Technical Reference Manual

Literature Number: SWPU270E
November 2011–Revised December 2011

WARNING: EXPORT NOTICE

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from Disclosing party under this Agreement, or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorisation from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws. This provision shall survive termination or expiration of this Agreement.

According to our best knowledge of the state and end-use of this product or technology, and in compliance with the export control regulations of dual-use goods in force in the origin and exporting countries, this technology is classified as follows:

US ECCN: 3E991

EU ECCN: EAR99

And may require export or re-export license for shipping it in compliance with the applicable regulations of certain countries.

Contents

| | |
|--|------------|
| Preface | 251 |
| 1 Introduction | 261 |
| 1.1 Overview | 262 |
| 1.2 Environment | 263 |
| 1.3 Description | 264 |
| 1.3.1 Cortex-A9 MPU Subsystem Description | 266 |
| 1.3.2 IVA-HD Subsystem Description | 266 |
| 1.3.3 Cortex-M3 MPU Subsystem Description | 267 |
| 1.3.4 Display Subsystem Description | 267 |
| 1.3.5 ABE Subsystem Description | 268 |
| 1.3.6 ISS Description | 269 |
| 1.3.7 3D Graphics Accelerators Description | 270 |
| 1.3.8 2D Graphics Accelerators | 271 |
| 1.3.9 Face Detect Module Description | 271 |
| 1.3.10 On-Chip Debug Support Description | 271 |
| 1.3.11 Power, Reset, and Clock Management Description | 272 |
| 1.3.12 On-Chip Memory Description | 273 |
| 1.3.13 Memory Management Description | 273 |
| 1.3.14 External Memory Interface Description | 273 |
| 1.3.15 System and Connection Peripherals | 273 |
| 1.3.15.1 System Peripherals | 273 |
| 1.3.15.2 Connection Peripherals | 274 |
| 1.4 Package-On-Package Concept | 275 |
| 1.5 OMAP4470 Family and Device Identification | 276 |
| 2 Memory Mapping | 279 |
| 2.1 Introduction | 280 |
| 2.2 L3 Memory Space Mapping | 282 |
| 2.2.1 L3_EMU Memory Space Mapping | 284 |
| 2.3 L4 Memory Space Mapping | 285 |
| 2.3.1 L4_CFG Memory Space Mapping | 285 |
| 2.3.2 L4_WKUP Memory Space Mapping | 287 |
| 2.3.3 L4_PER Memory Space Mapping | 288 |
| 2.3.4 L4_ABE Memory Space Mapping | 290 |
| 2.4 Dual Cortex-M3 Subsystem Memory Space Mapping | 295 |
| 2.5 DSP Subsystem Memory Space Mapping | 296 |
| 2.6 Display Subsystem Memory Space Mapping | 298 |
| 2.6.1 L3 Interconnect View of the Display Memory Space | 298 |
| 2.6.2 L4 Interconnect View of the Display Memory Space | 298 |
| 3 Power, Reset, and Clock Management | 299 |
| 3.1 Device Power Management Introduction | 300 |
| 3.1.1 Device Power-Management Architecture Building Blocks | 300 |
| 3.1.1.1 Clock Management | 300 |
| 3.1.1.1.1 Module Interface and Functional Clocks | 300 |

| | | |
|-----------|--|-----|
| 3.1.1.1.2 | Module-Level Clock Management | 301 |
| 3.1.1.1.3 | Clock Domain | 306 |
| 3.1.1.1.4 | Clock Domain-Level Clock Management | 307 |
| 3.1.1.1.5 | Clock Domain HW_AUTO Mode Sequences | 309 |
| 3.1.1.1.6 | Clock Domain Sleep/Wakeup | 312 |
| 3.1.1.1.7 | Clock Domain Dependency | 312 |
| 3.1.1.2 | Power Management | 315 |
| 3.1.1.2.1 | Power Domain | 315 |
| 3.1.1.2.2 | Module Logic and Memory Context | 317 |
| 3.1.1.2.3 | Retention-Till-Access Memory Feature | 317 |
| 3.1.1.2.4 | Power Domain Management | 317 |
| 3.1.1.3 | Voltage Management | 319 |
| 3.1.1.3.1 | Voltage Domain | 319 |
| 3.1.1.3.2 | Voltage Domain Management | 321 |
| 3.1.1.3.3 | AVS Overview | 322 |
| 3.1.2 | Power-Management Techniques | 324 |
| 3.1.2.1 | Standby Leakage Management | 324 |
| 3.1.2.2 | Dynamic Voltage and Frequency Scaling | 324 |
| 3.1.2.3 | Dynamic Power Switching | 325 |
| 3.1.2.4 | Adaptive Voltage Scaling | 326 |
| 3.1.2.5 | Adaptive Body Bias | 326 |
| 3.1.2.6 | Combining Power-Management Techniques | 327 |
| 3.1.2.6.1 | DPS Versus SLM | 328 |
| 3.2 | PRCM Subsystem Overview | 329 |
| 3.2.1 | Introduction | 329 |
| 3.2.2 | Power-Management Framework Features | 330 |
| 3.3 | PRCM Subsystem Environment | 331 |
| 3.3.1 | External Clock Signals | 331 |
| 3.3.2 | External Boot Signals | 332 |
| 3.3.3 | External Reset Signals | 332 |
| 3.3.4 | External Power Control Signals | 333 |
| 3.3.5 | External Voltage Inputs | 333 |
| 3.3.6 | External Wake-Up Signals | 334 |
| 3.4 | PRCM Subsystem Integration | 335 |
| 3.4.1 | Device Power-Management Layout | 335 |
| 3.4.2 | Power-Management Scheme, Reset, and Interrupt Requests | 337 |
| 3.4.2.1 | Power Domain | 337 |
| 3.4.2.2 | Resets | 338 |
| 3.4.2.3 | Interrupt Requests | 338 |
| 3.5 | Reset Management Functional Description | 339 |
| 3.5.1 | Overview | 339 |
| 3.5.1.1 | SCRM Reset Management Functional Description | 339 |
| 3.5.1.1.1 | Power-On Reset | 339 |
| 3.5.1.1.2 | Warm Reset | 339 |
| 3.5.1.2 | PRM Reset Management Functional Description | 339 |
| 3.5.2 | General Characteristics of Reset Signals | 340 |
| 3.5.2.1 | Scope | 340 |
| 3.5.2.2 | Occurrence | 340 |
| 3.5.2.3 | Source Type | 341 |
| 3.5.2.4 | Retention Type | 341 |
| 3.5.3 | Reset Sources | 341 |
| 3.5.3.1 | Global Reset Sources | 341 |
| 3.5.3.2 | Local Reset Sources | 342 |

| | | |
|-----------|---|-----|
| 3.5.4 | Reset Domains | 342 |
| 3.5.5 | Reset Logging | 356 |
| 3.5.5.1 | PRCM Module Reset Logging Mechanism | 356 |
| 3.5.6 | Reset Sequences | 357 |
| 3.5.6.1 | SCRM Power-on Reset Sequence | 357 |
| 3.5.6.2 | PRCM Module Power-On Reset Sequence | 357 |
| 3.5.6.3 | Cortex-A9 MPU Subsystem Power-On Reset Sequence | 359 |
| 3.5.6.4 | Cortex-A9 MPU Subsystem Warm Reset Sequence | 360 |
| 3.5.6.5 | Cortex-A9 MPU Subsystem Reset Sequence On Sleep and Wake-Up Transitions From RETENTION or OFF State | 361 |
| 3.5.6.6 | IVAHD Subsystem Power-On Reset Sequence | 361 |
| 3.5.6.7 | IVAHD Subsystem Software Warm Reset Sequence | 362 |
| 3.5.6.8 | DSP Subsystem Power-On Reset Sequence | 363 |
| 3.5.6.9 | DSP Subsystem Software Warm Reset Sequence | 364 |
| 3.5.6.10 | DSP Subsystem Reset Sequence On Wake-Up Transitions From OSWR RETENTION State | 364 |
| 3.5.6.11 | Cortex-M3 MPU Subsystem Power-On Reset Sequence | 365 |
| 3.5.6.12 | Cortex-M3 MPU Subsystem Software Warm Reset Sequence | 366 |
| 3.5.6.13 | Global Warm Reset Sequence | 368 |
| 3.6 | Clock Management Functional Description | 370 |
| 3.6.1 | Overview | 370 |
| 3.6.2 | External Clock Inputs | 371 |
| 3.6.2.1 | sys_32k Clock Input | 371 |
| 3.6.2.2 | High-Frequency System Clock Input | 371 |
| 3.6.3 | Internal Clock Sources/Generators | 371 |
| 3.6.3.1 | PRM Clock Source | 371 |
| 3.6.3.2 | CM Clock Source | 374 |
| 3.6.3.2.1 | CM1 Clock Generator | 374 |
| 3.6.3.2.2 | CM1_USB Clock Generator | 375 |
| 3.6.3.2.3 | CM1_ABE Clock Generator | 377 |
| 3.6.3.2.4 | CM2 Clock Generator | 378 |
| 3.6.3.3 | Generic DPLL Overview | 381 |
| 3.6.3.3.1 | DPLLs Output Clocks Parameters | 382 |
| 3.6.3.3.2 | Enable Control, Status, and Low-Power Operation Mode | 384 |
| 3.6.3.3.3 | DPLL Power Modes | 384 |
| 3.6.3.3.4 | DPLL Recalibration | 385 |
| 3.6.3.3.5 | DPLL Spread Spectrum Clocking | 386 |
| 3.6.3.3.6 | DPLL Output Power Down | 393 |
| 3.6.3.3.7 | DPLL Output Clock Gating | 393 |
| 3.6.3.4 | DPLL_PER Description | 393 |
| 3.6.3.4.1 | Overview | 393 |
| 3.6.3.4.2 | Synthesized Clock Parameters | 394 |
| 3.6.3.4.3 | Power Modes | 395 |
| 3.6.3.4.4 | Recalibration | 396 |
| 3.6.3.4.5 | Spread Spectrum Clocking | 396 |
| 3.6.3.4.6 | Output Power Down | 396 |
| 3.6.3.4.7 | DPLL_PER Preferred Settings | 397 |
| 3.6.3.5 | DPLL_CORE Description | 400 |
| 3.6.3.5.1 | Overview | 400 |
| 3.6.3.5.2 | Synthesized Clock Parameters | 400 |
| 3.6.3.5.3 | Power Modes | 401 |
| 3.6.3.5.4 | Recalibration | 402 |
| 3.6.3.5.5 | Spread Spectrum Clocking | 402 |
| 3.6.3.5.6 | Output Power-Down | 403 |

| | | |
|-----------|--------------------------------------|-----|
| 3.6.3.5.7 | DPLL_CORE Preferred Settings | 404 |
| 3.6.3.6 | DPLL_ABE Description | 407 |
| 3.6.3.6.1 | Overview | 407 |
| 3.6.3.6.2 | Synthesized Clock Parameters | 407 |
| 3.6.3.6.3 | Power Modes | 408 |
| 3.6.3.6.4 | Recalibration | 408 |
| 3.6.3.6.5 | Spread Spectrum Clocking | 408 |
| 3.6.3.6.6 | DPLL_ABE Preferred Settings | 408 |
| 3.6.3.7 | DPLL_MPU Description | 410 |
| 3.6.3.7.1 | Overview | 410 |
| 3.6.3.7.2 | Tactical Clocking Adjustment | 410 |
| 3.6.3.7.3 | Synthesized Clock Parameters | 411 |
| 3.6.3.7.4 | Power Modes | 411 |
| 3.6.3.7.5 | Recalibration | 412 |
| 3.6.3.7.6 | Spread Spectrum Clocking | 412 |
| 3.6.3.7.7 | DPLL_MPU Preferred Settings | 412 |
| 3.6.3.8 | DPLL_IVA Description | 414 |
| 3.6.3.8.1 | Overview | 414 |
| 3.6.3.8.2 | Synthesized Clock Parameters | 414 |
| 3.6.3.8.3 | Power Modes | 415 |
| 3.6.3.8.4 | Recalibration | 415 |
| 3.6.3.8.5 | Spread Spectrum Clocking | 415 |
| 3.6.3.8.6 | Output Power Down | 416 |
| 3.6.3.8.7 | DPLL_IVA Preferred Settings | 416 |
| 3.6.3.9 | DPLL_USB Description | 417 |
| 3.6.3.9.1 | Overview | 417 |
| 3.6.3.9.2 | Synthesized Clock Parameters | 417 |
| 3.6.3.9.3 | Power Modes | 418 |
| 3.6.3.9.4 | Spread Spectrum Clocking | 418 |
| 3.6.3.9.5 | DPLL_USB Preferred Settings | 419 |
| 3.6.3.10 | DPLLs Cascading | 420 |
| 3.6.4 | CD_WKUP Clock Domain | 421 |
| 3.6.4.1 | Overview | 421 |
| 3.6.4.2 | Clock Domain Modes | 421 |
| 3.6.4.3 | Clock Domain Dependency | 422 |
| 3.6.4.3.1 | Wake-Up Dependency | 422 |
| 3.6.4.4 | Clock Domain Module Attributes | 422 |
| 3.6.5 | CD_DSP Clock Domain | 424 |
| 3.6.5.1 | Overview | 424 |
| 3.6.5.2 | Clock Domain Modes | 425 |
| 3.6.5.3 | Clock Domain Dependency | 425 |
| 3.6.5.3.1 | Static Dependency | 425 |
| 3.6.5.3.2 | Dynamic Dependency | 426 |
| 3.6.5.4 | Clock Domain Module Attributes | 426 |
| 3.6.6 | CD_STD_EFUSE Clock Domain | 427 |
| 3.6.6.1 | Overview | 427 |
| 3.6.6.2 | Clock Domain Module Attributes | 427 |
| 3.6.7 | CD_CORTEXA9 Clock Domain | 428 |
| 3.6.7.1 | Overview | 428 |
| 3.6.7.2 | Clock Domain Modes | 428 |
| 3.6.7.3 | Clock Domain Dependency | 428 |
| 3.6.7.3.1 | Static Dependency | 428 |
| 3.6.7.3.2 | Dynamic Dependency | 429 |

| | | |
|------------|--------------------------------------|-----|
| 3.6.7.4 | Clock Domain Module Attributes | 429 |
| 3.6.8 | CD_L4_PER Clock Domain | 430 |
| 3.6.8.1 | Overview | 430 |
| 3.6.8.2 | Clock Domain Modes | 431 |
| 3.6.8.3 | Clock Domain Dependency | 432 |
| 3.6.8.3.1 | Dynamic Dependency | 432 |
| 3.6.8.3.2 | Wake-Up Dependency | 432 |
| 3.6.8.4 | Clock Domain Module Attributes | 437 |
| 3.6.9 | CD_L3_INIT Clock Domain | 442 |
| 3.6.9.1 | Overview | 442 |
| 3.6.9.2 | Clock Domain Modes | 443 |
| 3.6.9.3 | Clock Domain Dependency | 444 |
| 3.6.9.3.1 | Static Dependency | 444 |
| 3.6.9.3.2 | Dynamic Dependency | 444 |
| 3.6.9.3.3 | Wake-Up Dependency | 444 |
| 3.6.9.4 | Clock Domain Module Attributes | 446 |
| 3.6.10 | CD_IVAHD Clock Domain | 448 |
| 3.6.10.1 | Overview | 448 |
| 3.6.10.2 | Clock Domain Modes | 448 |
| 3.6.10.3 | Clock Domain Dependency | 449 |
| 3.6.10.3.1 | Static Dependency | 449 |
| 3.6.10.3.2 | Dynamic Dependency | 449 |
| 3.6.10.4 | Clock Domain Module Attributes | 449 |
| 3.6.11 | CD_SGX Clock Domain | 450 |
| 3.6.11.1 | Overview | 450 |
| 3.6.11.2 | Clock Domain Modes | 451 |
| 3.6.11.3 | Clock Domain Dependency | 451 |
| 3.6.11.3.1 | Static Dependency | 451 |
| 3.6.11.3.2 | Dynamic Dependency | 451 |
| 3.6.11.4 | Clock Domain Module Attributes | 451 |
| 3.6.12 | CD_EMU Clock Domain | 452 |
| 3.6.12.1 | Overview | 452 |
| 3.6.12.2 | Clock Domain Modes | 453 |
| 3.6.12.3 | Clock Domain Dependency | 454 |
| 3.6.12.3.1 | Dynamic Dependency | 454 |
| 3.6.12.4 | Clock Domain Module Attributes | 454 |
| 3.6.13 | CD_DSS Clock Domain | 454 |
| 3.6.13.1 | Overview | 454 |
| 3.6.13.2 | Clock Domain Modes | 455 |
| 3.6.13.3 | Clock Domain Dependency | 455 |
| 3.6.13.3.1 | Static Dependency | 455 |
| 3.6.13.3.2 | Dynamic Dependency | 456 |
| 3.6.13.3.3 | Wake-Up Dependency | 456 |
| 3.6.13.4 | Clock Domain Module Attributes | 457 |
| 3.6.14 | CD_L4_CFG Clock Domain | 458 |
| 3.6.14.1 | Overview | 458 |
| 3.6.14.2 | Clock Domain Modes | 459 |
| 3.6.14.3 | Clock Domain Dependency | 459 |
| 3.6.14.3.1 | Dynamic Dependency | 459 |
| 3.6.14.4 | Clock Domain Module Attributes | 459 |
| 3.6.15 | CD_L3_INSTR Clock Domain | 461 |
| 3.6.15.1 | Overview | 461 |
| 3.6.15.2 | Clock Domain Modes | 461 |

| | | |
|------------|--------------------------------------|-----|
| 3.6.15.3 | Clock Domain Dependency | 461 |
| 3.6.15.4 | Clock Domain Module Attributes | 461 |
| 3.6.16 | CD_L3_2 Clock Domain | 462 |
| 3.6.16.1 | Overview | 462 |
| 3.6.16.2 | Clock Domain Modes | 463 |
| 3.6.16.3 | Clock Domain Dependency | 463 |
| 3.6.16.3.1 | Dynamic Dependency | 463 |
| 3.6.16.4 | Clock Domain Module Attributes | 464 |
| 3.6.17 | CD_L3_1 Clock Domain | 465 |
| 3.6.17.1 | Overview | 465 |
| 3.6.17.2 | Clock Domain Modes | 465 |
| 3.6.17.3 | Clock Domain Dependency | 465 |
| 3.6.17.3.1 | Dynamic Dependency | 465 |
| 3.6.17.4 | Clock Domain Module Attributes | 466 |
| 3.6.18 | CD_EMIF Clock Domain | 466 |
| 3.6.18.1 | Overview | 466 |
| 3.6.18.2 | Clock Domain Modes | 467 |
| 3.6.18.3 | Clock Domain Dependency | 467 |
| 3.6.18.4 | Clock Domain Module Attributes | 467 |
| 3.6.19 | CD_CORTEXM3 Clock Domain | 469 |
| 3.6.19.1 | Overview | 469 |
| 3.6.19.2 | Clock Domain Modes | 469 |
| 3.6.19.3 | Clock Domain Dependency | 470 |
| 3.6.19.3.1 | Static Dependency | 470 |
| 3.6.19.3.2 | Dynamic Dependency | 470 |
| 3.6.19.4 | Clock Domain Module Attributes | 470 |
| 3.6.20 | CD_DMA Clock Domain | 471 |
| 3.6.20.1 | Overview | 471 |
| 3.6.20.2 | Clock Domain Modes | 472 |
| 3.6.20.3 | Clock Domain Dependency | 472 |
| 3.6.20.4 | Clock Domain Module Attributes | 472 |
| 3.6.21 | CD_C2C Clock Domain | 473 |
| 3.6.21.1 | Overview | 473 |
| 3.6.21.2 | Clock Domain Modes | 473 |
| 3.6.21.3 | Clock Domain Dependency | 474 |
| 3.6.21.3.1 | Static Dependency | 474 |
| 3.6.21.3.2 | Dynamic Dependency | 474 |
| 3.6.21.4 | Clock Domain Module Attributes | 474 |
| 3.6.22 | CD_CAM Clock Domain | 475 |
| 3.6.22.1 | Overview | 475 |
| 3.6.22.2 | Clock Domain Modes | 476 |
| 3.6.22.3 | Clock Domain Dependency | 476 |
| 3.6.22.3.1 | Static Dependency | 476 |
| 3.6.22.3.2 | Dynamic Dependency | 477 |
| 3.6.22.4 | Clock Domain Module Attributes | 477 |
| 3.6.23 | CD_ABE Clock Domain | 478 |
| 3.6.23.1 | Overview | 478 |
| 3.6.23.2 | Clock Domain Modes | 478 |
| 3.6.23.3 | Clock Domain Dependency | 479 |
| 3.6.23.3.1 | Wake-Up Dependency | 479 |
| 3.6.23.4 | Clock Domain Module Attributes | 481 |
| 3.6.24 | CD_L4_ALWON_CORE Clock Domain | 484 |
| 3.6.24.1 | Overview | 484 |

| | | |
|------------|--|-----|
| 3.6.24.2 | Clock Domain Modes | 484 |
| 3.6.24.3 | Clock Domain Dependency | 485 |
| 3.6.24.3.1 | Wake-Up Dependency | 485 |
| 3.6.24.4 | Clock Domain Module Attributes | 485 |
| 3.7 | Power Management Functional Description | 487 |
| 3.7.1 | PD_WKUP Description | 487 |
| 3.7.1.1 | Power Domain Modes | 487 |
| 3.7.2 | PD_DSP Description | 487 |
| 3.7.2.1 | Power Domain Modes | 488 |
| 3.7.2.1.1 | Logic and Memory Area Power Modes | 488 |
| 3.7.2.1.2 | Logic and Memory Area Power Modes Control and Status | 488 |
| 3.7.3 | PD_STD_EFUSE Description | 489 |
| 3.7.3.1 | Power Domain Modes | 489 |
| 3.7.4 | PD_MPU Description | 489 |
| 3.7.4.1 | Power Domain Modes | 490 |
| 3.7.4.1.1 | Logic and Memory Area Power Modes | 490 |
| 3.7.4.1.2 | Logic and Memory Area Power Modes Control and Status | 490 |
| 3.7.5 | PD_L4_PER Description | 491 |
| 3.7.5.1 | Power Domain Modes | 492 |
| 3.7.5.1.1 | Logic and Memory Area Power Modes | 493 |
| 3.7.5.1.2 | Logic and Memory Area Power Modes Control and Status | 493 |
| 3.7.6 | PD_L3_INIT Description | 494 |
| 3.7.6.1 | Power Domain Modes | 494 |
| 3.7.6.1.1 | Logic and Memory Area Power Modes | 494 |
| 3.7.6.1.2 | Logic and Memory Area Power Modes Control and Status | 495 |
| 3.7.7 | PD_IVAHD Description | 496 |
| 3.7.7.1 | Power Domain Modes | 496 |
| 3.7.7.1.1 | Logic and Memory Area Power Modes | 496 |
| 3.7.7.1.2 | Logic and Memory Area Power Modes Control and Status | 497 |
| 3.7.8 | PD_SGX Description | 497 |
| 3.7.8.1 | Power Domain Modes | 498 |
| 3.7.8.1.1 | Logic and Memory Area Power Modes | 498 |
| 3.7.8.1.2 | Logic and Memory Area Power Modes Control and Status | 498 |
| 3.7.9 | PD_EMU Description | 499 |
| 3.7.9.1 | Power Domain Modes | 499 |
| 3.7.9.1.1 | Logic and Memory Area Power Modes | 499 |
| 3.7.9.1.2 | Logic and Memory Area Power Modes Control and Status | 499 |
| 3.7.10 | PD_DSS Description | 500 |
| 3.7.10.1 | Power Domain Modes | 500 |
| 3.7.10.1.1 | Logic and Memory Area Power Modes | 500 |

About This Manual

FCC Warning

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

Information About Cautions and Warnings

This book may contain cautions and warnings.

CAUTION

This is an example of a caution statement.

A caution statement describes a situation that could potentially damage your software or equipment.

WARNING

This is an example of a warning statement.

A warning statement describes a situation that could potentially cause harm to you.

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

Register, Field, and Bit Calls

The naming convention applied for a call consists of:

- For a register call: `<Module name>.<Register name>`; for example: UART.UASR
- For a bit field call:
 - `<Module name>.<Register name>[End:Start] <Field name> field`; for example, UART.UASR[4:0] SPEED bit field
 - `<Field name> field <Module name>.<Register name>[End:Start]`; for example, SPEED bit field UART.UASR[4:0]
- For a bit call:
 - `<Module name>.<Register name>[pos] <Bit name> bit`; for example, UART.UASR[5] BIT_BY_CHAR bit
 - `<Bit name> bit <Module name>.<Register name>[pos]`; for example, BIT_BY_CHAR bit UART.UASR[5]

To help the reader navigate the document, each register call is hyperlinked to its register description in the register manual section. After each register description, a table summarizes all hyperlinked register calls.

To navigate in the PDF documents, see [Acrobat Reader Tips](#).

Coding Rules

The programming models or code listings follow the rules:

| Type | Definition | Example |
|-------------|--|---|
| File | Starts with the module name | PRCM_test1.c MCBSP1_init.h |
| Variable | Global variables are prefixed by "g_" Pointers are prefixed by "p" Global pointers are prefixed by "g_p" | g_SDMA_LogicalChan pAddrCounter g_pSDMA_LogicalChan |
| Function | Starts with the module name | PRCM_SetupClocks() ArmIntC_MaskInterrupts() |
| Typedef | Ends with "_t" | PRCM_Struct_t |
| Definition | Starts with the module name and is followed by the register name | #define SMS_ERR_TYPE *((volatile Uint32*)0x680080F4) #define MCBSP2_RCR1_REG *((volatile Uint32*)0x4807401C) |
| Enumeration | Starts with the module name | Typedef enum DMA_Mode_Label { INPUT_MODE OUTPUT_MODE } DMA_Mode_t; |

Flow Chart Rules

Flow charts follow the following rules:

| Shape | Name | Definition |
|---|-----------------------------------|---|
|  | Process | Any computational steps or processing function of a program; defined operation(s) causing change in value, form, or location of information |
|  | Decision | A decision or switching-type operation that determines which of a number of alternate paths is followed |
|  | Predefined process or sub-process | One or more named operations or program steps specified in a subroutine or another set of flow charts |
|  | Data or I/O | General I/O function; information available for processing (input) or recording of processed information (output) |
|  | Terminator | Terminal point in a flow chart: start, stop, halt, delay, or interrupt; may show exit from a closed subroutine |
|  | Annotation | Additional descriptive clarification, comment |
|  | On page connector (reference) | Exit to, or entry from, another part of chart in the same page |
|  | Off page connector (reference) | The flow continues on a different page. |
|  | Summing Junction | Logical AND |
|  | Or | Logical OR |
|  | Parallel mode (ISO) | Beginning or end of two or more simultaneous operations |
|  | Flow Line | Lines indicate the sequence of steps and the direction of flow. |

Acrobat Reader Tips

Acrobat includes two methods to search for words in a PDF:

- The Find toolbar provides a basic set of options to locate a word in the current PDF.
- The Search window lists words or partial words that match your text in the current PDF.

These guidelines apply to Acrobat Reader 5.x, 6.0, and 7.0.

For more information on Acrobat Reader search features, see the Adobe Reader Help.

To search for words in a document using the Find dialog box:

1. Open the document.
2. To display the Find toolbar, right-click in the toolbar area and select Find.
3. In the Find box, type the word, words, or partial words for which you want to search.
4. From the Find Options menu, select options as desired.
5. To view each search result, click the Find toolbar, the Find Previous button, or the Find Next button to go backward or forward through the document.

To search for words in a document using the Search PDF window:

1. Open the document.
2. Click the Search button on the File toolbar or right-click on your document and select Search.
3. Type the word, words, or part of a word for which you want to search.
4. Click Search.
5. The results appear in page order and, if applicable, show a few words of context. Each result displays an icon to identify the type of occurrence. All other searchable areas display the Search Result icon.
6. To display the page that contains a search result, click an item in the Results list. The occurrence is highlighted.
7. To navigate to the next result, choose Edit > Search Results > Next Result (or Ctrl+G).
8. To navigate to the previous result, choose Edit > Search Results > Previous Result (or Shift+Ctrl+G).

Navigate through your previous view

To retrace your path within an Adobe PDF document:

- For the previous view: Choose View > Go To > Previous View or Alt+Left Arrow.
- For the next view: Choose View > Go To > Next View or Alt+Right Arrow. The Next View command is available only if you have chosen Previous View.

If you view the PDF document in a browser, use options on the Navigation toolbar to move between views.

- Right-click the toolbar area, and then choose *Navigation*.
- Click the Go To Previous View button or the Go To Next View button.

NOTE: This navigation tip is useful to return to your previous view after clicking on a register call hyperlink.

Chapters impacted by the update to version E:

- Chapter 3: Power, Reset, and Clock Management

Introduction

This chapter introduces the features, subsystems, and architecture of the OMAP4470 high-performance multimedia device.

| Topic | Page |
|---|------|
| 1.1 Overview | 262 |
| 1.2 Environment | 263 |
| 1.3 Description | 264 |
| 1.4 Package-On-Package Concept | 275 |
| 1.5 OMAP4470 Family and Device Identification | 276 |

1.1 Overview

The OMAP4470 high-performance multimedia application device is based on enhanced OMAP™ architecture and uses 45-nm technology.

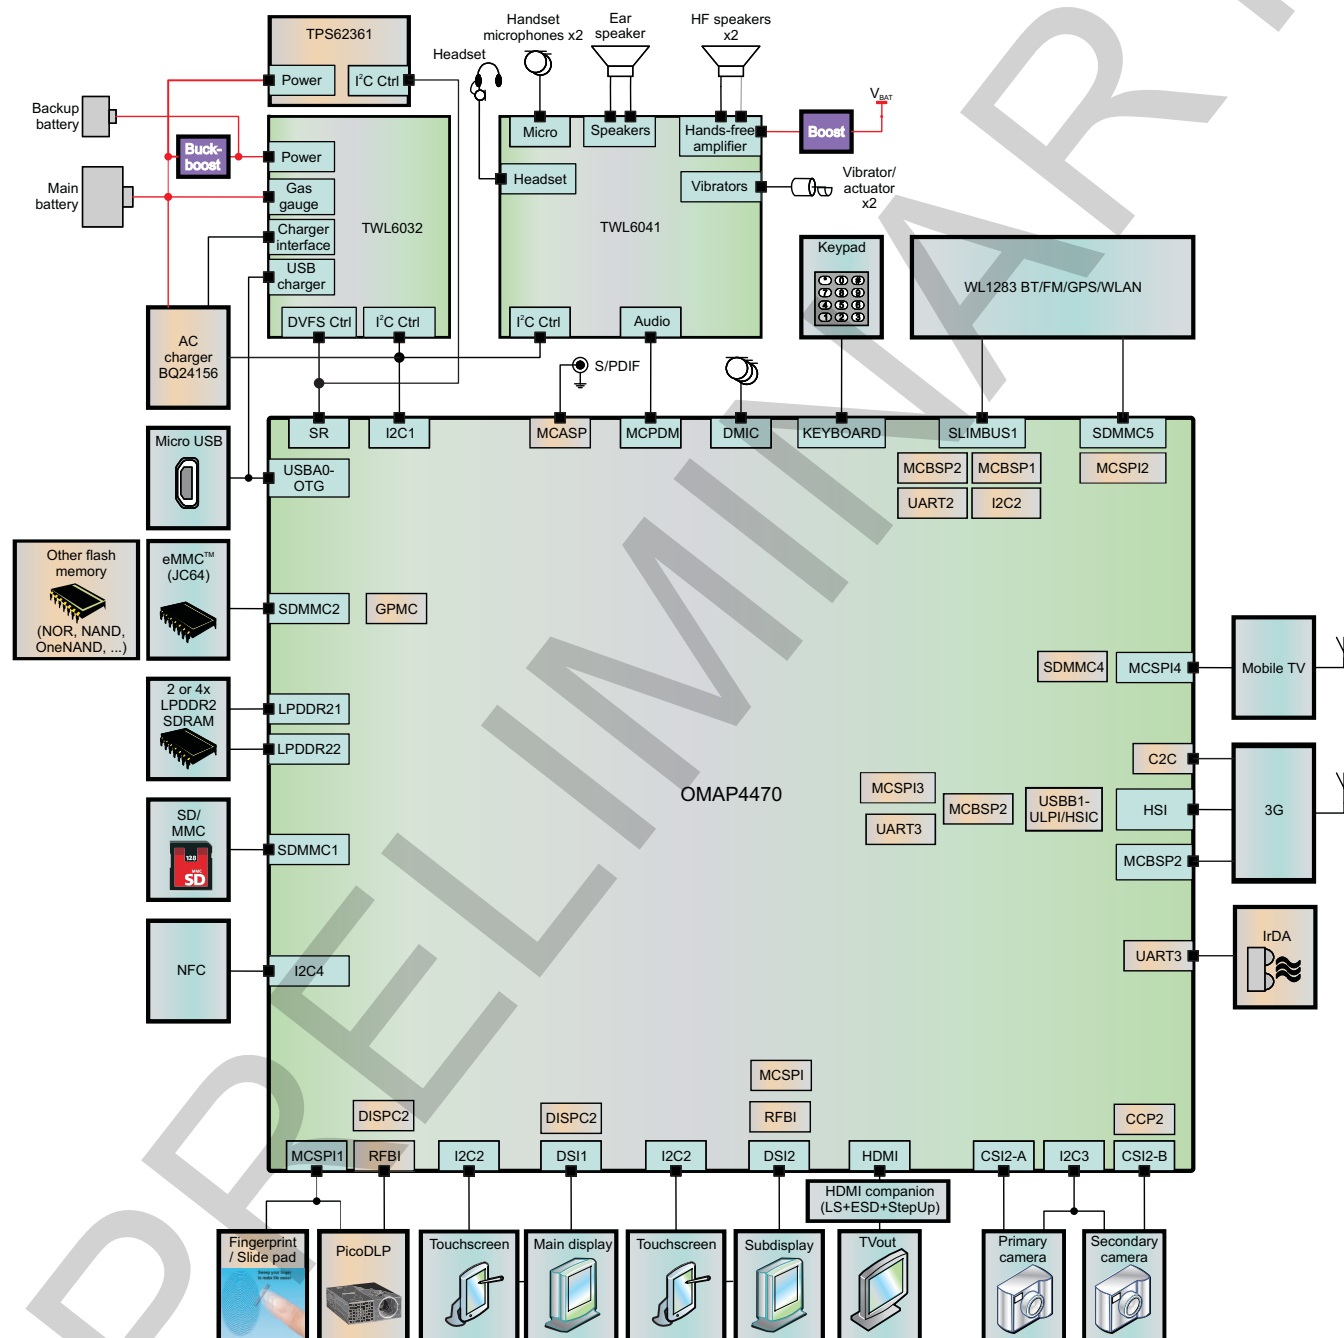

- The architecture is designed to provide best-in-class video, image, and graphics processing for 2.5/3G wireless terminals and high-performance personal digital assistants (PDAs). For that purpose, the device supports the following functions:
 - Streaming video up to full high definition (HD) (1920 × 1080, 30 fps)
 - 2-dimensional (2D)/3-dimensional (3D) mobile gaming
 - Video conferencing
 - High-resolution still image (up to 16 MP)
- The device supports high-level operating systems (OSs) such as:
 - Linux®
 - Palm OS®
 - Symbian OS™
 - Windows™ CE, WinMobile™
- The device is composed of the following subsystems:
 - Cortex™-A9 microprocessor unit (MPU) subsystem, including two ARM® Cortex-A9 cores
 - Digital signal processor (DSP) subsystem
 - Image and video accelerator high-definition (IVA-HD) subsystem
 - Cortex-M3 MPU subsystem, including two ARM Cortex-M3 microprocessors
 - Display subsystem
 - Audio back-end (ABE) subsystem
 - Imaging subsystem (ISS), consisting of image signal processor (ISP) and still image coprocessor (SIMCOP) block
 - 2D/3D graphic accelerator subsystems (SGX and BB2D)
 - Emulation (EMU) subsystem
- The device includes state-of-art power-management techniques required for high-performance mobile products.
- Comprehensive power management is integrated into the device.
- The device also integrates:
 - On-chip memory
 - External memory interfaces
 - Memory management
 - Level 3 (L3) and level 4 (L4) interconnects
 - System and connecting peripherals

1.2 Environment

This section provides an overview of the OMAP environment. The device is associated with power and audio integrated circuits (ICs). TI provides a global solution with the TWL6032/TWL6041 devices.

Figure 1-1 is an overview of a nonexhaustive environment for the high-tier OMAP4470 device.

Figure 1-1. OMAP4470 High-Tier Environment

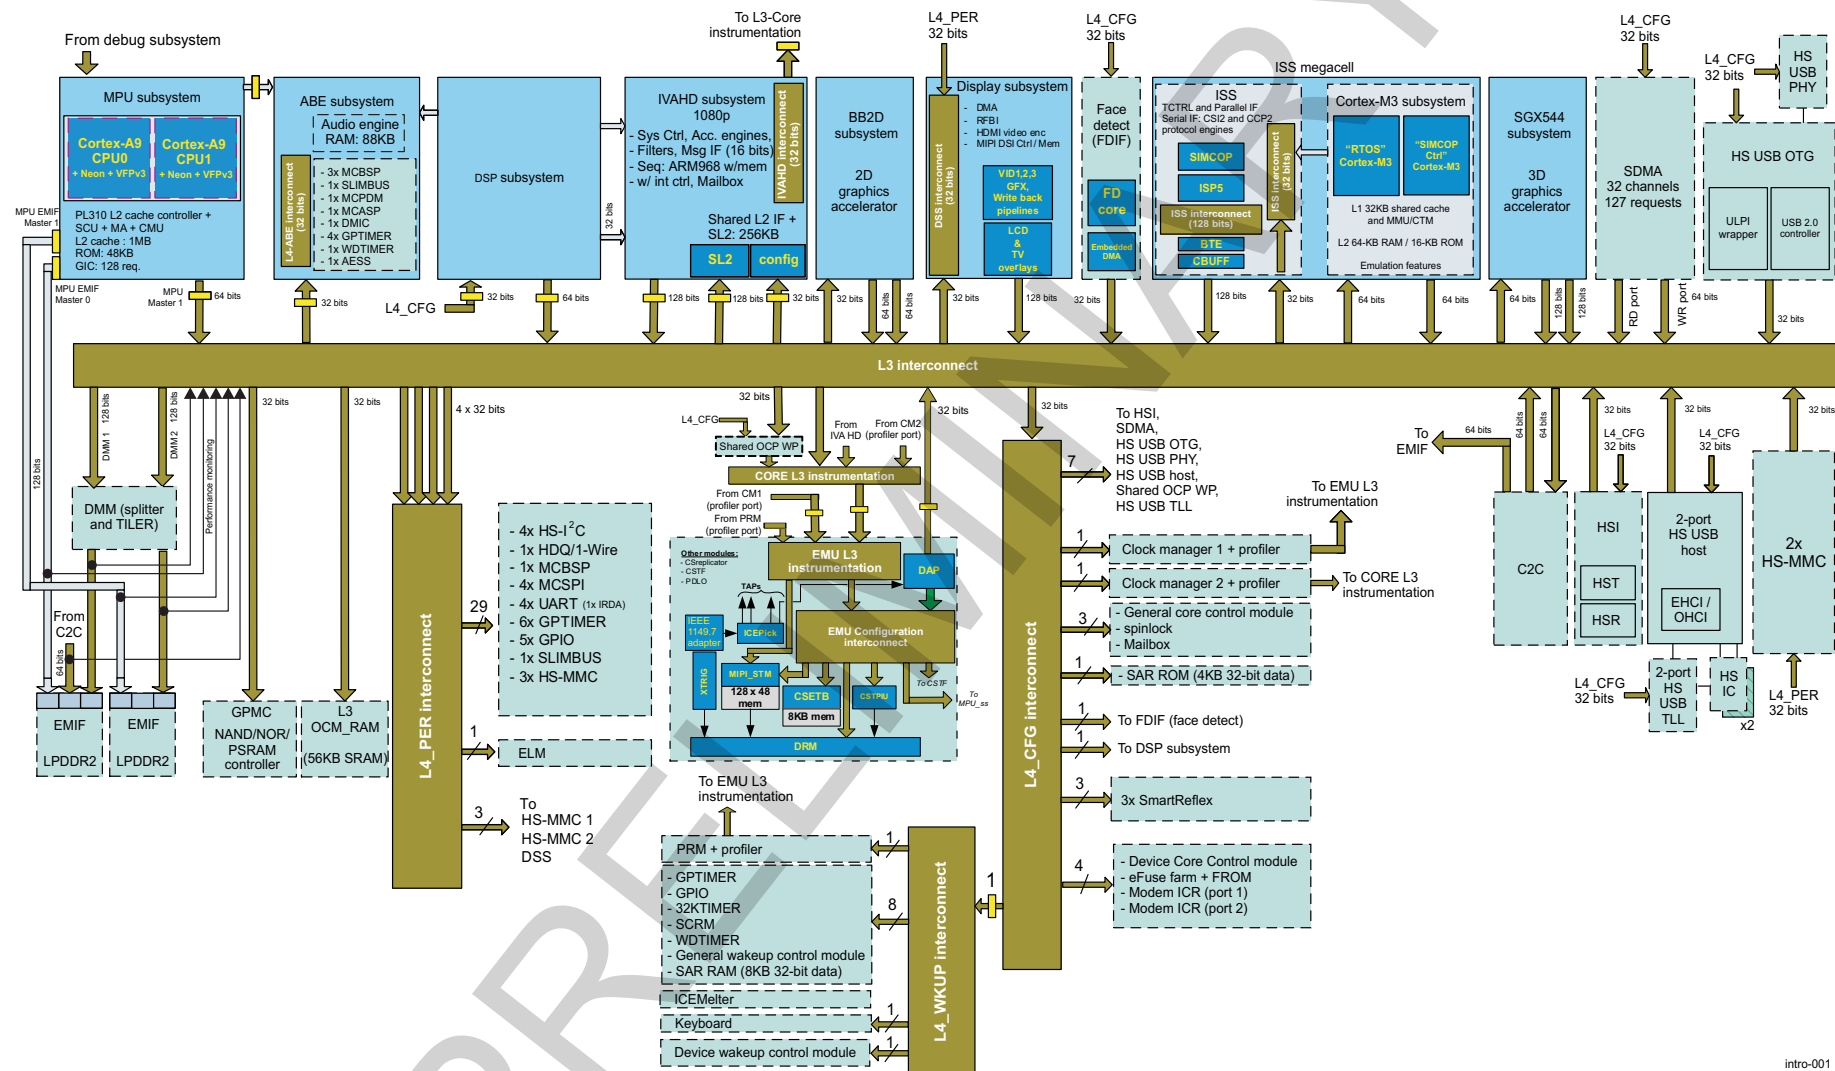

intro-002

1.3 Description

The device is offered in a 547-ball, $12 \times 12 \times 0.73$ -mm, 0.4-mm (bottom) ball pitch package. Some balls are available at the top of the device to allow memory stacking.

[Figure 1-2](#) is the block diagram of the OMAP4470 device.

Figure 1-2. OMAP4470 Block Diagram

intro-001

1.3.1 Cortex-A9 MPU Subsystem Description

The Cortex-A9 MPU subsystem integrates the following submodules:

- ARM Cortex-A9 MPCore
 - Two ARM Cortex-A9 central processing units (CPUs)
 - ARM Version 7 ISA™: Standard ARM instruction set plus Thumb®-2, Jazelle® RCT and Jazelle DBX Java™ accelerators
 - Neon™ SIMD coprocessor and VFPv3 per CPU
 - Interrupt controller (Cortex-A9 MPU INTC) with up to 128 interrupt requests
 - One general-purpose timer and one watchdog timer per CPU
 - Debug and trace features
 - 32-KB instruction and 32-KB data level 1 (L1) caches per CPU
- Shared 1-MB level 2 (L2) cache
- 48-KB bootable ROM
- Local power, reset, and clock management (PRCM) module
- Emulation features
- Digital phase-locked loop (DPLL)

1.3.2 IVA-HD Subsystem Description

The IVA-HD subsystem is a set of video encoder/decoder hardware accelerators. It supports the following features:

- Video up to 1080p at 30 fps
- Slow-motion camcorder
- Triple play (HD, SD, and JPEG capture)
- Real-time transcoding up to 720p
- Video conferencing up to 720p

The IVA-HD subsystem is composed of:

- Improved motion estimation acceleration engine (iME3), which is used in encode processing
- Improved loop filter acceleration engine (iLF3), which performs deblocking filtering
- Improved sequencer (iCONT1) based on the ARM968E-S™ microcontroller. It includes memory and INTC and is used as a primary sequencer.
- Intraprediction estimation engine (iPE3). It is used in encode processing.
- Calculation engine (CALC3), which performs transform and quantization calculations
- Motion compensation engine (MC3), which creates an interprediction macroblock with given motion vectors and modes from the reference data
- Entropy coder/decoder (ECD3), which uses Huffman and arithmetic codes during the process of encoding and decoding the stream
- Video DMA processor (iCONT2), which is also based on the ARM968E-S microcontroller and can be used as secondary sequencer
- Video DMA engine (vDMA), which is a DMA engine for data transmission between external memories and shared L2 memory
- Synchronization box (SYNCBOX) embedded in each hardware accelerator and in both iCONTs
- Mailbox for communication between IVA-HD and external to it processors (DSP, Cortex-A9, and Cortex-M3)
- Shared L2 interface and memory
- Video local interconnect for connection between the submodules of the IVA-HD, and between the IVA-HD and DSP subsystems
- IVA-HD system control module (SYSCTRL), which controls the clocks in the subsystem and PRCM handshaking

The IVA-HD subsystem can process three data formats for internal data: picture or slice, macroblock header, and residual data.

The IVA-HD supports the following formats:

- MPEG-1/-2/-4 such as MPEG-2 MP, ML, and MPEG-4 as SP/ASP
- Divx 5.02 and above
- Sorenson Spark (decode)
- H.263 P0 (encode and decode) and P3 (decode)
- H.264 Annex G (scalable baseline profile up to 720p)
- H.264 BL/MP/HP
- H.264 Annex H (partial)
- Stereoscopic video
- JPEG (encode/decode)
- VC-1 SP/MP/AP
- AVS-1.0
- RealVideo® 8/9/10 (decode only)
- On2® VP6.2/VP7 (decode only)

1.3.3 Cortex-M3 MPU Subsystem Description

The Cortex-M3 MPU subsystem includes the following components:

- Two Cortex-M3 CPUs: One for SIMCOP control, and the other for RTOS, ISP, and display subsystem control
- ARMv7-M and Thumb-2 instruction set architecture
- Dedicated INTC with up to 64 physical interrupt events
- Two-level memory subsystem hierarchy:
 - L1
 - 32-KB shared cache memory
 - L2 ROM + RAM
 - 64-KB RAM
 - 16-KB bootable ROM
- Cortex-M3 system bus directly connected to the ISS interconnect
- MMU for address translation
- Integrated power management
- Emulation feature embedded in the Cortex-M3

1.3.4 Display Subsystem Description

The display subsystem provides the control signals required to interface the OMAP system memory frame buffer (SDRAM) directly to the displays. It supports hardware cursor, independent gamma curve on all interfaces, multiple-buffer, and programmable color phase rotation (CPR). The display subsystem allows low-power display refresh and arbitration between normal and low-priority pipelines.

The display subsystem consists of the following sections:

- Display controller: It can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into the system memory. It supports the following components:
 - Three video pipelines, one graphic pipeline, and one write-back pipeline. The graphic pipeline supports pixel formats such as: ARGB16-4444, RGB16-565, ARGB16-1555, ARGB32-8888, RGBA32-8888, RGB24-888, and BITMAP (1, 2, 4, or 8 bits per pixel). It allows selection of the color-depth expansion.
 - Write-back pipeline uses poly-phase filtering for independent horizontal and vertical resampling

(upsampling and downsampling). It allows programmable color space conversion of RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, or YUV4:2:0-NV12, and selection of color-depth reduction from RGB24 to RGB16.

- Two LCD outputs, each one with dedicated overlay manager, for support of passive matrix color and monochrome displays (up to 8-bit interface) and active matrix color displays (up to 24-bit interface). Secondary LCD output is available through parallel CMOS interface for MIPI®-DPI 1.0 support.
- One TV output with dedicated overlay manager
- Own direct memory access (DMA) engine
- Remote frame buffer interface (RFBI) module:
 - Support for MIPI-DBI protocol
 - 8-/9-/16-bit parallel interface
 - Programmable pixel modes and output formats
- Two MIPI display serial interfaces (DSIs) with the following main features:
 - Support for MIPI-DSI (four data-lane complex inputs/outputs (I/Os) for DSI1 and two data-lane complex I/Os for DSI2)
 - Support for video mode and command mode
 - Data interleaving support for synchronous and asynchronous streams
 - Bidirectional data link support
- High-definition multimedia interface (HDMI) encoder with the following main features:
 - HDMI 1.3, HDCP 1.2, and DVI 1.0 compliant
 - Including support for the 3D Stereoscopic frame-packing formats of HDMI v1.4 standard (720p, 50 Hz, 720p, 60 Hz and 1080p, 24 Hz)
 - Deep-color mode support (10-bit for up to 1080p and up to 12-bit for 1080i/720p)
 - Support for uncompressed multichannel audio
 - Integrated high-bandwidth digital content protection (HDCP) encryption engine for transmitting protected audio and video content
 - Integrated transition minimized differential signaling (TMDS) and TERC4 encoders for data island support

1.3.5 ABE Subsystem Description

The ABE subsystem handles audio processing for the application. It manages the audio and voice streams between the Cortex-A9 MPU subsystem and/or DSP, and the physical interfaces.

The ABE subsystem allows:

- Buffering of audio samples
- Mixing audio with voice downstream and/or microphone upstream (sidetone)
- Postprocessing of equalization, 3D effects, bass-boost

The ABE subsystem consists of:

- Audio engine (AE) subsystem, which performs real-time signal processing such as:
 - Muxing and mixing voice and data streams
 - Postprocessing operations such as sampling rate conversion, volume control, 3D effects
 - Execution of whole data transfers in the ABE subsystem using audio traffic controller (ATC)

The AE subsystem includes an AE and has the following on-chip memories available: 64-KB data memory (DMEM); 6-KB coefficient memory (CMEM); and 18-KB sample memory (SMEM).

The ATC manages the data movement in the ABE subsystem and is in charge of interrupt generation to the DSP and Cortex-A9 MPU subsystems.

- Four general-purpose timers (GPTIMERS) and one watchdog timer (WDTIMER)
- Peripheral interfaces:

- Three multichannel buffered serial ports (McBSPs) for inter-IC sound (I2S™) external connectivity
- One multichannel audio serial port (McASP) supporting Sony/Philips digital interconnect format (S/PDIF) output
- One MIPI SLIMbus interface to support new generations of MIPI-compliant components
- One digital microphone (DMIC) for three stereo digital microphones support
- One multichannel pulse-density modulation (McPDM) interface, which ensures communication with the TWL6041 audio companion chip
- Internal interfaces for connection with the DSP and Cortex-A9 MPU subsystems and other modules in the device
- Dedicated power domain (ABE power domain)

1.3.6 ISS Description

The ISS processes data coming from the image sensor, memory, and IVA-HD subsystem. The ISS is responsible for multimedia applications such as camera viewfinders; video recording with up to 1080p at 30 fps; digital zoom; and still image processing, including image capture up to 16 MP with digital zoom and rotation. The ISS supports a pixel throughput of up to 200 MP/s. It assures good performance with sensors up to 16 MP and more (higher resolution can be achieved through multiple passes). The ISS can implement third-party algorithms for further flexibility when working with image sensors.

The ISS consists of:

- The ISP, which deals with on-the-fly or memory-to-memory data processing. It allows data collection for autoexposure, autowhite balance, autofocus, resizing, and histogram generation. The ISP consists of:
 - Image pipe interface (IPIPEIF) for synchronization signals (HD, VD) for the ISIF, IPIPE, RSZ, and hardware 3A (H3A) modules, data transfer from video port, SDRAM, ISIF, and various pixel data manipulation functions.
 - Image pipe (IPIPE) front-end and back-end modules for raw-data processing and RGB and YUV data processing, respectively. They support:
 - Sensor data linearization for dynamic range extension
 - Programmable 2D lens shading compensation correction
 - Black-level compensation
 - Gamma correction
 - RGB color correction
 - RGB-to-YUV4:2:2 color conversion
 - 3D look up table (LUT) for color correction
 - 2D edge enhancement
 - False Chroma suppression
 - H3A for autowhite balance, autoexposure, and autofocus
 - Pattern generator (PG) for internal test-data generation. It provides the ability to test some of the ISP submodules without the use of an external image sensor.
 - Two independent resizers, which allow YUV4:2:2 to YUV4:2:0 planar Chroma filtering and downsampling. The resizers support input and output flows with up to 200 MP/s, and memory-to-memory rescaling in the range $\times 1/4096$ scale down, and $\times 20$ scale up.
 - Image sensor interface (ISIF) can process the incoming data and supports the following main functions:
 - Sensor data linearization
 - Supports VGA read out mode
 - Color space conversion
 - Digital clamp with horizontal/vertical offset drift compensation
 - Vertical line defect correction

- Programmable 2D-matrix lens shading correction
- 10-to-8 bits A-Law compression table inside
- Buffer logic (BL), which processes and manages the requests to the module and memory subsystem
- Peripheral serial interfaces for connection with sensors and memories:
 - Two PHYs, CSIPHY1 and CSIPHY2, for physical connection to external sensors
 - Peripheral serial interfaces CSI2-A and CSI2-B/CCP2 for image data transfer from sensors to memory or ISP
- Peripheral 16-bit parallel interface, BT656 and SYNC mode
- SIMCOP module for memory-to-memory operation; JPEG encode/decode hardware acceleration; high-ISO filtering; block-based rotation; warping and fusion; and general-purpose imaging acceleration. The SIMCOP includes the following main submodules:
 - Two imaging extension (iMX) modules – programmable image and video processing engines
 - Noise filter 2 (NSF2) – for advanced noise filtering and edge-enhancement
 - Variable-length coder/decoder for JPEG (VLCDJ) module
 - Discrete cosine transform (DCT) module
 - Lens distortion correction (LDC) module
 - Rotation accelerator (ROT) engine
 - Hardware sequencer, which offloads sequencing tasks from the MPU
 - Shared buffers/memories
 - DMA controller
- Timing control module for CAM global reset control, CAM flash strobe, and CAM shutter
- System interfaces and interconnects comprising:
 - Two configuration interfaces
 - One 128-bit master data interface
 - Internal ISS interconnects for image data and configuration
 - On-chip RAM interface
 - Circular buffer (CBUFF) and burst-translation engine (BTE) for efficient communication with external memory (SDRAM/TILER support)

1.3.7 3D Graphics Accelerators Description

The 3D graphics accelerator subsystem is based on POWERVR® SGX544 core from Imagination Technologies. It supports phone/PDA and hand-held gaming applications. The SGX can process different data types simultaneously, such as: pixel data, vertex data, video data, and general-purpose data processing.

The SGX subsystem has the following features:

- API support for industry standards:
 - OGL-ES 1.1 and 2.0
 - OpenVG™ 1.1
 - OpenCL™-EP 1.1
 - Direct3D™ Feature Level 9.3
- Tile-based deferred rendering architecture reduces external bandwidth to SDRAM.
- Second-generation Universal Scalable Shader Engines (USSE2™):
 - Multithreaded engine incorporating vertex and pixel shader functionality
 - Automatic load balancing of vertex and pixel processing tasks
- Present and texture load accelerator (PTLA):
 - Enables to move, rotate, twiddle, and scale texture surfaces

- Supports RGB, ARGB, YUV4:2:2, and YUV4:2:0 surface formats
- Supports bilinear upscale
- Supports source color key
- Fully virtualized memory addressing for OS in a unified memory architecture:
 - MMU
 - Up to 4-GB virtual address space

1.3.8 2D Graphics Accelerators

The 2D graphics accelerator (BB2D) subsystem is based on the GC320 2D core from Vivante Corporation and has the following features:

- API support:
 - OpenWF™, DirectFB
 - GDI/DirectDraw
 - Adobe® Flash®
- BB2D architecture:
 - BitBlt and StretchBlt
 - DirectFB hardware acceleration
 - ROP2, ROP3, ROP4 full alpha blending and transparency
 - Clipping rectangle support
 - Alpha blending includes Java 2 Porter-Duff compositing rules
 - 90-, 180-, 270-degree rotation on every primitive
 - YUV-to-RGB color space conversion
 - Programmable display format conversion with 14 source and 7 destination formats
 - High-quality 9-tap, 32-phase filter for image and video scaling at 1080p
 - Monochrome expansion for text rendering
 - 32 K × 32 K coordinate system

1.3.9 Face Detect Module Description

The face detect module is a stand-alone module that performs face detection and tracking on a picture stored in the SDRAM memory. It communicates with the Cortex-A9 MPU, DSP, and Cortex-M3 MPU subsystems.

Face detect is typically used on:

- Video encoding
- Face-based priority auto-focusing
- Red-eye removal

The face detect module comprises:

- Face detection core with embedded DMA engine for data memory access
- RAM and ROM memories
- L3 and L4 port interfaces

1.3.10 On-Chip Debug Support Description

The on-chip debug support has the following features:

- Multiprocessor debugging lets users control multiple CPU cores embedded in the device, such as:
 - Global starting and stopping of individual or multiple processors
 - Each processor can generate triggers that can be used to alter the execution flow of other processors

- System clocking and power down
- Interconnection of multiple devices
- Channel triggering
- Target debugging, using IEEE 1149.1 (JTAG®), or IEEE 1149.7 (complementary superset of JTAG) port
- Reduction of power consumption in normal operating mode
- Real-time software trace allows the OMAP software masters to transmit trace data from OS processes or tasks on 256 different channels.

The debug subsystem includes:

- IEEE 1149.7 adapter
- Generic TAP for emulation and test control (ICEPick-D™)
- Debug access port (DAP)
- Processor trace subsystem
- System trace subsystem
- EMU configuration interconnect
- Cross-triggering unit (XTRIGGER)
- Debug resource manager (DRM)

ICEMelter:

- Controls the wake-up and power-down of the EMU power domain

CORE instrumentation interconnect:

- Initiator ports:
 - L3 interconnect (for software instrumentation and performance probes)
 - OCP-WP
 - IVA-HD instrumentation (HWA profiling)
 - CM2 instrumentation
- Target port:
 - EMU instrumentation interconnect

OCP watch-point (OCP-WP):

- Monitors L3 interconnect transaction when target transaction attributes match the user-defined attributes or trigger on external debug event
- Only one instance, shared among the following L3 targets:
 - GPMC
 - L4_PER
 - L4_CFG

Power management events profiler (PM instrumentation)

Clock management events profiler (CM instrumentation)

Statistics collector (performance probes)

1.3.11 Power, Reset, and Clock Management Description

The PRCM module allows efficient control of clocks and power according to the required performance, and reduction of power consumption.

The PRCM module is divided into:

- Power and reset management (PRM), based on the SmartReflex™ framework with the following features:
 - Dynamic clock gating

- Dynamic voltage and frequency scaling (DVFS)
- Dynamic power switching (DPS)
- Static leakage management (SLM)
- Adaptive body bias (ABB)
- Retention-till-access (RTA) for memories
- Clock management 1 (CM1) for clock generation, distribution, and management for the Cortex-A9 MPU, ABE, and CORE always-on power domains. The clock management allows reduction of dynamic consumption.
- Clock management 2 (CM2) for clock generation, distribution, and management for other modules

1.3.12 On-Chip Memory Description

The on-chip memory is divided into L3 OCM RAM, SAR ROM, SAR RAM, and memories in the subsystems (Cortex-A9, Cortex-M3, ABE, and IVA-HD).

- The L3 OCM RAM consists of 56 KB of on-chip SRAM.
- The save-and-restore (SAR) ROM consists of 4 KB and contains a linked list of descriptors used by the system DMA (sDMA).
- The SAR RAM consists of 8 KB divided into four blocks. It is used as context-saving memory when the device goes into off mode.

1.3.13 Memory Management Description

The memory management is performed from:

- sDMA controller with up to 127 requests, 32 prioritizable logical channels, and 256 × 64-bit FIFO
- Dynamic memory management (DMM) module, which performs global address translation, address rotation (tiling), and access interleaving

1.3.14 External Memory Interface Description

There are two main interfaces for connection to external memories: general-purpose memory controller (GPMC) and dual-channel SDRAM controller (external memory interface [EMIF]).

The GPMC supports:

- Asynchronous SRAM memories
- Asynchronous/synchronous NOR flash memories
- NAND flash memories
- Pseudo-SRAM devices

The two EMIFs allow:

- Connection between the device and LPDDR2-SDRAM memories. Support two CSs per EMIF controller.
- PHY is the DDR physical interface, which implements data-rate conversion in compliance with LPDDR2 JEDEC requirements.
- Memory density up to 8 Gbits supported per CS. Total address space is limited to 2GB = 16 Gbits

1.3.15 System and Connection Peripherals

The OMAP device supports a comprehensive set of peripherals to provide flexible and high-speed (HS) interfacing and on-chip programming resources.

1.3.15.1 System Peripherals

- Seven general-purpose timers (GPTIMER)
- One watchdog timer (WDTIMER)
- One 32-kHz synchronization timer (32KTIMER)

- System control module, which contains registers for the following functions:
 - Static device configuration
 - Debug and observability
 - Status
 - Pad configuration
 - I/O configuration
 - eFuse logic
 - Analog function control
 - System boot decoding logic
- System mailbox with eight mailbox message queues
- One SPINLOCK module with 32 hardware semaphores, which can service tasks between the Cortex-A9 MPU, DSP, and Cortex-M3 MPU subsystems
- One chip-to-chip (C2C) interface, which services the communication between the OMAP device and external devices

1.3.15.2 Connection Peripherals

- Three universal asynchronous receiver/transmitter (UART) modules as serial-communication interfaces
- One UART + IrDA SIR up to FIR + TV remote control interface (CIR)
- McBSP module to provide full-duplex serial communication between the OMAP device and other applications chips and codecs
- Five HS I²C™ controller modules; four of them are general-purpose modules with rates up to 3.4 Mbps, and the fifth one, in the PRCM module, performs dynamic voltage control and power sequencing with an external power IC.
- HDQ™/ 1-Wire® – Benchmarq HDQ and Dallas Semiconductor 1-Wire protocols interface
- Two HS MMC/SD/SDIO modules with 8-bit data bus interface, that can act as an initiator on L3 interconnect thanks to an embedded DMA
- Three HS MMC/SD/SDIO modules with 4-bit data bus interface
- Six general-purpose input/output (GPIO) modules with 32 I/Os each
- One keyboard controller, which supports up to 9 × 9 matrix keypads
- One MIPI SLIMbus interface
- Four multichannel serial peripheral interface (MCSPI) modules
- One HS universal serial bus (USB) on-the-go (OTG) module with embedded PHY, compliant with the USB2.0 (up to 480 Mbps) standard for HS functions and with the OTG supplement
- One HS multiport USB host module, which can be used for interchip connection or with an off-chip transceiver. It is compliant with the USB2.0 standard. The USB host module allows communication with USB peripherals with data rates up to 480 Mbps for HS, up to 12 Mbps for full-speed, and up to 1.5 Mbps for low-speed.
- One MIPI high-speed synchronous serial interface (HSI) module with two full-duplex serial communication interfaces. It is used for communication between the OMAP device and an external device, with data rates up to 192 Mbps for transmission, and up to 225 Mbps for reception. The MIPI HSI supports 16 logical channels on each destination (RX/TX).

1.4 Package-On-Package Concept

The OMAP4470 die uses flip-chip technology. The OMAP4470 package-on-package (POP) device supports memory stacking using a POP implementation.

The OMAP4470 die provides two LPDDR2 interfaces. Because each interface supports up to two chip-selects (CSs), up to four LPDDR2 memory dies are supported. Those interfaces are available only on device top ball out.

The two stacked memory packages are directly connected to the two LPDDR2 EMIF interfaces of the OMAP4470 die.

Figure 1-3 shows the concept of the POP solution, and Figure 1-4 shows stacked memory package on the POP device.

Figure 1-3. POP Concept

intro-003

Figure 1-4. Stacked Memory Package on the POP Device

intro-004

Two types of LPDDR-SDRAM memories are supported in the POP package: S4 and S2, with total size up to 2 GB and 32-bit data width.

The POP device includes feedthroughs. The feedthroughs are defined from the bottom ball-grid array (BGA) to the stacked memory. The purpose of some of the feedthroughs is to provide power supply to the stacked memories.

1.5 OMAP4470 Family and Device Identification

The OMAP4470 family is composed of the following devices:

- OMAP4470-1300
- OMAP4470-1500

Table 1-1 describes the identification registers.

The identification registers include the data registers listed in Table 1-2 and Table 1-3. These registers are read-only accessed ports that are programmed into eFuses FARM FROM.

Table 1-1. Device Identification Registers

| Register Name | Alias Name | Physical Address | Address Offset | Size |
|--------------------------|----------------|------------------|----------------|------|
| STD_FUSE_DIE_ID_0[31:0] | DIE_ID[31:0] | 0x4A00 2200 | 0x200 | 32 |
| ID_CODE[31:0] | ID_CODE[31:0] | 0x4A00 2204 | 0x204 | 32 |
| STD_FUSE_DIE_ID_1[31:0] | DIE_ID[63:32] | 0x4A00 2208 | 0x208 | 32 |
| STD_FUSE_DIE_ID_2[31:0] | DIE_ID[95:64] | 0x4A00 220C | 0x20C | 32 |
| STD_FUSE_DIE_ID_3[31:0] | DIE_ID[127:96] | 0x4A00 2210 | 0x210 | 32 |
| STD_FUSE_PROD_ID_0[31:0] | PROD_ID[31:0] | 0x4A00 2214 | 0x214 | 32 |
| STD_FUSE_PROD_ID_1[31:0] | PROD_ID[63:32] | 0x4A00 2218 | 0x218 | 32 |

Table 1-2. STD_FUSE_DIE_ID

| Field | Alias Name | Bits | Value |
|-------------------------|----------------|------|-----------------------|
| STD_FUSE_DIE_ID_0[31:0] | DIE_ID[31:0] | – | Single die identifier |
| STD_FUSE_DIE_ID_1[31:0] | DIE_ID[63:32] | – | Single die identifier |
| STD_FUSE_DIE_ID_2[31:0] | DIE_ID[95:64] | – | Single die identifier |
| STD_FUSE_DIE_ID_3[31:0] | DIE_ID[127:96] | – | Single die identifier |

The product type can be read in the value of the RAMP_SYSTEM bit field of the Table 1-3 register. The silicon revision can be read in the value of the VERSION bit field of the Table 1-3 register.

Table 1-3. ID_CODE

| Field | Bits | Value | Comment |
|----------------|-------------|----------------|----------------------------|
| ID_CODE[31:28] | VERSION | See Table 1-5. | Revision number |
| ID_CODE[27:12] | RAMP_SYSTEM | See Table 1-4. | Ramp system number |
| ID_CODE[11:1] | TI_IDM | 0x17 | Manufacturer identity (TI) |
| ID_CODE[0] | – | 0x1 | Always set to 1 |

The ramp system number is hardcoded in the design. Table 1-4 lists the ramp system number values, Table 1-5 lists the revision number values, and Table 1-6 lists ID_CODE values.

Table 1-4. Ramp System Number Values

| Silicon Type | Field | Value |

PRELIMINARY

Memory Mapping

This chapter describes the memory mapping in the device.

| Topic | Page |
|---|------|
| 2.1 Introduction | 280 |
| 2.2 L3 Memory Space Mapping | 282 |
| 2.3 L4 Memory Space Mapping | 285 |
| 2.4 Dual Cortex-M3 Subsystem Memory Space Mapping | 295 |
| 2.5 DSP Subsystem Memory Space Mapping | 296 |
| 2.6 Display Subsystem Memory Space Mapping | 298 |

2.1 Introduction

The Cortex™-A9 microprocessor unit (MPU) has a 32-bit address port, which allows it to handle a 4-GB space divided into several regions, depending on the target type.

The memory map comprises the following features that are shared among the initiators (for example, the Cortex-A9 MPU subsystem or the image and video accelerator [IVA-HD] subsystem).

- Memory space: General-purpose memory controller (GPMC)
- Dynamic memory management (DMM) controller
- Register spaces: Level 3 (L3) and level 4 (L4) interconnects
- Dedicated spaces: IVA-HD subsystem, graphic accelerator (SGX), etc.

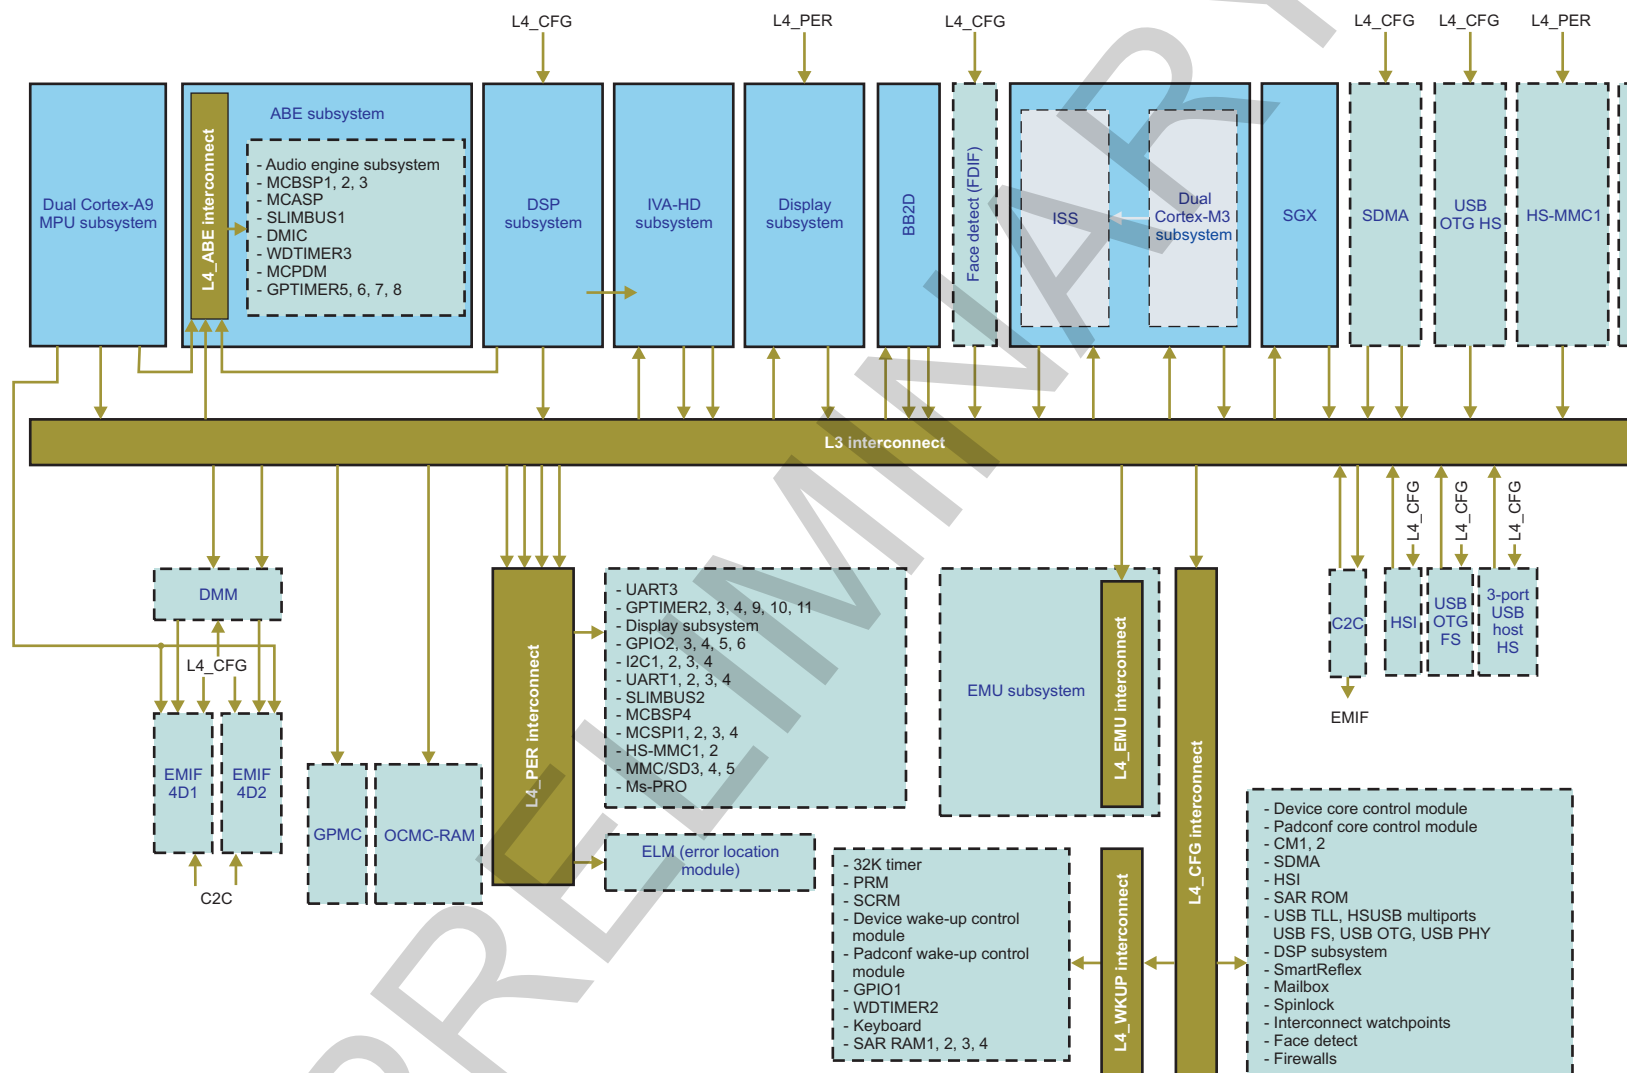

The GPMC and DMM are dedicated to memory connection. The GPMC is used for NOR/NAND flash and static RAM (SRAM) memories. The DMM is used for synchronous dynamic random access memory (SDRAM) memories, such as regular SDR (single-data rate)-SDRAM or mobile DDR (double-data rate)-SDRAM. For more information, see [Section 16.2, *Dynamic Memory Manager*](#), and [Section 16.3, *EMIF Controller*](#).

The L3 interconnect allows the sharing of resources, such as peripherals and external or on-chip memories, among all the initiators of the platform. The L4 interconnects control access to the peripherals.

Transfers across the platform between initiators and targets are physically conditioned by the chip interconnect and can be logically conditioned by firewalls. For more information about the intercommunication (L3 and L4 interconnects) and protection mechanisms implemented in the device, see [Section 14.2, *L3 Interconnect*](#), and [Section 14.3, *L4 Interconnects*](#).

[Figure 2-1](#) shows the interconnect of the device and the main modules and subsystems in the platform.

Figure 2-1. Interconnect Overview

2.2 L3 Memory Space Mapping

The memory space system is hierarchical: level 1 (L1), level 2 (L2), L3, and L4. L1 and L2 are memories in the Cortex-A9 MPU, Cortex™-M3 MPU, and the digital signal processor (DSP) subsystems. L3 handles many types of data transfers, including data exchange with system on-chip/external memories. The chip-level interconnect, which consists of one L3 and four L4s, enables communication among all modules and subsystems.

This section provides a global view of the memory mapping of the device at the L3 interconnect and describes the boot, GPMC, and SDRAM controller (SDRC) (EMIF/DMM) spaces.

The system memory mapping is flexible, with two levels of granularity for target address space allocation:

- L1: Four quarters are labeled Q0, Q1, Q2, and Q3. Each quarter corresponds to a 1-GB address space (total address space is 4GB).
- L2: Each quarter is divided into eight blocks of 32MB, with target spaces mapped in the blocks.

This organization allows all target spaces to be decoded based on the 7 most-significant bits (MSBs) of the 32-bit address ([31:25]).

- Boot space:

The system has a 48-KB boot space in the on-chip boot ROM or on the GPMC space.

When booting from the on-chip ROM with the appropriate external sys_boot pin configuration, the 48-KB memory space is redirected to the on-chip boot ROM address space [0x4002 0000–0x4002 BFFF].

When booting from the GPMC with the appropriate external sys_boot pins configuration, the memory space is part of the GPMC space. At reset, the 0x0000 0000 address is available on chip-select 0 (CS0) for a memory size of 16MB.

For more information about sys_boot pins configuration, see [Section 16.4, General-Purpose Memory Controller](#), and [Chapter 28, Initialization](#).

- GPMC space:

Eight independent GPMC chip-selects (gpmc_ncs0 to gpmc_ncs7) are available in the first quarter (Q0) of the addressing space to access NOR/NAND flash and SRAM. The chip-selects have a programmable start address and programmable size (16, 32, 64, or 128MB) in a total memory space of 1GB.

- EMIF1/EMIF2 CS0 space:

Q2 addressing space is interleaved on two LPDDR-memory controllers (EMIF1 and EMIF2), each activating its CS0 line (lpddr21_ncs0 and lpddr22_ncs0). These chip-selects can address 64, 128, 256, 512, 1024, and 2048MB. Interleaving occurs from 128-byte granularity up to 512-byte granularity.

The EMIF1-CS0 base address is always 0x8000 0000 at reset, and occupies a 1-GB address space at reset (interleaving disabled at reset).

- EMIF1/EMIF2 CS1 space:

Q3 addressing space is interleaved on two LPDDR-memory controllers (EMIF1 and EMIF2), each activating its CS1 line (lpddr21_ncs1 and lpddr22_ncs1). These chip-selects can be programmed to 64, 128, 256, 512, and 1024MB. Interleaving occurs at 128-MB granularity.

EMIF1-CS1 and EMIF2-CS1 are disabled at reset. Their base address is programmable to achieve a continuous address space with the respective CS0, regardless of the address range programmed.

EMIF1-CS1 is disabled if EMIF1-CS0 memory density is set to 2048MB (2GB) when interleaving is disabled, or if EMIF1-CS0 + EMIF2-CS0 memory density are set to 1024MB (1GB) when interleaving is enabled.

- TILER space:

Q3 addressing space is also used to access the tiling and isometric lightweight engine for rotation (TILER). This space is visible only for the imaging subsystem (ISS) and display subsystem.

[Table 2-1](#) describes the global memory space mapping.

Table 2-1. Global Memory Space Mapping

2.3 L4 Memory Space Mapping

Four L4 interconnects handle transfers with peripherals. Each interconnect is in a distinct power domain:

- L4_CFG: CORE power domain
- L4_WKUP: WKUP power domain
- L4_PER: PER power domain
- L4_ABE: ABE power domain

As with the L3 interconnect, the L4 interconnect can be configured to tune the access according to the characteristics of each module.

The following sections describe the register mapping of the L4 interconnect. Software configures these registers.

2.3.1 L4_CFG Memory Space Mapping

The L4_CFG interconnect is a 16-MB space composed of the L4_CFG interconnect configuration registers and the module registers.

[Table 2-3](#) describes the mapping of the registers for the L4_CFG interconnect.

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4_CFG interconnect. All other accesses are internal to the L4_CFG interconnect.

Table 2-3. L4_CFG Memory Space Mapping

| Module Name | Start Address (hex) | End Address (hex) | Size | Description |
|---|---------------------|-------------------|-------|-------------------------|
| L4_CFG configuration | 0x4A00 0000 | 0x4A00 07FF | 2KB | Address/protection (AP) |

2.3.2 L4_WKUP Memory Space Mapping

The L4_WKUP interconnect is a 256-KB space composed of the L4_WKUP interconnect configuration registers and the module registers.

[Table 2-4](#) describes the mapping of the registers for the L4_WKUP interconnect.

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4_WKUP interconnect. All other accesses are internal to the L4_WKUP interconnect.

Table 2-4. L4_WKUP Peripheral Space Mapping

| Module Name | Start Address (hex) | End Address (hex) | Size | Description |

NOTE: 8-bit and 16-bit peripherals are aligned on 32-bit address boundaries.

2.3.3 L4_PER Memory Space Mapping

The L4_PER interconnect is a 16-MB space composed of the L4_PER interconnect configuration registers and the module registers.

Table 2-5 describes the mapping of the registers for the L4_PER interconnect.

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4_PER interconnect. All other accesses are internal to the L4_PER interconnect.

Table 2-5. L4_PER Memory Space Mapping

| Module Name | Start Address (hex) | End Address (hex) | Size | Description |

2.3.4 L4_ABE Memory Space Mapping

The L4_ABE interconnect is a 16-MB space composed of the L4_ABE interconnect configuration registers and the module registers.

ABE modules are dual-mapped inside the Cortex-A9 MPU/DSP address space:

- Mapped in L3 as the L4 ABE space
- Mapped in Cortex-A9 MPU and DSP nonshared device map

NOTE: All memory spaces described as modules provide direct access to module registers outside the L4_ABE interconnect. All other accesses are internal to the L4_ABE interconnect.

Table 2-6 describes the mapping of the registers for the L4_ABE interconnect in the Cortex-A9 MPU nonshared (private) device address range (L4_ABE).

Table 2-6. ABE Cortex-A9 MPU Memory Space Mapping

| Module Name | Start Address (hex) | End Address (hex) | Size | Description |
|-------------|---------------------|-------------------|--------|--------------------------------|
| L4_ABE | 0x4010 0000 | 0x4010 3FFF | 16 KB | ABE domain (direct MPU access) |

| TILER | 0x6000 0000 | 0x7FFF FFFF | 512 MB |

⁽¹⁾ At reset, the MMU is loaded with page 0, which forces the L2 ROM or L2 RAM to be at address 0x0. The reset page also includes the L2 ROM, L2 RAM, shared cache MMU register, and WUGEN registers.

2.5 DSP Subsystem Memory Space Mapping

The DSP subsystem can access the ABE and IVA-HD blocks.

ABE has three different address spaces:

- **ABE NC:** This region is for accesses to registers in ABE. For more information about ABE peripheral memory mapping, see [Table 2-6](#).
- **ABE:** This region is for accesses to memory in ABE. Memory in the ABE subsystem can be cached in DSP L1 and L2. When enhanced direct memory access (eDMA) tries to access this space, L1/L2 is snooped and if data is present in DSP subsystem caches, data is provided to eDMA from DSP caches. However, if data is not present in DSP caches, the shared cache sends the access to ABE and data returned is not allocated into DSP cache; instead, it is sent to eDMA.
- **ABE locked region:** This region is similar to the ABE region, except that data from ABE is allocated into DSP caches and returned to eDMA.

The IVA-HD region is for accesses to IVA-HD accelerator memories and registers in IVA-HD. SL2 is the L2 cache in IVA-HD. There are three ways to access the IVA-HD accelerator memories:

- **SL2 - L1 region:** This region is for accesses to SL2 memory that can be mapped to DSP L1. When eDMA tries to access this space, L1/L2 is snooped and if data is present in DSP caches, the data is provided to eDMA from DSP caches. However, if data is not present in DSP caches, the shared cache sends the access to SL2 and data returned is not allocated into DSP L1 cache; instead, it is sent to eDMA.
- **SL2 - L2 region:** This region is for accesses to SL2 memory that can be mapped to DSP L2. When eDMA tries to access this space, L1/L2 is snooped and if data is present in DSP caches, the data is provided to eDMA from DSP caches. However, if data is not present in DSP caches, the shared cache sends the access to SL2 and data returned is not allocated into DSP L2 cache; instead, it is sent to eDMA.
- **SL2 locked region:** This region is similar to the previous regions, except that data is allocated into DSP caches and returned to eDMA.

[Table 2-10](#) describes the mapping of the registers for the DSP subsystem.

Table 2-10. DSP Subsystem Memory Space Mapping

2.6 Display Subsystem Memory Space Mapping

The display subsystem integrates a display controller (DISPC), a remote frame buffer interface (RFBI), two MIPI® display serial interfaces (DSI1 with four data lanes, and DSI2 with two data lanes) and HDMI link with its PHY (high-definition multimedia interface, digital part).

The DISPC is connected through an interconnect master port to the L3 interconnect and has its own DMAs to fetch the data from the system memory.

There are two views (from the L3_PER and L4_PER interconnects) of the display subsystem memory space mapping.

2.6.1 L3 Interconnect View of the Display Memory Space

[Table 2-11](#) lists the display subsystem memory space mapping from the perspective of the Cortex-A9 MPU subsystem through the L3 interconnect.

3.1 Device Power Management Introduction

Power management (efficient use of the limited battery resources on a mobile device) is one of the most important design aspects of any mobile system. It imposes strong control over limited available power resources to ensure they function for the longest possible length of time.

The device power-management architecture ensures maximum performance and operation time for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements.

This introduction contains the following information:

- Power-management architecture building blocks for the device
- State-of-the-art power-management techniques supported by the power-management architecture of the device

3.1.1 Device Power-Management Architecture Building Blocks

To provide a versatile architecture supporting multiple power-management techniques, the power-management framework is built with three levels of resource management:

- Clock
- Power
- Voltage management

These management levels are enforced by defining the managed entities or building blocks of the power-management architecture, called the clock, power, and voltage domains.

A domain is a group of modules or subsections of the device that share a common entity (for example, common clock source, common voltage source, or a common power switch). The group forming the domain is managed by a policy manager. For example, a clock for a clock domain is managed by a dedicated clock manager within the power, reset, and clock management (PRCM) module. The clock manager takes into consideration the joint clocking constraints of all the modules belonging to that clock domain (and, hence, receiving that clock).

NOTE: In the following sections, the term *module* is used to represent the device IPs (that is, modules or subsystems), other than the PRCM module, that receive clock, reset, or power signals from the PRCM module.

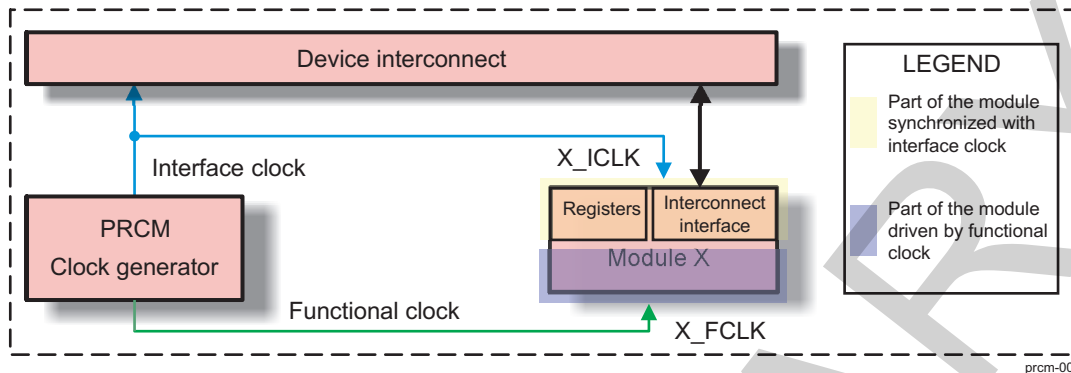

3.1.1.1 Clock Management

The PRCM module manages the gating (that is, switching off) and enabling of the clocks to the device modules. The clocks are managed based on the requirement constraints of the associated modules. The following sections identify the module clock characteristics, management policy, clock domains, and clock domain management.

3.1.1.1.1 Module Interface and Functional Clocks

Each module within the device has specific clock input characteristics requirements. Based on the characteristics of the clocks delivered to the modules, the clocks are divided into two categories: interface clocks and functional clocks (see [Figure 3-1](#)).

Figure 3-1. Functional and Interface Clocks

The interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and the interconnect.
- In most cases, they supply the system interconnect interface and registers of the module.
- A typical module has one interface clock, but modules with multiple interface clocks may also exist (that is, when connected to multiple interconnect buses).
- Interface clock management is done at the device level.
- From the standpoint of the PRCM module, an interface clock is identified with an `_ICLK` suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or a subsystem.
- A module can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. The mandatory clock(s) of a module must be operational. The optional clocks are used for specific features and can be shut down without stopping the module activity (for example, the clock for the camera).
- From the standpoint of the PRCM module, a functional clock is directly distributed to the related modules through a dedicated clock tree. It is identified with an `_FCLK` suffix.

NOTE: At the module level, the interface clocks are always fed by the interface clock outputs of the PRCM module. The functional clocks are fed either by a PRCM module functional clock output, or by a PRCM module interface clock output. In the latter case, the functional and interface module clocks inherit the clock-management features (autoidle features) of the PRCM module interface clock.

3.1.1.1.2 Module-Level Clock Management

Each module in the device may also have specific clock requirements. Certain module clocks must be *active* when operating in specific modes, or may be gated otherwise. Globally, the activation and gating of the module clocks are managed by the PRCM module. Hence, the PRCM module must be aware of when to activate and when to gate the module clocks.

The PRCM module differentiates the clock-management behavior for device modules based on whether the module can initiate transactions on the device interconnect (called master module) or it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based power-management protocols are used:

- Master standby protocol: Clock-management protocol between the PRCM and master modules
- Slave idle protocol: Clock-management protocol between the PRCM and slave modules

Master standby protocol:

This protocol is used to indicate that a master module must initiate a transaction on the device interconnect and requests specific (functional and interface) clocks for the purpose. The PRCM module ensures that the required clocks are active when the master module requests the PRCM module to enable them. This is called a module wake-up transition and the module is said to be functional after this transition completes.

Similarly, when the master module no longer requires the clocks, it informs the PRCM module, and the PRCM module can then gate the clocks to the module. The master module is then said to be in standby mode.

Although the protocol is completely hardware-controlled, software must configure the clock management behavior for the module. This is done by setting the **Module_SYSCONFIG.MIDLEMODE** or **Module_SYSCONFIG.STANDBYMODE** bit field, as presented in [Table 3-1](#). The behavior, identified by the Standby Mode Values column, must be configured.

Table 3-1. Master Module Standby Mode Settings

| Standby Mode Value | Selected Mode | Description |
|--------------------|------------------------------|--|
| 0x0 | Force-standby | The module unconditionally asserts the standby request to the PRCM module, regardless of its internal operations. The PRCM module may gate the functional and interface clocks to the module. This mode must be used carefully because it does not prevent any loss of data when the clocks are gated. |
| 0x1 | No-standby | The module never asserts the standby request to the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active; however, it is not efficient from a power-saving perspective because it never allows the PRCM module output clocks to be gated. |
| 0x2 | Smart-standby | The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idled. The PRCM module can then gate the clocks to the module. |
| 0x3 | Smart-standby wakeup-capable | The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idle. The PRCM module can then gate the clocks to the module. The module may generate (master-related) wake-up events when in STANDBY state. The mode is relevant only if the appropriate module mwakeup output is implemented. |

NOTE:

- Smart-standby mode is the preferred mode of operation, while force-standby and no-standby modes are intended for debugging purposes.
- A master module may support all or some of the standby modes listed in [Table 3-1](#). See the power-management section in the module chapter to identify the supported standby mode.

The standby status of a master module is indicated by the **CM_Power domain_Module_CLKCTRL[x] STBYST** bit in the PRCM module. [Table 3-2](#) describes the master module standby status.

Table 3-2. Master Module Standby Status

| STBYST Bit Value | Description |
|------------------|--------------------------------|
| 0x0 | The module is functional. |
| 0x1 | The module is in standby mode. |

[Table 3-3](#) lists the enabling conditions for the master module clocks managed by the standby protocol.

Table 3-3. Master Module Clock Enabling Conditions

| Relation | | Condition |
|----------|----|--|
| AND | | Clock domain is ready. |
| | OR | Master module standby request is deasserted. |

Table 3-3. Master Module Clock Enabling Conditions (continued)

| Relation | Condition |
|----------|--|
| | Master module wake-up request is asserted. |

Slave idle protocol:

This hardware protocol allows the PRCM module to control the state of a slave module. The PRCM module informs the slave module, through assertion of an idle request, when its clocks (interface and functional) can be gated. The slave can then acknowledge the request from the PRCM module and the PRCM module is then allowed to gate the clocks to the module. A slave module is said to be in IDLE state when its clocks are gated by the PRCM module.

Similarly, an idled slave module may need to be woken up because of a service request from a master module or as a result of an event (called a wake-up event, for example, interrupt or DMA request) received by the slave module. In this situation the PRCM module enables the clocks to the module and then deasserts the idle request to signal the module to wake up.

Although the protocol is completely hardware-controlled, software must configure the clock management behavior for the slave module. This is done by setting the Module_SYSCONFIG.SIDLEMODE or Module_SYSCONFIG.IDLEMODE bit field, as presented in [Table 3-4](#). The behavior, identified by the Idle Mode Value column, must be configured by software.

Table 3-4. Module Idle Mode Settings

| Idle Mode Value | Selected Mode | Description |
|-----------------|---------------------------|--|
| 0x0 | Force-idle | The module unconditionally acknowledges the idle request from the PRCM module, regardless of its internal operations. This mode must be used carefully because it does not prevent any loss of data when the clock is switched off. |
| 0x1 | No-idle | The module never acknowledges any idle request from the PRCM module. This mode is safe from a module point of view because it ensures the clocks remain active; however, it is not efficient from a power-saving perspective because it does not allow the PRCM module output clock to be shut off, and thus the power domain to be set to a lower power state. |
| 0x2 | Smart-idle | The module acknowledges the idle request basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or direct memory access (DMA) requests are processed. This is the best approach to an efficient system power management. |
| 0x3 | Smart-idle wakeup-capable | The module acknowledges the idle request basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management. The module may generate (IRQ- or DMA-request-related) wake-up events when in IDLE state. The mode is relevant only if the appropriate module wakeup output(s) is implemented. |

NOTE:

- Smart-idle mode is the preferred mode of operation, while force-idle and no-idle modes are intended for debugging purposes.
- A slave module may support all or some of the idle modes listed in [Table 3-4](#). See the power-management section in the module chapter to identify the supported idle modes.

The idle status of a slave module is indicated by the CM_Power domain_Module_CLKCTRL[x] IDLEST bit in the PRCM module. [Table 3-5](#) lists the possible idle statuses for a slave module.

Table 3-5. Slave Module Idle Status

| IDLEST Bit Value | Idle Status | Description |
|------------------|---------------|---|
| 0x0 | Functional | The module is fully functional. The interface and functional clocks are active. |
| 0x1 | In transition | The module is performing a wake-up or a sleep transition. |

Table 3-5. Slave Module Idle Status (continued)

| IDLEST Bit Value | Idle Status | Description |
|------------------|----------------|---|
| 0x2 | Interface idle | The module interface clock is idled. The module may remain functional if using a separate functional clock. |
| 0x3 | Full idle | The module is fully idle. the interface and functional clocks are gated. |

When configured in smart-idle mode, the slave module may acknowledge the idle request of the PRCM module based on the activity of its interface and/or functional clocks. To define which module clocks (that is, interface and/or functional) should be considered when responding to the PRCM module request, software must configure the Module_SYSCONFIG[x] CLOCKACTIVITY bit field.

The CLOCKACTIVITY setting is used internally by the module to determine on which part of the module the conditions to acknowledge the PRCM module idle request is tested. As an example, if the functional clock must remain active when the module is in idle mode, then the module must acknowledge PRCM module idle request by only considering the interface clock gating conditions (that is, there is no pending activity on the interconnect).

NOTE: See the power-management section in the module chapter to identify whether this feature is configurable.

Using the CLOCKACTIVITY setting along with the smart-idle mode ensures that the clock remains active for the module features that must remain available during the module idle mode. [Table 3-6](#) describes the possible CLOCKACTIVITY settings for a module:

Table 3-6. Slave Module Clock Activity Settings

| CLOCKACTIVITY Bit Value | Module Interface Clock | Module Functional Clock | Description |
|-------------------------|------------------------|-------------------------|---|
| 0x0 | Gated | Gated | The interface and functional clocks are considered when generating the acknowledgement. This setting also means both clocks may be gated upon a PRCM module idle request. |
| 0x1 | Active | Gated | The interface clock is not shut down and is not considered when generating the acknowledgement to the PRCM module idle request. Only the functional clock is considered. |
| 0x2 | Gated | Active | The functional clock is not shut down and is not considered when generating the acknowledgement to the PRCM module idle request. Only the interface clock is considered. |
| 0x3 | Active | Active | The interface and functional clocks are not shut down. The module can acknowledge the idle request without checking the internal functionalities linked to its clocks. |

NOTE:

- The software configuration of the CLOCKACTIVITY settings may not be available for a given module. For some modules, the CLOCKACTIVITY settings can be hardwired.
- A slave module may support all or some of the CLOCKACTIVITY settings listed in [Table 3-6](#).

See the power-management section in the specific module chapter to identify the supported idle feature and settings.

CAUTION

The PRCM module does not have any hardware means to read the CLOCKACTIVITY settings of the module. Software must ensure a consistent programming between the CLOCKACTIVITY settings of the module and the PRCM module clock gating control bits. The PRCM module must be configured (where software control is available) not to gate the module clock, which should remain active according to the CLOCKACTIVITY settings of the module.

For the idle protocol management on the PRCM module side, the behavior of PRCM module is configured in the CM_Power domain_module_CLKCTRL[x] MODULEMODE bit. Based on the configured behavior, the PRCM module asserts the idle request to the module either unconditionally (that is, immediately when the software requests), or through hardware control when the module idle conditions are satisfied.

Table 3-7 describes the configurable behavior of the MODULEMODE bit.

Table 3-7. Slave Module Mode Settings in PRCM

| MODULEMODE Bit Value | Selected Mode | Description |
|----------------------|---------------|--|
| 0x0 | Disabled | The PRCM module unconditionally asserts the module idle request. This request applies to the gating of the functional and interface clocks to the module. If acknowledged by the module, the PRCM module can gate all clocks to the module (that is, the module is completely disabled). It can only react to an asynchronous wake-up event (that is, a wake-up event that does not require the module functional clock to be active). |
| 0x1 | Auto | This mode applies to a module when the PRCM module only manages its interface clock and not its functional clock. The PRCM module automatically asserts/deasserts the module idle request based on the clock-domain transitions. If acknowledged by the module, the PRCM module can gate the interface clock to the module. |
| 0x2 | Enabled | This mode applies to a module when the PRCM module manages its interface and functional clocks. The functional clock to the module remains active unconditionally, while the PRCM module automatically asserts/deasserts the module idle request based on the clock-domain transitions. If acknowledged by the module, the PRCM module can only gate the interface clock to the module. |
| 0x3 | Reserved | Not available |

NOTE: The PRCM module may support all or some of the MODULEMODE module settings listed in Table 3-7. See the CM_Power domain_module_CLKCTRL[x] MODULEMODE bit description for the module to identify the supported settings.

Table 3-8 and Table 3-9 list the enabling conditions for the slave module clocks managed by the Idle protocol.

Table 3-8. Slave Module Interface Clock Enabling Conditions

| Relation | Condition |
|----------|---|
| AND | Clock domain is ready. |
| | Slave module idle status is 0x0 (fully functional). |
| | Slave module idle status is 0x1 (in transition). |
| | Slave module wake-up request is asserted. |

Table 3-9. Slave Module Functional Clock Enabling Conditions

| Relation | Condition |
|----------|---|
| AND | Clock domain is ready. |
| | Slave module idle status is 0x0 (fully functional). |
| | Slave module idle status is 0x1 (in transition). |

Table 3-9. Slave Module Functional Clock Enabling Conditions (continued)

| Relation | | Condition |
|----------|--|---|
| | | Slave module idle status is 0x2 (interface clock is idled). |
| | | Slave module wake-up request is asserted. |

The module clock domain must be ready for the optional clocks to the module, and any associated clock-enable control is asserted.

NOTE: A given clock can be used by more than one module. Clock enabling conditions are then ORed together (that is, the clock is provided as soon as one of the enabling conditions is true). As a consequence, the clock is disabled only when all related enabling conditions are false.

Module wake-up request:

In IDLE state, a slave module may have to wake up to generate an interrupt or a DMA request. This may be the result of an external request (for example, to the I/O port of a general-purpose input/output [GPIO] module) or an internally generated event (for example, WDTIMER time-up). The slave module, with wake-up capability, sends a wake-up request to the PRCM module. The PRCM module then activates the module clocks and acknowledges the module wake-up request.

In IDLE state, some slave modules may require functional clock(s) to generate a wake-up event. Such requests are called synchronous wake-up events on the PRCM module side, while the events generated when the functional or interface module clocks are gated are called asynchronous wake-up events.

NOTE: See the power-management section in the module chapter to identify whether its wake-up event is synchronous or asynchronous.

The standby and idle clock-management protocols allow the configuration of the module-level clock-management interaction between the PRCM module and individual modules of the device. However, the PRCM module may not necessarily gate the clock to the module immediately after the module switches to standby or idle mode at the end of this interaction. This is because the same clock can be shared by other modules that are active and need this shared clock to complete their activity. As a result, the PRCM module provides a second level of clock management called the clock domain level, as explained in [Section 3.1.1.1.3](#).

3.1.1.1.3 Clock Domain

A clock domain is a group of modules fed by clock signals controlled by the same clock manager in the PRCM module (see [Figure 3-2](#)). By gating the clocks in a clock domain, the clocks to all the modules belonging to that clock domain can be cut to lower their active power consumption (that is, the device is on and the clocks to the modules are dynamically switched to ACTIVE or INACTIVE [gated] states). Thus, a clock domain allows control of the dynamic power consumption of the device.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated clock manager within the PRCM module. This allows the PRCM module to individually activate and gate each clock domain of the device.

Figure 3-2. Generic Clock Domain

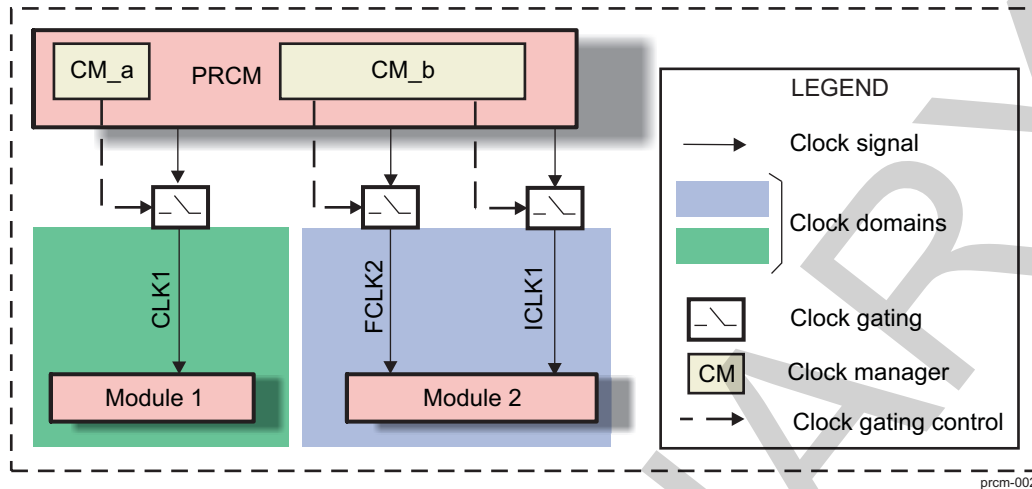

Figure 3-2 presents an example of two clock managers: CM_a and CM_b. Each clock manager manages a clock domain. The clock domain of CM_b is composed of two clocks: a functional clock (FCLK2) and an interface clock (ICLK1), while that of CM_a consists of a clock (CLK1) that is used by the module as functional and interface clock. The clocks to Module 2 can be gated independently of the clock to Module 1, thus ensuring power savings when Module 2 is not in use.

The PRCM module lets software check the status of the clock domain functional clocks. The CM_Clock domain_CLKSTCTRL[x] CLKACTIVITY_FCLK/Clock name_FCLK bit in the PRCM module identifies the state of the functional clock(s) within the clock domain. Table 3-10 lists the two possible states of the functional clock.

Table 3-10. Clock Domain Functional Clock States

| CLKACTIVITY Bit Value | Status | Description |
|-----------------------|--------|---|
| 0x0 | Gated | The functional clock of the clock domain is inactive. |
| 0x1 | Active | The functional clock of the clock domain is running. |

3.1.1.1.4 Clock Domain-Level Clock Management

The domain clock manager can automatically (that is, based on hardware conditions) and jointly manage the interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

A clock domain can switch between three possible states: ACTIVE, IDLE_TRANSITION, or INACTIVE. Figure 3-3 identifies the sleep and wake-up transitions of the clock domain between the ACTIVE and INACTIVE states.

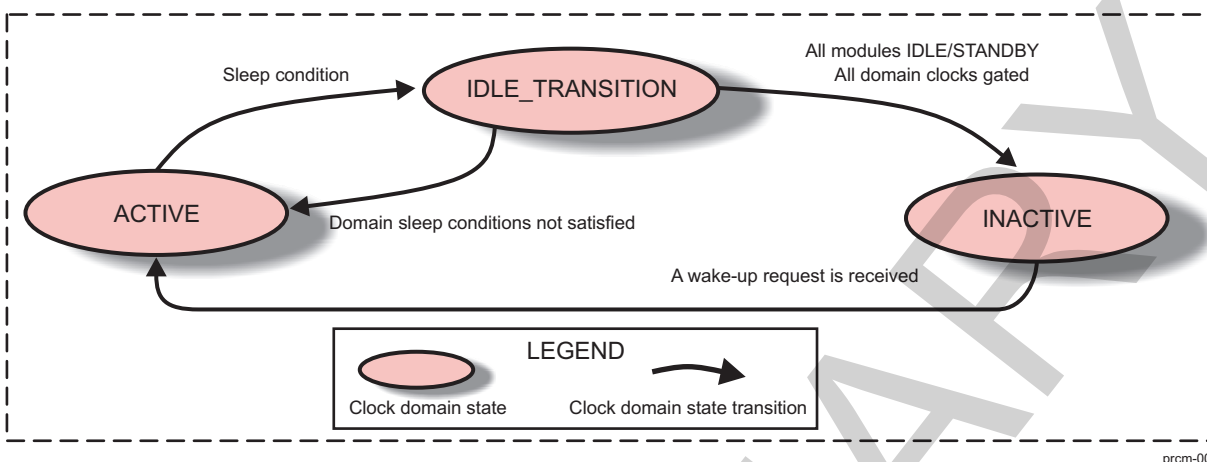

Figure 3-3. Clock Domain State Transitions

Table 3-11 defines the clock domain states.

Table 3-11. Clock Domain Clock States

| State | Description |
|-----------------|--|
| ACTIVE | <ul style="list-style-type: none"> Every nondisabled slave module (that is, those whose MODULEMODE value is not set to disabled) is put out of IDLE state. All functional clocks to the active slave modules (that is, not idled) of the clock domain are provided. All interface clocks to the nondisabled slave modules in the clock domain are provided. All functional and interface clocks to the active master modules (that is, not in STANDBY state) in the clock domain are provided. Every enabled optional clocks to the modules in the clock domain are provided. |
| IDLE_TRANSITION | <p>This is a transitory state.</p> <ul style="list-style-type: none"> Every master module in the clock domain is in STANDBY state. Every idle request to all the slave modules in the clock domain is asserted. The functional clocks to the slave module in enabled state (that is, those whose MODULEMODE values are set to enabled) remain active. Every enabled optional clocks to the modules in the clock domain are provided. |
| INACTIVE | <p>All clocks within the clock domain are gated.</p> <ul style="list-style-type: none"> Every slave module in the clock domain (that is, those whose MODULEMODE is set to disabled or auto) is in IDLE state and set to disabled or auto mode. Every master module in the clock domain is in STANDBY state. Every optional functional clock in the clock domain is gated. |

Each clock domain transition behavior is managed by an associated register bit field in the CM_Clock domain_CLKSTCTRL[x] CLKTRCTRL PRCM module.

Table 3-12 describes the clock domain clock transition mode settings.

Table 3-12. Clock Domain Clock Transition Mode Settings

| CLKTRCTRL Bit Value | Selected Mode | Description |
|---------------------|---------------|---|
| 0x0 | NO_SLEEP | A clock domain sleep transition is never initiated, irrespective of the hardware conditions. |
| 0x1 | SW_SLEEP | A software-forced sleep transition. The transition is initiated when the associated hardware conditions are satisfied (see Table 3-14). |
| 0x2 | SW_WKUP | A software-forced clock domain wake-up transition is initiated, irrespective of the hardware conditions identified in Table 3-13. |

Table 3-12. Clock Domain Clock Transition Mode Settings (continued)

| CLKTRCTRL Bit Value | Selected Mode | Description |
|---------------------|---------------|--|
| 0x3 | HW_AUTO | Hardware-controlled automatic sleep and wake-up transition is initiated by the PRCM module when the associated hardware conditions are satisfied (see Table 3-14 and Table 3-13). |

NOTE: Depending on the characteristics of a clock domain, it may or may not support all the clock transition mode settings described in [Table 3-12](#). See the clock domain clock management section of the specific clock domain to identify the supported clock transition mode settings.

3.1.1.1.5 Clock Domain HW_AUTO Mode Sequences

The sequence diagrams in [Figure 3-4](#) through [Figure 3-6](#) identify the PRCM module hardware-controlled enabling and gating of the functional and interface clocks to the module. They highlight the changes in the module state based on the changes to the clock domain state and module mode settings.

[Figure 3-4](#) highlights the behavior of a slave module receiving the interface and functional clocks and having two configurable module modes: Disabled and Enabled.

Figure 3-4. Clock Domain/Slave Module Clock-Management Interaction Sequence 1

prcm-004

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL-IDLE state and its functional and interface clocks are gated.

1. The clock domain wakes up and changes state to ACTIVE. As the module mode control is still disabled, this event has no effect on the module state. The functional and interface clocks may still be restarted automatically, based on the requirements of other modules sharing these clocks.

- Software changes the module mode to enabled. The clocks to the module are restarted automatically. The PRCM module then deasserts a hardware idle request signal to the module. The module sends an idle request acknowledge to the PRCM module. The module is now effectively awake. The module IDLE state is functional. If the module is enabled before the clock domain wakes up, Steps 1 and 2 are simultaneous.
- The clock domain switches to IDLE_TRANSITION state. In turn, the PRCM module requests the module to go into IDLE state by asserting the idle request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock. The functional clock of the module remains enabled as the module is in enabled mode.
- The clock domain does not have all conditions to complete the sleep transition, and wakes up again. In turn, the interface clock to the module is automatically restarted, if applicable, then the module is put out of IDLE state.
- Software disables the module. The PRCM module requests the module to go to IDLE state by asserting the idle request signal. When acknowledged, the clock to the module can be gated, depending on other modules sharing the same clock.
- The clock domain switches to the IDLE_TRANSITION state. When the clock domain sleep transition conditions are satisfied, the clocks (functional and interface) are gated. The clock domain then switches to INACTIVE state. This has no effect on the module, which is already in FULL-IDLE state.

Figure 3-5 highlights the behavior of the same slave module, receiving the interface and functional clocks, when the module mode is changed while the clock domain state is IDLE_TRANSITION.

Figure 3-5. Clock Domain/Slave Module Clock-Management Interaction Sequence 2

prcm-005

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL-IDLE state and its functional and interface clocks are gated.

- The clock domain wakes up and changes state to ACTIVE. As the module mode control is disabled, this event has no effect on the module state. The functional and interface clocks may still be restarted automatically, based on the requirements of other modules sharing these clocks.
- The clock domain goes into the IDLE_TRANSITION state. As the module mode control is disabled, this event has no effect on the state of the module.

- Software changes the module mode to enabled. The clocks to the module are restarted automatically and then the module is put out of IDLE state. As soon as acknowledged, the module is requested to go back to IDLE state with gating of the interface clock only (that is, the INTERFACE IDLE state). The interface clock to the module can be gated, depending on other modules sharing the same clocks.
- Software disables the module. The interface clock to the module is restarted automatically. The PRCM module requests the module to go to IDLE state by asserting the idle request signal. When acknowledged, the interface and the functional clocks to the module can be gated, depending on other modules sharing the same clock.
- When the clock domain sleep transition conditions are satisfied and the functional and interface clocks are gated, the clock domain switches to INACTIVE state. This has no effect on the module, which is already in FULL-IDLE state.

Figure 3-6 highlights the behavior of a slave module receiving only interface clock and supporting the configurable auto module mode.

Figure 3-6. Clock Domain/Slave Module Clock-Management Interaction Sequence 3

prcm-006

Initially, the clock domain, which includes the slave module, is inactive. The module is in FULL-IDLE state and its interface clock is gated.

- The clock domain wakes up and changes state to ACTIVE. In turn, the interface clock to the module is automatically restarted. The PRCM module then deasserts a hardware idle request signal to the module. The module sends an idle request acknowledge to the PRCM module. The module is now effectively awake (that is, the module IDLE state is functional).
- The clock domain switches to the IDLE_TRANSITION state. The PRCM module requests the module to go to IDLE state by asserting the idle request signal. When acknowledged, the interface clock to the module can be gated, depending on other modules sharing the same clock.
- The clock domain does not have all conditions to complete the sleep transition, and wakes up again. In turn, the interface clock to the module is automatically restarted if applicable, then the module is put out of IDLE state.
- Step 4 is the same as Step 2. The clock domain switches to the IDLE_TRANSITION state. The PRCM module requests the module to go to IDLE state by asserting the idle request signal. When acknowledged, the interface clock to the module can be gated, depending on other modules sharing the same clock.

5. The clock domain has all conditions to complete the sleep transition. The module is in IDLE state and its clock is gated.

3.1.1.1.6 Clock Domain Sleep/Wakeup

The clock domain manager initiates a domain wake-up transition when the conditions listed in [Table 3-13](#) are satisfied.

Table 3-13. Clock Domain Wake-Up Conditions

| Relation | Condition |
|----------|---|
| OR | The SW_WKUP clock transition mode for the clock domain is set (CLKTRCTRL = 0x2). |
| | At least one wake-up request is asserted by one of the modules of the clock domain. |
| | At least one dynamic dependency ⁽¹⁾ from another clock domain is active. |
| | At least one static dependency ⁽¹⁾ from another clock domain is active. |
| | At least one wake-up dependency ⁽¹⁾ from a module in another clock domain is active. |

⁽¹⁾ The dynamic, static dependency and the wake-up dependency are explained in [Section 3.1.1.1.7, Clock Domain Dependency](#).

The clock domain manager initiates a domain sleep transition when the conditions listed in [Table 3-14](#) are satisfied.

Table 3-14. Clock Domain Sleep Conditions

| Relation | | Condition |
|----------|-----|---|
| AND | | All master modules in the clock domain are in STANDBY state. |
| | | No wake-up request is asserted by any module of the clock domain. |
| | | No dynamic domain dependency ⁽¹⁾ from any other domain is active. |
| | | No wake-up dependency ⁽¹⁾ from any module in another domain is active. |
| | OR | The SW_SLEEP clock transition mode is set for the clock domain (CLKTRCTRL = 0x1). |
| | AND | The HW_AUTO clock transition mode is set for the clock domain (CLKTRCTRL = 0x3). |
| | | No static domain dependency ⁽¹⁾ from any other domain is active. |

⁽¹⁾ The dynamic, static dependency and the wake-up dependency are explained in [Section 3.1.1.1.7, Clock Domain Dependency](#).

3.1.1.1.7 Clock Domain Dependency

A domain dependency is a binary relationship between two clock domains. For example, clock domain A depends on clock domain B when a module in clock domain B provides services to a module in clock domain A. As a result, clock domain B must be active when clock domain A is active so that the module in clock domain B is accessible by the module in clock domain A.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two modules (for example, the clock domain of the device interconnect).

Thus, a clock domain may support the types of clock domain dependencies described in the following subsections.

3.1.1.1.7.1 Static Dependency

If clock domain A has a master module that can access a slave module in clock domain B, then clock domain A can have a static dependency with clock domain B. Similarly, a static dependency can also exist between domains A and B if domain B conveys the transactions from domain A module toward a module in any other domain. For example, CD_DSP can have a static dependency with CD_L3_1 because this domain has the L3 interconnect to carry the transactions from the DSP module.

This static dependency consists of forcing clock domain B to stay active, as long as there is at least one master module of clock domain A that is not in STANDBY state. If clock domains A and B are initially in GATED state, then clock domain B becomes active as soon as clock domain A becomes active when a wake-up request from the master module is received by the PRCM module.

Similarly, as a result of the static dependency, clock domain B can be gated only if all the master modules of clock domain A that can access the slave modules in clock domain B are in STANDBY state.

The static dependency between a source clock domain and a destination clock domain is configured in the PRCM module by setting the CM_Source Clock domain_STATICDEP[x] Destination Clock domain_STATDEP bit. As a result, the source clock domain forces the destination clock domain to become active and stay active as long as the source clock domain is active.

3.1.1.1.7.2 Dynamic Dependency

When clock domains A and B contain modules directly linked to a common device interconnect, these clock domains can have a dynamic dependency.

A dynamic dependency consists of forcing clock domain B to stay active as long as a module from clock domain A is communicating with the module in clock domain B through the interconnect. Clock domain B becomes active as soon as the communication is initiated. This is automatically managed by the PRCM module by monitoring the communication on the interconnect between the modules of the two clock domains.

Similarly, the inverse condition of this dependency can be stated: Clock domain B can be inactive only if all modules between clock domains A and B are quiet for a given sampling delay, identified as a sliding window duration on the interconnect activity status.

The size of the sliding window is based on the number of cycles of a prescaled L4 clock whose frequency is configured by setting the CM_DYN_DEP_PRESCAL[5:0] PRESCAL bit field. The prescaled clock frequency is given as:

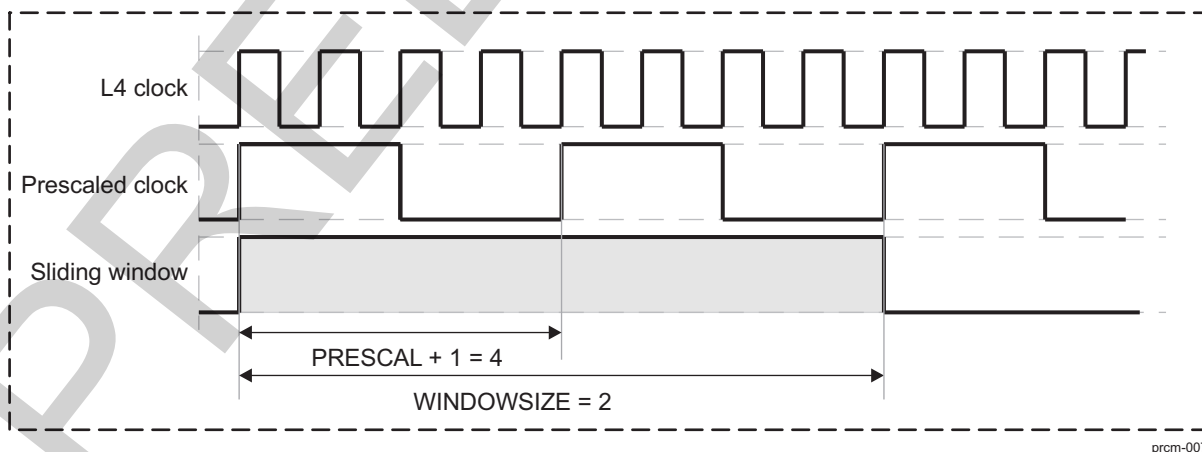

$$\text{Prescaled clock frequency} = \text{L4 interface clock frequency} / (\text{PRESCAL} + 1)$$

The size of the sliding window is fixed by setting the CM_Clock domain_DYNAMICDEP[27:24] WINDOWSIZE bit field. It is given as:

$$\text{Sliding window duration} = \text{WINDOWSIZE Period of Prescaled clock cycle}$$

Figure 3-7 presents an example of the sliding window duration equal to eight clock cycles of L4 clock when PRESCAL is set to 3 and WINDOWSIZE is set to 2.

Figure 3-7. Sliding window for Dynamic Dependency

This dynamic dependency is also referred to as the autosleep/autowake-up feature.

NOTE:

- The static dependency between two clock domains can be configured by software (PRCM module registers) or hardwired in the PRCM module.
- The dynamic dependency between two clock domains is hardwired in the PRCM module.

A dynamic dependency is said to be active when the following conditions exist:

- At least one master module or a slave interconnect module from clock domain A to domain B is active (that is, the master module is not in STANDBY state and/or the interconnect slave module is not in IDLE state).
- There has been one or more transaction on the interconnect within the sliding window duration.

Otherwise, dynamic dependency is said to be inactive.

The dynamic dependency between a source clock domain and a destination clock domain can be read in the PRCM module from the corresponding read-only CM_Source Clock domain_DYNAMICDEP[x] Destination Clock domain_DYNDEP bit.

3.1.1.1.7.3 Wake-Up Dependency

A wake-up dependency is a dependency between the clock domain of a module that owns one or several wake-up signals, toward the clock domain of another module needed to service the associated wake-up event. As a result of this dependency, the wake-up event to a module not only activates its clock domain, but also the clock domain of the servicing module.

NOTE: The wake-up signal that triggers a wake-up dependency stays active as long as the source of the event is not serviced, to ensure that clock domain of the servicing module remains active.

Wake-up dependencies allow acceleration of the wake-up transition of multiple domains needed to service the wake-up event by initiating their transition in parallel. The static and dynamic dependencies can allow the wake up of related domains but the complete wake-up transition of all the associated domains is slower because of the sequential cascading of their wake-up transitions.

In the device, the source event of the wake-up signal to a slave module can be one of the following types:

- Interrupt request to microprocessor unit (MPU) or digital signal processor (DSP) interrupt controller (INTC)
- DMA request to a DMA controller

Upon wakeup by these types of wake-up events, and for as long as they remain asserted, the PRCM module takes the following actions:

- The power domain of the servicing module (for example, MPU, DSP, or DMA) is forced to POWER ON state and the clock domain becomes active.
- The power domain of the device interconnect between servicing module and the module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The power domain of the slave module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.
- The slave module originator of the wake-up event is switched from IDLE to ACTIVE state.

On assertion of a wake-up event of a stand-alone master module, and as long as it remains asserted, the PRCM module takes the following action: The power domain of the master module originator of the wake-up event is forced to POWER ON state and the clock domain becomes active.

NOTE: For slave modules, the static and dynamic dependencies of a clock domain are not impacted by its wake-up dependency settings. For master modules, the static dependencies are not impacted.

Hence, in addition to the activation of the clock domains identified in [Section 3.1.1.1.7.3](#) above, all clock domains associated by static dependencies are also activated.

However, the clock domains associated with the waking up clock domain through dynamic dependencies are only activated if a transaction is initiated to these clock domains.

For each wake-up signal coming from a slave module, the type of the corresponding event can be configured in the PM_Power domain_Originator Module_WKDEP[x] WKUPDEP_Originator Module_Servicing Module bit of the PRCM module, where Power domain is the name of the power domain of the originator module of the wake-up event identified as Originator Module. Servicing Module refers to the module servicing the wake-up event.

NOTE: When only one event type is associated with the wake-up signal of a slave module, the WKUPDEP wake-up dependency for the module clock domain is not configurable and may be hardwired in the PRCM module.

In case of the master modules, there is no configurable wake-up dependency. Their power domain is switched on and their clock domain is activated by the PRCM module when they assert their wake-up signal.

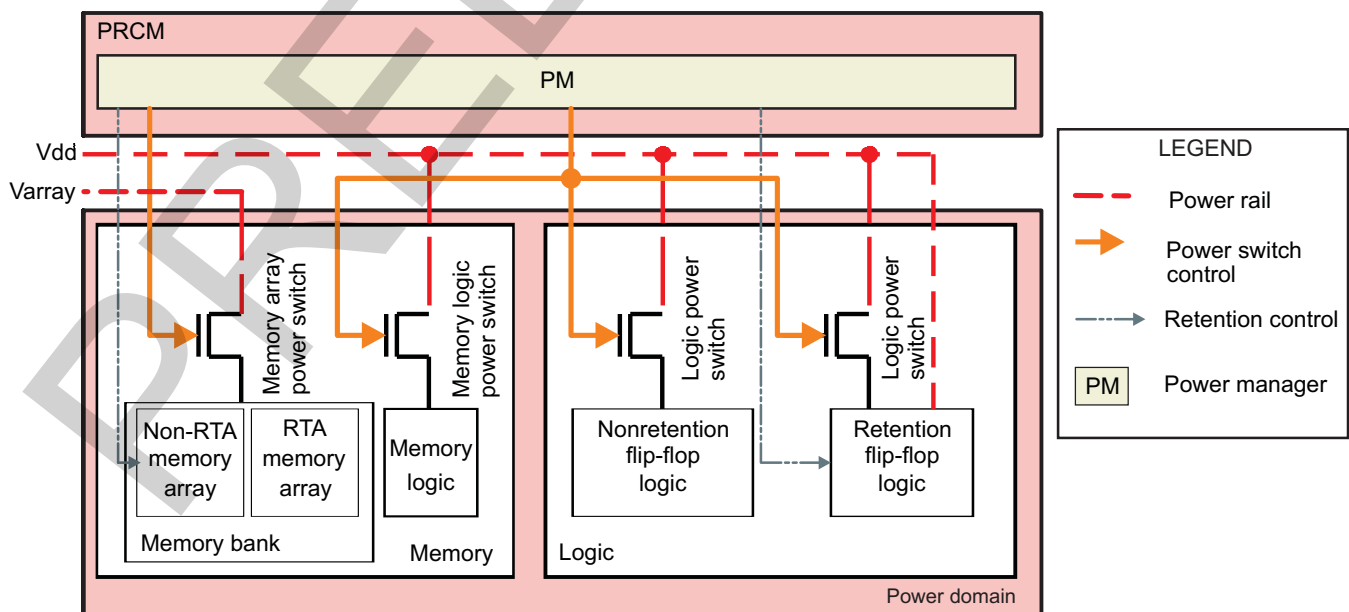

3.1.1.2 Power Management

The PRCM module manages the switching on and off of the power supply to the device modules. The power to the modules can be switched off when they are not in use to minimize device power consumption. Independent power control of sections of the device allow the PRCM module to turn on and off specific sections of the device without affecting the others.

3.1.1.2.1 Power Domain

A power domain is a section (that is, a group of modules) of the device with independent and dedicated power manager (see [Figure 3-8](#)). A power domain can be turned on and off without affecting the other parts of the device.

Figure 3-8. Generic Power Domain

prcm-008

To minimize device power consumption, the modules are grouped into power domains. A power domain can be split into some logic area and some memory area.

The memory area contains two entities:

- **Memory bank:** The memory bank is composed of memory arrays. It is powered by a dedicated voltage rail and an associated power switch (for example, Varray and memory array power switches). The memory array within the memory bank can be of RTA (retention-till-access), see [Section 3.1.1.2.2, Module Logic and Memory Context](#), or non-RTA type.
- **Memory logic:** The memory logic is powered by the same voltage source as the logic area of the power domain, but has its dedicated power switch (for example, Vdd and memory logic power switches).

The logic area in the power domain can also be split between retention flip-flops (RFFs) or nonretention flip-flops (DFFs).

[Table 3-15](#) lists the possible states and substates of the logic area in a power domain.

Table 3-15. States of a Logic Area in a Power Domain

| State | Substate | Description |
|-----------|----------------------------------|--|
| ON | ON-ACTIVE | Logic is fully powered and at least one enclosed clock domain is active. |
| | ON-INACTIVE | Logic is fully powered and all enclosed clock domains are idled. |
| RETENTION | CSWR (close switch retention) | Logic is fully powered and all enclosed clock domains are idled. |
| | OSWR (open switch retention) | Logic is powered down, except the RFF-based logic retains its value. The DFF is lost and reset. Vdd can be lowered to its retention voltage level if all power domains associated are in this or lower states. |
| OFF | | Logic power switches are off. All the logic (DFF and RFF) is lost except for the context, which has been saved in the scratchpad memory of an always-on power domain. Vdd can be set to 0 V if all associated power domains are in this state. |

NOTE: A power domain that does not have RFF logic may still support the OSWR power state. In this case, all its logic context is lost, yet its memory area context may remain valid if programmed to retention mode (see [Table 3-16](#) and [Table 3-19](#)).

The RETENTION states are useful for quick switching to low-power idle mode (in which the domain clocks are gated and the domain voltage is less than the on-voltage level) without losing the context, and then quickly switching back to ON-ACTIVE state when necessary. In a RETENTION state, power consumption is less than in ON power state.

CSWR state has the advantage of faster turn-on times over OSWR state, because in the latter case the entire context is maintained. However, CSWR state has the disadvantage of higher leakage currents over OSWR state.

The behavior of the memory array power switch and memory logic power switch can be selected through software settings in the PRCM module, or can be hardwired. Once the behavior is selected, the PRCM module hardware automatically handles these elements to ensure correct power transition sequencing between the power domain states.

Software can also initiate the memory array power state changes when the associated power domain is in On Power state. This allows the memory array to be turned off and on as needed.

The memory area can be configured to any power state identified in [Table 3-16](#).

Table 3-16. States of a Memory Area in a Power Domain

| State | Description |
|-------|---|
| ON | The memory array is powered and fully functional. Additionally, the RTA feature may put part or all of the memory array automatically into one of the retention states when not accessed, if this feature exists and is enabled on a given memory instance. |

Table 3-16. States of a Memory Area in a Power Domain (continued)

| State | Description |
|-----------|--|
| RETENTION | The memory array is fully powered, but memory is not accessible. The array can be put into one of the retention states, either through applicable direct retention control signal, or automatically if the RTA feature exists and is enabled on a given memory instance. Data in memory are always retained. |
| OFF | The memory array is powered down. Data in memory are lost. |

3.1.1.2.2 Module Logic and Memory Context

In case of a power state transition in the logic area or the memory area, the context of the module may no longer be valid. This can also be the case when the domain resets are asserted by the device. A specific RM_Clock Domain Name_Module Name_CONTEXT register provides the status of the device logic and memory context.

- The module logic context is made of simple flip-flops (DFFs) if the module has no logic RFFs.
- If the module has logic retention (full or partial), it is assumed that the context is made only of RFFs.

NOTE: The display subsystem (DSS) is an exception where the status of DFF and RFF context is presented, because only HMDI keys are retained, while most of the DSS is nonretained.

These context status bits must be cleared by software.

3.1.1.2.3 Retention-Till-Access Memory Feature

Most high-density memories within the device support the RTA feature. It consists of automatically putting part of or the entire memory array into retention when no access is made to the corresponding locations. This is managed within the memory bank by hardware and is transparent to the user software. As a consequence, RTA memories do not have any retention mode control signal coming from the PRCM module.

The RTA feature is controlled (enabled and disabled) from:

- eFuse bits configuration in the system control module, automatically loaded to the PRCM module.
- Software-controlled override capability through a bit field per voltage domain in the PRCM module (that is, PRM_LDO_SRAM_Memory Voltage Domain_SETUP[0] DISABLE_RTA_EXPORT).
- Hardware override capability controlled by the PRCM module through control of embedded static random-access memory (SRAM) low-dropout linear regulator (LDO) controller.

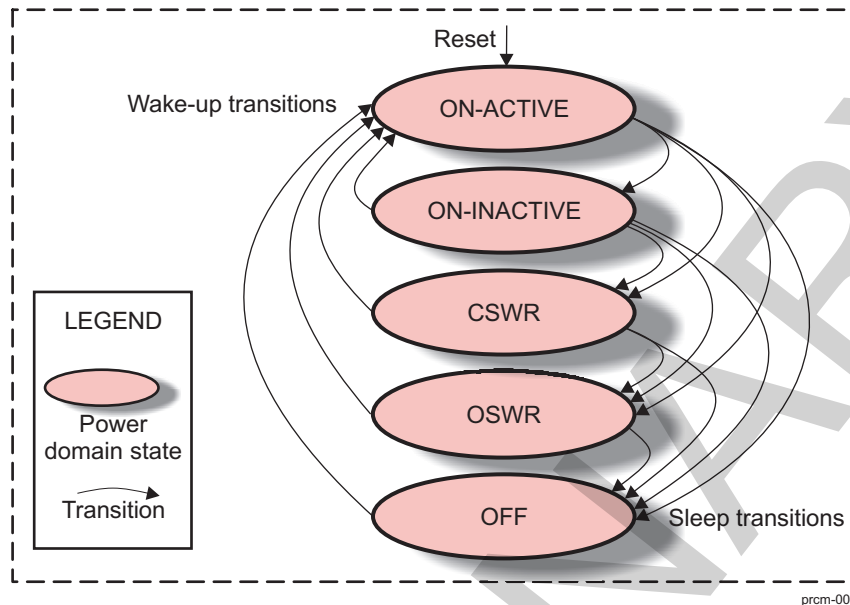

3.1.1.2.4 Power Domain Management

The power manager associated with each power domain is assigned the task of managing the domain power transitions. It ensures that all hardware conditions are satisfied before it can initiate a power domain transition from a source to a target power state (for example, from ON-ACTIVE state to OSWR state).

The hardware condition for power domain transition from ON-ACTIVE to any other transition state is:

- All clock domain managers in the power domain are in INACTIVE state: All modules in the domain are in IDLE or STANDBY state, and there is no constraining dependency (static, dynamic, or wake-up dependency) between the clock domains blocking the clock domain sleep transition.

Figure 3-9 shows all possible power domain state transitions.

Figure 3-9. Power Domain Transitions

Successive power-down transitions can be performed by lowering the power state from ON-ACTIVE to ON-INACTIVE to RETENTION, and then to OFF, as long as the hardware condition is satisfied.

However, the power domain wake-up transition from any low-power state (ON-INACTIVE, CSWR, OSWR, or OFF) to ON-ACTIVE is always direct. For example, user software cannot request a power domain transition from OSWR state to CSWR state, but only to ON-ACTIVE state.

The power domain manager initiates a power domain wake-up transition when the conditions listed in [Table 3-17](#) are satisfied.

Table 3-17. Power Domain Wake-Up Conditions

| Relation | | Condition |
|----------|----|---|
| AND | OR | Voltage domain is on. |
| | | There is at least a wake-up condition for one enclosed functional clock domain. |
| | | There is a request for clock generation or distribution enclosed in the power domain. |
| | | There is a PRCM module service request (applicable only to power domains, including PRCM module logic). |

The power domain manager initiates a domain sleep transition when the conditions listed in [Table 3-18](#) are satisfied.

Table 3-18. Power Domain Sleep Conditions

| Relation | Condition |
|----------|--|
| AND | All functional clock domains enclosed in the power domain are idled. |
| | All clock generation or distribution enclosed in the power domain is quiet, and corresponding input clocks are gated. For example, DPLL, if present, must be in stop mode. |
| | There is no PRCM module service request (applicable only to power domains, including PRCM module logic). |

[Table 3-19](#) lists the PRCM module power domain control and status features.

Table 3-19. Power Domain Control and Status Registers

| Register/Bit Field | Type | Description |
|---|---------|--|
| PM_Power domain_PWRSTCTRL[1:0] POWERSTATE | Control | Selects the target power state of the power domain among OFF, ON-ACTIVE, ON-INACTIVE, and RETENTION. |
| PM_Power domain_PWRSTCTRL[x] LOWPOWERSTATECHANGE | Control | Power state change request when domain has already performed a sleep transition. Allows going into deeper LOW-POWER state without waking up the power domain. |
| PM_Power domain_PWRSTCTRL[2] LOGICRETSTATE | Control | Selects whether the Power domain logic is in CSWR or OSWR state when the domain transitions to one of the RETENTION states. |
| PM_Power domain_PWRSTCTRL[x] memory bank_RETSTATE | Control | Selects whether the memory bank in the power domain is in ON or RETENTION state when the power domain is in RETENTION state. The memory bank can not be in ON state when the power domain is in RETENTION state. |
| PM_Power domain_PWRSTCTRL[x] memory bank_ONSTATE | Control | Selects whether the memory bank is in ON, RETENTION, or OFF state when the power domain is in ON state. |
| PM_Power domain_PWRSTST[1:0] POWERSTATEST | Status | Identifies the current state of the power domain. It can be OFF, RETENTION, ON-INACTIVE, or ON-ACTIVE. |
| PM_Power domain_PWRSTST[2] LOGICSTATEST | Status | Identifies the current state of the logic area in the power domain. It can be OFF or ON. |
| PM_Power domain_PWRSTST[20] INTRANSITION | Status | Identifies whether a power domain power state transition is in progress or there is no ongoing transition. |
| PM_Power domain_PWRSTST[x] memory bank_STATEST | Status | Identifies the current power state of the memory bank in the power domain. It can be OFF, RETENTION, or ON. For memory with RTA feature, the ON and RETENTION memory states are equivalent. |

3.1.1.3 Voltage Management

The PRCM module controls the voltage scaling (that is, switching the voltage in discrete steps or in a continuum within a range of possible values) of the power sources of the device. This allows control of the device power consumption according to the performance criteria defined. Higher performance is ensured with higher voltage and clock frequencies (and hence higher power consumption), while lower performance can be supported with lowered power consumption by reducing or completely gating the power supply to specific areas of the device and gating the associated clocks.

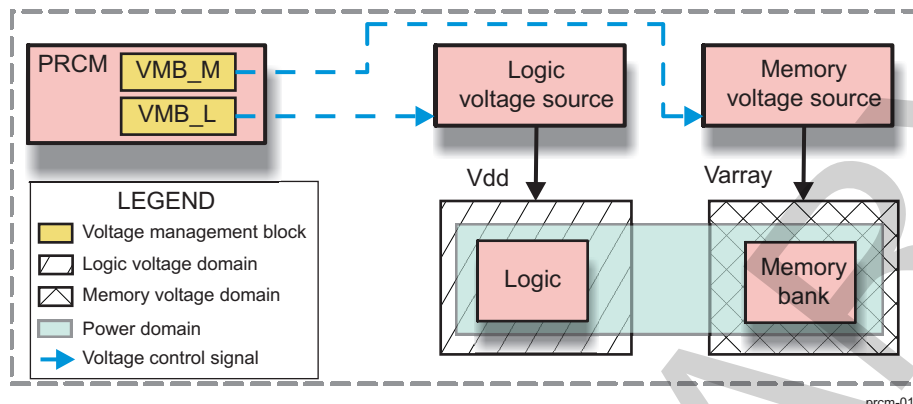

3.1.1.3.1 Voltage Domain

A voltage domain is a section of the device supplied by a dedicated voltage source (that is, an internal LDO or external switched mode power supply [SMPS]). A voltage domain may or may not be controlled by the PRCM module. When a voltage domain is controlled by the PRCM module, a dedicated voltage manager is associated. The voltage manager allows regulation of the voltage level of the source for the voltage domain, independently of other voltage domains of the device.

The voltage managers in the PRCM module can be of two types:

- Dynamically configurable by software to scale the domain voltage level to specific values within the device operational voltage range. This is called adaptive voltage scaling (AVS).
- Hardware controlled to automatically switch the domain voltage levels according to the associated hardware conditions

Figure 3-10 shows a voltage domain.

Figure 3-10. Generic Voltage Domain

By partitioning the device into independent voltage domains, different operating voltages can be assigned to the different sections of the device (that is, group of modules or memory banks). The independent voltage control allows voltage scaling of device subsections to ensure that each module or memory bank operates at the optimized operating voltage level based on the application performance requirements. When all modules within a voltage domain are idle (that is, have no ongoing transaction), the domain voltage can be lowered to reduce power consumption and then switched back to normal operating voltage level when a wake-up event is received by one of the modules of the voltage domain. Similarly, when a memory bank is not in use, it may be switched to retention or off voltage levels to ensure power savings.

Table 3-20 describes the different states of the logic voltage domain.

Table 3-20. States of Logic Voltage Domain

| State | Description |
|-----------|---|
| ON | The voltage regulator source for the voltage domain is active and operating in its normal voltage range for the current operating performance point (OPP) and can deliver up to the maximum load current defined for the current OPP. |
| SLEEP | The voltage regulator source is operating in its normal voltage range but it can only deliver a limited load current (no logic activity on this voltage domain). In sleep mode, regulator power consumption is reduced. |
| RETENTION | The voltage regulator source is operating at retention voltage level. It delivers the minimal load current required to maintain the voltage domain logic context. |
| OFF | The voltage regulator source is inactive and its output voltage is 0 volts. No supply current is provided in this mode. |

3.1.1.3.2 Voltage Domain Management

Figure 3-11 highlights the different voltage control paths available within a generic logic voltage management block to control the voltage supply to the device logic voltage domains.

Figure 3-11. Generic Logic Voltage Management

3.1.1.3.2.1 Logic Voltage PWR_REQ Voltage Control

A PWR_REQ signal is deasserted when the device enters the OFF state. The external power integrated circuit (IC) can use it to properly manage turn-off or turn-on of the logic voltage source.

3.1.1.3.2.2 Logic Voltage I²C Voltage Control

The PRM module allows three voltage control paths to a dedicated inter-integrated circuit (I²C™) interface for the logic voltage domains managed by it.

1. The PRM module hardware-managed voltage changes from device power manager voltage finite state-machine (FSM) through voltage manager FSM based on hardware conditions. It sends the voltage commands when the device enters in RETENTION or OFF state and upon device wakeup.
2. Direct control by user software through the PRM module registers for voltage scaling.
3. Adaptive voltage scaling (see [Section 3.1.1.3.3, AVS Overview](#)) with SmartReflex™ voltage control commands through the voltage processor.

NOTE: An I²C host module (not controlled by the PRM module) can be used to program the external power IC. Because this procedure completely bypasses the PRM module, see [Section 24.1 I²C](#).

Figure 3-12 highlights the voltage control path available within a generic memory voltage management block to control the voltage supply to the device memory voltage domains.

Figure 3-12. Generic Memory Voltage Management

The PRCM hardware supports automatic scaling down of the memory array supply whenever they transition to RETENTION or OFF power state. The device power manager FSM manages the voltage scaling of memory voltage domains through memory voltage controller (or LDO).

3.1.1.3.3 AVS Overview

SmartReflex is a power-management technique used for controlling the operating voltage of a device to reduce its active power consumption.

With SmartReflex, the power-supply voltage is adapted to the silicon performance in two ways:

- Statically adapted to the manufacturing process of a given device
- Dynamically adapted to the temperature-induced current performance of the device

SmartReflex achieves optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variations.

The static correction of the device voltage level (see [Figure 3-13](#)) is based on the desired performance level and silicon performance characteristics of the device. Due to process dispersion, each die has its specific silicon performance. The range of the process distribution defines the weak devices (low-performance silicon) and the strong devices (high-performance silicon).

A weak device is a device with the lowest performance tolerated for a process distribution; that is, at the typical voltage, the inherent maximum frequency is the lowest frequency of the chip distribution. Considered as the worst case, weak devices are used to constrain the target frequency of all the chips (OPP definition).

A strong device is a device with the highest performance tolerated for a process distribution. The inherent maximum frequency at the typical voltage is greater than the targeted frequency.

[Figure 3-13](#) identifies the fact that, with SmartReflex voltage-control architecture, it is possible to compensate for the device silicon characteristics and obtain optimal performance characteristics. Based on the device characteristics, the device voltage level can be adjusted for specific performance level.

Figure 3-13. SmartReflex Static Voltage Adjustment

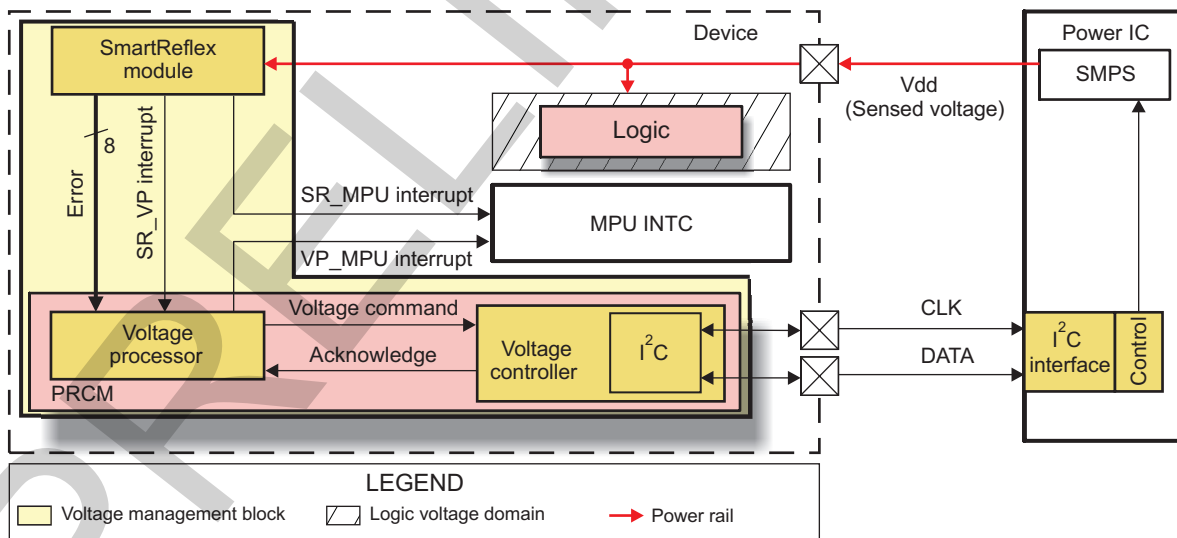

prcm-013

The dynamic correction of the device voltage is based on the real-time comparison of predefined performance points to the on-chip measured performance level. The device voltage level is raised or lowered to compensate for temperature-induced performance variations.

Without SmartReflex, the voltage variation is around the nominal voltage level and not controlled through any active dynamic compensation. This leads to power waste.

Figure 3-14 is a functional overview of the SmartReflex voltage-control architecture of the device connected to an external power IC.

Figure 3-14. SmartReflex Voltage Control Functional Overview

prcm-015

SmartReflex voltage control consists of the following modules:

- SmartReflex
- MPU INTC
- Voltage processor
- Voltage controller

- I²C interface
- SMPS

The SmartReflex module senses input voltage (V_{dd}) and generates an error value that identifies the difference between the desired optimal voltage and the actual value of the SMPS. This error value is set in an internal register (for software read, if necessary) and is also passed to the voltage processor.

The voltage processor converts the error value to a voltage command that defines the change in the output voltage of the SMPS required to bring it to the desired voltage level.

The voltage command is sent to the voltage controller, which passes it to the power IC through the dedicated I²C interface. The power IC then adjusts the output voltage of the SMPS according to the command.

In this way, the SmartReflex module dynamically adjusts the SMPS voltage to compensate for voltage variations.

The device supports Class-1.5 or software-controlled operational mode for SmartReflex voltage control.

3.1.1.3.3.1 Class-1.5 SmartReflex Voltage Control

In SmartReflex Class-1.5, the calibration procedure is triggered by the user software (for example once per day or week) to account for device aging. Additional temperature margins are fused, thus no user software is involved. .

3.1.2 Power-Management Techniques

The following sections describe the state-of-the-art power-management techniques supported by the device.

NOTE: The values in [Figure 3-15](#) through [Figure 3-17](#), which show power-management techniques, are hypothetical. They do not represent valid test results on the device.

3.1.2.1 Standby Leakage Management

Standby leakage management (SLM) is a power-management technique that reduces standby power consumption by reducing power leakage.

With SLM, the device switches into low-power system modes automatically or in response to user requests during system standby (that is, in situations when no application is started and system activity is negligible or limited).

When applying SLM, the system remains in the lowest static power mode compatible with the system response time requirement.

This technique trades static power consumption for wake-up latency.

3.1.2.2 Dynamic Voltage and Frequency Scaling

Dynamic voltage and frequency scaling (DVFS) consists of minimizing the idle time of the system. The DVFS technique uses dynamic selection of the optimal operating frequency and voltage to allow a task to be performed in the required length of time. This reduces the active power consumption (power consumed while executing a task) of the device while still meeting task requirements.

NOTE: The values in [Figure 3-15](#) are hypothetical. They are meant only to clarify the concept and do not represent valid test results on the device.

Figure 3-15. Comparison of Energy Consumed With/Without DVFS

Figure 3-15 shows the DVFS technique by comparing a process executed at maximum frequency and operating voltage without applying DVFS to the same process executed at optimal frequency and voltage using DVFS, based on the task requirements. If a task that must terminate in 4 seconds is performed at maximum operating frequency (left side of the figure), it terminates in 1 second, and the remaining 3 seconds are spent in idle mode. With DVFS (right side of the figure), the operating frequency is reduced to an optimal level; the task takes the full 4 seconds to complete, but power consumption is reduced. In addition, the voltage can be reduced further to save power so the dynamic and leakage power consumption are reduced.

DVFS requires control over the clock frequency and the operating voltage of the device elements. By intelligently switching the individual elements of the device to their OPPs, the power consumption of the device for a given task can be minimized.

For practical reasons related to device making (flow, tools), DVFS can be used only for a few discrete steps, not over a continuum of voltage and frequency values. Each step, or OPP, is composed of a voltage (V) and frequency (F) pair. For an OPP, the frequency corresponds to the maximum frequency allowed at a voltage, or reciprocally; the voltage corresponds to the minimum voltage allowed for a frequency.

When applying DVFS, a processor or system always runs at the lowest OPP that meets the performance requirement at a given time. The user determines the optimal OPP for a given task and then switches to that OPP to save power.

3.1.2.3 Dynamic Power Switching

Like DVFS, dynamic power switching (DPS) is a power-management technique aimed at reducing active power consumption of a device. However, whereas DVFS reduces the dynamic and leakage power consumption, DPS reduces only leakage power consumption, at the expense of a slight overhead in dynamic power consumption.

With DPS, the system switches dynamically between high- and low-consumption system power modes during system active time. When DPS is applied, a processor or system runs at the highest OPP (maximum frequency and voltage) to complete its tasks quickly, followed by an automatic switch to a low-power mode, for minimum power consumption. DPS is useful when a real-time application is waiting for an event. The system can switch into a low-power system mode if the wake-up latency conditions allow it.

This technique consists of maximizing the idle period of the system to reduce its power consumption.

NOTE: The values in Figure 3-16 are hypothetical. They are meant to clarify the concept only and do not represent valid test results on the device.

Figure 3-16. Comparison of Energy Consumed With/Without DPS

Figure 3-16 compares the behavior of power consumption for the same device operation without DPS (left side of the figure) and with DPS (right side of the figure). When operating without DPS, the device has a constant leakage current in idle mode. By using DPS, the system reduces the leakage current to zero. However, the transitions between system power modes may require storing the information before entering a low-power inactive state and restoring the information after a wake-up event (see Figure 3-16). This results in additional dynamic power consumption, referred to as the transition overhead (see Figure 3-16). Transition overhead must be considered for a DPS operation.

For efficient deployment of DPS techniques, it is necessary to predict dynamically the performance requirement of the applications running on the processor. The DPS controller must account for the overhead of wake-up latencies related to domain switching and ensure that they do not significantly affect the performance of the device. Even with transition overhead, however, the user can identify an optimal idle-time limit, after which the DPS is useful for dynamic power-saving.

3.1.2.4 Adaptive Voltage Scaling

SmartReflex-based AVS is a power-management technique for automatic control of the operating voltages of the device to reduce active power consumption.

With SmartReflex, power-supply voltage is adapted to silicon performance, either statically (based on performance points predefined in the manufacturing process of a given device) or dynamically (based on the temperature-induced real-time performance of the device). A comparison of these predefined performance points to the real-time on-chip measured performance determines whether to raise or lower the power-supply voltage.

AVS achieves the optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variation. The device voltage is automatically adapted to maintain performance of the device. This ensures optimal power consumption for a given OPP.

With AVS, the frequency steps are identified and the voltage is adapted according to the silicon performance of the device. In this case, instead of a voltage step for each frequency step, there is a corresponding range of voltages. The range depends on the fabrication process of the device and its real-time operating state (temperature) at a given frequency.

3.1.2.5 Adaptive Body Bias

The device implements transistor body bias techniques for optimizing the performance and power of some operating points.

Adaptive body bias (ABB) is based on the process corner and the current OPP. This is configured in the efuse at the device characterization and is not continuously updated. A dedicated LDO, that is, VDDLDO, is used to produce the voltage bias.

3.1.2.6 Combining Power-Management Techniques

The power-management techniques previously described have specific features and are most effective when used under the specific operating conditions of the device. Hence, the best active power savings are obtained by combining the DVFS, DPS, SLM, and AVS techniques. For a given operating state, one or more of the power-saving techniques can be applied to ensure optimal operation with maximum power saving.

AVS can be used at boot time to adapt the voltage to device process characteristics (strong/weak) and then used continuously to compensate temperature variations. AVS can also ensure maximum available application performance of the device at a given OPP.

When medium application performance is required, or when application performance requirements vary, DVFS can be applied. The voltage and frequency can be scaled to match the closest OPP that meets the performance requirement.

When application performance requirements fall between two OPPs, or when a low application performance is required that is below the lowest performance OPP, DPS can be applied to switch to low-power mode.

When combining DVFS and DPS, the operating frequency must not be scaled to match the performance requirement without scaling the voltage. Lower operating frequency increases task completion time and reduces idle time. This prevents DPS or reduces its efficiency (DPS becomes more effective as idle time increases). Unless DPS cannot be applied for other reasons, for a given operating point of DVFS the operating frequency must always be set to the maximum allowed at a given voltage. This ensures optimal process completion time and application of DPS.

If DPS cannot be applied in a given context, scaling the frequency while keeping the voltage constant does not save energy; it does, however, reduce peak power consumption. This can have a positive effect on temperature dissipation and battery life.

SLM must be used when no applications are running and performance requirement drops to zero.

NOTE: The OPPs shown in [Figure 3-17](#) are only for indication and clarity of text. They do not correspond to validated OPPs of the device.

Figure 3-17. Performance Level and Applied Power-Management Techniques**3.1.2.6.1 DPS Versus SLM**

DPS and SLM are similar concepts: they consist of switching the system between high- and low-power consumption modes. However, their operating timescales differ, principally in the latency allowed for mode transitions.

DPS is generally used in an applicative context (tasks are started). Therefore, mode transitions are related to system performance requirements or the processor load. DPS transition latencies must be small (typically between 10 μ s and 100 μ s) compared to the time constraints or deadlines of the application so that they do not degrade application performance. DPS requires performance prediction to ensure that transition latencies do not deteriorate device performance to the point that real-time application deadlines are missed or the user experience degrades too much for an interactive application.

SLM is not used in an applicative context (no task started). Mode transitions are related more to system responsiveness, and the transition latencies must be small compared to user sensitivity so that they do not degrade the user experience. For SLM, transition latencies are typically 1 ms to 10 ms or more.

DPS and SLM also differ in the type of wake-up event used to exit low-power idle mode. For DPS, wake-up events are application-related (timer, DMA request, peripheral interrupt, etc.); for SLM, wake-up events are user-related (touch screen, key pressed, peripheral connections, etc.).

3.2 PRCM Subsystem Overview

3.2.1 Introduction

The power-management framework of the device significantly reduces dynamic power consumption and static leakage current to extend the life of the battery in the end product. This framework incorporates support for state-of-the-art power-management techniques. It ensures optimal device operation with significantly reduced power consumption. The power-management framework (PMFW) of the device is split over the following modules:

- SCRM: Handles system-level (with one or more devices) clock and reset distribution and management.
- PRCM: A logical module composed of following three physical submodules:
 - PRM: Handles device-level power and reset management. It also handles some clocks in the device. This module always remains on, unless no power is supplied to the device pads.
 - CM1: Handles device-level clock management 1. This module remains always on unless the device is switched to off mode or no power is supplied to the device pads.
 - CM2: Handles device-level clock management 2. This module does not remain always on. It is switched to full-retention mode when its power domain (PD_CORE) is in RETENTION state. It is off when either the device is switched to off mode or no power is supplied to the device pads.
- SR_MPU, SR_IVA, and SR_CORE (SmartReflex): Handle AVS features

Together, these modules provide enhanced power-management features with the centralized control for the clock, reset, and power-management signals in the device.

The device supports the power-management techniques with the following features:

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows any combination of domain on/off states
- Clock tree with selective clock-gating conditions
- Hardware-controlled reset sequencing management
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Support for hardware-controlled autogating of module clocks
- Memory retention capability for preserving memory contents in low-power sleep mode
- DVFS support for the processor and peripherals
- AVS support for the processor and peripherals, for real-time performance adjustments
- Support for low-power device off mode input/output (I/O) pad configuration for minimum power consumption when in OFF power state

The PMFW interfaces with all the components of the device for power, clock, and reset management through associated control signals. It integrates enhanced features to let the device adapt energy consumption dynamically according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

The power-management modules are fully configurable through their level 4 (L4) interface ports.

[Figure 3-18](#) is an overview of the power-management modules and their internal connections with a generic power domain.

Figure 3-18. PMFW Overview

3.2.2 Power-Management Framework Features

The power-management modules have the following features:

- Manage independent power domains
- Control scalable logic voltage domains and selectable voltage modes for memory voltage domains
- Handle standby, idle, and wake-up procedures for the modules of the device
- Allow software and partial hardware control
- Monitor and handle wake-up events
- Control system clock and reset input sources
- Manage and distribute clocks and resets with high control granularity
- Handle power-up sequences
- Debug and emulation features
- Allow adaptive and dynamic voltage scaling feature through dedicated high-speed (HS) master I²C interface
- Control of RFF of device modules to support DPS

3.3 PRCM Subsystem Environment

The modules of the PMFW receive the external reset, clock, and power signals. See [Figure 3-18](#).

NOTE: In the remainder of this chapter, power IC refers to a peripheral power source IC that is interfaced with the device. It receives power control commands (voltage scaling and power switching) from the device and provides the necessary voltages and reset signals.

The following sections describe the interfaces for external clock, reset, and power sources.

3.3.1 External Clock Signals

The SCRM module receives a low-frequency clock input, sys_32k, at 32-kHz frequency. It can receive high-frequency system clock through two possible inputs: fref_slicer_in or fref_xtal_in. The fref_slicer_in supplies the input clock to an on-chip slicer, while fref_xtal_in can be used as external crystal connection for internal high-frequency clock generation through an on-chip oscillator.

The SCRM can output six alternate clocks, fref_clk[0:5]_out. Output clocks 1 to 4 can be gated or enabled through associated clock request signals, fref_clk[1:4]_req.

[Table 3-21](#) lists the external clock pins, signal names, their direction, associated modules, description, and reset values of the signals. If the signal is input to the device, the module is the destination module for the signal. If the signal is an output from the device, the module is the source module of the signal.

Table 3-21. External Clock Signals

| Pin | Signal | I/O ⁽¹⁾ | PMFW Module | Description | Module Reset Value |
|-------------------|--------------|--------------------|-------------|---|--------------------|
| sys_32k | SYS_32K | I | SCRM | 32-kHz clock input | Z |
| fref_clk_ioreq | SYSClk_REQ | I/O | SCRM | System clock request. Input when pins sysboot6=0 and sysboot7=0. Otherwise output. | Z |
| fref_slicer_in | SLICER_IN | I | SCRM | System clock input to the slicer. It can be a sinusoidal or square input signal. Otherwise, it may serve as an alternate clock input (SYS_ALTCLK) to an internal peripheral. ⁽²⁾ | Z |
| fref_slicer_AZ | SLICER_AZ | I | SCRM | Connected to ground at package level | Z |
| fref_xtal_in | XTAL_IN | I/O | SCRM | Oscillator drive input from crystal or alternate square clock input (SYS_ALTCLK) ⁽²⁾ | Z |
| fref_xtal_out | XTAL_OUT | O | SCRM | Oscillator drive output to crystal | Unknown |
| fref_clk[1:4]_req | CLK[1:4]_REQ | I | SCRM | Auxiliary clocks request | Z |
| fref_clk[0:5]_out | CLK[0:5]_OUT | O | SCRM | Auxiliary clocks outputs 0 to 5 | 0 |

⁽¹⁾ I = Input; O = Output; I/O = bidirectional

⁽²⁾ SYS_ALTCLK can be sourced by fref_slicer_in or fref_xtal_in based on SYSBOOT[7:6] settings. For more information, see [Section 28.2.4.1, Clock Source Selection](#).

The auxiliary clocks are controlled by the configuration of the SCRM.AUXCLK <clock id> (where clock ID can be 0 to 5); for example, fref_clk1_out is controlled by the SCRM.AUXCLK0 register. It controls the following features:

- Select the clock off output polarity
- Source clock input:
 - System clock
 - Clock from DPLL_CORE
 - Clock from DPLL_PER
- Initiate software-generated request
- Software-controlled clock gating
- Divide factor configuration from 1 to 16

The bidirectional fref_clk_ioreq pad can be used to manage the external system clock request and

auxiliary clock request 0. With this implementation, it is not expected to externally drive the system clock request when the SoC is the clock requester. This implementation requires programming the SCRM accordingly, in case the SoC needs the external system clock request. The programming consists in setting the [AUXCLK0\[9\]](#) DISABLECLK bit to 1 and the [AUXCLKREQ0\[4:2\]](#) MAPPING bit to 0. Without these settings the SCRM would incorrectly interpret an external clock request as an auxiliary clock request 0.

The SCRM must enable the output buffer of this bidirectional pad as long as it needs to request the external clock source, and the output buffer must be put in HiZ when it no longer needs the system clock source.

3.3.2 External Boot Signals

The PRM receives SYSBOOT[5:0] information by external pins sys_boot[5:0]. They are used to select interfaces or devices for the booting list. For more information, see [Section 28.2.4.2, Booting Device Order Selection](#).

The PRM receives SYSBOOT[7:6] information by external pins sys_boot[7:6]. It defines device source clock configuration. For more information, see [Section 28.2.4.1, Clock Source Selection](#).

[Table 3-22](#) lists the external boot pins, signal names, their direction, associated modules, description, and reset values of the signals. If the signal is input to the device, the module is the destination module for the signal. If the signal is an output from the device, the module is the source module of the signal.

Table 3-22. External Boot Signals

| Pin | Signal | I/O ⁽¹⁾ | PMFW Module | Description | Module Reset Value |
|-----------|----------|--------------------|-------------|---------------------------------|--------------------|
| sys_boot0 | SYSBOOT0 | I | PRM | System boot configuration pin 0 | Z |
| sys_boot1 | SYSBOOT1 | I | PRM | System boot configuration pin 1 | Z |
| sys_boot2 | SYSBOOT2 | I | PRM | System boot configuration pin 2 | Z |
| sys_boot3 | SYSBOOT3 | I | PRM | System boot configuration pin 3 | Z |
| sys_boot4 | SYSBOOT4 | I | PRM | System boot configuration pin 4 | Z |
| sys_boot5 | SYSBOOT5 | I | PRM | System boot configuration pin 5 | Z |
| sys_boot6 | SYSBOOT6 | I | SCRM | System boot configuration pin 6 | Z |
| sys_boot7 | SYSBOOT7 | I | SCRM | System boot configuration pin 7 | Z |

⁽¹⁾ I = Input; O = Output; I/O = bidirectional

3.3.3 External Reset Signals

The SCRM manages three reset signals:

- Power-on reset input on sys_nrespwron pin
- Power-on reset output on sys_pwron_reset_out pin
- Warm reset on sys_nreswarm pin

sys_nrespwron is asserted at device power up to reset the full logic in the device. The SCRM asserts the sys_pwron_reset_out signal to reset any associated external peripherals.

sys_nreswarm is a bidirectional pin. It can be activated at any time by an external device or an external reset push button action to cause a global warm reset event. The SCRM then holds sys_nreswarm to be driven out and maintained for a limited length of time at the boundary of the device. In this way, the device and its related peripherals are reset together.

The sys_reswarm and sys_nrespwron signals are active low. The sys_pwron_reset_out signal is also active low, and active means that the peripheral is under reset.

[Table 3-23](#) lists the external reset pins, signal names, their direction, associated modules, description and reset values of the signals. If the signal is input to the device, the module is the destination module for the signal. If the signal is an output from the device, the module is the source module of the signal.

Table 3-23. External Reset Signals

| Pin | Signal | I/O ⁽¹⁾ | PMFW Module | Description | Module Reset Value |
|---------------------|-------------------|--------------------|-------------|--|--------------------|
| sys_nreswarm | SYS_WARM_RST | I/O | SCRM | Warm reset input and output | 0 |
| sys_nrespwron | SYS_PWRON_RST_IN | I | SCRM | Power-on reset input | Z |
| sys_pwron_reset_out | SYS_PWRON_RST_OUT | O | SCRM | Power-on reset to external peripherals | 0 |

(1) I = Input; O = Output; I/O = Bidirectional

3.3.4 External Power Control Signals

The power control signals let the PMFW modules control the device voltage levels.

The voltage level of the scalable voltage sources in the external power IC can be scaled by sending commands to the power IC through a PRCM module dedicated I²C interface. The sr_scl and sr_sda are the clock and data pins, respectively, for this I²C interface.

The PRCM module can also command the external power IC to switch the device voltages to off level when the device is in off mode and reactivate them when it wakes up. This is managed through the signal on the sys_pwr_req pin.

Table 3-24 lists the signals, I/Os, and module reset values for the signals to the external power IC.

Table 3-24. Power Control Interface

| Pin | Signal | I/O ⁽¹⁾ | PMFW Module | Description | Module Reset Value |
|-------------|---------|--------------------|-------------|---|--------------------|
| sr_scl | SR_SCL | I/O | PRM | The SmartReflex dedicated I ² C interface clock line | 1 |
| sr_sda | SR_SDA | I/O | PRM | The SmartReflex dedicated I ² C interface data line | 1 |
| sys_pwr_req | PWR_REQ | O | PRM | Power request to external power IC, to exit device off mode. | 1 |

(1) I = Input; O = Output; I/O = bidirectional

3.3.5 External Voltage Inputs

Table 3-25 lists the external voltage sources related to the PRCM module.

NOTE: Table 3-25 highlights only the voltage sources that are either directly managed by the PRCM module or are received by parts of the PRCM module (for example, DPLLs, LDOs, etc.). It does not give the device voltage sources not directly associated with the PRCM module.

Table 3-25. Voltage Sources

| Pin | Signal | Managed by the PRCM | Description |
|----------------|----------------|---------------------|--|
| vdd | VDD_CORE_L | Yes (AVS and DVFS) | Supplies VDD_CORE_L logic voltage domain |
| vdd_mpu | VDD_MPU_L | Yes (AVS and DVFS) | Supplies VDD_MPU_L logic voltage domain |
| vdd_iva_audio | VDD_IVA_L | Yes (AVS and DVFS) | Supplies VDD_IVA_L logic voltage domain (that is, DSP and IVAHD) |
| vdda_dpll_core | VDDA_DPLL_CORE | No (fixed) | DPLL_CORE analog power supply |
| vdda_dpll_mpu | VDDA_DPLL_MPU | No (fixed) | DPLL_MPU analog power supply |
| vdda_dpll_iva | VDDA_DPLL_IVA | No (fixed) | DPLL_IVA analog power supply |
| vdda_dpll_per | VDDA_DPLL_PER | No (fixed) | DPLL_PER analog power supply |

Table 3-25. Voltage Sources (continued)

| Pin | Signal | Managed by the PRCM | Description |
|-------------------------|-------------------------|---------------------|---|
| vdda_dpll_audio | VDDA_DPLL_AUDIO | No (fixed) | DPLL_AUDIO analog power supply |
| vdda_slicer | VDDA_SLICER | No (fixed) | Clock slicer power supply |
| vdd_osc | VDD_OSC | No (fixed) | Clock oscillator core power supply |
| vdda_ldo_sram_mpu | VDDA_LDO_SRAM_MPU | No | Supplies LDO_MPU_M for MPU Cortex-A9 SRAM |
| vdda_ldo_sram_iva_audio | VDDA_LDO_SRAM_IVA_AUDIO | No | Supplies LDO_IVA_M for IVA SRAM |
| vdda_ldo_sram_core | VDDA_LDO_SRAM_CORE | No | Supplies LDO_CORE_M for CORE SRAM |
| vdda_ldo_emu_wkup | VDDA_LDO_EMU_WKUP | No | Supplies LDO_WAKEUP for WAKEUP/EMU logic |
| vdda_bdgp | VDDA_BDGP | No (fixed) | Bandgap supply input |
| vdda_vbldo_mpu | VDDA_VBBLDO_MPU | No | MPU VBB LDO supply input |
| vdda_vbldo_iva_audio | VDDA_VBBLDO_IVA | No | IVA VBB LDO supply input |

3.3.6 External Wake-Up Signals

A pre-wakeup request input goes directly to the PRCM module. It is used to wake up the device before the C2C_WAKEREQ_IN is asserted.

Table 3-26 lists the wake-up signal information.

Table 3-26. Wake-Up Signals

| Pin | Signal | Description |
|-----------|-----------|----------------|
| c2c_pwkup | C2C_PWKUP | C2C pre-wakeup |

3.4 PRCM Subsystem Integration

The internal configuration registers of the power-management modules can be accessed for configuration and control through their respective WKUP_L4 interconnect. In addition to the L4 interconnect, the internal modules interface contains the following interfaces and signals:

- A set of signals for idle/wake-up control for each module
- Clocks and reset signals for the modules
- Power control signals (switches and memories) to the power domains
- Interrupts to the MPU Cortex-A9, MPU Cortex-M3, and DSP INTCs
- Voltage error commands from the SmartReflex modules to the external power IC
- Phase-locked loop (PLL) control commands for recalibration and bypass of the digital phase-locked loops (DPLLs)

Figure 3-18 shows details of the control interface to a generic power domain.

3.4.1 Device Power-Management Layout

The PMFW sees the device split into voltage domains, power domain, and clock domains. Table 3-27 lists the device-level view with modules association to clock domains, power domains, and voltage domains.

Table 3-27. PMFW Device-Level Layout

| Voltage Domain | Power Domain | Clock Domain | Module |
|----------------|---------------|-------------------------------|----------------------|
| LDO_WAKEUP | PD_EMU | CD_EMU | DEBUG |
| | | N/A (the PRCM module itself) | CM1_EMU |

3.4.2 Power-Management Scheme, Reset, and Interrupt Requests

3.4.2.1 Power Domain

Table 3-28 lists the PMFW modules and their associated power domains.

Table 3-28. PMFW Module Power Domains

| PMFW Module | Power Domain |
|-------------|---------------|
| SCRM | PD_WKUP |
| PRM | PD_WKUP |
| CM1 | PD_ALWON_CORE |
| CM2 | PD_CORE |
| SR_MPU | PD_ALWON_CORE |
| SR_IVA | PD_ALWON_CORE |
| SR_CORE | PD_ALWON_CORE |

The PRM part of the PRCM module is in the PD_WKUP power domain, which is continuously active. It is composed of the logic that must be permanently supplied to manage domain power-state transitions and detect wake-up events.

The CM1 part of the PRCM module is in the PD_ALWON_CORE power domain, which is an always-on power domain, while the CM2 part of the PRCM module is in the PD_CORE power domain, which can be activated and deactivated according to the requirements of the executing applications.

3.4.2.2 Resets

The PMFW modules are reset by independent reset signals (see [Table 3-29](#)).

Table 3-29. PMFW Module Reset Signals

| PMFW Module | Reset Signal |
|-------------|--------------------------------------|
| SCRM | SYS_PWRON_RST_IN |
| PRM | SYS_PWRON_RST_IN |
| CM1 | ALWON_CM1_PWRON_RST ALWON_CM1_RST |
| CM2 | CM2_PWRON_RET_RST CM2_RET_RST |
| SR_MPU | ALWON_CORE_RST |
| SR_IVA | ALWON_CORE_RST |
| SR_CORE | ALWON_CORE_RST |

NOTE: See [Section 3.5.3, Reset Sources](#) for details on the reset trigger sources and assertion conditions.

3.4.2.3 Interrupt Requests

The PMFW modules can generate following interrupts listed in [Table 3-30](#).

Table 3-30. PMFW Module Interrupts

| Source PMFW Module | Source Signal Name | Destination Interrupt Controller | Destination Signal Name |
|--------------------|--------------------|----------------------------------|-------------------------|
| PRCM | PRCM_MPU_IRQ | CORTEX-A9_MPU_INTC | MA_IRQ_11 |
| PRCM | PRCM_M3_IRQ | CORTEX-M3_MPU_INTC | MM_IRQ_31 |
| PRCM | PRCM_DSP_IRQ | DSP_INTC | D_IRQ_57 |

3.5 Reset Management Functional Description

3.5.1 Overview

In the device the reset scheme is managed by the following modules:

- SCRM: System-level reset management. It provides correct reset routing and sequencing when one or more devices are stacked together in the same package.
- PRM: Device-level reset management

3.5.1.1 SCRM Reset Management Functional Description

The SCRM handles the device power-on and warm reset pads: sys_nrespwron and sys_nreswarm resets. Its tasks basically consist of:

- Extending reset duration beyond the pad reset release
- Routing the device pad resets to the reset manager in the PRM module

The SCRM is functionally sensitive to the device power-on reset. However, some of the register bits of SCRM registers are reset when a device warm reset occurs.

3.5.1.1.1 Power-On Reset

The SCRM receives the device power-on reset on the sys_nrespwron reset pad of the device. It extends the power-on reset duration to the device PRM module at least until a stable 32-kHz clock can be provided to it. The 32-kHz clock version of the device is active once the SCRM releases the internal power-on reset. The SCRM automatically deasserts the reset.

The SCRM automatically requests the system clock under a power-on reset condition. This mechanism is functionally active on the 32-kHz clock.

The power-on reset can also be asserted through software control. Software must enable the software reset assertion feature by setting the SCRM.[EXTPWONRSTCTRL](#)[0] ENABLE bit and then by setting the SCRM.[EXTPWONRSTCTRL](#)[1] PWRONRST bit to assert the reset.

3.5.1.1.2 Warm Reset

The device warm reset can be received from an external source through:

- warm reset pad sys_nreswarm
- from the device PRM module as a result of internal event
- general core Control Module thermal shutdown output - TSHUT

The SCRM extends the device pad warm reset duration to the device PRM module.

The SCRM routes a warm reset source (that is, sys_nreswarm pad/PRM module) to a warm reset destination (that is, PRM module).

This routing of reset from the device pad to the PRM is enabled and disabled using the SCRM.[EXTWARMRSTCTRL](#) register. It is enabled by default.

The source of a warm reset, for each destination is logged in the corresponding SCRM.[EXTWARMRSTST_REG](#) register. The status of the reset source is logged when the destination reset is released. This is done at 32-kHz clock.

Software must clear the reset status bit.

The general core Control Module thermal shutdown output (TSHUT) can be programmed as a source of a hardware warm reset, which is triggered when the device die temperature crosses a programmable FATAL threshold. For more information about the TSHUT warm reset generation, see section **Thermal Shutdown Functionality Comparators** of the **Control Module** chapter.

3.5.1.2 PRM Reset Management Functional Description

The PRM module manages the resets to all power domains inside the device.

NOTE: The PRM module has no knowledge or control over resets generated locally within a module (for example, through configuration register bit Module name_SYSCONFIG[x] SOFTRESET). Software reset has the same effect on the module logic as a hardware reset.

All PRM reset outputs are asynchronously asserted, while the deassertion is synchronous to the SYS_CLK clock. The reset managers in PRM use this clock for internal stall (delay) counter to delay deassertion of reset when the input reset source is deasserted.

In each power domain, one or more reset domains are defined. A reset domain is defined by a unique reset signal that originates from the reset manager and is connected to one or more modules of the device. All the connected modules of the reset domain are reset simultaneously when the reset signal is asserted. Independent control of these reset domains allows sequencing of the release of resets and ensures a safe reset of the entire power domain.

NOTE: All internal reset signals are active low, except for the DPLL reset signals, which are active high.

3.5.2 General Characteristics of Reset Signals

Reset signals can be categorized based on four criteria:

- Scope: Global or local reset
- Occurrence: Cold or warm reset
- Source type: Software or hardware triggered reset
- Retention type: Retention reset or nonretention reset

3.5.2.1 Scope

A reset signal can be categorized according to its scope (the area of the device affected by the reset):

- Global reset: Affects the entire logic of the device; all modules are reset. Generally, occurs when the device powers up or an abnormal operation is detected (the eFuse bad device is detected, etc.).
- Local reset: Affects one power domain, reset domain, or module. Generally, when a power domain transitions from off mode to active mode, or when a software-reset control bit for a domain is set, only the group of modules within that domain is affected.

3.5.2.2 Occurrence

A reset signal can be categorized depending on when the reset occurs:

- Cold reset: Occurs only on device power up or in certain emulation modes. The cold reset is a global reset that affects every module in the device. It usually corresponds to the initial power-on reset.
- Warm reset: Occurs when the device is in normal operating state. A module may use a warm reset to reset a subset of its logic. This is often done to speed up reset recovery time; that is, the time to transition to a safe operating state, compared to the time required upon receipt of a cold reset. Warm reset events include software-triggered reset per power domain, watchdog time-out, externally triggered and emulation initiated.

Modules that behave differently in cold reset and warm reset have two reset signals: RST and PWRON_RST. These reset signals reconstruct warm reset and cold reset in modules that require them.

The following modules are reset upon global cold reset events and not upon global warm reset events:

- All DPLLs associated with the PRCM
- All eFuses
- EMIF
- Control module – All the module instances in the PD_WKUP power domain

NOTE: For information about the PRCM module registers affected by the global warm reset, see the register description in [Section 3.11](#), *PRCM Register Manual*.

3.5.2.3 Source Type

A reset can be categorized depending on whether it is software-controlled or hardware-triggered:

- Software reset: Triggered by setting a bit in a configuration register of the PRCM module
- Hardware reset: Triggered by a signal from a hardware module inside or outside the PRCM module

3.5.2.4 Retention Type

The Power Domain Manager in PRM controls the assertion of two types of local cold reset sources, retention and nonretention reset. They are identified by the naming convention PowerDomain_DOM_RET_RST and PowerDomain_DOM_RST, respectively.

Upon transitioning a power domain to the ON-ACTIVE power state from the OFF power state:

- Retention type reset source is always asserted.
- Nonretention type reset source is always asserted.

Upon transitioning a power domain to the ON-ACTIVE power state from the RETENTION power state:

- Retention type reset source is never asserted.
- Nonretention type reset source is optionally asserted. The software-selectable option enables the PRM to support two retention mechanisms: CSWRET and OSWRET. Nonretention type reset source has following behavior:
 - It is asserted in-case of power domain state transition from OSWR-RETENTION state.
 - It is not asserted in-case of power domain state transition from CSWR-RETENTION state.

3.5.3 Reset Sources

The reset sources triggering the reset managers in the PRM are listed in this section.

3.5.3.1 Global Reset Sources

[Table 3-31](#) lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all the device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the reset triggering bit is identified.

Table 3-31. Global Reset Sources

| Type ⁽¹⁾ | Name | Source/Control | Description |
|---------------------|-----------------------|---|--|
| H/C | SYS_PWRON_RST | Received from SCRM through input pin or through software control | The entire device is reset on power up. |
| H/W | SYS_WARMIN_RST | Received from SCRM through input pin or through software control | External hardware warm reset |
| S/C | GLOBAL_COLD_SW_RST | PRCM module. PRM_RSTCTRL[1] RST_GLOBAL_COLD_SW | Global software cold reset |
| S/W | GLOBAL_WARM_SW_RST | PRCM module. PRM_RSTCTRL[0] RST_GLOBAL_WARM_SW | Global software warm reset |
| H/W | VDD_CORE_VOLT_MGR_RST | PRCM | Asserted by the voltage manager FSMs when no response from the power IC is received during wake-up transition from retention or off mode |
| H/W | VDD_IVA_VOLT_MGR_RST | PRCM | |
| H/W | VDD_MPU_VOLT_MGR_RST | PRCM | |
| H/W | ICEPICK_RST | ICEPick module | It is used in emulation mode only. |
| H/W | ICEPICKPOR_RST | ICEPick module | It is used in emulation mode only. |
| H/W | CORTEXA9_WDT_RST | Either WDTIMER2 or MPU_A9 subsystem | It is triggered by a time-out event. |
| H/W | C2C_WARM_RST | C2C module | Global hardware warm reset. |

(1) H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

3.5.3.2 Local Reset Sources

In addition to the global reset sources the device can have a number of local reset sources for each power domain. The local reset sources can be cold or warm reset sources. They can be software or hardware triggered. [Table 3-32](#) identifies the possible types of hardware-triggered local cold reset sources. Some power domains may support one or both of these local cold reset sources. The table does not highlight the software-triggered local warm reset sources which are listed in the reset management section of the respective power domains. A local reset source signal received by the reset manager resets only a specific part of the device (for example, some modules/subsystems within the power domain).

Table 3-32. Local Reset Sources

| Type ⁽¹⁾ | Name | Source/Control | Description |
|---------------------|----------------------|----------------|--|
| H/C | Power domain_RET_RST | PRCM | Asserted only for a power domain state transition from OFF to ON-ACTIVE state |
| H/C | Power domain_RST | PRCM | Asserted for any power domain transition from OFF or OSWR-RETENTION state to ON-ACTIVE state |

(1) H = Hardware reset, C = Cold reset

3.5.4 Reset Domains

A power domain may receive power-on reset (PWRON_RST) and/or normal reset (RST) signals. These signals reset nonretention logic and behave as follows:

- On any global or local cold reset, RST and PWRON_RST are asserted.
- On any global or local warm reset, only RST is asserted.

A power domain may receive two additional retention logic reset signals: power-on retention reset (PWRON_RET_RST) and/or retention reset (RET_RST). These signals behave as follows:

- On any global cold reset or wakeup from OFF state to ON-ACTIVE state, RET_RST and PWRON_RET_RST are asserted.
- On any global warm reset, only RET_RST is asserted.
- On wakeup from RETENTION state, these signals are not asserted.

This section presents the trigger sources and attributes for all reset domains of the device. See [Section 3.5.3, Reset Sources](#), for an explanation of each reset trigger source of the device.

[Table 3-33](#) identifies the associated power and reset domains for each module.

[Table 3-35](#) lists the attributes of the reset manager associated with the reset domains. The clock to the reset manager, the delay count before release of reset, and the reset release stall conditions for the reset domains are listed. Apart from the identified reset release stall conditions, a universal release stall condition (that is, applicable to all reset signals) is the eFuse scan completion.

Table 3-35. Reset Domains Attributes

| Reset Domain | RM Clock | RM Clock Count | Release Stall Conditions |
|----------------------|----------|----------------|----------------------------------|
| AUDIO_PWRON_RST | SYS_CLK | 0x0 | None |
| AUDIO_RST | SYS_CLK | 0x0 | None |

| DSP_PWRON_RST | SYS_CLK | ResetTime2 ⁽¹⁾ | DSP_ROOT_CLK clock is not active, RM_DSP_RSTCTRL [1] RST2 is cleared, and automatic restore is complete. |
| DSP_RET_RST | SYS_CLK | ResetTime2 ⁽¹⁾ | DSP_ROOT_CLK clock is not active and subsystem is reset. |
| DSP_SYS_RST | SYS_CLK | ResetTime2 ⁽¹⁾ | DSP_ROOT_CLK clock is not active and subsystem is reset. |
| WKUP_PWRON_RST | SYS_CLK | 0x0 | None |
| WKUP_RST | SYS_CLK | 0x0 | None |
| WKUP_SYS_PWRON_RST | None | N/A | None |

(1) ResetTime2 is set in the [PRM_RSTTIME](#)[14:10] RSTTIME2 bit field.

NOTE: WKUP_SYS_PWRON_RST is directly connected to SYS_PWRON_RST source reset.

3.5.5 Reset Logging

A reset of the device is logged in two ways. First, dedicated registers in the PRCM module (the RM_Power domain_RSTST) log the reset sources to power domain. Second, the Control Module logs the device reset activity in dedicated registers.

3.5.5.1 PRCM Module Reset Logging Mechanism

The reset status registers RM_power domain_RSTST and RM_RSTST are reset asynchronously on assertion of a global cold reset. However, a reset status bit is always logged when the reset is released to the domain.

For this reason, after the assertion of a global cold reset, the reset status register is cleared to 0. When the domain reset is released, the register bit to log the global cold reset (the RM_Power domain_RSTST[0] GLOBALCOLD_RST bit) is updated to 1. For the same reason, the reset status register of domains released from reset by software is updated only when software releases the domain reset.

The assertion of a global cold reset prevents logging any other source of reset until after the release of the domain reset. This is valid in the following situations:

- A source of reset other than global cold reset is asserted before, during, or after the active period of a global cold source of reset and before the release of the domain reset signal.
- A source of reset other than global cold reset was asserted and then released, but a global cold reset source was asserted before the release of the domain reset signal.

3.5.6 Reset Sequences

3.5.6.1 SCRM Power-on Reset Sequence

Figure 3-19 shows the power-on reset sequence as the reset is received by the SCRM and resulting interaction between SCRM and PRCM modules. Figure 3-20 shows the power-on reset sequence within the PRCM module.

Figure 3-19. SCRM Power-On Reset Sequence

1. The power-on reset pad is released from reset while the 32 kHz is already active.
2. SCRM releases its internal power-on reset clocked at the 32-kHz clock.
3. SCRM delays the release of PRCM module resets to account for the stabilization time of the system clock source. It routes the 32-kHz clock to the PRCM module.
4. SCRM releases from reset (both power-on and warm reset) the PRCM module.
5. The PRCM module asserts a system clock request to the SCRM.
6. Once the system clock setup time counter overflows, the internal system clock version of SCRM is stable.
7. SCRM ungates the system clock to the PRCM module.

3.5.6.2 PRCM Module Power-On Reset Sequence

Figure 3-20 shows the power-on reset sequence.

Figure 3-20. PRCM Module Power-On Reset Sequence

The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The SCRM module is supplying the 32-kHz clock to the PRCM module and the clock is stable.
- The power-on reset SYS_PWRON_RST_IN has been released by the external power IC.

The power-up sequence is:

1. The SCRM releases global power-on reset to the PRCM module (that is, PRCM_SYS_PWRON_RST). As a result, the PRCM module starts the power-on reset sequence.
2. The PRCM module releases the SYS_NRES_WARM_OUT to the SCRM (only after all voltage domains have ramped-up) after some 32-kHz clock cycles, and it also asserts the APE_PRCM_SYS_CLKREQ to the SCRM module to request the system clock.

3. SCRM provides the system clock to the PRCM module when the system clock source is stable.
4. Once the Standard eFuse controller clock has been enabled by the PRCM module, the PRM releases the standard eFuse controller domain from reset. This starts the eFuse sensing sequence. Upon completion of the eFuse auto load sequence, the PRM turns off the Standard eFuse controller clock. It also powers down the standard efuse controller power domain PD_STD_EFUSE.
5. The PRM logic is then released from reset. The PRM provides the CM1 with a version of the system clock and releases the CM1 from reset.
6. The CM1 starts the reference clock (and also bypass clock) of the CORE DPLL. In turn, the CORE DPLL, which is configured in bypass mode, generates the L3 clock (running at the system clock frequency at this stage). Now the CM1 logic is fully operational: CM1 logic is released from reset and L3 clock is running.
7. The CM1 starts the L4 clock version for the CM2 and the PRM deasserts the reset of the CM2.
8. The DPLLs are released from reset. The DPLLs can be released from reset before the L3 clock is running. The DPLL being under reset does not prevent the output clock from running. The CM1 starts the reference and bypass clocks to the DPLL_MPU.
9. The CORE is released from reset, provided the L3 clock is running. The EMIF comes out of reset as soon as CORE power domain power on retention reset (CORE_PWRON_RET_RST, see [Table 3-35](#)) is released by the PRCM module. The PRCM module also releases the EMIF_DDR_PHY_PWRON_RST. The PHY_ROOT_CLK is not running at this point, hence all the PHYs are asynchronously reset at the same time. The DDR_PHY_CLK clock is started later.
10. The PRCM module releases the idle request signal to the EMIF module once the EMIF functional clock is enabled. The EMIF then acknowledges the deassertion of idle request and becomes active.
11. The Cortex-A9 MPU subsystem is released from reset provided its clock is active and the L3 interconnect is operational.

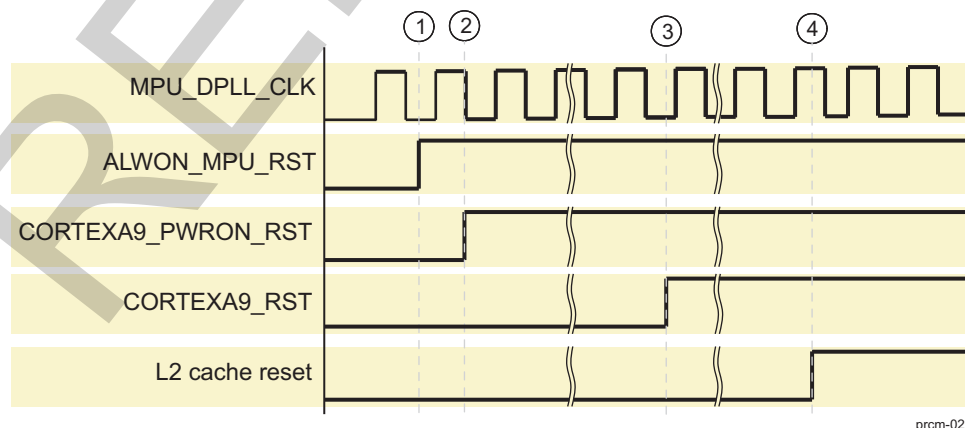

NOTE:

- PD_DSP and PD_IVAHD power domains are held under reset after power up by the assertion of software source of reset.
- PD_DSS, PD_SGX, PD_AUDIO, and PD_CAM are held under reset after power up until the PRCM module enables their interface clock.

3.5.6.3 Cortex-A9 MPU Subsystem Power-On Reset Sequence

[Figure 3-21](#) shows the power-on reset sequence of the Cortex-A9 MPU subsystem.

Figure 3-21. Cortex-A9 MPU Power-On Reset Sequence

The assumptions after power-on reset assertion are:

- The PRCM module provides the DPLL_MPU reference clock and the bypass clock.
- The PRCM module has released DPLL_MPU reset and the DPLL_MPU is in bypass mode providing the clock (that is, bypass clock) to all the modules inside the Cortex-A9 MPU subsystem.

The power-on reset sequence is:

1. The PRCM module releases asynchronously in PD_ALWON_MPU the ALWON_MPU_RST reset to the CORTEXA9_MPU_INTC module inside the Cortex-A9 MPU subsystem.
2. The PRCM module releases in PD_MPU the CORTEXA9_PWRON_RST (only after the MPU_DPLL_CLK is active) to the Cortex-A9 MPU subsystem and waits until the subsystem completes its internal reset sequence.
3. Once the Cortex-A9 MPU subsystem internal reset sequence completes, the PRCM module releases in PD_MPU the CORTEXA9_RST signal and the Cortex-A9 MPU starts booting.
4. The PRCM module releases the reset to L2 cache memory in the Cortex-A9 MPU subsystem 16 MPU_DPLL_CLK cycles after the release of CORTEXA9_PWRON_RST and CORTEXA9_RST.

NOTE:

- The reset to the L2 cache memory in the Cortex-A9 MPU subsystem is asserted during initial power-on reset (that is, when the PD_MPU wakes-up from OFF state). It is also asserted during local or global warm reset. However, it is not asserted when the PD_MPU wakes-up from RETENTION state, that is (when the logic is off and L2 memory is in RETENTION state). This ensures that the L2 cache is retained on wake-up.
- The L1 cache memory in the Cortex-A9 MPU subsystem is not retained on PD_MPU wake-up.

3.5.6.4 Cortex-A9 MPU Subsystem Warm Reset Sequence

Figure 3-22 shows the warm reset sequence of the Cortex-A9 MPU subsystem.

Figure 3-22. Cortex-A9 MPU Warm Reset Sequence

The assumptions are:

- The DPLL_MPU is locked and providing the clock to the Cortex-A9 MPU subsystem.
- A global or local warm reset to the Cortex-A9 MPU subsystem is asserted.

The warm reset sequence is:

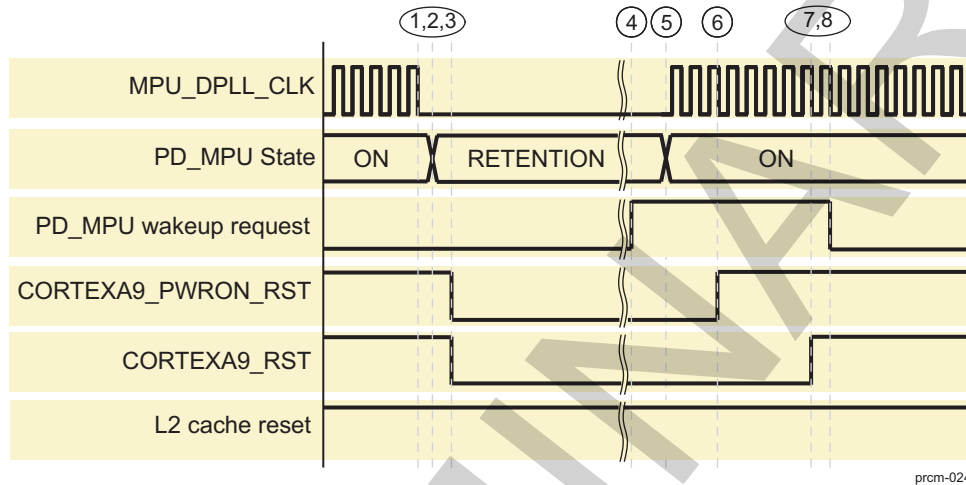

1. The PRCM module asserts in PD_ALWON_MPU the ALWON_MPU_RST reset to the CORTEXA9_MPU_INTC module inside Cortex-A9 MPU subsystem.
2. The PRCM module asserts in PD_MPU the CORTEXA9_RST reset to the Cortex-A9 MPU subsystem.
3. The PRCM module resets the L2 cache memory in the Cortex-A9 MPU subsystem by asserting its reset.
4. The PRCM module releases the ALWON_MPU_RST reset to the CORTEXA9_MPU_INTC module.
5. The PRCM module releases the CORTEXA9_RST, only after the DPLL_MPU is in bypass mode and MPU_DPLL_CLK is stable and active.
6. The PRCM module releases the reset to L2 cache memory in the Cortex-A9 MPU subsystem 16

MPU_DPLL_CLK cycles after the release of CORTEXA9_RST.

3.5.6.5 Cortex-A9 MPU Subsystem Reset Sequence On Sleep and Wake-Up Transitions From RETENTION or OFF State

Figure 3-22 shows the sleep and wake-up transitions reset sequence from RETENTION or OFF state of the Cortex-A9 MPU subsystem.

Figure 3-23. Cortex-A9 MPU Reset Sequence on Sleep and Wake-Up Transition

The assumption is:

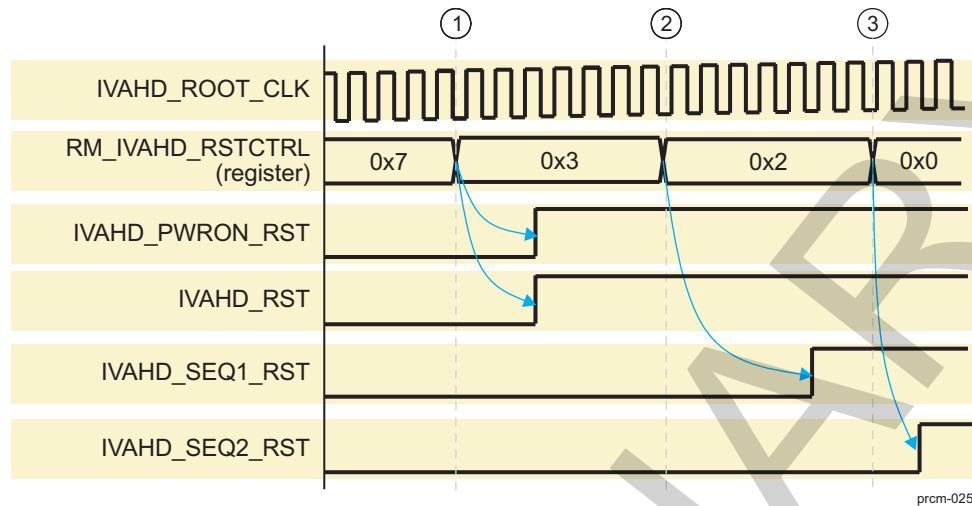

- The DPLL_MPU is locked and providing the clock to the Cortex-A9 MPU subsystem.

The sleep and wake-up transitions reset sequence is:

1. The PRCM module gates the MPU_DPLL_CLK to Cortex-A9 MPU subsystem.
2. The PRCM module switches the PD_MPU to RETENTION state.
3. The PRCM module asserts CORTEXA9_PWRON_RST and CORTEXA9_RST resets to Cortex-A9 MPU subsystem. The entire logic in the PD_MPU is held in reset. The reset to the L2 cache memory in the Cortex-A9 MPU subsystem is not asserted if the logic in the PD_MPU is held in reset.
4. The PRCM module resets the L2 cache memory in the Cortex-A9 MPU subsystem by asserting its reset.
5. The PRCM module releases the ALWON_MPU_RST reset to the CORTEXA9_MPU_INTC module.
6. The PRCM module releases the CORTEXA9_RST, only after the DPLL_MPU is in bypass mode and MPU_DPLL_CLK is stable and active.
7. The PRCM module releases the reset to L2 cache memory in the Cortex-A9 MPU subsystem 16 MPU_DPLL_CLK cycles after the release of CORTEXA9_RST.

3.5.6.6 IVAHD Subsystem Power-On Reset Sequence

Figure 3-24 shows the power-on reset sequence of the IVAHD subsystem.

Figure 3-24. IVAHD Power-On Reset Sequence

The power-on reset to IVAHD is applied when PD_IVAHD is powered. The assumptions after power-on reset assertion are:

- The PRCM module provides the functional clock IVAHD_ROOT_CLK to the IVAHD subsystem and it has been enabled by the software control.

The power-on reset sequence is:

1. Software clears the [RM_IVAHD_RSTCTRL](#)[2] RST3 bit. This causes the PRCM module to release the IVAHD_PWRON_RST reset used inside IVAHD to reset mainly the emulation logic and the IVAHD_RST reset used to reset all logic inside IVAHD. Then software can download data into TCM memory while keeping the sequencer CPUs under reset.
2. Software clears the [RM_IVAHD_RSTCTRL](#)[0] RST1 bit. This releases the IVAHD_SEQ1_RST reset to the Sequencer1 CPU.
3. Similarly, software can clear the [RM_IVAHD_RSTCTRL](#)[1] RST2 bit. This releases the IVAHD_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.7 IVAHD Subsystem Software Warm Reset Sequence

[Figure 3-25](#) shows the software warm reset sequence of the IVAHD Subsystem.

Figure 3-25. IVAHD Software Warm Reset Sequence

Before asserting the software reset to the IVAHD subsystem the MPU software must ensure that:

- IVAHD sequencer CPUs are in IDLE state ([CM_IVAHD_IVAHD_CLKCTRL](#)[17:16] IDLEST).
- The IVA HD subsystem is in STANDBY state ([CM_IVAHD_IVAHD_CLKCTRL](#)[18] STBYST).
- The functional clock to the IVAHD subsystem has been gated by the PRCM module ([CM_IVAHD_CLKSTCTRL](#)[8] CLKACTIVITY_IVAHD_CLK).

The software reset sequence is:

1. The MPU software sets the [RM_IVAHD_RSTCTRL](#)[2] RST3, [RM_IVAHD_RSTCTRL](#)[1] RST2, and [RM_IVAHD_RSTCTRL](#)[0] RST1 bits. This causes the PRCM module to assert the IVAHD_RST, IVAHD_SEQ1_RST, and IVAHD_SEQ2_RST resets to the IVAHD subsystem. The IVAHD_PWRON_RST remains deasserted.
2. The MPU software enables the functional clock to the IVAHD subsystem.
3. The MPU software clears the [RM_IVAHD_RSTCTRL](#)[2] RST3 and [RM_IVAHD_RSTCTRL](#)[0] RST1 bits. This causes the PRCM module to release the IVAHD_RST and IVAHD_SEQ1_RST resets to the IVAHD subsystem.
4. The MPU software clears the [RM_IVAHD_RSTCTRL](#)[1] RST2 bit. This releases the IVAHD_SEQ2_RST reset to the Sequencer2 CPU.

3.5.6.8 DSP Subsystem Power-On Reset Sequence

[Figure 3-26](#) shows the power-on reset sequence of the DSP subsystem.

Figure 3-26. DSP Subsystem Power-On Reset Sequence

The assumptions on power-on reset assertion are:

- The PD_DSP is on.
- The MPU software sets the [CM_DSP_DSP_CLKCTRL](#)[1:0] MODULEMODE bit field to Auto.
- The MPU software sets the [CM_DSP_CLKSTCTRL](#)[1:0] CLKTRCTRL bit field to SW_WKUP or HW_AUTO.
- The DPLL_IVA is active and providing the DSP_ROOT_CLK. It can be locked prior to this sequence.

The power-on reset sequence is:

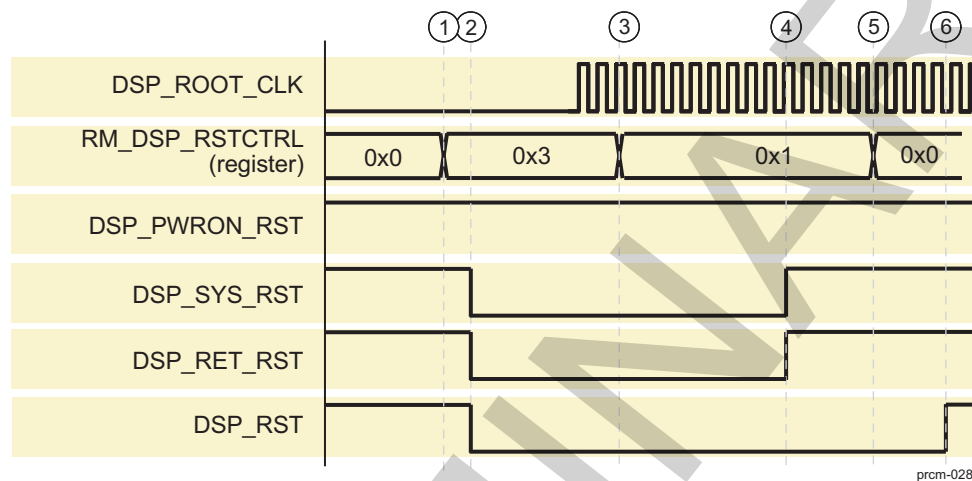

1. The MPU software clears the [RM_DSP_RSTCTRL](#)[1] RST2 bit in the PRCM module register to release from reset the DSP, MMU, and CACHE interface.
2. The PRCM module releases DSP_PWRON_RST once the reset manager counter ([PRM_RSTTIME](#)[14:10] RSTTIME2) has reached its limit. Upon the deassertion of power-on reset signal, the DSP subsystem starts the initialization sequence. During this initialization sequence all the internal registers inside DSP are properly reset and it also completes the reset for DSP, MMU, and CACHE interface.
3. Once the reset sequence of Step 2 completes and the reset manager counter ([PRM_RSTTIME](#)[14:10] RSTTIME2) has expired, the PRCM module releases DSP_SYS_RST and DSP_RET_RST signals.

4. The MPU software must configure the MMU once the MMU is out of reset. After MMU configuration is done, the MPU software clears the [RM_DSP_RSTCTRL\[0\]](#) RST1 bit in the PRCM module register.
5. The PRCM module releases DSP_RST, which causes the DSP to start booting.

3.5.6.9 DSP Subsystem Software Warm Reset Sequence

[Figure 3-27](#) shows the software warm reset sequence of the DSP subsystem.

Figure 3-27. DSP Subsystem Software Warm Reset Sequence

The assumptions on power-on reset assertion are:

- The DSP is in IDLE state.
- The DSP_ROOT_CLK is gated.

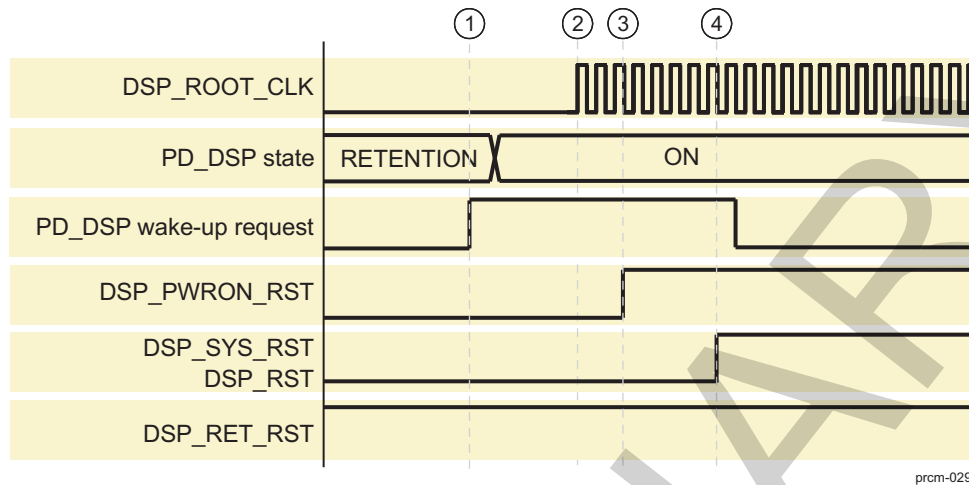

The power-on reset sequence is:

1. The MPU software sets the [RM_DSP_RSTCTRL\[1\]](#) RST2 and [RM_DSP_RSTCTRL\[0\]](#) RST1 bits.
2. The PRCM module asserts the DSP_SYS_RST, DSP_RET_RST, and DSP_RST reset signals. DSP_PWRON_RST remains deasserted in this case.
3. The MPU software re-enables the DSP_ROOT_CLK and clears the [RM_DSP_RSTCTRL\[1\]](#) RST2 bit in the PRCM module register to reset DSP, MMU, and CACHE interface. The DSP subsystem starts the partial initialization sequence for the warm reset.
4. Once the reset sequence of Step 3 completes and the reset manager counter ([PRM_RSTTIME\[14:10\]](#) RSTTIME2) has expired, the PRCM module releases the DSP_SYS_RST and DSP_RET_RST signals.
5. The MPU software clears the [RM_DSP_RSTCTRL\[0\]](#) RST1 bit in the PRCM module register.
6. The PRCM module releases DSP_RST, which causes the DSP to start booting.

3.5.6.10 DSP Subsystem Reset Sequence On Wake-Up Transitions From OSWR RETENTION State

[Figure 3-28](#) shows the reset sequence of the DSP subsystem on wake-up transitions from OSWR RETENTION state.

Figure 3-28. DSP Subsystem Reset Sequence On Wake-Up Transitions From OSWR RETENTION State

The assumptions on power-on reset assertion are:

- The DSP is in INACTIVE state.
- The DSP_ROOT_CLK is gated.
- The PD_DSP is in OSWR RETENTION state.
- The DSP_PWRON_RST, DSP_SYS_RST, and DSP_RST resets are held asserted, while DSP_RET_RST is not asserted by the PRCM module.

The power-on reset sequence is:

1. A wake-up request is received by the PRCM module and it switches the PD_DSP to ON state
2. The PRCM module then enables the DSP_ROOT_CLK and switches the CD_DSP to ACTIVE state.
3. The PRCM module releases DSP_PWRON_RST once the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) has reached its limit. Upon the deassertion of the power-on reset signal, the DSP subsystem starts the initialization sequence.
4. Once the reset sequence of Step 3 completes the PRCM module releases the DSP_SYS_RST and DSP_RST signals.

3.5.6.11 Cortex-M3 MPU Subsystem Power-On Reset Sequence

Figure 3-29 shows the power-on reset sequence of the Cortex-M3 MPU subsystem.

Figure 3-29. Cortex-M3 MPU Power-On Reset Sequence

The assumptions on power-on reset assertion are:

- The Cortex-M3 MPU subsystem is held in reset by the PRCM module and the CORTEXM3_PWRON_RST, CORTEXM3_RET_RST, CORTEXM3_RST1, CORTEXM3_RST2, and CORTEXM3_RST3 are asserted.

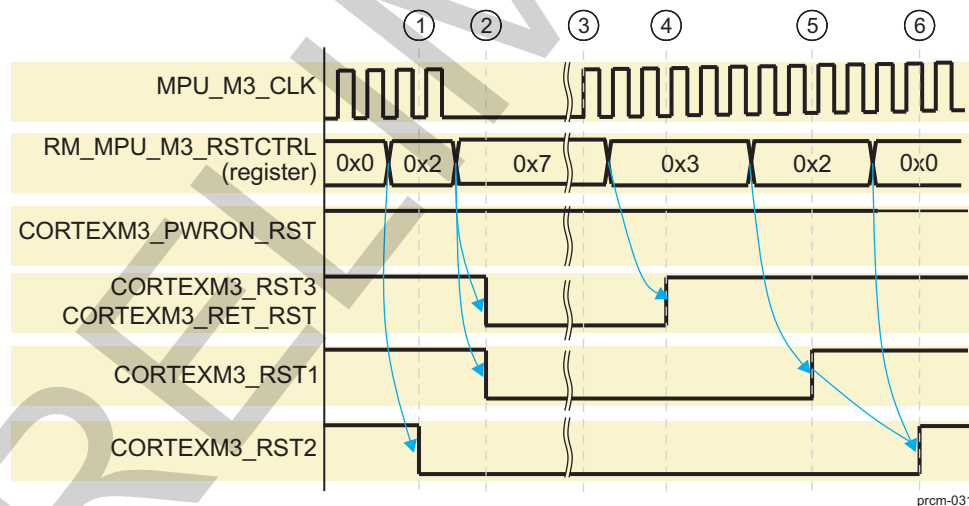

The power-on reset sequence is:

1. Software clears the [RM_MPU_M3_RSTCTRL\[2\]](#) RST3 bit in the PRCM module register to release from reset the MPU M3 Cache and MMU.
2. The PRCM module releases CORTEXM3_PWRON_RST once the reset manager counter ([PRM_RSTTIME\[14:10\]](#) RSTTIME2) has reached its limit and the MPU_M3_CLK is running. Upon the deassertion of the power-on reset signal, the Cortex-M3 MPU subsystem starts the CPU and MMU initialization sequence.
3. Once the reset sequence of Step 2 completes and the reset manager counter ([PRM_RSTTIME\[14:10\]](#) RSTTIME2) has expired, the PRCM module releases the CORTEXM3_RST3 and CORTEXM3_RET_RST signals.
4. The MPU software must configure the MMU once the MMU is out of reset. After MMU configuration and cache initialization is done, the MPU software clears the [RM_MPU_M3_RSTCTRL\[0\]](#) RST1 bit in the PRCM module register.
5. The PRCM module releases CORTEXM3_RST1, which causes the Cortex-M3 MPU Core 1 to start booting.
6. The MPU software can clear the [RM_MPU_M3_RSTCTRL\[1\]](#) RST2 bit in the PRCM module register so that the PRCM module releases the CORTEXM3_RST2 to the Cortex-M3 MPU Core 2.

3.5.6.12 Cortex-M3 MPU Subsystem Software Warm Reset Sequence

[Figure 3-30](#) shows the software warm reset sequence of the Cortex-M3 MPU subsystem.

Figure 3-30. Cortex-M3 MPU Subsystem Software Warm Reset Sequence

The assumptions on power-on reset assertion are:

- The Cortex-M3 MPU Core 2 is in Idle state.

The power-on reset sequence is:

1. The Cortex-M3 MPU Core 1 software or Cortex-A9 MPU software sets the [RM_MPU_M3_RSTCTRL\[1\]](#) RST2 bit. The PRCM module asserts the CORTEXM3_RST2 reset signal to the Cortex-M3 Core 2.
2. The Cortex-A9 MPU cuts the MPU_M3_CLK and software sets the [RM_MPU_M3_RSTCTRL\[2\]](#) RST3 and [RM_MPU_M3_RSTCTRL\[0\]](#) RST1 bits.
3. The PRCM module asserts the CORTEXM3_RST3, CORTEXM3_RET_RST, and CORTEXM3_RST1 reset signals. The CORTEXM3_PWRON_RST remains deasserted in this case.
4. The MPU software re-enables the MPU_M3_CLK and the initialization sequence starts inside

Cortex-M3 subsystem. Software clears the [RM_MPU_M3_RSTCTRL\[2\]](#) RST3 bit in the PRCM module register.

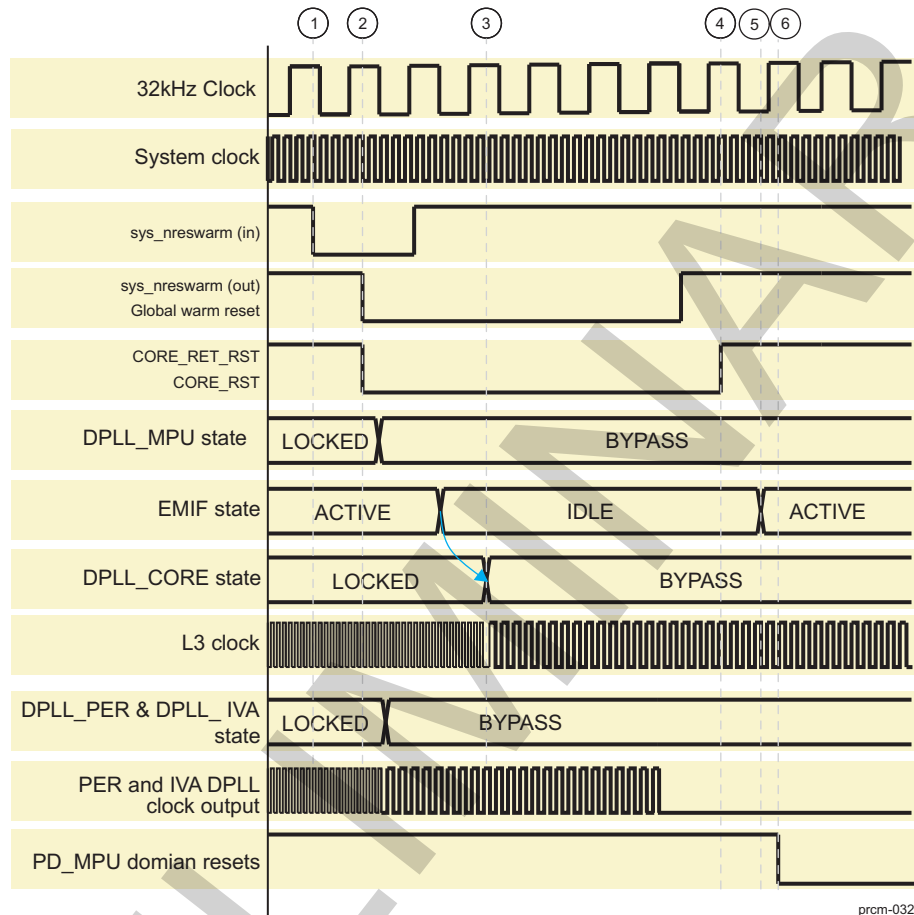

5. Once the reset sequence of Step 4 completes and the reset manager counter ([PRM_RSTTIME\[14:10\]](#) RSTTIME2) has expired, the PRCM module releases CORTEXM3_RST3, CORTEXM3_RET_RST, and CORTEXM3_RST1 reset signals. The Cortex-M3 MPU Core 1 starts rebooting.
6. Software can then clear the [RM_MPU_M3_RSTCTRL\[1\]](#) RST2 bit in the PRCM module register.. The PRCM module releases the CORTEXM3_RST2 reset signal to the Cortex-M3 MPU Core 2 to start booting.

3.5.6.13 Global Warm Reset Sequence

This section describes the global warm reset sequence.

Figure 3-31 shows the global warm reset sequence.

Figure 3-31. Global Warm Reset Sequence

The assumptions are:

- All the logic and memory voltage sources are at their nominal voltage levels.
- The device is active:
 - All resets are released.
 - MPU, CORE, and DSP DPLLs are locked.

The steps of a global warm reset sequence are:

1. On assertion of any global warm reset source the PRM signals the EMIF that a global warm reset event has occurred. The EMIF initiates IDLE state transition. The PRCM module delays global warm reset to the device for minimum 16 L3 clock cycles so that the EMIF switches to IDLE state and switches the external SDRAM memory to self-refresh mode.
2. The reset managers in PRM assert the following resets:
 - The external warm reset SYS_WARM_RST (output) to the SCRM.
 - All power domain warm resets are asserted.
 - DPLL resets are not asserted.
 - DPLL_MPU transitions to bypass mode.
 - DPLL_CORE transitions to bypass mode once the EMIF has switched to IDLE state.
 - DPLL_IVA and DPLL_PER transition to bypass mode.

- DPLL_ABE configuration is not changed.
 - The system clock remains active.
 - The PRM and CM registers, sensitive to warm reset, are asynchronously reset.
 - CM gates the clocks not needed, as per their default reset setting in the associated registers.
3. After the warm reset source is released, the global warm reset and extended until the following conditions are met:
- Device reset manager counter overflows. It is set up by the [PRM_RSTTIME](#)[9:0] RSTTIME1 bit field.
- During this time, the DPLL_ABE control registers are reset and DPLL_ABE transitions to bypass mode when the system clock restarts and the DPLL_ABE outputs are no longer used.
- All logic voltage sources (VDD_IVA, VDD_MPU, and VDD_CORE) are stable.

NOTE: Voltage stabilization is an additional condition if voltage scaling was performed before the assertion of the warm reset.

- 4. The CORE power domain is released from reset (that is, warm reset sensitive modules in the CORE power domain).
- 5. The PRCM module switches the EMIF back to ACTIVE state from IDLE state.
- 6. PD_MPU is released from reset when the clocks to the Cortex-A9 MPU subsystem are active. The Cortex-A9 MPU reboots.

NOTE:

- PD_DSP and PD_IVAHD power domains are held under reset after global warm reset by assertion of the software source of the reset.
 - PD_L4_PER, PD_L3_INIT, PD_DSS, PD_SGX, and PD_CAM are held under reset after global warm reset until the PRCM module enables their interface clock.
 - The reset to the standard eFuse power domain, PD_STD_EFUSE, is not asserted on a global warm reset.
-

3.6 Clock Management Functional Description

3.6.1 Overview

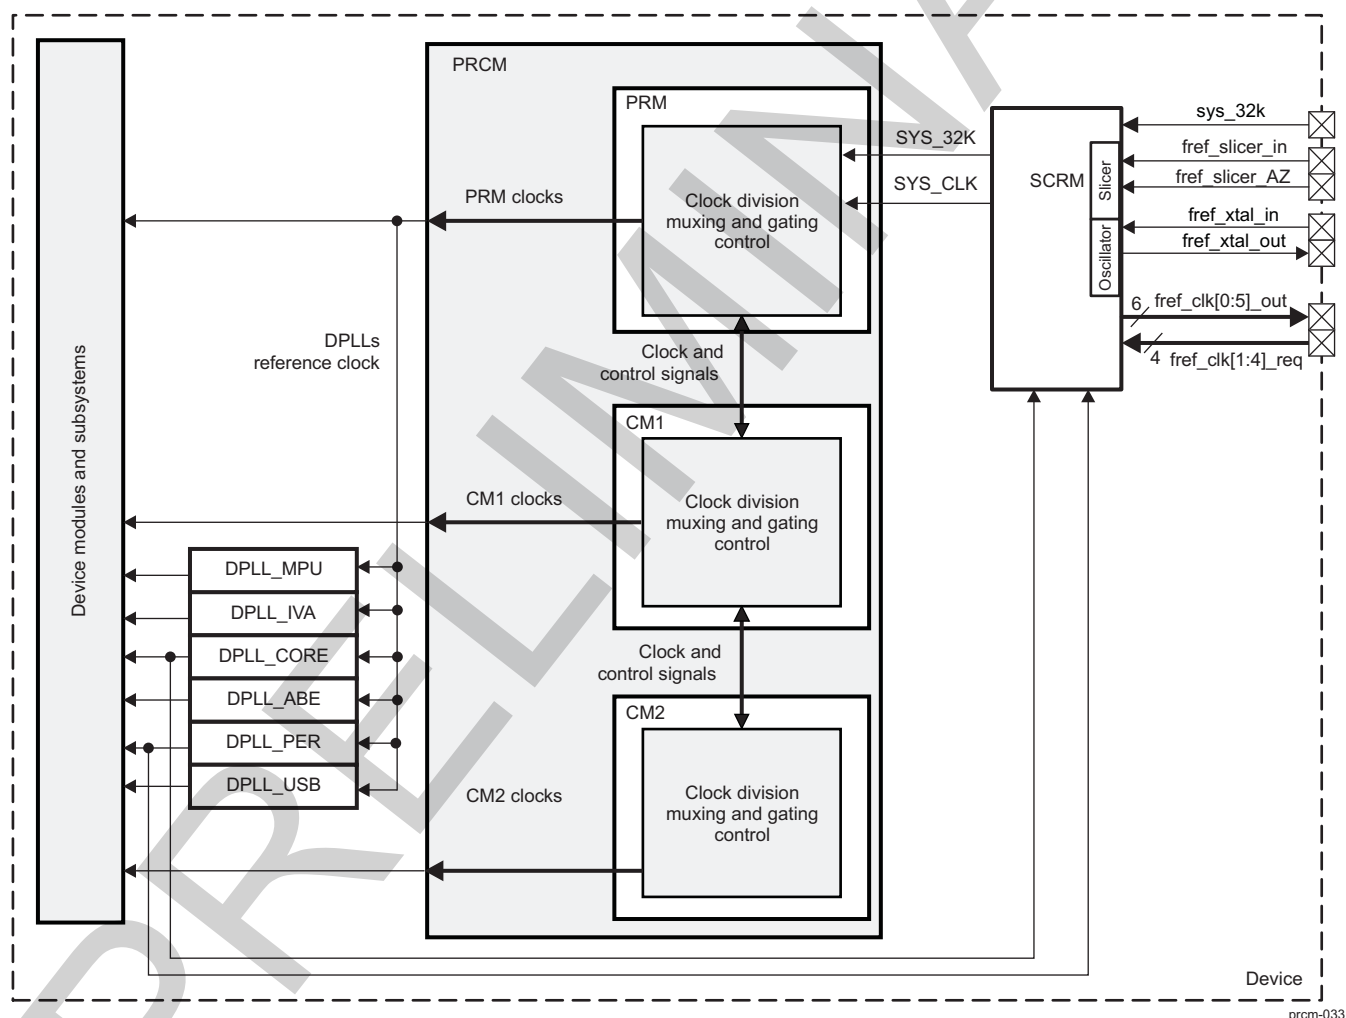

The PRCM module provides control for clock generation, division, distribution, synchronization, and gating. It distributes the clock sources to all modules in the device. See [Section 3.1.1.1, Clock Management](#), for information on the clock-management functional architecture of the device.

The high-frequency system clock is received by the device from an external source or generated within the device (internal oscillator) by the SCRM. The SCRM also receives the 32-kHz low-frequency clock from the external source.

The stable versions of the system and 32-kHz clock are provided by the SCRM to the PRCM module. The PRCM module provides clocks to the internal DPLLs for internal high-frequency clocks generation. Clock division and gating are handled by the PRM, the CM1 and CM2 sections of the PRCM module.

[Figure 3-32](#) shows the high-level clock-management scheme in the device.

Figure 3-32. PRCM Module Clock Manager Overview

prcm-033

3.6.2 External Clock Inputs

3.6.2.1 sys_32k Clock Input

The 32-kHz frequency is used for low-frequency operation (timer, debouncing, etc.). It supplies the wake-up domain for operation in lowest power mode and as clock source to the DPLL_ABE module (for audio back-end [ABE]).

3.6.2.2 High-Frequency System Clock Input

The system clock, SYS_CLK, is the main source clock of the device. SYS_CLK is received directly from the SCRM by the PRM subsection of the PRCM module. It is supplied as the reference clock to the DPLLs as well as functional clock to several modules.

3.6.3 Internal Clock Sources/Generators

The PRCM module clock sources/generators are split into the following parts:

- PRM clock source that receives the 32-kHz and system clocks from SCRM
- CM1 and CM2 clock sources that distribute high-frequency clocks
- DPLL clock generators that synthesize high-frequency clocks for the device

3.6.3.1 PRM Clock Source

The PRM clock source receives the SYS_32K and SYS_CLK clocks from the SCRM. It sources various versions (through gating controls) of these clocks to supply:

- PRCM-managed DPLLs with a reference clock, which is permanently supplied with always-on buffers
- The SR modules with a reference clock, which is permanently supplied with always-on buffers
- The DSS with a reference clock, which is permanently supplied with always-on buffers
- eFuse controller clocks (gated SYS_CLK clock), which are permanently supplied with always-on buffers
- The clocks for CM clock generator and the CORE power domain
- A version of SYS_CLK to ABE supplied by always-on buffers

[Figure 3-33](#) and [Figure 3-34](#) present a logical representation of the PRM clock source.

Figure 3-33. PRM Clock Manager Overview (a)

prcm-034

Figure 3-34. PRM Clock Manager Overview (b)

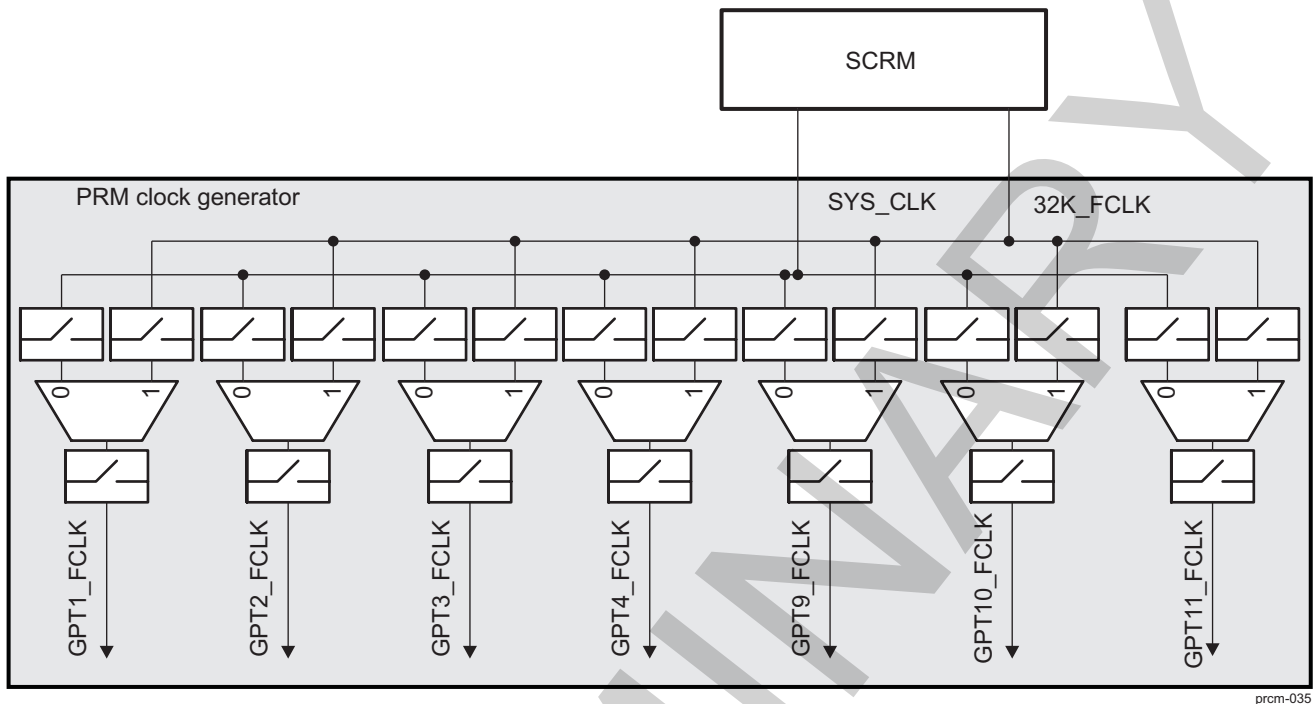

Table 3-36 identifies controls for clock dividers or muxes in the PRM.

Table 3-36. PRM Clock Division and Muxing Control

| Divider/Mux | Control Bit Field |
|------------------------------------|---------------------------------------|
| Mux ABE_DPLL_ALWON_CLK | CM_ABE_PLL_REF_CLKSEL[0] CLKSEL |
| Mux GPT1_FCLK | CM_WKUP_GPTIMER1_CLKCTRL[24] CLKSEL |
| Mux GPT2_FCLK | CM_L4PER_GPTIMER2_CLKCTRL[24] CLKSEL |
| Mux GPT3_FCLK | CM_L4PER_GPTIMER3_CLKCTRL[24] CLKSEL |
| Mux GPT4_FCLK | CM_L4PER_GPTIMER4_CLKCTRL[24] CLKSEL |
| Mux GPT9_FCLK | CM_L4PER_GPTIMER9_CLKCTRL[24] CLKSEL |
| Mux GPT10_FCLK | CM_L4PER_GPTIMER10_CLKCTRL[24] CLKSEL |
| Mux GPT11_FCLK | CM_L4PER_GPTIMER11_CLKCTRL[24] CLKSEL |
| Mux L4WKUP_ICLK | CM_L4_WKUP_CLKSEL[0] CLKSEL |
| Mux ABE_DPLL_BYPASS_CLK | CM_L4_WKUP_CLKSEL[0] CLKSEL |
| Divider WKUP_TS_FCLK, CORE_TS_FCLK | CM_WKUP_BANDGAP_CLKCTRL[25:24] CLKSEL |

NOTE: For clock signals control (gating/ungating management), see [Section 3.1.1.1, Clock Management](#).

PRM provides 32-kHz gated and ungated clock for use by portions of PD_WKUP power domain and some peripherals outside the PD_WKUP power domain.

It also provides the system clock to the display subsystem (DSS), and gated and buffered version to L4WKUP_ICLK interconnect clock, and the DPLLs controlled by the PRCM module. The gated version of the SYS_CLK is also provided to the SmartReflex modules of the device.

3.6.3.2 CM Clock Source

The clock manager (CM) is primarily responsible for generating interface and functional clocks from the internal clocks provided by DPLL_CORE and DPLL_PER. The CM is physically divided into two independent entities, CM1 placed in PD_ALWON_CORE always-on power domain and CM2 placed in PD_CORE switchable power domain. The split is done to provide control over various entities like modules, DPLLs and clocks during low power use case scenarios when the PD_CORE power domain can be switched to RETENTION state.

3.6.3.2.1 CM1 Clock Generator

CM1 receives system clock from the PRM, which serves as its functional clock. CM1 provides gated clock to PD_AUDIO and some DPLLs. It also provides clock to the L3 and L4 interconnects in the device.

Figure 3-35 shows the various functional and interface clocks generated by CM1:

Figure 3-35. CM1 Overview

prcm-036

Table 3-37 identifies controls for clock dividers or muxes in the CM1 clock source.

Table 3-37. CM1 Clock Division and Muxing Control

| Divider/Mux | Control Bit Field |
|--------------------------|--|
| Divider CORE_CLK | CM_CLKSEL_CORE [0] CLKSEL_CORE |
| Divider L3_ICLK | CM_CLKSEL_CORE [4] CLKSEL_L3 |
| Divider L4_ROOT_CLK | CM_CLKSEL_CORE [8] CLKSEL_L4 |
| Divider MPU_DPLL_HS_CLK | CM_BYPCLK_DPLL_MPU [1:0] CLKSEL |
| Divider IVA_DPLL_HS_CLK | CM_BYPCLK_DPLL_IVA [1:0] CLKSEL |
| Mux IVA_HSD_BYP_CLK | CM_CLKSEL_DPLL_IVA [23] DPLL_BYP_CLKSEL |
| Mux PER_HSD_BYP_CLK | CM_CLKSEL_DPLL_PER [23] DPLL_BYP_CLKSEL |
| Mux CORE_PHY_HSD_BYP_CLK | CM_CLKSEL_DPLL_CORE [23] DPLL_BYP_CLKSEL |

NOTE: For clock signals control (gating/ungating management), see [Section 3.1.1.1, Clock Management](#).

3.6.3.2.2 CM1_USB Clock Generator

CM_USB receives system clock from USBPHY and DPLL_USB. It provides gated clock to CD_L3_INIT.

[Figure 3-36](#) shows the various functional and interface clocks generated by CM1_USB:

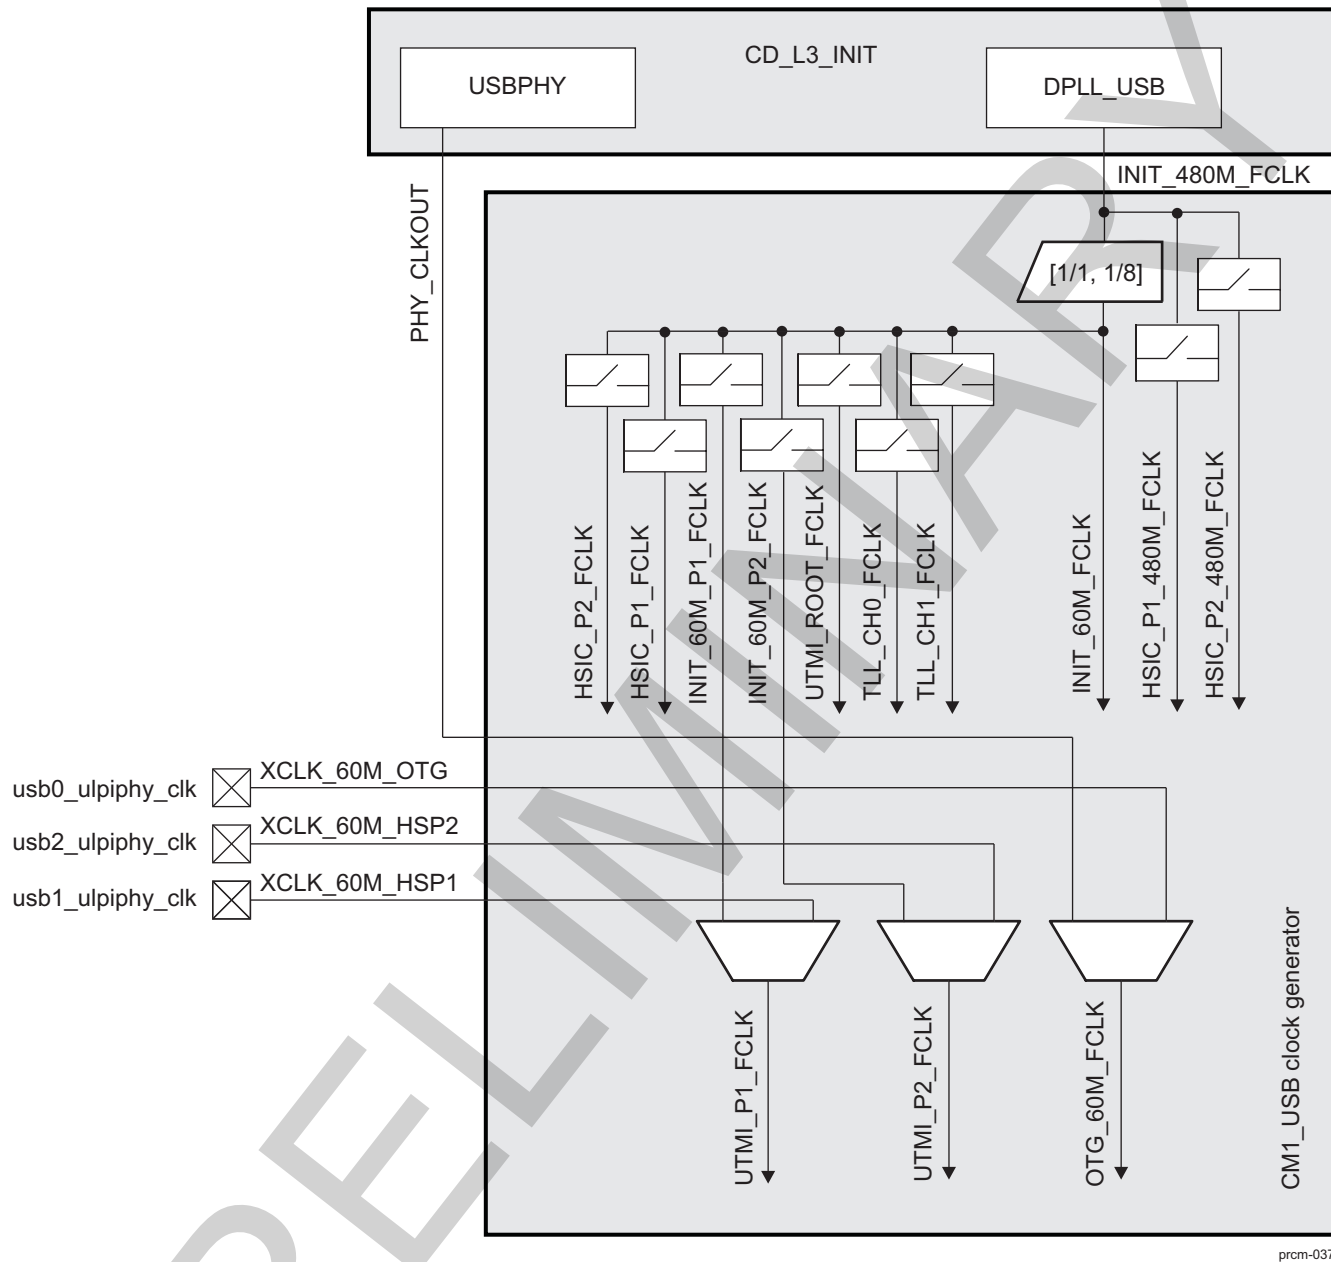

Figure 3-36. CM1_USB Clock Manager Overview

Table 3-38 identifies controls for clock dividers or muxes in the CM1_USB clock source.

Table 3-38. CM1_USB Clock Division and Muxing Control

| Divider/Mux | Control Bit Field |
|-----------------------|--|
| Divider INIT_60M_FCLK | CM_CLKSEL_USB_60MHZ[0] CLKSEL |
| Mux UTMI_P1_FCLK | CM_L3INIT_HSUSBHOST_CLKCTRL[24] CLKSEL_U TMI_ P1 |

NOTE: For the clock status bits see [Table 3-150](#)

NOTE: For clock signals control (gating/ungating management), see [Section 3.1.1.1, Clock Management](#).

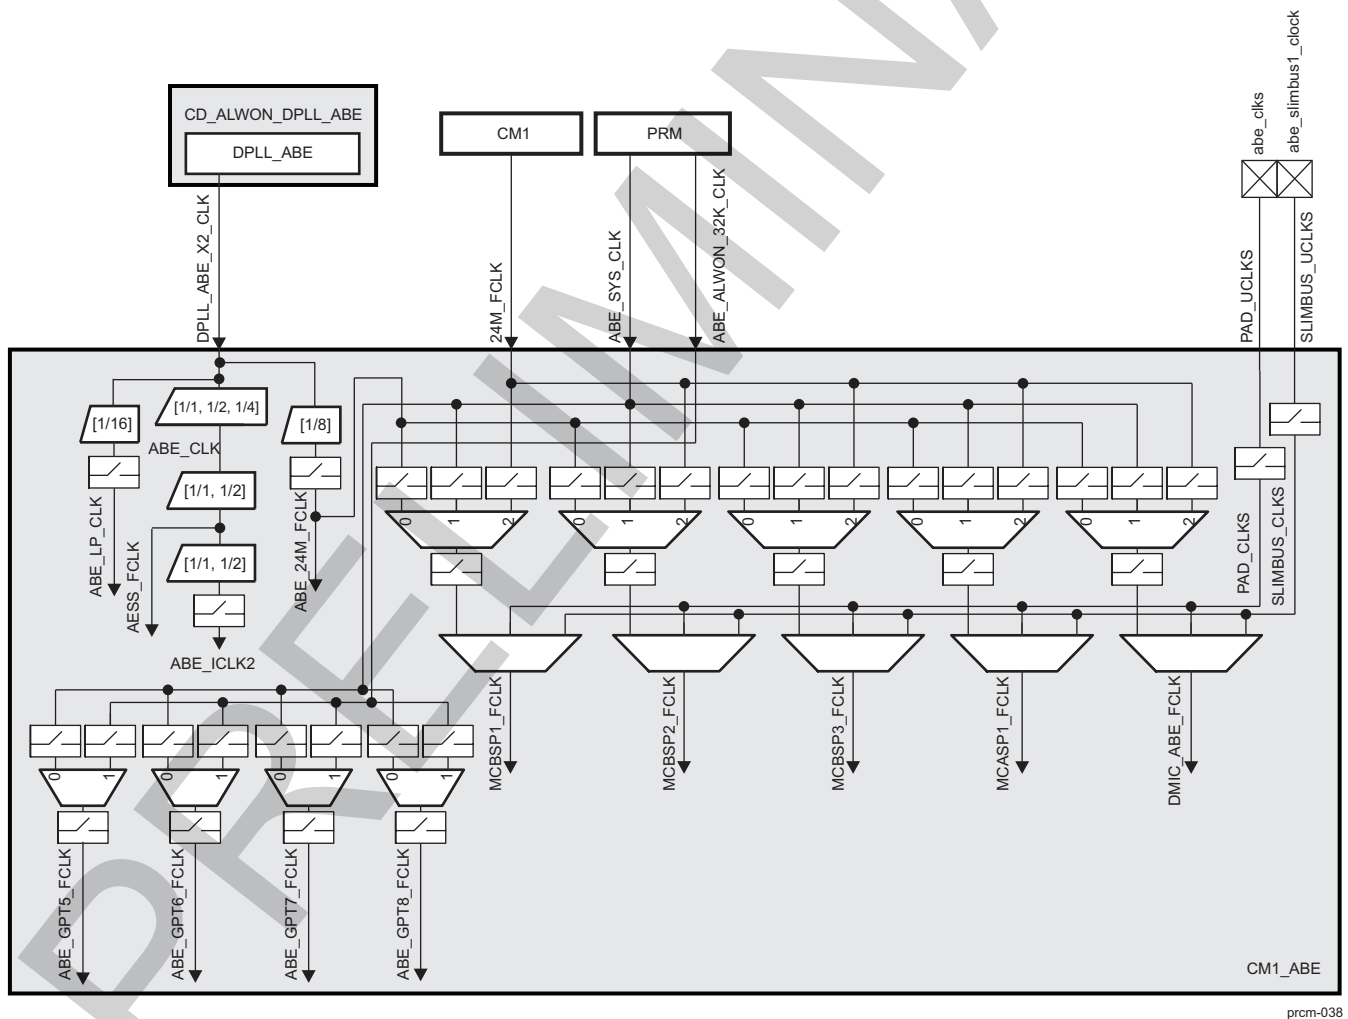

NOTE: For information about the CM1_USB clock signals control and status, see [Section 3.6.9, CD_L3_INIT Clock Domain](#).

3.6.3.2.3 CM1_ABE Clock Generator

CM1_ABE receives system clock from PRM. It provides gated clock to CD_L4_PER.

[Figure 3-37](#) show the various functional and interface clocks generated by CM1_ABE clock source.

Figure 3-37. CM1_ABE Clock Manager Overview

[Table 3-39](#) identifies controls for clock dividers or muxes in the CM1_ABE.

- (1) ABE_ICLK2 depends on the divider settings of the AESS_FCLK and is always divided by 2 of the ABE_CLK. So when AESS_FCLK divider is set to 1, then ABE_ICLK2 divider is set to 2 and vice versa.

NOTE: For the ABE subsystem, functional clock DPLL_ABE_X2_CLK must be set to 196.608 MHz in DPLL_ABE. ABE_CLK, which is sourced by the DPLL_ABE_X2_CLK, can be configured in the CM_CLKSEL_ABE[1:0] CLKSEL_OPP bit field according to the OPP. AESS_FCLK can be the same as ABE_CLK or ABE_CLK divided by 2, depending on the CM1_ABE_AESS_CLKCTRL[24] CLKSEL_AESS_FCLK bit.

For more information about setting DPLL parameters, see Section [Section 3.6.3.3.1](#).

NOTE: For clock signals control (gating/ungating management), see [Section 3.1.1.1, Clock Management](#).

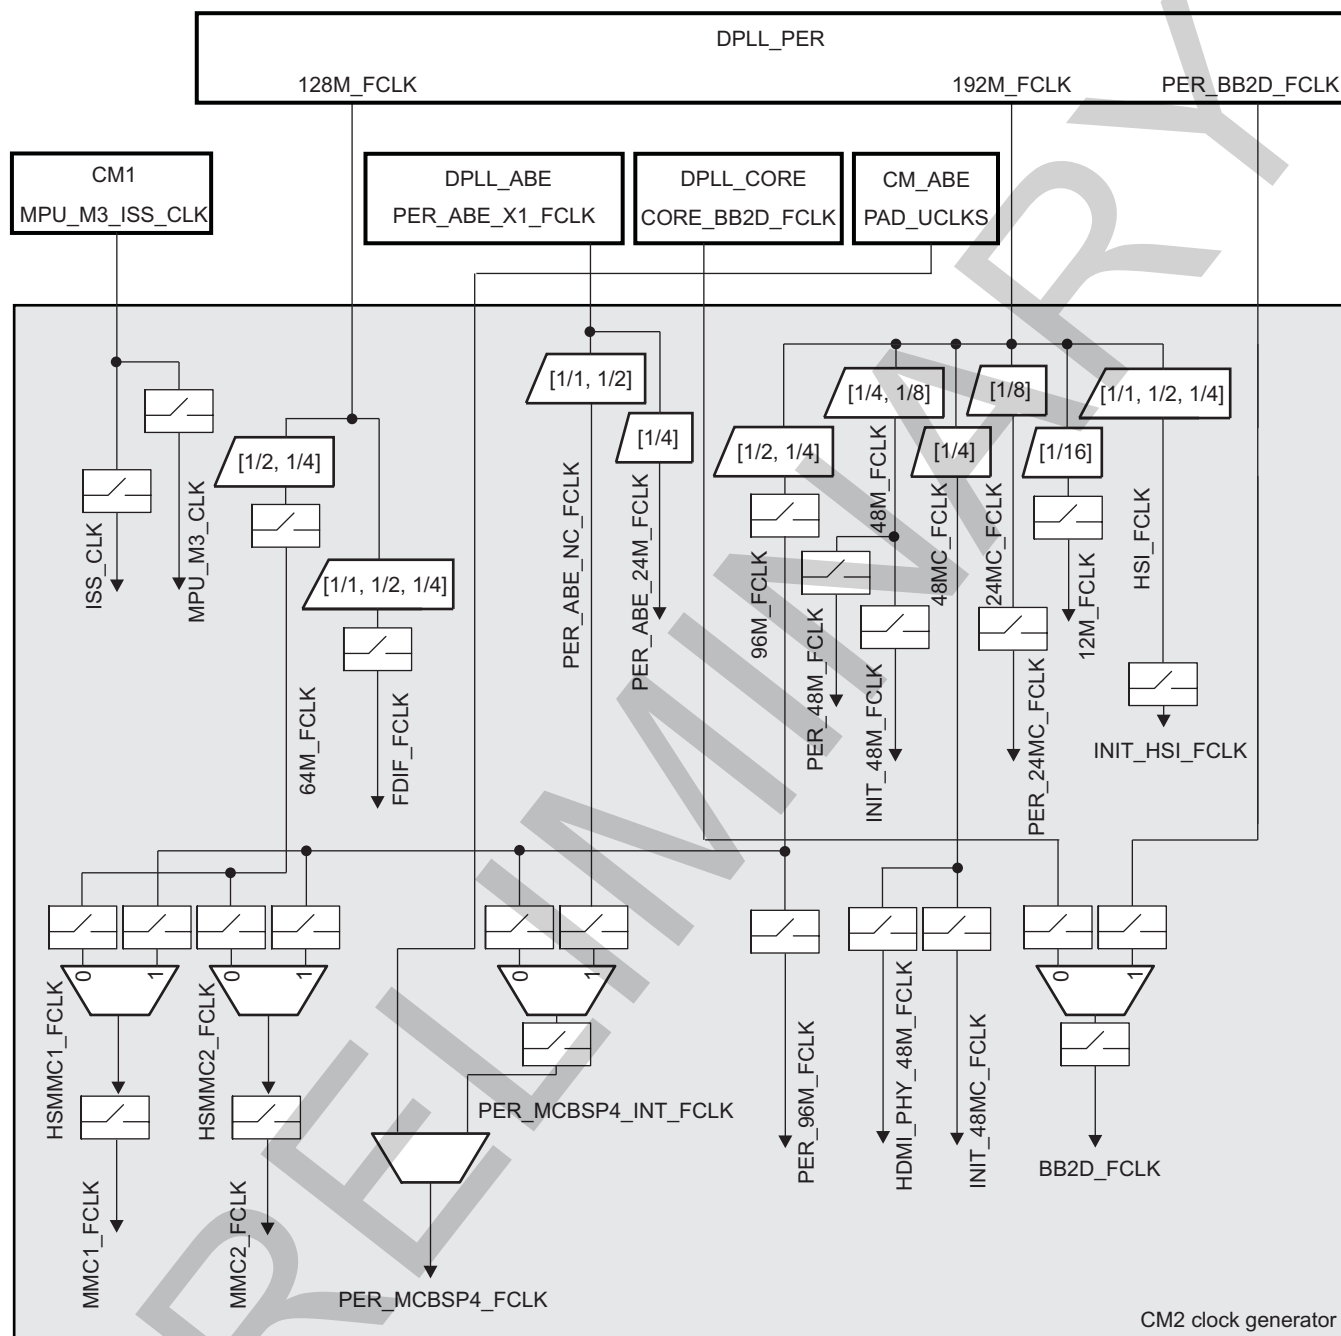

NOTE: For information about the CM1_ABE clock signals control and status, see [Section 3.6.23, CD_ABE Clock Domain](#).

3.6.3.2.4 CM2 Clock Generator

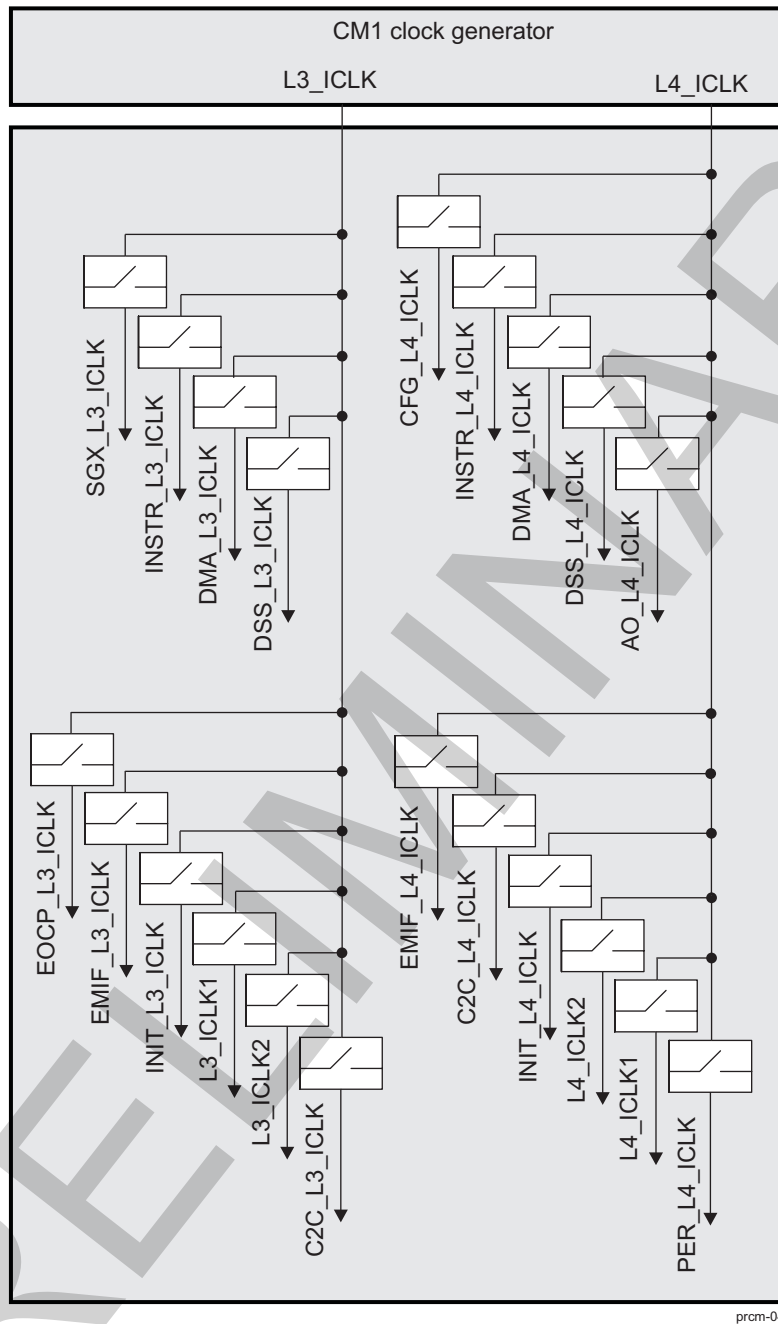

CM2 provides gated functional clocks to various modules of the device.

[Figure 3-38](#) and [Figure 3-39](#) show the various functional and interface clocks generated by CM2:

3.6.3.3 Generic DPLL Overview

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types, identified as type A and type B DPLLs.

Following DPLLs belong to type A:

- DPLL_MPU
- DPLL_IVA
- DPLL_CORE
- DPLL_PER
- DPLL_ABE

Following DPLL belongs to type B:

- DPLL_USB

All DPLLs support the features presented in the following sections, unless identified otherwise.

NOTE: This chapter discusses only the DPLLs that are directly controlled by the PRCM module. The other DPLLs embedded in and managed by other subsystems are covered in the description of their respective subsystems. For example, [Chapter 10, Display Subsystem](#), discusses the DPLL in the display subsystem.

3.6.3.3.1 DPLLs Output Clocks Parameters

Figure 3-40 shows the functional architecture of a generic DPLL.

Figure 3-40. Generic DPLL Functional Diagram

The DPLL has three input clocks:

- REF_CLK: used to generate the synthesized clock but can also be used as the bypass clock for two outputs of the DPLL, whenever the DPLL enters a bypass mode. It is mandatory for the DPLL clock synthesis.
- BYP_CLK_M2: Selectable bypass clock for the output of an M2 post-divider (optional).
- BYP_CLK_M3: Selectable bypass clock for the output of an M3 post-divider (optional).

The DPLL can be programmed to be locked at any frequency given by the following equation:

- $F_{dpll} = F_{ref} \times 2 \times M / (N + 1)$ or
- $F_{dpll} = F_{ref} \times 2 \times (4 \times M / (N + 1))$ in case REGM4XEN bit field is set (only applicable to DPLL_ABE).

Where:

- F_{dpll} is the DPLL lock frequency.
- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

It internally generates three main clocks: CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 as presented in Table 3-41.

Table 3-41. CLKOUT_M2, CLKOUTX2_M2, and CLKOUTX2_M3 Frequencies With DPLL State

| Output | Equation | DPLL Mode |
|-------------|------------------------------------|------------------------------|
| CLKOUT_M2 | $F_{dpll} / (2 \times M2)$ | Locked |
| | F_{ref} or BYP_CLK_M2 | Before lock or during relock |
| CLKOUTX2_M2 | $F_{dpll} / M2$ | Locked |
| | F_{ref} or BYP_CLK_M2 | Before lock or during relock |
| CLKOUTX2_M3 | $F_{dpll} / M3$ or BYP_CLK_M3 / M3 | Locked |
| | 0 | Before lock or during relock |

Where:

- M2 is the software-configured division ratio binary value.
- M3 is the software-configured division ratio binary value.
- CLKOUT_M2 and CLKOUTX2_M2 bypass clock input can be switched when the DPLL is not in locked state, using the M2 Bypass Clock Select Control bit.

- CLKOUTX2_M3 output clock can be switched when the DPLL is in locked state, using the M3 Clock Select Control bit.

NOTE:

- Zero-value for M2 and M3 division ratios is not allowed. They are set to 1 after reset.
- CLKOUT_M2 is generated based on a fix divide-by-2 ratio, except in bypass mode.

NOTE: The following rules apply for the DPLL internal clock, $F_{int} = CLKINP / (N + 1)$:

- $CLKINP / (N + 1)$ must be between 0.032 and 52 MHz for DPLL_MPU, DPLL_IVA, DPLL_ABE, DPLL_CORE, and DPLL_PER.
- $CLKINP / (N + 1)$ must be between 0.5 and 2.5 MHz for DPLL_USB.

The DPLL may contain an HSDIVIDER module to produce more clocks with divided ratio based on the DPLL synthesized clock frequency. HSDIVIDER provides four extra post-dividers from M4 to M7. The HSDIVIDER output clocks frequency is given by the equations in [Table 3-42](#):

Table 3-42. CLKOUTX2_Mn Frequencies With DPLL State

| Equation | DPLL Mode |
|--------------------------------------|------------------------------|
| $CLKOUTX2_Mn = F_{dpll} / (Mn + 1)$ | Locked |
| $CLKOUTX2_Mn = BYP_CLK_Mx$ | Before lock or during reload |

Where:

- F_{dpll} is the DPLL lock frequency.
- $Mn + 1$ is the software configured division ratio binary value.
- n is in the range from 4 to 7.

NOTE: The $Mn + 1$ division ratio is set to 1 after reset and 31 (0x1f) is an illegal value.

All clock outputs of the DPLL can be gated. The PRCM module provides the DPLL with a clock gating control signal to enable or disable the clock, and the DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated.

The type B DPLL (only DPLL_USB) has two outputs: CLKOUT and CLKDCOLDO. The DPLL can be programmed to be locked with the output clock frequencies given by the following equation:

- $F_{clkout} = F_{ref} \times (M / (N + 1)) \times (1 / M2)$
- $F_{clkdcoldo} = F_{ref} \times (M / (N + 1))$

Where:

- F_{clkout} is the frequency of the clock at output CLKOUT.
- $F_{clkdcoldo}$ is the frequency of the clock at output CLKDCOLDO.
- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.
- $M2$ is the software-configured division ratio binary value.

CLKOUT supports the same bypass modes as identified earlier. CLKDCOLDO does not support bypass mode.

3.6.3.3.2 Enable Control, Status, and Low-Power Operation Mode

The DPLL has a Manual Mode Control bit field, which allows the setting of the different operating modes of the DPLL. When the DPLL is switched to lock mode the current values of the multiplication ratio (M) and the division ratio (N) are latched in the DPLL. The DPLL then starts the lock or relock sequence, to synthesize the corresponding output frequency clock.

The status of the synthesized clock output of the DPLL is represented by the CLKOUT status bit. It can be gated or active.

The DPLL can be switched to low-power operation mode (also called LPMODE) to optimize DPLL power consumption when the input and output clock frequencies are low. This mode can be software enabled using the low-power mode control bit of the DPLL.

It must only be enabled if both of the following operating conditions are satisfied:

- $F_{ref}/(N+1)$ is less than or equal to 1 MHz.
- $F_{ref} \times M/(N+1)$ is less than or equal to 100 MHz.

With:

- F_{ref} is the REF_CLK frequency.
- M is the software-configured multiplication ratio binary value.
- N is the software-configured division ratio binary value.

3.6.3.3.3 DPLL Power Modes

DPLL may supports several power modes. Each mode results in a tradeoff between power savings and relock time.

[Table 3-43](#) shows the DPLL power modes.

Table 3-43. DPLL Power Modes

| Power Mode | CLKOUT State | Logic Current (mA) | Analog Current (mA) | Freq Lock Time | Phase Lock Time |
|--------------------|----------------------------|--------------------|---------------------|--------------------------------------|---------------------------------------|
| Low-power stop | Clock stopped | 0.05 (leakage) | 0.001 (leakage) | $1.5 \mu s + (20 \times 1/F_{ref})$ | $1.5 \mu s + (100 \times 1/F_{ref})$ |
| Fast-relock stop | Clock stopped | 0.05 (leakage) | 0.25 (leakage) | $0.05 \mu s + (20 \times 1/F_{ref})$ | $0.05 \mu s + (100 \times 1/F_{ref})$ |
| MN bypass | Bypass clock | 0.05 (leakage) | 0.001 (leakage) | $1.5 \mu s + (350 \times 1/F_{ref})$ | $1.5 \mu s + (500 \times 1/F_{ref})$ |
| Low-power bypass | Bypass clock/Clock stopped | 0.05 (leakage) | 0.001 (leakage) | $1.5 \mu s + (20 \times 1/F_{ref})$ | $1.5 \mu s + (100 \times 1/F_{ref})$ |
| Fast-relock bypass | Bypass clock/Clock stopped | 0.05 (leakage) | 0.25 (leakage) | $0.05 \mu s + (20 \times 1/F_{ref})$ | $0.05 \mu s + (100 \times 1/F_{ref})$ |
| Lock | Synthesized clock | 0.55 (active) | 1.95 (active) | N/A | N/A |

Where:

- F_{ref} is the REF_CLK frequency.

A DPLL power mode can be achieved on a software request (manual) and/or automatically (automatic), depending on the specific hardware conditions.

A DPLL can switch from one mode to the other as a result of the following:

- Software-programmed transition (manual): The software configures the dedicated DPLL Manual Mode Control feature for the next desired DPLL mode. It must ensure that the transition can be performed based on the clock activity on the device.
- Combined software-programmed and hardware-conditions-based transition (auto): This mode allows the DPLL to automatically transition to a low-power state (that is, any state other than MN BYPASS and the LOCK state) when the output clocks are gated or the destination clock domain is inactive. And to switch back to the LOCK state when the output clock is needed (that is, the clock is ungated or the clock domain becomes active). The desired low-power state for the automatic transition is configured in

dedicated Auto Mode Control parameter of the DPLL.

NOTE: With REF_CLK period = $1/\text{Fref} = (N + 1)/\text{CLKINP}$; ($\text{Fref} = \text{CLKINP}/(N + 1)$):

This formula indicates that a smaller N divider value provides a smaller time for switching the clock after an M2 post-divider change.

A compromise is necessary between the clock switching latency and power consumption. Having a smaller N value:

- Requires a higher M2 post-divider value to obtain the same target frequency.
 - Results in a higher DPLL lock frequency, and then higher power consumption.
-

NOTE:

- A manual transition can be performed from any power mode to any other power mode.
 - An automatic transition can be performed from lock mode to any low-power mode, except for the MN bypass mode.
-

3.6.3.3.4 DPLL Recalibration

Each time the DPLL is reset or performs a lock sequence (following a change in multiplier M or divider N value), it performs a recalibration of the output frequency, based on voltage and temperature conditions. In the locked mode the DPLL maintains a steady lock frequency output by compensating for voltage and temperature changes within a certain range. However, if the voltage or temperature drifts outside the range or shows a significant or fast change, the DPLL may not be able to track and compensate it. It would need a recalibration, which is signaled by assertion of a recalibration flag.

NOTE:

- The recalibration mechanism is active only while the DPLL is in locked mode. When the DPLL is in off or bypass mode (low-power or fast-relock), it does not assert the recalibration flag.
 - If the DPLL drifts out of the operating range limits while not locked, then when it tries to relock it fails to lock within the normal delay and recalibrates automatically before eventually locking. The only difference between this case and a standard relock is the recalibration delay.
-

During recalibration, the DPLL loses lock and output clock switches to the bypass clock.

The DPLL can automatically start recalibration when the recalibration flag is asserted, or recalibration can be triggered by software control. The trigger setting of the recalibration can be configured by the corresponding registers of the DPLL in the PRCM module. The software-controlled recalibration mode is selected by default.

Software-controlled recalibration: The DPLL continues its tracking mechanism as long as the recalibration is not triggered by software (that is, by enabling the Recalibration-Enable control parameter). If the DPLL reaches upper or lower bounds of the DCO control code and software has still not triggered recalibration, the DPLL stops its tracking mechanism. The output clock remains active, but frequency and jitter are not ensured to meet the requirement.

Automatic recalibration: The DPLL immediately starts the recalibration as soon as the recalibration flag is asserted.

NOTE: Automatic recalibration of the DPLL can start at any time. While relocking, the DPLL switches to bypass mode, which introduces a frequency change. For modules that are sensitive to frequency change while operating, this can introduce operational instability. For example, the external memory (EMIF) controller is sensitive to a frequency change on the DPLL because its embedded DLL relocks on a frequency change. Any EMIF access during this DLL relock period can be corrupted. It is, therefore, important to stall EMIF access during DPLL recalibration.

To allow the software to recalibrate the DPLL at the correct time depending on the device activity, the PRCM module can generate a wake-up event on processor power domain followed by an interrupt on the processor subsystem when the DPLL recalibration flag is asserted.

Table 3-44 shows the DPLL recalibration and control parameters.

Table 3-44. DPLL Recalibration Control Parameters

| Parameter | Description |
|--------------------------------------|--|
| Recalibration-Enable control | Enable/disable the DPLL automatic recalibration feature. |
| Recalibration-Interrupt mask control | Mask/unmask the DPLL recalibration interrupt to processor. |
| Recalibration-Interrupt status | Status of the DPLL recalibration interrupt to processor |

3.6.3.3.5 DPLL Spread Spectrum Clocking

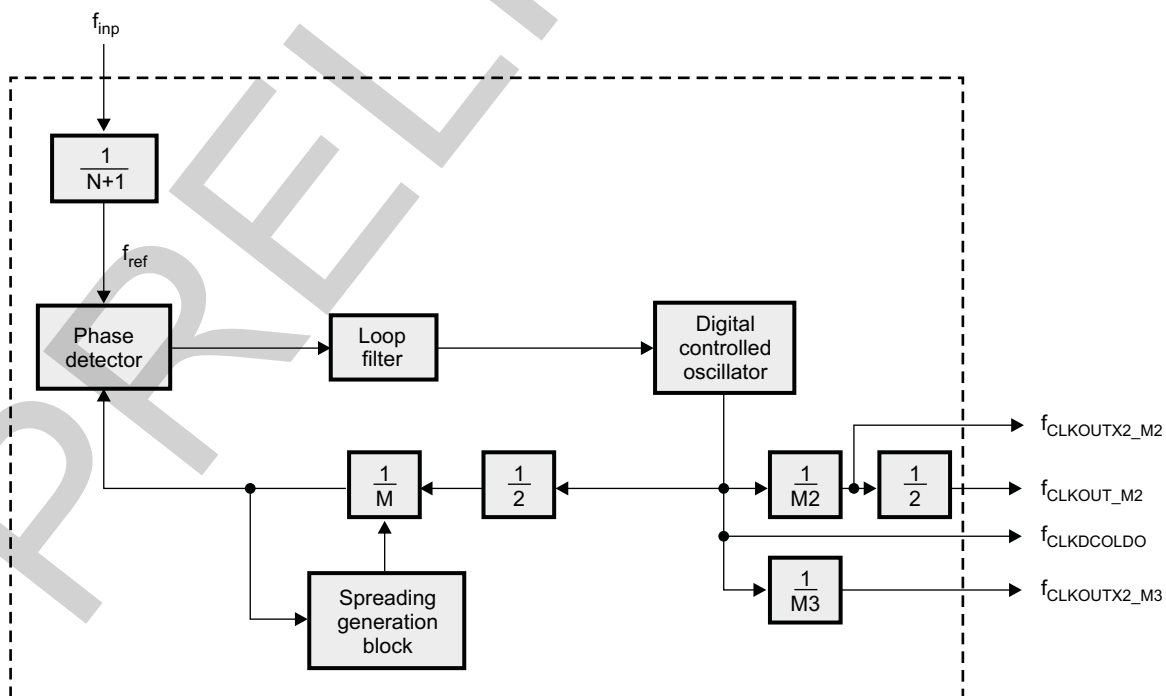

The synthesized clock output of the DPLL has a stable frequency. This periodicity generates a significant power peak at the selected frequency, which in turn causes an electromagnetic interference (EMI) disturbance to the environment. In communication devices, this clock signal generates unwanted spurious signals that interfere with the decoding of information received. It results in performance degradation, for example, in the form of high bit-error rates in case of a wireless communication interface.

To reduce the power peaks (and the electromagnetic noise generated at a specific frequency), an internal frequency modulation of the DPLL is used to distribute the energy to many different frequencies, thus reducing the power peaks. This is called spread spectrum clocking (SSC).

SSC in the DPLL is performed by changing the feedback divider (M) in a triangular pattern. This varies the frequency of the output clock in a triangular pattern. The frequency of this pattern is the modulation frequency (f_m). It is programmed as a ratio of the REF_CLK/4. This frequency modulation feature is integrated directly into some DPLLs of the device.

Figure 3-41 is a diagram of a DPLL that supports the SSC feature.

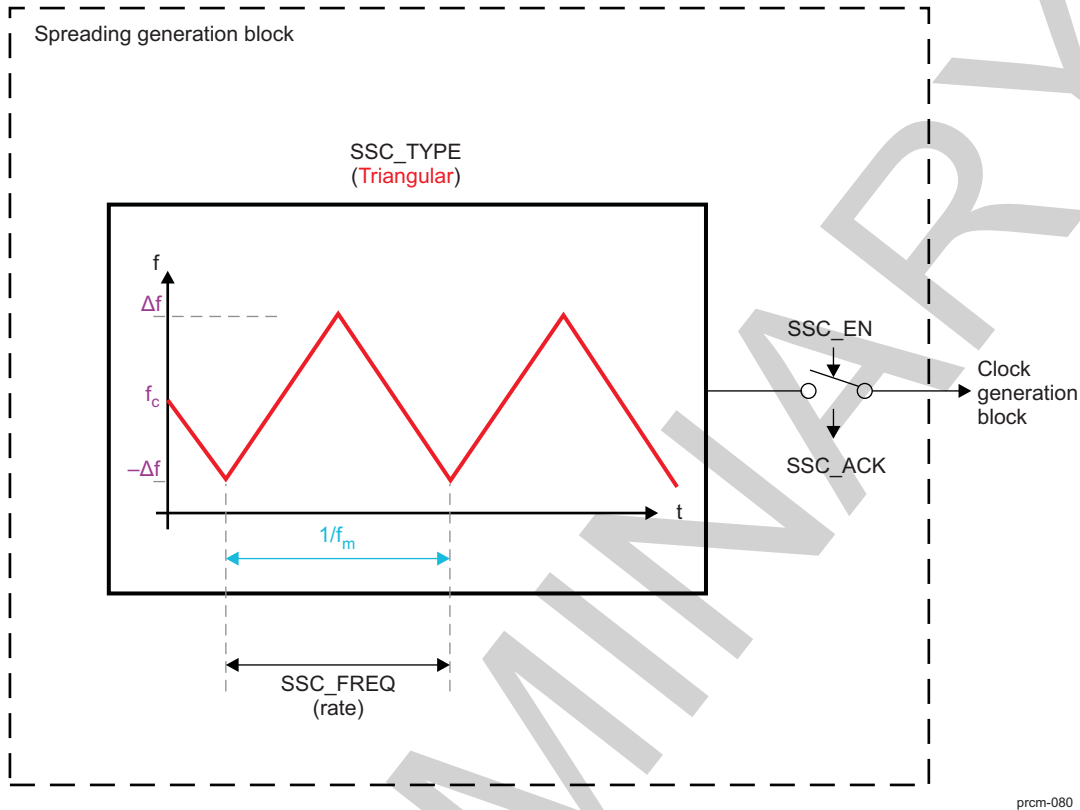

Figure 3-41. DPLL With SSC Reduction Feature

prcm-079

Figure 3-42 shows the spreading generation block diagram.

Figure 3-42. Spreading Generation Block Diagram

NOTE: Δf is the deviation from the center frequency. The total spreading deviation is equal to twice Δf . The peak (ΔM) or the amplitude of the triangular/square pattern as a percent of M is equal to the percent of the frequency spread (Δf), $\Delta M/M = \Delta f/f_c$.

f_c is the original output clock frequency.

f_m is the spreading frequency.

This additional block generates the required waveform used to reduce EMI. This waveform is then modulated with the initial signal to add some controlled deviation to the clock signal frequency, which spreads the energy of the clock and its harmonics into a band of frequencies, and then reduces EMI. **SSC_DOWNSPREAD** can control the position of the generated signal. It is controlled by the **CM_CLKMODE_DPLL_<module>[14] DPLL_SSC_DOWNSPREAD** bit of the corresponding registers (where <module> is the name of the concerned DPLLs). If the **DOWNSPREAD** bit is set to 1, the frequency spread on the lower side is twice the programmed value. The frequency spread on the higher side is 0.

The value of **SSC_FREQ** controls the rate of the generated signal. It can be programmed as a ratio of the reference clock: $f_{ref}/4$. The value that must be programmed is calculated as follows:

$$\text{ModFreqDivider} = f_{ref}/(4 \times f_m)$$

where $f_m < f_{ref}/70$, $f_{ref} = f_{inp}/(1 + N)$, and f_{inp} is the input clock for the DPLL

The **ModFreqDivider** is split into mantissa and exponent:

$$\text{ModFreqDivider} = \text{Mantissa} \times 2^{\text{Exponent}}$$

The same value of ModFreqDivider can be obtained by different combinations of mantissa and exponent values. However, it is recommended to set the target ModFreqDivider by programming a maximum mantissa and a minimum exponent. This is controlled by the CM_SSC_MODFREQDIV_DPLL_<module>[10:8] MODFREQDIV_EXPONENT and CM_SSC_MODFREQDIV_DPLL_<module>[6:0] MODFREQDIV_MANTISSA bit fields of the corresponding registers (where <module> is the name of the concerned DPLL).

To define the modulation-frequency divider step size (ΔM) for triangular SSC, a DeltaMStep parameter must be programmed. DeltaMStep is split into integer and fractional parts. The step size can be calculated as follows:

$\Delta M = \text{ModFreqDivider} \times \text{DeltaMStep}$, if Exponent ≤ 3

$\Delta M = 8 \times \text{Mantissa} \times \text{DeltaMStep}$, if Exponent > 3

It is controlled by the PRCM_CM_SSC_DELTAMSTEP_DPLL_<module>[19:0] DELTAMSTEP bit field of the corresponding register (where <module> is the name of the concerned DPLL). The PRCM_CM_SSC_DELTAMSTEP_DPLL_<module>[19:18] bit field defines the integer part, while the PRCM_CM_SSC_DELTAMSTEP_DPLL_<module>[17:0] bit field defines the fractional part. The DeltaMStep parameter must be programmed to define the modulation-frequency divider step size for trapezoidal SSC. It is split into integer and fractional parts. The step size can be calculated as follows:

$\Delta M = \text{DeltaMStep}$

The DeltaMStep integer part is controlled by the CM_SSC_DELTAMSTEP_DPLL_<module>[19:14] bit field, while the fractional part is controlled by the CM_SSC_DELTAMSTEP_DPLL_<module>[13:0] bit field (where <module> is the name of the concerned DPLL).

The SSC_EN signal enables and disables the frequency modulation feature of the DPLL. It is controlled by the PRCM_CM_CLKMODE_DPLL_<module>[12] DPLL_SSC_EN bit of the corresponding registers (where <module> is the name of the concerned DPLL).

The SSC_ACK signal notifies of the exact start and SSC end of the DPLL. It can be read by the PRCM_CM_CLKMODE_DPLL_<module>[13] DPLL_SSC_ACK bit of the corresponding registers (where <module> is the name of the concerned DPLL).

The following restriction applies to the range of M values: $M - \Delta M$ must be ≥ 20 . Also, $M + \Delta M$ must be ≤ 2045 . If DOWNSPREAD is enabled, $M - 2 \times \Delta M$ must be ≥ 20 , and $M \leq 2045$. In any case, the frequency modulation is programmed and does not generally have to be changed in real time.

Table 3-45 shows the DPLL SSC control parameters.

Table 3-45. DPLL SSC Control Parameters

| Parameter | Description |
|--|--|
| SSC enable control | Enable/disable the DPLL SSC feature. When set to disable, SSC is disabled only after completion of one full cycle of the modulation pattern to maintain the average frequency. |
| SSC acknowledge | Notifies the exact start and end of SSC |
| Modulation Frequency Divider setting (Mantissa and Exponent) | Set the ratio of the modulation frequency with respect to the REF_CLK/4 frequency. |
| M step size setting (DeltaMStepInteger and DeltaMStepFraction) | Set the feedback divider variation step-size. |

3.6.3.3.5.1 Definition

The SSC adds a variation to the frequency of an original clock, which spreads the generated interference over a larger band of frequencies.

In theory, SSC means that the clock signal is varied around the desired frequency. For example, for a 1-GHz clock, the frequency may be 999.5 MHz at one time and 1.0005 GHz at another time. Doing this constantly causes the power of the tone to be spread out more over a broader band of tight frequencies (centered at the desired tone). To realize this constant variation on the original signal, a modulation with an additional signal (called spreading waveform) is realized.

Creating an SSC by spreading the initial clock frequency is done by defining the following parameters:

- The spreading frequency (deviation), which is the ratio of the range of spreading frequency over the original clock frequency
- The modulation rate (f_m), which is used to determine the clock-frequency spreading-cycling rate, and is the time during which the generated clock frequency varies through f and returns to the original frequency
- The modulation waveform, which describes the variation curve over time

The spectral power reduction in the DPLL clocks is dependent on the modulation index (K), which is a ratio of spreading frequency, calculated from the frequency deviation (f) and the modulation rate (f_m).

3.6.3.3.5.2 Modulation Waveforms

The shape (profile) of the generated clock signal depends on the modulation waveform used during the frequency modulation. Several profiles can be used, according to the desired shaping for the energy spreading.

Figure 3-43 shows three examples of modulation waveforms and the spectrum of the corresponding modulated clock signal.

Figure 3-43. Modulation Profiles

The triangular wave gives a relatively flat spectrum and is easy to generate.

3.6.3.3.5.3 Effects on the Clock Signal

Figure 3-44 shows an example of the effect of triangular spreading on a clock signal.

Figure 3-44. Effect of the SSC in Frequency

Spectrum of signal without spreading

Spectrum of signal with triangular spreading

prcm-082

Figure 3-44 shows the power reduction of the main peak, and also the flatter aspect of the modulated signal. The minimum level of the second signal is higher than the first one. This effect is normal and is due to the noise added for the modulation.

NOTE: The spreading technique scatters the energy of the peaks on the other frequencies, which reduces the power of the peaks, but also increases the global noise of the signal.

Figure 3-45 shows the effect of triangular spreading on a clock signal in the time domain.

Figure 3-45. Effect of the SSC in the Time Domain

prcm-083

3.6.3.3.5.4 Estimation of the EMI Reduction Level

Figure 3-46 shows the effect of spreading on a clock and its harmonics.

Figure 3-46. Peaks Reduction Due to Spreading

EMI reduction can be estimated using the following equation:

$$(1) \text{ Peak_power_reduction} = 10 \times \log \left(\frac{(\text{Deviation} \times f_c)}{f_m} \right) - 10$$

Where:

- Peak_power_reduction in dB
- Deviation in percentage of the initial clock frequency (f_c), is equal to $\Delta f/f_c$.
- f_c is the original clock frequency, in MHz.
- f_m is the spreading frequency, in MHz.

According to equation (1), the deviation can also be calculated, and then f for a required reduction in peak-power:

$$(2) \text{ Deviation} = \left(\frac{f_m}{f_c} \right) \times 10^{((\text{Peak_power_reduction} + 10)/10)}$$

Example:

For $f_c = 160$ MHz, Deviation = 1% peak from f_c ($\Delta f = 1.6$ MHz) and $f_m = 16$ kHz, the estimated peak power reduction is 10 dB.

3.6.3.3.5.5 Bandwidth Calculation (Carson's Bandwidth Rule)

Carson's bandwidth rule defines the approximate bandwidth requirements of communications system components for a carrier signal that is frequency-modulated by a continuous or broad spectrum of frequencies rather than by a single frequency.

Carson's bandwidth rule is expressed by the relation $CBR = 2 \times (f + f_m)$, where CBR is the bandwidth requirement, f is the peak frequency deviation, and f_m is the highest frequency in the modulating signal. For example, an FM signal with a 5-kHz peak deviation and a maximum audio frequency of 3 kHz requires an approximate bandwidth of $2 \times (5 + 3) = 16$ kHz.

Theoretically, any FM signal has an infinite number of sidebands and, hence, an infinite bandwidth. In practice, all significant sideband energy (98 percent or more) is concentrated within the bandwidth defined by Carson's bandwidth rule.

3.6.3.3.5.6 SSC Configuration

The configuration of the spreading feature is not mandatory when programming the DPLL. This feature is usually enabled when the DPLL clocks generate harmonics, which can potentially interfere with the GSM carrier frequencies.

Once the clock generation control registers are configured, the spreading on the clock signal can be configured as follows:

1. Calculate ModFreqDivider and DeltaMStep based on the desired peak-power reduction.
2. Configure the MODFREQDIV_EXPONENT, MODFREQDIV_MANTISSA, and DELTAMSTEP bit fields according to the calculated values.
3. Enable the spreading using the DPLL_SSC_EN bit.

NOTE: Spreading on a clock must be carefully configured to avoid adding noise on frequencies that are used by another module. For example, adding spreading on a clock to reduce noise on GSM frequencies can move the generated noise to the frequency of the memory controller and thus degrade its performance.

Example:

For $f_c = 160$ MHz, Deviation = 1% peak from f_c ($\Delta f = 1.6$ MHz) and $f_m = 16$ kHz, the estimated peak power reduction is 10 dB.

The output clock can be calculated using the following equation: $f_c = (f_{in} \times M) / ((N + 1) \times M2)$ (where M is a software-controlled multiplier, N is a software-controlled divider, $M2$ is a software-controlled output divider, f_c stands for f_{CLKOUT_M2} ; for the calculation of other output clock frequencies and for more information, see [DPLLs Output Clocks Parameters](#), and the Clock Tree Tool).

The input clock is $f_{in} = 38.4$ MHz. The following settings of the DPLL are required to have $f_c = 160$ MHz: $M = 25$, $N = 2$, $M2 = 2$. The value of M satisfies the restrictions: $M - \Delta M \geq 20$. Also, $M + \Delta M \leq 2045$.

f_{ref} can be calculated using the following equation:

$$f_{ref} = f_{in} / (1 + N) = 12.8 \text{ MHz}$$

ModFreqDivider can be calculated using the following equation:

$$\text{ModFreqDivider} = f_{ref} / (4 \times f_m) = 200$$

The exponent and mantissa of ModFreqDivider can now be calculated (where ModFreqDivider = Mantissa $\times 2^{\text{Exponent}}$ and it must be used as the minimal value for the exponent):

$$\text{Mantissa} = 100, \text{Exponent} = 1$$

Knowing the deviation and M , ΔM can now be calculated:

$$\Delta M / M = 1\% \geq \Delta M = 0.01 \times 25 = 0.25$$

DeltaMStep can be calculated as follows:

$$\text{DeltaMStep} = \Delta M / \text{ModFreqDivider} = 0.00125$$

The integer and fractional part of DeltaMStep can now be determined:

Integer part = 0, Fractional part = $0.00125 \times 2^{18} = 327$ (for an 18-bit fractional part)

The DPLL can be configured as follows:

- MODFREQDIV_EXPONENT = 1
- MODFREQDIV_MANTISSA = 100
- DELTAMSTEP = 327

The state of the modulation feature can be monitored with the DPLL_SSC_ACK bit of the corresponding register.

NOTE: Because this is in-band modulation for the DPLL, the modulation frequency must be within the DPLL loop bandwidth ($f_m < f_{ref}/70$). A higher modulation frequency results in less spreading in the output clock.

When deactivating the spreading (DPLL_SSC_EN = 0), the end-of-spreading is synchronous to the internal spreading cycle. Thus, there is no residual average frequency error.

3.6.3.3.6 DPLL Output Power Down

The DCO clock LDO (DCOCLKLDO) of the DPLL can be powered down if all output dividers of the DPLL are powered down. The PRCM module automatically re-enables the power to the LDO when an output divider is powered up or the DPLL switches to bypass mode.

Similarly, all the output dividers (M2, M3, and the Mn) can be powered down when their output clocks are gated and powered up when the clocks are needed again.

Table 3-46. DPLL Power-Down Control Parameters

| Parameter | Description |
|-----------------------------------|--|
| DCO clock LDO power down control | Enable/disable automatic power-down feature if the all the output dividers are powered down. |
| M2, M3, and Mn (where n = 4 to 7) | Enables/disables automatic power-down feature of the corresponding output divider if the output clocks of the divider are gated. |

3.6.3.3.7 DPLL Output Clock Gating

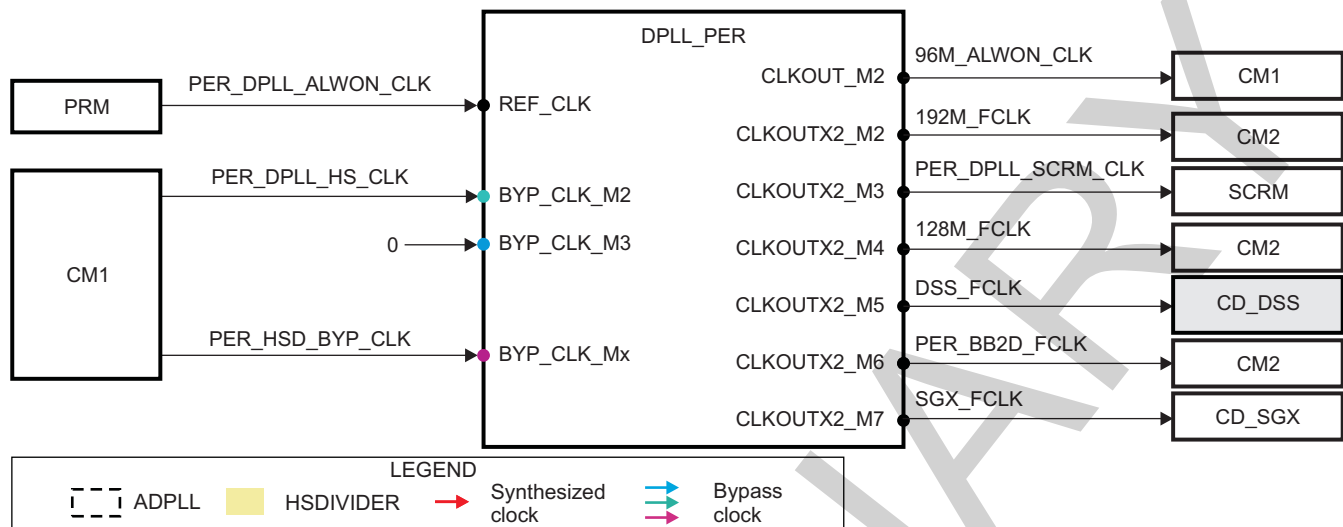

A clock gating control for DPLL output clocks allows selection between automatic clock gating and forcing the clock state. This control is done by the DPLL_CLKOUT_GATE_CTRL bit of the CM_DIV_Mn_DPLL name registers.

These bits are used for debug purposes. They are not required by any high-level operating system (HLOS). This does not apply to the [CM_DIV_M3_DPLL_CORE\[8\]](#) DPLL_CLKOUTHIF_GATE_CTRL and [CM_DIV_M3_DPLL_PER\[8\]](#) DPLL_CLKOUTHIF_GATE_CTRL bits. They enable the CORE_DPLL_SCRM_CLK and PER_DPLL_SCRM_CLK clocks that can be used as an SCRM auxiliary clock source.

3.6.3.4 DPLL_PER Description

3.6.3.4.1 Overview

[Figure 3-47](#) shows the overview of the DPLL. See [Section 3.6.3.3, Generic DPLL Overview](#), for a functional overview of a generic DPLL module.

Figure 3-47. DPLL_PER Overview

prcm-042

3.6.3.4.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See [Section 3.6.3.3, Generic DPLL Overview](#), for an explanation of the clock synthesis and output divider parameters of the DPLL module.

[Table 3-47](#) lists the clock synthesis parameters of the DPLL.

Table 3-47. DPLL_PER Clock Synthesis Parameters

| Parameter Name | Control Bit Field |
|----------------|--|
| M | CM_CLKSEL_DPLL_PER[18:8] DPLL_MULT |
| N | CM_CLKSEL_DPLL_PER[6:0] DPLL_DIV |

[Table 3-48](#) lists the clock output divider parameters of the DPLL.

Table 3-48. DPLL_PER Clock Output Parameters

| Clock Output/Divider | Parameter Name | Control/Status Bit Field |
|----------------------|---------------------|---|
| CLKOUT_M2 | Status | CM_DIV_M2_DPLL_PER[9] ST_DPLL_CLKOUT |
| CLKOUT_M2 | Gating Control | CM_DIV_M2_DPLL_PER[8] DPLL_CLKOUT_GATE_CTRL |

| CLKOUTX2_M7 | Divider Control | CM_DIV_M7_DPLL_PER [4:0] HSDIVIDER_CLKOUT4_DIV |

3.6.3.4.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identify the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Modes](#), for an explanation of the DPLL operating modes, and associated control and status features.

[Table 3-49](#) lists the operating modes supported by the DPLL.

Table 3-49. DPLL_PER Modes

| Low-Power Stop | Fast-Relock Stop | MN Bypass | Low-Power Bypass | Fast-Relock Bypass | Lock |
|----------------|------------------|---------------------|------------------|--------------------|-----------|
| Not available | Not available | Available (default) | Available | Available | Available |

[Table 3-50](#) lists the control bit fields for the operating mode control of the DPLL.

Table 3-50. DPLL_PER Mode Control Parameters

| Parameter Name | Control Bit Field |
|------------------------|--|
| Low-Power Mode Control | CM_CLKMODE_DPLL_PER[10] DPLL_LPMODE_EN |
| Manual Mode Control | CM_CLKMODE_DPLL_PER[2:0] DPLL_EN |
| Auto Mode Control | CM_AUTOIDLE_DPLL_PER[2:0] AUTO_DPLL_MODE |

3.6.3.4.4 Recalibration

Table 3-51 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See Section 3.6.3.3.4, *DPLL Recalibration*, for an explanation of the DPLL recalibration feature.

Table 3-51. DPLL_PER Recalibration Feature Parameters

| Parameter Name | Control/Status Bit Field |
|--|---|
| Recalibration - Enable Control | CM_CLKMODE_DPLL_PER[8] DPLL_DRIFTGUARD_EN |
| Recalibration - Interrupt Status | PRM_IRQSTATUS_MPU_A9[3] DPLL_PER_RECAL_ST |
| Recalibration - Interrupt MASK Control | PRM_IRQENABLE_MPU_A9[3] DPLL_PER_RECAL_EN |
| Recalibration - Interrupt Status | PRM_IRQSTATUS_MPU_M3[3] DPLL_PER_RECAL_ST |
| Recalibration - Interrupt MASK Control | PRM_IRQENABLE_MPU_M3[3] DPLL_PER_RECAL_EN |

3.6.3.4.5 Spread Spectrum Clocking

Table 3-52 lists the control bit fields associated with the SSC features of the DPLL. See Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*, for an explanation of the DPLL SSC feature.

Table 3-52. DPLL_PER Spread-Spectrum Clocking Feature Parameters

| Parameter Name | Control Bit Field |
|---|--|
| SSC Downspread | CM_CLKMODE_DPLL_PER[14] DPLL_SSC_DOWNSPREAD |
| SSC Acknowledge | CM_CLKMODE_DPLL_PER[13] DPLL_SSC_ACK |
| SSC Enable Control | CM_CLKMODE_DPLL_PER[12] DPLL_SSC_EN |
| Modulation Step Size Setting | CM_SSC_DELTAMSTEP_DPLL_PER[19:0] DELTAMSTEP |
| Modulation Frequency Divider - Exponent | CM_SSC_MODFREQDIV_DPLL_PER[10:8] MODFREQDIV_EXPONENT |
| Modulation Frequency Divider - Mantissa | CM_SSC_MODFREQDIV_DPLL_PER[6:0] MODFREQDIV_MANTISSA |

3.6.3.4.6 Output Power Down

Table 3-53 lists the control bit fields for the output power down features of the DPLL. See Section 3.6.3.3.6, *DPLL Output Power-Down*, for an explanation of the DPLL output power down feature.

Table 3-53. DPLL_PER Clock Output Power-down Parameters

| Parameter Name | Control/Status Bit Field |
|--|---|
| Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M4_DPLL_PER[12] HSDIVIDER_CLKOUT1_PWDN |
| Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M5_DPLL_PER[12] HSDIVIDER_CLKOUT2_PWDN |
| Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M6_DPLL_PER[12] HSDIVIDER_CLKOUT3_PWDN |
| Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M7_DPLL_PER[12] HSDIVIDER_CLKOUT4_PWDN |

3.6.3.4.7 DPLL_PER Preferred Settings

For SYS_CLK = 38.4 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x7), the DPLL_PER preferred settings are listed in [Table 3-54](#).

Table 3-54. DPLL_PER Preferred Settings for SYS_CLK = 38.4 MHz

| CORE OPPs | | PER DPLL | | | Peripheral Clocks | | | | | | | | | | | |
|---------------------|--------|--------------------------------------|----|---|-------------------|---|------|---|------|--|------|--|------|--|----|---|
| OPPs | | DPLL Locked Frequency (MHz) | M | N | M2 | 96M_ALWO N_CLK Actual Frequency (MHz) | M4+1 | 128M_FCLK Actual Frequency (MHz) | M5+1 | DSS_FCLK Actual Frequency (MHz) | M6+1 | PER_BB2D FCLK Max Frequency (MHz) | M7+1 | SGX_FCLK Actual Frequency (MHz) | M3 | PER_DPLL SCRM_CLK Max Frequency (MHz) |

3.6.3.5 DPLL_CORE Description

3.6.3.5.1 Overview

Figure 3-48 shows the overview of the DPLL. See [Section 3.6.3.3, Generic DPLL Overview](#), for a functional overview of a generic DPLL module.

Figure 3-48. DPLL_CORE Overview

prcm-043

3.6.3.5.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See [Section 3.6.3.3, Generic DPLL Overview](#), for an explanation of the clock synthesis and output divider parameters of the DPLL module.

[Table 3-59](#) lists the clock synthesis parameters of the DPLL.

Table 3-59. DPLL_CORE Clock Synthesis Parameters

| Parameter Name | Control Bit Field |
|----------------|---|
| M | CM_CLKSEL_DPLL_CORE[18:8] DPLL_MULT |
| N | CM_CLKSEL_DPLL_CORE[6:0] DPLL_DIV |
| M (Restore) | CM_CLKSEL_DPLL_CORE_RESTORE[18:8] DPLL_MULT |
| N (Restore) | CM_CLKSEL_DPLL_CORE_RESTORE[6:0] DPLL_DIV |

[Table 3-60](#) lists the clock output divider parameters of the DPLL.

Table 3-60. DPLL_CORE Clock Output Parameters

| Clock Output/Divider | Parameter Name | Control/Status Bit Field |
|----------------------|---------------------|--|
| CLKOUT_M2 | Status | CM_DIV_M2_DPLL_CORE[9] ST_DPLL_CLKOUT |

3.6.3.5.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identifies the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Modes](#), for an explanation of the DPLL operating modes, and associated control and status features.

[Table 3-61](#) lists the operating modes supported by the DPLL.

Table 3-61. DPLL_CORE Modes

| Low-Power Stop | Fast-Relock Stop | MN Bypass | Low-Power Bypass | Fast-Relock Bypass | Lock |
|----------------|------------------|---------------------|------------------|--------------------|-----------|
| Not available | Not available | Available (default) | Available | Available | Available |

[Table 3-62](#) lists the control bit fields for the operating mode control of the DPLL.

Table 3-62. DPLL_CORE Mode Control Parameters

| Parameter Name | Control Bit Field |
|----------------------------------|--|
| Low-Power Mode Control | CM_CLKMODE_DPLL_CORE[10] DPLL_LPMODE_EN |
| Manual Mode Control | CM_CLKMODE_DPLL_CORE[2:0] DPLL_EN |
| Auto Mode Control | CM_AUTOIDLE_DPLL_CORE[2:0] AUTO_DPLL_MODE |
| Low-Power Mode Control (Restore) | CM_CLKMODE_DPLL_CORE_RESTORE[10] DPLL_LPMODE_EN |
| Manual Mode Control (Restore) | CM_CLKMODE_DPLL_CORE_RESTORE[2:0] DPLL_EN |
| Auto Mode Control (Restore) | CM_AUTOIDLE_DPLL_CORE_RESTORE[2:0] AUTO_DPLL_MODE |

3.6.3.5.4 Recalibration

[Table 3-63](#) lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See [Section 3.6.3.3.4, DPLL Recalibration](#), for an explanation of the DPLL recalibration feature.

Table 3-63. DPLL_CORE Recalibration Feature Parameters

| Parameter Name | Control/Status Bit Field |
|--|---|
| Recalibration - Enable Control | CM_CLKMODE_DPLL_CORE[8] DPLL_DRIFTGUARD_EN |
| Recalibration - Enable Control | CM_CLKMODE_DPLL_CORE_RESTORE[8] DPLL_DRIFTGUARD_EN |
| Recalibration - Interrupt Status | PRM_IRQSTATUS_MPU_A9[0] DPLL_CORE_RECAL_ST |
| Recalibration - Interrupt mask Control | PRM_IRQENABLE_MPU_A9[0] DPLL_CORE_RECAL_EN |
| Recalibration - Interrupt Status | PRM_IRQSTATUS_MPU_M3[0] DPLL_CORE_RECAL_ST |
| Recalibration - Interrupt Mask Control | PRM_IRQENABLE_MPU_M3[0] DPLL_CORE_RECAL_EN |

3.6.3.5.5 Spread Spectrum Clocking

[Table 3-64](#) lists the control bit fields associated with the SSC features of the DPLL. See [Section 3.6.3.3.5, DPLL Spread Spectrum Clocking](#), for an explanation of the DPLL SSC feature.

Table 3-64. DPLL_CORE Spread-Spectrum Clocking Feature Parameters

| Parameter Name | Control Bit Field |
|---|--|
| SSC Downspread | CM_CLKMODE_DPLL_CORE[14] DPLL_SSC_DOWNSPREAD |
| SSC Acknowledge | CM_CLKMODE_DPLL_CORE[13] DPLL_SSC_ACK |
| SSC Enable Control | CM_CLKMODE_DPLL_CORE[12] DPLL_SSC_EN |
| Modulation Step Size Setting | CM_SSC_DELTAMSTEP_DPLL_CORE[19:0] DELTAMSTEP |
| Modulation Frequency Divider - Exponent | CM_SSC_MODFREQDIV_DPLL_CORE[10:8] MODFREQDIV_EXPONENT |
| Modulation Frequency Divider - Mantissa | CM_SSC_MODFREQDIV_DPLL_CORE[6:0] MODFREQDIV_MANTISSA |
| Restore Modulation Step Size setting | CM_SSC_DELTAMSTEP_DPLL_CORE_RESTORE[19:0] DELTAMSTEP |
| Restore Modulation Frequency Divider - Exponent | CM_SSC_MODFREQDIV_DPLL_CORE_RESTORE[10:8] MODFREQDIV_EXPONENT |
| Restore Modulation Frequency Divider - Mantissa | CM_SSC_MODFREQDIV_DPLL_CORE_RESTORE[6:0] MODFREQDIV_MANTISSA |
| Restore SSC Downspread | CM_CLKMODE_DPLL_CORE_RESTORE[14] DPLL_SSC_DOWNSPREAD |
| Restore SSC Acknowledge | CM_CLKMODE_DPLL_CORE_RESTORE[13] DPLL_SSC_ACK |
| Restore SSC Enable Control | CM_CLKMODE_DPLL_CORE_RESTORE[12] DPLL_SSC_EN |

3.6.3.5.6 Output Power-Down

Table 3-65 lists the control bit fields for the output power down features of the DPLL. See Section 3.6.3.3.6, *DPLL Output Power Down*, for an explanation of the DPLL output power-down feature.

Table 3-65. DPLL_CORE Clock Output Power-Down Parameters

| Parameter Name | Control/Status Bit Field |
|--|--|
| Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M4_DPLL_CORE [12] HSDIVIDER_CLKOUT1_PWDN |
| Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M5_DPLL_CORE [12] HSDIVIDER_CLKOUT2_PWDN |
| Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M6_DPLL_CORE [12] HSDIVIDER_CLKOUT3_PWDN |
| Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M7_DPLL_CORE [12] HSDIVIDER_CLKOUT4_PWDN |
| Restore Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M4_DPLL_CORE_RESTORE [12] HSDIVIDER_CLKOUT1_PWDN |
| Restore Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M5_DPLL_CORE_RESTORE [12] HSDIVIDER_CLKOUT2_PWDN |
| Restore Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M6_DPLL_CORE_RESTORE [12] HSDIVIDER_CLKOUT3_PWDN |
| Restore Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M7_DPLL_CORE_RESTORE [12] HSDIVIDER_CLKOUT4_PWDN |

3.6.3.5.7 DPLL_CORE Preferred Settings

For SYS_CLK = 38.4 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x7), the DPLL_CORE preferred settings are listed in [Table 3-66](#).

Table 3-66. DPLL_CORE Preferred Settings for SYS_CLK = 38.4 MHz

| CORE OPPs | | CORE DPLL | | | CORE Clocks | | | | | | | | | | | |
|---------------------|--------|-----------------------------|-----|---|-------------|-------------------------------------|------|-----------------------------------|------|------------------------------------|------|---------------------------------------|------|---------------------------------------|----|--|

3.6.3.6 DPLL_ABE Description

3.6.3.6.1 Overview

Figure 3-49 shows the overview of the DPLL. See [Section 3.6.3.3, Generic DPLL Overview](#), for a functional overview of a generic DPLL module.

Figure 3-49. DPLL_ABE Overview

prcm-044

3.6.3.6.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See [Section 3.6.3.3, Generic DPLL Overview](#), for an explanation of the clock synthesis and output divider parameters of the DPLL module.

Table 3-71 lists the clock synthesis parameters of the DPLL.

Table 3-71. DPLL_ABE Clock Synthesis Parameters

| Parameter Name | Control Bit Field |
|----------------|------------------------------------|
| M | CM_CLKSEL_DPLL_ABE[18:8] DPLL_MULT |
| N | CM_CLKSEL_DPLL_ABE[6:0] DPLL_DIV |

Table 3-72 lists the clock output divider parameters of the DPLL.

Table 3-72. DPLL_ABE Clock Output Parameters

| Clock Output/Divider | Parameter Name | Control/Status Bit Field |
|----------------------|---------------------|---|
| CLKOUT_M2 | Status | CM_DIV_M2_DPLL_ABE[9] ST_DPLL_CLKOUT |
| CLKOUT_M2 | Gating Control | CM_DIV_M2_DPLL_ABE[8] DPLL_CLKOUT_GATE_CTRL |
| CLKOUT_M2 | Divider Acknowledge | CM_DIV_M2_DPLL_ABE[5] DPLL_CLKOUT_DIVCHACK |
| CLKOUTX2_M2 | Status | CM_DIV_M2_DPLL_ABE[11] ST_DPLL_CLKOUTX2 |
| CLKOUTX2_M2 | Gating Control | CM_DIV_M2_DPLL_ABE[10] DPLL_CLKOUTX2_GATE_CTRL |
| CLKOUT_M2 | Divider Control | CM_DIV_M2_DPLL_ABE[4:0] DPLL_CLKOUT_DIV |
| CLKOUTX2_M3 | Status | CM_DIV_M3_DPLL_ABE[9] ST_DPLL_CLKOUTHIF |
| CLKOUTX2_M3 | Gating Control | CM_DIV_M3_DPLL_ABE[8] DPLL_CLKOUTHIF_GATE_CTRL |
| CLKOUTX2_M3 | Divider Acknowledge | CM_DIV_M3_DPLL_ABE[5] DPLL_CLKOUTHIF_DIVCHACK |
| CLKOUTX2_M3 | Divider Control | CM_DIV_M3_DPLL_ABE[4:0] DPLL_CLKOUTHIF_DIV |

3.6.3.6.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identify the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Mode](#), for an explanation of the DPLL operating modes, and associated control and status features.

[Table 3-73](#) lists the operating modes supported by the DPLL.

Table 3-73. DPLL_ABE Modes

| Low-Power Stop | Fast-Relock Stop | MN Bypass | Low-Power Bypass | Fast-Relock Bypass | Lock |
|----------------|------------------|---------------------|------------------|--------------------|-----------|
| Not available | Not available | Available (Default) | Available | Available | Available |

[Table 3-74](#) lists the control bit fields for the operating mode control of the DPLL.

Table 3-74. DPLL_ABE Mode Control Parameters

| Parameter Name | Control Bit Field |
|------------------------|---|
| Low-Power Mode Control | CM_CLKMODE_DPLL_ABE [10] DPLL_LP_MODE_EN |
| Manual Mode Control | CM_CLKMODE_DPLL_ABE [2:0] DPLL_EN |
| Auto Mode Control | CM_AUTOIDLE_DPLL_ABE [2:0] AUTO_DPLL_MODE |

3.6.3.6.4 Recalibration

[Table 3-75](#) lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See [Section 3.6.3.3.4, DPLL Recalibration](#), for an explanation of the DPLL recalibration feature.

Table 3-75. DPLL_ABE Recalibration Feature Parameters

| Parameter Name | Control/Status Bit Field |
|--|--|
| Recalibration - Enable Control | CM_CLKMODE_DPLL_ABE [8] DPLL_DRIFTGUARD_EN |
| Recalibration - Interrupt Status | PRM_IRQSTATUS_MPU_A9 [4] DPLL_ABE_RECAL_ST |
| Recalibration - Interrupt Mask Control | PRM_IRQENABLE_MPU_A9 [4] DPLL_ABE_RECAL_EN |

3.6.3.6.5 Spread Spectrum Clocking

[Table 3-76](#) lists the control bit fields associated with the SSC features of the DPLL. See [Section 3.6.3.3.5, DPLL Spread Spectrum Clocking](#), for an explanation of the DPLL SSC feature.

Table 3-76. DPLL_ABE Spread-Spectrum Clocking Feature Parameters

| Parameter Name | Control Bit Field |
|---|---|
| SSC Downspread | CM_CLKMODE_DPLL_ABE [14] DPLL_SSC_DOWNSPREAD |
| SSC Acknowledge | CM_CLKMODE_DPLL_ABE [13] DPLL_SSC_ACK |
| SSC Enable Control | CM_CLKMODE_DPLL_ABE [12] DPLL_SSC_EN |
| Modulation Step Size Setting | CM_SSC_DELTAMSTEP_DPLL_ABE [19:0] DELTAMSTEP |
| Modulation Frequency Divider - Exponent | CM_SSC_MODFREQDIV_DPLL_ABE [10:8] MODFREQDIV_EXPONENT |
| Modulation Frequency Divider - Mantissa | CM_SSC_MODFREQDIV_DPLL_ABE [6:0] MODFREQDIV_MANTISSA |

3.6.3.6.6 DPLL_ABE Preferred Settings

For SYS_CLK = 38.4 MHz (configured in [CM_SYS_CLKSEL](#)[2:0] SYS_CLKSEL = 0x7), the DPLL_ABE preferred settings are listed in [Table 3-77](#).

Table 3-77. DPLL_ABE Preferred Settings for SYS_CLK = 38.4 MHz

| IVA OPPs | ABE DPLL | | | ABE Clocks | | | |
|-----------|---------------------------|-----|---|------------|--|----|---------------------------------------|
| | DPLL Locked Freq (MHz) | M | N | M2 | DPLL_ABE_X2_CLK Actual Freq (MHz) – M2X2 o/p | M3 | CORE_DPLL_HS_CLK Actual Freq (MHz) |
| OPP_NTSB | 196,608 | 750 | 0 | 1 | 196,608 | 1 | 196,6 |
| OPP_NITRO | 196,608 | 750 | 0 | 1 | 196,608 | 1 | 196,6 |
| OPP_TURBO | 196,608 | 750 | 0 | 1 | 196,608 | 1 | 196,6 |
| OPP100 | 196,608 | 750 | 0 | 1 | 196,608 | 1 | 196,6 |
| OPP50 | 196,608 | 750 | 0 | 1 | 196,608 | 1 | 196,6 |

For SYS_CLK = 26.0 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x5), the DPLL_ABE preferred settings are listed in [Table 3-78](#).

3.6.3.7 DPLL_MPU Description

3.6.3.7.1 Overview

[Figure 3-50](#) shows the overview of the DPLL. See [Section 3.6.3.3](#), *Generic DPLL Overview*, for a functional overview of a generic DPLL module.

Figure 3-50. DPLL_MPU Overview

Table 3-82. MPU SS Clock Division Control

| Divider/Mux | Control Bit Field |
|-----------------------|---|
| Divider EOC_P_MA_ICLK | CM_MPU_MPU_CLKCTRL[24] CLKSEL_EMIF_DIV_MODE |

NOTE: For more information about setting the [CM_MPU_MPU_CLKCTRL\[24\]](#) CLKSEL_EMIF_DIV_MODE and [CM_MPU_MPU_CLKCTRL\[25\]](#) CLKSEL_ABE_DIV_MODE bits, see the *Data Manual Operating Condition Addendum*.

3.6.3.7.2 Tactical Clocking Adjustment

[Figure 3-50](#) includes the clocking adjustment scheme for DPLL_MPU. To obtain MPU_DPLL_CLK frequency higher than 1 GHz, the CLKOUTX2_M3 output is used instead of the CLKOUT_M2 output. The M3 output divider is hardwired to value 1 and a duty cycle correction circuit (DCC) is used to recover a correct duty cycle (48–52 percent maximum). The [CM_CLKSEL_DPLL_MPU\[22\]](#) DCC_EN bit must be set for DPLL_MPU for the DCC to be used.

There is a subsequent clock gating element after the DCC instance. The selection between CLKOUT_M2 and CLKOUTX2_M3 source clock is performed in a glitch-free manner using an OR gate and non-overlapping input clock technique. Additional FSM is added into the CM1 to control the clock switching sequence. The FSM includes a counter for a clock ramp step (configured by the [CM_CLKSEL_DPLL_MPU\[31:24\]](#) DCC_COUNT_MAX bit field) during which the output frequency is $F_{dpll}/(2 \cdot M2)$. This clock ramp step is used for two purposes:

- Allows enough time for DCC to lock (2.5 μ s)

- Eventually avoids a transient load issue on the power IC by programming a bigger value (up to 81.6 μ s)

Principles:

- When DCC_EN = 0, the DCC FSM is transparent and the CLKOUTX2_M3 gating element and the gating element after the DCC instance are off.
- When DCC_EN = 1:
 - CLKOUT_M2 is ungated as soon as the MPU clock is requested. The two other gating elements are off.
 - CLKOUTX2_M3 is ungated as soon as the DPLL is locked and the FSM starts the counter.
 - When the counter ends, CLKOUT_M2 is gated, and the DCC clock output is ungated with an assured 10-ns minimal nonoverlap time.
 - In case MPU clock is no longer requested, the DCC clock output is gated, and then the CLKOUTX2_M3 is gated.

3.6.3.7.3 Synthesized Clock Parameters

This section describes the clock synthesis and clock out divider parameters of the DPLL. See [Section 3.6.3.3, Generic DPLL Overview](#), for an explanation of the clock synthesis and output divider parameters of the DPLL module.

[Table 3-83](#) lists the clock synthesis parameters of the DPLL.

Table 3-83. DPLL_MPU Clock Synthesis Parameters

| Parameter Name | Control Bit Field |
|----------------|---|
| M | CM_CLKSEL_DPLL_MPU [18:8] DPLL_MULT |
| N | CM_CLKSEL_DPLL_MPU [6:0] DPLL_DIV |

[Table 3-84](#) lists the clock output divider parameters of the DPLL.

Table 3-84. DPLL_MPU Clock Output Parameters

| Clock Output/Divider | Parameter Name | Control/Status Bit Field |
|----------------------|---------------------|---|
| CLKOUT_M2 | Status | CM_DIV_M2_DPLL_MPU [9] ST_DPLL_CLKOUT |
| CLKOUT_M2 | Gating Control | CM_DIV_M2_DPLL_MPU [8] DPLL_CLKOUT_GATE_CTRL |
| CLKOUT_M2 | Divider Acknowledge | CM_DIV_M2_DPLL_MPU [5] DPLL_CLKOUT_DIVCHACK |
| CLKOUT_M2 | Divider Control | CM_DIV_M2_DPLL_MPU [4:0] DPLL_CLKOUT_DIV |

3.6.3.7.4 Power Modes

This section identifies the operating modes supported by the DPLL and also identify the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Modes](#), for an explanation of the DPLL operating modes and associated control and status features.

[Table 3-85](#) lists the operating modes supported by the DPLL.

Table 3-85. DPLL_MPU Modes

| Low-Power Stop | Fast-Relock Stop | MN Bypass | Low-Power Bypass | Fast-Relock Bypass | Lock |
|----------------|------------------|---------------------|------------------|--------------------|-----------|
| Not available | Not available | Available (Default) | Available | Available | Available |

Table 3-86 lists the control bit fields for the operating mode control of the DPLL.

Table 3-86. DPLL_MPU Mode Control Parameters

| Parameter Name | Control Bit Field |
|------------------------|--|
| Low-Power Mode Control | CM_CLKMODE_DPLL_MPU[10] DPLL_LPMODE_EN |
| Manual Mode Control | CM_CLKMODE_DPLL_MPU[2:0] DPLL_EN |
| Auto Mode Control | CM_AUTOIDLE_DPLL_MPU[2:0] AUTO_DPLL_MODE |

3.6.3.7.5 Recalibration

Table 3-87 lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See Section 3.6.3.3.4, *DPLL Recalibration*, for an explanation of the DPLL recalibration feature.

Table 3-87. DPLL_MPU Recalibration Feature Parameters

| Parameter Name | Control/Status Bit Field |
|--|---|
| Recalibration - Enable Control | CM_CLKMODE_DPLL_MPU[8] DPLL_DRIFTGUARD_EN |
| Recalibration - Interrupt Status | PRM_IRQSTATUS_MPU_A9[1] DPLL_MPU_RECAL_ST |
| Recalibration - Interrupt Mask Control | PRM_IRQENABLE_MPU_A9[1] DPLL_MPU_RECAL_EN |

3.6.3.7.6 Spread Spectrum Clocking

Table 3-88 lists the control bit fields associated with the SSC features of the DPLL. See Section 3.6.3.3.5, *DPLL Spread Spectrum Clocking*, for an explanation of the DPLL SSC feature.

Table 3-88. DPLL_MPU Spread-Spectrum Clocking Feature Parameters

| Parameter Name | Control Bit Field |
|---|--|
| SSC Downspread | CM_CLKMODE_DPLL_MPU[14] DPLL_SSC_DOWNSPREAD |
| SSC Acknowledge | CM_CLKMODE_DPLL_MPU[13] DPLL_SSC_ACK |
| SSC Enable Control | CM_CLKMODE_DPLL_MPU[12] DPLL_SSC_EN |
| Modulation Step Size Setting | CM_SSC_DELTAMSTEP_DPLL_MPU[19:0] DELTAMSTEP |
| Modulation Frequency Divider - Exponent | CM_SSC_MODFREQDIV_DPLL_MPU[10:8] MODFREQDIV_EXPONENT |
| Modulation Frequency Divider - Mantissa | CM_SSC_MODFREQDIV_DPLL_MPU[6:0] MODFREQDIV_MANTISSA |

3.6.3.7.7 DPLL_MPU Preferred Settings

For SYS_CLK = 38.4 MHz (configured in CM_SYS_CLKSEL[2:0] SYS_CLKSEL = 0x7), the DPLL_MPU preferred settings are listed in Table 3-89.

Table 3-89. DPLL_MPU Preferred Settings for SYS_CLK = 38.4 MHz

| MPU OPPs | MPU DPLL | | | MPU | | | |
|-----------|---------------------------|-----|---|-----|---|----|-----------------------------------|
| OPPs | DPLL Locked Freq (MHz) | M | N | M2 | | M3 | MPU_DPLL_CLK Actual Freq (MHz) |
| OPP_NTSB | 1497, 6 | 39 | 1 | | Use M3 output + Duty Cycle Correction | 1 | 1497, 6 |
| OPP_NITRO | 1297, 9 | 169 | 9 | | | 1 | 1297, 9 |

3.6.3.8 DPLL_IVA Description

3.6.3.8.1 Overview

Figure 3-51 shows the overview of the DPLL. See [Section 3.6.3.3, Generic DPLL Overview](#), for a functional overview of a generic DPLL module.

Figure 3-51. DPLL_IVA Overview

prcm-046

3.6.3.8.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See [Section 3.6.3.3, Generic DPLL Overview](#), for an explanation of the clock synthesis and output divider parameters of the DPLL module.

[Table 3-94](#) lists the clock synthesis parameters of the DPLL.

Table 3-94. DPLL_IVA Clock Synthesis Parameters

| Parameter Name | Control Bit Field |
|----------------|--|
| M | CM_CLKSEL_DPLL_IVA[18:8] DPLL_MULT |
| N | CM_CLKSEL_DPLL_IVA[6:0] DPLL_DIV |

[Table 3-95](#) lists the clock output divider parameters of the DPLL.

Table 3-95. DPLL_IVA Clock Output Parameters

| Clock Output/Divider | Parameter Name | Control/Status Bit Field |
|----------------------|---------------------|--|
| CLKOUTX2_M4 | Status | CM_DIV_M4_DPLL_IVA[9] ST_HSDIVIDER_CLKOUT1 |
| CLKOUTX2_M4 | Gating Control | CM_DIV_M4_DPLL_IVA[8] HSDIVIDER_CLKOUT1_GATE_CTRL |
| CLKOUTX2_M4 | Divider Acknowledge | CM_DIV_M4_DPLL_IVA[5] HSDIVIDER_CLKOUT1_DIVCHACK |
| CLKOUTX2_M4 | Divider Control | CM_DIV_M4_DPLL_IVA[4:0] HSDIVIDER_CLKOUT1_DIV |
| CLKOUTX2_M5 | Status | CM_DIV_M5_DPLL_IVA[9] ST_HSDIVIDER_CLKOUT2 |
| CLKOUTX2_M5 | Gating Control | CM_DIV_M5_DPLL_IVA[8] HSDIVIDER_CLKOUT2_GATE_CTRL |
| CLKOUTX2_M5 | Divider Acknowledge | CM_DIV_M5_DPLL_IVA[5] HSDIVIDER_CLKOUT2_DIVCHACK |
| CLKOUTX2_M5 | Divider Control | CM_DIV_M5_DPLL_IVA[4:0] HSDIVIDER_CLKOUT2_DIV |

3.6.3.8.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identify the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#) and [Section 3.6.3.3.3, DPLL Power Modes](#) for explanation on the DPLL operating modes, and associated control and status features.

[Table 3-96](#) presents the operating modes supported by the DPLL.

Table 3-96. DPLL_IVA Modes

| Low-Power Stop | Fast-Relock Stop | MN Bypass | Low-Power Bypass | Fast-Relock Bypass | Lock |
|----------------|------------------|---------------------|------------------|--------------------|-----------|
| Not available | Not available | Available (Default) | Available | Available | Available |

[Table 3-97](#) presents the control bit fields for the operating mode control of the DPLL.

Table 3-97. DPLL_IVA Mode Control Parameters

| Parameter Name | Control Bit Field |
|------------------------|---|
| Low-Power Mode Control | CM_CLKMODE_DPLL_IVA [10] DPLL_LPMODE_EN |
| Manual Mode Control | CM_CLKMODE_DPLL_IVA [2:0] DPLL_EN |
| Auto Mode Control | CM_AUTOIDLE_DPLL_IVA [2:0] AUTO_DPLL_MODE |

3.6.3.8.4 Recalibration

[Table 3-98](#) lists the control bit fields for the recalibration feature enable and interrupts of the DPLL. See [Section 3.6.3.3.4, DPLL Recalibration](#), for an explanation of the DPLL recalibration feature.

Table 3-98. DPLL_IVA Recalibration Feature Parameters

| Parameter Name | Control/Status Bit Field |
|--|--|
| Recalibration - Enable Control | CM_CLKMODE_DPLL_IVA [8] DPLL_DRIFTGUARD_EN |
| Recalibration - Interrupt Status | PRM_IRQSTATUS_MPU_A9 [2] DPLL_IVA_RECAL_ST |
| Recalibration - Interrupt Mask Control | PRM_IRQENABLE_MPU_A9 [2] DPLL_IVA_RECAL_EN |
| Recalibration - Interrupt Status | PRM_IRQSTATUS_MPU_M3 [2] DPLL_IVA_RECAL_ST |
| Recalibration - Interrupt Mask Control | PRM_IRQENABLE_MPU_M3 [2] DPLL_IVA_RECAL_EN |

3.6.3.8.5 Spread Spectrum Clocking

[Table 3-99](#) lists the control bit fields associated with the SSC features of the DPLL. See [Section 3.6.3.3.5, DPLL Spread Spectrum Clocking](#), for an explanation of the DPLL SSC feature.

Table 3-99. DPLL_IVA Spread-Spectrum Clocking Feature Parameters

| Parameter Name | Control Bit Field |
|---|---|
| SSC Downspread | CM_CLKMODE_DPLL_IVA [14] DPLL_SSC_DOWNSPREAD |
| SSC Acknowledge | CM_CLKMODE_DPLL_IVA [13] DPLL_SSC_ACK |
| SSC Enable Control | CM_CLKMODE_DPLL_IVA [12] DPLL_SSC_EN |
| Modulation Step Size Setting | CM_SSC_DELTAMSTEP_DPLL_IVA [19:0] DELTAMSTEP |
| Modulation Frequency Divider - Exponent | CM_SSC_MODFREQDIV_DPLL_IVA [10:8] MODFREQDIV_EXPONENT |
| Modulation Frequency Divider - Mantissa | CM_SSC_MODFREQDIV_DPLL_IVA [6:0] MODFREQDIV_MANTISSA |

3.6.3.8.6 Output Power Down

Table 3-100 lists the control bit fields for the output power down features of the DPLL. See Section 3.6.3.3.6, *DPLL Output Power-Down*, for an explanation of the DPLL output power-down feature.

Table 3-100. DPLL_IVA Clock Output Power-down Parameters

| Parameter Name | Control/Status Bit Field |
|--|---|
| Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M4_DPLL_IVA[12] HSDIVIDER_CLKOUT1_PWDN |
| Clock Divider - HSDIVIDER-Power Down Control | CM_DIV_M5_DPLL_IVA[12] HSDIVIDER_CLKOUT2_PWDN |

3.6.3.8.7 DPLL_IVA Preferred Settings

For SYS_CLK = 38.4 MHz (configured in CM_SYS_CLKSEL[2:0] SYS_CLKSEL = 0x7), the DPLL_IVA preferred settings are listed in Table 3-101.

Table 3-101. DPLL_IVA Preferred Settings for SYS_CLK = 38.4 MHz

| IVA OPPs | IVA DPLL | | | IVA Clocks | | | |
|-----------|---------------------------|-----|----|------------|-----------------------------------|------|-------------------------------------|
| OPPs | DPLL Locked Freq (MHz) | M | N | M4+1 | DSP_ROOT_CLK Actual Freq (MHz) | M5+1 | IVAHD_ROOT_CLK Actual Freq (MHz) |
| OPP_NTSB | 998, 4 | 13 | 0 | 2 | 499, 2 | 2 | 499, 2 |
| OPP_NITRO | 860, 2 | 56 | 4 | 2 | 430, 1 | 2 | 430, 1 |
| OPP_TURBO | 992, 0 | 155 | 11 | 2 | 496, 0 | 3 | 330, 7 |
| OPP100 | 1862, 4 | 97 | 3 | 4 | 465, 6 | 7 | 266, 1 |
| OPP50 | 1862, 4 | 97 | 3 | 8 | 232, 8 | 14 | 133, 0 |

For SYS_CLK = 26.0 MHz (configured in CM_SYS_CLKSEL[2:0] SYS_CLKSEL = 0x5), the DPLL_IVA preferred settings are listed in Table 3-102.

Table 3-102. DPLL_IVA Preferred Settings for SYS_CLK = 26.0 MHz

| IVA OPPs | IVA DPLL | | | IVA Clocks | | | |
|-----------|---------------------------|-----|----|------------|-----------------------------------|------|-------------------------------------|

3.6.3.9 DPLL_USB Description

3.6.3.9.1 Overview

[Figure 3-52](#) shows the overview of the DPLL. See [Section 3.6.3.3](#), *Generic DPLL Overview*, for a functional overview of a generic DPLL module.

Figure 3-52. DPLL_USB Overview

prcm-047

3.6.3.9.2 Synthesized Clock Parameters

This section presents the clock synthesis and clock out divider parameters of the DPLL. See [Section 3.6.3.3](#), *Generic PDLL Overview*, for an explanation of the clock synthesis and output divider parameters of the DPLL module.

[Table 3-106](#) lists the clock synthesis parameters of the DPLL.

Table 3-106. DPLL_USB Clock Synthesis Parameters

| Parameter Name | Control Bit Field |
|----------------|------------------------------------|
| M | CM_CLKSEL_DPLL_USB[19:8] DPLL_MULT |
| N | CM_CLKSEL_DPLL_USB[7:0] DPLL_DIV |

Table 3-107 lists the clock output divider parameters of the DPLL.

Table 3-107. DPLL_USB Clock Output Parameters

| Clock Output/Divider | Parameter Name | Control/Status Bit Field |
|----------------------|---------------------|--|
| CLKOUT_M2 | Status | CM_DIV_M2_DPLL_USB[9] ST_DPLL_CLKOUT |
| CLKOUT_M2 | Gating Control | CM_DIV_M2_DPLL_USB[8] DPLL_CLKOUT_GATE_CTRL |
| CLKOUT_M2 | Divider Acknowledge | CM_DIV_M2_DPLL_USB[7] DPLL_CLKOUT_DIVCHACK |
| CLKOUT_M2 | Divider Control | CM_DIV_M2_DPLL_USB[6:0] DPLL_CLKOUT_DIV |

3.6.3.9.3 Power Modes

This section identifies the operating modes supported by the DPLL and also identifies the control bit fields to set its operating modes. See [Section 3.6.3.3.2, Enable Control, Status and Low-Power Operation Mode](#), and [Section 3.6.3.3.3, DPLL Power Modes](#), for an explanation of the DPLL operating modes, and associated control and status features.

Table 3-108 lists the operating modes supported by the DPLL.

Table 3-108. DPLL_USB Modes

| Low-Power Stop | Fast-Relock Stop | MN Bypass | Low-Power Bypass | Fast-Relock Bypass | Lock |
|----------------|------------------|---------------------|------------------|--------------------|-----------|
| Available | Not available | Available (Default) | Available | Not available | Available |

Table 3-109 lists the control bit fields for the operating mode control of the DPLL.

Table 3-109. DPLL_USB Mode Control Parameters

| Parameter Name | Control Bit Field |
|---------------------|--|
| Manual Mode Control | CM_CLKMODE_DPLL_USB[2:0] DPLL_EN |
| Auto Mode Control | CM_AUTOIDLE_DPLL_USB[2:0] AUTO_DPLL_MODE |

3.6.3.9.4 Spread Spectrum Clocking

Table 3-110 lists the control bit fields associated with the SSC features of the DPLL. See [Section 3.6.3.3.5, DPLL Spread Spectrum Clocking](#), for an explanation of the DPLL SSC feature.

Table 3-110. DPLL_USB Spread-Spectrum Clocking Feature Parameters

| Parameter Name | Control Bit Field |
|---|---|
| SSC Downspread | CM_CLKMODE_DPLL_USB[14] DPLL_SSC_DOWNSPREAD |
| SSC Acknowledge | CM_CLKMODE_DPLL_USB[13] DPLL_SSC_ACK |
| SSC Enable Control | CM_CLKMODE_DPLL_USB[12] DPLL_SSC_EN |
| Modulation Step Size Setting | CM_SSC_DELTAMSTEP_DPLL_USB[19:0] DELTAMSTEP |
| Modulation Frequency Divider - Exponent | CM_SSC_MODFREQDIV_DPLL_USB[10:8] MODFREQDIV_EXPONENT |
| Modulation Frequency Divider - Mantissa | CM_SSC_MODFREQDIV_DPLL_USB[6:0] MODFREQDIV_MANTISSA |

3.6.3.9.5 DPLL_USB Preferred Settings

For SYS_CLK = 38.4 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x7), the DPLL_USB preferred settings are listed in [Table 3-111](#).

Table 3-111. DPLL_USB Preferred Settings for SYS_CLK = 38.4 MHz

| CORE OPPs | USB DPLL | | | USB | |
|-----------|---------------------------|-----|----|-----|-------------------------------------|
| OPPs | DPLL Locked Freq (MHz) | M | N | M2 | INIT_480M_FCLK Actual Freq (MHz) |
| OPP119 | 960 | 400 | 15 | 2 | 480, 0 |
| OPP100 | 960 | 400 | 15 | 2 | 480, 0 |
| OPP50 | 960 | 400 | 15 | 2 | 480, 0 |

For SYS_CLK = 26.0 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x5), the DPLL_USB preferred settings are listed in [Table 3-112](#).

Table 3-112. DPLL_USB Preferred Settings for SYS_CLK = 26.0 MHz

| CORE OPPs | USB DPLL | | | USB | |
|-----------|---------------------------|-----|----|-----|-------------------------------------|
| OPPs | DPLL Locked Freq (MHz) | M | N | M2 | INIT_480M_FCLK Actual Freq (MHz) |
| OPP119 | 960 | 480 | 12 | 2 | 480, 0 |
| OPP100 | 960 | 480 | 12 | 2 | 480, 0 |
| OPP50 | 960 | 480 | 12 | 2 | 480, 0 |

For SYS_CLK = 19.2 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x4), the DPLL_USB preferred settings are listed in [Table 3-113](#).

Table 3-113. DPLL_USB Preferred Settings for SYS_CLK = 19.2 MHz

| CORE OPPs | USB DPLL | | | USB | |
|-----------|---------------------------|-----|---|-----|-------------------------------------|
| OPPs | DPLL Locked Freq (MHz) | M | N | M2 | INIT_480M_FCLK Actual Freq (MHz) |
| OPP119 | 960 | 400 | 7 | 2 | 480, 0 |
| OPP100 | 960 | 400 | 7 | 2 | 480, 0 |
| OPP50 | 960 | 400 | 7 | 2 | 480, 0 |

For SYS_CLK = 16.8 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x3), the DPLL_USB preferred settings are listed in [Table 3-114](#).

Table 3-114. DPLL_USB Preferred Settings for SYS_CLK = 16.8 MHz

| CORE OPPs | USB DPLL | | | USB | |
|-----------|---------------------------|-----|---|-----|-------------------------------------|
| OPPs | DPLL Locked Freq (MHz) | M | N | M2 | INIT_480M_FCLK Actual Freq (MHz) |
| OPP119 | 960 | 400 | 6 | 2 | 480, 0 |
| OPP100 | 960 | 400 | 6 | 2 | 480, 0 |
| OPP50 | 960 | 400 | 6 | 2 | 480, 0 |

For SYS_CLK = 12.0 MHz (configured in [CM_SYS_CLKSEL\[2:0\]](#) SYS_CLKSEL = 0x1), the DPLL_USB preferred settings are listed in [Table 3-115](#).

Table 3-115. DPLL_USB Preferred Settings for SYS_CLK = 12.0 MHz

| CORE OPPs | USB DPLL | | | USB | |
|-----------|---------------------------|---|---|-----|-------------------------------------|
| OPPs | DPLL Locked Freq (MHz) | M | N | M2 | INIT_480M_FCLK Actual Freq (MHz) |

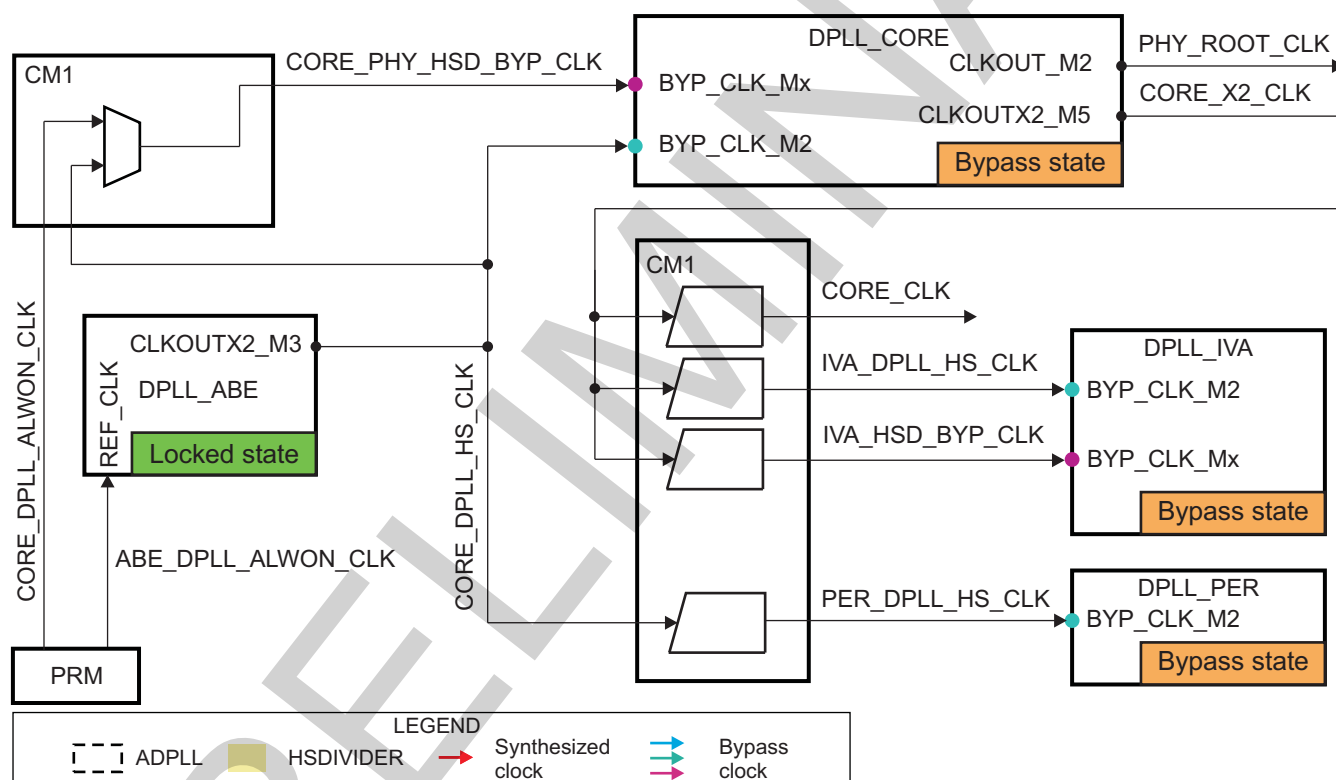

Table 3-115. DPLL_USB Preferred Settings for SYS_CLK = 12.0 MHz (continued)

| CORE OPPs | USB DPLL | | | USB | |
|-----------|----------|-----|---|-----|--------|
| OPP119 | 960 | 400 | 4 | 2 | 480, 0 |
| OPP100 | 960 | 400 | 4 | 2 | 480, 0 |
| OPP50 | 960 | 400 | 4 | 2 | 480, 0 |

3.6.3.10 DPLLs Cascading

To reduce the device power consumption in certain low-power use cases of the device, the DPLLs in the device can be cascaded so that functional clock to a power domain is provided by a DPLL upstream without locking the DPLL associated with the domain. In such a case, the unlocked DPLLs can be kept in the low-power bypass mode shows the scheme for cascading DPLLs.

Figure 3-53 shows a generic scheme for cascading DPLLs.

Figure 3-53. DPLLs Cascading Overview

prcm-049

The sequence of enabling the DPLL cascading is given below:

1. DPLL_ABE is locked by software request. Other DPLLs down stream must not be moved to bypass mode before DPLL_ABE is locked. This ensures that the output clocks of these DPLLs are not stopped when they switch to the DPLL_ABE output clock.
2. Internal EMIF shadow registers are set to take PHY clock and DLL reference clock derived from DPLL_ABE.
3. Bypass paths for DPLL_IVA is set up by configuring the programmable dividers in CM1 responsible for providing the bypass clock. The setting is based upon the OPP requirements.
4. DPLL_IVA is put into bypass mode by software (any of the bypass mode is allowed) and the output of the DPLL, if already enabled, switches from locked clock to bypass clock from DPLL_CORE.
5. DPLL_PER is put into bypass mode as well by software, if required. The outputs of the DPLL, if enabled, switch to the divided clock of DPLL_ABE CLKOUTX2_M3.

6. DPLL_CORE is set in bypass mode by configuring the bypass clocks input mux and the [CM_SHADOW_FREQ_CONFIG1](#)[10:8] DPLL_CORE_DPLL_EN bit field to a bypass mode in the DVFS shadow register in CM1 and setting [CM_SHADOW_FREQ_CONFIG1](#)[0] FREQ_UPDATE = 1 by software. This step triggers the handshake with EMIF to safely unlock the DPLL and move the output clock of DPLL_CORE to CORE_DPLL_HS_CLK. Ensure that the CORE_CLK divider in CM1 is correctly programmed to handle the OPP needs of the CORE power domain before this step.
7. Software can then switch the L4_WKUP interface clock from SYS_CLK to ABE_LP_CLK to allow for deasserting of the SYS_CLK request line to SCRM, if SYS_CLK is not requested by any other dependency.

The sequence of disabling the DPLL cascading is given below:

1. Software switches the L4_WKUP interface clock from ABE_LP_CLK to SYS_CLK requesting the restart of SYS_CLK by the SCRM, if not already present.
2. Software programs the EMIF internal shadow registers to prepare the switchback of EMIF interface from using DPLL_ABE clock to DPLL_CORE clock.
3. DPLL_IVA bypass path is correctly set for the targeted DPLL_CORE frequency by programming the bypass dividers for the DPLL in CM1.
4. DPLL_CORE is relocked using the DVFS shadow register in CM1. The PRCM module ensures that this step is executed with proper handshake with EMIF to allow for a frequency update on the EMIF interface.
5. Other DPLLs are locked as well if required, to fully exit from the DPLL cascading mode.
6. DPLL_ABE might be forced into STOPMODE or bypass mode by software or may enter one of the auto modes if so programmed.

3.6.4 CD_WKUP Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.4.1 Overview

[Figure 3-54](#) shows the overview of the clock domain.

Figure 3-54. CD_WKUP Overview

prcm-050

3.6.4.2 Clock Domain Modes

[Table 3-116](#) lists the clock domain modes supported by the clock domain.

Table 3-116. CD_WKUP Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|---------------|---------------|-----------|
| Available | Not available | Not available | Available |

Table 3-117 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-117. CD_WKUP Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|---|
| ABE_LP_CLK clock status | CM_WKUP_CLKSTCTRL[9] CLKACTIVITY_ABE_LP_CLK |
| WKUP_L4_ICLK2 clock status | CM_WKUP_CLKSTCTRL[12] CLKACTIVITY_WKUP_L4_ICLK2 |
| SYS_CLK clock status | CM_WKUP_CLKSTCTRL[8] CLKACTIVITY_SYS_CLK |
| WKUP_32K_FCLK clock status | CM_WKUP_CLKSTCTRL[11] CLKACTIVITY_WKUP_32K_FCLK |
| Clock Domain State Transition Control | CM_WKUP_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.4.3 Clock Domain Dependency

CD_WKUP has no static dependency or dynamic dependency with any other clock domain of the device.

3.6.4.3.1 Wake-Up Dependency

Table 3-118 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-118. CD_WKUP Wake-Up Dependency Association Parameters

| Originator Module | Originator Clock Domain | Servicing Clock Domain | Default Setting | Control Bit Field | Access Type |
|-------------------|-------------------------|------------------------|-----------------|---|-------------|
| GPIO1 | CD_WKUP | CD_DSP | Always enabled | PM_WKUP_GPIO1_WKDEP[6] WKUPDEP_GPIO1_IRQ2_DSP | Read only |
| GPIO1 | CD_WKUP | CD_CORTEXM3 | Disabled | PM_WKUP_GPIO1_WKDEP[1] WKUPDEP_GPIO1_IRQ1_MPU_M3 | Read/Write |
| GPIO1 | CD_WKUP | CD_CORTEXA9 | Disabled | PM_WKUP_GPIO1_WKDEP[0] WKUPDEP_GPIO1_IRQ1_MPU | Read/Write |
| KEYBOARD | CD_WKUP | CD_CORTEXA9 | Always enabled | PM_WKUP_KEYBOARD_WKDEP[0] WKUPDEP_KEYBOARD_MPU | Read only |
| GPTIMER1 | CD_WKUP | CD_CORTEXA9 | Always enabled | PM_WKUP_GPTIMER1_WKDEP[0] WKUPDEP_TIMER1_MPU | Read only |
| WDTIMER2 | CD_WKUP | CD_CORTEXM3 | Disabled | PM_WKUP_WDTIMER2_WKDEP[1] WKUPDEP_WDT2_MPU_M3 | Read/Write |
| WDTIMER2 | CD_WKUP | CD_CORTEXA9 | Disabled | PM_WKUP_WDTIMER2_WKDEP[0] WKUPDEP_WDT2_MPU | Read/Write |

3.6.4.4 Clock Domain Module Attributes

Table 3-119 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-119. CD_WKUP Modules Clocks Association

| Module | Clock | Clock Type |
|----------------------|---------------|------------|
| SYSCTRL_PADCONF_WKUP | WKUP_L4_ICLK2 | Functional |
| BANDGAP | WKUP_TS_FCLK | Functional |
| SYSCTRL_GENERAL_WKUP | WKUP_L4_ICLK2 | Functional |
| GPIO1 | WKUP_L4_ICLK2 | Interface |
| | WKUP_32K_FCLK | Functional |
| Keyboard | WKUP_L4_ICLK2 | Interface |
| | WKUP_32K_FCLK | Functional |
| SAR_RAM | WKUP_L4_ICLK2 | Interface |
| 32KTIMER | 32K_FCLK | Functional |
| | WKUP_L4_ICLK2 | Interface |
| GPTIMER1 | GPT1_FCLK | Functional |
| | WKUP_L4_ICLK2 | Interface |
| WDTIMER2 | WKUP_L4_ICLK2 | Interface |
| | WKUP_32K_FCLK | Functional |
| L4_WKUP interconnect | WKUP_L4_ICLK2 | Interface |

Table 3-120 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-120. CD_WKUP Modules Wake-Up Request

| Module | Wake-Up Feature |
|----------------------|--|
| SYSCTRL_PADCONF_WKUP | None |
| BANDGAP | None |
| SYSCTRL_GENERAL_WKUP | None |
| GPIO1 | Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ) |
| Keyboard | Slave wake-up request (MPU_A9 -IRQ) |
| SAR_RAM | None |
| 32KTIMER | None |
| GPTIMER1 | Slave wake-up request (MPU_A9 -IRQ) |
| WDTIMER2 | Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ) |
| L4_WKUP interconnect | None |

Table 3-121 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-121. CD_WKUP Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|----------|---------------------------|---|-------------|
| GPIO1 | Slave | CM_WKUP_GPIO1_CLKCTRL [17:16] IDLEST | Idle status |
| KEYBOARD | Slave | CM_WKUP_KEYBOARD_CLKCTRL [17:16] IDLEST | Idle status |
| SAR_RAM | Slave | CM_WKUP_SARRAM_CLKCTRL [17:16] IDLEST | Idle status |
| 32KTIMER | Slave | CM_WKUP_32KTIMER_CLKCTRL [17:16] IDLEST | Idle status |
| GPTIMER1 | Slave | CM_WKUP_GPTIMER1_CLKCTRL [17:16] IDLEST | Idle status |
| WDTIMER2 | Slave | CM_WKUP_WDTIMER2_CLKCTRL [17:16] IDLEST | Idle status |

Table 3-121. CD_WKUP Modules Clock-Management Modes and Control (continued)

| Module | Clock-Management Protocol | Status Bit Field | Role |
|----------------------|---------------------------|---|-------------|
| L4_WKUP interconnect | Slave | CM_WKUP_L4WKUP_CLKCTRL [17:16] IDLEST | Idle status |

[Table 3-122](#) lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 3-122. CD_WKUP Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|----------------------|-----------|-----------|-----------|---|-------------|
| GPIO1 | Available | Available | N/A | CM_WKUP_GPIO1_CLKCTRL [1:0] MODULEMODE | Read/Write |
| KEYBOARD | Available | N/A | Available | CM_WKUP_KEYBOARD_CLKCTRL [1:0] MODULEMODE | Read/Write |
| SAR_RAM | N/A | Available | N/A | CM_WKUP_SARRAM_CLKCTRL [1:0] MODULEMODE | Read only |
| 32KTIMER | N/A | Available | N/A | CM_WKUP_32KTIMER_CLKCTRL [1:0] MODULEMODE | Read only |
| GPTIMER1 | Available | N/A | Available | CM_WKUP_GPTIMER1_CLKCTRL [1:0] MODULEMODE | Read/Write |
| WDTIMER2 | Available | N/A | Available | CM_WKUP_WDTIMER2_CLKCTRL [1:0] MODULEMODE | Read/Write |
| L4_WKUP interconnect | N/A | Available | N/A | CM_WKUP_L4WKUP_CLKCTRL [1:0] MODULEMODE | Read only |

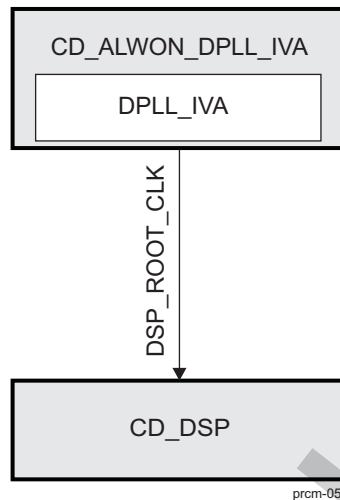

3.6.5 CD_DSP Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.5.1 Overview

[Figure 3-55](#) shows the overview of the clock domain.

Figure 3-55. CD_DSP Overview

3.6.5.2 Clock Domain Modes

Table 3-123 lists the clock domain modes supported by the clock domain.

Table 3-123. CD_DSP Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|-----------|-----------|-----------|
| Available | Available | Available | Available |

Table 3-124 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-124. CD_DSP Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|--|
| DSP_ROOT_CLK clock status | CM_DSP_CLKSTCTRL[8] CLKACTIVITY_DSP_ROOT_CLK |
| Clock Domain State Transition Control | CM_DSP_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.5.3 Clock Domain Dependency

CD_DSP has no module wake-up dependency with any other clock domain of the device.

3.6.5.3.1 Static Dependency

Table 3-125 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-125. CD_DSP Static Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|-----------------------------------|-------------|
| CD_ABE | Disabled | CM_DSP_STATICDEP[3] ABE_STATDEP | Read/Write |
| CD_CAM | Always disabled | CM_DSP_STATICDEP[9] ISS_STATDEP | Read only |
| CD_IVAHD | Disabled | CM_DSP_STATICDEP[2] IVAHD_STATDEP | Read/Write |
| CD_L3_1 | Disabled | CM_DSP_STATICDEP[5] L3_1_STATDEP | Read/Write |
| CD_L3_2 | Disabled | CM_DSP_STATICDEP[6] L3_2_STATDEP | Read/Write |

Table 3-125. CD_DSP Static Dependency Association Parameters (continued)

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--|-------------|
| CD_L3_INIT | Disabled | CM_DSP_STATICDEP [7] L3INIT_STATDEP | Read/Write |
| CD_L4_CFG | Disabled | CM_DSP_STATICDEP [12] L4CFG_STATDEP | Read/Write |
| CD_L4_PER | Disabled | CM_DSP_STATICDEP [13] L4PER_STATDEP | Read/Write |
| CD_EMIF | Disabled | CM_DSP_STATICDEP [4] MEMIF_STATDEP | Read/Write |

3.6.5.3.2 Dynamic Dependency

[Table 3-126](#) lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-126. CD_DSP Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|---|-------------|
| CD_ABE | Always enabled | CM_DSP_DYNAMICDEP [3] ABE_DYNDEP | Read only |
| CD_IVAHD | Always enabled | CM_DSP_DYNAMICDEP [2] IVAHD_DYNDEP | Read only |
| CD_L3_1 | Always enabled | CM_DSP_DYNAMICDEP [5] L3_1_DYNDEP | Read only |

3.6.5.4 Clock Domain Module Attributes

[Table 3-127](#) lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-127. CD_DSP Modules Clocks Association

| Module | Clock | Clock Type |
|--------|--------------|--------------------------|
| DSP | DSP_ROOT_CLK | Interface and functional |

[Table 3-128](#) lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-128. CD_DSP Modules Wake-Up Request

| Module | Wake-Up Feature |
|--------|------------------------|
| DSP | Master wake-up request |

[Table 3-129](#) lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-129. CD_DSP Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|--------|---------------------------|---|----------------|
| DSP | Master/Slave | CM_DSP_DSP_CLKCTRL [18] STBYST | Standby status |
| | | CM_DSP_DSP_CLKCTRL [17: 16] IDLEST | Idle status |

Table 3-130 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-130. CD_DSP Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|--------|-----------|-----------|---------|-----------------------------------|-------------|
| DSP | Available | Available | N/A | CM_DSP_DSP_CLKCTRL[1:0]MODULEMODE | Read/Write |

3.6.6 CD_STD_EFUSE Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.6.1 Overview

Figure 3-56 shows the overview of the clock domain.

Figure 3-56. CD_STD_EFUSE Overview

CD_STD_EFUSE is hardware-controlled by the PRCM module and has no software control or status bit fields. Similarly, it has no static, dynamic and wake-up dependency with respect to other clock domains of the device.

3.6.6.2 Clock Domain Module Attributes

The STD_EFUSE module of the clock domain is automatically controlled by the PRCM module hardware and has no software configurable module mode control or status bit fields.

Table 3-131 identifies for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-131. CD_STD_EFUSE Modules Clocks Association

| Module | Clock | Clock Type |
|-----------|------------------|------------|
| STD_EFUSE | STDEFUSE_SYS_CLK | Functional |

Table 3-132 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-132. CD_STD_EFUSE Modules Wake-Up Request

| Module | Wake-Up Feature |
|-----------|-----------------|
| STD_EFUSE | None |

3.6.7 CD_CORTEXA9 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.7.1 Overview

Figure 3-57 shows the overview of the clock domain.

Figure 3-57. CD_CORTEXA9 Overview

3.6.7.2 Clock Domain Modes

Table 3-133 lists the clock domain modes supported by the clock domain.

Table 3-133. CD_CORTEXA9 Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|---------------|-----------|-----------|
| Available | Not available | Available | Available |

Table 3-134 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-134. CD_CORTEXA9 Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|--|
| MPU_DPLL_CLK clock status | CM_MPU_CLKSTCTRL[9] CLKACTIVITY_MPU_DPLL_CLK |
| Clock Domain State Transition Control | CM_MPU_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.7.3 Clock Domain Dependency

CD_CORTEXA9 has no module wake-up dependency with any other clock domain of the device.

3.6.7.3.1 Static Dependency

Table 3-135 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-135. CD_CORTEXA9 Static Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|---------------------------------------|-------------|
| CD_ABE | Disabled | CM_MPU_STATICDEP[3] ABE_STATDEP | Read/Write |
| CD_C2C | Always disabled | CM_MPU_STATICDEP[18] C2C_STATDEP | Read only |
| CD_DSS | Disabled | CM_MPU_STATICDEP[8] DSS_STATDEP | Read/Write |
| CD_CORTEXM3 | Disabled | CM_MPU_STATICDEP[0] MPU_M3_STATDEP | Read/Write |
| CD_SGX | Disabled | CM_MPU_STATICDEP[10] SGX_STATDEP | Read/Write |
| CD_CAM | Always disabled | CM_MPU_STATICDEP[9] ISS_STATDEP | Read only |
| CD_IVAHD | Disabled | CM_MPU_STATICDEP[2] IVAHD_STATDEP | Read/Write |
| CD_L3_1 | Enabled | CM_MPU_STATICDEP[5] L3_1_STATDEP | Read/Write |
| CD_L3_2 | Enabled | CM_MPU_STATICDEP[6] L3_2_STATDEP | Read/Write |
| CD_L3_INIT | Enabled | CM_MPU_STATICDEP[7] L3INIT_STATDEP | Read/Write |
| CD_L4_CFG | Enabled | CM_MPU_STATICDEP[12] L4CFG_STATDEP | Read/Write |
| CD_L4_PER | Enabled | CM_MPU_STATICDEP[13] L4PER_STATDEP | Read/Write |
| CD_EMIF | Enabled | CM_MPU_STATICDEP[4] MEMIF_STATDEP | Read/Write |
| CD_DMA | Always disabled | CM_MPU_STATICDEP[11] SDMA_STATDEP | Read only |
| CD_DSP | Disabled | CM_MPU_STATICDEP[1] DSP_STATDEP | Read/Write |

3.6.7.3.2 Dynamic Dependency

Table 3-136 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-136. CD_CORTEXA9 Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--------------------------------------|-------------|
| CD_ABE | Always enabled | CM_MPU_DYNAMICDEP[3] ABE_DYNDEP | Read only |
| CD_L3_1 | Always enabled | CM_MPU_DYNAMICDEP[5] L3_1_DYNDEP | Read only |
| CD_EMIF | Always enabled | CM_MPU_DYNAMICDEP[4] MEMIF_DYNDEP | Read only |

3.6.7.4 Clock Domain Module Attributes

Table 3-137 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-137. CD_CORTEXA9 Modules Clocks Association

| Module | Clock | Clock Type |
|----------|--------------|--------------------------|
| CORTEXA9 | MPU_DPLL_CLK | Interface and Functional |

Table 3-138 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-138. CD_CORTEXA9 Modules Wake-Up Request

| Module | Wake-Up Feature |
|----------|------------------------|
| CORTEXA9 | Master wake-up request |

Table 3-139 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-139. CD_CORTEXA9 Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|----------|---------------------------|----------------------------------|----------------|
| CORTEXA9 | Master/Slave | CM_MPU_MPU_CLKCTRL[18] STBYST | Standby status |
| | | CM_MPU_MPU_CLKCTRL[17:16] IDLEST | Idle status |

Table 3-140 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-140. CD_CORTEXA9 Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|----------|----------|-----------|---------|------------------------------------|-------------|
| CORTEXA9 | N/A | Available | N/A | CM_MPU_MPU_CLKCTRL[1:0] MODULEMODE | Read only |

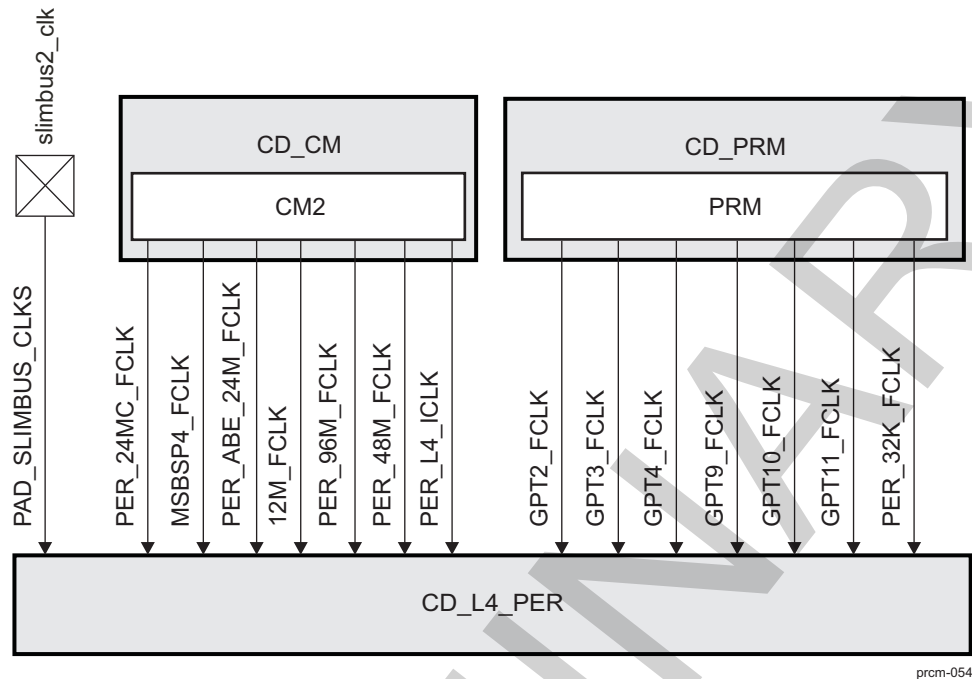

3.6.8 CD_L4_PER Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.8.1 Overview

Figure 3-58 shows the overview of the clock domain.

Figure 3-58. CD_L4_PER Overview

3.6.8.2 Clock Domain Modes

Table 3-141 lists the clock domain modes supported by the clock domain.

Table 3-141. CD_L4_PER Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|-----------|-----------|-----------|
| Available | Available | Available | Available |

Table 3-142 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-142. CD_L4_PER Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|-------------------------------|---|
| GPT10_FCLK clock status | CM_L4PER_CLKSTCTRL[9] CLKACTIVITY_GPT10_FCLK |
| GPT11_FCLK clock status | CM_L4PER_CLKSTCTRL[10] CLKACTIVITY_GPT11_FCLK |
| GPT2_FCLK clock status | CM_L4PER_CLKSTCTRL[11] CLKACTIVITY_GPT2_FCLK |
| GPT3_FCLK clock status | CM_L4PER_CLKSTCTRL[12] CLKACTIVITY_GPT3_FCLK |
| GPT4_FCLK clock status | CM_L4PER_CLKSTCTRL[13] CLKACTIVITY_GPT4_FCLK |
| GPT9_FCLK clock status | CM_L4PER_CLKSTCTRL[14] CLKACTIVITY_GPT9_FCLK |
| 12M_FCLK clock status | CM_L4PER_CLKSTCTRL[15] CLKACTIVITY_12M_FCLK_FCLK |
| PER_L4_ICLK clock status | CM_L4PER_CLKSTCTRL[8] CLKACTIVITY_L4_PER_ICLK |
| PER_24MC_FCLK clock status | CM_L4PER_CLKSTCTRL[16] CLKACTIVITY_PER_24MC_FCLK |
| PER_32K_FCLK clock status | CM_L4PER_CLKSTCTRL[17] CLKACTIVITY_PER_32K_FCLK |
| PER_48M_FCLK clock status | CM_L4PER_CLKSTCTRL[18] CLKACTIVITY_PER_48M_FCLK |
| PER_96M_FCLK clock status | CM_L4PER_CLKSTCTRL[19] CLKACTIVITY_PER_96M_FCLK |
| PER_ABE_24M_FCLK clock status | CM_L4PER_CLKSTCTRL[25] CLKACTIVITY_PER_ABE_24M_FCLK |
| MCBSP4_FCLK clock status | CM_L4PER_CLKSTCTRL[22] CLKACTIVITY_PER_MCBSP4_FCLK |

Table 3-142. CD_L4_PER Control and Status Parameters (continued)

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|-----------------------------------|
| Clock Domain State Transition Control | CM_L4PER_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.8.3 Clock Domain Dependency

CD_L4_PER has no static dependency with any other clock domain of the device.

3.6.8.3.1 Dynamic Dependency

Table 3-143 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-143. CD_L4_PER Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--|-------------|
| CD_DSS | Always enabled | CM_L4PER_DYNAMICDEP[8] DSS_DYNDEP | Read only |
| CD_L3_INIT | Always enabled | CM_L4PER_DYNAMICDEP[7] L3_INIT_DYNDEP | Read only |

3.6.8.3.2 Wake-Up Dependency

Table 3-144 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-144. CD_L4_PER Wake-Up Dependency Association Parameters

| Originator Module | Originator Clock Domain | Servicing Clock Domain | Default Setting | Control Bit Field | Access Type |
|-------------------|-------------------------|------------------------|-----------------|---|-------------|
| GPTIMER10 | CD_L4_PER | CD_CORTEXA9 | Always enabled | PM_L4PER_GPTIMER10_WKDEP[0] WKUPDEP_DMTIMER10_MPU | Read only |
| GPTIMER11 | CD_L4_PER | CD_CORTEXM3 | Disabled | PM_L4PER_GPTIMER11_WKDEP[1] WKUPDEP_DMTIMER11_MPU_M3 | Read/Write |
| GPTIMER11 | CD_L4_PER | CD_CORTEXA9 | Disabled | PM_L4PER_GPTIMER11_WKDEP[0] WKUPDEP_DMTIMER11_MPU | Read/Write |

3.6.9 CD_L3_INIT Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.9.1 Overview

[Figure 3-59](#) shows the overview of the clock domain.

Figure 3-59. CD_L3_INIT Overview

3.6.9.2 Clock Domain Modes

Table 3-149 lists the clock domain modes supported by the clock domain.

Table 3-149. CD_L3_INIT Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|-----------|-----------|-----------|
| Available | Available | Available | Available |

Table 3-150 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-150. CD_L3_INIT Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|--------------------------------|--|
| HSIC_P1_480M_FCLK clock status | CM_L3INIT_CLKSTCTRL[20] CLKACTIVITY_HSIC_P1_480M_FCLK |
| HSIC_P1_FCLK clock status | CM_L3INIT_CLKSTCTRL[26] CLKACTIVITY_HSIC_P1_FCLK |
| HSIC_P2_480M_FCLK clock status | CM_L3INIT_CLKSTCTRL[21] CLKACTIVITY_HSIC_P2_480M_FCLK |
| HSIC_P2_FCLK clock status | CM_L3INIT_CLKSTCTRL[27] CLKACTIVITY_HSIC_P2_FCLK |
| INIT_48MC_FCLK clock status | CM_L3INIT_CLKSTCTRL[12] CLKACTIVITY_INIT_48MC_FCLK |
| INIT_48M_FCLK clock status | CM_L3INIT_CLKSTCTRL[13] CLKACTIVITY_INIT_48M_FCLK |
| INIT_60M_P1_FCLK clock status | CM_L3INIT_CLKSTCTRL[28] CLKACTIVITY_INIT_60M_P1_FCLK |
| INIT_60M_P2_FCLK clock status | CM_L3INIT_CLKSTCTRL[29] CLKACTIVITY_INIT_60M_P2_FCLK |
| INIT_HSI_FCLK clock status | CM_L3INIT_CLKSTCTRL[16] CLKACTIVITY_INIT_HSI_FCLK |
| MMC1_FCLK clock status | CM_L3INIT_CLKSTCTRL[17] CLKACTIVITY_INIT_HSMMC1_FCLK |
| MMC2_FCLK clock status | CM_L3INIT_CLKSTCTRL[18] CLKACTIVITY_INIT_HSMMC2_FCLK |
| INIT_L3_ICLK clock status | CM_L3INIT_CLKSTCTRL[8] CLKACTIVITY_INIT_L3_ICLK |
| INIT_L4_ICLK clock status | CM_L3INIT_CLKSTCTRL[9] CLKACTIVITY_INIT_L4_ICLK |

Table 3-150. CD_L3_INIT Control and Status Parameters (continued)

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|--|
| TLL_CH0_FCLK clock status | CM_L3INIT_CLKSTCTRL[22] CLKACTIVITY_TLL_CH0_FCLK |
| TLL_CH1_FCLK clock status | CM_L3INIT_CLKSTCTRL[23] CLKACTIVITY_TLL_CH1_FCLK |
| UTMI_ROOT_FCLK clock status | CM_L3INIT_CLKSTCTRL[25] CLKACTIVITY_UTMI_ROOT_FCLK |
| Clock Domain State Transition Control | CM_L3INIT_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.9.3 Clock Domain Dependency

3.6.9.3.1 Static Dependency

Table 3-151 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-151. CD_L3_INIT Static Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|---------------------------------------|-------------|
| CD_ABE | Disabled | CM_L3INIT_STATICDEP[3] ABE_STATDEP | Read/Write |
| CD_IVAHD | Disabled | CM_L3INIT_STATICDEP[2] IVAHD_STATDEP | Read/Write |
| CD_L3_1 | Always enabled | CM_L3INIT_STATICDEP[5] L3_1_STATDEP | Read only |
| CD_L3_2 | Always enabled | CM_L3INIT_STATICDEP[6] L3_2_STATDEP | Read only |
| CD_L4_CFG | Disabled | CM_L3INIT_STATICDEP[12] L4CFG_STATDEP | Read/Write |
| CD_L4_PER | Disabled | CM_L3INIT_STATICDEP[13] L4PER_STATDEP | Read/Write |
| CD_EMIF | Disabled | CM_L3INIT_STATICDEP[4] MEMIF_STATDEP | Read/Write |

3.6.9.3.2 Dynamic Dependency

Table 3-152 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-152. CD_L3_INIT Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|-------------------------------------|-------------|
| CD_L3_1 | Always disabled | CM_L3INIT_DYNAMICDEP[5] L3_1_DYNDEP | Read only |
| CD_L3_2 | Always disabled | CM_L3INIT_DYNAMICDEP[6] L3_2_DYNDEP | Read only |

3.6.9.3.3 Wake-Up Dependency

Table 3-153 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-153. CD_L3_INIT Wake-Up Dependency Association Parameters

| Originator Module | Originator Clock Domain | Servicing Clock Domain | Default Setting | Control Bit Field | Access Type |
|-------------------|-------------------------|-----------------------------|-----------------|--|-------------|
| HSI | CD_L3_INIT | CD_CORTEXA9 | Disabled | PM_L3INIT_HSI_WKDEP[8] WKUPDEP_WGM_HSI_WAKE_MPU | Read/Write |
| HSI | CD_L3_INIT | CD_DSP | Always enabled | PM_L3INIT_HSI_WKDEP[6] WKUPDEP_HSI_DSP_DSP | Read only |
| HSI | CD_L3_INIT | CD_CORTEXM3 | Disabled | PM_L3INIT_HSI_WKDEP[1] WKUPDEP_HSI_MCU_MPU_M3 | Read/Write |
| HSI | CD_L3_INIT | CD_CORTEXA9 | Disabled | PM_L3INIT_HSI_WKDEP[0] WKUPDEP_HSI_MCU_MPU | Read/Write |
| HSMMC1 | CD_L3_INIT | CD_DMA, CD_L3_1, CD_L3_2 | Disabled | PM_L3INIT_MMC1_WKDEP[3] WKUPDEP_MMC1_SDMA | Read/Write |
| HSMMC1 | CD_L3_INIT | CD_DSP | Disabled | PM_L3INIT_MMC1_WKDEP[2] WKUPDEP_MMC1_DSP | Read/Write |
| HSMMC1 | CD_L3_INIT | CD_CORTEXM3 | Disabled | PM_L3INIT_MMC1_WKDEP[1] WKUPDEP_MMC1_MPU_M3 | Read/Write |
| HSMMC1 | CD_L3_INIT | CD_CORTEXA9 | Disabled | PM_L3INIT_MMC1_WKDEP[0] WKUPDEP_MMC1_MPU | Read/Write |
| HSMMC2 | CD_L3_INIT | CD_DMA, CD_L3_1, CD_L3_2 | Disabled | PM_L3INIT_MMC2_WKDEP[3] WKUPDEP_MMC2_SDMA | Read/Write |
| HSMMC2 | CD_L3_INIT | CD_DSP | Disabled | PM_L3INIT_MMC2_WKDEP[2] WKUPDEP_MMC2_DSP | Read/Write |
| HSMMC2 | CD_L3_INIT | CD_CORTEXM3 | Disabled | PM_L3INIT_MMC2_WKDEP[1] WKUPDEP_MMC2_MPU_M3 | Read/Write |
| HSMMC2 | CD_L3_INIT | CD_CORTEXA9 | Disabled | PM_L3INIT_MMC2_WKDEP[0] WKUPDEP_MMC2_MPU | Read/Write |
| HSUSBHOST | CD_L3_INIT | CD_CORTEXM3 | Disabled | PM_L3INIT_HSUSB_HOST_WKDEP[1] WKUPDEP_HSUSB_HOST_MPU_M3 | Read/Write |
| HSUSBHOST | CD_L3_INIT | CD_CORTEXA9 | Disabled | PM_L3INIT_HSUSB_HOST_WKDEP[0] WKUPDEP_HSUSB_HOST_MPU | Read/Write |
| HSUSBOTG | CD_L3_INIT | CD_CORTEXM3 | Disabled | PM_L3INIT_HSUSB_OTG_WKDEP[1] WKUPDEP_HSUSB_OTG_MPU_M3 | Read/Write |

Table 3-153. CD_L3_INIT Wake-Up Dependency Association Parameters (continued)

| Originator Module | Originator Clock Domain | Servicing Clock Domain | Default Setting | Control Bit Field | Access Type |
|-------------------|-------------------------|------------------------|-----------------|--|-------------|
| HSUSBOTG | CD_L3_INIT | CD_CORTEXA9 | Disabled | PM_L3INIT_HSUSB OTG_WKDEP[0] WKUPDEP_HSUSB OTG_MPU | Read/Write |
| HSUSBTLL | CD_L3_INIT | CD_CORTEXM3 | Disabled | PM_L3INIT_HSUSB TLL_WKDEP[1] WKUPDEP_HSUSB TLL_MPU_M3 | Read/Write |
| HSUSBTLL | CD_L3_INIT | CD_CORTEXA9 | Disabled | PM_L3INIT_HSUSB TLL_WKDEP[0] WKUPDEP_HSUSB TLL_MPU | Read/Write |

3.6.9.4 Clock Domain Module Attributes

Table 3-154 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-154. CD_L3_INIT Modules Clocks Association

| Module | Clock | Clock Type |
|-----------|---------------------|--------------------------|
| HSI | INIT_HSI_FCLK | Interface and functional |
| | INIT_L3_ICLK | Interface |
| | INIT_L4_ICLK | Interface |
| HSMC1 | MMC1_FCLK | Functional |
| | INIT_L3_ICLK | Interface |
| | INIT_L4_ICLK | Interface |
| HSMC2 | MMC2_FCLK | Functional |
| | INIT_L3_ICLK | Interface |
| | INIT_L4_ICLK | Interface |
| USBPHY | CORE_ALWON_32K_FCLK | Functional |
| | INIT_48M_FCLK | Functional |
| | INIT_L4_ICLK | Interface |
| | INIT_960M_FCLK | Functional |
| HSUSBHOST | HSIC_P1_480M_FCLK | Functional |
| | HSIC_P1_FCLK | Functional |
| | HSIC_P2_480M_FCLK | Functional |
| | HSIC_P2_FCLK | Functional |
| | INIT_48MC_FCLK | Functional (mandatory) |
| | INIT_48MC_FCLK | Functional (optional) |
| | INIT_L3_ICLK | Interface |
| | INIT_L4_ICLK | Interface |
| | UTMI_P1_FCLK | Functional |
| | UTMI_P2_FCLK | Functional |
| | UTMI_ROOT_FCLK | Functional |
| HSUSBOTG | INIT_L3_ICLK | Interface |
| | INIT_L4_ICLK | Interface |
| | OTG_60M_FCLK | Functional |
| HSUSBTLL | INIT_L4_ICLK | Interface |
| | TLL_CH0_FCLK | Functional |
| | TLL_CH1_FCLK | Functional |

Table 3-155 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-155. CD_L3_INIT Modules Wake-Up Request

| Module | Wake-Up Feature |
|-----------|---|
| HSI | Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ)/Master wake-up request |
| HSMMC1 | Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ, sDMA -DMA) |
| HSMMC2 | Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ, sDMA -DMA) |
| USBPHY | None |
| HSUSBHOST | Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ) |
| HSUSBOTG | Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ) |
| HSUSBTLL | Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ) |

Table 3-156 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-156. CD_L3_INIT Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|-----------|---------------------------|---|----------------|
| HSI | Slave/Master | CM_L3INIT_HSI_CLKCTRL[18] STBYST | Standby status |
| | | CM_L3INIT_HSI_CLKCTRL[17:16] IDLEST | Idle status |
| HSMMC1 | Master/Slave | CM_L3INIT_HSMMC1_CLKCTRL[18] STBYST | Standby status |
| | | CM_L3INIT_HSMMC1_CLKCTRL[17:16] IDLEST | Idle status |
| HSMMC2 | Master/Slave | CM_L3INIT_HSMMC2_CLKCTRL[18] STBYST | Standby status |
| | | CM_L3INIT_HSMMC2_CLKCTRL[17:16] IDLEST | Idle status |
| USBPHY | Slave | CM_L3INIT_USBPHY_CLKCTRL[17:16] IDLEST | Idle status |
| HSUSBHOST | Slave/Master | CM_L3INIT_HSUSBHOST_CLKCTRL[18] STBYST | Standby status |
| | | CM_L3INIT_HSUSBHOST_CLKCTRL[17:16] IDLEST | Idle status |
| | | CM_L3INIT_HSUSBHOST_CLKCTRL_RESTORE[18] STBYST | Standby status |
| | | CM_L3INIT_HSUSBHOST_CLKCTRL_RESTORE[17:16] IDLEST | Idle status |
| HSUSBOTG | Slave/Master | CM_L3INIT_HSUSBOTG_CLKCTRL[18] STBYST | Standby status |

Table 3-157 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-157. CD_L3_INIT Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|-----------|-----------|-----------|-----------|---|-------------|
| HSI | Available | Available | N/A | CM_L3INIT_HSI_CLKCTRL[1:0] MODULEMODE | Read/Write |
| HSMMC1 | Available | N/A | Available | CM_L3INIT_HSMMC1_CLKCTRL[1:0] MODULEMODE | Read/Write |
| HSMMC2 | Available | N/A | Available | CM_L3INIT_HSMMC2_CLKCTRL[1:0] MODULEMODE | Read/Write |
| USBPHY | Available | Available | N/A | CM_L3INIT_USBPHY_CLKCTRL[1:0] MODULEMODE | Read/Write |
| HSUSBHOST | Available | N/A | Available | CM_L3INIT_HSUSBHOST_CLKCTRL[1:0] MODULEMODE | Read/Write |
| HSUSBOTG | Available | Available | N/A | CM_L3INIT_HSUSBOTG_CLKCTRL[1:0] MODULEMODE | Read/Write |
| HSUSBTLL | Available | Available | N/A | CM_L3INIT_HSUSBTLL_CLKCTRL[1:0] MODULEMODE | Read/Write |

3.6.10 CD_IVAHD Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.10.1 Overview

Figure 3-60 shows the overview of the clock domain.

Figure 3-60. CD_IVAHD Overview

3.6.10.2 Clock Domain Modes

Table 3-158 lists the clock domain modes supported by the clock domain.

Table 3-158. CD_IVAHD Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|-----------|-----------|-----------|
| Available | Available | Available | Available |

Table 3-159 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-159. CD_IVAHD Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|---|
| IVAHD_ROOT_CLK clock status | CM_IVAHD_CLKSTCTRL[8] CLKACTIVITY_IVAHD_CLK |
| Clock Domain State Transition Control | CM_IVAHD_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.10.3 Clock Domain Dependency

CD_IVAHD has no module wake-up dependency with any other clock domain of the device

3.6.10.3.1 Static Dependency

Table 3-160 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-160. CD_IVAHD Static Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--|-------------|
| CD_L3_1 | Disabled | CM_IVAHD_STATICDEP[5] L3_1_STATDEP | Read/Write |
| CD_L3_2 | Always enabled | CM_IVAHD_STATICDEP[6] L3_2_STATDEP | Read only |
| CD_EMIF | Disabled | CM_IVAHD_STATICDEP[4] MEMIF_STATDEP | Read/Write |

3.6.10.3.2 Dynamic Dependency

Table 3-161 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-161. CD_IVAHD Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|---------------------------------------|-------------|
| CD_L3_2 | Always disabled | CM_IVAHD_DYNAMICDEP[6] L3_2_DYNDEP | Read only |

3.6.10.4 Clock Domain Module Attributes

Table 3-162 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-162. CD_IVAHD Modules Clocks Association

| Module | Clock | Clock Type |
|--------|----------------|--------------------------|
| IVAHD | IVAHD_ROOT_CLK | Interface and Functional |
| SL2 | IVAHD_ROOT_CLK | Interface |

Table 3-163 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-163. CD_IVAHD Modules Wake-Up Request

| Module | Wake-Up Feature |
|--------|-----------------|
| IVAHD | None |
| SL2 | None |

Table 3-164 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-164. CD_IVAHD Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|--------|---------------------------|---------------------------------------|----------------|
| IVAHD | Master/Slave | CM_IVAHD_IVAHD_CLKCTRL [18] STBYST | Standby status |
| | | CM_IVAHD_IVAHD_CLKCTRL [17:16] IDLEST | Idle status |
| SL2 | Slave | CM_IVAHD_SL2_CLKCTRL [17:16] IDLEST | Idle status |

Table 3-165 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-165. CD_IVAHD Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|--------|-----------|-----------|---------|--|-------------|
| IVAHD | Available | Available | N/A | CM_IVAHD_IVAHD_CLKCTRL[1:0] MODULEMODE | Read/Write |
| SL2 | Available | Available | N/A | CM_IVAHD_SL2_CLKCTRL[1:0] MODULEMODE | Read/Write |

3.6.11 CD_SGX Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.11.1 Overview

Figure 3-61 shows the overview of the clock domain.

Figure 3-61. CD_SGX Overview

prom-057

3.6.11.2 Clock Domain Modes

Table 3-166 lists the clock domain modes supported by the clock domain.

Table 3-166. CD_SGX Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|-----------|-----------|-----------|
| Available | Available | Available | Available |

Table 3-167 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-167. CD_SGX Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|---|
| SGX_L3_ICLK clock status | CM_SGX_CLKSTCTRL[8] CLKACTIVITY_SGX_L3_ICLK |
| SGX_FCLK clock status | CM_SGX_CLKSTCTRL[9] CLKACTIVITY_SGX_FCLK |
| Clock Domain State Transition Control | CM_SGX_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.11.3 Clock Domain Dependency

CD_SGX has no module wake-up dependency with any other clock domain of the device.

3.6.11.3.1 Static Dependency

Table 3-168 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-168. CD_SGX Static Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--------------------------------------|-------------|
| CD_IVAHD | Disabled | CM_SGX_STATICDEP[2] IVAHD_STATDEP | Read/Write |
| CD_L3_1 | Disabled | CM_SGX_STATICDEP[5] L3_1_STATDEP | Read/Write |
| CD_L3_2 | Always enabled | CM_SGX_STATICDEP[6] L3_2_STATDEP | Read only |
| CD_EMIF | Disabled | CM_SGX_STATICDEP[4] MEMIF_STATDEP | Read/Write |

3.6.11.3.2 Dynamic Dependency

Table 3-169 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-169. CD_SGX Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|-------------------------------------|-------------|
| CD_L3_2 | Always disabled | CM_SGX_DYNAMICDEP[6] L3_2_DYNDEP | Read only |

3.6.11.4 Clock Domain Module Attributes

Table 3-170 identifies for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-170. CD_SGX Modules Clocks Association

| Module | Clock | Clock Type |
|--------|-------------|------------|
| SGX | SGX_L3_ICLK | Interface |
| | SGX_FCLK | Functional |

[Table 3-171](#) lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-171. CD_SGX Modules Wake-Up Request

| Module | Wake-Up Feature |
|--------|-----------------|
| SGX | None |

[Table 3-172](#) lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-172. CD_SGX Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|--------|---------------------------|---|----------------|
| SGX | Master/Slave | CM_SGX_SGX_CLKCTRL [18:STBYST] | Standby status |
| | | CM_SGX_SGX_CLKCTRL [17:16] IDLEST | Idle status |

[Table 3-173](#) lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-173. CD_SGX Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|--------|-----------|------|-----------|---|-------------|
| SGX | Available | N/A | Available | CM_SGX_SGX_CLKCTRL [1:0] MODULEMODE | Read/Write |

3.6.12 CD_EMU Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.12.1 Overview

[Figure 3-62](#) shows the overview of the clock domain.

Figure 3-62. CD_EMU Overview

Table 3-174 lists controls for clock dividers or muxes in the clock domain.

Table 3-174. CD_EMU Clock Division and Muxing Control

| Divider/Mux | Control Bit Field |
|-------------------|---|
| Divider STM_CLK | CM_EMU_DEBUGSS_CLKCTRL[29:27] CLKSEL_PMD_STM_CLK |
| Divider TRACE_CLK | CM_EMU_DEBUGSS_CLKCTRL[26:24] CLKSEL_PMD_TRACE_CLK |

3.6.12.2 Clock Domain Modes

Table 3-175 lists the clock domain modes supported by the clock domain.

Table 3-175. CD_EMU Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|---------------|---------------|-----------|-----------|
| Not available | Not available | Available | Available |

Table 3-176 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-176. CD_EMU Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|--|
| CORE_DPLL_EMU_CLK clock status | CM_EMU_CLKSTCTRL[9] CLKACTIVITY_CORE_DPLL_EMU_CLK |
| EMU_SYS_CLK clock status | CM_EMU_CLKSTCTRL[8] CLKACTIVITY_EMU_SYS_CLK |
| Clock Domain State Transition Control | CM_EMU_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.12.3 Clock Domain Dependency

CD_EMU has no static or module wake-up dependency with any other clock domain of the device.

3.6.12.3.1 Dynamic Dependency

Table 3-177 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-177. CD_EMU Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|-------------------------------------|-------------|
| CD_L3_2 | Always enabled | CM_EMU_DYNAMICDEP[6] L3_2_DYNDEP | Read only |

3.6.12.4 Clock Domain Module Attributes

Table 3-178 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-178. CD_EMU Modules Clocks Association

| Module | Clock | Clock Type |
|--------|-------------|--------------------------|
| DEBUG | DBG_CLK | Interface |
| | EMU_SYS_CLK | Interface and Functional |
| | STM_CLK | Interface and Functional |
| | TRACE_CLK | Interface and Functional |

Table 3-179 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-179. CD_EMU Modules Wake-Up Request

| Module | Wake-Up Feature |
|--------|------------------------|
| DEBUG | Master wake-up request |

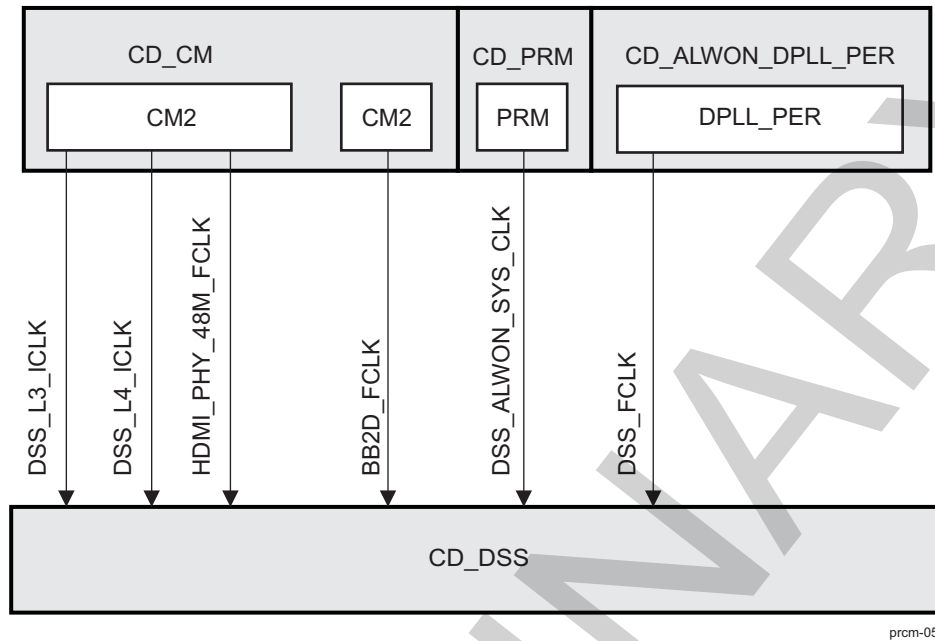

3.6.13 CD_DSS Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.13.1 Overview

Figure 3-63 shows the overview of the clock domain.

Figure 3-63. CD_DSS Overview

3.6.13.2 Clock Domain Modes

Table 3-180 lists the clock domain modes supported by the clock domain.

Table 3-180. CD_DSS Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|-----------|-----------|-----------|
| Available | Available | Available | Available |

Table 3-181 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-181. CD_DSS Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|--|
| DSS_ALWON_SYS_CLK clock status | CM_DSS_CLKSTCTRL[10] CLKACTIVITY_DSS_ALWON_SYS_CLK |
| DSS_FCLK clock status | CM_DSS_CLKSTCTRL[9] CLKACTIVITY_DSS_FCLK |
| HDMI_PHY_48M_FCLK clock status | CM_DSS_CLKSTCTRL[11] CLKACTIVITY_HDMI_PHY_48M_FCLK |
| DSS_L3_ICLK clock status | CM_DSS_CLKSTCTRL[8] CLKACTIVITY_DSS_L3_ICLK |
| BB2D_FCLK clock status | CM_DSS_CLKSTCTRL[12] CLKACTIVITY_BB2D_FCLK |
| Clock Domain State Transition Control | CM_DSS_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.13.3 Clock Domain Dependency

3.6.13.3.1 Static Dependency

Table 3-182 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-182. CD_DSS Static Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|---|-------------|
| CD_IVAHD | Disabled | CM_DSS_STATICDEP [2] IVAHD_STATDEP | Read/Write |
| CD_L3_1 | Always enabled | CM_DSS_STATICDEP [5] L3_1_STATDEP | Read only |
| CD_L3_2 | Always enabled | CM_DSS_STATICDEP [6] L3_2_STATDEP | Read only |
| CD_EMIF | Disabled | CM_DSS_STATICDEP [4] MEMIF_STATDEP | Read/Write |

3.6.13.3.2 Dynamic Dependency

[Table 3-183](#) lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-183. CD_DSS Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--|-------------|
| CD_L3_1 | Always disabled | CM_DSS_DYNAMICDEP [5] L3_1_DYNDEP | Read only |
| CD_L3_2 | Always disabled | CM_DSS_DYNAMICDEP [6] L3_2_DYNDEP | Read only |

3.6.13.3.3 Wake-Up Dependency

[Table 3-184](#) lists the wake-up dependency settings for the modules of this clock domain.

Table 3-184. CD_DSS Wake-Up Dependency Association Parameters

| Originator Module | Originator Clock Domain | Servicing Clock Domain | Default Setting | Control Bit Field | Access Type |
|-------------------|-------------------------|-----------------------------|-----------------|---|-------------|
| DSS-DSI1 | CD_DSS | CD_DMA, CD_L3_1, CD_L3_2 | Disabled | PM_DSS_DSS_WKDEP [7] WKUPDEP_DSI1_S DMA | Read/Write |
| DSS-DSI1 | CD_DSS | CD_DSP | Disabled | PM_DSS_DSS_WKDEP [6] WKUPDEP_DSI1_D SP | Read/Write |
| DSS-DSI1 | CD_DSS | CD_CORTEXM3 | Disabled | PM_DSS_DSS_WKDEP [5] WKUPDEP_DSI1_ MPU_M3 | Read/Write |
| DSS-DSI1 | CD_DSS | CD_CORTEXA9 | Disabled | PM_DSS_DSS_WKDEP [4] WKUPDEP_DSI1_ MPU | Read/Write |
| DSS-DSI2 | CD_DSS | CD_CORTEXM3 | Disabled | PM_DSS_DSS_WKDEP [9] WKUPDEP_DSI2_ MPU_M3 | Read/Write |
| DSS-DSI2 | CD_DSS | CD_CORTEXA9 | Disabled | PM_DSS_DSS_WKDEP [8] WKUPDEP_DSI2_ MPU | Read/Write |
| DSS-DSI2 | CD_DSS | CD_DMA, CD_L3_1, CD_L3_2 | Disabled | PM_DSS_DSS_WKDEP [11] WKUPDEP_DSI2_S DMA | Read/Write |

Table 3-184. CD_DSS Wake-Up Dependency Association Parameters (continued)

| Originator Module | Originator Clock Domain | Servicing Clock Domain | Default Setting | Control Bit Field | Access Type |
|-------------------|-------------------------|-----------------------------|-----------------|--|-------------|
| DSS-DSI2 | CD_DSS | CD_DSP | Disabled | PM_DSS_DSS_WK DEP[10] WKUPDEP_DSI2_D SP | Read/Write |
| DSS-HDMI | CD_DSS | CD_DMA, CD_L3_1, CD_L3_2 | Enabled | PM_DSS_DSS_WK DEP[19] WKUPDEP_HDMID MA_SDMA | Read/Write |
| DSS-HDMI | CD_DSS | CD_DSP | Disabled | PM_DSS_DSS_WK DEP[14] WKUPDEP_HDMII RQ_DSP | Read/Write |
| DSS-HDMI | CD_DSS | CD_CORTEXM3 | Disabled | PM_DSS_DSS_WK DEP[13] WKUPDEP_HDMII RQ_MPU_M3 | Read/Write |
| DSS-HDMI | CD_DSS | CD_CORTEXA9 | Disabled | PM_DSS_DSS_WK DEP[12] WKUPDEP_HDMII RQ_MPU | Read/Write |
| DSS-DISPC | CD_DSS | CD_CORTEXM3 | Disabled | PM_DSS_DSS_WK DEP[1] WKUPDEP_DISPC _MPU_M3 | Read/Write |
| DSS-DISPC | CD_DSS | CD_CORTEXA9 | Disabled | PM_DSS_DSS_WK DEP[0] WKUPDEP_DISPC _MPU | Read/Write |
| DSS-DISPC | CD_DSS | CD_DSP | Disabled | PM_DSS_DSS_WK DEP[2] WKUPDEP_DISPC _DSP | Read/Write |
| DSS-DISPC | CD_DSS | CD_DMA, CD_L3_1, CD_L3_2 | Disabled | PM_DSS_DSS_WK DEP[3] WKUPDEP_DISPC _SDMA | Read/Write |

3.6.13.4 Clock Domain Module Attributes

Table 3-185 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-185. CD_DSS Modules Clocks Association

| Module | Clock | Clock Type |
|--------|-------------------|------------|
| DSS | DSS_ALWON_SYS_CLK | Functional |
| | DSS_FCLK | Functional |
| | HDMI_PHY_48M_FCLK | Functional |
| | DSS_L3_ICLK | Interface |
| | DSS_L4_ICLK | Interface |
| BB2D | BB2D_FCLK | Functional |
| | DSS_L3_ICLK | Interface |

Table 3-186 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-186. CD_DSS Modules Wake-Up Request

| Module | Wake-Up Feature |
|--------|---|
| DSS | Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ, DSP -IRQ, sDMA -DMA) |
| BB2D | None |

Table 3-187 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-187. CD_DSS Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|--------|---------------------------|-----------------------------------|----------------|
| DSS | Master/Slave | CM_DSS_DSS_CLKCTRL[18] STBYST | Standby status |
| | | CM_DSS_DSS_CLKCTRL[17:16] IDLEST | Idle status |
| BB2D | Master/Slave | CM_DSS_BB2D_CLKCTRL[18] STBYST | Standby status |
| | | CM_DSS_BB2D_CLKCTRL[17:16] IDLEST | Idle status |

Table 3-188 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-188. CD_DSS Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|--------|-----------|------|-----------|-------------------------------------|-------------|
| DSS | Available | N/A | Available | CM_DSS_DSS_CLKCTRL[1:0] MODULEMODE | Read/Write |
| BB2D | Available | N/A | Available | CM_DSS_BB2D_CLKCTRL[1:0] MODULEMODE | Read/Write |

3.6.14 CD_L4_CFG Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.14.1 Overview

Figure 3-64 shows the overview of the clock domain.

Figure 3-64. CD_L4_CFG Overview

3.6.14.2 Clock Domain Modes

Table 3-189 lists the clock domain modes supported by the clock domain.

Table 3-189. CD_L4_CFG Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|---------------|---------------|-----------|
| Available | Not available | Not available | Available |

Table 3-190 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-190. CD_L4_CFG Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|---|
| CFG_L4_ICLK clock status | CM_L4CFG_CLKSTCTRL[8] CLKACTIVITY_CFG_L4_ICLK |
| Clock Domain State Transition Control | CM_L4CFG_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.14.3 Clock Domain Dependency

CD_L4_CFG has no static or module wake-up dependency with any other clock domain of the device.

3.6.14.3.1 Dynamic Dependency

Table 3-191 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-191. CD_L4_CFG Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--------------------------------------|-------------|
| CD_C2C | Always enabled | CM_L4CFG_DYNAMICDEP[18] C2C_DYNDEP | Read only |
| CD_DSS | Always enabled | CM_L4CFG_DYNAMICDEP[8] DSS_DYNDEP | Read only |
| CD_CAM | Always disabled | CM_L4CFG_DYNAMICDEP[9] ISS_DYNDEP | Read only |
| CD_L3_1 | Always enabled | CM_L4CFG_DYNAMICDEP[5] L3_1_DYNDEP | Read only |
| CD_L3_2 | Always enabled | CM_L4CFG_DYNAMICDEP[6] L3_2_DYNDEP | Read only |
| CD_L3_INIT | Always enabled | CM_L4CFG_DYNAMICDEP[7] L3INIT_DYNDEP | Read only |
| CD_EMIF | Always enabled | CM_L4CFG_DYNAMICDEP[4] MEMIF_DYNDEP | Read only |
| CD_DMA | Always enabled | CM_L4CFG_DYNAMICDEP[11] SDMA_DYNDEP | Read only |
| CD_DSP | Always enabled | CM_L4CFG_DYNAMICDEP[1] DSP_DYNDEP | Read only |

3.6.14.4 Clock Domain Module Attributes

Table 3-192 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-192. CD_L4_CFG Modules Clocks Association

| Module | Clock | Clock Type |
|----------------------|--------------|------------|
| SYSCTRL_PADCONF_CORE | CFG_L4_ICLK | Functional |
| SYSCTRL_GENERAL_CORE | CFG_L4_ICLK | Functional |
| | CORE_TS_FCLK | Functional |

Table 3-192. CD_L4_CFG Modules Clocks Association (continued)

| Module | Clock | Clock Type |
|---------------------|-------------|------------|
| SPINLOCK | CFG_L4_ICLK | Interface |
| L4_CFG interconnect | CFG_L4_ICLK | Interface |
| MAILBOX | CFG_L4_ICLK | Interface |
| SAR_ROM | CFG_L4_ICLK | Interface |

Table 3-193 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-193. CD_L4_CFG Modules Wake-Up Request

| Module | Wake-Up Feature |
|----------------------|-----------------|
| SYSCTRL_PADCONF_CORE | None |
| SYSCTRL_GENERAL_CORE | None |
| SPINLOCK | None |
| L4_CFG interconnect | None |
| MAILBOX | None |
| SAR_ROM | None |

Table 3-194 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-194. CD_L4_CFG Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|---------------------|---------------------------|---|-------------|
| SPINLOCK | Slave | CM_L4CFG_SPINLOCK_CLKCTRL[17:16] IDLEST | Idle status |
| L4_CFG interconnect | Slave | CM_L4CFG_L4_CFG_CLKCTRL[17:16] IDLEST | Idle status |
| MAILBOX | Slave | CM_L4CFG_MAILBOX_CLKCTRL[17:16] IDLEST | Idle status |
| SAR_ROM | Slave | CM_L4CFG_SAR_ROM_CLKCTRL[17:16] IDLEST | Idle status |

Table 3-195 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-195. CD_L4_CFG Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|---------------------|----------|-----------|---------|---|-------------|
| SPINLOCK | N/A | Available | N/A | CM_L4CFG_SPINLOCK_CLKCTRL[1:0] MODULEMODE | Read only |
| L4_CFG interconnect | N/A | Available | N/A | CM_L4CFG_L4_CFG_CLKCTRL[1:0] MODULEMODE | Read only |
| MAILBOX | N/A | Available | N/A | CM_L4CFG_MAILBOX_CLKCTRL[1:0] MODULEMODE | Read only |
| SAR_ROM | N/A | Available | N/A | CM_L4CFG_SAR_ROM_CLKCTRL[1:0] MODULEMODE | Read only |

3.6.15 CD_L3_INSTR Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.15.1 Overview

Figure 3-65 shows the overview of the clock domain.

Figure 3-65. CD_L3_INSTR Overview

3.6.15.2 Clock Domain Modes

Table 3-196 lists the clock domain modes supported by the clock domain.

Table 3-196. CD_L3_INSTR Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|---------------|---------------|---------------|-----------|
| Not available | Not available | Not available | Available |

Table 3-197 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-197. CD_L3_INSTR Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|---|
| INSTR_L3_ICLK clock status | CM_L3INSTR_CLKSTCTRL[8] CLKACTIVITY_L3_INSTR_ICLK |
| Clock Domain State Transition Control | CM_L3INSTR_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.15.3 Clock Domain Dependency

CD_L3_INSTR has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

3.6.15.4 Clock Domain Module Attributes

Table 3-198 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-198. CD_L3_INSTR Modules Clocks Association

| Module | Clock | Clock Type |
|-----------------------|---------------|------------|
| L3_3 interconnect | INSTR_L3_ICLK | Interface |
| | INSTR_L4_ICLK | Interface |
| L3_INSTR interconnect | INSTR_L3_ICLK | Interface |

Table 3-198. CD_L3_INSTR Modules Clocks Association (continued)

| Module | Clock | Clock Type |
|---------|---------------|------------|
| OCP_WP1 | INSTR_L3_ICLK | Interface |
| | INSTR_L4_ICLK | Interface |

Table 3-199 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-199. CD_L3_INSTR Modules Wake-Up Request

| Module | Wake-Up Feature |
|-----------------------|-----------------|
| L3_3 interconnect | None |
| L3_INSTR interconnect | None |

Table 3-200 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-200. CD_L3_INSTR Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|-----------------------|---------------------------|---|-------------|
| L3_3 interconnect | Slave | CM_L3INSTR_L3_3_CLKCTRL[17:16] IDLEST | Idle status |
| | | CM_L3INSTR_L3_3_CLKCTRL_RESTORE[17:16] IDLEST | Idle status |
| L3_INSTR interconnect | Slave | CM_L3INSTR_L3_INSTR_CLKCTRL[17:16] IDLEST | Idle status |
| | | CM_L3INSTR_L3_INSTR_CLKCTRL_RESTORE[17:16] IDLEST | Idle status |

Table 3-201 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-201. CD_L3_INSTR Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|-----------------------|-----------|-----------|---------|---|-------------|
| L3_3 interconnect | Available | Available | N/A | CM_L3INSTR_L3_3_CLKCTRL[1:0] MODULEMODE | Read/Write |
| L3_3 interconnect | Available | Available | N/A | CM_L3INSTR_L3_3_CLKCTRL_RESTORE[1:0] MODULEMODE | Read/Write |
| L3_INSTR interconnect | Available | Available | N/A | CM_L3INSTR_L3_INSTR_CLKCTRL[1:0] MODULEMODE | Read/Write |
| L3_INSTR interconnect | Available | Available | N/A | CM_L3INSTR_L3_INSTR_CLKCTRL_RESTORE[1:0] MODULEMODE | Read/Write |

3.6.16 CD_L3_2 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.16.1 Overview

Figure 3-66 shows the overview of the clock domain.

Figure 3-66. CD_L3_2 Overview

3.6.16.2 Clock Domain Modes

Table 3-202 lists the clock domain modes supported by the clock domain.

Table 3-202. CD_L3_2 Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|---------------|---------------|-----------|
| Available | Not available | Not available | Available |

Table 3-203 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-203. CD_L3_2 Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|--|
| L3_ICLK2 clock status | CM_L3_2_CLKSTCTRL[8] CLKACTIVITY_L3_2_ICLK |
| Clock Domain State Transition Control | CM_L3_2_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.16.3 Clock Domain Dependency

CD_L3_2 has no static or module wake-up dependency with any other clock domain of the device.

3.6.16.3.1 Dynamic Dependency

Table 3-204 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-204. CD_L3_2 Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--|-------------|
| CD_C2C | Always enabled | CM_L3_2_DYNAMICDEP[18] C2C_DYNDEP | Read only |
| CD_DSS | Always enabled | CM_L3_2_DYNAMICDEP[8] DSS_DYNDEP | Read only |
| CD_CORTEXM3 | Always enabled | CM_L3_2_DYNAMICDEP[0] MPU_M3_DYNDEP | Read only |
| CD_SGX | Always enabled | CM_L3_2_DYNAMICDEP[10] SGX_DYNDEP | Read only |
| CD_CAM | Always disabled | CM_L3_2_DYNAMICDEP[9] ISS_DYNDEP | Read only |
| CD_IVAHD | Always enabled | CM_L3_2_DYNAMICDEP[2] IVAHD_DYNDEP | Read only |

Table 3-204. CD_L3_2 Dynamic Dependency Association Parameters (continued)

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|---|-------------|
| CD_L3_1 | Always enabled | CM_L3_2_DYNAMICDEP [5] L3_1_DYNDEP | Read only |
| CD_L3_INIT | Always enabled | CM_L3_2_DYNAMICDEP [7] L3INIT_DYNDEP | Read only |
| CD_L4_PER | Always enabled | CM_L3_2_DYNAMICDEP [13] L4PER_DYNDEP | Read only |

3.6.16.4 Clock Domain Module Attributes

[Table 3-205](#) lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-205. CD_L3_2 Modules Clocks Association

| Module | Clock | Clock Type |
|-------------------|----------|------------|
| GPMC | L3_ICLK2 | Interface |
| L3_2 interconnect | L3_ICLK2 | Interface |
| | L4_ICLK2 | Interface |
| OCMC_RAM | L3_ICLK2 | Interface |

[Table 3-206](#) lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-206. CD_L3_2 Modules Wake-Up Request

| Module | Wake-Up Feature |
|-------------------|-----------------|
| GPMC | None |
| L3_2 interconnect | None |
| OCMC_RAM | None |

[Table 3-207](#) lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-207. CD_L3_2 Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|-------------------|---------------------------|---|-------------|
| GPMC | Slave | CM_L3_2_GPMC_CLKCTRL [17:16] IDLEST | Idle status |
| L3_2 interconnect | Slave | CM_L3_2_L3_2_CLKCTRL [17:16] IDLEST | Idle status |
| OCMC_RAM | Slave | CM_L3_2_OCMC_RAM_CLKCTRL [17:16] IDLEST | Idle status |

[Table 3-208](#) lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 3-208. CD_L3_2 Modules Slave Clock Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|-------------------|-----------|-----------|---------|---|-------------|
| GPMC | Available | Available | N/A | CM_L3_2_GPMC_CLKCTRL [1:0] MODULEMODE | Read/Write |
| L3_2 interconnect | N/A | Available | N/A | CM_L3_2_L3_2_CLKCTRL [1:0] MODULEMODE | Read only |

Table 3-208. CD_L3_2 Modules Slave Clock Management Modes and Control (continued)

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|----------|----------|-----------|---------|--|-------------|
| OCMC_RAM | N/A | Available | N/A | CM_L3_2_OCMC_RAM_CLKCTRL[1:0] MODULEMODE | Read only |

3.6.17 CD_L3_1 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.17.1 Overview

Figure 3-67 shows the overview of the clock domain.

Figure 3-67. CD_L3_1 Overview

3.6.17.2 Clock Domain Modes

Table 3-209 lists the clock domain modes supported by the clock domain.

Table 3-209. CD_L3_1 Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|---------------|---------------|-----------|
| Available | Not available | Not available | Available |

Table 3-210 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-210. CD_L3_1 Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|--|
| L3_ICLK1 clock status | CM_L3_1_CLKSTCTRL[8] CLKACTIVITY_L3_1_ICLK |
| Clock Domain State Transition Control | CM_L3_1_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.17.3 Clock Domain Dependency

CD_L3_1 has no static or module wake-up dependency with any other clock domain of the device.

3.6.17.3.1 Dynamic Dependency

Table 3-211 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-211. CD_L3_1 Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|---|-------------|
| CD_ABE | Always enabled | CM_L3_1_DYNAMICDEP [3] ABE_DYNDEP | Read only |
| CD_L3_2 | Always enabled | CM_L3_1_DYNAMICDEP [6] L3_2_DYNDEP | Read only |
| CD_L4_CFG | Always enabled | CM_L3_1_DYNAMICDEP [12] L4CFG_DYNDEP | Read only |
| CD_EMIF | Always enabled | CM_L3_1_DYNAMICDEP [4] MEMIF_DYNDEP | Read only |

3.6.17.4 Clock Domain Module Attributes

[Table 3-212](#) lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-212. CD_L3_1 Modules Clocks Association

| Module | Clock | Clock Type |
|-------------------|----------|------------|
| L3_1 interconnect | L3_ICLK1 | Interface |
| | L4_ICLK1 | Interface |

[Table 3-213](#) lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-213. CD_L3_1 Modules Wake-Up Request

| Module | Wake-Up Feature |
|-------------------|-----------------|
| L3_1 interconnect | None |

[Table 3-214](#) lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 3-214. CD_L3_1 Modules Clock Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|-------------------|---------------------------|---|-------------|
| L3_1 interconnect | Slave | CM_L3_1_L3_1_CLKCTRL [17:16] IDLEST | Idle status |

[Table 3-215](#) lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 3-215. CD_L3_1 Modules Slave Clock Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|-------------------|----------|-----------|---------|--|-------------|
| L3_1 interconnect | N/A | Available | N/A | CM_L3_1_L3_1_CLKCTRL [1:0] MODULEMODE | Read only |

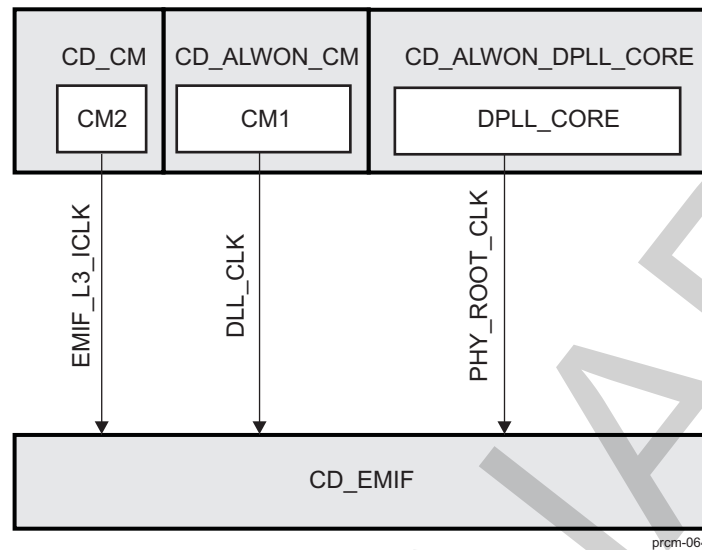

3.6.18 CD_EMIF Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.18.1 Overview

[Figure 3-68](#) shows the overview of the clock domain.

Figure 3-68. CD_EMIF Overview

3.6.18.2 Clock Domain Modes

Table 3-216 lists the clock domain modes supported by the clock domain.

Table 3-216. CD_EMIF Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|---------------|-----------|-----------|
| Available | Not available | Available | Available |

Table 3-217 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-217. CD_EMIF Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|---|
| DLL_CLK clock status | CM_MEMIF_CLKSTCTRL[9] CLKACTIVITY_DLL_CLK |
| EMIF_L3_ICLK clock status | CM_MEMIF_CLKSTCTRL[8] CLKACTIVITY_L3_EMIF_ICLK |
| PHY_ROOT_CLK clock status | CM_MEMIF_CLKSTCTRL[10] CLKACTIVITY_PHY_ROOT_CLK |
| Clock Domain State Transition Control | CM_MEMIF_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.18.3 Clock Domain Dependency

CD_EMIF has no static, dynamic, or module wake-up dependency with any other clock domain of the device.

3.6.18.4 Clock Domain Module Attributes

Table 3-218 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-218. CD_EMIF Modules Clocks Association

| Module | Clock | Clock Type |
|--------|--------------|------------|
| DLL | DLL_CLK | Functional |
| DMM | EMIF_L3_ICLK | Interface |
| EMIF1 | DLL_CLK | Interface |
| | EMIF_L3_ICLK | Interface |

Table 3-218. CD_EMIF Modules Clocks Association (continued)

| Module | Clock | Clock Type |
|---------|-----------------------------|------------|
| EMIF2 | EMIF_FCLK ⁽¹⁾ | Functional |
| | EOCP_MA_ICLK ⁽²⁾ | Interface |
| | EOCP_L3_ICLK ⁽²⁾ | Interface |
| | DLL_CLK | Interface |
| | EMIF_L3_ICLK | Interface |
| | EMIF_FCLK ⁽¹⁾ | Functional |
| | EOCP_MA_ICLK ⁽²⁾ | Interface |
| EMIF_FW | EOCP_L3_ICLK ⁽²⁾ | Interface |
| | EMIF_L3_ICLK | Interface |
| | EMIF_L4_ICLK | Interface |

⁽¹⁾ PHY_ROOT_CLK goes into DDRPHY. EMIF_FCLK comes out of DDRPHY and is PHY_ROOT_CLK divided by 4. DDR_PHY_CLK is PHY_ROOT_CLK divided by 2.

⁽²⁾ EMIF modules are clocked by EOCP_MA_ICLK when MPU is active, otherwise EOCP_L3_ICLK clock is used.

Table 3-219 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-219. CD_EMIF Modules Wake-Up Request

| Module | Wake-Up Feature |
|---------|-----------------|
| DDRPHY | None |
| DLL | None |
| DMM | None |
| EMIF1 | None |
| EMIF2 | None |
| EMIF_FW | None |

Table 3-220 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-220. CD_EMIF Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|---------|---------------------------|--|-------------|
| DMM | Slave | CM_MEMIF_DMM_CLKCTRL[17:16] IDLEST | Idle status |
| EMIF1 | Slave | CM_MEMIF_EMIF_1_CLKCTRL[17:16] IDLEST | Idle status |
| EMIF2 | Slave | CM_MEMIF_EMIF_2_CLKCTRL[17:16] IDLEST | Idle status |
| EMIF_FW | Slave | CM_MEMIF_EMIF_FW_CLKCTRL[17:16] IDLEST | Idle status |

Table 3-221 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-221. CD_EMIF Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|--------|-----------|-----------|---------|---|-------------|
| DMM | N/A | Available | N/A | CM_MEMIF_DMM_CLKCTRL[1:0] MODULEMODE | Read only |
| EMIF1 | Available | Available | N/A | CM_MEMIF_EMIF_1_CLKCTRL[1:0] MODULEMODE | Read/Write |

Table 3-221. CD_EMIF Modules Slave Clock-Management Modes and Control (continued)

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|---------|-----------|-----------|---------|--|-------------|
| EMIF2 | Available | Available | N/A | CM_MEMIF_EMIF_2_CLKCTRL[1:0] MODULEMODE | Read/Write |
| EMIF_FW | N/A | Available | N/A | CM_MEMIF_EMIF_FW_CLKCTRL[1:0] MODULEMODE | Read only |

3.6.19 CD_CORTEXM3 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.19.1 Overview

Figure 3-69 shows the overview of the clock domain.

Figure 3-69. CD_CORTEXM3 Overview

3.6.19.2 Clock Domain Modes

Table 3-222 lists the clock domain modes supported by the clock domain.

Table 3-222. CD_CORTEXM3 Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|-----------|-----------|-----------|
| Available | Available | Available | Available |

Table 3-223 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-223. CD_CORTEXM3 Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|---|
| MPU_M3_CLK clock status | CM_MPU_M3_CLKSTCTRL[8] CLKACTIVITY_MPU_M3_CLK |
| Clock Domain State Transition Control | CM_MPU_M3_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.19.3 Clock Domain Dependency

CD_CORTEXM3 has no module wake-up dependency with any other clock domain of the device.

3.6.19.3.1 Static Dependency

Table 3-224 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-224. CD_CORTEXM3 Static Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--|-------------|
| CD_ABE | Disabled | CM_MPU_M3_STATICDEP[3] ABE_STATDEP | Read/Write |
| CD_DSS | Disabled | CM_MPU_M3_STATICDEP[8] DSS_STATDEP | Read/Write |
| CD_SGX | Disabled | CM_MPU_M3_STATICDEP[10] SGX_STATDEP | Read/Write |
| CD_CAM | Always disabled | CM_MPU_M3_STATICDEP[9] ISS_STATDEP | Read only |
| CD_IVAHD | Disabled | CM_MPU_M3_STATICDEP[2] IVAHD_STATDEP | Read/Write |
| CD_L3_1 | Enabled | CM_MPU_M3_STATICDEP[5] L3_1_STATDEP | Read/Write |
| CD_L3_2 | Enabled | CM_MPU_M3_STATICDEP[6] L3_2_STATDEP | Read/Write |
| CD_L3_INIT | Disabled | CM_MPU_M3_STATICDEP[7] L3INIT_STATDEP | Read/Write |
| CD_L4_CFG | Enabled | CM_MPU_M3_STATICDEP[12] L4CFG_STATDEP | Read/Write |
| CD_L4_PER | Disabled | CM_MPU_M3_STATICDEP[13] L4PER_STATDEP | Read/Write |
| CD_EMIF | Enabled | CM_MPU_M3_STATICDEP[4] MEMIF_STATDEP | Read/Write |
| CD_DMA | Always disabled | CM_MPU_M3_STATICDEP[11] SDMA_STATDEP | Read only |
| CD_DSP | Disabled | CM_MPU_M3_STATICDEP[1] DSP_STATDEP | Read/Write |

3.6.19.3.2 Dynamic Dependency

Table 3-225 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-225. CD_CORTEXM3 Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--|-------------|
| CD_CAM | Always disabled | CM_MPU_M3_DYNAMICDEP[9] ISS_DYNDEP | Read only |
| CD_L3_2 | Always enabled | CM_MPU_M3_DYNAMICDEP[6] L3_2_DYNDEP | Read only |

3.6.19.4 Clock Domain Module Attributes

Table 3-226 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-226. CD_CORTEXM3 Modules Clocks Association

| Module | Clock | Clock Type |
|----------|------------|--------------------------|
| CORTEXM3 | MPU_M3_CLK | Interface and functional |

Table 3-227 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-227. CD_CORTEXM3 Modules Wake-Up Request

| Module | Wake-Up Feature |
|----------|------------------------|
| CORTEXM3 | Master wake-up request |

Table 3-228 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-228. CD_CORTEXM3 Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|----------|---------------------------|---|----------------|
| CORTEXM3 | Master/Slave | CM_MPU_M3_MPU_M3_CLK_CTRL[18] STBYST | Standby status |
| | | CM_MPU_M3_MPU_M3_CLK_CTRL[17:16] IDLEST | Idle status |

Table 3-229 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-229. CD_CORTEXM3 Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|----------|-----------|-----------|---------|--|-------------|
| CORTEXM3 | Available | Available | N/A | CM_MPU_M3_MPU_M3_CLKCTRL[1:0] MODULEMODE | Read/Write |

3.6.20 CD_DMA Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.20.1 Overview

Figure 3-70 shows the overview of the clock domain.

Figure 3-70. CD_DMA Overview

3.6.20.2 Clock Domain Modes

Table 3-230 lists the clock domain modes supported by the clock domain.

Table 3-230. CD_DMA Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|---------------|-----------|-----------|
| Available | Not available | Available | Available |

Table 3-231 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-231. CD_DMA Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|--|
| DMA_L3_ICLK clock status | CM_SDMA_CLKSTCTRL[8] CLKACTIVITY_DMA_L3_ICLK |
| Clock Domain State Transition Control | CM_SDMA_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.20.3 Clock Domain Dependency

CD_DMA has a permanently enabled static dependency to the CD_L3_2 clock domain. It has no dynamic or module wake-up dependency with any other clock domain of the device.

3.6.20.4 Clock Domain Module Attributes

Table 3-232 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-232. CD_DMA Modules Clocks Association

| Module | Clock | Clock Type |
|--------|-------------|--------------------------|
| sDMA | DMA_L3_ICLK | Interface and Functional |
| | DMA_L4_ICLK | Interface |

Table 3-233 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-233. CD_DMA Modules Wake-Up Request

| Module | Wake-Up Feature |
|--------|------------------------|
| sDMA | Master wake-up request |

Table 3-234 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-234. CD_DMA Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|--------|---------------------------|------------------------------------|----------------|
| sDMA | Master/Slave | CM_SDMA_SDMA_CLKCTRL[18] STBYST | Standby status |
| | | CM_SDMA_SDMA_CLKCTRL[17:16] IDLEST | Idle status |

Table 3-235 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 3-235. CD_DMA Modules Slave Clock Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|--------|----------|-----------|---------|--------------------------------------|-------------|
| sDMA | N/A | Available | N/A | CM_SDMA_SDMA_CLKCTRL[1:0] MODULEMODE | Read only |

3.6.21 CD_C2C Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.21.1 Overview

Figure 3-71 shows the overview of the clock domain.

Figure 3-71. CD_C2C Overview

3.6.21.2 Clock Domain Modes

Table 3-236 lists the clock domain modes supported by the clock domain.

Table 3-236. CD_C2C Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|---------------|-----------|-----------|
| Available | Not available | Available | Available |

Table 3-237 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-237. CD_C2C Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|--|
| C2C_L3_ICLK clock status | CM_C2C_CLKSTCTRL[8] CLKACTIVITY_L3_C2C_ICLK |
| C2C_L3X2_ICLK clock status | CM_C2C_CLKSTCTRL[10] CLKACTIVITY_L3X2_C2C_ICLK |
| C2C_L4_ICLK clock status | CM_C2C_CLKSTCTRL[9] CLKACTIVITY_L4_C2C_ICLK |
| Clock Domain State Transition Control | CM_C2C_CLKSTCTRL[1:0] CLKTRCTRL |

3.6.21.3 Clock Domain Dependency

CD_C2C has no module wake-up dependency with any other clock domain of the device.

3.6.21.3.1 Static Dependency

Table 3-238 lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-238. CD_C2C Static Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|---------------------------------------|-------------|
| CD_ABE | Disabled | CM_C2C_STATICDEP[3] ABE_STATDEP | Read/Write |
| CD_IVAHD | Disabled | CM_C2C_STATICDEP[2] IVAHD_STATDEP | Read/Write |
| CD_L3_1 | Disabled | CM_C2C_STATICDEP[5] L3_1_STATDEP | Read/Write |
| CD_L3_2 | Disabled | CM_C2C_STATICDEP[6] L3_2_STATDEP | Read/Write |
| CD_L3_INIT | Disabled | CM_C2C_STATICDEP[7] L3INIT_STATDEP | Read/Write |
| CD_L4_CFG | Disabled | CM_C2C_STATICDEP[12] L4CFG_STATDEP | Read/Write |
| CD_L4_PER | Disabled | CM_C2C_STATICDEP[13] L4PER_STATDEP | Read/Write |
| CD_EMIF | Enabled | CM_C2C_STATICDEP[4] MEMIF_STATDEP | Read/Write |

3.6.21.3.2 Dynamic Dependency

Table 3-239 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-239. CD_C2C Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--------------------------------------|-------------|
| CD_L3_2 | Always enabled | CM_C2C_DYNAMICDEP[6] L3_2_DYNDEP | Read only |
| CD_EMIF | Always enabled | CM_C2C_DYNAMICDEP[4] MEMIF_DYNDEP | Read only |

3.6.21.4 Clock Domain Module Attributes

Table 3-240 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-240. CD_C2C Modules Clocks Association

| Module | Clock | Clock Type |
|--------|---------------|------------|
| C2C | C2C_L3X2_ICLK | Interface |
| | C2C_L3_ICLK | Interface |
| C2C_FW | C2C_L3_ICLK | Interface |
| | C2C_L4_ICLK | Interface |

[Table 3-241](#) lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-241. CD_C2C Modules Wake-Up Request

| Module | Wake-Up Feature |
|--------|------------------------|
| C2C | Master wake-up request |
| C2C_FW | None |

[Table 3-242](#) lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-242. CD_C2C Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|--------|---------------------------|--------------------------------------|----------------|
| C2C | Master/Slave | CM_C2C_C2C_CLKCTRL[18] STBYST | Standby status |
| | | CM_C2C_C2C_CLKCTRL[17:16] IDLEST | Idle status |
| C2C_FW | Slave | CM_C2C_C2C_FW_CLKCTRL [17:16] IDLEST | Idle status |

[Table 3-243](#) lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-243. CD_C2C Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|--------|----------|-----------|---------|---------------------------------------|-------------|
| C2C | N/A | Available | N/A | CM_C2C_C2C_CLKCTRL[1:0] MODULEMODE | Read only |
| C2C_FW | N/A | Available | N/A | CM_C2C_C2C_FW_CLKCTRL[1:0] MODULEMODE | Read only |

3.6.22 CD_CAM Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.22.1 Overview

[Figure 3-72](#) shows the overview of the clock domain.

Figure 3-72. CD_CAM Overview

3.6.22.2 Clock Domain Modes

[Table 3-244](#) lists the clock domain modes supported by the clock domain.

Table 3-244. CD_CAM Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|-----------|-----------|-----------|
| Available | Available | Available | Available |

[Table 3-245](#) lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-245. CD_CAM Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|---|
| CAM_PHY_CTRL_CLK clock status | CM_CAM_CLKSTCTRL [9] CLKACTIVITY_CAM_PHY_CTRL_CLK |
| FDIF_FCLK clock status | CM_CAM_CLKSTCTRL [10] CLKACTIVITY_FDIF_FCLK |
| ISS_CLK clock status | CM_CAM_CLKSTCTRL [8] CLKACTIVITY_ISS_CLK |
| Clock Domain State Transition Control | CM_CAM_CLKSTCTRL [1:0] CLKTRCTRL |

3.6.22.3 Clock Domain Dependency

CD_CAM has no module wake-up dependency with any other clock domain of the device.

3.6.22.3.1 Static Dependency

[Table 3-246](#) lists the static dependency of the clock domain with respect to other clock domains of the device.

Table 3-246. CD_CAM Static Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--|-------------|
| CD_IVAHD | Disabled | CM_CAM_STATICDEP [2] IVAHD_STATDEP | Read/Write |
| CD_L3_1 | Disabled | CM_CAM_STATICDEP [5] L3_1_STATDEP | Read/Write |
| CD_L3_2 | Always enabled | CM_CAM_STATICDEP [6] L3_2_STATDEP | Read only |

Table 3-246. CD_CAM Static Dependency Association Parameters (continued)

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|--------------------------------------|-------------|
| CD_EMIF | Disabled | CM_CAM_STATICDEP[4] MEMIF_STATDEP | Read/Write |

3.6.22.3.2 Dynamic Dependency

Table 3-247 lists the dynamic dependency of the clock domain with respect to other clock domains of the device.

Table 3-247. CD_CAM Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|-------------------------------------|-------------|
| CD_L3_2 | Always disabled | CM_CAM_DYNAMICDEP[6] L3_2_DYNDEP | Read only |

3.6.22.4 Clock Domain Module Attributes

Table 3-248 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-248. CD_CAM Modules Clocks Association

| Module | Clock | Clock Type |
|-------------|------------------|--------------------------|
| FACE DETECT | FDIF_FCLK | Interface and Functional |
| ISS | CAM_PHY_CTRL_CLK | Functional |
| | ISS_CLK | Interface and Functional |

Table 3-249 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-249. CD_CAM Modules Wake-Up Request

| Module | Wake-Up Feature |
|-------------|-----------------|
| FACE DETECT | None |
| ISS | None |

Table 3-250 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-250. CD_CAM Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|-------------|---------------------------|---------------------------------------|----------------|
| FACE DETECT | Master/Slave | CM_CAM_FDIF_CLKCTRL[18] STBYST | Standby status |
| | | CM_CAM_FDIF_CLKCTRL[17: 16] IDLEST | Idle status |
| ISS | Master/Slave | CM_CAM_ISS_CLKCTRL[18] STBYST | Standby status |
| | | CM_CAM_ISS_CLKCTRL[17:1 6] IDLEST | Idle status |

Table 3-251 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-251. CD_CAM Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|-------------|-----------|------|-----------|------------------------------------|-------------|
| FACE DETECT | Available | N/A | Available | CM_CAM_FDIF_CLKCTRL[1:0]MODULEMODE | Read/Write |
| ISS | Available | N/A | Available | CM_CAM_ISS_CLKCTRL[1:0]MODULEMODE | Read/Write |

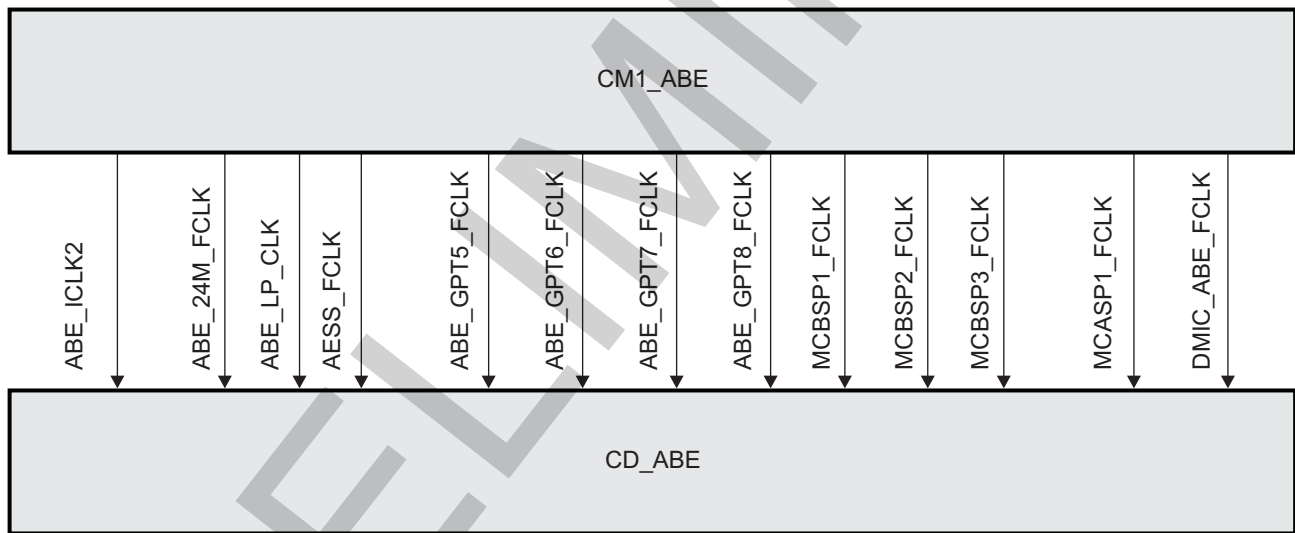

NOTE: To enable and access the ISS module, first the Cortex-M3 module must be enabled and the reset for Cortex-M3 CACHE and MMU must be cleared.

3.6.23 CD_ABE Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.23.1 Overview

Figure 3-73 shows the overview of the clock domain.

Figure 3-73. CD_ABE Overview

prcm-069

3.6.23.2 Clock Domain Modes

Table 3-252 lists the clock domain modes supported by the clock domain.

Table 3-252. CD_ABE Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|-----------|-----------|-----------|
| Available | Available | Available | Available |

Table 3-253 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 3-253. CD_ABE Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|--|
| ABE_24M_FCLK clock status | CM1_ABE_CLKSTCTRL [13] CLKACTIVITY_ABE_24M_FCLK |
| ABE_ALWON_32K_CLK clock status | CM1_ABE_CLKSTCTRL [12] CLKACTIVITY_ABE_ALWON_32K_CLK |
| ABE_SYSCLK clock status | CM1_ABE_CLKSTCTRL [11] CLKACTIVITY_ABE_SYSCLK |
| ABE_X2_CLK clock status | CM1_ABE_CLKSTCTRL [8] CLKACTIVITY_ABE_X2_CLK |
| 24M_FCLK clock status | CM1_ABE_CLKSTCTRL [10] CLKACTIVITY_24M_FCLK |
| ABE_ICLK2 clock status | CM1_ABE_CLKSTCTRL [9] CLKACTIVITY_ABE_ICLK2 |
| Clock Domain State Transition Control | CM1_ABE_CLKSTCTRL [1:0] CLKTRCTRL |

3.6.23.3 Clock Domain Dependency

CD_ABE has no static or dynamic dependency with any other clock domain of the device.

3.6.23.3.1 Wake-Up Dependency

[Table 3-254](#) lists the wake-up dependency settings for the modules of this clock domain.

Table 3-254. CD_ABE Wake-Up Dependency Association Parameters

| Originator Module | Originator Clock Domain | Servicing Clock Domain | Default Setting | Control Bit Field | Access Type |
|-------------------|-------------------------|-----------------------------|-----------------|---|-------------|
| DMIC | CD_ABE | CD_DMA, CD_L3_1, CD_L3_2 | Disabled | PM_ABE_DMIC_WKDEP [7] WKUPDEP_DMIC_DMA_SDMA | Read/Write |
| DMIC | CD_ABE | CD_DSP | Disabled | PM_ABE_DMIC_WKDEP [6] WKUPDEP_DMIC_DMA_DSP | Read/Write |
| DMIC | CD_ABE | CD_DSP | Disabled | PM_ABE_DMIC_WKDEP [2] WKUPDEP_DMIC_IRQ_DSP | Read/Write |
| DMIC | CD_ABE | CD_CORTXA9 | Disabled | PM_ABE_DMIC_WKDEP [0] WKUPDEP_DMIC_IRQ_MPU | Read/Write |
| MCASP1 | CD_ABE | CD_DMA, CD_L3_1, CD_L3_2 | Disabled | PM_ABE_MCASP_WKDEP [7] WKUPDEP_MCASP1_DMA_SDMA | Read/Write |
| MCASP1 | CD_ABE | CD_DSP | Disabled | PM_ABE_MCASP_WKDEP [6] WKUPDEP_MCASP1_DMA_DSP | Read/Write |
| MCASP1 | CD_ABE | CD_DSP | Disabled | PM_ABE_MCASP_WKDEP [2] WKUPDEP_MCASP1_IRQ_DSP | Read/Write |
| MCASP1 | CD_ABE | CD_CORTXA9 | Disabled | PM_ABE_MCASP_WKDEP [0] WKUPDEP_MCASP1_IRQ_MPU | Read/Write |
| MCBSP1 | CD_ABE | CD_DMA, CD_L3_1, CD_L3_2 | Disabled | PM_ABE_MCBSP1_WKDEP [3] WKUPDEP_MCBSP1_SDMA | Read/Write |

Table 3-254. CD_ABE Wake-Up Dependency Association Parameters (continued)

| Originator Module | Originator Clock Domain | Servicing Clock Domain | Default Setting | Control Bit Field | Access Type |
|-------------------|-------------------------|-----------------------------|-----------------|---|-------------|
| MCBSP1 | CD_ABE | CD_DSP | Disabled | PM_ABE_MCBSP1_WKDEP [2] WKUPDEP_MCBS P1_DSP | Read/Write |
| MCBSP1 | CD_ABE | CD_CORTEXA9 | Disabled | PM_ABE_MCBSP1_WKDEP [0] WKUPDEP_MCBS P1_MPU | Read/Write |

3.6.23.4 Clock Domain Module Attributes

Table 3-255 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-255. CD_ABE Modules Clocks Association

| Module | Clock | Clock Type |
|---------------------|---------------|--------------------------|
| AUDIO ENGINE | AESS_FCLK | Functional |
| | ABE_ICLK2 | Interface |
| DMIC | DMIC_ABE_FCLK | Functional |
| | ABE_ICLK2 | Interface |
| L4_ABE interconnect | ABE_ICLK2 | Interface |
| MCASP1 | MCASP1_FCLK | Functional |
| | ABE_ICLK2 | Interface and functional |
| MCBSP1 | MCBSP1_FCLK | Functional |

Table 3-255. CD_ABE Modules Clocks Association (continued)

| Module | Clock | Clock Type |
|----------|-------------------|------------|
| | ABE_ICLK2 | Interface |
| MCBSP2 | MCBSP2_FCLK | Functional |
| | ABE_ICLK2 | Interface |
| MCBSP3 | MCBSP3_FCLK | Functional |
| | ABE_ICLK2 | Interface |
| MCPDM | ABE_ICLK2 | Interface |
| | PAD_CLKS | Functional |
| SLIMBUS1 | ABE_24M_FCLK | Functional |
| | 24M_FCLK | Functional |
| | ABE_ICLK2 | Interface |
| | PAD_CLKS | Functional |
| | SLIMBUS_UCLKS | Functional |
| GPTIMER5 | ABE_GPT5_FCLK | Functional |
| | ABE_ICLK2 | Interface |
| GPTIMER6 | ABE_GPT6_FCLK | Functional |
| | ABE_ICLK2 | Interface |
| GPTIMER7 | ABE_GPT7_FCLK | Functional |
| | ABE_ICLK2 | Interface |
| GPTIMER8 | ABE_GPT8_FCLK | Functional |
| | ABE_ICLK2 | Interface |
| WDTIMER3 | ABE_ALWON_32K_CLK | Functional |
| | ABE_ICLK2 | Interface |

Table 3-256 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-256. CD_ABE Modules Wake-Up Request

| Module | Wake-Up Feature |
|---------------------|--|
| AUDIO ENGINE | None |
| DMIC | Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA) |
| L4_ABE interconnect | None |
| MCASP1 | Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA) |
| MCBSP1 | Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA) |
| MCBSP2 | Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA) |
| MCBSP3 | Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA) |
| MCPDM | Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA) |
| SLIMBUS1 | Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ and DMA, sDMA -DMA) |
| GPTIMER5 | Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ) |
| GPTIMER6 | Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ) |
| GPTIMER7 | Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ) |
| GPTIMER8 | Slave wake-up request (MPU_A9 -IRQ, DSP -IRQ) |
| WDTIMER3 | Slave wake-up request (MPU_A9 -IRQ) |

Table 3-257 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-257. CD_ABE Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|---------------------|---------------------------|--|----------------|
| AUDIO ENGINE | Slave/Master | CM1_ABE_AESS_CLKCTRL[18] STBYST | Standby status |
| | | CM1_ABE_AESS_CLKCTRL[17:16] IDLEST | Idle status |
| DMIC | Slave | CM1_ABE_DMIC_CLKCTRL[17:16] IDLEST | Idle status |
| L4_ABE interconnect | Slave | CM1_ABE_L4ABE_CLKCTRL[17:16] IDLEST | Idle status |
| MCASP1 | Slave | CM1_ABE_MCASP_CLKCTRL[17:16] IDLEST | Idle status |
| MCBSP1 | Slave | CM1_ABE_MCBSP1_CLKCTRL[17:16] IDLEST | Idle status |
| MCBSP2 | Slave | CM1_ABE_MCBSP2_CLKCTRL[17:16] IDLEST | Idle status |
| MCBSP3 | Slave | CM1_ABE_MCBSP3_CLKCTRL[17:16] IDLEST | Idle status |
| MCPDM | Slave | CM1_ABE_PDM_CLKCTRL[17:16] IDLEST | Idle status |
| SLIMBUS1 | Slave | CM1_ABE_SLIMBUS_CLKCTRL[17:16] IDLEST | Idle status |
| GPTIMER5 | Slave | CM1_ABE_GPTIMER5_CLKCTRL[17:16] IDLEST | Idle status |
| GPTIMER6 | Slave | CM1_ABE_GPTIMER6_CLKCTRL[17:16] IDLEST | Idle status |
| GPTIMER7 | Slave | CM1_ABE_GPTIMER7_CLKCTRL[17:16] IDLEST | Idle status |
| GPTIMER8 | Slave | CM1_ABE_GPTIMER8_CLKCTRL[17:16] IDLEST | Idle status |
| WDTIMER3 | Slave | CM1_ABE_WDTIMER3_CLKCTRL[17:16] IDLEST | Idle status |

Table 3-258 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-258. CD_ABE Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|---------------------|-----------|-----------|-----------|--|-------------|
| AUDIO ENGINE | Available | N/A | Available | CM1_ABE_AESS_CLKCTRL[1:0] MODULEMODE | Read/Write |
| DMIC | Available | N/A | Available | CM1_ABE_DMIC_CLKCTRL[1:0] MODULEMODE | Read/Write |
| L4_ABE interconnect | N/A | Available | N/A | CM1_ABE_L4ABE_CLKCTRL[1:0] MODULEMODE | Read only |

| GPTIMER8 | Available | N/A | Available | CM1_ABE_GPTIMER8_CLKCTRL[1:0] MODULEMODE | Read/Write |
| WDTIMER3 | Available | N/A | Available | CM1_ABE_WDTIMER3_CLKCTRL[1:0] MODULEMODE | Read/Write |

3.6.24 CD_L4_ALWON_CORE Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits. It also identifies its dependencies with other clock domains of the device.

3.6.24.1 Overview

Figure 3-74 shows the overview of the clock domain.

Figure 3-74. CD_L4_ALWON_CORE Overview

3.6.24.2 Clock Domain Modes

CD_L4_ALWON_CORE is an always-on clock domain and has no software-controlled clock domain modes management associated.

3.6.24.3 Clock Domain Dependency

CD_L4_ALWON_CORE has no static or dynamic dependency with any other clock domain of the device.

3.6.24.3.1 Wake-Up Dependency

Table 3-259 lists the wake-up dependency settings for the modules of this clock domain.

Table 3-259. CD_L4_ALWON_CORE Wake-Up Dependency Association Parameters

| Originator Module | Originator Clock Domain | Servicing Clock Domain | Default Setting | Control Bit Field | Access Type |
|-------------------|-------------------------|------------------------|-----------------|---|-------------|
| SR_CORE | CD_L4_ALWON_CORE | CD_CORTEXM3 | Disabled | PM_ALWON_SR_CORE_WKDEP[1] WKUPDEP_SR_CORE_MPU_M3 | Read/Write |
| | CD_L4_ALWON_CORE | CD_CORTEXA9 | Disabled | PM_ALWON_SR_CORE_WKDEP[0] WKUPDEP_SR_CORE_MPU | Read/Write |
| SR_IVA | CD_L4_ALWON_CORE | CD_CORTEXM3 | Disabled | PM_ALWON_SR_IVA_WKDEP[1] WKUPDEP_SR_IVA_MPU_M3 | Read/Write |
| | CD_L4_ALWON_CORE | CD_CORTEXA9 | Disabled | PM_ALWON_SR_IVA_WKDEP[0] WKUPDEP_SR_IVA_MPU | Read/Write |
| SR_MPU | CD_L4_ALWON_CORE | CD_CORTEXA9 | Always enabled | PM_ALWON_SR_MPU_WKDEP[0] WKUPDEP_SR_MPU_MPU | Read only |

3.6.24.4 Clock Domain Module Attributes

Table 3-260 lists for each module of the clock domain the clocks received by it and the role (that is, functional or interface clock).

Table 3-260. CD_L4_ALWON_CORE Modules Clocks Association

| Module | Clock | Clock Type |
|---------|-----------------|------------|
| SR_CORE | AO_L4_ICLK | Interface |
| | SR_CORE_SYS_CLK | Functional |
| SR_IVA | AO_L4_ICLK | Interface |
| | SR_IVA_SYS_CLK | Functional |
| SR_MPU | AO_L4_ICLK | Interface |
| | SR_MPU_SYS_CLK | Functional |

Table 3-261 lists the supported wake-up request generation capability for each module of the clock domain.

Table 3-261. CD_L4_ALWON_CORE Modules Wake-Up Request

| Module | Wake-Up Feature |
|---------|--|
| SR_CORE | Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ) |
| SR_IVA | Slave wake-up request (MPU_A9 -IRQ, MPU_M3 -IRQ) |
| SR_MPU | Slave wake-up request (MPU_A9 -IRQ) |

Table 3-262 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-262. CD_L4_ALWON_CORE Modules Clock-Management Modes and Control

| Module | Clock-Management Protocol | Status Bit Field | Role |
|---------|---------------------------|--|-------------|
| SR_CORE | Slave | CM_ALWON_SR_CORE_CLKCTRL[17:16] IDLEST | Idle status |
| SR_IVA | Slave | CM_ALWON_SR_IVA_CLKCTRL[17:16] IDLEST | Idle status |
| SR_MPU | Slave | CM_ALWON_SR_MPU_CLKCTRL[17:16] IDLEST | Idle status |

Table 3-263 lists the supported clock-management modes and associated software control bit fields for each module of the power domain.

Table 3-263. CD_L4_ALWON_CORE Modules Slave Clock-Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|---------|-----------|------|-----------|--|-------------|
| SR_CORE | Available | N/A | Available | CM_ALWON_SR_CORE_CLKCTRL[1:0] MODULEMODE | Read/Write |
| SR_IVA | Available | N/A | Available | CM_ALWON_SR_IVA_CLKCTRL[1:0] MODULEMODE | Read/Write |
| SR_MPU | Available | N/A | Available | CM_ALWON_SR_MPU_CLKCTRL[1:0] MODULEMODE | Read/Write |

3.7 Power Management Functional Description

This section highlights the functional concepts of power domain level power management in the device.

The following power domains support the DPS with switching times of less than 5 μ s.

- PD_CORE
- PD_DSP
- PD_MPU

3.7.1 PD_WKUP Description

PD_WKUP contains the following reset domains:

- WKUP_PWRON_RST
- WKUP_RST
- WKUP_SYS_PWRON_RST

PD_WKUP contains CD_WKUP clock domain.

Table 3-264 lists the logic retention capability for each module of the power domain.

Table 3-264. PD_WKUP Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|----------------------|-----------------|---|--------------------|
| SYSCTRL_PADCONF_WKUP | No | None | None |
| BANDGAP | No | None | None |
| SYSCTRL_GENERAL_WKUP | No | None | None |
| GPIO1 | No | RM_WKUP_GPIO1_CONTEXT[0] LOSTCONTEXT_DFF | None |
| KEYBOARD | No | RM_WKUP_KEYBOARD_CONTEXT[0] LOSTCONTEXT_DFF | None |
| PRM | No | None | None |
| SAR_RAM | No | RM_WKUP_SARRAM_CONTEXT[0] LOSTCONTEXT_DFF | None |
| SCRM | No | None | None |
| 32KTIMER | No | RM_WKUP_32KTIMER_CONTEXT[0] LOSTCONTEXT_DFF | None |
| GPTIMER1 | No | RM_WKUP_GPTIMER1_CONTEXT[0] LOSTCONTEXT_DFF | None |
| WDTIMER2 | No | RM_WKUP_WDTIMER2_CONTEXT[0] LOSTCONTEXT_DFF | None |
| L4_WKUP interconnect | No | RM_WKUP_L4WKUP_CONTEXT[0] LOSTCONTEXT_DFF | None |

3.7.1.1 Power Domain Modes

The PD_WKUP power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD_WKUP power domain has no memory banks.

3.7.2 PD_DSP Description

PD_DSP contains the following reset domains:

- DSP_RST
- DSP_PWRON_RST
- DSP_RET_RST
- DSP_SYS_RST

PD_DSP contains the CD_DSP clock domain.

Table 3-265 lists the logic retention capability for each module of the power domain.

Table 3-265. PD_DSP Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|--------|-----------------|--|--|
| DSP | Partial | RM_DSP_DSP_CONTEXT[0] LOSTCONTEXT_DFF | RM_DSP_DSP_CONTEXT[1] LOSTCONTEXT_RFF |

3.7.2.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See Section 3.1.1.2.1, for a functional description of the power-management architecture of a generic power domain.

3.7.2.1.1 Logic and Memory Area Power Modes

Table 3-266 lists the power modes supported by the logic area of the power domain.

Table 3-266. PD_DSP Logic Area Power Modes

| Off | Retention-OSWR | Retention-CSWR | On-Inactive | On-Active |
|-----------|----------------|----------------|-------------|-----------|
| Available | Available | Available | Available | Available |

Table 3-267 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-267. PD_DSP Memory Area Power Modes

| Memory Bank | Module - Memory | Logic On | Logic Retention | Logic Off | RTA Feature |
|-------------|-----------------|-----------|------------------|-----------|----------------|
| DSP_EDMA | | ON | RETENTION | OFF | |
| | DSP - DSP_EDMA | always_on | always_retention | | always_enabled |
| DSP_L1 | | ON | OFF, RETENTION | OFF | |
| | DSP - DSP_L1 | always_on | software_control | | None |
| DSP_L2 | | ON | OFF, RETENTION | OFF | |
| | DSP - DSP_L2 | always_on | software_control | | always_enabled |

3.7.2.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-268 lists the power modes controls for the power domain.

Table 3-268. PD_DSP Power Modes Control Parameters

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|--|-------------|---|-------------|
| Memory Area - State Control (Logic in Retention state) | DSP_L2 | PM_DSP_PWRSTCTRL[9] DSP_L2_RETSTATE | Read/Write |
| Memory Area - State Control (Logic in Retention state) | DSP_L1 | PM_DSP_PWRSTCTRL[8] DSP_L1_RETSTATE | Read/Write |
| Power Domain - Low Power State Change Control | | PM_DSP_PWRSTCTRL[4] LOWPOWERSTATECHANGE | Read/Write |
| Memory Area - State Control (Logic in On state) | DSP_EDMA | PM_DSP_PWRSTCTRL[21:20] DSP_EDMA_ONSTATE | Read only |
| Logic Area - Retention State Control | | PM_DSP_PWRSTCTRL[2] LOGICRETSTATE | Read/Write |

Table 3-268. PD_DSP Power Modes Control Parameters (continued)

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|--|-------------|---|-------------|
| Memory Area - State Control (Logic in On state) | DSP_L2 | PM_DSP_PWRSTCTRL[19:18] DSP_L2_ONSTATE | Read only |
| Memory Area - State Control (Logic in On state) | DSP_L1 | PM_DSP_PWRSTCTRL[17:16] DSP_L1_ONSTATE | Read only |
| Memory Area - State Control (Logic in Retention state) | DSP_EDMA | PM_DSP_PWRSTCTRL[10] DSP_EDMA_RETSTATE | Read only |
| Power Domain - State Transition Control | | PM_DSP_PWRSTCTRL[1:0] POWERSTATE | Read/Write |

Table 3-269 lists the power modes status for the power domain.

Table 3-269. PD_DSP Power Modes Status Parameters

| Parameter Name | Memory Bank | Status Bit Field |
|--|-------------|--|
| Power Domain - Last Power State Entered Status | | PM_DSP_PWRSTST[25:24] LASTPOWERSTATEENTERED |
| Memory Area - State Status | DSP_EDMA | PM_DSP_PWRSTST[9:8] DSP_EDMA_STATEST |
| Memory Area - State Status | DSP_L2 | PM_DSP_PWRSTST[7:6] DSP_L2_STATEST |
| Memory Area - State Status | DSP_L1 | PM_DSP_PWRSTST[5:4] DSP_L1_STATEST |
| Power Domain - State Transition Status | | PM_DSP_PWRSTST[20] INTRANSITION |
| Logic Area - State Status | | PM_DSP_PWRSTST[2] LOGICSTATEST |
| Power Domain - State Status | | PM_DSP_PWRSTST[1:0] POWERSTATEST |

3.7.3 PD_STD_EFUSE Description

PD_STD_EFUSE contains the STD_EFUSE_PWRON_RST reset domain.

PD_STD_EFUSE contains the CD_STD_EFUSE clock domain.

Table 3-270 lists the logic retention capability for each module of the power domain.

Table 3-270. PD_STD_EFUSE Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|-----------|-----------------|--------------------|--------------------|
| STD_EFUSE | No | None | None |

3.7.3.1 Power Domain Modes

The PD_STD_EFUSE power domain is hardware-controlled by the PRCM module and has no software control associated. It is switched to ON power state when the device is powered on and switched to OFF power state after the power-up sequence of the device.

The PD_STD_EFUSE power domain has no memory banks.

3.7.4 PD_MPU Description

PD_MPU contains the following reset domains:

- CORTEXA9_PWRON_RST
- CORTEXA9_RST

PD_MPU contains the CD_CORTEXA9 clock domain.

Table 3-271 lists the logic retention capability for each module of the power domain.

Table 3-271. PD_MPU Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|----------|-----------------|---|--------------------|
| CORTEXA9 | No | RM_MPU_MPU_CONTEXT [0] LOSTCONTEXT_DFF | None |

3.7.4.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.4.1.1 Logic and Memory Area Power Modes

[Table 3-272](#) lists the power modes supported by the logic area of the power domain.

Table 3-272. PD_MPU Logic Area Power Modes

| Off | Retention-OSWR | Retention-CSWR | On-Inactive | On-Active |
|-----------|----------------|----------------|-------------|-----------|
| Available | Available | Available | Available | Available |

[Table 3-273](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-273. PD_MPU Memory Area Power Modes

| Memory Bank | Module - Memory | Logic On | Logic Retention | Logic Off | RTA Feature |
|-------------|--------------------|-----------|------------------|-----------|----------------|
| MPU_L1 | | ON | OFF, RETENTION | OFF | |
| | CORTEXA9 - MPU_L1 | always_on | software_control | | None |
| MPU_L2 | | ON | OFF, RETENTION | OFF | |
| | CORTEXA9 - MPU_L2 | always_on | software_control | | always_enabled |
| MPU_RAM | | ON | RETENTION | OFF | |
| | CORTEXA9 - MPU_RAM | always_on | always_retention | | always_enabled |

3.7.4.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-274](#) lists the power modes controls for the power domain.

Table 3-274. PD_MPU Power Modes Control Parameters

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|--|-------------|---|-------------|
| Memory Area - State Control (Logic in Retention state) | MPU_L2 | PM_MPU_PWRSTCTRL [9] MPU_L2_RETSTATE | Read/Write |
| Memory Area - State Control (Logic in Retention state) | MPU_L1 | PM_MPU_PWRSTCTRL [8] MPU_L1_RETSTATE | Read/Write |
| Power Domain - Low Power State Change Control | | PM_MPU_PWRSTCTRL [4] LOWPOWERSTATECHANGE | Read only |
| Memory Area - State Control (Logic in On state) | MPU_RAM | PM_MPU_PWRSTCTRL [21:20] MPU_RAM_ONSTATE | Read only |
| Logic Area - Retention State Control | | PM_MPU_PWRSTCTRL [2] LOGICRETSTATE | Read/Write |

Table 3-274. PD_MPU Power Modes Control Parameters (continued)

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|---|-------------|--|-------------|
| Memory Area - State Control (Logic in On state) | MPU_L2 | PM_MPU_PWRSTCTRL [19:18]] MPU_L2_ONSTATE | Read only |
| Memory Area - State Control (Logic in On state) | MPU_L1 | PM_MPU_PWRSTCTRL [17:16]] MPU_L1_ONSTATE | Read only |
| Memory Area - State Control (Logic in Retention state) | MPU_RAM | PM_MPU_PWRSTCTRL [10] MPU_RAM_RETSTATE | Read only |
| Power Domain - State Transition Control | | PM_MPU_PWRSTCTRL [1:0] POWERSTATE | Read/Write |

[Table 3-275](#) lists the power modes status for the power domain.

Table 3-275. PD_MPU Power Modes Status Parameters

| Parameter Name | Memory Bank | Status Bit Field |
|---|-------------|---|
| Power Domain - Last Power State Entered Status | | PM_MPU_PWRSTST [25:24] LASTPOWERSTATEENTERED |
| Memory Area - State Status | MPU_RAM | PM_MPU_PWRSTST [9:8] MPU_RAM_STATEST |
| Memory Area - State Status | MPU_L2 | PM_MPU_PWRSTST [7:6] MPU_L2_STATEST |
| Memory Area - State Status | MPU_L1 | PM_MPU_PWRSTST [5:4] MPU_L1_STATEST |
| Power Domain - State Transition Status | | PM_MPU_PWRSTST [20] INTRANSITION |
| Logic Area - State Status | | PM_MPU_PWRSTST [2] LOGICSTATEST |
| Power Domain - State Status | | PM_MPU_PWRSTST [1:0] POWERSTATEST |

3.7.5 PD_L4_PER Description

PD_L4_PER contains the following reset domains:

- L4_PER_PWRON_RET_RST
- L4_PER_RET_RST
- L4_PER_RST

PD_L4_PER contains the CD_L4_PER clock domain.

•

[Table 3-276](#) lists the logic retention capability for each module of the power domain.

Table 3-276. PD_L4_PER Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|-----------|-----------------|---|--------------------|
| GPTIMER10 | No | RM_L4PER_GPTIMER10_CONTEXT [0] LOSTCONTEXT_DFF | None |
| GPTIMER11 | No | RM_L4PER_GPTIMER11_CONTEXT [0] LOSTCONTEXT_DFF | None |
| GPTIMER2 | No | RM_L4PER_GPTIMER2_CONTEXT [0] LOSTCONTEXT_DFF | None |
| GPTIMER3 | No | RM_L4PER_GPTIMER3_CONTEXT [0] LOSTCONTEXT_DFF | None |
| GPTIMER4 | No | RM_L4PER_GPTIMER4_CONTEXT [0] LOSTCONTEXT_DFF | None |
| GPTIMER9 | No | RM_L4PER_GPTIMER9_CONTEXT [0] LOSTCONTEXT_DFF | None |

Table 3-276. PD_L4_PER Modules Power Attributes (continued)

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|---------------------|-----------------|--|--|
| ELM | No | RM_L4PER_ELM_CONTEXT[0] LOSTCONTEXT_DFF | None |

3.7.5.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.5.1.1 Logic and Memory Area Power Modes

Table 3-277 lists the power modes supported by the logic area of the power domain.

Table 3-277. PD_L4_PER Logic Area Power Modes

| Off | Retention-OSWR | Retention-CSWR | On-Inactive | On-Active |
|-----------|----------------|----------------|-------------|-----------|
| Available | Available | Available | Available | Available |

Table 3-278 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-278. PD_L4_PER Memory Area Power Modes

| Memory Bank | Module - Memory | Logic On | Logic Retention | Logic Off | RTA Feature |
|------------------|-------------------------|-----------|------------------|-----------|-------------|
| NONRETAINED_BANK | | ON | OFF | OFF | |
| | MCBSP4 - MCBSP_BANK | always_on | always_off | | None |
| | HSMC3 - MMCHSSRAM | always_on | always_off | | None |
| | SLIMBUS2 - SLIMBUS_BANK | always_on | always_off | | None |
| RETAINED_BANK | | ON | RETENTION | OFF | |
| | UART1 - UART_MEM | always_on | always_retention | | None |

3.7.5.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-279 lists the power modes controls for the power domain.

Table 3-279. PD_L4_PER Power Modes Control Parameters

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|--|------------------|--|-------------|
| Memory Area - State Control (Logic in Retention state) | NONRETAINED_BANK | PM_L4PER_PWRSTCTRL[9] NONRETAINED_BANK_RETSTATE | Read only |
| Memory Area - State Control (Logic in Retention state) | RETAINED_BANK | PM_L4PER_PWRSTCTRL[8] RETAINED_BANK_RETSTATE | Read only |
| Power Domain - Low Power State Change Control | | PM_L4PER_PWRSTCTRL[4] LOWPOWERSTATECHANGE | Read/Write |
| Logic Area - Retention State Control | | PM_L4PER_PWRSTCTRL[2] LOGICRETSTATE | Read/Write |
| Memory Area - State Control (Logic in On state) | NONRETAINED_BANK | PM_L4PER_PWRSTCTRL[19:18] NONRETAINED_BANK_ONSTATE | Read only |
| Memory Area - State Control (Logic in On state) | RETAINED_BANK | PM_L4PER_PWRSTCTRL[17:16] RETAINED_BANK_ONSTATE | Read only |
| Power Domain - State Transition Control | | PM_L4PER_PWRSTCTRL[1:0] POWERSTATE | Read/Write |

Table 3-280 lists the power modes status for the power domain.

Table 3-280. PD_L4_PER Power Modes Status Parameters

| Parameter Name | Memory Bank | Status Bit Field |
|--|------------------|--|
| Power Domain - Last Power State Entered Status | | PM_L4PER_PWRSTST[25:24] LASTPOWERSTATEENTERED |
| Memory Area - State Status | NONRETAINED_BANK | PM_L4PER_PWRSTST[7:6] NONRETAINED_BANK_STATEST |
| Memory Area - State Status | RETAINED_BANK | PM_L4PER_PWRSTST[5:4] RETAINED_BANK_STATEST |
| Power Domain - State Transition Status | | PM_L4PER_PWRSTST[20] INTRANSITION |
| Logic Area - State Status | | PM_L4PER_PWRSTST[2] LOGICSTATEST |
| Power Domain - State Status | | PM_L4PER_PWRSTST[1:0] POWERSTATEST |

3.7.6 PD_L3_INIT Description

PD_L3_INIT contains the following reset domains:

- DPLL_L3_INIT_PWRON_RET_RST
- L3_INIT_PWRON_RST
- L3_INIT_RET_RST
- L3_INIT_RST

PD_L3_INIT contains the CD_L3_INIT clock domain.

Table 3-281 lists the logic retention capability for each module of the power domain.

Table 3-281. PD_L3_INIT Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|-----------|-----------------|---|---|
| CM1_USB | No | None | None |
| DPLL_USB | Full | None | None |
| HSI | Full | None | RM_L3INIT_HSI_CONTEXT[1] LOSTCONTEXT_RFF |
| HSMMC1 | Full | None | RM_L3INIT_MMC1_CONTEXT[1] LOSTCONTEXT_RFF |
| HSMMC2 | Full | None | RM_L3INIT_MMC2_CONTEXT[1] LOSTCONTEXT_RFF |
| USBPHY | No | RM_L3INIT_USBPHY_CONTEXT[0] LOSTCONTEXT_DFF | None |
| HSUSBHOST | Full | None | RM_L3INIT_USB_HOST_CONTEXT[1] LOSTCONTEXT_RFF |
| HSUSBOTG | Full | None | RM_L3INIT_USB_OTG_CONTEXT[1] LOSTCONTEXT_RFF |
| HSUSBTLL | Full | None | RM_L3INIT_HSUSBTLL_CONTEXT[1] LOSTCONTEXT_RFF |

3.7.6.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See Section 3.1.1.2.1 for a functional description of the power-management architecture of a generic power domain.

3.7.6.1.1 Logic and Memory Area Power Modes

Table 3-282 lists the power modes supported by the logic area of the power domain.

Table 3-282. PD_L3_INIT Logic Area Power Modes

| Off | Retention-OSWR | Retention-CSWR | On-Inactive | On-Active |
|-----------|----------------|----------------|-------------|-----------|
| Available | Available | Available | Available | Available |

[Table 3-283](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-283. PD_L3_INIT Memory Area Power Modes

| Memory Bank | Module - Memory | Logic On | Logic Retention | Logic Off | RTA Feature |
|--------------|-------------------|-----------|-----------------|-----------|----------------|
| L3INIT_BANK1 | | ON | OFF | OFF | |
| | HSI - HSI_DMAFIFO | always_on | always_off | | None |
| | HSMC1 - HSMC1SRAM | always_on | always_off | | None |
| | HSUSBOTG - USBMEM | always_on | always_off | | always_enabled |

3.7.6.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-284](#) lists the power modes controls for the power domain.

Table 3-284. PD_L3_INIT Power Modes Control Parameters

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|--|--------------|--|-------------|
| Memory Area - State Control (Logic in Retention state) | L3INIT_BANK1 | PM_L3INIT_PWRSTCTRL [8] L3INIT_BANK1_RETSTATE | Read only |
| Power Domain - Low Power State Change Control | | PM_L3INIT_PWRSTCTRL [4] LOWPOWERSTATECHANGE | Read/Write |
| Logic Area - Retention State Control | | PM_L3INIT_PWRSTCTRL [2] LOGICRETSTATE | Read/Write |
| Memory Area - State Control (Logic in On state) | L3INIT_BANK1 | PM_L3INIT_PWRSTCTRL [17:16] L3INIT_BANK1_ONSTATE | Read only |
| Power Domain - State Transition Control | | PM_L3INIT_PWRSTCTRL [1:0] POWERSTATE | Read/Write |

[Table 3-285](#) lists the power modes status for the power domain.

Table 3-285. PD_L3_INIT Power Modes Status Parameters

| Parameter Name | Memory Bank | Status Bit Field |
|--|--------------|---|
| Power Domain - Last Power State Entered Status | | PM_L3INIT_PWRSTST [25:24] LASTPOWERSTATEENTERED |
| Memory Area - State Status | L3INIT_BANK1 | PM_L3INIT_PWRSTST [5:4] L3INIT_BANK1_STATEST |
| Power Domain - State Transition Status | | PM_L3INIT_PWRSTST [20] INTRANSITION |
| Logic Area - State Status | | PM_L3INIT_PWRSTST [2] LOGICSTATEST |
| Power Domain - State Status | | PM_L3INIT_PWRSTST [1:0] POWERSTATEST |

3.7.7 PD_IVAHD Description

PD_IVAHD contains the following reset domains:

- IVAHD_PWRON_RST
- IVAHD_RST
- IVAHD_SEQ1_RST
- IVAHD_SEQ2_RST

PD_IVAHD contains the CD_IVAHD clock domain.

[Table 3-286](#) lists the logic retention capability for each module of the power domain.

Table 3-286. PD_IVAHD Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|--------|-----------------|---|--------------------|
| IVAHD | No | RM_IVAHD_IVAHD_CONTEXT[0] LOSTCONTEXT_DFF | None |
| SL2 | No | RM_IVAHD_SL2_CONTEXT[0] LOSTCONTEXT_DFF | None |

3.7.7.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.7.1.1 Logic and Memory Area Power Modes

[Table 3-287](#) lists the power modes supported by the logic area of the power domain.

Table 3-287. PD_IVAHD Logic Area Power Modes

| Off | Retention-OSWR | Retention-CSWR | On-Inactive | On-Active |
|-----------|----------------|----------------|-------------|-----------|
| Available | Available | Not available | Available | Available |

[Table 3-288](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-288. PD_IVAHD Memory Area Power Modes

| Memory Bank | Module - Memory | Logic On | Logic Retention | Logic Off | RTA Feature |
|-------------|-----------------|-----------|------------------|-----------|----------------|
| HWA_MEM | | ON | OFF | OFF | |
| | IVAHD - HWA_MEM | always_on | always_off | | always_enabled |
| SL2_MEM | | ON | OFF, RETENTION | OFF | |
| | SL2 - SL2MEM | always_on | software_control | | always_enabled |
| TCM1_MEM | | ON | OFF, RETENTION | OFF | |
| | IVAHD - TCM_1 | always_on | software_control | | always_enabled |
| TCM2_MEM | | ON | OFF, RETENTION | OFF | |
| | IVAHD - TCM_2 | always_on | software_control | | always_enabled |

3.7.7.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-289 lists the power modes controls for the power domain.

Table 3-289. PD_IVAHD Power Modes Control Parameters

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|---|-------------|---|-------------|
| Memory Area - State Control (Logic in Retention state) | SL2_MEM | PM_IVAHD_PWRSTCTRL [9] SL2_MEM_RETSTATE | Read/Write |
| Memory Area - State Control (Logic in Retention state) | HWA_MEM | PM_IVAHD_PWRSTCTRL [8] HWA_MEM_RETSTATE | Read only |
| Power Domain - Low Power State Change Control | | PM_IVAHD_PWRSTCTRL [4] LOWPOWERSTATECHANGE | Read/Write |
| Memory Area - State Control (Logic in On state) | TCM2_MEM | PM_IVAHD_PWRSTCTRL [23: 22] TCM2_MEM_ONSTATE | Read only |
| Memory Area - State Control (Logic in On state) | TCM1_MEM | PM_IVAHD_PWRSTCTRL [21: 20] TCM1_MEM_ONSTATE | Read only |
| Logic Area - Retention State Control | | PM_IVAHD_PWRSTCTRL [2] LOGICRETSTATE | Read only |
| Memory Area - State Control (Logic in On state) | SL2_MEM | PM_IVAHD_PWRSTCTRL [19: 18] SL2_MEM_ONSTATE | Read only |
| Memory Area - State Control (Logic in On state) | HWA_MEM | PM_IVAHD_PWRSTCTRL [17: 16] HWA_MEM_ONSTATE | Read only |
| Memory Area - State Control (Logic in Retention state) | TCM2_MEM | PM_IVAHD_PWRSTCTRL [11] TCM2_MEM_RETSTATE | Read/Write |
| Memory Area - State Control (Logic in Retention state) | TCM1_MEM | PM_IVAHD_PWRSTCTRL [10] TCM1_MEM_RETSTATE | Read/Write |
| Power Domain - State Transition Control | | PM_IVAHD_PWRSTCTRL [1:0] POWERSTATE | Read/Write |

Table 3-290 lists the power modes status for the power domain.

Table 3-290. PD_IVAHD Power Modes Status Parameters

| Parameter Name | Memory Bank | Status Bit Field |
|---|-------------|---|
| Power Domain - Last Power State Entered Status | | PM_IVAHD_PWRSTST [25:24] LASTPOWERSTATEENTERED |
| Memory Area - State Status | TCM1_MEM | PM_IVAHD_PWRSTST [9:8] TCM1_MEM_STATEST |
| Memory Area - State Status | SL2_MEM | PM_IVAHD_PWRSTST [7:6] SL2_MEM_STATEST |
| Memory Area - State Status | HWA_MEM | PM_IVAHD_PWRSTST [5:4] HWA_MEM_STATEST |
| Power Domain - State Transition Status | | PM_IVAHD_PWRSTST [20] INTRANSITION |
| Logic Area - State Status | | PM_IVAHD_PWRSTST [2] LOGICSTATEST |
| Memory Area - State Status | TCM2_MEM | PM_IVAHD_PWRSTST [11:10] TCM2_MEM_STATEST |
| Power Domain - State Status | | PM_IVAHD_PWRSTST [1:0] POWERSTATEST |

3.7.8 PD_SGX Description

PD_SGX contains the SGX_RST reset domain.

PD_SGX contains the CD_SGX clock domain.

Table 3-291 lists the logic retention capability for each module of the power domain.

Table 3-291. PD_SGX Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|--------|-----------------|---|--------------------|
| SGX | No | RM_SGX_SGX_CONTEXT [0] LOSTCONTEXT_DFF | None |

3.7.8.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.8.1.1 Logic and Memory Area Power Modes

[Table 3-292](#) lists the power modes supported by the logic area of the power domain.

Table 3-292. PD_SGX Logic Area Power Modes

| Off | Retention-OSWR | Retention-CSWR | On-Inactive | On-Active |
|-----------|----------------|----------------|-------------|-----------|
| Available | Not available | Not available | Available | Available |

[Table 3-293](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-293. PD_SGX Memory Area Power Modes

| Memory Bank | Module - Memory | Logic On | Logic Retention | Logic Off | RTA Feature |
|-------------|-----------------|-----------|-----------------|-----------|----------------|
| | SGX - SGX_MEM | always_on | always_off | | always_enabled |

3.7.8.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-294](#) lists the power modes controls for the power domain.

Table 3-294. PD_SGX Power Modes Control Parameters

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|---|-------------|---|-------------|
| Power Domain - Low Power State Change Control | | PM_SGX_PWRSTCTRL [4] LOWPOWERSTATECHANGE | Read/Write |
| Memory Area - State Control (Logic in On state) | SGX_MEM | PM_SGX_PWRSTCTRL [17:16] SGX_MEM_ONSTATE | Read only |
| Power Domain - State Transition Control | | PM_SGX_PWRSTCTRL [1:0] POWERSTATE | Read/Write |

[Table 3-295](#) lists the power modes status for the power domain.

Table 3-295. PD_SGX Power Modes Status Parameters

| Parameter Name | Memory Bank | Status Bit Field |
|--|-------------|---|
| Memory Area - State Status | SGX_MEM | PM_SGX_PWRSTST [5:4] SGX_MEM_STATEST |
| Power Domain - State Transition Status | | PM_SGX_PWRSTST [20] INTRANSITION |
| Logic Area - State Status | | PM_SGX_PWRSTST [2] LOGICSTATEST |
| Power Domain - State Status | | PM_SGX_PWRSTST [1:0] POWERSTATEST |

3.7.9 PD_EMU Description

PD_EMU contains the following reset domains:

- EMU_EARLY_PWRON_RST
- EMU_PWRON_RST
- EMU_RST

PD_EMU contains the CD_EMU clock domain.

Table 3-296 lists the logic retention capability for each module of the power domain.

Table 3-296. PD_EMU Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|---------|-----------------|--------------------|--------------------|
| CM1_EMU | No | None | None |
| DEBUG | No | None | None |

3.7.9.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See Section 3.1.1.2.1 for a functional description of the power-management architecture of a generic power domain.

3.7.9.1.1 Logic and Memory Area Power Modes

Table 3-297 lists the power modes supported by the logic area of the power domain.

Table 3-297. PD_EMU Logic Area Power Modes

| Off | Retention-OSWR | Retention-CSWR | On-Inactive | On-Active |
|-----------|----------------|----------------|---------------|-----------|
| Available | Not available | Not available | Not available | Available |

Table 3-298 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-298. PD_EMU Memory Area Power Modes

| Memory Bank | Module - Memory | Logic On | Logic Retention | Logic Off | RTA Feature |
|-------------|---------------------|-----------|-----------------|-----------|----------------|
| | DEBUG - DebugSS_MEM | always_on | always_off | | always_enabled |

3.7.9.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-299 lists the power modes controls for the power domain.

Table 3-299. PD_EMU Power Modes Control Parameters

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|---|-------------|---|-------------|
| Memory Area - State Control (Logic in On state) | EMU_BANK | PM_EMU_PWRSTCTRL[17:16]] EMU_BANK_ONSTATE | Read only |
| Power Domain - State Transition Control | | PM_EMU_PWRSTCTRL[1:0] POWERSTATE | Read only |

Table 3-300 lists the power modes status for the power domain.

Table 3-300. PD_EMU Power Modes Status Parameters

| Parameter Name | Memory Bank | Status Bit Field |
|--|-------------|---|
| Memory Area - State Status | EMU_BANK | PM_EMU_PWRSTST[5:4] EMU_BANK_STATEST |
| Power Domain - State Transition Status | | PM_EMU_PWRSTST[20] INTRANSITION |
| Logic Area - State Status | | PM_EMU_PWRSTST[2] LOGICSTATEST |
| Power Domain - State Status | | PM_EMU_PWRSTST[1:0] POWERSTATEST |

3.7.10 PD_DSS Description

PD_DSS contains the following reset domains:

- DSS_RET_RST
- DSS_RST

PD_DSS contains the CD_DSS clock domain.

Table 3-301 lists the logic retention capability for each module of the power domain.

Table 3-301. PD_DSS Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|--------|-----------------|---|--|
| DSS | Partial | RM_DSS_DSS_CONTEXT[0] LOSTCONTEXT_DFF | RM_DSS_DSS_CONTEXT[1] LOSTCONTEXT_RFF |
| BB2D | No | RM_DSS_BB2D_CONTEXT[0] LOSTCONTEXT_DFF | N/A |

3.7.10.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See Section 3.1.1.2.1 for a functional description of the power-management architecture of a generic power domain.

3.7.10.1.1 Logic and Memory Area Power Modes

Table 3-302 lists the power modes supported by the logic area of the power domain.

Table 3-302. PD_DSS Logic Area Power Modes

| Off | Retention-OSWR | Retention-CSWR | On-Inactive | On-Active |
|-----------|----------------|----------------|-------------|-----------|
| Available | Available | Available | Available | Available |

Table 3-303 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-303. PD_DSS Memory Area Power Modes

| Memory Bank | Module - Memory | Logic On | Logic Retention | Logic Off | RTA Feature |
|-------------|-----------------|-----------|-----------------|-----------|----------------|
| DSS_MEM | | ON | OFF | OFF | |
| | DSS - DSSMEM | always_on | always_off | | always_enabled |
| BB2D_MEM | | ON | OFF | OFF | |
| | BB2D - BB2D_MEM | always_on | always_off | | always_enabled |

3.7.10.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-304 lists the power modes controls for the power domain.

Table 3-304. PD_DSS Power Modes Control Parameters

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|---|-------------|--|-------------|
| Memory Area - State Control (Logic in Retention state) | DSS_MEM | PM_DSS_PWRSTCTRL[8] DSS_MEM_RETSTATE | Read only |
| Power Domain - Low Power State Change Control | | PM_DSS_PWRSTCTRL[4] LOWPOWERSTATECHANGE | Read/Write |
| Logic Area - Retention State Control | | PM_DSS_PWRSTCTRL[2] LOGICRETSTATE | Read/Write |
| Memory Area - State Control (Logic in On state) | DSS_MEM | PM_DSS_PWRSTCTRL[17:16] DSS_MEM_ONSTATE | Read only |
| Power Domain - State Transition Control | | PM_DSS_PWRSTCTRL[1:0] POWERSTATE | Read/Write |

Table 3-305 lists the power modes status for the power domain.

Table 3-305. PD_DSS Power Modes Status Parameters

| Parameter Name | Memory Bank | Status Bit Field |
|--|-------------|--|
| Memory Area - State Status | DSS_MEM | PM_DSS_PWRSTST[5:4] DSS_MEM_STATEST |
| Power Domain - State Transition Status | | PM_DSS_PWRSTST[20] INTRANSITION |
| Logic Area - State Status | | PM_DSS_PWRSTST[2] LOGICSTATEST |
| Power Domain - State Status | | PM_DSS_PWRSTST[1:0] POWERSTATEST |

3.7.11 PD_CORE Description

PD_CORE contains the following reset domains:

- CM2_PWRON_RET_RST
- CM2_RET_RST
- CORE_PWRON_RET_RST
- CORE_RET_RST
- CORE_RST
- DLL_RST
- CORTEXM3_PWRON_RST
- CORTEXM3_RET_RST
- CORTEXM3_RST1
- CORTEXM3_RST2
- CORTEXM3_RST3
- EMIF_PWRON_RST
- SDMA_RET_RST

PD_CORE contains the following clock domains:

- CD_C2C
- CD_DMA
- CD_CORTEXM3
- CD_EMIF
- CD_L3_1
- CD_L3_2
- CD_L3_INSTR

- CD_L4_CFG

[Table 3-306](#) lists the logic retention capability for each module of the power domain.

Table 3-306. PD_CORE Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|-----------------------|-----------------|--|--|
| SYSCTRL_PADCONF_CORE | Full | None | None |
| CM2 | Full | None | None |
| DDRPHY | No | None | None |
| SYSCTRL_GENERAL_CORE | Full | None | None |

3.7.11.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.11.1.1 Logic and Memory Area Power Modes

[Table 3-307](#) lists the power modes supported by the logic area of the power domain.

Table 3-307. PD_CORE Logic Area Power Modes

| Off | Retention-OSWR | Retention-CSWR | On-Inactive | On-Active |
|-----------|----------------|----------------|-------------|-----------|
| Available | Available | Available | Available | Available |

Table 3-308 presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-308. PD_CORE Memory Area Power Modes

| Memory Bank | Module - Memory | Logic On | Logic Retention | logic off | RTA Feature |
|-----------------|-------------------------------|--------------------|------------------|-----------|----------------|
| CORE_NRET_BANK | | ON | OFF | OFF | |
| | DMM - DMM_MEMBANK2 | always_on | always_off | | None |
| CORE_OCMRAM | | OFF, RETENTION, ON | OFF, RETENTION | OFF | |
| | OCMC_RAM - OCMC_RAM_Bank 1 | software_control | software_control | | always_enabled |
| CORE_OTHER_BANK | | ON | RETENTION | OFF | |
| | sDMA - DMA_MEM | always_on | always_retention | | None |
| | DMM - DMM_MEMBANK1 | always_on | always_retention | | always_enabled |
| MPU_M3_L2RAM | | ON | OFF, RETENTION | OFF | |
| | CORTEXM3 - MPU_M3_L2RAM_MEM | always_on | software_control | | always_enabled |
| MPU_M3_UNICACHE | | ON | OFF, RETENTION | OFF | |
| | CORTEXM3 - MPU_M3_Unicode_mem | always_on | software_control | | None |

3.7.11.1.2 Logic and Memory Area Power Modes Control and Status

Table 3-309 lists the power modes controls for the power domain.

Table 3-309. PD_CORE Power Modes Control Parameters

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|--|-----------------|--|-------------|
| Memory Area - State Control (Logic in Retention state) | CORE_OCMRAM | PM_CORE_PWRSTCTRL[9] CORE_OCMRAM_RETSTATE | Read/Write |
| Memory Area - State Control (Logic in Retention state) | CORE_OTHER_BANK | PM_CORE_PWRSTCTRL[8] CORE_OTHER_BANK_RETSTATE | Read only |
| Memory Area - State Control (Logic in On state) | CORE_NRET_BANK | PM_CORE_PWRSTCTRL[25:24] INTRCONN_NRET_BANK_ONSTATE | Read only |
| Memory Area - State Control (Logic in On state) | MPU_M3_UNICACHE | PM_CORE_PWRSTCTRL[23:22] MPU_M3_UNICACHE_ONSTATE | Read only |

Table 3-309. PD_CORE Power Modes Control Parameters (continued)

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|---|-----------------|---|-------------|
| Memory Area - State Control (Logic in On state) | MPU_M3_L2RAM | PM_CORE_PWRSTCTRL [21:20] MPU_M3_L2RAM_ONSTATE | Read only |
| Memory Area - State Control (Logic in On state) | CORE_OCMRAM | PM_CORE_PWRSTCTRL [19:18] CORE_OCMRAM_ONSTATE | Read/Write |
| Memory Area - State Control (Logic in On state) | CORE_OTHER_BANK | PM_CORE_PWRSTCTRL [17:16] CORE_OTHER_BANK_ONSTATE | Read only |
| Memory Area - State Control (Logic in Retention state) | CORE_NRET_BANK | PM_CORE_PWRSTCTRL [12] INTRCONN_NRET_BANK_RETSTATE | Read only |
| Memory Area - State Control (Logic in Retention state) | MPU_M3_UNICACHE | PM_CORE_PWRSTCTRL [11] MPU_M3_UNICACHE_RETSTATE | Read/Write |
| Memory Area - State Control (Logic in Retention) | MPU_M3_L2RAM | PM_CORE_PWRSTCTRL [10] MPU_M3_L2RAM_RETSTATE | Read/Write |
| Logic Area - Retention State Control | N/A | PM_CORE_PWRSTCTRL [2] LOGICRETSTATE | Read/Write |
| Power Domain - Low Power State Change Control | N/A | PM_CORE_PWRSTCTRL [4] LOWPOWERSTATECHANGE | Read/Write |
| Power Domain - State Transition Control | N/A | PM_CORE_PWRSTCTRL [1:0] POWERSTATE | Read/Write |

[Table 3-310](#) lists the power modes status for the power domain.

Table 3-310. PD_CORE Power Modes Status Parameters

| Parameter Name | Memory Bank | Status Bit Field |
|--|-----------------|---|
| Power Domain - Last Power State Entered Status | | PM_CORE_PWRSTST [25:24] LASTPOWERSTATEENTERED |
| Memory Area - State Status | MPU_M3_L2RAM | PM_CORE_PWRSTST [9:8] MPU_M3_L2RAM_STATEST |
| Memory Area - State Status | CORE_OCMRAM | PM_CORE_PWRSTST [7:6] CORE_OCMRAM_STATEST |
| Memory Area - State Status | CORE_OTHER_BANK | PM_CORE_PWRSTST [5:4] CORE_OTHER_BANK_STATEST |
| Memory Area - State Status | CORE_NRET_BANK | PM_CORE_PWRSTST [13:12] INTRCONN_NRET_BANK_STATEST |
| Memory Area - State Status | MPU_M3_UNICACHE | PM_CORE_PWRSTST [11:10] MPU_M3_UNICACHE_STATEST |
| Logic Area - State Status | | PM_CORE_PWRSTST [2] LOGICSTATEST |
| Power Domain - State Transition Status | | PM_CORE_PWRSTST [20] INTRANSITION |
| Power Domain - State Status | | PM_CORE_PWRSTST [1:0] POWERSTATEST |

3.7.12 PD_CAM Description

PD_CAM contains the CAM_RST reset domain.

PD_CAM contains the CD_CAM clock domain.

[Table 3-311](#) lists the logic retention capability for each module of the power domain.

Table 3-311. PD_CAM Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|-------------|-----------------|--|--------------------|
| FACE DETECT | No | RM_CAM_FDIF_CONTEXT [0] LOSTCONTEXT_DFF | None |
| ISS | No | RM_CAM_ISS_CONTEXT [0] LOSTCONTEXT_DFF | None |

3.7.12.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for functional description of the power-management architecture of a generic power domain.

3.7.12.1.1 Logic and Memory Area Power Modes

[Table 3-312](#) lists the power modes supported by the logic area of the power domain.

Table 3-312. PD_CAM Logic Area Power Modes

| Off | Retention-OSWR | Retention-CSWR | On-Inactive | On-Active |
|-----------|----------------|----------------|-------------|-----------|
| Available | Not available | Not available | Available | Available |

[Table 3-313](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-313. PD_CAM Memory Area Power Modes

| Memory Bank | Module - Memory | Logic On | Logic Retention | Logic Off | RTA Feature |
|-------------|-----------------------|-----------|-----------------|-----------|----------------|
| | FACE DETECT - FDIFMEM | always_on | always_off | | always_enabled |
| | ISS - ISSMEM | always_on | always_off | | always_enabled |

3.7.12.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-314](#) lists the power modes controls for the power domain.

Table 3-314. PD_CAM Power Modes Control Parameters

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|---|-------------|--|-------------|
| Power Domain - Low Power State Change Control | | PM_CAM_PWRSTCTRL [4] LOWPOWERSTATECHANGE | Read/Write |
| Memory Area - State Control (Logic in On state) | CAM_MEM | PM_CAM_PWRSTCTRL [17:16]]CAM_MEM_ONSTATE | Read only |
| Power Domain - State Transition Control | | PM_CAM_PWRSTCTRL [1:0] POWERSTATE | Read/Write |

[Table 3-315](#) lists the power modes status for the power domain.

Table 3-315. PD_CAM Power Modes Status Parameters

| Parameter Name | Memory Bank | Status Bit Field |
|--|-------------|---|
| Memory Area - State Status | CAM_MEM | PM_CAM_PWRSTST [5:4] CAM_MEM_STATEST |
| Power Domain - State Transition Status | | PM_CAM_PWRSTST [20] INTRANSITION |

Table 3-315. PD_CAM Power Modes Status Parameters (continued)

| Parameter Name | Memory Bank | Status Bit Field |
|-----------------------------|-------------|---|
| Logic Area - State Status | | PM_CAM_PWRSTST [2] LOGICSTATEST |
| Power Domain - State Status | | PM_CAM_PWRSTST [1:0] POWERSTATEST |

3.7.13 PD_AUDIO Description

PD_AUDIO contains the following reset domains:

- AUDIO_PWRON_RST
- AUDIO_RST

PD_AUDIO contains the CD_ABE clock domain.

[Table 3-316](#) lists the logic retention capability for each module of the power domain.

Table 3-316. PD_AUDIO Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|---------------------|-----------------|---|--------------------|
| AUDIO ENGINE | No | RM_ABE_AESS_CONTEXT [0] LOSTCONTEXT_DFF | None |
| CM1_ABE | No | None | None |
| DMIC | No | RM_ABE_DMIC_CONTEXT [0] LOSTCONTEXT_DFF | None |
| L4_ABE interconnect | No | None | None |
| MCASP1 | No | RM_ABE_MCASP_CONTEXT [0] LOSTCONTEXT_DFF | None |
| MCBSP1 | No | RM_ABE_MCBSP1_CONTEXT [0] LOSTCONTEXT_DFF | None |
| MCBSP2 | No | RM_ABE_MCBSP2_CONTEXT [0] LOSTCONTEXT_DFF | None |
| MCBSP3 | No | RM_ABE_MCBSP3_CONTEXT [0] LOSTCONTEXT_DFF | None |
| MCPDM | No | RM_ABE_PDM_CONTEXT [0] LOSTCONTEXT_DFF | None |
| SLIMBUS1 | No | RM_ABE_SLIMBUS_CONTEXT [0] LOSTCONTEXT_DFF | None |
| GPTIMER5 | No | RM_ABE_GPTIMER5_CONTEXT [0] LOSTCONTEXT_DFF | None |
| GPTIMER6 | No | RM_ABE_GPTIMER6_CONTEXT [0] LOSTCONTEXT_DFF | None |
| GPTIMER7 | No | RM_ABE_GPTIMER7_CONTEXT [0] LOSTCONTEXT_DFF | None |
| GPTIMER8 | No | RM_ABE_GPTIMER8_CONTEXT [0] LOSTCONTEXT_DFF | None |
| WDTIMER3 | No | RM_ABE_WDTIMER3_CONTEXT [0] LOSTCONTEXT_DFF | None |

3.7.13.1 Power Domain Modes

This section highlights the various power modes supported by the logic and memory areas of the power domain. It also identifies the software control and status bit fields associated. See [Section 3.1.1.2.1](#) for a functional description of the power-management architecture of a generic power domain.

3.7.13.1.1 Logic and Memory Area Power Modes

[Table 3-317](#) lists the power modes supported by the logic area of the power domain.

Table 3-317. PD_AUDIO Logic Area Power Modes

| Off | Retention-OSWR | Retention-CSWR | On-Inactive | On-Active |

| Available | Available | Not available | Available | Available |

[Table 3-318](#) presents the power modes supported by the memory area of the power domain. A memory area power mode is identified with respect to a power state of the power domain. The Logic On, Logic Retention, and Logic Off columns identify the power states of the power domain. The values in these columns identify the supported power state of the memory area (identified in the Memory Bank column) or the module memory inside the memory area (identified in the Module - Memory column). The RTA Feature column identifies whether the memory supports the RTA feature.

Table 3-318. PD_AUDIO Memory Area Power Modes

| Memory Bank | Module - Memory | Logic On | Logic Retention | Logic Off | RTA Feature |
|-------------|------------------------------|-----------|------------------|-----------|----------------|
| AESSMEM | | ON | RETENTION | OFF | |
| | AUDIO ENGINE - AESS_MemBank1 | always_on | always_retention | | always_enabled |
| PERIPHEM | | ON | OFF | OFF | |
| | DMIC - DMIC_BANK | always_on | always_off | | None |
| | MCBSP1 - MCBSP_BANK | always_on | always_off | | None |
| | MCPDM - MCPDM_BANK | always_on | always_off | | None |
| | SLIMBUS1 - SLIMBUS_BANK | always_on | always_off | | None |

3.7.13.1.2 Logic and Memory Area Power Modes Control and Status

[Table 3-319](#) lists the power modes controls for the power domain.

Table 3-319. PD_AUDIO Power Modes Control Parameters

| Parameter Name | Memory Bank | Control Bit Field | Access Type |
|--|-------------|---|-------------|
| Memory Area - State Control (Logic in Retention state) | AESSMEM | PM_ABE_PWRSTCTRL[8] AESSMEM_RETSTATE | Read only |
| Memory Area - State Control (Logic in On state) | PERIPHEM | PM_ABE_PWRSTCTRL[21:20] PERIPHEM_ONSTATE | Read only |
| Memory Area - State Control (Logic in On state) | AESSMEM | PM_ABE_PWRSTCTRL[17:16] AESSMEM_ONSTATE | Read only |
| Memory Area - State Control (Logic in Retention state) | PERIPHEM | PM_ABE_PWRSTCTRL[10] PERIPHEM_RETSTATE | Read only |
| Logic Area - Retention State Control | | PM_ABE_PWRSTCTRL[2] LOGICRETSTATE | Read only |
| Power Domain - Low Power State Change Control | | PM_ABE_PWRSTCTRL[4] LOWPOWERSTATECHANGE | Read/Write |
| Power Domain - State Transition Control | | PM_ABE_PWRSTCTRL[1:0] POWERSTATE | Read/Write |

[Table 3-320](#) lists the power modes status for the power domain.

Table 3-320. PD_AUDIO Power Modes Status Parameters

| Parameter Name | Memory Bank | Status Bit Field |
|--|-------------|--|
| Power Domain - Last Power State Entered Status | | PM_ABE_PWRSTST[25:24] LASTPOWERSTATEENTERED |
| Memory Area - State Status | PERIPHEM | PM_ABE_PWRSTST[9:8] PERIPHEM_STATEST |

Table 3-320. PD_AUDIO Power Modes Status Parameters (continued)

| Parameter Name | Memory Bank | Status Bit Field |
|--|-------------|--|
| Memory Area - State Status | AESSMEM | PM_ABE_PWRSTST [5:4] AESSMEM_STATEST |
| Power Domain - State Transition Status | | PM_ABE_PWRSTST [20] INTRANSITION |
| Logic Area - State Status | | PM_ABE_PWRSTST [2] LOGICSTATEST |
| Power Domain - State Status | | PM_ABE_PWRSTST [1:0] POWERSTATEST |

3.7.14 PD_ALWON_MPU Description

PD_ALWON_MPU contains the following reset domains:

- ALWON_MPU_RST
- DPLL_MPU_PWRON_RST

PD_ALWON_MPU has no associated clock domains.

[Table 3-321](#) lists the logic retention capability for each module of the power domain.

Table 3-321. PD_ALWON_MPU Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|-------------------|-----------------|--------------------|--------------------|
| DPLL_MPU | No | None | None |
| CORTEXA9_MPU_INTC | No | None | None |

3.7.14.1 Power Domain Modes

The PD_ALWON_MPU power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD_ALWON_MPU power domain has no memory banks.

3.7.15 PD_ALWON_DSP Description

PD_ALWON_DSP contains the following reset domains:

- ALWON_IVA_RST
- DPLL_IVA_PWRON_RST

PD_ALWON_DSP has no clock domains associated.

[Table 3-322](#) lists the logic retention capability for each module of the power domain.

Table 3-322. PD_ALWON_DSP Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|-------------|-----------------|--------------------|--------------------|
| DPLL_IVA | No | None | None |
| DSP_WKUPGEN | No | None | None |

3.7.15.1 Power Domain Modes

The PD_ALWON_DSP power domain is an always-on power domain and does not switch to retention state. There is no logic power state control or status bit field for this power domain.

The PD_ALWON_DSP power domain has no memory banks.

3.7.16 PD_ALWON_CORE Description

PD_ALWON_CORE contains the following reset domains:

- ALWON_CM1_PWRON_RST

- ALWON_CM1_RST
- ALWON_CORE_PWRON_RST
- ALWON_CORE_RST

PD_ALWON_CORE contains the following clock domains:

- CD_ALWON_CM
- CD_L4_ALWON_CORE

Table 3-323 lists the logic retention capability for each module of the power domain.

Table 3-323. PD_ALWON_CORE Modules Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|------------------|-----------------|---|--------------------|
| CM1 | No | None | None |
| DPLL_ABE | No | None | None |
| DPLL_CORE | No | None | None |
| DPLL_PER | No | None | None |
| CORTEXM3_WKUPGEN | No | None | None |
| SDMA_WKUPGEN | No | None | None |
| SR_CORE | No | RM_ALWON_SR_CORE_CONTEXT[0] LOSTCONTEXT_DFF | None |
| SR_IVA | No | RM_ALWON_SR_IVA_CONTEXT[0] LOSTCONTEXT_DFF | None |
| SR_MPU | No | RM_ALWON_SR_MPU_CONTEXT[0] LOSTCONTEXT_DFF | None |
| SPINNER | No | None | None |

3.7.16.1 Power Domain Modes

The PD_ALWON_CORE power domain is an always-on power domain and does not switch to RETENTION state. There is no logic power state control or status bit field for this power domain.

The PD_ALWON_CORE power domain has no memory banks.

3.8 Voltage Management Functional Description

This section describes the voltage domains and voltage control architecture. It also explains the interactions between the device and the external power IC.

3.8.1 Overview

The voltage-management architecture of the device is based on voltage sources managed by the PRCM module. They define the voltage domains within the device (see [Section 3.1.1.3, Voltage Management](#)). This partition of the voltage domains ensures independent voltage control of each voltage domain through dedicated SMPS or LDO. The following voltage domains are managed by the PRCM module:

- VDD_CORE_L
- VDD_MPU_L
- VDD_IVA_L
- LDO_CORE_M
- LDO_IVA_M
- LDO_MPU_M
- LDO_IVA_ABB
- LDO_MPU_ABB
- LDO_WAKEUP

NOTE: See [Table 3-25](#) for device power supply pin association to the power domain.

The PRCM module supports the AVS technique on the VDD_MPU_L, VDD_CORE_L, and VDD_IVA_L voltage domains, through automatic monitoring and adjustments of voltages by their dedicated SmartReflex modules. The VDD_MPU_L and VDD_IVA_L voltage domains support five DVFS OPPs. The VDD_CORE_L voltage domain supports two sets of DVFS OPPs: The first VDD_CORE_L set has two OPPs (OPP50 and OPP119); the second set has three OPPs (OPP50, OPP100 and OPP119) and is used in legacy mode (for old software compatability). The device cannot switch dynamically between these two sets of OPPs. The difference between the two sets (except the number of OPPs supported) is in the frequency that correspond to each OPP.

The PRCM module also supports ABB technique on the MPU and IVA voltage domains, through the LDO_MPU_ABB and LDO_IVA_ABB biasing voltages.

The PRCM module automatically scales down the LDO_MPU_M, LDO_CORE_M, and LDO_IVA_M voltage domains to retention voltage level whenever all memory banks on these domains have transitioned to the RETENTION or OFF power state.

[Table 3-324](#) lists the supported DVFS OPPs for each voltage domain. The exact values depend on the silicon; for more information, see the *Data Manual Operating Condition Addendum*.

Table 3-324. Supported DVFS OPPs Summary

| Voltage Domain | Operating Point | Control |
|---------------------|---|-----------------------|
| VDD_MPU_L (vdd_mpu) | OFF RETENTION OPP50 OPP100 OPP_TURBO OPP_NITRO OPP_NTSB | Hardware and software |
| VDD_IVA_L (vdd_iva) | OFF RETENTION OPP50 OPP100 | Hardware and software |

Table 3-324. Supported DVFS OPPs Summary (continued)

| Voltage Domain | Operating Point | Control |
|------------------|-----------------------|-----------------------|
| VDD_CORE_L (vdd) | OPP_TURBO | Hardware and software |
| | OPP_NITRO | |
| | OPP_NTSB | |
| | OFF | |
| | RETENTION | |
| | OPP50 | |
| | OPP100 ⁽¹⁾ | |
| | OPP119 | |

⁽¹⁾ VDD_CORE_L OPP100 is available only for second set of OPPs.

NOTE: For the supported OPPs for each device in the OMAP4470 family, see the *Data Manual Operating Condition Addendum*.

DVFS OPPs Dependencies

For detailed information about DVFS OPP dependencies, see the *Data Manual Operating Condition Addendum*.

For more information, see [Section 3.8.6.4](#), *DVFS Voting Mechanism (VDD_CORE_L and VDD_IVA_L Voltage Domains)*.

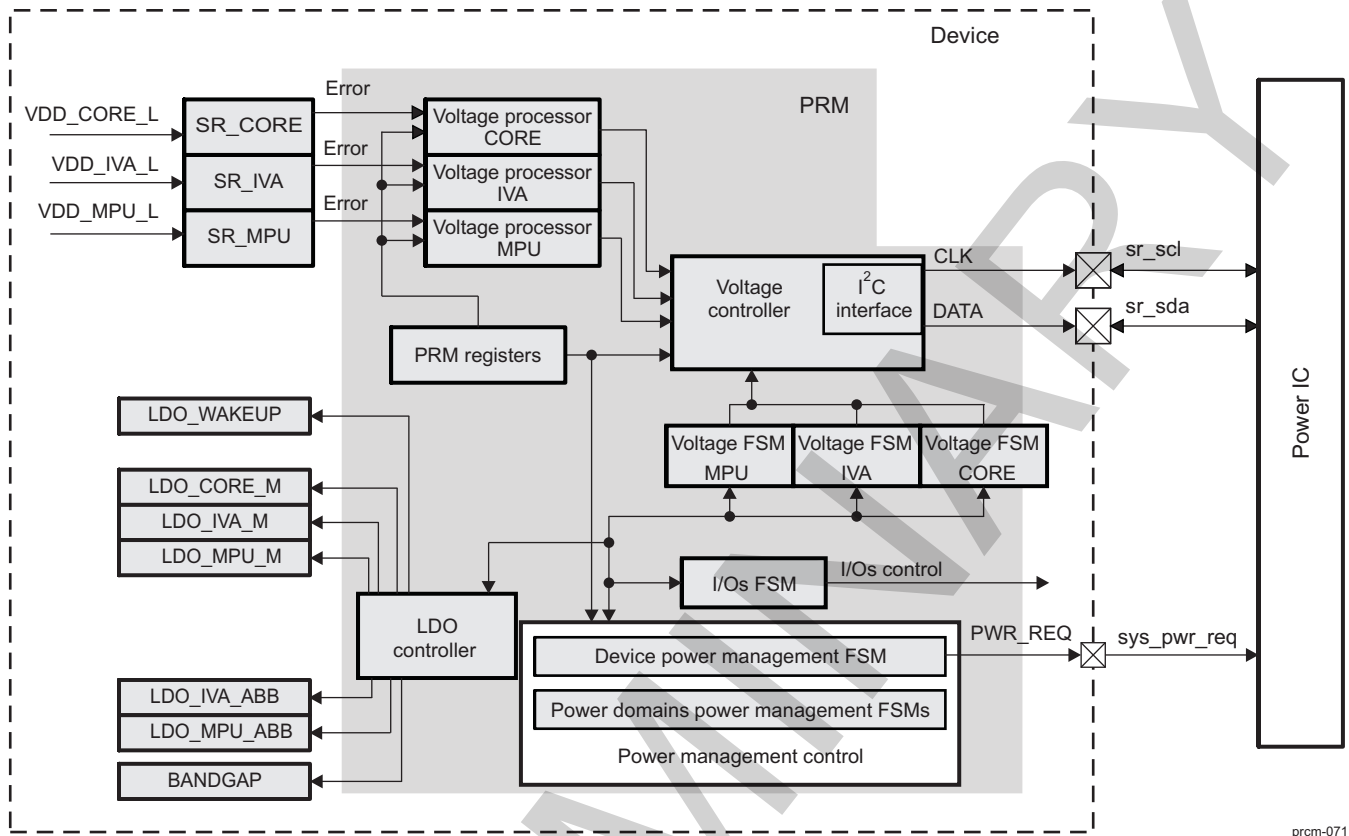

3.8.2 Voltage-Control Architecture

The PRM is split over several blocks that manage the different voltage sources.

- Voltage processors for converting SmartReflex data to voltage values before sending to the voltage controller
- Voltage FSMs for hardware control of voltages. They send commands to the voltage controller (I²C mode).
- A voltage controller for gathering commands from the PRCM module register (direct access), voltage processors, and voltage PRCMs. It then handles communication with the external power IC through the dedicated I²C interface.
- A device PRCM for managing the voltage PRCMs and I/O wake-up control and system clock control sequencing during device sleep and wake-up transitions.
- LDO regulator controllers for ABB management, memory arrays voltage management, and WAKEUP logic.
- Bandgap reference voltage sleep control

NOTE: The SmartReflex module allows dynamic voltage adjustments around an OPP voltage level to ensure target performance. It also allows switching from one OPP to another. However, it does not control voltage switching of the voltage domain to RETENTION or OFF level when all power domains within the power domain are in RETENTION or OFF power states. This is handled by the voltage PRCMs.

[Figure 3-75](#) shows the architecture for PRM voltage control.

Figure 3-75. PRM Voltage Control Architecture

prcm-071

3.8.3 VDD_MPU_L, VDD_CORE_L, and VDD_IVA_L Control

These power supply sources can be controlled using PRM dedicated I²C control.

3.8.3.1 PRM Dedicated I²C Control

The PRM I²C interface is dedicated to SmartReflex voltage control. It enables the voltage controller to send voltage commands to the external power IC. To reduce latency of voltage changes, the voltage controller is configurable to run in HS I²C mode. The PRM I²C interface supports multimaster mode.

The voltage controller receives voltage control commands from following input ports:

- Voltage processors ports: Each voltage processor sends voltage change commands to the voltage controller depending on the information received from the associated SmartReflex module.
- Voltage PRCMs ports: Each voltage PRCM sends commands to the voltage controller when the device enters RETENTION or OFF power state, and also when the device wakes up.
- PRM register port: The PRM registers give direct software control over the voltage levels of the external voltage sources.

An arbitration scheme in the voltage controller manages concurrent requests on different ports.

Each internal port has a handshake to indicate when the I²C frame resulting from the request on that port has been acknowledged by the external Power IC.

The PRM can also send external voltage source sleep commands that can be used to activate power IC sleep mode, where the voltage regulator maintains output voltage but only a small load is supported. This lets the external power IC reduce its power consumption as well.

NOTE: An I²C interface not controlled by the PRM can be used to program voltage levels of the external power IC. Because it is not a hardware-controlled interface its use is restricted to move the voltage level from one OPP to another.

In this case, the control software must operate voltage transition when the device activity allows one.

3.8.3.2 Adaptive Voltage Scaling

As explained in [Section 3.1.2.4, Adaptive Voltage Scaling](#), SmartReflex is a technology that uses adaptive power supply to reduce active power consumption. With SmartReflex, the power supply voltage can be adapted to the silicon performance either statically (for example, adapted to the manufacturing process of a given device), or dynamically (for example, adapted to the temperature-induced current performance of the device).

SmartReflex voltage control in the device is based on the dedicated SmartReflex modules and the voltage processors, in addition to the voltage controller with dedicated I²C interface, which are shared with the voltage PRCM modules and voltage control registers.

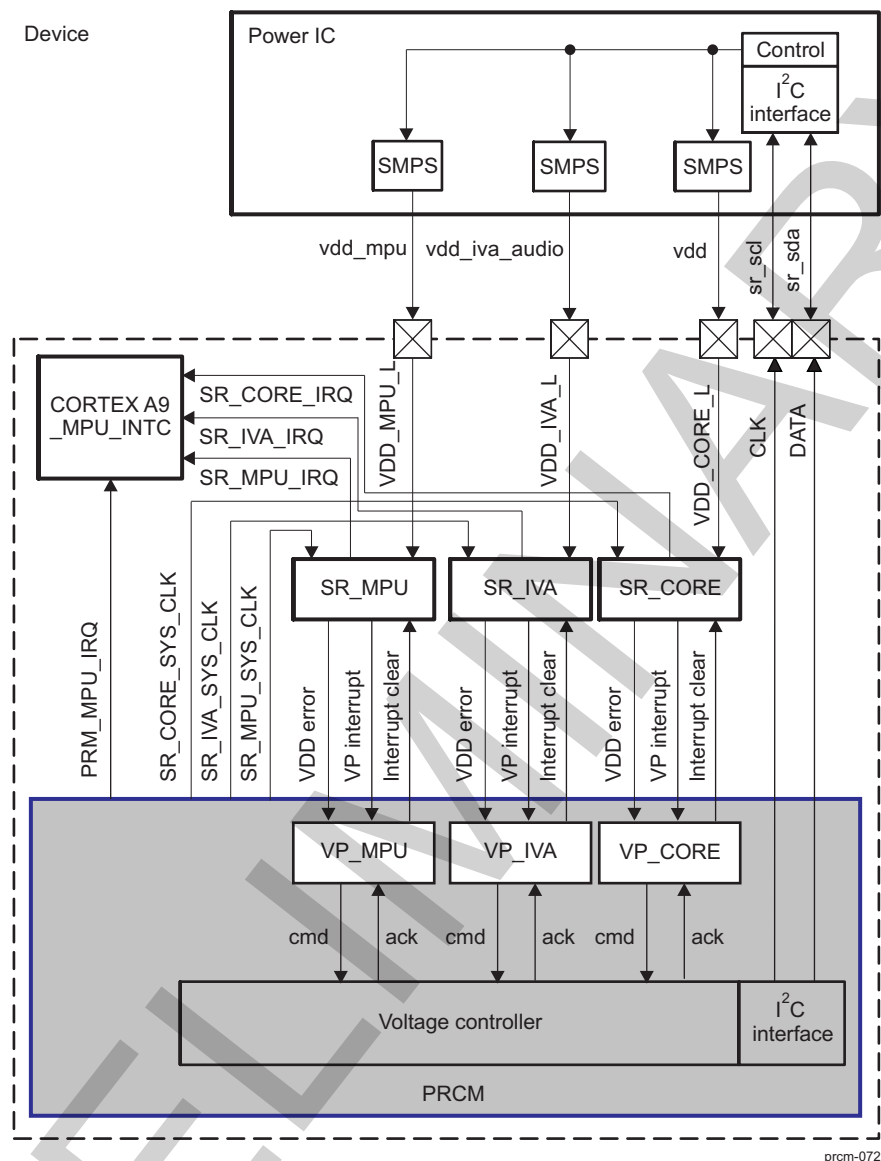

The SmartReflex modules allow a continuous real-time monitoring of voltage supply and device performance to do the following:

- Minimize the supply voltage to reduce the device power consumption.
- Maintain the desired device performance (by dynamically adjusting the device voltage) as the temperature of the device varies.

Because the SmartReflex modules and the voltage processors are dedicated to SmartReflex voltage control, they are described together in this section.

3.8.3.2.1 SmartReflex in the Device

[Figure 3-76](#) shows the SmartReflex integration.

Figure 3-76. SmartReflex Integration

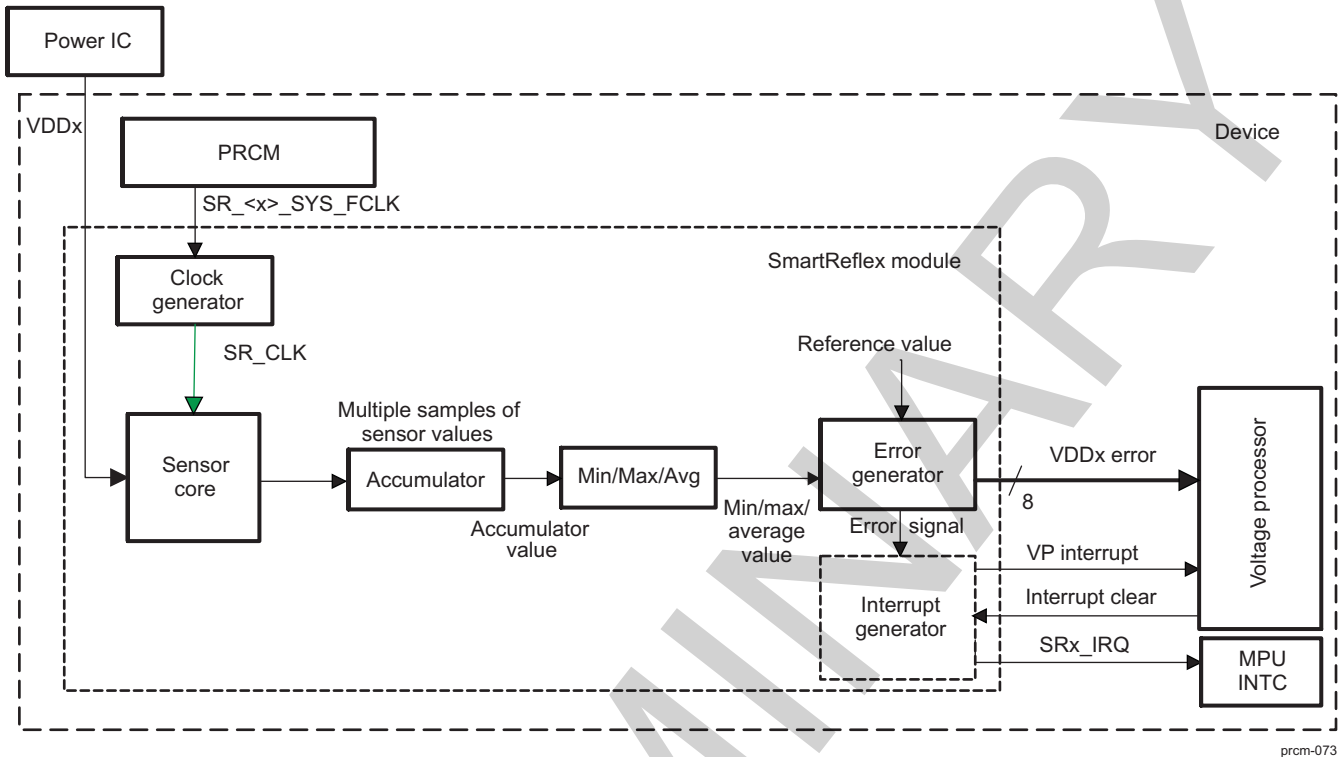

SmartReflex voltage control in the device is implemented for simultaneous control of three independent voltage sources. One SmartReflex module controls the VDD_CORE_L voltage, the second one is dedicated to VDD_IVA_L control, and the third controls the VDD_MPU_L voltage. Each SmartReflex module is connected to a voltage processor. Voltage commands from all voltage processors are passed to a voltage control, which sends them through a dedicated I²C master interface to the power IC.

SmartReflex modules are in the PD_ALWON_CORE power domain and supplied by the VDD_CORE_L voltage domain. Each module senses its own voltage domain (VDD_CORE_L, VDD_IVA_L, or VDD_MPU_L).

3.8.3.2.2 SmartReflex Module

Figure 3-77 is a functional overview of the SmartReflex module.

Figure 3-77. SmartReflex Module Functional Overview

3.8.3.2.3 SmartReflex Submodules

NOTE: In this section, SRn refers to SR_IVA, SR_MPU, and SR_CORE SmartReflex modules.

The SmartReflex module is enabled by setting the SRn.SRCONFIG[11] SR_EN bit. The SmartReflex module is composed of six blocks:

- Clock generator
- Sensor core
- Accumulator
- Minimum/maximum/average
- Error generator
- Interrupt generator

Clock Generator

The clock generator provides the internal SR_CLK sampling clock to the sensor core of the module. The SRn.SRCONFIG[21:12] SRCLKLENGTH bit field allows the setting of the frequency divider ratio between the SRn_SYS_CLK and the SR_CLK. It is calculated using Equation 1:

$$\text{SRn.SRCONFIG}[21:12] \text{ SRCLKLENGTH} = f_{\text{SRn_SYS_CLK}} / (2 \times f_{\text{SR_CLK}}) \quad (1)$$

Where $f_{\text{SRn_SYS_CLK}}$ is the frequency of the SRn_SYS_CLK, and $f_{\text{SR_CLK}}$ is the desired SR_CLK frequency.

To accurately use the target values programmed for SmartReflex modules in the device, the SRCLKLENGTH parameter must be set correctly. The target values for the SmartReflex modules are calculated with the SR_CLK frequency set at 100 kHz. It is thus mandatory that the value of the SRCLKLENGTH parameter is calculated from Equation 1 with $f_{\text{SR_CLK}}$ set at 100 kHz.

For example, if the system clock has a frequency of 38.4 MHz, and the target SR_CLK frequency is 100 kHz, the SRn.SRCONFIG[21:12] SRCLKLENGTH bit field is 192 (0x0C0).

Sensor Core

The sensor core receives the SR_CLK sampling clock and the voltage to be sensed. It generates sensor value samples proportional to the voltage sensed. For accuracy, a sensor core is composed of two sensors and generates two values per sample (one from each sensor).

The two sample values generated by the sensor core output can be read from the SRn.SENVAL[15:0] SENNVAL and SRn.SENVAL[31:16] SENPVAL bit fields.

The sensor core is enabled by the SRn.SRCONFIG[10] SENENABLE bit.

Accumulator

The accumulator consists of two stacks that store multiple samples of the two sensor values received from the sensor core.

The SRn.SRCONFIG[31:22] ACCUMDATA bit field defines the size of the accumulator in the number of samples to be stored. The allowable range is from 2 to 1023. The value of SRn.SRCONFIG[31:22] ACCUMDATA value is related to the desired sampling time window ($T_{\text{TimeWindow}}$) and the SR_CLK frequency ($f_{\text{SR_CLK}}$). It can be calculated using Equation 2:

$$\text{SRn.SRCONFIG[31:22] ACCUMDATA} = T_{\text{TimeWindow}} * f_{\text{SR_CLK}} \quad (2)$$

For example, for an accumulator time window of 10 ms and SR_CLK frequency of 32 kHz, the value of SRn.SRCONFIG[31:22] ACCUMDATA is 320 (0x140). The accumulation window must be large enough so that the minimum, maximum, and average counter values are accurate.

Minimum/Maximum/Average

The minimum/maximum/average block reads the samples stored in the accumulator and returns the minimum, maximum, and average values of the samples. Because the accumulator contains two separate groups of samples (one from each sensor of the sensor core), the minimum/maximum/average block also generates two sets of minimum, maximum, and average values.

The minimum, maximum, and average values of the samples of the first sensor can be read from the SRn.SENMIN[15:0] SENNMIN, SRn.SENMAX[15:0] SENNMAX, and SRn.SENAVG[15:0] SENNAVG bit fields, respectively.

For the sample values of the second sensor, the minimum, maximum, and average values can be read from the SRn.SENMIN[31:16] SENPMIN, SRn.SENMAX[31:16] SENPMAX, and SRn.SENAVG[31:16] SENPAVG bit fields, respectively.

The minimum/maximum/average block is enabled by the SRn.SRCONFIG[8] MINMAXAVGENABLE bit.

Error Generator

The error generator block reads the sample value generated by the sensor core and compares it with a reference value to calculate the error. This error is then passed to the voltage processor and the internal interrupt generator block.

The reference value for a given OPP of the device is configured by setting the SRn.NVALUERECIPROCAL[23:20] SENPGAIN, SRn.NVALUERECIPROCAL[19:16] SENNGAIN, SRn.NVALUERECIPROCAL[15:8] RSENPN, and SRn.NVALUERECIPROCAL[7:0] RSENENN bit fields by reading corresponding values from the eFuses (see Section 3.8.3.2.5, *SmartReflex Parameters Set After Silicon Characterization*).

The error generator sets the SRn.SRSTATUS[1] ERRGEN_VALID status bit when a valid error value is set in the SRn.SENERROR register.

The SRn.SENERROR register contains the average error (SRn.SENERROR[15:8] AVGERERROR) and the percentage of error (SRn.SENERROR[7:0] SENERROR).

The error generator block is enabled by the SRn.SRCONFIG[9] ERRORGENERATORENABLE bit.

Interrupt Generator

The interrupt generator block generates interrupts to the MPU INTC and the voltage processor module (if the corresponding interrupts are enabled) to indicate errors.

Table 3-325 and Table 3-326 list the interrupt events in the SmartReflex module and their enable and status bits.

Table 3-325. SmartReflex Interrupt Events

| Interrupt Type | Description |
|---------------------|--|
| Accumulator | The minimum/maximum/average module has completed computation over the accumulator data. |
| Valid | The average error is less than 2 percent of the true average error. |
| Disable acknowledge | The SmartReflex module is disabled and has cleared all MPU INTC and VP interrupts (internal registers are reset). This interrupt indicates to the software that the SmartReflex module is available for programming. |
| Bounds | The frequency error has crossed the maximum limit (ERRMAXLIMIT) or the minimum limit (ERRMINLIMIT). It is mapped to the voltage processor also. |

The SRn_CORTEX_M3_IRQs from SR_IVA and SR_CORE are mapped to the MM_IRQ_47 interrupt line of the CORTEXM3_MPU_INTC.

Table 3-326. SmartReflex Interrupt Events Enable and Status Bits

| Interrupt Type | Enable Bit | Status Bit |
|---------------------|---|---|
| Accumulator | SRn.IRQENABLE_SET[3] MCUACCUMINTENSET | SRn.IRQSTATUS[3] MCUACCUMINTSTATENA |
| | SRn.IRQENABLE_CLR[3] MCUACCUMINTENCLR | |
| Valid | SRn.IRQENABLE_SET[2] MCUVALIDINTENSET | SRn.IRQSTATUS[2] MCUVALIDINTSTATENA |
| | SRn.IRQENABLE_CLR[2] MCUVALIDINTENCLR | |
| Disable acknowledge | SRn.IRQENABLE_SET[0] MCUDISABLEACKINTENSET | SRn.IRQSTATUS[0] MCUDISABLEACKINTSTATENA |
| | SRn.IRQENABLE_CLR[0] MCUDISABLEACKINTENCLR | |
| Bounds | SRn.IRQENABLE_SET[1] MCUBOUNDSINTENSET | SRn.IRQSTATUS[1] MCUBOUNDSINTSTATENA |
| | SRn.IRQENABLE_CLR[1] MCUBOUNDSINTENCLR | |
| | SRn.ERRCONFIG[22] | SRn.ERRCONFIG[23] VPBOUNDSINTSTATENA |
| | VPBOUNDSINTENABLE | |

The minimum and maximum error limits for the bounds interrupt are configured in the SRn.ERRCONFIG[15:8] ERRMAXLIMIT and SRn.ERRCONFIG[7:0] ERRMINLIMIT bit fields.

Setting a bit to 1 in the IRQSTATUS register clears the interrupt pending status of each interrupt source whose corresponding bit is 1 in the value written. Other interrupt pending status bits are not affected (setting that bit to 0 does not affect the status).

3.8.3.2.4 Status Register

NOTE: In this section, SRn refers to SR_IVA, SR_MPU, and SR_CORE SmartReflex modules.

The status register (SRSTATUS) indicates the validity of the minimum/maximum/average and error generator output values.

SRSTATUS has the following bits and bit fields:

- SRn.[SRSTATUS](#)[3] [AVGERRVALID](#): Indicates the validity of the value in the SRn.[SENERREG](#)[15:8] [AVGERROR](#) bit field. When the value is 0, the average error is not valid. When the value is 1, the average error is within 2 percent of the valid average error.
- SRn.[SRSTATUS](#)[2] [MINMAXAVGVALID](#): Indicates the validity of the SRn.[SENVAL](#), SRn.[SENMIN](#), SRn.[SENMAX](#), and SRn.[SENAVG](#) registers. When the value is 0, the registers are not valid. When the value is 1, the registers contain valid values, although the values are not necessarily fully accumulated.
- SRn.[SRSTATUS](#)[1] [ERRGEN_VALID](#): Indicates the validity of the value in the SRn.[SENERREG](#)[7:0] [SENERREG](#) bit field. When the value is 0, the error value is invalid. When the value is 1, the error value is valid.
- SRn.[SRSTATUS](#)[0] [MINMAXAVGACCUMVALID](#): Indicates that the SRn.[SENVAL](#), SRn.[SENMIN](#), SRn.[SENMAX](#), and SRn.[SENAVG](#) registers contain their final values accumulated over the defined sample time period.

3.8.3.2.5 SmartReflex Parameters Set After Silicon Characterization

Certain parameters of the SmartReflex module are characterized and calibrated after silicon testing. These values are then either set in the eFuse farm of the device or provided separately. Users must configure these parameters according to their given values to ensure correct functioning of the module.

The values for the following parameters (explained in [Section 3.8.3.2.3, SmartReflex Submodules](#)) are set in the device eFuse after device silicon characterization:

- SRn.[SRCONFIG](#)[6:5] [SENNENABLE](#)
- SRn.[SRCONFIG](#)[4:3] [SENPENABLE](#)
- SRn.[NVALUERECIPROCAL](#)[23:20] [SENPAIN](#)
- SRn.[NVALUERECIPROCAL](#)[19:16] [SENNGAIN](#)
- SRn.[NVALUERECIPROCAL](#)[15:8] [RSENPN](#)
- SRn.[NVALUERECIPROCAL](#)[7:0] [RSENPN](#)

The eFuse values of these parameters must be read from the corresponding registers of the control module.

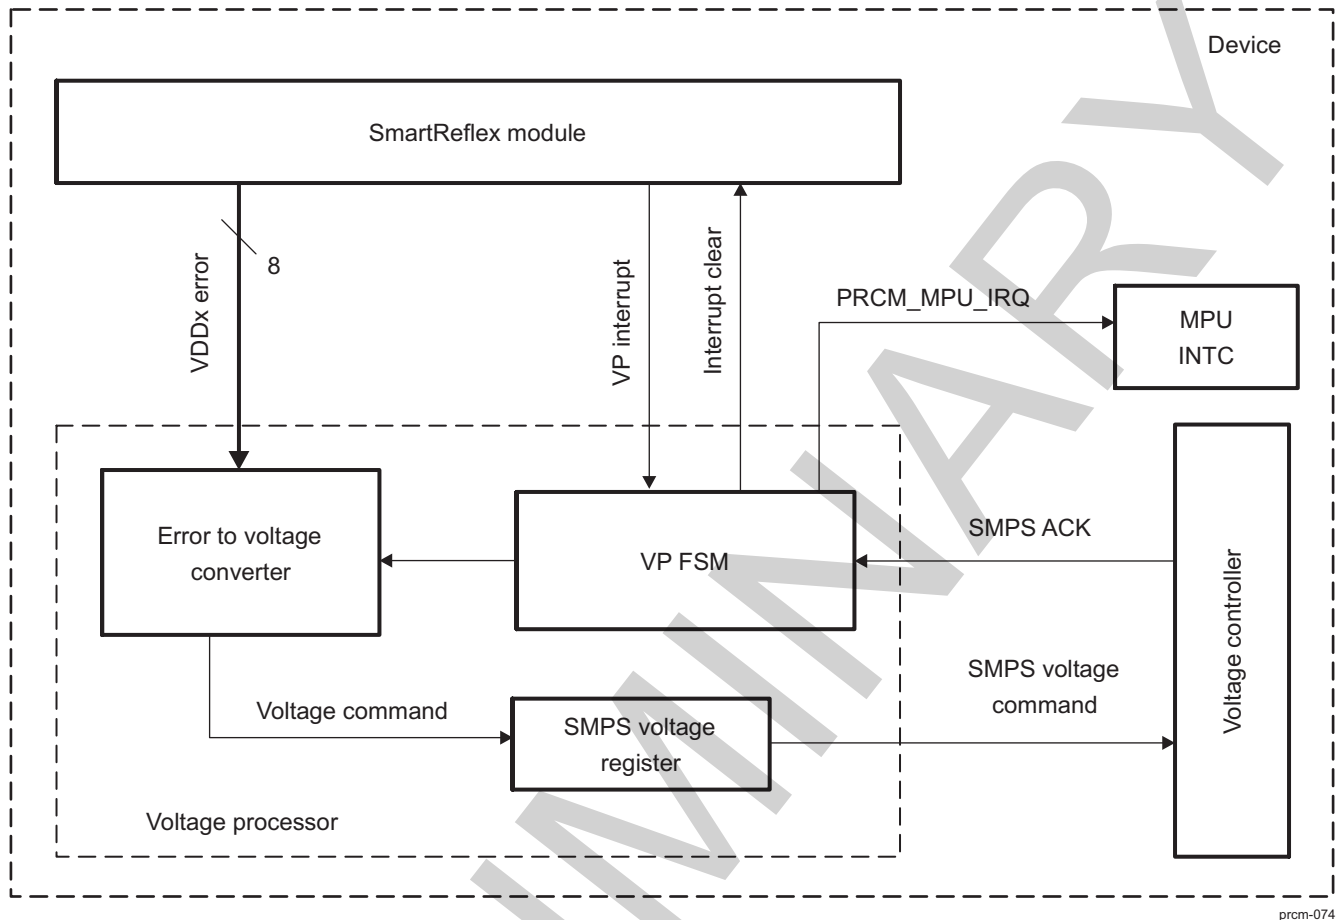

Information about the following parameters of the SmartReflex module is provided after silicon characterization:

- SRn.[AVGWEIGHT](#)[3:2] [SENP](#)[AVGWEIGHT](#)
- SRn.[AVGWEIGHT](#)[1:0] [SENN](#)[AVGWEIGHT](#)
- SRn.[ERRCONFIG](#)[18:16] [ERRWEIGHT](#)
- SRn.[ERRCONFIG](#)[15:8] [ERRMAXLIMIT](#)
- SRn.[ERRCONFIG](#)[7:0] [ERRMINLIMIT](#)

3.8.3.2.6 Voltage Processor Module

[Figure 3-78](#) is a functional overview of the voltage processor.

Figure 3-78. Voltage Processor Functional Overview

The voltage processor receives an error value and a VP interrupt signal from the SmartReflex module. Each time a new error value is sent, the SmartReflex module triggers an interrupt to inform the voltage processor. The voltage processor consists of an error-to-voltage command converter and a state controller. It processes an error and sends a voltage command to the voltage controller. It receives an acknowledge signal from the voltage controller when the SMPS receives the command. The voltage processor then acknowledges the SmartReflex module by clearing its interrupt.

The voltage processor is enabled by the PRM_VPn_CONFIG[0] VPENABLE bit.

Voltage Processor Interrupts

The voltage processor uses the PRCM_CORTEXM3_MPU_IRQ (MM_IRQ_46 of CORTEXM3_MPU_INTC) interrupt line of the CORTEXM3. [Table 3-327](#) and [Table 3-328](#) list the interrupt events in the voltage processor module and their enable and status bits.

Table 3-327. Voltage Processor Interrupt Events

| Interrupt Type | Description |
|---------------------|---|
| Transaction done | Voltage processor transaction is complete. |
| Equal value | Voltage requested in the new voltage command is the same as the current SMPS voltage. |
| No SMPS acknowledge | SMPS has not responded in a defined time interval to the transmitted voltage command. |
| Maximum VDD | New voltage requested in the voltage command is equal to or greater than maximum VDD. |
| Minimum VDD | New voltage requested in the voltage command is equal to or less than minimum VDD. |
| OPP change done | The average error is within the desired limit. |

NOTE: Transaction done and OPP change done interrupt events are generated under the same conditions (after voltage change).

Table 3-328. Voltage Processor Interrupt Event Enable and Status Bits

| Interrupt Type | Enable Bit | Status Bit |
|---------------------|--|--|
| Transaction done | PRM_IRQENABLE_MPU_M3[21] VP_CORE_TRANXDONE_EN | PRM_IRQSTATUS_MPU_M3[21] VP_CORE_TRANXDONE_ST |
| | PRM_IRQENABLE_MPU_M3[29] VP_IVA_TRANXDONE_EN | PRM_IRQSTATUS_MPU_M3[29] VP_IVA_TRANXDONE_ST |
| Equal value | PRM_IRQENABLE_MPU_M3[20] VP_CORE_EQVALUE_EN | PRM_IRQSTATUS_MPU_M3[20] VP_CORE_EQVALUE_ST |
| | PRM_IRQENABLE_MPU_M3[28] VP_CORE_EQVALUE_EN | PRM_IRQSTATUS_MPU_M3[28] VP_IVA_EQVALUE_ST |
| No SMPS acknowledge | PRM_IRQENABLE_MPU_M3[19] VP_CORE_NOSMPSACK_EN | PRM_IRQSTATUS_MPU_M3[19] VP_CORE_NOSMPSACK_ST |
| | PRM_IRQENABLE_MPU_M3[27] VP_IVA_NOSMPSACK_EN | PRM_IRQSTATUS_MPU_M3[27] VP_IVA_NOSMPSACK_ST |
| Maximum VDD | PRM_IRQENABLE_MPU_M3[18] VP_CORE_MAXVDD_EN | PRM_IRQSTATUS_MPU_M3[18] VP_CORE_MAXVDD_ST |
| | PRM_IRQENABLE_MPU_M3[26] VP_IVA_MAXVDD_EN | PRM_IRQSTATUS_MPU_M3[26] VP_IVA_MAXVDD_ST |
| Minimum VDD | PRM_IRQENABLE_MPU_M3[17] VP_CORE_MINVDD_EN | PRM_IRQSTATUS_MPU_M3[17] VP_CORE_MINVDD_ST |
| | PRM_IRQENABLE_MPU_M3[25] VP_IVA_MINVDD_EN | PRM_IRQSTATUS_MPU_M3[25] VP_IVA_MINVDD_ST |
| OPP change done | PRM_IRQENABLE_MPU_M3[16] VP_CORE_OPPCHANGEDONE_EN | PRM_IRQSTATUS_MPU_M3[16] VP_CORE_OPPCHANGEDONE_ST |
| | PRM_IRQENABLE_MPU_M3[24] VP_IVA_OPPCHANGEDONE_EN | PRM_IRQSTATUS_MPU_M3[24] VP_IVA_OPPCHANGEDONE_ST |

The status of the voltage processor is represented by the bits/bit fields shown in [Table 3-329](#).

Table 3-329. Voltage Processor Status

| Bit/Bit Field | Parameter | Description |
|---|-------------------------------------|---|
| PRCM module.PRM_VPn_VOLTAGE[7:0] VPVOLTAGE | Current voltage for SMPS | Value of the current voltage level requested by the voltage processor |
| PRCM module.PRM_VPn_STATUS[0] VPINIDLE | Voltage processor in INACTIVE state | The voltage processor is in idle mode. |

[Table 3-330](#) shows the parameters of the voltage processor that must be configured.

Table 3-330. Voltage Processor Parameters

| Bit/Bit Field | Parameter | Description |
|---|-------------------|--|
| PRCM.PRM_VPn_CONFIG[31:24] ERROROFFSET | Error offset | Error in voltage offset value |
| PRCM.PRM_VPn_CONFIG[23:16] ERRORGAIN | Error gain | Error in voltage gain value |
| PRCM.PRM_VPn_CONFIG[3] TIMEOUTEN | Time-out enable | Enables/disables the time-out set by the time-out delay parameter |
| PRCM.PRM_VPn_VSTEPMIN[7:0] VSTEPMIN | Minimum step size | Minimum voltage step size |
| PRCM.PRM_VPn_VSTEPMAX[7:0] VSTEPMAX | Maximum step size | Maximum voltage step size |
| PRCM.PRM_VPn_VLIMITTO[31:24] VDDMAX | Maximum VDD limit | Maximum voltage limit of the VDD |
| PRCM.PRM_VPn_VLIMITTO[23:16] VDDMIN | Minimum VDD limit | Minimum voltage limit of the VDD |
| PRCM.PRM_VPn_VLIMITTO[15:0] TIMEOUT | Time-out delay | Maximum delay between a voltage change command and its acknowledge |

Table 3-330. Voltage Processor Parameters (continued)

| Bit/Bit Field | Parameter | Description |
|---|------------------------|--|
| PRCM.PRM_VPn_CONFIG[15:8] INITVDD | Initial VDD voltage | Initial voltage set in the voltage processor |
| PRCM.PRM_VPn_CONFIG[2] INITVDD | Initialize VDD | Set initial voltage given in initial VDD voltage parameter in the voltage processor |
| PRCM.PRM_VPn_VSTEPMIN[23:8] SMPSWAITTIMEMIN | Minimum SMPS wait time | Slew rate for negative voltage steps |
| PRCM.PRM_VPn_VSTEPMAX[28:8] SMPSWAITTIMEMAX | Maximum SMPS wait time | Slew rate for positive voltage steps |
| PRCM.PRM_VPn_CONFIG[1] FORCEUPDATE | Force update | Sends the value of the VP current voltage parameter as the new voltage command to SMPS |

3.8.3.2.7 SMPS-Dependent Parameter Configuration

The values of the following parameters of the voltage processor module depend on the characteristics of the SMPS used:

- PRCM.PRM_VPn_CONFIG[31:24] ERROROFFSET
- PRCM.PRM_VPn_CONFIG[23:16] ERRORGAIN
- PRCM.PRM_VPn_VSTEPMIN[7:0] VSTEPMIN
- PRCM.PRM_VPn_VSTEPMAX[7:0] VSTEPMAX
- PRCM.PRM_VPn_VLIMITTO[31:24] VDDMAX
- PRCM.PRM_VPn_VLIMITTO[23:16] VDDMIN
- PRCM.PRM_VPn_VLIMITTO[15:0] TIMEOUT
- PRCM.PRM_VPn_VSTEPMIN[23:8] SMPSWAITTIMEMIN
- PRCM.PRM_VPn_VSTEPMAX[28:8] SMPSWAITTIMEMAX

For information about the values of these parameters, see the specification document of the SMPS used.

3.8.3.2.8 Communication Between SmartReflex, Voltage Processor, Voltage Controller, and SMPS

The SmartReflex module, voltage processor, voltage controller, and SMPS implement a simple handshake protocol based on a request/acknowledge mechanism (see [Figure 3-79](#)):

1. The SmartReflex module generates a VP interrupt (clears to 0) when the average error crosses the minimum or maximum error bounds.
2. The average VDDx error is passed to the voltage processor when automatic voltage control is enabled.
3. The voltage processor reads the error and generates the voltage command for the SMPS. It then informs the voltage controller that a new voltage command is ready for the SMPS. The voltage controller sends the voltage command to the SMPS (external power IC) through the dedicated I²C interface.
4. The SMPS responds to the reception of the voltage command with an acknowledgement to the voltage controller.
5. The voltage controller sends the acknowledgement to the voltage processor.
6. The voltage processor sends the interrupt-clear signal to the SmartReflex module.
7. The SmartReflex module clears the VP interrupt. It is now again ready to send a new frequency-error interrupt to the voltage processor.

Figure 3-79. SmartReflex – SMPS Communication for Automatic Voltage Adjustments

3.8.4 Internal LDOs Control

3.8.4.1 Memory LDOs

Embedded SRAM LDOs (that is, LDO_CORE_M, LDO_IVA_M, and LDO_MPU_M) are used to supply power to the split-rail memory arrays. The PRM generates the controls used to select LDO operating mode: on-active, on-retention, or off.

Split-rail type SRAMs are used in the device to implement the larger memories. These SRAMs feature memory array and periphery logic which are on separate supplies to allow independent power management. Proper memory operation, however, requires the SRAM array voltage to never be operated at a level lower than the SRAM periphery logic.

Memory LDO can switch to on, retention, and off mode:

- On mode: 1.2 V is the normal voltage reference used through all functional OPPs, whenever memories must be functional. When logic voltage level VDD_x_L (where x can be MPU, CORE, or IVA) becomes higher than the associated memory voltage level VDD_x_M, the LDO operates in the tracking mode and follows its respective the VDD_x_L voltage level.
- Retention mode: 0.6 V is set when software allows and when all memory banks belonging to the LDO memory voltage are in RETENTION or OFF state. In this mode, the output voltage is generated from the corresponding VDD_x_L logic voltage source.
- Off mode: 0 V is set when the device switches to off mode.

[Section 3.8.5.2, Memory LDOs Transitions](#), presents the state transition conditions and sequence for the memory LDOs.

NOTE: The voltage levels associated with the different modes may depend on the device characteristics.

3.8.4.2 LDO_WAKEUP

LDO_WAKEUP supports three voltage states depending on the PD_WKUP and PD_EMU activity:

- EMULATION overdrive: 1.2 V is voltage level and the LDO is set in bypass mode.
- ON: 1.06 V is the voltage reference (default state).

- SLEEP: 0.83 V is the voltage reference. It is set when the device enters sleep mode.

[Section 3.8.5.3, LDO_WAKEUP Transitions](#), presents the state transition conditions and sequences for the LDO_WKUP.

NOTE: The voltage levels associated with the different modes may depend on the device characteristics.

At boot time, the LDO_WAKEUP LDO is started in emulation mode. It is a software command (that is, from OS or ROM code) to set it to a different mode.

3.8.4.3 ABB LDOs Control

The ABB LDO supports three voltage modes:

- Bypass mode: In this mode the x_ABB LDO is bypassed and outputs the VDD_x_L voltages (x refers to MPU and IVA). This mode is activated when ABB is not required, or when voltage domain enters low-power mode.
- ABB Set1: This mode is enabled at OPP_NITRO.
- ABB Set2: This mode is enabled at OPP_TURBO.

The PRCM module provides the [PRM_LDO_ABB_MPU_SETUP](#) and [PRM_LDO_ABB_IVA_SETUP](#) registers for configuration with the following controls:

- SR2EN – To enable or bypass the ABB power management
- ACTIVE_RBB_SEL – To enable or bypass ABB Set2 mode
- ACTIVE_FBB_SEL – To enable or bypass ABB Set1 mode
- SR2_WTCNT_VALUE – LDO settling delay on OPP change. The delay is in number of system clock cycles.

The PRCM module provides the [PRM_LDO_ABB_MPU_CTRL](#) and [PRM_LDO_ABB_IVA_CTRL](#) registers for control:

- OPP_SEL – Current operational OPP
- OPP_CHANGE – Initiate an OPP-based ABB LDO setting change
- SR2_STATUS – Current mode of operation of ABB LDO
- SR2_IN_TRANSITION – ABB LDO is in transition.

For the ABB LDO state change programming sequence, see [Section 3.10.4.3, Changing OPP](#).

3.8.4.3.1 ABB Strategy for the Cortex-A9 MPU Operating at OPP_TURBO

The ABB Set2 technique is used for leakage current reduction for operation at OPP_TURBO (VDD_MPU_L). The ABB Set2 voltage is trimmed to be used at OPP_TURBO. Software should do the following:

```
If (CONTROL_STD_FUSE_OPP_DPLL_1[20] MPU_RBB_TURBO == 1) then enable ABB Set2 at
OPP_TURBO (PRM\_LDO\_ABB\_MPU\_SETUP[1] ACTIVE_RBB_SEL = 0x1)
Else no ABB is available for OPP_TURBO
```

3.8.4.3.2 ABB Strategy for the IVA-HD Operating at OPP_TURBO

The ABB Set2 technique is used for leakage current reduction for operation at OPP_TURBO (VDD_IVA_L). The ABB Set2 voltage is trimmed to be used at OPP_TURBO. Software should do the following:

```
If (CONTROL_STD_FUSE_OPP_DPLL_1[21] IVA_RBB_TURBO == 1) then enable ABB Set2 at
OPP_TURBO (PRM\_LDO\_ABB\_IVA\_SETUP[1] ACTIVE_RBB_SEL = 0x1)
```

3.8.4.4 Bandgap Control

Bandgap provides voltage reference for internal LDOs. The PRCM module automatically controls the switching between ON and OFF states of the bandgap, based on the device power state. It is completely transparent to user software.

The PRM_LDO_BANDGAP_CTRL[0] OFF_ENABLE bit controls whether the bandgap remains on or is shut off when the device switches to OFF power state.

3.8.5 Voltage Domain State Transitions

In [Section 3.1.1.3.1, Voltage Domain](#), the supported states of a voltage domain were presented. This section describes the trigger conditions to enable and perform sleep and wake-up transitions on PRCM module-controlled voltage domains:

- VDD_MPU_L
- VDD_IVA_L
- VDD_CORE_L
- LDO_MPU_M
- LDO_IVA_M
- LDO_CORE_M

It also identifies state transition sequences for these voltage domains.

When the voltage domain state transition control is set to automatic, the PRCM module initiates the voltage domain state transition when the required hardware conditions are satisfied. These hardware conditions can be based on the power domain state conditions and/or system clock state conditions. The PRCM module prevents any transition when the associated conditions are not satisfied.

The LDO_MPU_M, LDO_IVA_M, or LDO_CORE_M memory voltage domain is automatically transitioned to the retention level whenever all memory arrays in the domain reach the RETENTION or OFF power state. Similarly, a transition back to the ON state is triggered upon one or more domain memory arrays requiring a transition back to the ON power state.

If a voltage command acknowledgement is not received within an allowed response time window (communications error over the I²C interface), an error status is logged, a global warm reset is generated, and the transition is skipped.

3.8.5.1 VDD_x_L Transitions

The transition trigger conditions for sleep transition from ON to SLEEP or RETENTION state are:

- Software setting: [PRM_VOLTCTRL](#)[a:b] AUTO_CTRL_VDD_x_L = SLEEP (0x1) or RETENTION (0x2)
- Power states conditions:
 - For voltage domain SLEEP state transition – all power domains in the voltage domain must be in ON-INACTIVE, RETENTION, or OFF state.
 - For voltage domain RETENTION state transition – all power domains in the voltage domain must be in RETENTION or OFF state.
- Clock states conditions: No clock activity on voltage domain

NOTE:

- In case of VDD_CORE_L sleep transition from ON to SLEEP state, the PD_CORE can be in ON-INACTIVE or RETENTION only.
 - In case of VDD_MPU_L and VDD_IVA_L sleep transition from ON to SLEEP state, the reference and bypass clocks to their respective DPLLs must also be gated.
-

The transition trigger condition for wake-up transition from SLEEP or RETENTION state to ON state is:

- Any wake-up event occurs on the voltage domain.

Transition sequence:

1. All transition trigger conditions are met.
2. The voltage controller sends an ON, SLEEP, or RETENTION command sequence over the I²C interface.
3. The PRCM module waits for I²C command sequence acknowledge.
4. The PRCM module starts the voltage transition counter.
5. When the counter expires, a voltage transition completion state is reached.

3.8.5.2 Memory LDOs Transitions

The transition trigger conditions for on to retention mode are:

- At least one memory bank associated with the LDO is in RETENTION state and the rest of the memory banks may be in RETENTION or OFF states.

The transition trigger condition for on/retention mode to off mode transition is:

- Device is switching to OFF state.

Transition sequence:

1. Transition trigger conditions are true (that is, satisfied).
2. Switch LDO reference to:
 - Retention mode value if on-to-retention mode transition
 - Off mode value if on/retention-to-off mode transition
3. Start counter for LDO stabilization.
4. When counter expires, voltage transition completion state is reached.

3.8.5.3 LDO_WAKEUP Transitions

The ON-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY or OFF state) and the PD_EMU power domain is off.
- Clock states: Only the 32K clock is active in the CD_WKUP power domain (and system clock is gated at SCRM level)

The SLEEP-to-ON transition trigger condition is:

- Any device wake-up event other than emulation wake-up event

The EMULATION-to-ON transition trigger requires one of the following conditions:

- Power domain states: The PD_EMU power domain is OFF and device is in active mode
- Clock states: PD_EMU is OFF and any clock other than 32K clock is active in PD_WKUP

The EMULATION-to-SLEEP transition trigger conditions are:

- Power domain states: Device is in low-power state (STANDBY or OFF state) and the PD_EMU power domain is OFF.
- Clock states: Only the 32K clock is active in the CD_WKUP power domain (and system clock is gated at SCRM level)

The SLEEP or ON-to-EMULATION transition trigger condition is:

- Any wake-up event on PD_EMU

Transition sequence:

1. Transition trigger conditions are met.
2. LDO_WAKEUP initiates the transition.
3. Starts a counter for LDO_WAKEUP transition.
4. LDO_WAKEUP transition completes.

3.8.6 DVFS

Dynamic voltage and frequency scaling is a technique that can be used on the logic voltage domains (VDD_MPU_L, VDD_IVA-L, and VDD_CORE_L), independently of each other. Upon current or predictive performance request, determined by software according to ad hoc algorithms or heuristics, software can configure the PRCM module to change the OPP of a voltage domain. For an increase of performance, voltage is first raised, and then frequency is increased. For a decrease of performance, frequency is first decreased, and then voltage is dropped.

3.8.6.1 EMIF Clocks Frequency Scaling Constraints

The CD_EMIF clock domain is inside the PD_CORE power domain. The EMIF subsystem is getting several clocks:

- L3 interface clock
- DLL_CLK clock (that is, DLL clock): For the DLL only
- EMIF_FCLK clock: For external memory access and source of functional clock to EMIF. EMIF_FCLK frequency is DDR_PHY_CLK/2. DDR_PHY_CLK frequency is PHY_ROOT_CLK/2.

L3 interface clock frequency can be changed on the fly without affecting EMIF operations as long as DLL_CLK and PHY_ROOT_CLK clocks are not affected. EMIF has internal asynchronous bridge to handle different interface and functional clocks.

When DDR PHY clock frequency is to be changed, EMIF must be put into IDLE state. This ensures that external memory is in self-refresh mode.

Similarly, DLL frequency change implies that DLL must relock. It can be done only when EMIF is in IDLE state. Relock time is 400 DLL clock cycles.

The EMIF clocking scheme allows for change of OPP without DLL relock (that is, DLL is clocked by a relatively low frequency supported in all OPPs). Then change of OPP consists only of changing the DDR PHY clock frequency (and eventually L3 interface clock frequency).

NOTE: Software must ensure that no master module tries to access the registers of the EMIF during this sequence.

EMIF clocks control requirements in the PRCM module:

- EMIF clock frequency setting must be done through shadow registers for DLL_CLK and DDR_PHY clocks.
- EMIF clock frequency update bit field must be used to copy shadow register value as current values.
- The PRCM module hardware manages automatic EMIF clock frequency update sequence:
 1. Put the EMIF into IDLE state.
 2. Upload shadow register values in corresponding current register and wait for new EMIF clocks to be stable.
 3. Put the EMIF module back into ACTIVE state.

NOTE: The PRCM module must not gate the DLL_CLK and DDR_PHY clocks during automatic EMIF frequency change.

There is a programming model to perform automatic EMIF frequency changes as part of an OPP change (DVFS) or not. The automatic EMIF frequency change must always be performed while CD_EMIF is under software-forced wakeup (SW_WKUP).

VDD_CORE_L voltage fixed and only clock frequency switching

To change EMIF clock frequency without a voltage change (example, change of SYS_CLK divider value while DPLL_CORE is in bypass, change of DPLL_CORE mode between bypass and lock):

1. Software writes new EMIF timing parameters in shadow registers of the EMIF.
2. It then configures the clock selection and frequency setting shadow registers in the PRCM module.

3. The PRCM module sends an idle request to the EMIF (overriding the software settings of the MODULEMODE bit field for EMIF).
4. EMIF stalls transactions on internal interconnect, completes all committed transaction to the external memory and then puts the external memory in self-refresh mode.
5. The EMIF module then acknowledges the idle request of the PRCM module.
6. The PRCM module uploads the values configured in the shadow register bit fields to the corresponding current register bit fields.
7. The PRCM module waits for stabilization of the PHY_ROOT_CLK and DLL_CLK clocks through hardware monitoring, according to new settings.
8. The PRCM module requests the EMIF to exit idle (stops the overriding of the software settings of the MODULEMODE bit field for EMIF).
9. The PRCM module clears the frequency update field.
10. The EMIF copies the timing parameter configured in the shadow register as the current values.
11. The EMIF acknowledges that the PRCM module is functional, and starts accepting the transactions on the internal interconnect.
12. If DLL clock was changed, the EMIF waits for DLL to be relocked and transactions on internal interconnect, if required. The PRCM module is not aware of the DLL operations.
13. Accesses to SDRAM are serviced again.

Software execution can be stalled during the frequency change without harm as the critical hardware sequence is performed without software intervention. After having set the frequency update field, software should only poll for its clearing.

Accesses to external SDRAM are stalled for the following durations:

- 2 μ s maximum due to EMIF entering and exiting idle
- + 400 DLL clock cycles in case DLL clock frequency has changed.
- + DPLL lock time in case DPLL has been locked.

VDD_CORE_L voltage change for OPP switching

It is assumed that DLL clock frequency is not changed and that the DPLL_CORE mode is not changed and stays locked. Only the DDR_PHY clock frequency is changed using the post divider. L3 clock is likely also changed, but it does not affect the EMIF.

Accesses to external SDRAM must be stalled at maximum during 2 μ s due to this sequence.

Voltage scaling up consists of:

- Software indicates to EMIF that voltage change operation has started to allow EMIF to ensure regular code updates from DLL masters.
- Software disables SmartReflex for core voltage.
- Software performs direct VDD_CORE setting to new noncorrected value (for weak silicon) and wait for voltage stabilization.
- Software configures SmartReflex for corresponding OPP.
- Software re-enables SmartReflex for core voltage.
- Software indicates to EMIF that voltage change operation is complete and it does not need to control the code update from DLL masters directly.

3.8.6.2 GPMC Clocks Frequency Scaling Constraints

CD_L3_2 is inside the PD_CORE power domain. It supplies the L3_ICLK2 clock to the general-purpose memory controller (GPMC) module, which is used as interface and functional clock. GPMC timing parameters are supposed be programmed at boot for the nominal OPP. These timing parameters can be used for lower L3 frequency, at the downside of having slower access to external memory.

External memory connected to GPMC may not support on-the-fly L3 frequency changes. The following sequences are used to perform L3 frequency change as part or not of an OPP change (DVFS).

Hardware-controlled sequence

1. Software writes new L3 clock settings in the shadow register and sets the frequency update field.
2. The PRCM module requests idle to the GPMC.
3. The GPMC requests disconnection of its interconnect port and completes all outstanding transactions.
4. The GPMC acknowledges idle. Any access to the GPMC is then stalled.
5. The PRCM module uploads the values of the shadow register bit field in the corresponding current bit field.
6. The PRCM module waits for stabilization of the L3 clocks by monitoring the DPLL_CORE lock and/or divider acknowledge signals according to new settings.
7. The PRCM module clears the frequency update field.
8. The PRCM module requests the GPMC to exit idle.
9. The GPMC reallows interconnect connection and acknowledges it is functional.
10. Accesses to external memory are serviced again.

NOTE:

- The frequency update field is the same as the one for EMIF clock change. The same hardware in the PRCM module handles the frequency change of L3, DDR_PHY, and DLL clocks.
- If the GPMC supports on-the-fly L3 frequency change, then the [CM_SHADOW_FREQ_CONFIG2\[0\]](#) GPMC_FREQ_UPDATE bit can allow bypassing of the sequence.

Software-controlled sequence

1. Software configures the PRCM module to disable the GPMC.
2. The PRCM module requests idle to the GPMC.
3. The GPMC requests disconnection of its interconnect port and completes all outstanding transactions.
4. The GPMC acknowledges idle. Any access to the GPMC is then stalled.
5. Software programs the PRCM module to change L3 frequency and wait for L3 stabilization.
6. Software configures the PRCM module to re-enable the GPMC.
7. GPMC reallows interconnect connection and acknowledges it is functional.
8. Accesses to external memory are serviced again.

3.8.6.3 CORE DVFS Versus Subsystem Functionality**3.8.6.3.1 Display Subsystem**

The display subsystem is part of the CORE voltage domain. It has internal FIFOs that are sized to sustain a change of OPP on the CORE voltage domain with no DPLL relock and no DLL frequency change. Accesses to external SDRAM are stalled at maximum during 2 μ s in these conditions. The DSS functional clock is not affected by the change of OPP on CORE voltage domain. Hence, the DSS supports on-the-fly DVFS of the CORE voltage domain, assuming selected OPP remains compatible with the current DSS processing.

3.8.6.3.2 IVAHD

IVAHD is part of the IVA voltage domain. It can sustain a temporary stall of external SDRAM accesses because it is not real-time processing. IVAHD functional clock is not affected by the change of OPP on the CORE voltage domain; therefore, the IVAHD supports on-the-fly DVFS of the CORE voltage domain.

3.8.6.3.3 Imaging Subsystem

The Imaging subsystem (ISS) is part of the CORE voltage domain. It is real-time processing (or data flow). It cannot support a 2- μ s stall of external SDRAM access, due to the heavy data throughput (FIFO size increase is prohibitive). As a consequence, the ISS does not support on-the-fly change of OPP on CORE voltage domain. However, the CORE DVFS can be synchronized to the interframe idle window of ISS. During this window, ISS does not initiate transaction to external SDRAM. Core OPP can be changed safely assuming selected OPP remains compatible with the current ISS processing. ISS functional clock frequency can either remain unchanged, or be scaled according to the OPP change, assuming it remains compatible with the current ISS processing. This is the responsibility of software.

Example: CORE OPP change OPP50→OPP100, with functional clock frequency unchanged – OPP is 50%, ISS functional clock is at 50 MHz, clock coming from CORE DPLL, ISS clock divider is set to 4

Software performs OPP change: OPP50→OPP100, – ISS is now at 100 MHz, software sets the ISS clock divider to 8, ISS functional clock is back at 50 MHz.

3.8.6.4 DVFS Voting Mechanism (VDD_CORE_L and VDD_IVA_L Voltage Domains)

3.8.6.4.1 CORE OPP Voting Architecture

Core voltage domain operating point can be determined based on the following system masters:

- APE DSP processor
- APE Cortex-M3 MPU processor
- Modem

The PRCM module provides:

- Four read/write voting registers (that is, CM_CORE_DVFS_PERF_n, where n = 1 to 4). Software can use these to specify the performance level of the CORE voltage domain as requested by each system master (likely EMIF bandwidth only). Software must encode the bit fields; encoding is not interpreted by hardware.
- One read/write register (that is, CM_CORE_DVFS_CURRENT) to identify the current CORE voltage domain OPP setting. Software must configure this register based on current OPP setting of the register. It is not managed by hardware.

Voting Mechanism, For details on the voting mechanism for DVFS on the voltage domain, see [Section 3.8.6.4.3](#).

3.8.6.4.2 IVA OPP Voting Architecture

IVA voltage domain operating point can be determined based on the following subsystems performing different type of processing:

- DSP processor
- IVAHD accelerator
- ABE

The PRCM module provides:

- A read/write voting register (that is, CM_IVA_DVFS_PERF_Subsystem name) for each subsystem. Software can use these, to specify the performance level of the IVA voltage domain as requested by each subsystem. Software must encode the bit fields; encoding is not interpreted by hardware.
- One read/write register, that is, CM_IVA_DVFS_CURRENT, to identify the current IVA voltage domain OPP setting. It is again the software's responsibility to configure this register based on current OPP setting of the register. It is not managed by hardware.

See [Section 3.8.6.4.3, Voting Mechanism](#), to understand the voting mechanism for DVFS on the voltage domain.

3.8.6.4.3 Voting Mechanism

The operating point change for the CORE and IVA voltage domains can be performed by the respective masters or subsystems by executing the following steps:

1. Obtain ownership of the voltage domain DVFS semaphore using the SPINLOCK module.
2. Write new performance requirement value in its voting register.
3. Read the current OPP and the voting registers.
4. Compute the result of the voting using an ad hoc algorithm (for example, sum of performance requirements).
5. If the current OPP does not match the voting result (that is, either the OPP must be decreased in case of low performance demand, or the OPP must be increased in case of high performance demand) then the system master performs voltage domain OPP change to best match the voting result.
6. When change of OPP is completed, update the current voltage domain OPP register accordingly.
7. Release the voltage domain DVFS semaphore, using the SPINLOCK module.

3.9 Device Low-Power States

The device low-power states are the result of any valid combination of power domain states in which all the power domains are no longer in ACTIVE state. In such a situation the PRCM module hardware can trigger events to further lower the consumption of the device and the system.

Typically, the PRCM module can lower or even turn off the SMPS, shut down the system clock supplier, and allow the external power IC to turn off its internal resources.

These device low-power states are characterized by the system power consumption, the wake-up latency, and the required functionality.

The low-power states are:

- RETENTION: All the logic voltage domain (VDD_IVA_L and VDD_CORE_L) are in RETENTION state
- OFF: All the logic voltage domains are in OFF state
- LOW POWER: Any combination of logic voltage domains states (ON, SLEEP, and RETENTION state), other than those identified above.

Once the PRCM module hardware detects any valid combination of power domain state and if a proper programming model of the PRCM module has been set, the PRCM module automatically triggers the transition into the device low-power mode.

3.9.1 Device Wake-Up Source Summary

Each power domain in the device may contain modules that can generate the wake-up events. However, when the device is in OFF power state and all the logic voltage domains are off, only the modules with wake-up capability and that are in the PD_WKUP or PD_EMU power domain can generate the wake-up event. Modules in the other power domains require that their voltage domain be in RETENTION, SLEEP, or ON state to generate a wake-up event. Some modules may have a further constraint that their power domain should be in ON-INACTIVE or CSWR state to generate the wake-up event.

The wake-up events can be asynchronous or synchronous. Synchronous wake-up events require the 32-kHz clock or the system clock to be active, while asynchronous wake-up events do not require any active clock.

The Modules Attributes subsection of each clock domain in [Section 3.6, Clock Management Functional Description](#), presents the wake-up capability support for each module of the corresponding power domain.

While the device is in STANDBY mode, additional asynchronous wakeup events from other domains are able to wake up the device.

[Table 3-331](#) identifies which modules in which power domains can be configured to generate a wake-up while the device is in a low-power mode.

Table 3-331. Wake-Up Sources During Device Low Power Mode

| Device Power Mode | VDD_CORE_L state | VDD_MPU_L state | VDD_IVA_L state | Domain able to generate wakeup | Wakeup source |
|-------------------|---------------------------------------|-----------------|-----------------|--------------------------------|--|
| OFF | OFF | OFF | OFF | PD_WKUP | GPIO1 ⁽¹⁾ , Keyboard, GPTIMER1, WDT2, PRM interrupt requests towards Cortex-A9 MPU, C2C wake-up |
| | | | | PD_EMU | Any FORCEACTIVE directive |
| STANDBY | Any combination of RET or SLEEP state | | | PD_AUDIO ⁽²⁾ | DMIC, McASP, WDT3, |
| | | | | | McBSP1, McBSP2, McBSP3 |
| | | | | | McPDM, SLIMBUS1 |
| | | | | PD_CORE | Cortex-M3 MPU ⁽¹⁾⁽³⁾ |
| | | | | | SDMA ⁽¹⁾⁽³⁾ |
| | | | | | C2C ⁽²⁾⁽³⁾ |

⁽¹⁾ True in every domain power state⁽²⁾ Only modules able to generate asynchronous wake-up have to be taken into account, and only when domain is in INACT or CSWRET state.⁽³⁾ These modules have master wake-up (mwakeup) capability⁽⁴⁾ These modules have both master wake-up and slave wake-up capability

Table 3-331. Wake-Up Sources During Device Low Power Mode (continued)

| Device Power Mode | VDD_CORE_L state | VDD_MPU_L state | VDD_IVA_L state | Domain able to generate wakeup | Wakeup source |
|-------------------|------------------|-----------------|-----------------|--------------------------------|------------------------------------|
| | | | | | Dynamic dependency towards CD_L3_2 |
| | | | | PD_ALWON_CORE | SR_CORE, SR_IVA, SR_MPU |

NOTE: Any GPIO module can be a source of wake-up from OFF mode. For more information, see [Section 3.9.4, I/O Management](#).

3.9.2 Device RETENTION State Management

In RETENTION state, the voltages to the device are lowered to their minimum value to retain only the logic build with RFFs, while all DFF logic is lost. The memory area may be retained, depending on software configuration.

The device integrates enhanced device wake-up management while in RETENTION state. This allows:

- Triggering wake-up with limited capabilities from almost all programmed input pads all around the device.
- Triggering wake-up with full capabilities by using few GPIO inputs in the PD_WKUP power domain.

The logic voltages VDD_CORE_L, VDD_MPU_L, and VDD_IVA_L can transition to their retention value independently. Once the voltage domain state transition conditions are met in compliance with the software configuration, the PRCM module hardware initiates the transition into RETENTION state by sending an I²C command for the corresponding SMPS.

When all the logic voltages are transitioned to their RETENTION state, the PRCM module hardware can, depending on a software configuration, toggle its system clock request and/or its power request to allow the SCRM to shut down the system clock source and to request the external power IC to shut down internal resources.

The PRCM module, SCRM, and the external power IC can also be programmed so that the voltage VDD_CORE_L is managed by the power request signal. This means the following:

- The power IC manages the ramp-down and ramp-up time of the VDD_CORE_L SMPS when the power request is toggled.
- The SCRM accounts for the overall setup of the PMIC resources (internal PMIC resources and VDD_CORE_L SMPS).
- The PRCM module sends RETENTION and ON commands through the I²C interface. The retention voltage value must be equal to the current voltage value and the value of the On voltage must be set to the expected voltage value following the wakeup. Also, the setup time periods corresponding to the SMPS ramp-up and ramp-down must be set to a zero value.

3.9.3 Device OFF State Management

The off mode is the device mode where all power domains except for PD_WKUP are in OFF state and the logic voltage domains (VDD_MPU_L, VDD_IVA_L, and VDD_CORE_L) are shut down by the external power IC. Other power sources, such as the DPLL supplies, can be shut down by the external power IC during the off mode period.

The device integrates enhanced device wake-up management while in RETENTION state. This allows:

- Saving I/Os leakage by settings pads in the lowest power state compatible with the device environment.
- Triggering wakeup with limited capabilities from almost all programmed input pads all around the device.
- Triggering wakeup with full capabilities by using few GPIO inputs in the PD_WKUP power domain.

This section details the way the PRM manages and sequences the control of the various off mode contributors:

- LDO_WAKEUP
- Memory LDOs
- ABB LDOs
- Voltage controller
- Hardware save-and-restore (SAR) mechanism
- Hardware power request signal

NOTE: For more information about the SAR mechanism, see [Section 17.4.21](#), *Auto-Restore Feature*, in [Chapter 17](#).

Once the hardware conditions is met and according to the software configuration, the PRCM module hardware initiates the transition into off mode by sending I²C commands for each SMPS and by respecting required sequencing between the voltage domains.

When all the logic voltages are transitioned to their RETENTION state, the PRCM module hardware can, depending on a software configuration, toggle its system clock request and/or its power request:

- to allow the SCRM to shut down the system clock source.
- to request the external power IC to shut down internal resources.

The PRCM module, SCRM, and the external power IC can also be programmed so that the voltage VDD_CORE_L is managed by the power request signal. This means the following:

- The power IC manages the ramp-down and ramp-up time of the VDD_CORE_L SMPS when the power request is toggled.
- The SCRM accounts for the overall setup of the PMIC resources (internal PMIC resources and VDD_CORE_L SMPS).
- The PRCM module sends OFF and ON commands through the I²C interface. The OFF voltage value must be equal to the current voltage value and the value of the On voltage must be set to the expected voltage value following the wakeup. Also, the setup time periods corresponding to the SMPS ramp-up and ramp-down must be set to a zero value.

3.9.3.1 Device Off Mode Sleep Sequence

This section describes the main steps of the device off mode sleep sequence. The OFF command to shut down the voltages VDD_MPU_L, VDD_IVA_L, and VDD_CORE_L can be sent through the I²C interface. VDD_CORE_L may also be controlled independently using the power request signal.

NOTE: The power request signal can be used to turn off other resources of the power-management IC, even when it is not used for the VDD_CORE_L management.

NOTE: LDOs in the power companion device (TWL60xx), which are turned off in ACTIVE state, are switched on when entering into SLEEP state with the default value.

After the first power on, all resources must be configured, especially the power resources that are not part of the power-up sequence. This must be done by sending a command through the I²C interface.

1. Software has completed preliminary settings such as:
 - Settings in the external power IC
 - Voltage transition settling time settings in the PRCM module
 - Context save for the relevant modules
 - System control module is configured with valid I/O pads off mode configuration.
 - Enable/disable the wake-up feature for each pad by programming the system control module.

- Enable/disable the automatic gating of the system clock (PRCM).
 - Enable the I/O wake-up scheme (PRCM).
 - Program a consistent power state for each power domain (that is, OFF state for domains without hardware restored modules and OSWR state for domains with hardware restored modules build with RFF logic).
 - All modules in the PD_WKUP power domain must have their interrupts to Cortex-M3 and DSP, and their DMA requests to sDMA disabled.
 - Program automatic transition of the CD_WKUP clock domain.
 - Enable the off mode scheme (PRCM).
 - Configure the VDD_CORE_L management option:
 - Disable the option if a power request signal is not used for VDD_CORE_L management.
 - Enable the option if a power request signal is used for VDD_CORE_L management.
2. The PRCM module initiates the transition into off mode upon all of the following conditions:
- All the programmable power domains have reached their targeted Low-Power state which can either be Off or OSWRET. It does not apply to always-on power domains and to the EMU power domain.
 - The CD_WKUP clock domain is idled.
 - OFF mode has been enabled by software.
- At this stage the I/O wake-up scheme through the I/O pad daisy-chain is already enabled. The I/O isolation scheme is managed in parallel with the following sequence (see [Section 3.9.4, I/O Management](#)).
3. The PRCM module triggers in parallel:
- Switch off all SRAM LDOs.
 - Bypass all ABB LDOs.
 - Isolate the analog area from digital supply removal.
4. The PRCM module then sends in a row the OFF command for the voltages VDD_IVA_L and the VDD_MPU_L, once the following conditions are met:
- I/O isolation scheme is complete.
 - SRAM LDOs have ramped down to 0 V.
 - ABB LDOs have switched in bypass.
- The order between the two OFF commands is irrelevant and managed by the voltage controller.
5. Once the voltages VDD_IVA_L and VDD_MPU_L are ramped down to 0 V the PRCM module sends the Off command for the voltage VDD_CORE_L:
- If power request signal is not used for VDD_CORE_L management then the VDD_CORE_L is ramped down to 0 V.
 - If power request signal is used for VDD_CORE_L management then the OFF command for the voltage VDD_CORE_L, through the I²C interface, has no effect and the voltage VDD_CORE_L remains unchanged.
6. Once the OFF command for VDD_CORE_L is sent and acknowledged, the PRCM module gates locally its system clock.
7. The PRCM module deasserts the signal system clock request to the SCRM, if so configured by software. Similarly, it deasserts the signal power request if configured by software.
- If power request signal is used for VDD_CORE_L management, then VDD_CORE_L is ramped down to 0 V.
8. The SCRM acknowledges the power request to the PRCM module. This acknowledge is required by the PRCM module before toggling the signal power request again.
9. The SCRM informs the PRCM module that all versions of the system clock have been gated; hence the PRCM module can transition the LDO_WAKEUP to SLEEP state if the PD_EMU power domain is in OFF state.
10. The DEVICE_OFFWKUP_CORERSTACTST signal intended for the core control module is asserted. The EMIF1_DEVICE_OFFWKUP_CORERSTACTST and

EMIF2_DEVICE_OFFWKUP_CORERSTACTST signals intended for EMIF1 and EMIF2, respectively, are asserted according to their associated register bit fields, EMIF1_OFFWKUP_DISABLE and EMIF2_OFFWKUP_DISABLE.

3.9.3.2 Device Off Mode Wake-Up Sequences

The wake-up sequence includes a phase of hardware restore. Depending on the wake-up event source the restore sequence completes in one or two phases. The first phase always occurs and is sufficient to serve some type of wake-up events; for other sources of event a second phase is required and occurs immediately after the first phase. Phase 2 is split into two subphases (phase 2a and phase 2b). The device returns to off mode after the first phase completes.

Table 3-332 lists the device off wake-up and hardware restore phases.

Table 3-332. Device Off Wake-Up and Hardware Restore Phases

| Wake-Up Event | Phase 1 | Phase 2 | Comment |
|--|---------|---------|--|
| Wake-up request from PD_WKUP | Yes | Yes | This event must wake up the PD_MPU power domain by dependency. |
| PRM interrupt toward MPU-A9 (includes I/O wake-up detection) | Yes | Yes | This event wakes up the PD_WKUP power domain. The PD_MPU power domain wakes up by broadcast of the wake-up event, and the MPU-A9 boots up. |
| Global warm reset | Yes | No | After voltage stabilization, phase 1 restoration is performed. Then MPU-A9 reboots, because global warm reset is a source of PD_MPU power domain wakeup. |

3.9.3.2.1 Wake Up From a Wake-Up Event

This section describes the main steps of the wake-up sequence to exit the device from off mode. The ON command to ramp-up the voltages VDD_MPU_L, VDD_IVA_L, and VDD_CORE_L can be sent through the I²C interface. VDD_CORE_L can also be controlled independently using the power request signal.

NOTE: The power request signal can be used to turn on other resources of the power-management IC, even when it is not used for the VDD_CORE_L management.

Additionally it is assumed in this sequence that the wake-up source is not a global warm reset.

1. The PRCM module switches the LDO_WAKEUP from SLEEP to ON state and waits for the setup time of the LDO_WAKEUP (that is, four clock cycles of the 32-kHz clock).
2. The PRCM module asserts the system clock request signal to the SCRM, which in turn sends the request to the external power IC. The SCRM accounts for the system clock stabilization time before enabling the clock to the PRCM module.
3. The PRCM module also asserts the power request signal to the SCRM. The PRCM module waits for the acknowledge of its power request signal and activation of the system clock before sending an I²C command for the voltage ramp-up sequence.
 - If power request signal is used for VDD_CORE_L management, then the power-management IC ramps up the voltage VDD_CORE_L.
 - If power request signal is not used for VDD_CORE_L management, then the voltage VDD_CORE_L is unchanged.
4. The PRCM module sends the ON command for the VDD_CORE_L voltage ramp up, through the I²C interface and waits for the setup time of the SMPS.
 - If power request signal is used for VDD_CORE_L management, then the voltage VDD_CORE_L is unchanged.
 - If power request signal is not used for VDD_CORE_L management, then the power-management IC ramps up the voltage VDD_CORE_L.
5. The PRCM module sends in a row the ON commands for the voltages VDD_MPU_L and VDD_IVA_L and waits for the setup time of the two SMPS.
6. The PRCM module enables the system clock to the eFuse controller and releases its reset line. It

holds the other asserted resets until completion of the EFUSE bits sensing.

7. The PRCM module waits for the stabilization of the bandgap, memory LDOs and ABB LDOs stabilization.
8. Hardware restore phase 1 starts:
 - (a) The PRCM module ensures that:
 - CORTEXA9, CORTEXM3, and DSP are held in reset.
 - C2C is kept in STANDBY state.
 - The sDMA receives the restore request.
 - Phase 1 descriptor start address is sent to the sDMA.
 - MODULEMODE bit field of the L3_3 module is overridden to auto mode. This ensures the successful restoration of its firewalls during phase 1 of the restore.
 - (b) The PRCM module generates a wake-up event on the CD_SDMA clock domain. As a result, the PD_CORE power domain and CD_SDMA wake up. This causes CD_L3_1, CD_L3_2, CD_L4_CFG, CD_MEMIF, CD_L4_PER, and CD_L3_INIT to wake up because of the wake-up broadcast due to static dependency and their respective reset are released once their clock is active. The clock domain L4_WKUP wakes up (due to a wake-up broadcast on static dependency).
 - (c) The sDMA switches from STANDBY to ACTIVE state and performs phase 1 of the hardware restore:
 - Firewalls
 - System control module
 - EMIF
 - Part of the CM1 and part of the CM2 (core clock configuration, registers CLKTRCTRL of the CD_MPU, CD_L3_1, CD_L3_2, CD_L4_CFG, CD_MEMIF, CD_L4_PER, and CD_L3_INIT clock domains)

The sDMA makes the last write into the PRCM module end of phase 1 bit field. The PRCM module then switches it to STANDBY state and resets it.
 - (d) The PRCM module releases I/O isolation of the EMIF. The other I/Os stay isolated.
 - (e) The PRCM module checks and waits if necessary for the DPLL_CORE to be in a stable state.
 - (f) In parallel, the PRCM module does the following:
 - Releases the condition preventing C2C to remain in STANDBY state
 - Releases the override of the MODULEMODE bit field of the L3_3 module
9. Upon a need to perform phase 2 of the hardware automatic restore (according to the wake-up source), the following sequence occurs:
 - (a) Phase 2a sequence.
 - (i) The PRCM module drives the phase 2a descriptor start address to the sDMA.
 - (ii) The PRCM module releases the sDMA from reset.
 - (iii) The PRCM module generates a wake-up event on the CD_SDMA clock domain (same as in Step 2 of phase 1).
 - (iv) The sDMA performs phase 2a of the hardware restore:
 - The MODULEMODE bit field of each module to be restored during phase 2b is set to Enabled or Auto and the SARMODE bit field is enable if applicable. Only modules that have just interface clock(s) can be restored automatically.
 - The **CM_SDMA_STATICDEP** register is set to enable all necessary static dependency To wake up all power domains having modules to be restored during phase 2b

The sDMA makes the last write into the PRCM module at the end of phase 2a bit field. The PRCM module then switches it to Standby state and resets it. This completes phase 2a.
 - (b) Phase 2b sequence:
 - (i) The PRCM module drives the phase 2b descriptor start address to the sDMA.
 - (ii) The PRCM module releases the sDMA from reset.
 - (iii) The PRCM module generates a wake-up event on the CD_SDMA clock domain (same as in

Step 2 of phase 1).

(iv) The sDMA performs phase 2b of the hardware restore:

- Restore of the relevant modules

The sDMA makes the last write into the PRCM module at the end of the phase 2b bit field. The PRCM module then switches it to STANDBY state and resets it. This completes phase 2b.

10. The PRCM module releases I/O isolation of the remaining I/O, only if the [PRM_IO_PMCTRL.ISOOVR_EXTEND](#) bit field is not set.
11. The PRCM module releases the reset stall conditions holding CORTEXA9, CORTEXM3, and DSP in reset.
12. The PD_MPU power domain is woken up if required according to the wake-up source.

3.9.3.2.2 Wakeup Upon Global Warm Reset

When global warm reset is the source of the device wakeup, the sequence referred in [Section 3.9.3.2.1, Wake Up From a Wake-Up Event](#), is modified as follows:

Steps 4 and 5 are replaced with:

- The PRCM module waits for the three voltages VDD_MPU_L, VDD_IVA_L, and VDD_CORE_L stabilization time. It uses the [PRM_VOLTSETUP_WARMRESET](#) register for that purpose.

Step 6 is replaced by:

- The PRCM module enables the system clock to the eFuse controller and releases its reset line. In parallel, the device reset manager counts for global reset extension (setup by the [PRM_RSTTIME\[9:0\]](#) RSTTIME1 bit field). The PRCM module holds the other asserted resets until eFuse bits sensing completes and the global reset counter overflow.

Phase 2 of the hardware restore sequence is skipped.

Hardware blocks and modifies the [FREQ_UPDATE](#) bit field of [CM_SHADOW_FREQ_CONFIG1](#) register during phase 1.

3.9.3.3 Global Warm Reset During a Device Wake-Up Sequence

If a global warm reset occurs before the PRCM module completes voltage stabilization count, the global warm reset is applied immediately. As a consequence, the sequence described in [Section 3.9.3.2.2, Wake Up Upon Global Warm Reset](#), is performed.

If the global warm reset occurs after the PRCM module completes voltage stabilization (during eFuse sensing or during phase 1 of automatic restore):

- Global warm reset is delayed and applied after of phase 1 restore completes.
- Phase 2 of restore is discarded.
- The MPU boots after the warm reset sequence completes.

If the global warm reset occurs during phase 2 of automatic restore:

- Global warm reset is applied immediately.
- Phase 2 of restore is discarded.
- The MPU boots after the warm reset sequence completes.

3.9.4 I/O Management

[Figure 3-80](#) is an overview of the power-management modules and their internal connections with a generic power domain.

Figure 3-80. I/O Pads Daisy-Chain Configuration

prcm-076

Any I/O pad of the device can be configured to generate a wake-up event when the device is in off mode. This is managed by the configurations in the system control module and the PRM.

In the off mode, the I/O pads of the device form a daisy chain with the I/O pad logic output of one pad connected to the I/O pad logic input of the next one. The I/O pad logic at the two ends of the chain is connected to the PRM.

The I/O pad wake-up scheme must be enabled (WUEN signal) globally by setting the [PRM_IO_PMCTRL\[16\]](#) GLOBAL_WUEN bit and by also setting I/O pad wake-up enabled/disabled individually (WUEN signal) by writing to the following bit fields in the control module:

- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y [14] WAKEUPENABLE
- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y [30] WAKEUPENABLE

Once configured, the wake-up scheme within each I/O pad is enabled and disabled by triggering a control (WUCLKIN signal) of the I/O daisy chain. This is done thanks to a dedicated PRM module register bit [PRM_IO_PMCTRL\[8\]](#) WUCLK_CTRL. The software must enable the I/O wakeup prior entering a low-power mode and disable it following a wake-up event.

Setting the [PRM_IO_PMCTRL\[8\]](#) WUCLK_CTRL bit to 1 asserts the WUCLKIN signal high to reset spurious wake-up event and to latch the current pad input value. PRM module register [PRM_IO_PMCTRL\[9\]](#) WUCLK_STATUS logs the WUCLKOUT signal of the last pad of the I/O ring. Once this status is set to 1, software may clear the [PRM_IO_PMCTRL\[8\]](#) WUCLK_CTRL bit to effectively enable or disable the wake-up feature within each pad.

Additionally, it is required that the WUCLKIN is forced to 1 during global power-on reset. The I/O wake-up feature is enabled or disabled depending on a control (the WUEN signal) for each I/O pad. This control is generated by the Spinner logic resulting of the combination of a local enable/disable bit per pad in the control module and a global enable/disable bit located in the PRM module, that is, [PRM_IO_PMCTRL\[16\]](#) GLOBAL_WUEN.

When a wake-up event is detected by a wake-up enabled I/O pad in the daisy chain, it is logged within the I/O and is conveyed to the system control module (the WUEVT signal). All the I/O wake-up event statuses are mapped on memory-mapped registers in the system control module.

When the device wakes up, the MPU can determine all sources of the current wake-up event logged into the corresponding bit fields in the control module.

- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y [15] WAKEUPEVENT
- CONTROL.CONTROL_(CORE/WKUP)_PAD0_X_PAD1_Y [31] WAKEUPEVENT

For information about the control module, see [Chapter 19, Control Module](#).

I/Os have two associated buffers, that is, 1.2 V and 1.8 V. A software configuration determines which one is used in normal operation. However, in the device off mode, the 1.2-V buffer is always disabled, and the 1.8-V buffer stays on but is powered by 1.2 V instead of 1.8 V to minimize leakage, if pad configure to drive the output.

3.9.4.1 Hardware-Controlled I/O Isolation Sequences

I/Os have two buffers: 1.2 V and 1.8 V.

The software configuration determines whether the 1.2-V buffer or the 1.8-V buffer is used. Regardless of the buffer used, in off mode the 1.2-V buffer is always disabled and the 1.8-V buffer stays on but is powered by 1.2 V instead of 1.8 V to minimize leakage (if the pad is configured to drive the output).

In addition to this, I/Os support the following features:

- Wake-up override: The PRCM module can control the I/Os that are wakened; that is, brought out of isolation from device off mode based on the source of wakeup. The primary application of this feature is to restore only the minimal context of the device for access to EMIF upon C2C request.
- Wakeup phased wakeup: The I/Os support a phased wake-up approach; that is, the I/Os can be brought out of off mode isolation in two phases without affecting the functional operation of the I/Os already out of isolation. This feature is used to wake up the I/Os still held in isolation without affecting the EMIF operations when a full device wakeup is requested.

The I/O transitions are:

- Full on to full isolation: Pad output controls are stable (A, GZ). Pad off mode configuration is activated.
- Full Isolation to EMIF on: EMIF I/O interface is brought out of isolation. Partial device context is restored.
- EMIF on to full on: EMIF I/O interface are already out of isolation and a new wake-up event requires a full device wakeup.
- EMIF on to full Isolation: EMIF I/O interface and some nonrestore sensitive I/Os are already out of isolation. The PRCM module puts the device back in off mode.

3.9.4.2 Software-Controlled I/O Isolation

In addition to the hardware-controlled I/O transitions, a dedicated PRCM module register bit, [PRM_IO_PMCTRL\[0\] ISOCLK_OVERRIDE](#), can be used by the software to force the ISOCLKIN signal to the I/O pad. It is then propagated from one pad to the other in the wake-up enabled daisy-chain of I/Os. The PRCM module register [PRM_IO_PMCTR\[1\] ISOCLK_STATUS](#) logs the ISOCLKOUT signal of the last pad of the I/O daisy-chain.

NOTE: Override is used at boot time only when software needs to change the mode of an I/O from 1.8-V default mode to 1.2-V mode. When not overridden, this signal is controlled only by hardware.

[PRM_IO_PMCTRL\[4\] ISOOVR_EXTEND](#) bit allows extending the non-EMIF I/O isolation. This feature can be used by software to restore modules driving output such as GPIO while non-EMIF I/Os are still isolated. Once software completes the relevant module restore, it clears the bit and hardware performs the full-isolation-to-EMIF transition on hardware-controlled I/O transition.

The [PRM_IO_PMCTRL\[5\] IO_ON_STATUS](#) status bit is available for software to check completion of the EMIF on transition.

3.10 PRCM Module Programming Guide

3.10.1 DPLLs Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and use of the module.

3.10.1.1 Global Initialization

3.10.1.1.1 Surrounding Module Global Initialization

This section identifies the requirements of initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

[Table 3-333](#) shows the global initialization of the surrounding modules.

Table 3-333. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------|---|
| PRCM | Ensure that the DPLL reference clock (gated version of system clock) is active. |

3.10.1.1.2 DPLL Global Initialization

3.10.1.1.2.1 Main Sequence – DPLL Global Initialization

This procedure initializes the DPLL after a power-on or software reset and then locks it to the desired synthesized clock frequency.

Table 3-334. DPLL Global Initialization

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------------------|
| Configure SSC parameters | See Section 3.10.1.1.2.2 . | |
| Configure Recalibration parameters | See Section 3.10.1.1.2.3 . | |
| Set DPLL automatic idle mode | CM_AUTOIDLE_DPLL name[2:0] AUTO_DPLL_MODE | xx ⁽¹⁾ |
| Configure synthesized clock parameters | See Section 3.10.1.1.2.4 . | |
| Configure output clocks parameters | See Section 3.10.1.1.2.5 . | |
| Lock DPLL | CM_CLKMODE_DPLL name[0] DPLL_EN | 0x7 |

(1) It depends on the desired auto idle mode. See [Section 3.6.3.3.3](#), *DPLL Power Modes*.

3.10.1.1.2.2 Subsequence – SSC Parameter Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

Table 3-335. DPLL SSC Parameter Configuration

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------------------|
| Configure M Step Size | CM_SSC_DELTAMSTEP_DPLL name[19:0] DELTAMSTEP | xx ⁽¹⁾ |
| Configure modulation frequency divider exponent part | CM_SSC_MODFREQDIV_DPLL name[10:8] MODFREQDIV_EXPONENT | xx ⁽¹⁾ |
| Configure modulation frequency divider mantissa part | CM_SSC_MODFREQDIV_DPLL name[6:0] MODFREQDIV_MANTISSA | xx ⁽¹⁾ |
| Enable/disable frequency downspread | CM_CLKMODE_DPLL name[14] DPLL_SSC_DOWNSPREAD | xx ⁽²⁾ |
| Enable SSC feature | CM_CLKMODE_DPLL name[12] DPLL_SSC_EN | 0x1 |

Table 3-335. DPLL SSC Parameter Configuration (continued)

| Step | Register/Bit Field/Programming Model | Value |
|----------------------------------|---------------------------------------|-------|
| Wait until SSC start acknowledge | CM_CLKMODE_DPLL name[13] DPLL_SSC_ACK | 0x1 |

- (1) See SSC description in [Section 3.6.3.3.5, DPLL Spread Spectrum Clocking](#).
 (2) The selected value depends on the desired SSC feature settings.

3.10.1.1.2.3 Subsequence – Recalibration Parameter Configuration

This procedure enables the recalibration feature and the associated processor interrupt flag.

Table 3-336. DPLL Recalibration Parameter Configuration

| Step | Register/Bit Field/Programming Model | Value |
|--------------------------------------|--|-------|
| Clear recalibration interrupt status | PRM_IRQSTATUS_Processor name[x] DPLL name_RECAL_ST | 0x0 |
| Unmask recalibration interrupt flag | PRM_IRQENABLE_Processor name[x] DPLL name_RECAL_EN | 0x1 |
| Enable recalibration feature | CM_CLKMODE_DPLL name[8] DPLL_DRIFTGUARD_EN | 0x1 |

3.10.1.1.2.4 Subsequence – Synthesized Clock Parameter Configuration

This procedure configures the settings for the synthesized clock of the DPLL.

Table 3-337. DPLL Synthesized Clock Parameter Configuration

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------------------|
| Set DPLL clock synthesis multiplier | CM_CLKSEL_DPLL name[2:0] DPLL_MULT | xx ⁽¹⁾ |
| Set DPLL clock synthesis divider | CM_CLKSEL_DPLL name[2:0] DPLL_DIV | xx ⁽¹⁾ |
| IF : Low-power mode operation conditions satisfied? | Software test condition. See Section 3.6.3.3.2 . | |
| Enable DPLL low-power operation mode | CM_CLKMODE_DPLL name[10] DPLL_LPMODE_EN | 0x1 |
| ENDIF | | |

- (1) It depends on the desired synthesized clock frequency. See [Section 3.6.3.3, Generic DPLL Overview](#).

3.10.1.1.2.5 Subsequence – Output Clock Parameter Configuration

This procedure configures the settings for the output clocks of the DPLL.

Table 3-338. DPLL Output Clock Parameter Configuration

| Step | Register/Bit Field/Programming Model | Value |
|---|---|----------------------------|
| Set output clock dividers (that is, M2, M3 and Mn), where n is from 4 to 7. It depends on the available clock output of the DPLL. | CM_DIV_M2_DPLL name[4:0] DPLL_CLKOUT_DIV CM_DIV_M3_DPLL name[4:0] DPLL_CLKOUTHIF_DIV CM_DIV_Mn_DPLL name[4:0] HSDIVIDER_CLKOUTn-3_DIV | xx ⁽¹⁾ |
| Wait until divider change acknowledged | CM_DIV_M2_DPLL name[5] DPLL_CLKOUT_DIVCHACK CM_DIV_M3_DPLL name[5] DPLL_CLKOUTHIF_DIVCHACK CM_DIV_Mn_DPLL name[5] HSDIVIDER_CLKOUTn-3_DIVCHACK | Bit toggled ⁽²⁾ |

Table 3-338. DPLL Output Clock Parameter Configuration (continued)

| Step | Register/Bit Field/Programming Model | Value |
|---|--|-------------------|
| Enable/disable output clock dividers auto power-down feature. It applies to M2, M3, and Mn dividers, where n is from 4 to 7. It depends on the available clock output dividers of the DPLL. | CM_DIV_M2_DPLL name[12] DPLL_M2_PWDN CM_DIV_M3_DPLL name[12] DPLL_CLKOUTHIF_PWDN CM_DIV_Mn_DPLL name[12] HSDIVIDER_CLKOUTn-3_PWDN | xx ⁽³⁾ |
| Enable/disable output clocks automatic gating feature. It applies to M2, M3, and Mn clock outputs, where n is from 4 to 7. It depends on the available clock output of the DPLL. | CM_DIV_M2_DPLL name[8] DPLL_CLKOUT_GATE_CTRL CM_DIV_M3_DPLL name[8] DPLL_CLKOUTHIF_GATE_CTRL CM_DIV_Mn_DPLL name[8] HSDIVIDER_CLKOUTn-3_GATE_CTRL | xx ⁽⁴⁾ |

(1) It depends on the desired output clock frequency. See [Section 3.6.3.3, Generic DPLL Overview](#).

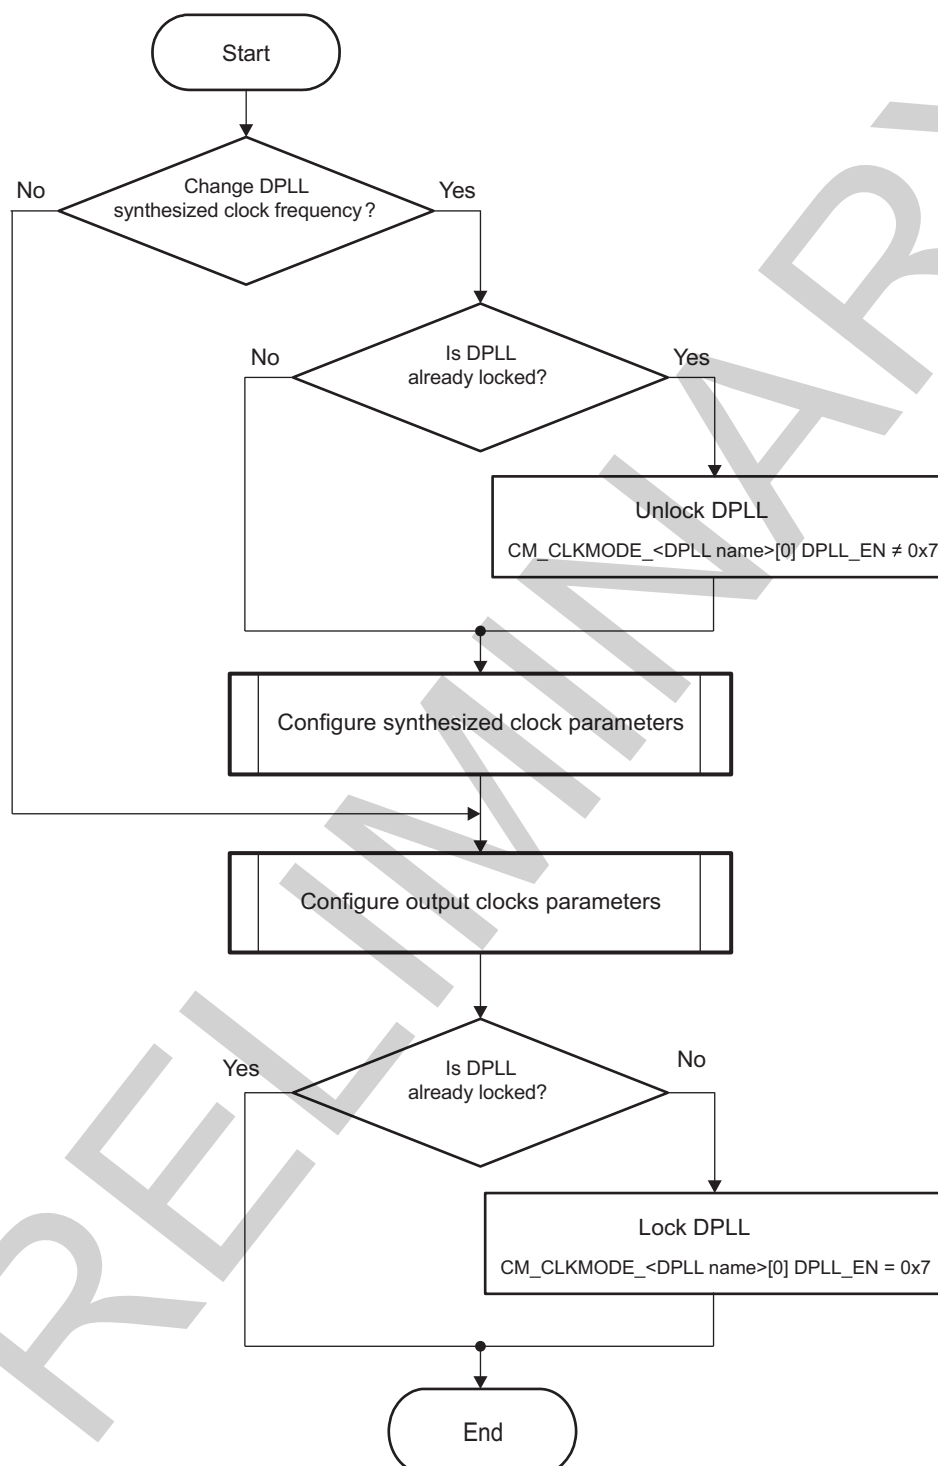

(2) It is toggled only if the programmed divider value differs from the previous one.

(3) It depends on whether output clock divider automatic power down feature is to be enabled or not. See [Section 3.6.3.3.6, DPLL Output Power-Down](#).

(4) It depends on whether output clock automatic gating feature is to be enabled or not.

3.10.1.2 DPLL Output Frequency Change

[Figure 3-81](#) shows the DPLL output-frequency change.

Figure 3-81. DPLL Output-Frequency Change

prcm-077

To unlock a DPLL, a mode other than the Lock Mode (0x7) should be programmed in the CM_CLKMODE_<DPLL name>[2:0] DPLL_EN bit field. The modes that can be programmed in the DPLL_EN bit field and unlock the DPLL are:

- For type A DPLLs:
 - MN bypass mode (0x4)

- Idle Low Power bypass mode (0x5)
- Idle Fast Relock bypass mode (0x6)
- For type B DLLs:
 - Low Power Stop mode (0x1)
 - MN bypass mode (0x4)
 - Idle Low Power bypass mode (0x5)

NOTE: DPLL_IVA does not support Idle Fast Relock bypass mode (0x6).

Table 3-339. Register Call Summary for Sequence – DPLL Output Frequency Change

| Register Name |
|----------------------|
| CM_CLKMODE_DPLL name |

Table 3-340. Subprocess Call Summary for Sequence – DPLL Output Frequency Change

| Subprocess Name | Cross-reference |
|--|--|
| Configure synthesized clock parameters | See Section 3.10.1.1.2.4 . |
| Configure output clocks parameters | See Section 3.10.1.1.2.5 . |

3.10.2 Clock Management Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and use of the clocks in the device.

3.10.2.1 Global Initialization

3.10.2.1.1 Surrounding Module Global Initialization

This section identifies the requirements of initializing the surrounding modules when the module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DPLLs.

[Table 3-341](#) shows the global initialization of the surrounding modules.

Table 3-341. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------|---|
| PRCM DPLLs | Ensure that the DPLLs managed by the PRCM module are initialized. |

3.10.2.1.2 Clock Management Global Initialization

3.10.2.1.2.1 Main Sequence – Clock Domain Global Initialization

This procedure initializes the clock domain of the device after a power-on or software reset.

Table 3-342. Clock Domain Global Initialization

| Step | Register/Bit Field/Programming Model | Value |
|--|--|---------------------------------|
| Configure module clock-management feature of master modules in the clock domain | Module name_SYSCONFIG[x] MIDLEMODE Module name_SYSCONFIG[x] STANDBYMODE | xx ⁽¹⁾ |
| Configure module clock-management feature of slave modules in the clock domain | See Section 3.10.3.3 . | |
| Enable/disable Static Sleep Dependency with other clock domains (that is, destination clock domains). Not all dependencies are configurable. | CM_Clock Domain name_STATICDEP [x] Destination Clock Domain name_STATDEP | 0x0 to Disable 0x1 to Enable |
| Set Dynamic Dependency window size | CM_Clock Domain name_DYNAMICDEP[27:24] WINDOWSIZE | xx ⁽²⁾ |
| Enable/disable module wake-up dependency for the modules of the clock domain. It is available when the module can generate an interrupt or a DMA request to a service provider module (for example, a processor or DMA). | PM_Clock Domain name_Module name_WKDEP[x] WKUPDEP_Module name_DMA/IRQ request_DMA/Processor name | 0x0 to disable 0x1 to enable |
| Set clock domain state transition feature | CM_Clock Domain name_CLKSTCTRL[1:0]11 CLKTRCTRL | xx ⁽³⁾ |

- (1) See the module register for valid modes.
- (2) It depends on the desired size of the window. See [Section 3.1.1.1.7.2, Clock Domain Dependency](#).
- (3) It depends on the desired state of the clock domain. See [Table 3-11](#).

3.10.2.1.2.2 Subsequence – Slave Module Clock-Management Parameters Configuration

This procedure configures the SSC parameters for the DPLL and enables the SSC feature.

Table 3-343. Slave Module Clock-Management Parameter Configuration

| Step | Register/Bit Field/Programming Model | Value |
|--|---|-------------------|
| Configure module idle mode feature | Module name_SYSCONFIG[x] SIDLEMODE Module name_SYSCONFIG[x] IDLEMODE | xx ⁽¹⁾ |
| IF : Smart-idle mode is selected | Module name_SYSCONFIG[x] SIDLEMODE Module name_SYSCONFIG[x] IDLEMODE | 0x10 |
| Configure module clock requirement feature | Module name_SYSCONFIG[x] CLOCKACTIVITY | x ⁽¹⁾ |
| ENDIF | | |
| Configure module management behavior on the PRCM module side | CM_Clock Domain name_Module name_CLKCTRL[1:0] MODULEMODE | xx ⁽²⁾ |

- (1) See the module register for valid settings.
- (2) The selected value depends on the desired clock-management behavior.

3.10.2.2 Clock Domain Sleep Transition and Troubleshooting

This procedure initiates a sleep transition on a clock domain and allows to debug if the transition does not occur.

Table 3-344. Clock Domain Sleep Transition and Troubleshooting

| Step | Register/Bit Field/Programming Model | Value |
|---|---|---|
| Set clock domain sleep transition state | CM_Clock Domain name_CLKSTCTRL[1:0]11 CLKTRCTRL | 0x1: SW_SLEEP 0x3: HW_AUTO |
| IF : Clock domain sleep transition not initiated? | | |
| Check all clock domain master modules are in standby mode | CM_Clock Domain name_Module name_CLKCTRL[18] STBYST | 0x1: Module in standby |
| Check all clock domain slave modules are in idle mode | CM_Clock Domain name_Module name_CLKCTRL[17:16] IDLEST | 0x1: In transition 0x2: Interface clock idled 0x3: Module idled |
| ENDIF | | |

3.10.2.3 Enable/Disable Software-Programmable Static Dependency

To change the setting of a software-programmable static dependency use the procedure described in [Table 3-345](#).

Table 3-345. Enable/Disable Software-Programmable Static Dependency

| Step | Register/Bit Field/Programming Model | Value |
|---|---|-------|
| Force destination domain to be awake (SW_WKUP) | CM_Dest_CDname_CLKSTCTRL[1:0] CLKTRCTRL | 0x2 |
| Wait until power domain which encloses the destination domain is ON | PM_Dest_PDname_PWRSTST | =0x3 |
| Change the static dependency | CM_Src_CDname_STATICDEP[x] Dest_CDname_STATDEP | 0x1 |
| Put destination domain back to automatic transition (HW_AUTO) | CM_Dest_CDname_CLKSTCTRL[1:0] CLKTRCTRL | 0x3 |

3.10.3 Power Management Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and control of the power domain in the device.

3.10.3.1 Global Initialization

3.10.3.1.1 Surrounding Module Global Initialization

It does not require any initialization sequence of any surrounding modules within the device. The external power IC and the device clocks should be active.

3.10.3.1.2 Power Management Global Initialization

3.10.3.1.2.1 Main Sequence – Power Domain Global Initialization and Setting

This procedure initializes the power domain of the device after a power-on or software reset.

Table 3-346. Power Domain Global Initialization

| Step | Register/Bit Field/Programming Model | Value |
|--|--|--|
| Configure memory area power state when the power domain is on. Not all memory area states are programmable. | PM_Power Domain name_PWRSTCTRL[x] Memory Bank name_ONSTATE | 0x0: Off 0x1: RETAINED 0x3: On |
| Configure memory area power state when the power domain transitions to RETENTION state. Not all memory area states are programmable. | PM_Power Domain name_PWRSTCTRL[x] Memory Bank name_RETSTATE | 0x0: Off 0x1: RETAINED |
| Configure logic area RETENTION power state when the power domain transitions to RETENTION state. | PM_Power Domain name_PWRSTCTRL[2] LOGICRETSTATE | 0x0: OSWR 0x1: CSWR |
| Select target power state of the power domain. Not all states are programmable. | PM_Power Domain name_PWRSTCTRL[1:0] POWERSTATE | 0x0: OFF 0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE |
| Wait until power state change is complete | PM_Power Domain name_PWRSTST[1:0] POWERSTATEST | 0x0: OFF 0x1: RETENTION 0x2: ON-INACTIVE 0x3: ON-ACTIVE |

3.10.3.2 Forced Memory Area State Change With Power Domain ON

This procedure initiates a forced memory area state change while the power domain is ON.

Table 3-347. Forced Memory Area State Change With Power Domain ON

| Step | Register/Bit Field/Programming Model | Value |
|--|---|--------------------------------------|
| Configure memory area target power state. Not all memory area states are programmable. | PM_Power Domain name_PWRSTCTRL[x] Memory Bank name_ONSTATE | 0x0: OFF 0x1: RETAINED 0x3: ON |
| Get memory area current state | PM_Power Domain name_PWRSTST[x] Memory Bank name_STATEST | 0x0: OFF 0x1: RETAINED 0x3: ON |

3.10.3.3 Forced Power Domain Low-Power State Transition

This procedure initiates a power state transition on a power domain from current low-power state (ON-INACTIVE or RETENTION) to a lower power state (RETENTION, OFF).

Table 3-348. Forced Memory Area State Change With Power Domain On

| Step | Register/Bit Field/Programming Model | Value |
|---|--|----------------------------|
| Select target low-power state of the power domain. Not all states are programmable. | PM_Power Domain name_PWRSTCTRL[1:0] POWERSTATE | 0x0: Off 0x1: Retention |
| Force power domain low-power state transition. | PM_Power Domain name_PWRSTCTRL[4] LOWPOWERSTATECHANGE | 0x1: Force change |
| Wait until state change is complete | PM_Power Domain name_PWRSTCTRL[4] LOWPOWERSTATECHANGE | 0x0: Change complete |
| Get current power state. | PM_Power Domain name_PWRSTST[1:0] POWERSTATEST | 0x0: Off 0x1: Retention |

3.10.4 Voltage Management Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and management of the voltage domains of the device.

3.10.4.1 Global Initialization

3.10.4.1.1 Surrounding Module Global Initialization

It does not require any initialization sequence of any surrounding modules within the device. The external power IC and the device clocks should be active.

3.10.4.1.2 Voltage Management Global Initialization

3.10.4.1.2.1 Main Sequence – Voltage Management Global Initialization and Setting

This procedure initializes the voltage management framework in the device.

Table 3-349. Power Domain Global Initialization

| Step | Register/Bit Field/Programming Model | Value |
|--------------------------------------|--|-------|
| Initialize SmartReflex modules | See Section 3.10.4.1.3 . | |
| Initialize voltage processor modules | See Section 3.10.4.1.4 . | |
| Initialize voltage controller module | See Section 3.10.4.1.5 . | |

3.10.4.1.3 SmartReflex Module Initialization

This procedure initializes the SmartReflex module.

Table 3-350. SmartReflex Module Configuration

| Step | Register/Bit Field/Programming Model | Value |
|---------------------------------------|--|-------|
| Configure clock | See Section 3.10.4.1.3.1 . | |
| Configure sensor | See Section 3.10.4.1.3.2 . | |
| Configure accumulator and min/max/avg | See Section 3.10.4.1.3.3 . | |
| Configure error generator | See Section 3.10.4.1.3.4 . | |
| Configure interrupt generator | See Section 3.10.4.1.3.5 . | |
| Enable module | SRn.SRCONFIG[11] SR_EN | 0x1 |

3.10.4.1.3.1 Subsequence – Clock Configuration

This procedure configures the clock for the SmartReflex module.

Table 3-351. SmartReflex Module Clock Configuration

| Step | Register/Bit Field/Programming Model | Value |
|-----------------------------------|--|---|
| Configure desired clock frequency | SRn.SRCONFIG[21:12] SRCLKLENGTH | xx ⁽¹⁾ |
| Configure desired idle mode | SRn.ERRCONFIG[25:24] IDLEMODE | 0x0: Forced-idle 0x1: No-idle 0x2: Smart-idle 0x3: Smart-idle Wakeup |
| Enable/disable wake-up feature | SRn.ERRCONFIG[26] WAKEUPENABLE | 0x0: Disable 0x1: Enable |
| Enable clock | CM_ALWON_SR name_CLKCTRL[1:0] MODULEMODE | 0x2: Enable |

⁽¹⁾ See [Equation 1](#) for clock frequency calculation.

3.10.4.1.3.2 Subsequence – Sensor Configuration

This procedure configures the sensor in the SmartReflex module.

Table 3-352. SmartReflex Module Sensor Configuration

| Step | Register/Bit Field/Programming Model | Value |
|----------------------|--------------------------------------|-------|
| Enable sensor core A | SRn.SRCONFIG[1] SENENABLE | 0x1 |
| Enable sensor core B | SRn.SRCONFIG[0] SENPENABLE | 0x1 |
| Enable sensor core | SRn.SRCONFIG[10] SENENABLE | 0x1 |

3.10.4.1.3.3 Subsequence – Accumulator and Min/Max/Avg Configuration

This procedure configures the accumulator and min/max/avg part of the SmartReflex module.

Table 3-353. Accumulator and Min/Max/Avg Configuration

| Step | Register/Bit Field/Programming Model | Value |
|---|--------------------------------------|--------------------|
| Set size of the accumulator | SRn.SRCONFIG[31:22] ACCUMDATA | xxx ⁽¹⁾ |
| Set average weight parameter for the sensor A | SRn.AVGWEIGHT[1:0] SENNAVGWEIGHT | x ⁽¹⁾ |
| Set average weight parameter for the sensor B | SRn.AVGWEIGHT[3:2] SENPAVGWEIGHT | x ⁽¹⁾ |
| Enable minimum/maximum/average | SRn.SRCONFIG[8] MINMAXAVGENABLE | 0x1 |

⁽¹⁾ These parameters are calculated as given in [Section 3.8.3.2.3, SmartReflex Submodules](#).

3.10.4.1.3.4 Subsequence – Error Generator Configuration

This procedure configures the error generator part of the SmartReflex module.

Table 3-354. Error Generator Configuration

| Step | Register/Bit Field/Programming Model | Value |
|---|---------------------------------------|-------------------|
| Configure four reference value parameters | SRn.NVALUEREICIPROCAL[23:20] SENPGAIN | x ⁽¹⁾ |
| | SRn.NVALUEREICIPROCAL[19:16] SENNGAIN | x ⁽¹⁾ |
| | SRn.NVALUEREICIPROCAL[15:8] SENPRN | xx ⁽¹⁾ |
| | SRn.NVALUEREICIPROCAL[7:0] SENNRN | xx ⁽¹⁾ |
| Enable the error generator | SRn.SRCONFIG[9] ERRORGENERATORENABLE | 0x1 |

⁽¹⁾ Configured according to the values read for the current operating voltage level from the control module register in [Section 3.8.3.2.3, SmartReflex Submodules](#).

3.10.4.1.3.5 Subsequence – Interrupt Generator Configuration

This procedure configures the interrupt generator part of the SmartReflex module.

Table 3-355. Interrupt Generator Configuration

| Step | Register/Bit Field/Programming Model | Value |
|---|---|-------|
| Set the four reference value parameters | SRn.ERRCONFIG[18:16] ERRWEIGHT | x |
| | SRn.ERRCONFIG[15:8] ERRMAXLIMIT | xx |
| | SRn.ERRCONFIG[7:0] ERRMINLIMIT | xx |
| IF : Automatic voltage control using voltage processor | Software test condition | |
| Clear voltage processor bounds interrupt status | SRn.ERRCONFIG[23] VPBOUNDSINTSTATENA | 0x1 |
| Unmask voltage processor bounds interrupt | SRn.ERRCONFIG[22] VPBOUNDSINTENABLE | 0x1 |
| ELSE-IF : Software-controlled voltage management | Software test condition | |
| Unmask Processor interrupt events | SRn.IRQENABLE_SET[3] MCUACCUMINTENASET | 0x1 |
| | SRn.IRQENABLE_SET[2] MCUVALIDINTENASET | 0x1 |
| | SRn.IRQENABLE_SET[1] MCUBOUNDSINTENASET | 0x1 |
| ENDIF | | |

3.10.4.1.4 Voltage Processor Initialization

This procedure initializes the voltage processor.

Table 3-356. Voltage Processor Module Initialization

| Step | Register/Bit Field/Programming Model | Value |
|--------------------------------------|--|-------|
| Configure error-to-voltage converter | See Section 3.10.4.1.4.1 . | |
| Configure PRCM | See Section 3.10.4.1.4.2 . | |
| Mask/unmask interrupt events | PRCM.PRM_IRQENABLE_Processor name | |
| Enable module | PRCM.PRM_Voltage Processor name_CONFIG[0] VPENABLE | 0x1 |

3.10.4.1.4.1 Subsequence – Error-to-Voltage Converter Configuration

This procedure configures the error-to-voltage converter of the voltage processor.

Table 3-357. Error-to-Voltage Converter Configuration

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------------------|
| Set error offset | PRCM.PRM_Voltage Processor name_CONFIG[31:24] ERROROFFSET | xx ⁽¹⁾ |
| Set error gain | PRCM.PRM_Voltage Processor name_CONFIG[23:16] ERRORGAIN | xx ⁽¹⁾ |
| Set SMPS negative voltage step slew rate | PRCM.PRM_Voltage Processor name_VSTEPMIN[23:8] SMPSWAITTIMEMIN | xx ⁽¹⁾ |
| Set SMPS minimum voltage step size | PRCM.PRM_Voltage Processor name_VSTEPMIN[7:0] VSTEPMIN | xx ⁽¹⁾ |
| Set SMPS positive voltage step slew rate | PRCM.PRM_Voltage Processor name_VSTEPMAX[23:8] SMPSWAITTIMEMAX | xx ⁽¹⁾ |
| Set SMPS maximum voltage step size | PRCM.PRM_Voltage Processor name_VSTEPMAX[7:0] VSTEPMAX | xx ⁽¹⁾ |
| Set SMPS minimum voltage limit | PRCM.PRM_Voltage Processor name_VLIMITTO[23:16] VDDMIN | xx ⁽¹⁾ |
| Set SMPS maximum voltage limit | PRCM.PRM_Voltage Processor name_VLIMITTO[31:24] VDDMAX | xx ⁽¹⁾ |

(1) Depend on the characteristics of the SMPS.

3.10.4.1.4.2 Subsequence – FSM Configuration

Ensure that VP voltage value is aligned with the current PMIC (external power IC) voltage value and if required perform the procedure in [Table 3-358](#).

Table 3-358. FSM Configuration

| Step | Register/Bit Field/Programming Model | Value |
|---|--|-------|
| Set target initial voltage level of the SMPS | PRCM.PRM_Voltage Processor name_CONFIG[15:8] INITVOLTAGE | xx |
| Assert the initial voltage into the voltage processor FSM | PRCM.PRM_Voltage Processor name_CONFIG[2] INITVDD | 0x1 |
| Clear the initialize bit | PRCM.PRM_Voltage Processor name_CONFIG[2] INITVDD | 0x0 |

3.10.4.1.5 Voltage Controller Initialization

This procedure initializes the voltage controller.

Table 3-359. Voltage Controller Module Initialization

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------------------|
| Configure power IC slave addresses | PRCM.PRM_VC_SMPS_SA[x] SA_Voltage Domain name | xx ⁽¹⁾ |
| Configure voltage configuration register addresses | PRCM.PRM_VC_VAL_SMPS_RA_VOL[x] VOLRA_Voltage Domain name | xx ⁽¹⁾ |
| Configure command configuration register addresses | PRCM.PRM_VC_VAL_SMPS_RA_CMD[x] CMDRA_Voltage Domain name | xx ⁽¹⁾ |
| Configure voltage domain command values | PRCM.PRM_VC_VAL_CMD_Voltage Domain name[x] Command name | xx ⁽¹⁾ |
| Configure pointers for the VDD channels | See Section 3.10.4.1.5.1 . | |
| Configure I ² C interface | See Section 3.10.4.1.5.2 . | |

(1) Depend on the characteristics of the SMPS.

3.10.4.1.5.1 Subsequence – VDD Channels Pointers Configuration

This procedure configures the FSM of the voltage processor.

Table 3-360. VDD Channel Pointer Configuration

| Step | Register/Bit Field/Programming Model | Value |
|---|--|-------|
| Set slave address pointer | PRCM.PRM_VC_CFG_CHANNEL[x] SA_Voltage Domain name | |
| Set voltage configuration register address pointer | PRCM.PRM_VC_CFG_CHANNEL[x] RAV_Voltage Domain name | |
| Set command configuration register address pointer | PRCM.PRM_VC_CFG_CHANNEL[x] RAC_Voltage Domain name | |
| Select voltage or command configuration register for FSM commands | PRCM.PRM_VC_CFG_CHANNEL[x] RACEN_Voltage Domain name | |
| Set command voltage level selection pointer | PRCM.PRM_VC_CFG_CHANNEL[x] CMD_Voltage Domain name | |

(1) Depend on the connectivity characteristics of the SMPS.

3.10.4.1.5.2 Subsequence – I²C Configuration

This procedure configures the I²C in the voltage controller.

Table 3-361. I²C Configuration

| Step | Register/Bit Field/Programming Model | Value |
|---|---------------------------------------|-----------------------------|
| Enable/disable I ² C bus double digital filter | PRCM.PRM_VC_CFG_I2C_MODE[6] DFILTEREN | |
| Set master code value for I ² C HS preamble | PRCM.PRM_VC_CFG_I2C_MODE[2:0] HSMCODE | |
| Enable/disable I ² C HS mode | PRCM.PRM_VC_CFG_I2C_MODE[3] HSMODEEN | 0x0: Disable 0x1: Enable |
| Enable/disable repeated start operation. | PRCM.PRM_VC_CFG_I2C_MODE[4] SRMODEEN | 0x0: Disable 0x1: Enable |

3.10.4.2 Disable Sequence for AVS (SmartReflex) and VP

3.10.4.2.1 Disable the Error Generator Module

Table 3-362. Disable the Error Generator

| Step | Register/Bit Field/Programming Model | Value |
|---|--------------------------------------|-------|
| Disable the VP BOUND IRQ ⁽¹⁾ | SRn.ERRCONFIG[22] VPBOUNDSINTENABLE | 0x0 |
| Disable the sensors | SRn.SRCONFIG[10] SENENABLE | 0x0 |
| Disable the Error Generator module | SRn.SRCONFIG[9] ERRORGENERATORENABLE | 0x0 |

⁽¹⁾ At this stage, it is important to not write 0x1 on bit SRn.ERRCONFIG[23] VPBOUNDSINTSTATENA

3.10.4.2.2 Disable the Voltage Processor

Table 3-363. Disable the Voltage Processor

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------|
| Disable the VP module | PRCM.PRM_Voltage Processor name_CONFIG[0] VPENABLE | 0x0 |
| Wait for VP being idled by pooling bit VPINIDLE to 0x1 | PRCM.PRM_Voltage Processor name_STATUS[0] VPINIDLE | ==0x1 |

3.10.4.2.3 Disable AVS (SmartReflex)

Table 3-364. Disable the SmartReflex Module

| Step | Register/Bit Field/Programming Model | Value |
|---|--|-------|
| Enable the MPU Disable Acknowledge IRQ | SRn.IRQENABLE_SET[0] MCUDISABLEACTINTENASET | 0x1 |
| Disable the SmartReflex module | SRn.SRCONFIG[11] SRENABLE | 0x0 |
| Clear the VP BOUND IRQ status bit only if it is set | SRn.ERRCONFIG[23] VPBOUNDSINTSTATENA | 0x1 |
| Disable the following MPU IRQs or at least check these IRQs are not enabled: ACCUM IRQ, VALID IRQ and BOUND IRQ | SRn.IRQENABLE_CLR[3] MCUACCUMINTENACLRL SRn.IRQENABLE_CLR[2] MCUVALIDINTENACLRL SRn.IRQENABLE_CLR[1] MCUBOUNDSINTENACLRL | 0x1 |

Table 3-364. Disable the SmartReflex Module (continued)

| Step | Register/Bit Field/Programming Model | Value |
|---|--|-------|
| Clear the following MPU IRQ statuses: ACCUM IRQ, VALID IRQ and BOUND IRQ | SRn.IRQSTATUS[3] MCUACCUMINTSTATENA SRn.IRQSTATUS[2] MCUVALIDINTSTATENA SRn.IRQSTATUS[1] MCUBOUNDSINTSTATENA | 0x1 |
| Wait for the MPU Disable Acknowledge IRQ | SRn.IRQSTATUS[0] MCUDISABLEACKINTSTATENA | ==0x1 |
| Disable the MPU Disable Acknowledge IRQ status | SRn.IRQENABLE_CLR[0] MCUDISABLEACKINTENACL | 0x1 |
| Clear the MPU Disable Acknowledge IRQ status | SRn.IRQSTATUS[0] MCUDISABLEACKINTSTATENA | 0x1 |

3.10.4.3 Changing OPP

This procedure allows changing of the voltage of the external SMPS from one OPP to the other. It also covers the programming sequence for ABB LDO if the OPP change requires a change in state of the ABB LDO.

NOTE: When switching from the current OPP to a target OPP, if the clock frequency of the target OPP is less than that of the current OPP, the clock frequency is first switched to the lower frequency of target OPP, and only then is the voltage scaling initiated. However, if the clock frequency of the target OPP is greater than that of the current OPP, voltage scaling is initiated before frequency scaling.

Table 3-365. Initial Settings

| Step Description | Register/Bit Field/Programming Model | Value |
|--|---|-------|
| Initial setting for activating ABB in OPP_NITRO mode | PRM_LDO_ABB_MPU_SETUP[2] or PRM_LDO_ABB_IVA_SETUP[2] ACTIVE_FBB_SEL | 0x1 |
| Initial setting for activating ABB in OPP_TURBO mode | PRM_LDO_ABB_MPU_SETUP[1] or PRM_LDO_ABB_IVA_SETUP[1] ACTIVE_RBB_SEL | 0x1 |
| Enable ABB power management of the ABB LDO | PRM_LDO_ABB_MPU_SETUP[0] or PRM_LDO_ABB_IVA_SETUP[0] SR2EN | 0x1 |

The above settings are sampled by activating OPP_CHANGE (that is, PRM_LDO_ABB_MPU_CTRL[2] OPP_CHANGE = 0x1 or PRM_LDO_ABB_IVA_CTRL[2] OPP_CHANGE = 0x1).

The programming steps in Table 3-366 and Table 3-367 assume the above settings are applied during the initialization phase.

Table 3-366. Transition From Lower OPP to Higher OPP

| Step ID | Step Description | Register/Register Bit Field/Programming Model | Value |
|---------|---|--|-------|
| 1 | Disable the SmartReflex module. | SRn.SRCONFIG[11] SR_EN | 0x0 |
| 2 | Mask SmartReflex interrupts | | |
| 3 | Disable the voltage processor module | PRM_Voltage Processor name_CONFIG[0] VPENABLE | 0x0 |
| 4 | Set the new OPP voltage value | PRM_Voltage Processor name_CONFIG[15:8] INITVOLTAGE | |
| 5 | Triggers a write of the value in the INITVOLTAGE into the voltage processor | PRM_Voltage Processor name_CONFIG[2] INITVDD | 0x1 |
| 6 | Force update of the SMPS | PRM_Voltage Processor name_CONFIG[1] FORCEUPDATE | 0x1 |

Table 3-366. Transition From Lower OPP to Higher OPP (continued)

| Step ID | Step Description | Register/Register Bit Field/Programming Model | Value |
|---------|---|---|--------------------------------------|
| 7 | Wait for voltage convergence to new OPP voltage (that is, wait for interrupt PRM_IRQSTATUS_MPU_A9_2 [5] VP_MPU_TRANXDONE_ST = 0x1 | PRM_IRQSTATUS_MPU_A9_2 [0] VP_MPU_OPPCHANGEDONE_ST | |
| 8 | Select the next OPP for the ABB LDO (Fast in case of ABB Set1) (Slow in case of ABB Set2) | PRM_LDO_ABB_MPU_CTRL [1:0] or PRM_LDO_ABB_IVA_CTRL [1:0] OPP_SEL | 0x1 for fast OPP 0x3 for slow OPP |
| 9 | Initiate the state change for the ABB LDO | PRM_LDO_ABB_MPU_CTRL [2] or PRM_LDO_ABB_IVA_CTRL [2] OPP_CHANGE | 0x1 |
| 10 | Wait until ABB LDO state transition completes | Pool PRM_LDO_ABB_MPU_CTRL [6]/ PRM_LDO_ABB_IVA_CTRL [6] SR2_IN_TRANSITION Or wait for interrupt PRM_IRQSTATUS_MPU_A9_2 [0] VP_MPU_OPPCHANGEDONE_ST | |
| 11 | Change MPU/IVA/CORE frequency to the new OPP frequency | | |
| 12 | Enable the SmartReflex module and interrupts | SRn.SRCONFIG [11] SR_EN | 0x1 |

NOTE: In [Table 3-366](#), steps 8 to 10 are only needed in case of ABB LDO state change. Steps 11 and 12 can be swapped.

Table 3-367. Transition From Higher OPP to Lower OPP

| Step ID | Step Description | Register/Register Bit Field/Programming Model | Value |
|---------|--|---|---|
| 1 | Change MPU/IVA/CORE frequency to new OPP frequency | | |
| 2 | Disable the SmartReflex module. | SRn.SRCONFIG [11] SR_EN | 0x0 |
| 3 | Mask SmartReflex interrupts | | |
| 4 | Disable the voltage processor module | PRM_Voltage Processor name_CONFIG [0] VPENABLE | 0x0 |
| 5 | Select the next OPP for the ABB LDO (Slow in case of ABB Set2) (Nominal in case of bypass) | PRM_LDO_ABB_MPU_CTRL [1:0] or PRM_LDO_ABB_IVA_CTRL [1:0] OPP_SEL | 0x0 for nominal OPP 0x3 for slow OPP |
| 6 | Initiate the state change for the ABB LDO | PRM_LDO_ABB_MPU_CTRL [2] or PRM_LDO_ABB_IVA_CTRL [2] OPP_CHANGE | 0x1 |
| 7 | Wait until ABB LDO state transition completes | Pool PRM_LDO_ABB_MPU_CTRL [6]/ PRM_LDO_ABB_IVA_CTRL [6] SR2_IN_TRANSITION Or wait for interrupt PRM_IRQSTATUS_MPU_A9_2 [0] VP_MPU_OPPCHANGEDONE_ST | |
| 8 | Set the new OPP voltage value | PRM_Voltage Processor name_CONFIG [15:8] INITVOLTAGE | |
| 9 | Triggers a write of the value in the INITVOLTAGE into the voltage processor | PRM_Voltage Processor name_CONFIG [2] INITVDD | 0x1 |
| 10 | Force update of the SMPS | PRM_Voltage Processor name_CONFIG [1] FORCEUPDATE | 0x1 |
| 11 | Wait for voltage convergence to new OPP voltage (that is, wait for interrupt PRM_IRQSTATUS_MPU_A9_2 [5] VP_MPU_TRANXDONE_ST = 0x1) | PRM_IRQSTATUS_MPU_A9_2 [0] VP_MPU_OPPCHANGEDONE_ST | |

Table 3-367. Transition From Higher OPP to Lower OPP (continued)

| Step ID | Step Description | Register/Register Bit Field/Programming Model | Value |
|---------|--|---|-------|
| 12 | Enable the SmartReflex module and interrupts | SRn.SRCONFIG[11] SR_EN | 0x1 |

NOTE: In [Table 3-367](#), steps 5 to 7 are only needed in case of ABB LDO state change.

| Bits | Field Name | Description | Type | Reset |
|------|-----------------|--|---------------|-------|
| 31 | ABB_IVA_DONE_ST | IVA ABB mode change done. This status is set when OPP_CHANGE bit is cleared by hardware in PRM_LDO_ABB_IVA_CRTL register. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 30 | VC_IVA_VPACK_ST | Voltage Controller IVA voltage processor command acknowledge status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------------------|---|---------------|-------|
| 29 | VP_IVA_TRANXDONE_ST | Voltage Processor IVA transaction completion status. This status is set when a transaction is completed in the voltage processor, including ABB mode change done if applicable (OPP_CHANGE bit cleared in PRM_LDO_ABB_IVA_CRTL). It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 28 | VP_IVA_EQVALUE_ST | Voltage Processor IVA voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 27 | VP_IVA_NOSMPSACK_ST | Voltage Processor IVA timeout event status. This status is set when the timeout occurred before the SMPS acknowledge. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 26 | VP_IVA_MAXVDD_ST | Voltage Processor IVA voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 25 | VP_IVA_MINVDD_ST | Voltage Processor IVA voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 24 | VP_IVA_OPPCHANGEDONE_ST | Voltage Processor IVA OPP change done status, including ABB mode change done if applicable (OPP_CHANGE bit cleared in PRM_LDO_ABB_IVA_CRTL). It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 23 | RESERVED | | R | 0 |
| 22 | VC_CORE_VPACK_ST | Voltage Controller CORE voltage processor command acknowledge status 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 21 | VP_CORE_TRANXDONE_ST | Voltage Processor CORE transaction completion status. This status is set when a transaction is completed in the voltage processor. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 20 | VP_CORE_EQVALUE_ST | Voltage Processor CORE voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 19 | VP_CORE_NOSMPSACK_ST | Voltage Processor CORE timeout event status. This status is set when the timeout occurred before the SMPS acknowledge. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|--------------------------|--|---------------|-------|
| 18 | VP_CORE_MAXVDD_ST | Voltage Processor CORE voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 17 | VP_CORE_MINVDD_ST | Voltage Processor CORE voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 16 | VP_CORE_OPPCHANGEDONE_ST | Voltage Processor CORE OPP change done status. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 15 | Reserved | | R | 0 |
| 14 | VC_BYPASSACK_ST | Voltage Controller bypass command acknowledge status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 13 | VC_TOERR_ST | Voltage Controller timeout error event status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 12 | VC_RAERR_ST | Voltage Controller register address acknowledge error event status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 11 | VC_SAERR_ST | Voltage Controller slave address acknowledge error event status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0x0 |
| 10 | RESERVED | | R | 0 |
| 9 | IO_ST | I/O pad event interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 8 | TRANSITION_ST | Software supervised transition completed event interrupt status (any domain). Asserted upon completion of any clock domain force wakeup transition or upon completion of any power domain sleep transition with at least one enclosed clock domain configured in forced-sleep. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | DPLL_ABE_RECAL_ST | ABE DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 3 | DPLL_PER_RECAL_ST | PER DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 2 | DPLL_IVA_RECAL_ST | IVA DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|--------------------|---|---------------|-------|
| 1 | DPLL_MPU_RECAL_ST | MPU DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 0 | DPLL_CORE_RECAL_ST | CORE DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------------------|---|---------------|-------|
| 31 | ABB_IVA_DONE_ST | IVA ABB mode change done. This status is set when OPP_CHANGE bit is cleared by hardware in PRM_LDO_ABB_IVA_CTRL register. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 30 | VC_IVA_VPACK_ST | Voltage Controller IVA voltage processor command acknowledge status 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 29 | VP_IVA_TRANXDONE_ST | Voltage Processor IVA transaction completion status. This status is set when a transaction is completed in the voltage processor, including ABB mode change done if applicable (OPP_CHANGE bit cleared in PRM_LDO_ABB_IVA_CTRL). It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 28 | VP_IVA_EQVALUE_ST | Voltage Processor IVA voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 27 | VP_IVA_NOSMPSACK_ST | Voltage Processor IVA timeout event status. This status is set when the timeout occurred before the SMPS acknowledge. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 26 | VP_IVA_MAXVDD_ST | Voltage Processor IVA voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 25 | VP_IVA_MINVDD_ST | Voltage Processor IVA voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 24 | VP_IVA_OPPCHANGEDONE_ST | Voltage Processor IVA OPP change done status, including ABB mode change done if applicable (OPP_CHANGE bit cleared in PRM_LDO_ABB_IVA_CTRL). It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 23 | RESERVED | | R | 0 |
| 22 | VC_CORE_VPACK_ST | Voltage Controller CORE voltage processor command acknowledge status 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 21 | VP_CORE_TRANXDONE_ST | Voltage Processor CORE transaction completion status. This status is set when a transaction is completed in the voltage processor. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|--------------------------|--|---------------|-------|
| 20 | VP_CORE_EQVALUE_ST | Voltage Processor CORE voltage value change event. This status is set when an update has been requested but the new voltage value is the same as the current SMPS voltage value. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 19 | VP_CORE_NOSMPSACK_ST | Voltage Processor CORE timeout event status. This status is set when the timeout occurred before the SMPS acknowledge. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 18 | VP_CORE_MAXVDD_ST | Voltage Processor CORE voltage higher limit event status. This status is set when the voltage higher limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 17 | VP_CORE_MINVDD_ST | Voltage Processor CORE voltage lower limit event status. This status is set when the voltage lower limit is reached. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 16 | VP_CORE_OPPCHANGEDONE_ST | Voltage Processor CORE OPP change done status. It is cleared by software. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 15 | RESERVED | | R | 0 |
| 14 | VC_BYPASSACK_ST | Voltage Controller bypass command acknowledge status 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 13 | VC_TOERR_ST | Voltage Controller timeout error event status 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 12 | VC_RAERR_ST | Voltage Controller register address acknowledge error event status 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 11 | VC_SAERR_ST | Voltage Controller slave address acknowledge error event status 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 10 | FORCEWKUP_ST | CORTEXM3 domain software supervised wakeup transition completed event interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 9 | IO_ST | I/O pad event interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 8 | TRANSITION_ST | Software supervised transition completed event interrupt status (any domain). Asserted upon completion of any clock domain force wakeup transition or upon completion of any power domain sleep transition with at least one enclosed clock domain configured in forced-sleep. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|--------------------|---|---------------|-------|
| 7:5 | RESERVED | | R | 0x0 |
| 4 | DPLL_ABE_RECAL_ST | ABE DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 3 | DPLL_PER_RECAL_ST | PER DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 2 | DPLL_IVA_RECAL_ST | IVA DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |
| 1 | RESERVED | | R | 0 |
| 0 | DPLL_CORE_RECAL_ST | CORE DPLL recalibration interrupt status. 0x0: No interrupt 0x1: Interrupt is pending | RW W1toClr | 0 |

| RESERVED | | | | | | | | | | | | | | | L3INIT_BANK1_ONSTATE | RESERVED | | | | | | | L3INIT_BANK1_RETSTATE | RESERVED | | LOWPOWERSTATECHANGE | RESERVED | | LOGICRETSTATE | POWERSTATE | |

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------------|---|--------------------|--------|
| 31:18 | RESERVED | | R | 0x0000 |
| 17:16 | L3INIT_BANK1_ONSTATE | L3INIT BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON. | R Returns 1s | 0x3 |
| 15:9 | RESERVED | | R | 0x00 |
| 8 | L3INIT_BANK1_RETSTATE | L3INIT BANK1 state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state. | R | 0 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | LOWPOWERSTATECHANGE | Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON. | RW WSpecial | 0 |
| 3 | RESERVED | | R | 0 |
| 2 | LOGICRETSTATE | Logic state when power domain is RETENTION 0x0: Only retention registers are retained and remain logic is off when the domain is in RETENTION state. 0x1: Whole logic is retained when domain is in RETENTION state. | RW | 1 |
| 1:0 | POWERSTATE | Power state control 0x0: OFF state 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State | RW | 0x0 |

| RESERVED | | | | | | | | | | | | NONRETAINED_BANK_ONSTATE | | RETAINED_BANK_ONSTATE | | RESERVED | | | | | | | | NONRETAINED_BANK_RETSTATE | | RETAINED_BANK_RETSTATE | | RESERVED | | LOWPOWERSTATECHANGE | | RESERVED | | LOGICRETSTATE | | POWERSTATE | |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------------|---|-----------------|-------|
| 31:20 | RESERVED | | R | 0x000 |
| 19:18 | NONRETAINED_BANK_ONSTATE | NONRETAINED_BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON. | R Returns 1s | 0x3 |
| 17:16 | RETAINED_BANK_ONSTATE | RETAINED_BANK state when domain is ON. Read 0x3: Memory bank is on when the domain is ON. | R Returns 1s | 0x3 |
| 15:10 | RESERVED | | R | 0x00 |
| 9 | NONRETAINED_BANK_RETSTATE | NONRETAINED_BANK state when domain is RETENTION. Read 0x0: Memory bank is off when the domain is in the RETENTION state. | R | 0 |
| 8 | RETAINED_BANK_RETSTATE | RETAINED_BANK state when domain is RETENTION. Read 0x1: Memory bank is retained when domain is in RETENTION state. | R Returns 1s | 1 |
| 7:5 | RESERVED | | R | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|------|---------------------|---|----------------|-------|
| 4 | LOWPOWERSTATECHANGE | Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: Do not request a low power state change. 0x1: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON. | RW WSpecial | 0 |
| 3 | RESERVED | | R | 0 |
| 2 | LOGICRETSTATE | Logic state when power domain is RETENTION 0x0: Only retention registers are retained and remaining logic is off when the domain is in RETENTION state. 0x1: Whole logic is retained when domain is in RETENTION state. | RW | 1 |
| 1:0 | POWERSTATE | Power state control 0x0: Reserved 0x1: RETENTION state 0x2: INACTIVE state 0x3: ON State | RW | 0x3 |

| Bits | Field Name | Description | Type | Reset |
|-------|--------------|---|------|--------|
| 31:17 | RESERVED | | R | 0x0000 |
| 16 | GLOBAL_WUEN | Global I/O wakeup enable. This is a gating condition to all individual I/O WUEN coming from control module. Gating is done in the Spinner logic. 0x0: All individual I/O WUEN are gated in the Spinner logic (overriden to 0). 0x1: All individual I/O WUEN from control module are going to IOs. | RW | 0 |
| 15:10 | RESERVED | | R | 0x00 |
| 9 | WUCLK_STATUS | Gives value of WUCLKOUT signal coming back from I/O pad ring. | R | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------|---|------|-------|
| 8 | WUCLK_CTRL | Direct control on WUCLKIN signal to I/O pad ring. 0x0: WUCLKIN signal is driven to 0. I/O wakeup daisy chain is functional as well as I/O whose wakeup feature is enabled. 0x1: WUCLKIN signal is driven to 1. I/O wakeup daisy chain is reset and is latching current pad states and WUEN inputs. | RW | 0 |
| 7:6 | RESERVED | | R | 0x0 |
| 5 | IOON_STATUS | Gives the functional status of the I/O ring. Read 0x0: Part or all of the IOs are not in the ON state, that is in isolation state Read 0x1: All IOs are in the ON state | R | 1 |
| 4 | ISOOVR_EXTEND | Control non-EMIF I/O isolation extension upon a device wakeup from OFF mode. 0x0: Non-EMIF I/O isolation is not extended. "EMIF_ON" I/O transition happens as soon as automatic restore is completed 0x1: Non-EMIF I/O isolation is extended. "EMIF_ON" I/O transition is stalled | RW | 0 |
| 3:2 | RESERVED | | R | 0x0 |
| 1 | ISOCLK_STATUS | Gives value of ISOCLKOUT signal coming back from I/O pad ring. | R | 0 |
| 0 | ISOCLK_OVERRIDE | Override control on ISOCLKIN signal to I/O pad ring. Override should be used at boot time only when it is needed to change the mode of an I/O from 1.8-V default mode to 1.2-V mode. When not overridden, this signal is controlled by hardware only. 0x0: ISOCLKIN signal is not overridden. 0x1: ISOCLKIN signal is overridden to active value (1). | RW | 0 |

| DCC_COUNT_MAX | | | | | | | | DPLL_BYP_CLKSEL | DCC_EN | RESERVED | | | | DPLL_MULT | | | | | | | | RESERVED | | DPLL_DIV | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------|---|--------------------|-------|
| 31:24 | DCC_COUNT_MAX | The value "NbCycles" set in this field determines the duration of the clock ramp step during which the output frequency is $F_{dpll}/(2 \times M2)$. The duration is computed as $32 \times \text{NbCycles}$ of L4 clock cycles (100 MHz). Duration should be 2.5 μs to allow enough time for DCC to lock. This bit field is relevant only when DCC_EN = 1. | RW | 0x05 |
| 23 | DPLL_BYP_CLKSEL | Only CLKINPULOW bypass clock supported for this PLL | R Returns 1s | 1 |
| 22 | DCC_EN | Enable or disable duty cycle correction. Must be enabled only for frequency 1 GHz. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|------------|--|------|-------|
| | | When enabled, the CLKOUTHIF output of the DPLL is used after duty cycle correction instead of CLKOUT. The M3 divider is hard-wired to 1 so the lock frequency Fdpll is directly provided to MPU. 0x0: DCC disabled 0x1: DCC enabled | | |
| 21:19 | RESERVED | | R | 0x0 |
| 18:8 | DPLL_MULT | DPLL multiplier factor (2 to 2047). This register is automatically cleared to 0 when the DPLL_EN field in the *CLKMODE_DPLL* register is set to select MN bypass mode. (equal to input M of DPLL; M=2 to 2047 = DPLL multiplies by M). 0x0: Reserved 0x1: Reserved | RW | 0x000 |
| 7 | RESERVED | | R | 0 |
| 6:0 | DPLL_DIV | DPLL divider factor (0 to 127) (equal to input N of DPLL; actual division factor is N+1). | RW | 0x00 |
