8.3.5.3 ISS ISP5 SYS2 Registers

CAUTION

The ISS ISP5 SYS2 registers are limited to 32 bit and 16 bit data accesses; 8bit data access is not allowed and can corrupt register content.

| Bits | Field Name | Description | Type | Reset |
|-------|-------------|--|------|----------|
| 31:10 | RESERVED | | R | 0x000000 |
| 9 | RSZB_CLK_EN | Resizer B clock enable This bit enable to enable / disable the RESIZER B clock. Note that it is a second level clock enable. This bit has effect only if RSZ_GCK_SDR is set to 1. 0x0: off 0x1: on | RW | 0 |
| 8 | RSZA_CLK_EN | Resizer A clock enable This bit enable to enable / disable the RESIZER A clock. Note that it is a second level clock enable. This bit has effect only if RSZ_GCK_SDR is set to 1. 0x0: off 0x1: on | RW | 0 |
| 7:1 | RESERVED | | R | 0x00 |
| 0 | AUTOGATING | Internal Clock Gating Strategy Enables or disables auto clock gating. | RW | 1 |

NOTE: This is only for debug purposes. When this bit is set to "0" autogating is not performed on any of the clocks, thus the clocks stay free running. Though, they are still controlled by the clock enable bit fields RSZA_CLK_EN and RSZB_CLK_EN.

0x0: Clocks are free running

0x1: Automatic clock gating strategy.

| Bits | Field Name | Description | Type | Reset |
|-------|------------|--|------|--------|
| 31:29 | RESERVED | | R | 0x0 |
| 28:16 | THRLD_LOW | When RSZ_IN_FIFO_CTRL.THRLD_HIGH = RSZ_IN_FIFO_CTRL.THRLD_LOW , the rsz_stall_input is not asserted. The only purpose of the RSZ_IN_FIFO_CTRL.THRLD_LOW register is to prevent rsz_stall_input signal assertion. | RW | 0x0000 |
| 15:13 | RESERVED | | R | 0x0 |
| 12:0 | THRLD_HIGH | High threshold value. The rsz_stall_input signal is asserted if 2 lines of circular buffer are full and the third line has more pixels than RSZ_IN_FIFO_CTRL.THRLD_HIGH . The rsz_stall_input signal stays high as long as one full line is not free for receiving further data. THRLD_HIGH is in terms of line size and can at max be programmed equal to the input line size (RSZ_SRC_HSZ). | RW | 0x0000 |

|-------|-----------------------------|--|------|--------|
| 31:16 | RESERVED | | R | 0x0000 |
| 15:0 | RSZ_FRACDIV | Fractional clock divider value. The fractional clock divider gates the read requests made to the input data buffer such that the input data buffer is read at an average frequency equal to FFCLK instead of FCLK. The value of FFCLK depends upon the upscaling ratios as well as the input pixel clock: see the functional spec. We have $FFCLK = FCLK / FRACDIV$ MHz and $RSZ_FRACDIV = 65536 / FRACDIV$. When $RSZ_FRACDIV = 65536$, we have: $FFCLK = FCLK$. | RW | 0xFFFF |

| 0 | EN | Resizer module enable The start flag of the RESIZER module. When EN is set to 1, the RESIZER module starts the processing from the next rising edge of the VD pulse. If the processing mode of the RESIZER module is set to "one shot", the EN bit is cleared to 0 after the end of the processing. One has to pay attention that when this bit is enabled and 0x0: Disable 0x1: Enable | RW | 0 |

|------|------------|--|------|-------------|
| 31:2 | RESERVED | | R | 0x0000 0000 |
| 1 | WRT | Video port WEN signal selection This bit selects whether the WEN signal which is present on the IPIPE and IPIPEIF video port is used or not to select the input data. If WRT is 0, the RESIZER module ignores the WEN signal and processes all image frame while RESIZER is enabled. If WRT is 1, the RESIZER module only processes the lines that arrived while the WEN is high. HD is used to sample the WEN signal. 0x0: Disable 0x1: Enable | RW | 0 |
| 0 | OST | The processing mode selection of the RESIZER module. Value 0 indicates the mode of free run, value 1 indicates the mode of one shot. 0x0: Free running 0x1: One shot | RW | 0 |

| 15:0 | HPS | Horizontal Start Position The RSZ_SRC_HPS register has two functions: The first function is to compensate for possible delay between the HD pulse and the first valid data. It is possible for this delay to be different than 0 when the RESIZER module gets its input data from the VP connected to the IPIPEIF module (the offset value can be odd or even). When data are coming from the IPIPE module, it is not required to resynchronize HD and the first valid data. The second function is to crop the data in the horizontal direction. When used for cropping, only RSZ_SRC_HPS must be even or null. | RW | 0x0000 |

|------|------------|--|------|-------------|
| 31:1 | RESERVED | | R | 0x0000 0000 |
| 0 | CORE | RSZ Core Clock Enable. This bit enables or disables the resizer core functional clock. When this bit is off, the resizer core (interpolator) is automatically bypassed (resizer-bypass mode of pass-through mode is selected depending on RSZ_SRC_FMT0 value). In resizer-bypass mode or pass-through mode, no up-scaling or downscaling process is operated. 0x0: Resizer core clock disabled. Resizer in bypass mode if RSZ_SRC_FMT0.BYPASS = 0 Resizer in pass-through if RSZ_SRC_FMT0.BYPASS = 1 0x1: Resizer core clock enabled. Resizer in rescaling mode if RSZ_SRC_FMT0.BYPASS = 0 Resizer in pass-through if RSZ_SRC_FMT0.BYPASS = 1 | RW | 0 |

| 16:0 | Y_OFT | Memory Line Offset Sets the size of each line in the circular buffer. It is expressed in bytes and unsigned. Note that OFT does not necessary corresponds to the size of a line in a frame, it can be much bigger. The line offset must be a multiple of 128 bytes (bits [6:0] of RZX_SDR_Y_OFT and RZX_SDR_C_OFT must be set to 0). Example: line 0 address = SAD line 1 address = SAD + 1 x OFT line 2 address = SAD + 2 x OFT | RW 0x00000 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

|-------|------------|---|------|---------|
| 31:17 | RESERVED | | R | 0x0000 |
| 16:0 | C_OFT | Memory Line Offset Sets the size of each line in the circular buffer. It is expressed in bytes and unsigned. Note that OFT does not necessary corresponds to the size of a line in a frame, it can be much bigger. The line offset must be a multiple of 128 bytes (bits [6:0] of RZX_SDR_Y_OFT and RZX_SDR_C_OFT must be set to 0). Example: line 0 address = SAD line 1 address = SAD + 1 x OFT line 2 address = SAD + 2 x OFT | RW | 0x00000 |

| Description | RESIZER B - INITIAL LUMINANCE PHASE OF VERTICAL RESIZING PROCESS When YUV4:2:2 data are output, the phase values for luma and chroma should typically be equal, that is, RZX_V_PHS_Y= RZX_V_PHS_C. The following constraints apply when setting the initial vertical phases ABS(RZX_V_PHS_Y - RZX_V_PHS_C) RZX_V_DIF. This constraint means that at most the distance between the initial phases for luminance and chrominance is not expected to exceed the distance between two luma pixels. Note that the absolute value is used, hence, the initial luma phase can be greater than the initial chroma phase or the other way around. As a reminder, the distance between two output pixels for luma is given by RZX_V_DIF. | | |

| 12:0 | C_PTR_S | | Start Line of Memory Pointer Sets the vertical position of the first output line in the output memory space. This value is expressed in number of lines. The hardware uses it to set up the initial value of the circular buffer. It must be set up such as PTR_S = (SAD - BAD) / OFT. This value must be set to 0 when RSZ_RZA_SDR_C_BAD = RSZ_RZA_SDR_C_SAD. | | | | | | | | | | | | | | | RW | | 0x0000 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Table 8-809. IPIPE_YUV_PHS

| | | | |
|------------------|---|----------|-----------|
| Address Offset | 0x0000 02C8 | Instance | ISS_IPIPE |
| Physical Address | 0x5201 0AC8 | | |
| Description | <p>YUV4:2:2 down sampling register.</p> <p>This register controls the YUV4:4:4 to YUV4:2:2 chroma downsampling. This register is valid if IPIPE_SRC_FMT.FMT = 0 (RAW input and YUV output).</p> <p>IPIPE_YUV_PHS = 0 leads to pure subsampling, no filtering, cosited chroma output.</p> <p>IPIPE_YUV_PHS = 1 leads to (1, 1) 1 filtering, centered chroma output.</p> <p>IPIPE_YUV_PHS = 2 leads to (1, 2, 1) 1 filtering, cosited chroma output.</p> <p>IPIPE_YUV_PHS = 3 leads to (1, 3, 3, 1) 3 filtering, centered chroma output.</p> <p>When the chroma output is cosited, and that downsampling is enabled in the RESIZER module, one need to take care that the averager disrupts the relative phase for luma and chroma color components. The RZA_H_PHS_ADJ and RZB_H_PHS_ADJ registers need to be used to fix the disruption.</p> | | |

|-------|------------|---|------|--------|
| 31:16 | RESERVED | | R | 0x0000 |
| 15:2 | RESERVED | | R | 0x0000 |
| 1 | CLR | Histogram memory clear. The histogram can be cleared before the start of operations. However, the clear takes 512 cycles and therefore: + if line size 512, the first line must not be used for histogram computation. + if line size 512, ceil (512/line size) lines must not be used for histogram computation. It's the programmer's responsibility to set the histogram computation area outside the "clear" area. 0x0: Disable 0x1: Enable | RW | 0 |
| 0 | SEL | This bit must be used to select which memory is used to store the histogram data. By selecting alternatively one or the other bit, one can double buffer the histogram output buffer. The 4 KB memory can either be read by the CPU or a DMA request. 0x0: Use Table 0 and 1 = 4KB in the memory ISP map. 0x1: Use Table 2 and 3 = 4KB in the memory ISP map. | RW | 0 |

|-------|------------|---|------|--------|
| 31:16 | RESERVED | | R | 0x0000 |
| 15:2 | RESERVED | | R | 0x0000 |
| 1 | DWEN | Controls the storage of image sensor RAW data in memory. This bit is loaded with the timing of the internal VD signal: it becomes active starting at the lead of the VD signal that comes after 1 is written in this bit. 0x0: Disable 0x1: Enable | RW | 0 |
| 0 | SYEN | Controls ON/OFF of VD/HD output. Internal timing generator becomes active and VD/HD output starts when 1 is written in this bit. In case of input, VD/HD loading begins. 0: Disable 1: Enable | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|------------|---|------|--------|
| 31:16 | RESERVED | | R | 0x0000 |
| 15 | VLDC | On/off control of CPU registers resynchronize function by VSYNC. All the others are shadowed registers, where register values are updated at V-sync timing by default. If VDLC=1, ISIF register values are updated immediately after register write just like non-shadowed registers. 0x0: Enable 0x1: Disable | RW | 0 |
| 14 | RESERVED | Reserved. must always be set to 0. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|---|------|-------|
| 13 | MSBINVI | MSB inverse of CIN port when the data are captured to SDRAM. The ISIF_MODESET.CCDW , ISIF_HSIZE.ADCR , ISIF_HSIZE.HSIZE , ISIF_CCDCFG.BSWD , ISIF_CCDCFG.MSBINV , ISIF_CCDCFG.SDRPACK bit fields control how pixel data are stored to SDRAM. 0x0: Disable 0x1: Enable | RW | 0 |
| 12 | BSWD | On/off control of Byte SWAP function when SDRAM capturing. The ISIF_MODESET.CCDW , ISIF_HSIZE.ADCR , ISIF_HSIZE.HSIZE , ISIF_CCDCFG.BSWD , ISIF_CCDCFG.MSBINV , ISIF_CCDCFG.SDRPACK bit fields control how pixel data are stored to SDRAM. 0x0: Disable 0x1: Enable (swap) | RW | 0 |
| 11 | Y8POS | Selects Y signal position when in 8bit input mode 0x0: even pixel 0x1: odd pixel | RW | 0 |
| 10 | EXTRG | Setting 1 to this register, the SDRAM address is initialized at the rising edge of FID input signal or DWEN register. | RW | 0 |
| 9 | TRGSEL | Select trigger source signal of SDRAM address initializing in case EXTRG=1. 0x0: DWEN register 0x1: FID input port | RW | 0 |
| 8 | WENLOG | Specifies the CCD valid area. 0x0: internal valid signal and WEN signal is ANDed logically. 0x1: internal valid signal and WEN signal is ORed logically. | RW | 0 |
| 7:6 | FIDMD | Specifies FID detection mode 0x0: latch the FID at the VSYNC timing 0x1: no latch the FID 0x3: Reserved 0x2: Reserved | RW | 0x0 |
| 5 | BT656 | Selects bit width of CCIR656. This bit applies only if ISIF_REC656IF.R656ON = 1. 0x0: 8 bits 0x1: 10 bits | RW | 0 |
| 4 | YCINSWP | The ISIF module has a 16-bit interface. When 16-bit YUV data are input, the luma data (YIN7-0) are expected to be on the 8 MS bits and the chroma (CIN7-0) data are expected to be on the LS bits. This bit enables to swap the 8 MS bits with the 8 LS bits of the interface in case the luma and chroma do not come in the correct order. See the top-level ISIF block diagram. 0x0: YIN7-0 = Y signal / CIN7-0 = C signal 0x1: YIN7-0 = C signal / CIN7-0 = Y signal | RW | 0 |
| 3 | RESERVED | Reserved. must always be set to 0. | RW | 0 |
| 2 | RESERVED | Reserved. must always be set to 0. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|--|------|-------|
| 1:0 | SDRPACK | <p>This bit field selects how the data are stored to SDRAM. There can be 8, 12 or 16 bits per pixel. The ISIF_MODESET.CCDW, ISIF_HSIZE.ADCR, ISIF_HSIZE.HSIZE, ISIF_CCDCFG.BSWD, ISIF_CCDCFG.MSBINV, ISIF_CCDCFG.SDRPACK bit fields control how pixel data are stored to SDRAM.</p> <p>0x0: 16 bits / pixel 0x1: 12 bits / pixel 0x3: Reserved 0x2: 8 bits / pixel</p> | RW | 0x0 |

|------|------------|--|------|-------------|
| 31:2 | RESERVED | | R | 0x0000 0000 |
| 1 | SYNCOFF | VD output mask This register masks the VD output to the IPIPE module. This can be useful when one wants to read data from SDRAM which are stored in a double buffer. If the VD is not masked each time we start the module an new VD will be generated to the IPIPEIF module. Let's consider two buffers A and B of N lines each. *This bit field is latched by VD. 0x0: VD output mask is disabled. 0x1: VD output mask is enabled. | RW | 0 |
| 0 | ENABLE | IPIPE I/F Enable This register is used to start the operation of SDRAM buffer memory read and generates SYNC signals. This register is available when INPSRC1 or INPSCR2 = 1, 2 or 3. 0x0: disable 0x1: enable | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|------------|---|------|--------|
| 31:16 | RESERVED | | R | 0x0000 |
| 15:14 | INPSRC1 | Selects the source for the mux (VPORT / ISIF / SDRAM) as well as the data format type. 0x0: VPORT_RAW 0x1: SDRAM_RAW 0x3: SDRAM_YUV 0x2: ISIF_DARKFM Input ports to DFS submodule are ISIF and SDRAM. | RW | 0x0 |
| 13:11 | DATASFT | SDRAM read data shift This register is available when INPSRC1 or INPSRC2 = 1 or 2, that is, when data are read from SDRAM. 0x6: Output data[11:0] = (read data[15:4] 4) 0x0FFF 0x1: Output data[11:0] = (read data[11:0] 1) 0x0FFF 0x7: Output data[11:0] = (read data[15:4] 4) 0x0FFF 0x0: Output data[11:0] = (read data[11:0]) 0x0FFF 0x2: Output data[11:0] = (read data[11:0] 2) 0x0FFF 0x4: Output data[11:0] = (read data[11:0] 4) 0x0FFF 0x5: Output data[11:0] = (read data[15:4] 4) 0x0FFF 0x3: Output data[11:0] = (read data[11:0] 3) 0x0FFF | RW | 0x0 |
| 10 | CLKSEL | IPIPEIF IPIPE module pixel clock selection. This register must be set to 1 when INPSRC1 or INPSRC2 = 1 or 3, that is, data are solely read from SDRAM (VPORT inactive). 0x0: Selects the pixel clock from the VPORT. 0x1: Selects the pixel clock from the fractional clock divider. The fractional clock divider value is setup with the IPIPEIF_CLKDIV register. | RW | 0 |
| 9:8 | UNPACK | 8-Bit, 12-bit Packed Mode When sensor raw data are stored in 8-bit packed mode or 12-bit packed mode, this register should code 1 or 3. This register is effective when INPSRC = 1 or 2. 0x0: 16 bits / pixel 0x1: 8 bits / pixel 0x3: 12 bits / pixel 0x2: 8 bits / pixel + inverse A law (8 bits to 10 bits) | RW | 0x0 |
| 7 | AVGFILT | Averaging Filter It applies (1,2,1) filter for the RGB/YCbCr data. *This bit field is latched by VD. 0x0: disable 0x1: enable | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|--|------|-------|
| 6:4 | RESERVED | | R | 0x0 |
| 3:2 | INPSRC2 | Selects the source for the mux (ISIF / SDRAM) as well as the data format type. 0x0: ISIF 0x1: SDRAM_RAW 0x3: SDRAM_YUV 0x2: ISIF_DARKFM Input ports to DFS submodule are VPORT and SDRAM. | RW | 0x0 |
| 1 | DECIM | Pixel Decimation The decimation rate defined by RSZ register. *This bit field is latched by VD. 0x0: No decimation 0x1: Decimation | RW | 0 |
| 0 | ONESHOT | One Shot Mode This register is available when INPSRC = 1 or 3. 0x0: Continuous mode 0x1: One shot mode | RW | 0 |

| 31:10 | RESERVED | | R | 0x000000 |
| 9:0 | GAIN | Gain Parameter Specifies the gain applied to RAW data before it is forwarded to the IPIPE module. The gain value is expressed using the U10Q9 fractional format. The range is from 0.00195 (1/512) to 1.99805(1023/512). By default the unity gain is applied, that is, IPIPEIF_GAIN.GAIN = 0x200. The gain is applied to RAW data only (IPIPEIF_CFG1.INPSRC2 != 3): the gain is not applied if the input data is YCbCr. *This bit field is latched by VD. | RW | 0x200 |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------|--|------|-------|
| 31:22 | AVE2LMT | AE/AWB Saturation Limit This is the value that all sub sampled pixels in the AE/AWB engine are compared to. If the data is greater or equal to this data then the block is considered saturated. | RW | 0x3FF |
| 21 | OVF | H3A module overflow status bit. If the H3A module overflows it will keep sending data. The software can read this status bit during vertical blanking period to ensure that no overflow happened while writing out the data to SDRAM. There is also an interrupt at ISP level (H3A_OVF) which can be used to monitor this. 0x0: Read 0: No overflow pending Write 0: Status bit unchanged 0x1: Read 1: Overflow happened while writing out the data. Output data likely to be corrupted. Write 1: Clear the status bit. | RW | 0 |
| 20 | AF_VF_EN | AF Vertical Focus Enable 0x0: 4 Color Horizontal FV only 0x1: 1 Color Horizontal FV and 1 Color Vertical FV | RW | 0 |
| 19 | AEW_MED_EN | AE/AWB Median filter Enable If the median filter is enabled, then the 1st 2 and last 2 pixels in the frame are not filtered. 0x0: Disable Auto Focus median filter 0x1: Enable Auto Focus median filter | RW | 0 |
| 18 | BUSYAEAWB | Busy bit for AE/AWB | R | 0 |
| 17 | AEW_ALAW_EN | AE/AWB A-law Enable 0x0: Disable Auto exposure/white balance A-law table 0x1: Enable Auto exposure/white balance A-law table. | RW | 0 |
| 16 | AEW_EN | AE/AWB enable 0x0: Disable Auto exposure/white balance 0x1: Enable Auto exposure/white balance | RW | 0 |
| 15 | BUSYAF | Busy bit for AF. | R | 0 |
| 14 | FVMODE | Focus Value Accumulation Mode 0x0: Sum mode. 0x1: Peak mode. | RW | 0 |
| 13:11 | RGBPOS | Red, Green, and blue pixel location in the AF windows RGBPOS(0): GR and GB as Bayer pattern RGBPOS(1): RG and GB as Bayer pattern RGBPOS(2): GR and BG as Bayer pattern RGBPOS(3): RG and BG as Bayer pattern RGBPOS(4): GG and RB as custom pattern RGBPOS(5): RB and GG as custom pattern 6 and 7 are reserved This Value is only used if VF is disabled | RW | 0x0 |
| 10:3 | MED_TH | Median filter threshold. | RW | 0xFF |
| 2 | AF_MED_EN | Auto Focus Median filter Enable If the median filter is enabled, then the 1st 2 and last 2 pixels in the frame are not in the valid region. Therefore the paxel start/end and IIR filter start positions should not be set within the 1st and last 2 pixels. 0x0: Disable AF median filter. 0x1: Enable AF median filter. | RW | 0 |
| 1 | AF_ALAW_EN | AF A-law table enable 0x0: Disable Auto Focus A-law table 0x1: Enable Auto Focus A-law table | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|--|------|-------|
| 0 | AF_EN | AF enable 0x0: Disable Auto Focus Engine 0x1: Enable Auto Focus Engine | RW | 0 |

| Description | Setup for the AF Engine Poxel Configuration | | | | | | | | | | | | | | | |
| Type | RW | | | | | | | | | | | | | | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|--------|----|----|----|--------|----|----|----|-------|----|----|----|-------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RESERVED | | | | | | | | AFINCH | | | | AFINCV | | | | PAXVC | | | | PAXHC | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|------------|---|------|-------|
| 31:21 | RESERVED | | R | 0x000 |
| 20:17 | AFINCH | AF Engine Column Increments Number of columns to increment in a paxel plus 1 multiplied by 2. Thus, the number of columns that can be skipped between two processed line pairs is 2-32 (even). The starting two columns in a paxel are first processed before this field is applied. This must be set so that there are at least 4 samples on a line when combined with the number of horizontal paxels. * This value is shadowed and latched on the rising edge of VSYNC. | RW | 0x0 |
| 16:13 | AFINCV | AF Engine Line Increments Number of lines to increment in a Poxel plus 1 multiplied by 2. Incrementing the line in a paxel is always done on a line pair due to the fact that the RGB pattern falls in two lines. If all the lines are to be processed, this field should be set to zero, and thus line count is incremented by 2 following a line pair. Thus, the number of lines that can be skipped between two processed line pairs is 0-30 (even). The starting two lines in a paxel are first processed before this field is applied. * This value is shadowed and latched on the rising edge of VSYNC. | RW | 0x0 |
| 12:6 | PAXVC | AF Engine Vertical Poxel Count The number of paxels in the vertical direction plus 1. The maximum number of vertical paxels in a frame should not exceed 128. The value should be set to ensure that the bandwidth requirements and buffer size are not exceeded. * This value is shadowed and latched on the rising edge of VSYNC. | RW | 0x00 |
| 5:0 | PAXHC | AF Engine Horizontal Poxel Count The number of paxels in the horizontal direction plus 1. It is illegal to set a number that is greater than 35 (total of 36 paxels in the horizontal direction). The minimum number of paxels should be 2 (valid range for the field is 1-35). * This value is shadowed and latched on the rising edge of VSYNC. | RW | 0x00 |

| Bits | Field Name | Description | Type | Reset |
|-------|------------|--|------|-------|
| 31:24 | WINH | AE/AWB Engine Window Height This specifies the window height in an even number of pixels, the window height is the value plus 1 multiplied by 2. The final value can be from 2-512 (even) * This value is shadowed and latched on the rising edge of VSYNC. | RW | 0x00 |
| 23:21 | RESERVED | | R | 0x0 |
| 20:13 | WINW | AE/AWB Engine Window Width This specifies the window width in an even number of pixels, the window width is the value plus 1 multiplied by 2. The minimum width is 16 pixels if the pixel clock is half or less of the ISS_FLCK clock. If the pixel clock is equal to the ISS_FLCK clock, the minimum width is 32 pixels. * This value is shadowed and latched on the rising edge of VSYNC. | RW | 0x00 |
| 12:6 | WINVC | AE/AWB Engine Vertical Window Count The number of windows in the vertical direction plus 1. The maximum number of vertical windows in a frame should not exceed 128. The value should be set to ensure that the bandwidth requirements and buffer size are not exceeded * This value is shadowed and latched on the rising edge of VSYNC. | RW | 0x00 |
| 5:0 | WINHC | AE/AWB Engine Horizontal Window Count The number of horizontal windows plus 1. The maximum number of horizontal windows is 35 plus 1 (36). The minimum number of windows should be 2 (valid range for the field is 1-35). * This value is shadowed and latched on the rising edge of VSYNC. | RW | 0x00 |

8.4 ISS Still Image Coprocessor

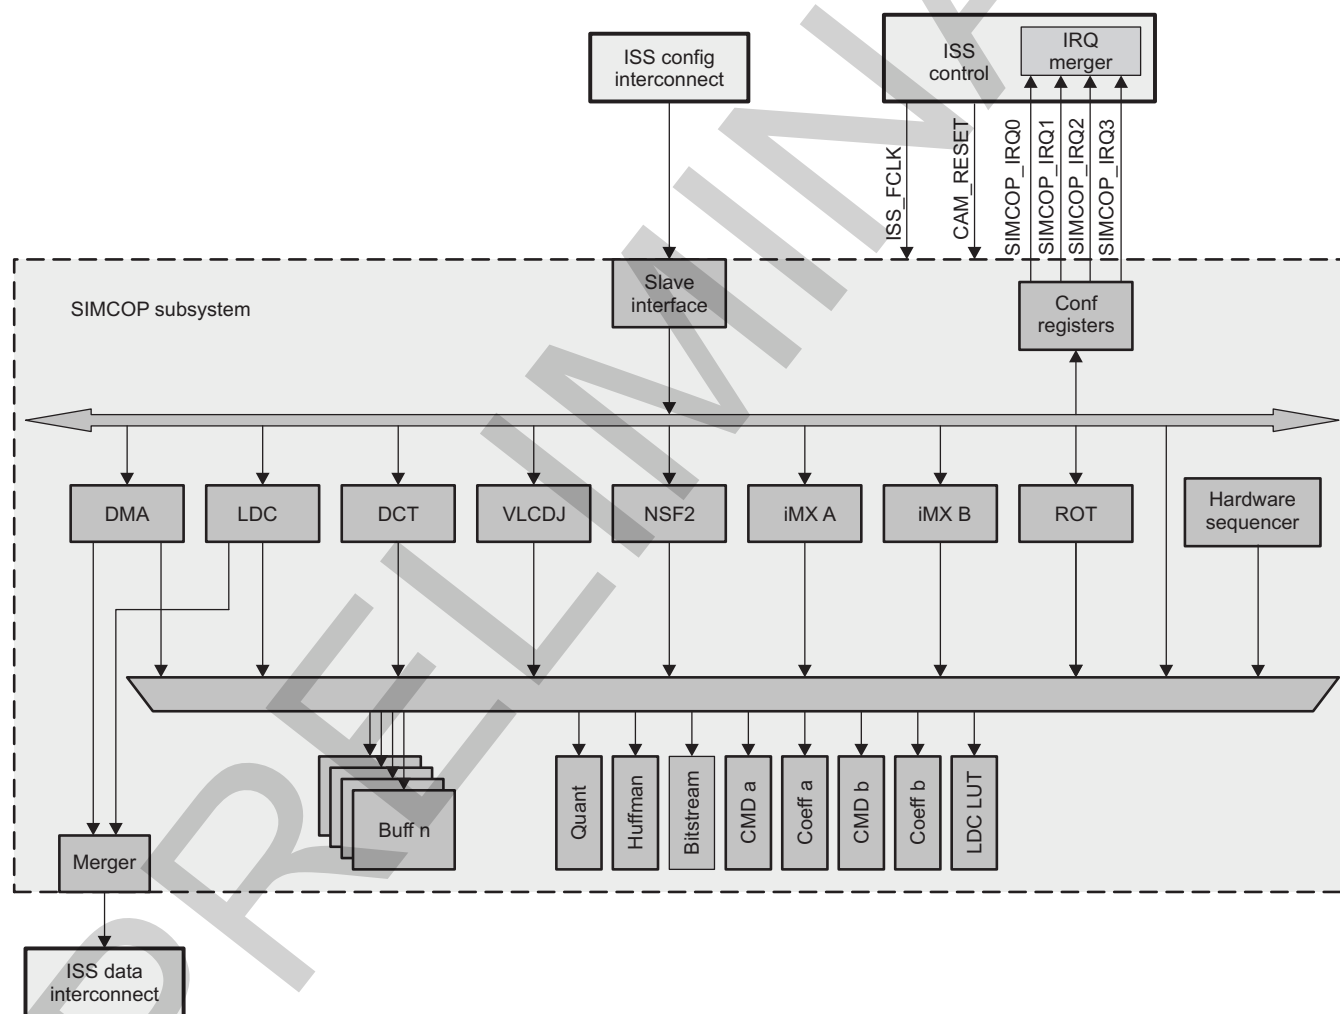

This section gives a high-level description of the ISS still iMage coprocessor (SIMCOP) in the device. For a high-level description of ISS level, see [Section 8.1, ISS: Overview](#).

8.4.1 ISS SIMCOP Overview

The SIMCOP subsystem is designed to encode, decode, and process image data. The SIMCOP is a macroblock-based memory-to-memory processing engine. It fetches macroblocks from system memory and stores them into local memories. Different accelerators take the fetched data, perform processing, and send the processing outcome back to local memories. From there the data could be further processed by other accelerators or be sent back to system memory. The SIMCOP needs an external central processing unit (CPU) to perform high-level control tasks and configurations. The SIMCOP is closely coupled to a CPU for that purpose.

Figure 8-243 shows a block diagram of the SIMCOP subsystem.

Figure 8-243. SIMCOP Subsystem Overview

simcop-002

The ISS SIMCOP subsystem consists of:

- Noise filter (NSF2) for advanced noise filtering and an edge-enhancement
- Two image and video processing engines (iMXs) supplement various fixed-function processing blocks
- Variable-length coder/decoder for JPEG (VLCDJ) module handles quantization and variable length coding, decoding and inverse quantization
- Discrete cosine transform (DCT) module implements method in the compression flow to transform

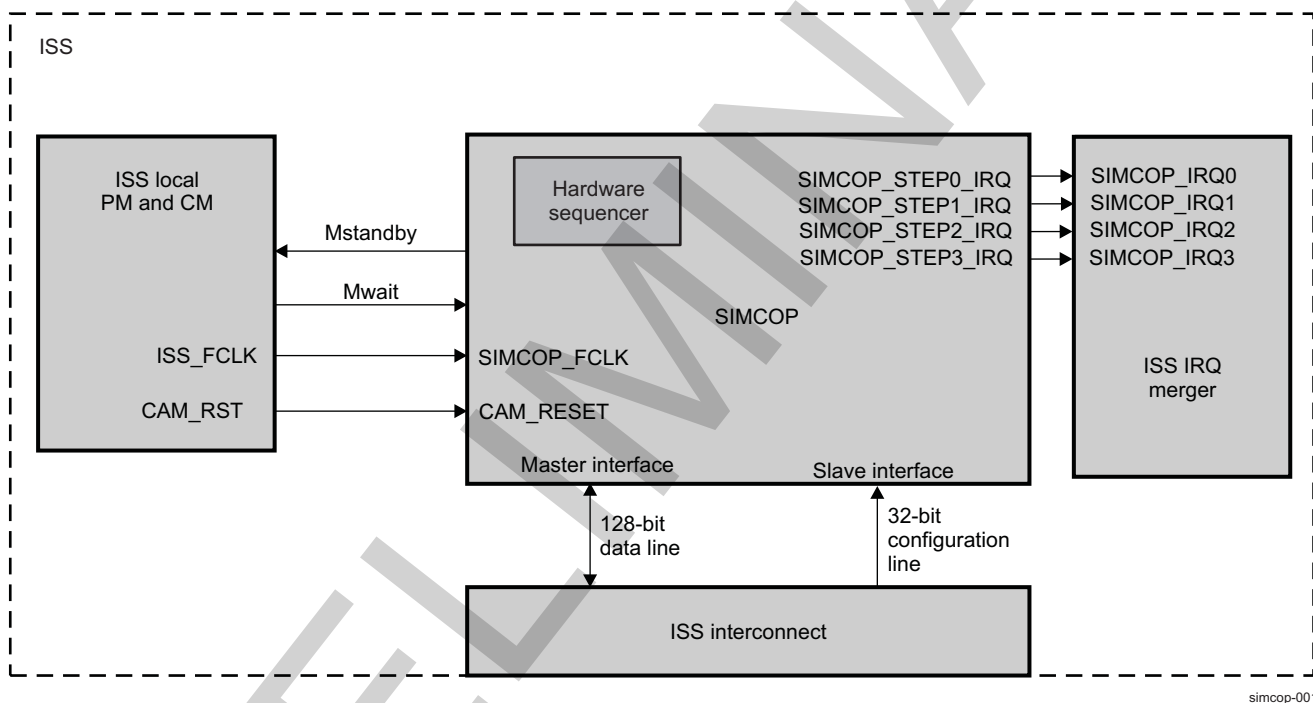

blocks of image

- Lens distortion correction (LDC) module deals with lens geometric distortion issues in the camera subsystem
- Rotation accelerator (ROT) engine blocks data rotation and shifting from a SIMCOP local memory to another SIMCOP local memory
- Hardware sequencer and buffers control SIMCOP modules/buffers to offload an external processor to perform low-level sequencing tasks
- Direct memory access (DMA) controller data transfers from SIMCOP memories to system memory or from system memory to SIMCOP memories

8.4.1.1 ISS SIMCOP Integration

The SIMCOP subsystem is connected to the rest of the system through the ISS local interconnect. [Figure 8-244](#) shows the integration of the SIMCOP subsystem in the ISS.

Figure 8-244. SIMCOP Integration

simcop-001

NOTE: For more information about the IDLE hardware handshake and the wake-up request, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

This section gives an overview of typical uses of the module. See [Chapter 3, Power, Reset, and Clock Management](#), for more information and settings of the PRCM relationship to ISS clocks and resets.

[Table 8-1236](#) lists the integration attributes.

Table 8-1236. Integration Attributes

| Module Instance | Attributes | |
|-----------------|--------------|--------------|
| | Power Domain | Interconnect |
| SIMCOP | PD_CAM | |

Table 8-1237 lists the clocks and resets values.

Table 8-1237. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|--|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| SIMCOP | SIMCOP_FCLK | ISS_FCLK | PRCM | Functional clock provided by ISS_CLK from the PRCM module. It is used by all ISS submodules and ISS top-level resources. |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| SIMCOP | CAM_RESET | CAM_RST | PRCM | ISS and SIMCOP global reset |

Table 8-1238 lists the hardware resets.

Table 8-1238. Hardware Requests

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|-------------------|--|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| SIMCOP | SIMCOP_STEP_0_IRQ | SIMCOP_IRQ0 | SIMCOP IRQ merger | Event triggered when a SIMCOP context is activated by the hardware sequencer |
| SIMCOP | SIMCOP_STEP_1_IRQ | SIMCOP_IRQ1 | SIMCOP IRQ merger | Event triggered when a SIMCOP context is activated by the hardware sequencer |
| SIMCOP | SIMCOP_STEP_2_IRQ | SIMCOP_IRQ2 | SIMCOP IRQ merger | Event triggered when a SIMCOP context is activated by the hardware sequencer |
| SIMCOP | SIMCOP_STEP_3_IRQ | SIMCOP_IRQ3 | SIMCOP IRQ merger | Event triggered when a SIMCOP context is activated by the hardware sequencer |

For more information about interrupt requests, see [Section 8.4.1.2.3, Interrupt Merger](#).

8.4.1.2 ISS SIMCOP Functional Description

8.4.1.2.1 ISS SIMCOP Local Power and Clock Management

8.4.1.2.1.1 ISS SIMCOP Local Clock Management

ISS has five asynchronous clock domains. The SIMCOP belongs to the ISS_FCLK clock domain.

An externally provided clock-enable signal is used. Multiple subdomains exist internally to reduce dynamic power consumption. This feature does not require intervention by the PRCM module. For high-level description of the SIMCOP clock domain and configuration inside ISS, see [Section 8.1.2.2, ISS Clocks](#).

Moreover, at high level the functional clock of ISS SIMCOP submodules can be cut by software to reduce power consumption by cutting off or turning on the modules from the [SIMCOP_CLKCTRL](#) register (see [Table 8-1239](#)).

When software wants to enable a submodule:

- Software sets the adequate bit in the [SIMCOP_CLKCTRL](#) register.
- Hardware enables the submodule functional and interface clocks.
- Hardware connects the configuration port of the submodule to the coprocessor bus.
- Hardware sets the appropriate bit in the [SIMCOP_CLKCTRL](#) register. Software must check if this bit is set before accessing the submodule.

[Table 8-1239](#) lists the ISS SIMCOP clock control register settings.

Table 8-1239. ISS SIMCOP Clock Control Register Settings

| Module Name | Bit Field Name | Description |
|-------------|--|--------------------------------|
| ROT | SIMCOP_CLKCTRL [7] ROT_A | Writing 0x1 enables the module |
| iMX B | SIMCOP_CLKCTRL [6] IMX_B | Writing 0x1 enables the module |
| iMX A | SIMCOP_CLKCTRL [5] IMX_A | Writing 0x1 enables the module |
| NSF2 | SIMCOP_CLKCTRL [4] NSF2 | Writing 0x1 enables the module |
| VLCDJ | SIMCOP_CLKCTRL [3] VLCDJ | Writing 0x1 enables the module |
| DCT | SIMCOP_CLKCTRL [2] DCT | Writing 0x1 enables the module |
| LDC | SIMCOP_CLKCTRL [1] LDC | Writing 0x1 enables the module |
| DMA | SIMCOP_CLKCTRL [0] DMA | Writing 0x1 enables the module |

When software wants to shutdown a submodule:

- Software ensures that the submodule is idle. Mainly:
 - The submodule must not generate new events.
 - The submodule must not have any pending events.
 - For initiators: the submodule must stop interconnect transaction generation.
- Software clears the appropriate bit in the [SIMCOP_CLKCTRL](#) register.
- Hardware disconnects the configuration port of the module from the coprocessor bus: no more accesses are routed to the submodule. Ongoing transactions are finished (hardware stays in this state as long as required).
- For initiators: hardware waits until there are no more outstanding transactions:
 - SIMCOP DMA provides an MStandBy signal for that purpose.
 - The LDC does not provide this information. Software must ensure that the LDC is idle. SIMCOP hardware ensures that the internal MTC2OCP bridges have no outstanding transactions.
- Hardware cuts the submodules clock.
- Hardware clears the appropriate [SIMCOP_CLKCTRL](#) registers.

SIMCOP submodules support autogating. They can gate their functional and interface clock internally based on functional requirements. This feature could be disabled for debug or power consumption measurement purposes.

8.4.1.2.1.2 Local Clock Autogating

The SIMCOP subsystem modules support autogating. They can gate their functional and interface clock internally based on functional requirements. This feature can be disabled. [Table 8-1240](#) summarizes which modules support autogating control and which control bit is used.

Table 8-1240. Autoclock Gating Bit Control

| SIMCOP Resource | Autogating Override |
|----------------------------|-------------------------------|
| SIMCOP top-level resources | N/A |
| SIMCOP DMA | N/A |
| LDC | N/A |
| DCT | DCT_CFG[5] AUTOGATING |
| VLCDJ | VLCDJ_CTRL[3] AUTOGATING |
| NSF2 | N/A |
| iMX A | iMXa.IMX_CLKCNTRL[0] CLKCNTRL |
| iMX B | iMXb.IMX_CLKCNTRL[0] CLKCNTRL |
| ROT | ROT_CFG[9] AUTOGATING |

8.4.1.2.1.3 ISS SIMCOP Power Management

The SIMCOP supports the STANDBY power-management protocol. It is used by the SIMCOP to indicate when it has no more interconnect transactions to perform. This information is used at ISS level to control the SIMCOP and ISS shut-down sequence. The SIMCOP does not have any internal wake-up events. DISCONNECT and IDLE protocols are not supported.

The typical SIMCOP shut-down sequence is:

1. Software disables all SIMCOP submodules. This ensures the SIMCOP does not:
 - (a) Generate any traffic on its master port: SIMCOP asserts the MStandby signal.
 - (b) Generate new events (IRQs).
2. Software clears all pending events at SIMCOP level: All interrupt lines become inactive.
3. Software initiates the SIMCOP shut-down sequence by writing the appropriate bit at ISS level.
4. ISS hardware:
 - (a) Disconnects the SIMCOP configuration port. Any access attempts to SIMCOP are blocked at ISS level. The DISCONNECT protocol is handled at ISS level: SIMCOP does not provide any handshake signals to support it.
 - (b) Waits until MStandby from SIMCOP is asserted (always true in a normal case because SIMCOP submodules are inactive)
 - (c) Asserts the SWait input of SIMCOP
 - (d) Cuts the SIMCOP clock

The typical SIMCOP enable sequence is:

1. Software initiates the SIMCOP enable sequence by writing the appropriate bit at ISS level.
2. ISS hardware:
 - (a) Enables the SIMCOP clock
 - (b) Deasserts the SWait input of the SIMCOP
 - (c) Connects the SIMCOP configuration port

Three modes for MStandBy control are supported. The mode is selected using the [SIMCOP_HL_SYSCONFIG\[5:4\]](#) STANDBYMODE bit field.

- Smart-standby: This is the normal mode to be used. When in this mode, the SIMCOP asserts the MStandBy signal when the MStandBy output of SIMCOP DMA is asserted, the LDC is effectively disabled ([SIMCOP_CLKCTRL\[1\]](#) LDC =0), and the MTCR2OCP bridge and the merger have no more outstanding transactions.
- Force-standby: This is a backup mode intended to be used only if smart-idle mode is bugged. When in this mode, the SIMCOP asserts MStandBy unconditionally. Software must ensure that the SIMCOP is in a correct quiet state before programming this mode.
- No-standby: This is a backup mode intended to be used only if smart-idle mode is bugged. When in this mode, the SIMCOP never asserts the MStandBy signal.

8.4.1.2.2 Software Reset

Software reset is intended to return the SIMCOP into a known state without requiring a complete device reset. A software reset at SIMCOP level is seen as a hardware reset for SIMCOP submodules. To perform a software reset, sets the [SIMCOP_HL_SYSCONFIG\[0\]](#) SOFTRESET bit to 1. The [SIMCOP_HL_SYSCONFIG\[0\]](#) SOFTRESET bit indicates that the software reset is ongoing when its value is 1. When the software reset completes, the [SIMCOP_HL_SYSCONFIG\[1\]](#) SOFTRESET bit is automatically reset. Software must ensure that the software reset completes before configuring the hardware sequencer or buffers.

8.4.1.2.3 Interrupt Merger

SIMCOP interrupts are merged at the SIMCOP subsystem level into four interrupts, as shown in [Figure 8-245](#).

Figure 8-245. SIMCOP Interrupt Merger Overview

These four outputs interrupts can be configured through [SIMCOP_HL_IRQENABLE_SET_i](#) and [SIMCOP_HL_IRQENABLE_CLR_i](#) (where $i = 0$ to 3, corresponding to output interrupt) to enable or disable interrupt mask for each interrupt output. Software can poll the value of interrupt before masking ([SIMCOP_HL_IRQSTATUS_RAW_i](#)) and after masking ([SIMCOP_HL_IRQSTATUS_i](#)).

Software can configure how outputs interrupts are generated through [SIMCOP_CTRL\[i\] IRQi_MODE](#) (where $i = 0$ to 3):

- 0x0: OR, the interrupt is asserted when one of the selected events has occurred
- 0x1: AND, the interrupt is asserted when all selected events have occurred

[Table 8-1241](#) shows how interrupts are mapped on the [SIMCOP_HL_IRQSTATUS_RAW_i](#), [SIMCOP_HL_IRQSTATUS_i](#), [SIMCOP_HL_IRQENABLE_SET_i](#), and [SIMCOP_HL_IRQENABLE_CLR_i](#) registers.

Table 8-1241. SIMCOP Interrupts

| Bit | Name | Description |
|-----|----------------------|---|
| 0 | SIMCOP_DMA_IRQ0 | Interrupt triggered by SIMCOP DMA |
| 1 | LDC_FRAME_IRQ | A full frame has been processed by LDC2 |
| 2 | DCT_IRQ | DCT operation has been completed (configured number of MCUs for YUV4:2:0/4:2:2 mode, or number of blocks for sequential block mode). |
| 3 | VLCDJ_BLOCK_IRQ | A macroblock has been processed (encode/decode). |
| 4 | NSF_IRQ | Event triggered by the NSF2 imaging accelerator when processing of a block is done |
| 5 | IMX_A_IRQ | Event triggered when iMX has executed a SLEEP instruction |
| 6 | IMX_B_IRQ | |
| 7 | ROT_A_IRQ | Event triggered by the ROT engine |
| 8 | RESERVED | Reserved |
| 9 | LDC_BLOCK_IRQ | A macroblock has been processed by LDC2. |
| 10 | SIMCOP_STEP0_IRQ | Event triggered when a SIMCOP context is activated by the hardware sequencer |
| 11 | SIMCOP_STEP1_IRQ | |
| 12 | SIMCOP_STEP2_IRQ | |
| 13 | SIMCOP_STEP3_IRQ | |
| 14 | DONE_IRQ | Event triggered when the hardware sequencer finishes the sequence: - the sequence step counter has reached the limit - All accelerator and DMA events for the last sequence step have been received. |
| 15 | VLCDJ_DECODE_ERR_IRQ | A decode error has been signaled by the VLCDJ |
| 16 | ICNT_ERR_IRQ | An error has been received on the SIMCOP master port on the L3 interconnect. |
| 17 | LDC2BRIDGE_ERR_IRQ | The LDC2 bridge has generated an error. This event must not trigger in a normal use case. |
| 18 | SIMCOP_DMA_IRQ1 | Interrupt triggered by SIMCOP DMA |
| 19 | CPU_PROC_START_IRQ | This interrupt is used when CPU data processing is used in a macroblock processing pipeline. When the CPU receives this IRQ, data is ready to be processed. When CPU is done with processing it acknowledges by setting the SIMCOP_HWSEQ_CTRL.CPU_PROC_DONE bit. The interrupt is cleared as usual. |

8.4.1.2.4 ISS SIMCOP Modules Description

This section gives links to each subsection for each submodule in the ISS SIMCOP module.

The ISS module provides unique ISS_FCLK for all the submodules inside the SIMCOP (see [Section 8.4.1.2.1.1, ISS SIMCOP Local Clock Management](#)).

For information about hardware and software resets for each module see [Table 8-1241](#).

For interrupt request information for each module, see [Section 8.4.1.2.3, Interrupt Merger](#).

ISS SIMCOP consists of the following submodules:

- Hardware sequencer and buffers, for more information see [Section 8.4.2, ISS SIMCOP Hardware Sequencer and Buffers](#).
- DMA, for more information, see [Section 8.4.3, ISS SIMCOP DMA Module](#).
- ROT, for more information, see [Section 8.4.7, ISS SIMCOP Rotation Accelerator \(ROT\) Module](#).
- iMX
- NSF2
- VLCDJ, for more information, see [Section 8.4.6, ISS SIMCOP Variable Length Coder/Decoder for JPEG \(VLCDJ\) Module](#).
- DCT, for more information, see [Section 8.4.5, ISS SIMCOP Discrete Cosine Transform \(DCT\) Module](#).
- LDC, for more information, see [Section 8.4.4, ISS SIMCOP LDC Module](#).

8.4.1.3 ISS SIMCOP Programming Models

8.4.1.3.1 Global Initialization

8.4.1.3.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the ISS SIMCOP module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration of the ISS SIMCOP.

Table 8-1242. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------|--|
| ISS local PM and CM | Module interface and functional clocks must be enabled. For more information, see Section 8.4.1.2.1, ISS SIMCOP Local Power and Clock Management . |

8.4.1.3.1.2 ISS SIMCOP Module Global Initialization

This procedure initializes the ISS SIMCOP module after a power on or software reset.

Table 8-1243. ISS SIMCOP Global Initialization

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------|
| Execute software reset. | SIMCOP_HL_SYSCONFIG[0] SOFTRESET | 0x1 |
| Wait until reset completed? | SIMCOP_HL_SYSCONFIG[0] SOFTRESET | 0x0 |
| Configure STANDBYMODE. | SIMCOP_HL_SYSCONFIG[5:4] STANDBYMODE | 0x2 |
| Configure submodules interface and functional clock. | SIMCOP_CLKCTRL[7:0] | xxx |
| Interrupt configuration | | |
| Set interrupt enable bit for the submodules. | SIMCOP_HL_IRQENABLE_SET_i[7:0] | xxx |

8.4.1.3.2 ISS SIMCOP Operational Modes Configuration

8.4.1.3.2.1 Interrupts

To unmask an interrupt for generation of SIMCOP_IRQi output interrupts, software must set the corresponding bit of [SIMCOP_HL_IRQENABLE_SET_i](#) (where i = 0 to 3) to 1.

Example 1, SIMCOP_IRQ1 is generated when DCT_IRQ or VLCDJ_BLOCK_IRQ are generated:

- [SIMCOP_HL_IRQENABLE_SET_i](#)[2] DCT_IRQ = 0x1 (where i = 1)
- [SIMCOP_HL_IRQENABLE_SET_i](#)[3] VLCDJ_BLOCK_IRQ = 0x1 (where i = 1)
- [SIMCOP_CTRL](#)[1] IRQ1_MODE = 0x0

Example 2, SIMCOP_IRQ3 is generated when IMX_A_IRQ and LDC_BLOCK_IRQ are generated:

- [SIMCOP_HL_IRQENABLE_SET_i](#)[5] IMX_A_IRQ = 0x1 (where i = 3)
- [SIMCOP_HL_IRQENABLE_SET_i](#)[9] LDC_BLOCK_IRQ = 0x1 (where i = 3)
- [SIMCOP_CTRL](#)[3] IRQ3_MODE = 0x1

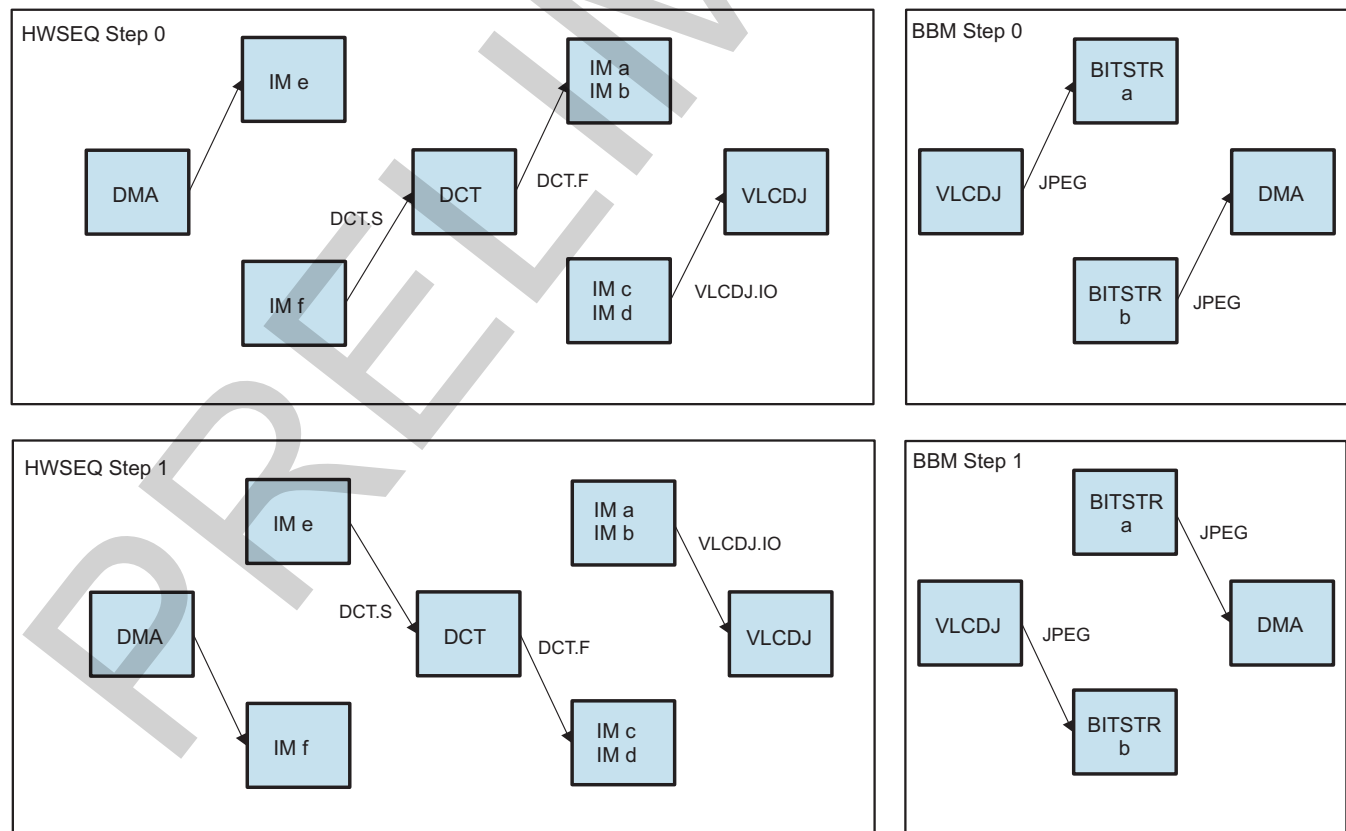

To mask an interrupt for generation of SIMCOP_IRQi output interrupts, software must clear the corresponding bit of [SIMCOP_HL_IRQENABLE_CLEAR_i](#) (where i = 0 to 3) to 0.

When an event occurs, the corresponding bit in the [SIMCOP_HL_IRQSTATUS_RAW_i](#) (where i = 0 to 3) register is set regardless if the event has been enabled or not. Bits in the [SIMCOP_HL_IRQSTATUS_i](#) (where i = 0 to 3) registers are only set when an enabled event occurs. Software can clear a pending event by setting the adequate bit in the [SIMCOP_HL_IRQSTATUS_i](#) (where i = 0 to 3) register.

8.4.1.3.2.2 JPEG Encode Operational Mode Configuration

Figure 8-246 shows a typical JPEG encode macroblock pipeline.

Figure 8-246. JPEG Encode Pipeline

simcop-012

Table 8-1244. JPEG Encode Pipeline

| Step | Register/Bit Field/Programming Model | Value |
|---|---|-------|
| Set SIMCOP DMA to fetch data from SDRAM and stored into an image buffer (IM e or IM f). | See DMA programming model Section 8.4.3.4 | xxx |
| Set DCT to reads data from an image buffer (IM e or IM f). | DCT_SPTR[12:5] ADDR | xxx |
| Set DCT to store data into sets of two image buffers (IM a + IM b or IM c + IM d). | DCT_FPTR[12:4] ADDR | xxx |
| Set VLCDJ to read data from image buffers. | See VLCDJ programming model Section 8.4.6.4 | xxx |
| Set VLCDJ to write the data to the bitstream buffer. | See VLCDJ programming model Section 8.4.6.4 | xxx |
| Set the SIMCOP DMA to send the data to SDRAM. | See DMA programming model Section 8.4.3.4 | xxx |

8.4.1.4 ISS SIMCOP Register Manual

8.4.1.4.1 SIMCOP Instance Summary

Table 8-1245 is the SIMCOP top level instance summary.

Table 8-1245. SIMCOP Instance Summary

| Module Name | Base Address L3 Interconnect | Base Address Cortex-M3 Private Access | Size |
|----------------|---------------------------------|--|-----------|
| SIMCOP_CONTROL | 0x5202 0000 | 0x5506 0000 | 256 bytes |

NOTE: Private Access is an access that does not use the L3/L4 interconnects.

| Bits | Field Name | Description | Type | Reset |
|-------|----------------------|---|---------------|-------|
| 31:20 | RESERVED | Read returns 0. | R | 0x000 |
| 19 | CPU_PROC_START_IRQ | Event triggered by the hardware sequencer to instruct the CPU to process a macroblock Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 18 | SIMCOP_DMA_IRQ1 | Event triggered by the SIMCOP DMA. This event is automatically cleared at SIMCOP level when it is cleared at SIMCOP DMA level. Check SIMCOP DMA IRQ registers. Read 0x0: No event pending Read 0x1: Event pending | R | 0 |
| 17 | LDC2BRIDGE_ERR_IRQ | The LDC2 bridge has generated an error. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 16 | ICNT_ERR_IRQ | An error has been received on the SIMCOP master port. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 15 | VLCDJ_DECODE_ERR_IRQ | A decode error has been signaled by the VLCDJ module Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 14 | DONE_IRQ | Event triggered when the hardware sequencer finishes the sequence: - the sequence step counter has reached the limit - all accelerator and DMA events for the last sequence step have been received. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 13 | STEP3_IRQ | Event triggered when Step 3 is activated by the hardware sequencer Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 12 | STEP2_IRQ | Event triggered when Step 2 is activated by the hardware sequencer Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|----------------|--|---------------|-------|
| 11 | STEP1_IRQ | Event triggered when Step 1 is activated by the hardware sequencer Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 10 | STEP0_IRQ | Event triggered when Step 0 is activated by the hardware sequencer Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 9 | LDC_BLOCK_IRQ | This event is triggered by LDC when a macroblock has been processed Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 8 | RESERVED | Read returns 0. | R | 0 |
| 7 | ROT_A | Event triggered by the ROT a engine Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 6 | IMX_B_IRQ | Event triggered when iMX has executed a SLEEP instruction. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 5 | IMX_A_IRQ | Event triggered when iMX has executed a SLEEP instruction. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 4 | NSF_IRQ_IRQ | Event triggered by the NSF2 imaging accelerator when processing of a block is done. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 3 | VLCDJ_BLOC_IRQ | This event is triggered by VLCDJ when a macroblock has been processed (encode/decode) Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------|---|---------------|-------|
| 2 | DCT_IRQ | Event triggered when a block has been processed by the DCT module and the filter outcome has been stored to an image buffer. Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 1 | LDC_FRAME_IRQ | This event is triggered by LDC when a full frame has been processed Write 0x0: No action Read 0x0: No event pending Read 0x1: Event pending Write 0x1: Set event (debug) | RW W1toSet | 0 |
| 0 | SIMCOP_DMA_IRQ0 | Event triggered by the SIMCOP DMA. This event is automatically cleared at SIMCOP level when it is cleared at SIMCOP DMA level. Check SIMCOP DMA IRQ registers. Read 0x0: No event pending Read 0x1: Event pending | R | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|----------------------|--|---------------|-------|
| 31:20 | RESERVED | Read returns 0. | R | 0x000 |
| 19 | CPU_PROC_START_IRQ | Event triggered by the hardware sequencer to instruct the CPU to process a macroblock Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 18 | SIMCOP_DMA_IRQ1 | Event triggered by the SIMCOP DMA. Check SIMCOP DMA IRQ registers. Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 17 | LDC2BRIDGE_ERR_IRQ | The LDC2 bridge has generated an error. Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 16 | ICNT_ERR_IRQ | An error has been received on the SIMCOP master port. Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 15 | VLCDJ_DECODE_ERR_IRQ | A decode error has been signaled by the VLCDJ module Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 14 | DONE_IRQ | Event triggered when the hardware sequencer finishes the sequence: The sequence step counter has reached the limit. All accelerator and DMA events for the last sequence step have been received. Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 13 | STEP3_IRQ | Event triggered when Step 3 is activated by the hardware sequencer Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 12 | STEP2_IRQ | Event triggered when Step 2 is activated by the hardware sequencer Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|----------------|--|---------------|-------|
| 11 | STEP1_IRQ | Event triggered when Step 1 is activated by the hardware sequencer Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 10 | STEP0_IRQ | Event triggered when Step 0 is activated by the hardware sequencer Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 9 | LDC_BLOCK_IRQ | This event is triggered by LDC when a macroblock has been processed Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 8 | RESERVED | Read returns 0. | R | 0 |
| 7 | ROT_A | Event triggered by the ROT a engine Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 6 | IMX_B_IRQ | Event triggered when iMX has executed a SLEEP instruction. Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 5 | IMX_A_IRQ | Event triggered when iMX has executed a SLEEP instruction. Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 4 | NSF_IRQ_IRQ | Event triggered by the NSF2 imaging accelerator when processing of a block is done. Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 3 | VLCDJ_BLOC_IRQ | This event is triggered by VLCDJ when a macroblock has been processed (encode/decode) Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------|---|---------------|-------|
| 2 | DCT_IRQ | Event triggered when a block has been processed by the DCT module and the filter outcome has been stored to an image buffer. Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 1 | LDC_FRAME_IRQ | This event is triggered by LDC when a full frame has been processed Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |
| 0 | SIMCOP_DMA_IRQ0 | Event triggered by the SIMCOP DMA. Check SIMCOP DMA IRQ registers. Write 0x0: No action Read 0x0: Interrupt disabled (masked) Read 0x1: Interrupt enabled Write 0x1: Enable interrupt | RW W1toSet | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|------------------------|---|------|-------|
| 31:29 | RESERVED | Read returns 0. | R | 0x0 |
| 28 | LDC_R_BURST_BREAK | Controls if bursts issued by the LDC2 bridge could cross burst length boundaries. When this register is set, the LDC2 bridge only issues aligned bursts. Register can only be used when LDC_R_MAX_BURST_LENGTH is 32, 64, or 128 bytes. 0x0: Yes. 0x1: No. OCP transactions must be split | RW | 0 |
| 27:26 | LDC_R_MAX_BURST_LENGTH | Limits the maximum burst length that could be used by the LDC2 bridge 0x0: 8 x 128 0x1: 6 x 128 0x2: 4 x 128 0x3: 2 x 128 | RW | 0x0 |
| 25 | RESERVED | Read returns 0. | R | 0 |
| 24:21 | LDC_R_TAG_CNT | Limits the maximum number of outstanding requests to LDC_R_TAG_CNT+1 | RW | 0x3 |
| 20 | RESERVED | Read returns 0. | R | 0 |
| 19:16 | LDC_R_TAG_OFST | First OCP tag ID that can be used by LDC reads. Software must prevent overlap with tags generated by the SIMCOP DMA. Typically this value should be equal to SIMCP_DMA_CTRL.TAG_CNT+1. | RW | 0xC |
| 15 | RESERVED | Read returns 0. | R | 0 |
| 14 | IMX_B_CMD | Switch for iMX # command memory 0x0: Coprocessor bus 0x1: iMX B instruction read / write | RW | 0 |
| 13:12 | IMX_A_CMD | Switch for iMX A command memory 0x0: Coprocessor bus 0x1: iMX A instruction read/write 0x2: iMX B instruction read/write | RW | 0x0 |
| 11 | HUFF | Switch for Huffman table 0x0: Coprocessor 0x1: VLCDJ Huffman table read | RW | 0 |
| 10 | QUANT | Switch for quantization table 0x0: Coprocessor bus 0x1: VLCDJ quantization table read | RW | 0 |
| 9 | RESERVED | Read returns 0. | R | 0 |
| 8 | LDC_LUT | Switch for LDC LUT 0x0: Coprocessor bus 0x1: The LDC module could access the LDC LUT. | RW | 0 |
| 7:6 | LDC_INPUT | Selects input data buffer for LDC. Memories attached to LDC as working memories cannot be used by any other accelerators. HWSEQ or HWSEQ software override settings are ignored for those memories. 0x0: No input memory attached 0x1: Use image buffers a and b 0x2: Use image buffers a, b, c, and d 0x3: Use LDC private input memory. | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|---|------|-------|
| 5:4 | NSF_WMEM | Selects working memory for NSF. Memories attached to NSF as working memories cannot be used by any other accelerators. HWSEQ or HWSEQ software override settings are ignored for those memories. 0x0: No working memory attached to NSF2. NSF2 cannot be used. 0x1: iMX A coefficient memory used. 0x2: Image buffers a and b used. Those image buffers cannot be used for other purposes. This setting has higher priority than the context configuration. 0x3: Image buffers a, b, c, and d used. Those image buffers cannot be used for other purposes. This setting has higher priority than the context configuration. | RW | 0x0 |
| 3 | IRQ3_MODE | Interrupt generation method 0x0: The interrupt line is asserted when one of the events enabled in SIMCOP_IRQENABLE_3 is pending. 0x1: The interrupt line is asserted when all events enabled in SIMCOP_IRQENABLE_3 are pending. | RW | 0 |
| 2 | IRQ2_MODE | Interrupt generation method 0x0: The interrupt line is asserted when one of the events enabled in SIMCOP_IRQENABLE_2 is pending. 0x1: The interrupt line is asserted when all events enabled in SIMCOP_IRQENABLE_2 are pending. | RW | 0 |
| 1 | IRQ1_MODE | Interrupt generation method 0x0: The interrupt line is asserted when one of the events enabled in SIMCOP_IRQENABLE_1 is pending. 0x1: The interrupt line is asserted when all events enabled in SIMCOP_IRQENABLE_1 are pending. | RW | 0 |
| 0 | IRQ0_MODE | Interrupt generation method 0x0: The interrupt line is asserted when one of the events enabled in SIMCOP_IRQENABLE_0 is pending. 0x1: The interrupt line is asserted when all events enabled in SIMCOP_IRQENABLE_0 are pending. | RW | 0 |

8.4.2 ISS SIMCOP Hardware Sequencer and Buffers

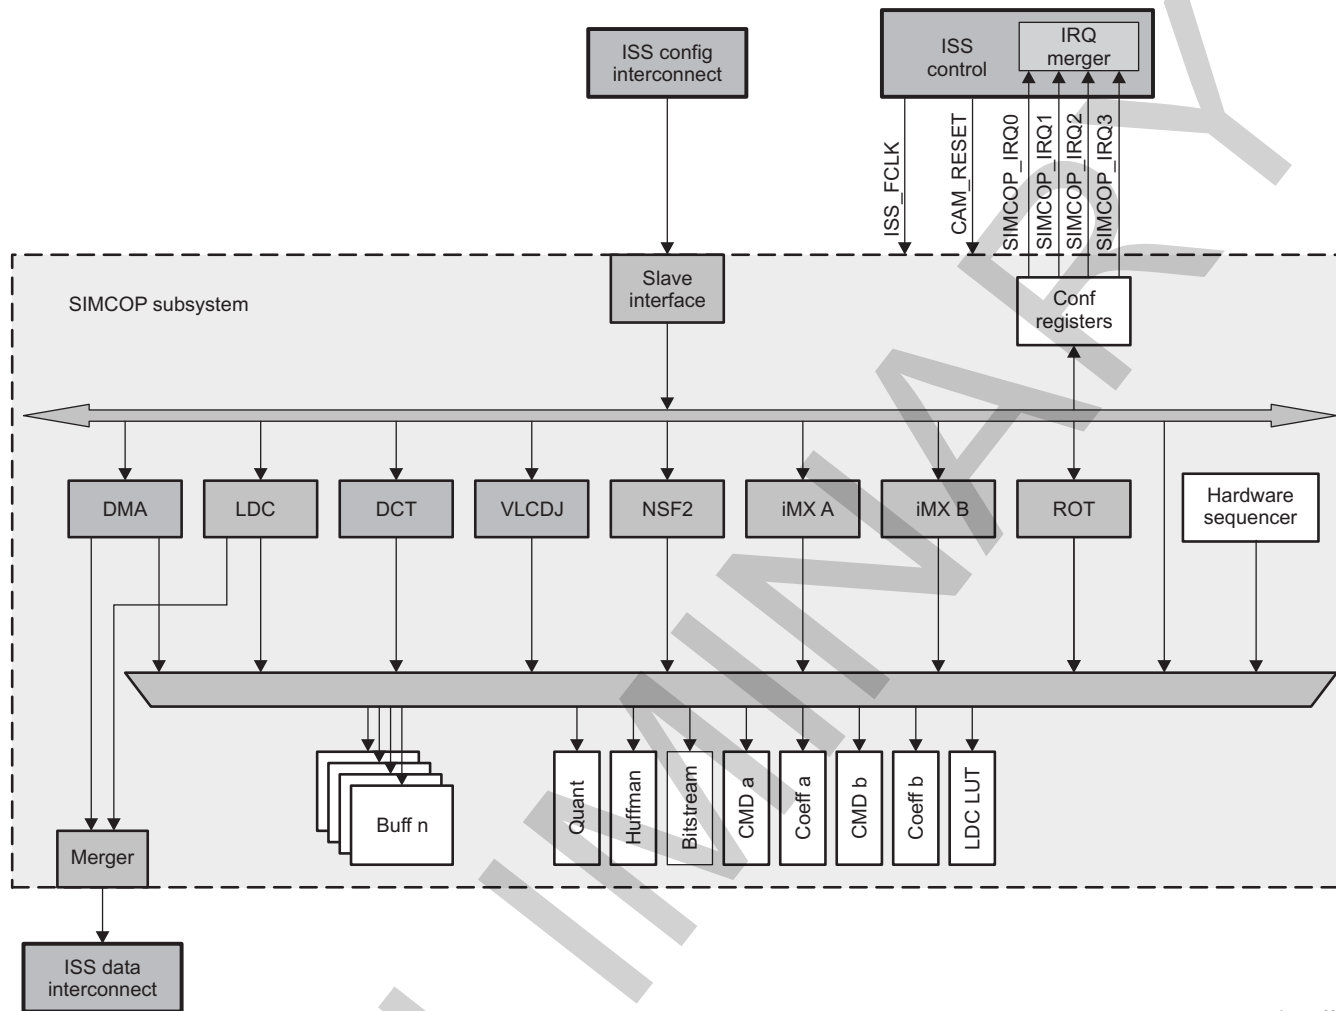

This section describes the hardware sequencer and buffers in the still image coprocessor (SIMCOP) subsystem.

8.4.2.1 ISS SIMCOP Hardware Sequencer and Buffers Overview

The SIMCOP hardware sequencer control all the modules included in the SIMCOP subsystem with their memories.

Figure 8-247 shows an overview of the hardware sequencer and buffers in the SIMCOP subsystem.

Figure 8-247. Hardware Sequencer and Buffers in the SIMCOP Subsystem

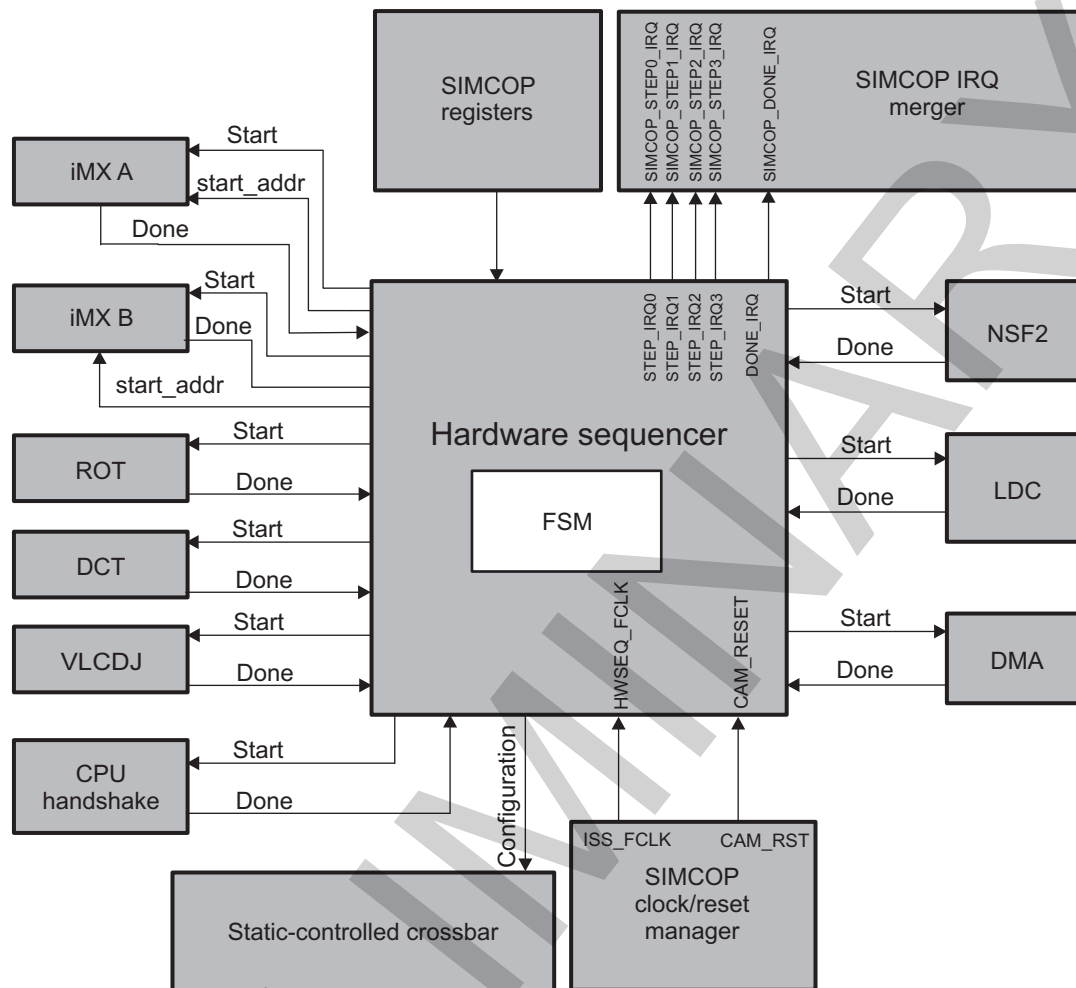

hwseq-001

- Hardware acceleration for low-level sequencing tasks:
 - Synchronizes with DMA, DCT, VLCDJ, ROT, NSF2, LDC, and iMX
 - Supports 4 memory crossbar contexts
- On-chip memories (RAM):
 - Eight image buffers, 4KB each
 - Quantization table storage: 512 bytes
 - Huffman table storage: 4KB
 - Bitstream buffer: 4KB
 - Two iMX coefficient memories: 16KB each
 - Two iMX program memories: 4KB for iMX A and 8KB for iMX B
 - LDC look-up table (LUT) storage: 256 entries
- Power-management support

8.4.2.2 ISS SIMCOP Hardware Sequencer and Buffer Integration

The hardware sequencer and buffers module is part of the SIMCOP subsystem in the imaging subsystem (ISS).

Figure 8-248 shows the integration of the hardware sequencer and buffers in the SIMCOP subsystem.

Figure 8-248. Hardware Sequencer and Buffer Integration

hwseq-011

Table 8-1266 lists the integration attributes, Table 8-1267 lists the clocks and resets, and Table 8-1268 lists the hardware requests.

Table 8-1266. Integration Attributes

| Module Instance | Attributes | |
|--------------------------------|--------------|--------------|
| | Power Domain | Interconnect |
| Hardware sequencer and buffers | PD_CAM | |

Table 8-1267. Clocks and Resets

| Clocks | | | | | |
|----------------------|-----------|-------------------------|--------------------|--------|--|
| Module Instance | | Destination Signal Name | Source Signal Name | Source | Description |
| Hardware and buffers | sequencer | HWSEQ_FCLK | ISS_FCLK | PRCM | Functional clock provided by ISS_CLK from PRCM . It is used by all ISS submodules and ISS top-level resources. |
| Resets | | | | | |
| Hardware and buffers | sequencer | CAM_RESET | CAM_RST | PRCM | ISS and SIMCOP global reset |

For information about clock and reset management, see [Section 8.4.1.2.1](#), *ISS SIMCOP Local Power and Clock Management*.

Table 8-1268. Hardware Requests

| Interrupt Requests | | | | | |
|--------------------------------|--------------------|-------------------------|-------------------|--|--|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description | |
| Hardware and buffers sequencer | STEP_IRQ0 | SIMCOP_STEP0_IRQ | SIMCOP IRQ merger | Event triggered when a SIMCOP context is activated by the hardware sequencer | |
| Hardware and buffers sequencer | STEP_IRQ1 | SIMCOP_STEP1_IRQ | SIMCOP IRQ merger | Event triggered when a SIMCOP context is activated by the hardware sequencer | |
| Hardware and buffers sequencer | STEP_IRQ2 | SIMCOP_STEP2_IRQ | SIMCOP IRQ merger | Event triggered when a SIMCOP context is activated by the hardware sequencer | |
| Hardware and buffers sequencer | STEP_IRQ3 | SIMCOP_STEP3_IRQ | SIMCOP IRQ merger | Event triggered when a SIMCOP context is activated by the hardware sequencer | |
| Hardware and buffers sequencer | DONE_IRQ | SIMCOP_DONE_IRQ | SIMCOP IRQ merger | Event triggered when the hardware sequencer finishes the sequence | |

For more information about interrupt requests, see [Section 8.4.1.2.3](#), *Interrupt Merger*.

8.4.2.3 ISS SIMCOP Hardware Sequencer and Buffers Functional Description

8.4.2.3.1 ISS SIMCOP Hardware Sequencer and Buffers Software Reset

For information about how to perform a software reset, see [Section 8.4.1.2.2, Software Reset](#).

8.4.2.3.2 ISS SIMCOP Hardware Sequencer and Buffers Power Management

For more information about power management, see [Section 8.4.1.2.1.3, ISS SIMCOP Power Management](#).

8.4.2.3.3 ISS SIMCOP Hardware Sequencer and Buffer Interrupt Requests

This module sends four interrupts to the ISS top level. For more information about interrupt management, see [Section 8.4.1.2.3, Interrupt Merger](#).

8.4.2.3.4 ISS SIMCOP Hardware Sequencer Buffer Description

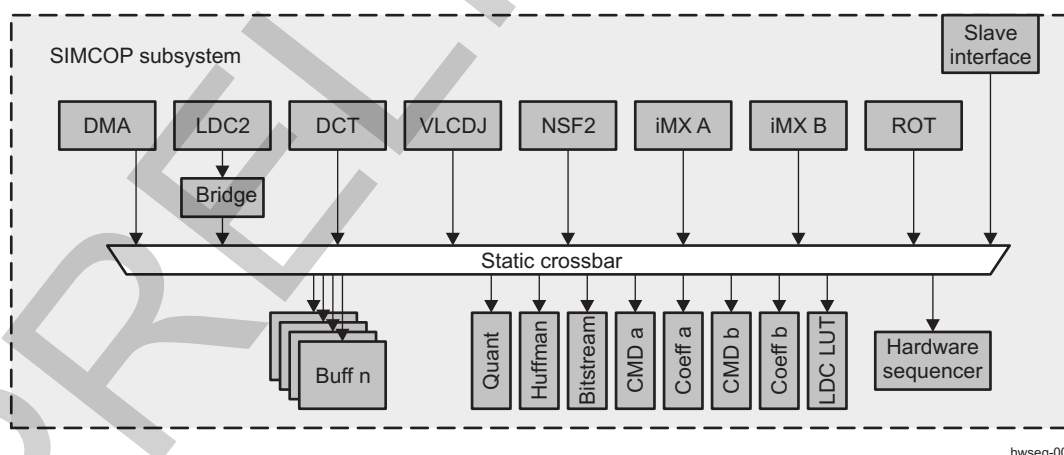

The SIMCOP subsystem includes the following memories:

- Eight image buffers, 4KB each
- Quantization table storage: 512 bytes
- Huffman table storage: 4KB
- Bitstream buffer: 4KB
- Two iMX coefficient memories: 16KB each
- Two iMX program memories: 4KB for iMX A and 8KB for iMX B
- LDC LUT storage: 256 entries
- LDC private working memory

8.4.2.3.4.1 Static Crossbar

The static crossbar connects SIMCOP modules to the SIMCOP memories as shown in [Figure 8-249](#).

Figure 8-249. SIMCOP Static Crossbar Overview

The buses for QUANT, HUFF, LDC LUT, CMD a, and CMD b are controlled by an external initiator. Typically, those memories are initialized before SIMCOP starts processing, and the content remains unchanged until the full frame is processed. The amount of data transferred to those memories is low and transfer is not timing critical. [Table 8-1269](#) shows how to connect these memories to SIMCOP modules.

NOTE: The transfer can only be done through the slave interface (for example, CPU or system DMA [sDMA]). The SIMCOP DMA cannot access those memories.

Table 8-1269. Static Crossbar Control Summary

| Memory | Register SIMCOP_CTRL | Value | | | | | | |
|--------------|-------------------------|-------|---------------|---------------|---------------|----------------|------------|--------------|
| | | Bus | iMX A inst | iMX B inst | VLCDJ HUFF | VLCDJ QUANT | LDC LUT | LDC INPUT |
| Quantization | [10] QUANT | 0 | | | | 1 | | |
| Huffman | [11] HUFF | 0 | | | 1 | | | |
| CMD a | [13:12] IMX_A_CMD | 0 | 1 | 2 | | | | |
| CMD b | [14] IMX_B_CMD | 0 | | 1 | | | | |
| LDC LUT | [8] LDC_LUT | 0 | | | | | 1 | |
| LDC Priv | [7:6] LDC_INPUT | | | | | | | 3 |

Image buffers and coefficient memories are used to store the data to be processed and processing results. Those memories can be accessed by the SIMCOP DMA, SIMCOP bus, and SIMCOP modules. [Table 8-1270](#) shows possible connections in the SIMCOP static crossbar: for example DCT Freq port can access image buffer A when SIMCOP_HWSEQ_SWITCH_i[2:0] IMBUFF_A = 5 (where i = 0, 1, 2, or 3 corresponds to the active context).

SIMCOP supports multiple contexts for the configuration of those memories. Software or the hardware sequencer can activate different contexts.

The BITSTREAM data flow is asynchronous from the macroblock pipeline. Therefore it supports dynamic buffer switching logic.

Table 8-1270. Static Crossbar Control Summary (2/2)

| Memory | Register (SIMCOP_HWSEQ_SWITCH_i and SIMCOP_HWSEQ_SWITCH_CTRL2_i) | Value | | | | | | | | | | | | | |
|-------------|---|-------|-----|------------------|------------------|-----------------|-----------------|--------------------|-------------|------------|----------------------------|----------|------------------------------|-----------|------------|

8.4.2.3.4.2 Image Buffers

Image buffers are four banks × 256 × 32 bits (4KB) working memories used by the SIMCOP modules to perform image processing operations. Image buffers are shared between the iMX, NSF2, DCT, LDC, VLCDJ, ROT, DMA, and SIMCOP bus accesses. Not all initiators can access the image buffers simultaneously.

Switches are controlled by the hardware sequencer or an external initiator through register configuration. Data is always organized in little-endian format.

One or multiple image buffers can be attached to a given accelerator port by configuring the adequate bits in the [SIMCOP_HWSEQ_STEP_SWITCH_i](#) registers.

The image buffer address mapping to different buses listed in [Table 8-1271](#) is controlled using the adequate [SIMCOP_HWSEQ_STEP_CTRL_i](#) register bit fields.

Table 8-1271. Image Buffer Address Map

| Port | OFST | 0x0000 | 0x1000 | 0x2000 | 0x3000 | 0x4000 | 0x5000 | 0x6000 | 0x7000 |

Figure 8-250. Image Buffer Width Translation

hwseq-003

8.4.2.3.4.3 Coefficient Memories

The IMX_COEF_A memory is used by the NSF2 to store temporary data. The IMX_x also uses COEFF_A and COEFF_B to store coefficients used during certain operations. IMX_COEF_A and IMX_COEFF_B are shared between the iMX, DMA, DCT, VLCDJ, and SIMCOP bus accesses. Only one initiator can access a coefficient memory at given time.

Switches are controlled by the hardware sequencer or an external initiator through register configuration. Data is always organized in little-endian format.

The initiators access types to the IMX_COEF_x memory are summarized in [Table 8-1272](#). Coefficient memory configuration depends on the initiators. Data is always organized little endian.

Table 8-1272. Coefficient Buffer Organization

| iMX | Coprocessor Bus | ROT In | DMA |
|--------------------------------|----------------------|----------------------|--------------------------|
| VLCDJ IO | | ROT Out | DCT Freq |
| | | | NSF2 WMEM ⁽¹⁾ |
| 4 banks × 2048 words × 16 bits | 4096 words × 32 bits | 2048 words × 64 bits | 1024 words × 128 bits |

⁽¹⁾ IMX_COEFF_A only

[Figure 8-251](#) shows how width conversion and bank interleaving is performed. Each color corresponds to a different physical bank.

Figure 8-251. Coefficient Memory Width Translation

8.4.2.3.4.4 Quantization Memories

The QUANT memory is used to store the quantization and dequantization tables for the VLCDJ module.

Coefficients are coded as 16-bit values. Every color component requires 8 × 8 quantization entries, therefore the QUANT memory of SIMCOP can hold up to four tables as shown in [Table 8-1273](#).

Table 8-1273. Quantization Table Storage in QUANT Memory

| Table | 0 | 1 | 2 | 3 |
|-------------|----------------|-----------------|--------|--------|
| ADDR | 0x000 | 0x0080 | 0x0100 | 0x0180 |
| Encode only | Y quantization | UV quantization | Unused | Unused |

Table 8-1273. Quantization Table Storage in QUANT Memory (continued)

| Table | 0 | 1 | 2 | 3 |
|-------------------|----------------|-----------------|------------------|-------------------|
| Decode only | Unused | Unused | Y dequantization | UV dequantization |
| Encode and decode | Y quantization | UV quantization | Y dequantization | UV dequantization |

QUANT is shared between the VLCDJ and SIMCOP bus accesses. All initiators cannot access QUANT simultaneously.

The initiators access types to the QUANT memory are summarized in [Table 8-1274](#). QUANT memory configuration depends on the initiators.

Table 8-1274. QUANT Memory Organization

| VLCDJ | Coprocessor Bus |
|---------------------|---------------------|
| 128 words × 32 bits | 128 words × 32 bits |

8.4.2.3.4.5 Huffman Tables

The HUFF memory is used to store the Huffman table for the VLCDJ module. Details about the Huffman table organization can be found in the VLCDJ module description (see [Section 8.4.6](#), *VLCDJ*).

HUFF memory is shared between the VLCDJ and SIMCOP bus accesses. All initiators cannot access HUFF simultaneously.

The initiators access types to the HUFF memory are summarized in [Table 8-1275](#). HUFF memory configuration depends on the initiators.

Table 8-1275. HUFF Memory Organization

| VLCDJ | Coprocessor Bus |
|----------------------|----------------------|
| 1024 words × 32 bits | 1024 words × 32 bits |

8.4.2.3.4.6 Bitstream Buffer

8.4.2.3.4.6.1 Overview

The bitstream buffer is used to store the VLCDJ bitstream. The bitstream buffer is shared between the VLCDJ, DMA, and SIMCOP bus accesses.

The bitstream buffer can be used in manual or automatic mode.

In manual mode, software selects if SIMCOP DMA, VLCDJ bitstream port, or SIMCOP bus can access the bitstream buffer. Manual mode is typically used to interleave JPEG encode and decode, for example, to support JPEG transcoding.

In automatic mode ([SIMCOP_HWSEQ_CTRL](#)[6:4] BITSTREAM = ENCODE or DECODE) the bitstream buffer is handled as two banks to prevent access collision between VLCDJ and SIMCOP DMA. A dedicated hardware engine (BBM) is used to ensure that VLCDJ and SIMCOP DMA access separate banks.

Automatic mode is disabled by writing [SIMCOP_HWSEQ_CTRL](#)[6:4] BITSTREAM = COPR.

The bitstream buffer mapping into the SIMCOP DMA address map depends on the [SIMCOP_HWSEQ_CTRL](#)[6:4] BITSTREAM and [SIMCOP_HWSEQ_CTRL](#)[3:2] BITSTR_XFER_SIZE bit fields and the internal state of the BBM. [Table 8-1276](#) lists the mapping of the bitstream buffer for SIMCOP DMA.

Table 8-1276. Bitstream Buffer Mapping to SIMCOP DMA

| SIMCOP_HWSEQ_CTRL | | Address Map | | BBM count | Bitstream buffer | |
|--------------------------------------|------------------|--------------------|--------|------------------|-------------------------|--------|
| BITSTREAM | XFER_SIZE | | | | | |
| 0: COPRO | N/A | 0x1000 | 0x1FFF | N/A | 0x000 | 0xFFFF |

8.4.2.3.4.6.2 Automatic Bitstream Buffer Management

To enter automatic mode software must write the following values into the BITSTREAM configuration register:

- [SIMCOP_HWSEQ_CTRL](#)[6:4] BITSTREAM=COPR (required to reset BBM)
- [SIMCOP_HWSEQ_CTRL](#)[6:4] BITSTREAM=JPEG_ENCODE or JPEG_DECODE

8.4.2.3.4.7 LDC Lookup Table

The LDC_LUT memory is used to store LUTs for the LDC module. LDC_LUT is shared between the LDC and SIMCOP bus accesses. All initiators cannot access LDC_LUT simultaneously.

The initiators access types to the QUANT memory are summarized in [Table 8-1277](#). QUANT memory configuration depends on the initiators.

Table 8-1277. LDC_LUT Memory Organization

| LDC | Coprocessor Bus |
|---------------------|---|
| 256 words × 14 bits | 128 words × 32 bits (see Table 8-1278) |

Table 8-1278. LUT Memory Format on 32-Bit Words

8.4.2.3.4.8 LDC Private Input Memory

The LDC has a private input memory that can be used when LDC operates in YUV 4:2:0 mode. For YUV 4:2:2 and RAW operation, LDC must use image buffers as input memories.

The LDC input memory is dedicated for LDC operation. It cannot be accessed from the SIMCOP bus or by any other SIMCOP module.

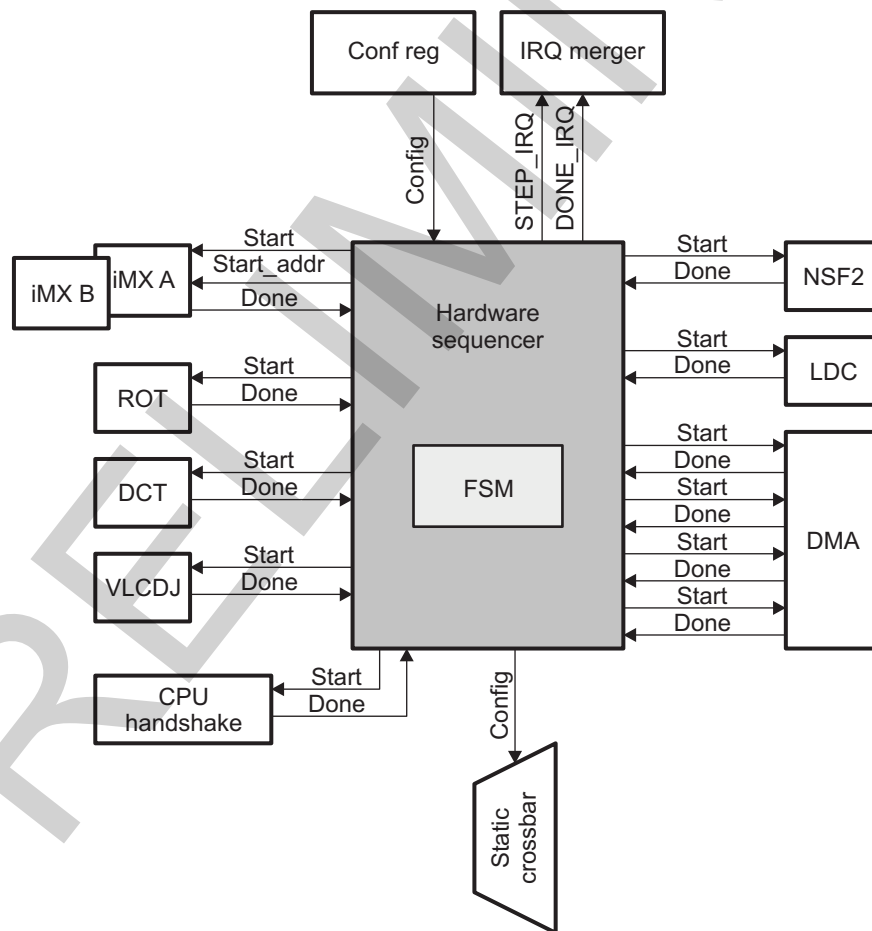

8.4.2.3.5 ISS SIMCOP Hardware Sequencer

SIMCOP typically processes a full frame on a macroblock by macroblock basis. SIMCOP modules and the DMA controller trigger an interrupt when they have completed a macroblock. This event can trigger an interrupt to an external initiator (manual mode) or trigger a context switch and resume DMA/SIMCOP module processing. Typically, initiator intervention is needed to fill the macroblock pipeline (called pipe-up. For example, first n macroblocks of an image) and to flush the macroblock pipeline (called pipe-down. For example, last n macroblocks of an image). Automatic sequencing mode is typically used for the rest of the image.

The hardware sequencer is particularly useful to offload the initiator during JPEG encode/decode, ROT, LDC, NSF2, or iMX processing.

Figure 8-252 shows the SIMCOP hardware sequencer overview.

Figure 8-252. SIMCOP Hardware Sequencer Overview

hwseq-008

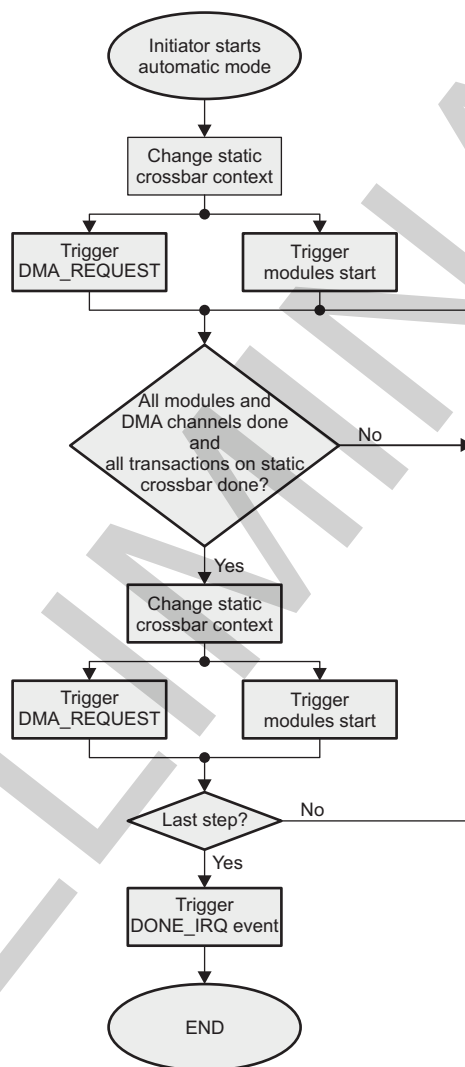

The hardware sequencer can automatically execute a predefined number of sequencing steps without

software intervention. That is called automatic operation. Automatic operation can also be used to pipeline filling and flushing with some limited software intervention. During automatic operation, the hardware sequencer controls generation of START/DONE pulses and the connections in the static-controlled crossbar. Software can take control over some resources while the hardware sequencer is running. That is called hardware sequencer override.

8.4.2.3.5.1 Automatic Operation

Figure 8-253 shows the flow diagram executed by the hardware sequencer.

Figure 8-253. Hardware Sequencing Example

hwseq-009

The external initiator configures the different SIMCOP modules and DMA channels. When this is done, the initiator enables the hardware sequencer. This resets the internal state of the hardware sequencer (pending events, context switch counter).

It starts by running sequence step [SIMCOP_HWSEQ_CTRL\[12:11\] STEP](#):

- Clear all pending completion events that have been selected for step 0 in the hardware sequencer. This does not affect the SIMCOP_IRQSTATUS register.
- Apply step [SIMCOP_HWSEQ_CTRL\[12:11\] STEP](#) configuration to the static crossbar.
- Start DMA transfers. Multiple channels can be enabled sequentially (for example, YUV 4:2:0 data transfers or SIMCOP→SDRAM followed by SDRAM→SIMCOP) by using the SIMCOP DMA linking feature.

- Start hardware accelerators. The list of accelerators to start can be selected by software using the [SIMCOP_HWSEQ_STEP_CTRL_i\[7:0\] *_SYNC](#) register.

The hardware sequencer then waits for completion of events from selected SIMCOP modules and SIMCOP DMA channels.

The hardware sequencer also ensures that all SIMCOP memory accesses requested by accelerators and DMA channels enabled for the synchronization step are complete. This condition prevents data corruption due to early switching.

Steps can be chained to define the sequence to execute. Steps are started until the step counter reaches the limit defined by software. When the last step has completed, a DONE_IRQ event is triggered.

SIMCOP can execute one hardware sequence at a time. However, software can be used to execute multiple independent sequences in parallel (for example, two unrelated macroblock pipelines) using the override feature.

The hardware sequencer has no specific support for macroblock pipeline filling (pipe-up) or flushing (pipe-down). It needs some software intervention.

The hardware sequencer supports sequences composed of up to four steps. Longer sequences require software intervention.

Figure 8-253 shows hardware sequencer operation.

Figure 8-254. Hardware Sequencer Operation Example

The example involves use of two SIMCOP modules (or DMA channels) that are synchronized using the hardware sequencer. A total of five sequencing steps are executed ([SIMCOP_HWSEQ_CTRL\[31:6\] HW_SEQ_STEP_COUNTER](#) = 5). The sequence is two steps long and starts with step 1. These two steps are configured using the [SIMCOP_HWSEQ_STEP_*_i](#) registers (where $i = 0$ and 1).

SIMCOP modules processing is started using START pulses (green). When SIMCOP modules are done they return a DONE pulse (red). Software can choose which accelerators to run for a given step using the [SIMCOP_HWSEQ_STEP_CTRL_i\[7:0\] *_SYNC](#) registers. They do not need to finish at the same time because the hardware sequencer waits for reception of all DONE pulses of used accelerators before moving to the next step.

The hardware sequencer also triggers a series of interrupts that can be used by software. For example, it is possible for software to change the configuration of inactive sequencing steps. This can be particularly useful to run longer sequences than what is supported by hardware.

For example, software can set up a 4-step looping sequence: Step $0 \rightarrow 1 \rightarrow 2 \rightarrow 3 \rightarrow 0 \rightarrow 1 \rightarrow \dots$. When the STEP1_IRQ event is triggered, software can load the configuration into the [SIMCOP_HWSEQ_STEP_*_i](#) registers, to be used the next time step 0 becomes active.

8.4.2.3.5.2 Hardware Sequencer Override

By default, the hardware sequencer controls START/DONE pulses of all SIMCOP modules as well as the static-controlled crossbar. Software can take control over some resources by setting the adequate bits in the [SIMCOP_HWSEQ_OVERRIDE](#) register. Sequencing resources under software control are managed using the [SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE](#) and [SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE](#) registers.

Changes to the [SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE](#)[27:11] *_OFST and [SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE](#) registers have immediate effect. Software must ensure there is no active traffic on the affected connection in the static-controlled crossbar.

For example, when software wants to alternatively attach image buffers a and b to SIMCOP_DMA while preserving the buffer start address in the SIMCOP DMA address map constant, it sets the following for the full application duration:

- [SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE](#)[2:0] IMBUFF_A = 1
- [SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE](#)[6:4] IMBUFF_B = 1

It then changes the [SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE](#)[2:0] IMBUFF_A and [SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE](#)[6:4] IMBUFF_B registers to attach the image buffers to the correct SIMCOP submodule.

The settings in the [SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE](#) and [SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE](#) registers for resources controlled by the hardware sequencer have no effect.

Synchronization with SIMCOP modules is controlled using the [SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE](#)[7:0] *_TRIGGER bit fields. For ROT, NSF, VLCDJ, DCT, and LDC, a START pulse is sent to the module when 1 is written into the adequate bit field. Software can trigger one or multiple start pulses at the time. The *_TRIGGER bit field is cleared by writing 1. It is automatically set by hardware when a DONE pulse is received from the relevant SIMCOP module.

Software can poll the status of the [SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE](#)[7:0] *_TRIGGER bit field to detect when a SIMCOP module has completed its processing task. Alternatively, software can also use an interrupt. SIMCOP can merge one or multiple internal events into SIMCOP outgoing interrupts. Software can choose between two modes for each interrupt output (SIMCOP_CTRL[3:0] IRQx_MODE):

- 0x0: OR, the interrupt is asserted when one of the selected events has occurred.
- 0x1: AND, the interrupt is asserted when all selected events have occurred.

The AND mode leads to lower initiator load. In fact, the initiator is only interrupted once per sequencing step, even when events from multiple SIMCOP submodules are expected. Also, it does not need to poll the SIMCOP_HL_IRQSTATUS_i register to detect which events have occurred: it simply must write 0xFFFF into the SIMCOP_HL_IRQSTATUS_i register to clear all pending events.

The SIMCOP DMA START/DONE control is slightly different. Software can trigger one or multiple DMA channels by writing into the [SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE](#)[7:5] DMA_TRIGGER bit field. The DMA_TRIGGER bit field returns the written value when all expected DONE pulses are received from SIMCOP DMA.

Alternatively, SIMCOP modules (except LDC) may be triggered by direct writes into their configuration registers. However, this approach leads to higher initiator load because multiple writes must be done.

8.4.2.4 ISS SIMCOP Hardware Sequencer and Buffers Basic Programming Model

8.4.2.4.1 ISS SIMCOP Application Programming Principle

Software must first configure SIMCOP access tag handling (SIMCOP_CTRL[24:21] LDC_R_TAG_CNT, SIMCOP_CTRL[19:16] LDC_R_TAG_OFST, and SIMCOP_DMA_CTRL[7:4] TAG_CNT). Software must ensure there is no active traffic on the SIMCOP master port before changing those registers.

Then it initializes Huffman, Quantization, and LDC LUT if they are used. Those memories must first be attached to the SIMCOP bus so they can be accessed from the slave port (SIMCOP_CTRL[11] HUFF, SIMCOP_CTRL[10] QUANT, and SIMCOP_CTRL[7:6] LDC_LUT). Then they can be preloaded using an external CPU or an external DMA engine. SIMCOP DMA cannot preload these tables.

Similarly, software can also preload data (such as filter coefficients) into iMX coefficient memories or image buffers. This can be handled by SIMCOP DMA:

- The buffers must first be attached to the SIMCOP DMA using the [SIMCOP_HWSEQ_OVERRIDE](#) and [SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE](#) registers.
- Alternatively, software can use the SIMCOP_HWSEQ_STEP_*_i registers (where i = 0) instead of the override feature. The hardware sequencer ensures that the configuration of step 0 is applied when the hardware sequencer is disabled.
- Software then configures and starts one or multiple data transfers using the SIMCOP DMA.
- Software monitors SIMCOP DMA events to know when DMA transfers are complete. Other configuration tasks may happen concurrently, but software must ensure that transfers complete before attaching the memories to another module.

Software must then enable the modules to be used.

Typically, the first steps and last steps of the macroblock pipeline are different from the ones in the middle of the pipeline. The hardware sequencer has no specific support for pipe-up and pipe-down. However, software can cut the sequence into smaller sequences to benefit from the hardware sequencing and to avoid software sequencing.

[Figure 8-255](#) shows an example of a 10-step sequence involving two DMA transfers and three modules.

Figure 8-255. Typical Hardware Sequencer-Controlled Sequencer With Pipe-Up and Pipe-Down

The macroblock pipeline is composed of a chain of three modules. Data between the modules is exchanged using ping-pong buffering.

Pipe-up and pipe-down require four sequencing steps each. The main processing can be done with two steps.

Software configures the hardware sequencer with the 4-step pipe-up sequence. Each step is executed once. When pipe-up is done, SIMCOP triggers the DONE_IRQ event.

Software then reconfigures the hardware sequencer for the 2-step main sequence. The number of steps is defined by the amount of data to process. When the main pipe is done, SIMCOP triggers the DONE_IRQ event.

Software finally reconfigures the hardware sequencer with the 4-step pipe-down sequence. Each step is executed once. When pipe-down is done, SIMCOP triggers the DONE_IRQ event.

[Figure 8-256](#) shows an example of pipe-up and pipe-down.

Figure 8-256. Pipe-Up and Pipe-Down

The hardware sequencer configuration determines which module can access a given SIMCOP memory for a sequence step.

8.4.2.4.2 External CPU Use for Data Processing

An external CPU can be used to perform some data processing, as SIMCOP hardware accelerators do. A similar mechanism to the START/DONE pulse interaction with SIMCOP hardware accelerators is implemented.

The external CPU receives the request to start processing by the CPU_PROC_START_IRQ interrupt merged at SIMCOP subsystem level. This interrupt is enabled and acknowledged as usual.

When processing completes, the CPU generates the DONE pulse to the hardware sequencer by setting the [SIMCOP_HWSEQ_CTRL\[10\] CPU_PROC_DONE](#) bit to 1.

8.4.2.4.3 Rotation Operational Mode Configuration

The macroblock pipeline is controlled by a 2-step hardware sequence:

Figure 8-257. Rotation Macroblock Pipeline

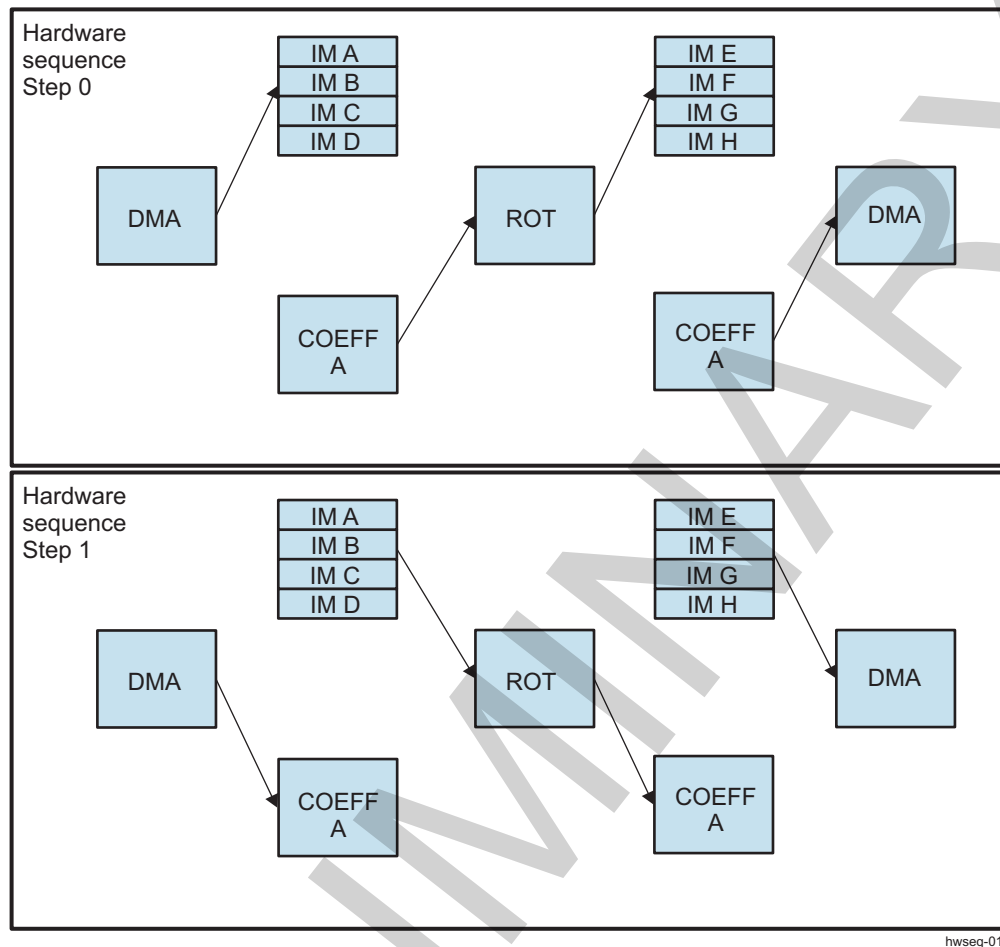

Table 8-1279. Rotation Macroblock Pipeline

| Step | Register/Bit Field/Programming Model | Value |
|---------------------------------|---|-------|
| Set DMA to access IMBUFF_A. | SIMCOP_HWSEQ_STEP_SWITCH_i[2:0] IMBUFF_A (i = 0) | 0x1 |
| Set ROT_A_O to access IMBUFF_E. | SIMCOP_HWSEQ_STEP_SWITCH_i[18:16] IMBUFF_E (i = 0) | 0x7 |
| Set ROT_A_I to access COEFF_A. | SIMCOP_HWSEQ_STEP_CTRL2_i[2:0] = COEFF_A (i = 0) | 0x6 |
| Set DMA to access COEFF_B. | SIMCOP_HWSEQ_STEP_CTRL2_i[6:4] COEFF_B (i = 0) | 0x1 |
| Set ROT_A_I to access IMBUFF_A. | SIMCOP_HWSEQ_STEP_SWITCH_i[2:0] IMBUFF_A (i = 1) | 0x6 |
| Set DMA to access IMBUFF_E. | SIMCOP_HWSEQ_STEP_SWITCH_i[18:16] IMBUFF_E (i = 1) | 0x1 |
| Set DMA to access COEFF_A. | SIMCOP_HWSEQ_STEP_CTRL2_i[2:0] COEFF_A (i = 1) | 0x1 |
| Set ROT_A_O to access COEFF_B. | SIMCOP_HWSEQ_STEP_CTRL2_i[6:4] COEFF_B (i = 1) | 0x6 |

8.4.2.4.4 LDC Operational Mode Configuration

The LDC module fetches data from system memory, performs the transformation, and stores results into image buffers. DCT and VLCDJ modules are used to JPEG compress this data and store the results to the bitstream buffer. The SIMCOP DMA is used to transfer compressed data from bitstream buffer to system memory.

Figure 8-258. LDC Transformation Pipeline

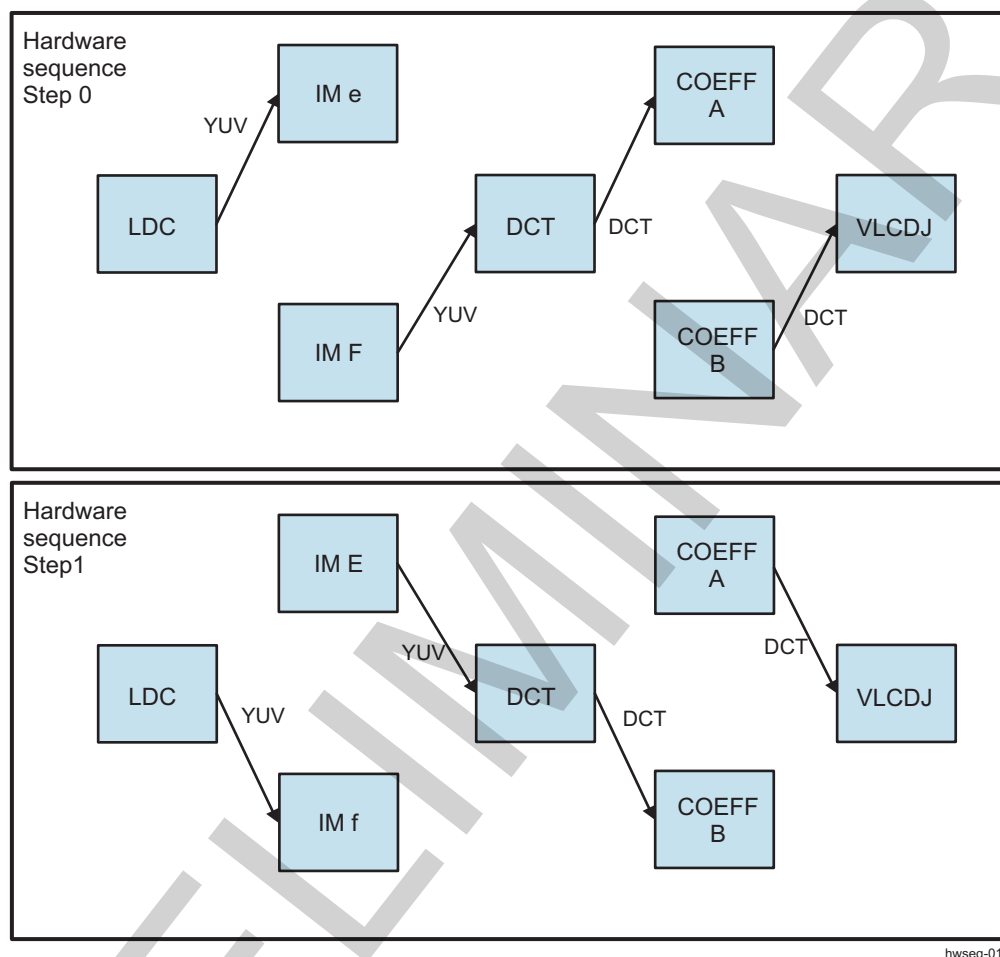

Table 8-1280. LDC Transformation

| Step | Register/Bit Field/Programming Model | Value |
|--|---|-------|
| Set IMBUFF_A and IMCUFF_B as input buffer. | SIMCOP_CTRL[7:6] LDC_INPUT | 0x1 |
| Set LDC to access IMBUFF_E. | SIMCOP_HWSEQ_STEP_SWITCH_i[18:16] IMBUFF_E | 0x6 |
| Set DCT to access COEFF_A. | SIMCOP_HWSEQ_STEP_CTRL2_i[2:0] COEFF_A | 0x5 |
| Set VLCDJ_IO to access COEFF_B. | SIMCOP_HWSEQ_STEP_CTRL2_i[6:4] COEFF_B | 0x4 |
| Set DCT to access IMBUFF_E. | SIMCOP_HWSEQ_STEP_SWITCH_i[18:16] IMBUFF_E | 0x4 |
| Set LDC to access IMBUFF_F. | SIMCOP_HWSEQ_STEP_SWITCH_i[18:16] IMBUFF_F | 0x6 |
| Set VLCDJ_IO to access COEFF_A. | SIMCOP_HWSEQ_STEP_CTRL2_i[2:0] COEFF_A | 0x4 |
| Set DCT to access COEFF_B. | SIMCOP_HWSEQ_STEP_CTRL2_i[6:4] COEFF_B | 0x5 |

8.4.2.4.5 Concurrent Software and Hardware Sequencing

Software can perform sequencing tasks concurrently with hardware sequencing. This is supported through the hardware sequencer override registers:

- [SIMCOP_HWSEQ_OVERRIDE](#)
- [SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE](#)
- [SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE](#)
- [SIMCOP_HWSEQ_STEP_CTRL2_OVERRIDE](#)

Software can select which hardware resources are controlled by the hardware sequencer and which resources are controlled by software. Configuration parameters for software-controlled resources are provided using those registers as well.

Table 8-1281. Concurrent Software and Hardware Sequencing

| Step | Register/Bit Field/Programming Model | Value |
|--|--|-------|
| Set software to control IMBUFF_E. | SIMCOP_HWSEQ_OVERRIDE [13] IMBUFF_E | 0x1 |
| Set DMA to access IMBUFF_E. | SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE [1 8:16] IMBUFF_E | 0x1 |
| Set software to control IMBUFF_F. | SIMCOP_HWSEQ_OVERRIDE [14] IMBUFF_F | 0x1 |
| Set DCT_S to access IMBUFF_F. | SIMCOP_HWSEQ_STEP_SWITCH_OVERRIDE [2 2:20] IMBUFF_F | 0x4 |
| Set software to control COEFF_A. | SIMCOP_HWSEQ_OVERRIDE [17] COEFF_A | 0x1 |
| Set iMX A to access the COEFF_A. | SIMCOP_HWSEQ_STEP_CTRL2_OVERRIDE [2:0] COEFF_A | 0x2 |
| Set hardware sequencer to control COEFF_B. | SIMCOP_HWSEQ_OVERRIDE [18] COEFF_B | 0x0 |
| Set iMX B to access the COEFF_B. | SIMCOP_HWSEQ_STEP_CTRL2_i [6:4] COEFF_B | 0x3 |

8.4.2.5 ISS SIMCOP Hardware Sequencer and Buffers Register Manual

8.4.2.5.1 Hardware Sequencer Instance Summary

Table 8-1282 summarizes the hardware sequencer instance.

Table 8-1282. Hardware Sequencer Instance Summary

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------|---|------|--------|
| 31:16 | HW_SEQ_STEP_COUNTER | Number of steps executed by the hardware sequencer. HW_SEQ_STEP_COUNTER=0 corresponds to manual sequencing. | RW | 0x0000 |
| 15:13 | RESERVED | Read returns 0. | R | 0x0 |
| 12:11 | STEP | This register is automatically updated by the hardware sequencer when it is active. Otherwise, software can use it to activate the content of a given set of step registers (SIMCOP_HWSEQ_STEP_i) or to choose the first step number of a sequence. | RW | 0x0 |
| 10 | CPU_PROC_DONE | Used by the CPU to tell that it has completed data processing. This feature should be used together with the CPU_PROC_START_IRQ event Read's always return 0. Write 0x0: No effect. Write 0x1: CPU processing completed. | W | 0 |
| 9:8 | BBM_SYNC_CHAN | Defines the SIMCOP DMA hardware synchronization channel to be used for BBM. This register is only used when BITSTREAM=ENCODE or DECODE. Software must ensure that the same DMA hardware synchronization channel is not used by the hardware sequencer. | RW | 0x0 |
| 7 | BBM_STATUS | Status of the Bitstream buffer management hardware.Used only during automatic mode [BITSTREAM=5 or 6]. Equals 0 (IDLE) in manual mode [BITSTREAM=0..4].Set when automatic mode is entered. Automatic encode mode: used to detect when all banks have been flushed after the processing has completed (i.e. but request bank signals have been de-asserted by BBM). Automatic decode mode (BITSTREAM=DECODE): returns to 0 (IDLE) when automatic mode is left (BITSTREAM=COPR). Read 0x1: BBM is busy. Read 0x0: BBM is idle | R | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------------|--|------|-------|
| 6:4 | BITSTREAM | <p>Bitstream buffer access control</p> <p>0x0: Bank 0: coprocessor bus (0x1000-0x17FF) Bank 1: coprocessor bus (0x1800-0x1FFF)</p> <p>0x1: Bank 0: DMA (0x1000-0x17FF) Bank 1: DMA (0x1800-0x1FFF)</p> <p>0x2: Bank 0: VLCDJ.B (0x000-0x7FF) Bank 1: VLCDJ.B (0x800-0xFFFF)</p> <p>0x3: Bank 0: DMA (0x1000-0x17FF) Bank 1: VLCDJ.B (0x800-0xFFFF)</p> <p>0x4: Bank 0: VLCDJ.B (0x000-0x7FF) Bank 1: DMA (0x1800-0x1FFF)</p> <p>0x5: The bitstream buffer is managed by hardware as a PING/PONG buffer to support JPEG encode use case. It can be accessed by the SIMCOP DMA or the VLCDJ module. The BITSTREAM hardware sequence is reset when the mode is changed to COPR, VLCDJ or DMA.</p> <p>0x6: The bitstream buffer is managed by hardware as a PING/PONG buffer to support JPEG decode use case. It can be accessed by the SIMCOP DMA or the VLCDJ module. The BITSTREAM hardware sequence is reset when the mode is changed to COPR, VLCDJ or DMA.</p> | RW | 0x0 |
| 3:2 | BITSTR_XFER_SIZE | <p>Defines the amount of data to be transferred per hardware request to the SIMCOP DMA. Bigger sizes lead to better SDRAM efficiency but prevents fine grained DMA transfer arbitration. This register is only used by hardware when BITSTREAM=ENCODE or BITSTREAM=DECODE.</p> <p>0x0: 2048 bytes</p> <p>0x1: 1024 bytes</p> <p>0x2: 512 bytes</p> <p>0x3: 256 bytes</p> | RW | 0x0 |
| 1 | HW_SEQ_STOP | <p>Stop the hardware sequencer. This feature is typically used to recover from an error condition. Read's always return 0.</p> <p>Write 0x0: No effect.</p> <p>Write 0x1: Stop the hardware sequence immediately (don't wait for expected DONE events). Setting this bit while the sequencer is idle has no effect.</p> | W | 0 |
| 0 | HW_SEQ_START | <p>Start the hardware sequencer. Read's always return 0.</p> <p>Write 0x0: No effect.</p> <p>Write 0x1: Starts step number SIMCOP_HWSEQ_CTRL[12:11] STEP of the hardware sequence. Setting this bit while the sequencer is running has no effect.</p> | W | 0 |

| Physical Address | 0x5202 0070 0x5506 0070 | | |
| Description | Hardware sequencer override control register. Bits in this register select what configuration register control a resource. 0: Resource controlled by hardware sequencer. Hardware uses the value from SIMCOP_HWSEQ_STEP_xx registers for the chosen resource 1: Resource controlled by software. Hardware uses the value from SIMCOP_HWSEQ_STEP_x_OVERRIDE registers for the chosen resource The bit field name matches the one of the resource. For example, IMX_A_D_OFST_OVR selects if SIMCOP_HWSEQ_STEP_CTRL_i[12:11] IMX_A_D_OFST or SIMCOP_HWSEQ_STEP_CTRL_OVERRIDE[12:11] IMX_A_D_OFST controls how image buffers are arranged in the iMX A address map. | | |

8.4.3 ISS SIMCOP DMA Module

This section describes the direct memory access (DMA) module in the still image coprocessor (SIMCOP) subsystem.

8.4.3.1 ISS SIMCOP DMA Overview

The direct memory access (DMA) module transfers data from system memory to the still image coprocessor (SIMCOP) memories and from SIMCOP memories. [Figure 8-259](#) is an overview of the DMA module in the SIMCOP subsystem.

Figure 8-259. DMA in the SIMCOP Subsystem

scpdma-001

The SIMCOP DMA supports the following features:

- Configuration interface, for register access
- Imaging subsystem (ISS) data interconnect master interface, for system memory access
 - Supports 1-dimensional (1D) and 2-dimensional (2D) burst
- SIMCOP crossbar master interface, for SIMCOP memories access
- Eight logical channels supported
- Hardware synchronization support
- 4-dimensional (4D) addressing modes
- 2D data block transfer (base address, stride, height, width)
- Array of 2D block transfer support

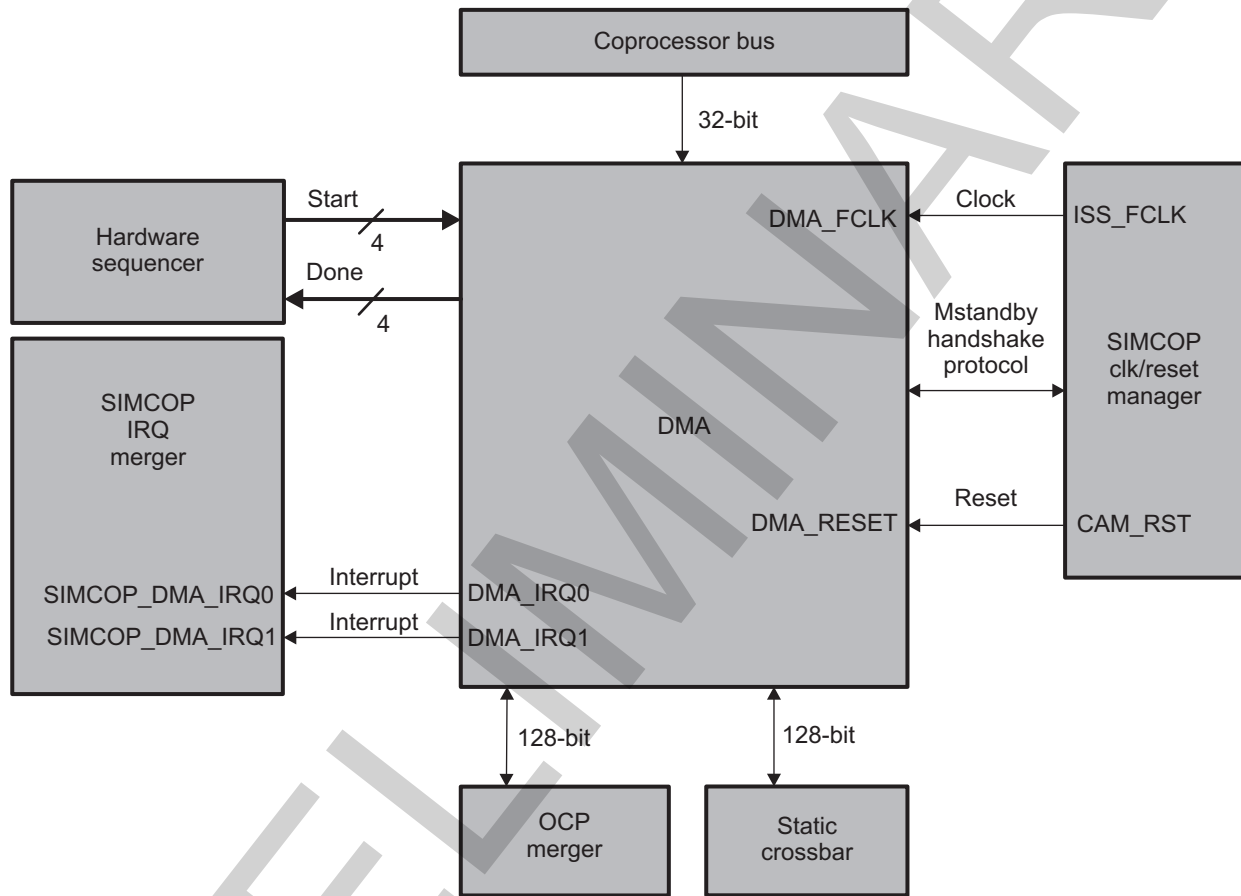

- Performance: Software-controllable bandwidth limiter

8.4.3.2 ISS SIMCOP DMA Integration

The DMA module is part of the SIMCOP subsystem in the ISS. [Figure 8-260](#) shows the integration of the DMA in the SIMCOP subsystem.

[Table 8-1304](#), [Table 8-1305](#), and [Table 8-1306](#) list the SIMCOP DMA integration attributes, clocks and resets, and hardware requests, respectively.

Figure 8-260. DMA Engine Integration

scpdma-004

Table 8-1304. Integration Attributes

| Module Instance | Attributes | |
|-----------------|--------------|--------------|
| | Power Domain | Interconnect |

Table 8-1306. Hardware Requests

| Module Instance | Source Signal Name | Destination Signal Name | Interrupt Requests | |
|-----------------|--------------------|-------------------------|--------------------|-----------------------------------|
| | | | Destination | Description |
| DMA | DMA_IRQ0 | SIMCOP_DMA_IRQ0 | SIMCOP IRQ merger | Interrupt triggered by SIMCOP DMA |
| DMA | DMA_IRQ1 | SIMCOP_DMA_IRQ1 | SIMCOP IRQ merger | Interrupt triggered by SIMCOP DMA |

For more information about interrupt requests, see [Section 8.4.1.2.3](#), *Interrupt Merger*.

8.4.3.3 ISS SIMCOP DMA Functional Description

8.4.3.3.1 ISS SIMCOP DMA Block Diagram

Figure 8-261 is a block diagram of the SIMCOP DMA.

An external initiator sets up logical channels using the configuration interface.

When a logical channel becomes active, a transfer must be executed. A transfer corresponds to a 2D block of data copied from system memory to SIMCOP memory and vice versa.

A transfer is decomposed into one or multiple transactions by the transaction generation unit.

The scheduler issues transactions when tags are available. There can be one outstanding command per tag on the ISS data interconnect.

8.4.3.3.2 ISS SIMCOP DMA Power Management

Table 8-1307 lists the power-management features available in the DMA module.

Table 8-1307. Local Power-Management Features

| Feature | Registers | Description |
|----------------------|--|---|
| Master standby modes | SIMCOP_DMA_SYSCONFIG [5:4] STANDBYMODE | Force-standby, no-standby, and smart-standby modes are available. |

8.4.3.3.3 ISS SIMCOP DMA Interrupt Requests

The SIMCOP DMA module can generate two interrupts, SIMCOP_DMA_IRQ0 and SIMCOP_DMA_IRQ1. These two interrupts are controlled by four registers:

- [SIMCOP_DMA_IRQSTATUS_RAW_j](#): The status of the interrupt before masking
- [SIMCOP_DMA_IRQSTATUS_j](#): The status of the interrupt after masking
- [SIMCOP_DMA_IRQENABLE_SET_j](#): Enable an interrupt to propagate to SIMCOP_DMA_IRQi signal

(unmask)

- [SIMCOP_DMA_IRQENABLE_CLR_j](#): Disable an interrupt to propagate to SIMCOP_DMA_IRQi signal (mask)

To clear an interrupt, software must write 1 in the corresponding bit of the [SIMCOP_DMA_IRQSTATUS_j](#) register even if the event is not enabled ([SIMCOP_DMA_IRQSTATUS_RAW_j](#) is also cleared).

[Table 8-1308](#) lists all the SIMCOP DMA events that can lead to an interrupt generation.

Table 8-1308. SIMCOP DMA Events List

| Bit Name | Bit | Event |
|----------------------|-----|---|
| BUS_ERR | 0 | Error occurred on bus |
| CHAN0_BLOCK_DONE_IRQ | 16 | Channel 0 has completed transfer of one 2D block. |
| CHAN1_BLOCK_DONE_IRQ | 17 | Channel 1 has completed transfer of one 2D block. |
| CHAN2_BLOCK_DONE_IRQ | 18 | Channel 2 has completed transfer of one 2D block. |
| CHAN3_BLOCK_DONE_IRQ | 19 | Channel 3 has completed transfer of one 2D block. |
| CHAN4_BLOCK_DONE_IRQ | 20 | Channel 4 has completed transfer of one 2D block. |
| CHAN5_BLOCK_DONE_IRQ | 21 | Channel 5 has completed transfer of one 2D block. |
| CHAN6_BLOCK_DONE_IRQ | 22 | Channel 6 has completed transfer of one 2D block. |
| CHAN7_BLOCK_DONE_IRQ | 23 | Channel 7 has completed transfer of one 2D block. |
| CHAN0_FRAME_DONE_IRQ | 24 | Channel 0 has completed transfer of the full frame. |
| CHAN1_FRAME_DONE_IRQ | 25 | Channel 1 has completed transfer of the full frame. |
| CHAN2_FRAME_DONE_IRQ | 26 | Channel 2 has completed transfer of the full frame. |
| CHAN3_FRAME_DONE_IRQ | 27 | Channel 3 has completed transfer of the full frame. |
| CHAN4_FRAME_DONE_IRQ | 28 | Channel 4 has completed transfer of the full frame. |
| CHAN5_FRAME_DONE_IRQ | 29 | Channel 5 has completed transfer of the full frame. |
| CHAN6_FRAME_DONE_IRQ | 30 | Channel 6 has completed transfer of the full frame. |
| CHAN7_FRAME_DONE_IRQ | 31 | Channel 7 has completed transfer of the full frame. |

8.4.3.3.4 ISS SIMCOP DMA Logical Channels

In the context of SIMCOP, multiple logical channels are required to offload the external initiator. Typical uses of multiple context are:

- Run a read transfer followed by a write transfer. That is the required mode to operate the NSF2 module. When the NSF2 completes processing, filtering outcome is first copied from the image buffers to system memory. When this transfer completes, new input data is fetched from system memory and stored in the image buffers.
- Read or write YUV4:2:0 data from system memory; YUV4:2:0 data is stored in two different system memory buffers.

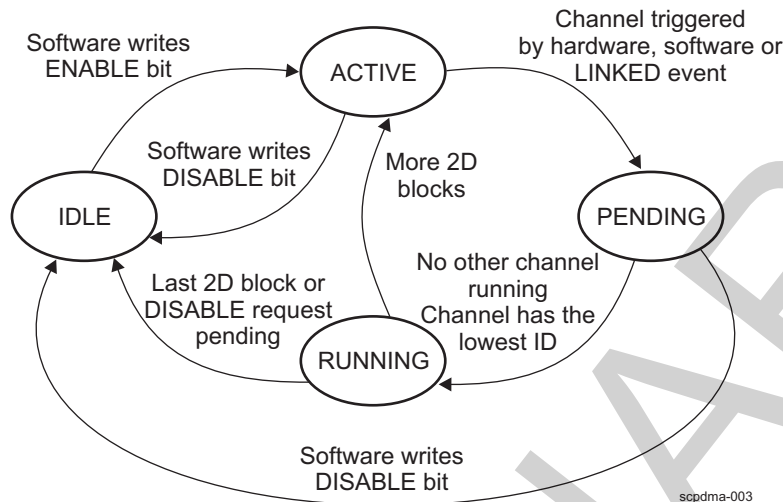

8.4.3.3.4.1 Logical Channel States

The SIMCOP DMA supports up to eight (([SIMCOP_DMA_HWINFO\[2\]](#) CHAN + 1)*4) logical channels. Each logical channel can be configured and triggered separately.

Idle logical channels must be configured and enabled ([SIMCOP_DMA_CHAN_CTRL_i\[0\]](#) ENABLE = 1) to be used.

[Figure 8-262](#) shows the different states of a logical channel. Software can poll the current state from the [SIMCOP_DMA_CHAN_CTRL_i\[4:3\]](#) STATUS bit field.

Figure 8-262. DMA Logical Channel States

When a trigger event is received by a channel in the ACTIVE state, it moves to the PENDING state. Trigger events received when the channel is in the IDLE, PENDING, or RUNNING state are discarded.

A logical channel is automatically disabled by hardware when a complete frame (all 2D blocks) is transferred. It can be disabled earlier by software by writing the [SIMCOP_DMA_CHAN_CTRL_i\[1\]](#) DISABLE bit. When a disable request occurs in the RUNNING state, it is memorized and executed when the channel leaves the RUNNING state. Pending disable requests have higher priority than channel trigger events.

When multiple logical channels are pending simultaneously, the following rules apply:

- An ongoing transfer of a 2D block is never stopped. It must complete before the next one starts.
- The logical channel with the lowest ID wins the arbitration (that is, CHAN0 has higher priority than CHAN1). Software can give higher priority to a channel by choosing a lower ID.

This situation can, for example, occur when software triggers a channel while a transfer is ongoing for another channel. Two types of interrupts can be generated:

- CHANx_BLOCK_DONE_IRQ (where x = channel number) is generated when the channel leaves the RUNNING state (RUNNING - ACTIVE or RUNNING - IDLE).
- CHANx_FRAME_DONE_IRQ (where x = channel number) is generated when the channel enters the IDLE state.

8.4.3.3.4.2 Logical Channel Chaining, Trigger, and Hardware Synchronization

Active logical channels can be triggered:

- By software. Writes the [SIMCOP_DMA_CHAN_CTRL_i\[2\]](#) SWTRIGGER bit
- By a hardware DMA request. A channel can be made sensitive to a pulse on the START[y] input when [SIMCOP_DMA_CHAN_CTRL_i\[19:17\]](#) HWSTART = y has been configured by software.
- When the previous channel in the linked list finishes. This feature is enabled through the [SIMCOP_DMA_CHAN_CTRL_i\[16:12\]](#) LINKED bit field of the preceding channel in the chain.

When a channel completes, it can optionally send a pulse to the DONE[y] output. Software enables this feature by configuring [SIMCOP_DMA_CHAN_CTRL_i\[22:20\]](#) HWSTOP = y.

Typically, the START + DONE synchronization mechanism is used together with the SIMCOP hardware sequencer. The hardware sequencer sends a pulse to START[y] a data transfer and the SIMCOP DMA responds with a DONE[y] pulse when the transfer completes. A transfer can be composed of one or multiple logical channels. For example, a YUV4:2:0-NV12 block copy from system memory to SIMCOP local memories requires two chained logical channels.

CAUTION

Software must ensure that only one trigger event source is selected at a given time for a logical channel; otherwise, unpredictable behavior may occur.

Typically, the following combinations can be used:

- Single channel triggered by software: Hardware synchronization and linking are disabled. Software writes the [SIMCOP_DMA_CHAN_CTRL_i\[2\]](#) SWTRIGGER bit to start the transfer of one 2D block. Software must not trigger the channel again before the [CHANx_BLOCK_DONE_IRQ](#) (where x = channel number) event is generated by the DMA.
- Channels chain-triggered by software: Multiple channels are linked together using the [SIMCOP_DMA_CHAN_CTRL_i\[16:12\]](#) LINKED bit field. Software triggers the first one in the chain and monitors the [CHANx_BLOCK_DONE_IRQ](#) (where x = channel number) event to know when the chain can be triggered again.
- Single channel triggered by hardware synchronization: Sensitivity on START pulses is activated through the [SIMCOP_DMA_CHAN_CTRL_i\[19:17\]](#) HWSTART bit field. DONE pulses are activated using the [SIMCOP_DMA_CHAN_CTRL_i\[22:20\]](#) HWSTOP bit field.
- Channels chain-triggered by hardware: Multiple channels are linked together using the [SIMCOP_DMA_CHAN_CTRL_i\[16:12\]](#) LINKED bit field. Sensitivity on START pulses is activated for the first channel in the chain through the [SIMCOP_DMA_CHAN_CTRL_i\[19:17\]](#) HWSTART bit field. DONE pulses for the last channel in the chain are activated using the [SIMCOP_DMA_CHAN_CTRL_i\[22:20\]](#) HWSTOP bit field.

8.4.3.3.4.3 Logical Channel Data Transfer

Each logical channel can handle 4D transfers from system memory to SIMCOP memory and vice versa.

A frame is composed of [SIMCOP_DMA_CHAN_FRAME_i\[9:0\]](#) XCNT * [SIMCOP_DMA_CHAN_FRAME_i\[25:16\]](#) YCNT 2D blocks of data. One 2D block of data is transferred each time a logical channel is in the RUNNING state.

The size of a 2D block is [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[13:4\]](#) XNUM * [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[28:16\]](#) YNUM words of 128 bits. The SIMCOP DMA can transfer only full 128-bit words.

2D blocks may overlap in system memory. This feature is typically used for source data fetches from system memory to handle filter dependencies. If this feature is not used, software must set:

- [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[13:4\]](#) XNUM = [SIMCOP_DMA_CHAN_BLOCK_STEP_i\[14:4\]](#) XSTEP
- [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[28:16\]](#) YNUM = [SIMCOP_DMA_CHAN_BLOCK_STEP_i\[29:16\]](#) YSTEP

Figure 8-263 shows DMA addressing.

Figure 8-263. DMA Addressing

The base position of 2D blocks in system memory is automatically computed by the SIMCOP DMA. The base address is computed using the following formula:

$$\text{SMEM_BASE} = \text{SIMCOP_DMA_CHAN_SMEM_ADDR_i}[31:4] \text{ ADDR} + \\ \text{Bx} * \text{SIMCOP_DMA_CHAN_BLOCK_STEP_i}[14:4] \text{ XSTEP} + \\ \text{By} * \text{SIMCOP_DMA_CHAN_BLOCK_STEP_i}[29:16] \text{ YSTEP} * \\ \text{SIMCOP_DMA_CHAN_SMEM_OFST_i}[19:4] \text{ OFST}$$

All 2D blocks of a logical channel have the same location in SIMCOP local memories:

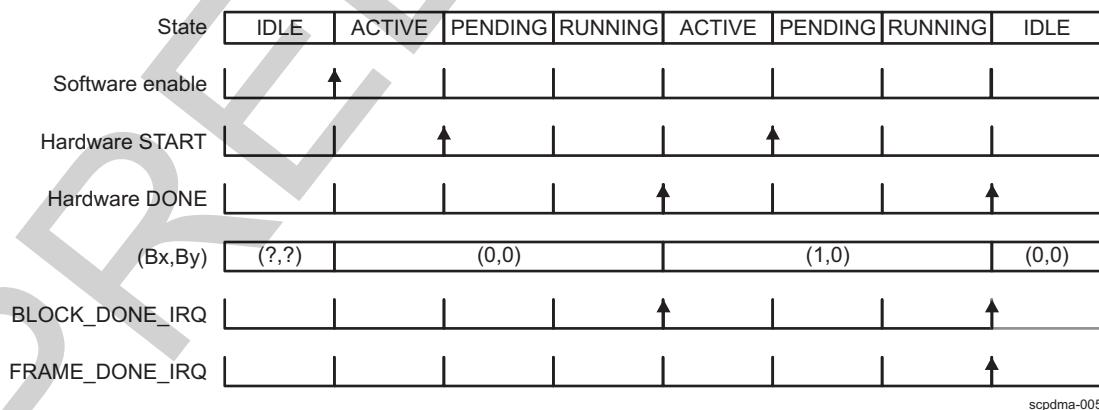

$$\text{BUF_BASE} = \text{SIMCOP_DMA_CHAN_BUF_ADDR_i}[23:4] \text{ ADDR}$$

The same functionality can also be used to read or write sparse data from synchronous dynamic random access memory (SDRAM). Typically, that is useful to split processing between two SIMCOP accelerators (that is, iMX).

Software can poll the status of a channel using the [SIMCOP_DMA_CHAN_CURRENT_BLOCK_i](#) register. It holds the Bx, By values of the last-transferred 2D block. The Bx, By values are reset when a channel is enabled (set the [SIMCOP_DMA_CHAN_CTRL_i\[0\]](#) ENABLE bit) and they are updated when a channel enters the RUNNING state.

Figure 8-264 shows an example of a 2-block large transfer.

Figure 8-264. 2-Block Large Transfer Example

8.4.3.3.5 Transaction Generation

Each transfer is decomposed into one or multiple transactions by the DMA engine. The firmware can define:

- Burst generation for regular or tiled accesses ([SIMCOP_DMA_CHAN_CTRL_i\[6\] TILERMODE](#)). Additional parameters must be defined for tiled accesses. See [Section 8.4.3.3.5.2, Block Bursts for Tiled Transfers](#).
- The maximum burst size ([SIMCOP_DMA_CTRL\[1:0\] MAX_BURST_SIZE](#)). It must be aligned with the interconnect configuration.
- Use of posted or nonposted writes ([SIMCOP_DMA_CTRL\[3\] POSTED_WRITES](#)). It must be aligned with the interconnect configuration. Mainly, in a multichannel system memory, system bursts must be issued nonposted.

8.4.3.3.5.1 Incrementing Bursts for Regular Transfers

Lines of 2D blocks are processed sequentially. The following transaction process is used for a given line:

1. Perform a single nonaligned burst from the start address to the next [SIMCOP_DMA_CTRL\[1:0\] MAX_BURST_SIZE](#) boundary (or less if the transfer is smaller).
2. Perform "n" aligned bursts (n can be 0).
3. Perform a single nonaligned burst up to the end address (if needed).

A transaction is aligned when the start address modulo burst length is 0.

8.4.3.3.5.2 Block Bursts for Tiled Transfers

The line stride is configured using the [SIMCOP_DMA_CHAN_SMEM_OFST_i\[19:4\] OFST](#) bit field. The full register content is used for internal address computation. The [SIMCOP_DMA_CHAN_SMEM_OFST_i\[19:4\] OFST](#) bit field must be a multiple of the [SIMCOP_DMA_CTRL\[1:0\] MAX_BURST_SIZE](#) bit field.

The SIMCOP DMA has the following alignment constraints:

- [SIMCOP_DMA_CHAN_SMEM_ADDR_i\[31:4\] ADDR](#) is 128 bit-aligned.
- [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[13:4\] XNUM](#) is 128 bit-aligned.

Only the values in [Table 8-1309](#) are allowed for the [SIMCOP_DMA_CTRL\[1:0\] MAX_BURST_SIZE](#) bit field. Other values lead to undefined behavior.

Table 8-1309. Allowed Maximum Burst Size

| Minimum Burst Height | MAX_BURST_SIZE |
|----------------------|-----------------------|
| 2 | 2, 4, or 8 x 128 bits |
| 4 | 4 or 8 x 128 bits |

8.4.3.4 ISS SIMCOP DMA Basic Programming Model

8.4.3.4.1 Initialization of Surrounding Modules

To initialize the DMA, the surrounding modules must be initialized. [Table 8-1310](#) lists these modules.

Table 8-1310. Initialization of Surrounding Modules

| Module | Minimum Required Setting | Optional Settings |
|-------------|---------------------------------------|---|
| CLKC | Enable SIMCOP clock. | |
| Buffers | Configure DMA access to image buffer. | |
| SIMCOP CTRL | | Configure SIMCOP CTRL to handle DMA interrupts. |

8.4.3.4.2 ISS SIMCOP DMA Channel Configuration and Hardware Synchronization

Software must fully configure a DMA channel before enabling it. It then configures channel linking and the used synchronization method.

The following example shows four logical channels chained with hardware synchronization used to copy YUV4:2:0-NV12 data from SIMCOP local memories to system memory, and then to copy YUV4:2:0-NV12 data from system memory to SIMCOP local memories.

YUV4:2:0-NV12 data is stored in two separate buffers in SDRAM. Therefore, two channels are used for the SIMCOP - system copy, and two channels are used for the system - SIMCOP copy.

In this example, the intent is to transfer a 2 x 2 array of 64 x 32 pixel blocks. It is assumed that input data is stored contiguously in system memory and that the output buffer size in system memory is 256 x 32 pixels. In SIMCOP local memories, data is contiguously stored starting at address 0.

The following configuration is used:

- Channel i = 0, input Y buffer:
 - [SIMCOP_DMA_CHAN_SMEM_ADDR_i\[31:4\]](#) ADDR = Start address of Y input buffer
 - [SIMCOP_DMA_CHAN_SMEM_OFST_i\[19:4\]](#) OFST = 16 (= 256 bytes)
 - [SIMCOP_DMA_CHAN_BUF_ADDR_i\[23:4\]](#) ADDR = 0
 - [SIMCOP_DMA_CHAN_BUF_OFST_i\[23:4\]](#) OFST = 8 (= 128 bytes)
 - [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[13:4\]](#) XNUM = 4 (= 64 bytes)
 - [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[28:16\]](#) YNUM = 32
 - [SIMCOP_DMA_CHAN_FRAME_i\[9:0\]](#) XCNT = 2
 - [SIMCOP_DMA_CHAN_FRAME_i\[25:16\]](#) YCNT = 2
 - [SIMCOP_DMA_CHAN_BLOCK_STEP_i\[14:4\]](#) XSTEP = 4 (= 64 bytes)
 - [SIMCOP_DMA_CHAN_BLOCK_STEP_i\[29:16\]](#) YSTEP = 32
- Channel i = 1, input UV buffer:
 - [SIMCOP_DMA_CHAN_SMEM_ADDR_i\[31:4\]](#) ADDR = Start address of UV input buffer
 - [SIMCOP_DMA_CHAN_SMEM_OFST_i\[19:4\]](#) OFST = 16 (= 256 bytes)
 - [SIMCOP_DMA_CHAN_BUF_ADDR_i\[23:4\]](#) ADDR = 128 (2KB)
 - [SIMCOP_DMA_CHAN_BUF_OFST_i\[23:4\]](#) OFST = 8 (= 128 bytes)
 - [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[13:4\]](#) XNUM = 4 (= 64 bytes)
 - [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[28:16\]](#) YNUM = 16
 - [SIMCOP_DMA_CHAN_FRAME_i\[9:0\]](#) XCNT = 2
 - [SIMCOP_DMA_CHAN_FRAME_i\[25:16\]](#) YCNT = 2
 - [SIMCOP_DMA_CHAN_BLOCK_STEP_i\[14:4\]](#) XSTEP = 4 (= 64 bytes)
 - [SIMCOP_DMA_CHAN_BLOCK_STEP_i\[29:16\]](#) YSTEP = 16
- Channel i = 2, output Y buffer:
 - [SIMCOP_DMA_CHAN_SMEM_ADDR_i\[31:4\]](#) ADDR = Start address of Y output buffer
 - [SIMCOP_DMA_CHAN_SMEM_OFST_i\[19:4\]](#) OFST = 16 (= 256 bytes)
 - [SIMCOP_DMA_CHAN_BUF_ADDR_i\[23:4\]](#) ADDR = 0
 - [SIMCOP_DMA_CHAN_BUF_OFST_i\[23:4\]](#) OFST = 8 (= 128 bytes)
 - [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[13:4\]](#) XNUM = 4 (= 64 bytes)
 - [SIMCOP_DMA_CHAN_BLOCK_SIZE_i\[28:16\]](#) YNUM = 32
 - [SIMCOP_DMA_CHAN_FRAME_i\[9:0\]](#) XCNT = 2
 - [SIMCOP_DMA_CHAN_FRAME_i\[25:16\]](#) YCNT = 2
 - [SIMCOP_DMA_CHAN_BLOCK_STEP_i\[14:4\]](#) XSTEP = 4 (= 64 bytes)
 - [SIMCOP_DMA_CHAN_BLOCK_STEP_i\[29:16\]](#) YSTEP = 32
- Channel i = 3, output UV buffer:

- `SIMCOP_DMA_CHAN_SMEM_ADDR_i[31:4]` ADDR = Start address of UV output buffer
- `SIMCOP_DMA_CHAN_SMEM_OFST_i[19:4]` OFST = 16 (= 256 bytes)
- `SIMCOP_DMA_CHAN_BUF_ADDR_i[23:4]` ADDR = 128 (= 2KB)
- `SIMCOP_DMA_CHAN_BUF_OFST_i[23:4]` OFST = 8 (= 128 bytes)
- `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[13:4]` XNUM = 4 (= 64 bytes)
- `SIMCOP_DMA_CHAN_BLOCK_SIZE_i[28:16]` YNUM = 16
- `SIMCOP_DMA_CHAN_FRAME_i[9:0]` XCNT = 2
- `SIMCOP_DMA_CHAN_FRAME_i[25:16]` YCNT = 2
- `SIMCOP_DMA_CHAN_BLOCK_STEP_i[14:4]` XSTEP = 4 (= 64 bytes)
- `SIMCOP_DMA_CHAN_BLOCK_STEP_i[29:16]` YSTEP = 16

Figure 8-265 shows the channel linking chain used. All four channels are executed sequentially. Doing so prevents access collision in SIMCOP local memories or system memories. Channel 0 is started by a START[0] pulse from SIMCOP. When Channel 3 completes the last transfer, a pulse to DONE[0] is sent back to SIMCOP.

Figure 8-266 shows the temporal channel sequence.

Figure 8-265. YUV4:2:0-NV12 Read/Write Chain

Figure 8-266. Temporal Channel Sequence

The following configuration is used for each channel:

- Channel $i = 0$, input Y buffer, first in sequence:
 - `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED = 0x11 (= CHAN1)
 - `SIMCOP_DMA_CHAN_CTRL_i[19:17]` HWSTART = 0x4 (= CHAN0)
 - `SIMCOP_DMA_CHAN_CTRL_i[5]` DIR = 1 (=SIMCOP buffers - system memory)
 - `SIMCOP_DMA_CHAN_CTRL_i[0]` ENABLE = 1
- Channel $i = 1$, input UV buffer, second in sequence:
 - `SIMCOP_DMA_CHAN_CTRL_i[16:12]` LINKED = 0x12 (= CHAN2)
 - `SIMCOP_DMA_CHAN_CTRL_i[5]` DIR = 1 (= SIMCOP buffers - system memory)
 - `SIMCOP_DMA_CHAN_CTRL_i[0]` ENABLE = 1

- Channel i = 2, output Y buffer, third in sequence:
 - [SIMCOP_DMA_CHAN_CTRL_i\[16:12\]](#) LINKED = 0x13 (= CHAN3)
 - [SIMCOP_DMA_CHAN_CTRL_i\[5\]](#) DIR = 0 (= system memory - SIMCOP buffers)
 - [SIMCOP_DMA_CHAN_CTRL_i\[0\]](#) ENABLE = 1
- Channel i = 3, output UV buffer, last in sequence:
 - [SIMCOP_DMA_CHAN_CTRL_i\[16:12\]](#) LINKED = 0x00 (no link)
 - [SIMCOP_DMA_CHAN_CTRL_i\[22:20\]](#) HWSTART = 0x4 (= CHAN0)
 - [SIMCOP_DMA_CHAN_CTRL_i\[5\]](#) DIR = 0 (= system memory - SIMCOP buffers)
 - [SIMCOP_DMA_CHAN_CTRL_i\[0\]](#) ENABLE = 1

Software can read the status of a logical channel at any time. However, logical channel configuration registers can be changed only when the channel is in the IDLE state.

Software can disable a logical channel by writing the [SIMCOP_DMA_CHAN_CTRL_i\[1\]](#) DISABLE bit. A channel is effectively disabled when [SIMCOP_DMA_CHAN_CTRL_i\[4:3\]](#) STATUS = IDLE. In case of linked channels, software must disable all channels in the chain and wait until all of them are back in the IDLE state before channels can be reprogrammed.

8.4.3.4.3 Software Synchronization

Software performs the following sequence:

1. Configures the channel
2. Enables the channel
3. Triggers the channel by writing the [SIMCOP_DMA_CHAN_CTRL_i\[2\]](#) SWTRIGGER bit
4. Waits for BLOCK_DONE_IRQ

Step 2 and Step 4 are repeated until all 2D blocks have been transferred.

8.4.3.5 ISS SIMCOP DMA Register Manual

8.4.3.5.1 ISS SIMCOP DMA Instance Summary

Table 8-1311 summarizes the DMA instance.

Table 8-1311. SIMCOP DMA Instance Summary

| Module Name | Base Address L3 Interconnect | Base Address Cortex-M3 Private Access | Size |
|-------------|---------------------------------|--|-----------|
| DMA | 0x5202 0200 | 0x5506 0200 | 512 bytes |

NOTE: Private Access is an access that does not use the L3/L4 interconnects.

8.4.4 ISS SIMCOP LDC Module

This chapter describes the lens distortion correction (LDC) module in the still image coprocessor (SIMCOP) subsystem.

8.4.4.1 ISS SIMCOP LDC Overview

The LDC deals with lens geometric distortion issues, chromatic aberration, and affine transformation for camera images. [Figure 8-267](#) is an overview of the LDC in the SIMCOP subsystem.

Figure 8-267. LDC in the SIMCOP Subsystem

ldc-001

For still image or video applications the LDC supports:

- Lens distortion correction:
 - YCbCr 4:2:2/4:2:0 data format input/output (I/O) for post-image-pipe correction
 - Correct barrel distortion and pin-cushion distortion
 - Radius-to-magnification-factor table to accommodate various distortion functions through

- programming
 - Configurable center point and horizontal/vertical adjustment
 - One 256-entry look-up table (LUT) for Y, Cb, and Cr
 - 8 bits for YCbCr
 - Bicubic interpolation for Y and bilinear interpolation for Cb/Cr
 - Bilinear interpolation mode for Y to offer faster processing
 - Up to 16,383 x 16,383 image dimension
 - Format restriction:
 - YCbCr 4:2:2 format: Tile width must be a multiple of 16.
 - YCbCr 4:2:0 format: Tile width must be a multiple of 32.
- Image warping, scaling, and rotation:
 - Affine transformation for image warping, scaling, and rotation
 - 8 bits for YCbCr
 - Bicubic interpolation for Y and bilinear interpolation for Cb/Cr
 - Bilinear interpolation mode for Y to offer double throughput
 - Format restriction:
 - YCbCr 4:2:2 format: Tile width must be a multiple of 16.
 - YCbCr 4:2:0 format: Tile width must be a multiple of 32.
- Chromatic aberration correction:
 - Supports Bayer data in unpacked 12-bit per pixel, 8-bit per pixel A-Law, 8-bit per pixel unpacked, and 12-bit per pixel packed formats
 - Radius-to-magnification-factor table to accommodate various distortion functions through programming
 - Configurable center point and horizontal/vertical adjustment
 - Red and blue distortion only. Green pixels are copied to output.
 - Independent 128-entry LUTs for red and blue
 - Bilinear interpolation
 - Up to 16,383 x 16,383 image dimension
 - Format restriction:
 - Unpacked 12-bit format: Tile width must be a multiple of 16.
 - A-Law 8-bit format: Tile width must be a multiple of 32.
 - Unpacked 8-bit format: Tile width must be a multiple of 32.
 - Packed 12-bit format: Tile width must be a multiple of 64.

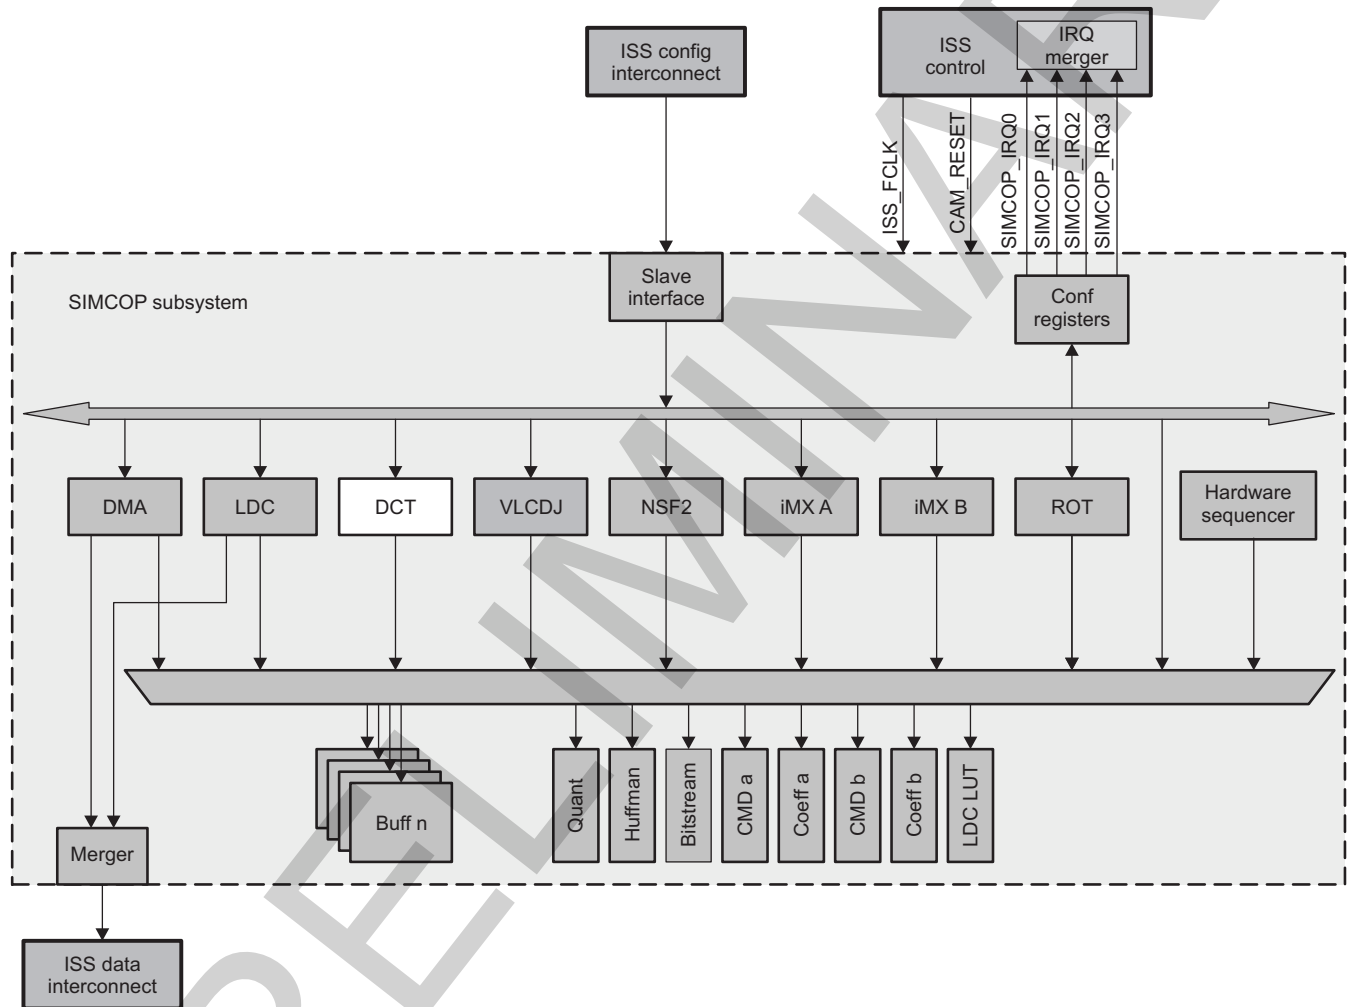

8.4.5 ISS SIMCOP Discrete Cosine Transform Module

This section describes the discrete cosine transform (DCT) module in the still-image coprocessor (SIMCOP) subsystem.

8.4.5.1 ISS SIMCOP DCT Overview

The DCT module performs DCT and inverse DCT (IDCT) operations required for still-image coder/decoder (codec) applications. [Figure 8-268](#) is an overview of the DCT in the SIMCOP subsystem.

Figure 8-268. DCT in the SIMCOP Subsystem

dct-001

For still-image or video applications, the DCT supports:

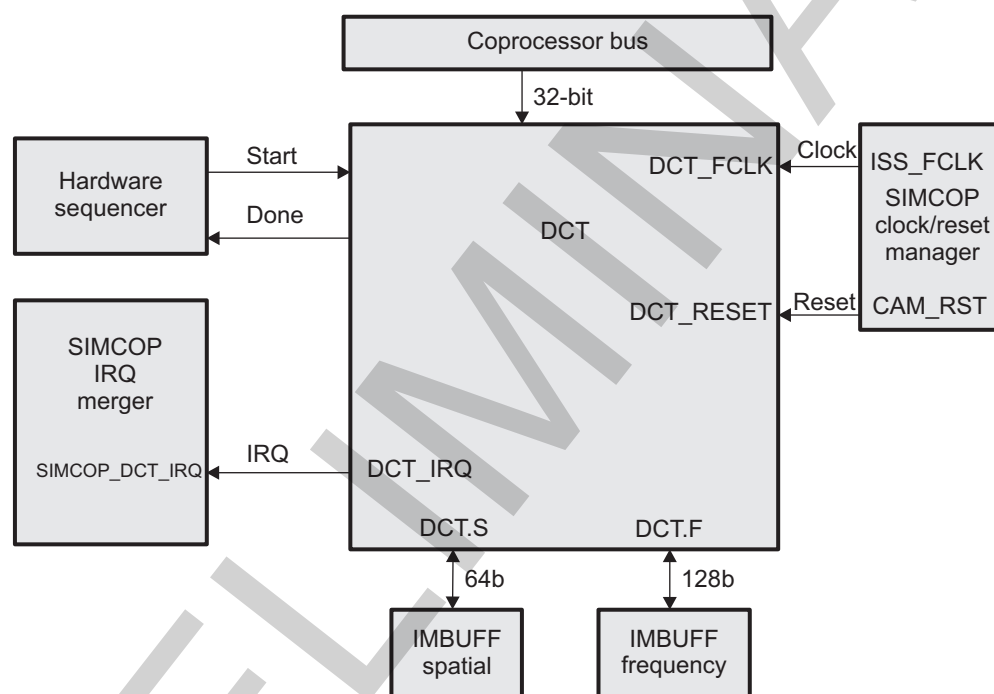

- 8-bit data in the spatial domain (input to DCT or output of IDCT) with –128 offset on color components
- 16-bit data in the frequency domain
- Exact input/output (I/O) range:
 - DCT expected input range [0, 255], subtracting 128 offset before transform, output saturated to [–1024, 1023]
 - IDCT expected input range [–1280, 1079], adding 128 to inverse transform outcome and saturating to [0, 255]
 - IDCT input range is from DCT output range plus [–256, 256] worst-case quantization error
- Configurable to process up to 32 microcontroller units (MCUs) at a time (21 MCUs for YUV4:2:0, and 32 MCUs for YUV4:2:2, because of memory size limitations)

- The following formats are supported by the DCT:
 - 16 x 16-pixel block MCU for YUV4:2:0 format, spatial data storage follows NV12
 - 16 x 8-pixel block MCU for YUV4:2:2 format, spatial data storage follows UYVY
 - Sequential 8 x 8 block mode, other than YUV4:2:0 and YUV4:2:2, a color-neutral format to allow flexibility in color component configuration in MCU, processes up to 64 blocks per task
- JPEG baseline sequential is supported by sequential 8 x 8 block mode. Some post-processing to reorder data and color space conversion may be required.
- All frequency domain data are stored sequentially for each 8 x 8 block, 16 bits per data point.

8.4.5.2 ISS SIMCOP DCT Integration

The DCT is part of the SIMCOP subsystem in the imaging subsystem (ISS). [Figure 8-269](#) shows the integration of the DCT in the SIMCOP subsystem.

Figure 8-269. DCT Engine Integration

dct-002

[Table 8-1347](#) through [Table 8-1349](#) list the integration attributes, clocks and resets, and hardware requests, respectively, for the DCT.

Table 8-1347. Integration Attributes

| Module Instance | Attributes | |
|-----------------|--------------|--------------|
| | Power Domain | Interconnect |
| DCT | PD_CAM | |

Table 8-1348. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|---|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| DCT | DCT_FCLK | ISS_FCLK | PRCM | Functional clock provided by ISS_CLK from the power, reset, and clock management (PRCM) module. It is used by all ISS submodules and ISS top-level resources. |
| Resets | | | | |
| DCT | DCT_RESET | CAM_RST | PRCM | ISS and SIMCOP global reset |

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|-------------------|----------------------------|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| DCT | DCT_IRQ | SIMCOP_DCT_IRQ | SIMCOP IRQ merger | DCT operation is complete. |

For more information about interrupt requests, see [Section 8.4.1.2.3](#), *Interrupt Merger*.

8.4.5.3 ISS SIMCOP DCT Functional Description

8.4.5.3.1 ISS SIMCOP DCT Block Diagram

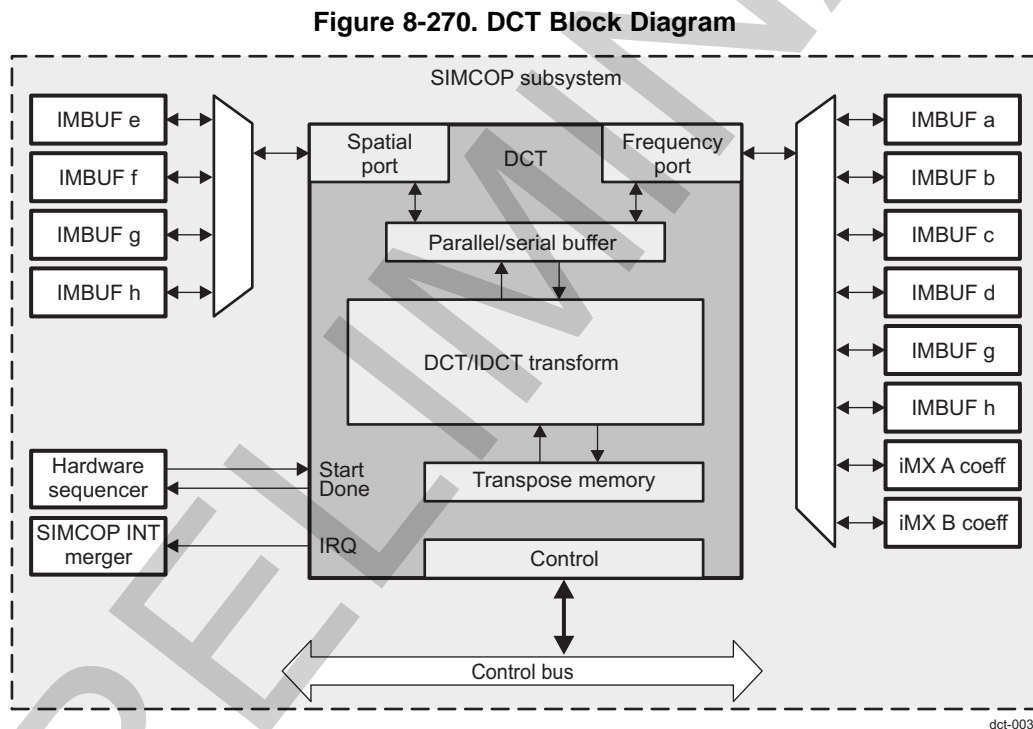

The DCT implements 8×8 , 2-dimensional (2D) DCT and IDCT specified in JPEG image coding standards:

- In 4:2:0 mode, spatial domain data is organized in NV12 format. The frequency domain is organized as six blocks of 8×8 .
- In 4:2:2 mode, spatial domain data is organized in UYVY format. The frequency domain is organized as four blocks of 8×8 .
- In sequential 8×8 block mode, spatial and frequency domain data are organized as N blocks of 8×8 blocks.

NOTE:

- The spatial domain is the DCT input and IDCT output.
- The frequency domain is the DCT output and IDCT input.

Figure 8-270 is a block diagram of the DCT.

8.4.5.3.2 ISS SIMCOP DCT Power Management

Table 8-1350 describes the power-management features available for the DCT.

Table 8-1350. Local Power-Management Features

| Feature | Registers | Description |
|------------------|---------------------------------------|---|
| Clock autogating | DCT_CFG[5] AUTOGATING | Free-running or autogating modes are available. |

8.4.5.3.3 ISS SIMCOP DCT Interrupt Requests

Table 8-1351 lists the event flags, and their mask, that can cause module interrupts.

Table 8-1351. Events

| Event Flag | Event Mask | Map to | Description |
|------------|----------------------------------|---------|-------------------|
| N/A | DCT_CFG[3] INTEN | DCT_IRQ | End of processing |

8.4.5.3.4 Control and Status

The DCT is controlled through the control registers accessed through the coprocessor bus by an external initiator. Before starting the DCT, the buffer memory must be configured for DCT access and initialized, and the control register must be set (for more information about DCT/IDCT processing, see [Section 8.4.5.3.4.1, DCT Configuration](#)).

The [DCT_CFG\[4\]](#) TRIG_SRC bit is used to select the DCT start source:

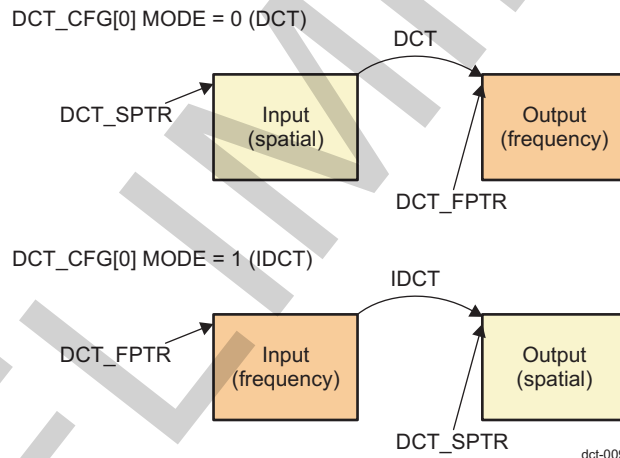

- If TRIG_SRC = 0, the DCT is started through the [DCT_CTRL\[0\]](#) EN bit.
- If TRIG_SRC = 1, the DCT is started by a hardware-start signal generated by the SIMCOP hardware sequencer.

When the DCT is configured for one trigger, the other trigger has no effect on the DCT.

An external initiator can read the state of the DCT (running or not running) by reading the [DCT_CTRL\[15\]](#) BUSY bit. When the BUSY bit goes back to 0, processing is complete (TRIG_SRC = 0 or 1).

Before starting the DCT, the [DCT_SPTR](#) and [DCT_FPTR](#) registers must be configured with spatial and frequency addresses. [Figure 8-271](#) shows the use of spatial and frequency addresses.

Figure 8-271. DCT I/O Address Configuration

An interrupt can be generated when DCT operation completes (the configured number of MCUs for YUV4:2:0/4:2:2 mode, or the number of blocks for sequential block mode). To enable interrupt generation, set the [DCT_CFG\[3\]](#) INTEN bit to 1.

When the [DCT_CFG\[3\]](#) INTEN bit is set to 0, no interrupt generation is performed.

8.4.5.3.4.1 DCT Configuration

The following features can be configured in the DCT register:

- DCT module operation: The [DCT_CFG\[0\]](#) MODE bit configures the processing:
 - MODE = 0: DCT processing
 - MODE = 1: IDCT processing
- Number of MCUs to process: The number of MCUs to process –1 is configured in the [DCT_CFG\[13:8\]](#) NMCUS bit field:
 - YUV4:2:0 maximum MCUs = 21 (memory limitation, 126 blocks)
 - YUV4:2:2 maximum MCUs = 32 (128 blocks)

- Sequential maximum MCUs = 64 (64 blocks)

8.4.5.3.5 Data Format

The DCT reads and writes data from and to image buffers. I/O format can be configured in the [DCT_CFG\[2:1\]](#) FMT bit field. The following formats can be configured:

- YUV4:2:0
- YUV4:2:2
- Sequential

8.4.5.3.5.1 YUV4:2:0 Format

In JPEG YUV4:2:0 format, each MCU is 16×16 pixels, and has 16×16 Y data points, 8×8 U data points, and 8×8 V data points. Each square array of 8×8 data points is called a block. Thus, an MCU with a YUV4:2:0 format has four Y blocks, one U block, and one V block.

This module follows the NV12 data storage format for YUV4:2:0 spatial data. For YUV4:2:0 format:

- $\text{line_offset_in_bytes} = (\text{DCT_CFG}[13:8] \text{ NMCUS} + 1) \cdot 16$
- $\text{starting_addr_uv} = \text{DCT_SPTR} + (\text{DCT_CFG}[13:8] \text{ NMCUS} + 1) \cdot 256$

[Figure 8-272](#) shows the organization of the data for two MCUs in the spatial domain, when the DCT is configured to process two MCUs. To select the YUV4:2:0 format, write 0x0 in the [DCT_CFG\[2:1\]](#) FMT bit field. YUV4:2:0 processes six blocks (four Y, one U, and one V) during each MCU DCT processing.

Figure 8-272. YUV4:2:0 Format Data Order

Byte offset

| | 0 | 1 | 2 | 3 | ... | 31 |
|-----|---------|---------|---------|---------|-----|----------|
| 0 | Y(0,0) | Y(1,0) | Y(2,0) | Y(3,0) | ... | Y(15,0) |
| 32 | Y(0,1) | Y(1,1) | Y(2,1) | Y(3,1) | ... | Y(15,1) |
| 64 | Y(0,2) | Y(1,2) | Y(2,2) | Y(3,2) | ... | Y(15,2) |
| | ... | | | | | |
| 480 | Y(0,15) | Y(1,15) | Y(2,15) | Y(3,15) | ... | Y(15,15) |
| 512 | U(0,0) | V(0,0) | U(2,0) | V(2,0) | ... | V(14,0) |
| 544 | U(0,2) | V(0,2) | U(2,2) | V(2,2) | ... | V(14,2) |
| | | | | | | |
| 736 | U(0,14) | V(0,14) | U(2,14) | V(2,14) | ... | V(14,14) |

dct-005

Each YUV4:2:0 has four Y blocks, one U block, and one V block. For the first MCU in [Figure 8-272](#), the blocks are:

- Y_Block 0:
 - Y(0, 0), Y(1, 0), ..., Y(7, 0)
 - Y(0, 1), Y(1, 1), ..., Y(7, 1)
 -
 - Y(0, 7), Y(1, 7), ..., Y(7, 7)
- Y_Block 1:
 - Y(8, 0), Y(9, 0), ..., Y(15, 0)
 - Y(8, 1), Y(9, 1), ..., Y(15, 1)
 -
 - Y(8, 7), Y(9, 7), ..., Y(15, 7)
- Y_Block 2:
 - Y(0, 8), Y(1, 8), ..., Y(7, 8)
 - Y(0, 9), Y(1, 9), ..., Y(7, 9)

-
- Y(0, 15), Y(1, 15), ..., Y(7, 15)
- Y_Block 3:
 - Y(8, 8), Y(9, 8), ..., Y(15, 8)
 - Y(8, 9), Y(9, 9), ..., Y(15, 9)
 -
 - Y(8, 15), Y(9, 15), ..., Y(15, 15)
- U_Block:
 - U(0, 0), U(2, 0), ..., U(14, 0)
 - U(0, 2), U(2, 2), ..., U(14, 2)
 -
 - U(0, 14), U(2, 14), ..., U(14, 14)
- V_Block:
 - V(0, 0), V(2, 0), ..., V(14, 0)
 - V(0, 2), V(2, 2), ..., V(14, 2)
 -
 - V(0, 14), V(2, 14), ..., V(14, 14)

8.4.5.3.5.2 YUV4:2:2 Format

In JPEG YUV4:2:2 format, each MCU is 16×8 pixels and has 16×8 Y data points, 8×8 U data points, and 8×8 V data points. Thus, an MCU with a YUV4:2:2 format has two Y blocks, one U block, and one V block.

This module follows the UYVY data storage format for YUV4:2:2 spatial data. For YUV4:2:2 format: $\text{line_offset_in_bytes} = (\text{DCT_CFG}[13:8] \text{ NMCUS} + 1) 32$

Figure 8-273 shows the organization of the data for two MCUs in the spatial domain when the DCT is configured to process two MCUs. To select the YUV4:2:2 format, write 0x1 in the [DCT_CFG\[2:1\]](#) FMT bit field. YUV4:2:2 processes four blocks (two Y, one U, and one V) during each MCU DCT processing.

Figure 8-273. YUV4:2:2 Format Data Order

| Byte offset | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | | 31 | 32 | 33 | 34 | | 63 |
|-------------|--------|--------|--------|--------|--------|--------|--------|--------|-----|---------|---------|---------|---------|-----|---------|
| 0 | U(0,0) | Y(0,0) | V(0,0) | Y(1,0) | U(2,0) | Y(2,0) | V(2,0) | Y(3,0) | ... | Y(15,0) | U(16,0) | Y(16,0) | V(16,0) | ... | Y(31,0) |
| 64 | U(0,1) | Y(0,1) | V(0,1) | Y(1,1) | U(2,1) | Y(2,1) | V(2,1) | Y(3,1) | ... | Y(15,1) | U(16,1) | Y(16,1) | V(16,1) | ... | Y(31,1) |
| 128 | U(0,2) | Y(0,2) | V(0,2) | Y(1,2) | U(2,2) | Y(2,2) | V(2,2) | Y(3,2) | ... | Y(15,2) | U(16,2) | Y(16,2) | V(16,2) | ... | Y(31,2) |
| | ⋮ | | | | | | | | ... | | | | | ... | |
| 448 | U(0,7) | Y(0,7) | V(0,7) | Y(1,7) | U(2,7) | Y(2,7) | V(2,7) | Y(3,7) | ... | Y(15,7) | U(16,7) | Y(16,7) | V(16,7) | ... | Y(31,7) |

dct-011

Each YUV4:2:2 has two Y blocks, one U block, and one V block. The four blocks of the first MCU are:

- Y_Block 0:
 - Y(0, 0), Y(1, 0), ..., Y(7, 0)
 - Y(0, 1), Y(1, 1), ..., Y(7, 1)
 -
 - Y(0, 7), Y(1, 7), ..., Y(7, 7)
- Y_Block 1:
 - Y(8, 0), Y(9, 0), ..., Y(15, 0)
 - Y(8, 1), Y(9, 1), ..., Y(15, 1)

-
- $Y(8, 7), Y(9, 7), \dots, Y(15, 7)$

8.4.5.3.5.3 Sequential Block Format

The sequential block format supports any color format other than YUV4:2:0 or YUV4:2:2. There is no notion of colors, and each 8×8 block is ordered sequentially. The DCT can be configured to process N blocks (versus N MCUs for YUV4:2:0 and YUV4:2:2, N is up to 64). In this format:

- Block i =
 - $X(8*i, 0), X(8*i+1, 0), \dots, X(8*i+7, 0)$
 - $X(8*i, 1), X(8*i+1, 1), \dots, X(8*i+7, 1)$
 -
 - $X(8*i, 7), X(8*i+1, 7), \dots, X(8*i+7, 7)$

To select sequential block format, write 0x2 in the [DCT_CFG\[2:1\]](#) FMT bit field.

8.4.5.4 ISS SIMCOP DCT Basic Programming Model

8.4.5.4.1 Initialization of Surrounding Modules

To initialize the DCT, the surrounding modules must be initialized. [Table 8-1352](#) lists these modules.

Table 8-1352. Initialization of Surrounding Modules

| Module | Minimum Required Setting | Optional Settings |
|-------------|---|---|
| CLKC | Enable the SIMCOP clock. | |
| Buffers | Configure DCT access to the image buffer. | |
| SIMCOP CTRL | | Configure SIMCOP CTRL to handle DCT interrupts. |

8.4.5.4.2 Using the DCT for DCT Processing

To configure the DCT for DCT processing, software must follow the procedure listed in [Table 8-1353](#).

Table 8-1353. DCT Processing Procedure

| Step | Register/Bit Field | Value |
|---|--------------------------------------|---|
| Prepare data in buffer memory. | SIMCOP buffers | |
| Switch buffer access to the DCT. | SIMCOP buffers | |
| Configure the start of the DCT input address (address must be in the memory buffer). | DCT_SPTR [12:5] ADDR | Start address (spatial domain) |
| Configure the start of the DCT output address (address must be in the memory buffer). | DCT_FPTR [13:4] ADDR | Start address (frequency domain) |
| Set the DCT_CFG register. | DCT_CFG [0] MODE | 0 (DCT mode) |
| | DCT_CFG [2:1] FMT | Depends on data format |
| | DCT_CFG [3] INTEN | 0: No interrupt 1: Interrupt at end of processing |
| | DCT_CFG [4] TRIG_SRC | 1: Start controlled by hardware signal 0: Start controlled by a register |
| | DCT_CFG [13:8] NMCUS | Number of MCUs to process |
| IF: DCT_CFG[4] TRIG_SRC = 0 | | |
| Start DCT through the register. | DCT_CTRL [0] EN | 1 |
| ELSE | | |
| Start the DCT using the hardware sequencer. | SIMCOP hardware sequencer | |
| ENDIF | | |

The DCT is now processing the blocks. To detect the end of DCT processing:

- If [DCT_CFG](#)[3] INTEN = 1, wait for the interrupt signal.
- If [DCT_CFG](#)[3] INTEN = 0, the processor must poll the [DCT_CTRL](#)[15] BUSY bit. When the BUSY bit is 0, processing is complete.

When DCT processing completes, the frequency output result is stored in the memory buffer at the address given by the [DCT_FPTR](#)[13:4] ADDR bit field.

8.4.5.4.3 Using the DCT for IDCT Processing

To configure the DCT for IDCT processing, software must follow the procedure listed in [Table 8-1354](#).

Table 8-1354. IDCT Processing Procedure

| Step | Register/Bit Field | Value |
|----------------------------------|--------------------|-------|
| Prepare data in buffer memory. | SIMCOP buffers | |
| Switch buffer access to the DCT. | SIMCOP buffers | |

Table 8-1354. IDCT Processing Procedure (continued)

| Step | Register/Bit Field | Value |
|---|--------------------------------------|---|
| Configure the start of the DCT output address (address must be in the memory buffer). | DCT_SPTR [12:5] ADDR | Start address (spatial domain) |
| Configure the start of the DCT input address (address must be in the memory buffer). | DCT_FPTR [13:4] ADDR | Start address (frequency domain) |
| Set the DCT_CFG register. | DCT_CFG [0] MODE | 1 (IDCT mode) |
| | DCT_CFG [2:1] FMT | Depends on data format |
| | DCT_CFG [3] INTEN | 0: No interrupt 1: Interrupt at end of processing |
| | DCT_CFG [4] TRIG_SRC | 1: Start controlled by a hardware signal 0: Start controlled by a register |
| | DCT_CFG [13:8] NMCUS | Number of MCUs to process |
| IF: DCT_CFG [4] TRIG_SRC = 0 | | |
| Start the DCT through a register. | DCT_CTRL [0] EN | 1 |
| ELSE | | |
| Start the DCT using hardware sequencer. | SIMCOP hardware sequencer | |
| ENDIF | | |

The DCT is now processing the blocks. To detect the end of IDCT processing:

- If [DCT_CFG](#)[3] INTEN = 1, wait for the interrupt signal.
- If [DCT_CFG](#)[3] INTEN = 0, the processor must poll the [DCT_CTRL](#)[15] BUSY bit. When the BUSY bit is 0, processing is complete.

When IDCT processing completes, the spatial output result is stored in the memory buffer at the address given by the [DCT_SPTR](#)[12:5] ADDR bit field.

8.4.6 ISS SIMCOP Variable Length Coder/Decoder for JPEG Module

This section describes the variable-length coder/decoder for JPEG (VLCDJ) module in the still-image coprocessor (SIMCOP) subsystem.

8.4.6.1 ISS SIMCOP VLCDJ Overview

The VLCDJ module handles quantization (Q) and variable-length coding (VLC) in JPEG encoding, and variable-length decoding (VLD) and inverse quantization (IQ) in JPEG decoding. These operations are required for JPEG image compression and decompression. Figure 8-274 is an overview of the VLCDJ in the SIMCOP subsystem.

Figure 8-274. VLCDJ in the SIMCOP Subsystem

vldj-001

The VLCDJ supports the following operations:

- Q and VLC for JPEG encoding
- VLD and IQ for JPEG decoding
- Data formats:
 - YUV4:2:0 format in 16 × 16-pixel microcontroller unit (MCU)
 - YUV4:2:2 format in 16 × 8-pixel MCU
 - Sequential block mode to support arbitrary color component configuration within JPEG baseline sequential (software intervention required to context-switch among color components)
- Configurable for number of MCUs per initiation (up to 21 MCUs for YUV4:2:0, 32 MCUs for YUV4:2:2,

64 8×8 blocks for sequential block mode)

- Discrete cosine transform (DCT) coefficients are stored sequentially for each 8×8 block, 16 bits per data point
- Stall processing for interface with bitstream data overrun/underrun protection
- Insertion of restart markers during encoding (YUV4:2:0, YUV4:2:2, sequential block modes)
- Record of restart marker locations during encoding (YUV4:2:0, YUV4:2:2 only)
- Processing of restart markers on the MCU boundary during decoding, reset of direct coefficient (DC) predictors as required by the JPEG standard (YUV4:2:0, YUV4:2:2, sequential block modes)

8.4.6.2 ISS SIMCOP VLCDJ Integration

The VLCDJ is part of the SIMCOP subsystem in the imaging subsystem (ISS). Figure 8-275 shows the integration of the VLCDJ in the SIMCOP subsystem.

Figure 8-275. VLCDJ Engine Integration

simcop-013

Table 8-1367 through Table 8-1369 list the integration attributes, clocks and resets, and hardware requests, respectively, for the VLCDJ.

Table 8-1367. Integration Attributes

| Module Instance | Attributes |
|-----------------|--------------|
| | Power Domain |

8.4.6.3 ISS SIMCOP VLCDJ Functional Description

8.4.6.3.1 ISS SIMCOP VLCDJ Block Diagram

The VLCDJ implements quantization, run-length encode, and Huffman encode stages of JPEG compression, and Huffman decode, run-length expansion, and dequantization stages of JPEG decompression. [Figure 8-276](#) is a block diagram of the VLCDJ with connected memories and modules.

Figure 8-276. VLCDJ Block Diagram

vldcj-003

8.4.6.3.2 ISS SIMCOP VLCDJ Power Management

The VLCDJ uses clock autogating to conserve power. When any substantial subblocks are not in use, the corresponding clock trees are gated off. [Table 8-1370](#) describes the power-management feature available for the VLCDJ.

Table 8-1370. Local Power-Management Feature

| Feature | Registers | Description |
|------------------|---|---|
| Clock autogating | VLCDJ_CTRL [3] AUTOGATING | Free-running or autogating modes are available. |

8.4.6.3.3 ISS SIMCOP VLCDJ Interrupt Requests

[Table 8-1371](#) lists the event flags and their masks that can cause module interrupts.

Table 8-1371. Events

| Event Flag | Event Mask | Map to | Description |
|------------|---|----------------------|-------------------------|
| N/A | VLCDJ_CTRL [4] INTEN_DONE | VLCDJ_BLOCK_IRQ | End of block processing |
| N/A | VLCDJ_CTRL [5] INTEN_ERR | VLCDJ_DECODE_ERR_IRQ | Error occurred |

8.4.6.3.4 ISS SIMCOP VLCDJ in JPEG Encoding Flow

Figure 8-277 shows the JPEG compression or encoding flow.

Figure 8-277. JPEG Encoding Flow

The DCT coefficients are quantized by dividing each data point with a quantizer. The quantizers form an 8×8 matrix for Luma Y, and another 8×8 matrix for U and V, and the matrices are fixed in each image. The quantizer matrices can vary between images, and are sometimes fine-tuned in a multiple-pass process to regulate the compressed JPEG file size.

For quantization, the VLCDJ reads a reciprocal of the quantizer values ($16 \text{ bits per entry carrying } 2^{15}/\text{quant}$) so that hardware performs multiplications rather than divisions. The result is rounded to the nearest integer.

After quantization, the DC terms (the first term in each 8×8 block of DCT coefficients) are differentially coded within each color. Thus, three predictors are used for the common formats.

Next, the coefficients are scanned in a zigzag order (the same order for all colors) to form DC term + zero-run and nonzero level pairs for the alternative coefficient (AC) terms. The run-level pairs are then coded with a Huffman table.

The DC level is first categorized into size groups, basically the number of bits that represents the absolute value of the level. This size is translated to a bit segment using the Huffman table. Then, additional bits are appended to represent the exact DC level.

For AC run-level pairs, the process is similar. Each AC level is first categorized into size groups, basically the number of bits that represents the absolute value of the level. The size and the run are combined and translated to a bit segment using the Huffman table. Then, additional bits are appended to represent the exact AC level.

The number of additional bits to encode after the Huffman-coded segment, for DC or AC level, equals the size value. For example, coefficient values -3 , -2 , and 3 are of size 2, because 2 bits are required to represent the absolute values 2 and 3. There are four coefficient values in the size -2 category, so 2 additional bits are required to uniquely identify each value.

Some special symbols go with the AC run/size pairs. The ZRL symbol represents a run of 15 zeros, and is used to code unusually long zero runs. The EOB symbol represents end of block, meaning that there are only 0 AC coefficients at the end.

In the bitstream management level, after each byte of $0xFF$, a byte of 0 is inserted to prevent the decoder from detecting special markers in the bitstream.

Because the VLCDJ handles multiple MCUs and allows restart marker insertion in MCU boundaries inside a task, the inserted flags are flagged to prevent the insertion of a 0 byte after $0xFF$.

8.4.6.3.5 ISS SIMCOP VLCDJ in JPEG Decoding Flow

Decoding or decompression operates in the reverse order, as shown in Figure 8-278.

Figure 8-278. JPEG Decoding Flow

1. In decoding, in the MCU data section, when the VLCDJ recognizes the 0xFF byte in the bitstream, it detects whether the next byte is a 0 byte. If it is, the 0 byte is removed and decoding continues as if the 0 byte is not there (the 0xFF byte is kept). If the next byte is not a 0 byte, the VLCDJ flags this as a JPEG data error. This can be caused by an earlier bitstream error that causes the module to parse outside the MCU entropy data and into markers that are not supported by the module.
2. Because the VLCDJ decodes for multiple MCUs, restart markers can occur in MCU boundaries. Restart marker detection and processing work with the 0 byte removal logic to ensure that restart markers are detected and removed correctly. When the VLCDJ detects a restart marker, it resets the DC predictors in the IQ stage.
3. The VLCDJ looks up the Huffman table to convert a variable-length bit segment into a DC size or an AC run/size pair. The number of additional bits equal to the size is extracted and the DC/AC coefficient is reconstructed. Then, zero runs are expanded.
4. IQ is performed, which is simply multiplication of the coefficients with values in the quantizer matrices.

8.4.6.3.6 Memory Interfaces

The VLCDJ has four memory interfaces (all memories are inside the SIMCOP subsystem):

- Image buffer (input DCT coefficients for encoding and output DCT coefficients for decoding)
- Quantizer memory
- Huffman memory
- Bitstream memory (output for encoding and input for decoding)

8.4.6.3.6.1 Image Buffer

An image buffer stores DCT data in the context of the VLCDJ. This is an input in encode mode and an output in decode mode.

When multiple MCUs are configured, DCT coefficients for the MCUs are stored sequentially (MCU 0 is stored first, followed by MCU 1, and so on).

Blocks in an MCU are stored sequentially; that is, block 0 first, block 1 next, and so on. There are six blocks per MCU in YUV4:2:0 format, {Y0, Y1, Y2, Y3, U, V}, and four blocks per MCU in YUV4:2:2 format, {Y0, Y1, U, V}.

The 64 DCT coefficients for each block are stored in an 8×8 transposed format (the companion DCT module handles the transposed format). Each coefficient, up to $[-2047, 2047]$ in range is stored on a 16-bit word. [Table 8-1372](#) lists the data format in each 8×8 block of coefficients.

Table 8-1372. Image Buffer Block Format

| Byte Offset | | | | | | | | |
|-------------|---|---------|---|---------|---|-----|---------|----|
| 0 | 1 | 2 | 3 | 4 | 5 | ... | 14 | 15 |
| c(0, 0) | | c(0, 1) | | c(0, 2) | | ... | c(0, 7) | |
| c(1, 0) | | c(1, 1) | | c(1, 2) | | ... | c(1, 7) | |
| c(2, 0) | | c(2, 1) | | c(2, 2) | | ... | c(2, 7) | |
| : | | | | | | | | |
| c(7, 0) | | c(7, 1) | | c(7, 2) | | ... | c(7, 7) | |

The DCT coefficients are processed in zigzag order (see [Figure 8-279](#)), as required by JPEG.

Figure 8-279. JPEG Zigzag Order

8.4.6.3.6.2 Quantizer Memory

The quantization memory stores the reciprocal of quantizers, $2^{15}/\text{qmat}[i][j]$ so that hardware performs multiplications rather than divisions. Each data point is stored in 16 bits.

The quantizer matrices have a fixed size, 64 16-bit elements each. The quantizer memory (QMEM) is sized to hold up to four matrices ([Table 8-1373](#) lists the recommended allocation for YUV4:2:0 and YUV4:2:2).

Table 8-1373. Recommended QMEM Allocation for YUV4:2:0 and YUV4:2:2

| Quadrant of QMEM | Address Offset (Bytes) | Contents |
|------------------|------------------------|---|
| 00 | 0x000 | (Encode) Quantizer reciprocal for Y ($2^{15}/\text{qmat}[i][j]$) |
| 01 | 0x080 | (Encode) Quantizer reciprocal for UV ($2^{15}/\text{qmat}[i][j]$) |
| 10 | 0x100 | (Decode) Quantizer for Y ($\text{qmat}[i][j]$) |
| 11 | 0x180 | (Decode) Quantizer for UV ($\text{qmat}[i][j]$) |

Each matrix is stored in zigzag order to make quantization and inverse quantization more efficient.

8.4.6.3.6.3 Huffman Memory

Huffman memories store Huffman encode tables and Huffman control/decode tables. For information about Huffman tables, see [Section 8.4.6.3.7, Huffman Table Organization](#).

8.4.6.3.6.4 Bitstream Memory

Bitstream memory is for input/output (I/O) bitstream. Bitstream data is stored in little-endian format in the memory. Circular buffer (CBUFF) start and end addresses are provided in registers to facilitate bitstream data management:

- [VLCDJE_CBUF\[11:10\]](#) START, start of ring buffer for encode mode (address must be 1KB-aligned)
- [VLCDJE_CBUF\[27:26\]](#) END, end of ring buffer for encode mode (address must be 1KB-aligned)
- [VLCDJD_CBUF\[11:10\]](#) START, start of ring buffer for decode mode (address must be 1KB-aligned)
- [VLCDJD_CBUF\[27:26\]](#) END, end of ring buffer for decode mode (address must be 1KB-aligned)

[Figure 8-280](#) shows the start and end addresses of a ring buffer.

Figure 8-280. VLCDJ Ring Buffer

In encoding and decoding, a bit-level boundary defines bitstream data written (for encoding) or parsed (for decoding). To point to that boundary, bit and byte pointers are provided in the registers:

- [VLCDJE_BSPTR](#)[19:16] BITPTR (encoding)
- [VLCDJE_BSPTR](#)[11:0] BYTEPTR (encoding)
- [VLCDJD_BSPTR](#)[19:16] BITPTR (decoding)
- [VLCDJD_BSPTR](#)[11:0] BYTEPTR (decoding)

BYTEPTR (byte pointer) points to the byte where the boundary lies, and BITPTR (bit pointer) specifies the number of available vacant data bits (for encoding) or remaining data bits (for decoding). BITPTR is always in the range of 1 to 8, where 8 indicates that an entire byte is available for writing or reading.

For example, for encoding, if BYTEPTR = 0 and BITPTR = 8, after the hardware encodes a specified number of MCUs that together generate 30 bits, or 3 full bytes and 6 bits, BYTEPTR = 3 and BITPTR = 2. The JPEG standard requires that at the end of MCU data, any remaining bits of the last byte are padded with 1s. For example, if the last byte has 4 bits written 0101, the last byte of MCU data in the JPEG data is 0x5F.

8.4.6.3.7 Huffman Table Organization

8.4.6.3.7.1 Huffman Table for Encode Mode

Because the Huffman encode tables are compact, they are fixed relative to a common pointer:

- The Luma DC table starts at [VLCDJE_VLCTBL](#)[11:2] ADDR (12 entries \times 4 = 48 bytes)
- The Luma AC table starts at [VLCDJE_VLCTBL](#)[11:2] ADDR + 48 bytes (11 \times 16 \times 4 = 704 bytes)
- The Chroma DC table starts at [VLCDJE_VLCTBL](#)[11:2] ADDR + 752 bytes (12 entries \times 4 = 48 bytes)
- The Chroma AC table starts at [VLCDJE_VLCTBL](#)[11:2] ADDR + 800 bytes (11 \times 16 \times 4 = 704 bytes)

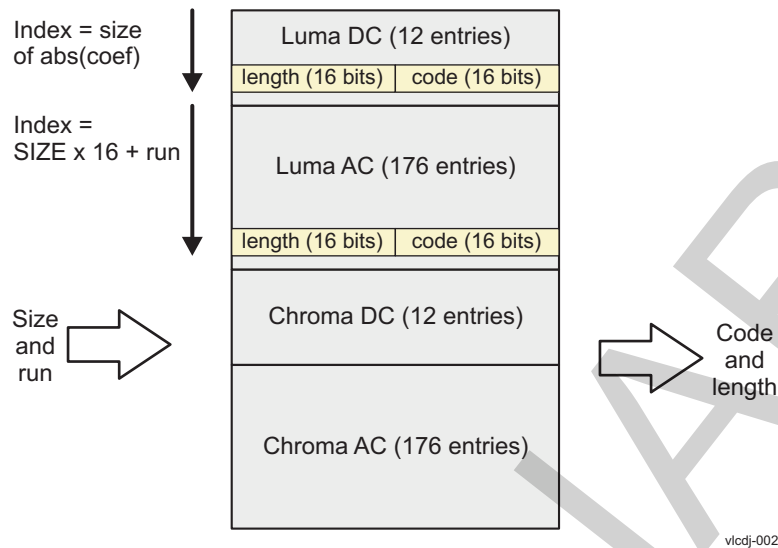

For DC tables, the index of each table corresponds to the size of the absolute value of the DC coefficient.

For AC tables, the index of each table corresponds to a formula including the size (of absolute value of nonzero AC coefficients) and the zero run: Index = SIZE \times 16 + run. Because the size cannot be 0, the first 16 entries hold special symbols. EOB is at entry 0, and ZRL is at entry 15.

The size of a nonnegative value is the number of bits required to represent the value (for example, a size of 4..7 = 3).

[Figure 8-281](#) shows the organization of the Huffman encode table.

Figure 8-281. Huffman Encode Table Organization

8.4.6.3.8 Restart Marker

8.4.6.3.8.1 Restart Marker Insertion for Encode

As specified in the JPEG standard, the VLCDJ can insert a restart marker at a specified MCU interval (for information about restart markers, see [Section 8.4.6.3.5, ISS SIMCOP VLDCJ in JPEG Decoding Flow](#)). Any remaining bits in the last partial byte are padded with 1s.

When enabled, the VLCDJ inserts a restart marker at the end of a group of MCUs. A partial byte is automatically padded with 1s.

8.4.6.3.8.2 Restart Marker Location Recording

To facilitate reordering of compressed JPEG data sections to achieve JPEG rotation, the VLCDJ also records the restart marker locations.

8.4.6.3.8.3 Restart Marker Handling for Decoding

Restart markers are handled automatically during MCU data decoding according to the JPEG standard. The DC predictors are reset at the MCU boundary where restart markers are present.

Because the handling of restart markers is complex, there is no check of the consistency of restart marker value or existence/nonexistence with the restart interval (which is not part of the decoder register setting). Correct JPEG files are decoded correctly. Incorrect JPEG files can escape error detection.

To decode correctly, in spite of the presence of restart markers, software must configure the VLCDJ with the correct byte pointer for the VLCDJ. To reset DC predictors to occur before an MCU, the byte pointer must point to the restart marker before the MCU data in the bitstream data. In other words, the VLCDJ does not search for the correct marker and resume MCU decoding after the marker. The VLCDJ detects the presence of the marker only at the MCU boundaries.

8.4.6.3.9 Encode/Decode Context Switching

The bitstream memory is organized as two banks of memory. When the VLCDJ performs only encoding or only decoding, the two banks are used to achieve VLCDJ and DMA concurrence, and automatic bitstream data DMA is supported.

When the VLCDJ performs one encode and one decode concurrently, both contexts can coexist in the configuration registers, because encode and decode configurations are in separate registers. The bitstream memory must be partitioned half-and-half between encode and decode. For example:

- [VLCDJE_CBUF](#)[11:10] START = 0x0
- [VLCDJE_CBUF](#)[27:26] END = 0x7FF
- [VLCDJD_CBUF](#)[11:10] START = 0x800
- [VLCDJD_CBUF](#)[27:26] END = 0xFFF

The byte pointers and the bitstream data DMA must be set up accordingly.

When the VLCDJ is encoding, the decode half of bitstream memory can be refilled by DMA. When the VLCDJ is decoding, the encode half of bitstream memory can be transferred out by DMA. Hardware does not support automatic triggering of DMA; software must submit DMA based on the byte pointer value of each context. For good SDRAM efficiency, the DMA block must be aligned correctly.

8.4.6.3.10 Using Sequential Block Mode for YUV4:4:4 Encoding/Decoding

In sequential block mode, because it deals with only one color component, the VLCDJ does the following:

- Uses DCPREDY for the DC predictor
- Uses the first quantizer matrix pointed by QM/QMR
- Starts from the first block pointed to by DCT
- Uses the first VLC/VLD table

Thus, to encode/decode YUV4:4:4 format using sequential block mode, software must switch context among Y, U, and V between initiations of the VLCDJ. Memory organization and registers are designed so that QM/QMR, DCT, and VLC/VLD tables can be swapped by changing the corresponding pointers in the registers. The DC predictor must be saved and restored.

For more information, see [Section 8.4.6.4.6, Example of YUV4:4:4 Encoding](#).

8.4.6.3.11 Error Reporting

The VLCDJ can report the following decode errors:

- Invalid Huffman code
- Block exceeding 64 coefficients

NOTE: Decoding of an 0xFF byte followed by a nonzero byte is not reported as an error (for more information, see [Section 8.4.6.3.5, ISS SIMCOP VLCDJ in JPEG Decoding Flow](#)).

When there is a decode error, VLCDJ operation is suspended immediately. Bit and byte pointers to the bitstream near where the error occurs are reflected in the [VLCDJD_BSPTTR](#)[19:16] BITPTR and [VLCDJD_BSPTTR](#)[11:0] BYTEPTR bit fields. The DCT coefficient index, in zigzag order of the task, near where the error occurs, is also reflected in a read-only bit field, [VLCDJD_DCTERR](#)[13:0] ERRPTR. For example, if decoding fails at the fifth coefficient of the third block of the VLCDJ task (which can be multiple MCUs), ERRPTR returns $2 \times 64 + 4 = 195$.

The IQ stage of the hardware does not stop and runs to completion. When there is a decode error, the DC predictor and decoded DCT coefficient outcomes are indeterminate.

Because the VLCDJ does not start in the middle of an MCU, software must recover from the error and configure the VLCDJ from an MCU boundary.

8.4.6.4 ISS SIMCOP VLCDJ Basic Programming Model

8.4.6.4.1 Initialization of Surrounding Modules

To initialize the VLCDJ, surrounding modules must be initialized. [Table 8-1374](#) lists these modules.

Table 8-1374. Initialization of Surrounding Modules

| Module | Minimum Required Setting | Optional Settings |
|-------------|---|---|
| CLKC | Enable the SIMCOP clock. | |
| Buffers | Configure VLCDJ access to the image buffer. | |
| SIMCOP CTRL | | Configure SIMCOP CTRL to handle VLCDJ interrupts. |

8.4.6.4.2 ISS SIMCOP VLCDJ Start and Register Modification During Processing

The module operation can be started with two mechanisms, depending on the status of the [VLCDJ_CTRL\[2\]](#) TRIG_SRC bit.

When the [VLCDJ_CTRL\[2\]](#) TRIG_SRC bit is set to 0 and the module is idle (the [VLCDJ_CTRL\[16\]](#) BUSY bit is set to 0), the module is started by setting the [VLCDJ_CTRL\[0\]](#) EN bit to 1. Any hardware start pulses are ignored. To simplify software control, in the same register write, changing the [VLCDJ_CTRL\[2\]](#) TRIG_SRC bit from 1 to 0 and setting the [VLCDJ_CTRL\[0\]](#) EN bit to 1 is recognized as a valid starting condition.

When the [VLCDJ_CTRL\[2\]](#) TRIG_SRC bit is set to 1 and the module is idle (the [VLCDJ_CTRL\[16\]](#) BUSY bit is set to 0), the module is started by the START signal going active. Any software write to the [VLCDJ_CTRL\[0\]](#) EN bit is ignored.

During encoding, encode configuration registers must not be modified by software, whereas decode configuration registers can be freely modified.

During decoding, decode configuration registers must not be modified by software, whereas encode configuration registers can be freely modified.

8.4.6.4.3 JPEG Encoding

For JPEG encoding of a YUV4:2:0 image consisting of eight MCUs per task, software first composes the JPEG header, which includes image dimension, YUV4:2:0 format, Huffman tables, quantizer matrices, and the start-of-scan marker and scan header, all before the MCU data. Software then sets up the encoding task, once per image, with the procedure listed in [Table 8-1375](#).

Table 8-1375. JPEG Encoding Procedure

| Step | Register/Bit Field | Value |
|--|--|---|
| Configure the encode configuration register. | VLCDJE_CFG[1:0] FMT | 0 (YUV4:2:0 mode) |
| | VLCDJE_CFG[13:8] NMCUS | 7 (eight MCUs) |
| | VLCDJE_CFG[2] RSTEN | 0 (no restart marker) |
| Configure the DC predictor. | VLCDJE_DCPREDY[11:0] PREDY | 0 (reset DC predictor for Y) |
| | VLCDJE_DCPREDUV[11:0] PREDU | 0 (reset DC predictors for U) |
| | VLCDJE_DCPREDUV[27:16] PREDV | 0 (reset DC predictors for V) |
| Configure the input and output memories. | VLCDJE_BSPTTR[11:0] BYTEPTR | 0 (beginning of bitstream memory) |
| | VLCDJE_BSPTTR[19:16] BITPTR | 8 (initially empty byte, thus 8 free bits) |
| | VLCDJE_CBUF[11:10] START | 0 (bitstream starts from beginning of first quadrant of bitstream memory) |
| | VLCDJE_CBUF[27:26] END | 3 (bitstream ends at end of fourth quadrant of bitstream memory) |
| | VLCDJE_DCTQM[13:4] DCT | 0 (DCT coefficients at beginning of image buffer) |

Table 8-1375. JPEG Encoding Procedure (continued)

| Step | Register/Bit Field | Value |
|---|---|--|
| Configure Huffman and quantizer memory pointers. | VLCDJE_DCTQM [24:23] QMR | 0 (quantizer matrix reciprocal at beginning of QMEM) |
| | VLCDJE_VLCTBL [11:2] ADDR | 0 (VLC table at beginning of HUFMEM) |
| Start encode with automatic ring buffer management. | VLCDJ_CTRL [1] MODE | 0 (encode mode) |
| | VLCDJ_CTRL [0] EN | 1 (start VLCDJ operation) |

For each group of eight MCUs (the VLCDJ does not care if these MCUs cross multiple MCU rows), software sets the [VLCDJ_CTRL](#)[0] EN bit to 1 (restart VLCDJ operation).

Alternately, the hardware sequencer can start the VLCDJ. Usually, DMA is also configured to bring in YUV4:2:0 image data as input to DCT, and DMA, DCT, and VLCDJ are all put under control of the hardware sequencer.

Bitstream data is managed automatically between the VLCDJ and DMA throughout JPEG encoding of MCUs.

NOTE: Many registers change during the encoding of a frame, but software is not required to access these registers, because the VLCDJ manages the status information between tasks.

The last hardware task may require a smaller number of MCUs (the [VLCDJE_CFG](#)[13:8] NMCUS bit field) to adjust for the number of MCUs in the last group.

After the last VLCDJ task for the image, software must disable the automatic bitstream buffer management and prepare for the next image by setting the following values (these can be issued as a single write):

- [VLCDJ_CTRL](#)[6] RBEN = 0 (disable automatic DMA interaction)
- [VLCDJ_CTRL](#)[7] CLRRB = 1

Finally, software must pad the last data byte with bit 1s, then place an end-of-image marker after the last data byte. The [VLCDJE_BSPTR](#)[11:0] BYTEPTR and [VLCDJE_BSPTR](#)[19:16] BITPTR bit fields indicate the locations of the last data byte and bit, respectively. Software must then set up DMA to transfer out the remaining data in bitstream memory.

The number of MCUs processed by hardware per task must be set according to image buffer allocation. For example, with 8KB available for DCT coefficient memory, and YUV4:2:0 format, it is possible to process $8K/(16 \times 16 \times 1.5 \times 2) = 10$ MCUs. Because the bitstream DMA is automatic, bitstream data does not overflow bitstream memory for this many MCUs in densely coded JPEG.

8.4.6.4.4 JPEG Decoding

For JPEG decoding of an image, software first parses the JPEG header, which includes image dimension, YUV sampling, Huffman tables, quantizer matrices, and start-of-scan marker and scan header, before the MCU data. Software then sets up DMA to load bitstream data into the first half of bitstream memory.

The Huffman tables must be processed to generate hardware control tables and decode tables for a particular JPEG file, unless the Huffman tables match previously processed tables for which the hardware control and decode tables are known. The hardware control and decode tables must be transferred to HUFMEM.

If the JPEG file is YUV4:2:0, and image buffer memory is sufficient to process eight MCUs per hardware task, software must set up the decode task, once per image, with the procedure listed in [Table 8-1376](#).

Table 8-1376. JPEG Decoding Procedure

| Step | Register/Bit Field | Value |
|--|--------------------------------------|-------------------|
| Configure the decode configuration register. | VLCDJD_CFG [1:0] FMT | 0 (YUV4:2:0 mode) |

Table 8-1376. JPEG Decoding Procedure (continued)

| Step | Register/Bit Field | Value |
|---|---|--|
| Configure the DC predictor. | VLCDJD_CFG [13:8] NMCUS | 7 (eight MCUs) |
| | VLCDJD_CFG [2] RSTEN | 0 (no restart marker) |
| | VLCDJD_DCPREDY [11:0] PREDY | 0 (reset DC predictor for Y) |
| | VLCDJD_DCPREDUV [11:0] PREDU | 0 (reset DC predictors for U) |
| Configure the input and output memories. | VLCDJD_DCPREDUV [27:16] PREDV | 0 (reset DC predictors for V) |
| | VLCDJD_BSPTR [11:0] BYTEPTR | 0 (beginning of bitstream memory) |
| | VLCDJD_BSPTR [19:16] BITPTR | 8 (initially empty byte, thus 8 free bits) |
| | VLCDJD_CBUF [11:10] START | 0 (bitstream starts from beginning of first quadrant of bitstream memory) |
| | VLCDJD_CBUF [27:26] END | 3 (bitstream ends at end of fourth quadrant of bitstream memory) |
| | VLCDJD_DCTQM [13:4] DCT | 0 (DCT coefficients at the beginning of the image buffer) |
| | VLCDJD_DCTQM [24:23] QMR | 0 (quantizer matrix at beginning of QMEM) |
| Configure Huffman and quantizer memory pointers. | VLCDJD_CTRLTBL [11:2] ADDR | 0 (typically, control table is placed at the beginning of HUFMEM) |
| | VLCDJD_DCDTBL0 [11:2] TBL0 | 30 (typically, the first decode table follows the control table, 60 shorts = 120 bytes = 30 words) |
| | VLCDJD_DCDTBL0 [27:18] TBL1 | ? (where the second decode table starts) |
| | VLCDJD_DCDTBL23 [11:2] TBL2 | ? (where the third decode table starts) |
| | VLCDJD_DCDTBL23 [27:18] TBL3 | ? (where the fourth decode table starts) |
| Start decode with automatic ring buffer management. | VLCDJ_CTRL [1] MODE | 1 (decode mode) |
| | VLCDJ_CTRL [0] EN | 1 (start VLCDJ operation) |

For each group of eight MCUs (the VLCDJ does not care if these MCUs cross multiple MCU rows), software sets the [VLCDJ_CTRL](#)[0] EN bit to 1 (restart VLCDJ operation).

Alternately, the hardware sequencer can start the VLCDJ, as well as control buffer switches and coordinate among the VLCDJ, DCT, and DMA.

Bitstream data is managed automatically between the VLCDJ and DMA throughout JPEG encoding of MCUs.

NOTE: Many registers change during the decoding of a frame, but software is not required to access these registers, because the VLCDJ manages the status information between tasks.

The last hardware task may require a smaller number of MCUs (the [VLCDJD_CFG](#)[13:8] NMCUS bit field) to adjust for the number of MCUs in the last group.

After the last VLCDJ task for the image, software must disable the automatic bitstream buffer management and prepare for the next image by setting the following values (these can be issued as a single write):

- [VLCDJ_CTRL](#)[6] RBEN = 0 (disable automatic DMA interaction)
- [VLCDJ_CTRL](#)[7] CLRRB = 1

Before the VLCDJ processes the next image decode, new bitstream data must be brought in, thereby overwriting the old data, and bit/byte pointers must be reset to the beginning of bitstream memory. As a result, any remaining bitstream data in bitstream memory afterward is harmless.

The number of MCUs processed by hardware per task must be set according to image buffer allocation. For example, with 16KB available for DCT coefficient memory, and YUV4:2:0 format, it is possible to process $16K/(16 \times 16 \times 1.5 \times 2) = 21$ MCUs. Because the bitstream DMA is automatic, there is no bitstream data underrun for this many MCUs.

8.4.6.4.5 Concurrent JPEG Encoding and Decoding

For concurrent decoding and encoding, the two operations are configured separately but similarly.

Half of bitstream memory is used for encoding (for example, the first half), and the rest is used for decoding. Automatic bitstream DMA does not work in this case, so the number of MCUs must accommodate the worst-case bitstream size per MCU.

Theoretically, the worst case is 16 bits of Huffman code plus 12 additional bits per coefficient, or 28 bits per coefficient. With natural images, there are typically about 8 bits per pixel when quantizers are minimal (that is, all 1s). With 16 bits per coefficient, or 768 bytes per MCU in YUV4:2:0 (this is 24 bits per pixel and three times the typical worst case), half of bitstream memory is 2KB, which can safely hold two MCUs.

In this case, half of QMEM is used for encoding and half is used for decoding. Encode and decode Huffman tables are placed so that they coexist in HUFFMEM.

The Huffman tables for encoding, decoding, and quantizer matrices must be placed accordingly in HUFFMEM and QMEM. Bitstream data is filled at the second half of bitstream memory for decoding.

Register fields are configured as listed in [Table 8-1377](#).

Table 8-1377. Concurrent JPEG Encoding and Decoding

| Step | Register/Bit Field | Value |
|---|--|---|
| Configure the encode register. | VLCDJE_CFG [1:0] FMT | 0 (YUV4:2:0 mode) |
| | VLCDJE_CFG [13:8] NMCUS | 1 (two MCUs) |
| | VLCDJD_CFG [2] RSTEN | 0 (no restart marker) |
| | VLCDJE_DCPREDY [11:0] PREDY | 0 (reset DC predictor for Y) |
| | VLCDJE_DCPREDU [11:0] PREDU | 0 (reset DC predictors for U) |
| | VLCDJE_DCPREDV [27:16] PREDV | 0 (reset DC predictors for V) |
| | VLCDJE_BSPTR [19:16] BITPTR | 8 (initially empty byte, thus 8 free bits) |
| | VLCDJE_DCTQM [13:4] DCT | 0 (DCT coefficients at beginning of image buffer) |
| Configure the decode register. | VLCDJD_CFG [1:0] FMT | 0 (YUV4:2:0 mode) |
| | VLCDJD_CFG [13:8] NMCUS | 1 (two MCUs) |
| | VLCDJD_CFG [2] RSTEN | 0 (no restart marker) |
| | VLCDJD_DCPREDY [11:0] PREDY | 0 (reset DC predictor for Y) |
| | VLCDJD_DCPREDU [11:0] PREDU | 0 (reset DC predictors for U) |
| | VLCDJD_DCPREDV [27:16] PREDV | 0 (reset DC predictors for V) |
| | VLCDJD_BSPTR [19:16] BITPTR | 8 (initially empty byte, thus 8 free bits) |
| | VLCDJD_DCTQM [13:4] DCT | 0 (DCT coefficients at the beginning of the image buffer) |
| Configure the byte pointer to bitstream memory. | VLCDJE_BSPTR [11:0] BYTEPTR | 0 (beginning of bitstream memory) |
| | VLCDJD_BSPTR [11:0] BYTEPTR | 0x800 (beginning of bitstream memory second half) |
| Configure the bitstream memory partition. | VLCDJE_CBUF [11:10] START | 0 (bitstream starts at beginning of first quadrant of bitstream memory) |
| | VLCDJE_CBUF [27:26] END | 1 (bitstream ends at end of second quadrant of bitstream memory) |
| | VLCDJD_CBUF [11:10] START | 2 (bitstream starts at beginning of third quadrant of bitstream memory) |
| | VLCDJD_CBUF [27:26] END | 3 (bitstream ends at end of fourth quadrant of bitstream memory) |

Table 8-1377. Concurrent JPEG Encoding and Decoding (continued)

| Step | Register/Bit Field | Value |
|---|---|---|
| Configure the quantizer matrix pointer. | VLCDJE_DCTQM [24:23] QMR | 0 (quantizer matrix at beginning of QMEM) |
| | VLCDJD_DCTQM [24:23] QMR | 2 (quantizer matrix at second half of QMEM) |
| Configure Huffman tables. | VLCDJE_VLCTBL [11:2] ADDR | 0 (VLC table at beginning of HUFMEM) |
| | VLCDJD_CTRLTBL [11:2] ADDR | 376 (after VLC table, $2 \times (24 + 352)$ shorts = 376 words) |
| | VLCDJD_DCDTBL0 [11:2] TBL0 | 406 (after control table of 30 words) |
| | VLCDJD_DCDTBL0 [27:18] TBL1 | ? (where the second decode table starts) |
| | VLCDJD_DCDTBL2 [11:2] TBL2 | ? (where the third decode table starts) |
| | VLCDJD_DCDTBL2 [27:18] TBL3 | ? (where the fourth decode table starts) |

Software sets the following values to start encoding:

- [VLCDJ_CTRL](#)[1] MODE = 0 (encode mode)
- [VLCDJ_CTRL](#)[0] EN = 1 (start VLCDJ operation)

When the VLCDJ completion interrupt is detected by software, encoding is complete and software must service the encoded bitstream data in the first half of bitstream memory, letting hardware access the second half of the bitstream for decoding. Software sets up bitstream writes to transfer the encoded bitstream from bitstream memory[0] to bitstream memory[$128 \times (\text{VLCDJE_BSPTR}[11:0] \text{ BYTEPTR}/128)$] (rounding down to 128-byte alignment improves SDRAM efficiency). Software must identify the bitstream data already transferred out, for the next round of servicing encoded bitstream data. Software must also service to-encode input data to the DCT.

After kicking off encode DMAs, without waiting for DMA completion, software must set the following values to start VLCDJ decoding in parallel with the DMA:

- [VLCDJ_CTRL](#)[1] MODE = 1 (decode mode)
- [VLCDJ_CTRL](#)[0] EN = 1 (start VLCDJ operation)

When the VLCDJ completion interrupt is detected by software, decoding is complete and software must service the decoded bitstream data in the second half of bitstream memory, letting hardware access the first half of the bitstream for encoding. Software sets up bitstream writes to transfer the bitstream to be decoded from bitstream memory[0] to bitstream memory[$128 \times (\text{VLCDJD_BSPTR}[11:0] \text{ BYTEPTR}/128)$] (rounding down to 128-byte alignment improves SDRAM efficiency). Software must identify the bitstream data already transferred in, for the next round of servicing bitstream data to be decoded. Software must also service decoded image data in the output image buffer of the DCT.

After kicking off decode DMAs, without waiting for DMA completion, software must start VLCDJ encoding in parallel with the DMA.

Software must continue to alternate between encoding and decoding until the image completes.

[Figure 8-282](#) shows the concurrence schedule for JPEG encoding and decoding.

Figure 8-282. Concurrence Schedule for JPEG Encoding and Decoding

vldj-007

Management of bitstream I/O and image I/O is heavy in intervals of only two MCUs. It is better to run only encoding for many MCUs, switch context, and then run decoding for many MCUs.

When running JPEG transcoding, decoding a picture and re-encoding it, to adjust quantizers and/or remove/insert restart markers, it can be more efficient to run encode and decode concurrently in VLCDJ, skipping DCT and image I/O DMA altogether. In this case, software handles only bitstream data I/O, which is more manageable.

Figure 8-283 shows the concurrence schedule for JPEG transcoding.

Figure 8-283. Concurrence Schedule for JPEG Transcoding

vldj-008

8.4.6.4.5.1 DMA and Buffer Manual Management

When the VLCDJ performs one encode and one decode concurrently, both contexts can coexist in the configuration registers, because encode and decode configurations are in separate registers. The bitstream memory must be partitioned half-and-half between encode and decode:

- `VLCDJE_CBUF[11:10] START = 0 (0x0)`
- `VLCDJE_CBUF[27:26] END = 1 (0x7FF)`
- `VLCDJD_CBUF[11:10] START = 2 (0x800)`
- `VLCDJD_CBUF[27:26] END = 3 (0xFFF)`

The byte pointers and the bitstream data DMA must be set up accordingly.

When the VLCDJ is encoding, the decode half of the bitstream memory can be refilled by DMA. When the VLCDJ is decoding, the encode half of the bitstream memory can be transferred out by DMA. Hardware does not support automatic triggering of DMA; software must submit DMA based on the byte pointer value of each context. For greater SDRAM efficiency, the DMA block must be aligned correctly. For example, the pseudocode that sets up the DMA for an encode task may appear as:

```
new_dma_ptr = VLCDJ_BSPTR.BYTEPTR ~0x3F; // align to 64-byte
if (new_dma_ptr == saved_dma_ptr)
{
    setup_dma(saved_dma_ptr, new_dma_ptr - saved_dma_ptr);
    // start DMA at saved_dma_ptr, length = new_dma_ptr - saved_dma_ptr
}
else // wraps around, need to DMA 2 blocks
{
    setup_dma(saved_dma_ptr, 0x800 - saved_dma_ptr);
    setup_dma(saved_dma_ptr, new_dma_ptr);
}
saved_dma_ptr = new_dma_ptr;
```

This DMA setup can be carried out concurrently with VLCDJ operation; thus, this code is executed with each encode or decode task. When the VLCDJ is encoding, software can access the decode bit/byte points to set up DMA for decoding, and vice versa.

Because hardware stalling does not work in this case, the number of MCUs must be configured so that in the worst case there is no bitstream data overrun or underrun.

The bitstream buffer can be allocated at a quarter of bitstream memory granularity, or 1KB. This allows at most four separate buffers to coexist in bitstream memory.

If multiple encode and/or decode threads are performed concurrently, software must save and restore the appropriate configuration registers. The register map has common registers in one group, encode registers in another group, and decode registers in a third group. Bitstream memory partitioning and corresponding DMA submission are left to software.

8.4.6.4.6 Example of YUV4:4:4 Encoding

The following pseudocode shows the general sequence involved in YUV4:4:4 encoding. Decoding can be similarly derived.

```
encode_yuv444()
{
    VLCDJ_CTRL[1] MODE = 0; /* encode */
    VLCDJE_CFG[1:0] FMT = 2; /* sequential block mode */
    VLCDJE_CFG[13:8] NMCUS = 0; /* 1 block at a time */
    pred_y = 0;
    pred_u = 0;
    pred_v = 0;
    for (i=0; inum_mcus; i++)
    {
        VLCDJE_DCPREDY = pred_y; /* restore Y context */
        VLCDJE_DCT = DCT_Y;
        VLCDJE_QMR = QMR_Y;
        VLCDJE_VLCTBL = VLC_Y;
        VLCDJ_CTRL[0] EN = 1; /* kick off VLCDJ for Y */
        pred_y = VLCDJE_DCPREDY; /* save Y context */
        VLCDJE_DCPREDY = pred_u; /* restore U context */
        VLCDJE_DCT = DCT_U;
        VLCDJE_QMR = QMR_UV;
        VLCDJE_VLCTBL = VLC_UV;
        VLCDJ_CTRL[0] EN = 1; /* kick off VLCDJ for U */
        pred_u = VLCDJE_DCPREDY; /* save U context */
        VLCDJE_DCPREDY = pred_v; /* restore V context */
        VLCDJE_DCT = DCT_V;
        VLCDJ_CTRL[0] EN = 1; /* kick off VLCDJ for V */
        pred_v = VLCDJE_DCPREDY; /* save V context */
    }
}
```

8.4.6.4.7 Example of Huffman Encode and Decode Tables

8.4.6.4.7.1 Huffman Encode Table

Sample JPEG Luma DC encode table:

```
unsigned short jpeg_dc_y[24] =
{
    0x0000, 0x0002, 0x0002, 0x0003, 0x0003, 0x0003, 0x0004, 0x0003,
    0x0005, 0x0003, 0x0006, 0x0003, 0x000e, 0x0004, 0x001e, 0x0005,
    0x003e, 0x0006, 0x007e, 0x0007, 0x00fe, 0x0008, 0x01fe, 0x0009
};
```

Table 8-1378 corresponds to Table 17 in the JPEG standard *ISO/IEC JTC1/SC29/WG10 Standard 10918-1 (JPEG), Information Technology – Digital Compression and Coding of Continuous-Tone Still Images – Requirements and Guidelines*.

Table 8-1378. Sample Luma DC Huffman Code Table

| Category | Code Length | Code Word |
|----------|-------------|-----------|
| 0 | 2 | 00 |
| 1 | 3 | 010 |
| 2 | 3 | 011 |
| 3 | 3 | 100 |
| 4 | 3 | 101 |
| 5 | 3 | 110 |
| 6 | 4 | 1110 |
| 7 | 5 | 11110 |
| 8 | 6 | 111110 |

**Table 8-1378. Sample Luma DC Huffman Code Table
(continued)**

| Category | Code Length | Code Word |
|----------|-------------|-----------|
| 9 | 7 | 1111110 |
| 10 | 8 | 11111110 |
| 11 | 9 | 111111110 |

To code a DC coefficient value of -5 :

Use $\text{abs}(-5) = 5$ to select a size of 3. Look up the encode table to find:

- $\text{jpeg_dc_y}[2 \times 3] = 4$ (code)
- $\text{jpeg_dc_y}[2 \times 3 + 1] = 3$ (length)

Thus, the VLCDJ adds 100 to the bitstream as the Huffman code of the size.

The additional bits for negative coefficients are ones complement of the absolute value, so for -5 , this is 010, or 2. After the Huffman code of the size, the VLCDJ adds 010 to the bitstream.

The AC coefficient table is the same, except that the VLCDJ uses $16 \times \text{size} + \text{run}$ to index the encode table.

8.4.6.4.7.2 Huffman Decode Tables

Sample JPEG Luma DC control and decode tables:

```
unsigned short jpeg_dc_yctl_tbl[13]=
{
    0x0000,0x0000,0x0000,0x0000,0x1800,0x2001,0x2802,0x3003,
    0x3804,0x4005,0x4806,0x4806,0x4806
};
unsigned short jpeg_dc_ydcd_tbl[14]=
{
    0x0000,0x480b,0x400a,0x3809,0x3008,0x2807,0x2006,0x1805,
    0x1804,0x1803,0x1802,0x1801,0x1000,0x1000
};
```

These tables contain the same information as [Table 8-1378](#), which complies with the JPEG standard.

8.4.6.5 ISS SIMCOP VLCDJ Register Manual

8.4.6.5.1 ISS SIMCOP VLCDJ Instance Summary

Table 8-1379 summarizes the VLDCJ instance.

Table 8-1379. ISS SIMCOP VLCDJ Instance Summary

| Module Name | Base Address L3 Interconnect | Base Address Cortex-M3 Private Access | Size |
|-------------|---------------------------------|--|-----------|
| VLCDJ | 0x5202 0600 | 0x5506 0600 | 128 bytes |

NOTE: Private Access is an access that does not use the L3/L4 interconnects.

8.4.6.5.2 VLCDJ Registers

| Bits | Field Name | Description | Type | Reset |
|-------|------------|---|------|-------|
| 31:17 | RESERVED | Read returns 0. | R | 0x00 |
| 16 | BUSY | Idle/busy status 0: Idle 1: Busy | R | 0 |
| 15:8 | RESERVED | Read returns 0. | R | 0x00 |
| 7 | CLRRB | Write only; read returns 0. | W | 0 |
| 6 | RBEN | Enable RB signaling. | RW | 0 |
| 5 | INTEN_ERR | Interrupt enable for decode error 0: No interrupt generated on decode error 1: Interrupt generated on decode error | RW | 0 |
| 4 | INTEN_DONE | Interrupt enable for task completion. DONE_VLCD is not gated by this and is always asserted at task completion. 0: No interrupt generated on task completion 1: Interrupt generated on task completion | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|---|------|-------|
| 3 | AUTOGATING | Internal clock gating on OCP clock and functional clock 0: Clocks are free-running. 1: Clocks are gated off in sub-blocks that are not required for operation. | RW | 1 |
| 2 | TRIG_SRC | Which mechanism starts VLCDJ operation 0: MMR write to VLCDJ_CTRL.EN 1: Hardware start signal | RW | 0 |
| 1 | MODE | 0: Encode 1: Decode | RW | 0 |
| 0 | EN | Module enable by software (write-only, read returns 0). When TRIG_SRC = 0 and BUSY = 0, set this field to 1 to start VLCDJ. When TRIG_SRC = 1, writes to this field are ignored. Setting TRIG_SRC = 0 and EN = 1 on the same register write is recognized. | W | 0 |

8.4.7 ISS SIMCOP Rotation Accelerator Module

This section describes the rotation accelerator (ROT) module in the still-image coprocessor (SIMCOP) subsystem.

8.4.7.1 ISS SIMCOP ROT Overview

The ROT module is intended to be used in the SIMCOP to perform block data rotation and data shifting from one SIMCOP local memory to another. The following formats and operations are supported:

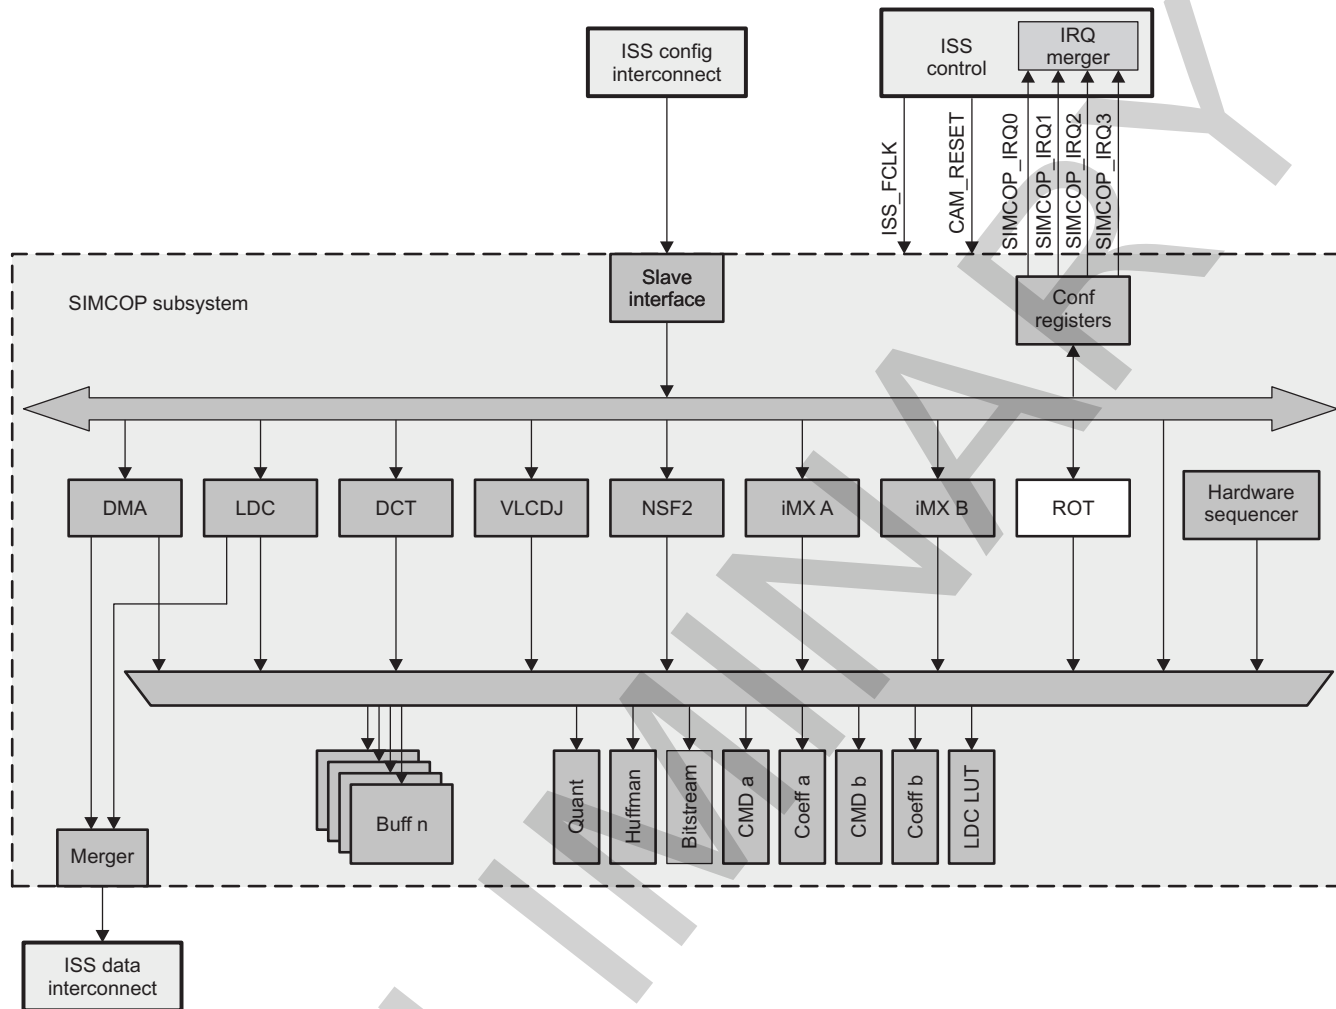

- YUV4:2:2 and generic 8-/16-/32-bit data block rotation by 90, 180, and 270 degrees
- YUV4:2:0 rotation by 90, 180, and 270 degrees
- Multiple-block rotation
- Data block shifting
- Data block horizontal circular shifting

The ROT supports a simple 1-block-per-initiation interaction, and includes a microcontroller unit (MCU) software-writable enable bit and hardware trigger signal to start the processing (see [Section 8.4.7.3.7, ISS SIMCOP ROT Synchronization](#)). It relies on external direct memory access (DMA) for transfers, and can work with the MCU or hardware sequencer to coordinate between transfer and computation.

The ROT has an input and output memory interface (see [Figure 8-286](#)). The rotation and horizontal-shifting operations read from the input memory and write to the output memory. The module connects to an input memory of up to 16KB (2048 × 64-bit), and an output memory of up to 16KB (2048 × 64-bit) using synchronous single-port memory interface.

[Figure 8-284](#) is an overview of the ROT.

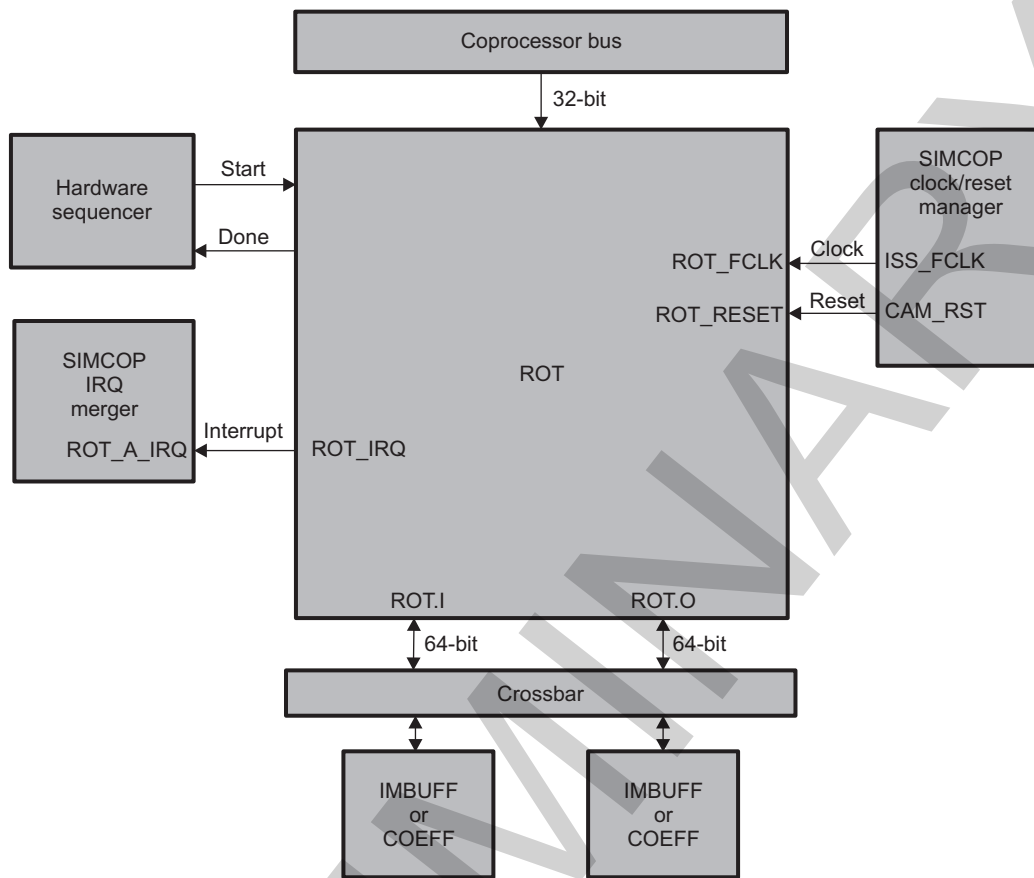

Figure 8-284. ISS SIMCOP ROT Module Overview

rot-001

8.4.7.2 ISS SIMCOP ROT Integration

The ROT is part of the SIMCOP subsystem in the imaging subsystem (ISS). [Figure 8-285](#) shows the integration of the ROT in the SIMCOP subsystem.

Figure 8-285. ISS SIMCOP ROT Engine Integration

rot-013

Table 8-1425 through Table 8-1427 list the integration attributes, clocks and resets, and hardware requests, respectively, of the SIMCOP ROT.

Table 8-1425. ISS SIMCOP ROT Integration Attributes

| Module Instance | Attributes |
|-----------------|--------------|
| | Power Domain |
| ROT | PD_CAM |

Table 8-1426. ISS SIMCOP ROT Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|---|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| ROT | ROT_FCLK | ISS_FCLK | PRCM | Functional clock provided by ISS_CLK from the power, reset, and clock management (PRCM) module. It is used by all ISS submodules and ISS top-level resources. |
| Resets | | | | |
| ROT | ROT_RESET | CAM_RST | PRCM | ISS and SIMCOP global reset |

For information about clock and reset management, see [Section 8.4.1.2.1, ISS SIMCOP Local Power and Clock Management](#).

Table 8-1427. ISS SIMCOP ROT Hardware Requests

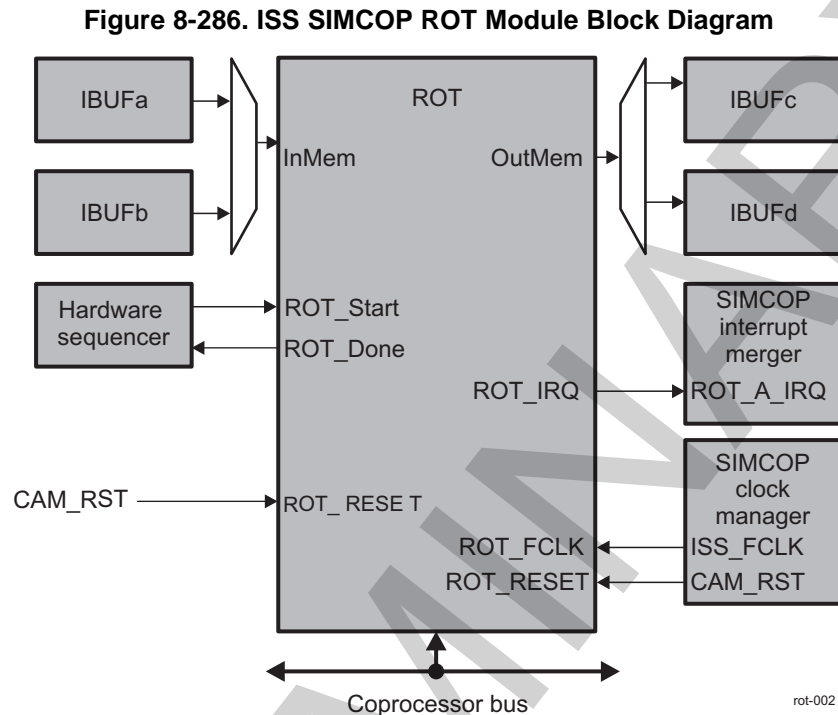

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|-------------------|------------------------------------|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| ROT | ROT_IRQ | ROT_A_IRQ | SIMCOP IRQ merger | Event triggered by the ROT engine. |

For more information about interrupt requests, see [Section 8.4.1.2.3](#), *Interrupt Merger*.

8.4.7.3 ISS SIMCOP ROT Functional Description

8.4.7.3.1 ISS SIMCOP ROT Block Diagram

Figure 8-286 shows the block diagram of the ROT.

8.4.7.3.2 ISS SIMCOP ROT Clock Configuration

The ROT receives a functional clock (ISS_FCLK) from the ISS SIMCOP. The configuration clock is derived from the functional clock and interconnect clock enable signal (the [ROT_CFG\[9\]](#) AUTOGATING bit).

8.4.7.3.3 ISS SIMCOP ROT Reset

The ROT receives an asynchronous hardware reset signal (CAM_RST) from the ISS SIMCOP.

8.4.7.3.4 ISS SIMCOP ROT Power Management

The ROT uses clock autogating to conserve power. When a subblock is not in use, the corresponding clock tree is gated. The [ROT_CFG\[9\]](#) AUTOGATING bit controls whether autogating is enabled.

8.4.7.3.5 ISS SIMCOP ROT Interrupt Requests

One interrupt output line, ROT_A_IRQ, is used as a sideband signal of the interconnect slave port. This signal is connected to the SIMCOP interrupt merger. See [Section 8.4.1.2.3, Interrupt Merger](#).

8.4.7.3.6 ISS SIMCOP ROT DMA Requests

The ROT has no DMA requests from the module.

8.4.7.3.7 ISS SIMCOP ROT Synchronization

The ROT has a simple one-block-per-task interaction with outside logic/microprocessor unit (MPU). The module can be started by setting the [ROT_CTRL\[0\]](#) EN bit to 0x1, or through the ROT_START signal of the hardware sequencer interface. When the ROT completes the specified rotation or data shift task, it sends a pulse on the ROT_DONE signal and, when the interrupt is enabled, sends a pulse on the ROT_A_IRQ interrupt output.

The [ROT_CFG\[8\]](#) TRIG_SRC bit specifies to which source the hardware must respond:

- When the ROT is idle and the [ROT_CFG\[8\]](#) TRIG_SRC bit is set to 0x0, hardware responds to the memory mapped register (MMR) mechanism, and any pulses on the start signal are ignored.
- When the ROT is idle and the [ROT_CFG\[8\]](#) TRIG_SRC bit is set to 0x1, hardware responds to the hardware start signal, and any write operation to the enable bit field is ignored.

When the ROT is busy, both triggering mechanisms are ignored.

8.4.7.3.8 ISS SIMCOP ROT Formats and Operations

The ROT supports the formats and operations described in the following sections.

8.4.7.3.8.1 ISS SIMCOP ROT YUV4:2:0 and Generic 8-/16-/32-Bit Data Block Rotation

Rotation of YUV4:2:0 and generic 8-bit, 16-bit, 32-bit data blocks is straightforward. None of the data points are altered; each data point is copied to an appropriate address location. Zero-degree rotation is included for completeness of the programming model, and involves only data copy.

When YUV4:2:0 data have separate Y and UV processing and must be separately rotated, Y data can use generic 8-bit data rotation, and UV data can use generic 16-bit data rotation.

8.4.7.3.8.2 ISS SIMCOP ROT YUV4:2:2 Rotation

Various rotation cases of YUV4:2:2 data are described in the following and shown in [Figure 8-287](#) through [Figure 8-289](#) using 4 × 4-pixel block as an example.

The degree of rotation is defined as rotating clockwise. For 90-degree rotation:

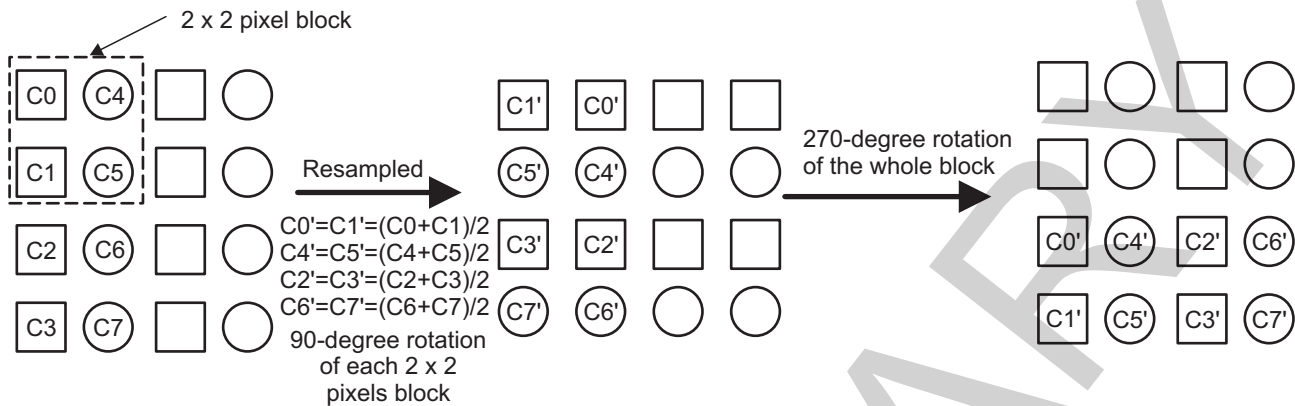

- The two U samples in each 2 × 2-pixel input block are averaged and then replicated to provide the two U samples in the 2 × 2-pixel output block.
- V samples - processed in the same way.

Thus, each 2N × 2N-pixel output block depends on only one 2N × 2N-pixel input block. After resampling every 2 × 2-pixel block, it is rotated –90 degrees, and then the whole 2N × 2N block is rotated 90 degrees.

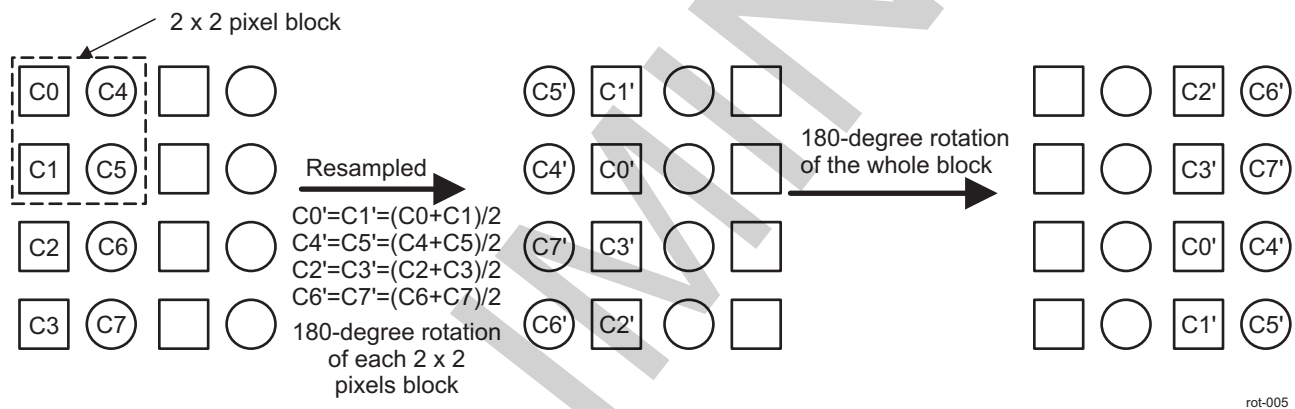

Figure 8-287. ISS SIMCOP ROT 90-Degree Rotation of YUV4:2:2 Data

The same algorithm is used for 270-degree rotation.

Figure 8-288. ISS SIMCOP ROT 270-Degree Rotation of YUV4:2:2 Data

For 180-degree rotation, there is no arithmetic operation; Chroma values are simply shifted horizontally before being rotated.

Figure 8-289. ISS SIMCOP ROT 180-Degree Rotation of YUV4:2:2 Data

NOTE: The intermediate process of 2 × 2 pixel block rotation, represented in the middle section in [Figure 8-287](#) through [Figure 8-289](#), does not involve data storage and reading into memory. This middle section is for better visualization of the process. The whole process is performed with a single memory reading and writing.

Zero-degree rotation is included for completeness of programming model, and involves only data copy.

8.4.7.3.8.3 ISS SIMCOP ROT Multiple-Block Rotation

For generic 8-/16-/32-bit data rotation and YUV4:2:0/4:2:2 rotation, multiple-block operation per hardware task is supported.

[Figure 8-290](#) through [Figure 8-293](#) show the multiple-block rotation feature.

The multiple blocks are in the horizontal dimension, and the blocks are horizontally adjacent to one another. In other words, in the source data and 180-degree rotated data, address offset between blocks is the source block width times the data size.

In the 90-degree and 270-degree rotated data, address offset is the source block height times the data size. The source/destination line offsets must be sufficiently large to accommodate the multiple blocks.

Figure 8-290. ISS SIMCOP ROT Block Representation Before Rotation

Figure 8-291. ISS SIMCOP ROT 90-Degree Block Rotation

Figure 8-292. ISS SIMCOP ROT 180-Degree Block Rotation

Figure 8-293. ISS SIMCOP ROT 270-Degree Block Rotation

The operation is configured with these parameters:

- [ROT_CFG\[2:0\]](#) OP (rotation orientation)
- [ROT_CFG\[6:4\]](#) FMT (data format)
- [ROT_CFG\[15:12\]](#) NBLKS (number of blocks minus 1; register value of 0 means one block, etc.)
- [ROT_BLKSZ\[11:0\]](#) BLKW (width of each block; all blocks have the same width/height)
- [ROT_BLKSZ\[27:16\]](#) BLKH (height of each block)
- [ROT_SRC_START1\[13:0\]](#) ADDR (starting address of the first input block)
- [ROT_SRC_LOFST\[15:0\]](#) ADDR (line offset of input block)
- [ROT_DST_START1\[13:0\]](#) ADDR (starting address of the first output block)
- [ROT_DST_LOFST\[15:0\]](#) ADDR (line offset of output block)
- [ROT_SRC_START2\[13:0\]](#) ADDR (starting address of the first input UV block, if format is YUV4:2:0)
- [ROT_DST_START2\[13:0\]](#) ADDR (starting address of the first output UV block, if format is YUV4:2:0)

8.4.7.3.8.4 ISS SIMCOP ROT Data-Block Shifting

The ROT supports shifting of 2-dimensional (2D) data blocks in 8-bit granularity. This function is intended to supplement the SIMCOP DMA module, which operates on 128-bit alignment.

[Figure 8-294](#) is an example of a 14 × 7-byte data block copied from one location in input memory to another location in output memory.

Figure 8-294. ISS SIMCOP ROT Data-Block Shifting Example

The following parameters are specified:

- [ROT_BLKSZ\[11:0\]](#) BLKW = 14 (in bytes)
- [ROT_BLKSZ\[27:16\]](#) BLKH = 7 (in rows)
- [ROT_SRC_LOFST\[15:0\]](#) LOFST = 24 (in bytes)
- [ROT_DST_LOFST\[15:0\]](#) LOFST = 16 (in bytes)

NOTE: This function can be used to shift horizontally as well as vertically.

8.4.7.3.8.5 ISS SIMCOP ROT Data-Block Horizontal Circular Shifting

The ROT supports shifting of 2D data blocks in 8-bit granularity, with horizontal circular buffer addressing. This function is intended to supplement the SIMCOP DMA module, which operates on 128-bit alignment.

[Figure 8-295](#) is an example of a 28 × 7-byte data block copied from one location in input memory to another location in output memory, and horizontal wrap-around occurs in the output memory.

Figure 8-295. ISS SIMCOP ROT Horizontal Circular Shifting Example

The following parameters are specified:

- `ROT_BLKSZ[11:0]` BLKW = 28 (in bytes)
- `ROT_BLKSZ[27:16]` BLKH = 7 (in rows)
- `ROT_SRC_LOFST[15:0]` LOFST = 32 (in bytes)
- `ROT_DST_LOFST[15:0]` LOFST = 64 (in bytes)

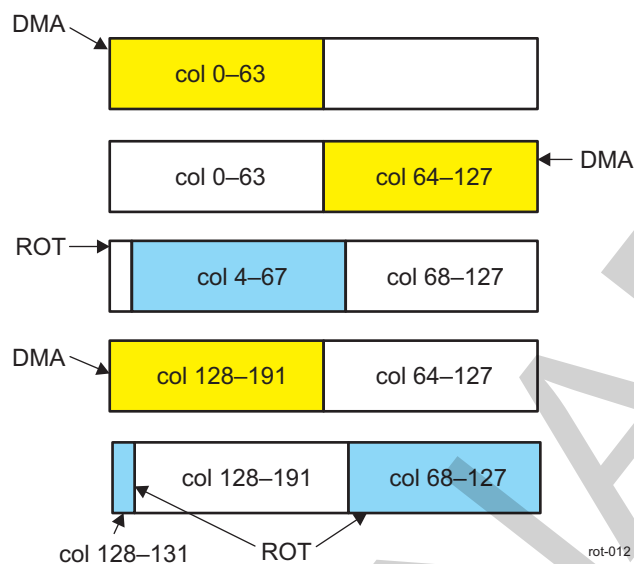

Wrapping around is allowed in the input memory, in the output memory, or in both. For this mode of operation, the line offset of the source and destination must be a power of 2, and at least 32 bytes. Source and destination line offsets can be different. This function is used to handle misaligned SDRAM data. The following example shows that the line offset is at least the minimal transfer width, or the SDRAM burst. For target applications, 32 bytes is the minimal burst size to support.

NOTE: This function can be used to shift horizontally as well as vertically. Input and output blocks can also have different line offsets.

This mode of operation is intended to be used to manage 2D data blocks that are out of SDRAM alignment (for example, to crop out the left-most 2 pixels of the ISP YUV4:2:2 output image before JPEG compression). Assume that the ISP output is 64-byte SDRAM burst-aligned; thus, the starting address for JPEG input is 4 bytes out of alignment. Without the horizontal circular shifting function, the best solution is to use wide data blocks (for example, 128 pixels = 256 bytes wide) to reduce the bandwidth penalty of misalignment (costing five bursts to get four bursts worth of data). With horizontal circular shifting, the bandwidth penalty can be eliminated. In this example, the SIMCOP DMA is configured to transfer aligned data, and the ROT is used to perform the crop-out. A memory transaction log would be:

- The DMA writes columns 0–63, starting at byte address 0.
- The DMA writes columns 64–127, starting at byte address 64.
- The ROT module reads columns 4–67, starting at byte address 4.
- The DMA writes columns 128–191, starting at byte address 0.
- The ROT module reads columns 68–131, starting at byte address 68, and so on.

Figure 8-296 shows the data movement by the DMA and the ROT.

Figure 8-296. ISS SIMCOP ROT Using Horizontal Circular Shifting to Manage Misaligned Data

8.4.7.4 ISS SIMCOP ROT Module Programming Guide

8.4.7.4.1 ISS SIMCOP ROT Low-Level Programming Models

This section describes the low-level programming sequences for configuration and use of the ROT.

8.4.7.4.1.1 ISS SIMCOP ROT Global Initialization

8.4.7.4.1.1.1 ISS SIMCOP ROT Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the ROT is to be used for the first time after a device reset. Initialization of surrounding modules is based on the integration and environment of the module.

[Table 8-1428](#) describes the global initialization of the surrounding modules.

Table 8-1428. ISS SIMCOP ROT Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------------|--|
| SIMCOP (clock management) | The ROT functional clock must be enabled. See Section 8.4.7.3.2, ISS SIMCOP ROT Clock Configuration . |
| SIMCOP (power management) | The ROT must be enabled (SIMCOP_CLKCTRL[7] ROT_A). See Section 8.4.1.2.1, ISS SIMCOP Local Power and Clock Management . |
| Buffers | Configure the ROT access to the image buffer inside the SIMCOP_HWSEQ_STEP_SWITCH_i register. See Section 8.4.2, ISS SIMCOP Hardware Sequencer and Buffers Module . |
| SIMCOP IRQ merger | Configure SIMCOP to handle the ROT interrupts. See Section 8.4.1.2.3, Interrupt Merger . |
| SIMCOP hardware sequencer | Configure the hardware sequencer to activate the ROT. See Section 8.4.2, ISS SIMCOP Hardware Sequencer and Buffers Module . |

8.4.7.4.1.1.2 ISS SIMCOP ROT Global Initialization

[Table 8-1429](#) describes the global initialization of the ROT.

Table 8-1429. ISS SIMCOP ROT Global Initialization of the ROT

| Step | Register/Bit Field/Programming Model | Value |
|-----------------|--------------------------------------|-------|
| Enable the ROT. | ROT_CTRL [0] EN | 0x0 |

8.4.7.4.1.2 ISS SIMCOP ROT Operational Modes Configuration

8.4.7.4.1.2.1 ISS SIMCOP ROT Rotation

The proper value for the trigger source bit ([ROT_CFG](#)[8] TRIG_SRC) is set depending on whether the operation is to be triggered by software, writing to MMR, or by the hardware sequencer. [Table 8-1430](#) lists the procedure to set the value of the trigger source bit.

Table 8-1430. ISS SIMCOP ROT Trigger Source Bit Value

| Step | Register/Bit Field/Programming Model | Value |
|--|---|-------|
| Configure the degree of rotation. | ROT_CFG [2:0] OP | xxx |
| Configure the data format. | ROT_CFG [6:4] FMT | xxx |
| Specify the block width and height. | ROT_BLKSZ [11:0] BLKW ROT_BLKSZ [27:16] BLKH | xxx |
| Specify the input and output starting addresses. | ROT_SRC_START1 [13:0] ADDR, ROT_DST_START1 [13:0] ADDR | xxx |
| Specify the line offsets. | ROT_SRC_LOFST [15:0] LOFST, ROT_DST_LOFST [15:0] LOFST | xxx |

Table 8-1430. ISS SIMCOP ROT Trigger Source Bit Value (continued)

| Step | Register/Bit Field/Programming Model | Value |
|--|---|-------|
| For UV data of YUV4:2:0, input and output second starting addresses. | ROT_SRC_START2 [13:0] ADDR, ROT_DST_START2 [13:0] ADDR | xxx |

8.4.7.4.1.2.2 ISS SIMCOP ROT Data-Block Shifting

[Table 8-1431](#) lists the bit field values for data-block shifting.

Table 8-1431. ISS SIMCOP ROT Data-Block Shifting

| Step | Register/Bit Field/Programming Model | Value |
|--|---|-------|
| Configure shifting. | ROT_CFG [2:0] OP | xxx |
| Set the data shifting block. | ROT_CFG [6:4] FMT | xxx |
| Specify the block width and height. | ROT_BLKSZ [11:0] BLKW, ROT_BLKSZ [27:16] BLKH | xxx |
| Specify the input and output starting addresses. | ROT_SRC_START1 [13:0] ADDR, ROT_DST_START1 [13:0] ADDR | xxx |
| Specify the line offsets. | ROT_SRC_LOFST [15:0] LOFST, ROT_DST_LOFST [15:0] LOFST | xxx |

Once the input data and output buffer are available, the [ROT_CTRL](#)[0] EN bit is set to 1 to trigger the operation through software. Alternatively, DMA transfer(s) and the hardware sequencer are configured to trigger the ROT with the hardware start signal when appropriate.

8.4.7.5 ISS SIMCOP ROT Register Manual

8.4.7.5.1 ISS SIMCOP ROT Instance Summary

Table 8-1432 lists the ROT instance.

Table 8-1432. ISS SIMCOP ROT Instance Summary

| Module Name | Base Address L3 Interconnect | Base Address Cortex-M3 Private Access | Size |
|-------------|---------------------------------|--|----------|
| ROT | 0x5202 0700 | 0x5506 0700 | 64 bytes |

NOTE: Private Access is an access that does not use the L3/L4 interconnects.

Face Detect

This chapter describes the features and functions of the Face Detect (FDIF) module of the multimedia device.

| Topic | Page |
|---------------------------------------|------|
| 9.1 Face Detect Overview | 2120 |
| 9.2 FDIF Integration | 2122 |
| 9.3 FDIF Functional Description | 2124 |
| 9.4 FDIF Programming Guide | 2128 |
| 9.5 FDIF Register Manual | 2131 |

9.1 Face Detect Overview

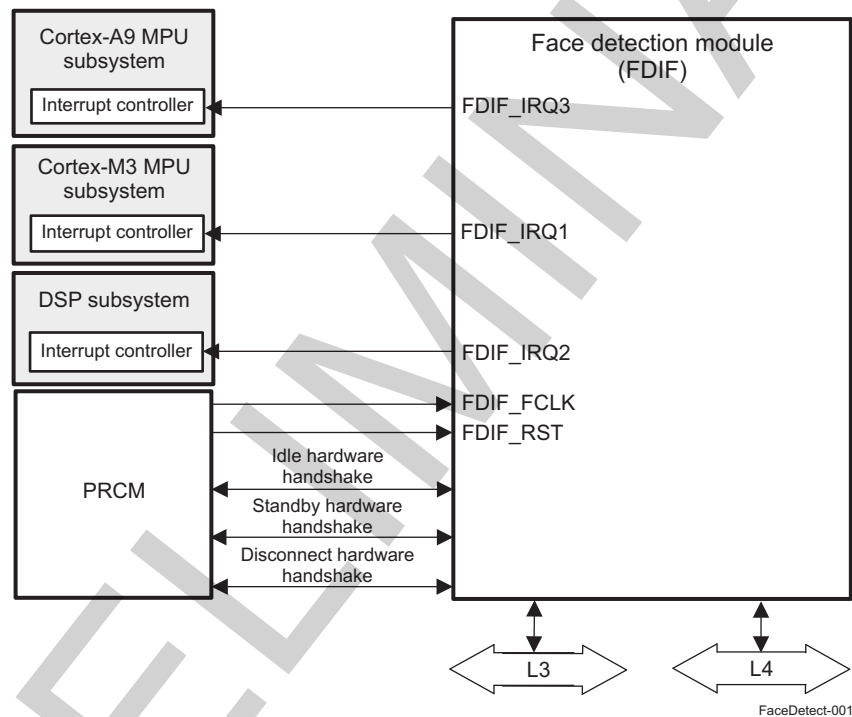

The FDIF module performs face detection within a picture stored in memory (QVGA luminance data resolution). This module is typically used for video encoding and face-based priority auto-focusing.

The face detect (FD) core is a standalone module: it embeds its own direct memory access (DMA) engine for accessing data in memory. The FD core is under microprocessor unit (MPU) control for its initialization and to start the processing operation.

The FD core supports single input resolution (QVGA) in a single format (8-bit luma). The FD core requires the input image to be stored in synchronous dynamic random access memory (SDRAM). The core also requires working memory mapped in SDRAM. The input image data (320x240) requires 75KB for the SDRAM and 51.25KB for the working memory.

Figure 9-1 is an overview of the FDIF. Three interrupt lines go to the three central processing units (CPUs) to allow control of the FD core module by different processors, but only one interrupt at a time can be active. The three interrupt lines provide flexibility for controlling the module.

Figure 9-1. Face Detect Highlight

9.1.1 Main Features

The FDIF has the following features:

- Two interconnects interface:
 - 32-bit-wide level 4 (L4) interface for register configuration
 - 32-bit-wide level 3 (L3) interface for command
- Supports the IDLE, STANDBY, and DISCONNECT protocols
- 3rd party IP features: For information about the input image features and detection capabilities, see [Table 9-1](#).

Table 9-1. 3rd Party IP Features

| Items | Description |
|------------------|--|
| Input image size | QVGA input image size H x V = 320 x 240 |

Table 9-1. 3rd Party IP Features (continued)

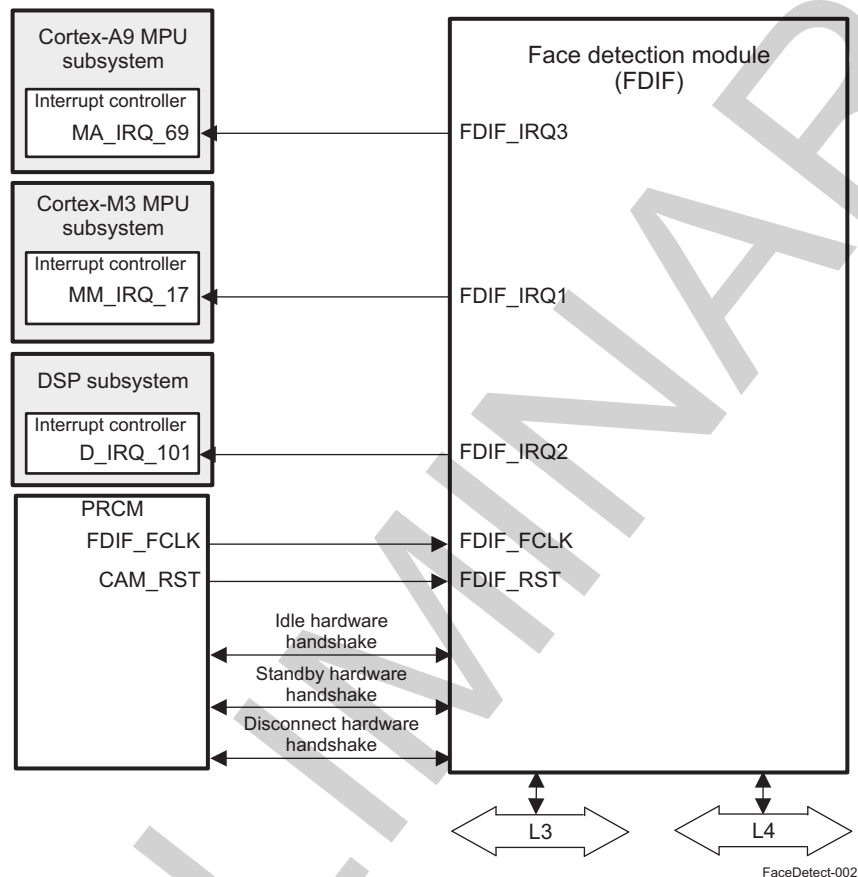

| Items | Description |
|-----------------------------|--|
| Input data format | 8-bit gray scale data in little-endian format (color pictures must be converted before FD can be applied) 0x00 = black and 0xFF = white |
| Face inclination | ± 45 degrees |
| Face direction | Up/down: ± 30 degrees Left/right: ± 60 degrees |
| Maximum detection count | 35 faces |
| Detection direction | The face orientation must be selected from the following possibilities: 0 degrees: Faces are vertical. + 90 degrees: Faces are rotated right by 90 degrees. – 90 degrees: Faces are rotated left by 90 degrees. |
| Detection minimum face size | Four grades are available: 20 pixels 25 pixels 32 pixels 40 pixels |
| Detection area | Detection start position: X = 0 to 160 Y = 0 to 120 Detection area size: X = 160 to 320 Y = 120 to 240 |
| Detection result | The following information is provided by the module for each face: Size Position Angle Confidence level |

9.2 FDIF Integration

This section describes the integration of FDIF in the device, including information about clocks, resets, and hardware requests.

Figure 9-2 shows the integration of the module in the device.

Figure 9-2. FDIF Integration

NOTE: For more information about the IDLE, STANDBY, and DISCONNECT hardware handshakes, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 9-2 through Table 9-4 summarize the integration of the module in the device. For more information about the power domain or the clock and reset signals, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 9-2. Integration Attributes

| Module Instance | Attributes | | |
|-----------------|--------------|--------------------|--------------|
| | Power Domain | Wake-Up Capability | Interconnect |
| Face Detect | PD_CAM | No | L3 |

Table 9-3. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|-------------|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |

Table 9-3. Clocks and Resets (continued)

| | | | | |
|------------------------|--------------------------------|---------------------------|---------------|--|
| Face detect | FDIF_FCLK | FDIF_FCLK | PRCM | For information about PRCM clock gating and management, see Chapter 3, Power, Reset, and Clock Management . |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| Face detect | FDIF_RST | CAM_RST | PRCM | For information about PRCM reset sources and distribution, see Chapter 3, Power, Reset, and Clock Management . |

Table 9-4. Hardware Requests

| | | | | |
|---------------------------|---------------------------|--------------------------------|--------------------------|--|
| Interrupt Requests | | | | |
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| Face detect | FDIF_IRQ3 | MA_IRQ_69 | Cortex™-A9 MPU subsystem | FDIF interrupt to the Cortex-A9 MPU subsystem |
| Face detect | FDIF_IRQ1 | MM_IRQ_17 | Cortex™-M3 MPU subsystem | FDIF interrupt to the Cortex-M3 MPU subsystem |
| Face detect | FDIF_IRQ2 | D_IRQ_101 | DSP subsystem | FDIF interrupt to the digital signal processor (DSP) subsystem |
| No DMA Requests | | | | |

NOTE: For more information about interrupt sources, see [Section 9.3.4, Interrupts and Events](#).

9.3 FDIF Functional Description

9.3.1 FDIF Block Description

The FDIF is a standalone module. It has a port connected to the L4 interconnect, which is used for configuration, and a port connected to the L3 interconnect, which is used to read and write data to the system memory.

CAUTION

These ports are accessible only in 32 bits.

The FDIF core contains the following submodules:

- Face detection (FD) IP core
- RAM and ROM memories

The FDIF module wraps the FD core for integration in the device. The following submodules are added:

- Clock generation
- Interrupt generation
- Power management
- L3 and L4 interface ports: Two ports required to decorrelate the FDIF clocks from other system clocks, one on the L3 port interface, and one on the L4 port interface.

Figure 9-3 shows the overall architecture of the FDIF.

Figure 9-3. FDIF Block Diagram

9.3.2 Software Reset

The module is reset by writing the [FDIF_SYSCONFIG\[0\]](#) SOFTRESET bit to 1. The bit is automatically reset by hardware. During reads, it always returns 0.

The FD core also provides a software reset setup by the [FD_CTRL\[0\]](#) SRST bit, but it is strongly recommended to use only the [FDIF_SYSCONFIG\[0\]](#) SOFTRESET bit.

9.3.3 System Power Management

There is one clock domain in FDIF: the L4 port domain and L3 port domain are synchronized with the module functional clock domain, FDIF_FCLK.

Table 9-5 lists the power-management features available for FDIF.

NOTE:

- For more information about source clock gating, see [Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of idle mode and standby mode and the power, reset, and clock management (PRCM) power handshake, see [Chapter 3, Power, Reset, and Clock Management](#).

Table 9-5. Local Power-Management Features

| Feature | Registers | Description |
|------------------------|------------------------------------|---|
| Clock autogating | No software control for it. | It is always enabled. |
| Slave idle modes | FDIF_SYSCONFIG[3:2] IDLEMODE | Force-idle, no-idle, and smart-idle modes are available |
| Clock activity | N/A | |
| Master standby modes | FDIF_SYSCONFIG[5:4] STANDBYMODE | Force-standby, no-standby, and smart-standby mode modes are available. See Section 9.3.3.2.1 for more information. |
| Global wake-up enable | N/A | |
| Wake-up sources enable | N/A | |

9.3.3.1 Autogating

The FDIF performs clock autogating whenever possible. There is no software control for it; it is always enabled.

9.3.3.2 PRCM Hardware Handshake

The FDIF supports the IDLE protocol between the L4 port and the PRCM module and the STANDBY protocol between the L3 port and the PRCM module. The FDIF also supports the DISCONNECT protocol on the L4 and L3 ports.

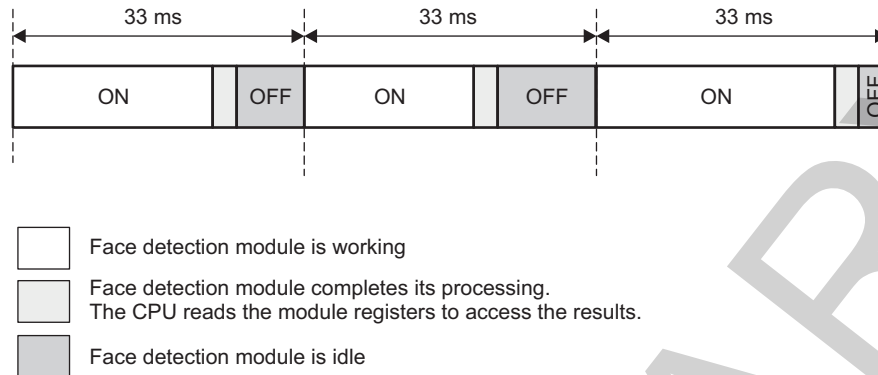

The FDIF first initiates the STANDBY protocol with the PRCM module, which in turn generates the IDLE protocol with the FDIF. The functional clock is gated by the PRCM module only when the IDLE and STANDBY power-management protocols are complete.

For more information about these protocols, see [Chapter 3, Power, Reset, and Clock Management](#).

9.3.3.2.1 Protocol Transitions

The FDIF goes to IDLE as soon as it is done processing and the MPU has read the results of the computation.

Figure 9-4 shows the principle. The 33-ms period corresponds to 30 fps, which is usually the target for imaging applications. Time spent in READ state (= ON state) is always the same, and the time in OFF state depends on the time spent in ON state.

Figure 9-4. FDIF Power-Management Transitions

FaceDetect-004

9.3.3.2.1.1 Normal Mode to Idle Mode

Software programs [FDIF_SYSCONFIG\[5:4\] STANDBYMODE = 0x2](#) to program the power-management mode.

When its processing is complete, the FD core generates the [FINISH_IRQ](#) event. At this time the [FD_CTRL\[1\] RUN](#) bit reflects that the FD core is idle.

Software running on the MPU reads the results of the FD algorithm. When it finishes reading the results, it clears the [FDIF_IRQSTATUS_RAW_j\[8\] FINISH_IRQ](#) bit and writes [FDIF_CTRL\[5\] MSTANDBY = 1](#) to initiate the MStandby signal generation. For more information about the STANDBY and IDLE hardware handshakes, see [Chapter 3, Power, Reset, and Clock Management](#).

The FDIF clock can be gated only when the STANDBY and IDLE protocols are complete.

9.3.3.2.1.2 Idle Mode to Normal Mode

The PRCM module deasserts a signal to the FDIF under software control so that the module can switch back to normal mode. Then, the module functional clock is ensured and stable. Software disables the MStandby signal generation by writing [FDIF_CTRL\[5\] MSTANDBY = 0](#), and then polls for [FDIF_CTRL\[6\] MSTANDBY_HDSHK = 1](#) to ensure that the power-management handshaking is complete. For more information about the standby and idle modes, see [Chapter 3, Power, Reset, and Clock Management](#).

9.3.4 Interrupts and Events

The FDIF has three interrupt lines ([FDIF_IRQ1](#), [FDIF_IRQ2](#), and [FDIF_IRQ3](#)) to enable flexibility for controlling the module. Each event can be enabled to only a single interrupt line (that is, to only one interrupt controller), because only one interrupt at a time can be active.

The FDIF generates events listed in [Table 9-6](#). An interrupt can be enabled by using the [FDIF_IRQENABLE_SET_j](#) register and can be disabled by using the [FDIF_IRQENABLE_CLR_j](#) register.

Table 9-6. Interrupts and Events Description

| Event Name | Description |
|---|---|
| FDIF_IRQSTATUS_RAW_j / FDIF_IRQSTATUS_j[8] FINISH_IRQ | This event is generated by the FD IP core. It flags the completion of the processing by the IP. |
| FDIF_IRQSTATUS_RAW_j / FDIF_IRQSTATUS_j[0] ERR_IRQ | This event flags that the L3 port has received an error. |

The [FDIF_IRQSTATUS_RAW_j](#) and [FDIF_IRQSTATUS_j](#) registers give the interrupt status. The difference between them is that the [FDIF_IRQSTATUS_RAW_j](#) register is set even if events are not enabled.

The [FDIF_IRQSTATUS_j](#) register can be used to clear events.

9.3.5 Typical Use

Typically, FD processing is applied to buffers provided by the ISP module, already in the correct format.

To enable FD processing, the 32-bit address of the input image in memory must be set up in the [FDIF_PICADDR](#) register, and the 32-bit address of the working memory must be set up in the [FDIF_WKADDR](#) register.

The detection condition settings can be set with the following registers:

- [FD_DCOND](#)
- [FD_STARTX](#)
- [FD_STARTY](#)
- [FD_SIZEX](#)
- [FD_STARTY](#)

For more information, see [Section 9.4, FDIF Programming Guide](#).

When the [FD_CTRL\[1\]](#) RUN bit is set to 1, the process starts. When the process is complete ([FD_CTRL\[2\]](#) FINISH = 1), the results are available in the following registers:

- [FD_DNUM](#)
- [FD_CENTERX_j](#)
- [FD_CENTERY_j](#)
- [FD_CONFSIZE_j](#)
- [FD_ANGLE_j](#)

For more information, see [Section 9.4, FDIF Programming Guide](#).

9.3.6 Performance Parameters

[Table 9-7](#) lists the register settings that affect performance.

Table 9-7. Performance Parameters

| Parameter | Comments |
|-----------------------------------|---|
| FD_DCOND[1:0] MIN | Sets the minimum face size. The permitted values are 20x20, 25x25, 32x32, and 40x40. A high value leads to higher performance. |
| FD_DCOND[3:2] DIR | Sets the detection direction setting. The permitted values are UP, RIGHT, and LEFT. The UP value should lead to better performance than RIGHT and LEFT. |
| FD_LHIT[3:0] LHIT | Sets the detection threshold. The permitted values are in the range of 0 to 9. A low value increases the FD probability detection, but it also increases false detections. |

9.3.7 L3 Interconnect Parameters

The FDIF is an initiator on the L3 interconnect. L3 accesses can be configured with the [FDIF_CTRL\[4:1\]](#) MAX_TAGS bit field and the [FDIF_CTRL\[0\]](#) WRNP bit. For more information about these parameters, see [Section 14.2 L3 interconnect](#).

9.4 FDIF Programming Guide

9.4.1 FDIF Low-level Programming Models

This section describes the low-level hardware programming sequences for the configuration and use of the FDIF.

9.4.1.1 Global Initialization

9.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the FDIF is to be used for the first time after a device reset. This initialization of the surrounding modules is based on the integration of the FDIF.

For more information, see [Section 9.2, FDIF Integration](#).

Table 9-8. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---|---|
| PRCM | FDIF_FCLK functional clock must be enabled. See Section 3.6.22, CD_CAM Clock Domain , in Chapter 3, Power, Reset, and Clock Management . |
| Cortex-A9 MPU interrupt controller (INTC) (or Cortex-M3 MPU INTC or DSP INTC) | The Cortex-A9 MPU (or Cortex-M3 MPU or DSP) interrupt controller must be configured to enable the interrupt request generation to the Cortex-A9 MPU (or Cortex-M3 MPU or DSP) subsystem when interrupt requests are generated by the FDIF. See the respective Functional Description in Chapter 18, Interrupt Controller , for the MPUs Section 18.4.1 , Section 18.4.2 , and the DSP interrupt request lines in Chapter 5, DSP Subsystem , for the DSP. |
| Interconnect (L3 and L4) | For more information, see Section 14.2, L3 Interconnect , and Section 14.3, L4 Interconnect . |

9.4.1.1.2 FDIF Global Initialization

9.4.1.1.2.1 Main Sequence – FDIF Global Initialization

[Table 9-9](#) lists the procedure to initialize the FDIF after a power-on or software reset.

Table 9-9. FDIF Global Initialization

| Step | Register/Bit Field/Programming Model | Value |
|------------------------------------|--------------------------------------|-------|
| Perform a software reset. | FDIF_SYSCONFIG[0] SOFTRESET | 0x1 |
| Wait until reset is finished. | FDIF_SYSCONFIG[0] SOFTRESET | 0x0 |
| Set the maximum interconnect tags. | FDIF_CTRL[4:1] MAX_TAGS | 0xA |
| Enable ERROR type Interrupt. | FDIF_IRQENABLE_SET_j[0] ERR_IRQ | 0x1 |

9.4.1.2 FD Operational Modes Configuration

9.4.1.2.1 FD Processing Modes

9.4.1.2.1.1 Main Sequence – FDIF Polling Method

| Step | Register/Bit Field/Programming Model | Value |
|---------------------------------|---|-------|
| Set image parameters. | See Section 9.4.1.2.1.3, Subsequence – Set Image Parameters . | |
| Request the processing. | FD_CTRL[1] RUN | 0x1 |
| Wait until process is finished. | FD_CTRL[2] FINISH | 0x1 |
| Read the results. | See Section 9.4.1.2.1.4 | |

9.4.1.2.1.2 Main Sequence – FDIF Interrupt Method

| Step | Register/Bit Field/Programming Model | Value |
|-------------------------------|---|-------|
| Set image parameters. | See Section 9.4.1.2.1.3, Subsequence – Set Image Parameters . | |
| Enable FINISH type interrupt. | FDIF_IRQENABLE_SET_j[8] FINISH IRQ | 0x1 |
| Request the processing. | FD_CTRL[1] RUN | 0x1 |

WHEN INTERRUPT OCCURS:

| Step | Register/Bit Field/Programming Model | Value |
|--|---|-------|
| IF: This is FD Process Complete Event? | FDIF_IRQSTATUS_j[8] FINISH_IRQ | 0x1 |
| Clear (Disable) FINISH type interrupt. | FDIF_IRQENABLE_CLR_j[8] FINISH IRQ | 0x1 |
| Read the results | See Section 9.4.1.2.1.4, Subsequence – Read the Results . | |
| ELSE | | |
| Clear (Disable) ERROR type Interrupt. | FDIF_IRQENABLE_CLR_j[0] ERR_IRQ | 0x1 |
| Perform a software reset. | FDIF_SYSCONFIG[0] SOFTRESET | 0x1 |
| For possible errors and the explanations of them, see Chapter 14, Interconnect . | | |
| ENDIF | | |

9.4.1.2.1.3 Subsequence – Set Image Parameters

| Step | Register/Bit Field/Programming Model | Value |
|--|---|--------|
| Set input image 32-bit address. | FDIF_PICADDR[31:5] ADDR | 0x---- |
| Set working memory 32-bit address. | FDIF_WKADDR[31:5] ADDR | 0x---- |
| Set the minimum face size. | FD_DCOND[1:0] MIN | 0x- |

| Bits | Field Name | Description | Type | Reset |
|------|-------------|---|------|------------|
| 31:6 | RESERVED | Reserved | R | 0x00000000 |
| 5:4 | STANDBYMODE | Configuration of the local initiator state management mode. By definition, initiator may generate read/write transaction as long as it is out of STANDBY state. 0x0: Force-standby mode: local initiator is unconditionally placed in standby state. Backup mode, for debug only. 0x1: No-standby mode: local initiator is unconditionally placed out of standby state. Backup mode, for debug only. 0x2: Smart-standby mode: local initiator standby status depends on local conditions, that is, the module's functional requirement from the initiator. IP module shall not generate (initiator-related) wake-up events. 0x3: Reserved | RW | 0x2 |
| 3:2 | IDLEMODE | Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state. 0x0: Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, that is, regardless of the IP module's internal requirements. Backup mode, for debug only. 0x1: No-idle mode: local target never enters idle state. Backup mode, for debug only. 0x2: Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wake-up events. 0x3: Reserved | RW | 0x2 |
| 1 | RESERVED | Reserved | R | 0 |
| 0 | SOFTRESET | Software reset. Read 0x0: Reset done, no pending action Write 0x0: No action Write 0x1: Initiate software reset Read 0x1: Reset (software or other) ongoing | RW | 0 |

When going from a idle to normal power management transition, the software polls for FDIF_CTRL.MSTANDBY_HDSHK = 1 before starting the face detection processing.</p> <p>Read 0x0: Handshaking not completed. Do not initiate traffic on L3.</p> <p>Read 0x1: Handshaking completed. Can safely use the FDIF module.</p> | R | 0 |
| 5 | MSTANDBY | <p>MStandby signal generation. This bit shall be set to initiate a power management transition from NORMAL to IDLE or IDLE to NORMAL.</p> <p>0x0: Write: Clear MStandby signal. One polls FDIF_CTRL.MSTANDBY_HDSHK = 1 after writing this bit to ensure that the power management handshaking is completed.</p> <p>0x1: Write: Asserts MStandby signal</p> | RW | 1 |
| 4:1 | MAX_TAGS | <p>Max interconnect tags. This bit field sets the maximum number of interconnect tags that the module shall use. This number is programmable between 1 (MAX_TAGS = 0) and FDIF_TAGS (MAX_TAGS = FDIF_TAGS - 1). The value of MAX_TAGS is reflected in the FDIF_HWINFO register setting. This register setting is expected to have impact on performance. It shall be set once at initialization. Higher value will give more bandwidth to the initiator. Lower value will give less bandwidth to the initiator. This value shall be set as low as possible such that other system initiators are not penalized.</p> | RW | 0xF |
| 0 | WRNP | <p>L3 port non-posted write control. Dynamic usage of this feature is not supported. This bit shall be set at initialization and not modified hereafter until the processing is completed. When non-posted writes are used, tags shall be used for best performance (MAX_TAGS 1).</p> <p>0x0: All writes are non posted</p> <p>0x1: All writes are posted</p> | RW | 0 |

PRELIMINARY

Display Subsystem

This chapter describes the display subsystem (DSS) for the device.

| Topic | Page |
|---|------|
| 10.1 Display Subsystem Overview | 2148 |
| 10.2 Display Controller | 2171 |
| 10.3 MIPI Display Serial Interface | 2423 |
| 10.4 High-Definition Multimedia Interface | 2616 |
| 10.5 Remote Frame Buffer Interface | 2619 |

10.1 Display Subsystem Overview

The display subsystem (DSS) provides the logic to display a video frame from the memory frame buffer on a liquid-crystal display (LCD) panel or a TV set.

The DSS can display different pictures simultaneously by using the primary LCD1 and secondary LCD2 outputs, in addition to the TV output.

The primary LCD output can be one of the following:

- Display serial interface (DSI) (MIPI® DSI)
- Remote frame buffer interface (RFBI) (MIPI DBI 2.0)

The secondary LCD output can be one of the following:

- Parallel CMOS output (MIPI DPI 1.0)
- DSI (MIPI DSI)
- RFBI (MIPI DBI 2.0)

The TV output can be:

- High-definition multimedia interface (HDMI)

The modules integrated in the DSS are:

- Display controller (DISPC):
 - One direct memory access (DMA) engine
 - Two LCD outputs and one TV output, each one with a dedicated overlay manager
 - One graphics pipeline (GFX), three video pipelines, and one write-back pipeline
- RFBI:
 - 8-, 9-, 16-bit parallel interface
 - Programmable pixel memory formats
 - Programmable output formats on one or multiple cycles per pixel
- Two DSI protocol engines:
 - 4-data lane complex input/output (I/O) for DSI1 and 2-data lane complex I/O for DSI2
 - Bidirectional data link support (only one data lane is used in reverse direction in command mode)
 - Supports video mode and command mode
 - Supports data interleaving
 - Supports up to 2048x1536 resolution through DSI1 and DSI2 linked to an external bridge
- HDMI protocol engine:
 - Supports HDMI 1.3 (including HDMI 1.4 3D frame-packing support up to 1080p, 24 Hz)
 - 30-bit RGB color
 - HDCP key protection
 - Deep color mode support (10-bit for 1080p and up to 12-bit for 1080i/720p)

The necessary phase-locked loops (PLLs) with their control modules and the physical layers (PHYs) are outside the DSS. The PHYs can be:

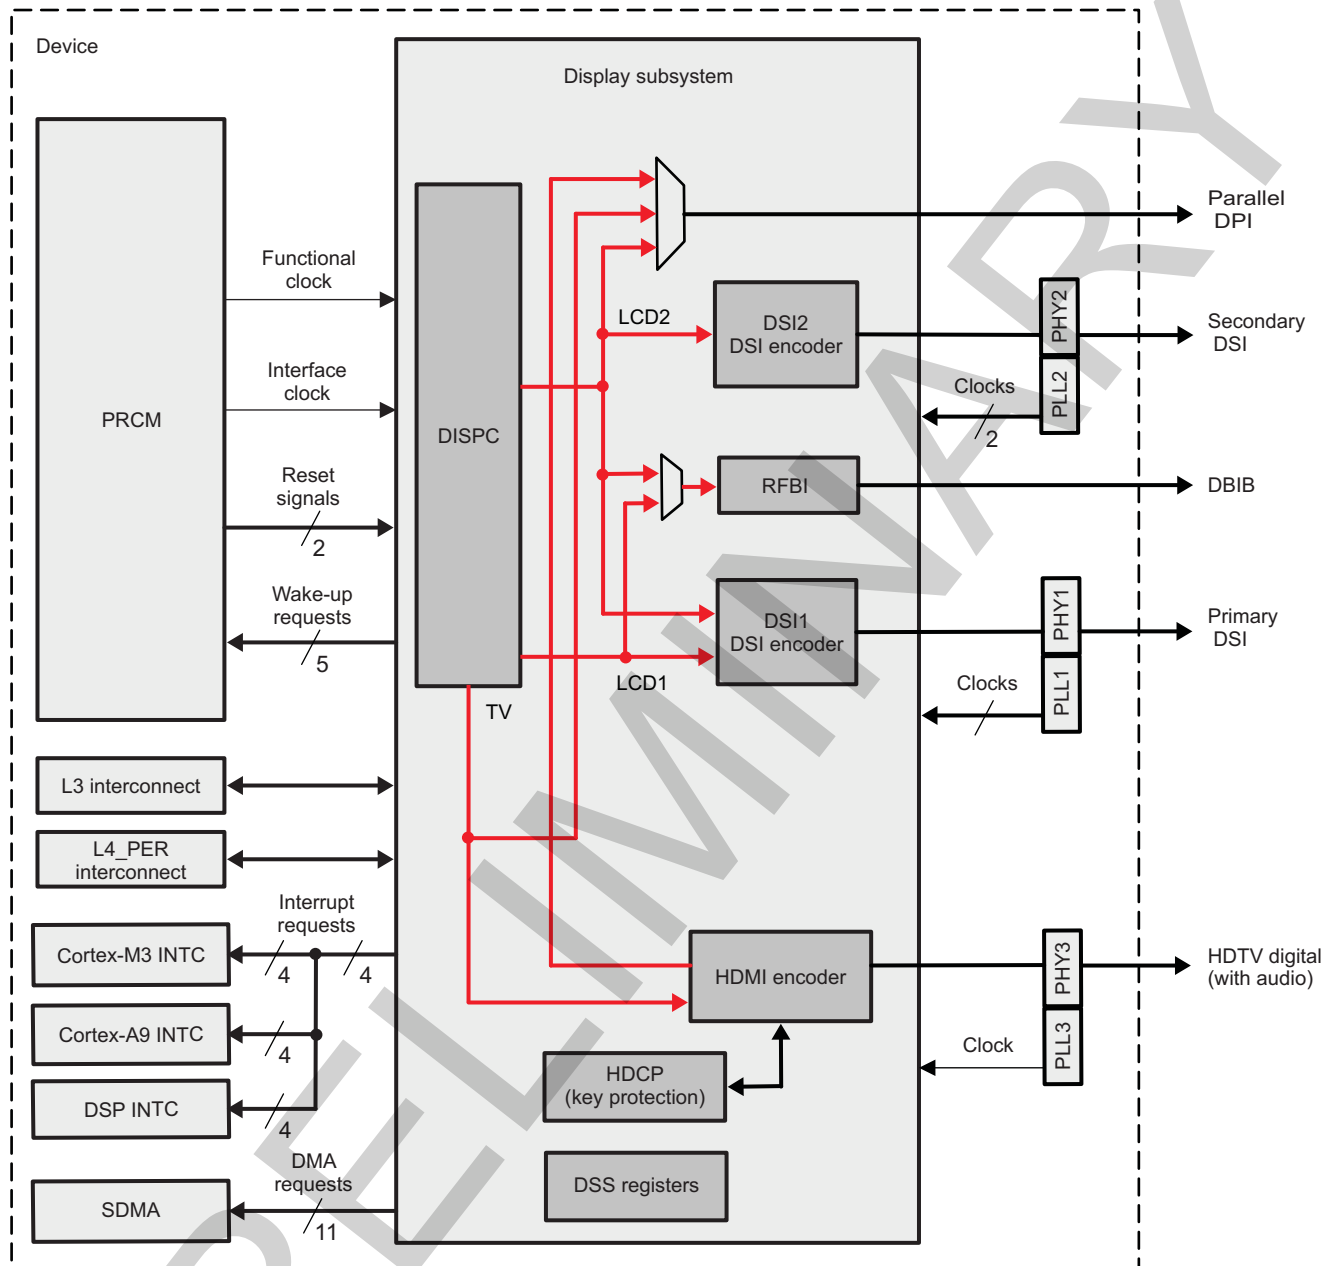

- HDMI-PHY
- DSI-PHY

To ensure efficient bandwidth, the DSS integrates:

- Local 32-bit interconnect with a level 4 (L4_PER) connection to configure the DSS modules
- Connection between level 3 (L3) interconnect and the DISPC to exchange data with synchronous dynamic random access memory (SDRAM) and memory using the DISPC DMA engine

Figure 10-1 is a high-level diagram of the DSS.

Figure 10-1. DSS Overview

dss-001

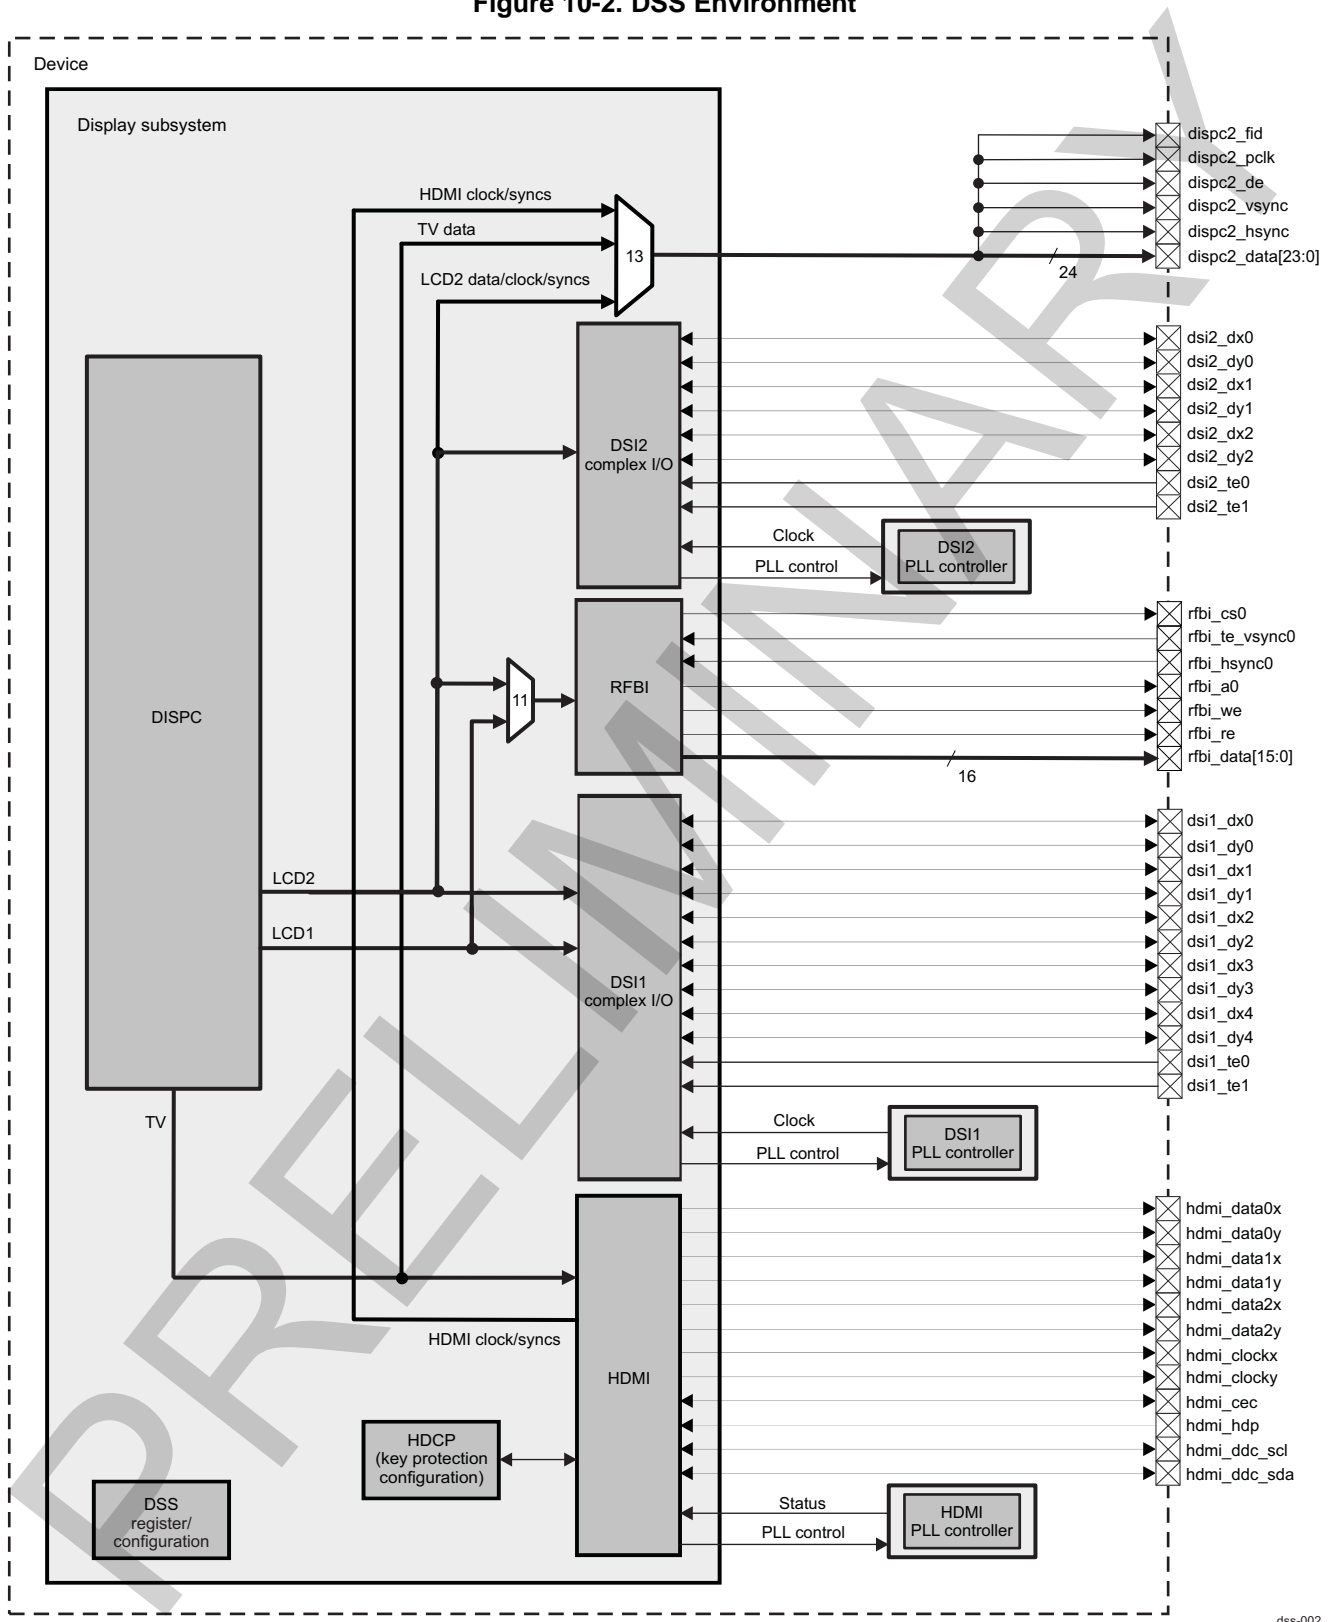

10.1.1 DSS Environment

This section describes the various outputs handled by the DSS:

- LCD support
- TV display support

[Figure 10-2](#) is a diagram of the DSS environment.

Figure 10-2. DSS Environment

dss-002

10.1.1.1 DSS LCD Support

LCD panels must be connected to the DSS of the device using parallel and/or serial interfaces. Two modes are supported in parallel:

- DBIB
- Display parallel interface (DPI)

10.1.1.1.1 Parallel Interface

In parallel interface, the modules of the DSS path are the DISPC and the RFBI.

The DISPC is connected to the memory through the L3 interconnect and uses its own DMA (with embedded FIFO) to read data from the system memory.

The remote frame buffer (RFB) of the LCD panel is connected directly to the RFBI module of the device. The RFBI controls the reads/writes from/to the RFB. The RFBI receives the output data from the DISPC and generates the signals to control the LCD panel. Through the RFBI, the microprocessor unit (MPU) can send commands or parameter/display data to the LCD panel and directly set the DISPC registers to read/write the data from/to the memory in the LCD panel.

The RFBI can be connected to either of the DISPC LCD outputs, but only one at a time can be used. The selection (multiplexer 11 in [Figure 10-2](#)) is done through the [DSS_CTRL\[14\]](#) RFBI_SWITCH bit. It is not allowed to change the configuration, when the DISPC or RFBI modules are active.

For more details, see [Section 10.2, Display Controller](#), and [Section 10.5, Remote Frame Buffer Interface](#).

In synchronous parallel interface, the required data and control signals are provided directly to an external MIPI DPI-compatible parallel panel.

Two configuration options are available, selected through the [DSS_CTRL\[17\]](#) LCD2_TV_SEL bit field (multiplexer 13 in [Figure 10-2](#)):

- LCD2_TV_SEL = 0 (default): The LCD2 channel of DISPC (pixel data, clock and synchronization signals) is output on the parallel interface.
- LCD2_TV_SEL = 1: The TV channel of DISPC (pixel data), together with the pixel clock and synchronization signals of HDMI, is output on the parallel interface.

, [Table 10-1](#) lists the exact DSS signals outgoing on the device boundary pads.

Table 10-1. Display Parallel Interface Signals Mapping

| Signal names at device pads (See Figure 10-2) | DSS_CTRL[17] LCD2_TV_SEL = 0 DISPC LCD2 channel out (pixel data, clock, syncs) | DSS_CTRL[17] LCD2_TV_SEL = 1 DISPC TV channel out (pixel data) HDMI (pixel clock, syncs) |
|---|---|--|
| dispc2_fid | DISPC_LCD2_FID | HDMI_M_FID |
| dispc2_pclk | DISPC_LCD2_PCLK | HDMI_M_PCLK |
| dispc2_de | DISPC_LCD2_DE | HDMI_M_DE |
| dispc2_vsync | DISPC_LCD2_VSYNC | HDMI_M_VS |
| dispc2_hsync | DISPC_LCD2_HSYNC | HDMI_M_HS |
| dispc2_data[23:0] | DISPC_LCD2_DATA[23:0] | DISPC_TV_DATA[29:0] |

For more details on LCD2 and TV out pixel data formats for the parallel interface, see [Section 10.2.2, Display Controller Environment](#).

10.1.1.1.2 Serial Interfaces

In serial interface, the DISPC and the two DSI modules with their associated PLLs are used in the data path. The DISPC is connected to the memory through the L3 interconnect and uses its own DMA to read the data from the system memory.

The DSI module contains a PLL to multiply the pixel clock by an appropriate factor. The resulting serialized data is then transmitted on one to four differential data pairs and an additional clock pair that has a reference transition at the boundary between pixels.

For more details, see [Section 10.3](#), *MIPI DSI*.

10.1.1.2 DSS TV Display Support

10.1.1.2.1 HDMI

In an HDMI configuration, the DISPC, HDMI, and HDCP modules and the associated PLL modules are used in the data path. The HDMI module converts the RGB video into standard high-definition digital video format. The module has a PLL, which can multiply the pixel clock by an appropriate factor. The data is transmitted on three differential data pairs and an additional clock pair.

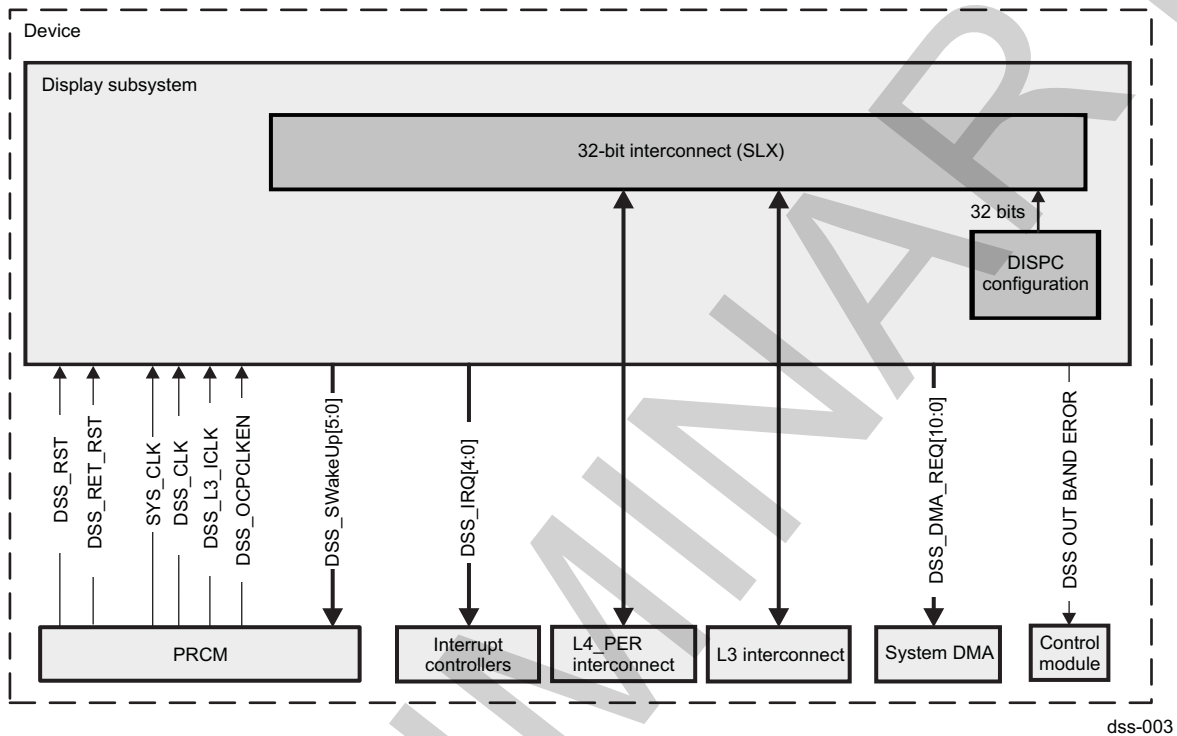

For more details, see [Section 10.4](#), *HDMI*.

10.1.2 DSS Integration

This section describes the integration of the DSS module in the device, including information about clocks, resets, and hardware requests.

Figure 10-3 shows the integration of the DSS in the device.

Figure 10-3. DSS Integration

10.1.2.1 DSS Clocks

The power, reset, and clock management (PRCM) module provides clock signals to the DSS.

Figure 10-4 shows the details of the DSS clock tree.

Figure 10-4. DSS Clock Tree

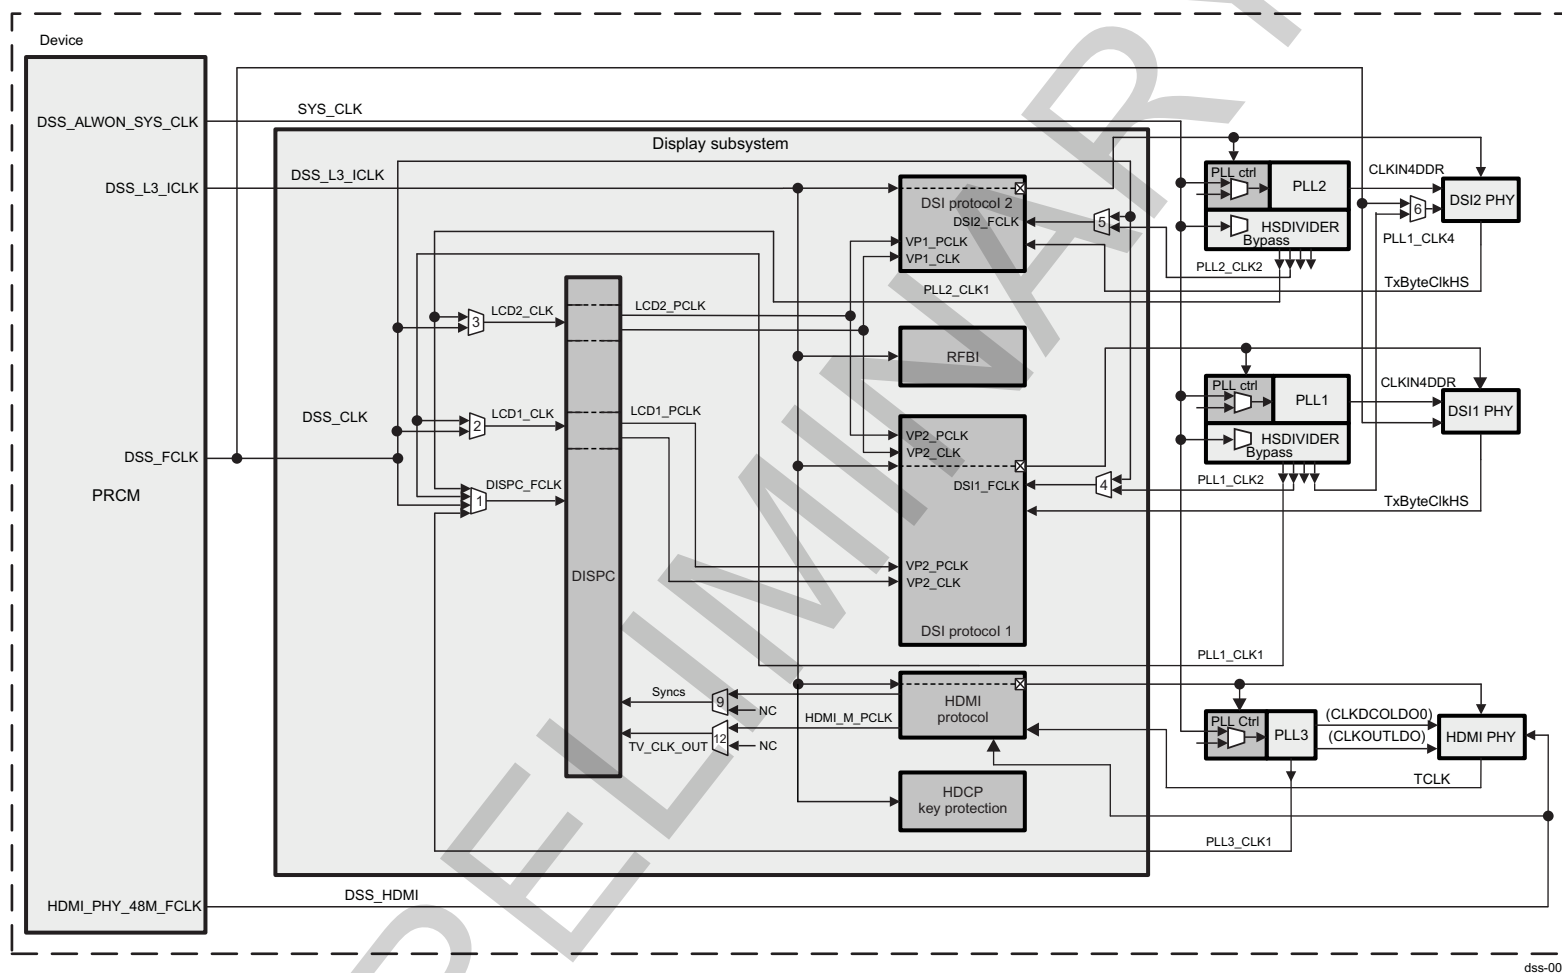

Table 10-2 lists the main DSS clocks and their sources.

Table 10-2. DSS Clocks

| Clocks | | | | |
|-----------------|-------------------------|--------------------|-------------|------------------|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| DSS | DSS_HDMI | HDMI_PHY_48M_FCLK | PRCM module | Functional clock |
| | DSS_CLK | DSS_FCLK | PRCM module | Functional clock |
| | SYS_CLK | DSS_ALWON_SYS_CLK | PRCM module | System clock |
| | DSS_L3_ICLK | DSS_L3_ICLK | PRCM module | Interface clock |

- The clock source for the L3 interface clock is DSS_L3_ICLK.
- The clock sources for the DSS modules are listed in [Table 10-3](#).

Table 10-3. DSS Modules Clock Sources

| Destination | Source Signal Name | Source | Multiplexer Number | DSS_CTRL Register Bit Field |
|---|--------------------|-----------------|--------------------|-----------------------------|
| DISPC functional clock (DISPC_FCLK) | DSS_CLK | DPLL_PER (PRCM) | 1 | [9:8] FCK_CLK_SWITCH |
| | PLL1_CLK1 | PLL1 | 1 | |
| | PLL2_CLK1 | PLL2 | 1 | |
| | PLL3_CLK1 | PLL3 | 1 | |
| DSI1 functional clock (LCD1_CLK) | DSS_CLK | DPLL_PER (PRCM) | 2 | [0] LCD1_CLK_SWITCH |
| | PLL1_CLK1 | PLL1 | 2 | |
| DSI2 functional clock (LCD2_CLK) | DSS_CLK | DPLL_PER (PRCM) | 3 | [12] LCD2_CLK_SWITCH |
| | PLL2_CLK1 | PLL2 | 3 | |
| DSI1 protocol engine functional clock (DSI1_FCLK) | DSS_CLK | DPLL_PER (PRCM) | 4 | [1] DSI1_CLK_SWITCH |
| | PLL1_CLK2 | PLL1 | 4 | |
| DSI2 protocol engine functional clock (DSI2_FCLK) | DSS_CLK | DPLL_PER (PRCM) | 5 | [10] DSI2_CLK_SWITCH |
| | PLL2_CLK2 | PLL2 | 5 | |
| DISPC external clock (TV_CLK_OUT) | HDMI_M_PCLK | HDMI | 12 | [15] VENC_HDMI_SWITCH |

NOTE: : For more information about the DSI1 and DSI2 video port clocks (VPn_PCLK and VPn_CLK, where n = 1 or 2), see [Table 10-4](#) and [Section 10.3.4.2, DSI Clock Configuration](#).

NOTE: Multiplexer 9 in [Figure 10-4](#) has the same control as multiplexer 12.

Multiplexer 6 in [Figure 10-4](#) allows the DSS_FCLK or PLL1_CLK4 clock to be sent on the DSI2 PHY bypass input. The use of the bypassed clock allows both DSI modules to run on DSS_FCLK or on a single PLL. The selection is done on device control module level. For more information, see [Section 10.3.4.2, DSI Clock Configuration](#) in [Section 10.3, MIPI Display Serial Interface](#).

[Table 10-4](#) lists the maximum frequencies of various DSS clocks for OPP119, OPP100 and OPP50. When the VDD_CORE_L voltage domain is defined for the first set of OPPs, then only OPP119 and OPP50 are supported. When the VDD_CORE_L voltage domain is defined for the second set of OPPs, then OPP119, OPP100 and OPP50 are supported.

The frequencies of listed DSS clocks for OPP119 and OPP100 are identical, except for the DSS_L3_ILCK, which has specific dependency on the selection of the VDD_CORE_L set of OPPs.

For more details on the device voltage management see [Section 3.8.1, Overview](#), in [Chapter 3, PRCM](#).

Table 10-4. DSS Clock Frequencies

| Clock Name | OPP100 OPP119 | OPP50 | Notes |
|------------------------|------------------|-------------|--|
| DSS_L3_ICLK | 233 MHz | 116.5 MHz | For the description and clock source, see Table 10-2 . DSS_L3_ICLK frequency is up to 233 MHz for OPP119 (up to 116.5 MHz for OPP50), only when the VDD_CORE_L voltage domain is defined for the first supported set of OPPs. When the VDD_CORE_L voltage domain is defined for the second set of OPPs, then DSS_L3_ICLK is available for OPP119 and OPP100 at up to 200 MHz, and for OPP50 at up to 100 MHz. |
| DSS_CLK | 186 MHz | 186 MHz | For the description and clock source, see Table 10-2 . |
| DISPC_FCLK | 186 MHz | 186 MHz | For the description and clock source, see Table 10-3 . |
| DISPC_CORE_CLK | 186 MHz | 93 MHz | DISPC internal functional clock. Generated from DISPC_CLK after LCD divider at the DISPC module level. For more details, see Section 10.2.4.1, Clock Configuration . |
| LCDn_CLK (n = 1 or 2) | 186 MHz | 93 MHz | For description and clock source, see Table 10-3 . |
| LCDn_PCLK (n = 1 or 2) | 170 MHz | 93 MHz | DISPC LCD output pixel clock. Generated from LCDn_CLK after two dividers (LCDn and PCDn) at the DISPC module level. For more details, see Section 10.2.4.1, Clock Configuration . |
| VPn_PCLK (n = 1 or 2) | 148.5 MHz | 74.25 MHz | DSI video port pixel clock. Sourced from LCDn_PCLK. |
| VPn_CLK (n = 1 or 2) | 186 MHz | 93 MHz | DSI video port clock. Generated from LCDn_CLK after a divider (LCDn) at DISPC module level. For more details, see Section 10.2.4.1, Clock Configuration . |
| DSIn_FCLK (n = 1 or 2) | 170 MHz | 93 MHz | For the description and clock source, see Table 10-3 . |
| DSS_HDMI_TCLK | 185.625 MHz | 92.8125 MHz | TMDS clock from the HDMI PHY. For the clock source, see Figure 10-4 . |
| TXCLKESC | 20 MHz | 20 MHz | DSI escape-mode transmit clock. For more details, see Section 10.3.4.4.4, Clock Requirements . |
| TXBYTECLKHS | 112.5 MHz | 103 MHz | DSI high-speed transmit byte clock (generated by the complex I/Os) TXBYTECLKHS = 112.5 MHz for up to three data lanes (900 Mbps per lane); TXBYTECLKHS = 103 MHz for four data lanes (824 Mbps per lane) |
| DSS_HDMI | 48 MHz | 48 MHz | For the description and clock source, see Table 10-2 . |

10.1.2.2 DSS Resets

The PRCM module provides two reset signals to the DSS.

[Figure 10-5](#) shows the details of the reset tree for the DSS.

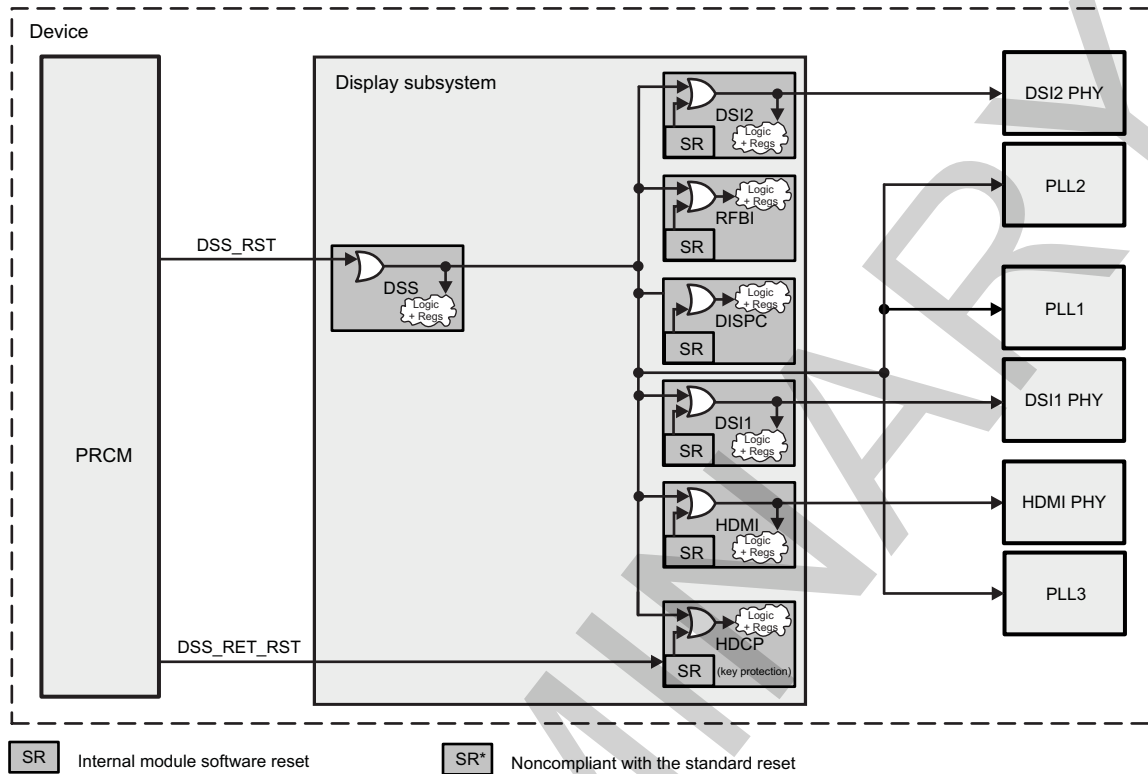

Figure 10-5. DSS Reset Scheme

Table 10-5 lists the resets for the DSS.

Table 10-5. DSS Resets

| Resets | | | | |
|-----------------|-------------------------|--------------------|-------------|--------------------|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| DSS | DISPSS_RET_RST | DSS_RET_RST | PRCM module | Retention reset |
| | DISPSS_RST | DSS_RST | PRCM module | Nonretention reset |

10.1.2.2.1 Hardware Reset

The DSS receives its DISPSS_RST reset signal (the reset signal of the DSS power domain) from the PRCM module. The DISPSS_RET_RST is used only for the HDCP key protection module.

10.1.2.3 DSS Power Management

The DSS modules are in the DSS power domain.

Table 10-6 lists the DSS power domains.

Table 10-6. DSS Power Domains

| Module Instance | Attributes |
|-------------------|---|
| | Power Domain |
| Display subsystem | PD_DSS |
| DISPC | For more details, see Section 10.2, Display Controller . |
| MIPI DSI1 | For more details, see Section 10.3, MIPI Display Serial Interface . |
| MIPI DSI2 | For more details, see Section 10.3, MIPI Display Serial Interface . |
| RFB | For more details, see Section 10.5, Remote Frame Buffer Interface . |

Table 10-6. DSS Power Domains (continued)

| | |
|------|--|
| HDMI | For more details, see Section 10.4 , <i>High-Definition Multimedia Interface</i> . |
|------|--|

10.1.2.3.1 Standby Mode

As part of the system-wide power-management scheme, the DSS supports the MStandby/MWait and SIdleReq/SIdleAck protocols:

- MStandby/MWait
 - DISPC
- SIdleReq/SIdleAck
 - DISPC
 - DSI1
 - DSI2
 - RFBI
 - HDMI
 - HDCP (key protection)
 - DSS interconnect

[Figure 10-6](#) shows the details of the DSS wake-up generation.

Figure 10-6. DSS IdleAck/MStandby Generation

dss-007

10.1.2.3.1.1 Conditions to Exit Standby Mode

For information about the conditions that allow the subsystem to exit standby mode, see [Section 10.2, Display Controller](#).

10.1.2.3.1.2 Standby Procedure Description

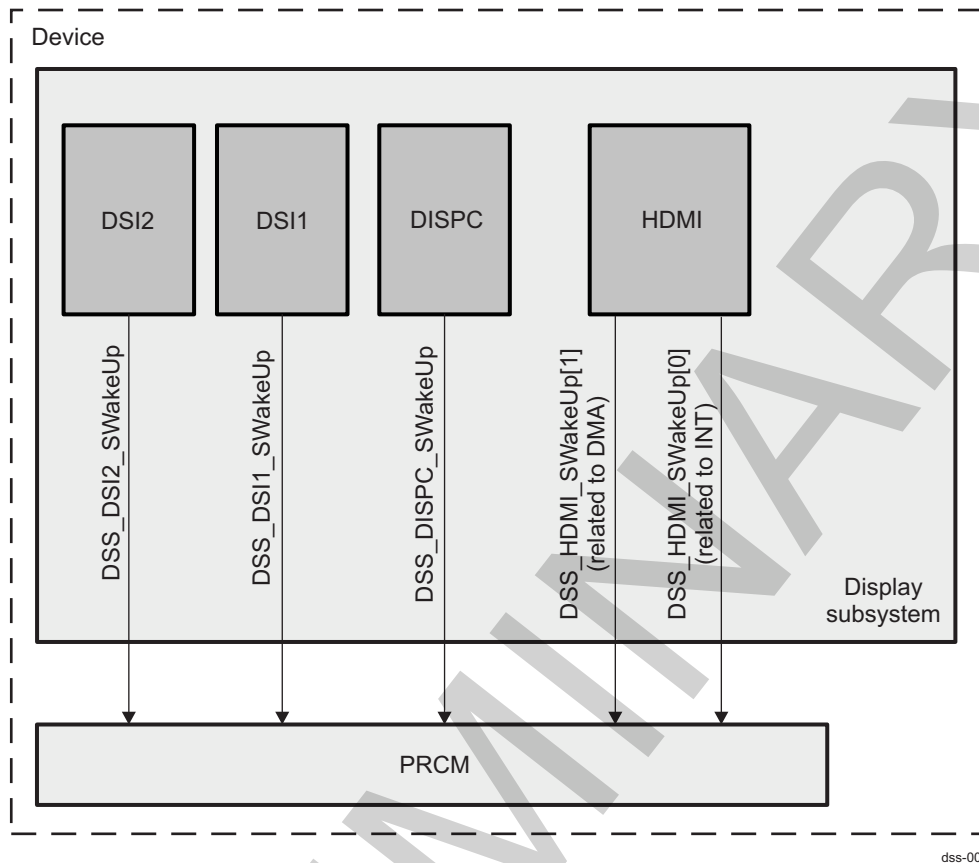

When the DSS initiates a standby procedure, it also initiates a standby/wait handshake protocol with the PRCM module that lets the PRCM module cut the DSS clocks.

10.1.2.3.2 Wake-Up Mode

The DISPC, DSI1, DSI2, and HDMI modules support the wake-up protocol. DSS_HDMI_SWakeUp is associated with DSS_HDMI_IRQ, which is generated by the HDMI module. For the events that generate an Swakeup and the description and configuration of the registers, see the DISPC, DSI, and HDMI TRM chapters.

[Figure 10-7](#) shows DSS wake-up generation.

Figure 10-7. DSS Wake-Up Generation

10.1.2.4 DSS Interrupt Requests

The DSS has four interrupt lines. The interrupt signals are connected to the MPUs and DSP interrupt controller (INTC) modules. The interrupts are generated from the DISPC, DSI1 and DSI2 protocol engines, and HDMI.

Figure 10-8 shows DSS interrupt generation.

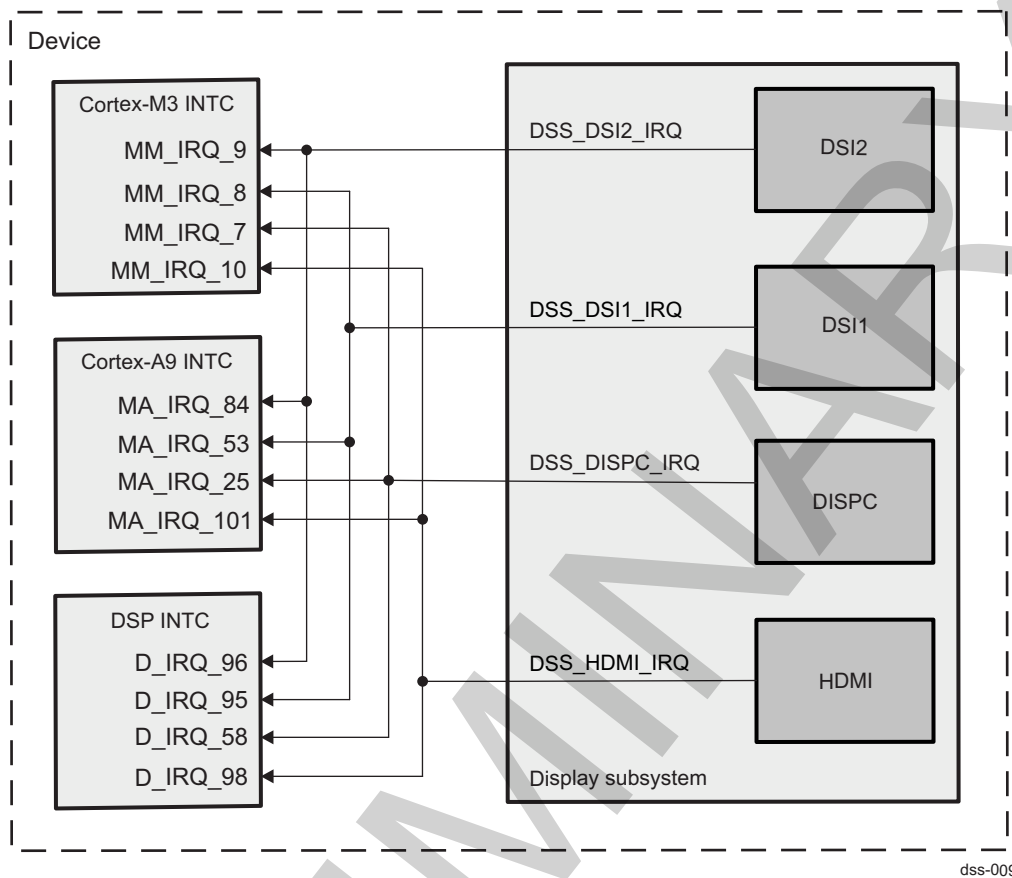

Figure 10-8. DSS Interrupt Generation

Table 10-7 lists the DSS interrupts.

Table 10-7. DSS Interrupts

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|-----------------|--------------------------------|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| DSS | | | | |
| DISPC | DSS_DISPC_IRQ | D_IRQ_58 | DSP INTC | DISPC interrupt request |
| | | MA_IRQ_25 | Cortex™-A9 INTC | DISPC interrupt request |
| | | MM_IRQ_7 | Cortex™-M3 INTC | DISPC interrupt request |
| MIPI DSI1 | DSS_DSI1_IRQ | D_IRQ_95 | DSP INTC | Display DSI1 interrupt request |
| | | MA_IRQ_53 | Cortex-A9 INTC | Display DSI1 interrupt request |
| | | MM_IRQ_8 | Cortex-M3 INTC | Display DSI1 interrupt request |
| MIPI DSI2 | DSS_DSI2_IRQ | D_IRQ_96 | DSP INTC | Display DSI2 interrupt request |
| | | MA_IRQ_84 | Cortex-A9 INTC | Display DSI2 interrupt request |
| | | MM_IRQ_9 | Cortex-M3 INTC | Display DSI2 interrupt request |
| HDMI | DSS_HDMI_IRQ | D_IRQ_98 | DSP INTC | Display HDMI interrupt request |
| | | MA_IRQ_101 | Cortex-A9 INTC | Display HDMI interrupt request |
| | | MM_IRQ_10 | Cortex-M3 INTC | Display HDMI interrupt request |

10.1.2.5 DSS DMA Requests

Eleven DMA requests are connected to the system DMA (sDMA).

The DMA requests are:

- Four DMA request signals from each DSI protocol engine (data traffic: from SDRAM or IVA-HD SL2 to DSI protocol engine and from DSI protocol engine to SDRAM or IVA-HD SL2)
- One DMA request signal from RFBI module (data traffic: from SDRAM to RFBI)
- One DMA request signal from HDMI module (audio traffic: from SDRAM or IVA-HD SL2 to HDMI)
- One DMA request signal from DISPC module (used for synchronization of a logical channel in the sDMA for memory-to-memory transfers)

Figure 10-9 shows the details of DSS DMA request generation.

Figure 10-9. DSS DMA Request Generation

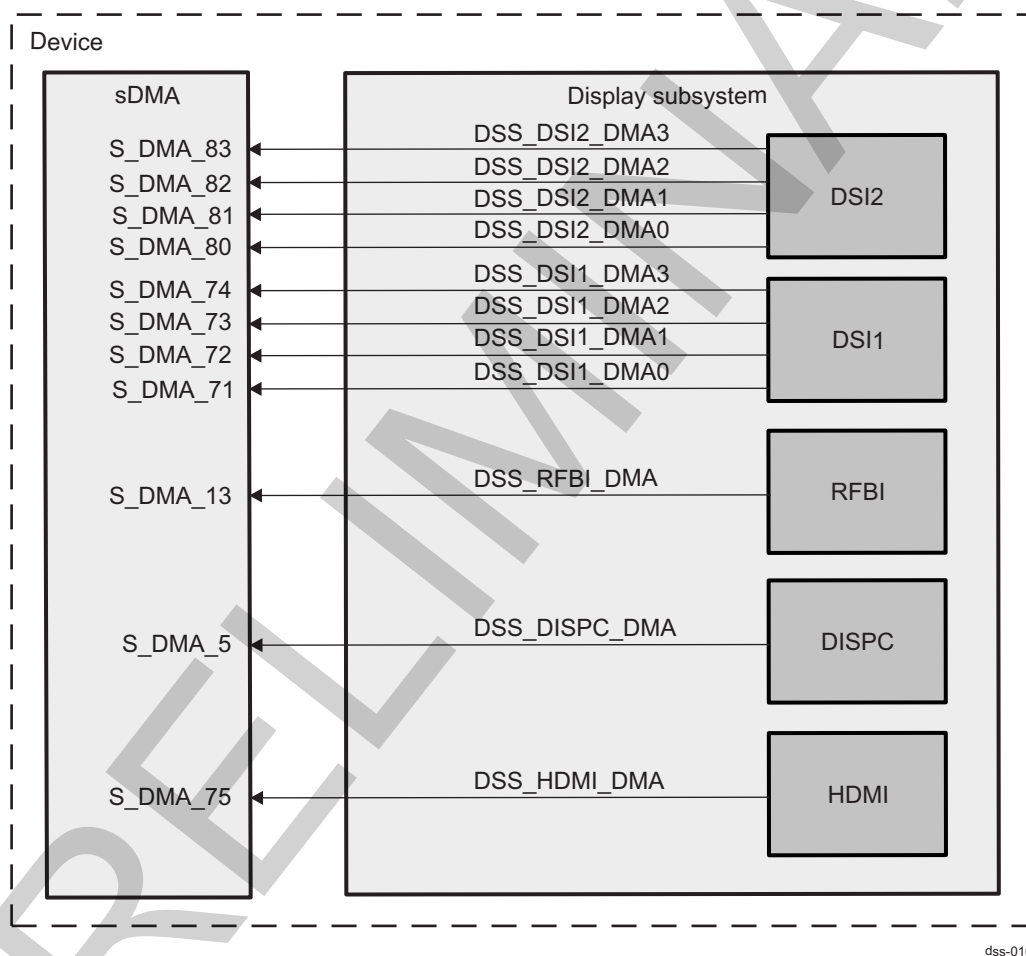

Table 10-8 lists the DSS DMA requests.

Table 10-8. DSS DMA Requests

| DMA Requests | | | | |
|-----------------|--------------------|-------------------------|-------------|--|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| RFBI | DSS_RFBI_DMA | S_DMA_13 | sDMA | DSS RFBI DMA request |
| DISPC | DSS_DISPC_DMA | S_DMA_5 | sDMA | The line trigger signal to synchronize a memory-to-memory logical channel in the DMA4 sDMA is generated by the DISPC IP. |

Table 10-8. DSS DMA Requests (continued)

| | | | | |
|-----------|---------------|----------|------|----------------------------|
| MIPI DSI1 | DSS_DSI1_DMA0 | S_DMA_71 | sDMA | DSS DSI1 DMA request 0 |
| | DSS_DSI1_DMA1 | S_DMA_72 | sDMA | DSS DSI1 DMA request 1 |
| | DSS_DSI1_DMA2 | S_DMA_73 | sDMA | DSS DSI1 DMA request 2 |
| | DSS_DSI1_DMA3 | S_DMA_74 | sDMA | DSS DSI1 DMA request 3 |
| MIPI DSI2 | DSS_DSI2_DMA0 | S_DMA_80 | sDMA | DSS DSI2 DMA request 0 |
| | DSS_DSI2_DMA1 | S_DMA_81 | sDMA | DSS DSI2 DMA request 1 |
| | DSS_DSI2_DMA2 | S_DMA_82 | sDMA | DSS DSI2 DMA request 2 |
| | DSS_DSI2_DMA3 | S_DMA_83 | sDMA | DSS DSI2 DMA request 3 |
| HDMI | DSS_HDMI_DMA | S_DMA_75 | sDMA | DSS HDMI audio DMA request |

10.1.3 DSS Register Manual

CAUTION

The main access to all DSS registers is through the L3 interconnect.
The access through the L4_PER interconnect is provided for back software compatibility.

10.1.3.1 DSS Instance Summary

Table 10-9. DSS Instance Summary

| Module Name | L4_PER Base Address | L3 Base Address | Size |
|-------------|---------------------|-----------------|------|
| DSS | 0x4804 0000 | 0x5800 0000 | 4KB |

10.1.3.2 DSS Registers

10.1.3.2.1 DSS Registers Mapping Summary

Table 10-10 summarizes the DSS register mapping.

Table 10-10. DSS Registers Mapping Summary

| Register Name | Type | Register Width (Bits) | Address Offset | DSS L4_PER Physical Address | DSS L3 Physical Address |
|---------------|------|-----------------------|----------------|-----------------------------|-------------------------|
| DSS_REVISION | R | 32 | 0x0000 0000 | 0x4804 0000 | 0x5800 0000 |
| RESERVED | R | 32 | 0x0000 0010 | 0x4804 0010 | 0x5800 0010 |

10.2 Display Controller

10.2.1 Display Controller Overview

Figure 10-10 shows a block diagram of the display subsystem.

Figure 10-10. Display Subsystem Highlight

dispc-064

The DISPC includes the following main features:

- Five pipelines for processing:
 - One graphics pipeline (GFX):
 - Pixel formats: ARGB16-4444, xRGB12-4444, RGBA16-4444, RGBx12-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888, RGBx32-8888, RGB24-888, and BITMAP (1, 2, 4, or 8 bits per pixel) (x means that the correspond bits in the container are not used)
 - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555

- to ARGB32-8888 and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the MSBs or adding 0s)
- Support for color look-up table (CLUT): 256 × 24-bit entries palette in RGB
- Support for antiflicker on RGB pixel formats using 3-tap filter.
- Three video pipelines (VID1, VID2, and VID3):
 - Pixel formats: ARGB16-4444, xRGB12-4444, RGBx12-4444, RGBA12-3333, RGBA16-4444, RGB16-565, ARGB16-1555, xRGB16-1555, ARGB32-8888, RGBA32-8888, xRGB32-8888, RGBx32-8888, RGB24-888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, and YUV4:2:0-NV12 (x means that the correspond bits in the container are not used)
 - Selection of the color depth expansion from ARGB16-4444, RGBA16-4444, and ARGB16-1555 to ARGB32-8888 and from xRGB12-4444, RGBx12-4444, and xRGB16-1555 to xRGB32-8888 (replication of the MSBs or adding 0s)
 - Programmable polyphase filter:
 - Independent horizontal and vertical resampling: upsampling (up to x8) and downsampling (down to 1/4)
 - Maximum input width of 1920 pixels
 - No limitation on the input height
 - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, and YUV4:2:0-NV12.
 - Alpha blending factor is rescaled like the R, G, and B color components.
 - Programmable color space conversion from YUV4:2:2 (YUV4:4:4, YUV4:2:0 after Chroma upsampling through the scaler) into ARGB32-8888. Images in YUV4:2:2 format with 90/270 degree rotation are preprocessed to YUV4:4:4 before the scaler, by duplicating the missing Chroma.
 - Programmable VC-1 range mapping
- One Write-back pipeline (WB): allows to take benefit of the hardware processing available inside the DISPC like color space conversion, rescaling, compositing to perform memory-to-memory transfer with data processing or capturing a displayed frame.
 - Programmable color space conversion RGB24 into YUV4:4:4 or to YUV4:2:2-UYVY, YUV4:2:2-YUV2, or YUV4:2:0-NV12 using programmable polyphase filter.
 - Programmable color space conversion RGB24 into YUV4:2:2-UYVY, YUV4:2:2-YUV2, or YUV4:2:0-NV12
 - Selection of the color depth reduction from RGB24 to RGB16
 - Programmable polyphase filter:
 - Independent horizontal and vertical resampling: upsampling (up to x8) and downsampling (down to 1/4)
 - Maximum input width of 1920 pixels
 - No limitation on the input height
 - Supported input formats are ARGB32-8888, YUV4:2:2-UYVY, YUV4:2:2-YUV2, and YUV4:2:0-NV12.
 - Alpha blending factor is rescaled like the R, G, and B color components.
 - Selection of the source of the data:
 - Overlay output:
 - Primary LCD
 - Secondary LCD
 - TV
 - Pipelines:
 - Graphic
 - Video 1
 - Video 2

- Video 3
- Two LCD outputs, primary (LCD1) and secondary (LCD2):
 - Input pixel format: ARGB32-8888
 - Output pixel format: RGB24-888
 - Overlay of graphic and video 1, 2, and 3 pipelines
 - Source and destination transparency color key
 - Global and pixel alpha blending (up to 8-bit blending factor)
 - Z-order programmable (full flexibility)
 - Three types of displays are supported:
 - Passive matrix monochrome: 4-/8-bit monochrome panel interface support (15 grayscale levels supported using dithering block)
 - Passive matrix color: 8-bit color panel interface support (3375 colors supported for a color panel using dithering block)
 - Active matrix color: 12-/16-/18-/24-bit panel interface support (replicated or dithered encoded pixel values)
 - Independent programmable timing generators for LCD1 and LCD2 to support:

| | | |
|----------------------|----------------------|---|
| Primary LCD | Using DSI1 interface | SXGA VESA timing @ 60 FPS |
| | Using RFBI | WVGA @ 30 fps |
| Secondary LCD | Using DSI2 interface | SXGA VESA timing @ 85 fps |
| | Using RFBI | WVGA @ 30 fps |
| | Using CMOS interface | SXGA VESA timing @ 85 fps1080i/720p CEA-861-D |

- Configurable LCD output mode: progressive or interlace mode
- Selection between RGB and YUV4:2:2 output pixel format
- Remote frame buffer support through the RFBI module
- Partial display through the RFBI
- Multiple-cycle output format on 8-/9-/12-/16-bit interface time division multiplexing (TDM)
- One TV output
 - Input pixel format: ARGB40-10.10.10.10
 - Output pixel format: ARGB40-10.10.10.10
 - Overlay of graphic and video 1, 2, and 3 pipelines
 - Source and destination transparency color key
 - Global and pixel alpha blending (up to 10-bit blending factor)
 - Z-order programmable (full flexibility)
 - Slave mode support (no master mode support) with synchronization signals provided by the HDMI TX
 - HSYNC (horizontal synchronization signal)
 - VSYNC (vertical synchronization signal)
 - RE (data request signal)
 - FID (field ID: odd/even field information)
 - RGB30-10.10.10 data bus output for connection to HDMI TX and extended to 36 by duplication of the MSBs
 - HD-1080p, HD-1080i, HD-720p, SD-480p, SD-576p, SD-576i, and SD-480i using HDMI
 - HDMI deep color mode support, 30-bit data output to HDMI encoder
 - Pixel duplication capability (from one pixel clock cycle up to eight cycles)
- Panel support with MIPI DPI protocol

- 4-/8-bit monochrome passive matrix panel interface support (15 grayscale levels supported using dithering block)
- 8-bit color passive matrix panel interface support (3375 colors supported for a color panel using dithering block)
- 12-/16-/18-/24-bit active matrix panel interface support (replicated or dithered encoded pixel values)
- Common
 - Rotation 0, 90, 180, and 270 using DMM-TILER
 - Synchronized buffer update
 - Hardware cursor (using the graphics pipeline or one of the video pipelines)
 - Independent gamma curve support on primary LCD output, secondary LCD output and TV output
 - Multiple-buffer support
 - Mirroring/flip-flop support (using DMM-TILER)
 - Programmable color-phase rotation (CPR)
 - Alpha blending support:
 - Embedded pixel factor (ARGB and RGBA)
 - Global alpha
- DMA (internal to the DISPC)
 - Support for accessing tiled structure through the TILER inside the dynamic memory management (DMM)
 - Support for rotation, flip-flop, and mirroring through the TILER inside the DMM
 - Support for memory fragmentation through the TILER inside the DMM
 - Integrated shared buffers between DMA engine and pipelines
 - Programmable buffer thresholds
 - Bandwidth limiter on write request (insertion on idle cycles between requests)
 - Support for immediate flip of the base address (GFX, VID1, VID2, and VID3 pipelines)
 - Support for MFLAG mechanism (dynamic increase of the priority of real-time data traffic)
- Advanced
 - Mode outputting data on display only from the DMA buffer (self-refresh using the DMA FIFO)
 - DMA buffer hand-check in stall mode
 - Arbitration between high/low priority (GFX, VID1, VID2, VID3, and WB pipelines)
- Power modes
 - Low-power saving modes
 - Support on-the-fly dynamic voltage and frequency scaling (DVFS)
 - Merge capability of the DMA buffers to support greater OFF period on the L3 interconnect
 - All buffers associated to a single pipeline
 - Reallocation of the buffers of the nonactive pipelines to the active pipelines

10.2.2 Display Controller Environment

The DISPC provides the required control signals to interface directly to an external parallel panel for the MIPI DPI protocol.

[Figure 10-11](#) shows the LCD support parallel interface.

NOTE: Parallel interface is available through the LCD2 and TV outputs of the DISPC.

The LCD2 data and control signals are multiplexed with the TV output data, and control signals provided by the HDMI module.
The selection can be done at the DSS top level. For further details and signals mapping, see [Section 10.1.1.1.1 Parallel Interface](#).

Figure 10-11. LCD Support Parallel Interface

dispc-083

Table 10-19 describes the interface signals to/from the LCD panel in bypass mode.

Table 10-19. Parallel Interface Signals

| Signal Name | Type ⁽¹⁾ | Description |
|-------------------|---------------------|--|
| dispc2_data[23:0] | O | Pixels data |
| dispc2_pclk | O | Pixel clock |
| dispc2_vsync | O | Vertical synchronization. The LCD frame clock (vsync) toggles after all the lines in a frame are transmitted to the LCD panel and a programmable number of line clock cycles has elapsed at the beginning and the end of each frame. |
| dispc2_hsync | O | Horizontal synchronization. The LCD line clock (hsync) toggles after all pixels in a line are transmitted to the LCD panel and a programmable number of pixel clock wait-states elapse, at the beginning and the end of each line. |

⁽¹⁾ I = Input, O = Output, I/O = Bidirectional

Table 10-19. Parallel Interface Signals (continued)

| Signal Name | Type ⁽¹⁾ | Description |
|-------------|---------------------|---|
| dispc2_de | O | <ul style="list-style-type: none"> In passive matrix technology, the de signal is configured to transition each time a programmable number of line clocks occurs. To prevent a DC charge within the screen pixels, the power and ground supplies of the panel are periodically switched. The DISPC signals the panel to switch the polarity by toggling the de pin. In active matrix technology, the de signal acts as an output-enable signal to indicate when data must be latched using the pixel clock. |
| dispc2_fid | O | The FID signal indicates the field identifier for the LCD output field. <ul style="list-style-type: none"> 0 means even. 1 means odd. |

10.2.2.1 LCD Output and Data Format for the Parallel Interface

This section describes the pixel data bus and shows timing diagrams of transactions and synchronizations.

Figure 10-12 through Figure 10-18 show the pixel data bus, depending on the use of 4-, 8-, 12-, 16-, 18-, or 24-pixel data output pins.

Table 10-20 lists the number of displayed pixels per pixel clock cycle based on the type of display panel.

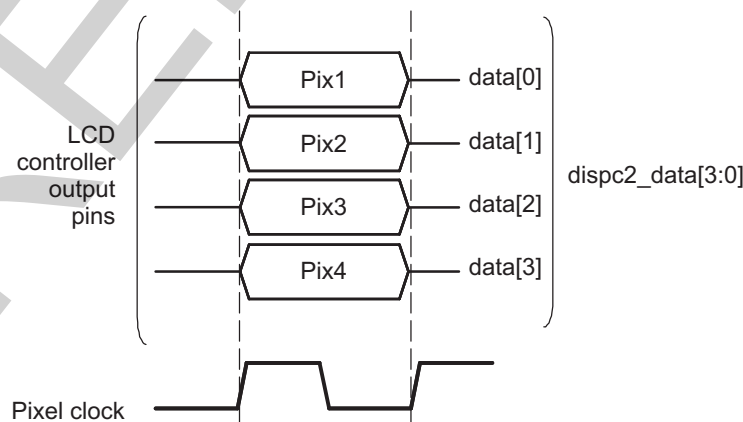

Table 10-20. Number of Displayed Pixels per Pixel Clock Cycle Based on Display Type

| Display Panel | Number of Displayed Pixels per Pixel Clock Cycle |
|----------------------|---|
| Monochrome 4-bit | 4 |
| Monochrome 8-bit | 8 |
| Passive matrix color | 8/3 |
| Active matrix | 1 |

- Passive matrix technology, monochrome mode

Monochrome displays use a 4-bit or 8-bit interface. Each bit represents one pixel (on or off), which means that 4 or 8 pixels are sent to the LCD at each pixel clock.

Figure 10-12 and Figure 10-13 show 4- and 8-bit monochrome displays, respectively.

Figure 10-12. LCD Pixel Data Monochrome4 Passive Matrix

dispc-054

Figure 10-13. LCD Pixel Data Monochrome8 Passive Matrix

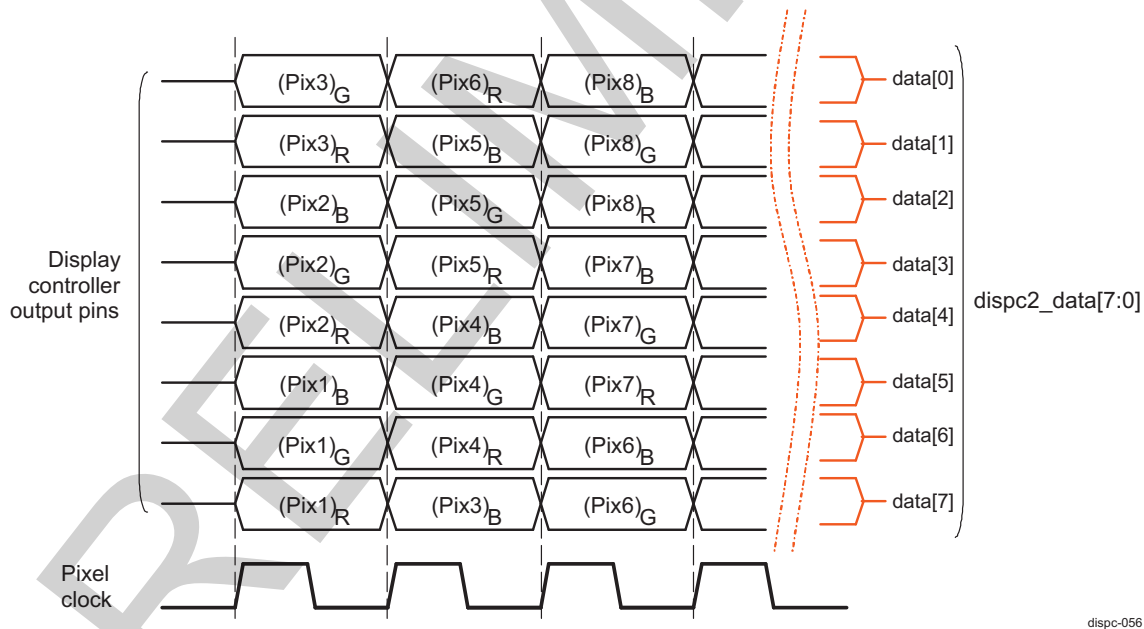

- Passive matrix technology, color mode

Color passive displays use 8-bit data input lines. In a given pixel clock cycle, each line represents one color component (red, green, or blue).

Figure 10-14 shows an 8-bit color passive matrix display.

Figure 10-14. LCD Pixel Data 8-Bit Color Passive Matrix

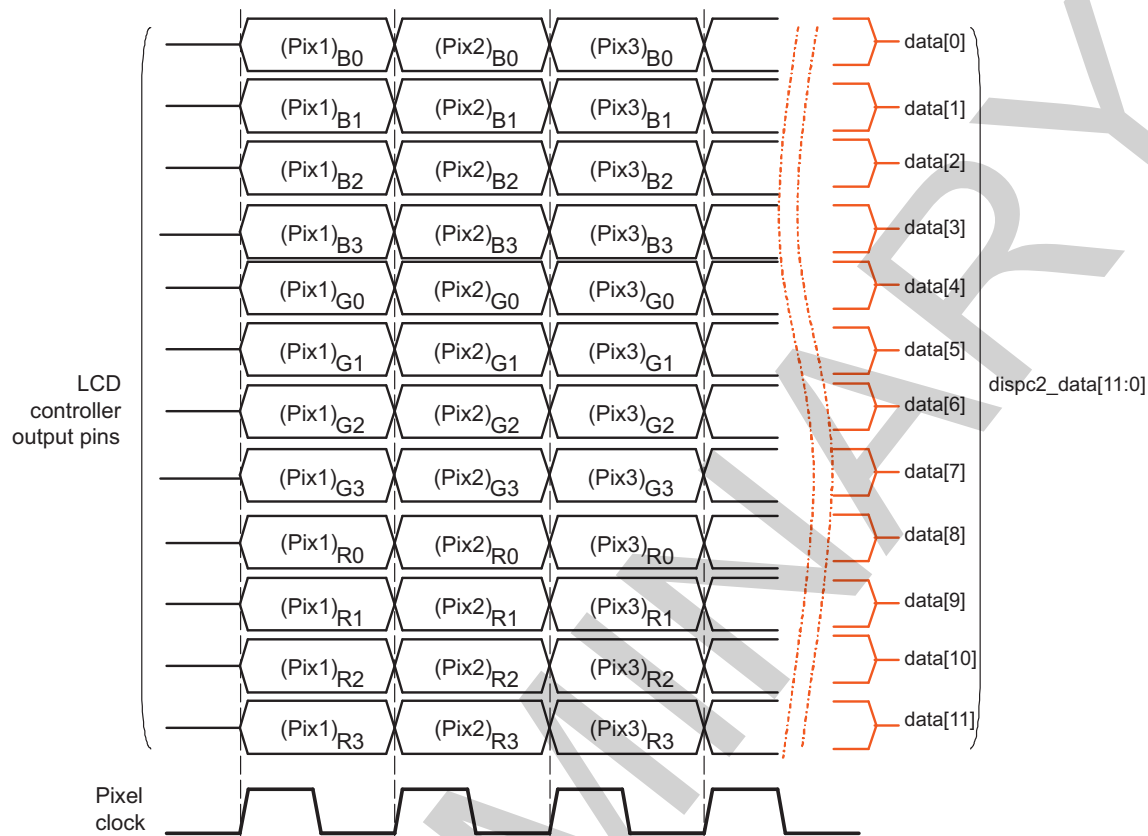

- Active matrix technology

Active matrix displays bypass the STN dithering logic block and the output FIFO. Each line represents one pixel.

Figure 10-15 through Figure 10-18 show 12-, 16-, 18-, and 24-active matrix displays, respectively.

Figure 10-15. LCD Pixel Data Color12 Active Matrix

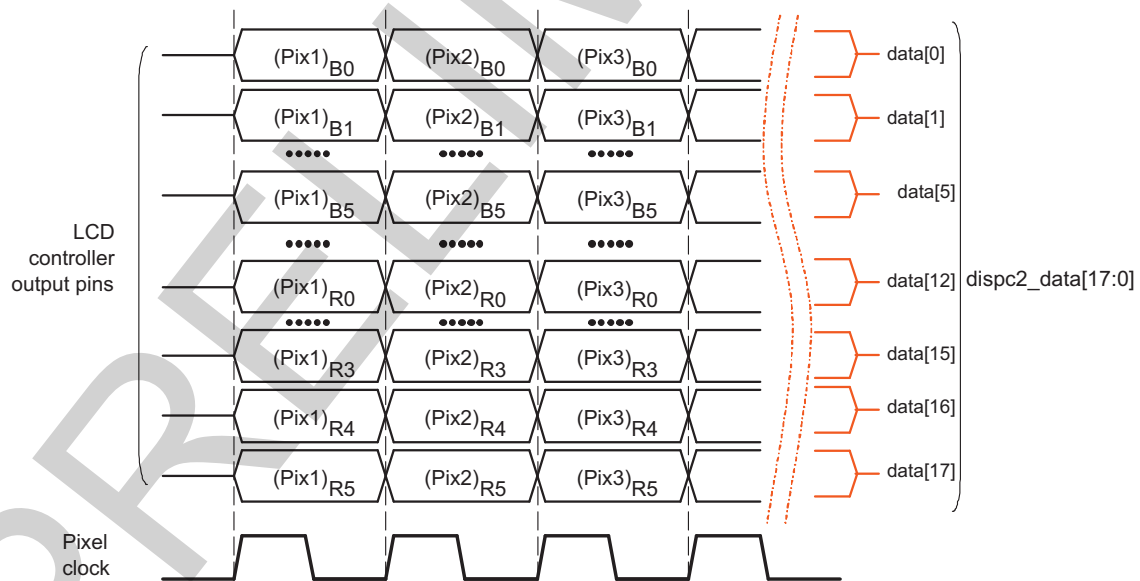

dispc-050

dispc-053

10.2.2.2 Transaction Timing Diagrams

Figure 10-19 through Figure 10-34 show timing diagrams of synchronization signals and pixel clock for passive matrix and active matrix panels. The DISPC directly drives these signals, which are related to the programmable fields described in Table 10-21.

Table 10-21. Programmable Fields in Bypass Mode

| Name | Register | Description |
|-------|--|--|
| PPL | DISPC_SIZE_LCD0[10:0] PPL bit field value + 1 | Pixels per line |
| LPP | DISPC_SIZE_LCD0[26:16] LPP bit field value + 1 | Lines per panel |
| HBP | DISPC_TIMING_Ho[31:20] HBP bit field value + 1 | Horizontal back porch |
| HFP | DISPC_TIMING_Ho[19:8] HFP bit field value + 1 | Horizontal front porch |

10.2.2.3 TV Output and Data Format for the Parallel Interface

This section describes the TV output pixel data bus for the parallel interface.

The TV pixel data interface is a 30-bit RGB interface. Only the MSB part of each color component is connected to the DSS boundary: R[9:2], G[9:2], and B[9:2]. The output of the data is synchronized to the data request signal (HDMI_M_DE) from the HDMI encoder.

Figure 10-35 shows the TV output pixel data format.

Figure 10-35. TV Output Pixel Data

dispc-093

10.2.3 Display Controller Integration

This section describes the DISPC integration in the device. The complete details about clocks, resets are detailed in the [Section 10.1, Display Subsystem Overview](#).

Figure 10-36. Display Controller Integration

[Table 10-22](#) and [Table 10-23](#) list the integration attributes and clock and resets, respectively.

[Table 10-24](#) summarizes the integration of the module in the device.

Table 10-22. Integration Attributes

| Module Instance | Attributes | |
|-----------------|--------------|--|
| | Power Domain | Interconnect |
| DISPC | PD_DSS | L3 for data transfer L4_PER for configuration |

Table 10-23. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|---------------------------------------|-----------|--|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| DISPC | DISPC_FCLK | DSS_CLK/PLL1_CLK1/PLL2_CLK1/PLL3_CLK1 | PRCM/PLLs | Functional clock for the DISPC logic. For multiplexing description and frequency ratings, see Section 10.1.2.1, DSS Clocks . |
| | LCD1_CLK | DSS_CLK/PLL1_CLK1 | PRCM/PLL1 | Clock used to generate the divided pixel clock for the primary LCD interface. For multiplexing description and frequency ratings, see Section 10.1.2.1, DSS Clocks . |
| | LCD2_CLK | DSS_CLK/PLL2_CLK1 | PRCM/PLL2 | Clock used to generate the divided pixel clock for the secondary LCD interface. For multiplexing description and frequency ratings, see Section 10.1.2.1, DSS Clocks . |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| DISPC | DISPC_RST | DISPSS_RST | PRCM/DSS | Hardware reset is coming from PRCM, or via a software reset performed at DSS level. For the tree reset description, see Section 10.1.2.2, DSS Resets . |

NOTE: If video mode is used, the VPn_PCLK and VPn_CLK clocks must be generated using a CLKIN4DDR clock.

Table 10-24. Hardware Requests

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|-------------|--|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| DISPC | DSS_DISPC_IRQ | MM_IRQ_ | Cortex-M3 | Display controller interrupt. For information about Cortex-M3 interrupt control, see Chapter 7 . |
| | DSS_DISPC_IRQ | D_IRQ_58 | DSP | Display controller interrupt. For information about DSP interrupt control, see Chapter 5 . |
| | DSS_DISPC_IRQ | MA_IRQ_25 | Cortex-A9 | Display controller interrupt. For information about Cortex-A9 interrupt control, see Chapter 4 . |

Table 10-24. Hardware Requests (continued)

| DMA Requests | | | | |
|-----------------|--------------------|-------------------------|-------------|--|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| DISPC | DSS_DISPC_DMA | S_DMA_5 | System DMA | The line trigger signal informs the sDMA that a programmable number of lines are output to the LCD, and that the system memory can be updated. For more details, see Section 10.2.4.5, sDMA Requests . |

NOTE:

- For a description of interrupt sources, see [Section 10.2.4.4, Interrupt Requests](#).
- For a description of DMA sources, see [Section 10.2.4.5, sDMA Requests](#).

10.2.4 Display Controller Functional Description

The DISPC can read and display the encoded pixel data stored in memory (see [Figure 10-37](#)).

Figure 10-37. DISPC Architecture Overview

dispc-068

The DISPC can read and display the encoded pixel data stored in memory and write the output of one of the overlays or one of the pipelines into system memory.

Several processes can be configured to manage the graphics pipeline (palette, antiflicker) and video pipelines (VC-1, color space conversion, scaling, overlay, and transparency, etc.).

The data coming out of a pipeline is sent to one of the three outputs depending on user configuration. An overlay manager manages inputs of multiple pipelines. User configuration of timings for LCD and TV are available.

The DISPC allows capturing of one output of the pipeline or overlay manager to redirect it into the WB pipeline. It allows to take benefit of the hardware processing available inside the DISPC like color space conversion, rescaling, compositing, etc., to perform memory-to-memory transfer with data processing.

10.2.4.1 Clock Configuration

The PCLK frequency for each LCD output is derived from a dedicated input clock: LCD1_CLK and LCD2_CLK for the primary and secondary LCD outputs, respectively. Each input clock is divided by the values of the DISPC_DIVISORo[23:16] LCD bit field and then the DISPC_DIVISORo[7:0] PCD bit field independently for each LCD pixel clock (see [Figure 10-38](#)). LCD1_PCLK and LCD2_PCLK are independent.

$$\text{LCD1_PCLK} = (\text{LCD1_CLK} / \text{LCD1}) / \text{PCD1}$$

$$\text{LCD2_PCLK} = (\text{LCD2_CLK} / \text{LCD2}) / \text{PCD2}$$

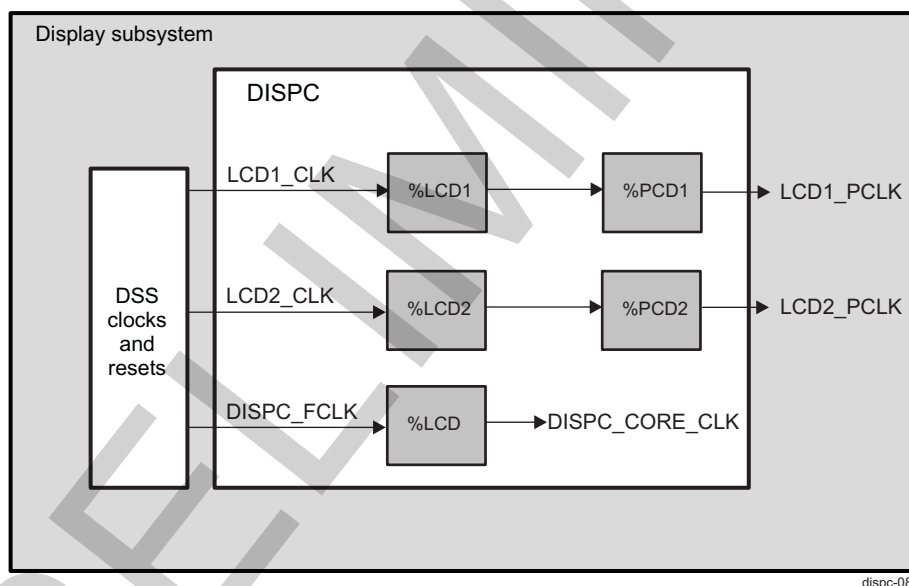

The functional clock of the DISPC (DISPC_CORE_CLK) is derived from DISPC_FCLK by an independent divisor. The dividing value is set in the [DISPC_DIVISOR\[23:16\]](#) LCD bit field.

NOTE: DISPC_CORE_CLK must be higher than or equal to the LCD1_PCLK, LCD2_PCLK, and TV_CLK clocks.

For more information about the DISPC clocks and frequency ratings, see [Section 10.1.2.1, DSS Clocks](#).

For backward compatibility, the divisor value LCD can be set to the value of LCD1. To enable this functionality, the [DISPC_DIVISOR\[0\]](#) ENABLE bit must be set to 1.

Figure 10-38. DISPC Clock Tree Overview

10.2.4.2 Software Reset

To perform a software reset on the DISPC, set the [DISPC_SYSCONFIG\[1\]](#) SOFTRESET bit to 0x1. The [DISPC_SYSSTATUS\[0\]](#) RESETDONE bit indicates that the software reset is complete when its value is 0x1. When the software reset completes, the [DISPC_SYSCONFIG\[1\]](#) SOFTRESET bit is automatically reset. Software must ensure that the software reset completes before doing DISPC operations.

10.2.4.3 Power Management

The DISPC supports the MStandby/Wait, IdleReq/SidleAck, and wake-up protocols as defined in PRCM chapter.

10.2.4.3.1 Idle Mode

The DISPC supports no-idle mode, force-idle mode, and smart-idle mode. The mode can be selected by programming the appropriate value in the [DISPC_SYSCONFIG](#)[4:3] SIDLEMODE bit field.

Conditions of assertion of the SIdleAck signal:

- In no-idle mode, SIdleAck is never asserted.
- In force-idle mode, SIdleAck is asserted unconditionally with a 1-configuration port interface clock cycle delay with respect to IdleReq assertion.

NOTE: A proper use of force-idle mode assumes that no interrupt need to be generated.

- In smart-idle mode, SIdleAck is asserted when at least the following conditions are satisfied:
 - No interrupt is pending.
 - The DISPC no longer uses the interface clock for the slave port.

Once SIdleAck is asserted:

- The DISPC interface lock used by the slave port can be shut down at any time.
- Any transactions on the configuration port (L4_PER interconnect) are ignored.

The conditions of deassertion of SIdleAck signal are:

- In force-idle mode, SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to IdleReq deassertion.
- In smart-idle mode, SIdleAck is deasserted with a 1-configuration port interface clock cycle delay with respect to IdleReq deassertion.

When SIdleAck is released, the DISPC is fully operational and a DMA request can be processed normally.

10.2.4.3.2 StandBy Mode

The DISPC supports no-standby mode, force-standby mode, and single smart-standby mode. The mode is set in the [DISPC_SYSCONFIG](#)[13:12] MIDDLEMODE bit field. The functional clock is always active if the module is enabled. The L3 clock can be shut down at any time independently of the status of MStandby.

The conditions of assertion of the MStandby signal are:

- In no-standby mode, MStandby is never asserted.
- In force-standby mode, MStandby is asserted when the module is disabled.
- In smart-standby, in the case of one of the following conditions:
 - GFX pipeline is disabled, or GFX pipeline is enabled but the data fetch is completed for GFX window, or GFX pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
 - VID1 pipeline is disabled, or VID1 pipeline is enabled but the data fetch is completed for VID1 window, or VID1 pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
 - VID2 pipeline is disabled, or VID2 pipeline is enabled but the data fetch is completed for VID2 window, or VID2 pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
 - VID3 pipeline is disabled, or VID3 pipeline is enabled but the data fetch is completed for VID3 window, or VID3 pipeline is enabled and the data fetch did not complete and data in the DMA buffer is greater than high threshold value.
 - WB pipeline is disabled, or WB pipeline is enabled but the data store to memory is completed for WB picture, or WB pipeline is enabled and the data storage did not complete but data in the DMA buffer is lower than low threshold value.

The MStandby signal asserts whenever all five events have occurred or the DISPC is disabled. While MStandby is asserted, the DISPC does not generate any transaction on the L3 master port.

The conditions of deassertion of the MStandby signal are:

- In force-standby mode, MStandby is deasserted only when the DISPC is enabled.
- In smart-standby mode, in the case of one of the following conditions:
 - GFX pipeline is enabled and the data fetch did not complete for GFX window and the data in the DMA buffer is less than low threshold value.
 - VID1 pipeline is enabled and the data fetch did not complete for VID1 window and the data in the DMA buffer is less than low threshold value.
 - VID2 pipeline is enabled and the data fetch did not complete for VID2 window and the data in the DMA buffer is less than low threshold value.
 - VID3 pipeline is enabled and the data fetch did not complete for VID3 window and the data in the DMA buffer is less than low threshold value.
 - WB pipeline is enabled and the data store did not complete for WB picture and the data in the DMA buffer is more than high threshold value.

Detection of the deassertion conditions assumes that the interface clocks are active.

10.2.4.3.3 Wakeup

The DISPC supports wake-up signaling. The mode can be selected by programming the appropriate value in the [DISPC_SYSCONFIG](#)[2] ENAWAKEUP bit. The SWakeup signal is asynchronous so it does not require the interface clock.

The conditions of assertion of the SWakeup signal are:

- GFX pipeline is enabled and the data fetch did not complete for the GFX window and the data in DMA buffer are less than low threshold value.
- VID1 pipeline is enabled and the data fetch did not complete for the VID1 window and the data in DMA buffer are less than low threshold value.
- VID2 pipeline is enabled and the data fetch did not complete for the VID2 window and the data in DMA buffer are less than low threshold value.
- VID3 pipeline is enabled and the data fetch did not complete for the VID3 window and the data in DMA buffer are less than low threshold value.
- WB pipeline is enabled and the data in DMA buffer are more than high threshold value.
- The last pixel is displayed into LCD1 panel if it is not the last frame.
- The last pixel is displayed into LCD2 panel if it is not the last frame.
- The last pixel is displayed into TV panel if it is not the last frame.

The SWakeup signal is asserted whenever any one of eight events occurs and IdleAck is asserted.

When one of the active pipelines reaches the low threshold and must refill its DMA buffer for the current frame, all other pipelines refill their own DMA buffer even if their low threshold has not been reached. The [DISPC_CONFIG](#)[17] BUFFERFILLING bit is used to increase the probability that the time increases, where there is no access to the L3 interconnect.

The condition of deassertion of SWakeup signal is: Immediately after deassertion of IdleReq.

10.2.4.4 Interrupt Requests

[Table 10-25](#) details the interrupts generated for the DISPC.

The interrupt line, DSS_DISPC_IRQ, indicates when one or more events are detected by the hardware. Each event is independently maskable by setting the [DISPC_IRQENABLE](#) register.

To check when a particular interrupt event occurs and to reset a particular event, the [DISPC_IRQSTATUS](#) register must be accessed. This register regroups all the status of the module internal events that generate an interrupt (read 0: No interrupt occurred; read 1: Interrupt occurred; write 1: Status bit reset). For more information on checking and clearing interrupt events, see *Display Subsystem Register Manual*.

[Table 10-25](#) lists the DISPC interrupt events.

Table 10-25. DISPC Interrupts

| Interrupt Name | Description |
|--------------------------|---|
| FRAMEDONE1_IRQ | Frame done for LCD1 output: Active frame related to the LCD1 has completed and LCD1 output of the DISPC is disabled. |
| FRAMEDONE2_IRQ | Frame done for LCD2 output: Active frame related to the LCD2 has completed and LCD2 output of the DISPC is disabled. |
| FRAMEDONETV_IRQ | Frame done for TV output: Active frame related to the TV output has completed and TV output of the DISPC is disabled. |
| FRAMEDONEWB_IRQ | Frame done for WB output: Active frame related to the WB has completed. First, it is used when the WB channel is connected to one of the pipelines to determine when the memory-to-memory transfer through DISPC is completed. Second, it is used when the WB channel is connected to one of the overlay output in nonreal-time mode to determine when the memory-to-memory transfer with overlay processing is completed. |
| VSYNC1_IRQ | VSYNC for primary LCD output: VSYNC interrupt for the primary LCD has occurred at the end of the frame. |
| VSYNC2_IRQ | VSYNC for secondary LCD output: VSYNC interrupt for the secondary LCD has occurred at the end of the frame. |
| EVSYNC_EVEN_IRQ | VSYNC for even field: EVSYNC_EVEN interrupt has occurred at the end of the frame (EVSYNC received and the field polarity is even) (HDMI) |
| EVSYNC_ODD_IRQ | VSYNC for odd field: EVSYNC_ODD interrupt has occurred at the end of the frame (EVSYNC received and the field polarity is odd) (HDMI) |
| ACBIASCOUNTSTATUS1_IRQ | AC bias count status for LCD1 output: AC Bias transition counter has decremented to 0. |
| ACBIASCOUNTSTATUS2_IRQ | AC bias count status for LCD2 output: AC Bias transition counter has decremented to 0 |
| PROGRAMMEDLINENUMBER_IRQ | Programmed line number: The primary LCD has reached the user programmed line number. |
| VID1ENDWINDOW_IRQ | End of the VID1 window: The DMA engine has fetched all the data from memory for VID1 for the current frame. |
| VID2ENDWINDOW_IRQ | End of the VID2 window: The DMA engine has fetched all the data from memory for VID2 for the current frame. |
| VID3ENDWINDOW_IRQ | End of the VID3 window: The DMA engine has fetched all the data from memory for VID3 for the current frame. |
| GFXENDWINDOW_IRQ | End of the graphics window: The DMA engine has fetched all the data from memory for the graphics for the current frame. |
| VID1BUFFERUNDERFLOW_IRQ | VID1 DMA buffer underflow: The input VID1 DMA buffer goes underflow. |
| VID2BUFFERUNDERFLOW_IRQ | VID2 DMA buffer underflow: The input VID2 DMA buffer goes underflow. |
| VID3BUFFERUNDERFLOW_IRQ | VID3 DMA buffer underflow: The input VID3 DMA buffer goes underflow. |
| WBBUFFEROVERFLOW_IRQ | WB DMA buffer overflow: The output WB DMA buffer goes overflow. It cannot occur when WB channel is used in memory-to-memory transfer mode but only in capture mode. In capture mode the timings are defined by the timer associated with the output. In memory-to-memory mode, there is timing constraint. |
| GFXBUFFERUNDERFLOW_IRQ | GFX DMA buffer underflow: The input Graphics DMA buffer goes underflow. |
| PALETTEGAMMALOADING_IRQ | Palette/gamma table loading: The palette/gamma table in the graphics pipeline has been loaded using the DISPC DMA engine. |
| WBUNCOMPLETEERROR_IRQ | The write back buffer has been flushed before being fully drained. In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that and will trigger every frame. |

Table 10-25. DISPC Interrupts (continued)

| Interrupt Name | Description |
|-----------------------|---|
| OCPERROR_IRQ | OCP error: L3 interconnect has sent SResp = ERR |
| SYNCLOST1_IRQ | Synchronization lost on LCD1 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output). |
| SYNCLOST2_IRQ | Synchronization lost on LCD2 output: Occurs when VSYNC width/front or back porches are not wide enough to load the pipelines with data (LCD output). |
| SYNCLOSTTV_IRQ | Synchronization lost on TV output: Occurs when porches are not wide enough to load the pipelines with data (TV output connected to HDMI). |
| WAKEUP_IRQ | Wakeup: Occurs when the SWakeup signal is asserted. |
| FLIPIMMEDIATEDONE_IRQ | Flip immediate done: Occurs when the DMA engine has acknowledged the immediate BA change, and software can write the new BA0. |

10.2.4.5 sDMA Requests

The DMA synchronization line, DSS_DISPC_DMA, is connected to the sDMA. This DMA request is not a classical one but rather a synchronization signal between the DISPC and sDMA. The sDMA is informed that a programmable number of lines are output to the LCD, and that a system memory can be updated. This request is related to the interrupt event PROGRAMMEDLINENUMBER_IRQ described in [Table 10-25](#). This allows the sDMA channel to be synchronized with the display subsystem internal DMA controller.

In other words, it allows to synchronize a memory-to-memory frame buffer update based on the scan line of the frame buffer in system memory (SDRAM or SRAM) by the DISPC. The DSS_DISPC_DMA DMA request is generated at a programmable line number defined in the [DISPC_LINE_NUMBER](#)[10:0] LINENUMBER bit field. This process allows an application to use a single frame buffer and update it after a certain number of lines has been read by the DISPC.

10.2.4.6 DMA Engine

The DMA engine:

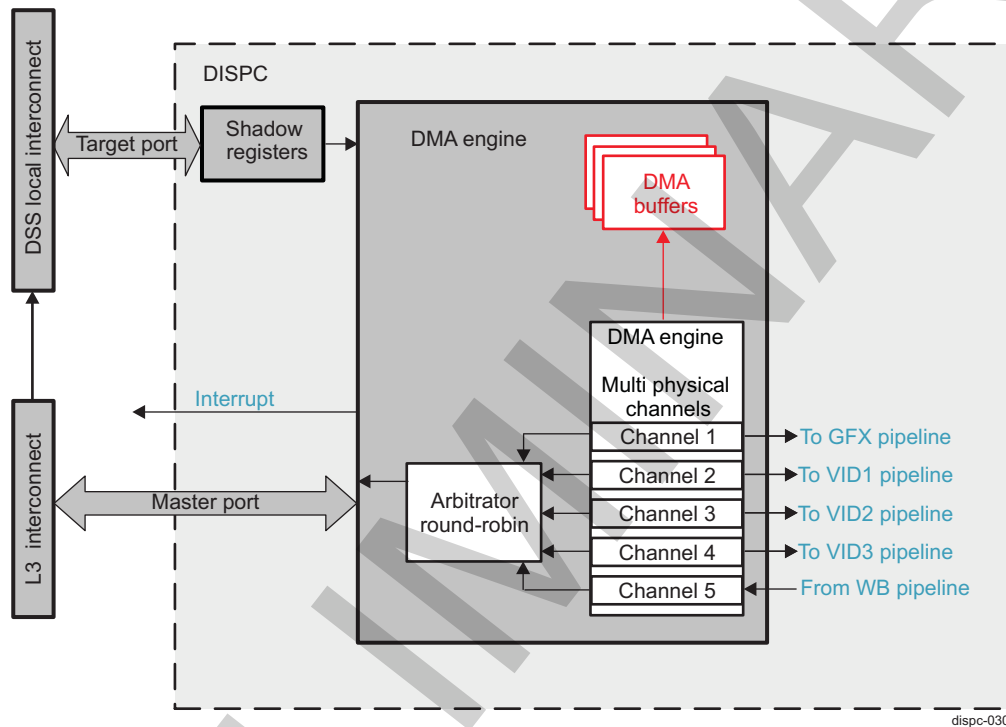

- Supplies data (encoded pixel data, palette, and gamma curve) from memories to GFX, VID1, VID2, and VID3 pipelines through the interconnect based on the configuration of the DISPC and pipelines settings.
- Stores (encoded pixel data) from the GFX/VID pipelines or overlays to memories through the WB pipeline and interconnect based on the configuration of the DISPC and WB pipeline settings.

Each pipeline has a dedicated buffer and a channel with independent settings. The default size and allocation of the DMA buffer is detailed in [Table 10-26](#). Each DMA buffer is divided into two spaces, a top and a bottom buffer. Depending on the application, a DMA buffer space can be associated to a pipeline or merged with other spaces. The total number of spaces for each individual pipeline is from 0 (pipeline inactive) to the number of pipelines ×2 (in that case, all the DMA buffers are associated to a single pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum number of spaces available. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum number of spaces required to support the throughput and the system latency. The space is assigned in the [DISPC_GLOBAL_BUFFER](#) register.

[Figure 10-39](#) shows an overview of the DMA engine.

Table 10-26. DMA Buffer Size

| Pipelines | DMA Buffer Size |
|-----------|---------------------------|
| GFX | 2 lines × 640 × 128 bits |
| VID1 | 2 lines × 1024 × 128 bits |
| VID2 | 2 lines × 1024 × 128 bits |
| VID3 | 2 lines × 1024 × 128 bits |
| WB | 2 lines × 1024 × 128 bits |

Figure 10-39. DMA Engine Overview**10.2.4.6.1 Addressing and Bursts**

For each line to be fetched/stored, the DMA engine:

- Calculates the pixel address.
- Aligns the address.
- Defines the burst structure:
 - Type of the burst (one-dimensional [1D] or two-dimensional [2D] burst structure)
 - Length of the burst

The DMA engine generates scan addresses to read/write data from/to system memory. The base address defines the start address of the first pixel, then the address is incremented based on the number of pixels per line, offset between two consecutive lines and number of lines. The byte address of each pixel in the frame buffer in the system memory is determined by:

$$\text{Pixel address} = \text{Base address} + x \times \text{bpp} + (y \times ((\text{width} \times \text{bpp}) + \text{increment}))$$

where:

- Base address corresponds to the base address (for YUV–NV12 format) defined by:
 - DISPC_GFX_BA_0[31:0] BA bit field
 - DISPC_GFX_BA_1[31:0] BA bit field
 - DISPC_VIDp_BA_0[31:0] BA bit field

- DISPC_VIDp_BA_1[31:0] BA bit field
- DISPC_VIDp_BA_UV_0[31:0] BA bit field
- DISPC_VIDp_BA_UV_1[31:0] BA bit field
- bpp corresponds to the number of bits per pixel defined by the [DISPC_GFX_ATTRIBUTES\[4:1\] FORMAT](#) bit field or [DISPC_VIDp_ATTRIBUTES\[4:1\] FORMAT](#) bit field.
- width corresponds to the number of pixels per line defined by [DISPC_GFX_SIZE\[10:0\] SIZE](#)+1 bit field or [DISPC_VIDp_SIZE\[10:0\] SIZE](#)+1 bit field.
- increment corresponds to the number of bytes to skip between two contiguous lines defined by [DISPC_GFX_ROW_INC\[31:0\] ROWINC](#) –1 bit field or [DISPC_VIDp_ROW_INC\[31:0\] ROWINC](#) –1 bit field.
- x corresponds to the pixel position on the x-axis.
- y corresponds to the pixel position on the y-axis.

NOTE: For YUV format, the pixel values are defined in two separated buffers (Y and UV). The Y buffers base address are defined in the [DISPC_VIDp_BA_j\[31:0\] BA](#) bit field. The UV buffers base address are defined in the [DISPC_VIDp_BA_UV_j\[31:0\] BA](#) bit field.

[Table 10-27](#) lists the registers settings for a simple access of a picture in system memory.

Table 10-27. Register Settings for Accessing Image in Internal Memory

| Registers | Value |
|---|--|
| DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j | PBA, the physical base address of image in the memory |
| DISPC_VIDp_BA_UV_j/DISPC_WB_BA_UV_j | PBA, the physical base address of UV buffers image in the memory |
| DISPC_GFX_PIXEL_INC / DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC | 1 or other in pixel incremental value |
| DISPC_GFX_ROW_INC / DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC | 1 or other in row incremental value |

A 128-bit interconnect request corresponds to one or several pixels depending on bits per pixels. Therefore, the DMA engine determines the appropriate burst sequence to optimize each new line fetching/storing. The DMA engine must prevent a single burst from crossing two lines. The DMA engine supports bursts of 2 × 128 bits, 4 × 128 bits, and 8 × 128 bits. The default burst size at reset time is 8 × 128 bits. The maximum burst size can be configured for each pipeline by setting the [DISPC_GFX_ATTRIBUTES\[7:6\] BURSTSIZE](#) bit field or [DISPC_VIDp_ATTRIBUTES\[15:14\] BURSTSIZE](#) bit field. Because the burst size must be aligned to the burst boundary, in case of misalignment, the DMA engine may issue single and/or smaller burst requests. Two types of burst are present:

- 1D-burst is used if the fetch/storage is linear in memory through the TILER. There is no rotation of the frame buffer. The frame buffer is not tiled.
- 2D-burst is used if the frame buffer is tiled.

Even if the [DISPC_VIDp_ROW_INC](#) does not equal 1, the 2D-burst can be selected by the user. It is used when the DISPC is configured to read one field of a frame by accessing only the even and odd lines.

NOTE: The burst size is initialized once at configuration and can be changed when the DISPC is disabled.

10.2.4.6.2 Immediate Base Address Flip Mechanism

The Flip Immediate mechanism is used to change of the fly the content of the frame buffer which is currently being displayed. The mechanism allows multiple changes (flips) of the base address (BA) during a frame. The mechanism is available for all pipelines (VID1, VID2, VID3, and GFX). Changes to the base address can be applied during the same line, or during different lines.

The following considerations must be considered:

- Data fetching from a new immediate BA is aligned with the data fetch mechanism of the DISPC DMA engine itself, and not with HSYNC or any other DISPC timing signal. After new VSYNC frame pulse, new BA will be taken by hardware, as soon as the first set of lines has been sent to internal pipeline of the DMA engine.
 - If multiple new BAs are written during the same line (before DMA engine acknowledges the first BA change), then programming steps 1 and 2 must be applied for each new BA (see the programming sequence in this section). The DMA will take only the last BA provided within the current line scan.
 - If multiple new BAs are written during different lines within the current frame, then programming steps #1 and #2 need to be applied for each new BA (see the programming flow further below in this section). The DMA takes the new BA each time it is updated.
- Immediate BA change cannot be achieved synchronously for two or more pipelines.
- Immediate BA change is possible only for BA0, and not possible for BA1. Interlaced mode using BA0 and BA1 is not supported.
- Immediate BA change is supported only in RGB color space.

The Flip Immediate mechanism programming flow follows:

1. Software writes the new immediate BA to the [DISPC_GFX_BA_j](#) register (where j=0) for the GFX pipeline, or to the [DISPC_VIDp_BA_j](#) register (where j=0) for the required VID pipeline.
2. Software sets to 0x1 the corresponding EN bit for the required pipeline in the [DISPC_BA0_FLIPIMMEDIATE_EN](#) register.
3. The DISPC DMA engine, after completing its current line (or set of lines) fetch, takes the new immediate BA.
4. Hardware resets the EN bit in [DISPC_BA0_FLIPIMMEDIATE_EN](#) register and asserts a flip immediate IRQ. The IRQ can be enabled through the [DISPC_IRQENABLE\[31\]](#) FLIPIMMEDIATEDONE_EN bit. The status of the event is available in the [DISPC_IRQSTATUS\[31\]](#) FLIPIMMEDIATEDONE_IRQ bit.

10.2.4.6.3 DMA Buffers

10.2.4.6.3.1 READ DMA Buffers (GFX and VID Pipelines)

When the vertical front porch (VFP) period starts after the last horizontal front porch (HFP) of the last line or the external VSYNC is received, the DMA buffers are flushed according to the selected output associated with the pipeline. The DMA engine restarts fetching data from the memory through the L3 interconnect. Enabling/disabling the DISPC flushes the DMA buffers (except WB DMA buffers).

Programmable high and low thresholds, independent for each DMA buffer, are used by the DMA engine to start and stop requesting data to the L3 interconnect.

- When low threshold (set in the [DISPC_GFX_BUF_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD bit field or [DISPC_VIDp_BUF_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD bit field) is reached, the DMA engine starts a request on the L3 interconnect to fill the DMA buffer.
- When high threshold (set in the [DISPC_GFX_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD bit field or [DISPC_VIDp_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD bit field) is reached, the DMA engine stops requesting encoded pixels.

To avoid underflow at the beginning of a frame and have sufficient encoded pixel data to start some processing, a preloading of the DMA buffer is configurable between a fixed value of bytes or the high threshold value. The preload ensures a minimum number of pixels present in the buffer. When the preload value is reached, the associated channel must start pulling pixels out of the DMA buffer. To enable the preload based on the value entered in the [DISPC_GFX_PRELOAD\[11:0\]](#) PRELOAD bit field or [DISPC_VIDp_PRELOAD\[11:0\]](#) PRELOAD bit field, the [DISPC_GFX_BUF_THRESHOLD\[11\]](#) BUFPRELOAD bit or [DISPC_VIDp_BUF_THRESHOLD\[19\]](#) BUFPRELOAD bit must be set to 0x0.

NOTE: When self-refresh mode is selected, meaning the data in the DMA buffers are used for multiple frames, and at the end of each frame, the DMA buffers are not flushed.

10.2.4.6.3.2 WRITE DMA Buffer (WB Pipeline)

Two modes are supported by the WB channel, selectable through the [DISPC_WB_ATTRIBUTES\[19\]](#) WRITEBACKMODE bit:

- Capture mode, WRITEBACKMODE bit set to 0: One of the overlay outputs going to LCD or TV outputs is captured and at the same time the data are sent on the output. The WB timings are controlled by the LCD or TV timings.
- Memory-to-memory mode, WRITEBACKMODE bit set to 1: One of the overlay outputs or one of the pipelines is captured to perform memory-to-memory transfer with some processing by the DISPC (rescaling, overlaying, color space conversion, etc.).

In capture mode: The WB DMA buffers are flushed when the VFP period starts after the HFP following the last line, or when the external VSYNC is received, depending on which output (LCD/TV) the WB pipeline is capturing data, if the programmed value in the [DISPC_WB_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field is set to 0. If the programmed value in the [DISPC_WB_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field is set to N (1:255), the write buffers DMA are flushed N lines later. The DMA engine starts storing data to memory through the L3-based interconnect as soon as enough data are available for the programmed burst size. When enabling/disabling the DISPC, the DMA buffers are flushed. The programmable low and high thresholds are used by the DMA engine to start and stop sending data to the L3 interconnect.

NOTE: If the [DISPC_WB_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit field is set to 0, the WB is reinitialized just at the end of the last line of a frame at the beginning of the VFP signal. To let the WB complete the data write to the external memory, the highest possible value compatible with the vertical blanking period must be set.

NOTE: In WB capture mode, if a new frame starts before the WB DMA buffers contents are fully written onto external memory, then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). The [DISPC_IRQSTATUS\[26\]](#) WBUNCOMPLETEERROR_IRQ interrupt bit indicates this situation and will trigger every frame. The WBUNCOMPLETEERROR interrupt can be enabled through the [DISPC_IRQENABLE\[26\]](#) WBUNCOMPLETEERROR_EN register bit. Software can avoid this case, by delaying the flush of WB DMA buffers through proper programming of the [DISPC_WB_ATTRIBUTES2\[7:0\]](#) WBDELAYCOUNT bit-field.

In memory-to-memory mode: The WB pipeline is not synchronized to any internal or external timing generator. The WB pipeline stores the output of one of the overlay outputs or one of the pipelines. When enabling/disabling the DISPC, the DMA buffers are flushed. The programmable low and high thresholds are used by the DMA engine to start and stop sending data to the L3 interconnect.

Programmable high and low thresholds are used by the DMA engine to start and stop sending data to the L3 interconnect.

- When high threshold (set in the [DISPC_WB_BUF_THRESHOLD\[31:16\]](#) BUFHIGHTHRESHOLD bit field) is reached, the DMA engines start sending data on the L3 interconnect to empty buffer.
- When low threshold (set in the [DISPC_WB_BUF_THRESHOLD\[15:0\]](#) BUFLOWTHRESHOLD bit field) is reached, the DMA engine stops sending encoded pixels.

At the end of the frame, to drain the DMA buffer, some smaller bursts (even single requests) must be issued to completely empty the DMA buffer. To limit the number of interconnect requests from the DISPC, a number of IDLE cycles between requests can be inserted. IDLE cycles can be inserted only when WB is used in memory-to-memory mode. It is ignored when WB is in capture mode.

The number of idle between requests can be activated and determined by :

- Setting the [DISPC_WB_ATTRIBUTES\[27\]](#) IDLESIZE bit to 0x0 (default value) and entering the number of idles between requests in the [DISPC_WB_ATTRIBUTES\[31:28\]](#) IDLENUMBER bit field. Idle numbers vary from 0 to 15.
- Setting the [DISPC_WB_ATTRIBUTES\[27\]](#) IDLESIZE bit to 0x1, which considers the size of the burst (the [DISPC_WB_ATTRIBUTES\[15:14\]](#) BURSTSIZE bit field) to determine the number of idles.

- If BURSTSIZE = 0x0, then idle equals IDLENUMBER (0 to 15).
- If BURSTSIZE = 0x1, then idle equals IDLENUMBER × 4 (0 to 60).
- If BURSTSIZE = 0x2, then idle equals IDLENUMBER × 8 (0 to 120).

10.2.4.6.4 MFLAG Mechanism and Arbitration

The MFLAG mechanism allows a dynamic increase of the priority of DISPC real-time traffic, when required, based on the fullness of the DISPC DMA read and write buffers.

The mechanism is implemented for all DMA buffers (GFX, VID1, VID2, VID3 and WB). Only high-priority pipelines can contribute to the MFLAG mechanism.

Programmable buffer thresholds (hysteresis) for each pipeline are used to indicate when the local MFLAG signal for each pipeline is generated. All local MFLAG signals are ORed to generate a single DSS MFLAG out band signal, which is provided to the L3 interconnect for granting OCP requests. The out band DSS MFLAG signal is asynchronous to any on-going OCP transaction.

The threshold for each pipeline corresponds to the fullness of the associated DMA buffer, and is defined by two threshold parameters:

- HT_MFLAG: High threshold.
 - For read access from the GFX, VID1, VID2, and VID3 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted).
 - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
 - This threshold can be programmed in the following bit fields:
 - For the GFX pipeline in the [DISPC_GFX_MFLAG_THRESHOLD__1](#)[31:16] HT_MFLAG bit field
 - For the VID1 pipeline in the [DISPC_VID1_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit field
 - For the VID2 pipeline in the [DISPC_VID2_MFLAG_THRESHOLD__1](#)[31:16] HT_MFLAG bit field
 - For the VID3 pipeline in the [DISPC_VID3_MFLAG_THRESHOLD__1](#)[31:16] HT_MFLAG bit field
 - For the WB pipeline in the [DISPC_WB_MFLAG_THRESHOLD](#)[31:16] HT_MFLAG bit field
- LT_MFLAG: Low threshold.
 - For read access from the GFX, VID1, VID2, and VID3 pipelines, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted).
 - For write access from the WB pipeline, when the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted).
 - This threshold can be programmed in the following bit fields:
 - For the GFX pipeline in the [DISPC_GFX_MFLAG_THRESHOLD__1](#)[15:0] LT_MFLAG bit field
 - For the VID1 pipeline in the [DISPC_VID1_MFLAG_THRESHOLD](#)[15:0] LT_MFLAG bit field
 - For the VID2 pipeline in the [DISPC_VID2_MFLAG_THRESHOLD__1](#)[15:0] LT_MFLAG bit field
 - For the VID3 pipeline in the [DISPC_VID3_MFLAG_THRESHOLD__1](#)[15:0] LT_MFLAG bit field
 - For the WB pipeline in the [DISPC_WB_MFLAG_THRESHOLD](#) [15:0] LT_MFLAG bit field

By default, the MFLAG mechanism is disabled ([DISPC_GLOBAL_MFLAG_ATTRIBUTE](#)[1:0] MFLAG_CTRL bit field = 0x0), and the DSS MFLAG out band signal is low (deasserted). The arbitration scheme for the DISPC pipelines is the same as described in [Section 10.2.4.6.7, Arbitration](#). That is, round-robin either between high-priority pipelines, or between normal-priority pipelines (if all pipelines are of normal priority)

When the [DISPC_GLOBAL_MFLAG_ATTRIBUTE](#)[1:0] MFLAG_CTRL bit field is set to 0x2, the MFLAG mechanism is enabled, and the DSS MFLAG out band signal is dynamically set to 0 or 1, depending on

DMA buffers fullness and programmed threshold levels, as explained previously in this section. In this case, the arbitration scheme for DISPC pipelines is round-robin between those high-priority pipelines, which have their local MFLAG signals asserted. If there are no high-priority pipelines with their local MFLAG signals asserted, then the arbitration scheme is the same as described in [Section 10.2.4.6.7, Arbitration](#).

The [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[2\]](#) MFLAG_START bit defines additional rules for the MFLAG mechanism:

- If the MFLAG_START bit is set to 0x0 (default value), then in the beginning of the frame when the DMA buffer is empty, the local MFLAG signal of each pipeline is kept at 0 until PRELOAD is reached (for more information on preloading, see [Section 10.2.4.6.3.1, READ DMA Buffers \(GFX and VID Pipelines\)](#)). Then, based on the setting of the [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field, the MFLAG signal is generated and internal logic is arbitrating between pipeline requests.
- If the MFLAG_START bit is set to 0x1, then even in the beginning of the frame when the DMA buffer is empty, the [DISPC_GLOBAL_MFLAG_ATTRIBUTE\[1:0\]](#) MFLAG_CTRL bit field defines the generation of the MFLAG signal for each pipeline.

10.2.4.6.5 Predecimation

The predecimation process consists of downscaling an image by fetching only the necessary pixels in the memory. Vertical and horizontal predecimation are possible:

- Vertical predecimation: The picture store in memory can be predecimated vertically by skipping lines. Burst mode is used to fetch the data when skipping lines. Only the lines that will be used by the DISPC are fetched from memory; the other lines are skipped. The DMA engine sends requests only for the useful lines using 1D burst or 2D burst, depending on the setting. The base address indicates the first valid pixel to fetch from memory. The number of lines to skip is set in the [DISPC_GFX_ROW_INC\[31:0\]](#) ROWINC bit field or [DISPC_VIDp_ROW_INC\[31:0\]](#) ROWINC bit field.

NOTE: When 2D burst mode is used, the access to data in memory is performed through the TILER module of DMM (for more details, see [Section 16.2.3.6, TILER](#)), and as a result a maximum of one line can be skipped.

- Horizontal predecimation: When fetching data from memory, it is possible to skip 1 out of 2 pixel data containers, up to 1 out of 16 pixel data containers, by setting the [DISPC_GFX_PIXEL_INC\[7:0\]](#) PIXELINC bit field or [DISPC_VIDp_PIXEL_INC\[7:0\]](#) PIXELINC bit field to the number of pixel data containers to skip (n), multiplied by the size of a pixel data container (in bytes) + 1. See the following note for more details.

NOTE: The restriction to horizontal predecimation is that there is at least one useful pixel per 128-bit request. In that case, the DMA engine uses burst mode instead of singles to optimize the requests in terms of latency and SDRAM efficiency.

No decimation is supported when the input format is 1, 2, 4, 8 BITMAP.

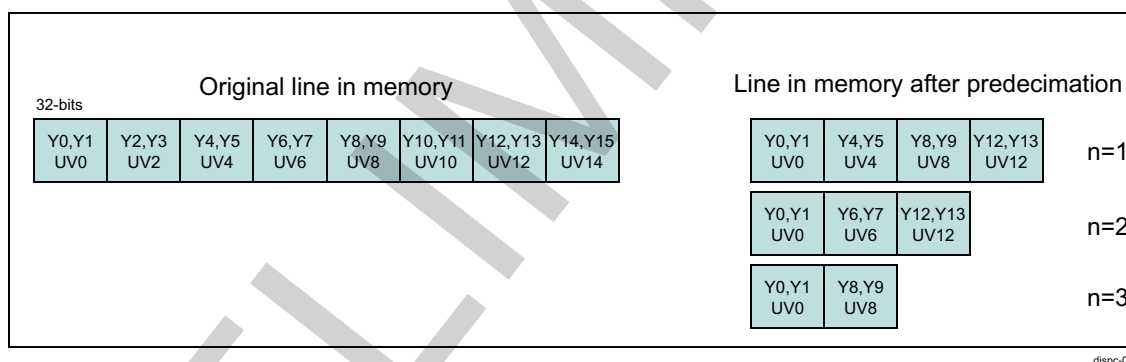

For RGB and YUV4:2:0 data formats, each pixel data container in memory holds 1 pixel. Thus, when configuring the PIXELINC bit field, the value of n equals the number of pixels to skip:

- For RGB format, one pixel data container = 32 bits = 1 pixel
- For YUV format:
 - One Y pixel data container = 8 bits = 1 pixel
 - One UV pixel data container = 16 bits = 1 pixel

For YUV4:2:2 format, each 32-bit pixel data container holds the Luma components for 2 pixels and the Chrominance component of 1 pixel (see [Figure 10-40](#)). Therefore, for the valid values of the PIXELINC bit field in the following YUV4:2:2 format, caution must be taken, because n does not equal the number of pixels, but instead the number of pixel data containers to skip:

- For n = 1, PIXELINC = 5
- For n = 2, PIXELINC = 9
- For n = 3, PIXELINC = 13
- For n = 4, PIXELINC = 17, etc.

Figure 10-40. YUV4:2:2 Predecimation

10.2.4.6.6 Progressive-to-Interlaced Format Conversion

The DMA engine can be used to perform YUV4:2:0 NV12 progressive-to-interlaced data conversion with 0-degree orientation. This section provides generic approach details.

Two possible configurations are available, depending on the setting of the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit, which defines the stride of each pixel value buffer for the YUV format. The following must be considered for both configurations:

- Bit [31] in the DISPC_VIDn_BA_j and DISPC_VIDn_BA_UV_j[31:0] BA bit fields, and the DISPC_VIDn_ATTRIBUTES[13:12] ROTATION bit field must be set to 0x0 to indicate 0-degree orientation.

Configuration 1 – YUV4:2:0 progressive to interlaced conversion

The DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit is set to 0x1. The CbCr container is twice the size of the Y container. All Luma and Chroma lines for even and odd fields are fetched from memory. The scaler unit of the respective pipeline can be used to downscale by 2 (through filtering) the fetched data to create the interlaced output. For more information about the scaler configuration, see [Section 10.2.4.10.4, Scaler Unit](#).

Configuration 2 – YUV4:2:0 progressive to YUV4:2:2 interlaced conversion

The DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit is set to 0x0. The CbCr container is the same size as the Y container. The DISPC_VIDn_ROW_INC register for the respective pipeline must be configured so that only the Y data is vertically predecimated by 2 (for more information, see [Section 10.2.4.6.5, Predecimation](#)). The CbCr data must not be predecimated. As a result, only the even Luma lines for the even field and the odd Luma lines for the odd field are fetched from memory. To create the interlaced output, the Chroma lines are all fetched from memory.

10.2.4.6.7 Arbitration

The requests (reads or writes) sent to the L3 interconnect are pipelined and are arbitrated in a round-robin scheme. The default arbitration scheme must be modified by setting the priority attribute of each pipeline as defined in the [DISPC_GFX_ATTRIBUTES\[14\] ARBITRATION](#) bit, [DISPC_VIDp_ATTRIBUTES\[14\] ARBITRATION](#) bit, or [DISPC_WB_ATTRIBUTES\[14\] ARBITRATION](#) bit.

By default, all pipelines have the same priority (normal), which means all pipelines requests are treated in a round-robin order manner. If one or more pipelines require a higher number of requests going to the L3 interconnect, its priority can be moved up to high priority. In this case, the high-priority pipeline is granted access before any pipeline in normal priority. If more than one active pipeline is in high priority, the behavior is the same as all active pipelines in normal priority. Normal active pipelines are not treated until all high active pipelines are finished. The ARBITRATION bit cannot be modified during the entire frame.

This function balances the bandwidth of the pipeline depending on its constraint. It can be used to give a higher priority to the pipelines with real-time constraints versus nonreal-time pipelines. For example, pipelines associated with the LCD output in stall mode must have a lower priority than pipelines associated with TV output.

10.2.4.6.8 DMA Power Modes

10.2.4.6.8.1 Low-Power Mode

Each DMA buffer is divided into two spaces. Each space can be associated with the pipeline or merged with other spaces. The total number of spaces for each individual pipeline is from 0 (pipeline inactive) to the number of pipelines \times 2 (in that case all the DMA buffers are associated with one pipeline). The sum of the number of spaces allocated for each pipeline must not be greater than the maximum available. The correct number of spaces must be allocated to ensure no underflow. The spaces allocated to each pipeline must be greater than or equal to the minimum required to support the throughput and the system latency.

NOTE: When the number of spaces is changed, the thresholds must be reprogrammed to reflect the new DMA buffer configuration.

10.2.4.6.8.2 Ultralow-Power Mode

In low-power mode, the L3 interconnect is used to fill up the DMA buffers to store all the data required to display a full frame. The L3 interconnect is not used to fetch the new pixels for the following frames. The data in the DMA buffer are reused to display on the screen.

The setting of the mode is independent for each pipeline. One pipeline may have all the frame pixels in its DMA buffer and the other pipelines may have to refill their respective DMA buffers along the display scan because the frame buffer is too big to be stored in the DMA buffer.

The DMA buffers can be merged to optimize the L3 interconnect off time. Merging the DMA buffers into one buffer can be used at the same time to improve ultralow-power mode (see [Section 10.2.4.6.8.1, Low-Power Mode](#)).

During the time in which the frames are fetched in the internal DMA buffer, MStandby must be asserted if the [DISPC_SYSCONFIG\[13:12\] MIDDLEMODE](#) bit field is set to 0x2 (smart-standby mode).

Two ultralow-power modes can be entered manually or automatically:

- Self-refresh mode: Self-refresh mode is started manually by setting the [DISPC_GFX_ATTRIBUTES\[15\]](#) SELFREFRESH bit or [DISPC_VIDp_ATTRIBUTES\[15\]](#) SELFREFRESH bit to 0x1 after capturing a frame in the DMA buffers. Stopping self-refresh mode is done by setting the SELFREFRESH bit to 0x0.
- Automatic self-refresh mode: By setting the [DISPC_GFX_ATTRIBUTES\[17\]](#) SELFREFRESHAUTO bit or [DISPC_VIDp_ATTRIBUTES\[17\]](#) SELFREFRESHAUTO bit to 0x1, the transition from OFF to ON self-refresh mode is done by hardware after capturing the first frame. Hardware reflects the status of the self-refresh mode by setting the SELFREFRESH bit to 0x1, which means that the data are read inside the DMA buffer without accessing the interconnect and system memory during the frame. Setting the SELFREFRESH bit to 0x0 updates the DMA buffer.

NOTE: The WB pipeline does not support ultralow-power mode.

10.2.4.7 Rotation and Mirroring

The DISPC provides flexible mechanisms for an efficient implementation of rotation using the DISPC, its DMA engine, and the rotation engine of the TILER module. The rotation is handled only through the TILER, which supplies the encoded pixels to the DISPC.

NOTE: No rotation or mirroring is supported when accessing internal SDRAM directly.

The TILER supports:

- Rotation 0-, 90-, 180-, 270-degree views
- Mirroring
- Any combination of the two previous (for example, Rot-90 + mirroring, etc.)

Figure 10-41. 90-Degree Rotation With Mirroring

When accessing YUV4:2:2 data, each 32-bit value loaded into the DMA buffer can represent either:

- Two consecutive pixels on the same line (for instance, 0-/180-degree rotation)
- Two pixels adjacent vertically (for instance, 90-/270-degree rotation)

The reading from the DMA buffer supports the extraction of the two pixels regardless of the rotation. When the pixels are not consecutive on the same line (90-/270-degree rotation), the chrominance sample of the first pixel of each 32-bit value is duplicated for the second pixel in the same 32-bit value.

The rotation flag [DISPC_VIDn_ATTRIBUTES\[13:12\]](#) ROTATION and the [DISPC_VIDn_ATTRIBUTES\[4:1\]](#) FORMAT bit fields define the processing to extract the pixels from YUV4:2:2 32-bit values. Software must ensure that the settings of the ROTATION and FORMAT bit fields are coherent with the rotation/mirroring defined through the address format in the TILER-specific address map. For more information, see [Section 16.2.3.6.2, TILER Macro-Architecture](#), in [Section 16.2, Dynamic Memory Manager](#).

[Table 10-28](#) describes the register settings of the DISPC when accessing, rotating, and mirroring an image using the TILER. A physical base address (PBA) for each rotation is determined and set as the buffer address (BA). The row incremental is determined and set in ROW_INC. The value of the pixel increment, PIXEL_INC, is set to 0x1 (contiguous pixels).

Table 10-28. Register Settings for Rotation Using TILER

| Rotation | Registers | Rotation With and Without Mirroring |
|-------------|--|-------------------------------------|
| 0 degree | DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC/DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC | PBA0 1 to 16 ROW0 |
| 90 degrees | DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC/DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC | PBA90 1 to 16 ROW90 |
| 180 degrees | DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC/DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC | PBA180 1 to 16 ROW180 |
| 270 degrees | DISPC_GFX_BA_j/DISPC_VIDp_BA_j/DISPC_WB_BA_j DISPC_GFX_PIXEL_INC/DISPC_VIDp_PIXEL_INC/DISPC_WB_PIXEL_INC DISPC_GFX_ROW_INC/DISPC_VIDp_ROW_INC/DISPC_WB_ROW_INC | PBA270 1 to 16 ROW270 |

NOTE: For YUV format, in addition to the DISPC_VIDp_BA_j register used for the Y component, the DISPC_VIDp_BA_UV_j register must be set to define the base address of the UV frame buffer in memory.

The PBA rotation is determined by:

- $PBA0 = PBA \mid (\text{mode } 27) \mid (\text{orientation } 29) \mid (132)$
- $PBA90 = PBA \mid (\text{mode } 27) \mid (\text{orientation } 29) \mid (132)$
- $PBA180 = PBA \mid (\text{mode } 27) \mid (\text{orientation } 29) \mid (132)$
- $PBA270 = PBA \mid (\text{mode } 27) \mid (\text{orientation } 29) \mid (132)$

Where PBA is the physical base address of image in the memory.

The ROW rotation is determine by:

- If 8 bits per pixel:
 - ROW0 = 16384: Width of the video picture in memory (in bytes) + 1
 - ROW90 = 8192: Width of the video picture in memory (in bytes) + 1
 - ROW180 = 16384: Width of the video picture in memory (in bytes) + 1
 - ROW270 = 8192: Width of the video picture in memory (in bytes) + 1
- If 16 bits per pixel:
 - ROW0 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW90 = 8192: Width of the video picture in memory (in bytes) + 1
 - ROW180 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW270 = 8192: Width of the video picture in memory (in bytes) + 1
- If 32 bits per pixel:
 - ROW0 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW90 = 16384: Width of the video picture in memory (in bytes) + 1
 - ROW180 = 32768: Width of the video picture in memory (in bytes) + 1
 - ROW270 = 16384: Width of the video picture in memory (in bytes) + 1

Table 10-29. Mode Definition

| | 8-Bit Tiled | 16-Bit Tiled | 32-Bit Tiled | Page Tiled |
|------|-------------|--------------|--------------|------------|
| Mode | 0 | 1 | 2 | 3 |

Table 10-30. Orientation Definition

| Type of Orientation | Value |
|--------------------------------|-------|
| 0-degree view | 0x0 |
| 180-degree view with mirroring | 0x1 |
| 0-degree view with mirroring | 0x2 |
| 180-degree view | 0x3 |
| 270-degree view with mirroring | 0x4 |
| 270-degree view | 0x5 |
| 90-degree view | 0x6 |
| 90-degree view with mirroring | 0x7 |

NOTE: For YUV4:2:0 progressive pixel format, because the value of the DISPC_VIDp_ROW_INC register is defined for the Y buffer, the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit must be set to 1 when rotating the picture by 0 and 180 degrees and must be reset to 0 when rotating the picture by 90 and 270 degrees.

For YUV4:2:0 interlaced pixel format, because the value of the DISPC_VIDp_ROW_INC register is defined for the Y buffer, the DISPC_VIDp_ATTRIBUTES[22] DOUBLESTRIDE bit must be set to 1 when rotating the picture by 0 and 180 degrees. Rotations of 90 and 270 degrees are not supported with this pixel format.

10.2.4.8 Memory Format

The graphic and video pipelines support various types of memory format. [Table 10-31](#) list all supported formats for each pipeline. The nibble mode is enabled by setting the [DISPC_GFX_ATTRIBUTES\[9\]](#) NIBBLEMODE bit to 0x1 and applies only to BITMAP format for the GFX pipeline.

Table 10-31. Memory Formats Supported

| Formats | GFX | VID1 | VID2 | VID3 | WB |
|---------------|-----|------|------|------|----|
| BITMAP 1-BPP | x | | | | |
| BITMAP 2-BPP | x | | | | |
| BITMAP 4-BPP | x | | | | |

10.2.4.9 Graphics Pipeline

The graphics pipeline is connected to the GFX FIFO for the input port and to the three overlay managers for the output or WB pipeline. The pixel output is directed to an LCD, TV, or WB path by setting the [DISPC_GFX_ATTRIBUTES](#)[8] CHANNELOUT bit and the [DISPC_GFX_ATTRIBUTES](#)[31:30] CHANNELOUT2 bit field. [Table 10-50](#) lists the bit field settings to orient a pipeline to an LCD, TV, or WB output. The default value directs the GFX pipeline to LCD1.

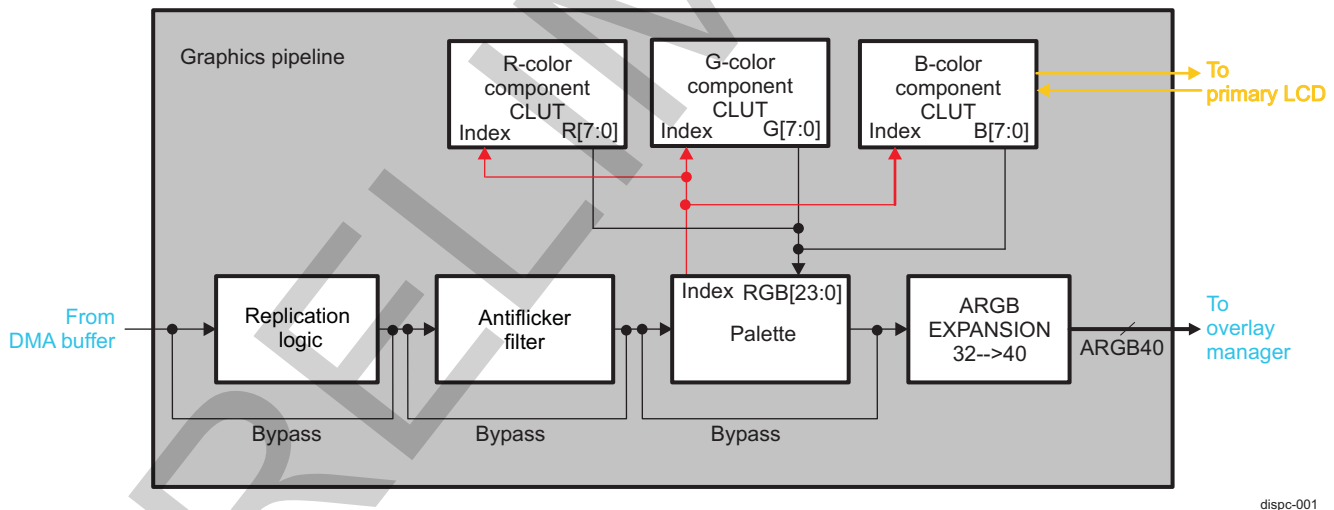

The pipeline consists of programmable replication logic, an antiflicker filter, and one 256-entry palette table. The replication logic is used to convert the RGB pixels, excluding the RGB24 format, into an ARGB32-based format. The antiflicker filter processes the graphics data in RGB format to remove some of the vertical flicker. The 256-entry palette is used to convert bitmap formats into RGB formats or for gamma corrections when RGB format is inputted.

[Table 10-31](#) lists the input formats supported by the graphics pipeline.

The graphics pipeline is enabled by setting the [DISPC_GFX_ATTRIBUTES](#)[0] ENABLE bit to 0x1.

[Figure 10-42](#) shows the graphics pipeline.

Figure 10-42. Graphics Pipeline

10.2.4.9.1 Replication Logic

The replication logic increases the color depth of the graphics-encoded pixels (from true color RGB 12, and 16 to 40 bpp).

- When the replication logic is enabled by setting the [DISPC_GFX_ATTRIBUTES](#)[5] REPLICATIONENABLE bit to 0x1, the MSBs are copied to the missing LSB. [Table 10-34](#) describes the remapping of the RGB pixels into ARGB 40-bit values.

Table 10-32. Replication Enabled: RGB Pixel Formats Remapping Into ARGB40-10.10.10.10

| Formats | A[7:0] | R[7:0] | G[7:0] | B[7:0] |
|-------------|--------------------|--------------------|--------------------|--------------------|
| | MSB LSB | MSB LSB | MSB LSB | MSB LSB |
| xRGB12-4444 | 11111111 | R[3:0]R[3:0]R[3:2] | G[3:0]G[3:0]G[3:2] | B[3:0]B[3:0]B[3:2] |
| RGBx12-4444 | 11111111 | R[3:0]R[3:0]R[3:2] | G[3:0]G[3:0]G[3:2] | B[3:0]B[3:0]B[3:2] |
| RGB16-565 | 11111111 | R[4:0]R[4:0] | G[5:0]G[5:2] | B[4:0]B[4:0] |
| xRGB16-1555 | 11111111 | R[4:0]R[4:0] | G[4:0]G[4:0] | B[4:0]B[4:0] |
| ARGB16-1555 | AAAAAAAA | R[4:0]R[4:0] | G[4:0]G[4:0] | B[4:0]B[4:0] |
| ARGB16-4444 | A[3:0]A[3:0]A[3:2] | R[3:0]R[3:0]R[3:2] | G[3:0]G[3:0]G[3:2] | B[3:0]B[3:0]B[3:2] |
| RGBA16-4444 | A[3:0]A[3:0]A[3:2] | R[3:0]R[3:0]R[3:2] | G[3:0]G[3:0]G[3:2] | B[3:0]B[3:0]B[3:2] |

- When the replication logic is disabled by setting the [DISPC_GFX_ATTRIBUTES\[5\]](#) REPLICATIONENABLE bit to 0x0, the encoded pixel values are shifted to the MSB boundary of the 24-bit format. The missing bit values are filled with 0s. [Table 10-35](#) describes the remapping of the RGB pixels into ARGB 40-bit values.

Table 10-33. Replication Disabled: RGB Pixel Formats Remapping Into ARGB40-10.10.10.10

10.2.4.9.2 Antiflicker Filter

The antiflicker filter processes the graphics data to remove some of the vertical flicker. It is based on 3-tap finite impulse response (FIR) filter with fixed coefficients. For each pixel to be output from the graphics pipeline, the pixel above and the pixel below the current line must be read from the DMA graphics FIFO. Therefore, three lines of pixels must be stored in the DMA graphics FIFO.

The antiflickering equations for A, R, G, and B components are:

$$A_{out}(x,y) = 0.25 \cdot A_{in}(x,y-1) + 0.5 \cdot A_{in}(x,y) + 0.25 \cdot A_{in}(x,y+1)$$

$$R_{out}(x,y) = 0.25 \cdot R_{in}(x,y-1) + 0.5 \cdot R_{in}(x,y) + 0.25 \cdot R_{in}(x,y+1)$$

$$G_{out}(x,y) = 0.25 \cdot G_{in}(x,y-1) + 0.5 \cdot G_{in}(x,y) + 0.25 \cdot G_{in}(x,y+1)$$

$$B_{out}(x,y) = 0.25 \cdot B_{in}(x,y-1) + 0.5 \cdot B_{in}(x,y) + 0.25 \cdot B_{in}(x,y+1)$$

For the first line of processing, because there is no pixel above, the value (x, y) is duplicated.

$$Out(x,y) = 0.25 \cdot In(x,y) + 0.5 \cdot In(x,y) + 0.25 \cdot In(x,y+1)$$

For the last line of processing, because there is no pixel below, the value (x, y) is duplicated.

$$Out(x,y) = 0.25 \cdot In(x,y-1) + 0.5 \cdot In(x,y) + 0.25 \cdot In(x,y)$$

NOTE: Antiflicker filtering is supported only in RGB formats and not in BITMAP formats.

Antiflickering is not supported for pictures with fewer than two lines. In this case, the user must disable the antiflickering processing.

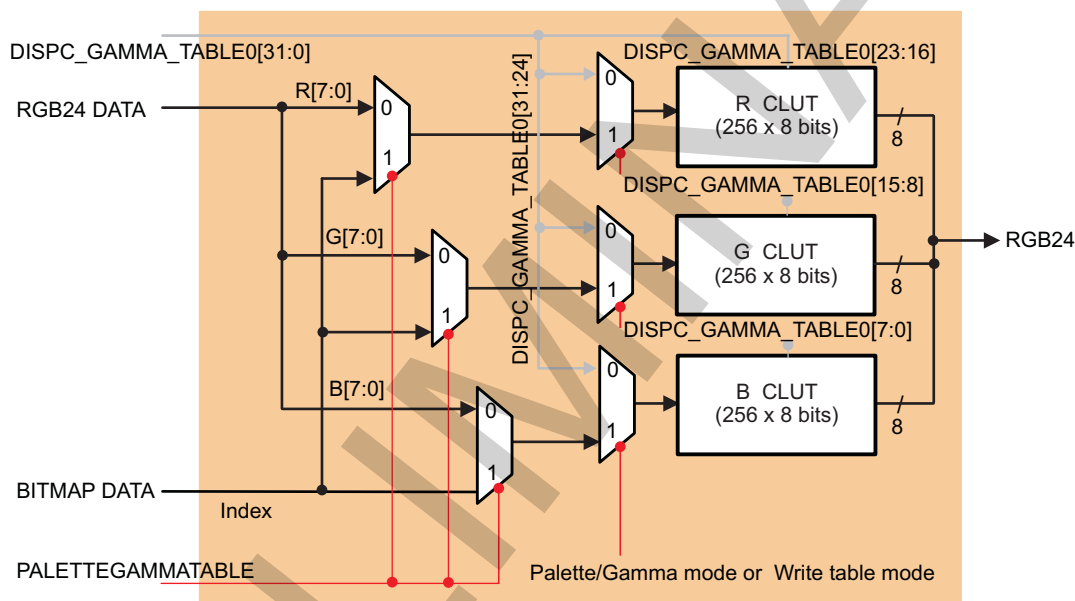

10.2.4.9.3 Color Look-Up Table (CLUT)

The graphics pipeline supports conversion of the BITMAP formats into RGB24 formats through a palette table. To enable palette mode, the `DISPC_CONFIG1[3]` PALETTEGAMMABLE bit must be set to 0x0. Figure 10-43 shows the internal architecture of the color look-up/gamma table.

The palette is split into three memories of 256-bit × 8-bit entries. For bitmap (CLUT) indexes, the same value (1-, 2-, 4-, or 8-bpp) indexes the three memories. The table can be reloaded every frame, once, or never (at the beginning of the frame before fetching pixels for the graphics). The table is loaded dynamically at the beginning of the frame by the DISPC DMA engine. The base address of the table buffer is set in the `DISPC_GFX_TABLE_BA[31:0]` TABLEBA bit field. It is possible to load the table for every frame or only for a specific frame by setting the `DISPC_CONFIG1[2:1]` LOADMODE bit field.

The table can be loaded without fetching data for the graphics pipeline. The DMA buffer associated with the graphics pipeline is used to fetch the table from memory. Regardless of the mode (color or monochrome) for each entry into the table, one 32-bit value is fetched from memory.

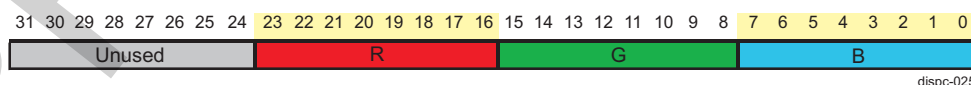

Figure 10-43. Palette/Gamma Correction Architecture

dispc-002

The palette mode uses the encoded pixel values from the input graphics FIFO as pointers to index the 24-bit-wide palette: 1-bpp pixels address 2 palette entries, 2-bpp pixels address 4 palette entries, 4-bpp pixels address 16 palette entries, and 8-bpp pixels address 256 palette entries. In color mode, the value within the palette is made up of three 8-bit fields, one for each color component: red, green, and blue (see Figure 10-44). For color operation, an individual frame is limited to a selection of 256 colors (the number of palette entries). In monochrome mode, only one 8-bit value is present. After passing through the palette, 256 grayscales and 16,777,216 colors are obtained (see Figure 10-45).

Figure 10-44. Data Memory Organization: Color Mode

dispc-025

Figure 10-45. Data Memory Organization: Gray Mode

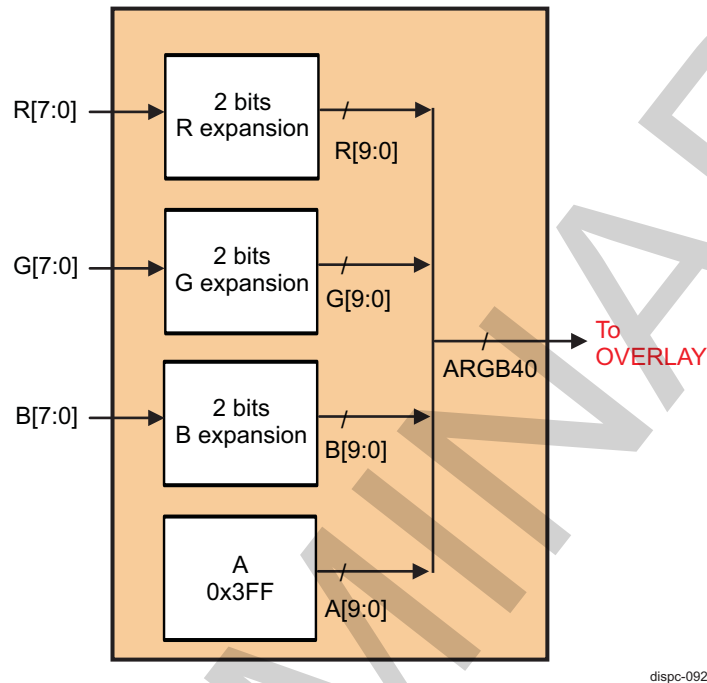

dispc-026

When a palette entry is selected by the encoded pixel value, the content of the entry and the index are sent to the LCD1 overlay manager.

10.2.4.9.4 Expansion to ARGB40

The expansion module takes in inputs the RGB24 pixel format outputted from the palette module. The module automatically replicates the 2 MSBs of each color component to create an ARGB40 pixel with the A component set to 0x3FF (see [Figure 10-46](#)).

Figure 10-46. Expansion to ARGB40

10.2.4.10 Video Pipelines

Three identical video pipelines are available, VID1, VID2, and VID3. Each video pipeline is connected to its video FIFO controller for the input port and to the three overlay managers LCD 1, LCD2, and TV or WB pipeline. The pixel output is directed to the LCD, TV, or WB path by setting the DISPC_VIDp_ATTRIBUTES[8] CHANNELOUT bit and the DISPC_VIDp_ATTRIBUTES[31:30] CHANNELOUT2 bit field. [Table 10-50](#) lists the bit field settings to orient a pipeline to an LCD, TV, or WB output. The default value directs all video pipelines to LCD1.

A video pipeline consists of a scaler unit, a color space conversion unit (CSC), a VC-1 range mapping unit, and some programmable replication logic. The video pipeline unit order can be configured in two manners (see [Figure 10-47](#) and [Figure 10-48](#)):

- Configuration 1: VC-1 range mapping unit followed by CSC a unit and then a scaler unit. The configuration is used to support RGB, ARGB, and RGBA formats, and YUV4:2:2 format in backward mode for both data types. Each block can be independently bypassed.
- Configuration 2: VC-1 range mapping unit followed by scaler unit and then a CSC unit. The configuration is used to support RGB, ARGB, and RGBA formats, and YUV4:2:2 format and YUV420-NV12 formats taking advantage of the scaler to resample the chrominance using five taps horizontally and three or five taps vertically. Each block can be independently bypassed.

The DISPC_VIDn_ATTRIBUTES2[8] YUVCHROMARESAMPLING bit controls the order of the scaler unit in the video pipeline:

- When the YUVCHROMARESAMPLING bit is set to 0x0, the video pipeline is in configuration 1, and the scaler follows the CSC unit. In case of YUV input data in 4:2:2 format, the chrominance resampling (4:2:2 to 4:4:4 format) is done by averaging the chrominance adjacent samples for only 0 degrees (zero rotation), because other rotation (90/180/270 degrees) is not supported in this mode. For more information about the supported chrominance resampling methods, see [Section 10.2.4.10.3.1, Chrominance Resampling](#).

- When the YUVCHROMARESAMPLING bit is set to 0x1, the video pipeline is in configuration 2, and the scaler precedes the CSC unit.
 - In case of YUV4:2:2 input data with 90-/270-degree rotation, the data is preprocessed by duplicating the missing chrominance samples.
 - In case of YUV4:2:2 input data with 0-/180-degree rotation, the chroma upsampling is performed in the scaler unit.

Table 10-31 lists the input formats supported by the video pipelines.

The video pipeline is enabled by setting ENABLE bit DISPC_VIDp_ATTRIBUTES[0] to 0x1.

Figure 10-47. Configuration 1: Video Pipeline

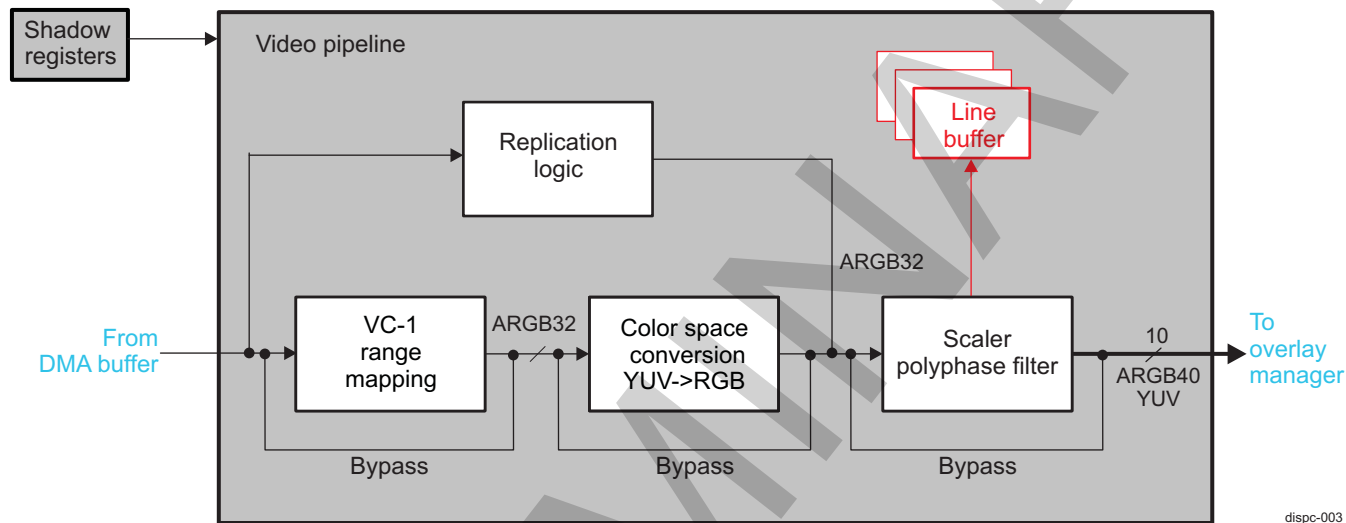

Figure 10-48. Configuration 2: Video Pipeline

10.2.4.10.1 Replication Logic

The replication logic increases the color depth of the video-encoded pixels (from true color RGB 12, and 16 to 32 bpp) and available only in configuration 1.

The expansion from 8 to 10 bits color component is done by:

- The CSC unit, when the scaler follows the CSC module and when the vertical scaler is disabled.
- The vertical scaler, when the scaler follows the CSC unit and is enabled.
- The replication bit module, when both the CSC unit and scaler are disabled.
- When the replication logic is enabled by setting the DISPC_VIDp_ATTRIBUTES[10]

REPLICATIONENABLE bit to 0x1, the MSBs are copied to the missing LSBs. [Table 10-34](#) describes the remapping of the RGB pixels into ARGB 32-bit values.

Table 10-34. Replication Enabled: RGB Pixel Formats Remapping Into ARGB32-8888

| Formats | A[7:0] | R[7:0] | G[7:0] | B[7:0] |
|-------------|--------------|--------------|--------------|--------------|
| | MSB LSB | MSB LSB | MSB LSB | MSB LSB |
| xRGB12-4444 | 11111111 | R[3:0]R[3:0] | G[3:0]G[3:0] | B[3:0]B[3:0] |
| RGBx12-4444 | 11111111 | R[3:0]R[3:0] | G[3:0]G[3:0] | B[3:0]B[3:0] |
| RGB16-565 | 11111111 | R[4:0]R[4:2] | G[5:0]G[5:4] | B[4:0]B[4:2] |
| xRGB16-1555 | 11111111 | R[4:0]R[4:2] | G[4:0]G[4:2] | B[4:0]B[4:2] |
| ARGB16-1555 | AAAAAAAA | R[4:0]R[4:2] | G[4:0]G[4:2] | B[4:0]B[4:2] |
| ARGB16-4444 | A[3:0]A[3:0] | R[3:0]R[3:0] | G[3:0]G[3:0] | B[3:0]B[3:0] |
| RGBA16-4444 | A[3:0]A[3:0] | R[3:0]R[3:0] | G[3:0]G[3:0] | B[3:0]B[3:0] |

- When the replication logic is disabled by setting the DISPC_VIDp_ATTRIBUTES[10] REPLICATIONENABLE bit to 0x0, the encoded pixel values are shifted to the MSB boundary of the 24-bit format. The missing bit values are filled with 0s. [Table 10-35](#) describes the remapping of the RGB pixels into ARGB 32-bit values.

Table 10-35. Replication Disabled: RGB Pixel Formats Remapping Into ARGB32-8888

| RGBA16-4444 | A[3:0]A[3:0] | R[3:0]0000 | G[3:0]0000 | B[3:0]0000 |

10.2.4.10.2 VC-1 Range Mapping Unit

The VC-1 range mapping unit is used when the video frame picture is decoded using a VC-1 codec by the video accelerator. It remaps the Y, Cb, and Cr components. The unit is used primarily for YUV4:2:0-NV12 pixel format but also can be applied to YUV4:2:2 pixel formats (YUV2 and UYVY).

The VC-1 range mapping unit is enabled by setting the DISPC_VIDp_ATTRIBUTES2[0] VC1ENABLE bit to 0x1. The DISPC_VIDp_ATTRIBUTES2[3:1] VC1_RANGE_Y and DISPC_VIDp_ATTRIBUTES2[6:4] VC1_RANGE_CBCR bit fields are two 3-bit values programmed by the user and are independent for each video pipeline. The module is governed by the equations:

$$Y_{out} = \text{CLIP}((((Y_{int} - 128) \times (VC1_RANGE_Y + 9) + 4) / 8) + 128)$$

$$C_b = \text{CLIP}((((C_b - 128) \times (VC1_RANGE_CBCR + 9) + 4) / 8) + 128)$$

$$C_r = \text{CLIP}((((C_r - 128) \times (VC1_RANGE_CBCR + 9) + 4) / 8) + 128)$$

NOTE: The input and output pixel values are unsigned (Y, Cr, and Cb).

The function CLIP () clips to 0 or 255 when min or max are reached, respectively; otherwise resulting output stay identical.

10.2.4.10.3 CSC Unit YUV to RGB

The CSC unit converts the video-encoded pixel values from YUV4:4:4 format into RGB24 or RGB30 format. The output format depends on the video pipeline configuration selected:

- Configuration 1: RGB24 output format, with 8-bit value per component: red, green, and blue
- Configuration 2: RGB30 output format, with 10-bit value per component: red, green, and blue

In case of YUV4:2:0 or YUV4:2:2 formats, a chrominance resampling to YUV4:4:4 is required before converting the YUV into RGB values (see [Section 10.2.4.10.3.1, Chrominance Resampling](#)). YUV4:2:2 or YUV4:2:0 to YUV4:4:4 chrominance resampling is a preprocessing to the color space conversion.

[Figure 10-49](#) to [Figure 10-52](#) show the 3×3 11-bit coefficients used to convert from YUV4:4:4 into RGB24. The coefficients are set according to the standard used to encode the pixel data in YUV color space. [Table 10-36](#) resumes the coefficients with their respective bit fields.

Table 10-36. Color Space Conversion YUV to RGB Bit Field Setting

| Coefficients | Bit Field Registers |
|--------------|----------------------------------|
| R_Y | DISPC_VIDp_CONV_COEF0[10:0] RY |
| R_{Cr} | DISPC_VIDp_CONV_COEF0[26:16] RCR |
| R_{Cb} | DISPC_VIDp_CONV_COEF1[10:0] RGB |
| G_Y | DISPC_VIDp_CONV_COEF1[26:16] GY |
| G_{Cr} | DISPC_VIDp_CONV_COEF2[10:0] GCR |
| G_{Cb} | DISPC_VIDp_CONV_COEF2[26:16] GCB |
| B_Y | DISPC_VIDp_CONV_COEF3[10:0] BY |
| B_{Cr} | DISPC_VIDp_CONV_COEF3[26:16] BCR |
| B_{Cb} | DISPC_VIDp_CONV_COEF4[10:0] BCB |

- For configuration 1 with an RGB24 output:
If the active range for the luminance samples (Y) is [235:16] and [240:16] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [255:0].

NOTE: The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

Figure 10-49. YCbCr to RGB Registers (FULLRANGE = 0), 8-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 16 \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-005

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [0:255], the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [0:255].

Figure 10-50. YCbCr to RGB Registers (FULLRANGE = 1), 8-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 128 \\ Cb_{IN} - 128 \end{bmatrix}$$

dispc-006

- For configuration 2 with an RGB30 output:
If the active range for the luminance samples (Y) is [940:64] and [960:64] for the chrominance samples (Cb and Cr), the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x0. The values of R, G, and B output components are clipped to the range [1023:0].

NOTE: The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

Figure 10-51. YCbCr to RGB Registers (FULLRANGE = 0), 10-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} - 64 \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-074

If the active range for the luminance samples (Y) and chrominance samples (Cb and Cr) is [1023:0], the range selection is done by setting the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit to 0x1. The values of R, G, and B output components are clipped to the range [1023:0].

Figure 10-52. YCbCr to RGB Registers (FULLRANGE = 1), 10-Bit Outputs

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} R_Y & R_{Cr} & R_{Cb} \\ G_Y & G_{Cr} & G_{Cb} \\ B_Y & B_{Cr} & B_{Cb} \end{bmatrix} * \begin{bmatrix} Y_{IN} \\ Cr_{IN} - 512 \\ Cb_{IN} - 512 \end{bmatrix}$$

dispc-075

10.2.4.10.3.1 Chrominance Resampling

Two methods are supported to resample chrominance:

- Averaging of the chrominance is done by software followed by hardware conversion when the video pipeline is in configuration 1.
- Filtering of the chrominance using the scaler unit (chrominance resampling and rescaling can be combined to support native rescaling of YUV format) when the video pipeline is in configuration 2.

To convert the YUV4:2:2 encoded pixel values into YUV4:4:4 format, the averaging of the chrominance technique can be used as shown in [Figure 10-53](#). The missing chrominance samples (Cb and Cr) are interpolated using the average values of the two closest values on the same line (,) or are repeated from the second pixel in the same 32-bit container (see [Figure 10-54](#)). For the last pixel, the chrominance samples are duplicated using the values from the previous pixel; otherwise, the chrominance samples are averaged using the two adjacent values. [Figure 10-55](#) shows the flow of the pixel.

Figure 10-53. Averaging of the Chrominance Formula

$$Cb_n(YCbCr\ 444) = \frac{Cb_{n-1}(YCbCr\ 422) + Cb_{n+1}(YCbCr\ 422)}{2} \text{ (n odd)}$$

$$Cr_n(YCbCr\ 444) = \frac{Cr_{n-1}(YCbCr\ 422) + Cr_{n+1}(YCbCr\ 422)}{2} \text{ (n odd)}$$

dispc-010

Figure 10-54. Averaging of the Chrominance Representation

dispc-011

Figure 10-55. YUV4:2:2 to RGB30 Using Averaging of the Chrominance

The scaler unit can be used to resample the chrominance of YUV4:2:0 and YUV4:2:2, as shown in [Figure 10-56](#) and [Figure 10-57](#), respectively. The settings of the scaler unit to perform chrominance resampling are described in [Section 10.2.4.10.4, Scaler Unit](#).

Figure 10-56. YUV4:2:0 to RGB30 Using Scaler Unit for Resampling Chrominance

Figure 10-57. YUV4:2:2 to RGB30 Using Scaler Unit for Resampling Chrominance

NOTE: If rotation must be supported, YUV4:2:2 and YUV4:2:0 (0-/180-degree rotation) chrominance resampling is done as shown in [Figure 10-57](#) and [Figure 10-56](#), respectively. For YUV4:2:2 (90-/270-degree rotation) data are preprocessed to present YUV4:4:4 on the scaler input (duplication of the missing chroma), as shown in [Figure 10-55](#).

10.2.4.10.4 Scaler Unit

All video formats are supported, including formats with alpha blending. Alpha blending is scaled with the same parameters as RGB color components. For the YUV formats, Y and Cb/Cr are processed independently. The filter is based on a FIR filter. The filtering can be used for different processing:

- Upsampling of the picture
- Downsampling of the picture
- Antiflicker reduction
- De-interlacing using "bob" algorithm
- Chrominance resampling in case of YUV data formats

NOTE: The user must ensure the resizing frame displays in the LCD/screen boundaries.

[Figure 10-58](#) shows an example of video upsampling.

Figure 10-58. Video Upsampling

The up/downsampling filter is a polyphase filter with five taps and eight phases for the horizontal filter, and a programmable number of taps (three or five) and eight phases for vertical filter. The input buffer has five input memory lines. The following limitations must be considered:

- The upsampling ratio is up to x8.
- The downsampling ratio using 3-tap configuration is down to x0.5 for RGB format.
- The downsampling ratio using 5-tap configuration is down to x0.25 for RGB format.
- If the input format is changed from YUV4:2:2 to YUV4:2:0 (WB pipeline), the downsampling ratio is further reduced:
 - Using 5-tap configuration, the ratio is down to x0.5 for RGB format.
 - Using 3-tap configuration, no downscaling is available.

For the vertical up/downsampling in 3-tap configuration, the equations are:

| For RGB formats | For YUV formats |
|--|---|
| $A_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * A_{in}(n+i)) >> 5$ | $Y_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * Y_{in}(n+i)) >> 5$ |
| $R_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * R_{in}(n+i)) >> 5$ | $Cr_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\Phi) * Cb_{in}(n+i)) >> 5$ |
| $G_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * G_{in}(n+i)) >> 5$ | $Cb_{out}(n) = (\sum_{i=-1}^{i=1} C_{vci}(\Phi) * Cr_{in}(n+i)) >> 5$ |
| $B_{out}(n) = (\sum_{i=-1}^{i=1} C_{vi}(\Phi) * B_{in}(n+i)) >> 5$ | |

dispc-013

(7)

For the vertical up/downsampling in 5-tap configuration, the equations are:

| For RGB formats | For YUV formats |
|--|---|
| $A_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * A_{in}(n+i)) >> 5$ | $Y_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * Y_{in}(n+i)) >> 5$ |
| $R_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * R_{in}(n+i)) >> 5$ | $Cb_{out}(n) = (\sum_{i=-2}^{i=2} C_{vci}(\Phi) * Cb_{in}(n+i)) >> 5$ |
| $G_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * G_{in}(n+i)) >> 5$ | $Cr_{out}(n) = (\sum_{i=-2}^{i=2} C_{vci}(\Phi) * Cr_{in}(n+i)) >> 5$ |
| $B_{out}(n) = (\sum_{i=-2}^{i=2} C_{vi}(\Phi) * B_{in}(n+i)) >> 5$ | |

dispc-012

(8)

For the horizontal up/downsampling in 5-tap configuration, the equations are:

| For RGB formats | For YUV formats |
|---|--|
| $A_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * A_{in}(n+i) \right) >> 7$ | $Y_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi_y) * Y_{in}(n+i) \right) >> 7$ |
| $R_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * R_{in}(n+i) \right) >> 7$ | $Cb_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hcb}(\Phi_c) * Cb_{in}(n+i) \right) >> 7$ |
| $G_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * G_{in}(n+i) \right) >> 7$ | $Cr_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hcb}(\Phi_c) * Cr_{in}(n+i) \right) >> 7$ |
| $B_{out}(n) = \left(\sum_{i=-2}^{i=2} C_{hi}(\Phi) * B_{in}(n+i) \right) >> 7$ | |

dispc-014

(9)

NOTE: The pixel (n + 1) is the previous pixel with respect to pixel (n). The line (n + 1) is the previous line with respect to line (n).

The coefficients $Ci()$ depend on the phase between input and output pixels.

NOTE: The coefficients are different for Y and Cr, Cb filtering because the calculations are independent due to the chrominance resampling for YUV4:2:2 and YUV4:2:0.

First, the vertical filter is applied to the encoded input pixel data, and then the horizontal filter is applied on the resulting pixel values to generate the output pixel values. The vertical input of the filter consists of five lines of 2048×32 bits for 3-tap and 5-tap configurations (see [Table 10-37](#)).

Table 10-37. Line Buffer Width for Scaler Unit

| Vertical Taps | Maximum Input Width (Pixels) |
|---------------|------------------------------|
| 3, 5 | 2048×32 bits |

At the beginning of frame scaling processing, the first line is duplicated to fill the first two lines in 3-tap configuration and the first three lines in 5-tap configuration.

At the end of frame scaling processing, the last line is duplicated if the scaling logic requires loading more lines and the last line has been reached.

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The video scalers have an 8-bit input and a 10-bit output. The vertical scaling changes the 8-bit input into a 10-bit clipped output and the horizontal scaling takes the 10-bit input.

[Figure 10-59](#) and [Figure 10-60](#) show the scaler macro-architecture for the component A, R, G, B, and Y. [Figure 10-61](#) and [Figure 10-62](#) show the scaler macro-architecture for component Cr and Cb.

The scaling output can be clipped to an output range of [1023:0] or [960:64] by configuring the DISPC_VIDp_ATTRIBUTES[11] FULLRANGE bit.

NOTE: The scaling and CSC clipping is set by the same bit, DISPC_VIDp_ATTRIBUTES[11] FULLRANGE.

The VID scaler unit vertical or/and horizontal sampling is defined by setting/resetting the DISPC_VIDp_ATTRIBUTES[6:5] RESIZEENABLE bit field.

A set of configurations must be valid before enabling the video up/downsampling block.

The following bit fields define the configuration of the video up/downsampling block for VIDp:

- Vertical up/downsampling increment the value of the DISPC_VIDp_FIR[28:16] FIRVINC bit field. The unsigned integer value range is [4096:1]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left(\frac{ORGSIZEY}{SIZEY} \right) \quad \text{dispc-066} \quad (10)$$

NOTE:

- If the value of the DISPC_VIDp_FIR[28:16] FIRVINC bit field is greater than 4096, it is clipped to 4096.
- If the DISPC_VIDp_SIZE[26:16] SIZEY bit field equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
- The values of the DISPC_VIDp_PICTURE_SIZE[26:16] ORGSIZEY and DISPC_VIDp_SIZE[26:16] SIZEY bit fields must be programmed with the value desired minus 1.

- Horizontal up/downsampling increments the value of the DISPC_VIDp_FIR[12:0] FIRHINC bit field: The unsigned integer value range is [1:4096]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left(\frac{ORGSEX}{SEX} \right) \quad \text{dispc-067} \quad (11)$$

NOTE:

- If the value of the DISPC_VIDp_FIR[12:0] FIRHINC bit field is greater than 4096, it is clipped to 4096.
- If the DISPC_VIDp_SIZE[10:0] SEX bit field equals 1, the DISPC_VIDp_SIZE[10:0] SEX bit field is replaced by 2 in the previous equation.
- The values of the DISPC_VIDp_PICTURE_SIZE[10:0] ORGSSEX and DISPC_VIDp_SIZE[10:0] SEX bit fields must be programmed with the value desired minus 1.

- Vertical up/downsampling accumulator value DISPC_VIDp_ACCU_j[26:16] VERTICALACCU bit field: The signed integer value range is [–1024:1023]. The accumulator value indicates on which phase the vertical filtering starts. The DISPC_VIDp_ACCU_0 register is used for progressive output and for interlace output; the DISPC_VIDp_ACCU_0 and DISPC_VIDp_ACCU_1 registers are used. Similarly, DISPC_VIDp_ACCU2_0 and DISPC_VIDp_ACCU2_1 are used in progressive or interlace output to

set the accumulator value of the Cb and Cr components when scaling YUV format.

- Vertical up/downsampling line buffer configuration DISPC_VIDp_ATTRIBUTES[21] VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit is reset, the 3-tap configuration is used.
- Horizontal up/downsampling accumulator value DISPC_VIDp_ACCU_j[10:0] HORIZONTALACCU bit field: The signed integer value range is [–1024:1023]. The accumulator value indicates on which phase the horizontal filtering starts. The DISPC_VIDp_ACCU_0 register is used for progressive output and for interlace output; the DISPC_VIDp_ACCU_0 and DISPC_VIDp_ACCU_1 registers are used. Similarly, DISPC_VIDp_ACCU2_0 and DISPC_VIDp_ACCU2_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.

Table 10-40. Vertical/Horizontal Accumulator Phase

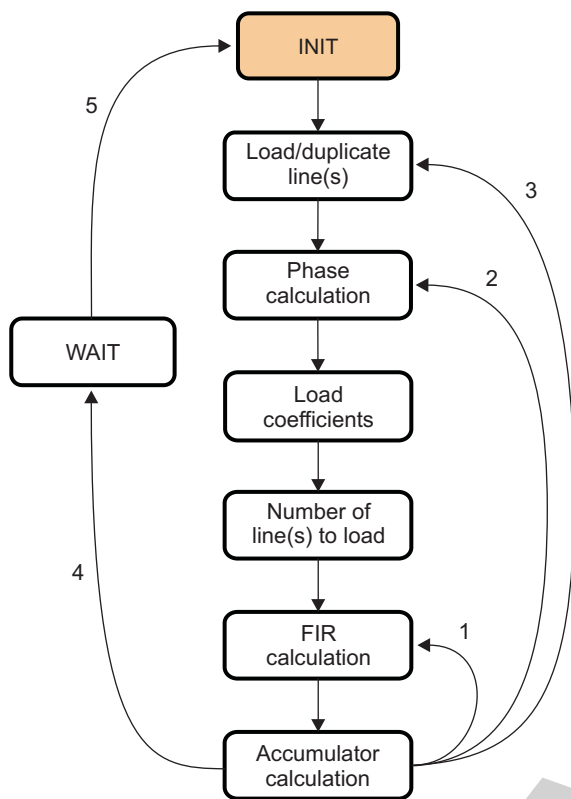

| Accumulator Value | Phases f |
|-------------------|----------|
| 0 | 0 |
| 128 or –896 | 1 |
| 256 or –768 | 2 |
| 384 or –640 | 3 |
| 512 or –512 | 4 |
| 640 or –384 | 5 |
| 768 or –256 | 6 |
| 896 or –128 | 7 |

- Vertical up/downsampling coefficients:
 - The 3-tap vertical up/downsampling coefficients are defined in the DISPC_VIDp_FIR_COEF_HV_i registers. There are eight registers for the eight phases with three coefficients for each, or a total of 24 programmable coefficients for the vertical up/downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
 - The 5-tap vertical up/downsampling coefficients: Two extra-tap vertical up/downsampling coefficients are defined in the DISPC_VIDp_FIR_COEF_V_i registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical up/downsampling block are used in addition to the 3-tap registers previously defined. Four YUV vertical up/downsampling coefficients are set in DISPC_VIDp_FIR_COEF_HV2_i and DISPC_VIDp_FIR_COEF_V2_i registers. [Table 10-38](#) and [Table 10-39](#) list all coefficients and their respective registers.
- Horizontal up/downsampling coefficients:
 - The DISPC_VIDp_FIR_COEF_H_i and DISPC_VIDp_FIR_COEF_HV_i registers define the 5-tap horizontal up/downsampling coefficients. Each DISPC_VIDp_FIR_COEF_H_i register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each DISPC_VIDp_FIR_COEF_HV_i register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal up/downsampling block are used. Four YUV horizontal up/downsampling coefficients are set in the DISPC_VIDp_FIR_COEF_HV2_i and DISPC_VIDp_FIR_COEF_H2_i registers. [Table 10-38](#) and [Table 10-39](#) list all coefficients and their respective registers.

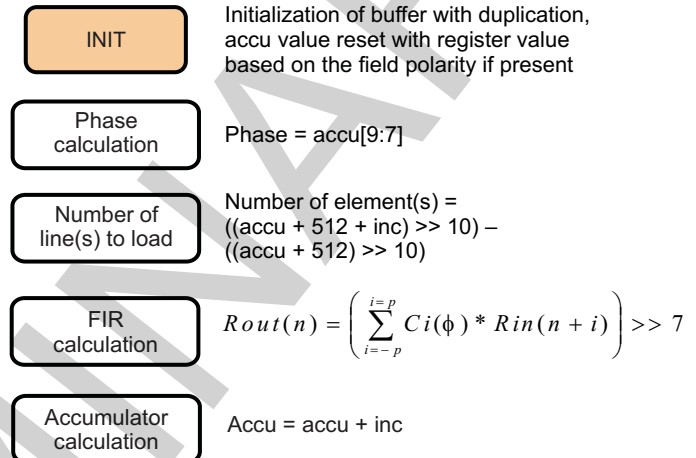

10.2.4.10.4.1 Scaling Algorithms

[Figure 10-63](#) and [Figure 10-64](#) show details of the up/downsampling finite state-machines (FSMs).

10.2.4.10.4.2 Scaling Limitations

Table 10-41 through Table 10-44 list the minimum ratio between the pixel clock frequency (PCLK) and the functional clock (DISPC_CORE_CLK) in the input pixel format when using the scaler unit. PCLK and FCLK are asynchronous. For each LCD output, a dedicated LCD clock is programmable with the LCD and PCD divisor values in DISPC_DIVISORo[23:16][7:0].

NOTE: The DISPC_CORE_CLK is derived from DISPC_FCLK through the LCD divisor.

NOTE: The downscaling ratio is not an integer, but it is the ratio DISPC_CORE_CLK/LCDn_PCLK, meaning if the ratio is 2.7, then the downscaling ratio is 2.7 and not 2.

Table 10-41. Pixel Clock Frequency Limitations (Any Pixel Format), Active Matrix Display

| DISPC_CORE_CLK/LCDn_PCLK Minimum Ratio | Horizontal Resampling | | | | |
|---|-----------------------|----------------------|---------|---------|---------|
| | Off | Up | 1:1–1:2 | 1:2–1:3 | 1:3–1:4 |
| | 2(1 ⁽¹⁾) | 2(1 ⁽¹⁾) | 2 | 3 | 4 |

(1) The minimum ratio can be 1 if the data are output on the rising edge of the PCLK (DISPC_POL_FREQo.IPC = 0); otherwise, the minimum ratio must be 2.

Table 10-42. Pixel Clock Frequency Limitations (Any Pixel Format), Passive Matrix Display – Mono4

| DISPC_CORE_CLK/LCDn_PCLK Minimum Ratio | Horizontal Resampling | | | | |
|---|-----------------------|----|---------|---------|---------|

| | 8 | 8 | 16 | 24 | 32 |

10.2.4.11 Write-Back Pipeline

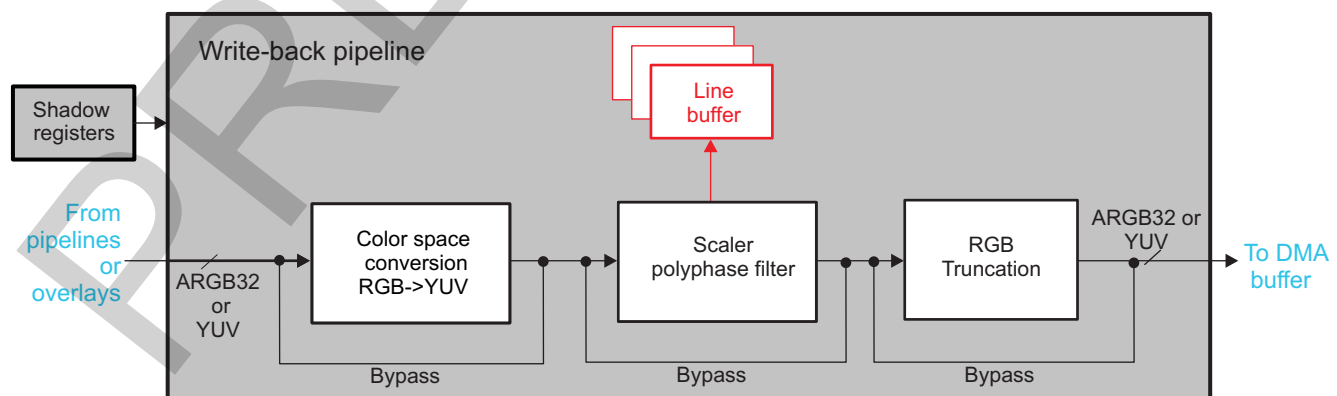

The write-back pipeline is used to store in the system memory the capture of the overlay output or the output of one of the pipelines. The WB pipeline consists of a CSC unit, a scaler unit, and an RGB truncation logic. Because the overlay works on ARGB32-8888 format and the video accelerator works on YUV format, the color space conversion from RGB to YUV is used to directly output to memory the format that can be encoded with no extra processing.

The write-back pipeline is connected to all the pipeline outputs (GFX, VD1, VID2, and VID3 pipelines) and to the output of the three overlay managers (LCD1, LCD2, and TV). The input is selected by setting the [DISPC_WB_ATTRIBUTES\[18:16\]](#) CHANNELIN bit field, and the capture frame rate is set in the [DISPC_WB_ATTRIBUTES\[26:24\]](#) CAPTUREMODE bit field.

Because the output format of the TV overlay manager is ARGB40, the graphics pipeline output is ARGB40, the video pipeline outputs are YUV4:2:2, YUV4:2:0, or ARGB40, and the WB input is ARGB32, the WB input does not consider the 2 LSBs of each ARGB component.

The WB pipeline is enabled by setting the [DISPC_WB_ATTRIBUTES\[0\]](#) ENABLE bit to 0x1.

[Figure 10-65](#) shows the graphics pipeline.

Figure 10-65. Write-Back Pipeline

dispc-016

10.2.4.11.1 CSC Unit RGB to YUV

The RGB-to-YUV CSC unit converts the encoded pixel values from RGB24 into YUV4:4:4 format. For YUV4:2:0 or YUV4:2:2 formats, a chrominance subsampling is required after converting the RGB into YUV values. Because of the subsampling, the following limitations must be considered:

- When converting RGB into YUV4:2:0 NV12 format:
 - Maximum horizontal downscale = x0.5
 - Maximum vertical downscale = x0.5
- When converting RGB into YUV4:2:2 format:
 - Maximum horizontal downscale = x0.5
 - Maximum vertical downscale = x0.25

Figure 10-66 and Figure 10-67 show the 3 × 3 11-bit coefficients used to convert from RGB24 into YUV4:4:4. The user sets the coefficients according to the standard used to encode the pixel data in YUV color space. Table 10-45 lists the coefficients with their respective bit fields.

Table 10-45. CSC RGB to YUV Bit Field Setting

| Coefficients | Bit Fields |
|--------------|--------------------------------|
| Y_R | DISPC_WB_CONV_COEF0[10:0] YR |
| Y_G | DISPC_WB_CONV_COEF0[26:16] YG |
| Y_B | DISPC_WB_CONV_COEF1[10:0] YB |
| Cr_R | DISPC_WB_CONV_COEF1[26:16] CRR |
| Cr_G | DISPC_WB_CONV_COEF2[10:0] CRG |
| Cr_B | DISPC_WB_CONV_COEF2[26:16] CRB |
| Cb_R | DISPC_WB_CONV_COEF3[10:0] CBR |
| Cb_G | DISPC_WB_CONV_COEF3[26:16] CBG |
| Cb_B | DISPC_WB_CONV_COEF4[10:0] CBB |

If the active range for the luminance samples (Y) is [235:16] and [240:16] for the chrominance samples (Cb and Cr), the values of Y, Cb, and Cr output components are clipped to the range [255:0]. The range selection is done by setting the DISPC_WB_ATTRIBUTES[11] FULLRANGE bit to 0x0.

Figure 10-66. RGB to YCbCr (FULLRANGE = 0)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 16 \\ 128 \\ 128 \end{bmatrix}$$

dispc-017

If the active range for the luminance samples (Y) and or the chrominance samples (Cb and Cr) is [255:0], the values of Y, Cb, and Cr output components are clipped to the range [255:0]. The range selection is done by setting the DISPC_WB_ATTRIBUTES[11] FULLRANGE bit to 0x1.

Figure 10-67. RGB to YCbCr (FULLRANGE = 1)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \frac{1}{256} * \begin{bmatrix} Y_R & Y_G & Y_B \\ Cb_R & Cb_G & Cb_B \\ Cr_R & Cr_G & Cr_B \end{bmatrix} * \begin{bmatrix} R_{IN} \\ G_{IN} \\ B_{IN} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

dispc-018

10.2.4.11.2 Scaler Unit

The functional aspect of the WB pipeline scaler unit is identical to the video pipeline scaler unit (see

Section 10.2.4.10.4), except in the output width when scaling ARGB components. The resulting output format is ARGB32 instead of ARGB40. In addition, the scaling limitations described in Section 10.2.4.10.4.2, *Scaling Limitations*, are relevant only to the video pipelines scaler units. In WB memory-to-memory mode there are no limitations on the DISPC_CORE_CLK/LCDn_PCLK ratio for horizontal resampling.

The programmable coefficients of the polyphase filters are signed 8-bit values (except for the central coefficient, which is unsigned). The WB scaler component has an 8-bit input and an 8-bit output.

Figure 10-68 and Figure 10-69 show the scaler macro-architecture for the component A, R, G, B, and Y. Figure 10-70 and Figure 10-71 show the scaler macro-architecture for component Cr and Cb.

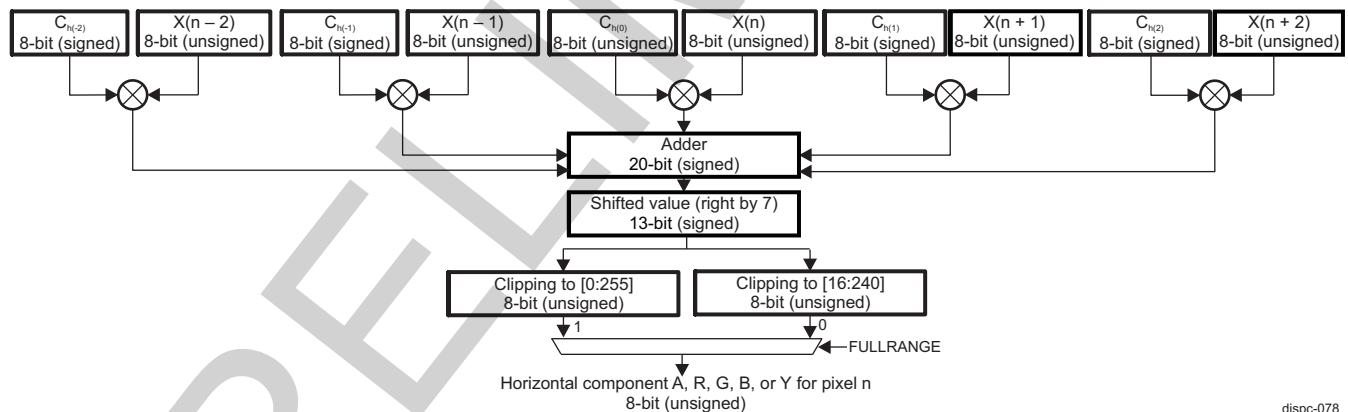

The scaling output can be clipped to an output range of [0:255] or [16:240] by configuring the DISPC_WB_ATTRIBUTES[11] FULLRANGE bit.

The WB scaler unit vertical or/and horizontal sampling is defined by setting/resetting the [DISPC_WB_ATTRIBUTES\[6:5\] RESIZEENABLE](#) bit field.

A set of configuration must be valid before enabling the video up/downsampling block.

The following fields define the configuration of the video up/downsampling block for WB:

- Vertical up/downsampling increments the value of the [DISPC_WB_FIR\[28:16\] FIRVINC](#) bit field. The unsigned integer value range is [4096:1]. Software calculates the value using the following equation:

$$FIRVINC = 1024 * \left(\frac{ORGSIZEY}{SIZEY} \right)$$

dispc-066

(12)

NOTE:

- If the value of the [DISPC_WB_FIR\[28:16\]](#) FIRVINC bit field is greater than 4096, it is clipped to 4096.
- If the [DISPC_WB_SIZE\[26:16\]](#) SIZEY bit field equals 0x1, SIZEY is replaced by 0x2 in the previous equation.
- The values of the [DISPC_WB_PICTURE_SIZE\[26:16\]](#) ORGSIZEY and [DISPC_WB_SIZE\[26:16\]](#) SIZEY bit fields must be programmed with the value desired minus 1.

- Horizontal up/downsampling increments the value of the [DISPC_WB_FIR\[12:0\]](#) FIRHINC bit field: The unsigned integer value range is [4096:1]. Software calculates the value using the following equation:

$$FIRHINC = 1024 * \left(\frac{ORGSIZEY}{SIZEY} \right) \quad \text{dispc-067} \quad (13)$$

NOTE:

- If the value of the [DISPC_WB_FIR\[12:0\]](#) FIRHINC bit field is greater than 4096, it is clipped to 4096.
 - If the [DISPC_WB_SIZE\[10:0\]](#) SIZEX bit field equals 1, the [DISPC_WB_SIZE\[10:0\]](#) SIZEX bit field is replaced by 2 in the previous equation.
 - The values of the [DISPC_WB_PICTURE_SIZE\[10:0\]](#) ORGSIZEX and [DISPC_WB_SIZE\[10:0\]](#) SIZEX bit fields must be programmed with the value desired minus 1.
- Vertical up/downsampling accumulator value [DISPC_WB_ACCU_j\[26:16\]](#) VERTICALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the vertical filtering starts. The DISPC_WB_ACCU_0 register is used for progressive output and for interlace output; the DISPC_WB_ACCU_0 and DISPC_WB_ACCU_1 registers are used. Similarly, DISPC_WB_ACCU2_0 and DISPC_WB_ACCU2_1 are used in progressive or interlace output to set the accumulator value of the Cb and Cr components when scaling YUV format.
 - Vertical up/downsampling line buffer configuration [DISPC_WB_ATTRIBUTES\[21\]](#) VERTICALTAPS bit: The default value at reset time is 0x0 (3-tap configuration is used). If the bit field is reset, the 3-tap configuration is used.
 - Horizontal up/downsampling accumulator value [DISPC_WB_ACCU_j\[10:0\]](#) HORIZONTALACCU bit field: The signed integer value range is [−1024:1023]. The accumulator value indicates on which phase the horizontal filtering starts. The DISPC_WB_ACCU_0 register is used for progressive output and for interlace output; the DISPC_WB_ACCU_0 and DISPC_WB_ACCU_1 registers are used. Similarly, DISPC_WB_ACCU2_0 and DISPC_WB_ACCU2_1 are used in progressive or interlace output to set the accumulator value of Cb and Cr components when scaling YUV format.

Table 10-48. Vertical/Horizontal Accumulator Phase

| Accumulator Value | | Phases f |
|-------------------|------|----------|
| | 0 | 0 |
| 128 or | −896 | 1 |
| 256 or | −768 | 2 |
| 384 or | −640 | 3 |
| 512 or | −512 | 4 |
| 640 or | −384 | 5 |
| 768 or | −256 | 6 |
| 896 or | −128 | 7 |

- Vertical up/downsampling coefficients:
 - The 3-tap vertical up/downsampling coefficients are defined in the [DISPC_WB_FIR_COEF_HV_i](#) registers. There are 8 registers for the 8 phases with 3 coefficients for each, or a total of 24 programmable coefficients for the vertical up/downsampling block. Each register contains two 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one).
 - The 5-tap vertical up/downsampling coefficients: Two extra-tap vertical up/downsampling coefficients are defined in the [DISPC_WB_FIR_COEF_V_i](#) registers. There are 8 registers for the 8 phases with 2 coefficients for each of them, so a total of 16 programmable coefficients for the vertical up/downsampling block are used in addition to the 3-tap registers previously defined. Four YUV vertical up/downsampling coefficients are set in the [DISPC_WB_FIR_COEF_HV2_i](#) and [DISPC_WB_FIR_COEF_V2_i](#) registers. [Table 10-46](#) and [Table 10-47](#) list all coefficients and their respective registers.
- Horizontal up/downsampling coefficients:
 - The [DISPC_WB_FIR_COEF_H_i](#) and [DISPC_WB_FIR_COEF_HV_i](#) registers define the 5-tap horizontal up/downsampling coefficients. Each [DISPC_WB_FIR_COEF_H_i](#) register contains three 8-bit signed coefficients and one 8-bit unsigned coefficient (the central one). Each [DISPC_WB_FIR_COEF_HV_i](#) register contains one 8-bit signed coefficient. A total of 40 programmable coefficients for the horizontal up/downsampling block are used. Four YUV horizontal up/downsampling coefficients are set in the [DISPC_WB_FIR_COEF_HV2_i](#) and [DISPC_WB_FIR_COEF_H2_i](#) registers. [Table 10-46](#) and [Table 10-47](#) list all coefficients and their respective registers.

10.2.4.11.3 RGB Truncation Logic

Truncation logic is used to convert a pixel from ARGB 32-bit format into a lower color depth: 12- or 16-bit format based. Setting the [DISPC_WB_ATTRIBUTES\[10\]](#) TRUNCATIONENABLE bit to 0x1 enables the truncation to the pixel format defined by the [DISPC_WB_ATTRIBUTES\[4:1\]](#) FORMAT bit field. The truncation is done by removing the necessary LSB of each component to match the output format. [Table 10-49](#) describes the truncation done on each component of the pixel.

Table 10-49. Truncation Logic

| Output Formats | A[7:0] | R[7:0] | G[7:0] | B[7:0] |
|----------------|---------|---------|---------|---------|
| | MSB LSB | MSB LSB | MSB LSB | MSB LSB |
| xRGB12-4444 | Ignored | R[7:4] | G[7:4] | B[7:4] |
| RGBx12-4444 | Ignored | R[7:4] | G[7:4] | B[7:4] |
| RGB16-565 | Ignored | R[7:3] | G[7:2] | B[7:3] |
| xRGB16-1555 | Ignored | R[7:3] | G[7:3] | B[7:3] |
| ARGB16-4444 | A[7:4] | R[7:4] | G[7:4] | B[7:4] |
| RGBA16-4444 | A[7:4] | R[7:4] | G[7:4] | B[7:4] |
| ARGB16-1555 | A[7] | R[7:3] | G[7:3] | B[7:3] |

NOTE: If there is no alpha field in the pixel format description, 0s or 1s must fill the container. 0s must be used for transparent and 1s for opaque. For example, in the xRGB12 pixel format, the upper 4 bits are set to 0s because the RGB value is only 12 bits inside a 16-bit container.

10.2.4.12 LCD Outputs

The LCD1 and LCD2 output paths consist of several processing blocks (see [Figure 10-72](#)):

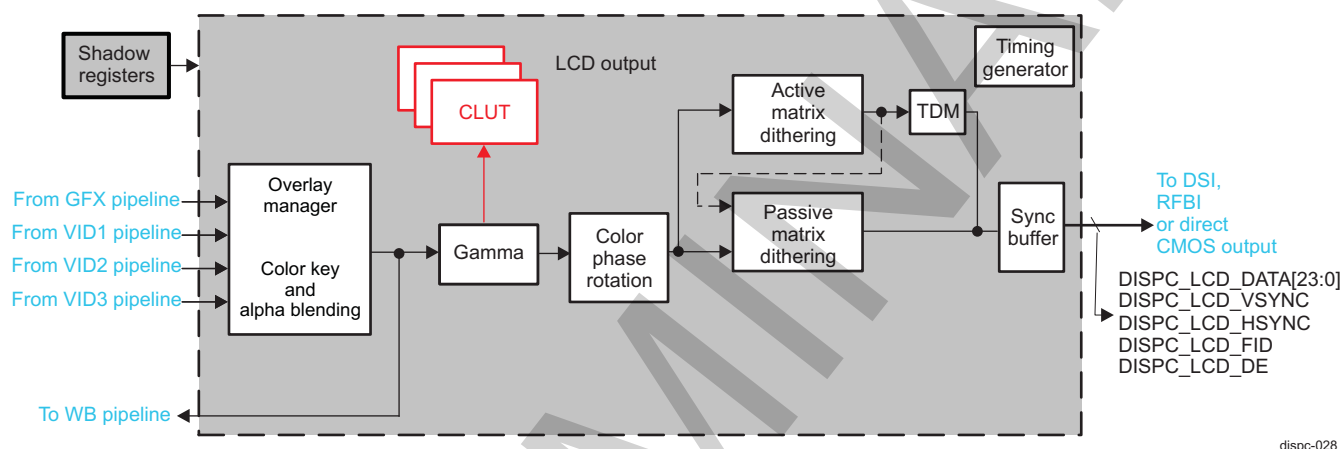

- Overlay manager
- Gamma correction unit
- CPR is also used for RGB-to-YUV conversion.
- Active matrix dithering with TDM
- Passive matrix dithering

- Synchronization buffer
- Timing generator

The display subsystem supports two types of display technologies (both monochrome and color modes):

- Passive matrix displays: supporting up to 16, 256, or 3375 colors to be displayed in each frame, depending on the color depth. The monochrome LCD has 15 grayscale levels available.
- Active matrix displays: the configuration of colors depends on the color depth:
 - 24 bpp supports 16,777,216 colors.
 - 18 bpp supports 262,144 colors.
 - 16 bpp supports 65,536 colors.
 - 12 bpp supports 4096 colors.

Figure 10-72. LCD Output Architecture

dispc-028

10.2.4.12.1 Overlay Manager

The overlay mechanism consists of displaying more than one layer (GFX, VID1 to VID3 layers) using:

- A priority rule based on a Z-order: Application can set the ordering layer of the frames.
- Transparency color keys: Destination and source transparency color keys can be set.
- Alpha blending values: Using the A component of a pixel or a blending set by the user for a layer, a level of transparency can be determined.

Each pipeline (GFX, VID1, VID2, and VID3) is assigned to a single overlay and, as a consequence, to a single display controller output, LCD1, LCD2, TV, or WB pipeline. An overlay manager can be connected to all four pipeline outputs simultaneously. The pipeline output is directed using the [DISPC_GFX_ATTRIBUTES\[8\]](#) CHANNELOUT bit and the [DISPC_VIDp_ATTRIBUTES\[31:30\]](#) CHANNELOUT2 bit field. [Table 10-50](#) lists the bit field settings to direct a pipeline to an LCD/TV or WB output. The default value directs all pipelines to LCD1.

Table 10-50. Pipeline Connection to LCD, TV, or WB Output

| Overlay Manager/Output | DISPC_GFX_ATTRIBUTES/DISPC_VIDp_ATTRIBUTES | |
|------------------------|--|---|
| | CHANNELOUT Bit | CHANNELOUT2 Bit Field |
| LCD1 | 0x0 | 0x0 |
| LCD2 | 0x0 | 0x1 |
| WB | 0x0 | 0x3 |
| TV | 0x1 | 0x0 (or 0x2 for VID2; see the following Note) |

NOTE: The combination of settings CHANNELOUT = 0x1 and CHANNELOUT2 = 0x1, 0x2, or 0x3 is reserved for the VID1 and VID3 pipelines. For the VID2 pipeline, this combination is reserved when any TV format other than HDMI 1.4 3D 1080p is to be output. Setting the [DISPC_VID2_ATTRIBUTES](#) register bit fields CHANNELOUT to 0x1 and CHANNELOUT2 to 0x2, is used in case of HDMI 1.4 3D 1080p format. For more information, see [Section 10.2.4.13.4, Timing and TV Format Settings](#).

The output of each LCD overlay manager is connected to the CPR block through the palette unit in the case of Gamma correction.

NOTE:

- When the pixel format is ARGB or RGBA, the color key match logic uses only the RGB value defined by ARGB or RGBA. The alpha blending factor is ignored.
- For LCD1 output, the same CLUT is used for BITMAP support by the graphics pipeline and for Gamma correction. In case of BITMAP format for graphics, Gamma correction is not available on the primary LCD output.

10.2.4.12.1.1 Priority Rule

The overlay manager is configured using the Z-order parameter. The Z-order value defined for each pipeline indicates the visibility order to the window on the screen. If the Z-order value of window A is lower than the Z-order to layer B, layer A is displayed below layer B. The transparency color keys and the alpha blending factors are then used to blend the layers together (see [Section 10.2.4.12.1.2](#) and [Section 10.2.4.12.1.3](#)). The Z-order is enabled by setting the [DISPC_GFX_ATTRIBUTES](#)[25] ZORDERENABLE bit or the DISPC_VIDp_ATTRIBUTES[25] ZORDERENABLE bit to 0x1 and by defining the Z-order in the [DISPC_GFX_ATTRIBUTES](#)[27:26] and DISPC_VIDp_ATTRIBUTES[27:26] ZORDER bit fields. [Table 10-51](#) resumes the register settings to enable and set the Z-order of a pipeline. [Table 10-51](#) shows the default Z-order values when LCDALPHABLENDERENABLE and ZORDERENABLE are disabled.

Table 10-51. Z-Order Register Settings and Default Configuration

| Pipeline | LCDALPHA BLENDERENABLE ⁽¹⁾ | ZORDERENABLE Bit | ZORDER Bit Field | Resulting Z-Order Number |
|----------|---------------------------------------|------------------|------------------|--------------------------|
| GFX | 0 | 0 | Don't care | 0 |
| | 0 | 1 | ZORDER | ZORDER |
| | 1 | Don't care | Don't care | 3 |
| VID1 | 0 | 0 | Don't care | 1 |
| | 0 | 1 | ZORDER | ZORDER |
| | 1 | Don't care | Don't care | 0 |
| VID2 | 0 | 0 | Don't care | 2 |
| | 0 | 1 | ZORDER | ZORDER |
| | 1 | Don't care | Don't care | 1 |
| VID3 | 0 | 0 | Don't care | 3 |
| | 0 | 1 | ZORDER | ZORDER |
| | 1 | Don't care | Don't care | 2 |

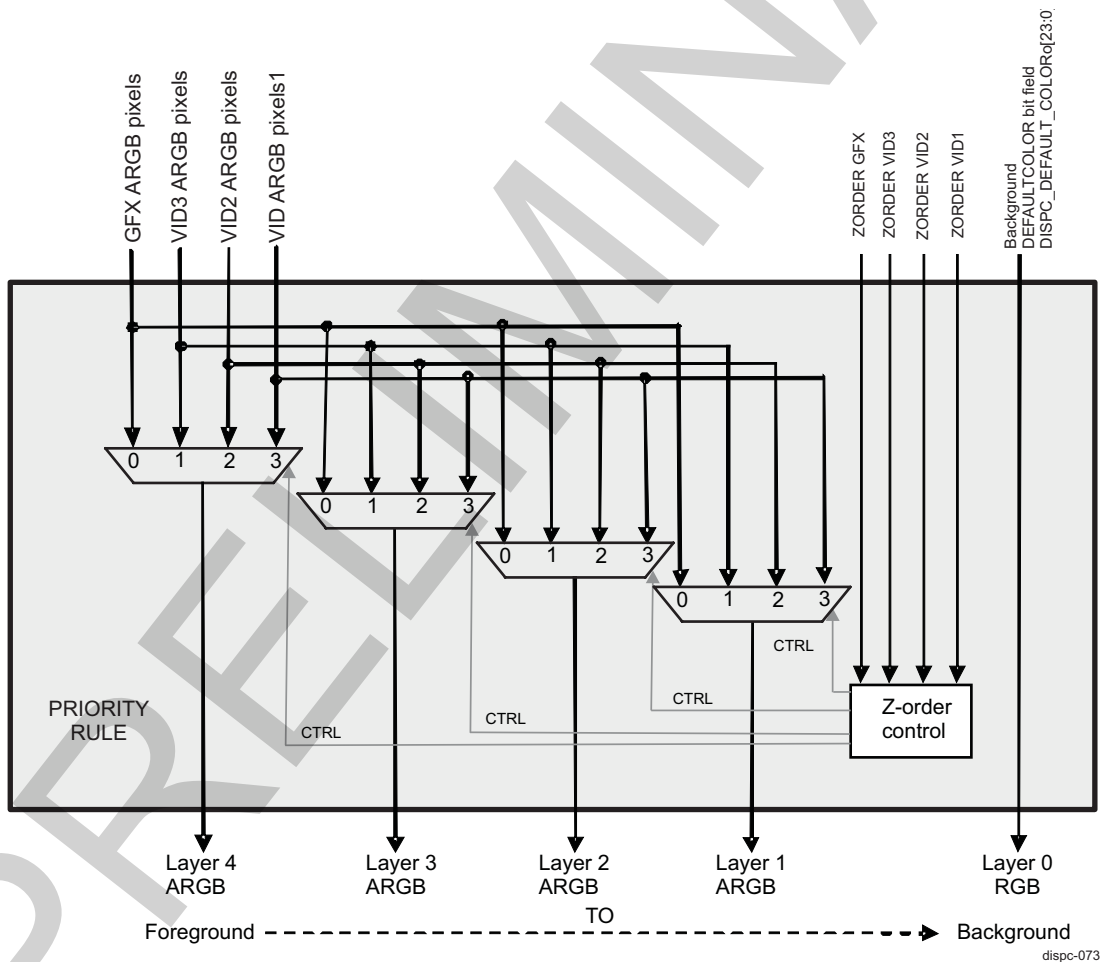

⁽¹⁾ Applies only to LCD1

Figure 10-73 shows the architecture of the priority rule.

NOTE:

- If ZORDERENABLE = 1, each Z-order must be different for each active pipeline. It is not possible to use the same value for more than one pipeline.
- Two modes are maintained for backward compatibility with OMAP3430:
 - LCDALPHABLENDERENABLE = 0 and ZORDERENABLE = 0 equivalent to the normal mode overlay settings
 - LCDALPHABLENDERENABLE = 1 equivalent to the alpha mode overlay settings
- When OMAP3430 backward compatibility mode is to be used, the following must be considered:
 - If Z-order is disabled for the VID1 and VID2 pipelines, the pipeline data is output on the LCD1/LCD2/TV overlay.
 - If Z-order is disabled for the VID3 pipeline, the pipeline data is output only on the LCD2 overlay.

Figure 10-73. Priority Rule Architecture

The height and width of each enabled layer (pipeline) must be defined in the SIZEX and SIZEY bit fields [DISPC_GFX_SIZE\[26:16\]\[10:0\]](#)/[DISPC_VIDp_SIZE\[26:16\]\[10:0\]](#), and its x and y positions defined in the POSX and POSY bit fields [DISPC_GFX_POSITION\[26:16\]\[10:0\]](#)/[DISPC_VIDp_POSITION\[26:16\]\[10:0\]](#). If there are no graphics or video-encoded pixels at a specific position, the programmable, solid background color appears. The solid background color is set in the [DISPC_DEFAULT_COLOR\[23:0\]](#) DEFAULTCOLOR bit field. [Figure 10-74](#) is an example of priority rule.

The Z-order reordering block must always map the pipelines to the blender logic in the same order—from background to foreground.

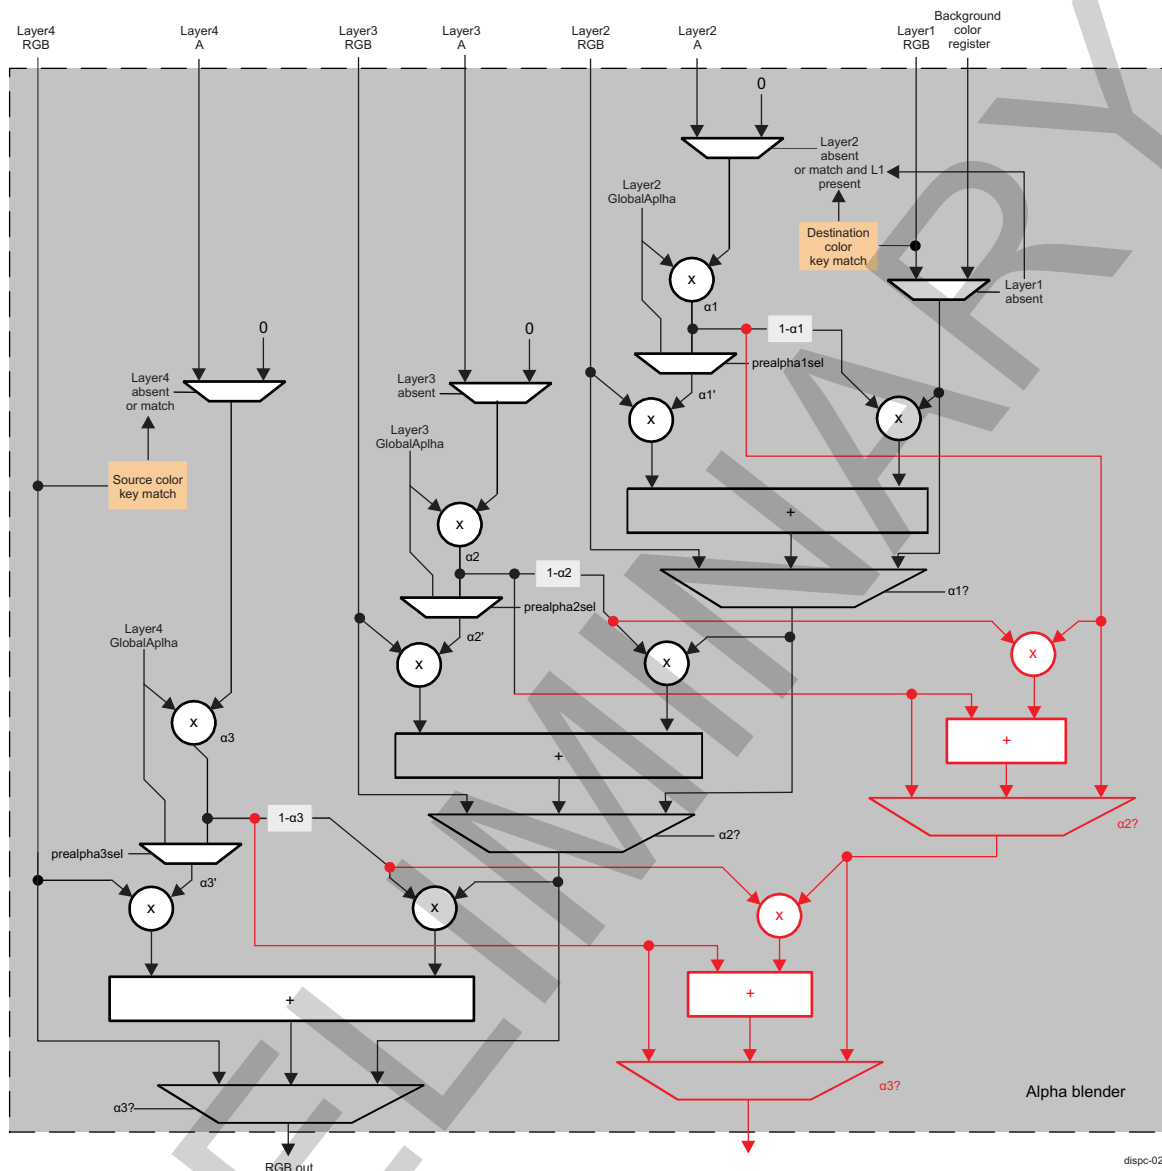

Figure 10-74. Example of Priority Rule: From Lower to Higher VID1, VID2, VID3, GFX

dispc-019

10.2.4.12.1.2 Alpha Blender

Figure 10-75 shows the alpha blending processing in detail.

Figure 10-75. Alpha Blending Architecture With Premultiplied Alpha Support

NOTE: "1-alpha" operator corresponds to the basic 1s-complement operation.

The alpha blending value is defined by:

- The component value A when using an ARGB or RGBA pixel format.
 - For ARGB-1555, the alpha blending is defined using a 1-bit value. It is converted into an 8-bit value by duplicating the 1-bit value (see [Table 10-52](#)).
 - For ARGB-4444, the alpha blending is defined using a 4-bit value. It is converted into an 8-bit value by duplicating the 4-bit value (see [Table 10-52](#)).
 - If the pixel format contains no alpha blending value, the pixel alpha value is considered to be 0xFF; if alpha is equal to 0xFF, there is no multiplication.
 - For BITMAP or YUV formats, there is no alpha blending factor associated with each pixel value. Only the global alpha blending factor associated with the window displaying the BITMAP or YUV format is used.
- The global alpha blending value set in the individual bit fields of the [DISPC_GLOBAL_ALPHA\[31:0\]](#)

register for LCD:

- VID3GLOBALALPHA
 - VID2GLOBALALPHA
 - VID1GLOBALALPHA
 - GFXGLOBALALPHA
- A total alpha blending value can be used when a combination of the pixel alpha blending value A and a global alpha blending is present. The resulting alpha value is determined as : $\text{Alpha} = (\text{Pixel Alpha} * \text{Global Alpha}) / 256$.

Table 10-52 lists the percentage of alpha blending in the function of the alpha blending value on 8 bits.

Table 10-52. Alpha Blending – ARGB

| Alpha Blending 1-Bit Value | Alpha Blending 4-Bit Value | Alpha Blending 8-Bit Value (Converted Value or Resulting Alpha) | % Blending |
|----------------------------|----------------------------|---|--------------------|
| 0x0 | 0x0 | 0x00 | 100% (transparent) |
| N/A | 0x1 | 0x11 | 93.33% |
| N/A | 0x2 | 0x22 | 86.6% |
| N/A | ... | ... | ... |
| N/A | 0xE | 0xEE | 6.6% |
| 0x1 | 0xF | 0xFF | 0% (opaque) |

Premultiplied Alpha

The image ARGB may have its RGB component already premultiplied with the alpha (ARGB) where:

- $R = A \times R$
- $G = A \times G$
- $B = A \times B$

In that case, the processing is as follows:

- Color component of premultiplied layers are multiplied with the Global Alpha, if Global Alpha is not equal to 0.
- Color component of the composed underlying layers are multiplied with $(1-A) * \text{Global Alpha}$

The additional premultiplied alpha option is associated with the pipelines GFX, VID1, VID2, and VID3. The option is accessible through the [28] PREMULIPLYALPHA bit for the respective pipeline register:

- [DISPC_GFX_ATTRIBUTES](#)
- [DISPC_VID1_ATTRIBUTES](#)
- [DISPC_VID2_ATTRIBUTES](#)
- [DISPC_VID3_ATTRIBUTES](#)

The following settings are available:

- PREMULIPLYALPHA bit = 0: Source is not premultiplied with alpha. Full blending is done in the DISPC.
- PREMULIPLYALPHA bit = 1: Source is premultiplied with alpha. Partial blending is done.

NOTE: The prealphasel controls in [Figure 10-75](#) correspond to the PREMULIPLYALPHA of the pipelines mapped on the respective layers.

The logic marked with red in [Figure 10-75](#) corresponds to the alpha value, computed when the Write Back channel copies back to memory the premultiplied color component: $A(\text{destination}) = A(\text{source}) + (1-A(\text{source}) \times A(\text{destination}))$

When the [DISPC_WB_ATTRIBUTES](#)[7] ALPHAENABLE bit is cleared, or when the overlay channel is not selected for WB, the computation of the A(destination) is disabled. The default value for the [DISPC_WB_ATTRIBUTES](#)[7] ALPHAENABLE bit is 0x0. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available:

- The ALPHAENABLE bit is set to 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay.
- The ALPHAENABLE bit is set to 0x0: The alpha value is not written back.

NOTE: The [DISPC_WB_ATTRIBUTES](#)[7] ALPHAENABLE bit is effective only when one of the output channels is written back, otherwise it is ignored.

10.2.4.12.1.3 Transparency Color Keys

The two transparency color keys are the video source transparency color key and the graphics destination transparency color key. The transparency color key can be used only with BITMAP formats (1, 2, 4, and 8 bits per pixel) and RGB formats (ARGB, RGB, RGBA, and RGBx). In this case the A information is ignored for the comparison between the pixel value and the color key value. It is possible to use YUV formats with some care because the comparison is between the input pixel value of the overlay manager from pipeline (GFX or one of the VID pipelines depending on the Z-order) and the color key value. The YUV data is converted to RGB format. If the original format is YUV, the user must consider color space conversion processing to define the RGB color key value used for the comparison.

The transparency color key is enabled by setting the following bits to 0x1:

- [DISPC_CONFIG1](#)[10] TCKLCDENABLE for LCD1
- [DISPC_CONFIG2](#)[10] TCKLCDENABLE for LCD2
- [DISPC_CONFIG1](#)[12] TCKTVENABLE for TV

The transparency color key is determined in the following bit fields.

- [DISPC_TRANS_COLOR0](#)[23:0] TRANSCOLORKEY for LCD1
- [DISPC_TRANS_COLOR2](#)[23:0] TRANSCOLORKEY for LCD2
- [DISPC_TRANS_COLOR1](#)[23:0] TRANSCOLORKEY for TV

NOTE:

- The video source transparency color key and graphics destination transparency color key cannot be active at the same time.
 - For CLUT bitmaps, the palette index is compared to the transparency color key and not to the palette value pointed to by the palette index.
-

- Video source transparency color key

The video source transparency color key value defines the encoded pixel data considered as transparent pixel. The encoded pixel values with the source color key value are not visible and the under layers encoded pixel values or solid background color are visible (the pixel alpha blending value of layer 4 is forced to 0x00, fully transparent).

The scaler can be enabled as a preprocessing in the VID pipeline. But it is necessary to consider the pixel scaling preprocessing to define the color key value to be used after the rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The video source transparency color key mode is selected by setting the following bits to 0x1:

- [DISPC_CONFIG1](#)[11] TCKLCDSELECTION bit for LCD1
- [DISPC_CONFIG2](#)[11] TCKLCDSELECTION bit for LCD2
- [DISPC_CONFIG1](#)[13] TCKTVENABLE bit for TV

[Figure 10-76](#) shows an example of source color key. The pixels with the transparency color key are not displayed; instead, pixels of the resulting layer underneath are shown.

Figure 10-76. Source Transparency Color Key Example

- Graphics destination transparency color key value

The graphics destination transparency color key value defines the encoded pixels in layer 1 that are not displayed. Other layer 1 pixels (nonequal to destination transparency color key) are displayed over layer 2. The encoded pixel values with the destination color key value are pixels not visible on the screen because pixels at the same position in layer 2 are visible, otherwise encoded pixels are visible above layer 2. The destination transparency color key applies only if layer 1 overlaps layer 2 (for details on layer position depending on the Z-order parameter, see [Section 10.2.4.12.1.1, Priority Rule](#)); otherwise, the destination transparency color key is ignored.

The scaler can be enabled as a preprocessor in the VID pipeline. It is necessary, however, to consider the pixel scaling preprocessing to define the color key value to be used after rescaling for the comparison between the input pixel value to the overlay manager and the color key value.

The destination transparency color key mode is selected by setting the following bits to 0x0:

- [DISPC_CONFIG1](#)[11] TCKLCDSELECTION bit for LCD
- [DISPC_CONFIG2](#)[11] TCKLCDSELECTION bit for LCD2
- [DISPC_CONFIG1](#)[13] TCKTVSELECTION bit for TV

[Figure 10-77](#) shows an example of the destination color key. The pixels, equal to the transparency color key, are not displayed and are replaced by layer 2 pixels. All other layer 1 pixels, different from the transparency color key, are displayed over layer 2.

Figure 10-77. Destination Transparency Color Key Example

10.2.4.12.1.4 Overlay Optimization

The overlay optimization consists in fetching only the required pixels; that is, pixels that contribute to the final picture to be displayed (LCD1, LCD2, or TV). The decision to fetch the pixel from memory is based on the information available in the registers and on the following rules:

- The layer is enabled.
- The global alpha blending factor for the layer is different than 0x00.
- The current layer is behind a nonopaque layer (the global alpha blending factor is different than 0xFF for the layer in the preceding).

The result of the overlay optimization is a reduction of the bandwidth by fetching only the mandatory pixels. The overlay mechanism is independent for each overlay: LCD1, LCD2, and TV. Because each layer (GFX, VID1, VID2, and VID3) can be associated to only one overlay at a time, it is possible to optimize the fetch of the pixels for each layer based on the overlay information. The overlay optimization must be run on the DMA engine time window and not on the display time window. The pixels are fetched by the DMA engine before the display processing.

The overlay optimization is enabled by setting the following bits to 0x1:

- [DISPC_CONTROL1](#)[12] OVERLAYOPTIMIZATION bit for LCD1
- [DISPC_CONTROL2](#)[12] OVERLAYOPTIMIZATION bit for LCD2
- [DISPC_CONTROL2](#)[13] TVOVERLAYOPTIMIZATION bit for TV

NOTE:

- The overlay optimization is not functional when a layer uses BITMAP1, BITMAP2, or BITMAP4 pixel formats.
- The pixel alpha blending factor in case of ARGB and RGBA formats cannot be used to take advantage of the pixel fully transparent (alpha blending factor equals 0x00).

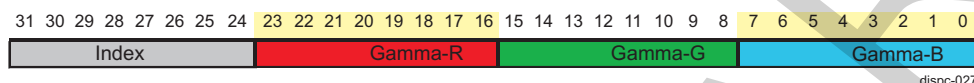

10.2.4.12.2 Gamma Correction Unit

In gamma curve mode, the selected encoded pixel values based on the color keys by the overlay manager from the video or graphics paths are sent to the gamma curve table. Each component of encoded pixel value is used as a pointer to index 1 out of 256 24-bit gamma curve entries in the table.

Each 8-bit component is replaced with the 8-bit table value corresponding to R, G, or B component. The table is loaded by software. It is possible to load only part of the table. For each access to the table, the 24-bit value is associated with index in the table by concatenating the 24-bit value (LSB of 32-bit access) and the 8-bit index value (MSB of the 32-bit access). [Figure 10-78](#) describes the format of one of the gamma curve values in the memory.

NOTE: If the CLUT is used in the GFX pipeline for palette, the gamma correction unit is not available on the primary LCD.

Figure 10-78. Data Memory Organization for Gamma Mode in LCD Output

10.2.4.12.3 CPR Unit

The CPR unit can be used to correct the LCD output colorimetry in case of nonpure white backlight.

The CPR is enabled by setting the DISPC_CONFIGo[15] CPR bit to 0x1. The coefficients are programmed in the following registers:

- Red 10-bit signed coefficients in DISPC_CPRo_COEF_R
- Green 10-bit signed coefficients in DISPC_CPRo_COEF_G
- Blue 10-bit signed coefficients in DISPC_CPRo_COEF_B

The CPR can be selected for passive and active matrix panel. The logic is integrated after the LCD overlay manager or the palette while using the gamma correction and before the spatial/temporal dithering. The CPR can be selected to correct the nonpure white backlight of the LCD module by using a programmable matrix to convert the 24-bit RGB pixel value into a new 24-bit RGB pixel value. The matrix is programmed through a set of nine 10-bit signed coefficients. The output of the calculation is clipped to [255:0]. The CPR is processed by the equation shown in [Figure 10-79](#). [Table 10-53](#) lists all coefficients with their respective bit field registers for settings.

Figure 10-79. CPR Matrix

$$\begin{bmatrix} R_{out} \\ G_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} R_r & R_g & R_b \\ G_r & G_g & G_b \\ B_r & B_g & B_b \end{bmatrix} * \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix}$$

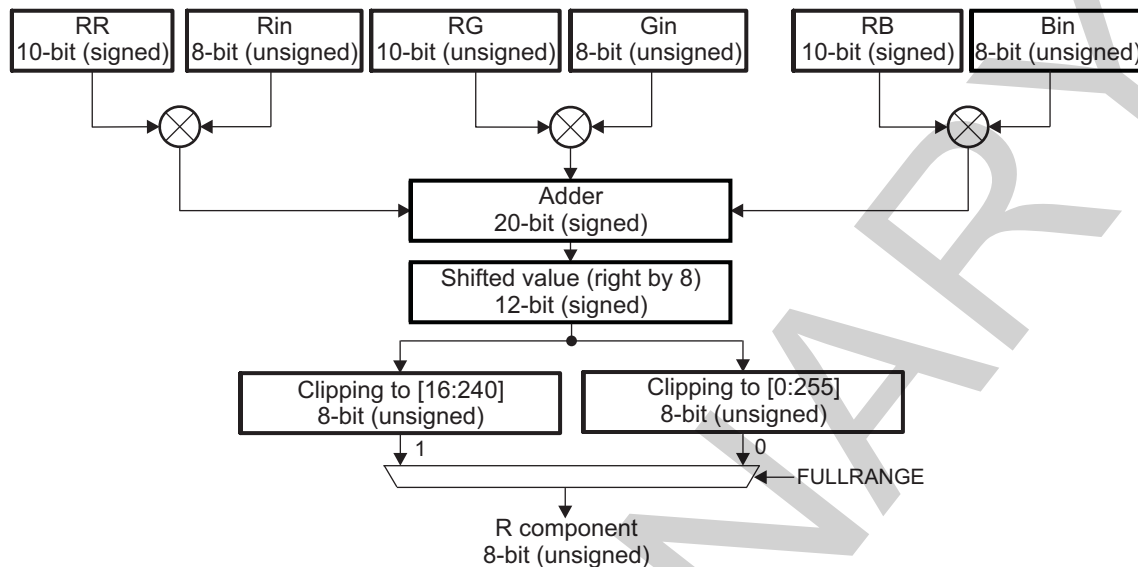

dispc-023

Table 10-53. CPR or RGB to YUV Coefficients With Associated Bit Fields

| Registers | Bit Field | Color Space Conversion | RGB to YUV |
|-------------------|-----------|------------------------|------------|
| DISPC_CPRo_COEF_R | RR | Rr | Yr |
| | RG | Rg | Yg |
| | RB | Rb | Yb |
| DISPC_CPRo_COEF_G | GR | Gr | Cbr |
| | GG | Gg | Cbg |
| | GB | Gb | Cbb |
| DISPC_CPRo_COEF_B | BR | Br | Crr |
| | BG | Bg | Crg |
| | BB | Bb | Crb |

Figure 10-80. CPR Macro-Architecture

dispc-024

10.2.4.12.4 Passive Matrix

The passive matrix display supports 16, 256, or 3375 colors to be displayed in each frame, depending on the color depth. The monochrome LCD has 15 grayscale levels available. To enable a passive matrix output, the DISPC_CONTROL0[3] STNTFT bit must be set to 0x0.

Spatial/temporal dithering is performed when using the passive matrix data path. The spatial/temporal dithering logic can be selected to enhance the quality of the passive matrix. When selected, the pixels are preprocessed by the spatial/temporal dithering logic before the passive matrix display dithering logic. The output format of the spatial/temporal dithering logic is RGB 12-bit (not configurable). The dithering logic is integrated after the CPR. The dithering algorithm is based on the frame rate control. The dithering logic can process the pixels one frame, two frames, or four frames. The number of frames is selected by setting the DISPC_CONTROL0[31:30] SPATIALTEMPORALDITHERINGFRAMES bit field. The temporal dithering logic is enabled by setting the DISPC_CONTROL0[7] STDITHERENABLE bit to 0x1. The output format of the dithering logic is RGB 12-bit (not configurable).

After the pixels, from GFX, VID pipelines, are merged depending on the transparency status and overlay, the result is sent to a color/grayscale temporal dither generator. The monochrome data or each RGB color component are encoded on 4 bits, which are the 4 MSBs of 8-bit pixel-encoded component defined by the merge of the graphics data and the video data.

These 4-bit values are used to select on the 16 intensity levels. The gray/color intensity is controlled by turning individual pixels on and off at varying period rates, making the average time the pixel is off longer than the average time the pixel is on, thus producing more intense grays/colors. The dithering generator also uses the intensity of adjacent pixels in the calculation to give the screen image a smooth appearance. The proprietary dither algorithm is optimized to provide a range of intensity values that matches the visual perception of color/gray graduations.

Single-panel monochrome screens use four or eight data lines; single-panel color screens use eight data pins. The output width is configured by setting the DISPC_CONTROL0[4] M8B bit, and the monochrome or color mode is selected by setting the DISPC_CONTROL0[2] MONOCOLOR bit.

10.2.4.12.5 Active Matrix

Depending on the color depth, the active matrix output:

- 24 bpp supports 16,777,216 colors.
- 18 bpp supports 262,144 colors.

- 16 bpp supports 65,536 colors.
- 12 bpp supports 4096 colors.

When in active matrix path configuration, after setting the DISPC_CONTROLo[3] STNTFT bit to 0x1, two submodules must be configured:

- Spatial/temporal dithering
- Multiple cycle output format (TDM)

10.2.4.12.5.1 Spatial/Temporal Dithering

When the active matrix path is used, the spatial/temporal dithering logic can be selected to enhance the quality of the active matrix outputs. The encoded pixel values are used by spatial/temporal dithering logic to display the data in a lower color depth on the LCD panel. The dithering logic is integrated after the CPR and before the TDM. The spatial/temporal dithering algorithm is based on the (x,y) pixel position and frame rate control. The dithering logic can process the pixels over one, two, or four frames. The number of frames is selected by setting the DISPC_CONTROLo[31:30] SPATIALTEMPORALDITHERINGFRAMES bit field. In the case of a single frame, only spatial processing is applied; with multiple frames, spatial and temporal processing are applied to the pixels. The spatial/temporal dithering logic is enabled by setting the DISPC_CONTROLo[7] STDITHERENABLE bit to 0x1.

NOTE:

- If the interface data bus is smaller than the pixel format size and spatial/temporal dithering is not enabled, the MSBs of the pixel color components are output on the interface data bus.
 - If the interface data bus is wider than the pixel format size, by programming the pixel components replication active/inactive, the MSB is replicated to the LSB of the interface data bus or the LSB is filled with 0s.
-

10.2.4.12.5.2 Multiple Cycle Output Format (TDM)

The pixels, after the active matrix display processing, are formatted on one or multiple cycles (from one to three cycles). The number of bits for each cycle is set in the DISPC_DATAo_CYCLE1 register for the first cycle, the DISPC_DATAo_CYCLE2 register for the second cycle, and DISPC_DATAo_CYCLE3 register for the third cycle. The interface data bus width can be 8, 9, 12, or 16 bits. The configuration of the data bus is done in the DISPC_CONTROLo[9:8] TFTDATALINES bit field.

When the TDM is disabled, the DISPC outputs the pixels using the conventional formats: Passive matrix display/active matrix display monochrome/color.

NOTE: The passive matrix dithering logic is always bypassed in active matrix display.

Figure 10-81 through Figure 10-84 show various examples of TDM settings in the function of pixel data formats and the interface data bus width.

Figure 10-81. 8-Bit Interface Settings

10.2.4.12.6 Synchronized Buffer Update

A synchronization mismatch between the frame buffer and the display refreshes, named tearing effect, can lead to images that appear to be stretched on the screen. To avoid it, a synchronization mechanism is used between the DISPC and the process that updates the buffer. An interrupt is generated when the display reaches a predefined line number. The PROGRAMMEDLINENUMBER_IRQ interrupt ([DISPC_IRQSTATUS](#) and [DISPC_IRQENABLE](#)) is a level signal and stays active during the programmed line of the display.

10.2.4.12.7 Timing Generator and Panel Settings

The size of and panel is defined by:

- Number of lines, DISPC_SIZE_LCD0[26:16] LPP bit field, with a value from 1 to 2048
- Number of pixels per line, DISPC_SIZE_LCD0[10:0] PPL bit field, with a value from 1 to 2048

Standard HSYNC/VSYNC timing generation are programmable for each LCD outputs independently:

- Horizontal front porch is set in the DISPC_TIMING_Ho[19:8] HFP bit field.
- Horizontal back porch is set in the DISPC_TIMING_Ho[31:20] HBP bit field.
- Horizontal synchronization pulse width is set in the DISPC_TIMING_Ho[7:0] HSW bit field.
- Vertical front porch is set in the DISPC_TIMING_Vo[19:8] VFP bit field.
- Vertical back porch is set in the DISPC_TIMING_Vo[31:20] VBP bit field.
- Vertical synchronization pulse width is set in the DISPC_TIMING_Vo[7:0] VSW bit field.

Horizontal/vertical synchronization and the polarity of ACBIAS signals are programmable by setting the DISPC_POL_FREQ0[12] IVS, DISPC_POL_FREQ0[13] IHS, and DISPC_POL_FREQ0[15] IEO bits. These signals can be gated by setting the DISPC_CONFIG0[7] VSYNCGATED and DISPC_CONFIG0[6] HSYNCGATED bits.

The latch of data can be driven on the rising or falling edge of the pixel clock by setting the DISPC_POL_FREQ0[14] IPC bit. The drive of the SYNC and VSYNC signals in the function of the pixel clock is done by setting the DISPC_POL_FREQ0[16] RF bit.

Table 10-54 describes the programming rules for LCD timing.

Table 10-54. Programming Rules

| | No Downsampling | Downsampling H or V | Downsampling H + V |
|--------------------------------|--------------------|------------------------|-----------------------|
| $(HBP + HSW + HFP) \times PCD$ | 8 | 10 | 20 |

Figure 10-85 shows the timing values description in the case of an active matrix display.

Figure 10-85. Timing Values (Active Matrix Display)

dispc-031

The 8-bit pixel clock divider (the [DISPC_DIVISOR](#)[7:0] PCD bit field) selects the pixel clock frequency. This bit field generates a range of pixel clock frequencies from LC/2 to LC/256, where LC is the logic clock from the divided functional clock of the DISPC by the [DISPC_DIVISOR](#)[23:16] LCD bit field.

The pixel clock is defined by the following equation:

$$\text{Pixel Clock} = (\text{FunctionalClock} / \text{LCD}[7:0]) / \text{PCD}[7:0]$$

The pixel clock can be gated by setting the [DISPC_CONFIGo](#)[5] [PIXELCLOCKGATED](#) bit to 0x1.

The LCD output can be configured in progressive output or interlace output. The selection is done by writing into the [DISPC_CONFIGo](#)[22] [OUTPUTMODEENABLE](#) bit. The reset value is 0x0, which means progressive mode. When progressive mode is selected, the FID signal associated to the LCD output is driven low (INACTIVE state). The selection can be changed only if the corresponding LCD output is disabled. The configuration is independent for each LCD output.

When in interlaced mode, the [DISPC_CONFIGo](#)[23] [FIDFIRST](#) bit indicates which field is output first:

- 0x0: Even field first (FID = 0)
- 0x1: Odd field first (FID = 1)

10.2.4.12.8 Stall Mode

Stall mode is used to indicate when the DISPC must stop sending data on the corresponding LCD output interface to avoid an overflow on the interface level. Stall mode is available when RFBI and DSI interface are used. The interface asserts the STALL signal to stop data output by the DISPC. It is deasserted by the interface to indicate when new data must be output by the DISPC. [Figure 10-86](#) shows the RFBI data stall mode activated.

Stall mode is selected by setting the [DISPC_CONTROLo](#)[11] [STALLMODE](#) bit.

NOTE: The [DISPC_CONTROLo](#)[5] [GOLCD](#) bit must not be set, but the DISPC configuration (DMA engine, pipelines associated with the LCD output) must be set before enabling the LCD output by setting the [DISPC_CONTROLo](#)[1] [LCDENABLE](#) bit.

Figure 10-86. RFBI Data Stall Signal Diagram

To avoid an underflow of the DMA buffer, the DMA buffer handshake must be enabled by setting the [DISPC_CONFIGo](#)[16] [BUFFERHANDCHECK](#) bit. The fullness of the buffers associated to the pipelines used for the LCD output is checked before providing data to the pipeline when the STALL signal is inactive. It prevents emptying the DMA buffer when the RFBI or DSI module requests data and there is not enough data in the DMA buffer of the DISPC. This feature must be enabled only when stall mode is used (the [STALLMODE](#) bit set to 0x1). When the DMA buffer handshake is activated, the pixel transfer to the RFBI or DSI module, outside a STALL period, can be stopped and restarted when there are enough data in the DMA buffer. The DMA buffer handshake ensures that the underflow does not occur for the pipelines associated with the LCD output when RFBI/DSI interfaces are used. The rate of the data transfer to the RFBI or DSI is, then, fully dependent on the state of the DMA buffer. [Figure 10-87](#) shows the RFBI data stall with FIFO handcheck mode activated.

Figure 10-87. RFBI Data Stall Signal Diagram With Handcheck

Stall mode is independently used when the RFBI or DSI protocol engines are connected to the LCD outputs and receive the pixels to reformat the data.

The STALL signals from the RFBI and DSI interfaces are merged into a single signal in the display subsystem. Only one signal for each LCD output is connected to the DISPC. [Figure 10-88](#) shows the STALL signal implementation.

One STALL signal is generated by the RFBI. The RFBI module asserts the stall signal when no more data must be output by the DISPC. It is deasserted to indicate when new data must be output by the DISPC.

Two STALL signals are generated by the DSI1 protocol engine IP. It is used by the DSI1 protocol engine when data are provided from the DISPC to the DSI1 protocol engine using the two video ports in command mode only. If one of the two video ports is in video mode, the STALL signal associated with the video port from the DSI1 protocol engine is not used (must be in INACTIVE state from the DSI1 protocol engine IP).

One STALL signal is generated by the DSI2 P\protocol engine IP. It is used by the DSI2 protocol engine when data are provided from the DISPC to the DSI2 protocol engine using the single video port in command mode only. If the video port is in video mode, the STALL signal associated with the video port from the DSI2 protocol engine is not used (must be in INACTIVE state from the DSI2 protocol engine IP).

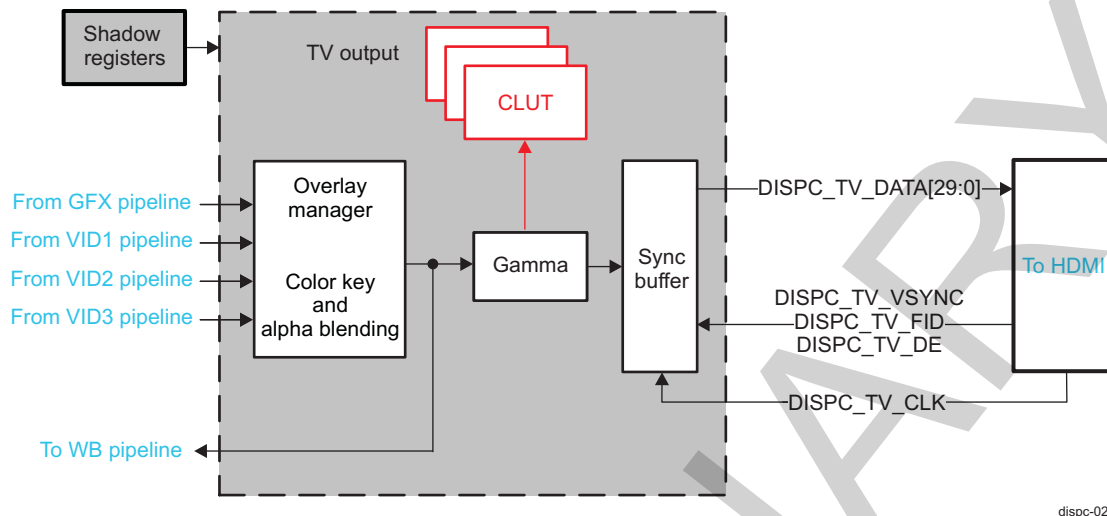

Figure 10-88. STALL Signal

10.2.4.13 TV Output

The TV output paths consist of several processing blocks (see [Figure 10-89](#)):

- Overlay manager
- Gamma correction unit
- Synchronization buffer

Figure 10-89. TV Output Architecture

The TV output is connected to the HDMI. The DISPC TV output receives an external clock, DISPC_TV_CLK, and based on the VSYNC generated by the HDMI, hold time, vertical offset, and horizontal offset, outputs the pixels synchronously. The size of the field/frame to output defines the number of pixels to output on each line and the number of lines for each field/frame.

10.2.4.13.1 Overlay Manager

The overlay mechanism is identical in LCD1 and LCD2 (see [Section 10.2.4.12.1, Overlay Manager](#)).

10.2.4.13.2 Gamma Correction Unit

The gamma correction unit works as described in [Section 10.2.4.12.2, Gamma Correction Unit](#). The only difference resides in the input pixel format RGB30. Each component of encoded pixel value is used as a pointer to index 1 out of 1024 30-bit gamma curve entries in the table. Each 10-bit component is replaced with the 10-bit table value corresponding to R, G, or B component. The table is loaded by software, through the DISPC_GAMMA_TABLE2 register. It is possible to load only part of the table. For each write access to the table, the 30-bit gamma value is associated with bit [31] INDEX to indicate that a new table is defined. Setting bit [31] INDEX to 0x1 for the first time, resets the internal index counter. All the following accesses are considered to be for incremented index addressing in the table (bit [31] INDEX set to 0 for each subsequent access). [Figure 10-90](#) shows the format of one of the gamma curve values in the memory.

Figure 10-90. Data Memory Organization for Gamma Mode in TV Output

10.2.4.13.3 Synchronized Buffer Update

The synchronized buffer update is identical in LCD1 and LCD2 (see [Section 10.2.4.12.6, Synchronized Buffer Update](#)).

10.2.4.13.4 Timing and TV Format Settings

[Figure 10-91](#) shows the TV formats supported.

Figure 10-91. TV Formats

The size of a TV output format is defined by:

- Number of lines, [DISPC_SIZE_TV\[26:16\]](#) LPP bit field, with a value from 1 to 2048
- Number of pixels per line, [DISPC_SIZE_TV\[10:0\]](#) PPL bit field, with a value from 1 to 2048
- Delta size between odd/even field, [DISPC_SIZE_TV\[15:14\]](#) DELTA_LPP bit field. This bit field controls only the output channel and not the size of the data field fetched from the frame buffer in memory.

The hold time of the pixels on the data bus is determined in clock cycles by the [DISPC_CONTROL1\[19:17\]](#) HT bit field. The default value at reset time is 0x0 (one cycle).

- When connected to the HDMI encoder, [Table 10-55](#) indicates the [DISPC_SIZE_TV](#) (PPL and LPP) value for each HD standard.

Table 10-55. PPL and LLP Value for HD Standard

| Standards | Active Pixels/Line | Active Lines | Digital Clock | DISPC_SIZE_TV |
|-------------|--------------------|--------------|--|-------------------------------|
| HD standard | 720p | 1280 | 74.25/74.125 MHz (60/59.99..frames/s) | 0x02CF04FF |
| | 1080i | 1920 | 74.25/74.125 MHz (60/59.99..frames/s) | 0x021B07FF |
| | 1080p | 1920 | 148.5/148.25 MHz (60/59.99..frames/s) | 0x043707FF |

- When connected to the HDMI encoder, to output any of the 3D frame-packing formats (720p @ 50 Hz, 720p @ 60 Hz, and 1080p @ 24 Hz, as defined in the HDMI v1.4 specification) supported by the device, [Table 10-56](#) lists the [DISPC_SIZE_TV](#) (PPL and LPP) value for each 3D standard.

Table 10-56. PPL and LLP Value for 3D Standard

| Standards | Active Pixels/Line | Active Lines | Digital Clock | DISPC_SIZE_TV |
|-------------|--------------------|--------------|-----------------------------|-------------------------------|
| 3D standard | 720p | 1280 | 148.5 MHz (50; 60 frames/s) | 5BD04FF |
| | 1080p | 1920 | 148.5 MHz (24 frames/s) | 9C0780 |

⁽¹⁾ See the following Note for information about configuring the 3D 1080p format.

NOTE: When configuring the DISPC to output any supported 3D frame-packing format, the following generic details must be considered:

- As defined by the HDMI v1.4 specification, Section 8.2.3.2, 3D frame-packing is a video format structure composed of two stereoscopic pictures: left and right.
- The stereoscopic pictures can be processed through the three video pipelines (VID1, VID2, or VID3). For more information about the configuration of video pipelines, see [Section 10.2.4.10, Video Pipelines](#).
- The 3D frame is generated by setting the TV overlay manager to combine the outputs of the selected video pipelines that hold the pictures. The VID1 or VID3 pipeline must carry the top field of the 3D frame (left stereoscopic picture), and the VID2 pipeline must always carry the bottom field of the frame (right stereoscopic picture). The top and bottom fields are separated by an active space area. For more information, see the HDMI v1.4 specification, Section 8.2.3.2.
- The pipeline carrying each field (top and bottom) of the 3D frame must have its height and width parameters defined in the [26:16] SIZEY and [10:0] SIZEX bit fields of DISPC_VIDp_SIZE register, and its Y and X positions defined in the [26:16] POSY and [10:0] POSX bit fields of the DISPC_VIDp_POSITION register. The active space area of the 3D frame can be encoded by setting the solid background color for the TV output (the [DISPC_DEFAULT_COLOR1\[23:0\] DEFAULTCOLOR](#) bit field). For more information about the overlay mechanism, see [Section 10.2.4.13.1, Overlay Manager](#).
- If the 3D 1080p format must be output, the following specific settings must be applied:
 - [DISPC_VID2_ATTRIBUTES\[31:30\] CHANNELOUT2](#) bit field = 0x2
 - [DISPC_SIZE_TV\[26:16\] LPP](#) = 0x9C

10.2.4.14 Shadow Registers

Some DISPC registers are termed *shadow registers*. A shadow register change has no direct effect on the configuration of the DISPC. The registers are shadow registers to allow software change the values of the registers at any time. When all the registers for a given configuration are into the registers, software must set 1 bit only to validate the configuration. When hardware reaches the end of the current frame and sees that the bit field has been set by software, the new configuration is now the configuration used by hardware.

The bits enabling hardware to use the new configuration are:

- The [DISPC_CONTROL1\[5\] GOLCD](#) bit for all the registers associated to the LCD1 output, and for all registers of WB and DMA, if the LCD1 channel is captured. The update of the registers of the WB and DMA is further delayed by the [DISPC_WB_ATTRIBUTES2\[7:0\] WBDELAYCOUNT](#) bit field or done when the next frame is captured (the [DISPC_WB_ATTRIBUTES\[26:24\] CAPTUREMODE](#) bit field must be different from 0). The update of the registers occurs at the VFP start period.
- The [DISPC_CONTROL1\[6\] GOTV](#) bit for all the registers associated to the TV output, and for all registers of WB and DMA, if the TV channel is captured. The update of the registers of the WB and DMA is further delayed by the [DISPC_WB_ATTRIBUTES2\[7:0\] WBDELAYCOUNT](#) bit field or done when the next frame is captured (the [DISPC_WB_ATTRIBUTES\[26:24\] CAPTUREMODE](#) bit field must be different from 0). The update of the registers occurs at the external EVSYNC.
- The [DISPC_CONTROL2\[5\] GOLCD](#) bit for all the registers associated to the LCD2 output, and for all registers of WB and DMA, if the LCD2 channel is captured. The update of the registers of the WB and DMA is further delayed by the [DISPC_WB_ATTRIBUTES2\[7:0\] WBDELAYCOUNT](#) bit field or done when the next frame is captured (the [DISPC_WB_ATTRIBUTES\[26:24\] CAPTUREMODE](#) bit field must be different from 0). The update of the registers occurs at the VFP start period.
- The [DISPC_WB_ATTRIBUTES\[0\] ENABLE](#) bit for all the registers associated to the WB, if the transfer memory-to-memory is not associated with a channel out
- The [DISPC_CONTROL2\[6\] GOWB](#) bit and the [5]GOLCD and [6]GOTV bits in the [DISPC_CONTROL1/DISPC_CONTROL2](#) registers, combined with the synchronization event of the channel output selected for write back. This applies to all registers associated with the selected channel out and further delayed by the setting in the [DISPC_WB_ATTRIBUTES2\[7:0\] WBDELAYCOUNT](#) bit field for all registers of the write back and DMA. The GOWB bit must be set only in WB capture mode; it is not required when WB memory-to-memory mode is used.

NOTE: Before setting the GOLCD, GOTV, or GOWB bits, the user must ensure that the bits are cleared. Hardware resets the bit when the update completes.

Table 10-57 lists the shadow registers. Registers that do not have a cross mark in any table column are not shadowed.

Table 10-57. Shadow Registers

10.2.5 Display Controller Programming Guide

10.2.5.1 Display Controller Low-Level Programming Models

This section covers the low-level hardware programming sequences for the configuration and use of the module.

10.2.5.1.1 Global Initialization

10.2.5.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the DISPC module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the DISPC. See the DISPC Module Integration and Environment Sections for more information.

Table 10-58. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|----------------------|---|
| PRCM | Module interface and functional clocks must be enabled. See Chapter 3, Power, Reset, and Clock Management . |
| Control Module | Module-specific pad muxing and configuration must be set in the control module. See Chapter 19, Control Module . |
| MPU INTC or DSP INTC | MPU and/or DSP interrupt controller configuration must be done to enable the interrupts from DISPC module. See Chapter 18, Interrupt Controller . |
| Interconnect | For more information about the interconnect configuration, see Chapter 14, Interconnect . |

10.2.5.1.2 Operational Modes Configuration

Table 10-59. DISPC Configuration

| Step | Register / Bit Field / Programming Model |
|------------------------------------|---|
| For a GFX pipeline configuration | |
| Configure the GFX DMA channel | See Table 10-60 |
| Configure the GFX pipeline | See Table 10-63 |
| Configure the LCD or TV output | For LCD output, see Table 10-81 For TV output, see Table 10-87 |
| For a Video pipeline configuration | |
| Configure the video DMA channel | See Table 10-61 |
| Configure the video pipeline | See Table 10-68 |
| Configure the LCD or TV output | For LCD output, see Table 10-81 For TV output, see Table 10-87 |
| For a WB pipeline configuration | |
| Configure the WB DMA channel | Refer to Table 10-62 |
| Configure the WB pipeline | For video pipelines, see Table 10-76 |

10.2.5.1.2.1 DMA Configuration

10.2.5.1.2.1.1 Main Sequence – DISPC DMA Channel Configuration

This subsequence describes the parameters of the GFX, video, or WB DMA channel parameters.

Table 10-60. Configure the GFX DMA Channel

| Step | Register / Bit Field / Programming Model | Value |
|---|---|-------|
| Set the base address for RGB pixel format or BITMAP component format according to memory access type, rotation, mirroring (see section DMA) | DISPC_GFX_BA_j [31:0] BA | 0x— |
| Set the rotation flag | DISPC_GFX_ATTRIBUTES [13:12] ROTATION | 0x— |
| Set the number of bytes to increment at the end of the row | DISPC_GFX_ROW_INC [31:0] ROWINC | 0x— |
| Set the number of bytes to increment between two pixels | DISPC_GFX_PIXEL_INC [7:0] PIXELINC | 0x— |
| Determine the FIFO preload mode | DISPC_GFX_ATTRIBUTES [11] BUFPRELOAD | 0x— |
| Set the preload value | DISPC_GFX_PRELOAD [11:0] PRELOAD | 0x— |
| Determine the burst type | DISPC_GFX_ATTRIBUTES [29] BURSTTYPE | 0x— |
| Set the burst size | DISPC_GFX_ATTRIBUTES [7:6] BURSTSIZE | 0x— |
| Set the high level of DMA FIFO threshold | DISPC_GFX_BUF_THRESHOLD [31:16] BUFHIGHTRESHOLD | 0x— |

Table 10-60. Configure the GFX DMA Channel (continued)

| Step | Register / Bit Field / Programming Model | Value |
|---|---|-------|
| Set the low level of DMA FIFO threshold | DISPC_GFX_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD | 0x— |
| Enable Selfrefresh | DISPC_GFX_ATTRIBUTES[24] SELFREFRESH | 0x— |
| Select priority over the other pipeline | DISPC_GFX_ATTRIBUTES[23] ARBITRATION | 0x— |

Table 10-61. Configure the Video DMA Channel

| Step | Register / Bit Field / Programming Model | Value |
|---|--|-------|
| Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (refer to section DMA) | DISPC_VIDp_BA_j[31:0] BA | 0x— |
| Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (refer to section DMA) ⁽¹⁾ | DISPC_VIDp_BA_UV_j[31:0] BA | 0x— |
| Set the rotation flag | DISPC_VIDp_ATTRIBUTES[13:12] ROTATION | 0x— |
| Set the number of bytes to increment at the end of the row | DISPC_VIDp_ROW_INC[31:0] ROWINC | 0x— |
| Set the number of bytes to increment between two pixels | DISPC_VIDp_PIXEL_INC[7:0] PIXELINC | 0x— |
| Set the X original image size | DISPC_VIDp_PICTURE_SIZE[10:0] ORGSIZE_X | 0x— |
| Set the Y original image size | DISPC_VIDp_PICTURE_SIZE[26:16] ORGSIZE_Y | 0x— |
| Determine the FIFO preload mode | DISPC_VIDp_ATTRIBUTES[19] BUFPRELOAD | 0x— |
| Set the preload value | DISPC_VIDp_PRELOAD[11:0] PRELOAD | 0x— |
| Determine the burst type | DISPC_VIDp_ATTRIBUTES[29] BURSTTYPE | 0x— |
| Set the burst size | DISPC_VIDp_ATTRIBUTES[15:14] BURSTSIZE | 0x— |
| Set the high level of DMA FIFO threshold | DISPC_VIDp_BUF_THRESHOLD[31:16] BUFHIGHTRESHOLD | 0x— |
| Set the low level of DMA FIFO threshold | DISPC_VIDp_BUF_THRESHOLD[15:0] BUFLOWTRESHOLD | 0x— |
| Enable Selfrefresh | DISPC_VIDp_ATTRIBUTES[24] SELFREFRESH | 0x— |
| Select priority over the other pipeline | DISPC_VIDp_ATTRIBUTES[23] ARBITRATION | 0x— |

⁽¹⁾ Applicable only for YUV pixel format

Table 10-62. Configure the WB DMA Channel

| Step | Register / Bit Field / Programming Model | Value |
|---|--|-------|
| Set the base address for RGB pixel format or Y component format according to memory access type, rotation, mirroring (refer to section DMA) | DISPC_WB_BA_j[31:0] BA | 0x— |
| Set the base address for Cb and Cr components according to memory access type, rotation, mirroring (refer to section DMA) ⁽¹⁾ | DISPC_WB_BA_UV_j[31:0] BA | 0x— |
| Set the stride of CbCr component ⁽²⁾ | DISPC_WB_ATTRIBUTES[22] DOUBLESTRIDE | 0x— |
| Set the rotation flag | DISPC_WB_ATTRIBUTES[13:12] ROTATION | 0x— |
| Set the number of bytes to increment at the end of the row | DISPC_WB_ROW_INC[31:0] ROWINC | 0x— |
| Set the number of bytes to increment between two pixels | DISPC_WB_PIXEL_INC[7:0] PIXELINC | 0x— |
| Set the X final image size in system memory | DISPC_WB_PICTURE_SIZE[10:0] ORGSIZE_X | 0x— |
| Set the Y final image size in system memory | DISPC_WB_PICTURE_SIZE[26:16] ORGSIZE_Y | 0x— |
| Set the burst size | DISPC_WB_ATTRIBUTES[15:14] BURSTSIZE | 0x— |

⁽¹⁾ Applicable only for YUV pixel format

⁽²⁾ Applicable only for YUV pixel format

Table 10-62. Configure the WB DMA Channel (continued)

| Step | Register / Bit Field / Programming Model | Value |
|--|---|-------|
| Set the high level of DMA FIFO threshold | DISPC_WB_BUF_THRESHOLD [31:16] BUFHIGHTRESHOLD | 0x– |
| Set the low level of DMA FIFO threshold | DISPC_WB_BUF_THRESHOLD [15:0] BUFLOWTRESHOLD | 0x– |
| Select priority over the other pipeline | DISPC_WB_ATTRIBUTES [23] ARBITRATION | 0x– |

10.2.5.1.2.2 GFX Pipeline Configuration

10.2.5.1.2.2.1 Main Sequence - Configure the GFX Pipeline

This procedure details the steps for a GFX pipeline configuration described in [Table 10-63](#)

Table 10-63. Configure the GFX Pipeline

| Step | Register / Bit Field / Programming Model | Value |
|--|---|-------|
| Configure the GFX Window | Refer to Table 10-64 | |
| Configure the GFX pipeline processing | Refer to Table 10-65 | |
| Configure the GFX pipeline layer output | Refer to Table 10-67 | |
| Validate the GFX configuration according to outputs associated to the pipeline | DISPC_CONTROL1 [5] GOLCD | |
| | DISPC_CONTROL2 [5] GOLCD | |
| | DISPC_CONTROL2 [6] GOWB | |
| | DISPC_CONTROL1 [6] GOTV | |
| Enable the GFX pipeline | DISPC_GFX_ATTRIBUTES [0] ENABLE | 0x1 |

10.2.5.1.2.2.2 Subsequence - Configure the GFX Window

This subsequence describes the parameters of the image to be displayed on the LCD panel.

Table 10-64. Configure the GFX Window

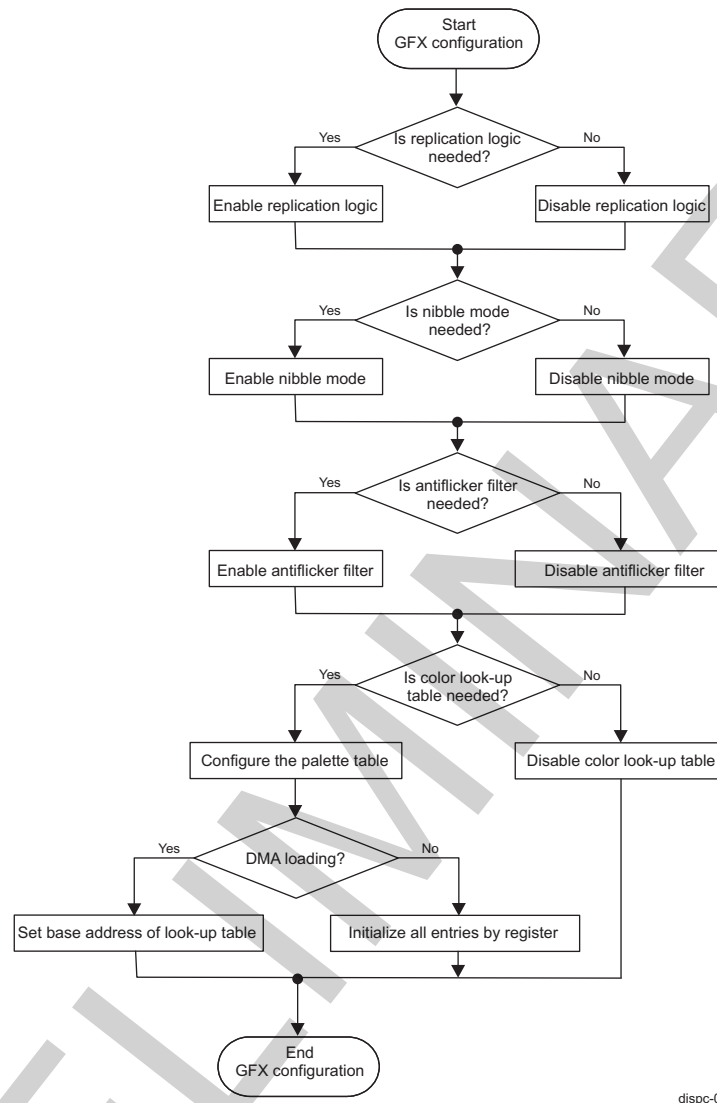

| Step | Register / Bit Field / Programming Model | Value |
|--|---|-------|
| Select the format of image | DISPC_GFX_ATTRIBUTES [4:1] FORMAT | 0x– |
| Set the X size of image to be displayed onto LCD panel | DISPC_GFX_SIZE [10:0] SIZEX | 0x– |
| Set the Y size of image to be displayed onto LCD panel | DISPC_GFX_SIZE [26:16] SIZEY | 0x– |
| Set the X position of image in respect to LCD panel | DISPC_GFX_POSITION [10:0] POSX | 0x– |
| Set the Y position of image in respect to LCD panel | DISPC_GFX_POSITION [26:16] POSY | 0x– |

10.2.5.1.2.2.3 Subsequence - Configure the GFX Pipeline Processing

Table 10-65. Configure the GFX Pipeline Processing

| Step | Register / Bit Field / Programming Model | Value |
|-----------------------------|--|-------|
| Enable replication logic | DISPC_GFX_ATTRIBUTES [5] REPLICATIONENABLE | 0x1 |
| Enable nibble mode | DISPC_GFX_ATTRIBUTES [9] NIBBLEMODE | 0x1 |
| Enable anti flicker filter | DISPC_GFX_ATTRIBUTES [24] ANTIFLICKER | 0x1 |
| Configure the palette table | Refer to Table 10-66 | 0x– |

Figure 10-92. Video Pipeline Processing Configuration

10.2.5.1.2.2.4 Subsequence - Configure the Palette Table

This subsequence resumes the settings for configuring the Color Look-Up table as palette for GFX pipeline,

NOTE:

- Software must ensure there is no visible effect when modifying the table since it is not under hardware control and the synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.
- If GFX pipeline is in BITMAP pixel format, gamma corrections is not available for LCD1.

Table 10-66. Configure the Palette Table

| Step | Register / Bit Field / Programming Model | Value |
|---|--|-------|
| Set look up table as palette table | DISPC_CONFIG1[3] PALETTEGAMMATALE | 0x0 |
| Select the load mode of the palette look-up table | DISPC_CONFIG1[2:1] LOADMODE | 0x– |

Table 10-66. Configure the Palette Table (continued)

| Step | Register / Bit Field / Programming Model | Value |
|---|---|-------|
| DMA loading | | |
| Set base address of look-up table | DISPC_GFX_TABLE_BA[31:0] TABLEBA | 0x– |
| Initialize all entries by register | | |
| Initialize all entries for the palette table by setting the table index and the RGB values associated to this index | DISPC_GAMMA_TABLE0[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B | 0x– |

10.2.5.1.2.2.5 Subsequence - Configure the GFX Pipeline Layer Output

This subsequence resume the video layer settings available at the pipeline level necessary when using the overlay manager.

Table 10-67. Configure the GFX Pipeline Layer Output

| Step | Register / Bit Field / Programming Model | Value |
|---|--|-------|
| Set the LCD/TV output | DISPC_GFX_ATTRIBUTES[8] CHANNELOUT | 0x– |
| If DISPC_GFX_ATTRIBUTES[8]=0, set the LCD output | DISPC_GFX_ATTRIBUTES[31:30] CHANNELOUT2 | 0x– |
| Set the Z-order priority of the layer for overlay manager | DISPC_GFX_ATTRIBUTES[27:26] ZORDER | 0x– |
| Enable the video pipeline Z-order | DISPC_GFX_ATTRIBUTES[25] ZORDERENABLE | 0x– |
| Set the Global Alpha value for the Alpha blender unit | DISPC_GLOBAL_ALPHA[7:0] GFXGLOBALALPHA | 0x– |

10.2.5.1.2.3 Video Pipeline Configuration

10.2.5.1.2.3.1 Main Sequence - Configure the Video Pipeline

This procedure details the steps for a video pipeline configuration described in [Table 10-68](#).

Table 10-68. Configure the Video Pipeline

| Step | Register / Bit Field / Programming Model | Value |
|--|--|-------|
| Configure the video window | Refer to Table 10-69 | |
| Configure the video pipeline processing | Refer to Table 10-70 | |
| Configure the video pipeline layer output | Refer to Table 10-75 | |
| Validate the video configuration according to outputs associated to the pipeline | DISPC_CONTROL1[5] GOLCD | |
| | DISPC_CONTROL2[5] GOLCD | |
| | DISPC_CONTROL2[6] GOWB | |
| | DISPC_CONTROL1[6] GOTV | |
| Enable video pipeline | DISPC_VIDp_ATTRIBUTES[0] ENABLE | 0x1 |

10.2.5.1.2.3.2 Subsequence - Configure the Video Window

This subsequence describes the parameters of the image to be displayed on the LCD panel.

Table 10-69. Configure the Video Window

| Step | Register / Bit Field / Programming Model | Value |
|--|--|-------|
| Select the format of image | DISPC_VIDp_ATTRIBUTES[4:1] FORMAT | 0x– |
| Set the X size of image to be displayed onto LCD panel | DISPC_VIDp_SIZE[10:0] SIZE_X | 0x– |

Table 10-69. Configure the Video Window (continued)

| Step | Register / Bit Field / Programming Model | Value |
|--|--|-------|
| Set the Y size of image to be displayed onto LCD panel | DISPC_VIDp_SIZE[10:0] SIZEY | 0x– |
| Set the X position of image in respect to LCD panel | DISPC_VIDp_POSITION[10:0] POSX | 0x– |
| Set the Y position of image in respect to LCD panel | DISPC_VIDp_POSITION[26:16] POSY | 0x– |

10.2.5.1.2.3.3 Subsequence - Configure the Video Pipeline Processing

Table 10-70. Configure the Video Pipeline Processing

| Step | Register / Bit Field / Programming Model | Value |
|---|---|-------|
| Select the video pipeline configuration 1 or 2 | DISPC_VIDp_ATTRIBUTES2[8] YUVCHROMARESAMPLING | 0x– |
| Enable/disable Replication Logic ⁽¹⁾ | DISPC_VIDp_ATTRIBUTES[10] REPLICATIONENABLE | 0x1 |
| Configure the VC-1 range mapping ⁽¹⁾ | Refer to Section 10.2.5.1.2.3.4 | |
| Configure the video Color Space Conversion ⁽¹⁾ | Refer to Section 10.2.5.1.2.3.5 | |
| Configure the video Scaler Unit ⁽¹⁾ | Refer to Section 10.2.5.1.2.3.6 | |

- ⁽¹⁾ This module configuration can be optional depending on:
- The video mode configuration selected, refer to [Figure 10-93](#)
 - The video format and application needs

Figure 10-93. Video Pipeline Processing Configuration

dispc-089

10.2.5.1.2.3.4 Subsequence - Configure the VC-1 Range Mapping**Table 10-71. Configure the VC-1 Range Mapping**

| Step | Register / Bit Field / Programming Model | Value |
|--|--|-------|
| Set the Y component VC-1 range mapping | DISPC_VIDp_ATTRIBUTES2[3:1] VC1_RANGE_Y | 0x– |
| Set the Cb and Cr component VC-1 range mapping | DISPC_VIDp_ATTRIBUTES2[6:4] VC1_RANGE_CBCR | 0x– |
| Enable VC-1 range mapping | DISPC_VIDp_ATTRIBUTES2[0] VC1ENABLE | 0x1 |

10.2.5.1.2.3.5 Subsequence - Configure the Video Color Space Conversion

Table 10-72. Configure the Video Color Space Conversion

| Step | Register / Bit Field / Programming Model | Value |
|--|---|-------|
| Select the range of the Color Space Conversion | DISPC_VIDp_ATTRIBUTES[11] FULLRANGE | 0x– |
| Set the RCr and RY coefficients | DISPC_VIDp_CONV_COEF0[26:16][10:0] RCR, RY | 0x– |
| Set the GY and RCB coefficients | DISPC_VIDp_CONV_COEF1[26:16][10:0] GY, RCB | 0x– |
| Set the GCb and GCr coefficients | DISPC_VIDp_CONV_COEF2[26:16][10:0] GCB, GCR | 0x– |
| Set the BCr and BY coefficients | DISPC_VIDp_CONV_COEF3[26:16][10:0] BCR, BY | 0x– |
| Set the BCb coefficient | DISPC_VIDp_CONV_COEF4[10:0] BCB | 0x– |
| Enable Color Space Conversion | DISPC_VIDp_ATTRIBUTES[9] COLORCONVENABLE | 0x1 |

10.2.5.1.2.3.6 Subsequence - Configure the Video Scaler Unit

This subsequence configures the video scaler unit. [Table 10-73](#) is applies to RGB pixel format. [Table 10-73](#) and [Table 10-74](#) apply to YUV pixel format.

Table 10-73. Configure the Video Scaler Unit for RGB Pixel Formats or Y Component

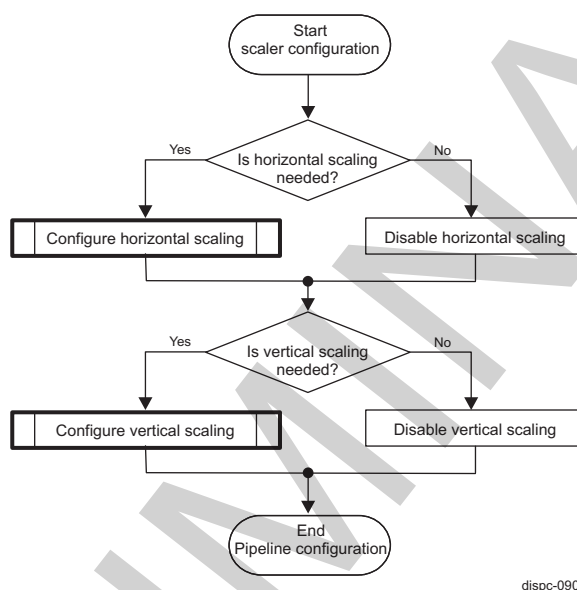

| Step | Register / Bit Field / Programming Model | Value |
|---|--|-------|
| Configure horizontal scaling | | |
| Set the horizontal resizing ratio | DISPC_VIDp_FIR[12:0] FIRHINC | 0x– |
| Set the horizontal FIR coefficients | DISPC_VIDp_FIR_COEF_H_i[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0 | 0x– |
| | DISPC_VIDp_FIR_COEF_HV_i[7:0] FIRHC4 | 0x– |
| Set the horizontal accumulators value | DISPC_VIDp_ACCU_i[10:0] HORIZONTALACCU | 0x– |
| Configure vertical scaling | | |
| Select number of vertical taps | DISPC_VIDp_ATTRIBUTES[21] VERTICALTAPS | 0x– |
| Set the vertical resizing ratio | DISPC_VIDp_FIR[28:16] FIRVINC | 0x– |
| Set the vertical FIR coefficients for RGB pixel format or Y component | DISPC_VIDp_FIR_COEF_HV_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0 | 0x– |
| | Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V_i[15:8][7:0] FIRVC22, FIRVC00 | 0x– |
| Set the vertical accumulators value for RGB pixel format or Y component | DISPC_VIDp_ACCU_j[26:16] VERTICALACCU | 0x– |
| Enable horizontal and vertical Scaler Unit | DISPC_VIDp_ATTRIBUTES[6:5] RESIZEENABLE | 0x– |

Table 10-74. Configure the Video Scaler Unit for Cb and Cr Components

| Step | Register / Bit Field / Programming Model | Value |
|--|--|-------|
| Configure horizontal scaling | | |
| Set the horizontal resizing ratio for Cb and Cr components | DISPC_VIDp_FIR2[12:0] FIRHINC | 0x– |
| Set the horizontal FIR coefficients for Cb and Cr components | DISPC_VIDp_FIR_COEF_H2_i[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0 | 0x– |
| | DISPC_VIDp_FIR_COEF_HV2_i[7:0] FIRHC4 | 0x– |
| Set the horizontal accumulators value for Cb and Cr components | DISPC_VIDp_ACCU2_i[10:0] HORIZONTALACCU | 0x– |
| Configure vertical scaling | | |
| Set the vertical resizing ratio for Cb and Cr components | DISPC_VIDp_FIR2[28:16] FIRVINC | 0x– |

Table 10-74. Configure the Video Scaler Unit for Cb and Cr Components (continued)

| Step | Register / Bit Field / Programming Model | Value |
|--|--|-------|
| Set the vertical FIR coefficients for Cb and Cr components | DISPC_VIDp_FIR_COEF_HV2_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0 | 0x– |
| | Only for 5-taps vertical: DISPC_VIDp_FIR_COEF_V2_i[15:8][7:0] FIRVC22, FIRVC00 | 0x– |
| Set the vertical accumulators value for Cb and Cr components | DISPC_VIDp_ACCU2_j[26:16] VERTICALACCU | 0x– |

Figure 10-94. Scaler Unit Programming Flow

10.2.5.1.2.3.7 Subsequence - Configure the Video Pipeline Layer Output

This subsequence resume the video layer settings available at the pipeline level necessary when using the overlay manager.

Table 10-75. Configure the Video Pipeline Layer Output

| Step | Register / Bit Field / Programming Model | Value |
|---|---|-------|
| Set the LCD/TV output | DISPC_VIDp_ATTRIBUTES[16] CHANNELOUT | 0x– |
| If DISPC_VIDp_ATTRIBUTES[16]=0, set the LCD output | DISPC_VIDp_ATTRIBUTES[31:30] CHANNELOUT2 | 0x– |
| Set the Z-order priority of the layer for overlay manager | DISPC_VIDp_ATTRIBUTES[27:26] ZORDER | 0x– |
| Enable the video pipeline Z-order | DISPC_VIDp_ATTRIBUTES[25] ZORDERENABLE | 0x– |
| Set the Global Alpha value for the Alpha blender unit | DISPC_GLOBAL_ALPHA[31:24][23:16][15:8] VID3GLOBALALPHA, VID2GLOBALALPHA , VID1GLOBALALPHA | 0x– |

10.2.5.1.2.4 WB Pipeline Configuration

10.2.5.1.2.4.1 Main Sequence - Configure the WB Pipeline

This procedure details the steps for a WB pipeline configuration described in [Table 10-76](#).

Table 10-76. Configure the WB Pipeline

| Step | Register / Bit Field / Programming Model | Value |
|--|---|-------|
| Configure the Capture window | Refer to Table 10-77 | |
| Configure the WB Scaler unit | Refer to Table 10-78 | |
| Enable truncation logic to match pixel size defined in the format of image DISPC_WB_ATTRIBUTES [4:1] FORMAT | DISPC_WB_ATTRIBUTES [10] TRUNCATIONENABLE | 0x– |
| if DISPC_WB_ATTRIBUTES [10] != , Configure the WB Color Space Conversion unit | Refer to Table 10-80 | |
| Validate the configuration according to the registers modification. ⁽¹⁾ | DISPC_CONTROL2 [6] GOWB | |
| Enable WB pipeline | DISPC_WB_ATTRIBUTES [0] ENABLE | 0x1 |

⁽¹⁾ Setting the GOWB bit is required only in WB capture mode; it is not required in WB memory-to-memory mode.

10.2.5.1.2.4.2 Subsequence - Configure the Capture Window

This subsequence describes the parameters of the image to be captured in the system memory.

Table 10-77. Configure the Capture Window

| Step | Register / Bit Field / Programming Model | Value |
|--|---|-------|
| Set the input source | DISPC_WB_ATTRIBUTES [18:16] CHANNELIN | 0x– |
| Select the format of image | DISPC_WB_ATTRIBUTES [4:1] FORMAT | 0x– |
| Set the X size of image to be captured | DISPC_WB_SIZE [10:0] SIZEX | 0x– |
| Set the Y size of image to be captured | DISPC_WB_SIZE [10:0] SIZEY | 0x– |

10.2.5.1.2.4.3 Subsequence - Configure the WB Scaler Unit

This subsequence configures the scaler unit. [Table 10-73](#) is applicable for RGB pixel format. [Table 10-73](#) and [Table 10-74](#) are applicable for YUV pixel format.

Table 10-78. Configure the WB Scaler Unit for RGB Pixel Formats or Y Component

| Step | Register / Bit Field / Programming Model | Value |
|---|---|-------|
| Configure horizontal scaling | | |
| Set the horizontal resizing ratio | DISPC_WB_FIR [12:0] FIRHINC | 0x– |
| Set the horizontal FIR coefficients | DISPC_WB_FIR_COEF_H_i [31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0 | 0x– |
| | DISPC_WB_FIR_COEF_HV_i [7:0] FIRHC4 | 0x– |
| Set the horizontal accumulators value | DISPC_WB_ACCU_i [10:0] HORIZONTALACCU | 0x– |
| Configure vertical scaling | | |
| Select number of vertical taps | DISPC_WB_ATTRIBUTES [21] VERTICALTAPS | 0x– |
| Set the vertical resizing ratio | DISPC_WB_FIR [28:16] FIRVINC | 0x– |
| Set the vertical FIR coefficients for RGB pixel format or Y component | DISPC_WB_FIR_COEF_HV_i [31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0 | 0x– |
| | Only for 5-taps vertical: DISPC_WB_FIR_COEF_V_i [15:8][7:0] FIRVC22, FIRVC00 | 0x– |
| Set the vertical accumulators value for RGB pixel format or Y component | DISPC_WB_ACCU_i [26:16] VERTICALACCU | 0x– |
| Enable horizontal and vertical Scaler Unit | DISPC_WB_ATTRIBUTES [6:5] RESIZEENABLE | 0x– |

Table 10-79. Configure the WB Scaler Unit for Cb and Cr Components

| Step | Register / Bit Field / Programming Model | Value |
|--|---|-------|
| Configure horizontal scaling | | |
| Set the horizontal resizing ratio for Cb and Cr components | DISPC_WB_FIR2[12:0] FIRHINC | 0x– |
| Set the horizontal FIR coefficients for Cb and Cr components | DISPC_WB_FIR_COEF_H2_i[31:24][23:16][15:8][7:0] FIRHC3, FIRHC2, FIRHC1, FIRHC0 | 0x– |
| | DISPC_WB_FIR_COEF_HV2_i[7:0] FIRHC4 | 0x– |
| Set the horizontal accumulators value for Cb and Cr components | DISPC_WB_ACCU2_i[10:0] HORIZONTALACCU | 0x– |
| Configure vertical scaling | | |
| Set the vertical resizing ratio for Cb and Cr components | DISPC_WB_FIR2[28:16] FIRVINC | 0x– |
| Set the vertical FIR coefficients for Cb and Cr components | DISPC_WB_FIR_COEF_HV2_i[31:24][23:16][15:8] FIRVC2, FIRVC1, FIRVC0 | 0x– |
| | Only for 5-taps vertical: DISPC_WB_FIR_COEF_V2_i[15:8][7:0] FIRVC22, FIRVC00 | 0x– |
| Set the vertical accumulators value for Cb and Cr components | DISPC_WB_ACCU2_i[26:16] VERTICALACCU | 0x– |

10.2.5.1.2.4.4 Subsequence - Configure the WB Color Space Conversion Unit

Table 10-80. Configure the WB Color Space Conversion Unit

| Step | Register / Bit Field / Programming Model | Value |
|--|---|-------|
| Select the range of the Color Space Conversion | DISPC_WB_ATTRIBUTES[11] FULLRANGE | 0x– |
| Set the RCr and RY coefficients | DISPC_WB_CONV_COEF0[26:16][10:0] YG, YR | 0x– |
| Set the GY and RCb coefficients | DISPC_WB_CONV_COEF1[26:16][10:0] CRR, YB | 0x– |
| Set the GCb and GCr coefficients | DISPC_WB_CONV_COEF2[26:16][10:0] CRB, CRG | 0x– |
| Set the BCr and BY coefficients | DISPC_WB_CONV_COEF3[26:16][10:0] CBG, CBR | 0x– |
| Set the BCb coefficient | DISPC_WB_CONV_COEF4[10:0] CBB | 0x– |
| Enable Color Space Conversion | DISPC_WB_ATTRIBUTES[9] COLORCONVENABLE | 0x1 |

10.2.5.1.2.5 LCD Output Configuration

10.2.5.1.2.5.1 Main Sequence - Configure the LCD Output

This procedure details the LCD output configuration.

Table 10-81. Configure the LCD Output

| Step | Register / Bit Field / Programming Model |
|---|--|
| Configure the LCD overlay manager | Table 10-82 |
| Configure the gamma table for gamma correction | Section 10.2.5.1.2.5.3 |
| Configure the Color Phase Rotation | Table 10-85 |
| Configure the LCD panel timings and parameters | Table 10-86 |
| Validate the LCD output configuration according | DISPC_CONTROL1[5] GOLCD |
| | DISPC_CONTROL2[5] GOLCD |
| Enable LCD output | DISPC_CONTROL1[0] LCDENABLE |
| | DISPC_CONTROL2[0] LCDENABLE |

10.2.5.1.2.5.2 Subsequence - Configure the Overlay Manager

This subsequence resumes the overlay manager settings and transparency color key configuration.

Table 10-82. Configure the LCD Overlay Manager

| Step | Register / Bit Field / Programming Model | Value |
|---|--|-------|
| Set the LCD panel background color | DISPC_DEFAULT_COLORo[23:0] DEFAULTCOLOR | 0x– |
| Enable/Disable overlay optimization | DISPC_CONTROLo[12] OVERLAYOPTIMIZATION | 0x– |
| Enable the Alpha blender ⁽¹⁾ | DISPC_CONFIG1[18] LCDALPHABLENDERENABLE | 0x1 |
| Configure the transparency color key | | |
| Set source or destination transparency color key mode | DISPC_CONFIGo[11] TCKLCDSELECTION | 0x– |
| Set the transparency color value | DISPC_TRANS_COLORo[23:0] TRANSCOLORKEY | 0x– |
| Enable transparency color key mode | DISPC_CONFIGo[10] TCKLCDENABLE | 0x– |

⁽¹⁾ Backward compatibility with only available for LCD1.

10.2.5.1.2.5.3 Subsequence - Configure the Gamma Table for Gamma Correction

This subsequence resumes the settings for configuring the gamma correction for LCD1, see [Table 10-83](#) and LCD2, see [Table 10-84](#).

NOTE:

- Software must ensure there is no visible effect when modifying the table because it is not under hardware control and the synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.
- If GFX pipeline is in BITMAP pixel format, gamma corrections is not available for LCD1.

Table 10-83. Configure the Gamma Table for LCD1

| Step | Register / Bit Field / Programming Model | Value |
|---|---|-------|
| Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index | DISPC_GAMMA_TABLE0[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B | 0x– |
| Set look up table as gamma table | DISPC_CONFIG1[3] PALETTEGAMMATALE | 0x1 |
| Select the load mode of the Gamma look-up table | DISPC_CONFIG1[2:1] LOADMODE | 0x– |

Table 10-84. Configure the Gamma Table for LCD2

| Step | Register / Bit Field / Programming Model | Value |
|--|---|-------|
| Enable Gamma table for LCD2 and TV | DISPC_CONFIG1[9] GAMATABLEENABLE | 0x1 |
| Initialize all entries for the gamma table by setting the table index and the RGB values associated to this index. | DISPC_GAMMA_TABLE1[31:24][23:16][15:8][7:0], INDEX, VALUE_R, VALUE_G, VALUE_B | 0x– |

10.2.5.1.2.5.4 Subsequence - Configure the Color Phase Rotation

[Table 10-85](#) resumes the settings for the Color Phase Rotation unit.

Table 10-85. Configure the Color Phase Rotation

| Step | Register / Bit Field / Programming Model | Value |
|----------------------------|--|-------|
| Set the Red coefficients | DISPC_CPRo_COEF_R [31:22][20:11][9:0] RR, RG, RB | 0x– |
| Set the Green coefficients | DISPC_CPRo_COEF_G [31:22][20:11][9:0] GR, GG, GB | 0x– |

Table 10-85. Configure the Color Phase Rotation (continued)

| Step | Register / Bit Field / Programming Model | Value |
|--|--|-------|
| Set the Blue coefficients | DISPC_CPRo_COEF_B [31:22][20:11][9:0] BR, BG, BB | 0x– |
| Disable Color Phase Rotation unit in RGB to YUV conversion | DISPC_CONFIGo[24] COLORCONVENABLE | 0x0 |
| Enable Color Phase Rotation unit | DISPC_CONFIGo[15] CPR | 0x1 |

10.2.5.1.2.5.5 Subsequence - Configure the LCD Panel Timings and Parameters

This subsequence resumes the setting for horizontal and vertical synchronization and also the signals polarity.

Table 10-86. Configure the LCD Panel Timings and Parameters

| Step | Register / Bit Field / Programming Model | Value |
|---|--|-------|
| Configure Spatial/Temporal Dithering | | |
| Select Spatial/Temporal number of frames | DISPC_CONTROLo[31:30] SPATIALTEMPORALDITHERINGFRAMES | 0x– |
| Enable Spatial/Temporal dithering | DISPC_CONTROLo[7] STDITHERENABLE | 0x– |
| Configure AC-bias | | |
| Configure the VSYNC, HSYNC and AC bias polarity | DISPC_POL_FREQo | 0x– |
| Configure the gating of AC bias polarity | DISPC_CONFIGo[8] ACBIASGATED | 0x– |
| Configure the AC bias polarity | DISPC_POL_FREQo[15] IEO | 0x– |
| Set the AC bias frequency | DISPC_POL_FREQo[7:0] ACB | 0x– |
| Set the number of AC bias transitions per interrupt | DISPC_POL_FREQo[11:8] ACBI | 0x– |
| Configure the pixel clock | | |
| Set the DISPC logic clock divisor | DISPC_DIVISORo[23:16] LCD | 0x– |
| Set the pixel clock divisor | DISPC_DIVISORo[7:0] PCD | 0x– |
| Configure the gating of Pixel clock | DISPC_CONFIGo[5] PIXELCLOCKGATED | 0x– |
| Configure the data | | |
| Set the pixel clock edge to drive data output | DISPC_POL_FREQo[14] IPC | 0x– |
| Configure the gating of data output | DISPC_CONFIGo[4] PIXELDATAGATED | 0x– |
| Set the data output mode | DISPC_CONFIGo[22] OUTPUTMODEENABLE | 0x– |
| Configure the panel parameters | | |
| Set the vertical TV size | DISPC_SIZE_LCDo[26:16] LPP | 0x– |
| Set the horizontal TV size | DISPC_SIZE_LCDo[10:0] PPL | 0x– |
| Set the panel type | DISPC_CONTROLo[3] STNTFT | 0x– |
| Configure the refresh rate and horizontal and vertical parameters | | |
| Set the vertical synchronization timing | DISPC_TIMING_Vo[31:20][19:8][7:0], VBP, VFP, VSW | 0x– |
| Configure the VSYNC polarity | DISPC_POL_FREQo[12] IVS | 0x– |
| Configure the gating of VSYNC | DISPC_CONFIGo[7] VSYNCGATED | 0x– |
| Set the horizontal synchronization timing | DISPC_TIMING_Ho[31:20][19:8][7:0], HBP, HFP, HSW | 0x– |
| Configure the HSYNC polarity | DISPC_POL_FREQo[13] IHS | 0x– |
| Configure the gating of HSYNC | DISPC_CONFIGo[6] HSYNCGATED | 0x– |
| Set the opposition of HSYNC and VSYNC driving | DISPC_POL_FREQo[17] ONOFF | 0x– |
| If DISPC_POL_FREQo[17] = 1, set the pixel clock edge to drive HSYNC and VSYNC | DISPC_POL_FREQo[16] RF | 0x– |
| Set the alignment of HSYNC and VSYNC | DISPC_POL_FREQo[18] ALIGN | 0x– |

10.2.5.1.2.6 TV Output Configuration

Main Sequence - Configure the TV Output

This procedure details the TV output configuration.

Table 10-87. Configure the TV Output

| Step | Register / Bit Field / Programming Model |
|--|---|
| Configure the TV overlay manager | Refer to Table 10-88 |
| Configure the gamma table for gamma correction | Refer to Table 10-89 |
| Configure the TV panel timings and parameters | Refer to Table 10-90 |
| Validate the TV output configuration according | DISPC_CONTROL1 [6] GOTV |
| Enable TV output | DISPC_CONTROL1 [1] TVENABLE |

10.2.5.1.2.6.1 Subsequence - Configure the TV Overlay Manager

This subsequence resumes the overlay manager settings and transparency color key configuration.

Table 10-88. Configure the TV Overlay Manager

| Step | Register / Bit Field / Programming Model | Value |
|---|--|-------|
| Set the TV panel background color | DISPC_DEFAULT_COLOR1 [23:0] DEFAULTCOLOR | 0x– |
| Enable/Disable overlay optimization | DISPC_CONTROL2 [13] TVOVERLAYOPTIMIZATION | 0x– |
| Enable the Alpha blender ⁽¹⁾ | DISPC_CONFIG1 [19] TVALPHABLENDERENABLE | 0x1 |
| Configure the transparency color key | | |
| Set source or destination transparency color key mode | DISPC_CONFIG1 [13] TCKTVSELECTION | 0x– |
| Set the transparency color value | DISPC_TRANS_COLOR1 [23:0] TRANSCOLORKEY | 0x– |
| Enable transparency color key mode | DISPC_CONFIG1 [10] TCKTVENABLE | 0x– |

⁽¹⁾ Backward compatibility with .

10.2.5.1.2.6.2 Subsequence - Configure the Gamma Table for Gamma Correction

NOTE:

- Software must ensure there is no visible effect when modifying the table since it is not under hardware control and the synchronization done using the DMA engine inside the DISPC to load the table when it is not used for displaying the picture on the screen is not present for this mode.

Table 10-89. Configure the Gamma Table for TV Output

| Step | Register / Bit Field / Programming Model | Value |
|--|---|-------|
| Enable Gamma table for LCD2 and TV | DISPC_CONFIG1 [9] GAMATABLEENABLE | 0x1 |
| Initialize all entries for the gamma table by setting the table index and the RGB values. For more information, see Section 10.2.4.13.2, Gamma Correction Unit . | DISPC_GAMMA_TABLE2 [31][29:20][19:10][9:0], INDEX, VALUE_R, VALUE_G, VALUE_B | 0x– |

10.2.5.1.2.6.3 Subsequence - Configure the TV Panel Timings and Parameters

This subsequence resumes the setting for horizontal and vertical synchronization and also the signals polarity.

Table 10-90. Configure the TV Panel Timings and Parameters

| Step | Register / Bit Field / Programming Model | Value |
|---------------------------------------|--|--|
| Set the hold time for TV data outputs | DISPC_CONFIG1[19:17] | 0x– |
| Set the vertical TV size | DISPC_SIZE_TV[26:16] LPP | See Table 10-91 for HD standards |
| Set the horizontal TV size | DISPC_SIZE_TV[10:0] PPL | |

Table 10-91. DISPC_SIZE_TV Values HD Standard

| Standards | | Active Pixels/line (PPL) | Active Lines (LPP) | Digital clock (DISPC_CTRL01. HT=0) | DISPC_SIZE_TV |
|-----------|-------|--------------------------|--------------------|---------------------------------------|---------------|
| HDTV | 720p | 1280 | 720 | 74.25/74.125 MHz (60/59.99..frames/s) | 0x02CF04FF |
| | 1080i | 1920 | 540 | 74.25/74.125 MHz (60/59.99..fields/s) | 0x021B07FF |
| | 1080p | 1920 | 1080 | 148.5/148.25 MHz (60/59.99..frames/s) | 0x043707FF |

10.2.6 Display Controller Use Cases and Tips

10.2.6.1 Hardware Cursor

The video layer or graphics layer can be used to display the hardware cursor. The encoded pixel data for the cursor image are in xRGB12-4444, ARGB16-4444, RGBx12-4444, RGBA16-4444, ARGB16-1555, RGB16-565, RGB24-888, xRGB24-88888, RGBA32-8888 or ARGB32-8888 formats if the source transparency color key is used; otherwise, any pixel format can be used for the cursor image considering the limitation in term of pixel supported by the pipeline used to display the cursor image. To display nonrectangle cursor, the transparency color key can be used or the alpha blending (pixel alpha blending); see [Section 10.2.4.12.1.3](#). The global alpha blending can be used in addition to the transparency source color key to make some fading effect when the cursor (with a nonrectangle shape) appears and disappears on the screen. The image of the cursor can be stored totally inside the DMA buffer in order to use the self-refresh mode (see [Section 10.2.4.6.8.2](#)). In that case, the image is loaded once and then displayed without accessing the system memory for loading the image for each frame. This saves bandwidth on interconnect and memory.

10.2.7 Display Controller Register Manual

CAUTION

The main access to all DISPC registers is through the L3 interconnect.
The access through L4_PER interconnect is provided for back software compatibility.

10.2.7.1 Display Controller Instance Summary

Table 10-92. DISPC Instance Summary

| Module Name | L4_PER Base Address | L3 Base Address | Size |
|-------------|---------------------|-----------------|------|
| DISPC | 0x4804 1000 | 0x5800 1000 | 4KB |

10.2.7.2 Display Controller Logical Register Mapping

Table 10-93. DISPC_VIDp_BA_j Logical Register Mapping

| Hardware Register | Description |
|---------------------------------|----------------------------------|
| DISPC_VID1_BA_j | Base Address of Video Pipeline 1 |
| DISPC_VID2_BA_j | Base Address of Video Pipeline 2 |
| DISPC_VID3_BA_j | Base Address of Video Pipeline 3 |

Table 10-94. DISPC_VIDp_BA_UV_j Logical Register Mapping

| Hardware Register | Description |
|------------------------------------|--|
| DISPC_VID1_BA_UV_j | Base Address of UV components for Video Pipeline 1 |
| DISPC_VID2_BA_UV_j | Base Address of UV components for Video Pipeline 2 |
| DISPC_VID3_BA_UV_j | Base Address of UV components for Video Pipeline 3 |

Table 10-95. DISPC_VIDp_POSITION Logical Register Mapping

| Hardware Register | Description |
|-------------------------------------|--------------------------------|
| DISPC_VID1_POSITION | Position of the video window 1 |
| DISPC_VID2_POSITION | Position of the video window 2 |
| DISPC_VID3_POSITION | Position of the video window 3 |

Table 10-96. DISPC_VIDp_SIZE Logical Register Mapping

| Hardware Register | Description |

| | | | |
|-------------------------|--|-----------------|--------------------------|
| Address Offset | 0x0000 0010 | | |
| Physical Address | 0x4804 1010 0x5800 1010 | Instance | DISPC_PER_L4 DISPC_L3 |
| Description | This register allows to control various parameters of the OCP interface. | | |
| Type | RW | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----------|----|---------------|----|----------|---|-----------|---|-----------|---|----------|---|-----------|---|----------|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| RESERVED | | | | | | | | | | | | | | | | MIDLEMODE | | RESERVED | | CLOCKACTIVITY | | RESERVED | | WARMRESET | | SIDLEMODE | | ENWAKEUP | | SOFTRESET | | AUTOIDLE | |

| Bits | Field Name | Description | Type | Reset |
|-------|------------|--|------|----------|
| 31:14 | RESERVED | Write 0s for future compatibility. Reads returns 0 | R | 0x000000 |
| 13:12 | MIDLEMODE | Master interface power management, standby/wait control 0x0: Force-standby. MStandby is only asserted when the module is disabled. MStandby is only asserted when the module is disabled. 0x1: No-Standby: MStandby is never asserted. 0x2: Smart-Standby. MStandby is asserted based on the internal activity of the module 0x3: Reserved | RW | 0x0 |
| 11:10 | RESERVED | Write 0s for future compatibility. Reads returns 0 | R | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|------|---------------|---|------|-------|
| 9:8 | CLOCKACTIVITY | Clocks activity during wake up mode period 0x0: OCP and Functional clocks can be switched off 0x1: Functional clocks can be switched off and OCP clocks are maintained during wake up period 0x2: OCP clocks can be switched off and Functional clocks are maintained during wake up period 0x3: OCP and Functional clocks are maintained during wake up period | RW | 0x0 |
| 7:6 | RESERVED | Write 0s for future compatibility. Reads returns 0 | R | 0x0 |
| 5 | WARMRESET | Warm reset. Set this bit to 1 triggers a module warm reset. The bit is automatically reset by the hardware. During reads, it always returns 0. The warm reset keep the configuration registers unchanged. 0x0: Normal mode 0x1: the warmreset is set | RW | 0 |
| 4:3 | SIDLEMODE | Slave interface power management, Idle req/ack control 0x0: Force-idle. An idle request is acknowledged unconditionally 0x1: No-idle. An idle request is never acknowledged 0x2: Smart-idle. Acknowledgment to an idle request is given based on the internal activity of the module. 0x3: Reserved | RW | 0x0 |
| 2 | ENWAKEUP | WakeUp feature control 0x0: Wakeup is disabled 0x1: Wakeup is enabled | RW | 0 |
| 1 | SOFTRESET | Software reset. Set this bit to 1 to trigger a module reset. The bit is automatically reset by the hardware. During reads, it always returns 0. 0x0: Normal mode 0x1: The module is reset | RW | 0 |
| 0 | AUTOIDLE | Internal OCP clock gating strategy 0x0: OCP clock is free-running 0x1: Automatic OCP L3 and L4 clocks gating strategy is applied, based on the OCP interface activity. Automatic functional clock gating is also applied to the functional clock based on the module activity (for instance DISPC_pipe_ATTRIBUTES.ENABLE) | RW | 1 |

| FLIPIMMEDIATEDONE_IRQ | RESERVED | | | | | | | WBUNCOMPLETEERROR_IRQ | WBUFFEROVERFLOW_IRQ | FRAMEDONETV_IRQ | FRAMEDONEWB_IRQ | FRAMEDONE2_IRQ | ACBIASCOUNTSTATUS2_IRQ | VID3BUFFERUNDERFLOW_IRQ | VID3ENDWINDOW_IRQ | VSYNC2_IRQ | SYNCLOST2_IRQ | WAKEUP_IRQ | SYNCLOSTTV_IRQ | SYNCLOST1_IRQ | VID2ENDWINDOW_IRQ | VID2BUFFERUNDERFLOW_IRQ | VID1ENDWINDOW_IRQ | VID1BUFFERUNDERFLOW_IRQ | OCPPERROR_IRQ | PALETTEGAMMALOADING_IRQ | GFXENDWINDOW_IRQ | GFXBUFFERUNDERFLOW_IRQ | PROGRAMMEDLINENUMBER_IRQ | ACBIASCOUNTSTATUS1_IRQ | EVSNC_ODD_IRQ | EVSNC_EVEN_IRQ | VSYNC1_IRQ | FRAMEDONE1_IRQ |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------------------|--|---------------|-------|
| 31 | FLIPIMMEDIATEDONE_IRQ | Flip Immediate Done. The DMA engine has acknowledged the immediate BA change, and software can write the new BA0. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 30:27 | RESERVED | Write 0s for future compatibility. Reads returns 0 | R | 0x00 |
| 26 | WBUNCOMPLETEDERROR_IRQ | Write-back DMA buffer is flushed before it is completely drained. In WB capture mode, if the new frame starts before the WB DMA buffers are fully drained (onto external memory), then the contents of the WB DMA buffers are lost (implying last few pixels/lines are corrupted in the captured frame in memory). This interrupt is an indication of that case and will trigger every frame. 0x0 READS: Event is false. 0x0 WRITES: Status bit unchanged. 0x1 READS: Event is true (Pending) 0x1 WRITES: Status bit is reset | RW W1toClr | 0 |
| 25 | WBBUFFEROVERFLOW_IRQ | Write-back DMA Buffer Overflow. The DMA buffer is full. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 24 | FRAMEDONETV_IRQ | Frame Done for the TV. The TV output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 23 | FRAMEDONEWB_IRQ | Frame Done for the write-back channel. The write-back channel has output the frame. All the data of the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. It is available only when the write-back pipeline transfers back to memory the output of one of the pipelines. In case of overlay capture, the interrupt is not generated and the user shall use the FrameDone for the corresponding captured output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 22 | FRAMEDONE2_IRQ | Frame Done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 21 | ACBIASCOUNTSTATUS2_IRQ | AC Bias Count Status for the secondary LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 20 | VID3BUFFERUNDERFLOW_IRQ | Video 3 DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 19 | VID3ENDWINDOW_IRQ | The end of the video 3 Window has been reached. It is detected by the overlay manager when the full video 3 has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 18 | VSYNC2_IRQ | Vertical Synchronization for the secondary LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 17 | SYNCLOST2_IRQ | Synchronization Lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|---------------------------|---|---------------|-------|
| 16 | WAKEUP_IRQ | Wake-up 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 15 | SYNCLOST_TV_IRQ | Synchronization Lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 14 | SYNC_LOST1_IRQ | Synchronization Lost on the primary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the primary LCD output. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 13 | VID2END_WINDOW_IRQ | The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 12 | VID2BUFFER_UNDERFLOW_IRQ | Video 2 DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 11 | VID1END_WINDOW_IRQ | The end of the video 1 Window has been reached. It is detected by the overlay manager when the full video 1 has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 10 | VID1BUFFER_UNDERFLOW_IRQ | Video 1 DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 9 | OCPERROR_IRQ | OCP Error. L3 Interconnect has sent SResp=ERR. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 8 | PALETTEGAMMA_LOADING_IRQ | Palette Gamma Loading status. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 7 | GFXEND_WINDOW_IRQ | The end of the graphics Window has been reached. It is detected by the overlay manager when the full graphics has been displayed. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 6 | GFXBUFFER_UNDERFLOW_IRQ | Graphics DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 5 | PROGRAMMED_LINENUMBER_IRQ | Programmed Line Number. It indicates that the scan of the primary LCD has reached the programmed user line number. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|----------------------------|--|---------------|-------|
| 4 | ACBIASCOUNT STATUS1_IRQ | AC Bias Count Status for the primary LCD 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 3 | EVSYNC_ ODD_IRQ | VSYNC for odd field from the TV encoder (HDMI) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 2 | EVSYNC_ EVEN_IRQ | VSYNC for even field from the TV encoder (HDMI) 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 1 | VSYNC1_IRQ | Vertical Synchronization for the primary LCD. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |
| 0 | FRAME DONE1_IRQ | Frame Done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent. 0x0: READS: Event is false. WRITES: Status bit unchanged. 0x1: READS: Event is true (pending). WRITES: Status bit is reset. | RW W1toClr | 0 |

| 26 | WBUNCOMPLETEERR OR_EN | The write back buffer has been flushed before been fully drained. Enable. 0x0: Interrupt is masked. 0x1: Interrupt is enabled. | RW | 0 |
| 25 | WBBUFFER OVERFLOW_EN | Write-back DMA Buffer Overflow. The DMA buffer is full 0x0: WBBufferOverflow is masked 0x1: WBBufferOverflow generates an interrupt when it occurs | RW | 0 |
| 24 | FRAME DONETV_EN | Frame Done for the TV. The TV output has been disabled by user. All the data have been sent. 0x0: Frame Done for the TV output is masked 0x1: Frame Done for the TV output generates an interrupt when it occurs | RW | 0 |
| 23 | FRAME DONEWB_EN | Frame Done for the write-back channel. The write-back channel has output the frame. All the data have been sent for the frame have been sent to the memory. There is no pending data inside the DMA engine for the write-back channel to be transferred to memory. 0x0: Frame Done for the write-back is masked 0x1: Frame Done for the write-back generates an interrupt when it occurs | RW | 0 |
| 22 | FRAME DONE2_EN | Frame Done for the secondary LCD. The secondary LCD output has been disabled by user. All the data have been sent. 0x0: Frame Done for the secondary LCD is masked 0x1: Frame Done for the secondary LCD generates an interrupt when it occurs | RW | 0 |
| 21 | ACBIASCOUNT STATUS2_EN | AC Bias Count Status for the secondary LCD 0x0: ACBiasCountStatus for the secondary LCD output is masked 0x1: ACBiasCountStatus for the secondary LCD output generates an interrupt when it occurs | RW | 0 |
| 20 | VID3BUFFER UNDERFLOW_EN | Video 3 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid3BufferUnderflow is masked 0x1: Vid3BufferUnderflow generates an interrupt when it occurs | RW | 0 |
| 19 | VID3END WINDOW_EN | The end of the video 3 Window has been reached. It is detected by the overlay manager when the full video 3 has been displayed. 0x0: Vid3EndWindow is masked 0x1: Vid3EndWindow generates an interrupt when it occurs | RW | 0 |
| 18 | VSYN2_EN | Vertical Synchronization for the secondary LCD 0x0: VSYNC for the secondary LCD output is masked 0x1: VSYNC for the secondary LCD output generates an interrupt when it occurs | RW | 0 |
| 17 | SYNC LOST2_EN | Synchronization Lost on the secondary LCD output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the secondary LCD output. 0x0: Synchronization Lost on the secondary LCD output is masked 0x1: Synchronization Lost on the secondary LCD output generates an interrupt when it occurs | RW | 0 |
| 16 | WAKEUP_EN | Wake Up Mask 0x0: WakeUp is masked 0x1: WakeUp generates an interrupt when it occurs | RW | 0 |
| 15 | SYNC LOSTTV_EN | Synchronization Lost on the TV output. The required data are not output at the correct time due to too short blanking periods or stall of at least one pipelines associated with the TV output. 0x0: Synchronization Lost on the TV output is masked 0x1: Synchronization Lost on the TV output generates an interrupt when it occurs | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------------------|---|------|-------|
| 14 | SYNC LOST1_EN | Synchronization Lost for the primary LCD 0x0: SyncLost for the primary LCD output is masked 0x1: SyncLost for the primary LCD output generates an interrupt when it occurs | RW | 0 |
| 13 | VID2END WINDOW_EN | The end of the video 2 Window has been reached. It is detected by the overlay manager when the full video 2 has been displayed. 0x0: Vid2EndWindow is masked 0x1: Vid2EndWindow generates an interrupt when it occurs | RW | 0 |
| 12 | VID2BUFFER UNDERFLOW_EN | Video 2 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid2BufferUnderflow is masked 0x1: Vid2BufferUnderflow generates an interrupt when it occurs | RW | 0 |
| 11 | ENDVID1 WINDOW_EN | The end of the video 1 Window has been reached. It is detected by the overlay manager when the full video 1 has been displayed. 0x0: EndVid1Window is masked 0x1: EndVid1Window generates an interrupt when it occurs | RW | 0 |
| 10 | VID1BUFFER UNDERFLOW_EN | Video 1 DMA Buffer Underflow. The DMA buffer is not necessary empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: Vid1BufferUnderflow is masked 0x1: Vid1BufferUnderflow generates an interrupt when it occurs | RW | 0 |
| 9 | OCPELLOWER_EN | OCP Error. L3 Interconnect has sent SResp=ERR. 0x0: OCPELLOWER is masked 0x1: OCPELLOWER generates an interrupt when it occurs | RW | 0 |
| 8 | PALETTE GAMMA_EN | Palette Gamma Loading mask. The palette used as Color Look Up Table (CLUT) for the graphics BITMAP formats (1-, 2-, 4-, or 4-bpp) or as gamma table for the overlay output for the primary LCD output has been loaded successfully. 0x0: PaletteGamma is masked 0x1: PaletteGamma generates an interrupt when it occurs | RW | 0 |
| 7 | GFXEND WINDOW_EN | The end of the graphics Window has been reached. It is detected by the overlay manager when the full graphics has been displayed. 0x0: GfxEndWindow is masked 0x1: GfxEndWindow generates an interrupt when it occurs | RW | 0 |
| 6 | GFXBUFFER UNDERFLOW_EN | Graphics DMA Buffer Underflow. The DMA buffer is not necessarily empty but required data are not present in the DMA buffer (due to out of order responses) 0x0: GfxBufferUnderflow is masked 0x1: GfxBufferUnderflow generates an interrupt when it occurs | RW | 0 |
| 5 | PROGRAMMED LINENUMBER_EN | Programmed Line Number. It indicates that the scan of the primary LCD has reached the programmed user line number. 0x0: ProgrammedLineNumber is masked 0x1: ProgrammedLineNumber generates an interrupt when it occurs | RW | 0 |
| 4 | ACBIASCOUNT STATUS1_EN | AC Bias Count Status for the primary LCD 0x0: ACBiasCountStatus for the primary LCD output is masked 0x1: ACBiasCountStatus for the primary LCD output generates an interrupt when it occurs | RW | 0 |
| 3 | EVSYNC_ODD_EN | VSYSN for odd field from the TV encoder (HDMI) 0x0: EVSYNC_ODD for the TV output is masked 0x1: EVSYNC_ODD for the TV output generates an interrupt when it occurs | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|----------------|--|------|-------|
| 2 | EVSYNC_EVEN_EN | VSYNC for even field from the TV encoder (HDMI) 0x0: EVSYNC_EVEN for the TV output is masked 0x1: EVSYNC_EVEN for the TV output generates an interrupt when it occurs | RW | 0 |
| 1 | VSYN1_EN | Vertical Synchronization for the primary LCD. 0x0: VSYNC for the primary LCD output is masked 0x1: VSYNC for the primary LCD output generates an interrupt when it occurs | RW | 0 |
| 0 | FRAMEDONE_EN | Frame Done for the primary LCD. The primary LCD output has been disabled by user. All the data have been sent. 0x0: FrameDone for the primary LCD output is masked 0x1: FrameDone for the primary LCD output generates an interrupt when it occurs | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------------------|---|------|-------|
| 31:30 | SPATIALTEMPORAL DITHERINGFRAMES | Spatial/Temporal dithering number of frames for the primary LCD output wr: VFP start period of primary LCD 0x0: Spatial only 0x1: Spatial and temporal over 2 frames 0x2: Spatial and temporal over 4 frames 0x3: Reserved | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------|---|------|-------|
| 29 | LCDENABLEPOL | Write 0s for future compatibility. Reads return 0. | R | 0 |
| 28 | LCDENABLESIGNAL | Write 0s for future compatibility. Reads return 0. | R | 0 |
| 27 | PCKFREEENABLE | Write 0s for future compatibility. Reads return 0. | R | 0 |
| 26:25 | TDMUNUSEDBITS | State of unused bits (TDM mode only) for the primary LCD output. wr: VFP start period of primary LCD 0x0: low level (0) 0x1: high level (1) 0x2: unchanged from previous state 0x3: reserved | RW | 0x0 |
| 24:23 | TDMCYCLEFORMAT | Cycle format (TDM mode only) for the primary LCD output wr: VFP start period of primary LCD 0x0: 1 cycle for 1 pixel 0x1: 2 cycles for 1 pixel 0x2: 3 cycles for 1 pixel 0x3: 3 cycles for 2 pixels | RW | 0x0 |
| 22:21 | TDMPARALLELMODE | Output Interface width (TDM mode only) for the primary LCD output wr: VFP start period of primary LCD 0x0: 8-bit parallel output interface selected 0x1: 9-bit parallel output interface selected 0x2: 12-bit parallel output interface selected 0x3: 16-bit parallel output interface selected | RW | 0x0 |
| 20 | TDMENABLE | Enable the multiple cycle format (TDM mode only used for TFT mode with the RFBI enable bit off) for the primary LCD output. wr: VFP start period of primary LCD 0x0: TDM disabled 0x1: TDM enabled | RW | 0 |
| 19:17 | HT | Hold Time for TV output wr: EVSYNC Encoded value (from 1 to 8) to specify the number of external digital clock periods to hold the data (programmed value = value minus 1) | RW | 0x0 |
| 16 | GPOUT1 | General Purpose Output Signal wr:immediate 0x0: The GPout1 is reset 0x1: The GPout1 is set | RW | 0 |
| 15 | GPOUT0 | General Purpose Output Signal wr:immediate 0x0: The GPout0 is reset 0x1: The GPout0 is set | RW | 0 |
| 14 | GPIN1 | General Purpose Input Signal wr: immediately Read 0x0: The GPin1 has been reset Read 0x1: The GPin1 has been set | R | 0 |
| 13 | GPIN0 | General Purpose Input Signal wr: immediately Read 0x0: The GPin0 has been reset Read 0x1: The GPin0 has been set | R | 0 |
| 12 | OVERLAYOPTIMIZATION | Overlay Optimization for the primary LCD output wr: VFP start period of the primary LCD 0x0: All the data for all the enabled pipelines are fetched from memory regardless of the overlay/alpha blending configuration. 0x1: The data not used by the overlay manager because of overlap between layers with no alpha blending between them shall not be fetched from memory in order to optimize the bandwidth. | RW | 0 |

Display Controller

www.ti.com

| Bits | Field Name | Description | Type | Reset |
|------|----------------|--|------|-------|
| 11 | STALLMODE | STALL Mode for the primary LCD output wr: VFP start period of primary LCD 0x0: Normal mode selected 0x1: STALL mode selected. The Display Controller sends the data without considering the VSYNC/HSYNC. The LCD output is disabled at the end of the transfer of the frame. The S/W has to re-enable the LCD output in order to generate a new frame. The stall mode is used in RFBI and DSI command modes. | RW | 0 |
| 10 | RESERVED | Reserved | R | 0 |
| 9:8 | TFTDATALINES | Number of lines of the primary LCD interface wr: VFP start period of primary LCD 0x0: 12-bit output aligned on the LSB of the pixel data interface 0x1: 16-bit output aligned on the LSB of the pixel data interface 0x2: 18-bit output aligned on the LSB of the pixel data interface 0x3: 24-bit output aligned on the LSB of the pixel data interface | RW | 0x0 |
| 7 | STDITHERENABLE | Spatial Temporal dithering enable for the primary LCD output wr: VFP start period of primary LCD 0x0: Spatial/Temporal dithering logic disabled 0x1: Spatial/Temporal dithering logic enabled | RW | 0 |
| 6 | GOTV | GO Command for the TV output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the TV output. wr: immediate 0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) associated with the TV output using the user values. The hardware resets the bit when the update is completed. 0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the TV output and the hardware can update the internal registers at the external VSYNC. | RW | 0 |
| 5 | GOLCD | GO Command for the primary LCD output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the primary LCD output. wr: immediate 0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) connected to the LCD output using the user values. The hardware resets the bit when the update is completed. 0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the LCD output and the hardware can update the internal registers at the VFP start period | RW | 0 |
| 4 | M8B | Mono 8-bit mode of the primary LCD wr: VFP start period of primary LCD output 0x0: Pixel data [3:0] is used to output four pixel values to the panel at each pixel clock transition. (only in Passive Mono 4-bit mode). 0x1: Pixel data [7:0] is used to output eight pixel values to the panel each pixel clock transition. (only in Passive Mono 8-bit mode). | RW | 0 |
| 3 | STNTFT | LCD Display type of the primary LCD wr: VFP start period of primary LCD output 0x0: Passive or STN display operation enabled. STN dither logic is enabled. 0x1: Active or TFT display operation enabled. STN Dither logic and output FIFO bypassed. | RW | 0 |
| 2 | MONOCOLOR | Monochrome/Color selection for the primary LCD wr: VFP start period of primary LCD output 0x0: Color operation enabled (STN mode only) 0x1: Monochrome operation enabled (STN mode only) | RW | 0 |
| 1 | TVENABLE | Enable the TV output wr: immediate effect only occurs at the end of the current frame. 0x0: TV output disabled (at the end of the current field if interlace output when the bit is reset) 0x1: TV output enabled | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|--|------|-------|
| 0 | LCDENABLE | Enable the primary LCD outputs wr: immediate Effect only occurs at the end of the current frame 0x0: LCD output disabled (at the end of the frame when the bit is reset) 0x1: LCD output enabled | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------|--|------|-------|
| 31:26 | RESERVED | Write 0s for future compatibility. Reads return 0. | R | 0x00 |
| 25 | FULLRANGE | Color Space Conversion full range setting. wr: VFP start of primary LCD 0x0: Limited range selected. 0x1: Full range selected. | RW | 0 |
| 24 | COLORCONV ENABLE | Enable the color space conversion. It shall be reset when CPR bit field is set to 0x1. wr: VFP start of primary LCD 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV | RW | 0 |
| 23 | FIDFIRST | Selects the first field to output in case of interlace mode. In case of progressive mode, the value is not used. wr: VFP start of primary LCD 0x0: First field is even. 0x1: Odd field is first. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------------|---|------|-------|
| 22 | OUTPUTMODE ENABLE | Selects between progressive and interlace mode for the primary LCD output. wr: VFP start of primary LCD 0x0: Progressive mode selected. 0x1: Interlace mode selected. | RW | 0 |
| 21:20 | RESERVED | Write 0s for future compatibility. Reads return 0. | RW | 0 |
| 19 | TVALPHABLENDER ENABLE | Selects the alpha blender overlay manager for the TV output instead of the color key alpha blender (LCD output). The bit field is deprecated. It is present for software backward compatibility only. When it is enabled, the Z-order defined in each ATTRIBUTES registers for only the pipelines associated pipeline connected to the TV output are invalid and replaced by the following: graphics z-order = 3, video3 z-order = 2, video2 z-order =1 and video1 z-order=0 If it disabled, the z-order and z-order enable bit fields defined in each ATTRIBUTES register are used. wr: EVSYNC start of primary LCD 0x0: Alpha blender is disabled. 0x1: The alpha blender is enabled. | RW | 0 |
| 18 | LCDALPHABLENDER ENABLE | Selects the alpha blender overlay manager for the primary LCD output instead of the color key alpha blender (LCD output). The bit field is deprecated. It is present for software backward compatibility only. When it is enabled, the Z-order defined in each ATTRIBUTES registers for only the pipelines associated with the primary LCD output are invalid and replaced by the following: graphics z-order = 3, video3 z-order = 2, video2 z-order =1 and video1 z-order=0 If it disabled, the z-order and z-order enable bit fields defined in each ATTRIBUTES register are used. wr: VFP start of primary LCD 0x0: Alpha blender is disabled. The color key alpha blending is used. 0x1: The alpha blender is enabled. | RW | 0 |
| 17 | BUFFERFILLING | Controls if the DMA buffers are refilled only when the LOW threshold is reached or if all DMA buffers are refilled when at least one of them reaches the LOW threshold. wr: immediate 0x0: Each DMA buffer is refilled when it reaches LOW threshold. 0x1: All DMA buffers are refilled up to high threshold when at least one of them reaches the LOW threshold. (only active DMA buffers shall be considered and when reaching the end of the frame the DMA buffer goes to empty condition so no need to fill it again). | RW | 0 |
| 16 | BUFFERHAND CHECK | Controls the handcheck between DMA buffer and STALL signal in order to prevent from underflow. The bit shall be set to 0 when the module is not in STALL mode. (primary LCD output) wr: VFP start of primary LCD 0x0: Only the STALL signal (generated by RFBI, DSI1 or DSI2 depending on which IP uses the LCD output) is used regardless of the DMA buffer fullness information in order to provide data to the RFBI,DSI1 or DS2 module. 0x1: The STALL signal (generated by RFBI, DSI1 or DSI2 depending on which IP uses the LCD output) is used in combination with the DMA buffer fullness information in order to provide data to the RFBI, DSI1 or DSI2 module only when it does not generated buffer underflow. | RW | 0 |
| 15 | CPR | Color Phase Rotation Control (primary LCD output). It shall be reset when ColorConvEnable bit field is set to 1 wr: VFP start period of primary LCD output 0x0: Color Phase Rotation Disabled 0x1: Color Phase Rotation Enabled | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------------|---|------|-------|
| 14 | BUFFERMERGE | Buffer merge control wr: EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory or VFP. When enabled, the DISPC_GLOBAL_BUFFER register is ignored. This bit must be set to zero when the write back channel is used. When DISPC_CONTROL2.GOWB is used BUFFERMERGE MUST be zero. When DISPC_CONTROL2.GOWB is used BUFFERMERGE MUST be zero. wr: immediate 0x0: DMA buffer merge disabled Each DMA buffer is dedicated to one pipeline. 0x1: DMA buffer merge enabled All the DMA buffers are merged into a single one to be used by the single active pipeline. | RW | 0 |
| 13 | TCKTV SELECTION | Transparency Color Key Selection (TV output) wr: EVSYNC 0x0: Destination transparency color key selected 0x1: Source transparency color key selected | RW | 0 |
| 12 | TCKTVENABLE | Transparency Color Key Enabled (TV output) wr: EVSYNC 0x0: Disable the transparency color key for the TV output 0x1: Enable the transparency color key for the TV output | RW | 0 |
| 11 | TCKLCD SELECTION | Transparency Color Key Selection (primary LCD output) wr: VFP start period of primary LCD output 0x0: Destination transparency color key selected 0x1: Source transparency color key selected | RW | 0 |
| 10 | TCKLCDENABLE | Transparency Color Key Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: Disable the transparency color key for the LCD 0x1: Enable the transparency color key for the LCD | RW | 0 |
| 9 | GAMATABLE ENABLE | For backward compatibility, an enable bit has been added on the 2 additional gamma tables (secondary display TV). Gamma table of LCD1 is always enabled. 0x0: Gamma table LDC2 TV are bypassed 0x1: Gamma table LCD2 TV are enabled | RW | 0 |
| 8 | ACBIASGATED | ACBias Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: ACBias Gated Disabled 0x1: ACBias Gated Enabled | RW | 0 |
| 7 | VSYNCGATED | VSYNC Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: VSYNC Gated Disabled 0x1: VSYNC Gated Enabled | RW | 0 |
| 6 | HSYNCGATED | HSYNC Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: HSYNC Gated Disabled 0x1: HSYNC Gated Enabled | RW | 0 |
| 5 | PIXELCLOCK GATED | Pixel Clock Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: Pixel Clock Gated Disabled 0x1: Pixel Clock Gated Enabled | RW | 0 |
| 4 | PIXELDATAGATED | Pixel Data Gated Enabled (primary LCD output) wr: VFP start period of primary LCD output 0x0: Pixel Data Gated Disabled 0x1: Pixel Data Gated Enabled | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------------|--|------|-------|
| 3 | PALETTEGAMMA TABLE | <p>Palette/Gamma Table selection wr: VFP start period of primary LCD output or VFP start period of secondary LCD output or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the graphics pipeline: primary LCD, secondary LCD, TV output or write-back to the memory. In case of the table is used as gamma table, it is used for the primary LCD output only.</p> <p>0x0: LUT used as palette (only if graphics format is BITMAP1, 2, 4, and 8)</p> <p>0x1: LUT used as gamma table (only if graphics format is NOT BITMAP1, 2, 4, and 8 or no graphics window present)</p> | RW | 0 |
| 2:1 | LOADMODE | <p>Loading Mode for the Palette/Gamma Table wr: VFP start period of primary LCD output or VFP start period of secondary LCD output or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory</p> <p>0x0: Palette/Gamma Table and data are loaded every frame</p> <p>0x1: Palette/Gamma Table to be loaded. The user sets the bit when the palette/gamma table has to be loaded. Hardware resets the bit to 0x2 when table has been loaded. (DISPC_GFX_ATTRIBUTES.ENABLE has to be set to 1).</p> <p>0x2: Frame data only loaded every frame</p> <p>0x3: Palette/Gamma Table and frame data loaded on first frame then switch to 0x2 (Hardware).</p> | RW | 0x0 |
| 0 | PIXELGATED | <p>Pixel Gated Enable (only for TFT) (primary LCD output) wr: VFP start period of primary LCD output</p> <p>0x0: Pixel clock always toggles (only in TFT mode)</p> <p>0x1: Pixel clock only toggles when there is valid data to display. (only in TFT mode)</p> | RW | 0 |

|-------------|-----------|------------------|--------|--------------|-------------|----------|----|----|----|----|----|----|----|-----------------|----------|-------------|-------------|----------|------------|----------|------------|------------|-----------|-------------------|--------|---|---|---|--------|---|---|
| CHANNELOUT2 | BURSTTYPE | PREMULTIPLYALPHA | ZORDER | ZORDERENABLE | ANTIFLICKER | RESERVED | | | | | | | | SELFREFRESHAUTO | RESERVED | SELFREFRESH | ARBITRATION | ROTATION | BUFPRELOAD | RESERVED | NIBBLEMODE | CHANNELOUT | BURSTSIZE | REPLICATIONENABLE | FORMAT | | | | ENABLE | | |

| Bits | Field Name | Description | Type | Reset |
|-------|------------------|---|------|-------|
| 31:30 | CHANNELOUT2 | It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should set to zero) wr: immediate 0x0: primary LCD output selected. 0x1: Secondary LCD output selected. 0x3: Write-back output to the memory selected. | RW | 0x0 |
| 29 | BURSTTYPE | The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. (It does not apply to the palette loading OCP requests using INCR burst only) 0x0: INC burst type is used. 0x1: 2D block burst type is used. | RW | 0 |
| 28 | PREMULTIPLYALPHA | The field configures the DISPC GFX to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplied alpha data color component 0x1: Premultiplied alpha data color component | RW | 0 |
| 27:26 | ZORDER | Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0. 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3 | RW | 0x0 |

Display Controller

www.ti.com

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------|---|------|-------|
| 25 | ZORDERENABLE | Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled. 0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27). | RW | 0 |
| 24 | ANTIFLICKER | Antiflicker filtering using a 3-tap filter with hardcoded coefficients (1/4, 1/2, 1/4) 0x0: Antiflicker disabled. 0x1: Antiflicker enabled. | RW | 0 |
| 23:18 | RESERVED | Write 0s for future compatibility. Reads return 0. | R | 0x00 |
| 17 | SELFREFRESHAUTO | Automatic self-refresh mode 0x0: The transition from Selfrefresh "disabled" to "enabled" is controlled by software 0x1: The transition from Selfrefresh "disabled" to "enabled" is controlled only by hardware | RW | 0 |
| 16 | RESERVED | | R | 0 |
| 15 | SELFREFRESH | Enables the self refresh of the graphics window from its own DMA buffer. This bit should be set only after having set the GO bit of the channel and read back a zero in its field. 0x0: The graphics pipeline accesses the interconnect to fetch data from the system memory. 0x1: The graphics pipeline does not need anymore to fetch data from memory. Only the graphics DMA buffer is used. It takes effect after the frame has been loaded in the DMA buffer. | RW | 0 |
| 14 | ARBITRATION | Determines the priority of the graphics pipeline. When the graphics pipeline is one of the high priority pipelines. The arbitration wheel gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The graphics pipeline is one of the normal priority pipeline. 0x1: The graphics pipeline is one of the high priority pipeline. | RW | 0 |
| 13:12 | ROTATION | Graphics Rotation Flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees | RW | 0x0 |
| 11 | BUFPRELOAD | Graphics Preload Value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value | RW | 0 |
| 10 | RESERVED | Write 0s for future compatibility. Reads return 0. | R | 0 |
| 9 | NIBBLEMODE | Graphics Nibble Mode (only for 1-, 2- and 4-bpp) 0x0: Nibble mode is disabled 0x1: Nibble mode is enabled | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-------------------|---|------|-------|
| 8 | CHANNELOUT | Graphics Channel Out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected | RW | 0 |
| 7:6 | BURSTSIZE | Graphics DMA Burst Size 0x0: 2x128bit bursts 0x1: 4x128bit bursts 0x3: Reserved 0x2: 8x128bit bursts | RW | 0x2 |
| 5 | REPLICATIONENABLE | Graphics Replication Enabled: RGB, ARGB, and RGBA formats are converted into ARGB32-8888 using replication of the MSBs or '0s 0x0: Disable Graphics replication logic. The conversion to ARGB32-8888 is done by adding 0s for the LSBs 0x1: Enable Graphics replication logic. The conversion to ARGB32-8888 is done by duplicating the MSBs for the LSBs | RW | 1 |
| 4:1 | FORMAT | Graphics format. It defines the pixel format when fetching the graphics picture into memory. 0x6: RGB16-565 0x1: BITMAP2 (CLUT is required to be used) 0xA: RGBx12-4444 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: BITMAP1 (CLUT is required to be used) 0x2: BITMAP4 (CLUT is required to be used) 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: RGBA12-4444 0x4: xRGB12-4444 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x3: BITMAP8 (CLUT is required to be used) 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container) | RW | 0x0 |
| 0 | ENABLE | Graphics Enable 0x0: Graphics disabled (graphics pipeline inactive and graphics window not present) 0x1: Graphics enabled (graphics pipeline active and graphics window present on the screen) | RW | 0 |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|------------------|---|------|-------|
| 31:30 | CHANNELOUT2 | It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should be set to zero) wr: immediate 0x0: primary LCD output selected. 0x1: Secondary LCD output selected. 0x3: Write-back output to the memory selected. | RW | 0x0 |
| 29 | BURSTTYPE | The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used. | RW | 0 |
| 28 | PREMULTIPHYALPHA | The field configures the DISPC VID1 to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplied alpha data color component 0x1: Premultiplied alpha data color component | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------|---|------|-------|
| 27:26 | ZORDER | <p>Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.</p> <p>0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values.</p> <p>0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3</p> <p>0x3: Z-order 3: layer above all the other layers</p> <p>0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3</p> | RW | 0x0 |
| 25 | ZORDERENABLE | <p>Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled.</p> <p>0x0: Z-order disabled. The Z-order of the layer is 0.</p> <p>0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).</p> | RW | 0 |
| 24 | SELFREFRESH | <p>Enables the self refresh of the video window from its own DMA buffer only.</p> <p>0x0: The video pipeline accesses the interconnect to fetch data from the system memory.</p> <p>0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video1 is used. It takes effect after the frame has been loaded in the DMA buffer.</p> | RW | 0 |
| 23 | ARBITRATION | <p>Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.</p> <p>0x0: The video pipeline is one of the normal priority pipeline.</p> <p>0x1: The video pipeline is one of the high priority pipeline.</p> | RW | 0 |
| 22 | DOUBLESTRIDE | <p>Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride.</p> <p>It is only used in case of YUV4:2:0.</p> <p>0x0: The CbCr stride value is equal to the Y stride.</p> <p>0x1: The CbCr stride value is double to the Y stride.</p> | RW | 0 |
| 21 | VERTICALTAPS | <p>Video Vertical Resize Tap Number. The vertical polyphase filter can be configured in 3-tap or 5-tap configuration.</p> <p>According to the number of taps, the maximum input picture width is double while using 3-tap compared to 5-tap.</p> <p>0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used.</p> <p>The associated bit fields for the 2 other taps coefficients do not need to be initialized.</p> <p>0x1: 5 taps are used for the vertical filtering logic.</p> | RW | 0 |
| 20 | DMAOPTIMIZATION | <p>Write 0s for future compatibility.</p> <p>Reads return 0.</p> | R | 0 |
| 19 | BUFPRELOAD | <p>Video Preload Value</p> <p>0x0: Hardware prefetches pixels up to the preload value defined in the preload register</p> <p>0x1: Hardware prefetches pixels up to high threshold value</p> | RW | 0 |

| Description | The register configures the number of bytes to increment between two pixels for the buffer associated with the video window 2. For more information, see Section 10.2.4.6.5, Predecimation . The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory | | | |

Table 10-210. DISPC_VID1_PICTURE_SIZE

| | | | |
|-------------------------|---|-----------------|--------------------------|
| Address Offset | 0x0000 00E4 | | |
| Physical Address | 0x4804 10E4 0x5800 10E4 | Instance | DISPC_PER_L4 DISPC_L3 |
| Description | The register configures the size of the video picture associated with the video layer 1 before up/down-scaling. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory | | |
| Type | RW | | |

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| RESERVED | | | | | | | | ORGSIZEY | | | | | | | | RESERVED | | | | | | | | ORGSIZEX | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|------------|--|------|-------|
| 31:27 | RESERVED | Write 0s for future compatibility. Reads return 0. | R | 0x00 |
| 26:16 | ORGSIZEY | Number of lines of the video picture. Encoded value (from 1 to 2048) to specify the number of lines of the video picture in memory (program to value minus 1). When predecimation is set, the value represents the size of the image after predecimation but the max size of the unpredecimated image size in memory is still bounded to 2 ¹¹ . | RW | 0x000 |
| 15:11 | RESERVED | Write 0s for future compatibility. Reads return 0. | R | 0x00 |
| 10:0 | ORGSIZEX | Number of pixels of the video picture Encoded value (from 1 to 2048) to specify the number of pixels of the video picture in memory (program to value minus 1). The size is limited to the size of the line buffer of the vertical sampling block in case the video picture is processed by the vertical filtering unit. (program to value minus 1). When predecimation is set, the value represents the size of the image after predecimation but the max size of the unpredecimated image size in memory is still bounded to 2 ¹¹ . | RW | 0x000 |

| Address Offset | 0x0000 014C + (0x4 * j) | Index | j = 0 to 1 |
| Physical Address | 0x4804 114C + (0x4 * j) 0x5800 114C + (0x4 * j) | Instance | DISPC_PER_L4 DISPC_L3 |
| Description | The register configures the base address of the video buffer for the video window 2 (DISPC_VID2_BA_0 DISPC_VID2_BA_1 for ping-pong mechanism with external trigger, based on the field polarity otherwise only DISPC_VID2_BA_0 is used)). Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory | | |
| Type | RW | | |

| BA | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Bits | Field Name | Description | Type | Reset |
|------|------------|--|------|-------------|
| 31:0 | BA | Video base address Base address of the video buffer (aligned on pixel size boundary except in case of RGB24 packed format, 4-pixel alignment is required; in case of YUV4:2:2, 2-pixel alignment is required, and YUV4:2:0, byte alignment is supported)). It case of YUV4:2:0 format, it indicates the base address of the Y buffer. When the TILER is addressed, the bits: [28:27] = 0x0 for 8-bit tiled [28:27] = 0x1 for 16-bit tiled [28:27] = 0x2 for 32-bit tiled [28:27] = 0x3 for page mode [31:29] = 0x0 for 0-degree view [31:29] = 0x1 for 180-degree view + mirroring [31:29] = 0x2 for 0-degree view + mirroring [31:29] = 0x3 for 180-degree view [31:29] = 0x4 for 270-degree view + mirroring [31:29] = 0x5 for 270-degree view [31:29] = 0x6 for 90-degree view [31:29] = 0x7 for 90-degree view + mirroring Otherwise the bits indicated the corresponding bit address to access the SDRAM. | RW | 0x0000 0000 |

| CHANNELOUT2 | | BURSTTYPE | | PREMULTIPLYALPHA | | ZORDER | | ZORDERENABLE | SELFREFRESH | ARBITRATION | DOUBLESTRIDE | VERTICALTAPS | DMAOPTIMIZATION | BUFPRELOAD | RESERVED | SELFREFRESHAUTO | CHANNELOUT | BURSTSIZE | | ROTATION | | FULLRANGE | | REPLICATIONENABLE | COLORCONVENABLE | VRESIZECONF | HRESIZECONF | RESIZEENABLE | | FORMAT | | | | ENABLE |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------|---|------|-------|
| 31:30 | CHANNELOUT2 | Value 0x2 is reserved when bit [16] CHANNELOUT = 0. Values 0x1, 0x2 and 0x3 are reserved when bit CHANNELOUT = 1 and TV format other than HDMI 1.4 3D 1080p is to be output. wr: immediate. 0x0: primary LCD output selected. 0x2: TV output selected. Used only for HDMI 1.4 3D 1080p format. 0x1: Secondary LCD output selected. 0x3: Write-back output to the memory selected. | RW | 0x0 |
| 29 | BURSTTYPE | The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|------------------|---|------|-------|
| 28 | PREMULTIPLYALPHA | The field configures the DISPC VID2 to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplied alpha data color component 0x1: Premultiplied alpha data color component | RW | 0 |
| 27:26 | ZORDER | Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value. If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0. 0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values. 0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3 0x3: Z-order 3: layer above all the other layers 0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3 | RW | 0x0 |
| 25 | ZORDERENABLE | Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled. 0x0: Z-order disabled. The Z-order of the layer is 0. 0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27). | RW | 0 |
| 24 | SELFREFRESH | Enables the self refresh of the video window from its own DMA buffer only. 0x0: The video pipeline accesses the interconnect to fetch data from the system memory. 0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video2 is used. It takes effect after the frame has been loaded in the DMA buffer. | RW | 0 |
| 23 | ARBITRATION | Determines the priority of the video pipeline. The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The video pipeline is one of the normal priority pipeline. 0x1: The video pipeline is one of the high priority pipeline. | RW | 0 |
| 22 | DOUBLESTRIDE | Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0. 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride. | RW | 0 |
| 21 | VERTICALTAPS | Video Vertical Resize Tap Number 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. The associated bit fields for the 2 other taps coefficients do not need to be initialized. 0x1: 5 taps are used for the vertical filtering logic. | RW | 0 |
| 20 | DMAOPTIMIZATION | Write 0s for future compatibility. Reads return 0. | R | 0 |
| 19 | BUFPRELOAD | Video Preload Value 0x0: Hardware prefetches pixels up to the preload value defined in the preload register 0x1: Hardware prefetches pixels up to high threshold value | RW | 0 |

Display Controller

www.ti.com

| Bits | Field Name | Description | Type | Reset |
|-------|-------------------|--|------|-------|
| 18 | RESERVED | Write 0s for future compatibility. Reads return 0. | R | 0 |
| 17 | SELFREFRESHAUTO | Automatic self-refresh mode 0x0: The transition from SELFREFRESH "disabled" to "enabled" is controlled by SW. 0x1: The transition from SELFREFRESH "disabled" to "enabled" is controlled only by hardware. | RW | 0 |
| 16 | CHANNELOUT | Video Channel Out configuration: LCD, WB or TV. wr: immediate 0x0: LCD output or WB to the memory selected. bit fields 31 and 30 defines the output associated (primary, secondary or write-back). 0x1: TV output selected | RW | 0 |
| 15:14 | BURSTSIZE | Video DMA Burst Size 0x0: 2x128bit bursts 0x1: 4x128bit bursts 0x3: Reserved 0x2: 8x128bit bursts | RW | 0x2 |
| 13:12 | ROTATION | Video Rotation Flag 0x0: No rotation 0x1: Rotation by 90 degrees 0x3: Rotation by 270 degrees 0x2: Rotation by 180 degrees | RW | 0x0 |
| 11 | FULLRANGE | Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion | RW | 0 |
| 10 | REPLICATIONENABLE | Replication Enable 0x0: Disable Video replication logic 0x1: Enable Video replication logic | RW | 1 |
| 9 | COLORCONVENABLE | Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion YUV to RGB 0x1: Enable Color Space Conversion YUV to RGB | RW | 0 |
| 8 | VRESIZECONF | Write 0s for future compatibility. Reads return 0. | R | 0 |
| 7 | HRESIZECONF | Write 0s for future compatibility. Reads return 0. | R | 0 |
| 6:5 | RESIZEENABLE | Video Resize Enable 0x0: Disable both horizontal and vertical resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing | RW | 0x0 |

| 26:25 | TDMUNUSEDBITS | State of unused bits (TDM mode only) for the secondary LCD output wr: VFP start period of secondary LCD output 0x0: low level (0) 0x1: high level (1) 0x2: unchanged from previous state 0x3: reserved | RW | 0x0 |
| 24:23 | TDMCYCLEFORMAT | Cycle format (TDM mode only) for the secondary LCD output wr: VFP start period of secondary LCD output 0x0: 1 cycle for 1 pixel 0x1: 2 cycles for 1 pixel 0x2: 3 cycles for 1 pixel 0x3: 3 cycles for 2 pixels | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------------|--|------|-------|
| 22:21 | TDMPARALLEL MODE | Output Interface width (TDM mode only) for the secondary LCD output wr: VFP start period of secondary LCD output 0x0: 8-bit parallel output interface selected 0x1: 9-bit parallel output interface selected 0x2: 12-bit parallel output interface selected 0x3: 16-bit parallel output interface selected | RW | 0x0 |
| 20 | TDMENABLE | Enable the multiple cycle format (TDM mode only used for Active Matrix mode with the RFBI enable bit off) for the secondary LCD output wr: VFP start period of secondary LCD output 0x0: TDM disabled 0x1: TDM enabled | RW | 0 |
| 19:14 | RESERVED | Write 0s for future compatibility. Reads return 0. | R | 0x00 |
| 13 | TVOVERLAY OPTIMIZATION | Overlay Optimization for the TV output wr: VFP or EVSYNC or when DISPC_CONTROL2 .GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory 0x0: All the data for all the enabled pipelines are fetched from memory regardless of the overlay/alpha blending configuration. 0x1: The data not used by the overlay manager because of overlap between layers with no alpha blending between them shall not be fetched from memory in order to optimize the bandwidth. | RW | 0 |
| 12 | OVERLAY OPTIMIZATION | Overlay Optimization for the secondary LCD output wr: VFP or EVSYNC or when DISPC_CONTROL2 .GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory 0x0: All the data for all the enabled pipelines are fetched from memory regardless of the overlay/alpha blending configuration. 0x1: The data not used by the overlay manager because of overlap between layers with no alpha blending between them shall not be fetched from memory in order to optimize the bandwidth. | RW | 0 |
| 11 | STALLMODE | STALL Mode for the secondary LCD output wr: VFP start period of secondary LCD output 0x0: Normal mode selected 0x1: STALL mode selected. The Display Controller sends the data without considering the VSYNC/HSYNC. The LCD output is disabled at the end of the transfer of the frame. The S/W has to re-enable the LCD output in order to generate a new frame. | RW | 0 |
| 10 | RESERVED | Write 0s for future compatibility. Reads return 0. | R | 0 |
| 9:8 | TFTDATALINES | Number of lines of the secondary LCD interface wr: VFP start period of secondary LCD output 0x0: 12-bit output aligned on the LSB of the pixel data interface 0x1: 16-bit output aligned on the LSB of the pixel data interface 0x2: 18-bit output aligned on the LSB of the pixel data interface 0x3: 24-bit output aligned on the LSB of the pixel data interface | RW | 0x0 |
| 7 | STDITHER ENABLE | Spatial Temporal dithering enable for the secondary LCD output wr: VFP start period of secondary LCD output 0x0: Spatial/Temporal dithering logic disabled 0x1: Spatial/Temporal dithering logic enabled | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|---|------|-------|
| 6 | GOWB | GO Command for the write-back output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the write-back output to the memory. wr:immediate 0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) connected to the write-back pipeline using the user values. The hardware resets the bit when the update is completed. 0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the write-back pipeline and the hardware can update the internal registers immediately | RW | 0 |
| 5 | GOLCD | GO Command for the secondary LCD output. It is used to synchronized the pipelines (graphics and/or video ones) associated with the secondary LCD output. wr:immediate 0x0: The hardware has finished updating the internal shadow registers of the pipeline(s) connected to the LCD output using the user values. The hardware resets the bit when the update is completed. 0x1: The user has finished to program the shadow registers of the pipeline(s) associated with the LCD output and the hardware can update the internal registers at the VFP start period | RW | 0 |
| 4 | M8B | Mono 8-bit mode of the secondary LCD wr: VFP start period of secondary LCD output 0x0: Pixel data [3:0] is used to output four pixel values to the panel at each pixel clock transition. (only in Passive Mono 4-bit mode). 0x1: Pixel data [7:0] is used to output eight pixel values to the panel each pixel clock transition. (only in Passive Mono 8-bit mode). | RW | 0 |
| 3 | STNTFT | LCD Display type of the secondary LCD wr: VFP start period of secondary LCD output 0x0: Passive Matrix display operation enabled. Passive Matrix dither logic is enabled. 0x1: Active or TFT display operation enabled. STN Dither logic and output FIFO bypassed. | RW | 0 |
| 2 | MONOCOLOR | Monochrome/Color selection for the secondary LCD wr: VFP start period of secondary LCD output 0x0: Color operation enabled (Passive Matrix mode only) 0x1: Monochrome operation enabled (Passive Matrix mode only) | RW | 0 |
| 1 | RESERVED | Write 0s for future compatibility. Reads return 0. | R | 0 |
| 0 | LCDENABLE | Enable the secondary LCD output wr:immediate 0x0: LCD output disabled (at the end of the frame when the bit is reset) 0x1: LCD output enabled | RW | 0 |

| CHANNELOUT2 | | BURSTTYPE | | PREMULTIPLYALPHA | | ZORDER | | ZORDERENABLE | SELFREFRESH | ARBITRATION | DOUBLESTRIDE | VERTICALTAPS | DMAOPTIMIZATION | BUFPRELOAD | RESERVED | SELFREFRESHAUTO | CHANNELOUT | BURSTSIZE | ROTATION | FULLRANGE | REPLICATIONENABLE | COLORCONVENABLE | VRESIZECONF | HRESIZECONF | RESIZEENABLE | FORMAT | | | | ENABLE | |

| Bits | Field Name | Description | Type | Reset |
|-------|------------------|---|------|-------|
| 31:30 | CHANNELOUT2 | It is not used if CHANNELOUT is set to TV. Reserved when CHANNELOUT = 1 (should be set to zero) wr: immediate 0x0: primary LCD output selected. 0x1: Secondary LCD output selected. 0x3: Write-back output to the memory selected. | RW | 0x0 |
| 29 | BURSTTYPE | The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used. | RW | 0 |
| 28 | PREMULTIPLYALPHA | The field configures the DISPC VID3 to process incoming data as premultiplied alpha data or non premultiplied alpha data. Default setting is non premultiplied alpha data. 0x0: Non premultiplied alpha data color component 0x1: Premultiplied alpha data color component | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------|--|------|-------|
| 27:26 | ZORDER | <p>Z-Order defining the priority of the layer compared to others when overlaying. It is software responsibility to ensure that each layer connected to the same overlay manager has a different z-order value.</p> <p>If bit 25 is set to 0, the ZORDER bit field is ignored and replaced by the value 0.</p> <p>0x0: Z-order 0: layer above solid background color and below layer with higher Z-order values.</p> <p>0x1: Z-order 1: layer above layer with z-order value of 0 and below layers with z-order values of 2 and 3</p> <p>0x3: Z-order 3: layer above all the other layers</p> <p>0x2: Z-order 2: layer above layers with z-order value of 0 and 1 and below layer with z-order value of 3</p> | RW | 0x0 |
| 25 | ZORDERENABLE | <p>Z-order Enable. The bit field ZORDER is only used when the Z-order is enabled.</p> <p>0x0: Z-order disabled. The Z-order of the layer is 0.</p> <p>0x1: Z-order enabled. The Z-order is defined by the bit field ZORDER (bits 26 and 27).</p> | RW | 0 |
| 24 | SELFREFRESH | <p>Enables the self refresh of the video window from its own DMA buffer only.</p> <p>0x0: The video pipeline accesses the interconnect to fetch data from the system memory.</p> <p>0x1: The video pipeline does not need anymore to fetch data from memory. Only the DMA buffer associated with the video3 is used. It takes effect after the frame has been loaded in the DMA buffer.</p> | RW | 0 |
| 23 | ARBITRATION | <p>Determines the priority of the video pipeline.</p> <p>The video pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them.</p> <p>0x0: The video pipeline is one of the normal priority pipeline.</p> <p>0x1: The video pipeline is one of the high priority pipeline.</p> | RW | 0 |
| 22 | DOUBLESTRIDE | <p>Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride.</p> <p>It is only used in case of YUV4:2:0.</p> <p>0x0: The CbCr stride value is equal to the Y stride.</p> <p>0x1: The CbCr stride value is double to the Y stride.</p> | RW | 0 |
| 21 | VERTICALTAPS | <p>Video Vertical Resize Tap Number</p> <p>0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used.</p> <p>The associated bit fields for the 2 other taps coefficients do not need to be initialized.</p> <p>0x1: 5 taps are used for the vertical filtering logic.</p> | RW | 0 |
| 20 | DMAOPTIMIZATION | <p>Write 0s for future compatibility.</p> <p>Reads return 0.</p> | R | 0 |

| Physical Address | 0x4804 1398 0x5800 1398 | Instance | DISPC_PER_L4 DISPC_L3 |
| Description | The register configures the number of bytes to increment between two pixels for the buffer associated with the video window 3. For more information, see Section 10.2.4.6.5, Predecimation . The register is used only when the TILER is not present in the system in order to perform low performance rotation. When the TILER IP is present it is highly recommended to use it for performing the rotation. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory | | |

|------|------------|---|------|----------|
| 31:8 | RESERVED | Write 0s for future compatibility. Reads return 0. | R | 0x000000 |
| 7:0 | PIXELINC | Number of bytes to increment between two pixels. Encoded unsigned value (from 1 to 255) to specify the number of bytes between two pixels in the video buffer. The value 0 is invalid. The value 1 means next pixel. The value 1+n* <i>bpp</i> means increment of <i>n</i> pixels. For YUV4:2:0, Max supported value is 128. | RW | 0x01 |

| IDLENUMBER | | | | IDLESIZE | CAPTUREMODE | | | ARBITRATION | DOUBLESTRIDE | VERTICALTAPS | RESERVED | WRITEBACKMODE | CHANNELIN | | | BURSTSIZE | RESERVED | | FULLRANGE | TRUNCATIONENABLE | COLORCONVENABLE | BURSTTYPE | ALPHAENABLE | RESIZEENABLE | FORMAT | | | ENABLE | | | |

| Bits | Field Name | Description | Type | Reset |
|-------|-------------|--|------|-------|
| 31:28 | IDLENUMBER | Determines the number of idles between requests on the L3 interconnect. It is only used when the write-back pipeline does data transfer from memory to memory. When the output of an overlay is stored in memory through the write-back pipeline in capture mode, the bit field IDLENUMBER is ignored since a timing generator is used to time the transfer. The number of IDLE cycles is IDLENUMBER (from 0 to 15) if IDLESIZE=0. The number of IDLE cycles is IDLENUMBERx8 (from 0 to 120) if IDLESIZE=1 and BURSTSIZE=2. The number of IDLE cycles is IDLENUMBERx4 (from 0 to 60) if IDLESIZE=1 and BURSTSIZE=1. The number of IDLE cycles is IDLENUMBERx2 (from 0 to 30) if IDLESIZE=1 and BURSTSIZE=0. | RW | 0x0 |
| 27 | IDLESIZE | Determines if the IDLENUMBER corresponds to a number of bursts or singles. 0x0: The number of idles between requests is defined by IDLENUMBER as number of cycles. 0x1: The number of idles between requests is defined by IDLENUMBER multiplied by burst size as number of cycles. | RW | 0 |
| 26:24 | CAPTUREMODE | Defines the frame rate capture. 0x6: Only one out of six frames is captured. The first one is captured then the second one is skipped and so on. 0x1: Only one frame is captured. 0x7: Only one out of seven frames is captured. The first one is captured then the second one is skipped and so on. 0x0: All frames are captures until the write-back channel is disabled or there is no more data generated by the overlay or the pipeline attached to the write-back channel. 0x2: Only one out of two frames is captured. The first one is captured then the second one is skipped and so on. 0x4: Only one out of four frames is captured. The first one is captured then the second one is skipped and so on. 0x5: Only one out of five frames is captured. The first one is captured then the second one is skipped and so on. 0x3: Only one out of three frames is captured. The first one is captured then the second one is skipped and so on. | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|-------|------------------|---|------|-------|
| 23 | ARBITRATION | Determines the priority of the write-back pipeline. The write-back pipeline is one of the high priority pipeline. The arbitration gives always the priority first to the high priority pipelines using round-robin between them. When there is only normal priority pipelines sending requests, the round-robin applies between them. 0x0: The write-back pipeline is one of the normal priority pipeline. 0x1: The write-back pipeline is one of the high priority pipeline. | RW | 0 |
| 22 | DOUBLESTRIDE | Determines if the stride for CbCr buffer is the 1x or 2x of the Y buffer stride. It is only used in case of YUV4:2:0. 0x0: The CbCr stride value is equal to the Y stride. 0x1: The CbCr stride value is double to the Y stride. | RW | 0 |
| 21 | VERTICALTAPS | Video Vertical Resize Tap Number 0x0: 3 taps are used for the vertical filtering logic. The 2 other taps are not used. 0x1: 5 taps are used for the vertical filtering logic. | RW | 0 |
| 20 | RESERVED | Write 0s for future compatibility. Reads return 0. | R | 0x0 |
| 19 | WRITEBACKMODE | When connected to the overlay output of a channel the write back can operate as a simple transfer from memory to memory (composition engine) or as a capture channel. 0x0: Capture mode (default mode) 0x1: Memory-to-memory mode | RW | 0x0 |
| 18:16 | CHANNELIN | Video Channel In configuration wr: immediate 0x6: Video3 pipeline output 0x1: Secondary LCD output 0x0: Primary LCD overlay output 0x2: TV overlay output 0x4: Video1 pipeline output 0x5: Video2 pipeline output 0x3: Graphics pipeline output | RW | 0x0 |
| 15:14 | BURSTSIZE | Write-back DMA Burst Size 0x0: 2x128bit bursts 0x1: 4x128bit bursts 0x3: Reserved 0x2: 8x128bit bursts | RW | 0x2 |
| 13:12 | RESERVED | RESERVED | RW | 0x0 |
| 11 | FULLRANGE | Color Space Conversion full range setting. 0x0: Limited range selected: 16 subtracted from Y before color space conversion 0x1: Full range selected: Y is not modified before the color space conversion | RW | 0 |
| 10 | TRUNCATIONENABLE | It applies only when the input format to the write-back pipeline from the overlay or directly from one of the pipelines is ARGB32. If the format is one of the YUV supported formats, the bit field is ignored. 0x0: Disable truncation logic 0x1: Enable truncation logic from ARGB32 to the pixel format defined in the field FORMAT. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|-----------------|--|------|-------|
| 9 | COLORCONVENABLE | Enable the color space conversion. The hardware does not enable/disable the conversion based on the pixel format. The bit field shall be reset when the format is not YUV. 0x0: Disable Color Space Conversion RGB to YUV 0x1: Enable Color Space Conversion RGB to YUV | RW | 0 |
| 8 | BURSTTYPE | The type of burst can be INCR (incremental) or BLCK (2D block). The 2D block is required when the TILER is targeted by the DMA engine. 0x0: INC burst type is used. 0x1: 2D block burst type is used. | RW | 0 |
| 7 | ALPHAENABLE | Premultiplied alpha enable Read 0x1: Enabled Read 0x0: Disabled. This bit also disable the logic present in the associated channel out that compute the alpha component sent to the WB pipe. When the WB is configured to copy back one of the output channels (output of overlay), the following configurations are available: 0x1: The WB pipe copies back to memory the premultiplied alpha calculated through the overlay. 0x0: The alpha value is not written back. | RW | 0 |
| 6:5 | RESIZEENABLE | Resize Enable 0x0: Disable the resize processing 0x1: Enable the horizontal resize processing 0x3: Enable both horizontal and vertical resize processing 0x2: Enable the vertical resize processing | RW | 0x0 |
| 4:1 | FORMAT | Write-back Format. It defines the pixel format when storing the write-back picture into memory. 0x6: RGB16-565 0x1: RGB12x-4444 0xA: YUV2 4:2:2 co-sited 0x7: ARGB16-1555 0xD: RGBA32-8888 0x0: NV12 4:2:0 2 buffers (Y + UV) 0x2: RGBA12-4444 0x8: xRGB24-8888 (32-bit container) 0x9: RGB24-888 (24-bit container) 0xB: UYVY 4:2:2 co-sited 0x5: ARGB16-4444 0xF: xRGB15-1555 0xC: ARGB32-8888 0x4: xRGB12-4444 0xE: RGBx24-8888 (24-bit RGB aligned on MSB of the 32-bit container) | RW | 0x0 |
| 0 | ENABLE | Write-back Enable. wr: immediate 0x0: Write-back disabled 0x1: Write-back enabled | RW | 0 |

| Physical Address | 0x4804 16B4 + (0x8 * i) 0x5800 16B4 + (0x8 * i) | Instance | DISPC_PER_L4 DISPC_L3 |
| Description | The bank of registers configure the up/down-scaling coefficients for the horizontal resize of the video picture associated with the video window 2 for the phases from 0 to 7. It is used for Crb and Cr setting. It is used only when the pixel format at the input of the filter is one of the YUV formats. If the pixel format at the input of the filter is ARGB (all ARGB, RGB, RGBA are converted to ARGB32-8888 by the color space conversion before going to the filter is the color space conversion is done before the filter). When the register is not used by the hardware, any value can be used for the bit fields. Shadow register, updated on VFP start period of primary LCD or VFP start period of the secondary LCD or EVSYNC or when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline). The synchronization event is defined based on the output using the pipeline: primary LCD, secondary LCD, TV output or write-back to the memory | | |

| Description | The register configures the resize accumulator init values for horizontal and vertical up/downsampling of the write back pipeline (DISPC_WB_ACCU2_0 DISPC_WB_ACCU2_1 for ping-pong mechanism with external trigger, based on the field polarity). It is used for Cb and Cr setting. It is used only when the pixel format at the input of the filter is one of the YUV formats. If the pixel format at the input of the filter is ARGB (all ARGB, RGB, RGBA are converted to ARGB32-8888 by the color space conversion before going to the filter is the color space conversion is done before the filter). When the register is not used by the hardware, any value can be used for the bit fields. Shadow register, updated when DISPC_CONTROL2.GOWB is set to 1 by software and current WB frame is finished (no more data in the write-back pipeline) when the WB pipeline is directly connected to one of the pipelines (graphics or video), otherwise updated on VFP start period of primary LCD or VFP start period of secondary LCD or EVSYNC depending on which overlay output is selected as an input to the WB pipeline | | |

See [OMAP4470 MIPI Disclaimer](#) for details.

10.3.1 MIPI DSI Overview

The display serial interface (DSI) module connects to a DSI display module directly or through an external DSI bridge. The DSI module is connected to DISPC and L3/L4_PER interconnects

[Figure 10-95](#) is a block diagram of the DSI module.

Figure 10-95. DSI Overview

dsi-001

There are two DSI modules in the display subsystem (DSS) that provide the following main features:

- **DSI 1 (primary)**
 - Supports MIPI-DSI (up to four data lanes + one clock lane)
 - Supports video mode and command mode
 - Support multiple displays (one video mode and one command mode). In command mode, pixel data are provided from the level 3 (L3) interface or from one of the overlay manager outputs.
 - Bidirectional data link support for command mode (only one data lane is used in reverse direction)

- RGB16, RGB18 nonpacked, and RGB24 formats supported for command mode
- RGB16, RGB18 packed and nonpacked, and RGB24 formats supported for video mode
- Burst support for the video mode
- Supports up to four data-configurable lanes, in addition to the clock signaling
- Maximum data rate of 824 Mbps per data pair for four-data lane configuration, and 900 Mbps for up to three-data lane configuration
- Data splitter for 2-data, 3-data and 4-data lane configurations
- Data interleaving support for one synchronous stream (video mode) from the DISPC and up to three asynchronous streams (command mode) from the interconnect concurrently, or up to four asynchronous streams (command mode) from the interconnect
- Transfer of pixels and data received on the video port or L3 interconnect to the display through DSI DSI_PHY
- Serial configuration port (SCP) for the DSI_PHY complex input/output (I/O) and DSI phase-locked loop (PLL)
- Connection to the DSI_PHY complex I/O through PPI
- Error-correction code (ECC) and checksum generation
- MIPI DCS support
- DSI 2 (secondary)
 - Supports MIPI-DSI (up to two data lanes + one clock lane)
 - Supports video mode and command mode
 - Support multiple displays (one video mode and one command mode). In command mode, pixel data are provided from the L3 interface or from one of the overlay manager outputs.
 - Bidirectional data link support for command mode (only one data lane is used in reverse direction)
 - RGB16, RGB18 nonpacked, and RGB24 formats supported for command mode
 - RGB16, RGB18 packed and nonpacked, and RGB24 formats supported for video mode
 - Burst support for the video mode
 - Supports one data-configurable lane, in addition to the clock signaling
 - Maximum data rate of 900 Mbps per data pair
 - Data splitter for 2-data lane configuration
 - Data interleaving support for one synchronous stream (video mode) from the DISPC and up to three asynchronous streams (command mode) from the interconnect concurrently, or up to four asynchronous streams (command mode) from the interconnect
 - Transfer pixels and data received on the video port or Interface interconnect to the display through DSI DSI_PHY
 - Serial configuration port (SCP) for the DSI_PHY complex I/O and DSI PLL
 - Connection to the DSI_PHY complex I/O through the physical layer (PHY) protocol interface (PPI)
 - ECC and checksum generation
 - MIPI DCS support

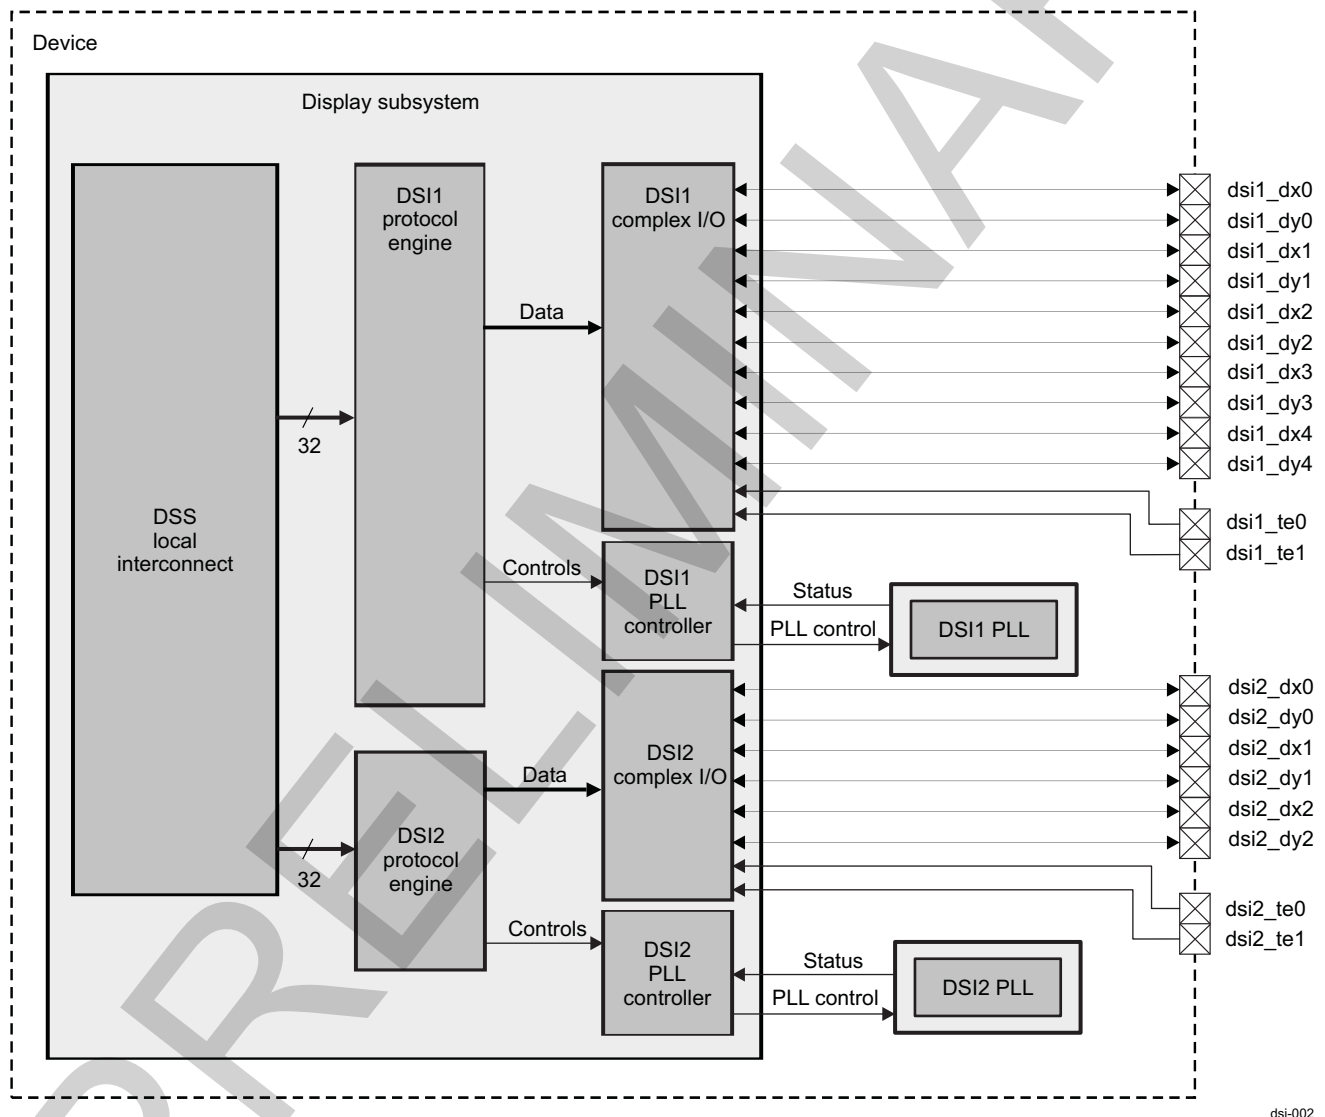

10.3.2 DSI Environment

NOTE: Copyright 2005-2008 MIPI Alliance, Inc. All rights reserved. MIPI Alliance Member Confidential.

This section describes the DSI application fields from an environment point of view (external connections). It describes the DSI connectivity options, lists all possible interfaces, and describes the protocol and data format used in each case.

Figure 10-96 is a block diagram of the DSI environment.

Figure 10-96. DSI Environment

The DSI is a bidirectional differential serial interface with data/clock for the PHY (configured in unidirectional link in case the display module is only unidirectional). The maximum capacity of a DSI data transfer is 824 Mbps for four data lanes. The speed of the link can be configured by software only when the DSI_PHY is in STOP state or ULTRALOW-POWER state (ULPS).

Figure 10-97 shows the high-level data flow of the DSI transmitter/receiver.

Figure 10-97. DSI Transmitter/Receiver Data Flow

10.3.2.1 DSI PHY

Table 10-472 lists the DSI1 I/Os.

Table 10-472. I/O Description of DSI1

| Signal Name | | I/O ⁽¹⁾ | Description | Value at Reset |
|-------------|--------|--------------------|----------------------------------|----------------|
| dsi1_dx0 | lane 1 | I/O | Serial data/clock lane | N/A |
| dsi1_dy0 | | | | |
| dsi1_dx1 | lane 2 | I/O | Serial data/clock lane | N/A |
| dsi1_dy1 | | | | |
| dsi1_dx2 | lane 3 | I/O | Serial data/clock lane | N/A |
| dsi1_dy2 | | | | |
| dsi1_dx3 | lane 4 | I/O | Serial data/clock lane | N/A |
| dsi1_dy3 | | | | |
| dsi1_dx4 | lane 5 | I/O | Serial data lane only | N/A |
| dsi1_dy4 | | | | |
| dsi1_te0 | te0 | I | DSI1 tearing effect (TE) input 0 | N/A |

⁽¹⁾ I = Input; O = Output; I/O = Bidirectional

Table 10-472. I/O Description of DSI1 (continued)

| Signal Name | | I/O ⁽¹⁾ | Description | Value at Reset |
|-------------|-----|--------------------|-----------------|----------------|
| dsi1_te1 | te1 | I | DSI1 TE input 1 | N/A |

NOTE: Each serial lane (lane 1 through lane 5) can be used as a data lane. Serial lanes 1 through 4 can be used as clock lanes (lane 5 can never be a clock lane). All polarities on all lanes are supported. The MIPI DSI 1.01 protocol requires at least one clock lane and one data lane.

Table 10-473 lists the DSI2 I/Os.

Table 10-473. I/O Description of DSI2

| Signal Name | | I/O ⁽¹⁾ | Description | Value at Reset |
|-------------|--------|--------------------|------------------------|----------------|
| dsi2_dx0 | lane 1 | I/O | Serial data/clock lane | N/A |
| dsi2_dy0 | | | | |
| dsi2_dx1 | lane 2 | I/O | Serial data/clock lane | N/A |
| dsi2_dy1 | | | | |
| dsi2_dx2 | lane 3 | I/O | Serial data/clock lane | N/A |
| dsi2_dy2 | | | | |
| dsi2_te0 | te0 | I | DSI2 TE input 0 | N/A |
| dsi2_te1 | te1 | I | DSI2 TE input 1 | N/A |

⁽¹⁾ I = Input; O = Output; I/O = Bidirectional

NOTE: Each serial lane (lane 1 through lane 3) can be used as a clock lane or a data lane. All polarities on all lanes are supported. The MIPI DSI 1.01 protocol requires at least one clock lane and one data lane.

Lanes support four operating modes:

- HS mode: High-speed transmit mode
- LP mode: Low-power transmit mode (also called low-power state [LPS])
- ULPS: ULTRALOW-POWER state used between two transmissions
- Off mode: Lane is off.

NOTE: The CONTROL_DSIPHY register in the control module of the device provides the following control over the DSI lanes:

- Enable and disable each lane (the DSI2_LANEENABLE[31:29] and DSI1_LANEENABLE[28:24] bit fields).
- Pulldown enable and disable on each lane (the DSI1_PIPD[23:19] and DSI2_PIPD[18:14] bit fields)

For more information, see [Section 19.6.6, SYSCTRL_PADCONF_CORE Register Summary](#), in [Chapter 19, Control Module](#).

10.3.2.1.1 Data/Clock Configuration

Data-clock signaling consists of one to four data pairs and one clock pair. The minimum configuration is one data pair and one clock pair.

- The data signal carries the bit serial data. The DSI transmitter in the host sends the data in-quadrature with the dual data rate (DDR) clock in HS mode; otherwise, the clock is extracted from the received data in LS mode. The data is transmitted byte-wise LSB first.
- The clock signal carries the DDR clock signal in HS transmission.
- Software users must configure the order of the data lanes to indicate the byte order while splitting the

byte stream for each DSI_PHY into bytes.

Table 10-474 lists some of the DSI lane configurations.

NOTE: All combinations for the order of the clock and data lanes are supported (except clock cannot be on lane 5) but not explicitly described in Table 10-474.

Table 10-474. DSI Lane Configuration

| DSI_PHY Lane Configuration | Data/Clock Lane Position | | | | | Description |
|--|--------------------------|-------|-------|-------|-------|------------------|
| | 1 | 2 | 3 | 4 | 5 | |
| Mode CLK + DATA1 | | | | | | Single data lane |
| | CLK | DATA1 | | | | |

| | DATA2 | DATA1 | CLK | DATA3 | DATA4 | |
| | DATA4 | DATA3 | CLK | DATA1 | DATA2 | |
| | DATA3 | DATA4 | CLK | DATA2 | DATA1 | |
| | DATA1 | DATA2 | CLK | DATA4 | DATA3 | |
| | DATA1 | DATA4 | CLK | DATA3 | DATA2 | |
| | DATA1 | DATA3 | CLK | DATA4 | DATA2 | |

NOTE:

- The byte on D_n is sent before the byte on $D_n + 1$; all the combinations of data and clock are supported through programming of the [DSI_COMPLEXIO_CFG1](#) register. The `CLOCK_POSITION` and `CLOCK_POL` bit fields configure which lane transmits the clock and define its polarity. Eight bit fields (`DATA1_POSITION` and `DATA1_POL`, through `DATA4_POSITION` and `DATA4_POL`) configure the data lanes and their polarity. The `DATA2_POSITION` through `DATA4_POSITION` bit fields can be set to 0; in this case, only the data lane defined in the `DATA1_POSITION` bit field is used, and data is transmitted on only one clock lane and one data lane.
- Only `DATA1` is bidirectional in command mode. The low-power received information is always sent by the display panel using `DATA1`. Because any lane of the DSI complex I/O can be configured as data lane `DATA1`, all lanes of the complex I/O are bidirectional.

10.3.2.1.2 ULPS

Each lane can be put in ULPS by software configuration. The ULPS mode requires the following conditions:

- The lane must be in ULP state.
- For data lanes, no data must be pending in the DSI module.
- For data lane 1, no bus turnaround (BTA) should have been sent. The DSI module must have control of the bus.

For more information on ULPS configuration, see [Section 10.3.4.4.16](#), *Ultralow-Power State Configuration*.

10.3.2.2 DSI Protocol Layer

Low-level protocol (LLP) is a byte-oriented protocol. It supports short and long packet formats. The DSI protocol layer defines how the display data is transported onto the PHY. Packets can be sent using HS mode or low-speed (LS) mode. LLP is selected through DSI registers. The features of the DSI protocol layer are:

- Transport of arbitrary data (payload independent)
- 8-bit word size
- Support for up to four interleaved VCs on the same link
- Special packets for frame start, frame end, line start, and line end information
- Descriptor for the type, pixel depth, and format of application-specific payload data
- ECC for 1-bit or 2-bit error detection in the header
- 16-bit checksum code for error detection

[Figure 10-98](#) shows the protocol layer with short and long packets.

Figure 10-98. Protocol Layer With Short and Long Packets

dsi-004

10.3.2.2.1 Short Packet

Figure 10-99 shows the structure of the short packet. A short packet must contain an 8-bit data ID followed by two command or data bytes and an 8-bit ECC. No packet footer (PF) should be present. Short packets must be 4 bytes long. The ECC byte allows correction of single-bit errors and detection of 2-bit errors in the short packet.

Figure 10-99. Short Packet Structure

NOTE: The short packets can be sent in LP mode or HS mode.

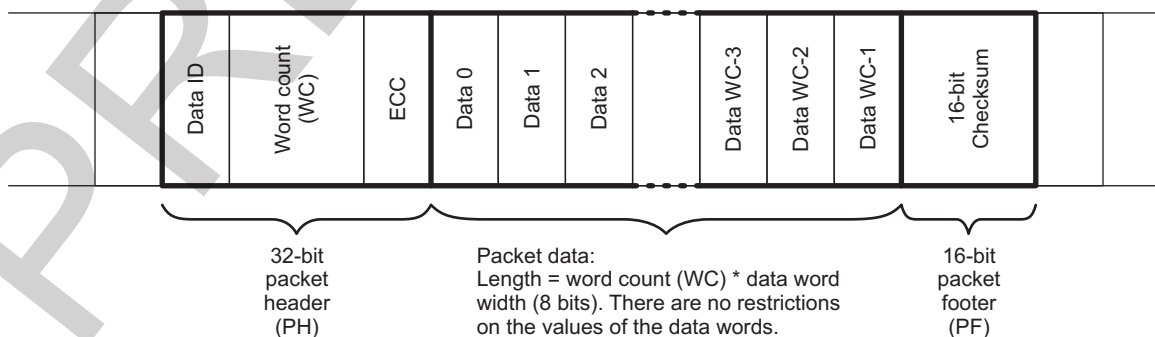

The [DSI_VC_SHORT_PACKET_HEADER_i](#) register is used to send only short packets (ECC can be calculated by hardware or by software users for debug purposes). This register is not used for video mode data because the short packets are generated by hardware based on the following events:

- Synchronization events received on the video port (assertion/deassertion of the HSYNC and VSYNC input signals)
- [DSI_CTRL\[18\]](#) VP_HSYNC_END
- [DSI_CTRL\[17\]](#) VP_HSYNC_START
- [DSI_CTRL\[16\]](#) VP_VSYNC_END
- [DSI_CTRL\[15\]](#) VP_VSYNC_START
- [DSI_CTRL\[11\]](#) VP_VSYNC_POL
- [DSI_CTRL\[10\]](#) VP_HSYNC_POL
- [DSI_VC_CTRL_i\[1\]](#) SOURCE

10.3.2.2.2 Long Packet

Figure 10-100 shows the structure of the long packet. A long packet must consist of three elements: 32-bit packet header (PH), application-specific data payload with a variable number of bytes, and 16-bit PF.

Figure 10-100. Long Packet Structure

The PH is further composed as follows:

- 8-bit data identifier: The data identifier defines the VC for the data and the DT for the application-specific payload data.
- 16-bit word count: The word count defines the number of bytes in the data payload between the end of the PH and the start of the PF. The PH and the PF must not be included in the word count.
- 8-bit ECC: The ECC byte allows single-bit errors to be corrected and 2-bit errors to be detected in the PH. This includes the data identifier and the word count fields.

After the end of the PH, the receiver reads the next word count × bytes of the data payload. There are no limitations on the value of a data word within the data payload block (that is, no embedded codes are used). Once the receiver has read the data payload, it reads the checksum in the PF. The host processor must always calculate and transmit a checksum in the PF. Peripherals are not required to calculate a checksum. In the special case of a 0-byte data payload, if the payload length is 0, the checksum calculation results in (0xFFFF). If the checksum is not calculated, the PF must consist of 2 bytes of 0s (0x0000). In the generic case, the length of the data payload must be a multiple of bytes. In addition, each data format can impose additional restrictions on the length of the payload data (that is, a multiple of 4 bytes). Each byte is transmitted LSB first. Payload data can be transmitted in any byte order, restricted only by data format requirements. Multibyte elements, such as word count and checksum, must be transmitted least-significant byte (LSByte) first.

NOTE: Long packets can be sent in LP or HS mode.

The [DSI_VC_LONG_PACKET_HEADER_i](#) register provides headers for long packets (ECC is always calculated by hardware). The register is used for video and command modes.

If video mode is enabled for a virtual channel, it is not possible to transfer data concurrently (interleaved in a frame) using long packets received on the video and L3 interconnect ports because the [DSI_VC_LONG_PACKET_HEADER_i](#) register is used by the video mode. The register can be unprogrammed by the user to send long packets received on the L3 interconnect port only when there is no expected data on the video port. Software must program the register correctly to send sequentially long packets in video and command modes.

The word count (WC) defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register for the VC associated with the video port indicates the number of bytes to receive (one line or two lines can be used, depending on the WC and the size of the line buffer). The total size defined in the WC of the header register cannot exceed the size of the line buffer multiplied by the number of buffer lines.

The [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register is used to provide payload data for long packets (checksum is calculated by hardware when [DSI_VC_CTRL_i\[7\]](#) CS_TX_EN is set to 1; otherwise, the value is 0x00). The register is not used in video mode because payload data are provided by the video port.

Software must ensure that the following sequence for write accesses to the header and payload registers ([DSI_VC_LONG_PACKET_HEADER_i](#) and [DSI_VC_LONG_PACKET_PAYLOAD_i](#), respectively) is followed:

- A long PH value with WC = 0 written in the [DSI_VC_LONG_PACKET_HEADER_i](#) register can be followed by any access.
- A long PH value with WC 0 written in the [DSI_VC_LONG_PACKET_HEADER_i](#) register must be followed by one or more writes to the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register defined by the WC value before writing again to the same [DSI_VC_LONG_PACKET_HEADER_i](#) register.

CAUTION

If this sequence is not followed, no error is generated. Access to other DSI registers during this sequence is allowed.

10.3.2.2.3 Data Identifier

The data identifier byte contains the values for the virtual channel ID and data type, as shown in [Figure 10-101](#). The virtual channel ID is contained in the 2 MSBs of the data identifier byte and identify the data as directed to one of four virtual channels. The value of the data type is contained in the 6 LSBs of the data identifier byte.

Figure 10-101. Data Identifier Structure

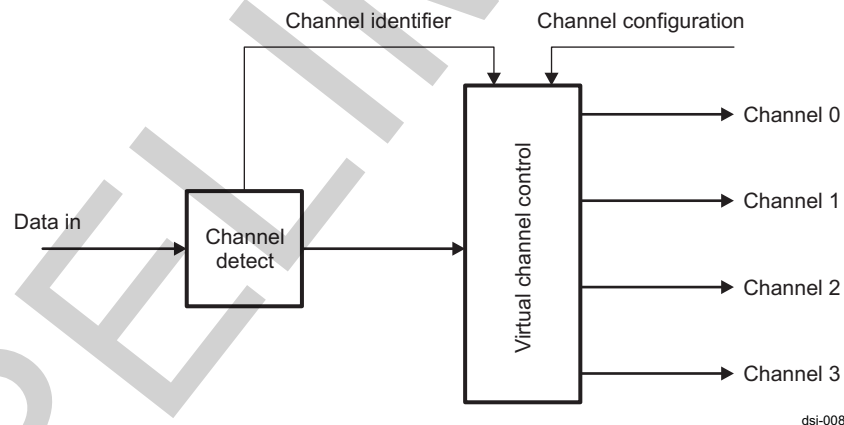

10.3.2.2.3.1 VC ID – VC Field, DI[7:6]

The host can service up to four peripherals with tagged commands or blocks of data using the VC ID field of the header for packets targeted at different peripherals. The VC ID enables one serial stream to service two or more virtual peripherals by multiplexing packets onto a common transmission channel. Each packet sent in a single transmission has its own VC assignment and can be directed to different peripherals. The VC ID is defined in the [DSI_VC_SHORT_PACKET_HEADER_i](#) and [DSI_VC_LONG_PACKET_HEADER_i](#) registers for short and long packets, respectively. It will not be modified by hardware. There is one set of registers for each VC. Each set of registers defines the characteristics of the traffic between the host and the display associated with the VC.

[Figure 10-102](#) shows the VC controller.

Figure 10-102. VC Controller

10.3.2.2.3.2 Data Type Field DT[5:0]

The data type field specifies whether the packet is long or short and the packet format. The data type field, and the word count field for long packets, informs the receiver about how many bytes to expect in the rest of the packet. This is necessary because the beginning and end of a packet are not indicated by special packet start/end sync codes. This permits packets to convey arbitrary data, but it also requires the PH to specify the size of the packet.

10.3.2.2.4 Synchronization Codes

Each frame can be identified by two synchronization codes:

- For the start of the vertical synchronization (VSSC) pulse

- For the end of the vertical synchronization (VSEC) pulse

Each line can be identified by two synchronization codes:

- For the start of the horizontal synchronization (HSSC) pulse
- For the end of the horizontal synchronization (HSEC) pulse

The synchronization events are not required by the display (peripheral): they are optional. Users can program which synchronization events are generated to the display from the timings received from the DISPC in video mode. When data are received on the L3 interconnect port, the synchronization codes are not automatically generated by the protocol engine. They can be provided on the L3 interconnect port by writing to the registers with limited timing control. It is highly recommended to use the video port from the DISPC to receive the synchronization events to automatically generate short synchronization packets to the peripheral.

When the DSI protocol engine detects that the VSYNC signal from the DISPC transitions from inactive to active state, the VSSC short packet replaces the following HSSC corresponding to the following HSYNC synchronization short packet (if the generation is enabled).

When the transition from active to inactive state is detected, the VSEC short packet is generated (if the generation is enabled) replacing the HSEC synchronization packet corresponding to the following HSYNC.

When the DSI protocol engine detects that the HSYNC signal from the DISPC transitions from inactive to active state, the HSSC short packet is generated (if the generation is enabled).

When the transition from active to inactive state is detected, the HSEC short packet is generated (if generation is enabled).

For the first frame, any HSYNC and data received on the video port before the first VSYNC must be ignored. Because the first VSYNC sent to the display is also recognized as an HSYNC for the first line, there is no HSYNC sent for the first line. To send the synchronization codes, the DSI protocol engine uses the short packets. [Table 10-475](#) lists the 6-bit DT synchronization code values.

Table 10-475. Synchronization Codes

| Synchronization Code | Value | Comments |
|-----------------------------------|-------|----------|
| Vertical sync start code (VSSC) | 0x1 | Optional |
| Vertical sync end code (VSEC) | 0x11 | Optional |
| Horizontal sync start code (HSSC) | 0x21 | Optional |
| Horizontal sync end code (HSEC) | 0x31 | Optional |

10.3.2.2.5 Blanking

To keep the DSI link in HS state while using video mode, during blanking periods, long blanking packets are sent to the display. The DSI_VM_TIMINGx (where x = 1 to 8) registers define the size of the long blanking packets after:

- Horizontal sync start code (short packet)
- Horizontal sync end code (short packet)
- Vertical sync start code (short packet)
- Vertical sync end code (short packet)
- Pixels (long packet)

[Table 10-476](#) defines the short packet values for the synchronization packets:

Table 10-476. Sync Short Packet Values

| VC ID | Sync Code | Header (First Byte) | Header (Second Byte): Data Field LSB | Header (Third Byte): Data Field MSB | Header (ECC) |
|-------|-----------|---------------------|--------------------------------------|-------------------------------------|---------------------------------|
| 0x0 | 0x1 | 0x1 | 0x0 | 0x0 | See Notes following this table. |
| | 0x11 | 0x11 | | | |
| | 0x21 | 0x21 | | | |
| | 0x31 | 0x31 | | | |
| 0x1 | 0x1 | 0x41 | | | |
| | 0x11 | 0x51 | | | |
| | 0x21 | 0x61 | | | |
| | 0x31 | 0x91 | | | |
| 0x2 | 0x1 | 0x81 | | | |
| | 0x11 | 0x81 | | | |
| | 0x21 | 0xA1 | | | |
| | 0x31 | 0xB1 | | | |
| 0x3 | 0x1 | 0xC1 | | | |
| | 0x11 | 0xD1 | | | |
| | 0x21 | 0xC1 | | | |
| | 0x31 | 0xF1 | | | |

NOTE:

- If the ECC is enabled by setting the [DSI_VC_CTRL\[i\]\[8\] ECC_TX_EN](#) bit to 1 for the VC in video mode, the ECC value is calculated; otherwise, 0x00 is used for the blanking long packets and sync short packets. If the CRC is enabled by setting the [DSI_VC_CTRL\[i\]\[7\] CS_TX_EN](#) bit to 1 for the VC in video mode, the checksum value is calculated; otherwise, 0x00 is used for the blanking long packets.
- In other cases, when the [DSI_VC_CTRL\[i\]\[7\] CS_TX_EN](#) bit is set to 0, the value 0x00 is always used for the CRC (long packets). When the [DSI_VC_CTRL\[i\]\[8\] ECC_TX_EN](#) bit is set to 0, the value 0x00 is used for the ECC for short and long packets, except when the header is provided by the register, because the ECC field is available in the register. It can be used to generate invalid ECC values when the header is provided by the register.

The DSI link (lanes and clock separately) can be put in ULPS. While using the blanking values formerly defined, the packets (short and long) are considered in HS mode.

Timing parameters VSA, VBP, VFP, HSA, HBP, HFP, VACT, and t_L are defined in the [DSI_VM_TIMING1](#) through [DSI_VM_TIMING8](#) registers. HSA, HBP, HFP, and t_L are defined using the byte clock unit (TXBYTECLKHS - HS transmit byte clock generated by DSI_PHY) and also in low-power clock cycles (TxClkEsc). VSA, VBP, VFP, and VACT are defined by the number of lines. When the HS blanking packets are sent during the blanking periods, the parameters are used to determine the blanking packet payload size (taking into account the 4-byte header and the 2-byte checksum).

The configuration of the DISPC timing generator must be used when the DISPC timings are used to generate DSI HS video mode transfer.

Special care must be taken in the case of the last line of the frame. The LPS transition is required when the link is in HS mode for the whole frame.

When BTA is sent for the data packets, the following blanking period cannot be used for sending any data from the TX FIFO. When the blanking period starts with one HS packet from one VC, it can be followed only by another HS packet from the same VC, or by a trigger (for example, BTA). When there is no more HS data to send for this VC, the lane is in LPS.

When the blanking period starts with one LP packet from one VC, it can be followed only by another LP packet from the same VC, by another VC, by trigger (BTA, for example), or by extra LP NULL packets. If the trigger is sent, it is not possible to send any more data. When there is no more data from the TX FIFO to send in LP mode or the trigger has been sent, the lane is put into LPS. If the lanes must be kept in HS mode during blanking periods (except for the last blanking period of the frame), the HS blanking packets must be used. If one trigger is sent at the beginning of the blanking period, the rest of the blanking period is in LPS.

Figure 10-103 and Figure 10-104 show a nonburst transfer in DSI video mode with and without VE and HE, respectively. Figure 10-105 shows a burst transfer in DSI video mode without VE and HE.

Figure 10-103. DSI Video Mode: Nonburst Transfer With VE and HE

dsi-009

Figure 10-104. DSI Video Mode: Nonburst Transfer Without VE and HE

dss-010

NOTE: HSA timing is not used and does not have to be programmed when HE short packet is not generated.

Figure 10-105. DSI Video Mode: Burst Transfer Without VE and HE

dsi-011

NOTE: HSA timing is not used and does not have to be programmed when HE short packet is not generated.

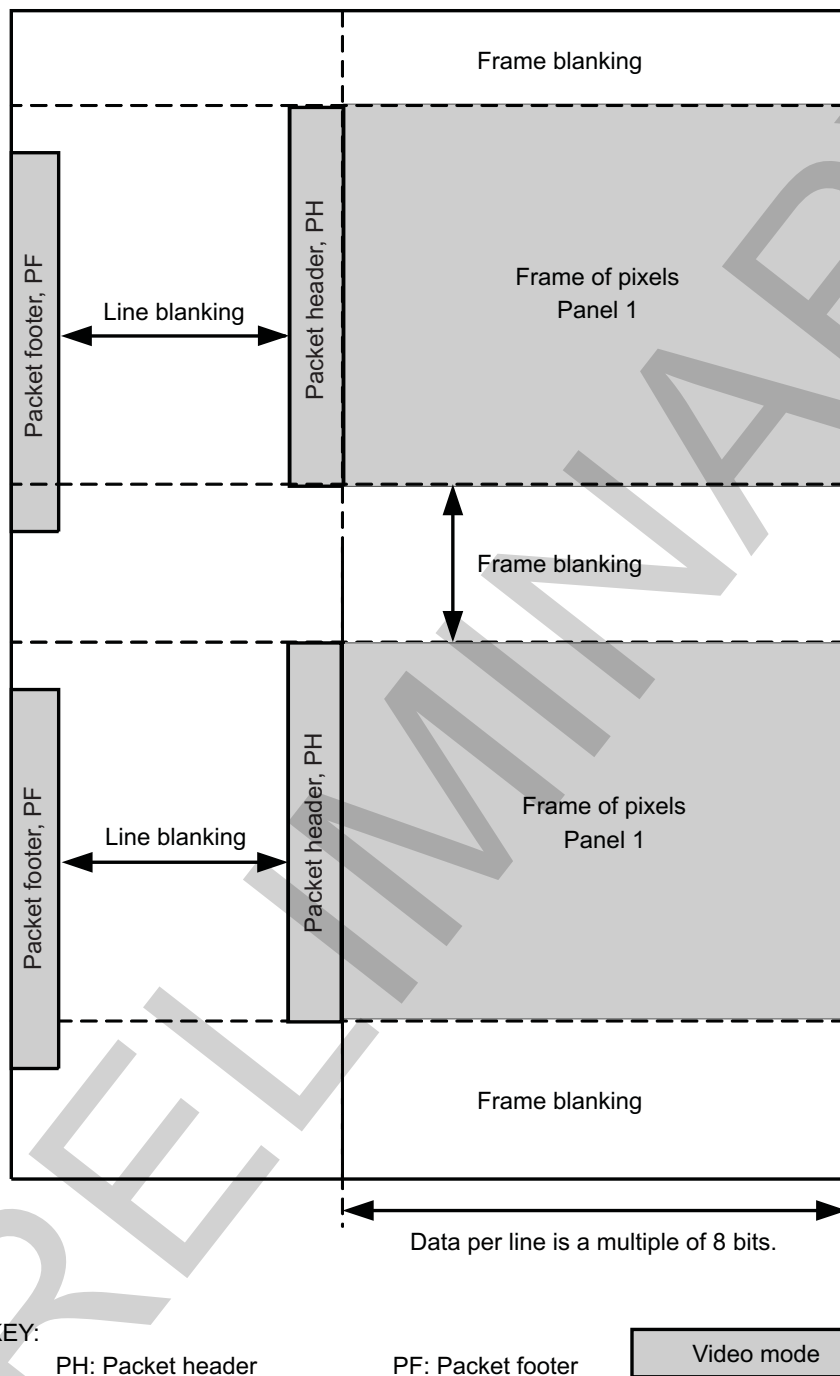

In [Figure 10-104](#) and [Figure 10-105](#), if HSYNC end short packet is not generated (HSA does not exist), HBP must not be 0.

10.3.2.2.6 Frame Structures

NOTE: The figures in this section show only pixel packets and blanking periods; they do not show synchronization packets.

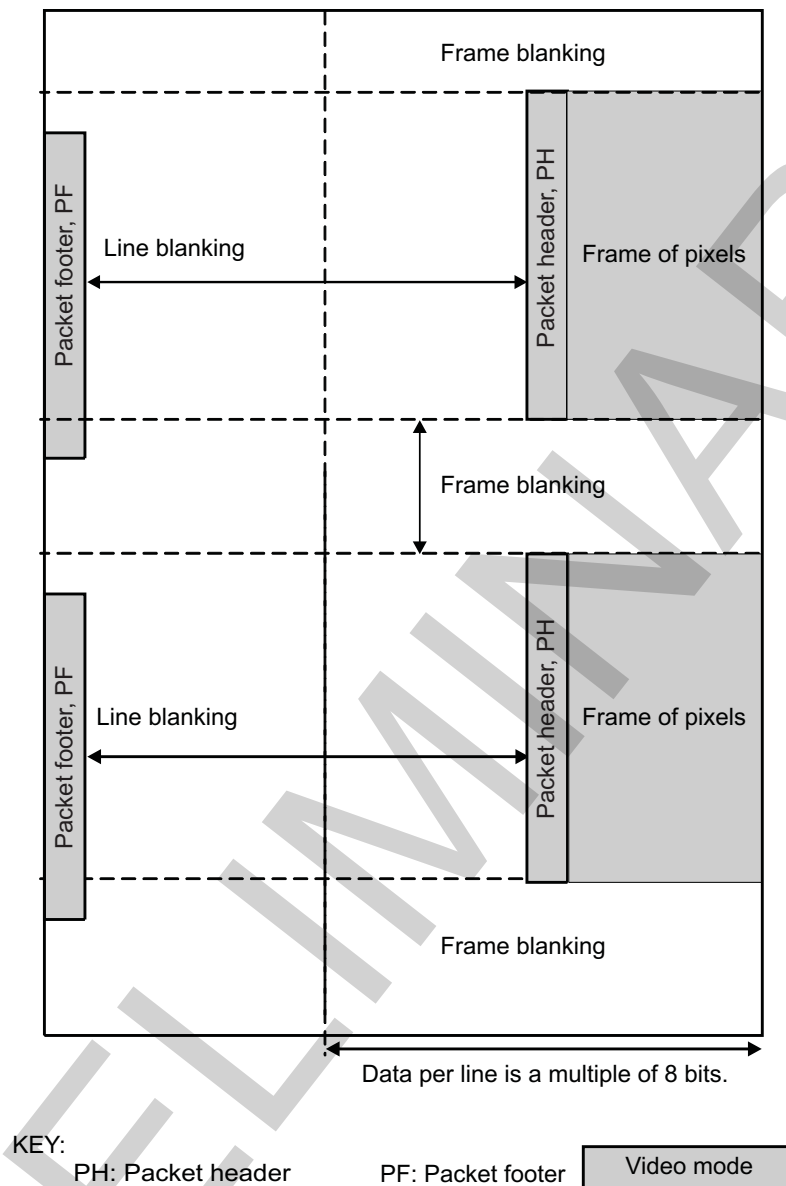

[Figure 10-106](#) shows the DSI general frame structure.

dsi-014

10.3.2.2.7 VCs

The DSI protocol layer transports VCs. VCs separate different data flows, which are interleaved in the same data stream. Each VC is identified by a unique channel identification number in the PH. The channel identification number is encoded in 2 bits. The DSI protocol engine determines the channel identifier number to be used for generating the PH and multiplexes the interleaved data streams. The DSI protocol engine supports multiple (up to 4) concurrent VCs. [Table 10-477](#) summarizes the VC values used for each channel.

Table 10-477. VC Values

| VC Number | Value |
|-----------|-------|
| VC 0 | 0x0 |
| VC 1 | 0x1 |
| VC 2 | 0x2 |
| VC 3 | 0x3 |

If multiple displays are connected to a single DSI port on the host, a hub can be used to route the data stream to the appropriate display based on the VC ID. Typically, VC ID 0x0 is used for the primary display and 0x1 for the secondary. The hub may have its own VC ID to provide communication capability between the host and the hub.

There is one set of registers for each VC. The attributes of the VC define the following characteristics:

- Transfer mode ([DSI_VC_CTRL_i\[4\]](#) MODE bit):
 - Video mode
 - Command mode
- Data type
- Source ([DSI_VC_CTRL_i\[1\]](#) SOURCE bit)
 - Video port
 - Slave interconnect port
- HS or LP forward transmission
- Automatic BTA generation
 - Short packets ([DSI_VC_CTRL_i\[2\]](#) BTA_SHORT_EN bit)
 - Long packets ([DSI_VC_CTRL_i\[3\]](#) BTA_LONG_EN bit)
- DMA request configurations for RX and TX
 - DMA request number ([DSI_VC_CTRL_i\[29:27\]](#) DMA_RX_REQ_NB bit field for RX FIFO and [DSI_VC_CTRL_i\[23:21\]](#) DMA_TX_REQ_NB bit field for TX FIFO)
 - DMA threshold ([DSI_VC_CTRL_i\[26:24\]](#) DMA_RX_THRESHOLD bit field for RX FIFO and [DSI_VC_CTRL_i\[19:17\]](#) DMA_TX_THRESHOLD bit field for TX FIFO)
- Mode speed ([DSI_VC_CTRL_i\[9\]](#) MODE_SPEED bit)
- ECC transmission ([DSI_VC_CTRL_i\[8\]](#) ECC_TX_EN bit)
- CS transmission ([DSI_VC_CTRL_i\[7\]](#) CS_TX_EN bit)

NOTE: The VC ID is not calculated by the DSI module but is provided while writing into the [DSI_VC_SHORT_PACKET_HEADER_i](#) and [DSI_VC_LONG_PACKET_HEADER_i](#) registers.

10.3.2.3 DSI Multilane Layer

A layer consists of lane splitter logic to split the incoming byte stream into a serial stream. The bits are sent with the LSB first. The number of active lanes is configurable through a register. The order of the lanes is configurable. The number of lanes can be changed only in ULPS or when all data lanes are in STOP state.

10.3.2.3.1 SoT and EoT in Multilane Configurations

Because a HS transmission is composed of an arbitrary number of bytes that may not be an integer multiple of the number of lanes, some lanes may run out of data before others. Therefore, the lane management layer, as it buffers up the final set of less-than-N bytes, deasserts its valid data signal into lanes for which there is no further data. Although all lanes start simultaneously with parallel start-of-transmissions (SoTs), each lane operates independently and may complete the HS transmission before the other lanes, sending an end-of-transmission (EoT) one cycle (byte) earlier.

10.3.2.3.2 Lane Splitter

The lane splitter can split the byte stream into two, three, or four lanes (for one lane, the splitter is bypassed). Figure 10-109 through Figure 10-112 show the byte position in each serial link for one-, two-, three-, and four-data lane configurations. The byte stream always starts from lane 1. It finishes on one of the lanes, depending on the number of bytes to send and the number of lanes. The splitter module is used only when packets are sent using HS mode. In LS mode, only data lane 1 is used.

Figure 10-109. Four-Data Lane Configuration

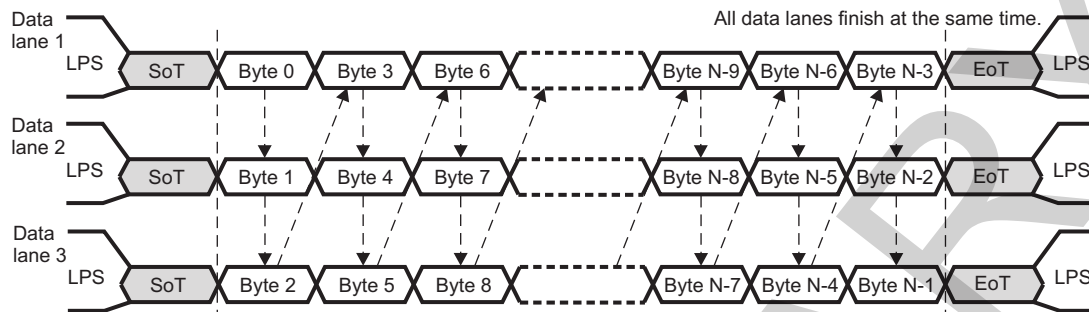

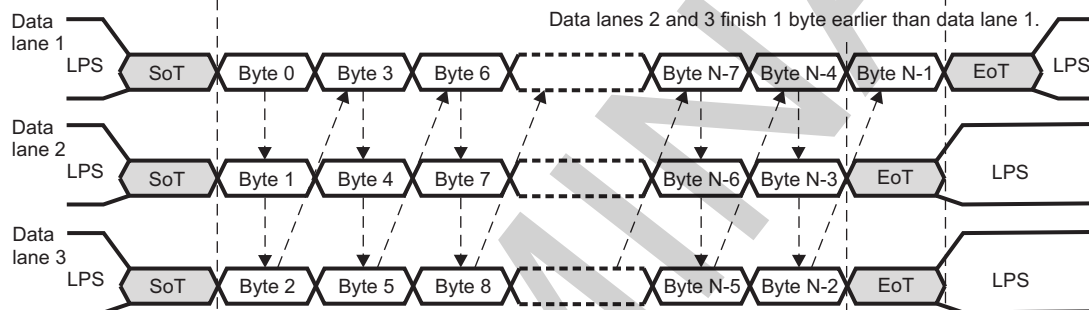

Figure 10-110. Three-Data Lane Configuration

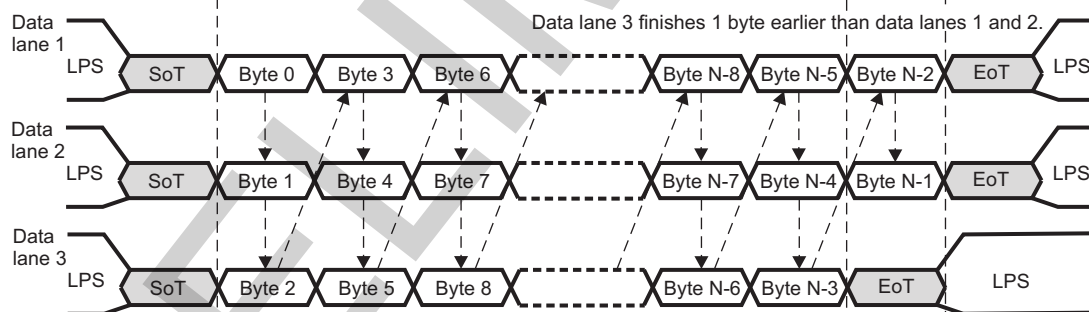

The number of bytes, N, is an integer multiple of the number of lanes.

The number of bytes, N, is not an integer multiple of the number of lanes (Example 1).

The number of bytes, N, is not an integer multiple of the number of lanes (Example 2).

Key:

LPS: Low-power state

SoT: Start of transmission

EoT: End of transmission

ds1-015

Figure 10-111. Two-Data Lane Configuration

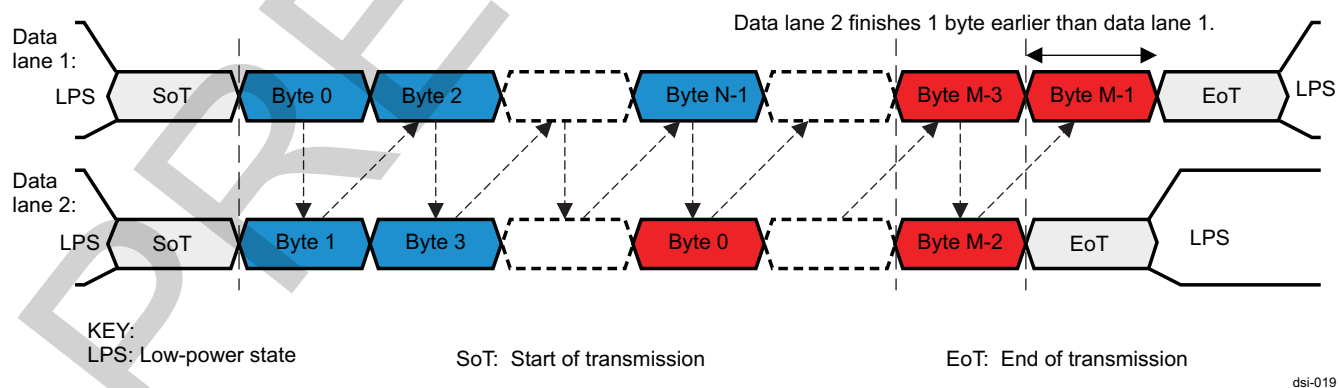

Figure 10-112. One-Data Lane Configuration

For back-to-back packets, the byte stream is considered as a single packet by the splitter module. [Figure 10-113](#) shows an example of two packets sent back-to-back. N bytes are used for the first packet and M bytes for the second packet.

Figure 10-113. Two Packets Using Two-Data Lane Configuration (Example)

10.3.2.4 DSI Pixel Data Formats

This section describes how the DSI-supported pixel data formats in video mode are transmitted over the serial interface. The DSI protocol engine can cope with all data formats if the data line length sent through the DSI physical protocol is a multiple of a pixel. This condition is required for the DSI protocol engine to work properly.

10.3.2.4.1 Pixel Data Formats in Video Mode

The host can send different pixel formats in video mode. [Table 10-478](#) lists the pixel formats supported by the DSI in video mode.

Table 10-478. Pixel Data Format in Video Mode

| Mode | Description |
|---|---------------|
| RGB888 (using 24-bit container) | RGB888 |
| RGB666 (using 24-bit container) | RGB666 |
| RGB666 (18-bit packet using 18-bit container) | RGB666_PACKET |
| RGB565 (using 16-bit container) | RGB565 |

10.3.2.4.2 24 bpp – RGB Color Format, Long Packet (Video Mode)

Figure 10-114 shows the RGB888 format.

Figure 10-114. 24-bpp RGB Color Format, Long Packet (Video Mode)

dsi-020

Packed-pixel stream, 24-bit format is a long packet used to transmit image data formatted as 24-bit pixels to a video-mode display module. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (8 bits), G (8 bits), and B (8 bits), in that order. Each color component occupies 1 byte in the pixel stream; no components are split across byte boundaries. Within a color component, the LSB is sent first and the MSB last.

10.3.2.4.3 24 Bits per Pixel - RGB Color Format, Long Packet (Command Mode)

Figure 10-115 shows the RGB888 format.

Figure 10-115. 24-bpp RGB Color Format, Long Packet (Command Mode)

dsi-021

This format is the same as the packed pixel stream format.

10.3.2.4.4 18 bpp (Loosely Packed) – RGB Color Format, Long Packet (Transparent for DSI Protocol Engine) (Video Mode)

Figure 10-116 shows the RGB666 format.

Figure 10-116. 18-bpp (Loosely Packed) RGB Color Format, Long Packet (Transparent for DSI Protocol Engine) (Video Mode)

dsi-022

In 18-bit loosely packed pixel format, each R, G, and B color component is 6 bits but is shifted to the upper bits of the byte, such that the valid pixel bits occupy bits [7:2] of each byte. Bits [1:0] of each payload byte representing active pixels are ignored. As a result, each pixel requires 3 bytes as it is transmitted across the link. This requires more bandwidth than packed format but requires less shifting and multiplexing logic in the packing and unpacking functions on each end of the link. This format is used to transmit RGB image data formatted as pixels to a video mode display module that displays 18-bit pixels. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (6 bits), G (6 bits), and B (6 bits), in that order. Within a color component, the LSB is sent first and the MSB last.

10.3.2.4.5 18-bpp (Loosely Packed) – RGB Color Format, Long Packet (Command Mode)

Figure 10-117 shows the RGB666 format.

Figure 10-117. 18-bpp (Loosely Packed) RGB Color Format, Long Packet (Command Mode)

dsi-023

This format is the same as the packed-pixel stream format.

10.3.2.4.6 18-bpp (Packed) – RGB Color Format, Long Packet (Video Mode)

Figure 10-118 shows the RGB666_PACKED format.

Figure 10-118. 18-bpp (Packed) RGB Color Format, Long Packet (Video Mode)

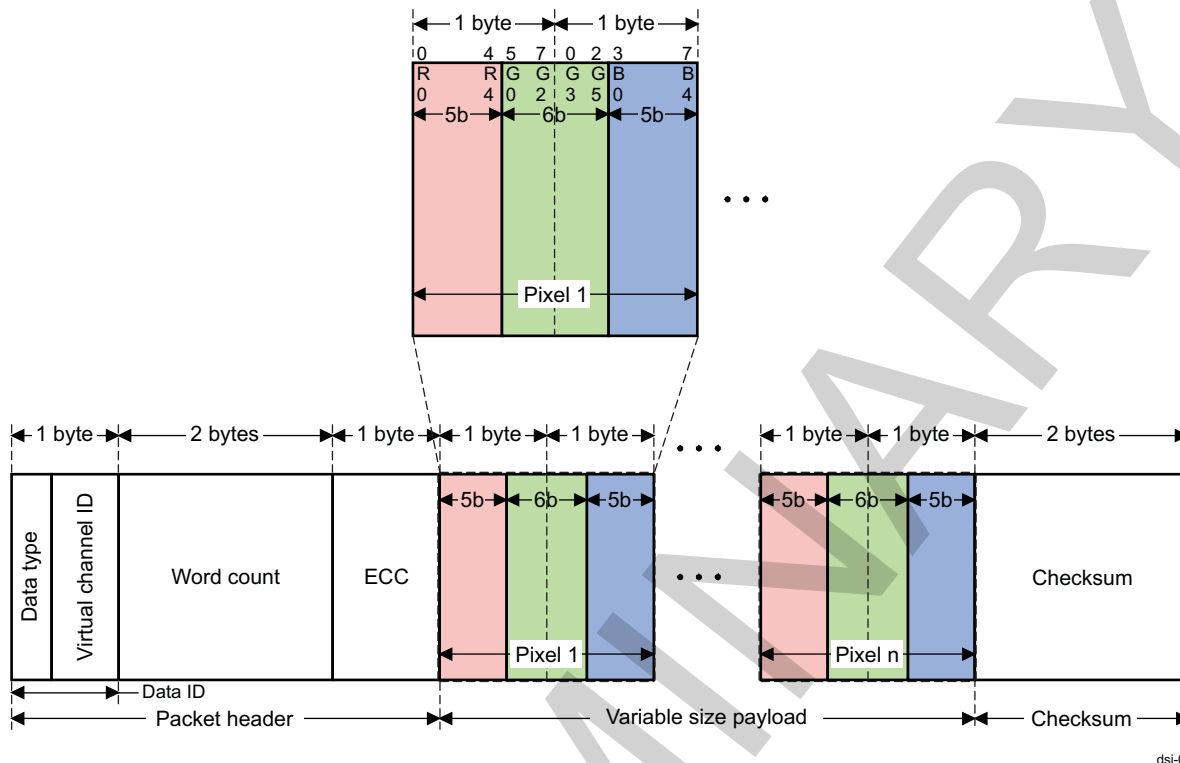

dsi-024

Packed pixel stream 18-bit format is a long packet. It is used to transmit RGB image data formatted as pixels to a video mode display module that displays 18-bit pixels. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (6 bits), G (6 bits), and B (6 bits), in that order. Within a color component, the LSB is sent first and the MSB last. With this format, it is strongly recommended that the total line width be a multiple of 4 pixels (9 bytes). This format is not supported in command mode.

10.3.2.4.7 16 bpp – RGB Color Format, Long Packet (Video Mode)

Figure 10-119 shows the RGB565 format.

Figure 10-119. 16-bpp RGB Color Format, Long Packet (Video Mode)

Packed-pixel stream, 16-bit format is a long packet used to transmit image data formatted as 16-bit pixels to a video mode display module. The packet consists of the data ID byte, a 2-byte WC, an ECC byte, a payload of length WC bytes, and a 2-byte checksum. The pixel format is R (5 bits), G (6 bits; split across 2 bytes), and B (5 bits), in that order. Within a color component, the LSB is sent first and the MSB last.

10.3.2.4.8 16 bpp – RGB Color Format, Long Packet (Command Mode)

Figure 10-120 shows the RGB565 format.

Figure 10-120. 16-bpp RGB Color Format, Long Packet (Command Mode)

dsi-026

This is the opposite byte order from the packed pixel stream format. To retain flexibility, the byte order is made programmable using [DSI_VC_CTRL_i\[12\] RGB565_ORDER](#) bit, with this order the default for command mode through the video port.

10.3.3 DSI Integration

This section describes the integration of the DSI in the device, including information about clocks, resets, and hardware requests.

Figure 10-121 shows the integration of the DSI in the device.

Figure 10-121. DSI Integration

dsi-027

NOTE: For more information about the wake-up request, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 10-479 through Table 10-482 summarize the integration of the DSI module in the device.

Table 10-479. Integration Attributes

| Module Instance | Attributes | |
|-----------------|--------------|---|
| | Power Domain | Interconnect |
| MIPI DSI1 | PD_DSS | L3 for data L4_PER for configuration |
| MIPI DSI2 | PD_DSS | L3 for data L4_PER for configuration |

NOTE: L3 interconnect is used primarily for data.

L4_PER interconnect is used primarily for configuration but is also used for backward software compatibility.

Table 10-480. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|-----------------------|-------------------------|-----------------------------------|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| | SYS_CLK | DSS_ALWON_SYS_CLK | PRCM module | Functional clock for the DSI PLLs |
| MIPI DSI1 | DSI1_FCLK | DSS_FCLK PLL1_CLK2 | PRCM module DSI1 PLL | Functional clock |
| | DSI1_ICLK | DSS_L3_ICLK | PRCM module | Interface clock |
| MIPI DSI2 | DSI2_FCLK | DSS_FCLK PLL2_CLK2 | PRCM module DSI2 PLL | Functional clock |
| | DSI2_ICLK | DSS_L3_ICLK | PRCM module | Interface clock |
| Resets | | | | |
| MIPI DSI1 | DSI1_RST | DISPSS_RST | PRCM module | Nonretention reset |
| MIPI DSI2 | DSI2_RST | DISPSS_RST | PRCM module | Nonretention reset |

NOTE: If video mode is used, the VPn_PCLK and VPn_CLK clocks must be generated using a CLKIN4DDR clock.

NOTE: For information about clock distribution and configuration inside the module, see [Section 10.3.4.2, DSI Clock Configuration](#).

Table 10-481. Interrupt Requests

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|----------------|--------------------------------|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| MIPI DSI1 | DSS_DSI1_IRQ | D_IRQ_95 | DSP INTC | Display DSI1 interrupt request |
| | DSS_DSI1_IRQ | MA_IRQ_53 | Cortex-A9 INTC | Display DSI1 interrupt request |
| | DSS_DSI1_IRQ | MM_IRQ_8 | Cortex-M3 INTC | Display DSI1 interrupt request |
| MIPI DSI2 | DSS_DSI2_IRQ | D_IRQ_96 | DSP INTC | Display DSI2 interrupt request |
| | DSS_DSI2_IRQ | MA_IRQ_84 | Cortex-A9 INTC | Display DSI2 interrupt request |
| | DSS_DSI2_IRQ | MM_IRQ_9 | Cortex-M3 INTC | Display DSI2 interrupt request |

NOTE: For a description of the interrupt source, see [Section 10.3.4.3, DSI Interrupt Requests](#).

Table 10-482. DMA Requests

| DMA Requests | | | | |
|-----------------|--------------------|-------------------------|-------------|--------------------|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| MIPI DSI1 | DSS_DSI1_DMA0 | S_DMA_71 | sDMA | DSI1 DMA request 0 |
| | DSS_DSI1_DMA1 | S_DMA_72 | sDMA | DSI1 DMA request 1 |

10.3.4 DSI Functional Description

This section describes the functions of the DSI1 and DSI2 modules.

10.3.4.1 DSI Block Diagram

Figure 10-122 is a schematic of DSI1 and DSI2.

Figure 10-122. DSI Schematic

10.3.4.2 DSI Clock Configuration

Figure 10-123 shows the clock tree for DSI1 and DSI2.

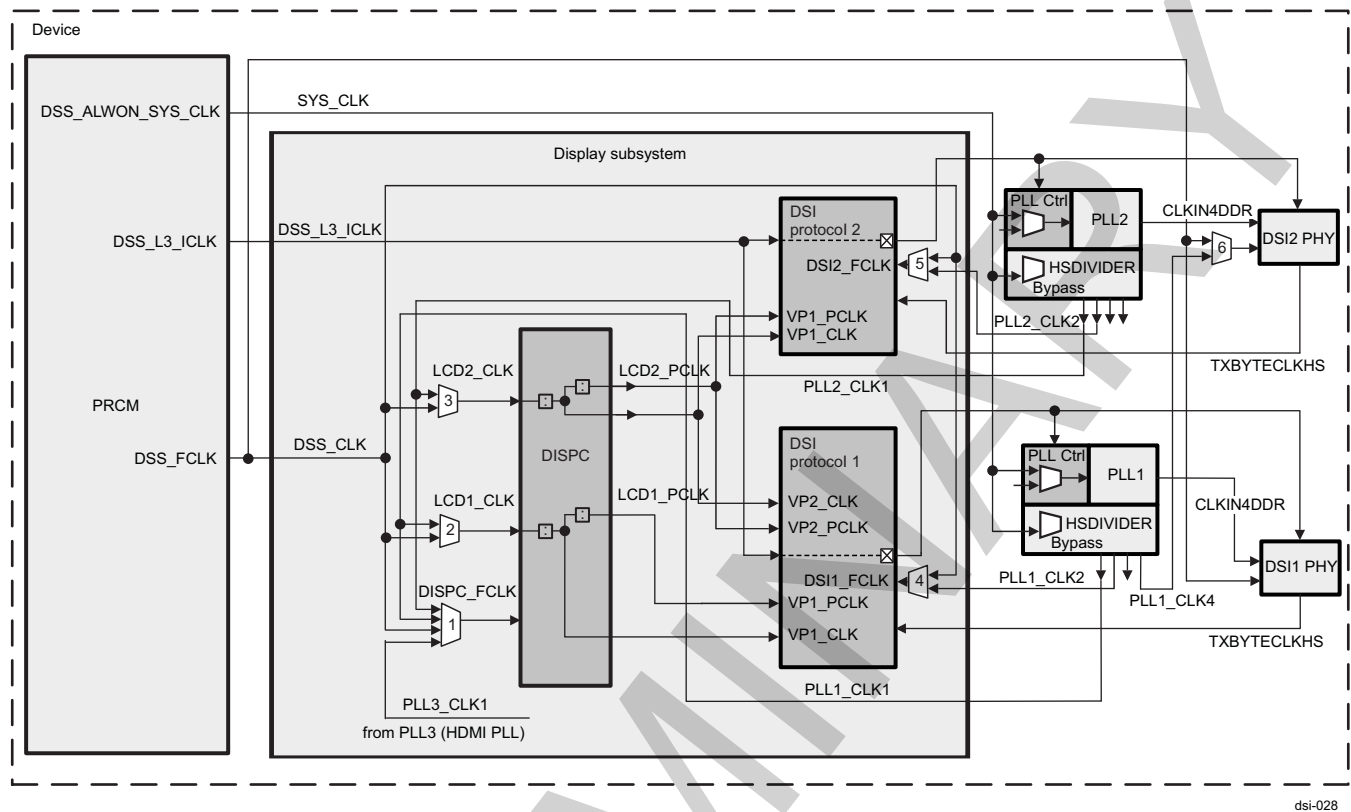

Figure 10-123. DSI Clock Tree

Table 10-483 shows the controls for clock multiplexers.

Table 10-483. DSI Multiplexer Controls

| Destination | Source Signal Name | Source | Multiplexer Number | DSS Register Bit Field |
|---|--------------------|-----------------|--------------------|---|
| DISPC functional clock (DISPC_FCLK) | DSS_CLK | DPLL_PER (PRCM) | 1 | For more information, see Section 10.1.2 , <i>DSS Integration</i> . |
| | PLL1_CLK1 | PLL1 | 1 | |
| | PLL2_CLK1 | PLL2 | 1 | |
| | PLL3_CLK1 | PLL3 | 1 | |
| DSI1 functional clock (LCD1_CLK) | DSS_CLK | DPLL_PER (PRCM) | 2 | For more information, see Section 10.1.2 , <i>DSS Integration</i> . |
| | PLL1_CLK1 | PLL1 | 2 | |
| DSI2 functional clock (LCD2_CLK) | DSS_CLK | DPLL_PER (PRCM) | 3 | For more information, see Section 10.1.2 , <i>DSS Integration</i> . |
| | PLL2_CLK1 | PLL2 | 3 | |
| DSI1 protocol engine functional clock (DSI1_FCLK) | DSS_CLK | DPLL_PER (PRCM) | 4 | For more information, see Section 10.1.2 , <i>DSS Integration</i> . |
| | PLL1_CLK2 | PLL1 | 4 | |
| DSI2 protocol engine functional clock (DSI2_FCLK) | DSS_CLK | DPLL_PER (PRCM) | 5 | For more information, see Section 10.1.2 , <i>DSS Integration</i> . |
| | PLL2_CLK2 | PLL2 | 5 | |

NOTE: For more information about the DSI1 and DSI2 video port clocks (VPn_CLK and VPn_PCLK, where n = 1 or 2), see [Section 10.3.4.4.5, Video Port Interface](#).

NOTE: For the frequency ratings of the various DSI clocks, see [Section 10.1.2.1, DSS Clocks](#).

NOTE: Multiplexer 6, shown in [Figure 10-123](#), allows the DSS_FCLK or PLL1_CLK4 clock to be sent on DSI2 PHY bypass input. The use of the bypassed clock allows both DSI modules to run on DSS_FCLK or on a single PLL (DSI1 PLL).

- To select the clock source for the DSI2 PHY bypass input, configure the CONTROL.CONTROL_DSS_CONTROL[0] DSS_MUX6_SELECT bit in the device control module. See [Chapter 19, Control Module](#).
- To enable the bypass input for the DSI1 PHY or DSI2 PHY module, set the DSI_PLL_CONFIGURATION2[15] BYPASSEN bit to 1.

10.3.4.3 DSI Interrupt Requests

The DSI protocol engine requires a single interrupt line. The [DSI_IRQSTATUS](#) register indicates the general interrupt events. Each VC and complex I/O has a dedicated interrupt register: [DSI_VC_IRQSTATUS_i](#) and [DSI_COMPLEXIO_IRQSTATUS](#), respectively.

[Table 10-484](#) lists the DSI global interrupt events.

Table 10-484. DSI Global Interrupts

| IRQ Name | Description |
|-----------------------|--|
| Resynchronization_IRQ | Resynchronization in video mode |
| TA_TO_IRQ | Turnaround timer expired |
| SYNC_LOST_IRQ | Synchronization with video port is lost (video mode only). |
| ACK_TRIGGER_IRQ | Acknowledge trigger is received. |
| TE_TRIGGER_IRQ | TE PHY trigger is received. |
| WAKEUP_IRQ | Occurs when the SWakeUp signal is asserted. |
| HS_TX_TO_IRQ | HS TX time-out Interrupt |
| LP_RX_TO_IRQ | LS RX time-out Interrupt |
| COMPLEXIO_ERR_IRQ | Error signaling from complex I/O: The interrupt is triggered when an error is received from the complex I/O (events are defined in DSI_COMPLEXIO_IRQSTATUS). |
| PLL_RECAL_IRQ | PLL recalibration event (assertion of DSIRecal signal from the DSI PLL control module) |
| PLL_UNLOCK_IRQ | PLL un-lock event (deassertion of DSILock signal from the DSI PLL control module) |
| PLL_LOCK_IRQ | PLL lock event (assertion of DSILock signal from the DSI PLL control module) |
| VIRTUAL_CHANNEL3_IRQ | VC 3 error signaling from DSI VC 3: The interrupt is triggered when an error is received from DSI VC 3 (events are defined in DSI_VC_IRQENABLE_i register, where i = 3). |
| VIRTUAL_CHANNEL2_IRQ | VC 2 error signaling from DSI VC 2: The interrupt is triggered when an error is received from DSI VC 2 (events are defined in DSI_VC_IRQENABLE_i register, where i = 2). |
| VIRTUAL_CHANNEL1_IRQ | VC 1 error signaling from DSI VC 1: The interrupt is triggered when an error is received from DSI VC 1 (events are defined in DSI_VC_IRQENABLE_i register, where i = 1). |
| VIRTUAL_CHANNEL0_IRQ | VC 0 error signaling from DSI VC 0: The interrupt is triggered when an error is received from DSI VC 0 (events are defined in DSI_VC_IRQENABLE_i register, where i = 0). |
| TE0_LINE_IRQ | TE detected on TE0 CMOS input signal |
| TE1_LINE_IRQ | TE detected on TE1 CMOS input signal |

Table 10-485. Register Access Width Limitations

| Register Name | Register Access Width |
|--|-----------------------|
| All DSI complex I/O registers (DSI_PHY SCP) | 32-bit only |
| All DSI PLL control module registers | 32-bit only |
| DSI_VC_LONG_PACKET_HEADER_i | 32-bit only |
| DSI_VC_SHORT_PACKET_HEADER_i | 32-bit only |
| DSI_VC_LONG_PACKET_PAYLOAD_i | 16- and 32-bit |
| All other DSI protocol engine registers | 8-, 16-, and 32-bit |

CAUTION

If a different access width than listed in [Table 10-485](#) is used, an interface error is generated in response to the write using SResp = ERR.

The DSI protocol engine is globally controlled by the [DSI_CTRL](#) register. The interface to the complex I/O is enabled by setting the [DSI_CTRL\[0\] IF_EN](#) bit. When the interface is disabled, it is possible to provide data to the TX FIFO and read pending data in the RX FIFO. When the [DSI_CTRL\[0\] IF_EN](#) bit is set to 1, the pending packets are sent to the DSI complex I/O, and the data transfer from the video port is ignored until the first vertical sync event is received.

When the [DSI_CTRL\[0\] IF_EN](#) bit is reset by software, the DSI protocol engine must finish the transfer of the pending data in the TX FIFO and wait for a response if BTA has been sent (the protocol engine is in receive mode); hardware then resets the [DSI_CTRL\[0\] IF_EN](#) bit. When using video mode, the VC associated with the video port must be enabled before enabling the interface according to the following sequence:

1. The [DSI_CTRL\[0\] IF_EN](#) bit is equal to 0.
2. Enable the VC associated with video mode by setting the [DSI_VC_CTRL_i\[0\] VC_EN](#) bit.
3. Set the [DSI_CTRL\[0\] IF_EN](#) bit to 1.

10.3.4.4.3 DSI Transfer Modes

Two main transfer modes are supported by the DSI modules:

- Video mode: Pixels are received from the video port (VP1 or VP2.) There are some real-time constraints (pixels must be sent at the pixel frequency required by the panel module).
- Command mode: Pixels can be received from the video port or from the L3 interconnect slave port. There are no real-time constraints except that the TE must be avoided by starting the transfer at the correct time during the scan of the display and that it must be fast enough.

10.3.4.4.3.1 Video Mode

Video mode refers to the MIPI display pixel interface (DPI) standard. The sync events and pixels must be sent according to the display mode timings. Data is received from the video ports. The DISPC fetches the data from the system memory and provides it to the DSI protocol engine through VP1 or VP2. The short packets used for the sync event use precalculated 32-bit values. The long packets are constructed using the header defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) registers. In case of synchronization short packets for video mode, because hardware generates short packets without using the [DSI_VC_SHORT_PACKET_HEADER_i](#) register, if the [DSI_VC_CTRL_i\[8\] ECC_TX_EN](#) bit is set, the ECC is calculated; otherwise, 0 is used. The feature is used to generate incorrect ECC for debug purpose and to ease the check of the link and peripheral error detection and correction.

The [DSI_VM_TIMING1](#) through [DSI_VM_TIMING8](#) registers define the timings of the video mode.

The [DSI_VM_TIMING2\[27:24\] WINDOW_SYNC](#) bit field defines the synchronization period. The recommended value is 0x4 based on the implementation of the resynchronization scheme.

The [DSI_CTRL\[20\] BLANKING_MODE](#) bit defines whether long blanking packets or LPS are used during the blanking periods (except HFP, HBP, and HSA defined by other bits) when there is no pending data in TX FIFO ready to be sent. Software must ensure that there is no data in the TX FIFO, no BTA, no RESET trigger sent, and the [DSI_VC_CTRL_i\[9\] MODE_SPEED](#) bit is set to 1 (HS mode) to keep the video mode transfer in HS mode during blanking periods (except for the last blanking period, because it is required to go to LPS at least once per frame).

The [DSI_CTRL\[21\] HFP_BLANKING_MODE](#), [DSI_CTRL\[22\] HBP_BLANKING_MODE](#), and [DSI_CTRL\[23\] HSA_BLANKING_MODE](#) bits define whether during these blanking packets data from TX FIFO or long blanking packets are sent.

To ensure that the writes to the [DSI_VC_LONG_PACKET_HEADER_i](#) register are handled correctly as header information for video mode long packets, the following registers must be programmed:

- [DSI_VC_CTRL_i\[0\] VC_EN](#) bit set to 0
- [DSI_VC_CTRL_i\[4\] MODE](#) bit set to 1
- [DSI_VC_LONG_PACKET_HEADER_i](#) register access
- [DSI_VC_CTRL_i\[0\] VC_EN](#) bit set to 1

NOTE: The hardware ignores [DSI_VC_CTRL_i\[1\] SOURCE](#) and [DSI_VC_CTRL_i\[9\] MODE_SPEED](#) bits when video mode is selected (the [DSI_VC_CTRL_i\[4\] MODE](#) bit set to 1).

The [SYNC_LOST_IRQ](#) and [RESYNCHRONIZATION_IRQ](#) interrupt events indicate whether the DSI protocol engine has not been able to resynchronize the video port timing to its own timing base or if it has been done. The [RESYNCHRONIZATION_IRQ](#) indicates to the software user that the video port works but the configuration of the timings for the DISPC and for DSI protocol engine may need to be modified to avoid the resynchronization. The [SYNC_LOST_IRQ](#) and [RESYNCHRONIZATION_IRQ](#) events can be respectively monitored in [DSI_IRQSTATUS\[18\] SYNC_LOST_IRQ](#) and [DSI_IRQSTATUS\[5\] RESYNCHRONIZATION_IRQ](#) status bits.

10.3.4.4.3.2 Command Mode

The command mode refers to the MIPI display command set (DCS) standard. The commands, parameters, and pixels are sent to the display module with limited real-time constraints (as defined in [Section 10.3.4.4.3.1, Video Mode](#)). The pixels can be provided on one of the two video ports by the DISPC or on the L3 interconnect slave port.

The [DSI_VC_LONG_PACKET_HEADER_i](#) registers are used for the header of long packets; the [DSI_VC_SHORT_PACKET_HEADER_i](#) registers are used for the short packets.

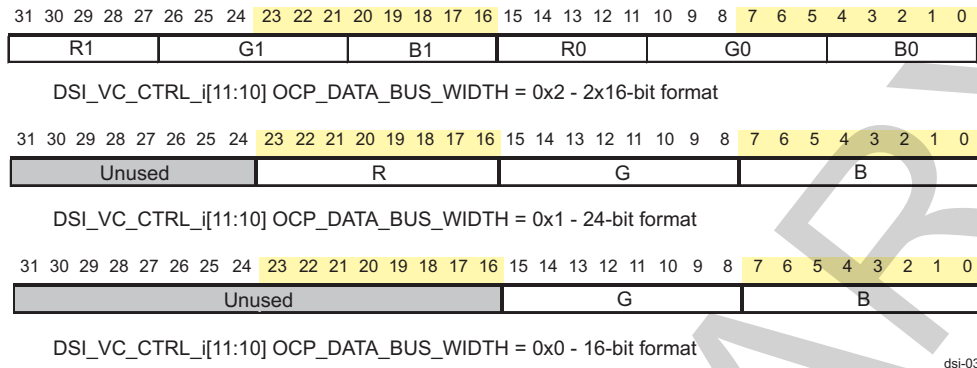

For the payload, the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register is used. Each 32-bit payload data is written to the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register from the MPU subsystem or sDMA. It is buffered to send packets with higher rate than the L3 interconnect frequency can provide. If [DSI_VC_CTRL_i\[30\] DCS_CMD_ENABLE](#) = 1, the word count defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register is used to determine the number of bytes to be sent using the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register minus the size of the DCS command header added by the protocol engine at the beginning of the payload (also sent using the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register). If [DSI_VC_CTRL_i\[30\] DCS_CMD_ENABLE](#) = 0, the word count defined in the register [DSI_VC_LONG_PACKET_HEADER_i](#) register is used to determine the number of bytes to be sent using the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register.

The [DSI_VC_CTRL_i\[11:10\] OCP_DATA_BUS_WIDTH](#) bit field is used to define the size of the data on the L3 interconnect slave port for the write access (read access to the RX FIFO is not affected by the bit field value):

- 0x0: 16-bit data width (LSB of the 32-bit interface port data bus)
- 0x1: 24-bit data width (LSB of the 32-bit interface port data bus)
- 0x2: 2x16-bit data width (first pixel on the LSB of the 32-bit Interface port data bus and second pixel on the MSB of the 32-bit interface port data bus for the same interface access)
- 0x3: 32-bit data width (no bit, no byte, no pixel manipulation)

Figure 10-125 shows the different data width configurations of the L3 interconnect slave port.

Figure 10-125. Interface Data Configuration

NOTE: To provide 18-bit pixel loosely packed format to the L3 interconnect slave port, the [DSI_VC_CTRL_i\[11:10\] OCP_DATA_BUS_WIDTH](#) bit field must be set to 0x1. The 18-bit pixel packed format is not supported in case of command mode on the L3 interconnect slave port.

The write into the [DSI_VC_LONG_PACKET_HEADER_i](#) register is required before accessing the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register. The DSI protocol engine must extract the length of the payload and discard the extra data sent using the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register. Writes into the [DSI_VC_LONG_PACKET_HEADER_i](#) register are valid only if the VC is enabled; otherwise, the write is ignored. When receiving pixels on the video port, only the [DSI_VC_LONG_PACKET_HEADER_i](#) register is used. The video port pixels are used for the payload.

10.3.4.4.3.2.1 Command Mode TX FIFO

The single TX FIFO is used to store data from the L3 interconnect before sending it to the panel. The configuration of the FIFO for a specific VC must be done only when the VC is disabled.

The VC must not be enabled when data is still pending in the TX FIFO for the corresponding space allocated for the VC from the previous active period. When the VC space in the TX FIFO is empty, the VC can be enabled.

For each VC, two dedicated registers ([DSI_VC_LONG_PACKET_HEADER_i](#) and [DSI_VC_LONG_PACKET_PAYLOAD_i](#)) are used to provide data for long packets. The [DSI_VC_SHORT_PACKET_HEADER_i](#) register is used to provide data for short packets (32 bits long).

For each long packet, the [DSI_VC_LONG_PACKET_HEADER_i](#) register must be written first, and then the [DSI_VC_LONG_PACKET_PAYLOAD_i](#) register. The only exception is when the word count defined in the header equals 0. In that case, it is not required to write into the payload register. For consecutive long packets, the header must be written into the [DSI_VC_LONG_PACKET_HEADER_i](#) register even if the value remains the same.

The TX FIFO stores all the pending bytes to be sent to the peripheral(s). Multiple receivers can be addressed using the VC capability.

The 32-bit write requests for each VC to the TX FIFO are kept in order while sending the data to the DSI_PHY inside the VC requests. The only exception is the last 32-bit write for the last bytes of the payload data, because it can be 1, 2, 3, or 4 bytes.

When the last transfer is a 32-bit write, but the number of valid bytes is only 1, 2, or 3 (calculated using the header word count and the number of bytes are received for the payload), hardware stores the 32-bit value into the TX FIFO but the invalid bytes are not sent and are discarded.

When the word count defined in the [DSI_VC_LONG_PACKET_HEADER_i](#) register is not a multiple of the request threshold value defined in the [DSI_VC_CTRL_i\[19:17\] DMA_TX_THRESHOLD](#) bit field, 32-bit requests and/or bytes are discarded by hardware to store in FIFO only the exact number of valid bytes.

The triggering event to send data to the DSI link is one of the following events:

- All bytes have been received in the FIFO (header + payload).
- The space of the FIFO allocated for the VC is full.
- The space of the FIFO allocated for the VC is not enough to request more data using DMA request (the threshold value is bigger than the space left in the TX FIFO for the VC).
- When the VC is disabled, the remaining bytes in the FIFO are sent to the DSI link.

NOTE: In case video mode is active, the blanking period must be large enough to allow the transfer of the packet(s).

Sequential arbitration must be set ([DSI_CTRL\[3\]](#) bit TX_FIFO_ARBITRATION = 0x1) if only one VC is used to send multiple packets during the same blanking period.

When consecutive packets should be sent in HS mode, to ensure that there is no LP transition between them, at least one of the following conditions must be valid:

- Packets from the same VC
- Short packets or long packets with a payload size multiple of 4 bytes

To stop a transfer immediately when packets are being transferred from the TX FIFO to DSI_PHY, a flush of the FIFO is necessary. It can be required in a dead-lock situation to flush the FIFO even if bytes are still in the FIFO. In that case, it is necessary to ensure having a known state of the whole DSI protocol engine module (software reset may be required) to start of new transfer through the TX FIFO.

To flush the FIFO (discard the data) for some pending bytes:

1. Change the size of the space of FIFO to 0 by writing [DSI_TX_FIFO_VC_SIZE](#) [VCi_FIFO_SIZE](#) bit fields (where i is the VC number from 0 to 3).
2. Disable the VC by resetting the [DSI_VC_CTRL_i\[0\]](#) VC_EN bit to 0.
3. Wait for [DSI_VC_CTRL_i\[15\]](#) VC_BUSY = 0 (VC_BUSY is set to 0 after TX FIFO flush is done).

It is necessary to check that there is no pending request before changing the size of the allocated FIFO for the VC by reading the relevant [DSI_VC_CTRL_i\[15\]](#) VC_BUSY bit or by using the interrupt PACKET_SENT_IRQ. This interrupt is monitored by reading the [DSI_VC_IRQSTATUS_i\[2\]](#) PACKET_SENT_IRQ status bit.

The [DSI_CTRL\[3\]](#) TX_FIFO_ARBITRATION bit defines the arbitration scheme:

- Round-robin between enabled VCs with pending ready requests (that is, all bytes for the packets are in the FIFO or the space of the FIFO for the VC is full) starting from the VC that has the lowest VC ID number.
- Sequential: All the pending ready requests for one VC are sent before moving to another VC. The condition of "space of the FIFO is full" is evaluated after the end of each packet.

To use in-order for all requests for all channels, a single VC must be used. (The VC ID defined in the header provided to hardware using the [DSI_VC_LONG_PACKET_HEADER_i](#) or [DSI_VC_SHORT_PACKET_HEADER_i](#) register is not used and not modified by the DSI protocol engine.)

The [DSI_TX_FIFO_VC_SIZE](#) register defines the allocated number of 33-bit values for each VC in the TX FIFO and the start address for each VC. The size of the space allocated in the TX FIFO is defined by the [DSI_TX_FIFO_VC_SIZE](#) register - [VCi_FIFO_SIZE](#) bit fields. It must be a multiple of the threshold defined in the [DSI_VC_CTRL_i\[19:17\]](#) DMA_TX_THRESHOLD bit field. To change the size of the space of the memory allocated for a specific VC, the VC must be disabled by setting the [DSI_VC_CTRL_i\[0\]](#) VC_EN bit to 0. The whole FIFO cannot be used by all the VCs at the same time because a VC can be disabled to change one or multiple parameters. Software users must configure the start address and size for each VC correctly.

[Table 10-486](#) lists the corresponding values for the size of the space allocated in the FIFO.

Table 10-486. VC TX FIFO Size Values

| DSI_TX_FIFO_VC_SIZE.VCi_FIFO_SIZE (where i = 0, 3) | Space Size (up to the Size of the FIFO) |
|--|---|
| 0 | 0 x 33 bits |
| 1 | 32 x 33 bits |
| 2 | 64 x 33 bits |
| 3 | 96 x 33 bits |
| 4 | 128 x 33 bits |

NOTE: TX FIFO is 128 x 33 bits. Therefore, the sum of all VC FIFO allocations cannot exceed 128 x 33 bits.

CAUTION

Bit 32 of each location in the FIFO is used by the DSI protocol engine to tag the data in the TX FIFO. It is for internal use only.

Table 10-487 lists the start address of the space in the FIFO.

Table 10-487. VC TX FIFO Start Address

| DSI_TX_FIFO_VC_SIZE.VCx_FIFO_ADD (where x = 0, 2) | Start Address |
|---|---------------|
| 0 | 0 |
| 1 | 32 |
| 2 | 64 |
| 3 | 96 |
| 4 | 128 |

CAUTION

The different VC spaces must not overlap.

When the TX FIFO is full:

- The overflow interrupt (FIFO_TX_OVF_IRQ) is generated in the [DSI_VC_IRQSTATUS_i\[3\]](#) FIFO_TX_OVF_IRQ status bit.
- There is no L3 interconnect error generated.
- The interface commands are accepted but the data are not written into the FIFO.

To ensure that all writes are stored correctly in the TX FIFO, the FIFO must not be full. The room in the space allocated for the VC in the TX FIFO is given in the [DSI_TX_FIFO_VC_EMPTYNESS](#) register. When there is no space allocated in the TX FIFO for the VC, the [DSI_TX_FIFO_VC_EMPTYNESS](#) register indicates a value of 0 for the VC space emptiness.

While waiting to receive the first VSYNC event on the video port to start video mode on the DSI link, no command data from TX FIFO is sent on the interface. This is required to ensure that, when receiving the VSYNC event, there is no ongoing command mode transfer that could delay the start of video mode on the the DSI link.

10.3.4.4.3.2.2 Command Mode RX FIFO

The RX FIFO stores the data received from the DSI complex I/O. The data are always packed in the RX FIFO (single or multiple packets received during single or multiple BTA periods).

The read requests (single or burst) can be less than, equal to, or greater than the packet size. If the packet size is smaller than the read request, the following packet(s) is also transferred. If the packet size is longer than the read request, only part of the packet is transferred. In that case, the logic keeps the VC information to provide the rest of the data during the next read request(s).

The [DSI_RX_FIFO_VC_SIZE](#) register defines the allocated number of 33-bit values for each VC in the RX FIFO and the start address for each VC. Only the enabled VCs are considered.

To change the size of the memory space allocated for a specific VC, the VC must be disabled by resetting the [DSI_VC_CTRL_i\[0\]](#) VC_EN bit to 0. The entire FIFO cannot be used by the entire VC at the same time because a VC can be disabled to change one or multiple parameters. Software users must configure the start address and size for each VC correctly.

Table 10-488 lists the corresponding values for the size of the space allocated in the FIFO:

Table 10-488. VC RX FIFO Size Values

| DSI_RX_FIFO_VC_SIZE .VCi_FIFO_SIZE (where i = 0, 3) | Space Size (up to the size of the FIFO) |
|---|---|
| 0 | 0 x 33 bits |
| 1 | 32 x 33 bits |
| 2 | 64 x 33 bits |
| 3 | 96 x 33 bits |
| 4 | 128 x 33 bits |

NOTE: RX FIFO is 128 x 33 bits. Therefore, the sum of all VC FIFO allocations cannot exceed 128 x 33 bits.

CAUTION

Bit 32 of each location in the FIFO is used by the DSI protocol engine to tag the data in the RX FIFO. It is for internal use only.

Table 10-489 lists the start address of the space in the FIFO.

Table 10-489. VC RX FIFO Start Address

| DSI_RX_FIFO_VC_SIZE .VCx_FIFO_ADD (where x = 0, 2) | Start Address |
|--|---------------|
| 0 | 0 |
| 1 | 32 |
| 2 | 64 |
| 3 | 96 |
| 4 | 128 |

CAUTION

The different VC spaces must not overlap.

While reading the received bytes in the RX FIFO, only the [DSI_VC_SHORT_PACKET_HEADER_i](#) register is used, because hardware does not keep track of the header position for long packets and the start/end of each packet. Software must extract the information from the bytes read from the RX FIFO. There is no specific hardware to track the received bytes in the RX FIFO. The [DSI_VC_LONG_PACKET_HEADER_i](#) and [DSI_VC_LONG_PACKET_PAYLOAD_i](#) registers are not used.

The ECC is used only by the first header when receiving multiple packets during the same LP RX transfer from the peripheral because the DSI protocol engine does not parse the header to identify the length of the packets. In case of multiple packets, the checksum is not enabled because hardware checks the checksum considering a single packet. The ECC in the first header is used to correct and check the header. For the following headers in the same LP RX transfer, hardware does not detect a header and cannot check and/or detect errors in the headers of the packets except for the first packet.

When the RX FIFO is empty:

- No interface error is generated.
- Commands are accepted and the data for the responses are 0s.

10.3.4.4.3.2.3 Command Mode DMA Requests

The DMA requests (DSI_DMA_REQ) are used to allow automatic transfer by the sDMA or MPU (with less efficiency and throughput capability) from the DSI RX FIFO to the system memory and from the system memory to the DSI TX FIFO. Two independent DMA requests for RX FIFO and TX FIFO for the same VC are supported. The read and write accesses can use burst structure.

The thresholds used for requests for the TX FIFO and RX FIFO are programmable through the [DSI_VC_CTRL_i\[19:17\] DMA_TX_THRESHOLD](#) and [DSI_VC_CTRL_i\[26:24\] DMA_RX_THRESHOLD](#) bit fields for TX FIFO and RX FIFO, respectively. DMA requests are asserted on the threshold value. The size of the space allocated in TX FIFO for each VC must be a multiple of the value of the [DSI_VC_CTRL_i\[19:17\] DMA_TX_THRESHOLD](#) bit field.

In the case of TX FIFO, if all the bytes defined by the word count field in the [DSI_VC_LONG_PACKET_HEADER_i](#) register are received, the DMA request is no longer asserted. Even during the last transfer, less than the DMA_TX_THRESHOLD number of bytes are received because the word count is not a multiple of the DMA_TX_THRESHOLD value.

In the case of RX FIFO, while the DMA request is used to transfer the data from the RX FIFO to the system memory, the sDMA must be programmed to read the exact number of received bytes in the FIFO. If users do not know the size of the received bytes, the direct access of the RX FIFO through the [DSI_VC_SHORT_PACKET_HEADER_i](#) register is performed until the [DSI_VC_CTRL_i\[20\] RX_FIFO_NOT_EMPTY](#) bit goes to 0.

The only exception is when the LP data transfer finishes and the threshold value is not reached. In this case, the DMA request is asserted. The drain of the FIFO is supported in that configuration to empty the FIFO even if the number of data received is not a multiple of the threshold value.

The use of each DMA request is programmable by software. The [DSI_VC_CTRL_i\[23:21\] DMA_TX_REQ_NB](#) bit field is dedicated to DMA request numbering for the TX FIFO. The [DSI_VC_CTRL_i\[29:27\] DMA_RX_REQ_NB](#) bit field is dedicated to DMA request numbering for the RX FIFO.

When the DMA request is used to indicate the number of 32-bit values ready in the RX FIFO that BTA has received from the peripheral, which indicates an end of the transfer from the peripheral to the host for a transfer to the system memory, the DMA request that corresponds to the VC ID is generated.

The sDMA transfers the number of 32-bit values defined in the threshold register or the exact number of bytes received from the peripheral (the user must know the number of expected received bytes to program the sDMA correctly). When the sDMA transfers a multiple number of threshold values, the DSI protocol engine sends 0s for the data when there is no more received data in the RX FIFO for the VC. Software users must parse the data and determine the valid bytes.

The size of the DMA transfer can be determined by reading the [DSI_RX_FIFO_VC_FULLNESS](#) register. The BTA interrupt (BTA_IRQ) must be used to know when to read the number of received bytes. The BTA interrupt must be monitored by reading the [DSI_VC_IRQSTATUS_i\[5\] BTA_IRQ](#) status bit. The DMA request must not be enabled until the sDMA is programmed with the correct number of data to read from RX FIFO.

This method must also be used when the RX FIFO space for the VC is expected to overflow because the expected number of data to be received is greater than the space allocated for the VC. Instead, the DMA request is asserted as soon as the threshold is reached or when BTA is received.

When the DMA request is used to indicate the number of 33-bit entries empty in the TX FIFO for a transfer from the system memory, the DMA request corresponding to the VC ID is generated.

NOTE: For the most efficient transfer, the size of the request (read or write, single or burst) must be aligned with the threshold value.

Concurrent access using interlaced requests (read/write) to the TX and RX FIFO is supported for the same VC ID or different VC IDs.

10.3.4.4.3.3 Video + Command Mode

The two modes can be interlaced to send two DSI streams to two types of panels: video or command. The number of concurrent video streams is limited to one. The number of concurrent command mode streams is limited to four when there is no video stream, and three when there is a video stream.

- For DSI1, which has two video ports (see [Section 10.3.4.4.5, Video Port Interface](#)), it is possible to send video or command mode streams from DISPC to DSI1 primary video port (VP1), and a command stream on the secondary VP (VP2) for interleaving. In addition, it is also possible to send concurrently a command mode stream on the L3 Interconnect slave port for interleaving.
- For DSI2, which has one video port, it is possible to send a video stream or a command mode stream from DISPC to DSI2 primary VP (VP1). There is no secondary VP. Interleaving of command mode transfers is only possible through L3 Interconnect slave port.

10.3.4.4.3.4 Burst Mode

Frequency and transparent burst modes are supported:

- Frequency burst mode is used to reduce the HS period by increasing the clock frequency on the DSI link. In some cases, it reduces power consumption on the link. The non-HS period used typically to drive the main panel can be used to send data to the secondary panel or to allow feedback (acknowledge) from the primary and secondary panels. The DSI protocol engine must buffer a full line before sending the HS packets for the line. A double-buffering mechanism is required to send a line while the following one is being received on the video port. For more information about double-buffering, see [Section 10.3.4.4.5.4, Ping-Pong Buffer](#).
- The transparent burst mode is used by increasing the pixel clock frequency generated by the DISPC with an increase of the horizontal blanking period.

10.3.4.4.3.5 Interleaving Mode

Video mode can output command mode packets, which are provided to DSI through the L3 interconnect, during the blanking periods of the video stream sequence on the PPI link. These command mode packets can be programmed as HS packets or low-power packets.

During a video stream sequence on the PPI link, four types of gap exist:

- BLLP gap: Blanking period during VSA, VBP, and VFP lines
- HSA gap: Blanking period during VACT lines; always between HS and HE short packet
- HBP gap: Blanking period during VACT lines; always between HS/HE short packet and data pixel long packet
- HFP gap: Blanking period during VACT lines; always between data pixel long packet and the end of the current VACT line

To perform interleaving in a particular gap, video mode must be set to go into LPS during the blanking gap. Each type of gap has separate configurable register bits that determine whether a blanking long packet will be sent or the link will go into LPS during the gap on the PPI link. If LPS is set during a gap, the DSI module performs interleaving during that period.

Two set of registers are available for:

- HS interleaving (when HS command mode packets must be sent during a video stream on the PPI link)

- Low-power interleaving (when low-power command mode packets must be sent during a video stream on the PPI link)

10.3.4.4.3.5.1 HS Command Mode Interleaving

Figure 10-126 shows the various HS mode scenarios in interleaving mode during a blanking gap. For each type of blanking gap, a dedicated bit field determines the number of TXBYTECLKHS clock cycles used for interleaving in HS command mode packets.

- The [DSI_VM_TIMING6](#)[31:16] BL_HS_INTERLEAVING bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during a BLLP gap.
- The [DSI_VM_TIMING4](#)[7:0] HBP_HS_INTERLEAVING bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during an HBP gap.
- The [DSI_VM_TIMING4](#)[15:8] HFP_HS_INTERLEAVING bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during an HFP gap.
- The [DSI_VM_TIMING4](#)[23:16] HSA_HS_INTERLEAVING bit field defines the number of TXBYTECLKHS clock cycles used to interleave HS command mode packets during an HSA gap.

These programmable values must be programmed to satisfy the timings for the clock and data lane to enter and exit HS mode latency. According to the scenario, different equations must be considered when calculating the register values.

Figure 10-126. HS Command Mode Interleaving

dsi-327

NOTE: For calculations and equations, the following abbreviations are used: EXIT_CLK_HS_MODE represents the exit HS mode latency for the clock lane. There is no dedicated register for this value but the programmer must know this value for further calculations:

$$\text{EXIT_CLK_HS_MODE} = T_{\text{CLK-TRAIL}} + T_{\text{S-EXIT}}$$

NOTE: For more information about other timing parameters used in the following equations, see [Section 10.3.4.4.4.1, Timing Parameters for an LP to HS Transaction](#), and [Section 10.3.4.4.4.2, Timing Parameters for an HS to LP Transaction](#).

For the following equations, BLANKING_PERIOD represents the BLLP, HSA, HBP, or HFP blanking periods. The HS_INTERLEAVING period represents the maximal period HS command mode packets. Its value is set in the BL_HS_INTERLEAVING, HSA_HS_INTERLEAVING, HBP_HS_INTERLEAVING, or HFP_HS_INTERLEAVING bit fields, depending on the blanking type.

In each scenario, two calculations are present, depending on the value of the [DSI_CLK_CTRL\[13\]](#) DDR_CLK_ALWAYS_ON bit:

- DDR_CLK_ALWAYS_ON = 1: Clock lane is always active.
- DDR_CLK_ALWAYS_ON = 0: Clock lane is activated only when there are HS packets to be sent on the PPI link.

CAUTION

When the DDR_CLK_ALWAYS_ON bit is programmed to 1, the following must be considered:

- LP state can be achieved on the PPI link only if the data lane has enough time to go out from HS mode and enter a new HS mode during a period inside which the PPI link is meant to be in LP state.
- This can be expressed with the following equation:

$$\text{EXIT_HS_MODE_LATENCY} + \max\{\text{ENTER_HS_MODE_LATENCY}, 2\} + 1 \leq \text{BLANKING_PERIOD}$$
- If the equation cannot be satisfied, because the LP state period is too short, software must program the DSI module in a way that during this blanking period a HS blanking packet is sent.

When the DDR_CLK_ALWAYS_ON bit is programmed to 0, the following must be considered:

- LP state can be achieved on the PPI link only if the data and clock lanes have enough time to go out from HS mode and enter a new HS mode during a period inside which the PPI link is meant to be in LP state.
- This can be expressed with the following equations:

$$\text{EXIT_HS_MODE_LATENCY} + \max\{\text{ENTER_HS_MODE_LATENCY}, 2\} + 1 \leq \text{BLANKING_PERIOD}$$

$$\text{DDR_CLK_POST} + \text{EXIT_CLK_HS_MODE} + \text{DDR_CLK_PRE} + \text{ENTER_HS_MODE_LATENCY}(\text{data lane}) + 1 \leq \text{BLANKING_PERIOD}$$
- If both equations cannot be satisfied, because the LP state period is too short, software must program the DSI module in a way that during this blanking period a HS blanking packet is sent.

- Scenario 1: The gap for interleaving starts and ends with a regular video stream HS packet.
 - DDR_CLK_ALWAYS_ON = 1

$$\text{HS_INTERLEAVING} = \text{BLANKING_PERIOD} - (\text{EXIT_HS_MODE_LATENCY} + \max\{\text{ENTER_HS_MODE_LATENCY}, 2\} + 1)$$
 - DDR_CLK_ALWAYS_ON = 0

$$HS_INTER1 = BLANKING_PERIOD - (EXIT_HS_MODE_LATENCY + \max\{ENTER_HS_MODE_LATENCY, 2\} + 1)$$

$$HS_INTER2 = BLANKING_PERIOD - (DDR_CLK_POST + EXIT_CLK_HS_MODE + DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + 1)$$

$$HS_INTERLEAVING = \min\{HS_INTER1, HS_INTER2\}$$

- Scenario 2: The gap for interleaving starts with a regular video stream HS packet and ends in LPS.
 - $DDR_CLK_ALWAYS_ON = 1$
 $HS_INTERLEAVING = BLANKING_PERIOD - (EXIT_HS_MODE_LATENCY + 3)$
 - $DDR_CLK_ALWAYS_ON = 0$
 $HS_INTER1 = BLANKING_PERIOD - (EXIT_HS_MODE_LATENCY + 3)$
 $HS_INTER2 = BLANKING_PERIOD - (DDR_CLK_POST + EXIT_CLK_HS_MODE + 3)$
 $HS_INTERLEAVING = \min\{HS_INTER1, HS_INTER2\}$
- Scenario 3: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.
 - $DDR_CLK_ALWAYS_ON = 1$
 $HS_INTERLEAVING = BLANKING_PERIOD - (ENTER_HS_MODE_LATENCY + EXIT_HS_MODE_LATENCY + \max\{ENTER_HS_MODE_LATENCY, 2\} + 1)$
 - $DDR_CLK_ALWAYS_ON = 0$
 $HS_INTER1 = BLANKING_PERIOD - (DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + EXIT_HS_MODE_LATENCY + \max\{ENTER_HS_MODE_LATENCY, 2\} + 1)$
 $HS_INTER2 = BLANKING_PERIOD - (DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + DDR_CLK_POST + EXIT_CLK_HS_MODE + DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + 1)$
 $HS_INTERLEAVING = \min\{HS_INTER1, HS_INTER2\}$
- Scenario 4: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.
 - $DDR_CLK_ALWAYS_ON = 1$
 $HS_INTERLEAVING = BLANKING_PERIOD - (ENTER_HS_MODE_LATENCY + EXIT_HS_MODE_LATENCY + 3)$
 - $DDR_CLK_ALWAYS_ON = 0$
 $HS_INTER1 = BLANKING_PERIOD - (DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + EXIT_HS_MODE_LATENCY + 3)$
 $HS_INTER2 = BLANKING_PERIOD - (DDR_CLK_PRE + ENTER_HS_MODE_LATENCY + DDR_CLK_POST + EXIT_CLK_HS_MODE + 1)$
 $HS_INTERLEAVING = \min\{HS_INTER1, HS_INTER2\}$

10.3.4.4.3.5.2 LP Command Mode Interleaving

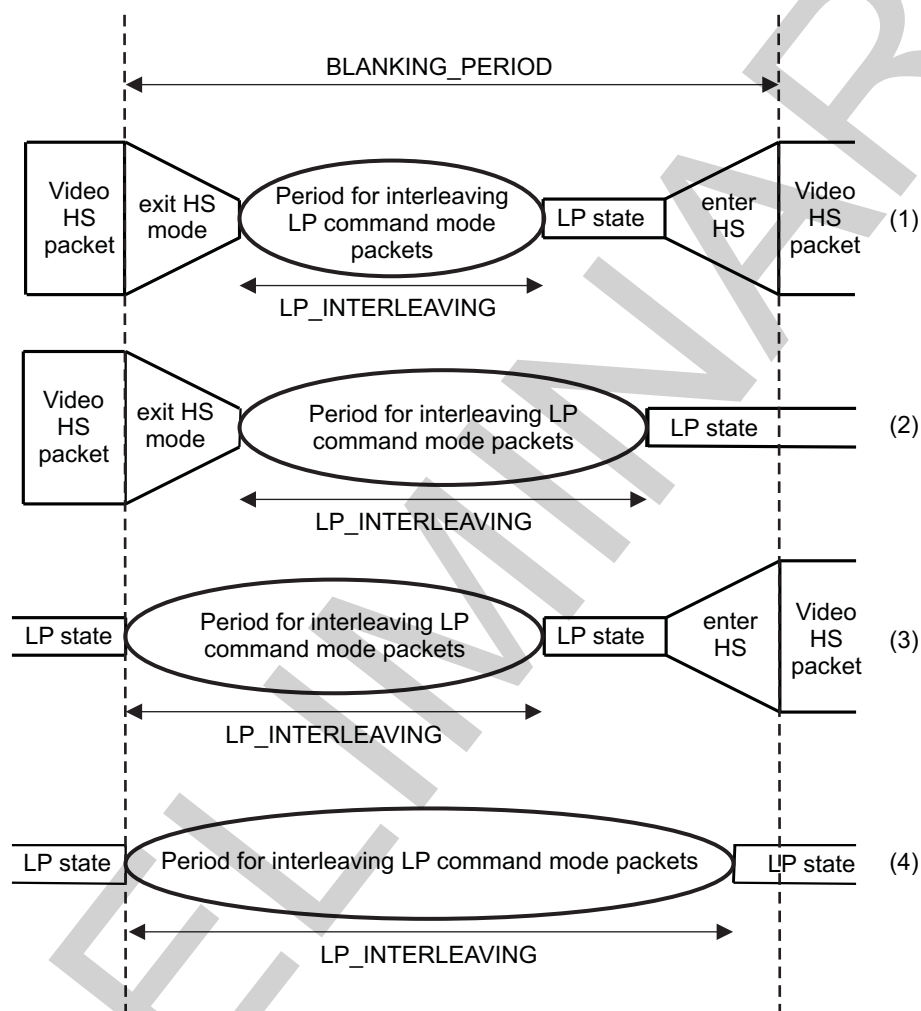

Figure 10-127 shows the various LP mode scenarios in interleaving mode during a blanking gap. For each type of blanking gap, a dedicated bit field determines the number of bytes of LP command mode packets that can be sent during a blanking period.

- The [DSI_VM_TIMING6](#)[15:0] BL_LP_INTERLEAVING bit field defines the number of bytes of LP command mode packets that can be sent during a BLLP gap.
- The [DSI_VM_TIMING5](#)[7:0] HBP_LP_INTERLEAVING bit field defines the number of bytes of LP command mode packets that can be sent during an HBP gap.
- The [DSI_VM_TIMING5](#)[15:8] HFP_LP_INTERLEAVING bit field defines the number of bytes of LP command mode packets that can be sent during an HFP gap.
- The [DSI_VM_TIMING5](#)[23:16] HSA_LP_INTERLEAVING bit field defines the number of bytes of LP command mode packets that can be sent during an HSA gap.

These values must be programmed to satisfy the timings for clock and data lane enter and exit LP mode latency. Clock lane timings do not affect LP command mode interleaving, because the clock lane can be controlled separately, compared with the data lane HS and low-power mutually exclusive control. Clock lanes can be in HS mode while the data lanes are in HS data transfer mode, low-power data transfer mode, or in LPS.

According to this scenario, different equations must be considered for calculating register values.

Figure 10-127. LP Command Mode Interleaving

dsi-328

For the following equations, BLANKING_PERIOD represents the BLLP, HSA, HBP, or HFP blanking periods. The LP_INTERLEAVING period represents the maximal period in LP command mode packets. Its value is set in the BL_LP_INTERLEAVING, HSA_LP_INTERLEAVING, HBP_LP_INTERLEAVING, or HFP_LP_INTERLEAVING bit fields, depending on the blanking type.

ALLOWED_HSBYTE_CLOCKS_FOR_LP represents the number of TXBYTECLKHS clock cycles during which LP interleaving can appear.

To calculate the LP_INTERLEAVING value:

1. Calculate how many TXBYTECLKHS clock cycles can be reserved for LP interleaving during the appropriate blanking video mode gap.
2. Calculate the value of LP_INTERLEAVING according to the results of Step 1.

Step 1:

- Scenario 1: The gap for interleaving starts and ends with a regular video stream HS packet.

$ALLOWED_HSBYTE_CLOCKS_FOR_LP = BLANKING_PERIOD - (EXIT_HS_MODE_LATENCY + \max\{ENTER_HS_MODE_LATENCY, 2\} + 1)$

- Scenario 2: The gap for interleaving starts with a regular video stream HS packet and ends in LPS.
 $ALLOWED_HSBYTE_CLOCKS_FOR_LP = BLANKING_PERIOD - (EXIT_HS_MODE_LATENCY + 1)$

- Scenario 3: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.

$ALLOWED_HSBYTE_CLOCKS_FOR_LP = BLANKING_PERIOD - (\max\{ENTER_HS_MODE_LATENCY, 2\} + 1)$

- Scenario 4: The gap for interleaving starts with the LPS and ends with a regular video stream HS packet.

$ALLOWED_HSBYTE_CLOCKS_FOR_LP = BLANKING_PERIOD - 1$

After finishing Step 1, the time period available for LP interleaving is known:

$T_{lp_available} = ALLOWED_HSBYTE_CLOCKS_FOR_LP * T_{TXBYTECLKHS}$

Step 2:

The resulting value must be programmed in the appropriate video mode register for LP interleaving.

$$LP_INTERLEAVING < \left\lceil \frac{T_{lp_available} - 8 * T_{hsbyte_clk} - 5 * T_{dsif_clk} - 26}{T_{txclkesc} / 16} \right\rceil$$

dsi-E124

T_{hsbyte_clk} : Period of TXBYTECLKHS clock of DSI_PHY module

T_{dsif_clk} : Period of DSI functional clock

$T_{txclkesc}$: Period of LP transmit escape clock

10.3.4.4.4 Clock Requirements

The serial clock generated by the DSI host and sent to the display can be a continuous clock. The clock lane supports clock transmission even if there is no data to send for displays that require continuous clock. It is software-programmed through the [DSI_CLK_CTRL\[13\] DDR_CLK_ALWAYS_ON](#) bit: This bit can be programmed only when the interface is disabled (the [DSI_CTRL\[0\] IF_EN](#) bit set to 0).

The peripheral can use two different kinds of clocks. The first one is the DDR clock provided on the clock lane. The second clock is some transitions on the data lane 1 even if there is no valid data to send using LP mode.

The LP clock ($TxClkEsc$) frequency provided to the DSI complex I/O is in the range of 67 percent to 150 percent of the peripheral low-power (LP) clock frequency. It is generated internally by the DSI protocol engine module using the DSI functional clock. The DSI functional clock is divided by 1, 2, 3, up to 8191 using the value programmed in the [DSI_CLK_CTRL\[12:0\] LP_CLK_DIVISOR](#) bit field. The LP clock generated from the DSI functional clock must be in the range of 20 MHz to 32 kHz. The duty cycle must be 50/50 (minimum high time = 24ns). LP clock frequency visible on the pads (DP x or DN) is half the frequency of $TxClkEsc$.

The [DSI_CLK_CTRL\[20\] LP_CLK_ENABLE](#) bit is used to enable or disable the clock. When disabled, the value of the [DSI_CLK_CTRL\[12:0\] LP_CLK_DIVISOR](#) bit field is ignored and does not have to be programmed by software users.

10.3.4.4.4.1 Timing Parameters for an LP to HS Transaction

[Figure 10-128](#) shows the timing requirement when switching the data and clock lane state from LP to HS. lists the LP to HS timing parameters.

Figure 10-128. LP to HS Timing

dsi-325

Table 10-490. LP to HS Timing Parameters

| Timings | Description | Registers/Associated Bit Fields | Register Settings | Timing Seen on the Line |
|---|--|--|--|--|
| T_{LPX} | Length of any low-power state period | DSI_PHY_REGISTER1 [20:16] REG_TLPXBY2 The value set in this bit field is half of the T_{LPX} | CEIL (25 ns / DDR_Clock_Period) | CEIL (2 * REG_TLPXBY2/4) * 4 * DDR_Clock_Period |
| $T_{CLK-PREPARE}$ | Time to drive the CLK lane to LP-00 state, to prepare for HS clock transmission | DSI_PHY_REGISTER2 [7:0] REG_TCLKPREPARE | CEIL (65 ns / DDR_Clock_Period) | REG_TCLKPREPARE * DDR_Clock_Period + (~ 25 ns – +5 ns) |
| $T_{CLK-ZERO}$ | Time to drive the CLK lane to HS-0 state, before starting the clock | DSI_PHY_REGISTER1 [7:0] REG_TCLKZERO | CEIL (265 ns / DDR_Clock_Period) | {CEIL [(REG_TCLKZERO + 3)/4] * 4 + CEIL (REG_TCLKPREPARE/ 4) * 4 – REG_TCLKPREPARE + 2} * DDR_Clock_Period + (~ 0 ns – +5 ns) |
| $T_{CLK-PRE}$ | Time that the HS clock must be driven before any associated data lane begins the transition from LP to HS mode | N/A | N/A | DDR_CLK_PRE - T_{LPX} - $T_{CLK-PREPARE}$ - $T_{CLK-ZERO}$ |
| $T_{HS-PREPARE}$ | Time to drive the data lane to LP-00 state, to prepare for HS packet transmission | DSI_PHY_REGISTER0 [31:24] REG_THSPREPARE | CEIL (70 ns / DDR_Clock_Period) + 2 | REG_THSPREPARE * DDR_Clock_Period + (~26.5 ns – + 4 ns) |
| $T_{HS-ZERO} + T_{HS-PREPARE}$ | $T_{HS-ZERO}$: Time to drive the data lane to HS-0 state before the synchronous sequence. | DSI_PHY_REGISTER0 [23:16] REG_THSPRPR_THSZERO | CEIL (175 ns / DDR_Clock_Period) + 2 | {CEIL [(N + 3)/4] * 4 + CEIL (M/4) * 4 + 3} * DDR_Clock_Period + (~ – 29 ns – 0 ns). Where N = REG_THSPREPARE_T HSZERO – REG_THSPREPARE M = REG_THSPREPARE |
| $T_{DDR_CLK_PRE}$ | Time between the CLK lane request assertion and the data request assertion to switch the data lanes to HS | DSI_CLK_TIMING [15:8] DDR_CLK_PRE | CEIL [($T_{LPX} + T_{CLK-PREPARE}$ + $T_{CLK-ZERO} + T_{CLK-PRE}$) / $T_{TXBYTECLKHS}$] ⁽¹⁾⁽²⁾ | |
| $T_{ENTER_HS_MODE_LATENCY}$ ⁽³⁾ | Time to enter data lane into HS mode. | DSI_VM_TIMING7 [31:6] ENTER_HS_MODE_LATENCY | CEIL [($T_{LPX} + T_{HS-PREPARE}$ + $T_{HS-ZERO}$) / $T_{TXBYTECLKHS}$] ⁽¹⁾ | |

⁽¹⁾ The timings seen on the line should be used to determine the register value.

⁽²⁾ See the MIPI D-PHY specification for the $T_{CLK-PRE}$ value.

⁽³⁾ ENTER_HS_MODE_LATENCY timing applies only to video mode. It does not need to be programmed in command mode.

In the example in [Table 10-491](#), the DDR clock = 400 MHz; TxByteClkHS = 100 MHz.

Table 10-491. LP to HS Timing Parameters Example for 400-MHz DDR Clock

| Timings | Registers/Associated Bit Fields | Default Register Settings (Programmed at Reset) | Timing Seen on the Line |
|-------------------|--|---|-------------------------|
| T_{LPX} | DSI_PHY_REGISTER1 [20:16] REG_TLPXBY2 | 10 | 50 ns |
| $T_{CLK-PREPARE}$ | DSI_PHY_REGISTER2 [7:0] REG_TCLKPREPARE | 26 | 40–70 ns |

Table 10-491. LP to HS Timing Parameters Example for 400-MHz DDR Clock (continued)

| Timings | Registers/Associated Bit Fields | Default Register Settings (Programmed at Reset) | Timing Seen on the Line |
|-------------------------------------|--|--|-------------------------|
| $T_{\text{CLK-ZERO}}$ | DSI_PHY_REGISTER1 [7:0] REG_TCLKZERO | 106 | 280–285 ns |
| $T_{\text{CLK-PRE}}$ ⁽¹⁾ | N/A | N/A | 80 ns |
| $T_{\text{HS-PREPARE}}$ | DSI_PHY_REGISTER0 [31:24] REG_THSPREPARE | 30 | 48.5–79 ns |
| $T_{\text{HS-ZERO}}$ | DSI_PHY_REGISTER0 [23:16] REG_THSPRPR_THSZERO | 72 | 178.5–207.5 ns |
| $T_{\text{DDR_CLK_PRE}}$ | DSI_CLK_TIMING [15:8] DDR_CLK_PRE | 45–49 ⁽²⁾ | 450–490 ns |
| $T_{\text{ENTER_HS_MODE_LATENCY}}$ | DSI_VM_TIMING7 [31:16] ENTER_HS_MODE_LATENCY | 24 * $T_{\text{TXBYTECLKHS}}$ or 96 * DDR_CLOCK 34 * $T_{\text{TXBYTECLKHS}}$ or 136 * DDR_CLOCK ⁽²⁾ | 277–336.5 ns |

⁽¹⁾ See the MIPI D-PHY specification for the $T_{\text{CLK-PRE}}$ value.

⁽²⁾ Register setting calculated based on the values in the Timing Seen on the Line column.

10.3.4.4.2 Timing Parameters for an HS to LP Transaction

Figure 10-129 shows the timing requirement when switching the state of the data and clock lanes from HS to LP. lists the HS to LP timing parameters.

Figure 10-129. HS to LP Timing

dsi-326

Table 10-492. HS to LP Timing Parameters

| Timings | Description | Registers/Associated Bit Fields | Register Settings | Timing Seen on the Line |
|-------------------------------------|--|--|---|--|
| T_{HS-EOT} | If EoT is enabled, a delay is added to EXIT_HS_MODE_LATENCY to send the EoT packet. The EoT period depends on the number of data lanes. | N/A | N/A | DIVROUNDUP (4, NB_DATA_LANES) Thus: One data lane = Four DDR clocks Two data lanes = Two DDR clocks |
| $T_{HS-TRAIL}$ | Time to drive flipped differential state after last payload data bit of an HS transmission burst | DSI_PHY_REGISTER0 [15:8] REG_THSTRAIL | CEIL (60 ns / DDR_Clock_Period) + 5 | {CEIL [(REG_THSTRAIL + 3)/4] * 4 – 2.75} * DDR_Clock_Period + (~0 ns – 5 ns) |
| $T_{HS-EXIT}$ | Time to drive data lane to LP-11 state, after HS burst | DSI_PHY_REGISTER0 [7:0] REG_THSEXIT | CEIL (145 ns / DDR_Clock_Period) | {CEIL [(REG_THSEXIT/4) * 4] * DDR_Clock_Period – (~3 ns – 45 ns)} |
| $T_{CLK-POST}$ | Time that the transmitter must continue sending HS clock after the last associated data lane has transitioned to LP mode | N/A | N/A | DDR_CLK_POST - $T_{HS-EOT}^{(1)}$ - $T_{HS-TRAIL}$ |
| $T_{CLK-TRAIL}$ | Time to drive HS differential state after last payload clock bit of an HS transmission burst | DSI_PHY_REGISTER1 [15:8] REG_TCLKTRAIL | CEIL (60 ns / DDR_Clock_Period) + 2 | {CEIL [(REG_TCLKTRAIL + 3)/4] * 4 – 1.5} * DDR_Clock_Period + (~0 ns – 5 ns) |
| $T_{DDR_CLK_POST}$ | Time between the data lane request deassertion and the CLK request deassertion to switch the data lanes into LP mode. The DDR_CLK_POST value must follow the rule: $T_{DDR_CLK_POST} \geq T_{HS-TRAIL} + T_{HS-EOT} + T_{CLK-POST}$ | DSI_CLK_TIMING [7:0] DDR_CLK_POST | CEIL [($T_{HS-TRAIL} + T_{HS-EOT}^{(1)} + T_{CLK-POST}$) / $T_{TXBYTECLKHS}$] ^{(2) (3)} | |
| $T_{EXIT_HS_MODE_LATENCY}^{(4)}$ | Time to exit HS mode | DSI_VM_TIMING7 [15:0] EXIT_HS_MODE_LATENCY | CEIL [($T_{HS-TRAIL} + T_{HS-EXIT} + T_{HS-EOT}^{(1)}$) / $T_{TXBYTECLKHS}$] ⁽²⁾ | |

(1) If T_{HS-EOT} is enabled

(2) The timings seen on the line should be used to determine the register value.

(3) See the MIPI D-PHY specification for the $T_{CLK-POST}$ value.

(4) EXIT_HS_MODE_LATENCY timing applies only to video mode. It does not need to be programmed in command mode.

In the example in [Table 10-493](#), the DDR clock = 400 MHz; TxByteClkHS = 100 MHz; two data lanes.**Table 10-493. HS to LP Timing Parameters Example for 400-MHz DDR Clock and Two Data Lanes**

| Timings | Registers/Associated Bit Fields | Default Register Settings (Programmed at Reset) | Timing Seen on the Line (T_{HS-EOT} Enabled) | Timing Seen on the Line (T_{HS-EOT} Disabled) |
|----------------|---|---|---|--|
| T_{HS-EOT} | N/A | N/A | 5 ns | N/A |
| $T_{HS-TRAIL}$ | DSI_PHY_REGISTER0 [15:8] REG_THSTRAIL | 29 | 73.125–78.125 ns | 73.125–78.125 ns |

(continued)**

| Timings | Registers/Associated Bit Fields | Default Register Settings (Programmed at Reset) | Timing Seen on the Line (T _{HS-EOT} Enabled) | Timing Seen on the Line (T _{HS-EOT} Disabled) |
|--------------------------------------|--|---|--|---|
| T _{HS-EXIT} | DSI_PHY_REGISTER0 [7:0] REG_THSEXIT | 58 | 105–147 ns | 105–147 ns |
| T _{CLK-POST} ⁽¹⁾ | N/A | N/A | 585 ns | 580 ns |
| T _{CLK-TRAIL} | DSI_PHY_REGISTER1 [15:8] REG_TCLKTRAIL | 26 | 76.25–81.25 ns | 76.25–81.25 ns |
| DDR_CLK_POST | DSI_CLK_TIMING [7:0] DDR_CLK_POST | 66 * TxByteClkHS or 264 * DDR_CLOCK 67 * TxByteClkHS or 268 * DDR_CLOCK ⁽²⁾ | 658.125–663.125 ns | 653.125–658.125 ns |
| EXIT_HS_MODE_LATE NCY | DSI_VM_TIMING7 [15:0] EXIT_HS_MODE_LATE NCY | 19 * TxByteClkHS or 76 * DDR_CLOCK 24 * TxByteClkHS or 96 * DDR_CLOCK ⁽²⁾ | 183.125–230.125 ns | 178.125–225.125 ns |

⁽¹⁾ See the MIPI D-PHY specification.

⁽²⁾ Register setting calculated based on the values in Timing Seen on the Line (T_{HS-EOT} Enabled) column.

10.3.4.4.3 Extra LP Transitions

Some DSI receivers require extra clock cycles in LP mode to process the data. The DSI protocol engine can be programmed to send automatically one NULL long packet. It applies only when no more data are ready to be sent from the internal FIFO to the peripheral on the last LS transfer. The same value is used for all the VCs sending packets in LS mode.

The size of the payload is defined by the [DSI_CLK_CTRL](#)[17:16] LP_CLK_NULL_PACKET_SIZE bit field. The header value depends on the size of the payload as described in [Table 10-494](#) and [Table 10-495](#).

NOTE: In [Table 10-494](#) and [Table 10-495](#), ECC and checksum are enabled.

Table 10-494. Extra NULL PH

| VC ID | Payload size (DSI_CLK_CTRL [17:16] LP_CLK_NULL_PACKET_SIZE) | Header (1st Byte) | Header (2nd Byte): WC LSB | Header (3rd Byte): WC MSB | Header (ECC) |
|-------|--|----------------------|------------------------------|------------------------------|--------------|
| 0x0 | 0 | 0x9 | 0x0 | 0x0 | 0x9 |
| | 1 | | 0x1 | | 0x13 |
| | 2 | | 0x2 | | 0x2F |
| | 3 | | 0x3 | | 0x35 |
| 0x1 | 0 | 0x49 | 0x0 | | 0x1F |
| | 1 | | 0x1 | | 0x05 |
| | 2 | | 0x2 | | 0x39 |
| | 3 | | 0x3 | | 0x23 |
| 0x2 | 0 | 0x89 | 0x0 | | 0x10 |
| | 1 | | 0x1 | | 0x0A |
| | 2 | | 0x2 | | 0x36 |
| | 3 | | 0x3 | | 0x2C |
| 0x3 | 0 | 0xC9 | 0x0 | | 0x06 |
| | 1 | | 0x1 | | 0x1C |
| | 2 | | 0x2 | | 0x20 |

Table 10-494. Extra NULL PH (continued)

| VC ID | Payload size (DSI_CLK_CTRL [17:16] LP_CLK_NULL_PACKET_SIZE) | Header (1st Byte) | Header (2nd Byte): WC LSB | Header (3rd Byte): WC MSB | Header (ECC) |
|-------|---|----------------------|------------------------------|------------------------------|--------------|
| | 3 | | 0x3 | | 0x3A |
