

DRV5056 单极比例式线性霍尔效应传感器

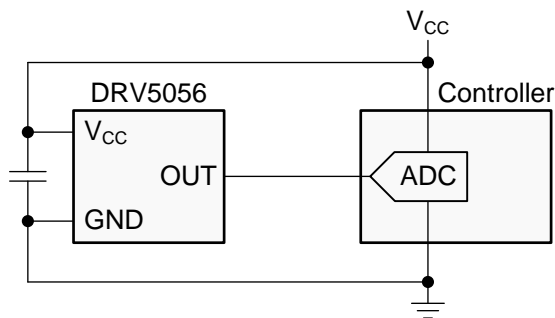

1 特性

- 单极线性霍尔效应传感器
- 由 3.3V 和 5V 电源供电
- 具有 0.6V 静态失调电压的模拟输出：
 - 可最大限度地提高电压摆幅以实现高精度
- 磁性灵敏度选项 ($V_{CC} = 5V$ 时)：
 - A1: 200mV/mT, 20mT 范围
 - A2: 100mV/mT, 39mT 范围
 - A3: 50mV/mT, 79mT 范围
 - A4: 25mV/mT, 158mT 范围
 - A6: 100mV/mT, 39mT 范围
- 20kHz 快速检测带宽
- 低噪声输出, 具有 $\pm 1mA$ 的驱动能力
- 磁体温度漂移补偿
- 行业标准封装：
 - 表面贴装 SOT-23
 - 穿孔 TO-92

2 应用

- 精确位置检测
- 工业自动化和机器人
- 家用电器
- 游戏手柄、踏板、键盘、触发器
- 高度找平、倾斜和重量测量
- 流体流速测量
- 医疗设备
- 电流检测

典型电路原理图

3 说明

DRV5056 器件是一款线性霍尔效应传感器, 可按比例响应南磁极磁通量密度。该器件可用于进行精确的位置检测, 应用范围广泛。

此模拟输出配备特色的单极磁响应, 无磁场时可驱动 0.6V 的电压, 存在南磁极时电压会升高。对于感应一个磁极的应用, 此响应可以最大限度提高输出动态范围。4 种灵敏度选项可以基于所需的感应范围进一步最大限度提高输出摆幅。

该器件由 3.3V 或 5V 电源供电。它可检测垂直于封装顶部的磁通量, 两个封装选项提供不同的检测方向。

该器件使用比例式架构, 当外部模数转换器 (ADC) 使用相同的 V_{CC} 进行参考时, 可以最大限度减小 V_{CC} 容差产生的误差。此外, 该器件还具有磁体温度补偿功能, 可以抵消磁体漂移, 在的宽温度范围内实现线性性能。

A1 至 A4 选项支持 $-40^{\circ}C$ 至 $+125^{\circ}C$ 的温度范围。A6 版本支持 $0^{\circ}C$ 至 $85^{\circ}C$ 的温度范围。

5 Pin Configuration and Functions

Pin Functions

NAME	PIN		I/O	DESCRIPTION
	SOT-23	TO-92		
GND	3	2	—	Ground reference
OUT	2	3	O	Analog output
V _{CC}	1	1	—	Power supply. TI recommends connecting this pin to a ceramic capacitor to ground with a value of at least 0.1 μ F.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Power supply voltage	V _{CC}	-0.3	7	V
Output voltage	OUT	-0.3	V _{CC} + 0.3	V
Magnetic flux density, B _{MAX}		Unlimited		T
Operating junction temperature, T _J		-40	150	°C
Storage temperature, T _{stg}		-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2500	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±750	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V _{CC}	Power supply voltage ⁽¹⁾	3	3.6	V
		4.5	5.5	
I _O	Output continuous current	–1	1	mA
T _A	A1-A4 versions operating ambient temperature ⁽²⁾	–40	125	°C
T _A	A6 version operating ambient temperature ⁽²⁾	0	85	°C

(1) There are two isolated operating V_{CC} ranges. For more information see the [Operating V_{CC} Ranges](#) section.

(2) Power dissipation and thermal limits must be observed.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DRV5056		UNIT
		SOT-23 (DBZ)	TO-92 (LPG)	
		3 PINS	3 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	170	121	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	66	67	°C/W
R _{θJB}	Junction-to-board thermal resistance	49	97	°C/W
Y _{JT}	Junction-to-top characterization parameter	1.7	7.6	°C/W
Y _{JB}	Junction-to-board characterization parameter	48	97	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

for V_{CC} = 3 V to 3.63 V and 4.5 V to 5.5 V, over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS ⁽¹⁾		MIN	TYP	MAX	UNIT
I _{CC}	Operating supply current				6	10	mA
t _{ON}	Power-on time (see Figure 19)	B = 0 mT, no load on OUT			150	300	µs
f _{BW}	Sensing bandwidth				20		kHz
t _d	Propagation delay time	From change in B to change in OUT			10		µs
B _{ND}	Input-referred RMS noise density	V _{CC} = 5 V			130		nT/√Hz
		V _{CC} = 3.3 V			215		
B _N	Input-referred noise	B _{ND} × 6.6 × √20 kHz	V _{CC} = 5 V		0.12		mT _{PP}
			V _{CC} = 3.3 V		0.2		
V _N	Output-referred noise ⁽²⁾	B _N × S	DRV5056A1		24		mV _{PP}
			DRV5056A2, DRV5056A6		12		
			DRV5056A3		6		
			DRV5056A4		3		

(1) B is the applied magnetic flux density.

(2) V_N describes voltage noise on the device output. If the full device bandwidth is not needed, noise can be reduced with an RC filter.

6.6 Magnetic Characteristics

for $V_{CC} = 3\text{ V to }3.63\text{ V}$ and $4.5\text{ V to }5.5\text{ V}$, over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS ⁽¹⁾		MIN	TYP	MAX	UNIT
V_Q	Quiescent voltage	$B = 0\text{ mT}$, $T_A = 25^\circ\text{C}$	DRV5056A1	0.535	0.6	0.665	V
			DRV5056A2, DRV5056A6	0.54	0.6	0.66	
			DRV5056A3, DRV5056A4	0.55	0.6	0.65	
$V_{Q\Delta T}$	Quiescent voltage temperature drift	$B = 0\text{ mT}$, $T_A = -40^\circ\text{C to }125^\circ\text{C}$ versus 25°C	$V_{CC} = 5\text{ V}$	0.08		V	
			$V_{CC} = 3.3\text{ V}$	0.04			
$V_{Q\Delta L}$	Quiescent voltage lifetime drift	High-temperature operating stress for 1000 hours	< 0.5%				
S	Sensitivity	$V_{CC} = 5\text{ V}$, $T_A = 25^\circ\text{C}$	DRV5056A1	190	200	210	mV/mT
			DRV5056A2, DRV5056A6	95	100	105	
			DRV5056A3	47.5	50	52.5	
			DRV5056A4	23.8	25	26.2	
		$V_{CC} = 3.3\text{ V}$, $T_A = 25^\circ\text{C}$	DRV5056A1	114	120	126	
			DRV5056A2, DRV5056A6	57	60	63	
			DRV5056A3	28.5	30	31.5	
			DRV5056A4	14.3	15	15.8	
B_L	Linear magnetic sensing range ⁽²⁾	$V_{CC} = 5\text{ V}$, $T_A = 25^\circ\text{C}$	DRV5056A1	20			mT
			DRV5056A2, DRV5056A6	39			
			DRV5056A3	79			
			DRV5056A4	158			
		$V_{CC} = 3.3\text{ V}$, $T_A = 25^\circ\text{C}$	DRV5056A1	19			
			DRV5056A2, DRV5056A6	39			
			DRV5056A3	78			
			DRV5056A4	155			
V_L	Linear range of output voltage ⁽³⁾		V_Q		$V_{CC} - 0.2$	V	
S_{TC}	Sensitivity temperature compensation for magnets ⁽⁴⁾	DRV5056A6	0.05	0.12	0.19	%/°C	
S_{TC}	Sensitivity temperature compensation for magnets ⁽⁴⁾	DRV5056A1, DRV5056A2, DRV5056A3, DRV5056A4		0.12		%/°C	
S_{LE}	Sensitivity linearity error ⁽³⁾	V_{OUT} is within V_L		$\pm 1\%$			
S_{RE}	Sensitivity ratiometry error ⁽⁵⁾	$T_A = 25^\circ\text{C}$, with respect to $V_{CC} = 3.3\text{ V}$ or 5 V	-2.5%		2.5%		
$S_{\Delta L}$	Sensitivity lifetime drift	High-temperature operating stress for 1000 hours	< 0.5%				

(1) B is the applied magnetic flux density.

(2) B_L describes the minimum linear sensing range at 25°C taking into account the maximum V_Q and Sensitivity tolerances.

(3) See the [Sensitivity Linearity](#) section.

(4) S_{TC} describes the rate the device increases Sensitivity with temperature. For more information, see the [Sensitivity Temperature Compensation For Magnets](#) section.

(5) See the [Ratiometric Architecture](#) section.

7 Detailed Description

7.1 Overview

The DRV5056 is a 3-pin linear Hall effect sensor with fully integrated signal conditioning, temperature compensation circuits, mechanical stress cancellation, and amplifiers. The device operates from 3.3-V and 5-V ($\pm 10\%$) power supplies, measures magnetic flux density, and outputs a proportional analog voltage that is referenced to V_{CC} .

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Magnetic Flux Direction

As shown in [图 16](#), the DRV5056 is sensitive to the magnetic field component that is perpendicular to the die inside the package.

图 16. Direction of Sensitivity

Feature Description (接下页)

Magnetic flux that travels from the bottom to the top of the package is considered positive. This condition exists when a south magnetic pole is near the top (marked-side) of the package. Magnetic flux that travels from the top to the bottom of the package results in negative millitesla values.

图 17. The Flux Direction for Positive B

7.3.2 Magnetic Response

The DRV5056 outputs an analog voltage according to 公式 1 when in the presence of a magnetic field:

$$V_{OUT} = V_Q + B \times (\text{Sensitivity}_{(25^\circ\text{C})} \times (1 + S_{TC} \times (T_A - 25^\circ\text{C})))$$

where

- V_Q is typically 600 mV
- B is the applied magnetic flux density
- $\text{Sensitivity}_{(25^\circ\text{C})}$ depends on the device option and V_{CC}
- S_{TC} is typically 0.12%/°C
- T_A is the ambient temperature
- V_{OUT} is within the V_L range

(1)

As an example, consider the DRV5056A3 with $V_{CC} = 3.3$ V, a temperature of 50°C, and 67 mT applied. Excluding tolerances, $V_{OUT} = 600$ mV + 67 mT × (30 mV/mT × [1 + 0.0012/°C × (50°C – 25°C)]) = 2.67 V.

The DRV5056 only responds to the flux density of a magnetic south pole.

Feature Description (接下页)

7.3.3 Sensitivity Linearity

The device produces a linear response when the output voltage is within the specified V_L range. Outside this range, sensitivity is reduced and nonlinear. 图 18 graphs the magnetic response.

图 18. Magnetic Response

公式 2 calculates parameter B_L , the minimum linear sensing range at 25°C taking into account the maximum quiescent voltage and sensitivity tolerances.

$$B_{L(MIN)} = \frac{V_{L(MAX)} - V_{Q(MAX)}}{S_{(MAX)}} \quad (2)$$

The parameter S_{LE} defines linearity error as the difference in sensitivity between any two positive B values when the output is within the V_L range.

7.3.4 Ratiometric Architecture

The DRV5056 has a ratiometric analog architecture that scales the sensitivity linearly with the power-supply voltage. For example, the sensitivity is 5% higher when $V_{CC} = 5.25$ V compared to $V_{CC} = 5$ V. This behavior enables external ADCs to digitize a more consistent value regardless of the power-supply voltage tolerance, when the ADC uses V_{CC} as its reference.

公式 3 calculates sensitivity ratiometry error:

$$S_{RE} = 1 - \frac{S_{(VCC)} / S_{(5V)}}{V_{CC} / 5V} \quad \text{for } V_{CC} = 4.5 \text{ V to } 5.5 \text{ V}, \quad S_{RE} = 1 - \frac{S_{(VCC)} / S_{(3.3V)}}{V_{CC} / 3.3V} \quad \text{for } V_{CC} = 3 \text{ V to } 3.6 \text{ V}$$

where

- $S_{(VCC)}$ is the sensitivity at the current V_{CC} voltage
 - $S_{(5V)}$ or $S_{(3.3V)}$ is the sensitivity when $V_{CC} = 5$ V or 3.3 V
 - V_{CC} is the current V_{CC} voltage
- (3)

Feature Description (接下页)

7.3.5 Operating V_{CC} Ranges

The DRV5056 has two recommended operating V_{CC} ranges: 3 V to 3.6 V and 4.5 V to 5.5 V. When V_{CC} is in the middle region between 3.6 V to 4.5 V, the device continues to function, but sensitivity is less known because there is a crossover threshold near 4 V that adjusts device characteristics.

7.3.6 Sensitivity Temperature Compensation For Magnets

Magnets generally produce weaker fields as temperature increases. The DRV5056 compensates by increasing sensitivity with temperature, as defined by the parameter S_{TC} . The sensitivity at $T_A = 125^\circ\text{C}$ is typically 12% higher than at $T_A = 25^\circ\text{C}$.

7.3.7 Power-On Time

After the V_{CC} voltage is applied, the DRV5056 requires a short initialization time before the output is set. The parameter t_{ON} describes the time from when V_{CC} crosses 3 V until OUT is within 5% of V_Q , with 0 mT applied and no load attached to OUT. 图 19 shows this timing diagram.

图 19. t_{ON} Definition

Feature Description (接下页)

7.3.8 Hall Element Location

图 20 shows the location of the sensing element inside each package option.

图 20. Hall Element Location

7.4 Device Functional Modes

The DRV5056 has one mode of operation that applies when the *Recommended Operating Conditions* are met.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Selecting the Sensitivity Option

Select the highest DRV5056 sensitivity option that can measure the required range of magnetic flux density, so that the output voltage swing is maximized.

Larger magnets and greater sensing distances can generally enable better positional accuracy than very small magnets at close distances, because magnetic flux density increases exponentially with the proximity to a magnet.

8.1.2 Temperature Compensation for Magnets

The DRV5056 temperature compensation is designed to directly compensate the average drift of neodymium (NdFeB) magnets and partially compensate ferrite magnets. The residual flux density (B_r) of a magnet typically reduces by 0.12%/°C for NdFeB, and 0.20%/°C for ferrite. When the operating temperature range of a system is reduced, temperature drift errors are also reduced.

8.1.3 Adding a Low-Pass Filter

As illustrated in the *Functional Block Diagram*, an RC low-pass filter can be added to the device output for the purpose of minimizing voltage noise when the full 20-kHz bandwidth is not needed. This filter can improve the signal-to-noise ratio (SNR) and overall accuracy. Do not connect a capacitor directly to the device output without a resistor in between because doing so can make the output unstable.

8.1.4 Designing for Wire Break Detection

Some systems must detect if interconnect wires become open or shorted. The DRV5056 can support this function.

First, select a sensitivity option that causes the output voltage to stay within the V_L range during normal operation. Second, add a pullup resistor between OUT and V_{CC} . TI recommends a value between 20 k Ω to 100 k Ω , and the current through OUT must not exceed the I_O specification, including current going into an external ADC. Then, if the output voltage is ever measured to be within 150 mV of V_{CC} or GND, a fault condition exists. 图 21 shows the circuit, and 表 1 describes fault scenarios.

图 21. Wire Fault Detection Circuit

表 1. Fault Scenarios and the Resulting V_{OUT}

FAULT SCENARIO	V_{OUT}
V_{CC} disconnects	Close to GND
GND disconnects	Close to V_{CC}
V_{CC} shorts to OUT	Close to V_{CC}
GND shorts to OUT	Close to GND

8.2 Typical Application

图 22. Unipolar Sensing Application

8.2.1 Design Requirements

Use the parameters listed in 表 2 for this design example.

表 2. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V_{CC}	3.3 V
Magnet	10-mm diameter x 6-mm long cylinder, ferrite
Distance from magnet to sensor	From 20 mm to 3 mm
Maximum B at the sensor at 25°C	72 mT at 3 mm
Device option	DRV5056A3-Q1

8.2.2 Detailed Design Procedure

This design example consists of a mechanical component that moves back and forth, an embedded magnet with the south pole facing the printed-circuit board, and a DRV5056. The DRV5056 outputs an analog voltage that describes the precise position of the component. The component must not contain ferromagnetic materials such as iron, nickel, and cobalt because these materials change the magnetic flux density at the sensor.

When designing a linear magnetic sensing system, always consider these three variables: the magnet, sensing distance, and range of the sensor. Select the DRV5056 with the highest sensitivity that has a B_L (linear magnetic sensing range) that is larger than the maximum magnetic flux density in the application.

Magnets are made from various ferromagnetic materials that have tradeoffs in cost, drift with temperature, absolute maximum temperature ratings, remanence or residual induction (B_r), and coercivity (H_c). The B_r and the dimensions of a magnet determine the magnetic flux density (B) produced in 3-dimensional space. For simple magnet shapes, such as rectangular blocks and cylinders, there are simple equations that solve B at a given distance centered with the magnet. 图 23 shows diagrams for 公式 4 and 公式 5.

图 23. Rectangular Block and Cylinder Magnets

Use 公式 4 for the rectangular block shown in 图 23:

$$\vec{B} = \frac{B_r}{\pi} \left(\arctan \left(\frac{WL}{2D\sqrt{4D^2 + W^2 + L^2}} \right) - \arctan \left(\frac{WL}{2(D+T)\sqrt{4(D+T)^2 + W^2 + L^2}} \right) \right) \quad (4)$$

Use 公式 5 for the cylinder shown in 图 23:

$$\vec{B} = \frac{B_r}{2} \left(\frac{D+T}{\sqrt{(0.5C)^2 + (D+T)^2}} - \frac{D}{\sqrt{(0.5C)^2 + D^2}} \right)$$

where

- W is width
- L is length
- T is thickness (the direction of magnetization)
- D is distance
- C is diameter

(5)

8.2.3 Application Curve

图 24 shows the magnetic flux density versus distance for a 10-mm × 6-mm cylinder ferrite magnet.

图 24. Magnetic Profile of a 10-mm × 6-mm Cylindrical Ferrite Magnet

8.3 What to Do and What Not to Do

Because the Hall element is sensitive to magnetic fields that are perpendicular to the top of the package, a correct magnet approach must be used for the sensor to detect the field. 图 25 illustrates correct and incorrect approaches.

What to Do and What Not to Do (接下页)

图 25. Correct and Incorrect Magnet Approaches

9 Power Supply Recommendations

A decoupling capacitor close to the device must be used to provide local energy with minimal inductance. TI recommends using a ceramic capacitor with a value of at least 0.01 μF .

10 Layout

10.1 Layout Guidelines

Magnetic fields pass through most nonferromagnetic materials with no significant disturbance. Embedding Hall effect sensors within plastic or aluminum enclosures and sensing magnets on the outside is common practice. Magnetic fields also easily pass through most printed-circuit boards, which makes placing the magnet on the opposite side possible.

10.2 Layout Examples

图 26. Layout Examples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

DBZ0003A

PACKAGE OUTLINE

SOT-23 - 1.12 mm max height

SMALL OUTLINE TRANSISTOR

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC registration TO-236, except minimum foot length.
4. Support pin may differ or may not be present.
5. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25mm per side
