

LP8866S-Q1

ZHCSLM9B - AUGUST 2020 - REVISED MAY 2024

# LP8866S-Q1 具有六个 150mA 通道的汽车级显示 LED 背光驱动器

# 1 特性

ŦF

**TEXAS** 

- 符合面向汽车应用的 AEC-Q100 标准:
  - 器件温度等级 1:

INSTRUMENTS

- 40°C 至 +125°C,T<sub>A</sub>
- 器件 HBM ESD 分类等级 2
- 器件 CDM ESD 分类等级 C4B
- 输入电压工作范围:3V至48V
- 六个高精度电流阱
  - 各电流阱直流电流高达 150mA
  - 电流匹配度为 1% ( 典型值 )
  - 使用 152Hz LED 输出 PWM 频率时,调光比为 32000:1
  - 使用 I2C 或 PWM 输入时,最高 16 位 LED 调 光分辨率
  - 可配置 8 个 LED 灯串
- 自动移相 PWM 调光
- 12 位模拟调光
- 最高 48V V<sub>OUT</sub> 升压或 SEPIC 直流/直流控制器
  - 开关频率为 100kHz 至 2.2MHz
  - 升压展频功能可降低 EMI
  - 升压同步输入,可通过外部时钟设置升压开关频率
  - 禁用升压时,输出电压自动放电
- 多种故障诊断功能

# 2 应用

- 为以下应用提供背光:
  - 汽车信息娱乐系统
  - 汽车仪表组
  - 智能车镜
  - 抬头显示屏 (HUD)

# 3 说明

LP8866S-Q1 是一款具有升压控制器的汽车级高效 LED 驱动器。六个高精度电流阱支持根据使用的通道 数自动调整相移。可通过 I<sup>2</sup>C 接口或 PWM 输入对 LED 亮度进行全局控制。

升压控制器基于 LED 电流阱余量电压进行自适应输出 电压控制。该特性可在所有条件下将升压电压调节到能 够满足需要的最低水平,从而更大限度降低功耗。凭借 宽范围可调频率,LP8866S-Q1 可避免 AM 无线电频 段的干扰。

LP8866S-Q1 支持内置混合 PWM 调光和模拟电流调 光,可降低 EMI、延长 LED 使用寿命并提高总光学效 率。

器件信息

# **4** Pin Configuration and Functions

图 4-1. DCP Package 38-Pin HTSSOP Top View

# 表 4-1. HTTSOP Pin Functions

PIN DESCRIPTION						
NO.	NAME	TYPE	DESCRIPTION			
1	VDD	Power	Power supply input for internal analog and digital circuit. Connect a 10 $\mu$ F capacitor between the VDD pin to GND.			
2	EN	Analog	Enable input.			
3	C1N	Analog	Negative input for charge pump flying capacitor. If feature not used leave this pin floating.			
4	C1P	Analog	Positive input for charge pump flying capacitor. If feature not used leave this pin floating.			
5	CPUMP	Power	Charge pump output pin. Connect to VDD if charge pump is not used. A 4.7µF decoupling capacitor is recommended on CPUMP pin.			
6	CPUMP	Power	Charge pump output pin. Always connects with pin 5.			
7	GD	Analog	Gate driver output for external N-FET.			
8	PGND	GND	Power ground.			
9	PGND	GND	Power ground.			
10	ISNS	Analog	Boost current sense pin.			
11	ISNSGND	GND	Current sense resistor GND.			
12	ISET	Analog	LED full-scale current setup through external resistor.			
13	FB	Analog	Boost feedback input.			
14	NC	N/A	No connect - Leave floating.			
15	DISCHARGE	Analog	Boost output voltage discharge pin. Connect to Boost output.			
16	NC	N/A	No connect - Leave floating.			
17	OUT6	Analog	LED current sink output. If unused tie to ground			
18	OUT5	Analog	LED current sink output. If unused tie to ground			
19	OUT4	Analog	LED current sink output. If unused tie to ground.			
20	OUT3	Analog	LED current sink output. If unused tie to ground.			
21	OUT2	Analog	LED current sink output. If unused tie to ground.			
22	OUT1	Analog	LED current sink output. If unused tie to ground.			
23	NC	N/A	No connect - Leave floating.			
24	INT	Analog	Device fault interrupt output, open drain. A 10k Ω pullup resistor is recommended.			
25	SDA	Analog	SDA for I2C interface. A 10k $\Omega$ pullup resistor is recommended.			
26	SCL	Analog	SCL for I2C interface. A 10k Ω pullup resistor is recommended.			
27	BST_SYNC	Analog	Input for synchronizing boost. When synchronization is not used, connect this pin to ground to disable spread spectrum or to VDD to enable spread spectrum.			
28	PWM	Analog	PWM input for brightness control. Tie to GND if unused.			
29	SGND	GND	Signal ground.			
30	LED_SET	Analog	LED string configuration through external resistor. Do not leave floating.			
31	PWM FSET	Analog	LED dimming frequency setup through external resistor. Do not leave floating.			
32	 BST_FSET	Analog	Boost switching frequency setup through external resistor. Do not leave floating.			
33	MODE	Analog	Dimming mode setup through external resistor. Do not leave floating.			
34	DGND	GND	Digital ground.			
35	UVLO	Analog	Input voltage sense for programming input UVLO threshold through external resistor to VIN.			
36	VSENSE P	Analog	Pin for input voltage detection for OVP protection and positive input for input current sense.			
37	 VSENSE_N	Analog	Negative input for input current sense. If input current sense is not used, please tie to VSENSE_P pin.			
38	SD	Analog	Power line FET control. Open Drain output. If unused, leave this pin floating.			
DAP	LED_GND	GND	LED ground connection.			

### 表 4-2. QFN Pin Functions

11BS1_STNCAnalogto disable spread spectrum or to VDD to enable spread spectrum.12PVMAnalogPVM input for brightness control. Tie to GND if unused.13SGNDGNDSignal ground.14LED_SETAnalogLED string configuration through external resistor. Do not leave floating.15PVM_FSETAnalogLED dimming frequency setup through external resistor. Do not leave floating.16BST_FSETAnalogBoost switching frequency setup through external resistor. Do not leave floating.17MODEAnalogDimming mode setup through external resistor. Do not leave floating.18UVLOAnalogInput voltage sense for programming input UVLO threshold through external resistor to VIND19VSENSE_PAnalogPin for input voltage detection for OVP protection and positive input for input current sense20VSENSE_NAnalogPower line FET control. Open Drain output. If unused, leave this pin floating.21SDAnalogPower supply input for internal analog and digital circuit. Connect a 10 μ F capacitor betwe the VDD pin to GND23ENAnalogNegative input for charge pump flying capacitor. If feature not used leave this pin floating.26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7μF decoupling capacitor is recommended on CPUMP pin.27GDAnalogGate driver output for external n-FET.28PGNDGNDPower ground.29ISNSAnalogBoost current sense pin.30	PIN						
2         OUT5         Analog         LED current sink output. If unused tie to ground           3         OUT4         Analog         LED current sink output. If unused tie to ground.           4         LED_GND         GND         LED current sink output. If unused tie to ground.           6         OUT2         Analog         LED current sink output. If unused tie to ground.           7         OUT1         Analog         LED current sink output. If unused tie to ground.           8         INT         Analog         Device fault interrupt output, open drain. A 10k Ω pullup resistor is recommended.           9         SDA         Analog         SCL for 12C interface. A 10k Ω pullup resistor is recommended.           10         SCL         Analog         SCL for 12C interface. A 10k Ω pullup resistor is recommended.           11         BST_SYNC         Analog         PWM input for synchronizing boost. When synchronization is not used, connect this pin to ground to disable spread spectrum.           12         PWM         Analog         LED string configuration through external resistor. Do not leave floating.           13         SGND         GND         Signal ground.         The LED string configuration through external resistor. Do not leave floating.           14         LED_SET         Analog         Dimming mode setup through external resistor. Do not leave floating. <th>NO.</th> <th>NAME</th> <th>IYPE</th> <th>DESCRIPTION</th>	NO.	NAME	IYPE	DESCRIPTION			
3         OUT4         Analog         LED current sink output. If unused tie to ground.           4         LED_GND         GND         LED ground connection.           5         OUT3         Analog         LED current sink output. If unused tie to ground.           6         OUT1         Analog         LED current sink output. If unused tie to ground.           7         OUT1         Analog         LED current sink output. If unused tie to ground.           8         INT         Analog         Device fault interrupt output, open drain. If unused tie to ground.			
8         INT         Analog         Device fault interrupt output, open drain. A 10k Ω pullup resistor is recommended.           9         SDA         Analog         SDA for I2C interface. A 10k Ω pullup resistor is recommended.           10         SCL         Analog         SDA for I2C interface. A 10k Ω pullup resistor is recommended.           11         BST_SYNC         Analog         Input for synchronizing boost. When synchronization is not used, connect this pin to ground to disable spread spectrum or to VDD to enable spread spectrum.           12         PWM         Analog         PWM input for brightness control. Tie to GND if unused.           13         SGND         GND         Signal ground.           14         LED_SET         Analog         LED dimming frequency setup through external resistor. Do not leave floating.           16         BST_FSET         Analog         Dimming mode setup through external resistor. Do not leave floating.           17         MODE         Analog         Dimming mode setup through external resistor. Do not leave floating.           18         UVLO         Analog         Pin for input voltage detection for OVP protection and positive input for input current sense is not used, please lie to VSENSE_P           20         VSENSE_N         Analog         Power supply input for input current sense. If input current sense is not used leave this pin floating.           21	6	OUT2	Analog	LED current sink output. If unused tie to ground.			
9         SDA         Analog         SDA for I2C interface. A 10k Ω pullup resistor is recommended.           10         SCL         Analog         SCL for I2C interface. A 10k Ω pullup resistor is recommended.           11         BST_SYNC         Analog         Input for synchronizing boost. When synchronization is not used, connect this pin to ground to disable spread spectrum to VDD to enable spread spectrum.           12         PWM         Analog         PWM input for brightness control. Tie to GND if unused.           13         SGND         GND         Signal ground.           14         LED_SET         Analog         LED string configuration through external resistor. Do not leave floating.           15         PWM_FSET         Analog         Dimming frequency setup through external resistor. Do not leave floating.           16         BST_FSET         Analog         Dimming mode setup through external resistor. Do not leave floating.           17         MODE         Analog         Dimming mode setup through external resistor. Do not leave floating.           18         UVLO         Analog         Pin for input voltage detection for OVP protection and positive input for input current sense.           20         VSENSE_P         Analog         Power line FET control. Open Drain output. If unused, leave this pin floating.           21         SD         Analog         Power line FE	7	OUT1	Analog	LED current sink output. If unused tie to ground.			
10         SCL         Analog         SCL for 12C interface. A 10k Ω pullup resistor is recommended.           11         BST_SYNC         Analog         Input for synchronizing boost. When synchronization is not used, connect this pin to groun to disable spread spectrum or to VDD to enable spread spectrum.           12         PWM         Analog         PWM input for brightness control. Tie to GND if unused.           13         SGND         GND         Signal ground.           14         LED_SET         Analog         LED string configuration through external resistor. Do not leave floating.           15         PWM_FSET         Analog         LED dimming frequency setup through external resistor. Do not leave floating.           16         BST_FSET         Analog         Dimming mode setup through external resistor. Do not leave floating.           17         MODE         Analog         Dimming frequency setup through external resistor. Do not leave floating.           18         UVLO         Analog         Negative input for input ourent sense. If input ourent sense is not used, please the to VSENSE_P           20         VSENSE_N         Analog         Power line FET control. Open Drain output. If unused, leave this pin floating.           21         SD         Analog         Power supply input for internal analog and digital circuit. Connect a 10 µ F capacitor betwe the VDD pin to GND           23	8	INT	Analog	Device fault interrupt output, open drain. A 10k $\Omega$ pullup resistor is recommended.			
11         BST_SYNC         Analog         Input for synchronizing boost. When synchronization is not used, connect this pin to groun to disable spread spectrum or to VDD to enable spread spectrum.           12         PWM         Analog         PWM input for brightness control. Tie to GND if unused.           13         SGND         GND         Signal ground.           14         LED_SET         Analog         LED driming frequency setup through external resistor. Do not leave floating.           15         PVM_FSET         Analog         LED driming frequency setup through external resistor. Do not leave floating.           17         MODE         Analog         Dimming mede setup through external resistor. Do not leave floating.           18         UVLO         Analog         Input voltage sense for programming input UVLO threshold through external resistor to VIN           19         VSENSE_P         Analog         Pin for input voltage detection for OVP protection and positive input for input current sense           20         VSENSE_N         Analog         Power ine FET control. Open Drain output. If unused, leave this pin floating.           21         SD         Analog         Power supply input for charge pump flying capacitor. If feature not used leave this pin floating.           23         EN         Analog         Negative input for charge pump flying capacitor. If feature not used leave this pin floating.      <	9	SDA	Analog	SDA for I2C interface. A 10k $\Omega$ pullup resistor is recommended.			
11BS1_STNCAnalogto disable spread spectrum or to VDD to enable spread spectrum.12PVMAnalogPVM input for brightness control. Tie to GND if unused.13SGNDGNDSignal ground.14LED_SETAnalogLED string configuration through external resistor. Do not leave floating.15PVM_FSETAnalogLED dimming frequency setup through external resistor. Do not leave floating.16BST_FSETAnalogBoost switching frequency setup through external resistor. Do not leave floating.17MODEAnalogDimming mode setup through external resistor. Do not leave floating.18UVLOAnalogInput voltage sense for programming input UVLO threshold through external resistor to VIND19VSENSE_PAnalogPin for input voltage detection for OVP protection and positive input for input current sense20VSENSE_NAnalogPower line FET control. Open Drain output. If unused, leave this pin floating.21SDAnalogPower supply input for internal analog and digital circuit. Connect a 10 μ F capacitor betwe the VDD pin to GND23ENAnalogNegative input for charge pump flying capacitor. If feature not used leave this pin floating.26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7μF decoupling capacitor is recommended on CPUMP pin.27GDAnalogGate driver output for external n-FET.28PGNDGNDPower ground.29ISNSAnalogBoost current sense pin.30	10	SCL	Analog	SCL for I2C interface. A 10k $\Omega$ pullup resistor is recommended.			
13       SGND       GND       Signal ground.         14       LED_SET       Analog       LED string configuration through external resistor. Do not leave floating.         15       PWM_FSET       Analog       LED dimming frequency setup through external resistor. Do not leave floating.         16       BST_FSET       Analog       Dimming mode setup through external resistor. Do not leave floating.         17       MODE       Analog       Dimming mode setup through external resistor. Do not leave floating.         18       UVLO       Analog       Input voltage sense for programming input UVLO threshold through external resistor to VIN         19       VSENSE_P       Analog       Pin for input voltage detection for OVP protection and positive input for input current sense         20       VSENSE_N       Analog       Power line FET control. Open Drain output. If unused, leave this pin floating.         21       SD       Analog       Power supply input for internal analog and digital circuit. Connect a 10 µ F capacitor betwe the VDD pin to GND         23       EN       Analog       Negative input for charge pump flying capacitor. If feature not used leave this pin floating.         26       CPUMP       Power       Charge pump output pin. Connect to VDD if charge pump is not used. A 4.7µF decoupling capacitor is recommended on CPUMP pin.         26       CPUMP       Power       Charge p	11	BST_SYNC	Analog	Input for synchronizing boost. When synchronization is not used, connect this pin to ground to disable spread spectrum or to VDD to enable spread spectrum.			
14       LED_SET       Analog       LED string configuration through external resistor. Do not leave floating.         15       PWM_FSET       Analog       LED dimming frequency setup through external resistor. Do not leave floating.         16       BST_FSET       Analog       Boost switching frequency setup through external resistor. Do not leave floating.         17       MODE       Analog       Dimming mode setup through external resistor. Do not leave floating.         18       UVLO       Analog       Dimming mode setup through external resistor. Do not leave floating.         19       VSENSE_P       Analog       Pin for input voltage sense for programming input UVLO threshold through external resistor to VIN         19       VSENSE_P       Analog       Pin for input voltage detection for OVP protection and positive input for input current sense         20       VSENSE_N       Analog       Power line FET control. Open Drain output. If unused, leave this pin floating.         21       SD       Analog       Power supply input for internal analog and digital circuit. Connect a 10 µ F capacitor betwe the VDD pin to GND         23       EN       Analog       Negative input for charge pump flying capacitor. If feature not used leave this pin floating.         24       C1N       Analog       Negative input for charge pump flying capacitor. If feature not used leave this pin floating.         25	12	PWM	Analog	VM input for brightness control. Tie to GND if unused.			
15       PWM_FSET       Analog       LED dimming frequency setup through external resistor. Do not leave floating.         16       BST_FSET       Analog       Boost switching frequency setup through external resistor. Do not leave floating.         17       MODE       Analog       Dimming mode setup through external resistor. Do not leave floating.         18       UVLO       Analog       Input voltage sense for programming input UVLO threshold through external resistor to VIN         19       VSENSE_P       Analog       Pin for input voltage detection for OVP protection and positive input for input current sense         20       VSENSE_N       Analog       Negative input for input current sense. If input current sense is not used, please tie to VSENSE_P pin.         21       SD       Analog       Power line FET control. Open Drain output. If unused, leave this pin floating.         22       VDD       Power       Power supply input for internal analog and digital circuit. Connect a 10 μ F capacitor betwe the VDD pin to GND         23       EN       Analog       Regative input for charge pump flying capacitor. If feature not used leave this pin floating.         24       C1N       Analog       Negative input for charge pump flying capacitor. If feature not used leave this pin floating.         25       C1P       Analog       Positive input for charge pump flying capacitor. If feature not used leave this pin floating.	13	SGND	GND	Signal ground.			
16       BST_FSET       Analog       Boost switching frequency setup through external resistor. Do not leave floating.         17       MODE       Analog       Dimming mode setup through external resistor. Do not leave floating.         18       UVLO       Analog       Input voltage sense for programming input UVLO threshold through external resistor to VIN         19       VSENSE_P       Analog       Pin for input voltage detection for OVP protection and positive input for input current sense         20       VSENSE_N       Analog       Negative input for input current sense. If input current sense is not used, please tie to VSENSE_P pin.         21       SD       Analog       Power line FET control. Open Drain output. If unused, leave this pin floating.         22       VDD       Power       Power supply input for internal analog and digital circuit. Connect a 10 μ F capacitor betwe the VDD pin to GND         23       EN       Analog       Negative input for charge pump flying capacitor. If feature not used leave this pin floating.         24       C1N       Analog       Negative input for charge pump flying capacitor. If feature not used leave this pin floating.         25       C1P       Analog       Postive input for charge pump flying capacitor. If feature not used leave this pin floating.         26       CPUMP       Power       Charge pump output pin. Connect to VDD if charge pump is not used. A 4.7µF decoupling capacitor is	14	LED_SET	Analog	LED string configuration through external resistor. Do not leave floating.			
17MODEAnalogDimming mode setup through external resistor. Do not leave floating.18UVLOAnalogInput voltage sense for programming input UVLO threshold through external resistor to VIN19VSENSE_PAnalogPin for input voltage detection for OVP protection and positive input for input current sense20VSENSE_NAnalogNegative input for input current sense. If input current sense is not used, please tie to VSENSE_P pin.21SDAnalogPower line FET control. Open Drain output. If unused, leave this pin floating.22VDDPowerPower supply input for internal analog and digital circuit. Connect a 10 μ F capacitor betwe the VDD pin to GND23ENAnalogNegative input for charge pump flying capacitor. If feature not used leave this pin floating.25C1PAnalogPositive input for charge pump flying capacitor. If feature not used leave this pin floating.26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7µF decoupling capacitor is recommended on CPUMP pin.27GDAnalogGate driver output for external N-FET.28PGNDGNDPower ground.29ISNSAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense resistor GND.31ISETAnalogLED full-scale current setup through external resistor.32FBAnalogBoost feedback input.	15	PWM_FSET	Analog	LED dimming frequency setup through external resistor. Do not leave floating.			
18UVLOAnalogInput voltage sense for programming input UVLO threshold through external resistor to VIN19VSENSE_PAnalogPin for input voltage detection for OVP protection and positive input for input current sense20VSENSE_NAnalogNegative input for input current sense. If input current sense is not used, please tie to VSENSE_P pin.21SDAnalogPower line FET control. Open Drain output. If unused, leave this pin floating.22VDDPowerPower supply input for internal analog and digital circuit. Connect a 10 μ F capacitor betwe the VDD pin to GND23ENAnalogEnable input.24C1NAnalogNegative input for charge pump flying capacitor. If feature not used leave this pin floating.25C1PAnalogPositive input for charge pump flying capacitor. If feature not used leave this pin floating.26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7µF decoupling capacitor is recommended on CPUMP pin.27GDAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense pin.30ISNSGNDGNDCurrent sense pin.31ISETAnalogLED full-scale current setup through external resistor.32FBAnalogBoost feedback input.	16	BST_FSET	Analog	Boost switching frequency setup through external resistor. Do not leave floating.			
19VSENSE_PAnalogPin for input voltage detection for OVP protection and positive input for input current sense20VSENSE_NAnalogNegative input for input current sense. If input current sense is not used, please tie to VSENSE_P pin.21SDAnalogPower line FET control. Open Drain output. If unused, leave this pin floating.22VDDPowerPower supply input for internal analog and digital circuit. Connect a 10 μ F capacitor betwe the VDD pin to GND23ENAnalogEnable input.24C1NAnalogNegative input for charge pump flying capacitor. If feature not used leave this pin floating.25C1PAnalogPositive input for charge pump flying capacitor. If feature not used leave this pin floating.26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7µF decoupling capacitor is recommended on CPUMP pin.27GDAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense pin.31ISETAnalogLED full-scale current setup through external resistor.32FBAnalogBoost feedback input.	17	MODE	Analog	Dimming mode setup through external resistor. Do not leave floating.			
20VSENSE_NAnalogNegative input for input current sense. If input current sense is not used, please tie to VSENSE_P pin.21SDAnalogPower line FET control. Open Drain output. If unused, leave this pin floating.22VDDPowerPower supply input for internal analog and digital circuit. Connect a 10 μ F capacitor betwe the VDD pin to GND23ENAnalogEnable input.24C1NAnalogNegative input for charge pump flying capacitor. If feature not used leave this pin floating.25C1PAnalogPositive input for charge pump flying capacitor. If feature not used leave this pin floating.26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7μF decoupling capacitor is recommended on CPUMP pin.27GDAnalogGate driver output for external N-FET.28PGNDGNDPower ground.29ISNSAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense resistor GND.31ISETAnalogLED full-scale current setup through external resistor.32FBAnalogBoost feedback input.	18	UVLO	Analog	Input voltage sense for programming input UVLO threshold through external resistor to VIN.			
20VSENSE_NAnalogVSENSE_P pin.21SDAnalogPower line FET control. Open Drain output. If unused, leave this pin floating.22VDDPowerPower supply input for internal analog and digital circuit. Connect a 10 μ F capacitor betwe the VDD pin to GND23ENAnalogEnable input.24C1NAnalogNegative input for charge pump flying capacitor. If feature not used leave this pin floating.25C1PAnalogPositive input for charge pump flying capacitor. If feature not used leave this pin floating.26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7μF decoupling capacitor is recommended on CPUMP pin.27GDAnalogGate driver output for external N-FET.28PGNDGNDPower ground.29ISNSAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense resistor GND.31ISETAnalogBoost feedback input.	19	VSENSE_P	Analog	Pin for input voltage detection for OVP protection and positive input for input current sense.			
22VDDPowerPower supply input for internal analog and digital circuit. Connect a 10 μ F capacitor betwe the VDD pin to GND23ENAnalogEnable input.24C1NAnalogNegative input for charge pump flying capacitor. If feature not used leave this pin floating.25C1PAnalogPositive input for charge pump flying capacitor. If feature not used leave this pin floating.26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7μF decoupling capacitor is recommended on CPUMP pin.27GDAnalogGate driver output for external N-FET.28PGNDGNDPower ground.29ISNSAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense resistor GND.31ISETAnalogLED full-scale current setup through external resistor.32FBAnalogBoost feedback input.	20	VSENSE_N	Analog				
22VDDPowerthe VDD pin to GND23ENAnalogEnable input.24C1NAnalogNegative input for charge pump flying capacitor. If feature not used leave this pin floating.25C1PAnalogPositive input for charge pump flying capacitor. If feature not used leave this pin floating.26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7µF decoupling capacitor is recommended on CPUMP pin.27GDAnalogGate driver output for external N-FET.28PGNDGNDPower ground.29ISNSAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense resistor GND.31ISETAnalogBoost feedback input.	21	SD	Analog	Power line FET control. Open Drain output. If unused, leave this pin floating.			
24C1NAnalogNegative input for charge pump flying capacitor. If feature not used leave this pin floating.25C1PAnalogPositive input for charge pump flying capacitor. If feature not used leave this pin floating.26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7μF decoupling capacitor is recommended on CPUMP pin.27GDAnalogGate driver output for external N-FET.28PGNDGNDPower ground.29ISNSAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense resistor GND.31ISETAnalogLED full-scale current setup through external resistor.32FBAnalogBoost feedback input.	22	VDD	Power	Power supply input for internal analog and digital circuit. Connect a 10 $\mu$ F capacitor between the VDD pin to GND			
25C1PAnalogPositive input for charge pump flying capacitor. If feature not used leave this pin floating.26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7μF decoupling capacitor is recommended on CPUMP pin.27GDAnalogGate driver output for external N-FET.28PGNDGNDPower ground.29ISNSAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense resistor GND.31ISETAnalogLED full-scale current setup through external resistor.32FBAnalogBoost feedback input.	23	EN	Analog	Enable input.			
26CPUMPPowerCharge pump output pin. Connect to VDD if charge pump is not used. A 4.7µF decoupling capacitor is recommended on CPUMP pin.27GDAnalogGate driver output for external N-FET.28PGNDGNDPower ground.29ISNSAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense resistor GND.31ISETAnalogLED full-scale current setup through external resistor.32FBAnalogBoost feedback input.	24	C1N	Analog	Negative input for charge pump flying capacitor. If feature not used leave this pin floating.			
20CFOMPFowercapacitor is recommended on CPUMP pin.27GDAnalogGate driver output for external N-FET.28PGNDGNDPower ground.29ISNSAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense resistor GND.31ISETAnalogLED full-scale current setup through external resistor.32FBAnalogBoost feedback input.	25	C1P	Analog	Positive input for charge pump flying capacitor. If feature not used leave this pin floating.			
28       PGND       GND       Power ground.         29       ISNS       Analog       Boost current sense pin.         30       ISNSGND       GND       Current sense resistor GND.         31       ISET       Analog       LED full-scale current setup through external resistor.         32       FB       Analog       Boost feedback input.	26	CPUMP	Power	Charge pump output pin. Connect to VDD if charge pump is not used. A 4.7µF decoupling capacitor is recommended on CPUMP pin.			
29ISNSAnalogBoost current sense pin.30ISNSGNDGNDCurrent sense resistor GND.31ISETAnalogLED full-scale current setup through external resistor.32FBAnalogBoost feedback input.	27	GD	Analog	Gate driver output for external N-FET.			
30     ISNSGND     GND     Current sense resistor GND.       31     ISET     Analog     LED full-scale current setup through external resistor.       32     FB     Analog     Boost feedback input.	28	PGND	GND	Power ground.			
31     ISET     Analog     LED full-scale current setup through external resistor.       32     FB     Analog     Boost feedback input.	29	ISNS	Analog	Boost current sense pin.			
32 FB Analog Boost feedback input.	30	ISNSGND	GND	Current sense resistor GND.			
	31	ISET	Analog	LED full-scale current setup through external resistor.			
	32	FB	Analog	Boost feedback input.			
DAP LED_GND GND LED ground connection.	DAP	LED_GND	GND	LED ground connection.			

# **5** Specifications

# 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1) (2)</sup>

		MIN	MAX	UNIT
Voltage on pins	VSENSE_N, SD, UVLO	- 0.3	VSENSE _P + 0.3	V
	VSENSE_P, FB, DISCHARGE , OUT1 to OUT6	- 0.3	52	V
Voltage on pins	C1N, C1P, VDD, EN, ISNS, ISNS_GND, INT, MODE, PWM_FSET, BST_FSET, LED_SET, ISET, GD and CPUMP	- 0.3	6	V
Voltage on pins	PWM, BST_SYNC, SDA, SCL	- 0.3	VDD + 0.3	V
	Continuous power dissipation <sup>(4)</sup>		Internally Limited	W
	Ambient temperature, TA <sup>(3)</sup>	- 40	125	
Thermal	Junction temperature, TJ <sup>(3)</sup>	- 40	150	°C
	Lead temperature (soldering)		260	°C
	Storage temperature, Tstg	- 65	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

(2) All voltages are with respect to the potential at the GND pins.

(3) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature  $(T_{A-MAX})$  is dependent on the maximum operating junction temperature  $(T_{J-MAX} = 150^{\circ}C)$ , the power dissipation of the device in the application (P), the junction-to-board thermal resistance and the temperature difference between the system board and the ambient ( $\Delta t_{BA}$ ), which is given by the following equation:  $T_{A-MAX} = T_{J-MAX} - (\Theta_{JB} \times P) - \Delta t_{BA}$ 

(4) Internal thermal shutdown circuitry protects the device from permanent damage. Thermal shutdown engages at T<sub>J</sub> = 165°C (typical) and disengages at T<sub>J</sub> = 150°C (typical).

# 5.2 ESD Ratings

				VALUE	UNIT	
		Human body model (HBM), per AEC Q100	0-002 <sup>(1)</sup>	±2000		
	Electrostatic discharge	Charged device model (CDM), per AEC	Corner pins (1, 19, 20 and 38)	±750	V	
		Q100-011	Other pins	±500		

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### **5.3 Recommended Operating Conditions**

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	NOM	MAX	UNIT
	VSENSE_P, VSENSE_N, SD, UVLO	3	12	48	
	FB, DISCHARGE, OUT1 to OUT6	0		48	
Voltage on	ISNS, ISNSGND	0		5.5	V
pins	EN, PWM, INT, SDA, SCL, BST_SYNC	0	3.3	5.5	v
	VDD	3	3.3/5	5.5	
	C1N, C1P, CPUMP,GD	0	5	5.5	
Thermal	Ambient temperature, T <sub>A</sub>	- 40		125	°C

(1) All voltages are with respect to the potential at the GND pins.

R <sub>0 JB</sub>	Junction-to-board thermal resistance	8.8	6.8	°C/W
ΨJT	Junction-to-top characterization parameter	0.3	0.3	C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	8.9	6.8	
R <sub>0 JC(bot)</sub>	Junction-to-case (bottom) thermal resistance	2.7	1.8	1

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

(2) Junction-to-ambient thermal resistance is highly application and board-layout dependent. In applications where high maximum power dissipation exists, special care must be paid to thermal dissipation issues in board design.

# 6 Detailed Description

# 6.1 Overview

The LP8866S-Q1 device is a high-voltage LED driver for automotive infotainment, clusters, HUD and other automotive display LED backlight applications. PWM input is used for brightness control by default. Alternatively, the brightness can also be controlled by I2C Interface.

The boost frequency, LED PWM frequency, and LED string current are configured with external resistors through the BST\_FSET, PWM\_FSET, and ISET pins. The INT pin is used to report faults to the system. Fault interrupt status can be cleared with the I2C interface, or is cleared on the falling edge of the EN pin.

The LP8866S-Q1 supports pure PWM dimming. The six LED current drivers provide up to 150mA per output and can be tied together to support higher current LEDs. The maximum output current of the LED drivers is set with the ISET resistor and can be optionally scaled by the LEDx\_CURRENT[11:0] register bits with I2C interface. The LED output PWM frequency is set with a PWM\_FSET resistor. The number of connected LED strings is configured by the LED\_SET resistor, and the device automatically selects the corresponding phase shift mode. For example, if the device is set to 4-strings mode, each LED output is phase shifted by 90 degrees with each other (= 360 / 4). Unused outputs, which must be connected to GND, will be disabled and excluded from adaptive voltage and won't generate any LED faults.

A resistor divider connected from  $V_{OUT}$  to the FB pin sets the maximum voltage of the boost. For best efficiency, the boost voltage is adapted automatically to the minimum necessary level needed to drive the LED strings by monitoring all the LED output voltages continuously. The switching frequency of the boost regulator can be set between 100kHz and 2.2MHz by the BST\_FSET resistor. The boost has a start-up feature that reduces the peak current from the power-line during start-up. The LP8866S-Q1 can also control a power-line FET to reduce battery leakage when disabled and provide isolation and protection in the event of a fault.

Fault detection features of LP8866S-Q1 include:

- Open-string and shorted LED detection
  - LED fault detection prevents system overheating in case of open or short in some of the LED strings
- · LED short-to-ground detection
- ISET/BST\_FSET/PWM\_FSET/LED\_SET/MODE resistor out-of-range detection
- Boost overcurrent
- Boost overvoltage
- Device undervoltage protection (VDD UVLO)

- Threshold sensing from VDD pin

- V<sub>IN</sub> input overvoltage protection (V<sub>IN</sub> OVP)
  - Threshold sensing from VSENSE\_P pin
- V<sub>IN</sub> input undervoltage protection (V<sub>IN</sub> UVLO)
  - Threshold sensing from UVLO pin
- V<sub>IN</sub> input overcurrent protection (V<sub>IN</sub> OCP)
  - Threshold sensing across voltage between VSENSE\_P pin and VSENSE\_N pin
- Thermal shutdown in case of die overtemperature

# 6.2 Functional Block Diagram

#### LP8866S-Q1 ZHCSLM9B - AUGUST 2020 - REVISED MAY 2024

# 6.3 Feature Description

### 6.3.1 Control Interface

Device control interface includes:

- EN is the enable input for the LP8866S-Q1 device.
- PWM is the default input to control the brightness of all current sinks by duty cycle.
- INT is an open-drain fault output indicating fault condition detection.
- SDA and SCL are data and clock line for I2C interface to control the brightness of all current sinks and read back the fault conditions for diagnosis.
- BST\_SYNC is used to input an external clock for the boost switching frequency and control the internal boost clock mode.
  - The external clock is auto detected at start-up and, if missing, the internal clock is used.
  - Optionally, the BST\_SYNC can be tied to VDD to enable the boost spread spectrum function or tied to GND to disable it.
- ISET pin to set the maximum LED current level per string.

### 6.3.2 Function Setting

Device parameter setting includes:

- BST\_FSET pin is used to set the boost switching frequency through a resistor to signal ground.
- PWM\_FSET pin is used to set the LED output PWM dimming frequency through a resistor to signal ground.
- MODE pin is used to set the dimming mode via an external resistor to signal ground.
- LED\_SET pin is used to set the LED configuration through a resistor to signal ground.
- · ISET pin is used to set the maximum LED current level per OUTx pin.

### 6.3.3 Device Supply (VDD)

All internal analog and digital blocks of LP8866S-Q1 are biased from external supply from VDD pin. Either a typical 5V or 3.3V supply rail is able to supply VDD from previous linear regulator or DC/DC converter with at least 150mA current capability.

#### 6.3.4 Enable (EN)

The LP8866S-Q1 only turns on when the input voltage of EN pin is above the voltage threshold (VEN<sub>IH</sub>) and turns off when the voltage of EN pin is below the threshold (VEN<sub>IL</sub>). All analog and digital blocks start operating once the LP8866S-Q1 is enabled by asserting EN pin. The SD pin is floating, I2C interface and Fault detection are not active if the EN pin is de-asserted.

# 6.3.5 Charge Pump

An integrated regulated charge pump can be used to supply the gate drive for the external FET of the boost controller. The charge pump is enabled or disabled by automatically detecting whether VDD and CPUMP pin are connected together. If VDD is < 4.5V then use the charge pump to generate a 5V gate voltage to drive the external boost switching FET. To use the charge pump, a  $2.2\mu$ F capacitor is placed between C1N and C1P. If the charge pump is not required, C1N and C1P could be left unconnected and CPUMP pins tied to VDD. A  $4.7\mu$ F CPUMP capacitor is used to store energy for the gate driver. The CPUMP capacitor is required to be used in both charge pump enabled and disabled conditions and must be placed as close as possible to the CPUMP pins.  $\mathbb{K}$  6-1 and  $\mathbb{K}$  6-2 show required connections for both use cases.

图 6-2. Charge Pump Disabled Circuit

If the charge pump is enabled, the CPCAP\_STATUS bit shows whether a fly capacitor was detected and the CP\_STATUS bit shows status of any charge pump faults and generates an INT signal. The CP\_INT\_EN bit can be used to prevent the charge-pump fault from causing an interrupt on the INT pin.

#### 6.3.6 Boost Controller

The LP8866S-Q1 current-mode-controlled boost DC/DC controller generates the anode voltage for the LEDs. The boost is a current-mode-controlled topology with a cycle by cycle current limit. The boost converter senses the switch current and across the external sense resistor connected between ISNS and ISNSGND. A  $20m \Omega$  sense resistor results in a 10A cycle by cycle current limit. The sense resistor value could vary from  $15m \Omega$  to  $50m \Omega$  depending on the application. Maximum boost voltage is configured with external FB-pin resistor divider connected between V<sub>OUT</sub> and FB. The FB-divider equation is described in # 6.3.6.3.

图 6-3. Boost Controller Block Diagram

The boost switching frequency is adjustable from 100kHz to 2.2MHz via an external resistor at BST\_FSET (see  $\ddagger 6-1$ ). Resistor with 1% accuracy is needed to ensure proper operation.

衣 6-1. Boost Frequency Selection

124	2222				

表 6-1	Boost	Frequen	cy Selection	•
10-1.	DUUSI	riequeir		

#### 6.3.6.1 Boost Cycle-by-Cycle Current Limit

The voltage between ISNS and ISNSGND is used for both boost DC/DC controller's current sensing and cycleby-cycle current limit settings. When the cycle-by-cycle current limit is reached, the controller will turn off the switching MOSFET immediately and turn on it again in next siwtching cycle. This cycle-by-cycle current limit could be used as a common protection for all related DC/DC components (inductor, schottky diode and switching MOSFET) to avoid current running over their max limit. Cycle-by-cycle current limit won't trigger any faults of the device.

$$I_{CYCLE\_LIMIT} = \frac{V_{ISNS}}{R_{SENSE}}$$

(1)

where

V<sub>ISNS</sub> = 200mV

### 6.3.6.2 Controller Min On/Off Time

The device boost DC/DC controller has minimum on/off time as below table. Minimum off time should be specially taken care in system design. The SW node rising time plus falling time should be higher than minimum off time to avoid controller not turning off the MOSFET.

Frequency (kHz)	Minimum Switch OFF Time (ns)	Minimum Switch ON Time (ns)				
100 to 500	150	150				
1818 to 2222	40	110				

#### 表 6-2. Controller Minimum On/Off Time

#### 6.3.6.3 Boost Adaptive Voltage Control

The LP8866S-Q1 boost DC/DC converter generates the anode voltage for the LEDs. During normal operation, boost output voltage is adjusted automatically based on the LED current sink headroom voltages. This is called adaptive boost control. The number of used LED outputs is set by LED\_SET pin and only the active LED outputs are monitored to control the adaptive boost voltage. Any LED strings with open or short faults are also removed from the adaptive voltage control loop. The LED driver pin voltages are periodically monitored by the control loop and the boost voltage is raised if any of the LED outputs falls below the V<sub>HEADROOM</sub> threshold. The boost voltage is lowered until any of the LED outputs touch the V<sub>HEADROOM</sub> threshold. See 8 6-4 for how the boost voltage automatically scales based on the OUTx-pin voltage, V<sub>HEADROOM</sub> and V<sub>HEADROOM</sub> HYS.

图 6-4. Adaptive Boost Voltage Control Loop Function

The resistive divider ( $R_1$ ,  $R_2$ ) defines both the minimum and maximum adaptive boost voltage levels. The feedback circuit operates the same in boost and SEPIC topologies. Choose maximum boost voltage is based on the maximum LED string voltage specification, and needs at least 1V higher than maximum LED string voltage to make current sink work normally. Before the LED drivers are active, the boost starts up to the initial boost level. The initial boost voltage is approximately in the 88% point of minimum to maximum boost voltage. Once the LED driver channels are active, the boost output voltage is adjusted automatically based on OUTx pin voltages. The FB pin resistor divider also scales the boost OVP, OCP levels and the LED short level in HUD application.

#### 6.3.6.3.1 FB Divider Using Two-Resistor Method

A typical FB-pin circuit uses a two-resistor divider circuit between the boost output voltage and ground.

#### 图 6-5. Two-Resistor FB Divider Circuit

Maximum boost voltage can be calculated with Equation 2. The maximum boost voltage can be reached during OPEN string detection or if all LED strings are left disconnected.

$$V_{\text{BOOST}_MAX} = I_{\text{SEL}_MAX} \times R_1 + \left(\frac{R_1}{R_2} + 1\right) \times V_{\text{REF}}$$
(2)

where

- V<sub>REF</sub>= 1.21V
- I<sub>SEL MAX</sub> = 38.7µA
- $R_1 / R_2$  normal recommended range is 7~15

The minimum boost voltage must be less than the minimum LED string voltage. Minimum boost voltage is calculated with Equation 3:

$$V_{\text{BOOST}_{\text{MIN}}} = \left(\frac{R_1}{R_2} + 1\right) \times V_{\text{REF}}$$
(3)

where

• V<sub>REF</sub> = 1.21V

When the boost OVP\_LOW level is reached, the boost controller stops switching the boost FET and the BSTOVPL\_STATUS bit is set. The LED drivers are still active during this condition, and the boost resumes normal switching operation once the boost output level falls. The boost OVP low voltage threshold changes dynamically with current boost voltage. It is calculated in Equation 4:

$$V_{\text{BOOST}_\text{OVPL}} = V_{\text{BOOST}} + \left(\frac{R_1}{R_2} + 1\right) \times (V_{\text{FB}_\text{OVPL}} - V_{\text{REF}})$$
(4)

where

- V<sub>FB OVPL</sub> = 1.423V
- V<sub>REF</sub> = 1.21V

When the boost OVP\_HIGH level is reached the boost controller enters fault recovery mode, and the BSTOVPH\_STATUS bit is set. The boost OVP high-voltage threshold also changes dynamically with current boost voltage and is calculated in Equation 5:

$$V_{\text{BOOST}_\text{OVPH}} = V_{\text{BOOST}} + \left(\frac{R_1}{R_2} + 1\right) \times (V_{\text{FB}_\text{OVPH}} - V_{\text{REF}})$$
(5)

where

- V<sub>FB OVPH</sub> = 1.76V
- V<sub>REF</sub> = 1.21V

When the boost UVP level is reached the boost controller starts a 110ms OCP counter. The LP8866S-Q1 device enters the fault recovery mode and sets the BSTOCP\_STATUS bit if the boost voltage does not rise above the UVP threshold before the timer expires. The boost UVP voltage threshold also changes dynamically with current boost voltage and is calculated in Equation 6:

$$V_{\text{BOOST\_UVP}} = V_{\text{BOOST}} - \left(\frac{R_1}{R_2} + 1\right) \times (V_{\text{REF}} - V_{\text{UVP}})$$

where

- V<sub>UVP</sub> = 0.886V
- V<sub>REF</sub> = 1.21V

(6)

### 6.3.6.3.2 FB Divider Using Three-Resistor Method

A FB-pin circuit using a three-resistor divider circuit can be used for applications where less than  $200 \text{ k} \Omega$  resistors are required.

图 6-6. Three-Resistor FB Divider Circuit

Maximum boost voltage can be calculated with Equation 7. The maximum boost voltage can be reached during OPEN string detection or if all LED strings are left disconnected.

$$V_{\text{BOOST\_MAX}} = \left(\frac{R_1 \times R_3}{R_2} + R_1 + R_3\right) \times I_{\text{SEL\_MAX}} + \left(\frac{R_1}{R_2} + 1\right) \times V_{\text{REF}}$$
(7)

where

- V<sub>REF</sub> = 1.21V
- I<sub>SEL MAX</sub> = 38.7μA
- $R_1 / R_2$  normal recommended range is 7 to 15

The minimum boost voltage must be less than the minimum LED string voltage. Minimum boost voltage is calculated in Equation 8:

$$V_{\text{BOOST}_{\text{MIN}}} = \left(\frac{R_1}{R_2} + 1\right) \times V_{\text{REF}}$$
(8)

When the boost OVP\_LOW level is reached the boost controller stops switching the boost FET, and the BSTOVPL\_STATUS bit is set. The LED drivers are still active during this condition, and the boost resumes normal switching operation once the boost output level falls. The boost OVP low voltage threshold changes dynamically with current boost voltage. It is calculated in Equation 9:

$$V_{\text{BOOST}_\text{OVPL}} = V_{\text{BOOST}} + \left(\frac{R_1}{R_2} + 1\right) \times (V_{\text{FB}_\text{OVPL}} - V_{\text{REF}})$$
(9)

where

- V<sub>FB OVPL</sub>= 1.423V
- V<sub>REF</sub>= 1.21V

When the boost OVP\_LOW level is reached the boost controller enters fault recovery mode, and the BSTOVPH\_STATUS bit is set. The boost OVP high-voltage threshold also changes dynamically with current boost voltage and is calculated in Equation 10:

$$V_{\text{BOOST}_\text{OVPH}} = V_{\text{BOOST}} + \left(\frac{R_1}{R_2} + 1\right) \times \left(V_{\text{FB}_\text{OVPH}} - V_{\text{REF}}\right)$$
(10)

where

- V<sub>FB OVPH</sub> = 1.76V
- V<sub>REF</sub>= 1.21V

When the boost UVP level is reached the boost controller starts a 110ms OCP counter. The LP8866S-Q1 device enters the fault recovery mode and sets the BSTOCP\_STATUS bit if the boost voltage does not rise above the UVP threshold before the timer expires. The boost UVP voltage threshold also changes dynamically with current boost voltage and is calculated in Equation 11:

$$V_{\text{BOOST}_{UVP}} = V_{\text{BOOST}} - \left(\frac{R_1}{R_2} + 1\right) \times (V_{\text{REF}} - V_{\text{UVP}})$$
(11)

where

- V<sub>UVP</sub> = 0.886V
- V<sub>REF</sub>= 1.21V

### 6.3.6.3.3 FB Divider Using External Compensation

The device has internal compensation network to keep the DC-DC control loop in good stability in most cases. However, an additional external compensation network could also be added on FB-pin to offer more flexibility in loop design or solving some extreme use-cases.

#### 图 6-7. External Compensation Network

This network will create one additional pole and one additional zero in the loop.

$$f_{POLE\_COMP} = \frac{1}{2\pi [(R_1 || R_2) + R_4] C_{COMP}}$$
(12)  
$$f_{ZERO\_COMP} = \frac{1}{2\pi R_4 C_{COMP}}$$
(13)

It could be noted that  $R_3$  doesn't take part in the compensation. So this external compensation network could be both used in two-divider network and T-divider network with no equation change.

In real application, for example, when DC-DC loop has stability concern, putting the additional pole in 1kHz and the additional zero in 2kHz will suppress the loop gain by approximately 6dB after 2kHz. This will benefit gain margin and phase margin a lot.

#### 6.3.6.4 Boost Sync and Spread Spectrum

Copyright © 2024 Texas Instruments Incorporated

Spread spectrum function could be enabled when BST SYNC pin is high and disabled when BST SYNC pin is low.

If an external CLK signal is on the BST SYNC pin, the boost controller can be clocked by this signal. If the clock disappears later, the boost continues operation at the frequency defined by RBST FSET resistor, and the spread spectrum function will be enabled or disabled depending on the final pin level of BST SYNC.

#### 表 6-3. Boost Synchronization Mode

BST_SYNC PIN LEVEL	BOOST CLOCK MODE
Low (GND)	Spread spectrum disabled
High (VDDIO)	Spread spectrum enabled
100kHz to 2222kHz clock frequency	Spread spectrum disabled, external synchronization mode

If using the external BST\_SYNC input, the R<sub>BST\_SET</sub> resistor should be chosen the closest boost frequency options with the external frequency.

The spread spectrum function helps to reduce EMI noise around the switching frequency and its harmonic frequencies. The internal spread spectrum function modulates the boost frequency ±3.3% to 7.2% from the central frequency with a 200Hz to 1.2kHz modulation frequency. The switching frequency variation is programmable by SPREAD RANGE register, and the modulation frequency is programmable by SPREAD MOD FREQ register. The spread-spectrum function cannot be used when an external synchronization clock is used.

SPREAD_RANGE (Binary)	SWITCHING FREQUENCY VARIATION			
00	±3.3%			
01	±4.3%			
10 (Default)	±5.3%			
11	±7.2%			

#### 表 6-4. Spread Spectrum Frequency Range

表 6-5. Spread Spectrum Modulation Frequency				
SPREAD_MOD_FREQ (Binary)	MODULATION FREQUENCY			
00 (Default)	200Hz			
01	500Hz			
10	800Hz			
11	1200Hz			

#### -- - - ...

#### 6.3.6.5 Boost Output Discharge

When the EN pin is pulled low, the device stops the boost controller and LED current sinks, turns off the powerline FET, and starts to discharge the boost output. The discharge pin typically sinks 30mA current. The discharge duration is 400ms. After 400ms, the device shuts down. The DISCHARGE pin must be connected with boost output for normal operation.

There is one internal comparator to monitor the voltage of DISCHARGE pin. As soon as the voltage of DISCHARGE pin is higher than  $V_{BST_OVPH}$  (typically 50V), the device enters into fault recovery mode, and BST\_OVPH fault is reported. This provides further protection if boost voltage is out of control because of system failure.

Discharge function is only available in HTSSOP package. It's not available in QFN package.

#### 6.3.6.6 Light Load Mode

The DC-DC controller will enter into light load mode in below condition:

- V<sub>IN</sub> voltage is very close to V<sub>OUT</sub>
- Loading current is very low
- PWM pulse width is very short

When DC-DC converter enters into light load mode, it stops switching occasionally to make sure output voltage won't rise up too much. It could also be called as PFM mode, since the DC-DC converter switching frequency will change in this mode.

# 6.3.7 LED Current Sinks

### 6.3.7.1 LED Output Current Setting

The maximum output LED current is set by an external resistor value. For the application only using external resistor  $R_{ISET}$  to set the maximum LED current for each string, the Equation 14 is used to calculate the current setting of all strings:

$$I_{LED} = \frac{1.21V}{R_{ISET}} \times 2580$$
(14)

The LEDx\_CURRENT[11:0] registers can also be used to adjust strings current down from this maximum. The default value for LEDx\_CURRENT[11:0] registers is the maximum 0xFFF(4095). Equation 15 is used to calculate the current setting of an individual string:

$$I_{\text{LED}} = \left(\frac{1.21V}{R_{\text{ISET}}} \times 2580\right) \times \left(\frac{\text{LED}_{\text{CURRENT}}[11:0]}{4095}\right)$$
(15)

For high accuracy of LED current, the ILED current is recommended to set in range from 30mA to 200mA. So the R<sub>ISET</sub> value is in the range from 15.6k  $\Omega$  to 104k  $\Omega$ .

图 6-8. LED Driver Current Setting Circuit

#### 6.3.7.2 LED Output String Configuration

The Six LED driver channels of the LP8866S-Q1 device is configured by the LED\_SET resistor, which supports applications using one to Six LED strings. Resistor with 1% accuracy is needed to ensure proper operation. The driver channels can also be tied together in groups of one, two or three. This allows the LP8866S-Q1 device to drive three 300mA LED strings, two 450mA LED strings, or one 900mA LED string. The LED strings are always appropriately phase shifted for their string configuration. This reduces the ripple seen at the boost output, which allows smaller output capacitors and reduces audible ringing in the capacitors. Phase shift increases the load frequency, which can move potential capacitor noise above the audible band while still keeping PWM frequency low to support a higher dimming ratio.

When the LP8866S-Q1 device is firstly powered on, the string configuration is configured by the LED\_SET resistor and the phases of each channel are automatically configured. The LED string configuration must not be changed unless the LP8866S-Q1 is powered off in shutdown state. The unused LEDx pins should be tied to ground.

R_LED_SET (k Ω)	CONFIGURATION	OUT1	OUT2	OUT3	OUT4	OUT5	OUT6	AUTOMATIC PHASE SHIFT
3.92	6 Channels	150mA	150mA	150mA	150mA	150mA	150mA	60°
4.75	5 Channels	150mA	150mA	150mA	150mA	150mA	(Tied to GND)	72°
5.76	4 Channels	150mA	150mA	150mA	150mA	(Tied to GND)	(Tied to GND)	90°
7.87	3 Channels	150mA	150mA	150mA	(Tied to GND)	(Tied to GND)	(Tied to GND)	120°
11	2 Channels	150mA	150mA	(Tied to GND)	(Tied to GND)	(Tied to GND)	(Tied to GND)	180°
17.8	3 Channels	300	mA	300	mA	30	0mA	120°
42.2	2 Channels	450mA 450mA		180°				
124	1 Channels	900mA		None				

### 表 6-6. LED Output String Configuration

#### 6.3.7.3 LED Output PWM Clock Generation

The LED PWM frequency is asynchronous from the input PWM frequency. The LED PWM frequency is generated from the internal 20MHz oscillator and can be set to eight discrete frequencies from 152Hz to 19.531kHz. The PWM dimming resolution is highest when the lowest PWM frequency is used. The PWM\_FSET resistor determines the LED PWM frequency based on  $\gtrsim$  6-8. PWM resolution in Table 7-8 is with PWM dither disabled.

### 6.3.8 Brightness Control

The LP8866S-Q1 supports global brightness control for all LED strings through either duty cycle input on PWM pin or register by I2C bus. An internal 20MHz clock is used for generating PWM outputs.

#### 6.3.8.1 Brightness Control Signal Path

The BRT\_MODE register selects whether the input to the display brightness path is the PWM input pin or DISP\_BRT register. PWM input control will be the default setup after power on. The brightness control signal path diagram is shown in  $\bigotimes$  6-9

The display brightness path has sloper function that can be enabled. By default the sloper function is enabled. The sloper and dither function also can be programmable by I2C control. The sloper function is described in  $\ddagger$  6.3.8.7, and the dither function is described in  $\ddagger$  6.3.8.9.

图 6-9. LP8866S-Q1 Brightness Path Diagram

#### 6.3.8.2 Dimming Mode

Dimming mode can be adjusted via an external resistor to MODE pin (see  $\frac{1}{8}$  6-7). Resistor with 1% accuracy is needed to ensure proper operation.

R_MODE (k Ω)	MODE	I2C Address
3.92	Phase-shift PWM Mode	0x2B
4.75	Hybrid Mode	0x2B
5.76	Current Dimming Mode	0x2B
7.87	Direct PWM Mode	0x2B
11	Phase-shift PWM Mode	0x2A
17.8	Hybrid Mode	0x2A
42.2	Current Dimming Mode	0x2A
124	Direct PWM Mode	0x2A

#### 表 6-7. Dimming Mode Configuration

#### 6.3.8.3 LED Dimming Frequency

The LED dimming frequency is asynchronous from the input PWM frequency for phase-shift PWM mode and hybrid dimming mode. The LED dimming frequency is generated from the internal 20MHz oscillator and can be set to eight discrete frequencies from 152Hz to 19.531kHz. The PWM dimming resolution is highest when the lowest PWM frequency is used. The PWM\_FSET resistor determines the LED Dimming frequency based on  $\frac{1}{8}$  6-8. Resistor with 1% accuracy is needed to ensure proper operation. PWM resolution in  $\frac{1}{8}$  6-8 is with PWM dither disabled.

R_PWM_FSET (k Ω)	LED PWM FREQUENCY (Hz)	PWM DIMMING RESOLUTION (bits)
3.92	152	16
4.75	305	16
5.76	610	15
7.87	1221	14
11	2441	13
17.8	4883	12
42.2	9766	11
124	19531	10

#### 表 6-8. LED PWM Frequency Selection

#### 6.3.8.4 Phase-Shift PWM Mode

In Phase-Shift PWM mode, all current active channels are turned on and off at LED dimming frequency with a constant delay. However, the number of used channels or channel groups determine the phase delay time between two neighboring channels as shown in  $\mathbb{E}$  6-10.

# 图 6-10. Phase-Shift Dimming Diagram

#### 6.3.8.5 Hybrid Mode

In addition to phase-shift PWM dimming, LP8866S-Q1 supports a hybrid-dimming mode. Hybrid dimming combines PWM and current modes for brightness control for the display brightness path. By using hybrid dimming, dimming ratio could be increased by another 8 times. In hybrid mode, PWM dimming is used for low brightness range of brightness, and current dimming is used for high brightness levels as shown in B 6-11. Current dimming control enables improved optical efficiency due to increased LED efficiency at lower currents. PWM dimming control at low brightness levels ensures linear and accurate control. Hybrid mode can be selected through resistor value at MODE pin as R 6-7. The PWM and current modes transition threshold can be set at 12.5% or at 0% brightness. The latter selection allows for pure current dimming control mode.

图 6-11. Hybrid Dimming Diagram

### 6.3.8.6 Direct PWM Mode

In direct PWM mode, all active channels are turned on and off and are synchronized with the input PWM signal.

### 图 6-12. Direct PWM Dimming Diagram

#### 6.3.8.7 Sloper

An optional sloper function makes the transition from one brightness value to another optically smooth. By default the advanced sloper is enabled with a 200ms linear sloper duration. Transition time between two brightness values is programmed with the SLOPE\_SELECT[2:0] bits (when 000, sloper is disabled). With advanced sloper enabled the brightness changes are further smoothed to be more pleasing to the human eye. Advanced slope is enabled with ADV\_SLOPE\_ENABLE register bit.

图 6-13. Brightness Sloper

#### 6.3.8.8 PWM Detector Hysteresis

PWM detector has an internal hysteresis function. It means when PWM input is used (except direct PWM mode), PWM output duty cycle will change only when PWM input duty cycle changes by more than 0.19%. This is to avoid the PWM duty cycle sampling error due to the onboard PWM signal's rising/falling time.

#### 6.3.8.9 Dither

The number of brightness steps when using LED output PWM dimming is equal to the 20MHz oscillator frequency divided by the LED PWM frequency (set by PWM\_FSET resistor). The PWM duty cycle dither is a function the LP8866S-Q1 uses to increase the number of brightness dimming steps beyond this oscillator clock limitation. The dither function modulates the LED driver output duty cycle over time to create more possible average brightness levels. The DITHER\_SELECT[3:0] register bits control the level of dither, disabled, 1, 2, 3 or 4 bits using the I2C interface. By default the dither is disabled.

When the 1-bit dither is selected, to support higher brightness resolution, the width of every second PWM pulse could be increased by one LSB (one 20MHz clock period). When the 3-bit dither is selected, within a sequence of 8 PWM periods the number of pulses with increased length varies depending on the dither value: dither value 000 - all 8 pulses at default length; 001 - one of the 8 pulses is longer; 010 - two of the 8 pulses are longer, and so forth, until at 111 - seven of the 8 pulses have increased length. A for the seven of PWM output dither.

### 图 6-14. PWM Dither Example

The dither block also helps in low brightness scenario when dimming ratio is limited by LED PWM output frequency and the LED output pulse is less than the minimum pulse width (200ns). In such scenario, the dither block will skip some of the PWM pulses to reduce the brightness further, enabling high dimming ratio. The end result is that the LED PWM frequency is reduced as more and more minimum pulses are skipped or dithered out. At the same time, dither block will also guarantee that the minimum LED PWM frequency is not less than 152Hz to ensure no brightness flickering. 🔀 6-15 shows how the dither works in low brightness scenario.

图 6-15. Minimum Brightness Dither Example

#### 6.3.9 Protection and Fault Detections

The LP8866S-Q1 device includes fault detections for LED open, short and short-to-GND conditions, boost input undervoltage, overvoltage and overcurrent, boost output overvoltage and overcurrent, VDD undervoltage, die overtemperature and external components. The host can monitor the status of the faults in registers SUPPLY\_FAULT\_STATUS, BOOST\_FAULT\_STATUS and LED\_STATUS.

#### 6.3.9.1 Supply Faults

#### 6.3.9.1.1 V<sub>IN</sub> Undervoltage Faults (VINUVLO)

The LP8866S-Q1 device supports  $V_{IN}$  undervoltage and overvoltage protection. The undervoltage threshold is programmable through external resistor divider on UVLO pin. If during operation of the LP8866S-Q1 device, the UVLO pin voltage falls below the UVLO falling level (0.787V typical), the boost, LED outputs, and power-line FET will be turned off, and the device will enter STANDBY mode. The VINUVLO\_STATUS bit is also set in the SUPPLY\_FAULT\_STATUS register, and the INT pin is triggered. When the UVLO voltage rises above the rising threshold level the LP8866S-Q1 exits STANDBY and begins the start-up sequence.

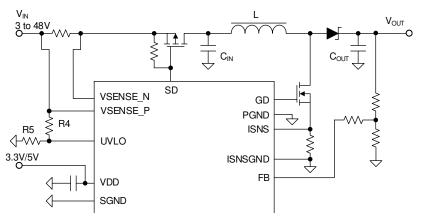

图 6-16. VIN UVLO Setting Circuit

The following equation is used to calculate the UVLO threshold for VIN rising edge:

$$VIN_{UVLO\_RISING} = (\frac{R_4}{R_5} + 1) \times VIN_{UVLO\_TH}$$
(16)

where

• VIN<sub>UVLO TH</sub> = 0.787V

The hysteresis of UVLO threshold can be designed and calculated with the following equation.

$$VIN_{HYST} = R_4 \times I_{UVLO}$$
(17)

where

So the following equation can be used for UVLO threshold for VIN falling edge:

 $VIN_{UVLO FALLING} = VIN_{UVLO RISING} - VIN_{HYST}$ 

(18)

The bottom resistors,  $R_5$  of voltage divider is able to be disconnected to the GND through an additional external N-type of FET as 8 6-17. This design is to minimize the current leakage from VIN in shutdown mode to extend the battery life.

图 6-17. V<sub>IN</sub> UVLO Setting Circuit Without Current Leakage Path

### 6.3.9.1.2 V<sub>IN</sub> Overvoltage Faults (VINOVP)

The overvoltage threshold for  $V_{IN}$  rising edge is internal fixed at typical 43 V. If during LP8866S-Q1 operation, VSENSE\_P pin voltage rises above the OVP rising threshold, boost, LED outputs, and power-line FET will be turned off, and the device will enter STANDBY mode. The VINOVP\_STATUS bit will also be set in the SUPPLY\_FAULT\_STATUS register, and the INT pin will be triggered. When the VSENSE\_P pin voltage falls below the falling threshold level, the LP8866S-Q1 exits STANDBY and begins the start-up sequence.

#### 6.3.9.1.3 V<sub>DD</sub> Undervoltage Faults (VDDUVLO)

If during LP8866S-Q1 device operation VDD falls below VDDUVLO falling level, boost, power-line FET, and LED outputs are turned off, and the device enters STANDBY mode. The VDDUVLO\_STATUS fault bit will be set in the SUPPLY\_FAULT\_STATUS register, and the INT pin will be triggered. The LP8866S-Q1 restarts automatically to ACTIVE mode when V<sub>DD</sub> rises above VDDUVLO rising threshold.

#### 6.3.9.1.4 V<sub>IN</sub> OCP Faults (VINOCP)

If during LP8866S-Q1 device operation voltage drop on RISENSE resistor rises above 220mV, boost, power-line FET, and LED outputs are turned off, and the device enters Fault Recovery mode and then attempt to restart 100ms after fault occurs. The VINOCP\_STATUS fault bit are set in the SUPPLY\_FAULT\_STATUS register, and the INT pin is triggered.

$$I_{VIN\_OCP} = \frac{VIN_{OCP\_TH}}{R_{ISENSE}}$$

where

VIN<sub>OCP\_TH</sub> = 220mV

### 6.3.9.1.4.1 VIN OCP Current Limit vs. Boost Cycle-by-Cycle Current Limit

VIN OCP current limit is totally different from boost cycle-by-cycle current limit.

Boost cycle-by-cycle current limit is to protect the DC/DC components (inductor, schottky diode and switching MOSFET) in normal scenario, avoiding current running over their max limit. The normal scenario means when loading has sharp change or input voltage has sharp change. It won't trigger any device fault.

VIN OCP current limit is to protect system from ciritical system hazard (e.g, inductor short, switching MOSFET short). It will trigger the device to shutdown all the LED channels and enter into fault recovery state.

(19)

VIN OCP current limit should be always greater than boost cycle-by-cycle current limit. This means R<sub>ISENSE</sub> should be always no smaller than R<sub>SENSE</sub>.

## 6.3.9.1.5 Charge Pump Faults (CPCAP, CP)

If during LP8866S-Q1 device operation voltage of CPUMP pin falls below typical 4.2V, boost, power-line FET, and LED outputs are turned off, and the device enters Fault Recovery mode and then attempt to restart 100ms after fault occurs. The CP\_STATUS fault bit will beset in the SUPPLY\_FAULT\_STATUS register, and the INT pin are triggered.

If during LP8866S-Q1 device initialization, the charge pump fly capacitor is disconnected or shorted, charge pump are turned off. In result, boost, power-line FET, and LED outputs are turned off, and the device enters Fault Recovery mode and then attempt to restart 100 ms after fault occurs. Both CPCAP\_STATUS and CP\_STATUS fault bits are set in the SUPPLY\_FAULT\_STATUS register, and the INT pin are triggered.

#### 6.3.9.1.6 CRC Error Faults (CRCERR)

If during LP8866S-Q1 device initialization, the factory default configuration for registers, options and trim bits are not corrected loaded from memory, LP8866S-Q1 keeps operating normally, unless other fault criteria is triggered. The CRCERR\_STATUS fault bit are set in the SUPPLY\_FAULT\_STATUS register and the INT pin are triggered.

#### 6.3.9.2 Boost Faults

#### 6.3.9.2.1 Boost Overvoltage Faults (BSTOVPL, BSTOVPH)

Boost overvoltage is detected if the FB pin voltage exceeds the  $V_{FB_OVPL}$  threshold. When boost overvoltage is detected, BSTOVPL\_STATUS bit will be set in the BOOST\_FAULT\_STATUS register. The boost FET stops switching, and the output voltage will be automatically limited. If the BSTOVPL\_STATUS bit is continually set (that is, reappears after clearing), it may indicate an loop issue in the application. Boost overvoltage low is monitored during device Boost Softstart and Normal mode.

A second boost overvoltage high fault is detected if the FB pin voltage exceeds the  $V_{FB_OVPH}$  threshold or the DISCHARGE pin voltage exceeds the  $V_{BST_OVPH}$ . The LP8866S-Q1 device enters the fault recovery state to protect system damage from a high boost voltage. When boost overvoltage is detected, BSTOVPH\_STATUS bit is set in the BOOST\_FAULT\_STATUS register. A fault interrupt is also generated. The device enters Fault Recovery mode and then attempt to restart after 100ms. Boost overvoltage high is monitored during Boost Softstart and Normal mode.

#### 6.3.9.2.2 Boost Overcurrent Faults (BSTOCP)

Boost overcurrent is detected if the FB pin voltage drops below the  $V_{UVP}$  threshold for 110ms. If the boost overcurrent timer expires before the output voltage recovers, the BSTOCP\_STATUS bit is set in the BOOST\_FAULT\_STATUS register. The fault recovery state is entered, and a fault interrupt is generated. The device will enter Fault Recovery mode and then attempt to restart after 100ms. If the BSTOCP\_STATUS bit is permanently set, it may indicate an issue in the application. Boost overcurrent is monitored from the boost start, and fault may trigger during boost start-up.

#### 6.3.9.2.3 LEDSET Resistor Missing Faults (LEDSET)

The LEDSET resistor missing or invalid is detected if the resistor is not assembled or not valid value as requested during the initialization. The LP8866S-Q1 device defaults to 6-channel/150mA configuration if the LEDSET resistor is missing or invalid. The LEDSET\_STATUS fault bit is set in the BOOST\_FAULT\_STATUS register. The LEDSET resistor missing or invalid fault will not be monitored after initialization, so that the LP8866S-Q1 is operating in the configuration determined during initialization even though the LEDSET resistor is missing or invalid after initialization.

## 6.3.9.2.4 MODE Resistor Missing Faults (MODESEL)

The MODE resistor missing or invalid is detected if the resistor is not assembled or not valid value as requested during the initialization. LP8866S-Q1 defaults to phase-shift PWM mode with I2C address 0x2A if the MODE resistor is missing or invalid. The MODESEL\_STATUS fault bit will be set in the BOOST\_FAULT\_STATUS

register. The MODE resistor missing or invalid fault is not monitored after initialization, so that the LP8866S-Q1 operates in the mode determined during initialization even though the MODE resistor is missing or invalid after initialization.

## 6.3.9.2.5 FSET Resistor Missing Faults (FSET)

The FSET resistor missing or invalid for both BOOST\_FSET and PWM\_FSET is detected if any one of them is not assembled or not a valid value as requested during the initialization. LP8866S-Q1 defaults the switching frequency of boost to 400kHz if BOOST\_FSET resistor is missing or invalid, or PWM dimming frequency to 305Hz if PWM\_FSET resistor is missing or invalid. The FSET\_STATUS fault bit is set in the BOOST\_FAULT\_STATUS register. The FSET resistor missing or invalid fault is not monitored after initialization, so that the LP8866S-Q1 device operates at the boost switching frequency and the PWM dimming frequency determined during initialization even though the FSET resistor is missing or invalid after initialization.

# 6.3.9.2.6 ISET Resistor Out of Range Faults (ISET)

If the ISET pin resistor is shorted to GND during normal operation, the maximum current for each LED channel can be calculated in Equation 20:

$$I_{LED\_ISET\_FAULT} = I_{LED\_LIMIT} \times \left(\frac{LED\_CURRENT[11:0]}{4095}\right)$$
(20)

where

# • $I_{LED\_LIMIT} = 280 \text{mA}$

LED\_CURRENT[11:0] register will be automatically modified to 1/4 of latest programmed data. if it is not programmed after device enabling, the default value of LED\_CURRENT[11:0] register is 0xFFF and automatically modified to 0x3FF after the fault occurs. If ISET pin voltage returns back to above 1.1V, the LED\_CURRENT[11:0] register data automatically returns to latest programmed data. The ISET\_STATUS fault bit will be set in the BOOST\_FAULT\_STATUS register and the INT pin is triggered.

## 6.3.9.2.7 Thermal Shutdown Faults (TSD)

If the die temperature of LP8866S-Q1 reaches the thermal shutdown threshold  $T_{SD}$ , the boost, power-line FET, and LED outputs on LP8866S-Q1 shuts down to protect the device from damage. Fault status bit TSD\_STATUS bit will be set, and the INT pin will be triggered. The device restarts the power-line FET, the boost, and LED outputs when temperature drops by TSD\_HYS amount.

## 6.3.9.3 LED Faults

#### 6.3.9.3.1 Open LED Faults (OPEN\_LED)

During normal boost operation, boost voltage is raised if any of the used LED outputs falls below the LED\_DRV\_HEADROOM threshold level. Open LED fault is detected if boost output voltage has reached the maximum and at least one LED output is still below the threshold. The open string is then disconnected from the boost adaptive control loop and its output is disabled. Any LED fault sets the status bit LED\_STATUS and an interrupt is generated unless LED interrupt is disabled. The detail of open LED faults can be read from bits OPEN\_LED and LEDx\_FAULT (x = 1...6). These bits maintain their value until device power-down. But the LED\_STATUS bit could be cleared by the interrupt clearing procedure. If a new LED fault is detected, LED\_STATUS is set and an interrupt generated again.

## 图 6-18. LED Open and Short Detection Logic

## 6.3.9.3.2 Short LED Faults (SHORT\_LED)

Short LED fault is detected if one or more LED outputs are above the  $V_{LEDSHORT}$  typical 5.4V and at least one LED output is inside the normal operation window (see [4] 6-18). Shorted string is disconnected from the boost adaptive control loop and the LED PWM output is disabled. LED\_STATUS status bit is set and an interrupt generated similarly as in open LED case. Detailed shorted LED fault can be read from bits SHORT\_LED and LEDx\_FAULT (x = 1...6), indicating the faulty LED) in LED\_FAULT\_STATUS register.

In HUD application, when output channels are connected as groups and only one or two groups are active, one more special condition will trigger the short LED fault. This is when boost adaptive voltage comes to minimum and one of the LED channels voltage is still higher than  $V_{HEADROOM} + V_{HEADROOM HYS}$ .

## 6.3.9.3.3 LED Short to GND Faults (GND\_LED)

During boost soft start and normal boost operation, if LED output is lower than V<sub>SHORTGND</sub> for 20ms, device turns off the corresponding LED output channel and output a typical 6mA current for 300µs period again. After this operation, if output voltage is still lower than V<sub>HEADROOM</sub>, LED short to GND fault will be reported.

If LED short to GND is reported, boost, LED outputs and power-line FET is turned off, the device will enter Fault Recovery mode. LED\_STATUS bit is set and an interrupt generated similarly as in open LED case. LED short to GND fault reason can be read from bits LED\_GND and LEDx\_FAULT (x = 1...6) in LED\_FAULT\_STATUS register. These bits maintain their value until device powers are down while the LED\_STATUS bit is cleared by the interrupt clearing procedure.

#### 6.3.9.3.4 Invalid LED String Faults (INVSTRING)

During device initialization, any of un-used LED outputs pins are checked whether connected to GND or not. If they are not connected to GND as expected, the LP8866S-Q1 reports invalid string fault and tries to function normally if possible. The INVSTRING\_STATUS fault bit is set in the LED\_FAULT\_STATUS register, and the INT pin is triggered. The LEDSET resistor missing or invalid fault is not detected after initialization, so that the LP8866S-Q1 operates in the configuration determined during initialization even though the LEDSET resistor is missing or invalid after initialization.

#### 6.3.9.3.5 I2C Timeout Faults

If chip receives I2C command without STOP signal for 500ms, I2C communication block auto resets and waits for the next command. I2C\_ERROR\_STATUS fault bit is set in the LED\_FAULT\_STATUS register, and the INT pin is triggered.

#### 6.3.9.4 Overview of the Fault and Protection Schemes

	₹ 6-5. Fault and Frotection Schemes				
FAULT NAME	STATUS BIT	CONDITION	TRIGGER FAULT INTERRUPT	ENTER FAULT RECOVERY	ACTION
V <sub>IN</sub> undervoltage	VINUVLO_STATUS	UVLO voltage falls below 0.787V.	Yes	Yes	Device goes to standby and then attempts to restart once the input voltage rises above threshold.
V <sub>IN</sub> overvoltage	VINOVP_STATUS	V <sub>IN</sub> voltage rises above 43V.	Yes	Yes	Device goes to standby and waits until input voltage falls below threshold before restarting.
V <sub>DD</sub> undervoltage	VDDUVLO_STATUS	V <sub>DD</sub> level falls below VDDUVLO threshold.	Yes	No	Device restarts once VDD level rises above VDDUVLO threshold.
V <sub>IN</sub> overcurrent	VINOCP_STATUS	Voltage across R <sub>ISENSE</sub> exceeds 220mV.	Yes	Yes	Device goes to Fault Recovery and then attempts to restart 100ms after fault occurs.
Charge pump fault	CP_STATUS	Charge pump voltage level is abnormal.	Yes	Yes	Device goes to Fault Recovery and then attempts to restart 100ms after fault occurs.
Charge pump components missing	CPCAP_STATUS	Charge pump is missing components.	Yes	No	Charge pump is disabled. Charge pump fault will be reported. Device tries to keep normal operation.
Boost sync clock invalid fault	BSTSYNC_STATUS	Device is enabled while a valid external SYNC clock is running. Then SYNC stops or changes to frequency < 75kHz.	Yes	No	Defaults to internal clock frequency selected by BST_FSET resistor. If BST_SYNC input is held high then spread spectrum is enabled. If BST_SYNC input is held low then spread spectrum is disabled.
CRC error	CRCERR_STATUS	Factory default configuration for registers, options and trim bits are not correctly loaded from memory.	Yes	No	Device functions normally, if possible.
Boost OVP low	BSTOVPLOW_STATUS	FB pin voltage rises above V <sub>FB_OVPL</sub> level.	No	No	Boost stops switching until boost voltage level falls. The device remains in normal mode with LED drivers operational.
Boost OVP high	BSTOVPH_STATUS	FB pin voltage rises above $V_{FB_OVPH}$ level or DISCHARGE pin voltage rises above $V_{BST_OVPH}$ .	Yes	Yes	Device goes to Fault Recovery and waits until output voltage falls below threshold before restarting.
Boost overcurrent	BSTOCP_STATUS	FB pin voltages falls below $V_{\mbox{UVP}}$ level for 110ms.	Yes	Yes	Device goes to Fault Recovery and then attempts to start 100ms after fault occurs.
LEDSET detection fault	LEDSET_STATUS	LEDSET resistor missing or invalid.	No	No	Defaults to 6-channel / 150mA configuration.
MODE detection fault	MODESEL_STATUS	MODE resistor missing or invalid.	No	No	Defaults to phase-shift PWM mode, I2C address is 0x2A.
FSET detection fault	FSET_STATUS	BST_FSET or PWM_FSET resistor are missing or an invalid value.	No	No	Device keeps operating at 400-kHz switching frequency for boost converter and 305Hz for PWM dimming frequency.

# 表 6-9. Fault and Protection Schemes

# 表 6-9. Fault and Protection Schemes (续)

			· ·		
FAULT NAME	STATUS BIT	CONDITION	TRIGGER FAULT INTERRUPT	ENTER FAULT RECOVERY	ACTION
ISET resistor fault	ISET_STATUS	ISET pin voltage is pulled down to below 1V due to ISET pin resistor shorted to GND	Yes	No	LED_CURRENT[11:0] is written to 0x3FF. Total LED current limited to 70mA.
Thermal shutdown	TSD_STATUS	Junction temperature rises above T <sub>SD</sub> threshold.	Yes	Yes	Device goes to standby and then attempts to restart once die temperature falls below threshold.
Open LED string	LED_STATUS OPEN_LED	Headroom voltage on one or more channels is below minimum level and boost has adapted to maximum level.	Yes	No	Faulted LED string is disabled and removed from adaptive boost control loop. String is re-enabled next power cycle.
LED internal short	LED_STATUS_SHORT_L ED	Headroom voltage on one or more channels is above the SHORTED_LED_THRESHOLD for > 5ms while the headroom of at least one channel is still below this threshold.	Yes	No	Faulted LED string is disabled and removed from adaptive boost control loop. String is re-enabled next power cycle.
LED short to GND	LED_STATUS_GND_LE D	During PL FET SOFT START, voltage of one or more used LED output is below $V_{HEADROOM}$ when small test current is injected. In BOOST_SU and Normal Stage, voltage of one or more used LED output is below $V_{SHORTGND}$ .and keeps still when the corresponding channel is off and small test current is injected.	Yes	Yes	Device goes to Fault Recovery and then attempts to restart 100 ms after fault occurs.
Invalid LED string detected	INVSTRING_STATUS	Configured unused LED output is detected not short to GND.	Yes	No	Device functions normally, if possible.
I2C timeout	I2C_ERROR_STATUS	Device receives I2C command without STOP signal for 500ms.	Yes	No	Device functions normally and waits for the next I2C command.

# 6.4 Device Functional Modes

# 6.4.1 State Diagram

图 6-19. State Machine Diagram

## 6.4.2 Shutdown

When EN is pulled low, boost, power-line FET, and LED outputs are turned off, and the device tries to discharge the boost output for 400ms. After this, the device is totally turned off.

## 6.4.3 Device Initialization

After POR is released device initialization begins. During this state the LDO is started up, EEPROM default and trim configurations are loaded, LEDSET, MODE, BOOST\_FSET and PWM\_FSET resistors are detected.

## 6.4.4 Standby Mode

Starting from Standby mode, the device can be accessed with I2C to change any configuration registers.

Standby Mode is immediately switched to Power-line FET Soft Start mode if there's no fault.

#### 6.4.5 Power-line FET Soft Start

Power-line FET is gradually enabled during this 25ms long state. Boost input and output capacitors are charged to  $V_{IN}$  level.  $V_{IN}$  faults for OCP, OVP, and UVP and fault for LED short to GND are enabled.

## 6.4.6 Boost Start-Up

Boost voltage is ramped to initial boost voltage level with reduced current limit for 50ms. All boost faults are now enabled.

Copyright © 2024 Texas Instruments Incorporated

# 6.4.7 Normal Mode

LED drivers are enabled when brightness is greater than zero. All LED faults are active.

## 6.4.8 Fault Recovery

Some critical faults can trigger fault recover state. LED drivers, boost converter, and power-line FET are disabled for 100ms, and the device attempts to restart from standby mode if EN is still high and brightness is greater than zero.

# 6.4.9 Latch Fault

If all LED strings are disabled due to faults then the LP8866S-Q1 enters the latch fault mode. This state can be exited only by pulling the EN pin low.

## 6.4.10 Start-Up Sequence

图 6-20. Start-Up Sequence Diagram

# 6.5 Programming

# 6.5.1 I2C-Compatible Interface

The LP8866S-Q1 device supports I2C interface to access and change the configuration. The 7-bit base slave address is 0x2A or 0x2B. The address could be configured through the resistor settings of MODE pin.

Write I2C transactions are made up of 4 bytes. The first byte includes the 7-bit slave address and Write bit. The 7-bit slave address selects the LP8866S-Q1 slave device. The second byte is eight bits register address. The last two bytes are the 16-bit register value.

Read I2C transactions are made up of 5 bytes. The first byte includes the 7-bit slave address and Write bit. The 7-bit slave address selects the LP8866S-Q1 slave device. The second byte is eight bits register address. The third byte includes the 7-bit slave address and Read bit. The last two bytes are the 16-bit register value returned from the slave.

## where

• W bit = 0

图 6-21. I2C Write

- R bit = 1
- W bit = 0

## 6.5.2 Programming Examples

#### 6.5.2.1 General Configuration Registers

The LP8866S-Q1 does not require any serial interface configuration. It can be simply controlled with the EN pin and PWM pin. Most of the device configuration is accomplished using external resistor values. If I2C interface is available then extended configuration is possible. The configuration registers can be written from standby state to normal state as shown in  $\frac{1}{5}$  6-10.

REGISTER NAME FUNCTION			
ADV_SLOPE_ENABLE	Enables advance sloper S-shape smoothing function.		
DITHER_SELECT	Selects up to 3 bits of PWM dither for added dimming resolution.		
SLOPE_SELECT	Selects duration for linear brightness sloper.		
BRT_MODE	Selects PWM pin or DISPLAY_BRT register for brightness control.		
SPREAD_RANGE	Selects up to 2 bits boost switching frequency spread spectrum range.		
SPREAD_MOD_FREQ	Selects up to 2 bits boost switching frequency spread spectrum modulation frequency.		
SPREAD_PSEUDO_EN	Enables pseudo random modulation for boost switching spread spectrum frequency.		

## 表 6-10. Configuration Registers

#### 6.5.2.2 Clearing Fault Interrupts

The LP8866S-Q1 has an INT pin to alert the host when a fault occurs. If I2C interface is available, the Interrupt Fault Status registers can be read back to learn which fault(s) have been detected. These status bits are located in the SUPPLY\_STATUS, BOOST\_STATUS and LED\_STATUS registers. Each interrupt status has a STATUS bit and a CLEAR bit. To clear a fault interrupt status a 1 must be written to both the STATUS bit and CLEAR bit at the same time.

#### 6.5.2.3 Disabling Fault Interrupts

By default, most of the LP8866S-Q1 faults trigger the INT pin. Each fault has two INT\_EN bits. These bits are located in the SUPPLY\_INT\_EN, BOOST\_INT\_EN, and LED\_INT\_EN registers. If the INT\_EN bit is read and returns 2b'10, the INT pin is triggered when that fault occurs. The fault interrupt can be disabled by writing 2b'01 to its INT\_EN bits, or it can be enabled by writing 2b'11 to its INT\_EN bits. There is also a GLOBAL fault interrupt that can be disabled to prevent any faults from triggering the INT pin.

#### 6.5.2.4 Diagnostic Registers

The LP8866S-Q1 contains several diagnostic registers than can be read with the serial interface for debugging or additional device information.  $\ge 6-11$  is a summary of the available registers.

REGISTER NAME	FUNCTION		
FSM_LIVE_STATUS	Current state of the functional state machine		
PWM_INPUT_STATUS	Measured 16-bit duty cycle of the PWM pin input		
LED_PWM_STATUS	16-bit LED PWM duty cycle from state machine		
LED_CURRENT_STATUS	12-bit LED current DAC value from state machine		
VBOOST_STATUS	10-bit value for adaptive boost voltage target — value is linear between VBOOST_MIN and VBOOST_MAX calculations		
MODE_SEL_CFG	Dimming mode configuration from MODE detection		
LED_STRING_CFG	LED string phase configuration from LEDSET detection		
BOOST_FREQ_SEL	Boost switching frequency value from BST_FSET detection		
PWM_FREQ_SEL	LED PWM frequency value from PWM_FSET detection		

# 7 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围, TI 不担保其准确性和完整性。TI 的客 户应负责确定器件是否适用于其应用。客户应验证并测试其设计,以确保系统功能。

# 7.1 Application Information

The LP8866S-Q1 device is designed for automotive applications, and an input voltage  $V_{IN}$  is intended to be connected to the vehicle battery. Depending on the input voltage, the device may be used in either boost mode or SEPIC mode. The device is internally powered from the VDD pin, and voltage must be in 2.7V to 5.5V range. The device has flexible configurability through external components or by an I2C interface. If the VDD voltage is not high enough to drive an external nMOSFET gate, an internal charge pump must be used to power the gate driver (GD pin).

# 7.2 Typical Applications

# 7.2.1 Full Feature Application for Display Backlight

[₭] 7-1 shows a full application for the LP8866S-Q1 device in a boost topology. It supports 6 LED strings in display mode, each at 150mA, with an automatic 60° phase shift. Brightness control register is used for LED dimming method through I2C communication. The charge pump is enabled for a 400kHz boost switching frequency with spread spectrum.

图 7-1. Full Feature Application for Display Backlight

## 7.2.1.1 Design Requirements

This typical LED-driver application is designed to meet the parameters listed in  $\frac{1}{8}$  7-1:

# 表 7-1. LP8866S-Q1 Full-Feature Design Parameters

DESIGN PARAMETER	VALUE
VIN voltage range	5V to 20V (Quiescent Voltage)
VDD voltage	3.3V
LED strings configuration	6 strings, 7 LEDs in series
Charge pump	Enabled
Brightness control	12C
Output configuration	OUT1 to OUT6 are in phase shift mode (60°)
LED string current	150mA
Boost frequency	400kHz
Inductor	22µH at 6.5A saturation current
R <sub>ISENSE</sub>	<b>20m</b> Ω
Power-line FET	Enabled
R <sub>SENSE</sub>	<b>30m</b> Ω
Input/Output capacitors	$C_{IN}$ and $C_{OUT}$ : 1 × 33µF electrolytic + 1 × 10µF ceramic
Spread spectrum	Enabled
Discharge function	Enabled

## 7.2.1.2 Detailed Design Procedure

### 7.2.1.2.1 Inductor Selection

There are a few things to consider when choosing an inductor: inductance, current rating, and DC resistance (DCR). 表 7-2 shows recommended inductor values for each operating frequency. The LP8866S-Q1 device automatically sets internal boost compensation controls depending on the selected switching frequency.

SW FREQUENCY (kHz)	INDUCTANCE (µH)		
100	47		
200	33		
303	22		
400	22		
500	22		
1818	10		
2000	10		
2222	10		

#### 表 7-2. Inductance Values for Boost Switching Frequencies

The current rating of inductor must be at least 25% higher than maximum boost switching current  $I_{SW(max)}$ , which can be calculated with Equation 21. TI recommends to use an inductor with low DCR to achieve good efficiency. Efficiency varies with load condition, switching frequency, and components. 80% can be used as a typical estimation. 65% efficiency needs to take into account in extreme condition.

Product Folder Links: LP8866S-Q1

$$I_{SW(max)} = \frac{\Delta I_L}{2} + \frac{I_{OUT(max)}}{1 - D}$$

where

- $\Delta I_{L} = V_{IN(min)} \times D / f_{SW} \times L$
- D = 1 V<sub>IN(min)</sub> × η / V<sub>OUT</sub>
- I<sub>SW(max)</sub>: Maximum switching current
- $\Delta$  I<sub>L</sub>: Inductor ripple current
- I<sub>OUT(max)</sub>: Maximum output current
- D: Boost duty cycle
- VIN(min): Minimum input voltage
- $f_{SW}$ : Minimum switching frequency of the converter
- L: Inductance
- V<sub>OUT</sub>: Output voltage
- $\eta$  : Efficiency of boost converter

49

(21)

#### 7.2.1.2.2 Output Capacitor Selection

Recommended voltage rating for output capacitors is 50% higher than maximum output voltage level. Capacitance value determines voltage ripple and boost stability. The DC-bias effect can reduce the effective capacitance significantly, by up to 80%, a consideration for capacitance value selection. The conservative target effective capacitance is  $50\mu$ F to achieve good phase and gain margin levels. A design table in product webpage could be refered for the target effective capacitance in a certain application. TI recommends using  $33\mu$ F Alpolymer electrolytic capacitor together with  $10\mu$ F ceramic capacitors in parallel to reduce ripple, increase stability, and reduce ESR effect.

#### 7.2.1.2.3 Input Capacitor Selection

Recommended input capacitance is the same as output capacitance although input capacitors are not as critical to boost operation. Input capacitance can be reduced but must ensure enough filtering for input power.

#### 7.2.1.2.4 Charge Pump Output Capacitor

TI recommends a ceramic capacitor with at least 10V voltage rating for the output capacitor of the charge pump. A 10  $\mu$  F capacitor can be used for most applications.

#### 7.2.1.2.5 Charge Pump Flying Capacitor

TI recommends a ceramic capacitor with at least 10V voltage rating for the flying capacitor of the charge pump. One 2.2  $\mu$  F capacitor connecting C1P and C1N pins can be used for most applications.

#### 7.2.1.2.6 Output Diode

A Schottky diode must be used for the boost output diode. Current rating must be at least 25% higher than the maximum output current. Schottky diodes with a low forward drop and fast switching speeds are ideal for increasing efficiency. At maximum current, the forward voltage must be as low as possible; less than 0.5V is recommended. Reverse breakdown voltage of the Schottky diode must be significantly larger than the output voltage, 25% higher voltage rating is recommended. Do not use ordinary rectifier diodes, because slow switching speeds and long recovery times cause efficiency and load regulation to suffer.

## 7.2.1.2.7 Switching FET

Gate-drive voltage for the FET is 5V. Switching FET is a critical component for determining power efficiency of the boost converter. Several aspects need to be considered when selecting switching FET such as voltage and current rating,  $R_{DSON}$ , power dissipation, thermal resistance and rise/fall times. An N type MOSFET with at least 25% higher voltage rating than maximum output voltage must be used. Current rating of switching FET should be same or higher than inductor rating.  $R_{DSON}$  must be as low as possible, less than 20m $\Omega$  is recommended. Thermal resistance (R  $_{\theta}$  JA) must also be low to dissipate heat from power loss on switching FET. In most cases, a resistance is recommended between GD pin and Switching FET's gate terminal. It could be used to control the rising/falling time of the switching FET. This gate resistance could offer the flexibility of balancing between EMC performance and efficiency.

#### 7.2.1.2.8 Boost Sense Resistor

The R<sub>SENSE</sub> resistor determines the boost overcurrent limit and is sensed every boost switching cycle. A highpower 20m  $\Omega$  resistor can be used for sensing the boost SW current and setting maximum current limit at 10A (typical). R<sub>SENSE</sub> can be increased to lower this limit and can be calculated with Equation 22. In typical condition, to avoid too much efficiency loss on R<sub>SENSE</sub> resistor, boost overcurrent limit is recommended to be set above 4A, therefore R<sub>SENSE</sub> doesn't exceed 50m  $\Omega$ . Power rating can be calculated from the inductor current and sense resistor resistance value.

$$R_{SENSE} = \frac{200 \text{ mV}}{I_{BOOST \text{ OCP}}}$$

## where

• R<sub>SENSE</sub>: boost sense resistor (m Ω)

(22)

I<sub>BOOST\_OCP</sub>: boost overcurrent limit

# 7.2.1.2.9 Power-Line FET

A power line FET can be used to disconnect input power from boost input to protect the LP8866S-Q1 device and boost components in case an overcurrent event occurs. A P type MOSFET is used for the power-line FET. Voltage rating must be at least 25% higher than maximum input voltage level. Low  $R_{DSON}$  is important to reduce power loss on the FET — less than 20m $\Omega$  is recommended. Current rating for the FET must be at least 25% higher than input peak current. Minimum Gate-to-Source voltage (V<sub>GS</sub>) to turn on transistor fully must be less than minimum input voltage; use a 20k  $\Omega$  resistor between the pFET gate and source.

# 7.2.1.2.10 Input Current Sense Resistor

A high-power resistor can be used for sensing the boost input current. Overcurrent condition is detected when the voltage across  $R_{ISENSE}$  reaches 220mV. Typical 20m  $\Omega$  sense resistor is used to set 11A input current limit. Sense resistor value can be increased to lower overcurrent limit for application as needed. Power rating can be calculated from the input current and resistance value.

## 7.2.1.2.11 Feedback Resistor Divider

Feedback resistors  $R_{FB1}$  and  $R_{FB2}$  determine the maximum boost output level. Output voltage can be calculated as in Equation 23:

$$V_{OUT\_MAX} = \left(\frac{V_{BG}}{R_{FB2}} + I_{SEL\_MAX}\right) \times R_{FB1} + V_{BG}$$
(23)

where

- V<sub>BG</sub> = 1.21V
- I<sub>SEL MAX</sub> = 38.7µA
- R<sub>FB1</sub> / R<sub>FB2</sub> normal recommended range is 7~15

# 7.2.1.2.12 Critical Components for Design

图 7-2 shows the critical part of circuitry: boost components, the LP8866S-Q1 internal charge pump for gatedriver powering, and powering/grounding of LP8866S-Q1. Schematic example is shown in 图 7-2.

图 7-2. Critical Components for Full Feature Design

## 7.2.1.3 Application Curves

Copyright © 2024 Texas Instruments Incorporated

## 7.2.2 Application with Basic/Minimal Operation

The LP8866S-Q1 needs only a few external components for basic functionality if material cost and PCB area for a solution need to be minimized. In this example LP8866S-Q1 is configured with external components and no I2C communication. The power-line FET is removed, as is input current sensing. Internal charge pump is not used, and all external synchronization functions and special features are disabled. The  $33\mu$ F Al-polymer electrolytic capacitor is removed for PCB area and height limitation. And boost external compensation is used to compensate the removal of the  $33\mu$ F Al-polymer electrolytic capacitor.

图 7-5. Minimal Solution/Minimum Components Application

## 7.2.2.1 Design Requirements

This typical LED-driver application is designed to meet the parameters listed in  $\frac{1}{8}$  7-4:

# 表 7-4. LP8866S-Q1 Minimal Solution Design Parameters

DESIGN PARAMETER	VALUE
VIN voltage range	3V to 20V (Quiescent Voltage)
VDD voltage	5V
LED strings configuration	6 strings, 7 LEDs in series
Charge pump	Disabled
Brightness control	PWM
Output configuration	OUT1 to OUT6 are in phase shift mode (60°)
LED string current	120mA
Boost frequency	400kHz
Inductor	22µH at 6.5A saturation current
R <sub>ISENSE</sub>	<b>20m</b> Ω
Power-line FET	Enabled
R <sub>SENSE</sub>	<b>30</b> m Ω
Input/Output capacitors	C <sub>IN</sub> and C <sub>OUT</sub> : 3 × 10µF ceramic
Spread spectrum	Enabled
Discharge function	Enabled

#### 7.2.2.2 Detailed Design Procedure

See Detailed Design Procedure.

7.2.2.3 Application Curves

See Application Curves.

# 7.2.3 SEPIC Mode Application

When LED string voltage can be above and below the input voltage level, use the SEPIC configuration. In SEPIC mode, the SW pin detects a maximum voltage equal to the sum of the input and output voltages, a consideration when selecting components.

图 7-6. SEPIC Mode with Three LEDs in Series

57

## 7.2.3.1 Design Requirements

This typical LED-driver application is designed to meet the parameters listed in  $\frac{1}{8}$  7-5:

# 表 7-5. LP8866S-Q1 SEPIC Mode Design Parameters

DESIGN PARAMETER	VALUE
V <sub>IN</sub> voltage range	4.5V to 20V (quiescent voltage)
V <sub>DD</sub> voltage	3.3V
LED strings configuration	5 strings, 3 LEDs in series
Charge pump	Enabled
Brightness control	I2C
Output configuration	OUT1 to OUT5 are in phase shift PWM mode
LED string current	80mA
Boost frequency	2.2MHz
Inductor	10µH at 4A saturation current
R <sub>ISENSE</sub>	<b>20m</b> Ω
Power-line FET	Enabled
R <sub>SENSE</sub>	50m Ω
Input/Output capacitors	$C_{IN}$ and $C_{OUT}$ : 1 × 33µF electrolytic + 1 × 10µF ceramic
Spread spectrum	Enabled
Discharge function	Enabled

#### 7.2.3.2 Detailed Design Procedure

# 7.2.3.2.1 Inductor Selection

Inductance for both inductors can be selected from  $\frac{1}{8}$  7-6, depending on operating frequency for the application. Current rating is recommended to be at least 25% higher than maximum inductor peak current. Peak-to-peak ripple current can be estimated to be approximately 40% of the maximum input current and and inductor peak current can be calculated with Equation 24, Equation 25, and Equation 26:

inequencies			
SW FREQUENCY (kHz)	INDUCTANCE (µH)		
100	22		
200	15		
303	10		
400	10		
500	10		
1818	4.7		
2000	4.7		
2222	4.7		

# 表 7-6. Inductance Values for SEPIC Switching Frequencies

(24)

(25)

(26)

$$I_{L1(peak)} = I_{OUT} \ \times \ \frac{V_{OUT} + V_D}{V_{IN(min)}} \ \times \ \left(1 + \ \frac{40\%}{2}\right)$$

where

- I<sub>L1(peak)</sub>: Peak current for inductor 1
- I<sub>OUT</sub>: Maximum output current
- V<sub>OUT</sub>: Output voltage
- V<sub>D</sub>: Diode forward voltage drop
- V<sub>IN(min)</sub>: Minimum input voltage

$$I_{L2(peak)} = I_{OUT} \times \left(1 + \frac{40\%}{2}\right)$$

where

- I<sub>L2(peak)</sub>: Peak current for inductor 2
- IOUT: Maximum output current

$$\Delta I_{L} = I_{IN} \times 40\% = I_{OUT} \times \frac{V_{OUT}}{V_{IN(min)}} \times 40\%$$

where

- $\Delta I_L$ : Inductor ripple current
- I<sub>IN</sub>: Input current
- V<sub>OUT</sub>: Output voltage
- V<sub>IN(min)</sub>: Minimum input voltage

#### 7.2.3.2.2 Coupling Capacitor Selection

The coupling capacitors Cs isolate the input from the output and provide protection against a shorted load. The selection of SEPIC capacitors, Cs, depends mostly on the RMS current, which can be calculated with Equation 27. The capacitors must be rated for a large RMS current relative to the output power; TI recommends at least 25% higher rating for  $I_{RMS}$ . When using uncoupled inductors, use one  $10\mu$ F ceramic capacitor in parallel with one  $33\mu$ F electrolytic capacitor and series  $2\Omega$  resistor. If coupled inductors are used, then use only one  $10\mu$ F ceramic capacitor.

$$I_{Cs(rms)} = I_{OUT} \times \sqrt{\frac{V_{OUT} + V_D}{V_{IN(min)}}}$$

(27)

# where

- I<sub>Cs(rms)</sub>: RMS current of Cs capacitor
- I<sub>OUT</sub>: Output current
- V<sub>OUT</sub>: Output voltage
- V<sub>D</sub>: Diode forward voltage drop
- V<sub>IN(min)</sub>: Minimum input voltage

## 7.2.3.2.3 Output Capacitor Selection

See Detailed Design Procedure.

#### 7.2.3.2.4 Input Capacitor Selection

See Detailed Design Procedure.

7.2.3.2.5 Charge Pump Output Capacitor

See Detailed Design Procedure.

7.2.3.2.6 Charge Pump Flying Capacitor

See Detailed Design Procedure.

## 7.2.3.2.7 Switching FET

Gate-drive voltage for the FET is 5V. Use an N-type MOSFET for the switching FET. The switching FET for SEPIC mode sees a maximum voltage of  $V_{IN(max)} + V_{OUT}$ , 25% higher rating is recommended. Current rating is also recommended to be 25% higher than peak current, which can be calculated with Equation 28. R<sub>DSON</sub> must be as low as possible — less than 20m $\Omega$  is recommended. Thermal resistance (R  $_{\theta JA}$ ) must also be low to dissipate heat from power loss on switching FET. Typical rise/fall time values recommended are less than 10 ns.

 $I_{Q1(peak)} = I_{L1(peak)} + I_{L2(peak)}$ 

(28)

## where

- I<sub>Q1(peak)</sub>: Peak current for switching FET
- I<sub>L1(peak)</sub>: Peak current for inductor 1
- I<sub>IL2(peak)</sub>: Peak current for inductor 2 BOOST\_OCP

#### LP8866S-Q1 ZHCSLM9B - AUGUST 2020 - REVISED MAY 2024

# 7.2.3.2.8 Output Diode

A Schottky diode must be used for the SEPIC output diode. Current rating must be at least 25% higher than the maximum current, which is the same as switch peak current. Schottky diodes with a low forward drop and fast switching speeds are ideal for increasing efficiency. At maximum current, the forward voltage must be as low as possible; TI recommends less than 0.5V. Reverse breakdown voltage of the Schottky diode must be able to withstand  $V_{IN(max)} + V_{OUT(max)}$ ; at least 25% higher voltage rating is recommended. Do not use ordinary rectifier diodes, because slow switching speeds and long recovery times cause efficiency and load regulation to suffer.

## 7.2.3.2.9 Switching Sense Resistor

See Detailed Design Procedure.

#### 7.2.3.2.10 Power-Line FET

See Detailed Design Procedure.

#### 7.2.3.2.11 Input Current Sense Resistor

See Detailed Design Procedure.

#### 7.2.3.2.12 Feedback Resistor Divider

Feedback resistors  $R_{FB1}$  and  $R_{FB2}$  determine the maximum boost output level. Output voltage can be calculated as follows:

$$V_{OUT\_MAX} = \left(\frac{V_{BG}}{R_{FB2}} + I_{SEL\_MAX}\right) \times R_{FB1} + V_{BG}$$
(29)

where

- V<sub>BG</sub> = 1.21 V
- I<sub>SEL\_MAX</sub> = 38.7 μA
- R<sub>FB1</sub> / R<sub>FB2</sub> normal recommended range is 5~15 (recommended for SEPIC Mode)

#### 7.2.3.2.13 Critical Components for Design

图 7-7 shows the critical part of circuitry: SEPIC components, the LP8866S-Q1 internal charge pump for gatedriver powering, and powering/grounding of LP8866S-Q1. Schematic example is shown below.

图 7-7. SEPIC Mode with Three LEDs in Series

# 表 7-7. Recommended Components for SEPIC Design Example

REFERENCE DESIGNATOR	DESCRIPTION	NOTE
R <sub>ISENSE</sub>	20m <sub>Ω</sub> , 1W	Input current sensing resistor
R <sub>SD</sub>	20k Ω , 0.1W	Power-line FET gate pullup resistor
R <sub>SENSE</sub>	50m Ω , 1W	Boost current sensing resistor
R <sub>G</sub>	15Ω, 0.1W	Gate resistor to control the rising/falling time of nMOSFET for EMC
R <sub>UVLO1</sub>	76.8k Ω , 0.1W	These UVLO resistor settings set the
R <sub>UVLO2</sub>	20.5k Ω , 0.1W	VIN_UVLO rising voltage at 3.75 V, VIN_UVLO falling voltage at 3.35V
R <sub>FB2</sub>	60k Ω , 0.1W	Bottom feedback divider resistor
R <sub>FB1</sub>	<b>330k</b> Ω , 0.1W	Top feedback divider resistor
R <sub>BST_FSET</sub>	124k Ω , 0.1W	Boost frequency set resistor (2200kHz)
R <sub>ISET</sub>	38.7 k Ω , 0.1W	Current set resistor (80mA per channel)
R <sub>PWM_FSET</sub>	4.75kΩ, 0.1W	Output PWM frequency set resistor (305Hz PWM frequency)
R <sub>MODE</sub>	3.92kΩ, 0.1W	Mode resistor (Phase-Shift PWM mode with 0x2B I2C address)
R <sub>LED_SET</sub>	4.75kΩ, 0.1W	LED_SET resistor (5 channels configuration)
C <sub>PUMP</sub>	10µF, 10V ceramic	Charge-pump output capacitor
C <sub>2X</sub>	2.2µF, 10V ceramic	Flying capacitor
C <sub>VDD</sub>	4.7μF + 0.1μF, 10V ceramic	VDD bypass capacitor
C <sub>IN</sub>	1 × 33µF, 50V electrolytic + 1 × 10-µF, 50V ceramic	Boost input capacitor
C <sub>OUT</sub>	1 × 33µF, 50V electrolytic + 1 × 10-µF, 50V ceramic	Boost output capacitor
C <sub>S1</sub>	10µF, 50V ceramic	SEPIC coupling capacitor
C <sub>S2</sub>	33µF, 50V electrolytic	SEPIC coupling capacitor
RS	2 Ω , 0.125W	SEPIC resistor
L1	4.7µH saturation current 3A	SEPIC inductor
L2	4.7µH saturation current 3A	SEPIC inductor
D1	50V 10A Schottky diode	SEPIC Schottky diode
Q1	60V, 25A nMOSFET	SEPIC nMOSFET
Q2	60V, 30A pMOSFET	Power-line FET

# 7.2.3.3 Application Curves

See Application Curves.

# 7.3 Power Supply Recommendations

The LP8866S-Q1 is designed to operate from a car battery. The  $V_{IN}$  input must be protected from reverse voltage and voltage dump condition over 48V. The impedance of the input supply rail must be low enough that the input current transient does not cause drop below VIN UVLO level. If the input supply is connected with long wires, additional bulk capacitance may be required in addition to normal input capacitor.

The voltage range for  $V_{DD}$  is 3V to 5.5V. A ceramic capacitor must be placed as close as possible to the VDD pin. The boost gate driver is powered from the CPUMP pins. A ceramic capacitor must be placed as close to the CPUMP pins as possible.

# 7.4 Layout

## 7.4.1 Layout Guidelines

[⊠ 7-8 shows a layout recommendation for the LP8866S-Q1 used to illustrate the principles of good layout. This layout can be adapted to the actual application layout if and where possible. It is important that all boost components are close to each other and to the chip; the high-current traces must be wide enough. VDD must be as noise-free as possible. Place a V<sub>DD</sub> bypass capacitor near the VDD and GND pins. A charge-pump capacitor, boost input capacitors, and boost output capacitors must have closest VIAs to GND. Place the charge-pump capacitors close to the device. The main points to guide the PCB layout design:

- Current loops need to be minimized:
  - For low frequency the minimal current loop can be achieved by placing the boost components as close as possible to each other. Input and output capacitor grounds need to be close to each other to minimize current loop size.
  - Minimal current loops for high frequencies can be achieved by making sure that the ground plane is intact under the current traces. High frequency return currents follow the route with minimum impedance, which is the route with minimum loop area, not necessarily the shortest path. Minimum loop area is formed when return current flows just under the *positive* current route in the ground plane, if the ground plane is intact under the route.
  - For high frequency the copper area capacitance must be taken into account. For example, the copper area for the drain of boost N-MOSFET is a tradeoff between capacitance and the cooling capacity of the components.
- GND plane must be intact under the high-current-boost traces to provide shortest possible return path and smallest possible current loops for high frequencies.
- Route boost output voltage (V<sub>OUT</sub>) to LEDs, FB pin & Discharge pin after output capacitors not straight from the diode cathode.
- FB network should be placed as close as possible to the FB pin, not near boost output
- A small bypass capacitor (TI recommends a 39-pF capacitor) could be placed close to the FB pin and GND to suppress high frequency noise
- VDD line must be separated from the high current supply path to the boost converter to prevent high frequency ripple affecting the chip behavior.
- Capacitor connected to charge pump output CPUMP is recommended to have 10µF capacitance. This
  capacitor must be as close as possible to CPUMP pin. This capacitor provides a greater peak current for gate
  driver and must be used even if the charge pump is disabled. If the charge pump is disabled, the VDD and
  CPUMP pins must be tied together.
- Input and output capacitors need low-impedance grounding (wide traces with many vias to GND plane).
- Input/output ceramic capacitors have DC-bias effect. If the output capacitance is too low, it can cause boost
  to become unstable under certain load conditions. DC bias characteristics should be obtained from the
  component manufacturer; DC bias is not taken into account on component tolerance.

# 10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

# PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LP8866SQDCPRQ1	ACTIVE	HTSSOP	DCP	38	2000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	LP8866SQ1	Samples
LP8866SQRHBRQ1	ACTIVE	VQFN	RHB	32	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	LP8866S	Samples

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided.
