu12 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | DPM_EMU12_MUXMODE | Functional multiplexing selection for pad dpm_emu12 0x0: Select dpm_emu12 0x1: Select usba0_ulpihy_dat6 0x3: Select gpio_23 0x4: Select rfb_data7 0x5: Select disp2_data7 0x6: Select hw_dbg12 0x7: Select safe_mode | RW | 0x7 |
| 15 | DPM_EMU11_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | DPM_EMU11_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | DPM_EMU11_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad dpm_emu11 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 12 | DPM_EMU11_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad dpm_emu11 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 11 | DPM_EMU11_OFFMODEOUTVALUE | OffMode mode output value for pad dpm_emu11 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 10 | DPM_EMU11_OFFMODEOUTENABLE | OffMode mode output enable value for pad dpm_emu11. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | DPM_EMU11_OFFMODEENABLE | OffMode mode override control for pad dpm_emu11 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | DPM_EMU11_INPUTENABLE | Input enable value for pad dpm_emu11 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | DPM_EMU11_PULLTYPESELE CT | pullup/down selection for pad dpm_emu11 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 3 | DPM_EMU11_PULLUDENABLE | pullup/down enable for pad dpm_emu11 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------------|--|------|-------|
| 2:0 | DPM_EMU11_MUXMODE | Functional multiplexing selection for pad dpm_emu11 0x0: Select dpm_emu11 0x1: Select usba0_ulpiphy_dat5 0x3: Select gpio_22 0x4: Select rfb_data8 0x5: Select disp2_data8 0x6: Select hw_dbg11 0x7: Select safe_mode | RW | 0x7 |
