10.3.4.4.5 Video Port Interface

NOTE: The signals described in this section are internal and not bounded outside the device. This section describes the internal connections between the DISPC and the DSI protocol engine.

[Table 10-496](#) and [Table 10-497](#) summarize the video interface signals.

- DSI1 has two video ports (VP1 and VP2):
 - VP1 is connected to the LCD1 output of DISPC.
 - VP2 is connected to the LCD2 output of DISPC.
- DSI2 has one video port (VP1):
 - VP1 is connected to the LCD2 output of DISPC.

These interfaces are used to connect the DISPC outputs to the DSI protocol engine to send real-time data streams. For video mode, only the active matrix timings are supported by DSI protocol engine.

When the two video ports of DSI1 are used for two video mode transfers, only the synchronization signals on video port 1 are used by the DSI protocol engine. The synchronization signals on video port 2 are ignored. When only one video mode is enabled, it must be connected to video port 1. It is not possible to enable video mode on video port 2 without enabling video mode on video 1 (dual-video mode). The HSYNC/VSNC/DE/DATA signals are driven on the rising or falling edge of the pixel clock (VP_PCLK).

Table 10-496. Video Port 1 Signals for DSI1 and DSI2 Protocol Engines

| Signal Name | Type ⁽¹⁾ | Description |
|----------------|---------------------|--|
| VP1_HSYNC | I | Horizontal synchronization signal |
| VP1_VSYNC | I | Vertical synchronization signal |
| VP1_DATA[23:0] | I | Parallel output data: Bits 0 to 23 |
| VP1_PCLK | I | Pixel clock. In case of STALL configuration, it is used to indicate when new data is on the data bus during the clock period of VP1_CLK. The VP1_PCLK is generated from VP1_CLK through division inside the DISPC. The clock ratio is indicated in the DSI_CTRL [4] VP_CLK_RATIO bit and must be aligned with the configuration of the clock divisor in the display controller (DISPC_DIVISOR1[7:0] PCD bit field for DISPC LCD1 output, and the DISPC_DIVISOR2[7:0] PCD bit field for DISPC LCD2 output). The source of the VP1_PCLK for DSI1 is the LCD1_PCLK. The source of the VP1_PCLK for DSI2 is LCD2_PCLK. For more information, see Section 10.2.4.1, Clock Configuration , and Section 10.3.4.2, DSI Clock Configuration . |

⁽¹⁾ I = Input; O = Output

Table 10-496. Video Port 1 Signals for DSI1 and DSI2 Protocol Engines (continued)

| Signal Name | Type ⁽¹⁾ | Description |
|-------------|---------------------|---|
| VP1_DE | I | Data enable |
| VP1_STALL | O | The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in STALL mode; in that mode, HSYNC and VSYNC are not generated). |
| VP1_CLK | I | DISPC internal clock. It is a free-running clock. The source of VP1_CLK for DSI1 is LCD1_CLK, divided down. The source of VP1_CLK for DSI2 is LCD2_CLK, divided down. For more information, see Section 10.2.4.1, Clock Configuration , and Section 10.3.4.2, DSI Clock Configuration . |

Table 10-497. Video Port 2 Signals for DSI1 Protocol Engine

| Signal Name | Type ⁽¹⁾ | Description |
|----------------|---------------------|---|
| VP2_HSYNC | I | Horizontal synchronization signal |
| VP2_VSYNC | I | Vertical synchronization signal |
| VP2_DATA[23:0] | I | Parallel output data: Bits 0 to 23 |
| VP2_PCLK | I | Pixel clock. In case of STALL configuration, it is used to indicate when new data is on the data bus during the clock period of VP2_CLK. The VP2_PCLK is generated from VP2_CLK through division inside the DISPC. The clock ratio is indicated in the DSI_CTRL2[4] VP_CLK_RATIO bit and must be aligned with the configuration of the clock divisor in the display controller (DISPC_DIVISOR2[7:0] PCD bit field for DISPC LCD2 output). The source of the VP2_PCLK for DSI1 is LCD2_PCLK. For more information, see Section 10.2.4.1, Clock Configuration , and Section 10.3.4.2, DSI Clock Configuration . |
| VP2_DE | I | Data enable |
| VP2_STALL | O | The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in STALL mode; in that mode, HSYNC and VSYNC are not generated). |
| VP2_CLK | I | DISPC internal clock. It is a free-running clock. The source of the VP2_CLK for DSI1 is LCD2_CLK, divided down. For more information, see Section 10.2.4.1, Clock Configuration , and Section 10.3.4.2, DSI Clock Configuration . |

⁽¹⁾ I = Input; O = Output

NOTE:

- The polarities of VP_HSYNC and VP_VSYNC are programmable by setting the [DSI_CTRL](#) and [DSI_CTRL2](#) registers.
- Clocks VP_CLK and VP_PCLK can have the same frequency.
- The number of bits to be captured on the video port (the width of the data bus) is defined in the [DSI_CTRL\[7:6\] VP_DATA_BUS_WIDTH](#) bit field for DSI1 and the [DSI_CTRL2\[7:6\] VP_DATA_BUS_WIDTH](#) for DSI2. The supported formats are 16, 18, and 24 bits.
- For the 18-bit pixel format using 24 bits on the DSI link, the format to be used by the DSI protocol engine is 24-bit because the DISPC must convert the 18-bit pixels into 24-bit pixels. There is no logic inside the DSI protocol engine to convert from 18-bit format to 24-bit format.

The data received on the video port can be stored in the line buffer memories or sent directly on the DSI interface in two cases:

- The line buffer size is too small compared to the line from the DISPC.
- There is no line buffer instantiated. If there is no line buffer, the burst mode, defined as frequency burst mode, cannot be used. Only transparency burst mode is supported.

NOTE: The [DSI_CTRL\[13:12\] LINE_BUFFER](#) and [DSI_CTRL2\[13:12\] LINE_BUFFER](#) bit fields define the number of lines to be used for transferring data from the video port to the DSI1 and DSI2 link.

10.3.4.4.5.1 Video Port Used for Video Mode

If the video port is used for video mode, VP_STALL is not used. [Table 10-498](#) and [Table 10-499](#) list the active signals on the video port.

Table 10-498. Video Port 1 for DSI1 and DSI2 in the Context of Video Mode

| Signal Name | Type ⁽¹⁾ | Description |
|----------------|---------------------|--|
| VP1_HSYNC | I | Horizontal synchronization signal |
| VP1_VSYNC | I | Vertical synchronization signal |
| VP1_DATA[23:0] | I | Parallel output data: Bits 0 to 23 |
| VP1_PCLK | I | Pixel clock |
| VP1_DE | I | Data enable |
| VP1_CLK | I | It is a free-running clock used as the DISPC functional clock. |

⁽¹⁾ I = Input; O = Output

Table 10-499. Video Port 2 for DSI1 in the Context of Video Mode

| Signal Name | Type ⁽¹⁾ | Description |
|----------------|---------------------|--|
| VP2_HSYNC | I | Horizontal synchronization signal |
| VP2_VSYNC | I | Vertical synchronization signal |
| VP2_DATA[23:0] | I | Parallel output data: Bits 0 to 23 |
| VP2_PCLK | I | Pixel clock |
| VP2_DE | I | Data enable |
| VP2_CLK | I | It is a free-running clock used as the DISPC functional clock. |

⁽¹⁾ I = Input; O = Output

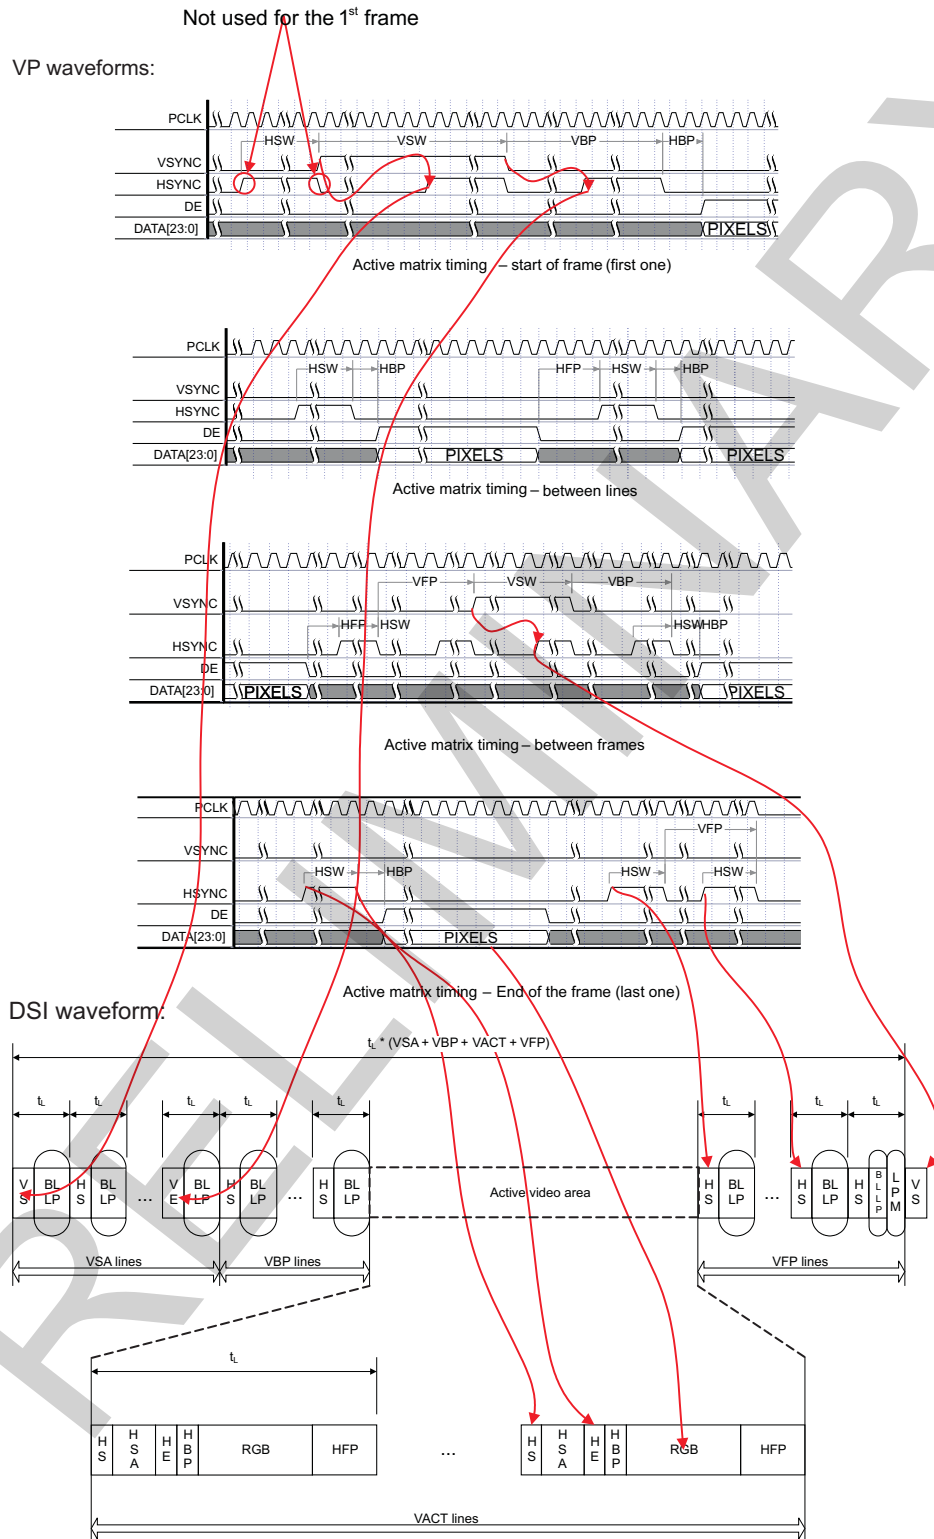

Three video modes are available:

- No-line buffer: The data received on the video port are directly outputted to the DSI port without buffering. The ratio of VP_PCLK and the DSI HS clock period must ensure the same throughput on the two ports (the two clocks must be generated using the same PLL; the subsystem must provide this configuration).
- One-line buffer:
 - The data can be transferred as described in the no-line buffer configuration.
 - The data are first stored in the line buffer; and then when all the data for one line are received, the DSI protocol engine sends the entire line. Software must adjust timings to let enough time for storing all line data into the line buffer before sending to DSI outputs. The synchronization packets are never stored in the line buffer.
- Two-line buffers:
 - The data can be transferred as described in the one-line buffer configuration.
 - One line is stored when the second line is output on the DSI port. This allows burst capability. While receiving the first line of the frame, no RGB packets are sent, because the line buffers are empty. To send the last line of the frame, a dummy line must be provided by the display controller to flush the line buffers. The synchronization packets are never stored in the line buffer.

NOTE: If more active lines are received on the video port than the number of lines defined in the [DSI_VM_TIMING3\[15:0\]](#) VACT bit field, the extra lines are discarded by the DSI protocol engine. These lines are treated as blanking lines.

[Figure 10-130](#) through [Figure 10-132](#) show these three video modes.

Figure 10-130. DSI Video Mode Without Burst (No-Line Buffer)

Active video area

VBP lines

VFP lines

VACT lines

Timeline labels: H S A, H E, H B P, RGB, HFP

Display Subsystem 2485

NOTE: In [Figure 10-130](#) through [Figure 10-132](#):

- When HSYNC start and HSYNC end short packets are not generated (HSA does not exist), the HBP signal must not be 0.
- Software must ensure that VBP is always defined so that there is at least one HSYNC during VBP.
- In blanking low-power mode (BL-LP), two options are possible:
 - The lane remains in ULPS, and the [DSI_CTRL\[20\]](#) BLANKING_MODE bit is set to 0x0.
 - Dummy bytes are sent during LP with the [DSI_CTRL\[20\]](#) BLANKING_MODE bit set to 0x1; the number of sent bytes is determined by the [DSI_VM_TIMING6\[15:0\]](#) BL_LP_INTERLEAVING bit field.

In DSI video mode, if the VSA bit field in [DSI_VM_TIMING2](#) is set to 0x0, no vertical synchronization packet will be sent even if VP_VSYNC_START is set to 0x1 in [DSI_CTRL](#).

If the signal VP_DE is not asserted during enough VP_PCLK cycles to be able to capture the number of bytes defined in the word count of the header, the module must send the valid data received on the video port followed by bytes of 0s to match the required number of bytes to transmit. The VP_PCLK must be present during all extra cycles where the DSI protocol engine is expecting pixels.

If the VP_DE signal is asserted for too many VP_PCLK cycles, the module stops capturing the data on the video port while the number of bytes to capture, as defined in the word count field of the header, is reached.

The HS checks that the received synchronization events on the video port (VSYNC and HSYNC) are within the synchronization window based on expected timings. If the timings (internal and received) are out of sync, the interrupt for out-of-sync is generated and the interface is disabled (the [DSI_CTRL\[0\]](#) IF_EN bit is automatically reset by hardware). The unsynchronization window is defined by the [DSI_VM_TIMING2\[27:24\]](#) WINDOW_SYNC bit field.

10.3.4.4.5.2 Video Port Used for Command Mode

If the video port is used for command mode, the VP_HSYNC, VP_VSYNC, and VP_DE signals are not used. [Table 10-500](#) and [Table 10-501](#) describe the active signals on video port 1 and video port 2, respectively.

Table 10-500. Video Port 1 for DSI1 and DSI2 in the Context of Command Mode

| Signal Name | Type ⁽¹⁾ | Description |
|----------------|---------------------|--|
| VP1_DATA[23:0] | I | Parallel output data: Bits 0 to 23 |
| VP1_PCLK | I | One pulse is generated every time new data is output on the data bus. |
| VP1_STALL | O | The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in stall mode; in that mode, HSYNC and VSYNC are not generated). |
| VP1_CLK | I | DISPC internal clock: It is a free-running clock used as the DISPC functional clock. |

⁽¹⁾ I = Input; O = Output

Table 10-501. Video Port 2 for DSI1 in the Context of Command Mode

| Signal Name | Type ⁽¹⁾ | Description |
|----------------|---------------------|--|
| VP2_DATA[23:0] | I | Parallel output data: Bits 0 to 23 |
| VP2_PCLK | I | One pulse is generated every time new data is output on the data bus. |
| VP2_STALL | O | The stall signal must be deasserted to receive pixel and asserted to stop receiving pixel. (It can be used only while the DISPC is configured in stall mode; in that mode, HSYNC and VSYNC are not generated). |
| VP2_CLK | I | DISPC internal clock: It is a free running-clock used as the DISPC functional clock. |

⁽¹⁾ I = Input; O = Output

NOTE: The stall signal must be deasserted to receive pixels and asserted to stop receiving pixels.

Figure 10-133 and Figure 10-134 show the VP_STALL signal assertion and deassertion on rising and falling edges, respectively.

Figure 10-133. Stall Timing With Pixel on Rising Edge

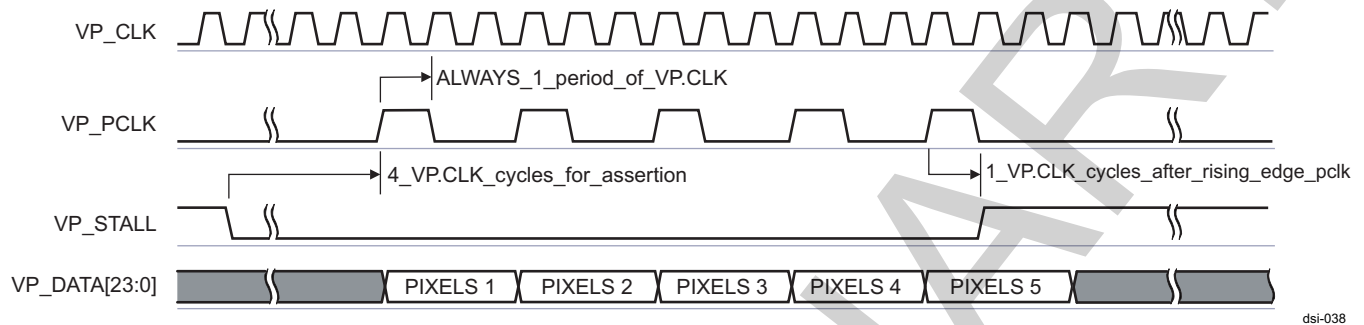

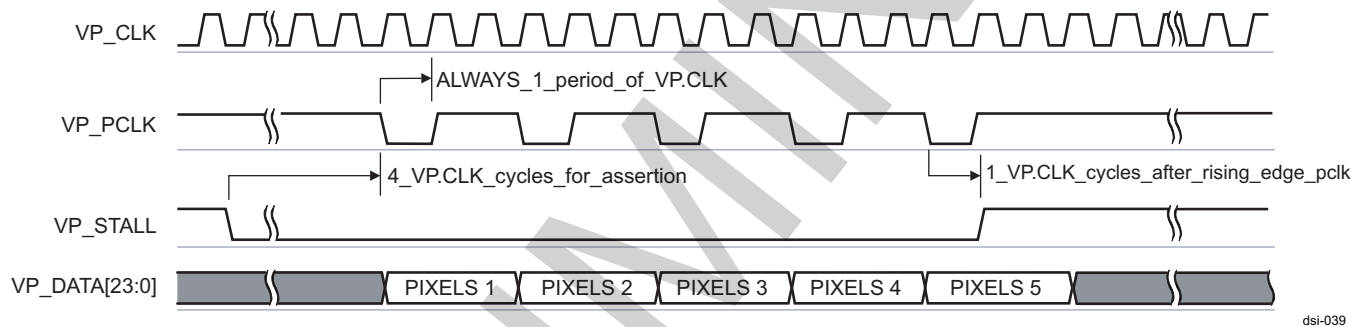

Figure 10-134. Stall Timing With Pixel on Falling Edge

The VP_STALL signal is asserted to stop the transfer when the last data is output. The data can be output on the rising or falling edge of the VP_PCLK through registers in the DISPC module. Data output on the falling edge of VP_PCLK is supported by the DSI protocol engine.

The VP_PCLK clock is generated from VP_CLK; these two clocks are balanced. Assertion and deassertion of VP_PCLK is done on the rising edge of VP_CLK. The width of the VP_PCLK pulse depends on the configuration of the clock divisor in the DISPC. For more information, see [Section 10.2, Display Controller](#). In the DSI protocol engine, the information is defined in the [DSI_CTRL\[4\]](#) VP_CLK_RATIO bit and must be aligned with the DISPC configuration.

Deassertion of the VP_STALL signal occurs at least four VP_CLK cycles before assertion of VP_PCLK. Assertion of VP_STALL occurs one cycle VP_CLK after deassertion of VP_PCLK for the last pixel to be transferred. The VP_CLK clock is generated by the DISPC under software control. It can be kept running between assertion and deassertion of VP_STALL.

The stall assertion/deassertion depends on the number of bytes to be received considering the size of the video port bus defined in the [DSI_CTRL\[7:6\]](#) VP_DATA_BUS_WIDTH bit field for video port 1 and the [DSI_CTRL2\[7:6\]](#) VP_DATA_BUS_WIDTH bit field for video port 2.

Figure 10-135 shows the data flow in command mode using the video port.

Figure 10-135. Data Flow in Command Mode Using the Video Port

Two command modes are available:

- One-line buffer: The data are stored in the line buffer before being sent.
- Two-line buffers: The two lines are used if the word count defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register is bigger than the line size; otherwise, one-line buffer must be used.

NOTE: In command mode, the video port can be used only in one- or two-line buffer configuration. No-line buffer configuration is not allowed.

The packets can be sent using high speed or low speed.

The DCS command in the payload can be inserted automatically using the [DSI_VC_CTRL_i\[30\]](#) DCS_CMD_ENABLE bit. If TE is used, hardware automatically inserts the DCS Write Start command for the first packet of the frame transfer and DCS Write Continue command for all subsequent packets. The [DSI_VC_CTRL_i\[31\]](#) DCS_CMD_CODE bit is ignored.

10.3.4.4.5.3 Burst Mode

When burst mode is enabled, the video port receives data from the DISPC at the pixel clock. The DSI protocol engine buffers the data in its own line FIFO (double-line buffer size). The read speed of the line can be twice the pixel clock to increase the blanking time of the video mode and to allow command mode traffic to be interleaved during the blanking period. Burst mode uses a dual-line buffer.

The DSI port can output data from one line buffer while the second line buffer is accessed by the video port. The two processes are concurrent but they do not access the same line at the same time. The DSI transfer can start only when the entire video port line is transferred into a line buffer. The switch is controlled by the VP_HS signal on the video port side and by an internal signal on the DSI port indicating that the last data for the current line has been written into the line buffer.

NOTE: The line buffers are used to store only the pixels. The synchronization codes are not stored in the line buffers; they must be sent according to the video port timings.

NOTE: The number of line buffers to be used while receiving data on the video port can be selected by setting the [DSI_CTRL\[13:12\]](#) LINE_BUFFER bit field.

10.3.4.4.5.4 Ping-Pong Buffer

The ping-pong buffer stores data incoming from the DISPC in one of the two line buffers. When one line buffer is used to store the pixels received on the video port, the second line buffer is used to provide data on the DSI link. The ping-pong buffer is supported in command mode, provided the size of the packet defined in the header register is less than the size of each line buffer (768 x 32 bits for VP1 of DSI2 and VP2 of DSI1, and 960 x 32 bits for VP1 of DSI1). If the size of the packet is greater than the size of the line buffer, the ping-pong mechanism cannot be used (both lines are used as a single line).

Figure 10-136 shows the video port used in ping-pong mode .

The ping-pong buffer status can be checked by the [DSI_VC_CTRL_i\[14\]](#) PP_BUSY bit.

- When PP_BUSY equals 1, the ping-pong buffer is active and the line buffers are not ready to receive data; therefore, a new header cannot be updated.
- When PP_BUSY equals 0, at least one line buffer is empty; therefore, a new header can be updated. PP_BUSY is then set to 0x1. If both line buffers are empty, two headers can be written, one following the other. PP_BUSY remains at 0x0 after the first header is written, and is set to 0x1 after second header is written.

An IRQ is available to update header on events. The IRQ is enabled by setting the [DSI_VC_IRQENABLE_i\[8\]](#) PP_BUSY_CHANGE_IRQ bit to 0x1, and its status is accessible on the [DSI_VC_IRQSTATUS_i\[8\]](#) PP_BUSY_CHANGE_IRQ bit.

10.3.4.4.6 SCP Interface

The SCP interface is used to transfer register values from the DSI protocol engine to the DSI PLL control module and to the DSI complex I/O. It spends several cycles to serialize the data to be sent. Software users must consider the delay in processing the transfer of the data from/to the L3 Interconnect slave port to/from the module.

10.3.4.4.6.1 Shadowing Register

The first three SCP registers for the DSI complex I/O address map must be implemented as shadow registers. The shadowing mechanism is enabled and disabled using the [DSI_COMPLEXIO_CFG1\[31\]](#) SHADOWING bit:

- When setting the [DSI_COMPLEXIO_CFG1\[31\]](#) SHADOWING bit to 1, the transfer of the values from the three first local interconnect port registers into the three first registers of the DSI complex I/O ([DSI_PHY_REGISTER0](#) through [DSI_PHY_REGISTER2](#)) is done only when the DISPC_UPDATE_SYNC signal from the DISPC is active and the [DSI_COMPLEXIO_CFG1\[30\]](#) GOBIT bit is set to 1. If there is no pending update for the three registers when the DISPC_UPDATE_SYNC signal is asserted, the [DSI_COMPLEXIO_CFG1\[30\]](#) GOBIT bit is reset by hardware and there is no SCP transfer.
 - If there is only one register to update, only the corresponding new value is transferred. The second

and third registers in the DSI complex I/O are not updated. When the transfer completes, the [DSI_COMPLEXIO_CFG1\[30\]](#) GOBIT bit is reset by hardware.

- If the two registers need to be updated, the register with the lower address is transferred first, followed by the second register. When the transfers complete, the [DSI_COMPLEXIO_CFG1\[30\]](#) GOBIT bit is reset by hardware.
- If the three registers need to be updated, the register with the lowest address is transferred first, and then the other registers are transferred according to incremental address. When the transfers complete, the GOBIT bit is reset by hardware.

When there is an on-going transfer (read or write) to any SCP register, the transfer must complete before updating the shadowing registers.

- When unsetting the [DSI_COMPLEXIO_CFG1\[31\]](#) SHADOWING bit to 0, if the transfer into the first two DSI complex I/O registers has already started, it should be finished.

NOTE: When reading the shadow registers, the local value stored in the DSI protocol engine is returned if the update is pending; otherwise, the values stored in the DSI complex I/O are returned.

10.3.4.4.6.2 *Busy Signal*

The SCPBusy signal indicates there is still activity using the SCPClk clock provided by the PRCM module. The SCPClk clock is the divided DSS_L3_ICLK/4 clock.

10.3.4.4.7 *Timers*

NOTE: Among the timers described in this section, only the HS TX, LP RX, and TurnRequests timers generate interrupts immediately when the timer value is null. The ForceTxStopMode timer ends counting instantly and ForceTxStopMode is not asserted.

10.3.4.4.7.1 *T_{wakeup} Timer*

The T_{wakeup} timer is not implemented in the DSI protocol engine. The general-purpose (GP) timer must be used to handle wakeup. This timer is used for exiting ULP status mode for the active lanes (clock and/or data lanes). The sequence to exit ULP state is:

1. Change the state of TxULPSExit for each lane to ACTIVE.
2. Wait for the interrupt that indicates all lanes with TxULPSExit ACTIVE have acknowledged by asserting ULPSActiveNot. This is done by reading the [DSI_COMPLEXIO_IRQSTATUS](#) register - ULPSACTIVENOT_ALLi_IRQ bit fields (where i = 0, 1).
3. Start the application wake-up timer (GP timer).
4. Wait for the time-out.
5. Change the TxUlpsClk signals to INACTIVE state for the clock lane and/or TxRequestEsc INACTIVE state for the data lane(s).

NOTE: The minimum time for the wake-up period is 1 ms.

To enter ULPS mode for clock lane, TxUlpsClk state must be changed to ACTIVE state. To enter ULPS mode for data lane, TxRequestEsc state must be changed to ACTIVE state (also TxUlpsEsc, if it is not in ACTIVE state already).

10.3.4.4.7.2 *ForceTxStopMode FSM*

The ForceTxStopMode signal is used at initialization time (DSI complex I/O). [Figure 10-137](#) shows the ForceTxStopMode finite state-machine (FSM) to assert and deassert the ForceTxStopMode signal.

Figure 10-137. ForceTxStopMode FSM

The DSI protocol engine asserts the ForceTxStopMode signal by setting the [DSI_TIMING1\[15\]](#) FORCE_TX_STOP_MODE_IO bit to 1. Asserting the FORCE_TX_STOP_MODE_IO bit allows the lanes to be initialized. The lanes are in STOP state when the ForceTxStopMode signal is high.

No data can be sent before the ForceTxStopMode signal is deasserted. The deassertion time is defined by the STOP_STATE_COUNTER_IO, STOP_STATE_X4_IO and STOP_STATE_X16_IO bit fields in [DSI_TIMING1\[14:0\]](#) register. The [DSI_TIMING1\[15:0\]](#) FORCE_TX_STOP_MODE_IO bit is reset by hardware when the time is reached.

This bit can be reset by software.

The calculation of the number of DSI_CLK functional clock cycles assertion period is defined by:

Total period in DSI_FCLK cycles = STOP_STATE_COUNTER_IO x ((STOP_STATE_X16_IO x 15) + 1) x ((STOP_STATE_X4_IO x 3)).

10.3.4.4.7.3 TurnRequest FSM

The TurnRequest signal is used to request a turnaround. It is valid only for the data lane 1 because the other data lanes cannot be used in reverse direction to receive data from the DSI receiver. When the TurnRequest signal is asserted, the TA_TO timer is started. [Figure 10-138](#) shows the TurnRequest FSM to assert and deassert the TurnRequest signal.

Figure 10-138. TurnRequest FSM

dsi-049

The DSI protocol engine asserts the TurnRequest signal during one TxClkEsc cycle when turnaround is enabled through the [DSI_VC_CTRL_i\[6\] BTA_EN](#) bit (for more information, see [Section 10.3.4.4.8, Bus Turnaround](#)). The [DSI_TIMING1\[31\] TA_TO](#) bit is set/reset by software to enable or disable the timer for turnaround procedure failure. It can be reset by software or automatically by hardware when the time-out occurs.

The timer is loaded with the value in the number of DSI_FCLK cycles:

$$\text{DSI_TIMING1}[28:16] \text{ TA_TO_COUNTER} \times ((\text{DSI_TIMING1}[30] \text{ TA_TO_X16} \times 15) + 1) \times ((\text{DSI_TIMING1}[29] \text{ TA_TO_X8} \times 7) + 1).$$

When the TA_TO_IRQ interrupt is generated (the turnaround timer expired and the procedure failed), hardware automatically resets the [DSI_TIMING1\[31\] TA_TO](#) bit and asserts the ForceTXStopMode signal (see [Section 10.3.4.4.7.2, ForceTxStopMode FSM](#)) for the DSI_PHY to drive the LP-11 STOP state. The ForceTXStopMode timer is used to define the minimum duration of the LP-11 state. The STOP state can be longer if there is no activity.

Hardware resets the [DSI_TIMING1\[15\] FORCE_TX_STOP_MODE_IO](#) bit, followed by an internal logic reset except for all register values and TX FIFO content, and then resets the [DSI_CTRL\[0\] IF_EN](#) bit. Software must take action to recover (for example, by resetting the peripheral if it is not responding). It must wait for the [DSI_CTRL\[0\] IF_EN](#) bit to be reset to 0 before starting the recovery sequence.

10.3.4.4.7.4 Peripheral Reset Timer

The peripheral reset timer is not implemented in the DSI protocol engine module. Instead, a GP timer must be used in case of reset of the peripheral to determine when the peripheral is ready to operate again.

10.3.4.4.7.5 HS TX Timer

The HS TX timer is used to detect when the host has been in TX mode for too long. When time-out occurs, the EOT is forced. The timer is reloaded when a start of HS transmission occurs. It is enabled and disabled by software through the [DSI_TIMING2\[31\] HS_TX_TO](#) bit. The interrupt HS_TX_TO_IRQ is generated when the timer expires. The [DSI_IRQSTATUS\[14\] HS_TX_TO_IRQ](#) bit is set to 1 when the HS TX time-out occurs.

The maximum time supported is 20 ms. It can be used to determine that at least once per frame in video mode, the HS mode is stopped to enter ULPS.

The timer is loaded with the value in the number of TXBYTECLKHS:

$DSI_TIMING2[28:16] \text{ HS_TX_TO_COUNTER} \times (1 + (DSI_TIMING2[30] \text{ HS_TX_TO_X64} \times 63) \times (1 + (DSI_TIMING2[29] \text{ HS_TX_TO_X16} \times 15)))$

Figure 10-139 shows the HS TX timer FSM.

Figure 10-139. HS TX Timer FSM

When the time-out occurs, hardware sends an EOT request for the DSI complex I/O to drive LP-11 STOP state. This is followed by the generation of the interrupt. Hardware performs an internal logic reset including the TX FIFO content but excluding the register values, and then resets the [DSI_CTRL\[0\] IF_EN](#) bit.

Software must take action to recover (for example, by resetting the peripheral if it is not responding). It must wait for the [DSI_CTRL\[0\] IF_EN](#) bit to be reset to 0 before taking any recovery action.

10.3.4.4.7.6 LP RX Timer

When the host is in low-power receive mode after a BTA, the LP RX timer is loaded. When the timer expires, the host requests the DSI complex I/O to drive LP-11. The interrupt [LP_RX_TO_IRQ](#) is generated when the timer expires. The [DSI_IRQSTATUS\[15\] LP_RX_TO_IRQ](#) bit is set to 1 when the LP RX time-out occurs.

The [DSI_TIMING2\[15\] LP_RX_TO](#) bit is set/reset by software to enable or disable the timer.

The timer is loaded with the value in the number of DSI_CLK functional clock cycles:

$DSI_TIMING2[12:0] \text{ LP_RX_TO_COUNTER} \times ((DSI_TIMING2[14] \text{ LP_RX_TO_X16} \times 15) + 1) \times ((DSI_TIMING2[13] \text{ LP_RX_TO_X4} \times 3) + 1)$

Figure 10-140 shows the LP RX timer FSM.

Figure 10-140. LP RX Timer FSM

dsi-051

When the interrupt is generated, hardware automatically resets the [DSI_TIMING2\[15\] LP_RX_TO](#) bit and then asserts `ForceTxStopMode` for the DSI complex I/O to drive LP-11 STOP state. The `ForceTxStopMode` timer is used to define the minimum duration of the LP-11 state. The STOP state can be longer if there is no activity.

Hardware resets the `ForceTxStopMode` bit, followed by an internal logic reset except for all register values and TX FIFO content, and then resets the [DSI_CTRL\[0\] IF_EN](#) bit. Software must take action to recover (for example, by resetting the peripheral if it is not responding). It must wait for the [DSI_TIMING1\[15\] FORCE_TX_STOP_MODE_IO](#) and [DSI_CTRL\[0\] IF_EN](#) bits to be reset before starting the recovery sequence. The TX FIFO is not flushed (the FIFO is flushed only when [DSI_VC_CTRL_i\[0\] VC_EN](#) is set to 1).

10.3.4.4.8 Bus Turnaround

The bus turnaround (BTA) is not automatically sent by default after each packet is sent to the panel(s). It is programmable independently for each VC ID. BTA generation can be enabled when the [DSI_VC_CTRL_i\[6\] BTA_EN](#) bit is set to 1 by software. Software must ensure that when the BTA is sent to the peripheral, enough time is allocated for the response and for the BTA from the peripheral to the host. For more information about possible DSI PHY timing adjustments during the turnaround procedure, see [Section 10.3.4.6.5.3, Turnaround Request in Transmit Mode](#), and [Section 10.3.4.6.5.4, Turnaround Request in Receive Mode](#).

When setting the [DSI_VC_CTRL_i\[6\] BTA_EN](#) bit to 1, one BTA is sent manually to the peripheral. This manual mode can be used for packets in command or video mode.

Acknowledgment from the peripheral for successful BTA is indicated by asserting the `BTA_IRQ` interrupt, if it is enabled in the [DSI_VC_IRQENABLE_i\[5\] BTA_IRQ_EN](#) bit. To monitor the BTA interrupt, the user must read the [DSI_VC_IRQSTATUS_i\[5\] BTA_IRQ](#) status bit.

CAUTION

The BTA should be sent when the RX FIFO is empty. Users must empty the RX FIFO before sending BTA to the peripheral to ensure that when receiving new data from the peripheral, the allocated spaces for all the VCs are empty.

In automatic mode, the BTA is sent automatically at the end of short or long packet transmission, if the [DSI_VC_CTRL_i\[2\]](#) BTA_SHORT_EN or [DSI_VC_CTRL_i\[3\]](#) BTA_LONG_EN bit is set to 1.

Two modes can be used for each VC ID:

- Automatic: After each packet, a BTA is sent. To determine the size of the long packet, the protocol engine on the host side reads the word count defined in the header (in the [DSI_VC_LONG_PACKET_HEADER_i](#) register) and uses it to determine the last data to be sent on the DSI link. For short packets, the size is always 4 bytes. The BTA is then sent to the peripheral. The word count is also used to determine how many bytes are to be transferred from the 32-bit write access to the payload register ([DSI_VC_LONG_PACKET_PAYLOAD_i](#)).
- Manual:
 - Data transfer through L3 interconnect: When transferring data using the L3 interconnect port, while all data have been provided to the DSI protocol engine, users can select the BTA for the last packet provided to the L3 interconnect port only by setting the [DSI_VC_CTRL_i\[6\]](#) BTA_EN bit, or for the last packets and the following ones by setting automatic mode.
 - Data transfer through video port: In the case of data transfer using the video port, the [DSI_VC_CTRL_i\[6\]](#) BTA_EN bit can be selected at any time during the transfer of the packet.
- For video mode packets (data and synchronization events), it is not possible to determine when the BTA is sent; therefore, it is highly recommended to use manual BTA mode only in command mode. It is possible, however, to use the BTA for a VC in video mode.

For data provided on the video port, an interrupt for end of packet transfer [PACKET_SENT_IRQ](#) is provided to indicate when the packet is completely sent by the DSI complex I/O. [PACKET_SENT_IRQ](#) can be monitored in the [DSI_VC_IRQSTATUS_i\[2\]](#) [PACKET_SENT_IRQ](#) status bit. The BTA is available even if the space allocated in the TX FIFO for the corresponding VC is empty. It must be sent later even if no packet was sent before the BTA request. The [DSI_VC_CTRL_i\[6\]](#) BTA_EN bit must be reset if the BTA request was sent, even if automatic mode for this specific type of packets is enabled.

The BTA is supported for video and command mode packets. It is not possible to send the BTA during the blanking periods of video mode when HS blanking packets should be sent; that is, when one of the following bits is set to 1:

- [DSI_CTRL\[20\]](#) BLANKING_MODE
- [DSI_CTRL\[21\]](#) HFP_BLANKING_MODE
- [DSI_CTRL\[22\]](#) HBP_BLANKING_MODE
- [DSI_CTRL\[23\]](#) HSA_BLANKING_MODE

Therefore, in video mode, the BTA request is delayed until there is a blanking period without HS blanking packets.

When the TurnRequest signal is asserted (always only for data lane 1), the TA_TO timer is started. If the direction signal is not changed according to the turnaround request, the TA_TO interrupt is generated. When the direction signal is in output mode, any data on the input data bus is ignored because the DSI is in transmission mode (data and triggers must be ignored). For more information about the TA_TO timer, see [Section 10.3.4.4.7.3, TurnRequest FSM](#).

10.3.4.4.9 PHY Triggers

The DSI protocol engine uses three triggers that are supported only for data lane 1:

- Reset trigger from host to display
- Tearing effect (TE) trigger from display to host
- Acknowledge trigger from display to host

CAUTION

Each trigger is associated with a dedicated user-configurable receive or transmit pattern, which is loaded in the [DSI_PHY_REGISTER3](#) or [DSI_PHY_REGISTER4](#) bit fields. The default (reset) values of the bit fields are aligned with the *MIPI D-PHY Specification v1.0*. If any of these values need to be changed, the following must be considered:

- If any of the bit fields is written with a nondefault value, the other bit fields in the same register must also be configured with different values. This is to ensure that two different trigger bit fields are not programmed with the same pattern.
- If two or more bit fields are written with equal values, unpredictable behavior of the DSI PHY module may occur.

10.3.4.4.9.1 Reset

The DSI protocol engine can use one of the triggers of the DSI_PHY to send a reset to the display. The reset trigger pattern is configurable through the [DSI_PHY_REGISTER3](#)[31:24] REG_TXTRIGGERESC3 bit field. To send the reset pattern to the peripheral, the [DSI_CTRL](#)[5] TRIGGER_RESET bit must be set to 1. When software requires the trigger reset pattern to be sent, the DSI protocol engine resets its own logic, but not the registers. Software can select between two reset modes:

- Immediate reset: All pending requests in TX FIFO not already considered for transfer scheduling, the RX FIFO requests, and the data from video port are ignored. Only the current transfer on the DSI link and those already scheduled are transmitted. All the other transfers are discarded.
- Synchronized reset: The mode is valid only if there is VC using the video mode and if it is active. The principle is to wait for the current video frame to be transferred on the link. Any data on the video port after the current frame are ignored.

To select reset mode, the [DSI_CTRL](#)[14] TRIGGER_RESET_MODE bit must be programmed.

CAUTION

For both reset modes, the DSI protocol engine flushes the FIFOs, synchronization buffers, and line buffers before resetting the [DSI_CTRL](#)[0] IF_EN bit.

10.3.4.4.9.2 Tearing Effect

TE on the display is avoided by having synchronization information from the display. It is used only in command mode and is not functional in video mode.

There are two types of TE triggers:

- DSI PHY TE trigger
- CMOS TE line (one of the two input signals can be selected for the TE trigger of a VC; the signal is asynchronous).

Software must set and send the appropriate sequence to receive the TE trigger pattern from the peripheral on the DSI link, or use the CMOS TE line. The value of the expected TE trigger pattern can be configured through the [DSI_PHY_REGISTER4](#)[23:16] REG_RXTRIGGERESC2 bit field.

When the TE PHY trigger pattern is received, the DSI protocol engine generates the TE_TRIGGER_IRQ interrupt with a TE event, if the interrupt is enabled. To enable the interrupt, the [DSI_IRQENABLE](#)[16] TE_TRIGGER_IRQ_EN bit must be set to 1. The [DSI_IRQSTATUS](#)[16] TE_TRIGGER_IRQ status bit indicates whether the interrupt event has been generated.

When using the TE CMOS signal, the DSI protocol engine generates the TE0_LINE or TE1_LINE interrupt, if it is enabled, depending on which line is used. One or multiple VCs can be synchronized using the same TE line. Both lines can be active at the same time for different VCs.

The [DSI_VC_TE_i\[30\]](#) TE_EN bit must be set and the [DSI_VC_TE_i\[29\]](#) TE_LINE bit must be reset to indicate that hardware must use the TE PHY trigger to start the transfer of the data from the related VC. TE_EN is reset when all the data are sent to the peripheral.

The [DSI_VC_TE_i\[30\]](#) TE_EN, [DSI_VC_TE_i\[29\]](#) TE_LINE, and [DSI_VC_TE_i\[28\]](#) TE_LINE_NB bits must be set to select between the TE0 and TE1 line to indicate that hardware must use the TE0 line or TE1 line to start the transfer of the data from the related VC. The bits are reset when all the data are sent to the peripheral.

The [DSI_TE_VSYNC_WIDTH_j](#), [DSI_TE_HSYNC_WIDTH_j](#), and [DSI_TE_HSYNC_NUMBER_j](#) registers indicate which mode is used to detect the start of the transfer:

- If [DSI_TE_HSYNC_NUMBER_j\[10:0\]](#) LINE_NUMBER = 0, [DSI_TE_HSYNC_WIDTH_j](#) is ignored. When a pulse on the TE line is detected to be wider than the [DSI_TE_VSYNC_WIDTH_j\[19:8\]](#) MIN_VSYNC_PULSE_WIDTH bit field, data transfer starts from the protocol engine to the peripheral at the falling edge of the TE CMOS line.
- If the [DSI_TE_HSYNC_NUMBER_j\[10:0\]](#) LINE_NUMBER bit field is greater than 0, [DSI_TE_HSYNC_WIDTH_j](#) is used. The DSI protocol engine waits until it detects a pulse wider than the [DSI_TE_VSYNC_WIDTH_j\[19:8\]](#) MIN_VSYNC_PULSE_WIDTH bit field, and then counts each pulse wider than [DSI_TE_HSYNC_WIDTH_j\[19:8\]](#) MIN_HSYNC_PULSE_WIDTH but smaller than [DSI_TE_VSYNC_WIDTH_j\[19:8\]](#) MIN_VSYNC_PULSE_WIDTH. When the number of HSYNC pulses is reached, data transfer from the DSI protocol engine to the peripheral starts. In case the number of HSYNC pulses is not reached due to a new VSYNC pulse being detected, the counter of HSYNC pulses restarts from 0.

NOTE: [DSI_TE_HSYNC_WIDTH_j\[19:8\]](#) MIN_HSYNC_PULSE_WIDTH is always programmed with a value smaller than [DSI_TE_VSYNC_WIDTH_j\[19:8\]](#) MIN_VSYNC_PULSE_WIDTH.

NOTE: The following must always be set before [DSI_VC_TE_i\[30\]](#) TE_EN is enabled:

- [DSI_TE_HSYNC_WIDTH_j\[19:8\]](#) MIN_HSYNC_PULSE_WIDTH
 - [DSI_TE_VSYNC_WIDTH_j\[19:8\]](#) MIN_VSYNC_PULSE_WIDTH
 - [DSI_VC_TE_i\[29\]](#) TE_LINE
 - [DSI_VC_TE_i\[28\]](#) TE_LINE_NB
-

The [DSI_VC_TE_i\[31\]](#) TE_START bit must be used when automatic mode is disabled ([DSI_VC_TE_i\[30\]](#) TE_EN bit = 0). It allows users to start the transfer manually based on application events or based on the TE trigger interrupt (TE_TRIGGER_IRQ).

The number of bytes to be transferred is defined by using the [DSI_VC_TE_i\[23:0\]](#) TE_SIZE bit field. The TE_SIZE bit field is decremented for each payload byte (it does not include checksum) sent on the DSI link. The register content must not be modified by software during a transfer. The [DSI_VC_TE_i\[23:0\]](#) TE_SIZE bit field must be set first to indicate that the following accesses to the [DSI_VC_LONG_PACKET_HEADER_i](#) register must be used for TE transfer.

The data can be provided from two sources (select by setting the [DSI_VC_CTRL_i\[1\]](#) SOURCE bit):

- L3 interconnect slave port using DMA request: The DMA request [DSI_DMA_REQ_i](#) must be asserted only when the TE trigger is received or when the [DSI_VC_TE_i\[31\]](#) TE_START bit is set by the user and must no longer be asserted when all the bytes defined in the [DSI_VC_TE_i\[23:0\]](#) TE_SIZE bit field are sent on the DSI link. The VC is associated with a DMA request by programming the number in the [DSI_VC_CTRL_i\[23:21\]](#) DMA_TX_REQ_NB bit field. The [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register is used to provide the number of bytes defined by the [DSI_VC_TE_i\[23:0\]](#) TE_SIZE bit field (the checksum value is not provided in the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register). The size of the header is not considered in the number of bytes to transfer. The [DSI_VC_SHORT_PACKET_HEADER_i](#) register is not used.
-

NOTE: All DMA requests associated to a VC must be disabled when they are not used ([DSI_VC_CTRL_i\[23:21\]](#) DMA_TX_REQ_NB = 0x4).

- Video port: The DMA request is not asserted. The data are captured in the line buffer using the STALL mechanism. If no line buffer is instantiated (that is, the [DSI_CTRL\[13:12\] LINE_BUFFER](#) bit field is set to 0), it is not possible to use the video port to provide data. The line buffer is filled according to the word count defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register header. The value must be written before the TE trigger event is received or before the [DSI_VC_TE_i\[31\] TE_START](#) bit is set to 1 by software. If the total number of bytes defined by the [DSI_VC_TE_i\[23:0\] TE_SIZE](#) bit field is not a multiple of the word count defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register, all the packets are the same size defined by the WC of the header, except the last transfer. The size of the last transfer is defined by the remaining bytes to send. Because the [DSI_VC_TE_i\[23:0\] TE_SIZE](#) bit field is modified after each packet transfer, the size of the last packet is equal to the value of the [DSI_VC_TE_i\[23:0\] TE_SIZE](#) bit field before the last transfer (the header and the payload checksum sizes are not included in the [DSI_VC_TE_i\[23:0\] TE_SIZE](#) bit field).

When the transfer completes, the value of the [DSI_VC_TE_i\[23:0\] TE_SIZE](#) bit field is equal to 0. Software must ensure that the pending data in the TX FIFO for the corresponding VC using TE are related to the TE transfer. Any data in the TX FIFO that must be sent before the reception of the TE trigger must be sent before the TE. This is done by not enabling the TE trigger until all data for the corresponding VC are sent to the peripheral. Software can check that the space allocated for the VC in the TX FIFO is empty by reading the [DSI_VC_CTRL_i\[5\] TX_FIFO_NOT_EMPTY](#) status bit.

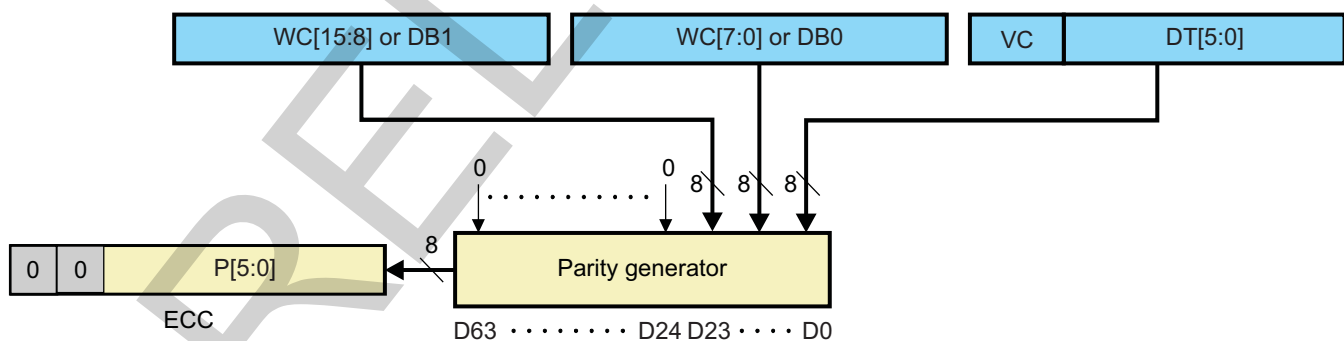

10.3.4.4.9.3 Acknowledge

The corresponding acknowledge interrupt (ACK_TRIGGER_IRQ) is generated when the acknowledge trigger is received. The value of the expected acknowledge trigger pattern can be configured through the [DSI_PHY_REGISTER4\[15:8\] REG_RXTRIGGERESC1](#) bit field. To enable the acknowledge interrupt, set the [DSI_IRQENABLE\[17\] ACK_TRIGGER_IRQ_EN](#) bit to 1. When the interrupt is generated, the [DSI_IRQSTATUS\[17\] ACK_TRIGGER_IRQ](#) status bit is set to 1.

10.3.4.4.10 ECC Generation

The DSI protocol uses a 4-byte PH. Because ECC generation requires a fixed word length of 64-bits, the packet headers must be padded with additional bits to form a full 8-byte value for ECC generation and checking. The PH minus the ECC byte should occupy bits D[23:0], and the pad bits should occupy bits D[63:24]. All padding bits must be 0 to generate the ECC byte. ECC can be generated using a parallel approach, as shown in [Figure 10-141](#).

Figure 10-141. 64-Bit ECC Generation on TX Side

dsi-052

The ECC generation/check can be enabled and disabled by software. It is defined by a common bit for all the VCs:

- The [DSI_CTRL\[2\] ECC_RX_EN](#) bit enables and disables ECC generation in the receive direction.
- The [DSI_VC_CTRL_i\[8\] ECC_TX_EN](#) bit enables and disables ECC generation in the transmit direction.

The ECC can be provided while writing the ECC value directly into the [DSI_VC_LONG_PACKET_HEADER_i](#) and [DSI_VC_SHORT_PACKET_HEADER_i](#) registers. The [DSI_VC_CTRL_i\[8\] ECC_TX_EN](#) bit indicates whether the ECC value will be calculated or whether the value written in the register will be used instead for command and video modes.

10.3.4.4.11 Checksum Generation for Long Packet Payloads

Long packets are comprised of a PH protected by an ECC byte and a payload of 0 to $2^{16} - 1$ bytes. To detect the errors during the transmission of long packets, a checksum is calculated over the payload portion of the data packet. For the special case of a 0-length payload, the 2-byte checksum is set to 0xFFFF. The checksum can only indicate the presence of one or more errors in the payload. Unlike ECC, the checksum does not enable error correction. For this reason, checksum calculation is not useful for some unidirectional DSI implementations, because the peripheral has no way to report errors to the host processor. Checksum generation and transmission is mandatory for host processors sending long packets to peripherals; it is optional for peripherals transmitting long packets to the host processor. However, the format of long packets is fixed; the peripherals that do not support checksum generation must transmit 2 bytes with a value of 0x0000 in place of the checksum bytes when sending long packets to the host processor. The host processor must disable checksum checking for received long packets from peripherals that do not support checksum generation.

Checksum must be realized as a 16-bit CRC with a generator polynomial of $x^{16} + x^{12} + x^5 + x^0$. The LSByte is sent first, followed by the MSByte. Within the byte, the LSB is sent first.

Figure 10-142 shows the checksum transmission.

Figure 10-142. Checksum Transmission

dsi-053

Figure 10-143 shows the CRC implementation. The CRC shift register is initialized to 0xFFFF before packet data enters. Packet data not including the PH then enters as a bitwise data stream from the left, LSB first. Each bit is fed through the CRC shift register before it is passed to the output for transmission to the peripheral. After all bytes in the packet payload have passed through the CRC shift register, the shift register contains the checksum. C15 contains the MSB of the checksum, and C0 contains the LSB of the 16-bit checksum. The checksum is then appended to the data stream and sent to the receiver.

Figure 10-143. 16 Bit CRC Generation Using a Shift Register

dsi-054

Checksum generation/check can be enabled and disabled by software. It is defined by a common bit for all the VCs:

- The [DSI_CTRL\[1\]](#) CS_RX_EN bit enables and disables checksum generation in the receive direction.
- The [DSI_VC_CTRL\[i\]\[7\]](#) CS_TX_EN bit enables and disables checksum generation in the transmit direction

10.3.4.4.12 EOT Packet

A new packet type allows the DSI protocol (rather than the DSI_PHY) at the display to detect the HS EOT. This is a fixed short packet (4 bytes) that is added at every HS to LP transition. This function is enabled by the [DSI_CTRL\[19\]](#) EOT_ENABLE bit.

The EOT packet has a fixed format:

- Data Type = DI [5:0] = 0b001000
- Virtual Channel = DI [7:6] = 0b00
- Payload Data [15:0] = 0x0F0F
- ECC [7:0] = 0x01

When more than one data lane is used, the EOT packet bytes are distributed across the multiple lanes. EOT packet generation is supported only for the end of HS transmissions. No EOT packet is added at the end of LP transmissions. For LP reception, any EOT packet received is simply passed through as any other packet, but no internal decode or use is made of the EOT information.

10.3.4.4.13 Software Reset

The DSI protocol engine can be reset by software. This reset can be done for debug purposes or after a protocol error and has the same effect as the hardware reset. The DSI protocol engine can be reset by setting the [DSI_SYSCONFIG](#)[1] SOFT_RESET bit to 1. Software can monitor the [DSI_SYSSTATUS](#)[0] RESET_DONE status bit to wait for the reset to complete. If after five reads the [DSI_SYSSTATUS](#)[0] RESET_DONE status bit still returns 0, it can be assumed that an error occurred during the reset stage.

NOTE: This software reset is optional because a hardware reset is always performed on the DSI protocol engine at device reset.

10.3.4.4.14 Power Management

The power-management behavior of the DSI protocol engine is controlled by the [DSI_SYSCONFIG](#) register. This register controls the way the module interacts with the PRCM module. The [DSI_SYSCONFIG](#)[0] AUTO_IDLE bit must be set to 1 (default value) to enable automatic clock gating in the module.

The DSI protocol engine implements a handshake protocol on the L3 interconnect slave port with the PRCM module. The protocol engine provides control signal CIO_CLK_ICG to gate the SCPClk (DSS_L3_ICLK/4). It allows reduction of the power consumption of the complex I/O while the DSI link is not in use ([DSI_CLK_CTRL](#)[14] CIO_CLK_ICG).

10.3.4.4.15 Power Control of DSI PHY Complex I/O and DSI PLL

The DSI protocol engine can control and send power commands for the DSI complex I/O and DSI PLL controller modules.

10.3.4.4.15.1 Complex I/O Power Control Commands

10.3.4.4.15.1.1 Complex I/O Power Control Commands

The DSI complex I/O can be set in three modes:

- OFF: In this power state, the complete DSI_PHY circuit is powered down. The internal LDO is OFF.
- ON: In this power state, the complete DSI_PHY circuit is powered on and functional.
- ULPS: In this power state, the ULPS exit detection circuit power switch is ON for the lanes that are in receive ULPS. For the lanes that are in transmit ULPS, the circuitry for weak pulldown is ON. The ULTRALOW POWER state must be used only when all the three lanes are in ULPS (transmit or receive).

10.3.4.4.15.1.2 Complex I/O Power FSM

[Figure 10-144](#) shows the FSM to control the power state of the complex I/O.

Figure 10-144. Complex I/O Power FSM

ds1-045

The PwrCmdOff, PwrCmdUlp, and PwrCmdOn commands control the state transition of the DSI complex I/O. The [DSI_COMPLEXIO_CFG1\[28:27\] PWR_CMD](#) bit field allows the state to be modified. The allowed transitions are: OFF - ON, and ON - ULPS, and ULPS - OFF. The [DSI_COMPLEXIO_CFG1\[26:25\] PWR_STATUS](#) bit field gives a status on the current state of the DSI complex I/O.

CAUTION

- In automatic mode, software must ensure that the DSI complex I/O is in ON state (that is, ON command already sent) before sending requests to the complex I/O.
- In a command request to change to a state that is the current one (acknowledge has been received), the command is ignored (nothing is sent to the DSI complex I/O).
- To change the state to ULPS, all ULPSActiveNot signals must be low. The ULPSActiveNot_ALL0_IRQ interrupt indicates the state of the ULPSActiveNot signals. The change from ULPS to ON state is required before starting the ULP exit sequence (for information, see [Section 10.3.4.4.7.1, T_{wakeup} Timer](#)).

10.3.4.4.15.2 DSI PLL Power Control Commands

The DSI PLL controller module can be set in four modes:

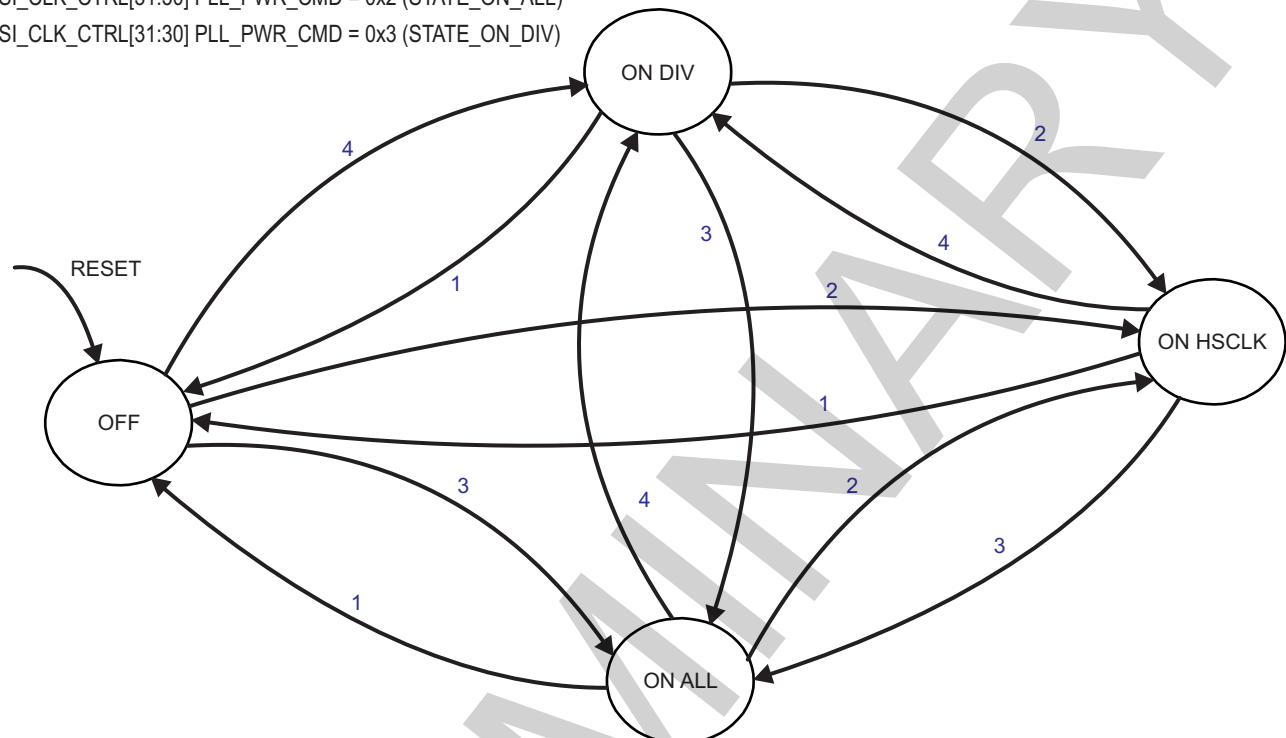

- OFF: DSI PLL and HSDIVIDER are OFF.
- ON ALL: Both DSI PLL and HSDIVIDER are ON. The CLKIN4DDR clock is provided to the DSI complex I/O and the second clock output is provided to the HSDIVIDER.
- ON HSCLK: The DSI PLL is ON. The HSDIVIDER is OFF. The CLKIN4DDR clock is provided to the DSI complex I/O, but the second clock output is not provided to the HSDIVIDER.
- ON DIV: DSI PLL and HSDIVIDER are ON. The CLKIN4DDR clock is not provided to the DSI complex I/O, but the second clock output is provided to the HSDIVIDER.

10.3.4.4.15.2.1 DSI-PLL Power FSM

[Figure 10-145](#) shows the DSI PLL power FSM.

Figure 10-145. DSI PLL Power FSM

- 1 = DSI_CLK_CTRL[31:30] PLL_PWR_CMD = 0x0 (STATE_OFF)
 2 = DSI_CLK_CTRL[31:30] PLL_PWR_CMD = 0x1 (STATE_ON_HSCLK)
 3 = DSI_CLK_CTRL[31:30] PLL_PWR_CMD = 0x2 (STATE_ON_ALL)
 4 = DSI_CLK_CTRL[31:30] PLL_PWR_CMD = 0x3 (STATE_ON_DIV)

dsi-046

The following commands control the state transition of the DSI PLL control module:

- PLLPwrCmdOff
- PLLPwrCmdOnAll
- PLLPwrCmdOnDIV
- PLLPwrCmdOnHSClk

Setting the [DSI_CLK_CTRL\[31:30\] PLL_PWR_CMD](#) bit field modifies the state. The [DSI_CLK_CTRL\[29:28\] PLL_PWR_STATUS](#) bit field gives a status on the current state of the DSI PLL controller.

NOTE: If a command requests to change to a state that is the current one (acknowledge has been received), the command is ignored (nothing is sent to the DSI PLL control module).

10.3.4.4.15.2.1.1 DSI PLL HS Clock Signals

The DSIStopClk signal is provided to the DSI PLL control module. It indicates when the DSI protocol engine does not need to use the HS mode and the PLL HS output (CLKIN4DDR clock) can be stopped. The following conditions must also be met when DISPC_UPDATE_SYNC may be generated by the DISPC, because that must result in the PLL HS output being stopped.

When the interface is disabled ([DSI_CTRL\[0\] IF_EN](#) bit set to 0) and the clock lane is stopped ([DSI_CLK_CTRL\[13\] DDR_CLK_ALWAYS_ON](#) = 0), the signal DSIStopClk is asserted.

Assertion of the DSIStopClk depends on the following conditions:

- Clock lane TxRequestHS is deasserted (the DDR clock on the clock lane is no longer required). For TxRequestHS deassertion, the following conditions are required:

- The [DSI_CLK_CTRL\[13\]](#) `DDR_CLK_ALWAYS_ON` bit must be reset to 0 and no HS data transfer must be on-going or already scheduled.
- No VC ACTIVE in video mode. No VC using the video mode is enabled. If the VC is enabled, the mode is command mode only (the [DSI_VC_CTRL_i\[0\]](#) `VC_EN` bit set to 1 and [DSI_VC_CTRL_i\[4\]](#) `MODE` bit set to 0).
- No command mode requiring HS transfer (one or more VCs using command mode can be active)
- Or [DSI_CTRL\[0\]](#) `IF_EN` bit is reset to 0 (the previous conditions are not all required, except the [DSI_CLK_CTRL\[13\]](#) `DDR_CLK_ALWAYS_ON` bit must be set to 0 after resetting the [DSI_CTRL\[0\]](#) `IF_EN` bit)

The deassertion of the `DSISopClk` depends on one of the following conditions (the DSI interface is enabled by setting the [DSI_CTRL\[0\]](#) `IF_EN` bit to 1):

- Clock lane `TxRequestHS` must be asserted (the DDR clock on the clock lane is required).
- One video mode VC ACTIVE
- At least one VC in command mode requiring HS transfer
- The [DSI_CLK_CTRL\[13\]](#) `DDR_CLK_ALWAYS_ON` bit is set to 1 by software users (the [DSI_CTRL\[0\]](#) `IF_EN` bit must be reset to 0 for updating the value of the `DDR_CLK_ALWAYS_ON` bit).

Automatic assertion/deassertion is enabled by using the [DSI_CLK_CTRL\[18\]](#) `HS_AUTO_STOP_ENABLE` bit.

Manual mode can be used by setting/resetting the [DSI_CLK_CTRL\[19\]](#) `HS_MANUAL_STOP_CTRL` bit to assert/deassert the `DSISopClk` signal.

NOTE: Setting the [DSI_CTRL\[24\]](#) `DISPC_UPDATE_SYNC` bit to 0x1 enables the use of the `Dispc_Update_Sync` signal to synchronize.

10.3.4.4.15.2.1.2 DSI-PLL HS Clock FSM

Figure 10-146 shows the DSI PLL HS clock FSM.

Figure 10-146. DSI PLL HS Clock FSM

ds1-047

When `DSISopClk` is used there is a latency through other modules (DSI PLL controller and `DSI_PHY`) before `TXBYTECLKHS` is stopped. This latency must be considered to prevent any issue when `DSISopClk` is deasserted soon after being asserted. This is done using a hardware timer programmed using the [DSI_STOPCLK_TIMING\[7:0\]](#) `DSI_STOPCLK_LATENCY` bit field. This timer is programmed in number of periods of the DSI protocol functional clock (`DSI_FCLK`). At reset value, the timer is programmed with value 0x80 (128).

CAUTION

The programmed value in the [DSI_STOPCLK_TIMING\[7:0\]](#) DSI_STOPCLK_LATENCY bit field must be greater than $((3 \times L3_ICLK \text{ period}) + (5 \times CLKIN4DDR \text{ period})) / (DSI_FCLK \text{ period})$.

10.3.4.4.16 Ultralow-Power State Configuration

This section describes how to enter/exit to/from ULTRALOW-POWER state (ULPS).

NOTE: The [DSI_COMPLEXIO_CFG2\[9:0\]](#) LANEx_ULPS_SIGy bits (*x* range is 1 to 5, corresponding to lane 1 to lane 5 for DSI1, and 1 to 3, corresponding to lane 1 to lane 3 for DSI2; *y* range is 1 to 2) must be read back after writing to verify that the write operations are effective before proceeding to the next step. This is to take latency at low TxClkEsc frequencies into account.

10.3.4.4.16.1 Entering ULPS

To enter into ULPS for a clock lane, the following sequence is required:

1. Wait for [DSI_COMPLEXIO_CFG2\[16\]](#) HS_BUSY and [DSI_COMPLEXIO_CFG2\[17\]](#) LP_BUSY bits to be reset to 0 and ensure that the [DSI_CLK_CTRL\[13\]](#) DDR_CLK_ALWAYS_ON bit is 0.
2. TxUlpsClk state should change from inactive to active by setting the [DSI_COMPLEXIO_CFG2\[9:5\]](#) LANEx_ULPS_SIG2 bit to 1.

To enter into ULPS for a data lane, the following sequence is required:

1. Wait for all TX_FIFOs for all VCs working in HS are empty, for video mode is not active, and for [DSI_COMPLEXIO_CFG2\[16\]](#) HS_BUSY bit is reset to 0 (in addition for data lane 1, [DSI_COMPLEXIO_CFG2\[17\]](#) LP_BUSY bit is reset to 0)
2. TxRequestEsc state should change from inactive to active by setting the [DSI_COMPLEXIO_CFG2\[9:5\]](#) LANEx_ULPS_SIG2 bit to 1.

10.3.4.4.16.2 Exiting ULPS

To exit from ULPS for a clock lane, the following sequence is required:

1. Change the state of TxUlpsExit for each lane to ACTIVE by setting the [DSI_COMPLEXIO_CFG2\[4:0\]](#) LANEx_ULPS_SIG1 bit to 1.
2. Wait for the ULPSACTIVENOT_ALL1_IRQ interrupt indicating that all lanes with TxUlpsExit active have acknowledged by asserting UlpsActiveNot. This is performed by monitoring the [DSI_COMPLEXIO_IRQSTATUS\[31\]](#) ULPSACTIVENOT_ALL1_IRQ status bit.
3. Start the wake-up timer (GPTimer).
4. Wait for the time-out.
5. Change TxUlpsClk signals to INACTIVE state for the clock lane by resetting the [DSI_COMPLEXIO_CFG2\[9:5\]](#) LANEx_ULPS_SIG2 bit to 0.
6. Reset the [DSI_COMPLEXIO_CFG2\[4:0\]](#) LANEx_ULPS_SIG1 bit to 0.

NOTE: When the [DSI_COMPLEXIO_CFG2\[9:5\]](#) LANEx_ULPS_SIG2 and [DSI_COMPLEXIO_CFG2\[4:0\]](#) LANEx_ULPS_SIG1 bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

To exit from ULPS for a clock lane, in case the complex I/O is in OFF state (the DSI protocol engine sends the complex I/O to OFF state (PWROFF command) by setting [DSI_COMPLEXIO_CFG1\[28:27\]](#) PWR_CMD = 0x0), the sequence is:

1. Change TxUlpsCk signals to INACTIVE state for the clock lane by resetting the [DSI_COMPLEXIO_CFG2\[9:5\]](#) LANEx_ULPS_SIG2 bit to 0.
2. Change the state of TxUlpsExit for clock lane to INACTIVE state by resetting the [DSI_COMPLEXIO_CFG2\[4:0\]](#) LANEx_ULPS_SIG1 bit to 0. This step is necessary only in case a PWROFF command (the command for power control of the complex I/O) is issued while the sequence for exiting is in progress (TxUlpsExit signal is already in ACTIVE state).

NOTE: When the [DSI_COMPLEXIO_CFG2](#) LANEx_ULPS_SIG2[9:5] and [DSI_COMPLEXIO_CFG2](#) LANEx_ULPS_SIG1 bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

To exit from ULPS for a data lane, the following sequence is required:

1. Change the state of TxUlpsExit for each lane to ACTIVE by setting the [DSI_COMPLEXIO_CFG2\[4:0\]](#) LANEx_ULPS_SIG1 bit to 1.
2. Wait for the ULPSACTIVENOT_ALL1_IRQ interrupt indicating that all lanes with TxUlpsExit active have acknowledged by asserting UlpsActiveNot. This is performed by monitoring the [DSI_COMPLEXIO_IRQSTATUS\[31\]](#) ULPSACTIVENOT_ALL1_IRQ status bit.
3. Start the application wake-up timer (GPTimer).
4. Wait for the time-out.
5. Change TxRequestEsc signals to INACTIVE state for the data lane by resetting the [DSI_COMPLEXIO_CFG2\[9:5\]](#) LANEx_ULPS_SIG2 bit to 0.
6. Reset the [DSI_COMPLEXIO_CFG2\[4:0\]](#) LANEx_ULPS_SIG1 bit to 0.

NOTE: When the [DSI_COMPLEXIO_CFG2](#) LANEx_ULPS_SIG2 and [DSI_COMPLEXIO_CFG2](#) LANEx_ULPS_SIG1 bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

To exit from ULPS for a data lane, in case the complex I/O is in OFF state (the DSI protocol engine sends the complex I/O into OFF state by setting [DSI_COMPLEXIO_CFG1\[28:27\]](#) PWR_CMD = 0x0), the sequence is:

1. Change TxRequestEsc signals to INACTIVE state by resetting the [DSI_COMPLEXIO_CFG2\[9:5\]](#) LANEx_ULPS_SIG2 bit to 0.
2. Change the state of TxUlpsExit to INACTIVE state by resetting the [DSI_COMPLEXIO_CFG2\[4:0\]](#) LANEx_ULPS_SIG1 bit to 0. This step is necessary only in case a PWROFF command is issued while the sequence for exiting is in progress (TxUlpsExit signal is already in ACTIVE state).

NOTE: When the [DSI_COMPLEXIO_CFG2](#) LANEx_ULPS_SIG2 and [DSI_COMPLEXIO_CFG2](#) LANEx_ULPS_SIG1 bits are both being written to 0, they can be combined into one write. Both bits must be read back to confirm they are effective before proceeding.

When the sequence for entering/exiting into/from ULP state is started for specific lanes, users should wait for the completion of the sequence before changing the state of the same or other lanes.

10.3.4.4.17 Interrupts

There is a single interrupt request generated by each DSI: DSI_IRQ. This interrupt line is merged with another interrupt line from the DISPC_IRQ into a single interrupt request IRQ. The DSI_IRQ events are generated only for the enabled VC(s). Two registers are used to enable and monitor the DSI interrupt events:

- **DSI_IRQENABLE**: This register enables and disables interrupt event reporting for the VCs. Each event for the VC is configured in the **DSI_VC_IRQENABLE_i** register dedicated to the VC number. In addition, it includes 1 bit to enable error reporting for the complex I/O. The interrupt is triggered when any error is received from the complex I/O.
- **DSI_IRQSTATUS**: The register flags which VC(s) have generated an interrupt. Based on the VC number, the **DSI_VC_IRQSTATUS_i** register indicates the event generating the interrupt. In addition, it includes 1 bit for the status of error reporting for the complex I/O.

Table 10-502 lists the DSI VC interrupt events

Table 10-502. DSI VC Interrupts

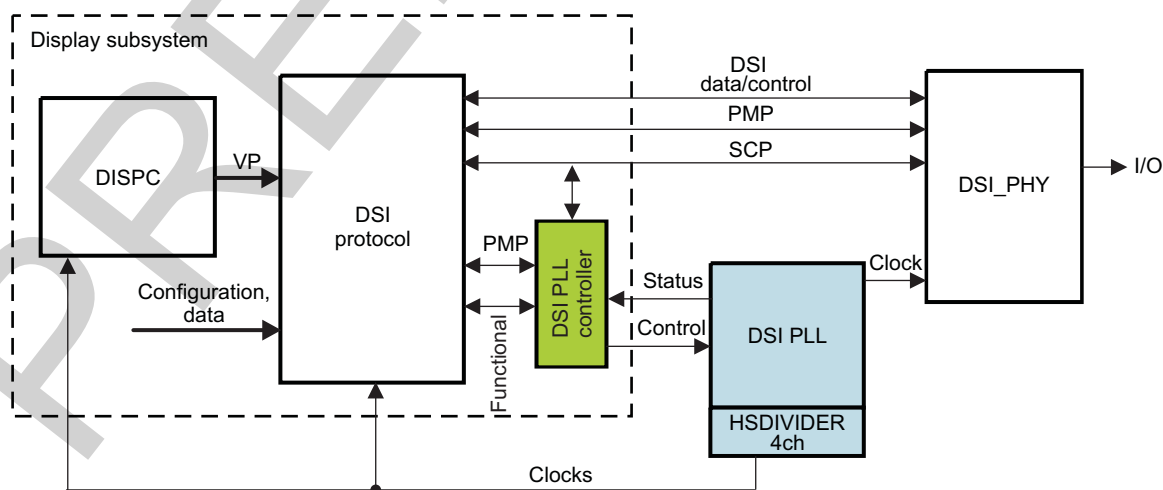

| IRQ Name | Description |
|-----------------------|---|
| ECC_CORRECTION_IRQ | Indicates whether a 1-bit error correction has occurred using ECC (short and long packets). |
| PACKET_SENT_IRQ | Indicates that a packet has been sent. It is used when BTA manual mode is used. |
| CS_IRQ | Virtual channel. Checksum of the payload mismatch detection. |
| FIFO_RX_OVF_IRQ | RX FIFO overflow. The FIFO used on the L3 interconnect slave port for buffering the data received on the DSI link has overflowed. |
| FIFO_TX_OVF_IRQ | TX FIFO overflow. The FIFO used on the L3 interconnect slave port for buffering the data received on the interface slave port has overflowed. |
| BTA_IRQ | BTA is received from the peripheral (the VC ID used for the last BTA request transfer to the peripheral will be used to determine which VC will be used to flag the interrupt). |
| ECC_NO_CORRECTION_IRQ | ECC error (short and long packets). No correction of the header because of more than 1-bit error. |
| FIFO_TX_UDF_IRQ | TX FIFO underflow. The FIFO used on the slave port for buffering the data received on the L3 interconnect slave port has underflowed in the middle of a packet transfer. |

10.3.4.5 DSI PLL Controllers

10.3.4.5.1 DSI PLL Controllers Overview

Two DSI PLL controller modules are part of the DSS. They use the SCP (see [Section 10.3.4.4.6, Serial Configuration Port Interface](#)) and power-management port (PMP) as the primary interfaces to the DSI protocol engines. The SCP interface is used to set the configuration of the digital phase-locked loop (DPLL) and HSDIVIDER modules, primarily the various counter values. The PMP is used to control the power state of the DPLL and HSDIVIDER modules. [Figure 10-147](#) is an overview of a single DSI PLL controller module in the display subsystem.

Figure 10-147. DSI PLL Controller Overview

dsi-056

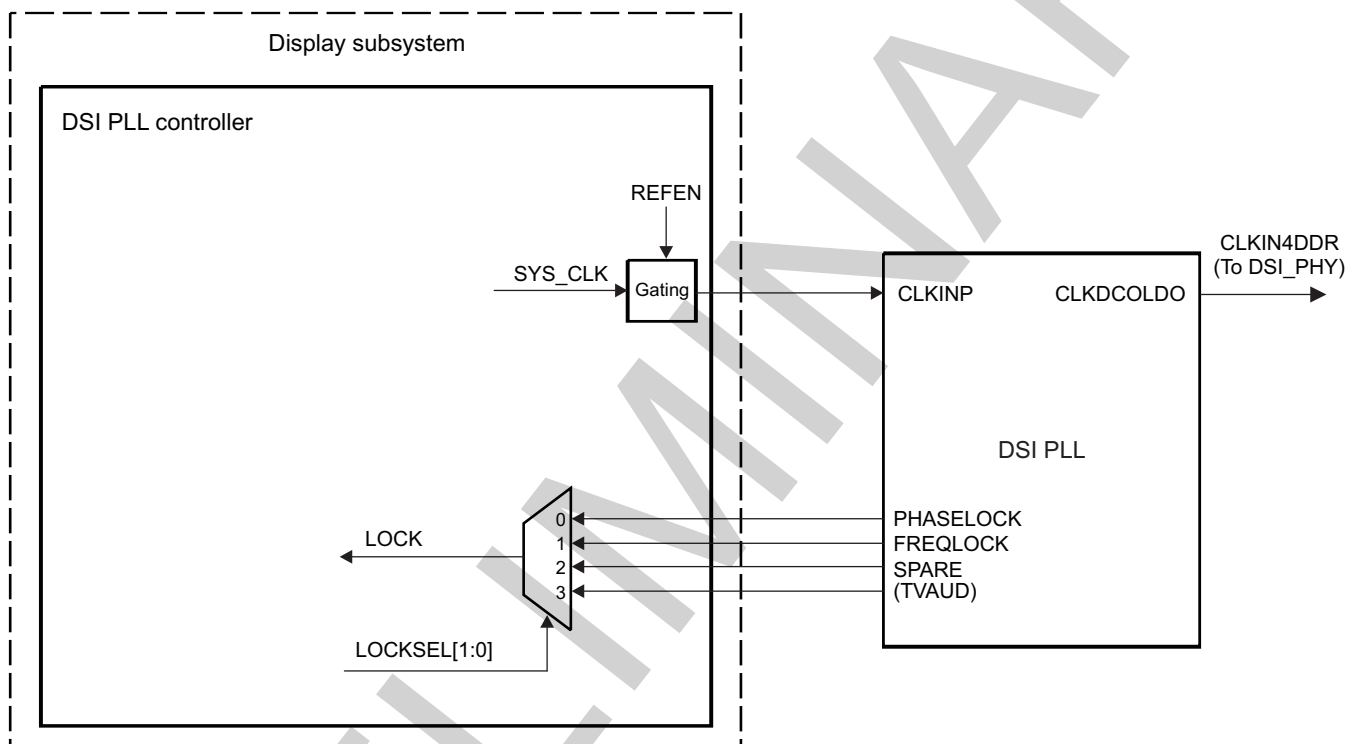

NOTE: The DSI PLL controller modules do not have an interface to L3/L4_PER interconnects. The programmable features are managed by registers mapped into the DSI protocol engines.

10.3.4.5.2 DSI PLL Controllers Architecture

The DSI PLLs use instances of the DPLL modules of type A. For more information regarding various DPLL types within the device, see , *Generic DPLL Overview*, in [Chapter 3, Power, Reset, and Clock Management](#).

[Figure 10-148](#) shows the internal reference diagram of a single DSI PLL.

Figure 10-148. DSI PLL Reference Diagram

dsi-057

The DSI PLL clock output (CLKDCOLDO) corresponds to the CLKIN4DDR clock of a DSI complex I/O (DSI_PHY) module.

Only the SYS_CLK clock is used as an input reference clock for the DSI PLL. The DSI PLL controller can gate this clock by setting the [DSI_PLL_CONFIGURATION2\[13\]](#) PLL_REFEN bit.

[Figure 10-149](#) is a simplified block diagram of the DSI PLL instance used for the DSI modules.

Figure 10-149. DSI PLL Functional Block Diagram

The input clock **CLKINP** goes to a predivider $N + 1$. The entire loop runs on the **REFCLK** clock after this predivider. The value of $N + 1$ is controlled through the [DSI_PLL_CONFIGURATION1\[8:1\]](#) **PLL_REGN** bit field. The frequency range for the **CLKINP** and **REFCLK** clocks is 0.032 MHz to 52 MHz.

The output clock **CLKDCOLDO** is synthesized by digitally controlled oscillator (the **DCO** block), that automatically detects the frequency range. The **CLKDCOLDO** frequency can be given with $\text{CLKDCOLDO} = \text{CLKINP} \times 2 \times M / (N + 1)$. For that purpose the feedback multiplier M must be configured through the [DSI_PLL_CONFIGURATION1\[20:9\]](#) **PLL_REGM** bit field.

The DSI PLL module supports fractional synthesis; that is, the frequency multiplication factor M can be programmed as fractional. This is done through the use of a sigma delta feedback divider (M). A fractional value (**REGM.f**) of 18 bits is supported, thus enabling control for better accuracy. Programming the fractional value is done by setting the [DSI_PLL_CONFIGURATION4\[17:0\]](#) **PLL_REGM_F** register bit field. Fractional synthesis is supported only in the following range: $20 \leq M \leq 2045$.

The module also supports spread spectrum clocking (SSC) on its output clocks. SSC is used to spread the spectral peaking of the clock to reduce electromagnetic interference (EMI). When SSC is enabled, the clock spectrum is spread by the amount of frequency spread, and the attenuation is given by the ratio of the frequency spread (df) and the modulation frequency (fm); that is, $\{10 \times \log_{10}(df/fm)\} - 10$ dB.

The SSC is performed by changing the feedback divider (M) in a triangular pattern, which means the frequency of the output clock varies in a triangular pattern. The frequency of the triangular pattern is modulation frequency (fm). The peak (dM) or the amplitude of the triangular pattern as a percent of M is equal to the percent of the frequency spread (df) (that is, $dM/M = df/F_{out}$).

Because this is in band modulation for the DSI PLL, the modulation frequency (fm) must be within the bandwidth of the PLL (lowest BW of **REFCLK**/70; that is, **REFCLK** must be $> fm \times 70$). A higher modulation frequency results in less spreading in the output clock.

The SSC can be enabled and disabled by asserting the [DSI_PLL_SSC_CONFIGURATION1\[0\]](#) **EN_SSC** bit. The acknowledge signal **SSCACK**, observed by the [DSI_PLL_STATUS\[12\]](#) **SSC_EN_ACK** bit, notifies the exact start and end of SSC. When **EN_SSC** is deasserted, SSC is disabled only after completion of one full cycle of the triangular pattern given by the modulation frequency. This is done to maintain the average frequency.

The modulation frequency (fm) can be programmed as a ratio of **REFCLK**/4; that is, the value of **ModFreqDivider** programmed in the [DSI_PLL_SSC_CONFIGURATION2\[29:20\]](#) **MODFREQDIVIDER** bit field must be $= \text{REFCLK} / (4 \times fm)$. The **ModFreqDivider** is split into Mantissa and 2^{Exponent} ($\text{ModFreqDivider} = \text{ModFreqDividerMantissa} \times 2^{\text{ModFreqDividerExponent}}$).

- The Mantissa is controlled by bits [29:23] of the **MODFREQDIVIDER** bit field.
- The Exponent is controlled by bits [22:20] of the **MODFREQDIVIDER** bit field.

Although the same value of **ModFreqDivider** can be obtained by different combinations of Mantissa and Exponent values, it is preferred to get the target **ModFreqDivider** by programming maximum Mantissa and minimum Exponent values.

To define the frequency spread (df), M must be controlled as explained previously. To define M, the step size of M for each REFCLK during the triangular pattern must be programmed (that is, $M = \text{ModFreqDivider} * \text{DeltaMStep}$). DeltaMStep is controlled by the [DSI_PLL_SSC_CONFIGURATION2\[19:0\]](#) DELTAM bit field. DeltaMStep is split into an integer part and a fractional part:

- The integer part is controlled by bits [19:18] of the DELTAM bit field.
- The fractional part is controlled by bits [17:0] of the DELTAM bit field.

The frequency spread achieved, however, has an overshoot of 20% or an inaccuracy of +20%.

If the [DSI_PLL_SSC_CONFIGURATION1\[2\]](#) DOWNSPREAD bit is set to 1, the frequency spread on the lower side is twice the programmed value. The frequency spread on the higher side is 0 (except for the overshoot, as described above).

NOTE: There is a restriction in the range of M values. The restriction is that $(M - dM)$ must be ≥ 20 . Also, $M + dM$ must be ≤ 2045 . If the [DSI_PLL_SSC_CONFIGURATION1\[2\]](#) DOWNSPREAD bit is set to 1, then $(M - 2*dM)$ must be ≥ 20 and $M \leq 2045$.

10.3.4.5.3 DSI PLL Operations

The DSI PLL configuration signals operate according to [Table 10-503](#), which indicates the operation when the PLLs are not locked.

Table 10-503. DSI PLL Operation Modes When Not Locked

| DSI PLL Operation Mode | Stop Mode Low Power ⁽¹⁾ | Stop Mode Fast Relock ⁽¹⁾ | Idle Bypass |
|--|---|---|--|
| Mode Description | Output clocks stopped Lowest power standby | Output clocks stopped Fastest start-up time | Selects when PLLs and HSDIVIDERS bypass clocks are used |
| DSI_PLL_CONFIGURATION2[0] PLL_IDLE | 0 | 0 | 1 |
| DSI_PLL_CONFIGURATION2[6] PLL_LOWCURRSTBY | 1 | 0 | 1 |
| DSI_PLL_CONFIGURATION1[0] PLL_STOPMODE | 1 | 1 | x |

⁽¹⁾ This mode must be used for better performance.

When locked, the PLL output frequency is: Input frequency * 2 * M/(N + 1), where:

- M multiplier is programmed in the [DSI_PLL_CONFIGURATION1\[20:9\]](#) PLL_REGM bit field.
- N divider is programmed in the [DSI_PLL_CONFIGURATION1\[8:1\]](#) PLL_REGN bit field.

10.3.4.5.4 DSI PLL Controllers Shadowing Mechanism

The configuration registers are accessed through the DSI protocol engine register spaces using the SCP interface. This includes all the configuration signals and returning status signals.

CAUTION

All writes must be 32-bit operations, because the SCP interface always transfers 32 bits; 16-or 8-bit operations may lead to unpredictable errors.

A shadow mechanism is implemented for appropriate register values so that configurations can optionally be updated in synchronization with the DISPC and DSI protocol engines. The front porch time from the DISPC indicates the time when making the update of the value. All the required updated values must be written before this signal is asserted. For more information, see [Section 10.3.4.4.6.1, Shadowing Register](#).

10.3.4.5.5 Error Handling

The PLL lock and recalibration signals can be monitored to detect the loss of lock or the requirement to recalibrate (caused by a large temperature change since the last lock request):

- The [DSI_PLL_STATUS](#)[1] PLL_LOCK status bit gives the DSI PLL lock state.
- The [DSI_PLL_STATUS](#)[2] PLL_RECAL status bit informs whether the PLL must be uncalibrated.

These signals can also generate interrupts at the DSI protocol engine level:

- The PLL_LOCK_IRQ interrupt indicates that the DSI PLL control module has sent a lock request to the DSI PLL. To monitor this event, read the [DSI_IRQSTATUS](#)[7] PLL_LOCK_IRQ bit. Set this bit to 1 to clear the status bit.
- The PLL_UNLOCK_IRQ interrupt indicates that the DSI PLL control module has sent an unlock request to the DSI PLL. To monitor this event, read the [DSI_IRQSTATUS](#)[8] PLL_UNLOCK_IRQ bit. Set this bit to 1 to clear the status bit.
- The PLL_RECAL_IRQ interrupt indicates that the DSI PLL control module has sent a recalibration request to the DSI PLL. To monitor this event, read the [DSI_IRQSTATUS](#)[9] PLL_RECAL_IRQ bit. Set this bit to 1 to clear the status bit.

The PLL reference loss and limp status signals can also be monitored:

- The [DSI_PLL_STATUS](#)[3] PLL_LOSSREF status bit informs whether the DSI PLL has lost the reference.
- The [DSI_PLL_STATUS](#)[4] PLL_LIMP bit informs about the DSI PLL limp status.

10.3.4.5.6 Software Reset

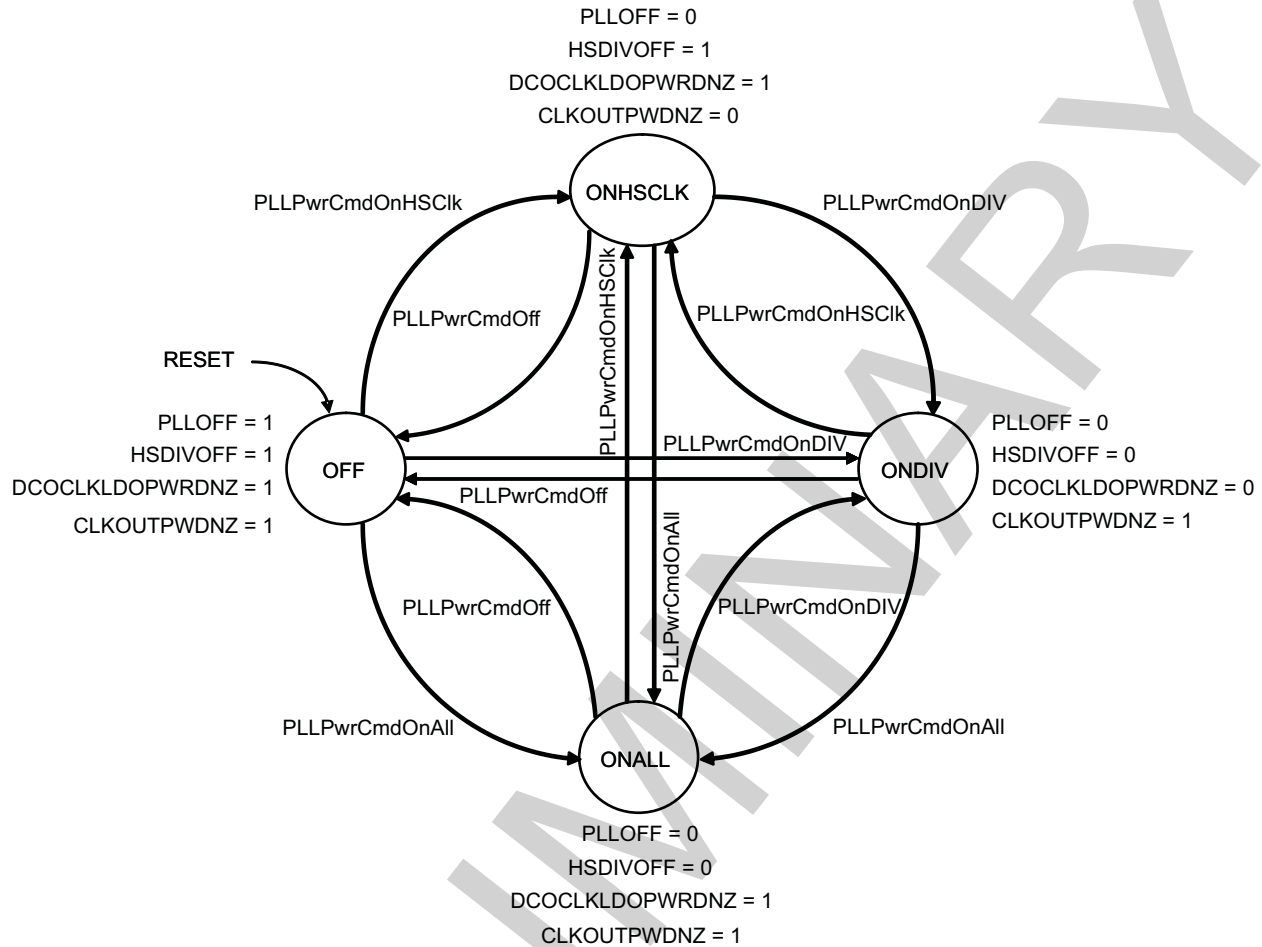

The DSI PLL control modules do not have their own software reset. They are reset by the global DSS_RST signal at PRCM module level. See [Section 10.1.2.2, DSS Resets](#). Nevertheless, software users can monitor the reset statuses of the DSI PLL control modules by reading the [DSI_PLL_STATUS](#)[0] PLLCTRL_RESET_DONE status bits.

10.3.4.5.7 Power Management

The PLLCTRL manages only the LDO power of the DSI PLL and HSDIVIDER; this is done by overriding the SYSRESET signals. All other power-management signals are integrated with the display subsystem power management..

[Figure 10-150](#) shows the power states that are controlled through the PMP.

Figure 10-150. Power State Diagram

dsi-058

10.3.4.5.8 DSI PLL Clock-Gating Sequence

Clock gating can be used to reduce system power consumption when the DSI protocol engine indicates that it does not need the clock. If the HSDIVIDER is not used, the PLL can also be stopped (at the cost of additional unstating latency).

The DSI protocol engines must verify when the PLLs have unstated by inspecting the LOCK signal (the [DSI_PLL_STATUS\[1\]](#) PLL_LOCK status bit), because the TXBYTECLKHS clocks are stopped when the CLKIN4DDR clocks generated by the DSI PLL are stopped. This eliminates the need for any explicit feedback that the clock has been unstated. This flow chart should run even if the [DSI_PLL_GO\[0\]](#) PLL_GO bit is not set.

[Figure 10-151](#) shows the DSI PLL gated mode sequence.

Figure 10-151. Gated Mode Sequence

- Table 10-504. Register Call Summary for Gated Mode Sequence**

| Register Name | Register Name | Register Name |
|------------------------|-----------------|---------------|
| DSI_PLL_CONFIGURATION2 | DSI_PLL_CONTROL | DSI_PLL_GO |

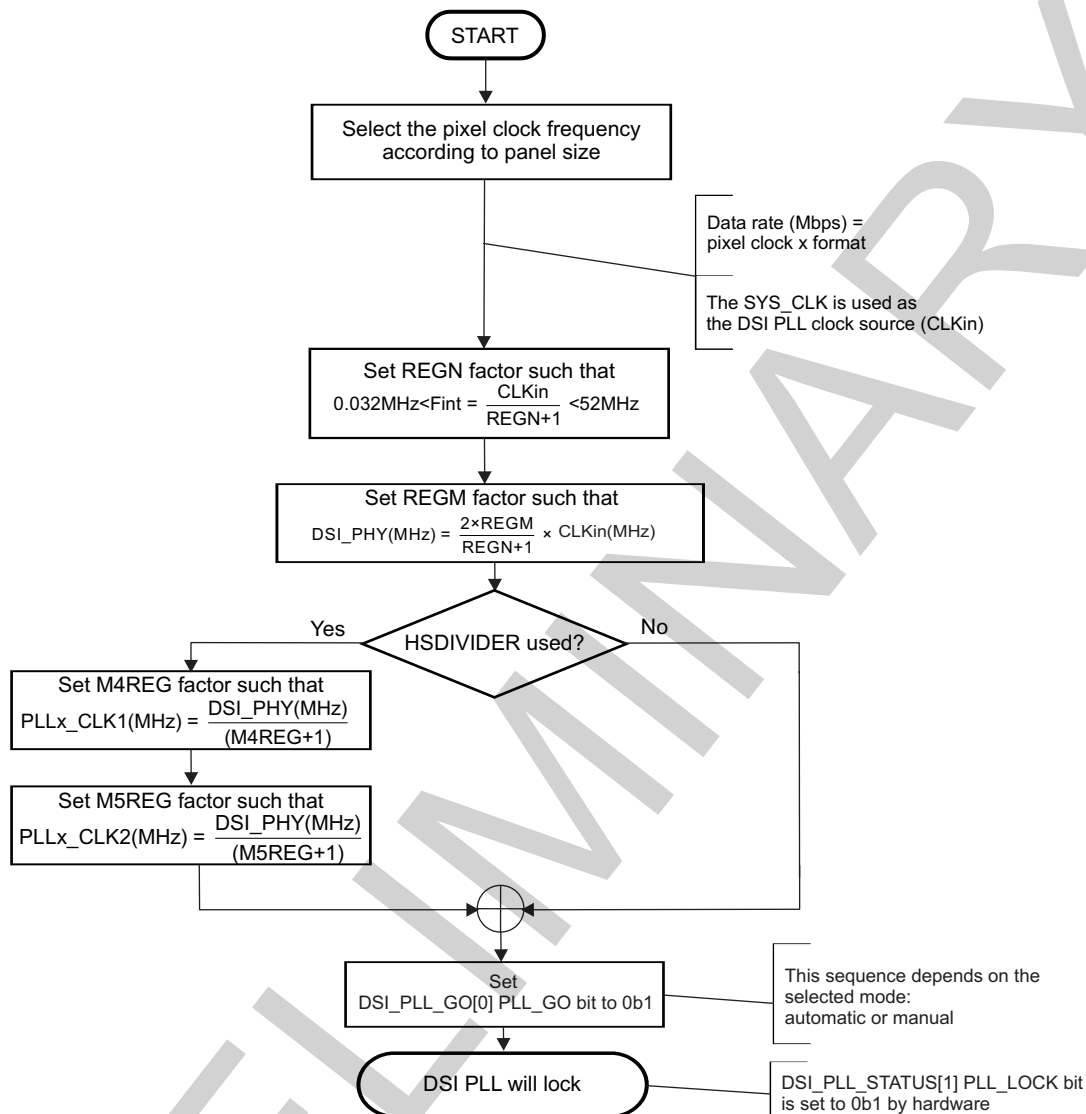

10.3.4.5.9 DSI PLL Clock Sequence

The two DSI PLLs generate the CLKIN4DDR clocks. Each HSDIVIDER outputs two clocks: PLLx_CLK1, connected to the DISPC; and PLLx_CLK2, connected to the DSI protocol engine (where x is the number of the dedicated DSI PLLs [1 or 2]). If these two clocks are not used, the HSDIVIDER functions are not required. In addition, the HSDIVIDER of the DSI1 PLL generates one more clock, PLL1_CLK4, which is used as bypass input for DSI2_PHY.

The CLKIN4DDR clocks are twice the data rate and four times the DSI output clock frequency. The DSI PLL factors must be calculated based on the required input and output frequencies, keeping the PLL internal reference frequency in the appropriate range:

- REGM factor is programmed by the [DSI_PLL_CONFIGURATION1](#)[20:9] PLL_REGM bit field.
- REGN factor is programmed by the [DSI_PLL_CONFIGURATION1](#)[8:1] PLL_REGN bit field.
- M4REG factor is programmed by the [DSI_PLL_CONFIGURATION1](#)[25:21] M4_CLOCK_DIV bit field, and applies to PLLx_CLK1.
- M5REG factor is programmed by the [DSI_PLL_CONFIGURATION1](#)[30:26] M5_CLOCK_DIV bit field, and applies to PLLx_CLK2.
- M7 factor is programmed by the [DSI_PLL_CONFIGURATION3](#)[9:5] M7_CLOCK_DIV field, and applies to PLL1_CLK4.

[Figure 10-152](#) shows the programming sequence.

Figure 10-152. DSI PLL Programming Sequence**NOTE:**

- The M4REG and M5REG factors must be set respecting the following conditions:
 - The PLLx_CLK1 frequency must be a multiple of PCLK frequency (for proper settings of the PCD and LCD factors in the DISPC).
 - The PLLx_CLK1 and PLLx_CLK2 frequencies must be lower than 186 MHz. For more information about clock frequency ratings, see [Section 10.1.2.1, DSS Clocks](#).
- Most of the other DSI PLL programming values are available for software flexibility, but it is not recommended to update the values in normal use. For the recommended DSI PLL values, see [Section 10.3.4.5.11, DSI PLL Recommended Values](#).

Table 10-505. Register Call Summary for DSI PLL Programming Sequence

| Register Name | Register Name | Register Name |
|--|----------------------------|--------------------------------|
| DSI_PLL_CONFIGURATION2 | DSI_PLL_GO | DSI_PLL_STATUS |

10.3.4.5.10 DSI PLL Go Sequence

In manual mode (the [DSI_PLL_CONTROL\[0\] PLL_AUTOMODE](#) bit is set to 0), the DPLL requires a sequence on TINITZ, TENABLE, and TENABLEDIV to update the configuration values and start the locking sequence.

When all the configuration values are programmed into the registers, the GO bit must be set. The appropriate sequence is then sent on the TINITZ, TENABLE, and TENABLEDIV pins, respecting the timing requirements of the DSI PLL. The [DSI_PLL_GO\[0\] PLL_GO](#) bit is cleared to 0 at the end of the sequence.

The TENABLEDIV signal is shared with the HSDIVIDER module so that it is programmed at the same time. In this mode, software must deassert CLKINEN by unsetting the [DSI_PLL_CONFIGURATION2\[14\] PHY_CLKINEN](#) to 0 and assert HSDIVBYPASS correctly by setting the [DSI_PLL_CONFIGURATION2\[20\] HSDIVBYPASS](#) bit to 1 to prevent uncontrolled frequencies affecting DSI_PHY and the display subsystem during PLL locking. In manual mode, the shadow register is updated anyway so that valid values are present when later selecting automatic mode.

[Figure 10-153](#) shows the DSI PLL Go flow chart in manual mode (the [DSI_PLL_CONTROL\[0\] PLL_AUTOMODE](#) bit is set to 0).

Figure 10-153. DSI PLL Go Sequence (Manual Mode)

dsi-062

- (1) All thick-outlined blocks show operations performed by software. Other blocks show operations performed by hardware.

In automatic mode (the [DSI_PLL_CONTROL\[0\] PLL_AUTOMODE](#) bit is set to 1), the TINITZ, TENABLE, and TENABLEDIV sequence and the update of the PLL configuration from the [DSI_PLL_CONFIGURATION2](#) register are deferred until the time of the front porch time signal sent by the DISPC module. This is intended to simplify the software to implement a configuration change (such as a frequency change to support a different link bandwidth). In this mode, CLKINEN, HSDIVBYPASS, and REFEN are automatically controlled and the register value is overridden.

[Figure 10-154](#) shows the DSI PLL Go flow chart in automatic mode (the [DSI_PLL_CONTROL\[0\] PLL_AUTOMODE](#) bit is set to 1).

Figure 10-154. DSI PLL Go Sequence (Automatic Mode)

10.3.4.5.12 How to Configure the DSI PLL in Video Mode

Figure 10-155 is a global overview of the DSI1 and DSI2 clock trees when used in video mode.

Figure 10-155. DSI Clock Tree in Video Mode

The settings of the DSI PLL registers can be summarized by the following equations.

Equation 1

$$N \times T_{VP_CLK} = T_L \times T_{TXBYTECLKHS}$$

ds1-e101

where

- $T_L = T_{HS} + HSA_{DSI} + T_{HE} + HFP_{DSI} + \text{ceiling}((WC + 6) / NDL) + HBP_{DSI}$
- N is an integer.
- NDL: Number of data lanes
- WC: Word count or payload in bytes
- HSA_{DSI} is HSA period in video mode.
- HBP_{DSI} is HBP period in video mode.
- HFP_{DSI} is HFP period in video mode.

T_{HS} is the length of HSYNC start short packet in the number of byte clock cycles (TXBYTECLKHS).

- The generation of this packet can be enabled by setting the [DSI_CTRL\[17\]](#) VP_HSYNC_START bit to 1.
- T_{HS} is equal to $\text{ceiling}(4 / NDL)$, if VP_HSYNC_START = 1; else, it is 0.

T_{HE} is the length of HSYNC end short packet in the number of byte clock cycles (TXBYTECLKHS).

- The generation of this packet can be enabled by setting the [DSI_CTRL\[18\]](#) VP_HSYNC_END bit to 1.
- T_{HE} is equal to 1, if (VP_HSYNC_START = 1, VP_HSYNC_END = 1, $HSA_{DSI} = 0$, and NDL = 3), else
- T_{HE} is equal to $\text{ceiling}(4 / NDL)$, if (VP_HSYNC_START = 1 and VP_HSYNC_END = 1); else, it is 0.

NOTE: HSA_{DSI} timing is not used and does not have to be programmed when HE short packet is not generated.

Equation 2

$$R = T_{TXBYTECLKHS} / T_{VP_PCLK}$$

ds1-e102

To synchronize the DISPC and DSI protocol engines, users must follow the ratio R between TXBYTECLKHS and VP_PCLK, as listed in [Table 10-508](#).

Table 10-508. Ratio R

| Number of Data Lanes (Up to 4 Data Lanes for DSI1) (Up to 2 Data Lanes for DSI2) | Pixel Format | Ratio R |
|--|--------------|---------|
| 1 | 16-bit pixel | 1/2 |
| 1 | 18-bit pixel | 4/9 |
| 1 | 24-bit pixel | 1/3 |
| 2 | 16-bit pixel | 1 |
| 2 | 18-bit pixel | 8/9 |
| 2 | 24-bit pixel | 2/3 |
| 3 | 16-bit pixel | 3/2 |
| 3 | 18-bit pixel | 4/3 |
| 3 | 24-bit pixel | 1 |
| 4 | 16-bit pixel | 2 |
| 4 | 18-bit pixel | 16/9 |
| 4 | 24-bit pixel | 4/3 |

All cases are covered by:

$$F_{VP_PCLK} \times \text{bits_per_pixel} = F_{TXBYTECLKHS} \times NDL \times 8$$

dsi-e110

Equation 3

$$(HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times T_{VP_PCLK} = (4/NDL + HFP_{DSI} + (WC + 6)/NDL + HBP_{DSI}) \times T_{TXBYTECLKHS}$$

dsi-e103

Equation 4

$$HFP_{DSI} = ((HFP_{DISPC} \times \text{bits_per_pixel}) / (NDL \times 8)) - (2 / NDL)$$

dsi-e109

Example

The desired performances are:

- Clock lane at 150 MHz
- RGB24-888
- 1-data lane
- LCD size 480 × 640 with $HSA_{DISP} = HFP_{DISP} = HBP_{DISP} = 20$, $VSA_{DISP} = VFP_{DISP} = VBP_{DISP} = 2$

Step 1. Determine REGM and REGN.

To obtain correct stability, F_{int} must be kept between 0.032 MHz and 52 MHz. In this case, F_{int} is maintained at 2 MHz. For more information, see [Section 10.3.4.5.2, DSI PLL Controllers Architecture](#), [Section 10.3.4.5.9, DSI PLL Clock Sequence](#), and [Section 10.3.5.2.1.1, Main Sequence – DSI PLL Setup](#).

$$REGN = (F_{SYS_CLK} / F_{int}) - 1$$

$$REGN = 12$$

$$REGM = (REGN + 1) \times F_{CLKIN4DDR} / (2 \times F_{SYS_CLK})$$

$$REGM = 150$$

dsi-e113

where

- $SYS_CLK = 26$ MHz is used as a reference clock.

Step 2. Determine VP_PCLK and TXBYTECLKHS clocks.

TXBYTECLKHS frequency is equal to 37.5 MHz. With ratio R equal to 1/3, VP_PCLK frequency is equal to 12.5 MHz. The frame rate can be estimated by:

$$\text{Frame rate} = F_{VP_PCLK} / (HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times (VSA_{DISPC} + LPP + VBP_{DISPC})$$

$$\text{Frame rate} = 12.5 \text{ MHz} / (540) \times (646)$$

$$\text{Frame rate} = 35.83 \text{ frame/sec}$$

dsi-e123

Step 3. Determine LCD, PCD, and M4REG.

$$T_{CLKIN4DDR} = T_{TXBYTECLKHS} / 16 = T_{VP_PCLK} / ((M4REG + 1) \times LCD \times PCD)$$

$$((M4REG + 1) \times LCD \times PCD) = 16 \times 3$$

dsi-e115

If LCD and PCD are set to 1 and 3, respectively, M4REG is equal to 15.

Step 4. Verify N as integer.

First, TL must be determined:

$$(HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times T_{VP_PCLK} / T_{TXBYTECLKHS} = T_L = 1620$$

dsi-e116

From **Equation 1** follows:

$$N \times T_{VP_CLK} = T_L \times T_{TXBYTECLKHS}$$

$$N = T_{TXBYTECLKHS} \times T_L / T_{VP_CLK} = T_L / (R \times PCD)$$

$$N = 14580$$

N is an integer.

Step 5. Determine HFP and HBP of the DSI protocol engine.

From **Equation 3** follows:

$$((HSA_{DISPC} + HFP_{DISPC} + PPL + HBP_{DISPC}) \times T_{VP_PCLK} / T_{TXBYTECLKHS}) - (4/NDL + (WC + 6)/NDL) = HFP_{DSI} + HBP_{DSI}$$

$$HFP_{DSI} + HBP_{DSI} = 170$$

dsi-e117

From **Equation 4** follows:

$$HFP_{DSI} = ((HFP_{DISP} \times \text{bits_per_pixel}) / NDL \times 8) - (2/NDL)$$

$$HFP_{DSI} = 58$$

$$HBP_{DSI} = 170 - 58 = 112$$

dsi-e121

10.3.4.6 DSI Complex I/O

10.3.4.6.1 DSI Complex I/O Overview

DSI_PHY is a complex I/O with five unidirectional (HS) lane modules. This includes four data lane modules and one clock lane module. Each lane module has two data pads (DX, DY). These data pads are connected with a complementary lane module on the DSI receiver device using a point-to-point interconnect.

Lane modules support HS burst mode. Forward direction and reverse direction escape modes are also supported. Escape modes can be used for low-power data transmission, among other things.

The maximum data rate supported in HS mode is 824 Mbps for four data lanes, and 900 Mbps for up to three data lanes. The lane module function and position are configurable; that is, any lane module can be chosen as a clock lane module, and the DX/DY data pad for each lane module can be configured as a DP or DN pin defined by the D-PHY specification.

DSI_PHY interacts with the higher layers of the DSI link through the PPI. DSI_PHY does not include a PLL; a high-frequency clock input is expected in HS mode (CLKIN4DDR). DSI_PHY also supports the SCP interface to set various configuration and control registers.

10.3.4.6.2 Software Reset

The clock domain using the TXBYTECLKHS byte clock from the DSI complex I/O has dedicated reset-done information in the [DSI_COMPLEXIO_CFG1](#)[29] RESET_DONE bit. The [DSI_SYSCONFIG](#)[1] SOFT_RESET bit is used to reset the byte clock power domain. A dummy read using the SCP interface to any DSI_PHY register is required after DSI_PHY reset to complete the reset of the DSI complex I/O.

10.3.4.6.3 Reset-Done Bits

The DSI complex I/O has several clock domains. The reset status for each clock domain is provided in the [DSI_PHY_REGISTER5](#) register:

- [DSI_PHY_REGISTER5](#)[31] RESETDONETXBYTECLK bit: Reset done for the TXBYTECLK domain.
- [DSI_PHY_REGISTER5](#)[28:24] RESETDONETXCLKESC_i bit field: Reset done for the TXCLKESC domain for lane *i* (where *i* = 0 to 4).
- [DSI_PHY_REGISTER5](#)[30] RESETDONESCPCCLK bit: Reset done for the SCP clock domain. Software users must perform a dummy read on this bit to initiate the reset sequence of the SCP FSM. When the reset sequence completes, the RESETDONESCPCCLK signal goes high, and software users can read again the [DSI_PHY_REGISTER5](#)[30] RESETDONESCPCCLK bit to ensure that the value is now 1.

NOTE: Software must not write in the DSI_PHY SCP registers before the [DSI_PHY_REGISTER5](#)[30] RESETDONESCPCCLK bit is set to 1.

- [DSI_PHY_REGISTER5](#)[29] RESETDONEPWRCLK bit: Reset done for the PWR clock domain. The reset sequence of the PWR FSM is complete when the RESETDONEPWRCLK signal goes high.

10.3.4.6.4 Pad Configuration

The number of lanes is configurable through the [DSI_COMPLEXIO_CFG1](#) register.

It is not allowed to change on the fly the position (by modifying the DATA_x_POSITION, where *x* = 1 through 4, and CLOCK_POSITION fields), the P/N order (positive/negative order of the differential pair by modifying the DATA_y_POL, where *y* = 1 through 4, and CLOCK_POL), or the number of active data lanes (by modifying the [DSI_COMPLEXIO_CFG1](#)[10:8] DATA2_POSITION, [DSI_COMPLEXIO_CFG1](#)[14:12] DATA3_POSITION, and [DSI_COMPLEXIO_CFG1](#)[18:16] DATA4_POSITION bit fields). To add or remove lanes 2, 3, or 4, it is required to be in OFF mode for the DSI complex I/O.

The configuration of the DSI complex I/O (number of data lanes, position, differential order) must not be changed while the [DSI_CLK_CTRL](#)[20] LP_CLK_ENABLE bit is set to 1. For hardware to recognize a new configuration of the complex I/O (done in the [DSI_COMPLEXIO_CFG1](#) register), the following sequence shall be followed:

1. Set the [DSI_CTRL](#)[0] IF_EN bit to 1.
2. Reset the [DSI_CTRL](#)[0] IF_EN bit to 0.
3. Set [DSI_CLK_CTRL](#)[20] LP_CLK_ENABLE bit to 1.
4. Set again the [DSI_CTRL](#)[0] IF_EN bit to 1.

If the sequence is not followed, the DSI complex I/O configuration is undetermined.

The minimum requirement for the number of lanes is one clock lane and one data lane. By default, data lanes 2, 3, and 4 are not connected (the reset value of the DATA_x_POSITION bit fields is 0).

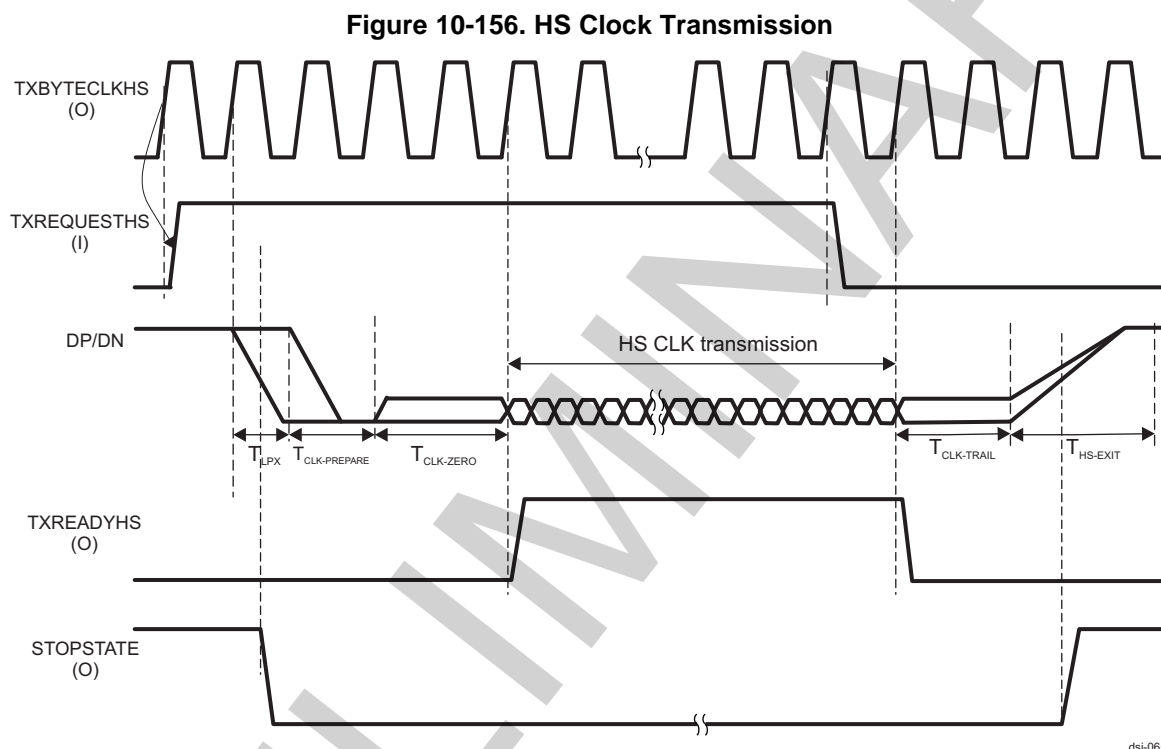

10.3.4.6.5 Display Timing Configuration

NOTE: Copyright 2005-2008 MIPI Alliance, Inc. All rights reserved. MIPI Alliance Member Confidential.

Depending on the CLKIN4DDR clock frequency settings programmed with the DSI PLL control module, software users must program accordingly the timing parameters in the DSI complex I/O registers.

10.3.4.6.5.1 High-Speed Clock Transmission

Figure 10-156 shows an example of HS clock transmission.

TXBYTECLKHS is an output clock that is derived by dividing CLKIN4DDR by 16.

The TXBYTECLKHS clock is driven by DSI_PHY when:

- The CLKIN4DDR is running and [DSI_PLL_CONFIGURATION2](#)[14] PHY_CLKINEN bit is set to '1'.
- DSI_PHY is in ON power state ([DSI_COMPLEXIO_CFG1](#)[28:27] PWR_CMD bit = 1) and at least one lane is enabled.

To begin transmission, the protocol drives TXREQUESTHS high on a rising edge of TXBYTECLKHS. The PHY detects this signal on the next rising edge, after which it initiates the LP SoT procedure.

During an HS clock transmission, these parameters are defined in multiples of CLKIN4DDR and are programmed by the following bit fields:

- TLPX timing is programmed by [DSI_PHY_REGISTER1](#)[20:16] TLPXBY2.
- THS-PREPARE timing is programmed by [DSI_PHY_REGISTER0](#)[31:24] THSPREPARE.
- TCLK-ZERO timing is programmed by [DSI_PHY_REGISTER1](#)[7:0] TCLKZERO.

TCLK-ZERO is extended, if required, so that the entire LP SoT procedure lasts an integer number of TXBYTECLKHS cycles.

At the end of the SoT procedure, HS clock transmission begins. At the same time, TXREADYHS is made high.

To stop clock transmission, the protocol drives TXREQUESTHS low on a rising edge of TXBYTECLKHS. The DSI_PHY detects this change in TXREQUESTHS on the next edge and stops clock transmission. TXREADYHS is made low.

The DSI_PHY then goes through the LP EoT procedure. The TCLK-TRAIL and THS-EXIT parameters are also multiples of CLKIN4DDR and are programmed by the following bit fields:

- TCLK-TRAIL timing is programmed by [DSI_PHY_REGISTER1\[15:8\]](#) TCLKTRAIL.
- THS-EXIT timing is programmed by [DSI_PHY_REGISTER0\[7:0\]](#) THSEXIT.

The DSI_PHY completes the SoT and EoT procedures, once begun, regardless of any change in the PPI signals. If TXREQUESTHS goes low during the SoT procedure, the PHY starts the EoT procedure immediately after finishing the SoT procedure and no clock is transmitted.

STOPSTATE is high whenever the line is in LP-11 state, as determined by the outputs of the low-power receivers. This signal is not synchronized with TXBYTECLKHS.

The HS clock must be present for a period of time before (TCLK-PRE) and after (TCLK-POST) HS data transmission. The protocol must ensure that these timings are met by asserting and deasserting TXREQUESTHS appropriately.

The PHY ensures that the clock signal has a quadrature phase with respect to a toggling bit sequence on any data lane, and a rising edge in the center of the first transmitted bit of each data byte. These relations are not described in the timing diagram.

CLKIN4DDR can be shut off 300 ns after the clock lane goes to STOPSTATE. Alternatively, CLKIN4DDR can be shut down after TCLK-Trail + THS-Exit + 2 Txbyteclk periods after the TxRequestHS falling edge is received by DSI_PHY.

The DSI protocol engine must ensure that TXREQUESTESC, TXULPSCLK, and TURNREQUEST are low whenever TXREQUESTHS is asserted.

10.3.4.6.5.2 High-Speed Data Transmission

[Figure 10-157](#) shows an example of HS data transmission.

Figure 10-157. HS Data Transmission

To begin transmission, the protocol drives TXDATAHS with the first byte of data on a rising edge of TXBYTECLKHS. It also makes TXREQUESTHS high on the same rising edge. The PHY detects TXREQUESTHS going high on the next rising edge of TXBYTECLKHS, following which it initiates the LP SoT procedure.

During an HS data transmission, these timings are multiples of CLKIN4DDR and are programmed by the following bit fields:

- TLPX timing is programmed by [DSI_PHY_REGISTER1](#)[20:16] TLPXBY2.
- THS-PREPARE + THS-ZERO timing is programmed by [DSI_PHY_REGISTER0](#)[23:16] THSPRPR_THSZERO.

THS-ZERO is extended, if required, so that the entire LP SoT procedure lasts an integer number of TXBYTECLKHS cycles. THS-SYNC corresponds to the length of the sync pattern (8 HS bits), and can be configured through the [DSI_PHY_REGISTER2](#)[31:24] HSSYNCPATTERN bit field.

Toward the end of the SoT procedure, the PHY makes TXREADYHS high on a positive edge of TXBYTECLKHS and then starts accepting data from TXDATAHS from the next positive edge onward. The protocol is expected to provide (new) valid data on TXDATAHS on every positive edge of TXBYTECLKHS if TXREADYHS is high.

At the end of the SoT procedure, HS data transmission begins. HS data transmission happens LSB first.

To stop data transmission, the protocol drives TXREQUESTHS low on a rising edge of TXBYTECLKHS. The PHY detects this change in TXREQUESTHS on the next edge and stops data transmission. TXREADYHS is made low and data on TXDATAHS, from that point, is ignored.

The PHY then goes through the LP EoT procedure. THS-TRAIL and THS-EXIT are also multiples of CLKIN4DDR and are programmed by the following bit fields:

- THS-TRAIL timing is programmed by [DSI_PHY_REGISTER0](#)[15:8] THSTRAIL.

- THS-EXIT timing is programmed by [DSI_PHY_REGISTER0\[7:0\] THSEXIT](#).

The PHY completes the SoT and EoT procedures, once begun, regardless of any change in PPI signals. If TXREQUESTHS goes low during the SoT procedure, the PHY starts the EoT procedure immediately after finishing the SoT procedure and no data is transmitted.

STOPSTATE is high whenever the line is in LP-11 state, as determined by the outputs of the low-power receivers. This signal is not synchronized with TXBYTECLKHS.

The protocol must ensure that TXREQUESTESC, TXULPSCLK, and TURNREQUEST are low whenever TXREQUESTHS is asserted.

10.3.4.6.5.3 Turnaround Request in Transmit Mode

When the DSI PHY is in transmit mode, the DSI protocol engine can request a turnaround by making the TurnRequest signal high for at least one clock cycle of TxClkEsc (see [Section 10.3.4.4.7.3, TurnRequest FSM](#)).

The DSI PHY transmits the turnaround request pattern (LP 11-10-00-10-00-00-00-00) (see [Figure 10-158](#)). The number of 00 states at the end of the pattern is defined by the T_{TA-GO} timing parameter and is programmable through the [DSI_PHY_REGISTER1\[31:29\] REG_TTAGO](#) bit field, in number of TxClkEsc clocks. Following the transmission of the pattern, the DSI PHY disables its LP transmitters and waits for an acknowledgment from the remote device. The remote device detects the turnaround request and acknowledges it by driving LP 10, followed by the STOP state. When this acknowledgment is received (BTA_IRQ is asserted, as described in [Section 10.3.4.4.8, Bus Turnaround](#)), the DSI PHY switches to receive mode and indicates the completion of the turnaround procedure by changing the direction (BTA_EN = 0).

Figure 10-158. Turnaround Request in Transmit Mode

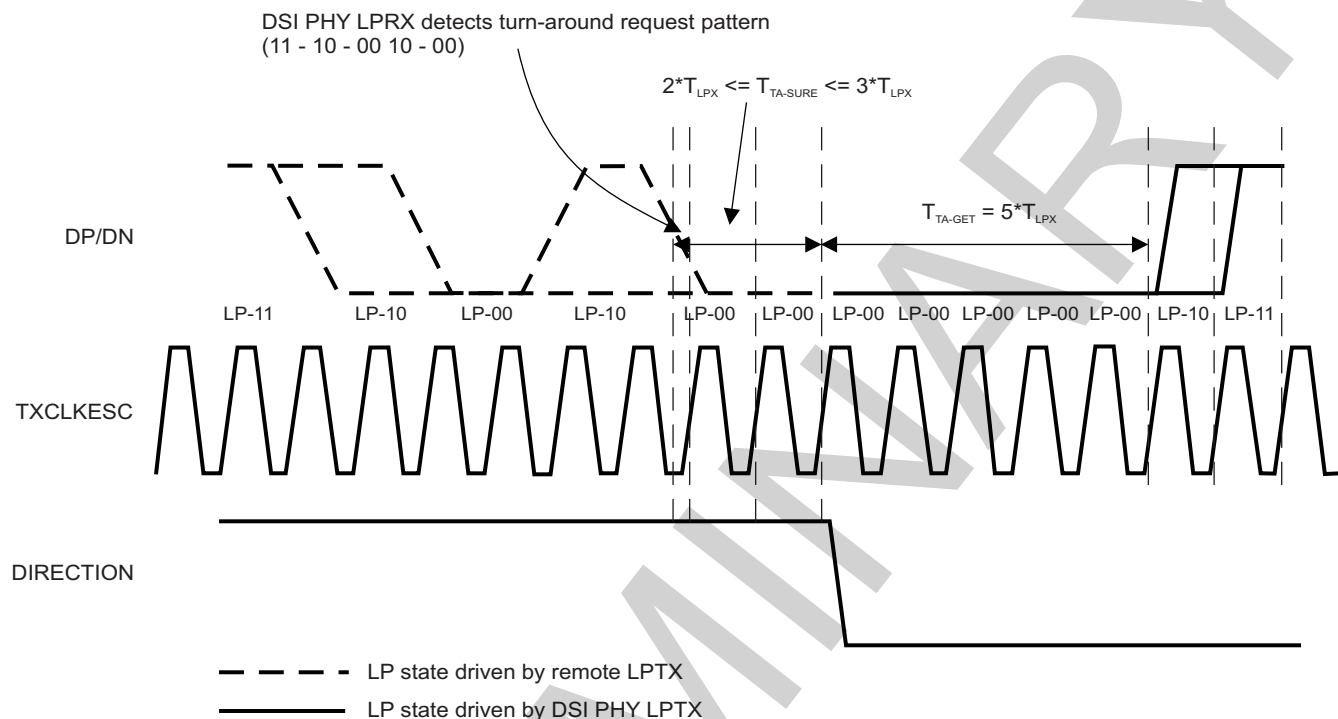

dsi-028

The DSI protocol engine must not stop TxClkEsc after the turnaround process completes (the [DSI_CLK_CTRL\[20\] LP_CLK_ENABLE](#) bit must be kept at 1), because TxClkEsc is also used in handling a turnaround request transmitted by a remote slave device (see [Section 10.3.4.6.5.4, Turnaround Request in Receive Mode](#)).

10.3.4.6.5.4 Turnaround Request in Receive Mode

When DSI PHY is in receive mode, an LP pattern of 11-10-00-10-00 on DP/DN lines indicates a turnaround request from the remote device (see [Figure 10-159](#)).

Figure 10-159. Turnaround Request in Receive Mode

dsi-029

If the line stays in LP-00 for a time $T_{TA-SURE}$, the DSI PHY accepts the turnaround request, changes the direction, transmits LP-00 for a time T_{TA-GET} , and then transmits the acknowledgment pattern LP-10, followed by the STOP state.

This completes the turnaround procedure (BTA_IRQ is asserted, as described in [Section 10.3.4.4.8, Bus Turnaround](#)). The $T_{TA-SURE}$ and T_{TA-GET} timing parameters are programmable through [DSI_PHY_REGISTER1](#) in number of TxClkEsc clocks:

- $T_{TA-SURE}$ can be configured in the [28:27] REG_TTASURE bit field.
- T_{TA-GET} can be configured in the [26:24] REG_TTAGET bit field.

10.3.4.6.5.5 Other DSI PHY Transmission and Reception

The timings of the following sequences defined in the DSI_PHY protocol cannot be programmed by the user:

- Low-power data transmission
- Escape mode trigger command transmission
- ULPS command transmission on data lanes
- ULPS transmission on clock lane
- Low-power data in receive mode
- Low-power trigger in receive mode
- ULPS command on clock lane in receive mode
- ULPS command on data lane in receive mode

10.3.4.6.6 Power Management

Power management of the DSI_PHY analog circuitry is done through the internal power FSM, which is

controlled by the subsystem. The control interface is a basic command and acknowledge protocol. The subsystem is the master of the interface. There is a dedicated command pin for each power state of DSI_PHY and a common acknowledge pin. The subsystem sends the power command and clock. The internal FSM does the sequencing and control generation of internal power domains. It then asserts the acknowledge, which signals the completion of the power state transition. The internal power control FSM is powered by a constant power supply.

The main features of the power control interface are:

- One dedicated command line per power state
- Only one command line can be asserted at a time.
- One acknowledge signal common to all command lines
- The command line cannot be cleared unless the acknowledge has been returned.
- All the command lines and the acknowledge signal must be cleared before triggering a new command.

DSI_PHY supports three power states:

- OFF/GPIO mode (OFF): The entire analog circuit is powered down. Internal LDO is OFF. All analog circuitry on 1.8-V supply is powered down. The ULPS exit detection circuit power switch is OFF. DSI_PHY takes leakage level current.
- ON: Complete analog circuit is powered on and functional. LDO is ON. (DSI_PHY calibrates every time the module enters power on state.)
- ULPS: Only the DSI_PHY mode ULPS exit detection circuit power switch is ON. All the other analog circuitry is switched OFF. LDO is OFF.

NOTE: ULPS must be entered only when all used lane modules go into ULPS state. PHY power state must be returned to ON power state when any one of the used modules goes out of ULPS. No PPI signal except TXULPSEXIT must be toggled when in this power state.

Figure 10-160 shows the power states of the DSI complex I/O

Figure 10-160. Power State Diagram

dsi-060

10.3.4.6.7 Error Handling

A dedicated register for the DSI complex I/O ([DSI_COMPLEXIO_IRQSTATUS](#)) indicates the state of each error provided by the DSI complex I/O error signals. The DSI_PHY reports the following errors:

- [DSI_COMPLEXIO_IRQSTATUS](#)[9:5] ERRESCi_IRQ: ERRESC is asserted if an unrecognized Escape entry command is received. This remains high until the next change in the line state.
- [DSI_COMPLEXIO_IRQSTATUS](#)[4:0] ERRSYNCESCi_IRQ: If the number of bits received during a low-power data transmission is not a multiple of 8 when the transmission ends, ERRSYNCESC is made high and remains high until the next change in line state.
- [DSI_COMPLEXIO_IRQSTATUS](#)[14:10] ERRCONTROLi_IRQ: ERRCONTROL is asserted if an incorrect line state sequence is detected. For example, if a turnaround request or escape mode request is immediately followed by a STOP state instead of the required BRIDGE state, this signal is asserted and remains asserted until the next change in the line state.
- [DSI_COMPLEXIO_IRQSTATUS](#) ERRCONTENTIONLP0_i_IRQ: ERRCONTENTION0LPDX and ERRCONTENTION0LPDY are asserted when the lane module detects a contention situation on lines DX and DY, respectively, while trying to drive the lines low. Contention is detected only if it lasts at least 50 ns.
- [DSI_COMPLEXIO_IRQSTATUS](#) ERRCONTENTIONLP1_i_IRQ: ERRCONTENTION1LPDX and ERRCONTENTION1LPDY are asserted when the lane module detects a contention situation on lines DX and DY, respectively, while trying to drive the lines high. Contention is detected only if it lasts at least 50 ns.

The ULPSACTIVENOT signal goes low, which indicates to the protocol that the PHY has entered ULPS. When all the ULPSActiveNot signals are low, the [DSI_COMPLEXIO_IRQSTATUS](#)[30] ULPSACTIVENOT_ALL0_IRQ event is generated. When all the ULPSActiveNot signals are high, the [DSI_COMPLEXIO_IRQSTATUS](#)[31] ULPSACTIVENOT_ALL1_IRQ event is generated.

When any of the events defined in the [DSI_COMPLEXIO_IRQSTATUS](#) register happen, the [DSI_IRQSTATUS](#)[10] COMPLEXIO_ERR_IRQ bit is set to 1 at DSI protocol engine level.

Table 10-509 lists the DSI complex I/O interrupt events.

Table 10-509. DSI Complex I/O Interrupts

| IRQ Name | Description |
|------------------------|---|
| ULPSActiveNot_ALL0_IRQ | All the ULPSActiveNOT signals are 0. |
| ULPSActiveNot_ALL1_IRQ | All the ULPSActiveNOT signals corresponding to the lanes with TXULPSExit being high are high. |
| STATEULPM5_IRQ | Lane 5 in ULPS |
| STATEULPM4_IRQ | Lane 4 in ULPS |
| STATEULPM3_IRQ | Lane 3 in ULPS |
| STATEULPM2_IRQ | Lane 2 in ULPS |
| STATEULPM1_IRQ | Lane 1 in ULPS |
| ERRCONTROL5_IRQ | Control error for lane 5 |
| ERRCONTROL4_IRQ | Control error for lane 4 |
| ERRCONTROL3_IRQ | Control error for lane 3 |
| ERRCONTROL2_IRQ | Control error for lane 2 |
| ERRCONTROL1_IRQ | Control error for lane 1 |
| ERRESC5_IRQ | Escape entry error for lane 5 (edge trigger interrupt) |
| ERRESC4_IRQ | Escape entry error for lane 4 (edge trigger interrupt) |
| ERRESC3_IRQ | Escape entry error for lane 3 (edge trigger interrupt) |
| ERRESC2_IRQ | Escape entry error for lane 2 (edge trigger interrupt) |
| ERRESC1_IRQ | Escape entry error for lane 1 (edge trigger interrupt) |
| ERRCONTENTIONLP1_1_IRQ | Contention LP1 error for lane 1 |
| ERRCONTENTIONLP0_1_IRQ | Contention LP0 error for lane 1 |
| ERRCONTENTIONLP1_2_IRQ | Contention LP1 error for lane 2 |
| ERRCONTENTIONLP0_2_IRQ | Contention LP0 error for lane 2 |
| ERRCONTENTIONLP1_3_IRQ | Contention LP1 error for lane 3 |
| ERRCONTENTIONLP0_3_IRQ | Contention LP0 error for lane 3 |
| ERRCONTENTIONLP1_4_IRQ | Contention LP1 error for lane 4 |

Table 10-509. DSI Complex I/O Interrupts (continued)

| IRQ Name | Description |
|------------------------|--|
| ERRCONTENTIONLP0_4_IRQ | Contention LP0 error for lane 4 |
| ERRCONTENTIONLP1_5_IRQ | Contention LP1 error for lane 5 |
| ERRCONTENTIONLP0_5_IRQ | Contention LP0 error for lane 5 |
| ERRSYNCE5_IRQ | Low-power data transmission synchronization error for lane 5 |
| ERRSYNCE4_IRQ | Low-power data transmission synchronization error for lane 4 |
| ERRSYNCE3_IRQ | Low-power data transmission synchronization error for lane 3 |
| ERRSYNCE2_IRQ | Low-power data transmission synchronization error for lane 2 |
| ERRSYNCE1_IRQ | Low-power data transmission synchronization error for lane 1 |

Software must take appropriate action when receiving the interrupt indicating the error from the complex I/O. The action can be:

- Reset the DSI protocol engine module
- Reset the peripheral through the reset trigger or directly driving the hardware reset pin of the display module
- Ignore the error

10.3.5 DSI Programming Model

This section describes the low-level hardware programming sequences for the configuration and use of the DSI module.

10.3.5.1 DSI Global Initialization

10.3.5.1.1 Surrounding Modules Global Initialization

This section describes the requirements to initialize the surrounding modules when the DSI module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DSI. For more information, see [Section 10.3.3, DSI Integration](#), and [Section 10.3.2, DSI Environment](#).

[Table 10-510](#) describes the global initialization of the surrounding modules.

Table 10-510. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|--------------------------|--|
| PRCM | DSI module interface and functional clocks must be enabled. The module power management (idle and sleep modes) must be configured. For more information, see Chapter 3, Power, Reset, and Clock Management . |
| MPU INTC | MPU interrupt controller (INTC) configuration must be done to enable interrupts from the DSI module. For more information about the module configuration, see Chapter 18, Interrupt Controllers . |
| DSP INTC | DSP INTC configuration must be done to enable interrupts from the DSI module. For more information about the module configuration, see Chapter 5, DSP Subsystem . |
| sDMA | DMA configuration must be done to enable DSI module DMA channel requests. For more information about the configuration, see Chapter 17, sDMA . |
| L3 / L4_PER Interconnect | For information about the interconnect configuration, see Chapter 14, Interconnect . |

10.3.5.1.2 DSI Global Initialization

10.3.5.1.2.1 Main Sequence - DSI Global Initialization

This procedure initializes the DSI after a power on or software reset.

[Table 10-511](#) summarizes the DSI global initialization.

Table 10-511. DSI Global Initialization

| Steps | Registers | Value |
|--|---|-------|
| Reset IRQ status. | DSI_IRQSTATUS [31:0] | 0x0 |
| Set clock activity. | DSI_SYSCONFIG [9:8] CLOCKACTIVITY | x |
| Configure power management. | DSI_SYSCONFIG [4:3] SIDLEMODE | x |
| Reset DSI protocol engine. | DSI_SYSCONFIG [1] SOFT_RESET | 0x1 |
| Wait until five reads of reset status? | Software test condition | |
| Read reset status. | DSI_SYSSTATUS [0] RESET_DONE | |
| IF: Is reset ongoing? | DSI_SYSSTATUS [0] RESET_DONE | = 0x0 |
| Error occurred during reset stage ⁽¹⁾ | | |
| ENDIF | | |

10.3.5.2 DSI Operational Modes Configuration

10.3.5.2.1 DSI Video Mode Using the DISPC Video Port

10.3.5.2.1.1 Main Sequence - DSI PLL Setup

Table 10-512 lists the steps required to configure DSI PLL.

Table 10-512. DSI PLL Configuration Registers

| Steps | Registers | Value |
|---|---|-------|
| Turn ON/OFF the PLL and HSDIVIDER. | DSI_CLK_CTRL [31:30] PLL_PWR_CMD | x |
| Wait until the status of the PLL is set (value according to the previous step)? | DSI_CLK_CTRL [29:28] PLL_PWR_STATUS | = x |
| Set the divider value for DSI protocol engine clock source M5REG. | DSI_PLL_CONFIGURATION1 [30:26] M5_CLOCK_DIV | x |
| Set the divider value for clock source M4REG. | DSI_PLL_CONFIGURATION1 [25:21] M4_CLOCK_DIV | x |
| Set the value for M divider for PLL. | DSI_PLL_CONFIGURATION1 [20:9] DSI_PLL_REGM | x |
| Set the value for N divider for PLL. | DSI_PLL_CONFIGURATION1 [8:1] DSI_PLL_REGN | x |
| Enable/disable PLL STOPMODE. | DSI_PLL_CONFIGURATION1 [0] PLL_STOPMODE | x |
| Enable/disable DSI protocol engine clock divider. | DSI_PLL_CONFIGURATION2 [18] M5_CLOCK_EN | x |
| Enable/disable M4 clock source divider. | DSI_PLL_CONFIGURATION2 [16] M4_CLOCK_EN | x |
| Enable/disable DSI PHY clock. | DSI_PLL_CONFIGURATION2 [14] PHY_CLKINEN | x |
| Enable/disable PLL reference clock. | DSI_PLL_CONFIGURATION2 [13] PLL_REFEN | x |
| Set PLL automatic update mode. | DSI_PLL_CONTROL [0] PLL_AUTOMODE | x |
| Request PLL locking sequence. | DSI_PLL_GO [0] PLL_GO | 0x1 |
| Read until PLL_GO bit = 0? | DSI_PLL_GO [0] PLL_GO | = 0x0 |
| Wait until PLL is locked? | DSI_PLL_STATUS [1] PLL_LOCK | = 0x1 |
| Set the ratio for the LP clock. | DSI_CLK_CTRL [12:0] LP_CLK_DIVISOR | x |
| Enable/disable DSS_L3_ICLK clock gating to DSI_PHY and PLL module. | DSI_CLK_CTRL [14] CIO_CLK_ICG | x |
| Enable/disable the automatic assertion/deassertion of DSISetpClk. | DSI_CLK_CTRL [18] HS_AUTO_STOP_ENABLE | x |
| Configure the DSI functional clock synchronization and clock speed. | DSI_CLK_CTRL [21] LP_RX_SYNCHRO_ENABLE | x |
| Turn ON/OFF PLL and HSDIVIDER. | DSI_CLK_CTRL [31:30] PLL_PWR_CMD | x |

10.3.5.2.1.2 Main Sequence - Set Up DSI Protocol Engine

10.3.5.2.1.2.1 Set Up DSI Control Registers

Table 10-513 lists the steps to set up the DSI control registers. Table 10-514 lists the steps to set up the DSI complex I/O registers.

Table 10-513. DSI Control Registers

| Steps | Registers | Value |
|--|---|-------|
| Enable the interrupt event for lost synchronization with the video port. | DSI_IRQENABLE [18] SYNC_LOST_IRQ_EN | 0x1 |
| Enable interrupt event for sent packet on desired VC. | DSI_VC_IRQENABLE_i [2] PACKET_SENT_IRQ_EN | x |
| Enable HSYNC END pulse detection (short packet generation). | DSI_CTRL [17] VP_HSYNC_START | 0x1 |
| Enable VSYNC START pulse detection (short packet generation). | DSI_CTRL [15] VP_VSYNC_START | 0x1 |

Table 10-513. DSI Control Registers (continued)

| Steps | Registers | Value |
|---|---|-------|
| Select trigger reset mode. | DSI_CTRL[14] TRIGGER_RESET_MODE | x |
| Set the number of line buffers. | DSI_CTRL[13:12] LINE_BUFFER | x |
| Set video port HSYNC signal polarity. | DSI_CTRL[10] VP_HSYNC_POL | x |
| Set video port VSYNC signal polarity. | DSI_CTRL[11] VP_VSYNC_POL | x |
| Set video port data enable signal polarity. | DSI_CTRL[9] VP_DE_POL | x |
| Set the size of the video port data bus. | DSI_CTRL[7:6] VP_DATA_BUS_WIDTH | x |
| Set the arbitration scheme for granting the VC pending ready requests in the TX FIFO. | DSI_CTRL[3] TX_FIFO_ARBITRATION | x |
| Enable/disable the ECC check for the received header. | DSI_CTRL[2] ECC_RX_EN | 0x1 |

Table 10-514. DSI Complex I/O Registers

| Steps | Registers | Value |
|---|--|-------------|
| Configure synchronized update on the shadow register. | DSI_COMPLEXIO_CFG1[30] GOBIT | x |
| Set the complex I/O power state. | DSI_COMPLEXIO_CFG1[28:27] PWR_CMD | x |
| Set the position of data lane 1. | DSI_COMPLEXIO_CFG1[6:4] DATA1_POSITION | x |
| Set the position of the clock lane. | DSI_COMPLEXIO_CFG1[2:0] CLOCK_POSITION | x |
| Clear the Interrupt status register. | DSI_COMPLEXIO_IRQSTATUS | 0xFFFF FFFF |
| Disable all interrupt events. | DSI_COMPLEXIO_IRQENABLE | 0x0 |
| Enable the DSI protocol engine. | DSI_CTRL[0] IF_EN | 0x1 |
| Disable the DSI protocol engine. | DSI_CTRL[0] IF_EN | 0x0 |
| Wait until the interface is disabled? | DSI_CTRL[0] IF_EN | = 0x0 |
| Enable the low-power clock (TXCLKESC). | DSI_CLK_CTRL[20] LP_CLK_ENABLE | 0x1 |
| Wait until reset is done? | DSI_COMPLEXIO_CFG1[29] RESET_DONE | = 0x1 |
| Check if power control is ON? | DSI_COMPLEXIO_CFG1[26:25] PWR_STATUS | = 0x1 |
| Wait until internal module reset is complete? | DSI_SYSSTATUS[0] RESETDONE | = 0x1 |

10.3.5.2.1.2.2 Configure DSI Timing and VCs

[Table 10-515](#) lists the steps to configure DSI timing and the VCs.

Table 10-515. DSI Timing Registers

| Steps | Registers | Value |
|---|---|-------|
| Determine the number of DSI_FCLK clock cycles for the STOP-STATE counter. | DSI_TIMING1[12:0] STOP_STATE_COUNTER_IO | 0x- |
| Determine the number of BYTE_CLK clock cycles for the HS RX timer. | DSI_TIMING2[28:16] HS_TX_TO_COUNTER | 0x- |
| Enable/disable the multiplication factor of 16 for the number of BYTE_CLK clock cycles for the HS TX timer. | DSI_TIMING2[29] HS_TX_TO_X16 | 0x- |
| Determine the number of DSI_FCLK clock cycles for the LP RX timer. | DSI_TIMING2[12:0] LP_RX_TO_COUNTER | 0x- |
| Enable/disable the multiplication factor of 16 for the number of DSI_FCLK clock cycles for the LP RX timer. | DSI_TIMING2[14] LP_RX_TO_X16 | 0x- |
| Set the horizontal sync active period. | DSI_VM_TIMING1[31:24] HSA | 0x- |
| Set the horizontal front porch. | DSI_VM_TIMING1[23:12] HFP | 0x- |
| Set the horizontal back porch. | DSI_VM_TIMING1[11:0] HBP | 0x- |

Table 10-515. DSI Timing Registers (continued)

| Steps | Registers | Value |
|---|--|-------|
| Set the number of BYTE clock cycles for the sync window. | DSI_VM_TIMING2 [27:24] WINDOW_SYNC | 0x- |
| Set the vertical sync active period. | DSI_VM_TIMING2 [23:16] VSA ⁽¹⁾ | 0x- |
| Set the vertical front porch. | DSI_VM_TIMING2 [15:8] VFP | 0x- |
| Set the vertical back porch. | DSI_VM_TIMING2 [7:0] VBP | 0x- |
| Set the line length. | DSI_VM_TIMING3 [31:16] TL | 0x- |
| Set the number of active lines. | DSI_VM_TIMING3 [15:0] VACT | 0x- |
| Set the number of TXBYTECLKHS clock cycles for entering HS mode. | DSI_VM_TIMING7 [31:16] ENTER_HS_MODE_LATENCY | 0x- |
| Set the number of TXBYTECLKHSe clock cycles for exiting HS mode. | DSI_VM_TIMING7 [15:0] EXIT_HS_MODE_LATENCY | 0x- |
| Set the number of TXBYTECLKHS clock cycles between the start of the DDR clock and the assertion of the data request signal. | DSI_CLK_TIMING [15:8] DDR_CLK_PRE | 0x- |
| Set the number of TXBYTECLKHS clock cycles after the deassertion of the data request signal and the stop of the DDR clock. | DSI_CLK_TIMING [7:0] DDR_CLK_POST | 0x- |
| Configure the RX FIFO DMA request. | DSI_VC_CTRL_i [29:27] DMA_RX_REQ_NB | 0x- |
| Configure the TX FIFO DMA request. | DSI_VC_CTRL_i [23:21] DMA_TX_REQ_NB | 0x- |
| Enable/disable the ECC generation for the transmit header. | DSI_VC_CTRL_i [8] ECC_TX_EN | 0x- |
| Enable/disable the checksum generation for the transmit payload. | DSI_VC_CTRL_i [7] CS_TX_EN | 0x- |
| Select video mode. | DSI_VC_CTRL_i [4] MODE | 0x- |

⁽¹⁾ In DSI video mode, if the VSA bit field in [DSI_VM_TIMING2](#) is set to 0x0, no vertical synchronization packet will be sent even if VP_VSYNC_START is set to 0x1 in [DSI_CTRL](#).

10.3.5.2.1.3 Main Sequence - Configure DSI_PHY

[Table 10-516](#) summarizes the timing in the functions of DDR_CLK_P. For more information about the timing calculation, see [Section 10.3.4.4.4, Clock Requirements](#).

Table 10-516. Calculate DSI_PHY Timing

| Steps | Registers | Value |
|--|--|----------------------------------|
| Settings of the DSI protocol timing. For a complete description of the timing specifications, see Section 10.3.4.4.4, Clock Requirements . | DSI_PHY_REGISTER0 [31:24] REG_THSPREPARE | ceil(70ns/DDR clock period) + 2 |
| | DSI_PHY_REGISTER0 [23:16] REG_PRPR_THSZERO | ceil(175ns/DDR clock period) + 2 |
| | DSI_PHY_REGISTER0 [7:0] REG_THSEXIT | ceil(145ns/DDR clock period) |
| | DSI_PHY_REGISTER0 [15:8] REG_THSTRAIL | ceil(60ns/DDR clock period) + 5 |
| | DSI_PHY_REGISTER2 [7:0] REG_TCLKPREPARE | ceil(65ns/DDR clock period) |
| | DSI_PHY_REGISTER1 [7:0] REG_TCLKZERO | ceil(265ns/DDR clock period) |
| | DSI_PHY_REGISTER1 [15:8] REG_TCLKTRAIL | ceil(60ns/DDR clock period) + 2 |
| | DSI_PHY_REGISTER1 [20:16] REG_TLPXBY2 | ceil(25ns/DDR clock period) |

10.3.5.2.1.4 Main Sequence - Drive STOP State

Table 10-517 lists the steps to drive STOP state.

Table 10-517. Drive STOP State

| Steps | Registers | Value |
|---------------------------------------|--|-------|
| Force TX stop mode. | DSI_TIMING1 [15] FORCE_TX_STOP_MODE_IO | 0x1 |
| Wait until FORCE_TX_STOP_MODE_IO = 0? | DSI_TIMING1 [15] FORCE_TX_STOP_MODE_IO | = 0x0 |

10.3.5.2.1.5 Main Sequence - Enable Video Mode

Table 10-517 lists the steps to enable video mode.

Table 10-518. Enable Video Mode

| Steps | Registers | Value |
|----------------------------|---|-------|
| Set up long packet header. | DSI_VC_LONG_PACKET_HEADER_i | 0x- |
| Enable desired VC. | DSI_VC_CTRL_i [1] VC_EN | 0x1 |
| Enable DSI module. | DSI_CTRL [0] IF_EN | 0x1 |
| Wait until IF_EN = 1? | DSI_CTRL [0] IF_EN | = 0x1 |

10.3.5.2.2 DSI Command Mode Using the DISPC Video Port

This section explains the basic programming model of command mode using the DISPC video port.

10.3.5.2.2.1 Main Sequence - Configure DSI PLL

Table 10-519 lists the steps required to configure the DSI PLL.

Table 10-519. Configure DSI PLL

| Steps | Register/Bit Field/Programming | Value |
|---|---|-------|
| Set PLL and HSDIVIDER to ON state. | DSI_CLK_CTRL [31:30] PLL_PWR_CMD | 0x2 |
| Wait until PLL and HSDIVIDER are enabled? | DSI_CLK_CTRL [29:28] PLL_PWR_STATUS | = 0x2 |
| Set the M5REG value. | DSI_PLL_CONFIGURATION1 [30:26] M5_CLK_DIV | x |
| Set the M4REG value. | DSI_PLL_CONFIGURATION1 [25:21] M4_CLOCK_DIV | x |
| Set the REGN value. | DSI_PLL_CONFIGURATION1 [8:1] PLL_REGN | x |
| Set the REGM value. | DSI_PLL_CONFIGURATION1 [20:9] PLL_REGM | x |
| Select PLL STOPMODE. | DSI_PLL_CONFIGURATION1 [0] PLL_STOPMODE | 0x1 |
| Enable/disable PLL reference clock control. | DSI_PLL_CONFIGURATION2 [13] PLL_REFEN | x |
| Enable/disable CLKIN4DDR control. | DSI_PLL_CONFIGURATION2 [14] PHY_CLKINEN | x |
| Enable/disable DSS clock divider. | DSI_PLL_CONFIGURATION2 [16] M4_CLOCK_EN | x |
| Enable/disable DSI protocol engine clock divider. | DSI_PLL_CONFIGURATION2 [18] M5_CLOCK_EN | x |
| Configure synchronization of configuration update with DISPC_UPDATE_SYNC. | DSI_PLL_CONTROL [0] PLL_AUTOMODE | x |
| Start PLL locking sequence. | DSI_PLL_GO [0] PLL_GO | 0x1 |
| Wait until there is no pending action? | DSI_PLL_GO [0] PLL_GO | = 0x0 |
| Check whether PLL is locked? | DSI_PLL_STATUS [1] PLL_LOCK | = 0x1 |
| Set the LP mode clock ratio. | DSI_CLK_CTRL [12:0] LP_CLK_DIVISOR | x |
| Configure DSS_L3_ICLK clock to the DSI complex I/O. | DSI_CLK_CTRL [14] CIO_CLK_ICG | x |
| Enable/disable the automatic assertion/deassertion of the DSISopClk signal. | DSI_CLK_CTRL [18] HS_AUTO_STOP_ENABLE | x |

Table 10-519. Configure DSI PLL (continued)

| Steps | Register/Bit Field/Programming | Value |
|--|---|-------|
| Define the DSI functional clock value and synchronization. | DSI_CLK_CTRL[21] LP_RX_SYNCHRO_ENABLE | x |
| Turn on PLL and HSDIVIDER. | DSI_CLK_CTRL[31:30] PLL_PWR_CMD | 0x2 |

10.3.5.2.2.2 Main Sequence - Switch to DSI PLL Clock Source

[Table 10-520](#) lists the sequence to switch the DSI and DISPC module clocks to DSI PLL clock source.

Table 10-520. Switch to DSI PLL Clock Source

| Steps | Reference | Value |
|----------------------------------|---|-------|
| Switch DISPC clock to PLL1_CLK1. | For more information, see Section 10.1.2, DSS Integration | |
| Switch DSI clock to PLL1_CLK2. | For more information, see Section 10.1.2, DSS Integration . | |

10.3.5.2.2.3 Main Sequence - Configure DSI Protocol Engine

10.3.5.2.2.3.1 Set Up DSI Control Registers

[Table 10-521](#) lists the steps required to set up the DSI control registers. [Table 10-522](#) lists the steps to set up the DSI complex I/O registers.

Table 10-521. DSI Control Registers

| Steps | Register/Bit Field/Programming | Value |
|---|--|-------|
| Enable IRQ for lost synchronization with video port. | DSI_IRQENABLE[18] SYNC_LOST_IRQ_EN | 0x1 |
| Enable IRQ to indicate that packet has been sent on desired VC. | DSI_VC_IRQENABLE_i[2] PACKET_SENT_IRQ_EN | 0x1 |
| Set the trigger reset mode. | DSI_CTRL[14] TRIGGER_RESET_MODE | x |
| Configure the number of active line buffers. | DSI_CTRL[13:12] LINE_BUFFER | x |
| Set the size of the video port data bus. | DSI_CTRL[7:6] VP_DATA_BUS_WIDTH | x |
| Define the ratio between VP_CLK and VP_PCLK. | DSI_CTRL[4] VP_CLK_RATIO | x |
| Set the arbitration scheme for granting the VC pending ready requests in the TX FIFO. | DSI_CTRL[3] TX_FIFO_ARBITRATION | x |
| Enable/disable the ECC check for the received header. | DSI_CTRL[2] ECC_RX_EN | x |

Table 10-522. DSI Complex I/O Registers

| Steps | Register/Bit Field/Programming | Value |
|--|--|-------------|
| Determine the position of the clock lane. | DSI_COMPLEXIO_CFG1[2:0] CLOCK_POSITION | x |
| Set the position of data lane 1. | DSI_COMPLEXIO_CFG1[6:4] DATA1_POSITION | x |
| Configure the power state of the complex I/O. | DSI_COMPLEXIO_CFG1[28:27] PWR_CMD | x |
| Enable the synchronization of the shadow registers with DISPC_UPDATE_SYNC. | DSI_COMPLEXIO_CFG1[30] GOBIT | 0x1 |
| Clear the complex I/O IRQ status. | DSI_COMPLEXIO_IRQSTATUS | 0xFFFF FFFF |
| Disable all complex I/O IRQ events. | DSI_COMPLEXIO_IRQENABLE | 0x0 |
| Enable the DSI protocol engine interface. | DSI_CTRL[0] IF_EN | 0x1 |
| Disable the DSI protocol engine interface. | DSI_CTRL[0] IF_EN | 0x0 |
| Wait until interface is disabled? | DSI_CTRL[0] IF_EN | = 0x0 |
| Enable the LP clock. | DSI_CLK_CTRL[20] LP_CLK_ENABLE | 0x1 |

Table 10-522. DSI Complex I/O Registers (continued)

| Steps | Register/Bit Field/Programming | Value |
|---|---|-------|
| Check whether internal reset is complete? | DSI_COMPLEXIO_CFG1 [29] RESET_DONE | = 0x1 |
| Check whether power state of complex I/O is ON? | DSI_COMPLEXIO_CFG1 [26:25] PWR_STATUS | = 0x1 |
| Check whether reset is complete? | DSI_SYSSTATUS [0] RESETDONE | = 0x1 |

10.3.5.2.2.3.2 Configure DSI Timing and VCs

[Table 10-523](#) lists the steps to configure DSI timing and the VCs.

Table 10-523. DSI Timing Registers

| Steps | Register/Bit Field/Programming | Value |
|--|---|-------|
| Determine the number of DSI_FCLK clock cycles for the STOP-STATE counter. | DSI_TIMING1 [12:0] STOP_STATE_COUNTER_IO | 0x- |
| Enable/disable the multiplication factor of 4 for the number of DSI_FCLK clock cycles for the STOP-STATE counter. | DSI_TIMING1 [13] STOP_STATE_X4_IO | 0x- |
| Enable/disable the multiplication factor of 16 for the number of DSI_FCLK clock cycles for the STOP-STATE counter. | DSI_TIMING1 [14] STOP_STATE_X16_IO | 0x- |
| Clear turnaround timer settings. | DSI_TIMING1 [30:16] | 0x0 |
| Determine the number of DSI_FCLK clock cycles for the LP RX timer. | DSI_TIMING2 [12:0] LP_RX_TO_COUNTER | 0x- |
| Enable/disable the multiplication factor of 4 for the number of DSI_FCLK clock cycles for the LP RX timer. | DSI_TIMING2 [13] LP_RX_TO_X4 | 0x- |
| Enable/disable the multiplication factor of 16 for the number of DSI_FCLK clock cycles for the LP RX timer. | DSI_TIMING2 [14] LP_RX_TO_X16 | 0x- |
| Determine the number of BYTE_CLK clock cycles for the HS RX timer. | DSI_TIMING2 [28:16] HS_TX_TO_COUNTER | 0x- |
| Enable/disable the multiplication factor of 16 for the number of BYTE_CLK clock cycles for the HS TX timer. | DSI_TIMING2 [29] HS_TX_TO_X16 | 0x- |
| Enable/disable the multiplication factor of 64 for the number of BYTE_CLK clock cycles for the HS TX timer. | DSI_TIMING2 [30] HS_TX_TO_X64 | 0x- |
| Set the number of TXBYTECLKHS clock cycles | DSI_CLK_TIMING [15:8] DDR_CLK_PRE and DSI_CLK_TIMING [7:0] DDR_CLK_POST | 0x- |
| Configuration of VCI | | |
| Select source of data and enable VP_STALL. | DSI_VC_CTRL_i [1] SOURCE | 0x1 |
| Enable/disable the checksum generation for the transmit payload. | DSI_VC_CTRL_i [7] CS_TX_EN | 0x- |
| Enable/disable the ECC generation for the transmit header. | DSI_VC_CTRL_i [8] ECC_TX_EN | 0x- |
| Enable/disable HS mode to send short and long packets to the peripheral. | DSI_VC_CTRL_i [9] MODE_SPEED | 0x- |
| Configure DMA request for TX FIFO. | DSI_VC_CTRL_i [23:21] DMA_TX_REQ_NB | 0x- |
| Configure DMA request for RX FIFO. | DSI_VC_CTRL_i [29:27] DMA_RX_REQ_NB | 0x- |
| Configuration TX and RX FIFO | | |
| Set size of the RX FIFO allocated for used VC. | DSI_RX_FIFO_VC_SIZE | 0x- |
| Set size of the TX FIFO allocated for used VC. | DSI_TX_FIFO_VC_SIZE | 0x- |

10.3.5.2.2.4 Main Sequence - Configure DSI_PHY Timing

Table 10-524 summarizes DSI_PHY timing settings. For more information about timing calculation, see Section 10.3.4.4.4, *Clock Requirements*.

Table 10-524. Configure DSI_PHY Timing

| Steps | Register/Bit Field/Programming | Value |
|---|--|----------------------------------|
| Settings of the DSI protocol timing. For a complete description of timing specifications, see Section 10.3.4.4.4, <i>Clock Requirements</i> . | DSI_PHY_REGISTER0[31:24] REG_THSPREPARE | ceil(70ns/DDR clock period) + 2 |
| | DSI_PHY_REGISTER0[23:16] REG_THSPRPR_THSZERO | ceil(175ns/DDR clock period) + 2 |
| | DSI_PHY_REGISTER0[7:0] REG_THSEXIT | ceil(145ns/DDR clock period) |
| | DSI_PHY_REGISTER0[15:8] REG_THSTRAIL | ceil(60ns/DDR clock period) + 5 |
| | DSI_PHY_REGISTER2[7:0] REG_TCLKPREPARE | ceil(65ns/DDR clock period) |
| | DSI_PHY_REGISTER1[7:0] REG_TCLKZERO | ceil(265ns/DDR clock period) |
| | DSI_PHY_REGISTER1[15:8] REG_TCLKTRAIL | ceil(60ns/DDR clock period) + 2 |
| | DSI_PHY_REGISTER1[20:16] REG_TLPXBY2 | ceil(25ns/DDR clock period) |

10.3.5.2.2.5 Main Sequence - Drive STOP State

Table 10-525 lists the steps to drive the STOP state.

Table 10-525. Drive STOP State

| Steps | Register/Bit Field/Programming | Value |
|---|---------------------------------------|-------|
| Force TX stop mode. | DSI_TIMING1[15] FORCE_TX_STOP_MODE_IO | 0x1 |
| Wait until the end of TX stop mode assertion? | DSI_TIMING1[15] FORCE_TX_STOP_MODE_IO | = 0x1 |

10.3.5.2.2.6 Main Sequence - Enable Command Mode Using DISPC Video Port

Table 10-526 lists the steps to enable DISPC to send frames continuously. Two BTAs must be generated:

- The first BTA gives bus possession to the display module.
- The second BTA obtains the TE trigger.

Table 10-526. Enable Command Mode and Automatic TE

| Steps | Register/Bit Field/Programming | Value |
|---|---|-------|
| Insert DCS write memory continue/start code. | DSI_VC_CTRL_i[31] DCS_CMD_CODE | 0x- |
| Enable/disable automatic insertion of DCS command codes when data is sourced by the video port. | DSI_VC_CTRL_i[30] DCS_CMD_ENABLE | 0x- |
| Enable used VC. | DSI_VC_CTRL_i[0] VC_EN | 0x1 |
| Enable DSI protocol engine interface. | DSI_CTRL[0] IF_EN | 0x1 |
| Wait until interface is enabled? | DSI_CTRL[0] IF_EN | = 0x0 |
| Send the sequence to receive the TE trigger from the peripheral. | DSI_VC_SHORT_PACKET_HEADER_i[31:0] HEADER | 0x- |
| Wait until packet is sent? | DSI_VC_IRQSTATUS_i[2] PACKET_SENT_IRQ | = 0x1 |
| Write 1 to reset the status bit. | DSI_VC_IRQSTATUS_i[2] PACKET_SENT_IRQ | 0x1 |

NOTE: Keep Reserved bits at reset value in [DSI_PHY_REGISTER1](#) and [DSI_PHY_REGISTER2](#).

10.3.5.2.2.7 Main Sequence - Send Frame Data to LCD Panel Using Automatic TE

[Table 10-527](#) summarizes the steps to send a frame data to the LCD panel using automatic TE.

Table 10-527. Send Frame Data to LCD Panel Using Automatic TE

| Steps | Register/Bit Field/Programming | Value |
|--|---|------------|
| Enable the transfer between DISPC and DSI. Reset after the transfer is done. | For more information, see Section 10.2 , <i>Display Controller</i> chapter. | |
| Specify the number of bytes to send. When DCS insertion is used, word count (WC) must include this one DCS byte. | DSI_VC_TE_i[23:0] TE_SIZE | (WC+1)*LPP |
| Set up long packet header. | DSI_VC_LONG_PACKET_HEADER_i[31:0] HEADER | 0x- |
| Enable/disable TE control. | DSI_VC_TE_i[30] TE_EN | 0x1 |
| Wait until RX FIFO is empty? | DSI_VC_CTRL_i[20] RX_FIFO_NOT_EMPTY | = 0x0 |
| Wait until TX FIFO is not full? | DSI_VC_CTRL_i[16] TX_FIFO_FULL | = 0x0 |
| Enable first BTA to give bus possession to the display module. | DSI_VC_CTRL_i[6] BTA_EN | 0x1 |
| Wait until BTA IRQ event occurs? | DSI_VC_IRQSTATUS_i[5] BTA_IRQ | = 0x1 |
| Write 1 to clear BTA IRQ status bit. | DSI_VC_IRQSTATUS_i[5] BTA_IRQ | 0x1 |
| Enable the second BTA to get the TE trigger. | DSI_VC_CTRL_i[6] BTA_EN | 0x1 |
| Wait until BTA IRQ event occurs? | DSI_VC_IRQSTATUS_i[5] BTA_IRQ | = 0x1 |
| Write 1 to clear BTA IRQ status bit. | DSI_VC_IRQSTATUS_i[5] BTA_IRQ | 0x1 |
| Wait until transfer is complete? | DSI_VC_TE_i[30] TE_EN | = 0x0 |

10.3.6 DSI Register Manual

This section describes the DSI module registers.

CAUTION

The main access to all DSI registers is through the L3 interconnect.

The access through L4_PER interconnect is provided for back software compatibility.

10.3.6.1 DSI Instance Summary

Table 10-528 summarizes the DSI module instances.

Table 10-528. DSI Instance Summary

| Module Name | L3 Base Address | L4_PER Base Address | Size |
|----------------------|-----------------|---------------------|-----------|
| DSI1_PROTOCOL_ENGINE | 0x5800 4000 | 0x4804 4000 | 512 bytes |
| DSI1_PHY | 0x5800 4200 | 0x4804 4200 | 64 bytes |
| DSI1_PLLCTRL | 0x5800 4300 | 0x4804 4300 | 32 bytes |
| DSI2_PROTOCOL_ENGINE | 0x5800 5000 | 0x4804 5000 | 512 bytes |
| DSI2_PHY | 0x5800 5200 | 0x4804 5200 | 64 bytes |
| DSI2_PLLCTRL | 0x5800 5300 | 0x4804 5300 | 32 bytes |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------------|--|------|-------|
| 31:25 | RESERVED | | R | 0x00 |
| 24 | DISPC_UPDATE_SYNC | Determines if the Dispc_Update_Sync signal from the display controller is used. 0x0: Dispc_Update_Sync signal is not used. 0x1: Dispc_Update_Sync signal is used. | RW | 0 |
| 23 | HSA_BLANKING_MODE | Blanking mode 0x0: Packets in TX FIFO are sent during HSA blanking period of video mode or LPS is used. 0x1: LONG BLANKING PACKETS only are used during HSA blanking period of video mode. | RW | 0 |
| 22 | HBP_BLANKING_MODE | Blanking mode 0x0: Packets in TX FIFO are sent during HBP blanking period of video mode or LPS is used. 0x1: LONG BLANKING PACKETS only are used during HBP blanking period of video mode. | RW | 0 |
| 21 | HFP_BLANKING_MODE | Blanking mode 0x0: Packets in TX FIFO are sent during HFP blanking period of video mode or LPS is used. 0x1: LONG BLANKING PACKETS only are used during HFP blanking period of video mode. | RW | 0 |
| 20 | BLANKING_MODE | Blanking mode 0x0: LPS is used during blanking periods of video mode (except HSA, HBP, HFP defined in HSA_BLANKING_MODE, HBP_BLANKING_MODE AND HFP_BLANKING_MODE respectively) when there is no command mode data in TX FIFO ready to be sent. So blanking periods can be different during the frame depending on the TX FIFO. 0x1: LONG BLANKING PACKETS are used during blanking periods of video mode (except HSA, HBP, HFP defined in HSA_BLANKING_MODE, HBP_BLANKING_MODE AND HFP_BLANKING_MODE respectively) regardless of the packets present in the TX FIFO ready to be sent | RW | 0 |
| 19 | EOT_ENABLE | Enable EOT packets at the end of HS transmission. 0x0: No EOT packets 0x1: EOT packet is sent at all HS to LP transitions. | RW | 0 |
| 18 | VP_HSYNC_END | HSYNC end pulse. 0x0: Disabled. No HSYNC END short packet is generated. 0x1: Enabled. While the HSYNC END pulse is detected, the associated short packet HSYNC END is generated. | RW | 0 |
| 17 | VP_HSYNC_START | HSYNC start pulse. 0x0: Disabled. No HSYNC START short packet is generated. 0x1: Enabled. While the HSYNC start pulse is detected, the associated short packet HSYNC START is generated. | RW | 0 |
| 16 | VP_VSYNC_END | VSYNC end pulse. 0x0: Disabled. No VSYNC END short packet is generated. 0x1: Enabled. While the VSYNC END pulse is detected, the associated short packet VSYNC END is generated. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|--------------------|---|------|-------|
| 15 | VP_VSYNC_START | <p>VSYNC start pulse.</p> <p>0x0: Disabled. No VSYNC START short packet is generated.</p> <p>0x1: Enabled. While the VSYNC START pulse is detected, the associated short packet VSYNC START is generated.⁽¹⁾</p> | RW | 0 |
| 14 | TRIGGER_RESET_MODE | <p>Selection of the trigger reset mode</p> <p>0x0: Synchronized: the mode is only valid if there is virtual channel using the video mode and it is active. The principal is to wait for the current video frame to be transferred on the link. Any data received after the VSYNC are ignored.</p> <p>0x1: Immediate: all pending requests in TX FIFO are taken into account for transfer scheduling, the RX FIFO is ignored, and the data from video port are ignored as soon as possible. Only the current transfer on DSI link and already scheduled ones are transmitted. All the other transfers are discarded.</p> | RW | 0 |
| 13:12 | LINE_BUFFER | <p>Number of line buffers to be used while receiving data on the video port. The valid values are from 0 to DSI_GNQ[17:16] VP1_NB_LINE_BUFFER.</p> <p>0x0: No line buffer</p> <p>0x1: 1 line buffer</p> <p>0x2: 2 line buffers</p> | RW | 0x0 |
| 11 | VP_VSYNC_POL | <p>VP vertical synchronization signal polarity</p> <p>0x0: VSYNC signal on the video port is active low.</p> <p>0x1: VSYNC signal on the video port is active high.</p> | RW | 0 |
| 10 | VP_HSYNC_POL | <p>VP horizontal synchronization signal polarity</p> <p>0x0: HSYNC signal on the video port is active low.</p> <p>0x1: HSYNC signal on the video port is active high.</p> | RW | 0 |
| 9 | VP_DE_POL | <p>VP data enable signal polarity</p> <p>0x0: DE signal on the video port is active low.</p> <p>0x1: DE signal on the video port is active high.</p> | RW | 0 |
| 8 | VP_CLK_POL | <p>VP pixel clock polarity</p> <p>0x0: The DSI Protocol Engine module captures the data on the VP on the pixel clock falling edge. The module connected to the VP shall drive the data on the pixel clock rising edge.</p> <p>0x1: The DSI Protocol Engine module captures the data on the VP on the pixel clock raising edge. The module connected to the VP shall drive the data on the pixel clock falling edge.</p> | RW | 1 |
| 7:6 | VP_DATA_BUS_WIDTH | <p>Defines the size of the video port data bus</p> <p>0x0: 16-bits data width (LSB of the 24-bit video port data bus)</p> <p>0x1: 18-bits data width (LSB of the 24-bit video port data bus)</p> <p>0x2: 24-bits data width (LSB of the 24-bit video port data bus)</p> | RW | 0x0 |

⁽¹⁾ In DSI video mode, if the VSA bit field in DSI_VM_TIMING2 is set to 0x0, no vertical synchronization packet will be sent even if VP_VSYNC_START is set to 0x1 in DSI_CTRL.

| Bits | Field Name | Description | Type | Reset |
|------|---------------------|---|------|-------|
| 5 | TRIGGER_RESET | Send the reset trigger to the peripheral. 0x0: READS: Reset trigger generation is completed. It is reset by hardware when it is completed. WRITES: Cancellation of the request for Reset trigger generation (maybe too late since it is already on going) 0x1: READS: Generation of the reset trigger has been requested by user (could be on going but not completed yet). WRITES: Request for Reset trigger to be sent to the peripheral. | RW | 0 |
| 4 | VP_CLK_RATIO | The field indicates the clock ratio between VP_CLK and VP_PCLK. The clock VP_PCLK is generated from VP_CLK. It is divided down. The information is only used when the video port is used to provide data in command mode. In the case of video mode, it is not used. 0x0: The clock VP_PCLK is the clock VP_CLK divided by 2. The duty cycle of VP_PCLK is 50/50. 0x1: The clock VP_PCLK is the clock VP_CLK divided by 3 or more. The duty cycle of VP_PCLK is not 50/50 for odd ratio numbers (3,5,7,...). | RW | 0 |
| 3 | TX_FIFO_ARBITRATION | Defines the arbitration scheme for granting the virtual channel pending ready requests in the TX FIFO 0x0: Round-Robin Scheme is used 0x1: Sequential Scheme is used | RW | 0 |
| 2 | ECC_RX_EN | Enables the Error Correction Code check for the received header (short and long packets for all virtual channel ids). 0x0: Disabled 0x1: Enabled | RW | 0 |
| 1 | CS_RX_EN | Enables the checksum check for the received payload (long packet only for all virtual channel ids). 0x0: Disabled 0x1: Enabled | RW | 0 |
| 0 | IF_EN | Enables the module. When the module is disabled the signals from the complex I/O are gated (no updates of the interrupt status register). It is not possible to change the bit fields in the register DSI_CTRL except IF_EN when it is enabled. All the other registers can be changed except the ones that require DSI_VC_CTRL_i[0] VC_EN to be equal to 0 to be modified. 0x0: The interface is disabled. If one of the virtual channel uses the video mode with the video port to receive the data, the DSI protocol engines is disabled when the next VSYNC is received and all the data in the FIFO for the other virtual channels in command mode are sent to the peripherals (if BTA_EN is enabled, the DSI protocol needs to wait for the response and BTA from the peripheral before disabling all the internal logic since an acknowledge is requested). 0x1: The interface is enabled immediately, the data acquisition on the video port starts on the next VSYNC (video mode) or first data received in the Slave port FIFO (command mode). | RW | 0 |

| 31:25 | RESERVED | | R | 0x00 |
| 24 | NB_VIDEO_PORTS | Number of video ports Read 0x0: Video port 1 only is present Read 0x1: Video port 1 and video port 2 are present | R | 0 |

MIPI Display Serial Interface

www.ti.com

| Bits | Field Name | Description | Type | Reset |
|-------|----------------------|---|------|------------------------------|
| 23:22 | VP2_NB_LINE_BUFFER | Determines the number of video buffer lines associated to video port 2. Read 0x0: No line buffer Read 0x1: 1 line buffer of the size defined in LINE_BUFFER_SIZE Read 0x2: 2 line buffers of the size defined in LINE_BUFFER_SIZE | R | 0x2 for DSI1 0x0 for DSI2 |
| 21 | RESERVED | | R | 0 |
| 20:18 | VP2_LINE_BUFFER_SIZE | Determines the video line buffer size associated to video port 2 . Read 0x1: 512x24-bits, 682x18-bits, 768x16bits (memory of 384x32-bits) Read 0x2: 682x24-bits, 910x18-bits, 1024x16bits (memory of 512x32-bits) Read 0x3: 853x24-bits, 1137x18-bits, 1280x16bits (memory of 640x32-bits) Read 0x4: 1024x24-bits, 1365x18-bits, 1536x16bits (memory of 768x32-bits) Read 0x5: 1194x24-bits, 1592x18-bits, 1792x16bits (memory of 896x32-bits) Read 0x6: 1365x24-bits, 1820x18-bits, 2048x16bits (memory of 1024x32-bits) | R | 0x4 for DSI1 0x1 for DSI2 |
| 17:16 | VP1_NB_LINE_BUFFER | Determines the number of video buffer lines associated to video port 1. Read 0x0: No line buffer Read 0x1: 1 line buffer of the size defined in LINE_BUFFER_SIZE Read 0x2: 2 line buffers of the size defined in LINE_BUFFER_SIZE | R | 0x2 |
| 15 | RESERVED | | R | 0 |
| 14:12 | VP1_LINE_BUFFER_SIZE | Determines the video line buffer size associated to video port 1 . Read 0x1: 512x24-bits, 682x18-bits, 768x16bits (memory of 384x32-bits) Read 0x2: 682x24-bits, 910x18-bits, 1024x16bits (memory of 512x32-bits) Read 0x3: 853x24-bits, 1137x18-bits, 1280x16bits (memory of 640x32-bits) Read 0x4: 1024x24-bits, 1365x18-bits, 1536x16bits (memory of 768x32-bits) Read 0x5: 1194x24-bits, 1592x18-bits, 1792x16bits (memory of 896x32-bits) Read 0x6: 1365x24-bits, 1820x18-bits, 2048x16bits (memory of 1024x32-bits) | R | 0x6 for DSI1 0x4 for DSI2 |
| 11:9 | NB_DATA_LANES | Determines the number of data lanes supported by the DSI protocol engine . Read 0x1: 1 Data lane Read 0x2: 2 Data lanes Read 0x3: 3 Data lanes Read 0x4: 4 Data lanes | R | 0x4 for DSI1 0x2 for DSI2 |
| 8:6 | NB_DMA_REQUEST | Determines the number of DMA_REQ signals. Read 0x0: No DMA request Read 0x1: 1 DMA request Read 0x2: 2 DMA requests Read 0x3: 3 DMA requests Read 0x4: 4 DMA requests | R | 0x4 |

| Bits | Field Name | Description | Type | Reset |
|------|--------------|---|------|-------|
| 5:3 | RX_FIFODEPTH | Determines the data RX FIFO depth (32-bit words) on the slave port. Read 0x4: 32x 33 bits Read 0x5: 64x 33 bits Read 0x6: 128 x 33 bits Read 0x7: 256 x 33 bits | R | 0x6 |
| 2:0 | TX_FIFODEPTH | Determines the data TX FIFO depth (33-bit words) on the slave port. Read 0x4: 32x 33 bits Read 0x5: 64x 33 bits Read 0x6: 128 x 33 bits Read 0x7: 256 x 33 bits | R | 0x6 |

| SHADOWING | GOBIT | RESET_DONE | PWR_CMD | | PWR_STATUS | | RESERVED | RESERVED | RESERVED | DATA4_POL | DATA4_POSITION | DATA3_POL | | DATA3_POSITION | DATA2_POL | DATA2_POSITION | DATA1_POL | | DATA1_POSITION | CLOCK_POL | CLOCK_POSITION | | | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|------|------------|--|------|-------|
| 31 | SHADOWING | Shadowing configuration. 0x0: Disabled. The writes to the DSI_PHY_REGISTER0 through DSI_PHY_REGISTER2 registers is done like the other SCP registers. 0x1: Enabled. The writes to the DSI_PHY_REGISTER0 through DSI_PHY_REGISTER2 registers is done only when the GOBIT is set and when the signal DISPCupdateSync from the display controller module is active. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|----------------|---|------|-------|
| 30 | GOBIT | Allows the synchronized update of the shadow registers when the signal DISPCUpdateSync is active. 0x0: Resets the GOBIT. The hardware has finished the update of the shadow SCP registers. The bit is reset by Hardware. The software can reset the bit in case the user decides to abort it. There is no guarantee that the software reset is done before the transfer of the values to the complex IO. 0x1: Set the GOBIT. Only when the transfer of the new values for the three first registers is completed (3, 2, 1, or 0 transfers are performed based on the number of registers to update), the GOBIT is reset. The DISPCUpdateSync signal is used to synchronize the update. The bit shall be set only when it is in reset state. | RW | 0 |
| 29 | RESET_DONE | Internal reset monitoring of the power domain using the TXBYTECLKHS clock from the complex I/O Read 0x0: Internal module reset is on going. Read 0x1: Reset completed. | R | 1 |
| 28:27 | PWR_CMD | Command for power control of the complex I/O 0x0: Command to change to OFF state 0x1: Command to change to ON state 0x2: Command to change to ULTRALOW-POWER state | RW | 0x0 |
| 26:25 | PWR_STATUS | Status of the power control of the complex I/O Read 0x0: Complex I/O in OFF state Read 0x1: Complex I/O in ON state Read 0x2: Complex I/O in ULTRALOW-POWER state | R | 0x0 |
| 24:22 | RESERVED | Reserved | R | 0x0 |
| 21 | RESERVED | Reserved | R | 0 |
| 20 | RESERVED | Reserved | RW | 0 |
| 19 | DATA4_POL | +/- differential pin order of DATA lane 4. Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+) | RW | 0 |
| 18:16 | DATA4_POSITION | Position and order of the DATA lane 4. Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: Not used/connected 0x1: Data lane 4 is at the position 1 (lane 1). 0x2: Data lane 4 is at the position 2 (lane 2). 0x3: Data lane 4 is at the position 3 (lane 3). 0x4: Data lane 4 is at the position 4 (lane 4). 0x5: Data lane 4 is at the position 5 (lane 5). | RW | 0x0 |
| 15 | DATA3_POL | +/- differential pin order of DATA lane 3. Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+) | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|----------------|---|------|-------|
| 14:12 | DATA3_POSITION | Position and order of the DATA lane 3. Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: Not used/connected 0x1: Data lane 3 is at the position 1 (lane 1). 0x2: Data lane 3 is at the position 2 (lane 2). 0x3: Data lane 3 is at the position 3 (lane 3). 0x4: Data lane 3 is at the position 4 (lane 4). 0x5: Data lane 3 is at the position 5 (lane 5). | RW | 0x0 |
| 11 | DATA2_POL | +/- differential pin order of DATA lane 2. 0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+) | RW | 0 |
| 10:8 | DATA2_POSITION | Position and order of the DATA lane 2. 0x0: Not used/connected 0x1: Data lane 2 is at the position 1 (lane 1). 0x2: Data lane 2 is at the position 2 (lane 2). 0x3: Data lane 2 is at the position 3 (lane 3). 0x4: Data lane 2 is at the position 4 (lane 4). 0x5: Data lane 2 is at the position 5 (lane 5). | RW | 0x0 |
| 7 | DATA1_POL | +/- pin differential pin order of DATA lane 1 0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+) | RW | 0 |
| 6:4 | DATA1_POSITION | Position and order of the DATA lane 1. The data lane 1 is always present. 0x0: Not used/connected 0x1: Data lane 1 is at the position 1 (lane 1). 0x2: Data lane 1 is at the position 2 (lane 2). 0x3: Data lane 1 is at the position 3 (lane 3). 0x4: Data lane 1 is at the position 4 (lane 4). 0x5: Data lane 1 is at the position 5 (lane 5). | RW | 0x0 |
| 3 | CLOCK_POL | +/- differential pin order of CLOCK lane. 0x0: +/- pin order (DSI.DX=+ and DSI.DY=-) 0x1: -/+ pin order (DSI.DX=- and DSI.DY=+) | RW | 0 |
| 2:0 | CLOCK_POSITION | Position and order of the CLOCK lane. 0, 5, 6 and 7 are reserved. The clock lane is always present but cannot be at the position 5 even if the COMPLEX I/O consists of 5 lanes. 0x0: Not used/connected 0x1: Clock lane is at the position 1 (lane 1). 0x2: Clock lane is at the position 2 (lane 2). 0x3: Clock lane is at the position 3 (lane 3). 0x4: Clock lane is at the position 4 (lane 4). 0x5: Reserved 0x6: Reserved 0x7: Reserved | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------------------|---|------|-------|
| 31 | ULPSACTIVENOT_ALL1_IRQ | All the ULPSActiveNOT signals corresponding to the lanes with TXULPSExit being high are high. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 30 | ULPSACTIVENOT_ALL0_IRQ | All signals ULPSActiveNOT are 0 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 29 | ERRCONTENTIONLP1_5_IRQ | Contention LP1 error for lane 5 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------------------|---|------|-------|
| 28 | ERRCONTENTIONLP0_5_IRQ | Contention LP0 error for lane 5 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 27 | ERRCONTENTIONLP1_4_IRQ | Contention LP1 error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 26 | ERRCONTENTIONLP0_4_IRQ | Contention LP0 error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 25 | ERRCONTENTIONLP1_3_IRQ | Contention LP1 error for lane 3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 24 | ERRCONTENTIONLP0_3_IRQ | Contention LP0 error for lane 3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 23 | ERRCONTENTIONLP1_2_IRQ | Contention LP1 error for lane 2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 22 | ERRCONTENTIONLP0_2_IRQ | Contention LP0 error for lane 2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 21 | ERRCONTENTIONLP1_1_IRQ | Contention LP1 error for lane 1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 20 | ERRCONTENTIONLP0_1_IRQ | Contention LP0 error for lane 1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 19 | STATEULPS5_IRQ | lane 5 in ULTRALOW-POWER State Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------|---|------|-------|
| 18 | STATEULPS4_IRQ | lane 4 in ultralow-power mode Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 17 | STATEULPS3_IRQ | lane 3 in ULTRALOW-POWER state 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 16 | STATEULPS2_IRQ | lane 2 in ULTRALOW-POWER state 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 15 | STATEULPS1_IRQ | lane 1 in ULTRALOW-POWER state 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 14 | ERRCONTROL5_IRQ | Control error for lane 5 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 13 | ERRCONTROL4_IRQ | Control error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 12 | ERRCONTROL3_IRQ | Control error for lane 3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 11 | ERRCONTROL2_IRQ | Control error for lane 2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 10 | ERRCONTROL1_IRQ | Control error for lane 1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 9 | ERRESC5_IRQ | Escape entry error for lane 5 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------|--|------|-------|
| 8 | ERRESC4_IRQ | Escape entry error for lane 4 Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 7 | ERRESC3_IRQ | Escape entry error for lane 3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 6 | ERRESC2_IRQ | Escape entry error for lane 2 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 5 | ERRESC1_IRQ | Escape entry error for lane 1 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 4 | ERRSYNCESC5_IRQ | Low power Data transmission synchronization error for lane 5 Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 3 | ERRSYNCESC4_IRQ | Low power Data transmission synchronization error for lane 4 Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |
| 2 | ERRSYNCESC3_IRQ | Low power Data transmission synchronization error for lane 3 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|---------------------------|---|------|-------|
| 31 | ULPSACTIVENOT_ALL1_IRQ_EN | All the ULPSActiveNOT signals corresponding to the lanes with TXULPSExit being high are high. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 30 | ULPSACTIVENOT_ALL0_IRQ_EN | All signals ULPSActiveNOT are 0 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 29 | ERRCONTENTIONLP1_5_IRQ_EN | Contention LP1 error for lane 5 Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 28 | ERRCONTENTIONLP0_5_IRQ_EN | Contention LP0 error for lane 5 Applicable only to DS1. For DS12 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|---------------------------|---|------|-------|
| 27 | ERRCONTENTIONLP1_4_IRQ_EN | Contention LP1 error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 26 | ERRCONTENTIONLP0_4_IRQ_EN | Contention LP0 error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 25 | ERRCONTENTIONLP1_3_IRQ_EN | Contention LP1 error for lane 3 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 24 | ERRCONTENTIONLP0_3_IRQ_EN | Contention LP0 error for lane 3 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 23 | ERRCONTENTIONLP1_2_IRQ_EN | Contention LP1 error for lane 2 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 22 | ERRCONTENTIONLP0_2_IRQ_EN | Contention LP0 error for lane 2 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 21 | ERRCONTENTIONLP1_1_IRQ_EN | Contention LP1 error for lane 1 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 20 | ERRCONTENTIONLP0_1_IRQ_EN | Contention LP0 error for lane 1 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 19 | STATEULPS5_IRQ_EN | lane 5 in ULTRALOW-POWER state Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 18 | STATEULPS4_IRQ_EN | lane 4 in ULTRALOW-POWER state Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 17 | STATEULPS3_IRQ_EN | lane 3 in ULTRALOW-POWER state 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 16 | STATEULPS2_IRQ_EN | lane 2 in ULTRALOW-POWER state 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 15 | STATEULPS1_IRQ_EN | lane 1 in ULTRALOW-POWER state 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 14 | ERRCONTROL5_IRQ_EN | Control error for lane 5 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|--------------------|--|------|-------|
| 13 | ERRCONTROL4_IRQ_EN | Control error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 12 | ERRCONTROL3_IRQ_EN | Control error for lane 3 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 11 | ERRCONTROL2_IRQ_EN | Control error for lane 2 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 10 | ERRCONTROL1_IRQ_EN | Control error for lane 1 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 9 | ERRESC5_IRQ_EN | Escape entry error for lane 5 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 8 | ERRESC4_IRQ_EN | Escape entry error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 7 | ERRESC3_IRQ_EN | Escape entry error for lane 3 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 6 | ERRESC2_IRQ_EN | Escape entry error for lane 2 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 5 | ERRESC1_IRQ_EN | Escape entry error for lane 1 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 4 | ERRSYNCESC5_IRQ_EN | Low power Data transmission synchronization error for lane 5 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 3 | ERRSYNCESC4_IRQ_EN | Low power Data transmission synchronization error for lane 4 Applicable only to DS1. For DSI2 this bit field is RESERVED. 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 2 | ERRSYNCESC3_IRQ_EN | Low power Data transmission synchronization error for lane 3 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |
| 1 | ERRSYNCESC2_IRQ_EN | Low power Data transmission synchronization error for lane 2 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|---------------------|--|------|-------|
| 0 | ERRSYNCSESC1_IRQ_EN | Low power Data transmission synchronization error for lane 1 0x0: Event is masked 0x1: Event generates an interrupt when it occurs | RW | 0 |

| PLL_PWR_CMD | | PLL_PWR_STATUS | | RESERVED | | | | | LP_RX_SYNCHRO_ENABLE | | LP_CLK_ENABLE | | HS_MANUAL_STOP_CTRL | | HS_AUTO_STOP_ENABLE | | LP_CLK_NULL_PACKET_SIZE | | LP_CLK_NULL_PACKET_ENABLE | | CIO_CLK_ICG | | DDR_CLK_ALWAYS_ON | | LP_CLK_DIVISOR | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------|---|------|-------|
| 31:30 | PLL_PWR_CMD | Command for power control of the DSI PLL Control module 0x0: Command to change to OFF state 0x1: Command to change to ON state for PLL only (HSDIVISER is OFF) 0x2: Command to change to ON state for both PLL and HSDIVISER 0x3: Command to change to ON state for both PLL and HSDIVISER (no clock output to the DSI complex I/O) | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------------|---|------|--------|
| 29:28 | PLL_PWR_STATUS | Status of the power control of the DSI PLL Control module Read 0x0: DSI PLL Control module in OFF state Read 0x1: DSI PLL Control module in ON state for PLL only (HSDIVISER is OFF) Read 0x2: DSI PLL Control module in ON state for both PLL and HSDIVISER Read 0x3: DSI PLL Control module in ON state for both PLL and HSDIVISER (no clock output to the DSI complex I/O) | R | 0x0 |
| 27:22 | RESERVED | | R | 0x00 |
| 21 | LP_RX_SYNCHRO_ENABLE | Defines if the functional is higher or lower than 30 MHz. The information is used to define synchronization to be used for RxValidEsc. 0x0: The DSI functional clock is equal or slower than 30 MHz. The synchronization is falling/rising. 0x1: The DSI functional clock is higher than 30 MHz. The synchronization is rising/rising. | RW | 0 |
| 20 | LP_CLK_ENABLE | Controls the gating of the TXCLKESC clock. 0x0: Disabled. The clock is not generated. The value of LP_CLK_DIVISOR is not used and does not need to be programmed. 0x1: Enabled. The clock is generated. The value of LP_CLK_DIVISOR is used and needs to be programmed. | RW | 0 |
| 19 | HS_MANUAL_STOP_CTRL | In case HS_AUTO_STOP_ENABLE=0, the bit field allows manual control of the assertion/de-assertion of the signal DSISStopClk by the user. 0x0: DSISStopClk de-assertion unconditionally. 0x1: DSISStopClk assertion unconditionally. | RW | 0 |
| 18 | HS_AUTO_STOP_ENABLE | Enables the automatic assertion/de-assertion of DSISStopClk signal. 0x0: Auto mode disabled. 0x1: Auto mode enabled. | RW | 0 |
| 17:16 | LP_CLK_NULL_PACKET_SIZE | Indicates the size of LP NULL Packets to be sent automatically when after the last LP packet transfer. It is used by the receiver to drain its internal pipeline. The valid values are from 0 to 3 bytes for the payload size. | RW | 0x0 |
| 15 | LP_CLK_NULL_PACKET_ENABLE | Enables the generation of NULL packet in low speed. 0x0: Disabled. The NULL packet is not sent in LP mode after the last LP packet. 0x1: Enabled. The NULL packet is sent in LP mode after the last LP packet. | RW | 0 |
| 14 | CIO_CLK_ICG | Gates SCPClk clock provided to DSI_PHY and PLL-CTRL module. 0x0: Disabled. SCPClk is not generated. It remains at 0. 0x1: Enabled. SCPClk is generated (OCP_CLK/4) | RW | 0 |
| 13 | DDR_CLK_ALWAYS_ON | Defines if the DDR clock is also sent when there is no HS packets sent to the peripheral (low-power mode). So TXRequest for the clock lane is not de-asserted. 0x0: Disabled. The DDR clock is only provided when HS packets are sent. 0x1: Enabled. The DDR clock is always sent to the peripheral regardless of the state of the data lanes (HS or LS mode). | RW | 0 |
| 12:0 | LP_CLK_DIVISOR | Defines the ratio to be used for the generation of the low-power mode clock from DSI functional clock. The supported values are from 1 to 8191(the value 0 is invalid). The output frequency shall be in the range between 20 MHz and 32 kHz. | RW | 0x0001 |

| | | | |
|------------------|--|----------|--|
| Address Offset | 0x0000 0058 | Instance | DSI1_PROTOCOL_ENGINE_L3 DSI1_PROTOCOL_ENGINE_PE R_L4 DSI2_PROTOCOL_ENGINE_L3 DSI2_PROTOCOL_ENGINE_PE R_L4 |
| Physical Address | 0x5800 4058 0x4804 4058 0x5800 5058 0x4804 5058 | | |
| Description | TIMING1 REGISTER This register controls the DSI Protocol Engine module timers. Any bit field can be modified while DSI_CTRL[0] IF_EN is set to '1'. It is used to indicate the number of DSI1_CLK and DSI2_CLK functional clocks cycles for the timers FORCE_TX_STOP_TIMER and TA_TO_TIMER | | |
| Type | RW | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|-----------|----------|---------------|----|----|----|----|----|----|----|----|----|----|----|-----------------------|-------------------|------------------|-----------------------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TA_TO | TA_TO_X16 | TA_TO_X8 | TA_TO_COUNTER | | | | | | | | | | | | FORCE_TX_STOP_MODE_IO | STOP_STATE_X16_IO | STOP_STATE_X4_IO | STOP_STATE_COUNTER_IO | | | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|------|------------|--|------|-------|
| 31 | TA_TO | Enables the turn-around timer 0x0: Turn-around counter is disabled. 0x1: Turn-around counter is enabled (required to receive TA interrupt in case the turn-around procedure is not successful). | RW | 0 |
| 30 | TA_TO_X16 | Multiplication factor for the number of DSI_CLK functional clocks cycles defined in TA_TO_COUNTER bit field 0x0: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 1x 0x1: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 16x | RW | 1 |

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------------|---|------|--------|
| 29 | TA_TO_X8 | Multiplication factor for the number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER bit field 0x0: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 1x 0x1: The number of DSI_CLK functional clock cycles defined in TA_TO_COUNTER is multiplied by 8x | RW | 1 |
| 28:16 | TA_TO_COUNTER | Turn around counter. It indicates the number of DSI_CLK function clock to wait for the change of the Direction PPI signal according to the TurnRequest signal The value is from 0 to 8191. | RW | 0x1FFF |
| 15 | FORCE_TX_STOP_MODE_IO | Control of ForceTxStopMode signal 0x0: De-assertion of ForceTxStopMode. The hardware reset the bit at the end of the ForceTXStopMode assertion. The software can reset the bit in order to stop the assertion of the ForceTXStopMode signal prior to the completion of the period. 0x1: Assertion of ForceTxStopMode | RW | 0 |
| 14 | STOP_STATE_X16_IO | Multiplication factor for the number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO bit field 0x0: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO is multiplied by 1x 0x1: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO is multiplied by 16x | RW | 1 |
| 13 | STOP_STATE_X4_IO | Multiplication factor for the number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO bit field 0x0: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER is multiplied by 1x 0x1: The number of DSI_CLK functional clock cycles defined in STOP_STATE_COUNTER_IO is multiplied by 4x | RW | 1 |
| 12:0 | STOP_STATE_COUNTER_IO | Stop state counter. It indicates the number of DSI_CLK function clock to assert ForceTXStopMode signal. The value is from 0 to 8191. | RW | 0x1FFF |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|-------------|----|----|----|-----|----|----|----|----|----|----|----|-----|----|----|----|----|----|---|---|-----|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RESERVED | | | | WINDOW_SYNC | | | | VSA | | | | | | | | VFP | | | | | | | | VBP | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------|---|------|-------|
| 31:28 | RESERVED | | R | 0x0 |
| 27:24 | WINDOW_SYNC | Number of BYTE clock cycles for the synchronization window. An interrupt for synchronization lost is generated when the received synchronizaton on video port is not inside the window. DSI does not change its own timings if the synch is inside the window. The valid values are from 4 to 15. | RW | 0x0 |
| 23:16 | VSA | Defines the vertical Sync active period used in video mode in number of lines. The supported values are from 0 to 255 It is used to generate the short packet for End of Vertical synchronization. ⁽¹⁾ | RW | 0x00 |
| 15:8 | VFP | Defines the vertical front porch used in video mode in number of lines. The supported values are from 0 to 255 | RW | 0x00 |
| 7:0 | VBP | Defines the vertical back porch used in video mode in number of lines. The supported values are from 0 to 255 | RW | 0x00 |

⁽¹⁾ In DSI video mode, if the VSA bit field in DSI_VM_TIMING2 is set to 0x0, no vertical synchronization packet will be sent even if VP_VSYNC_START is set to 0x1 in DSI_CTRL.

| RESERVED | | | | | | | | | | | | | | | | DDR_CLK_PRE | | | | | | | | DDR_CLK_POST | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------|---|------|--------|
| 31:16 | RESERVED | | R | 0x0000 |
| 15:8 | DDR_CLK_PRE | Indicates the number of TXBYTECLKHS clock cycles between the start of the DDR clock and the assertion of the data request signal. The values from 1 to 255 are valid. The value 0 is reserved. The value is not used if DSI_CLK_CTRL[13] DDR_CLK_ALWAYS_ON is set to '1' since the DDR clock is always present. | RW | 0x01 |

| Bits | Field Name | Description | Type | Reset |
|------|--------------|--|------|-------|
| 7:0 | DDR_CLK_POST | Indicates the number of TXBYTECLKHS clock cycles after the de-assertion of the data request signal and the stop of the DDR clock. The values from 1 to 255 are valid. The value 0 is reserved. The value is not used if DSI_CLK_CTRL [13] DDR_CLK_ALWAYS_ON is set to '1' since the DDR clock is always present. | RW | 0x01 |

| ENTER_HS_MODE_LATENCY | | | | | | | | | | | | | | | | EXIT_HS_MODE_LATENCY | | | | | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------------|--|------|--------|
| 31:16 | ENTER_HS_MODE_LATENCY | Defines the number of TXBYTECLKHS clock cycles necessary for entering to HS mode. It corresponds to the delay in number of HS clock cycles from assertion of TxRequestHS signal to 1 until assertion of TxReadyHS signal to 1. The supported values are from 0 to 65535 . | RW | 0x0000 |

| Bits | Field Name | Description | Type | Reset |
|------|----------------------|--|------|--------|
| 15:0 | EXIT_HS_MODE_LATENCY | Defines the number of TXBYTECLKHS clock cycles necessary for exiting from HS mode. It corresponds to the maximum delay in number of TXBYTECLKHS clock from de-assertion of TxRequestHS signal until PPI link is in LP-11 state from which a new entrance to HS mode can be initiated which does not take more than ENTER_HS_MODE_LATENCY clock cycles. The supported values are from 0 to 65535 | RW | 0x0000 |

| RESERVED | | | | | | | | | | | | | | | | LINE_BUFFER | | | | VP_VSYNC_POL | | VP_HSYNC_POL | | VP_DE_POL | | VP_CLK_POL | | VP_DATA_BUS_WIDTH | | RESERVED | | VP_CLK_RATIO | | RESERVED | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------------|--|------|---------|
| 31:14 | RESERVED | | R | 0x00000 |
| 13:12 | LINE_BUFFER | Number of line buffers to be used while receiving data on the video port. The valid values are from 0 to DSI_GNQ[23:22] VP2_NB_LINE_BUFFER. 0x0: No line buffer 0x1: 1 line buffer 0x2: 2 line buffers | RW | 0x0 |
| 11 | VP_VSYNC_POL | VP vertical synchronization signal polarity 0x0: VSYNC signal on the video port is active low. 0x1: VSYNC signal on the video port is active high. | RW | 0 |
| 10 | VP_HSYNC_POL | VP horizontal synchronization signal polarity 0x0: HSYNC signal on the video port is active low. 0x1: HSYNC signal on the video port is active high. | RW | 0 |
| 9 | VP_DE_POL | VP data enable signal polarity 0x0: DE signal on the video port is active low. 0x1: DE signal on the video port is active high. | RW | 0 |
| 8 | VP_CLK_POL | VP pixel clock polarity 0x0: The DSI Protocol Engine module captures the data on the VP on the pixel clock falling edge. The module connected to the VP shall drive the data on the pixel clock rising edge. 0x1: The DSI Protocol Engine module captures the data on the VP on the pixel clock raising edge. The module connected to the VP shall drive the data on the pixel clock falling edge. | RW | 1 |
| 7:6 | VP_DATA_BUS_WIDTH | Defines the size of the video port data bus 0x0: 16-bits data width (LSB of the 24-bit video port data bus) 0x1: 18-bits data width (LSB of the 24-bit video port data bus) 0x2: 24-bits data width (LSB of the 24-bit video port data bus) | RW | 0x0 |
| 5 | RESERVED | | R | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|--------------|---|------|-------|
| 4 | VP_CLK_RATIO | The field indicates the clock ratio between VP_CLK and VP_PCLK. The clock VP_PCLK is generated from VP_CLK. It is divided down. The information is only used when the video port is used to provide data in command mode. In the case of video mode, it is not used. 0x0: The clock VP_PCLK is the clock VP_CLK divided by 2. The duty cycle of VP_PCLK is 50/50. 0x1: The clock VP_PCLK is the clock VP_CLK divided by 3 or more. The duty cycle of VP_PCLK is not 50/50 for odd ratio numbers (3,5,7,...). | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------------|---|------|-------|
| 31 | DCS_CMD_CODE | DCS command code value to insert between header and video port or Interface slave data when enabled by DCS_CMD_ENABLE (only when TE mechanism is not used otherwise the bit field DCS_CMD_CODE is ignored by DSI protocol engine). 0x0: DCS write memory continue code is inserted. 0x1: DCS write memory start code is inserted. | RW | 0 |
| 30 | DCS_CMD_ENABLE | Enables automatic insertion of DCS command codes when data is sourced by the video port. 0x0: DCS command code is NOT inserted when command mode traffic is coming from the Video Port or Interface slave port. 0x1: DCS command code is inserted automatically when command mode traffic is coming from the Video Port or Interface slave port. | RW | 0 |
| 29:27 | DMA_RX_REQ_NB | Selection of the use of the DMA request (associated to the RX FIFO) 0x0: DMA_req0 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 0) 0x1: DMA_req1 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 1) 0x2: DMA_req2 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 2) 0x3: DMA_req3 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is equal to 3) 0x4: No DMA req selected | RW | 0x0 |
| 26:24 | DMA_RX_THRESHOLD | Defines the threshold value for the DMA request (associated to the RX FIFO) 0x0: 1x 32 bits 0x1: 2 x 32 bits 0x2: 4 x 32 bits 0x3: 8 x 32 bits 0x4: 16 x 32 bits 0x5: 32 x 32 bits | RW | 0x0 |
| 23:21 | DMA_TX_REQ_NB | Selection of the use of the DMA request (associated to the TX FIFO) 0x0: DMA_req0 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 0) 0x1: DMA_req1 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 1) 0x2: DMA_req2 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is greater than 2) 0x3: DMA_req3 is selected (valid only if DSI_GNQ[8:6] NB_DMA_REQUEST is equal to 3) 0x4: No DMA req selected | RW | 0x0 |
| 20 | RX_FIFO_NOT_EMPTY | FIFO status in command mode. Otherwise, this bit can be ignored. Read 0x0: The RX FIFO is empty (the FIFO does not contain any data for the virtual channel) Read 0x1: The RX FIFO is not empty (the FIFO contains at least one byte for the virtual channel) | R | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|--------------------|---|------|-------|
| 19:17 | DMA_TX_THRESHOLD | Defines the threshold value for the DMA request (associated to the TX FIFO) 0x0: 1x 32 bits 0x1: 2 x 32 bits 0x2: 4 x 32 bits 0x3: 8 x 32 bits 0x4: 16 x 32 bits 0x5: 32 x 32 bits | RW | 0x0 |
| 16 | TX_FIFO_FULL | FIFO status in command mode. Otherwise, this bit can be ignored. Read 0x0: The TX FIFO is not full (the FIFO can accept at least one more 32-bit value) Read 0x1: The TX FIFO is full | R | 0 |
| 15 | VC_BUSY | Indicates if previously scheduled activities (packets, BTA) are still being processed. Forced to 1 if VC is enabled. Software should check this bit is 0 before changing channel configuration. Read 0x0: No pending operations for this VC Read 0x1: Pending operations for this VC | R | 0 |
| 14 | PP_BUSY | Ping-pong buffer busy status. Read 0x0: Software is permitted to write a new header for VP command mode traffic. Read 0x1: Software is NOT permitted to write a new header for VP command mode traffic. | R | 0 |
| 13 | VP_SOURCE | Selection between video port 1 and video port 2. If DSI_GNQ[24] NB_VIDEO_PORTS = 0, the bit field is ignored since only video port 1 is present. 0x0: The video port 1 is selected. 0x1: The video port 2 is selected. Note: This selection applies only to DSI1. For DSI2 to work properly, the VP_SOURCE bit must always be set to 0x0. | RW | 0 |
| 12 | RGB565_ORDER | Byte order for RGB565 0x0: Byte order as for DBI compliance 0x1: Byte order as for video mode | RW | 0 |
| 11:10 | OCP_DATA_BUS_WIDTH | Defines the size of the Interface data bus 0x0: 16-bits data width (LSB of the 32-bit Interface port data bus) 0x1: 24-bits data width (LSB of the 32-bit Interface port data bus) 0x2: 2x16-bits data width (first pixel on the LSB of the 32-bit Interface port data bus and second pixel on the MSB of the 32-bit Interface port data bus for the same Interface access) 0x3: 32-bits data width | RW | 0x0 |
| 9 | MODE_SPEED | Selection of the mode. The information is used by hardware only if MODE=COMMAND_MODE otherwise it is ignored. 0x0: Low-power mode (CMOS) is used to send short and long packets to the peripheral. 0x1: High Speed mode (SLVS) is used to send short and long packets to the peripheral. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------------|---|------|-------|
| 8 | ECC_TX_EN | Enables the Error Correction Code generation for the transmit header (short and long packets). 0x0: Disabled 0x1: Enabled | RW | 0 |
| 7 | CS_TX_EN | Enables the checksum generation for the transmit payload (long packet only). 0x0: Disabled. The value 0x00 is used. 0x1: Enabled. The checksum value is calculated by HW. | RW | 0 |
| 6 | BTA_EN | Send the bus turn around to the peripheral. It can be used when the automatic mode is enabled (BTA_SHORT_EN=1 or/and BTA_LONG_EN=1). In that case only one BTA is sent to the peripheral. The manual mode is used to allow the user to define for which packets, the turn around is required for example getting acknowledge from the peripheral. 0x0: READS: BTA generation is completed. It is reset by hardware when it is completed. WRITES: Cancellation of the BTA generation (not guarantee since it could already on going, shall not be used). 0x1: READS: BTA generation has been requested by user (it could be on going but not completed). WRITES: Request for BTA generation. | RW | 0 |
| 5 | TX_FIFO_NOT_EMPTY | FIFO status Read 0x0: The TX FIFO is empty (the FIFO does not contain any data for the virtual channel) Read 0x1: The TX FIFO is not empty (the FIFO contains at least one byte for the virtual channel) | R | 0 |
| 4 | MODE | Selection of the mode 0x0: Command mode. 0x1: Video mode. The bit fields MODE_SPEED and SOURCE are not used by hardware. The bit field VP_SOURCE is used to select between video port 1 and video port 2 when two video ports are present. | RW | 0 |
| 3 | BTA_LONG_EN | Enables the automatic bus turn-around after completion of each long packet transmission. 0x0: Disabled 0x1: Enabled | RW | 0 |
| 2 | BTA_SHORT_EN | Enables the automatic bus turn-around after completion of each short packet transmission. 0x0: Disabled 0x1: Enabled | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|---|------|-------|
| 1 | SOURCE | <p>Selection of the source between Interface and the Video port(s) (used by the hardware only if MODE=COMMAND MODE (0x0) otherwise it is ignored). The number of available video ports is defined in DSI_GNQ[24] NB_VIDEO_PORTS bit.</p> <p>0x0: All the data are provided by the slave port. Any transfer on the video port is ignored for this virtual channel.</p> <p>0x1: If MODE=VIDEO_MODE, the data received on the video port 1 or video port 2, selected using VP_SOURCE (pixels and enabled synchronization events using DSI_CTRL[17] VP_HSYNC_START, DSI_CTRL[18] VP_HSYNC_END, DSI_CTRL[15] VP_VSYNC_START, DSI_CTRL[16] VP_VSYNC_END for video port 1 and DSI_CTRL2[] VP_HSYNC_START, DSI_CTRL2[] VP_HSYNC_END, DSI_CTRL2[] VP_VSYNC_START, DSI_CTRL2[] VP_VSYNC_END for video port 2) are sent on the virtual channel (only one virtual channel can be associated with the video port, it is the software responsibility to ensure that no more than one virtual channel is enabled with the video port as the main source for data).</p> <p>If MODE=COMMAND_MODE, the VP.STALL signal is used by the protocol engine to indicate when new data are required. The synchronization signals are not generated by the display controller. Regardless of the MODE, no data can be provided on the Interface slave port.</p> | RW | 0 |
| 0 | VC_EN | <p>Enables the virtual channel.</p> <p>0x0: Disabled. The virtual channel shall be disabled for any register change in the DSI_VC_... registers to the corresponding VC ID (except for setting the DSI_VC_CTRL_i[6] BTA_EN, DSI_VC_TE_i[23:0] TE_SIZE and DSI_VC_TE_i[31] TE_START bit fields, and DSI_VC_LONG_..., DSI_VC_SHORT_..., DSI_VC_IRQ... registers).</p> <p>0x1: Enabled. No change is allowed to the virtual channel registers expect resetting the VC_EN.</p> | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|------------|--|------|-------|
| 31 | TE_START | Manual control of the start of the transfer. The user can use the TE interrupt in order to know that the TE trigger has been received prior to set the TE_START bit field. It is not mandatory to use the TE interrupt. 0x0: Indicates the end of the transfer. The bit can be used by user to cancel the transfer if not already started. The FIFO shall be flushed by software to ensure there is no data remaining in it. 0x1: Starts the transfer of the data. The size is defined in TE_SIZE. The bit field is set until the transfer is completed. It is reset by hardware when the transfer is completed. | RW | 0 |
| 30 | TE_EN | Tearing Effect Control 0x0: Disables the automatic transfer. The user shall use the interruption in order to know when TE PHY trigger is received or when the TE is detected on the input CMOS signals. The hardware reset the bit field when the transfer is completed (TE_SIZE=0). 0x1: Enables the automatic transfer of the data using the TE PHY trigger or one of the TE input signals as a synchronization event. The bit field TE_LINE defines if the CMOS signal is used or if the PHY trigger is used. | RW | 0 |
| 29 | TE_LINE | 0x0: Disabled the TE CMOS signalling for the automatic data transfer. The DSI PHY trigger is used for the automatic data transfer. 0x1: Enables the TE CMOS signalling for the automatic data transfer. The DSI PHY trigger is not used for the automatic data transfer. | RW | 0 |
| 28 | TE_LINE_NB | Selection between TE0 and TE1 CMOS signals. 0x0: TE0 CMOS input line is selected 0x1: TE1 CMOS input line is selected | RW | 0 |
| 27:24 | RESERVED | | R | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|---|------|----------|
| 23:0 | TE_SIZE | Defines the number of byte (payload data excluding the check -sum) to be sent. The write into the register DSI_VC_LONG_PACKET_HEADER_i shall be performed by the user before sending data from the register DSI_VC_LONG_PACKET_PAYLOAD_i . The register value is decremented for every byte sent of the DSI link. At the end of the transfer (TE_SIZE=0), the bit field TE_EN is reset by hardware. The DMA request will be asserted when the trigger is received in order to receive data in the TX FIFO. It should not be deasserted until all data (TE_SIZE) have been received in the FIFO. | RW | 0x000000 |

| Description | Configuration register for HS mode timings | | |
| Type | RW | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|---------------------|----|----|----|----|----|----|----|--------------|----|----|----|----|----|---|---|-------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| REG_THSPREPARE | | | | | | | | REG_THSPRPR_THSZERO | | | | | | | | REG_THSTRAIL | | | | | | | | REG_THSEXIT | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------|--|------|-------|
| 31:24 | REG_THSPREPARE | REG_THSPREPARE timing parameter in multiples of DDR clock period. DDR clock = CLKIN4DDR/4. D-PHY specification: $40\text{ ns} + 4 * \text{UI} \div 85\text{ ns} + 6 * \text{UI}$. UI = Unit Interval, equal to the duration of any HS state on the clock lane. Default value is programmed for 400 MHz. | RW | 0x1E |
| 23:16 | REG_THSPRPR_THSZERO | REG_THSPREPARE_THSZERO timing parameter in multiples of DDR clock period. DDR clock = CLKIN4DDR/4. D-PHY specification: $145\text{ ns} + 10 * \text{UI}$. Default value is programmed for 400 MHz. | RW | 0x48 |
| 15:8 | REG_THSTRAIL | REG_THSTRAIL timing parameter in multiples of DDR clock period. DDR clock = CLKIN4DDR/4. D-PHY specification: $60\text{ ns} + 4 * \text{UI}$. Default value is programmed for 400 MHz. | RW | 0x1D |
| 7:0 | REG_THSEXIT | REG_THSEXIT timing parameter in multiples of DDR clock frequency. DDR clock = CLKIN4DDR/4. D-PHY specification: 100 ns. Default value is programmed for 400 MHz. | RW | 0x3A |

| Description | Configuration register for LP mode and HS mode timings | | |
| Type | RW | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|-------------|----|----|----|------------|----|----|----|----------|----|----|----|-------------|----|----|----|---------------|----|---|---|--------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| REG_TTAGO | | | | REG_TTASURE | | | | REG_TTAGET | | | | RESERVED | | | | REG_TLPXBY2 | | | | REG_TCLKTRAIL | | | | REG_TCLKZERO | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------|--|------|-------|
| 31:29 | REG_TTAGO | TTA-GO timing in terms of number of TXCLKESC clocks. 0x0: 2 cycles 0x1: 3 cycles 0x2: 4 cycles 0x3: 5 cycles 0x4: 6 cycles 0x5: 7 cycles 0x6: 8 cycles 0x7: 9 cycles Default value: 4 cycles | RW | 0x2 |
| 28:27 | REG_TTASURE | TTA-SURE timing in terms of number of TXCLKESC clocks. 0x0: 2 cycles 0x1: 1 cycles 0x2: 3 cycles 0x3: 4 cycles Default value: 2 cycles | RW | 0x0 |
| 26:24 | REG_TTAGET | TTA-GET timing in terms of number of TXCLKESC clocks. 0x0: 3 cycles 0x1: 4 cycles 0x2: 5 cycles 0x3: 6 cycles 0x4: 7 cycles 0x5: 8 cycles 0x6: 9 cycles 0x7: 10 cycles Default value: 5 cycles | RW | 0x2 |
| 23:21 | RESERVED | Reserved | R | 0x0 |
| 20:16 | REG_TLPXBY2 | (TLPX)/2 timing parameter in multiples of DDR clock frequency. DDR clock = CLKIN4DDR/4. Default value is programmed for 400 MHz. This is the internal timer value. The value seen on line will have variance due to rise/fall mismatch effects. | RW | 0x0A |

| Bits | Field Name | Description | Type | Reset |
|------|---------------|--|------|-------|
| | | Note: TLPX is used to define the length of LP-01 state in HS start of Transmission sequences on clock and data lanes. For all other purposes TLPX is defined by the period of TXLPESC | | |
| 15:8 | REG_TCLKTRAIL | REG_TCLKTRAIL timing parameter in multiples of DDR clock frequency. DDR clock = CLKIN4DDR/4. D-PHY specification: 60 ns. Default value is programmed for 400 MHz | RW | 0x1A |
| 7:0 | REG_TCLKZERO | REG_TCLKZERO timing parameter in multiples of DDR clock period. DDR clock = CLKIN4DDR/4. D-PHY specification: (REG_TCLKPREPARE + REG_TCLKZERO) 300 ns. Derived specification for REG_TCLKZERO (Min REG_TCLKPREPARE = 38 ns): REG_TCLKZERO 262 ns. Default value is programmed for 400 MHz | RW | 0x6A |

| HSSYNCPATTERN | | | | | | | | RESERVED | | | | | | | | OVRDULPMTX | REGULPMTX | | | | RESERVED | REG_TCLKPREPARE | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------|---|------|-------|
| 31:24 | HSSYNCPATTERN | Default : 184 (10111000). MSB (last received bit of sync pattern), LSB (first received bit of sync pattern). | RW | 0xB8 |
| 23:17 | RESERVED | Reserved. Read returns zero. Write only zero for future compatibility. | R | 0x00 |
| 16 | OVRDULPMTX | Global enable of the weak pulldown on the DSI lanes, configured through the [15:11] REGULPMTX bit field: 1: Enable weak pulldown on DSI lanes. 0: Disable weak pulldown on DSI lanes (default). | RW | 0 |
| 15:11 | REGULPMTX | Configuration of the weak pulldowns on the DSI lanes. For each bit, the following settings apply: 1: Enable weak pulldown on the lane. | RW | 0x00 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------|--|------|-------|
| | | 0: Disable weak pulldown on the lane (default). | | |
| | | Bit [15]: DSI lane 4 (applies only to DSI1; reserved for DSI2) | | |
| | | Bit [14]: DSI lane 3 (applies only to DSI1; reserved for DSI2) | | |
| | | Bit [13]: DSI lane 2 (applies to DSI1 and DSI2) | | |
| | | Bit [12]: DSI lane 1 (applies to DSI1 and DSI2) | | |
| | | Bit [11]: DSI lane 0 (applies to DSI1 and DSI2) | | |
| 10:8 | RESERVED | Reserved | RW | 0x0 |
| 7:0 | REG_TCLKPREPARE | TCLK-PREPARE timing parameter in multiples of DDR clock period. D-PHY specification: 38 ns + 95 ns. Default value is programmed for 400 MHz. | RW | 0x1A |

| Description | This register controls the PLL reset/power and modes | | |
| Type | RW | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|----------------|--------------|--------------|--------------|--------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| RESERVED | | | | | | | | | | | | | | | | | | | | | | | | | | | | HSDIV_SYSRESET | PLL_SYSRESET | PLL_HALTMODE | PLL_GATEMODE | PLL_AUTOMODE |

| Bits | Field Name | Description | Type | Reset |
|------|----------------|---|------|-----------|
| 31:5 | RESERVED | Reads as zero. | R | 0x0000000 |
| 4 | HSDIV_SYSRESET | Force HSDIVIDER SYSRESET 0x0: HSDIVIDER SYSRESET controlled by power FSM 0x1: HSDIVIDER SYSRESET forced active | RW | 0 |
| 3 | PLL_SYSRESET | Force DSI PLL SYSRESET 0x0: PLL SYSRESET controlled by power FSM 0x1: PLL SYSRESET forced active | RW | 0 |
| 2 | PLL_HALTMODE | Allow PLL to be halted if no activity. Reserved when DSI1_PLLCTRL_AUTO is 0. 0x0: PLL will not be halted 0x1: PLL will be halted based on activity | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|--------------|--|------|-------|
| 1 | PLL_GATEMODE | Allow PLL clock gating for power saving Reserved when DSI1_PLLCTRL_AUTO is 0. 0x0: CLKIN4DDR clock on 0x1: CLKIN4DDR clock gated by DSI Protocol Engine activity | RW | 0 |
| 0 | PLL_AUTOMODE | Automatic update mode. If this bit is set then the configuration updates will be synchronised to DISPCUpdateSync. If this bit is clear configuration updates will be done immediately. Reserved when DSI1_PLLCTRL_AUTO is 0. 0x0: Manual mode 0x1: Automatic mode | RW | 0 |

| 31:13 | RESERVED | Reads as zero. | R | 0x00000 |
| 12 | SSC_EN_ACK | Spread Spectrum Clocking acknowledge Read 0x0: Spread Spectrum Clocking inactive Read 0x1: Spread Spectrum Clocking active | R | 0 |

MIPI Display Serial Interface

www.ti.com

| Bits | Field Name | Description | Type | Reset |
|------|-------------------------|--|------|-------|
| 11 | M7_CLOCK_ACK | Acknowledge for enable of clock Verify the status before selecting this source in the clock mux Read 0x0: M7 clock inactive Read 0x1: M7 clock active | R | 0 |
| 10 | RESERVED | Reserved | R | 0 |
| 9 | BYPASSACKZ | State of bypass mode on PHY and HSDIVIDER Read 0x0: DSI_PHY and HSDIVIDER have switched to using the bypass clocks. Read 0x1: PLL outputs are still being used by DSI_PHY or HSDIVIDER | R | 0 |
| 8 | M5_CLOCK_ACK | Acknowledge for enable of DSI Protocol Engine clock Verify the status before selecting this source in the DSI Protocol Engine clock mux Read 0x0: M5 Protocol Engine clock inactive Read 0x1: M5 Protocol Engine clock active | R | 0 |
| 7 | M4_CLOCK_ACK | Acknowledge for enable of clock Verify the status before selecting this source in the clock mux Read 0x0: M4 clock inactive Read 0x1: M4 clock active | R | 0 |
| 6 | PLL_BYPASS | DSI PLL Bypass status Read 0x0: PLL not bypassing Read 0x1: PLL bypass | R | 0 |
| 5 | PLL_HIGHJITTER | PLL High Jitter status Read 0x0: PLL in normal jitter condition Read 0x1: PLL in high jitter condition: Phase error 24% | R | 0 |
| 4 | PLL_LIMP | PLL Limp status Read 0x0: LIMP mode inactive Read 0x1: LIMP mode active | R | 0 |
| 3 | PLL_LOSSREF | PLL Reference Loss status Read 0x0: Reference input active Read 0x1: Reference input inactive | R | 0 |
| 2 | PLL_RECAL | PLL recalibration status If this bit is active, the PLL needs to be recalibrated Read 0x0: Recalibration is not required Read 0x1: Recalibration is required | R | 0 |
| 1 | PLL_LOCK | PLL Lock status See the programming guide for the use of this bit Read 0x0: PLL is not locked Read 0x1: PLL is locked | R | 0 |
| 0 | DSI1_PLLCTRL_RESET_DONE | DSI1_PLLCTRL reset done status Read 0x0: Reset is in progress Read 0x1: Reset has completed | R | 0 |

10.4 High-Definition Multimedia Interface

This section introduces the high-definition multimedia interface (HDMI) module. It also describes its main functions and connections in the device.

10.4.1 High-Definition Multimedia Interface (HDMI) Overview

Figure 10-161 shows an overview of the HDMI module.

Figure 10-161. HDMI Overview

hdmi-001

10.4.1.1 HDMI Main Features

The HDMI module provides the following main features:

- HDMI 1.3, HDCP 1.2, and DVI 1.0 compliant
 - Including support for the 3D stereoscopic frame-packing formats of the HDMI v1.4 standard (720p, 50 Hz; 720p, 60 Hz; and 1080p, 24 Hz)
- EIA/CEA-861-D video format support (refer to [Table 10-643](#) for more details)
- VESA DMT video format support (refer to [Table 10-644](#) for more details)
- Support for deep-color mode:
 - 10-bit/component color depth up to 1080p @60Hz
 - 12-bit/component color depth up to 720p/1080i @60Hz
- Supports up to 148.5 MHz pixel clock (1920 x 1080p @60Hz)

- Video formats: 24-bit RGB
- Uncompressed multi-channel (up to 8 channels) audio (L-PCM) support
- Master I2C interface for Display Data Channel (DDC) connection
- Consumer Electronic Control (CEC) interface
- Integrated High-bandwidth Digital Content Protection (HDCP) encryption engine for transmitting protected audio and video content (authentication performed by software)
- Integrated Transition Minimized Differential Signaling (TMDS) and TMDS Error Reduction Coding (TERC4) encoders for data island support
- Integrated TMDS PHY (3 TMDS differential data lanes + TMDS differential clock lane)
 - Up to 1,85625 Gbps per lane at (1080p @60Hz at 10 bits/component, lower resolutions at 12 bits/component)
 - 928,125Mbps per lane at (720p/1080i @60Hz 10 bits/component, lower resolutions at 12 bits/component)
 - 337,5 Mbps at (576p @50Hz/480p @60Hz 10 bits/component)

10.4.1.2 HDMI Video Formats and Timings

10.4.1.2.1 CEA-861-D video formats and timings

Table 10-643 presents the video timings supported by the HDMI module, according to the CEA-861-D standard:

Table 10-643. HDMI Video Timings (CEA-861-D)

| Refresh Rate | Resolution |
|------------------------|--------------|
| 24 Hz (Low field rate) | 1920 x 1080p |
| 50 Hz | 1920 x 1080p |
| | 1920 x 1080i |
| | 1280 x 720p |
| | 2880 x 576p |
| | 1440 x 576p |
| | 1440 x 576i |
| 59.94 Hz | 720 x 576p |
| | 1920 x 1080p |
| | 2880 x 480p |
| | 1440 x 480p |
| | 1440 x 480i |
| | 720 x 480p |
| 60 Hz | 640 x 480p |
| | 1920 x 1080p |
| | 1920 x 1080i |
| | 2880 x 480p |
| | 1280 x 720p |
| | 1440 x 480p |
| | 1440 x 480i |
| | 720 x 480p |
| | 640 x 480p |

10.4.1.2.2 VESA DMT video formats and timings

Table 10-644 presents the video timings supported by the HDMI module, according to the VESA DMT standard:

Table 10-644. HDMI Video timings (VESA DMT)

| Refresh Rate | Resolution |
|--------------------------|--------------|
| 60 Hz | 640 x 480p |
| | 800 x 600p |
| | 848 x 480p |
| | 1024 x 768p |
| | 1280 x 768p |
| | 1280 x 800p |
| | 1280 x 960p |
| | 1280 x 1024p |

| | 1366 x 768p |
| | 1400 x 1050p |
| | 1440 x 900p |
| | 1680 x 1050p |
| | 1920 x 1080p |
| 60 Hz (Reduced Blanking) | 1280 x 768p |
| | 1280 x 800p |
| | 1400 x 1050p |
| | 1440 x 900p |
| | 1680 x 1050p |

10.5 Remote Frame Buffer Interface

This section describes the remote frame buffer interface (RFBI).

10.5.1 Remote Frame Buffer Interface Overview

The RFBI module is part of the display subsystem that provides the logic to display a picture from the memory frame buffer (SDRAM or SRAM) on a LCD panel.

The RFBI is connected to the L3 and L4_PER interconnect through the display subsystem local interconnect. It is preferred from a performance point of view to use the L4_PER interconnect for configuration and the L3 interconnect for data transfer.

Figure 10-162 shows an overview of the RFBI.

Figure 10-162. RFBI Highlight

rfbi-001

The RFBI supports the MIPI DBI protocol with the following features:

- Access to RFB direct MPU interface
 - Sends commands to the RFB panel through the slave port interconnect
 - Sends data, received from the DISPC or from the MPU through the DISPC pixel data bus, to the RFB panel
 - Reads data/status from the RFB to the slave port interconnect
- RFB interface
 - 8-/9-/16-bit parallel interface
 - One programmable configuration for one LCD connected to the RFBI
- Data formats

- Programmable pixel modes (12-/16-/18-/24-BPP modes in RGB format)
- Programmable output formats on one/multiple cycles per pixel (data from the DISPC and the L3 interconnect)
- FIFO
 - One slave port with DMA request and interconnect FIFO of 24×32 -bit depth (for write access to the [RFBI_DATA](#) register only)
 - One video port FIFO of 8×24 -bit depth receiving data from the DISPC through [RFBI_DATA](#)

10.5.2 RFBI Environment

In the display subsystem, data are read by the DISPC from the memory frame buffer (SDRAM, SRAM, IVA-HD SL2, etc.), and sent through the RFBI to the external LCD/RFB.

The DISPC associated with the RFBI implements the MIPI DBI protocol.

The DISPC provides the required control signals to interface the memory frame buffer (SDRAM, SRAM or IVAHD-SL2) directly to the external displays. The RFBI is connected to the memory through the L3 interconnect and has its own DMA (with embedded FIFOs) to read data from the system memory. There is one master port (L3 interconnect) and two slave ports (one for L4_PER interconnect and the other for L3 interconnect).

The DISPC_CONTROL1[16] GPOUT[1] and DISPC_CONTROL1[15] GPOUT[0] bits control selection of the display subsystem modules (see [Table 10-645](#)).

Table 10-645. I/O Pad Mode Selection

| DSS.DISPC_CONTROL[16] GPOUT1 | DSS.DISPC_CONTROL[15] GPOUT0 | Mode |
|------------------------------|------------------------------|-------------|
| 0 | 0 | Reset |
| 0 | 1 | RFBI mode |
| 1 | 0 | Invalid |
| 1 | 1 | Bypass mode |

The RFB of the LCD panel is directly connected to the RFBI of the device. The RFBI controls the reads/writes from/to the RFB. The RFBI receives data from its slave port or output from the DISPC and generates the signals to control the LCD panel. Through the RFBI, the MPU can send commands or parameter/display data to the LCD panel and directly set the DISPC registers to read/write data from/to the memory in the LCD panel. The RFBI can manage only one LCD panel.

10.5.2.1 RFBI Parallel Interface (MIPI DBI Protocol)

[Figure 10-163](#) shows the LCD support parallel interface in RFBI mode.

Figure 10-163. RFBI LCD Support Interface

[Table 10-646](#) describes the interface signals to/from the LCD panel.

Table 10-646. LCD Interface Signals

| Signal Name | Type ⁽¹⁾ | Description |
|-----------------|---------------------|---------------|
| rfbi_data[15:0] | I/O | RFBI I/O data |

⁽¹⁾ I = Input; O = Output; I/O = Input/Output

Table 10-646. LCD Interface Signals (continued)

| Signal Name | Type ⁽¹⁾ | Description |
|----------------|---------------------|--|
| rfbi_re | O | Read access signal |
| rfbi_we | O | Write access signal |
| rfbi_a0 | O | Command/data selection signal |
| rfbi_cs0 | O | Chip-select (CS) signal for LCD 1 |
| rfbi_te_vsync0 | I | Tearing effect (TE) synchronization signal (TE or VSYNC for LCD panel 1) |
| rfbi_hsync0 | I | HSYNC from LCD panel 1 |

- **rfbi_data[15:0]:** The pixel data comprises the RFBI pixel data (bits 15:0). A write/read command must be sent to the LCD panel to send/read the data.
Before any data access, the application must send commands and parameters when it is necessary to configure an LCD panel. The data is used as input in read operations during production test and also to read the status of the registers in the LCD panel and pixels from the embedded frame buffer in the LCD panel.
- **rfbi_re:** This is the read-enable signal used to indicate when a read from the embedded memory in the LCD panel is ongoing. The RFBI registers describe the behavior of the read signal (off/on/cycle time). The polarity of the read-enable signal is programmable. The read is used to get status/data information from the LCD panel.
- **rfbi_we:** The write-enable signal is used to indicate when a write is ongoing. The RFBI registers allow flexible behavior of the write signal (programmable off/on/cycle times and signal polarity).
- **rfbi_a0:** The signal is asserted to indicate its status: Command or data. The polarity is programmable and the status of the signal depends on the RFBI registers written by the application (CMD/READ/STATUS/PARAM/PIXEL). The register in use by the hardware defines the status of **rfbi_a0**. The order of the writes/reads to the RFBI registers CMD/READ/STATUS/PARAM/PIXEL defines the transitions of A0.
- **rfbi_cs0:** The signal is the chip-select (CS0) asserted to indicate which LCD panel is selected and must be ready to receive/transmit commands and data. When RE or WE is on, CS0 must not be changed.
To select the trigger mode, configure the [RFBI_CONFIG\[3:2\]](#) TRIGGERMODE bit field (0x0: Internal trigger mode with the [RFBI_CONTROL\[4\]](#) ITE bit, 0x1: External trigger mode with the TE signal **rfbi_te_vsync0**, 0x2: External trigger mode with the **rfbi_te_vsync0**, and **rfbi_hsync0** signals with the programmable line counter).
- **rfbi_te_vsync0** (only used by RFBI if [RFBI_CONFIG\[3:2\]](#) TRIGGERMODE = 0x1 or 0x2, otherwise ignored): Based on the trigger mode selected, the signal is the TE pulse signal or the LCD panel vertical synchronization (VSYNC) pulse signal. **rfbi_te_vsync0** is used by the TE logic as the synchronization signal to send the pixel to the LCD panel.
- **rfbi_hsync0** (only used by RFBI if [RFBI_CONFIG\[3:2\]](#) TRIGGERMODE = 0x2, otherwise ignored): The HSYNC pulse signals indicate to the RFBI when horizontal synchronization occurs. The polarity of the HSYNC signals is programmable. The minimum pulse width of the signal is two RFBI_ICLK clock cycles. **rfbi_hsync0** is used by the TE logic as a synchronization signal to send the pixel to the LCD panel.

10.5.2.1.1 Description of the Tearing Effect Pulse Signal

The TE signal can be generated externally by the RFBI depending on the value of the [RFBI_CONFIG\[3:2\]](#) TRIGGERMODE bit field:

- TRIGGERMODE = 0x1: external trigger mode with TE signal. TE signal corresponds to **rfbi_te_vsync0** pad.
- TRIGGERMODE = 0x2: external trigger mode with HSYNC/VSYNC signals. HSYNC signal corresponds to **rfbi_hsync0** pad and VSYNC signal to **rfbi_te_vsync0** pad.

The externally generated TE synchronization signal is a logical OR or AND operation between the HSYNC and VSYNC signals (see [Figure 10-164](#)). The logical operation (OR or AND) depends on the HSYNC and VSYNC signals polarity. The VSYNC signal indicates to the RFBI when vertical synchronization occurs; the HSYNC signal indicates to the RFBI when horizontal synchronization occurs.

Figure 10-164. External Generation of TE Signal Based on Logical OR Operation Between HSYNC and VSYNC (Active-High)

- TE signal is connected to rfb_te_vsync0 external pad when the [RFBI_CONFIG\[3:2\] TRIGGERMODE](#) bit field is set to 0x1.
- HSYNC and VSYNC signals are connected to rfb_hsync0 and rfb_te_vsync0, respectively, when the [RFBI_CONFIG\[3:2\] TRIGGERMODE](#) bit field is set to 0x2.

The RFBI module detects the VSYNC and HSYNC pulses embedded in the received signal. VSYNC is detected based on the minimum pulse width defined by the [RFBI_VSYNC_WIDTH](#) register. VSYNC is not triggered by an inactive-to-active edge.

HSYNC is detected based on the minimum pulse width defined by the [RFBI_HSYNC_WIDTH](#) register. HSYNC is not triggered by an inactive-to-active edge.

The signal is generated from external logic based on VSYNC and HSYNC of the LCD panel. The automatic trigger can be programmed based on the external RFBI_TE signal or use the [RFBI_CONTROL\[4\] ITE](#) bit to start data capture (internal trigger mode).

The polarity of the TE signal is programmable in the [RFBI_CONFIG](#) register. HSYNC and VSYNC pulses embedded in the TE signal have the same polarity, which is active high for an ORed signal and active low for an ANDed signal. The minimum pulse width of the signal is two RFBI_ICLK clock cycles. Hardware resets the line counter when VSYNC occurs and increments it at every HSYNC. Transfer to the LCD panel begins when the line counter reaches the programmable line number.

10.5.2.2 Transaction Timing Diagrams

[Table 10-647](#) lists the programmable timing fields. [Figure 10-165](#) through [Figure 10-167](#) show timing diagrams of read/write transactions to the LCD panel for the RFBI. In these figures, the polarity 0 (active low) is used to describe the RFBI_A0, RFBI_CSi, RFBI_RE, and RFBI_WE signals.

Table 10-647. Programmable Timing Fields in RFBI Mode

| Timing Name | Register Field | Description |
|--------------|---|---|
| CSONTime | RFBI_ONOFF_TIME[3:0] CSONTIME bit field | CS assertion time from start access time |
| CSOffTime | RFBI_ONOFF_TIME[9:4] CSOFFTIME bit field | CS deassertion time from start access time |
| WECycleTime | RFBI_CYCLE_TIME[5:0] WECYCLETIME bit field | The time when A0 becomes valid until write cycle completion |
| WEOnTime | RFBI_ONOFF_TIME[13:10] WEONTIME bit field | WE assertion delay time from start access time |
| WEOffTime | RFBI_ONOFF_TIME[19:14] WEOFFTIME bit field | WE deassertion delay time from start access time |
| RECycleTime | RFBI_CYCLE_TIME[11:6] RECYCLETIME bit field | The time when A0 becomes valid until read cycle completion |
| REOnTime | RFBI_ONOFF_TIME[23:20] REONTIME bit field | RE assertion delay time from start access time |
| REOffTime | RFBI_ONOFF_TIME[29:24] REOFFTIME bit field | RE deassertion delay time from start access time |
| CSPulseWidth | RFBI_CYCLE_TIME[17:12] CSPULSEWIDTH bit field | The time when write cycle time or read cycle time completes |

Figure 10-167. Read to Write and Write to Read

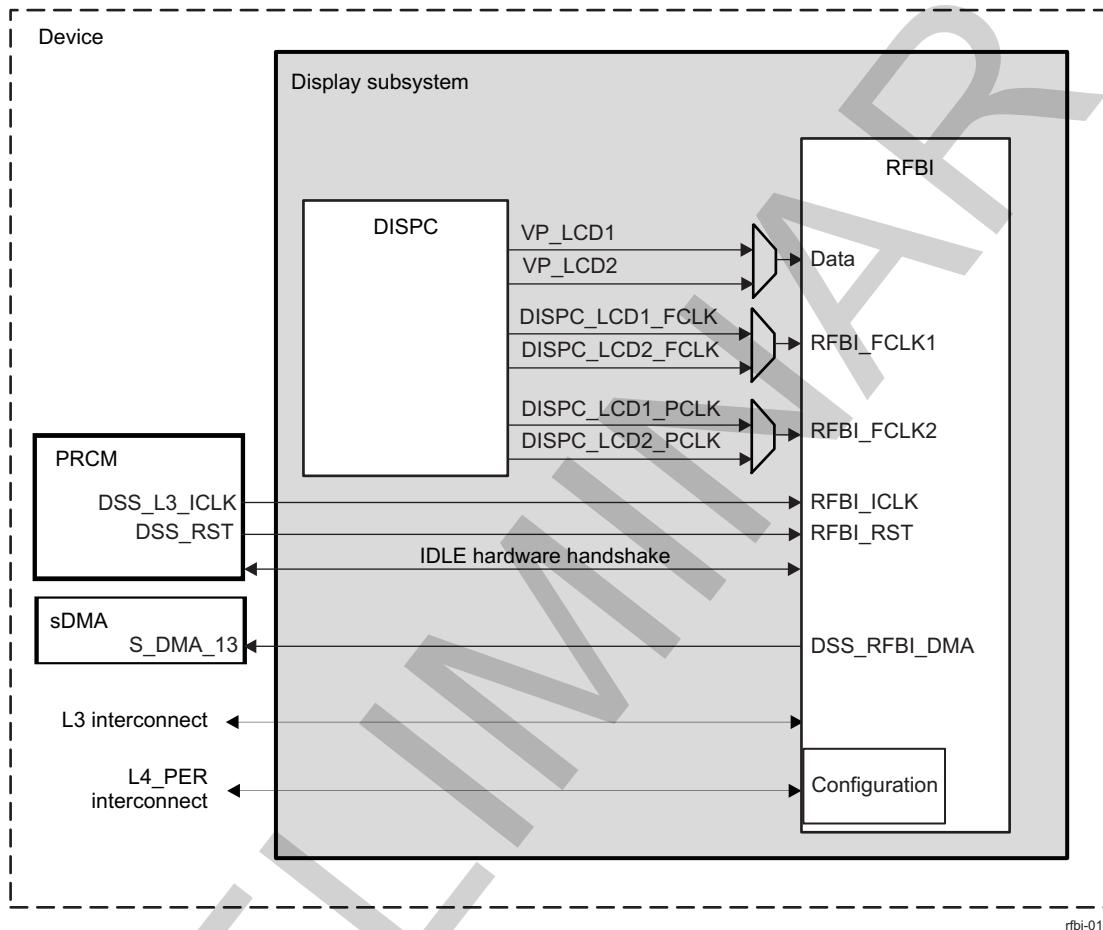

10.5.3 RFBI Integration

This section describes the RFBI integration in the device, including information about clocks, resets, and hardware requests.

Figure 10-168 shows the RFBI module integration.

Figure 10-168. RFBI Integration

NOTE: For more information about the IDLE hardware handshake, see [Section 3.1.1.1.2, Module-Level Clock Management, Chapter 3, Power, Reset, and Clock Management](#).

Table 10-648 through Table 10-650 summarize the integration of the module in the device.

Table 10-648. Integration Attributes

| Module Instance | Attributes | | |
|-----------------|--------------|--------------------|--------------|
| | Power Domain | Wake-Up Capability | Interconnect |
| RFBI | PD_DSS | No | L3 L4_PER |

Table 10-649. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|--|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| RFBI | RFBI_FCLK1 | DISPC_LCDx_FCLK | DISPC | Logic clock used by the RFBI when capturing data on the video port and for the generation of the RFBI_STALL signal |
| | RFBI_FCLK2 | DISPC_LCDx_PCLK | DISPC | Pixel clock used by the RFBI to capture the pixels |
| | RFBI_ICLK | DSS_L3_ICLK | PRCM | L3 interface clock |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| RFBI | RFBI_RST | DSS_RST | PRCM | Display subsystem global hardware reset |

NOTE: If video mode is used, the VPn_PCLK and VPn_CLK clocks must be generated using a CLKIN4DDR clock.

Table 10-650. Hardware Requests

| DMA Requests | | | | |
|-----------------|--------------------|-------------------------|-------------|------------------|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| RFBI | DSS_RFBI_DMA | S_DMA_13 | sDMA | RFBI DMA request |

NOTE: For DMA source description, see [Section 10.5.3.1, DMA Requests](#).

10.5.3.1 DMA Requests

All peripherals internal to the device use the transition-sensitive scheme for DMA requests. For more information about the transition-sensitive scheme, see [Chapter 17, sDMA](#).

[Table 10-651](#) describes the RFBI DMA request.

Table 10-651. RFBI DMA Request Description

| DMA | Source | Description | Sensitivity ⁽¹⁾ |
|----------|--------------|--|----------------------------|
| RFBI_DMA | DSS_RFBI_DMA | The DMA request can be used to transfer data using the sDMA T from memory to RFBI interconnect slave FIFO. | T |

⁽¹⁾ T: Transition-sensitive (fixed in hardware) active low request

10.5.4 RFBI Functional Description

This section describes the functions of the RFBI.

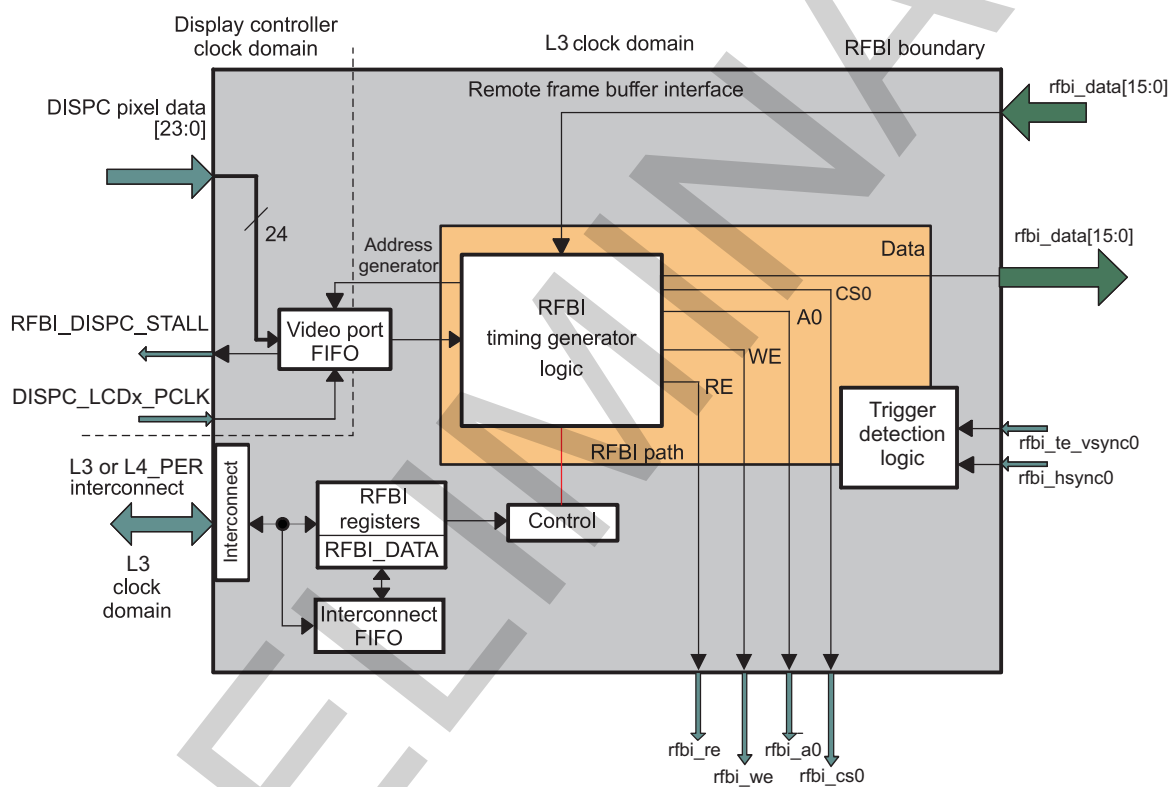

10.5.4.1 Block Diagram

The RFBI can capture the output pixel from the DISPC and send the data to the RFB in the LCD panel. The application configures the RFBI, sends commands, reads data, and configures the DISPC to send data fetched from the system memory by the DISPC DMA engine. The commands/data are sent using an 8-, 9-, or 16-bit parallel interface.

The DISPC is configured to send the data in 12-, 16-, 18-, or 24-BPP format. In the video port FIFO, the encoded pixel values are in an LSB alignment independent of the endianness in system memory.

Figure 10-169 is an overview of the RFBI architecture.

Figure 10-169. RFBI Architecture Overview

rfbi-015

10.5.4.2 Clock Configuration

The RFBI functional clocks (RFB_FCLK1 and RFB_FCLK2) are provided internally to the display subsystem by the DISPC. For more details about the DISPC clocks, see, [Section 10.2 Display Controller](#).

10.5.4.3 Software Reset

To perform a software reset, set the [RFB_SYSCONFIG\[1\] SOFTRESET](#) bit to 1. The [RFB_SYSSTATUS\[0\] RESETDONE](#) bit indicates that the software reset is complete when its value is 1. When the software reset completes, the [RFB_SYSCONFIG\[1\] SOFTRESET](#) bit is automatically reset. Software must ensure that the software reset completes before performing any RFBI operation.

10.5.4.4 Power Management

[Table 10-652](#) describes power-management features available for the RFBI.

NOTE: For information about source clock gating description, see [Section 3.1.1.2, Module-Level Clock Management](#) in [Chapter 3, Power, Reset and Clock Management](#).

Table 10-652. Local Power Management Features

| Feature | Registers | Description |
|------------------------|---|---|
| Clock autogating | RFBI_SYSCONFIG [0] AUTOIDLE bit | This bit allows a local power optimization inside the module by gating functional clocks (RFBI_FCLK1, RFBI_FCLK2) and interface clock (RFBI_ICLK) upon the internal activity. |
| Slave idle modes | RFBI_SYSCONFIG [4:3] SIDLEMODE bit field | Force-idle, no-idle, and smart-idle. For more details, see below. |
| Clock activity | N/A | Feature not available |
| Master standby modes | N/A | Feature not available |
| Global wake-up enable | N/A | Feature not available |
| Wake-up sources enable | N/A | Feature not available |

As shown in [Table 10-652](#), the RFBI supports the No-Idle, Force-idle, and Smart-Idle modes.

The conditions of assertion of the SIdleAck signal are:

- No-idle mode: SIdleAck is never asserted.
- Force-idle mode: SIdleAck is asserted unconditionally after one RFBI_ICLK clock cycle delay with respect to assertion of IdleReq.
- Smart-idle mode: SIdleAck is asserted when the following conditions are satisfied:
 - The RFBI stops using the RFBI_ICLK clock and all the data have been sent to the RFB (LCD panel).

Once SIdleAck signal is asserted:

- The RFBI_ICLK (DSS_L3_ICLK) clock can shutdown at any time.
- Any transaction on the RFBI configuration port is ignored

The conditions of deassertion of the SIdleAck signal are:

- Force-idle mode: In this mode SIdleAck is deasserted after one RFBI_ICLK clock cycle delay with respect to deassertion of IdleReq.
- Smart-idle mode: In this mode SIdleAck is deasserted after one RFBI_ICLK clock cycle delay with respect to deassertion of IdleReq.

Once SIdleAck is released, the RFBI is fully operational (guaranteed only in the case of smart-idle mode).

10.5.4.5 Interrupt Requests

The RFBI does not generate interrupts but the following DISPC interrupts can be enabled depending on which LCD output of DISPC is currently used for connection to the RFBI:

- FRAMEDONE1_IRQ
- PROGRAMMEDLINENUMBER_IRQ
- GFXFIFOUNDERFLOW_IRQ
- GFXENDWINDOW_IRQ
- PALETTEGAMMALOADING_IRQ
- OCPERROR_IRQ
- VID1FIFOUNDERFLOW_IRQ
- VID1ENDWINDOW_IRQ
- VID2FIFOUNDERFLOW_IRQ
- VID2ENDWINDOW_IRQ

- SYNCLOST1_IRQ
- WAKEUP_IRQ
- SYNCLOST2_IRQ
- VID3FIFOUNDERFLOW_IRQ
- VID3ENDWINDOW_IRQ
- FRAMEDONE2_IRQ

NOTE: For more details about DISPC interrupts, see, [Section 10.2 Display Controller](#).
The other DISPC interrupts are not used in the RFBI.

10.5.4.6 DMA Requests

[Table 10-653](#) lists event flags and their mask, that can cause RFBI DMA requests.

Table 10-653. DMA Requests Events

| DMA Request Name | DMA Request Mask | Map to | Description |
|------------------|---|----------|--|
| DSS_RFBI_DMA | RFBI_CONTROL [7] DISABLE_DMA_REQ | S_DMA_XX | DMA request used to transfer data using the sDMA from memory to the RFBI interconnect FIFO |

NOTE: For more details about DMA requests, see [Figure 10-175](#).

10.5.4.7 Video Port FIFO

10.5.4.7.1 Description

The input video port FIFO receives data from the DISPC at the pixel clock. The data in the video port FIFO are read by the RFBI and sent to the LCD panel. The video port FIFO is 24 bits wide and each pixel in 12-, 16-, 18-, and 24-BPP format is stored in the video port FIFO using one 24-bit value aligned on the 24-bit LSB. [Section 10.5.4.9, RFBI Output Parallel Modes](#), provides examples of various output configurations based on the interface width (up to 16 bits) and pixel format output (up to 24 bits). Setting the [RFBI_CONTROL](#)[1] RFBIMODE bit to 0 directs the MPU to send commands, parameters, and data from the input video port FIFO.

10.5.4.7.2 RFBI Input Formats

The encoded pixel formats supported at the RFBI input interface connected to the DISPC are: RGB12-444, RGB16-565, RGB18-666, and RGB24-888. This input data width is controlled by the [RFBI_CONFIG](#)[6:5] DATATYPE bit field. The following graphics describe the bit representation of each format in the video port FIFO. The output of the DISPC is aligned on the LSB of the interface. The pixels are then formatted in accordance with the configuration of the output interlaces (multiple cycles); for more details, see [Section 10.5.4.9.1, Cycle Mode Selection](#).

- RGB12-444 format:

- RGB16-565 format:

- RGB18-666 format:

- RGB24-888 format:

NOTE: These pixel formats are also supported when data are provided from the slave port interconnect (for writing parameters).

10.5.4.7.3 Stall Mechanism

The stall signal (RFBI_STALL) is generated by the video port FIFO and used to indicate when the DISPC must stop sending data on the corresponding LCD output interface. This stall signal is used for both LCD outputs (DISPC_LCD1_DATA_STALL and DISPC_LCD2_DATA_STALL) only when the DISPC is configured in stall mode. The stall mode is activated by setting the DISPC_CONTROL0[11] STALLMODE bit to 1 for the primary LCD output and DISPC_CONTROL0[11] STALLMODE bit to 1 for the secondary LCD output.

NOTE: When the DISPC is configured in stall mode, the minimum transfer size is 1 byte.

The RFBI_STALL signal allows the RFBI to reformat the data.

RFBI_STALL is asserted when at least one of the following cases occurs:

- Default status when there is no data to capture from the DISPC
- High FIFO threshold reached
- End of transfer (number of data to output)
- RFBI reset
- [RFBI_CONTROL\[0\] ENABLE](#) bit reset to 0x0

RFBI_STALL is deasserted when the [RFBI_CONTROL\[0\] ENABLE](#) bit is set to 0x1 and at least one of the following cases occurs:

- Low FIFO threshold reached
- External TE occurs and the [RFBI_CONFIG\[3:2\] TRIGGERMODE](#) bit field is set to 0x1 for automatic external trigger (start of the transfer, the FIFO pointers are reset, the FIFO is empty).
- [RFBI_CONTROL\[4\] ITE](#) bit set to 0x1 by users (start of transfer, the FIFO pointers are reset, the FIFO is empty)

NOTE: This stall mechanism is also used by the DSI protocol engines. When multiple modules are connected to the same LCD output (RFBI and DSI protocol engines), the STALL signals from the modules are merged into a single DISPC_LCDx_DATA_STALL signal inside the display subsystem. Only one signal for each LCD output is connected the DISPC (two signals total for the two LCD outputs). In that case, only one module can control the STALL assertion/deassertion. The module which is not using the LCD output interface at that time is not disturbed because the STALL signal is asserted/deasserted by another module. For more details, see chapter *Display Subsystem*.

The RFBI asserts the STALL signal to stop data output by the DISPC. It is deasserted to indicate when new data must be output by the DISPC.

10.5.4.7.3.1 Data Stall Diagram Without DMA Buffer Handshake

Figure 10-170 shows the RFBI data stall diagram when DISPC_DIVISOR[7:0] PCD bit field is set to 3.

Figure 10-170. RFBI Data Stall Signal Diagram With PCD=3

10.5.4.7.3.2 Data Stall Diagram with DMA Buffer Handshake

To avoid underflow of the DMA buffer, the DMA buffer handshake feature can be enabled by setting the DISPC_CONFIG0[16] BUFFERHANDCHECK bit to 1. The fullness of the FIFOs associated with the pipelines used for the LCD output is checked when the STALL signal is inactive before providing data to the pipeline. This prevents emptying the FIFO when the RFBI requests data and there is not enough data in the DISPC DMA buffer. This feature must be enabled only when stall mode is used (DISPC_CONTROL0[11] STALLMODE bit set to 1).

When the DMA buffer handshake feature is activated, the pixel transfer to the RFBI during STALL inactivity period can be stopped (no DISPC_LCD1_PCLK or DISPC_LCD2_PCLK pulse) and restarted when there is enough data in the DMA buffer. The DMA buffer handshake ensures that underflow cannot occur for the pipelines associated with the LCD output in stall mode. Figure 10-171 shows the RFBI data stall with DMA buffer handshake mode activated (PCD=3).

Figure 10-171. RFBI Data Stall Signal Diagram With Handshake With PCD=3

10.5.4.8 Interconnect FIFO

10.5.4.8.1 Description

The interconnect FIFO receives the data from RFBI_DATA write requests to the slave port interconnect slave port. The data in the interconnect FIFO are read by the RFBI and sent to the LCD panel. The interconnect FIFO is 32 bits wide. The size of the interconnect FIFO is 24 words of 32 bits (that is, 24 words of RFBI_DATA). The address of the RFBI_DATA register is used to access the interconnect FIFO. The DSS_RFBI_DMA DMA request can be used to transfer data using the system DMA from memory to interconnect FIFO.

10.5.4.8.2 Using DMA Request With Interconnect FIFO

10.5.4.8.2.1 Threshold for DMA Request Generation

The RFBI_CONTROL[6:5] HIGHTHRESHOLD bit field is used to define the threshold to be used for the generation of the DMA request to receive data into the interconnect FIFO (24 × 32 FIFO depth) through the address of the register RFBI_DATA. The sDMA configuration regarding the size of the burst depends on the value of the RFBI_CONTROL[6:5] HIGHTHRESHOLD bit field. The supported values are 4 × 32, 8 × 32 and 16 × 32. When for example, 4 words of 32 bits are set for the threshold, the sDMA sends a burst of 4 × 32 bits only. The sDMA receives the DMA request and is in charge of providing the correct number of bytes.

10.5.4.8.2.2 Disabling DMA Request

If the [RFBI_CONTROL](#)[7] DISABLE_DMA_REQ bit is reset, the DMA request is generated when there is enough room in the interconnect FIFO to accept the full burst. In case the RFBI receives writes slave port requests to the [RFBI_DATA](#) location when the interconnect FIFO is full, the request is not accepted. The RFBI waits for a free entry in the interconnect FIFO to accept the slave port request.

If the [RFBI_CONTROL](#)[7] DISABLE_DMA_REQ bit is set, the DMA request is not generated. The threshold value is ignored.

NOTE: Software users can access the [RFBI_DATA](#) location without using the DMA request and without programming the high threshold value (backward compatibility mode).

10.5.4.8.2.3 Smart DMA Request Mode

If the [RFBI_CONTROL](#)[8] SMART_DMA_REQ bit is reset (smart DMA mode disabled), the DMA request is asserted and deasserted depending on the interconnect FIFO space even if Midlreq is high in smart-idle/no-idle mode and the entire burst gets error responses from the RFBI. The RFBI waits for a free entry in the interconnect FIFO to accept the burst request.

If the [RFBI_CONTROL](#)[8] SMART_DMA_REQ bit is set (smart DMA mode enabled), the DMA request is deasserted after two [RFBI_ICLK](#) clock cycles if it has been asserted for more than or equal to two [RFBI_ICLK](#) clock cycles and Midlreq is high in smart-idle or no-idle mode. If asserting time is less than two [RFBI_ICLK](#) clock cycles, no more burst requests are accepted even if the space is available in the interconnect FIFO.

10.5.4.9 RFBI Output Parallel Modes

10.5.4.9.1 Cycle Mode Selection

The **RFBI_CONFIG**[10:9] **CYCLEFORMAT** bit field defines the number of cycles to output a pixel. The number of cycles determines the number of registers used to format the data in the interconnect FIFO with the appropriate number of bits (starting from the LSB) and with the alignment on the interface. The data are formatted based on the configuration of the **RFBI_DATA_CYCLEi** registers.

- One cycle: **RFBI_CONFIG**[10:9] **CYCLEFORMAT** bit field = 0x00 and the **RFBI_DATA_CYCLE1** register
- Two cycles: **RFBI_CONFIG** [10:9] **CYCLEFORMAT** bit field = 0x01 and the **RFBI_DATA_CYCLE1** and **RFBI_DATA_CYCLE2** registers
- Three cycles: **RFBI_CONFIG**[10:9] **CYCLEFORMAT** bit field = 0x10 and the **RFBI_DATA_CYCLE1**, **RFBI_DATA_CYCLE2**, and **RFBI_DATA_CYCLE3** registers

Figure 10-172 through Figure 10-174 list the bits position of the pixel during the cycles for an 8-, 9- and 16-bit parallel output, respectively.

rfbi-028

10.5.4.9.2 Unmodified Bits

In a cycle, if every bit in the interface does not have a pixel value, the status of the unused bits can be programmed to be 0, 1, or the previous value (I/O power consumption optimization). Based on the configuration, the undefined bits for each cycle are defined with the previous values of the bits at the same position in the previous cycle, 0s, or 1s (the unused bits can be at any position). The [RFBI_CONFIG\[12:11\] UNUSEDBITS](#) bit field is used.

10.5.4.9.3 Number of Pixels to Transfer

The [RFBI_PIXEL_CNT](#)[31:0] PIXELCNT bit field indicates the number of pixels to be transferred to the LCD panel. The value can be changed only when the [RFBI_CONTROL](#)[0] ENABLE bit is reset.

During the transfer, the hardware decrements the register when a pixel is sent to the RFB. When the [RFBI_CONTROL](#)[0] ENABLE bit is set and a new value is written in the [RFBI_PIXEL_CNT](#) register, and the current value in the register is a not 0 (the remaining number of pixels to transfer), the ongoing transfer is aborted.

10.5.4.10 RFBI Timing Generator

10.5.4.10.1 Configuration Selection

The [RFBI_CONTROL](#)[3:2] CONFIGSELECT bit field selects the chip select.

10.5.4.10.2 Read/Write

Depending on the status of A0, WE, and RE, the commands and display/parameter data are written to the panel (handled by the state-machine for the commands/parameter data and stored in memory for the display data), or the display data/status values are read from the LCD panel (status and display data in the LCD panel memory). The polarity of A0 (RFBI_A0 signal), WE (RFBI_WE signal), RE (RFBI_RE signal), and CS0 (RFBI_CS0 signal) is programmable.

[Table 10-654](#) describes the read/write function.

Table 10-654. Read/Write Function Description

| A0 (RFBI_A0) | WE (RFBI_WE) | RE (RFBI_RE) | Function Description |
|--------------|--------------|--------------|--|
| 1 | 0 | 1 | Display data write, parameter data write |
| 1 | 1 | 0 | Display data read |
| 0 | 1 | 0 | Status read |
| 0 | 0 | 1 | Command data write |

A minimum of RFBI_Cs cycle time, as defined in [Table 10-655](#), is required to keep the RFBI_CS0 signal asserted between write transfers of multiple pixels.

[Table 10-655](#) lists the minimum cycle time for RFBI_CS0, depending on the source of pixels (DISPC or slave port) and the cycle format (1pixel/cycle, 1 pixel/2 cycles, or 1 pixel/3 cycles).

Table 10-655. Minimum Cycle Time for CS0/WE Always Asserted

| RFBI Performance | RFBI_CONFIG [10:9] CYCLEFORMAT | RFBI_CONFIG [8:7] PORTFORMAT | Minimum Cycle Time (in Number of RFBI_ICLK Clock Cycles) |
|-------------------------|---|---|---|
| Slave port interconnect | 1 pixel/cycle | 1 pixel | 5 |
| | 1 pixel/2 cycles | 1 pixel | 4 |
| | 1 pixel/3 cycles | 1 pixel | 4 |
| | 1 pixel/cycle | 2 pixels | 4 |
| | 1 pixel/2 cycles | 2 pixels | 4 |
| | 1 pixel/3 cycles | 2 pixels | 4 |
| DISPC | 1 pixel/cycle | N/A | 4 |
| | 1 pixel/2 cycles | N/A | 3 |
| | 1 pixel/3 cycles | N/A | 3 |
| | 2 pixel/3 cycles | N/A | 6 |

10.5.4.10.3 RFBI State-Machine

The RFBI_A0, RFBI_RE, and RFBI_WE signals are asserted and deasserted based on the register accessed (RFBI_CMD, RFBI_PARAM, RFBI_DATA, RFBI_READ, or RFBI_STATUS). (See Table 10-654.) When the RFBI_SYSSTATUS[8] BUSY bit is set by hardware, any access to the registers is stalled, except for the RFBI_DATA register.

The RFBI_SYSSTATUS[9] BUSYRFBIDATA bit indicates whether there are still pending data in the interconnect FIFO associated with the RFBI_DATA register only.

- Command register
Write one command at a time by writing through the slave port interconnect into the RFBI_CMD register. If the previous command is not processed, the RFBI_SYSSTATUS[8] BUSY bit is set by hardware and the access to writing a new command is stalled.
- Parameter register
Write one parameter at a time by writing in the RFBI_PARAM register.
If the previous parameter is not processed, the RFBI_SYSSTATUS[8] BUSY bit is set by hardware and the access to writing a new parameter is stalled.
- Data register
Write one or two pixels at a time by writing in the RFBI_DATA register.
The pixels are formatted based on the specified cycle format. If two pixels are written into the 32-data register, the RFBI_CONFIG[8:7] PORTFORMAT bit field indicates the number of pixels for each slave port access to the register and the order of the pixels.
If the previous data are not processed, the RFBI_SYSSTATUS[8] BUSY bit is set by hardware and any access for writing new data is stalled. When the RFBI_SYSSTATUS[8] BUSY bit is reset by hardware, the access is not stalled.
- Read/status register
Send through the command and parameter registers the correct information to receive data in the data or status register. The read data from the LCD panel is initiated by writing into the RFBI_READ or RFBI_STATUS registers. In this case, the RFBI_SYSSTATUS[8] BUSY bit is set until the data are available in the register.
When the RFBI_SYSSTATUS[8] BUSY bit is set by hardware, the read or write access is stalled until the register is updated with a new value from the LCD panel. To avoid the stall, the software can poll the RFBI_SYSSTATUS[8] BUSY bit until it is reset by hardware. To receive the data, send the appropriate command/parameters.

10.5.4.10.4 RFBI Timings

The timing registers can be accessed only when there is no transaction in progress (based on the value of the RFBI_CONTROL[3:2] CONFIGSELECT bit field). Granularity is defined using the RFBI_CONFIG[4] TIMEGRANULARITY bit. This feature allows the extension of programmable ranges of timing parameters for the RFBI interface. See Table 10-656 for the configuration values of the timing bits.

- Chip-select assertion/deassertion time (CSOnTime/CSOffTime)
RFBI_A0 setup time to chip-select assertion is assured by the programmable chip-select assertion time from the start access time:
RFBI_ONOFF_TIME[3:0] CSONTIME bit field.
The chip-select deassertion time from the start access time is programmable:
RFBI_ONOFF_TIME[9:4] CSOFFTIME bit field

CAUTION

Configuring RFBI_ONOFF_TIME[3:0] CSONTIME = RFBI_ONOFF_TIME[9:4] CSOFFTIME = 0 is not supported and must be avoided. This configuration creates contention on the bus and progressively damages the LCD panel.

- Chip-select pulse width (CSPulseWidth)

The total chip-select pulse width is the time when write cycle time or read cycle time has completed and is programmable:

[RFBI_CYCLE_TIME](#)[17:12] CSPULSEWIDTH bit field

It applies on the read-to-write, write-to-read, read-to-read, and write-to-write access based on:

- The [RFBI_CYCLE_TIME](#)[19] RRENABLE bit: Read-to-read access
- The [RFBI_CYCLE_TIME](#)[20] WWENABLE bit: Write-to-write access
- The [RFBI_CYCLE_TIME](#)[18] RWENABLE bit: Read-to-write access
- The [RFBI_CYCLE_TIME](#)[21] WRENABLE bit: Write-to-read access

By default, it applies to any access (read-to-read, read-to-write, write-to-read, write-to-write) when the chip-select CS0 is activated by setting the [RFBI_CONTROL](#)[3:2] CONFIGSELECT bit field to 0x1.

- Access time

Access time is the time delay between A0 assertion to data sampling before RE signal deassertion; access time is programmable:

[RFBI_CYCLE_TIME](#)[27:22] ACCESTIME bit field

When reading the data on the bus, the data are sampled at the end of the access time, which occurs before the end of the read off time ([RFBI_ONOFF_TIME](#)[29:24] REOFFTIME).

- Write-enable cycle time (WECycleTime)

The total write-enable cycle time is the time when A0 becomes valid until write cycle completion; the write-enable cycle time is programmable:

The [RFBI_CYCLE_TIME](#)[5:0] WECYCLETIME bit field

- Write-enable assertion/deassertion time (WEOnTime/WEOffTime)

The WE assertion delay time from start access time is programmable:

[RFBI_ONOFF_TIME](#)[13:10] WEONTIME bit field

The WE deassertion delay time from the start access time is programmable:

[RFBI_ONOFF_TIME](#)[19:14] WEOFFTIME bit field

- Read-enable cycle time (RECycleTime)

The total read-enable cycle time is the time when A0 becomes valid until read cycle completion; the read-enable cycle time is programmable:

The [RFBI_CYCLE_TIME](#)[11:6] RECYCLETIME bit field

- Read-enable assertion/deassertion time (REOnTime/REOffTime)

The RE assertion delay time from the start access time is programmable:

[RFBI_ONOFF_TIME](#)[23:20] REONTIME bit field

The RE deassertion delay time from the start access time is programmable:

[RFBI_ONOFF_TIME](#)[29:24] REOFFTIME bit field

At cycle time completion (read access or write access), all control signals (RFBI_CS0, RFBI_WE, and RFBI_RE) are deasserted regardless of their deassertion time parameter values, if they are not deasserted already.

However, an exception to this forced deassertion exists when a pipelined request to CS0 is pending. Also, a control signal with deassertion time parameters equal to the cycle time parameter is not necessarily deasserted when a pipelined request to the same chip-select or different chip-select is pending. This prevents any unnecessary glitch transitions.

If no inactive cycles are required between successive accesses to the same chip-select (the [RFBI_CYCLE_TIME](#)[17:12] CSPULSEWIDTH bit field = 0), and if assertion time parameters associated with the following access equal 0, the asserted control signals (RFBI_CS0, RFBI_WE, and RFBI_RE) stay asserted. This applies only to write-to-write access combination. In case of read-to-write, read-to-read, or write-to-read sequences, the RFBI_CS0, RFBI_WE, and RFBI_RE signals are always deasserted.

[Table 10-656](#) lists the configuration values for each timing bit.

Table 10-656. RFBI Timings Configuration

| Timing Configuration Bits | Granularity ⁽¹⁾ | |
|--|----------------------------|----------|
| | One | Two |
| RFBI_ONOFF_TIME [3:0] CSONTIME | 0 to 15 | 0 to 30 |
| RFBI_ONOFF_TIME [9:4] CSOFFTIME | 0 to 63 | 0 to 126 |
| RFBI_CYCLE_TIME [17:12] CSPULSEWIDTH | 0 to 63 | 0 to 126 |
| RFBI_CYCLE_TIME [27:22] ACCESSTIME | 0 to 63 | 0 to 126 |
| RFBI_CYCLE_TIME [5:0] WECYCLETIME | 0 to 63 | 0 to 126 |
| RFBI_ONOFF_TIME [13:10] WEONTIME | 0 to 15 | 0 to 30 |
| RFBI_ONOFF_TIME [19:14] WEOFFTIME | 0 to 63 | 0 to 126 |
| RFBI_CYCLE_TIME [11:6] RECYCLETIME | 0 to 63 | 0 to 126 |
| RFBI_ONOFF_TIME [23:20] REONTIME | 0 to 15 | 0 to 30 |
| RFBI_ONOFF_TIME [29:24] REOFFTIME | 0 to 63 | 0 to 126 |

⁽¹⁾ Number of RFBI_ICLK clock cycles. The granularity can be configured using the [RFBI_CONFIG](#)[4] TIMEGRANULARITY bit.

10.5.4.11 Trigger Detection Logic

10.5.4.11.1 Trigger Mode

Setting the [RFBI_CONFIG](#)[3:2] TRIGGERMODE bit field configures the different trigger modes:

- Internal trigger mode with the internal programmable [RFBI_CONTROL](#)[4] ITE bit
- External trigger mode with external TE signal ([RFBI_TE_VSYNC](#))
- External trigger mode with external VSYNC/HSYNC signals

10.5.4.11.2 Internal Trigger Mode

10.5.4.11.2.1 ITE Bit

Set the [RFBI_CONTROL](#)[4] ITE bit to start capturing the data from the DISPC. The DISPC must be configured in the RFBI mode to account for the [RFBI_DISPC_STALL](#) signal. Setting the trigger mode to external ([RFBI_CONFIG](#)[3:2] TRIGGERMODE bit field set to 0x1 or 0x2) causes the [RFBI_CONTROL](#)[4] ITE bit to be ignored. The chip-select CS0 must be selected ([RFBI_CONTROL](#)[3:2] CONFIGSELECT set to 0x1) when this bit is set by users.

10.5.4.11.3 External Trigger Mode

There are two external trigger modes:

- TE only: VSYNC and HSYNC are merged by logical OR operation, and are detected through VSYNC and HSYNC pulse widths.
- HSYNC/VSYNC: This mode uses the two external signals which are detected through VSYNC and HSYNC pulse widths.

10.5.4.11.3.1 Programmable Line Number

When the trigger mode is set to external trigger mode with HSYNC and VSYNC or the TE, hardware resets the line counter when the VSYNC occurs and, after a programmable number of lines programmed by the user in the [RFBI_LINE_NUMBER](#)[10:0] LINENUMBER bit field (the HSYNC pulse occurs for every line), the transfer to the LCD panel begins. When the programmable line number is 0, only the VSYNC pulse indicates the beginning of the transfer in both modes: HSYNC/VSYNC and TE (logical OR operation between HSYNC and VSYNC).

10.5.4.11.3.2 VSYNC Pulse Width (Minimum Value)

The [RFBI_VSYNC_WIDTH](#)[15:0] MINVSYNCPULSEWIDTH bit field defines the minimum number of RFBI_ICLK clock cycles of the VSYNC pulse for detection on VSYNC. It allows differentiation between VSYNC and HSYNC, which are ORed on the same signal, and is also used in HSYNC/VSYNC mode on the two separate input lines.

- The VSYNC pulse width must be equal to at least two RFBI_ICLK clock cycles when HSYNC is not present (TE trigger mode only).
- The VSYNC pulse width must be equal to at least four RFBI_ICLK clock cycles when HSYNC is present (TE trigger mode only).

10.5.4.11.3.3 HSYNC Pulse Width (Minimum Value)

The [RFBI_HSYNC_WIDTH](#)[15:0] MINHSYNCPULSEWIDTH bit field defines the minimum number of RFBI_ICLK clock cycles of the HSYNC pulse for detection on HSYNC. It allows differentiation between VSYNC and HSYNC, which are ORed on the same signal, and is also used in VSYNC/HSYNC mode on the separate two input lines. To be detected, the HSYNC/VSYNC pulse width must always be equal to at least two RFBI_ICLK clock cycles. See [Table 10-657](#).

Table 10-657. Minimum Pulse Width (HSYNC/VSYNC)

| Configuration Bits | TE Mode | HSYNC/VSYNC Mode |
|--|---------|------------------|
| RFBI_HSYNC_WIDTH [15:0] MINHSYNCPULSEWIDTH field value | 2 | 2 |
| RFBI_VSYNC_WIDTH [15:0] MINVSYNCPULSEWIDTH field value | 4 | 2 |

The pulse received by the RFBI must be at least two RFBI_ICLK clock cycles to be detected. In case of TE mode, since the minimum value for differentiate VSYNC and HSYNC is two RFBI_ICLK clock cycles, the VSYNC pulse width must be at least four RFBI_ICLK clock cycles and the HSYNC pulse width must be at least two RFBI_ICLK clock cycles

10.5.5 RFBI Programming Guide

10.5.5.1 RFBI Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and use of the RFBI.

10.5.5.1.1 Global Initialization

10.5.5.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the RFBI is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the RFBI. For more information, see [Section 10.5.2, RFBI Environment](#), and [Section 10.5.3, RFBI Integrator](#).

[Table 10-658](#) describes the global initialization of surrounding modules.

Table 10-658. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------|--|
| PRCM | RFBI_ICLK interface clock must be enabled. See Chapter 3, Power, Reset, and Clock Management . |
| DISPC | RFBI_FCLK1 and RFBI_FCLK2 functional clocks must be enabled. See Section 10.2.1, Display Controller . |
| Control module | rfb_i_re pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_we pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_cs0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_te_vsync0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_data[15:0] pads muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_hsync0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. rfb_i_a0 pad muxing must be set in the SYSCTRL_PADCONF_CORE module. See Chapter 19, Control Module . |
| MPU INTC | MPU interrupt controller configuration must be done to enable the interrupts from the DISPC module. See Chapter 18, Interrupt Controllers . |
| sDMA | DMA configuration must be done to enable the RFBI module DMA channel requests. See Chapter 17, Direct Memory Access . |
| Interconnect | See Chapter 14, Interconnect , for more information about the interconnect configuration. |

NOTE: The MPU INTC and the sDMA configurations are necessary if the interrupt- and DMA-based communication modes are used.

10.5.5.1.1.2 RFBI Global Initialization

10.5.5.1.1.2.1 Main Sequence RFBI Global Initialization

This procedure initializes the RFB and DISPC after a power on or software reset. See [Table 10-659](#).

Table 10-659. RFBI Global Initialization

| Step | Register/Bit Field Programming Model | Value |
|----------------------------------|--|-------|
| DISPC configuration in RFBI mode | See Section 10.5.5.1.1.2.2, Subsequence: DISPC Configuration . | |
| RFBI configuration | See Section 10.5.5.1.1.2.3, Subsequence: RFBI Configuration . | |
| LCD panel configuration | See Section 10.5.5.1.1.2.4, Subsequence: LCD Panel Configuration . | |

10.5.5.1.1.2.2 Subsequence: DISPC Configuration

This procedure configures the DISPC registers in RFBI mode. See [Table 10-660](#).

Table 10-660. DISPC Configuration in RFBI Mode

| Step | Register/Bit Field Programming Model | Value |
|--|--|-------|
| DISPC pipeline configuration | Configuration of the pipeline associated to the LCD output (DMA engine, pipelines associated to the LCD output, etc.). See Section 10.2.4, Display Controller Functional Description | |
| Enable TFT mode. | DISPC_CONTROL0[3] STNTFT | 0x1 |
| Program the DISPC in RFBI mode. | DISPC_CONTROL0[11] STALLMODE | 0x1 |
| Reset the DISPC signal configuration to default value. | DISPC_POL_FREQ0 | 0x00 |
| Select the RFBI data path. | DISPC_CONTROL1[16:15] GPOUT | 0x1 |
| Enable the hardware handshake to avoid the DISPC FIFO underflow (applies to the pipeline connected to the LCD output). | DISPC_CONFIG0[16] BUFFERHANDCHECK | 0x1 |

NOTE: In RFBI mode, the DISPC_CONTROL0[5] GOLCD bit must not be set to 1. It must be disabled before resetting the DISPC_CONTROL0[11] STALLMODE bit to 0.

The hardware handshake applies to the pipelines connected to the LCD output. It must be disabled before resetting the DISPC_CONTROL0[11] STALLMODE bit to 0.

10.5.5.1.1.2.3 Subsequence: RFBI Configuration

This procedure configures the RFBI registers. See [Table 10-661](#).

CAUTION

The RFBI configuration registers for CS0 configuration can be accessed only when the configuration is not in use (that is, when the [RFBI_CONTROL\[3:2\] CONFIGSELECT](#) is set to 0x0).

Table 10-661. RFBI Configuration – Main Sequence

| Step | Register/Bit Field Programming Model | Value |
|----------------------------|---|-------|
| Enable the RFBI data path. | RFBI_CONTROL[1] RFBIMODE | 0x0 |
| DMA mode configuration | See Section 10.5.5.1.1.2.3.1, Subsequence: DMA Mode Configuration . | |

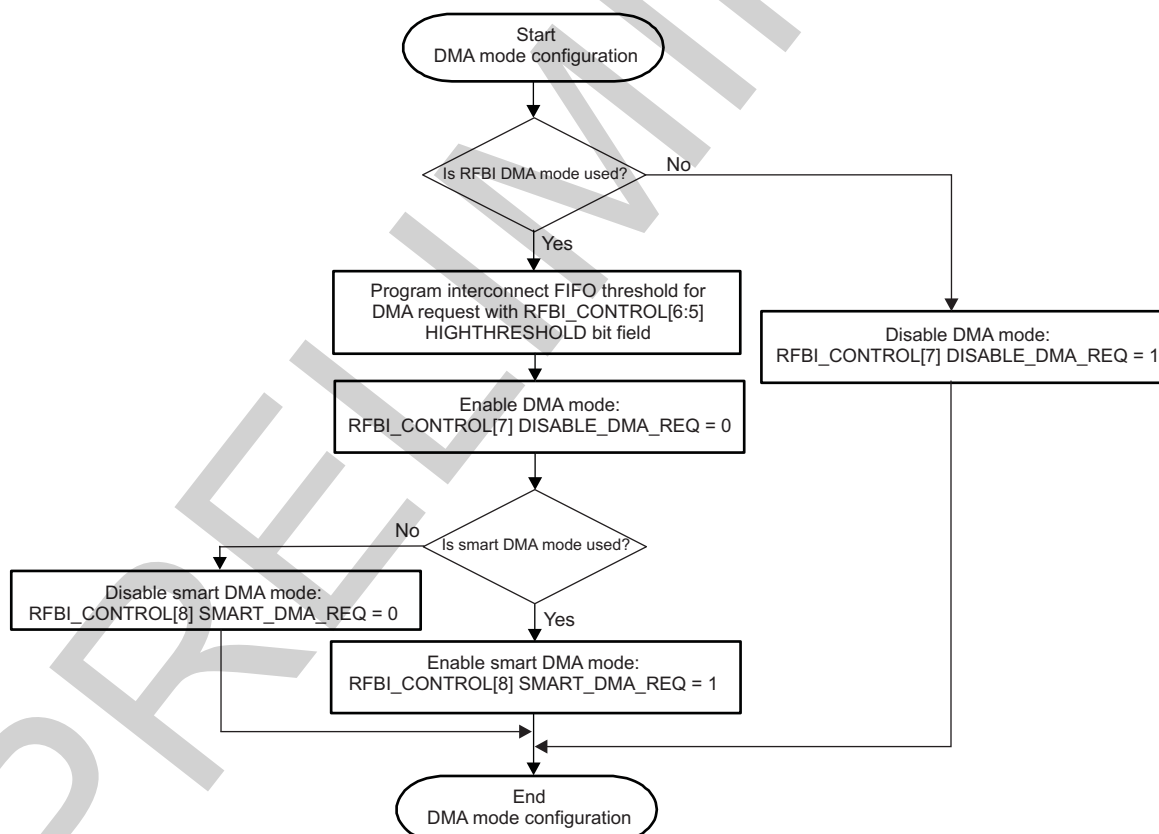

Table 10-661. RFBI Configuration – Main Sequence (continued)

| Step | Register/Bit Field Programming Model | Value |
|---|--|--------------------|
| Disable the chip-select and configuration (this step is necessary to configure the timing registers). | RFBI_CONTROL[3:2] CONFIGSELECT | 0x0 |
| Timing and polarity signals configuration | See Section 10.5.5.1.1.2.3.2, Subsequence: Timing and Polarity Signals Configuration . | |
| Configure the parallel input data width. | RFBI_CONFIG[6:5] DATATYPE | x ⁽¹⁾ |
| Configure the number of cycles. | RFBI_CONFIG[10:9] CYCLEFORMAT | x ⁽¹⁾ |
| Trigger mode settings | See Section 10.5.5.1.1.2.3.3, Subsequence: Trigger Mode Settings . | |
| Program the data format per cycle. | RFBI_DATA_CYCLE_1 | xxx ⁽¹⁾ |
| | RFBI_DATA_CYCLE_2 | xxx ⁽¹⁾ |
| | RFBI_DATA_CYCLE_3 | xxx ⁽¹⁾ |
| Select the configuration of CS0 | RFBI_CONTROL[3:2] CONFIGSELECT | 0x1 |

⁽¹⁾ Values depend on the application

10.5.5.1.1.2.3.1 Subsequence: DMA Mode Configuration

Figure 10-175 shows DMA mode configuration.

Figure 10-175. DMA Mode Configuration

rfbi-024

Table 10-662 describes DMA mode configuration.

Table 10-662. Register Call Summary for Subsequence: DMA Mode Configuration

| Register Name |
|------------------------------|
| RFBI_CONTROL |

10.5.5.1.1.2.3.2 Subsequence: Timing and Polarity Signals Configuration

[Table 10-663](#) describes timing and polarity signals configuration.

Table 10-663. Timing and Polarity Signals Configuration

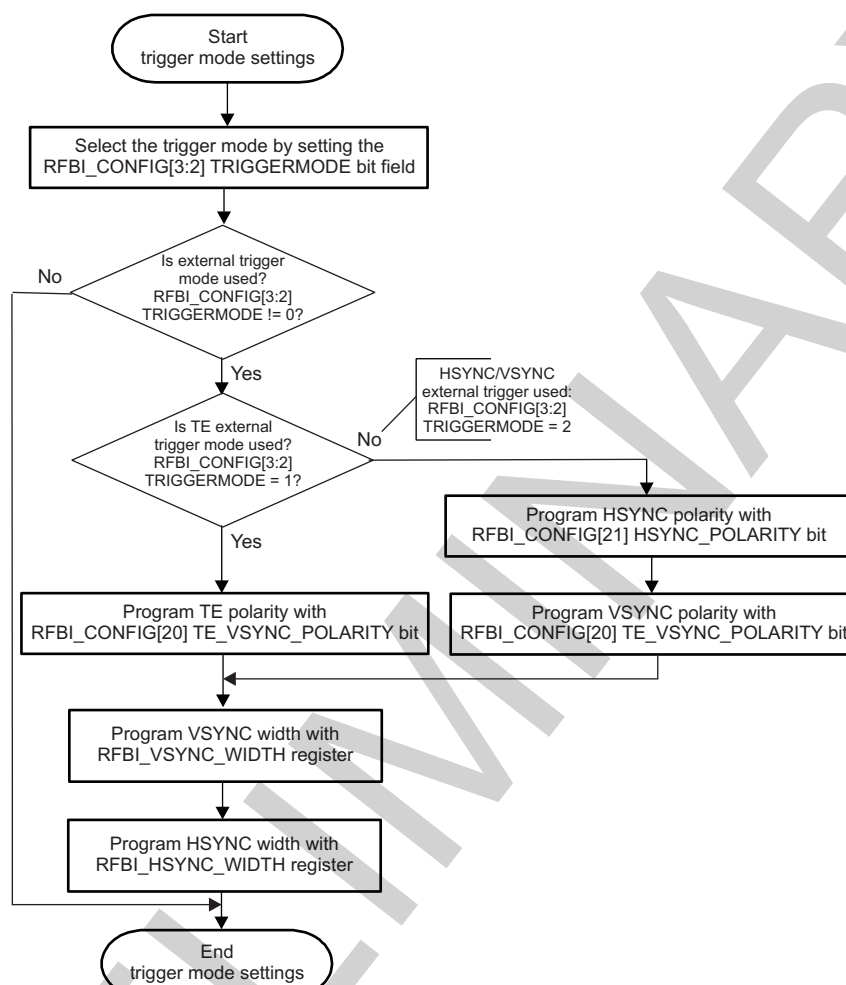

| Step | Register/Bit Field Programming Model | Value |
|--------------------------------|--|--------------------|
| Program ON/OFF timings. | RFBI_ONOFF_TIME | xxx ⁽¹⁾ |
| Program cycle timings. | RFBI_CYCLE_TIME | xxx ⁽¹⁾ |
| Program CS polarity. | RFBI_CONFIG[19] CSPOLARITY | x ⁽¹⁾ |
| Program WE polarity. | RFBI_CONFIG[18] WEPOLARITY | x ⁽¹⁾ |
| Program RE polarity. | RFBI_CONFIG[17] REPOLARITY | x ⁽¹⁾ |
| Program A0 polarity. | RFBI_CONFIG[16] A0POLARITY | x ⁽¹⁾ |
| Program unused bits. | RFBI_CONFIG[12:11] UNUSEDBITS | x ⁽¹⁾ |
| Program the factor x2 latency. | RFBI_CONFIG[4] TIMEGRANULARITY | x ⁽¹⁾ |

⁽¹⁾ Values depend on the application.

10.5.5.1.1.2.3.3 Subsequence: Trigger Mode Settings

Figure 10-176 shows trigger mode settings.

Figure 10-176. Trigger Mode Settings

rfbi-025

Table 10-664 describes register call summary for subsequence: trigger mode settings

Table 10-664. Register Call Summary for Subsequence: Trigger Mode Settings

| Register Name | | |

| RFBI_CONFIG | RFBI_VSYNC_WIDTH | RFBI_HSYNC_WIDTH |

10.5.5.1.1.2.4 Subsequence: LCD Panel Configuration

This procedure consists of sending and receiving commands. See Table 10-665 and Table 10-666.

Table 10-665. RFBI Command Interface: Writing Command to the LCD Panel

| Step | Register/Bit Field Programming Model | Value |
|---------------------------------|--------------------------------------|-------------------|
| Write command to the LCD panel. | RFBI_CMD[8:0] CMD | 0x ⁽¹⁾ |
| Wait until BUSY != 1. | RFBI_SYSSTATUS[8] BUSY | |

⁽¹⁾ Value depends on the command sent to the LCD panel.

Table 10-666. RFBI Command Interface: Reading Command From the LCD Panel

| Step | Register/Bit Field Programming Model | Value |
|----------------------------------|--------------------------------------|-------------------|
| Initialize reading command. | RFBI_STATUS[8:0] STATUS | 0x |
| Initialize reading command. | RFBI_READ [8:0] READ | 0x |
| Wait until BUSY != 1. | RFBI_SYSSTATUS[8] BUSY | |
| Read command from the LCD panel. | RFBI_STATUS[8:0] STATUS | 0x ⁽¹⁾ |
| | RFBI_READ [8:0] READ | 0x ⁽¹⁾ |

⁽¹⁾ Value depends on the command read from the LCD panel.

10.5.5.1.2 Operational Modes Configuration

10.5.5.1.2.1 RFBI Start Transfer

10.5.5.1.2.1.1 Main Sequence: RFBI Start Transfer With Polling Method

Table 10-667 describes the RFBI start transfer polling method.

Table 10-667. RFBI Start Transfer With Polling Method

| Step | Register/Bit Field Programming Model | Value |
|-----------------------------|--|-------|
| Enable DISPC module output. | See Section 10.5.5.1.2.1.4, Subsequence: DISPC Output Enable. | |
| Enable RFBI module output. | See Section 10.5.5.1.2.1.5, Subsequence: RFBI Interrupts Enable. | |
| Detect event. | See Table 10-673. | |

10.5.5.1.2.1.2 Main Sequence: RFBI Start Transfer With Interrupts and DMA Method

Table 10-668 describes the RFBI start transfer interrupts method.

Table 10-668. RFBI Start Transfer With Interrupts Method

| Step | Register/Bit Field Programming Model | Value |
|-----------------------------|---|-------|
| Enable DISPC interrupts. | See Table 10-669. | |
| Enable DISPC module output. | See Section 10.5.5.1.2.1.4, Subsequence: DISPC Output Enable. | |
| Enable RFBI module output. | See Section 10.5.5.1.2.1.5, RFBI Interrupts Enable. | |
| Detect Event. | See Table 10-673. | |

10.5.5.1.2.1.3 Subsequence: DISPC Interrupts Enable

This procedure enables the DISPC interrupts used in RFBI mode. See Table 10-669.

Table 10-669. DISPC Interrupts Enable

| Step | Register/Bit Field Programming Model | Value |
|---------------------------------|--------------------------------------|--------|
| Clears all interrupts | DISPC_IRQSTATUS | 0xFFFF |
| Enable the FRAMEDONEi IRQ. | DISPC_IRQENABLE FRAMEDONEi_EN | 0x1 |
| Enable the BUFFERUNDERFLOW IRQ. | DISPC_IRQENABLE BUFFERUNDERFLOW_EN | 0x1 |
| Enable the SYNCLOSTi IRQ. | DISPC_IRQENABLE SYNCLOSTi_EN | 0x1 |

NOTE: The other interrupts requests (see [Section 10.5.4.5, Interrupt Requests](#)) can also be enabled, depending on the application.

10.5.5.1.2.1.4 Subsequence: DISPC Output Enable

This procedure enables the DISPC output. See [Table 10-670](#).

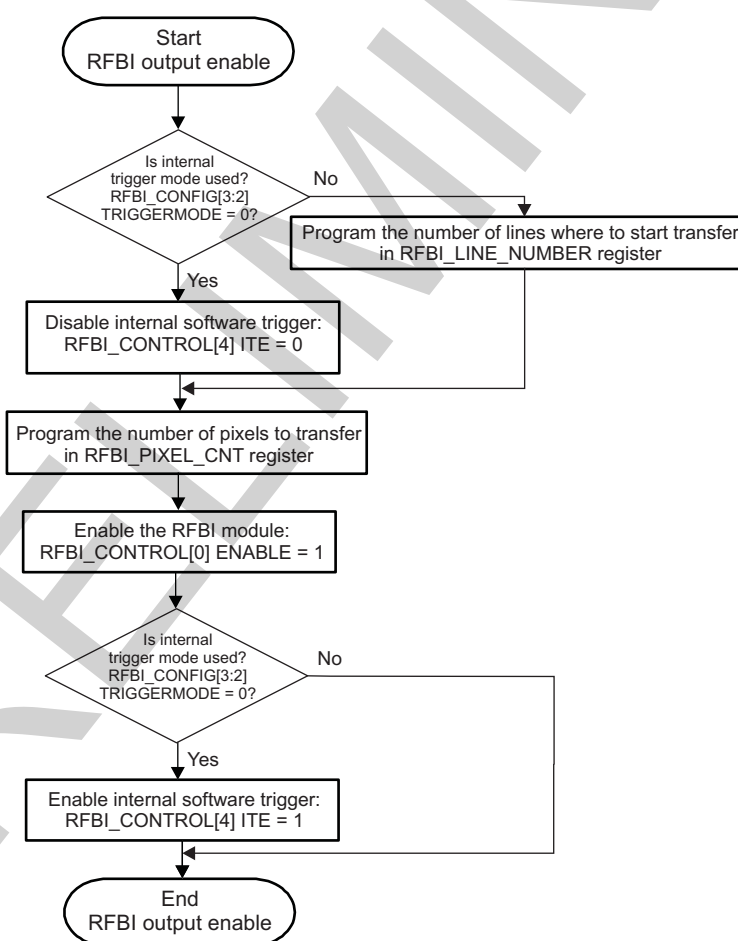

Table 10-670. DISPC Output Enable

| Step | Register/Bit Field Programming Model | Value |
|-----------------------------------|--------------------------------------|-------|
| Enable the video or GFX pipeline. | DISPC_VIDp_ATTRIBUTES[0] ENABLE | 0x1 |
| | DISPC_GFX_ATTRIBUTES[0] ENABLE | 0x1 |
| Enable the DISPC output. | DISPC_CONTROLo[0] LCDENABLE | 0x1 |

10.5.5.1.2.1.5 Subsequence: RFBI Output Enable

This procedure enables the RFBI output. [Figure 10-177](#) details the settings for this subsequence.

Figure 10-177. RFBI Output Enable Flow Chart

rfbi-022

[Table 10-671](#) describes RFBI output enable.

Table 10-671. Register Call Summary for Subsequence: RFBI Output Enable

| Register Name | | |
|----------------|--------------|------------------|
| RFBI_CONFIG | RFBI_CONTROL | RFBI_LINE_NUMBER |
| RFBI_PIXEL_CNT | | |

Table 10-672 describes the RFBI behavior depending on the RFBI output enable.

Table 10-672. RFBI Behavior

| RFBI_CONTROL[0] ENABLE Bit Value | RFBI Behavior |
|----------------------------------|--|
| 0 | Slave port interconnect can write command/parameter/data and read data/status from the RFB. Slave port interconnect access can only be done to the active CS0. |
| 1 | The DISPC sends pixels to the RFB. |

NOTE: The LCD output is disabled at the end of the transfer of the frame. The software must reenble the LCD output to generate a new frame by setting the DISPC_CONTROLo[0] LCDENABLE bit to 1.

CAUTION

The following registers must not be modified when the module is enabled (the RFBI_CONTROL[0] ENABLE bit set to 1):

- RFBI_CONTROL
- RFBI_PIXEL_CNT
- RFBI_LINE_NUMBER
- RFBI_STATUS
- RFBI_CONFIG
- RFBI_ONOFF_TIME
- RFBI_CYCLE_TIME
- RFBI_DATA_CYCLE_i (i = 1 to 3)
- RFBI_VSYNC_WIDTH
- RFBI_HSYNC_WIDTH

NOTE: The RFBI_STALL STALL signal is asserted when the RFBI is disabled. Through the slave port, pixels can be sent to the LCD panel only when the pixel count has reached 0x0.

10.5.5.1.2.1.6 Subsequence: Detect Event

Table 10-673 describes the detect event.

Table 10-673. Detect Event

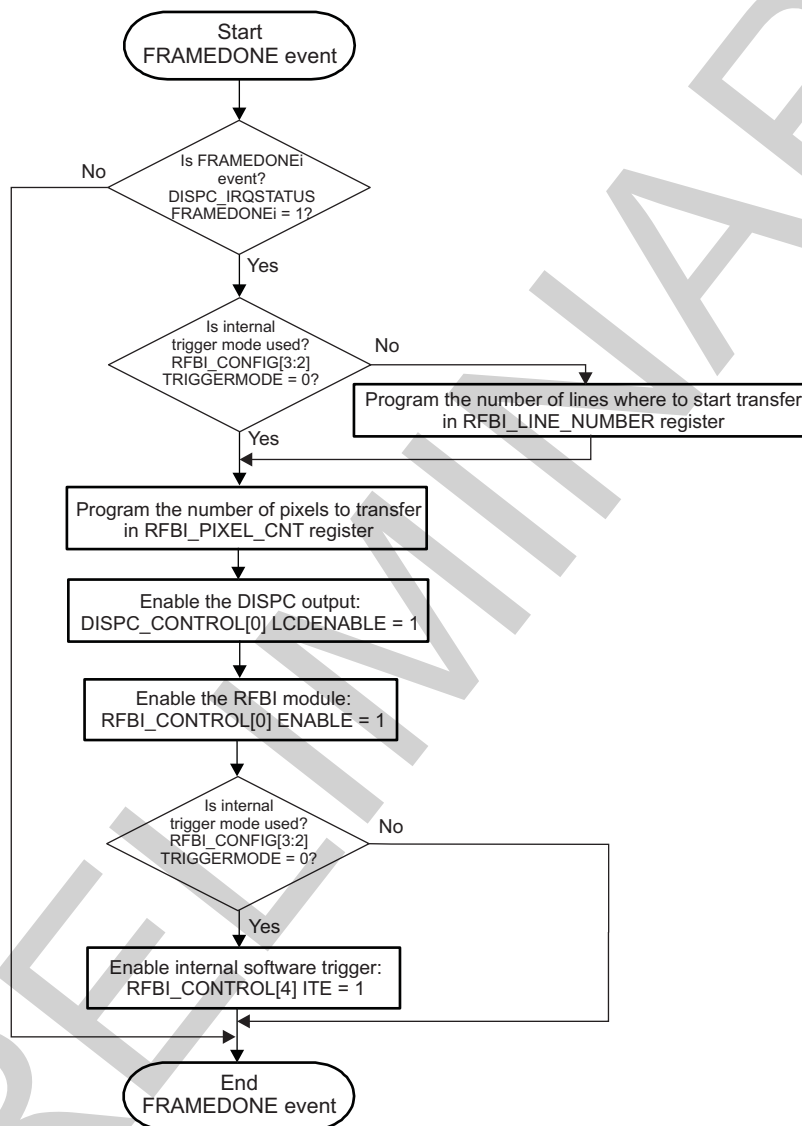

| Step | Register/Bit Field Programming Model | Value |
|----------------------------------|--|-------|
| Wait until DISPC_IRQSTATUS != 0. | DISPC_IRQSTATUS | |
| Service event. | See Section 10.5.5.1.3, RFBI Events Servicing. | |

10.5.5.1.3 RFBI Events Servicing

10.5.5.1.3.1 FRAMEDONE Interrupt Servicing

The FRAMEDONE event occurs each time a frame has been transferred to the LCD panel. [Figure 10-178](#) details how to serve this event.

Figure 10-178. FRAMEDONE Event Servicing Flow Chart

rfbi-023

[Table 10-674](#) describes FRAMEDONE interrupt servicing.

Table 10-674. Register Call Summary for RFBI Events Servicing: FRAMEDONE Interrupt Servicing

| Register Name | | |
|--------------------------------|-------------------------------|----------------------------------|
| DISPC_IRQSTATUS | RFBI_CONFIG | RFBI_LINE_NUMBER |
| RFBI_PIXEL_CNT | DISPC_CONTROL | RFBI_CONTROL |

10.5.6 RFBI Hardware Status Features

Table 10-675 lists the RFBI hardware status features.

Table 10-675. RFBI Hardware Status Features

| Feature | Type | Register/Bit Field/Observability Control | Description |
|---------------------|--------|--|--|
| Data pending | Status | RFBI_SYSTATUS[9] BUSYRFBIDATA | It is set to 1 when some data are pending to be processed from interconnect FIFO. |
| Slave port bus busy | Status | RFBI_SYSTATUS[9] BUSY | It is set to 1 when the slave port bus is busy and access of some RFBI registers (RFBI_CMD , RFBI_STATUS , RFBI_PARAM , and RFBI_READ) is stalled. |

10.5.7 RFBI Register Manual

CAUTION

The main access to all RFBI registers is through the L3 interconnect.
The access through L4_PER interconnect is provided for back software compatibility.

10.5.7.1 RFBI Instance Summary

Table 10-676. RFBI Instance Summary

| Module Name | L3 Base Address | L4_PER Base Address | Size |
|-------------|-----------------|---------------------|------|
| RFBI | 0x5800 2000 | 0x4804 2000 | 4KB |

10.5.7.2 RFBI Registers

10.5.7.2.1 RFBI Register Summary

Table 10-677. RFBI Registers Mapping Summary

| RESERVED | | | | | | | | | | | | | | | | SMART_DMA_REQ | | DISABLE_DMA_REQ | | HIGHTHRESHOLD | | ITE | | CONFIGSELECT | | RFBIMODE | | ENABLE | | | |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------|--|------|----------|
| 31:9 | RESERVED | Write 0's for future compatibility. Reads return 0. | RO | 0x000000 |
| 8 | SMART_DMA_REQ | Smart DMA request 0x0: The dmareq is asserted and deasserted depending on FIFO space even if Midlreq is high in smart-idle/no-idle mode and the entire burst gets error responses from the module. 0x1: The dmareq is deasserted after 2 clock cycles if it has been asserted for more than or equal to 2 clock cycles and Midlreq is high in smart-idle or no-idle mode. No more burst requests will be given even if the space is available in the FIFO. | RW | 0 |
| 7 | DISABLE_DMA_REQ | Disable DMA request 0x0: The dmareq is enabled and the signal is generated based on the space available and the request coming into the data register. 0x1: The dmareq is disabled and the signal is not generated at all based on space in FIFO. It stays high until the DISABLE DM AREQ is high even if there is space in FIFO to take requests. | RW | 0 |
| 6:5 | HIGHTHRESHOLD | Defines the FIFO high threshold used by hardware to assert DMA request. Used only if data written to RFBI_DATA are sent using system DMA. 0x0: Size of the transfer of 4 words of 32-bit wide 0x1: Size of the transfer of 8 words of 32-bit wide 0x2: Size of the transfer of 16 words of 32-bit wide | RW | 0x0 |
| 4 | ITE | Internal Trigger 0x0: Hardware waits for ITE bit to be set if in internal trigger mode for the configuration in use. 0x1: User sets the ITE bit to start the transfer, when hardware takes into account the bit, the hardware resets it. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|--------------|---|------|-------|
| 3:2 | CONFIGSELECT | Select the CS and configuration 0x0: No CS selected 0x1: CS0 selected 0x2: Reserved 0x3: Reserved | RW | 0x0 |
| 1 | RFBIMODE | RFBIMode 0x0: The RFBIMode is selected. 0x1: The RFBIMode is not selected. | RW | 1 |
| 0 | ENABLE | Enable/Disable flag 0x0: Disable the RFBIModule. 0x1: Enable the RFBIModule. | RW | 0 |

PRELIMINARY

3D Graphics Accelerator

This chapter describes the 3D graphics accelerator for the device.

NOTE: The SGX subsystem is an instantiation by Texas Instruments of the POWERVR® SGX544-SC core from Imagination Technologies Ltd.

This document contains materials that are © Imagination Technologies Ltd.

| Topic | Page |
|---------------------------------------|------|
| 11.1 SGX Overview | 2668 |
| 11.2 SGX Integration | 2670 |
| 11.3 SGX Functional Description | 2672 |
| 11.4 SGX Register Manual | 2674 |

11.1 SGX Overview

The 3D graphics subsystem accelerates 2-dimensional (2D) and 3-dimensional (3D) graphics and compute applications. It is based on the POWERVR® SGX544 core from Imagination Technologies. [Figure 11-1](#) shows the SGX subsystem.

Figure 11-1. SGX Overview

sgx-001

11.1.1 SGX Features Overview

- API support for industry standards:
 - OGL-ES 1.1 and 2.0
 - OpenVG™ 1.1
 - OpenCL™-EP 1.1
 - Direct3D™ Feature Level 9.3
- Single-core SGX architecture:
 - SGX544 core
- Tile-based deferred rendering architecture:
 - Reduces external bandwidth to SDRAM
- Second-generation Universal Scalable Shader Engines (USSE2™):
 - Multithreaded engine incorporating vertex and pixel shader functionality
 - Automatic load balancing of vertex and pixel processing tasks
- Present and texture load accelerator (PTLA):
 - Enables to move, rotate, twiddle, and scale texture surfaces
 - Supports RGB, ARGB, YUV4:2:2, and YUV4:2:0 surface formats
 - Supports bilinear upscale

- Supports source color key
- Fully virtualized memory addressing for operating system (OS) in a unified memory architecture:
 - Memory management unit (MMU)
 - Up to 4-GB virtual address space

11.1.2 Graphics Feature Overview

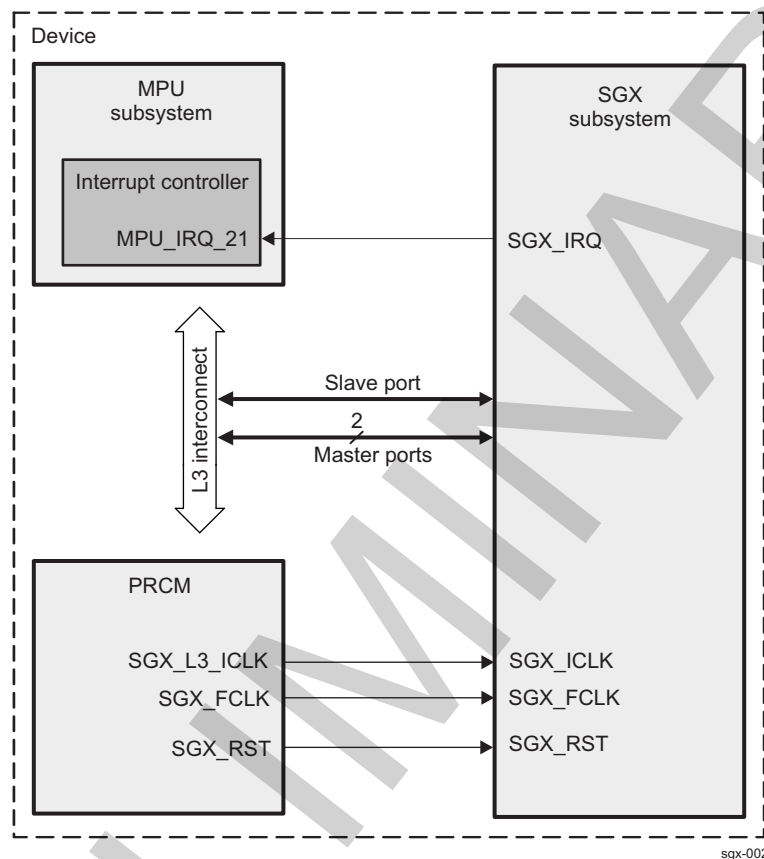

- Texture support:
 - Cube map
 - Projected textures
 - Nonsquare textures
- Texture formats:
 - RGBA 8888, 565, 1555, and 1565
 - Monochromatic 8, 16, 16f, 32f, and 32int
 - Dual channel, 8:8, 16:16, and 16f:16f
 - Compressed textures:
 - PVRTC-i 2 bpp
 - PVRTC-i 4 bpp
 - PVRTC-ii 2 bpp
 - PVRTC-ii 4 bpp
 - ETC1
 - Programmable support for YUV formats:
 - Programmable matrix in hardware, coefficients on 12 bits
 - YUV4:2:2, YUV4:2:0, two planes (NV12 or NV21); YUV4:2:0, three planes
- Resolution support:
 - Frame buffer maximum = 4096 × 4096
 - Texture maximum size = 4096 × 4096
- Texture filtering:
 - Bilinear, trilinear
 - Independent minimum and mag control
- Anti-aliasing:
 - 4× multisampling
 - Programmable sample positions

11.2 SGX Integration

This section describes the integration of the module in the device, including information about clocks, resets, and hardware requests.

Figure 11-2 shows the SGX integration.

Figure 11-2. SGX Integration

The SGX subsystem is connected to the level 3 (L3) interconnect by two 128-bit master and a 64-bit slave interfaces.

Table 11-1 through Table 11-3 summarize the integration of the module in the device.

Table 11-1. Integration Attributes

| Module Instance | Attributes | |
|-----------------|--------------|--------------|
| | Power Domain | Interconnect |
| SGX | PD_SGX | L3 |

Table 11-2. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|----------------------|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| SGX | SGX_ICLK | SGX_L3_ICLK | PRCM | SGX interface clock |
| SGX | SGX_FCLK | SGX_FCLK | PRCM | SGX functional clock |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| SGX | SGX_RST | SGX_RST | PRCM | SGX reset signal |

Table 11-3. Hardware Requests

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|-------------|--|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| SGX | SGX_IRQ | MPU_IRQ_21 | MPU INTC | SGX interrupt request to the microprocessor unit (MPU) interrupt controller (INTC) |

11.3 SGX Functional Description

11.3.1 SGX Block Diagram

The SGX subsystem is based on the POWERVR SGX544-SC core. The SGX architecture comprises the following elements:

- SGX544 core
- PTLA

Figure 11-3 shows the SGX top-level block diagram.

Figure 11-3. SGX Block Diagram

11.3.2 SGX Clock Configuration

The SGX subsystem operates from two clocks: an interface clock (SGX_ICLK) and one functional clock (SGX_FCLK). The power, reset, and clock management (PRCM) module generates and distributes the clocks inside the device.

- The SGX_ICLK manages the data transfer on the L3 master and slave ports.

The SGX_ICLK frequency is selected based on the L3 interconnect clock frequency of the whole device. For more information about the interface clock, see [Section 3.6.11, CD_SGX Clock Domains](#).

When no longer required by the SGX subsystem, SGX_ICLK can be disabled by software at the PRCM level. For more information, see [PD_SGX Description](#), in *Power, Reset, and Clock Management*.

NOTE: SGX_ICLK is cut only if the SGX is ready to go into IDLE state.

- SGX_FCLK is the functional clocks and is used inside the SGX subsystem to generate clock signals to multiple SGX clock domains.

Using the clock source selection and the digital phase-locked loop (DPLL) settings, SGX_FCLK frequency can be adjusted.

The SGX_FCLK clock is provided by the peripheral DPLL, as described in [CD_SGX Clock Domain](#), in *Power, Reset, and Clock Management*.

When no longer needed by the SGX subsystem, SGX_FCLK can be cut by software at the PRCM level if the module is ready to enter IDLE state. For more information, see [PD_SGX Description](#), in *Power, Reset, and Clock Management*.

11.3.3 SGX Software Reset

The SGX subsystem has its own reset domain. Global reset of the SGX is performed by activating the SGX_RST signal in the SGX_RST domain.

NOTE: The APIs delivered with the SGX provide a software reset functionally equivalent to a hardware reset.

11.3.4 SGX Power Management

The SGX subsystem has its own power domain (SGX power domain). For additional information about the SGX power domain, see [PD_SGX Description](#), in *Power, Reset, and Clock Management*.

NOTE: The SGX handles automatic clock gating performed on the multiple internal module clock domains.

In addition, software-controlled clock gating is managed inside the SGX and handled by the related API delivered with the module.

11.3.5 SGX Interrupt Requests

The SGX subsystem can generate one interrupt signal to the MPU INTC mapped to SGX_IRQ.

11.4 SGX Register Manual

CAUTION

All SGX registers are limited to 32-bit data accesses; 8- and 16-bit accesses are not allowed because they can corrupt register content.

This section describes the TI-specific registers.

11.4.1 SGX Instance Summary

2D Graphics Accelerator

This chapter describes the advanced bit blitter 2-dimensional (2D) graphics accelerator (BB2D) for the device.

NOTE: The BB2D subsystem is an instantiation by Texas Instruments of the GC320™ core from Vivante Corp.

This document contains materials that are © Vivante Corp.

GC320 is a trademark or registered trademark of Vivante Corp.

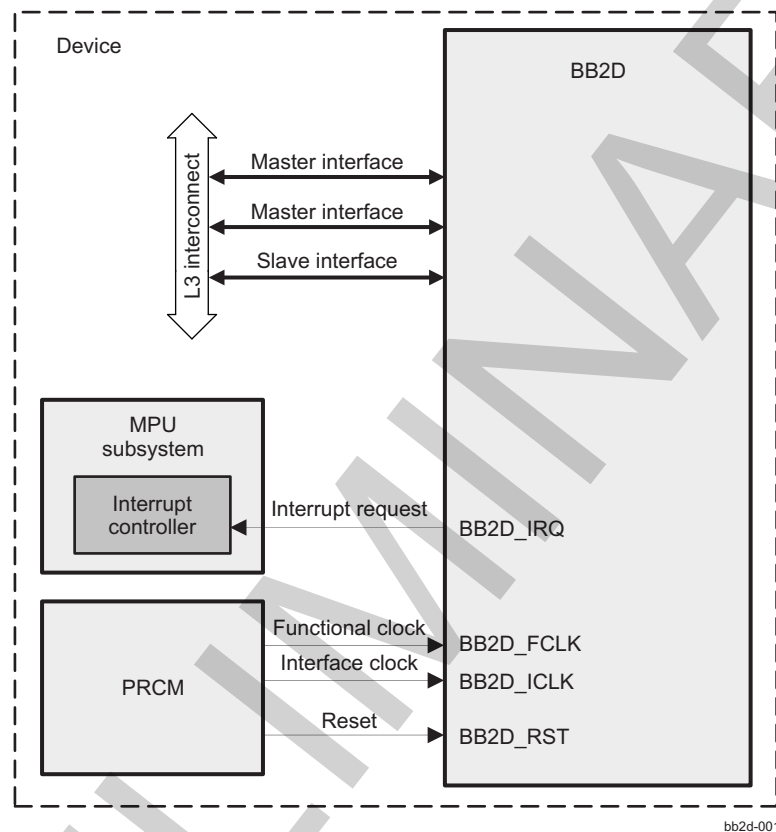

| Topic | Page |

| 12.1 BB2D Overview | 2692 |
| 12.2 BB2D Integration | 2694 |
| 12.3 BB2D Functional Description | 2696 |
| 12.4 BB2D Register Manual | 2698 |

12.1 BB2D Overview

The 2D graphics accelerator subsystem accelerates 2D graphics applications. The 2D graphics accelerator subsystem is based on the GC320 2D GPU core from Vivante Corporation. The hardware acceleration is brought to numerous 2D applications, including on-screen display and touch screen user interfaces, graphical user interfaces (GUIs) and menu displays, flash animation, and gaming.

Figure 12-1 shows the BB2D subsystem.

Figure 12-1. BB2D Overview

12.1.1 BB2D Features Overview

- API support:
 - OpenWF™, DirectFB
 - GDI/DirectDraw™
 - Flash
- BB2D architecture:
 - BitBlt and StretchBlt
 - DirectFB hardware acceleration
 - ROP2, ROP3, ROP4 full alpha blending and transparency
 - Clipping rectangle support
 - Alpha blending includes Java® 2 Porter-Duff compositing rules
 - 90-, 180-, 270-degree rotation on every primitive
 - YUV-to-RGB color space conversion
 - Programmable display format conversion with 14 source and 7 destination formats
 - High-quality 9-tap, 32-phase filter for image and video scaling at 1080p
 - Monochrome expansion for text rendering

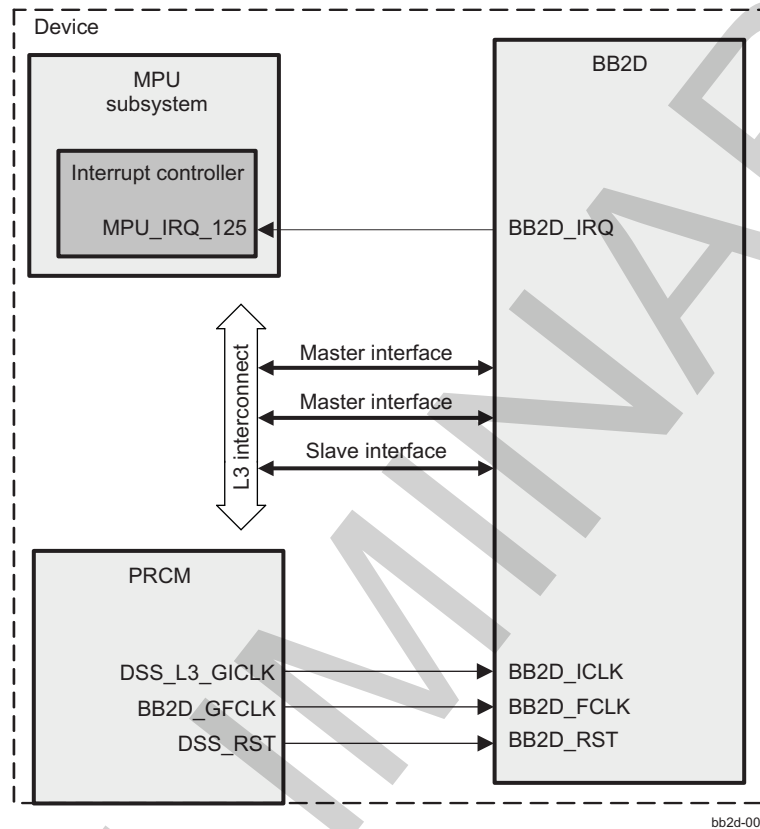

- 32 K × 32 K coordinate system
- Hardware acceleration for DirectFB:
 - High-speed video scaler
 - ROP2/3/4
 - Rectangle filling and drawing
 - Line drawing
 - Simple blitting
 - Stretch blitting
 - Blending with alpha channel (per-pixel alpha)
 - Blending with alpha factor (alpha modulation)
 - Nine source and destination blending functions
 - Porter-Duff rules support
 - Premultiplied alpha support
 - Colorized blitting (color modulation)
 - Source color keying
 - Destination color keying

12.2 BB2D Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 12-2 shows BB2D integration.

Figure 12-2. BB2D Integration

bb2d-002

The BB2D subsystem is connected to the level 3 (L3) interconnect by two 64-bit master interfaces and one 32-bit slave interface.

Table 12-1 through Table 12-3 summarize the integration of the module in the device.

Table 12-1. Integration Attributes

| Module Instance | Attributes | |
|-----------------|--------------|--------------|
| | Power Domain | Interconnect |
| BB2D | PD_DSS | L3 |

Table 12-2. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|--|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| BB2D | BB2D_ICLK | DSS_L3_GICLK | PRCM | BB2D interface clock |
| | BB2D_FCLK | BB2D_GFCLK | PRCM | BB2D functional clock. Can be selected between PER_BB2D_FCLK from DPLL_PER and CORE_BB2D_FCLK from DPLL_CORE. See Chapter 3, PRCM. |
| Resets | | | | |

Table 12-2. Clocks and Resets (continued)

| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
|-----------------|-------------------------|--------------------|--------|-------------------|
| BB2D | BB2D_RST | DSS_RST | PRCM | BB2D reset signal |

Table 12-3. Hardware Requests

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|-------------|---|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| BB2D | BB2D_IRQ | MPU_IRQ_125 | MPU INTC | BB2D interrupt request to the MPU interrupt controller (INTC) |

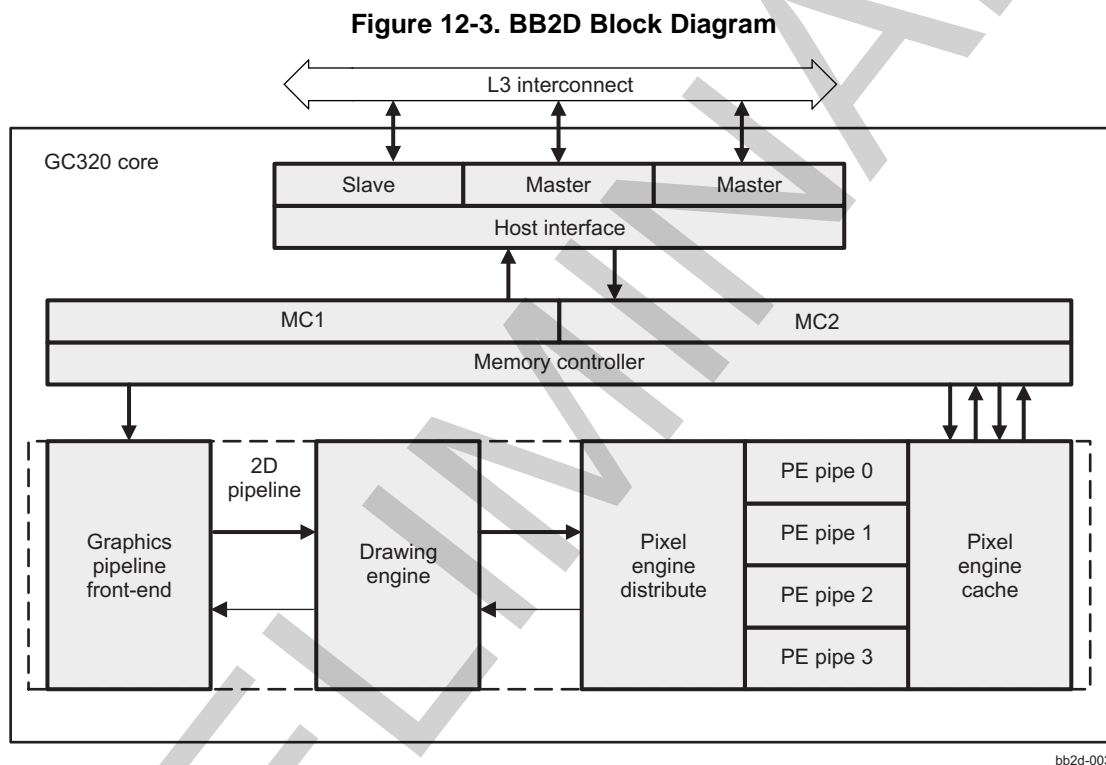

12.3 BB2D Functional Description

12.3.1 BB2D Block Diagram

The BB2D subsystem is based on the following main blocks:

- Host interface: Allows the BB2D core to communicate with external memory and the MPU through the L3 interconnect. In this block, data crosses clock domain boundaries.
- Memory controller: Internal memory unit that is the block-to-host interface for memory requests
- Graphics pipeline front-end: Inserts high-level primitives and commands into the graphics pipeline.
- 2D drawing and scaling engine: Draws 2D graphics primitives and rasterizes 2D images.
- Pixel engine: manipulates and filters pixels in rendered images. BB2D has four pixel pipes.

Figure 12-3 shows the BB2D top-level block diagram.

12.3.2 BB2D Clock Configuration

The BB2D subsystem operates from two clocks: an interface clock (BB2D_ICLK) and functional clock (BB2D_FCLK). The power, reset, and clock management (PRCM) module generates and distributes the clocks inside the device.

- The BB2D_ICLK interface clock manages the data transfer on the L3 master and slave ports.

The BB2D_ICLK frequency is selected based on the whole device L3 interconnect clock frequency. For more information on the interface clock, see [Section 3.6.13, CD_DSS Clock Domain](#).

When BB2D_ICLK is no longer required by the BB2D subsystem, it can be disabled by software at the PRCM level.

NOTE: BB2D_ICLK is cut only if the BB2D is ready to go into IDLE state.

- The BB2D_FCLK functional clock is used inside the BB2D subsystem to generate clock signals to multiple BB2D clock domains. The BB2D automatically gates clocks to domains, that are not currently in use.

Using the clock source selection and the DPLL settings, the frequency of BB2D_FCLK can be adjusted.

The BB2D_FCLK clock can be provided by the peripheral DPLL or the core DPLL, as described in [Section 3.6.13, CD_DSS Clock Domain](#). Selection is made at the PRCM level.

When BB2D_FCLK is no longer needed by the BB2D subsystem, it can be cut by software at the PRCM level, if the module is ready to enter IDLE state.

12.3.3 BB2D Software Reset

The BB2D subsystem is part of the DSS reset domain. A global reset of the BB2D is performed by activating the BB2D_RST signal in the DSS_RST domain.

NOTE: The APIs delivered with the BB2D provide a software reset functionally equivalent to a hardware reset.

12.3.4 BB2D Power Management

The BB2D subsystem is part of the DSS power domain (PD_DSS). For additional information about PD_DSS, see [Section 3.7.10, PD_DSS Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).

NOTE: The BB2D handles automatic clock gating performed on the multiple internal clock domains.

When 2D operations are complete, software may set the [GCGPOUT0\[0\] GCHOLD](#) bit to 1 to enter a low-power state. Setting GCHOLD to 1 moves the BB2D operational state into IDLE. Once in IDLE state, the system standby hardware signal (mstandby) is asserted.

12.3.5 BB2D Interrupt Requests

The BB2D subsystem can generate one interrupt signal to the MPU INTC mapped to BB2D_IRQ.

12.4 BB2D Register Manual

CAUTION

All BB2D registers are limited to 32-bit data accesses; 8- and 16-bit accesses are not allowed because they can corrupt register content.

12.4.1 BB2D Instance Summary

| 24 | BUG_FIXES0 | | R | 1 |
| 23 | SHADER_MSA | Put the MSA data into sideband fifo. | R | 0 |
| 22 | MC_20 | New style MC with separate paths for color and depth. | R | 0 |
| 21 | DEFAULT_REG0 | Unavailable registers will return 0. | R | 1 |
| 20 | EXTRA_SHADER_INSTRUCTION S1 | Sqrt, sin, cos instructions are available. | R | 1 |
| 19 | SHADER_GETS_W | W is sent to SH from RA. | R | 1 |
| 18 | VG_21 | Minor updates to VG pipe (Event generation from VG, TS, PE). Tiled image support. | R | 0 |
| 17 | VG_FILTER | VG filter is available. | R | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|---------------------------------------|--|------|-------|
| 16 | EXTRA_SHADER_INSTRUCTION0 | Floor, ceil, and sign instructions are available. | R | 1 |
| 15 | COMPRESSION_FIFO_FIXED | If this bit is not set, the FIFO counter should be set to 50. Else, the default should remain. | R | 1 |
| 14 | TS_EXTENDED_COMMANDS | New commands added to the tessellator. | R | 0 |
| 13 | VG_20 | Major updates to VG pipe (TS buffer tiling. State masking.). | R | 0 |
| 12 | SUPER_TILED_32X32 | 32x32 super tile is available. | R | 1 |
| 11 | SEPARATE_TILE_STATUS_WHEN_INTERLEAVED | Use 2 separate tile status buffers in interleaved mode. | R | 1 |
| 10 | TILE_STATUS_2BITS | 2 bits are used instead of 4 bits for tile status. | R | 1 |
| 9 | RENDER_8K | Supports 8K render target. | R | 1 |
| 8 | CORRECT_AUTO_DISABLE | Reserved. | R | 0 |
| 7 | PE20_2D | 2D PE 2.0 is present. | R | 1 |
| 6 | FAST_CLEAR_FLUSH | Proper flush is done in fast clear cache. | R | 1 |
| 5 | SPECIAL_MSAA_LOD | Special LOD calculation when MSAA is on. | R | 1 |
| 4 | CORRECT_TEXTURE_CONVERTER | Driver hack is not needed. | R | 1 |
| 3 | TEXTURE8_K | Supports 8Kx8K textures. | R | 1 |
| 2 | ENDIANNESS_CONFIG | Configurable endianness support. | R | 1 |
| 1 | DUAL_RETURN_BUS | Dual Return Bus from HI to clients. | R | 1 |
| 0 | FLIP_Y | Y flipping capability is added to resolve. | R | 1 |

| | | | |
|-------------------------|--|-----------------|------|
| Address Offset | 0x0000 0434 | Instance | BB2D |
| Physical Address | 0x5900 0434 | | |
| Description | Controls the priority of the display controller requests. This works like a PWM. One register gives the period, and the other gives the ON time. When PWM is ON, display requests are accepted if both display and the other request is valid. If it is OFF, the other request will be accepted. If only one request is valid, it takes the bus regardless of the PWM bit. | | |

Audio Back End

This chapter describes the audio back end (ABE) module.

| Topic | Page |
|-------------------------|------|
| 13.1 ABE Overview | 2742 |

13.1 ABE Overview

The audio back end (ABE) module is a subsystem that manages various audio and voice uplink and downlink streams between the initiator (the Cortex™-A9 microprocessor unit [MPU], digital signal processor [DSP], or direct memory access [DMA] controller) and the peripheral physical interfaces (multichannel buffered serial port [McBSP], SLIMbus®, digital microcontroller [DMIC], multichannel pulse density modulation [McPDM], and multichannel audio serial port [McASP]).

The ABE module handles the audio processing for the applications. It receives voice or audio samples from the initiator or the external audio chip (TWL6040 or other) and sends them to the peripheral interfaces or memories after processing. The ABE can perform buffering of audio samples, mix audio with a voice down stream and/or a microphone up stream (sidetone), and can apply some post-processing.

The ABE integrates the following modules:

- Peripheral physical interfaces:
 - Three McBSP modules
 - One McASP module
 - One mobile industry processor interface (MIPI) SLIMbus interface
 - One DMIC module to support up to six mono and up to three stereo digital microphones
 - One MCPDM module to support interconnect with an external audio chip.
- Audio engine (AE):
 - Performs real-time signal processing like sample rate conversion, filtering, equalizing, and side-tone
 - Audio traffic controller (ATC):
 - Performs data move in the ABE
 - Generates interrupt requests to the DSP and Cortex-A9 interrupt controllers
 - On-chip memory:
 - 64KB of RAM; 32-bit data memory (DMEM)
 - 6KB for coefficient memory RAM (CMEM)
 - 18KB for sample memory RAM (SMEM)
- Local L4 interconnect (L4_ABE) to:
 - L3 interconnect
 - Cortex-A9 MPU
 - DSP

The Cortex-A9 MPU and the DSP have private access to the L4_ABE interconnect. All other initiators (sDMA) can access the L4_ABE only through the L3 interconnect.
- Timers:
 - Four general-purpose (GP) timers
 - One watchdog timer
- Clock and reset management: Receives clock and reset signals from the device PRCM module. The audio engine operates from the DPLL_ABE, which is in the PRCM module. The ABE modules can be supplied with clock signals from the DPLL_ABE or the DPLL_PER. The ABE has its own hardware reset domain (AUDIO_RST).
- Power management: The ABE module is power-independent. It has its own dedicated power domain (PD_ABE) and can execute audio processing with the rest of the device in retention or in off mode.
- Each peripheral in the ABE can be accessed directly by the initiator when the AE is bypassed (legacy mode, for old software compatability).

Figure 13-1 is a high-level overview of the ABE.

Figure 13-1. Audio Back End

abe-001

13.1.1 AE Subsystem

The AE is the core of the ABE subsystem. It performs the real-time audio processing within the ABE: mixing, muxing, volume control, smooth muting, sampling rate conversion, and side-tone equalization. The AE subsystem also processes and executes all data transfers. To optimize the global processing, the ATC moves the data. An IRQ/DMA controller controls system IRQ and DMA requests. Input DMA requests come from the ABE peripherals, and output DMA requests and IRQ are generated and sent to the system (Cortex-A9 MPU interrupt controller, DSP interrupt controller, system DMA [sDMA], and the DSP enhanced direct memory access controller [eDMA]).

The AE subsystem contains:

- AE: processes the sample in SMEM with help of CMEM.
 - SMEM
 - CMEM
- DMEM contains the audio buffer and communication circular buffer.
- ATC: Transfers data between all modules in the ABE
- IRQ DMA controller

For more information about the audio engine, see the *Hardware Abstraction Layer (HAL) Addendum*.

13.1.2 Local Audio Interconnect

The ABE has its own audio local interconnect (L4_ABE), which interconnects and manages the data flow among all ABE modules.

L4_ABE main features are:

- Initiator ports: Cortex-A9 MPU, DSP, L3 interconnect, and AE subsystem. The sDMA operates with the L4_ABE interconnect through the L3 interconnect initiator port. The eDMA operates with the L4_ABE interconnect through the DSP initiator port.
- Target ports: AE subsystem, McBSP1/2/3, DMIC, McPDM, McASP, GPTIMER5/6/7/8, WDT3, and SLIMBUS1
- 8-, 16-, or 32-bit data, single access
- 4-bit x 32-bit initiator ports for each interconnect instance
- Auto clock-gating feature
- Little-endian transaction assumed for all packing/unpacking operations
- Nonblocking architecture with fair arbitration between threads
- Target interconnect interfaces support fully synchronous and divided synchronous accesses.

For more information, see [Chapter 14, Interconnect](#).

13.1.3 GP Timers

The ABE embeds four GP timers: GPTIMER5 through GPTIMER8. All GP timers have interrupts connected to the Cortex-A9 MPU, DSP, and AE subsystems.

GP timer controllers have the following functions:

- Interconnect slave interface (L4) supports:
 - 32-bit data bus width
 - 16-/32-bit access supported
 - 10-bit address bus width
 - Burst not supported
 - WNP (Write-Non-Posted) supported
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Supported modes:
 - Compare and capture modes
 - Auto-reload mode
 - Start-stop mode
- Programmable divider clock source
- Dedicated input trigger for capture mode and dedicated OUT trigger/PWM signal
- On-the-fly read/write register
- Supports disconnect protocol

For more information, see [Section 23.2, General-Purpose Timers](#).

13.1.4 Watchdog Timer

The ABE embeds one watchdog timer, WDT3, that generates an interrupt condition to the Cortex-A9 MPU on overflow, which can be used by the application software through the PRCM module to indirectly trigger a global warm reset.

WDT3 main features are:

- Interconnect slave interface (L4) supports:
 - 32-bit data bus width

- 16- and 32-bit access supported
- 11-bit address bus width
- Burst not supported
- WNP supported
- Free-running 32-bit upward counter
- Programmable divider clock source
- Watchdog is reset on power up or after a warm reset and then starts counting.
- Reset or interrupt actions on a timer overflow condition and according to the watchdog timer source
- Support of disconnect protocol

For more information, see [Section 23.3](#), *Watchdog Timers*.

13.1.5 Digital Microphone Controller

The DMIC allows support of up to three digital stereo microphones that send it a pulse-density modulated stream of bits, transferred on one period or one half-period of the clock (over-sampling clock) provided to the DMIC. Each microphone is directly connected to the TX filter decimator to extract the audio samples with a maximum OF 96 db SNR with a frequency sampling set to 96 kHz.

The DMIC has the following features:

- Six external pin connections (three data lines and three clock lines)
- Delivers one common clock (on the three clock lines) for all digital microphones
- Supports idle request/acknowledge protocol
- Supports stereo and mono digital microphones (up to three)
- Rising or falling edge configuration for the clock signal sampling
- DMIC-clock-programmable
- Interconnect slave interface (internal interconnect) supports 32-bit data bus width.
- One DMA request capability on a programmable FIFO threshold
- One RX FIFO (16-bit x 24-bit word depth) per microphone
- Complies with PRCM interrupts to the Cortex-A9 MPU and DSP subsystems
- Interconnect sample format: 32 bits (only 24 are significant)
- Supports idle request/acknowledge PRCM protocol

For more information, see [Section 24.7](#), *DMIC*.

13.1.6 SLIMbus

There is one SLIMbus module instantiation inside the ABE, SLIMbus1. The SLIMbus controller provides a bidirectional, multidrop, multichannel 2-line serial interface between the ABE and up to seven off-chip components in a system such as an audio codec, a Bluetooth® module, or an FM radio receiver/transmitter. Because of its versatility, SLIMbus can accommodate a wide range of peripherals and clocked frame-oriented protocols (I2S, pulse code modulation [PCM], time division multiplexing [TDM]).

SLIMbus has the following features:

- Supports idle request/acknowledge PRCM protocol
- Complies with MIPI SLIMbus standard version 1.0
- Interconnect slave interface (L4) supports:
 - 32-bit data bus width
 - 8-, 16-, and 32-bit access supported
 - 11-bit address bus width
 - Burst not supported
 - WNP supported
- Support of seven SLIMbus devices:

- One manager
- One framer
- One interface
- Four generic
- Message protocol partially implemented in SLIMbus module hardware:
 - Information elements are not stored in the module.
 - Message interpretation is not processed in the module.
 - FIFO size: 32 bytes for TX, 32 bytes for RX
- Support for eight TX and eight RX independent ports (data channels):
 - Supported transport protocols: Isochronous, pulled, pushed, asynchronous
 - Programmable segment data length (sample size) from 8 to 32 bits (8, 12, 16, 20, 24, 28, 32), including DATA and AUX
 - Programmable FIFO sizes
 - Programmable port assignment to any of the four generic devices
 - One DMA request line per port
- Operating frequencies of 0 to 24.576 MHz
- Supports disconnect protocol

For more information, see [Section 24.9](#), *Serial Low-Power Inter-Chip Media Bus Controller*.

13.1.7 Multichannel Audio Serial Port

The multichannel audio serial port (McASP) is a GP audio serial port. It is useful for intercomponent (DIT) transmission. The McASP is intended to be flexible enough so that it may connect gluelessly to audio A/D, D/A, CODEC and SPDIF transmit physical layer components.

McASP has the following features:

- 2-interconnect slave interface supports:
 - One interconnect configuration slave interface
 - One interconnect DMA slave interface
 - 32-bit data bus width
 - 16- and 32-bit access
 - 10-bit address bus width
 - Burst not supported
 - WNP
- Supports idle request/acknowledge protocol
- Buffers for transmit/receive operations
- DMA requests (one per direction) link with the 32-bit register
- Up to four transmit channels
- Four serializers implemented
- Support of disconnect protocol

For more information, see [Section 24.8](#), *McASP*.

13.1.8 Multichannel Buffered Serial Port

There are three McBSP instantiations: McBSP1 through McBSP3. They provide a full-duplex direct serial interface between the ABE and external devices, such as other modems, BT chips, or codecs. Because of its versatility, a McBSP can accommodate a wide range of peripherals and clocked frame-oriented protocols (I2S, PCM, TDM).

List of recommended usage per McBSP:

- MCBSP1: BT voice/audio data
- MCBSP2: Digital baseband (DBB) voice data
- MCBSP3: MIDI FM data

The McBSP has the following features:

- Interconnect slave interface (internal interconnect) supports:
 - 32-bit data bus width
 - 8-, 16-, and 32-bit access
 - 10-bit address bus width
 - Burst not supported
 - WNP
- Buffers for transmit/receive operations: 128/128 32-bit words (McBSP1, 2, 3)
- Interrupts configurable in legacy mode (two requests) or PRCM-compliant (one request)
- DMA requests (one per direction) triggered with programmable FIFO thresholds
- Multidrop support
- Serial interface description
- Four-pin configuration (McBSP1, 2, 3)
- Full-duplex communication
- Multichannel selection modes
- Support to enable or block transfers in each channel
- Up to 128 channels for transmission and for reception
- Supported protocols
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected A/D and D/A devices:
 - I2S-compliant devices
 - TDM bus devices
 - PCM devices
- A wide selection of data sizes: 8, 12, 16, 20, 24, and 32 bits
- Supports idle request/acknowledge protocol
- Clock generation support:
 - Independent clocking and framing for reception and for transmission up to 48 MHz
 - Support for external generation of clock signals and frame-synchronization (frame-sync) signals
 - A programmable sample rate generator for internal generation and control of clock signals and frame-sync signals
- Support of disconnect protocol

For a complete description, see [Section 24.5](#), *Multichannel Buffered Serial Port*.

13.1.9 Multichannel Pulse Density Modulation Module

The McPDM is a proprietary interface based on multichannel pulse density modulation. The module consists of five downlinks and three uplinks. Two other uplink channels are reserved for status communication.

The McPDM has the following features:

- Interconnect slave interface (L4_ABE internal interconnect) supports:
 - 32-bit data bus width
 - 10-bit address bus width
 - Burst not supported
 - WNP

- Full-duplex communication:
 - Five audio downstream channels
 - three audio upstream channels
- RX/TX FIFO operations: 32-bit words per channels
- Complies with PRCM interrupts:
 - One to the MPU subsystem
 - One to the DSP subsystem
- DMA requests (one per direction) triggered with programmable FIFO thresholds; depending on the FIFO implementation, one per channel or one per direction
- Decimation filter for embedded uplink paths (five paths if two status paths)
- Oversampling for embedded uplinks (five paths)
- Sigma delta for embedded downlinks (three paths)
- Deserializers for the two status upstream channels
- Support of disconnect protocol

For more information, see [Section 24.6](#), *Multichannel PDM Controller*.

Interconnect

This chapter describes the device interconnect.

NOTE: The L3 interconnect is instantiation of the NoC interconnect from Arteris, Inc. Arteris is a registered trademark of Arteris, Inc.

|---|-------------|
| 14.1 Interconnect Overview | 2750 |
| 14.2 L3 Interconnect | 2758 |
| 14.3 L4 Interconnects | 2902 |

14.1 Interconnect Overview

14.1.1 Terminology

The following terminology is critical to understanding the interconnect:

- **Initiator:** Module able to initiate read and write requests to the chip interconnect (typically: processors, direct memory access [DMA], etc.).
- **Target:** Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers).

NOTE: A module can have several separate ports; therefore, a module can be an initiator and a target.

- **Agent:** Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).
- **Interconnect:** The decoding, routing, and arbitration logic that enables the connection between multiple initiator modules and multiple target modules connected on it.
- **Register target (RT):** Special TA used to access the interconnect internal configuration registers
- **Data-flow signal:** Any signal that is part of a clearly identified transfer or data flow (typically: command, address, byte enables, etc.). Signal behavior is defined by the protocol semantics.
- **Sideband signal:** Any signal whose behavior is not associated to a precise transaction or data flow.
- **Out-of-band error:** Any signal whose behavior is associated to a device error-reporting scheme, as opposed to in-band errors.

NOTE: Interrupt requests and DMA requests are not routed by the interconnect in the device.

- **Firewall:** A programmable feature integrated in a TA or level 4 (L4) interconnect to prevent unauthorized access to or from a module. A firewall can be configured using three criteria:
 - Initiator requesting access
 - Address space access
 - Type of access
- **ConnID:** Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted in band with the request and is used for firewall and error-logging mechanism.
- **Firewall comparison mechanism:** A comparison made in the firewall between access in-band qualifiers and access permissions that are programmed in the firewall configuration registers. If the comparison is successful, access is allowed; otherwise, access is denied.
- **MCcmd qualifier:** Command bus that indicates the type of transfer requested. [Table 14-1](#) lists the commands encoded. For information specific to level 3 (L3) interconnect error logging, see [Table 14-26](#).

Table 14-1. MCcmd Qualifier Description

| MCcmd[2:0] | Transaction Type |
|------------|------------------|
| 0 0 0 | Idle |
| 0 0 1 | Write |
| 0 1 0 | Read |
| 0 1 1 | ReadEx |
| 1 0 0 | Not used |
| 1 0 1 | Write nonposted |
| 1 1 0 | Not used |

Table 14-1. MCmd Qualifier Description (continued)

| MCmd[2:0] | Transaction Type |
|-----------|------------------|
| 1 1 1 | Not used |

- MReqInfo qualifier: Four MReqInfo qualifiers describe the access during the use of the firewall comparison mechanism, as described in [Table 14-2](#).

Table 14-2. MReqInfo Qualifier Description

| Qualifiers | Description |
|----------------|---|
| MReqType | 0: Data access 1: Opcode fetch |
| MReqSupervisor | 0: User mode 1: Supervisor mode |
| MReqDebug | 0: Functional access 1: Debug access |

- Register that configures the combination of the MReqInfo, allowing access permission to the TM based on the MReqInfo in-band qualifier values.
- SError: Target that indicates an error condition to the initiator.
- SResp qualifier: Response from the target to the initiator concerning the transaction, as described in [Table 14-3](#).

Table 14-3. SResp Qualifier Description

| SResp[1:0] | Description |
|------------|-------------------|
| 0 0 | No response |
| 0 1 | Data valid/accept |
| 1 0 | Not used |
| 1 1 | Error |

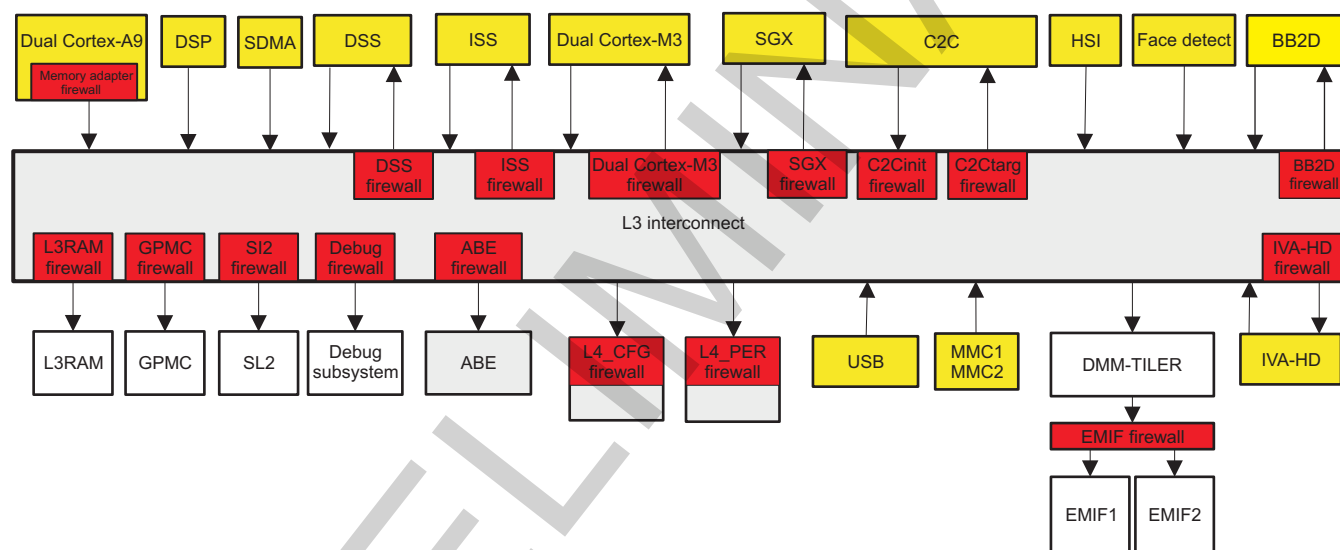

14.1.2 Architecture Overview

The device memory hierarchy includes four levels:

- Level 1 (L1) is internal to the central processing units (CPUs). It concerns data exchange with the internal L1 cache memory subsystem, and it is the closest memory to the microprocessor unit (MPU) core and the IVA-HD core.
- Level 2 (L2) is included in the IVA-HD subsystem and the MPU subsystem.
- The chip-level interconnect consists of one L3 interconnect and four L4 interconnects. It enables communication among the modules and subsystems in the device.

Figure 14-1 shows an overview of the L3 and L4 interconnect architecture.

Figure 14-1. Interconnect Overview

i3-012

- L3 handles many types of data transfers, especially exchanges with system-on-chip (SoC)/external memories. L3 transfers data with a maximum width of 128 bits from the initiator to the target. The L3 interconnect is a little-endian platform.
- The L4 is composed of the following:
 - L4_CFG: Includes the majority of the configuration interface for L3 system modules and peripheral interconnect; L4_PER: Includes the main peripherals that require system direct memory access (sDMA).
 - L4_WKUP: Includes peripherals attached to the WKUP power domain.

Modules are connected to the interconnect through an IA for the initiator module and a TA for target modules. Each module/subsystem connection is statically configured to tune the access, depending on the characteristics of the module.

To unauthorized a module or L4 interconnect access, some TAs include configurable firewalls (FWs). A firewall restricts or filters the accesses allowed to an initiator according to different access criteria. The firewalls can usually be configured by software.

The L3 and L4 interconnect default settings are fully functional; they enable all possible functional data paths and a minimal default protection setting. However, the interconnect parameters can be modified to fit user expectations.

14.1.3 Module Distribution

IAs and TAs provide the interface to connect the different modules and the interconnect.

Table 14-4 through Table 14-11 list the device modules, subsystems, and associated agents. The agents are listed for each interconnect domain:

- L3 initiator (master network interface units [NIUs] – MN) and target (slave NIUs – SN) agents
- L4_PER initiator and target agents
- L4_CFG initiator and target agents
- L4_WKUP initiator and target agents

14.1.3.1 L3 Interconnect Module Distribution

Table 14-4 and Table 14-5 list the IAs and TAs, respectively, of the L3 interconnect.

Table 14-4. Master NIUs

| Master NIU Name | Description |
|------------------|---|
| L3_MN_CORTEXA9 | Cortex-A9™ MPU subsystem |
| L3_MN_DSP | Digital signal processr (DSP) subsystem |
| L3_MN_DSS | Display subsystem |
| L3_MN_MMC1/2 | Multimedia controller |
| L3_MN_BB2D | 2D graphics accelerator |
| L3_MN_IVAHD | Video accelerator subsystem |
| L3_MN_SGX | Graphic accelerator |
| L3_MN_ISS | Imaging accelerator subsystem |
| L3_MN_CORTEXM3 | Cortex-M3™ MPU subsystem |
| L3_MN_FACEDETECT | Face detection module |
| L3_MN_SDMA_rd | sDMA |
| L3_MN_SDMA_wr | sDMA |
| L3_MN_HSI | HS synchronous serial interrupt controller (INTC) |
| L3_MN_HSUSBOTG | HS OTG USB controller |
| L3_MN_HSUSBHOST | Multiport USB host controller |
| L3_MN_C2C | C2C |
| L3_MN_DAP | JTAG®/emulation access to system resources |

Table 14-5. Slave NIUs

| Slave NIU Name | Description |
|----------------|--|
| L3_SN_OCM_RAM | On-chip memory controller |
| L3_SN_GPMC | General-purpose memory controller (GPMC) |
| L3_SN_C2C | Chip-to-chip |
| L3_SN_DMM1 | Dynamic memory management |

Table 14-5. Slave NIUs (continued)

| Slave NIU Name | Description |
|---------------------|---|
| L3_SN_DMM2 | Dynamic memory management |
| L3_SN_SGX | Graphic accelerator |
| L3_SN_BB2D | 2D graphics accelerator |
| L3_SN_ISS | Imaging accelerator subsystem |
| L3_SN_IVAHD_CFG | Video accelerator subsystem configuration |
| L3_SN_IVAHD_SL2 | Video accelerator subsystem shared memory |
| L3_SN_DSP | DSP subsystem |
| L3_SN_CORTEXM3 | Cortex-M3 MPU subsystem |
| L3_SN_DSS | Display subsystem |
| L3 interconnect | L3 internal registers |
| L3_SN_ABE | Audio back end |
| L3_SN_L4_CFG | L4 interconnect configuration |
| L3_SN_L4_PER0/1/2/3 | L4 interconnect peripherals |
| L3_SN_L3_INSTR | L3 instrumentation |

14.1.3.2 L4 Interconnect Module Distribution

IAs and TAs provide the interface to connect the different modules to their associated interconnect.

[Table 14-6](#) through [Table 14-11](#) list the device modules, subsystems, and their associated agents. The agents are listed for each L4 interconnect domain.

14.1.3.2.1 L4_PER Interconnect Agents

The L4_PER interconnect handles transfers only to peripherals in the PER power domain. [Table 14-6](#) lists the L4_PER TAs.

Table 14-6. L4_PER TAs

| Module Target Name | Description |
|--------------------|--|
| PER_TA_UART1 | Universal asynchronous receiver-transmitter (UART) port 1 module |
| PER_TA_UART2 | UART port 2 module |
| PER_TA_UART3 | UART port 3 module |
| PER_TA_UART4 | UART port 4 module |
| PER_TA_GPTIMER2 | General-purpose timer 2 (GPTIMER2) module |
| PER_TA_GPTIMER3 | GPTIMER3 module |
| PER_TA_GPTIMER4 | GPTIMER4 module |
| PER_TA_GPTIMER9 | GPTIMER9 module |
| PER_TA_GPTIMER10 | GPTIMER10 module |
| PER_TA_GPTIMER11 | GPTIMER11 module |
| PER_TA_DSS | Display subsystem configuration module |
| PER_TA_GPIO2 | General-purpose input/output 2 (GPIO2) module |
| PER_TA_GPIO3 | GPIO3 module |
| PER_TA_GPIO4 | GPIO4 module |
| PER_TA_GPIO5 | GPIO5 module |
| PER_TA_GPIO6 | GPIO6 module |
| PER_TA_I2C1 | Multimaster inter-integrated circuit 1 (I2C1) module |
| PER_TA_I2C2 | Multimaster I2C2 module |
| PER_TA_I2C3 | Multimaster I2C3 module |

Table 14-6. L4_PER TAs (continued)

| Module Target Name | Description |
|--------------------|--|
| PER_TA_I2C4 | Multimaster I2C4 module |
| PER_TA_SLIMBUS2 | SLIMBUS2 module |
| PER_TA_ELM | Error location module |
| PER_TA_MCBSP4 | Multichannel buffered serial port 4 (McBSP4) module |
| PER_TA_MCSPI1 | Multichannel serial peripheral interface 1 (McBSP1) module |
| PER_TA_MCSPI2 | McSPI2 module |
| PER_TA_MCSPI3 | McSPI3 module |
| PER_TA_MCSPI4 | McSPI4 module |
| PER_TA_HSMMC1 | Multimedia card (MMC) controller 1 module |
| PER_TA_HSMMC2 | MMC controller 2 module |
| PER_TA_HSMMC3 | MMC controller 3 module |
| PER_TA_HSMMC4 | MMC controller 4 module |
| PER_TA_HSMMC5 | MMC controller 5 module |
| PER_TA_HDQ1W | Single-wire serial link low-rate module |

Four ports communicate between the L3 interconnect and the L4_PER interconnect to allow the L3 initiators to access the L4_PER targets. [Table 14-7](#) lists the L4_PER initiator TAs.

For the list of initiators authorized to access the L4 peripheral peripherals, see [Section 14.2.3.2.2, Connectivity Matrix](#).

Table 14-7. L4_PER IAs

| Module Initiator Name | Description |
|-----------------------|------------------------------------|
| PER_IA_0 | L3 sDMA RD interconnect port |
| PER_IA_1 | L3 sDMA WR interconnect port |
| PER_IA_2 | L3 MPU subsystem interconnect port |
| PER_IA_3 | L3 others interconnect port |

14.1.3.2.2 L4_CFG Interconnect Agents

The L4_CFG interconnect handles transfers only to peripherals in the CORE power domain. [Table 14-8](#) lists the L4_CFG TAs.

Table 14-8. L4_CFG TAs

| Module Target Name | Description |
|-----------------------------|------------------------------------|
| CFG_TA_SYSCTRL_GENERAL_CORE | System control general core module |
| CFG_TA_SYSCTRL_PADCONF_CORE | System control padconf core module |
| CFG_TA_CM_CORE_AON | Clock manager 1 module |
| CFG_TA_CM_CORE | Clock manager 1 module core |
| CFG_TA_DMA_SYSTEM | sDMA module |
| CFG_TA_HSI | HS SSI module |
| CFG_TA_SAR_ROM | Save-and-restore (SAR) ROM |
| CFG_TA_HSUSBOTG | HS USB OTG module |
| CFG_TA_HSUSBHOST | HS USB host module |
| CFG_TA_HSUSBPHY | HS USB PHY module |
| CFG_TA_HSUSBTLL | USB TTL module |
| CFG_TA_DSP | DSP subsystem |

Table 14-8. L4_CFG TAs (continued)

| Module Target Name | Description |
|------------------------|-----------------------------------|
| CFG_TA_SR1 | SmartReflex1 module |
| CFG_TA_SR2 | SmartReflex2 module |
| CFG_TA_SR3 | SmartReflex3 module |
| CFG_TA_MAILBOX | Mailbox module |
| CFG_TA_SPINLOCK | Spinlock module |
| CFG_TA_FACEDETECT | Face detect module |
| CFG_TA_MAFW | Memory adapter firewall |
| CFG_TA_EMIFFW | EMIF firewall |
| CFG_TA_GPMCFW | GPMC firewall |
| CFG_TA_OCMCFW | OCMC_RAM firewall |
| CFG_TA_SGXFW | SGX firewall |
| CFG_TA_BB2DFW | BB2D firewall |
| CFG_TA_ISSFW | ISS firewall |
| CFG_TA_CORTEXM3FW | Cortex-M3 firewall |
| CFG_TA_DSSFW | Display subsystem (DSS) firewall |
| CFG_TA_SL2FW | SL2 firewall |
| CFG_TA_IVAHDFW | IVA-HD firewall |
| CFG_TA_L3_INSTR | EMU subsystem firewall |
| CFG_TA_ABEFW | ABE firewall |
| CFG_TA_L4_WKUP | L4_WKUP connection |
| CFG_TA_MODEM_ICR_PA/PB | Modem intercommunication register |

A unique port, CFG_IA_0, communicates between the L3 interconnect and the L4_CFG interconnect to allow the L3 initiators to access the L4_CFG targets (see [Table 14-9](#)).

For the list of initiators authorized to access the L4_CFG peripherals, see [Section 14.2.3.2.2, Connectivity Matrix](#).

Table 14-9. L4_CFG IAs

| Module Initiator Name | Description |
|-----------------------|----------------------|
| CFG_IA_0 | L3 interconnect port |

14.1.3.2.3 L4_WKUP Interconnect Agents

The L4_WKUP interconnect handles transfers only to peripherals in the WKUP power domain. [Table 14-10](#) lists the TAs. [Table 14-11](#) lists the L4_WKUP IAs.

Table 14-10. L4_WKUP TAs

| Module Target Name | Description |
|------------------------------|--|
| WKUP_TA_GPIO1 | GPIO1 module |
| WKUP_TA_32KTIMER | 32-kHz timer module |
| WKUP_TA_SAR_RAM | Save-and-restore RAM |
| WKUP_TA_KEYBOARD | Keyboard module |
| WKUP_TA_SYSCTRL_GENERAL_WKUP | System control general WKUP module |
| WKUP_TA_SYSCTRL_PADCONF_WKUP | System control padconf WKUP module |
| WKUP_TA_PRM | Power reset management module |
| WKUP_TA_SCRM | System clock and reset management module |
| WKUP_TA_WDTIMER2 | WDTIMER2 module |

Table 14-11. L4_WKUP IAs

| Module Initiator Name | Description |
|-----------------------|--------------------------|
| WKUP_IA_0 | L4_CFG interconnect port |

14.1.4 Connectivity Matrix

Figure 14-2 shows the functional paths between the L3 interconnect initiator modules and the L3 and L4 TAs. In the figure, functional paths are indicated by the following:

- A cell contains a + sign when a functional path exists.
- A cell is blank when a functional path does not exist.

Figure 14-2. L3 Connectivity Matrix

I3-001

14.2 L3 Interconnect

This section describes the L3 interconnect and its components. With the exception of register points, each component includes functions for the request and response networks.

14.2.1 L3 Interconnect Overview

The L3 interconnect links cores in a flexible topology that couples low power with high performance. Innovative physical structures and advanced protocols ensure bandwidth and latency to individual IP cores, providing dedicated connections between IP cores and logical connections over a shared interconnect.

The main features of the L3 interconnects are:

- NIUs: Master NIUs for the IAs and slave NIUs for the TAs
- A partially depleted crossbar exchange network
- A special internal slave NIU for accessing L3 interconnect configuration registers
- True little-endian platform
- Transaction errors tracking and logging registers
- All signaling support for chip-level power-management infrastructure

[Figure 14-3](#) is an overview of the L3 interconnect and the peripherals attached to it.

Figure 14-3. L3 Interconnect Overview

14.2.2 L3 Interconnect Integration

Table 14-12 through Table 14-14 summarize the integration of the module in the device.

Table 14-12. Integration Attributes

| Module Instance | Attributes |
|-----------------|--------------|
| | Power Domain |
| L3 | PD_CORE |

Table 14-13. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|--|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| L3 | L3_CLK2 | L3_ICLK2 | PRCM | Functional and interface clock |
| | L3_CLK1 | L3_ICLK1 | PRCM | Functional and interface clock |
| | L3_CLK3 | INSTR_L3_ICLK | PRCM | Functional and interface clock |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| L3 | L3_CORE_RET_RST | CORE_RET_RST | PRCM | Reset of L3_PER interconnect retention registers |
| | L3_CORE_RST | CORE_RST | PRCM | Reset of L3_PER interconnect |

Table 14-14. Hardware Requests

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|----------------|----------------------------|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| L3 | L3_APP_IRQ | C2C_IRQ_18 | C2C INTC | Interrupt to the SSCM |
| | L3_DBG_IRQ | MA_IRQ_9 | Cortex-A9 INTC | Interrupt to the Cortex-A9 |
| | L3_APP_IRQ | D_IRQ_84 | DSP INTC | Interrupt to the DSP |
| | L3_APP_IRQ | MA_IRQ_10 | Cortex-A9 INTC | Interrupt to the Cortex-A9 |

14.2.3 L3 Interconnect Functional Description

14.2.3.1 Module Use in L3 Interconnect

The L3 interconnect network components have ConnID values for each master NIU or slave NIU. The ID uniquely identifies the master NIU or the slave NIU for an interconnect transfer. The interconnect uses ConnIDs for a number of purposes, including the following:

- Slave NIUs for error logging
- Power disconnect slave NIU for error logging
- FLAGMUX to mask interrupts: Three, one for each clock domain
- STATCOLL for configuring and monitoring: The STATCOLL components compute the traffic statistics within a user-defined window and periodically report to the user through the debug interface
- Bandwidth regulator for configuration: The bandwidth critical masters are IVA-HD, BB2D, and SGX
- Some rate adapters for configuration of throughput ratio

14.2.3.2 Module Distribution

Master NIUs and slave NIUs provide the interface to connect the different modules to their associated interconnect.

[Table 14-15](#) and [Table 14-16](#) list all the modules and subsystems with their associated agents. The agents are listed for each L3 interconnect domain.

14.2.3.2.1 L3 Interconnect Agents

Any initiator or target core is connected to the L3 interconnect through an NIU. NIUs act as entry points to the L3 interconnect, and also include various programming registers. [Table 14-15](#) lists the supported master NIU ports.

Table 14-15. Master NIUs

| Master NIU | Description |
|------------------|---|
| L3_MN_CORTEXA9 | Cortex-A9 MPU subsystem |
| L3_MN_DSP | DSP subsystem |
| L3_MN_DSS | Display subsystem |
| L3_MN_MMC1/2 | Multimedia controller |
| L3_MN_BB2D | 2D graphics accelerator |
| L3_MN_IVAHD | Video accelerator subsystem |
| L3_MN_SGX | Graphic accelerator |
| L3_MN_ISS | Imaging accelerator subsystem |
| L3_MN_CORTEXM3 | Cortex-M3 MPU subsystem |
| L3_MN_FACEDETECT | Face detection module |
| L3_MN_SDMA_rd | sDMA |
| L3_MN_SDMA_wr | sDMA |
| L3_MN_HSI | HS synchronous serial INTC |
| L3_MN_HSUSBOTG | HS OTG USB controller |
| L3_MN_HSUSBHOST | Multiport USB host controller |
| L3_MN_C2C | C2C |
| L3_MN_DAP | JTAG/emulation access to system resources |

[Table 14-16](#) lists the supported slave NIU ports.

Table 14-16. Slave NIUs

| Slave NIU | Description |
|---------------------|---|
| L3_SN_OCM_RAM | On-chip memory controller |
| L3_SN_GPMC | GPMC |
| L3_SN_C2C | C2C |
| L3_SN_DMM1 | Dynamic memory management |
| L3_SN_DMM2 | Dynamic memory management |
| L3_SN_SGX | Graphic accelerator |
| L3_SN_BB2D | 2D Graphics accelerator |
| L3_SN_ISS | Imaging accelerator subsystem |
| L3_SN_IVAHD_CFG | Video accelerator subsystem configuration |
| L3_SN_IVAHD_SL2 | Video accelerator subsystem shared memory |
| L3_SN_DSP | DSP subsystem |
| L3_SN_CORTEXM3 | Cortex-M3 MPU subsystem |
| L3_SN_DSS | Display subsystem |
| L3 interconnect | L3 internal registers |
| L3_SN_ABE | Audio back end |
| L3_SN_L4_CFG | L4 interconnect configuration |
| L3_SN_L4_PER0/1/2/3 | L4 interconnect peripherals |
| L3_SN_L3_INSTR | L3 instrumentation (debug) |

14.2.3.2.2 L3 Connectivity Matrix

The L3 interconnect is divided into three subclock domains:

- L3_CLK1: Low-power domain
- L3_CLK2: Peripherals and multimedia
- L3_CLK3: Instrumentation (debug)

Each subclock domain is implemented in a different clock domain.

14.2.3.2.2.1 Clock Domain Mapping of the L3 Interconnect Modules

Each clock domain (CLK1, CLK2, and CLK3) has its own host, flag mux, slave NIUs, and bandwidth regulators as listed in [Table 14-17](#).

Table 14-17. L3 Clock Domains and Elements

| L3 Clock Domain | Elements |
|-----------------|---|
| CLK1 | HOST_CLK1 DMM1/2 ABE L4_CFG FLAGMUX_CLK1 PWR_DISK_CLK2 RATE_ADAPT_ABE |
| CLK2 | HOST_CLK2 GPMC OCM_RAM DSS ISS CORTEX-M3 BB2D |

Table 14-17. L3 Clock Domains and Elements (continued)

| L3 Clock Domain | Elements |
|-----------------|--|
| | SGX IVAHD SL2 L4_PER0/1/2/3 FLAGMUX_CLK2 PWR_DISC_CLK1 RATE_ADAPT_GPMC IVAHD_BW BB2D_BW SGX_BW C2C |
| CLK3 | HOST_CLK3 L4_EMU FLAGMUX STATCOLL |

Figure 14-4 shows the functional paths between the L3 interconnect master NIUs and the L3 and L4 slave NIU agents. The functional paths in the figure are indicated by the following:

- A cell contains a plus sign when a functional path exists.
- A cell is blank when a functional path does not exist.

Figure 14-4. L3 Connectivity Matrix

I3-001

14.2.3.2.3 Master NIU Identification

An master NIU ID (ConnID) is assigned to every module in the device. The ID uniquely identifies the master NIU for an interconnect transfer (see [Table 14-18](#)). The interconnect uses ConnID values for a number of purposes, including:

- Master source identification for the protection mechanism
- Response route generation
- Firewall error logging
- L3 interconnect error logging

Table 14-18. ConnID Values

| ConnID | Master NIU |
|--------|------------|
| 0x0 | Cortex-A9 |
| 0x4 | DAP |
| 0x8 | DSP |
| 0xC | IVAHD |

Table 14-18. ConnID Values (continued)

| ConnID | Master NIU |
|--------|------------|
| 0x10 | ISS |
| 0x11 | Cortex-M3 |
| 0x12 | FaceDetect |
| 0x14 | sDMA_rd |
| 0x15 | sDMA_wr |
| 0x18 | SGX_P1 |
| 0x19 | SGX_P2 |
| 0x1A | BB2D_P1 |

| 0x30 | HSUSBHOST |
| 0x31 | HSUSBOTG |
| 0x32 | FSUSB |
| 0x34 | Reserved |
| 0x38 | PERF_PROBE |

14.2.3.3 Bandwidth Regulators

The bandwidth regulators prevent master NIUs from consuming too much bandwidth of a link, or a slave NIU that is shared between several data flows: packets are then transported at a slower rate. The value of a bandwidth can be programmed in the bandwidth regulator. When the bandwidth is below the programmed value, the pressure bit is set to 1, thus giving priority to this master. When the bandwidth is above the programmed value, the pressure bit is set to 0 and the concerned master has the same weight as others.

The bandwidth registers regulate the packet flow by applying flow control on the RX port, thus ensuring that the traffic does not exceed the allocated bandwidth. The next packet is sent only when an internal timer expires. The registers in this group are:

- [L3_BW_R_WATERMARK](#): Gives the amount of data allowed to exceed the average bandwidth during a short time period
- [L3_BW_R_PRESS](#): Describes the pressure applied to outgoing packets
- [L3_BW_R_CLEARHISTORY](#): Resets the traffic counter when set to 1. It is used after an update in the [L3_BW_R_BANDWIDTH](#) and [L3_BW_R_WATERMARK](#) registers (see [Section 14.2.5.1.6, L3 BW Regulator Register Summary and Description](#)).

14.2.3.4 Bandwidth Limiter

The bandwidth limiter is added to control the bandwidth of the BB2D module. It is used to insert idle cycles between read requests. This prevents a large number of RD requests from getting processed together, thus avoiding a large number of RD responses; numerous RD responses could overflow the 128-to-64 bit width converter on the response path and block back to the DMM port.

The bandwidth limiter regulates the packet flow in the L3 interconnect by applying flow control when a user-defined bandwidth limit is reached. The next packet is served only after an internal timer expires, thus ensuring that traffic does not exceed the allocated bandwidth.

The registers in this group are:

- **WATERMARK:** Gives the amount of data allowed to exceed the average bandwidth during a short time period. To set the actual watermark to n bytes, the register must be set to $n + 1$
- **CLEARHISTORY:** Resets the traffic counter when set to 1
- **BANDWIDTH_FRACTIONAL** and **BANDWIDTH_INTEGER:** These two registers set the average payload bandwidth

NOTE: The bandwidth limiter is configured to be transparent at reset.

14.2.3.5 Flag Mux Generators

The flag mux generator collects information such as errors and interrupts from slave NIUs and the interconnect firewall. The result signals are then sent to the MPU INTC without interfering with the interconnect traffic. The L3_FLAGMUX_MASK registers can be used to prevent the flag mux from seeing certain events.

The unit has a standard COREREG register for identification of the attached core type. The [L3_FLAGMUX_STDHOSTHDR_VERSIONREG](#) register identifies the characteristics of the attached core. The unit-specific registers (MASK bit 0 or bit 1 of the flag inputs, and L3_FLAGMUX_REGERR bit 0 or bit 1) are used to read the input errors. Each register is dedicated to reporting the bit corresponding to the register number; for example, [L3_FLAGMUX_REGERR0](#) reports on bit 0, and [L3_FLAGMUX_REGERR1](#) reports on bit 1. Any given L3_FLAGMUX_REGERR register reports the same bit for all flag source inputs (see [Table 14-163](#)).

14.2.3.6 Rate Adapter Generators

The rate adapter generators give the option to configure the L3 interconnect to work in auto-adaptive mode or pipeline mode for sending the packets by using the CNF register. The rate adapter can be configured in store-and-forward mode when the throughput ratio is not well defined, or in auto-adaptive mode when the throughput ratio is predictable. Because the ratios are predictable in the L3 interconnect, the rate adapters are always used in auto-adaptive mode, except for the rate adapter on the L4_CFG and L4_ABE responses path. L4_CFG and L4_ABE are configured in store-and-forward mode. The main rate adapt registers are:

- **CLK1_RATE_ADAPT_RESP_32TO128_CLK1:** Removes WAIT cycles on responses coming from ABE, L4CFG, and power disconnect to host
- **CLK2_RATE_ADAPT_RESP_32TO128_CLK2:** Removes WAIT cycles on responses coming from CLK2 32-bit slaves (see [Table 14-207](#))

14.2.3.7 Statistic Collectors Group

Statistic collectors are internal masters that share the same master address as the master NIUs. These components compute the traffic statistics within a defined window and periodically report through the DEBUG interface. The key features of the statistic collector are:

- Nonintrusive monitoring
- Programmable filters and counters
- Results collected at a programmable time interval

Event detectors are programmed through the [L3_STCOL_REQEVT](#) and [L3_STCOL_RSPEVT](#) configuration registers for request and response ports, respectively. The following events can be identified:

- Word transfer
- WAIT cycles
- Flow control
- Payload transfers
- Latency measurements

Performance monitoring is enabled through the [L3_STCOL_EN](#) register. The [L3_STCOL_SOFTEN](#) register enables software to monitor the performance. Event muxes are programmed through the [L3_STCOL_EVTMUX_SELO](#) configuration register, which determines which port will be monitored by a filter configured by the filter registers (see [Table 14-216](#)).

Filters are programmed through the configuration register, along with additional selection criteria programmed through the mask/match registers (see [Table 14-216](#)). A filter can be configured to accept or reject:

- Read operations
- Write operations
- Errors
- Addresses

Filter operations are programmed through the [L3_STCOL_OP](#) registers (see [Table 14-216](#)).

14.2.3.8 L3 Protection and Firewalls

Device protection relies on L3 firewalls and their configuration.

14.2.3.8.1 L3 Firewall Reset

The values of L3 firewall registers on reset are tied in hardware or exported from the control module registers.

Values exported from the control module are intended to give defined rights to the firewalls at reset and thus ensure the content after going out of reset. Because the control module consists of retention flip-flops (RFFs), which immunize it against register content loss during retention power state, the registers of the control module storing the exported values are not subject to a soft reset.

The L3 firewall registers are also retention-capable and are immune against content loss during CORE RETENTION power state. The control module registers are reset only by a cold reset, whereas the L3 firewall registers are reset by clearing the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit. When the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit comes back automatically to 1, the exported values are loaded.

CAUTION

Before reprogramming the firewall registers and/or before using the [FW_LOAD_REQ](#) mechanism, the request must be asserted by configuring the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit.

To load the exported values at run time:

1. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x1 to ensure that no transaction can reach the slave NIU (suspend).
2. Clear the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit by setting it to 0x1.
3. Wait until hardware resets the [REGUPDATE_CONTROL\[1\] FW_LOAD_REQ](#) bit to 0x1.
4. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x0 to allow transactions to reach the slave NIU (resume).

To reprogram the firewall registers at run time:

1. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x1 to ensure that no transaction can reach the slave NIU (suspend).
2. Upload the new values to all firewall registers.
3. Set the [REGUPDATE_CONTROL\[0\] BUSY_REQ](#) bit to 0x0 to allow transactions to reach the slave NIU (resume).

NOTE: Hardware reset values can be modified by exported values from the control module at reset.

14.2.3.8.1.1 L3 Firewall – Exported Reset Values

Table 14-19 and Table 14-20 list the exported reset values and mapping, respectively.

Table 14-19. L3 Firewall Exported Reset Values

| MRM_PERMISSION_REGION_LOW_j [15:12] | MRM_PERMISSION_REGION_LOW_j [11:0] |
|--|---------------------------------------|
| 0x0 | 0xFFF |
| 0xF | 0xFFF |
| 0x0 | 0x038 |
| 0x2 | 0x038 |

Table 14-20. L3 Firewall Exported Values Mapping

| CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF Bits | Slave NIU Firewall |
|---|----------------------------------|
| [0] and [16] | GPMC |
| [1] and [17] | C2CINIT |
| [2] and [18] | C2CTARG |
| [3] and [19] | L3 RAM |
| [4] and [20] | DSS |
| [5] and [21] | ISS and dual Cortex-M3 subsystem |
| [6] and [22] | SGX |
| [7] and [23] | SL2 |
| [8] and [24] | IVA-HD |
| [10] and [26] | BB2D |
| [11] and [27] | EMIF |
| [12] and [28] | DEBUG |
| [13] and [29] | L4 AUDIO |

For more information, see [Chapter 19, Control Module](#).

14.2.3.8.2 Power Management

As part of the system-wide power-management scheme, the L3 interconnect goes into IDLE state after receiving a request from the power, reset, and clock management (PRCM) module after all commands are serviced. This function is handled by hardware.

To reduce power consumption, the L3 interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

Retention is performed on all software-accessible registers:

- Statistic collectors
- Internal rate adapters
- Bandwidth regulators
- TAs
- Firewalls

This process prevents reconfiguration after a clock domain switches off.

14.2.3.8.3 L3 Firewall Functionality

The access to the slave NIUs is granted only to master NIUs according to in-band attributes sent in each transaction crossing the L3 interconnect, such as:

- MCMD: Specifies the type of access (read or write) required by the master NIU
- ConnID: Used to determine the permission of the master NIU
- MReqInfo: Transaction attribute adding information about the access type

Table 14-21 lists the MReqInfo values.

Table 14-21. MReqInfo Values

| Qualifier | Access Definition | Access Description |
|----------------|---------------------------|--|
| MReqType | 0: Data 1: Opcode | Indicates whether the request is for instruction fetch or data access |
| MReqDebug | 0: Functional 1: Debug | When set, indicates that the request has been issued by a master NIU in DEBUG state |
| MReqSupervisor | 0: User 1: Privilege | When set, indicates that the request is qualified with the supervisor attribute. It can be provided by a processor running in supervisor mode or by a module that inherited this attribute from the processor (DMA channel with a supervisor attribute). |

The firewall comparison mechanism enables access to a protected slave NIU only when a correct combination of three MReqInfo in-band parameters is transmitted.

MReqInfo is a combination of a fixed 3-bit pattern that corresponds to a combination of the parameters MReqDebug, MReqType, and MReqSupervisor. See Table 14-22.

Table 14-22. L3 ReqInfo Mapping

| ReqInfo Name | | MReqDebug | MReqType | MReqSupervisor |
|--------------|---------------------|-----------|----------|----------------|
| Master NIUs | L3_MN_CORTEXA9 | x | x | x |
| | L3_MN_CORTEXM3 | x | x | x |
| | L3_MN_DSP | x | x | |
| | L3_MN_IVAHD | | | |

14.2.3.8.3.1 Protection Regions

Each slave NIU address space is subdivided into protection regions (maximum of 10). The regions are configurable with a size of 4-KB granularity. The firewalls can also be multiport while using the description of the same regions for dual access memories or to support interleaving mechanisms on several memories.

[Table 14-23](#) lists the number of protected regions and ports for each slave NIU.

Table 14-23. Slave NIU Firewall and Region Configuration

| Slave NIU | Firewall | Number of Regions | Number of Ports |
|--------------------------|----------------|-------------------|-----------------|
| L3 OCMC_RAM | L3 OCMC_RAM | 10 | 1 |
| GPMC | GPMC | 8 | 1 |
| SL2 | SL2 | 1 | 1 |
| SGX | SGX | 1 | 1 |
| C2C | C2CTARG | 1 | 1 |
| L3 interconnect | C2CINIT | 4 | 2 |
| ISS | ISS | 1 | 1 |
| Dual Cortex-M3 subsystem | Dual Cortex-M3 | 1 | 1 |
| DSS | DSS | 1 | 1 |
| IVA-HD | IVA-HD | 1 | 1 |
| BB2D | BB2D | 1 | 1 |
| ABE | ABE | 1 | 1 |
| EMIF | EMIF | 8 | 3 |

Two types of regions are distinguished in a slave NIU firewall:

- Default region: Available in all slave NIUs. It covers the entire slave NIU address range and must be reset or overlaid by other firewall configured regions, because it always has the lowest priority.
- Normal region: The number of normal regions varies in a slave NIU; they have identical capabilities (see [Table 14-23](#)).

Each region has the following characteristics:

- Start address: Physical slave NIU start address
- End address: Physical slave NIU end address
- Specific access rights (see [Section 14.2.3.8.3.3, Protection Mechanism per Region Examples](#))
- Priority level from 0 (lowest) to 10 (highest)

Depending on its priority level, a region can override the settings of another region; the access rights of the region with the highest priority apply. All regions have a fixed (not configurable) priority level that corresponds to their number: Region 1 has priority level 1, region 2 has priority level 2, and so on.

Figure 14-5 shows the priority level with associated regions. This priority level scheme allows multiplying the flexibility and capability of the firewall. Figure 14-5 shows a 7-region firewall setting that creates 13 regions (twice the number of regions created than originally available).

Figure 14-5. L3 Interconnect Region Overlay and Priority Level Overview

13-003

The address range covered by the regions is defined in the [START_REGION_i](#) and [END_REGION_i](#) registers. The boundary checks are done on a minimum size of 4-KB pages; thus, bits [11:0] of those 32-bit registers are not checked.

The address space size of the slave NIUs (bits [31:12]) depends on the size of the slave NIU to protect; that is, if a memory is only 48KB, then the size is defined through bits [16:12] of the slave NIU start/end address registers of the firewall region ([START_REGION_i\[16:12\]](#) and [END_REGION_i\[16:12\]](#)).

On multiport firewalls (EMIF), the checking of each REGION {0, n} can be activated on one or several ports at the same time. However, if interleaving is not desired on some parts of the protected memory space, it is possible to apply or not apply region checking on selected ports using the region enable/disable on port instance capability of the [END_REGION_i](#) register.

Most slave NIUs support only one input port (port 0) except:

- The EMIF module protected by the EMIF firewall has three ports:
 - Port 0 for Cortex-A9 accesses
 - Port 1 for the first L3 interconnect accesses
 - Port 2 for the second L3 interconnect accesses

A region can be applied or not to each port independently. To enable and disable the regions:

- For port 0: Set/clear the [END_REGION_i\[0\]](#) REGION_ENABLE_PORT0 bit (for all L3 firewalls).

- For port 1: Set/clear the [END_REGION_i\[1\]](#) REGION_ENABLE_PORT1 bit (only for EMIF firewalls).
- For port 2: Set/clear the [END_REGION_i\[2\]](#) REGION_ENABLE_PORT2 bit (only for EMIF firewalls).

14.2.3.8.3.2 L3 Firewall Registers Overview

[Table 14-24](#) and [Table 14-25](#) list the L3 firewall permission-setting registers.

Table 14-24. L3 Firewall Read/Write Permission-Setting Register

| Register Name | Bits | Field Name | Description (See Table 14-18 .) | Field Modifiability |
|--|------|------------|---|---------------------|
| MRM_PERMISSION_REGION_HIGH_j | 31 | RESERVED | Reserved | – |
| | 30 | RESERVED | Reserved | – |
| | 29 | RESERVED | Reserved | – |
| | 28 | RESERVED | Reserved | – |
| | 27 | RESERVED | Reserved | – |
| | 26 | RESERVED | Reserved | – |
| | 25 | W12 | ConnID = 12 write permission | RW |
| | 24 | R12 | ConnID = 12 read permission | RW |
| | 23 | RESERVED | Reserved | – |
| | 22 | RESERVED | Reserved | – |
| | 21 | W10 | ConnID = 10 write permission | RW |
| | 20 | R10 | ConnID = 10 read permission | RW |
| | 19 | W9 | ConnID = 9 write permission | RW |
| | 18 | R9 | ConnID = 9 read permission | RW |
| | 17 | W8 | ConnID = 8 write permission | RW |
| | 16 | R8 | ConnID = 8 read permission | RW |
| | 15 | W7 | ConnID = 7 write permission | RW |
| | 14 | R7 | ConnID = 7 read permission | RW |
| | 13 | W6 | ConnID = 6 write permission | RW |
| | 12 | R6 | ConnID = 6 read permission | RW |
| | 11 | W5 | ConnID = 5 write permission | RW |
| | 10 | R5 | ConnID = 5 read permission | RW |
| | 9 | W4 | ConnID = 4 write permission | RW |
| | 8 | R4 | ConnID = 4 read permission | RW |
| | 7 | W3 | ConnID = 3 write permission | RW |
| | 6 | R3 | ConnID = 3 read permission | RW |
| | 5 | W2 | ConnID = 2 write permission | RW |
| | 4 | R2 | ConnID = 2 read permission | RW |
| | 3 | W1 | ConnID = 1 write permission | RW |
| | 2 | R1 | ConnID = 1 read permission | RW |
| | 1 | W0 | ConnID = 0 write permission | RW |
| | 0 | R0 | ConnID = 0 read permission | RW |

Table 14-25. L3 Firewall Permission-Setting Register

| Register name | Type of Permission | Bits | Field Name | Description | Field Modifiability |
|---|--------------------|-------|---------------|-------------------------|---------------------|
| MRM_PERMISSION_REGION_LOW_j | DEBUG | 15 | PUB_PRV_DEBUG | Privilege debug allowed | RW |
| | | 14 | PUB_USR_DEBUG | User debug allowed | RW |
| | | 13:12 | RESERVED | Reserved | RW |
| | | 11 | PUB_PRV_READ | Privilege read allowed | RW |
| | | 10 | PUB_PRV_WRITE | Privilege write allowed | RW |

Table 14-25. L3 Firewall Permission-Setting Register (continued)

| Register name | Type of Permission | Bits | Field Name | Description | Field Modifiability |
|---------------|--------------------|------|---------------|---------------------------|---------------------|
| | Access | 9 | PUB_PRV_EXE | Privilege exe allowed | RW |
| | | 8 | PUB_USR_READ | User read access allowed | RW |
| | | 7 | PUB_USR_WRITE | User write access allowed | RW |
| | | 6 | PUB_USR_EXE | User exe access allowed | RW |

14.2.3.8.3.3 Protection Mechanism per Region Examples

The access permission of each region is configurable and defined through the [MRM_PERMISSION_REGION_HIGH_j](#) and [MRM_PERMISSION_REGION_LOW_j](#) registers (see [Section 14.2.3.8.3.2, L3 Firewall Registers Overview](#)).

Master NIU permissions:

1. To give read access to the master NIU with ConnID = n, set the [MRM_PERMISSION_REGION_HIGH_j\[n × 2\] Rn](#) bit.
2. To give write access to the master NIU with ConnID = n, set the [MRM_PERMISSION_REGION_HIGH_j\[n × 2 + 1\] Wn](#) bit.

Debug permissions:

1. To give privilege debug access, set the [MRM_PERMISSION_REGION_LOW_j\[15\] PUB_PRV_DEBUG](#) bit.
2. To give user debug access, set the [MRM_PERMISSION_REGION_LOW_j\[14\] PUB_USR_DEBUG](#) bit.

User, read/write/executable permissions:

1. To give privilege write access, set the [MRM_PERMISSION_REGION_LOW_j\[11\] PUB_PRV_WRITE](#) bit.
2. To give privilege read access, set the [MRM_PERMISSION_REGION_LOW_j\[10\] PUB_PRV_READ](#) bit.
3. To give privilege exe access, set the [MRM_PERMISSION_REGION_LOW_j\[9\] PUB_PRV_EXE](#) bit.
4. To give user write access, set the [MRM_PERMISSION_REGION_LOW_j\[8\] PUB_USR_WRITE](#) bit.
5. To give user read access, set the [MRM_PERMISSION_REGION_LOW_j\[7\] PUB_USR_READ](#) bit.
6. To give user exe access, set the [MRM_PERMISSION_REGION_LOW_j\[6\] PUB_USR_EXE](#) bit.

Example: To provide debug write privilege access to the master NIU ConnID = 7, the following bits must be set:

- [MRM_PERMISSION_REGION_HIGH_j\[15\] W7](#)
- [MRM_PERMISSION_REGION_LOW_j\[15\] PUB_PRV_DEBUG](#)

14.2.3.8.3.4 L3 Firewall Error Logging

If a protection violation error is detected, the following signals are generated:

- An in-band error is generated to the master NIU of the access.
- An interrupt is generated to the Cortex-A9 and DSP INTCs.

The L3 interconnect does not differentiate errors generated by firewalls from all other supported types of errors.

An in-band error is generated by modules each time an access is not allowed. When an in-band error is sent back into the transaction it is seen as an external prefetch or data abort by the initiator, depending on whether the transaction was an instruction fetch or a data access.

Information about in-band errors is logged into two registers:

- **ERROR_LOG_k**: Logs the information about the start/end address of the hit region and the qualifiers of the transaction
- **LOGICAL_ADDR_ERRLOG_k[31:12]**: Logs the address of the failed access

NOTE: When a multiport firewall is implemented, these registers are duplicated for each port.

Table 14-26 lists the L3 firewall error-logging registers.

Table 14-26. L3 Firewall Error-Logging Registers

| Register Name | Register Field Name | Field Modifiability | Parameter Comments |
|--------------------|----------------------------|---------------------|---|
| ERROR_LOG_k | RESERVED[31:24] | Read only | Reads return 0s. |
| | BLK_BURST_VIOLATION[23] | Read/write | Read 0x1: 2D burst not allowed or exceeds allowed size. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers. |
| | RESERVED[22] | Read only | Reads return 0s. |
| | REGION_START_ERRLOG[21:17] | Read/write | Read: Wrong access hit this region number. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers. |
| | REGION_END_ERRLOG[16:12] | Read/write | Read: Wrong access hit this region number. Write to clear the ERROR_LOG_k and LOGICAL_ADDR_ERRLOG_k registers. |
| | REQINFO_ERRLOG[11:0] | Read/write | Mapping of the error according to the reqinfo vector: [11:8] ConnID [3:0] [7] MCMD [0] [3] MReqDebug [1] MReqSupervisor [0] MReqType |

L3 firewall errors can be cleared by writing to the **ERROR_LOG_k** register in the firewall that recorded the error. Clearing the **ERROR_LOG_k** register deasserts the corresponding error if it exists.

The L3 firewall register **ERROR_LOG_k** must be cleared before clearing the **CONTROL_CORE_SEC_ERR_STATUS_FUNC** and **CONTROL_CORE_SEC_ERR_STATUS_DEBUG** registers in the control module.

When a protection violation occurs, an interrupt is sent to the MPU and IVA-HD INTC (if enabled). An in-band error is sent back, and an error is logged in the **CONTROL_SEC_ERR_STATUS_FUNC** and **CONTROL_SEC_ERR_STATUS_DEBUG** registers, depending on the functional mode:

- In application mode:
 - **CONTROL_SEC_ERR_STATUS_FUNC[01]** - L3 RAM protection violation
 - **CONTROL_SEC_ERR_STATUS_FUNC[02]** - GPMC protection violation
 - **CONTROL_SEC_ERR_STATUS_FUNC[03]** - EMIF protection violation
 - **CONTROL_SEC_ERR_STATUS_FUNC[04]** - IVA-HD protection violation

- CONTROL_SEC_ERR_STATUS_FUNC[05] - Cortex-M3 protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[06] - SL2 protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[09] - BB2D protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[12] - C2C slave NIU protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[13] - SGX protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[14] - DSS protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[15] - ISS protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[18] - DEBUG protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[19] - ABE protection violation
- CONTROL_SEC_ERR_STATUS_FUNC[20] - C2C init protection violation
- In debug mode:
 - CONTROL_SEC_ERR_STATUS_DEBUG[01] - L3 RAM protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[02] - GPMC protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[03] - EMIF protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[04] - IVA-HD protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[05] - Cortex-M3 protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[06] - SL2 protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[09] - BB2D protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[12] - C2C slave NIU protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[13] - SGX protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[14] - DSS protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[15] - ISS protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[18] - DEBUG protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[19] - ABE protection violation
 - CONTROL_SEC_ERR_STATUS_DEBUG[20] - C2C init protection violation

For more information, see [Chapter 19, Control Module](#).

14.2.3.8.3.5 L3 Firewall Default Configuration

[Table 14-27](#) summarizes the configuration of the L3 firewalls.

Table 14-27. L3 Firewalls Default Configurations

| Device/Region: 0 | | | | | | |
|----------------------|-------------|------------------|------------|--------------|--|--|
| Permission Type | Reset Value | Reset Value | Reset Type | Run Time | Firewall Register (where j = 0) | Control Module Register |
| ACCESS_PERMISSION | All | 0xFFFF | Exported | Configurable | MRM_PERMISSION_REGION_LOW_j[11:0] | CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF[k] |
| DEBUG_PERMISSION | All | 0xF | Exported | Configurable | MRM_PERMISSION_REGION_LOW_j[15:12] | CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF[l] CONTROL_CORE_L3_HW_FW_EXPORTED_VALUES_CONF[k] |
| INITIATOR_PERMISSION | All | 0xFFFF FFFFFF | Tied | Configurable | MRM_PERMISSION_REGION_HIGH_j[31:0] | N/A |

NOTE: For the values of k and l, see [Table 14-28](#).

Table 14-28. Control Module Register – Factorization

| Variable Value | | Module Name | Regions |
|----------------|----|------------------------|----------------|
| k | l | | |
| 3 | 19 | L3 RAM firewall | Regions 1 to 9 |
| 0 | 16 | GPMC firewall | Regions 1 to 7 |
| 7 | 23 | SL2 firewall | Regions 1 to 7 |
| 6 | 22 | SGX firewall | Regions 1 to 7 |
| 5 | 21 | ISS firewall | Regions 1 to 7 |
| 5 | 21 | Cortex-M3 firewall | Regions 1 to 7 |
| 4 | 20 | DSS firewall | Regions 1 to 7 |
| 8 | 24 | IVAHD firewall | Regions 1 to 7 |
| 10 | 26 | BB2D firewall | Regions 1 to 7 |
| 12 | 28 | DEBUG firewall | Region 1 |
| 13 | 29 | ABE firewall | Region 1 |
| 1 | 17 | C2C slave NIU firewall | Region 1 |
| 9 | 25 | C2C init firewall | Regions 1 to 3 |
| 11 | 27 | EMIF firewall | Regions 1 to 7 |

14.2.3.9 L3 Interconnect Error Handling

Error logging is enabled in the L3 interconnect. The three major types of errors are:

- Slave NIU errors
- Firewall errors (see [Section 14.2.3.8.3.4, L3 Firewall Error Logging](#))
- Flag mux errors

14.2.3.9.1 Global Error-Routing Scheme

[Figure 14-6](#) shows the L3 global error-routing scheme.

Figure 14-6. L3 Global Error-Routing Scheme

13-005

14.2.3.9.2 Slave NIU Error Logging

Error logging is implemented only at slave NIUs. Because the interconnect does not support master NIU error logging, an erroneous packet must be created and sent to one of the slave NIUs. The slave NIU that receives an erroneous packet is predictable but can change per master (see [Table 14-29](#)).

Table 14-29. L3 Connectivity and Holes Error Routing

| Master | Connectivity and Hole Errors Logged Into Slave NIUs |
|------------------|---|
| L3_MN_DAP | L3_SN_GPMC |
| L3_MN_CORTEXM3 | |
| L3_MN_CORTEXA9 | |
| L3_MN_SDMA_RD | |
| L3_MN_SDMA_WR | |
| L3_MN_DSP | L3_SN_DMM1 |
| L3_MN_IVANHD | |
| L3_MN_MMC1 | |
| L3_MN_MMC2 | |
| L3_MN_SGX_P1 | |
| L3_MN_BB2D_P1 | L3_SN_DMM2 |
| L3_MN_DSS | |
| L3_MN_ISS | |
| L3_MN_FACEDETECT | |
| L3_MN_SGX_P2 | |
| L3_MN_BB2D_P2 | L3_SN_OCM_RAM |
| L3_MN_HSUSBOTG | |
| L3_MN_HSI | L3_SN_ABE |
| L3_MN_HSUSBHOST | |
| L3_MN_C2C | L3_SN_L4_PER3 |

The slave NIU can be configured to report standard errors (errors generated within the interconnect):

- Firewall error: Protection violation; this error indicates that a request was rejected by a firewall and is reported to the control module. For more information, see [Section 14.2.3.8.3.4, L3 Firewall Error Logging](#).
- Address hole: This error reports an unknown address for a request. The address map is local to each master NIU; therefore, an address hole error is reported each time a master NIU requests an access to a slave NIU to which it is not logically connected, even if this address exists in the global L3 address map. This error is detected only once per burst.
- Unsupported commands: This error reports that the master NIU sent a command that cannot be processed, because the slave NIU cannot accept it and no conversion to another command is possible. This error is detected only once per burst.
- Report custom errors: Basically, when the slave answer is SResp = ERR
- Report severity level, for standard error and custom errors:
 - None: Error logging for this type of error is disabled.
 - Error: Error is logged for this type of error.
 - Fault: Error is logged and interrupt is generated for this type of error.
- Generate interrupt on 2 bits depending on the MReqDebug qualifier:
 - Application error - Fault[0]
 - Debug error - Fault[1]

By default, all slave NIUs are configured with standard and custom error levels set to FAULT. The errors are reported on the two flag muxes (see [Figure 14-6](#)), depending on the access type, application or debug. For more information, see [Section 14.2.3.9.3, Flag Mux Error Logging](#).

The slave NIU power-disconnect component also has error logging enabled. This is because the slave NIU in this case is in a clock domain that is switched off and therefore cannot catch the error. By nature, this component can generate only standard errors. By default, it is configured with the error level set to FAULT.

Wake up on demand: If an error packet reaches a slave NIU that is set with MDiscBehave = 1 (wake up on demand), then the active signal is asserted and L3 processes the error generation when the

slave is awake. This is inefficient but it simplifies NIU implementation and should not be a problem, because errors are supposed to occur only during software debug.

14.2.3.9.3 Flag Mux Error Logging

All fault signals are sent to a flag mux component. There are four important FLAGMUX registers:

- [L3_FLAGMUX_MASK0](#): Masks application error sources
- [L3_FLAGMUX_MASK1](#): Masks debug error sources
- [L3_FLAGMUX_REGERR0](#): Checks which application error sources are active
- [L3_FLAGMUX_REGERR1](#): Checks which debug error sources are active

The two L3_FLAGMUX_MASK registers mask bit 0 or bit 1 of the flag inputs, and the L3_FLAGMUX_REGERR registers read input errors. Each register is dedicated to reporting the bit corresponding to the register number.

[Table 14-30](#) describes the mapping of the flags to the corresponding sources.

Table 14-30. Interconnect Flag Mapping

| | Flag Mux Input | Source |
|---------------|----------------|-----------------|
| CLK1 flag mux | 0 | L3_SN_DMM1 |
| | 1 | L3_SN_DMM2 |
| | 2 | L3_SN_ABE |
| | 3 | L3_SN_L4CFG |
| | 4 | CLK2 PWR DISC |
| CLK2 flag mux | 0 | L3_SN_Cortex-M3 |
| | 1 | L3_SN_DSS |
| | 2 | L3_SN_GPMC |
| | 3 | L3_SN_ISS |
| | 4 | L3_SN_IVAHD |
| | 5 | Reserved |
| | 6 | L3_SN_L4PER0 |
| | 7 | L3_SN_OCMCRAM |
| | 8 | L3_SN_GPMC |
| | 9 | L3_SN_SGX |
| | 10 | L3_SN_SL2 |
| | 11 | L3_SN_C2C |
| | 12 | CLK1 PWR DISC |
| | 13 | Reserved |
| | 14 | Reserved |
| | 15 | L3_SN_L4PER3 |
| | 16 | L3_SN_L4PER1 |
| | 17 | L3_SN_L4PER2 |
| CLK3 flag mux | 18 | BB2D |
| | 0 | DEBUGSS |

14.2.3.9.4 Severity Level of Standard and Custom Errors

The slave NIU registers are important for error logging.

- The [L3_TARG_STDERRLOG_SVRTSTDLVL](#) register shows the severity level for standard errors. According to the severity level, error logging is disabled, enabled with level ERROR, or enabled with level ERROR and flag FAULT.
- The [L3_TARG_STDERRLOG_SVRTCUSTOMLVL](#) register shows the severity level for custom errors (see [L3_TARG_CUSTOMERRLOG_SVRTCUSTOMLVL](#)).

- The [L3_TARG_STDERRLOG_MAIN](#) register is the main register for error-logging management. It shows the validity of the logged information, standard or custom.
- The [L3_TARG_STDERRLOG_HDR](#) register stores packets in case of a standard error.
- The [L3_TARG_STDERRLOG_MSTADDR](#) register returns the MSTADDR field of the logged packet.
- The [L3_TARG_STDERRLOG_SLVADDR](#) register returns the SLVADDR field of the stored packet.
- The [L3_TARG_STDERRLOG_INFO](#) register saves the information field of the logged packet.

14.2.4 L3 Interconnect Programming Guide

14.2.4.1 L3 Interconnect Low-Level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L3 interconnect module.

14.2.4.1.1 Global Initialization

14.2.4.1.1.1 Global Initialization of Surrounding Modules

This section identifies the requirements for initializing the surrounding modules when the L3 interconnect module is to be used for the first time after a device reset. The initialization of surrounding modules is based on the integration and environment of the L3 interconnect. For more information, see [Section 14.2.2, L3 Interconnect Integration](#).

[Table 14-31](#) lists the surrounding modules.

Table 14-31. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------|---|
| PRCM | For information about the configuration of the PRCM module, see Chapter 3, Power, Reset, and Clock Management . |
| Control module | For information about the configuration of the control module, see Chapter 19, Control Module . |
| MPU INTC | The MPU INTC must be configured to enable interrupts from the L3 interconnect module. See Chapter 18, Interrupt Controllers . |
| sDMA | For information about the configuration of the sDMA, see Chapter 17, sDMA . |
| L3 interconnect | For information about the configuration of the interconnect, see Chapter 14, Interconnect . |

14.2.4.2 Operational Modes Configuration

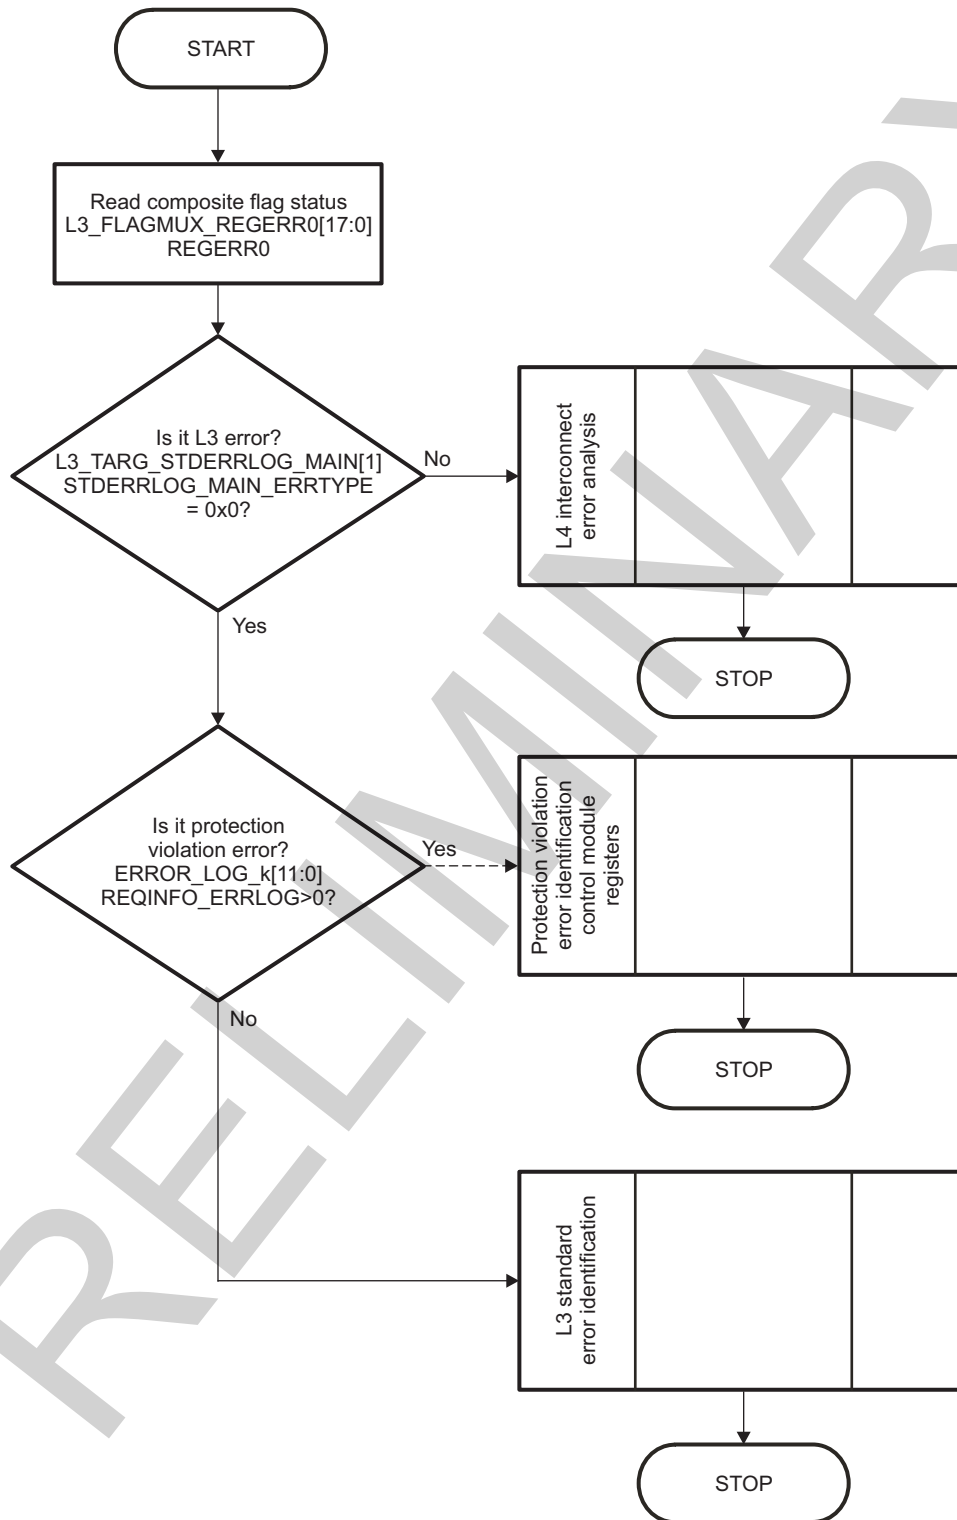

14.2.4.2.1 L3 Interconnect Error Analysis Mode

14.2.4.2.1.1 Main Sequence: L3 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 14-7](#) shows the software sequence required in most cases.

Figure 14-7. Typical Error Analysis Sequence

I3-013

Table 14-32 lists the register call summary for error analysis mode in the main sequence.

Table 14-32. Register Call Summary: Main Sequence – Error Analysis Mode

| Register Name | Register Name | Register Name |
|--|---|--|
| ERROR_LOG_k | L3_FLAGMUX_REGERR0 | L3_FLAGMUX_REGERR1 |
| L3_TARG_STDERRLOG_MAIN | CONTROL.CONTROL_SEC_ERR_STAT US_FUNC | CONTROL.CONTROL_SEC_ERR_STAT US_DEBUG |

[Table 14-33](#) lists the subprocess call summary for error analysis mode in the main sequence.

Table 14-33. Subprocess Call Summary for Main Sequence – Error Analysis Mode

| Subprocess | Cross-Reference |
|---|--|
| L4 interconnect error analysis | See Section 14.2.4.2.1 , <i>L4 Interconnect Error Analysis Mode</i> . |
| L3 interconnect protection violation error identification | See Section 14.2.4.2.1.1.2 , <i>Subsequence: L3 Interconnect Protection Violation Error Identification</i> . |
| L3 interconnect unsupported command/address hole error identification | See Section 14.2.4.2.1.1.3 , <i>Subsequence: L3 Interconnect Unsupported Command/Address Hole Error Identification</i> . |
| L3 interconnect reset FLAGMUX and module | See Section 14.2.4.2.1.1.4 , <i>Subsequence: L3 Interconnect Reset FLAGMUX and Module</i> . |

14.2.4.2.1.1.1 L3 Custom Error Identification

[Table 14-34](#) demonstrates custom error identification.

Table 14-34. Custom Error Identification

| Step | Register | Value |
|--|---|-------|
| IF: Is CustomError detected? | L3_TARG_STDERRLOG_MAIN [1] STDERRLOG_MAIN_ERRTYPE | = 0x1 |
| Read info field of the response packet. | L3_TARG_STDERRLOG_CUSTOMINFO _INFO[7:0] STDERRLOG_CUSTOMINFO_INFO | xxx |
| Read the address of the initiator that caused the error. | L3_TARG_STDERRLOG_CUSTOMINFO _MSTADDR[7:0] STDERRLOG_CUSTOMINFO_MSTADDR | xxx |
| Read the type of the operation (read/write). | L3_TARG_STDERRLOG_CUSTOMINFO _OPCODE[1:0] STDERRLOG_CUSTOMINFO_OPCODE | xxx |
| ENDIF | | |

NOTE: To understand why the target IP has returned an error, the user must read the target IP registers.

14.2.4.2.1.1.2 Subsequence: L3 Interconnect Protection Violation Error Identification

The procedure listed in [Table 14-35](#) describes protection violation error identification and where it is logged in the control module registers. Two types of errors are logged: application errors and debug errors.

Table 14-35. Protection Violation Error Identification

| Step | Register/Bit Field/Programming Model | Value |
|--|---|-------|
| Read the burst violation. | ERROR_LOG_k [23] BLK_BURST_VIOLATION | xxx |
| Read the initiator ID. | ERROR_LOG_k [11:8] CONNID | xxx |
| Read the command that caused the error. | ERROR_LOG_k [7] MCMD | xxx |
| Read the address of the request that caused the error. | LOGICAL_ADDR_ERRLOG_k [31:0] SLVOFS_LOGICAL | xxx |

Table 14-35. Protection Violation Error Identification (continued)

| Step | Register/Bit Field/Programming Model | Value |
|---|--|-------|
| IF: Is it an application error? | L3_FLAGMUX_REGERR0 [18:0] REGERROR0 | = 0x0 |
| Read the status bits to see which module firewall has worked. | CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[20:0] | xxx |
| Clear the status bits. | CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[20:0] | xxx |
| Clear the status bit. | L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_MAIN_CLRLOG | 0x0 |
| ELSE IF | L3_FLAGMUX_REGERR1 [18:0] REGERROR1 | = 0x1 |
| Read the status bits to see the module. | CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG[20:0] | xxx |
| Clear the status bits. | CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG[20:0] | xxx |
| Clear the status bit. | L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_MAIN_CLRLOG | 0x0 |
| ENDIF | | |
| Clear the burst violation. | ERROR_LOG_k [23] BLK_BURST_VIOLATION | 0x0 |
| Clear the error status. | ERROR_LOG_k [21:17] REGION_START_ERRLOG | 0x00 |

14.2.4.2.1.1.3 Subsequence: L3 Interconnect Standard Error Identification

The procedure listed in [Table 14-36](#) describes the identification of standard errors inside the L3 interconnect. The standard errors are: unsupported command, address hole, and disconnect.

Table 14-36. L3 Standard Error Identification

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------|
| IF: Is an error detected? | L3_TARG_STDERRLOG_MAIN [18] STDERRLOG_MAIN_ERRCNT | = 0x1 |
| Read the corresponding flag. | L3_FLAGMUX_REGERR0 [18:0] REGERROR0 | xxx |
| Read the corresponding flag. | L3_FLAGMUX_REGERR1 [18:0] REGERROR1 | xxx |
| Localize the slave NIU that generated the error. | See Table 14-30 . | |
| ELSE | | |
| Clear the error log. | L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_MAIN_CLRLOG | 0x0 |
| Clear the severity error status. | L3_TARG_STDERRLOG_SVRTSTDLVL [1:0] STDERRLOG_SVRTSTDLVL_0 | 0x2 |
| ENDIF | | |

14.2.4.2.1.1.4 Subsequence: L3 Interconnect FLAGMUX Configuration

The procedure listed in [Table 14-37](#) gives information about the configuration of FLAGMUX masks.

Table 14-37. FLAGMUX Configuration

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------|
| Set the FLAGMUX masks to mask an event. | L3_FLAGMUX_MASK0 [18:0] MASK0 L3_FLAGMUX_MASK1 [18:0] MASK1 | xxx |
| Read the REGERR bits to see if an error is recorded. | L3_FLAGMUX_REGERR0 [18:0] REGERR0 L3_FLAGMUX_REGERR1 [18:0] REGERR1 | xxx |
| Clear the slave NIU error log and the FLAGMUX error. | L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_SVRTSTDLVL_0 | 0x2 |

PRELIMINARY

14.2.5 L3 Interconnect Register Manual

14.2.5.1 L3 Register Group Summary

The registers in the L3 interconnect are divided into eight groups:

- Firewall registers (See [Table 14-39](#))
- HOST registers (See [Table 14-62](#))
- TARG registers (See [Table 14-98](#))
- PWR_DISK registers (See [Table 14-140](#))
- FLAGMUX registers (See [Table 14-164](#))
- BW registers (See [Table 14-179](#))
- RA registers (See [Table 14-208](#))
- STATCOLL registers (See [Table 14-216](#))

14.2.5.1.1 L3 Firewall Registers Summary and Description

Table 14-38. L3 Firewall Instance Summary

| Module Name | Base Address | Size |
|-------------------------|--------------|------|
| C2C-Master NIU firewall | 0x4A20 4000 | 4KB |
| C2C-Slave NIU firewall | 0x4A20 6000 | 4KB |
| MA firewall | 0x4A20 A000 | 4KB |

| 3 | STDHOSTHDR_MAINCTLREG_CM | | Reserved for internal testing. Must be set to 0. Type: Control. Reset value: 0x0. | | | | | | | | | | | | | | | | | | | R | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 2 | STDHOSTHDR_MAINCTLREG_FLT | | Asserted when a Fault condition is detected: if the unit includes Error Logging, Flt is asserted when the FltCnt register field indicates a Fault, and deasserted when FltCnt is reset. If no Error Logging is implemented, this bit becomes unit-dependent. In all cases, Flt bit and Flt pin (service network) have the same logical level. Type: Status. Reset value: X. | | | | | | | | | | | | | | | | | | | R | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 1 | RESERVED | | Reserved | | | | | | | | | | | | | | | | | | | R | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 0 | STDHOSTHDR_MAINCTLREG_EN | | Sets the global core enable. Note: A disabled master does not generate any NTPP requests, and a disabled slave replies with an error packet to any request it receives. Type: Control. Reset value: 0x1. | | | | | | | | | | | | | | | | | | | RW | 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

14.3 L4 Interconnects

This section details the device L4 interconnects.

14.3.1 L4 Interconnect Overview

The device uses three separate L4 interconnect structures to connect peripheral modules. All L4s handle transfers with peripherals but are in distinct power domains.

[Figure 14-8](#) is an overview of the L4 interconnects and the peripherals attached to them.

The L4 interconnect is composed of the following interconnects:

- L4_CFG: Includes the majority of the configuration interface for L3 system modules and peripheral interconnect
- L4_PER: Includes the main peripherals that require sDMA access
- L4_WKUP: Includes peripherals attached to the WKUP power domain

Figure 14-8. L4 Interconnect Overview

icnt-013

The main features of the L4 interconnects are:

- From one to four 32-bit initiator ports for each L4 interconnect instance
- 8-, 16-, or 32-bit data, single, or burst transactions
- Little endian
- Nonblocking architecture with fair arbitration between threads
- Target interfaces: Fully synchronous or divided synchronous
- L4_CFG and L4_PER frequency equal half of L3 frequency
- Protection logic that provides user-configurable access control to targets by each initiator
- Implementation of RFFs to support low-voltage dynamic power switching

14.3.2 L4 Interconnect Integration

Table 14-346 and Table 14-347 summarize the integration of the module in the device.

Table 14-346. Integration Attributes

| Module Instance | Attributes |
|-----------------|--------------|
| | Power Domain |
| L4_PER | PD_L4_PER |
| L4_CFG | PD_CORE |
| L4_WKUP | PD_WKUP |

Table 14-347. Clocks and Resets

14.3.3 L4 Interconnect Functional Description

14.3.3.1 Module Distribution

IAs and TAs provide the interface to connect the different modules to their associated interconnect.

[Table 14-348](#) through [Table 14-353](#) list all the modules and subsystems with their associated agents. The agents are listed for each L4 interconnect domain.

14.3.3.1.1 L4_PER Interconnect Agents

The L4_PER interconnect handles transfers only to peripherals in the PER power domain. [Table 14-348](#) lists the PER TAs.

Table 14-348. L4 PER TAs

| Module Target Name | Description |
|--------------------|---|
| PER_TA_UART1 | UART port 1 module |
| PER_TA_UART2 | UART port 2 module |
| PER_TA_UART3 | UARTport 3 module |
| PER_TA_UART4 | UART port 4 module |
| PER_TA_GPTIMER2 | GPTIMER2 module |
| PER_TA_GPTIMER3 | GPTIMER3 module |
| PER_TA_GPTIMER4 | GPTIMER4 module |
| PER_TA_GPTIMER9 | GPTIMER9 module |
| PER_TA_GPTIMER10 | GPTIMER10 module |
| PER_TA_GPTIMER11 | GPTIMER11 module |
| PER_TA_DSS | Display subsystem configuration module |
| PER_TA_GPIO2 | General-purpose input/output 2 (GPIO2) module |
| PER_TA_GPIO3 | GPIO3 module |
| PER_TA_GPIO4 | GPIO4 module |
| PER_TA_GPIO5 | GPIO5 module |
| PER_TA_GPIO6 | GPIO6 module |
| PER_TA_I2C1 | Multimaster I2C1 module |
| PER_TA_I2C2 | Multimaster I2C2 module |
| PER_TA_I2C3 | Multimaster I2C3 module |
| PER_TA_I2C4 | Multimaster I2C4 module |
| PER_TA_SLIMBUS2 | SILMBUS2 module |
| PER_TA_ELM | Error location module |
| PER_TA_MCBSP4 | McBSP4 module |
| PER_TA_MCSPI1 | McSPI1 module |
| PER_TA_MCSPI2 | MCSPi2 module |
| PER_TA_MCSPI3 | MCSPi3 module |
| PER_TA_MCSPI4 | MCSPi4 module |
| PER_TA_HSMMC1 | MMC controller 1 module |
| PER_TA_HSMMC2 | MMC controller 2 module |
| PER_TA_HSMMC3 | MMC controller 3 module |
| PER_TA_HSMMC4 | MMC controller 4 module |
| PER_TA_HSMMC5 | MMC controller 5 module |
| PER_TA_HDQ1W | Single-wire serial link low-rate module |

Four ports communicate between the L3 interconnect and the L4_PER interconnect to allow the L3 initiators to access the L4_PER targets. [Table 14-349](#) lists the L4_PER initiator TAs.

For the list of initiators authorized to access the L4 peripheral peripherals, see [Section 14.2.3.2.2, Connectivity Matrix](#).

Table 14-349. L4_PER IAs

| Module Initiator Name | Description |
|-----------------------|--|
| PER_IA_0 | L3 system direct memory access (sDMA) RD interconnect port |
| PER_IA_1 | L3 sDMA WR interconnect port |
| PER_IA_2 | L3 MPU subsystem interconnect port |
| PER_IA_3 | L3 others interconnect port |

14.3.3.1.2 L4_CFG Interconnect Agents

The L4_CFG interconnect handles transfers only to peripherals in the core power domain. [Table 14-350](#) lists the L4_CFG TAs.

Table 14-350. L4_CFG TAs

| Module Target Name | Description |
|-----------------------------|------------------------------------|
| CFG_TA_SYSCTRL_GENERAL_CORE | System control general core module |
| CFG_TA_SYSCTRL_PADCONF_CORE | System control padconf core module |
| CFG_TA_CM_CORE_AON | Clock manager 1 module |
| CFG_TA_CM_CORE | Clock manager 1 module core |
| CFG_TA_DMA_SYSTEM | sDMA module |
| CFG_TA_HSI | HS SSI module |
| CFG_TA_SAR_ROM | SAR ROM |
| CFG_TA_HSUSBOTG | HS USB OTG module |
| CFG_TA_HSUSBHOST | HS USB host module |
| CFG_TA_HSUSBPHY | HS USB PHY module |
| CFG_TA_HSUSBTLL | USB TTL module |
| CFG_TA_DSP | DSP subsystem |
| CFG_TA_SR1 | SmartReflex1 module |
| CFG_TA_SR2 | SmartReflex2 module |
| CFG_TA_SR3 | SmartReflex3 module |
| CFG_TA_MAILBOX | Mailbox module |
| CFG_TA_SPINLOCK | Spinlock module |
| CFG_TA_FACEDETECT | Face detect module |
| CFG_TA_MAFW | Memory adapter firewall |
| CFG_TA_EMIFFW | EMIF firewall |
| CFG_TA_GPMCFW | GPMC firewall |
| CFG_TA_OCMCRAMFW | OCMC_RAM firewall |
| CFG_TA_SGXFW | SGX firewall |
| CFG_TA_BB2DFW | BB2D firewall |
| CFG_TA_ISSF | ISS firewall |
| CFG_TA_CORTEXM3FW | Cortex-M3 firewall |
| CFG_TA_DSSFW | Display subsystem (DSS) firewall |
| CFG_TA_SL2FW | SL2 firewall |
| CFG_TA_IVAHDFW | IVA-HD firewall |
| CFG_TA_L3_INSTR | EMU subsystem firewall |
| CFG_TA_ABEFW | ABE firewall |

Table 14-350. L4_CFG TAs (continued)

| Module Target Name | Description |
|------------------------|-----------------------------------|
| CFG_TA_L4_WKUP | L4_WKUP connection |
| CFG_TA_MODEM_ICR_PA/PB | Modem intercommunication register |

A unique port, CFG_IA_0, communicates between the L3 interconnect and the L4_CFG interconnect to allow the L3 initiators to access the L4_CFG targets (see [Table 14-351](#)).

For the list of initiators authorized to access the L4_CFG peripherals, see [Section 14.2.3.2.2, Connectivity Matrix](#).

Table 14-351. L4_CFG IAs

| Module Initiator Name | Description |
|-----------------------|----------------------|
| CFG_IA_0 | L3 interconnect port |

14.3.3.1.3 L4_WKUP Interconnect Agents

The L4-WKUP interconnect handles transfers only to peripherals in the WKUP power domain.

[Table 14-352](#) lists the TAs. [Table 14-353](#) lists the L4 WKUP initiator agents.

Table 14-352. L4_WKUP TAs

| Module Target Name | Description |
|------------------------------|--|
| WKUP_TA_GPIO1 | GPIO1 module |
| WKUP_TA_32KTIMER | 32-kHz timer module |
| WKUP_TA_SAR_RAM | SAR RAM |
| WKUP_TA_KEYBOARD | Keyboard module |
| WKUP_TA_SYSCTRL_GENERAL_WKUP | System control general WKUP module |
| WKUP_TA_SYSCTRL_PADCONF_WKUP | System control padconf WKUP module |
| WKUP_TA_PRM | Power reset management module |
| WKUP_TA_SCRM | System clock and reset management module |
| WKUP_TA_WDTIMER2 | WDTIMER2 module |
| WKUP_TA_GPTIMER1 | GPTIMER1 module |

Table 14-353. L4_WKUP IA

| Module Initiator Name | Description |
|-----------------------|--------------------------|
| WKUP_IA_0 | L4_CFG interconnect port |

14.3.3.2 Power Management

As part of the system-wide power-management scheme, the L4 interconnects go into IDLE state after receiving a request from the PRCM module after all commands are serviced. This function is handled by hardware. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

To reduce power consumption, each L4 interconnect automatically performs internal clock autogating. This is managed by hardware; no software configurations or settings are required.

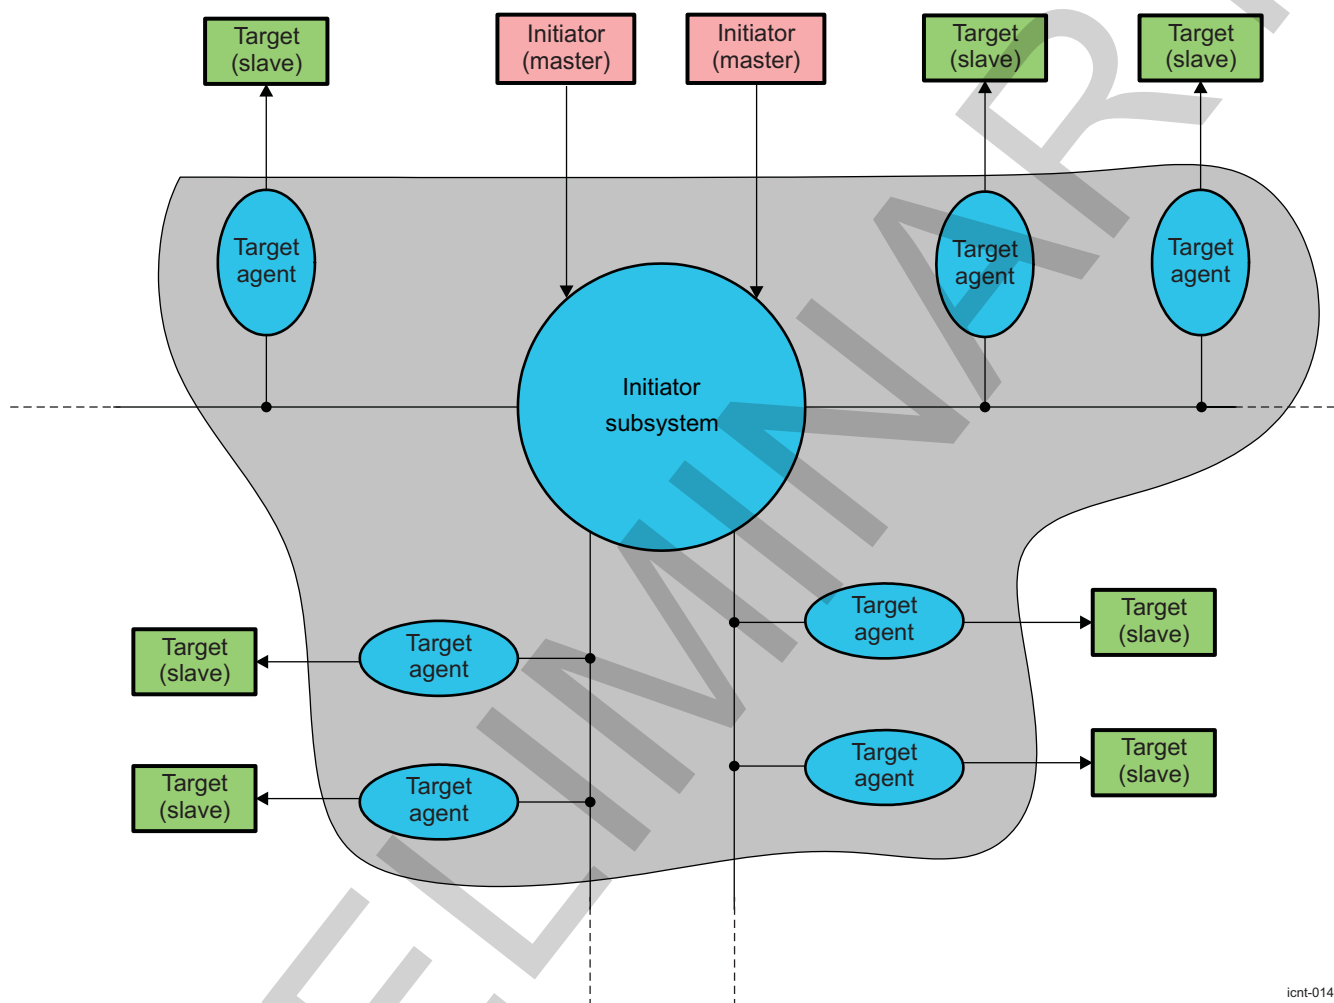

Retention is performed on all software-accessible registers at IAs, TAs, and firewalls. This process prevents reconfiguration after a clock domain switches off. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

14.3.3.3 L4 Firewalls

[Figure 14-9](#) is an internal view of the L4 interconnects in the overall interconnect. This architecture, with

one initiator subsystem centralizing all initiator master requests and distributing them to all target modules (peripherals), enables the L4 interconnect firewall functions to be centralized at the L4 initiator subsystem level. The L4 firewall filters the accesses based on the configurable protection groups defined in the L4 address protection (AP) registers. Each module or TA is assigned to a protection group. The configuration is also defined in the L4 AP and is programmable on a module-per-module basis.

Figure 14-9. L4 Initiator-Target Connectivity

icnt-014

NOTE: As Figure 14-9 shows, targets are attached to branches. Branches do not impact the function of the L4 interconnect but are present to simplify timing closure and reduce active power consumption.

Because of the large address spaces and the number of peripherals connected to an L4 interconnect, two parameters are used to set up access permission:

- Programmable groups for initiators
 - Eight protection groups for L4_PER and L4_CFG interconnect
- Segments divided into regions of 4KB
 - 100 regions for the L4_PER interconnect
 - 104 regions for the L4_CFG interconnect

NOTE:

- Regions and segments are present for the L4_WKUP interconnect but cannot be programmed.
- L4_WKUP protection is done through the L4_CFG interconnect.

Protection group members are TAs with the same protection settings. A region is programmed to allow access to a unique selectable protection group. For better protection, different regions are grouped into protection group regions and associated with a protection group member.

All L4 interconnect information, such as numbers of protection groups, regions, and segments, is available in the [L4_LA_INITIATOR_INFO_L](#) register.

14.3.3.3.1 Protection Group

A protection group is defined by its initiators and REQ_INFO is allowed. Two registers define these two settings:

- The CONNID_BIT_VECTOR field [L4_AP_PROT_GROUP_MEMBERS_k_L](#) is a 1-bit vector that defines which initiator belongs to a group. A protection group is accessible by an initiator when the bit position corresponding to its ConnID is set to 1 in the CONNID_BIT_VECTOR field. [Table 14-354](#) lists all the ConnIDs available at the L4 levels.
- The ENABLE field [L4_AP_PROT_GROUP_ROLES_k_L](#) lists all possible REQ_INFO combinations associated with the [L4_AP_PROT_GROUP_MEMBERS_k_L](#) register. Setting a Req bit in this register determines the initiators type of access. For more information, see [L3 Firewall Functionality](#). Two REQ_INFOS are used in L4 interconnects: MReqDebug and MReqSupervisor.

NOTE: Permissions are identical for read and write accesses in L4 interconnect.

k indicates the protection group number.

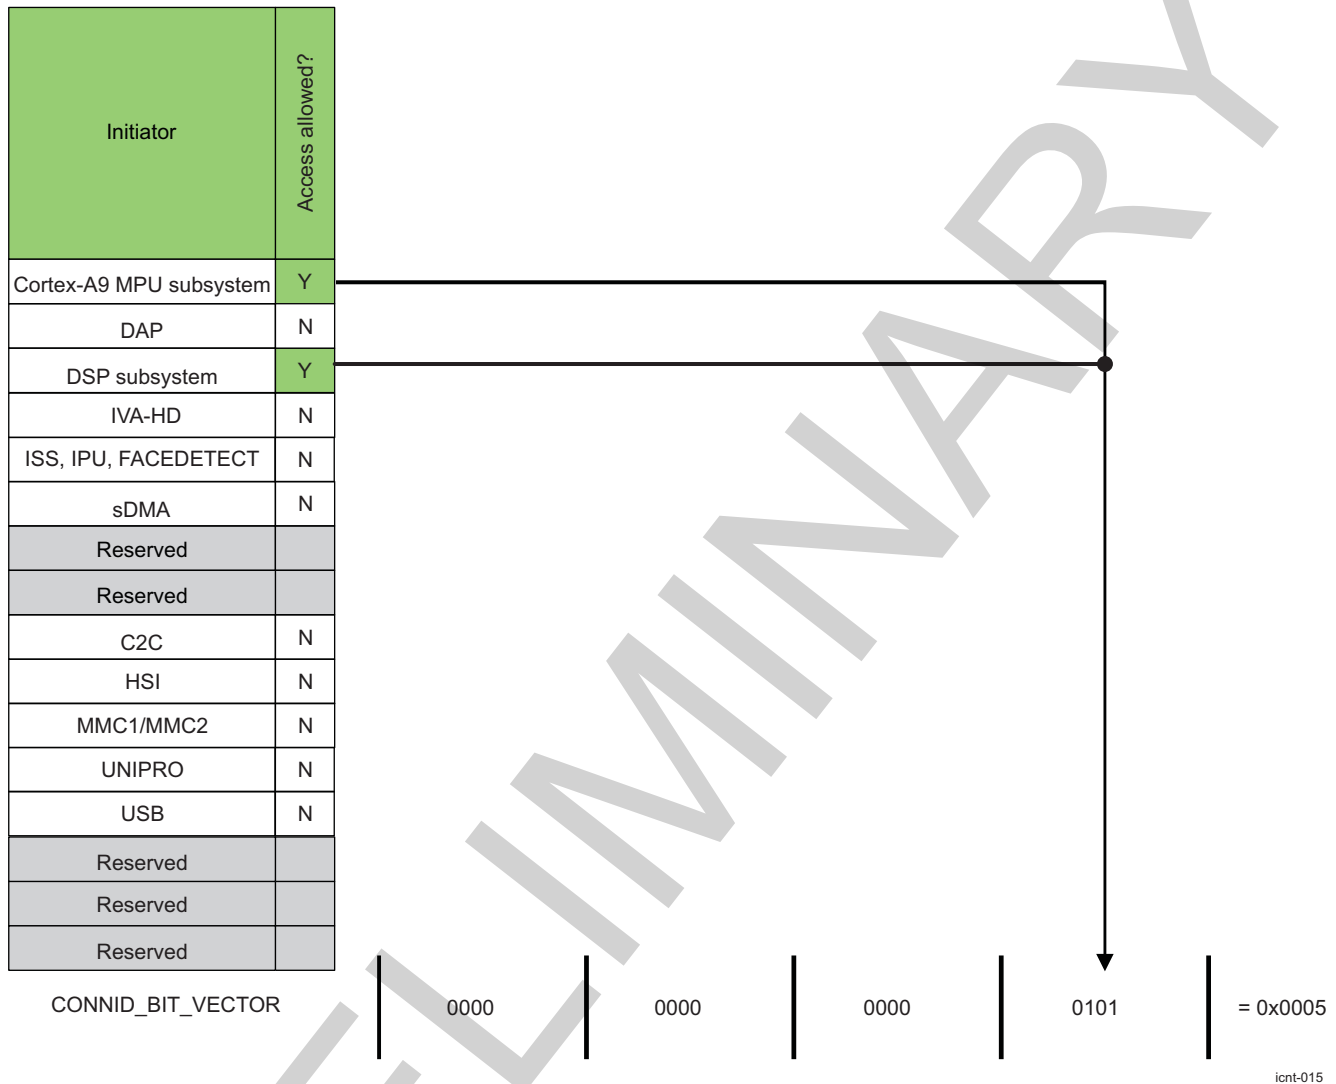

L indicates the region number.

Table 14-354. L4 ConnID Definition

| ConnID | Initiator |
|--------|-------------------------|
| 0 | Cortex-A9 MPU Subsystem |
| 1 | DAP |
| 2 | DSP |

| B | UNIPRO |
| C | USB |
| D | RESERVED |
| E | RESERVED |
| F | RESERVED |

Figure 14-10 is an example of CONNID_BIT_VECTOR.

Figure 14-10. Example of CONNID_BIT_VECTOR L4_AP_PROT_GROUP_MEMBERS_k

Setting bits 0 and 2 in the PROT_GROUP_ID_1 register defines a group initiator that can access targets in protection group 1, and includes the following:

- Cortex-A9 MPU subsystem
- DSP subsystem

Protection group 1 can be applied to multiple protection regions with no limitation. Each protection region that is configured with protection group 1 enables permission access only to the two initiators.

The L4_AP_REGION_I_H PROT_GROUP_ID field determines the region to which the protection group member is attached.

The values of some CONNID_BIT_VECTOR and ENABLE fields are exported by the system control module (SCM) at reset or are user writable (see Table 14-477 for more information).

Table 14-355 and Table 14-356 list the default configuration of the various groups for each L4 interconnect. For each group, some modules/regions are associated with it with default initiator members.

Table 14-355. L4_PER Firewall Default Configuration

| Group | Default Modules Associated With Group | Register | Modifiability | Default Value |
|--------------------------|---------------------------------------|--|---------------|-------------------|

| | | L4_AP_PROT_GROUP_MEM BERS_7_L | Yes | 0xFFFF (all) |

14.3.3.3.2 Segments and Regions

The protection mechanism for L4 interconnects is based on a hierarchical segmentation, as shown in [Figure 14-11](#). By default, some regions are attached to specific protection group members. This specificity lets users set up the permission access to certain types of modules requiring the same access protection without managing region allocation.

Figure 14-11. L4 Segmentation

icnt-016

All interconnect address spaces are covered by regions. [Table 14-357](#) through [Table 14-359](#) list the module mapping with their addresses, region numbers, and default protection group allocated to them.

NOTE: Module refers to the configuration registers of the module.

TA refers to the interconnect configuration registers of the TA associated with the module.

Table 14-357. Region Allocations for L4_PER Interconnect

14.3.3.3.3 L4 Firewall Address and Protection Register Settings

Table 14-360 lists the settings of the AP registers relative to an L4 interconnect firewall. These values are computed based on the physical implementation of each L4 interconnect.

Table 14-360. L4 Firewall Register Description Overview

| Register Type | Register Name | Bits | Field | Description |
|-------------------|---|-------|---------------------|--|
| Segment | L4_AP_SEGMENT_i_L ⁽¹⁾ | 23:0 | BASE | Segment base address |
| | L4_AP_SEGMENT_i_H ⁽¹⁾ | 4:0 | SIZE | Segment size equals 2 ^{SIZE} |
| Protection groups | L4_AP_PROT_GROUP_MEMBERS_k_L ⁽²⁾ | 15:0 | CONNID_BIT_VECTOR | For L4ConnID, see Table 14-354. |
| | L4_AP_PROT_GROUP_ROLES_k_L ⁽²⁾ | 31:0 | ENABLE | For REQ_INFO description, see Section 14.2.3, L3 Interconnect Functional Description. ⁽³⁾ |
| Region setting | L4_AP_REGION_l_L ⁽⁴⁾ | 23:0 | BASE | Defines the base address of region with respect to its segment base address |
| | L4_AP_REGION_l_H ⁽⁴⁾ | 27:24 | SEGMENT_ID | Segment ID number of the region |
| | | 22:20 | PROT_GROUP_ID | Protection group member attached to the region |
| | | 19:17 | BYTE_DATA_WIDTH_EXP | Determines the number of bytes in an access |
| | | 5:1 | SIZE | Region size equals 2 ^{SIZE} |
| | | 0 | ENABLE | Enables the region protection |

⁽¹⁾ i = 0 to 1 for PER_AP
i = 0 to 6 for CFG_AP

⁽²⁾ k = 0 to 7 for PER_AP
k = 0 to 7 for CFG_AP

⁽³⁾ For L interconnects, only MReqDebug and MReqSupervisor are available.

⁽⁴⁾ l = 0 to 96 for PER_AP
l = 0 to 113 for CFG_AP

14.3.3.4 L4 Error Detection and Reporting

14.3.3.4.1 IA and TA Error Detection and Logging

The L4 interconnect provides mechanisms for handling internally detected errors or errors reported by modules attached to the L4 target ports.

NOTE: L4_IA and L4_TA denote the IA and TA, respectively, for all L4 interconnects: L4_PER, L4_CFG, and L4_WKUP.

The L4 interconnects handle four types of errors:

- No target core found or address hole, detected and logged at IA
- Unsupported command, detected and logged at IA
- Protection violation, detected and logged at IA (see Section 14.3.3.3, L4 Firewalls)
- Target does not service a request before a time-out expires. The error is detected and logged at TA (see Section 14.3.3.4.2, Time-Out).

Table 14-361 lists the value of the [L4_IA_ERROR_LOG_L\[25:24\]](#) CODE bit field stored when an error occurs.

Table 14-361. L4 CODE Bit Field Definition

| CODE (bits 1:0) | Error Type | REQ_INFO | Secondary | ConnID | CMD |
|-----------------|----------------------|----------|-----------|--------|-----|
| 0 | No error | | | | |
| 1 | Unsupported command | x | x | x | x |
| 2 | Address hole | x | x | x | x |
| 3 | Protection violation | x | | x | x |

- No target core found/address hole: This error indicates that a request was addressed to a hole in the L4 address map. When this error occurs, an in-band error response is returned to the L3 level. The error is also logged into the [L4_IA_AGENT_STATUS_L\[27\]](#) INBAND_ERROR bit. Additionally, an address hole error code is logged to the [L4_IA_ERROR_LOG_L\[25:24\]](#) CODE bit field.
- Unsupported command: This error indicates that the command type of the request is not supported by the accessed target register. The error is logged into the [L4_IA_AGENT_STATUS_L\[27\]](#) INBAND_ERROR bit. An unsupported command error code is written to the [L4_IA_ERROR_LOG_L\[25:24\]](#) CODE bit field for the initiator interface.
- Protection violation: This error indicates that a request is not issued from an allowed initiator member or is issued with the inappropriate ReqInfo qualifiers associated with the target region. This error is reported using an in-band error and is written to the [L4_IA_AGENT_STATUS_L\[27\]](#) INBAND_ERROR bit. A protection violation error code is saved into the [L4_IA_ERROR_LOG_L\[25:24\]](#) CODE bit field for the same initiator interface. A protection violation is also logged in the [L4_IA_AGENT_STATUS_L\[31\]](#) PROT_ERROR_SECONDARY or [30] PROT_ERROR_PRIMARY bit when in debug or applicative mode, respectively.

The [L4_IA_ERROR_LOG_L\[30\]](#) SECONDARY bit indicates whether the error occurred in application or debug.

The [L4_IA_ERROR_LOG_H\[15:0\]](#) REQ_INFO bit field returns the type access (REQ_INFO qualifier) that caused the error.

The [L4_IA_ERROR_LOG_L\[11:8\]](#) CONNID bit field returns the ID of the initiator that caused the error.

The [L4_IA_ERROR_LOG_ADDR_L\[31:0\]](#) register logs the address for error conditions.

A [L4_IA_ERROR_LOG_L\[31\]](#) MULTI bit is asserted when multiple errors are detected. In this case, the error code corresponds to the first error that occurs.

14.3.3.4.2 Time-Out

A time-out mechanism can be enabled at the interconnect level and on a per-target basis. If the mechanism is enabled for a TA and interconnect and commands are not accepted or responses are not returned within the expected delay, the L4 interconnect generates an error event.

NOTE: The time-out mechanism is not available on the L4_WKUP interconnect, but L4_WKUP time-outs are detected in CFG_TA_L4WKUP of the L4_CFG interconnect.

The error is logged in the [L4_TA_AGENT_STATUS_L\[8\]](#) REQ_TIMEOUT bit. The affected TA enters an error state that causes it to send an error response to any new request targeted at it. To recover from this state, the TA must be reset by the system software. The time-out is counted starting from the moment a command is presented to the target, regardless of the target response to this command.

The L4 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected TAs. The time-base circuit offers four possible sets of four time-base signals. Selection is done by programming the [L4_LA_NETWORK_CONTROL_L\[10:8\]](#) TIMEOUT_BASE bit field.

The selected time-base signals are available at any TA. Each TA can be programmed to refer to one of these four time-base signals, using the [L4_TA_AGENT_CONTROL_L\[10:8\]](#) REQ_TIMEOUT bit field. These four signals are referred to as 1X time-base, 4X time-base, 16X time-base, and 64X time-base.

Table 14-362 lists all values in number of L4 clock cycles.

Table 14-362. L4 Time-Out Link and TA Programming

| L4_TA_AGENT_CONTROL_L REQ_TIMEOUT[2:0] | | | | | |
|--|--|------|--------|--------|---------|
| L4_LA_NETWORK_CON TROL_L TIMEOUT_BASE[2:0] | 0 | 1 | 2 | 3 | 4 |
| 0 | All L4 time-out features are disabled. | | | | |
| 1 | Locally disabled | 64 | 256 | 1024 | 4096 |
| 2 | | 256 | 1024 | 4096 | 16,384 |
| 3 | | 1024 | 4096 | 16,384 | 65,536 |
| 4 | | 4096 | 16,384 | 65,536 | 262,144 |

The default reset value is 0x2 for REQ_TIMEOUT and 0x4 for TIMEOUT_BASE, implying 16,384 clock cycles.

A time-out condition is detected when the command acceptance or the response is not received after a delay of from one to three time-base periods.

Example:

- L4 frequency = 65 MHz
- TIMEOUT_BASE = 4 in the L4_LA_NETWORK_CONTROL_L register
- REQ_TIMEOUT = 2 in the L4_TA_AGENT_CONTROL_L for TA A
- REQ_TIMEOUT = 4 in the L4_TA_AGENT_CONTROL_L for TA B

At agent A, the time-base unit is 16,384 cycles. A time-out is issued when a request to the attached module is not accepted, or no response is sent after a delay of 252 μ s to 756 μ s.

At agent B, the time-base unit is 262,144 cycles. A time-out is issued when a request to the attached module is not accepted, or no response is sent after a delay of 4 ms to 12 ms.

On detection of a time-out condition, the TA logs the error in the L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT bit, and it also reports the error to the IA, which forwards it to the L3 interconnects.

After the time-out is detected and logged, the behavior of the attached module is ignored. A new request targeting the module arriving at the timed-out TA receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

To recover from a time-out error, software is assumed to first reset the faulty module and then the TA using the L4_TA_AGENT_CONTROL_L[0] OCP_RESET bit.

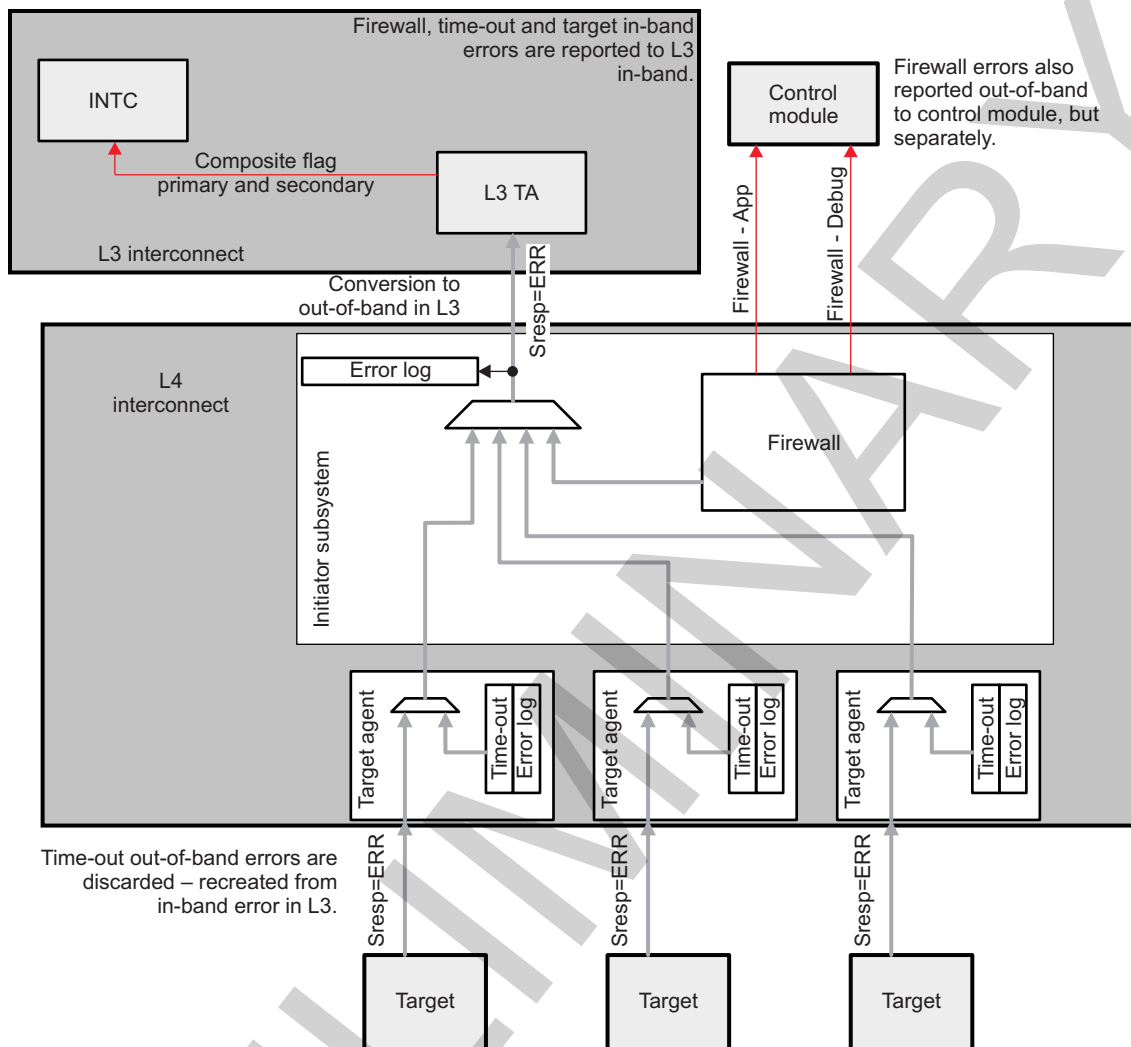

14.3.3.4.3 Error Reporting

Figure 14-12 shows the error-reporting scheme used in the L4 interconnects. All L4 in-band errors are reported to their respective L3 TA, where errors are converted in an out-of band error signal (the L3 applicative and debug composite flags) going to the L3 INTCs.

Two levels of mask are present to report the error at INTC level:

- At the applicative and debug composite flag, to enable interrupt reporting, the following bits must be set:
 - L4 CFG in L3_CLK1_FLAG_MASK_0[3] and L3_CLK1_FLAG_STATUS_1[3]
 - L4 PER in L3_CLK2_FLAG_MASK_0[17][16][15][6] and L3_CLK2_FLAG_STATUS_1[17][16][15][6]
- At the L3 TA level, see Section 14.2, L3 Interconnect.

Figure 14-12. L4 Error Reporting

icnt-017

14.3.3.4.4 Error Recovery

Setting the `L4_TA_AGENT_CONTROL_L[0] OCP_RESET` bit to 1 initiates the software reset period. Software reset must be asserted for at least 16 cycles of the target module interface clock, which can be a divided clock with respect to the L4 clock.

During the software reset period:

- Requests sent to the target module receive error responses. Therefore, if the faulty request is part of a DMA transfer, it is necessary to stop the DMA to prevent unwanted errors.
- Requests sent to the TA register block are processed as usual.
- The `L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT` status bit is cleared.

Setting the `L4_TA_AGENT_CONTROL_L[0] OCP_RESET` bit to 0 terminates the software reset period.

The attached module must then be reset to complete the recovery.

14.3.3.4.5 Firewall Error Logging in the Control Module

When a protection violation occurs, an interrupt is sent to the INTCs (if enabled). An in-band error is sent back to L3 IA and an out-band error can also be logged in the CONTROL.CONTROL_SEC_ERR_STATUS register in the SCM. These out-band errors are enabled and disabled at the L4 IA level by setting the [L4_IA_AGENT_CONTROL_L\[31\]\[30\]](#) PROT_ERROR_SECONDARY_REP or PROT_ERROR_PRIMARY_REP bit to 1 for debug and application mode, respectively.

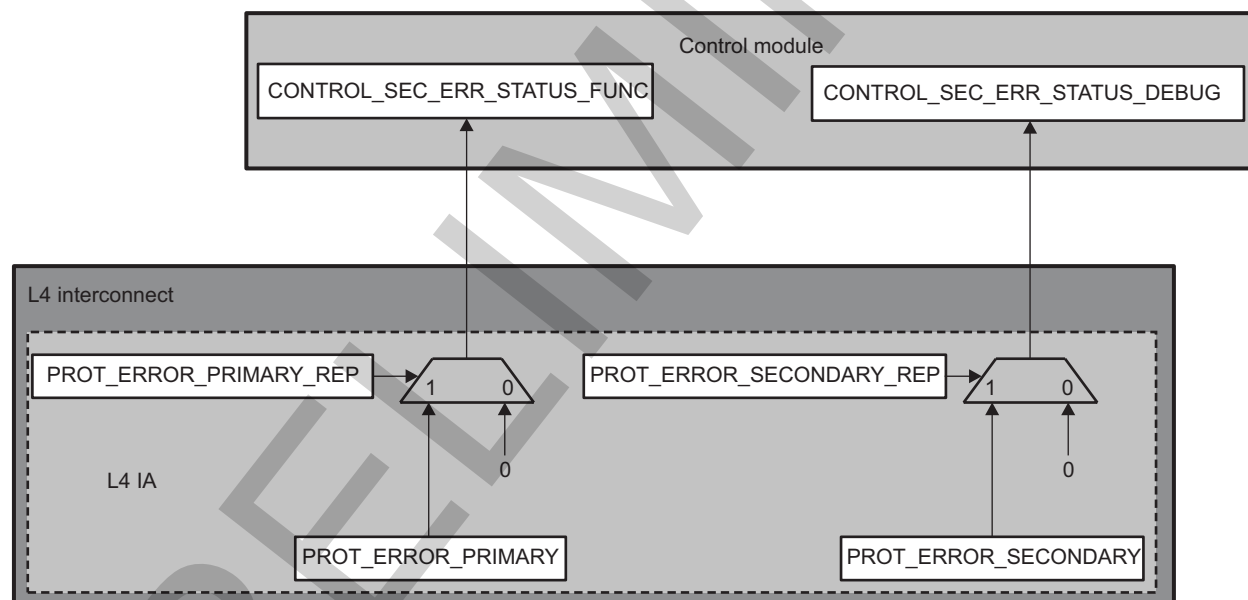

At the control module level, two logging registers are used, depending on the mode:

- In application mode or primary error reporting:
 - CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[16] = L4_CFG protection violation
 - CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[17] = L4_PER protection violation
- In debug mode or secondary error reporting:
 - CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG[16] = L4_CFG protection violation
 - CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG[17] = L4_PER protection violation

NOTE: The CONTROL.CONTROL_SEC_ERR_STATUS_xxx registers are only readable.

Figure 14-13 shows the global protection error reporting to the control module.

Figure 14-13. Protection Violation Out-of-Band Error Reporting

14.3.4 L4 Interconnect Programming Guide

14.3.4.1 L4 Interconnect Low-level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L4 interconnect module.

14.3.4.1.1 Global Initialization

14.3.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the L4 interconnect module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the L4 interconnect. For more information, see [Section 14.3.2, L4 Interconnect Integration](#).

Table 14-363. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------|---|
| PRCM | For more information about the configuration of the module, see Chapter 3, Power, Reset, and Clock Management . |
| Control module | For more information about the configuration of the module, see Chapter 19, Control Module . |
| MPU INTC | The MPU INTC must be configured to enable the interrupts from L4 interconnect module. See Chapter 18, Interrupt Controllers . |
| sDMA | For more information about the configuration of the sDMA, see Chapter 17, sDMA . |
| L3 interconnect | For more information about the interconnect configuration, see Chapter 14, Interconnect . |

14.3.4.1.2 Operational Modes Configuration

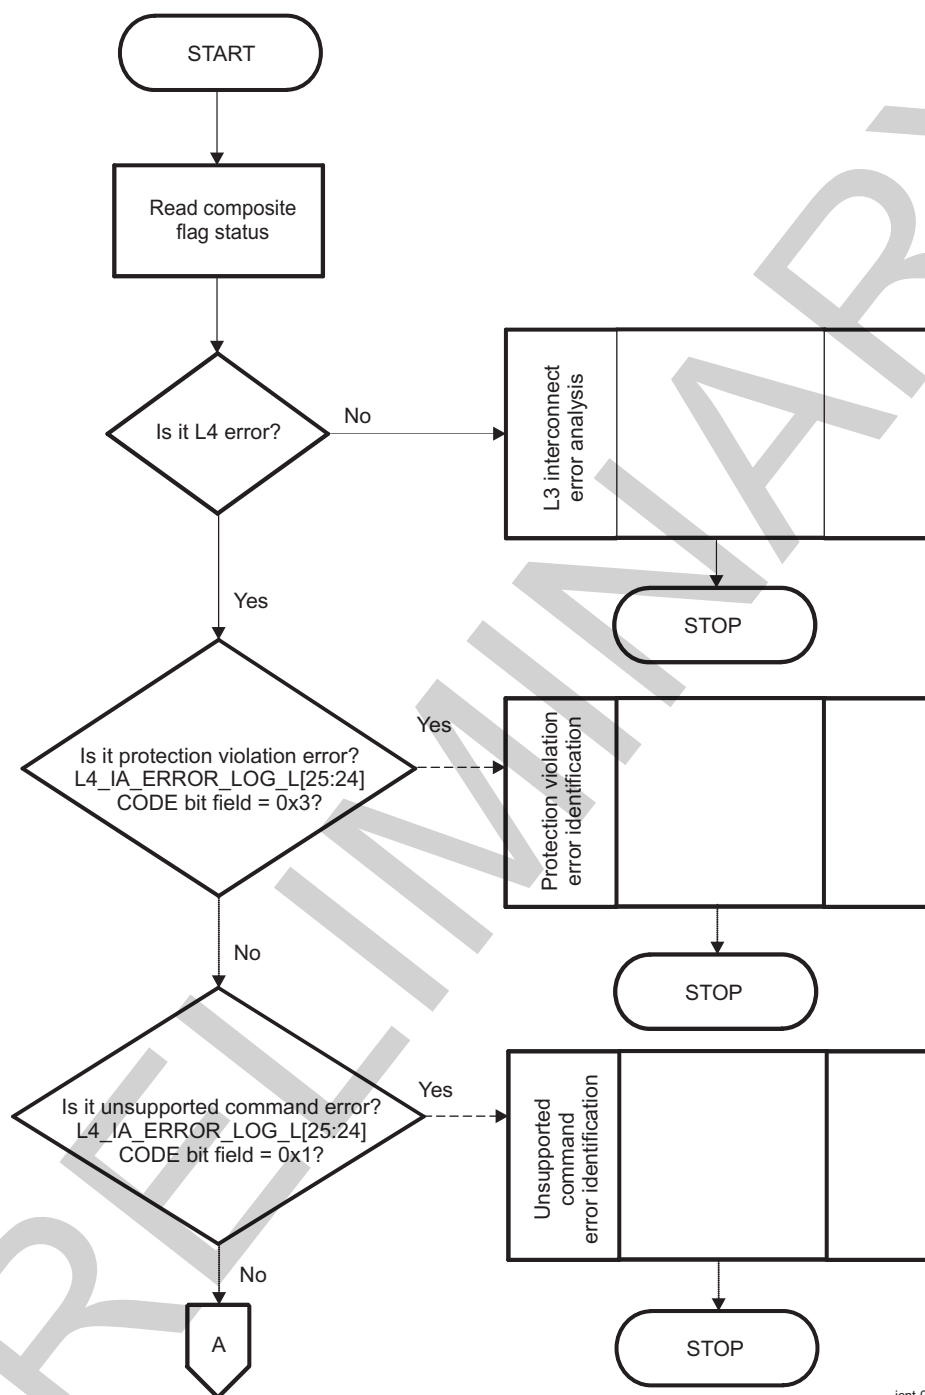

14.3.4.1.2.1 L4 Interconnect Error Analysis Mode

14.3.4.1.2.1.1 Main Sequence: L4 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

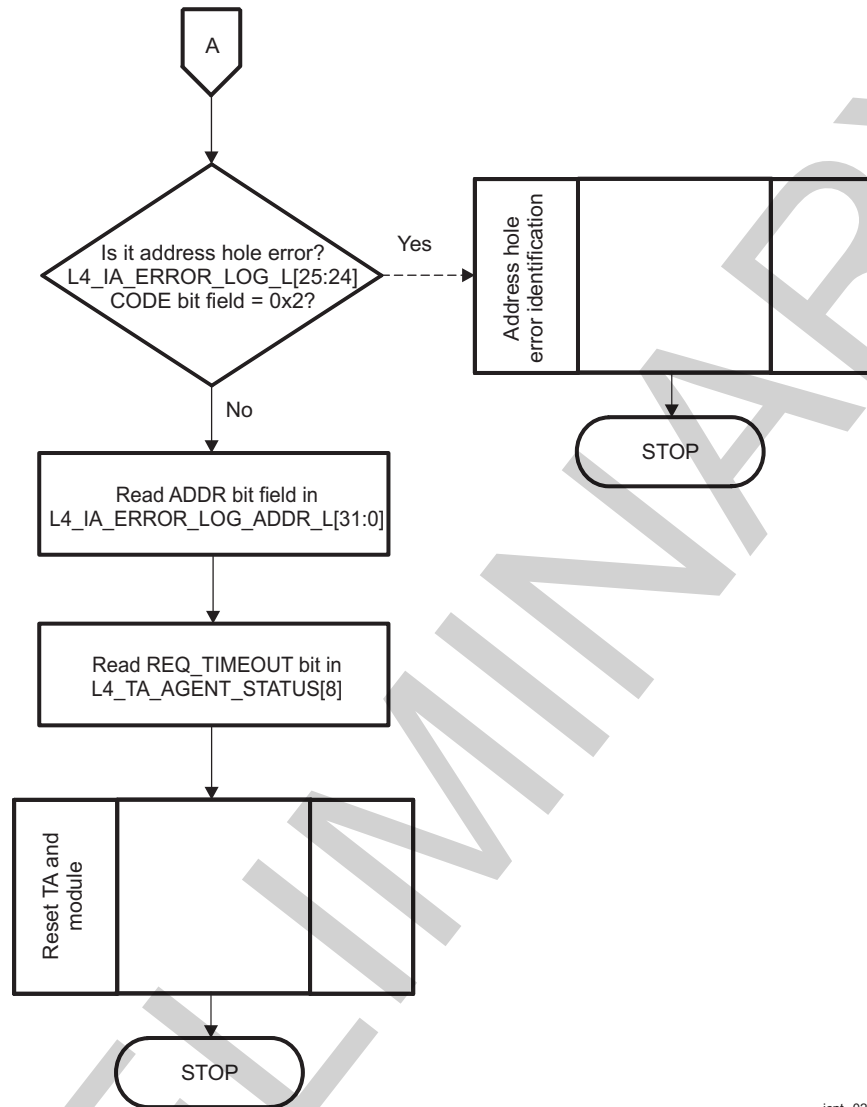

[Figure 14-14](#) and [Figure 14-15](#) show the software sequence required in most cases.

[Table 14-364](#) and [Table 14-365](#) show the main sequence for error analysis mode and its subprocess call summary, respectively.

Figure 14-14. Typical Error Analysis Sequence

icnt-019

Figure 14-15. Typical Error Analysis Sequence

icnt-020

Table 14-364. Main Sequence – Error Analysis Mode

| Register Name | Register Name | Register Name |
|---------------------------------------|---|--|
| L4_IA_ERROR_LOG_L | L4_IA_ERROR_LOG_ADDR_L | L4_IA_AGENT_STATUS_L |

| L4 interconnect unsupported command/address hole error identification | Section 14.3.4.1.2.1.3, Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification |
| L4 interconnect reset TA and module | Section 14.3.4.1.2.1.4, Subsequence: L4 Interconnect Reset TA and Module |

14.3.4.1.2.1.2 Subsequence: L4 Interconnect Protection Violation Error Identification

This procedure describes the protection violation error identification (see [Table 14-366](#)).

Table 14-366. Protection Violation Error Identification

| Step | Register/Bit Field/Programming Model | Value |
|--|---|-------|
| Read multiple errors detection. | L4_IA_ERROR_LOG_L [31] MULTI | |
| Read initiator ID. | L4_IA_ERROR_LOG_L [11:8] CONNID | |
| Read command that cause the error. | L4_IA_ERROR_LOG_L [2:0] CMD | |
| Read address of request that caused the error. | L4_IA_ERROR_LOG_ADDR_L [31:0] ADDR | |
| IF: Is it a primary error? | L4_IA_AGENT_STATUS_L [30] PROT_ERROR_PRIMARY | =0x1 |
| Read status bits. | CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[17:16] | |
| Write 1 to clear status bits. | CONTROL.CONTROL_SEC_ERR_STATUS_FUNC[17:16] | 0x3 |
| Write 1 to clear IA status bit. | L4_IA_AGENT_STATUS_L [30] PROT_ERROR_PRIMARY | 0x1 |
| ELSE | | |
| Read status bits. | CONTROL.CONTROL_SEC_ERR_STATUS_DEBUG[17:16] | |
| Write 1 to clear status bits. | CONTROL.CONTROL_SEC_ERR_STATUS_DEB_DEBUG[17:16] | 0x3 |
| Write 1 to clear IA status bit | L4_IA_AGENT_STATUS_L [31] PROT_ERROR_SECONDARY | 0x1 |
| ENDIF | | |
| Write 1 to clear multiple errors detection. | L4_IA_ERROR_LOG_L [31] MULTI | 0x1 |
| Write 1 to clear in-band error status. | L4_IA_AGENT_STATUS_L [24] INBAND_ERROR | 0x1 |

14.3.4.1.2.1.3 Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification

This procedure describes the identification of unsupported command/address hole error (see [Table 14-367](#)).

Table 14-367. Unsupported Command/Address Hole Error Identification

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------|
| Read multiple errors detection. | L4_IA_ERROR_LOG_L [31] MULTI | |
| Read initiator ID. | L4_IA_ERROR_LOG_L [11:8] CONNID | |
| Read command that caused the error. | L4_IA_ERROR_LOG_L [2:0] CMD | |
| Read address of request that caused the error. | L4_IA_ERROR_LOG_ADDR_L [31:0] ADDR | |
| Read secondary status. | L4_IA_ERROR_LOG_L [30] SECONDARY | |
| Write 1 to clear secondary status. | L4_IA_ERROR_LOG_L [30] SECONDARY | 0x1 |
| Write 1 to clear multiple errors detection. | L4_IA_ERROR_LOG_L [31] MULTI | 0x1 |
| Write 1 to clear inband error status. | L4_IA_AGENT_STATUS_L [24] INBAND_ERROR | 0x1 |

14.3.4.1.2.1.4 Subsequence: L4 Interconnect Reset TA and Module

This procedure resets the TA and module (see [Table 14-368](#)).

Table 14-368. Reset TA and Module

| Step | Register/Bit Field/Programming Model | Value |
|---|---|-------|
| Reset TA. | L4_TA_AGENT_CONTROL_L [0] OCP_RESET | 0x1 |
| Wait until target module clock = 16 cycles. | | |

Table 14-368. Reset TA and Module (continued)

| Step | Register/Bit Field/Programming Model | Value |
|---|---|-------|
| Write 0 to clear TA time-out status. | L4_TA_AGENT_CONTROL_L [10:8] REQ_TIMEOUT | 0x0 |
| Write 0 to clear TA reset. | L4_TA_AGENT_CONTROL_L [0] OCP_RESET | 0x0 |
| Reset the attached module. ⁽¹⁾ | | |

⁽¹⁾ For more information, see the respective module chapter.

14.3.4.1.2.2 L4 Interconnect Time-Out Configuration Mode

14.3.4.1.2.2.1 Main Sequence: L4 Interconnect Time-Out Configuration Mode

This procedure describes the time-out configuration sequence (see [Table 14-369](#)).

Table 14-369. Time-Out Configuration

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------|
| Disable time-out. | L4_LA_NETWORK_CONTROL_L [10:8] TIMEOUT_BASE | 0x0 |
| Clear TA time-out error status. ⁽¹⁾ | L4_TA_AGENT_STATUS_L [8] REQ_TIMEOUT | 0x1 |
| Set time-out at TA level. ⁽¹⁾ | L4_TA_AGENT_CONTROL_L [10:8] REQ_TIMEOUT | xxx |
| Set time-out base. | L4_LA_NETWORK_CONTROL_L [10:8] TIMEOUT_BASE | xxx |

⁽¹⁾ Must be done for each TA.

14.3.4.1.2.3 L4 Interconnect Firewall Configuration Mode

14.3.4.1.2.3.1 Main Sequence: L4 Interconnect Firewall Configuration Mode

This procedure describes the firewall configuration sequence (see [Table 14-370](#)).

Table 14-370. Firewall Configuration

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------|
| Define the members of protection group k. ⁽¹⁾ | L4_AP_PROT_GROUP_MEMBERS_k_L [15:0] CONNID_BIT_VECTOR | xxx |
| Define the access type of a protection group k. ⁽¹⁾ | L4_AP_PROT_GROUP_ROLES_k_L [15:0] ENABLE | xx |
| Set region affiliation to protection group. ⁽²⁾ | L4_AP_REGION_I_L [22:20] PROT_GROUP_ID | xxx |

⁽¹⁾ Must be done for each protection group.

⁽²⁾ Must be done for each region.

14.3.5 L4 Interconnects Register Manual

Table 14-371 through Table 14-373 list all L4 register blocks for IA, TA, AP, and LA. Each module instance is shown with the module register mapping and bit and bit field definitions.

14.3.5.1 L4 Interconnects Instance Summary

| RESERVED | | | | | | | CLOCK_GATE_DISABLE | RESERVED | | THREAD0_PRI | RESERVED | | | | | | | | | | | EXT_CLOCK | RESERVED | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|--------------------|--|------|-------|
| 31:25 | RESERVED | Read returns 0. | R | 0x00 |
| 24 | CLOCK_GATE_DISABLE | When set to 1 this field disables all clock gating. | RW | 0 |
| 23:21 | RESERVED | Read returns 0. | R | 0x0 |
| 20 | THREAD0_PRI | Sets thread priority. If the field is set to 0, the default, all initiator threads are treated the same. Setting the THREAD0_PRI field to 1 assigns a higher arbitration priority to thread 0 of the first initiator OCP interface. To avoid starvation, arbitration is imposed by the initiator subsystem. When multiple requests from different initiator threads are dispatched to targets simultaneously, the oldest request is dispatched first. If thread 0 is assigned a higher priority, a request on thread 0 always wins arbitration. Assigning thread 0 of the first initiator OCP the highest priority on a request or response can result in the starvation of other threads. | R | 1 |
| 19:9 | RESERVED | Read returns 0. | R | 0x000 |
| 8 | EXT_CLOCK | When set to 1, the ext_clk_off_i signal on the initiator subsystem instructs the entire L4 to shut off. | R | 1 |
| 7:0 | RESERVED | Read returns 0. | R | 0x00 |

Chip-to-Chip Interface (C2C)

This chapter describes the C2C interconnection of the device.

| Topic | Page |
|--|------|
| 15.1 C2C Overview | 2972 |
| 15.2 C2C Integration | 2974 |
| 15.3 C2C Power, Reset, and Clock Management | 2975 |
| 15.4 C2C L3 Interconnect | 3001 |
| 15.5 C2C SSCM | 3006 |
| 15.6 Intersystem Communication Register Module | 3008 |
| 15.7 C2C Register Manual | 3016 |

15.1 C2C Overview

The chip-to-chip (C2C) is a serial, low-latency, peer-to-peer communication protocol that enables the extension of an internal protocol bus to one physical device over a printed circuit board (PCB). The C2C accomplishes this function by serializing local bus transactions in one device. The serialized transactions are transferred between devices through C2C ports, and the remote bus transactions are deserialized.

The C2C includes three main functional submodules:

- The Arteris® interconnect (NoC_C2C_Device), including the interface ports and the C2C port
- The physical interface (PHY_C2C_Device)
- The subsystem control module (SSCM), which supports the clock division during operating performance point (OPP) changes, wake-up and sleep sequences, and sideband signal protocol encapsulation

Figure 15-1 shows an example of the C2C implementation mirror mode.

Figure 15-1. C2C Implementation Mirror Mode Example

c2c-001

The C2C includes the following general features:

- Low-pin-count interface
- Scalability up to 16 inputs/16 outputs (The device supports up to 8 inputs/16 outputs or 16 inputs/8 outputs only.)
- No mandatory 3-state signals
- All signals driven using source synchronous clocking (two dual data rate [DDR] clock signals per direction for TX and RX paths)
- Supports two PHY voltages: 1.2 and 1.8 V
- Supports symmetric (peer-to-peer) and asymmetric (host/peripheral) communication operations
- Protocol support of in-band flow control
- No extra pins needed
- All request packets, response packets, and flow control information multiplexed and sent across the same physical pins
- Supports multiple outstanding transaction reads, writes, and interrupts
- Supports mirror mode to enable self-test with identical device

- Provides signals for system power management

PRELIMINARY

15.2 C2C Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Table 15-1 through Table 15-3 summarize the integration of the module in the device.

Table 15-1. Integration Attributes

| Module Instance | Attributes |
|-----------------|--------------|
| | Power Domain |
| C2C | PD_CORE |

Table 15-2. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|------------------------------|

Table 15-3. Hardware Requests

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|-----------------|--|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| C2C | C2C_SSCM_IRQ0 | MA_IRQ_27 | Cortex™-A9 INTC | Interrupt request to the Cortex-A9 interrupt controller (INTC) |
| | C2C_SSCM_IRQ1 | MA_IRQ_88 | Cortex-A9 INTC | Interrupt request to the Cortex-A9 INTC |
| | C2C_SSCM_IRQ0 | MM_IRQ_46 | Cortex™-M3 INTC | Interrupt request to the Cortex-M3 INTC |
| | C2C_SSCM_IRQ1 | MM_IRQ_47 | Cortex-M3 INTC | Interrupt request to the Cortex-M3 INTC |
| | C2C_SSCM_IRQ0 | D_IRQ_85 | DSP INTC | Interrupt request to the digital signal processor (DSP) INTC |
| | C2C_SSCM_IRQ1 | D_IRQ_86 | DSP INTC | Interrupt request to the DSP INTC |
| DMA Requests | | | | |
| C2C | C2C_SSCM_GPO_0 | S_DMA_20 | sDMA | Destination is system DMA (sDMA) |
| | C2C_SSCM_GPO_1 | S_DMA_21 | sDMA | Destination is sDMA |
| | C2C_SSCM_GPO_2 | S_DMA_67 | sDMA | Destination is sDMA |
| | C2C_SSCM_GPO_3 | S_DMA_68 | sDMA | Destination is sDMA |

NOTE: The gpio_wk0 device pad can be used as a C2C pre-wakeup pin. The purpose of this pin is to start the APE wakeup before C2C is ready on the distant device to trigger the c2c_wakereqin pad. The signal from the C2C pre-wakeup pin goes only to the PRCM module, not to the C2C module.

15.3 C2C Power, Reset, and Clock Management

15.3.1 PRCM Overview

The power, reset, and clock management (PRCM) module provides device-level clock, reset, and power control for other modules, as well as clock and reset signals to the C2C.

Figure 15-2 shows the C2C mode-specific overview of the PRCM.

Figure 15-2. PRCM Overview

15.3.2 Reset Manager Functional Description

15.3.2.1 Reset Sources

This section describes the reset sources triggering the reset managers in the power and reset manager (PRM).

15.3.2.1.1 Global Reset Sources

Table 15-4 lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the reset triggering bit is identified.

Table 15-4. Global Reset Sources

| Type | Name | Source/Control | Description |
|----------|--------------|----------------|----------------------------|
| Hardware | C2C_WARM_RST | C2C module | Global hardware warm reset |

15.3.2.2 Reset Domains

A power domain can receive power-on reset (PWRON_RST) and/or normal reset (RST) signals. These signals reset nonretention logic and behave as follows:

- RST and PWRON_RST are asserted on any global or local cold reset.
- Only RST is asserted on any global or local warm reset.

A power domain can receive two additional retention logic reset signals: power-on retention reset (PWRON_RET_RST) and/or retention reset (RET_RST). These signals behave as follows:

- RET_RST and PWRON_RET_RST are asserted on any global cold reset or wakeup from OFF state to ON-ACTIVE state.
- Only RET_RST is asserted on any global warm reset.
- These signals are not asserted on wakeup from RETENTION state.

This section presents the trigger sources and attributes for all reset domains of the device. See [Section 15.3.2.1, Reset Sources](#), for an explanation of each reset trigger source for the device.

[Table 15-5](#) identifies the associated power and reset domains for each module.

Table 15-5. C2C Power and Reset Domain Association

| Module | Power Domain | Reset Domains |
|--------|--------------|------------------------------|
| C2C | PD_CORE | CORE_RET_RST, CORE_RST |
| C2C_FW | PD_CORE | CORE_PWRON_RET_RST, CORE_RST |

[Table 15-6](#) lists the reset sources that trigger the reset domains of the device.

15.3.3 Clock Manager Functional Description

15.3.3.1 CD_C2C Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits, and their dependencies on other device clock domains.

15.3.3.1.1 Overview

Figure 15-3 shows an overview of the clock domain.

Figure 15-3. CD_C2C Overview

15.3.3.1.2 Clock Domain Modes

Table 15-7 lists the clock domain modes supported by the clock domain.

Table 15-7. CD_C2C Clock Domain Modes

| NO_SLEEP | SW_SLEEP | SW_WKUP | HW_AUTO |
|-----------|---------------|-----------|-----------|
| Available | Not available | Available | Available |

Table 15-8 lists the clock domain state transition control and status bits for the clock in this clock domain.

Table 15-8. CD_C2C Control and Status Parameters

| Parameter Name | Control/Status Bit Field |
|---------------------------------------|---|
| C2C_L3_ICLK clock status | CM_C2C_CLKSTCTRL[8] CLKACTIVITY_L3_C2C_ICLK |
| C2C_L4_ICLK clock status | CM_C2C_CLKSTCTRL[9] CLKACTIVITY_L4_C2C_ICLK |
| Clock domain state transition control | CM_C2C_CLKSTCTRL[1:0] CLKTRCTRL |

15.3.3.1.3 Clock Domain Dependency

CD_C2C has no module wake-up dependency on any other device clock domains.

15.3.3.1.3.1 Static Dependency

Table 15-9 lists the static dependency of the clock domain on other device clock domains.

Table 15-9. CD_C2C Static Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|------------------------------------|-------------|
| CD_ABE | Disabled | CM_C2C_STATICDEP[3] ABE_STATDEP | Read/write |
| CD_IVAHD | Disabled | CM_C2C_STATICDEP[2] IVAHD_STATDEP | Read/write |
| CD_L3_1 | Disabled | CM_C2C_STATICDEP[5] L3_1_STATDEP | Read/write |
| CD_L3_2 | Disabled | CM_C2C_STATICDEP[6] L3_2_STATDEP | Read/write |
| CD_L3_INIT | Disabled | CM_C2C_STATICDEP[7] L3INIT_STATDEP | Read/write |
| CD_L4_CFG | Disabled | CM_C2C_STATICDEP[12] L4CFG_STATDEP | Read/write |
| CD_L4_PER | Disabled | CM_C2C_STATICDEP[13] L4PER_STATDEP | Read/write |
| CD_EMIF | Enabled | CM_C2C_STATICDEP[4] MEMIF_STATDEP | Read/write |

15.3.3.1.3.2 Dynamic Dependency

Table 15-10 lists the dynamic dependency of the clock domain on other device clock domains.

Table 15-10. CD_C2C Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|-----------------------------------|-------------|
| CD_L3_2 | Always enabled | CM_C2C_DYNAMICDEP[6] L3_2_DYNDEP | Read only |
| CD_EMIF | Always enabled | CM_C2C_DYNAMICDEP[4] MEMIF_DYNDEP | Read only |

15.3.3.1.4 Clock Domain Module Attributes

Table 15-11 lists the clocks received by each module of the clock domain and their role (that is, as a functional or interface clock).

Table 15-11. CD_C2C Module Clocks Association

| Module | Clock | Clock Type |
|--------|-------------|------------|
| C2C | C2C_L3_ICLK | Interface |
| C2C_FW | C2C_L3_ICLK | Interface |
| | C2C_L4_ICLK | Interface |

Table 15-12 lists the supported wake-up request generation capability for each module of the clock domain.

Table 15-12. CD_C2C Module Wake-Up Request

| Module | Wake-Up Feature |
|--------|------------------------|
| C2C | Master wake-up request |
| C2C_FW | None |

Table 15-13 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 15-13. CD_C2C Module Clock Management Modes and Control

| Module | Clock Mgmt. Protocol | Status Bit Field | Role |
|--------|----------------------|--------------------------------------|----------------|
| C2C | Master/slave | CM_C2C_C2C_CLKCTRL[18] STBYST | Standby status |
| | | CM_C2C_C2C_CLKCTRL[17:16] IDLEST | Idle status |
| C2C_FW | Slave | CM_C2C_C2C_FW_CLKCTRL [17:16] IDLEST | Idle status |

Table 15-14 lists the supported clock management modes and associated software control bit fields for each module of the power domain.

Table 15-14. CD_C2C Modules Slave Clock Management Modes and Control

| Module | Disabled | Auto | Enabled | Control Bit Field | Access Type |
|--------|----------|-----------|---------|---------------------------------------|-------------|
| C2C | N/A | Available | N/A | CM_C2C_C2C_CLKCTRL[1:0] MODULEMODE | Read only |
| C2C_FW | N/A | Available | N/A | CM_C2C_C2C_FW_CLKCTRL[1:0] MODULEMODE | Read only |

15.3.3.2 CD_CORTEXA9 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits, and their dependencies on other device clock domains.

15.3.3.2.1 Clock Domain Dependency

CD_CORTEXA9 has no module wake-up dependency on any other device clock domain.

15.3.3.2.1.1 Static Dependency

Table 15-15 lists the static dependency of the clock domain on other device clock domains.

Table 15-15. CD_CORTEXA9 Static Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|----------------------------------|-------------|
| CD_C2C | Always disabled | CM_MPU_STATICDEP[18] C2C_STATDEP | Read only |

15.3.3.3 CD_L4_CFG Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits, and their dependencies on other device clock domains.

15.3.3.3.1 Clock Domain Dependency

CD_L4_CFG has no static or module wake-up dependency on any other device clock domain.

15.3.3.3.1.1 Dynamic Dependency

Table 15-16 lists the dynamic dependency of the clock domain on other device clock domains.

Table 15-16. CD_L4_CFG Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|------------------------------------|-------------|
| CD_C2C | Always enabled | CM_L4CFG_DYNAMICDEP[18] C2C_DYNDEP | Read only |

15.3.3.4 CD_L3_2 Clock Domain

This section identifies the modes supported by the clock domain, the associated control and status bits, and their dependencies on other device clock domains.

15.3.3.4.1 Clock Domain Dependency

CD_L3_2 has no static or module wake-up dependency on any other device clock domain.

15.3.3.4.1.1 Dynamic Dependency

Table 15-17 identifies the dynamic dependency of the clock domain on other device clock domains.

Table 15-17. CD_L3_2 Dynamic Dependency Association Parameters

| Clock Domain Name | Default Setting | Control Bit Field | Access Type |
|-------------------|-----------------|-----------------------------------|-------------|
| CD_C2C | Always enabled | CM_L3_2_DYNAMICDEP[18] C2C_DYNDEP | Read only |

15.3.4 Power Management Functional Description

The section highlights the functional concepts of power-domain-level power management in the device.

The PD_CORE power domain supports the DPS with switching times of less than 5 μ s.

15.3.4.1 PD_CORE Description

PD_CORE contains the following clock domains:

- CD_C2C
- CD_DMA
- CD_CORTEXM3
- CD_EMIF
- CD_L3_1
- CD_L3_2
- CD_L3_INSTR
- CD_L4_CFG

Table 15-18 lists the logic retention capability for each module of the power domain.

Table 15-18. PD_CORE C2C Power Attributes

| Module | Logic Retention | DFF Context Status | RFF Context Status |
|--------|-----------------|---|---|
| C2C | Partial | RM_C2C_C2C_CONTEXT[0] LOSTCONTEXT_DFF | RM_C2C_C2C_CONTEXT[1] LOSTCONTEXT_RFF |
| C2C_FW | Partial | RM_C2C_C2C_FW_CONTEXT[0] LOSTCONTEXT_DFF | RM_C2C_C2C_FW_CONTEXT[1] LOSTCONTEXT_RFF |

15.3.5 PRCM Register Manual

15.3.5.1 PRM Instance Summary

Table 15-19 lists the PRCM registers and their addresses and sizes.

Table 15-19. PRM Instance Summary

| Module Name | L4 Base Address | Size |
|---------------------|-----------------|-----------|
| INTRCONN_SOCKET_PRM | 0x4A30 6000 | 256 bytes |
| CKGEN_PRM | 0x4A30 6100 | 256 bytes |
| MPU_PRM | 0x4A30 6300 | 256 bytes |
| DSP_PRM | 0x4A30 6400 | 256 bytes |
| ABE_PRM | 0x4A30 6500 | 256 bytes |
| ALWAYS_ON_PRM | 0x4A30 6600 | 256 bytes |
| CORE_PRM | 0x4A30 6700 | 2K bytes |
| IWAHD_PRM | 0x4A30 6F00 | 256 bytes |
| CAM_PRM | 0x4A30 7000 | 256 bytes |
| DSS_PRM | 0x4A30 7100 | 256 bytes |
| SGX_PRM | 0x4A30 7200 | 256 bytes |
| L3INIT_PRM | 0x4A30 7300 | 256 bytes |
| L4PER_PRM | 0x4A30 7400 | 512 bytes |
| WKUP_PRM | 0x4A30 7700 | 256 bytes |
| WKUP_CM | 0x4A30 7800 | 256 bytes |
| EMU_PRM | 0x4A30 7900 | 256 bytes |
| EMU_CM | 0x4A30 7A00 | 256 bytes |
| DEVICE_PRM | 0x4A30 7B00 | 256 bytes |
| INSTR_PRM | 0x4A30 7F00 | 256 bytes |

15.3.5.2 CORE_PRM Registers

15.3.5.2.1 CORE_PRM Register Summary

Table 15-20 summarizes the CORE_PRM registers.

Table 15-20. CORE_PRM Registers Mapping Summary

| Register Name | Type | Register Width (Bits) | Address Offset | CORE_PRM L4 Base Address |
|---------------------------------------|------|-----------------------|----------------|--------------------------|
| RM_C2C_C2C_CONTEXT | RW | 32 | 0x0000 0524 | 0x4A30 6C24 |
| RM_C2C_C2C_FW_CONTEXT | RW | 32 | 0x0000 0534 | 0x4A30 6C34 |

15.3.5.2.2 CORE_PRM Register Description

Table 15-21 through Table 15-23 describe the individual CORE_PRM registers in detail.

Table 15-21. RM_C2C_C2C_CONTEXT

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| Address Offset | 0x0000 0524 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Physical Address | 0x4A30 6C24 | | | | | | | | | | | | | | | | InstanceCORE_PRM | | | | | | | | | | | | | | | |

15.3.5.3.2 CORE_CM2 Register Description

[Table 15-26](#) through [Table 15-36](#) describe the individual CORE_CM2 registers in detail.

Table 15-26. CM_C2C_CLKSTCTRL

| | | | |
|------------------|--|----------|----------|
| Address Offset | 0x0000 0500 | Instance | CORE_CM2 |
| Physical Address | See Table 15-25 . | | |
| Description | This register enables the domain power state transition. It controls the hardware-supervised domain power state transition between On-Active and On-Inactive states. It also holds 1 status bit per clock input of the domain. | | |
| Type | RW | | |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------------------------|----|----|----|----|----|-------------------------|---|-------------------------|---|----------|---|---|---|---|---|--|-----------|--|
| RESERVED | | | | | | | | | | | | | | | | CCLKACTIVITY_L3X2_C2C_ICLK | | | | | | CLKACTIVITY_L4_C2C_ICLK | | CLKACTIVITY_L3_C2C_ICLK | | RESERVED | | | | | | | CLKTRCTRL | |

| Bits | Field Name | Description | Type | Reset |
|-------|----------------------------|---|------|----------|
| 31:11 | RESERVED | | R | 0x000000 |
| 10 | CCLKACTIVITY_L3X2_C2C_ICLK | This field indicates the state of the L3X2_C2C_ICLK clock in the domain. [warm reset insensitive] Read 0x0: Corresponding clock is definitely gated. Read 0x1: Corresponding clock is running or gating/ungating transition is ongoing. | R | 0 |
| 9 | CLKACTIVITY_L4_C2C_ICLK | This field indicates the state of the L4_C2C_ICLK clock in the domain. [warm reset insensitive] Read 0x0: On-Inactive is definitely gated. Read 0x1: On-Inactive is running or gating/ungating transition is ongoing. | R | 0 |
| 8 | CLKACTIVITY_L3_C2C_ICLK | This field indicates the state of the L3_C2C_ICLK clock in the domain. [warm reset insensitive] Read 0x0: On-Inactive is definitely gated. Read 0x1: On-Inactive is running or gating/ungating transition is ongoing. | R | 0 |
| 7:2 | RESERVED | | R | 0x00 |
| 1:0 | CLKTRCTRL | Controls the clock state transition of the C2C clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may occur. Read 0x1: Reserved 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transitions are based upon hardware conditions. | RW | 0x3 |

Table 15-32. CM_C2C_C2C_CLKCTRL

| | | | |
|-------------------------|---------------------------------------|-----------------|----------|
| Address Offset | 0x0000 0520 | Instance | CORE_CM2 |
| Physical Address | See Table 15-25 . | | |
| Description | This register manages the C2C clocks. | | |
| Type | R | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|--------|--------|----------|----|----|----|----|----|----|---|---|---|---|---|------------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RESERVED | | | | | | | | | | | | | STBYST | IDLEST | RESERVED | | | | | | | | | | | | MODULEMODE | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|------------|--|--------------|--------|
| 31:19 | RESERVED | | R | 0x0000 |
| 18 | STBYST | C2C module standby status [warm reset insensitive] Read 0x0: Module is functional (not in standby). Read 0x1: Module is in standby. | R | 1 |
| 17:16 | IDLEST | C2C interface idle status [warm reset insensitive] Read 0x0: C2C interface is in functional state. Read 0x1: C2C interface is in a transitory state. Read 0x2: C2C interface is in Idle state. | R | 0x2 |
| 15:2 | RESERVED | | R | 0x0000 |
| 1:0 | MODULEMODE | Controls the way mandatory clocks are managed. Read 0x1: Module is managed automatically by hardware according to clock domain transition. A clock domain sleep transition put module into idle. A wakeup domain transition put it back into function. If CLKTRCTRL = 3, any INTRCONN access to module is always granted. Module clocks may be gated according to the clock domain state. | R Returns | 0x1 |

C2C Power, Reset, and Clock Management

- [CD_C2C Clock Domain: \[0\] \[1\] \[2\]](#)
- [CORE_CM2 Registers: \[3\]](#)

Table 15-34. CM_C2C_C2C_FW_CLKCTRL

| | | | |
|-------------------------|--|-----------------|----------|
| Address Offset | 0x0000 0530 | Instance | CORE_CM2 |
| Physical Address | See Table 15-25 . | | |
| Description | This register manages the C2C_FW clocks. | | |
| Type | R | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|--------|----|----------|----|----|----|----|----|----|----|------------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RESERVED | | | | | | | | IDLEST | | RESERVED | | | | | | | | MODULEMODE | | | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|------------|--|------|--------|
| 31:18 | RESERVED | | R | 0x0000 |
| 17:16 | IDLEST | Module idle status [warm reset insensitive] Read 0x0: Module is fully functional, including INTRCONN. Read 0x1: Module is performing transition: wakeup, or sleep, or sleep abortion. Read 0x2: Module is in Idle mode (only INTRCONN part). It is functional if using separate functional clock. Read 0x3: Module is disabled and cannot be accessed. | R | 0x3 |
| 15:2 | RESERVED | | R | 0x0000 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|---|---------------|-------|
| 1:0 | MODULEMODE | Controls the way mandatory clocks are managed Read 0x1: Module is managed automatically by hardware according to clock domain transition. A clock domain sleep transition puts module into idle. A wakeup domain transition puts it back into function. If CLKTRCTRL = 3, any INTRCONN access to module is always granted. Module clocks may be gated according to the clock domain state. | R Rreturns | 0x1 |

15.4 C2C L3 Interconnect

NOTE: The L3 interconnect is an instantiation of the Arteris interconnect from Arteris, Inc.

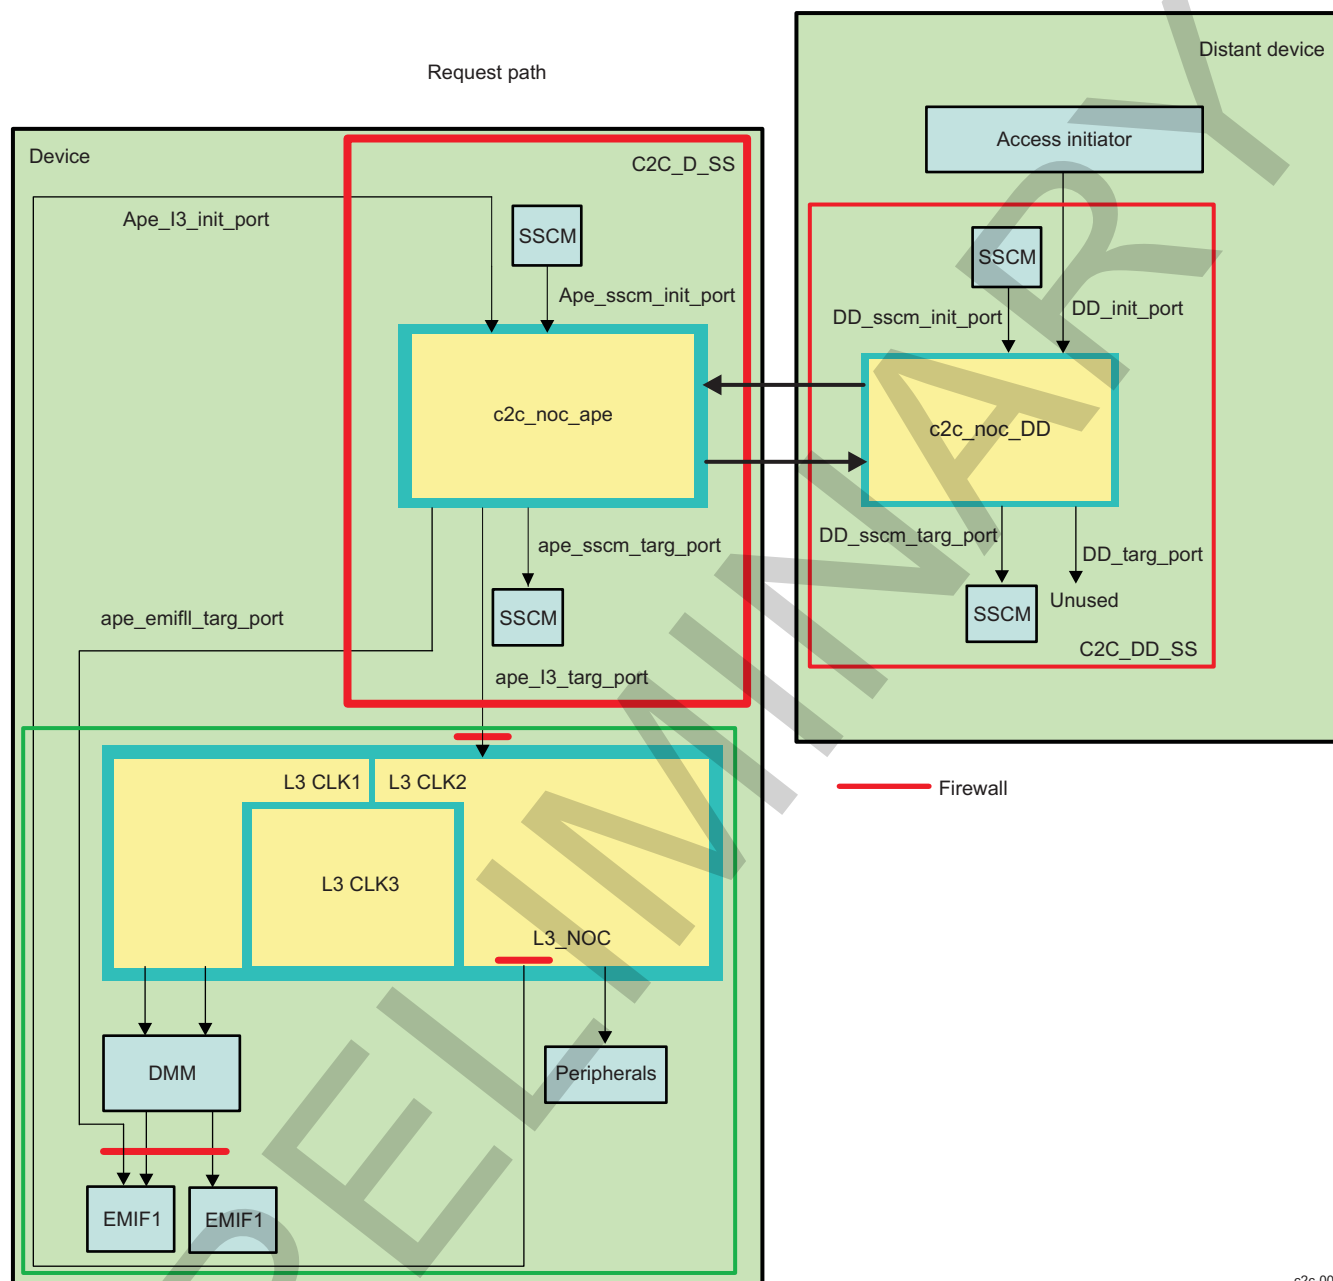

This document contains materials that are ©2003–2009 Arteris, Inc., and that constitute proprietary information of Arteris, Inc.

All materials and trademarks are used under license from Arteris, Inc. For additional information, see the Arteris reference manuals, or contact Arteris, Inc.

NoC is an abbreviation for network on chip.

15.4.1 C2C Interconnect Overview

[Figure 15-4](#) shows the L3 interconnect interface.

Figure 15-4. C2C L3 Interface

c2c-004

The C2C L3 interface includes the following main features:

- Network interface units (NIUs): Master NIUs for the initiator agents (IAs) and slave NIUs for the target agents (TAs)
- A partially depleted crossbar exchange network
- A special internal slave NIU to access L3 interconnect configuration registers
- True little-endian platform
- Transaction errors tracking and logging registers
- Provides all signaling support for the chip-level, power-management infrastructure

15.4.2 C2C Interconnect Integration

15.4.2.1 Clocking, Reset, and Power-Management Scheme

15.4.2.1.1 Clocks

Table 15-54 lists the C2C L3 interconnect clocks. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 15-54. Clocks

| Module | Type | Name | Source | Description |
|--------|-----------|-------------|--------|--|
| C2C L3 | Interface | C2C_L3_ICLK | PRCM | Interface/functional clock for the C2C |

15.4.2.1.2 Resets

Table 15-55 lists the C2C L3 interconnect resets. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 15-55. Resets

| Module | Name | Source | Description |
|--------|----------|--------|-------------------|
| C2C L3 | CORE_RST | PRCM | Global warm reset |

15.4.2.1.3 Power Management

The L3 interconnect ports belong to the CORE power domain. As part of the system-wide power-management scheme, the L3 ports go into IDLE state after receiving a request from the PRCM module and after all commands are serviced. For more information, see [Chapter 3, Power, Reset, and Clock Management](#).

15.4.3 C2C Interconnect Functional Description

15.4.3.1 Slave NIU Configuration

All external subsystem master NIUs can initiate transactions to the L3 applicative slave NIUs listed in [Table 15-56](#) through the C2C port link, as shown in [Table 15-56](#).

Table 15-56. C2C Connectivity

| Master NIUs | Slave NIUs | | | | |
|-------------|------------|---------------|------------------|------------------|------------------|
| | APE_L3_SN | APE_emifll_SN | APE_SSCM | DD_L3_SN | DD_SSCM |
| APE_L3_MN | | | 0 | 0 ⁽¹⁾ | 0 ⁽²⁾ |
| APE_SSCM_MN | | | | | 0 |
| DD_SSCM_MN | | | 0 | | |
| DD_L3_MN | 0 | 0 | 0 ⁽²⁾ | | 0 |

⁽¹⁾ This connection must be assessed according to system requirements on a case-by-case basis.

⁽²⁾ These connections are present only for debugging purposes.

[Table 15-57](#) lists the mapping of the C2C required information.

Table 15-57. C2C ReqInfo Mapping

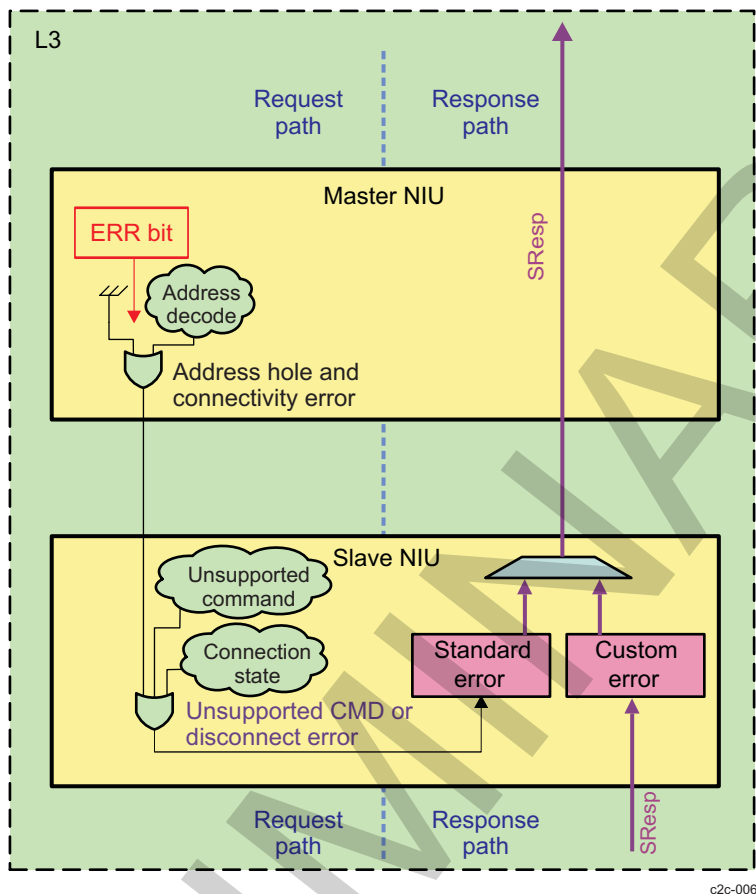

| | ReqInfo Name | MReqDebug | MReqType | MReqSupervisor |
|-----|--------------|-----------|----------|----------------|
| MNs | APE_L3 | x | 0 | x |
| | APE_SSCM | | | |
| | DD_L3 | x | 0 | x |
| SNs | APE_L3 | x | 0 | x |
| | APE_EMIF1 | x | 0 | x |
| | APE_SSCM | | | |
| | DD_SSCM | | | |
| | DD_MNs | x | 0 | x |

15.4.3.2 Global Error Routing Scheme

Error logging is not enabled on the C2C because it is already enabled in the L3 interconnect. The C2C L3 only reports in-band errors. For more information about L3 interconnect error logging, see [Section 14.2, L3 Interconnect](#).

[Figure 15-5](#) shows the C2C global error routing scheme.

Figure 15-5. C2C Global Error Routing Scheme

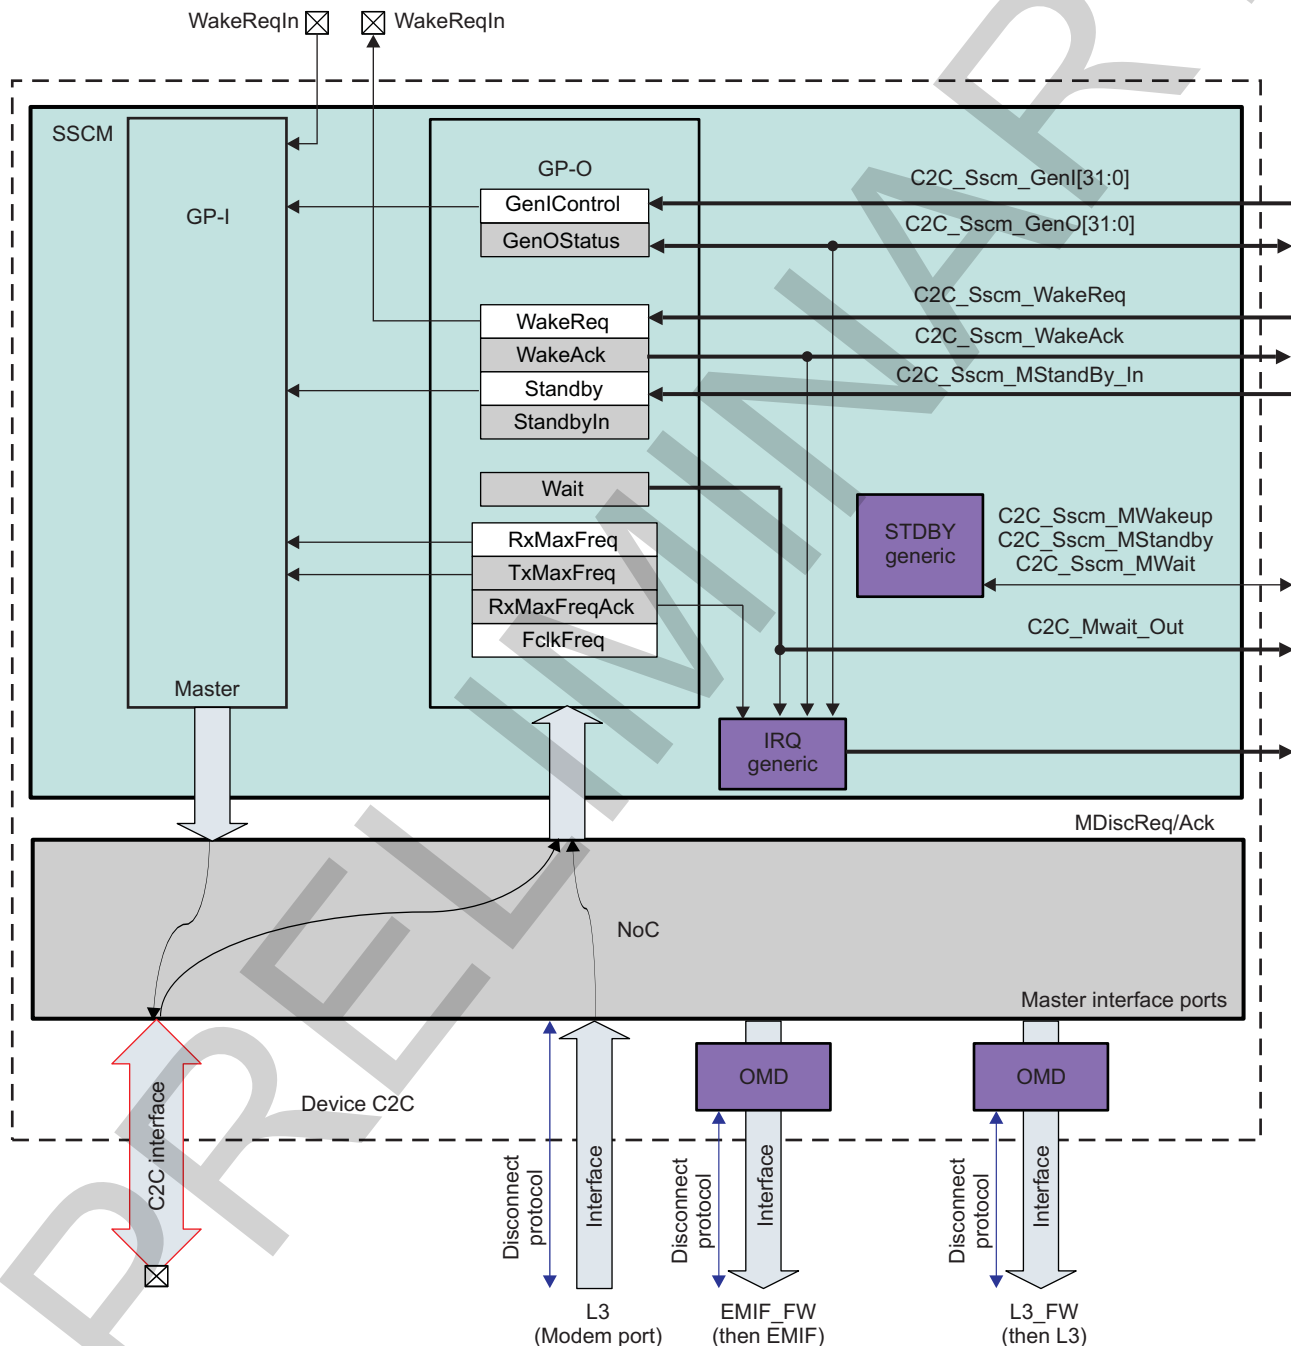

15.5 C2C SSCM

15.5.1 SSCM Overview

The SSCM supports clock division during OPP changes, the wake-up and sleep sequences, and interrupts signaling. Figure 15-7 shows the C2C SSCM block diagram.

Figure 15-6. C2C SSCM Block Diagram

c2c-003

The C2C SSCM supports:

- Different handshakes for local and distant OPP changes
- Sleep and wake-up sequences initiated locally or from a remote side

- TX clock automatic division
- Transport of general-purpose signals to and from distant C2C
- GPI and GPO submodules

15.5.2 SSCM Interrupts

15.5.2.1 SSCM GPI Interrupt Mapping

Table 15-58 lists the SSCM GPI interrupt mapping.

Table 15-58. SSCM GPI Interrupt Mapping

| C2C_SSCM_GPI | Source | Description |
|---------------------|----------------------------------|--|
| C2C_SSCM_GPI[0] | SYS_IRQ1n | External interrupt |
| C2C_SSCM_GPI[1] | MAIL_U3_C2C_IRQ | Device to DD mailbox interrupt |
| C2C_SSCM_GPI[2] | MODEM_ICR_IRQ | Distant (Modem) ICR Interrupt |
| C2C_SSCM_GPI[3] | UART1_IRQ | UART module 1 |
| C2C_SSCM_GPI[4] | UART2_IRQ | UART module 2 |

15.5.3 SSCM GPO

The interrupts described in [Section 15.1, C2C Overview](#), are active in GPO mode.

15.6 Intersystem Communication Register Module

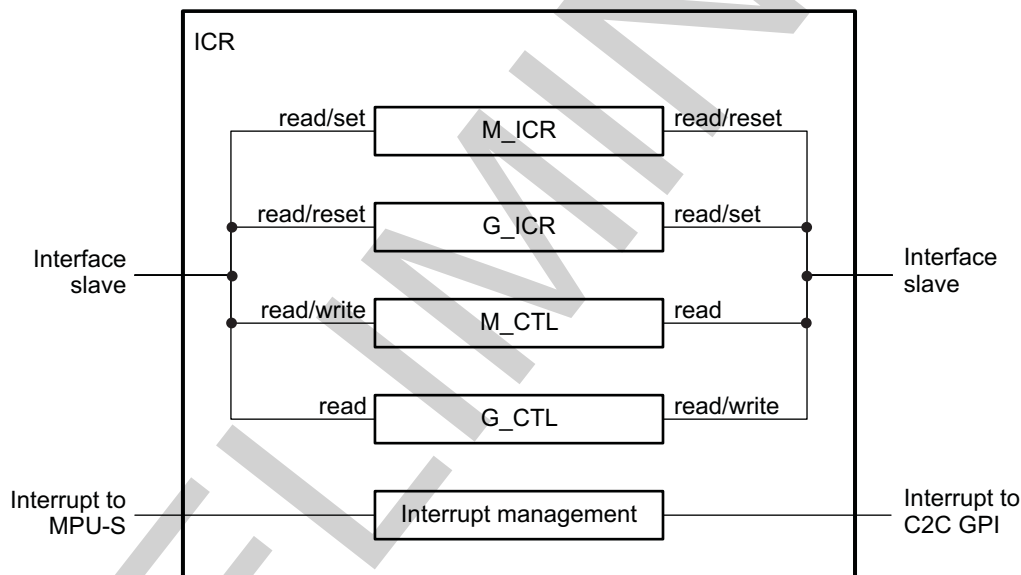

15.6.1 intersystem Communication Register Overview

The intersystem communication register (ICR) module synchronizes microprocessor unit (MPU) and modem activity, relying on flag mechanisms that are shared by both systems. Basically, the MPU sets a flag that is reset by the modem and vice versa. For a given direction, all flags are set by the source subsystem and are reset by the destination subsystem when it wants to. Each subsystem can read flags without resetting them. To avoid continuous polling on the ICRs, each subsystem can receive an interrupt when an operation that is related to it (set or reset) completes.

15.6.2 ICR Functional Description

The ICR is used when the device is connected to an external initiator device connected on the C2C port. Otherwise, the ICR is not used. The MPU and the external systems communicate with the help of two ICRs. One ICR (**G_ICR**) is used by the external system to inform the device MPU subsystem of an event and to send commands to the MPU-S. In the same way, the other ICR (**M_ICR**) is used by the device MPU subsystem to inform the external system of an event and to send commands to the MPU subsystem. The bits definition of the **G_ICR** and **M_ICR** registers are defined by software.

Figure 15-7. ICR Block Diagram

c2c-005

15.6.2.1 ICR Clocking Scheme

The ICR function operates from the L4-core interface clock.

15.6.2.2 Flag Management

Flags are used to notify the other subsystem of an event. Software determines the meaning of each flag. The following communication sequence from the MPU-S to the modem-S is typical:

- The MPU-S writes one or more flags in the **M_ICR** register.
- An interrupt is sent to the modem-S (if enabled).
- The modem-S reads the **M_ICR** register to check which flags are set.
- The modem-S resets one or more flags in the **M_ICR** register.
- An interrupt is sent to the MPU-S (if enabled).
- The MPU-S reads the **M_ICR** register to check which flags are reset.

15.6.2.3 Setting and Resetting a Flag

To set a flag, the MPU-S must set the desired bit of the **M_ICR** register to 1. Setting a bit of **M_ICR** to 0 does not change its content (that is, if previous value was 1, bit value remains 1 after the write access, [modem-S does the same thing with **G_ICR** register]).

To reset a flag, the MPU-S must set the desired bit of the **G_ICR** register to 1 (that is, if previous value of the bit was 1, then it becomes 0 else it remains 0, [modem-S does the same thing with **M_ICR** register]).

15.6.2.4 Interrupt Management

Interrupt behavior is the same on both sides (MPU and modem).

Two kinds of events can generate an interrupt to the MPU:

- The modem sets a flag in **G_ICR** register.
- The modem resets a flag in **M_ICR** register.

Interrupt generation is controlled by the **M_CTL** register.

Interrupt generation mechanism to the modem is exactly the same as on the MPU side:

- The MPU sets a flag in the **M_ICR** register.
- The MPU resets a flag in the **G_ICR** register.

Interrupt generation is controlled by the **G_CTL** register. To acknowledge an interrupt, the MPU must clear the **M_IRQ_STATUS** register by setting to 1 the bits that caused the interrupt. Acknowledgment on the modem side follows the same procedure with the **G_IRQ_STATUS** register.

15.6.3 ICR Register Manual

15.6.3.1 ICR Instance Summary

Table 15-59. C2C Instance Summary

| Module Name | Module Base Address | Size |
|-------------|---------------------|------|
| ICR_MPU | 0x4A0B 6000 | 4KB |
| ICR_MDM | 0x4A0C D000 | 4KB |

15.6.3.2.1 ICR Register Summary

Table 15-60 lists the mapping summary of the ICR registers.

Table 15-60. ICR Registers Mapping Summary

| Bits | Field Name | Description | Type | Reset |
|------|-------------|---|---------------|-------|
| 31 | GENO_IRQ_31 | Reading 1 indicates C2c_Sscm_GENO (31) signal and GENO_31 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 30 | GENO_IRQ_30 | Reading 1 indicates C2c_Sscm_GENO (30) signal and GENO_30 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 29 | GENO_IRQ_29 | Reading 1 indicates C2c_Sscm_GENO (29) signal and GENO_29 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 28 | GENO_IRQ_28 | Reading 1 indicates C2c_Sscm_GENO (28) signal and GENO_28 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 27 | GENO_IRQ_27 | Reading 1 indicates C2c_Sscm_GENO (27) signal and GENO_27 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 26 | GENO_IRQ_26 | Reading 1 indicates C2c_Sscm_GENO (26) signal and GENO_26 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 25 | GENO_IRQ_25 | Reading 1 indicates C2c_Sscm_GENO (25) signal and GENO_25 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 24 | GENO_IRQ_24 | Reading 1 indicates C2c_Sscm_GENO (24) signal and GENO_24 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------|---|---------------|-------|
| 23 | GENO_IRQ_23 | Reading 1 indicates C2c_Sscm_GENO (23) signal and GENO_23 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 22 | GENO_IRQ_22 | Reading 1 indicates C2c_Sscm_GENO (22) signal and GENO_22 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 21 | GENO_IRQ_21 | Reading 1 indicates C2c_Sscm_GENO (21) signal and GENO_21 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 20 | GENO_IRQ_20 | Reading 1 indicates C2c_Sscm_GENO (20) signal and GENO_20 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 19 | GENO_IRQ_19 | Reading 1 indicates C2c_Sscm_GENO (19) signal and GENO_19 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 18 | GENO_IRQ_18 | Reading 1 indicates C2c_Sscm_GENO (18) signal and GENO_18 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 17 | GENO_IRQ_17 | Reading 1 indicates C2c_Sscm_GENO (17) signal and GENO_17 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 16 | GENO_IRQ_16 | Reading 1 indicates C2c_Sscm_GENO (16) signal and GENO_16 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 15 | GENO_IRQ_15 | Reading 1 indicates C2c_Sscm_GENO (15) signal and GENO_15 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 14 | GENO_IRQ_14 | Reading 1 indicates C2c_Sscm_GENO (14) signal and GENO_14 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 13 | GENO_IRQ_13 | Reading 1 indicates C2c_Sscm_GENO (13) signal and GENO_13 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------|---|---------------|-------|
| 12 | GENO_IRQ_12 | Reading 1 indicates C2c_Sscm_GENO (12) signal and GENO_12 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 11 | GENO_IRQ_11 | Reading 1 indicates C2c_Sscm_GENO (11) signal and GENO_11 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 10 | GENO_IRQ_10 | Reading 1 indicates C2c_Sscm_GENO (10) signal and GENO_10 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 9 | GENO_IRQ_9 | Reading 1 indicates C2c_Sscm_GENO (9) signal and GENO_9 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 8 | GENO_IRQ_8 | Reading 1 indicates C2c_Sscm_GENO (8) signal and GENO_8 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 7 | GENO_IRQ_7 | Reading 1 indicates C2c_Sscm_GENO (7) signal and GENO_7 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 6 | GENO_IRQ_6 | Reading 1 indicates C2c_Sscm_GENO (6) signal and GENO_6 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 5 | GENO_IRQ_5 | Reading 1 indicates C2c_Sscm_GENO (5) signal and GENO_5 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 4 | GENO_IRQ_4 | Reading 1 indicates C2c_Sscm_GENO (4) signal and GENO_4 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 3 | GENO_IRQ_3 | Reading 1 indicates C2c_Sscm_GENO (3) signal and GENO_3 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 2 | GENO_IRQ_2 | Reading 1 indicates C2c_Sscm_GENO (2) signal and GENO_2 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|---|---------------|-------|
| 1 | GENO_IRQ_1 | Reading 1 indicates C2c_Sscm_GENO (1) signal and GENO_1 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |
| 0 | GENO_IRQ_0 | Reading 1 indicates C2c_Sscm_GENO (0) signal and GENO_0 value in GENO_STATUS register have been modified by distant C2C. Writing 1 to this bit sets the bit. Writing 0 has no effect. | RW W1toSet | 0 |

| 26 | GENO_IRQ_26 | Reading 1 indicates C2c_Sscm_GENO (26) signal and GENO_26 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 25 | GENO_IRQ_25 | Reading 1 indicates C2c_Sscm_GENO (25) signal and GENO_25 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 24 | GENO_IRQ_24 | Reading 1 indicates C2c_Sscm_GENO (24) signal and GENO_24 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 23 | GENO_IRQ_23 | Reading 1 indicates C2c_Sscm_GENO (23) signal and GENO_23 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------|--|---------------|-------|
| 22 | GENO_IRQ_22 | Reading 1 indicates C2c_Sscm_GENO (22) signal and GENO_22 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 21 | GENO_IRQ_21 | Reading 1 indicates C2c_Sscm_GENO (21) signal and GENO_21 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 20 | GENO_IRQ_20 | Reading 1 indicates C2c_Sscm_GENO (20) signal and GENO_20 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 19 | GENO_IRQ_19 | Reading 1 indicates C2c_Sscm_GENO (19) signal and GENO_19 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 18 | GENO_IRQ_18 | Reading 1 indicates C2c_Sscm_GENO (18) signal and GENO_18 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 17 | GENO_IRQ_17 | Reading 1 indicates C2c_Sscm_GENO (17) signal and GENO_17 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 16 | GENO_IRQ_16 | Reading 1 indicates C2c_Sscm_GENO (16) signal and GENO_16 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 15 | GENO_IRQ_15 | Reading 1 indicates C2c_Sscm_GENO (15) signal and GENO_15 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 14 | GENO_IRQ_14 | Reading 1 indicates C2c_Sscm_GENO (14) signal and GENO_14 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 13 | GENO_IRQ_13 | Reading 1 indicates C2c_Sscm_GENO (13) signal and GENO_13 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 12 | GENO_IRQ_12 | Reading 1 indicates C2c_Sscm_GENO (12) signal and GENO_12 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 11 | GENO_IRQ_11 | Reading 1 indicates C2c_Sscm_GENO (11) signal and GENO_11 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 10 | GENO_IRQ_10 | Reading 1 indicates C2c_Sscm_GENO (10) signal and GENO_10 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|--|---------------|-------|
| 9 | GENO_IRQ_9 | Reading 1 indicates C2c_Sscm_GENO (9) signal and GENO_9 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 8 | GENO_IRQ_8 | Reading 1 indicates C2c_Sscm_GENO (8) signal and GENO_8 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 7 | GENO_IRQ_7 | Reading 1 indicates C2c_Sscm_GENO (7) signal and GENO_7 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 6 | GENO_IRQ_6 | Reading 1 indicates C2c_Sscm_GENO (6) signal and GENO_6 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 5 | GENO_IRQ_5 | Reading 1 indicates C2c_Sscm_GENO (5) signal and GENO_5 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 4 | GENO_IRQ_4 | Reading 1 indicates C2c_Sscm_GENO (4) signal and GENO_4 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 3 | GENO_IRQ_3 | Reading 1 indicates C2c_Sscm_GENO (3) signal and GENO_3 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 2 | GENO_IRQ_2 | Reading 1 indicates C2c_Sscm_GENO (2) signal and GENO_2 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 1 | GENO_IRQ_1 | Reading 1 indicates C2c_Sscm_GENO (1) signal and GENO_1 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |
| 0 | GENO_IRQ_0 | Reading 1 indicates C2c_Sscm_GENO (0) signal and GENO_0 value in GENO_STATUS register have been modified by distant C2C and interrupt source is not masked. Writing 1 to this bit clears the bit. Writing 0 has no effect. | RW W1toClr | 0 |

PRELIMINARY

Memory Subsystem

This chapter introduces the memory subsystem of the device.

| Topic | Page |
|---|-------------|
| 16.1 Memory Subsystem Overview | 3048 |
| 16.2 Dynamic Memory Manager | 3053 |
| 16.3 EMIF Controller | 3133 |
| 16.4 General-Purpose Memory Controller | 3206 |
| 16.5 Error Location Module | 3346 |
| 16.6 On-Chip Memory (OCM) Subsystem | 3373 |

16.1 Memory Subsystem Overview

Figure 16-1 shows a functional diagram of all memory subsystems in the device.

Figure 16-1. Memory Subsystem Functional Diagram

16.1.1 DMM Overview

The dynamic memory manager (DMM) module is typically located immediately in front of the synchronous dynamic random access memory (SDRAM) controller (SDRC), as shown in Figure 16-1.

In a broad sense, the DMM manages various aspects of memory accesses such as:

- Initiator-indexed priority generation
- Multizone SDRAM interleaving configuration
- Block object transfer optimization – tiling
- Centralized low-latency page translation – MMU-like feature

The dynamic qualifier for memory management highlights the software configurability, and hence the runtime nature, of the four aspects of memory management handled by the DMM.

16.1.1.1 DMM Features

From a functional perspective, the role of the DMM is to:

- Add initiator-based priority to any incoming requests
- Perform to/from tiling conversions of tiled requests
- Make on-the-fly basic transforms, such as quadrant rotations and mirroring
- Optionally, provide a low-latency page-based translation to handle memory fragmentation – MMU
- Distribute the traffic on all attached memory controllers according to the interleaving configuration

The main features of the DMM are:

- Programmable multizone DRAM mapping and interleaving configuration
- Programmable initiator-based request priority extension

- Multichannel memory transfer optimization
- Single SDRAM page request generation
- Low-latency interconnect port
- Page-grained address translation to manage memory fragmentation
- Automatic synchronized reloading of the address translation table

16.1.2 TILER Overview

The tiling and isometric lightweight engine for rotation (TILER) is a submodule of the DMM (see [Figure 16-1](#)) and is therefore described in [Section 16.2, Dynamic Memory Manager](#).

The TILER is intended to improve bidimensional (tiled) block transfer efficiency. It is, therefore, a module aimed at:

- Primarily, efficient handling of 2-dimension (2D) data mapped in tiles, such as video or graphics macroblocks
- Optionally, managing the memory fragmentation and zero-copy physical frame-buffer swapping through a page-grained translation
- Making isometric (distance preserving) transforms, such as 90-, 180-, or 270-degree rotations, with a horizontal or vertical reflection

The lightweight qualifier of this engine highlights its limited support of isometric transforms, as:

- Rotation performs only basic quadrant rotations by some multiple of 90 degrees.
- Reflection is limited to horizontal and vertical flip.
- Translation is restricted to a 4-KB page granularity.

Written differently, the functionality of the TILER is to map a 2D virtually addressed interconnect request into one or more physically addressed interconnect requests by:

- Transforming the virtual address, data, and byte-enable to match the requested 0-, 90-, 180-, or 270-degree orientation in a tiled 2D addressing space
- Optionally, translating the oriented tiled address by a page-specific vector to manage memory fragmentation and physical object aliasing

16.1.2.1 TILER Features

The main features of the TILER are:

- Efficiency improvement of 2D block access on SDRAMs
- Optimized interlaced access on tiled frames
- 2D virtual-to-physical address translation of SDRAM bidimensional objects to handle rotation
- Page-grained address translation to manage memory fragmentation and physical buffer aliasing
- Unlimited number of 2D tiled objects supported in any (0, 90, 180, or 270 degrees) orientation
- Full bandwidth use by minimizing the size of raster-based initiator buffers
- Optimization of multichannel memory transfers
- Interconnect request granularity balance (in X and Y directions)

16.1.3 EMIF Overview

The extended memory interface (EMIF) module is typically located near the DMM module, as shown in [Figure 16-1](#).

The EMIF provides connectivity between the device and LPDDR2-type memory. It manages data bus read/write accesses between external memories, the microprocessor unit (MPU), and the direct memory access (DMA) controller. It acts as the primary interface between SDRAM and all functional blocks, such as the ARM®, IVA-HD, imaging subsystem (ISS), GFX, and DMA controllers.

16.1.3.1 Main Features

The EMIF has the following capabilities:

- Supports JEDEC standard-compliant LPDDR2-SDRAM (S2 and S4) devices
- 2-GB SDRAM address range over two chip selects (CSs) (configurable with the DMM; see [Section 16.2, Dynamic Memory Manager](#), for more information)
- Supports two independent CSs, with their corresponding register sets, and independent page tracking
- Both CSs must have the same memory type and size.
- Flexible address muxing scheme that permits choosing different bank-mapping allocation by configuring the bank, column, and row-address decoding ordering
- 16- or 32-bit data path to external SDRAM
- Supports LPDDR2 devices with 1, 2, 4, or 8 internal banks
- Supports the following data bus widths:
 - 128-bit level 3 (L3) interconnect data bus width
 - 16- and 32-bit SDRAM data bus width
- Supports the following CAS latencies: 3, 4, 5, 6, 7, and 8
- Supports 256-, 512-, 1024-, and 2048-word page sizes
- Supports the following burst lengths: 8
- Supports sequential burst type
- SDRAM auto-initialization from reset or configuration change
- Supports bank interleaving across both CSs if same memory type
- Supports self-refresh and precharge power-down modes for low power (per CS, manual entry/exit self-refresh, and deep power-down modes)
- Supports deep power-down mode for low power
- Supports partial array self-refresh and temperature-controlled self-refresh modes for low power. Temperature-controlled self-refresh is supported only for mobile SDRAM having an on-chip temperature sensor.
- Supports prioritized refresh
- Programmable SDRAM refresh rate and backlog counter
- Supports ZQ calibration
- Supports temperature monitoring

16.1.4 GPMC Overview

The general-purpose memory controller (GPMC) is an unified memory controller dedicated to interfacing external memory devices:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (available only in nonmuxed mode) burst NOR flash devices
- NAND flash
- Pseudo-SRAM devices

16.1.4.1 GPMC Features

The GPMC is the external memory controller of the device. The GPMC data access engine provides a flexible programming model for communication with all standard memories. The GPMC supports various accesses:

- Asynchronous read/write access
- Asynchronous read page access (4, 8, and 16 Word16)
- Synchronous read/write access
- Synchronous read/write burst access without wrap capability (4, 8, and 16 Word16)

- Synchronous read/write burst access with wrap capability (4, 8, and 16 Word16)
- Address/data-multiplexed access
- Little- and big-endian access

The GPMC can communicate with a wide range of external devices:

- External asynchronous or synchronous 8-bit wide memory or device (nonburst device)
- External asynchronous or synchronous 16-bit wide memory or device
- External 16-bit nonmultiplexed device with limited address range (2KB)
- External 16-bit address/data-multiplexed NOR flash device
- External 8-bit and 16-bit NAND flash device
- External 16-bit pseudo-SRAM (pSRAM) device

The main features of the GPMC are:

- 8- or 16-bit-wide data path to external memory device
- Supports up to eight CS regions of programmable size and programmable base addresses in a total address space of 1GB
- Supports transactions controlled by a firewall
- On-the-fly error code detection using the Bose-Chaudhuri-Hocquenghem (BCH) ($t = 4, 8, \text{ or } 16$) or Hamming code to improve the reliability of NAND with a minimum effect on software (NAND flash with 512-byte page size or greater)
- Fully pipelined operation for optimal memory bandwidth use
- External device clock provided from the L3 clock divided by 1, 2, 3, or 4
- Supports programmable autoclock gating when no access is detected
- Independent and programmable control signal timing parameters for setup and hold time on a per-chip basis. Parameters are set according to the memory device timing parameters, with a timing granularity of one L3 clock cycle.
- Flexible internal access time control (WAIT state) and flexible handshake mode using external WAIT pin monitoring
- Support bus keeping
- Support bus turnaround
- Prefetch and write posting engine associated with system DMA (sDMA) to achieve full performance from the AND device with minimum effect on NOR/SRAM concurrent access

NOTE: Page mode is available only in nonmultiplexed mode.

16.1.5 ELM Overview

NAND flash memories are dense and nonvolatile, but error-prone. Whenever NAND flash memories are read from, some level of error correction is required. In the case of NAND modules with no internal correction capability, sometimes referred to as bare NAND, the correction process is delegated to the memory controller.

The error location module (ELM) must be used in conjunction with the GPMC. The GPMC probes data read from an external NAND flash and uses them to compute checksum-like information, called syndrome polynomials, on a per-block basis. Each syndrome polynomial gives a status of the read operations for a full block, including 512 bytes of data, parity bits, and an optional spare area data field, with a maximum block size of 1023 bytes. Computation is based on the BCH algorithm. The ELM extracts error addresses from these syndrome polynomials.

Based on the syndrome polynomial value, the ELM can detect errors, compute the number of errors, and give the location of each error bit. The actual data is not required to complete the error correction algorithm. Errors can be reported anywhere in the NAND flash block, including in the parity bits.

The maximum acceptable number of errors that can be corrected depends on a configuration parameter. Error correction levels of 4, 8, and 16 bits are supported. The ELM relies on a static definition of the generator polynomial for each error correction level that corresponds to the generator polynomials defined in the GPMC. A larger number of errors can be detected, but the ELM cannot correct them all. The offending block is then tagged as uncorrectable.

When the error location process completes, an interrupt is triggered to inform a central processing unit (CPU) that its status can be checked. The error locations for the NAND page can be retrieved from the module through register accesses.

16.1.5.1 ELM Features

The ELM features:

- 4, 8, and 16 bits per 512-byte block error location based on BCH algorithm
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation when error location process completes:
 - When the full page has been processed in page mode
 - For each syndrome polynomial in continuous mode

16.1.6 OCM Overview

The on-chip memory (OCM) subsystem consists of the following OCM controllers: one connected to an on-chip ROM (SAR ROM), one connected to an on-chip RAM (SAR RAM), and one connected to an on-chip SRAM (L3 SRAM). Each memory controller has its own dedicated interface to the L3 interconnect.

16.1.6.1 SAR ROM

This on-chip ROM contains 4KB of memory and a linked list of descriptors used by sDMA during the restore context operation (when the device transitions from off to on mode).

The device-embedded SAR ROM has the following characteristics:

- 4-KB ROM
- 32-bit access per cycle
- Support for single- and burst-access transactions

16.1.6.2 SAR RAM

The on-chip SAR RAM contains 8KB and is mapped as four blocks with irregular region sizes. This memory content is preserved when the device goes into off mode (as long as the wake-up voltage domain remains supplied). It is used as context-saving memory to be written by software so that sDMA restores its saved content when the device transitions from off to on mode.

The device-embedded SAR RAM has the following characteristics:

- Support for single-access transactions
 - Operates at full L4-PER interconnect clock frequency
 - 32-bit access per cycle

16.1.6.3 L3 OCM_RAM

The on-chip L3 OCM_RAM contains 56KB of RAM, and partitioning is defined by the L3 firewall logic. The device-embedded L3 OCM_RAM has the following characteristics:

- Support for single and burst access transactions:
 - Operates at full L3 interconnect clock frequency
 - Fully pipelined, one 32-bit access per cycle
- Restricted access support

16.2 Dynamic Memory Manager

16.2.1 DMM Overview

This section describes the dynamic memory manager (DMM) and its tiling and isometric lightweight engine for rotation (TILER) submodule.

The DMM is introduced in [Section 16.1, Memory Subsystem Overview](#) in [Chapter 16, Memory Subsystem](#).

The function of the DMM is to:

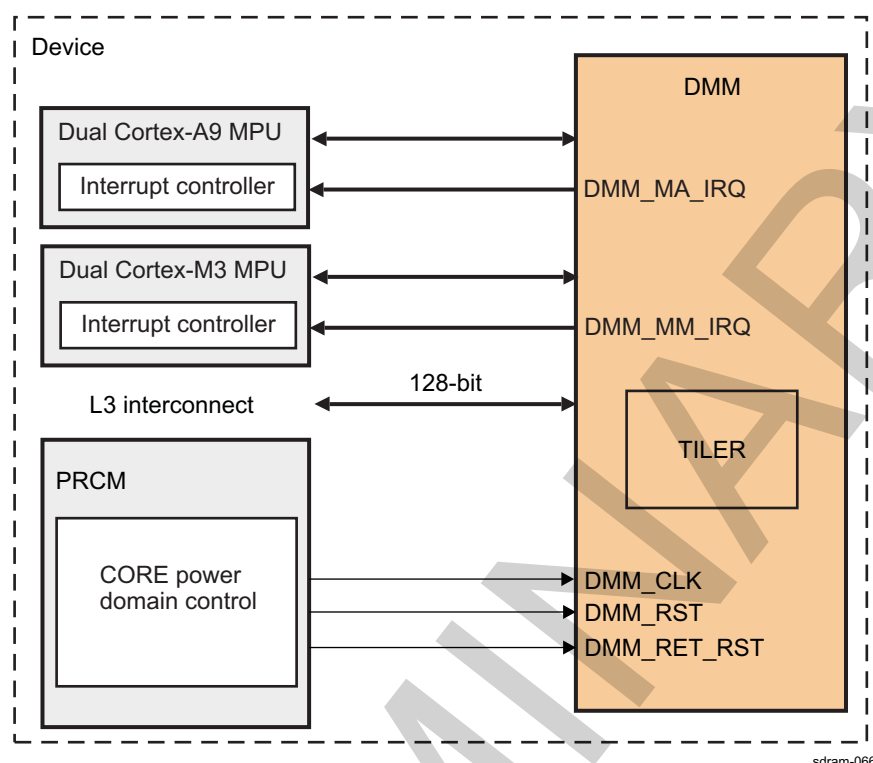

- Add initiator-based priority to any incoming requests
- Perform to-and-from tiling conversions of tiled requests
- Make on-the-fly basic transforms, such as quadrant rotations and mirroring
- Optionally provide a low-latency page-based translation to handle memory fragmentation – memory management unit (MMU)
- Distribute the traffic on all attached memory controllers according to the interleaving configuration

The TILER is also introduced in [Section 16.1, Memory Subsystem Overview](#) in [Chapter 16, Memory Subsystem](#).

The functions of the TILER are:

- Primary handling efficiently 2-dimensional (2D) data mapped in tiles, such as video or graphics macroblocks
- Optionally managing the memory fragmentation and zero-copy physical frame buffers swapping through a page-grained translation
- Allowing optimized interlaced accesses on tiled frames
- Making (distance preserving) transforms, such as 90-, 180-, or 270-degree rotations, with a horizontal or vertical reflection
- Interleaving the memory accesses among the two memory controllers (also called EMIF). For more information, see [Section 16.3, EMIF Controller](#).

[Figure 16-2](#) is an overview of the DMM and TILER in the device.

Figure 16-2. DMM and Tiler Overview

16.2.2 DMM Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

- IDLE hardware handshake (the DMM supports only smart-idle mode)
- No STANDBY hardware handshake
- No wake-up request
- No system direct memory access (sDMA) requests
- One interrupt line for interrupt request (IRQ)
- One functional clock

Figure 16-3 shows the integration of DMM in the device.

Figure 16-3. DMM Integration

NOTE: For more information about the IDLE hardware handshake, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 16-1 through Table 16-3 summarize the integration of DMM in the device.

16.2.3 DMM Functional Description

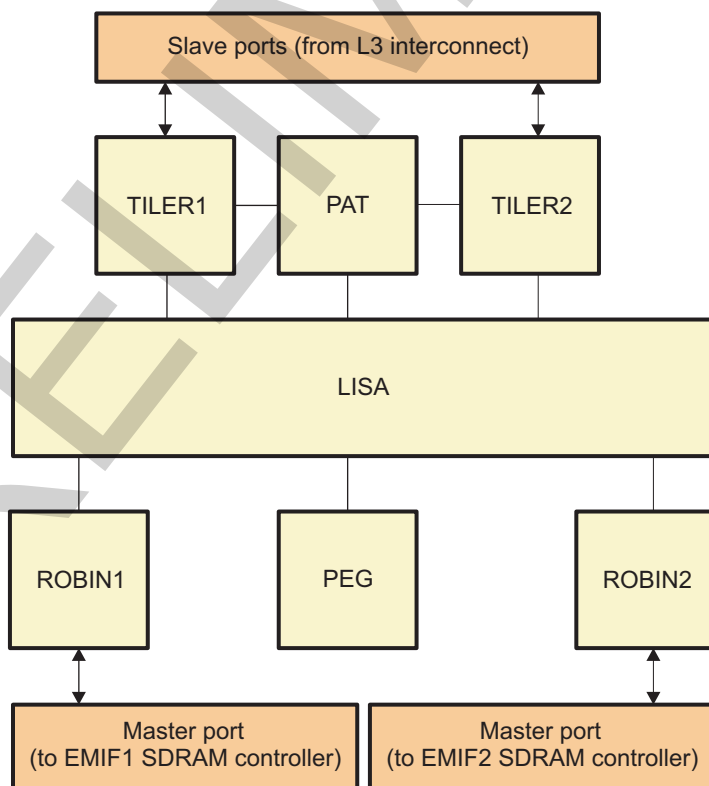

16.2.3.1 DMM Block Diagram

Figure 16-4 shows the DMM macro architecture. The DMM consists of six blocks:

- Two TILERS, each with its own interconnect slave port for converting requests back and forth between the input virtual addressing mode and the output physical tiled addressing mode. The tiling conversions of requests, write data, and responses is performed entirely in the TILER blocks.
- Two reordering buffer and initiator nodes (ROBINs), each with its own interconnect master port to initiate requests to the SDRC and allow tiled data, tiled response, and split response reconstruction. The ROBIN block manages only the reordering buffer and performs data reordering due to the orientation.
- A physical address translator (PAT) for managing the memory fragmentation
- A priority extension generator (PEG) to generate priorities required by the SDRC; these priorities are not used in the DMM.
- A local interconnect and synchronization agent (LISA) to synchronize all DMM subsystems and provide access to their configuration registers

Figure 16-4 is a block diagram of the DMM.

Figure 16-4. DMM Block Diagram

sdram-003

CAUTION

The interconnect must ensure that virtually addressed requests target only a TILER port.

16.2.3.2 DMM Clock Configuration

Table 16-5 describes the DMM clocks.

Table 16-5. DMM Clocks

| Signal | I/O ⁽¹⁾ | Description |
|---------|--------------------|--------------------------------|
| DMM_CLK | I | Functional and interface clock |

⁽¹⁾ I = Input; O = Output

The DMM is concerned with SDRC management and is in the MEMIF clock domain among the SDRCs. The DMM is a fully synchronous module, which uses the clock and clock-enable signals provided in the MEMIF clock domain to generate its interface and functional clocks.

To configure DMM_CLK control and settings, see Table 16-2.

16.2.3.3 DMM Power Management

DMM power is supplied by the CORE power domain, and DMM power management complies with system power-management guidelines.

Table 16-6 describes the power-management features available for the DMM module.

Table 16-6. DMM Local Power-Management Features

| Feature | Registers | Description |
|------------------------|---|--|
| Clock auto gating | N/A | Feature not available |
| Slave idle modes | DMM_SYSCONFIG[3:2] SIDLEMODE bit field | Only smart-idle wake-up mode is available. |
| Clock activity | N/A | Feature not available |
| Master standby modes | N/A | Feature not available |
| Global wake-up enable | N/A | Feature not available |
| Wake-up sources enable | N/A | Feature not available |

Some of the DMM module registers are affected by the save-and-restore (SAR) mechanism. For more information about SAR, see Chapter 3, *Power, Reset, and Clock Management*.

16.2.3.4 DMM Interrupt Requests

Errors in PAT area refill registers are reported through the DMM_PAT_STATUS_i[15:10] ERROR bit field (see Table 16-7).

Table 16-7. DMM Hardware Status Features

| Feature | Type | Register | Description |
|-----------------|-----------|---|--|
| PAT error flags | Read-only | DMM_PAT_STATUS_i[15:10] ERROR (i = 0 to 3) | Unexpected update of the PAT area refill registers |

Table 16-8 lists the event flags, and their masks, that can cause module interrupts.

Table 16-8. Events

| Interrupt | Event Flag | Event Mask |
|---------------|--|--|
| ERR_LUT_MISS3 | DMM_PAT_IRQSTATUS[31] EVENT0 DMM_PAT_IRQSTATUS_RAW[31] EVENT0 | DMM_PAT_IRQENABLE_SET[31] EVENT0 DMM_PAT_IRQENABLE_CLR[31] EVENT0 |
| ERR_UPD_DATA3 | DMM_PAT_IRQSTATUS[30] EVENT0 DMM_PAT_IRQSTATUS_RAW[30] EVENT0 | DMM_PAT_IRQENABLE_SET[30] EVENT0 DMM_PAT_IRQENABLE_CLR[30] EVENT0 |

16.2.3.5 DMM

16.2.3.5.1 DMM Concepts

The DMM introduces the concepts of dynamic mapping and DMM atomic units.

16.2.3.5.1.1 Dynamic Mapping

The DMM manages its internal memory space as an ordered set of up to four sections. [Figure 16-5](#) shows the DMM sections and memory mapping.

Figure 16-5. DMM Sections and Memory Mapping

sdram_004

In the DMM, a section is:

- A segment of 16MiB to 2GiB, which is power-of-two in size and aligned to that size in the system map
- An area with a constant interleaving scheme: constant interleaving granularity on a constant set of SDR (EMIF) targets
- Given a priority equal to its index: the higher the index, the higher the priority

NOTE: Whenever a request hits more than one DMM section, it follows the interleaving scheme of the section having the highest index.

The interleaving configuration of the DMM, its section-based dynamic memory mapping, is shown on the right in [Figure 16-5](#). In this example, a request at the system address Addr follows the interleaving scheme of section 3, although it hits sections 1, 2, and 3. Similarly, the DMM configuration given in this example prevents any request from using the interleaving scheme of section 0, because section 0 is fully masked by section 1, which has a higher priority.

Each of the four sections is configured through a [DMM_LISA_MAP_i](#) register, where $i = 0$ to 3.

NOTE: The DMM and SDRC registers ([Table 16-88](#) and EMIF registers; see [EMIF Controller](#)) are declared in two extra static DMM sections of the highest priority so that they cannot be masked by any standard programmable DMM section.

NOTE: The DMM atomic size is:

- 1kiB in noninterleaved sections
- Equal to the interleaving granularity (128, 256, or 512 bytes) in interleaved sections

16.2.3.5.1.2 Address Mapping

The address mapping inside the DMM is configurable through up to four sections. A DMM section description fits in a single register ([DMM_LISA_MAP_i](#)). Each section is defined based on:

- Its system address: The base address of the decoding range for the section
- Its size: The encoding is the number of bits used in the upper 8 bits of the incoming system address
- Its physical address: The base address of the memory range access in the external memory controller
- Its address space: The address space used on the external (for the DMM) memory controller when hitting this section. For details, see [Section 16.3.4.1.1, L3 Interface](#).
- The target memory controller. A section may hit a single or pair of controllers.
- Its interleaving definition

The address decoding is priority-based. In case of overlapping sections, only the highest-order one is hit. Register memory spaces have priority over regular memory sections. In case of four sections, the priority order is therefore:

1. Registers
2. [DMM_LISA_MAP_3](#)
3. [DMM_LISA_MAP_2](#)
4. [DMM_LISA_MAP_1](#)
5. [DMM_LISA_MAP_0](#)

All register-related addresses are reserved and fixed in the overall address mapping:

- DMM registers: 0x4E00_0000 to 0x4FFF_FFFF
- EMIF1 registers: 0x4C00_0000 to 0x4CFF_FFFF
- EMIF2 registers: 0x4D00_0000 to 0x4DFF_FFFF

There is no overlapping between register sections.

NOTE: Section decoding happens after PAT address translation in the case of TILER. In non-bypass mode, the system address considered for TILER accesses is the virtual address computed based on the PAT translation tables.

The [DMM_LISA_LOCK](#) register is used to lock the configuration once set. If written to 1, the LOCK bit prevents further writes to all [DMM_LISA_MAP_i](#) registers. The LOCK bit cannot be written back to 0. A reset is required to reprogram the sections.

16.2.3.5.1.3 Address Translation

The PAT engine of the DMM is composed of a 32-k entry physical address translation vector table and one or two refill engines. The refill engine is a specialized DMA for refilling the content of the PAT table.

The address translation mechanism is available only when the incoming request hits a page mode or tiled mode container; that is, when the incoming address targets the TILER or its aliased view in the system addressing space. Otherwise, the PAT logic is bypassed so that the resulting physical address corresponds to the input address.

The PAT engine supports multiple address translation schemes, called views, which can be bound to one or more initiators through a view mapping mechanism.

16.2.3.5.1.3.1 PAT View Mappings

The PAT engine can have up to 16 groups of initiators that share a set of four PAT views. The connection from an initiator to a PAT view is made through the DMM_PAT_VIEW register. Given that each PAT view index is coded on 4 bits, the DMM_PAT_VIEW register is a 64-bit register split into two 32-bit registers ([DMM_PAT_VIEW0](#) for the first eight PAT view indexes and [DMM_PAT_VIEW1](#) for the last eight PAT view indexes).

The PAT view index that corresponds to the initiator having the value *i* as the 4 most-significant bits (MSBs) of its L3 ConnID uses the view referenced in entry *i* of the DMM_PAT_VIEW. For example, the initiator 0xC4 uses the thirteenth view index of the DMM_PAT_VIEW register, the fifth view index in the [DMM_PAT_VIEW1](#) register.

The PAT view index of the initiator *i* is found in the Vi field. The Wi field is aimed at writing the corresponding Vi. When writing to the DMM_PAT_VIEW registers, the only Vi view indexes that are updated are those having their corresponding Wi bit, and byte enable, set. The Wi bits are always read as 0. For instance, to set the PAT view indexes V3 and V7 to 2 and 1, respectively, the [DMM_PAT_VIEW0](#) register must be written with 5000 6000h.

16.2.3.5.1.3.2 PAT View Map Base Address

The PAT view map base address defines the base address of all PAT translated addresses.

Bit [31] of all PAT translated addresses is set to BASE_ADDR. For example, if the [DMM_PAT_VIEW_MAP_BASE](#) register is set to 8000 0000h, all PAT translated addresses will have bit [31] set to 1 so that the translated addresses range from 8000 0000h to FFFF FFFFh. All reserved bits of this DMM PAT base address register are read to 0.

16.2.3.5.1.3.3 PAT Views

A PAT view defines the kind of physical address translation to perform for each mode accesses (page, 8-bit, 16-bit and 32-bit). Each mode of each PAT view can be configured to use a container-grained translation or page-mode translation.

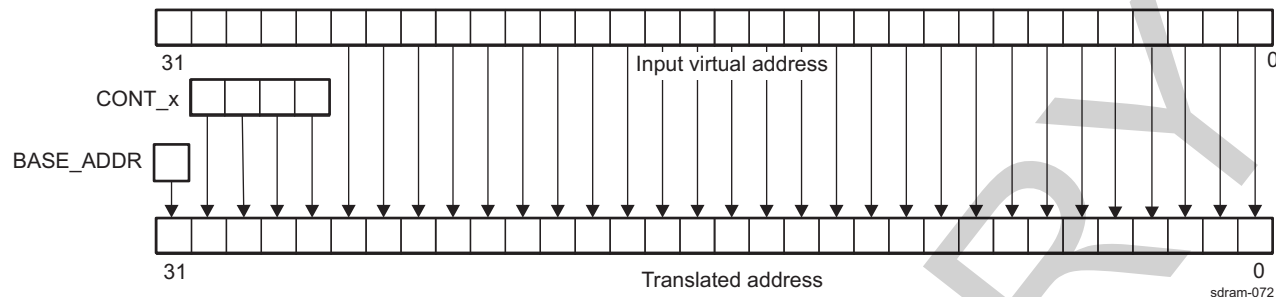

16.2.3.5.1.3.3.1 PAT Direct Access Translation

The container-grained translation is named the direct access. In this mode, the translation vector is given directly by the CONT_x bit field that corresponds to the accessed mode.

- A page mode access uses the vector contained in the [DMM_PAT_VIEW_MAP_i](#)[27:24] CONT_PAGE bit field.
- A 32-bit mode access uses the vector contained in the [DMM_PAT_VIEW_MAP_i](#)[19:16] CONT_32 bit field.
- A 16-bit mode access uses the vector contained in the [DMM_PAT_VIEW_MAP_i](#)[11:8] CONT_16 bit field.
- An 8-bit mode access uses the vector contained in the [DMM_PAT_VIEW_MAP_i](#)[3:0] CONT_8 bit field.

See [Figure 16-6](#).

Figure 16-6. PAT Direct Access Translation

16.2.3.5.1.3.3.2 PAT Indirect Access Translation

The page-grained translation is named the indirect access. In this mode the translation vector is found in the internal 32-k entry physical address translation vector table at the index given by bits [26:12] of the input virtual address, and the [DMM_PAT_VIEW_MAP_i](#) CONT_x bit field references the internal physical address translation table to use. Because the DMM uses only one such table, in this mode the CONT_x bit field must be written as 0. See [Figure 16-7](#).

Figure 16-7. PAT Indirect Access Translation

Each entry of the PAT lookup table (LUT) is a 19-bit vector that replaces bits [30:12] of the input virtual address. The PAT index aimed at selecting the vector in the table consists of bits [26:12] of the input virtual address.

16.2.3.5.1.3.3.3 PAT View Configuration

There are four different views in a DMM, each with its own [DMM_PAT_VIEW_MAP_i](#) register for defining the kind of address translation to perform.

The PAT view type of each mode is selected by the ACCESS_x bit field in the [DMM_PAT_VIEW_MAP_i](#) register, i being the index of the considered view. When this field is set to 1, the indirect access scheme is used; otherwise, the PAT performs the address translation in a direct way with the corresponding CONT_x vector.

When configuring a mode in a view to use the indirect access, the corresponding CONT_x bit field must be filled with 0.

16.2.3.5.1.3.3.4 PAT Address Translation LUT

The PAT LUT has the same geometry as the DMM container. It has 128 lines of 256 entries of 19-bit each. See [Figure 16-8](#).

Figure 16-8. Physical Address Translation Table

| | | | | | | | | | |
|-------------|-------------|-------------|-------------|-------------|---------------|---------------|---------------|---------------|---------------|
| $E_{0,0}$ | $E_{1,0}$ | $E_{2,0}$ | $E_{3,0}$ | $E_{4,0}$ | $E_{251,0}$ | $E_{252,0}$ | $E_{253,0}$ | $E_{254,0}$ | $E_{255,0}$ |
| $E_{0,1}$ | $E_{1,1}$ | $E_{2,1}$ | $E_{3,1}$ | $E_{4,1}$ | $E_{251,1}$ | $E_{252,1}$ | $E_{253,1}$ | $E_{254,1}$ | $E_{255,1}$ |
| $E_{0,2}$ | $E_{1,2}$ | $E_{2,2}$ | $E_{3,2}$ | $E_{4,2}$ | $E_{251,2}$ | $E_{252,2}$ | $E_{253,2}$ | $E_{254,2}$ | $E_{255,2}$ |
| $E_{0,125}$ | $E_{1,125}$ | $E_{2,125}$ | $E_{3,125}$ | $E_{4,125}$ | $E_{251,125}$ | $E_{252,125}$ | $E_{253,125}$ | $E_{254,125}$ | $E_{255,125}$ |
| $E_{0,126}$ | $E_{1,126}$ | $E_{2,126}$ | $E_{3,126}$ | $E_{4,126}$ | $E_{251,126}$ | $E_{252,126}$ | $E_{253,126}$ | $E_{254,126}$ | $E_{255,126}$ |
| $E_{0,127}$ | $E_{1,127}$ | $E_{2,127}$ | $E_{3,127}$ | $E_{4,127}$ | $E_{251,127}$ | $E_{252,127}$ | $E_{253,127}$ | $E_{254,127}$ | $E_{255,127}$ |

$E_{x,y}$ 4-KB page entry

sdram-074

Each entry of the PAT address corresponds to the page in the DMM container that has the same location. The entry (74, 42) in the table corresponds to the page (74, 42) in any DMM container.

16.2.3.5.1.3.3.5 Direct Access to the PAT Table Vectors

The PAT table is typically refilled with specialized DMA called refill engines. Some direct read and write access to the content of this table is granted when disabling the use of one or the other refill engine by writing 1 in the MODE*i* field of the [DMM_PAT_CONFIG](#) register that corresponds to the refill engine *i* to disable.

In this mode, often called the debug mode, the data read in or written to the [DMM_PAT_DATA_i](#) register corresponds to the vector in the PAT table, whose index is in the X0 and Y0 fields of the [DMM_PAT_AREA_i](#) register.

16.2.3.5.1.3.3.6 Automatic Refill Through the Refill Engines

See [Section 16.2.4.1](#), PAT Use Cases.

16.2.3.5.2 DMM Transaction Flows

16.2.3.5.2.1 Nontiled Transaction Flow

Each nontiled interconnect transaction that reaches the DMM on a TILER port is subject to the same processing.

The TILER blocks consider separated request, data, and response paths. An overview of each path follows and more detailed information is in [Section 16.2.3.5.3](#), DMM Internal Macro-Architecture.

On the request path, the flow consists of:

- Allocating a TILER response context for the timely generation of the appropriate responses
- Splitting 2D requests in a collection of 1D requests – TILER ports
- Splitting requests at DMM unit boundaries; the split granularity is provided by the LISA mapping registers
- Allocating an available buffer in the appropriate ROBIN, for both read and write requests
- In case of a write request, allocating and updating a TILER write context to direct the incoming write data into the relevant reordering buffer

- Generating the initiator-indexed priority extension by use of the PEG block

On the write data path, the flow consists of forwarding incoming data to the relevant reordering buffer in accordance with the corresponding TILER write context.

On the response path, responses are returned when:

- At least one response has entered each related buffer, in case of read requests
- All related responses have returned from the SDRC, in case of write requests
- AND no other previous pending response with the same tag exists

16.2.3.5.2.2 Tiled Transaction Flow

Similarly, each tiled interconnect transaction that reaches the DMM is subject to the same processing.

The TILER blocks consider separated request, data, and response paths. An overview of each path follows, and more detailed information is in [Section 16.2.3.5.3, DMM Internal Macro-Architecture](#).

On the request path, the processing phase consists of:

- Decoding the address to qualify whether the request targets the TILER or the memory directly
- Transforming TILER-specific requests to their natural representation; the address, width, and height are modified accordingly

On the request path, the generation phase consists of:

- Allocating a TILER response context for the timely generation of the appropriate responses
- Splitting malformed: The request stride differs from the container stride and from the double of this container stride – tiled 2D requests in a collection of 1D requests
- Splitting tiled requests at tile boundaries
- Performing the page-based address translation by use of the PAT block
- Allocating an available buffer in the appropriate ROBIN, for read and write requests
- In case of a write request, allocating and updating a TILER write context to direct the incoming write data into the relevant reordering buffer
- Generating the initiator-indexed priority extension by use of the PEG block

On the data path, any incoming data is transformed in accordance with the corresponding TILER write context and sent to the appropriate reordering buffer.

On the response path, responses are returned when:

- A minimal number of responses have entered the corresponding buffers, in case of read requests
- All related responses have returned from the SDRCs, in case of write requests
- No other previous pending response with the same tag exists

16.2.3.5.3 DMM Internal Macro-Architecture

This section describes the DMM internal macro-architecture, specifically:

- Input request decoding
- PAT and synchronized translation table reloading
- Output request and response generation
- Memory mapping in the system addressing space, including interleaving
- Tag management
- Priority handling
- Contexts
- Maximum allowed burst size
- Reconstruction buffer dimensioning

16.2.3.5.3.1 LISA Description

The LISA is a full crossbar aimed at setting priorities, managing tag, and mapping memory.

The interconnect routes are:

- TILER requests on the ROBIN initiator nodes
- TILER write data on the ROBIN write buffers
- ROBIN read data to the relevant TILER initiators

The LISA block registers are [DMM_LISA_MAP_i](#) (where $i = 0$ to 3) and [DMM_LISA_LOCK](#).

When two ROBINS are in use, the two ports are interleaved at a programmable boundary from 128 bytes or more (configurable with the [DMM_LISA_MAP_i\[19:18\]](#) SDRG_INTL bit field).

16.2.3.5.3.2 PAT Description

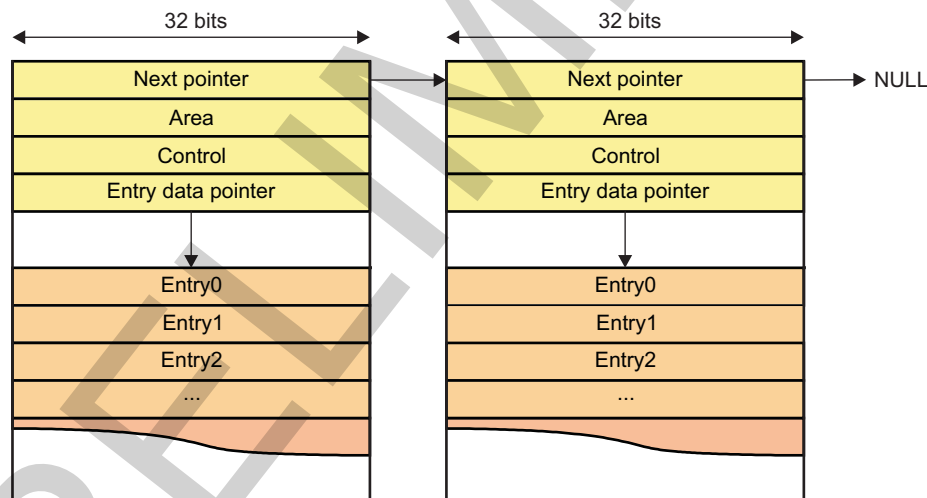

The PAT block maps physical pages to each TILER container page. The internal address translation memories used in the PAT block are designed with RFFs. It consists of:

- A memory-based LUT which has the same geometry as the container pages
- A refill engine for modifying entries in a given area of the internal LUT

A PAT descriptor is a singly-linked list node (see [Figure 16-9](#)) that contains:

- A description of the LUT area to reload
- A description of how to reload the defined LUT area
- A pointer to the location where the corresponding LUT entries are stored

Figure 16-9. PAT Descriptors

sdram-065

PAT descriptors are chained and processed until a NULL pointer is encountered. The PAT bank allocation scheme allows the updating of four consecutive entries of a line in a single cycle regardless of the refilling orientation.

The PAT descriptor structure directly maps the following registers (where $i = 0$ to 3):

- [DMM_PAT_DESCR_i](#)
- [DMM_PAT_AREA_i](#)
- [DMM_PAT_CTRL_i](#)
- [DMM_PAT_DATA_i](#)

The PAT refill engine can be started by:

- Filling manually all the necessary registers:
 - [DMM_PAT_AREA_i](#) with the $(x0, y0) (x1, y1)$ area definition

- [DMM_PAT_DATA_i](#) with the physical address of the corresponding area entry table
- [DMM_PAT_CTRL_i](#)[6:4] DIRECTION bit field with the relevant (S, Y, X) direction of the area refill
- [DMM_PAT_CTRL_i](#)[0] START bit with 1
- Writing the physical address of a memory-mapped PAT descriptor in [DMM_PAT_DESCR_i](#), which updates:
 - [DMM_PAT_AREA_i](#) with the area value of the descriptor
 - [DMM_PAT_DATA_i](#) with the data value of the descriptor
 - [DMM_PAT_CTRL_i](#) with the control value of the descriptor
 - [DMM_PAT_DESCR_i](#) with the next value of the descriptor
- The data part of the PAT refill starts only when the [DMM_PAT_CTRL_i](#)[0] START bit is asserted.

The [DMM_PAT_STATUS_i](#) register can be used to see whether the process has completed without errors.

16.2.3.5.3.3 PEG Description

The PEG is a dynamic software-programmable, initiator-ConnID-indexed table of priorities. Its role is to change on the fly the priority of an initiator, for initiators that do not generate their own per-transaction priority. The mapping of each initiator to the table (split into eight registers) is based on its 6-MSB group ConnID (see [Table 29-20](#), *ConnID Mapping (Debug View)*, in [Chapter 29](#), *On-Chip Debug Support*).

When an interconnect request enters the DMM, its priority is extracted from the PEG LUT and set in its MReqInfo field.

The 64 priority entries are software-programmable with eight [DMM_PEG_PRIO](#) registers ([DMM_PEG_PRIO_k](#)).

These eight registers are each split into eight 4-bit fields, each field mapping an entry of the LUT with:

- The 3-bit priority coded on the 3 least-significant bits (LSBs): Px field. A priority of 0 defines the highest priority and a priority of 7 defines the lowest priority. The priority of a request with ConnId equal to y is written in (8.n + x) P field, where n is the number of the priority register (n = 0 to 7) and x is the number of the P field in the corresponding register (x = 0 to 7). If the ConnId is 0x16, its priority is written in the third priority register (where n = 2), in the P4 bit field ([18:16]), because x = 4.
- A \overline{W} x field-specific active-low local write enable bit, always read as 0, on the most-significant bit (MSB). The role of the \overline{W} bit is to allow the modification of a single entry without requiring a read-modify-write sequence. Because its \overline{W} bits are always read as 0, writing back the modified register updates all priority fields of the register.

Although this priority information is generated before entering the LISA block, it is not used internally in the local interconnect arbitration but is forwarded to the SDRC as an MReqInfo, where it indicates the command priority.

It is also possible to give a priority for the internal PAT engine through the [DMM_PEG_PRIO_PAT](#) register.

16.2.3.5.3.4 ROBIN Description

The ROBIN is a block that provides some working buffering for converting data and responses to-and-from between raster and tiled organizations, and a master port to connect to the SDRC.

The ROBIN block:

- Forwards requests
- Writes data and buffers responses
- Keeps write data ordering
- Performs intraword tiling and orientation transforms
- Handles tags

16.2.3.5.3.5 TILER Description

The main function of the TILER is request conversion caused by tiling.

The TILER block:

- Decodes the address to qualify whether the request targets the TILER or the memory directly
- Converts TILER-specific requests to their natural representation; address, width, and height are modified accordingly
- Allocates an internal response context for the timely generation of appropriate responses
- Splits tiled requests at tile boundaries and not-tiled requests at DMM atomic section boundaries
- Requests the page-based address translation
- Requests buffer allocation in the appropriate ROBIN
- In case of a write request, allocates and updates an internal write context to direct the incoming write data into the relevant reordering buffer

The interdependent tiling and isometric transform concepts introduced in the TILER are described in the following section.

16.2.3.6 TILER

16.2.3.6.1 TILER Concepts

This section describes the concepts behind the TILER transforms, through a top-down approach starting from the main object container.

16.2.3.6.1.1 TILER Rationale

This section is a synthesis of all TILER concepts, giving one rule per TILER structure level.

[Figure 16-10](#) shows the TILER address space structure for tiled modes.

Figure 16-10. TILER Address Space Structure for Tiled Modes

sdram-005_public

16.2.3.6.1.1.1 The TILER is a 4-GB Virtual Address Space Composed of Eight Views

There is one view for each of the eight possible ways of scanning a frame-buffer:

- From left to right then from top to bottom

- From right to left then from top to bottom
- From left to right then from bottom to top
- From right to left then from bottom to top
- From top to bottom then from left to right
- From top to bottom then from right to left
- From bottom to top then from left to right
- From bottom to top then from right to left

16.2.3.6.1.1.2 A View is a 512-MB Virtual Address Space Composed of Four Containers

There is one container per element size to allow correct access patterns in any of the eight possible orientations. The container is the entity where all objects of a given element type are allocated.

The element is the entity of maximum size (8, 16, 32 bits or page-sized), which is invariant in any orientation.

16.2.3.6.1.1.3 A Container is a 128-MB Virtual Address Space

A container is composed of an array of 128 lines of 256 pages of 4 KB each.

The page defines the granularity of physical memory allocation through a PAT unit – MMU.

16.2.3.6.1.1.4 A Page is a 4-KB Virtual Address Space

A page is composed of two lines. Each line consists of two tiles.

16.2.3.6.1.1.5 A Tile is a 1-KB Address Space

The tile is designed to offer bidimensional data locality in a single SDRAM page. In this respect, it is sized to 1 KB; that is, to the size of the smallest SDRAM page.

16.2.3.6.1.2 TILER Modes

The TILER supports three major modes, bypass, page, and tiled. Each mode has a specific output request generation.

16.2.3.6.1.2.1 Bypass Mode

This mode is transparent from the TILER perspective. However, from the DMM perspective:

- 2D block bursts are broken down on a line basis in a set of incremental bursts.
- Incremental bursts, including those issued by a 2D block burst breakdown, are split at the DMM atomic unit of the section hit by the burst at:
 - The interleaving granularity of the section (128, 256, or 512 bytes) in interleaved sections
 - 1-KB boundary in noninterleaved sections

16.2.3.6.1.2.2 Page Mode

This mode uses the DMM address translation mechanism for nontiled accesses. In this respect it is similar to bypass mode:

- 2D block bursts are broken down on a line basis in a set of incremental bursts.
- Incremental bursts, including those issued by a 2D block burst breakdown, are split at:
 - The interleaving granularity of the section (128, 256, or 512 bytes) in interleaved sections
 - 1-KB boundary in noninterleaved sections

16.2.3.6.1.2.3 Tiled Mode

Tiled mode has two major breakdown algorithms:

- One for well-formed 2D block requests that conform to the orientation, mode, and stride listed in [Table 16-9](#)
- One for 1D incremental requests and ill-formed 2D block requests

Table 16-9. Well-Formed Tiled Mode 2D Block Requests

| Orientation | | | Mode | | Stride | Description |
|-------------|---|---|------|----|---------|---|
| S | Y | X | M1 | M0 | (bytes) | |
| 0 | x | x | 0 | 0 | 16,384 | Plain access to an 8-bit progressive frame in 0 or 180 degrees |
| | | | | | 32,768 | Field access to an 8-bit interlaced frame 0 or 180 degrees |
| | | | 0 | 1 | 32,768 | Plain access to a 16-bit progressive frame in 0 or 180 degrees |
| | | | | | 65,536 | Field access to a 16-bit interlaced frame 0 or 180 degrees |
| | | | 1 | 0 | 32,768 | Plain access to a 32-bit progressive frame in 0 or 180 degrees |
| | | | | | 65,536 | Field access to a 32-bit interlaced frame 0 or 180 degrees |
| 1 | x | x | 0 | 0 | 8192 | Plain access to an 8-bit progressive frame in 90 or 270 degrees |
| | | | | | 16,384 | Field access to an 8-bit interlaced frame 90 or 270 degrees |
| | | | 0 | 1 | 8192 | Plain access to a 16-bit progressive frame in 90 or 270 degrees |
| | | | | | 16,384 | Field access to a 16-bit interlaced frame 90 or 270 degrees |
| | | | 1 | 0 | 16,384 | Plain access to a 32-bit progressive frame in 90 or 270 degrees |
| | | | | | 32,768 | Field access to a 32-bit interlaced frame 90 or 270 degrees |

Similar to the bypass and page modes, ill-formed 2D block requests are broken down on a line basis in a set of incremental bursts. In tiled mode, however, these incremental virtual bursts do not translate to 1D physical burst requests.

16.2.3.6.1.3 Object Container Definition

The object container is the unique addressable entry point of the TILER. It is a 128-MB virtual address space, where all objects of a same kind and orientation are allocated.

Four main types of containers are present in the TILER, each referred by a mode:

- 8-bit element mode, for efficiently accessing bidimensional arrays of 8-bit data
- 16-bit element mode, for efficiently accessing bidimensional arrays of 16-bit data
- 32-bit element mode, for efficiently accessing bidimensional arrays of 32-bit data
- Page mode, for efficient 1D accesses

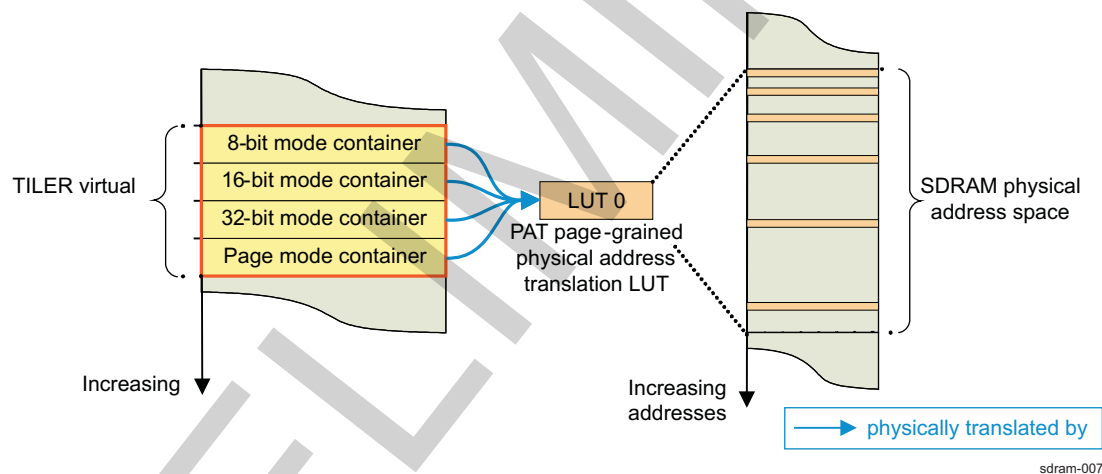

[Figure 16-11](#) shows the TILER object containers and views.

Figure 16-11. TILER Object Containers and Views

The 512-MB virtual address space composed of four 128-MB object containers of different modes is called a view. Because eight orientations are available per mode, the TILER actually manages 32 kinds of containers.

The physical memory footprint of a 512-MB TILER view is directly subject to the nature of the PAT unit.

A unique PAT LUT is instantiated in the DMM. This table is shared by all TILER modes. Hence, each of the four modes cannot be given its own private page-grained PAT LUT. A maximum of 128MB of objects among all TILER modes can be managed as shown in Figure 16-12.

Figure 16-12. TILER Memory Footprint With PAT and Shared Physical Address Translation LUT

Although each of the four modes has its own separate virtual 128-MB object container, these containers are all mapped to the same piecewise 128-MB physical address space, and are then not physically separated. Consequently, a memory-related system constraint is that no more than 128-MB of objects can be available simultaneously in a TILER view.

NOTE: Software must ensure that any object allocated in a mode does not physically overlap with any other object, even in another mode.

16.2.3.6.1.4 Page Definition

A TILER page defines the granularity of object allocation in virtual TILER containers.

Because the subpage structure is mode-specific, the page is the smallest granularity common to all modes, making it the granularity to consider in the TILER resource manager for object allocation.

16.2.3.6.1.4.1 Container Geometry With 4-KB Pages

Because the size of the page is 4 KB, any 128-MB object container is a set of 32,768 pages, organized in an array of 256 columns and 128 rows, as shown in Figure 16-13.

Figure 16-13. Object Container Geometry With 4-KB Pages

This array of pages is mapped to the system address space, as shown in Figure 16-14.

Figure 16-14. TILER Page Mapping When Using 4-KB Pages

In any 128-MB object container, the 4-KB page $P_{x,y}$ at column x (where $0 = x \leq 255$) and row y (where $0 = y \leq 127$), is found at an offset of $4096 \cdot (x + 256 \cdot y)$ bytes from the base address of the related object container.

Similarly, the page $P_{x,y}$ at column x (where $0 = x \leq 255$) and row y (where $0 = y \leq 127$), is translated by the LUT entry $E_{x+256 \cdot y}$ found at the index $x + 256 \cdot y$.

16.2.3.6.1.4.2 Container Geometry and Page Mapping Summary

The TILER has a page size of 4096 bytes. The page $P_{x,y}$:

- Has $\max_x = 256$ and $\max_y = 128$
- Is found at an offset of $4096 \cdot (x + \max_x \cdot y)$ bytes from the base address of the related object container
- Is translated by the entry at the index $(x + \max_x \cdot y)$ of the LUT

16.2.3.6.1.5 Orientation

This section describes the eight on-the-fly orientation-related isometric transforms, which correspond to all available changes of orthonormal basis in the bidimensional space of the TILER container.

Figure 16-15 shows isometric transforms in the TILER container

Figure 16-15. Isometric Transforms in the TILER Container

Mathematically speaking, all these transforms correspond to the composition of a 0-, 90-, 180-, or 270-degree rotation with an optional reflection. The nature of this orientation is based on the three following binary parameters:

- X to change the direction of the x axis of the TILER container
- Y to change the direction of the y axis of the TILER container
- S to swap the modified x and y axis

Hereafter in this document the term orientation refers to any composition of a "quadrant" rotation with an optional horizontal (flip-flop) or vertical mirroring.

16.2.3.6.1.6 Tile Definition

A tile is a subdivision of a page that is aimed at:

- Representing a 2D block to better balance accesses in both directions
- Ensuring that any tiled access that fits within a tile is made atomic in the SDRG and fits in a single SDRAM memory page
- Minimizing the number of SDRAM page openings per 2D block transfer

The tile is defined as a 1-KB 2D block, and a 4-KB page as an array of two lines of two tiles each.

When the considered page is in an interleaved DMM section, it is necessary that:

- The DMM memory interleaving size of tiled accesses is set to 1 KB (a tile size) so that any tiled request that fits within a tile, fits in a single SDRAM memory page.
- Any request that spans two or four tiles is distributed on a maximum number of SDRGs.

16.2.3.6.1.7 TILER Virtual Addressing

The TILER can be virtually accessed in four different modes: 8-, 16-, 32-bit, and page modes. Each mode defines the element granularity to apply isometric transforms, as summarized in Table 16-10.

Table 16-10. Coding and Description of TILER Modes

| Mode | Name | Granularity (Element Size) |
|------|-------------------|----------------------------|
| 0 | 8-bit tiled mode | 8 bits |
| 1 | 16-bit tiled mode | 16 bits |
| 2 | 32-bit tiled mode | 32 bits |
| 3 | Page mode | 4096 bytes |

For instance, making a vertical mirror of a 16-byte horizontal line that contains the word 000102030405060708090A0B0C0D0E0Fh, leads to:

- 0F0E0D0C0B0A09080706050403020100h in 8-bit tiled mode
- 0E0F0C0D0A0B08090607040502030001h in 16-bit tiled mode
- 0C0D0E0F08090A0B0405060700010203h in 32-bit tiled mode
- 000102030405060708090A0B0C0D0E0Fh in page mode – unchanged because the element granularity is 4KB

Besides, because each of the eight orientations is available for any of the four modes, the TILER has 32 addressing possibilities (see [Table 16-11](#)).

Table 16-11. Coding and Description of TILER Orientations

| S | Y | X | Description | Alternate description |
|---|---|---|---------------------------------------|--|
| 0 | 0 | 0 | 0-degree view | Natural view |
| 0 | 0 | 1 | 0-degree view with vertical mirror | 180-degree view with horizontal mirror |
| 0 | 1 | 0 | 0-degree view with horizontal mirror | 180-degree view with vertical mirror |
| 0 | 1 | 1 | 180-degree view | |
| 1 | 0 | 0 | 90-degree view with vertical mirror | 270-degree view with horizontal mirror |
| 1 | 0 | 1 | 270-degree view | |
| 1 | 1 | 0 | 90-degree view | |
| 1 | 1 | 1 | 90-degree view with horizontal mirror | 270-degree view with vertical mirror |

16.2.3.6.1.7.1 Page Mode Virtual Addressing and Characteristics

When used in page mode, the 128-MB TILER space is seen as an orientation-specific sequence of 32,768 pages of 4 KB each. The access sequence inside a page is left unchanged.

Therefore, in page mode, the TILER is accessed similarly to any 128-MB memory, with a 27-bit byte-based address.

NOTE: From here forward, the address is noted as *a* (see [Figure 16-16](#)).

Figure 16-16. Page Mode Virtual Addressing

sdram-027

16.2.3.6.1.7.2 Tiled Mode Virtual Addressing and Characteristics

When used in tiled mode, the 128-MB TILER space is seen as a giant frame-buffer, the container. The addressing and characteristics of this giant frame-buffer depend on:

- The tiled mode, which defines the considered atomic element size
- The orientation, which potentially swaps its x and y axis, and hence the container geometry

[Table 16-12](#) summarizes the container characteristics in tiled mode.

Table 16-12. Tiled Mode Container Characteristics

| Orientation S | Υ | \bar{X} | Element Size (Bits) | Width (Elements) | Height (Elements) | Stride (Bytes) | |
|------------------|------------|-----------|------------------------|---------------------|----------------------|----------------|------------|
| | | | | | | Progressive | Interlaced |
| 0 | x | x | 8 | 16,384 | 8192 | 16,384 | 32,768 |
| | | | 16 | 16,384 | 4096 | 32,768 | 65,536 |
| | | | 32 | 8192 | 4096 | 32,768 | 65,536 |
| 1 | x | x | 8 | 8192 | 16,384 | 8192 | 16,384 |
| | | | 16 | 4096 | 16,384 | 8192 | 16,384 |
| | | | 32 | 4096 | 8192 | 16,384 | 32,768 |

As a result, the coordinate (x_0, y_0) of a pixel in an oriented view is translated in a virtual address, as shown in [Figure 16-17](#) and [Figure 16-18](#).

Figure 16-17. Tiled Mode Addressing in 0- or 180-Degree Orientation (S = 0)**Figure 16-18. Tiled Mode Addressing in 90- or 270-Degree Orientation (S = 1)**

16.2.3.6.1.7.3 Element Ordering in the TILER Container

This section describes how elements (8-, 16-, or 32-bit data or a 4-KB page) are ordered in the container. In other words, this section describes how the path of incrementing virtual addresses is mapped in the container.

Regardless of the mode, and hence the element size, the sequence for ordering the elements in their related container is strictly similar and depends only on the related orientation. In other words:

- Mode is concerned with element granularity.
- Orientation is concerned with change of orthonormal basis for ordering the elements in the mode-specific container.

A corollary to the previous statements is that in a given mode the internal structure of an element is unchanged regardless of the orientation. In page mode for instance, the offset of a word inside a page is invariant by orientation; the content of a page is always accessed in the same manner.

In the following sections, the natural container orthonormal basis is referenced as:

$$(\vec{x}_N, \vec{y}_N)$$

sdram-030

and the oriented orthonormal basis is referenced as:

$$(\vec{x}_O, \vec{y}_O)$$

sdram-031

16.2.3.6.1.7.3.1 Natural View or 0-Degree View (Orientation 0)

This orientation defined by $S = 0$, $\overline{Y} = 0$, and $\overline{X} = 0$ means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = \vec{x}_N \\ \vec{y}_O = \vec{y}_N \end{cases}$$

sdram-032

In any TILER mode, the elements are ordered from left to right and then from top to bottom in their container, as shown in Figure 16-19 and Figure 16-20.

Figure 16-19. Tiled Mode Ordering of Elements in Natural View

Figure 16-20. Page Mode Ordering of Elements in Natural View

16.2.3.6.1.7.3.2 0-Degree View With Vertical Mirror or 180-Degree View With Horizontal Mirror

(Orientation 1)

This orientation defined by $S = 0$, $\overline{Y} = 0$, and $\overline{X} = 1$ and means that the operated change of basis is:

$$\begin{cases} \vec{x}_O = -\vec{x}_N \\ \vec{y}_O = \vec{y}_N \end{cases}$$

sdram-035

In any TILER mode, the elements are then ordered from right to left and then from top to bottom in their container, as shown in Figure 16-21 and Figure 16-22.

Figure 16-21. Tiled Mode Ordering of Elements in 0-Degree View With Vertical Mirror

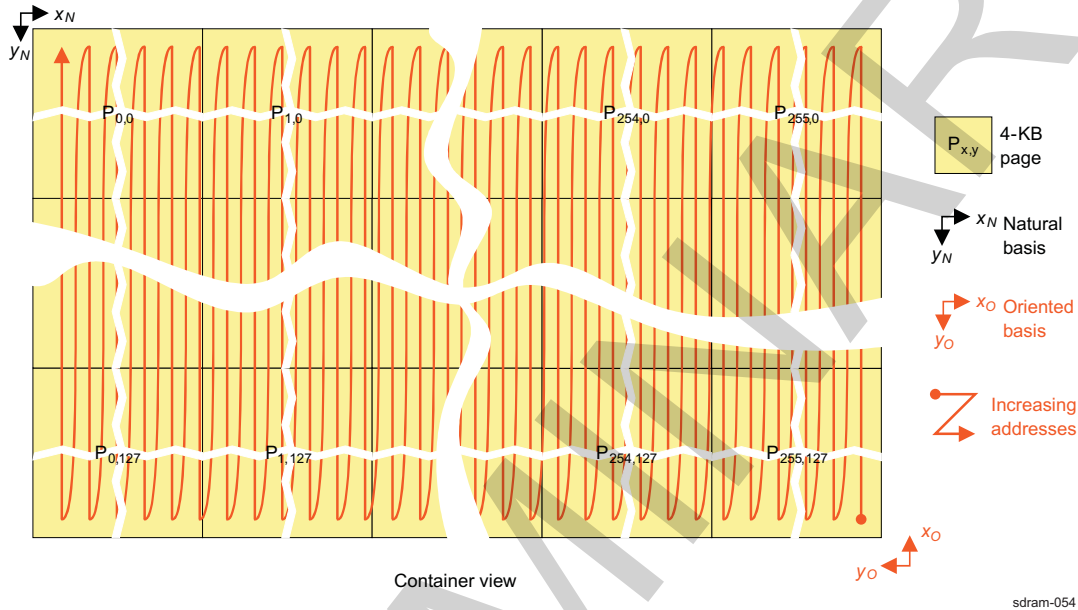

Figure 16-34. Page Mode Ordering of Elements in 90-Degree View With Horizontal Mirror

16.2.3.6.2 TILER Macro-Architecture

The TILER requires a 4-GB addressing space to map its 128-MB physical container in four modes and

eight orientations. Because its addressing space alone fills the 4-GB global system address map, the TILER addressing space cannot enter as-is into the system address map. Besides, putting in place a register-based mechanism per initiator to specify the orientation of the following accesses and then reducing the TILER addressing space to a single 512-MB view is not an option; this is because most of the bandwidth-hungry initiators require simultaneous accesses to the TILER container in different views.

As a result, 32 bits are not enough to address all these requests, because the TILER port must convey not only virtually addressed requests to the "oriented" TILER containers but also physically addressed requests to the attached SDRCs. A thirty-third address bit is necessary to distinguish the two separated address maps, as shown in Figure 16-35.

Figure 16-35. TILER Port Address Map

Still, having separated systems and TILER-specific address maps is not sufficient. In a system many existing and external IP blocks still rely on a 32-bit address and would then be limited to one or the other 4-GB addressing space. To overcome this limitation, one 512-MB view is aliased in the system address map as (see Table 16-13 and Figure 16-36).

Table 16-13. TILER Aliased View in the L3 Interconnect Mapping

| Start Address (hex) | End Address (hex) | Size |
|---------------------|-------------------|--------|
| 0x6000_0000 | 0x7FFF_FFFF | 512 MB |

From all incoming requests, TILER requests are filtered as having an address that fits one of the following:

- The address format in the TILER-specific address map given in Table 16-14, or
- The address format of the aliased view in the system address map given in Table 16-15; other requests are forwarded directly to the SDR in TILER bypass mode.

Table 16-14. Address Format in the TILER-Specific Address Map

| 32 | 31 | 30 | 29 | 28 | 27 | 26 ... 4 | 3 ... 0 |
|----|-------------|----|----|------|----|-----------------|---------|
| T | Orientation | | | Mode | | Virtual address | |
| 1 | S | Y | X | M1 | M0 | A26 ... A4 | 0 |

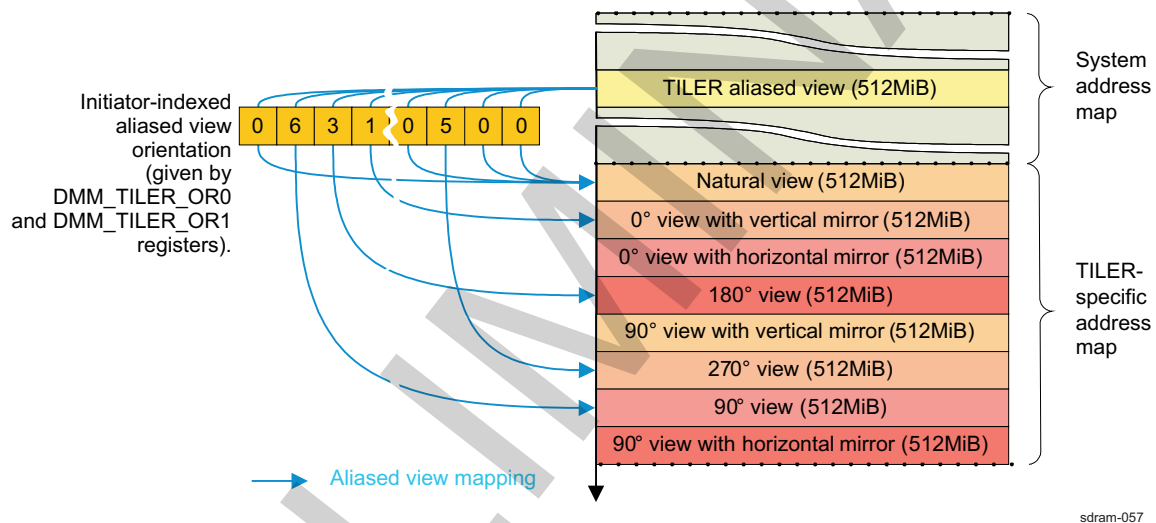

Table 16-15. Address Format of the TILER Aliased View in the System Address Map

| 32 | 31 | 30 | 29 | 28 | 27 | 26 ... 4 | 3 ... 0 |
|----|----------------|----|----|------|----|-----------------|---------|
| T | TILER aliasing | | | Mode | | Virtual address | |
| 0 | 0 | 1 | 1 | M1 | M0 | A26 ... A4 | 0 |

In these address formats:

- The thirty-third bit, noted T, is aimed at distinguishing the standard 4-GiB system address map from the 4-GiB TILER-specific address map.
- The orientation bits, noted S, \overline{Y} , and \overline{X} , define the request orientation, as specified in [Table 16-11](#).
- The mode bits, noted M1 and M0, define the request mode, as specified in [Table 16-10](#).
- The remaining 27 bits, noted A0 to A26, define the mode and orientation specific virtual address, as defined in [Figure 16-16](#), [Figure 16-17](#), and [Figure 16-18](#).

The orientation of the aliased TILER view is extracted from an initiator-indexed LUT, as shown in [Figure 16-36](#).

Figure 16-36. TILER Aliased View Orientation

As shown in [Figure 16-36](#), an internal initiator-indexed LUT stores the current orientation of the aliased view for each initiator.

When an interconnect request hits the TILER aliased view in the system address map, the request initiator orientation is extracted from the LUT and the request address is translated according to this orientation: the T bit is set and bits [31:29] are replaced with the orientation.

Regarding the dimensioning of this LUT, given that initiators simultaneously accessing multiple views use the TILER-specific address map, and many initiators do not need to access any view or can be restricted to accessing only the natural view, only a limited number of initiators are likely to dynamically modify the orientation of its aliased TILER view.

The orientation LUT is limited to 16 entries. These 16 orientation entries are mapped on the two 32-bit [DMM_TILER_OR0](#) and [DMM_TILER_OR1](#) registers.

The first eight entries of the LUT are mapped in the [DMM_TILER_OR0](#) register, and the last eight entries are mapped in the [DMM_TILER_OR1](#) register. Therefore, given an index x, the orientation related to this index is given in the ORx field.

Each of these registers is split into eight 4-bit fields, each field mapping an entry of the LUT with:

- An S, \overline{Y} , \overline{X} orientation code on the 3 LSBs
- An \overline{W} field-specific active-low local write-enable bit, always read as 0, on the MSB.

The registers fields that correspond to initiators that do not need any dynamic configuration of their aliased view orientation must be specified as reserved fields, and only written with zeros.

The \overline{W} bit allows the modification of a single entry without requiring a read-modify-write sequence. This approach is then more accommodating:

- In a system where multiple initiators can modify their own fields in the registers
- With initiators unable to make the read-modify-write sequence, such as DMA

Still, the \overline{W} bit is active-low to keep the compatibility with the usual read-modify-write sequence. When reading an aliased view orientation register, because all its \overline{W} bits are read as 0, if these bits are untouched by the modification—as they should be—writing back the modified register updates all orientation fields of the register.

16.2.3.6.3 TILER Guidelines for Initiators

16.2.3.6.3.1 Buffered Raster-Based Initiators

16.2.3.6.3.1.1 Buffer Size

The necessary minimum buffer size depends on the SDRAM prefetch size and on initiator support in terms of the following:

- Element size
- Orientation
- Maximum number of elements per line in all supported element sizes and orientations

Let N be the maximum number of elements per line for a given mode (element size) and orientation, P be the SDRAM memory prefetch size in bytes, and \max be the function returning the maximum of the two parameters. The minimum necessary line buffer size to handle all resolutions in a given mode and orientation is listed in [Table 16-16](#).

Table 16-16. Minimum Buffer Size to Efficiently Handle Lines of up to N Elements

| | 0- or 180- Degree Orientation ($S = 0$) | 90- or 270-Degree Orientation ($S = 1$) |
|-------------|--|---|
| 8-bit mode | $4 \times N$ bytes | $\max(4, P/4) \times N$ bytes |
| 16-bit mode | None | $\max(8, P/2) \times N$ bytes |
| 32-bit mode | None | $\max(8, P/2) \times N$ bytes |

This minimal buffer size can be reached only with an advanced FIFO management scheme. The standard ping-pong buffer requires twice this buffer size.

NOTE: Given their nature, field accesses to an interlaced frame-buffer require buffers twice as small as in the standard progressive case.

For instance, an initiator that must handle only a single progressive frame-buffer in any orientation of:

- Up to 1920×1080 in YUV4:2:0
- Up to 1600×1200 in 16-bit RGB565
- Up to 800×600 in 32-bit ARGB

requires a line buffer of at least 15,360 bytes because:

- $4 \times 1920 + 4 \times 2960 = 15,360$ bytes required for a 3-plane YUV4:2:0 frame of 1920×1080
- $4 \times 1920 + 8 \times 960 = 15,360$ bytes required for a 2-plane YUV4:2:0 frame of 1920×1080
- $8 \times 1600 = 12,800$ bytes required for a 16-bit RGB565 frame of 1600×1200
- $8 \times 800 = 6400$ bytes required for a 32-bit ARGB frame of 800×600

and a line buffer of at least 30,720 bytes when using a simple ping-pong buffer scheme.

16.2.3.6.3.1.2 Performance

[Table 16-17](#) gives the ratio of effective data to transferred data at the external memory interface for buffered raster-based initiators in each mode and orientation, when using an up-to-32-bit DDR, lpDDR, or lpDDR2 SDRAM, or an up-to-16-bit DDR2 memory.

Table 16-17. Memory Data Payload for Buffered Raster-Based Initiators on Up-to-32-Bit DDR, lpDDR, or lpDDR2

| | 0- or 180-Degree Orientation (S = 0) | | 90- or 270-Degree Orientation (S = 1) | |
|-------------|--------------------------------------|------------|---------------------------------------|------------|
| | Progressive | Interlaced | Progressive | Interlaced |
| 8-bit mode | 100% | 100% | 100% | 50% |
| 16-bit mode | 100% | 100% | 100% | 50% |
| 32-bit mode | 100% | 100% | 100% | 50% |
| Page mode | 100% | N/A | 100% | 100% |

When using 32-bit DDR, lpDDR, or lpDDR2 SDRAMs, or 16-bit DDR, DDR2, lpDDR, or lpDDR2 memories, whenever all previous guidelines are fulfilled, there is no penalty for these initiators to access a tiled object in any orientation, except for accesses to an interlaced frame in 90- or 270-degree orientation where the memory bandwidth is twice the requested bandwidth.

When using up-to-32-bit DDR, lpDDR, lpDDR2, or up-to-16-bit DDR2 SDRAMs, all accesses, except interlaced accesses in a 90- or 270-degree orientation, are equally efficient and offer the full possible memory bandwidth.

Because of its progressive nature, page mode does not introduce any performance hit.

[Table 16-18](#) lists the ratio of effective data-to-transferred data at the external memory interface for the buffered raster-based initiators in each mode and orientation when using a 32-bit DDR2 or DDR3 memory.

Table 16-18. Memory Data Payload for Buffered Raster-Based Initiators on 32-Bit DDR2 or DDR3

| | 0- or 180-Degree Orientation (S = 0) | | 90- or 270-Degree Orientation (S = 1) | |
|-------------|--------------------------------------|------------|---------------------------------------|------------|
| | Progressive | Interlaced | Progressive | Interlaced |
| 8-bit mode | 100% | 50% | 100% | 50% |
| 16-bit mode | 100% | 50% | 100% | 50% |
| 32-bit mode | 100% | 50% | 100% | 50% |
| Page mode | 100% | N/A | 100% | 100% |

When using 32-bit DDR2 or DDR3 SDRAMs, whenever all previous guidelines are fulfilled, there is no penalty for these initiators to access a tiled object in any orientation, except for accesses to an interlaced frame in any orientation where the memory bandwidth is twice the requested bandwidth.

When using DDR2 or DDR3 SDRAMs, all accesses, except interlaced accesses, are equally efficient and offer the full possible memory bandwidth.

Similarly, page mode does not introduce any performance hit.

16.2.4 DMM Use Cases and Tips

16.2.4.1 PAT Use Cases

Five ways to use PAT are:

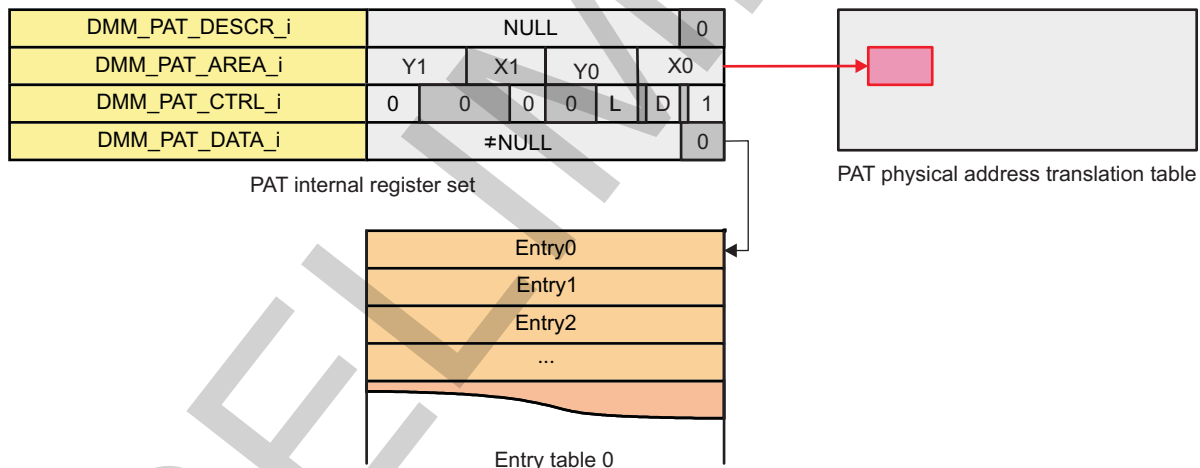

- Simple manual area refill
- Single auto-configured area refill
- Chained auto-configured area refill
- Synchronized auto-configured area refill
- Cyclic synchronized auto-configured area refill

16.2.4.1.1 Simple Manual Area Refill

The following must be performed to create a 16-byte aligned memory-mapped entry table containing all entries of the defined area (see [Figure 16-37](#)):

1. Write the [DMM_PAT_AREA_i](#) register with the relevant (x0, y0) (x1, y1) area definition.
2. Write the [DMM_PAT_DATA_i](#) register with the physical address of the created entry table.
3. Write the [DMM_PAT_CTRL_i](#) register with the requested refill direction and assert the [DMM_PAT_CTRL_i\[0\]](#) START bit with the requested refill direction D and with the LUT ID L if multiple LUTs are present in the system.
4. The refill is done when the [DMM_PAT_STATUS_i\[3\]](#) DONE bit is set.
5. A new refill can be initiated when the [DMM_PAT_STATUS_i\[0\]](#) READY bit is set.

Figure 16-37. Simple Manual Area Refill Scheme

sdram-067

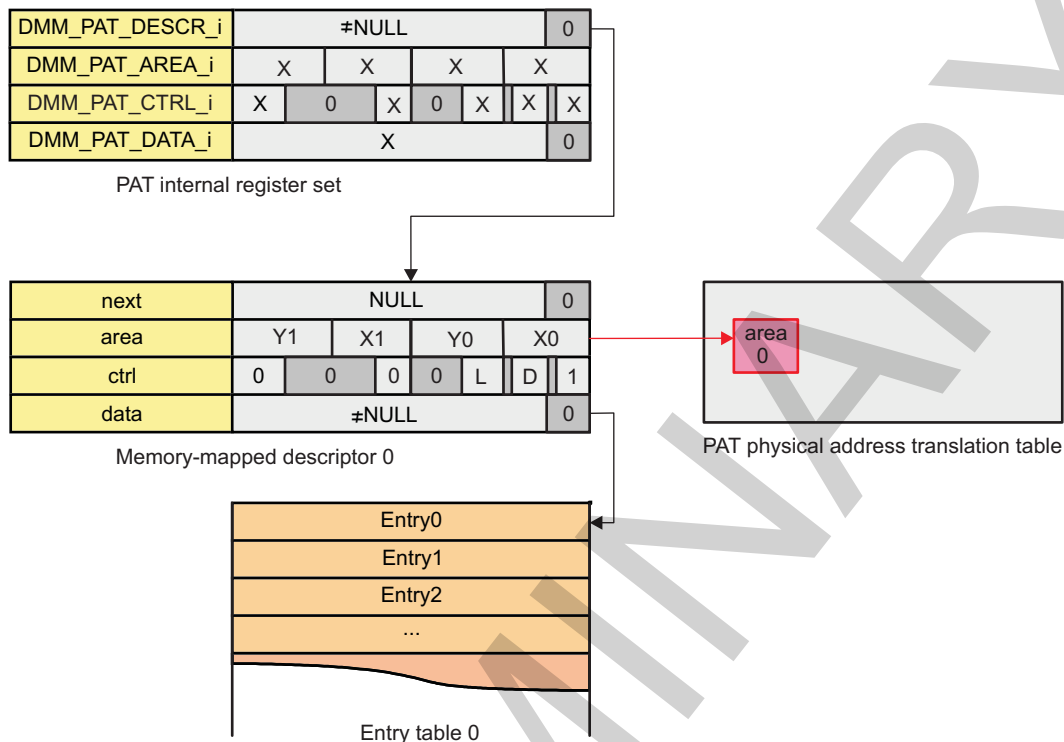

16.2.4.1.2 Single Auto-Configured Area Refill

The following must be performed to create a 16-byte aligned memory-mapped entry table containing all entries of the defined area (see [Figure 16-38](#)):

1. Create a 16-byte aligned memory-mapped descriptor structure where:
 - The next field is set to NULL.
 - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
 - The ctrl field is set with the requested direction D, with the requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as this descriptor enters the PAT refill engine.
 - The data field is set to the physical address of the created entry table.
2. Write the [DMM_PAT_DESCR_i](#) register with the physical address of the created descriptor.
3. The refill is done when the [DMM_PAT_STATUS_i\[3\]](#) DONE bit is set.

4. A new refill can be initiated when the [DMM_PAT_STATUS_i\[0\]](#) READY bit is set.

Figure 16-38. Single Auto-Configured Area Refill Scheme

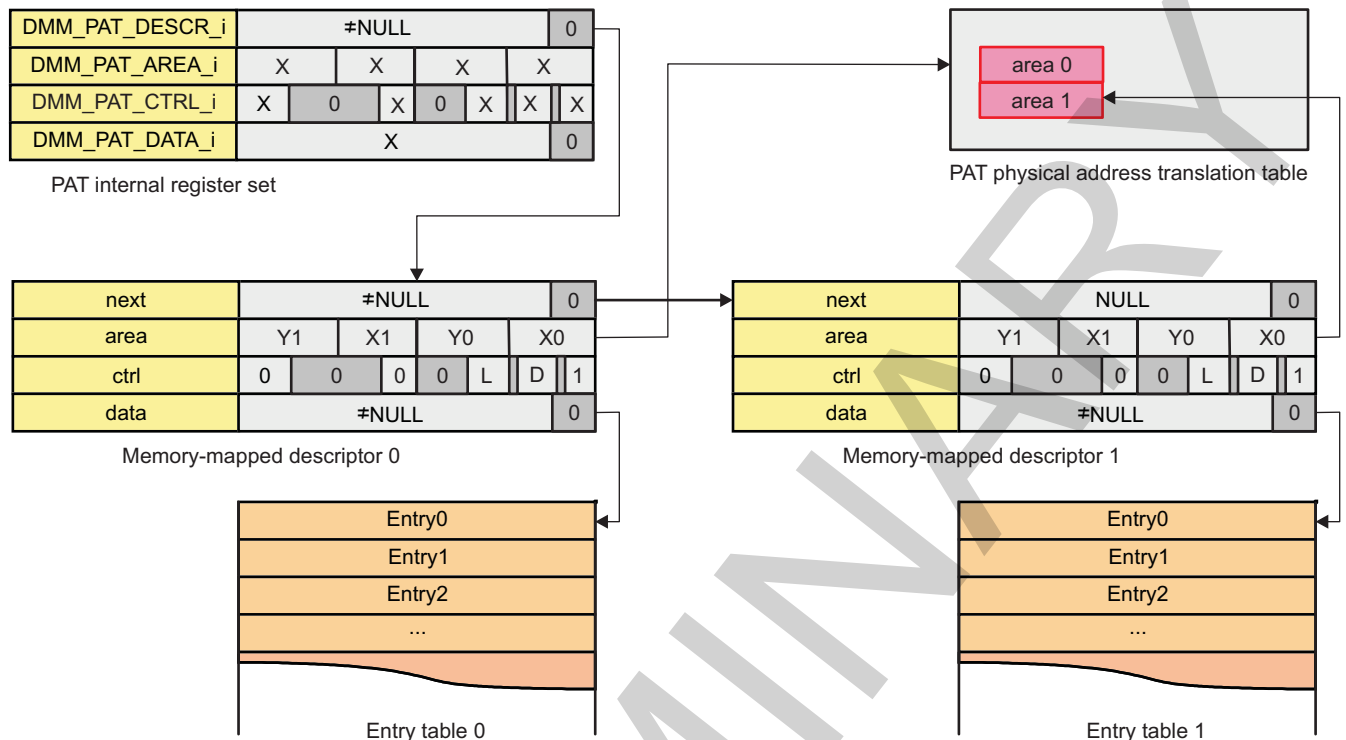

sdram-068

16.2.4.1.3 Chained Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see [Figure 16-39](#)):

- Create one 16-byte aligned memory-mapped descriptor structure per area where:
 - The next field is set to the physical address of the next descriptor or NULL for the last one.
 - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
 - The ctrl field is set with the requested direction D, with the requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done.
 - The data field is set to the physical address of the corresponding entry table.
- Write the [DMM_PAT_DESCR_i](#) register with the physical address of the first created descriptor.
- Each area refill is done when the [DMM_PAT_STATUS_i\[3\]](#) DONE bit is set.
- All area refills are done when the [DMM_PAT_STATUS_i\[0\]](#) READY bit is set.
- A new refill can be initiated when the [DMM_PAT_STATUS_i\[0\]](#) READY bit is set.

Figure 16-39. Chained Auto-Configured Area Refill Scheme

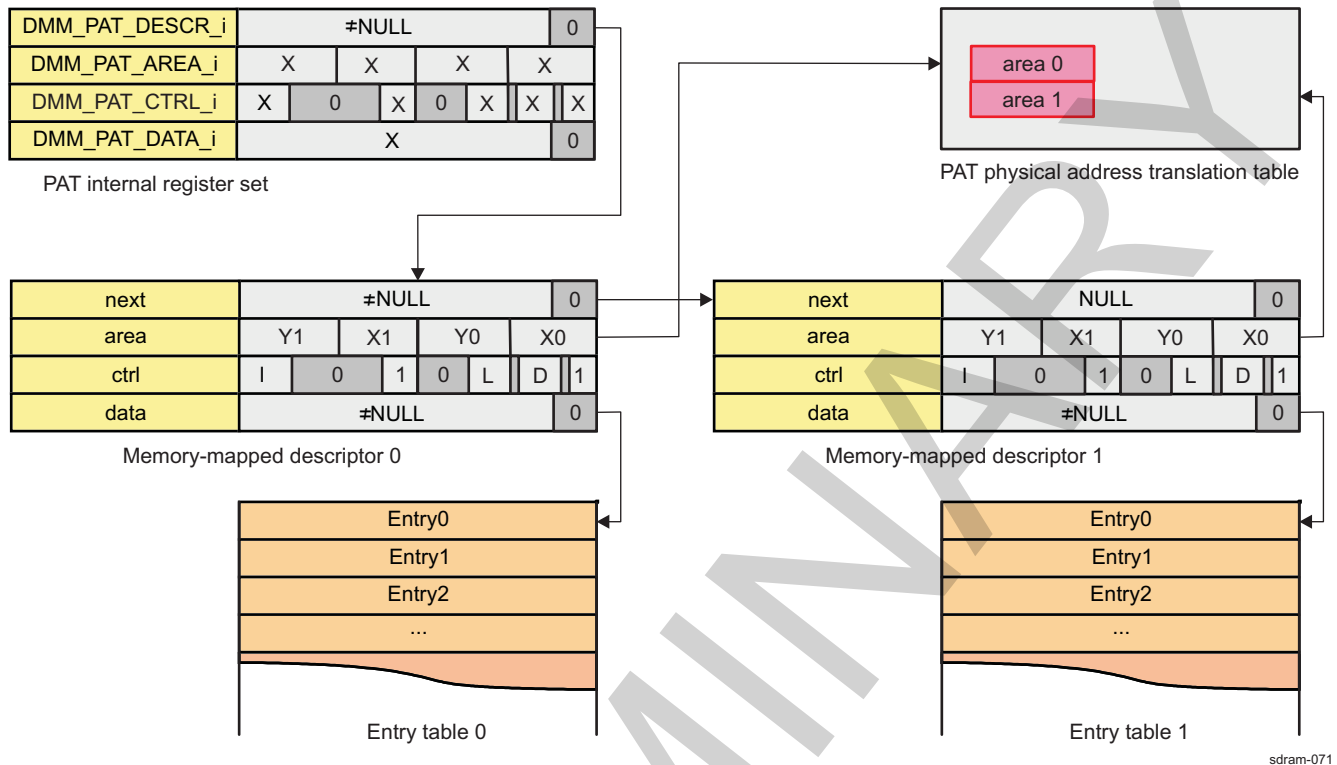

sdram-069

16.2.4.1.4 Synchronized Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see Figure 16-40):

1. Create one 16-byte aligned memory-mapped descriptor structure per area where:
 - The `next` field is set to the physical address of the next descriptor or NULL for the last one.
 - The `area` field is set with the relevant (x0, y0) (x1, y1) area definition.
 - The `ctrl` field is set with the synchronizing initiator identifier I, the SYNC bit is asserted, the requested direction D and the requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area.
 - The `data` field is set to the physical address of the corresponding entry table.
2. Write the `DMM_PAT_DESCR_i` register with the physical address of the first created descriptor.
3. Each area refill is done when the `DMM_PAT_STATUS_i[3]` DONE bit is set.
4. All area refills are done when the `DMM_PAT_STATUS_i[0]` READY bit is set.
5. A new refill can be initiated when the `DMM_PAT_STATUS_i[0]` READY bit is set.

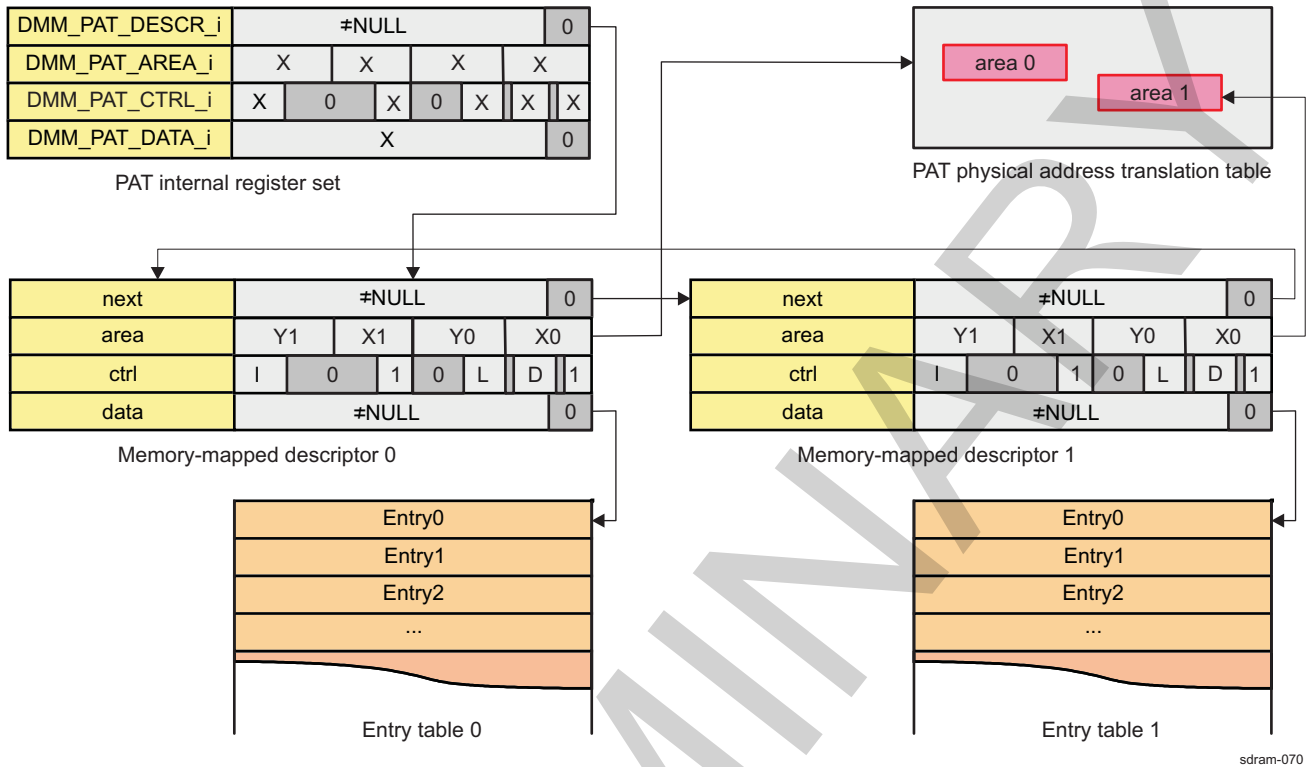

Figure 16-40. Synchronized Auto-Configured Area Refill Scheme

16.2.4.1.5 Cyclic Synchronized Auto-Configured Area Refill

The following must be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area (see [Figure 16-41](#)):

- Create one 16-byte aligned memory-mapped descriptor structure per area where:
 - The next field is set to the physical address of the next descriptor in the circular list.
 - The area field is set with the relevant (x0, y0) (x1, y1) area definition.
 - The control field is set with the synchronizing initiator identifier I, the SYNC bit asserted, the requested direction D and requested LUT ID L if multiple LUTs are present in the system, and the START bit is asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area.
 - The data field is set to the physical address of the corresponding entry table.
- Write the [DMM_PAT_DESCR_i](#) register with the physical address of the initial descriptor.
- Each area refill is done when the [DMM_PAT_STATUS_i\[3\]](#) DONE bit is set.
- A new refill can be initiated by writing any value to the [DMM_PAT_DESCR_i](#) register to abort the current one.

Figure 16-41. Cyclic Synchronized Auto-Configured Area Refill Scheme

NOTE: Never use circular lists of descriptors where all descriptors have the `DMM_PAT_CTRL_i[0]` START bit set and there is no synchronization. This leads to an endless continuous refill.

16.2.4.2 Addressing Management with LISA

16.2.4.2.1 Case 1: Use of One Memory Controller

In this example, assume there is 1 GB of external memory evenly spread onto two address spaces. The address range for address space 0 must start at offset 0x2000_0000 (see Table 16-19).

Table 16-19. Address Definition

| Address Range | Memory Controller | Memory Controller Address Space ⁽¹⁾ | Memory Controller Address Range |
|----------------------------|-------------------|--|---------------------------------|
| 0x8000_0000 to 0x9FFF_FFFF | EMIF1 | 0x1 | 0x0000_0000 to 0x1FFF_FFFF |
| 0xA000_0000 to 0xBFFF_FFFF | EMIF1 | 0x0 | 0x2000_0000 to 0x3FFF_FFFF |

⁽¹⁾ For memory controller address spaces, see Section 16.3.4.1.1, L3 Interface.

This configuration requires two nonoverlapping sections to be set. They can be defined in any order because there is no concern with priority in this case (see Table 16-20):

Table 16-20. Configuration

| Bit Field | Section 0 (DMM_LISA_MAP_0) | Section 1 (DMM_LISA_MAP_1) |
|-------------------|----------------------------|----------------------------|
| [31:24] SYS_ADDR | 0x80 | 0xA0 |
| [22:20] SYS_SIZE | 0x5 | 0x5 |
| [19:18] SDRC_INTL | 0x0 (not applicable) | 0x0 (not applicable) |

Table 16-20. Configuration (continued)

| Bit Field | Section 0 (DMM_LISA_MAP_0) | Section 1 (DMM_LISA_MAP_1) |
|----------------------|----------------------------|----------------------------|
| [17:16] SDRC_ADDRSPC | 0x1 | 0x0 |
| [8] SDRC_MAP | 0x1 (only one controller) | 0x1 (only one controller) |
| [7:0] SDRC_ADDR | 0x00 | 0x20 |

To check whether an address hits a section, use the 8 upper address bits of the address and mask them with the hit mask: $2^8 - 2^{\text{SYS_SIZE}}$. If the result is equal to SYS_ADDR, the section is hit.

To define the physical address to be issued to the memory controller, use the 8 upper address bits of the system address, mask them with the address mask: $2^{\text{SYS_SIZE}} - 1$, and OR them with SDRC_ADDR. This gives the resulting 8 upper physical address bits. All lower address bits are forwarded unchanged.

Request to address 0x99AE_37F0:

- Upper address bits: 0x99
- Hit mask: $2^8 - 2^5 = 0xE0$
- Masked upper address bits: 0x80 – hits section 0
- Address mask: $2^5 - 1 = 0x1F$
- Masked upper address bits: 0x19
- OR with SDRC_ADDR: 0x19
- Physical address: 0x19AE_37F0

This request is forwarded to address 0x19AE_37F0, address space 1 of the memory controller.

Request to address 0xB7FF_0340:

- Upper address bits: 0xB7
- Hit mask: $2^8 - 2^5 = 0xE0$
- Masked upper address bits: 0xA0 – hits section 1
- Address mask: $2^5 - 1 = 0x1F$
- Masked upper address bits: 0x17
- OR with SDRC_ADDR: 0x57
- Physical address: 0x57FF_0340

This request is forwarded to address 0x57FF_0340, address space 0 of the memory controller.

16.2.4.2.2 Case 2: Use of Two Memory Controllers

In the case of 512 MB interleaved at 128-byte boundaries and 256 MB noninterleaved on the second memory controller, one address space per memory controller, the following results are achieved (see [Table 16-21](#)):

Table 16-21. Address Definition

| Address Range | Memory Controller | Memory Controller Address Space ⁽¹⁾ | Memory Controller Address Range |
|----------------------------|---|--|--|
| 0x8000_0000 to 0x9FFF_FFFF | EMIF1 and EMIF2, interleaved at 128-byte boundaries | 0x0 on both controllers | 0x0000_0000 to 0x0FFF_FFFF on both controllers |
| 0xA000_0000 to 0xAFFF_FFFF | EMIF2 only | 0x0 | 0x1000_0000 to 0x1FFF_FFFF |

⁽¹⁾ For memory controller address spaces, see [Section 16.3.4.1.1, L3 Interface](#).

Two sections are used to map such a configuration, see [Table 16-22](#):

Table 16-22. Configuration

| Bit Field | Section 0 (DMM_LISA_MAP_0) | Section 1 (DMM_LISA_MAP_1) |
|----------------------|----------------------------|----------------------------|
| [31:24] SYS_ADDR | 0x80 | 0xA0 |
| [22:20] SYS_SIZE | 0x5 | 0x4 |
| [19:18] SDRC_INTL | 0x1 | 0x0 (not applicable) |
| [17:16] SDRC_ADDRSPC | 0x0 | 0x0 |
| [8] SDRC_MAP | 0x3 | 0x2 |
| [7:0] SDRC_ADDR | 0x00 | 0x10 |

Detecting a section hit is the same for the interleaved case as for the single controller case: to check whether an address hits a section, use the 8 upper address bits of the address and mask them with the hit mask: $2^8 - 2^{\text{SYS_SIZE}}$. If the result is equal to SYS_ADDR, the section is hit.

The physical address generation is modified for the interleaved case. In case of 256-byte interleaving, the first chunk of 256 bytes is mapped to the first controller, the second chunk to the second controller, and so on. This results in system address bit 8 to be decoded as the controller indicator, 0 for the first controller, and 1 for the second controller (system address bit 7 is used for interleaving at the 128-byte boundary, and bit 9 for 512 bytes). This bit is not included in the computed physical address, meaning the upper system address bits [31:9] are shifted to bits [30:8] when generating the physical address.

The rest of the address generation is handled the same as for the single controller case: to define the physical address to be issued to the memory controller, use the 8 upper address bits of the system address, mask them with the address mask: $2^{\text{SYS_SIZE}} - 1$, and OR them with SDRC_ADDR. This gives the resulting 8 upper physical address bits. All lower address bits are forwarded unchanged.

Request to address 0x99AE_37F0:

- Upper address bits: 0x99
- Hit mask: $2^8 - 2^5 = 0xE0$
- Masked upper address bits: 0x80 – hits section 0
- Address mask: $2^5 - 1 = 0x1F$
- Masked upper address bits: 0x19
- Full masked address: 0x19AE_37F0
- Bit 7 is 1 – targets the second memory controller
- Full masked shifted address (suppressing bit 7): 0x0CD7_1BF0 (see [Section 16.2.4.2.2.1](#))
- OR upper physical address bits with SDRC_ADDR: 0x0CD7_1BF0
- Physical address: 0x0CD7_1BF0

This request is forwarded to address 0x0CD7_1BF0, address space 0, of the second memory controller.

16.2.4.2.2.1 Address Upper Bits Shifting

Table 16-23 describes shifting the address upper bits.

Table 16-23. Address Upper Bits Shifting

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| Address Before Interleaving | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | |
| Address After Interleaving | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |

16.2.5 DMM Basic Programming Model

The programming model section:

- Describes how objects can be addressed in all TILER modes and orientations
- Explains how the physical containers and PAT LUT can be shared between different modes
- Does not give an exhaustive description of the TILER and DMM registers, because these are described in [Section 16.2.3.5, DMM](#), and [Section 16.2.3.6, TILER](#).

16.2.5.1 Global Initialization

This section identifies the requirements for initializing the surrounding modules when the DMM is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DMM (see [Table 16-24](#)).

Table 16-24. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|--|---|
| PRCM | The module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management . |
| Dual Cortex - M3 microprocessor unit (MPU) | Cortex-M3 interrupt controller (INTC) configuration must be done to enable the interrupts from the DMM. See Chapter 18, Interrupt Controllers . |
| Dual Cortex - A9 MPU | Cortex-A9 INTC configuration must be done to enable interrupts from the DMM. See Chapter 18, Interrupt Controllers . |
| L3 interconnect | Data interface |

16.2.5.2 DMM Module Global Initialization

This procedure in [Table 16-25](#) initializes the DMM after a power-on reset (POR).

Table 16-25. DMM Global Initialization

| Step | Register/Bit Field/Programming Model | Value |
|---|---|-------|
| Configure the DMM for smart-idle power management mode. | DMM_SYSCONFIG [3:2] IDLE_MODE | 0x2 |

16.2.5.3 DMM Operational Modes Configuration

16.2.5.3.1 Different Operational Modes

The TILER can be virtually accessed in four different modes: 8-, 16-, 32-bit, and page modes. Each mode defines the element granularity to apply isometric transforms (see [Table 16-26](#)).

Table 16-26. Coding and Description of TILER Modes

| Mode | Name | Granularity (Element Size) |
|------|-------------------|----------------------------|
| 0 | 8-bit tiled mode | 8 bits |
| 1 | 16-bit tiled mode | 16 bits |
| 2 | 32-bit tiled mode | 32 bits |
| 3 | Page mode | 4096 bytes |

16.2.5.3.2 Configuration Settings and LUT Refill

The procedure in [Table 16-27](#) provides the configuration settings and LUT refill.

Table 16-27. Configuration Settings and LUT Refill

| Step | Register/Bit Field/Programming Model | Value |
|--|--------------------------------------|-------|
| PAT configuration refill Engine 0 | DMM_PAT_CONFIG[0] MODE0 | xxx |
| PAT configuration refill Engine 1 | DMM_PAT_CONFIG[1] MODE1 | xxx |
| Set DMM PAT view register value for each initiator. | DMM_PAT_VIEW0 Vx DMM_PAT_VIEW1 Vx | xxx |
| Set DMM PAT write enable for the initiators. | DMM_PAT_VIEW0 Wx DMM_PAT_VIEW1 Wx | xxx |
| Choosing container type and access method | DMM_PAT_VIEW_MAP_i | xxx |
| Define the base address of all view mappings. | DMM_PAT_VIEW_MAP_BASE[31] BASE_ADDR | xxx |

16.2.5.3.6 Error Handling

The procedure in [Table 16-31](#) provides the sequence for error handling.

Table 16-31. Error Handling

| Step | Register/Bit Field/Programming Model | Value |
|--|---|-------|
| Enable interrupt for selected type of error. | DMM_PAT_IRQENABLE_SET [15:9] DMM_PAT_IRQENABLE_SET [7:0] | xxx |
| When interrupt occurs | | |
| Disable type of error to handle. | DMM_PAT_IRQENABLE_CLR [15:9] DMM_PAT_IRQENABLE_CLR [7:0] | xxx |
| Check error status. | DMM_PAT_IRQSTATUS [15:9] DMM_PAT_IRQSTATUS [7:0] | xxx |

16.2.5.3.7 PAT Programming Model

The PAT maps the tiled data anywhere in the 4-GB physical address range, with a PAGE granularity. (The TILER page is the granularity of physical memory allocation in the TILER container. Each page is 4kiB).

A PAT view defines the kind of PAT to perform for each page, 8-, 16-, and 32-bit mode access. Each mode in each PAT view can be programmed in two different modes: direct translation and indirect translation.

16.2.5.3.7.1 PAT in Direct Translation Mode

In this mode, the PAT performs a translation of the 128-MB virtual container as a whole in the physical address space (that is, in the SDRAM). This mode is used only for debug or in case of a DMM without a PAT.

16.2.5.3.7.2 PAT in Indirect Translation Mode

This is the most commonly used mode. In this mode, the PAT performs a translation of each 4-KB page individually. In this way the 128-MB virtual address space can be scattered in the whole 2GB of the physical address space. This is achieved by using a 32,678-word LUT that converts each page index (32,678 possible values) into 19 address bits that represent this page address in the physical memory. The main characteristic of this mode is there is no constraint on the use of the physical memory except that it is uses a multiple of 4-KB areas located at 4-KB boundaries in the physical memory. In this mode, the translation vector is in the internal 32-k entry PAT vector table at the index given by bits [26:12] of the input virtual address, and CONT_x = 0.

Programming sequence:

1. Set the [DMM_PAT_VIEW0](#) register (or [DMM_PAT_VIEW1](#), depending on the L3 CONN_ID of the initiator that is to perform the tiled accesses) with the appropriate value. For example, if the L3 CONN_ID equals 0, then the [DMM_PAT_VIEW0](#) register must be programmed with the value 0x0000_0001 (PAT view 1 selected for initiator 0).
2. Set [DMM_PAT_VIEW_MAP_BASE](#)[31] = 0x8000_0000 (must always be programmed at 1 to select the upper 2GB of the physical address space that corresponds to the external memory).

- Set all 16-bit tiled accesses in indirect translation mode by setting at least the field ACCESS_16 to 1 (DMM_PAT_VIEW_MAP_1 = 0x0000_8000), program DMM_PAT_VIEW_MAP_1 at 0x8080_8080.

16.2.5.4 Addressing an Object in Tiled Mode

This section describes how a frame-buffer with a top-left pixel at (x0,y0) in the natural view container and a bottom right pixel at (x1,y1) in the natural view container is addressed in any tiled mode and orientation.

16.2.5.4.1 Frame-Buffer Addressing

NOTE: In this section, the (x,y) coordinates are given in pixel units.

Given an (S, \bar{Y} , \bar{X}) orientation, the (x,y) coordinates of the first pixel of the frame in the oriented view (where W = the width and H = the height in pixels of the container in the considered frame mode) is:

(x,y) = (x_{or}, y_{or}) when S, (y_{or}, x_{or}) otherwise
with:

x_{or} = x₀ when \bar{X} , W-1-x₁ otherwise

y_{or} = y₀ when \bar{Y} , H-1-y₁ otherwise

Given a (M₁, M₀) TILER mode where M₁ ≠ 0 or M₀ ≠ 0, the size in bytes of a pixel is 2^{2M₁+M₀}.

Therefore, given an (S, \bar{Y} , \bar{X}) orientation and a n(M₁, M₀) TILER mode where M₁ ≠ 0 or M₀ ≠ 0, the byte offset of the base address of the considered oriented frame in its container is:

base_address((x₀, y₀), (x₁, y₁), (S, \bar{Y} , \bar{X}), (M₁, M₀)) = (y_{or}W + x_{or}) P₅ when S, (x_{or}H + y_{or}) P₅ otherwise

with:

x_{or} = x₀ when \bar{X} , W-1-x₁ otherwise

y_{or} = y₀ when \bar{Y} , H-1-y₁ otherwise

P₅ = 2^{2M₁+M₀}

In its natural orientation, the TILER container consists of 8192 lines of 16,384 pixels of 8 bits, or 4096 lines of 16,384 pixels of 16 bits, or 4096 lines of 8192 pixels of 32 bits.

Figure 16-42. Example of 8-Bit Frame-Buffer Addressing in any Orientation

sdram-075

This frame-buffer address generation is independent from the page size. For instance, the 8-bit frame-buffer shown in Figure 16-42 that ranges from the top-left pixel at (16, 32) to the bottom-right pixel at (223, 159) in the natural orientation view, corresponds to the 29-bit view address offsets and full 33-bit TILER addresses given in Table 16-32.

Table 16-32. 29-Bit View Address Offset and 33-Bit Full TILER Address for an 8-Bit Frame-Buffer

| S | Y | X | x _{or} | y _{or} | 29-Bit Address Offset in View | Full 33-Bit TILER Address |
|---|---|---|-----------------|-----------------|-------------------------------|---------------------------|
| 0 | 0 | 0 | 16 | 32 | 00080010h | 100080010h |
| 0 | 0 | 1 | 16,160 | 32 | 00083F20h | 120083F20h |
| 0 | 1 | 0 | 16 | 8032 | 07D80010h | 147D80010h |
| 0 | 1 | 1 | 16,160 | 8032 | 07D83F20h | 167D83F20h |
| 1 | 0 | 0 | 16 | 32 | 00020020h | 180020020h |
| 1 | 0 | 1 | 16,160 | 32 | 07E40020h | 1A7E40020h |
| 1 | 1 | 0 | 16 | 8032 | 00021F60h | 1C0021F60h |
| 1 | 1 | 1 | 16,160 | 8032 | 07E41F60h | 1E7E41F60h |

In this example the TILER is addressed in 8-bit mode, which translates to addresses with all mode bits (bits 27 and 28) cleared in the 29-bit address offset in view and in the full 33-bit TILER address.

16.2.5.4.2 TILER Page Mapping

Let:

- c (c = 0, 1, or 2) be the TILER page configuration (0 for 4-KB pages, 1 for 16-KB pages, and 2 for 64-KB pages)
- (x₀, y₀) be the top-left pixel and (x₁, y₁) be the bottom-right pixel of a frame in its natural orientation
- W be the width and H the height in pixels of the container in the considered frame mode

The top-left page coordinates (P_{x0}, P_{y0}) and bottom-right page coordinates (P_{x1}, P_{y1}) that correspond to the frame are given by: P_{x0} = (64.x₀.2^{2-c}) / W, P_{y0} = (32.y₀.2^{2-c}) / H, P_{x1} = (64.x₁.2^{2-c}) / W and P_{y1} = (32.y₁.2^{2-c}) / H.

In its natural orientation, the TILER container consists of 8192 lines of 16,384 pixels of 8 bits, or 4096 lines of 16,384 pixels of 16 bits, or 4096 lines of 8192 pixels of 32 bits.

NOTE: The page area type has the same structure as the [DMM_PAT_AREA_i](#) registers. For instance, the 8-bit frame-buffer described in [Figure 16-42](#) and ranging from the top-left pixel at (16, 32) to the bottom-right pixel at (223, 159) in the natural orientation view, is mapped from the top-left page at P0,0 to the bottom-right page P3,2.

16.2.5.5 Addressing an Object in Page Mode

In page mode, the orientation modifies only the sequence of accessed pages, not their content. In this respect the orientation must be seen as a way to optimize the one-dimensional (1D) object allocation in a TILER container by allowing a 1D object spanning multiple pages to map a set of adjacent pages in any direction. For instance, a 1.25-MB object, mapped on 320 pages of 4-KB can be allocated in a TILER container in any of the eight orientations (see [Section 16.2.3.6.1.7.3, Element Ordering in the TILER Container](#)).

The initial page can be chosen freely among all pages. In this respect, the address offset of a page in a TILER container is expressed as:

Let:

- c (c = 0, 1 or 2) be the TILER page configuration (0 for 4-KB pages, 1 for 16-KB pages, and 2 for 64-KB pages)
- (S, Y, X) be the orientation of the considered 1D object in page mode
- (P_x, P_y) be the coordinate of the initial page in the natural orientation view

The byte offset of the base address of the considered initial page in its oriented container is:
base_address((P_x, P_y), (S, Y, X)) = 4096.(64.y_{or}.2^{2-c} + x_{or}).2^{2-c} when S, 4096.(32.x_{or}.2^{2-c} + y_{or}).2^{2-c} otherwise
with:

x_{or} = P_x when X, 64.2^{2-c}-1-P_x otherwise

y_{or} = P_y when Y, 32.2^{2-c}-1-P_y otherwise

For instance, a 1D object starting from the page P32,63 in the natural orientation view on a DMM using 4-KB pages, corresponds to the 29-bit view address offsets and full 33-bit TILER addresses given in [Table 16-33](#).

Table 16-33. 29-Bit View Address Offset and 33-Bit Full TILER Address for a 1D Object

| S | Y | X | x _{or} | y _{or} | 29-Bit Address Offset in View | Full 33-Bit TILER Address |
|---|---|---|-----------------|-----------------|-------------------------------|---------------------------|
| 0 | 0 | 0 | 32 | 63 | 1BF20000h | 11BF20000h |
| 0 | 0 | 1 | 223 | 63 | 1BFDF000h | 13BFDF000h |
| 0 | 1 | 0 | 32 | 64 | 1C020000h | 15C020000h |
| 0 | 1 | 1 | 223 | 64 | 1C0DF000h | 17C0DF000h |
| 1 | 0 | 0 | 32 | 63 | 1903F000h | 19903F000h |
| 1 | 0 | 1 | 223 | 63 | 1EFBF000h | 1BEFBF000h |
| 1 | 1 | 0 | 32 | 64 | 19040000h | 1D9040000h |
| 1 | 1 | 1 | 223 | 64 | 1EFC0000h | 1FEFC0000h |

In this example the TILER is addressed in page mode, which translates to addresses with mode bits (bits 27 and 28) set in the 29-bit address offset in view and full 33-bit TILER address.

16.2.5.6 Sharing Containers Between Different Modes

When allocating objects in TILER containers, take care to ensure that no two objects physically overlap.

In this respect, and to ease the object allocation and deallocation, it is strongly advised to share a TILER page only for different objects that do both of the following:

- Belong to the same mode
- Have the same lifetime (that is, are allocated and deallocated simultaneously)

Two objects of different modes can physically overlap if:

- One physical page is mapped twice in two different locations of the DMM LUT.
- The two objects share the DMM LUT and the intersection of their two page set is not empty.

These two issues can be easily avoided by allocating a physical page only once in the DMM LUT.

The second issue is a bit more difficult, especially if the allocation of objects in the various TILER containers must be dynamic. Managing the fragmentation within a flat memory model in a space-constrained system is not straightforward, and is the main reason for the existence of MMUs in most current processors, which adds yet another constraint to the problem (the y dimension, which makes it even more difficult).

Returning to the CPU-analogy, the memory fragmentation issue has been mostly solved by using a virtual memory space larger than the actual physical memory space and a virtual-to-physical translation system. This allows contiguous virtual memory allocation when sufficient physical memory is available and the larger contiguous physical buffer is smaller than the requested memory allocation.

Similarly, the DMM answer to this object allocation in the TILER containers is two-fold:

- The DMM must have sufficient virtual address space in all modes to permit a static allocation of a pool of virtual buffers in all TILER modes for all TILER-aware initiators.
- Each TILER-aware initiator must dynamically manage its own pool of virtual buffers.

16.2.6 DMM Register Manual

This section provides information about the DMM registers. [Table 16-34](#) describes the DMM instance.

16.2.6.1 DMM Instance Summary

Table 16-34. DMM Instance Summary

16.3 EMIF Controller

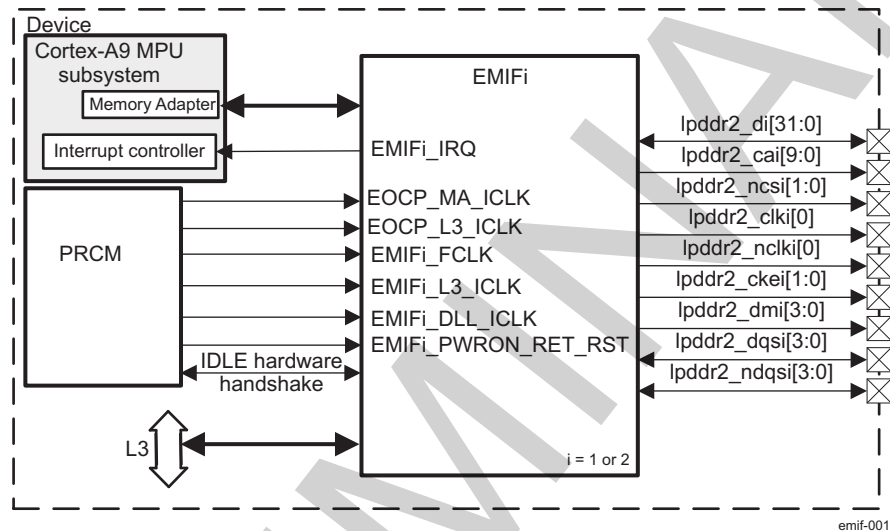

This section describes the features and functions of the external memory interface (EMIF) module of the device.

16.3.1 EMIF Module Overview

The EMIF module provides connectivity between the device and the LPDDR2-type memories and manages data bus read/write accesses between external memories, the microprocessor unit (MPU), and the direct memory access (DMA) controller.

The device includes two EMIF controllers. Figure 16-43 is an overview of the EMIF module.

Figure 16-43. EMIF Module Overview

16.3.1.1 EMIF Module Main Features

The EMIF module supports the following features:

- JEDEC standard-compliant LPDDR2-SDRAM (S2 and S4) devices
- 2-GB SDRAM address ranges over two chip-selects (CSs) (1GB per CS) (configurable with the dynamic memory manager (DMM) module; see Section 16.2, *Dynamic Memory Manager*, for more information)
- Two independent CSs with their corresponding register sets and independent page tracking
- Both CSs must have the same memory type and size.
- Flexible address muxing scheme, which permits the choosing of different bank mapping allocation by configuring the decoding order of the bank, column, and row address
- 16- or 32-bit data path to external SDRAM
- LPDDR2 devices with one, two, four, or eight internal banks
- Data bus widths:
 - 128-bit L3 interconnect data bus width
 - 16- and 32-bit SDRAM data bus widths
- CAS latencies: 3, 4, 5, 6, 7, and 8
- 256-, 512-, 1024-, and 2048-word page sizes
- Burst lengths: 8
- Sequential burst type
- SDRAM auto initialization from reset or configuration change
- Bank interleaving across both CSs if the same memory type

- Self-refresh and precharge power-down modes for low power (per CS, manual entry/exit self-refresh and deep power-down modes)
- Deep power-down mode for low power
- Partial array self-refresh and temperature-controlled self-refresh modes for low power. Temperature-controlled self-refresh is supported only for mobile SDRAM having on-chip temperature sensor.
- Prioritized refresh
- Programmable SDRAM refresh rate and backlog counter
- Output impedance (ZQ) calibration
- Active power-down
- Temperature monitoring

16.3.1.2 Not Supported Features

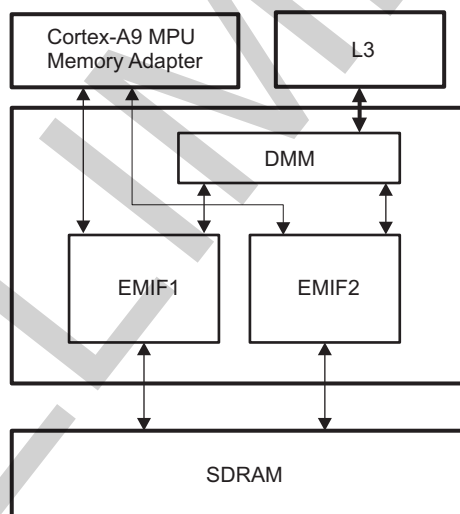

The EMIF module does not support:

- Interleave burst type
- Auto precharge
- Per-bank refreshes for LPDDR2-SDRAM

16.3.1.3 EMIF Overall Architecture

Figure 16-44 shows the EMIF connection with the surrounding modules.

Figure 16-44. EMIF Overall Architecture

emif-007

16.3.2 EMIF Environment

This section describes the EMIF application fields from an environment point of view (external connections).

Figure 16-45 shows the EMIF generic configuration.

Figure 16-45. EMIF Generic Configuration

emif-006

16.3.2.1 EMIF Signals

Table 16-92 describes the module signals and specifies their links to functions.

Table 16-92. I/O Signals

| Signal | I/O ⁽¹⁾ | Description |
|--------------------------------|--------------------|--|
| EMIF1 | | |
| <code>lpddr21_dq[31:0]</code> | I/O | Data bus |
| <code>lpddr21_ca[9:0]</code> | O | Double-data rate (DDR) command/address |
| <code>lpddr21_ncs[1:0]</code> | O | Chip selects 1–0 (active low) |
| <code>lpddr21_clk</code> | O | Clock |
| <code>lpddr21_nclk</code> | O | Clock invert |
| <code>lpddr21_cke[1:0]</code> | O | Clock enables 1–0 |
| <code>lpddr21_dm[3:0]</code> | I/O | Data mask |
| <code>lpddr21_dqs[3:0]</code> | I/O | Data strobe |
| <code>lpddr21_ndqs[3:0]</code> | I/O | Data strobe invert |

⁽¹⁾ I = Input; O = Output

Table 16-92. I/O Signals (continued)

| Signal | I/O ⁽¹⁾ | Description |
|-------------------|--------------------|-------------------------------|
| EMIF2 | | |
| lpddr22_dq[31:0] | I/O | Data bus |
| lpddr22_ca[9:0] | O | DDR command/address |
| lpddr22_ncs[1:0] | O | Chip selects 1–0 (active low) |
| lpddr22_clk | O | Clock |
| lpddr22_nclk | O | Clock invert |
| lpddr22_cke[1:0] | O | Clock enables 1–0 |
| lpddr22_dm[3:0] | I/O | Data mask |
| lpddr22_dqs[3:0] | I/O | Data strobe |
| lpddr22_ndqs[3:0] | I/O | Data strobe invert |

The CKE memory pin is dynamically driven by the SDRAM controller (SDRC) according to the memory interface activity. Each CS has its own CKE pin so that each CS can be controlled independently in terms of power-down, deep power-down, and self-refresh modes.

Each LPDDR2 channel (that is, each EMIF controller) can be connected to two external LPDDR2 memories. For more information, see [Section 16.2](#), *Dynamic Memory Manager*.

16.3.3 EMIF Integration

This section describes the integration of the module in the device, and includes information about clocks, resets, and hardware requests.

Figure 16-46 shows the integration of the EMIF1 module in the device.

Figure 16-46. EMIF1 Integration

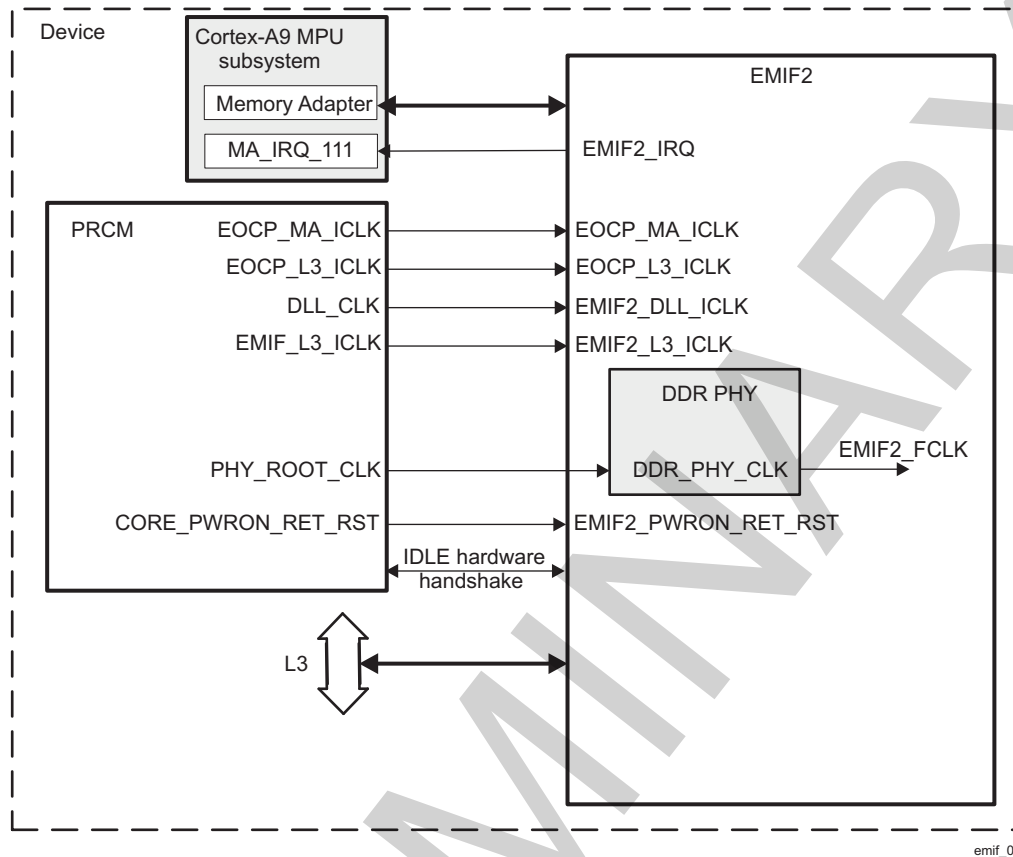

Figure 16-47 shows the integration of the EMIF2 module in the device.

Figure 16-47. EMIF2 Integration

NOTE: DDR_PHY_CLK is equal to PHY_ROOT_CLK divided by 2. EMIFi_FCLK is equal to DDR_PHY_CLK divided by 2.

For more information about the EMIF clocking scheme, see [Chapter 3, Power, Reset, and Clock Management](#).

NOTE: For more information about the IDLE hardware handshake, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 16-93 through Table 16-95 summarize the integration of the module in the device.

Table 16-93. Integration Attributes

| Module Instance | Attributes | | |
|-----------------|--------------|--------------------|--------------|
| | Power Domain | Wake-Up Capability | Interconnect |
| EMIF1 | PD_CORE | No | L3 |
| EMIF2 | PD_CORE | No | L3 |

Table 16-94. Clocks and Resets

| Module Instance | Destination Signal Name | Clocks | | |
|-----------------|-------------------------|--------------------|--------|-----------------------------|
| | | Source Signal Name | Source | Description |
| EMIF1 | EMIF1_FCLK | EMIF_FCLK | PRCM | EMIF1 core functional clock |
| | EMIF1_L3_ICLK | EMIF_L3_ICLK | PRCM | Interface clock |

Table 16-94. Clocks and Resets (continued)

| | | | | |
|------------------------|--------------------------------|---------------------------|---------------|-----------------------------|
| | EOCP_MA_ICLK | EOCP_MA_ICLK | PRCM | Interface clock |
| | EOCP_L3_ICLK | EOCP_L3_ICLK | PRCM | Interface clock |
| | EMIF1_DLL_ICLK | DLL_CLK | PRCM | Interface clock |

| | EMIF2_L3_ICLK | EMIF_L3_ICLK | PRCM | Interface clock |
| | EOCP_MA_ICLK | EOCP_MA_ICLK | PRCM | Interface clock |
| | EOCP_L3_ICLK | EOCP_L3_ICLK | PRCM | Interface clock |
| | EMIF2_DLL_ICLK | DLL_CLK | PRCM | Interface clock |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| EMIF1 | EMIF1_PWRON_RET_RST | CORE_PWRON_RET_RST | PRCM | Retention reset |
| EMIF2 | EMIF2_PWRON_RET_RST | CORE_PWRON_RET_RST | PRCM | Retention reset |

NOTE: The two clocks EOCP_MA_ICLK and EOCP_L3_ICLK are exclusive. EMIF modules are clocked by EOCP_MA_ICLK when MPU is active, otherwise EOCP_L3_ICLK clock is used.

Table 16-95. Hardware Requests

| | | | | |
|---------------------------|---------------------------|--------------------------------|--|--------------------------------|
| Interrupt Requests | | | | |
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| EMIF1 | EMIF1_IRQ | MA_IRQ_110 | Cortex™-A9 interrupt controller (INTC) | Interrupt to the MPU subsystem |
| EMIF2 | EMIF2_IRQ | MA_IRQ_111 | Cortex™-A9 INTC | Interrupt to the MPU subsystem |
| No DMA Requests | | | | |

NOTE: For the description of the interrupt source, see [Section 16.3.4.5, Interrupt Requests](#).

16.3.4 EMIF Functional Description

16.3.4.1 Block Diagram

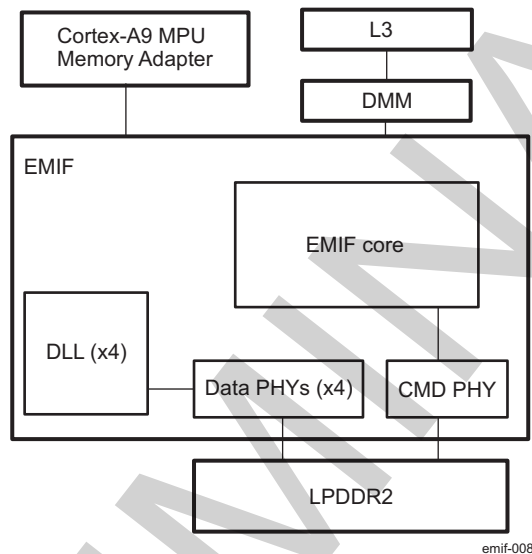

The EMIF is an L3 bus peripheral that provides an interface to the LPDDR2 memories.

Figure 16-48 shows the interconnection between the EMIF module and the other modules.

Digital locked loops (DLLs) are used to delay the input DQS signals during reads so that these strobe signals can be used to latch incoming data on the DQ pins, as required by the LPDDR2 standard.

Physical layers (PHYs) are hard macros that convert single-data rate (SDR) signals to DDR signals.

Figure 16-48. EMIF Block Diagram

16.3.4.1.1 L3 Interface

The EMIF supports three local interfaces: one connects to the system interconnect, one to a low-latency master, and one comes from the MPU half of the EMIF-to-MPU connection. These interfaces are used to request all external memory device accesses, to access the EMIF registers, and to transfer all data to and from the EMIF controller. Table 16-96 shows the MAddrSpace mapping to different chip-selects. A third interface arranges the connection between the EMIF and the MPU. It is separated to the MPU half of the EMIF-to-MPU L3 Interface and the EMIF half of the EMIF-to-MPU L3 Interface.

Table 16-96. MAddrSpace Mapping to Chip-Selects

| MAddrSpace ⁽¹⁾ | Chip-Select | Description | Exclusions |
|---------------------------|-------------|-------------------------|----------------------------|
| 0x0 | ICS[1:0] | SDRAM(s) | |
| 0x1 | CS1 | Reserved for LPDDR2-NVM | |
| 0x2 | N/A | Reserved | Not visible to the MA port |
| 0x3 | N/A | Internal registers | Not visible to the MA port |

⁽¹⁾ See DMM_LISA_MAP_i [17:16] SDR_C_ADDRSPC register in Section 16.2, *Dynamic Memory Manager*.

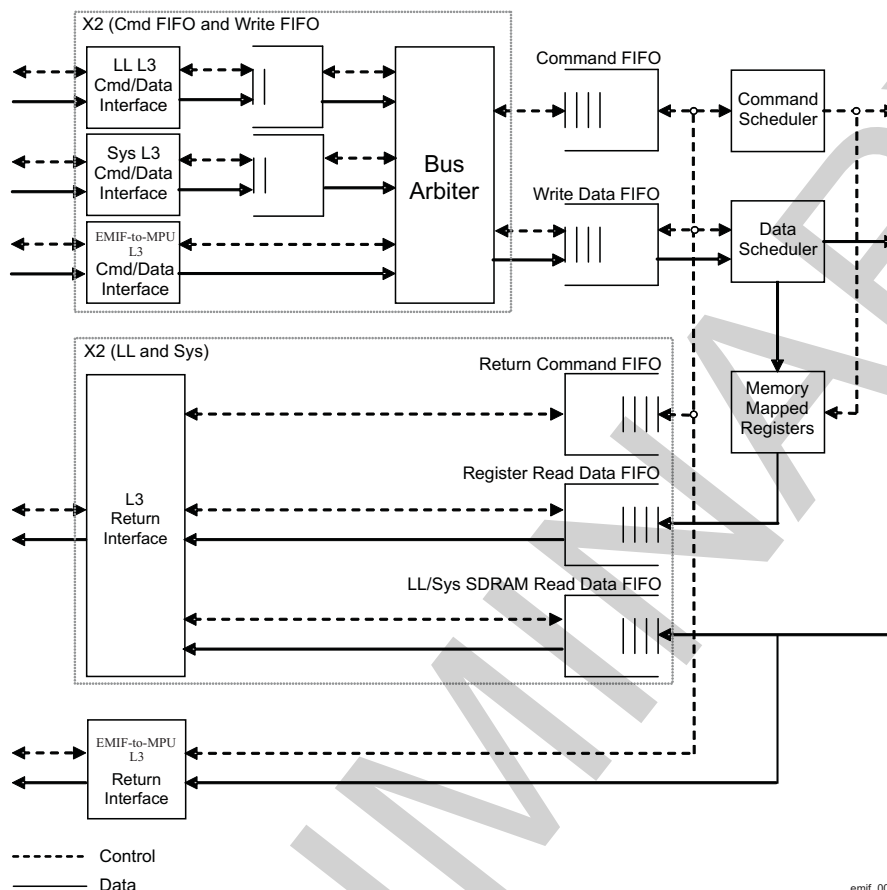

16.3.4.1.2 FIFO Description

The EMIF module contains the following FIFOs:

- Command FIFO
- Write data FIFO
- Return command FIFO
- Two read data FIFOs

Figure 16-49 shows the overall architecture of the EMIF module.

Figure 16-49. FIFO Block Diagram

Because the system (128-bit) L3 interface is the main interface, it has a higher allocation of FIFO slots than the low-latency (64-bit) L3 interface. Table 16-97 lists the allocation of the entries.

Table 16-97. FIFO Allocation

| Parameter | System L3 Interface Entries | Low-Latency L3 Interface Entries | MPU Half of the EMIF-to-MPU L3 Interface Entries |
|-------------------------|-----------------------------|----------------------------------|--|
| Pre Command FIFO | 5 | 5 | 3 |
| Command FIFO | Programmable ⁽¹⁾ | Programmable ⁽¹⁾ | Programmable ⁽¹⁾ |
| Pre Write FIFO | 8 | 8 | 8 |
| Write Data FIFO | Up to 19+8 | Up to 19 + 8 | Up to 19 + 8 |
| Return Command FIFO | 22 | 17 | 13 |
| SDRAM Read Data FIFO | 22 | 17 | 20 |
| Register Read Data FIFO | 2 | 2 | 0 |

⁽¹⁾ The total number of entries in the command FIFO is 10.

The command FIFO is shared between the three L3 interfaces, whereas there are three different FIFOs for every other type, one dedicated to each L3 interface.

The command FIFO stores all the commands coming in on the L3 command interface. The allocation of entries in the command FIFO is programmable per L3 interface using the [EMIF_L3_CONFIG\[27:24\]](#) REG_SYS_THRESH_MAX, [EMIF_L3_CONFIG\[19:16\]](#) REG_LL_THRESH_MAX, and [EMIF_L3_CONFIG\[23:20\]](#) REG_MPU_TRESH_MAX bit fields.

If the addition of the [EMIF_L3_CONFIG\[27:24\] REG_SYS_THRESH_MAX](#) and [EMIF_L3_CONFIG\[19:16\] REG_LL_THRESH_MAX](#) bit fields is greater than the number of entries in the command FIFO, the allocation depends on the traffic on the interfaces. For example, if both fields are programmed to 7, then either of the interfaces can use seven entries in the command FIFO if the other interface is idle. If both interfaces have traffic, then the EMIF starts to gradually allocate entries to both interfaces until it settles down to seven entries for the low-latency interface and three entries for the system interface, because the low-latency interface has higher priority. If the low-latency interface has no traffic, the system interface can use seven entries.

The allocation also depends on the traffic on the interfaces, if the [EMIF_L3_CONFIG\[27:24\] REG_SYS_THRESH_MAX](#) and [EMIF_L3_CONFIG\[19:16\] REG_LL_THRESH_MAX](#) bit fields are programmed to be equal to or greater than the number of entries in the command FIFO. For example, if both fields are programmed to 10, then the low-latency port can use all the entries if there is no traffic on the system interface. However, if there is no traffic on the low-latency interface, the system interface can use all but one entry. This is because the low-latency interface has higher priority than the system interface. The only way for the system interface to use all command FIFO entries is to set the [EMIF_L3_CONFIG\[19:16\] REG_LL_THRESH_MAX](#) bit field to 0. Writing 0 reserves no space for the associated interface. If the value is set to 0 and a request is seen for that interface, the command FIFO assumes a value of 1 for that interface.

The write data FIFO stores the write data for all the write transactions coming in on the L3 write data interface. The write FIFO is shared for all the ports. A similar token mechanism is used to allocate the write FIFO with the following exceptions. All ports are given a minimum of four tokens, which ensures that each has ensured access to three write FIFO locations. Any one port can only use up to 19 of the 25 write FIFO locations. Because there is an 8-word pre-FIFO, each port can have up to 27 backlogged writes.

The return command FIFO stores all the return transactions that are to be issued to the L3 return interface. These include the write status return and the read data return commands.

Two read data FIFOs store the read data to be sent to the L3 return interface. One read data FIFO stores read data from the memory mapped registers. The other read data FIFO stores read data from external memory.

A write command is executed only when four L3 words of the corresponding data is received in the write data FIFO, or when it is the last data, and if there is space in the return command FIFO. The EMIF schedules a read-only if the results can fit into the return command FIFO and the corresponding read data FIFOs.

16.3.4.1.3 MPU Port Restrictions

The EMIF MPU port is defined only to process memory requests. All register accesses are processed through the system or LL ports of the EMIF. The EMIF MPU port does not support 2D or register requests required or provided by the system and LL interfaces. The port priority is as follows:

1. LL port (highest priority)
2. System or MPU, depending on the MPriority field of the MReqInfo bus

The EMIF considers an address that matches and requires coherency if the arriving address rounded down to the nearest 1-K block matches any address in the FIFO rounded down to the nearest 1-K block plus or minus 1-K block. This ensures that any address within a burst will be coherent with any address within any other burst. This ensures that any address within 1024 bytes will be coherent. It is possible to be coherent up to 2048 bytes apart depending on the address. To maintain coherency two rules must be followed:

- Rule A: Any command arriving on any interface (MPU, system, or LL) that matches an address in the cFIFO is executed after the command in the cFIFO.
- Rule B: Any command arriving within a 10-cycle window of another, from the different interfaces that do not match any address in the cFIFO but may match command addresses arriving on a different interface, can be executed in any order.

16.3.4.1.4 Arbitration

The EMIF looks at all the commands stored in the command FIFO to schedule commands to the external memory. All commands with the same MConnID on a particular L3 interface complete in order. The EMIF does not ensure ordering between commands with different MConnIDs or between commands from two L3 interfaces. For more information about L3 interconnect terms (MConnID, MCMD, MADDR, etc.) see [Section 14.2, L3 Interconnect](#).

However, the EMIF does maintain data coherency. Therefore, the EMIF blocks a command, regardless of priority or the L3 interface, if that command is to the same block address (2048 bytes) as an older command that is not complete. Thus, the EMIF may have one pending read or write for each MConnID. Among all pending reads, the EMIF selects all reads that have their corresponding SDRAM banks already open. Similarly, among all pending writes, the EMIF selects all writes that have their corresponding SDRAM banks already open. Accesses to memory mapped registers are treated as accesses that have open banks.

As a result of this reordering, the EMIF may now have several pending reads and writes that have their corresponding banks open. The EMIF then selects the highest priority read from pending reads, and the highest priority write from pending writes. Commands from the low-latency L3 interface have a higher priority over the commands from the system L3 interface. If two or more commands have the highest priority, the EMIF selects the oldest command. As a result, the EMIF may now have the next read and a write command. If the return command FIFO and the read data FIFO have space and the external bus conflict is resolved, the EMIF performs the final read command before the final write command. If the return command FIFO has space but the read data FIFO is full, the EMIF performs the final write command before the final read command. Resolution of external bus conflict means all the SDRAM command-to-command counters are satisfied and the read-to-write or write-to-read turnaround time is met.

The EMIF does not support tag interleaving. In other words, for an L3 interface, the EMIF completes executing an L3 command before it switches to another command. The EMIF can, however, interleave execution between commands from two L3 interfaces.

The data coherency inside the EMIF is ensured only in a single level of L3 infrastructure. For example, if a write from a secondary L3 bus segment is blocked by a bridge element, the read from a tertiary bus can still beat the write to the EMIF. In such a case, to confirm that a write from master A has landed before a read from master B is performed, master A must wait for the write status from the EMIF before indicating to master B that the data is ready to be read. If master A does not use the L3 wait status, it must do the following:

1. Perform the required write.
2. Perform a dummy write to the [EMIF_MOD_ID_REV](#) register.
3. Perform a dummy read to the [EMIF_MOD_ID_REV](#) register.
4. Indicate to master B that the data is ready to be read after completion of read in Step 3. The completion of read in Step 3 ensures that the previous writes were done.

Apart from reads and writes, the EMIF must also open and close SDRAM banks and maintain the refresh counts for an SDRAM. The priority of SDRAM commands with respect to refresh levels are:

1. SDRAM refresh request when refresh-must level is reached (highest priority)
2. L3 request for a read without a higher priority write
3. SDRAM refresh request when refresh-need level is reached
4. L3 request for a write
5. SDRAM activate commands
6. SDRAM deactivate commands
7. SDRAM deep power-down request
8. SDRAM refresh request when refresh-may level is reached
9. SDRAM self-refresh or SDRAM power-down request (lowest priority)

While performing the previous scheduling algorithm, the EMIF may encounter two conditions:

- A continuous stream of high-priority commands can block lower priority commands.

- A continuous stream of SDRAM commands to a row in an open bank can block commands to another row in the same bank.

In addition to this scheduling, the highest priority condition is a reset command. If this condition occurs, the EMIF abandons what it is doing and begins its start-up sequence. In this case, commands and data stored in the FIFOs are lost. The EMIF also starts its start-up sequence whenever the [EMIF_SDRAM_CONFIG](#) register is written and the [EMIF_SDRAM_REF_CTRL\[31\] REG_INITREF_DIS](#) bit is set to 0. In this case, commands and data stored in the FIFOs are not lost. The EMIF ensures that in-flight read or write transactions to the SDRAM are complete before starting the initialization sequence.

All the accesses to an SDRAM are pipelined to maximize use of the external bus. All of these are done while fulfilling the access timing requirements of an SDRAM.

16.3.4.2 Clock Management

The EMIF can gate EMIF_FCLK. There is an internal mechanism that can stop EMIF_FCLK automatically.

EMIF_FCLK can be stopped only after the SDRAM is put into self-refresh mode and the power-idle protocol on the L3 bus completes.

The EMIF waits for the DLL lock before performing any memory access.

The EMIF_FCLK frequency can be changed only after putting the external SDRAM in self-refresh mode.

EMIFi_FCLK frequency is equal to half of the DDR_PHY_CLK frequency. DDR_PHY_CLK is equal to half of the PHY_ROOT_CLK frequency.

16.3.4.3 Software Reset

The EMIF does not support a software reset.

The EMIF supports global warm reset mode, during which the EMIF keeps the SDRAM content. Upon a request from the PRCM module indicating a need to enter global warm reset mode, the EMIF does the following:

1. Completes the ongoing access and then puts the SDRAM in self-refresh mode
2. Clears all its FIFO contents and deasserts the sys_SCmdAccept and sys_SDataAccept ports

When the global warm reset must terminate:

1. The PRCM block deasserts its request signal to the EMIF.
2. The EMIF exits self-refresh mode when it receives host accesses from the MPU to the external memory.

16.3.4.4 System Power Management

16.3.4.4.1 Read Idle Window

The [EMIF_READ_IDLE_CTRL](#) register can force idle time between consecutive reads to allow the DDR PHY to recalibrate the DLL delays during gradual voltage and frequency change.

The [EMIF_READ_IDLE_CTRL\[8:0\] REG_READ_IDLE_INTERVAL](#) bit field determines the maximum interval $((\text{REG_READ_IDLE_INTERVAL} + 1) * 64 \text{ EMIF_FCLK clock cycles})$ between read idle detections or force read idle time. A value of 0 disables the read idle function.

The [EMIF_READ_IDLE_CTRL\[19:16\] REG_READ_IDLE_LEN](#) bit field determines the minimum size of idle window for the read idle detection and the force read idle time. The EMIF introduces idle time only if it does not see at least $(\text{REG_READ_IDLE_LEN} + 1) * 2$ number of idle EMIF_FCLK cycles in [REG_READ_IDLE_INTERVAL](#). Any command other than a read command is considered idle for this purpose. Force read idle occurs when the data bus is busy transferring read data and the read idle interval expires without seeing a read idle length pause in the reads.

16.3.4.4.2 LPDDR2-SDRAM Power-Down Mode

The EMIF supports power-down mode for low power. The EMIF automatically puts the SDRAM into power-down mode after it is idle for [EMIF_PWR_MGMT_CTRL\[15:12\] REG_PD_TIM](#) number of EMIF_FCLK cycles and the [EMIF_PWR_MGMT_CTRL\[10:8\] REG_LP_MODE](#) bit field is set to 0x4. In power-down mode, the EMIF does not stop the clocks to the SDRAM. The EMIF maintains [lpddr2i_cke\[j\]\[1:0\]](#) (where i = 1 or 2 and j = 0 or 1) low to maintain the power-down mode.

When the SDRAM is in power-down mode, the EMIF services register accesses normally.

If the LPDDR2-SDRAM is in power-down mode and one of the following occurs, the EMIF brings SDRAM out of power-down mode:

1. [EMIF_PWR_MGMT_CTRL\[10:8\] REG_LP_MODE](#) bit field is changed from 0x4 to some other value.
2. An SDRAM access is requested.
3. The refresh-must level is reached.

For LPDDR2-SDRAM, the EMIF module:

1. Drives [lpddr2i_cke\[j\]\[1:0\]](#) (where i = 1 or 2 and j = 0 or 1) high
2. Waits for [EMIF_SDRAM_TIM_2\[30:28\] REG_T_XP + 1](#) cycles
3. Enters its idle mode and can issue any commands

16.3.4.4.3 LPDDR2-SDRAM Deep Power-Down Mode

For ultimate power savings, the EMIF supports deep power-down mode for LPDDR2-SDRAM.

The SDRAM can be forced into deep power-down mode through software by setting the [EMIF_PWR_MGMT_CTRL\[11\] REG_DPD_EN](#) bit to 0x1. In this case the EMIF continues normal operation until all SDRAM access requests are serviced. At this point the EMIF issues a deep power-down command. The EMIF then maintains [lpddr2i_cke\[j\]\[1:0\]](#) (where i = 1 or 2 and j = 0 or 1) low to maintain deep power-down mode. In deep power-down mode, the EMIF automatically stops the clocks to the SDRAM.

Setting the [EMIF_PWR_MGMT_CTRL\[11\] REG_DPD_EN](#) bit to 1 overrides the setting of the [EMIF_PWR_MGMT_CTRL\[10:8\] REG_LP_MODE](#) bit field. Therefore, if the SDRAM is in self-refresh or power-down mode, and the [EMIF_PWR_MGMT_CTRL\[11\] REG_DPD_EN](#) bit is set to 1, the EMIF exits those modes and goes into deep power-down mode.

When the SDRAM is in deep power-down mode, the EMIF services register accesses normally.

If the [EMIF_PWR_MGMT_CTRL\[11\] REG_DPD_EN](#) bit is set to 0x0, the EMIF brings the SDRAM out of deep power-down mode.

For LPDDR2-SDRAM, the EMIF controller:

1. Drives [lpddr2i_cke\[j\]\[1:0\]](#) (where i = 1 or 2 and j = 0 or 1) high
2. Issues a RESET command to LPDDR2 (MRW)
3. Enters its idle mode and can issue any commands
4. Software must perform initialization, as specified in [Section 16.3.4.12, LPDDR2-SDRAM Initialization](#).

16.3.4.4.4 LPDDR2-SDRAM Self-Refresh Mode

The EMIF supports self-refresh mode for low power. The EMIF automatically puts the SDRAM into self-refresh mode after the EMIF is idle for [EMIF_PWR_MGMT_CTRL\[3:0\] REG_CS_TIM](#) number of EMIF_FCLK cycles and the [EMIF_PWR_MGMT_CTRL\[10:8\] REG_LP_MODE](#) bit field is set to 0x2. In self-refresh mode, the EMIF automatically stops the clocks to the SDRAM. The EMIF maintains [lpddr2i_cke\[j\]\[1:0\]](#) (where i = 1 or 2 and j = 0 or 1) low to maintain self-refresh mode.

When the SDRAM is in self-refresh mode, the EMIF services register accesses normally.

If the LPDDR2-SDRAM is in self-refresh mode and one of the following occurs, the EMIF brings SDRAM out of self-refresh mode:

1. The [EMIF_PWR_MGMT_CTRL\[10:8\] REG_LP_MODE](#) bit field is changed from 0x2 to some other value.

2. An SDRAM access is requested.
3. [EMIF_SDRAM_TIM_2\[2:0\]](#) REG_T_CKE + 1 cycles have elapsed since the SELF-REFRESH command was issued.

For LPDDR2-SDRAM, the EMIF:

1. Enables clocks
2. Drives [lpddr2i_cke\[j\[1:0\]\]](#) (i = 1 or 2 and j = 0 or 1) high
3. Waits for [EMIF_SDRAM_TIM_2\[24:16\]](#) REG_T_XSNR + 1 cycles
4. Starts an auto-refresh cycle in the next cycle
5. Enters its idle mode and can issue any commands

16.3.4.4.5 Save and Restore

The EMIF supports the save-and-restore mechanism to switch off power to the EMIF.

For more information about the off-mode sequence and restoration of power to the EMIF sequence, see [Chapter 3, Power, Reset, and Clock Management](#).

16.3.4.4.6 Retention Mode

EMIF supports full-retention mode.

16.3.4.5 Interrupt Requests

The EMIF sources two interrupts: one for the system L3 interface and the other for the low-latency L3 interface. The pulse and level interrupt signals for a particular interface are sourced from the same raw interrupt internal to the module.

The EMIF sets the [EMIF_IRQSTATUS_RAW_SYS\[0\]](#) REG_RAW_SYS/[EMIF_IRQSTATUS_RAW_LL\[0\]](#) REG_RAW_LL bit (depending on which interface sent the command having an error) to 1, if an access request to an unsupported MAddrSpace is received. If such an error occurs, it is due to bad programming of the DMM. For more information about addressing, see [Section 16.2, Dynamic Memory Manager](#).

The interrupts can be cleared by writing 1 to the corresponding bits in the [EMIF_IRQSTATUS_RAW_SYS/EMIF_IRQSTATUS_RAW_LL](#) or the [EMIF_IRQSTATUS_SYS/EMIF_IRQSTATUS_LL](#) registers.

[Table 16-98](#) lists the event flags and their mask that can cause module interrupts.

Table 16-98. Events

| Event Flag | Event Mask | Description |
|---|--|---|
| EMIF_IRQSTATUS_RAW_SYS[1] REG_TA_SYS / EMIF_IRQSTATUS_SYS[1] REG_TA_SYS | EMIF_IRQENABLE_SET_SYS[1] REG_EN_TA_SYS / EMIF_IRQENABLE_CLR_SYS[1] REG_EN_TA_SYS | System L3 interrupt for SDRAM temperature alert |
| EMIF_IRQSTATUS_RAW_LL[1] REG_TA_LL / EMIF_IRQSTATUS_LL[1] REG_TA_LL | EMIF_IRQENABLE_SET_LL[1] REG_EN_TA_LL / EMIF_IRQENABLE_CLR_LL[1] REG_EN_TA_LL | Low-latency L3 interrupt for SDRAM temperature alert |
| EMIF_IRQSTATUS_RAW_SYS[0] REG_ERR_SYS / EMIF_IRQSTATUS_SYS[0] REG_ERR_SYS | EMIF_IRQENABLE_SET_SYS[0] REG_EN_ERR_SYS / EMIF_IRQENABLE_CLR_SYS[0] REG_EN_ERR_SYS | System L3 interrupt for command or address error |
| EMIF_IRQSTATUS_RAW_LL[0] REG_ERR_LL / EMIF_IRQSTATUS_LL[0] REG_ERR_LL | EMIF_IRQENABLE_SET_LL[0] REG_EN_ERR_LL / EMIF_IRQENABLE_CLR_LL[0] REG_EN_ERR_LL | Low-latency L3 interrupt for command or address error |

16.3.4.6 SDRAM Output Impedance Calibration

The EMIF supports automatic output impedance calibration. The ZQ calibration can be enabled per CS by setting the [EMIF_ZQ_CONFIG\[31\] REG_ZQ_CS1EN](#) and [EMIF_ZQ_CONFIG\[30\] REG_ZQ_CS0EN](#) bits. The EMIF supports three types of ZQ calibration commands:

- ZQINIT: ZQ calibration command during initialization
- ZQCS: ZQ calibration short command
- ZQCL: ZQ calibration long command

The EMIF issues a ZQCS command each time the [EMIF_ZQ_CONFIG\[15:0\] REG_ZQ_REFINTERVAL](#) bit field expires. In other words, the [REG_ZQ_REFINTERVAL](#) defines the interval between ZQCS commands. When a ZQCS command is issued, the EMIF waits and blocks any other command for ([EMIF_SDRAM_TIM_3\[20:15\] REG_ZQ_ZQCS](#) + 1) number of DDR clock cycles.

If the [EMIF_ZQ_CONFIG\[28\] REG_ZQ_SFEXITEN](#) bit field is set to 1, the EMIF issues a ZQCL command every time it exits self-refresh, active power-down, and precharge power-down modes. When a ZQCL command is issued, the EMIF waits and blocks any other command for ([EMIF_ZQ_CONFIG\[17:16\] REG_ZQ_ZQCL_MULT](#) + 1) × ([EMIF_SDRAM_TIM_3\[20:15\] REG_ZQ_ZQCS](#) + 1) number of DDR clock cycles.

If a separate calibration resistor is used per device, the ZQ calibration can be performed simultaneously over both CSs. To enable ZQ calibration to be performed simultaneously over both CSs, the [EMIF_ZQ_CONFIG\[27\] REG_ZQ_DUALCALEN](#) bit must be set to 1. If [REG_ZQ_DUALCALEN](#) is set to 0, the EMIF performs ZQ calibration per CS serially.

16.3.4.7 SDRAM Temperature Monitoring

The EMIF supports automatic temperature monitoring to facilitate the software update of the refresh rate according to the temperature changes of the LPDDR2. Temperature monitoring can be enabled per CS by setting the [EMIF_TEMP_ALERT_CONFIG\[31\] REG_TA_CS1EN](#) and [EMIF_TEMP_ALERT_CONFIG\[30\] REG_TA_CS0EN](#) bits.

The EMIF polls the temperature of the LPDDR2 (issues an MRR command to Mode Register 4) every time the [EMIF_TEMP_ALERT_CONFIG\[21:0\] REG_TA_REFINTERVAL](#) bit field expires. In other words, [REG_TA_REFINTERVAL](#) defines the interval between temperature alert polls. If the EMIF sees a 1 on bit 7 of the read data value from the MRR, which indicates the temperature has changed, the [EMIF_IRQSTATUS_SYS\[1\] REG_TA_SYS](#) bit (for L3 interconnect) or [EMIF_IRQSTATUS_LL\[1\] REG_TA_LL](#) bit (for low-latency L3) is set and the module sends an interrupt on the system and low-latency interrupt lines, respectively. When the interrupt is received, software updates the [EMIF_SDRAM_REF_CTRL\[15:0\] REG_REFRESH_RATE](#) bit field to the required value as per the temperature change.

If the [EMIF_TEMP_ALERT_CONFIG\[28\] REG_TA_SFEXITEN](#) bit is set to 1, the EMIF polls for temperature change every time it exits self-refresh, active power-down, and precharge power-down modes.

Because the EMIF is performing an MRR, it needs information about how the LPDDR2 is connected. The [EMIF_TEMP_ALERT_CONFIG\[27:26\] REG_TA_DEVWDT](#) and [EMIF_TEMP_ALERT_CONFIG\[25:24\] REG_TA_DEVCNT](#) bit fields provide the necessary information to the EMIF for MRR data compare. For example, if [REG_TA_DEVWDT](#) is set to 0, which indicates 8-bit devices are used, and if [REG_TA_DEVCNT](#) is set to 2, which indicates four devices are used to form a 32-bit bus, the mask used for checking is 4'b1111; that is, the EMIF expects data on each byte lane on a 32-bit bus.

16.3.4.8 SDRAM Refresh Scheduling

The EMIF uses two counters to schedule AUTO REFRESH commands: a 13-bit decrementing refresh interval counter and a 4-bit refresh backlog counter. The interval counter is used to define the rate at which connected SDRAM devices are refreshed. It is loaded with the value of the

[EMIF_SDRAM_REF_CTRL](#)[15:0] REG_REFRESH_RATE bit field at reset (only the 13 LSBs are taken). The interval counter decrements by 1 each cycle until it reaches 0, at which point it reloads from the [EMIF_SDRAM_REF_CTRL](#)[15:0] REG_REFRESH_RATE bit field and restarts decrementing. The counter also reloads and restarts decrementing whenever the [EMIF_SDRAM_REF_CTRL](#)[15:0] REG_REFRESH_RATE bit field is updated.

The refresh backlog counter records the number of outstanding AUTO REFRESH commands the EMIF has. The backlog counter increments by 1 each time the interval counter reloads (unless it has reached its maximum value of 15). The backlog counter decrements by 1 each time the EMIF issues an AUTO REFRESH command (unless it is already 0). For the range of values that the backlog counter can take, there are four levels of urgency with which the EMIF must perform an auto refresh cycle (in which it issues AUTO REFRESH commands):

1. Refresh-may level is reached when the backlog count is greater than 0, which indicates there is a refresh backlog; therefore, if the EMIF is not busy and none of the SDRAM banks are open, the EMIF must perform an auto refresh cycle.
2. Refresh-release level is reached when the backlog count is greater than 4, which indicates the refresh backlog is getting bigger; therefore, if the EMIF is not busy it must perform an auto refresh cycle even if any of the banks are open.
3. Refresh-need level is reached when the backlog count is greater than 5, which indicates the refresh backlog is getting bigger and the EMIF must raise the priority of performing an auto refresh cycle above that of servicing new memory write requests. The EMIF starts servicing new memory accesses after the refresh-release level is cleared.
4. Refresh-must level is reached when the backlog count is greater than 7, which indicates the refresh backlog is becoming excessive and the EMIF must perform an auto refresh cycle before servicing any new memory access requests. The EMIF starts servicing new memory accesses after the refresh-release level is cleared.

The refresh counters do not operate when SDRAM is in self-refresh mode.

The EMIF issues AUTO REFRESH commands within auto refresh cycles. An auto refresh cycle consists of issuing an AUTO REFRESH command and waiting T_{RFC} (see [EMIF_SDRAM_TIM_3](#)) cycles before rechecking the refresh levels. If the refresh-release level is not reached, the EMIF starts another auto refresh cycle; otherwise, it returns to idle mode where it can issue any command. The EMIF ensures that no more than eight AUTO REFRESH commands are issued in any rolling $tREFBW (= 4 * 8 * tRFC)$ window.

16.3.4.8.1 Performance Counters Description

The [EMIF_PERF_CNT_1](#) and [EMIF_PERF_CNT_2](#) registers can be used to monitor or calculate the EMIF bandwidth and efficiency. These counters can count events such as total SDRAM accesses, SDRAM activates, reads, writes, etc. Each counter counts events independent of the other counters. In addition to the ability to count events, the counters can also filter the events from a particular master or address space. The events to be counted and the filter enabling can be configured using the [EMIF_PERF_CNT_CFG](#) register. The filter value to be used can be configured using the [EMIF_PERF_CNT_SEL](#) register. Each counter can be configured independently.

[Table 16-99](#) lists all the events that can be counted and whether a filter can be applied to a particular event. A filter can be applied to an event if the following bits for Performance Counter 1 and Performance Counter 2 can be set equal to 0x1 for that event:

- Performance Counter 1: [EMIF_PERF_CNT_CFG](#)[15] REG_CNTR1_MCONNID_EN and [EMIF_PERF_CNT_CFG](#)[14] REG_CNTR1_REGION_EN
- Performance Counter 2: [EMIF_PERF_CNT_CFG](#)[31] REG_CNTR2_MCONNID_EN and [EMIF_PERF_CNT_CFG](#)[30] REG_CNTR2_REGION_EN

[Table 16-99](#) shows the possible filter configurations for the two performance counters. These filter configurations can be used in conjunction with a L3 master ID and/or external chip-select to obtain performance statistics for a particular L3 master and/or external chip-select.

Table 16-99. Performance Counter Filter Configuration

| CNTRn_CFG ⁽¹⁾ | CNTRn_REGION_EN ⁽¹⁾ | CNTRn_MCONNID_EN ⁽¹⁾ | Description |
|--------------------------|--------------------------------|---------------------------------|---|
| 0x0 ⁽²⁾ | 0x0 | 0x0 or 0x1 | Count total SDRAM accesses |
| 0x1 ⁽²⁾ | 0x0 | 0x0 or 0x1 | Count total SDRAM activates |
| 0x2 ⁽²⁾ | 0x0 or 0x1 | 0x0 or 0x1 | Count total L3 reads. CPU cache based operations are 32 bytes. DMA burst is 128 bytes. |
| 0x3 ⁽²⁾ | 0x0 or 0x1 | 0x0 or 0x1 | Count total L3 writes. CPU cache based operations are 32 bytes. DMA burst is 128 bytes. |
| 0x4 | 0x0 | 0x0 | Count number of EMIF FCLK clock cycles L3 Command FIFO is full |
| 0x5 | 0x0 | 0x0 | Count number of EMIF FCLK clock cycles L3 Write Data FIFO is full |
| 0x6 | 0x0 | 0x0 | Count number of EMIF FCLK clock cycles L3 Read Data FIFO is full |
| 0x7 | 0x0 | 0x0 | Count number of EMIF FCLK clock cycles L3 Return Command FIFO is full |
| 0x8 | 0x0 or 0x1 | 0x0 or 0x1 | Count number of priority elevations |
| 0x9 | 0x0 | 0x0 | Count number of EMIF FCLK clock cycles that a command was pending |
| 0xA ⁽²⁾ | 0x0 | 0x0 | Count number of EMIF FCLK clock cycles for which the memory data bus was transferring data. |
| 0xA ⁽²⁾ | 0x0 | 0x1 | Count number of L3 commands for which the memory data bus was transferring data. |
| 0xB to 0xF | 0x0 | 0x0 | Reserved for future use. |

⁽¹⁾ n = 1 or 2

⁽²⁾ When MReqDebug is set to a 1 for a particular L3 command, the performance counters will not be incremented for that command.

When CNTRn_CFG = 0xA and CNTRn_MCONNID_EN=0x1, the following guidelines must apply:

- Count of 1 implies OCP command up to 32 bytes for all the initiators except for Cortex-A9 MPU
- Count of 1 implies OCP command up to 16 bytes for Cortex-A9 MPU when all the other initiators are not generating traffic on SDRAM.
- If there are multiple initiators generating traffic, then Count for Cortex-A9 MPU doesn't indicate the bandwidth directly. The following formula must be used:

$$\text{Actual MPU Count} = \text{Count value} - \sum_{i=0}^{\text{all_initiators-MPU}} \text{Count}_i$$

where i is different initiators and Count_i is the Count value for each of those initiators. Then:

- Actual MPU count of 1 implies OCP command up to 16 bytes for Cortex-A9 MPU
- Bandwidth for all other initiators except MPU is Count × 32 bytes
- Bandwidth calculation for MPU is MPU Count × 16 bytes

16.3.4.8.2 Performance Counters General Examples

16.3.4.8.2.1 PERF_CNT_1 General Example for Counting Write Accesses

The Performance Counter 1 register must count all write accesses from the dual Cortex-M3 MPU subsystem:

- To enable counting writes, the [EMIF_PERF_CNT_CFG\[3:0\]](#) REG_CNTR1_CFG bit field must be set to 0x3.

- The [EMIF_PERF_CNT_SEL\[15:8\]](#) REG_MCONNID1 bit field must be set to 0x44. The values programmed into the REG_MCONNIDx bit fields are those in [Table 29-20](#), in [Chapter 29, On-Chip Debug Support](#), left-shifted by 2 bits.
- To enable filtering, the [EMIF_PERF_CNT_CFG\[15\]](#) REG_CNTR1_MCONNID_EN bit must be set to 0x1.

With this configuration, Counter 1 counts every write made to the EMIF from master 0x44 to any address space. This does not include accesses from other masters and does not include commands other than writes.

16.3.4.8.2.2 *PERF_CNT_2 General Example for Counting Total Access*

The Performance Counter 2 register must count total accesses to SDRAM regardless of the masters or address space.

- To enable counting all SDRAM accesses, the [EMIF_PERF_CNT_CFG\[19:16\]](#) REG_CNTR2_CFG bit field must be set to 0x0.
- To disable filtering, the [EMIF_PERF_CNT_CFG\[31\]](#) REG_CNTR2_MCONNID_EN and the [EMIF_PERF_CNT_CFG\[30\]](#) REG_CNTR2_REGION_EN bits must be set to 0x0.

With this configuration, Counter 2 counts every access made to the EMIF. This includes all accesses from all masters and to any address space.

16.3.4.8.2.3 *PERF_CNT_3 General Example for Counting all Read Accesses*

The Performance Counter 1 register must count all read accesses from the dual Cortex-M3 MPU subsystem to address space 0x0.

- To enable counting reads, the [EMIF_PERF_CNT_CFG\[3:0\]](#) REG_CNTR1_CFG bit field must be set to 0x2.
- The [EMIF_PERF_CNT_SEL\[15:8\]](#) REG_MCONNID1 and [EMIF_PERF_CNT_SEL\[1:0\]](#) REG_REGION_SEL1 bit fields must be set to 0x44 and 0x0, respectively.
- To enable filtering, the [EMIF_PERF_CNT_CFG\[15\]](#) REG_CNTR1_MCONNID_EN and [EMIF_PERF_CNT_CFG\[14\]](#) REG_CNTR1_REGION_EN bits must be set to 0x1.

With this configuration, Counter 1 counts every read made to the EMIF from master 0x44 to address space 0x0. This does not include accesses from other masters or accesses to other address space and does not include commands other than reads.

16.3.4.9 *EMIF Access Cycles*

By default, the EMIF keeps the SDRAM CSs active. To direct a command to one of the SDRAMs, the EMIF deasserts the CS to the other SDRAMs for the duration of the command. If the [EMIF_SDRAM_CONFIG\[3\]](#) REG_EBANK bit in the SDRAM configuration register is set to 0, CS1 is always driven high except during initialization and for REFRESH, POWER DOWN, SELF-REFRESH, and DEEP POWER-DOWN commands.

The EMIF always performs burst accesses to the SDRAM. Multiple SDRAM bursts may be needed to service a single L3 burst request. [Table 16-100](#) through [Table 16-104](#) show a few examples of how EMIF accesses SDRAM for a linear incrementing transaction type. T0, T1, etc. are clock cycles. R0 is read starting at column 0, R8 is read starting at column 8, and R16 is read starting at column 16. D0-1 is the data from column 0 and 1, D2-3 is the data from column 2 and 3, and so on.

Table 16-100. 64-Byte Linear Read Starting at Address 0x0

| | | | | D6-7 | Unused | D8-9 | D10-11 | D12-13 | D14-15 | D16-17 | D18-19 | D20-21 | Unused |

The EMIF uses the unused data phases in the preceding figures by issuing successive read commands if there are reads to open banks pending in the command FIFO.

The write data conversion from SDR to DDR is done outside the EMIF.

16.3.4.9.1 SDRAM Read

A read access to an SDRAM is initiated with a READ command. The EMIF provides the internal bank address and the column address on pad_ca_o with the READ command. The EMIF registers the first read data from lpddr2i_dj (where i = 1 or 2 and j = 0 or 1) after (read_latency + 3) DDR clock cycles. Read latency is programmed in the [EMIF_DDR_PHY_CTRL_1](#) register.

16.3.4.9.2 SDRAM Write

A write access to an SDRAM is initiated with a WRITE command. The EMIF provides the internal bank address and the column address on pad_ca_o with the WRITE command.

The EMIF delays the write data by the appropriate write latency minus 1. Subsequent data words are provided on lpddr2i_dj (where i = 1 or 2 and j = 0 or 1) along with the appropriate data mask on lpddr2i_dmj (where i = 1 or 2 and j = 0 or 1) on each successive clock cycle. The DDR PHY then adds one more clock cycle delay to the write data to appropriately center the write data to the outgoing DQS.

16.3.4.10 Turnaround Time

[Table 16-105](#) lists the turnaround time the EMIF introduces on the data bus for various back-to-back accesses. The EMIF takes advantage of the CAS latencies and packs the commands as close as possible on the control bus to introduce the following turnaround time on the data bus.

Table 16-105. Turnaround Time

| Previous Access | Next Access | Turnaround Time (Number of DDR Clock Cycles) |
|-----------------|---------------------------|--|
| SDRAM read | SDRAM read to the same CS | 0 |

Table 16-105. Turnaround Time (continued)

| Previous Access | Next Access | Turnaround Time (Number of DDR Clock Cycles) |
|-----------------|------------------------------|--|
| SDRAM read | SDRAM read to a different CS | 2 |
| SDRAM read | SDRAM write | 2 |
| SDRAM write | SDRAM write | 0 |
| SDRAM write | SDRAM read | 2 |

16.3.4.11 SDRAM Address Mapping

The EMIF interleaves the internal banks for SDRAM connected to both CSs (see [Table 16-106](#) for the SDRAM addressing space), according to the DMM (for more information, see [Section 16.2, Dynamic Memory Manager](#)). From the system point of view, the external SDRAM is seen as one block of SDRAM. If two external 64-MB devices are used, a 128-MB memory block is observed. If two external 32-MB devices are used, a 64-MB block is observed.

Table 16-106. SDRAM Addressing Space

| Module Name | Base Address | Size |
|--|--------------|---|
| EMIF1 EMIF2-CS0-SDRAM ⁽¹⁾ | 0x8000 0000 | 0 to 1GB, programmable in DMM (see Section 16.2, Dynamic Memory Manager) |
| EMIF1 EMIF2-CS1-SDRAM ⁽²⁾ | 0xC000 0000 | 0 to 1GB, programmable in DMM (see Section 16.2, Dynamic Memory Manager) |

⁽¹⁾ The addressing space is interleaved on two LPDDR memory controllers (EMIF1, EMIF2), each activating their CS0 line. These CSs can address 64, 128, 256, 512, 1024, or 2048MBs. Interleaving occurs at 128-byte granularity. EMIF1-CS0 base address is always 0x8000 0000 at reset, and occupies a 1-GB address space at reset (interleaving disabled at reset).

⁽²⁾ The addressing space is interleaved on two LPDDR memory controllers (EMIF1, EMIF2), each activating its CS1 line. These CSs are programmable to 64, 128, 256, 512, or 1024MBs. Interleaving occurs at 128-byte granularity. EMIF1-CS1 and EMIF2-CS1 are disabled at reset. Their base address is programmable to achieve a continuous address space with the respective CS0, regardless of the programmed address range. EMIF1-CS1 is disabled if the EMIF1-CS0 memory density is set to 2048MB (2GB) when interleaving is disabled, or if the EMIF1-CS0 + EMIF2-CS0 memory density is set to 1024MB (1GB) when interleaving is enabled.

When addressing SDRAM, if the [EMIF_SDRAM_CONFIG\[28:27\] REG_IBANK_POS](#) bit field is set to 0, the EMIF uses the following three bit fields to determine the mapping from the source address to the SDRAM row, column, bank, and CS:

- [EMIF_SDRAM_CONFIG\[6:4\] REG_IBANK](#)
- [EMIF_SDRAM_CONFIG\[3\] REG_EBANK](#)
- [EMIF_SDRAM_CONFIG\[2:0\] REG_PAGESIZE](#)

If the [EMIF_SDRAM_CONFIG\[28:27\] REG_IBANK_POS](#) bit field is set to 1, 2, or 3, the EMIF uses the following four bit fields to determine the mapping from the source address to the SDRAM row, column, bank, and CS:

- [EMIF_SDRAM_CONFIG\[6:4\] REG_IBANK](#)
- [EMIF_SDRAM_CONFIG\[3\] REG_EBANK](#)
- [EMIF_SDRAM_CONFIG\[2:0\] REG_PAGESIZE](#)
- [EMIF_SDRAM_CONFIG\[9:7\] REG_ROWSIZE](#)

In all cases the EMIF considers its SDRAM address space to be a single logical block, regardless of the number of physical devices or whether the devices are mapped across one or two EMIF CSs.

For [EMIF_SDRAM_CONFIG\[28:27\] REG_IBANK_POS](#) = 0, [Table 16-107](#) and [Table 16-108](#) list which source address bits (MAddr) map to the SDRAM row, column, bank, and CS bits for all combinations of [REG_IBANK](#), [REG_EBANK](#), and [REG_PAGESIZE](#).

For [EMIF_SDRAM_CONFIG\[28:27\] REG_IBANK_POS](#) != 0, [Table 16-110](#) and [Table 16-111](#) show which source address bits (MAddr) map to the SDRAM row, column, bank, and CS bits for all combinations of [REG_IBANK](#), [REG_EBANK](#), [REG_PAGESIZE](#), and [REG_ROWSIZE](#).

The tables also list the maximum size of the resulting SDRAM space.

| 4096 | 0 | 3 | 3 | row | | | | | | | | bank | col | | | | | |

For [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS = 0, the effect of the address-mapping scheme is that as the source address increments across SDRAM page boundaries, the EMIF moves onto the same page in the next bank in the current device (lpddr2i_cs1[0]n, where i = 1 or 2). This movement along the banks of the current device continues until the page is accessed in all banks in the current device. The EMIF then proceeds to the same page in the next device (if [EMIF_SDRAM_CONFIG\[3\]](#) REG_EBANK = 1, lpddr2i_cs1[1]n, where i = 1 or 2) and proceeds through the same page in all its banks before moving to the next page in the first device (lpddr2i_cs1[0]n, where i = 1 or 2). The EMIF exploits this movement across internal banks and CSs while remaining on the same page to maximize the number of open SDRAM banks within the overall SDRAM space.

Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time, and can interleave among all of them.

[Table 16-109](#) through [Table 16-111](#) list the L3 address to SDRAM address mapping. In each case, there are x bits for bank, followed by y bits for row, followed by z bits for CS, followed by s bits for bank, and t bits for col in MAddr[31:N] (x, y, z, s, and t are given depending on the value of the [EMIF_SDRAM_CONFIG](#) bit field).

Table 16-109. L3 Address to SDRAM Address Mapping for [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS = 1 and [EMIF_SDRAM_CONFIG_2\[27\]](#) REG_EBANK_POS = 0

| MAddr[31:N] | | | | |
|---|---|---|---|--|
| Bank Address | Row Address | Chip-Select | Bank Address | Column Address |
| Number of bits defined by EMIF_SDRAM_CONFIG [6] REG_IBANK | Number of bits defined by EMIF_SDRAM_CONFIG [9:7] REG_ROWSIZE | Number of bits defined by EMIF_SDRAM_CONFIG [3] REG_EBANK | Number of bits defined by EMIF_SDRAM_CONFIG [5:3] REG_IBANK | Number of bits defined by EMIF_SDRAM_CONFIG [2:0] REG_PAGESIZE |
| = 0: 0 bit | = 0: 9 bits | = 0: 0 bit | = 0: 0 bit | = 0: 8 bits |
| = 1: 0 bit | = 1: 10 bits | = 1: 1 bit | = 1: 1 bit | = 1: 9 bits |
| | = 2: 11 bits | | = 2: 2 bits | = 2: 10 bits |
| | = 3: 12 bits | | = 3: 2 bits | = 3: 11 bits |
| | = 4: 13 bits | | | |
| | = 5: 14 bits | | | |
| | = 6: 15 bits | | | |
| | = 7: 16 bits | | | |

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

The REG_IBANK bit field is listed twice because it gives the number of bank bits depending on their place in the MAddr.

For EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 1, the EMIF interleaves banks the same as for EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 0, but the interleaving of banks within a device (per CS) is limited to four banks. Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time, but can interleave among only 8 of them.

Table 16-110. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 2 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 0

| MAddr[31:N] | | | | |
|---|---|---|---|--|
| Bank Address | Row Address | Chip-Select | Bank Address | Column Address |
| Number of bits defined by EMIF_SDRAM_CONFIG [6:5] REG_IBANK | Number of bits defined by EMIF_SDRAM_CONFIG [9:7] REG_ROWSIZE | Number of bits defined by EMIF_SDRAM_CONFIG [3] REG_EBANK | Number of bits defined by EMIF_SDRAM_CONFIG [4] REG_IBANK | Number of bits defined by EMIF_SDRAM_CONFIG [2:0] REG_PAGESIZE |
| = 0: 0 bit | = 0: 9 bits | = 0: 0 bit | = 0: 0 bit | = 0: 8 bits |
| = 1: 0 bit | = 1: 10 bits | = 1: 1 bit | = 1: 1 bit | = 1: 9 bits |
| = 2: 1 bit | = 2: 11 bits | | | = 2: 10 bits |
| = 3: 2 bits | = 3: 12 bits | | | = 3: 11 bits |
| | = 4: 13 bits | | | |
| | = 5: 14 bits | | | |
| | = 6: 15 bits | | | |
| | = 7: 16 bits | | | |

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

For [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS = 2, the EMIF interleaves banks the same as for [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS = 0, but the interleaving of banks within a device (per CS) is limited to two banks. Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time, but can interleave among only 4 of them.

Table 16-111. L3 Address to SDRAM Address Mapping for [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS = 3 and [EMIF_SDRAM_CONFIG_2\[27\]](#) REG_EBANK_POS = 0

| MAddr[31:N] | | | |
|--|--|--|---|
| Bank Address | Row Address | Chip-Select | Column Address |
| Number of bits defined by EMIF_SDRAM_CONFIG[6:4] REG_IBANK | Number of bits defined by EMIF_SDRAM_CONFIG[9:7] REG_ROWSIZE | Number of bits defined by EMIF_SDRAM_CONFIG[3] REG_EBANK | Number of bits defined by EMIF_SDRAM_CONFIG[2:0] REG_PAGESIZE |
| = 0: 0 bit | = 0: 9 bits | = 0: 0 bit | = 0: 8 bits |
| = 1: 1 bit | = 1: 10 bits | = 1: 1 bit | = 1: 9 bits |
| = 2: 2 bits | = 2: 11 bits | | = 2: 10 bits |
| = 3: 3 bits | = 3: 12 bits | | = 3: 11 bits |
| | = 4: 13 bits | | |
| | = 5: 14 bits | | |
| | = 6: 15 bits | | |
| | = 7: 16 bits | | |

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

For [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS = 3, the EMIF cannot interleave banks within a device (per CS). However, it can interleave banks between the two CSs. Thus, the EMIF can keep a maximum of 16 banks (eight internal banks across two CSs) open at a time, but can interleave among only 2 of them.

Because the EMIF interleave among a fewer number of banks when [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS != 0, these cases are lower in performance than the [EMIF_SDRAM_CONFIG\[28:27\]](#) REG_IBANK_POS = 0 case. Thus, these cases are recommended to be used only with partial array self-refresh where performance can be traded off for power savings.

Table 16-112. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 1 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 1

| MAddr[31:N] | | | | |
|---|---|---|---|--|
| Chip-Select | Bank Address | Row Address | Bank Address | Column Address |
| Number of bits defined by EMIF_SDRAM_CONFIG[3] REG_EBANK | Number of bits defined by EMIF_SDRAM_CONFIG[6:4] REG_IBANK | Number of bits defined by EMIF_SDRAM_CONFIG[9:7] REG_ROWSIZE | Number of bits defined by EMIF_SDRAM_CONFIG[6:4] REG_IBANK | Number of bits defined by EMIF_SDRAM_CONFIG[2:0] REG_PAGESIZE |
| = 0: 0 bit | = 0: 0 bit | = 0: 9 bits | = 0: 0 bit | = 0: 8 bits |
| = 1: 1 bit | = 1: 0 bit | = 1: 10 bits | = 1: 1 bit | = 1: 9 bits |
| | = 2: 0 bit | = 2: 11 bits | = 2: 2 bits | = 2: 10 bits |
| | = 3: 1 bit | = 3: 12 bits | = 3: 2 bits | = 3: 11 bits |
| | | = 4: 13 bits | | |
| | | = 5: 14 bits | | |
| | | = 6: 15 bits | | |
| | | = 7: 16 bits | | |

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

The interleaving of banks within a device (per chip-select) is limited to four banks. The EMIF cannot interleave banks between the two chip-selects. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip-selects) open at a time, but can interleave among only 4 of them.

Table 16-113. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS = 2 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 1

| | | = 5: 14 bits | | |
| | | = 6: 15 bits | | |
| | | = 7: 16 bits | | |

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

The interleaving of banks within a device (per chip-select) is limited to two banks. The EMIF cannot interleave banks between the two chip-selects. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip-selects) open at a time, but can interleave among only 2 of them.

**Table 16-114. L3 Address to SDRAM Address Mapping for EMIF_SDRAM_CONFIG[28:27]
REG_IBANK_POS = 3 and EMIF_SDRAM_CONFIG_2[27] REG_EBANK_POS = 1**

| MAddr[31:N] | | | |
|--|--|--|---|
| Chip-Select | Bank Address | Row Address | Column Address |
| Number of bits defined by EMIF_SDRAM_CONFIG[3] REG_EBANK | Number of bits defined by EMIF_SDRAM_CONFIG[6:4] REG_IBANK | Number of bits defined by EMIF_SDRAM_CONFIG[9:7] REG_ROWSIZE | Number of bits defined by EMIF_SDRAM_CONFIG[2:0] REG_PAGESIZE |
| = 0: 0 bit | = 0: 0 bit | = 0: 9 bits | = 0: 8 bits |
| = 1: 1 bit | = 1: 1 bit | = 1: 10 bits | = 1: 9 bits |
| | = 2: 2 bits | = 2: 11 bits | = 2: 10 bits |
| | = 3: 3 bits | = 3: 12 bits | = 3: 11 bits |
| | | = 4: 13 bits | |
| | | = 5: 14 bits | |
| | | = 6: 15 bits | |
| | | = 7: 16 bits | |

NOTE: N = 1 for 16-bit SDRAM, and N = 2 for 32-bit SDRAM.

The EMIF cannot interleave banks within a device (per chip-select) or between the two chip-selects. Thus, the EMIF can keep a maximum of 16 banks (8 internal banks across two chip-selects) open at a time, but cannot interleave among them.

Because the EMIF interleaves among fewer banks when REG_IBANK_POS != 0 or REG_EBANK_POS = 1, these cases are lower in performance than the REG_IBANK_POS = 0 case. Thus, these cases are recommended to be used only along with partial array self-refresh, where performance can be traded for power savings.

16.3.4.12 LPDDR2 SDRAM Initialization

When coming out of reset if the [EMIF_SDRAM_CONFIG](#)[31:29] REG_SDRAM_TYPE bit field is equal to 4 or 5, the EMIF performs an LPDDR2 initialization sequence as follows:

1. Drives lpddr2i_cke[j[1:0] (where i = 1 or 2 and j = 0 or 1) high and starts to issue NOP commands continuously.
2. After 16 SDRAM refresh rate intervals, issues a PRECHARGE-ALL command. The SDRAM refresh rate is defined in the [EMIF_SDRAM_REF_CTRL](#)[15:0] REG_REFRESH_RATE bit field.
3. Issues a RESET command.
4. Software initializes LPDDR2 using the [EMIF_LPDDR2_MODE_REG_CFG](#) and [EMIF_LPDDR2_MODE_REG_DATA](#) registers. Software must enable refreshes by writing 1 in the [EMIF_LPDDR2_MODE_REG_CFG](#)[30] REG_REFRESH_EN bit during the last MRW command.

The EMIF also performs the initialization sequence whenever the [EMIF_SDRAM_CONFIG](#) register is written and the LPDDR2 initialization was not performed previously because the SDRAM_REF_CTRL[31] REG_INITREF_DIS bit was set to 0. Once the EMIF performs initialization, rewriting the SDRAM configuration register does not cause reinitialization.

NOTE: The values of the different bit fields in the [EMIF_SDRAM_CONFIG](#) and [EMIF_SDRAM_CONFIG_2](#) registers are set by the control module at reset. These values must be modified by the configuration header feature in the ROM code or by the initial boot image running from an external XIP booting memory or internal RAM (see [Section 28.4.8, Image Format](#)). They must not be modified during run time, because they reflect the used hardware LPDDR2 SDRAM configurations.

The EMIF does not perform any transactions until the LPDDR2 initialization sequence completes.

When the EMIF comes out of reset, the delay time in Step 2 resulting from the 16 refresh rate intervals + 8 cycles is approximately $16 \times \text{EMIF_SDRAM_REF_CTRL}[15:0] \text{ REG_REFRESH_RATE} / \text{input frequency}$.

16.3.5 EMIF Programming Guide

16.3.5.1 EMIF Low-Level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the EMIF module.

The following programming sequences are double, because there are two EMIF modules (EMIF1 and EMIF2) with the same register mapping but different register addresses.

16.3.5.1.1 Global Initialization

Table 16-115. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|--------------------------------|---|
| PRCM | The module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management . |
| Interrupt submodule of the MPU | The interrupt requests from the EMIF must be enabled (unmasked). See Chapter 18, Interrupt Controllers . |
| DMM | The EMIF is a slave to the DMM. The DMM must be enabled and configured for communication with LPDDR2 memories. See Section 16.2, Dynamic Memory Manager . |

16.3.5.1.1.1 EMIF Module Global Initialization

This procedure initializes the EMIF after a power-on reset (POR). The unused bits in all registers must be written with zeros. The values of the shadow registers are loaded in their corresponding registers when the signal SidleAck is asserted.

NOTE: The values of the different bit fields in the [EMIF_SDRAM_CONFIG](#) and [EMIF_SDRAM_CONFIG_2](#) registers are set by the control module at reset. These values must be modified by the configuration header feature in the ROM code or by the initial boot image running from an external XIP booting memory or internal RAM (see [Section 28.4.8, Image Format](#)). They must not be modified during run time, because they reflect the used hardware LPDDR2 SDRAM configurations.

Table 16-116. EMIF Global Initialization

| Step | Register/Bit Field/Programming Model | Value |
|---|---|-------------------------------------|
| Disable the automatic power management mode. | EMIF_PWR_MGMT_CTRL [10:8] REG_LP_MODE | 0x0 |
| Write the shadow register of the EMIF_PWR_MGMT_CTRL with the same value. | EMIF_PWR_MGMT_CTRL_SHDW | EMIF_PWR_MGMT_CTRL |
| Configure the DDR PHY physical layer to the SDRAM. (Read Latency for the read data from SDRAM in number of DDR clock cycles) | EMIF_DDR_PHY_CTRL_1 | 0x----- |
| Write the shadow register of the EMIF_DDR_PHY_CTRL_1 with the same value. | EMIF_DDR_PHY_CTRL_1_SHDW | EMIF_DDR_PHY_CTRL_1 |
| Configure the DDR PHY physical layer to the SDRAM parameters. | EMIF_DDR_PHY_CTRL_2 | 0x----- |
| Write the shadow register of the EMIF_SDRAM_REF_CTRL with the same value. | EMIF_SDRAM_REF_CTRL_SHDW | EMIF_SDRAM_REF_CTRL |
| Define the CS to be used and the mode register address. | EMIF_LPDDR2_MODE_REG_CFG | 0x-00000- |
| Configure the system and low-latency L3 threshold maxima and the priority counter of an old command. | EMIF_L3_CONFIG | 0x0-0-00- |
| Configure the performance counter configuration register. | EMIF_PERF_CNT_CFG | 0x-00--00- |

Table 16-116. EMIF Global Initialization (continued)

| Step | Register/Bit Field/Programming Model | Value |
|--|---|------------|
| Configure the performance counter master region select register. | EMIF_PERF_CNT_SEL | 0x--0---0- |
| Define timings and clock parameters. | EMIF Timing Initialization | |
| Configure the SDRAM output impedance calibration parameters. | EMIF Output Impedance Calibration Mode | |
| Configure the temperature alert parameters. | EMIF Temperature Monitoring Mode | |
| Enable system L3 interrupt for command or address error and/or for temperature alert. | EMIF_IRQENABLE_SET_SYS [1:0] | 0x3 |
| Enable low-latency L3 interrupt. | EMIF_IRQENABLE_SET_LL [1:0] | 0x3 |
| Specify the dummy-data to be written to the memory for refresh cycles. | EMIF_LPDDR2_MODE_REG_DATA | 0x000000-- |
| Clear all eventual previous indications of treated interrupts; write the four registers: | EMIF_IRQSTATUS_SYS , EMIF_IRQSTATUS_LL , EMIF_IRQSTATUS_RAW_SYS , EMIF_IRQSTATUS_RAW_LL | 0x00000003 |

Table 16-117. Subprocess Call Summary for Main Sequence – EMIF Global Initialization

| Subprocess Name | Cross-Reference |
|--|--|
| EMIF Timing Initialization | Table 16-118 <i>EMIF Timing Initialization</i> |
| EMIF Output Impedance Calibration Mode | Table 16-119 <i>EMIF Output Impedance Calibration Mode</i> |
| EMIF Temperature Monitoring Mode | Table 16-127 <i>EMIF Temperature Monitoring Mode</i> |

16.3.5.1.1.2 Subsequence – EMIF Timing Initialization

Table 16-118. Subsequence – EMIF Timing Initialization

| Step | Register/Bit Field/Programming Model | Value |
|---|--|-------------------------------------|
| Configure the time after which the EMIF being in Idle mode will put the SDRAM in power-saving mode. | EMIF_PWR_MGMT_CTRL [3:0] REG_CS_TIM | 0x- |
| Write the shadow register of the EMIF_PWR_MGMT_CTRL with the same value. | EMIF_PWR_MGMT_CTRL_SHDW | EMIF_PWR_MGMT_CTRL |
| Define the rate at which the connected SDRAM devices are refreshed. | EMIF_SDRAM_REF_CTRL [15:0] REG_REFRESH_RATE | 0x---- |
| Write the shadow register of the EMIF_SDRAM_REF_CTRL with the same value. | EMIF_SDRAM_REF_CTRL_SHDW | EMIF_SDRAM_REF_CTRL |
| Define the timings and clock parameters: 1) Minimum number of DDR clock cycles for which LPDDR2 must remain in self-refresh mode 2) Number of DDR clock cycles for a ZQCS command 3) Number of DDR clock that satisfies tDQSCKmax for LPDDR2 4) Minimum number of DDR clock cycles from refresh or load mode to refresh or activate 5) Maximum number of reg_refresh_rate intervals from activate to precharge command | EMIF_SDRAM_TIM_3 | 0x0000---- |
| Write the shadow register of the EMIF_SDRAM_TIM_3 . | EMIF_SDRAM_TIM_3_SHDW | EMIF_SDRAM_TIM_3 |
| Define minimum number of DDR clock cycles from power-down exit to any command other than a read command. | EMIF_SDRAM_TIM_2 [30:28]REG_T_XP | 0x- |
| Write the shadow register of the EMIF_SDRAM_TIM_2 . | EMIF_SDRAM_TIM_2_SHDW | EMIF_SDRAM_TIM_2 |

Table 16-118. Subsequence – EMIF Timing Initialization (continued)

| Step | Register/Bit Field/Programming Model | Value |
|--|---|-------------------------------------|
| Determine the minimum size of the read idle window for read idle detection and the force read idle time. | EMIF_READ_IDLE_CTRL [19:16] REG_READ_IDLE_LEN | 0x- |
| Determine the maximum interval between read idle detections or force. | EMIF_READ_IDLE_CTRL [8:0] REG_READ_IDLE_INTERVAL | 0x— |
| Write the shadow register of the EMIF_READ_IDLE_CTRL with the same value. | EMIF_READ_IDLE_CTRL_SHDW | EMIF_READ_IDLE_CTRL |
| Configure the temperature alert parameters. | EMIF_TEMP_ALERT_CONFIG | 0x----- |
| Specify the data to be written to the memory. | EMIF_LPDDR2_MODE_REG_DATA | 0x000000— |

16.3.5.1.2 Operational Modes Configuration

16.3.5.1.2.1 EMIF Output Impedance Calibration Mode

Table 16-119. EMIF Output Impedance Calibration Mode

| Step | Register/Bit Field/Programming Model | Value |
|---|--|--------|
| Determine whether CS1 or CS0 will be used for automatic output impedance calibration (Option 1). | EMIF_ZQ_CONFIG [31:30] REG_ZQ_CS1/0EN | 0x- |
| Determine whether CS1 and CS 0 will be used for automatic output impedance calibration simultaneously (Option 2). | EMIF_ZQ_CONFIG [29] REG_ZQ_DUALCALEN | 0x- |
| Define the interval (number of refresh periods) between ZQCS commands. | EMIF_ZQ_CONFIG [15:0] REG_ZQ_REFINTERVAL | 0x---- |
| Define the number of ZQCL intervals that build the ZQINIT interval. | EMIF_ZQ_CONFIG [19:18] REG_ZQ_ZQINIT_MULT | 0x- |
| Define the number of ZQCS intervals that build the ZQCL interval. | EMIF_ZQ_CONFIG [17:16] REG_ZQ_ZQCL_MULT | 0x- |
| Enable the issuing of ZQ-Long command on self-refresh, active power-down, and precharge power-down exit. | EMIF_ZQ_CONFIG [28] REG_ZQ_SFEXITEN | 0x1 |

16.3.5.1.2.2 EMIF Read

Table 16-120. EMIF Read

| Step | Register/Bit Field/Programming Model | Value |
|---|---|---|
| Define the read latency of the memory. | EMIF_DDR_PHY_CTRL_1 [3:0] REG_READ_LATENCY | 0x- |
| Choose CS0 or CS1 to issue the mode register command. | EMIF_LPDDR2_MODE_REG_CFG [31] REG_CS | 0x- |
| Write the memory address. | EMIF_LPDDR2_MODE_REG_CFG [7:0] REG_ADDRESS | 0x---- |
| Initiate read command by reading the register. | EMIF_LPDDR2_MODE_REG_DATA [7:0] | Configure the SDRAM output impedance calibration parameters 0x-00----- |

16.3.5.1.2.3 EMIF Write

Table 16-121. EMIF Write

| Step | Register/Bit Field/Programming Model | Value |
|--|---|--------|
| Choose CS0 or CS1 to issue mode register command. | EMIF_LPDDR2_MODE_REG_CFG[31] REG_CS | 0x- |
| Write the memory address. | EMIF_LPDDR2_MODE_REG_CFG[7:0] REG_ADDRESS | 0x---- |
| Define the minimum number of DDR clock cycles from last write transfer to precharge. | EMIF_SDRAM_TIM_1[20:17] REG_T_WR | 0x- |
| Supply the data byte to be written and initiate write command by writing the register. | EMIF_LPDDR2_MODE_REG_DATA[7:0] REG_VALUE_0 | 0x- |

16.3.5.1.2.4 EMIF SDRAM Refresh

Table 16-122. EMIF SDRAM Refresh

| Step | Register/Bit Field/Programming Model | Value |
|---|---|---------------------|
| Define the minimum number of DDR clock cycles from refresh or load mode to refresh or activate. | EMIF_SDRAM_TIM_3[12:4] REG_T_RFC | 0x---- |
| Write the shadow register of EMIF_SDRAM_TIM_3. | EMIF_SDRAM_TIM_3_SHDW | EMIF_SDRAM_TIM_3 |
| Define the rate at which the connected SDRAM devices are refreshed. | EMIF_SDRAM_REF_CTRL[15:0] REG_REFRESH_RATE | 0x---- |
| Disable the SDRAM-DDR1/2/3 refresh. | EMIF_SDRAM_REF_CTRL[31] REG_INITREF_DIS | 0x1 |
| Write the shadow register of EMIF_SDRAM_REF_CTRL. | EMIF_SDRAM_REF_CTRL_SHDW | EMIF_SDRAM_REF_CTRL |
| Choose CS0 or CS1 to issue mode register command. | EMIF_LPDDR2_MODE_REG_CFG[31] | 0x- |
| Enable refresh for SDRAM-LPDDR2 memory. | EMIF_LPDDR2_MODE_REG_CFG[30] | 0x1 |
| Dummy write to start the LPDDR2 refresh cycles. | EMIF_LPDDR2_MODE_REG_DATA | 0x00000000 |

16.3.5.1.2.5 EMIF SDRAM Self-Refresh

Table 16-123. EMIF SDRAM Self-Refresh

| Step | Register/Bit Field/Programming Model | Value |
|--|--------------------------------------|------------------|
| Define minimum number of DDR clock cycles from self-refresh exit to any command other than a read command. | EMIF_SDRAM_TIM_2[24:16] REG_T_XSNR | 0x— |
| Write the shadow register of EMIF_SDRAM_TIM_2. | EMIF_SDRAM_TIM_2_SHDW | EMIF_SDRAM_TIM_2 |
| Enable self-refresh mode. | EMIF_PWR_MGMT_CTRL[10:8] REG_LP_MODE | 0x2 |

16.3.5.1.2.6 EMIF LPDDR2 SDRAM Power-Down Mode

Table 16-124. EMIF SDRAM Power-Down Mode

| Step | Register/Bit Field/Programming Model | Value |
|--|--------------------------------------|------------------|
| Define minimum number of DDR clock cycles from power-down exit to any command other than a read command. | EMIF_SDRAM_TIM_2[30:28] REG_T_XP | 0x- |
| Write the shadow register of EMIF_SDRAM_TIM_2. | EMIF_SDRAM_TIM_2_SHDW | EMIF_SDRAM_TIM_2 |
| Define the number of DDR clock cycles after which the external memory will be put in power-saving mode when the EMIF enters idle mode. | EMIF_PWR_MGMT_CTRL[3:0] REG_CS_TIM | 0x- |

Table 16-124. EMIF SDRAM Power-Down Mode (continued)

| Step | Register/Bit Field/Programming Model | Value |
|---------------------------------|---|-------|
| Enable (enter) power-down mode. | EMIF_PWR_MGMT_CTRL [10:8] REG_LP_MODE | 0x4 |

16.3.5.1.2.7 EMIF LPDDR2-SDRAM Deep Power-Down Mode

Table 16-125. EMIF LPDDR2-SDRAM Deep Power-Down Mode

| Step | Register/Bit Field/Programming Model | Value |
|--|---|----------------------------------|
| Define minimum number of DDR clock cycles from power-down exit to any command other than a read command. | EMIF_SDRAM_TIM_2 [30:28] REG_T_XP | 0x- |
| Write the shadow register of EMIF_SDRAM_TIM_2 . | EMIF_SDRAM_TIM_2_SHDW | EMIF_SDRAM_TIM_2 |
| Define the number of DDR clock cycles after which the external memory will be put in power-saving mode when the EMIF enters idle mode. | EMIF_PWR_MGMT_CTRL [3:0] REG_CS_TIM | 0x- |
| Enable (enter) deep power-down mode. | EMIF_PWR_MGMT_CTRL [11] REG_DPD_EN | 0x1 |

16.3.5.1.2.8 EMIF Global Warm Reset (Software Reset)

Table 16-126. EMIF Global Warm Reset (Software Reset)

| Step | Register/Bit Field/Programming Model | Value |
|--|---|--|
| IF: External request for reset | Input signal EMIFi_GLOBAL_RST | Asserted (see the programming model in the PRCM chapter) |
| Follow the sequence in Section 16.3.5.1.2.5 EMIF SDRAM Self-Refresh Sequence . | EMIF_PWR_MGMT_CTRL [10:8] REG_LP_MODE | 0x2 |
| ELSE: | Input signal EMIFi_GLOBAL_RST | Deasserted (see the programming model in the PRCM chapter) |
| Disable (exit) self-refresh mode when not needed. | EMIF_PWR_MGMT_CTRL [10:8] REG_LP_MODE | 0x0 |
| ENDIF | | |

16.3.5.1.2.9 EMIF Temperature Monitoring Mode

Table 16-127. EMIF Temperature Monitoring Mode

| Step | Register/Bit Field/Programming Model | Value |
|---|---|---------|
| Determine whether CS1 or CS0 will be used for temperature alert polling. | EMIF_TEMP_ALERT_CONFIG [31:30] REG_TA_CS1/0EN | 0x- |
| Define the interval (number of refresh periods) between temperature alert polls. | EMIF_TEMP_ALERT_CONFIG [21:0] REG_TA_REFINTERVAL | 0x----- |
| Define how wide the physical memory device will be. | EMIF_TEMP_ALERT_CONFIG [27:26] REG_TA_DEVWDT | 0x- |
| Define which external byte lanes will contain a device for temperature monitoring (which devices to be polled). | EMIF_TEMP_ALERT_CONFIG [25:24] REG_TA_DEVCNT | 0x- |
| Enable system L3 interrupt for SDRAM temperature alert. | EMIF_IRQENABLE_SET_SYS [1] REG_EN_TA_SYS | 0x1 |
| Enable low-latency L3 interrupt for SDRAM temperature alert. | EMIF_IRQENABLE_SET_LL [1] REG_EN_TA_LL | 0x1 |

Table 16-127. EMIF Temperature Monitoring Mode (continued)

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------|
| Enable the issuing of a temperature alert poll on self-refresh exit (poll for temperature change every time EMIF exits self-refresh, active power-down, and precharge power-down modes). | EMIF_TEMP_ALERT_CONFIG [28] REG_TA_SFEXITEN | 0x1 |

16.3.5.1.3 EMIF Events Servicing

16.3.5.1.3.1 Interrupt Servicing

This section describes event servicing (interrupt treatment) of the EMIF module.

The following Interrupt mechanism is double, because there are two EMIF modules with different register addresses and two Interrupt lines, EMIF1_IRQ and EMIF2_IRQ.

Table 16-128. EMIF Event Servicing

| Step | Register/Bit Field/Programming Model | Value |
|--|---|-----------|
| Clear all eventual previous indications of treated interrupts, and write the four registers: | EMIF_IRQSTATUS_SYS , EMIF_IRQSTATUS_LL , EMIF_IRQSTATUS_RAW_SYS , EMIF_IRQSTATUS_RAW_LL | 0x0000003 |
| Enable the system L3 interrupts. | EMIF_IRQENABLE_SET_SYS | 0x0000003 |
| Enable the low-latency L3 interrupts. | EMIF_IRQENABLE_SET_LL | 0x0000003 |
| Wait until an event occurs. | | |
| Read the status registers: | EMIF_IRQSTATUS_SYS , EMIF_IRQSTATUS_LL , EMIF_IRQSTATUS_RAW_SYS , EMIF_IRQSTATUS_RAW_LL | |
| IF: the EMIF_IRQSTATUS_SYS [0] = 1 | | |
| Read the error log register and determine the addressing mode, command type, and connection ID of the first errored transaction: | EMIF_L3_ERR_LOG | |
| Start the interrupt handler for system L3 Command/address error. | – INTC of the MPU | |
| ELSE IF: the EMIF_IRQSTATUS_SYS [1] = 1 | | |
| Read the error log register and determine the addressing mode, command type, and connection ID of the first errored transaction: | EMIF_L3_ERR_LOG | |
| Start the interrupt handler for system L3 Temperature alert. | – INTC of the MPU | |
| Update the REFRESH_RATE to the required value as per the temperature change. | EMIF_SDRAM_REF_CTRL [15:0] REG_REFRESH_RATE | 0x---- |
| ELSE IF: the EMIF_IRQSTATUS_RAW_SYS [0] = 1 | | |
| Read the error log register and determine the addressing mode, command type, and connection ID of the first errored transaction: | EMIF_L3_ERR_LOG | |
| Start the interrupt handler for raw system L3 – Command/address error. | – INTC of the MPU | |
| ELSE IF: the EMIF_IRQSTATUS_RAW_SYS [1] = 1 | | |
| Read the error log register and determine the addressing mode, command type, and connection ID of the first errored transaction: | EMIF_L3_ERR_LOG | |
| Start the interrupt handler for raw system L3 – Temperature alert | – INTC of the MPU | |
| Update the REFRESH_RATE to the required value as per the temperature change. | EMIF_SDRAM_REF_CTRL [15:0] REG_REFRESH_RATE | 0x---- |
| ELSE IF: the EMIF_IRQSTATUS_LL [0] = 1 | | |

Table 16-128. EMIF Event Servicing (continued)

| Step | Register/Bit Field/Programming Model | Value |
|--|---|--------|
| Read the error log register and determine the addressing mode, command type, and connection ID of the first errored transaction: | EMIF_L3_ERR_LOG | |
| Start the interrupt handler for low-latency L3 – Command/address error. | INTC of the MPU | |
| ELSE IF: the EMIF_IRQSTATUS_LL[1] = 1 | | |
| Read the error log register and determine the addressing mode, command type, and connection ID of the first errored transaction: | EMIF_L3_ERR_LOG | |
| Start the interrupt handler for low-latency L3 – Temperature alert. | INTC of the MPU | |
| Update the REFRESH_RATE to the required value as per the temperature change. | EMIF_SDRAM_REF_CTRL[15:0] REG_REFRESH_RATE | 0x---- |
| ELSE IF: The EMIF_IRQSTATUS_RAW_LL[0] = 1 | | |
| Read the error log register and determine the addressing mode, command type, and connection ID of the first errored transaction: | EMIF_L3_ERR_LOG | |
| Start the interrupt handler for raw low-latency L3 – Command/address error | INTC of the MPU | |
| ELSE: The EMIF_IRQSTATUS_RAW_LL[1] = 1 | | |
| Read the error log register and determine the addressing mode, command type, and connection ID of the first errored transaction: | EMIF_L3_ERR_LOG | |
| Start the interrupt handler for raw low-latency L3 – Temperature alert. | INTC of the MPU | |
| Update the REFRESH_RATE to the required value as per the temperature change. | EMIF_SDRAM_REF_CTRL[15:0] REG_REFRESH_RATE | 0x---- |
| ENDIF | | |
| Wait until the termination of the corresponding interrupt handler. | IINTC of the MPU | |
| IF: Address/command error was treated | | |
| Clear the LSB in the relevant IRQ status registers, SYS or LL; write both registers: | EMIF_IRQSTATUS_SYS[0] REG_ERR_SYS and EMIF_IRQSTATUS_RAW_SYS[0] REG_ERR_SYS, or EMIF_IRQSTATUS_LL[0] REG_ERR_LL and EMIF_IRQSTATUS_RAW_LL[0] REG_ERR_LL | 0x1 |
| Disable the corresponding interrupt if needed; write: | EMIF_IRQENABLE_CLR_SYS[0] REG_EN_ERR_SYS or EMIF_IRQENABLE_CLR_LL[0] REG_EN_ERR_LL | 0x1 |
| ELSE: (Temperature alert proceeded) | | |
| Clear the corresponding bit in the relevant IRQ status registers, SYS or LL; write both registers: | EMIF_IRQSTATUS_SYS[1] REG_TA_SYS and EMIF_IRQSTATUS_RAW_SYS[1] REG_TA_SYS, or EMIF_IRQSTATUS_LL[1] REG_TA_LL and EMIF_IRQSTATUS_RAW_LL[1] REG_TA_LL | 0x1 |
| Disable the corresponding interrupt if needed; write: | EMIF_IRQENABLE_CLR_SYS[1] REG_EN_TA_SYS or EMIF_IRQENABLE_CLR_LL[1] REG_EN_TA_LL | 0x1 |
| ENDIF | | |

NOTE: The values of the different bit fields in the [EMIF_SDRAM_CONFIG](#) and [EMIF_SDRAM_CONFIG2](#) registers are set by the control module at reset. These values must be modified by the configuration header feature in the ROM code or by the initial boot image running from an external XIP booting memory or internal RAM (see [Section 28.4.8, Image Format](#)). They must not be modified during run time, because they reflect the used hardware LPDDR2 SDRAM configurations.

16.3.6.2.2 EMIF Register Description

[Table 16-131](#) through [Table 16-213](#) describe the individual EMIF registers.

| REG_SDRAM_TYPE | | | | REG_IBANK_POS | | | | RESERVED | | | | REG_DDR2_DDQS | | | | RESERVED | | | | REG_NARROW_MODE | | | | REG_CL | | | | REG_ROWSIZE | | | | REG_IBANK | | | | REG_EBANK | | | | REG_PAGESIZE | | | |
| | | | | | | | | | | | | REG_DDR_DISABLE_DLL | | | | | | | | REG_ROWSIZE | | | | | | | | REG_EBANK | | | | | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------|---|------|--------------------|
| 31:29 | REG_SDRAM_TYPE | SDRAM Type selection. Set to 4 for LPDDR2-S4, Set to 5 for LPDDR2-S2 All other value are reserved. | RW | 0x- ⁽¹⁾ |
| 28:27 | REG_IBANK_POS | Internal bank position. Set to 0 to assign internal bank address bits from L3 address as shown in Table 16-107 and Table 16-108 . Set to 1, 2, or 3 to assign internal bank address bits from L3 address as shown in Table 16-109 , Table 16-110 , and Table 16-111 . | RW | 0x- ⁽¹⁾ |
| 26:24 | RESERVED | RESERVED | RW | 0x0 |
| 23 | REG_DDR2_DDQS | DDR2 differential DQS enable. Set to 0 for single-ended DQS. Set to 1 for differential DQS. This bit is only for DDR2 mode, because the device supports LPDDR2; this bit is don't care. | RW | 0x- ⁽¹⁾ |
| 22:21 | RESERVED | RESERVED | RW | 0x- ⁽¹⁾ |
| 20 | REG_DDR_DISABLE_DLL | Disable DLL select. Set to 1 to disable DLL inside SDRAM. | RW | 0x- ⁽¹⁾ |
| 19:16 | RESERVED | RESERVED | RW | 0x0 |
| 15:14 | REG_NARROW_MODE | SDRAM data bus width. Set to 0 for 32-bit and set to 1 for 16-bit. All other values are reserved. | RW | 0x- ⁽¹⁾ |
| 13:10 | REG_CL | CAS Latency (referred to as read latency (RL) in some SDRAM specs). The value of this field defines the CAS latency to be used when accessing connected SDRAM devices. Value of 3, 4, 5, 6, 7, and 8 (CAS latency of 3, 4, 5, 6, 7, and 8) are supported for LPDDR2-SDRAM. All other values are reserved. Also program the EMIF_DDR_PHY_CTRL_1 [3:0] REG_READ_LATENCY | RW | 0x- ⁽¹⁾ |

⁽¹⁾ Value loaded by the control module at reset (see [Section 19.6.4, SYSCTRL_GENERAL_WKUP Register Summary](#)).

| Bits | Field Name | Description | Type | Reset |
|------|--------------|--|------|--------------------|
| 9:7 | REG_ROWSIZE | Row Size. Defines the number of row address bits of connected SDRAM devices. Set to 0 for 9 row bits, Set to 1 for 10 row bits, Set to 2 for 11 row bits, Set to 3 for 12 row bits, Set to 4 for 13 row bits, Set to 5 for 14 row bits, Set to 6 for 15 row bits, Set to 7 for 16 row bits. This field is only used when EMIF_SDRAM_CONFIG[28:27] REG_IBANK_POS field is set to 1, 2, or 3 or REG_EBANK_POS field in EMIF_SDRAM_CONFIG_2 register is set to 1. | RW | 0x- ⁽²⁾ |
| 6:4 | REG_IBANK | Internal Bank setup. Defines number of banks inside connected SDRAM devices. Set to 0 for 1 bank, Set to 1 for 2 banks, Set to 2 for 4 banks, Set to 3 for 8 banks. All other values are reserved. | RW | 0x- ⁽²⁾ |
| 3 | REG_EBANK | External chip select setup. Defines whether SDRAM accesses will use 1 or 2 chip select lines. Set to 0 to use pad_cs_o_n[0] only. Set to 1 to use pad_cs_o_n[1:0]. This bit will automatically be set to 0 if EMIF_SDRAM_CONFIG_2[30] REG_CS1NVMEN field is set to 1. | RW | 0x- ⁽²⁾ |
| 2:0 | REG_PAGESIZE | Page Size. Defines the internal page size of connected SDRAM devices. Set to 0 for 256-word page (8 column bits), Set to 1 for 512-word page (9 column bits), Set to 2 for 1024-word page (10 column bits), Set to 3 for 2048-word page (11 column bits). All other values are reserved. | RW | 0x- ⁽²⁾ |

⁽²⁾ Value loaded by the control module at reset (see [Section 19.6.4, SYSCTRL_GENERAL_WKUP Register Summary](#)).

The EMIF will put the external SDRAM in Power-Down mode after the EMIF is idle for these number of DDR clock cycles and if reg_lp_mode field is set to 4. Set to 0 to immediately enter Power-Down mode. Set to 1 for 16 clocks, set to 2 for 32 clocks, set to 3 for 64 clocks, set to 4 for 128 clocks, set to 5 for 256 clocks, set to 6 for 512 clocks, set to 7 for 1024 clocks, set to 8 for 2048 clocks, set to 9 for 4096 clocks, set to 10 for 8192 clocks, set to 11 for 16384 clocks, set to 12 for 32768 clocks, set to 13 for 65536 clocks, set to 14 for 131072 clocks, and set to 15 for 262144 clocks. | RW | 0x0 |
| 11 | REG_DPD_EN | Deep Power Down enable. Set to 0 for normal operation. Set to 1 to enter deep power-down mode. This mode will override the reg_lp_mode field setting. | RW | 0 |
| 10:8 | REG_LP_MODE | Automatic Power Management enable Set to 1: Reserved Set to 2: Self-refresh mode Set to 4: Power-down mode All other values will disable automatic power management. | RW | 0x0 |
| 7:4 | REG_SR_TIM | Power Mangement timer for Self Refresh. The EMIF will put the external SDRAM in Self Refresh mode after the EMIF is idle for these number of DDR clock cycles and if reg_lp_mode field is set to 2. Set to 0 to immediately enter Self Refresh mode. Set to 1 for 16 clocks, set to 2 for 32 clocks, set to 3 for 64 clocks, set to 4 for 128 clocks, set to 5 for 256 clocks, set to 6 for 512 clocks, set to 7 for 1024 clocks, set to 8 for 2048 clocks, set to 9 for 4096 clocks, set to 10 for 8192 clocks, set to 11 for 16384 clocks, set to 12 for 32768 clocks, set to 13 for 65536 clocks, set to 14 for 131072 clocks, and set to 15 for 262144 clocks. | RW | 0x0 |
| 3:0 | REG_CS_TIM | Power Mangement timer for Clock Stop. The EMIF will put the external SDRAM in Clock Stop mode after the EMIF is idle for these number of DDR clock cycles and if reg_lp_mode field is set to 1. Set to 0 to immediately enter Clock Stop mode. Set to 1 for 16 clocks, set to 2 for 32 clocks, set to 3 for 64 clocks, set to 4 for 128 clocks, set to 5 for 256 clocks, set to 6 for 512 clocks, set to 7 for 1024 clocks, set to 8 for 2048 clocks, set to 9 for 4096 clocks, set to 10 for 8192 clocks, set to 11 for 16384 clocks, set to 12 for 32768 clocks, set to 13 for 65536 clocks, set to 14 for 131072 clocks, and set to 15 for 262144 clocks. | RW | 0x0 |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|--------------------|--|------|-------|
| 31:28 | RESERVED | Reserved for future use. | R | 0x0 |
| 27:24 | REG_SYS_THRESH_MAX | System L3 Threshold Maximum. The number of commands the system interface can consume in the command FIFO. The value is used to determine when to stop future request, writing a zero will reserve no space for the associated interface. In the event the value is set to zero and a request is seen for that interface, the command FIFO will assume a value of 1. Since the low-latency interface has effectively a higher priority, the only way for the system interface to use all command FIFO entries is to set the REG_LL_THRESH_MAX to zero. | RW | 0x7 |
| 23:20 | REG_MPU_THRESH_MAX | MPU Interface Threshold Maximum. The number of commands the MPU interface can consume in the command FIFO. The value is used to determine when to stop future request, writing a zero will reserve no space for the associated interface. In the event the value is set to zero and a request is seen for that interface, the command FIFO will assume a value of 1. | RW | 0x7 |
| 19:16 | REG_LL_THRESH_MAX | Low-latency L3 Threshold Maximum. The number of commands the low latency interface can consume in the command FIFO. The value is used to determine when to stop future request, writing a zero will reserve no space for the associated interface. In the event the value is set to zero and a request is seen for that interface, the command FIFO will assume a value of 1. | RW | 0x7 |
| 15:8 | RESERVED | Reserved for future use. | R | 0x0 |
| 7:0 | RESERVED | Although this field is reserved, it is still read writable. Values written have no effect on operation of the EMIF4D3. | RW | 0xFF |

| 31:20 | RESERVED | Reserved for future use. | R | 0x0 |
| 19:16 | REG_READ_IDLE_LEN | The Read Idle Length field determines the minimum required size that a read idle window must be to be detected or generated. The actual read idle length will be (REG_READ_IDLE_LEN+1)*2 EMIF_FCLK clocks. The value programmed should be (the required read idle length minus one) divided by two. | RW | 0x5 |
| 15:9 | RESERVED | Reserved for future use. | R | 0x0 |
| 8:0 | REG_READ_IDLE_INTERVAL | The Read Idle Interval field determines the maximum interval between successive read idle events. The actual interval between read idle events is (REG_READ_IDLE_INTERVAL+1)*64 EMIF_FCLK clocks. The value programmed should be (the required max interval divided by sixty four) minus one. A value of 0 disables the read idle function. | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|-------|--------------------|--|------|----------|
| 31 | REG_TA_CS1EN | Writing a 1 enables temperature alert polling for CS1. | RW | 0x0 |
| 30 | REG_TA_CS0EN | Writing a 1 enables temperature alert polling for CS0. | RW | 0x0 |
| 29 | RESERVED | Reserved | R | 0x0 |
| 28 | REG_TA_SFEXITEN | Temperature Alert Poll on Self-Refresh, Active Power-Down, and Precharge Power-Down exit enable. Writing a 1 enables the issuing of a temperature alert poll on Self-Refresh exit. | RW | 0x0 |
| 27:26 | REG_TA_DEVWDT | This field indicates how wide a physical device is. It is used in conjunction with the reg_ta_devcnt register to determine which byte lanes contain the temperature alert info. A value of 0 = eight bit wide, 1 = sixteen bit wide, 2 = thirty two bit wide. All others are reserved. If this field is set to 1 and the reg_ta_devcnt field is set to one the byte mask for checking will be 4'b0101. | RW | 0x0 |
| 25:24 | REG_TA_DEVCNT | This field indicates which external byte lanes contain a device for temperature monitoring. A value of 0 = one device, 1 = two devices, 2 = four devices. All other reserved. | RW | 0x0 |
| 23:22 | RESERVED | Reserved | R | 0x0 |
| 21:0 | REG_TA_REFINTERVAL | Number of refresh periods between temperature alert polls. This field supports between one refresh period to 10 seconds between temperature alert polls. Refresh period is defined by reg_refresh_rate in SDRAM Refresh Control register. | RW | 0x000000 |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------------------------------|---|------|-------|
| 31:30 | DLL_MASTER_SENSITIVITY | This field defines the level of sensitivity of the DLL master: the lower the value, the more sensitive the DLL is to PVT variation. The recommended setting is 0x2. | RW | 0x0 |
| 29:26 | REG_PHY_FREEZE_DELAY_CODE_POSTAMBLE | Postamble time respected by the DATA PHY freezing the DLL slave code after reads | RW | 0x0 |
| 25:22 | REG_PHY_FREEZE_DELAY_CODE_PREAMBLE | Preamble time respected by the DATA PHY before freezing the DLL slave code during reads | RW | 0x0 |
| 21:12 | REG_DLL_MASTER_SW_CODE_CTRL | DLL delay code when in software override mode | RW | 0x1FF |
| 11:4 | REG_DLL_SLAVE_DLY_CTRL | DLL slave delay ratio control | RW | 0xFF |

| Bits | Field Name | Description | Type | Reset |
|------|------------------|---|------|-------|
| 3:0 | REG_READ_LATENCY | This field defines the read latency for the read data from SDRAM in number of DDR clock cycles. This field is used by the EMIF as well as the PHY. The EMIF will expect the first read data to arrive (reg_read_latency + 3) DDR clock cycles from the read command. The REG_READ_LATENCY must be set to RL + EMIF_SDRAM_TIM_3 [14:13] REG_T_TDQSCKMAX , where REG_T_TDQSCKMAX = ceiling(tDQSCKmax / tCKavg) - 1 The write latency (WL) is tied to the RL. See the LPDDR2 SDRAM standard. | RW | 0x0 |

16.4 General-Purpose Memory Controller

16.4.1 GPMC Overview

The general-purpose memory controller (GPMC) is a unified memory controller dedicated to interfacing external memory devices:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (only available in non-muxed mode) burst NOR flash devices
- NAND Flash
- Pseudo-SRAM devices

16.4.2 GPMC Environment

This section describes the GPMC application fields from an environment point of view (external connections). It describes GPMC connectivity options, and gives three possible interfaces.

16.4.2.1 GPMC Modes

This section shows three GPMC external connections options:

- [Figure 16-50](#) shows a connection between the GPMC and a 16-bit synchronous address/data-multiplexed (or AAD-multiplexed, but this protocol use less address pins) external memory device ([Figure 16-50](#)).
- [Figure 16-50](#) shows a connection between the GPMC and a 16-bit synchronous nonmultiplexed external memory device ([Figure 16-51](#)).
- [Figure 16-52](#) shows a connection between the GPMC and a 16-bit NAND device ([Figure 16-52](#)).

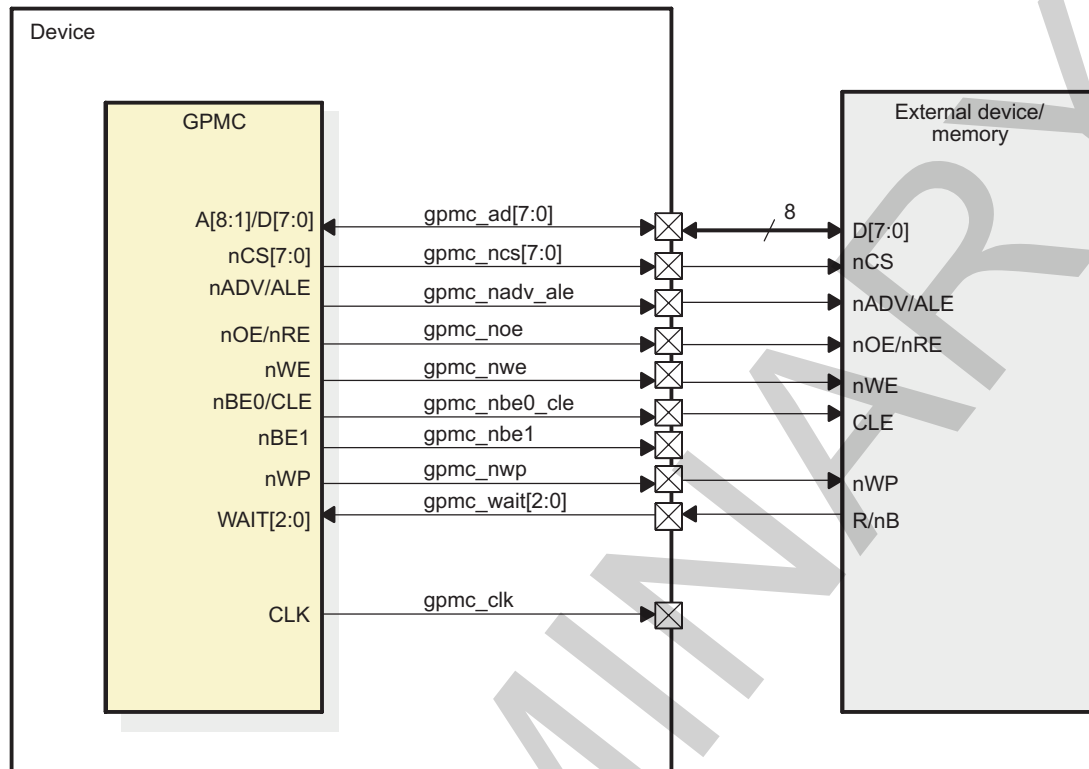

NOTE: The device does not provide the A0 byte address line required for random-byte addressable 8-bit wide device interfacing (for multiplexed and nonmultiplexed protocol). Hence, an 8-bit device must be connected to the D[7:0] / gpmc_ad[7:0] data bus (rather than D[15:8] / gpmc_ad[15:8]) of the GPMC controller. This limits the use of 8-bit wide device interfacing to byte-alias access.

Figure 16-50. GPMC to 16-Bit Address/Data-Multiplexed Memory

Figure 16-51. GPMC to 16-Bit Nonmultiplexed Memory

Figure 16-52. GPMC to 8-Bit NAND Device

gpmc-003

16.4.2.2 GPMC Signals

Table 16-215 lists the GPMC subsystem I/O pins.

Table 16-215. GPMC I/O Description

| Pin Name | I/O | Description |
|----------------|------------------|--|
| gpmc_a[25:16] | O | Address |
| gpmc_ad[15:0] | I/O | Data |
| gpmc_ncs[7:0] | O | Chip-selects (active low) |
| gpmc_clk | O ⁽¹⁾ | Clock generated for the external memory or device |
| gpmc_nadv_ale | O | Address valid (active low). Also used as address latch enable (active high) for NAND protocol memories. |
| gpmc_noe_nre | O | Output enable (active low). Also used as read enable (active low) for NAND protocol memories. |
| gpmc_nwe | O | Write enable (active low) |
| gpmc_nbe0_cle | O | Lower-byte enable (active low). Also used as command latch enable for NAND protocol memories. |
| gpmc_nbe1 | O | Upper-byte enable (active low). |
| gpmc_nwp | O | Write protect (active low) |
| gpmc_wait[2:0] | I | External wait signal for NOR and NAND protocol memories. The wait signals can be mapped on any of the chip-select. |
| gpmc_io_dir | O | gpmc_ad[15:0] signal direction control: Low during transmit (for write access: data OUT from GPMC to memory), High during receive (for read access: data IN from memory to GPMC) |

⁽¹⁾ This output signal is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

Table 16-216 shows the use of address and data GPMC controller pins based on the type of external device.

Table 16-216. GPMC Pin Multiplexing Options

| GPMC Pin | Multiplexed Address Data 16-Bit Device | Nonmultiplexed Address Data 16-Bit Device With LIMITED- ADDRESS Bit Enabled | 16-Bit NAND Device | 8-Bit NAND Device |

| gpmc_ad[11] | A12/D11 | D11 | D11 | Not used |
| gpmc_ad[10] | A11/D10 | D10 | D10 | Not used |
| gpmc_ad[9] | A10/D9 | D9 | D9 | Not used |
| gpmc_ad[8] | A9/D8 | D8 | D8 | Not used |
| gpmc_ad[7] | A8/D7 | D7 | D7 | D7 |
| gpmc_ad[6] | A7/D6 | D6 | D6 | D6 |
| gpmc_ad[5] | A6/D5 | D5 | D5 | D5 |
| gpmc_ad[4] | A5/D4 | D4 | D4 | D4 |
| gpmc_ad[3] | A4/D3 | D3 | D3 | D3 |
| gpmc_ad[2] | A3/D2 | D2 | D2 | D2 |
| gpmc_ad[1] | A2/D1 | D1 | D1 | D1 |
| gpmc_ad[0] | A1/D0 | D0 | D0 | D0 |

When using non-multiplexed memories, it is recommended to enable [GPMC_CONFIG\[1\] LIMITEDADDRESS](#). This bit forces A[26:11] to 1 on the GPMC I/O side. Thus, only 2Kbytes of memory address space is accessible regardless of the memory size.

With all device types, the GPMC does not drive unnecessary address lines. They stay at their reset value of 0x00.

Address mapping supports address/data-multiplexed 16-bit wide devices:

- The NOR flash memory controller still supports non-multiplexed address and data memory devices.
- Multiplexing mode can be selected through the [GPMC_CONFIG1_i\[9:8\] MUXADDDATA](#) bit field (i = 0 to 7).
- Asynchronous page mode is not supported for multiplexed address and data devices.

NOTE: The numbering for A (address) is starting from 1 instead of 0 such as D (data) because the A0 signal is handled within the GPMC but is not driven to any pad. The signal is only relevant to 8-bit accesses and this configuration is not recommended. If such a memory or device is connected, only every second word in the memory is accessible, that is, each 16-bit aligned 8-bit word is mapped but not the non-16-bit aligned ones. Any access to a non-aligned one will actually result in accessing the associated aligned one, at address A1 instead of address A.

16.4.3 GPMC Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

- No STANDBY hardware handshake
- No wake-up request
- One system direct memory access (sDMA) request
- One interrupt request to the Cortex-A9 MPU Interrupt Controller (MA_IRQ) and to DSP subsystem (D_IRQ)
- One clock for functional and interface domains

Figure 16-53 shows GPMC integration.

Figure 16-53. GPMC Integration

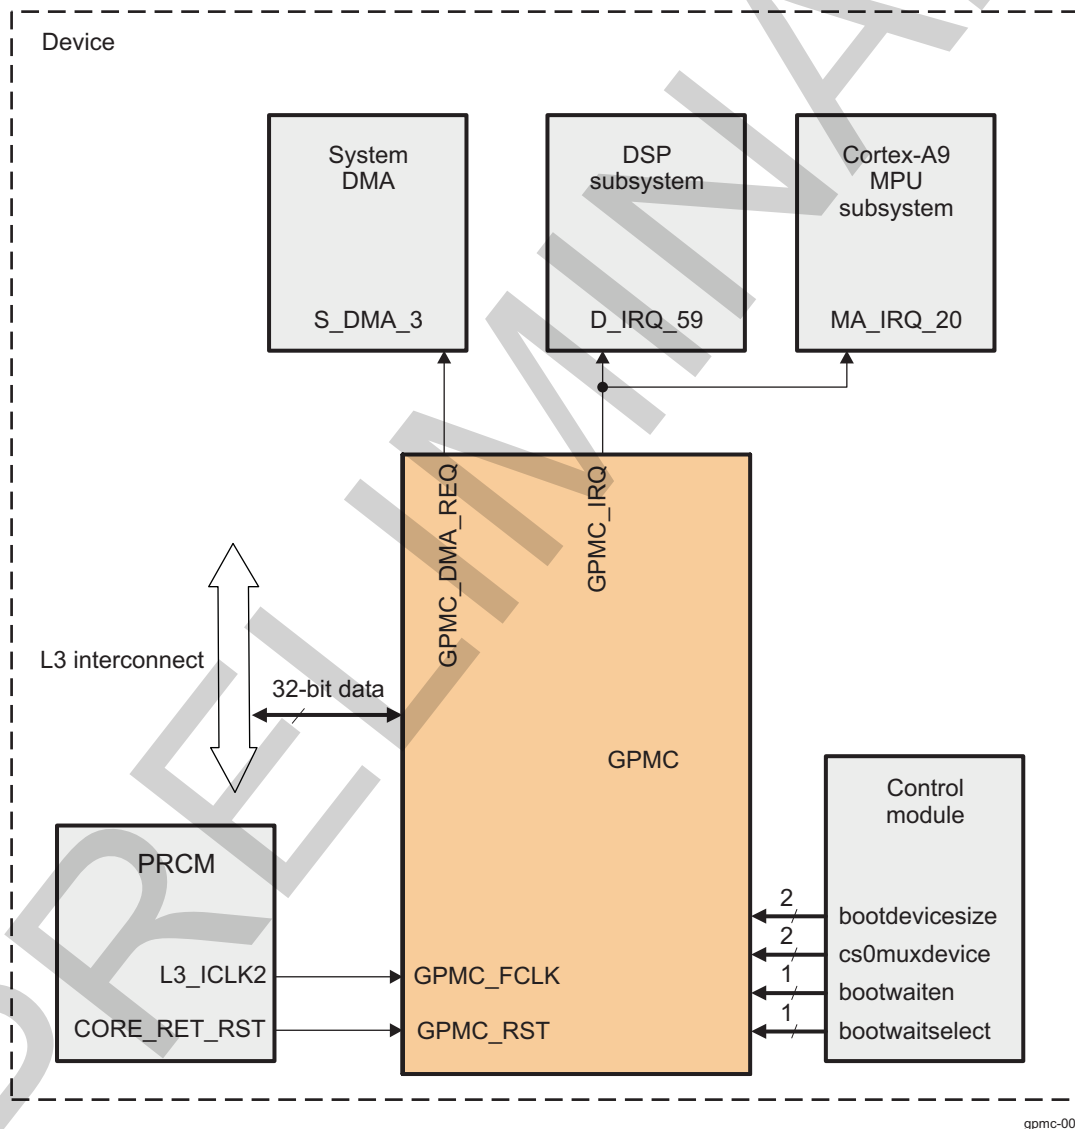

Table 16-217, Table 16-218 and Table 16-219 summarize the integration of the module in the device.

Table 16-217. GPMC Integration Attributes

| Module Instance | Attributes | | |
|-----------------|--------------|--------------------|--------------|
| | Power Domain | Wake-up Capability | Interconnect |
| GPMC | PD_CORE | No | L3 |

NOTE:

- For information about operation performance point (OPP) configuration description, see [Section 3.1.1.1.2, Module Level Clock Management](#) in [Chapter 3, Power, Reset, and Clock Management](#).

Table 16-218. GPMC Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|------------------|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| GPMC | GPMC_FCLK | L3_ICLK2 | PRCM | Functional clock |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| GPMC | GPMC_RST | CORE_RET_RST | PRCM | GPMC reset |

NOTE: For clock description, see [Section 16.4.4.2, GPMC Clock Configuration](#).

Table 16-219. GPMC Hardware Requests

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|-------------|---|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| GPMC | GPMC_IRQ | D_IRQ_59 | DSP | GPMC interrupt to DSP subsystem |
| | GPMC_IRQ | MA_IRQ_20 | Cortex-A9 | GPMC interrupt to Cortex-A9 MPU subsystem |
| DMA Requests | | | | |
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| GPMC | GPMC_DMA_REQ | S_DMA_3 | sDMA | GPMC request from Prefetch Engine to sDMA |

NOTE:

- For interrupt source description, see [Section 16.4.4.5, GPMC Interrupt Requests](#).
- For DMA source description, see [Section 16.4.4.6, GPMC DMA Requests](#).

16.4.4 GPMC Functional Description

The GPMC basic programming model offers maximum flexibility to support various access protocols for each of the eight configurable chip-selects. Use optimal chip-select settings, based on the characteristics of the external device:

- Different protocols can be selected to support generic asynchronous or synchronous random-access devices (NOR flash, SRAM) or to support specific NAND devices.
- The address and the data bus can be multiplexed on the same external bus.
- Read and write access can be independently defined as asynchronous or synchronous.
- System requests (byte, 16-bit word, burst) are performed through single or multiple accesses. External access profiles (single, multiple with optimized burst length, native- or emulated-wrap) are based on external device characteristics (supported protocol, bus width, data buffer size, native-wrap support).
- System burst read or write requests are synchronous-burst (multiple-read or multiple-write). When neither burst nor page mode is supported by external memory or ASIC devices, system burst read or write requests are translated to successive single synchronous or asynchronous accesses (single reads or single writes). 8-bit wide devices are supported only in single synchronous or single asynchronous read or write mode.
- To simulate a programmable internal-wait state, an external wait pin can be monitored to dynamically control external access at the beginning (initial access time) of and during a burst access.

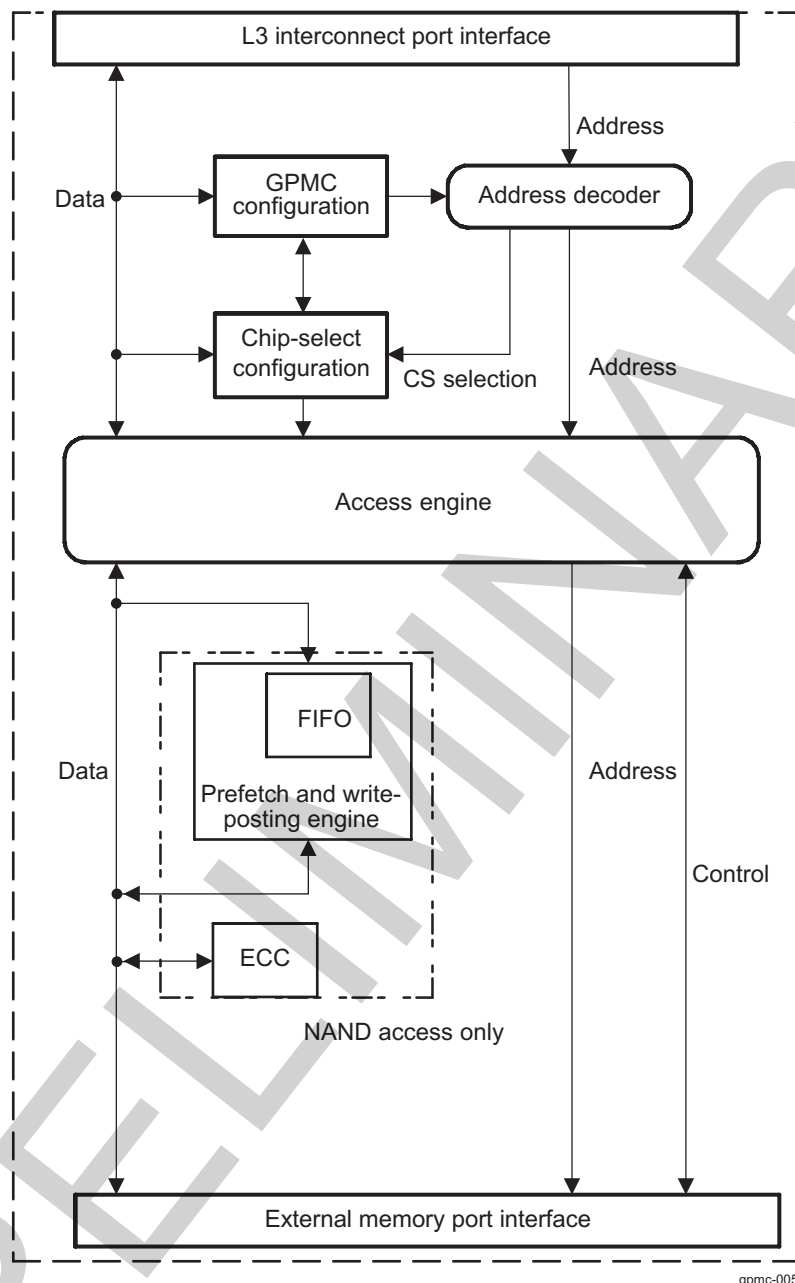

Each control signal is controlled independently for each chip-select. The internal functional clock of the GPMC (GPMC_FCLK) is used as a time reference to specify the following:

- Read- and write-access duration
- Most GPMC external interface control-signal assertion and deassertion times
- Data-capture time during read access
- External wait-pin monitoring time
- Duration of idle time between accesses, when required

16.4.4.1 GPMC Block Diagram

Figure 16-54 shows the GPMC functional block diagram. The GPMC consists of six blocks:

- L3 interconnect port interface
- Address decoder, GPMC configuration, and chip-select configuration register file
- Access engine
- Prefetch and write-posting engine
- Error correction code engine (ECC)
- External device/memory port interface

Figure 16-54. GPMC Block Diagram

The GPMC can access various external devices through the L3 Interconnect. The flexible programming model allows a wide range of attached device types and access schemes.

Based on the programmed configuration bit fields stored in the GPMC registers, the GPMC is able to generate all control signals timing depending on the attached device and access type.

Given the chip-select decoding and its associated configuration registers, the GPMC selects the appropriate device type control signals timing.

16.4.4.2 GPMC Clock Configuration

Table 16-220 describes the GPMC clocks.

Table 16-220. GPMC Clocks

| Signal | I/O ⁽¹⁾ | Description |
|-----------|--------------------|---|
| GPMC_FCLK | I | Functional and interface clock |
| gpmc_clk | O | External clock provided to synchronous external memory devices. |

⁽¹⁾ I = Input; O = Output

The gpmc_clk is generated by the GPMC from the internal GPMC_FCLK clock. The source of the GPMC_FCLK is described in [Table 16-218](#). The gpmc_clk is configured via the [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER field (for i = 0 to 7) as shown in [Table 16-221](#).

Table 16-221. gpmc_clk Configuration

| Source Clock | GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER | gpmc_clk Generated Clock Provided to External Memory Device |
|--------------|--|--|
| GPMC_FCLK | 00 | GPMC_FCLK |
| | 01 | GPMC_FCLK/2 |
| | 10 | GPMC_FCLK/3 |
| | 11 | GPMC_FCLK/4 |

16.4.4.3 GPMC Software Reset

The GPMC can be reset by software through the [GPMC_SYSCONFIG\[1\]](#) SOFTRESET bit. Setting the bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Hardware and software resets initialize all GPMC registers and the finite state-machine (FSM) immediately and unconditionally. The [GPMC_SYSSTATUS\[0\]](#) RESETDONE bit indicates that the software reset is complete when its value is 1. The software must ensure that the software reset completes before doing GPMC operations.

16.4.4.4 GPMC Power Management

GPMC power is supplied by the CORE power domain, and GPMC power management complies with system power-management guidelines.

[Table 16-222](#) describes power-management features available for the GPMC module.

NOTE:

- For information about source clock gating and sleep/wake-up transitions description, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.6, Clock Management Functional Description](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 16-222. GPMC Local Power Management Features

| Feature | Registers | Description |
|------------------------|---|---|
| Clock Auto Gating | GPMC_SYSCONFIG[0] AUTOIDLE bit | This bit allows a local power optimization inside the module, by gating the GPMC_FCLK clock upon the internal activity. |
| Slave Idle Modes | GPMC_SYSCONFIG[4:3] SIDLEMODE bit field | Force-idle, No-idle and Smart-idle wakeup modes are available |
| Clock Activity | N/A | Feature not available |
| Master Standby Modes | N/A | Feature not available |
| Global Wake-up Enable | N/A | Feature not available |
| Wake-up Sources Enable | N/A | Feature not available |

16.4.4.5 GPMC Interrupt Requests

The GPMC generates one interrupt event as shown in [Figure 16-53](#) :

- The interrupt request goes from GPMC (GPMC_IRQ) to the Cortex-A9 MPU subsystem : MA_IRQ_20 and to the DSP subsystem : D_IRQ_59.

[Table 16-223](#) lists the event flags, and their mask, that can cause module interrupts.

Table 16-223. GPMC Interrupt Events

| Event Flag | Event Mask | Sensitivity | Map to | Description |
|---|---|-------------|------------------------|---|
| GPMC_IRQSTATUS [10] WAIT2EDGE DETECTIONSTATUS | GPMC_IRQENABLE [10] WAIT2EDGE DETECTIONENABLE | Edge | D_IRQ_59 and MA_IRQ_20 | Wait2 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait2 signal. The rising or falling edge detection of Wait2 is selected through GPMC_CONFIG [10] WAIT2PINPOLARITY |
| GPMC_IRQSTATUS [9] WAIT1EDGE DETECTIONSTATUS | GPMC_IRQENABLE [9] WAIT1EDGE DETECTIONENABLE | Edge | D_IRQ_59 and MA_IRQ_20 | Wait1 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait1 signal. The rising or falling edge detection of Wait1 is selected through GPMC_CONFIG [9] WAIT1PINPOLARITY |
| GPMC_IRQSTATUS [8] WAIT0EDGE DETECTIONSTATUS | GPMC_IRQENABLE [8] WAIT0EDGE DETECTIONENABLE | Edge | D_IRQ_59 and MA_IRQ_20 | Wait0 edge detection interrupt: Triggered if a rising or falling edge is detected on the gpmc_wait0 signal. The rising or falling edge detection of Wait0 is selected through GPMC_CONFIG [8] WAIT0PINPOLARITY |
| GPMC_IRQSTATUS [1] TERMINAL COUNTSTATUS | GPMC_IRQENABLE [1] TERMINAL COUNTENABLE | Level | D_IRQ_59 and MA_IRQ_20 | Terminal count event: Triggered on prefetch process completion, that is when the number of currently remaining data to be requested reaches zero |
| GPMC_IRQSTATUS [0] FIFOEVENTSTATUS | GPMC_IRQENABLE [0] FIFOEVENTENABLE | Level | D_IRQ_59 and MA_IRQ_20 | FIFO event interrupt: Indicates FIFO levels availability for in Write-Posting mode and prefetch mode. GPMC_PREFETCH_CONFIG1 [2] DMAMODE shall be set to 0. |

16.4.4.6 GPMC DMA Requests

The GPMC generates one DMA event as shown in [Figure 16-53](#) :

- From GPMC (GPMC_DMA_REQ) to the system DMA (sDMA) : S_DMA_3.

16.4.4.7 L3 Interconnect Interface

The GPMC L3 interconnect interface is a pipelined interface including an 16 x 32-bit word write buffer.

Any system host can issue external access requests through the GPMC.

The device system can issue the following requests through this interface:

- One 8-bit / 16-bit / 32-bit interconnect access (read/write)
- Two incrementing 32-bit interconnect accesses (read/write)
- Two wrapped 32-bit interconnect accesses (read/write)
- Four incrementing 32-bit interconnect accesses (read/write)
- Four wrapped 32-bit interconnect accesses (read/write)
- Eight incrementing 32-bit interconnect accesses (read/write)
- Eight wrapped 32-bit interconnect accesses (read/write)

Only linear burst transactions are supported; interleaved burst transactions are not supported. Only power-of-two-length precise bursts 2 x 32, 4 x 32, 8 x 32 or 16 x 32 with the burst base address aligned on the total burst size are supported (this limitation applies to incrementing bursts only).

This interface also provides one interrupt and one DMA request line, for specific event control.

It is recommended to program the ATTACHEDDEVICEPAGELENGTH field ([GPMC_CONFIG1_i\[24:23\]](#)) according to the effective attached device page length and to enable WRAPBURST bit ([GPMC_CONFIG1_i\[31\]](#)) if the attached device supports wrapping burst.

However, it is possible to emulate wrapping burst on a non-wrapping memory by providing relevant addresses within the page or splitting transactions. Bursts larger than the memory page length are chopped into multiple bursts transactions. Due to the alignment requirements, a page boundary is never crossed.

16.4.4.8 GPMC Address and Data Bus

The current application supports GPMC connection to NAND devices and to address/data-multiplexed memories or devices. Connection to address/data-nonmultiplexed memories or devices is supported with a limited address range of 2 Kbytes.

Depending on the GPMC configuration of each chip-select, address and data bus lines that are not required for a particular access protocol are not updated (changed from current value) and are not sampled when input (input data bus).

- When the [GPMC_CONFIG\[1\]](#) LIMITEDADDRESS bit is set to 1, A26-A11 are not modified during an external memory access. This limits the memory address space to 2K-byte regardless of the memory size.
- For address/data-multiplexed and AAD-multiplexed NOR devices, the address is multiplexed on the data bus.
- 8-bit wide NOR devices do not use GPMC I/O: gpmc_ad[15:8] for data (they are used for address if needed).
- 16-bit wide NAND devices do not use GPMC I/O: gpmc_a[25:16].
- 8-bit wide NAND devices do not use GPMC I/O: gpmc_a[25:16] and GPMC I/O: gpmc_ad[15:8].

CAUTION

Before accessing a chip-select configured with a nonmultiplexed protocol, set the LIMITEDADDRESS bit control.

16.4.4.8.1 GPMC I/O Configuration Setting

NOTE: In this section and next sections, the *i* in GPMC_CONFIGx_i stands for the GPMC chip-select *i* where *i* = 0 to 7.

To select a NAND device, program the following register fields:

- [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE field = 0b10
- [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit = 0b00

To select an address/data-multiplexed device, program the following register fields:

- [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE field = 0b00
- [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit = 0b10

To select an address/address/data-multiplexed device, program the following register fields:

- [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE field = 0b00
- [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit = 0b01

To select an address/data-nonmultiplexed device (limited to a 2K-byte address range), program the following register fields:

- [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE field = 0b00
- [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit = 0b00
- [GPMC_CONFIG\[1\]](#) LIMITEDADDRESS bit = 1

NOTE: The [GPMC_CONFIG\[1\]](#) LIMITEDADDRESS bit only applies to address/data-nonmultiplexed devices; it has no effect on other device types (NAND, address/data-multiplexed).

16.4.4.8.2 GPMC CS0 Default Configuration at IC Reset

To ensure a correct external boot with a GPMC access from IC reset time on CS0, several external pins are sampled:

- The sys_boot[4:0] pins (device boundary) define the sequence of interfaces and devices to use for booting.
- The sys_boot[5] pin defines which group of booting sequences is preferred: memory booting (sys_boot[5] = 0) or peripheral booting (sys_boot[5] = 1).
- Additional pins are used to configure reset values in the [GPMC_CONFIG1_i](#) register (where i = 0) as detailed below and in [Table 16-224](#):
 - The *bootdevicesize* input pin (at the GPMC boundary) defines the size of the attached device on chip-select 0 and is used to configure the [GPMC_CONFIG1_i\[13:12\]](#) DEVICESIZE bits (where i = 0). The BOOT_DEVICE_TYPE signal is propagated from the system control module (SCM). Its value is fixed for the device at 0x1 at IC reset, which means that only 16-bit memories are supported for booting.
 - The *cs0muxdevice* input pin (at the GPMC boundary) selects whether the attached device to chip-select 0 is an address/data-multiplexed device or not. The input pin is used to configure the [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit (where i = 0). The CS0_MUX_DEVICE signal is propagated from the SCM. Its value is fixed for the device at 0x2 at IC reset, which means that only address/data-multiplexed memories are supported for booting (that is, in a standalone way from memories connected to CS0).
 - The *bootwaiten* input pin (at the GPMC boundary) enables the monitoring on chip-select 0 of the WAIT pin at IC reset release time for read accesses. The input pin is used to configure the [GPMC_CONFIG1_i\[22\]](#) WAITREADMONITORING bit (where i = 0). The BOOT_WAIT_ENABLE signal is propagated from the system control module (SCM). When sys_boot[5:0] = 0b11 1111, the BOOT_WAIT_ENABLE signal is activated, causing the wait pin to be monitored for read accesses.
 - The *bootwaitselect* input pin selects the WAIT signal at IC reset release time between WAIT0 input pin, WAIT1 input pin or WAIT2 input pin. At IC reset release time, these three pins have different polarity.

Table 16-224. Boot Control Interface Input Signals Description

| Signal Name | Width | Description |
|-----------------------|-------|--|
| <i>bootdevicesize</i> | 2 | Size of the device attached on CS0 0b00: 8-bit 0b01: 16-bit 0b10: Reserved 0b11: Reserved |
| <i>cs0muxdevice</i> | 2 | Multiplexing mode of the device on CS0 0b00: Nonmultiplexed device on CS0 0b01: AAD-multiplexed device on CS0 (address-address-data) 0b10: Address/Data-multiplexed device on CS0 0b11: Reserved |
| <i>bootwaiten</i> | 1 | Wait monitoring on CS0 at IC reset release time for read accesses 0: Wait pin is not monitored 1: Wait pin is monitored |
| <i>bootwaitselect</i> | 1 | Selection of the wait pin 0: WAIT0 input pin 1: WAIT1 input pin 2: WAIT2 input pin |

CAUTION

Using the internal boot code, the entire CS0 configuration can be modified before the first CS0 access. This modification of internal boot code is necessary for two external devices:

- NAND device attached to CS0
- Nonmultiplexed 2 Kbytes address range device attached to CS0

At reset time, the IC may boot from the internal ROM.

Reset values of the timing control parameters are defined to cope with direct boot on address and data multiplexed NOR Flash device, on non-multiplexed NOR Flash device or on any asynchronous device with large timing margins assuming a low GPMC_FCLK frequency (for example, 19.2Mhz) at boot time.

For a multiplexed access, the address 16 low-order bits are presented onto gpmc_ad[15:0] while the high-order bits are presented both onto gpmc_a[26:16]. If the external chip interface to the memories uses a 16-bit data bus, the high-order address bits are sampled on the address bus.

The reset values of timing parameters used at boot time are:

- CSONTIME = 1
- CSRDOFFTIME = 16
- ADVONTIME = 4
- ADVRDOFFTIME = 5
- OEONTIME = 6
- OEOFFTIME = 16
- RDACCESSTIME = 15
- RDCYCLETIME = 17

For an AAD-multiplexed access, all address bits are passed onto the data bus using two nADV rising edge. The first rising edge latches the address MSB down to bit 17 while the second rising edge latches address bits 16 down to 1. This configuration is only used for 16-bit memories.

The reset values of these timing parameters used at boot time are:

- ADVAADMUXONTIME = 1
- ADVAADMUXRDOFFTIME = 2
- OEAADMUXONTIME = 1
- OEAADMUXRDOFFTIME = 3

16.4.4.9 Address Decoder and Chip-Select Configuration

Addresses are decoded accordingly with the address request of the chip-select and the content of the chip-select base address register file, which includes a set of global GPMC configuration registers and eight sets of chip-select configuration registers.

The GPMC configuration register file is memory-mapped and can be read or written with byte, 16-bit word, or 32-bit word accesses. The register file should be configured as a noncacheable, nonbufferable region to prevent any desynchronization between host execution (write request) and the completion of register configuration (write completed with register updated). [Section 16.4.7, GPMC Register Manual](#) provides the GPMC register locations. For the map of GPMC memory locations, see [Chapter 2, Memory Mapping](#).

After the chip-select is configured, the access engine accesses the external device, drives the external interface control signals, and applies the interface protocol based on user-defined timing parameters and settings.

16.4.4.9.1 Chip-Select Base Address and Region Size

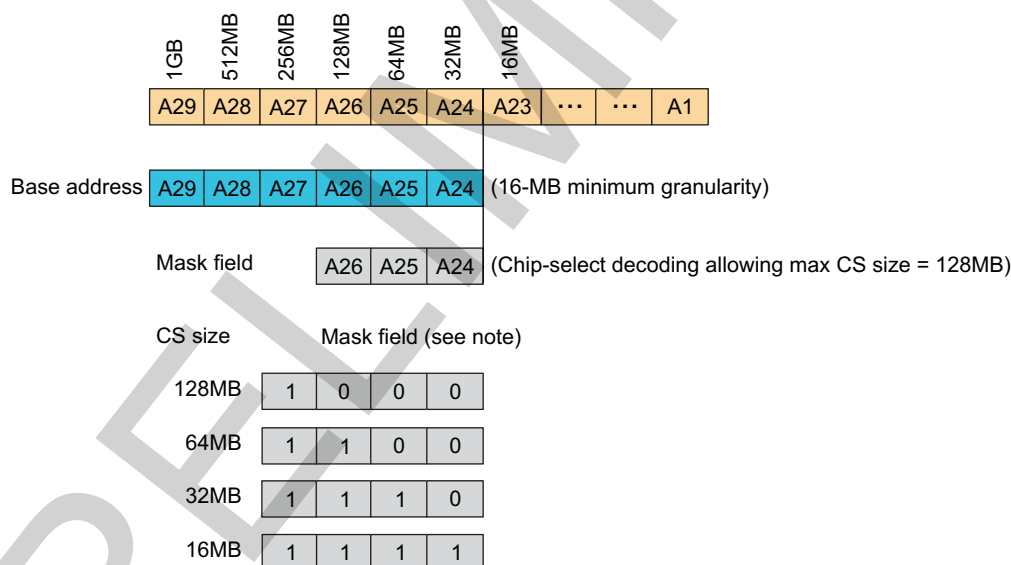

Any external memory or ASIC device attached to the GPMC external interface can be accessed by any device system host within the GPMC 1 Gbyte contiguous address space. For details, see [Chapter 2, Memory Mapping](#).

The GPMC 1G byte address space can be divided into a maximum of eight chip-select regions with programmable base address and programmable CS size. The CS size is programmable from 16M bytes to 128M bytes (must be a power-of-2) and is defined by the mask field. Attached memory smaller than the programmed CS region size is accessed through the entire CS region (aliasing).

Each chip-select has a 6-bit base address encoding and a 4-bit decoding mask, which must be programmed according to the following rules:

- The programmed chip-select region base address must be aligned on the chip-select region size address boundary and is limited to a power-of-2 address value. During access decoding, the register base address value is used for address comparison with the address-bit line mapping as described in [Figure 16-55](#) (with A0 as the device system byte-address line). Base address is programmed through the `GPMC_CONFIG7_i[5:0]` BASEADDRESS bit field
- The register mask is used to exclude some address lines from the decoding. A register mask bit field set to 0 suppresses the associated address line from the address comparison (incoming address bit line is don't care). The register mask value must be limited to the subsequent value, based on the desired chip-select region size. Any other value has an undefined result. When multiple chip-select regions with overlapping addresses are enabled concurrently, access to these chip-select regions is cancelled and a GPMC access error is posted. The mask field is programmed through the `GPMC_CONFIG7_i[11:8]` MASKADDRESS bit field.

Figure 16-55. Chip-Select Address Mapping and Decoding Mask

gpmc-006

Chip-select configuration (base and mask address or any protocol and timing settings) must be performed while the associated chip-select is disabled through the `GPMC_CONFIG7_i[6]` CSVALID bit (where *i* stands for the GPMC chip-select value, *i* = 0 to 7). In addition, a chip-select configuration can only be disabled if there is no ongoing access to that chip-select. This requires activity monitoring of the prefetch or write-posting engine if the engine is active on the chip-select. Also, the write buffer state must be monitored to wait for any posted write completion to the chip-select.

Any access attempted to a nonvalid GPMC address region (CSVALID disabled or address decoding outside a valid chip-select region) is not propagated to the external interface and a GPMC access error is posted. In case of chip-selects overlapping, an error is generated and no access will occur on either chip-select.

Chip-select 0 is the only chip-select region enabled after either a power-up or a GPMC reset.

CAUTION

Although the GPMC interface can drive up to 4 chip-selects, the frequency specified for this interface is for a specific load. If this load is exceeded, the maximum frequency cannot be reached. One solution is to implement a board with buffers, to allow the slowest device to maintain the total load on the lines.

16.4.4.9.2 Access Protocol

16.4.4.9.2.1 Supported Devices

The access protocol of each chip-select can be independently specified through the [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE parameter (where i = 0 to 7) for:

- Random-access synchronous or asynchronous memory like NOR flash, SRAM
- NAND flash asynchronous devices

NOTE: For more information about the NAND flash GPMC basic programming model and NAND support, see [Section 16.4.4.13](#), *NAND Device Basic Programming Model*, and [Section 16.4.4.13.1](#), *NAND Memory Device in Byte or Word 16 Stream Mode*.

16.4.4.9.2.2 Access Size Adaptation and Device Width

Each chip-select can be independently configured through the [GPMC_CONFIG1_i\[13:12\]](#) DEVICESIZE field (i = 0 to 7) to interface with a 16-bit wide device or an 8-bit wide device. System requests with data width greater than the external device data bus width are split into successive accesses according to both the external device data-bus width and little-endian data organization.

NOTE: The device does not provide the A0 byte address line required for random-byte addressable 8-bit wide device interfacing (for both multiplexed and nonmultiplexed protocol). It limits the use of 8-bit wide device interfacing to byte-alias accesses. This limitation is not applicable to NAND device interfacing (8-bit wide or 16-bit wide devices).

16.4.4.9.2.3 Address/Data-Multiplexing Interface

For random synchronous or asynchronous memory interfacing (DEVICETYPE = 0b00), an address- and data-multiplexing protocol can be selected through the [GPMC_CONFIG1_i\[9:8\]](#) MUXADDDATA bit field (i = 0 to 7). The nADV signal must be used as the external device address latch control signal. For the associated chip-select configuration, nADV assertion and deassertion time and nOE assertion time must be set to the appropriate value to meet the address latch setup/hold time requirements of the external device. See [Section 16.4.3](#), *GPMC Integration*.

NOTE: This address/data-multiplexing interface is not applicable to NAND device interfacing. NAND devices require a specific address, command, and data multiplexing protocol. See [Section 16.4.4.13](#), *NAND Device Basic Programming Model*.

16.4.4.9.3 External Signals

16.4.4.9.3.1 WAIT Pin Monitoring Control

GPMC access time can be dynamically controlled using an external gpmc_wait pin when the external device access time is not deterministic and cannot be defined and controlled only using the GPMC internal RDACCESSTIME, WRACCESSTIME and PAGEBURSTACCESSTIME wait state generator.

The GPMC features three input wait pins: gpmc_wait2, gpmc_wait1 and gpmc_wait0. These pins allow control of external devices with different wait-pin polarity. They also allow the overlap of wait-pin assertion from different devices without affecting access to devices for which the wait pin is not asserted.

- The [GPMC_CONFIG1_i\[17:16\]](#) WAITPINSELECT field (i = 0 to 7) selects which input gpmc_wait pin is used for the device attached to the corresponding chip-select.
- The polarity of the wait pin is defined through the WAITxPINPOLARITY bit of the [GPMC_CONFIG](#) register. A wait pin configured to be active low means that low level on the WAIT signal indicates that the data is not ready and that the data bus is invalid. When WAIT is inactive, data is valid.

The GPMC access engine can be configured per CS to monitor the wait pin of the external memory device or not, based on the access type: read or write.

- The [GPMC_CONFIG1_i\[22\]](#) WAITREADMONITORING bit defines whether the wait pin should be monitored during read accesses or not.
- The [GPMC_CONFIG1_i\[21\]](#) WAITWRITEMONITORING bit defines whether the wait pin should be monitored during write accesses or not.

The GPMC access engine can be configured to monitor the wait pin of the external memory device asynchronously or synchronously with the GPMC_CLK clock, depending on the access type: synchronous or asynchronous (the [GPMC_CONFIG1_i\[29\]](#) READTYPE and [GPMC_CONFIG1_i\[27\]](#) WRITETYPE bits).

16.4.4.9.3.1.1 Wait Monitoring During an Asynchronous Read Access

When wait-pin monitoring is enabled for read accesses (WAITREADMONITORING), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the wait-deasserted state.

During asynchronous read accesses with wait-pin monitoring enabled, the wait pin must be at a valid level (asserted or deasserted) for at least two GPMC clock cycles before RDACCESSTIME completes, to ensure correct dynamic access-time control through wait-pin monitoring. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

In this context, RDACCESSTIME is used as a WAIT invalid timing window and is set to such a value that the wait pin is at a valid state two GPMC clock cycles before RDACCESSTIME completes.

Similarly, during a multiple-access cycle (for example, asynchronous read page mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-deasserted state. Wait-monitoring pipelining is also applicable to multiple accesses (access within a page).

- WAIT monitored as active freezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as asserted extends the current access time in the page. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For an access within a page, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as inactive completes the current access time and starts the next access phase in the page. The data bus is considered valid, and data are captured during this clock cycle. In case of a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their related control timing value and according to the CYCLETIME counter status.

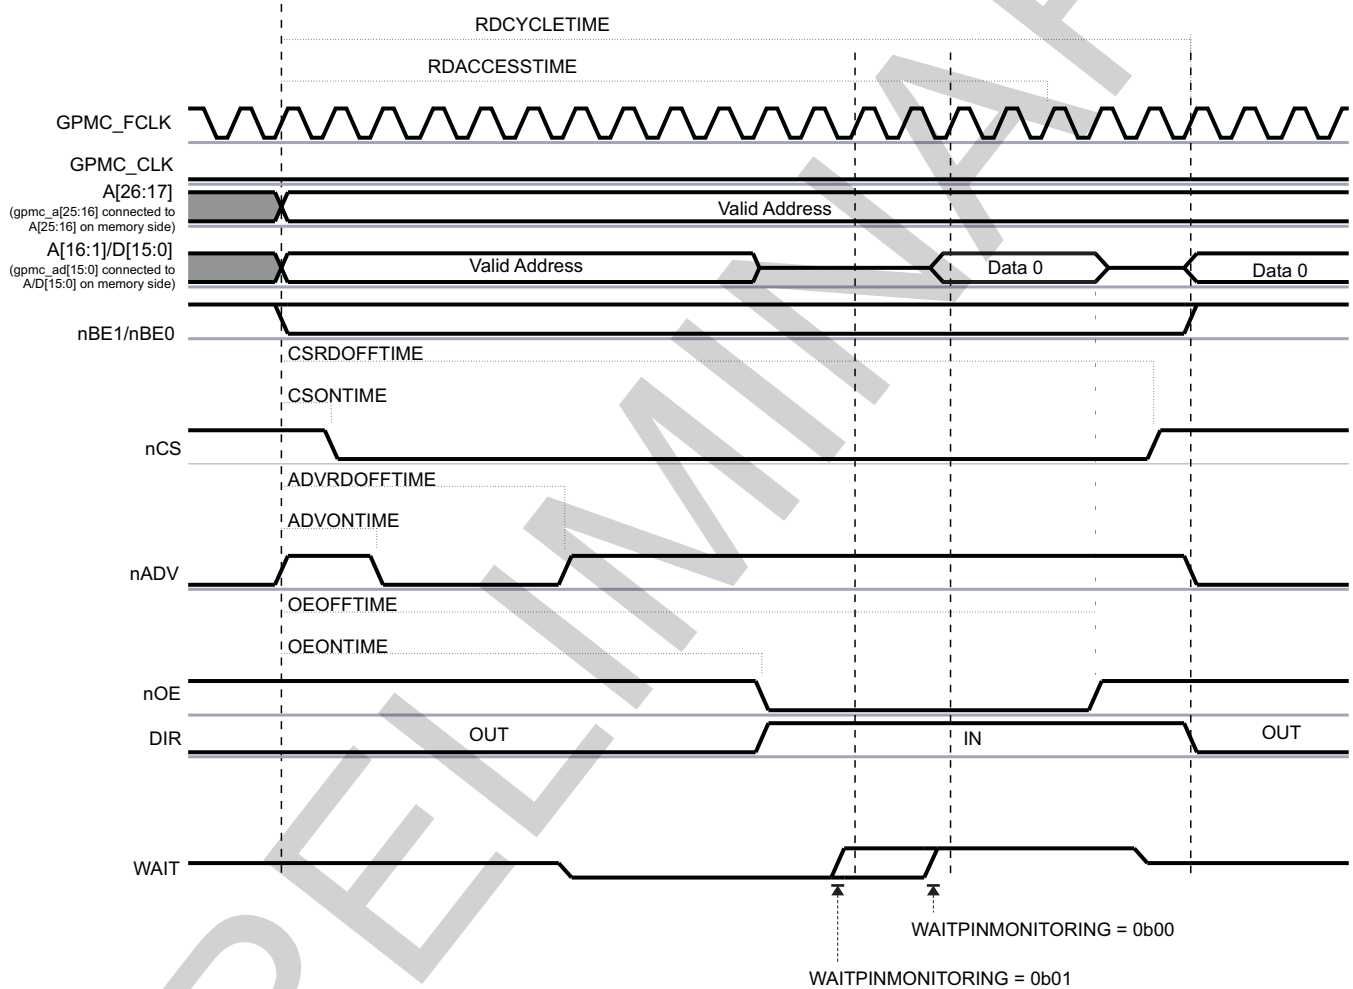

When a delay larger than two GPMC clocks must be observed between wait-pin deactivation time and data valid time (including the required GPMC and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data-capture time and the effective unlock of the CYCLETIME counter. This extra delay can be programmed in the [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME field (i = 0 to 7).

NOTE:

- The WAITMONITORINGTIME parameter does not delay the wait-pin active or inactive detection, nor does it modify the two GPMC clocks pipelined detection delay.
- This extra delay is expressed as a number of GPMC_CLK clock cycles, even though the access is defined as asynchronous, and no GPMC_CLK clock is provided to the external device. Still, GPMCFCLKDIVIDER is used as a divider for the GPMC clock, so it must be programmed to define the correct WAITMONITORINGTIME delay.

Figure 16-56 shows wait behavior during an asynchronous single read access.

Figure 16-56. Wait Behavior During an Asynchronous Single Read Access (GPMCFCLKDivider = 1)

gpmc-008

NOTE: The WAIT signal is active low. [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME = 0b00, or 0b01.

16.4.4.9.3.1.2 Wait Monitoring During an Asynchronous Write Access

When wait-pin monitoring is enabled for write accesses ([GPMC_CONFIG1_i\[21\]](#) WAITWRITEMONITORING bit = 0x1), the WAIT-invalid timing window is defined by the WRACCESSTIME field. WRACCESSTIME must be set so that the wait pin is at a valid state two GPMC clock cycles before WRACCESSTIME completes. The advance pipelining of the two GPMC clock cycles is the result of the internal synchronization requirements for the WAIT signal.

- WAIT monitored as active freezes the CYCLETIME counter. This informs the GPMC that the data bus is not captured by the external device. The control signals are kept in their current state. The data bus still drives the data.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. This informs that the data bus is correctly captured by the external device. All signals, including the data bus, are controlled according to their related control timing value and to the CYCLETIME counter status.

When a delay larger than two GPMC clock cycles must be observed between wait-pin deassertion time and the effective data write into the external device (including the required GPMC data setup time and the device data setup time), an extra delay can be added between wait-pin deassertion time detection and effective data write time into the external device and the effective unfreezing of the CYCLETIME counter. This extra delay can be programmed in the [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME fields ($i = 0$ to 7).

NOTE:

- The WAITMONITORINGTIME parameter does not delay the wait-pin assertion or deassertion detection, nor does it modify the two GPMC clock cycles pipelined detection delay.
- This extra delay is expressed as a number of GPMC_CLK clock cycles, even though the access is defined as asynchronous, and even though no clock is provided to the external device. Still, [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER is used as a divider for the GPMC clock and so it must be programmed to define the correct WAITMONITORINGTIME delay.

16.4.4.9.3.1.3 Wait Monitoring During a Synchronous Read Access

During synchronous accesses with wait-pin monitoring enabled, the wait pin is captured synchronously with GPMC_CLK, using the rising edge of this clock.

The WAIT signal can be programmed to apply to the same clock cycle it is captured in. Alternatively, it can be sampled one or two GPMC_CLK cycles ahead of the clock cycle it applies to. This pipelining is applicable to the entire burst access, and to all data phase in the burst access. This WAIT pipelining depth is programmed in the [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME field (where $i = 0$ to 7), and is expressed as a number of GPMC_CLK clock cycles.

In synchronous mode, when wait-pin monitoring is enabled ([GPMC_CONFIG1_i\[22\]](#) WAITREADMONITORING bit), the effective access time is a logical AND combination of the RDACCESSTIME timing completion and the WAIT deasserted-state detection.

Depending on the programmed WAITMONITORINGTIME value, the wait pin should be at a valid level, either asserted or deasserted:

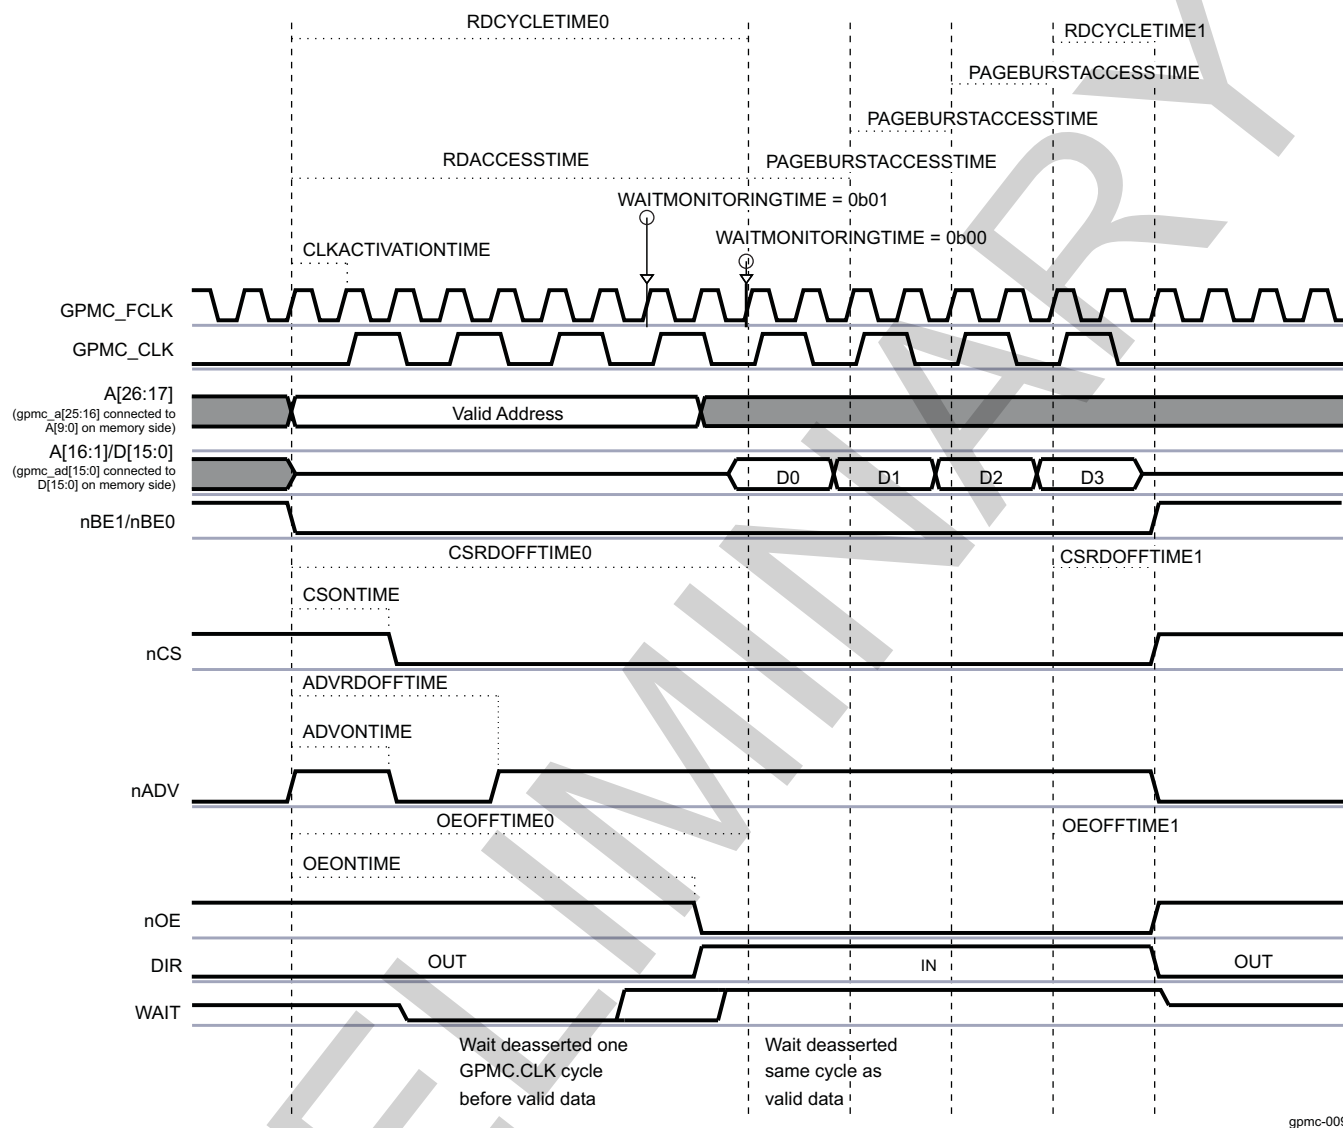

- In the same clock cycle the data is valid if WAITMONITORINGTIME = 0 (at RDACCESSTIME completion)
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC_FCLK clock cycles before RDACCESSTIME completion if WAITMONITORINGTIME not equal to 0

Similarly, during a multiple-access cycle (burst mode), the effective access time is a logical AND combination of PAGEBURSTACCESSTIME timing completion and the wait-inactive state. The Wait pipelining depth programming applies to the whole burst access.

- WAIT monitored as active freezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in a lock state), WAIT monitored as active extends the current access time in the burst. Control signals are kept in their current state. The data bus is considered invalid, and no data are captured during this clock cycle.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For an access within a burst (when the CYCLETIME counter is by definition in lock state), WAIT monitored as inactive completes the current access time and starts the next access phase in the burst. The data bus is considered valid, and data are captured during this clock cycle. In a single access or if this was the last access in a multiple-access cycle, all signals are controlled according to their relative control timing value and the CYCLETIME counter status.

Figure 16-57 shows wait behavior during a synchronous read burst access.

Figure 16-57. Wait Behavior During a Synchronous Read Burst Access

NOTE: The WAIT signal is active low. WAITMONITORINGTIME = 00, 01.

16.4.4.9.3.1.4 Wait Monitoring During a Synchronous Write Access

During synchronous accesses with wait-pin monitoring enabled (the WAITWRITEMONITORING bit), the wait pin is captured synchronously with GPMC_CLK, using the rising edge of this clock.

If enabled, external wait-pin monitoring can be used in combination with WRACCESSTIME to delay the effective memory device GPMC_CLK capture edge.

Wait-monitoring pipelining depth is similar to synchronous read access:

- At WRACCESSTIME completion if WAITMONITORINGTIME = 0
- In the WAITMONITORINGTIME x (GPMCFCLKDIVIDER + 1) GPMC_FCLK cycles before WRACCESSTIME completion if WAITMONITORINGTIME not equal to 0.

Wait-monitoring pipelining definition applies to whole burst accesses:

- WAIT monitored as active freezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as active indicates that the data bus is not being captured by the external device. Control signals are kept in their current state. The data bus is kept in its current state.
- WAIT monitored as inactive unfreezes the CYCLETIME counter. For accesses within a burst, when the CYCLETIME counter is by definition in a lock state, WAIT monitored as inactive indicates the effective data capture of the bus by the external device and starts the next access of the burst. In case of a single access or if this was the last access in a multiple access cycle, all signals, including the data bus, are controlled according to their related control timing value and the CYCLETIME counter status.

NOTE: Wait monitoring is supported for all configurations except for [GPMC_CONFIG1_i\[19:18\]](#) WAITMONITORINGTIME = 0x0 (where i = 0 to 7) for write bursts with a clock divider of 1 or 2 ([GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER field equal to 0x0 or 0x1 respectively).

16.4.4.9.3.1.5 WAIT with NAND Device

For details about the use of the wait pin for communication with a NAND flash external device, see [Section 16.4.4.13.2, NAND Device-Ready Pin](#).

16.4.4.9.3.1.6 Idle Cycle Control Between Successive Accesses

16.4.4.9.3.1.6.1 Bus Turnaround (BUSTURNAROUND)

To prevent data-bus contention, an access that follows a read access to a slow memory/device must be delayed (in other words, control the nCS/nOE de-assertion to data bus in high-impedance delay).

The bus turnaround is a time-out counter starting after nCS or nOE de-assertion time, whichever occurs first, and delays the next access start-cycle time. The counter is programmed through the [GPMC_CONFIG6_i\[3:0\]](#) BUSTURNAROUND bit field (where i = 0 to 7).

After a read access to a chip-select with a non zero BUSTURNAROUND, the next access is delayed until the BUSTURNAROUND delay completes, if the next access is one of the following:

- A write access to any chip-select (same or different from the chip-select data was read from)
- A read access to a different chip-select from the chip-select data was read access from
- A read or write access to a chip-select associated with an address/data-multiplexed device

NOTE: Bus keeping starts after bus turnaround completion so that DIR changes from IN to OUT after bus turnaround. The bus will not have enough time to go into high-impedance even though it could be driven with the same value before bus turnaround timing.

BUSTURNAROUND delay runs in parallel with [GPMC_CONFIG6_i\[3:0\]](#) CYCLE2CYCLEDELAY delays. It should be noted that BUSTURNAROUND is a timing parameter for the ending chip-select access while CYCLE2CYCLEDELAY is a timing parameter for the following chip-select access. The effective minimum delay between successive accesses is driven by these delay timing parameters and by the access type of the following access. See [Figure 16-58](#) to [Figure 16-60](#).

Another way to prevent bus contention is to define an earlier nCS or nOE deassertion time for slow devices or to extend the value of RDCYCLETIME. Doing this prevents bus contention, but affects all accesses of this specific chip-select.

Figure 16-58. Read to Read for an Address-Data Multiplexed Device, on Different CS, without Bus Turnaround (nCS0 attached to a fast device)

gpmc-049

Figure 16-59. Read to Read / Write for an Address-Data Multiplexed Device, on Different CS, with Bus Turnaround

gpmc-050

Figure 16-60. Read to Read / Write for a Address-Data or AAD-multiplexed device, on the Same CS, with Bus Turnaround

16.4.4.9.3.1.6.2 Idle Cycles Between Accesses to Same Chip-Select (CYCLE2CYCLESAMEECSEN, CYCLE2CYCLEDELAY)

Some devices require a minimum chip-select signal inactive time between accesses. The [GPMC_CONFIG6_i\[7\]](#) CYCLE2CYCLESAMEECSEN bit ($i = 0$ to 7) enables insertion of a minimum number of GPMC_FCLK cycles, defined by the [GPMC_CONFIG6_i\[11:8\]](#) CYCLE2CYCLEDELAY field, between successive accesses of any type (read or write) to the same chip-select.

If CYCLE2CYCLESAMEECSEN is enabled, any subsequent access to the same chip-select is delayed until its CYCLE2CYCLEDELAY completes. The CYCLE2CYCLEDELAY counter starts when CSRDOFFTIME/CSWROFFTIME completes.

The same applies to successive accesses occurring during 32-bit word or burst accesses split into successive single accesses when the single-access mode is used ([GPMC_CONFIG1_i\[30\]](#) READMULTIPLE = 0 or [GPMC_CONFIG1_i\[28\]](#) WRITEMULTIPLE = 0).

All control signals (CS, ADV#/ALE, BE0#/CLE, WE#, and GPMC.CLK) are kept inactive (ADV#/ALE, BE0#/CLE, and GPMC.CLK at low level; and CS, OE#/RE, and WE at high level) during the idle GPMC_FCLK cycles. This prevents back-to-back accesses to the same chip-select without idle cycles between accesses.

16.4.4.9.3.1.6.3 Idle Cycles Between Accesses to Different Chip-Select (CYCLE2CYCLEDIFFECSEN, CYCLE2CYCLEDELAY)

Because of the pipelined behavior of the system, successive accesses to different chip-selects can occur back-to-back with no idle cycles between accesses. Depending on the control signals (nCS , $nADV/ALE$, $nBE0/CLE$, nOE/RE , nWE) assertion and de-assertion timing parameters and on the IC timing parameters, some control signals assertion times may overlap between the successive accesses to different CS. Similarly, some control signals (WE, OE/RE) may not respect required transition times.

To work around the overlapping and to observe the required control-signal transitions, a minimum of CYCLE2CYCLEDELAY inactive cycles is inserted between the access being initiated to this chip-select and the previous access ending for a different chip-select. This applies to any type of access (read or write).

If [GPMC_CONFIG6_i\[6\]](#) CYCLE2CYCLEDIFFCSEN is enabled, the chip-select access is delayed until CYCLE2CYCLEDELAY cycles have expired since the end of a previous access to a different chip-select. CYCLE2CYCLEDELAY count starts at CSRDOFFTIME/CSWROFFTIME completion. All control signals are kept inactive during the idle GPMC_FCLK cycles.

NOTE: CYCLE2CYCLESAMECSEN and CYCLE2CYCLEDIFFCSEN should be set in [GPMC_CONFIG6_i](#) registers to respectively get idle cycles inserted between accesses on this chip-select and after accesses to a different chip-select.

The CYCLE2CYCLEDELAY delay runs in parallel with the BUSTURNAROUND delay. It should be noted that BUSTURNAROUND is a timing parameter defined for the ending chip-select access, whereas CYCLE2CYCLEDELAY is a timing parameter defined for the starting chip-select access. The effective minimum delay between successive accesses is based on the larger delay timing parameter and on access type combination, since bus turnaround does not apply to all access types. See [Section 16.4.4.9.3.1.6.1, Bus Turnaround \(BUSTURNAROUND\)](#) for more details on bus turnaround.

[Table 16-225](#) describes the configuration required for idle cycle insertion.

Table 16-225. Idle Cycle Insertion Configuration

| 1st Access Type | BUSTURN AROUND Timing Parameter | Second Access Type | Chip-Select | Add/Data Multiplexed | CYCLE2 CYCLE SAMECSEN Parameter | CYCLE2 CYCLE DIFFCSEN Parameter | Idle Cycle Insertion Between the Two Accesses |
|-----------------|---------------------------------|--------------------|-------------|----------------------|---------------------------------|---------------------------------|--|
| R/W | = 0 | R/W | Any | Any | 0 | x | No idle cycles are inserted if the two accesses are well pipelined. |
| R | 0 | R | Same | Nonmuxed | x | 0 | No idle cycles are inserted if the two accesses are well pipelined. |
| R | 0 | R | Different | Nonmuxed | 0 | 0 | BUSTURNAROUND cycles are inserted. |
| R | 0 | R/W | Any | Muxed | 0 | 0 | BUSTURNAROUND cycles are inserted. |
| R | 0 | W | Any | Any | 0 | 0 | BUSTURNAROUND cycles are inserted. |
| W | 0 | R/W | Any | Any | 0 | 0 | No idle cycles are inserted if the two accesses are well pipelined. |
| R/W | = 0 | R/W | Same | Any | 1 | x | CYCLE2CYCLEDELAY cycles are inserted. |
| R/W | = 0 | R/W | Different | Any | x | 1 | CYCLE2CYCLEDELAY cycles are inserted. |
| R/W | 0 | R/W | Same | Any | 1 | x | CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is max (BUSTURNAROUND, CYCLE2CYCLEDELAY). |
| R/W | 0 | R/W | Different | Any | x | 1 | CYCLE2CYCLEDELAY cycles are inserted. If BTA idle cycles already apply on these two back-to-back accesses, the effective delay is maximum (BUSTURNAROUND, CYCLE2CYCLEDELAY). |

16.4.4.9.3.1.7 Slow Device Support (TIMEPARAGRANULARITY Parameter)

All access-timing parameters can be multiplied by 2 by setting the [GPMC_CONFIG1_i\[4\]](#) TIMEPARAGRANULARITY bit (where i stands for the GPMC chip-select value, i = 0 to 7). Increasing all access timing parameters allows support of slow devices.

16.4.4.9.3.2 *gpmc_io_dir Pin*

The `gpmc_io_dir` pin is used to control I/O direction on the GPMC data bus `gpmc_ad[15:0]`. Depending on top-level pad multiplexing, this signal can be output and used externally to the device, if required.

The `gpmc_io_dir` pin is low during transmit (OUT) and high during receive (IN).

For write accesses, the `gpmc_io_dir` pin stays OUT from start-cycle time to end-cycle time.

For read accesses, the `gpmc_io_dir` pin goes from OUT to IN at `nOE` assertion time and stays IN until:

- BUSTURNAROUND is enabled:
 - The `gpmc_io_dir` pin goes from IN to OUT at end-cycle time plus programmable bus turnaround time.
- BUSTURNAROUND is disabled:
 - After an asynchronous read access, the `gpmc_io_dir` pin goes from IN to OUT at `RDACCESSTIME + 1 GPMC_FCLK` cycle or when `RDCYCLETIME` completes, whichever occurs last.
 - After a synchronous read access, the `gpmc_io_dir` pin goes from IN to OUT at `RDACCESSTIME + 2 GPMC_FCLK` cycles or when `RDCYCLETIME` completes, whichever occurs last.

Because of the bus-keeping feature of the GPMC, after a read or write access and with no other accesses pending, the default value of the `gpmc_io_dir` pin is OUT (see [Section 16.4.4.10.10, Bus Keeping Support](#)).

In nonmultiplexed devices, the `gpmc_io_dir` pin stays IN between two successive read accesses to prevent unnecessary toggling (nonmultiplexed 16-bit wide devices support is limited to 2 Kbytes).

16.4.4.9.3.3 *Reset*

No reset signal is sent to the external memory device by the GPMC. For more information about external-device reset, see [Chapter 3, Power, Reset, and Clock Management](#).

The PRCM module provides an input pin, `global_rst_n`, to the GPMC:

- The `global_rst_n` pin is activated during device warm reset and cold reset.
- The `global_rst_n` pin initializes the internal state-machine and the internal configuration registers.

16.4.4.9.3.4 *Write Protect Signal (nWP)*

When connected to the attached memory device, the write protect signal can enable or disable the lockdown function of the attached memory.

The `gpmc_nwp` output pin value is controlled through the `GPMC_CONFIG[4]` WRITEPROTECT bit, which is common to all CS.

16.4.4.9.3.5 *Byte Enable (nBE1/nBE0)*

Byte enable signals (`nBE1/nBE0`) are:

- Valid (asserted or nonasserted according to the incoming system request) from access start to access completion for asynchronous and synchronous single accesses
- Asserted low from access start to access completion for asynchronous and synchronous multiple read accesses
- Valid (asserted or nonasserted, according to the incoming system request) synchronously to each written data for synchronous multiple write accesses

16.4.4.9.4 *Error Handling*

When an error occurs in the GPMC, the error information is stored in the `GPMC_ERR_TYPE` register and the address of the illegal access is stored in the `GPMC_ERR_ADDRESS` register. The GPMC only keeps the first error abort information until the `GPMC_ERR_TYPE` register is reset. Subsequent accesses that cause errors are not logged until the error is cleared by hardware with the `GPMC_ERR_TYPE[0]` ERRORVALID bit.

- **ERRORNOTSUPPADD** occurs when an incoming system request address decoding does not match any valid chip-select region, or if two chip-select regions are defined as overlapped, or if a register file access is tried outside the valid address range of 1 Kbyte.
- **ERRORNOTSUPPMCMD** occurs when an unsupported command request is decoded at the L3 interconnect interface.
- **ERRORTIMEOUT**: A time-out mechanism prevents the system from hanging. The start value of the 9-bit time-out counter is defined in the [GPMC_TIMEOUT_CONTROL](#) register and enabled with the [GPMC_TIMEOUT_CONTROL\[0\] TIMEOUTENABLE](#) bit. When enabled, the counter starts at start-cycle time until it reaches 0 and data is not responded to from memory, then a time-out error occurs. When data are sent from memory, this counter is reset to its start value. With multiple accesses (asynchronous page mode or synchronous burst mode), the counter is reset to its start value for each data access within the burst.

The GPMC does not generate interrupts on these errors. True abort to the MPU or interrupt generation is handled at interconnect level.

16.4.4.10 Timing Setting

The GPMC offers the maximum flexibility to support various access protocols. Most of the timing parameters of the protocol access used by the GPMC to communicate with attached memories or devices are programmable on a chip-select basis. Assertion and deassertion times of control signals are defined to match the attached memory or device timing specifications and to get maximum performance during accesses. For more information on GPMC_CLK and GPMC_FCLK see [Section 16.4.4.10.6, GPMC_CLK](#).

NOTE: In the following sections, the start access time refer to the time at which the access begins.

16.4.4.10.1 Read Cycle Time and Write Cycle Time (RDCYCLETIME / WRCYCLETIME)

The [GPMC_CONFIG5_i\[4:0\] RDCYCLETIME](#) and [GPMC_CONFIG5_i\[12:8\] WRCYCLETIME](#) fields ($i = 0$ to 7) define the address bus and byte enables valid times for read and write accesses. To ensure a correct duty cycle of GPMC_CLK between accesses, RDCYCLETIME and WRCYCLETIME are expressed in GPMC_FCLK cycles and must be multiples of the GPMC_CLK cycle. RDCYCLETIME and WRCYCLETIME bit fields can be set with a granularity of 1 or 2 through [GPMC_CONFIG1_i\[4\] TIMEPARAGRANULARITY](#).

When either RDCYCLETIME or WRCYCLETIME completes, if they are not already deasserted, all control signals (nCS, nADV/ALE, nOE/RE, nWE, and BE0/CLE) are deasserted to their reset values, regardless of their deassertion time parameters.

An exception to this forced deassertion occurs when a pipelined request to the same chip-select or to a different chip-select is pending. In such a case, it is not necessary to deassert a control signal with deassertion time parameters equal to the cycle-time parameter. This exception to forced deassertion prevents any unnecessary glitches. This requirement also applies to BE signals, thus avoiding an unnecessary BE glitch transition when pipelining requests.

NOTE: All control signals (CS, ADV#/ALE, BE0#/CLE, WE#, and GPMC.CLK) are kept inactive (ADV#/ALE, BE0#/CLE, and GPMC.CLK at low level; and CS, OE#/RE, and WE at high level) during the idle GPMC.FCLK cycles.

If no inactive cycles are required between successive accesses to the same or to a different chip-select ([GPMC_CONFIG6_i\[7\] CYCLE2CYCLESAMECSSEN = 0](#) or [GPMC_CONFIG6_i\[6\] CYCLE2CYCLEDIFFCSSEN = 0](#), where $i = 0$ to 7), and if assertion-time parameters associated with the pipelined access are equal to 0, asserted control signals (nCS, nADV/ALE, nBE0/CLE, nWE, and nOE/RE) are kept asserted. This applies to any read/write to read/write access combination.

If inactive cycles are inserted between successive accesses, that is, [CYCLE2CYCLESAMECSSEN = 1](#) or [CYCLE2CYCLEDIFFCSSEN = 1](#), the control signals are forced to their respective default reset values for the number of GPMC_FCLK cycles defined in [CYCLE2CYCLEDELAY](#).

16.4.4.10.2 nCS: Chip-Select Signal Control Assertion/Deassertion Time (CSONTIME / CSRDOFFTIME / CSWROFFTIME / CSEXTRADELAY)

The [GPMC_CONFIG2_i\[3:0\]](#) CSONTIME field (where i = 0 to 7) defines the nCS signal-assertion time relative to the start access time. It is common for read and write accesses.

[GPMC_CONFIG2_i\[12:8\]](#) CSRDOFFTIME (read access) and [GPMC_CONFIG2_i\[20:16\]](#) CSWROFFTIME (write access) bit fields define the nCS signal deassertion time relative to start access time.

CSONTIME, CSRDOFFTIME and CSWROFFTIME parameters are applicable to synchronous and asynchronous modes. CSONTIME can be used to control an address and byte enable setup time before chip-select assertion. CSRDOFFTIME and CSWROFFTIME can be used to control an address and byte enable hold time after chip-select deassertion.

nCS signal transitions as controlled through CSONTIME, CSRDOFFTIME, and CSWROFFTIME can be delayed by half a GPMC_FCLK period by enabling the [GPMC_CONFIG2_i\[7\]](#) CSEXTRADELAY bit. This half of a GPMC_FCLK period provides more granularity on the nCS assertion and deassertion time to guarantee proper setup and hold time relative to GPMC_CLK. CSEXTRADELAY is especially useful in configurations where GPMC_CLK and GPMC_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, CSEXTRADELAY applies to all parameters controlling nCS transitions.

The CSEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than the nCS signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

16.4.4.10.3 nADV/ALE: Address Valid/Address Latch Enable Signal Control Assertion/Deassertion Time (ADVONTIME / ADVRDOFFTIME / ADVWROFFTIME / ADVEXTRADELAY/ADVAADMUXONTIME/ADVAADMUXRDOFFTIME/ADVAADMUXWROFFTIME)

The [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME field (where i = 0 to 7) defines the nADV/ALE signal-assertion time relative to start access time. It is common to read and write accesses.

[GPMC_CONFIG3_i\[12:8\]](#) ADVRDOFFTIME (read access) and [GPMC_CONFIG3_i\[20:16\]](#) ADVWROFFTIME (write access) bit fields define the nADV/ALE signal-deassertion time relative to start access time.

ADVONTIME can be used to control an address and byte enable valid setup time control before nADV/ALE assertion. ADVRDOFFTIME and ADVWROFFTIME can be used to control an address and byte enable valid hold time control after nADV/ALE de-assertion. ADVRDOFFTIME and ADVWROFFTIME are applicable to both synchronous and asynchronous modes.

nADV/ALE signal transitions as controlled through ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME can be delayed by half a GPMC_FCLK period by enabling the [GPMC_CONFIG3_i\[7\]](#) ADVEXTRADELAY bit. This half of a GPMC_FCLK period provides more granularity on nADV/ALE assertion and deassertion time to guarantee proper setup and hold time relative to GPMC_CLK. The ADVEXTRADELAY configuration parameter is especially useful in configurations where GPMC_CLK and GPMC_FCLK have the same frequency, but can be used for all GPMC configurations. If enabled, ADVEXTRADELAY applies to all parameters controlling nADV/ALE transitions.

ADVEXTRADELAY must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the RDCYCLETIME and WRCYCLETIME bit fields to be greater than nADV/ALE signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

[GPMC_CONFIG3_i\[6:4\]](#) ADVAADMUXONTIME, [GPMC_CONFIG3_i\[26:24\]](#) ADVAADMUXRDOFFTIME, and [GPMC_CONFIG3_i\[30:28\]](#) ADVAADMUXWROFFTIME parameters have the same functions as ADVONTIME, ADVRDOFFTIME, and ADVWROFFTIME, but apply to the first address phase in the AAD-multiplexed protocol. It is the user responsibility to make sure ADVAADMUXxxOFFTIME is programmed to a value lower than or equal to ADVxxOFFTIME. Functionality in AAD-mux mode is undefined if the settings do not comply with this requirement. ADVAADMUXxxOFFTIME can be programmed to the same value as ADVONTIME if no high nADV pulse is needed between the two AAD-mux address phases, which is the typical case in synchronous mode. In this configuration, nADV is kept low until it reaches the correct ADVxxOFFTIME.

See [Section 16.4.4.13](#), *NAND Access Description* for more details on ADVONTIME, ADVRDOffTIME, ADVWROffTIME, and ADVAADMUXRDOffTIME, ADVAADMUXWROffTIME usage for CLE and ALE (Command / Address Latch Enable) usage for a NAND Flash interface.

16.4.4.10.4 nOE/nRE: Output Enable / Read Enable Signal Control Assertion / Deassertion Time (OEONTIME / OEOFFTIME / OEEXTRADELAY / OEAADMUXONTIME / OEAADMUXOFFTIME)

The [GPMC_CONFIG4_i\[3:0\]](#) OEONTIME field (where i = 0 to 7) defines the nOE/nRE signal assertion time relative to start access time. It is applicable only to read accesses.

The [GPMC_CONFIG4_i\[12:8\]](#) OEOFFTIME field defines the nOE/nRE signal deassertion time relative to start access time. It is applicable only to read accesses. nOE/nRE is not asserted during a write cycle.

OEONTIME, OEOFFTIME, OEAADMUXONTIME and OEAADMUXOFFTIME parameters are applicable to synchronous and asynchronous modes. OEONTIME can be used to control an address and byte enable valid setup time control before nOE/nRE assertion. OEOFFTIME can be used to control an address and byte enable valid hold time control after nOE/nRE assertion.

OEAADMUXONTIME and OEAADMUXOFFTIME parameters have the same functions as OEONTIME and OEOFFTIME, but apply to the first OE assertion in the AAD-multiplexed protocol for a read phase, or to the only OE assertion for a write phase. It is the user responsibility to make sure OEAADMUXOFFTIME is programmed to a value lower than OEONTIME. Functionality in AAD-mux mode is undefined if the settings do not comply with this requirement. OEAADMUXOFFTIME shall never be equal to OEONTIME because the AAD-mux protocol requires a second address phase with the nOE signal deasserted before nOE can be asserted again to define a read command.

The nOE/RE signal transitions as controlled through OEONTIME, OEOFFTIME, OEAADMUXONTIME and OEAADMUXOFFTIME can be delayed by half a GPMC_FCLK period by enabling the [GPMC_CONFIG4_i\[7\]](#) OEEXTRADELAY bit. This half of a GPMC_FCLK period provides more granularity on nOE/RE assertion and deassertion time to guaranty proper setup and hold time relative to GPMC_CLK. If enabled, OEEXTRADELAY applies to all parameters controlling nOE/nRE transitions.

OEEXTRADELAY must be used carefully, to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program RDCYCLETIME and WRCYCLETIME to be greater than nOE/RE signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

NOTE: When the GPMC generates a read access to an address-/data-multiplexed device, it drives the address bus until nOE assertion time.

16.4.4.10.5 nWE: Write Enable Signal Control Assertion / Deassertion Time (WEONTIME / WEOFFTIME / WEEXTRADELAY)

The [GPMC_CONFIG4_i\[19:16\]](#) WEONTIME field (where i = 0 to 7) defines the nWE signal-assertion time relative to start access time. The [GPMC_CONFIG4_i\[28:24\]](#) WEOFFTIME field defines the nWE signal-deassertion time relative to start access time. These bit fields only apply to write accesses. nWE is not asserted during a read cycle.

WEONTIME can be used to control an address and byte enable valid setup time control before nWE assertion. WEOFFTIME can be used to control an address and byte enable valid hold time control after nWE assertion.

nWE signal transitions as controlled through WEONTIME, and WEOFFTIME can be delayed by half a GPMC_FCLK period by enabling the [GPMC_CONFIG4_i\[23\]](#) WEEXTRADELAY bit. This half of a GPMC_FCLK period provides more granularity on nWE assertion and deassertion time to guaranty proper setup and hold time relative to GPMC_CLK. If enabled, WEEXTRADELAY applies to all parameters controlling nWE transitions.

The WEEXTRADELAY bit must be used carefully to avoid control-signal overlap between successive accesses to different chip-selects. This implies the need to program the WRCYCLETIME bit field to be greater than the nWE signal-deassertion time, including the extra half-GPMC_FCLK-period delay.

16.4.4.10.6 GPMC_CLK

GPMC_CLK is the external clock provided to the attached synchronous memory or device.

- The GPMC_CLK clock frequency is the GPMC_FCLK functional clock frequency divided by 1, 2, 3, or 4, depending on the [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER bit field (where $i = 0$ to 7), with a guaranteed 50-percent duty cycle.
- The GPMC_CLK clock is only activated when the access in progress is defined as synchronous (read or write access).
- The [GPMC_CONFIG1_i\[26:25\]](#) CLKACTIVATIONTIME field ($i = 0$ to 7) defines the number of GPMC_FCLK cycles from start access time to GPMC_CLK activation.
- The GPMC_CLK clock is stopped when cycle time completes and is asserted low between accesses.
- The GPMC_CLK clock is kept low when access is defined as asynchronous.

CAUTION

When cycle time completes, the GPMC_CLK may be high because of the GPMCFCLKDIVIDER bit field. To ensure correct stoppage of the GPMC_CLK clock within the 50-percent required duty cycle, it is the user's responsibility to extend the RDCYCLETIME or WRCYCLETIME value.

NOTE: To ensure a correct external clock cycle, the following rules must be applied:

- (RDCYCLETIME CLKACTIVATIONTIME) must be a multiple of (GPMCFCLKDIVIDER + 1).
- The PAGEBURSTACCESSTIME value must be a multiple of (GPMCFCLKDIVIDER + 1).

16.4.4.10.7 GPMC_CLK and Control Signals Setup and Hold

Control-signal transition (assertion and deassertion) setup and hold values with respect to the GPMC_CLK edge can be controlled in the following ways:

- For the GPMC_CLK signal, the [GPMC_CONFIG1_i\[26:25\]](#) CLKACTIVATIONTIME field ($i = 0$ to 7) allows setup and hold control of control-signal assertion time.
- The use of a divided GPMC_CLK allows setup and hold control of control-signal assertion and deassertion times.
- When GPMC_CLK runs at the GPMC_FCLK frequency so that GPMC_CLK edge and control-signal transitions refer to the same GPMC_FCLK edge, the control-signal transitions can be delayed by half of a GPMC_FCLK period to provide minimum setup and hold times. This half-GPMC_FCLK delay is enabled with the CSEXTRADELAY, ADVEXTRADELAY, OEEXTRADELAY, or WEEXTRADELAY parameter. This delay must be used carefully to prevent control-signal overlap between successive accesses to different chip-selects. This implies that the RDCYCLETIME and WRCYCLETIME are greater than the last control-signal deassertion time, including the extra half-GPMC_FCLK cycle.

16.4.4.10.8 Access Time (RDACCESSTIME / WRACCESSTIME)

The read access time and write access time durations can be programmed independently through [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME and [GPMC_CONFIG6_i\[28:24\]](#) WRACCESSTIME ($i = 0$ to 7). This allows nOE and GPMC data capture timing parameters to be independent of nWE and memory device data capture timing parameters. RDACCESSTIME and WRACCESSTIME bit fields can be set with a granularity of 1 or 2 through [GPMC_CONFIG1_i\[4\]](#) TIMEPARAGRANULARITY.

16.4.4.10.8.1 Access Time on Read Access

In asynchronous read mode, for single and paged accesses, [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME field ($i = 0$ to 7) defines the number of GPMC_FCLK cycles from start access time to the GPMC_FCLK rising edge used for the first data capture. RDACCESSTIME must be programmed to the rounded greater value (in GPMC_FCLK cycles) of the read access time of the attached memory device.

In synchronous read mode, for single or burst accesses, RDACCESSTIME defines the number of GPMC_FCLK cycles from start access time to the GPMC_FCLK rising edge corresponding to the GPMC_CLK rising edge used for the first data capture.

GPMC_CLK which is sent to the memory device for synchronization with the GPMC controller, is internally retimed to correctly latch the returned data. [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME must be greater than RDACCESSTIME in order to let the GPMC latch the last return data using the internally retimed GPMC_CLK.

The external WAIT signal can be used in conjunction with RDACCESSTIME to control the effective GPMC data-capture GPMC_FCLK edge on read access in both asynchronous mode and synchronous mode. For details about wait monitoring, see [Section 16.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

16.4.4.10.8.2 Access Time on Write Access

In asynchronous write mode, the [GPMC_CONFIG6_i\[28:24\]](#) WRACCESSTIME timing parameter is not used to define the effective write access time. Instead, it is used as a WAIT invalid timing window, and must be set to a correct value so that the gpmc_wait pin is at a valid state two GPMC_CLK cycles before WRACCESSTIME completes. For details about wait monitoring, see [Section 16.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

In synchronous write mode, for single or burst accesses, WRACCESSTIME defines the number of GPMC_FCLK cycles from start access time to the GPMC_CLK rising edge used by the memory device for the first data capture.

The external WAIT signal can be used in conjunction with WRACCESSTIME to control the effective memory device data capture GPMC_CLK edge for a synchronous write access. For details about wait monitoring, see [Section 16.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

16.4.4.10.9 Page Burst Access Time (PAGEBURSTACCESSTIME)

[GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESSTIME bit field ($i = 0$ to 7) can be set with a granularity of 1 or 2 through [GPMC_CONFIG1_i\[4\]](#) TIMEPARAGRANULARITY.

16.4.4.10.9.1 Page Burst Access Time on Read Access

In asynchronous page read mode, the delay between successive word captures in a page is controlled through the PAGEBURSTACCESSTIME bit field. The PAGEBURSTACCESSTIME parameter must be programmed to the rounded greater value (in GPMC_FCLK cycles) of the read access time of the attached device.

In synchronous burst read mode, the delay between successive word captures in a burst is controlled through the PAGEBURSTACCESSTIME field.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective GPMC data capture GPMC_FCLK edge on read access. For details about wait monitoring, see [Section 16.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

16.4.4.10.9.2 Page Burst Access Time on Write Access

Asynchronous page write mode is not supported. PAGEBURSTACCESSTIME is irrelevant in this case.

In synchronous burst write mode, PAGEBURSTACCESSTIME controls the delay between successive memory device word captures in a burst.

The external WAIT signal can be used in conjunction with PAGEBURSTACCESSTIME to control the effective memory-device data capture GPMC_CLK edge in synchronous write mode. For details about wait monitoring, see [Section 16.4.4.9.3.1, Chip-Select Base Address and Region Size](#).

16.4.4.10.10 Bus Keeping Support

At the end-cycle time of a read access, if no other access is pending, the GPMC drives the bus with the last data read after RDCYCLETIME completion time to prevent bus floating and reduce power consumption.

After a write access, if no other access is pending, the GPMC keeps driving the data bus after WRCYCLETIME completes with the same data to prevent bus floating and power consumption.

16.4.4.11 NOR Access Description

For each chip-select configuration, the read access can be specified as either asynchronous or synchronous access through the [GPMC_CONFIG1_i\[29\]](#) READTYPE bit ($i = 0$ to 7). For each chip-select configuration, the write access can be specified as either synchronous or asynchronous access through the [GPMC_CONFIG1_i\[27\]](#) WRITETYPE bit ($i = 0$ to 7).

Asynchronous and synchronous read and write access time and related control signals are controlled through timing parameters that refer to GPMC_FCLK. The primary difference of synchronous mode is the availability of a configurable clock interface (GPMC_CLK) to control the external device. Synchronous mode also affects data-capture and wait-pin monitoring schemes in read access.

For details about asynchronous and synchronous access, see the descriptions of GPMC_CLK, RdAccessTime, WrAccessTime, and wait-pin monitoring.

For more information about timing-parameter settings, see the sample timing diagrams in this chapter.

NOTE: The address bus and nBE[1:0] are fixed for the duration of a synchronous burst read access, but they are updated for each beat of an asynchronous page-read access.

16.4.4.11.1 Asynchronous Access Description

This section describes:

- Asynchronous single-read operation on an address/data multiplexed device
- Asynchronous single write operation on an address/data-multiplexed device
- Asynchronous single read operation on an AAD-multiplexed device
- Asynchronous single write operation on an AAD-multiplexed device
- Asynchronous multiple (page) read operation on a non-multiplexed device

In asynchronous operations GPMC_CLK is not provided outside the GPMC and is kept low.

16.4.4.11.1.1 Access on Address/Data Multiplexed Devices

16.4.4.11.1.1.1 Asynchronous Single-Read Operation on an Address/Data Multiplexed Device

Figure 16-61 shows an asynchronous single read operation on an address/data-multiplexed device.

Figure 16-61. Asynchronous Single Read on an Address/Data-Multiplexed Device

See Section 16.4.5.6.1, *GPMC Timing Parameters Formulas* for formulas to calculate timing parameters.

Table 16-257 lists the timing bit fields to set up in order to configure the GPMC in asynchronous single read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For details, see Section 16.4.4.9.2.3, *Address/Data-Multiplexing Interface*.

Address bits (A[16:1] from a GPMC perspective, A[15:0] from an external device perspective) are placed on the address/data bus, and the remaining address bits gpmc_a[25:16] are placed on the address bus. The address phase ends at nOE assertion, when the DIR signal goes from OUT to IN.

- Chip-select signal nCS:
 - nCS assertion time is controlled by the GPMC_CONFIG2_i[3:0] CS ONTIME field. It controls the address setup time to nCS assertion.
 - nCS deassertion time is controlled by the GPMC_CONFIG2_i[12:8] CSRD OFFTIME field. It controls the address hold time from nCS deassertion.
- Address valid signal nADV:
 - nADV assertion time is controlled by the GPMC_CONFIG3_i[3:0] ADV ONTIME field.
 - nADV deassertion time is controlled by the GPMC_CONFIG3_i[12:8] ADV RD OFFTIME field.
- Output enable signal nOE:
 - nOE assertion indicates a read cycle.
 - nOE assertion time is controlled by the GPMC_CONFIG4_i[3:0] OE ONTIME field.

- nOE deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\] OEOFFTIME](#) field.
- Read data is latched when RDACCESSTIME completes. Access time is defined in the [GPMC_CONFIG5_i\[20:16\] RDACCESSTIME](#) field.
- Direction signal DIR: DIR goes from OUT to IN at the same time that nOE is asserted.
- The end of the access is defined by the [GPMC_CONFIG5_i\[4:0\] RDCYCLETIME](#) parameter.

In the GPMC, when a 16-bit wide device is attached to the controller, a 32-bit word write access is split into two 16-bit word write accesses. For more information about GPMC access size and type adaptation, see [Section 16.4.4.11.5, System Burst Versus External Device Burst Support](#).

Between two successive accesses, if an nCS pulse is needed:

- The [GPMC_CONFIG6_i\[11:8\] CYCLE2CYCLEDELAY](#) field can be programmed with [GPMC_CONFIG6_i\[7\] CYCLE2CYCLESAMECSEN](#) enabled.
- The CSWROFFTIME and CSONTIME parameters also allow a chip-select pulse, but this affects all other types of access.

Figure 16-62. Two Asynchronous Single Read Accesses on an Address/Data Multiplexed Device (32-bit read split into 2 x 16-bit read)

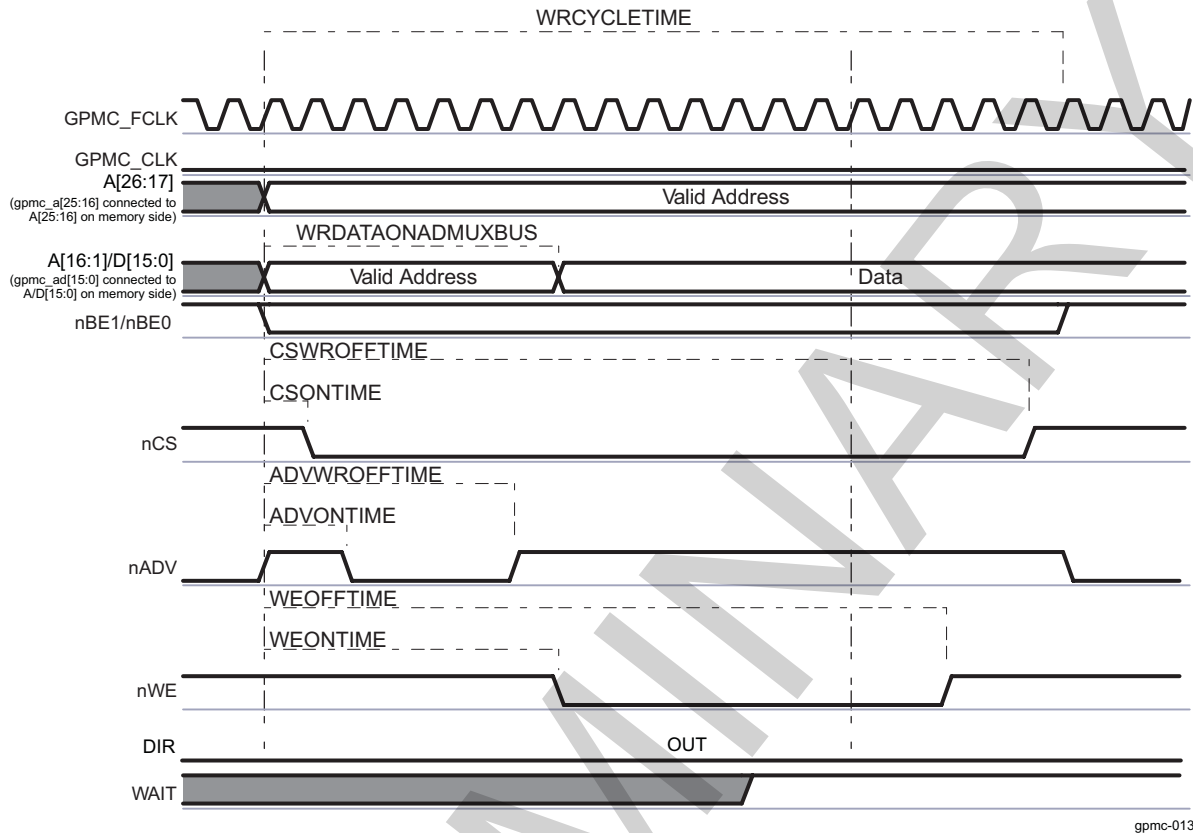

gpmc-044

16.4.4.11.1.2 Asynchronous Single Write Operation on an Address/Data-Multiplexed Device

Figure 16-63 shows an asynchronous single write operation on an address/data-multiplexed device.

Figure 16-63. Asynchronous Single Write on an Address/Data-Multiplexed Device

gpmc-013

See [Section 16.4.5.6.1, GPMC Timing Parameters Formulas](#) for formulas to calculate timing parameters.

[Table 16-257](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode.

When the GPMC generates a write access to an address/data-multiplexed device, it drives the address bus until nWE assertion time. For more information, see [Section 16.4.4.9.2.3, Address/Data-Multiplexing Interface](#).

The nCS, and nADV signals are controlled in the same way as for asynchronous single read operation on an address/data-multiplexed device.

- Write enable signal nWE:
 - nWE assertion indicates a write cycle.
 - nWE assertion time is controlled by the [GPMC_CONFIG4_i\[19:16\] WEONTIME](#) field.
 - nWE deassertion time is controlled by the [GPMC_CONFIG4_i\[28:24\] WEOFFTIME](#) field.
- Direction signal DIR: DIR signal is OUT during the entire access.
- The end of the access is defined by the [GPMC_CONFIG5_i\[12:8\] WRCYCLETIME](#) parameter.

Address bits A[16:1] (GPMC point of view) are placed on the address/data bus at the start of cycle time, and the remaining address bits A[26:17] are placed on the address bus.

Data is driven on the address/data bus at a [GPMC_CONFIG6_i\[19:16\] WRDATAONADMUXBUS](#) time.

NOTE: Write multiple access in asynchronous mode is not supported. If WRITEMULTIPLE is enabled with WRITETYPE as asynchronous, the GPMC processes single asynchronous accesses.

After a write operation, if no other access (read or write) is pending, the data bus keeps its previous value. See [Section 16.4.4.10.10](#), *Bus Keeping Support*.

16.4.4.11.1.1.3 Asynchronous Multiple (Page) Write Operation on an Address/Data-Multiplexed Device

Write multiple (page) access in asynchronous mode is not supported for address/data-multiplexed devices.

If [GPMC_CONFIG1_i\[28\]](#) WRITEMULTIPLE is enabled (0x1) with [GPMC_CONFIG1_i\[27\]](#) WRITETYPE as asynchronous (0x0), the GPMC processes single asynchronous accesses.

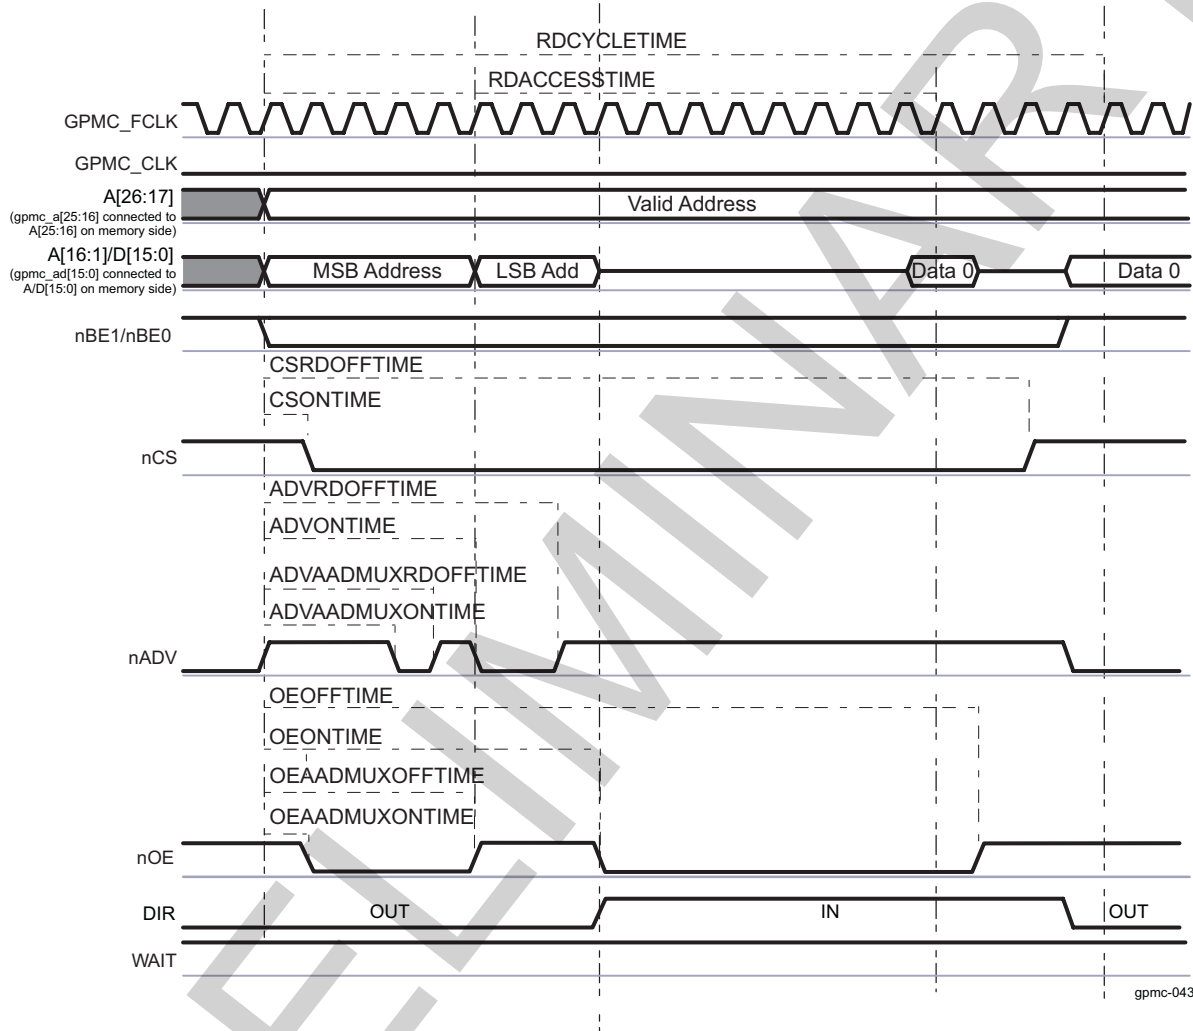

For accesses on non-multiplexed devices refer to [Section 16.4.4.11.3](#), *Asynchronous and Synchronous Accesses in Nonmultiplexed Mode*.

16.4.4.11.1.2 Access on Address/Address/Data Multiplexed Devices

16.4.4.11.1.2.1 Asynchronous Single Read Operation on an AAD-Multiplexed Device

Figure 16-64 shows an asynchronous single read operation on an AAD-multiplexed device.

Figure 16-64. Asynchronous Single Read on an AAD-Multiplexed Device

See [Section 16.4.5.6.1, GPMC Timing Parameters Formulas](#) for formulas to calculate timing parameters.

[Table 16-257](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode.

When the GPMC generates a read access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The first address phase ends at the first nOE deassertion time. The second phase for LSB address is qualified with nOE driven high. The second address phase ends at the second nOE assertion time, when the DIR signal goes from OUT to IN.

The nCS, and DIR signals are controlled in the same way as for asynchronous single read operation on an address/data-multiplexed device.

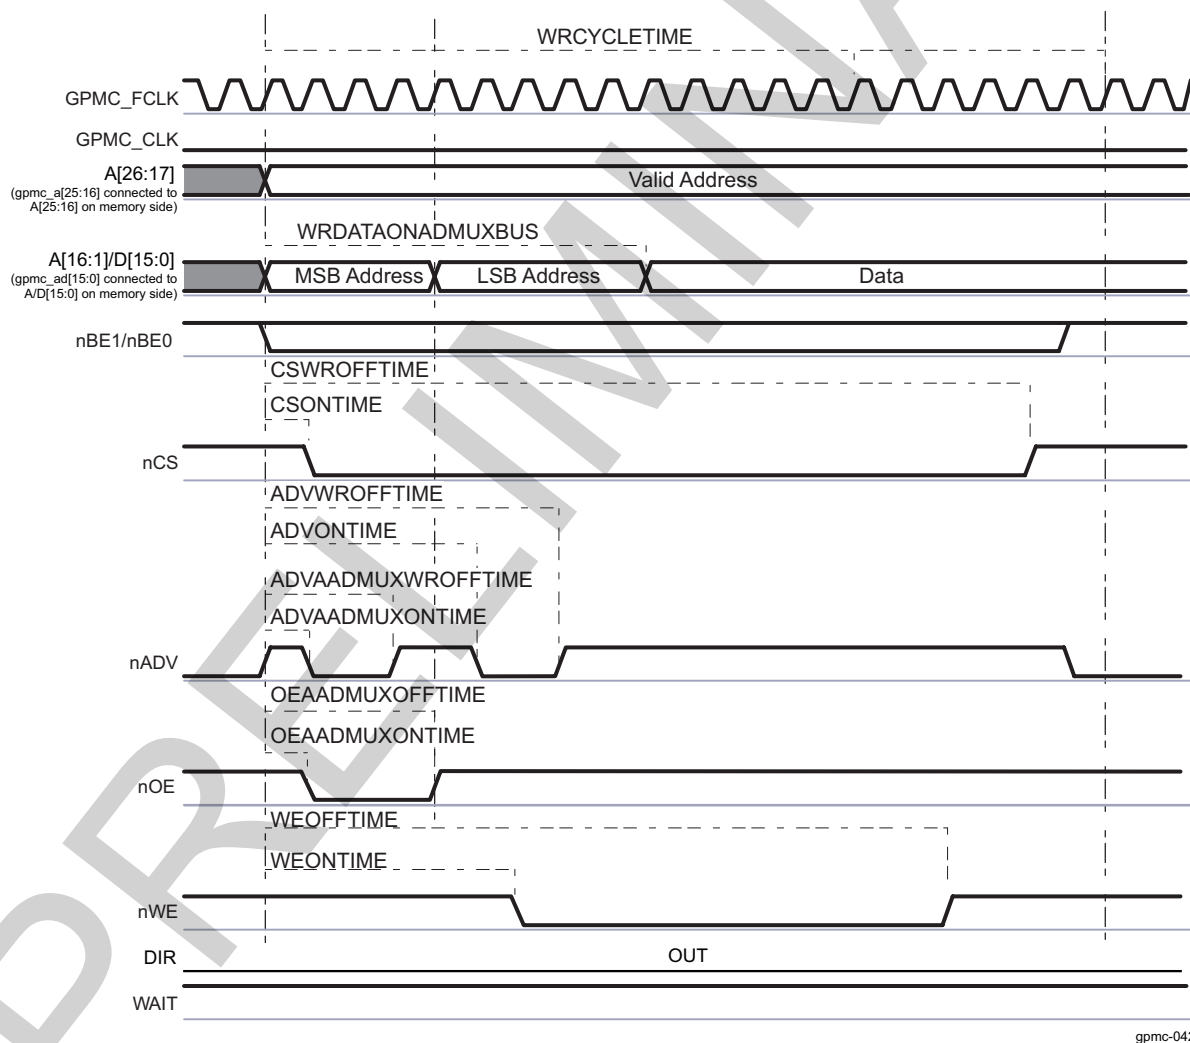

- Address valid signal nADV. nADV is asserted and deasserted twice during a read transaction:
 - nADV first assertion time is controlled by the [GPMC_CONFIG3_i\[6:4\] ADVAADMUXONTIME](#) field.
 - nADV first deassertion time is controlled by the [GPMC_CONFIG3_i\[26:24\] ADVAADMUXRD OFFTIME](#) field.

- nADV second assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME field.
- nADV second deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\]](#) ADVRDOFFTIME field.
- Output Enable signal nOE. nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
 - nOE first assertion time is controlled by the [GPMC_CONFIG4_i\[6:4\]](#) OEAADMUXONTIME field.
 - nOE first deassertion time is controlled by the [GPMC_CONFIG3_i\[15:13\]](#) OEAADMUXOFFTIME field.
 - nOE second assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\]](#) OEONTIME field.
 - nOE second deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\]](#) OEOFFTIME field.

16.4.4.11.1.2.2 Asynchronous Single Write Operation on an AAD-Multiplexed Device

Figure 16-65 shows an asynchronous single write operation on an AAD-multiplexed device.

Figure 16-65. Asynchronous Single Write on an AAD-Multiplexed Device

See [Section 16.4.5.6.1, GPMC Timing Parameters Formulas](#) for formulas to calculate timing parameters.

[Table 16-257](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single write mode.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS, nWE, and DIR signals are controlled in the same way as for asynchronous single write operation on an address/data-multiplexed device. See [Table 16-248](#).

- Address valid signal nADV is asserted and deasserted twice during a write transaction:
 - nADV first assertion time is controlled by the [GPMC_CONFIG3_i\[6:4\]](#) ADVAADMUXONTIME field.
 - nADV first deassertion time is controlled by the [GPMC_CONFIG3_i\[30:28\]](#) ADVAADMUXWROFFTIME field.
 - nADV second assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME field.
 - nADV second deassertion time is controlled by the [GPMC_CONFIG3_i\[20:16\]](#) ADVWROFFTIME field.
- Output Enable signal nOE is asserted during the address phase of a write transaction:
 - nOE assertion time is controlled by the [GPMC_CONFIG4_i\[6:4\]](#) OEAADMUXONTIME field.
 - nOE deassertion time is controlled by the [GPMC_CONFIG3_i\[15:13\]](#) OEAADMUXOFFTIME field.

The address bits for the first address phase are driven onto the data bus until nOE deassertion. Data is driven onto the address/data bus at the clock edge defined by the [GPMC_CONFIG6_i\[19:16\]](#) WRDATAONADMUXBUS parameter.

16.4.4.11.1.2.3 Asynchronous Multiple (Page) Read Operation on an AAD-Multiplexed Device

Write multiple (page) access in asynchronous mode is not supported for AAD-multiplexed devices.

If [GPMC_CONFIG1_i\[28\]](#) WRITEMULTIPLE is enabled (0x1) with [GPMC_CONFIG1_i\[27\]](#) WRITETYPE as asynchronous (0x0), the GPMC processes single asynchronous accesses.

For accesses on non-multiplexed devices refer to [Section 16.4.4.11.3, Asynchronous and Synchronous Accessed in Nonmultiplexed Mode](#).

16.4.4.11.2 Synchronous Access Description

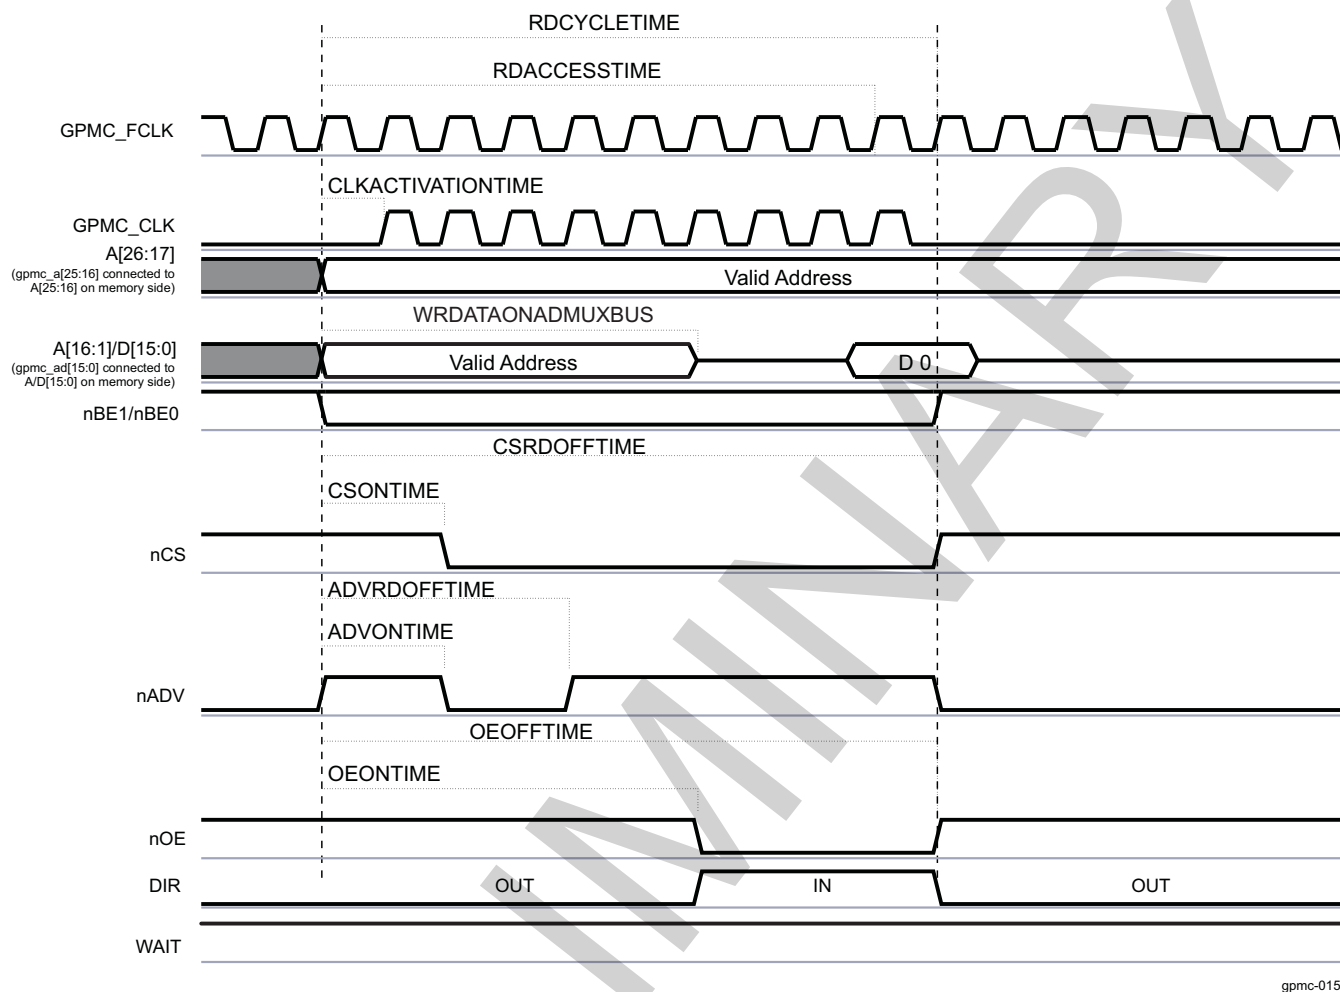

This section details read and write synchronous accesses on address/data multiplexed. All information in this section can be applied to any type of memory - non-multiplexed, address and data multiplexed or AAD-multiplexed - with a difference limited to the address phase. For accesses on non-multiplexed devices refer to [Section 16.4.4.11.3, Asynchronous and Synchronous Accessed in Nonmultiplexed Mode](#).

In synchronous operations:

- The GPMC_CLK clock is provided outside the GPMC when accessing the memory device.
- The GPMC_CLK clock is derived from the GPMC_FCLK clock using the [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER field. In the following section i stands for the chip-select number, i = 0 to 7.
- The [GPMC_CONFIG1_i\[26:25\]](#) CLKACTIVATIONTIME field specifies that the GPMC_CLK is provided outside the GPMC 0, 1, or 2 GPMC_FCLK cycles after start access time until RDCYCLETIME or WRCYCLETIME completion.

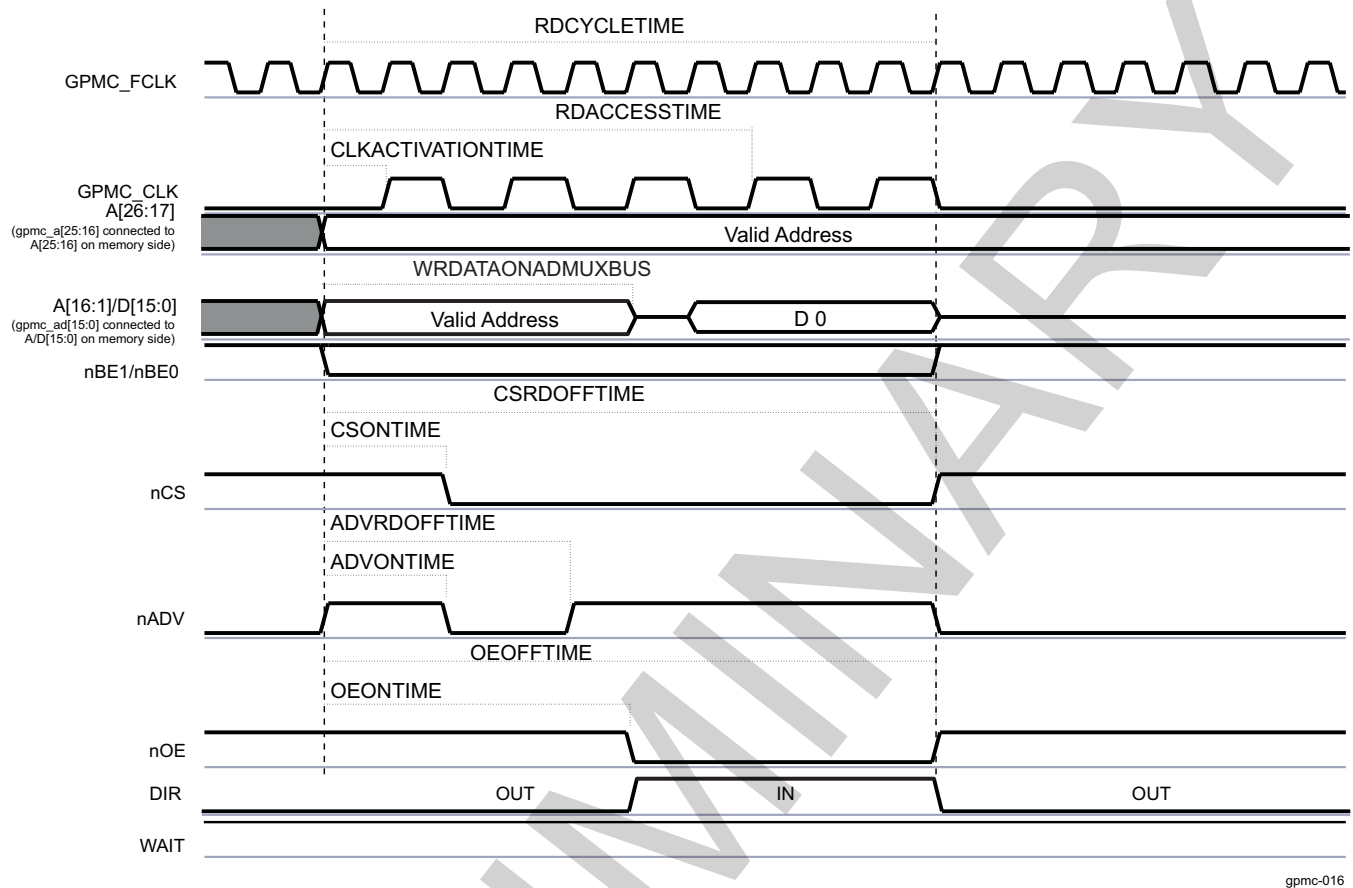

16.4.4.11.2.1 Synchronous Single Read

[Figure 16-66](#) and [Figure 16-67](#) show a synchronous single-read operation with GPMCFCLKDIVIDER equal to 0 and 1, respectively.

Figure 16-66. Synchronous Single Read (GPMCFCLKDIVIDER = 0)

gpmc-015

Figure 16-67. Synchronous Single Read (GPMCFCLKDIVIDER = 1)

See [Section 16.4.5.6.1, GPMC Timing Parameters Formulas](#) for formulas to calculate timing parameters.

[Table 16-257](#) lists the timing bit fields to set up in order to configure the GPMC in asynchronous single read mode.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For details, see [Section 16.4.4.9.2.3, Address/Data-Multiplexing Interface](#).

- Chip-select signal nCS:
 - nCS assertion time is controlled by the [GPMC_CONFIG2_i\[3:0\] CSONTIME](#) field and ensures address setup time to nCS assertion.
 - nCS deassertion time is controlled by the [GPMC_CONFIG2_i\[12:8\] CSRDOFFTIME](#) field and ensures address hold time to nCS deassertion.
- Address valid signal nADV:
 - nADV assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\] ADVONTIME](#) field.
 - nADV deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\] ADVRDOFFTIME](#) field.
- Output enable signal nOE:
 - nOE assertion indicates a read cycle.
 - nOE assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\] OEONTIME](#) field.
 - nOE deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\] OEOFFTIME](#) field.
- Initial latency for the first read data is controlled by [GPMC_CONFIG5_i\[20:16\] RDACCESSTIME](#) or by monitoring the WAIT signal.
- Total access time ([GPMC_CONFIG5_i\[4:0\] RDCYCLETIME](#)) corresponds to RDACCESSTIME plus the address hold time from nCS deassertion, plus time from RDACCESSTIME to CSRDOFFTIME.
- Direction signal DIR: DIR goes from OUT to IN at the same time as nOE assertion.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS, and DIR signals are controlled in the same way as for synchronous single read operation on an address/data-multiplexed device.

- Address valid signal nADV is asserted and deasserted twice during a read transaction:
 - nADV first assertion time is controlled by the [GPMC_CONFIG3_i\[6:4\]](#) ADVAADMUXONTIME field.
 - nADV first deassertion time is controlled by the [GPMC_CONFIG3_i\[26:24\]](#) ADVAADMUXRDOFFTIME field.
 - nADV second assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME field.
 - nADV second deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\]](#) ADVRDOFFTIME field.
- Output Enable signal nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
 - nOE first assertion time is controlled by the [GPMC_CONFIG4_i\[6:4\]](#) OEAADMUXONTIME field.
 - nOE first deassertion time is controlled by the [GPMC_CONFIG3_i\[15:13\]](#) OEAADMUXOFFTIME field.
 - nOE second assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\]](#) OEONTIME field.
 - nOE second deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\]](#) OEOFFTIME field.

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 16.4.4.10.10](#), *Bus Keeping Support*.

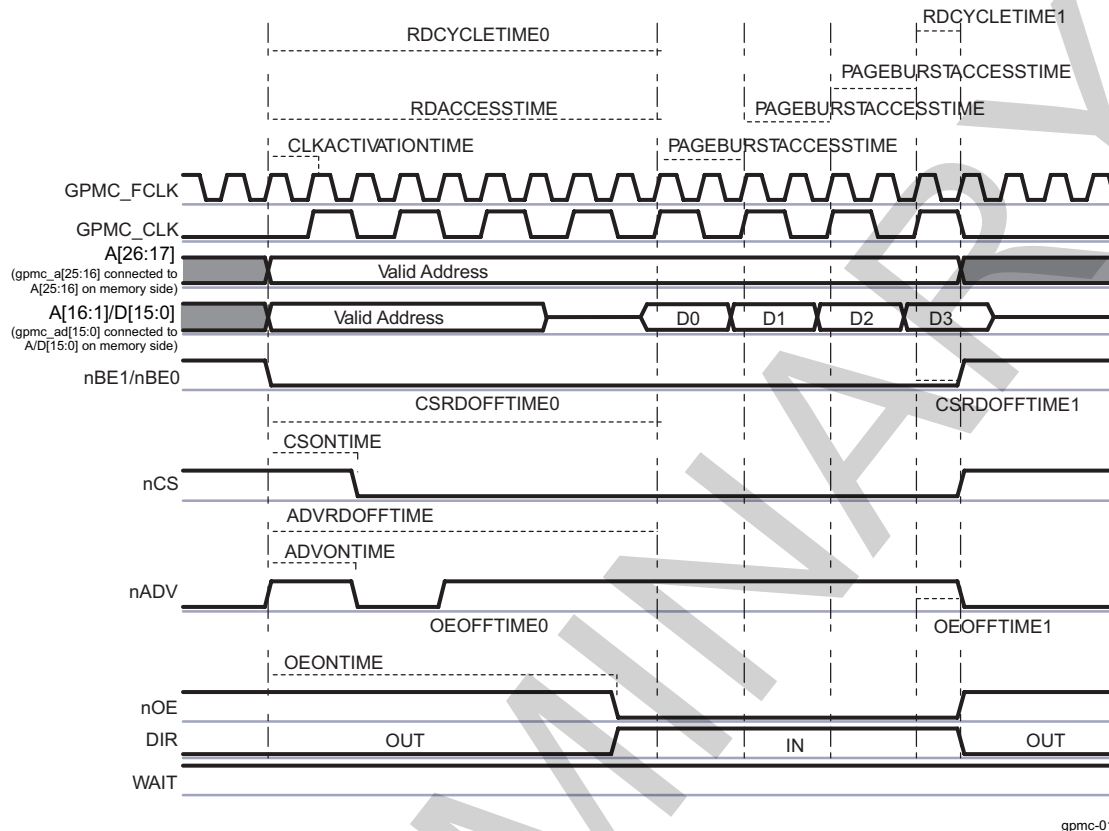

16.4.4.11.2.2 Synchronous Multiple (Burst) Read (4-, 8-, 16-Word16 Burst With Wraparound Capability)

[Figure 16-68](#) and [Figure 16-69](#) show a synchronous multiple read operation with GPMCFCLKDivider equal to 0 and 1, respectively.

Figure 16-68. Synchronous Multiple (Burst) Read (GPMC_FCLKDIVIDER = 0)

gpmc-018

Figure 16-69. Synchronous Multiple (Burst) Read (GPMCFCLKDIVIDER = 1)

gpmc-019

When [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to [GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

The nCS, nADV, nOE and DIR signals are controlled in the same way as for synchronous single read operation. See [Table 16-243](#).

Initial latency for the first read data is controlled by RDACCESSTIME or by monitoring the WAIT signal. Successive read data are provided by the memory device each one or two GPMC_CLK cycles. The PAGEBURSTACCESSTIME parameter must be set accordingly with [GPMC_CONFIG1_i\[1:0\]](#) GPMCFCLKDIVIDER and the memory-device internal configuration. Depending on the device page length, the GPMC checks device page crossing during a new burst request and purposely insert initial latency (of RDACCESSTIME) when required.

Total access time [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME corresponds to RDACCESSTIME plus the address hold time from nCS deassertion. In [Figure 16-69](#), RDCYCLETIME programmed value equals to RDCYCLETIME0 + RDCYCLETIME1.

After a read operation, if no other access (read or write) is pending, the data bus is driven with the previous read value. See [Section 16.4.4.10.10, Bus Keeping Support](#).

Burst wraparound is enabled through the [GPMC_CONFIG1_i\[31\]](#) WRAPBURST bit and allows a 4-, 8-, or 16-Word16 linear burst access to wrap within its burst-length boundary through [GPMC_CONFIG1_i\[24:23\]](#) ATTACHEDDEVICEPAGELENGTH.

16.4.4.11.2.3 Synchronous Single Write

Burst write mode is used for synchronous single or burst accesses.

Figure 16-70. Synchronous Single Write on an Address/Data-Multiplexed Device

When the GPMC generates a write access to an address/data-multiplexed device, it drives the data bus (with address bits A[16:1]) until [GPMC_CONFIG6_i\[19:16\]](#) WRDATAONADMUXBUS time. First data of the burst is driven on the address/data bus at WRDATAONADMUXBUS time.

16.4.4.11.2.4 Synchronous Multiple (Burst) Write

Synchronous burst write mode provides synchronous single or consecutive accesses.

[Figure 16-71](#) shows a synchronous burst write access when the chip-select is configured in address/data-multiplexed mode.

Figure 16-71. Synchronous Multiple Write (Burst Write) in Address/Data-Multiplexed Mode

Figure 16-72 shows the same synchronous burst write access when the chip-select is configured in address/address/data-multiplexed (AAD-multiplexed) mode.

Figure 16-72. Synchronous Multiple Write (Burst Write) in Address/Address/Data-Multiplexed Mode

The first data of the burst is driven on the A/D bus at [GPMC_CONFIG6_i\[19:16\]](#) WRDATAONADMUXBUS.

When WRACCESSTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to the [GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

When the GPMC generates a read access to an address/data-multiplexed device, it drives the address bus until nOE assertion time. For details, see [Section 16.4.4.9.2.3, Address/Data-Multiplexing Interface](#).

- Chip-select signal nCS:
 - nCS assertion time is controlled by the [GPMC_CONFIG2_i\[3:0\]](#) CSONTIME field ($i = 0$ to 7) and ensures address setup time to nCS assertion.
 - nCS deassertion time controlled by the [GPMC_CONFIG2_i\[20:16\]](#) CSWROFFTIME field and ensures address hold time to nCS deassertion.
- Address valid signal nADV:
 - nADV assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME field.
 - nADV deassertion time is controlled by the [GPMC_CONFIG3_i\[20:16\]](#) ADVWROFFTIME field.
- Write enable signal nWE:
 - nWE assertion indicates a read cycle.
 - nWE assertion time is controlled by the [GPMC_CONFIG4_i\[19:16\]](#) WEONTIME field.

- nWE deassertion time is controlled by the [GPMC_CONFIG4_i\[28:24\]](#) WEOFFTIME field.

NOTE: The nWE falling edge must not be used to control the time when the burst first data is driven in the address/data bus because some new devices require the nWE signal at low during the address phase.

- Direction signal DIR is OUT during the entire access.

When the GPMC generates a write access to an AAD-multiplexed device, all address bits are driven onto the address/data bus in two separate phases. The first phase is used for the MSB address and is qualified with nOE driven low. The second phase for LSB address is qualified with nOE driven high. The address phase ends at nWE assertion time.

The nCS, and DIR signals are controlled as detailed above.

- Address valid signal nADV is asserted and deasserted twice during a read transaction:
 - nADV first assertion time is controlled by the [GPMC_CONFIG3_i\[6:4\]](#) ADVAADMUXONTIME field.
 - nADV first deassertion time is controlled by the [GPMC_CONFIG3_i\[26:24\]](#) ADVAADMUXRDOFFTIME field.
 - nADV second assertion time is controlled by the [GPMC_CONFIG3_i\[3:0\]](#) ADVONTIME field.
 - nADV second deassertion time is controlled by the [GPMC_CONFIG3_i\[12:8\]](#) ADVRDOFFTIME field.
- Output Enable signal nOE is asserted and deasserted twice during a read transaction (nOE second assertion indicates a read cycle):
 - nOE first assertion time is controlled by the [GPMC_CONFIG4_i\[6:4\]](#) OEAADMUXONTIME field.
 - nOE first deassertion time is controlled by the [GPMC_CONFIG4_i\[15:13\]](#) OEAADMUXOFFTIME field.
 - nOE second assertion time is controlled by the [GPMC_CONFIG4_i\[3:0\]](#) OEONTIME field.
 - nOE second deassertion time is controlled by the [GPMC_CONFIG4_i\[12:8\]](#) OEOFFTIME field.

First write data is driven by the GPMC at [GPMC_CONFIG6_i\[19:16\]](#) WRDATAONADMUXBUS, when in address/data mux configuration. The next write data of the burst is driven on the bus at WRACCESSTIME + 1 during [GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESSTIME GPMC_FCLK cycles. The last data of the synchronous burst write is driven until [GPMC_CONFIG5_i\[12:8\]](#) WRCYCLETIME completes.

- WRACCESSTIME is defined in the [GPMC_CONFIG6_i\[28:24\]](#) register.
- The PAGEBURSTACCESSTIME parameter must be set accordingly with GPMCFCLKDIVIDER and the memory-device internal configuration.

Total access time [GPMC_CONFIG5_i\[12:8\]](#) WRCYCLETIME corresponds to WRACCESSTIME plus the address hold time from nCS deassertion. In [Figure 16-71](#), the WRCYCLETIME programmed value equals WRCYCLETIME0 + WRCYCLETIME1. WRCYCLETIME0 and WRCYCLETIME1 delays are not actual parameters and are only a graphical representation of the full WRCYCLETIME value.

After a write operation, if no other access (read or write) is pending, the data bus keeps the previous value. See [Section 16.4.4.10.10, Bus Keeping Support](#).

16.4.4.11.3 Asynchronous and Synchronous Accesses in Nonmultiplexed Mode

Page mode is only available in non-muxed mode. The non-muxed mode is described in this section even though its use is very limited (address space limited to 2 KBytes).

- Asynchronous single read operation on a nonmultiplexed device
- Asynchronous single write operation on a nonmultiplexed device
- Asynchronous multiple (page mode) read operation on a nonmultiplexed device
- Synchronous operations on a nonmultiplexed device

16.4.4.11.3.1 Asynchronous Single Read Operation on a Nonmultiplexed Device

[Figure 16-73](#) shows an asynchronous single read operation on a nonmultiplexed device.

Figure 16-73. Asynchronous Single Read on an Address/Data-Nonmultiplexed Device

The 10-bit address is driven onto the address bus A[10:1] and the 16-bit data is driven onto the data bus D[15:0].

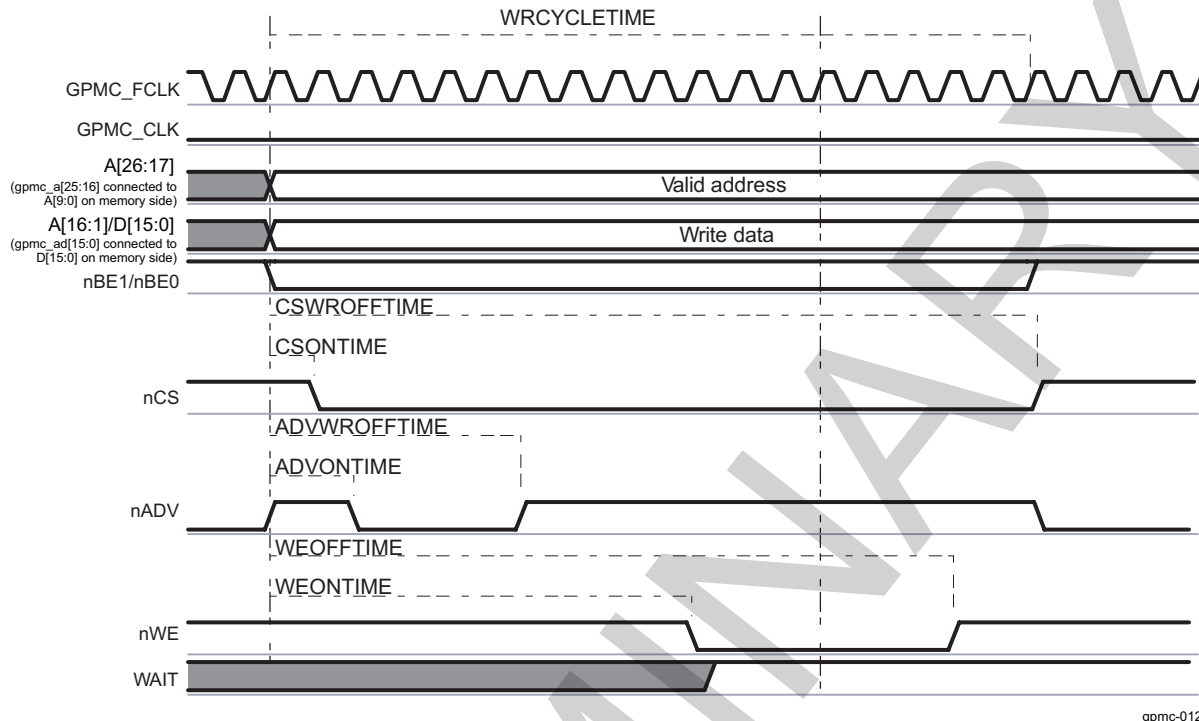

Read data is latched at [GPMC_CONFIG1_5\[20:16\]](#) RDACCESSTIME completion time. The end of the access is defined by the [GPMC_CONFIG1_5\[4:0\]](#) RDCYCLETIME parameter.

Set [GPMC_CONFIG\[1\] LIMITEDADDRESS](#) to 0x1 (A26-A11 are not modified during an external memory access).

nCS, nADV, nOE and DIR signals are controlled in the same way as address/data multiplexed accesses, see [Table 16-248](#).

16.4.4.11.3.2 Asynchronous Single Write Operation on a Nonmultiplexed Device

[Figure 16-74](#) shows an asynchronous single write operation on a nonmultiplexed device.

Figure 16-74. Asynchronous Single Write on an Address/Data-Nonmultiplexed Device

The 10-bit address is driven onto the address bus A[10:1] and the 16-bit data is driven onto the data bus D[15:0].

Set [GPMC_CONFIG\[1\] LIMITEDADDRESS](#) to 0x1 (A26-A11 are not modified during an external memory access).

nCS, nADV, nWE and DIR signals are controlled in the same way as address/data multiplexed accesses, see [Table 16-248](#).

16.4.4.11.3.3 Asynchronous Multiple (Page Mode) Read Operation on a Nonmultiplexed Device

[Figure 16-75](#) shows an asynchronous multiple read operation on a Nonmultiplexed Device, in which two word32 host read accesses to the GPMC are split into one multiple (page mode of 4 word16) read access to the attached device.

Figure 16-75. Asynchronous Multiple (Page Mode) Read

NOTE: The WAIT signal is active low.

nCS, nADV, nOE and DIR signals are controlled in the same way as address/data multiplexed accesses, see [Table 16-248](#).

When RDACCESSTIME completes, control-signal timings are frozen during the multiple data transactions, corresponding to PAGEBURSTACCESSTIME multiplied by the number of remaining data transactions.

Read data is latched at [GPMC_CONFIG5_i\[20:16\]](#) RDACCESSTIME completion time (i = 0 to 7). The end of the access is defined by the [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME parameter.

Set [GPMC_CONFIG\[1\]](#) LIMITEDADDRESS to 0x1 (A26-A11 are not modified during an external memory access).

During consecutive accesses, the GPMC increments the address after each data read completes.

Delay between successive read data in the page is controlled by the [GPMC_CONFIG5_i\[27:24\]](#) PAGEBURSTACCESSTIME parameter. Depending on the device page length, the GPMC can control device page crossing during a burst request and insert initial RDACCESSTIME latency. Note that page crossing is only possible with a new burst access, meaning a new initial access phase is initiated.

Total access time RDCYCLETIME corresponds to RDACCESSTIME plus the address hold time starting from the nCS deassertion.

- The read cycle time is defined in the [GPMC_CONFIG5_i\[4:0\]](#) RDCYCLETIME field.
- In [Figure 16-75](#), the RDCYCLETIME programmed value equals RDCYCLETIME0 (before paged accesses) + RDCYCLETIME1 (after paged accesses).

16.4.4.11.3.4 Synchronous Operations on a Nonmultiplexed Device

All information for this section is equivalent to similar operations for address/data- or AAD-multiplexed accesses. The only difference resides in the address phase. See [Section 16.4.5.3, GPMC Configuration in NOR Mode](#).

16.4.4.11.4 Page and Burst Support

Each chip-select can be configured to process system single or burst requests into successive single accesses or asynchronous page/synchronous burst accesses, with appropriate access size adaptation.

Depending on the external device page or burst capability, read and write accesses can be independently configured through the GPMC. The [GPMC_CONFIG1_i\[30\]](#) READMULTIPLE and [GPMC_CONFIG1_i\[28\]](#) WRITEMULTIPLE bits ($i = 0$ to 7) are associated with the READTYPE and WRITETYPE parameters.

NOTE:

- Asynchronous write page mode is not supported.
- 8-bit wide device support is limited to nonburstable devices (READMULTIPLE and WRITEMULTIPLE are ignored).
- Not applicable to NAND device interfacing.

16.4.4.11.5 System Burst Versus External Device Burst Support

The device system can issue the following requests to the GPMC:

- Byte, 16-bit word, 32-bit word requests (byte enable controlled). This is always a single request from the interconnect point of view.
- Incrementing fixed-length bursts of two words, four words, and eight words
- Wrapped (critical word access first) fixed-length burst of two, four, or eight words

To process a system request with the optimal protocol, the READMULTIPLE (and READTYPE) and WRITEMULTIPLE (and WRITETYPE) parameters must be set according to the burstable capability (synchronous or asynchronous) of the attached device.

The GPMC access engine issues only fixed-length burst. The maximum length that can be issued is defined per CS by the [GPMC_CONFIG1_i\[24:23\]](#) ATTACHEDDEVICEPAGELENGTH field ($i = 0$ to 7). When the ATTACHEDDEVICEPAGELENGTH value is less than the system burst request length (including the appropriate access size adaptation according to the device width), the GPMC splits the system burst request into multiple bursts. Within the specified 4-, 8-, or 16-word value, the ATTACHEDDEVICEPAGELENGTH field value must correspond to the maximum-length burst supported by the memory device configured in fixed-length burst mode (as opposed to continuous burst mode).

To get optimal performance from memory devices that natively support 16 Word16-length-wrapping burst capability (critical word access first), the ATTACHEDDEVICEPAGELENGTH parameter must be set to 16 words and the [GPMC_CONFIG1_i\[31\]](#) WRAPBURST bit ($i = 0$ to 7) must be set to 1. Similarly DEVICESPAGELENGTH is set to 4 and 8 for memories supporting respectively 4 and 8 Word16-length-wrapping burst.

When the memory device does not offer (or is not configured to offer) native 16 Word16-length-wrapping burst, the WRAPBURST parameter must be cleared, and the GPMC access engine emulates the wrapping burst by issuing the appropriate burst sequences according to the ATTACHEDDEVICEPAGELENGTH value.

When the memory device does not support native-wrapping burst, there is usually no difference in behavior between a fixed burst length mode and a continuous burst mode configuration (except for a potential power increase from a memory-speculative data prefetch in a continuous burst read). However, even though continuous burst mode is compatible with GPMC behavior, because the GPMC access engine issues only fixed-length burst and does not benefit from continuous burst mode, it is best to configure the memory device in fixed-length burst mode.

The memory device maximum-length burst (configured in fixed-length burst wrap or nonwrap mode) usually corresponds to the memory device data buffer size. Memory devices with a minimum of 16 half-word buffers are the most appropriate (especially with wrap support), but memory devices with smaller buffer size (4 or 8) are also supported, assuming that the [GPMC_CONFIG1_i\[24:23\]](#) ATTACHEDDEVICEPAGELENGTH field is set accordingly to 4 or 8 words.

The device system issues only requests with addresses or starting addresses for nonwrapping burst requests; that is, the request size boundary is aligned. In case of an eight-word-wrapping burst, the wrapping address always occurs on the eight-words boundary. As a consequence, all words requested must be available from the memory data buffer when the buffer size is equal to or greater than the ATTACHEDDEVICEPAGELENGTH value. This usually means that data can be read from or written to the buffer at a constant rate (number of cycles between data) without wait states between data accesses. If the memory does not behave this way (nonzero wait state burstable memory), wait-pin monitoring must be enabled to dynamically control data-access completion within the burst.

NOTE: When the system burst request length is less than the ATTACHEDDEVICEPAGELENGTH value, the GPMC proceeds with the required accesses.

16.4.4.12 pSRAM Access Specificities

pSRAM devices are SRAM-pin-compatible low-power memories that contain a self-refreshed DRAM memory array. The [GPMC_CONFIG1_i\[11:10\]](#) DEVICETYPE field (i = 0 to 7) must be set to 0b00.

The pSRAM devices uses the NOR protocol. It support the following operations:

- Asynchronous single read
- Asynchronous page read
- Asynchronous single write
- Synchronous single read and write
- Synchronous burst read
- Synchronous burst write (not supported by NOR Flash memory)

pSRAM devices must be powered up and initialized in a predefined manner according to the specifications of the attached device.

pSRAM devices can be programmed to use either mode: fixed or variable latency. pSRAM devices can either automatically schedule autorefresh operations, which force the GPMC to use its WAIT signal capability when read or write operations occur during an internal self-refresh operation, or pSRAM devices automatically include the autorefresh operation in the access time. These devices do not require additional WAIT signal capability or a minimum nCS high pulse width between consecutive accesses to ensure that the correct internal refresh operation is scheduled.

16.4.4.13 NAND Access Description

NAND (8-bit and 16-bit) memory devices using a standard NAND asynchronous address/data-multiplexing scheme can be supported on any chip-select with the appropriate asynchronous configuration settings.

As for any other type of memory compatible with the GPMC interface, accesses to a chip-select allocated to a NAND device can be interleaved with accesses to chip-selects allocated to other external devices.

This interleaved capability limits the system to *chip enable don't care* NAND devices since the chip-select allocated to the NAND device has to be deasserted if accesses to other chip-selects are requested.

16.4.4.13.1 NAND Memory Device in Byte or 16-bit Word Stream Mode

NAND devices require correct command and address programming before data array read or write accesses. The GPMC does not include specific hardware to translate a random address system request into a NAND-specific multiphase access. In that sense, GPMC NAND support, as opposed to random memory-map device support, is data-stream-oriented (byte or 16-bit word).

The GPMC NAND programming model relies on a software driver for address and command formatting with the correct data address pointer value according to the block and page structure. Because of NAND structure and protocol interface diversity, the GPMC does not support automatic command and address phase programming, and software drivers must access the NAND device ID to ensure that correct command and address formatting are used for the identified device.

NAND device data read and write accesses are achieved through an asynchronous read or write access. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Any chip-select region can be qualified as a NAND region to constrain the nADV/ALE signal as Address Latch Enable (ALE active high, default state value at low) during address program access, and the nBE0/CLE signal as Command Latch Enable (CLE active high, default state value at low) during command program access. GPMC address lines are not used (the previous value is not changed) during NAND access.

16.4.4.13.1.1 Chip-Select Configuration for NAND Interfacing in Byte or Word Stream Mode

The [GPMC_CONFIG1_i](#) register (where $i = 0$ to 7) associated with a NAND device region interfaced in byte or word stream mode can be initialized with a minimum size of 16 Mbytes, because any address location in the chip-select memory region can be used to access a NAND data array. The NAND Flash protocol specifies an address sequence where address bits are passed through the data bus in a series of write accesses with the ALE pin asserted. After this address phase, all operations are streamed and the system requests address is irrelevant.

CAUTION

To allow correct command, address, and data-access controls, the [GPMC_CONFIG1_i](#) register associated with a NAND device region must be initialized in asynchronous read and write modes with the parameters shown in [Table 16-226](#). Failure to comply with these settings corrupts the NAND interface protocol.

Table 16-226. Chip-Select Configuration for NAND Interfacing

| Bit Field | Register | Value | Comments |
|--------------------------|---|--------------|--|
| WRAPBURST | GPMC_CONFIG1_i[31] ⁽¹⁾ | 0 | No wrap |
| READMULTIPLE | GPMC_CONFIG1_i[30] | 0 | Single access |
| READTYPE | GPMC_CONFIG1_i[29] | 0 | Asynchronous mode |
| WRITEMULTIPLE | GPMC_CONFIG1_i[28] | 0 | Single access |
| WRITETYPE | GPMC_CONFIG1_i[27] | 0 | Asynchronous mode |
| CLKACTIVATIONTIME | GPMC_CONFIG1_i[26:25] | 0b00 | |
| ATTACHEDDEVICEPAGELENGTH | GPMC_CONFIG1_i[24:23] | Don't care | Single-access mode |
| WAITREADMONITORING | GPMC_CONFIG1_i[22] | 0 | Wait not monitored by GPMC access engine |
| WAITWRITEMONITORING | GPMC_CONFIG1_i[21] | 0 | Wait not monitored by GPMC access engine |
| WAITMONITORINGTIME | GPMC_CONFIG1_i[19:18] | Don't care | Wait not monitored by GPMC access engine |
| WAITPINSELECT | GPMC_CONFIG1_i[17:16] | | Select which wait is monitored by edge detectors |
| DEVICESIZE | GPMC_CONFIG1_i[13:12] | 0b00 or 0b01 | 8- or 16-bit interface |
| DEVICETYPE | GPMC_CONFIG1_i[11:10] | 0b10 | NAND device in stream mode |
| MUXADDDATA | GPMC_CONFIG1_i[9:8] | 0b00 | Nonmultiplexed mode |

⁽¹⁾ $i = 0$ to 7

Table 16-226. Chip-Select Configuration for NAND Interfacing (continued)

| Bit Field | Register | Value | Comments |
|---------------------|-------------------------------------|------------|--|
| TIMEPARAGRANULARITY | GPMC_CONFIG1_i[4] | 0 | Timing achieved with best GPMC clock granularity |
| GPMCFCLKDIVIDER | GPMC_CONFIG1_i[1:0] | Don't care | Asynchronous mode |

The [GPMC_CONFIG1_i](#) to [GPMC_CONFIG4_i](#) register (where i = 0 to 7) associated with a NAND device region must be initialized with the correct control-signal timing value according to the NAND device timing parameters.

16.4.4.13.1.2 NAND Device Command and Address Phase Control

NAND devices require multiple address programming phases. The MPU software driver is responsible for issuing the correct number of command and address program accesses, according to the device command set and the device address-mapping scheme.

NAND device-command and address-phase programming is achieved through write requests to the [GPMC_NAND_COMMAND_i](#) and [GPMC_NAND_ADDRESS_i](#) register locations (i = 0 to 7) with the correct command and address values. These locations are mapped in the associated chip-select register region. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Command and address values are not latched during the access and cannot be read back at the register location.

- Only write accesses must be issued to these locations, but the GPMC does not discard any read access. Accessing a NAND device with nOE and CLE or ALE asserted (read access) can produce undefined results.
- Write accesses to the [GPMC_NAND_COMMAND_i](#) register location and to the [GPMC_NAND_ADDRESS_i](#) register location must be posted for faster operations (i = 0 to 7). The [GPMC_CONFIG\[0\]](#) NANDFORCEPOSTEDWRITE bit enables write accesses to these locations as posted, even if they are defined as nonposted.

A write buffer is used to store write transaction information before the external device is accessed:

- Up to eight consecutive posted write accesses can be accepted and stored in the write buffer.
- For nonposted write, the pipeline is one deep.
- An [GPMC_STATUS\[0\]](#) EMPTYWRITEBUFFERSTATUS bit stores the empty status of the write buffer.

[GPMC_NAND_COMMAND_i](#) and [GPMC_NAND_ADDRESS_i](#) (i = 0 to 7) are 32-bit word locations, which means any 32-bit word or 16-bit word access is split into 4- or 2-byte accesses if an 8-bit wide NAND device is attached. For multiple-command phase or multiple-address phase, the software driver can use 32-bit word or 16-bit word access to these registers, but it must account for the splitting and little-endian ordering scheme. When only one byte command or address phase is required, only byte write access to [GPMC_NAND_COMMAND_i](#) and [GPMC_NAND_ADDRESS_i](#) can be used, and any of the four byte locations of the registers are valid.

The same applies to a [GPMC_NAND_COMMAND_i](#) and a [GPMC_NAND_ADDRESS_i](#) (i = 0 to 7) 32-bit word write access to a 16-bit wide NAND device (split into two 16-bit word accesses). In the case of a 16-bit word write access, the MSByte of the 16-bit word value must be set according to the NAND device requirement (usually 0). Either 16-bit word location or any one of the four byte locations of the registers is valid.

16.4.4.13.1.3 Command Latch Cycle

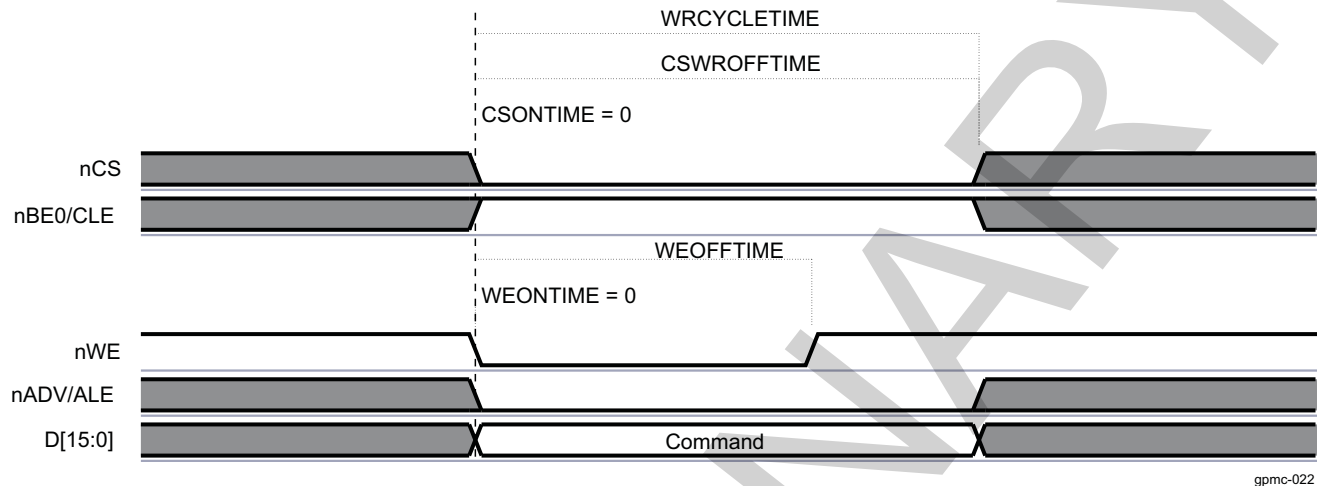

Writing data at the [GPMC_NAND_COMMAND_i](#) location (i = 0 to 7) places the data as the NAND command value on the bus, using a regular asynchronous write access.

- nCE is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- CLE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.

- nWE is controlled by the WEONTIME and WEOFFTIME timing parameters.
- ALE and nRE (nOE) are maintained inactive.

Figure 16-76 shows the NAND command latch cycle.

Figure 16-76. NAND Command Latch Cycle

NOTE: CLE is shared with the nBE0 output signal and has an inverted polarity from BE0. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, nBE0 (also nBE1) must not toggle, because it is shared with CLE.

NAND Flash memories do not use byte enable signals at all.

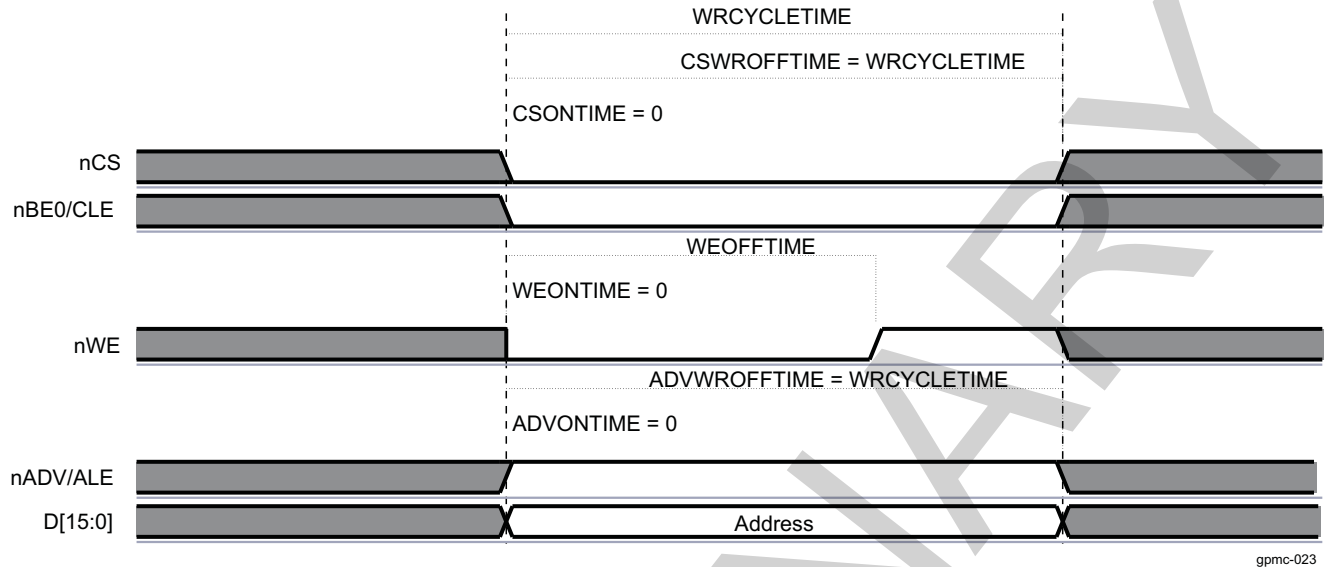

16.4.4.13.1.4 Address Latch Cycle

Writing data at the [GPMC_NAND_ADDRESS_i](#) location ($i = 0$ to 7) places the data as the NAND partial address value on the bus, using a regular asynchronous write access.

- nCS is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- ALE is controlled by the ADVONTIME and ADVWROFFTIME timing parameters.
- nWE is controlled by the WEONTIME and WEOFFTIME timing parameters.
- CLE and nRE (nOE) are maintained inactive.

Figure 16-77 shows the NAND address latch cycle.

Figure 16-77. NAND Address Latch Cycle

NOTE: ALE is shared with the nADV output signal and has an inverted polarity from ADV. The NAND qualifier deals with this. During the asynchronous NAND data access cycle, ALE is kept stable.

16.4.4.13.1.5 NAND Device Data Read and Write Phase Control in Stream Mode

NAND device data read and write accesses are achieved through a read or write request to the chip-select-associated memory region at any address location in the region or through a read or write request to the [GPMC_NAND_DATA_i](#) location ($i = 0$ to 7) mapped in the chip-select-associated control register region. [GPMC_NAND_DATA_i](#) is not a true register, but an address location to enable **nRE** or **nWE** signal control. The associated chip-select signal timing control must be programmed according to the NAND device timing specification.

Reading data from the [GPMC_NAND_DATA_i](#) location or from any location in the associated chip-select memory region activates an asynchronous read access.

- **nCS** is controlled by the **CSONTIME** and **CSRDOFFTIME** timing parameters.
- **nRE** is controlled by the **OEONTIME** and **OEOFFTIME** timing parameters.
- To take advantage of **nRE** high-to-data invalid minimum timing value, the **RDACCESSTIME** can be set so that data are effectively captured after **nRE** deassertion. This allows optimization of NAND read access cycle time completion. For optimal timing parameter settings, see the NAND device and the device IC timing parameters.

ALE, CLE, and **nWE** are maintained inactive.

[Figure 16-78](#) shows the NAND data read cycle.

Figure 16-78. NAND Data Read Cycle

Writing data to the [GPMC_NAND_DATA_i](#) location or to any location in the associated chip-select memory region activates an asynchronous write access.

- nCS is controlled by the CSONTIME and CSWROFFTIME timing parameters.
- nWE is controlled by the WEONTIME and WEOFFTIME timing parameters.
- ALE, CLE, and nRE (nOE) are maintained inactive.

[Figure 16-79](#) shows the NAND data write cycle.

Figure 16-79. NAND Data Write Cycle

16.4.4.13.1.6 NAND Device General Chip-Select Timing Control Requirement

For most NAND devices, read data access time is dominated by nCS-to-data-valid timing and has faster nRE-to-data-valid timing. Successive accesses with nCS deassertions between accesses are affected by this timing constraint. Because accesses to a NAND device can be interleaved with other chip-select accesses, there is no certainty that nCS always stays low between two accesses to the same chip-select. Moreover, an nCS deassertion time between the same chip-select NAND accesses is likely to be required as follows: the nCS deassertion requires programming CYCLETIME and RDACCESSTIME according to the nCS-to-data-valid critical timing.

To get full performance from NAND read and write accesses, the prefetch engine can dynamically reduce

RDCYCLETIME, WRCYCLETIME, RDACCESSTIME, WRACCESSTIME, CSRDOFFTIME, CSWROFFTIME, ADVRDOFFTIME, ADVWROFFTIME, OEOFFTIME, and WEOFFTIME on back-to-back NAND accesses (to the same memory) and suppress the minimum nCS high pulse width between accesses. For more information about optimal prefetch engine access, see [Section 16.4.4.13.4, Prefetch and Write-Posting Engine](#).

Some NAND devices require minimum write-to-read idle time, especially for device-status read accesses following status-read command programming (write access). If such write-to-read transactions are used, a minimum nCS high pulse width must be set. For this, CYCLE2CYCLESAMECSSEN and CYCLE2CYCLEDELAY must be set according to the appropriate timing requirement to prevent any timing violation.

NAND devices usually have an important nRE high to data bus in tristate mode. This requires a bus turnaround setting (BUSTURNAROUND = 1), so that the next access to a different chip-select is delayed until the BUSTURNAROUND delay completes. Back-to-back NAND read accesses to the same NAND Flash are not affected by the programmed bus turnaround delay.

16.4.4.13.1.7 Read and Write Access Size Adaptation

16.4.4.13.1.7.1 8-bit wide NAND Device

Host 16-bit word and 32-bit word read and write access requests to a chip-select associated with an 8-bit wide NAND device are split into successive read and write byte accesses to the NAND memory device. Byte access is ordered according to little-endian organization. A NAND 8-bit wide device must be interfaced on the D0D7 interface bus lane. GPMC data accesses are justified on this bus lane when the chip-select is associated with an 8-bit wide NAND device.

16.4.4.13.1.7.2 16-bit wide NAND Device

Host 32-bit word read and write access requests to a chip-select associated with a 16-bit wide NAND device are split into successive read and write 16-bit word accesses to the NAND memory device. 16-bit word access is ordered according to little-endian organization.

Host byte read and write access requests to a 16-bit wide NAND device are completed as 16-bit accesses on the device itself, because there is no byte-addressing capability on 16-bit wide NAND devices. This means that the NAND device address pointer is incremented on a 16-bit word basis and not on a byte basis. For a read access, only the requested byte is given back to the host, but the remaining byte is not stored or saved by the GPMC, and the next byte or 16-bit word read access gets the next 16-bit word NAND location. For a write access, the invalid byte part of the 16-bit word is driven to FF, and the next byte or 16-bit word write access programs the next 16-bit word NAND location.

Generally, byte access to a 16-bit wide NAND device should be avoided, especially when ECC calculation is enabled. 8-bit or 16-bit ECC-based computations are corrupted by a byte read to a 16-bit wide NAND device, because the nonrequested byte is considered invalid on a read access (not captured on the external data bus; FF is fed to the ECC engine) and is set to FF on a write access.

Host requests (read/write) issued in the chip-select memory region are translated in successive single or split accesses (read/write) to the attached device. Therefore, incrementing 32-bit burst requests are translated in multiple 32-bit sequential accesses following the access adaptation of the 32-bit to 8- or 16-bit device.

16.4.4.13.2 NAND Device-Ready Pin

The NAND memory device provides a ready pin to indicate data availability after a block/page opening and to indicate that data programming is complete. The ready pin can be connected to one of the WAIT GPMC input pins; data read accesses must not be tried when the ready pin is sampled inactive (device is not ready) even if the associated chip-select WAITREADMONITORING bit field is set. The duration of the NAND device busy state after the block/page opening is so long (up to 50 micro second) that accesses occurring when the ready pin is sampled inactive can stall GPMC access and eventually cause a system time-out.

NOTE: If a read access to a NAND flash is done using the wait monitoring mode, the device is blocked during a page opening, and so is the GPMC. If the correct settings are used, other chip-selects can be used while the memory processes the page opening command.

To avoid a time-out caused by a block/page opening delay in NAND flash, disable the wait pin monitoring for read and write accesses (that is, set the [GPMC_CONFIG1_i\[21\]](#) WAITWRITEMONITORING and [GPMC_CONFIG1_i\[22\]](#) WAITREADMONITORING bits to 0, where $i = 0$ to 7), and use one of the following methods instead:

- Use software to poll the WAITnSTATUS bit ($n = 0$ to 3) of the [GPMC_STATUS](#) register.
- Configure an interrupt that is generated on the WAIT signal change (through the [GPMC_IRQENABLE](#) register bits[11:8]).

Even if the READWAITMONITORING bit is not set, the external memory nR/B pin status is captured in the programmed WAIT bit in the [GPMC_STATUS](#) register.

The READWAITMONITORING bit method must be used for other memories than NAND flash, if they require the use of a WAIT signal.

16.4.4.13.2.1 Ready Pin Monitored by Software Polling

The ready signal state can be monitored through the [GPMC_STATUS](#) WAITxSTATUS bit ($x = 0$ or 1). The software must monitor the ready pin only when the signal is declared valid. Refer to the NAND device timing parameters to set the correct software temporization to monitor ready only after the invalid window is complete from the last read command written to the NAND device.

16.4.4.13.2.2 Ready Pin Monitored by Hardware Interrupt

Each gpmc_wait input pin can generate an interrupt when a wait-to-no-wait transition is detected. Depending on whether the [GPMC_CONFIG](#) WAITxPINPOLARITY bits ($x = 0$ or 1) is active low or active high, the wait-to-no-wait transition is a low-to-high external WAIT signal transition or a high-to-low external WAIT signal transition, respectively.

The wait transition pin detector must be cleared before any transition detection. This is done by writing 1 to the WAITxEDGEDETECTIONSTATUS bit ($x = 0$ or 3) of the [GPMC_IRQSTATUS](#) register according to the gpmc_wait pin used for the NAND device-ready signal monitoring. To detect a wait-to-no-wait transition, the transition detector requires a wait active time detection of a minimum of two GPMC_FCLK cycles. Software must incorporate precautions to clear the wait transition pin detector before wait (busy) time completes.

A wait-to-no-wait transition detection can issue a GPMC interrupt if the WAITxEDGEDETECTIONENABLE bit in the [GPMC_IRQENABLE](#) register is set and if the WAITxEDGEDETECTIONSTATUS bit field in the [GPMC_IRQSTATUS](#) register is set.

The WAITMONITORINGTIME field does not affect wait-to-no-wait transition time detection.

It is also possible to poll the WAITxEDGEDETECTIONSTATUS bit field in the [GPMC_IRQSTATUS](#) register according to the gpmc_wait pin used for the NAND device ready signal monitoring.

16.4.4.13.3 ECC Calculator

The General Purpose Memory Controller includes an Error Code Correction (ECC) calculator circuitry that enables on the fly ECC calculation during data read or data program (that is, write) operations. The page size supported by the ECC calculator in one calculation/context is 512 bytes.

The user can choose from two different algorithms with different error correction capabilities through the [GPMC_ECC_CONFIG\[16\]](#) ECCALGORITHM bit:

1. Hamming code for 1-bit error code correction on 8- or 16-bit NAND Flash organized with page size greater than 512 bytes
2. BCH (Bose-Chaudhuri-Hocquenghem) code for 4- to 16-bit error correction

The GPMC does not directly handle the error code correction itself. During writes, the GPMC computes parity bits. During reads, the GPMC provides enough information for the processor to correct errors without reading the data buffer all over again.

The Hamming code ECC is based on a 2-dimensional (row and column) bit parity accumulation. This parity accumulation is either accomplished on the programmed number of bytes or 16-bit words read from the memory device, or written to the memory device in stream mode.

Because the ECC engine includes only one accumulation context, it can be allocated to only one chip-select at a time through the [GPMC_ECC_CONFIG\[3:1\]](#) ECCCS bit field. Even if two CS use different ECC algorithms, one the Hamming code and the other a BCH code, they must define separate ECC contexts because some of the ECC registers are common to all types of algorithms.

16.4.4.13.3.1 Hamming Code

All references to Error Code Correction (ECC) in this subsection refer to the 1-bit error correction Hamming code.

The ECC is based on a two-dimensional (row and column) bit parity accumulation known as Hamming Code. The parity accumulation is done for a programmed number of bytes or 16-bit word read from the memory device or written to the memory device in stream mode.

There is no automatic error detection or correction, and it is the software NAND driver responsibility to read the multiple ECC calculation results, compare them to the expected code value, and take the appropriate corrective actions according to the error handling strategy (ECC storage in spare byte, error correction on read, block invalidation).

The ECC engine includes a single accumulation context. It can be allocated to a single designated chip-select at a time and parallel computations on different chip-selects are not possible. Since it is allocated to a single chip-select, the ECC computation is not affected by interleaved GPMC accesses to other chip-selects and devices. The ECC accumulation is sequentially processed in the order of data read from or written to the memory on the designated chip-select. The ECC engine does not differentiate read accesses from write accesses and does not differentiate data from command or status information. It is the software responsibility to make sure only relevant data are passed to the NAND flash memory while the ECC computation engine is active.

The starting NAND page location must be programmed first, followed by an ECC accumulation context reset with an ECC enabling, if required. The NAND device accesses discussed in the following sections must be limited to data read or write until the specified number of ECC calculations is completed.

16.4.4.13.3.1.1 ECC Result Register and ECC Computation Accumulation Size

The GPMC includes up to nine ECC result registers ([GPMC_ECCj_RESULT](#), j = 1 to 9) to store ECC computation results when the specified number of bytes or 16-bit words has been computed.

The ECC result registers are used sequentially; one ECC result is stored in one ECC result register on the list, the next ECC result is stored in the next ECC result register on the list, and so forth, until the last ECC computation. The [GPMC_ECCj_RESULT](#) register value is valid only when the programmed number of bytes or 16-bit words has been accumulated, which means that the same number of bytes or 16-bit words has been read from or written to the NAND device in sequence.

The [GPMC_ECC_CONTROL\[3:0\]](#) ECCPOINTER field must be set to the correct value to select the ECC result register to be used first in the list for the incoming ECC computation process. The ECCPointer can be read to determine which ECC register is used in the next ECC result storage for the ongoing ECC computation. The [GPMC_ECCj_RESULT](#) register value (j = 1 to 9) can be considered valid when ECCPOINTER equals j + 1. When [GPMC_ECCj_RESULT](#) (where j = 9) is updated, ECCPOINTER is frozen at 10, and ECC computing is stopped (ECCENABLE = 0).

The ECC accumulator must be reset before any ECC computation accumulation process. The [GPMC_ECC_CONTROL\[8\]](#) ECCCLEAR bit must be set to 1 (nonpersistent bit) to clear the accumulator and all ECC result registers.

For each ECC result (each [GPMC_ECCj_RESULT](#) register, j = 1 to 9), the number of bytes or 16-bit words used for ECC computing accumulation can be selected from between two programmable values.

The ECCjRESULTSISE bits (j = 1 to 9) in the [GPMC_ECC_SIZE_CONFIG](#) register select which programmable size value (ECCSIZE0 or ECCSIZE1) must be used for this ECC result (stored in [GPMC_ECCj_RESULT](#)).

The ECCSIZE0 and ECCSIZE1 fields allow selection of the number of bytes or 16-bit words used for ECC computation accumulation. Any even values from 2 to 512 are allowed.

Flexibility in the number of ECCs computed and the number of bytes or 16-bit words used in the successive ECC computations enables different NAND page error-correction strategies. Usually based on 256 or 512 bytes and on 128 or 256 16-bit word, the number of ECC results required is a function of the NAND device page size. Specific ECC accumulation size can be used when computing the ECC on the NAND spare byte.

For example, with a 2 Kbyte data page 8-bit wide NAND device, eight ECCs accumulated on 256 bytes can be computed and added to one extra ECC computed on the 24 spare bytes area where the eight ECC results used for comparison and correction with the computed data page ECC are stored. The GPMC then provides nine [GPMC_ECCj_RESULT](#) registers (j= 1 to 9) to store the results. In this case, ECCSIZE0 is set to 256, and ECCSIZE1 is set to 24; the ECC[1:8]RESULTSISE bits are set to 0, and the ECC9RESULTSISE bit is set to 1.

16.4.4.13.3.1.2 ECC Enabling

The [GPMC_ECC_CONFIG](#)[3:1] ECCCS field selects the allocated chip-select. The [GPMC_ECC_CONFIG](#)[0] ECCENABLE bit enables ECC computation on the next detected read or write access to the selected chip-select.

The ECCPOINTER, ECCCLEAR, ECCSIZE, ECCjRESULTSISE (where j = 1 to 9), ECC16B, and ECCCS fields must not be changed or cleared while an ECC computation is in progress.

The ECC accumulator and ECC result register must not be changed or cleared while an ECC computation is in progress.

[Table 16-227](#) describes the ECC enable settings.

Table 16-227. ECC Enable Settings

| Bit Field | Register | Value | Comments |
|-----------------------------------|--------------------------------------|-----------|---|
| ECCCS | GPMC_ECC_CONFIG | 0-3 | Selects the chip-select where ECC is computed |
| ECC16B | GPMC_ECC_CONFIG | 0/1 | Selects column number for ECC calculation |
| ECCCLEAR | GPMC_ECC_CONTROL | 0-7 | Clears all ECC result registers |
| ECCPOINTER | GPMC_ECC_CONTROL | 0-7 | A write to this bit field selects the ECC result register where the first ECC computation is stored. Set to 1 by default. |
| ECCSIZE1 | GPMC_ECC_SIZE_CONFIG | 0x00-0xFF | Defines ECCSIZE1 |
| ECCSIZE0 | GPMC_ECC_SIZE_CONFIG | 0x00-0xFF | Defines ECCSIZE0 |
| ECCjRESULTSISE (j from 1 to 9) | GPMC_ECC_SIZE_CONFIG | 0/1 | Selects the size of ECCn result register |
| ECCENABLE | GPMC_ECC_CONFIG | 1 | Enables the ECC computation |

16.4.4.13.3.1.3 ECC Computation

The ECC algorithm is a multiple parity bit accumulation computed on the odd and even bit streams extracted from the byte or Word 16 streams. The parity accumulation is split into row and column accumulations, as shown in [Figure 16-80](#) and [Figure 16-81](#). The intermediate row and column parities are used to compute the upper level row and column parities. Only the final computation of each parity bit is used for ECC comparison and correction.

P1o = bit7 XOR bit5 XOR bit3 XOR bit1 on each byte of the data stream

P1e = bit6 XOR bit4 XOR bit2 XOR bit0 on each byte of the data stream

P2o = bit7 XOR bit6 XOR bit3 XOR bit2 on each byte of the data stream

P2e = bit5 XOR bit4 XOR bit1 XOR bit0 on each byte of the data stream

$P4o = \text{bit7 XOR bit6 XOR bit5 XOR bit4}$ on each byte of the data stream

$P4e = \text{bit3 XOR bit2 XOR bit1 XOR bit0}$ on each byte of the data stream

Each column parity bit is XORed with the previous accumulated value.

Figure 16-80. Hamming Code Accumulation Algorithm (1/2)

gpmc-026

For line parities, the bits of each new data are XORed together, and line parity bits are computed as described below:

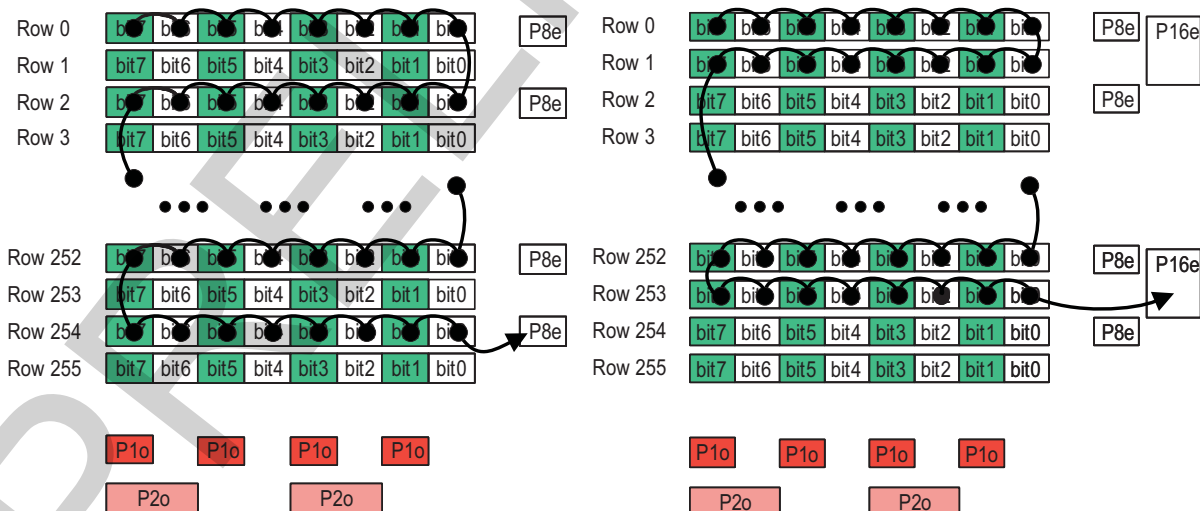

$P8e = \text{row0 XOR row2 XOR row4 XOR ... XOR row254}$

$P8o = \text{row1 XOR row3 XOR row5 XOR ... XOR row255}$

$P16e = \text{row0 XOR row1 XOR row4 XOR row5 XOR ... XOR row252 XOR row 253}$

$P16o = \text{row2 XOR row3 XOR row6 XOR row7 XOR ... XOR row254 XOR row 255}$

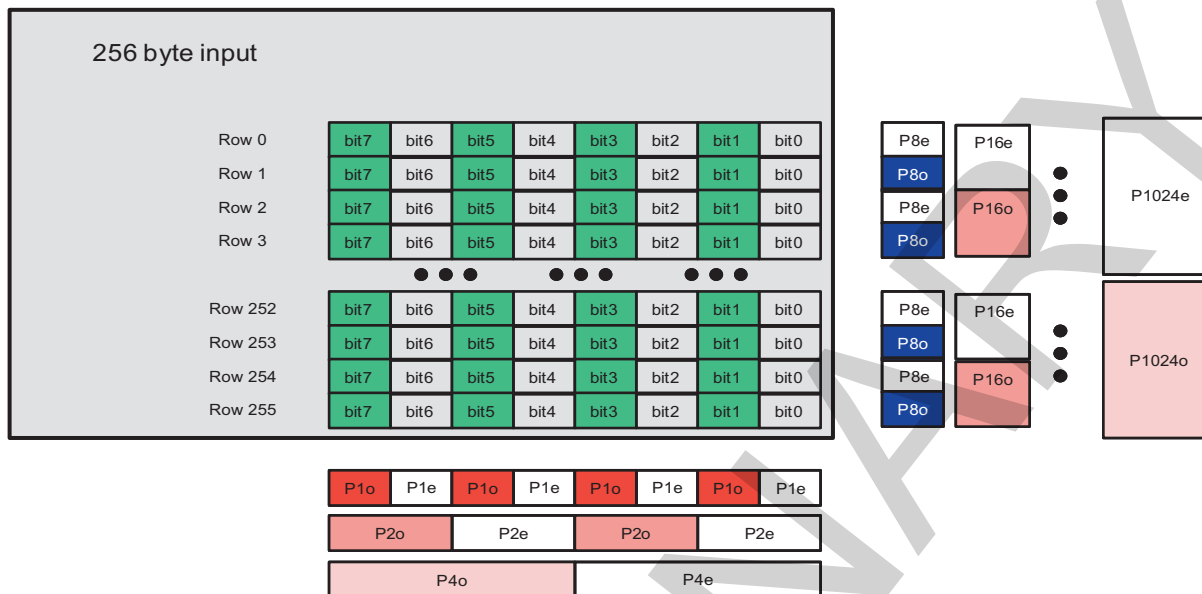

Figure 16-81. Hamming Code Accumulation Algorithm (2/2)

gpmc-027

Unused parity bits in the result registers are set to 0.

Figure 16-82 shows ECC computation for a 256-byte data stream (read or write). The result includes six column parity bits ($P1o$ - $P2o$ - $P4o$ for odd parities, and $P1e$ - $P2e$ - $P4e$ for even parities) and sixteen row parity bits ($P8o$ - $P16o$ - $P32o$ - $P1024o$ for odd parities, and $P8e$ - $P16e$ - $P32e$ - $P1024e$ for even parities).

Figure 16-82. ECC Computation for a 256-Byte Data Stream (Read or Write)

gpmc-028

Figure 16-83 shows ECC computation for a 512-byte data stream (read or write). The result includes six column parity bits (P1o-P2o-P4o for odd parities, and P1e-P2e-P4e for even parities) and eighteen row parity bits (P8o-P16o-P32o-P1024o - P2048o for odd parities, and P8e-P16e-P32e-P1024e- P2048e for even parities).

Figure 16-83. ECC Computation for a 512-Byte Data Stream (Read or Write)

gpmc-029

For a 2 Kbytes page, four 512 bytes ECC calculations plus one for the spare area are required. Results are stored in the [GPMC_ECCj_RESULT](#) registers ($j = 1$ to 9).

16.4.4.13.3.1.4 ECC Comparison and Correction

To detect an error, the computed ECC result must be XORed with the parity value stored in the spare area of the accessed page.

- If the result of this logical XOR is all 0s, no error is detected and the read data is correct.
- If every second bit in the parity result is a 1, one bit is corrupted and is located at bit address (P2048o, P1024o, P512o, P256o, P128o, P64o, P32o, P16o, P8o, P4o, P2o, P1o). The software must correct the corresponding bit.
- If only one bit in the parity result is 1, it is an ECC error and the read data is correct.

16.4.4.13.3.1.5 ECC Calculation Based on 8-Bit Word

The 8-bit based ECC computation is used for 8-bit wide NAND device interfacing.

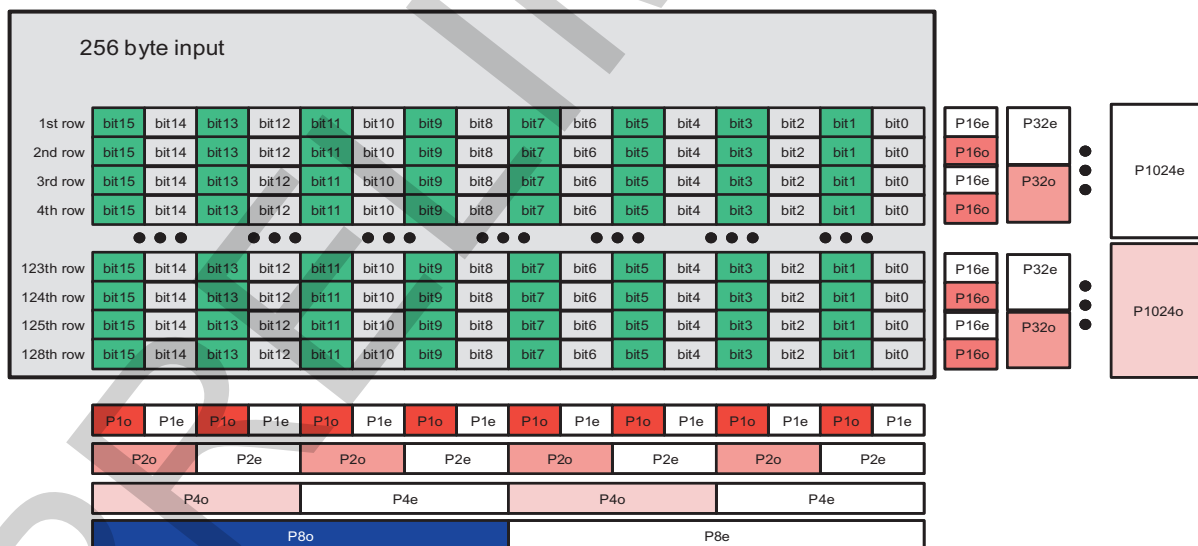

The 8-bit based ECC computation can be used for 16-bit wide NAND device interfacing to get backward compatibility on the error-handling strategy used with 8-bit wide NAND devices. In this case, the 16-bit wide data read from or written to the NAND device is fragmented into 2 bytes. According to little-endian access, the least significant bit (LSB) of the 16-bit wide data is ordered first in the byte stream used for 8-bit based ECC computation.

16.4.4.13.3.1.6 ECC Calculation Based on 16-Bit Word

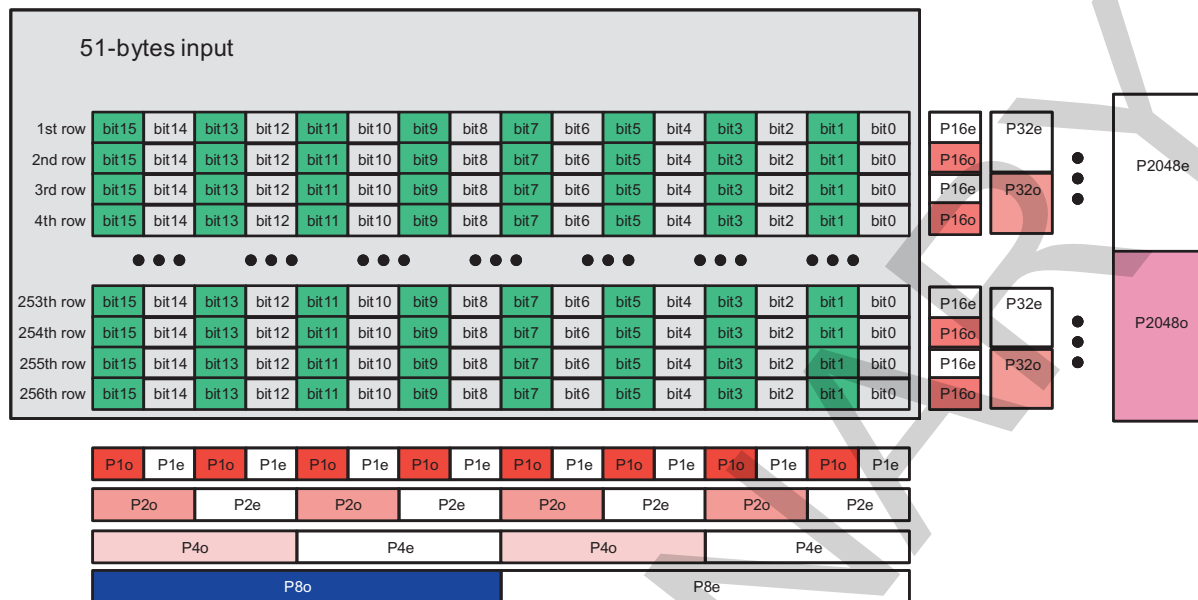

ECC computation based on a 16-bit word is used for 16-bit wide NAND device interfacing. This ECC computation is not supported when interfacing an 8-bit wide NAND device, and the [GPMC_ECC_CONFIG\[7\]](#) ECC16B bit must be set to 0 when interfacing an 8-bit wide NAND device.

The parity computation based on 16-bit words affects the row and column parity mapping. The main difference is that the odd and even parity bits P8o and P8e are computed on rows for an 8-bit based ECC while there are computed on columns for a 16-bit based ECC. [Figure 16-84](#) and [Figure 16-85](#) show a 128 Word 16 ECC computation scheme and a 256 16-bit word ECC computation scheme.

gpmc-030

Figure 16-85. 256 Word16 ECC Computation

gpmc-031

16.4.4.13.3.2 BCH Code (Bose-Chaudhuri-Hocquenghem)

All references to Error Code Correction (ECC) in this subsection refer to the 4- to 16-bit error correction BCH code.

16.4.4.13.3.2.1 Requirements

- Read and write accesses to a NAND flash take place by whole pages, in a predetermined sequence: first the data byte page itself, then some spare bytes, including the BCH ECC (and other information). The NAND IC can cache a full page, including spares, for read and write accesses.
Typical page write sequence:
 - Sequential write to NAND cache of main data + spare data, for a page. ECC is calculated on the fly. Calculated ECC may be inserted on the fly in the spares, or replaced by dummy accesses.
 - When the calculated ECC is replaced by dummy accesses, it must be written to the cache in a second, separate phase. The ECC module is disabled during that time.
 - NAND writes its cache line (page) to the array.
 Typical page read sequence:
 - Sequential read of a page. ECC is calculated on the fly.
 - ECC module buffers status determines the presence of errors.
- Accesses to several memories may be interleaved by the GPMC, but only one of those memories can be a NAND using the BCH engine at a time; in other words, only one BCH calculation (for example, for a single page) can be on-going at any time. Note also that the sequential nature of NAND accesses guarantees that the data is always written / read out in the same order. BCH-relevant accesses are selected by the GPMCs chip-select.
- Each page may hold up to 4 Kbytes of data, spare bytes not included. This means up to 8 x 512-byte BCH messages. Since all the data is written / read out first, followed by the BCH ECC, this means that the BCH engine must be able to hold 8 104-bit remainders or syndromes (or smaller, 52-bit ones) at the same time.
The BCH module has the capacity to store all remainders internally. After the page start, an internal counter is used to detect the 512-byte sector boundaries. On those boundaries, the current remainder is stored and the divider reset for the next calculation. At the end of the page, the BCH module contains all remainders.
- NAND access cycles hold 8 or 16 bits of data each (1 or 2 bytes); Each NAND cycle takes at least 4

cycles of the GPMCs internal clock. This means the NAND flash timing parameters must define a RDCYCLETIME and a WRCYCLETIME of at least 4 clock cycles after optimization when using the BCH calculator.

5. The spare area is assumed to be large enough to hold the BCH ECC, that is, to have at least a message of 13 bytes available per 512-byte sector of data. The zone of unused spare area by the ECC may or may not be protected by the same ECC scheme, by extending the BCH message beyond 512 bytes (maximum codeword is 1023-byte long, ECC included, which leaves a lot of space to cover some spares bytes).

16.4.4.13.3.2.2 Memory-Mapping of the BCH Codeword

BCH encoding considers a block of data to protect as a polynomial message $M(x)$. In our standard case, 512 bytes of data (that is, 2^{12} bits = 4096 bits) are seen as a polynomial of degree $2^{12} - 1 = 4095$, with parameters ranging from M0 to M4095. For 512 bytes of data, 52 bits are required for 4-bit error correction, and 104 bits are required for 8-bit error correction and 207 bits are required for 16-bit error correction. The ECC is a remainder polynomial $R(x)$ of degree 103 (or 51, depending on the selected mode). The complete codeword $C(x)$ is the concatenation of $M(x)$ and $R(x)$ as shown in Table 16-228.

Table 16-228. Flattened BCH Codeword Mapping (512 Bytes + 104 Bits)

| Bit number | Message $M(x)$ | | | ECC $R(x)$ | | |
|------------|----------------|-----|----|------------|-----|----|
| | M4095 | ... | M0 | R103 | ... | R0 |

If the message is extended by the addition of spare bytes to be protected by the same ECC, the principle is still valid. For example, a 3-byte extension of the message gives a polynomial message $M(x)$ of degree $((512 + 3) * 8) - 1 = 4119$, for a total of $3 + 13 = 16$ spare bytes of spare, all protected as part of the same codeword.

The message and the ECC bits are manipulated and mapped in the GPMC byte-oriented system. The ECC bits are stored in [GPMC_BCH_RESULT0_i](#), [GPMC_BCH_RESULT1_i](#), [GPMC_BCH_RESULT2_i](#), and [GPMC_BCH_RESULT3_i](#) (where $i = 0$ to 7).

16.4.4.13.3.2.2.1 Memory-Mapping of the Data Message

The data message mapping shall follow the following rules:

- Bit endianness within a byte is little-endian, that is, the bytes LS bit is also the lowest-degree polynomial parameter: a byte b7-b0 (with b0 the LS bit) represents a segment of polynomial $b7 * x^{(7+i)} + b6 * x^{(6+i)} + \dots + b0 * x^i$
- The message is mapped in the NAND starting with the highest-order parameters, that is, in the lowest addresses of a NAND page.
- Byte endianness within the NANDs 16-bit words is big endian. This means that the same message mapped in 8- and 16-bit memories has the same content at the same byte address.

NOTE: The BCH module has no visibility over actual addresses. The most important point is the sequence of data word the BCH sees. However, the NAND page is always scanned incrementally in read and write accesses, and this produces the mapping patterns described below.

The following tables represent the mapping of the same 512-byte vector (typically a BCH message) in the NANDs memory space. Note that the byte 'address' is only an offset modulo 512 (0x200), since the same page may contain several contiguous 512-byte sectors (BCH blocks). The LSB and MSB are respectively the bits M0 and $M(2^{12}-1)$ of the codeword mapping given above. In both cases the data vectors are aligned, that is, their boundaries coincide with the RAMs data word boundaries.

Table 16-229. Aligned Message Byte Mapping in 8-bit NAND

| Byte offset | 8-bit word |
|-------------|------------------------|
| 0x000 | (msb) Byte 511 (0x1FF) |
| 0x001 | Byte 510 (0x1FE) |
| ... | ... |
| 0x1FF | Byte 0 (0x0) (lsb) |

Table 16-230. Aligned Message Byte Mapping in 16-bit NAND

| Byte offset | 16-bit words MSB | 16-bit words LSB |
|-------------|------------------|------------------------|
| 0x000 | Byte 510 (0x1FE) | (msb) Byte 511 (0x1FF) |
| 0x002 | Byte 508 (0x1FC) | Byte 509 (0x1FD) |
| ... | ... | ... |
| 0x1FE | Byte 0 (0x0) | (lsb) Byte 1 (0x1) |

The following tables show the mapping in memory of arbitrarily-sized messages, starting on access (byte or 16-bit word) boundaries for more clarity. Note that message may actually start and stop on arbitrary nibbles. A nibble is a 4-bit entity. The unused nibbles are not discarded, and they can still be used by the BCH module, but as part of the next message section (for example, on another sectors ECC).

Table 16-231. Aligned Nibble Mapping of Message in 8-bit NAND

| Byte offset | 8-bit word | |
|-------------|-------------------------------|-------------------------------|
| | 4-bit most significant Nibble | 4-bit less significant Nibble |
| 1 | (msb) Nibble S-1 | Nibble S-2 |
| 2 | Nibble S-3 | Nibble S-4 |
| ... | ... | ... |
| S/2 - 2 | Nibble 3 | Nibble 2 |
| S/2 - 1 | Nibble 1 | Nibble 0 (lsb) |

Table 16-232. Misaligned Nibble Mapping of Message in 8-bit NAND

| Byte offset | 8-bit word | |

| $(S+3)/2 - 4$ | Nibble 2 | Nibble 1 | Nibble 4 | Nibble 3 |
| $(S+3)/2 - 2$ | | | Nibble 0 (lsb) | |

Note that many other cases exist than the ones represented above, for example, where the message does not start on a word boundary.

16.4.4.13.3.2.2.2 Memory-Mapping of the ECC

The ECC (or remainder) is presented by the BCH module as a single 104-bit (or 52-bit), little-endian vector. It is up to the software to fetch those 13 bytes (or 6 bytes) from the modules interface, then store them to the NANDs spare area (page write) or to an intermediate buffer for comparison with the stored ECC (page read). There are no constraints on the ECC mapping inside the spare area: it is a softwarecontrolled operation.

However, it is advised to maintain a coherence in the respective formats of the message or the ECC remainder once they have been read out of the NAND. The error correction algorithm works from the complete codeword (concatenated message and remainder) once an error as been detected. The creation of this codeword should be made as straightforward as possible.

There are cases where the same NAND access contains both data and the ECC protecting that data. This is the case when the data/ECC boundary (which can be on any nibble) does not coincide with an access boundary. The ECC is calculated on-the-fly following the write. In that case, the write must also contain part of the ECC because it is impossible to insert the ECC on-the-fly. Instead:

- During the initial page write (BCH encoding), the ECC is replaced by dummy bits. The BCH encoder is by definition turned OFF during the ECC section, so the BCH result is unmodified.
- During a second phase, the ECC is written to the correct location, next to the actual data.
- The completed line buffer is then written to the NAND array.

16.4.4.13.3.2.2.3 Wrapping Modes

For a given wrapping mode, the module automatically goes through a specific number of sections, as data is being fed into the module. For each section, the BCH core can be enabled (in which case the data is fed to the BCH divider) or not (in which case the BCH simply counts to the end of the section). When enabled, the data is added to the ongoing calculation for a given sector number (for example, number 0).

Wrapping modes are described below. To get a better understanding and see the real-life read and write sequences implemented with each mode, see [Section 16.4.4.13.3.2.3, Supported NAND Page Mappings and ECC Schemes](#).

For each mode:

- a sequence describes the mode in pseudo-language, with for each section the size and the buffer used for ECC processing (if ON). The programmable lengths are size, size0 and size1.
- a checksum condition is given. If the checksum condition is not respected for a given mode, the modules behavior is unpredictable. S is the number of sectors in the page; size0 and size1 are the section sizes programmed for the mode, in nibbles.

Note that wrapping modes 8, 9, 10, and 11 insert a 1-nibble padding where the BCH processing is OFF. This is intended for $t = 4$ ECC, where ECC is 6 bytes long and the ECC area is expected to include (at least) 1 unused nibble to remain byte-aligned.

16.4.4.13.3.2.4 Manual Mode (0x0)

This mode is intended for short sequences, added manually to a given buffer through the software data port input. A complete page may be built out of several such sequences.

To process an arbitrary sequence of 4-bit nibbles, accesses to the software data port must be made, containing the appropriate data. If the sequence end does not coincide with an access boundary (for example, to process 5 nibbles = 20 bits in 16-bit access mode) and those nibbles need to be skipped, a number of unused nibbles must be programmed in [GPMC_ECC_SIZE_CONFIG\[29:22\] ECCSIZE1](#). (In the same example: 5 nibbles to process + 3 to discard = 8 nibbles = exactly 2 x 16-bit accesses. Software must set:

- [GPMC_ECC_SIZE_CONFIG\[19:12\] ECCSIZE0](#) = 0x5
- [GPMC_ECC_SIZE_CONFIG\[29:22\] ECCSIZE1](#) = 0x3

NOTE: In the following figures size and size0 are the same parameter.

Figure 16-86. Manual Mode Sequence and Mapping

gpmc-032

Section processing sequence:

- One time with buffer
 - size0 nibbles of data, processing ON
 - size1 nibbles of unused data, processing OFF

Checksum: size0 + size1 nibbles must fit in a whole number of accesses.

In the following sections, S is the number of sectors in the page.

16.4.4.13.3.2.5 Mode 0x1

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
 - size0 nibbles spare, processing ON
 - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = S × (size0 + size1)

16.4.4.13.3.2.6 Mode 0xA (10)

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
 - size0 nibbles spare, processing ON
 - 1 nibble pad spare, processing OFF

- size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = $S \times (\text{size0} + 1 + \text{size1})$

16.4.4.13.3.2.2.7 Mode 0x2

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
 - size0 nibbles spare, processing OFF
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = $S \times (\text{size0} + \text{size1})$

16.4.4.13.3.2.2.8 Mode 0x3

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- One time with buffer 0
 - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = $\text{size0} + (S \times \text{size1})$

16.4.4.13.3.2.2.9 Mode 0x7

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- One time with buffer 0
 - size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
 - size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = $\text{size0} + (S \times \text{size1})$

16.4.4.13.3.2.2.10 Mode 0x8

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- One time with buffer 0
 - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
 - 1 nibble padding spare, processing OFF
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = $\text{size0} + (S \times (1 + \text{size1}))$

16.4.4.13.3.2.2.11 Mode 0x4

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
 - One time (no buffer used)
 - size0 nibbles spare, processing OFF
 - Repeat with buffer 0 to S-1
 - size1 nibbles spare, processing ON
- Checksum: Spare area size (nibbles) = size0 + (S × size1)

16.4.4.13.3.2.2.12 Mode 0x9

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- One time (no buffer used)
 - size0 nibbles spare, processing OFF
- Repeat with buffer 0 to S-1
 - 1 nibble padding spare, processing OFF
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = size0 + (S × (1+size1))

16.4.4.13.3.2.2.13 Mode 0x5

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
 - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S × (size0 + size1)

16.4.4.13.3.2.2.14 Mode 0xB (11)

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1
 - size0 nibbles spare, processing ON
- Repeat with buffer 0 to S-1
 - 1 nibble padding spare, processing OFF
 - size1 nibbles spare, processing ON

Checksum: Spare area size (nibbles) = S × (size0 + 1 + size1)

16.4.4.13.3.2.2.15 Mode 0x6

Page processing sequence:

- Repeat with buffer 0 to S-1
 - 512-byte data, processing ON
- Repeat with buffer 0 to S-1

- size0 nibbles spare, processing ON
- Repeat S times (no buffer used)
- size1 nibbles spare, processing OFF

Checksum: Spare area size (nibbles) = $S \times (\text{size0} + \text{size1})$

16.4.4.13.3.2.3 Supported NAND Page Mappings and ECC Schemes

The following rules apply throughout the entire mapping description:

- Main data area (sectors) size is hardcoded to 512 bytes.
- Spare area size is programmable.
- All page sections (of main area data bytes, protected spare bytes, unprotected spare bytes, and ECC) are defined as explained in [Section 16.4.4.13.3.2.1, Memory-Mapping of the Data Message](#).

Each one of the following sections shows a NAND page mapping example (per-sector spare mappings, pooled spare mapping, per-sector spare mapping, with ECC separated at the end of the page).

In the mapping diagrams, sections that belong to the same BCH codeword have the same color (blue or green); unprotected sections are not covered (orange) by the BCH scheme.

Below each mapping diagram, a write (encoding) and read (decoding: syndrome generation) sequence is given, with the number of the active buffers at each point in time (yellow). In the inactive zones (grey), no computing is taking place but the data counter is still active.

In [Figure 16-87](#) to [Figure 16-89](#), tables on the left summarize the mode, size0, size1 parameters to program for respectively write and read processing of a page, with the given mapping, where :

- P is the size of spare byte section Protected by the ECC (in nibbles)
- U is the size of spare byte section Unprotected by the ECC (in nibbles)
- E is the size of the ECC itself (in nibbles)
- S is the number of Sectors per page (2 in the current diagrams)

Each time the processing of a BCH block is complete (ECC calculation for write/encoding, syndrome generation for read/decoding, indicated by red arrows), the update pointer is pulsed. Note that the processing for block 0 can be the first or the last to complete, depending on the NAND page mapping and operation (read or write). All examples show a page size of 1kByte + spares, that is, $S = 2$ sectors of 512 bytes. The same principles can be extended to larger pages by adding more sectors.

The actual BCH codeword size is used during the error location work to restrict the search range: by definition, errors can only happen in the codeword that was actually written to the NAND, and not in the mathematical codeword of $n = 2^{13} - 1 = 8191$ bits. That codeword (higher-order bits) is all-zero and implicit during computations.

The actual BCH codeword size depends on the mode, on the programmed sizes and on the sector number (all sizes in nibbles):

- Spares mapped and protected per sector (below: see M1-M2-M3-M9-M10):
 - all sectors: $(512) + P + E$
- Spares pooled and protected by sector 0 (below: see M5-M6):
 - sector 0 codeword: $(512) + P + E$
 - other sectors: $(512) + E$
- Unprotected spares (below: see M4-M7-M8-M11-M12):
 - all codewords $(512) + E$

16.4.4.13.3.2.3.1 Per-Sector Spare Mappings

In these schemes, each 512-byte sector of the main area has its own dedicated section of the spare area. The spare area of each sector is composed of :

- ECC, which must be located after the data it protects
- other data, which may or may not be protected by the sectors ECC

Figure 16-87. NAND Page Mapping and ECC: Per-Sector Schemes

gpmc-033

16.4.4.13.3.2.3.2 Pooled Spare Mapping

In the schemes below, the spare area is pooled for the page.

- The ECC of each sector is aligned at the end of the spare area.
- The non-ECC spare data may or may not be covered by the ECC of sector 0

Figure 16-88. NAND Page Mapping and ECC: Pooled Spare Schemes

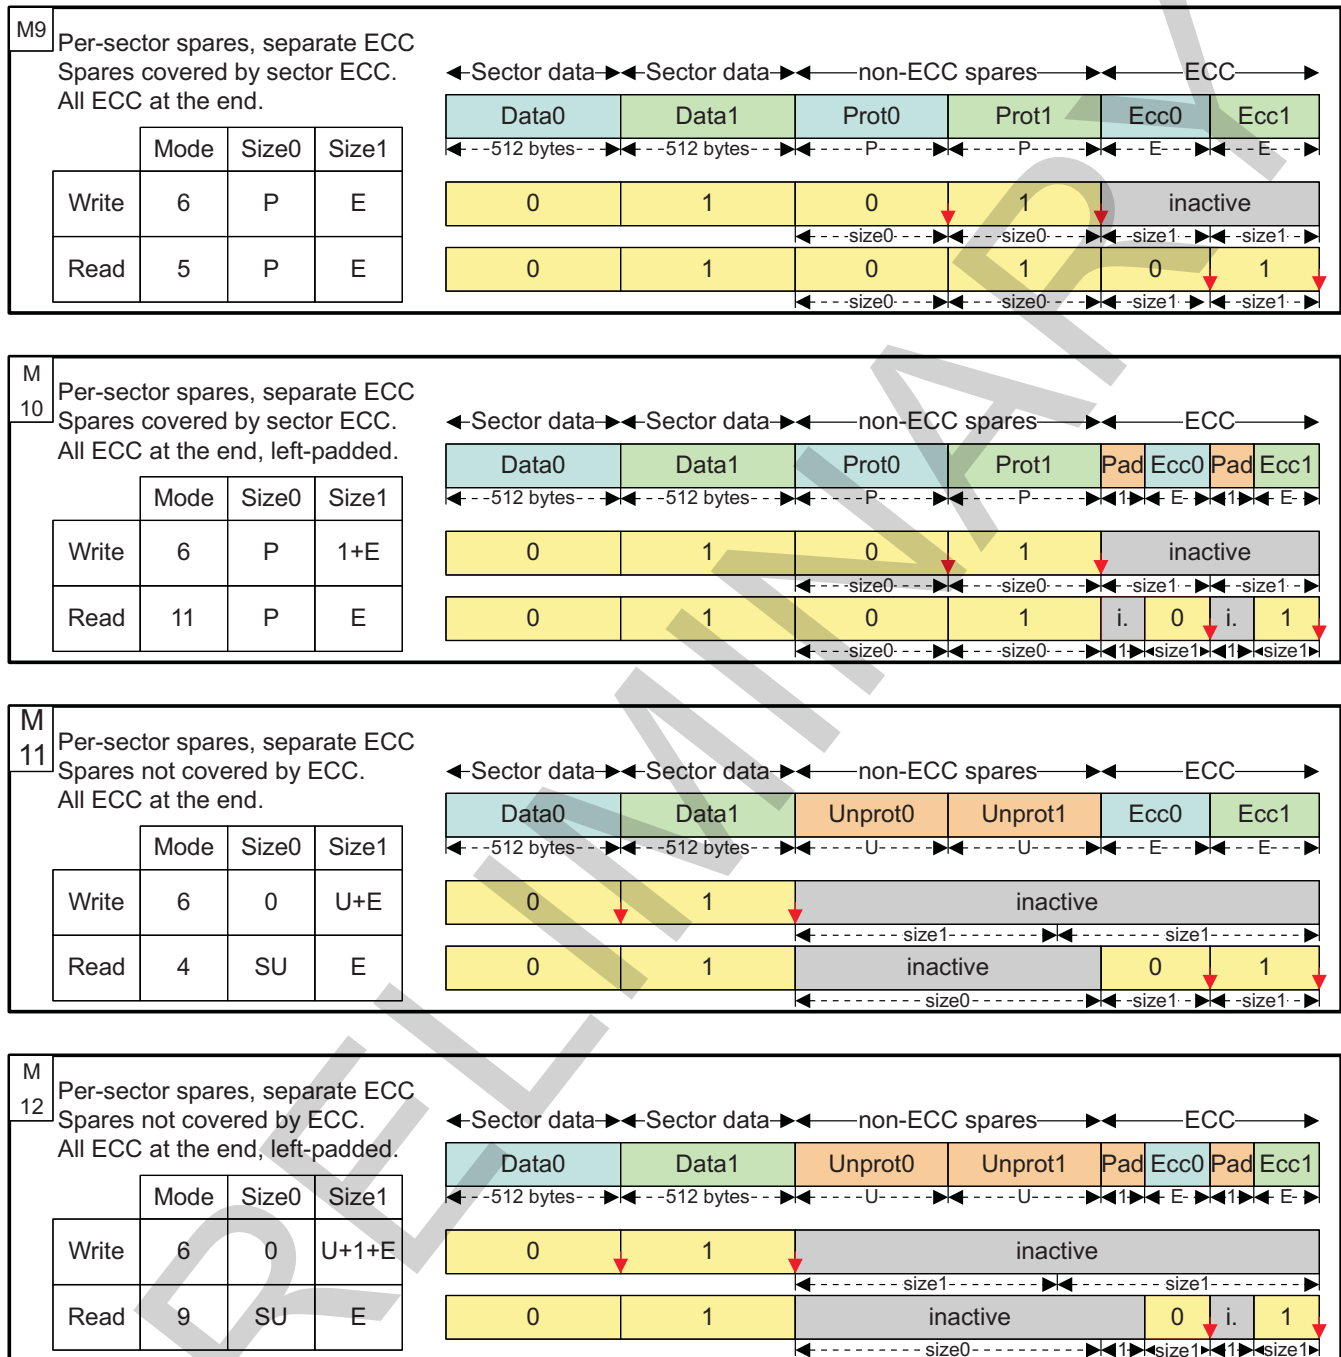

gpmc-034

16.4.4.13.3.2.3.3 Per-Sector Spare Mapping, with ECC Separated at the End of the Page

In these schemes, each 512-byte sector of the main area is associated with 2 sections of the spare area.

- ECC section, all aligned at the end of the page
- other data section, aligned before the ECCs, each of which may or may not be protected by its sectors ECC

Figure 16-89. NAND Page Mapping and ECC: Per-Sector Schemes, with Separate ECC

gpmc_035

16.4.4.13.4 Prefetch and Write-Posting Engine

NAND device data access cycles are usually much slower than the MPU system frequency; such NAND read or write accesses issued by the processor will impact the overall system performance, especially considering long read or write sequences required for NAND page loading or programming. To minimize this effect on system performance, the GPMC includes a prefetch and write-posting engine, which can be used to read from or write to any chip-select location in a buffered manner.

The prefetch and write-posting engine is a simplified embedded-access requester that presents requests to the access engine on a user-defined chip-select target. The access engine interleaves these requests with any request coming from the L3 interface; as a default the prefetch and write-posting engine has the lowest priority.

The prefetch and write-posting engine is dedicated to data-stream access (as opposed to random data access); thus, it is primarily dedicated to NAND support. The engine does not include an address generator; the request is limited to chip-select target identification. It includes a 64-byte FIFO associated with a DMA request synchronization line, for optimal DMA-based use.

The prefetch and write-posting engine uses an embedded 64 bytes (32 16-bit word) FIFO to prefetch data from the NAND device in read mode (prefetch mode) or to store host data to be programmed into the NAND device in write mode (write-posting mode). The FIFO draining and filling (read and write) can be controlled either by the MPU through interrupt synchronization (an interrupt is triggered whenever a programmable threshold is reached) or the sDMA through DMA request synchronization, with a programmable request byte size in both prefetch or posting mode.

The prefetch and write-posting engine includes a single memory pool. Therefore, only one mode, read or write, can be used at any given time. In other words, the prefetch and write-posting engine is a single-context engine that can be allocated to only one chip-select at a time for a read prefetch or a write-posting process.

The engine does not support atomic command and address phase programming and is limited to linear memory read or write access. In consequence, it is limited to NAND data-stream access. The engine relies on the MPU NAND software driver to control block and page opening with the correct data address pointer initialization, before the engine can read from or write to the NAND memory device.

Once started, the engine data reads and writes sequencing is solely based on FIFO location availability and until the total programmed number of bytes is read or written.

Any host-concurrent accesses to a different chip-select are correctly interleaved with ongoing engine accesses. The engine has the lowest priority access so that host accesses to a different chip-select do not suffer a large latency.

A round-robin arbitration scheme can be enabled to ensure minimum bandwidth to the prefetch and write-posting engine in the case of back-to-back direct memory requests to a different chip-select. If the [GPMC_PREFETCH_CONFIG1\[23\] PFPWENROUNDROBIN](#) bit is enabled, the arbitration grants the prefetch and write posting engine access to the GPMC bus for a number of requests programmed in the [GPMC_PREFETCH_CONFIG1\[19:16\] PFPWWEIGHTEDPRIO](#) field.

The prefetch/write-posting engine read or write request is routed to the access engine with the chip-select destination ID. After the required arbitration phase, the access engine processes the request as a single access with the data access size equal to the device size specified in the corresponding chip-select configuration.

NOTE: The destination chip-select configuration must be set to the NAND protocol-compatible configuration for which address lines are not used (the address bus is not changed from its current value). Selecting a different chip-select configuration can produce undefined behavior.

16.4.4.13.4.1 General Facts About the Engine Configuration

The engine can be configured only if the [GPMC_PREFETCH_CONTROL\[0\] STARTENGINE](#) bit is deasserted.

The engine must be correctly configured in prefetch or write-posting mode and must be linked to a NAND chip-select before it can be started. The chip-select is linked using the [GPMC_PREFETCH_CONFIG1\[26:24\] ENGINECSSELECTOR](#) field.

In both prefetch and write-posting modes, the engine respectively uses byte or 16-bit word access requests for an 8- or 16-bit-wide NAND device attached to the linked chip-select. The FIFOTHRESHOLD and TRANSFERCOUNT fields must be programmed accordingly as a number of bytes.

When the [GPMC_PREFETCH_CONFIG1\[7\]](#) ENABLEENGINE bit is set, the FIFO entry on the L3 interconnect port side is accessible at any address in the associated chip-select memory region. When the ENABLEENGINE bit is set, any host access to this chip-select is rerouted to the FIFO input. Directly accessing the NAND device linked to this chip-select from the host is still possible through the [GPMC_NAND_COMMAND_i](#), [GPMC_NAND_ADDRESS_i](#), and [GPMC_NAND_DATA_i](#) registers (where i = 0 to 7).

The FIFO entry on the L3 interconnect port can be accessed with byte, 16-bit word, or 32-bit word access size, according to little-endian format, even though the FIFO input is 32 bits wide.

The FIFO control is made easier through the use of interrupts or DMA requests associated with the FIFOTHRESHOLD bit field. The [GPMC_PREFETCH_STATUS\[30:24\]](#) FIFOPINTER field monitors the number of available bytes to be read in prefetch mode or the number of free empty slots which can be written in write-posting mode. The [GPMC_PREFETCH_STATUS\[13:0\]](#) COUNTVALUE field monitors the number of remaining bytes to be read or written by the engine according to the TRANSFERCOUNT value. The FIFOPINTER and COUNTVALUE bit fields are always expressed as a number of bytes even if a 16-bit wide NAND device is attached to the linked chip-select.

In prefetch mode, when the FIFOPINTER equals 0, that is, the FIFO is empty, a host read access receives the byte last read from the FIFO as its response. In case of 32-bit word or 16-bit word read accesses, the last byte read from the FIFO is copied the required number of times to fit the requested word size. In write-posting mode, when the FIFOPINTER equals 0, that is, the FIFO is full, a host write overwrites the last FIFO byte location. There is no underflow or overflow error reporting in the GPMC.

16.4.4.13.4.2 Prefetch Mode

The prefetch mode is selected when the [GPMC_PREFETCH_CONFIG1\[0\]](#) ACCESSMODE bit is cleared.

The MPU NAND software driver must issue the block and page opening (READ) command with the correct data address pointer initialization before the engine can be started to read from the NAND memory device. The engine is started by asserting the [GPMC_PREFETCH_CONTROL\[0\]](#) STARTENGINE bit. The STARTENGINE bit automatically clears when the prefetch process completes.

If required, the ECC calculator engine must be initialized (that is, reset, configured, and enabled) before the prefetch engine is started, so that the ECC is correctly computed on all data read by the prefetch engine.

When the [GPMC_PREFETCH_CONFIG1\[3\]](#) SYNCHROMODE bit is cleared, the prefetch engine starts requesting data as soon as the STARTENGINE bit is set. If using this configuration, the host must monitor the NAND device-ready pin so that it only sets the STARTENGINE bit when the NAND device is in a ready state, meaning data is valid for prefetching.

When the SYNCHROMODE bit is set, the prefetch engine starts requesting data when an active to inactive wait signal transition is detected. The transition detector must be cleared before any transition detection; see [Section 16.4.4.13.2.2, Ready Pin Monitored by Hardware Interrupt](#). The [GPMC_PREFETCH_CONFIG1\[5:4\]](#) WAITPINSELECTOR field selects which gpmc_wait pin edge detector triggers the prefetch engine in this synchronized mode.

If the STARTENGINE bit is set after the NAND address phase (page opening command), the engine is effectively started only after the actual NAND address phase completion. To prevent GPMC stall during this NAND address phase, set the STARTENGINE bit field before NAND address phase completion when in synchronized mode. The prefetch engine will start when an active to inactive wait signal transition is detected. The STARTENGINE bit is automatically cleared on prefetch process completion.

The prefetch engine issues a read request to fill the FIFO with the amount of data specified by [GPMC_PREFETCH_CONFIG2\[13:0\]](#) TRANSFERCOUNT field.

Table 16-237. Prefetch Mode Configuration

| Bit Field | Register | Value | Comments |
|------------------|--|--------|--|
| STARTENGINE | GPMC_PREFETCH_CONTROL[0] | 0 | Prefetch engine can be configured only if STARTENGINE is set to 0. |
| ENGINECSSELECTOR | GPMC_PREFETCH_CONFIG1[26:24] | 0 to 3 | Selects the chip-select associated with a NAND device where the prefetch engine is active. |

Table 16-237. Prefetch Mode Configuration (continued)

| Bit Field | Register | Value | Comments |
|-----------------------|---|--------|---|
| ACCESSMODE | GPMC_PREFETCH_CONFIG1 [0] | 0 | Selects prefetch mode |
| FIFOTHRESHOLD | GPMC_PREFETCH_CONFIG1 [14:8] | | Selects the maximum number of bytes read or written by the host on DMA or interrupt request |
| TRANSFERCOUNT | GPMC_PREFETCH_CONFIG2 [13:0] | | Selects the number of bytes to be read or written by the engine to the selected chip-select |
| SYNCHROMODE | GPMC_PREFETCH_CONFIG1 [3] | 0/1 | Selects when the engine starts the access to the chip-select |
| WAITPINSELECT | GPMC_PREFETCH_CONFIG1 [17:16] | 0 to 1 | Selects wait pin edge detector (if GPMC_PREFETCH_CONFIG1 [3] SYNCHROMODE = 0x1) |
| ENABLEOPTIMIZEDACCESS | GPMC_PREFETCH_CONFIG1 [27] | 0/1 | See Section 16.4.4.13.4.6, Optimizing NAND Access Using the Prefetch and Write-Posting Engine . |
| CYCLOOPTIMIZATION | GPMC_PREFETCH_CONFIG1 [30:28] | | Number of clock cycle removed to timing parameters |
| ENABLEENGINE | GPMC_PREFETCH_CONFIG1 [7] | 1 | Engine enabled |
| STARTENGINE | GPMC_PREFETCH_CONTROL [0] | 1 | Starts the prefetch engine |

16.4.4.13.4.3 FIFO Control in Prefetch Mode

The FIFO can be drained directly by the MPU or by an sDMA channel.

In MPU draining mode, the FIFO status can be monitored through the [GPMC_PREFETCH_STATUS](#)[30:24] FIFOPINTER field or through the [GPMC_PREFETCH_STATUS](#)[16] FIFOTHRESHOLDSTATUS bit. The FIFOPINTER indicates the current number of available data to be read; FIFOTHRESHOLDSTATUS set to 1 indicates that at least FIFOTHRESHOLD bytes are available from the FIFO.

An interrupt can be triggered by the GPMC if the [GPMC_IRQENABLE](#)[0] FIFOEVENTENABLE bit is set. The FIFO interrupt event is logged, and the [GPMC_IRQSTATUS](#)[0] FIFOEVENTSTATUS bit is set. To clear the interrupt, the MPU must read all the available bytes, or at least enough bytes to get below the programmed FIFO threshold, and the FIFOEVENTSTATUS bit must be cleared to enable further interrupt events. The FIFOEVENTSTATUS bit must always be reset prior to asserting the FIFOEVENTENABLE bit to clear any out-of-date logged interrupt event. This interrupt generation must be enabled after enabling the STARTENGINE bit.

Prefetch completion can be monitored through the [GPMC_PREFETCH_STATUS](#)[13:0] COUNTVALUE field. COUNTVALUE indicates the number of currently remaining data to be requested according to the TRANSFERCOUNT value. An interrupt can be triggered by the GPMC when the prefetch process is complete (that is, COUNTVALUE equals 0) if the [GPMC_IRQENABLE](#)[1] TERMINALCOUNTEVENTENABLE bit is set. At prefetch completion, the TERMINALCOUNT interrupt event is also logged, and the [GPMC_IRQSTATUS](#)[1] TERMINALCOUNTSTATUS bit is set. To clear the interrupt, the MPU must clear the TERMINALCOUNTSTATUS bit. The TERMINALCOUNTSTATUS bit must always be cleared prior to asserting the TERMINALCOUNTEVENTENABLE bit to clear any out-of-date logged interrupt event.

NOTE: The COUNTVALUE value is only valid when the prefetch engine is active (started), and an interrupt is only triggered when COUNTVALUE reaches 0, that is, when the prefetch engine automatically goes from an active to an inactive state.

The number of bytes to be prefetched (programmed in TRANSFERCOUNT) must be a multiple of the

programmed FIFOTHRESHOLD to trigger the correct number of interrupts allowing a deterministic and transparent FIFO control. If this guideline is respected, the number of ISR accesses is always required and the FIFO is always empty after the last interrupt is triggered. In other cases, the TERMINALCOUNT interrupt must be used to read the remaining bytes in the FIFO (the number of remaining bytes being lower than the FIFOTHRESHOLD value).

In DMA draining mode, the [GPMC_PREFETCH_CONFIG1\[2\]](#) DMAMODE bit must be set so that the GPMC issues a DMA hardware request when at least FIFOTHRESHOLD bytes are ready to be read from the FIFO. The DMA channel owning this DMA request must be programmed so that the number of bytes programmed in FIFOTHRESHOLD is read from the FIFO during the DMA request process. The DMA request is kept active until this number of bytes has effectively been read from the FIFO, and no other DMA request can be issued until the ongoing active request is complete.

In prefetch mode, the TERMINALCOUNT event is also a source of DMA requests if the number of bytes to be prefetched is not a multiple of FIFOTHRESHOLD, the remaining bytes in the FIFO can be read by the DMA channel using the last DMA request. This assumes that the number of remaining bytes to be read is known and controlled through the DMA channel programming model.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive to active prefetch (the STARTENGINE bit is set to 1). The associated DMA channel must always be enabled by the MPU after setting the STARTENGINE bit so that the out-of-date active DMA request does not trigger spurious DMA transfers.

16.4.4.13.4.4 Write-Posting Mode

The write-posting mode is selected when the [GPMC_PREFETCH_CONFIG1\[0\]](#) ACCESSMODE bit is set.

The MPU NAND software driver must issue the correct address pointer initialization command (page program) before the engine can start writing data into the NAND memory device. The engine starts when the [GPMC_PREFETCH_CONFIG1\[0\]](#) STARTENGINE bit is set to 1. The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the MPU NAND software driver must issue the second cycle program command and monitor the status for programming process completion (adding ECC handling, if required).

If used, the ECC calculator engine must be started (configured, reset, and enabled) before the posting engine is started so that the ECC parities are properly calculated on all data written by the prefetch engine to the associated chip-select.

In write-posting mode, the [GPMC_PREFETCH_CONFIG1\[3\]](#) SYNCHROMODE bit must be cleared so that posting starts as soon as the STARTENGINE bit is set and the FIFO is not empty.

If the STARTENGINE bit is set after the NAND address phase (page program command), the STARTENGINE setting is effective only after the actual NAND command completion. To prevent GPMC stall during this NAND command phase, set the STARTENGINE bit field before the NAND address completion and ensure that the associated DMA channel is enabled after the NAND address phase.

The posting engine issues a write request when valid data are available from the FIFO and until the programmed [GPMC_PREFETCH_CONFIG2\[13:0\]](#) TRANSFERCOUNT accesses have been completed.

The STARTENGINE bit clears automatically when posting completes. When all data have been written to the NAND memory device, the MPU NAND software driver must issue the second cycle program command and monitor the status for programming process completion. The closing program command phase must only be issued when the full NAND page has been written into the NAND flash write buffer, including the spare area data and the ECC parities, if used.

Table 16-238. Write-Posting Mode Configuration

| Bit Field | Register | Value | Comments |
|------------------|--|--------|---|
| STARTENGINE | GPMC_PREFETCH_CONFIG1[0] | 0 | Write-posting engine can be configured only if STARTENGINE is set to 0. |
| ENGINECSSELECTOR | GPMC_PREFETCH_CONFIG1[26:24] | 0 to 3 | Selects the chip-select associated with a NAND device where the prefetch engine is active |
| ACCESSMODE | GPMC_PREFETCH_CONFIG1[0] | 1 | Selects write-posting mode |

Table 16-238. Write-Posting Mode Configuration (continued)

| Bit Field | Register | Value | Comments |
|-----------------------|---|-------|---|
| FIFOTHRESHOLD | GPMC_PREFETCH_CONFIG1 [14:8] | | Selects the maximum number of bytes read or written by the host on DMA or interrupt request |
| TRANSFERCOUNT | GPMC_PREFETCH_CONFIG2 [13:0] | | Selects the number of bytes to be read or written by the engine from/to the selected chip-select |
| SYNCHROMODE | GPMC_PREFETCH_CONFIG1 [3] | 0 | Engine starts the access to chip-select as soon as STARTENGINE is set. |
| ENABLEOPTIMIZEDACCESS | GPMC_PREFETCH_CONFIG1 [27] | 0/1 | See Section 16.4.4.13.4.6, Optimizing NAND Access Using the Prefetch and Write-Posting Engine . |
| CYCLOPTIMIZATION | GPMC_PREFETCH_CONFIG1 [30:28] | | |
| ENABLEENGINE | GPMC_PREFETCH_CONFIG1 [7] | 1 | Engine enabled |
| STARTENGINE | GPMC_PREFETCH_CONTROL [0] | 1 | Starts the prefetch engine |

16.4.4.13.4.5 FIFO Control in Write-Posting Mode

The FIFO can be filled directly by the MPU or by an sDMA channel.

In MPU filling mode, the FIFO status can be monitored through the [FIFOPOINTER](#) or through the [GPMC_PREFETCH_STATUS](#)[16] [FIFOTHRESHOLDSTATUS](#) bit. [FIFOPOINTER](#) indicates the current number of available free byte places in the FIFO, and the [FIFOTHRESHOLDSTATUS](#) bit, when set, indicates that at least [FIFOTHRESHOLD](#) free byte places are available in the FIFO.

An interrupt can be issued by the GPMC if the [GPMC_IRQENABLE](#)[0] [FIFOEVENTENABLE](#) bit is set. When the interrupt is fired, the [GPMC_IRQSTATUS](#)[0] [FIFOEVENTSTATUS](#) bit is set. To clear the interrupt, the MPU must write enough bytes to fill the FIFO, or enough bytes to get below the programmed threshold, and the [FIFOEVENTSTATUS](#) bit must be cleared to get further interrupt events. The [FIFOEVENTSTATUS](#) bit must always be cleared prior to asserting the [FIFOEVENTENABLE](#) bit to clear any out-of-date logged interrupt event. This interrupt must be enabled after enabling the [STARTENGINE](#) bit.

The posting completion can be monitored through the [GPMC_PREFETCH_STATUS](#)[13:0] [COUNTVALUE](#) field. [COUNTVALUE](#) indicates the current number of remaining data to be written based on the [TRANSFERCOUNT](#) value. An interrupt is issued by the GPMC when the write-posting process completes (that is, [COUNTVALUE](#) equal to 0) if the [GPMC_IRQENABLE](#)[1] [TERMINALCOUNTEVENTENABLE](#) bit is set. When the interrupt is fired, the [GPMC_IRQSTATUS](#)[1] [TERMINALCOUNTSTATUS](#) bit is set. To clear the interrupt, the MPU must clear the [TERMINALCOUNTSTATUS](#) bit. The [TERMINALCOUNTSTATUS](#) bit must always be cleared prior to asserting the [TERMINALCOUNTEVENTENABLE](#) bit to clear any out-of-date logged interrupt event.

NOTE: The [COUNTVALUE](#) value is only valid if the write-posting engine is active and started, and an interrupt is only issued when [COUNTVALUE](#) reaches 0, that is, when the posting engine automatically goes from active to inactive.

In DMA filling mode, the [DMAMode](#) bit field in the [GPMC_PREFETCH_CONFIG1](#)[2] [DMAMODE](#) bit must be set so that the GPMC issues a DMA hardware request when at least [FIFOTHRESHOLD](#) bytes-free places are available in the FIFO. The DMA channel owning this DMA request must be programmed so that a number of bytes equal to the value programmed in the [FIFOTHRESHOLD](#) bit field are written into the FIFO during the DMA access. The DMA request remains active until the associated number of bytes has effectively been written into the FIFO, and no other DMA request can be issued until the ongoing active request has been completed.

Any potentially active DMA request is cleared when the prefetch engine goes from inactive to active prefetch ([STARTENGINE](#) set to 1). The associated DMA channel must always be enabled by the MPU after setting the [STARTENGINE](#) bit so that an out-of-date active DMA request does not trigger spurious DMA transfers.

In write-posting mode, the DMA or the MPU fill the FIFO with no consideration to the associated byte enables. Any byte stored in the FIFO is written into the memory device.

16.4.4.13.4.6 Optimizing NAND Access Using the Prefetch and Write-Posting Engine

Access time to a NAND memory device can be optimized for back-to-back accesses if the associated nCS signal is not deasserted between accesses. The GPMC access engine can track prefetch engine accesses to optimize the access timing parameter programmed for the allocated chip-select, if no accesses to other chip-selects (that is, interleaved accesses) occur. Similarly, the access engine also eliminates the CYCLE2CYCLEDELAY even if CYCLE2CYCLESAMECSN is set. This capability is limited to the prefetch and write-posting engine accesses, and MPU accesses to a NAND memory device (through the defined chip-select memory region or through the [GPMC_NAND_DATA_i](#) location, $i = 0$ to 7) are never optimized.

The [GPMC_PREFETCH_CONFIG1](#)[27] ENABLEOPTIMIZEDACCESS bit must be set to enable optimized accesses. To optimize access time, the [GPMC_PREFETCH_CONFIG1](#)[30:28] CYCLEOPTIMIZATION field defines the number of GPMC_FCLK cycles to be suppressed from the RDCYCLETIME, WRCYCLETIME, RDACCESSTIME, WRACCESSTIME, CSOFFTIME, ADVOFFTIME, OEOFFTIME, and WEOFFTIME timing parameters.

[Figure 16-90](#) highlights that, in the case of back-to-back accesses to the NAND flash through the prefetch engine, CYCLE2CYCLESAMECSN is forced to 0 when using optimized accesses. The first access uses the regular timing settings for this chip-select. All accesses after this one use settings reduced by x clock cycles, x being defined by the [GPMC_PREFETCH_CONFIG1](#)[30:28] CYCLEOPTIMIZATION field.

16.4.4.13.4.7 Interleaved Accesses Between Prefetch and Write-Posting Engine and Other Chip-Selects

Any on-going read or write access from the prefetch and write-posting engine is completed before an

access to any other chip-select can be initiated. As a default, the arbiter uses a fixed-priority algorithm, and the prefetch and write-posting engine has the lowest priority. The maximum latency added to access starting time in this case equals the RDCYCLETIME or WRCYCLETIME (optimized or not) plus the requested BUSTURNAROUND delay for bus turnaround completion programmed for the chip-select to which the NAND device is connected to.

Alternatively, a round-robin arbitration can be used to prioritize accesses to the external bus. This arbitration scheme is enabled by setting the [GPMC_PREFETCH_CONFIG1](#)[23] PFPWENROUNDROBIN bit. When a request to another chip-select is received while the prefetch and write-posting engine is active, priority is given to the new request. The request processed thereafter is the prefetch and write-posting engine request, even if another interconnect request is passed in the mean time. The engine keeps control of the bus for an additional number of requests programmed in the [GPMC_PREFETCH_CONFIG1](#)[19:16] PFPWWEIGHTEDPRIO bit field. Control is then passed to the direct interconnect request.

As an example, the round-robin arbitration scheme is selected with PFPWWEIGHTEDPRIO set to 0x2. Considering the prefetch and write-posting engine and the interconnect interface are always requesting access to the external interface, the GPMC grants priority to the direct interconnect access for one request. The GPMC then grants priority to the engine for three requests, and finally back to the direct interconnect access, until the arbiter is reset when one of the two initiators stops initiating requests.

16.4.5 GPMC Basic Programming Model

16.4.5.1 GPMC High-Level Programming Model Overview

The goal of the basic high-level programming model is to introduce a top down approach to users that need to configure the GPMC module.

[Figure 16-91](#), [Table 16-239](#), [Table 16-240](#) and [Table 16-241](#) show a programming model top level diagram for the GPMC, and the description of each step. Each block of the diagram is detailed in one of the following subsections through a set of registers to configure.

Figure 16-91. Programming Model Top Level Diagram

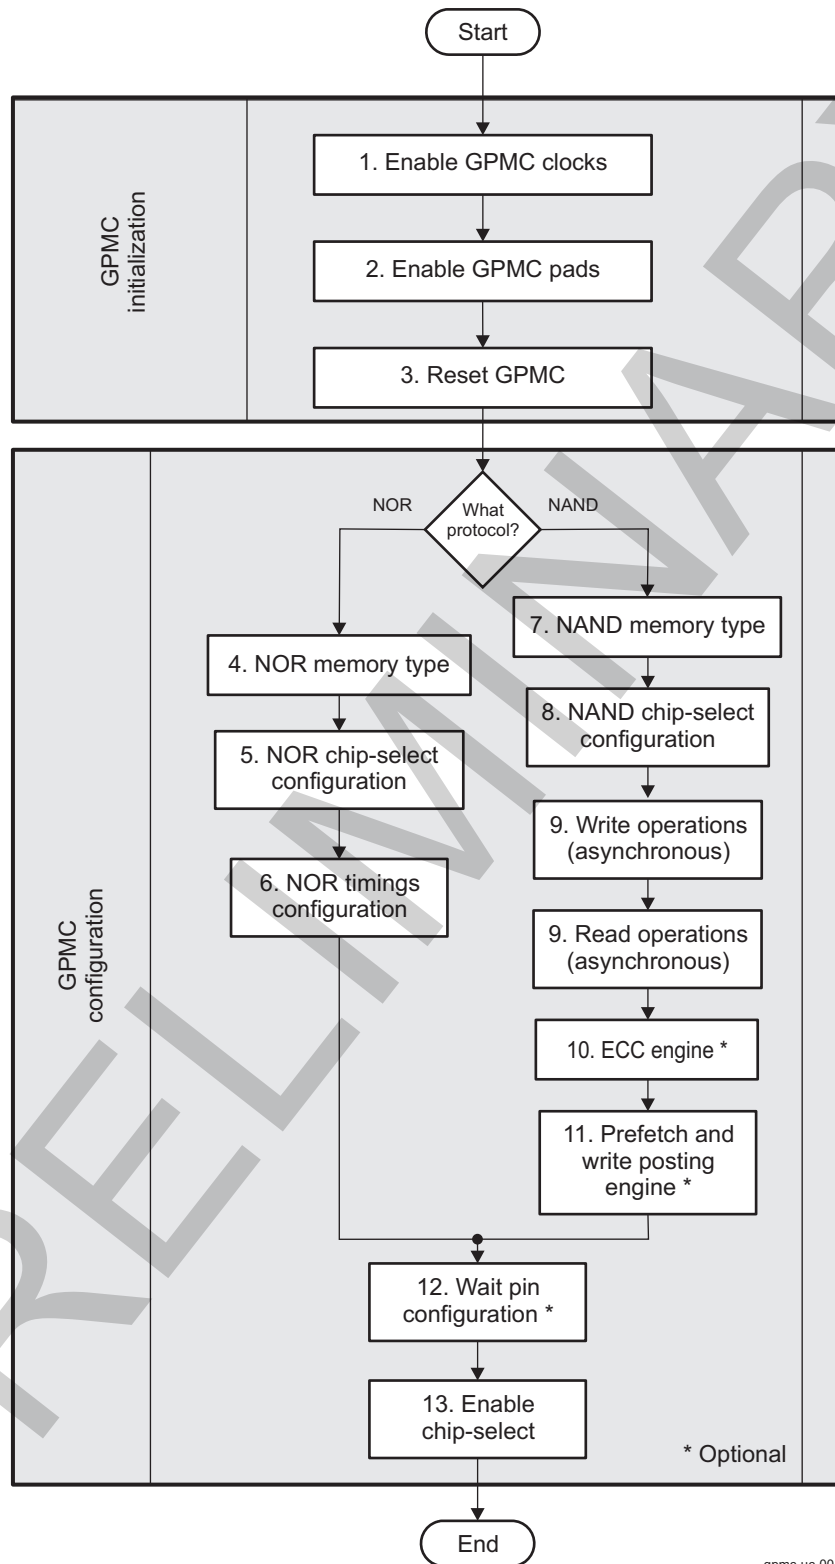

Table 16-239. GPMC Initialization

| Step | Description |
|--------------------|--|
| Enable GPMC clocks | Module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management . |
| Enable GPMC pads | Module-specific pad muxing and configuration must be set in the control module. See Chapter 19, Control Module . |
| Reset GPMC | See Table 16-242 |

Table 16-240. GPMC Configuration in NOR Mode

| Step | Description |
|-------------------------------|----------------------------------|
| NOR Memory Type | See Table 16-243 |
| NOR Chip-Select Configuration | See Table 16-244 |
| NOR Timings Configuration | See Table 16-245 |
| Wait Pin Configuration | See Table 16-253 |
| Enable Chip-Select | See Table 16-254 |

Table 16-241. GPMC Configuration in NAND Mode

| Step | Description |
|-----------------------------------|----------------------------------|
| NAND Memory Type | See Table 16-248 |
| NAND Chip-Select Configuration | See Table 16-249 |
| Write Operations (Asynchronous) | See Table 16-250 |
| Read Operations (Asynchronous) | See Table 16-250 |
| ECC Engine | See Table 16-251 |
| Prefetch and Write-Posting Engine | See Table 16-252 |
| Wait Pin Configuration | See Table 16-253 |
| Enable Chip-Select | See Table 16-254 |

16.4.5.2 GPMC Initialization

[Table 16-270](#) describes the settings required to prepare the GPMC, that is enabling its clock, its pads, and proceeding to a GPMC reset.

Table 16-242. Reset GPMC

| Sub-process Name | Register / Bit Field | Value |
|------------------------|--|-------|
| Start a software reset | GPMC_SYSCONFIG [1] SOFTRESET | 0x1 |
| Wait until | GPMC_SYSSTATUS [0] RESETDONE = | 0x1 |

16.4.5.3 GPMC Configuration in NOR Mode

This section gives a generic configuration for parameters related to the NOR memory connected to the GPMC.

Table 16-243. NOR Memory Type

| Sub-process Name | Register / Bit Field | Value |
|--|---|-------|
| Set the NOR protocol | GPMC_CONFIG1 [11:10] DEVICETYPE | 0x0 |
| Set a device size | GPMC_CONFIG1 [13:12] DEVICESIZE | x |
| Select an address and data multiplexing protocol | GPMC_CONFIG1 [9] MUXADDDATA | x |
| Set the attached device page length | GPMC_CONFIG1 [24:23] ATTACHEDDEVICEPAGELENGTH | x |
| Set the wrapping burst capabilities | GPMC_CONFIG1 [31] WRAPBURST | x |

Table 16-243. NOR Memory Type (continued)

| Sub-process Name | Register / Bit Field | Value |
|--|---|-------|
| Select a timing signals latencies factor | GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY | x |
| Select an output clock frequency ⁽¹⁾ | GPMC_CONFIG1_i[1:0] GPMCFCLKDIVIDER | x |
| Choose an output clock activation time ⁽¹⁾ | GPMC_CONFIG1_i[26:25] CLKACTIVATIONTIME | x |
| Set a single or multiple access for read operations ⁽¹⁾ | GPMC_CONFIG1_i[30] READMULTIPLE | x |
| Set a synchronous or asynchronous mode for read operations | GPMC_CONFIG1_i[29] READTYPE | x |
| Set a single or multiple access for write operations | GPMC_CONFIG1_i[28] WRITEMULTIPLE | x |
| Set a synchronous or asynchronous mode for write operations | GPMC_CONFIG1_i[27] WRITETYPE | x |

⁽¹⁾ Only applies to synchronous configurations (or non-multiplexed async for the multiple access one).

Table 16-244. NOR Chip-Select Configuration

| Sub-process Name | Register / Bit Field | Value |
|-------------------------------------|--|-------|
| Select the chip-select base address | GPMC_CONFIG7_i[5:0] BASEADDRESS | x |
| Select the chip-select mask address | GPMC_CONFIG7_i[11:8] MASKADDRESS | x |

Table 16-245. NOR Timings Configuration

| Sub-process Name | Register / Bit Field | Value |
|--|--|-------|
| Configure adequate timing parameters in various memory modes | See Section 16.4.5.6 , <i>GPMC Timing Parameters</i> | |

Table 16-246. Wait Pin Configuration

| Sub-process Name | Register / Bit Field | Value |
|--|--|-------|
| Enable or disable wait pin monitoring for read operations | GPMC_CONFIG1_i[22] WAITREADMONITORING | x |
| Enable or disable wait pin monitoring for write operations | GPMC_CONFIG1_i[21] WAITWRITEMONITORING | x |
| Select a wait pin monitoring time | GPMC_CONFIG1_i[19:18] WAITMONITORINGTIME | x |
| Choose the input wait pin for the chip-select | GPMC_CONFIG1_i[17:16] WAITPINSELECT | x |

Table 16-247. Enable Chip-Select

| Sub-process Name | Register / Bit Field | Value |
|--|---|-------|
| When all parameters are configured, enable the chip-select | GPMC_CONFIG7_i[6] CSVALID | x |

16.4.5.4 GPMC Configuration in NAND Mode

This section gives a generic configuration for parameters related to the NAND memory connected to the GPMC.

Table 16-248. NAND Memory Type

| Sub-process Name | Register / Bit Field | Value |
|--|---|-------|
| Set the NAND protocol | GPMC_CONFIG1_i[11:10] DEVICETYPE | 0x2 |
| Set a device size | GPMC_CONFIG1_i[13:12] DEVICESIZE | x |
| Set the address and data multiplexing protocol to non-multiplexed attached device | GPMC_CONFIG1_i[9] MUXADDDATA | 0x0 |
| Select a timing signals latencies factor | GPMC_CONFIG1_i[4] TIMEPARAGRANULARITY | x |
| Set a synchronous or asynchronous mode and a single or multiple access for read and write operations | See Section 16.4.5.5 , <i>Set Memory Access</i> | x |

Table 16-249. NAND Chip-Select Configuration

| Sub-process Name | Register / Bit Field | Value |
|--|--|-------|
| Select the chip-select base address | GPMC_CONFIG7_i[5:0] BASEADDRESS | x |
| Select the chip-select minimum granularity (16M bytes) | GPMC_CONFIG7_i[11:8] MASKADDRESS | x |

Table 16-250. Asynchronous Read and Write Operations

| Sub-process Name | Register / Bit Field | Value |
|--|--|-------|
| Configure adequate timing parameters in asynchronous modes | See Section 16.4.5.6 , <i>GPMC Timing Parameters</i> | |

Table 16-251. ECC Engine

| Sub-process Name | Register / Bit Field | Value |
|---|---|---------------------|
| Select the ECC result register where the first ECC computation is stored (Only applies to Hamming) | GPMC_ECC_CONTROL[3:0] ECCPOINTER | x ⁽¹⁾ |
| Clear all ECC result registers | GPMC_ECC_CONTROL[8] ECCCLEAR | Write '1' to clear. |
| Define ECCSIZE0 and ECCSIZE1 | GPMC_ECC_SIZE_CONFIG[19:12] ECCSIZE0 and [29:22] ECCSIZE1 | x ⁽²⁾ |
| Select the size of each of the 9 result registers (size specified by ECCSIZE0 or ECCSIZE1) | GPMC_ECC_SIZE_CONFIG[j-1] ECCjRESULTSIZ | x |
| Select the chip-select where ECC is computed | GPMC_ECC_CONFIG[3:1] ECCCS | x |
| Select the Hamming code or BCH code ECC algorithm in use | GPMC_ECC_CONFIG[16] ECCALGORITHM | x |
| Select word size for ECC calculation | GPMC_ECC_CONFIG[7] ECC16B | x |
| If the BCH code is used, Set an error correction capability and Select a number of sectors to process | GPMC_ECC_CONFIG[13:12] ECCBCHTSEL and GPMC_ECC_CONFIG[6:4] ECCTOPSECTOR | x |
| Enable the ECC computation | GPMC_ECC_CONFIG[0] ECCENABLE | 0x1 |

⁽¹⁾ This parameter depends on the numbers of sectors in a page.

⁽²⁾ Depends on the size of each sector in the NAND page.

Table 16-252. Prefetch and Write-Posting Engine

| Sub-process Name | Register / Bit Field | Value |
|--|---|-------|
| Disable the engine before configuration | GPMC_PREFETCH_CONTROL[0] STARTENGINE | 0x0 |
| Select the chip-select associated with a NAND device where the prefetch engine is active | GPMC_PREFETCH_CONFIG1[26:24] ENGINECSSELECTOR | x |
| Select access direction through prefetch engine, read or write. | GPMC_PREFETCH_CONFIG1[0] ACCESSMODE | x |
| Select the threshold used to issue a DMA request | GPMC_PREFETCH_CONFIG1[14:8] FIFOTHRESHOLD | x |
| Select either DMA synchronized mode or software manual mode. | GPMC_PREFETCH_CONFIG1[2] DMAMODE | x |
| Select if the engine immediately starts accessing the memory upon STARTENGINE assertion or if hardware synchronization based on a WAIT signal is used. | GPMC_PREFETCH_CONFIG1[3] SYNCHROMODE | x |
| Select which wait pin edge detector should start the engine in synchronized mode | GPMC_PREFETCH_CONFIG1[5:4] WAITPINSELECTOR | x |
| Enter a number of clock cycles removed to timing parameters (For all back-to-back accesses to the NAND flash but not the first one) | GPMC_PREFETCH_CONFIG1[30:28] CYCLOPTIMIZATION | x |
| Enable the prefetch postwrite engine | GPMC_PREFETCH_CONFIG1[7] ENABLEENGINE | 0x1 |
