

# ADS981x 具有集成模拟前端的 18 位 2MSPS/通道双通道同步采样 ADC

## 1 特性

- 具有模拟前端的 8 通道 18 位 ADC :
  - 双路同步采样 :  $4 \times 1$  个通道
  - 恒定的  $1\text{M}\Omega$  输入阻抗前端
- 可编程模拟输入范围 :
  - $\pm 12\text{V}$ 、 $\pm 10\text{V}$ 、 $\pm 7\text{V}$ 、 $\pm 5\text{V}$ 、 $\pm 3.5\text{V}$  和  $\pm 2.5\text{V}$
  - 单端和差分输入
  - $\pm 12\text{V}$  共模电压范围
  - 输入过压保护 : 高达  $\pm 18\text{V}$
- 用户可选模拟输入带宽 :
  - $21\text{kHz}$  和  $400\text{kHz}$
- 集成低漂移精密基准
  - ADC 基准 :  $4.096\text{V}$
  - 用于外部电路的  $2.5\text{V}$  基准输出
- 最大吞吐量时具有出色的交流和直流性能 :
  - DNL :  $\pm 0.3\text{ LSB}$ , INL :  $\pm 1.5\text{ LSB}$
  - SNR :  $92.2\text{ dB}$ , THD :  $-112\text{ dB}$
- 电源 :
  - 模拟和数字 :  $5\text{V}$  和  $1.8\text{V}$
  - 数字接口 :  $1.2\text{V}$  至  $1.8\text{V}$
- 温度范围 :  $-40^\circ\text{C}$  至  $+125^\circ\text{C}$

## 2 应用

- 半导体测试
- 电池测试
- 数据采集 (DAQ)

器件框图

## 3 说明

ADS981x 是基于双通道同步采样 18 位逐次逼近寄存器 (SAR) 模数转换器 (ADC) 的 8 通道数据采集 (DAQ) 系统。ADS981x 的每个通道都具有一个完整的模拟前端，其中包含输入钳位保护电路、 $1\text{M}\Omega$  输入阻抗和一个具有用户可选带宽选项的可编程增益放大器 (PGA)。高输入阻抗特性允许直连传感器和变压器，因此无需使用外部驱动器电路。ADS981x 可配置为接受单极或双极输入，共模电压高达  $\pm 12\text{V}$ 。

该器件还具有用于 ADC 的  $4.096\text{V}$  基准和用于外部电路的  $2.5\text{V}$  基准输出。凭借支持  $1.2\text{V}$  至  $1.8\text{V}$  运行的数字接口，ADS981x 无需外部电压电平转换器即可使用。

### 封装信息

器件型号	封装 <sup>(1)</sup>	封装尺寸 <sup>(2)</sup>
ADS981x	RSH ( VQFN , 56 )	7mm × 7mm

(1) 如需更多信息，请参阅 [机械、封装和可订购信息](#)。

(2) 封装尺寸 (长 x 宽) 为标称值，并包括引脚 (如适用)。

### 器件信息

器件型号	SPEED	总功耗
ADS9817	2Msp/通道	232 mW
ADS9815	1MSPS/通道	160 mW

## 4 Pin Configuration and Functions

图 4-1. RSH Package, 56-Pin VQFN (Top View)

表 4-1. Pin Functions

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
AIN1M	55	AI	Analog input channel 1, negative input.
AIN1P	54	AI	Analog input channel 1, positive input.
AIN2M	2	AI	Analog input channel 2, negative input.
AIN2P	1	AI	Analog input channel 2, positive input.
AIN3M	4	AI	Analog input channel 3, negative input.
AIN3P	3	AI	Analog input channel 3, positive input.
AIN4M	6	AI	Analog input channel 4, negative input.
AIN4P	5	AI	Analog input channel 4, positive input.
AIN5M	10	AI	Analog input channel 5, negative input.
AIN5P	9	AI	Analog input channel 5, positive input.
AIN6M	12	AI	Analog input channel 6, negative input.
AIN6P	11	AI	Analog input channel 6, positive input.
AIN7M	14	AI	Analog input channel 7, negative input.
AIN7P	13	AI	Analog input channel 7, positive input.
AIN8M	17	AI	Analog input channel 8, negative input.
AIN8P	16	AI	Analog input channel 8, positive input.
AVDD_5V	15, 56	P	5-V analog supply. Connect 1- $\mu$ F and 0.1- $\mu$ F decoupling capacitors to GND.
CS	25	DI	Chip-select input for SPI interface configuration; active low. This pin has an internal 100-k $\Omega$ pullup resistor to IOVDD.
D0	34	DO	Serial output data lane 0.
D1	35	DO	Serial data output lane 1.

表 4-1. Pin Functions (续)

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
D2	36	DO	Serial data output lane 2.
D3	37	DO	Serial data output lane 3.
DCLKOUT	33	DO	Clock output for data interface.
FCLKOUT	40	DO	Frame synchronization output for data interface.
GND	7, 23, 29, 42, 46	P	Ground.
IOVDD	30, 41	P	Digital I/O supply for data interface. Connect 1- $\mu$ F and 0.1- $\mu$ F decoupling capacitor to GND.
NC	20, 38, 39, 50, 51	—	Not connected. No external connection.
PWDN	32	DI	Power-down control; active low. PWDN has an internal 100-k $\Omega$ pullup resistor to the digital interface supply.
REFIO	52	AI/AO	REFIO acts as an internal reference output when the internal reference is enabled. REFIO functions as an input pin for the external reference when the internal reference is disabled. Connect a 10- $\mu$ F decoupling capacitor to the REFM pins.
REFM	8, 18, 53	AI	Reference ground potential. Connect to GND.
REFOUT_2V5	19	AO	2.5-V reference output. Connect a decoupling 10- $\mu$ F capacitor to the REFM pins.
RESET	31	DI	Reset input for the device; active low. RESET has an internal 100-k $\Omega$ pullup resistor to the digital interface supply.
SCLK	26	DI	Serial clock input for the configuration interface. SCLK has an internal 100-k $\Omega$ pulldown resistor to the digital interface ground.
SDI	27	DI	SDI is a multifunction logic input; pin function is determined by the SPI_EN pin. SDI has an internal 100-k $\Omega$ pulldown resistor to GND. SPI_EN = 0b: SDI is the logic input to select between the internal or external reference. Connect SDI to GND for the external reference. Connect SDI to IOVDD for the internal reference. SPI_EN = 1b: Serial data input for the configuration interface.
SDO	28	DO	Serial data output for the configuration interface.
SMPL_CLKP	44	DI	Single-ended ADC sampling clock input. SMPL_CLKP is the positive input for the differential sampling clock input to the ADC.
SMPL_CLKM	43	DI	Connect SMPL_CLKM to GND for a single-ended ADC sampling clock input. SMPL_CLKM is the negative input for the differential sampling clock input to the ADC.
SMPL_SYNC	45	DI	Synchronization input. See the <a href="#">Sample Synchronization</a> section on how to use the SMPL_SYNC pin.
SPI_EN	24	DI	Logic input to enable the SPI interface configuration (CS, SCLK, SDI, and SDO). SPI_EN has an internal 100-k $\Omega$ pullup resistor to the digital interface supply.
VDD_1V8	21, 22, 47, 48, 49	P	1.8-V power-supply. Connect 1- $\mu$ F and 0.1- $\mu$ F decoupling capacitors to GND.
Thermal pad	—	P	Exposed thermal pad; connect to GND.

(1) I = input, O = output, I/O = input or output, G = ground, and P = power.

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
AVDD_5V to GND	- 0.3	6	V
VDD_1V8 to GND	- 0.3	2.1	V
IOVDD to GND	- 0.3	2.1	V
AINxP and AINxM to GND	- 18	18	V
REFIO to REFM	REFM - 0.3	AVDD_5V + 0.3	V
REFM to GND	GND - 0.3	GND + 0.3	V
Digital inputs to GND	GND - 0.3	2.1	V
Input current to any pin except supply pins <sup>(2)</sup>	- 10	10	mA
Junction temperature, T <sub>J</sub>	- 40	150	°C
Storage temperature, T <sub>stg</sub>	- 60	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) Pin current must be limited to 10 mA or less.

### 5.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SUPPLY</b>						
AVDD_5V	Analog power supply	AVDD_5V to GND, 5 V	4.75	5	5.25	V
VDD_1V8	Analog power supply	VDD_1V8 to GND, 1.8 V	1.75	1.8	1.85	V
IOVDD	Digital interface power supply	IOVDD to GND	1.15	1.8	1.85	V
<b>REFERENCE VOLTAGE</b>						
V <sub>REF</sub>	Reference voltage to the ADC	External reference	4.092	4.096	4.100	V
<b>ANALOG INPUTS</b>						
V <sub>FSR</sub>	Full-scale input range	RANGE_CHx = 0010b	- 2.5	2.5	V	
		RANGE_CHx = 0001b	- 3.5	3.5		
		RANGE_CHx = 0000b	- 5	5		
		RANGE_CHx = 0011b	- 7	7		
		RANGE_CHx = 0100b	- 10	10		
		RANGE_CHx = 0101b	- 12	12		
AInxP	Operating input voltage, positive input		- 17	17	V	
AInxM	Operating input voltage, negative input		- 17	17	V	
<b>TEMPERATURE RANGE</b>						
T <sub>A</sub>	Ambient temperature		- 40	25	125	°C

## 5.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		ADS981x	UNIT
		RSH (VQFN)	
		56 PINS	
R <sub>θ JA</sub>	Junction-to-ambient thermal resistance	23.2	°C/W
R <sub>θ JC(top)</sub>	Junction-to-case (top) thermal resistance	10.5	°C/W
R <sub>θ JB</sub>	Junction-to-board thermal resistance	6.1	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.1	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	6.0	°C/W
R <sub>θ JC(bot)</sub>	Junction-to-case (bottom) thermal resistance	0.9	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application note](#).

## 5.5 Electrical Characteristics

at AVDD\_5V = 4.75 V to 5.25 V, VDD\_1V8 = 1.75 V to 1.85 V, IOVDD = 1.15 V to 1.85 V, V<sub>REF</sub> = 4.096 V (internal or external), and maximum throughput (unless otherwise noted); minimum and maximum values at T<sub>A</sub> = -40°C to +125°C; typical values at T<sub>A</sub> = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>ANALOG INPUTS</b>						
R <sub>IN</sub>	Input impedance	All input ranges	0.85	1	1.15	MΩ
	Input impedance thermal drift	All input ranges		10	25	ppm/°C
	Input capacitance			10		pF
<b>ANALOG INPUT FILTER</b>						
BW <sub>(-3 dB)</sub>	Analog input LPF bandwidth - 3 dB	Low-bandwidth filter, all input ranges	21			kHz
		Wide-bandwidth filter, input range = ±2.5 V	182			
		Wide-bandwidth filter, input range = ±3.5 V	240			
		Wide-bandwidth filter, input range = ±5 V	320			
		Wide-bandwidth filter, input range = ±7 V	400			
		Wide-bandwidth filter, input range = ±10 V	385			
		Wide-bandwidth filter, input range = ±12 V	375			
<b>DC PERFORMANCE</b>						
	Resolution	No missing codes	18			Bits
DNL	Differential nonlinearity	Wide-CM enabled and disabled, all ranges	-0.99	±0.5	0.99	LSB
INL	Integral nonlinearity	Wide-CM enabled and disabled, all ranges, T <sub>A</sub> = 0°C to 70°C	-4	±1.5	4	LSB
		Wide-CM enabled and disabled, all ranges, T <sub>A</sub> = -40°C to 125°C	-4.5	±1.5	4.5	LSB
Offset error	Offset error	Wide-CM disabled, RANGE = ±2.5 V	-175	±90	175	LSB
		Wide-CM enabled, RANGE = ±2.5 V		±120		
		Wide-CM disabled, RANGE = ±3.5 V	-100	±60	100	
		Wide-CM enabled, RANGE = ±3.5 V		±80		
		Wide-CM disabled, RANGE = ±5 V	-50	±10	50	
		Wide-CM enabled, RANGE = ±5 V		±60		
		Wide-CM enabled, RANGE = ±7 V	-100	±35	100	
		Wide-CM enabled, RANGE = ±10 V	-50	±10	50	
		Wide-CM enabled, RANGE = ±12 V	-75	±15	75	
Offset error matching	Offset error matching	Wide-CM disabled, RANGE = ±2.5 V	0	300	512	LSB
		Wide-CM enabled, RANGE = ±2.5 V	0	450	750	
		Wide-CM disabled, RANGE = ±3.5 V	0	150	256	
		Wide-CM enabled, RANGE = ±3.5 V	0	300	512	
		Wide-CM disabled, RANGE = ±5 V	0	25	64	
		Wide-CM enabled, RANGE = ±5 V	0	175	296	
		Wide-CM enabled, RANGE = ±7 V	0	100	200	
		Wide-CM enabled, RANGE = ±10 V	0	25	64	
		Wide-CM enabled, RANGE = ±12 V	0	35	96	
	Offset error thermal drift	Wide-CM enabled and disabled, all ranges		0.5	1.5	ppm/°C

## 5.5 Electrical Characteristics (续)

at AVDD\_5V = 4.75 V to 5.25 V, VDD\_1V8 = 1.75 V to 1.85 V, IOVDD = 1.15 V to 1.85 V, V<sub>REF</sub> = 4.096 V (internal or external), and maximum throughput (unless otherwise noted); minimum and maximum values at T<sub>A</sub> = -40°C to +125°C; typical values at T<sub>A</sub> = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Gain error		Wide-CM disabled, RANGE = ±2.5 V, ±3.5 V, and ±5 V	-130	±48	130	LSB
		Wide-CM enabled, RANGE = ±2.5 V, ±3.5 V, and ±5 V		±100		
		Wide-CM enabled, RANGE = ±7V, ±10 V, ±12 V	-130	±48	130	
Gain error matching		Wide-CM disabled, RANGE = ±2.5 V, ±3.5 V, and ±5 V	0	±96	200	LSB
		Wide-CM enabled, RANGE = ±2.5 V, ±3.5 V, and ±5 V	0	±200	600	
		Wide-CM enabled, RANGE = ±7V, ±10 V, ±12 V	0	±96	200	
	Gain error thermal drift	Wide-CM enabled and disabled, all ranges		0.7	3	ppm/°C

### AC PERFORMANCE

SNR	Signal-to-noise ratio	Low-noise filter, f <sub>IN</sub> = 2 kHz, range = ±2.5 V	86.7	89.5	dBFS
		Low-noise filter, f <sub>IN</sub> = 2 kHz, range = ±3.5 V	87.8	90.5	
		Low-noise filter, f <sub>IN</sub> = 2 kHz, range = ±5 V	88.5	91.4	
		Low-noise filter, f <sub>IN</sub> = 2 kHz, range = ±7 V	89.3	91.3	
		Low-noise filter, f <sub>IN</sub> = 2 kHz, range = ±10 V	89.9	91.8	
		Low-noise filter, f <sub>IN</sub> = 2 kHz, range = ±12 V	90	92	
		Wide-bandwidth filter, f <sub>IN</sub> = 2 kHz, range = ±2.5 V	79	82.5	
		Wide-bandwidth filter, f <sub>IN</sub> = 2 kHz, range = ±3.5 V	80	83.5	
		Wide-bandwidth filter, f <sub>IN</sub> = 2 kHz, range = ±5 V	80.5	84.5	
		Wide-bandwidth filter, f <sub>IN</sub> = 2 kHz, range = ±7 V	81.5	83.5	
		Wide-bandwidth filter, f <sub>IN</sub> = 2 kHz, range = ±10 V	83	85	
		Wide-bandwidth filter, f <sub>IN</sub> = 2 kHz, range = ±12 V	83.5	85.5	

## 5.5 Electrical Characteristics (续)

at AVDD\_5V = 4.75 V to 5.25 V, VDD\_1V8 = 1.75 V to 1.85 V, IOVDD = 1.15 V to 1.85 V, V<sub>REF</sub> = 4.096 V (internal or external), and maximum throughput (unless otherwise noted); minimum and maximum values at T<sub>A</sub> = -40°C to +125°C; typical values at T<sub>A</sub> = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SINAD	Signal-to-noise + distortion ratio	Low-noise filter, f <sub>IN</sub> = 2 kHz, range = ±2.5 V	85.7	88.9		dB
		Low-noise filter, f <sub>IN</sub> = 2 kHz, range = ±3.5 V	86.7	89.9

THD	Total harmonic distortion	Wide-bandwidth filter, f <sub>IN</sub> = 2 kHz, range = ±10 V	82.3	84.7		dB
		Wide-bandwidth filter, f <sub>IN</sub> = 2 kHz, range = ±12 V	82.8	85.1		
SFDR	Spurious-free dynamic range	Low-noise filter, f <sub>IN</sub> = 2 kHz, all ranges	-113			dB
		Wide-bandwidth filter, f <sub>IN</sub> = 2 kHz, all ranges	-113			
SFDR	Spurious-free dynamic range	f <sub>IN</sub> = 2 kHz		113		dB
	CMRR	at dc		-70		dB
	Isolation crosstalk	at dc		-100		dB

### INTERNAL REFERENCE

V <sub>REF</sub> <sup>(1)</sup>	Voltage on REFIO pin (configured as output)	1-μF capacitor on REFIO pin, T <sub>A</sub> = 25°C	4.092	4.096	4.1	V
	Reference temperature drift			10	25	ppm/°C

### DIGITAL INPUTS

V <sub>IL</sub>	Input low logic level		-0.3	0.3	IOVDD	V
V <sub>IH</sub>	Input high logic level		0.7	IOVDD	IOVDD	V
	Input current		-1	0.1	1	μA
	Input capacitance			6		pF

### LVDS SAMPLING CLOCK INPUT

V <sub>TH</sub>	High-level input voltage			100		mV
V <sub>TL</sub>	Low-level input voltage		-100			mV
V <sub>ICM</sub>	Input common-mode voltage		0.3	1.2	1.4	V

### DIGITAL OUTPUTS

V <sub>OL</sub>	Output low logic level	I <sub>OL</sub> = 500 μA sink	0	0.2	IOVDD	V
V <sub>OH</sub>	Output high logic level	I <sub>OH</sub> = 500 μA source	0.8	IOVDD	IOVDD	V

### POWER SUPPLY

	Total power dissipation	Maximum throughput		232	304	mW
I <sub>AVDD_5V</sub>	Supply current from AVDD_5V	Maximum throughput, internal reference		26	32	
		Power-down		0.2	2	mA

## 5.5 Electrical Characteristics (续)

at AVDD\_5V = 4.75 V to 5.25 V, VDD\_1V8 = 1.75 V to 1.85 V, IOVDD = 1.15 V to 1.85 V, V<sub>REF</sub> = 4.096 V (internal or external), and maximum throughput (unless otherwise noted); minimum and maximum values at T<sub>A</sub> = -40°C to +125°C; typical values at T<sub>A</sub> = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>VDD_1V8</sub>	Supply current from VDD_1V8	Maximum throughput, internal reference		50	70	mA
		Power-down		0.2	8	
I <sub>IOVDD</sub>	Supply current from IOVDD	Maximum throughput		7	10	mA
		Power-down		0.1	2	

(1) Does not include the variation in voltage resulting from solder shift effects.

## 5.6 Timing Requirements

at AVDD\_5V = 4.75 V to 5.25 V, VDD\_1V8 = 1.75 V to 1.85 V, IOVDD = 1.15 V to 1.85 V, and maximum throughput (unless otherwise noted); minimum and maximum values at  $T_A = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ ; typical values at  $T_A = 25^\circ\text{C}$

		MIN	MAX	UNIT
<b>CONVERSION CYCLE</b>				
$f_{SMPL\_CLK}$	Sampling frequency	3.6	8	MHz
$t_{SMPL\_CLK}$	Sampling time interval	$1 / f_{SMPL\_CLK}$		ns
$t_{PL\_SMPL\_CLK}$	SMPL_CLK low time	$0.45 t_{SMPL\_CLK}$	$0.55 t_{SMPL\_CLK}$	ns
$t_{PH\_SMPL\_CLK}$	SMPL_CLK high time	$0.45 t_{SMPL\_CLK}$	$0.55 t_{SMPL\_CLK}$	ns
<b>SPI INTERFACE TIMINGS (CONFIGURATION INTERFACE)</b>				
$f_{SCLK}$	Maximum SCLK frequency		20	MHz
$t_{PH\_CK}$	SCLK high time	0.48	0.52	$t_{CLK}$
$t_{PL\_CK}$	SCLK low time	0.48	0.52	$t_{CLK}$
$t_{hi\_CS}$	Pulse duration: $\overline{CS}$ high	220		ns
$t_{d\_CSCK}$	Delay time: $\overline{CS}$ falling to the first SCLK capture edge	20		ns
$t_{su\_CKDI}$	Setup time: SDI data valid to the SCLK rising edge	10		ns
$t_{ht\_CKDI}$	Hold time: SCLK rising edge to data valid on SDI	5		ns
$t_{D\_CKCS}$	Delay time: last SCLK falling to $\overline{CS}$ rising	5		ns
<b>CMOS DATA INTERFACE</b>				
$t_{su\_SS}$	Setup time: SMPL_SYNC rising edge to SMPL_CLK falling edge	10		ns
$t_{ht\_SS}$	Hold time: SMPL_CLK falling edge to SMPL_SYNC high	10		ns

## 5.7 Switching Characteristics

at AVDD\_5V = 4.75 V to 5.25 V, VDD\_1V8 = 1.75 V to 1.85 V, IOVDD = 1.15 V to 1.85 V, and maximum throughput (unless otherwise noted); minimum and maximum values at  $T_A = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ ; typical values at  $T_A = 25^\circ\text{C}$

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
<b>RESET</b>					
$t_{PU}$	Power-up time for device			25	ms
<b>SPI INTERFACE TIMINGS (CONFIGURATION INTERFACE)</b>					
$t_{den\_CKDO}$	Delay time: 8 <sup>th</sup> SCLK rising edge to data enable			22	ns
$t_{dz\_CKDO}$	Delay time: 24 <sup>th</sup> SCLK rising edge to SDO going Hi-Z			50	ns
$t_d\_CKDO$	Delay time: SCLK falling edge to corresponding data valid on SDO			16	ns

## 6 Detailed Description

### 6.1 Overview

The ADS981x is an 18-bit data acquisition (DAQ) system with eight-channel analog inputs that can be configured as either single-ended or differential. Each analog input channel consists of an input clamp protection circuit, and a programmable gain amplifier (PGA) with user-selectable bandwidth options. The input signals are digitized using an 18-bit analog-to-digital converter (ADC), based on the successive approximation register (SAR) architecture. This overall system can achieve a maximum throughput of 2 MSPS/channel for all channels. The device features a 4.096-V internal reference with a fast-settling buffer.

The device operates from 5-V and 1.8-V analog supplies and can accommodate true bipolar input signals. The input clamp protection circuitry can tolerate voltages up to  $\pm 18$  V. The device offers a constant  $1\text{-M}\Omega$  resistive input impedance irrespective of the sampling frequency or the selected input range. The ADS981x offers a simplified end solution without requiring external high-voltage bipolar supplies and complicated driver circuits.

### 6.2 Functional Block Diagram

## 6.3 Feature Description

### 6.3.1 Analog Inputs

The ADS981x incorporates dual, simultaneous-sampling, 18-bit successive approximation register (SAR) analog-to-digital converters (ADCs). Each ADC is connected to four analog input channels through a multiplexer. The device has a total of eight analog input pairs. The ADC digitizes the voltage difference between the analog input pairs  $\text{AIN}_{\text{xP}} - \text{AIN}_{\text{xM}}$ . 图 6-1 shows the simplified circuit schematic for each analog input channel, including the input clamp protection circuit, PGA, low-pass filter, multiplexer, high-speed ADC driver, and a precision 18-bit SAR ADC.

图 6-1. Front-End Circuit Schematic for the Selected Analog Input Channel

#### 6.3.1.1 Input Clamp Protection Circuit

The ADS981x features an internal clamp protection circuit on each of the eight analog input channels, see 图 6-1. The input clamp protection circuit allows each analog input to swing up to a maximum voltage of  $\pm 18$  V. Beyond an input voltage of  $\pm 18$  V, the input clamp circuit turns on and still operates from the single 5-V supply. 图 6-2 shows a typical current versus voltage characteristic curve for the input clamp.

For input voltages above the clamp threshold, make sure that the input current never exceeds  $\pm 10$  mA. A resistor placed in series with the analog inputs is an effective way to limit the input current. In addition to limiting the input current, the series resistor can also provide an antialiasing, low-pass filter (LPF) when coupled with a capacitor. Matching the external source impedance on the  $\text{AIN}_{\text{xP}}$  and  $\text{AIN}_{\text{xM}}$  pins cancels any additional offset error.

图 6-2. Input Protection Clamp Profile, Input Clamp Current vs Source Voltage

#### 6.3.1.2 Programmable Gain Amplifier (PGA)

The ADS981x features a PGA at every analog input channel. The PGA supports single-ended and differential inputs with a bipolar signal swing. 表 6-1 lists the supported analog input ranges. The analog input range can be

configured independently for each channel by using the RANGE\_CHx register fields in address 0xC2 and address 0xC3.

**表 6-1. Analog Input Ranges**

DIFFERENTIAL INPUTS	SINGLE-ENDED INPUTS	RANGE_CHx CONFIGURATION
±12 V	±12 V	5
±10 V	±10 V	4
±7 V	±7 V	3
±5 V	±5 V	0
±3.5 V	±3.5 V	1
±2.5 V	±2.5 V	2

Each analog input channel features an antialiasing, low-pass filter (LPF) at the output of the PGA. 表 6-2 lists the various programmable LPF options available in the ADS981x corresponding to the analog input range. 图 5-14 and 图 5-15 illustrate the frequency responses for low-bandwidth and wide-bandwidth LPF configurations. The analog input bandwidth for the eight analog input channels can be selected using the ANA\_BW[7:0] bits in address 0xC0 of register bank 1.

**表 6-2. Low-Pass Filter Corner Frequency**

LPF	ANALOG INPUT RANGE	CORNER FREQUENCY (-3 dB)
Low-bandwidth	All input ranges	21.2 kHz
Wide-bandwidth	±12 V	375 kHz
	±10 V	385 kHz
	±7 V	400 kHz
	±5 V	320 kHz
	±3.5 V	240 kHz
	±2.5 V	185 kHz

### 6.3.1.3 Wide-Common-Mode Voltage Rejection Circuit

The ADS981x features a common-mode (CM) rejection circuit at the analog inputs that supports CM voltages up to ±12 V. The CM voltage for differential inputs is given by 方程式 1. On power-up or after reset, the common-mode voltage range for the analog input channels is ±12 V (WIDE\_CM\_EN1 = 0b). Voltage at the analog inputs, in all cases, must be within the *Absolute Maximum Ratings*.

$$\text{Common mode voltage} = \frac{(\text{Voltage on AINP}) + (\text{Voltage on AINM})}{2} \quad (1)$$

As described in 表 6-3, the CM voltage rejection circuit can be optimized for various CM voltages for differential inputs.

**表 6-3. Wide Common-Mode Configuration for Differential Inputs**

COMMON-MODE (CM) RANGE	CM_CTRL_EN	ADC A (ANALOG INPUT CHANNELS 1 - 4)		ADC B (ANALOG INPUT CHANNELS 5 - 8)	
		CM_EN_ADC_A	CM_RNG_ADC_A [1:0]	CM_EN_ADC_B	CM_RNG_ADC_B [1:0]
CM ≤ ±1 V	1	0	Don't care	0	Don't care
CM ≤ ±RANGE / 2		1	0	1	0
CM ≤ ±6 V			2		2
CM ≤ ±12 V			1		1

The CM voltage rejection circuit must be configured depending on the analog input range of the PGA when using single-ended inputs as well. 表 6-4 lists the recommended configuration for single-ended inputs for various analog input voltage ranges.

**表 6-4. Wide Common-Mode Configuration for Single-Ended Inputs**

PGA ANALOG INPUT RANGE	CM_CTRL_EN	ADC A (ANALOG INPUT CHANNELS 1 - 4)		ADC B (ANALOG INPUT CHANNELS 5 - 8)	
		CM_EN_ADC_A	CM_RNG_ADC_A [1:0]	CM_EN_ADC_B	CM_RNG_ADC_B [1:0]
±2.5 V, ±3.5 V, and ±5 V	1	0	Don't care	0	Don't care
±7 V, ±10 V, and ±12 V		1	0	1	0

#### 6.3.1.4 Gain Error Calibration

The ADS981x features calibration logic to minimize gain error from the analog inputs. Enable gain error calibration for minimum gain error. Gain error calibration can be enabled by configuring the GE\_CAL\_EN1 (address = 0xD), GE\_CAL\_EN2, GE\_CAL\_EN3 (address = 0x33), and GE\_CAL\_EN4 (address = 0x34).

If gain error calibration is not enabled as shown in 表 6-5, the full-scale analog input ranges are increased by a factor of 1.024.

**表 6-5. Analog Input Ranges vs Gain-Error Calibration**

RANGE_CHx CONFIGURATION	ANALOG INPUT RANGE WITH CALIBRATION	ANALOG INPUT RANGE WITHOUT CALIBRATION
5	±12 V	±12.288 V
4	±10 V	±10.24 V
3	±7 V	±7.168 V
0	±5 V	±5.12 V
1	±3.5 V	±3.584 V
2	±2.5 V	±2.56 V

### 6.3.2 ADC Transfer Function

The ADS981x outputs 18 bits of conversion data in either straight-binary or binary two's-complement formats. The format for the output codes is the same across all analog channels. The format for the output codes can be selected using the DATA\_FORMAT field in address 0xD in register bank 1. 图 6-3 and 表 6-6 show the transfer characteristics for the ADS981x. The LSB size depends on the analog input range selected, gain-error calibration, and system gain error calibration as shown in 方程式 2.

$$LSB = \frac{\text{Analog input range}}{2^{18}} \times (1 + G \times 0.024) \quad (2)$$

where:

- G is 0 when gain-error calibration is enabled, otherwise G is 1; see the *Gain Error Calibration* section

图 6-3. Transfer Characteristics

表 6-6. ADC Full-Scale Range and LSB Size

RANGE	+FS	MIDSCALE	- FS	LSB
±2.5 V	2.5 V	0 V	- 2.5 V	19.07 µV
±3.5 V	3.5 V	0 V	- 3.5 V	26.70 µV
±5 V	5 V	0 V	- 5 V	38.15 µV
±7 V	7 V	0 V	- 7 V	53.41 µV
±10 V	10 V	0 V	- 10 V	76.29 µV
±12 V	12 V	0 V	- 12 V	91.55 µV

### 6.3.3 ADC Sampling Clock Input

Use a low-jitter external clock with a high slew rate to maximize SNR performance. The ADS981x can be operated with a differential or a single-ended clock input. Clock amplitude impacts the ADC aperture jitter and consequently the SNR. For maximum SNR performance, provide a clock signal with fast slew rates that maximizes swing between IOVDD and GND levels.

The sampling clock must be a free-running continuous clock. The ADC generates a valid output data, data clock, and frame clock  $t_{PU\_SMPL\_CLK}$ , as specified in the [Switching Characteristics](#) after a free-running sampling clock is applied. The ADC output data, data clock, and frame clock are invalid when the sampling clock is stopped.

图 6-4 shows a diagram of the differential sampling clock input. For this configuration, connect the differential sampling clock input to the SMPL\_CLKP and SMPL\_CLKM pins. 图 6-5 shows a diagram of the single-ended sampling clock input. In this configuration, connect the single-ended sampling clock to SMPL\_CLKP and connect SMPL\_CLKM to ground.

图 6-4. AC-Coupled Differential Sampling Clock

图 6-5. Single-Ended Sampling Clock

### 6.3.4 Reference

The ADS981x has a precision, low-drift voltage reference internal to the device. For best performance, filter the internal reference noise by connecting a 10- $\mu$ F ceramic bypass capacitor to the REFIO pin. An external reference can also be connected at the REFIO pin and the internal reference voltage can be disabled by writing to PD\_REF = 1b in address 0xC1 of register bank 1.

#### 6.3.4.1 Internal Reference Voltage

The ADS981x features an internal reference voltage with a nominal output voltage of 4.096 V. On power-up, the internal reference is enabled by default. As shown in 图 6-6, place a minimum 10- $\mu$ F decoupling capacitor between the REFIO and REFM pins.

图 6-6. Internal Reference Voltage

### 6.3.4.2 External Reference Voltage

An external 4.096-V reference voltage, as shown in [图 6-7](#), can be connected at the REFIO pin with an appropriate decoupling capacitor placed between the REFIO and REFM pins. For improved thermal drift performance, the [REF7040](#) is recommended. To disable the internal reference, set PD\_REF = 1b in address 0xC1 in register bank 1. The REFIO pin has ESD protection diodes connected to the AVDD\_5V and REFM pins.

[图 6-7. External Reference Voltage](#)

### 6.3.5 Sample Synchronization

As illustrated in [图 5-2](#), [图 5-3](#), [图 5-4](#), and [图 5-5](#), the SMPL\_SYNC pin can synchronize multiple ADCs using an external SYNC signal. The SMPL\_SYNC pin is latched in by the falling edge of the sampling clock.

The synchronization signal is only required one time during power-up. As illustrated in [图 5-2](#), [图 5-3](#), [图 5-4](#), and [图 5-5](#), the SYNC signal resets the internal analog channel selection logic and aligns the FCLKOUT signal to the data frame. If no SYNC signal is given, the internal analog channel selection logic and FCLKOUT are not synchronized, which can lead to a different alignment between the sequence of channel output data and FCLKOUT. When using multiple ADCs with the same sampling clock, the SYNC signal makes sure all ADCs sample the same respective analog input channel at the same time.

### 6.3.6 Data Interface

The ADS981x supports 2-lane and 4-lane mode with single-data-rate (SDR) and double-data-rate (DDR) interface modes. The data interface can be selected using the configuration SPI as described in [表 6-7](#). The ADC generates the data (D[3:0]), data clock (DCLKOUT), and frame clock (FCLKOUT) in response to the sampling clock signal on the SMPL\_CLK input pin. The 18-bit ADC conversion result is output MSB first in a 24-bit data packet and the last six bits are zeroes.

The data interface signals can be described as:

- D[3:0]: Data output from the ADC. In 4-lane mode all four lanes are used, whereas in 2-lane mode D3 and D1 are used to output ADC data.
- DCLKOUT: Data clock output from the ADC.
- FCLKOUT: Frame clock output from the ADC delimiting each set of 8-channel data. A SYNC pulse is required on power-up or after device reset to align the rising edge of FCLKOUT with channel 0 data output, as described in the [Sample Synchronization](#) section.

Use the registers in 表 6-7 to configure the data interface.

**表 6-7. Register Configurations For Interface Modes**

INTERFACE MODE	FIGURE	DATA_RATE (Address = 0xC1)	DATA_LANES (Address = 0xC1)
4-lane, DDR	图 5-2	0	0
2-lane, DDR	图 5-3	0	1
4-lane, SDR	图 5-4	1	0
2-lane, SDR	图 5-5	1	1

### 6.3.6.1 Data Clock Output

The ADS981x features a source-synchronous data interface where the ADC provides the output data and the clock to capture the data. The clock to capture the data is output on the DCLKOUT pin. The clock frequency depends on the sampling clock speed, data rate (SDR or DDR), and number of output lanes (4-lanes or 2-lanes) and is given by 方程式 3. The frame clock frequency is given by 方程式 4.

$$\text{Data clock frequency} = \frac{24 \text{ bits/channel} \times 8 \text{ channels}}{\text{Number of data lanes} \times \text{Data rate (SDR} = 1, \text{DDR} = 2)} \times \text{Sampling clock frequency} \quad (3)$$

$$\text{Frame clock frequency} = \frac{\text{Sampling clock frequency}}{4} \quad (4)$$

表 6-8 shows the data clock frequency for the maximum sampling rates for the ADS9817 and ADS9815 for various interface modes.

**表 6-8. Data Clock Frequency for Interface Modes**

INTERFACE MODE	ADS9815 (f <sub>SMPL_CLK</sub> = 4 MHz)	ADS9817 (f <sub>SMPL_CLK</sub> = 8 MHz)
4-lane, DDR	24 MHz	48 MHz
2-lane, DDR	48 MHz	96 MHz
4-lane, SDR	48 MHz	96 MHz
2-lane, SDR	96 MHz	Not supported

### 6.3.6.2 ADC Output Data Randomizer

As shown in 图 6-8, the ADS981x features a data output randomizer. When enabled, the ADC conversion result is bit-wise exclusive-ORed (XOR) with the LSB of the conversion result. The LSB of the ADC conversion result has equal probability of being either 1 or 0. As a result of the XOR operation, the data output from the ADS981x is randomized. The ground bounce created by the transmission of this randomized result over the data interface is uncorrelated with the analog input voltage. This uncorrelated transmission helps minimize interference between data transmission and analog performance of the ADC when the PCB layout does not minimize ground bounce.

图 6-8. Bit-Wise XOR Operation

### 6.3.6.3 Test Patterns for Data Interface

The ADS981x features test patterns that can be used by the host for debugging and verifying the data interface. The test patterns replace the ADC output data with predefined digital data. The test patterns can be enabled by configuring the corresponding register addresses 0x13 through 0x1B in bank 1.

The ADS981x supports the following test patterns:

- User-defined output: User-defined, 24-bit pattern. Separate patterns for ADC A and ADC B; see the [User-Defined Test Pattern](#) section.
- Ramp output: Digital ramp output with a user-defined increment between two steps. There are separate ramp outputs for ADC A and ADC B; see the [Ramp Test Pattern](#) section.
- Alternate output: User-defined, 24-bit outputs that alternate between two user-defined patterns; see the [User-Defined Alternating Test Pattern](#) section.

To disable the test patterns, set TEST\_PAT\_EN\_CHA and TEST\_PAT\_EN\_CHB to 0b.

#### 6.3.6.3.1 User-Defined Test Pattern

The user-defined test pattern allows the host to specify a fixed 24-bit value that is output by the ADS981x. Configure the registers in bank 1 to enable the user-defined test pattern:

- Configure the test patterns in TEST\_PAT0\_ADC\_A (address = 0x15 MSB, 0x14 LSB) and TEST\_PAT0\_ADC\_B (address = 0x1A MSB, 0x19 LSB)
- Set TEST\_PAT\_EN\_ADC\_A = 1, TEST\_PAT\_MODE\_ADC\_A = 0 (address = 0x13) and TEST\_PAT\_EN\_ADC\_B = 1, TEST\_PAT\_MODE\_ADC\_B = 0 (address = 0x18)

The ADS981x outputs the TEST\_PAT0\_ADC\_A (address 0x15 [7:0], address 0x14 [15:0]) and TEST\_PAT0\_ADC\_B (address 0x1A [7:0], address 0x19 [15:0]) register values in place of ADC A and ADC B data, respectively.

#### 6.3.6.3.2 User-Defined Alternating Test Pattern

The user-defined alternating test pattern allows the host to specify two fixed 24-bit values that are output by the ADS981x alternately. Configure the registers in bank 1 to enable the user-defined alternating test pattern:

- Configure the test patterns in TEST\_PAT0\_CHA (address = 0x14, 0x15), TEST\_PAT1\_CHA (address = 0x15, 0x16) and TEST\_PAT0\_CHB (address = 0x19, 0x1A), TEST\_PAT1\_CHB (address = 0x1A, 0x1B)
- Set TEST\_PAT\_EN\_CHA = 1, TEST\_PATMODE\_CHA = 3 (address = 0x13) and TEST\_PAT\_EN\_CHB = 1, TEST\_PATMODE\_CHB = 3 (address = 0x18)

The ADS981x outputs the TEST\_PAT0\_CHA and TEST\_PAT0\_CHB register values in place of the ADC A and ADC B data, respectively, in one output frame and the TEST\_PAT1\_CHA and TEST\_PAT1\_CHB register values in the next frame.

#### 6.3.6.3.3 Ramp Test Pattern

The ramp test pattern allows the host to specify a digital ramp that is output by the ADS981x. Configure the registers in bank 1 to enable the ramp test pattern:

- Configure the increment value between two successive steps of the digital ramp in the RAMP\_INC\_CHA (address = 0x13) and RAMP\_INC\_CHB (address = 0x18) registers, respectively. The digital ramp increments by N + 1, where N is the value configured in these registers.
- Set TEST\_PAT\_EN\_CHA = 1, TEST\_PATMODE\_CHA = 2 (address = 0x13) and TEST\_PAT\_EN\_CHB = 1, TEST\_PATMODE\_CHB = 2 (address = 0x18).

The ADS981x outputs digital ramp values in place of the ADC A and ADC B data, respectively.

## 6.4 Device Functional Modes

### 6.4.1 Power-Down

The ADS981x can be powered-down by either a logic 0 on the PWDN pin or by writing 11b to the PD\_CH field in address 0xC0 in register bank 1. The device registers are initialized to the default values after power-up and the device must be initialized with a sequence of register write operations; see the [Initialization Sequence](#) section.

### 6.4.2 Reset

The ADS981x can be powered down by either a logic 0 on the RESET pin or by writing 1b to the RESET field in address 0x00 in register bank 0. The device registers are initialized to the default values after reset and the device must be initialized with a sequence of register write operations; see the [Initialization Sequence](#) section.

### 6.4.3 Initialization Sequence

As shown in [表 6-9](#), the ADS981x must be initialized by a sequence of register writes after device power-up or reset. A free-running sampling clock must be connected to the ADC before executing the initialization sequence. The ADS981x registers are initialized with the default value after the initialization sequence is complete.

**表 6-9. ADS981x Initialization Sequence**

STEP NUMBER	REGISTER			COMMENT
	BANK	ADDRESS	VALUE[15:0]

18	1	0xF4	0x0000	INIT = 0
19	1	0xF4	0x0002	INIT = 1
20	Wait 1 ms (min)			
21	1	0xF4	0x0000	INIT = 0
22	Wait 1 ms (min)			
23	1	0x33	0x0000	INIT_KEY = 0
24	1	0x0D	<user-defined>	Enable gain error calibration and select ADC output data format
25	1	0x33	0x2040	Enable gain error calibration
26	1	0x34	0x0010	Enable gain error calibration

As shown in [表 6-10](#), the default settings of the ADS981x can be changed for user-defined configuration:

- Analog inputs: analog input range, bandwidth, and common-mode voltage range
- Data interface: number of output lanes, single or double data rate

**表 6-10. ADS981x User-Configuration**

STEP	REGISTER			COMMENT
	BANK	ADDRESS	VALUE[15:0]	
1	1	0xC1	<user-defined>	Configure data interface (data rate, number of lanes) and select internal or external reference
2	1	0xC2 and 0xC3	<user-defined>	Select analog input ranges. See <a href="#">表 6-1</a>
3	1	0xC0	<user-defined>	Select analog input bandwidth. See <a href="#">表 6-2</a>
4	1	0xC4 and 0xC5	<user-defined>	Select common-mode range for analog inputs. See <a href="#">表 6-3</a> and <a href="#">表 6-4</a>

#### 6.4.4 Normal Operation

After the ADS981x is initialized (see [表 6-9](#)), the ADS981x converts analog input voltages to digital output. A free-running sampling clock is required for normal device operation; see the [ADC Sampling Clock Input](#) section.

## 6.5 Programming

### 6.5.1 Register Write

Register write access is enabled by setting SPI\_RD\_EN = 0b. The 16-bit configuration registers are grouped in three register banks and are addressable with an 8-bit register address. Register bank 1 and register bank 2 can be selected for read or write operation by configuring the PAGE\_SEL0 and PAGE\_SEL1 bits, respectively. Registers in bank 0 are always accessible, irrespective of the PAGE\_SELx bits because the register addresses in bank 0 are unique and are not used in register banks 1 and 2.

As shown in [图 6-9](#), steps to write to a register are:

1. Frame 1: Write to register address 0x03 in register bank 0 to select either register bank 1 or bank 2 for a subsequent register write. This frame has no effect when writing to registers in bank 0.
2. Frame 2: Write to a register in the bank selected in frame 1. Repeat this step for writing to multiple registers in the same register bank.

**图 6-9. Register Write**

### 6.5.2 Register Read

Select the desired register bank by writing to register address 0x03 in register bank 0. Register read access is enabled by setting SPI\_RD\_EN = 1b and SPI\_MODE = 1b in register bank 0. As illustrated in [图 6-10](#), registers can be read using two 24-bit SPI frames after SPI\_RD\_EN and SPI\_MODE are set. The first SPI frame selects the register bank. The ADC returns the 16-bit register value in the second SPI frame corresponding to the 8-bit register address.

As illustrated in [图 6-10](#), steps to read a register are:

1. Frame 1: With SPI\_RD\_EN = 0b, write to register address 0x03 in register bank 0 to select the desired register bank 0 for reading.
2. Frame 2: Set SPI\_RD\_EN = 1b and SPI\_MODE = 1b in register address 0x00 in register bank 0.
3. Frame 3: Read any register in the selected bank using a 24-bit SPI frame containing the desired register address. Repeat this step with the address of any register in the selected bank to read the corresponding register.
4. Frame 4: Set SPI\_RD\_EN = 0 to disable register reads and re-enable register writes.
5. Repeat steps 1 through 4 to read registers in a different bank.

**图 6-10. Register Read**

### 6.5.3 Multiple Devices: Daisy-Chain Topology for SPI Configuration

图 6-11 shows a typical connection diagram showing multiple devices in a daisy-chain topology.

**图 6-11. Daisy-Chain Connections for SPI Configuration**

The  $\overline{CS}$  and SCLK inputs of all ADCs are connected together and controlled by a single  $\overline{CS}$  and SCLK pin of the controller, respectively. The SDI input pin of the first ADC in the chain (ADC1) is connected to the peripheral IN controller OUT (PICO) pin of the controller, the SDO output pin of ADC1 is connected to the SDI input pin of ADC2, and so on. The SDO output pin of the last ADC in the chain (ADC4) is connected to the peripheral OUT controller IN (POCI) pin of the controller. The data on the PICO pin passes through ADC1 with a 24-SCLK delay, as long as  $\overline{CS}$  is active.

The daisy-chain mode must be enabled after power-up or after the device is reset. Set the daisy-chain length in the DAISY\_CHAIN\_LENGTH register to enable daisy-chain mode. The daisy-chain length is the number of ADCs in the chain excluding ADC1. In 图 6-11, the DAISY\_CHAIN\_LENGTH = 3.

### 6.5.3.1 Register Write With Daisy-Chain

Writing to registers in a daisy-chain configuration requires  $N \times 24$ -SCLKs in one SPI frame. A register write in a daisy-chain containing four ADCs, as shown in [图 6-12](#), requires 96 SCLKs.

**图 6-12. Register Write With Daisy-Chain**

Daisy-chain mode is enabled on power-up or after device reset. Configure the DAISY\_CHAIN\_LENGTH field to enable daisy-chain mode. The waveform shown in [图 6-12](#) must be repeated  $N$  times, where  $N$  is the number of ADCs in the daisy-chain. [图 6-13](#) provides the SPI waveform, containing  $N$  SPI frames, for enabling daisy-chain mode for  $N$  ADCs.

**图 6-13. Register Write to Configure Daisy-Chain Length**

### 6.5.3.2 Register Read With Daisy-Chain

[图 6-14](#) illustrates an SPI waveform for reading registers in a daisy-chain configuration. The steps for reading registers from  $N$  ADCs connected in a daisy-chain are as follows:

1. Register read is enabled by writing to the following registers using the [Register Write With Daisy-Chain](#):
  - a. Write to PAGE\_SEL to select the desired register bank
  - b. Enable register read by writing SPI\_RD\_EN = 0b (default on power-up)
2. With the register bank selected and SPI\_RD\_EN = 0b, the controller can read register data in the following two steps:
  - a.  $N \times 24$ -bit SPI frame containing the 8-bit register address to be read:  $N$ -times {0xFE, 0x00, 8-bit register address}
  - b.  $N \times 24$ -bit SPI frame to read out register data:  $N$ -times {0xFF, 0xFF, 0xFF}

The 0xFE in step 2a configures the ADC for register read from the specified 8-bit address. At the end of step 2a, the output shift register in the ADC is loaded with register data. The ADC returns the 8-bit register address and corresponding 16-bit register data in step 2b.

## 8 Application and Implementation

### 备注

以下应用部分中的信息不属TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

### 8.1 Application Information

The following section gives an example circuit and recommendations for using the ADS9817 in a data acquisition (DAQ) system. The ADS9817 includes an integrated analog front-end for each input channel and an integrated precision reference with a buffer. As such, this device family does not require any additional external circuits for driving the reference or analog input pins of the ADC.

### 8.2 Typical Application

#### 8.2.1 Data Acquisition (DAQ) System

图 8-1. Recommended Schematic

## 8.2.2 Design Requirements

The goal of this application is to design an 8-channel data acquisition system (DAQ) based on the ADS981x with an internal reference. 表 8-1 lists the parameters for this design.

表 8-1. Design Parameters

PARAMETER	VALUE
Sampling rate	Up to 2 MSPS/channel
ADC reference	Internal, 4.096 V
ADC analog input type	Differential
ADC analog input range	-5 V to +5 V
Output impedance of the source driving the ADC analog inputs	Up to 200 $\Omega$

## 8.2.3 Detailed Design Procedure

### 8.2.3.1 CMOS Data Interface

The ADS981x features a high-speed CMOS serial interface for ADC data output. ADC data are launched on D[3:0] and the corresponding data clock is launched on DCLKOUT. The DCLKOUT frequency is 192 MHz for 2 MSPS/channel sampling rate (24 SMPL\_CLK bits and an 8-MHz SMPL\_CLK rate).

High-speed CMOS switching can create ground bounce that adversely impacts the SNR of the ADC. Ground bounce increments with increases in PCB trace capacitance. Minimize the PCB trace length for D[3:0] and DCLKOUT. Place a CMOS buffer, with low input capacitance, close to the ADS981x to minimize the effect of CMOS switching noise.

## 8.2.4 Application Curves

## 8.3 Power Supply Recommendations

The ADS981x has three separate power supplies: AVDD\_5V, VDD\_1V8, and IOVDD. There is no requirement for a specific power-up sequence. The data and configuration digital interfaces are powered by IOVDD. A common 1.8-V supply powers the VDD\_1V8 and IOVDD pins. 图 8-4 illustrates the decoupling capacitor connections for the respective power supplies. Each power-supply pin must have separate decoupling capacitors.

图 8-4. Power-Supply Decoupling

## 8.4 Layout

### 8.4.1 Layout Guidelines

图 8-5 illustrates a board layout example for the ADS981x. Avoid crossing digital lines with the analog signal path and keep the analog input signals and the reference signals away from noise sources.

Use  $0.1\text{-}\mu\text{F}$  ceramic bypass capacitors in close proximity to the AVDD\_5V, VDD\_1V8, and IOVDD power-supply pins. Avoid placing vias between the power-supply pins and the bypass capacitors.

Place the reference decoupling capacitor close to the device REFIO and REFM pins. Avoid placing vias between the REFIO pin and the bypass capacitors. Connect the GND, REFM, and IOGND pins to a ground plane using short, low-impedance paths.

### 8.4.2 Layout Example

图 8-5. Example Layout

## 9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

### 9.1 接收文档更新通知

要接收文档更新通知，请导航至 [ti.com](#) 上的器件产品文件夹。点击 [通知](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

### 9.2 支持资源

[TI E2E™ 中文支持论坛](#) 是工程师的重要参考资料，可直接从专家处获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题，获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [使用条款](#)。

### 9.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

### 9.4 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

### 9.5 术语表

#### TI 术语表

本术语表列出并解释了术语、首字母缩略词和定义。

## 10 Revision History

注：以前版本的页码可能与当前版本的页码不同

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

PADS9815RSHT	ACTIVE	VQFN	RSH	56	250	TBD	Call TI	Call TI	-40 to 125		Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

  - B. This drawing is subject to change without notice.
  - C. Quad Flatpack, No-leads (QFN) package configuration.
  - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

# THERMAL PAD MECHANICAL DATA

RSH (S-PVQFN-N56)

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

# LAND PATTERN DATA

RSH (S-PVQFN-N56)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

## 重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做出任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他功能安全、信息安全、监管或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的应用。严禁对这些资源进行其他复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。

TI 提供的产品受 [TI 的销售条款](#) 或 [ti.com](#) 上其他适用条款/TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。

TI 反对并拒绝您可能提出的任何其他或不同的条款。
